Extract from Letter to
Amalgamated Wireless.

Brisbane.

18th October, 1927.

Since receiving those A.W.A. Super-Audio Transformers I have installed one in a broadcast four-valve receiver, and one in my short wave receiver at my radio station CAL. There is no doubt that they are the best, as we amateurs say, for on the four-valve I found an increase in volume, clearer music, especially the high notes of the violin and the cornet, and very quiet operation.

Results on the one that I installed in my short wave receiver are as follows: A much more musical note on Morse stations, telephones much clearer, elimination of noise, thus making a better set all round. It is indeed with pleasure that I have found in this case that an Australian Transformer was better than an American manufacture.

Wishing every success to A.W.A. Australian-made Products.

Yours faithfully,

Oleg J. B. W. M.

FRIDAY, 25th NOVEMBER, 1927.

Broadcasting Conditions in the Country

CONSIDERABLE attention is being given of late to the conditions under which broadcast service is obtained in country districts; and to the measures desirable for the improvement of the services. It is only right that special attention should be given to the subject, because the city and suburban listeners are well catered for.

The service in country districts—say, over one hundred miles or more from the city—cannot be considered satisfactory, if we assess a good service as one reliably received, and "reliably received" means that the speech and music, or the "signal" as it is termed technically, is louder than the noises which affect the receivers. Those noises may be our old friend atmospherics or may be the comparatively newer acquaintances—radiation and induction energy from Post Office telephone apparatus used in exchanges, or interfering energy derived from electric power systems.

These noises or noise energy may be sufficiently strong to affect detrimentally the quality of broadcast music received. The noise is as great or greater than the signal. The aim of broadcast engineers is to ensure that a safe ratio between the two will be maintained. This signal to noise ratio should be such that the signal will always be greater than the noise.

The ideal condition is that when the signal is much louder than the noise, as phonograph music is louder than the needle scratch. Such a condition is obtainable only in receivers located near the broadcasting station. In country districts it is impossible with ordinary conditions of atmospherics in summer.

We may assume that the noise "level" or strength throughout the State is uniformly 10 units. The signal strength near the broadcast station may be 100 units; at a distance of 20 miles it may be 50 units; and gradually falling away until at 100 miles it is only 10. At that point it has a moderate

chance only of giving some sort of good service, but further on when, say, it is down to five, then we know it is below the noise level—the noise is twice as strong as the signal with consequent and well-known annoyance to listeners.

No efforts by the owner of the receiver can improve the conditions considerably. There are many methods of attempting to cut out atmospherics, but they all result in cutting down the signal strength as well. The only real remedy is to bring the signal strength up; this can only be done by increasing the power of the transmitting station greatly or by erecting a "local" re-transmitting or re-broadcasting station. As discussed recently the more satisfactory method is the latter one.

These country stations—whether we call them relay stations, re-transmitting stations, re-broadcasting stations, or simultaneous broadcasting stations, doesn't matter—are urgently required. The last-named definition is perhaps the best, because the purpose of the stations is to broadcast on their own respective wave lengths the programme that is broadcasted by the main station. The main station is connected by a telephone circuit to the country station and simultaneously the programme is broadcasted by the main and the country station. Thus when 3LO is transmitting at Braybrook the programme is also sent from the studio by telephone line to, say, Ballarat, where it is transmitted on another wave length.

3LO, Melbourne, has made commendable efforts to establish relay stations, but for some unaccountable reason the Post Master General's Department is not assisting the worthy project. Whatever the reason for the delay may be it is most regrettable, as the establishment of two or more stations would make a big difference in improving the receiving conditions for country listeners.

Country listeners troubled by atmospherics will be interested in the constructive details for a simple and effective wave trap published on page 11.

Catching Up with the Wireless World.

By R. E. CORDER.

LORD BIRKENHEAD is reported to have said: "It's all to the good that men should go on talking." This seems to find favor with the broadcasting companies.

THE LONG, LONG TRAIL: It is estimated that just under 80,000 paying visitors passed through the turnstile at the Wireless Exhibition in London.

A TRUNK CALL: A telephonist at the Hague had a startling experience the other day when, unknown to him, the line was connected via Amsterdam with the famous Eindhoven short-wave station. On his enquiring whether he was speaking to Amsterdam he received the reply: "No, you are speaking to Bandoeing. (Bandoeing is in the Dutch East Indies.)

FRANCE AND GERMANY: Before the end of 1928 France will have new stations at Nîmes, while the Eiffel Tower proposes to increase its power to 50 kilowatts. The same tale can be told of Germany. The new high-power stations at Ziesen will open next month, at about the same time as the new station at Cologne, and other stations will soon be in operation at Altenburg and Radenthal.

PORUGAL will shortly have a finger in the pie with new stations at Lisbon and Oporto, and Spain will assert herself with new stations at Barcelona, University, Melilla, and Almeria. Greece has prepared a scheme for seven stations at Athens, Corinth, Petra, Syre, Sente, Khios, and Saloniens. Then Holland will come forward with two new stations, one of which will be at Amsterdam. A Hungarian 20-kilowatt station will make its debut this month. Add to all these Russia's little estimate of fifty new stations and we see that a different basis of wavelength distribution must be sought.

MR. J. I. BAIRD, the inventor of television and phonovision, is reported as saying that some faces sound like a gurgle. Still, perhaps it was only ginger beer.

THIS WEEK'S LIBEL is the story of the Scotsman who bought a *carav*, used it for three years and then took it back to the shop and said he had just learned that it contained a vacuum, and he would like either a gas-filled valve in exchange or his money back.

A MODERN MINSTREL
I've sung upon the prairie,
I've sung on every sea,
In desert wastes city,
To Veldt folk—for a fee,

I've sung upon the mountains,
In valleys and in plains,
On lawns by playing fountains,
I've even sung on trains.

In hospitals have cured men's pain,
In prisons gained their cheers,
Soothed in asylums sad insane,
In churches drawn chaotic tears,
Through England, Scotland, Ireland,
Wales,

The Theatres and the Halls,
Could of those triumphs tell true tales
Of "Curtains" and "Recalls."

I've lived to sing in China,
Made music in Malaya,
Aye, voted few things bair,
Even to Singa-pore way,

New Zealand and Australia,
Tasmania, Newfoundland,
Through Canada and Africa,
On India's coral strand.

To audiences of gold-diggers,
To cooers and to kings,
To soldiers and to sail-ridgers
(He sees the world who sings);

On world-tours over four years,
Over hundred thousand miles,
Few incidents were fraught with fears,
But many, laughs and smiles.

A train snowed-up for thirty hours,
One, locusts brought to stand-still,
Baw trees up-born by great gales
powers;

Had storms at sea to thrill;

For singing oft "Upon the air,"
Fine folk I've never seen,
Pen pages of rich praises rare,
"Tis good and glad to glean.

—ALFRED CUNNINGHAM.

A RADIO SALESMAN has had to appear before the court on a charge of stealing wireless components from his firm. We suppose he took advantage of the "stocktaking" season.

JUST AS THE TURKS were apparently becoming happy and at peace with themselves and the world Mustapha Kemal delivered a radio address that took seven days to pass a given point.

THIS IS BEYOND all question the greatest act of cruelty ever committed against a nation by its ruler. Even Nero in his most barbous moods knew enough to vary his act with a little jazz on the bull fiddle.

THERE WERE 400,000 words in Mustapha's radio address and at least 200,000 of them were just strange whines and curious noises. If it hadn't been for the static the President's speech would have given the Turkish people their best sleep in history.

MUSTAPHA opened up on a Saturday afternoon with "Fellow citizens" and on the following Tuesday he hadn't reached the point where his address said "And secondly."

WEDNESDAY NOON he had just sprung the line "My purpose in coming before you to-night is," and there was every likelihood that by Thursday night he would be well into the body of his talk.

AFTER THE FIRST hundred hours every Turk in Turkey had studied his ears full of prayer rugs, but was putting up a brave front and trying to stay in front of the loud speaker like a dutiful subject until Kemal would sign off and let in the Angora Melody Boys, the Palace Troubadours, the Harem Choristers and whatever jazz orchestra is now boasting ginger ale in Anatolia.

Hello! So this is 3LO.

An artist's impressions of a broadcasting studio. An inside pen picture of 3LO in action during an evening's programme.

By Nora Cooper.

A WAY in a back lane in the heart of Melbourne there is an innocent-looking building which might be anything from a Jewish Tabernacle to the latest thing in baby clinics. Over the door is a strange device circular in shape, inscribed with mystic signs, apparently the hieroglyphics of some dead and gone religious faith. Screw your head round, and look a little closer, though, and you will be pained to find that they are written in ordinary plain English—not "Excalibur," as you might have supposed, but 3LO.

Through the dark doorway, and upstairs to No. 1 Studio, and you find yourself in a soft warm-toned stillness, the pregnant stillness of which is always associated with the "inside of things."

For this is truly the "inside." Here are born all the broadcasting programmes with which 3LO delight the heart of Mr. and Mrs. Suburbia and all the little Suburbians, to say nothing of the country folk, and which make the welkin ring, to the probable disgust of the heavenly choir who have hitherto had the air to themselves.

Here you can see and hear many strange things, and lose perhaps one or two illusions. You may discover that the lady whose touching little ballad moved you to tears the other night when you listened in, is fat and fifty, with a devastating smile. You may see a nervous violinist bowing and smiling futilely to an invisible audience, after his turn, or a plump comedian singing comic songs with an awful fixity of face and gesture, so afraid is he of getting out of the radius of the microphone. You may hear just what a band can do in the way of a recital when there are no tiresome regulations for the restriction of its noise to cramp its enthusiasm. You may see a bed-time story in the flesh.

Perhaps the last is the greatest thrill of all. For it is hard to believe that you actually personate, who looks like John Wesley, Beerbohm Tree and Abraham Lincoln rolled into one, is the genial Billy Bunny, who can put such pathos into the adventures of Brer Rabbit, or who has such a large family of nephews and nieces that it takes him twenty minutes every night

just to wish them many happy returns of the day.

Whether you are familiar with the ways of wireless or not, it is fun to watch a programme being made. Here comes a lady vocalist, a little nervous—it is obviously the first time she has sung to the microphone, but the impressive announcement of her name and piece by Maurice Dudley would give courage to a newly wed bridegroom to meet his mother-in-law. Her voice is sweet and true, though halting. Suddenly the peaceful gloom of the studio is stabbed by a flash of light on the indicator. "Louder" is the silent command. The lady gives one terrified glance, treads on the gas and goes for her life, ending in a final triumphant top note which could almost travel out to Braybrook by itself.

That over, we draw a long breath, and wipe our heated brow whilst a well-known Tivoli comedian tries conclusions with the microphone. He does his best to confine the expression of his art to its cramping radius, and the red sign calls him to order several times. At the end, the favored few who compose the studio audience, applaud him heartily, but whether it is his actual jokes, or his dexterity in "putting them over" "au naturel," so to speak, without the comforting support of his usual "business," it is hard to tell. From sheer force of habit our friend comes forward to the footlights to take his call, beamingly ready with an encore.

But, alas, there are no encores on the air, and his place is taken "instantly" by an earnest person who explains with lurid details, just what is wrong with the dietary of civilisation. He regards the microphone in front of him very much as a Government meat inspector might regard a consignment of condemned mutton. Fortunately the instrument receives his burning words with the same impassivity as it receives everything else—otherwise it might have gone hard with it.

Then there is Joe Aronson's jazz band. What power—what picturesqueness! Listening to it at one's own fireside is not nearly so thrilling as seeing it in the flesh. Here is an instance when the doubtful privilege of

television—if it can be applied to radio—would be really a blessing. To be able to see Joe and his trusty henchmen tossing their heads and putting their backs into the latest fox-trot—why we would rush the chance of dancing to a neighbour's wireless instead of dodging it as we do now, very often.

One longs to talk in the studio. There are so many interesting things to comment upon, so many questions to ask—for instance, why does Mr. So and So always stand on one leg when he sings, or why Miss Somebody Else regards the microphone with such concentrated scorn as the plays her piece, that one feels it ought to blush for very shame, for eavesdropping—caught in the act, so to speak. But the manager vent—wily—do not allow anyone to talk. There are gentle little red notices all around the walls, enjoining "Silence," which keep you in place, whilst the mosaic pattern of song and, story, musical thunder and thunder of eloquence is slowly unrolled for the benefit of a waiting world.

And wireless programmes are not at all easy to make. 3LO, Melbourne, have a very efficient system of selection and arrangement, and they have done much and are doing more to lift the wireless concert out of the slough of boredom and harmless banality in which it seems to have hitherto inexcusably languished. Artists and their repertoire undergo searching examination before they are finally admitted to the "invisible choir," and should one break his leg, or lose his voice or his nerve at the critical moment, another is ready to take his place at an instant's notice, as not for one instant is the voice of 3LO silent once it has begun to talk.

