# People Depend On You - You Can Depend On Us

**T**here's no telling when the next outage will happen, but you can usually guarantee it won't be on a bright sunny day. That's why the Sencore CA780 "Cabelizer" is designed to be used under all types of conditions, including the dark. The CA780 is designed to help you find any metallic cable problem from just a few inches all the way out to 65,000 feet and features the best sensitivity in the industry so that no problem goes unfound.

For more information on the CA780, or any other of Sencore's cable products, simply call

# The Perfect Marriage of LIGHT and AIR.

## MC<sup>2</sup>.650

UNEQUALLED FOR FIBER-TO-FEEDER TRANSMISSION

- TIME PROVEN COAXIAL PRODUCT
  - LOWEST ATTENUATION
- FULL ALUMINUM WALL THICKNESS
- EXCELLENT HANDLING PROPERTIES
- FULLY BONDED . . . MOISTURE AND SUCKOUT RESISTANT

Whenever fiber optic cable is to meet coaxial feeder, the air-dielectric design of .650 MC<sup>2</sup> assures the most advantageous match. Produced since 1985, .650 MC<sup>2</sup> is the only coaxial available today that has the diameter and handling ease of a feeder cable, with the electrical performance of a trunk cable.

Foam-core coaxials cannot achieve the attenuation of .650 MC<sup>2</sup> without increasing cable diameter and sacrificing full aluminum wall thickness. They simply cannot compete with the time-honored capabilities and economies of .650 MC<sup>2</sup>.

## MC<sup>2</sup> Feeds The Future

# AMS 5000

## PLAY THE GAME BY YOUR OWN RULES.

### The AMS 5000. We've taken the risk out of ATM.

As a major player in the competition to build the information superhighway, you can't afford to miss out on ATM. But evolving standards, product uncertainty, and the fear of high initial investment costs can create formidable obstacles. That's why Hitachi's AMS 5000 Product Family is designed to give customers complete flexibility in structuring ATM networks.

The AMS 5000 gives you the combination of multiplexing and switching functions and the flexibility to select and mix interface protocols both now and in the future. In addition, AMS 5000's modular, building block architecture and incomparable scalability reduce your initial capital investment and deployment costs. Your ATM network can evolve from the outside in — starting close to your customer and eliminating lengthy, expensive backhaul access links.

When you compare this network edge deployment with the cost of a centralized, large-scale ATM switch, it's easy to see why only Hitachi gives you a bottom-line advantage.

### Hitachi has the power to help you win.

As one of the world's 10 largest industrial corporations, Hitachi possesses over 80 years experience in technology, employs over 18,000 researchers and engineers (including 1,100 Ph.D.'s), and invested over \$4 billion on research & development in 1993.

So it comes as no surprise that our corporate commitment to technology has already made us a formidable contender in the telecommunications industry. We have the resources, the knowledge, the experience, and the commitment to research & development to ensure that our telecommunications products continue to provide exactly what you need. To learn more about Hitachi's AMS 5000 Product Family, call us at 1-800-446-8820 today.

**EDITOR'S LETTER**

# Quality and reliability

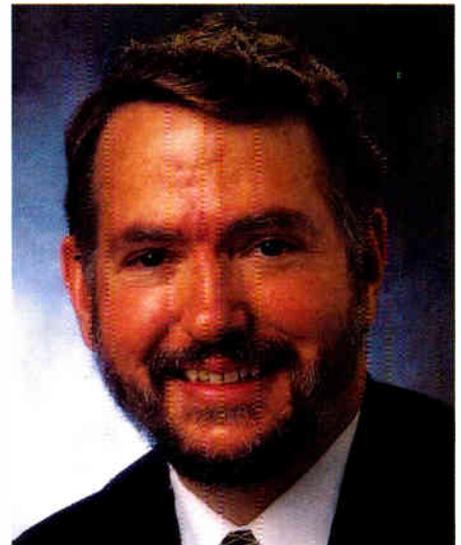

**L**ast month's National Cable Television Association convention in Dallas provided a look at interactive, data communications and telephony-via-cable technology. The future appears to hold a lot of promise for advanced nonentertainment CATV-based services, but at least one panelist cautioned, "We could lose the war." Judging by the results of a survey conducted for *Cable World* magazine (May 8, 1995 issue) by Talmey-Drake Research & Strategy Inc., we have a lot of battles to win in order to claim victory in the war.

Here's the bottom line: Before we worry much about the high tech stuff, we have to make sure the basic stuff is taken care of. First and foremost is giving our subscribers the confidence that we can be a serious player in the future of telecommunications. Right now, cable is perceived by much of the public as a low tech industry. According to the *Cable World* survey, when asked which companies would lead the way in developing the information superhighway, subscribers put cable next to last, behind AT&T (31%), IBM (20%) and the telcos (19%). We got a whopping 7% — barely ahead of Microsoft at 5%.

Bad programming (9%), not enough channels (9%), and high monthly subscription fees (14%) are among the top problems with cable, according to the survey. Also cited were poor reception (11%) and outages (11%). These latter two are something we in the technical community can do something about.

Coincidentally, one of the engineering panel sessions at this month's Cable-Tec Expo in Las Vegas is "Improving System Operations: Laying the Groundwork for Our Future." I'll be on that panel, speaking about two relatively low tech subjects: quality and reliability. I'm convinced that we must get these two right before we move beyond being entertainment providers.

Fiber-based architectures in rebuilds and upgrades, the use of high-quality equipment, preventive maintenance, proactive outage management, training, good installation practices

and effective quality control programs collectively will do much to improve overall reliability. These efforts also will improve overall signal quality, but more important, we need to make sure we have a thorough understanding of the engineering process. Quality begins at the stage where we choose the architecture, set the technical specs and design the system. If we don't provide for it here, no amount of effort after the fact will bring subscribers the quality they demand and deserve.

Once we have reliability and quality under control, only then will we be prepared to move forward with advanced services. Of course, management will simultaneously have to work on the programming and cost concerns as well as do something about our low tech image. It's going to take a little public education and PR to turn that last one around.

### **CT's new look**

As you flip through this month's issue of *Communications Technology*, you'll notice some changes. Although we look a bit different, our first and foremost commitment is still the same: Bringing you the technological information you need to continue to carry our industry into the future. We hope you find the new look attractive and easy to read.

*Ronald J. Hranac  
Senior Technical Editor*

# Nobody carries a more durable, dependable & versatile line of batteries.

For any climate, for virtually any application, POWER GUARD offers a complete line of maintenance-free, fully accessorized batteries to meet your needs.

**Handles and Hardware Included.** POWER GUARD Premium Gel Cell, AGM Sealed and Flooded batteries are manufactured to the highest quality standards in the industry. And only POWER GUARD batteries come equipped with convenient carrying handles and hardware for safer, easier transportation and installation.

**Maintenance-Free and Recyclable.** Our batteries are exclusively designed

for longer cycle life and maintenance-free operation. And all POWER GUARD batteries are 100% recyclable. Simply call our convenient 800 number, and we'll pick up your spent batteries.

**In Stock for Immediate Delivery.** In a bind? As part of our commitment to meet customer needs, POWER GUARD has batteries in-stock and available for immediate delivery. Call POWER GUARD and have your batteries shipped when and where you need them. POWER GUARD, your single source for all the power you need.

## DON'T BE LEFT BEHIND!

Keeping up with all the new technologies is a challenge in itself. There is a way to take advantage of the leap in technology. And it's called Fiberworks.

- ▶ Fiberworks is a comprehensive series of training courses about cable television, fiber optics, digital network systems, technology and deployment.
- ▶ Developed by ANTEC, the company that introduced fiber optics to the cable television industry, courses emphasize solutions for today's evolving networks.
- ▶ ANTEC training programs are accredited through the International Association for Continuing Education and Training (IACET) to award Continuing Education Units (CEU's) to participants.

For more information about course content, course customization and available dates, contact our Training Administrator at the ANTEC Technical Training Center in Denver, Colorado. Call 1-800-FIBER ME (1-800-342-3763).

# Analog? Digital? Fiber? Copper? HFC? Standard makes a network work.

Putting together or upgrading a head-end is more complex than ever. You need technology that will bridge the gap between today's wants and tomorrow's needs.

Standard has all the essential equipment you'll need for a rapidly changing environment.

## The cornerstone of the intelligent headend.

For proof, take a look at our Stratum modulator, a self-healing, advanced broadband network modulation system. Stratum combines up to 78 channels in a single six foot EIA rack. Ideal for master headend applications or remote hub operation, Stratum offers exceptional RF performance, complete remote control operation and status monitoring capability. And with the unique automated redundancy module, the system can instantaneously correct detected faults, by internally re-routing video,

audio and IF signals to designated back-up modules.

## The perfect upgrade solution.

Upgrading your headend? Start with our Agile IRD II integrated satellite receiver/descrambler. With a fully synthesized PLL tuning circuit and micro-processor control over the dual conversion C/Ku-band 950-1450 MHz RF input, it's the preferred choice for the continuous duty cycle CATV master headend environment.

