# The PILOT 10-1 Double Calibrated Vernier Dial

THE PILOT KILOGRAD

Only **7|6**

*Pay 7/6 and make  
your old  
set up-to-date in appear-  
ance and easier to operate*

*Showsthe way to better tuning*

**Reasons why the Pilot Kilograd Dial is the Best of the New Type Vernier Dials  
on the Market**

None excel it in appearance.

It can be put on any old set now in use and, of course, improve the tuning control.

It is the only vernier dial that will show both clockwise and anti-clockwise calibrations, so that dealers can make no mistake in placing quantity orders.

It has a friction control that prevents the slightest backlash.

Finally, while being as mechanically strong as any offered to the public, it is the cheapest bakelite moulded vernier dial available in Australia to-day.

Sole agents for the Pilot Electric Mfg. Co., the largest manufacturers of radio parts in the world are—

# Simplify Radio Operation by using

## **BRACH-STATS**

*The Automatic Filament Control*

### Gives Longer Life to Your Valves

BRACH-STATS possess the unique property of automatically changing in resistance with varying A battery voltages, thereby making hand rheostats unnecessary, and simplifying the operation of radio sets.

Brach-Stats are connected in series with the radio filaments.

They permit an almost constant flow of current.

They protect Valves and lengthen their life many times.

They are simple and reliable, and make wiring easy.

One Brach-Stat (according to type) can be used to control any number of valves.

Brach-Stats are furnished on standard mountings in types to suit every valve, and are as easy to interchange as a fuse. They can be used on any radio circuit.

The electrical characteristics of Brach-Stats are superior to any product of their kind on the market.

OCTOBER 8, 1926.

## *Relay Stations Next*

**B**ROADCASTING in N.S.W. has never fully recovered from the blow struck by the sealed set. The high wavelength substituted by the promoters of the sealed set prevented what might have been the speedy recovery of a healthy youngster.

The resulting wide range of wavelengths demanding a specially constructed receiver caused endless trouble. Imported sets were useless for wavelengths over 600 metres, and in the endeavour to establish a new Australian industry to meet this demand the experience of older countries was disregarded.

Selectivity is not possible on a moderately priced receiver, with a wavelength range of 200 to 2000 metres. When the lower wavelengths began to fill with smaller stations, interference was rife, despite well-spaced wavelengths. Listeners-in were dissatisfied, and broadcasting languished in N.S.W.

Meanwhile, 3LO, benefitting by 2FC's experience, reduced its wavelength, while radio was in its infancy in that State. Rather late the mistake was realised and remedied in N.S.W., but instead of a fresh, enthusiastic body of listeners-in, 2FC now has an ex-

perienced listener somewhat cynical towards broadcast reception.

It is easy to analyse what has happened. We would like to think now that our troubles are past, and that broadcasting in N.S.W. has only a progressive future in store. Looking forward, it is apparent that the next step in the development of radio in Australia is a relay system.

Captain P. P. Eckersley, acknowledged to be the foremost radio engineer in Europe, holds that enjoyable reception is only consistent within a radius of 100 miles of a broadcaster. European conditions differ from those in Australia in many aspects, but, accepting this statement as a basis for argument, we should need three relay stations in N.S.W.

The most suitable centres for such stations are Hay, in the Riverina country and far west, Orange, in the mountain district, where reception is erratic, and Armidale in the north. These stations would cover all the thickly populated districts of N.S.W. The far outback would not be covered, but the few listeners-in in this area would not justify the expense of stations. Broken Hill will probably have its own station shortly.

Scott Sanders, the well-known Scotch comedian, is seen on our cover this week. He broadcast for the first time in Australia at 2FC on Monday.

# Between You and Me and the Microphone

A WELL-KNOWN solo entertainer, who sings "Tea for Two," as though he meant it, which he doesn't, recently received a letter containing two small packets of tea and an address. He is now searching music catalogues for a song about bank notes.

CONTAINED in the N.Z. Public Works Estimates for lighthouses and harbour works for 1926-27 is a radio direction-finding beacon for Lyttelton Harbour, estimated to cost £1500.

THE NEW government radio station at Garambi, Japan, is now exchanging messages with Hongkong, South China, the Philippines and South Sea stations.

"Father, I wish you'd punish Willie. He's been such a bad boy. He wouldn't come in when I called him, he was impudent, he threw a stone through the cellar window, and he—"

"Oh, come, come! We mustn't be too hard on the boy. It's just youthful spirits."

FIRE CHIEF Harry B. Lee, of Melbourne, has recruited radio to ranks of his fire-fighting forces. All fire engines are to be equipped with radio sets, so that the officer in charge at a fire can communicate direct with Headquarters for assistance. The homes of all the head officers of fire districts have already been supplied with sets.

THERE are nearly 1,000,000 radio sets on farms in the United States. In some States, there are radio sets on 25 to 40 per cent. of all farms. Estimates made by the U.S. Department of Agriculture in 1923 showed 145,000 sets in use on farms at that time; 365,000 sets in 1924, and 553,000 sets early in 1925.

Conducted by  
R. E. CORDER

THERE'S one thing about the wireless talks on fashions—they don't need to be very long.

A SUBURBAN listener complains that he was unable to get "Carmen" on his valve set. Perhaps he will succeed next time, if he tries a better conductor.

MR. SCOTT ALEXANDER has produced more than 50 comedies and dramas from 2FC. He is at present in N.Z., playing the role of the sea-captain in "White Cargo."

THE RADIO paradise of the world is Bude, in Cornwall, England, where American stations are continuously received and where Continental broadcasters are heard with the loudest and clearest of volume even in summer.

"And he was fooling with one of the new valves in your radio set."

"WHAT?"

THE workers in a North Sydney laundry have wireless whilst they are at work. Perhaps this is how they get that atmospheric effect on the edge of the starched collars.

REMARKABLE long-distance reception is reported by the wireless officer on the "Hobsons Bay," using a standard PI one valve set on a recent voyage. When the vessel was in the Australian Bight, all Australian stations were received during the day, while at night reception was effected from Honolulu, Japan, Manila, Hongkong, Madras, Colombo, Aden, Java, Singapore, Lorenzo Marques (East Africa), New Zealand, and Suva.

CRITICS are saying that some of the items in the 2FC programmes are too sluggish. If they are thinking of Redgum's talk on "The week's work in the garden" that certainly is a sluggish topic.

A BRUSSELS court has decided that the air above State property belongs to the State, and that a person cannot, therefore, erect an aerial stretching across State property.

A SHORT WAVE station was recently set up in the Marconi School in Tokio with surprisingly successful results. Reports were received from Canada and California, Italy, Russia, and Australia. The station broadcasts on a 36 metre wave length every evening. Now you bams!

GERMANY is manufacturing considerable radio apparatus, and exported 3,123 metric tons in 1925, an increase of about eighty-five per cent over the exports in the previous year. The goods appear to be going chiefly to Great Britain, although Japan is now purchasing some apparatus. The total value of radio exports last year was £1,407,540, a gain of over £475,200 over the 1924 figures.

"Let me at him!"

AT THE race track at Grunwald near Berlin, one of the most famous race tracks in Europe, radio sets have been installed recently for communication between the judges' stand and other parts of the track. The transmitters and receivers are adjustable to any wavelength between 200 and 1,000 metres. Some of the outfits are portable so that temporary stations can be set up anywhere in a short time.

## "Wire Music, Him Belong God"

*By Capt. Frank Hurley*

I VOW that never again will I go adventuring into wild and isolated corners of the world without taking a complete radio equipment with me. During my recent expedition to Torres Straits and New Guinea, radio not only assisted directly the welfare of my party, but, indirectly, was a factor in bringing the plans of the expedition to a successful issue.

I know too well the mental hunger one develops for social intercourse, and the yearning for the diversions of civilization, when isolated in desolate places for a protracted period. I have come to the conclusion that radio is almost as necessary for the mental relaxation of those whose duties carry them into such places, as good, wholesome food is to the body.

I can remember as far back as 1911, as a member of Sir Douglas Mawson's Antarctic expedition, the tremendous value of the small Tele-

funken set supplied to the expedition by Amalgamated Wireless. Walter Hannam was in charge of the apparatus, which was then looked upon as a doubtful experiment.

During the long, dreary hours of the Polar night, when confined to our hut for many weeks on end, what a source of entertainment and diversion we had by listening-in! With what keen expectations we waited, night after night, as Hannam strained to catch the faintest signal from the outside world! With what joy we hailed the first, feeble signals! The Telefunken set eventually proved not only a boon in breaking down the barriers of isolation, but was of inestimable value in transmitting meteorological reports and other scientific data. What almost unbelievable developments have taken place in radio since those days!

Mr. Carroll, of New Systems Telephones, suggested that I should take a superheterodyne set with me on my last expedition. I admit I knew little about this type of instrument, but, as Mawson did, I fully realised the immense advantages to be gained if the experiment worked. I might mention that with my first expedition to New Guinea, four years ago, I also carried a Telefunken set, which enabled me to maintain constant communication with Sydney.

I was astonished at the compactness and portability of the instrument. The superheterodyne, complete with accumulators and batteries, could readily be transported by two native carriers. On the voyage up to Thursday Island, I gave the gear a thorough test. Suffice to say, the passengers and ship's party were extremely sorry when I disembarked at Thursday Island, for the set, a source of many jovial evening's entertainment, went with me.

*Our contributor, Captain Frank Hurley, who has just returned from Torres Straits and New Guinea, where he filmed "The Hounds of the Deep." His travel talks have created a sensation at 2FC.*

Adventures were to come speedily and unexpectedly. All aboard a pearl-lugger we set sail for Mahuting Island, some 60 miles from "T.I." and with a stiff blow and a choppy sea running, we shipped a good deal of water. To protract the experience, our mainsail carried away, and by the time we neared our destination, darkness had fallen. Mahuting Island is surrounded with a maze of coral reefs, and despite the intimate local knowledge of my native crew, we grounded with great force, qualms, and sickening sensations. Running on a coral shoal was a new experience to my picture artists, who hitherto had scarcely ventured beyond the confines of the studios. It was rather unfortunate that the mishap occurred at night, as one of my film dramas involved a lugger being wrecked on a reef. The hero, however, was saved the annoyance of rescuing the heroine in actuality, as the leak we sprung was readily kept under by the pump. With the rising tide, we floated off some hours later, and reached our destination without further excitement.

Camp was made and the equipment and stores discharged. I discovered,

to my dismay, that the battery box, containing the batteries and accumulators, supplied by Mr. Carroll, was under water. It seemed that my hopes for radio reception were to be foiled at the outset. I could readily recharge the accumulators, as I had brought a small hand-driven dynamo for the purpose. There were plenty of natives at Mahuting to keep the handle turning! The batteries seemed perfectly watertight, but I knew that there must have been a steady discharge taking place across the terminals during their immersion.

After the party was settled down, and routine work was in progress, I decided to erect and test the outfit, forlorn hope though it seemed. There was no scarcity of aerial poles, tall cocoanuts standing over 60 feet in height, were ideal. When I explained to the natives that the small, brown box was going to bring talk and music to them from the white man's world, I was greeted with uproarious laughter.

