Perfect Control

HAVE you absolute control of your receiver? Absolute control means the ability to tune in any particular station without interference. It means being able to tune down softly on the local station, and yet be able to bring up the volume of the distant station without sacrificing tone or suffering interference.

A Centralab Radiohm does it for you

Control your radio receiver with a Centralab Radiohm for greatest flexibility and power. Gives smooth variation of resistance. Ideal for plate circuit control of oscillation. Now used as a standard by most of the prominent manufacturers.

Centralab Radiohm.
Perfect control, from a whisper to maximum volume.

Genuine RADIOTRONS bear the above seal

RADIOTRON UX 199

Equally serviceable as a detector or as a high efficiency radio or audio frequency amplifier. Extremely economical in operation. Adaptable to dry battery operated sets.
Filament voltage 3. Current .06 amps. **Price 12/6**

RADIOTRON UX 201A

The standard all round flexible storage battery valve—good in any detector or amplifier circuit—sure to give the best results at the lowest operating cost.
Filament voltage 5. Current .25 amps. **Price 12/-**

RADIOTRON UX 120

New dry cell Radiotron for use in the last stage of audio amplification only. Exceedingly high filament emission. Volume equal to that of two UV199's.
Filament voltage 3. Current .125 amps. **Price 17/6**

RADIOTRON UX 113

A new power valve similar to the familiar UV201A, but several times as powerful. Designed for use as last valve in accumulator operated sets, when it will deliver far more energy than the average loud speaker requires. Two of these valves will give exceptional results. Filament voltage 5. Current 5amps.

FRIDAY, JANUARY 7, 1927.

Looking Ahead

MONG other things it requires courage to be a prophet among radio enthusiasts. Every listener-in considers it his right to be allowed to amaze those he meets with wonder stories of a future dominated by radio. Weird and fanciful as are most of these visions (varying according to the imagination of the listener), it is natural that they should conflict, so it is to invite criticism to publish one's forecast of radio developments within the next fifty years.

Fortunately for us (for his article made excellent reading), Mr. E. T. Fisk, in addition to possessing a thorough grasp of the fundamental principles and practical applications of electrics and an imagination carefully disciplined by a knowledge of the limitations of human nature, is fearless of the searching criticism of radio men. It is noticeable that, though there have been many vague references to the future of radio, very few men of prominence in other parts of the world have ventured to predict definite radio developments. To be a prophet in one's own country is not only to be unhonoured but also to be called a fool, unless the prophet enjoys high prestige in the minds of the public. Perhaps that is why so few have ventured to take up the role. Again, one must be more than a radio man;

something of a philosopher is necessary for, during the next fifty years, radio will be so much a part of our lives that to predict the advance of radio is to predict the advance made by humanity itself.

A survey of new receivers now on the market indicates that the trend this year is in the direction of tuned radio frequency models having two, and in some cases three, stages of radio frequency amplification, with detector and ordinarily two stages of audio frequency amplification. Much development has been made during the past year or two along the lines of improvement in the audio frequency amplification end of the receiver through the use of power valves in the output stage or stages. The fact that power valves are necessary, in order to prevent distortion where smaller valves are overloaded, is now well recognised and the power valves are to-day a part of the modern receiving set.

The trend in cabinet design is decidedly towards console models, although there is still a very large volume of sales in the table types. The indication now is that the public has come to regard radio as a permanent fixture in the home, and therefore feels that the receiving set should be properly housed in its own individual cabinet of the console or furniture type.

Between You and Me and the Microphone

Conducted by
R. E. CORDER

MORE THAN 1,500 letters reach 4QG each week from listeners-in.

REFERENCE to the Birthday book at 4QG shows that over 700 children were wished "Many Happy Returns" during the month of November.

THE NEW ZEALAND P.M.G. has given the Radio Broadcasting Company the necessary six months notice to erect and operate an up-to-date high-powered broadcasting station at Wellington.

THE RADIO BROADCASTING COMPANY of New Zealand announces that the 3YA, Christchurch, silent day will be observed on Tuesdays in future instead of Thursdays.

THE CALCUTTA STATION, 5AF, which used a power of 12 kilowatts, has been closed down, and its place will very shortly be filled by a new station, which will operate on 12 kilowatts. Whereas 5AF had a daylight range of 200 miles only, the new Calcutta station will be within range of Australian listeners.

KNOCKED DOWN by a motor car in one of the main streets of Brisbane recently an elderly woman was admitted to hospital in a critical condition. When it was seen she would not live the Roma Street police broadcast her description through 4QG. Within five minutes the woman was identified and her relatives reached her bedside before she died.

A RADIO LISTENER at Lakemba has written to 2FC asking that the G.P.O. clock chimes be broadcast more often. He explained that listeners in his neighbourhood set their watches and clocks each night, before going to bed, taking the time from the radio set. As a matter of fact both the Sydney stations tune in G.P.O. every hour, and occasionally work in the quarter and half hour chimes as well. Watchmakers and jewellers usually take the time over the air and a number of country schools check the clock in the same way.

THE NUMBER OF receiving licences now issued in Great Britain is 2,105,000. It is hoped that the 25 million mark will be reached this year.

A BALLAD OF BROADCASTING.

*There are poets who sing
About flowers in the spring
A subject that seems everlasting;
My poetical theme
Is a practical scheme
To ensure the success of broadcasting.
Now the scheme I propose,
Is one, I suppose,
Which most listeners' approval will
gain—
That all pirates should be
Made to pay double fee,
Or in "trunk" be compelled to remain.*

*And these nuisances great,
Who each might oscillate,
And other folks' pleasure do spoil;
Should be heavily fined,
Or in prison confined,
Or dumped down on some desolate isle.
And those listeners who grouse
At the programmes, I'd have
In some spot where no wireless they'd
hear
With an old gramophone,
And cracked records, whose tone
Would horribly grate on their ear,*

*Those for jazz tunes who seek
Every night at the week,
I'd ship the whole lot right away,
To some spot far distant land,
Where with Jacobson's band,
They could fox-trot the whole blooming
day.*

*And that other mod lot,
Who on "highbrow" do dote,
And sneer at each popular air—
With Beethoven I'd dose,
Till they turned up their toes,
And died in a dismal despair.

Then, freed from those pests,
For the popular tastes,
To cater would be pleasure lasting;
And the broadcaster's job,
Of all worry would rob,
And ensure the success of broadcasting
Clarendon.*

A.S.

A CLERGYMAN has been lecturing on happiness from KGO. He ought to have performed enough marriages to know that there is no such thing.

TO COMBAT forest fires, similar to those which raged throughout N.S.W. just before Christmas, the Forestry Department of California employs radio.

THE APPEAL FOR FUNDS to instal a wireless set at the Deniliquin Hospital has resulted in the collection of \$80, reports the "Pastoral Times."

THE GREEK GOVERNMENT has prohibited the use of receiving sets tuning to more than 2000 metres. One of the best ways to win listeners on a particular wavelength is to pass a law against listening-in on it.

THE BROADCASTING INTERFERENCE TANGLE which has hampered European broadcasting has been solved by a committee of experts. The standard of 10 kilocycles separation has been adopted and the 99 channels available have been divided into two groups, 33 exclusive and 66 non-exclusive channels. Of the exclusive channels, Germany receives 12, Great Britain and France 9, Western Russia, Italy, Spain and Sweden 5, Czechoslovakia and Norway 3, and the remaining countries one or two each. The 66 non-exclusive wavelengths must accommodate 116 stations, approximately an average of 7 per common channel.

A PLEA that television devices should be under Government control was made by Lt.-Col. J. R. Relf in his lecture before the Radio Society of Great Britain recently. "What," he asked, "would be the consequences if this invention got into the hands of unscrupulous traders at home and abroad?" The application of television, said the lecturer, meant revolution to practically all standards of living at the present time.

How We Celebrated Christmas Eve

By OSWALD ANDERSON

In this article the manager of Farmer's Broadcasting Service gives the reader a very good idea of the trouble and effort which lies behind a big programme such as that broadcast from 2FC on Christmas Eve. In the above picture those artists who took part in that programme are seen.

IN a weak moment some time ago, I said to that good friend of 2FC,

Mr. E. J. Van de Velde, affectionately called "Van" by all those at the studio: "Have you any good photographs of London?" The word photographs to "Van" is meat and drink, and one has yet to discover a subject unphotographed by him. The next morning he appeared with a series of fine photos of the better and lesser known parts of London, and the idea of broadcasting a Christmas Eve in London was discussed.

The services of Mr. S. H. Bowden, an authority, were called upon, and we set about writing our first big radio scenario. Now that the whole thing is over, one marvels at the effrontery displayed in attempting, and getting away with, such a difficult proposition as to take up the whole of an evening's programme—three hours—to a story, the realism of scenes and places of which could

only be fully appreciated by those who had either visited London or who had a very good idea of this wonderful city.

We have always been told that the production of a play should entail rehearsals, and preparation of all the details that go with the launching of a play on the legitimate stage, but it is a fact that the principals of our story were called up for half-an-hour's rough rehearsal only on the afternoon of the show. Yet, from 8.0 to 11.0 we were able to keep the story going without one break, which speaks volumes for the versatility of the radio mind.

Through the courtesy of the Columbia Gramophone Company, the new recording studios were placed at the disposal of 2FC, and our party of thirty arrived at Homebush on Christmas Eve just a quarter of an hour before the programme was timed to commence.

The first trouble that we struck

was that our special "noise box," or we should say the engine calculated to carry out all the noise effects was found to be of no use. Upon this wonderful contrivance we had founded our hopes. It was, Mr. Halbert maintained, capable of producing noises, from the expiring squeak of a penny balloon, to the sound of a "rumbling tank," not to speak of minor disturbances such as underground railways, &c. Was it any wonder, then, that our spirits sank to zero when we realised that this "gad-get" which was meant to operate on what is called a D.C. current, would not function on an "A.C." current. However, nothing daunted, we scouted round and found a drill, a motor horn and various instruments guaranteed to create suitable atmosphere, and these were pressed hurriedly into service. This was no sooner done than the call came from the studio to start our play. Our genial H. P. Williams was the producer, Mr. Lawrence Halbert, effects department, and

Mr. Oswald Anderson, manager 2FC, who contributes this article.

How We Celebrated Christmas

(Continued from Page 5.)

general poop bah, Mr. Ewart Chapple, musical director, and the story was to be told by Mr. S. H. Bowden, taking the part of a London press man, Mr. E. J. Van de Velde, a breezy Australian and Mr. Halbert, a young Englishman," that is when he had sufficient time to break away from noise making." Then we had a special staff of effect makers, and in addition the services of others were called upon, none of whom actually knew the whole story. From the moment the carols in St. Paul's commenced at 8 p.m., and the tale was taken up by the principals of the play, until the moment when at 11 p.m. carols were sung in the Soho restaurant, while the snow fell and the dawn of Christmas Day drew near, not a break occurred in our transmission or our story. This speaks volumes for the ready wit and quick brain of those who helped to make this evening a success. Such detail as general conversation, and the noise of footsteps, street cars, &c. while two of the characters were

walking down the street from one place to another — all these were woven into the picture. Such trifles as the noise of the party buying tickets, the giving of change, the arrival and opening of doors as the party entered a theatre—all this was put on the air. The artists had only the script, which gave them a bare outline of the story, consequently the conversation was impromptu, but they simply spoke and acted as they would have done in real life, and in this way a most natural effect was obtained.