## Complete the package.

The TVM550S modulator, with the integrated CSG60 BTSC stereo generator, gives you noise and spurious free RF output, not to mention ultra-stable PLL-synthesized tuning. Perfect for the expansion of channels and upgrading headends, the TVM550S, coupled with the IRD II's advanced headend technology, completes a space-saving CATV package addressing full compliance

with FCC part 76 Video/Audio and RF performance standards for future headend requirements.

## You deserve a toast.

When you purchase Standard, you've chosen the finest line of headend equipment available. Congratulations! Celebrate your good taste, and good fortune...

*The right technology... for right now.*

# Essential equipment.

### TVM550S MODULATOR

Cover the broadband spectrum from 54 to 550 MHz with a single unit.

**AGILE IRD-II**  
Cable industry's first RS250 certified broadcast quality IRD.

### CSG60 BTSC STEREO GENERATOR

Have it integrated into the TVM Series or get the space-saving two-pack.

### STRATUM MODULATION SYSTEM

Put up to 78 channels in six feet of rack space.

## CableLabs testing digital conformance

Cable Television Laboratories Inc. began digital video system conformance testing at its facilities in Louisville, CO. The tests will help verify the compatibility and interoperability of different vendors' compressed digital bit streams and decoders. The advanced phases of this conformance testing were approved by the CableLabs board of directors last December.

The bulk of work since then has been in creating the computer software and hardware configurations that will be employed in this testing.

Currently, half of some 104 system transport stream elements and 75% of some 71 video stream elements are verified in the tested bit streams. The video parameters are checked to comply with the main profile at main level definition.

Tests are being performed on MPEG-2 transport streams at the system layer level using a common, agreed upon interface in order to test the video, audio, data, synchronization and multiplexing (not just elementary bit streams such as compressed video alone).

## Comcast picks AT&T for broadband trial

Comcast Corp. will use AT&T Network Systems' HFC-2000 broadband access system for an integrated video and telephony services trial scheduled to begin early next year. This represents the first application of AT&T's hybrid fiber/coax (HFC) access platform with a major cable company.

Initial deployment will provide basic telephony services to approximately 1,000 Comcast customers. Also, the system will enable Comcast to offer a variety of other services to its customers including ISDN data services, dedicated data services and small business applications.

In other news, AT&T Corp. and Samsung Electronics signed agreements to support the integration of the Microsoft Interactive Television (MITV) platform in tests and commercial deployments around the world. AT&T and Samsung also have joined Insight, Microsoft's collaborative program, to prepare the broadband industry for early testing and deployment of MITV.

AT&T and Samsung join Alcatel SEL AG, Andersen Consulting Co., Lockheed Missiles & Space Co., NTT Data Communications Systems Corp. and Olivetti SDA in providing integrating support for the MITV broad-

## Industry veteran Jimmy Schulz dies

Superior Electronics Group is saddened to announce the death of Jimmy Schulz, who died of a heart attack in Dallas on May 7. Schulz was the director of technical services for the company, a 20-year cable TV veteran, and is perhaps best known as chief engineer at Paragon in Minneapolis.

Jimmy was 42 and is survived by his wife, Vicki, and his two children Jeremy, 6, and Jason, 13. A memorial service was held May 12 in Sarasota, FL.

A memorial trust fund has been set up for the family. Donations can be sent to: Jimmy Schulz Memorial Trust Fund, South Trust Bank, 1800 2nd St., Sarasota, FL 34236, Acct. #01141662.

MICHNER

band network architecture, combining the operating system with a variety of servers, switches, set-top boxes and network operation and management software to provide a complete end-to-end system that can be deployed by network operators.

## PowerTV forms interactive TV consortium

PowerTV formed an open consortium to provide information and guidance regarding the interactive TV market. The Partners in Open Wideband Entertainment Resources (POWER) alliance is made up of eight initial ITV-related hardware, software and operating systems companies. The alliance is dedicated to fostering open standards for the industry.

It will work with worldwide standards organizations such as ANSI/ISO and DAVIC (Digital Audio-Visual Council) to support open-architecture initiatives related to interactive TV. Initial members include Argonaut Technologies, C-Cube Microsystems, PowerTV, Scala, Scientific-Atlanta, Software Development Systems, Sybase and 3DLabs.

## H-P signs digital deals

Bell South will be the first Hewlett-Packard MediaStream server

customer to install the new H-P real-time MPEG encoding system in an upcoming field trial. Bell South is building a broadband network that will pass 12,000 residences in greater Atlanta.

In other news, TCI increased its intent to order H-P's Kayak system digital media receivers from 500,000 to 750,000. Total orders for the Kayak system topped 1 million units with a 100,000-unit intent to order from Cox Communications.

## GI, ACTV pen compatibility deal

General Instrument and ACTV announced an agreement whereby ACTV's individualized programming technology will be compatible with GI's DigiCipher digital compression system. ACTV's software enables personalized interactivity for video, audio and data.

ACTV recently completed its InTV master control facility for its on-schedule commercial interactive network rollout. The facility is in Agoura Hills, CA.

• • •

## Notes

Society of Cable Television Engineers President Bill Riker was presented this year's National Cable Television Association's Vanguard Award in the science and technology category at the National Show in Dallas.

Microsoft Corp. and NBC formed

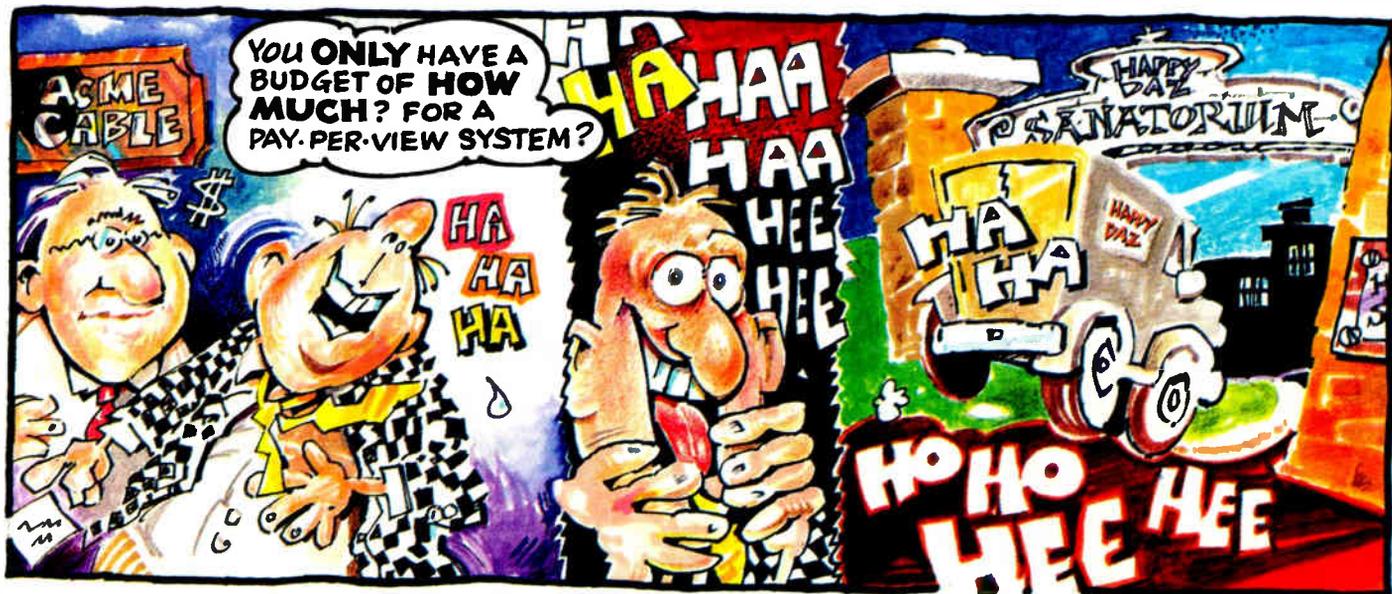

an alliance to develop and market branded multimedia products. The alliance covers a broad range of areas, including online service, CD-ROM, interactive TV and other digital products, as well as the integration of those efforts into traditional broadcast and cable TV.

The Video and Electronics Standards Association's open set-top standard received the support of the National Cable Television Association, National Association of Broadcasters and the Interactive Television Association, who will work together to complete the development of the standard that promises to bring video-on-demand, interactive TV and interactive games to the consumer market.

TCI Technology Ventures and venture capital firm Kleiner, Perkins, Caufield & Byers formed a company, to be called @Home, to provide Internet access through cable TV wires.

General Instrument established a long-term relationship with Wink Communications, licensing Wink's technology for use in all GI set-tops. Wink's technology allows various data-driven interactive services to be delivered as stand-alone applications including "virtual channels" that provide interactive weather reports, traffic updates and local community information.

Virginia Power will join Cox in a trial of Nortel's integrated digital transport technology in Virginia. Virginia Power will test the delivery of interactive energy management services over the hybrid fiber/coax network to a limited number of Cox and Virginia Power employees' homes.

Reader Service Number 204

## Society selects UPC bar code

The Engineering Committee of the SCTE announced the issuance of an Interim Material Management Practice that calls for the use of the universal product code (UPC) as the bar code standard for the cable telecommunications industry.

This interim practice will be replaced with a wider-ranging Material Management Practice when that practice has been defined.

"This is the first step in the adoption of an overall electronic data interchange (EDI) practice," stated SCTE Material Management Subcommittee Chairman Tom Gimbel.