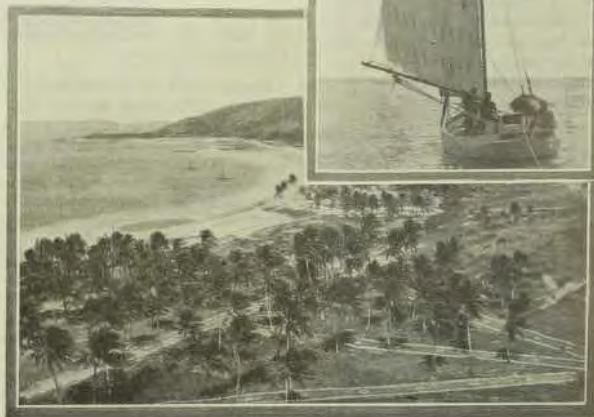

I set Marico, my head boy, to sink a well till he came to water. We were camped a short distance inland from the beach—and this meant digging a shaft fifteen feet deep, to Marico, an

extremely stupid procedure. Phineasa scaled up the cocoanuts, and made the aerial fast. By the time this was done, Marico had reached water. An earth wire soldered to a benzine tin, lowered down the hole and buried, made a splendid earth. That evening I felt as much excited as when we made our first wireless test in the Antarctic, many years ago. It was only a matter of setting the dials, and the announcer's voice came through.

"This is 4QG, Brisbane, the Queensland Radio Service," we heard as clearly and distinctly through the air as though I had been alongside him. All the village folks, some 500 natives, had rolled up for the occasion, and I ascended to an even higher flight in their estimation, than when I visited them in a flying machine three years previously.

(Continued on page 45)

*The pearl-lugger mentioned is seen on the right. Below is the bay of Thursday Island.*

# Clearing the Air about Fading Phenomena

*A clear non-technical statement of the few facts we know about fading by a radio engineer who has studied broadcasting in every part of the world. As studio manager of 3LO he led the recent expedition which investigated fading conditions in Gippsland*

By T. W. Bearup

THE word that is being worked overtime these days by radio enthusiasts is fading. A little while ago the popular subject was selectivity; and before that it was low-loss. About a year ago it was wavelength, before that it was the sealed set. But in the dark and distant days of the sealed set we didn't have so many wireless fans. It is curious how these words have formed the subject of articles in the papers and have been the main topic of discussion in the restaurants. It is not improbable also, that the subjects discussed are but superficially understood. That is not to be wondered at when we consider the newness of the technique of wireless and the changes that have followed one another so rapidly.

One has barely got to the fundamentals of a new method, theory or circuit, when another step forward—or aside—is made and although some of these steps do not advance us very much, we must persevere study them lest we be left in the rear. There is one danger in talking too glibly of these subjects. One is apt to influence opinions improperly or carelessly formed that lead to remarks and criticism which are unfair. That danger in discussing the subject of fading is very evident at the present time in the number and variety of comments we hear of or read concerning the transmissions from our broadcasting stations. Of course, we must not overlook the fact that the percentage of criticisms is really extremely small.

Someone writes to the daily papers making wild or careless remarks about the transmission from 3LO. That letter is followed up by another a day or so after. And yet there are people who really think that such isolated and perhaps irresponsible opinions represent the

## Summarised report of the Fading Expedition

YALLOURN, Sept. 9: Sunset signals muffled. Quick short fades about twice a minute, each fall about five seconds at one third of usual strength. Fading worst at 7 p.m., gone at 8.30 p.m. Distortion of 2BL and 5CL at 10.30 p.m. 4QG and 2FC clear and steady throughout.

BAIRNSDALE, Sept. 10: From sunset until 10.20 p.m. not more than a few words from 3LO intelligible. Fades about two seconds every quarter minute. Distortion at 10.45 p.m., but clear at 11.15 p.m. and 2FC and 4QG clear and constant.

ORBOST, Sept. 11: Conditions better here. Signals rising and falling in intensity without distortion. 5CL fading at long regular intervals. 2BL distorted at 10.30 p.m., 2FC slight fading, 3LO distorted at intervals, 4QG clear and steady.

SALES, Sept. 12: Fading and distortion as at Bairnsdale. 2BL clear, no distortion, 5CL weak, 4QG clear, but later erratic, 2FC clear and steady without fading or distortion.

PORT ALBERT, Sept. 13: 3LO reception worst throughout test, distortion great, 5CL steady, 2BL and 4QG steady and clear with slight fading.

view of a majority of the listeners. Obviously such a conclusion is far from truth. It is impossible for

3LO, or for any other station for that matter, to escape criticism; broadcasting is so young and is so intimate an affair that it must be discussed, even if immaturely, by a number of listeners.

But, as fading is the latest subject for these critics, it is well to clear the air a bit as to the real position of the matter. We frequently read of fading as if it is a peculiarly Australian evil; and indeed, there are some people who can confidently and cocksurely account for its existence in the defects of the station's design or operation.

Far be it from me to attempt to create the impression that fading does not exist, and that all the criticisms are moonshine. (That is not a bad pun, really, although an unconscious one; for if some of our young scientists study this subject of fading a little deeper, they will find that the moon has a definite influence on the occurrence of the annoying phenomenon). Fading in wireless transmission—or rather reception—is, like the poor, always with us. Its intensity and characteristics vary in different localities, in different seasons, with night and day and with different wavelengths.

Expressed shortly, fading is experienced in every country where broadcasting is being conducted. And there is no cure for it. Mainly because the cause of the phenomena is not definitely known. Its effects are fairly well known, but like atmospherics—the other big bugbear of wireless reception—owing to the absence of scientific knowledge of the cause of the interference, a reliable cure cannot be prescribed.

Anyone who reads the more reliable literature of wireless, even if he has no technical grasp of the technical fundamentals of wireless, will learn that fading is a serious

obstacle to good and consistent reception in some parts of every country. He will also note that competent authorities and experts have been tackling the baffling problem for a long time. Yet there is no reliable method of freeing the listener from the annoying effects. There are several theories as to the cause; but these are merely theories that are incapable of proof or demonstration.

The favourite one nowadays (there may be a different one propounded any day) is founded on the belief that a layer of gases surrounds the earth and the surface (next the earth) of this layer is continually shifting. It is supposed that the wave motion which conveys the electro-magnetic energy containing the power to influence our aerials and receiver, starts from the transmitting aerial in two directions. One direction is practically vertical and the other horizontal, or at all events parallel with the surface of the earth. Each of the radiations, vertical and horizontal, con-

tains the energy to excite receiving aerials. The horizontal form of radiation or wave gradually diminishes or peters out at a distance from the transmitting aerial governed by the power put into that aerial and also governed by the frequency or wavelength. Thus a wave may start off from the station in great strength and gradually weakens in strength until at a distance of, let us say, 100 miles, it is so attenuated or weakened that its energy is sufficient only to influence a very sensitive receiving system. Thus, while a crystal receiver will be capable of intercepting the energy strongly at a distance of five miles, it will require a very efficient aerial system and receiving set to produce any effect at the hundred miles point.

The vertical form of radiation, however, does not behave in such a rational manner. It shoots up into the upper atmosphere, but its nocturnal behaviour is quite different from its daytime methods. In daytime its

passage upward is limited, and it apparently peters out quite early. It is supposed that the sun's rays act as a fog to the electro-magnetic rays of radiation and like a ray of light in a fog, it does not penetrate far. At night, when that electric fog caused by the sun is missing, the path of the wave is not obstructed until it meets the layer of gases that surround the earth—called the Heaviside layer, after the English physicist who propounded the theory. When the wave strikes the layer it rebounds, is reflected back to the earth. When it gets back to earth the trouble commences.

The two waves, vertical and horizontal started off from the transmitting aerial in step or in phase. When the vertical wave reflected from the Heaviside layer gets back to earth and joins the horizontal wave, all will be well for the listener, if the two waves are still in step. But more often than not, the vertical wave in its rebound is not in step when it joins the horizontal or ground wave. If the two waves are in step, the energy affecting the receiving aerials in that locality is increased and good strong signals are intercepted. If not in step, the signals (that is the speech or music) are weakened or distorted; the degree of weakening or distortion varying according to the extent of out-of-step between the two waves.

If the vertical (reflected) wave reaches the earth at a point further than the point of 100 miles we arbitrarily fixed for purposes of illustration, the distortion will not be noticed, because there is only one wave affecting the receiving aerial. But there is likely to be fading; that is, loss of signals as distinct from distortion of them. The reflected wave leaves the surface of the heaviside layer at different points owing to the movement of that cloudy surface, and thus the point where the wave strikes the earth varies in the extent or magnitude of the power to affect an aerial. And this variation of the reflection with consequent alteration of signal strength, or field strength as it is technically called, causes the received energy to vary in strength. Thus the music gradually disappears and comes again.

(Continued on Page 49.)

### WHAT THE EXPEDITION FOUND

*Below is the official summary attached to the report on fading conditions in Gippsland, submitted by the three members of the 3LO expedition, Mr. T. F. Bearup, Mr. H. Johnston, and Mr. W. E. Coats.*

In all cases the loop directions were found to be normal. The same comparative results were obtained with all sets whether using aerial and earth system or frame aerial. It is a significant fact that, in every town visited where distortion was in evidence, local listeners informed us that distortion of 3LO had first appeared about Easter time, i.e., towards the beginning of winter.

No evidence of mountain fading was found and this was confirmed by inquiries from constant listeners in the places visited. In cases of fading checks were made to ascertain whether this was due to frequency change, but in no case was this found.

No connection was found to exist between the fading of the various stations—each one being quite independent of the other. It was found that as a general rule, 4QG was the most popular station for night reception. Although

2FC could generally be heard satisfactorily a great number of the sets in use were neutrodynes and superheterodynes which were not capable of being tuned to the longer wavelength.

While 4QG is received so clearly in Gippsland, the same trouble is experienced by listeners closer to that station as is now being felt by 3LO listeners in Gippsland. Whereas, in Queensland, 3LO's signals are reported to be almost perfect, both as regards strength and clarity. At the present time listeners in Gippsland with effective receivers, are able to get good service from 3LO during daylight hours; but after sunset, it is necessary to look to the Interstate stations for entertainment. At this period of the year, atmospheric disturbances are at a minimum, but with the approach of summer, it will become increasingly difficult to receive these distant stations.

**Kerwin Maegraith has some new ideas for brightening 2FC's Studios**

BURGESS—"THE STANDARD IGNITION—TELEPHONE"—BATTERIES

# 3LO Experiments with Sound and Studios

THAT it is the business of a broadcasting company to do all that is possible to improve the service to its listeners is recognized by 3LO, Melbourne. Not only has the company sent its engineers to different parts of the country to investigate the receiving conditions and see what can be done to improve the reception, but the company has recently tried a new study with the object of endeavouring to improve the broadcasting at its source. It is the largest studio in the southern hemisphere, if not in the world. Experiments are in hand to determine the usefulness or otherwise of draping the walls and covering the floor. Although these experiments have not been carried on to their limit, there is already noticeable a decided improvement in many items—particularly the band renditions. There is more "room-tone" or atmosphere about the items such as one is accustomed to in listening to music in a hall.

