Bayer Four Valve Receiver
Japanese Outlook on Radio

CUT OUT INTERFERENCE CUT DOWN STATIC

THE MUTER INTERFERENCE ELIMINATOR AND STATIC REDUCER has been designed to assist the tuning of your set and is absolutely effective in eliminating interference on the broadcast bands. It is composed of a tuning coil which is balanced by a variable condenser providing an additional means of tuning for the valve or crystal set.

The Muter Eliminator is far more effective than any other form of wave trap, because it can be used in either one of two methods. The first is by induction and the second is by absorption.

It not only cuts out interference and smooths reception, but it definitely **REDUCES STATIC**—and to an extent which can only be appreciated by those who have installed one.

Fit a Muter Eliminator and get real radio reception ——— Easily fitted

ELECTRAD

Certified Radio Products

Electrad Glass Grid Leaks

Electrad Grid Leaks are made by a new and controlled process. Each Grid Leak is individually tested before it leaves the Electrad factory. They are non-microphonic and moisture proof, while the resistance is constant.

Sizes $\frac{1}{2}$ to 5 megohms, plain. Price 2/3
 Sizes $\frac{1}{2}$ to 5 megohms, de luxe. Price 3/9

Electrad Lightning Arrester

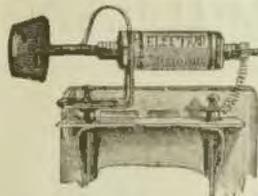

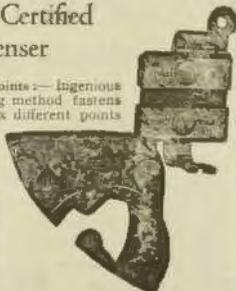

Consists of an air gap between two copper conductors, arranged in an improved manner, so that it is impossible for the spacing of the gap to vary. It is then hermetically sealed and the gap is therefore absolutely watertight. The housing protecting the air gap is moulded in glazed porcelain with a highly ornamental finish. These arresters comply with Fire Underwriters regulations. Price 3/6

Electrad Certified Condenser

The Six Pressure Points:—Ingenious riveting and binding method fastens parts securely at six different points and exerts EVEN PRESSURE upon the largest possible surface.

Thin sheet copper is used in place of tin-foil. A slip of the soldering iron cannot damage the copper and thereby ruin this condenser.

WIRELESS WEEKLY

VOL. 9, NO. 6.

FRIDAY, DEC. 3, 1926.

A Phonograph or a Radio?

RADIO ruins sopranos, according to Thomas A. Edison, the famous inventor, in a statement published by almost every American newspaper last month. Drawing a comparison between his own phonograph music and radio entertainment, he is reported as having said that wireless distorts music and the human voice. He contended that public interest in broadcasting is on the wane because people are finding that they can get far better musical entertainment from the phonograph.

Can Mr. Edison tell us how thousands of farmers scattered throughout Australia can receive last-minute news, market and stock reports on the phonograph? Or how an even greater multitude, tense with the excitement of the moment, can hear a vivid description of the Melbourne Cup the very second issued from the observer's lips? Where, in the phonograph, is the thrill of reaching out into the unknown ether and perhaps hearing some strange foreign station—a Japanese opera or an American jazz band? What owner of a talking machine can hear a new symphonic concert or musical comedy each week—not the same one over and over again?

As long as radio can offer these features its popularity will not wane. The phonograph gives us world-famous musicians and singers, some now dead, but the radio gives us variety and topical news. They have never been rivals, otherwise why would some stations have regular gramophone or phonograph sessions, or why would records be made of radio items?

Even if Mr. Edison is correct in his accusation that the radio receiver is a bad reproducer, the statement is made to seem paradoxical in view of the fact that the amplifying device employed on the very modern electric phonographs is distinctly taken from similar systems employed in the average radio receiver. This adoption was due to a comparison made between a radio set and an ordinary phonograph in which the background of noise caused by the motor and the needle was noticeable on the phonograph but absent in the radio receiver. Certainly many listeners experience a background of noise in reception, but were they to spend the same amount of money on their set as the phonograph owner spends on his machine and records, they would not have this trouble.

Between You and Me and the Microphone

ACCORDING to "L'Antenne," there are now in the world 922 broadcasting stations. The country having the greatest number in proportion to its size is Cuba, which has 36.

MR. GEORGE BERNARD SHAW has announced himself as "a declared enemy of radio," and has prohibited the broadcasting of his plays in Germany.

A FEW WEEKS back the 4QG announcer became uneasy as the hands of the clock crept round to 8 p.m. A concert was to be broadcast by the Blackstone St. David's Society, and most of the titles of songs had to be pronounced in Welsh. Nevertheless, he rose to the occasion and was afterwards complimented by Welsh listeners, on his pronunciation.

THERE ARE times, however, when even the best announcer will break down. The name of one of the foreign ships in touch with the Pinkenba Coastal Radio Station upset the 4QG announcer's mental equilibrium recently. The ship's name was "Bjornstjernen/uaon," and the only alternative left was to spell it.

A STORM drove 3LO off the air for several hours recently. Continuing the service meant risking the loss of expensive valves, involving a longer stoppage. The accident threw the programmes for the night out of gear, but the artists, including Rupert Hazel, the comedian, and Sam Clopham, world's champion wrestler, held an impromptu concert in the studio for an audience of visitors.

FIRST RADIO ENTHUSIAST: You know I've got an old P.I. at home that separates 2BL from 3LO and I only live a hundred yards from 2BL. Second Ditto: That's nothing. Last night I tuned in 2FC with a double male quartet singing and by a patent device of my own I separated the eight voices and heard each one of them singing solo.

Conducted by
R. E. CORDER

UNDER THE new broadcasting administration in Germany the State will hold 51 per cent. of the shares.

FOR ATTEMPTING to "raffle" a wireless set, Clifford Howarth was recently fined five shillings and costs, at Preston, London, under the Lottery Act of 1823.

INTEREST in broadcasting is steadily increasing in Sweden. No fewer than 25,000 new listeners have taken out licenses during the summer months, and the total in that country now amounts to about 210,000.

CHARGED WITH having neglected our own country in the matter of broadcast transceivers, 2FC has expended much time and money on preparing an annual series of descriptive talks on the country districts of N.S.W. and Victoria, by Mr. E. J. Van de Velde, above. He is now toting the two States by air, taking photographs with a special aerial camera.

WE SHALL soon have the human voice "swimming" the channel. Senator Marconi has been experimenting in the "Electra" with a remarkable new loud speaker, which can be heard on both sides of the River Dart, in the middle of which the yacht is lying. He thinks it quite possible to make the human voice carry from Dover to Calais, with slight modifications of the apparatus. The chief claim for this giant loud speaker is that, in spite of the enormous volume obtainable from it, quality is not sacrificed to any noticeable extent.

AS A MEANS of educating the public in matters relating to the Traffic Acts Regulations, the police authorities are prepared to answer from the broadcasting stations queries on any matter of general traffic interest.

IF A MOTORIST were to state that he enjoyed being caught in the full glare of another man's headlight, we should know what to call him. And yet, strangely enough, the variety artist in front of the microphone so enjoys being dazzled that the B.B.C. has begun experiments with spot lights!

A TALENTED blind girl musician has been discovered by broadcasting station 2FC, Sydney—Miss Joyce Frew. She is a pupil of Mr. Gordon Lavers, who is also blind, and Miss Frew is an artist of a very high order both on the piano and the violin. She holds three British and Australian musical degrees. In conjunction with Mr. Gordon Lavers, Miss Frew will be heard from broadcasting station 2FC on the evening of December 8.

TWO MORE HOSPITALS are being equipped with radio receiving sets for the entertainment of patients—Manly which has been equipped at the low cost of £120, and the Home of Peace, Petersham, where a campaign is being conducted with a view to raising £100 to equip that institution. There are 35 men and women patients at the Home of Peace and if the experience of other institutions is repeated the radio will bring them much cheer.

I SAW AN ingenious ghost picture a few days ago, taken by order of 3LO to illustrate a feature of their programmes—a ghost story written expressly for the station. The effect of the picture is that of a studio full of auditors, all looking up with terror at a grey ghost that rises terrifying arms above a head that looks like death, while its trailing, misty feet simply fade out. The conviction of the beholder is irresistible that he is looking at a genuine photograph.

"Radio is striking a death blow at Denominational Prejudice"

An article by the
Rev. F. H. Raward

ONE occasionally meets a self-appointed critic who declares with great emphasis that the Christian church is a conservative, unprogressive institution, finding in its history its supreme glory and its outworn forms an inadequate programme for these scientific days.

Speaking broadly, the criticism is not borne out by facts. There has grown up a new race of clerics and church officers who are wide awake and progressive. They find the inspiration for their practice in the theory that the business of spreading the philosophy of the Christ deserves as scientific prosecution as any other business.

To these the opportunity presented by radio has been eagerly seized. Their efforts to secure the finest results have been crowned with a splendid measure of success. In numerous instances the best type of "radio voice" and "radio sense" have been rapidly achieved. The tremendous vote recorded for church services in the census recently taken was an eloquent testimony to the public's recognition of the excellence of church broadcasting. From churches there have been broadcast in addition to services anniversary meetings, concerts, weddings, and sacramental services. As far as the writer's knowledge goes, the only service which has not as yet been put on the air is the funeral service.

Church broadcasting has been for some time a regular institution. It is well past the experimental stages. From the wealth of data available, one is able without any hesitation to arrive at a clear-cut decision as to its real value.

For the prominent churches from which services are regularly transmitted church broadcasting has signified a very wide publicity. Desired or otherwise, this fact stands out. It has meant an infinite widening of its

sphere of influence. It has also incalculably increased its opportunity for appeal. Many a church thus favoured has experienced a revitalisation of its whole life.

To the suburban and near country churches the broadcasting of services has not made a great deal of difference. The amazing number of such, however, which found the Gipsy

Smith campaign services a great opportunity for short transmissions has a broad hint of what may be done along similar lines. The significance of church broadcasting for country homes is great indeed. To such, an institution as the Central Methodist Mission, which, counting in its frequent afternoon transmissions, broadcasts more frequently than any other church in the State, large numbers of letters come in. Practically every one of these is eulogistic and some are quite pathetic in their expressions of appreciation.

The significance of church broad-

The business of spreading the philosophy of Christ deserves as scientific prosecution as any other business, says the Rev. F. H. Raward in this article. He is seen here in a characteristic attitude broadcasting from the Central Methodist Mission.

casting for the dwellers in the outback is beyond words. Having lived with these people and shared their sense of isolation I thank God for the new day which has dawned for the brave hearted pioneering people back of beyond. It has lifted the sense of responsibility from the souls of many mothers and fathers who contemplated the rearing of their family quite apart from religious services with the deepest concern. To churchless lands the radio has brought regular services of the finest type Sunday by Sunday.

To outback missionaries radio comes with the offer of infinite help. One of the latest developments is indicated in the practice of one progressive cleric who carries with him a fine set which he operates for the benefit of his congregations. Thus he is relieved from one of his greatest worries, i.e., the preparation of addresses at the sacrifice of his extensive pastoral work, while he ministers to his people to the very limit of his powers during the week, he is comforted by the thought that one of the finest preachers in the State is busily preparing the message for his flock.

To the person prevented from attendance at church, to the hospital patient lying in some institution well equipped with radio, to the student for the preaching office, and to the person who is estranged from church life, but who will listen-in, church broadcasting has a significance that none but an infinite mind could reckon.

One of the most important contributions which church broadcasting is making to the Commonwealth is along the lines of the removal of denominational prejudice. Previously it was possible for a person to think that his church had a monopoly of truth and decorum, but to become familiar with the excellence which belongs to each type of church service invariably is to destroy such an erroneous conception. The truth beats in upon one that there is no such thing as monopoly but a more or less even distribution among the churches of merit. Out of this better understanding springs mutual respect. Organic church union may be merely a dream but real church unity

is not only a reality but a practicable basis for united effort and mutual benefit. After all, church differences are more fancied than real. In the great essentials and the mutual recognition of the authority of the Scriptures as well as the supremacy of Christ, we stand side by side. It is undeniable that radio is contributing to the wider appreciation of this set of facts. As wireless goes on its way it strikes a death blow at the unreasoning spirit of denominational prejudice. The significance of church broadcasting to the public generally is a fascinating subject for speculation. To say that the widest dissemination of truth and the earnest inculcation of the finest principles of con-

are irresistibly led to the conclusion that they are finished masters of English to listen to whom is a liberal education. This in days when our glorious mother tongue suffers untold indignities at the lips of so many is something of outstanding importance. Further, beyond the words one is brought to the recognition of reasoning power which is superb. I submit that such living touch as radio offers with these cultured leaders is to the receptive and impressionable mind a tremendously significant thing. Personally I have come from the transmissions of a church service with something approaching mental exhilaration. I felt keyed to a finer music and capable of better effort. I am loth to believe that the experience of many others fails to approximate to my own.