In one of the scenes we stumbled upon quite a happy way of filling ten minutes. The manager of the restaurant was supposed to have a very fine wireless set, so after listen-

The following letter is typical of the many hundreds received after 2FC's special Christmas Eve programme. It is from Mr. E. H. Walker, Woodburn Park, Thirlmere, who writes:

"Just a line to tell you how much we all enjoyed the 'Christmas Eve Broadcast.' You entertained us on an Christmas Eve. My daughter has written you thanking you for your message of welcome to Australia, and they have explained that we have just arrived back home from Peru in South America, for our vacations. I am connected with the Submarine Cable Service over there, and whatever prejudices I might have had regarding broadcasting have been wiped out, after listening to the various programmes you have provided us with. My sister, who is with our parents out at a farm 3 miles or so from Thirlmere, has a fine 5-valve set, and the enjoyment they get from it is above all description. It keeps them in touch with the outside world, and gives them infinite pleasure, and keeps them from being lonely. I got the radio fever, in fact, some time ago, while in Peru, but got disinterested in the results my friends got. A lot of radio 'Fans' over there professed to get distant stations, but I never got sufficient proof to go to the expense of purchasing a set that would satisfy me. The average set was not (as far as I could gather) capable of receiving more than the Lima Broadcasting Station, which have not yet been able to establish what would call a first-class concert. It was, therefore, a great pleasure to us to listen to the trip to London on Christmas Eve. We all sat up, enjoying every minute of the entertainment, and at its conclusion, were surprised to find that we were not in London, nor in a Sydney theatre listening to the direct interpretation of the trip, but in a small room, away in the country, miles away from any metropolis."

ing to his cafe orchestra and the various cabaret artists, we called this supposed set into operation switching over London to Queen's Hall, the scenes which followed were quite impromptu. Tuning in and howling valves, noises were heard and then the announcement: "2LO — London and Daventry calling the British Isles," and then followed a most wonderful reproduction of the London Symphony Orchestra, conducted by Sir Landon Ronald, playing the Fire Music from the "Valkyrie." Other well known places were visited by the magic of the wonderful set until the game was becoming exciting. We all entered into the spirit of it, and the cafe proprietor was asked if it was actually possible to get on to Sydney — as one of the party had heard a man living in Surrey had heard the Sydney station 2FC. The cafe manager shrugged his shoulders and signified it was quite a simple matter—"more howling and tuning in," and then to every listener's amusement was heard Mr. Halbert's voice announcing the "Pig and Egg Market reports in early morning session. The real humour of the situation only struck us afterwards, when we realised that allowing for the difference in time, this is just what listeners in London would have heard.

From a listener's point of view, the evening's entertainment should have been most enjoyable, because the items from the various London Halls were excellent, and one must chuckle when it was realised what clever spoofs were worked on the air that night.

From the letters of congratulation received at the studio after the holidays, it seemed clear we made a hit, and spurred on by our initial success, further evenings are to be arranged along the same lines.

The holiday season is by the way a bad season for outside stunts. There are so few worlds outside the studio left to conquer. All the thrills associated with undersea and aerial transmissions, truiliers, &c. have departed, and the development of studio material becomes necessary. It has been said that 2FC was the first Australian station to deliberately

(Continued on Page 45.)

It's in the Air

Radio Irritations by a Man with a Grouch

I LIKE wireless. Radio is my friend. I am on fairly good terms even with static, since I recognise that it plays the part that fleas play in the scheme of things. As David Harum said, "A moderate amount of fleas is good for a dawg—keeps him fr'm broodlin' over bein' a dawg." Same with static; it is the crumpled rose-leaf in the bed of radio.

But feel bound to "let out" now and then on some of the more idiotic features of radio. There is a sort of "air-sickness" about broadcasting today, which badly needs either a doctor or a moral gyroscope to keep the thing on an evil keel.

I am tempted sometimes to wonder if there is any originality in the world, so quick are men to follow sheep-like the lead given elsewhere. Take moving pictures, for example. No sooner does a picture with the word "Flaming" make a success than a half-score films still in the making are given a twist which will enable them to have the word included in their titles, till the flaming things cover every hoarding in the country. So from "Manhandled" we got "Womanhandled," and the next thing we'll see "Flapperhandled," I suppose.

Coming back to radio, consider the number of Uncles that have been added to the world since the first wire-

less Uncle was invented. What a riot of unoriginality. Uncles mean nothing in the lives of most children, except grouchy, down-at-heels individuals who come on visits and endge money and tobacco from Father, and make Mother wonder when in the world they will go. Yet this avuncular relationship is foisted on Bedtime Storymen the world over. We have Billy Bunny, and Uncle Peter, and Uncle Harry, all talking to the kids in a sugary, sickly tone that ought to give a species of air diabetes to half the population. What miserable specimens they are, too, lying their heads off in the interests of a spurious morality. They get letters from parents, telling them the secret vices of Maudie, aged 3, and Willie, aged 5, and they solemnly pull up their socks before the microphone, smooth out the betraying letter and in honeyed tones they say—"Oh, Maudie, darling, a little bird has been telling me that you have been smoking Daddy's cigars. Now, Maudie, that is a very, very wrong thing to do. Those cigars cost Daddy credit at the tobacconist's and, besides, you should wait till you are a couple of years older before you take to smoking. Your darling Mammy never smoked till she was eight. And, Willie, I am sorry to say the Wireless Bird has told me that you are chewing tobacco. My dear little lad, you'll never grow up like Daddy if you chew tobacco. Tobacco, my dear little boy, was made to smoke, not to chew, except in America, where the poor people get nothing nice to drink, and so must do something to take their minds off trouble."

There, that's the sort of bunk they put over, till Maudie and Willie get a set on birds they never get rid of. They wring the necks of every bird they can catch, never dreaming that it is Uncle Sillyass who is doing the dirty work.

Then here's a funny thing. Every announcer believes that he is the world's best announcer. I have known

Did you ever feel like this about radio? Our contributor was this way when he wrote this article.

several, and they have all confided to me that of course it sounds like conceit but that they have had letters from as far north as Timbuctoo, where they have been picked up several times, and these letters tell them that there is no announcer at any station who has quite the same timbre in his voice as he has. All the time the timbre isn't in his voice, but in his head. I have always thought that the demeanour of an announcer going to the microphone is modelled on that of an archangel going to the hole in the floor of heaven with a message to mankind. There is the same dignity about it, the same air that, "Now, I'm going to make a stir in the world." I really believe there is no announcer in the world who does not tell his friends—"It's a funny thing to think of you know, old chap, but I suppose not even the Prime Minister is as well known as I am." Only in America they make it the President, and in England and Spain, the King. The principle is the same.

Thank heaven we haven't yet copied the idea some American stations have of reading the telegrams of congratulations that come, telegrams enthusiasm over the way the announcer read the weather reports last Tuesday night, or the fine way Madame de Squall rendered the ballad, "Ah! Miou!" from "Les Persians." I believe that the reading of these congratulations sometimes takes a couple of hours. Just think of the boredom

(Continued on Page 47.)

Coming Features in the Broadcasting Programmes

MUSIC LOVERS will appreciate the series of Beethoven recitals which 2FC has arranged, commencing on Wednesday, January 12th, by Madame Evelyn Grieg and M. Henri Staell. Madame Greig, whose knowledge of the old masters is extensive, will intersperse each sonata with explanatory remarks.

IN RESPONSE to insistent requests from many enthusiastic listeners, Mr. E. J. Van de Velde will give the second of his series "Who's Who in the Zoo" on Thursday, January 13. Corporal Phillips, better known as "Imito," will give imitations of the various animals Mr. Van de Velde is going to talk about, and Miss Dorothy Ewhank will sing bird songs from the cycle by Liza Lehman.

EVER ON THE LOOK OUT for a fresh diversity, 2FC has formed a combination of "Radio Revellers." Plays and acts specially written for broadcasting will be given by this party, and the first of the series of revels will be broadcast on Saturday, January 15. These entertainments will be conducted along the lines of the "Co-optimists" in London.

AN ENTERTAINMENT has been arranged for the Prince of Wales' Soldiers' Hospital, Randwick, on Sunday, January 16, after the close of the church service.

LEICHHARDT BAND, winners of the carnival last year, are strong favorites for the 1927 Band Carnival. The contest begins at the Show Ground on Saturday, January 22, when "C" Grade will play. On Sunday afternoon, January 23, there will be a quick step display, on Monday evening, January 24, "B" Grade, on Tuesday, January 25, "A" Grade, and on Wednesday evening, January 26, (Anniversary Day) the "A" Grade finalists will play.

A NEW combination of vocalists—the Harmony Four—will be heard this year from 4QG. A special programme has been arranged for the initial appearance of this quartette party on Sunday night, January 9.

AMONG THE ARTISTS to begin their season at 3LO with the New Year is Dr. Arnoldo Bartolini, whose rich mellow baritone has won golden opinions throughout the Commonwealth. We are promised exceptionally fine musical programmes as this fine artist has wisely adapted his selections to suit musical tastes of all degrees.

THE "LUNCH HOUR" concerts at 3LO are becoming increasingly popular. Among the artists engaged to broadcast at that hour, few are more

as duets for steel guitars. These tuneful ditties that urge us to become acquainted with the "Sands of Waikiki" are ever popular, and, in certain quarters, command wonderfully attentive audiences.

PIETRO SARCOLI, the eminent Italian violinist, has been re-engaged to broadcast from 3LO. Listeners are already familiar with his masterly rendering of the superb "movements" from the famous concertos, and his sympathetic solo work in selections of lighter vein. His instrument is of great age, and value, and possesses a rich tone of extraordinary sweetness.

WITH THE NEW YEAR all talks at 3LO, except those of paramount interest, are to finish before 8 p.m. During the day the musical programme will begin at 12.30 instead of 1, which fact will be appreciated by the people at home who "switch on for half an hour or so" whilst they are having their solitary bite of lunch.

INCLUDED in the programmes for the New Year are two new comers to 3LO. Miss Lottie Daniell, a coloratura soprano, and Miss Roma Driver, contralto, will shortly make their bow before the microphone. Both possess highly trained voices and with a wide range of songs.

NEW ARTISTS at 2FC include — Miss Nora Hill, Irish soprano; Miss Daisy Richards, violinist; Miss Eileen Boyd, contralto; Miss Eleanor Stanton, contralto; the Whitchello Dance Trio; Miss Suzanne Ennis, contralto; Miss Leslie Elliott, popular entertainer from 3LO; Mr. Brunton Gibb and Miss Elsie Lang, whose clever sketches are much appreciated; Mr. Alfred Cunningham, English baritone; Mr. Cliff Arnold, novelty pianist; Mr. Norman Francis, baritone; Mr. Walter Whyte, tenor; and Miss Belle Pollard. Mr. Whyte has been out of the limelight for some years, owing to a severe nervous breakdown, but despite his illness, his voice still holds that pleasing quality which the microphone enhances.

Tom Lamond, a promising young 2FC artist. A pupil of Mr. Burns Walker, Gilbert Webb, and the Guildhall School of Music, London, he has appeared in a number of concerts at the Sydney Town Hall.

welcome than Miss Mascotte Ralston, of "Lilac Time" fame, who, with her ukulele and her plaintive original way of singing, that lifts ballads of the "I'm sitting on top of the World" type, so much above the ordinary, has sung herself into favour in an amazingly short space of time.

THE MOANA LUO DUO, popular 3LO artists, have been burning the midnight oil in their endeavour to keep pace with the times, by arranging the latest Hawaiian melodies

The Humour of Radio Interviewing

INTERVIEWING for broadcasting purposes is often amusing. It is very different for a trained journalist to chat with some person who has come into the limelight, and later writes his impressions of the conversation, and for a radio announcer to drag his victim before the microphone and ask him questions which everyone who owns a radio set can hear.

The journalist may spend an hour with his subject and then condense the latter's remarks and opinions into a quarter of a column, rounding off the sentences and trimming up the grammar as required. But every word of the radio announcer and the replies of the person interviewed go into the microphone and are heard by listeners for hundreds of miles around.

The humor enters into the question when the hero of the occasion will not talk. A journalist, finding his subject reticent may draw him out with questions. "Do you believe in the vegetarian theory?" he may ask. "Are you a supporter of the feminist party?" and in accordance with the replies the published interview might read: "Mr. Smith said he was a believer in vegetarianism, but did not support the feminist party."