These activities of 3LO in the interests of listeners so as to improve re-

ception suggest some thoughts on the quality of reproduction of music in broadcasting generally. It is admitted that the reproduction in the loud speakers of several classes of music is not perfect—far from it. Where does the trouble lie? It does not all rest with the broadcasting station. There is a long chain containing many weak links between the orchestra in the studio and the loud speaker,

The sound collecting device in the studio—the microphone—though a remarkably efficient instrument in many respects, cannot be expected to collect and pass on all the complicated wave forms of the symphonies of an orchestra. The vibrations of such music may vary from 100 to 5000 per second. Yet the microphone is expected to pick up all of them with equal fidelity and pass them on to the amplifier. The studio microphone has been designed to do that as far as it is possible to do so, but of itself it cannot do it and an amplifying or boosting equipment is necessary in addition. The microphone is purposely made inefficient, in comparison with the ordinary telephone microphone; it is about one hundred times less efficient or sensitive. The object of doing that is to ensure that all the various notes will be collected equally and none emphasised unduly in relation to the others. It does that fairly well.

With correct "placing" of the microphone in relation to the voices or musical instruments, the notes will all be picked up. The vibrations caused by these notes have to be changed into electrical vibrations and passed on to the broadcasting station through an amplifier and the connecting telephone line. The amplifier is a complicated instrument which in capable hands is able to make up some of the deficiencies of the microphone. Low notes that are too low

*Colin Thompson, in whom 3LO claims to have discovered a remarkable voice.*

can be made louder; high notes that are unduly high or not high enough can be straightened up with reasonable satisfaction. To do this properly the engineer controlling the amplifier manifestly should be able to appreciate the niceties of music thoroughly—he should be a musician as well as a radio man.

Before the output from the amplifier is sent over the telephone line to the broadcasting station, the volume of current must be such that it will not disturb telephone subscribers' lines in the same cable, and yet it must be strong enough to drown any noises that are picked up in the cable. This necessitates a careful balancing or equalizing of the line at both ends or noises and distortion will be picked. It is practically impossible to eliminate all the faults, but a very good job is made of keeping the current carrying the musical vibrations as pure as possible.

At the broadcasting station the chances of introducing distortion are numerous, and the difficulties in the way of preventing distortion very great. By careful attention to design and constant attention to the complicated equipment by competent

*Hugh Steyne,  
'Laughterman' of  
"Tell Me More,"  
who broadcast from  
3LO recently.*

# Studio Notes and News

## RADIO HISTORY.

Broadcasting will play an important part in the historic functions at Canberra on October 11 and 12. On the former day the Marquis of Salisbury, on behalf of the House of Lords, will hand over the Speaker's chair for the new Commonwealth Parliament House. This ceremony will be broadcast by 2FC. On Tuesday, October 12, the Empire delegation will be entertained at an official "at home" at Canberra and the music for the evening will be broadcast from Sydney, being picked up on loud speakers at the scene of the festivities. A feature of the evening will be national choral numbers in praise of Australia, Canada, Scotland, Wales, Ireland, and other parts of the Empire. Scot Sanders, the Scottish humorist, will also be heard by radio for the first time before leaving for London.

## TALKS FOR BOYS.

A series of talks that will be followed eagerly by "boys" of all ages—and girls, too, for that matter—has been arranged by the 3LO with Mr. E. C. H. Taylor, who, in addition to being the secretary of the associated public schools, is the popular "footer" coach of the Melbourne Grammar School.

*Kerwin Maegraith, young Australian caricaturist, who is preparing a series of talks from 2FC. He contributes some original ideas for brightening the 2FC studio on page 9.*

## RADIO BOYS' CHOIR.

The boys' choir being organised by Mrs. McIntosh, of Bondi, on behalf of 2FL, now numbers 27 voices. Their quality is already known to listeners, as they have been heard singing hymns during the children's services on Sunday evenings. Mrs. McIntosh is weeding out a few and strengthening the party before the lads are counted thoroughly qualified.

## "HELLO MAN'S" SESSIONS.

So popular has become the "Hello Man's" session for older boys and girls that alteration in the times for the earlier session is suggested. The proposed new times are: 5.45 p.m., Talks to the younger ones; 6.30 p.m., Story for the older ones; 6.45 p.m., Dinner Orchestra; 7.15 p.m., Usual news session.

## GREAT SNAKES.

When the Rev. F. H. Raward, whose interesting natural history talks are featured from 2FC, sent in this title for his next talk, it made the studio manager realise how versatile Mr. Raward must be. He has first hand knowledge of Australia, as indicated by his talks on camels, ostriches and emus have been most interesting. Mr. Raward has a talk on mosquitoes ready for early delivery.

*Miss Monica A. Horder, 2GB's violinist.*

## "ROSE MARIE."

Act II. of "Rose Marie" will be broadcast by 2FC on October 8. The transmission will be preceded by a talk by Miss Harriet Bennett from her dressing room.

## RIFLEMEN'S SERVICE.

The National Rifle Association's special service, conducted by the Bishop of Goulburn, at Liverpool Camp on October 10, will be broadcast by 2FC. Special band music and items by St. Luke's Choir will be transmitted.

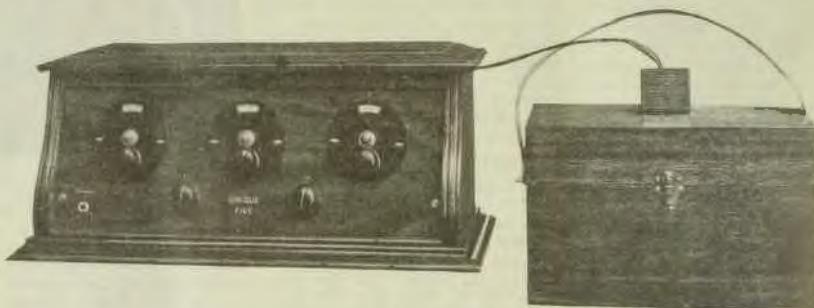

## SWEET VOICED DULCITONE.

At the request of listeners, 2FC has arranged for further items to be played by Madame Evelyn Greig on the sweet-voiced Dulcitone. She will collaborate with Madame Vera Tasma, soprano, in a special programme, on Sunday, October 17.

## SYDNEY'S "BIG BEN."

2FC will now take their time signals from Sydney's Post Office, a line having been run to Challis House, which is right opposite the Post Office, by arrangement with the University authorities. Taking advantage of the 2FC system of dual transmission, the striking of the chimes is very cleverly worked. At any moment during the rendering of an item, from the studio or outside, it is possible to place the chimes on the air at the same time, forming an effective background. This avoids the necessity of crossing over, and coming back to the item being given, which means saving a wait of two minutes or more.

# Ambitions Realised in the MINGAY'S "UNIQUE 5"

## AN AUSTRALIAN PRODUCT.

The manufacturing of Radio Sets in Australia was formerly an experiment resulting in the production of sets that either would not work, were full of distortion or squeals, hard to tune-in, or easily went out of order.

To-day, after many years of experience under practical conditions, and a realisation of the many shortcomings existing in the Sets of the past, the building of Radio Sets has become a science, and the "UNIQUE 5" represents the very best in Radio designing, engineering and production methods. We can now offer you an excellent Five Valve Set at a very reasonable price to sell on terms.

Its many features are unique, hence the name. The results leave nothing to be desired and the obtaining of those results is very easy. The set consists of two stages of balanced radio frequency, detector, and two audio stages. The cabinet is large and of an attractive design. **MINGAY "UNIQUE" RADIO SETS.**

The "UNIQUE 5" and its Battery Box has been designed with the idea of making it the easiest selling Radio set on the Australian market.

The wonderful appeal that the "UNIQUE 5" makes to the average person, especially women, enables the machine to be sold with a minimum of time and expense.

It is essential that the installation of a radio set be as simple as possible. The "UNIQUE 5" is simplicity itself, and presents no trouble to the average person. No multiplicity of terminals to confuse the user, no necessity for pieces of wire to be connected from the set to the batteries, no untidy battery con-

nections, the Aerial, Earth and Battery wires are all incorporated in one complete cable leading from the set to the Battery Box.

### Battery Box.

This Battery Box is unique in many ways. The plug on the end of the cable simply plugs into the socket on the top of the box, which automatically connects all batteries together with aerial and earth to the set.

The Aerial lead-in is connected to the 'A' terminal on top of the box. Three terminals are fitted, No. 1 being for a short aerial, and No. 2 for a long aerial. Either terminal can be tried for best results. The third terminal is for the earth connection.

Inside is space provision for two 45 volt Columbia or Burgess batteries and for an "A" battery of accumulators or dry cells, or eliminator, depending on the type of valves used. The "C" battery is fitted inside the cabinet.

The batteries are all connected up inside the box prior to being despatched to the customer, thus enabling all connections to be made quickly and simply.

The Box itself is well constructed and dove-tailed Walnut Colored Container, fitted with a carrying handle.

### Selectivity.

The "UNIQUE 5" has been tried out under extreme conditions and on a large outside aerial selectivity is very good. 3LO, 4QG, 5CL, 3AR, 2GB and 2KY is obtained without interference.

### Distance.

In order to prove the pulling power and extreme efficiency of the

"UNIQUE 5" each set is tested on an inside aerial and all stations received at good loud speaker strength.

### Tonal Quality.

Careful design and use of quality apparatus has enabled reproduction of very fine tonal quality to be a great feature of the "UNIQUE 5". Adjustment of the tone is possible by the Tone Control Knob.

### Ease of Operation.

This is the keynote of the "UNIQUE 5." To reduce selling costs, a Radio Set must be easy to operate. The tuning dials all read the same. Volume is controlled by one knob and tone by the other. There are no other controls. The insertion of the plug brings the set into action, and no adjustments are necessary. The vernier dial windows allow for the stations to be recorded, so that future reception of that station is simple.

### Absence of Unsightly External Wires.

Hitherto the practice has been to have terminals fitted in the set and connected by pieces of wire to the batteries, etc., but in the "UNIQUE 5" this is eliminated, the connections being made by one well made cable, which is plugged straight into the battery box.

### Absence of Untidy Internal Wiring.

The very latest practice of sub-panel construction has been incorporated in the "UNIQUE 5". The internal wiring is all done under the sub-panel and is out of sight. This prevents any damage from bare wire shorting, etc.

**Interchangeable Valves.**

The set is so designed that 201A or dry cell valves, such as B406, etc., can be used.

**Panel.**

Following the style of the latest imported sets, the beautifully finished sloping panel of well-seasoned 6-ply wood harmonises with the color scheme of the cabinet and is pronounced by all who see it to be a great improvement. The black vernier Control Dials form a pleasing contrast to the Walnut colored panel. The engraving on the panel completes a job that reflects careful attention to appearances. The sloping panel allows for ease of handling.

**General Design.**

It must be acknowledged that the general design, together with the pleasing lines and color of the cabinet, make the whole arrangement very attractive indeed.

**Instruction and Calibration Chart.**

Inside the lid is a card illustrating the method of connection, the erection of the aerial, the settings for the dials as tested and other information.

**Standardisation.**

Realising the necessity and demand for a good radio set capable of doing all that is asked of it, and at a price and on terms within the reach of the multitude rather than the few, we have organised our factory to produce only standard sets. To-day is the day of specialisation. The mechanic of yesterday assembled and built the whole set. To-day the man who fits the condensers to the panel does not solder the wires on to the socket. The number of operations per person is cut down to a minimum and so efficiency is obtained together with quantity production. We are equipped to produce hundreds

of sets per week, and are already producing more sets per day than any manufacturer we know of.