The EDI practice will allow trading partners in the cable industry to maximize the use of computer systems in controlling material inventory. The interim practice is being issued at this time in order to get the material suppliers started marking

the material with the familiar bar code used in retail and industrial distribution channels throughout the world.

Gimbel comments, "The cable industry is moving toward the use of electronic systems to place purchase orders, receive invoices and settle accounts. The EDI system will reduce the cost of all material administration functions and facilitate 'just-in-time' management techniques."

The subcommittee's next step will be to issue a product and package bar code marking practice. This practice will outline what additional information will be marked on products and packages in bar code form.

The SCTE Material Management Subcommittee is composed of cable operators, equipment manufacturers and distributors. Membership is open to all participants in the cable industry. For further information on the Material Management Subcommittee, please contact Secretary Richard Pulley at (215) 665-1700.

## Donations sought for new fiber seminar

SCTE is requesting the donation of equipment and materials to be utilized in its new basic fiber-optics training seminar.

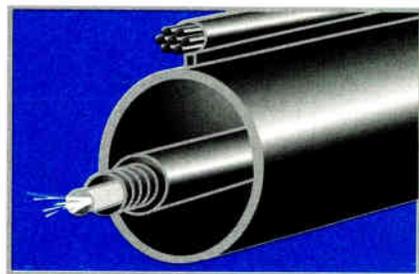

Items needed include optical fiber, cladding removal and cleaving tools, an emergency restoration kit, power meters, optical time domain reflectometer (OTDR), cleaning pads and an alcohol/fiber cleaner, jumpers with connectors (ST, TC and SC), safety goggles and a mechanical splicer with reusable splices.

The Society also is seeking the support of a fusion splice manufacturer/vendor to attend the seminar on the afternoon of its second day.

This fusion splice representative will discuss the need for good fusion splicing in fiber systems, provide a fusion splicer, demonstrate how to make a fusion splice and allow each attendee to make one fusion splice that

# Don't Get Stranded . . .

# With Anything Else.

### Integral's MOD System Makes Aerial Construction A Snap.

The hassles of lashing and delashing aerial cable — and the inherent time and expense it adds to a new installation or repair job — can strand you at a construction project long after your deadline has come and gone.

Integral comes to the rescue with Messenger-on-Duct (MOD), a uniquely designed conduit system that packages your strand and fiber optic cable together in a single conduit assembly.

MOD with a pre-lubricated pull line pre-installed will enable your crews to make unassisted pulls of up to 10,000 feet, simplifying even your biggest jobs.

So why get hung up with traditional strand and cable, when you can choose MOD for your next aerial project? Increase your cable up time and decrease your cable service down time with

Integral's MOD. Call 1-800-527-2168 for complete details today!

## MSOs support Installer Certification

The Society is pleased to announce that 354 installers from over 70 companies successfully completed Installer Certification training and testing during 1994. The SCTE certification program helps ensure that employees are professional, knowledgeable and competent. In turn, their companies boast a more efficient work force and gain an enhanced image through increased customer satisfaction and confidence.

SCTE would like to recognize the companies that supported SCTE's certification program in 1994. What follows is a list of the companies that participated and the number of employees certified: Crown Cable (51); Comcast Cablevision (32); Viacom Cablevision (26); Continental (11); TCI Cablevision (11); Baker Installations (10); Paragon Cable (10); Colony Cablevision (9); Star Cablevision (9); River Raisin Cablevision (9);

Columbia Cable (8); C-Tec Cable (8); Inland Valley Cablevision (8); Marcus Cable (7).

## Survey indicates Society support

The need for and interest in certification for technical personnel were confirmed in a survey conducted at the 1995 Texas Cable Show.

Sixty industry professionals, 50% of whom work at the corporate or system general management level, participated in an SCTE training survey focusing on the amount and types of training provided for their technical employees and their opinions on the value of certification.

Here are some results:

- 80% of the respondents felt that technical certification was important to them, showing their strong support for SCTE's certification programs. They indicated that there are a variety of reasons for this support. Among the benefits cited were that certification "measures employees' qualifications," "improves job performance" and "improves customer satisfaction."

- Results show a variety of training environments and resources are being utilized. 37% said they train new employees through industry seminars (such as those conducted by SCTE's 73 chapters and meeting groups), and 40% train new employees through programs conducted at the system level. 61% percent of the respondents indicated that they provide ongoing training to employees through regional or national seminars, such as SCTE's "Technology for Technicians" regional seminars and Cable-Tec Expo, the industry's premier hardware trade show.

## NJ Chapter to hold annual vendor fair

The Society's New Jersey Chapter will hold its third annual vendor fair June 29 at the TKR Training Center in Piscataway, NJ. Participating vendors include everything from bucket truck manufacturers to advanced technology companies (telephony-over-cable, interactive services and data-over-cable.)

For further information, contact Dan O'Sullivan at (908) 356-1110.

**New**

## MicroStealth Multi-Channel Testing -- for under \$900

**The Faster, Easier, Comprehensive signal level meter for cable TV installers.**

**Multi-Featured...** For the first time, installers can check all channels quickly and accurately—ensuring FCC compliance and reducing subscriber callbacks.

MicroStealth's scan mode displays multiple channels simultaneously on a single screen. Plus, measure up to 890 MHz for today's high bandwidth cable systems.

**Easy Viewing...** View the signal levels on a detailed, high resolution LCD display -- a feature, up until now, only available on higher priced signal level meters.

**Easy to Use...** With the press of a single button, cable installers can easily get a snapshot of the system's performance. There is even a one button *Go/No-Go* function so you can be sure you are within FCC compliance on every installation. MicroStealths are lightweight, rugged and water resistant, to withstand the abuse of every-day field use.

**MicroPriced...** The new MicroStealths are yours at unbelievably low prices. Even the enhanced MicroStealth MS1200 with 890 MHz frequency extensions, full scan mode, FCC *Go/No-Go*, and printer driver capability, is about half the price you would expect.

All the accuracy, speed and ease of use at a price you expect from a leader.

# Ghost canceling

**T**V ghosts are multiple images caused by multipath echoes. Sometimes the situation shown in Figure 1 occurs. The receiving antenna may have a short direct path between it and the transmitter antenna. The same signal can reach the receiver antenna over a

different longer echo path due to reflection off nearby buildings and other objects. Then the receiver will show two images, a strong main image and a weaker "ghost" of the echo shifted right on the screen. This is called a post-delay ghost or post-ghost. It also is possible for a ghost to occur before

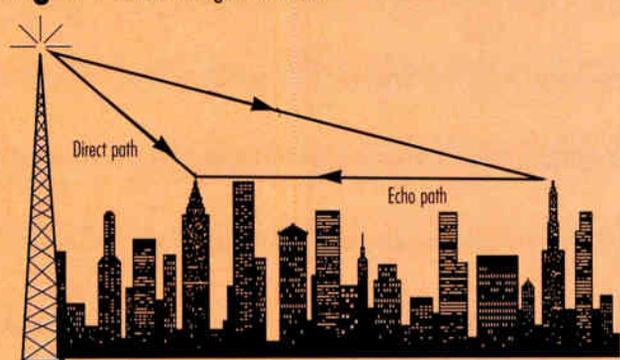

the main image resulting in a pre-ghost. In CATV the cable propagation is about two-thirds that of over-the-air transmission, so a signal from a broadcast transmitter will likely reach the subscriber before the same signal carried on cable. If the TV tuner has inadequate shielding, the broadcast signal will leak into the

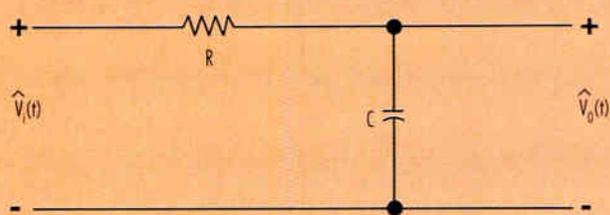

tuner and mix with that cable signal arriving a few microseconds later (often referred to as DPU — direct pickup). The result is a pre-ghost for large delays and a smearing of detail for small delays.<sup>1</sup>

From a 1944 paper in the proceedings of the IRE (Institute of Radio Engineers — the predecessor of the IEEE), "It has become apparent that

# DAWN... THE SATELLITE COMMUNICATIONS SPECIALISTS

## Professional

Before Dawn, end-users were in the dark about details relating to satellite communications equipment. Dawn Satellite specialists are meeting the product and service needs of today's commercial satellite users.

As product providers for the Radio, CATV, Broadcast TV, and Educational markets, we employ experts who can competently advise you on all your communications needs.

And, unlike some companies, our commitment to you does not end there — we continue to provide engineering and technical support even after the sale.

Dawn Satellite delivers only quality products with unparalleled service, in a very cost-effective manner. We will prepare you to meet the dawn of a new age in satellite communications.