The radio interviewer (and incidentally it may be mentioned that pressmen are the best interviewers for broadcasting) cannot do it that way. This was discovered by Uncle George Saunders, announcing for 2BL, a few nights ago when broadcasting from the Maroubra Speedway.

The big event of the evening was a motor cycle race in which Cecil Brown (America) beat Harry Peel (N.S.W.). At the conclusion, Uncle George hauled Brown before the microphone and started to make him talk to the listeners. Brown was shy and Mr. Saunders found it heavy going. "How did you feel when you saw Peel 50 yards ahead?" he asked. "All right," was the brief reply. "I suppose this is your first time in front of a microphone?" said Uncle George. "Yes," said Brown. "And I suppose you felt quite confident

that you would catch Peel?" Again Brown said "Yes." And to half a dozen more questions he continued to say "Yes" with an occasional "No."

At last in desperation the interviewer remarked: "I suppose you know plenty of people who will be listening-in to-night?" "Yes," said Brown. "Well," observed Uncle George, "speak to them."

No answer from Brown.

"Call any one you like," said Uncle George. Still the speed man had nothing to say. "Can't you think of anyone you would like to speak to?" "No."

"And isn't there anything special you'd like to say?"

Again Brown answered with the one word, and at that Uncle George gave him up.

The man who lost the race was a much better talker. Asked how he came to be beaten when he had gained a lead of 50 yards, he replied: "I think the bike overheated, towards the finish she began to sicken up. But I hope there will be a return match."

Some of these radio interviewers are amusing because the chief performer has nothing to say. Others talk so hard that the only way to stop them is to cut off the switch. And still they go on talking, but as no one can hear no harm is done.

TABLE OF USEFUL COIL WINDING DATA.

Now that solenoid or cylindrical types of coils are becoming popular the information given in this table will be of particular interest to many home constructors. It shows the number of turns to the inch for any gauge of wire of any of the standard forms of insulation. The figures are based on the wire being wound each turn close to its neighbour, and will assist to determine just how long a tube will be required to accommodate any given number of turns. This information will prove of very great value to all, so we advise you to keep this table handy alongside the workbench for reference:

Standard Wire Gauge	Enamelled Covered.	Single Silk Covered.	Double Covered.	Silk Covered.	Single Cotton Covered.	Double Cotton Covered.	Standard Wire Gauge

2FC Long Distance Tests--Remarkable Crystal Results

EXPERIMENTS are being conducted by Mr. A. J. Scott-Dack, chief wireless officer of the Orient liner "Oronsay," to determine the long distance strength of 2FC, Sydney. Recently, 2FC received a letter from a Mr. Stanley Dodman, of Frensham, Surrey, England, stating that, on October 27, at 12.5 p.m., Greenwich mean time, he listened to 2FC broadcasting the Californian Dance Band from the Palais Royal.

In view of this, Mr. Scott-Dack has agreed to listen to 2FC daily on the present trip of the "Oronsay," and after his arrival in England on January 24, 25, 26, and 27, at 7 a.m., Sydney time (equal to 9 p.m. on the previous night in London), special messages will be sent from 2FC for Mr. Scott-Dack, Mr. Dodman, and other listeners to hear—if they can.

After all the fact is practicable enough. Radio has already reached such a point that listeners who go to the trouble with their sets can pick up stations all over the world. In the near future, we may expect to have concerts in London broadcast to Australia, and relayed (re broadcast) by the Australian station that the every day listener can hear. In the meanwhile, the Sydney stations are on the air daily for longer periods even than the celebrated London station 2LO.

Mr. Scott-Dack's last report was as follows:—

"On the midnight of December 15, at about 640 miles (as crow flies) from 2FC I heard announcer say:—'This concludes our programme for to-night, 2FC closing down until 7 o'clock to-morrow morning.' Then the National Anthem was played on a piano. I heard two solos just before that but they were jammed out by 3LO. This reception was carried out on a crystal receiver. Your signals were strength R5. Then I switched over to a single valve receiver and your signal strength was about R.8."

"On December 16, when we were 40 miles off Adelaide (or nearly 1000 miles from 2FC) at 11.32 p.m. Sydney time, I heard "Valencia" played on a gramophone from 2FC. After that I

heard you announce a fox trot, but missed the name. I also heard you give the time, seven minutes to 12, and the chimes from "Big Ben," Sydney, at midnight, and then the National Anthem played on a piano. This was received first on a crystal receiver, and strength of signal was about R.5, with a little fading at times. I then switched over to a single valve receiver, and brought your signals up to about strength R.9. This I think you will agree is nearly a record for a plain crystal receiver. I personally have never heard of any station being picked up at a greater range on a crystal set.

"It is certainly very good for a one-valve set, as when I put the two-valve amplifier on, I could work you easily on a loud speaker. These tests I must say are getting very interesting, and I will look forward to the time when I shall be trying to pick you up in England."

COMBINED RADIO DEMONSTRATION.

THE first combined radio demonstration held recently at Bondi and Coogee beaches, was calculated to bring home to seaside holiday makers the value of a radio set in the open air.

Fourteen motor cars each with a radio set on board, were lined along

the sea walls facing the beach, pouring forth everything emanating from the broadcasting stations. A surf carnival was in progress at Bondi, and a description of it was being broadcast through 2BL, so that the people within range of the loud speakers could hear an account of what was going on in front of their eyes.

When the party of demonstrators moved on to Coogee, the Bondi Carnival was still being described, and promenaders gathered round the loud speakers to hear how the local club was faring in the competitions at the neighbouring surf. A feature of the afternoon was a thrilling account of the team's race through the surf. This was won by the Manly Club, of which "Boy" Charlton is a member. Charlton's swim was followed intently by thousands who could not see him, doubtless, also by many who had their receiving sets in action miles away from the beach.

Another feature of the afternoon's broadcasting which attracted the attention of the crowd was the description of Randwick Races by 2FC. Many who seemed to take no great interest in the musical items broadcast, or the description of the surf competitions, stood close up to the loud speakers to hear every word of the 2FC announcer.

Arthur Wendling and Molly Molloy, versatile instrumentalists and vocalists, who are among the latest recruits to broadcast from 3LO.

6WF Establishes World's Record Relay

By relaying, through U2XAF, and 6AG, the American station WGY over a distance of 13,000 miles the Perth station has created a new world's record for a broadcast relay. The relay was carried out six times during one month.

LISTENERS interested in broadcast relays from America, are notified that the next relay will be at 7.30 a.m. on Sunday morning next."

The very ordinary wording of the above announcement, made by 6WF a couple of months ago, indicated a very ordinary occurrence at that station. Perth listeners show no excitement now when hearing the announcer of WGY, Schenectady, U.S.A., reading market reports and discussing the price of eggs. One Sunday morning recently they had the amazing experience of hearing a jazz item announced, and relayed from the Ten-erife Hotel, Albany, N.Y., on the previous Saturday morning.

Westralian Farmers have established a world record by relaying six transmissions from WGY. Each relay was carried out on 32.79 metres through WGY's short wave station 2XAF, and received in Perth at 6AG, operated by the manager of 6WF, Mr. W. G. Coxon. The feat is all the more remarkable when it is considered that the waves followed the dark portion of the globe, and the reception was obtained with three hours of daylight on this end. The distance traversed by the waves was over 13,000 miles, and no preparation was made by 2XAF. Previously, 2XAF had been relayed in South Africa, and by 5 Don N, Adelaide.

The first relay took place on September 13, and although interference was caused by a few local valve sets on the first occasion, the reproduction and volume was equal to that broadcast directly from the studio. Before the second attempt, however, an appeal was made to all enthusiasts to leave the air clear. Little trouble

A party of native Indians broadcast from 4QG recently. The singing was rather mournful, due to the fact that their octave contains 22 semitones. One of the accompanying instruments was a harmonium or small organ which is played with one hand and pumped with the other. Two drums formed the rest of the accompaniment. They are known as tabla and are made either out of wood and skin or clay and skin.

has been experienced since then. No doubt this is because better results are obtained by tuning to 6WF instead of direct to the American station.

The crystal control used at 2XAF made possible a stable adjustment on the receiver picking up the music in Perth. On one occasion a windy morning made this difficult, but a remedy was found by staving the aerial more rigidly. The aerial consisted of a vertical tube, 15 feet high, with a counterpoise.

The receiver used employed the well-known Reinartz circuit, with a two valve low frequency amplifier, while a two valve choke capacity coupled amplifier was used to transmit over the land line to 6WF from the receiver. No difficulty was found in tuning to 2XAF.

During the relays all portions of the apparatus that could be earthed were done so, and the land line ran in lead covered wire for a distance of 50 feet until it was clear of the aerial system. No interference was caused whatever on the land line, due, no doubt, to the early hour on Sunday morning during which the relay was carried out. At this time the lines are most free of the disturbing induction noises of the city.

The music, after passing through

five valves, was still good. Only transmitters using crystal control on these short wavelengths could give satisfactory reproduction after such a great degree of amplification. Ordinary transmissions were in progress from 2XAF, and no preparations were made by either station for thefeat.

An attempt was made to receive KDKA (at the time of the last special tests for Australia) during the evening with a view to re-broadcasting. Although at times ample volume was obtained, the reception was spoiled by rapid fading (every second or two) and atmospherics on the 60 metre band.

During the morning hours short wave reception from America is invariably good, and no fading was experienced whatever, and mostly there are not any atmospherics to interfere on the short wave used by 2XAF. When special time signals were sent to Fitzgerald Smith, conducting an exploring party to the interior of Brazil, an opportunity was taken to give to 6WF's listeners, by medium of another amplifier and microphone, a few particulars of the relay. While the description was being done, the loud speaker in the receiving room gave a back ground of time signals.

Broadcast Progress

A statement of the policy of 3LO, Melbourne, in regard to relay stations is made in this article by our 3LO correspondent. The announcement that a Royal Commission is to enquire into wireless is also discussed.

THE policy of 3LO, Melbourne, has been to provide a broadcasting service which could be received on simple sets and if possible upon crystal sets with a reasonably sized aerial.

The first step in realising this object was the reduction of the wavelength of 3LO which has enabled the listeners-in in the metropolitan area to receive broadcasting signals of good quality on the simplest receiving sets. The signal strength of 3LO is so strong that listeners in the metropolitan area can hear both in the daytime and at night without serious interference from either atmospheric disturbances or ordinary electrical disturbances due to tramways, lifts, etc., except when those are exceptionally bad. It is realised, however, that listeners outside the metropolitan area, particularly those in parts of Victoria most remote from Melbourne, are not in as favorable position for receiving the broadcasting service. They need to use more elaborate sets to receive the signals as the signals are of lower intensity and atmospheric and other interference is more serious and at distances over 50 miles, the fading of the signals is sometimes pronounced.

3LO, Melbourne, in association with the Postmaster General's Department, and the Amalgamated Wireless (Asia) Ltd., recently made a survey of the reception in Gippsland and to the north of Melbourne as far as Albury. This survey showed that in the interests of listeners in the country, it has become necessary to take steps to provide and improve the service for them.

After a technical examination of the problem of giving an improved service to the country listeners, it

has been decided it would be best to follow the British practice of establishing relay stations from which the 3LO programmes would be simultaneously broadcasted. It is believed that the British practice, in broadcasting, is the leading practice and is the best to follow. If four such relay stations could be established, one in Gippsland, in the neighbourhood of Maffra, a second in the neighbourhood of Wangaratta, and the third in the neighbourhood of Bendigo, and a fourth in the Western District, possibly near Hamilton, a greatly improved service would be given to the listener-in in the country.

There are however, a number of technical and economic difficulties which have to be considered before this system of relay stations could be established. Each of these stations would require, for a considerable portion of the day, the exclusive use of a telephone line suitable for the transmission of speech and music. In spite of these difficulties, however, plans are being made to establish a relay station at Bendigo and stations at the other centres which have been mentioned may follow.