**Guarantee.**

The fullest confidence in our products enables us to guarantee the "UNIQUE 5" for 12 months. It is sealed in such a way that the wiring and internal mechanism cannot be interfered with in any way without breaking the seal. We guarantee the set itself in every direction. It is practically fool proof. We can not conceive how any person can do any harm to it, so that if the set will not work (providing the valves and batteries, etc., are O.K.), we guarantee to repair it if it is sent to our factory or through our dealer. If the set is faulty we will pay the return freight.

**Prices.**

"UNIQUE 5," complete with all high grade accessories, including Loud Speaker, Aerial Equipment, dry "A," "B" and "C" Batteries, in handsome polished box as one unit, Valves, etc. £34

"UNIQUE 5," complete with all high grade accessories, including Loud Speaker, Aerial Equipment, Accumulator, "B" and "C" Batteries in handsome polished box as one unit, Valves, etc. £39

**PORTABLE "UNIQUE 5."**

This coming Summer is going to be a Radio Summer.

The "UNIQUE PORTABLE" is now nearing completion, and will be a fine job. It is going to be the best selling radio set on the Australian market this Summer. Prices are as follows:—

"UNIQUE 5 PORTABLE" with vernier dials and built in loud speaker (no other accessories) £29

"UNIQUE 5 PORTABLE" complete with all equipment and built in loud speaker £40

**UNIQUE 8 SUPER HETERODYNE**

Made under License.

Final developments of our "UNIQUE 8" are now in progress. It promises to be something new in the way of Supers. Our experience in this direction has enabled us to put out a set, second to none and superior to most. Further details will be supplied later. Prices will be, approximately:—

"UNIQUE 8" Super-Heterodyne Table Model, £75 complete with Speaker.

"UNIQUE 8" Super-Heterodyne Portable, £77 complete with speaker. "UNIQUE 8" Super-Heterodyne Console Models, complete with valves, "A" battery and Charger, "B" Battery Eliminator, "C" Battery, Big Cone Loud Speaker and loop £135  
"UNIQUE 8" Super-Heterodyne Console Model, with loop aerial and built-in Speaker £110 Sales Policy.

Our financial strength allows us to offer dealers a most attractive proposition to sell "UNIQUE" Sets on terms. Write us for full information. The whole organisation is built on years of experience. All the staff from the Managing Director down, have had years of experience in actual manufacture of broadcast receivers.

**Our Manufacturing process is right.**

**Our Products are right.**

**Our Sales Policy is right.**

**Our Sales Terms are right.**

Let us put you right on to a good proposition—Write to-day.

If you are interested in selling Radio Sets, and want to obtain your share of the business, that will be there, to get at the same time well established for the coming season, write us fully what your prospects are and all about yourself. If the information meets with our approval we are prepared to send you a set on three days' trial. It is guaranteed and sealed.

# CROSLEY MUSICONES

The National Radio Exhibition, which is now open at Olympia, London, is claimed to be the Greatest the World has seen.

Receiving sets for home use, mostly of the type designed for simpler operation, were the greatest attraction, and these in almost every instance in conjunction with **Cone Type** Speakers, as it is claimed that these speakers with their large reproducing surface give softer tone and non-directional distribution, making them ideal for drawing room use.

The speakers that created the furor at the above Exhibition were the famous **Crosley Musicones** pictured below, which have also taken America by storm.

In this, their first year, the production has already exceeded half a million; and most of those sales have been to replace the now obsolete horn type speakers.

**£4/17/6**

Sold on a "Satisfaction or Money Back" guarantee

**£4/17/6**

Hear a Musicone before you buy an obsolete or imitation

Why not buy the latest and have correct musical reproduction

Contrast the slender beauty of the **Crosley Musicone** with the fat ugliness of a horn—Contrast its perfect tonal properties with the best you have ever heard—Contrast its price with the prices of to-day's "loud speakers." The answer is plain—You will choose the **CROSLEY MUSICONE**. Obtainable from —Swain & Co., W. Harry Wiles, Colville, Moore Ltd., Miss Wallace, Mick Simmons Ltd., Edgar V. Hudson (Brisbane), Adelaide Radio Co. (Adelaide), and most leading dealers, or write direct to—

**METROPOLITAN ELECTRIC COMPANY, LIMITED,**

SYDNEY

# Why Not Realise this Dream?

If you heard this talk from 2FC you must have made this wish. Read how you can realise it.

**D**O you remember this travel talk from 2FC recently?

"After leaving Darwin, in turn we steamed past the islands of Timor, Soerma and Lombok, as we made sail for Bali. This island lies close to the East Coast of Java. The straits between Java and Bali were most interesting and most beautiful. On both sides of the steamer towered precipitous ranges. The water was a beautiful deep blue in colour, and in the distance leisurely rolled up dreamy little beaches, fringed with banana trees and cocoanut palms."

The smooth even tones of the speaker conjured visions in your mind. He continued:

"These trees extend back for a little distance until the ground gradually slopes up to foothills and mountains. High above in the background tower range of misty blue-enveloped mountains, thickly covered in jungle-like forests. Every few miles a gigantic peak rises sheer and loses its head and shoulders in the clouds. The distance cloud-enveloped ranges formed a sombre mysterious background for the bright green cultivations and white beaches, while the sunlight sparkled and glanced on the waters, alive with flying fish and white-sailed native craft."

What listener didn't wish for a holiday in Java after hearing this. By diverting a little of his spare time energy into the right channels any reader of "Wireless Weekly" has a chance of realising his wish.

There is a free return passage to Java and Singapore on one of Messrs. Burns Philp's mail steamers and incidental expenses amounting to £50 for the reader securing the greatest number of pre-paid subscriptions to "Wireless Weekly."

It's not hard to sell a good proposition to any wide-awake listener. You are a reader yourself; and know why you are buying the paper. Do your neighbour a good turn, and introduce him to us.

In addition to a trip to Java as first prize, we offer a special prize for the youth between 16 and 18 securing the

greatest number of subscriptions. By special arrangement with Amalgamated Wireless, we will present a full course through the Marconi School of Wireless to the winner in this section.

Here is a career which in the ordinary course of events would cost £50 to begin, free to any youth willing to devote his spare time and energy in an attempt to grasp this opportunity.

An intensive Marconi course lasts approximately 12 months, and at the end of that time the student sits for examination, conducted by the Postmaster-General's Department, and on passing receives a first-class wireless operator's certificate. This qualifies him for the position of ship's operator, and paves the way to the position of a radio engineer.

It is immaterial whether the student be in the city or country, since the course will be dealt with by post until the student is well advanced, and then several weeks' personal tuition will be given in the school in Sydney.

Subscription orders may be secured on "Wireless Weekly" forms. Books of 25 will be supplied to anyone filling in the following contract and sending it to Wireless Newspapers Limited.

To the Director,

Wireless Newspapers Limited,  
51 Castlereagh Street,  
Sydney.

Sir,—

In consideration of your allowing me to enter the "Wireless Weekly" Subscription Competition of Wireless Newspapers Limited, and supply me with a book of subscription forms, I undertake to remit to you within 24 hours after receiving same any signed subscription orders received and the amount of money received by me as represented on the order. I also undertake to account to you for all subscription order forms which you supply to me.

10 ROWE STREET (Next Hotel Australia Buildings), SYDNEY ————— Phone B 2261

*Full constructional details of a four-valve loop receiver designed for the listener-in unable to erect an outdoor aerial. The loop receiver also has the advantage of being less sensitive to static.*

Often the experienced radio man is consulted by a friend wishing to obtain a radio receiver yielding satisfactory results without an outdoor aerial. It is with regret that the radio man has to advise his friend that his requirements are fulfilled only with a multi-valve receiver, such as a Super-Heterodyne. Frequently the cost of such a receiver bars his friend from the pleasures of radio, while many are unable to erect outdoor aerials.

The receiver this week overcomes both these difficulties. A frame or loop aerial is all that is required to produce satisfactory results on a simply constructed and easily controlled four-valve receiver. With Summer almost here, this receiver will be most suited for reception in zones where static is prevalent, as it is a well-known fact that the loop receiver is not so greatly affected by static as is the ordinary out-door aerial.

Many people do not know just how a frame aerial functions. For their benefit we explain. Although the difference in time is only a small fraction of a second, the wireless wave

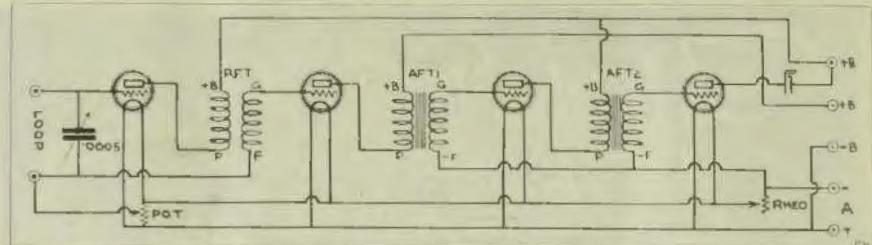

strikes one vertical side of the frame before the other when the frame is pointing towards the transmitting station. This means a difference in potential between the two vertical edges of the frame winding and a current is set up which reverses in direction at a frequency corresponding to the inducing waves. It follows that the frame aerial is directional in its qualities, and has to be pointed edge on towards the station from which it is desired to receive.

In this particular receiver this is

very much the case, as, for example, at Dulwich Hill no sign of 2GB (Theosophical Station) was heard on a given setting when the frame was pointing to the direction of 2BL, but immediately the direction of the frame was altered towards 2GR, this station came in with wonderful punch on the speaker, and was pleasant to listen to. This fact must be borne in mind when operating this receiver, which, by the way, is so selective that a vernier dial is absolutely essential for tuning to receive the best results.

A good feature lies in the fact that this set does not employ honeycomb coils or any other type of wire-wound inductance except the frame aerial itself. There are three controls on the front panel. One is the main tuning dial, one the potentiometer, and one the rheostat which controls all four valves. The potentiometer is invaluable inasmuch as it clears up any mushiness or whistles which may arise in the set, thus ensuring good quality of reception. Last night it was quite a treat to hear 2BL transmitting the church service, and it is regretted that 2FC was not on their

<i>List of Parts.</i>	
1 Panel, Dilecta or Radion,	18in. x 5in. x 3in.
1 3005 mfd. Variable Condenser.	
1 Vernier Dial.	
4 Valve Sockets.	
1 Rheostat.	
1 400-ohm. Potentiometer.	
1 Radio Frequency Transformer, 200 to 600 metres.	
2 Audio Frequency Transformers.	
1 S.C. Jack.	
1 Terminal Board, comprising seven terminals mounted on bakelite.	
1 Baseboard, Busbar, etc.	
1 Frame Aerial or Loop.	

The circuit diagram. Note the feed back from the F of the radio frequency transformer. This is most important.

new wavelength, in order to listen to them. The new wavelength of 2FC has been borne in mind, therefore don't hesitate to build this set, fearing that 2FC will not be heard.

