INNOVATION & INFORMATION Magnavox at its best

Magnavox leads the industry in advanced cable technologies. PowerDoubling™, Feedforward, and amplifier bandwidths to 550/600 MHz—you continue to look to Magnavox for innovations. Our transformerless power supply is cool, efficient, and cost-effective. It's the direction of the future.

We excel at making your system easy to install and maintain. Our reliable 600 MHz passives allow easy upgrades with interchangeable base assemblies. And our enhanced status-monitoring system underscores our dedication to reliable field operations.

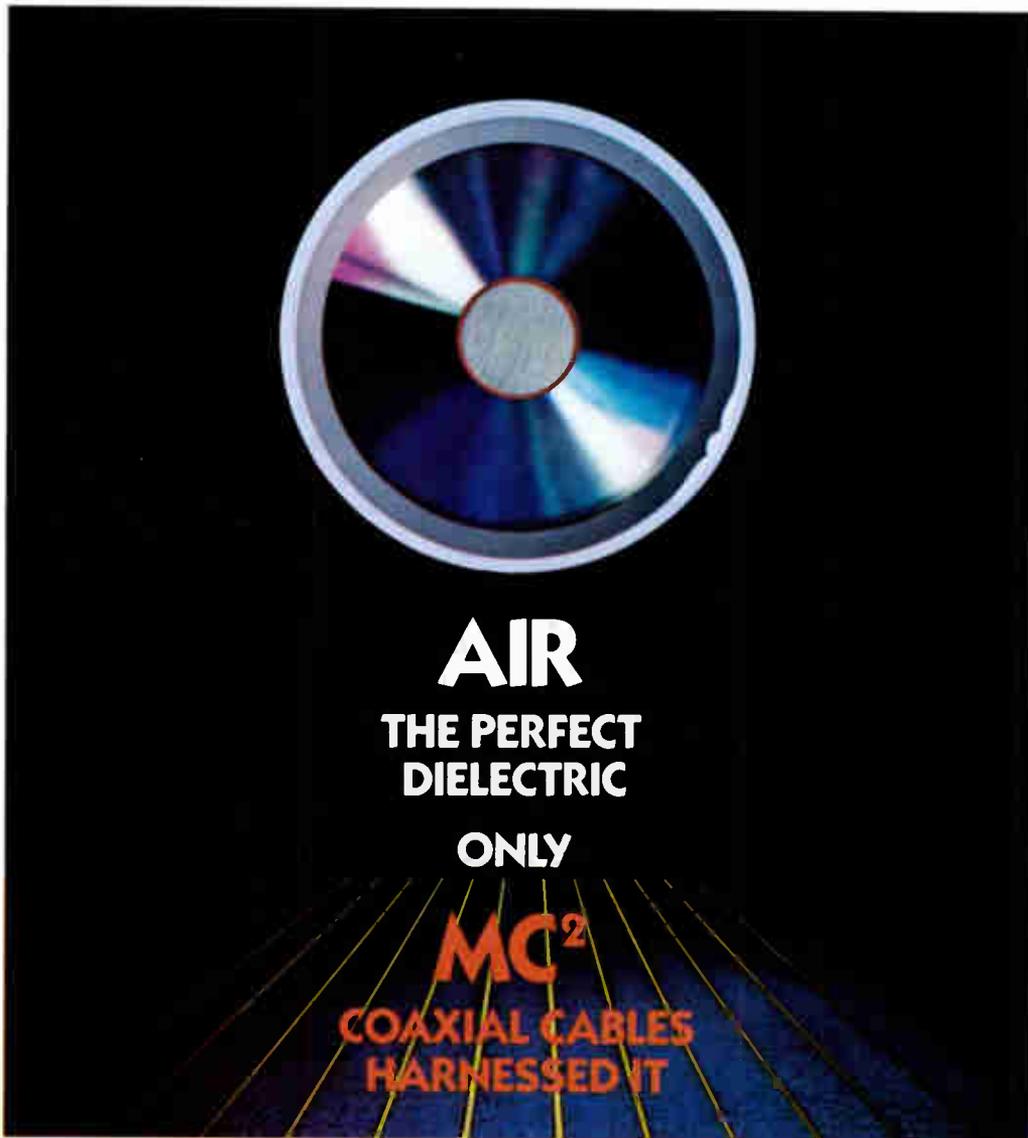

Magnavox's commitment to you extends beyond the sale. Our exclusive Mobile Training Center sets the standards for training in the industry by providing hands-on experience. And our technical publications give you clear and complete instructions.

Put our innovations and information to work for your system. Talk to your Magnavox account executive, or call toll-free 800-448-5171 (in NY State 800-522-7464); Telex 937329; FAX 315-682-9006.

Magnavox CATV Systems, Inc.
A North American Philips Company
100 Fairgrounds Drive
Manlius, NY 13104

TRIOLOGY LEADS IN TECHNOLOGY:

That unique achievement resulted in the only coaxial cable with 93% velocity of propagation. Which means the lowest attenuation over the longest distances. It means fewer amplifiers in new installations, and stronger signals with less noise in re-builds and upgrades. Cost-effectiveness in

all situations is significant.

And the polyethylene sleeve—totally bonded to sheath and disc spacers—assures superior handling characteristics. With MC², you don't have to trade off signal strength for tight bends and ruggedness.

Jerrold Starcom® VI WITH VOLUME CONTROL The Industry Standard

Only one addressable converter—Jerrold's STARCOM® VI (Model DPV5)—offers:

- VOLUME CONTROL
- RF SCRAMBLING
- IPPV-READY NOW
- VCR TIME-CONTROLLED PROGRAMMING
- STEREO COMPATIBLE

With features like these and the industry's largest installed base by far, it's no wonder almost everyone in the industry is trying to build "Jerrold compatible" converters. That's what makes Jerrold the industry standard.

For more information contact your Jerrold Account Executive, or call or write Jerrold Division, General Instrument Corporation, 2200 Byberry Road, Hatboro, PA 19040. 215-674-4800.

JERROLD

... Where innovation is a tradition

GENERAL INSTRUMENT

We're cooking with microwave

What a feast we have in store for you with this New Year's issue! Everything you've always wanted to know about microwave applications in cable. It starts with some well-prepared features and columns offering a smorgasbord of microwave topics, then moves on to a real treat: an expanded "Tech Book" by Ron Hranac, also about microwave. As I said, a feast.

But wait—the tempting finale, a pull-out chart compiled by Jones Intercable's Hranac and Paul Vadakin, displaying the frequencies for CARS band microwave. Suitable for posting on your office wall. Bon appetit!

Our philosophy

I think it's time we reiterated our philosophy at *CT*. To understand a topic (like microwave) fully, you've got to cover it thoroughly. That's what we've always done, from the very first issue in March 1984. We don't just "touch on" a subject, we go all out to give you the whole picture, from various points of view.

Besides the information contained in our "mini-handbook" on microwave, this month we also feature some excellent articles on tests and measurements.

And let's not forget our Western Show wrap-up. We've tried to present the major events: speakers, seminars, exhibits and products. This month we're highlighting some of the equipment that was introduced at the show, and we'll wrap it up in next month's product news.

Where else can you find all this? Right, nowhere else. So, those of you with a protective cover around your issue should take the time to fill out the qualification form and drop it in the mail post-haste. Go ahead, do it now. I'll be here when you're finished. This will keep you on our records and keep our records accurate. Thanks, you won't regret it.

Win a trip

On page 80 is something I think you'll find exciting—*CT*'s essay contest, our first ever. If you enter with a 250-word article on the topic "How does *Communications Technology* magazine best serve the cable TV engineering community and the SCTE" and are chosen by our panel of judges, you'll win an expenses-paid vacation for four to the 1987 Cable-Tec Expo in Orlando, Fla., April 2-5. And you'll get your essay printed in *CT*. But you don't have much time to enter: deadline is March 1.

The SCTE will open its new national headquarters in Exton, Pa., this month. This is indeed a move forward. Congratulations to Bill Riker and company. You'll read more about it next month.

I talked about this last month, but it deserves another mention. The SCTE national headquarters and its Chattahoochee Chapter are co-

sponsoring an engineering and technical management development seminar at the Holiday Inn Airport/South in Atlanta on Jan. 21-22. Speakers and panel moderators include Bob Luff of Jones Intercable, Cliff Paul of RTK and Wendell Bailey of the NCTA. For more information, contact Mike Aloisi, president of the Chattahoochee Chapter, at (404) 396-1333; or Guy Lee, (404) 451-4788. You still have time to attend.

This issue contains the complete information package for the SCTE Cable-Tec Expo '87, including a registration form. If you pre-register before March 2, you'll get in at last year's prices. So don't delay; this year's going to be another blockbuster event. If you want more information, circle #1 on the reader service card.

Closed-circuit to SCTE national members: you already should have received your election packet for nominating new officers. Please mail them as soon as possible. If you haven't received yours, or if you have questions, call Bill Riker at the SCTE, (215) 363-6888.

Finally, coming up in next month's *CT* will be an update of the SCTE's Outstanding Achievement Awards.

Well, that does it for another month. Enjoy your microwave issue!

Congratulations to David Wilhelm and Ruben Gonzalez, the first two recipients of the SCTE Technical Tuition Assistance Awards. Read more about it in this month's *Interval*.

LOW PRICED HIGH TECH FOR CATV.

THE 9630 RECEIVER.

Scientific-Atlanta's newest satellite receiver—the 9630—combines leading edge technology with modest cost.

UNQUESTIONABLE QUALITY.

No question about it. The name Scientific-Atlanta *means* unsurpassed quality, advanced electronics and superior design. And now we've packed all of this in a sleek, new package—the compact 9630 receiver. It's the most advanced offering yet for the CATV market.

COMPLETE FLEXIBILITY.

The 9630 gives you both C- and Ku-Band compatibility. In addition

to the standard 24-channel C-Band format, twenty programmable channel frequencies for Ku-Band let you receive at any transponder frequency—full or split, now or later. The 9630 operates from 950 to 1450 MHz IF frequency. It offers an optional block-down converter for use in existing LNA systems. It can be used with all present descrambling technologies, and even includes a key lock to secure operational settings.

Audio features of the 9630 are everything you could want—two standard demodulators with independent synthesized tuning, and a choice of normal or narrow bandwidths.

NEW AFFORDABILITY.

CATV operators are always looking for high-end equipment at a low-end price. Well, the search is over. The

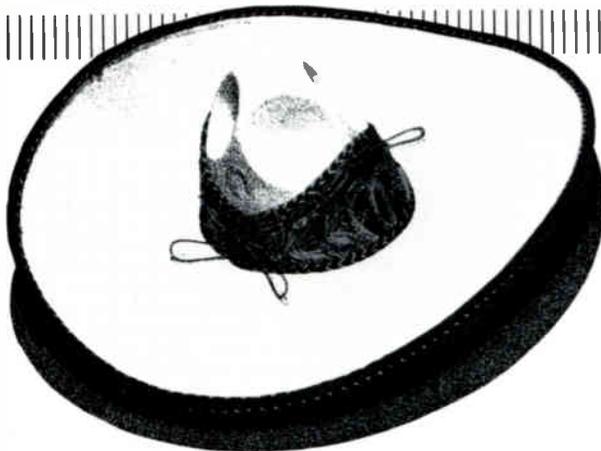

Scientific-Atlanta 9630 receiver gives you the best of both. Superior engineering and design in the 9630 make low cost possible without compromising quality.

SEE FOR YOURSELF.

The Scientific-Atlanta 9630 is the right receiver for right now. It comes with all the high quality, reliability, service and support you expect from Scientific-Atlanta. Get the whole story with one toll-free call to 1-800-722-2009. Or write to Scientific-Atlanta, Dept. AR, P.O. Box 105027, Atlanta, GA 30348.

Scientific Atlanta

The Texas Show

SCTE to coordinate Texas Show sessions

SAN ANTONIO, Texas—The Society of Cable Television Engineers (SCTE) will coordinate the technical panels for the upcoming Texas Cable Show at the San Antonio Convention Center Feb. 18-20. Sponsored by the Texas Cable Television Association (TCTA), the show also will include Broadband Communications Technician/Engineer Certification exams on Wednesday, Feb. 18 between 10 a.m. and 2 p.m.

SCTE technical panels and moderators, slated for Thursday, Feb. 19, are as follows:

10:30-11:45 a.m.—"Future TV sets," with Bill Riker (SCTE).

1:45-3 p.m.—"Rebuild vs. retrofit," with Tom Polis (Communications Construction Group Inc.).

1:45-3 p.m.—"Addressability," with Dan Pike (Prime Cable).

3:15-4:30 p.m.—"FCC update on technical issues," with Cliff Paul, consultant.

For more information, contact Bill Arnold, TCTA executive secretary, (512) 474-2082.

FCC postpones must-carry rules

WASHINGTON—Late last month the Federal Communications Commission postponed the effective date of its new must-carry rules, including the obligation to install A/B switches, pending review of petitions for reconsideration. The National Cable Television Association (NCTA), joined by the National Association of Broadcasters (NAB) and the Community Antenna Television Association (CATA) and later supported by the Television Operators Caucus, had asked the FCC to stay the A/B switch obligations and the five-year sunset provision. Others had requested a stay of the rules in their entirety. The commission's decision specifically denies all the requests but grants the relief requested—namely a postponement.

A recent report by NCTA concluded that the A/B switch requirement would have cost the cable industry almost \$1.4 billion over the next five years.

assets of Katek were bought for an undisclosed sum.

Jack Craig, former president of PTS Corp., will serve as president of the new company. Ron Katz, previously of RT/Katek, will serve as executive vice president and general manager of operations. PTS/Katek will operate 13 service centers nationwide, providing repair and sales of converters, amplifiers and distribution equipment.

Itel's acquisition of Anixter approved

SKOKIE, Ill.—The boards of directors of Itel Corp. and Anixter Bros. Inc. approved the acquisition of Anixter by Itel in a transaction valued at over \$500 million. In its offer, Itel has agreed to pay \$14 per share in cash for all Anixter common shares; Anixter currently has 36.4 million shares outstanding.

Anixter Bros. is a supply specialist for wire, cable and other products used in telecommunications, data and cable TV industries. Itel operates businesses in the cargo container, rail and marine dredging industries. Both companies are based in the Chicago area.

• The 1986 Industrial Research Institute's Achievement Award was presented to Dr. Robert Maurer of Corning Glass Works, Corning, N.Y. Maurer is credited with having developed the optical fiber that proved optical communications were possible. The institute is an association of 265 domestic and foreign companies established in 1938 to address problems confronting managers of industrial R&D.

• Sachs Communications Inc. is providing drop line installation training, aimed primarily at installers and technicians of companies using Sachs products. Consisting of slide and video presentations followed by a practical hands-on demonstration, training usually is done at the customer's office.

• Effective immediately, Eagle Cable Inc.'s new, enlarged facilities are located at 12135 "F" East 11th St., Tulsa, Okla. 74128, (918) 437-0666.

• Inwood Cable of Inwood, W.V., added two CARS band microwave relay paths to its existing 4.8-mile Channel Master Micro-Beam system. All three cable plants are linked to the service through microwave signals originating at the headend on Round Top Mountain, not by direct cable lines.

• Catel Telecommunications has moved to 4050 Technology Pl., Fremont, Calif. 94537-5122, (415) 659-8988. Its new toll-free number for calls outside California is (800) 225-4046.

• Comsearch Inc. has introduced testing and support services for compliance with FCC regulations on exposure to radio frequency (RF) radiation hazards. The company also is offering testing services for compliance with state and local laws and regulations and testing for use in connection with zoning and land use applications.

• Cabletek Center Products Inc. has moved to 850 Taylor St., Elyria, Ohio 44035; its phone number, (216) 365-3889, remains the same. The move comes after an increase in the OEM's business and the addition of new products.

• Pioneer Communications of America Inc. has relocated its corporate headquarters to 600 E. Crescent Ave., Upper Saddle River, N.J. 07458, (800) 421-6450. This does not affect the company's repair facility, sales support or cable engineering staff, all of which will stay in Columbus, Ohio.

• Burnup & Sims Cable Products Group has moved its national sales and marketing headquarters to 8000 E. Prentice Ave., Suite C-5, Englewood, Colo. 80111, (303) 694-6446. The company's Lectro Division has been awarded the power supply portion of the Philadelphia build from Comcast, consisting of 650 plant miles. Also, Burnup & Sims' Capscan Division has been awarded the cable portion of the Queens, N.Y., build from ATC, consisting of 450 plant miles.

• Power Guard Inc. of Hull, Ga., and Merit Communications Supply of Decatur, Ga., have reached agreement for Merit to be a national distributor of Power Guard standby and non-standby supplies.

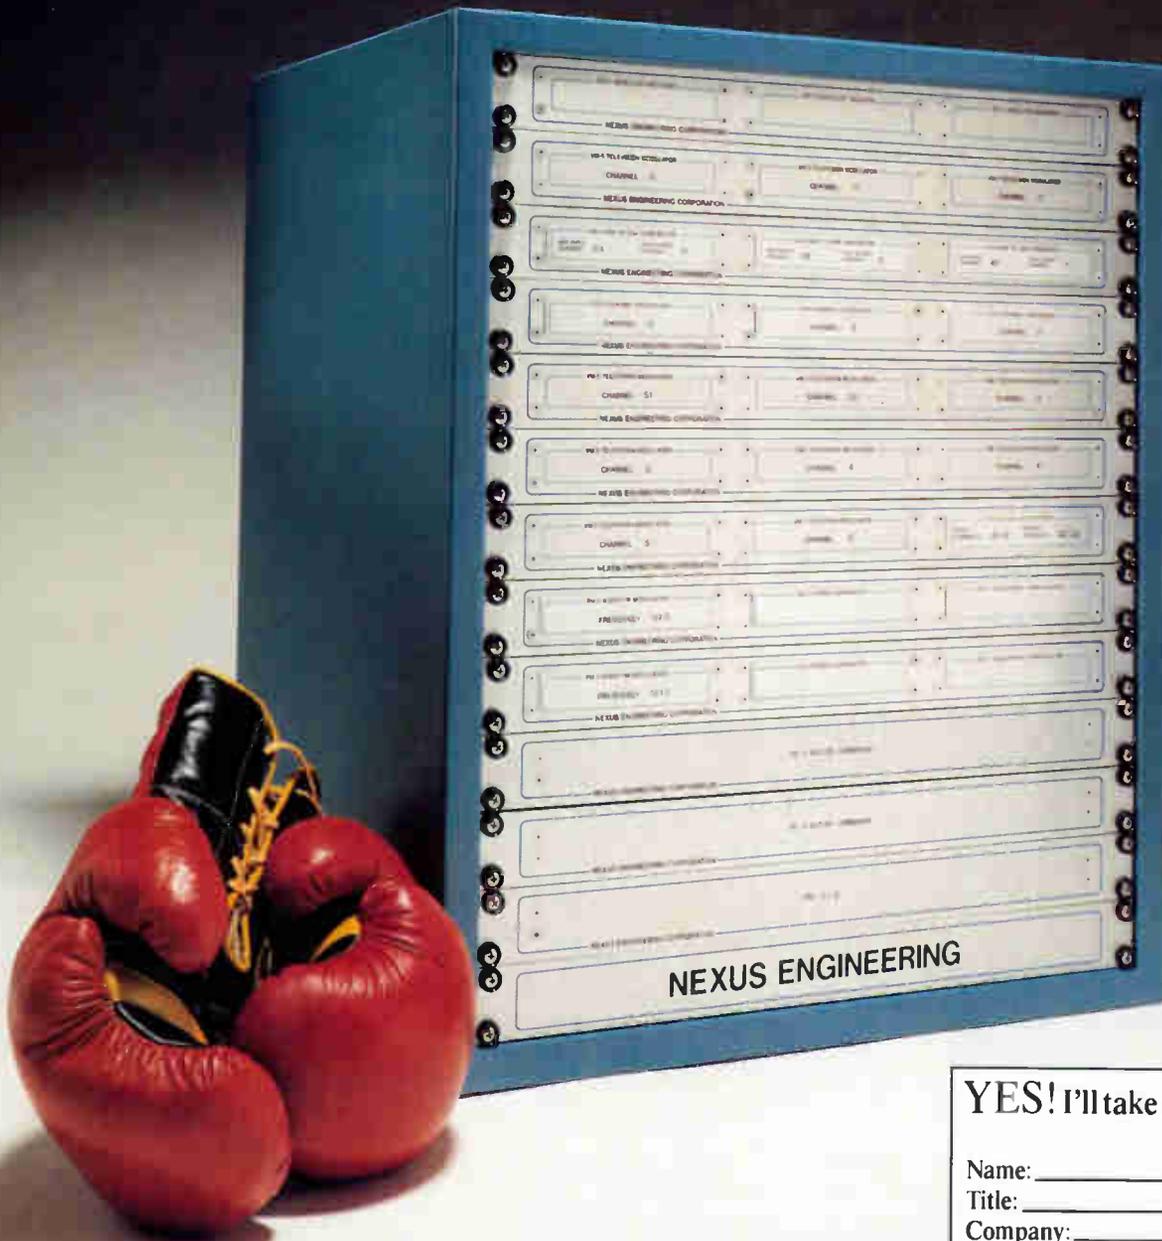

• Satellite Cable TV Corp. of Phoenix, Ariz., has changed its name to CableAmerica Corp. The MSO owns and operates over 35 cable franchises throughout the South, West and Midwest.

• Alpha Technologies Inc. has announced completion of its new facility, which will house the company's expansion in the telecommunications, computer and power supply markets, at 3767 Alpha Way, Bellingham, Wash. 98225, (206) 647-2360.

PTS Corp. announces acquisition of Katek

BLOOMINGTON, Ind.—PTS Corp., an electronics rebuilding firm, announced the acquisition of Katek from RT/Katek Inc. A new corporation has been formed under the name PTS/Katek. Terms of the acquisition were not released: all

Functional and scientific illiteracy

By Isaac S. Blonder

Chairman, Blonder-Tongue Laboratories Inc.

The extent of functional illiteracy, defined as the inability to read and write, is periodically discussed and researched with widely varying results. Estimates made by reputable sources range from 10 million to 60 million individuals who are performing below the eighth grade level. If illiteracy is restricted to the absolute inability to read or write at all, most studies point to 10 million souls whose only access to civilization is verbal. Expressed as a percentage of the U.S. adult community, 5.5 percent to 33 percent of your neighbors are destined for the underclass segment of our civilization.

In our wonderful land of opportunity and universal education, freedom from hunger, and social programs for every aspect of poverty, how does one arrive at adulthood without the necessary elementary three R's? The answers are legion and controversial, the remedial programs extensive, expensive and endless, but 10 million have confounded the authorities and they exist, a burden to themselves and society.

Thus, it seems as if most educational pundits,

when they issue their profound papers on our educational ills, zero in on the illiterates as the major challenge to our well-being and the arena in which one must fight bravely with unlimited funds and vigor.

A very minor role

Well, I for one disagree with this popular belief. Frankly speaking, the functional illiterates play a very minor role in our social fabric. No matter how complex and intricate our world can become, there always will be tasks that only need a live body doing physical work guided by verbal instructions.

To achieve the highest level of prosperity and good living for all, we should concentrate our educational efforts on the *scientific* illiterates among us.

The designation "scientific illiterates" is rarely mentioned. Perhaps I may be guilty of coining yet one more term. My description of a scientific illiterate is "a person who possesses the ability to gain an education in reading and writing but deliberately bypasses the study of science because it is too difficult or too demanding of his time that he might otherwise spend in the pursuit of pleasure." (Do not mistake my use of the masculine gender; the feminine contingent is historically even more reluctant to pursue the study of science.)