**Call Toll Free  
1-800-866-6969**

## Expertise

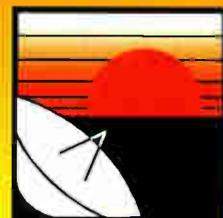

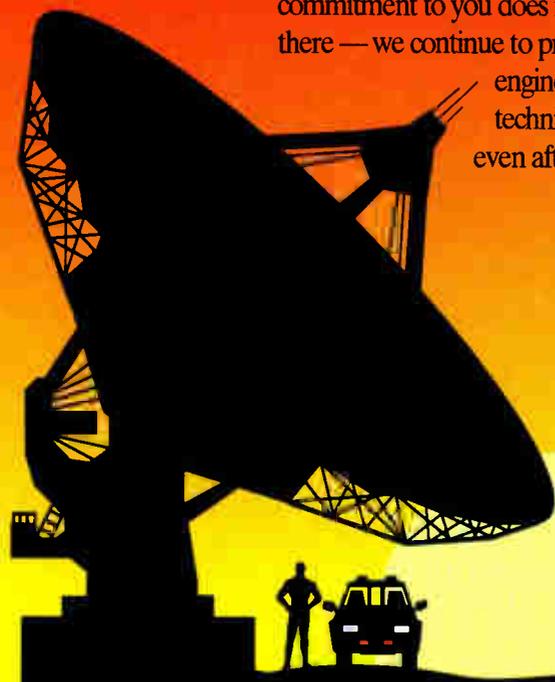

Dawn Satellite is dedicated to shedding light on all of your satellite communications requirements. Some products and services provided are:

### Products:

- ◆ Digital Ready LNB's
- ◆ Satellite Antennas
- ◆ Block Translators
- ◆ Downconverters
- ◆ Satellite Receivers
- ◆ Cable and Connectors
- ◆ Antenna Motorization Systems
- ◆ Accessories

### Services

- ◆ Technical Assistance
- ◆ Design and Engineering

secondary images are the number one problem of the telecaster." Finally, after 50 years, the solution to this "number one problem" is at hand. This solution was really not possible before the recent advent of high-speed, low-cost digital electronics and the progress of developments in DSP (digital signal processing). As we progress into the transmission of digital signals, ghosting poses even more serious concerns. Instead of just an annoying secondary image, the ghost digital echo may interfere with the main digital signal strongly enough to prevent any reconstruction of the analog signal, i.e., effectively no signal reception.

**Digital filters**

Ghost cancellation would be impossible without the use of digital filters. Analog filters are implemented with the use of hardware combinations of capacitors, resistors and inductances — and transistors in the case of active analog filters. Figure 2 (page 16) shows a sim-

ple analog RC low-pass filter, i.e., passes lower frequencies and does not pass higher frequencies. The equation describing the action of this filter (where  $\hat{v}_i(t) = 0$  for  $t < 0$ ) is

$$\hat{v}_o(t) = \int_0^t \frac{1}{RC} e^{-(1/RC)(t-\tau)} \hat{v}_i(\tau) d\tau$$

A block diagram of a digital filter is shown in Figure 3 (page 16).

Because the input to the analog RC filter is analog the first step for the equivalent digital filter is to have an analog-to-digital (A/D) converter at the input end to convert the analog input voltage  $\hat{v}_i(t)$  into a digital signal  $v_i(n)$ . In a reverse manner a D/A converter is placed at the output end of the digital filter to convert the output digital signal  $v_o(n)$  into an analog output signal  $\hat{v}_o(t)$ .

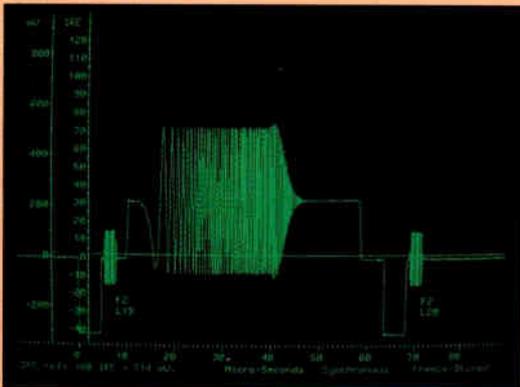

If software is created to satisfy the requirement of the filter equation, then the digital filter in the block diagram in Figure 3 (page 16) would be a computer — if implemented in hardware the filter would be a chip. The analog action of this filter (attenuating the high frequencies and passing the low frequencies) is done in the digital domain just by manipulating digital bits and thus achieves the same results that would be obtained by the use of hardware parts in the analog domain. Of course much more sophisticated digital filters can be implemented in the same manner.

**How are ghosts canceled?**

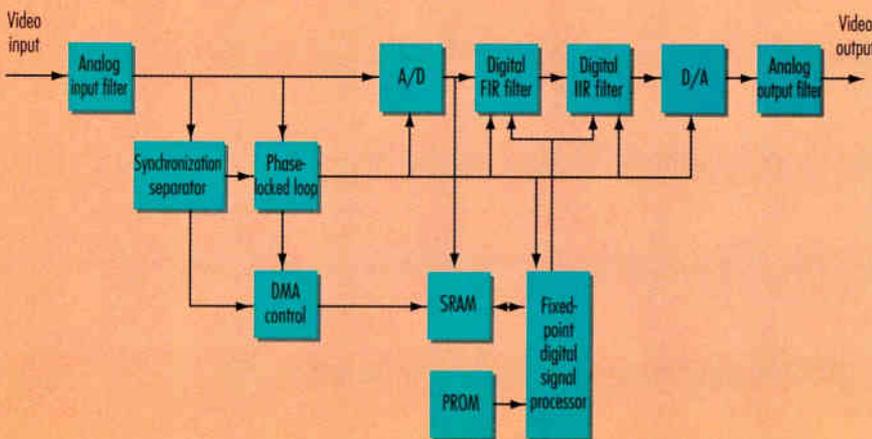

Ghosts are canceled in the receiver with a two-step process:

- 1) Characterize the ghosting channel →

**Figure 8:** Block diagram of digital filter

2) Cancel the ghosts using adaptive digital filters

To facilitate the channel characterization step the broadcasting station transmits a "ghost cancellation reference" (GCR) signal. The received analog composite baseband video signal is converted to digital form by an A/D converter. See Figure 4 (page 16). The receiver compares the received, ghosted version of the GCR signal with a clear, stored replica of the same signal. The results of such comparisons are computed by a digital signal processor chip. The chip uses special ghost cancellation algorithms to calculate the co-

efficients to be fed to the digital ghost canceling filter that cancels the ghosts. This two-step process occurs continuously. The coefficients of the digital filter are being constantly updated to follow transient conditions as measured from the received GCR. The digital signal from the filter is then converted back to an analog de-ghosted signal.

In the Philips ghost canceling system the GCR signal is the key link between the broadcaster and the receiver. It carries all the information that the receiver needs to be able to successfully cancel ghosts. It looks like a swept-frequency chirp pulse, as shown in Figure 5 (page 16). In fact it is not such a pulse. Instead it was carefully synthesized to have a flat frequency spectrum over the entire 4.2 MHz band of interest to NTSC applications. (The spectrum of a linear FM chirp pulse is not flat.)

In recognition of the fact that commercial ghost cancellation would not be possible without a standard GCR signal the Advanced Television Systems Committee (ATSC) began to search for the most suitable GCR in 1989. The starting point was the GCR that was adopted as the national standard in Japan in that year after many years of research by the BTA (Broadcast Technology Association of Japan). The BTA GCR was a  $(\sin X)/X$  signal rather than the flat frequency spectrum of the Philips GCR. In the 1989-1992 time interval, the ATSC Specialist Group on ghost cancellation compared the original BTA signal to four

other candidates — submitted by AT&T/Zenith, Sarnoff/Thomson, Samsung and Philips. Tests were conducted in late 1991 and early 1992. Based on the results of these tests, the ATSC voted unanimously in August 1992 to recommend the Philips GCR as the U.S. standard signal. On Oct. 27, 1992, the FCC gave its approval for placing the GCR signal into Line 19 of the vertical blanking interval (VBI), making the Philips GCR and its VBI location the official U.S. voluntary standard. The GCR as inserted into Line 19 of the VBI is shown in the photo in Figure 6 (page 19).

### Philips ghost canceler

Since 1992 Philips has offered a professional model ghost canceler called Vector for use in CATV headends. A block diagram of Vector is shown in Figure 7 (page 19). It can be seen as a somewhat more detailed version of the simplified block diagram of the ghost canceler in Figure 4 (page 16).

In the Vector the ghost canceling filter function is implemented with two digital filters, an FIR (finite impulse response) filter and an IIR (infinite impulse response) filter contained in two custom chips.<sup>2</sup> The FIR filter is used to cancel pre-ghosts, main signal distortion and post-ghosts. The IIR filter is used to cancel post-ghosts. Each chip has nine sections of 20 tap transversal filters with programmable delays. See Figure 8 (page 21). More details about the operation of these filters can be found in Reference 2. The digital signal processor (DSP) chip needed to perform the necessary calculations and control the ghost cancellation process is an off-the-shelf Texas Instrument TMS320C25 chip.

Specifications call for canceling ghosts in the range of  $-3 \mu\text{s}$  to  $+45 \mu\text{s}$ .

The Vector is designed to cancel up to 13 groups or clusters of ghosts, where each group can contain several closely spaced echoes. David Koo, GCR project leader at Philips Laboratories and inventor of the Philips GCR system, stated that at times these specifications are exceeded. In CATV headends the units are normally used while being tuned to a single channel for long periods of time. On the other hand consumers often do rapid "channel hopping" or "surfing." To accommodate this additional digital memory is allocated in the consumer version to store initial approximations to the filter coefficients for each channel.