So it goes on. For twelve hours every day, 3LO flings out gay patterns of sound on to the limitless air. One might wonder at the music of the spheres becoming peevish at so much competition. One might imagine celestial performers who have hitherto had it all their own way complaining to their musical directors that some of their best bits were being spoiled owing to interference from a go-ahead station in Melbourne, or, perhaps, such is the power of progress—they might find themselves obliging inad-

Empire Radio Association Suggested

A Representative of the Wireless Association of Great Britain will shortly visit Australia with the object of forming a branch of a proposed Empire Association

An interesting letter proposing that an Empire Wireless Association be formed, has been received by Mr. R. F. Gardner, manager of SAR, from Mr. H. A. Hankey, secretary of the Wireless Association of Great Britain.

Mr. Hankey writes:

"I have had the matter of Empire broadcasting at heart for a period of nearly two years, and an original article was written in the 'Wireless World' last year pointing out the desirability of establishing Broadcast Communications, which would be of immense psychological importance, and of decided practical value. It should be mentioned at once that my experience of wireless dates back some twenty-one years, and since the War I have been with Messrs. Marconi for four years, and the British Broadcasting Corporation for two years.

(Continued from Previous Page)

vertently with bits out of Gilbert and Sullivan, or "To-night's My Night with Baby," which they had "picked up" and taken a fancy to.

It is soothing to sit in the dimness of the studio, lulled by the sonorous voice of Billy Bunny as he flings his mighty message of innocent cheer his invisible audience—scores and scores of bright little eyes and eager little ears, tense, silent, excited, listening in hard for the magic sound of their own name; or, later, when the music starts, to imagine how in some far away settlement Dada Wayback is pushing back his chair from the tea-table, wiping the crumbs from his whiskers, and reaching out for the earphones.

He will listen to the programmes with varying emotions—keen and shrewd over the weather and stock market reports, bored and inattentive when the educational gentleman comes along, frankly bewildered when the band breaks into "Tannhauser," wiping a surreptitious tear over "Annie Laurie," or lost in a maze of chuckles and thigh slapping at the jokes of the funny man. So that in this, apart from its myriad other uses, wireless is a truly great servant of mankind.

"During the recent Colonial Office Conference, held in London, I made it my business to arrange for an item on the agenda dealing with the matter of Empire Broadcasting, and intense interest can be said to have dated from that time. It so happened that the Dutch authorities commenced operations at about the same time, which greatly enhanced the proceedings, and, of course, the recent transmissions from the Commonwealth have definitely shown us what can be done. Incidentally, I received the whole programme on a quarter wave length aerial! Mr. Gerald Marcus has also been most helpful, and I may say that I was instrumental in obtaining his recent transmitting licence for the use of higher power.

"This Association is really a Listeners' League, which, in addition to representation on programme and technical matters before the Wireless Organizations Advisory Committee of the B.B.C., conducts unlimited correspondence with its members on all matters pertaining to transmission and reception, and gives them legal protection, in addition to a comprehensive Insurance Policy. The strong point, however, as regards residents in the British Isles is the Patrol Scheme, which is based upon the working of the Automobile Association. Members receive free visits from our Patrol Engineers stationed in all parts of the country, and unbiased advice is given regarding their troubles. There are also some 300 Registered Dealers who have undergone a qualifying examination, and in consequence we can safely refer our members to these dealers for actual repair work.

"Another listeners' organisation in the British Isles which does not embrace the Patrol scheme, namely, the Wireless League, also exists, and it may interest you to know that our Joint Councils have been in communication for the last two or three months with a view to amalgamation, as it is felt that one representative body would be in a much stronger position. This is borne out by the merging of the Automobile Association and the Motor Union some years ago. It is then proposed that we form an Empire Broadcasting Branch in order that Commonwealth and Dominion listeners may be officially

represented before the Wireless Organisations Committee, and have a direct say in programme and technical matters when the proposed station is erected. Incidentally, they will bring quite a lot of pressure to bear in getting a real move on. You will be aware that the British Broadcasting Corporation has been very slow in taking the matter up. This is, perhaps, not unusual in Government departments! Nevertheless, it is highly desirable to have a representative body to keep things going. Beyond this representation, overseas members will receive a Monthly Bulletin of technical and chatty material concerning short waves and the Empire Station in particular. Alternatively this brochure might take the form of a Magazine issued quarterly, which, naturally, could be of better quality than the more frequent issue. This is a matter which will have to have consideration after tackling the public themselves. Thirdly, individual correspondence with members will be welcomed. This would be particularly useful to those members situated up country, and in the 'bush.'

"One must not forget that Australia, New Zealand, and South Africa would form the nucleus of this branch, and we are assured of support in East Africa and F.M.S. Obviously Canada, the West Indies, Pacific Isles, Hongkong, West Africa, etc., etc., would follow suit. We may say that each member would receive a good class certificate to prove that he is properly registered. The proposed membership fee is the equivalent of £1 sterling per annum.

"It is my intention to give as much publicity as possible to the enterprise at the ports of call, and in addition to find out the definite requirements of those interested in the Empire Station and its working. Incidentally, I shall take a short wave receiver in order to obtain reception data en route.

"The proposed date of leaving is the 17th December by the s.s. 'Demosthenes,' which calls at Durban, Cape Town, Melbourne, Sydney and Brisbane, etc. Incidentally, I might add that the A.B.C. of South Africa has also kindly notified me that I shall have an opportunity of addressing the listening public through their stations during my relatively short sojourn."

Marie Burke, of the "Who's Talking Company," who broadcast from 3LO recently. She will share a response in "Waddles."

A UNIQUE COMPLIMENT has been paid to SAR, Melbourne, by a number of parents and children of Koondrook and Barham districts (Vic. and N.S.W.). They have forwarded to the manager, Mr. R. F. Gardner, a testimonial bearing more than 100 signatures expressing approval of the appointment of Mr. H. J. Book, who will talk to the children under the name of "Brer Rabbit."

MAGGIE FOSTER: Listeners will be glad to know that Miss Maggie Foster—with her curls and violin—is once again broadcasting from Studio 3LO, Melbourne, after having had a wonderfully successful tour throughout Australasia. Among her most successful contributions to the programme, is a solo on which she gives a life-like imitation of a canary. This was written for her during a tour through New Zealand some little time ago, and presented at the close of a selection in which Miss Foster had imitated a number of musical instruments—the composer thinking she might care to add another novelty to her already extensive repertoire.

It's All in the Air

Coming Features in the Broadcasting Programs

LORD MAYOR TO SPEAK: Sir Stephen Morrell will speak at 3LO on "The Million Shilling Fund" on Wednesday evening, November 23rd.

LITTLE RED RIDING HOOD: Miss Yetty Landau's pupils will produce this charming fantasia from Nursery Rhyme Land for broadcasting by 3LO during the Children's Hour on Thursday, November 24.

TIVOLI THEATRE ORCHESTRA: The first part of the Tivoli Theatre programme, including Ernest Orman and his orchestra, will be broadcast by 3LO, Melbourne, on Friday afternoon, November 25th.

SCOTS WHA HAR: The speeches at the official luncheon at the Highland gathering will be transmitted by 3LO from the Exhibition Building on Saturday, November 26th, at 1.35 p.m.

POPULAR ORCHESTRA: Many listeners will welcome the return on the air of Malcolm Reid's Orchestra. This orchestra has recently been reorganized and augmented, and will be heard from 3CL every Friday evening between 8 and 9.

THE SYDNEY Madrigal Society's concert will commence the series on 23rd November. The choral items have been well chosen, and solos by Gwen Salva, Frank Hutchens and Jules Van der Klaai add considerably to an already attractive programme.

THE NOVEMBER BRIDE: Voting coupons for the most popular November bride have arrived at 3CL in large numbers, and the competitors are all anxiously awaiting to see the result of the voting. The winner of the competition will receive presents totalling in value approximately £100. The marriage of the winner will take place on Saturday, November 26th, the ceremony and reception being broadcast by 3CL.

Some of the best artists have been engaged by 3CL to render musical items, and the whole event is sure to be a joyful one.

HENTY CELEBRATIONS: From the Chapter House of St. Paul's Cathedral on Wednesday evening, November 23rd, the Henty celebrations will be broadcast.

THE BIRD MAN: Listeners will be pleased to hear Dr. J. A. Leach again at 3LO, Melbourne. He will speak on "Sparrows" on Saturday evening, November 26th.

BEPPIE DE VRIES: Miss Beppie de Vries, who is appearing as Kathie in "The Student Prince" at His Majesty's Theatre, will be heard in an interesting talk to be transmitted by 3LO from her dressing room on Thursday evening, November 24th.

TALKS ON ROWING: Mr. J. P. Marcus, who is well known through his activities in connection with the S.A. Rowing Association, will deliver a talk at 7.30 p.m. on November 25th. Mr. Marcus is an extremely popular gentleman in South Australian sporting circles, and his talk is sure to be of special interest.

Robert Chambers, the coach of the Australian team in the Inter-colonial games at Perth, who is broadcasting a series of talks at 3LO on "Training."

In the Programmes.

SEVERAL interesting things have been included in the programmes that will usher in December. From Ballarat on Sunday, 4th December, the old story of our baby rebellion, the Eureka Stockade, will be told at the anniversary services, which 3LO will broadcast. The following day 3LO goes further afield in pursuance of its country decentralisation policy. It will broadcast a fine concert from Echuca.

On the 7th December Miss Mary Campbell, of Mr. Fritz Hart's Conservatorium of Music, will give a programme exclusively English. Choral, vocal and instrumental music will be given by a good company of artists, headed by Mr. Hart himself. This will serve, not only to delight the ear, but to reveal how far and how fast English music is progressing. On Saturday another delightful treat in the shape of the old favorite, "Ma Me Rosette," will be given by Madame Ashton's pupils, from the Studio.

A new personality in broadcasting makes his first appearance for a week, beginning 8th December. This is Cy Peir, who is called the Ukelele Troubadour, a name sufficiently descriptive in itself to dispense with explanation. His appearance will be watched with interest.

OPERATIC ENTERTAINERS: Two newcomers to Studio 3LO, Melbourne, are Pollard and White, entertainers, who with the aid of a well-trained baritone and soprano voice—and a piano—contrive a musical turn which is much above the average, and distinctly original. Their repertoire contains a pleasing variety of songs—ranging from Grand and Comic Opera selections to Light Comedy—daintily rendered by Miss Pollard—whilst their artistically arranged duets will form a welcome addition to the programme.

FAMOUS FOOTBALLER ON CRICKET: Few people are more welcome over the air than Mr. Rod McGregor, who, during the football season, made thousands of friends among listeners, and now is proving himself a brilliant broadcaster of the descriptions of the various cricket matches. Although many listeners were under the impression that Mr. McGregor's activities in the realm of sport were confined to the football field, this is not the case, for, in addition to being a "pennant" cricketer, he is the secretary of the State Schools' Amateur Athletic Association, and, with a selected committee, controls and directs the sports and games in the schools, both boys and girls coming under his jurisdiction.

ONE OF THE DIGGERS: One of the most popular artists broadcasting from Studio 3LO, Melbourne, is "Bobby" Pearce, whose pleasing baritone voice is heard to best advantage in breezy songs of the open road, such as "Stonecracker John." Among his friends, this favourite artist is regarded as something of a "wonder"—for he was badly knocked about during the War—having many operations—and spending the later part of his time overseas in many hospitals. On returning home, he joined the "Famous Diggers" Concert Party, and with them made many successful tours of Australia and New Zealand—and has now settled in Melbourne—being much in request at various smoke nights and other musical functions. It is interesting to note that two other artists frequently heard from Studio 3LO—Syd Exton, the well-known tenor, and "Johnny" Marks, the versatile comedian—have been his companions "throughout the piece"—for they fought side by side in Flanders—spent several months together in hospital—toured Australia and New Zealand in the same concert party—and have met at the end of the journey in the spacious studio at 3LO, Melbourne.

Ethel D'Arey, soprano, who is regularly heard from 2FC.

Jazz v. Beethoven.

Apianist whose name is well known in musical circles, in London and Sydney, called at 2FC Studio the other day, primarily to congratulate the management on the tremendous progress radio has made through the world broadcasting activities of that station. The talk turned on the millions of listeners the British Broadcasting Corporation satisfies, and the comparatively meagre, but discontented, Australian listening public. "As far as programmes are concerned, one does not hear 2LO listeners complaining. Perhaps it is they are more easily pleased than Australians," said the visitor smiling. "I don't doubt it," commented Mr. Anderson grimly, in the light of three years of programme building experience. "Well, may I offer a suggestion?" It was Mr. Anderson's turn to smile. "Constructive criticism is the breath of life to a broadcasting station, Madame," he replied.

"**YOUR SLOGAN IS 'DIVERSITY,'**" his visitor told him, "but you carry it too far. You give lovers of good music twelve minutes of the gems of the masters, and you follow it up with the lowest order of harmony—a ukelele solo. Not unnaturally, I loathe ukelele solos, but I am quite prepared to bear in mind there are hundreds of listeners who cordially detest the classics. What I would like to suggest is that you devote, say, one hour to good music, and then continue with the popular programme. I, and many more like me, would appreciate longer than an hour, but we are not nearly so selfish as your jazz lover, who calls for jazz all the time, and we would be content to enjoy our hour. There is a good deal to be said for this argument, and 2FC have decided to arrange for one night in the week, probably Wednesday, when the programme will satisfy the most ardent of classic devotees."