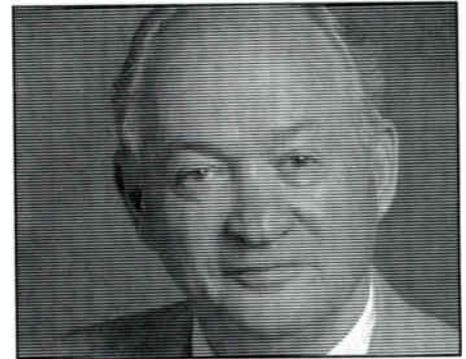

Once upon a time, probably ending in the '30s, our schools demanded attendance in predetermined curricula, without options, to achieve the old-fashioned concept of a rounded education.

Taking a nosedive

Apparently, following World War II, the students were allowed to elect their own menu of simplistic studies, the school year got shorter, the teachers unmotivated, and correspondingly the study of science took a nosedive. What few science courses survived were non-mathematical, full of entertaining tricks to entice the student to enroll and devoid of any solid material.

The inevitable result: Our upper echelon of intellectuals are scientific illiterates. They are the cream of our country, to whom we must look for leadership and prosperity, and what do they have to offer us? Scientific ignorance. Admittedly, I haven't taken the time to research this subject in detail and, as I have previously stated, it is not recognized and documented as our major educational disease. But we can look at some of the more obvious problems arising from it.

We all can agree that science increasingly is the basis of our standard of living and survival in today's world. Gone are the plowshare and the sword; instead, the computer and the laboratory determine our future. One would believe that our leaders must be knowledgeable in science to understand the new technology and thereby

able to competitively choose the path for the future.

Let us start with the judicial system. I have never seen a judge with a science education and, from my experience in the federal courts right through the Supreme Court, they all may be expert in law but are relatively as naked in scientific studies as the aforementioned functional illiterates who are unable to read and write.

How about Congress? It's full of lawyers, football players, basketball players and more lawyers. Can they decide on their own the wisdom of a legislative proposal on weapons, environment or the use of our scarce radiation spectrum? Not likely!

I believe there is one governor who is a scientist. He must feel lost in the company of his fellow governors, most of whom are scientifically illiterate lawyers.

Town fathers

If you still have the stomach for it, look at your town fathers, preponderantly lawyers in my own town, and I suspect the same is true in yours. I doubt if they voluntarily ever took a science course just to enjoy the thrill of learning how our universe is constituted. Yet our zoning laws, sewers, water and environment are dictated by these scientifically illiterate individuals.

Even our beloved Federal Communications Commission, which monitors one of the most difficult, demanding and technical tasks in Washington—the use of the radio frequencies—has not had an engineer as a commissioner since ancient times. Imagine the light that would glow in those hallowed halls, if by some miracle we had a new team composed of Bailey, Ciciora, Johnson, Taylor and Stern!

Thirty percent of college graduates go on to teaching. Judging by the flood of critical studies of teacher colleges appearing in our newspapers, standards are pitiful for graduation—and science courses are invisible. It seems that they are taught the technique of teaching without studying the subjects to be taught.

How can we persuade our students to forego the fleshpots of our decadent schools and study the 70 hours weekly that prevail in several work-oriented countries? I don't have the answer, but I can predict the result: The scientific illiterates will wind up with a living standard marginally superior to the functional illiterates.

Reader Service Number 7.

Agile Omni, the industry's most advanced receiver designed by the most relied upon name in the business... Standard.

With the new Agile Omni, you need no other receiver.

Standard designed it for cable TV operators, broadcasters, CATV, SMATV, and business and special teleconferencing networks—now and in the future.

An onboard microprocessor permits selection of any band available from domestic satellites, including the 32-channel ANIK C2. Channel tuning provides direct reading of the transponder-assigned channel number and a format control permits selection of six frequency band formats—24-channel C-band, SBS/USAT and Spacenet already installed. Select channel and format, and the microprocessor controls frequency, channel spacing, transponder bandwidth, audio

frequency and bandwidth, and antenna and video polarity—automatically.

Omni's flexible design can handle up to three separate subcarriers including stereo programming or data. Omni also will accept descrambling modules—eliminating the need for expensive add-on descramblers.

For CATV and SMATV applications, severe microwave terrestrial interference is minimized by optional internal SAW notch filters, automatically programmed to switch in. A 30 MHz low DG/DP LC bandwidth filter is standard, and a second internally installed optional filter of 18, 22, 26, or 36 MHz bandwidth can be controlled by the microprocessor, or manually switched.

Standard's proven RF

loop-thru circuitry and blockdown conversion technology combine, with better image rejection and lower differential gain and phase, to provide excellent video performance. C/N threshold is an impressive 6.5 dB at the wide 30 MHz bandwidth.

Agile Omni is an affordable, flexible receiver designed to keep you in business, a commitment Standard backs with its unique 5-year warranty program. Contact us for further information.

 **Standard**

(In Calif. 800/824-7766, ext. 275)

Engineered to a new Standard

Operating functions including MGC, AGC, AFC, level sets, normal/invert video, clamp/unclamp video, skew, subcarrier frequency selection, vid. 0 and P test points are conveniently located on the front panel. Meter reads C/N ratio, signal strength or center line.

Format control enable selections of desired satellite system. Direct-reading channel selector displays transponder-assigned channel. Second selectable subcarrier and space for optional third subcarrier of descrambler modules.

Boosters for CARS band microwave systems

By Eric G. Pastell
And Dr. Thomas M. Straus

Hughes Aircraft Co., Microwave Products Division

Broadcasters for years have used two types of radio relay devices, active and passive repeaters, to circumvent obstacles in the transmission paths of studio-transmitter links (STLs) and intercity relay (ICR) stations. Passive repeaters require no power input and simply change the direction of the microwave signal in the same way a mirror reflects a beam of light. Active repeaters not only redirect the signal, but also amplify and retransmit it on a different frequency than the received signal.

In March 1984 the Federal Communications Commission authorized the use in the United States of nontranslating active repeaters, called *boosters*, for all broadcast auxiliary microwave services¹. A booster is a class of unattended fixed relay station whose output frequency is the same as the input frequency. Microwave boosters possess characteristics of both active and passive repeaters in that they simply amplify the signal and use the same frequencies for both reception and retransmission. Boosters previously have been used in the VHF and UHF bands to retransmit the signals of a primary broadcast station to an area otherwise unable to receive it. By its action, the FCC sought to make boosters available as a low-cost and spectrum-efficient alternative to the problem of microwave path obstruction.

Steady improvements in gallium arsenide (GaAs) FET (field-effect transistor) technology over the past few years have led to the development of advanced low-noise Ku-band GaAs FET devices with the gain, bandwidth and power necessary for 13 GHz microwave applications. These devices are used to produce both low-noise amplifiers (LNAs) with noise figures in the order of 3 dB and linear broadband power amplifiers with 1 dB compression in excess of 1 watt.

Hardware description

In its simplest form, the booster is just a 2 watt GaAs FET amplifier with input and output isolators, harmonic and band-limiting filters, and power supply housed in an outdoor enclosure. Figure 1 shows the block diagram of this basic configuration. The power amplifier provides a nominal 28 dB of gain and a 3 IM intercept point of 41 dBm with an 11 dB noise figure. The input filter limits potential interference due to out-of-band signals that may leak into the booster input through a side lobe of the receive antenna. The 12 volt power supply is a DC-to-DC converter that accepts an unregulated 19 to 35 volt input from either a standard DC supply or from a solar power source when the booster is located in a remote environment. The booster is packaged in a modified CATV trunk amplifier housing.

The performance of the basic booster can be improved by adding a low-noise driver amplifier

Figure 1: Basic microwave booster

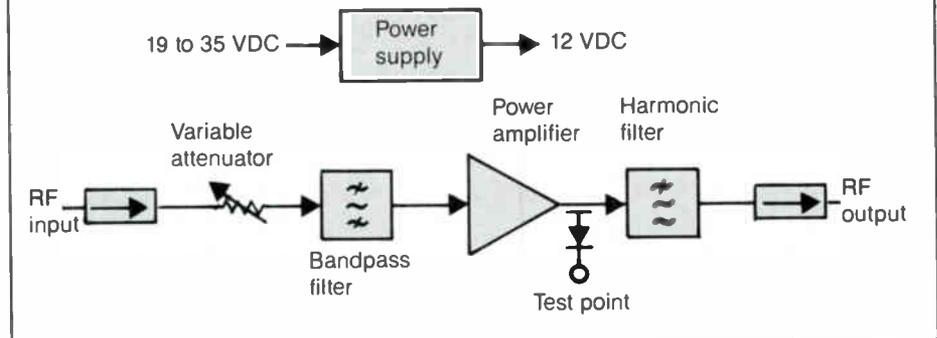

Figure 2: Microwave booster with LNA

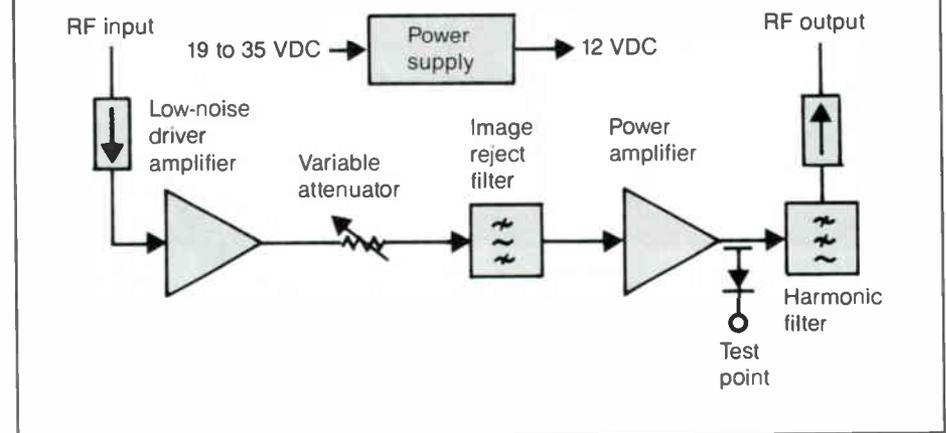

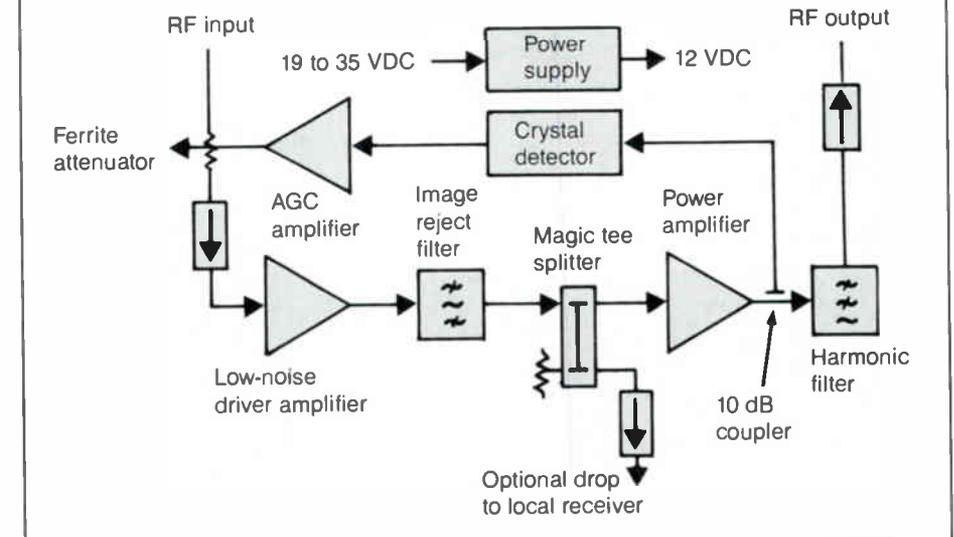

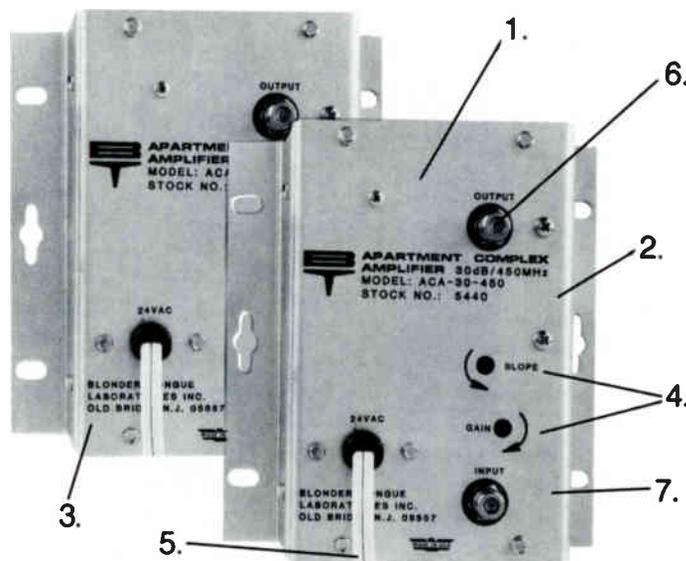

Figure 3: Microwave booster with AGC and local drop

Why Use Anything Else?

BLONDER-TONGUE

has the broadband distribution amplifier with ALL the features you need and then some.

Only Blonder-Tongue's ACA Apartment Complex Amplifier has all these features to satisfy your system's requirements for a low profile, compact, cable-drop fed amplifier.

1. -110dB radiation shielding to prevent interference and meet stringent FCC anti-radiation rules.
2. Sturdy, lightweight aluminum chassis provides superior heat dissipation for component reliability.
3. The Blonder-Tongue ACA is available in two models to meet your specific requirements. Take your pick of 40 MHz to 300 MHz bandwidth or 40 MHz to a full 450 MHz.
4. Continuously adjustable slope and gain controls are located on the front panel for easy setting.
5. External, UL listed power transformer with a six-foot cord.
6. Output Level (dBmV) from 48 to 63 depending on Bandwidth used.
7. The ACA takes only minimum mounting space — (2" x 5 $\frac{3}{8}$ " x 5 $\frac{5}{8}$ ")

And that's not all!!! The Blonder-Tongue ACA has 32dB of gain hybrid IC circuitry for high output with low distortion and line transient protection.

ahead of the power amplifier to increase the overall gain of the unit and lower its noise figure. The driver amplifier is either a single- or dual-stage GaAs FET LNA with a nominal gain of 7 or 15 dB, respectively, and a noise figure less than 4 dB. Figure 2 shows this configuration.

Although the power amplifier's contribution is not entirely negligible, the noise figure of the driver amplifier and the subsequent overall booster gain primarily determine the output noise of the booster. On the other hand, the overall 3 IM intercept point of the booster is determined primarily by the output amplifier with only a small degradation introduced by the LNA. In applications where a local signal drop is desired at the booster location to feed a receiver, a magic-tee power splitter is inserted between the filter and output amplifier. In this case, the filter serves to reject the LNA image frequency noise⁴, as well as to limit the frequency band of the otherwise wideband FET amplifiers. When the magic tee is added, the overall gain of the booster is decreased 3 dB, but the noise figure is degraded only slightly because the splitter loss follows the gain of the driver LNA.

An optional microwave AGC (automatic gain control) circuit further improves the overall performance of the booster and increases its utility. A simplified block diagram of the booster with optional two-stage LNAs and AGC is shown in Figure 3. The AGC is designed to maintain a constant output level for up to a 25 dB range of incoming microwave signal. In AGC, the booster C/N (carrier-to-noise) and third-order distortion are constant. The usual two-for-one tradeoff of these two parameters is obtained by adjustment of the AGC set point. The AGC adjustment sets the output C/N of the booster under unfaded conditions to a constant value that can be varied between about 50 to 60 dB.

The AGC circuit operates in the following manner: The output of the booster is sampled by a 10 dB coupler and fed to a temperature-compensated crystal detector, which supplies a control voltage to an AGC amplifier. The insertion loss of a ferrite attenuator at the input of the booster is controlled electronically by the AGC amplifier to maintain a constant input signal level to the LNA. In practice, the AGC range is determined by both the maximum signal level available at

the input of the booster and the selected AGC set point. Although AGC is not provided in Figures 1 and 2, the selection of the clear-weather operating point can be fine-tuned by the attenuator setting. Table 1 summarizes key specifications including the nominal gain of the various booster configurations when the attenuator is set for minimum loss.

Booster applications

Boosters primarily are used for redirecting or "bending" microwave signals around obstruc-

tions such as buildings, trees and hills. In this application, they provide an efficient alternative to the construction of additional microwave repeater stations, with substantial savings in both cost and spectrum since they are non-translating amplifiers.¹

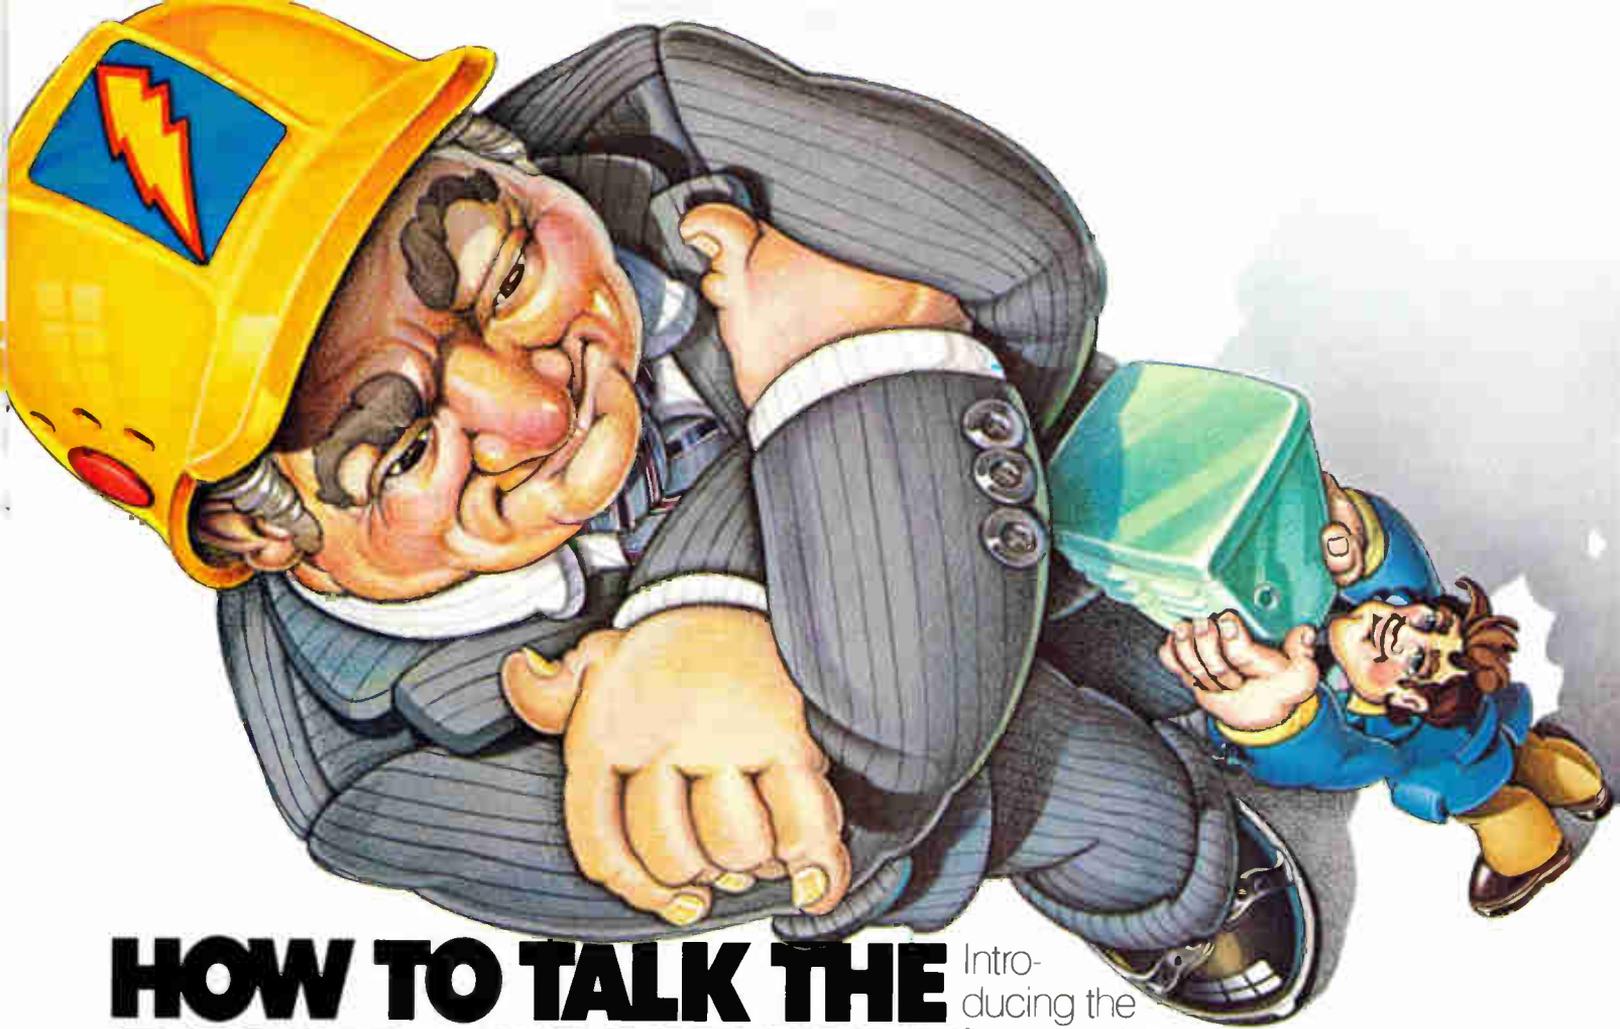

As active devices, boosters also can provide performance and cost advantages over passive reflectors. For the CARS band at 12.8 GHz, a booster with a nominal gain of 40 dB used with two 8-foot antennas has about 30 dB more overall system gain than a small passive reflector, and

HOW TO TALK THE POWER COMPANY INTO LOWERING YOUR BILL 10%.

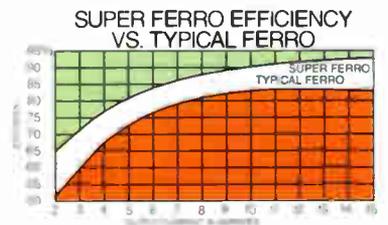

Introducing the first superferroresonant power supply—the new Lectro **Super Ferro**.

It's a radical improvement in power supply technology. It operates 10% more efficiently than most power supplies available until now.

For example, the **Super Ferro** is 93% efficient at normal load factor (see graph at right). Take that news to your power company, and you've got a powerful argument for a 10% saving in your power bill.

We've put together test results to help you prove the increased efficiency of the **Super Ferro** to even the most skeptical utility company.

Call **1-800-551-3790** or write today for complete details and test results. Because that 10% would look better on your bottom line than on your power line.

Super Ferro Outperforms The Average Power Supply At Every Load Factor

THE NEW LECTRO SUPER FERRO BY LECTRO

about 10 dB more far-field system gain than the largest practical reflector size of 30 by 48 feet. Moreover, the gain of a reflector decreases as the included angle between the incident and reflected signal increases. At a 130° angle, the booster exhibits an additional 7.5 dB advantage over the passive reflector. For angles greater than 130°, double passive repeaters normally are required.

A secondary use for a booster is to extend the length of a microwave path to expand a system, especially from an established receiving station. In this application the optional splitter is used to provide a local microwave drop to feed the receiver, and the booster is equipped with a two-stage LNA. Thus, an existing receiver automatically benefits from the addition of the LNA in the booster (usually with AGC), which lowers the receiver's effective noise figure. A booster also may be used to implement two tandem links in some applications where a direct path proves slightly longer than practical, or where tower heights at the end stations are limited.

In planning two tandem paths using a booster, care must be taken to prevent the possibility of overreach interference.⁵ This occurs when the signals from the transmitter on the first link reach the receiver on the second link, causing frequency-dependent constructive or destructive self-interference. In many cases, overreach is prevented by physical terrain blockage between the end stations. For site configurations where line-of-sight can exist, the system should be designed to provide at least a 40 dB carrier-to-interference ratio into the receiver. This design goal easily can be achieved by antenna discrimination if the two links are assigned opposite polarizations, and the transfer angle at the booster repeat station (i.e., change in azimuth) is kept greater than about 10° so that the two links are not almost directly in line.