Not the least important effect of the broadcasting of church services is upon the preacher himself. This effect is invariably beneficial. First, it is mentally stimulating. To reflect that some of the keenest thinkers in the State may be listening to his address stabs him broad awake to the necessity of the production of the very best of which he is capable. Reasoning must be sound; logic must be flawless; facts must be incontrovertible; conclusions must be unassailable. Second, it is elocutionarily stimulating. Slurred words, dropped syllables faulty endings, indistinct articulation, are capital crimes in the sphere of radio. A new carefulness with words and their pronunciation is an inevitable element in the radio preacher's experience. Third, it tends to the development of personality. The preacher knows that beside the dear old lady who is ready to believe that everything is perfectly lovely if her dear curate says it, there is the ruthless critic who is prepared to divest himself of every feather with which he has been wont to fly. Before he lies a letter from a listener-in who begins: "I said when I picked up the 'phones, I wonder what piffle this fellow is going to give out." From the seclusion of the local church and the circle of more or less admiring friends, the radio preacher is flung neck and crop into the rough and

(Continued on Page 37.)

The Rev. Raward says:

Church broadcasting has a significance that none but an infinite mind could reckon.

As wireless goes on its way it strikes a death blow at the unreasoning spirit of denominational prejudice.

Not the least important effect of the broadcasting of church services is upon the preacher himself.

Many churches favoured by the broadcasting companies have experienced a revitalisation of their life.

The significance of church broadcasting for the dwellers outback is beyond words.

duct are valueless is to lay the most serious of charges against the intelligence and moral sense of society. It is a well known axiom of psychology that we are consciously or unconsciously influenced by whatever enters even the margin of consciousness. Reasoning then from the established fact that church services are shared in by many people in their homes, we find that the influence of s. h is a natural inference with all the characteristics of truth about it.

Some of the preachers of to-day use the finest English that is to be heard in the world. Listen carefully to certain men who for obvious reasons cannot be named and you

All the World's a Stage

Even when one broadcasts, says Laurence Halbert in this interview by W.P.H. Having run the whole gamut from pantomime to grand opera on stages in Great Britain, Europe, Africa, the East, Australia and New Zealand he believes that he has at last found his right place as an announcer.

I HAD heard his voice on the air from an aeroplane 11,000 feet up, and from a trawler at sea, and was determined when the first opportunity occurred that I would know him in the flesh. With this idea in view, I visited 2FC the other night, and made the acquaintance of Laurence Halbert, one of the station's announcers. I found him a shy sort of chap, and not very willing to talk about himself, but I felt that the man who took on broadcasting from 11,000 feet in the air and also went to sea for three days on a trawler on a similar mission, could tell a good story if he was once persuaded to talk.

I had heard that Halbert was once on the stage, and I turned the conversation in this direction in the hope of getting some reminiscences. After a little leading he began to talk more freely, and let me know that he had been for some twelve years on the stage playing in most European countries. He had run the whole gamut from pantomime to Grand Opera. We got on to talking about different parts of the Old Country we both knew well, and he told me of the famous 6 a.m. performances in the Rhondha Valley, where he had performed at that ungodly hour to the miners, and where nobody outside a Welshman was considered a singer. Then getting on to common ground again, we talked about the Javanese in Dyjoceta, and we laughed together over many similar experiences with the Dutch, French and Malaysians. I found that he had been through the East with the Royal Opera Company and he told me many of the ups and downs of his two years' tour with the company.

His trips into the countries where the sun shone told their tale, for on

returning to London he pined for warmer climes. Africa and Australia were always in his mind, and when an opportunity presented itself to tour South Africa with Thurston Hall—who at a later date visited this country—he jumped at the chance. Following this Halbert joined up with the Renee Kelly Company and toured for a further period in South Africa.

As he put it, all good things ultimately come to an end," and the day came when he had to decide whether he would return to England or strike out on his own and visit Australia. It was a case of London with rain and fogs, or Australia with its sunshine—and Australia won the day. Halbert then told me of his delightful trip to Sydney, and of his surprise at the sights presented by the capital cities of Australia. Of course, he gave me the usual old-jar about "Our 'Arbour."

He then visited New Zealand and upon his return to Australia became associated with 2FC—at first as a soloist and then as an announcer. Halbert then went on to say how they tried him out on the prices of potatoes and onions, and also how they joked him about his pronunciation of some of the aboriginal names attached to country towns; also, how, after many months of severe trial, he was ultimately considered far enough advanced to be given night sessions in the studio.

We then chatted on the difference between work on the stage and work in the studio. I asked Halbert if he found it as difficult to please the unseen audience as it was the crowd who attended in the theatre, and he replied that the main difference lay in the fact that the theatre audience, when critical, said things—while the radio audience wrote things. He told

Laurence Halbert.

me that broadcasting was a very severe trial for anyone who was super-sensitive. When a member of an audience in a theatre disapproved of you he could hardly disturb the show to the point of telling you what he thought, whereas the radio fan sits down in his calm moments and puts a letter into the station, which, when it has been read, makes you feel like a quick trip to the Gap. "However, there is always the satisfaction of knowing that no one is exempt from criticism in this game," he added.

I asked him whether he liked announcing, and he said, "I do, indeed." There is a wonderful field for the imagination, and a boundless supply of new experiences. Halbert told me that in both his aeroplane and trawler trips the excitement and novelty carried him through. Asked if he would like to go back again to the old stage life, he quickly replied—"No, I much prefer to remain in broadcasting."

At this moment I heard a buzzer in the studio, and took this as a hint that it was time for me to leave.

Coming Programme Features

LISTENERS-IN are promised an opportunity of judging between the choirs of the Marist Bros., Ridge St., North Sydney, and the Marist Bros. of Mosman. Each church has a boys' choir numbering 100, and on December 7 the Mosman boys, under the conductorship of Brother Barnabas, will broadcast from 2FC at 8.30. On the following Monday, December 13, the Ridge Street boys, conducted by Brother Adrian, will be on the air.

SPORTSMEN CAN look forward to December 18, 27, and 29, when 2FC will broadcast a full description of very race at Randwick direct from the racecourse. For those who do not care for racing, 2FC will broadcast the whole performance of the Messiah on Sunday afternoon, December 5, and again on Sunday afternoon, December 12. Flotow's Grand Opera, "Martha," will be broadcast on the afternoon of December 19.

PRODUCED BY the Railway and Tramway Institute Musical Society, the well known musical comedy — "Very Good, Eddie,"—will be broadcast by 2FC on December 4. The cast

Miss Hilda Lane, a charming young Queensland, who is often heard from 2BL.

is one of the strongest the society has had for some time. Erolld Healy as Eddie and Jack Grant as the clerk will carry the comedy roles. Mr. Harry McInerney will play the lead. Opposite him will be Miss Myee Taylor, while Miss Lois Melville, Miss Laurie Diad, Miss Muriel Drake, and Messrs. Whelan, Trunks, Heffernan, and Macdonald help to make the show one of the best the society has played for some time.

ON MONDAY, December 6, 2BL will open with its daily physical culture exercises at 7.15 a.m. During the Early Morning Session, news is also broadcast. The Women's Session, conducted by Mrs. Jordan, will include a talk on "Meatless Dishes."

MUSICAL STUDENTS will welcome the announcement that Mr. Sutton Crow contemplates giving a series of lunch-hour talks from 3LO on various musical subjects, lasting half an hour. For the first series he has chosen "Lives of famous Composers" and the discourse will be illustrated by vocal and instrumental selections by University students.

THE CONCERT PARTY formed by 2FC will visit Lithgow Hospital on Saturday, December 11. In the evening the artists will entertain the patients in the hospital and the concert will be broadcast, so that all outside listeners in the State can hear. Uncle Monty and Uncle Rus. will entertain the children.

DURING THE EVENING after the concert the party will inspect the blast furnaces which will be described over the air and the party will sing the anvil chorus and other appropriate items. While at Lithgow the party will visit Mr. Jones' noted Zig Zag brewery—and no doubt their singing will be none the less brisk on that account. On December 18 a trip will be made to the Waterfall Sanatorium in conjunction with the "Smith Family of Joy Spreaders."

Mr. A. E. Y. Benham, the well-known basso, a Melba protegee who is heard frequently from 2FL.

ACTING IN CONJUNCTION with the Harbours and Rivers Department controlling the buoys and lights of the Queensland coast, a party from 4QG will accompany the diving plant down Moreton Bay to the Pile Light shortly. A full description of the bay will be broadcast and an announcer from Station 4QG will make a descent in 40 feet of water, broadcasting his experiences from the bottom of the bay. This "stunt" transmission has been effected by Station 2FC and 3LO, but 4QG, profiting by experience, will use a special microphone designed and built by the station engineers. It will not be fitted in the diver's helmet, but in another portion of the diving suit. It is hoped this will eliminate the echo effects which would tend to muffle the announcer's voice.

THE FOLLOWING ARTISTS are now being heard from 2FC: Mr. Alfred Cunningham, English baritone; Victor Gouriet, comedian; Miss Dorothy Dewar, comedienne; Miss Rosalie Duvalli, harpist; Miss Eileen Boyd, contralto; Mr. Chas. Lawrence, entertainer, in conjunction with Miss Nea Hallett, soubrette; Victor Evans, baritone; and Miss Daisy Richards.

Japan's Outlook On Radio Broadcasting

By TAKEO KIMIZUKA

In quaintly phrased English our correspondent, writing from Fusano, Kayusa, Chiboken, gives here a Japanese listener's ideas on radio. He invites correspondence with Australians.

THESE exists no such national boundary in space of radio wave activity as the frontier of a country. Space must be of joint ownership just as the Sun. Others cannot make even a single complaint when one breathes a great deal of air which fills up all the space, and likewise, no country can do that when one listens to a sweet voice which is brought from a far country by means of electric wave travelling through space.

We have as much appetite for hearing as that for seeing. This desire for hearing is about to be contented by the gullowing development of radio broadcast. As a voice in a place is now to be heard at any corner of the world with suitable transmitter and receiver, radio is of unlimited interest, and I believe this is the best means to promote the friendship among nations.

The lack of friendly relations leads to misunderstanding between nations, and, in turn, this sometimes results in terrible destruction of peace. There is no more miserable loss than war for mankind. Though it means the race for tools of civilisation, the conduct is nothing but the offensive appearance of wild beasts. War is really the most barbarous act done by mankind. As we have no doubt been born to live in peace and with happiness on earth, I hope radio will be of great service for dispelling the misunderstanding between nations and worldly everlasting peace will come.

Having this aim in mind, it is quite essential for us to take proper steps to mutually obtain the true knowledge of radio broadcasting field of all the world. This conception has driven me to the compilation of a list of world-wide radio broadcasting stations.

It was April last I happened to enjoy beautiful foreign musics through a speaker. It took me, indeed, nearly

one hundred days until I might ascertain by letters that they had been broadcastings from 3LO (Melbourne), 4QG (Brisbane), 5CL (Adelaide), 2BL (Sydney), of Australia, KZRHQ (Manila) of the Philippine, 2GR (Madras) of India, and KGO (California) all several thousand miles away from here. It was so long for waiting answers that it was beyond description. This is because of the lack of the correct and latest informations in regards to foreign broadcasting stations. I have in hand a few copies of informations published in a certain country, but they were so obsolete and inaccurate that they were nothing but misleading.

Deep impressions of the inconvenience and sympathy extended to earnest fellow radio-fans of the world are a second motive for the compilation of the list. Of course the copies of the list are to be distributed with the author's compliments to most of broadcasting stations, publishers of radio magazines and newspaper offices when printed.