TWO DISTINGUISHED MUSICIANS: On Sunday, November 27th, music lovers will have a great treat from Studio 3LO, Melbourne, for a joint recital of piano and flute is to be broadcasted, the two artists being the distinguished Australian pianist, Mr. William G. James, and the well-known flautist, Mr. Stanley Baines. Both these artists are well known to listeners as musicians of exceptional ability, and the very attractive programme that they have arranged for this occasion will be greatly enjoyed and appreciated by everyone.

Can Man Conquer in War on Static?

The reasons why static cannot be entirely eliminated are discussed in this article by an expert. Various types of static prevention devices are discussed and the reader is invited to turn to page II, where constructional details for a simple wave trap are given.

THE chief reason that it is so difficult to eliminate static is that it comes from so many different sources of disturbance. It is as though nature were sending from thousands of radio stations of her own, tuned to all possible wave lengths and frequently of great power. So the result is, since static is coming in on all wave lengths, that no matter where we tune our receiving apparatus it is impossible to avoid it.

The only difference between the static waves and the waves from radio stations is that the static is highly damped; that is, very broadly tuned, as compared with the usual ether waves. This enables sharply tuned receivers to discriminate to a certain extent in favor of the radio signals, since the sharper the receiver tuning the narrower the band of static which is being received. But even at best this affords very little help.

Perhaps a word or two as to the cause of static may not be amiss. It is, we believe, in general caused by electrical discharges in the atmosphere; much of it undoubtedly comes from lightning and non-luminous discharges in the thunder clouds. But it may also probably originate where my two bodies of air at different electrical potentials come together.

In regard to non-luminous discharges from thunder clouds, it has been suggested in England that the cloud may discharge quite as readily to the upper conducting atmospheric layers as to the earth. Even though the distance may be so much greater, the diminution of air pressure with the height would render the discharge so easy that it is extremely likely that such discharges may take place even without luminous effects. Watson Watt, in analysing the records of European radio stations in order to determine the causes of static, has concluded that in only about 35 per cent. of the cases given could thunderstorms be identified as the sources of these disturbances, but that in 75 per cent. the sources were rain areas of some kind.

Static Prevention Devices.
Hundreds, and perhaps thousands,

of devices have been produced by various people which, it was hoped, would overcome static. When they have been thoroughly tested, however, while some have been slightly useful, none have proved cure-all.

The fact is, it is rather easy to imagine that static has been eliminated when experiments are being made with weak static and rather strong signals, for it is only necessary to cut down both equally in order to make static disappear. If a record had been kept of the time of year in these inventions it would usually be found that they were developed during the Autumn and Winter and finally came to grief under the high static of the following Summer. Most of these anti-static devices may be divided into the following classes: Directional reception devices, audio-frequency tuning devices, signal limiting devices and balanced circuits.

Directional reception, at least as far as long-wave radio-telegraphy is concerned, is certainly the most effective means of combating static which we have at present. It is particularly useful where the reception is from overseas, since most of the static comes from the land side and roughly from the opposite direction of the signal. This principle is employed in the Beverage antenna, as used by the Radio Corporation of America and others, for long-wave transoceanic reception, and in the unidirectional combination of loop and antenna, as used by our navy. Some of these antennae are often many miles long.

Audio frequency tuning is somewhat useful in the reception of code, on account of the difference in tone of the signal and the static, but obviously cannot be used in broadcasting reception, where all the musical tones must be equally received.

In Limiting devices, by means of vacuum tubes or by other means, the maximum strength of signal which can pass through the receiver is limited. This is an idea which has formed the basis for a very large number of static-reducing inventions, and it does indeed bring the static

down to the strength of the signal. But the unfortunate fact is that when the strong static is coming in, the receiver is practically dead, so that at that moment no signal is received, and in the case of code, dots drop out and holes are left in the dashes.

A number of years ago a rather complicated form of static and interference eliminator was devised which worked somewhat on the principle of the combination lock, in which only the impulses which came in a definite combination could get through the receiver. But in this case, like the limiting devices, static also destroyed the clearness of the signal.

None of the arrangements thus far mentioned offers any hope for a real cure of static, and unless some brand-new idea is developed we cannot see any definite prospect of getting rid of it entirely.

At present, the best way of avoiding trouble is to make the signal stronger than the static. Strong signals may be obtained either by using great power or by getting close to the sending station. So the simplest means of avoiding static interference is to make as much use as possible of the local stations. For, except in rare instances, reception over a distance of but a few miles offers the only possibility of perfect enjoyment of a fine musical programme.

The conquering of static by high power at the sending station is evidently limited by economic considerations, for doubling the power of a sending station only increases the amplitude of its waves by about one and one-half times, since the amplitude increases as the square root of the power. Therefore, at a distance of several hundred miles, any probable increase in station power will not be able to drown out static when it is very severe.

It must be concluded, therefore, that static seems to have the best of us, except when we are close to the transmitting station, because with all the powers of nature behind it, it will always at times be able to drown out our human efforts.

The Safety Valve

Readers are urged to express their opinion on matters pertaining to broadcasting. If you have some grievance, if you have some constructive criticism to offer, here is your chance for expression—your safety valve. The editor assumes no responsibility for statements made by readers and published on this page, as opinions of correspondents do not represent our editorial policies or beliefs. Anonymous letters are not considered.

A BURIED AERIAL.

Dear Sir.—Enclosed please find cutting from an English provincial paper, the "Herne Bay Press," of September 3rd. It deals with the subject of buried aerials and gives a description of how to make one.

I have made an aerial of the sort described and use it with my Murdoch Junior 3 Valve Set, and find it very satisfactory. The signals are very little weaker than when using my ordinary single wire aerial, and although I am using ordinary "lead-in" wire in place of the lead covered as recommended, the static trouble is very appreciably diminished, I believe when I am able to obtain the lead-covered wire it will be cut out altogether.

The wire I used in the actual aerial was also No. 16 lead-in-wire. The condenser readings on the set are lowered by the buried aerial (i.e., the reading of, say, 2FC now shows a higher wave length than formerly), and finer tuning is necessary, although greater selectivity is obtained. I am using two Mullard P.M. 3 valves and one Radiotron UX198, otherwise the set is as purchased.

Hobart (7ZL) is coming very loudly on two pairs of 'phones, but 2YA, Wellington, had closed down before I began listening-in. Usually, I can get them with ease on two pairs of 'phones and sometimes well on the loud speaker, although that is not quite up to the mark just now.

I have not seen much mention of buried aerials in "Wireless Weekly," but knowing that a good many people's sole means of enjoyment is wireless and that often that is spoilt by static, I thought I would pass on the idea in the hope that possibly it would be of use to someone.

I have tried also the "double earth" system, but cannot get anything like the results from it that I saw from this buried aerial.

As I mentioned, my set is only a Murdoch Junior 3 Valve, bought last June, but I can get easily on 'phones or speaker 2FC, 2BL, 2GB, 3LO, 3AR,

4QG, and 5CL, at excellent 'phone strength 2KY, 2UW, 2BE, 3DB, 7ZL, 7UZ, 5DN, 2YA (N.Z.), and have got, altogether I have never really tried to see how many I could get, a whole host of amateurs in South Australia, Queensland and New South Wales.

Yours, etc.,
Quandialla, N.S.W. J. CARTER.

For the benefit of those interested in buried aerials we reprint the cutting forwarded to us by Mr. Carter. It reads as follows:—

"A well-known American wireless inventor, Professor J. H. Rogers, has been experimenting for some time past with devices designed to eliminate or at all events to reduce very greatly the effects of atmospheric interference during reception. The best arrangement yet found consists in eliminating altogether the high aerial and using instead a wire buried beneath the surface of the ground. One might think at first sight that such a collector would be very inefficient, reducing signal strength to something very small indeed. Those who have tried a buried aerial, however, report that there is very little diminution in signal strength, but that atmospheres are almost if not entirely silenced even at times when they are so violent that reception with an ordinary aerial is impossible. Professor Rogers states that his own experiments have shown that signal strength remains practically constant no matter how deeply this strange form of aerial is buried, but that atmospheres are so faithfully dealt with by it that reception may take place even during a thunderstorm. As readers may care to test out the efficiency of the buried aerial for themselves I will give particulars of a type which has been found very effective in America, where during the summer atmospheres are often so powerful that reception of even the local station is almost impossible by ordinary methods. Obtain about sixty feet of rubber-covered wire and wind this into a coil a yard in diameter. Dig a

hole four feet deep. Fix one end of the coil of wire to a stick laid across the top of the hole and leave the other free. The coil will thus assume the shape of a spiral spring, with its lower end resting at the bottom of the hole. Now replace the earth and remove the stick. To the end of this wire solder a length of lead-covered cable, such as is used in telephone work, and attach the other end of this to the terminal of your aerial lead-in tube. It is essential to use lead-covered cable for the connection between the buried aerial and the lead-in tube, for otherwise atmospheric will be picked up by the wire itself."

GREEN MARIA WANTED.

Dear Sir—I would like to draw your attention to a letter from G. W. Smith, of Hamilton ("Wireless Weekly," 18/11/27). He states that he is being interfered with by the local pest, "Rusty Mangle."

He also states that he had conferred with several people in his district and they are all complaining, so I hereby give him some information. I might add that I do not care if he makes use of it or not, but I found it quite useful to me.

Call casually upon some neighbor and ask how the wireless is working and then most probably he will say, "Great! Come in and hear 'ABC' or 'XYZ' of Sydbourne, New South Victoria," and you will most probably find that he is the "mangling" culprit, although he really does not know it.

Most probably he is blaming someone else for the "squeals" he himself creates.

The next thing to do is to "just put a little oil in or on the mangle."

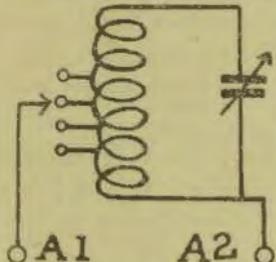

Hoping that they will soon have one of those "Green Maries" (such as you had for your cover picture last week) out here to levy heavy and drastic punishment on "howlers" and "pirates."

Yours, etc.,
Parramatta. J. T. LAING.

Eliminate that Interfering Local Station

A Wave Trap which Will Trap.

THE problem of interference is a vast one, so much so that many writers approach the subject with diffidence. A high powered local station, as often as not, completely drowns the reception of the distant station so often desired, and to say

the least, it is extremely annoying. The real solution of the problem lies in obtaining a receiver possessing the selective qualities of such an order that the local station is relegated into silence when other stations are received.

Such a set invariably employs radio frequency amplification in some one of its forms. The Neutrodynes, Soddyne, Marco Four and Super-Heterodyne, for example, all are selective receivers, making use of radio frequency amplification. Yet even with these selective receivers difficulty is sometimes experienced in saying "no" to the local station, particularly when the set is situated within a half mile or less of this local station.

This brings us to the question "What can be done to cut out the undesired station?" There is one solution, and that is, the installation of a wave trap. Some readers will say that wave traps are ineffective, they have tried them without much success. This is partly true, for there are many wave traps which do not seem to "deliver the goods." There are many and contributory reasons for this, the main one being the difference in lengths, heights, etc., of different aerials. It therefore behoves us to seek some such wave trap which will respond satisfactorily to all aerials. The one about to be described is just the type, and its use will give many happy hours to its owners. Mind you, it is not put forward as a panacea for all selectivity troubles, for some sets are so broadly

tuned that nothing short of an axe will render them selective, super-selective, in fact, for then not even the local or any other station be heard.

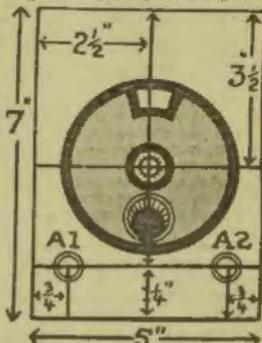

The installation of this unit means the addition of what might be termed special selectivity. It is not intended to take the place of true inherent selectivity, but it goes a long way to improving the average non-selective receiver, and often will make such a receiver equal to the more selective types. Many Reimarts receivers just lack the little bit more of selectiveness desired to bring in 3LO, while 2BL is transmitting. This wave trap will cut out 2BL, and allow 3LO to come through alright. Some people again say that a wave trap cuts down the volume. This is partly true, but is actually of little or no account, for the average person prefers to listen to one station at a time, even if 10 per cent. of the volume is missing.

Now there are two types of wave traps, one acting as an acceptor, and the other as a rejector. This one works effectively when the trap circuit is tuned to the wavelength of the undesired station and acts as a barrier to the unwanted signals, yet permitting the signals of other stations to pass freely. It is not a complicated arrangement, it is extremely simple, very few parts being required in its construction.

The circuit used is reproduced here, and its simplicity must be noted. The coil L1 is a home-made coil, with tappings to allow for auto-coupling. The whole coil is tuned with a variable condenser of .0005 mfd. capacity. A1 and A2 are the aerial terminals, A1 being the terminal to which the aerial lead in is attached, and A2 is that terminal which is joined to the aerial

terminal of the receiver itself. From A1 there is a flexible lead (denoted by the arrow point) to which is joined an ordinary battery clip, which in turn grips on one of the taps on the coil.