In all booster applications, the input and output antennas must be isolated from each other to prevent uncontrolled feedback. To ensure that the amplitude ripple induced by self-interference is less than ±0.1 dB, this port-to-port isolation should be at least 40 dB greater than the nominal booster gain. Thus, if the booster gain is 40 dB, 80 dB of near-field antenna isolation is required. The near-field isolation between two parabolic antennas mounted on the same structure does not vary significantly with their sizes or polarizations, but depends on their azimuth difference and physical spacing. For all practical CARS band applications, antenna isolation of 80 dB is readily achievable, and usually the isolation will be about 100 dB.

When designing a microwave link with a booster, care must be taken to balance noise, CTB (composite triple beat) and operating power levels in order to maintain acceptable performance standards for the overall system. Power output levels usable for moderate path lengths can be obtained, provided waveguide losses are kept to a minimum. Table 2 summarizes booster output levels for a composite triple beat specification of 65 dB. The output power of the booster can be increased at the expense of CTB, as shown in Figure 4. Just as with CATV amplifiers, a normal two-for-one tradeoff exists. All CTB performances are specified with CW (continuous

Your next trencher.

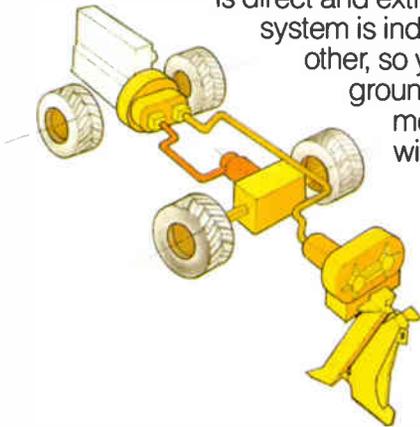

If it isn't a Case,

here's what you'll be missing.

Total control.

Case offers you standard dual hydrostatic drive — one to power attachments, one for ground drive. Power metering for both functions is direct and extremely precise. Each system is independent of the other, so you can vary ground speed to accommodate soil conditions without disturbing your plow or chainline speed — or vice versa.

Hydraulically articulated steering lets you maneuver easily, too.

Isolated plow vibration.

Our unique eight-point suspension and hinged drop chute with removable gate isolate vibration from the machine and cable. Service loops can be restrung without cutting or splicing. And only Case offers a front trencher, rear plow combination.

Underground versatility.

Your Case trencher is more than just a trencher with our backhoe, Hydra-borer® or cable layer attachments. Case versatility also lets you mount most of these primary tools front or back.

Maneuverability. Warranty. Faster restrung. Attachments. Four Case advantages.

See your Case dealer today and get the trenching edge that comes with a Case.

The other half of the warranty.

Most manufacturers back their trenchers with a ninety-day warranty on parts only. But the warranty on Case trenchers covers both parts and labor for six months. Your Case dealer also offers one-stop service.

wave) carriers just as for CATV amplifiers. If the specification were in terms of NTSC modulated carriers, either the CTB would appear to be an 8 to 12 dB better number, or the output power would be 4 to 6 dB higher^{3,6}, but the actual transmitter performance would, of course, not improve. Thus, up to 6 dB additional power output is obtainable if the Canadian Department of Communications BP-23 measurement is applied in place of the CW carrier technique⁷.

The maximum allowable input level for boosters without AGC is just the maximum output level (based on allowable CTB) less the overall (adjustable) gain of the booster. This is also the required clear-weather input level for purposes of obtaining the desired output. For a booster with AGC, the normal two-for-one tradeoff between

'In all booster applications, the input and output antennas must be isolated from each other to prevent uncontrolled feedback'

C/N and CTB can be made by adjustment of the AGC set point.

One example of a typical booster application is summarized by Table 3. In this instance, the basic microwave booster configuration of Figure 1 is utilized. The primary 10-mile path is fed by

an MTX-132 transmitter with 35 channels. The booster "bends" this path and extends it by three miles to an AML (amplitude modulated link) receiver equipped with an internal single-stage LNA. Note that the net CTB is greater than 72 dB and C/N is almost 52 dB in clear weather. If either portion of the path fades, the C/N will degrade 1 dB for each dB of rain or multipath attenuation.

A second example utilizes the booster configuration of Figure 3, which includes a two-stage driver LNA and AGC. The results are summarized in Table 4. In this example, a two-stage LNA also is used at the receiver, outside of its AGC loop for the lowest possible noise figure. The CTB of the receiver and its external LNA will further degrade the CTB generated by the booster. Overall system CTB is calculated by first separately voltage-adding the VHF and microwave contributions, and then power-adding the resultant sums.

In this example, the AGC would hold the repeater output constant for 11 dB rain fade while maintaining the repeater C/N and CTB constant at the desired clear-weather values. Without the AGC option, the repeater input must be padded down (i.e., use smaller antennas) or the repeater gain reduced. In either case, the overall link has much more "outage" time for C/N less than 35 dB, and perhaps even more significantly much more time with C/N in the 35 to 43 dB region where overall cable system quality would be noticeably degraded. This example shows that a repeater with AGC is particularly useful when the first leg of the microwave path is much longer than the second, and when the received signal level at the repeater site can be much higher than -47 dBm.

Useful tools

CARS band microwave boosters are low-cost non-translating microwave amplifier stations that can be useful tools in overcoming problems of path obstructions. The booster characteristics including gain and noise figure should be matched to the application. Features such as microwave AGC and a local drop to feed a receiver can be provided. The design of a microwave link using a booster depends on a number of factors and involves tradeoffs in gain, output power, C/N and CTB performance. Careful engineering is required to optimize the overall system design.

This article was presented as a paper at the 1986 Canadian Cable Television Association convention and expo in Vancouver, B.C.

CABLE-TEC EXPO 1987 AND ANNUAL ENGINEERING CONFERENCE FACT SHEET

DATES: Annual Engineering Conference, April 2, 1987

Cable-Tec Expo, April 3-5, 1987

LOCATION: Hyatt Orlando Hotel - Orlando, Florida

HISTORY: Cable-Tec Expo '87 is the fifth annual convention/tradeshow sponsored by the Society of Cable Television Engineers, Inc., combining a wide variety of technical programs, hands-on training and breakout technical workshops with non-commercial hardware exhibits. The Annual Engineering Conference will be the SCTE's eleventh yearly conference dedicated to current engineering issues, FCC compliance and technical management. In addition, the Society has presented more than 60 technical programs in cities across the United States over the past fifteen years, attended by more than 11,000 engineering and technical personnel from the broadband communications industries.

ATTENDANCE: Attendance is open to individuals within the CATV industry as well as anyone involved in the broadband communications industries. Over 1,000 registered attendees are expected from all levels of the cable television and related businesses: persons engaged in engineering, construction, management, design, installation, technical direction or administration of cabled broadband, microwave, broadcasting, satellite, institutional, telephone, data or closed-circuit communications systems; persons employed by educational institutions, federal, state and local governments, regulatory agencies and related trade organizations are invited.

PROGRAMS: The Annual Engineering Conference will be packed with six hours of technical and management papers presented by many of the industry's engineering leaders. The annual membership meeting, scheduled during the conference luncheon, will afford attendees the opportunity to meet members of SCTE's Board of Directors. Awards also will be presented at the luncheon for "Member of the Year," as well as the "President's Award."

The 2½ day Cable-Tec Expo follows the Annual Engineering Conference and combines practical workshops with "hands-on" technical training and hardware displays. The format features many schoolroom style workshops to choose from. No other activities are scheduled during workshop sessions in order to guarantee maximum attendance and participation.

EXHIBITS: The exhibit floor has been designed to provide industry suppliers with the opportunity to present live technical demonstrations of their products in a relaxed and non-commercial atmosphere.

Over 100 hardware exhibitors are expected to participate in the 1987 Cable-Tec Expo. Exhibits will include all types of products, supplies, services and equipment used in the design, construction, installation, repair, maintenance and operation of cable television systems. The exhibit floor will also feature a Technical Training Center for further equipment demonstrations.

SPECIAL EVENTS: The Florida Cable Television Association and SCTE's Florida Chapter will sponsor a welcome reception on April 2. NASA space shuttle commander Paul Weitz will be guest speaker during the Engineering Conference. Friday night, April 3, features the main social event — the Expo Evening — at Medieval Times. Dress for the Expo Evening is casual. Scheduled for Sunday, April 5, is the administration of Broadband Communication Technician and Engineer (BCT/E) Professional Designation Certification Program examinations. In addition, a special "Behind the Scenes" tour of technologies employed by Walt Disney World and Epcot Center will be available to Expo attendees at an extra charge (see registration form).

PRELIMINARY PROGRAM

Engineering Conference

- Lightning and Grounding
Dr. Rodney Bent, Consultant for NASA
- Consumer Interface Issues
Making Cable Compatible
- A Technical Evaluation of Competing Technologies
DBS, MMDS, SMATV, VCR
- Developing a Corporate Training Program
- *Guest Speaker - Paul Weitz, Space Shuttle Commander

Expo Workshops To Include:

- Ku Band Technology and TVRO Calculations
- A Working Class on Cable System Design
- Headend Antenna Theory and EMI Reduction
- Performing Measurements on Basic Test Equipment
- BCT/E Certification Program Review Courses
- Baseband Video Test Equipment Measurements and Modulator Alignment
- A Technical Evaluation of Pay TV Security
- Q. and A. Session with FCC Engineers
- *PLUS MUCH MORE!

SCHEDULE OF EVENTS

Wednesday, April 1, 1987

5:00 P.M. - 8:00 P.M.

Annual Engineering Conference
Registration

7:00 P.M. - 11:00 P.M.

Expo Evening

Thursday, April 2, 1987

8:00 A.M. - 9:00 A.M.

Conference Registration

Saturday, April 4, 1987

8:30 A.M. - Noon

Hands-On Workshops

9:00 A.M. - 5:00 P.M.

Engineering Conference and
Annual Membership Meeting

Noon - 5:00 P.M.

Exhibit Hall Open

4:00 P.M. - 8:00 P.M.

4:00 P.M. - 5:00 P.M.

Exhibitors' Reception

6:00 P.M. - 8:00 P.M.

Welcome Reception (sponsored by
the Florida Cable Television Association
and the SCTE Florida Chapter)

Sunday, April 5, 1987

8:30 A.M. - Noon

BCT/E Certification Program
Examinations

Friday, April 3, 1987

8:00 A.M. - 4:00 P.M.

Registration

9:00 A.M. - 12:30 P.M.

"Behind the Scenes" technical tour of
Walt Disney World (optional at extra
charge — 200 persons maximum)

8:30 A.M. - Noon

Hands-On Workshops

1:30 P.M. - 5:00 P.M.

"Behind the Scenes" technical tour of
Walt Disney World (optional at extra
charge — 200 persons maximum)

Noon - 5:00 P.M.

Exhibit Hall Open

CABLE-TEC EXPO '87 REGISTRATION FEES UNCHANGED FROM 1986

	Until March 2, 1987		On-Site	
	MEMBER	NON-MEMBER	MEMBER	NON-MEMBER
Engineering Conference and Expo*	\$195.00	\$350.00	\$215.00	\$370.00
EXPO only**	\$145.00	\$250.00	\$165.00	\$270.00
Engineering Conference only	\$120.00	\$200.00	\$140.00	\$220.00
Spouse Registration*		\$ 95.00		\$ 95.00

ADMISSIONS: Admission to all events will be color coded badges received at the registration desk upon arrival

* Includes tickets to the Membership Luncheon and Expo Evening

**Includes 1 ticket for the Expo Evening. Additional tickets are available at \$50.00 each.

Lunch Service at special prices will be available Friday and Saturday on the exhibit floor for your convenience.

TRANSPORTATION: SCTE has designated Eastern Airlines and United Airlines as the Expo's official air carriers. Discounted coach and "Supersaver" air fares have been arranged and National Rent-A-Car is offering special rates to attendees (see enclosed brochures). Transportation from Orlando Airport to the hotel can be economically gained through Airport Limousine Service (located near the baggage claim) for approximately \$8.00

PLEASE NOTE — Although you may be able to locate equally priced air fares through your local travel agency, SCTE receives credit for all flights booked through the toll-free numbers listed in the enclosed brochures — even if your travel agent uses them to make your reservations. Your doing so will help us greatly by cutting costs in flying out engineers from the FCC and instructors for Expo workshops. Additionally, your local travel agent can receive an additional 5% OFF Supersaver fares on United by ordering your tickets using these toll-free telephone numbers.

LODGING: The Hyatt Orlando Hotel is offering special attendee room rates
*Single - \$69.00
*Double - \$79.00 (up to four persons)

Double rooms shared by two for the unbeatable rate of \$39.50 per night per person. Please make reservations directly through the Hyatt Orlando. Please use the enclosed reservation card for your convenience. **HOTEL RESERVATIONS MUST BE MADE BY MARCH 1, 1987**

ENTERTAINMENT: The Orlando Visitors Bureau will provide attendees with guides to area dining, nightlife and sightseeing activities. Spouse programs will also be available on April 2, 3 and 4.

SPONSOR: Society of Cable Television Engineers
P.O. Box 2389
West Chester, PA 19380
(215) 363-6888

INSTRUCTIONS

1. **Deadline:** Cable-Tec Expo '87 Registration Forms must be received by SCTE National Headquarters on or before March 1, 1987. Forms received after that date cannot be processed and will be returned to sender. If you do not pre-register for the Cable-Tec Expo in advance, you must register on-site in Orlando.

*Use a separate form for each individual (forms may be copied).

**Appropriate registration and activity fees must be enclosed for this form to be processed.

*Hotel reservations must be sent directly to the Hyatt Orlando Hotel and must be received by March 1, 1987. (This is prime vacation season in Florida and no rooms will be held after this date unless registration cards are received.)

2. **Registration Cancellations:** All cancellations must be received in writing by SCTE National Headquarters on or before March 15, 1987. Substitutions will be accepted until March 25, 1987. A \$50.00 cancellation charge is applicable to all registrations cancelled after March 1, 1987. **NO REFUNDS WILL BE GRANTED AFTER MARCH 15, 1987.**

3. Telephone requests for cancellations and substitutions will not be accepted by the SCTE National Headquarters. All requests for cancellations must be submitted in writing and received before March 15, 1987 and all requests for substitutions must be received before March 25, 1987.

4. Return the Cable-Tec Expo 1987 pre-registration form with the appropriate registration fees to:

SCTE
P.O. Box 2389
West Chester, PA 19380
(215) 363-6888

5. Please make flight reservations through Eastern Airlines at 800-468-7022 or United Airlines at 800-521-4041. Rental car reservations may be made through National at 800-328-7949.

6. All correspondence concerning hotel reservations should be made directly with the Hyatt Orlando Hotel at 305-396-1234

I hereby apply for membership in the Society of Cable Television Engineers, Inc., and agree to abide by its by laws. Further member materials will be mailed to me within 45 days. Payment U.S. Funds is enclosed. I understand dues are billed annually.

SCTE is a 501(c) (6) non-profit professional membership organization. Your dues may be tax deductible. Consult your local IRS office or tax advisor.

INNOVATION IN ACTION SPECIAL "BEHIND THE SCENES" TECHNICAL TOUR OF WALT DISNEY WORLD

At a press conference on November 25, 1965, Walt Disney announced his plans and dreams for a whole new "Disney World" to be developed in central Florida. On his 27,443 acres of property he would build a Vacation Kingdom with themed parks, resort hotels, campgrounds, golf courses, a shopping village, and a wide variety of recreational opportunities for vacationing guests.

Walt Disney also saw his Florida Project as a testing ground for new ideas and technologies; an innovative community that could serve as a model of the American free enterprise system. Numerous exciting and innovative projects, both on stage and behind-the-scenes, have helped make WALT DISNEY WORLD (to quote Architectural Digest Editor, Peter Blake) "the most creative piece of urban planning in America."

At last, the spirit of those technological and creative innovations has been captured and capsulized in a three and one-half hour program that takes you behind the scenes where Walt Disney's philosophy is being applied on a day-to-day basis, managing the world's number one tourist destination.

Itinerary

Opening Presentation

Drawing upon documentary film footage and slides, the opening session of the workshop recounts events leading to the announcement of the Florida Project. The construction and development of the Vacation Kingdom are highlighted, and innovative systems behind the scenes are introduced.

Field Trip

The field trip portion of the workshop gives you a chance to visit many of the interesting aspects of our operation that work behind the scenes to produce the "show" that guests enjoy onstage.

Tunnel/Utilidor — Nine acres of basement and one mile of corridors lie beneath the Magic Kingdom Theme Park. This area houses the utility system for the Magic Kingdom, offices, studios, break areas, and maintenance shops. It also provides underground access for employees and materials to get to locations throughout the Magic Kingdom.

Wardrobe — WALT DISNEY WORLD operates the world's largest working wardrobe, where costumes of all shapes, sizes, and descriptions are designed, maintained, and issued to employees.

Topiary Garden, Tree Farm and Nursery — WALT DISNEY WORLD is noted for its beautiful landscapes and gardens. This 120 acre operation supports the growing areas on stage, by growing and acclimatizing plants prior to their installation in the Theme Parks.

Production Center — The central staging area for all Magic Kingdom live entertainment, the Production Center houses rehearsal stages, set production workshops, and parade floats.

Vista United Telecommunications — One of the nation's most advanced telecommunications systems, Vista United supports all telephone, video, and data communications on the property. Vista's numerous firsts include the first commercial installation of fiber optic cable, the first totally electronic switching system in the United States, and the first 911 emergency system in the State of Florida.

Special Notes

*This workshop involves backstage areas; it does not tour Magic Kingdom or EPCOT Center attractions.

*Because of the nature of this program, the tour is limited to those age 17 and over.

*Reservations for the tour are limited. All tickets must be reserved and paid for using the attached Expo Reservation Form. Tickets will not be available on-site.

CABLE-TEC EXPO REGISTRATION

Everyone must register. ID badge must be worn and visible at all times in workshops and on the EXPO floor. To avoid delay, fill in all information requested. Full and complete payment must be sent with this registration form. Use Official Hotel Form for room arrangements.

Registration Fee includes technical workshops, EXPO and hospitality/entertainment event. SCTE Individual Active, Senior and Charter Members must provide Member ID Number. New Individual Members applying with registration, must attach SCTE Member Application and payment of dues. If you wish to register more than one (1) person, please make copies of this form.

Spouse registration may be made on-site.

How to adjust FML microwave transmitter deviation

So often when maintaining FM microwave transmitters, it's all too easy to check output power and frequency, and make sure 1 volt of video is present at the transmitter's baseband input. But somewhere in the shuffle, deviation just doesn't get checked. This article addresses a method of setting FM deviation—one that is relatively easy and extremely accurate.

By Ron Hranac

Corporate Engineer, Jones Intercable Inc

Frequency modulation (FM) is a communications technique developed some 50 years ago to overcome the problems of noise and static common to amplitude modulation (AM) communications. In FM, the modulating intelligence is conveyed by changing the frequency of an electromagnetic signal, as opposed to AM, where amplitude variations represent the transmitted intelligence.

The amount of carrier frequency change, or deviation in an FM signal, corresponds to the amplitude, or strength of the modulating signal. The rate of carrier deviation corresponds to the frequency of the modulating signal. For example, a strong modulating signal will cause the frequency deviation to be larger; the higher the frequency of the modulating signal, the more rapid the deviation will be.

AM signals contain a pair of sidebands for each modulating frequency, but an FM signal theoretically can contain an infinite number of sidebands, each spaced at integral multiples of the modulating frequency. Because of the deviation of FM carriers and their sideband content, FM signals generally occupy more bandwidth

'Insufficient deviation results in ineffective use of the RF spectrum'

than their AM counterparts. FM bandwidth can be estimated by Carson's rule, which states:

$$\text{Bandwidth} = 2(f + \Delta F)$$

where f is the maximum baseband modulating frequency and ΔF is peak FM deviation.

Bessel functions and FM deviation

The additional sidebands that occur in an FM signal are a function of the relationship between the modulating frequency and the amount of carrier deviation. This relationship, called the modulation index, is the ratio between deviation and the modulating frequency, expressed as

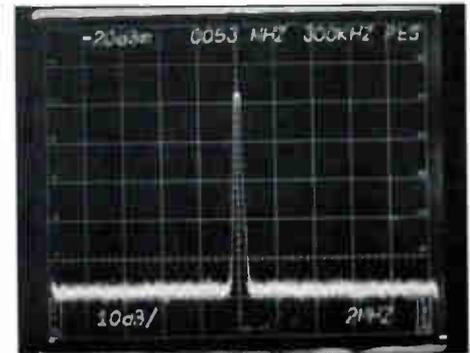

$$t = \Delta F/f$$

where: t = the modulation index

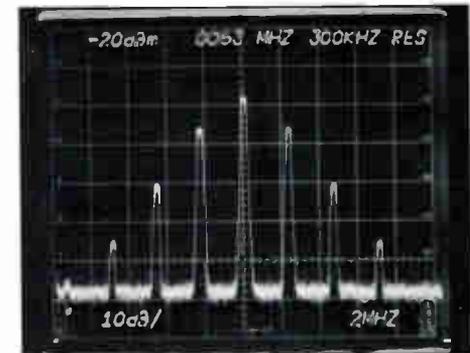

ΔF = carrier deviation, in Hz

f = modulating frequency, in Hz

Bessel functions mathematically describe the relationship of the amplitudes of an FM carrier and its sidebands to the modulation index. FM carrier and sideband amplitudes vary from maximum to minimum through zero with changes in the modulation index, but the RMS (root mean square) value of the amplitudes is always constant and equal to the unmodulated carrier am-

Waveform of an unmodulated carrier.

As deviation is turned up, sidebands appear, spaced at integral multiples of the modulating frequency (2.33 MHz).

plitude. As deviation is increased from zero, the carrier and sidebands will go through successions of nulling to zero amplitude. The first time the carrier nulls to zero amplitude is known as the first carrier Bessel null, and occurs at a modulation index of 2.4048. Knowing this, and the modulation index relationship $t = \Delta F/f$, one can determine the required modulating frequency that will provide the first carrier Bessel null, which represents a certain FM deviation.

Example: What modulating frequency is required to produce the first carrier Bessel null on an FML microwave transmitter, assuming a desired 4 MHz FM deviation with 1 volt peak-to-peak baseband input level? *Solution:* Using the formula $t = \Delta F/f$, substitute the modulation index of 2.4048 for t , and 4,000,000 Hz (4 MHz) for ΔF :

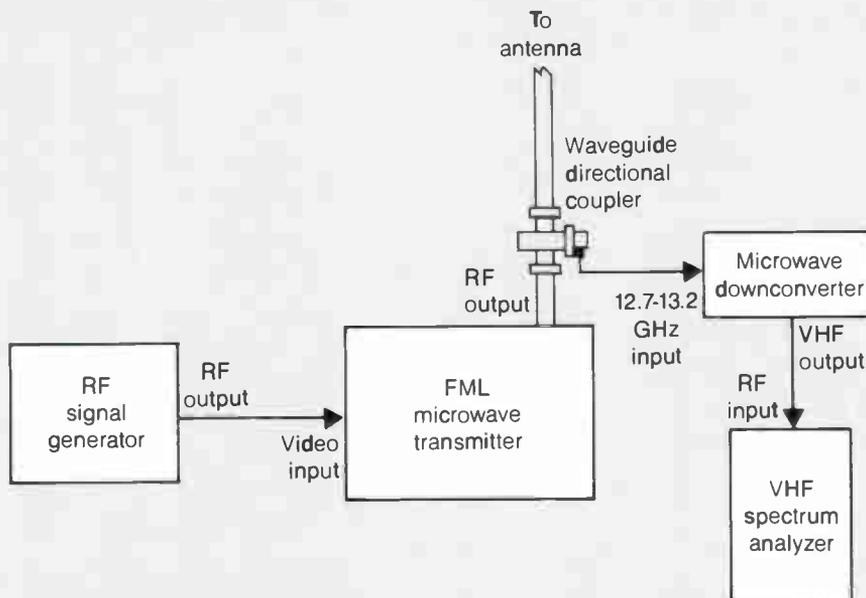

$$\begin{aligned} 2.4048 &= 4,000,000/f \\ f &= 4,000,000/2.4048 \\ f &= 1.663,340 \text{ Hz} \end{aligned}$$

The required 1 volt peak-to-peak modulating frequency, then, is 1.66334 MHz. (Note: If video pre-emphasis or other baseband processing is present in the transmitter, then this result will not be valid. The equipment manufacturer will have to recommend the proper frequency necessary to overcome the effects of these circuits.)