Government Management of Broadcasting

AN announcement has been made to the effect that a Royal Commission is being appointed by the Federal Government to enquire into wireless. So far there is no official confirmation of the report, but there is no reason to doubt that the Government has actually decided to appoint the Commission.

There are some reasonable grounds,

Mr. P. W. Pearce, the physical culture expert, who broadcasts from 3LO.

however, for speculating on the possible outcome of the investigation. One of the proposals made by the organization that asked for the appointment of the Royal Commission is the setting up of another Government department to control radio—to take the control away from the Postmaster-General's Department and add another to the already numerous Federal Departments.

To some broadcasting enthusiasts this may seem quite a good proposal; to hold one department responsible for radio control without having any conflicting or competitive interest such as telegraph and telephone line communication to interfere with the unhampered administration of the wireless laws. A little reflection, however, will show that the proposed alteration may not be in the best interests of listeners.

The post office organization reaches everywhere; its officers are in every hamlet and town and its officials available to listeners almost at all times. Thus it is that the amount retained by the Government for selling the listeners' licenses, keeping the records, making inspections and sending us our renewal notices concerning li-

censes, is only two shillings. If another department, without the facilities of the post office were required to carry out these duties, obviously a great expenditure would be incurred in arranging for representatives or agents. The nett result would probably be that the amount kept back from the license fee would be greater than that now held by the post office. That would mean that the license fees would be increased or the amount handed to the broadcasting companies would be reduced.

Any serious reduction of the companies' revenue would be reflected in a lessening of the activities or improvements of the service which a company would undertake only if the revenue were assured.

The establishment of a radio department would be the forerunner of direct control and management of the broadcasting services. It will repay listeners to consider well the possibilities of such a radical change. It is manifest to any thinking listener with any experience of broadcasting, that it is a business that can be undertaken best by people experienced in the entertainment business and familiar with the musical trade.

What is likely to be the result if a director of broadcasting attempts to run the service? Hedged in as he will be by red tape and other official restrictions; looking mainly at the administrative or official side of the business and totally inexperienced in the details of management of this tricky and never-stopping business—the interests and necessities of listeners are likely to be jeopardized.

THE ELECTROCULTURE of seeds is the educational subject chosen for country listeners for the next six weeks by 2GB. These lectures have been prepared by the inventor of the XX treatment, Mr. A. C. Bennett, who established the first and probably the only electric nursery in Australia. This method is a great advance on the old system practiced in earlier experiments of electroculture, being a ray system using high frequency current. The first lecture, "The Seed and the Cell," will be given on Monday, January 8, at 7.30 p.m.

Convert Your Crystal Set Into A Split-Coil Single Valve Receiver

LAST week we described in these pages a Capacity Coupled Single Valve set making its appeal to many radioists residing close to a high powered broadcasting station. As may be gathered from the title, the method of coupling used was by means of a very small capacity fixed condenser, which allowed maximum selectivity.

This week another single valver will be described, this time employing standard method of inductive coupling. To this end there is employed a honeycomb coil which is inductively coupled to a grid coil wound on the solenoid principle. The aerial or honeycomb coil is aperiodic, that is to say, it is untuned and is fixed in close proximity to the solenoid coil, thus conveying the energy to the solenoid coil inductively.

An arrangement of this coil is very simple indeed, besides being remarkably efficient. The cost of parts will be very low, and here is an opportunity for the crystal man to convert his receiver into a one valve set, with a minimum of expense. Not only is this split coil receiver excellent for the local stations, but granted that a reasonably good aerial earth system is installed one or two of the long distance stations will be receivable.

It is a well known fact that the popular three-coil receiver is very difficult to control on the long distance stations just now. This is be-

cause of the coarseness of reaction which is of the "swinging coil" method and materially upsets the grid circuit tuning adjustment whenever the reaction adjustment is varied.

This split coil receiver practically overcomes this difficulty, as a very fine, smooth adjustment of the reaction is possible without appreciably affecting the grid circuit tuning. The aerial is a form of the popular Rein-

artz and is similar in many respects to the circuit of the receiver described last week. The reaction adjustment is controlled by a small midget condenser marked C3 on the diagram. This is very effective indeed and when used in conjunction with the variable grid leak the receiver may be made to oscillate of the whole waveband of the broadcasting stations.

From the circuit diagram it will be seen that only one .0005 mfd. C1 (23 plate) variable condenser is used. The aperiodic aerial coil is L1, L2 being the grid coil, the solenoid already referred to. The whole of this coil is tuned by condenser C1, the centre tapping being taken direct to the filament positive. The bottom of L2 is fed through midget condenser C3 to the plate of the valve, thus producing reaction. Note the position of the variable grid leak—this is most important as is also the inclusion of the choke coil L3. This choke coil takes the form of a honeycomb coil of the value of approximately 200 turns, although as low as 75 turns may be used. This is proved on trial. The choke coil is necessary to force the reaction through the circuit in the proper manner, but may be dispensed with if one stage of audio frequency is added to this receiver. In this instance, it frequently happens that the primary winding of the transformer is sufficient in itself to act as a choke.

LIST OF PARTS.

- 1 Panel, 12 x 9 x 3/16 inches
- 1 .0005 Quaker variable condenser.
- 1 30-ohms Ajax rheostat.
- 1 Lissen variable grid leak.
- 1 Midget condenser (preferred).
- 2 Fixed panel plugs.
- 1 3-inch length of 3 inch diameter tubing.
- 4 ozs. No. 24 gauge DCC wire.
- 1 Valve socket.
- 1 .00025 grid condenser.
- 1 Terminal board.
- 2 Telephone terminals on board.
- 1 Baseboard, 11 x 9 x 3/16 in.
- 1 35-turn honeycomb coil.
- 1 50-turn honeycomb coil.
- 1 200-turn honeycomb coil.
- Busbar, screws, etc.

The components used in this receiver will be found in this article. Considering that quite a number of crystal users will convert from their present sets to this receiver, we have taken up quite a lot of room both for panel and baseboard. Also to further simplify matters the receiver has been photographed before completion, that is, the baseboard with the baseboard parts, and the panel with its own parts. To further assist the constructor a rule has been laid along each article and photographed, to show the dimensions as well as the different distances of each part. Only a plan view of the baseboard is

given, as we feel sure that this will suffice.

Construction.

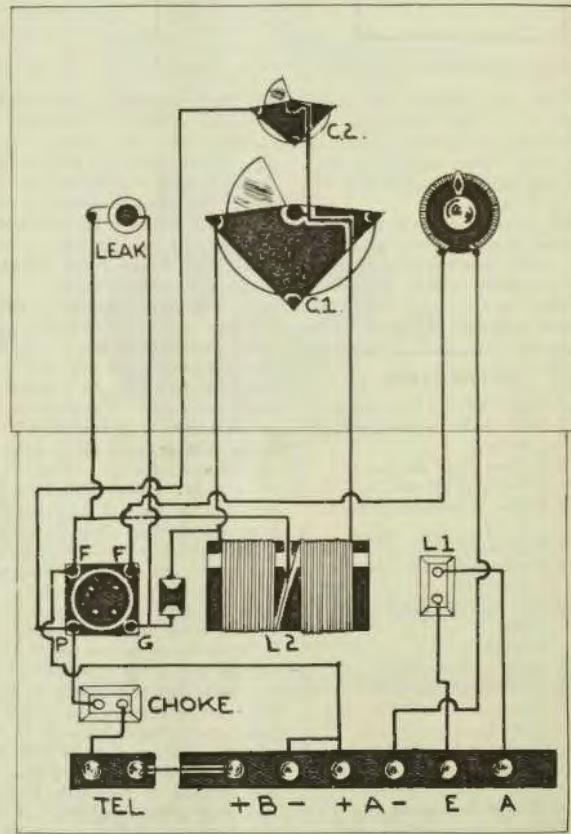

The construction of this receiver does not call for any special skill, either mechanical or electrical. Gather all the components itemised on the list and place them handy to you on the table. Firstly, wind the grid Coil L2. For this purpose use the three inch tubing and the 20 gauge wire. If cardboard tubing is used, bake it in an oven to dry out any moisture and when warm coat it inside and outside with shellac varnish. Radium or Dilecto tubing need not be treated in this fashion.

However, at a distance of 3/8 inch from one edge pierce or drill two small size holes, half an inch apart, and thread the end of the wire through these holes to hold the wire securely. Now wind on 50 turns of wire, taking a tapping at the 28th turn. This is best done by continuing the 25th turn of a space of half an inch, as shown in the photograph. Secure the last turn as you did the first and leave coil aside.

Next mount the fixed panel plugs on to short strips of dilecto or radion as also shown. One of these plugs is for the aerial coil, whereas the other is used for the choke coil.

Now mark out and drill the panel, following out the panel diagram given for the purpose. A nail or a centre-punch used to make a small indentation will allow the drill to enter without slipping. Always remember to use a light pressure and a quick speed when drilling dilecto or radion, and thus will the difficulty of splitting and tearing the panel be easily overcome. Should the panel have very rough edges, remove these with the use of a carpenter's scraper in preference to a file, which after all leaves a somewhat coarse surface, whereas the scraper on the other hand, leaves a very nice smooth edge which is worth while. Where countersinking is called for use a larger size drill, say, about half an inch in diameter, and counter-sink with this, taking care, of course, not to drill right through the panel.

When the panel has been prepared, mount thereon the various components, the rheostat, then the grid leak, then the midget condenser, and finally the large size condenser, C1. The condenser actually used in this receiver is of the one hole mounting type, thus precluding the necessity of employing fixing screws, but perhaps the condenser you may wish to use uses fixing screws, in that case the necessary holes will have to be provided and countersunk. As it is advisable to employ a vernier dial in this receiver, it will be found that a fixing hole for the catch screw is necessary. Use the template provided with the dial, to locate the position for this hole and drill accordingly. Perhaps this catch screw may

Wire from this wiring diagram.

have to be installed before the variable condenser is mounted, but this you can determine for yourselves according to the particular brand of vernier dial used.

Components on Baseboard.

It is always wise to treat the baseboard to one or two coats of shellac varnish before mounting thereon the components. A few moment's study of the photograph of the baseboard will show the positions of the various parts. To determine these correctly mount your panel to the front edge of the baseboard using three screws for this purpose. These screw holes are not shown in the illustration of the panel layout, but can easily be located by yourself. When the panel is in position fix the plug for L1 in its position. Two small pillars or distance pieces made from short lengths of 3/8 inch diameter fibre tubing, or for that matter, the insulation portions of warden plugs provided with well known B batteries. It will be found wise when the connections for this plug are underneath the small piece of dielco on which they are mounted to press into service two small soldering lugs for simplicity of connection.

The position of the serial coil plug having been satisfactorily determined and this plug correctly mounted, it is next necessary to place the grid coil L2 in its proper position. As the serial coil must be tightly coupled to the grid coil plug a 50 turn coil into this plug and measure the distance from the baseboard to the bottom of this coil. Two brackets will have to be formed from some half inch by one-sixteenth inch brass strip and of such a length that the bottom of the solenoid coil is on the same level as the bottom of the honeycomb coil. These brackets are very easily formed and should be attached to the outer edges of the cylindrical coil by means of a short bolt and nut. When mounted in position, screw the cylindrical coil in position on the baseboard, keeping your mind all the time that the honeycomb coil should be as close as possible to the other coil.

Now, instal the valve socket in position, and also the choke coil plug,

and also the terminal boards. It will be noticed that once again the telephone terminals are placed at the back of the receiver, and this keeps panel free from any dragging wires in any way.