Reference to the drawings shows the general scheme of things. A

wooden baseboard 9 inches long has mounted on it the tapped coil, which is at the back of the board. There is a reason for this, so do it. The upright panel has on it the variable condenser, and the two terminals. Notice that a vernier dial is shown, this being actually a necessity, for the tuning of the wave trap is very sharp.

A secret of success of this wave trap lies in the type of coil, and the gauge of wire used. There are actually forty turns of No. 34 double silk covered wire wound on a three inch diameter Dilecto former, approximately one inch in length. Tapping points are provided in the winding at the eighth, twelfth, sixteenth and twentieth turn. The constructor may please himself on the method adopted by way of tappings. It is always preferable to take the tappings in such a way that a positive connection may be made by means of the clip to the different tappings.

The coil is wound in a very simple manner. Two holes are drilled parallel to one another, each about $\frac{1}{8}$ an inch from one end. Through these holes are threaded the beginning of the D.S.C. wire, and the winding is commenced and continued until 40 turns are wound, the tappings being provided as previously declared. For the sake of neatness, it will be found advisable to drill a hole through the

LIST OF PARTS FOR WAVE TRAP.

- 1 Dilecto or Hard Rubber Panel, 7 x 5 x 1-8.
- 1 .0005 Advance Little Centra-line Condenser.
- 1 Pilot Kilograd Dial.
- 1 lin. length 3in. diam. Dilecto Tubing.
- 40x. No. 34 D.S.C. Wire.
- 2 Terminals.
- 1 Piece of Dilecto, 3 x 1 x 1-8.
- 1 Battery Clip.
- 1 Baseboard, 9 x 3 1/2 x 3/8in.
- Sundry Screws, etc.

tube and thread the wire through this, making contact with, say, a contact stud or a small terminal. This should happen to each tapping, if preferred, thus ensuring that all four tappings provide an easy yet solid contact. If, of course, it is desired to make simple loops for each tapping, this may be done, but remember that the battery clip must make a good connection to this thin gauge wire. A wise plan is resorted to by giving the winding on this former a coat of shellac, which, besides holding the turns in position, renders them impervious to moisture.

The coil should be mounted on the back of the baseboard, which should also be coated with shellac. A strip of Dilecto 3 inches long by about 1 inch in diameter comes in handy for this. The coil is secured to the baseboard by this strip and two screws. All that now remains to do is to drill the panel to accept the variable condenser and the terminals. The drilling diagram shows how this is done. Remember, at this stage, to provide the catch screw for the vernier dial. Mount the panel apparatus and screw the panel to the baseboard.

The rest is easy. The wiring must be completed. To A1 is joined the flexible lead from A1. To the other end of this flex is connected the battery clip. Approximately 9 inches or so of wire is used for this purpose. Across the whole coil is fixed the variable condenser. The moving plates go to the beginning—that is, the beginning of the eight turns tap. The fixed plates go to the end—that is, the fortieth turn. To the beginning, the first turn joins the terminal known as A2—to the moving plates of the condenser, in fact. Now comes the initial test.

Firstly, without any other connections than those made already test out. Place the wave trap unit in such a way that the coil is close to one of the coils of the receiving set. To this receiving set is at the present joined the aerial and the earth. Tune in to the interfering station—bring it up to the loudest point. Now turn the vernier dial of the wave trap until the interfering station is completely cut out. Try different tappings with the battery clip until this effect is produced. Having reached it, then proceed as follows:

Join the lead in of the aerial to A1 and connect A2 to the aerial terminal of the receiver—that is to say, insert the wave trap in series with the receiver proper and the aerial. Retune the wave trap circuit. The "silent" point for the local station will be found a few degrees away from where it was found before the aerial was connected. Alter the tapping on

the coil. Retune again. It may be better here. Try it.

Now look for 3LO. Don't worry about the wave trap setting. Have you got them? Good. Now try altering the wave trap setting. This may be better, yet it may not, but still try, is it not? Then come back again to where you were. Next try 4QG. Got them? Good-oh! A good little wave trap, isn't it? Try the other stations now. You'll find them alright. Later on, you will find that the tapping of the wave trap coil will not need to be interfered with after

the best setting is found. This setting depends greatly on the individual characteristics of your own aerial system, which it is hoped never varies.

The actual test proved of great interest. At Marrickville on the Hackness Reflex (12 valves), where a slight interference between 3LO and 2BL was experienced, this was overcome by use of the wave trap, as also was the interference between 2YA, Wellington, N.Z., and 2FC. If it does this there (and it was at this address that the vernier dial proved indispensable), then it will do it most effectively elsewhere. We recommend it.

A MICROPHONE "ON TOUR."

4QG's Outside Transmissions.

"**VARIETY** is The Spice of Life" So says an old proverb.

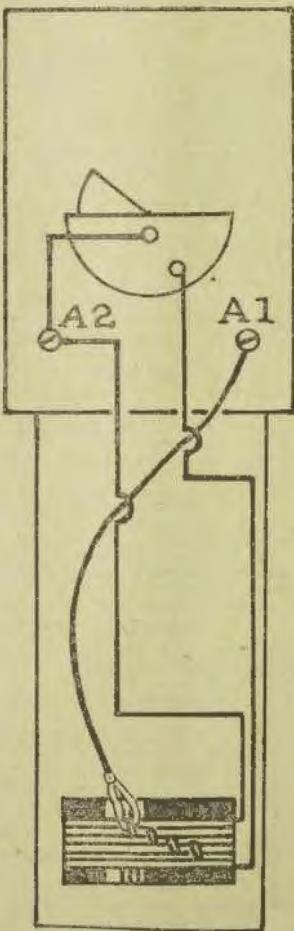

The broadcast station certainly is forced to realise the truth of this. A radio audience is cosmopolitan, and the director of a broadcasting station is therefore always on the lookout for something new, some tit-bit to include in his programme so as to whet the appetite of his invisible audience.

Even in a very large city where theatres and dance halls are numerous the task is no small one. In this respect 4QG is slightly handicapped, for although a few outside shows are available each week, the variety is by no means great. This fact has forced the management of the station to look further afield, and 4QG has done remarkably well.

The station's microphone has been to the bottom of the sea in an attempt to convey to the listeners some idea of the doings of the aquatic world. It has descended to the depths of a coal mine, and has recorded, through the announcer, the description of the bowels of a liner. It has even ascended to the top of one of the station's massive towers, while the chief engineer gave listeners a panoramic description of Brisbane and its environs.

Almost every eisteddfod in Southern Queensland during the past eighteen months has been broadcast. And last, but by no means least, the welcomes extended to almost every notable personage visiting the city during the past eighteen months have been transmitted by radio. These have included the Visit of Their Royal Highnesses, the Duke and Duchess of York, during whose visit the microphone attended no less than ten receptions in their honour; one being the Camp Draft at Beaudesert, a distance of 47 miles.

The "Mike" has been as far north as Bundaberg, and as far south as Lismore, and has travelled in all about 7,500 miles, or nearly three times across Australia on the mission of Variety.

There are no rivals to the Philco.

Big Move by 3LO: Radio Education

REMARKABLE to relate in a world where the first impulse of humankind is to coil against every thing, not a single publicly expressed objection has been uttered against the application of 3LO, Melbourne, to be granted licences to broadcast in Tasmania, Western Australia and South Australia.

On the contrary, as soon as the announcement of its intention was made in those other States, letters began to pour into 3LO, Melbourne, expressing gratification at the possibility. No tribute more sincere could have been paid to the station, for interstate jealousy might have been roused by a fancied slight to stations already existing. No such slight was intended of course.

It is a moot point how far the Government will be prepared to go in admitting the principle of what may be termed "overlapping". As against this point of view, wireless is a Federal matter, under Federal control. State boundaries are artificial, arbitrary. It is a matter of accident that the stations on the air are classified according to the State in whose territory they operate. The principle of continent-wide scope has been admitted in the very suggestion that the funds of one or two successful stations should be partly allocated to boosting up the weaker stations in less populated states.

If it is right to make a forced levy on these successful and efficient stations, it is difficult to see on what grounds the application to allow an efficient station to manage the business by following up the forced levy could be refused. One thing is abundantly evident. Listeners all over the States are enthusiastic at the possibility that they may have operating in their midst such a station as 3LO, Melbourne.

Education by Wireless.

THERE are differing opinions on the advisability of including an educational curriculum in the programmes of the Class "A" station. Mr. Tate, the Director of Education in Victoria, has returned from abroad absolutely convinced of the great untapped possibilities of the radio for such purposes. He is late in coming to this view. Three separate times 3LO, Melbourne, has offered to co-operate with the Victorian Education Department, but nothing has been done.

"JOE."

From the wild West Coast of Tasmania the following appreciative message has just been received by Joe Accanson—

"We held an examination in our town and with the result that 'you and your boy' got first place in 3LO. We are pleased with all 'the numbers and the novelties are great'."

"The little letters 'Joe'

"To rest on when we part,
Three little simple letters
Graved on my waiting heart
'Joe.'
We know you and like you
And while we parted be
Well sing your praises
O'er land and sky and sea
'Joe.'

Objections have been made by listeners on the score of dullness. In effect they say "Radio is primarily an entertainment. Certainly you may not please all tastes with the entertainment you provide, but entertainment must be your main, if not your sole, function. If you put educational talks into your programmes to a greater extent than at present you will bore us and we will drop our licences."

That is a serious consideration for the manager of a public utility who has to amuse thousands of people, and who can bore them only in a very limited way.

The solution for this and other difficulties will one day, no doubt, be a double wave-length, one of which instructional matter can be broadcast, and the other will carry entertainment. Till that happy, and expensive, day dawns, education of children over the air is bound to cause grumbling. Already there is an educational hour in the programmes of 3LO, Melbourne, and this is likely to be extended. There is much need for a campaign to educate the listening public to bear with education.

ONE IRATE old gentleman complains that the broadcast programmes nowadays are not fit for pigs. Now is the time for the broadcasting programmes to supply some that are.

Brother Bill.

WHEN 3LO, Melbourne, substituted talks by "Brother Bill" for those of "Billy Bunny" there were grumblings from many admirers that the glory of 3LO had departed. Brother Bill took his place, but the Bunny "fans" shut their ears to him, charmed he never so wisely. Feeling ran high among a certain section of listeners, who conceived the idea that Billy Bunny was their own peculiar property. One of these, a clergyman, actually sent a petition extensively signed, praying 3LO to reinstate the Bunny. None other could adequately take his place.

Brother Bill thus began his work handicapped by some force of public opinion directed against him. His success has been the more remarkable since it had to make its way against such a force. From far and near came countless tributes to his way with children and grown-ups alike.

Last week came the final, ultimate triumph. This came in the form of a letter from the pro-Bunny petitioning clergyman, solemnly recanting his former opinion and unreservedly placing Brother Bill on a pinnacle. He withdrew the former petition, and in its place sent a numerously-signed document ringing with the praises of Brother Bill, collected paean by paean throughout the whole countryside.

I have already related in these notes how the little talks of this contributor to 3LO's programmes have been published in response to many requests. Further suprises have been ordered and are in their turn exhausted. This is popularity with a vengeance. It is a compliment, not to the man alone, but to the perspicacity of the managers of the station keen enough to read Brother Bill's value.

* * * * *

IT IS GENERALLY conceded that a young country is unlikely to produce a really great composer, and America needed three hundred years of history to produce the nearest to a great composer in the person of McDowell. The works of this greatest of American-born musical figures contain many charming examples of the romantic or suggestive school, and his "Polonaise" for piano forte to be broadcast by station 4QG from the Tivoli Theatre, Ipswich, on November 29th, should be of interest to listeners. Miss V. Driver will be the soloist.

THE NIGHTHAWK

A Receiver of four valves, one control, stability of operation, and employing neutralised radio frequency. Brings in the interstate stations with remarkable clarity and volume. Inexpensive to build.

THE trend of modern receivers today is towards simplicity of control. The ideal or perhaps the ultimate is the one dial control, but this brings with it many problems, even grave problems, that must be solved. Simplicity is the key-note always, it is something to be strived for, yet it is hard to do this satisfactorily without loss of some description. This loss may be one of selectivity, it may also be one of sensitivity, it may even be both, and it is an accepted fact to-day that a wireless receiver to be efficient cannot sacrifice these qualifications in order that simplicity of control exists.

Here we have some difficulties which must be overcome, or that must be reconciled. If one dial control is to be selected, not only must the physical factors be taken into consideration, but also the electrical factors are necessarily involved. But altogether, the whole is not insurmountable.

One Dial Control.

This week's article deals with a receiver which is essentially one of one dial control. It comprises four valves, one of which functions as a radio frequency valve for bringing in the weak distant stations, a detector valve, necessarily followed by two stages of audio frequency amplification. The constructor at this juncture may look askance at the front panel view of this excellent receiver, and no doubt may be inclined to ask just why, if this is a one dial control receiver—just why there are other two knobs seen on the front of the panel.