Field tests by the ATSC showed that ghosted images were improved about 95% of the time as a result of ghost cancellation. The magnitude of the improvements were such that most ghosted images had no perceptible ghosts after cancellation.

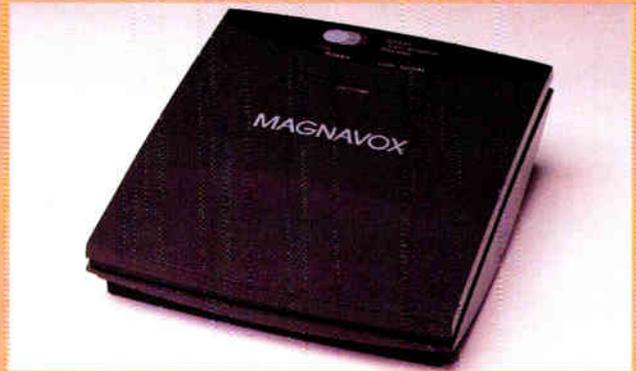

Performance of the Vector is shown in the photo in Figure 9, which shows two monitors — the left with a ghosted picture, the Vector digital ghost canceler in the middle and the right monitor showing the de-ghosted picture.

The Vector currently sells for about \$4,000. Philips is now ready to release a single chip that handles all the tasks performed by the \$4,000 unit. The chip will go into a consumer ghost cancellation box made by the Magnavox division of Philips at a cost of approximately \$150. A photo of that box, called ImageLock, is shown in Figure 10. The chip ultimately will be designed directly into the TV set or VCR.

### Conclusions

At the '95 National Association of Broadcasters convention, Alford Rodgers, vice president of Philips consumer electronics company, said "Ap-

**Figure 10:** ImageLock GC2010 consumer ghost canceler

proximately 50% of terrestrial broadcasters in the U.S. currently are broadcasting the GCR, and in the next 12 months we should be well on the way to 100%." The governments of Holland and Germany are considering the Philips GCR as the "defined signal"; Canada is in the process of adopting it; and it is already in use in England and Mexico. As Rodgers said, "Our overseas tests have gone well, and by all indications, Philips' GCR signal will soon become the standard for the world."

As noted previously, ghosting can be a much more serious problem in digital transmission than in analog transmission. The two most widely proposed modulation methods for digital transmission of television are quadrature amplitude modulation (QAM) and vestigial sideband (VSB). Multipath in digital transmission using these modulation methods is usually dealt with in the digital demodulators with a device known as an adaptive equalizer. The GCR inventor David Koo said that the GCR system can be made to work with both QAM and VSB transmissions and in his opinion will perform better than adaptive equalizers.

Well, time will tell but the comfort level is definitely improved as we venture into the new and different world of digital transmission with more tools in our toolbox. **CT**

# Powering: 90 volts?

**S**hould the cable industry be preparing for 90 volt system powering? Pressures appear to be mounting for increased plant voltage for several competitive and technical reasons. But there are safety issues to weigh carefully.

## Why 90 volts?

Today's more competitive telecommunications environment is creating increased interest by both cable operators and telephone companies in providing telephony services over existing or newly constructed broadband networks. And because telephones are sometimes needed in safety-of-life situations (medical emergencies, burglary, fire) both industries favor powering the customer's on-premises equipment, the customer interface unit (CIU) and phones, from the broadband plant rather than from the home. This allows the broadband network's standby power supplies to power the telephone equipment even when there is a local power outage.

However, the impact of thousands of these small additional loads distributed throughout the plant results in higher average current levels all over the system as well as even higher peak levels. Peaks?

Today's CIUs may require a few watts in the standby mode and 3-4 watts when active during the period of a telephone call. The concept of variable plant powering requirements is new to cable operators accustomed to nearly constant trunk and line extender amplifier loads. But since CIU power requirements increase from standby during active-call status, the worst-case plant load must assume situations when half or nearly all customers desire to go off-hook to make a call during the same period (Mother's Day or a communitywide emergency).

However, added total telephony powering requirements on systems with older long cascade architectures can result in current require-

ments exceeding the overall plant design as well as exceeding certain individual components, such as the current rating of taps, directional couplers, or amplifier power-passing circuits. Meltdown!

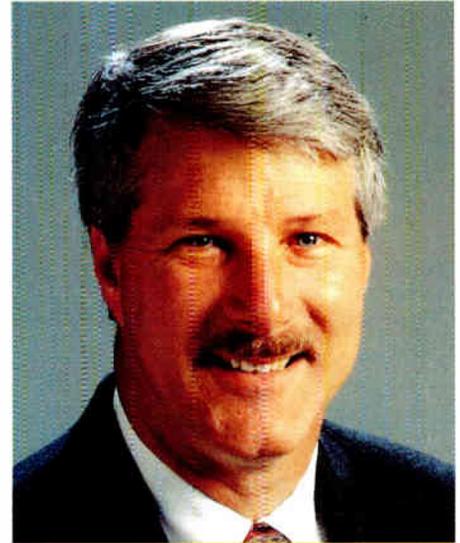

So how does increasing system voltage help? A system redesign would be very expensive, especially in underground areas where it is almost impossible to relocate network components without significant reconstruction costs. But Ohm's law tells us, for example, that current levels would be reduced from 30 amperes to just 20 amperes by a system powering increase from 60 volts to 90 volts. Accordingly, a system can easily reduce its maximum current requirements by simply increasing its adoption of a higher plant operating voltage.

It also is believed that network powering of telephony reduces expensive service calls caused by various customer powering problems such as inadvertently unplugging the power transformer or having its power interrupted from a switch or blown circuit breaker. Further, the installation process could be much more complicated if it is necessary to route power from somewhere in the house to the outside-mounted CIU.

Various studies suggest that the negative impact of power line spikes from transients and lightning would be reduced in systems operating at higher voltages. And, at higher operating currents, the  $I^2 \times R$  cable power losses increase by the square of the current. In many systems the power bill can be as high as the gasoline bill for the service trucks. So, improving a system's overall powering efficiency represents a savings of important annual dollars in a competitive industry. And over the life of these systems, the savings are even more significant.

## Why not batteries?

If the primary concern is local

**"There is no reason for accidents to increase with 90 volt system powering."**

power interruption, why not use home-mounted backup batteries for the CIU? Well, the argument against relying on home-mounted batteries, is that you can't rely on them! Like all rechargeable batteries, they would go bad over time and the customer would not know it. Even with some kind of reminder to replace the batteries, many consumers would not, leaving them vulnerable to power-related outages. Also, it would be difficult for network operators to maintain consumer batteries located inside customers' homes without a service call, and mounting the battery outside in the CIU would expose the battery to freezing temperatures in many locations. Network operators would have the responsibility of properly disposing of millions of worn-out rechargeable batteries laden with heavy metals. →

**On June 15, Trilithic will  
unveil a breakthrough in  
CATV test equipment...**

**Until then... here's a hint:**

*Atlantic Salmon  
(Salmo salar)*

## **This new product will perform as well upstream as the Atlantic Salmon.**

We recognize that the return path is the key to many of the services your system will soon introduce. We also recognize that servicing and maintaining the return path has its own unique problems.

At Trilithic, we have perfected an instrument system that will solve all your upstream problems including flatness and ingress.

Visit the Trilithic booth at the Cable-Tec Expo on June 15, for the unveiling of the first instrument to meet the challenges of return path maintenance.

And see how Trilithic will get you upstream when nothing else will.

 **TRILITHIC**  
The Best Thing On Cable

9202 E. 33rd Street  
Indianapolis, IN 46236  
317-895-3600  
1-800-344-2412  
Fax: 317-895-3613

Despite these issues, many believe that over time emergency powering by batteries may shift back to consumers. Proponents point to the fact that consumers are already comfortable with "safety-of-life" battery responsibility in smoke detectors, portable and wireless phones. Also, the home security industry relies on home-based rechargeable batteries that are maintained as part of the service contract.

### How would systems repower?

At one time the cable industry practice was to use 30 volt power supplies. But as service areas and cascades grew along with higher bandwidth, and more sophisticated amplifier technologies evolved requiring more power, so did system over-current requirements. The change to today's universal 60 volt powering practice occurred painlessly over time by manufacturers building dual voltage power packs fitted with field-selectable jumpers that line technicians could change as they upgraded their systems leg-by-leg to 60 volts, usually in association with a general plant upgrade to higher bandwidths. An upgrade to 90 volts would be implemented

in the same fashion today. In fact, many amplifier manufacturers are already selling equipment that is ready for 90 volts today.

### Safety first

But there is a potential safety and regulatory issue that must be considered. Safety organization codes such as National Electrical Code (NEC) and National Electrical Safety Code (NESC) specify maximum voltages allowable on cables that are located in the communications area on poles and around dwellings where the general public could come in contact with them.