Setting deviation

Proper deviation of an FM signal is important for several reasons. It establishes baseband unity

Figure 1: Equipment configuration for transmitter deviation adjustment

Stereo is too expensive!

Until now BTSC stereo was considered by many to be too expensive. The other alternative was high churn from dissatisfied subscribers owning stereo TV sets.

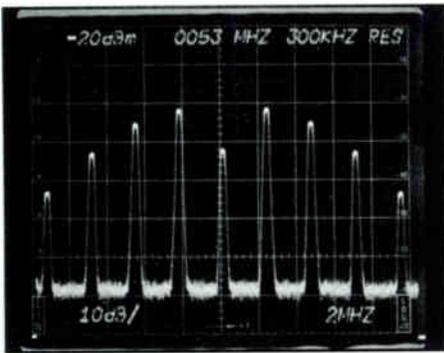

Problem: The majority of new TV sets manufactured are stereo.

Answer: ignore the problem
 purchase expensive equipment
 contact ISS for the logical answer.

The new ISS GL 20-20 offers uncompromised BTSC stereo at a price well below today's current market. For the correct solution to your stereo problems contact ISS Engineering for full information.

Carrier beginning to null.

gain, which will provide optimum S/N (signal-to-noise) and distortion performance. But perhaps

more important, it avoids excessive deviation, which can cause signal splatter and interference. Insufficient deviation results in inefficient use of the RF spectrum. It also is wise to check new equipment, since deviation is not always adjusted correctly at the factory. Using the Bessel null technique to check and set FM deviation is among the most accurate methods available.

To set deviation on an FML microwave transmitter, the following equipment will be needed:

- Video waveform monitor or oscilloscope, terminated in 75 ohms;
- RF signal generator, 75 ohm impedance, that will generate stable CW (continuous wave) carriers in the 1 MHz to 10 MHz range;
- Frequency counter to measure the output of

First carrier Bessel null indicates proper deviation.

- the RF signal generator;
 - Microwave spectrum analyzer, or VHF spectrum analyzer with an external microwave downconverter that covers the 12.7 to 13.2 GHz band; and
 - WR-75 crossguide directional coupler, 20 to 30 dB, to provide a transmitter test point (if the transmitter is not already equipped with one).
- Connect the RF signal generator to the frequency counter and set the signal generator to 1.66334 MHz (from previous example), or a frequency recommended by the manufacturer if pre-emphasis is installed in the transmitter (2.33 MHz for a M/A-COM MA-12G with video pre-emphasis). Adjust the amplitude of the RF signal generator to 1 volt peak-to-peak as measured on the terminated waveform monitor or oscilloscope (same as measuring video). Next, connect the RF signal generator to the transmitter video input, and the analyzer to the waveguide directional coupler test point (Figure 1). In some cases, it may be necessary to turn off the transmitter's automatic video sensing circuit.

Tune in the transmitter signal on the spectrum analyzer and set the analyzer controls to 10 dB/vertical division, 300 kHz resolution bandwidth and 2 MHz/horizontal division. While observing the analyzer display, turn the microwave transmitter deviation (video level) control all the way down; note the unmodulated carrier. Tune the carrier to the center of the analyzer's screen.

Slowly turn up the deviation control, noting the appearance of sidebands. As the deviation control is turned up more, the center carrier will begin to null out. When the carrier has been nulled to minimum amplitude (sidebands will remain), the transmitter deviation is 4 MHz relative to 1 volt peak-to-peak baseband input level.

Disconnect the equipment; ensure that the transmitter video input is 1 volt peak-to-peak, reconnect it to the transmitter and turn the automatic video sensing circuit back on. At the receive site, adjust the receiver video output to 1 volt peak-to-peak. The system is now at unity gain.

FM deviation adjustment can be part of the regular routine of microwave equipment maintenance. At least once a year, transmitter output power, frequency and deviation should be checked. Transmitter and receiver operating voltages, and video and subcarrier levels should be checked more often, and adjusted as necessary. Keeping tabs on all these parameters will ensure optimum CARS band operation. ■

Micro-Beam™

The Cable Expansion Problem Solver

Channel Master® MICRO-BEAM™ is a flexible, cost-effective CARS-band microwave relay system designed to solve the cable expansion problem facing today's cable operators.

That's why some of the top MSO's like, United Cable, Centel Cable, Cable Entertainment, Sonic Communications and Telescripts, use MICRO-BEAM™ as an alternative to the more expensive systems on the market today.

Eliminates Additional Headends

MICRO-BEAM™ reaches isolated subscriber pockets and spans natural barriers without additional remote headends, adapting to your entire service including audio, video, data and addressability signals and commercial insertion capabilities. MICRO-BEAM™ also saves you that \$500 per-channel descrambling cost by allowing you to descramble each channel at the main headend. In fact, MICRO-BEAM™ is so compact, it allows you to transmit from a weatherproof unit that mounts behind the antenna. It can even be mounted on water towers, and can be placed anywhere in your system, not just at the headend.

Two Affordable Systems

MICRO-BEAM™ is available in two affordable systems that can be configured in many ways to meet your systems needs. A 36-channel 300 MHz system available in 1 and 5 watts, allows many more receive sites and offers cost savings in smaller systems for as low as \$46,965! The 1-watt system can transmit your signal fully loaded over 9 miles in each of four directions or 15 miles in each direction with the 5-watt system.

The 60-channel 450 MHz system also comes in 1 and 5 watts and provides the range and channel capacity larger systems demand.

For example, the 1-watt system can cover a path distance fully loaded up to 7 miles in four directions or 14 miles in one direction. The 5-watt system can carry 60-channels up to 20 miles and allows up to 4 separate receivers fully loaded up to 12 miles in each direction.

In addition to extra power, the 5-watt system utilizes GaAs FET amplification, highly stable microwave oscillator and redundancy of key components to insure reliable operation and reduce maintenance. A Status Monitor Panel, included with the 5-watt transmitter, allows remote monitoring of all system functions by bringing all test points to the headend or tower base.

The rugged transmitter unit is housed in a heavy-duty weatherproof housing designed for pressurization. The transmitter is cable powered, and operates in temperatures ranging from -50°C to +60°C, with humidities up to 100%.

Cost-Effective Expansion

With MICRO-BEAM™ you can expand your system cost-effectively because there are no "hidden costs" for optional equipment and services, so you get more for your money!

Standard Equipment & Services

- 450 MHz Transmitter
- Microwave Receiver
- LNA/Image Rejection Filter/AGC
- Mounts, Waveguides, Connectors
- Feasibility Study
- Installation of MICRO-BEAM™

Electronics

- F.C.C. Application Assistance
- Alignment of Microwave Paths
- 1-Year Warranty on Parts and On-Site Service
- 24-Hour, 7-Days A Week, Technical & Warranty Service (in continental U.S. only)

Because MICRO-BEAM™ is basically option free, the system you order is in stock, giving you the fastest lead time of any microwave product on the market.

Two New Microwave Products

Channel Master® has added a new microwave repeater and microwave multiplier to its line of CATV equipment products, providing added versatility and cost-savings to CARS—band system expansion.

The new **Repeater** available in 1 and 5 watts, is a low noise amplifier designed to consolidate transmitter and receiver functions, allowing microwave links to be cascaded or hopped without downconverting and then up-converting the signal.

The new **Multiplier** allows the systematic addition of microwave paths to a single transmitter location without utilizing expensive and often excessive, high-powered tube type equipment. Designed with adequate gain to allow full output power over a wide range of input power, microwave paths can be added as needed, with the 1-watt delivering 60 channels up to 14 miles and the 5-watt, 60 channels up to 20 miles.

Contact us today and let our staff of qualified specialists show you how really flexible and cost-efficient your cable system expansion can be with MICRO-BEAM™.

Baseband video performance testing

This is the first in a series on measuring performance levels of baseband video signals.

By **Jim Schmeiser**
Staff Engineer

And **Terry Snyder**
District Field Engineer Group W Cable Inc

As the cable TV industry continues to grow, a greater emphasis is being placed on obtaining the best quality picture available for delivery to the customer. Many technological developments in electronics have been finding an application in cable, either to increase the quantity of services or the quality of existing services. As the demand for better quality increases, so must a larger demand be placed on the technician responsible for the quality of that signal.

All TV signals begin as baseband video and are returned to baseband video at the customer's set. But what exactly is meant by the term *baseband video* and what are its components?

Definition through illustration

Let's begin with a few definitions and explanations of terms used with video. All illustrations presented and terms defined refer to NTSC (National Television Systems Committee) video. This industrywide engineering group developed the format and technical specifications for the color television signal used in the United States.

Through the accompanying illustrations, a realistic definition of terms easily can be understood. All waveforms presented are produced by a video signal generator for clarity.

Figure 1 represents two fields of composite video, which consists of blanking, field and line sync, color sync, chrominance, and luminance information. Two fields make up one frame of video and contain 525 lines of video; each field has 262½ lines. Figure 2 shows two fields of program video from a TV station after being demodulated.

Figure 3 shows two lines of video, referred to as a multiburst test signal, while Figure 4 is a display of two lines of program video from a television station after being demodulated. Figure 5 is a display of one line of video and Figure 6 is a single line of program video. Figures 7 and 8 illustrate an expanded view of horizontal blanking, showing various portions of the signal in Figure 5.

Figure 9 shows the colorburst content. The burst must have a minimum of eight cycles, the first cycle beginning where one half-cycle equals or exceeds 50 percent of the peak amplitude of the burst. Figure 10 is colorburst detail of program video.

Measuring video levels

As far as the frequency spectrum of composite

video is concerned, the bandwidth is 0 to 4.2 MHz; the level of video is 1 volt peak-to-peak. To define this parameter, we use a waveform monitor with a scale marked in IRE (Institute of Radio Engineers). Before making any level measurements, calibrate the waveform monitor according to the manufacturer's instructions. One volt peak-to-peak of video is achieved when the peak white level is on the 100 IRE line and the bottom of the horizontal sync pulse is on the -40 IRE line.

As previously mentioned, all of the test signals are full-field test signals. Comparing this with pro-

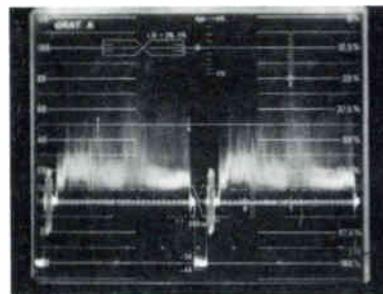

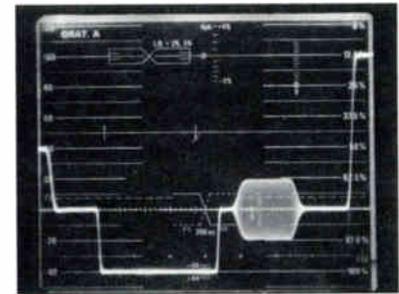

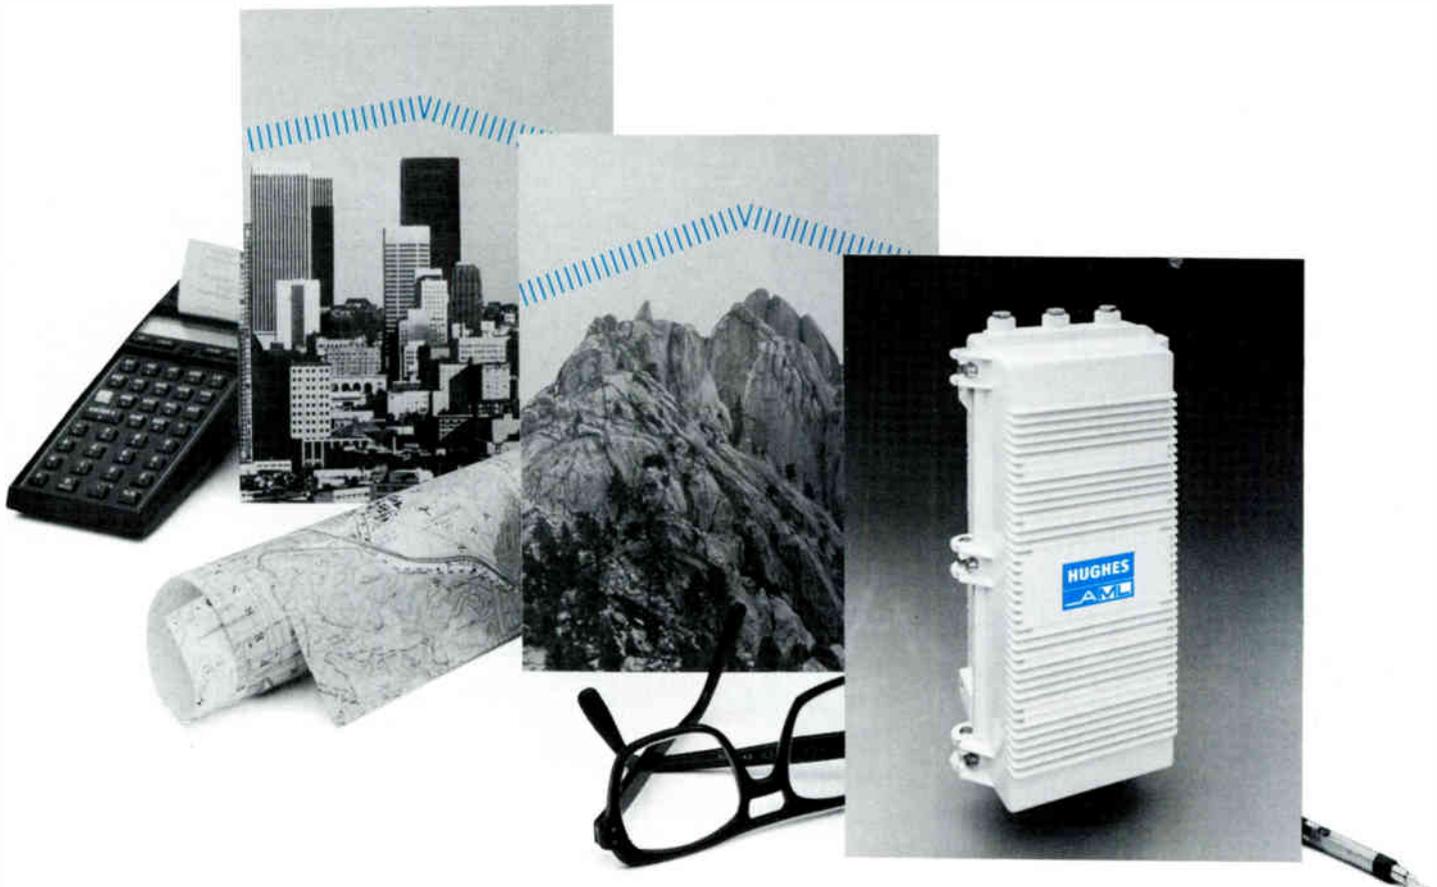

Figure 7: Horizontal blanking

FINALLY, A PRACTICAL SOLUTION TO OUT-OF-SIGHT MICROWAVE TRANSMISSIONS.

Until now, all microwave systems shared this common problem: transmissions that weren't line-of-sight often drove costs out-of-sight. But with the new low-cost Active Repeater from Hughes Aircraft Company, you can now get around those obstacles and profit from areas previously too expensive to serve.

The easy to install Hughes 2-watt MWB-122 Active Repeater is directly compatible with all CARS band transmitters and receivers including Hughes AML® systems. It is outdoor mounted, totally self-contained, and its low power requirements are easily met by a small DC or solar power source. Whether your microwave path is blocked by man-made or natural obstacles—and whether your transmission is AM or FM—the MWB-122 stands alone as your most practical solution.

This Active Repeater is the latest development in

the most comprehensive line of CARS band microwave equipment available. The Hughes AML Microwave Line includes an entire selection of low, medium, and high power transmitters and receivers suitable to every application. In addition, Hughes offers the product quality, experience, and support services that really can remove all obstacles from earning greater profits.

Find out more about the Hughes MWB-122 Active Repeater. Contact: Hughes Microwave Communications Products, Bldg. 245, P.O. Box 2940, Torrance, CA 90509-2940 or call toll free (800) 227-7359, Ext. 6233. In California (213) 517-6233. In Canada: COMLINK Systems Inc., 1420 Bayly Street, Unit 5, Pickering, Ontario L1W 3R4, (416) 831-8282.

gram video, we see that program video constantly is changing levels, giving us nothing practical with which to measure 1 volt of video. Therefore, on most broadcast signals, there has been a test signal inserted on the vertical blanking interval, known as the vertical interval test signal (VITS).

This usually is found on lines 18-21 and in one or both fields.

Future topics covered in this series will include types of video waveform monitors and waveform analysis.

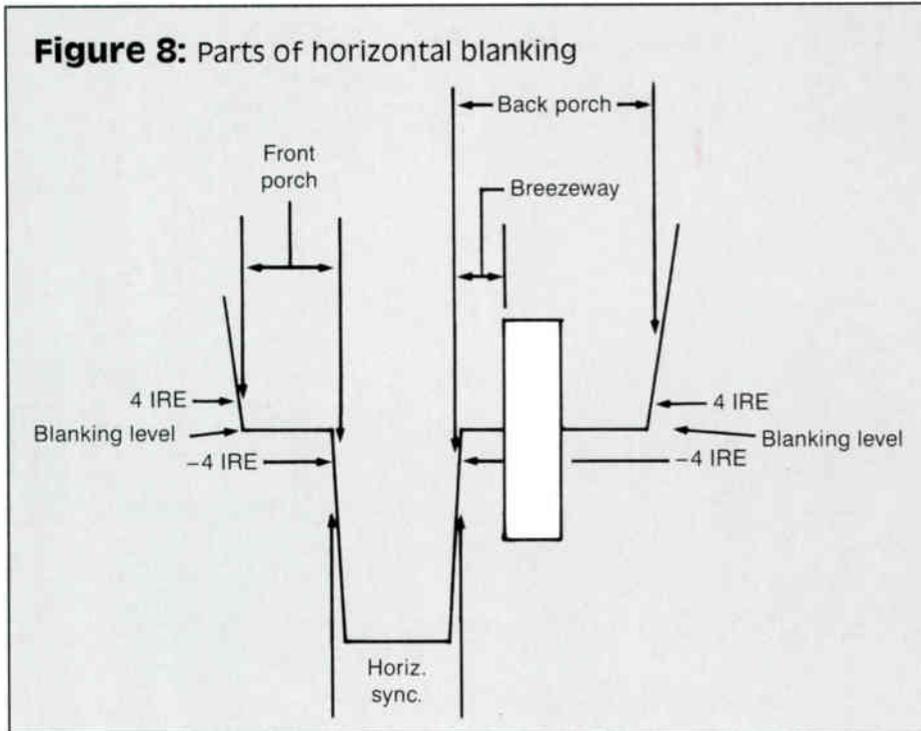

Figure 9: Colorburst content of baseband video

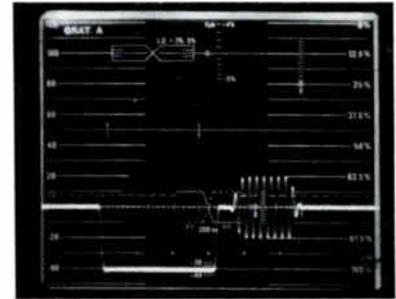

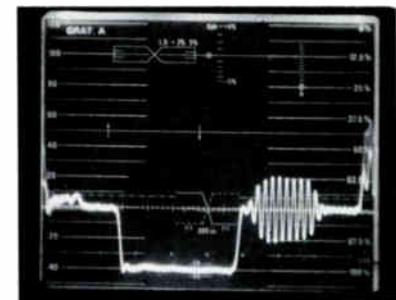

Figure 10: Colorburst content of program video

LANCA "L" SERIES

DIGITAL TIME DOMAIN REFLECTOMETER

The LANCA "L" Series Custom Digital Time Domain Reflectometers provide a real breakthrough in PERFORMANCE and PRICE. These reliable and versatile test instruments are light weight, rechargeable battery operated, compatible with most dual channel 60 megahertz oscilloscopes and can be programmed and calibrated by the user to meet specific test requirements.

Digital (DTDR) Test Mode: Standard on all models—Pressing key "4" on the Keypad will cause the Digital Test Mode to run a one time test of the cable and display the cable condition as: "OPEN", "SHORT" or "OK TO" in feet, meters or nanoseconds.

Analog (ATDR) Test Mode: Standard on all models—Pressing key "5" on the Keypad will cause the DTDR to enter the ATDR Mode. This mode requires the use of a dual channel 60 megahertz oscilloscope in conjunction with the DTDR. Test Pulse Widths are selectable as: 15ns, 150ns, 1100ns or 37 microseconds. This mode is used to detect pulse reflections that are smaller in magnitude than opens and shorts or to examine the shape of a reflected pulse. Examining smaller reflections allows the user to distinguish connections, taps, etc. and to map out networks.

The new 'SOLUTION ONE'

For simplified 2-button master control over
all TV/VCR/pay T.V. switching.
It's the answer you've been waiting for.

Forget those older big box units with their truck-dash-board styling. Forget the number of knobs, dials and switches it takes to operate them. Discover instead the new breed of TV/VCR Switcher from SEAM Electronics that does a great deal more, for a good deal less!

With our revolutionary 'SOLUTION ONE' Switcher in command, quick convenient changeover is accomplished by simply depressing or releasing two pushbuttons. You lose nothing – and simplify everything. All possible combinations of regular TV viewing, pay television, cable input, taped VCR content, rental movies, monitoring and even recording or recording-while-viewing are accommodated. The converter continues its regular function under its guidance. Stereo, cable-ready and remote control convenience, lost due to pay T.V. decoder limitation, is restored. What you achieve in total is faster, no nonsense, error-free central control over selection!

Check its other impressive credentials...

- The device is 'passive', requiring no direct AC power source – a real bonus in a crowded multi-component setup.
- Installation is a straightforward, once only operation using standard CATV coaxial cable connections; maintenance is virtually non-existent.
- Innovative passive R.F. switch design supplies a minimum isolation of 70 DB up to 100 MHZ and 60 DB up to 450 MHZ thus assuring long life, interference free operation (full specifications on request).
- Compact slimline styling (6.8" x 3.5" x 1.5") with a furniture-quality simulated walnut finish and gold tone accent trim.
- Comes fully packaged with Owner's Manual and one year limited warranty.
- And the cost? A mere fraction of the price tag of those larger 'active' units.
- Switch over to the superior 'SOLUTION ONE' – its right on the money!

Making friends with the TDR

By Duff Campbell
Riser-Bond Instruments

The latter part of the 20th century could be called the "communications age." Not only are states and counties served to their remotest corners by telephone systems, they are becoming increasingly dependent upon other cable networks. Now we have cable TV, telex and facsimile networks, control systems for railways, plus innumerable other cable systems. There are public and private systems, large and small, using everything from twisted pairs to the latest in multi-core cables. The wirescape is everywhere. Environmental pressure ensures that more and more cable is buried. With such a large investment in outside plant, major headaches can result when faults develop.