The writer will state emphatically here, that apart from this seeming oversight, this receiver is essentially one which is controlled by one dial. The other two knobs naturally serve

their purposes, one as a reaction control, and the other as a balancing arrangement. This balancing arrangement is brought about by virtue of the fact that there is required a two gang condenser for tuning two different circuits, and as it is difficult to arrange two inductances of a given constants over all wavelengths, some form of balancing is necessary.

Reaction.

The other knob, as has been mentioned, controls the reaction. This reaction control is a very necessary feature, as it is required so that maximum reign and power is available. It is of the capacity control type—similar to the Reimartz form of reaction, and is particularly effective. It is well-known that this form of reaction does not interfere with the tuning of the set for any given wavelength, but the decided increase in volume and in range that it produces, renders its incorporation a worthy feature. This is decidedly what seems to be another control, but in practice it really is not, as like the knob controlling the balancing, this so-called control once set in position, need never be looked at again, nor need be touched, for stations receivable on the usual broadcast band.

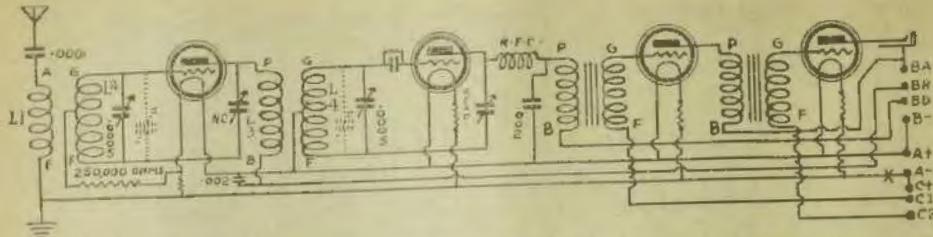

The Two Gang Condenser.

Now the two gang condenser is extremely interesting and it will be learned that later on, that although two condensers are ganged together, in such a position, that only one dial is necessary to control them, yet each condenser is a separate unit, one from the other. In other words, these

PARTS REQUIRED.

Although the parts listed below and mentioned throughout the articles were found to be suitable as in the receiver described, it cannot be insisted that they are not absolutely essential that they be rigidly adhered to.
Other parts of similar quality and technical values should function quite satisfactorily.

- 1 Diecto, or Hard Rubber Panel, 15 x 7 x 3/16.
- 1 Ormond Double Gang Condenser.
- 1 Emma Verner Dial.
- 2 2in. lengths of 3in. diameter Diecto tubing.
- 2 No. 24 D.S.C. Wire.
- 2 Advance Midget Condensers.
- 1 Advance Neutralising Condenser.
- 1 Battery Switch.
- 1 S.C. Jack.
- 1 Radioker A.F. Choke.
- 4 Amperites or Brachmats.
- 4 Valve Sockets.
- 2 Peerless A.F. Transformers.
- 1 Durham 250,000 ohms Leak and Clips.
- 2 .002 Wetless Condensers.
- 1 .00025 Wetless Condenser, and Clips.
- 1 .0001 Wetless Condenser, and Clips.
- 11 Terminals.
- 1 Terminal Strip.
- Baseboard, Bushbar, Screws, etc.

condensers are totally insulated from each other. From this it will be understood that in this receiver there are two tuned circuits. The average person will know from this what has already been specified, that there is one stage of radio frequency amplification prior to the detector.

Now, if it is possible, to produce evenly matched tuned circuits in the radio frequency, and in the detector circuit, then a two gang condenser remains quite even on all wavelengths. This is brought about by having two coils of a midget inductance value, and these two coils with a ganged condenser, will tune evenly over the wavelengths to which the receiver will respond. But there are certain "safety first" rules to be observed. Probably, in spite of the fact that the condensers are supposed to be evenly matched, there may be one setting which is slightly out, and therefore, in being out, will render uneven tuning. This is not a desirable feature, hence the incorporation of the small balancing condenser on the panel.

Neutralised Radio Frequency.

Now, we come to the question of just what form the radio frequency amplification is advisable. Undoubtedly, that type known as the neutralised system of radio frequency is best. It is not a hard matter to devise a means of neutralising the average receiver, in which the radio frequency is employed. The standard system of employing a neutralising condenser is incorporated in this receiver, and produces most interesting results.

Any receiver employing neutralised radio frequency does not create any interference in near-by receivers even although the detector valve is oscillating. This is of extreme importance when seeking the distant station, as it is possible to have the detector valve oscillating, and thereby producing the carrier waves, yet it does not cause any trouble in the aerial circuit itself. It is a distinct advantage over the average form of radio frequency amplification, and as this receiver is one which is modernly efficient, this system of radio fre-

quency amplification has naturally been chosen.

The Circuit.

The circuit diagram shows just the form of circuit used. L1 is the aperiodic aerial coupling coil, coupled to the secondary or grid coil L2, which is centre tapped for neutralisation purposes. L3, L4, is the radio frequency transformer, and it will be seen that L4, being the tuned circuit of the detector valve employs the Hartley system of reaction. The reaction condenser is a small advance midget condenser, this being ample for the purposes of reaction.

In order to keep the radio frequency energy altogether apart from the audio stages, a radio frequency choke is inserted between the plate of the detector valve and the primary of the first audio transformer. Further, as a means of stabilisation, a 250,000 ohms resistor is inserted between the centre tap of L2 and the A battery negative. This is a distinct advantage, and it is hardly necessary to go into reasons for this in this article. As a further means of bypassing, a .002 fixed condenser is connected between the A positive wire, one side of the R.F. choke. Here, again, is where safety first has been thought of.

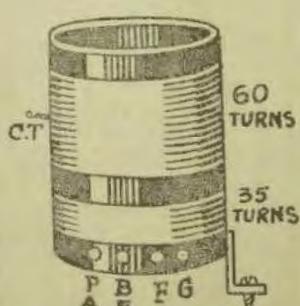

As it is our object to keep as many controls off the front of the panel as is possible, instead of rheostats, Amperites or Brachstatts are used. These little units are useful here, as much as not any one valve in particular is critical of adjustment so that the resistors used satisfy the purposes of filament control, and as they are not variable, and off the panel, damaged by meddling fingers will not occur. Each particular valve has an Amperite or Brachstat suitable, and it is only a matter of consulting your dealer in order to obtain the correct types.

Contrary to what may seem so at first sight, this receiver is not expensive to build. The coils themselves may be wound at home very cheaply, and the constructor may choose just what apparatus he so desires to build this set. The list appended shows the actual parts used in the receiver, and while it is not strictly necessary to adhere to these brands, it is naturally advisable to stick to the values specified in order that best results will accrue.

The construction calls for very little skill, and only the average commonsense. A few household tools are all that is required, and a little patience and perseverance will produce a really wonderful receiver. The coils should be wound first.

Coil Specifications.

Both coils are wound exactly similar to one another. Each comprises primary and secondary, the primary in each instance being 35 turns of No. 24 gauge, D.S.C. wire, and the secondary, 60 turns of the same gauge wire, tapped at the thirtieth turn in each instance. To secure the beginnings and the ends of these windings two small holes should be drilled through which the wire is threaded and fixed securely. A distance of 3-8 of an inch separates the primary from the secondary in each instance. In order to keep all the wiring low and neat all five connections in each coil should be taken to a contact stud fixed at the bottom of the former,

The Mighty 83X Philco is Supreme.

there being five for each former, two for the primary and three for the secondary.

Panel Layout.

The next thing to do is to prepare the panel, by marking out and drilling the required holes to accept the different parts, which are mounted thereon. Don't forget to allow for the fixing screws for the variable condenser, which is ganged, and also for the catch screw which is required to keep the vernier dial in position. The battery switch and the jack, each require only one hole for fixing, the position of all the holes being clearly seen in the drawing depicting the panel layout. Mount the necessary components and fix the panel in position to the baseboard.

Baseboard Layout.

Now, attention should be paid to the dressing of the baseboard. This is somewhat deeper than is usual with the average receiver, but has been chosen of such dimensions for a particular reason. The plan view reveals that the radio frequency components are kept on one side of the baseboard, and the audio frequency parts on the other side of the baseboard. Thus, interaction is overcome. The baseboard should be given a coat of shellac varnish and the various components laid out as suggested by the drawings. It is noted that each coil former is fitted with a small bracket so that it may be secured to the baseboard. Short wood screws are necessary for this purpose, so don't forget to lay in a supply of different sizes of wood screws before attempting to assemble the receiver.

Wiring.

Follow out the layout as shown, then commence the wiring. The wiring diagram is sufficiently explicit for the average person to follow, and when taken in conjunction with the circuit diagram no difficulty should be met with in the wiring. Right angled busbar wiring or soft spaghetti covered point to point wiring may be chosen as well, this depending on the taste of the constructor himself. Leave till the very last moment the connecting up of the midget balancing condenser on the panel, as this may have to be attached to the condenser, which tunes the first grid coil, or perhaps to the second grid coil, this depending on the particular circumstance of the aerial load. When everything is checked off and found to be correct, even with the small compensating condenser unconnected, the receiver may be tested out under actual conditions of reception. It is therefore necessary to select the most suitable valves for the purpose.

Valves.

Almost any good valve will give good results, but attention should be drawn to the special purpose valves at present available. For the high frequency stage a valve having a high impedance around the regions of 20,000 to 30,000 ohms is to be preferred. A Cossor 6 volt rectifier band H.F. valve functioned particularly well in the radio frequency stage, and a Mullard PM5, for a detector, and for the first audio seemed best followed by a Mullard PM250 for the last stage. This combination gave a most wonderful volume, combined with a very high degree of selectivity, and, therefore, one is pardoned for specifying these valves in particular. It is quite possible that there are other equally suitable valves, but the constructor can determine this for himself.

Battery Voltage.

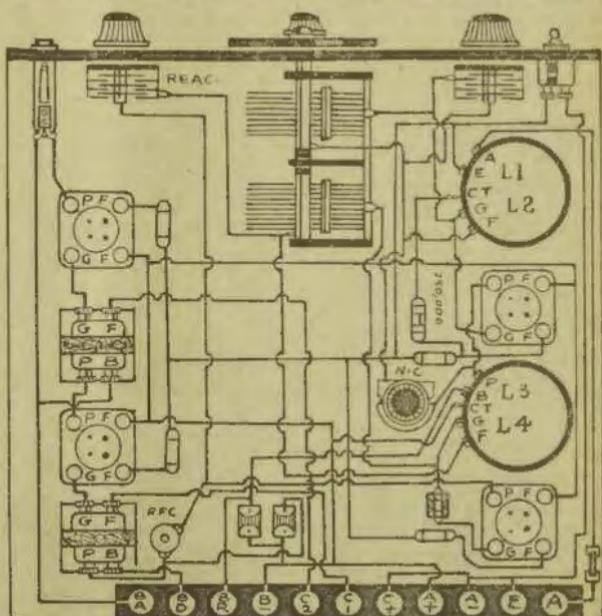

The matter of battery voltage is one which must be considered in conjunction with the particular valves proposed to be used. With each valve the maker provides a slip showing the recommended voltages for different

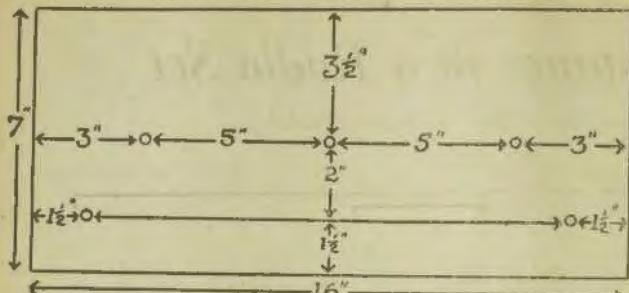

purposes, and these instructions should be followed within reasonable limits. However, with the valves above mentioned, it was found that with 60 volts and the radio frequency valve 45 volts in the detector and 90 on the audio stages, excellent results were the order of the day.

With Radiokes valves, and these were tried—it is difficult to determine which combination suits best—the voltages of the radio frequency stage was built up to 90 just the same as with the audio stages, but here general purpose Radiokes UX201A valves were used instead of the special purpose type above mentioned. Still determine for yourself by experiment which voltages give the best results, and don't treat this matter lightly, as it plays a most important part, not only in this receiver, but in every other receiver so far designed.

Testing.

Hook on the aerial and earth, plug in the loud speaker, do this after having inserted your valves in their respective sockets, and connect up the batteries correctly. Now tune into the local station by tuning the

tuning dial until it is heard. Leave the midget reaction condenser with the moving plates right out of the fixed plates. Bring this local station up to its loudest point, and then attend to the balancing.

Balancing.

Loosen the set screw in the ebony tube, which couples the two variable condensers together, and adjust the two halves separately by means of the rod provided for the purpose, and with the dial controlling the condenser nearest to the panel until the local station is heard at its greatest strength. Leave this now, and neutralise the radio frequency valve.

Neutralising.

Remove the Amperite governing the filament current of this valve, noting that the reaction condenser is set at zero. It will now be found that although the local station is still receivable, the detector valve will oscillate. If this is extremely violent, then reduce the B battery voltage of the detector valve until this oscillation ceases. Now carefully rotate the neutralising condenser mounted on the baseboard until the local station either disappears altogether or becomes particularly weak. This should occur at one setting only of the neutralising condenser. The exact setting can only be determined by experiment, which is only a matter of a few moments really.