A glance at the circuit diagram will show that there is used one stage of transformer-coupled radio frequency, detector and two stages of audio frequency. A careful scrutiny of the radio frequency transformer will point out that regeneration is employed. This is accomplished by feeding back the plate energy of the first valve into the loop, the energy being accepted inductively from the radio frequency transformer secondary, as it would be impracticable to take this energy direct from the plate of the valve as a short circuit would result through the loop itself. A .0005 mfd. variable condenser is used to tune this loop, which may be tapped as required. It may happen that the total inductance in the loop may be too great to tune as low as the wavelength employed by 2UE, for example, hence the necessity of a tapped loop so that a smaller number of turns may be pressed into service as required. An hour or so

of experiment and you may determine this for yourselves.

A number of readers will remember the "Marnikay" Receiver, published in this journal some months ago. They will remember just how selective the one-valve "Marnikay" was, so that they will have no hesitation whatever in building or recommending this receiver. The parts required are itemized, but it may be mentioned that the radio frequency transformer really required need not go beyond 600 metres wavelength, as it is useless to expect to receive 6WF (Perth) on this receiver, to do so would, no doubt, mean a distinct loss in efficiency on the shorter waves the set is designed to receive.

#### Construction.

The building of this set calls for no special knowledge, nor any apart from the standard tools usually required to construct a radio receiver. The panel has to be laid out according to the panel layout diagram produced here. Right in the centre of the panel is located the variable condenser, underneath which will be found the single circuit jack for plugging in your loud speaker. On the

left hand side is the potentiometer, and on the right hand provision is made for the rheostat. This rheostat is perhaps worthy of a word of explanation. The average 30-ohm rheostat will not carry any more than half an amp, therefore should the stan-

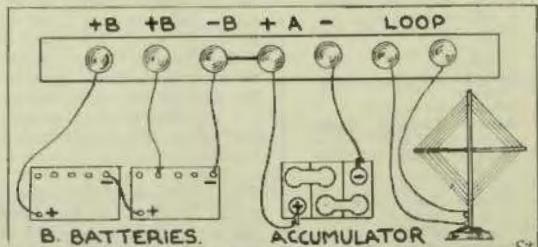

The panel layout. There are no terminals on the front to war the appearance.

dard UV201A valves be desired a 30-ohm rheostat will be too small, as the total current consumed by these valves will be more than half an amp, in fact this current will amount to 1 ampere. To suit these valves, a 6-ohm rheostat is suitable, but for valves such as Cossor Point One, or Philips B406, a 30-ohm rheostat will be found perfectly satisfactory. Always see that you get the correct rheostat for the valves you employ. A word with your radio dealer will help you if you are in any doubt regarding this question.

However, lay your panel on a flat surface, such as a table, and mark off with a centre punch. Drill the required holes for your panel components, and should your panel be so finger-marked that a rub with a dry cloth will not remove them, it will be found that a good old rub with Brasso and finishing off with a dry cloth will ensure a handsome polish. Mount your panel components and leave on the one side until you produce your baseboard layout.

#### Baseboard.

The baseboard used in this receiver

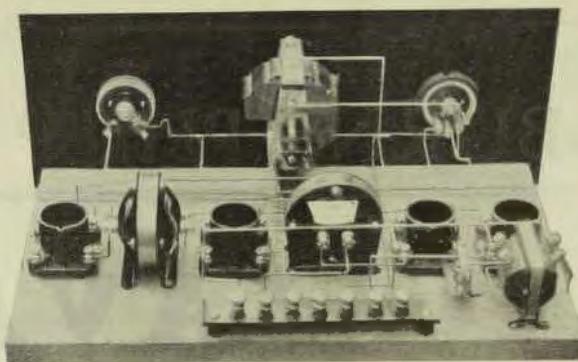

This shows the method of connecting up the "A" and "B" batteries and loop.

is of maple, 17in. x 9in. x  $\frac{3}{8}$ in. or 1in. thickness. If desired, a coat of shellac can be applied. When this is dry, the valve sockets and transformers can be screwed down. The back of panel wiring diagram as well as the back of panel view will be of great value to you in this particular job. Follow out carefully, making each particular piece of apparatus secure and you can then proceed with the wiring.

#### Wiring.

The wiring of the receiver should be taken in easy stages, and be assured of accuracy as you proceed. Firstly, join together one filament connection of each socket. Next connect the grid terminal of each transformer to the grid terminal of each valve socket, noting, of course, that in the instance of the radio frequency transformer the grid condenser and grid leak are inserted in this circuit. Again, P terminal of the second and third valves are respectively connected to the P terminals of the second and third transformers. Then the F minus terminal of these transformers are connected together and joined to the minus of the "A" battery. Take each step slowly, and when finished,

*This shows the view of the back of the receiver. The radio frequency transformer is seen in front of the radio frequency valve.*

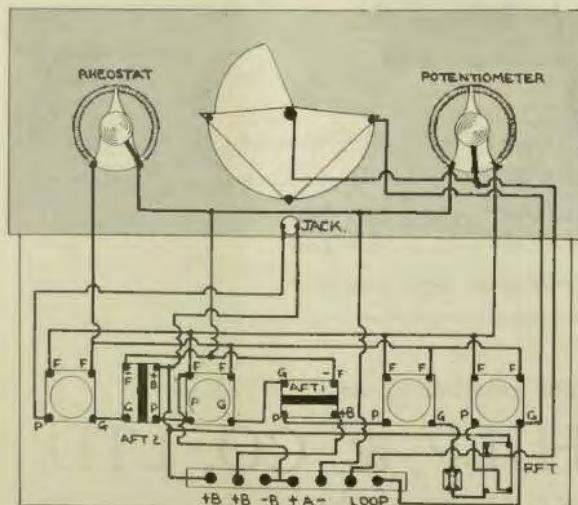

check over carefully rectifying any errors before proceeding further.

#### Operation.

There is really very little in the operation of this receiver, and the connecting of the "A" and "B" batteries calls for no great engineering knowledge. For the benefit of those who have never before connected "A" and "B" batteries to a receiver a diagram showing just how this is done will be found

here. Bear in mind, of course, never to connect a 6-volt accumulator on a 1.8 valve nor even on a 4 volt valve, as there is a very strong danger of these valves burning out under these circumstances. Pay attention to what the maker of each valve has to say regarding it, as they know exactly what they are doing, and also what their valves are capable of standing up to. Remember this now and at all times.

The loop has to be connected across the two terminals provided for this purpose, and pointed in the direction of the station that is being sought. Turn up your rheostat and plug in your loud speaker. Rotate the vernier dial very slowly until you locate the station. Alter the direction of your loop until you find the loudest point, and should the receiver squeal an adjustment of the potentiometer should entirely remove it and provide you with music of a very high quality. Perhaps until you become more familiar with this receiver, the headphones should be used, and by the manipulation of your loop and condenser you will be able to pick up all the local stations at perfectly good loud speaker strength. After a while the Interstate stations may be sought, but perhaps only phone strength will result. This will depend upon many factors over which perhaps you have no control whatever, but be assured that the local stations' programmes will be of particular interest to a great majority of readers.

*The back of panel wiring diagram. Compare with back of panel view shown above.*

# TRIMM SUPER SPEAKERS

Same wonderful reproduction as Trimm Headsets

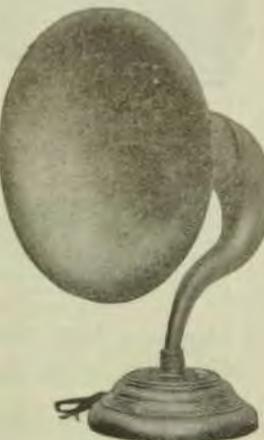

## TRIMM Entertainer

The Trimm Entertainer will appeal to every radio buyer. This speaker gives the performance and tones of speakers selling at much higher prices, yet its price is within everyone's reach. The Entertainer stands 19½ inches high, has a 12-inch bell. Volconite horn and base are finished in the attractive Volox black. Slide adjustment lever gives instant control of tone and volume. Large diaphragm gives purer, sweeter musical tones over the entire range found in radio broadcasting.

Price £4/9/-

## Trimm Concert

The Trimm Concert is the speaker with the "Natural" tone. Large Volconite horn stands 22 inches high. Opening of sound chamber is ½ inch, increasing gradually to 15 inches at the bell. Extra large diaphragm gives beautiful tones over the entire range, from high of violin to low of organ. The Concert is the only speaker that reproduces the bass of orchestral or instrumental selections in their true tonal value. For appearance, tone, results and volume on DX as well as local, the "Concert" cannot be excelled. Standard finish black. Volume is controlled by easily accessible adjustment.

Price £6

 12—G.P.O. Clock Chimes. Close down.

## AFTERNOON SESSION.

- 2—G.P.O. Clock Chimes.  
 3.4—Musical items from the Studio.  
 3.50—Robert Stock Exchange Quotations.  
 3.55—Weather Information.  
 4—G.P.G. Clock Chimes: Close Down.

## EARLY EVENING SESSION.

- 7—Children's Corner. "Big Brother" chats to his Pals.  
 7.15—The adventures of George, the Bookshelf Cat." "An Ink Story," by Aunt Stella.

## NIGHT SESSION.

- 8—G.P.O. Clock Chimes. "The Mercury" special Tasmanian news service. Railway auction produce sales. Weather information.  
 8.5—Robert Stock Exchange quotations.  
 8.10—Selections from Jones' E.X.L. Band: Conductor, Mr. L. M. Barnett.  
 8.30—Mrs. E. W. Bailey, L.A.B., contralto; Miss Dorothy Glover, mezzo; contralto; Miss Dorothy Newton, soprano; Miss Amy Butterworth, pianist; Mr. George Muir, tenor; Mr. Rolf Lyons, baritone; Miss Elsie Lamkin, soprano.  
 9.50—The "Mercury" special Interstate news service. Weather synopses. Station announcements. National Anthem.

**2 B E**

Wavelength, 316 metres. Power, 100 watts. Every Tuesday and Thursday evening, from 6.30 p.m. to 9 p.m.

- 6.30 to 7.30—Mealtide Music, consisting of vocal and orchestral items.  
 7.30 to 8—Lectures, orchestral and vocal items.

B.E. will be glad to get into touch with artists willing to give their services to this station.

**N.Z. Broadcasters.**

The transmissions from I.Y.A. the Auckland station, which recently went on the air, are as follows:

Tuesdays and Fridays—Afternoon sessions, 1 to 4.30; children's session, 6.30 to 7; news and market session, 7.15 to 7.45; evening session, 8 to 10.

Wednesdays and Thursdays—Afternoon session, 3 to 4.30; news and market session, 7.15 to 7.45; evening session, 8 to 10.

Saturdays—Afternoon session, 3 to 4.30; news and market session, 7.15 to 7.45; evening session, 8 to 11.

Sundays—Evening session, 7 to 9.

There will be no transmissions from the Auckland station on Mondays. The new Christchurch station will be completed about August 21, and its time table will be so arranged that it will be working on full power on Mondays.

I.Y.A.—La Gloria Gramophone Co., Auckland. Power, 55 watts; wavelength, 275 metres. Transmits first two Sundays in the month. Broadcasts from Congregational Church, commencing 8.30. Last two Sundays, gramophone items, 8.10 p.m.