Locating a fault in a buried cable can be time-consuming and expensive if the exact location can be determined only by digging. One solution has been to utilize a time domain reflectometer (TDR) to help solve this problem. However, at the inception of time domain reflectometry, expensive and complicated high-speed oscilloscopes were used to make the time measurements. Today, microcomputer technology makes it possible to build a compact, battery-operated device that meets most of the needs of the technician at a fraction of the cost and complexity of the instruments it succeeds. Using TDRs, open and short circuits can be detected and their locations pinpointed. Other major impedance discontinuities also can be detected.

How it works

When a signal is transmitted down a properly terminated cable, the termination absorbs all of the signal. However, when a cable is not terminated in its characteristic impedance, some of the signal is reflected back through the cable to the signal source. The two extremes of improper termination are an open and a short circuit. In either case, all of the signal energy (minus the cable loss) is reflected. Conditions between these two extreme cases cause part of the signal to be reflected. TDRs send a pulse down the cable and measure the time required for reflections to return to the source. By knowing the cable's velocity of propagation (VOP), the operator can measure the actual distance from the source to the fault.

Referring to Figure 1, let us look at the building blocks that make up the TDR. A *pulse generator* transmits a narrow pulse of energy down the cable under test. A *timing circuit* measures the time between the transmitted pulse and the arrival of the reflected pulse, converts this measurement to distance—taking the VOP of the cable into consideration—and sends the information to the *digital display*. The VOP is adjustable by front panel control for the type of cable being tested.

Although the VOP probably is the most confusing and "asked about" feature of a TDR, it really is not that difficult to determine and use to your best advantage. Light travels in a vacuum at approximately 186,000 miles per second. A signal travels down a cable at a somewhat slower

rate. This slower rate is the VOP and is expressed as a percentage of the speed of light. The VOP of a signal in a cable is a function of the material that separates the center conductors from the sheath. This material is known as the dielectric.

Dielectric materials found in various types of cable include air, foam, pulp and plastic. Most cable manufacturers list the VOP for each type of cable made, usually as "VOP X%." A VOP of 0.84 thus would be 84 percent of the speed of light. Although "dielectric constant" and "VOP" sometimes have been used as interchangeable terms, the VOP is found by taking the inverse square root of the dielectric constant. If a manufacturer lists a number greater than 1.00, this would be the dielectric constant. If the number listed is 0.99 or less, it would be the VOP. Table 1 is a partial listing of cable types and their corresponding VOPs.

Sources of error

Three sources of error usually are encountered when troubleshooting with a TDR:

- **Temperature:** The VOP shown for a particular cable can vary approximately 1 percent for every 10°C of temperature change from room temperature. The lower the temperature, the higher the number usually becomes.

- **Cable:** The manufacturing run for a particular cable and the age of the cable can affect the VOP by as much as ±1 percent.

- **Instrument:** The accuracy of the TDR to make consistent and repeatable readings with very little deviation is critical.

All the factors that can affect the accuracy of faultfinding can be minimized by "normalizing out" the various errors. Because these factors contribute to fault location error, care should be taken to minimize their effect by use of the following techniques.

The first step is to locate the path of the cable using a cable locator. The length of the cable then is determined with a measuring wheel, with a length added for cable depth. Once the length is found, the VOP, as indicated by the cable manufacturer, is dialed into the TDR. The cable then is tested from both ends and the readings recorded. If the two readings added together equal the total length of the cable, you have accurately located the fault. However, if the two readings add up to a total greater or less than the known length, simply change the VOP setting and retest the cable from both ends.

Continue changing the setting until the two readings equal the known length of the cable under test. The fault location is then pinpointed. This technique assumes only one fault. If there are gross changes in the thumbwheel settings there probably are multiple faults or the cable route and length measurement may be wrong.

Another technique for determining the best VOP setting is to locate another cable identical to the one you wish to test. It is best if the cable is the same brand, same gauge, and same age and temperature as that of the cable you wish to test. The length of this cable is measured as closely as possible. The TDR is connected and the VOP setting adjusted while the display is

'Getting to know the instrument and the proper testing procedures result in greater accuracy and respect for its use'

watched. When the display shows the true length of the cable, the correct VOP for that particular cable at that particular moment has been determined. This VOP setting then is used for testing the faulty cable.

Although the VOP setting is important, it is not critical, since it can be determined as described previously. As with any other piece of test equipment, getting to know the instrument and the proper testing procedures result in greater accuracy and respect for its use.

Typical problems

There are many types of cable problems that can be solved by the TDR. For example, church services are shown Sunday on the local cable

system. One Sunday, it was clear that the signal was not getting out. The technician first checked the transmitting equipment, finding that all was in order. The cable was next. The church is linked into the system by a 2,100-foot line. Checking from the church, the TDR indicated an open at 2,000 feet. From the other end, an open was indicated at 108 feet. With the aid of a cable locator and measuring wheel, the problem was found quickly. A new school-crossing sign erected the week before had gone right through the cable. The fault was found in just 15 minutes.

The TDR also has been found to be ideal for problem solving unrelated to cable faults. For instance, it can be used to measure cable length on reels, thus easing stock control. The TDR also is useful in identifying multiple cables into a pedestal on a new-build. By knowing where the cables should go and their approximate lengths, you can identify them by reading their lengths.

A helpful friend

As with any tool, the TDR is of little value sitting on the shelf; it must be used frequently so the technician can retain familiarity with its operation. Too often the TDR has been used only as a last resort, when it could have saved time and money when the problem first appeared. It should be kept close at hand in your service van, so that it will be readily available. When used by the technician on the job as a first resort, the TDR can become a helpful friend. ■

An audio metering system for CATV

By Bret Peters

Field Engineer Tulsa Cable Television

As CATV engineers, most of us can measure video and RF parameters to the nth degree, have the equipment necessary to perform such measurements, and have stringent guidelines established by our corporations or the FCC to comply with. But aural measurements usually are confined to carrier frequency and amplitude. If each channel sounds about as loud as the local off-air stations, we call that acceptable.

There are only two instruments that are absolutely necessary to troubleshoot and monitor audio in the CATV headend: an oscilloscope and a modulation meter. The oscilloscope you already should have and you can build a modulation meter.

The oscilloscope can reveal a variety of defects in the audio channels. Some examples are clipping, noise, unbalanced lines and hum. The "oscilloscope" is as valuable to audio as the waveform monitor is to video. (By the way, if you use the waveform monitor at the frame rate and leave the input unterminated, you can observe audio waveforms simply by connecting a probe and looking in the appropriate locations. Try it.) If your headend is not brand new, you'll locate at least one problem the first time you look at all your sources. I wander around the headend about once a month, looking at receivers and subcarrier cards in search of just these types of problems.

The other invaluable instrument is a deviation meter. The metering found in most of the modulators that I've seen surely are meant to be just a rough guide in a pinch. Unit-to-unit tolerance is generally high.

Two kinds of meters

What is called for is a meter that allows you to change channels and observe deviation as easily as checking RF levels and video modulation depth. First, we'll examine the two main types

'Since the advent of digital audio, dynamic range has increased drastically'

of metering that are currently popular, the VU (volume unit) meter and the PPM (peak program meter). After that, we'll move on to a construction project that uses the type best suited for modulation monitoring.

The VU meter is a holdover from the days when the telephone industry was in its infancy. It was designed in a time when meter movements were mechanical, slow and somewhat insensitive.

If we set up modulation with a sine wave and spectrum analyzer, and call ± 25 kHz 0 dBV, we can pronounce this correct and set our programming up with it. Right? Wrong. When program audio is applied and we modulate to 0 dBV, we will be overdeviated, typically about ± 70 kHz.

What happened? The VU reads root mean square (RMS) voltage, not peak. Voice and music have considerably less RMS voltage than a sine wave, about 6-10 dB less. Proof of this can be had by feeding a VU meter directly first with a square wave, then a sine wave and finally a triangle wave, while holding frequency and peak amplitude constant. The indicated level will change as the RMS value of the different wave shapes change (Figure 1).

Ignoring pre-emphasis, had this been modulation, our carrier swing would have remained the same for all three wave shapes. The meter, however, would not have indicated this. We could, I suppose, pad the meter about 10 dB, set up as before, then remove the pad for program audio. It's a "fudge" factor, but another problem begins to appear: VU meters are slow. Voices and

music have another quality that separates them from sine waves: short-term peaks in the envelope of the signal. The current ANSI specification for a meter with VU ballistics calls for a 300 millisecond rise time. (See Figure 2.)

What do we need? A PPM meter, designed to follow the peak voltage envelope of the signal with faster attack times. Electronic meters also tend not to overshoot, as a mechanical meter does.

The German DIN specification 45406 calls for a 10 millisecond rise time to a level 1 dB down from that indicated by a steady-state signal. This corresponds to an integration time short enough to catch significant peaks in a signal, yet wide enough to ignore peaks that would not normally be called excessive overdeviation, by convention. This specification also calls for a decay time of 1.5 seconds to fall 20 dB. The slow release is designed to make the meter easier to read.

Questions arise

Now that we have defined a meter that will read true deviation and be consistent for music, voice and test tones, some questions arise. What about pre-emphasis? If you employ a spectrum analyzer and signal generator, then you must use a low distortion sine wave at about 400 Hz to keep out of the pre-/de-emphasis curve area. The curve was designed as a noise improvement system. In the case of normal program sources, the effect on total deviation is minimal, due to the low level at which high frequency energy is usually in such sources.

What do I attach this to? You can use any demodulator that has a fairly flat audio passband and fixed or semi-fixed—requiring an adjustment tool—output. The output should be independent of the audio monitor volume setting. The unit has a high-input impedance and represents negligible loading for most demodulator outputs.

Now that I've set deviation to 100 percent on loud peaks, some of my program sources sound "soft," overall. Since the advent of digital audio, dynamic range has increased drastically. (*Dynamic range* is generally defined as the difference between the lowest level that provides acceptable signal-to-noise and the highest level that produces acceptable distortion.) Some of the program suppliers think that 30-40 dB of dynamic range is really neat. Since their new digitized scrambling systems can deliver it, do so.

The problem is that television audio is nearly an afterthought to the picture. The narrow deviation lends itself to about 10-15 dB of dynamic range before noise starts to be serious. Add to that the listening environment of the normal subscriber, and you have a genuine problem. The only recourse is to compress the audio before it leaves the headend or contact the program suppliers, to see if they will do it.

I'm using BTSC; what good is a mono meter? It can warn of overdeviation or underdeviation in the sum channel. Further analysis might be called for.

Building a peak program meter

Now that we know what we need to accomplish, let's build a PPM that will do the job. (See Figure 3.) The heart of the project is a DIN-

WAVETEK

If you've got illegals, minor breaks or loose housings, then you may have signal leakage.

Only Wavetek offers so many low cost leakage detection and measurement systems.

Model ST-1C/CR-1B. With this signal transmitter and receiver system, you can equip your vehicles to patrol for signal leakage from an inserted signal at your head end. Just turn it on and leave it on. You're always ready for leaks.

Model RD-1. Test your system's compliance with FCC CATV radiation specifications. This tuned dipole comes with adjustable whip antennas which you can set for frequencies from 50 to 250 MHz. With a built-in 16 dB pre-amp, measure signal levels in the -30 to -50 dBmV range accurately and economically.

Model CR-6. This hand held receiver scans six different system video carriers and sounds a tone alarm when it detects a leak. The tone's pitch indicates the leak's relative amplitude. LED readouts indicate which channel is leaking. Hook it onto your belt and go. Easy and accurate.

For details on our complete line of leakage detection equipment, call Wavetek toll free 1 800 622-5515. In Indiana, 317 788-5965. TWX 810-687-6038.

MOST FOLLOW STANDARDS...

...A VERY FEW SET THEM.

In every industry there are leaders who are innovative and dedicated to producing the highest quality product. The vision of these leaders fuels progress; they forge ahead and bring new solutions to the marketplace. Most of all, these leaders listen to their customers and translate their needs into products and services of the highest standard.

In CATV, Alpha has set the standard in Standby Power technology. This leadership is based on a long list of 'firsts' in powering concepts and product capabilities. Implementation

of Alpha's single ferro-resonant power supply design revolutionized the industry and gave new meaning to cable system reliability and customer satisfaction.

Direct cost reductions through improved battery performance and

simplified system maintenance were brought about by Alpha's temperature compensating and performance monitor-

ing circuit designs. In addition to these technological contributions, Alpha has

established the highest quality and safety standards. To date Alpha remains the only Standby Power manufacturer offering UL, CSA and SEV listed products to the CATV industry.

The unique *Lifeline* status monitoring system provides

diagnostic information and remote control facilities on *one-way* and two-way cable systems. This pioneering development now enables operators to optimize service strategies and reduce overall system maintenance costs. *Lifeline* is Alpha's latest in a series of

historic status monitoring milestones: the first and only stand-alone power-supply monitoring system, hardware interfaces

for the major amplifier monitoring systems, and complete monitoring software have all preceded the *Lifeline* introduction.

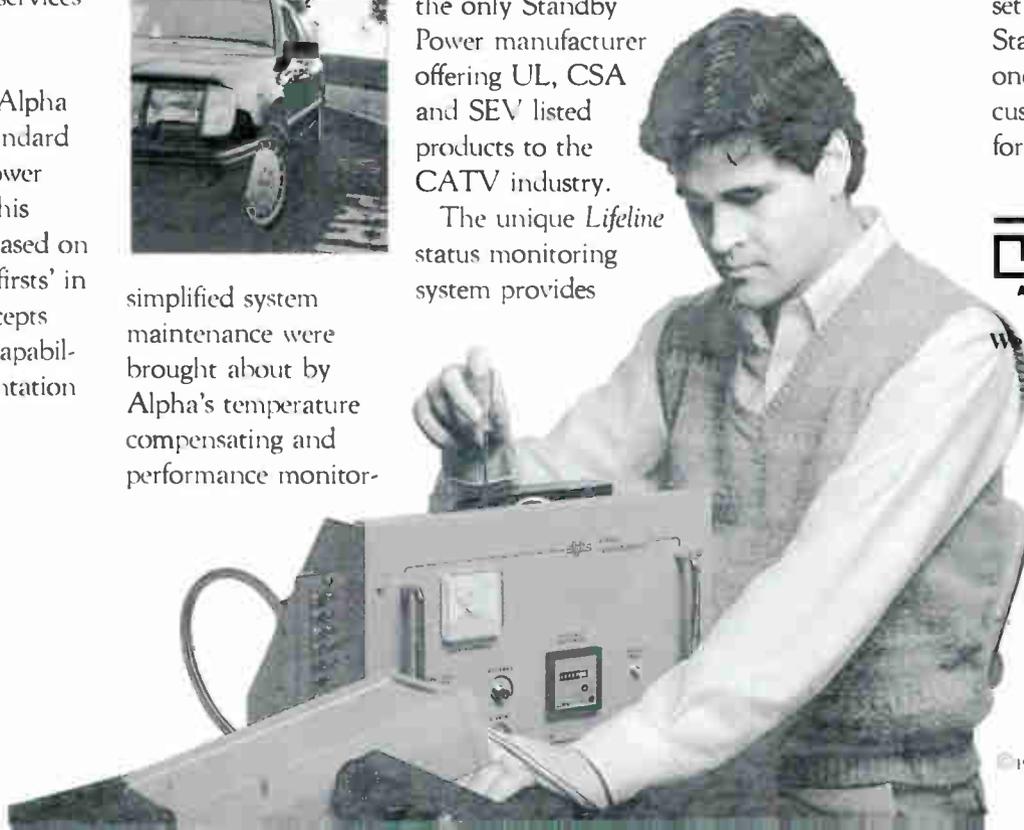

Alpha Technologies set the standards in Standby Power for one reason: Alpha's customers won't settle for second best.

We're Here to Back You Up.

weighted, full-wave rectifier that has response times similar to that specified. This is formed by U2A and U2B, and the diodes D1 through D4. A small amount of filtering is provided by C2 to provide the integration. U1A is a buffer amplifier to separate the circuit from the outside world.

The display drivers U3 and U4 have an internal resistor string attached to 10 voltage comparators, one for each LED. The rectified signal is applied to the input and the LEDs light up according to level. There is 16 dB of pad between U3 and U4, to obtain the increased range.

The LF353 FET (field-effect transistor) input operational amplifier is the best to use, if you can locate it. The slew rate is higher (13 V/ μ s). Using the components listed in Figure 3 will give the

desired attack times for each of the types of operational amplifiers. Use of the arrangement shown for the LM1458 will give good attack time, but release also is faster, making the display slightly harder to interpret. Do not use any type of Norton amplifier, such as the LM2900, since it does not behave properly. (The entire circuit is based on a compilation of designs in the 1982 *Linear Databook* of National Semiconductor Corp., under the section for the LM3916. Note that U3 is an LM3915; U4 is an LM3916.)

You will need a power supply that can deliver three voltages with respect to ground: ± 15 volts and 5 volts. This can be salvaged, or the LM series of voltage regulators make assembly easy. The 5-volt supply will be asked to deliver approx-

imately .5 amperes. If you employ an LM7805, it will need to be heat sunk. Use a regulator for the LED supply to keep the constantly changing current demand from interfering with the brightness of the LEDs.

Construction is not particularly critical. There is no RF on board. I laid mine out on a perfboard that had a pin-out identical to the breadboard I worked up the circuit on. This saved the hassle of etching and drilling. I cut the power buss foils in the middle. The left side became 5 volt and ground, the right side ± 15 volt.

I had a bunch of rectangular red LEDs and a couple of yellow ones. I used the yellow ones to mark the -10 dB and 0 dB points. A better way might be green from the bottom to -1 dB, yellow for 0 dB and red for the rest. Use what you can find—it's not critical. Just make it easy to read. You could put it in a box or rack mount it. If the meter is always on and in sight, you will pay attention to it.

Adjusting tracking and input level

There are only two adjustments to make. These are tracking and input level. The tracking level is adjusted so that there is a 3 dB step between the LM3915 and the LM3916. Feed a test tone to the input with an audio signal generator while observing the input waveform on an oscilloscope. Adjust the input level until only LED #10 lights. Double the peak-to-peak voltage, as read on the scope, by adjusting the output of the signal generator. Adjust tracking until only LED #12 lights. A doubling of voltage is a 6 dB increase. Tracking is now set.

There are several ways to calibrate input level. They vary in accuracy, but all are better than adjusting deviation "by ear." The first method, using a test tone on a carrier while observing a spectrum analyzer, may be the most accurate. This relies on the calibration of the spectrum analyzer and your interpretation of it.

The second way could be a test tone issued by a local station. My local PBS affiliate puts a tone and color bars up every morning before regular broadcast hours, calling it 0 dB. I do too, so at least I'm tracked to one station. If you demod/remod the local, you will need to calibrate off-air, not through the cable.

The third way, using the peak program levels of a local station in your area, may not be as accurate as the other two methods but would be consistent with your interpretation of the meter.

Don't touch that dial

Once calibrated, if the levels of your modulators seem out of whack, don't be in a hurry to adjust them. Commercials, cartoons and game shows usually are excellent to check levels with. Familiarity with the meter is essential, and so is an understanding that program suppliers occasionally don't watch as close as they should. Some services change program levels every shift. When different people are at the mix, they interpret the meters differently, so the levels may change.

Author's note: Many thanks to Frank McClatchie of FM Systems Inc., who pointed me in the right direction.

Find RF leaks fast with a Vitek Tracer!

Two models, the TR-1 and TR-2, offer a choice of signal detection sensitivity, power options, and unit size. No transmitters are needed, which allows you to utilize existing signals.

The TR-1 is calibrated to the FCC specification of 20 μ V/meter.

Each model features a crystal controlled local oscillator with front panel frequency adjustment, meter display and tone to signal detected leakage.

To get complete information on the Vitek TR-1 and TR-2 Tracers, call or write today.

THE 1986
WESTERN
SHOW

Western Show wrap-up

By Toni Barnett

Dynamic, technical blockbusters, the greatest show on earth? Not exactly, but lively and healthy would be good adjectives to describe this year's Western Cable Show held in Anaheim, Calif., Dec. 3-5. The mood of the vendors, programmers and attendees was extremely upbeat.

The number of exhibitors increased to 209 from 186 in 1985. Advance attendance was up 4 percent over last year, and on-site registration was up 5 percent—7,700 this year compared to 7,500 last year. Unlike previous shows where floor traffic was heavy one particular day out of three, this year traffic was steady all three days. Not bad for a flat industry.

Admittedly, there were a few technical innovations to take note of, but most of the activity on the technical side involved around operators gearing up for rebuilds and upgrades.

A great deal of credit for this well-coordinated, smooth-flowing show belongs to the CCTA, NCTA and Rauscher & Associates. In fact, we have just learned that the NCTA has named Louise Rauscher as vice president for industry communications. Credit also is due to the Society of

Clockwise from far lower left: With attendance up slightly from last year (7,700 vs. 7,500), the '86 Western Show provided an upbeat atmosphere for the smooth-running event. Traffic was steady on the exhibit floor where 209 companies displayed their wares. The tech sessions, coordinated by the Society of Cable Television Engineers, were very well-attended. SCTE At-Large Director Tom Polis and Executive Vice President Bill Riker man the Society's booth, which included a cooperative demonstration of the decoder interface IS-15 by the NCTA. Bob Luff, SCTE president and an at-large director, and Polis. (All Western Show photographs by Bob Sullivan.)

Cable Television Engineers, who sponsored the technical sessions.

McKinney delivers bomb

We knew it was coming, and according to James McKinney, Mass Media Bureau Chief for the FCC, "The decision is firm and it is final."

McKinney delivered the FCC's first public explanation on the new must-carry decision to a standing-room-only crowd who gladly participated in a rousing booing session against the newly mandated A-B switches.

"The commission resolved its long-term concerns by adopting a two-part regulatory approach. The first prong ensures that cable subscribers will be given the choice to directly access broadcast signals," he explained. "The commission will require cable operators to inform the American public that they will need to retain the ability to obtain broadcast signals off-the-air."

"The second part of our long-term policy," he continued, "is to assist subscribers in re-establishing the technical capability to access off-the-air signals if they choose to do so. Providing both new and existing cable subscribers with input selector switches ensures that subscribers will have the opportunity to access off-the-air signals, should they decide to exercise that option."

Responding to an NCTA paper, McKinney declared, "I have read the technical critique of A-B switches released in such a timely matter for the benefit of the trade press. Speaking as an engineer—I was not and am not frightened by the NCTA document. Given the cost of initiating and serving your subscribers, I am also unimpressed by the dollar costs (even if I really believed them)." (Editor's note: How can we expect the public to correctly hook-up an A-B switch when they haven't been able to figure out how to use their VCR timers?)