These rules have generally restricted cable operators from using higher than 60 volt powering. Several initiatives are underway to have these rules amended to allow higher voltage, such as 90 volts. Of primary concern is the safety of employees and the public. While 60 volts has potential to kill, many experts believe 90 volts has that risk even more so. The danger is not limited to electrocution. Serious accidents can occur when employees or the public working on ladders or the roof inadvertently come in contact with exposed voltages (squirrel or abrasion

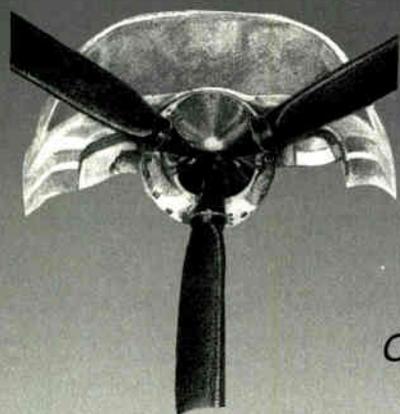

damage) and suffer a startling shock that causes loss of balance and a fall. Even unsuspecting employees of another utility accustomed to cable's lower voltage threat could be caught off guard. This is of course a concern to safety organizations.

There is no reason for accidents to increase with 90 volt system powering if operators properly train and inform all those involved and insist that all safety precautions be followed at all times. Cable has been challenged in maintaining training levels over the years because of higher employee turnover than other utility-type companies routinely in contact with high voltages.

### Conclusion

Competition and technology advances may stimulate some broadband systems to consider increasing plant powering to 90 volts. Safety organizations are reviewing the issues and it is likely provisions will be made for conditional approvals. Many vendors already have 90 volt equipment available. But to take advantages of the benefits higher system operating voltages may provide, systems must recognize the importance of safety issues. **CT**

Recipient of  
Communications Technology's  
1995 Service in Technology Award

**Time Warner's  
FSN team**

# The FSN Team: 1995 Service in Technology Award

*This year "Communications Technology" is proud to present the Service in Technology Award to the team at Time Warner Cable responsible for making the Orlando, FL, Full Service Network (FSN) a reality. What follows is a short overview of the technology and the people behind the FSN.*

By Andy Morris

The launch of Time Warner Cable's FSN in Orlando, FL, was not only a triumphant convergence of technologies but also an interesting convergence of corporate cultures. The cable engineers from Time Warner and Scientific-Atlanta learned how to decipher the jargon and work in concert with engineers from Silicon

Graphics Inc. and AT&T in order to develop and implement the technology that made the FSN possible.

## The players

Mike Hayashi, vice president, advanced technology, Time Warner Cable, explained that Time Warner Cable engineers easily mastered this art of corporate convergence since Time Warner itself is composed of so many diverse companies.

"Time Warner has Time Warner

*The Home Communications Terminal by S-A, SGI and Toshiba.*

Cable, Time Inc. magazines, Warner Brothers Studios and Warner Music. We are already communicating with and working with many strange and diverse cultures within our own company," said Hayashi.

"In Orlando, our partners included

**Michael Adams** is a senior project engineer with Time Warner Cable responsible for ATM network-

ing in the FSN. Previously he was a manager of ATM switch software development for Bell Northern Research in Canada.

Adams graduated from the University of Bristol, England, with a BSc in electrical and electronic engineering in 1976. He worked with Kent Process Control as a hardware and software designer for two years before moving to Digital Equipment in Reading, England. Here Michael worked on diagnostic and communications software including narrowband ISDN. Michael moved to Ottawa, Canada, in 1988 to join Bell North Research and worked on fiber-to-the-home, SMDS, frame relay and ATM projects. He joined Time Warner Cable in 1993 to work on the FSN as a network architect and project manager.

**Ralph Brown** is currently a senior software engineer at Time Warner Cable Engineering and

Technology in Englewood, CO. In this position, he is responsible for the design of interactive TV software architectures for the FSN. Prior to joining Time Warner Cable, he was a software engineering manager at Solbourne Computer Inc.

Ralph earned a master's degree in electrical engineering from Massachusetts Institute of Technology. His thesis work at MIT was in speech recognition. He received his bachelor's degree in electrical engineering, Summa Cum Laude, from North Carolina State University.

After completing his degree at MIT, Brown designed packet switching hardware at Bell Laboratories in Denver. Subsequently, he worked for Precision Visuals designing and developing device independent graphics software. He then moved to Sophia Antipolis, France, to work for LogiTec SA, developing software for computer animation and video production. He joined Time Warner Cable in 1994 to work on the FSN as a software architect and technical project manager.

**John Callahan** is software program manager with Time Warner Cable responsible for software tech-

nologies development in support of Time Warner Cable's vision of broadband, interactive, multimedia communications and entertainment services on its FSN architecture.

Callahan has held several previous positions in systems software development, systems engineering and telecommunications network engineering with AT&T Bell Laboratories and US West Advanced Technologies prior to joining Time Warner Cable (on loan from US West).

John holds a B.A. in computer science from Ohio Wesleyan University and a M.S. in computer science from the University of Illinois at Urbana-Champaign. He has focused his engineering efforts on narrowband messaging and broadband information services architectures. John joined Time Warner Cable in 1993 to work on the FSN as a software systems engineer and program manager for systems software development.

## FOCUS: FSN TEAM

US West, Hitachi, Toshiba, Objective System Integrators and Anderson Consulting as well as SGI, S-A and AT&T. Orlando was probably the very first project that brought not only Time Warner but all the other companies into the one goal of deploying an interactive network."

Initial development for the Orlando FSN took place at Time Warner Cable headquarters in Denver. Hayashi said, "We were the integrators, the program managers, for the

**Lynn Edwards** graduated from Furman University in Greenville, SC, with a B.S. in computer science/math in 1990. She graduated from the University of Colorado at Boulder with a master's in computer engineering/telecommunications in 1993.

Edwards joined Time Warner Cable in 1994 to work on the FSN as an associate engineer.

Orlando project. We had to make sure our partners were focused on working toward the right common goal.

"It is important to understand how we chose our partners. I believe we chose the best in each of their respective fields and this means that the work they performed in the past has been done correctly.

"If you look at SGI, it is very strong in the graphics environment, in high-end computing. It is the best in that field and the company grew in that environment. As for AT&T, its GCNS-2000 ATM switch is the largest in the world and it is number one in the marketplace. S-A, of course, has always been a leading supplier to the cable industry."

Hayashi added, "We all had our beliefs in how things should be done and there are many ways of doing any one thing. When you are working with companies of that quality, there are, naturally, a lot of creative differences on how things should get done. And that's where you can call it conflict, but on the other hand that

**Michael Hayashi** is currently vice president, advanced engineering for Time Warner Cable Engineering & Technology in Englewood, CO. He oversees the company's FSN development, subscriber technologies and network engineering.

He was appointed vice president, international development, for Time Warner Cable in 1992, where he was involved with the next generation of terminals and provided vital international liaison with the company's Japanese partners.

Prior to joining Time Warner, Hayashi was vice president and general manager of video systems for Scientific-Atlanta and was responsible for product line management of all addressable equipment, including set-top terminals, interdiction technology, international activity and commercial MMDS hardware. His technological accomplishments include the development and introduction of the first set-top with on-screen display and other easy-to-use interactive features.

To the Time Warner  
Full Service Network  
Team on having the  
spirit and drive to  
bring new technology  
to the cable industry

**The FSN's remote also is the video game controller.**

is how integration takes place. "SGI, S-A, AT&T made the true engineering efforts that went into the FSN. They were the technology developers that helped us put this together. We were the agents that made sure things took place in a timely fashion. We made sure the communication was there. We performed technology conflict resolution. We functioned as the integrators of this engineering R&D program."

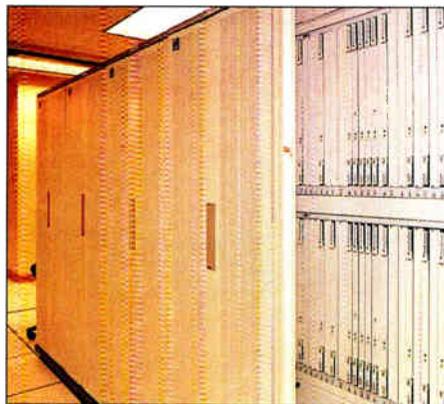

### Culture clashes?

Hayashi discussed the cultural differences between the different partners.

He said, "Of course, there was the acronym thing and we had to go through our own understanding of

**Hitachi built the multiplexer/decoder multiplexer used in the network.**

**AT&T's ATM switch can send 20 gigabytes per second.**

what the languages were. Today, we all have a vocabulary that is really quite extensive!

"There were obvious cultural differences between the East Coast-based AT&T and S-A with their suits and ties and the free, creative West Coast Silicon Valley environment of SGI. Time Warner Cable, based in Denver, was in between both culturally and geographically. When we initially assembled for a big meeting in Denver you could immediately tell who was from where."

Hayashi stated, tongue-in-cheek, that a close second to the achievement of building the FSN was that these multiple company multicultural meetings "did help us convince our management that casual dressing is good."

### The relevancy of technology

On a more serious note, Hayashi explained, "There was a tremendous amount of focus on technology itself, but the dynamics of integrating these working environments was the most difficult challenge. Integration means that when all the entities are brought together they work as a coherent unit. That's true for equipment, that's true for software and that's true for people. I think we are all going to go through the integration process in the next couple of years."