I.Y.C.—R. C. Shepherd, Whangarei. 15 watts; 259 metres. Transmits Monday, Wednesday, and Friday, 8.15 p.m.

I.T.Q.—L. A. Keith, Auckland. 50 watts, 235 metres. Monday and Thursday, 8.10 p.m. Sunday afternoons, 2.30, instrumental items. Shortly introducing kiddies items, 4.30-5 p.m., Sunday.

## RACES BY RADIO.

By C. C. FAULKNER.

The scene is a flat on the third storey of a house overlooking the racecourse close to the judge's box. Having studied the position I venture to assert that from no point on the course could a better view of the whole proceedings be obtained. One outstanding advantage, from the broadcasting point of view, struck me immediately: the man describing the race, by closing his window, can shut out all distracting noises. This he does, but as soon as the race is over and the results announced, he opens the window, and the cheering and shouting of the crowd is wafted over the air for hundreds of miles. Punters in Charleville (Queensland) have heard the results; in New Zealand they bet while the horses are running; in the farthest corner of N.S.W. they hear everything.

Business Man, travelling United States 20th October, is prepared to execute commissions re agencies, etc., for radio, electrical, and machinery lines. Apply by letter, "N.L." "Wireless Weekly," 51 Castlereagh Street.

# PHILIPS HIGH TENSION SUPPLY UNIT

A Real "B" Battery Eliminator

Separate terminals for detector and Low Frequency circuits, with a Rheostat on each circuit.

THIS unit will eliminate "B" battery worries entirely. No more faulty reception — no more disappointment or spoilt programmes. Philips Unit gives an ample supply of High Tension Current direct from your A.C. house lighting circuit at an infinitesimal cost. PHILIPS is

# CO-AXIAL MOUNTING

**The new Constructional System which ensures (a) longer life (b) lower running costs and (c) greater uniformity in results. Used for the first time in this wonderful new Cossor Dull Emitter.**

FEW years ago Cossor astonished the Radio world by evolving a method of valve construction which, for the first time, utilised almost the whole of the electron stream. Two years later this success was followed up by the introduction of a unique triple-coated filament which operated at a phenomenally low temperature. And now Cossor—in introducing the new **Cossor Point One**—demonstrates that the same spirit of progress which has always dominated its activities is as vigorous as ever.

### Why Valves vary in performance

It is well known that if a batch of valves were made up using identical filaments, grids, and anodes, without due regard being paid to the accurate spacing of the elements, that every valve would vary considerably in results. There would hardly two alike. Any variation in height between filament and grid, or between grid and anode, exerts considerable influence upon performance. All elements must be mounted co-axially to obtain the best results, and any method which GUARANTEES this must result in an incomparably higher standard of efficiency.

In the new **Cossor Point One** there is at last available a patented system of mounting which invariably aligns the filament, grid, and anode from top to bottom.

### How Co-axial Mounting is achieved

Owing to the peculiar advantages possessed by the shape of the Cossor grid and anode it has been found possible to secure these two

elements together at the top by means of a **seamless** insulator. The grid itself ends in two prongs, which are inserted into the base of the **seamless** insulator. The anode rests on a wide flange provided, and is welded at its base to two stout nickel supports. Even extreme forces cannot dislodge the exact relative positions of these two elements since fixed in their places, to a hundredth part of an inch, they are there for all time.

### The New Shockproof Filament Suspension System

Through the centre of the **seamless** tube runs a fine wire which holds the filament in its correct position. Unlike other valves, the filament in the **Cossor Point One** is not held

under tension. Its shockproof support provides exactly the degree of elasticity to enable it to absorb the sharp concussion caused by an accidental blow. A knock which would shatter the filament in an ordinary valve is rendered harmless by this amazingly efficient suspension.

### Greater uniformity and economy

Thus, with the filament, grid, and anode in permanent alignment, it is reasonable to expect a greater uniformity in results. The supreme importance of this will be instantly appreciated by users of Neutrodynes and Super-Heterodyne Receiving Sets, employing several stages of MATCHED Radio Frequency amplification.

But, in addition, this new valve is exceptionally economical. Its triple-coated filament consumes only one-tenth of an ampere at 13 volts. A super-heterodyne using 7 of them would actually consume less current than a little one-valve set with a single bright emitter.

Bearing in mind, too, the fact that this filament operates at a glow which is practically invisible, it will be obvious that no last wireless enthusiast can afford a valve which must give an incredibly long and uniform service.

**BIGGER BUSINESS FORCES**  
*Noyes Bros. to Expand*

It is a healthy sign that the interest in radio is developing in ever widening circles when we find firms under the necessity of getting into larger premises to enable them to cope with the business.

A number of migrations and expansions have taken place lately and the latest firm to seek more accommodation for their radio business is Messrs. Noyes Bros. (Sydney), Ltd., of 115 Clarence Street.

It is only so recently as May last year that Noyes Bros., one of the oldest engineering houses in Australia, decided to enter the field of radio, and in the short space of sixteen months have built up and consolidated a position which now places them in the front rank of the radio industry.

This rapid development has been fostered and stimulated by the wise policy of offering only the highest quality of radio goods, combined with a prompt and generous measure of service. Realising that the public will not get the highest satisfaction from radio by the use of cheap apparatus, they secured the distribution of a number of high-class British lines, such as Igranic Radio Devices, Igranic Super-heterodyne Kits, Brown loud speakers, headphones, etc., and Oldham batteries, and in addition handle Philips valves, battery chargers, etc., and Cutler Hammer parts, as advertised in current periodicals.

Starting in a very modest way in the main building in Clarence Street, the radio department has grown so quickly that the accommodation there soon proved inadequate and more room had to be acquired. This has been secured at Erskine House, corner of York and Erskine Streets, where the whole of the radio business of this firm is now centred on the second floor.

Messrs. Noyes Bros. will appreciate a visit from all their radio friends to their new premises, where large stocks of all lines are carried.

## Use Emmco Vernier Dials

THE advantage of the absolute hair-line adjustment of an Emmco Dial can only be appreciated when searching on a crowded wave-band. Its remarkable precision and the ease of control which it gives to the most sensitive receiver makes tuning in the work of a moment. It gives skill to your fingers. It gives efficiency to your set. And there is no vernier like it for distance-getting.

Manufactured by

Electricity Meter Manufacturing Company Ltd.  
SYDNEY, N.S.W.

# Who wants a Selective Crystal Set?

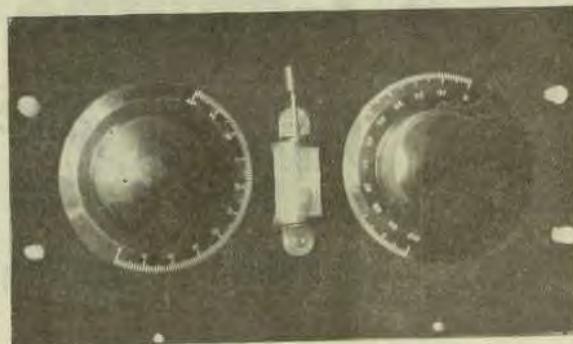

Designed for the listener-in wishing to tune in 2FC on the new wavelength this crystal set combines simplicity of construction with unusual selectivity.

WITH 2FC on 442 metres, many owners of crystal receivers are finding that their present sets are not efficient. Interference or lack of selectivity is the main cause. The crystal sets designed a year or so ago or even several months back are now out of date on account of the inception of 2KY and 2GB as well as 2FC's change.

There is no doubt selectivity in a crystal receiver is a difficult matter. Those folks living within a mile or so of a broadcasting station generally find that their crystal receiver responds only to the neighbouring station. This is unfortunate, for the only remedy is to construct a one-valve selective receiver.

However, there are many experiencing interference, which can be avoided without such measures. To these listeners-in and to the beginner this article is addressed.

The crystal receiver illustrated here is unusually selective with good volume. The construction is simple, and if carefully carried out the set will present a good appearance.

Several of the parts required for this set will probably be found at home, while the remainder may be obtained from any of the advertisers in "W.W."

- 1 Panel, 12 x 7 x 1/8.
- 1 .001 variable condenser.
- 1 .0005 variable condenser.
- 1 Crystal detector.
- 4 Terminals.
- 1 Coil former 5" x 3".
- 1 lb. 20 D.C.C. wire.
- 1 Baseboard, 11 x 7 x 1.

#### Coil Construction.

The coil is the first part to be constructed.

At a distance of 1 inch from one end of the former, pierce 2 small holes and thread the end of the wire

through each hole in order to hold it securely. Then wind on 20 turns of wire, finishing off as you started. This is the primary coil.

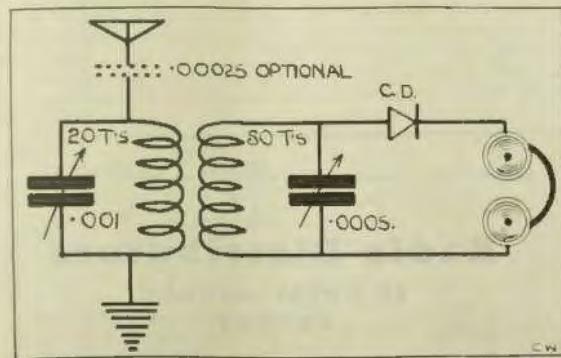

The secondary coil consists of 50 turns of the same gauge wire wound on the same former. Commence the winding about half an inch from the end of the primary winding and secure as you did the first coil. There is no necessity to dope this coil with shellac in any way.

#### Panel Layout.

The drawing herewith gives you the panel layout. Provision is made for the condensers, crystal detector and terminals. Use the templates provided with the condensers, and be careful to drill correctly. Mount your apparatus on the panel. Should the crystal detector come to you on a baseboard remove the baseboard and mount the detector directly on the panel.

#### Wiring.

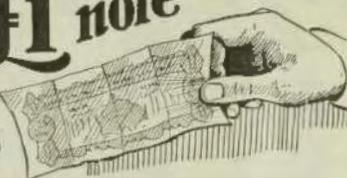

The panel wiring may now be proceeded with. The aerial terminal is taken to the one side of the larger condenser—the other side being joined to the earth terminal. One side of the crystal detector is connected to the one side of the .0005 mfd. variable condenser. One terminal of the phones is linked up with the remaining terminal of the crystal detector which a wire joins the remaining phone terminal to the remaining side of the smaller variable

This circuit design can be followed by any beginner. Note the small number of turns on the primary and secondary coils.

# A Genuine Offer

**This £1 note  
can be  
yours**

IT is simply human nature to look for the catch in any proposition offering payment for easy spare-time work. So many wonderful schemes have been evolved, but they usually call for a lot of work you don't feel inclined to tackle after a hard day at your ordinary business.

#### THERE IS NO CATCH IN OUR OFFER !

It represents a genuine, honest chance to earn more money without hard work or brain fag, and will appeal to any reader (old or young) of this paper anywhere.

FILL THIS IN AND MAIL IT TO-DAY

RADIO DISTRIBUTORS, 29 ROYAL ARCADE, SYDNEY

*Kindly send me details of your proposition.*

MA 1790

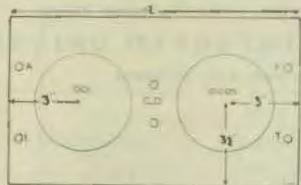

MA 1744

exit and the back of panel wiring diagram.