On the floor

While most vendors displayed previously introduced equipment, there were a few exhibitors

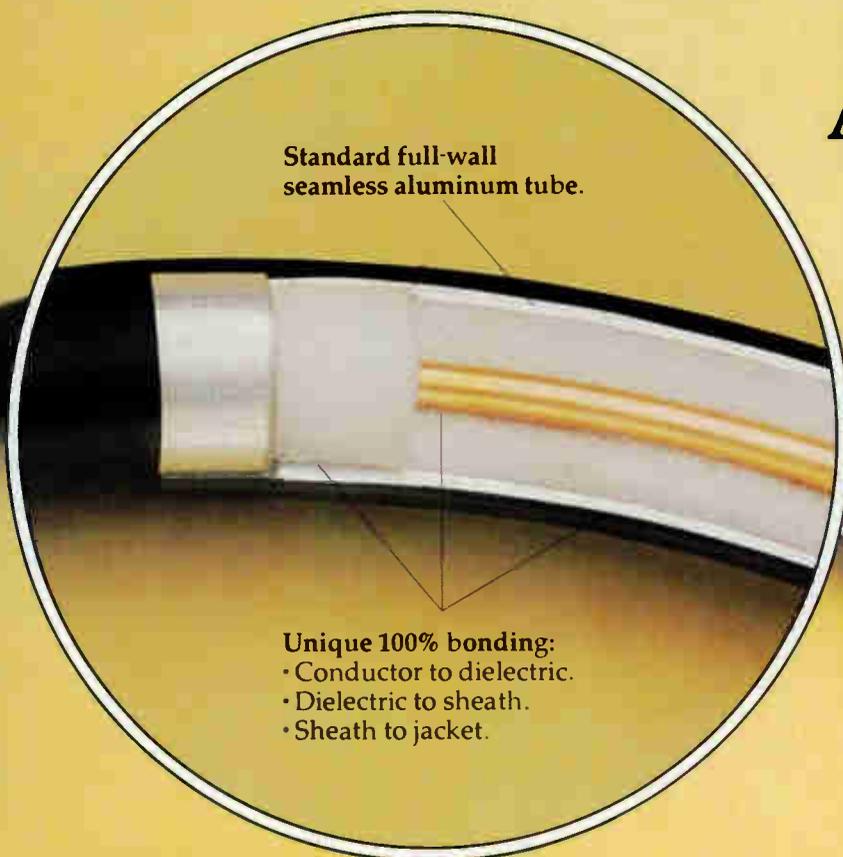

who deserve the limelight. Scientific-Atlanta displayed a plethora of new equipment. Most notably, the company featured its new Series 4400 broadband delivery system, which TCI will be using in January 1987. This new system places the equipment outside the home. The unit mounts to an external wall in a mechanically secured, tamper-evident enclosure and delivers a composite broadband signal to wall outlets inside the home.

According to an S-A spokesman, "We have an order from TCI for a device that takes the electronics out of the home and replaces it with a device that denies unauthorized video from entering the home. We've developed a new positive trap technology that will make it more secure than the traditional positive trap."

Magnavox CATV Systems kicked off the show with a live demonstration of its latest innovations

THE ANATOMY OF A SUPER CABLE

Standard full-wall seamless aluminum tube.

Unique 100% bonding:
• Conductor to dielectric.
• Dielectric to sheath.
• Sheath to jacket.

Bend radius as tight as 4" with 1/2" cable.

INTRODUCING T4 PLUS™ TOUGHER AND TAMER FOR EXTRA PERFORMANCE WITHOUT COMPROMISE.

THE STANDARD IS NOW THE SUPER-STANDARD

Standard connectors and cable preparation tools. No additional parts inventory or special training required.

Temperature-stable electrical and mechanical performance, to withstand broad temperature swings and years of winter/summer extremes.

Jacket bonded to sheath for additional handling ease and increased corrosion protection. Peels away easily, leaving no adhesive residue. Continuous conductor-through-jacket bonding greatly increases sidewall and pull strength. Extra-rugged LLDPE* jacket dramatically increases abrasion resistance and reduces pulling friction.

*Linear Low Density Polyethylene is an extra-tough polymer that still can be readily cut for cold weather connectorization.

Easy coring with standard tools. Resistant to abuse. No objectionable residue left on aluminum surface.

For a sample of this remarkable new cable, contact TFC today at P.O. Box 384, Wallingford, CT 06492, (203) 265-8482 or (800) 243-6904.

LSP Company

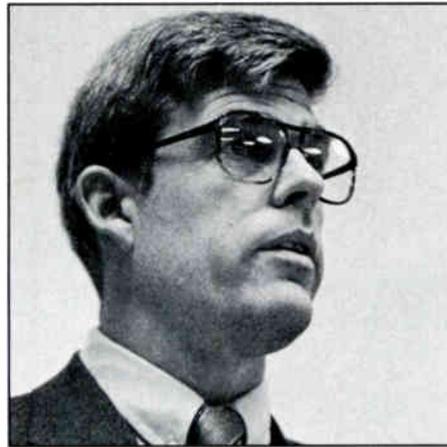

in status monitoring equipment. The company's Digital System Sentry with analog (DSSA) measurement products monitored a live cascade connected to a standby power supply. DSSA products shown operating included a forward field module with a microprocessor enabling it to perform functions beyond the scope of standard automatic gain/slope control modules, and an interface unit used to connect the controlling computer and the cable system. I also was quite impressed with a new line of software added to Magnavox's status monitoring package. This software package, the SOFT/DSS-IBM, using color graphic displays, helps monitor cable systems by providing feedback such as bar graphs of analog parameters, color-coded fault windows, and schematic maps showing signal paths through a cascade.

Several vendors had peripheral equipment they introduced. Please see the product section in this wrap-up and the next issue of *CT* for further details.

Getting technical

For the first time at a major show, the cooperative efforts of the SCTE and the NCTA were highly visible at SCTE's booth. A demonstration of the decoder interface standard (IS-15) equipment was set up in the booth. Also on hand to provide a briefing of this new standard was J.J. Gibson, fellow of the Technical Staff of Consumer Electronics Research for RCA.

Gibson explained that the Electronics Industries Association (EIA), a group of consumer elec-

Gill Cable's Dave Large, a pioneer of BTSC stereo, moderated the session on that topic.

tronics manufacturers, and the NCTA cooperatively developed this new standard. The purpose of the standard is to define a connector that would be included on new TV receivers and VCRs that would permit hook-up of a low-cost simple descrambler to the TV set. This would eliminate the need for a separate converter/descrambler.

The decoder interface standard is a technical specification that enables decoder manufacturers to produce set-back (versus set-top) descramblers, which plug into a socket behind TV receivers and VCRs made to specification.

According to Gibson, "Two manufacturers will have this product on the market in the first quarter

of 1987. Panasonic's units will be available in July of '87, and in late '87-'88, VCRs will be manufactured also using this interface technology."

Off the floor

Kanematsu-Gosho held a press conference premiering its new Sprucer 310 two-way interactive cable television converter, which allows the viewer to order pay-per-view events and bill them to a major credit card. According to a KG spokesperson, "The system was designed for the hotel/motel/condominium/resort community areas that had previously, at best, been underserved by the cable industry because we didn't know how to get services to them or how to bill those services. It is a system that utilizes proven field-tested technology and software. The added dimension, however, is that the bill will be generated and charged to your major credit card."

The VideoCipher Division of General Instrument also held a press conference regarding pirate activities. J. Lawrence Dunham, executive vice president and general manager of the division, stated that GI is speaking out to educate and warn consumers about fraudulent descrambler products, and cautioned consumers about claims regarding so-called pirate VideoCipher satellite TV descramblers.

"Consumers are being victimized right now by unscrupulous people and organizations selling purported 'fixes' to VideoCipher II descramblers, which are claimed to break the security of our VideoCipher II system," stated Dunham. "Our investigation of these products," he con-

CAN YOU IGNORE STEREO T.V. ?

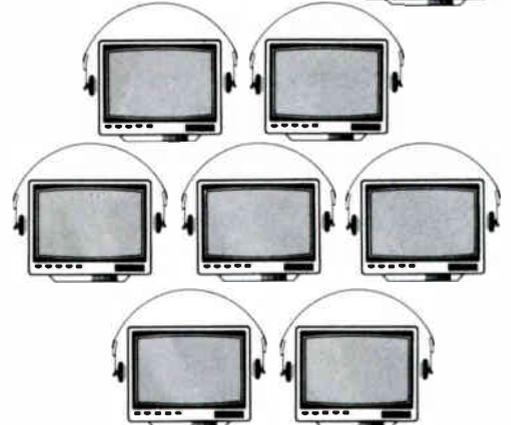

The over-the-air broadcasters, TV set manufacturers, and (more important) the consumers have adopted the BTSC format as the de facto standard for stereophonic sound with television. In fact, more than three quarters of all homes are in the vicinity of one or more BTSC transmitting stations; and there are millions of TV sets and stereo VCR's already in service which are capable of receiving BTSC.

The Learning **MTS-1** and **MTS-2** BTSC Stereo Generators, both utilizing dbx® companding, offer you a cost effective method of getting satellite delivered services through your cable system in the BTSC format.

THE BTSC SOLUTIONS FROM

180 McCormick Avenue • Costa Mesa • CA 92626 • (714) 979-4511 TWX: 510 600 4362

LEARNING INDUSTRIES

An excellent overview on technical follow-up was presented in "After the Acquisition: A Technical Evaluation."

tinued, "shows many are outright frauds. In all other cases, attacks we have seen have been anticipated and can be controlled through multiple levels of security measures available to render these so-called pirate descramblers useless."

Technically speaking

The technical seminars, sponsored by the SCTE, were well-presented. Subjects ran the gamut from "Technology and Distribution Future of Satellite Communications" to "Current Technical Issues Facing the Cable Industry" to "Practical Considerations in Implementing BTSC Stereo Television." And, importantly, the SCTE administered several hours of BCT/E certification testing.

For most of the technical sessions, attendance was at a maximum, and several technical industry leaders were in the audience.

I found the most interesting technical session to be "Technology and Distribution Future of Satellite Communications" paneled by what the CATV industry calls "cream-skimmers." The presentations by the distinguished panelists exceeded my expectations. The session was moderated by Charles Hewitt, formerly executive vice president of SPACE. (Prior to the Western Show, the Direct Broadcast Satellite Association and SPACE formally merged their organizations to form the Satellite Broadcast and Communications Association. Hewitt is the president of this new organization.)

Instead of a totally one-sided view for direct satellite transmission to the home, the panelists presented various scenarios in which cable and satellite could work together.

Taylor Howard, director of R&D for Chaparral Communications, made an analogy to direct satellite communications that many of us in cable can identify with. "There were a lot of people who, 30 years ago, fought cable. You changed the movie industry, the broadcast industry and the way people look at television. The same thing's going on again... Here comes a technology that hits everything at once... We are seeing the cable television industry putting in its budget, \$350,000 next year, to go on a promotional campaign to

FCC Mass Media Bureau Chief James McKinney: "The decision is firm and it is final."

TWO AND A HALF YEARS TO DESIGN.

TWO HOURS TO LEARN.

If you've been monitoring your system using a FSM, you can easily operate the WINDOW. Two and a half years of research and development and marketing made this sophisticated piece of test equipment simple to learn to operate.

The WINDOW's 3 diagnostic ranges plus 9 memory locations replace half a dozen pieces of expensive equipment. Need we say more?

Find out about WINDOW today, it will open a whole new world of powerful capabilities for your field techs, even the rookies.

The "Practical Considerations in Implementing BTSC Stereo Television" session provided good information on systems already using this technology.

woo back its customers... The probable truth to me... is I see a split market. I see homes like mine that have cable, satellite TV and broadcast TV. I don't want to miss anything... I feel that every television home will be served by satellite. Now, served by satellite doesn't necessary mean a dish... I think 50 million to 60 million homes will have outside antennas privately dedicated to their home at some time. I think an equal number of homes will have cable television. And a larger number of homes will have off-the-air television... The one thing that the cable system does very, very well is provide local content. That's the one thing a satellite system can never do... That's why I see a sharing in the marketplace."

Charles Ergen, president of Echosphere Corp., had quite a different view of satellite and cable technology. "In my vision of the future...in

every single home in the United States that owns a TV set, I see a satellite dish... I think the reason I see this is economics. With the advent of scrambling, the economics have changed... The cost of owning a satellite system has gone up. So, it's very unlikely that as an industry, we're going to be a major factor at C-band in major franchised areas... There are still 15 million to 20 million homes out there that will never have cable, and for those people, we're still an economic alternative... The prices of decoders will come down and will become more economical. The trends will change... In 1990-1991... I think the economics will change drastically. The reasons they'll change drastically will be Ku-band... I think that what's going to happen as we get into the 1990s, it's suddenly going to be more economical just to give people dishes... Not only is it going to be

cheaper, but in my opinion, the technology will be better. The video quality will be superior, high definition TV could become a reality, audio and stereo sound will be better. Dependability will be better and addressability will be much easier... My vision is I invite you to join this technology and embrace it and try to make the most out of it."

Andrew Hospidor, president of RCA American, offered a slightly different view. "The question of the programmer and cable operator has decide is which technology provides the most efficient way in getting my programming to my customers? We think K-band offers some unique opportunities. We think K-band will own SMATV in the near future. RCA is not out of the C-band business and is not intending to get out of the C-band business... Our C-band business will depend largely on our ability to find risk-sharing ventures in which programmers and operators come together with us in standing the risks for the launch and operation of satellites."

Tech Track 2 focused on "Current Technical Issues Facing the Cable Industry." Wendell Bailey, vice president of science and technology for the NCTA, provided a Washington update. He detailed several technical issues including one stemming from the "Captain Midnight" situation. "Anyone uplinking to satellites," said Bailey, "must identify themselves by code (possibly in the vertical blanking interval)."

John Wong, engineer for the Mass Media Bureau for the FCC, related several issues before the commission. Of note was that "there will be no changes in the 18 GHz area."

Bob Dickinson, president of Dovetail Systems, spoke on his favorite topic, signal leakage. Stated Dickinson, "Our only acceptable goal is leak-free cable systems." And, he asked the audience several important questions: "Is the kind of monitoring we do effective?; Is the monitoring of a single frequency sufficient?" He also expressed other concerns. "Flyovers are a great idea...but you can't see individual leaks..."

Walt Ciciora, vice president of new technology for ATC, gave a discourse on decoder interface (IS-15). "The consumer electronics interface issue is a complicated one. It's going to get more complicated."

The third tech track dealt with "Practical Considerations in Implementing BTSC Stereo Television." Moderating this panel was a veteran of BTSC, Dave Large, vice president of engineering for Gill Cable. Large declared: "BTSC is a fact, and it's available to 90 percent of today's households." This panel featured such notables as James Gibson, RCA Labs; W.J.J. Hoge, consultant to Learning Industries; Al Johnson, director of marketing for Synchronous Communications; and Walter Reames, manager of special projects for Gill Cable. The upshot of this session was a lot of good information (problems and solutions) on systems already using BTSC.

The fourth technical session targeted on "Test Equipment Advances: Sweeping Without Interference to 550 MHz." Bill Riker, executive vice president for the SCTE, moderated this session, and took the opportunity to update the audience on the upcoming Cable-Tec Expo in April 1987.

The tech track on "Current Technical Issues Facing the Cable Industry," covered a variety of topics from uplinking safeguards to IS-15.

Ron Adamson, technical manager for Texscan Corp., talked about new advances. "One of the more current advances," he said, "is the surface-mount technology and the more powerful micro-processor pieces." Adamson also stated that there needs to be more focus on the part of manufacturers concerning operating temperatures. He also noted that because of the cumulative leakage index, there needs to be new methods of measurements and instrumentation.

Syd Fluck and Bill LeDoux of Calan Inc. spoke about continuous tracking and the problems with addressable converters. "Addressable converters," said LeDoux, "don't like rapid high levels going through them."

The last tech track, "After the Acquisition: A

Technical Evaluation," provided an excellent overview on technical followup. Robert Luff, group vice president for Jones Intercable, gave his insight into the entire process. "The acquiring company," explained Luff, "should look for two ways to better performance: expand the system (upgrade it to make it more revenue efficient); or leave the revenues but reduce rebuild, personnel and vehicle maintenance."

If you were unable to attend this year's Western Show, we hope this wrap-up will provide insight into what's currently happening. Even more, we hope that this information will encourage you to attend the trade shows. Now, sit back and enjoy some of the photos that we hope will bring the show closer to you.

From the Western Show...

Alpha Technologies' 3000 Series uninterruptible power supply.

Alpha Technologies introduced two new product series, the ALC Series of line power conditioners and the 3000 Series uninterruptible power supplies (UPS).

The high-power UPS products have application in the computer, CATV, LAN, telephone and industrial marketplaces. The ferroresonant UPS design, according to Alpha, offers uninterruptible power with the added benefits of higher efficiency, quieter operation and lower price. Offered in three formats (3 kVA, 2 kVA and 1.5 kVA), the units are supplied in rack-mounting or mobile-cabinet configurations. Various back-up times in the event of complete power blackouts are available through a choice of battery packages and battery extender options. The 3000 Series also protects equipment from the effects of spikes, surges and brownouts.

The ALC Series of line power conditioners handles power ratings from 150 VA to 1,000 VA. The units, which isolate power line variations from equipment, are designed to compensate for brownouts, to filter harmful spikes and electrical noise and to regulate varying line voltages at a constant, safe value.

For complete details, contact Alpha Technologies, 3767 Alpha Way, Bellingham, Wash. 98225, (206) 647-2360; or circle #100 on the reader service card.

Audiocom Inc. announced that it has begun distributing a new line of telecommunications equipment exclusively to the cable TV industry. The new product line includes interactive voice-response systems, automatic call sequencers and digital announcement systems.

Pay-per-view, hotlines, collection calls, appointment verifications and telemarketing are some of the applications that interactive voice-response systems can manage. The units work in both the inbound and outbound modes, use digital voice storage technology and, according to the company, can interface with virtually any billing service and host computer system.

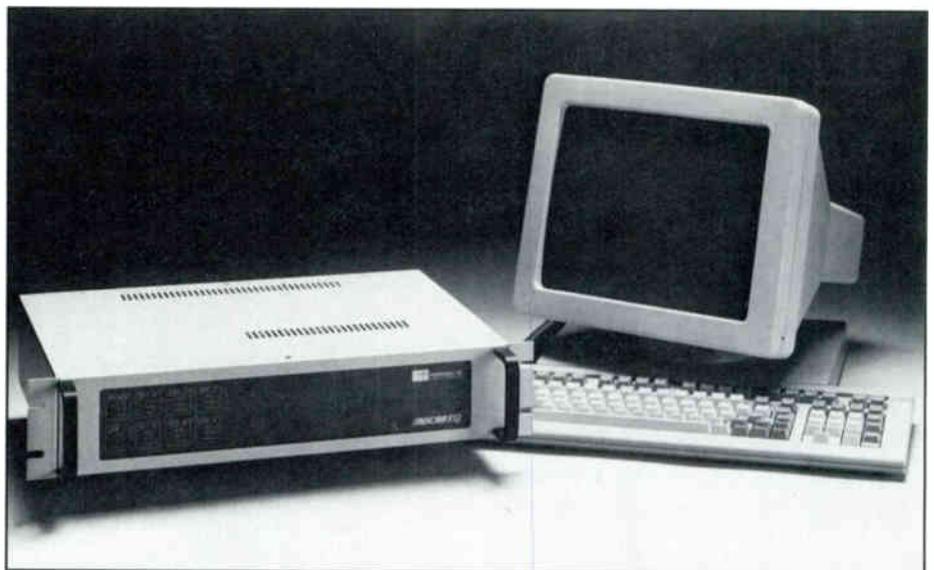

Audiocom's line of automatic call sequencers answer each incoming call with a recorded message, place the caller on hold and then process each call in the order it was received. As well, they can provide call management information to system managers.

Digital announcement systems are used to provide callers with pre-recorded messages of varying lengths, without involving personnel. Applications include programming information and service disruption hotlines. Messages can be changed routinely, and with some units, by remote access.

For further information, contact Audiocom Inc., 14645 N.W. 77th Ave., #203, Miami Lakes, Fla. 33014, (305) 825-4653, (800) 272-0555; or circle #99 on the reader service card.

Business Systems Inc. introduced Cable-TALK, a voice recognition system that can be integrated into its cable television management system. The system permits the telephone caller to speak interactively with the answering computer. This optional feature provides subscriber interaction with the cable office for pay-per-view, shop-at-home, technician tracking, and subscription orders and queries.

For more information, contact Business Systems Inc., 1 Marcus Dr., Greenville, S.C. 29615-9626, (803) 297-9290; or circle #98 on the reader service card.

Channelmatic Inc. introduced two new products. The first is an automated random access ad insertion system called the ADCART 2+2, which is capable of fully automatic, two-channel stereo ad insertion. Using a new proprietary spot information encoding technique the system is able to free both audio tracks of conventional VCRs for two-channel stereo. As well, all audio switching, including satellite TVRO, VCR, auxiliary and preview, is full two-channel stereo.

The ADCART 2+2 employs advanced digital logic to regulate most important system functions. Instead of having to tweak audio trim pots to adjust audio levels, the system does it automatically; once the operator has set the levels with the CRT terminal keyboard. According to the company, the terminal's user-friendly interface features uncluttered screens, and commands are entered with single keystrokes from logically arranged, plain-language menus. A single screen displays summary system status information 12 channels at a time. System status also appears on the front panels of the Channel Control Units (CCU). As the heart of an ADCART 2+2 system, the CCU controls all ad insertion switching functions on two channels, and occupies only 3½ inches of vertical rack space. Expansion can be accomplished by adding one CCU for each two additional channels. Error reporting is an integral part of the ADCART 2+2 system. Any system error is immediately noted and displayed on the CRT screen. If a VCR error causes a spot to be lost, that fact is noted and becomes part of the verification log.

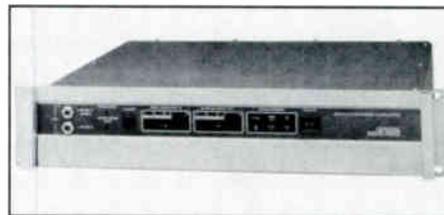

Channelmatic also introduced a new product in its line of ad insertion equipment designed to fill ad insertion requirements for small cable systems operating on limited budgets. The NSS-4A Network Share Switcher enables a cable system to insert advertising or program material into four CATV satellite networks from one source. It will interface with character generators, computer graphic generators, or low-cost sequential ad insertion equipment.

The switcher contains four dual-tone multifrequency (DTMF) decoders. When a decoder detects a valid cue tone, it disables the other three decoders. After a predetermined delay, the unit switches the ad source into the designated network. When the ad has finished, the NSS-4A switches back to the network, and resets all the decoders to detect the next tone that occurs on one of the four networks. Ads are inserted on a first come, first served basis.

For further information, contact Channelmatic Inc., 821 Tavern Rd., Alpine, Calif. 92001, (800) 231-1618, (619) 445-2691; or circle #97 on the reader service card.

The Model AI-0 addressable interface unit from Jerrold.

Jerrold's Commander 5 frequency agile headend modulator.

Falcone International Inc. unveiled a 2X option for its ASI-SC insertion unit that allows the unit to control commercial insertion on two channels using only one VCR. The ASI-2X expander box accomplishes control by switching between networks after each insertion.

For further information, contact Falcone International, 1355 Marietta Pkwy., Suite 104, Marietta, Ga. 30067, (404) 427-9496; or circle #96 on the reader service card.