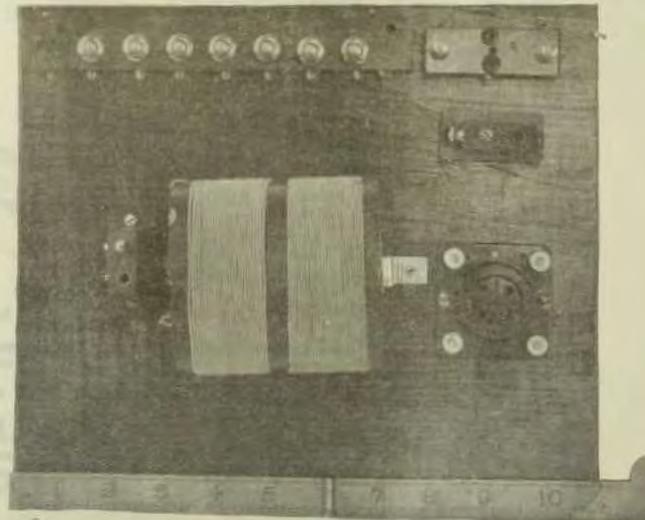

Wiring.

When everything has been placed in its correct position the wiring of the receiver may now be proceeded with. There are two different methods of wiring, one being the usual square busbar right-angled method, the other the straight-out, point to point wiring, varnished cambric spaghetti being required to enclose the connecting wire. It is your privilege to choose whichever method you prefer, and carry on with the wiring as itemised in the back of panel wiring diagram. As this is very clear it will not be necessary to describe this again in this article. It will be of great assistance to you when wiring to mark off the wiring diagram each wire as it is inserted in the set. This ensures that every wire would be in this position and not one left out. The moving elements of the midget condenser should be connected to the moving plates of the

grid tuning condenser and from thence to that end of the solenoid coil which is remote from the grid of the valve. The fixed plates of the midget reaction condenser should be taken to the plate of the valve. Otherwise, everything else is in perfect order.

Testing the Set.

Carefully recheck all your work, particularly the wiring, and then test the set by hooking on to the aerial and earth and connecting up both batteries. Never under any circumstances allow the B battery to be connected to the A battery terminal, as this will mean that the valve will be rendered useless. Insert the valve in its socket, and gradually turn up the rheostat. Into the aerial coil plug insert a 35-turn honeycomb coil, and the choke coil plug should be provided with, say, a 200 turn honeycomb coil. When the telephones are connected to their respective terminals, a distinct "pluck" should be heard in the phones when the second tip is inserted in its terminal. This proves that the B battery portion of the circuit is quite all right. Now slowly turn the main tuning dial until the local station is heard. In-

The baseboard layout. The rule will assist in gauging the measurements.

PHILIPS HIGH TENSION SUPPLY UNIT

A Real "B" Battery Eliminator

Separate terminals for detector and Low Frequency circuits, with a Rheostat on each circuit.

THIS unit will eliminate "B" battery worries entirely. No more faulty reception — no more disappointment or spoilt programmes. Philips Unit gives an ample supply of High Tension Current direct from your A.C. house lighting circuit at an infinitesimal cost. PHILIPS is

Let your next Valve be a PHILIPS

PHILIPS

LAMPS AND RADIO

The panel layout. Follow these dimensions when marking out and drilling.

crease the filament rheostat setting until maximum signal strength is obtained in this manner. Finally, find the correct adjustment for the Midget tuning condenser, a distinct increase in volume being discernible as this condenser is swung through its entire range.

Seek the second station now, paying distinct attention to the variable grid leak and the reaction condenser. After having familiarised yourself a little more with this receiver you will find that certain adjustments of the midget condenser will set up oscillation in the receiver. The best position for reception is just off this oscillation point, but it may be pointed out that with certain valves quite a lot of high tension is required on the plate to get this set to oscillate at all.

There is no mistaking oscillation when it occurs, as frequently the set breaks into oscillation with a slight "pop," which sound is repeated as the reaction condenser is turned around again. If this "pop" is very pronounced and is difficult to remove, decrease the plate voltage and lower the filament current until the set slides into oscillation, the only indication of which being the distortion of signals which results.

Test Report.

The actual set described here, tested at Marrickville, proved that it was well worth building. All the local stations were received at remarkably good strength, and 4QG Brisbane could be heard also at reasonably good strength for a one valve receiver; a 50-turn coil in the aerial circuit

was necessary to receive 3AR, Melbourne, which was heard very weakly and amidst considerable static. This also precluded any sign of 5CL, Adelaide, but after all this is only a one-valve set, from which one must not expect too much. Summer conditions are not conducive to good inter-State reception in any way, and it is quite possible that had clear nights been available when testing this receiver the results would have been surprising.

Altogether this receiver is most satisfactory, and will be found a considerable improvement on the average one-valve receiver so popular nowadays.

IT IS NINE months since "Rose Marie" opened in Sydney. Not for a long time has a musical comedy had such a phenomenal run, and 2FC listeners are indeed fortunate in again hearing its popular numbers over the air. The second act will be broadcast on Friday, January 28.

2FC will describe every ball that is bowled in the forthcoming match between N.S.W. and South Australia, beginning on Friday, January 7, and carrying through to the finish of the match.

The back of panel view of this receiver.

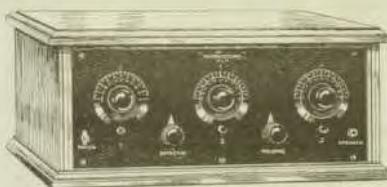

The New and Improved

WONDERTONE IV.

HOME CONSTRUCTION RECEIVER

is the result of exhaustive experiments to place before the Australian public a receiver that does not require any technical knowledge whatever to build. With our new and simple building instructions a boy of 7 can build it. Furthermore, the circuit employed is especially designed for the combination of simplicity of Control—Distance—Volume—Clarity—and Selectivity. No jamming of stations with the new and wonderful Wondertone HCIV., and no special tools are required, only a screw-driver, pliers. The connecting wires are all cut and prepared to the required lengths and by following the instructions it is impossible to make a mistake.

CREATIONS IN

Colmovoxtone

Colmovoxtone

In designing these new broadcast receivers, Colmovoxtone has successfully interpreted the radio needs of the Australian home.

Three decisive advantages are won by Colmovoxtone—unusually simplicity of control—reproducive off exceptional clearness in any direction—volume—handily built.

- Colmovoxtone 2 Valve Receiver
- Colmovoxtone 3 Valve Receiver
- Colmovoxtone 4 Valve Receiver
- Colmovoxtone 5 Valve Receiver

Colmovoxtone Broadcasters are especially fine polished cabinet, having only silver, all joined equipment, safety lighting, shagreen, etc.

	Price	Deposit	Delivery
2 Valve Set	\$2.12 41	\$1.06 21	10 days
3 Valve Set	\$2.12 41	\$1.06 21	10 days
4 Valve Set	\$2.12 41	\$1.06 21	10 days
5 Valve Set	\$2.12 41	\$1.06 21	10 days

The following summary is set down here for guidance if required additional accessories for one valve set \$2.50; two valve sets \$4.25; three valve sets \$6.00; four valve sets \$7.50.

Every assistance given on making up bookings. Price quoted net price.

Colmovoxtone Lines

RADIO SETS

abinet designed for quiet dignity and convenience without unnecessary cost.

Its Colmovoxtone reduces to a minimum all superfluous chaffage, and places the service on the same foot as the radio expert. In point of selectivity and distance, Colmovoxtone Broadcast Receivers also yields the most discriminating.

Success of the "PORTA" attracts imitations! INTERIM INJUNCTION GRANTED!

AN IDEAL XMAS GIFT.

THE IMMEDIATE POPULARITY which the "PORTA" enjoyed after its introduction soon enticed others to copy the original design of this ingenious portable Radio Set, and in order to protect the public from proceedings were at once instituted to prevent misrepresentation. The interim injunction which has been granted indicates that the Court at once gave the protection sought, and has ordered the discontinuance of others attempting to manufacture or pass off any machine the same as the "PORTA".

WARNING.—Any one seeking to make or sell Portable Radio Sets of the same design and exclusive features as the "PORTA" will at once be issued legal notice and proceedings taken without delay. Any information from the public of imitators will be appreciated.

ENTERTAINS EVERYWHERE.

The compact, convenient "PORTA" SET is simple itself—simply open the lid and automatically the set will operate to perfection. It is absolutely self-contained, complete with all accessories, including the Sferavox Speaker. No aerial, no earth. Terms arranged. Write for literature or call and hear the unique "PORTA".

TAKE IT WITH YOU ON YOUR HOLIDAYS.
MUSIC IN A MOMENT—JUST OPEN THE LID.

MISS MASCOTTE RALSTON.

AMONG the younger set of stage favourites, there are few more popular girls than Miss Mascotte Ralston, who recently began a brief season of broadcasting from 3LO. She is seen on our cover this week. Mascotte is one of those extremely fortunate people, lavishly gifted in a dozen different ways, and, in each, equally clever. She might easily have made a name for herself in a score of directions, but, coming from a family closely connected with the theatre, it was inevitable that she should choose this channel as an outlet for her talents.

The finished artistic performance of her father, John Ralston, as Franz Schubert in "Lilac Time," is yet a fragrant memory with theatre goers, and it was during this production that Mascotte rapidly rose from chorus to the part of Tilli, a role which called for much grace of acting and finished vocalism. The next time theatre goers made the acquaintance of this little lady was in a comedy part in "Nothing but Lies;" where, with Mr. Harry Green, she played a delightful comedy role, bringing out the subtlety and humour with convincing ability.

Her vocal repertoire is wide and varied, covering the ground from Grand Opera to the dainty little ditties she sings to the accompaniment of her own Ukelele—and these are the numbers she has selected to broadcast from the studio. In her spare time she is a keen athlete, golf and tennis being first favourites. She was "runner" up in the recent "Miss Australia" competition, and her "nearness" to being the selected one, brought reams of correspondence to her doors, one well-known physical culture expert offering to train and enter her for any championships against "all comers." The offer was gracefully declined.

Miss Mascotte is no stranger to the studio—she has been heard in Ukelele duets with Miss Vera Spaul, but this time listeners are to have the pleasure of renewing their acquaintance with her delightful voice as heard in "Lilac Time."

How to Add a Stage of Audio Frequency to Your Present Receiver

OUITE a goodly number of people at times desire a little more volume from their receivers and really do not know just how to go about doing this. This applies to many owners of crystal sets or one and two valve sets.

At the very outset it must be said that if more volume is required from any receiver of the type enumerated above it is essential to add a stage of low frequency or as it is more frequently known audio frequency amplification. Now, audio frequency amplification, as its name implies, is added to an existing receiver after the signals are detected, hence the name audio frequency amplifier. What happens is that the detected signal, which is of audible strength, is built up in volume, thus increasing in strength a very weak signal to one of greater volume.

This does not apply to radio or, as it is sometimes known, high frequency amplification. In this instance the signal strength of the incoming signal is built up prior to detection, and has not the same effect of increasing the volume of the local broadcasting station as it has of increasing the strength of the distant broadcasting station.

It is our intention in this short article to describe how to increase the volume of the local station to make it suitable for more than one pair of headphones for loud speaker results according to the set to which this arrangement is added. At the very outset it must be understood that we do not advocate the addition of this particular unit to a receiver already employing two stages of audio frequency amplification. Two stages of low frequency amplification will suffice for all general purposes, and if the constructor desires to add a further valve to his three-valve set employing two stages of low frequency amplification it will suit his purpose to add a stage of high frequency instead of low frequency.

There are many proud possessors of one and two valve sets such as the

From the hundreds of enquiries reaching the Technical Editor for a method of increasing the volume of a receiver without making extensive alterations, it is evident that the loud speaker is superseding headphones in many homes.