"We learned that a lot of the theories we believed as engineers were wrong. We learned that we are not consumers — that consumers are consumers. We learned the value of extensive user-interface testing and consumer behavior testing. We learned something about what consumers do and don't want to see on their TV sets and we learned some-

**James Ludington** is vice president, technology, for the FSN in Orlando. Prior to this, he was

the project director for Quantum, the world's first 150-channel cable service launched in Queens, NY, by Time Warner in 1992.

Ludington joined Time Warner in September 1982 after graduating from Colorado State University with a B.S. in industrial construction management. As project manager from 1983-1988, he directed projects in Austin, TX; Burlington, NC; Colorado Springs, CO; and Queens, NY.

**Jay Vaughan** currently is director of engineering for Time Warner Cable in Denver. His current

mission is to advance TWC's interests in the emerging standards forums and in technical advisory/regulatory arenas, such as the EIA NCTA Joint Engineering Committee subgroups. Jay also has responsibility for TWC's National Training Center and launch support of new services such as the Sega Channel.

He began his career in cable 18 years ago as the single technician in a small system outside of Austin, TX. After spending a couple of years working for Jerrold/GI, he spent four years with Rogers Cablesystems in California and Texas prior to joining American Television & Communications in Denver in 1987. Vaughan spent two years in France for ATC on a consulting project and worked on advancing Time Warner's fiber architecture after returning from this overseas assignment. He also worked on set-top deployment and other projects prior to his current assignment.

Congratulations!  
Congratulations!

thing about which interactive services appeal to consumers. The things we all learned in this area were very, very valuable."

Hayashi said that the Orlando project gave him and other Time Warner Cable engineers a better understanding of the relevancy of software integration.

"When you are writing a couple of million lines of code, you just don't go into a room and hack it. You need to have a certain amount of structure and then you have to ask yourself, 'What are the relevant structures?' I think as an industry we are beginning to understand how important this kind of software development is to our business."

"The design and implementation of the Orlando FSN was a tremendous learning experience for all the partners," continued Hayashi.

"In terms of switch interfaces, I don't think we had a situation where we were building a tunnel from both ends and we got to the middle and we were off by a meter. That didn't quite happen because we were able to tightly integrate the communications aspects associated with the project.

"The funny thing is that despite all the communication and coordination and despite how well we all worked together — until the day about one year ago when we actually saw the end-to-end environment and actually touched the converter and ran an application — we all had a very different understanding of what the FSN would look like."

The actual launch of the FSN in Orlando was very gratifying for Hayashi and the full team of engineers involved in the Orlando project.

"When (Time Warner CEO) Gerry Levin turned on the system and you saw the Carousel (SGI's interactive navigational user-interface) come up — it was a very moving thing when the audience actually clapped and cheers went up. I've never been to a technology exhibition where the audience cheered. It was very stunning for all of us."

Hayashi indicated that the real work has just begun in Orlando. "The Time Warner Cable people in Orlando now have the task of developing applications that are extremely exciting and stimulating to the consumer. I think we have a tremendous opportunity to do that in Orlando," he said.

Hayashi added, "The next step is to go into a very extensive application development and consumer behavioral study in Orlando. That is really important for us because if we have a very good understanding of how consumers interact with the system we will be able to design a much more efficient network. That is what we will be working on for the next year or so."

Behind all the interactive hype, Hayashi believes truly significant technology and product developments have occurred. "Core technology developments that are already taking place in our business include 64-QAM modulation, digital video compression and the video server. Efforts in all these areas are well underway. After work in those areas is complete, we will be ready to fully deploy those technologies. At that point of time we should be ready to roll out a very good and very extensive suite of interactive applications," he said. ■

**Susan Whitehead** is a senior program director in US West's Multimedia Group who spent 15

months at Time Warner Cable assisting in the deployment of the FSN. She has 24 years experience in information systems management, customer needs analysis, and program/project management. She was program director — FSN, responsible for program managing the technical deployment. In addition to managing the interface to the eight major teaming partners providing products/services to TWC, she was key to driving integration testing, quality and processes.

Whitehead is a project management professional with the National Project Management Institute, a founding and active member of the US West Board for Program Management, and a founding member of US West's Strategic Electronic Data Interchange Board.

**Louis Williamson** is senior project engineer in the Time Warner Cable Engineering &

Technology. He graduated from Virginia Polytechnic Institute and State University in 1980 with a BSEE. He worked for Martin Marietta Aerospace from 1980 to 1983 in the RF systems group where he was involved with various projects in the electronic warfare area.

Williamson joined the research and development group of American Television & Communications (now Time Warner Cable) in 1983. He has worked on numerous development projects in his 12 years at Time Warner Cable, most notably his work in the field of fiber optics and recently on the FSN.

# Installation services: Increase quality, decrease cost

**M**any cable companies are looking for ways to comply with the National Cable Television Association's Customer Service Guarantee Program without incurring extra costs. Many believe they can get more control over quality and save money by using more of their own in-house staff (rather than contractors) for installation services. But will this really solve the problem?

When you take a hard look at the installation operation, you'll find that most of our problems start before the technician arrives at the customer's home. Before we can improve the quality of the job, we must improve our system of identifying the customer's needs. In other words, we need to improve the quality of the work order. Then, if we

can streamline the installation processes, we'll improve the quality of the job and save money. Operations can become the strategic way for the cable industry to stay competitive.

## Improve information flow

How much can you expect to save by streamlining operations? An article in the Nov. 28, 1994, issue of *Fortune* says, "So clogged is the gross national pipeline with unnecessary steps and redundant stockpiles that the grocery industry alone believes it can wash \$30 billion, or nearly 10% of its annual operating costs, out of the system." Cable companies, as well as grocery stores, can benefit from this basic theory: Get rid of the duplication and inefficiency and you'll have more opportu-

nity to get cost out of the supply chain and give quality to the customer.

This is not easy. Finding ways to improve the information flow and streamline processes is a tough challenge. W. Edwards Deming, the man who developed a theory for quality improvement provides insight that cable companies can use. He explains that we must break down barriers, especially communication barriers, with our customers. We must find the most direct path to the customer, and get rid of all processes that stand in the way.

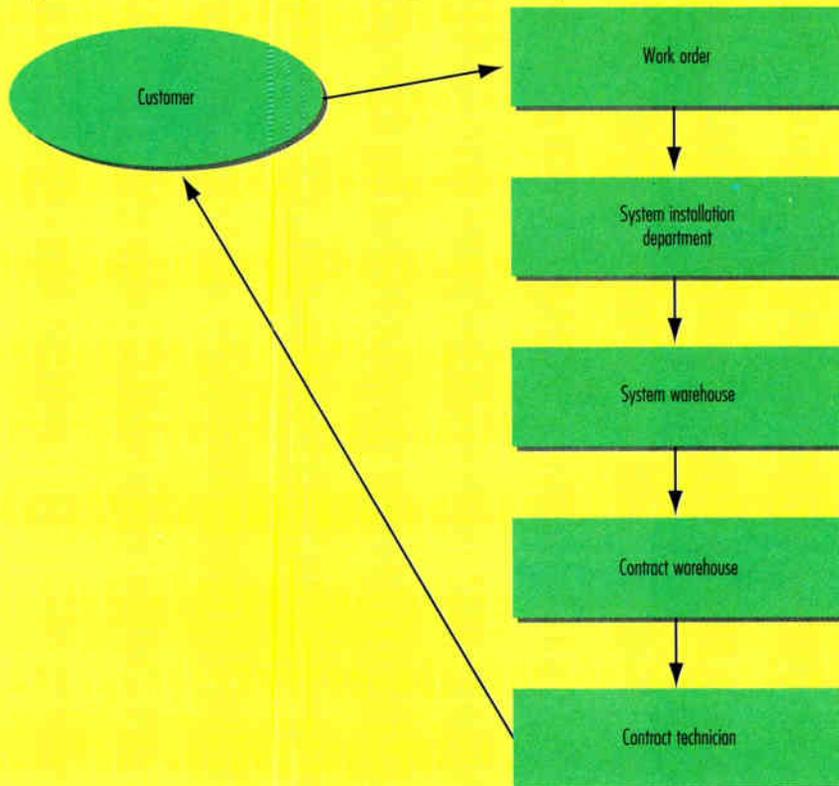

"This is precisely what the cable industry needs right now," says John Santangelo, regional director of technical operations, Charter Communications, St. Louis. "We're facing increased competition and a mandate to improve customer service. We must find ways to reduce our costs and give our customers more of what they want."

The grocery store industry is facing problems not all that different from the cable TV industry's. Wal-Mart-type chains, with very efficient distribution systems, are giving grocery stores unwanted competition. And similar to the NCTA's Customer Service Guarantee Program, the grocery industry is fighting back with its own initiative, "Efficient Consumer Response." Keith Wagar, vice president of procurement and in-bound logistics at Spartan Stores, Grand Rapids, MI, said in the previously mentioned *Fortune* article, "We've got to eliminate all the activities that don't add value to the consumer. Our only chance is to look at the transaction from manufacturer to consumer as a single process. It's a strategy for survival, a strategy for growth."