This plan is to put all the voices in the air by radio in worldly common possession and to try to arrive at the goal of worldly peace. I eagerly desire the recognition of my sincerity and their hearty co-operation to the ladies and gentlemen of any nationality who pay attention to this circular of mine.

As up-to-date and accuracy are the purport of the list, it is desirable to publish it monthly, if possible. You will find, enclosed herewith, the first publication of the list which has been collected recently. If you kindly let me know, at an earliest opportunity, such particulars of the broadcasting stations in your neighbouring countries as necessary for the list, I am very much obliged to you. In addition, I am very anxious to know the names and addresses of newspaper offices, magazines and organizations

in connection with radio, to be able to communicate with them.

I shall be very glad to receive the newest informations from you at the beginning of every month and to forward to you the succeeding issues of the list when ready for distribution. As the second issue is to be out after my reception of your reply, it will be two or three months later, but the three and the following are expected to be out regularly. I sincerely hope that the second issue and the following will be authorized by your deepest sympathy and cordial guidance. When you find any mistake or anything to be improved in the list, please be so kind as to let me know without delay. If you send me magazines, printed matters, photos, etc., which serve the investigation of present radio in your country, I shall be glad to send you, in return, something you like.

I know the day is coming radio fans of all the world can hear radio voice of all the world with a simple apparatus. In near future, I believe such a marvellous revolutionary radio invention will be accomplished that we shall be able to hear a voice coming from the other extreme of the earth, 20,000 kilometers apart, as easily as that coming from a place, a few hundred kilometers apart, at present. From this point of view, I think my advocacy for the promotion of international friendship by radio and by publication of a list of the world-wide radio broadcasting stations deserve something. Expecting your cordial co-operation, I am eagerly waiting for your kind answer before I post my letter. For my own convenience, it is hoped your answer will be written in English. Besides this, if you stick on the envelope of your letter a piece of paper on which my name and address is printed in Japanese it will reach me very soon without fail.

Radio's Greatest Enemy is Interference

"WE like the band performances best; but sometimes we don't know whether it is a band or a thunderstorm!" That was the expressive comment made to me in a tram recently by a man from outback Queensland. He was referring to the broadcasting services, and explained that at his homestead they listen-in regularly to 3LO, Melbourne. The descriptions of the wrestling and the popular science talks were popular items always, as were also many of the musical numbers. But the band items won greatest favour amongst those distant listeners.

The traveller's severe comment on the band reproductions, however, was a reference to the interference caused by atmospherics. That form of noise in radio receivers is a severe handicap to the enjoyment of broadcasting in many districts; probably more so in Western Queensland than in the Southern States. Atmospherics constitute the greatest, or one of the greatest, problems confronting the radio engineer. It is not only in broadcasting that the annoyance is experienced; in wireless telegraph signalling over short and great distances the same problem is met, and many precautions are taken to eliminate the interference.

What Causes Atmospherics

Although very great strides have been made in wireless development, particularly during the past five years, the difficulties caused by atmospherics have not been overcome. Very many and varied devices and methods have been tried, and some are in use, designed for the purpose of getting rid of the nuisance; but all these have failed. There are certainly some very successful methods for limiting the effect of the interference—but this limiting always involves reducing the signal strength. It is possible to reduce the effect of atmospherics, but in doing so the volume of sound in the headphones is also reduced. And it follows that to reduce the interfering signals—if atmospheric disturbances in receivers can be called signals—to a minimum,

One thing is outstanding in the development of broadcasting — our failure to defeat interference. In this article the writer gives some hints which will help you to reduce the trouble.

the desired signals or sounds would also be reduced to a useless minimum. Therefore, a compromise must be effected.

The failure to produce a device or method for cutting out atmospherics is due to a want of knowledge of the origin of the atmospherics. It is known that they are associated with changes in the electric state of the atmosphere; they are worst when thunderstorms are prevalent, and are experienced most in the equatorial regions. But there is no scientific data as to their exact causes. That is the big handicap that faces the experimenter or research worker who attacks the problem of designing equipment—simple and economical—for the purpose of leaving the receiver free to reproduce the studio items without the distorting and annoying noises. It is generally recognized that atmospherics are electrical discharges in the atmosphere, invisible lightning—and these discharges act on the aerials like wireless signals, with the important difference that they have no regular wavelength. And having no definite frequency or wavelength, they cannot be tuned out completely.

How can they be Cut Out?

They cannot be tuned out altogether but it is possible to lessen the disturbance in the loud speaker. In broadcast reception the use of a small aerial is often very effective. The small frame aerial used with super-heterodynes and other sensitive sets is very satisfactory in counteracting the nuisance. With or-

inary receivers such small aerials cannot be used unless the set is near a powerful broadcasting station, and other methods must be employed. One method is to connect a condenser across the aerial and earth terminals.

Loose contacts between wires and their terminals, or in the moving parts of a condenser, or in the valve sockets will also cause noises. Such noises in conjunction with rundown batteries may have been more the cause of the disturbing noises in his set than the atmospherics referred to by the traveller from Queensland.

A condenser across the loud speaker terminals will also be of use. But the two main points to watch are—an aerial that is not too long and loosely coupled circuits. If the set is not home assembled we cannot have any more loose coupling than the set will permit, except in sets that have movable coils. The aerial, however, can be attended to. It must not be too long. Generally, a good length to use is 75 to 80 feet, including about 20 feet down lead. The higher the better. A crystal set requires a bigger aerial than a valve set, containing two or more valves.

(Continued on Page 41.)

It is not certain whether little Miss Van de Velde has borrowed the cat's whisker to listen-in, or whether she is attempting to intercept her pet in the Dick Whittington bedtime story from 2FC.

Interesting Things Said Interestingly

MR. E. T. FISK, Managing Director of Amalgamated Wireless, at a dinner to the staff of the radio-electric works of the company:

"We are building up one of the vital secondary industries—an industry particularly adaptable to Australian conditions. The present prosperous conditions in Australia have been made possible by pioneers, who had gone through many experiences and vicissitudes in achieving their objects.

"First there came the pioneers of the primary industries, those interested in mining, agriculture, and pastoral pursuits. Another and later body of pioneers were those who essayed the establishment of the secondary industries. Of that body you here present are a part: Ten years ago, it would have been far easier for the company to have written out indent orders for wireless equipment than to have commenced wireless manufacture in Australia. Whilst difficulties innumerable have been encountered in the establishment of manufacturing wireless apparatus in Australia, I am pleased to say that they are achieving wonders. In every phase of Australian wireless activities, equipment designed and manufactured in Australia by Australians is being successfully utilised."

USING MORE ELECTRICITY.

DAVID SARNOFF (New York; vice-president, general manager, Radio Corporation of America):—

"The development of radio sets, which dispense with batteries and use house lighting current, together with the fact that radio keeps people at home, is resulting in larger consumption of electricity.

"The types of broadcast receivers which now operate completely from the lighting circuit, require up to 200 watts for their operation. The numerous power accessories on the market require from seven to fifty watts. It is reasonable to assume that within the next three to five years, by far

The increasing importance of the part played by radio in politics, industry, and our social life is well indicated by these extracts from the statements of world famous men.

The larger percentage of broadcast receivers will draw their local source of energy from the lighting socket. It is estimated that the average of such receivers will consume energy at the rate of eight kilowatt hours per month."

RADIO THE PEACEMAKER.

MR. J. RAMSAY MACDONALD, M.P., in a statement made after listening to the broadcasting of speeches of the Assembly of the League of Nations, said:—

"I doubt if any discovery of our time is more marvellous in its effects, or is destined to have more influence on the human mind than wireless. The broadcasting of Geneva has brought this mighty assembly of the world States into the home of thousands of our people and of millions like them in other parts of the world. It could not have meant so much to them as it did to me because I have been there, and, consequently, my ears awakened a responsive vision. But to be behind a curtain and to hear, even if seeing be forbidden, the business of such a gathering, must enliven interest and quicken intelligence. The League of Nations must be more real to every listener after that morning than ever it was before.

"How appropriate it has been that a landmark has been set in this marvellous development in human contact by the broadcasting of speeches delivered at an Assembly of the League of Nations. I see in it not only a promotion of peace and enlightenment, but a vast extension of the rare opportunities which the mass of mankind have of judging the qualities and the capacities of those set to rule over them."

JUDGING A PEOPLE BY RADIO.

IN an article in the "Radio Times," London, Sir Harry Lauder, the famous Scotch comedian, says:—

"Let us (the concert and radio programme managers) work smoothly together. The importance of maintaining British prestige demands it, because, in the days to come, if broadcasting maintains its present rate of development, other nations will judge us by what they hear as well as by what they see. We must, therefore, take care that what is sent out from our broadcast stations is the very best we have to offer. I think the time has already arrived when we should be making plans with this end in view. The time is coming when Paris, Rome, New York, and other parts of the world will regularly listen to the radio programmes of London and Daventry. When that time comes, the London station should have the finest orchestra in the British Isles, no matter what the cost.

"Time will prove the accuracy of my vision. Henceforth, British prestige among the nations will depend largely on how we develop our radio. Let us now make certain that the foundation shall be built on harmony among ourselves."

FREE RADIO FOR THE BLIND.

ARTHUR BURROWS (Geneva; manager of the International Radiophone Bureau, writing in "Popular Wireless," London), says:

"Broadcasting is actually changing the outlook in the lives of many persons. Its value to the blind is already so freely recognised that the German Government has not hesitated to pay for 2000 sets of receiving apparatus for the afflicted within its frontiers, and the recent British Governmental Committee has recommended exemption from licence fees for the sightless living in the British Isles. I hope that this proposal may be carried a stage further, and that all blind persons in Britain without the necessary means will sooner or later be given a suitable receiving set."

How long before we can tune in London?

THE most interesting radio news of the past few days has been the announcement that arrangements are being made to sound the Dominions as to their participation in a huge scheme by which nine 50 kilowatt stations will be established round the world so that by a proper system of co-ordination it will be possible to broadcast Dominions music to the Old World, and vice versa.

I must confess that although I look for this development of radio in the fullness of time, I am rather sceptical of its immediate fulfilment, since it depends on the Dominions agreeing to contribute their quota of the half-million or so it is estimated to cost. The actual commercial and governmental business in radio will be sufficiently catered for by the beam wireless that is already under submission, and which has been recently proved so successful in Canada. I do not see signs of such a mellow generosity in the Commonwealth Government, to take but one instance, as to lead me to hope that their rapid desire to allow the natives of the Orkneys to listen to an opera in Melbourne will lead them to spending 50,000 of the taxpayers' money to bring it about. As long as the fruition of the plan depends on governments, then, I fear that we shall have to wait a long time.

There is something very stimulating to the imagination in thinking that voices may one day echo round the world, but a few minutes' reflection will show that, after the first novelty wears off, there is a danger of boredom. Programmes from America and England are no whit better than those from Australia. It is remarkable how quickly one loses the "kick" of distance. I believe that if communication were to be established with Mars, every user of a crystal set would howl with fiendish and far-reaching effect for a few months; after that most of them would be tuning in to an earth station like 3LO or any other where a good, ordinary, well-transmitted programme was to be heard.

Among other things our 3LO correspondent discusses this week the experiments now being carried out by the British Broadcasting Corporation for the erection of relay stations throughout the Empire. It will not be long before we will be able to tune in 2LO as well as 3LO, he says

Continuous service round the world would necessitate a 24 hours' programme. This would bring complications in its train. One fact I see sticking out a mile. When such universal communication is an established fact, governments will move to take over all control of radio. It will mark the end of the private entrepreneur of the air.

3LO's Greatest Musical Venture.
On December 8th, 3LO will broad-

cast from its studio the most ambitious concert it has yet given. The University Symphony Orchestra will be transported to the studio, and in conjunction with the Collingwood Citizens' Band, it will perform under the baton of Professor Bernard Heinze.

The fact of outstanding importance about such concerts as this is that the great mass of people, not one per cent. of whom ever heard really good music well done prior to the advent of wireless, now are beginning to realise that "classical" does not necessarily mean "dull" in relation to music. Men and women whose ideal of the excellent in music used to be a melody from "High Jinks," now know that a tune can be just as merry and yet not so cloying as popular hurdy gurdy tunes. I have noticed the faces of the musically uneducated while they were listening to Raymond Ellis' excellent rendering of the "Largo al Factotum" from "The Barber of Seville" and have seen the surprised delight with which they betrayed the fact that they were actually enjoying a song from grand opera. Dr. Floyd has shown me letters from simple souls away outback to whom his organ playing has brought wondrous pleasure. There can be no doubt that the radio is going to prove an extraordinarily valuable agent in raising public taste.