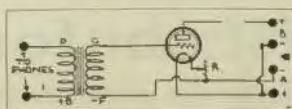

receiver described in this week's "Wireless Weekly," and also that one described in last week's journal who may find that the volume is not sufficient for their purpose. To these people will this unit appeal, and also to those who have any of the well-known makes of two valve receivers, the exception being the Harkness Reflex and the "Wireless Weekly" two-valve reflex recently described. The parts required are few. Here is a list of them:—

- 1 Panel.
- 1 30-ohms rheostat.
- 1 Valve socket.
- 1 Audio frequency transformer.
- 1 Baseboard.
- 8 Terminals.
- 8 Lengths of busbar.

Discussing these materials, let us point out that the actual size of the panel should be governed according to the size panel used in the existing receiver. For example, should the panel of the existing one-valve receiver be, say, 9 inches long by 7 inches high, a suitable size for this unit would be 5 inches long by 7 inches high, the same size panel being ideally suited if the two-valve receiver is catered for in a panel 12 inches long by 7 inches high. But again, the crystal user may desire to add this unit and to leave provision for a second stage of audio frequency amplification; therefore, in this instance a panel size 12 x 7 inches would be eminently suitable for the incorporation of the two units.

The choice of audio frequency transformer will be left to yourselves, there being many different makes to choose from. But if this is for the first stage after a one valve set or a crystal set a 5 or a 6 to 1 transformer will suit nicely, but if for a second stage then do not go beyond a 3½ to 1 ratio transformer. Now the ratio of a transformer is governed by the relation of the primary winding to the secondary winding. All audio frequency transformers have a primary and a secondary winding, and the ratio is arrived at with relation to these windings. When you read of transformers of a 5 to 1 ratio or any other ratio for that matter, it is generally understood that the secondary winding of the transformer has five times the quantity of turns that the primary consists of, or 3½ times or 6 times as the case may be. But it does not necessarily happen that the step-up in signal strength is of the same ratio; very rarely is it, in fact; but nevertheless the induced voltage or signal strength in the secondary winding is much higher than that of the primary winding. Hence the step-up effect.

To construct this unit very little ability is required. Firstly, prepare the panel to accept the rheostat, the four terminals and the fixing screws for attaching the panel to the baseboard. This is really very simple, and from the wiring diagram given the positions of the parts may be clearly gauged. The baseboard should be treated to one or two coats of shellac varnish, and the transformer valve sockets and terminal board should be mounted in the positions

The circuit diagram.

TWICE THE SATISFACTION

AND

Half the Cost

Nine Outstanding Features of the Ray-O-Vac

The Exclusive construction of Ray-O-Vac "B" batteries combines a number of characteristics which easily distinguish them as leaders in the "B" battery field. Nine features are outstanding:

- 1.—Zinc can of rolled sheet stock.
- 2.—Water and acid proof epoxy paint partition.
- 3.—Connecting wire securely soldered.
- 4.—Insulating compound between cells.
- 5.—Waterproof outer container.
- 6.—Screw Post Terminals make positive connections with wire, eyelet or spade connector.
- 7.—Binner in upper seal.
- 8.—Heavy non-bulging top seal.
- 9.—Screw post terminal soldered securely to individual cells.

No. 9303—The Master Ray-O-Vac 45 volt; double the amperage of ordinary 45 volt flat	£ 1 16 0
No. 2301—45 volt flat, with 7 tappings	1 6 0
No. 2303—45 volt upright, with 3 tappings	1 6 0
No. 2151—22½ volt flat, with 6 tappings	0 15 9
No. 2153—22½ volt upright, 2 terminals only. Specially recommended for detector valve	0 15 0
No. 5151—BP 22½ volt medium	0 12 6
No. 4151—22½ volt for portable sets	0 10 6
No. 231R—4½ "C" battery. Voltage adjustment of 1½, 3, and 4½ volt; can be used as A, B, or C battery	0 4 6
No. 531R—4½ volt Grid Bias "C" Battery	0 3 6
No. 1211—1½ volt "A" battery—the best 1½ volt single cell on the market to-day	0 3 3
No. 6—1½ volt cell for radio or telephone use	0 3 3
No. 1231—3 cell 4½ volt A battery in one case	0 12 6

No. 2303.

Added to this, they have remarkably long life.

And the cost is so low.

No. 231R.

indicated. It will be seen that the transformer is on the input side of the panel, with the secondary of this transformer adjacent to the valve socket. Follow out the layout carefully, and good results will accrue.

Now the wiring of this unit should take up only a few moments, and is clearly shown in the diagram. Wire up accordingly and check over to make certain that everything is quite all right. At this stage it may be well to point out a little feature concerning the connection of the A battery plus to the B battery minus. If this unit is to be attached to a crystal receiver this will be quite in order, but if to a valve receiver it is just as well to ascertain how the connections of the A to the B battery is made in the valve receiver. Should the A positive join the B negative in the receiver, the arrangement shown in this diagram is quite satisfactory, but, on the other hand, if the A negative is connected to the B negative in the receiver connect these two terminals accordingly in the amplifier. This, it is hoped, is quite clear.

To instal the unit is also a very simple matter. All that is necessary is to insert the valve in the socket and connect up the batteries. The A battery going to the set should have two further leads to be taken to the A battery terminals of this amplifier. Another lead should be taken from the maximum B positive available on your B battery to the B battery terminal of the amplifier, the negative terminal of this amplifier being in this instance entirely forgotten about. A last connection is made by joining the phone terminals of the receiver to the input terminals of the amplifier. The phones or loud speaker as the case may be should now be connected to the terminals marked OUT in the amplifier, and the valves switched on by means of the rheostat.

In the case of a crystal receiver, connect the telephone terminals across to the terminals marked IN in the amplifier and link up a suitable A and B battery to their respective terminals. The A battery must always be governed by the particular valve in use. If the valve is a dull-emitter of the 3 to 4 volt type, then three dry cells in series are required for an A

The back of panel wiring diagram.

battery to heat or light up the filaments. On the other hand, if the valve is of a 6 volt type consuming, say, a quarter of an amp, or 25 of an amp as it is known, it is best to obtain an accumulator of the order of 6 volts if one is not already available. The B battery again may be connected to its respective terminals, and keep in mind always that between 45 and 90 volts is a suitable value for this B battery. The greater the voltage of the B battery up to certain limits the greater will be the volume resulting. Now when hooked up to either receiver with the phones connected to the terminals marked OUT, and the receiver tuned in, much greater volume is now available than hitherto has been the case. Gradually turn the rheostat up until the maximum signal strength is available.

In presupposing one or two queries we would emphasize that this amplifier unit does not in any way affect the tuning of the existing receiver, and the set is therefore not in any way more difficult to tune. It may happen that when this amplifier unit is linked up with a two valve receiver already employing a stage of audio frequency amplification, a high pitched whistle is heard throughout

all reception. To overcome this, simply reverse the primary leads of one of the transformers, preferably the second transformer, that is, the one included in this unit. The simplest way to do this is to reverse the leads from the telephone terminals of the set to the input terminals of this unit. To further explain this, if the top telephone terminal is taken to the top input terminal and the bottom to the bottom the whistling will be overcome by taking the top telephone terminal to the bottom input terminal and the bottom telephone terminal to the top telephone terminal, when the whistle will disappear entirely.

For those who are desirous of having a circuit diagram this is reproduced here, the input terminals being marked TO PHONES and the output terminals shown where the break occurs in the plate lead of the valve.

This is a very handy little unit, and its purposes are many, and will enable many people to enjoy loud speaker reception instead of phones. Excepting the accessories such as valves and batteries the total cost of all the material need not exceed 30/- in all, but this depends on the class of material used.

Some Points for the Crystal User

A Talk Broadcast from 3LO by H. K. Love

In my previous talks I have dealt with subjects which have primarily been connected with valve receivers. I would not like those using crystal receivers to think they have been forgotten. There are many little

points which may be watched on a crystal receiver and if these are observed results may be much improved.

One of the most important things about the crystal itself is that it should be a good piece, it should always be clean, free from dust and grease. If a crystal is picked up in the fingers a light film of oil will often be deposited on it, and this will at once reduce its sensitivity. If it is neces-

sary to remove the crystal from its holder at any time, it should be lifted with a small pair of pliers or tweezers. If there is any doubt about the cleanliness of the crystal, take it out and give it a good washing with a tooth brush in clean water, a little soap may be used, provided it is well rinsed off before the crystal is replaced. The crystal should not be held in the fingers during this operation.

Dust should be kept from the crystal by mounting it in a dust-proof container—these are supplied with most of the crystal detectors now on the market, and consist of a small piece of glass tube.

The adjustment of the cat whisker or contact point of a crystal detector should be very fine. Not sufficient care is being taken by many users of this point. Many of the old crystal detectors used by the amateurs during experiments before the war had some wonderful vernier arrangements for adjusting the pressure of the contact point on the crystal. A great deal of the sensitivity of the unit depends on this adjustment.

It must be remembered that the range of a crystal receiver in the days before the valve was very considerable, we do not seem to obtain results like the old times on crystal receivers. I have, night after night, sat in my shack and listened to spark signals from Adelaide, Perth, Port Moresby and New Zealand on a crystal receiver. One doesn't hear much of this kind of thing now.

If listeners will take the pains to make their crystal receiver a little more than "just a crystal set" there is no reason at all why very good medium distance reception should not be accomplished. There are cases on record where crystal listeners have been able to receive both 3LO and 2FC from somewhere in the centre of Victoria.

One of the chief troubles of the city crystal receiver is the problem of interference. It can safely be said that most of this is caused by the inability of the receiver to tune sharply, or, in other words, lack of selectivity.

How We Celebrated Christmas

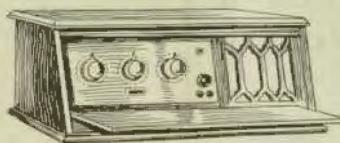

(Continued from Page 6.)

introduce atmosphere into studio transmission. Listeners will remember the clever radio serial drama produced Mr. Scott Alexander early last year, when this thrilling story held the attention of our listeners week by week until plot was revealed on the last evening. Although the questions put to listeners were most involved, and unusually difficult, there were 1500 people who sent in sensible answers, valuable prizes were given to the winners. During the enactment of this radio serial, which, by the way, was the first of its kind to be given in the world, all sorts of effects were introduced—many of them crude—and, and from this early beginning we have developed our effects department, which will be closely associated with all our plays in the future.

Rightly or wrongly, we think that listeners get tired of the monotony of ordinary studio programmes—8 p.m. Miss Smith (soprano); 8.15 Mr. Brown (baritone); 8.15 Mr. Smith (tenor), and so on, yet every station has to give this class of programme—it is their stock in trade. Without it one could not exist now that talks seem to be less popular. But can we not now and again break away and try something original? Anyhow, we think we are on the right track, and our next big night in this direction will be given when we will take our listeners in imagination, in a trip from Sydney to London, calling in at all the various ports, transmitting music and song from the different countries visited, giving opportunity for some excellent items. Then a few weeks later, the return trip will be given, going round by a different route. This should appeal very much to the imagination of listeners, the majority of whom have travelled over the routes to be described.

Coming back to the story of our Christmas play, an announcement was given at the close of our programme pointing out that we had covered very extensive ground, and asking listeners for their opinion of our efforts. We said further, that a number of inaccuracies appeared

in our story, and asked listeners to give us their opinion where these mistakes occurred. To the first fifty letters received in this way we propose to send to each writer a souvenir in the shape of a reproduction of the various scenes of London life, published in the pictorial section of the "Evening News," which gave on Christmas Eve a number of the places to be visited.

This announcement became necessary, as opinion was divided on one particular subject, and perhaps your readers can help us to solve the problem. Half of our staff were certain that the various theatres and shows are not open in London on Christmas Eve, and the other half were just as certain they were. As our story was based on visits to various theatres, &c., it became quite a serious break if it was a fact that these places were not open. So we hit on the plan of covering ourselves by the announcement concerning any inconsistencies that may have crept in. To give our play it took thirty actual performers, three microphones, two amplifying gears, and hundreds of feet of wire, and our thanks are certainly due to the manager and staff of the Columbia Gramophone Company for the assistance afforded us. No ordinary broadcasting studio would have been sufficiently spacious to take all our party at the one time, as our operations extended into every corner of the studio, where the effects of conversation etc.—far and near—were obtained, and we are indeed grateful for the facilities afforded us at the excellently equipped studio at Homebush.