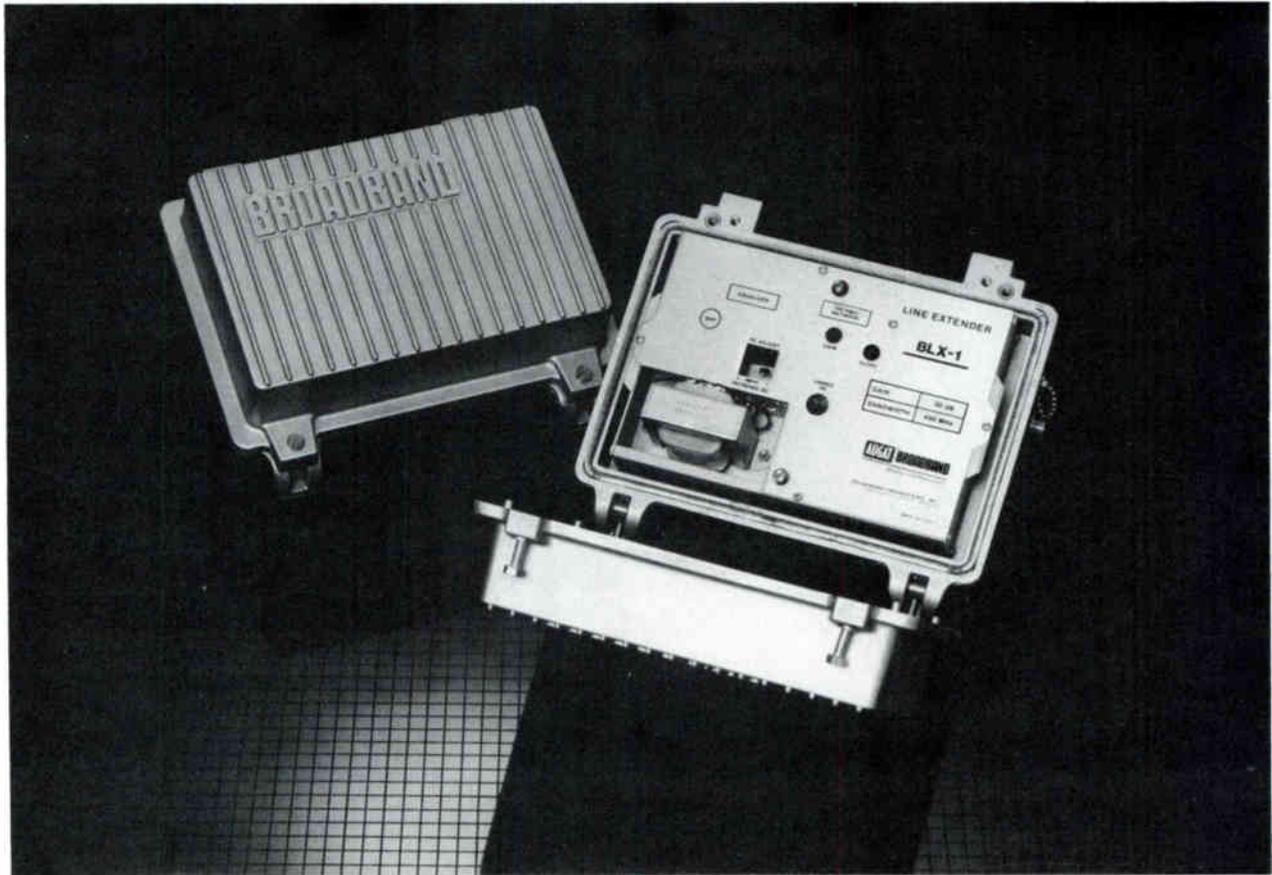

Two products were introduced by Intercept Communication Products Inc., the Sandwich Groundblock Model SGB 500 and a 16-way splitter. The groundblock is designed to connect the outer sheath of a coaxial cable to a copper ground wire, which is then connected to a grounding rod. In applications where aluminum coaxial cable is used to feed cable TV signals to a building, the SGB 500 permits grounding of the cable system before entering the building as required by NESC codes. The "sandwich" configuration permits installation of the groundblock after the cable is already installed. Since cable is not cut, no interruption of service is experienced.

The unit consists of two aluminum plates with grooves for cable and messenger, a stainless steel clamp to secure copper ground wire and stainless steel spring leaf to secure coaxial cable to aluminum plates. The spring leaf is actuated by a screw. This feature eliminates the probability of denting the cable in the course of installation, according to the company. A stainless steel clamp mounted on the groundblock secures the copper wire, #6 AWG, from the ground rod. There is no physical contact between copper and aluminum assuring galvanic integrity. The groundblock is available to fit a variety of cable sizes.

The 16-way splitter, Model HS 16, operates from 5 to 600 MHz and features a zinc die-cast housing, nickel-plated F connectors (brass connectors optional) and an integral ground block. The port-to-port isolation is 27 dB (25 dB at 500-600 MHz) with an 18 dB return loss at all ports. The nominal impedance is 75 ohms and insertion loss is 14 dB (0 dB [active] and 10 dB [active] are optional).

For complete details, contact Intercept Communication Products, 85 Fifth Ave., Bldg. 16, Paterson, N.J. 07524, (201) 471-2212, (800) 526-0623; or circle #95 on the reader service card.

The Jerrold Division of General Instrument Corp. unveiled three new product offerings. The latest member of the Starcom VI family of addressable converters, baseband Model DPBB,

Broadband: For flexibility in outdoor distribution amplifiers

Broadband has a complete line of one and two-way outdoor distribution amplifiers to meet any line extender or distribution requirement.

Flexibility is the key word. With gains of 26 to 50 dB and bandwidths up to 550 MHz, we can meet virtually any requirement that you have.

We offer reduced distortions with power doubler hybrids in many models.

For ease of maintenance, our amplifiers feature plug-in hybrids.

Excellent heat sinking, with an extruded aluminum chassis in close contact with the housing heat sink fins, assures the best possible heat transfer. That means lower operating temperatures and long life.

For information on specifications, pricing and delivery, call Broadband Engineering at 800-327-6690 (305-747-5000 in Florida) or write us at 1311 Commerce Lane, Jupiter, Florida 33458.

For quality, performance and service, call Broadband

AUGAT[®] BROADBAND

Quality and Innovation

High accuracy OTDR costs only \$9,975.

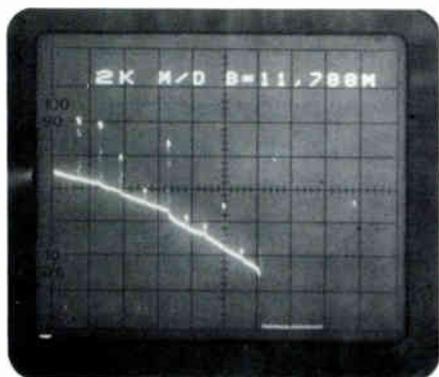

This rugged, weathersealed OTDR provides full capabilities for testing and trouble-shooting short wavelength optical cable systems

Laser Precision's high performance TD-9920 has shown outstanding reliability in the field for the past five years with the telcos, military, cable installers, and power utilities. This compact, 25 lbs., multimode optical time domain reflectometer offers more features and better accuracy than any other small portable. Designed to go anywhere, the TD-9920 operates on rechargeable battery or 110/220 VAC.

Specifications of the TD-9920 include: $\pm 0.01\%$ base accuracy, 0.025dB resolution, 40dB range, one meter distance resolution, 20 kilometer range, dual cursors, real-time display, dwell mode, and alphanumeric readout of dB loss, absolute, and relative distance measurements on the CRT. The standard wavelength of the TD-9920 is 850nm. Other wavelengths in the 800 to 900nm range are also available.

HIGHLY ACCURATE DISTANCE, SPLICE LOSS, & 2-POINT LOSS MEASUREMENTS

The TD-9920's dual cursors can be used to obtain accurate measurements between any two points along the fiber optic link. They can be used to measure the distance of a fault from any point along the cable, such as a documented splice, to help pinpoint the exact location. During splicing, the real-time display and dwell mode function as a "live monitor" enabling you to optimize the fiber core alignment for minimum loss. For end-to-end tests of the installed link, the TD-9920 will display the total amount of loss. The TD-9920 is designed to handle every phase of optical cable testing and trouble-shooting.

For more information on the special offer TD-9920-XTR, contact LASER PRECISION CORPORATION, 1231 Hart St., Utica, NY 13502, or call (315) 797-4449, or telex: 646803.

Reader Service Number 41.

The Starcom VI Model DPBB converter from Jerrold.

is a full-featured, 550 MHz addressable converter with impulse capability. The DPBB is compatible with all existing and new Jerrold systems and can be used in the same systems with all members of the Starcom VI family. In addition to impulse capability, the new baseband converter also has volume control, last channel recall, favorite channel programming, time-controlled programming for VCRs, parental control and remote control enable/disable.

The new headend-mounted addressable interface (Model AI-0), designed for use by smaller cable systems, is capable of servicing 8,000 subscribers in its basic mode, and 16,000 when optionally upgraded. It is controlled either through a billing system computer or by using a terminal and modem (Model AI-RTM) sold by Jerrold. The AI-0 was scheduled to be available for quantity shipments this month.

The Commander 5, a 550 MHz frequency agile headend modulator, is intended for use in all headend situations, and incorporates a user-friendly design that offers a full range of features, according to the firm. Features include front panel channel selection, video depth of modulation display, audio frequency deviation display and a front panel status indicator. As well, the Commander 5 is stereo-compatible, has automatic gain control, automatic signal switching, RF and baseband scrambling compatibility, and, in the phaselock version, is switchable for HRC or IRC operation. A complete set of options packaged on a single board will be available to provide video switching, audio and video AGC, second level IF switching and 4.5 MHz audio input. Both the phaselock version and option board are scheduled for production this spring. The modulator will be available for bulk shipments early this year.

For further information, contact Jerrold Division, General Instrument Corp., 2200 Byberry Rd., Hatboro, Pa. 19040, (215) 674-4800; or circle #94 on the reader service card.

Kanematsu-Gosho (USA) Inc. premiered its new 444 MHz Sprucer 310 two-way interactive cable television converter. The 310, which allows the viewer to order pay-per-view events and bill them to a major credit card, is designed especially for hotel/motel and resort applications. Viewers can order pay-per-view events using a keypad in the top of the converter. The order is then relayed to the cable system, where authorization and billing are handled.

The Sprucer 310 is fully compatible with the

Sprucer 300 interactive converter, which is designed for residential use. Both units can be used within the same cable system. The 310 shares many of the most popular aspects of the 300, including the FAST (forced automatic select tuning) feature, which is designed to allow the cable operator to select the channel that the subscribers' TV sets will be tuned to when turned on.

For more details, contact Kanematsu-Gosho, 400 Cottontail Lane, Somerset, N.J. 08873, (201) 271-7300; or circle #93 on the reader service card.

Magnavox CATV Systems Inc. had several new products available: the Model 5-MLE-H/60 line extender and a status monitoring software package.

The 5-MLE-H/60 is a high-gain line extender designed to help overcome the increased cable and passive loss associated with higher bandwidth rebuilds. The line extender has diplex filters and operates in both the forward (50-450 MHz) and return (5-33 MHz) directions. It has a series regulated power supply for 60 VAC systems, with a typical operating gain of 33 dB.

The software package, designated SOFT/DSS-IBM, complements Magnavox's Digital System Sentry (DSS) line of status monitoring products. Using color graphic displays, the software helps monitor cable systems by providing feedback such as bar graphs of analog parameters, color-coded fault windows, and schematic maps showing signal paths through a cascade.

Color-coded bar graphs identify the parameters of a single mainstation as good, having a minor fault, or having a major fault. Analog parameters monitored include forward and return carrier levels, AGC/ASC gain and slope control voltages, power supply output voltage, and temperature inside the mainstation. Color-coded fault windows identify fault location as well as magnitude. Because of SOFT/DSS-IBM's schematic display showing connections between mainstations, problem sources can be quickly pinpointed and corrected, according to the company.

For more information, contact Magnavox CATV Systems, 100 Fairgrounds Dr., Manlius, N.Y. 13104, (315) 682-9105; or circle #92 on the reader service card.

Riser-Bond Instruments introduced the Model 2901B+ time domain reflectometer and cable fault locator. The scope output feature is said to enable the operator to connect an external oscilloscope to the front panel, allowing the operator to view the transmitted and reflected pulse and actual signature of the cable under test. The digital LCD simultaneously displays the

Kanematsu-Gosho's Sprucer 310 converter.

HI-TECH FROM THE TROPICS

AMPLIFIER REPAIR / FSM REPAIR AND HEAD END EQUIPMENT REPAIR

Our CATV amplifier repair lab supports our repair components and upgrade modules to make sure every product QRF ships works the first time, Every Time! We think QRF has the most knowledgeable repair technicians in the CATV industry.

Every amplifier is distortion tested after repair. Our repair laboratory has Dix-Hills Racks and can draw parts from the largest repair parts inventory in the industry, with one day emergency service, AT NO EXTRA CHARGE!

Head end equipment repair department, also signal level meters (F.S.M.'S).

All the equipment needed to repair processors, modulators and F.S.M.'s, with highly trained men to solve any problem.

NOTE: The H.P. Spectrum Analyzer and the 1000MHz Wavetek Sweep set-up.

800-327-9767 Nationwide • Call toll-free 800-433-0107 (In FL)

Expert Engineering Advice At Your Fingertips

QRF Repair Lab Offers . . .

- Most up-to-date test equipment
- Huge inventory of replacement components
- A knowledgeable staff of trained technicians
- Our repair costs are inexpensive

- 90 day warranty
- Most amplifiers are individually boxed
- Standard, express or rush repair service
- Repair tags & shipping labels supplied to you—NO CHARGE!

ALWAYS LOOKING AHEAD TO THE FUTURE

DMV

The Model 8580 IPPV-capable converter from Scientific-Atlanta.

distance to the cable fault in feet (or meters). The product can be used for cable fault location or for cable length measurement on any metallic paired cable.

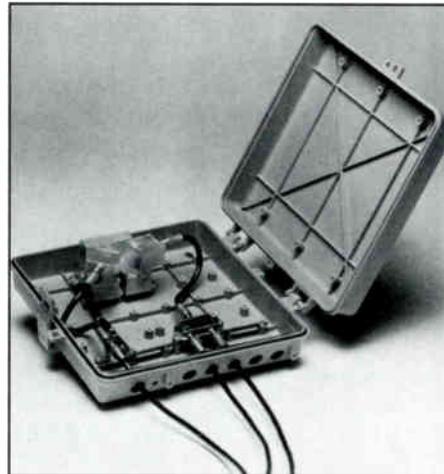

For additional information, contact Riser-Bond Instruments, P.O. Box 188, Aurora, Neb. 68818, (402) 694-5201; or circle #91 on the reader service card.

Scientific-Atlanta Inc. (S-A) introduced two new basic service, set-top terminals, Models 8505 and 8510. Designed for operation in 330 MHz systems, the Model 8505 is the most basic; two buttons on the front allow subscribers to tune upward or downward and turn the unit on and off. The unit features two-speed channel increment/decrement, accessed by pressing either button for more than two seconds to increase channel changing speed. Model 8510 operates in systems up to 450 MHz and adds infrared remote control for direct channel entry and automatic fine tuning.

S-A's Series 4400 broadband delivery system is designed to eliminate many of the problems associated with home entertainment center compatibility. The unit mounts to an external wall in a mechanically secured tamper-evident enclosure and delivers a composite broadband signal to wall outlets inside the home. The trap removes an interfering carrier placed extremely close to the video carrier by an interfering carrier generator device located at the headend.

According to S-A, the system features modular components that plug together to allow configuration according to various needs. Components include I/O modules that interface the F-connector on the drop cable to the system.

S-A also introduced the Series 6500 multipoint distribution amplifier, designed to accept a wide variety of modules. This allows the product to be configured as a line extender, as a terminating bridger or, when configured with optional AGC, as an alternative to trunk station amplifiers. The product housing features four connection ports, said to make installations easier and quicker

S-A's Series 4400 broadband delivery system.

Scientific-Atlanta's 8505/10 set-top.

when the signal path must be split in two or more directions exiting the amplifier. Splitters and directional couplers used to divide the signal can be plugged inside the amplifier housing, eliminating the need for connecting external passive devices and reducing the chances for signal leakage problems, amplifier misalignment and cable separation.

Finally, S-A introduced its Masterworks impulse pay-per-view (IPPV) system that allows operators flexibility in establishing operating parameters. With this system, cable operators can determine subscriber credit lines, the value of credit units, the number of credits a program will cost, the amount of free preview permitted and the number of pay channels offered. The set-top's LED display presents the pertinent buying information, which can be entered either on the unit's keypad or via remote control. The LED display also flashes to warn the subscriber that a purchase is about to be made or that a purchased program is about to start.

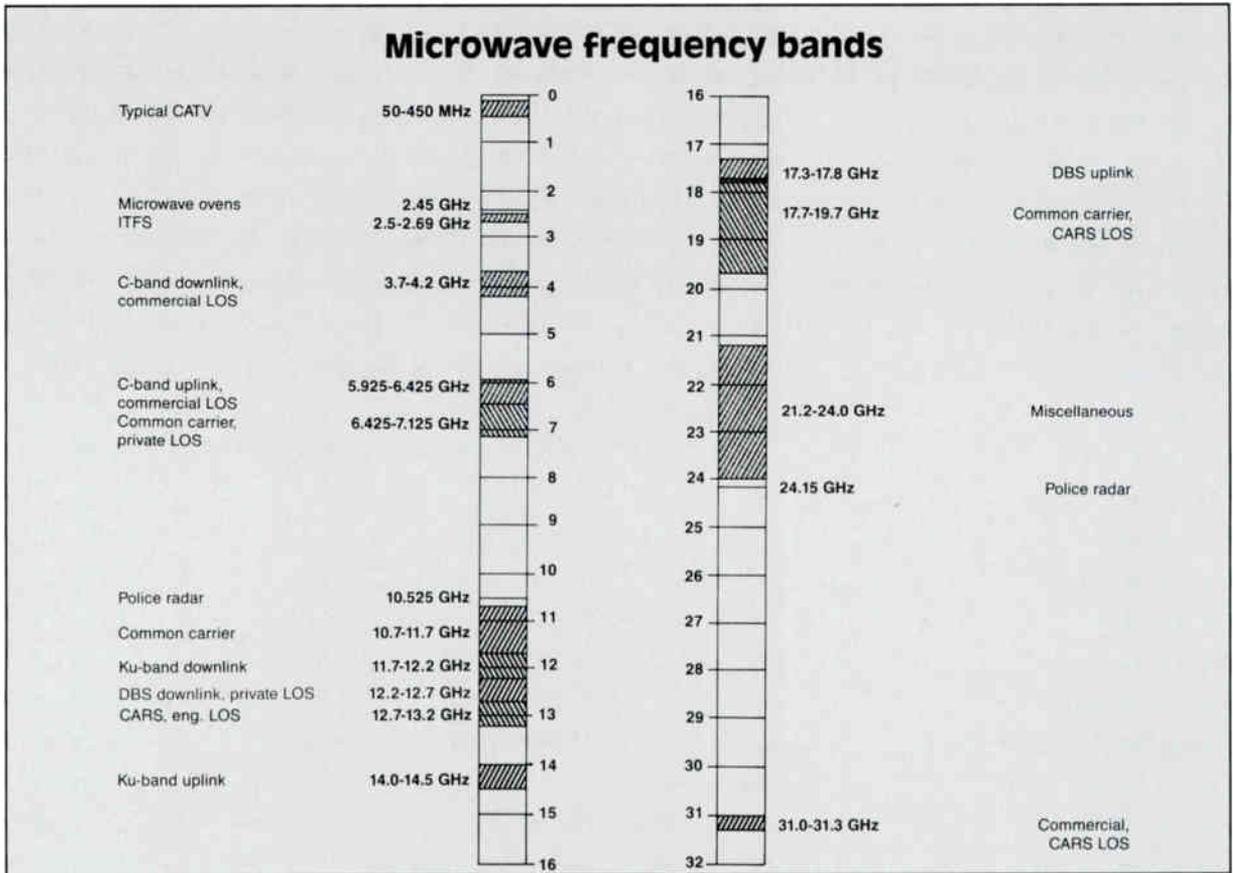

For more information, contact Scientific-Atlanta, 1 Technology Pkwy., Box 105600, Atlanta, Ga. 30348, (404) 441-4000; or circle #90 on the reader service card.

Zenith Electronics introduced its new impulse pay-per-view system, the "PM-Pulse," built around the company's PM addressable decoders introduced earlier in 1986. Using the phase modulation scrambling technique, the PM system is said to be a secure, cost-effective RF system. PM-Pulse is a store-and-forward system; on impulse, even minutes before an IPPV event, subscribers enter a code on the decoder's remote control transmitter. The program is unscrambled immediately. The headend system polls the decoders in the system at a rate of 100,000 per hour, signaling each box to transmit the encrypted ordering data to the operator's billing system.

For more information, contact Zenith Electronics Corp., 1000 Milwaukee Ave., Glenview, Ill. 60025, (312) 391-8181; or circle #89 on the reader service card.

Microwave for CATV operators

Waveguide polarization

Waveguide and antenna polarization is determined by the direction of the microwave signal E-field vectors (arrows in diagram), either parallel (horizontal) or perpendicular (vertical) to the Earth's surface.

Horizontal

Vertical

Earth's surface

Waveguide attenuation (12.7-13.2 GHz)

Waveguide type	dB/foot	dB/100 feet
Rectangular	0.0415	4.15
Elliptical (EW-122)	0.0410	4.10
Elliptical (EW-127)	0.0370	3.70
Circular*	0.0125	1.25
Flex	0.15	15.00

*Circular waveguide loss does not include top and bottom transition loss, which is typically 0.3 dB total.

Antennas and radomes (12.7-13.2 GHz)

Size	Antenna gain	Radome loss
4'	41.5 dB	1.5 dB
6'	45.1 dB	1.7 dB
8'	47.6 dB	1.8 dB
10'	48.8 dB	2.1 dB
12'	50.9 dB	2.2 dB

Decibel conversions

50-ohm conversions

$\text{dB}\mu\text{V} - 60 = \text{dBmV}$
 $\text{dB}\mu\text{V} - 120 = \text{dBV}$
 $\text{dB}\mu\text{V} - 107 = \text{dBm}$
 $\text{dB}\mu\text{V} - 137 = \text{dBW}$
 $\text{dBmV} + 60 = \text{dB}\mu\text{V}$
 $\text{dBmV} - 60 = \text{dBV}$
 $\text{dBmV} - 47 = \text{dBm}$
 $\text{dBmV} - 77 = \text{dBW}$
 $\text{dBV} + 120 = \text{dB}\mu\text{V}$
 $\text{dBV} + 60 = \text{dBmV}$
 $\text{dBV} + 13 = \text{dBm}$
 $\text{dBV} - 17 = \text{dBW}$
 $\text{dBm} + 107 = \text{dB}\mu\text{V}$
 $\text{dBm} + 47 = \text{dBmV}$
 $\text{dBm} - 13 = \text{dBV}$
 $\text{dBm} - 30 = \text{dBW}$
 $\text{dBW} + 137 = \text{dB}\mu\text{V}$
 $\text{dBW} + 77 = \text{dBmV}$
 $\text{dBW} + 17 = \text{dBV}$
 $\text{dBW} + 30 = \text{dBm}$

75-ohm conversions

$\text{dB}\mu\text{V} - 138.75 = \text{dBW}$
 $\text{dB}\mu\text{V} - 60 = \text{dBmV}$
 $\text{dB}\mu\text{V} - 108.75 = \text{dBm}$
 $\text{dB}\mu\text{V} - 120 = \text{dBV}$
 $\text{dBmV} - 78.75 = \text{dBW}$
 $\text{dBmV} + 60 = \text{dB}\mu\text{V}$
 $\text{dBmV} - 48.75 = \text{dBm}$
 $\text{dBmV} - 60 = \text{dBV}$
 $\text{dBV} - 18.75 = \text{dBW}$
 $\text{dBV} + 120 = \text{dB}\mu\text{V}$
 $\text{dBV} + 60 = \text{dBmV}$
 $\text{dBV} + 11.25 = \text{dBm}$
 $\text{dBm} - 30 = \text{dBW}$
 $\text{dBm} + 108.75 = \text{dB}\mu\text{V}$
 $\text{dBm} + 48.75 = \text{dBmV}$
 $\text{dBm} - 11.25 = \text{dBV}$
 $\text{dBW} + 138.75 = \text{dB}\mu\text{V}$
 $\text{dBW} + 78.75 = \text{dBmV}$
 $\text{dBW} + 30 = \text{dBm}$
 $\text{dBW} + 18.75 = \text{dBV}$

$0 \text{ dB}\mu\text{V} = 1 \text{ microvolt across reference impedance}$
 $0 \text{ dBmV} = 1 \text{ millivolt across reference impedance}$
 $0 \text{ dBV} = 1 \text{ volt across reference impedance}$
 $0 \text{ dBm} = 1 \text{ milliwatt across reference impedance}$
 $0 \text{ dBW} = 1 \text{ watt across reference impedance}$

Microwave formulas

Path attenuation

$$\text{Attenuation (dB)} = 96.6 + 20\log_{10}F + 20\log_{10}D$$

Fresnel zone clearance

$$\text{1st Fresnel zone} = 72.1 \sqrt{\frac{d_1 d_2}{FD}}$$

$$\text{0.6 Fresnel zone} = 43.26 \sqrt{\frac{d_1 d_2}{FD}}$$

Earth curvature

$$h(@K=\infty) = 0$$

$$h(@K=4/3) = \frac{d_1 d_2}{2}$$

$$h(@K=2/3) = d_1 d_2$$

$$h(@K=1) = 0.67d_1 d_2$$

$$h = \frac{d_1 d_2}{1.5K}$$

For all these formulas:

F = frequency in GHz

D = total path length in statute miles

h = height in feet

d₁ = distance from one end of the microwave path to a given obstruction point

d₂ = distance from obstruction point to the other end of the microwave path

K = equivalent Earth radius factor

Relationship between system reliability and outage time

Percent reliability	Outage time each		
	Year	Month (avg.)	Day (avg.)
0%	8,760 hrs.	720 hrs.	24 hrs.
50%	4,380 hrs.	360 hrs.	12 hrs.
80%	1,752 hrs.	144 hrs.	4.8 hrs.
90%	876 hrs.	72 hrs.	2.4 hrs.
95%	438 hrs.	36 hrs.	1.2 hrs.
98%	175 hrs.	14 hrs.	29 min.
99%	88 hrs.	7 hrs.	14.4 min.
99.9%	8.8 hrs.	43 min.	1.44 min.
99.99%	53 min.	4.3 min.	8.6 sec.
99.999%	5.3 min.	26 sec.	0.86 sec.
99.9999%	32 sec.	2.6 sec.	0.086 sec.