The University Conservatorium recognises this, and wishes to go the step further that is logically compulsory, namely, to tell the listening people just why it does and should love certain music and despise certain other. To this end, Mr. J. Sutton Crow, on December 8th, has been engaged to give the first of a series of lunch-hour talks on music. His little lectures will give no one a pain in the head. They are designed for popular consumption and he will drive home each point he makes with a practical demonstration. When he tells his listeners to keep their ears open for certain effects in a symphony, some of the Conservatorium

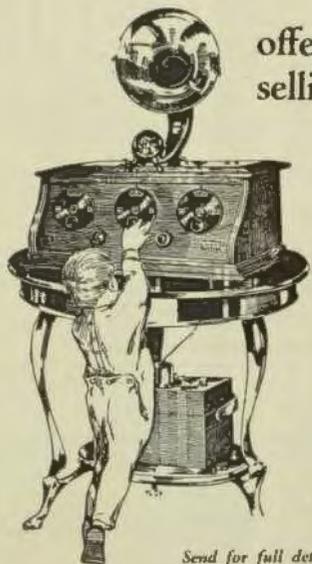

Mr. W. A. Priestly, "Muskat," of the "Sparting Globe," who gave a realistic description of the Melbourne Cup for 3LO.

students will actually play the number he refers to, as an illustration of his point. These talks should prove very popular.

Children's Choirs to be Broadcast.

Few things are more inspiring than the voices of children raised in song. The Cathedral Choir's golden voices are always eagerly listened to each evening. B.O. is going to try an experiment in children's community singing on the 10th of December. The Northcote Central State School is proud of its children's voices; proud, too, of its boy's band. Both will be heard on the date mentioned. Everyone knows Mr. F. C. Johnson, the conductor of the Collingwood Citizens' Band. Mr. Johnson will conduct the boys. It would not be surprising if the success of this band led to the establishment of many others. Boys love to make a row, and when the row can be forced through brass and toned down to resemble music, their cup of happiness overflows. There is no reason why their "savage breasts" should not be soothed by this means. The Toorak Central School, jealous of the reputation of the south side of the river, will also be heard in community song, though they lack the extra entertainment of a band. Both programmes will take only half an hour, commencing at 8.

A Perfect Instrument.

The other day I joined some friends in a private room at Allan's to hear a thing they called a super-phonie Sonora. I had previously heard them both talking with bated breath, though, I confess, I never knew exactly when a breath is sufficiently bated. I overheard adjectives flying about—"marvellous," "unbelievable," and so on, so I begged to be let in on the joke. Solemnly, almost in procession, they led the way to where a big, overgrown gramophone stood. It is not a gramophone, but it is what every good gramophone hopes to be when it dies. It is an angel gramophone. There is no sound of a needle; the volume is tremendous, and yet it can be "stopped down" to a whisper; its tone is all that is claimed.

Build a Four Valve Set

using the modern "Sub Panel" method as described in this issue of Wireless Weekly

Here are the required parts

£ s. d.		£ s. d.

The Bayer Sub-panel Four Valve Receiver

A receiver embodying a new principle in construction, designed for the listener-in requiring a neat set, selectivity, compactness, and simplicity.

THE receiver to be described this week is a slight departure from the usual back of panel layout. Almost every set described in "Wireless Weekly" has been constructed on the lines of a baseboard for the component parts. This certainly is a most satisfactory arrangement, but the writer has noticed recently that quite a number of manufacturers of high grade sets employ the sub-panel method of construction and wiring. This sub-panel method of wiring, besides looking very neat, lends itself admirably to short leads so necessary in obtaining maximum efficiency. Again, the simplicity of construction is apparent and quite a fair amount of space is also saved. Looking at the back of panel view of the Bayer, the audio transformers are seen mounted beneath the sub-panel where most of the wiring is kept, as all the connections for the valve sockets and transformers are underneath this sub-panel, thus ensuring remarkable neatness, which will appeal to most constructors.

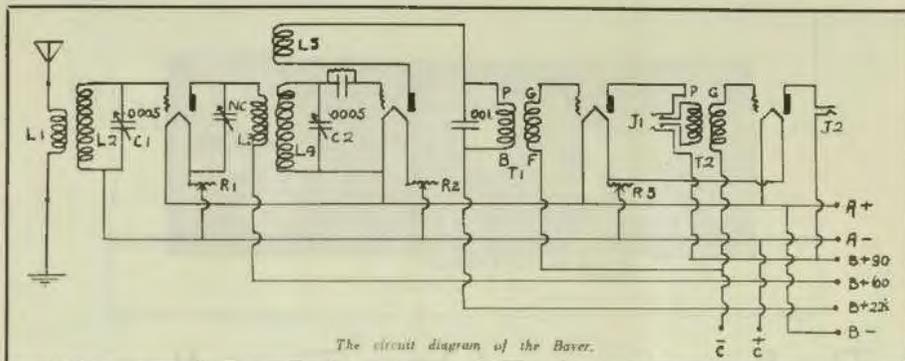

A glance at the circuit diagram will indicate a strong similarity between the circuit employed in this receiver and that usually employed in the Browning Drake receiver. Comprising one stage of radio frequency, detector and two stages of audio frequency, the Bayer is ideally suited

for bringing in the distant stations at loud speaker strength. It will be gathered from the circuit that the transformer method of radio frequency coupling is used, with the reaction coupled to the secondary of this transformer. As only a small number of turns in the primary coil of this radio frequency transformer and also of the aerial coupling coil is used, selectivity, a most essential feature in radio receivers to-day, is thus assured. The radio frequency is stabilised by a small Midget variable condenser connected from the plate of the first valve to the filament minus. As a further assistance in stabilising, the radio frequency valve has a separate rheostat as well as a separate "B" battery tapping. Many receivers of the neutralised radio frequency type are difficult to neutralise, mainly on account of too much plate voltage being applied on the plate of the radio frequency valve. This difficulty is overcome in this receiver as already indicated.

Two stages of audio frequency are added in order that excellent loud speaker strength will result on all stations, provision being made to plug in to one stage only if desired. The well-known transformer coupled method of audio frequency is maintained and a "C" battery is in the

circuit, thereby producing good quality reception as well as saving the drain on the "B" battery.

A few words concerning the parts used will not be out of place here. On account of its softness Radion has been used, as there are four one-inch holes required for the Benjamin sub-panel sockets. These sockets are of the anti-microphonic type, generally known amongst amateurs as "punching ball" sockets, as the valve can be punched about in the socket without any microphonic noises being heard on the speaker or headphones. The Commodore condensers are a very high grade brass plate S.L.F. job, and the Atlas filament controls are of the carbon type, yet do not pack. The Bayer coils are a product of the Metropolitan Electric Company and are very well made. L1 and L2 are coupled together, L1, the primary, being fitted inside the secondary L2 in such a manner that the primary is slightly variable in relation to the secondary. This is an advantage, but once the position has been set it need not be touched again. The radio frequency transformer consists of L3, L4 and L5, L3 being situated in a similar position as the primary of the aerial coils. L5 the reaction, is mounted on a rotor which allows a variation of ninety degrees to the secondary, L4. This

can be seen in the photograph of the back of panel.

The Midget condenser is also seen in this view, there being many different types on the market to choose from. The Benjamin brackets are required for holding the sub-panel, and are also attached to the front panel. They are indispensable in all sub-panel receivers. All of the parts itemised may be purchased from any of the advertisers in "Wireless Weekly." The cabinet seen in the top photograph is a product of Grose & Daniell, the sides and top being of glass, and the corner pillars of nickel plated brass, the rest of the material being of highly polished maple presents a very nice appearance.

Construction.

Gather all your components together, and start off building this receiver. Firstly, mark off your panel consulting the panel layout for this purpose. Use the template provided with the condensers to locate the fixing holes for these particular components. The Atlas filament controls are one whole fixing, thus saving time in mounting. The same applies to the inter-stage transformer. Now plot the position for the Benjamin brackets. These will be seen in the photograph, one on each end of the panel, and below the level of the variable condenser. Mount your panel components, noting that the condensers do not foul the position of the Benjamin brackets. Don't mount the brackets just yet.

Attention is now to be paid to the sub-panel, on which is mounted your

four Benjamin sockets, two transformers, Midget condenser and terminals. No sub-panel diagram is given here, as this will not be required. The aerial coupling coils, L1 and L2, are mounted at the one

transformer, T1, followed by the first audio valve socket, then transformer T2 at right angles to T1, and finally the second audio valve socket. Arranged right at the back, within half an inch from the edge, are the terminals. The back of panel view shows this sub-panel layout clearly, excepting the fact that the knob of the Midget condenser hides the detector valve socket, although the four terminal screws of this socket are clearly seen.

Looking at this back of panel view, the terminal arrangement reading from left to right is as follows: B positive, 90 volts for the audio stages, B positive, 22 volts for the detector stage, then B positive 60 volts for the radio stages. Next B minus, then A positive, A negative, C positive and C negative. At the extreme right end is the earth and aerial terminals, ten terminals in all. The best way to locate the positions of the different sub-panel components is to lay them temporarily on the sub-panel, thus determining the most suitable layout.

The Benjamin sockets come to you equipped with a template, which is used to determine the exact positions of the four screws required for each socket, also the position of the large one inch hole which allows the top portion of the socket to protrude through the sub-panel. To remove the socket from the cardboard template it is necessary to unscrew a screw on the under side of the socket. This will leave the socket in two portions. One-inch holes are necessary for each socket, and they may

SHOPPING LIST FOR THE BAYER.

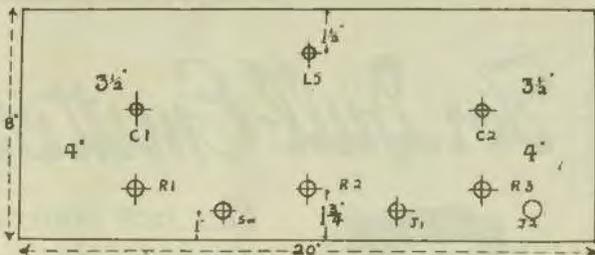

- 1 Radion panel, 20 x 8 x 3/16 inches.
- 1 Radion sub-panel, 18 x 4 x 1/16 inches.
- 2 .0005 Commodore S.L.F. condensers.
- 3 Clarke's Atlas filament controls.
- 1 Emmeo D.C. jack.
- 1 Emmeo S.C. jack.
- 1 Emmeo battery switch.
- 1 Set of Radiokes Bayer coils.
- 4 Benjamin sub-panel sockets.
- 2 Jefferson 41 transformers.
- 1 Midget condenser.
- 10 Engraved terminals.
- 1 Pair of Benjamin brackets.
- 1 Wetless .00025 grid condenser and leak.
- 1 .061 Wetless condenser.

end, next to this again is located the radio frequency valve socket, next the detector socket about three-quarters of an inch away. At the back of this socket is placed the Midget condenser, next comes the first audio

be cut out with an extension bit or with a fretsaw. An alternative is to drill the largest sized hole possible and with a half round file bring the hole up to the correct dimensions. The position of the Midget condenser is behind the detector valve socket. Don't forget to allow the required room for the Benjamin brackets and to drill the necessary holes for fixing these brackets to the sub-panel. The sub-panel should overlap about one eighth of an inch over the Benjamin brackets, but measure this for yourself, noting that the sub-panel when mounted will not crush against the Bayer transformer. Mount the required parts on this sub-panel, paying particular attention to the valve sockets.

Wiring.