FOR SALE.—Browning-Drake four valve sets, complete with all equipment, in handsome silky oak floor cabinets. Demonstration by appointment.

WANTED.—All kinds secondhand Wireless Sets, Parts, Speakers, etc. Best prices given. JACK RAPKEN, 16 George Street West. MA 1198.

It's In The Air

(Continued from Page 7.)

of the wretched listeners, forced to hearken to all this. We have long gone beyond the point when everything over the air was wondrous, and even the sound of a scratching whisper, covered with static, drew a delighted squeal from mother and the girls. We want entertainment, and the announcer reading wires telling how they loved his voice in Portland, Oregon, isn't going to make us love him. One sufferer in the United States has mentioned an even worse thing they do over in the land of liberty. Before a song is sung, the announcer announces that it is dedicated to someone, often one of the listeners who has made the special request that it be sung. This is going too far.

I sincerely hope that this innovation won't reach Australia. It would be terrible to hear Mr. Smith announcing that Mr. Albert Agnoz "will now play 'Sometime or Never,' a composition expressly composed by the composer to compose his nerves, and dedicated to Mrs. McSwiggin, of Woopwoop, who first gave the musician his inspiration." My friend in the United States foresees that if this thing is going to continue, we shall soon have it introduced into other walks of life. He says that the tram conductor will soon be intoning that he intends to stop the car at Pueblo Crescent for Mr. and Mrs. Brown. The stop after that is dedicated to Mr. Harold Kiwi, the polished journalist." Or he has the horrible fear that the theatre usher may cry as he threads his way among the pews—"Well, folks, I am finding seats, B.10 and 11 dedicated by kind permission of Messrs. J. C. Williamson to the well-known Mr. and Mrs. John Smith, of 'Emuovo.'"

Personally, my chief aversion on the radio is to the lady who tells her fellow-woman what the well-dressed sisters of the sex are wearing this season. She adopts a familiar, hospitable style that assumes that the said sisters are actually in the room with her.

"That's right, ladies," she says, "come right in. I am just waiting for you. No, Mrs. Brown, don't sit there, come over here where the fire

is warmer. You sit over in the cold, Mrs. Smith. You're stout and won't feel it. Oh, my dears, talking about stout women, the latest dresses are all plus silhouette than ever," and so on. Yet there is a dreadful fascination about her quips and oddities that forbids me to tune her out and reach after loftier things like Rupert Hazell. Oh, well, it's a new year, and a grouch is out of place. Still, you know what I mean, don't you?

Xmas Greetings

CHRISTMAS greetings for 2FC were broadcast by Mr. Cochran, on Christmas Eve, as follows:-

"To most of us who are getting up in years, Christmas Eve brings back pleasant memories of the wonders of our childhood. We look back upon the days when, with awe and wonder, we hung our stocking in the most conspicuous place so that Santa Claus would not overlook us.

"To the dear little kiddies the visitation of Father Christmas—who never grows old like we poor mortals—still remains a wonderful mystery.

"Looking at the clock, I see that it is now within a minute or two of midnight, and my thoughts dwell on the millions of stockings throughout the civilized world which are, at this moment, loaded full with the good things that are—in a few hours' time—to create so much merriment to grown-ups and kiddies alike.

"It is wonderful to think that this little message which we are broadcasting as midnight approaches, will be heard not only in the southern Pacific, but will travel far overseas, to the other side of the world. Thus it will be, in wishing one and all a very happy and bright Christmas-tide, we shall include—not only those residing in sunny Australia, but in all parts of the civilised world to which the air waves will carry our message to-night.

"Before wishing you goodnight, I will ask you to listen to 'Big Ben' ushering in Christmas morning, with his mighty toll." And as the bell finished striking, "Again, may I wish you one and all a very very Happy Christmas from Station 2FC."

Radiokes acknowledged as the World's Best

Ever Since
 you started in Radio
 you've set your heart on
A Super Het!

A powerful, living set under your hands—
 plenty of punch on the far distant stations
 — instant control — and above all, ABSOLUTE SELECTIVITY. That's what puts the real thrill into radio.

Emmco offers to-day a Kit which brings the coveted super-het. within reach of every radio listener — a Kit, which has been specially designed for home construction.

The Emmco Super Kit comprises Aerial Coupling Coil and Plugs, three Intermediate Transformers, Filter and Oscillator. ALL PERFECTLY MATCHED AND BALANCED.

With each Kit is supplied full size blue prints, wiring diagrams and easily followed directions for building. Take a Kit home and build a Super-het. this week-end.

All Readers' Queries Answered Here

In conjunction with Farmer's Broadcasting Service the Technical Editor of "Wireless Weekly" will answer all listeners' queries arising from the wavelength change. Answers will appear in these columns and will be broadcast from 2FC each Thursday night.

A. A. R. (Uralla):—

Q. 1: I have a five valve receiver which, since the drop in Farmer's wavelength will not give daylight reception, existing on the headphones. What would you say on the low wavelength? I had no difficulty in receiving them at loud speaker strength during daytime. Please tell me what coils I should use to receive this station at loud speaker strength during the day.

A. 1: I am afraid that it is not a matter of coils in any way. It is well known that the short wave on which 2FC is operating, as well as other short wave stations, is not at all conducive to loud speaker results during the day. I am afraid I cannot make any suggestion to help you in this matter.

M. T. (Tugger, Q.):—

Q. 1: As I am very anxious to learn the Morse code, I would be pleased if you could forward to me a crystal set circuit by which I would be able to get all the low wavelengths. I live 25 miles from Brisbane.

A. 1: I presume you mean the amateur stations when you say low wavelengths. This being so, a crystal set would not serve any useful purpose, as the amateurs are invariably using low wavelengths around 1500 m. and more, and indeed what is known as C.W. A crystal will not detect C.W. Therefore it becomes necessary to construct a shortwave multi-valve receiver.

Q. 2: I have a five-valve Neutrodyne receiving set, and would like to know if I should be able to tune in 1YA while 2FC is working, also if it should be possible for me to tune in 7ZL, Hobart. As I said above I am 25 miles from Brisbane.

A. 2: By reducing your aerial to 70 feet overall greater selectivity will be the result which would mean that 1YA would be selected over 2FC. Of course, don't forget that the New Zealand station closes down at approximately half past eight, our time. Later on 7ZL will be on a much higher power and therefore be receivable; provided, of course, that your receiver will respond to the wavelength.

J. C. (Roselle):—

Q. 1: I would like to ask a few questions, firstly, in the Extraordinary One Valver would Grodin Spider formers wound with the same length of wire as instead of coil described?

A. 1: Yes, they could be used, but will require too much alteration to describe through this column.

Q. 2: What voltage would you advise for B battery?

A. 2: Between 22½ and 45 volts.

Q. 3: I would like to add a C battery to this circuit?

A. 3: A C battery is only used in an amplifier, therefore with this circuit it is not suitable.

Q. 4: My aerial is 100 feet long with 25 feet lead-in, and 20 foot earth. Is this too much?

A. 4: You would be well advised to check 20 feet off it.

W. W. W. (Mount Colah):—

Q. 1: I am not certain whether to put the 5 to 1 transformer in the first stage and the 1½ to 1 in the second stage. Will you please tell me which to do?

Q. 2: Always have the higher ratio transformer in the first stage, and the 2½ to 1 in the second stage, that is nearest to the phones.

J. W. W. (Milton):—

Q. 1: I would be glad to know through your

columns if it would be possible to make a successful A battery on the same lines as the B battery described in "Wireless Weekly" of April 1st, 1926. I have six porous pots x 5 inches, and also some positive elements from 1.5 volt Ever-Beady dry cell.

A. 1: A reasonably good one cheap A battery can be made from the porous pots you have on hand together with some Leclanche Zincs and some larger size jam jars. Into each jar add some sal ammoniac and water and then insert the porous pot with the rear alongside in the electrolyte. The zinc is the negative and the porous pot is the positive terminal. Each cell would yield approximately 1.5 volts. For your purpose for three D.V. 2 yards of these cells should be linked together in series-parallel. If polarization takes place, spread half an inch of powdered sulphur on the surface of the electrolyte. But why not obtain Ampton Carbonoids?

A. W. B. (Earwood):—

Q. 1: I have a one valve receiver in which I use two variable condensers sizes .001 and .00025. I intend building the two valve Reliance as described in "Wireless Weekly" dated 15/10/26, and would like to know whether I could use the two mentioned condensers instead of the two .00025 as stated.

A. 1: Yes, use a .00025 for tuning the grid coil, which would require an increase of 35 turns. A .001 condenser would be satisfactory for the reaction.

F. T. (Petersham):—

Q. 1: Would you kindly let me know through "Wireless Weekly" how to charge the accumulator B battery described in "Wireless Weekly," November 19th, 1926, by 240 volt direct current?

A. 1: Simply connect the 60 watt lamp in series with the D.C. m.m.e., and omit the rectifier altogether.

H. H. G. (Coogee):—

Q. 1: My set is a three coil, three valves—what would be the correct length of aerial overall to use for this circuit at Coogee, i.e., for local stations?

A. 1: Do not exceed 70 feet overall, that is including your down lead.

Q. 2: Would it be possible to obtain Inter-State reception on this set?

A. 2: It would not be too dangerous considering the location. Don't forget that some transmissions are not too good for long distance reception as is winter time.

E. V. C. (Newtown):—

Q. 1: I have a five valve Neutrodyne set which has cost me just over £50, and I find that I cannot receive any Inter-State stations at all. My main idea for building the set was to receive distant stations, so I am becoming a bit disheartened with it, and am wondering if you could help me out of the difficulty. Every local station can be tuned in well, and my aerial is quite of suitable dimension.

A. 1: I am rather sorry to hear of your disappointment. All I can say is that the Neutrodynes is not built correctly, for this receiver is a most wonderful one, and should receive Inter-State stations very satisfactorily. Run your receiver along to a reputable dealer, who will rectify this fault.

Beginner (Bulwer Min., Q.):—

Q. 1: What wavelength would the Extraordinary Single Valver cover?

A. 1: This receives pretty well the broadcasting wavelengths excepting that of 6WP.

Q. 2: What would be the best voltage for the R battery in this set?

A. 2: This is determined by the particular valve you use, between 22½ and 40 volts will just suit.

Q. 3: What length aerial would be the best for this set?

A. 3: In your district an aerial 100 feet long would be most satisfactory.

Q. 4: What condenser would be suitable for UV 100 valve?

A. 4: A 300-micro rheostat.

R. L. (Warwick, Q.):—

Q. 1: I am desirous of building the one control five valve receiver recently described in "Wireless Weekly" and would like to know where to obtain the U.S.L. condenser tube.

A. 1: Write Australia General Electric Co. Ltd., Box 2517, P.O., Sydney.

C. J. H. (Stanthorpe):—

Q. 1: Being unable to use a drill, would a baseboard and panel of thick beeswax serve instead of the usual bakelite?

A. 1: Yes, but I am curious to know just how you will shape it.

K. G. O. (Coogee):—

Q. 1: I have a single valve three coil receiver, and live about a quarter of a mile from Broadcasters, and can get everything on the air, including 5LO, when 2RL is not transmitting. Will the wave trap in "Wireless Weekly" a few weeks ago cut them out?

A. 1: My advice is to try this out for yourself. I really couldn't say definitely.

A. M. J. North (Adelaide):—

Q. 1: I would be very glad if you will let me know the qualifications required, fee and method of obtaining an experimental license?