#### Tuning Hints.

There is really nothing to say regarding the operation of this simple receiver. All that is required is to turn the condensers until you hear the station. All the local stations will be heard nicely, and one apart from the other. Should you hear two stations at once, overcome this, altering the distance between the two coils. It means rewinding the primary, but do so and finish one inch away from the beginning of the secondary. This gives a looser coupling and means more selectivity. Should this not completely solve the difficulty, the insertion of a fixed condenser of a capacity of 00025 or 0005 mfd. in the aerial lead as shown in the dotted lines on the circuit diagram will assist still further. Before inserting this condenser finally try it out by clamping one side underneath the aerial terminal and hooking your aerial to the other side.

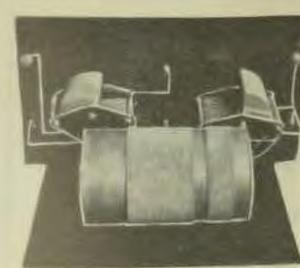

Excellent results are assured with this receiver, but don't forget to obtain a good sample of crystal.

Lay out your panel according to this diagram.

#### HOSPITAL CONCERTS.

Station 2FC is organising a party of radio artists to visit the hospitals on Saturday evenings. The patients will be entertained for a couple of hours and part of the programme will be broadcast so that listeners everywhere can hear. Mr. Rus. Garling, who will act as concert director, will take "Jerry" and will give the sick children some of his amusing ventriloquial acts. The Hello Man will tell his bed time stories at the bedside of the children in hospital. Many of the principal hospitals in the metropolitan area will shortly be equipped with receiving sets, thanks to the recent newspaper appeal, and the move of 2FC will enable patients to listen to the concert party in another hospital while awaiting their turn.

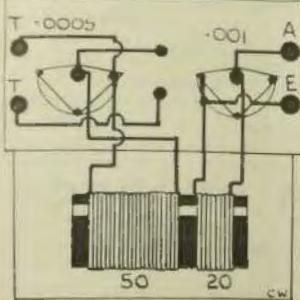

Illustrating the method of mounting the coil former and condensers. The back of panel view.

condenser. Square busbar is generally used for the wiring, and it looks very neat.

Now screw your panel to your baseboard and attach your coil. Small supports should be pressed into service to keep the wire of the coil from resting on the board. Little wooden supports will be found ideal, and screw your coil to the baseboard, using a brass wood screw for the purpose. Make sure that you mount your coil in such a manner that the primary coil (20 turns) is immediately behind the .001 variable condenser and the secondary portion is near to the .0005 variable condenser.

Complete the wiring now by joining the beginning of the primary coil to the aerial side of the larger condenser and the end of this same coil to the earth side of this condenser. The top of the secondary is connected to that side of the smaller condenser which joins the crystal detector, the other side of the condenser being linked up to the end turn of the secondary coil.

This completes your wiring which you had better check off with the cir-

This diagram shows you how to wire each component.

**"Wire Music, Him Belong God"**

(Continued from page 6)

Though the sound of human voices and music coming from the loud speaker was, for the moment, terrifying and bewildering to the natives, they soon accepted the "telephone belong God" as another specimen of the white man's magic, to whom, in their simple belief, all is possible. Those who had assisted in the erection of the plant, did not fail to strike a pose beside the machine in the full limelight of public admiration.

Sambo, of 4QG, was a great "hit." His infectious laugh kept my dark listeners-in in convulsions, and there was not a native piccaninny who did not ask me to request Uncle George to admit them to the radio family, and to send Hector post-haste with boxes of chocolates!

The natives had never heard a jazz band before, and when the joyful noise blared forth at them, it was accepted with mixed feelings. Mario, who dug the pit for the "earth," chuckled and took the credit for bringing that brand of noise from the ground.

"That come from hell-noise belong devil," he said.

A little later, however, an excellent choral and organ item came over the air. The natives recognised the hymn as one taught to them by the mission. Phineasa, who had strained the aerial high aloft between the coconuts, was quick to take advantage of the number.

"That one come from sky—I catch 'em along wire—music belong God!"

I enjoined the congregation to join in, which they did with great fervor. Phineasa had scored a triumph!

"The studio time is two minutes past nine."

Those who could read the time by my alarm clock, were astonished. "He speak true," they said, simply, but all were deeply impressed.

The instrument was as sublime a revelation to us as it was to the natives. Instead of dreading the nights, we looked forward to them. The programmes were a mental tonic to all, keeping us attuned and in good spirits for the day's work.

I doubt if radio music was ever presented or appreciated under more

We release the

## "D.J. Standard 4"

absolutely complete  
nothing more to buy !

# £25

After months of work to attain perfection, David Jones' now release the "D.J. Standard 4" as the supreme Wireless value!

With the "D.J. Standard 4" *there are absolutely no extras to buy*. It is complete with "Trim-enter-tainer" Loud Speaker, and genuine Peto & Radford Accumulators.

This new Set RECEIVES ALL INTERSTATE BROADCASTING STATIONS AT LOUD SPEAKER STRENGTH—including New Zealand, but excluding Perth.

It is adapted to the new wave length conditions of 2FC.

It is extremely simple and absolutely stable in operation.

Only two dials for tuning! No moving coils to change!

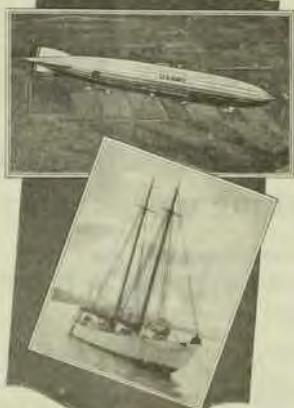

In attractive polished Maple Cabinet. Price complete, £25

RADIO DEPARTMENT—22 YORK STREET.

## PLAYS WRITTEN FOR RADIO.

Radio is creating a new technique in the question of play writing, and 2FC has for some time endeavoured to develop the writing of special plays for broadcasting purposes. Mr. Scott Alexander has been successful in this direction, preparing and producing more than fifty comedies and dramas for that Station. In addition, new plays are being written for 2FC by Mr. James Donnelly, whose prolific pen has produced a number of humorous and musical plays. One of these will be given from that Station on Monday, October 4, in which an attempt will be made to show how a listener-in searches for his radio amusement by dialing every station in Australia, and just missing the item he is looking for.

## SEASONAL MODELS VANISHING

Seasonable models, a big obstacle to all-year-around sales of receiving sets, are rapidly disappearing.

Manufacturing policy is very definitely moving against the practice of introducing new models at a certain definite time of the year. Many of the larger manufacturers are adopting the policy of some of the automobile manufacturers, that of making improvements whenever possible, but no seasonal models. Others again recognise that many concerns have brought out so-called new models which, beyond one or two minor changes in design, perhaps a new dial, or something like that, are no different from their predecessors.

## VERNIER REACTION CONTROL

Fine and accurate control of reaction is necessary when receiving distant telephony stations.

In sets using two plug-in coils, aerial coil and reaction coil, the desired effect can be obtained conveniently and efficiently by substituting a three-coil holder in place of the two-coil holder. The third socket in the holder is then used to take a coil of from four to eight turns only, which is connected in series with the main reaction coil.

Approximate coupling values are then obtained by the main reaction coil in the usual way, the small coil then being adjusted to obtain a vernier effect.

## These Batteries Last Longer

Ever-Ready Radio Batteries are now made in Australia, and are placed on the market immediately after manufacture. This ensures always a fresh battery, crammed to the full with maximum energy.

It is one of the many reasons why Ever-Ready Batteries are so popular amongst radio enthusiasts.

Your dealer has the particular type you want.

5 Parker Street,  
139 Queen Street, Melbourne.

Distributor for Queensland:  
**EDGAR V. HUDSON,**  
55 Charlotte Street, Brisbane.

(a) Amplification with any valve and transformer depends greatly on the transformer impedance; the higher the transformer impedance the better the reproduction, particularly of the lower notes.

HENCE IT IS UNNECESSARY TO VARY THE IMPEDANCE OF THE TRANSFORMER TO MATCH THAT OF THE VALVE USED; ON THE CONTRARY, THE HIGHEST POSSIBLE TRANSFORMER IMPEDANCE SHOULD BE USED AT EVERY STAGE.

(b) IMPEDANCE DEPENDS ON FREQUENCY, AND TO STATE TRANSFORMER IMPEDANCE WITHOUT STATING THE FREQUENCY AT WHICH IT IS MEASURED CONVEYS NOTHING.

A good transformer has a high impedance even at low frequencies to reproduce low notes satisfactorily. A transformer may have a high impedance at a comparatively high frequency, say, 500, and yet be a bad transformer because the whole range of male and female-speaking voices, as well as most of the fundamental musical notes are at frequencies below 500.

### *Clearing the Air about Fading Phenomena*

(Continued from page 8)

It sounds logical enough, and in fact there are some scientists who have weighty and mathematical arguments to prove that it is a practical explanation of the phenomenon. But—and this is the point—they cannot tell us how to cure it. A partial cure is to increase the power sent out into the two waves; but even that has been proved to be an ineffective cure for the difficulty in certain types of localities — valleys in hills, or places directly behind hills, for example. The only cure for such cases as those is to build more stations on the hills; but that cure is ruled out in economic considerations.

Broadcasting stations obviously cannot be put up and operated efficiently all over the country. Some people, therefore, must perchance be the unfortunate ones; at all events, until science shows the way to get those two waves to behave and deliver their energy to aerials in all localities without too serious diminution in strength and without mutual interference.

### *"Wire Music, Him Belong God"*

(Continued from page 45)

unusual conditions than in this strange theatre of nature, hemmed around by rustling palms and roofed by the starlit dome of the heavens. Though static occasionally compelled us to shut down, I was generally able to receive Australian and New Zealand stations at least five nights of the week. One evening I thought I had tapped Marico's "hell." I had merely tuned into JOAK, Japan. This station was broadcasting, with all its fury, a Japanese opera. It was a great joke for my listeners, who wondered what new noise the loud speaker might spit at them.

Mr. Carroll's batteries, in spite of their initial immersion in seawater, stood up to the severe test of tropical steamy heat marvellously; in fact, they appeared to be immune to climatic conditions, and whatever drain I made upon them. These batteries, after four months' continual service in the tropics, are still operating the set in my home.

# "SFERAVOX"

Produced by

SOCIETE FRANCAIS RADIO-ELECTRIQUE, PARIS

Faithful

Sensitive

Beautiful

Powerful

Toned in Silver.

Silver in Tone

£5·5·0

#### PROPERTIES OF THE "SFERAVOX."

Both on account of the entirely new principles of design and the particularities of its construction, the "SFERAVOX" is the only Loud Speaker combining the qualities of sensitivity, power and purity of reproduction, which, up to the present, have been considered as mutually antagonistic. It reproduces the sound impulses in any desired degree of strength, as a very agreeable tone, and both human voices as well as music are reproduced with irreproachable truth.

BROWN & DUREAU, Ltd. Broughton House  
Clarence St., SYDNEY

# Is Your Problem Here?

W.A.D. (Mandurama):

Q.: Can you supply me with a list of the different capacities of variable condensers and the number of plates each contain?