Everything is now ready for wiring. First of all, join one side of each of the filament controls together, then one side of the switch to this common wire. Next link to this common wire moving plates of the aerial condenser C1. Then join the fixed plates of the radio condenser C2 to the top of the secondary of the Bayer transformer, the bottom of this transformer is to be connected to the moving plates of this same condenser, C2. This is about

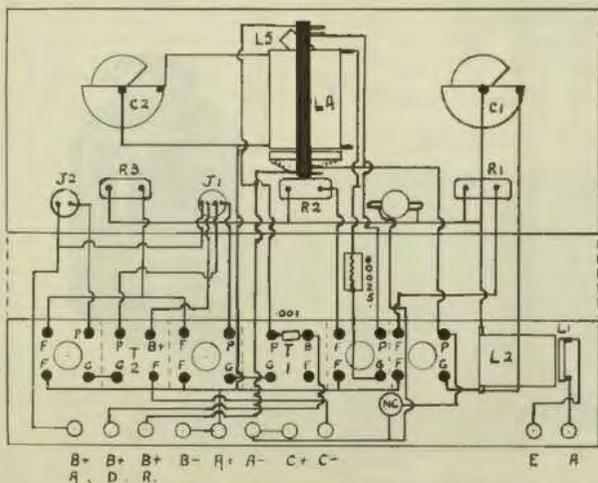

The drilling template for the main panel slots.

as far as you can go with the main panel wiring for the moment, therefore turn your attention to the sub-panel, which, at this stage, should not be connected to the main panel. Proceed with the wiring of this sub-panel, starting off at the audio end first and working up to the radio end, completing as much of the wiring as is possible before finally assembling by means of the Benjamin brackets to the main panel. The wiring diagram is of great assistance to you in this matter, but for the sake of clearness the audio transformers are not shown at right angles, and the grid leak and condenser is out of

position. The Bayer transformer is equipped with soldering lugs which can be traced to the correct coils. For example, the two top lugs are for connections to the reaction coil L5, the third lug from the top is for the top of the secondary (which is taken to the fixed plates of condenser C2), the two bottom lugs are for the primary coil L3, whereas the third lug from the bottom is for the filament positive or grid return of the detector valve. There is no mistaking the correct soldering lugs of the aerial and grid coils of the first valve.

It will be, perhaps, advisable to employ spaghetti covered wire for this sub-panel work, as this will prevent any possibility of short-circuiting the various leads. Varnished cambric spaghetti and No. 20 bare wire may be used, if desired, as in this instance nothing is gained by right angled bends as is so with the standard baseboard layout. Compare the back of panel diagram with the circuit diagram as you proceed, thereby checking off as you are working. A fair amount of soldering is required, particularly with the Benjamin sockets, so employ a good, clean, hot iron and some resin cored solder for this purpose.

Soldering is quite an easy matter, but the average person is inclined to consider a joint is soldered when it is only stuck together. Let your iron rest just long enough to let the solder run in, and do not handle the soldered joints until it has set properly. Blowing on a new joint assists to cool it quickly. Try it. Again, when soldering, do not get your fingers too close to the prescriptive joint as the heat travels along

The back of panel wiring diagram, showing sub-panel connections.

For Dull-Emitter Valves

AMPLION CARBONCEL No. 222
A heavy duty low tension battery for filament lighting.

Voltage, 1.45. Capacity, 500 a.h.
complete with sal ammoniac. It is
only £2/15/-

This new battery gives uniform
voltage and possesses remarkable
:: "staying power" ::

AMPLION presents the first air-depolarising primary battery to really successfully replace the expensive accumulator. Further it is actually an improvement, especially on the dependable "dry" battery.

THE AMPLION CARBONCEL is constructed to an exclusive formula which enables it to deliver steady, level voltage over a remarkably long period.

STAYING POWER
is a conspicuous characteristic. It gives 12 to 18 months service on a multi-valve set on its first charge.

RECHARGING
may be done at home in a few minutes by simply adding a little sal ammoniac, and new zinc.

**TABLE SHOWING THE VOLTS MAINTAINED AT
VARIOUS RATES OF DISCHARGE.**

Type	Discharge Rates.				
	.1 amp.	.3 amp.	.5 amp.	1 amp.	1 amp.
222		1.20 v.	1.15 v.	1.10 v.	0.96 v.
229	1.1 v.	1.05 v.	1.00 v.		

The above figures relate to intermittent or semi-continuous discharge only, for 3 to 5 hour periods.

Ask for Amplion Carboncels by name and number.

the busbar very quickly, frequently resulting in a nasty burn. Always grip the busbar with a pair of pliers and hold steadily while soldering.

Perhaps if the uninitiated were to tin each respective joint before soldering it would help matters. To each of the lugs of the Benjamin sockets apply a small portion of solder with a hot iron, then, when a joint is being made, all that is necessary is to apply a similar portion of solder to the end of your busbar, then laying the two tinned ends together, and applying heat with the iron only. This will ensure a thoroughly satisfactory joint. Wipe off all residue of resin with a damp rag and a neat clean joint is the result.

When you have completed the wiring of the sub-panel as far as you can go, permanently attach it to the main panel by means of the brackets, and finish off the wiring. When this is done the receiver is now ready for testing.

Testing.

If you are satisfied that your wiring is absolutely O.K., insert the four valves in their respective sockets, and connect up your "A," "B," and "C" batteries. A four and a half volt grid bias battery will be ample provided not more than ninety volts is used on the audio valve plates. The "A" battery depends on the particular valves used. For the standard 201A type, a 6 volt accumulator will be found necessary. This 6 volt accumulator is also required for the

True Blues, Phillips C509 and the Mullard types. On the other hand, the Phillips B406, D.V.3's, and other similar valves only require a 4 volt accumulator. Cossor Point One valves need only a two volt accumulator. Still, carefully read any literature which comes with valves to determine the correct size of "A" battery, as dire results are frequently the consequences of employing an accumulator which is not of the correct voltage. The "B" battery voltages are already specified in a previous portion of this article.

Connect your aerial and earth to their respective terminals, and plug in your headphones in the first jack, turn up your valves and listen in. Keep your reaction coil L5 at zero coupling, that is, with the coil at right angles to the secondary. It may happen that the station you tune-in will come in with a very shrill whistle. Overcome this by adjusting the Midget condenser until the whistle disappears, just disappears and no more, and good, clear reception should take place. Locate a station of low wavelength while you are adjusting this Midget condenser. Then, after clearing up the whistle, rotate your dials through the different stations, noting of course all the time that clear reception results. If this balancing condenser is adjusted too much, it will decrease the signal strength unnecessarily. Once adjusted, this need not be touched any further.

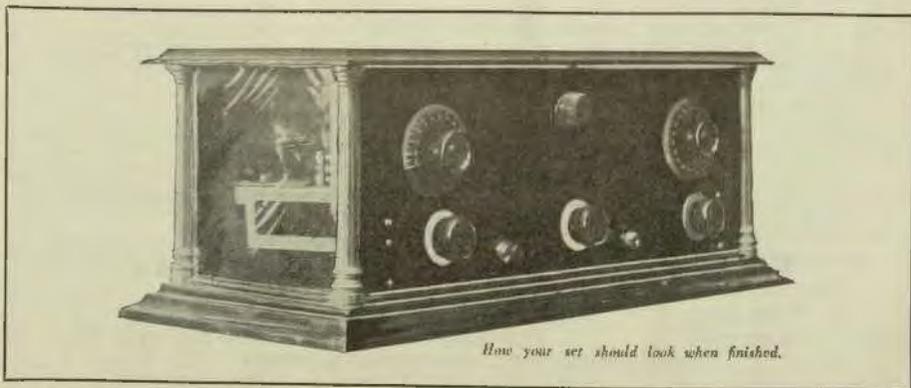

Both dials should read almost cor-

respondingly on the different stations. If the Inter-state station is difficult to clear up a slight adjustment of the filament control, particularly the detector valve, will help greatly. On some stations, too, the radio frequency filament control plays a most important part. The reaction coil L5 really acts as a volume control, but balance this up carefully with the radio frequency rheostat. Spend about an hour or so familiarising yourself with your new receiver, note the effect of the different controls, tune in all the local stations first, and later on note your results on the long distance stuff. A short aerial is most suitable for this receiver, don't exceed fifty feet over all, and remember a short earth lead is a distinct advantage.

You will be proud of the Bayer receiver, the results will please you immensely. The quality of tone is splendid. In actual operation, tested at Marriekville, this receiver proved a huge success. Inter-state stations were received at good loud speaker strength, even on a 25 foot aerial, but the fifty foot aerial yielded louder results with an equal amount of selectivity.

Next Week.

It is proposed next week to describe the details necessary to construct a split secondary two-valve receiver. This method allows interesting reception with extraordinary selectivity from long distance stations.

How your set should look when finished.

There's a size in Burgess for every Cabinet.

The New Wondertone IV. Home Construction Receiver

is the result of exhaustive experiments to place before the Australian public a receiver that does not require any electrical knowledge whatever to build. With our new and simple building instructions a boy of 7 can build it. Furthermore, the circuit employed is especially designed for the combination of Simplicity of Control—Distance—Volume—Clarity and Selectivity. No jamming of stations with the new and wonderful Wondertone HCIV., and no special tools are required, only a screw-driver, pliers. The connecting wires are all cut and prepared to the required lengths and by following the instructions it is impossible to make a mistake.

	£ s. d.
Wondertone HC4 parts ready to assemble with 60 ampere hour accumulator	19 17 6
Wondertone HC4 parts ready to assemble with dry cell "A" Battery	17 12 6

The accessories include everything necessary for a complete receiver such as Stained Maple Cabinet, Bakelite Panel drilled and engraved, heavy duty "B" Battery, Accumulator or dry "A" Battery, "C" Battery, "B" Battery Voltmeter, Hydrometer (for 6 volt accumulator), Headphones, Battery Connecting cable and Aerial equipment.

Faithful battery service

To have faith in your battery is to presume it will give faithful service. The Ever-Ready Battery enjoys the confidence of thousands of users throughout the Commonwealth because of its long life and all-round reliability. Your dealer stocks a variety of types, one of which is made to suit your requirements.

THE "STANDARD" DRY CELL RADIO BATTERY.

Price 3/-

The Ever-Ready Radio "Standard" Dry Cell, as illustrated, is fitted with two screw terminals, and since its introduction has met with great success, users recognizing its immense superiority, over any imported cell. Size, 2 1/2 x 4 1/2. Weight, 2 1/2 lbs. Also for bells, telephones, signalling and electro-medical apparatus, etc.

"WANDA" PLUG RADIO BATTERY.

This illustrates the new Radio High-tension "W" Battery, which can be obtained 5 1/2, 42, or 55 volts—fitted with a Wanda Plug, and 2 screw terminals.

Price:
 Small size, type WP, 3 1/2 volt 2/6
 Small size, type WF, 42 volt 12/6
 Small size, type WJ, 55 volt 15/-
 Large size, type XP, 3 1/2 volt 16/-
 Large size, type XJ, 42 volt 21/-
 Extra Large Super Service, 42 volt 26/8

"STANDARD" "A" BATTERY.

Price 3/-

The Ever-Ready "Standard" "A" Battery (3 cell), 4.5 volt, specially designed for economical operation of 1, 2, or 3 valves, taking .06 amperes at 3 volt. For sets with four or more valves, the most economical service is obtained by using two "Standard" "A" batteries connected in parallel.

NEW EVER-READY No. 126, OR "A," "B," OR "C" BATTERY.

Price 2/9

One of a group of radio batteries—Useful in wireless, lighting, and amplification. Size, 3 1/2 x 4 x 1 1/2. Most useful for bells, telephones, burglar alarms, medical coils, etc. With three brass terminals. Voltages 1.5, 3 or 4.5 volts. Useful for all wireless purposes as well as general utility.

If unobtainable locally, write for address of nearest source of supply to

The Ever-Ready Co. (Gt. Britain) Ltd.

Simple, Accurate and easily adjusted

The vernier movement comprises three sets of enclosed precision machine cut gears, and reduces the speed of the moving coil block by eight times. The moving block moves in the same direction as the knob, which prevents confusion. It also becomes absolutely rigid in any position, holding the heaviest coil securely. No screws required to tighten it.

Moving block cannot fall

Bakelite Mouldings for the side plates, coil blocks and knobs; heavy nickel plating for the metal parts.

WANTED.—All kinds secondhand Wireless Sets, Parts, Sponkers, etc. Best prices given. JACK RAPKEN, 16 George Street West, MA 1195.

YOUNG AUSTRALIA

A score of years back, city dwellers and those back of beyond knew little more of each other than people on separate continents. At the summons of the Great War, Australia discovered its country sons and the country sons discovered the world. The boys of farm and orchard and station stepped into the shell-light of Europe and a civilisation in arms.

Each great-hearted Australian city opened its arms to every lad in khaki and a link of eternal friendship was forged. The youth of all Australia became a glorious family, welcomed by a united purpose.