A. 1: Write to Chief Radio Inspector, P.M.G. Department, Castlereagh Street, Sydney.

W. L. R. (Mildura):—

Q. 1: We have a four valve set but find we cannot pick up any station well during daytime. Can you please explain why? Also sometimes the music and speech from 2FO in the evening will go right to practically a whisper in the loud speaker. What causes this and how can it be altered?

A. 1: It must be understood that on the broadcast wavelength and daylight reception there is no possibility of dealing with the long wave of station 2FC. The reception in daylight is missed in most parts of the country, and I can't help you to overcome the difficulty. The finding you speak of is another problem which cannot be overcome. I wish I could help you.

H. H. C. (Collarenebri):—

Q. 1: I am having some trouble trying to neutralize UX-201A valves in the neutrodynes. Can you give me some suggestions?

A. 1: A very good scheme to assist in neutralizing the Neutrodynes employing these valves is to install a variable high resistance in the plate supply of the radio frequency valves. For further particulars of this see "Radio" 15/10/26.

P. J. (Penrith, Q.):—

Q. 1: I have made the Extraordinary One-valve receiver and can only get a whiz! I have not made the set in accordance with the instructions given, and am enclosing a sketch showing my alterations. Can you account for this?

A. 1: Yes, very easily. You must clearly understand that before any receiver is published in "Wireless Weekly" considerable pains are taken to arrive at the best layout and wiring system, and if departed from, as you

have done, it is only natural that you will have to go over all the ground experimental work to reach satisfaction. Why not follow my scheme entirely. It's good, you know.

J. A. C. (Blandford, Q.) :-

Q. 1: I want to make a Bi-chromate of potash H battery of, say, 100 volts. Can you give me the necessary particulars?

A. 1: Personally, I would not advise this, as besides being a very "messy" battery you would continually renewing zincs.

R. O. B. (Queried) :-

Q. 1: I have a Rely valve receiver and am using general purpose bright emitter valves of the Continental type. Is it advisable to replace these valves for special purpose tubes? I have a 6 volt accumulator.

A. 1: Perhaps it would be advisable from the point of view in saving the filament consumption if nothing else. There are many types of modernised general purpose valves which would prove advantageous. Write to one of the advertisers of "Wireless Weekly" who will be happy to assist you in your choice of valves.

Q. 2: What is the highest plate voltage I can run on the Continental valves without damaging them?

A. 2: This depends on the particular brand of valve you use. With the usual bright emitter valve, when too much plate voltage is applied, a faint bluish fluorescent glow is perceptible. Try stepping up until this glow is discernible then come down to the best working point.

Q. 3: I have a combination of water pipes driven into the ground for my earth. Will a counterpoise increase my signal strength?

A. 3: Try this out for yourself.

H. W. (Izzy) :-

Q. 1: I wish to get particulars of how to make a charger for charging my A battery?

A. 1: See "Radio," 30/10/25.

J. O. (Tawmworth Falls) :-

Q. 1: I wish to alter my vario coupler receiver into the Old Reliable. My vario coupler has seven tappings on the panel, which makes it difficult for me to instal in the new primary winding.

A. 1: Why not unwind the vario coupler altogether, and re-wind it as shown for the Old Reliable? There must be some method of eliminating the tappings. Discourage with them altogether, and cut the leads.

F. H. T. (Canowindra) :-

Q. 1: I feel my duty to write you and thank you for the circuits and descriptions of the "Extraordinary One Valve Receiver" described in your valued paper a few weeks ago. I built it and within the first week I got 4QG, 3LO, 2BL, 2PC, 2KY, 2GB, and 2CL. On any night I can go to the set and pick up 2BL, 2PC, 3LO, and 4QG, with such volume that I have to cut it down. I had many friends who laughed at the idea of a one valve radio detector, but now they have heard their words of sneers are unfounded. I now intend building a small speaker set without incurring too much expense. I am interested in the Tetrode-valve Regenerative Interflex. Do you think it would give loud speaker strength on the inter-State stations? I think we are situated about 160 air miles west of Sydney.

A. 1: The Regenerative Interflex, properly built, is certainly a very wonderful set, and will give good loud speaker results from inter-State stations.

H. B. S. (Kilkara) :-

X (Cobalt) :-

Q. 1: I am desirous of building a four or a five valve receiver suitable for Inter-State and New Zealand reception. Which set would you advise me to build—the Barer Sub-panel four or the One Control five valves?

A. 1: Obviously, I cannot draw comparisons between receivers. The results with each receiver are published in the paper, and it is the privilege of the reader to choose that which suits him best.

Q. 2: Would I get better daylight reception if I used a 6 volt A battery and stronger

"SFERAVOX"

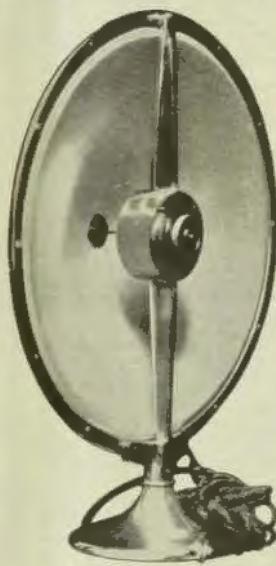

The Masterpiece of Cone Speakers

£5·5·0

Purity of
Tone
Sensitivity
Power
Distortionless

Cone Speaker

£5·5·0

READ THIS:

The "SFERAVOX," being designed on a novel principle and having a diaphragm of an entirely new type, will give the utmost sensitivity and irreproachable faithfulness of reproduction.

The "SFERAVOX" diaphragm is carried on a nickel-plated ring, which is in turn fastened to a base plate, finished in a like manner.

The diaphragm proper is made of special parchment paper, impregnated with finely distributed silver in a so-called "Argenta bath." The coating is extremely thin, and thus all overtones are avoided, whilst the frequency of the diaphragm vibration is selected in such a manner that same will not coincide with the frequencies of the tonal reproduction.

Australasian Representatives:

walzen and B batteries to suit, in place of the 4 volt anti-parallel amperage valves?

A. J.: In reading over these columns you will notice over and over again have I stressed that daylight reception is not nearly so good as night-time reception. Perhaps your present valves may be worn out; in that case the substitution suggested would be perhaps advisable. I would not recommend you to mix 4 and 6 volt valves together in the one set.

Q. 3: What is your opinion of the cone speaker? Do you think it would be satisfactory?

A. J.: I certainly do. Forward 3d. in stamps, and a copy of "Wireless Weekly" with instructions for making a cone speaker will be mailed to you.

T. B. (Thallon, Q.):—

Q. 4: Could a .901 Polar condenser be suitable for the wavemeter in "Wireless Weekly"? 1/10/26?

A. J.: Yes, perfectly suitable. You need not alter the turns in any way. I cannot advise you on the second matter, but can sympathise with you in the matter of low-level valves. It seems incredible that in your situation you should suffer from this. It appears that there is still quite a number of radiotelegraph stations who have not learned the Eleventh Commandment: "Thou Shall Not Oscillate," but let me hasten to say as time goes on this matter will be self remedied. Failing, unfortunately, is something no one can explain away at the present time. Many theories are advanced, but all to no purpose.

BRIEF REPLIES.

G. R. T. (Stockton): Many thanks for the photograph of your receiver, which is unfortunately too small a photograph to be published. Let me congratulate you on the appearance. It is a credit to you.

A. H. R. (Newtown): During the last two or three months there have been several four valve receivers published, one of which we doubt should suit your purpose. Look over your back copies.

L. P. (Kennington): You are being catered for in this issue.

T. M. (Newtown): Something certainly must be wrong with this receiver. Run it down to Hargreaves Ltd., 386 George St., Sydney, who have the original set.

V. P. (Gordon): I cannot send you special break of panel views of receivers as obviously it takes too much time, and if I did so in one instance I would have to continue, and really there is only 24 hours in a day. I am sorry. Why not have a yarn with a more experienced radio friend?

T. B. (See Why): See reply to R. H. C. (Collaroy).

R. M. (Mudly): The amplifier in this issue is just what you want.

W. H. (Byde): Can you give me some comparisons of audibility meter tests with and without your new attachment to the serial? I would be glad to know.

J. L. (Outley): Insert a .602 fixed condenser across the secondary terminal of your last transformer, or if desired install a Magnuram Tone Purifier.

A. H. C. (Undercliffe): Your requirements will be very shortly catered for in "Wireless Weekly". The crystal is the cause of your trouble in your present set.

H. P. H. (Sutherland): Modernise your receiver. Build the one valve set in this week's or last week's "Wireless Weekly."

H. A. P. (Glebe Point): Your trouble lies in the coupling of the plate coil. Play about with this until you master it. Your aerial should not exceed 76 feet overall. Heartily reciprocate your greetings.

W. C. (Marrickville): My advise to you is to have a yarn with a radio friend. Call up someone you know knows something.

E. S. (Brisbane): The crystal receiver you describe is not suitable for Sydney. Build the Hamill receiver of "Wireless Weekly" 12/11/26.

J. M. S. (Cremorne): Spans the primary a little further away from the secondary coil.

New Price -- 45/- Each

Brandede

**The Table-Talker
makes a friend of the electrical impulse**

Acoustics is the science of sound. Radio acoustics is the science of transforming the electrical impulse into a audible sound. The electrical impulse is a jolly little fellow who needs to be consulted if you are to get the best out of him. We've been making friends with him for seventeen years and the *Table-Talker* is but one result of our efforts. The goose-neck horn means clearer and more rounded tones, and the patent material of which it is constructed eliminates any suggestion of harshness or metallic resonance. Fitted with an adjustable diaphragm, it is finished in a pleasant shade of neutral brown. Height 18", bell 10".

Ask your Dealer for Brandede.

Buy Energy

When you buy a battery, size is nothing to go by. Nor is shape: nor—unless a guarantee goes with it and the trade-mark of a reputable maker—is what the label says.

When you buy a P. & R. Accumulator you buy energy; capacity; a little black case full of valve-operating service. A P. & R. label tells the truth: it isn't a pious hope: not an optimist's dream: it's a plain statement of fact. When it says amp-hours it means AMP-HOURS. No more. No less.

Other things. A P. & R. Dagenite case is acid-proof and leak-proof. It's nearly unbreakable, even if you drop it. P. & R. terminals are petroleum-jelly-packed to stop creep: P. & R. patent vents are spray- and spill-proof. A P. & R. is a *battery*. It needs no crate. You don't have to buy a carrier. And a P. & R. has a long, long, working life.

Ask your dealer about

Points for the Crystal User

(Continued from Page 44.)

It is quite impossible for a single coil receiver, which uses the same inductance to tune the aerial and the closed circuit, to cut out interference. All crystal sets should be altered to loose coupled circuits, in which the aerial is tuned by a coil and condenser and the closed circuit by a coil and condenser which is inductively coupled to the aerial coil.

Then by close tuning and a variation of the coupling the unit will become reasonably sharp. Sharp tuning means more volume, therefore there should be no objection at all from the operator's point of view.

A good deal of experimental work may be necessary in order to get the best results with this lay out, but every crystal user should make the change, as it will pay in the long run.

"Ere To-morrow Dawns," sung by Mr. Charles Smyth, for 2BL recently, promises to achieve much popularity. The composer is Mr. Edmond Samuels the Sydney chemist.

The Conservation of Energy

RADION Panels far excel
any other insulating material in the conservation of both physical and electrical energy.

Radion can be easily sawed, drilled, machined and otherwise worked with minimum effort and without the slightest danger of chipping, cracking or breaking.

In the conservation of electrical energy, Radion is supreme, due to its established superiority over any other material in the four main

characteristics required, namely:

- 1—Low angle phase difference
- 2—Low dielectric constant
- 3—High resistivity
- 4—Low absorption of moisture

Do not jeopardize the value of your receiving set by using inferior materials. Save time and energy in the making and loss of power in the operation of your set by always insisting upon genuine Radion Panels and parts. Look for the name stamped on every piece.