Path reliability formulas

Fade probability (multipath outage hours) =

$$a \times b \times 2.5 \times 10^{-6} \times F \times D^3 \times 10^{-\frac{f}{10}}$$

$$\text{Critical rain rate} = \left(0.465 \frac{f}{D}\right)^{0.8}$$

Slope of rain curve =

$$\log_{10} \left[\frac{\left(\frac{24 \text{ hr. rain}/24}{1 \text{ hr. rain}}\right)^{\frac{1}{1.38}}}{1} \right]$$

$$\text{Rain outage hours} = \left(\frac{\text{Critical rain rate}}{1 \text{ hr. rain}} \right)^{\frac{1}{\text{slope}}}$$

$$\text{Percent reliability} = \frac{8760 - (\text{hrs. multipath} + \text{hrs. rain})}{87.6}$$

For all these formulas:

F = frequency in GHz

D = total path length in statute miles

f = fade margin (to 35 dB C/N for AML, to FM improvement threshold for FML)

1 hr. rain = maximum rainfall, in inches, occurring in any one-hour period during the previous five years

24 hr. rain = maximum rainfall in inches, occurring in any 24-hour period during the previous five years

a = terrain factor: Very smooth terrain, including over water, a = 4; average terrain with some roughness, a = 1; mountainous terrain, a = 0.25.

b = temperature/humidity factor: Gulf coast or similar hot, humid areas, b = 0.5; normal interior or northern climate, b = 0.25; high altitude (mountainous) or very dry (desert), b = 0.125.

Take Your Family to Disney World and Attend Cable-Tec Expo '87 for Free

***Communications Technology* and the Society of Cable Television Engineers are sponsoring an essay contest:**

“How Does *Communications Technology Magazine* Best Serve the Cable TV Engineering Community and the SCTE?”

The winner will receive an expenses-paid trip for a family of four to Orlando, Fla., home of **Disney World** and the site of the **1987 Cable-Tec Expo** (April 2-5). **CT** will provide for round-trip air fare and hotel accommodations for three days and four nights; the **SCTE** will provide free registration to the Cable-Tec Expo for the winner.

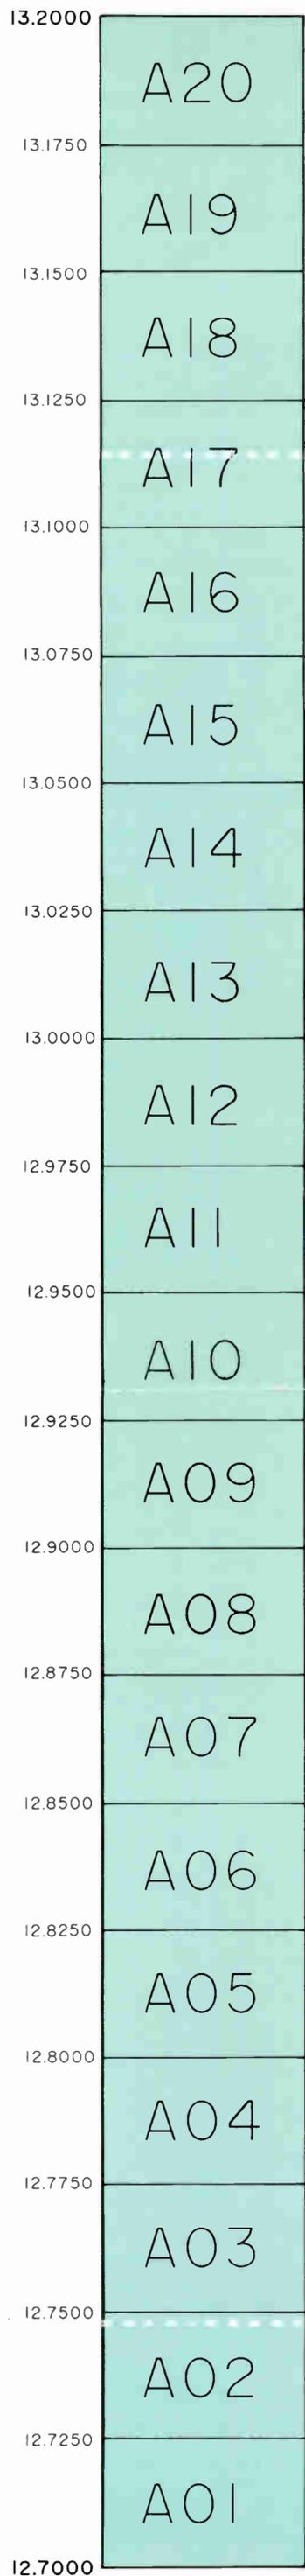

The essay must be no more than 250 words, typed and double-spaced. Be sure to include your name, company, address and day telephone number. Deadline for entries is **March 1, 1987**. The winner

will be selected by a panel of four, composed of SCTE Directors Bob Luff and Sally Kinsman, and two members of the *CT* staff.

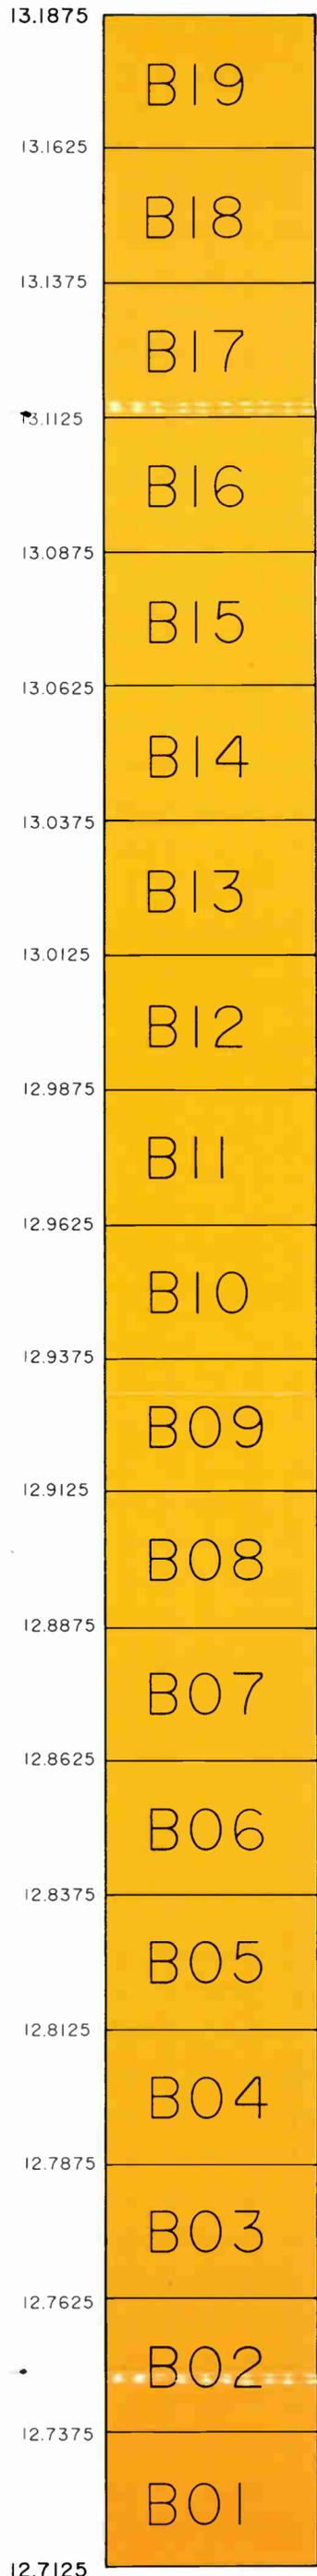

This contest is open to anyone involved in the cable television industry except *Communications Technology Publications Corp.* and *national SCTE* employees and directors, and their relatives. All entries become the property of *CTPC*, and may be reprinted along with the author's photograph at our discretion. Send entries to **CT Essay Contest, P.O. Box 3208, Englewood, Colo. 80155**.

FROM SMALL TOWN TO DOWNTOWN— HUGHES HAS THE RIGHT SYSTEM FOR YOUR APPLICATION

No one microwave system is intended to fit every application. And that's why Hughes Aircraft Company offers you a choice. Whether you're serving a rural community or a metropolitan area, you can now get a microwave video distribution system suited to your specific application...as well as your pocketbook.

Low Power. This low-cost, solid state OLE-111 transmitter is pole mountable, will handle 1-60 TV channels, and allows you to rapidly and inexpensively extend your cable plant from the end of a cascade to new subscriber pockets.

Medium Power. The most widely used Hughes AML® transmitter, the MTX-132, is easily expandable to accommodate cable systems up to 550 MHz, and is ideal for providing local distribution of a large number of television signals from headend to hubs.

High Power. The STX-141 offers the ultimate in high power microwave video distribution. It is intended for use where large num-

bers of hubs are served, or where long microwave paths may be encountered.

Beam Bender. This low-cost, on-frequency, active repeater is solid state, requires little power, and is designed for outdoor mounting. The MWB-122 is used to redirect a microwave signal when the path is blocked by a man-made or natural obstacle.

These transmitters deliver AM or FM signals, and, like all Hughes AML products, are backed by a comprehensive support program. So contact Hughes today and let us help you select the right system for your microwave application. Hughes Microwave Communications Products, Bldg. 245, P.O. Box 2940, Torrance, CA 90509-2940, or call toll free (800) 227-7359, Ext. 6233. In California: (213) 517-6233. In Canada: COMLINK Systems Inc., 1420 Bayly Street, Unit 5, Pickering, Ontario L1W 3R4, (416) 831-8282.

AML microwaves

By Jeff Kaczor

Engineer, Complete Channel TV Inc

AML (amplitude modulated link) microwave preventive maintenance should accomplish three things: ensure system reliability, ensure system quality and provide an insight when problems do occur. When planning a maintenance program, you should start with the transmitter input and encompass the entire system to the receive interface unit (IFU) or IFU output.

The transmitter site requires daily preventive maintenance; transmitter output levels should be checked daily. If the transmitter is in a remote location, it should be checked at least two or three times per week. Of course, your transmitter is going to run only as well as your headend. At least half the time when problems do happen in our system, they usually are in the headend. We do not use a headend combiner but a transmitter, a transmitter monitor and an IFU to feed trunk out of the building; the advantages of this far outweigh having a headend combiner. The two main reasons we decided to do it this way were transmitter isolation and ease of headend setup.

If you use a combiner, you must first check trunk out then check your transmitter out. When you read your IFU out, you are looking at the transmitter. The idea behind this is that it is much easier to maintain one mix instead of two. This setup also will force you to have at least one hot-running spare receiver to back up the transmit monitor in your system; we have three. A majority of preventive maintenance is done on a monthly basis.

Recording measurements

In our system, to check transmitter input and transmitter frequency we usually keep the counter on the transmitter oscillator hooked up and running. Klystron currents are logged in a separate book so that we can look at a particular klystron during six months to a year without having to wade through a lot of paper. The redundant oscillator also is switched in and allowed to run for a day; its frequency and output levels are checked. If it is a MTX transmitter, we pull it off the shelf and test it quarterly.

Air-conditioning for the transmitter/headend room is checked for belt tension and condition. Filters and heat exchanging coils should be examined for dirt and obstructions. Without a reliable air-conditioning system it is hard to run an STX high-power array.

A complete check of all receive sites should be done monthly. Receiver operating parameters should be established and not change much. In a composite system, check the receiver frequency. IFU input and output should be measured and logged along with receiver parameters.

Waveguide pressure, both primary and secondary, also should be logged on the same sheet. If you have a good, tight site, your wave-

guide pressure won't change either. If it does leak, get the soapy water out and find the leaks. I strongly recommend using dry nitrogen rather than air dehydrators, because the heater that should keep the desiccant dry might fail and eventually lead to a problem known as "moisture in the waveguide." Sites where you can hook up a nitrogen tank to run 2 to 5 pounds per square inch and not have to change the tank but once or twice per year decreases your probability of taking on water. We have sites where we change the tank every four to five years and we also have

'Another thing to check while on your monthly receive site run is a general visual inspection of the site'

others where after five years no appreciable pressure has been lost. Of course, some of this

depends on who built the site.

I cannot place enough emphasis on the mechanical integrity of the system. Another thing to check while out on your monthly receive site run is a general visual inspection of the site, including building condition, security, etc. If you have a phase-lock system, you can perform what we call the "phase-lock shock test": While observing the error voltage, slap the front of the receiver with the palm of your hand. If you don't have any bad connections in your receiver, then it won't move. If it does move, you have a bad connection; find it.

Transmitter power should be set; we do it bi-yearly. All towers should be checked for grounding, guy tension, plumb, visual inspection for corrosion and anchor inspection.

Once all system parameters are established,

a preventive maintenance routine will keep an AML system just purring along. If the equipment is properly installed and set up according to manufacturer specifications, long-standing reliability can be expected.

Summary of preventive maintenance

Daily

1. Check trunk out levels.
2. Check TX monitor for proper levels.
3. Check TX waveguide pressure.

Weekly

1. Check source lock voltage; log klystron voltage and current and power supply voltages.

Monthly

1. Check TX frequency.
2. Check all receive sites for the following:
 - a. levels out of RX

- b. levels out for trunk
- c. RX frequency, source lock voltage, AGC voltage, power supply voltages
- d. waveguide pressure and tank pressure
- e. general visual inspection of site
- f. fade margin (watch for fluctuations on windy days)

Yearly

1. Tower inspection:
 - a. grounding
 - b. guy tension
 - c. plumb
 - d. visual inspection for corrosion
 - e. anchor inspection
2. Set TX power (I do it bi-yearly)

With our CAT System you can monitor your headend without leaving your office.

Now you can measure headends, hubsites and remote test points with the touch of a button — right from your desk!

It's as quick as a cat with RF/Superior's Computer Aided Test System. It's fast. Safe. FCC accurate. In-depth. Cost effective. And we can put it to work for you in your office right now.

Imagine! Now you can measure system test point levels to within $\pm 0.6\text{dB}$ and frequency to better than 0.0001% — all without disturbing a single connector.

Plus you can compute system response and system stability; predict when channel frequency will exceed FCC limits; print data in graphical or numerical formats; flag out-of-limit conditions; and more.

The best part is, you can do it all automatically right from the comfort of your office while you sit back and pour yourself another cup of coffee.

Get the picture? Good. Because we'd like to tell you more.

Communication tower installation

By Ted Glatz
UNR-Rohn Inc

There are many uses for communications towers in our fast-moving, modern society. Towers may be used for cable and broadcast TV, microwave, AM and FM broadcast, and cellular radio, just to name a few. As there are only two basic types of towers—guyed or self-supporting—the amount of land available and the cost usually are the deciding factors in the type chosen. Making sure that the tower is designed and constructed/installed properly requires planning and experience.

Before the tower parameters can be determined certain information is required, such as wind- and ice-loading, antenna-loading, plot plan or site area, and any other specifications unique to the particular application. In addition, an accurate, detailed soil analysis should be performed so that the foundations can be engineered for the existing conditions.

Once the specific requirements are known, we

utilize a computer-aided design system to ensure that the tower and its components will meet the provided criteria. At the appropriate time in the construction schedule and after the necessary permits have been obtained, the installation is ready to begin.

The installation

Most tower installations are broken down into three phases: foundation installation, tower erection, and antenna and line installation.

Depending upon the circumstances, a different subcontractor may be selected for each of these phases or just one chosen to install the entire job. Over the years towers have gotten much larger; foundations, likewise, must be much larger in order to support the added loads. In many cases, because of the larger foundations required for self-supporting towers, a specialized foundation subcontractor should be employed. Special foundations could consist of large mat-types, pier and pad, drill and bell, or large diam-

eter vertical shafts. Guyed tower foundations usually consist of a pier and pad base for the tower and three or more "dead-man" buried anchor blocks.

Tower foundations should be installed following the design parameters as well as industry-mandated codes. These codes define minimum requirements for cement, aggregate, admixture, reinforcements, mixing, transporting of the ready-mix material and placement of concrete. They also define minimum requirements for compaction of the back-fill against the installed concrete. We require our foundation subcontractors take concrete cylinder tests and have the results certified by the testing laboratory as added insurance that the concrete did in fact reach the specified strength. In some cases, slump tests also are taken at the time concrete is poured.

Erecting the tower

After the tower foundation has cured for the appropriate amount of time, the tower material is shipped and arrangements made for the tower erector to be present upon arrival. The tower material usually is hauled to the site by 40-foot flatbed trucks. During the unloading procedure the erector lays out the material, with whatever is to be used first nearest the tower base. As well, the erector should take an accurate inventory against the packing list to make sure that all material needed for the erection of the tower is on hand.

Depending on the size of the tower, it may be assembled and erected with a crane or using a winch and gin pole to stack the tower. Because of the size and weight of the tower elements, many erectors now use mobile cranes or cherry-pickers to speed up the work. At times, depending on location, helicopters are used. In any case the tower, as assembled, should be kept true and plumb as it is being stacked.

Painting and lighting

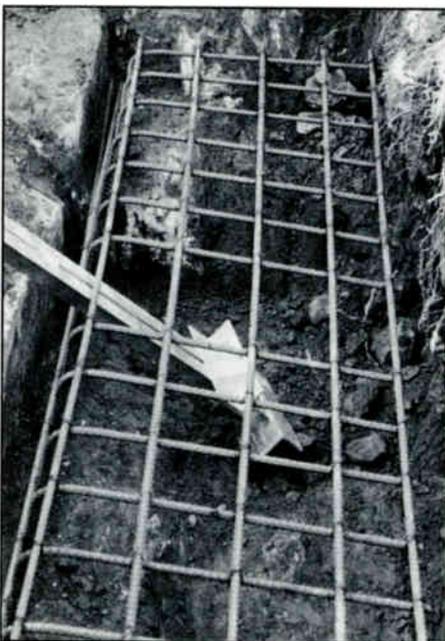

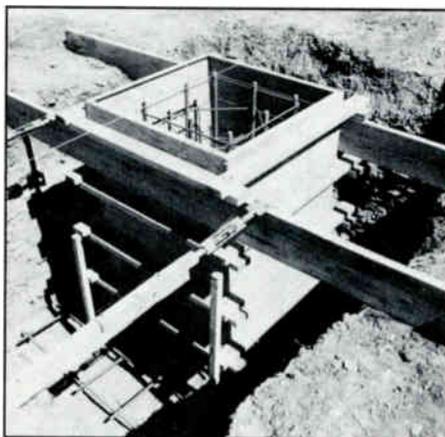

If the towers are required to be painted in accordance with FAA regulations, this may be done at the manufacturer's facilities, on the ground at the site or in the air after erection. If lighting is required, this is done during erection. However, prior to the permanent lights being installed, temporary lighting must be used as set forth by the FAA.

The tower grounding system usually is attached to the tower base section at the commencement of the stacking procedure. During erection, certain attachments such as ladders and safety climbing devices, antenna mounts, ice shields, etc., are installed on the tower. After erection, the communication devices (antennas, horns, etc.) are installed along with the appropriate feed lines.

Upon completion of the erection work, minor adjustments may be necessary to make sure that the tower is true and plumb in accordance with specifications and recognized standards. ■

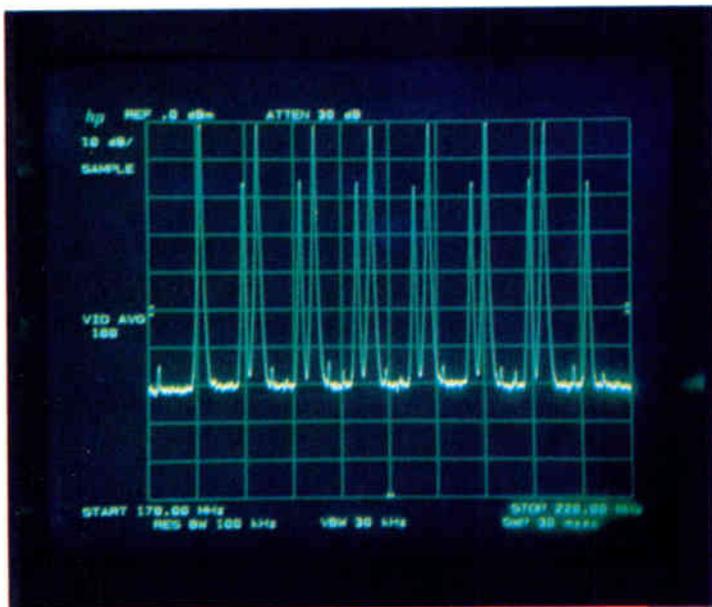

Clockwise from above: self-supporting tower being erected using a crane; pier-and-pad foundation for guyed tower base under construction; foundation reinforcements for "dead-man" anchor block for guyed tower.

Raychem's GelTek™ Sealant Strip

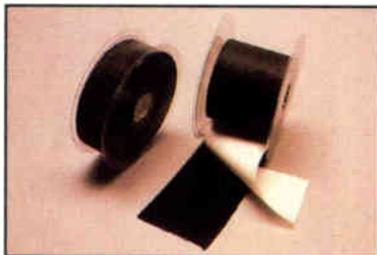

Seals Out Moisture & Prevents Corrosion

Take the easy, one-step method to seal out moisture and to corrosion protect your CATV equipment. Raychem's GelTek™ sealant strip will wrap around, adhere instantly and conform to the many sizes and shapes found in your system. Even irregular connectors like right angle and housing to housings can now be protected.

You won't need any special tools or training for installation or re-entry. GelTek™ sealant strip is cold-applied right off the roll, protecting surfaces thoroughly and instantly. Small punctures will close and reseal themselves immediately. The strip can be removed cleanly and quickly when re-entry is needed.

Temperature extremes won't affect your installation. GelTek™ strip handles and performs effectively in sub-zero weather as well as in desert conditions.

GelTek™ strip is available in two standard roll sizes; 1 inch wide by 20 feet, and 2 inches wide by 10 feet. Both come in a convenient dispenser package.

GelTek™ Sealant Strip:

- Seals out moisture and prevents corrosion
- No mess, no cure delays
- Tools are not needed for installation
- Is highly conformable and adheres to all surfaces
- Removes cleanly, easily
- Reseals around small punctures
- Remains stable in temperature extremes
- Comes in a convenient dispenser package
- Cost-effective

Raychem

ANIXTER

Anixter, America's No. 1 supply specialist for the Cable-TV industry, provides everything from head-end equipment to subscriber products for operating, maintaining, upgrading and constructing CATV systems. Anixter serves the industry from computerized distribution centers throughout the United States, Canada and the United Kingdom.