Peace brought a gradual reversion to old conditions, but now the few square miles around his isolated home no longer satisfied the boy of war-broadened vision.

For a time unrest threatened to have disastrous results on many homes. Parents despaired of their boys ever settling down to an ordinary everyday existence, and minor tragedies seemed likely to follow the great tragedy!

Radio came as a new star of hope! It became possible to live miles from civilisation and yet be as closely in touch with current events as the man who read his paper at breakfast each morning.

From the city broadcasting stations each evening, messages are sent to one vast community possessing a united interest in radio. This has linked suburban drawing room and isolated homestead, and put them on an equal footing.

In the country, the radio set is the magnet uniting a score of interests and binding home life anew. Miss reading your daily newspaper for a week and you will have some idea of what it formerly meant to get news days after it had been forgotten in the cities.

Needless to say, every wise man in the long distances jealously takes precautions against even temporarily losing the benefits of the wireless—which has become a daily joy. He cannot afford to risk music using an inferior make of battery.

That is why the only choice is invariably Burgess, the world's best and most enduring battery—half the cost because double the life.

Careful experiment and years of research in their radio laboratories

have resulted in making Burgess the dry battery supreme.

That is why they are used by the American Navy and by all to whom reliability is essential.

Explorers throughout the world have given their lives into the safe-keeping of Burgess. You may place your trust to-day in the same perfect battery.*

THE FIRST WEEK in December presents several features of special interest to 3LO, Melbourne. On Sunday, Dec. 5, the Heidelberg Musical Society, under the baton of Mr. Burgin, will give a sacred concert. On that date also Mr. Harold Rodgers will play several request numbers on pianoforte and organ as a farewell performance prior to his departure for America. On the next night the University Symphony Orchestra is to be broadcast, and on the Wednesday there will be a University Conservatorium concert at the Auditorium. During the lunch hour of Wednesday, also, from 1.15 to 1.45, Mr. Sutton Crowe and his students will give a lunch-hour concert.

The Significance of Church Broadcasting

(Continued from Page 6.)

tumble of the world outside where neither the rough nor the tumble are ever wanting. Under the influence of all this one's bumps of combativeness, reason and courage positively protrude. Fourth, it increases the sense of responsibility and a sense of responsibility is to a man what ballast is to a ship. To realise that he is faced with the possibility of influencing either for good or ill large numbers of people pulls up with a round turn any man who might be tempted to carelessness. To the member of the congregation from which a service is being broadcast these comes a sense of goodwill towards the unseen host of listeners-in. The people outside are enjoying their service and rejoicing in that which gladdens their hearts. Brotherly kindness is the result.

The significance of church broadcasting to the far off listener-in manifests itself in the removal of a sense of isolation. The great world of the city is brought into the four walls of their room. They share with the most fortunately placed in the land their richest privilege. They feel that they are one with suburbanites and city dwellers. To feel that you "do not belong" is one of life's bitterest woes. Radio is its sworn foe.

The best results can be achieved from the broadcasting of church services only by an earnest application of those governing principles which investigation and experiences have established.

The sermon should be brief. Listening-in is more tiring than simply listening. The man who is effective for a certain time in an ordinarily-preached sermon, if he be wise, will reduce his time 25 or 50 per cent. Sentences must be short and crisp. The theme should be practical rather than theoretical. The Anglo-Saxon type of English should be the one used. Provision must be made to meet the broad general needs of the most varied collection of listeners. Brevity and clarity are the watch-

Guaranteed Workmanship & Clarity of Reproduction

The 'D.J. STANDARD 4'

£25

Absolutely complete No extras to buy

This powerful and highly selective Set is simplified to the greatest possible extent, there are no moving coils to change or get out of order—only two dials, so simple that anyone can regulate the tuning. Once tuned in the "D.J. Standard-4" remains stable. There is no difficulty in picking up whichever station you want—all inter-State Stations at Loud Speaker Strength (except Perth.)

Here is what you
get for your £25

4 B 406 Phillip Valves, 4-volt 33-amp. Peto-Radford Accumulator, 2 large capacity Volton "B" Batteries, 1 Trimm Entertainer Speaker, 1 pair Trimm Dependable Phones, 2 Phone Plugs, 100 feet of Aerial Wire, 30 feet of Insulated Lead-in Wire, 4 Insulators, 6 feet Flex Wire for connecting Batteries, 1 Lighting Arrester. The whole enclosed in handsome cabinet of polished maple.

Buy it on Deferred Payments

You can now have the pleasure of securing the "D.J. Standard-4" delivered into your own home on the deposit of £2/10/-; balance to be paid at the rate of 9/6 per week, to be completed within 12 months.

DAVID JONES'

The R. D. A. III.

R. D. A. Receivers are supplied absolutely complete in all details.

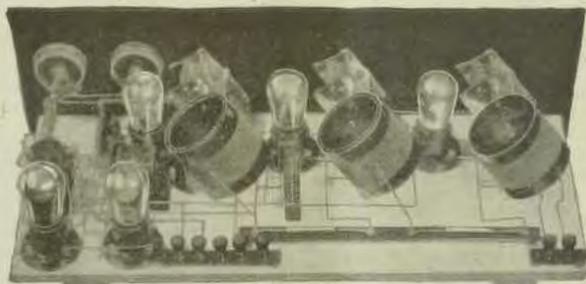

FROM 15/- DEPOSIT

THERE is no longer any reason why the splendid entertainment provided by our Broadcasting Stations need be denied to anybody.

An R. D. A. Receiver which is a guaranteed product and which embodies every modern factor essential to perfect radio reproduction, may be had for a very small deposit—the balance to be paid on our well-known easy payment system.

An R. D. A. Receiver is not only a highly efficient Broadcast Receiver, but as will be seen from the illustration on this page, it is an article of furniture that enhances the beauty of the home.

words. Finally, the sermon must "get somewhere."

The Scripture lesson should be chosen with care. The Bible has passages which almost seem as though they were written for church broadcasting. Twenty verses is a fair maximum unless two lessons from the Old and New Testaments be combined when the number may be slightly increased. Explanatory references, speaking generally, should be cut out.

The hymns should be mainly composed of the old dignified favorites, so that wherever desired listeners-in may join in the singing.

The organ solos should contain a very distinct melody, running through a succession of harmonious chords do not go over satisfactorily. They tend to become a tonal blur. The stops which are the radio organists' best friends are such as resemble the note of the piccolo, oboe, etc. Upon these he should ring the changes with a good deal of freedom.

The anthem chosen for the broadcast service should be the most attractive one in the choir's repertoire, and if it contains several solo parts all the better. The conductor of a choir which broadcasts should be a man of sufficient courage to say no to any particular member of the choir whose desire to get on the air is not approximated by a corresponding capacity for radio musicianship.

Finally, the principle governing all church transmissions is "Only the very best possible is permissible." This should dominate all the radio arrangements. Anything which will just do positively will not do.

A RADIO ENTHUSIAST at Queanbeyan writes to a Sydney wireless firm emphasising the importance of the broadcasting of the wool sale prices from Sydney. He states that he knows of a case where a travelling "wool jobber" was defeated in a deal by a grazier as the latter, having regularly received the wool prices by radio, refused to sell to the jobber, and decided to send his clip to the catalogue as usual.

FARMER'S

High-Grade Radio Accessories

Keenly Priced and of Proved Reliability

FACTS

ABOUT

Impedance of Audio Frequency Transformers

THE FAMOUS

BRITISH MADE

TRANSFORMER

TYPE AF 3

Has the following Impedances:

AT 100 PERIODS - - - 50,000 OHMS.

AT 500 PERIODS - - 410,000 OHMS.

No better Transformer is available at any price

Dealers please communicate with:

A. BEAL PRITCHETT (Aust.) LTD., Sydney and Melbourne.

WEDNA LTD., Adelaide.

EDGAR V. HUDSON, Brisbane.

- (a) Amplification with any valve and transformer depends greatly on the transformer impedance; the higher the transformer impedance the better the reproduction, particularly of the lower notes.

HENCE IT IS UNNECESSARY TO VARY THE IMPEDANCE OF THE TRANSFORMER TO MATCH THAT OF THE VALVE USED; ON THE CONTRARY, THE HIGHEST POSSIBLE TRANSFORMER IMPEDANCE SHOULD BE USED AT EVERY STAGE.

- (b) IMPEDANCE DEPENDS ON FREQUENCY, AND TO STATE TRANSFORMER IMPEDANCE WITHOUT STATING THE FREQUENCY AT WHICH IT IS MEASURED CONVEYS NOTHING.

A good transformer has a high impedance even at low frequencies to reproduce low notes satisfactorily. A transformer may have a high impedance at a comparatively high frequency, say, 500, and yet be a bad transformer because the whole range of male and female speaking voices, as well as most of the fundamental musical notes are at frequencies below 500.

*Half the cost—
because double the life*

Burgess Batteries Meet Every Need

Your wireless deserves the best. How many exquisite sets are spoiled to listeners-in by the foolish economy of a bad battery! Only a Burgess can give just that clear strength and purity which win the praise of your guests. Long life adds to efficiency. Daring adventurers have taken the Burgess Battery above the clouds, beneath the sea, among the ice-floes of the Arctic and into the blazing heat of New Guinea jungles. Each time the Burgess stood the test triumphantly,—and it will do the same for you.

Buy right and you must buy Burgess!

The Burgess Line takes care of every Radio Battery demand. Burgess "A's" are especially designed for radio filament lighting, and have remarkably long life. Burgess "B's" meet every need—from the smallest size for portable sets up to over-size—for especially heavy current drains—horizontal type or vertical type—whichever is preferred. Burgess "C's" for dependable "grid bias duty." With Burgess Radio Batteries you know that you get quality and service, the two essentials.

S-B

Radio's Greatest Enemy is Interference

(Continued from Page 10.)

because the crystal set gives to the 'phones only what it picks up from the aerial, while a valve set amplifies or boosts up the amount of energy picked up by aerial system.

Blaming Static.

There have been times when most of us have found atmospheric, or static, or X's, as they are variously called, to be good friends. When the set does not work well on the evening that we invited friends to listen-in, it was customary to blame the failure on the static. Sometimes we didn't know and were quite honest about it. But times have changed. We know more about the set these days, and people know the familiar effects of atmospheric better. There are, however, cases discovered by the traders every day, where the noises attributed to atmospheric are really caused by faults in the set or batteries.

A battery (B battery) that is nearly run down will cause noises in the receiver not unlike those produced by distant atmospheric or static discharges. A battery having a voltage of 22½ volts will develop those noises if the voltage falls below about 17 volts. When it is discharged to that extent it is time to get a new one. And that proves the necessity for having a small voltmeter, so that one can tell readily how the batteries are.

THE EXTRAORDINARY ONE VALVER.

Mr. A. Allen, of West End, South Brisbane, writes: "I have built the Extraordinary One-Valve receiver of 'W.W.' 22/10/26. I can get the local station (4QG) on the loud speaker."

Mr. W. Jordan, of Ipswich, Q.: "I am writing to tell you of the great success I have had with the Extraordinary One-Valve receiver. I only finished it half an hour ago, and as soon as I put on the batteries in came 2HL clear and strong. Then I tuned in 3LO, 4QG, and 2GB."

Hosts of other appreciative letters have been received by us.

G.G.H. Majestic Reproducer

Radio for Farmers

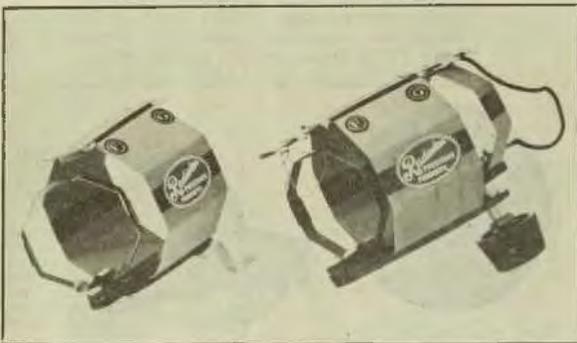

ALTHOUGH constant evidence is forthcoming as to the value of a radio receiving set to a farmer or grazier, no definite effort has yet been made in Australia to collect exact information regarding the cash saving which the man on the land may hope for by investing in a radio set. In the United States, however, a census has just been taken in which 44,550 farmers replied to a series of questions. Forty-six per cent. of those replying gave instances of cash savings having been effected by the use of radio on the farms. Most of the replies stated that the information most sought by farmers was market reports, as these helped them to sell their produce to the best advantage. By this means they were enabled to hurry their produce to market when there was a possibility of a fall in price, or to hold it if the market was over stocked or if there was a possibility of an increased price.