A.: This is a rather difficult question to answer with authority, as all manufacturers do not standardise on any given number of plates to a given capacity. The capacity of any condenser depends on the strength of the dielectric and the area of the plates. For example, a 43 plate condenser with the moving plates when all in may have a capacity of .001 mfd. if the distance between the moving and fixed plates be one-sixteenth of an inch, but this capacity is greatly increased if the distance be one-thirty-second of an inch and lessened if the distance between these plates is altered to one-eighth of an inch. However, as a guide we are publishing herewith a table, showing approximate values.—

Plates.	Capacity.
43	.001
23	.0005
17	.00035
13	.00025
9	.00018
7	.0001

R. H. C. (Collarender):

Q.: When is a B battery worn out?

A.: A B battery is worn out when it ceases to function as such. It is obviously impossible to give a stated time of life for a B battery, so many different factors having to be taken into consideration. Should your batteries be used for eight hours a day they certainly won't last as long as they would with four hours' use a day. A B battery soon lets you know when its useful life is ended. Crackling noises, frying sounds, and distortion are the symptoms, and it is then advisable to replace them. You would be well advised to stand B batteries on their ends, and not lying flat down, as air circulation means a lot to batteries, and never, under any circumstances, leave them in the sun, preferring always a cool place. Do not link up an old or partially worn out B battery to a new one. If in series, resistance is set up, which precludes good reception,

and if joined up in parallel, the old B battery will accept quite a lot of life from the new one, and will not be able to hold it. Look over your set carefully to see that there is no leakage and try disconnecting your B battery when not in use. For three or more valves, always use the heavy duty type—it is more economical in the long run.

N.E.C. (Uralla):

Q.: I have built the two-valve reflex receiver recently published in W.W., but can only get howls from it, which become more pronounced when the grid and plate terminals of either valve are touched.

A.: It seems that you are not using by-pass condensers, as recommended. If you are using them, test them as one may be defective. Substitute other condensers. Perhaps you would be well advised to test one valve only and then the second valve. You will thus allocate your trouble to one valve, which will be easily rectified.

R.E.U. (Gladeside):

Q.: Please tell me where and what are stations 3ME and 3MA?

A.: These are test stations of Amalgamated Wireless (A.s.m.) Ltd. situated in Melbourne.

L.G.C. (Blayney):

Q.: Would you please supply me with a diagram showing how to add a stage of radio frequency to a three coil receiver? I would like to switch out the radio frequency when not required.

A.: See W.W. of 18/2/26 for full information. We would rather you did not use a switch on the radio frequency side.

G.H. (Griffith) asks:

Q.: I am using a B battery of 40 volts on my audio amplifiers. Will it increase the volume?

A.: Yes.

Q.: I have an A battery comprising three dry cells connected in series. Would three more in series so joined as to form two banks in parallel give more punch to the volume?

A.: No, but the life of your A battery so connected would be more than double the three joined in series.

Q.: My series aerial condenser will only work when the moving

plates are completely enmeshed within the fixed plates—why is this?

A.: Use a smaller size coil in the aerial circuit.

G.T.H. (Point Cook):

Q.: Could you please inform me where I can obtain tantalum?

A.: The tantalum which we received was obtained in England, and is the property of the Technical Editor, who intends using it as explained in W.W. of 10/9/26.

Q.: Can you give me details for building a spark coil suitable for use with a 201A valve as oscillator in a transmitter?

A.: A spark coil from a Ford will be found quite satisfactory.

A.M.I. (Newcastle) is experiencing some trouble with the W.W. Reflex receiver.

Q.: When the loud speaker is touched, a dreadful squealing arises.

A.: Too much plate voltage and coupling too close. Reduce both.

Q.: Volume is good, but modulation is harsh. Can you explain?

A.: Yes, reverse your tickler connections. See answer to N.E.C. (Uralla).

G.S. (Parramatta): Your present aerial is quite alright, without any alteration.

W.E.H. (Contamundra): The drop in the wavelength of 2FC has automatically solved your problem. Build the Neutrodyne.

L.M. (Wongan Hills, W.A.): We should advise you to talk this over with your local garage proprietor.

S.J.B. (Esteiville): Don't tackle this, as it will be too complicated.

H.W.McK. (Homebush): Thanks for the suggestion, but as 2FC has altered the wavelength, suggest you build the Regenerative Interflex in this issue.

R.W. (Hinton):

(1) Obtain one of the valve handbooks from any agent for valves and decide this question for yourself.

(2) Leave your aerial as it is.

A.E.S. (Auburn):

C 509: Your second inquiry will be answered next week.

W.G. (Singleton):

Perhaps as you suggest you are too far away.

### 3LO Experiments with Sound and Studios

(Continued from Page 10.)

engineers the result is very satisfactory. When we consider that the voice in the studio which in power is about one hundred millionth of a watt is gradually amplified or boosted up until it has a power of nearly two thousand watts, we can realize the difficulties encountered in endeavouring to maintain the voice or music faithful to its original form.

When the voice is radiated—or rather saddle on to the high frequency carrier that is radiated and carries it in all directions, many and complex actions take place. These generally are not properly understood, but there are sound theories which enable us to obtain a mental picture of what happens.

No loud speaker is capable of reproducing the sounds faithfully. Both the transformers and the loud speakers will distort some musical sounds and a compromise is aimed at. The research and experiment on transformers and loud speakers has been remarkable in recent years, and the receivers are gradually being improved. The advent of the Cone loud speakers has marked a decided advance and it is not unlikely that the present unsightly horn types of speakers will be obsolete in a few years.

The construction of the receivers—the layout of the components and connecting up in home assembled sets—is a fruitful source of trouble leading to unfaithful reproduction. The maintenance of the batteries, particularly the B batteries; the condition of the earth connection—to say nothing of the method of operation—are all capable of causing unsatisfactory reception of even the best transmitted items. And added to all these is the interference caused by atmospherics, which is beyond the power of any man or device to eliminate. That bughorn of broadcasting is more severe in summer than in winter. Listeners near a powerful station like 3LO are not so severely affected by it as are listeners at a great distance. The signals from the station are strong enough to drown the interfering noises nearby, but at a great distance cannot do so.

MR. JOHN HARRINGTON

(Managing director, Harringtons Limited, Australia and New Zealand) who recently spoke from station 4QG (Brisbane) while on a motoring tour in Queensland. Mr. Harrington emphasised the fact that to get really good reception of broadcasting programmes, it is necessary to purchase good quality radio sets from reliable, well-established warehouses. Mr. Harrington, who visited some of the big broadcasting stations in U.S.A. and Great Britain last year, said, after his inspection of 4QG, that it compared most favourably with anything he had seen. He considered 4QG most neat and efficient.

Mr. Harrington received reports from the staff of his radio and photo warehouses all over Australia and New Zealand that his speech was received quite clearly. Mr. R. A. S. Martin, a big radio dealer of Cowra, N.S.W., reported excellent reception of Mr. Harrington's speech, remarking that the voice sounded very much like Uncle George's, of Broadcasters Limited. Mr. Harrington is, himself, an enthusiastic listener-in.

### NAUTICAL NIGHT.

For those with a streak of salt in their blood, should tune in 4QG on Friday, October 15. A talk on "The Mercantile Marine in Wartime," by Mr. F. W. Stevens, will open the session. The musical portion of the programme will include sea ditties.

### THE SESQUI-CENTENNIAL.

This year all eyes in America are on Philadelphia, the Cradle of Independence. Thousands and thousands of people from all over the country and all over the world are streaming into that city.

The Sesqui-Centennial is the greatest world display ever seen. As you enter the grounds, passing under the mammoth electric reproduction of the Liberty Bell, the first thing you see is a spick and span electric coach waiting to carry you smoothly and comfortably over the entire circuit of the grounds. Twenty-five of these special de luxe coaches are provided, and each coach seats comfortably 40 passengers. The electric power to drive each coach is provided by 40 "Philco" batteries, made by the makers of the famous "Philco" Rechargeable "B" Batteries, which have proved so efficient in Australia.

### A SHIELDED WAVE METER FOR YOUR STATION.

A full description of the above is contained in the August issue of "Q.S.T.", written by F. H. Schnell, of Station 9XH-SEK—Burgess Battery Laboratories. All amateur transmitters should read it.

### A GRID-METER DRIVER.

An interesting article also appears in this same issue, by W. A. Hoffman, another member of the experimental staff of the Burgess Laboratories, concerning a grid meter driver.

### THE VALUE OF ADVERTISING.

During the next eight months, the "Philco" Battery Company, of Philadelphia, U.S.A., are going to spend the huge sum of £130,000 in advertising in national magazines and in newspapers all over America and Australia. A special sales and service manual is being prepared as an aid to dealers, so that they can give the service to their customers which the "Philco" Company insist on.

### RADIO IN AMERICA.

In America there are 6,000,000 radio sets in use now, and it is probable two to three million more will be sold this year. "Philco" sold 400,000 Radio "A" batteries last year, and it is estimated that 2,000,000 will be sold this year.\*

## Columbia Heavy Duty "B" Battery No. 4770

MADE to stand up and deliver the large plate current required by multi-tube sets. Especially economical for sets of four or more tubes, operating at 90 volts or more, and for all power amplifiers.

Subscription Rates: 12 months (52 issues), 13/- post free; 6 months (26 issues), 6/6 post free.

### Get Rid of Valve Trouble

Get rid of those disturbing microphonic noises—prevent the danger of breakage from shock. Ask your dealer for the new improved Lotus Brugency Valve Holder, which absorbs shock and protects your valves.

Valve sockets and engines are locked together by a mechanical process, making a definite permanent connection. Brassed mountings, nickel silver springs and phosphor bronze valve sockets, nickel-plated. From all Radio Dealers.

# Genuine R.C.A. RADIOTRONS bear the above seal

### RADIOTRON UX 199

Equally serviceable as a detector or as a high efficiency radio or audio frequency amplifier. Extremely economical in operation. Adaptable to dry battery operated sets.

Filament voltage 3. Current .06 amps.

**Price 13/6**

### RADIOTRON UX 201A

The standard all-round flexible storage battery valve—good in any detector or amplifier circuit—sure to give the best results at the lowest operating cost.

Filament voltage 3. Current .35 amps.

**Price 13/6**

### RADIOTRON UX 120

New dry cell Radiotron for use in the last stage of audio amplification only. Exceedingly high filament emission. Volume equal to that of two UV 199's.

Filament voltage 3. Current .125 amps.

**Price 17/6**

### RADIOTRON UX 112

A new power valve similar to the familiar UV 201A, but several times as powerful. Designed for use as last valve in accumulator operated sets, when it will deliver far more energy than the average loud speaker requires. Two of these valves will give exceptional results. Filament voltage 5. Current .5 amps.

**Price £25/0**

MODEL A.R.35  
£1/17/-

MODEL A.R.67  
£2/16/-

FEW owners of gramaphones know that the sound conduit of their instrument can be made an excellent medium for the acoustic radiation of wireless signals and music.

The AMPLION Gramaphone attachment is not merely an overgrown earpiece, but a real loud speaker unit embodying the results of more than thirty years experience in the design and production of loud speaking telephones.

The attachment may be fitted simply to the tone arm of any make of gramaphone, thus converting it at once into a loud speaker.