Grid Bias.

Next pay attention to the grid bias battery. Re-insert the Amperite governing the radio frequency valve, and make different adjustment on the C battery until the purest signals are obtained. Take each audio valve one after the other, for this grid biasing adjustment, which is another thing to be determined after a few moments trial. The amount of grid bias required depends on the actual valves used in the audio stages, but as an

indication it is worth noting that with the Radiokes valves using 50 volts on the plate, only 45 volts grid bias on C battery was required. Even with the Mullard PM256, in the last stage, and mark you, this is a power valve, only 75 volts grid bias was found necessary. These indications are just by the way of a slight assistance, so determine for yourself just what is really required.

Final Balancing.

At this stage comes the final stage of balancing the double gang condenser. This is done by means of the small midget condenser on the panel. Tune in to one of the B class stations on the lower wave band, such as 2UW or 2UE, or perhaps, do as the writer actually found to be the best, tune in to 3AR Melbourne on the higher wave band. This, at this stage, may entail the use of reaction to such an extent that the detector valve oscillates. Don't be afraid of this, as there will be no interference produced to upset your neighbours, on account of the fact that neutralising should have been effected beforehand. Having pieced up the carrier wave, that portion of the gang condenser which tunes the R.F. circuit should be adjusted till the carrier is heard at its loudest. It should then be resolved by reducing reaction and the gang condenser readjusted again, so that the transmission is tuned in as strongly as possible.

Next, turn the gang condenser until one of the lower wave band stations, such as the two aforementioned N.S.W. low wave stations. Try if the R.F. portion of the gang condenser needs readjustment more than a few degrees. If it is found that it needs its capacity decreasing, then connect the compensating condenser across the detector portion of the condenser. If the contrary is true, then shunt the midget panel condenser across the R.F. section of the gang condenser. Still, in nine cases out of ten, it will be found that the midget balancing

condenser will be needed across the R.F. portion of the gang condenser.

Test Report.

Little more need be said about this excellent receiver, beyond sincerely recommending it to everyone who is seeking a really high-grade inter-State receiver, which will repay the reasonably small outlay. At Marrieville on a short aerial, approximately 50 feet long, all the Inter-State A class stations were nicely received at loud-speaker strength. 3AR was received at a far greater strength than was 5CL, but later on in the evening there was little to choose between these two stations. Needless to say, 3LO and 4QG made their presence known, the latter station, in fact, proving much superior in volume in the earlier part of the evening than did 3LO, but for some reason or other there was a slight amount of distortion from Brisbane. That this was no fault of the receiver just described was proved by trying out on the Marco Four, and the good old Solodyne. Perhaps, it was just a passing phase with 4QG, itself.

Just a last word to presuppose a question which may be asked by many. The Ormond condenser mentioned is one in which each separate portion is electrically separated so that this means that if the constructor desires to gang two Emmeo or Advance condensers of the right capacity or two of any other type of gangable condensers, then attention should be paid to the necessity of using a short piece of Dilecto rod and not the usual brass spindle or rod often used for this purpose. This is of extreme importance, and should not be overlooked under any circumstances.

Since the previous portion of this article was written, this receiver was subjected to further tests, with a Mayolian B battery eliminator as the power supply. Results were truly wonderful, and when the different voltages were measured, it was found that the R.F. valve had 80 volts, the detector 40 volts, and both audio valves 120 volts, with the C battery undisturbed. This may be of passing interest, hence its inclusion here. Go ahead and build your receiver now.

Use of Resistance in a Radio Set

Properly Applied, the Effect is Indispensable.

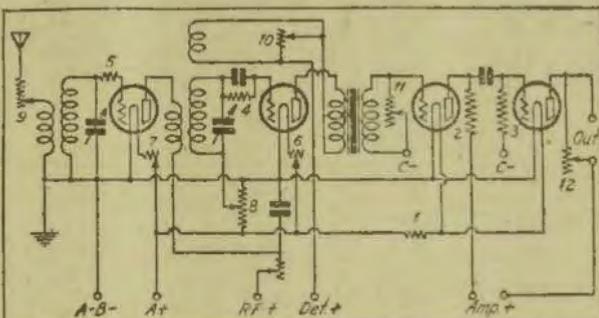

By K. B. HUMPHREY

HERE are several different kinds of resistance in the radio receiver, but in this particular article we are concerned only with the ohmic resistance in the circuit and not with the resistance offered in an electric circuit in which inductance and capacity are acted upon by alternating currents. The resistances in a radio receiver may be divided into two general classes, the fixed and the variable. The fixed resistance units may be divided into groups; there is the fixed ballast resistance used for controlling the filament current, the resistors used both in the plate and grid circuits of certain types of audio coupling, the extremely high resistances used as grid leak, the many fixed resistances used in eliminator work, the grid circuit resistance used for damping out oscillation in tuned radio frequency circuits and many others.

In order to illustrate the various uses of resistance units in the radio circuit a diagram of a circuit is given showing the different positions of the resistances in an ordinary hookup of the tuned radio frequency type with a regenerative detector. Of course, it must be understood that there are other applications where a fixed or variable resistance can be used, but it is thought that the idea will be expressed in the ones illustrated even if the exact connection is not given as used in some specific instance.

No. 1 of the fixed resistances illustrates the position of a resistance unit when used to control the filament current of the two audio tubes shown. This idea can be applied to any or all of the tubes and by using the proper value they work effectively with from one up to any number of valves. This resistance may be of ordinary wire and need not provide for regulation over widely varying supply voltages. The ordinary ballast resistance, which does apply a certain amount of regulatory action, that is, when the supply voltage is increased the extra current flowing heats up the wire and increases the resistance, thus decreasing the current, is in reality a variable resistance. The variation is automatic, however, and the position in the circuit is the same as indicated at No. 1.

No. 2 and No. 3 are fixed resistors used in resistance coupling units, No. 2 is a resistance introduced directly in the plate lead of the tube and has

Circuit diagram showing where various resistances are employed.

a value of from 80,000 to 100,000 ohms. Its function is to provide a variation in the current due to fluctuations in the tube plate circuit and impressing them directly on the fixed condenser and thence to the grid of the next tube. No. 3 is a grid leak, but is of lower value than those used in the detector circuit. When three stages are used, the values run 1 megohm in the first stage, $\frac{1}{2}$ megohm in the second and $\frac{1}{4}$ megohm in the last stage. These values are by no means critical and many experimenters have ideas of their own as to what these values should be. The higher the value the more volume, but there is a limit, due to the fact that the tube will block if too high a value is used. It is necessary to provide a path from the grid to the filament in order that a charge will not accumulate on the grid and stop the amplifying action of the valve. There are other combinations where a choke coil is used in place of the No. 2 resistor and a grid leak as shown at No. 3.

The ordinary grid leak is shown at 4 in the diagram and is from 1 megohm up to 8 megohms. In some cases this is made variable, but for ordinary work this is not at all necessary and when once adjusted to the value used may be left alone. The function is much the same in the detector as in the position mentioned in the preceding paragraph. That is, it prevents the piling up of a negative charge on the grid and blocking of the tube. The small condenser would

isolate the grid from the rest of the circuit if it were not for the leak. In some cases the grid leak is connected directly from grid to the positive filament. There is no particular difference in the action.

No. 5 shows a fixed resistance placed in the grid circuit for the purpose of damping out oscillation. When a tube is in oscillation, there is a certain amount of current flowing in the grid and this resistance acts against it, while in the course of ordinary operation there is merely a voltage variation in the circuit and little current. Therefore, when the tube starts to oscillate the resistance absorbs the current and the tube stops oscillating. The action is entirely automatic.

There are a number of positions for the use of fixed resistors in eliminator circuits, which will not be gone into, as this is an accessory and not part of the receiver itself. Also when using the alternating current for filament supply there are numerous small fixed resistors used for balancing up the different circuits.

Variable Resistances.

The field of the variable resistance is somewhat larger than the fixed resistance and in practically every case where a fixed resistance is used one of the variable type may replace it. For instance, in the case of the ballast resistance. Rheostats are

Data on the Proper Thickness for Shields in Radio Circuits.

AMONG the radio novelties exhibited at the last New York Radio show were individual aluminum shields designed by L. M. Cockaday and the engineers of the Aluminum Company of America to prevent feed-back and interference between the parts of a radio receiver. Metallic shielding of receivers is in the order of the day, but it is not always necessary to surround the set, or parts of it, with continuous metal boxes. In some circuits mere walls of metal, inserted at the proper places, may serve well enough to prevent undesirable interaction.

The shields under discussion in this article are of this type. They are made of virgin sheet aluminum, six inches long and four inches high. The metal is eighty-one mils thick, this thickness having been found by tests to be sufficient for adequate shielding, while using a minimum amount of metal. Each shield carries a bent-over flange, drilled for screws,

which permits easy attachment of the shield to the baseboard. The shields are strong enough to stand upright without difficulty. Slots permit the passage of wires which must traverse the shields. The shields may be used in any type of circuit or any radio apparatus where partial shielding is necessary.

It is frequently imagined that adequate shielding can be obtained by surrounding the parts of a radio receiver with tinfoil or other thin metal, often glued to the inside of the cabinet. To demonstrate that this is not the case a special oscillator with which the effectiveness of any type and thickness of radio shield may be tested has been developed by the Aluminum Company. So vividly does the oscillator show the behavior of the radio waves that they can almost be seen to pass across between two coils when no shield is interposed and to be stopped when a shield of thick aluminum is inserted.

This matter of the acoustics of rooms, necessary to get the best quality from radio reproduction, is very little known, even to experts. Rules are difficult to formulate, but, in a very general way, it may be said that absorbing material, like a heavy curtain, placed behind the loud speaker, is usually a good thing, the other side of the room being left relatively bare, so that the sound waves will be well reflected from it. The exact best arrangement can be determined only by trial.

What I am urging, then, as the ideal city receiver, is one which concentrates on quality, including its own accessories, so that all will be matched in impedance and using a circuit such that there is real quality there to be let through. This must be combined, somehow, with high selectivity, so that the many local stations which crowd on each other's heels can be brought in or kept out, one by one, as desired. Third, there must be no need of a large or fine antenna. No antenna at all is better still, for then the static and electrical interferences will be at a minimum.

Can such a receiver be built? Certainly, I have one myself. The only difficulty is in making it cheaply. That is the problem for the radio designer; to make a receiver which

has these necessary city qualities and which can be sold at a low price. That, like the famous "good five-cent cigar," is undoubtedly something that the country needs.

Two small coils a few inches apart are connected, one to an oscillating circuit, the other to a sensitive meter. When no shielding is used the radio impulses pass unimpeded from one of these coils to the other one. The meter shows a large deflection. There is a holder, however, into which metal shields can be inserted, one after the other, between the two coils. When a shield of thick metal is inserted the reading of the meter drops almost to zero. The thick metal entirely prevents the passage of the radio field through it.

With thin metal, on the other hand, the meter deflection is maintained at almost the same value as when no shield is there, thus showing that a large fraction of the radio impulse will pass through metal which is too thin or too low in electrical conductivity. The great advantage of aluminium for radio shielding is that it is highly conductive, having the highest electrical conductivity, weight for weight, of any known metal or alloy. Its extremely light weight is a great advantage also for radio use. An adequate set of aluminium shields weighs only a fraction of the weight of a similarly effective set made of other metals.

With the oscillator it is possible to demonstrate that the necessary thing in a good radio shield is an electrical conductivity high enough to permit eddy currents created by the radio field to flow in the metal of the shield with little resistance and with small formation of heat. When the shielding metal is too thin, for example, with sheets of tinfoil or of other metal foils, a shield may actually become hot when placed in the field of the oscillator. This heating still further decreases the electrical conductivity of the metal and makes the shield even less effective than it was before.

Resistors Simplify Filament's Control

Removable Cartridges take Place of Several Rheostats.

By Arthur H. Lynch.

ONE of the most noticeable trends in the development of the radio art has been the determined efforts that have been made to reduce the number of controls to operate a receiver. This trend has also brought in its wake a growing tendency to standardize equipment so that new developments can be incorporated in a receiver without much effort or expense.

The standardization of valve bases which permitted easy interchangeability of valves and the appearance of the standard UX type sockets were great steps in this direction. With a set equipped with such sockets, new valves could easily be inserted in a receiver to bring it up to date provided the rheostats were changed to suit the characteristics of the valves.

Changing of rheostats is seldom easy or practical.

When filament regulation is obtained through the use of filament controls it is an easy matter to substitute new resistance elements to take the place of the old ones, and the use of any valve or combination of valves is possible by the use of the proper sizes.

It is easy to understand the need for hand rheostat control in the old days when the 200 type of "soft" detector valves was popular. These valves required critical adjustment of the voltage applied across the filament terminals of the valve. The new valves of the 200-A and 201-A types, however, do not require such critical control.