Some who replied to the questions stated that the weather reports by radio had saved the farmers hundreds of thousands of dollars during the past year. The National Farm Radio Council has held "radio mass meetings" to discuss matters of general interest. Addresses were given at headquarters of the council; these were broadcast, and farmers who owned receiving sets gathered their neighbours to listen in their own homes. In some instances as many as 250,000 farmers attended "meetings" held in this way.

RADIO AT COROWA RACES.

For the benefit of those who attended the last COROWA races, a radio receiving set fitted with a loud speaker was installed at the front of the grandstand, and during the afternoon descriptions of the racing in Melbourne and Sydney was received. This is probably the first time that a wireless set has been in operation on a southern district race course, and judging from the success of this innovation, it will not be the last.

Announcing the 'New Radiokes' Bayer Four T.R.F. Coil Kit

This Kit has been selected by the technical staff of "Wireless Weekly" for the construction of the famous "Bayer Four" Receiver, described in this issue. Remember that it was only chosen as a result of its supreme quality—that essential which makes all the difference to Radio reception.

Limitations removed—new possibilities, new pleasures made available for a larger circle of Radio enthusiasts by this marvellous coil kit—and the price is only . . . 25/-.

Marconi Looks Back

The famous promotor of radio broadcasting writes of his early difficulties.

SENATORE GUGLIELMO MARCONI, in an article, "Looking Back Over Thirty Years of Radio," in the "Radio Broadcast," says of his first experiments with radio telegraphy:

"It was stated that radio telegraphy would never be in a position to compete with other rapid means of communication over long distances, such as that carried on by cables.

"But even in the face of such observations often made officially in the parliaments of great nations, I was never discouraged. We Bolognese often smile in the face of the most difficult situations.

"In fact, by means of the use of thermionic valves — a brilliant conception of Fleming, perfected by De Forest, Langmuir, and Armstrong in America, by Meissner in Germany, and by Round and Franklin in England—and by means of the use of balanced tuned circuits, of electric filters, of power amplifiers, and finally of directional radiators, I succeeded in obtaining results such as to ensure a regular radio telegraphic service by day and night between Europe and America; thus also in 1918, I could for the first time in history, communicate from England to Australia, i.e., almost as far as the antipodes, over a distance of about 20,000 kilometres (12,500 miles).

"To-day there are thousands of ships equipped with radio telegraphy for the safety of human life at sea, and to maintain alive the daily activity of the countless persons who cross the oceans; to-day radio communications between Europe and America, the Far East and South America handle a huge amount of traffic to the advantage of the growing demands of civilisation; to-day millions of radio telephonic receivers scattered in the most distant countries carry on continuous communication with the greatest centres radiating news of everything of

interest to mankind; to-day, by means of circular radio telephonic diffusion (so-called "broadcasting"), public opinion can be kept calm during any popular disturbance which interferes with the peace-making work of the press, as was proved on the occasion of the recent general strike in England; to-day many hundreds of thousands of people find occupation, study and work in the new industry created by radio telegraphy; to-day aerial navigation is possible and safe up to the farthest bounds by means of radio communication, as has been recently demonstrated by the great triumph of Italian boldness and technical training obtained in the glorious "Norge" expedition.

"The field of radio transmissions is continually getting wider, thus the radio transmission of photographs to a distance is already an accomplished fact, and even now the practical solution of the great problem of television is seen to be possible in the near future."

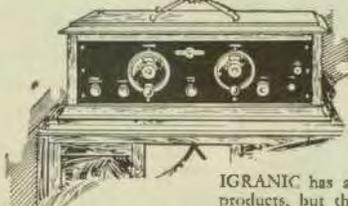

MISSIONARIES LISTEN-IN.

The London Missionary Society's steamer, "John Williams," carries a four-valve set built by the Chief Engineer, Mr. Thomas Young. In a letter received by 2FC last mail he states that the ship's company listened to the Australian stations throughout the whole of the present trip. Mr. Young says he has mislaid the slip of paper on which he recorded the programmes of the various stations, and he cannot remember whether it was 2FC or 2BL from which he heard Charlie Kelleway talking about cricket. As a matter of fact it was 2BL, but listeners on the Missionary steamer are not particular which station they listen to provided the programme is good. Mr. Young writes in very complimentary terms of the singing of Mr. Alfred O'Shea and a two-act play from 2FC. "I have been doing exceptionally well the last few nights," he says. "About 7 p.m. I got the broadcasting station at Los Angeles; at 8 p.m. I got Auckland and Christchurch, and at 11 p.m. I got Sydney, Melbourne, and Brisbane. Mr. Young states that the "John Williams" was heading for Gilbert Islands from Fiji.

The New IGRANIC

SUPER HETERODYNE

*The Most Perfect Set
Yet Produced*

*There is no finer performance than
Super-Heterodyne performance and no
finer Super-Heterodyne than Igranic*

IGRANIC has always set an exceedingly high standard in all its products, but the latest product of this famous British Factory has created a tremendous interest that is world-wide.

I have recently completed one of your "Igranic" Super-Heterodyne Kits and wish to inform you that I am exceedingly pleased with it in every way.

I have not heard any set to give such volume on the same number of valves and I was able to tune-in all the Australian Stations on the loop with considerable strength. The New Zealand station 1YA was very nearly as loud as Melbourne.

The selectivity is all that could be desired and no trouble was experienced from interference between 2BL and 3LO.

The original of this letter from a leading Sydney expert may be seen on request.

The advantages possessed by a well-designed Super-Heterodyne Radio Receiver are Range, Volume, Sensitivity, Selectivity, Stability, Purity and Ease of Operation. The Igranic Super-Heterodyne Receiver offers all these. For instance, it is capable of receiving from all interstate stations (with the possible exception of Perth), and from Auckland, 1YA, on a frame or indoor aerial at full loud speaker strength.

It is exceedingly selective, no trouble being experienced in tuning-out any station not required. 2BL, 2FC and 3LO might be a thousand or only ten metres apart for all it matters to the Igranic Super-Heterodyne. It is pleasingly free from all extraneous noises, and the purity of tone and absence of distortion are a revelation even to the most exacting critic.

Price (including everything) from £75, according to cabinet work.

All Readers' Queries Answered Here

In conjunction with Farmer's Broadcasting Service the Technical Editor of "Wireless Weekly" will answer all listeners' queries arising from the wavelength change. Answers will appear in these columns and will be broadcast from 2FC each Thursday night.

W. G. (Birmingham)—

Q. 1: I would like to build a four-valve receiver, and am undecided whether to build the Browning-Drake or the Marco Four. Please recommend the better for my purpose?

A. 1: I regret I cannot recommend one above the other. Both are particularly good receivers, the more popular, perhaps, being the Browning-Drake.

Q. 2: I would prefer one with variable condenser in either circuit.

A. 2: I would prefer you to obtain a .0005 infid. condenser and set up the .001.

T. P. S. (Barnwood)—

Q. 1: I am desirous of constructing the Harkness Reflex receiver, and would like you to answer me these questions:

Q. 1: Would Gredan formers 3 inch in diameter be suitable for winding the coils?

A. 1: Yes. Shalloe both inside and outside for.

Q. 2: What is the correct A and B battery voltages?

A. 2: This depends on the valves used. If dual emitters, the A battery should be four volts. Read the valve maker's instructions. The B battery may be between 45 and 90 volts according to the volume desired. Many thanks for your appreciative remarks. I hope to continue in your good favour.

C. A. S. (Northwood)—

Q. 1: Will you please tell me why I must have a separate B battery for an audio stage in the Extraordinary One Valve?

A. 1: Without a separate B battery for an audio stage the set howls and squeals thereby being unsuitable. We note your spiritual results with the one valve.

G. H. (Bristol)—

Q. 1: I would like to reflex my Reinartz three-valve. Would you advise this?

A. 1: No, don't try it.

M. V. (Hurstville)—

Q. 1: Would the Philips Charger be suitable for charging the accumulator B battery of "W.W.", 15/11/26?

A. 1: No. Construct the rectifier as described.

W. C. (Liverpool)—

Q. 1: I built myself the Crystal Receiver of W.W. 8/10/26, and got excellent results. I also built one for a friend at Cooney, but can only hear 20L. Can you tell me how to overcome this?

A. 1: Build the Handil Crystal Receiver in "W.W." 12/11/26, using both .0005 variable condensers and watch the coupling turns.

Q. 2: Is a valve receiver more selective than a crystal receiver?

A. 2: It is easier to make a valve receiver selective.

P. A. P. (Mossman)—

Q. 1: I am contemplating building the Accumulator B battery described in "W.W." 15/11/26, and am undecided whether to charge B batteries up to 98 volts, be suitable for recharging?

A. 1: Yes.

T. H. G. (Bilmain)—

Q. 1: Should I get intermediate reception on the two-valve Reinartz of "W.W." 15/10/26?

A. 1: I can only tell you that the model I built gave fair intermediate reception on phones. Quite a lot depends on handling the receiver.

M. F. G. (Geneff, S.A.)—

Q. 1: I intend to build the Extraordinary One Valve. What valve did you use?

A. 1: Concor Point One.

Q. 2: If I used a S.I.F. condenser 0005 mfd., would it make any difference to the tuning?

A. 2: It would be an advantage to use an S.I.F. condenser.

Q. 3: Would enamelled wire suit for coil windings instead of D.C.C. wire?

A. 3: I'd prefer you to use D.C.C. wire, but enamelled will do.

Q. 4: I intend adding two stages of audio to this. Would it prove satisfactory?

A. 4: No.

F. J. K. (Ashfield)—

Q. 1: I have built a Browning-Drake receiver, and have some difficulty in neutralising it. I use B406 valves throughout. Can you help?

A. 1: You will overcome your difficulty by providing a separate tapping for the plate supply of the R.F. valve. Try 45 volts. Perhaps you can use a DV190 valve in the R.F. stage things would be better.

R. C. C. (Indooroopilly, Q.)—

Q. 1: Please tell me the diameter of the former in the "W.W." Reinartz of 15/10/26, also give lead and ratio of transformer?

A. 1: The former three inches in diameter, grid leak, 2 meg. with .0005 condenser. Transformer ratio, 3 to 1.

J. P. D. W. (North Sydney)—

Q. 1: Will the rectifier described in "W.W." 10/11/26, be suitable for charging a 45 volt Duth's accumulator?

A. 1: Yes, quite the thing. Glad to hear of your good results. Sincerely,

J. H. (Brownswood)—

Q. 1: I have been told that the Browning-Drake receiver must have all the valves matched. Is this so?

A. 1: No. It is often advisable to employ a True Bias Power plug Valve in the rectifier stage when all valve valves are used. If four valve valves are installed a DV190 in the R.F. stage will help in neutralising.

Q. 2: Would a two plate condenser do for neutralising?

A. 2: Yes, provided its capacity is not too great.

G. W. C. (Leura)—

Q. 1: I shall be glad to know the gauge of wire recommended for the collapsible roof described in "Wireless Weekly," 23/4/26?

A. 1: Mars' aerial wire, obtainable from any of the advertisers in this paper.

S. B. (Bicester)—

Q. 1: Can I receive loud speaker results on the local broadcast wavelengths on a two valve dual-tmitter set?

A. 1: Yes, quite nicely.

Q. 2: Can you recommend a two-valve circuit with dual-mitters to achieve the above results?

A. 2: Build the Reinartz in "Wireless Weekly," at 15/10/26. Thanks for your good wishes.

Worshipful (Liswich)—

Q. 1: Can I use 2½ inch bakelite tubing for the Harkness Reflex?

A. 1: Yes, but employ two .0005 variable condensers. The primary may be wound alongside the secondary as suggested.

J. R. P. (Browwood)—

Q. 1: Although my experience extends over only a few weeks, I was able to build the Handil Crystal Receiver from your excellent article in the "Wireless Weekly" of the 12th November, and after a week's trial I am pleased to say that your words of praise for this receiver are fully justified. In using

two sets of headphones, I find the signal strength of 20B and 2KY weak, although 2FC and 2HL are very satisfactory. Can I improve them?

A. 1: I am pleased to hear of your good results. To improve 20B and 2KY use a smaller inductively coil in the primary, and put your condenser in series. I would rather use you with a valve receiver for Morse code work.

Old Number (Macclesfield)—

Q. 1: Would the chemical rectifier cut up more current than a battery charger?

A. 1: No.

Q. 2: I have a four valve set, using D.V. 3 valves. Would the battery last out longer than the time stated in "Wireless Weekly"?

A. 2: As mentioned in the article, this battery improves with use and will last longer than the time stated. I have just issued a letter from a reader telling us that his battery lasts well over a fortnight with the use charge. I would advise you to get a better type of meter.

J.C. (Kilmarnock)—

Q. 1: I intend making up the two-valve Reinartz. Will it be possible from us here, and will it get intermediate stations on encephalons?

A. 1: This receiver should be quite suitable for your purpose; therefore I recommend it.

B. T. (North Ilkka)—

Q. 1: I would like a wireless set interferer with a telephone if they are both connected to the same earth wire?

A. 1: No.

Q. 2: Is an "A" battery of 4½ volts (dry cell) too much for a two-valve set using Philips A306 valves?

A. 2: No, quite suitable.

Q. 3: Is a "C" battery any improvement in a three-valve set?

A. 3: Yes. A "C" battery is an improvement inasmuch as it saves your "B" battery current and also increases the volume on the receiver, as well as sweetening the tone to a marked extent. Connect as follows: In a three-valve set such as you have join the terminals marked F on each transformer and take a lead from this to the minus terminal of the "C" battery. The positive terminal of the "C" battery is connected to the minus terminal of the "A" battery. Four and a half volts will be found ample with 80 volts "B" battery.

J. B. (Stoker's Sliding)—

Q. 1: Would Ford coils do instead of the "B" batteries for reception?

A. 1: I don't advise this at all, as the reception would not please you in any way.

S. C. (Merrymount, Q.)—

Q. 1: Would you please let me know how the aerial of three-quarter inch copper pipe is attached to the set wire. "Wireless Weekly," 29/10/26?

A. 1: Use a lead of heavy flexible wire and run through the lead-in tube in the ordinary manner.

D. T. M. (Moss Vale)—

Q. 1: What coils should I use for 3AR and 5CL on the three-coil one-valve receiver?

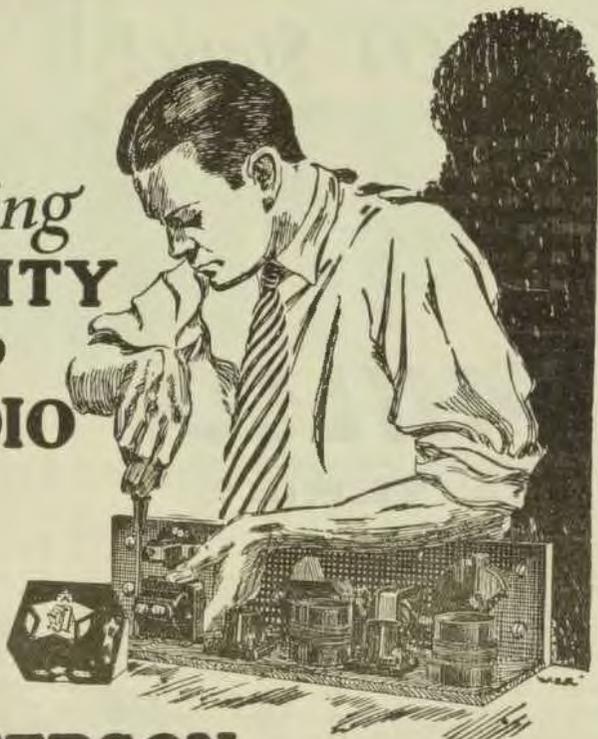

A. 1: For 3AR, use the same coils as for 4G6, and for 5CL, use primary 50, secondary 75, reaction 75.

J. R. (God's Harbour)—

Q. 1: I have a Little Rabbit plant which works in conjunction with a 32 volt Willard battery. Q. 1: Could I use 2 cells of this battery as an "A" battery?

A. 1: No.

Finest
 B
 Battery

In
 the
 World

A: You could do so, but you would be better off with a separate set with "A" battery, and a small charging board. See your local electrician regarding this charging board, and ask him to make it suitable for the purpose.

T. S. (Aberlure):—

Q: I have built my regenerative from various condenser parts, and a primary winding disc turned from 3/4 inch ebonite, but am now at a loss as how to go about winding aerial coupling and grid coils. Is it necessary to employ these coils or can I work with regenerators only?

A: It is necessary to employ the aerial coupling and grid coils, or if desired, grid coil only, without employing loose coupling on the aerial circuit. This may be wound in ordinary solenoid fashion, similar to the secondary of the regenerator.

Lesra (Hood):—

Q: I have tried all different types of crystal receivers, but find that selectivity is very difficult in this neighborhood. Can you recommend me a circuit of a receiver which will suit my purpose?

A: Build the Hamit Crystal set described in "Wireless Weekly" of the 12/11/26.

L. H. (Maryborough, Q.):—

Q: I have a Tungar "A" and "B" battery charger and wish to make "B" battery output function as a "B" battery eliminator. Could you furnish me with necessary circuit, and what extra condensers, etc., are required?

A: I am afraid this is not practicable, therefore don't try.

S. C. C. (Lithgow):—

Q: I have bought all necessary parts to make an ordinary single valve (W.W. 22/10/26) and would like to know the correct voltage to give valve (Common Point One) if dry cells would be satisfactory, and if so, would I need one or two cells?

A: The valve you have chosen is quite suitable and two dry cells connected in series will do quite well for an "A" battery. Use a 30 ohm rheostat, but do not turn it full on.

BRIEF REPLIES.

C. McP. (Mascot): Look for this shortly in W.W.

H. B. (Brisbaneville): See W.W. 29/10/26 for the Old Reliable. Break off at the primary of the sound transformer.

S. L. B. (Brisbaneville): Thanks. Your experiences are interesting. Glad to hear from you.

R. G. H. (Epping): Build the Brownings-Drake using an indoor aerial.

M. M. (Manly): The alternative scheme is quite usual.

L. W. (Marrickville): I have answered this question over and over again in these columns since the Harkness Reply was published. The 2000 condenser will suit.

A. E. (Petaham): The particulars are too meagre for anyone to judge. Have you built the receiver correctly? Is your aerial too long, etc? Tell me some more and I'll help you.

C. R. (Allora): Many thanks for your letter. The Extraordinary One Valve is certainly splendid!

F. T. (Campbell): The One Valve Reflex of W.W. 23/7/26 will suit you.

R. J. H. (Telokelley): It appears that your kit is defective. Are you sure that the layout of your parts is all right? The circuit is quite O.K. See W.W. 1/10/26.

G. R. (Lane Cove): The valves are quite suitable.

F. E. M. (Burswood): See W.W. 12/12/26.

C. P. (Granville): I am conducting tests with the half aerial. You will be advised at some later date.

A. E. S. (Newley): Test your fixed condensers. One is broken down.

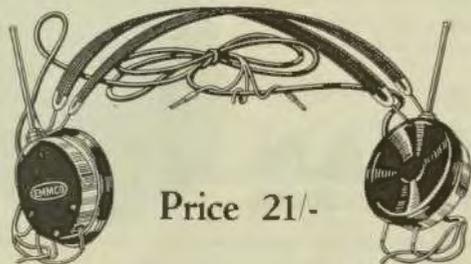

Troubled (Punchbowl): Interview your radio dealer.

LISTEN IN COMFORT

THE EMMCO PILLOW PHONE supplies the need of all those who desire to listen-in in comfort. Simply place the Pillow Phone, fitted with its Emmco Unit, in the place of your favourite cushion, attach the leads to your receiver, and enjoy the broadcasting while you read or rest. The sweetness of tone and the volume will surprise you.

THE EMMCO PILLOW PHONE is supplied without cover for 27/6, but covers in exquisite designs and material are obtainable from dealers at prices ranging from 2/6 to 21/-.

Price 21/-

Changes in the Regulation of British Broadcasting

THE British Broadcasting Company will, next year, be replaced by the British Broadcasting Commission. Suggestions have been made for a system of inter-Empire broadcasting with the Daventry station in England as its starting point. The first relay station is projected for Moncton, New Brunswick, a distance of 2,440 miles. From this point, the programmes will be distributed via land lines to Canadian broadcasting stations throughout the Dominion. From Vancouver, a distance of 2,300 miles of wire line, the programmes would again take the other route to Australia, a distance of 5,000 miles. This offers the greatest distance barrier, but, by the use of high power and high frequencies, it is feasible, at least during favourable seasons.

An alternative route would be through a relay station at the Fanning Islands, 3,885 miles from Vancouver, and 3,710 miles from Sydney, Australia. Sydney would be the distributing centre for the Australian continent. At Perth, a radio link

would be established with New Zealand and Ceylon, and, from the latter point, to Cape Town and India. The jump from Cape Town to Malta would complete the system, involving a total of eight radio relays.

Stupendous as the plan is in its conception, its estimated cost less than a million. Owing to time differences, it would be of practical value only on special occasions of tremendous importance, once the novelty of inter-Empire programmes had worn off. As a feat of radio technique, it would be a wonderful demonstration of radio's possibilities. As for its sociological and political aspects, in uniting the Empire, the plan represents an entirely new development in the application of radio communication.

Politics by Radio

The high powered radiocasting station 2KY operating from the Sydney Trades Hall is having a marked influence on political and industrial affairs. The recent A.L.P. conference congratulated the manage-

ment of the Trades Hall broadcast station on the success of its activities, and the State Labor Government is being urged to proceed with its plans for the establishing of relay broadcasting stations in various country centres.

A considerable number of trade union offices are now equipped with radio receiving sets, and sets have also been installed in a number of factories where workers gather in the lunch hour to hear talks on politics and political economy as expounded through the Trades Hall station.

A movement has now been initiated to instal receiving equipment in the branches of the A.L.P. Warringah Branch at Dee Why is among the first to take this course. Members of the League are building a set themselves, having purchased the parts. The intention is that members will make the headquarters of the League a rallying centre where they can congregate weekly and listen to lectures, political and social news, and entertainments from the Trades Hall station—and doubtless other stations as well.

Valves with the Wonderful P.M. Filament

THE wonderful P.M. Filament offers you three times more for your money. It is so tough that even after 1,000 hours' life it can be tied in knots and cannot be broken except by the very roughest handling—result, safety against accidents.

There is more than strength in the P.M. Filament. It has up to 3 times greater length and up to $5\frac{1}{2}$ times greater emission than an ordinary filament. This is where the P.M. Filament gives you real value.

Another big point, the P.M. Filament requires only one-tenth ampere, giving 7 times the life to each of your accumulator charges. For great economy, great life and great results secure the valves with

Genuine

RADIOTRONS

bear the above seal

RADIOTRON UX 199

Equally serviceable as a detector or as a high efficiency radio or audio frequency amplifier. Extremely economical in operation. Adaptable to dry battery operated sets.

Filament voltage 3. Current .06 amps. **Price 19/6**

RADIOTRON UX 201A

The standard all round flexible storage battery valve—good in any detector or amplifier circuit—sure to give the best results at the lowest operating cost.

Filament voltage 5. Current .25 amps. **Price 12/-**

RADIOTRON UX 120

New dry cell Radiotron for use in the last stage of audio amplification only. Exceedingly high filament emission. Volume equal to that of two UX199's.

Filament voltage 3. Current .125 amps. **Price 17/6**

RADIOTRON UX 112

A new power valve similar to the familiar UX201A, but several times as powerful. Designed for use as last valve in accumulator operated sets, when it will deliver far more energy than the average loud speaker requires. Two of these valves will give exceptional results. Filament voltage 5. Current 5 amps.

Radiolux AMPLION

The Natural Tone Loud Speaker

A good speaker is the only kind worth having. A poor one will ruin otherwise good reception.

A good speaker reproduces *faithfully* every tone of speech . . . every note and change in tempo of music, broadcast.

The RADIOLUX AMPLION is the world-wide standard of good loud speaker reproduction. You can hear *all* the high and low tones . . . every note — with a Radiolux — clear, full, and above all, *natural*.

Ask your dealer for a demonstration.