It can easily be seen that a slight change of filament voltage in the old 200 type valve causes a considerable difference in relative audibility or sensitivity. Even as slight a change as two-tenths of a volt, from 4.7 down to 4.5 volts, causes a drop in relative audibility of from 70 points down to 22 points.

With the new valves of the 201-A type all this has been changed. Here critical adjustment of the filament voltage is not required, as can be seen from the fact that the relative audibility or sensitivity remains practically the same for filament voltages from 8.75 to 5 volts.

A fixed resistance that will cut down the voltage of a fully charged

"A" battery to 5 volts for a 5 volt valve is all that is necessary to act as a safety valve to prevent excess voltage from being applied to the filament terminals.

As the battery discharges the voltage decreases, but the slightly decreased voltage across the filament terminals has practically no effect on the operation of the tube, because, regardless of the drop in voltage in the battery and the additional drop through the resistance, the voltage is still more than the minimum of 2.75 volts required for operation of the valve filament at full efficiency.

The best resistance element to use is made of a special resistance alloy encased in a glass case with metal end pieces. This cartridge can be installed in a suitable mounting so that the resistance elements can be interchanged as required for different types and combinations of tubes.

Volume control can be obtained by using a 6 to 10 ohm rheostat in series with the equalizer which controls the radio frequency valves or by any of the other now common methods of volume control using variable high resistances.

A Tasmanian Holiday.

TASMANIA has figured largely in SLO, Melbourne, arrangements. It will be remembered that it was the honeymoon locale of the September Bride. Now it has been chosen as the place for a two weeks' holiday for some lucky SLO, Melbourne, listener.

A competition that calls for the use of no gray matter is being arranged. The sole qualification is that the successful aspirant is a licensee-holder, either by himself or his family (and "his" includes "her" in this case). Contestants do nothing but wait. Chance does all the work.

All you do, if you wish to enter, is send your name and address and license number of your wireless set, or that on which you habitually listen to in SLO, Melbourne.

Thousands of licensees will nerve themselves to this intellectual task. Then, on a certain date early in De-

cember, all the applications are heaped together, and one is drawn at random. The applicant whose name is on the letter will be packed off to Appleland. Simple, isn't it? It doesn't matter whether it is man, woman, or child. Competitors, however, must endorse their envelopes, "Spend Christmas in Tasmania."

More Competitions

AT least two new and very novel competitions are under consideration by SLO, Melbourne. One is meant to bring out into the open the shy, long-haired woman. It is believed that somewhere hidden away, whether in the wilds of Fitzroy, or the secret places of Gippsland, may be found still long-haired women hiding their tresses from the shears of the barber. The time has come when long hair is regaining its value owing to its rarity. Before long hair actually becomes a museum piece, SLO, Melbourne, wants to locate it. To this end women lucky enough to possess it are to be offered an inducement to permit it to be photographed, classified, and documented. I have no idea of the conditions that will govern this contest. I simply tell that the project is in the hair, so to speak.

Another contest also has to do with the head, but with its contents, rather than with its adornment.

Has the study of poetry declined? Do modern women know anything of Elizabeth Barrett Browning, or do they think it is a new preparation for making gravy? Does Byron mean anything to them? Is Wordsworth significant?

Many people who despise this generation have said that they read nothing but Michael Arlen and Elvior Glynn. SLO, Melbourne, wants to find out. Some of the finest English poets, who used to be household words, will be dredged for their best-known quotations.

These will be read by skilled elocutionists over the air, and the person who, over a series of readings, comes closest to the correct placing of the quotations, will get a valuable prize.

Radio Books Reviewed

The Thermonic Valve.

The Four Electrode Valve.

*The Admiralty Handbook
of Wireless Telegraphy.*

By Fred Goddard.

By Fred Goddard.

MESSRS. Turner and Henderson Ltd., of 10-18 Hunter-street, Sydney, have sent along to us a copy of the Admiralty Handbook of Wireless Telegraphy. This excellent publication is issued by the Lord Commissioners of the Admiralty, London, and has been prepared by Captain W. G. H. Miles, R.M., under the supervision of the Director of the Signal Department. It does not appear as an annual, but is published at irregular intervals, each new publication superseding the previous one. Primarily intended for the information and guidance of officers and men of His Majesty's Fleet, this handbook is one which no genuine experimenter should really be without.

Containing as it does 19 chapters, crammed full of information, it deals with every section of wireless and is written in such a manner that it can be clearly understood. There are approximately 270 line drawings, illustrating various points referred to in the book, which is printed on excellent paper, and well bound in cloth.

Among the subjects dealt with, there is electricity and magnetism, the Electron Theory, Ionization, and so on. There is a long chapter on Inductance and Capacity, another one on alternating currents, still more on continuous waves, rectifying circuits—in which the subject of selectivity is discussed at a great length—Thermionic valves and their action, amplifiers, transmitting valves and transmitting circuits, radio telephony, wave meters and so on.

All the subjects are dealt with in a most comprehensive manner, and in addition there are many tables of figures which the average enthusiast will find an every-day use. The person who wishes to make a study of this vast subject of wireless cannot do better than obtain a copy of this excellent publication, which is the finest of its type that has come into our hands. If the reader is intending to become a transmitter, then there is more than ample material in this handbook to give him a vast knowledge for the A.O.P. examination. From Messrs. Turner and Henderson Ltd., we understand that the price is 7/-, and excellent value is given.

We have just received this excellent little publication for review. The author is a man who is fully conversant with the subject, and he deals with it from a very simple point of view. The book is free from involved technicalities and is eloquently illustrated, a large number of circuit diagrams, ranging from single valves to super-heterodynes, being included, with constructional details.

The construction, action and control of valves is dealt with at length; the first chapter in fact, deals with what a valve is, and is treated in such a manner that even the youngest schoolboy would quickly get sufficient working knowledge of valves. The other chapters in the book are written in an exactly similar strain, the whole from cover to cover being so simply explained, that it is a book for every wireless enthusiast, irrespective of just how little or how much he knows. One very interesting part is really worth the price of the book in itself and this portion deals with how to use today, it is unquestionable a fact that the general standard of reception would be much higher than it is if operators knew more of their valves and the author of this book has succeeded in dealing with this subject in such a manner that he will appeal to everyone who owns a valve receiver. Further than this, there is furnished a fund of information hitherto available only to advanced wireless experimenters.

Our copy has been received direct from the publishers, Meases, Mills and Brown, Ltd., 49 Rupert-street, London. We understand that the price will be round about 3/-.

AN OSCILLATING WAVE-METER. State Father: "So, coming to listen to the new radio was only a blind, I find my daughter in your arms with her hand on your shoulder."

Confused Sailor: "Er—no, sir." You see, I was simply getting her wave-length, and he kindly dressed her new permanent wave.

We have just received this excellent publication for review. The author is a man who is fully conversant with the subject, and he deals with it from a very simple point of view. The book is free from involved technicalities and is eloquently illustrated, a large number of circuit diagrams, ranging from single valves to super-heterodynes, being included, with constructional details.

The construction, action and control of valves is dealt with at length; the first chapter in fact, deals with what a valve is, and is treated in such a manner that even the youngest schoolboy would quickly get sufficient working knowledge of valves. The other chapters in the book are written in an exactly similar strain, the whole from cover to cover being so simply explained, that it is a book for every wireless enthusiast, irrespective of just how little or how much he knows. One very interesting part is really worth the price of the book in itself and this portion deals with how to use today, it is unquestionable a fact that the general standard of reception would be much higher than it is if operators knew more of their valves and the author of this book has succeeded in dealing with this subject in such a manner that he will appeal to everyone who owns a valve receiver. Further than this, there is furnished a fund of information hitherto available only to advanced wireless experimenters.

Like "The Thermonic Valve," this excellent publication is printed on very good paper, and is cloth bound. There are over 64 diagrams, and circuits, from the simplest to the more complicated. Almost every known receiver has been discussed and described with relation to the four electrode valve, all circuits are particularly well drawn, and the most minute detail is entered into.

Certainly, this is the best book of its class, which has so far been published, and great credit is due to Mr. Goddard, for dealing with it in such a comprehensive manner as he has done in this book. Meases, Mills and Brown, Ltd., of London, forwarded us our copy, which will sell at a similar price to "The Thermonic Valve."

Summer-time is Portable-time.

Build the simple three valve portable radio receiver described in the November issue of "Radio" to take with you when you go holidaying this Xmas. Complete in case with loud-speaker, frame aerial, and battery compartment, it can be built at little expense.

8 p.m.—"Big Ben".

From the Lyceum Theatre, Pitt Street, Sydney: Items by the Orchestra.

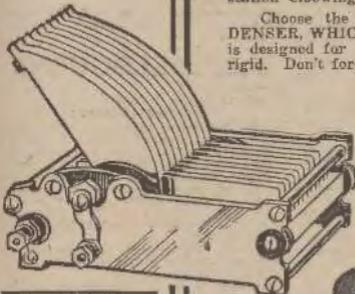

THE ability to choose your own programme from the various stations is a great boon! It means that if you do not care for the jazz from here, or the lecture from there, you can tune in elsewhere—WITHOUT INTERFERENCE.

Selectivity depends primarily upon the kind of condenser your set possesses. Any condenser may permit you to tune in 3LO, 4QG, 2FC, SCL, and other stations, but if your logging of them is all crowded on one small section of the dial, you are apt to have the lecture from this station elbowing its way into the concert programme from that.

Choose the "ADVANCE" STRAIGHT LINE FREQUENCY CONDENSER, WHICH DOES AWAY WITH ALL STATION-BUNCHING. It is designed for multiple mounting, is in a one-piece frame, and is most rigid. Don't forget the name—"Advance." Your dealer has it.

Announcement**Jefferson Transformers**

No matter what circuit you wish to complete, there is a JEFFERSON Transformer that will bring you the highest possible degree of amplification. Right from the start put JEFFERSONS in your set—don't experiment—export Radio Engineers after careful and exhaustive tests have found them perfect in every detail of construction. Distant stations are tuned in with ease, and you will be highly pleased with the extreme sensitivity, quietness and the freedom from distortion.

What is the cost of your batteries per radio hour?

Have you ever computed the price of battery equipment on the basis of its cost per radio hour? Discriminating radio enthusiasts everywhere are finding that not only are Yale Batteries superior in use, but they also have a far greater average life. In other words, they "Cost less per radio hour" than any other battery.

The answer to a thousand questions

Thousands of times the question has been asked—"What makes Burgess Batteries Better?"

The answer is a single word—"Chrome."

Chrome—the great preserving element found in finest metal, leather, and paint, is patented in Burgess Batteries giving them double the life and power of ordinary dry batteries.

8.55 p.m.—National Anthem; Close Down.

THE wonderful P.M. Filament offers you three times more for your money. It is so tough that even after 1,000 hours' life can be tied in knots and cannot be broken except by the very roughest handling—result, safety against accident.

There is more than strength in the P.M. Filament. It has up to 3 times greater length and up to 50 times greater emission than an ordinary filament. This is where the P.M. filament gives you real value.

Another big point, the P.M. Filament requires only one-tenth ampere giving 7 times the life to each of your accumulators.

For great economy, great life and great results secure the valves with

THE WONDERFUL P.M. FILAMENT,
 MULLARD P.M. VALVES are British made,
 "By British."

For 2-volt accumulator:

P.M.1 H.F.	0.1 amp. 15/4
P.M.1 L.P.	0.1 amp. 15/8

P.M.1 A. (Rectifier Cap.)	0.1 amp. 15/4
---------------------------	---------------

P.M.2 (Power)	0.35 amp. 15/2
---------------	----------------

For 4-volt accumulator or 3 dry cells:

P.M.3 (General Purpose)	0.1 amp. 15/3
-------------------------	---------------

P.M.3 A (Rectifier Cap.)	0.1 amp. 15/3
--------------------------	---------------

P.M.4 (Power)	0.3 amp. 15/3
---------------	---------------

For 6-volt accumulator or 4 dry cells:

P.M.5 (General Purpose)	0.1 amp. 15/4
-------------------------	---------------

P.M.5 A (Rectifier Cap.)	0.1 amp. 15/4
--------------------------	---------------

P.M.6 (Power)	0.3 amp. 15/4
---------------	---------------

For 12-volt valves for last I.F. stage:

P.M.7A	(4 coils) 0.2 amp. 15/-
--------	-------------------------

P.M.7B	(6 coils) 0.25 amp. 15/-
--------	--------------------------

P.M.8	(6 coils) 0.3 amp. 15/-
-------	-------------------------

P.M.9	(6 coils) 0.35 amp. 15/-
-------	--------------------------

P.M.10	(6 coils) 0.4 amp. 15/-
--------	-------------------------

P.M.11	(6 coils) 0.5 amp. 15/-
--------	-------------------------

P.M.12	(6 coils) 0.6 amp. 15/-
--------	-------------------------

P.M.13	(6 coils) 0.7 amp. 15/-
--------	-------------------------

P.M.14	(6 coils) 0.8 amp. 15/-
--------	-------------------------

P.M.15	(6 coils) 0.9 amp. 15/-
--------	-------------------------

P.M.16	(6 coils) 1.0 amp. 15/-
--------	-------------------------

P.M.17	(6 coils) 1.1 amp. 15/-
--------	-------------------------

P.M.18	(6 coils) 1.2 amp. 15/-
--------	-------------------------

P.M.19	(6 coils) 1.3 amp. 15/-
--------	-------------------------

P.M.20	(6 coils) 1.4 amp. 15/-
--------	-------------------------

P.M.21	(6 coils) 1.5 amp. 15/-
--------	-------------------------

P.M.22	(6 coils) 1.6 amp. 15/-
--------	-------------------------

P.M.23	(6 coils) 1.7 amp. 15/-
--------	-------------------------

P.M.24	(6 coils) 1.8 amp. 15/-
--------	-------------------------

P.M.25	(6 coils) 1.9 amp. 15/-
--------	-------------------------

P.M.26	(6 coils) 2.0 amp. 15/-
--------	-------------------------

P.M.27	(6 coils) 2.1 amp. 15/-
--------	-------------------------

P.M.28	(6 coils) 2.2 amp. 15/-
--------	-------------------------

P.M.29	(6 coils) 2.3 amp. 15/-
--------	-------------------------

P.M.30	(6 coils) 2.4 amp. 15/-
--------	-------------------------

P.M.31	(6 coils) 2.5 amp. 15/-
--------	-------------------------

P.M.32	(6 coils) 2.6 amp. 15/-
--------	-------------------------

P.M.33	(6 coils) 2.7 amp. 15/-
--------	-------------------------

P.M.34	(6 coils) 2.8 amp. 15/-
--------	-------------------------

P.M.35	(6 coils) 2.9 amp. 15/-
--------	-------------------------

P.M.36	(6 coils) 3.0 amp. 15/-
--------	-------------------------

P.M.37	(6 coils) 3.1 amp. 15/-
--------	-------------------------

P.M.38	(6 coils) 3.2 amp. 15/-
--------	-------------------------

P.M.39	(6 coils) 3.3 amp. 15/-

The Flapper's Lament

Dad read somewhere that the sun is a wonderful tonic, so he lay on the bench for two hours. Now he is eating his meals off the mantelpiece and has blisters on his sense of humor. So I have come to the rescue.

I have been pushing my way through the long grass on his recent articles—mostly about women. Lend me your ear:

Dad imagines himself a modern Viking with a huge dominating personality, and a reverberating voice which belongs to cave man days. Actually he is fat, bald, prosy, and chirps, "Yes, my dear," to mother in the accents of a sick sparrow!

His New System friends have certainly taught Dad a good deal since the day he brought home a splendid dry battery—the Burgess,—and then rang up to know how often he had to pour water into it!

The real fact is that he has an "inferiority complex" when Mother is around, and the only way he can swell out is to read the Adventure Booklet sent to him from 280 Castlereagh Street by N. S. T. Pty. Ltd.—no need to spell it out.

Then he expands into a Hurley or a Byrd or a Kingsford Smith,—waves his Burgess Battery as he charges New Guinea savages or uses it as a magic carpet to hop across the Pacific.

About that time I fade gently through the door and pick up one of my retinax.

I wonder if "he" will some day be podgy, prosy, particular and pathetic? It's a terrible risk for a girl!

Yet, after all, matrimony to-day seems very like a Burgess Battery—after a few years you can swap the old for the new and start afresh. It reminds me of Life—born, bobbed, buried and begin again!

And they say that no sound is ever lost but goes on vibrating for ever. My hat! Just imagine listening in some day to 49 variants of "you are the first girl I ever kissed!" Wouldn't it jar the fiftieth fellow who had just split the same hoary old lie?

Sorry—there's Dad calling for liniment! Cheery, my children! Buy Burgess and be happy!!!

Contralto solo, "The String of Pearls" (Philips).

Mrs. J. McSwaine, "Gardens of Lillies" (Ormsby).

C.C.M. Orchestra, Electrolytic item, Selected.

Miss Staley, "For The 'Rose'" (Britti).

What Mr. Maclurcan expects of a Radio Set

When you are choosing your Radio, you must look for—and insist upon—seven essential points, says Mr. Charles Maclurcan, A.M.I.R.E., the well-known radio expert.

1. Perfect tone reproduction with a simple method of controlling volume.
2. Sufficient sensitivity and number of valves to enable reception of all Australian stations with good volume. Usually five or six are necessary for this.
3. It must be selective, so that there is no interference between stations.
4. It must be simple to control, with not more than two, but preferably one dial for tuning.
5. It must not be an eyesore in appearance. But at the same time you must remember it is a Wireless Set, and not have it disguised as a sideboard or a perambulator.
6. It should not cost more than £40 or £50 complete with all accessories.
7. It should be fully guaranteed and purchased from a firm of such standing that the guarantee means something.

The "D.J. Super-Six" amply meets these demands. We invite you to come in and test it out for yourself in our Radio Department, 22 York Street, or write for further particulars.

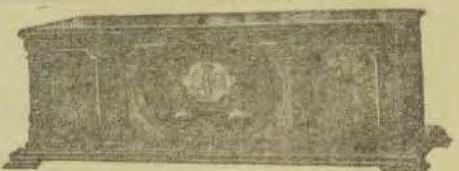

Cash price, ready to instal, is £45 or £4/10/- deposit and 17/3 weekly for one year.

On Friday Nights Radio Lectures are given by Mr. Basil Cooke, F.R.A.S.

DAVID JONES'

Open till 9 p.m. Fridays

The Perfect Valve Receiver

Single Dial Control

FARMER'S present this perfect receiving set, featuring unsurpassed purity of tone and simplicity of control; it is capable of producing any volume desired.

This new model five-valve receiver is set in a handsome cabinet of Queensland Maple inlaid with walnut; beautiful "Ducor" finish. Control is effected from a central dial, and each stage is completely protected with copper shields. The cabinet has ample space for all batteries; supplied with accessories and loud speaker. Price £2/10/-

This set erected free in City or Suburbs.

Farmer's Standard 2-Valve Receiver

Efficient and reliable! An ideal set for reception of all programmes. Interference of outside stations is absolutely eliminated. Included with standard equipment are two "Radiotron" valves of a type specially adapted to this particular set. Price, with one pair of headphones. £14.10/- With loud-speaker equipment. Price £22/-

Extra Equipment for the Enthusiast

Headphones by all prominent makers

"N. & K."	Price, per pair	17/6
"Peerless."	Price, per pair	21/-
"Radiola."	Price, per pair	35/-
New double-reading voltmeter;	0-10 and 0-100.	Price, each, 12/6

Still Further Reduced Brown Cabinet & H.Q. Models

Quality now talks price

IN most instances quality and low price do not blend to any great degree, but now with the announcement of new and greatly lowered prices for certain popular Brown Loud Speaker Models, it can be safely claimed that quality now talks price!

Brown Cabinet Model

Just look at these reductions
featured in connection with
Brown Cabinet and H.Q. Models.

Type.	Old Price.	New Price.
H.Q.	£7/15/0	£7/-
Cabinet	£8/10/0	£6/10/-

Keen as were the values offering
by each of these models previously,
the new prices featured
indicate them as being doubly
attractive.

Every Brown Speaker Guaranteed

H.Q. Horn Type
Brown.

Each Brown Speaker sold is
covered by a generous guarantee—a fact which assured the
purchaser of the unconditional correction of any defect which
should occur within a certain period, after buying. No matter
what the purpose—or the
price limit, there is a Brown
Loud Speaker or headphones to
meet each individual requirement.

Write now—right away, for
pamphlet "W" giving fuller particulars
and prices of all Brown
Loud Speaker Models.

Obtainable at all Radio Stores
and Electrical Houses.

All Readers' Queries Answered Here.

P.G.M. (HURSTVILLE).—Q: As a constant reader of your popular weekly journal, I wish to seek your advice on a little trouble I have had in building the Harkness Three-Valve Reflex, published in April. I have taken great care in assembling this receiver, and adhered strictly to instructions contained in the article describing it, with one exception, I put in three rheostats instead of two. I did this because I had the panel drilled for three, and having one off would show unsightly holes. When connecting the receiver up and switching on the valves, I found that I could not in all the stations on the dial, with excellent volume and clarity, the selectivity was good, especially on A3, but to my surprise it did not bowl in any position on the dials, and the midget condenser seems absolutely useless. It can be twisted to any position, even when the station is tuned to maximum volume without the slightest difference being made. This seemed remarkable in view of the fact that your article says this condenser will have to be adjusted to eliminate howls. I attribute this lack of howl (if I might put it that way) to the fact that I cannot get a whisper from interstate stations, not even on the "phones. Would the presence of the third rheostat have the effect of this thinning? I have friends who have made up this set and are getting good interstate results on the speaker, but find they have to control the bowl, could you help me in this detail? I have tried reversing all coil connections without any difference in results. I am using radio valve Philips B406, detector A409, audio B406, 4½ volts C battery, 30 volts detector, 30 radio and audio. I am very pleased with this set. It

is the clearest I have heard, but I know better results can be obtained, I would naturally like to perfect it.

A: The presence of a third rheostat should not affect the selectivity in any shape or form. Your locality is a very good one for reception, and you should now experience any lack of selectivity in any way. I feel certain that were you to balance up your battery voltage, particularly the B and C batteries, which you would find that the midget condenser referred to would play an important part and that would account quite freely. Try other factory sets on the radio and audio, and don't be afraid to increase your detector voltage much higher. As much as nine volts may be required for grid bias purposes. Provided you have followed out the directions in the paper, provided you spend a little time in ascertaining the voltages of your batteries, I am sure you will be amply repaid.

W. MC. (PUNCHBOWL).—Q: I will be indebted to you if you will please supply me with the specifications necessary for constructing the two coils for the Universal Four Valve receiver of "Wireless Weekly," 23/9/27.

A: For Coil 1, the aerial coupling coil, the size required is a primary and a secondary. The secondary consists of 30 turns of No. 30 gauge D.S.C. wire spaced 40 turns to the inch, preferably, and wound on a two inch diameter former square, 3 inches long. The primary or the spiralled aerial coil consists of from 15 to 25 turns of the same gauge wire wound on a former 1¾ in. in diameter. This former is fitted inside the secondary coil, the primary winding should be at the earth end

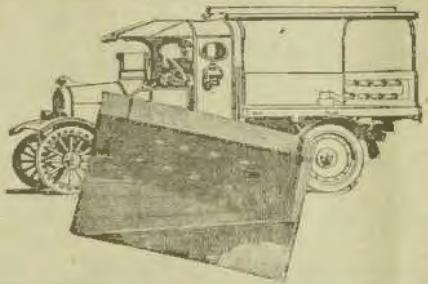

of the whole coil. The Reimann coil wind as follows: On a two inch diameter former is wound 90 turns of 30 D.S.C. wire spaced as before. The primary winding consists of 20 turns of the same gauge wire wound on a 1½ inch former in such a way that when arranged within the secondary coil it comes exactly opposite the centre of the secondary winding. The reaction winding is wound below this primary and comprises 25 turns of the same gauge wire. All these windings are made in the same direction, and the connection can be gauged from the circuit diagram published with the Universal Four Valve receiver. The primary and reaction windings need not be space wound. The cans should be made of either copper or aluminium, and should be round. Take 3½ inches in diameter. This allows a natural clearance of ½ in. all round the coil before the earth is reached. There should also be ½ in. high clearance at both ends of the bottom of the winding. Many thanks for your complimentary remarks.

C.V.G. (SYDNEY).—Q: Would you tell me if it is possible to wind an F.R. shake?

A: Yes. A hexagonal coil of from 120 to 190 turns will suit, but if desired 190 turns of No. 20 gauge enamelled wire, wound on a former 1½ inches in diameter, will be found suitable.

A.C. (WAUCHOPE).—Q: Would you please, forward me a blue print of a four-valve set?

A: I regret that we have not any blue prints. We don't cater for them, but recommend you to see "Wireless Weekly," 11/11/27, for the Marconi Four. The details are simple to follow.

EIGHT "LOTUS" Valve Holders fitted with large power valves and fixed to tailboard of Ford Motor Lorry, driven over rough roads for 30 miles, survived the test. At the finish, each spring was as it started—perfect. No damage or loosening at connection of leg socket and spring—no valve loose from the holder. Both were electrically perfect all the way.

Fit the "LOTUS" to your set, and protect your valves.

Lotus Valve Holder, 2½ each.
Lotus Valve Holder, with Grid Leak, 3½ each.
Lotus Valve Holder, with Terminals, 3½ each.

John Arnold, P.O. Box 871, De Graves Street, Melbourne.

*The Amplion Siftron
In Moulded Bakelite Case*

A

Filter Circuit is necessary

Just as fuses are placed in an electric circuit to prevent undue load being carried by the conductors, so should a filter circuit be an integral part of every radio set, in order that only the useful speech currents reach the loud speaker. Such an addition is a refinement which becomes an absolute necessity with a cone loud speaker, or if a super-power valve is used in the last stage.

The Amplion Siftron has been designed by engineers whose sole aim is "Better Radio Reproduction." Its components have the correct electrical values, and it is a compact unit which can be used with any loud speaker or with any set without the necessity of altering the wiring.

New Reduced Price 27/6