## The source of the problem

Similarly, if we analyze the cable installation transaction from the creation of the work order to final installation, we can begin to see a solution. The

# Laser By Only From Gene

When you design a system, you want a laser with the power you need. Right? You wouldn't want a laser with the power to transmit across town when you're only

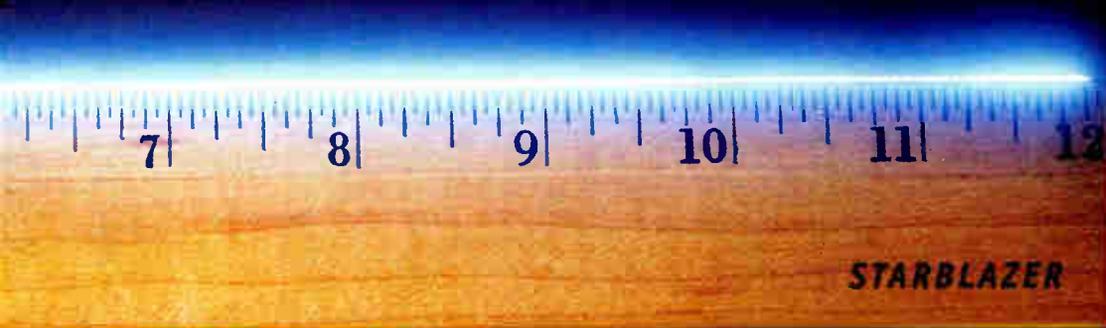

transmitting across the street.

Introducing STARBLAZER™ 750 MHz. "Laser By The Foot." Six different lasers with five different power options that rocket your

signal as far as you need it to go. It's the most economical way to send a signal.

STARBLAZER lasers not only provide superior picture quality,

# The Foot. ral Instrument.

they're also very versatile--which means they adapt easily to many architectures and applications.

Don't be overpowered by a laser. Just get the power you need

with STARBLAZER.

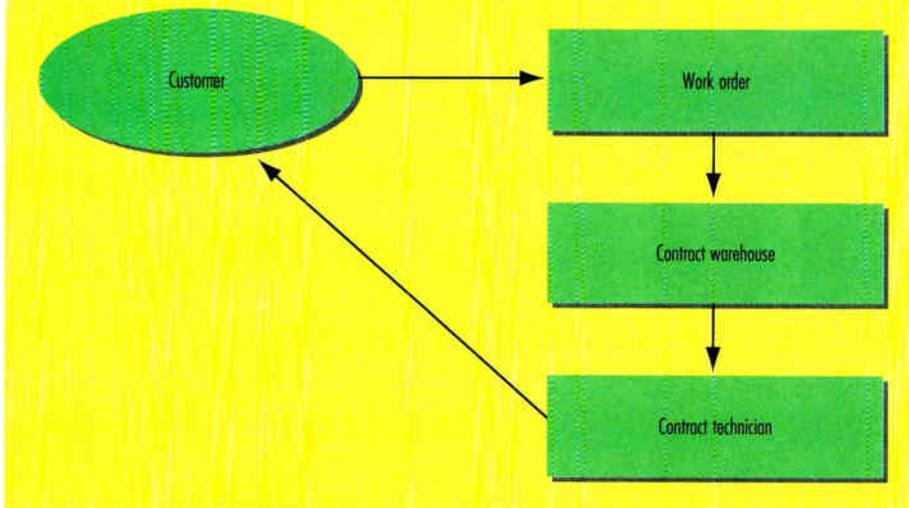

Call us at 1-800-523-6678 to find out more.

"Laser By The Foot." Another first from General Instrument.

**General  
Instrument**

**Figure 2:** Save money by eliminating processes

person responsible for creating the original work order is the customer service representative (CSR) or salesperson. In most companies, this person has a very limited knowledge about the installation function. Their core responsibility is to sell programming packages and enter the customer into the billing system. Many do not have the training, nor the time, to ask the kind of questions that will precisely identify the work the customer needs.

For example, a CSR may pre-qualify a customer by asking, "Do you have cable service in the room you want it?" If the customer says yes, the CSR may assign four points to the job. (Each point equals 10 minutes.) When the technician arrives, however, he or she finds that cable is in the right room, but on the wrong wall. So what was ordered as a reconnect has become a reconnect and relocate. That's added work not reflected in the work order and not reflected in that technician's schedule. This creates a backlog, and the on-time guarantee promise is a problem for all other customers the rest of the day.

One solution might be to give the CSRs additional installation training. We need to remember, however, that the installation function is only a small part of CSRs' jobs — their main responsibility is to sign up the customer, explain the billing process and sell additional programming services. We could wind up spending a lot of money that will probably do little to improve the overall quality. The CSR's job is too important to be compounded with crucial installation service responsibilities.

### Solving the problem

Another way to solve the problem is to create a new position — an installation specialist — who has the sole responsibility to ensure the work order is accurate. This will be a full-time, professional position that requires specialized training.

This is how the new system would work. Once the CSR has entered the customer on the system, the installation specialist will get a message on his or her computer terminal. The specialist will then contact the customer and ask the customer the right questions to create an accurate work order that will enable the customer to get on-time service. Following Deming's advice, we're breaking down communication barriers with customers. This strategy may not eliminate all mistakes, but it will dramatically improve the quality of the installation service.

This means we can improve service and minimize the conflicts between the customer and the cable company.

### Eliminate duplicate processes

What about reducing costs? Deming explains that one of the best ways to minimize total costs is to award business to outside contractors and build long-term relationships of loyalty and trust.

Now, the reason using an outside contractor can save you money is that the contractor creates opportunities for you to eliminate internal processes. But many cable companies overlook these opportunities. Let's look at one process — the process of receiving information from your customer for installation. Most cable companies pre-

pare the work-order in-house, route the job to one of its staff, who pulls the equipment from the warehouse, and then transfers the job and the equipment to the contractor warehouse. (See Figure 1 on page 28.)

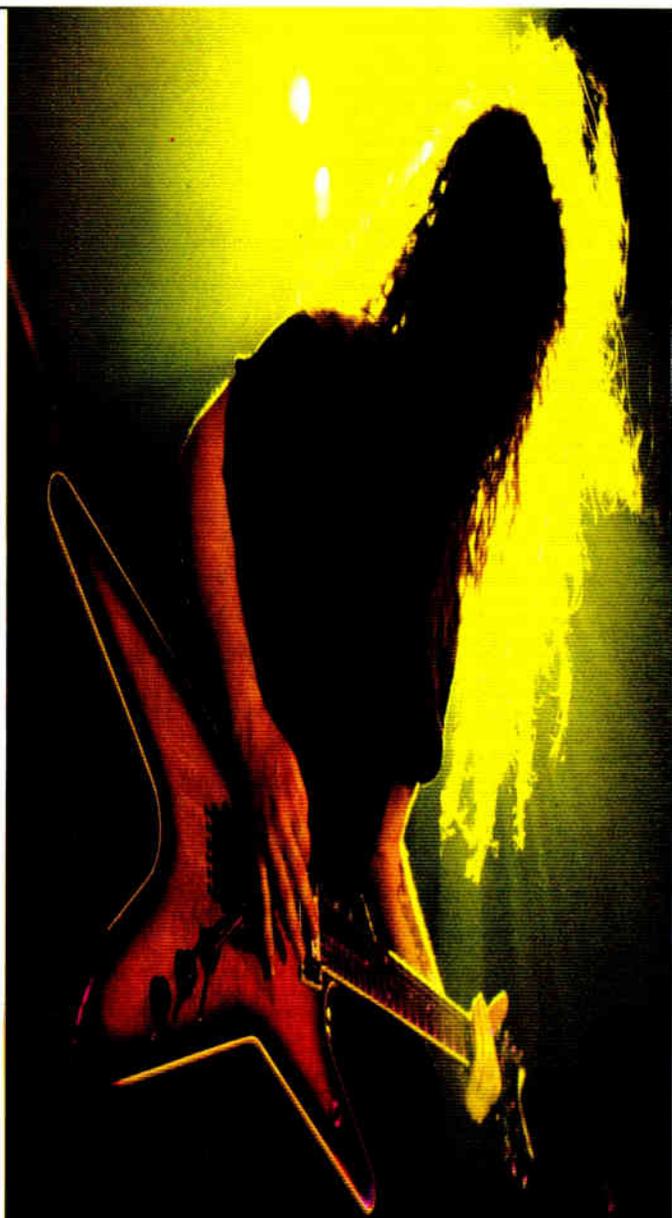

To truly maximize the cost benefits of using a contractor, cut out every process in your company that the contractor can do for you. Let the contractor contact the customer, prepare the work order, route the job and pull the equipment from its warehouse. (See Figure 2.) By collaborating with your contractor, together you can create the right kind of work order for the contractor to use so you are still in control over the process. In this scenario, the equipment never touches your company's hands and you save warehouse costs, including payroll, insurance and other overhead needed to maintain this equipment.

"To get the most for your contractor dollars, you need to make the contractor a part of your overall team," says Robert Moel, vice president of technical operations, Warner Cable, Houston.

Maybe giving a contractor full responsibility for the entire installation could be a way to relieve the burden of quality assurance. Let an outside contractor pay for the costs involved in training the installation specialist. By utilizing the electronic links from the cable system to immediately put the contractor's installation specialist in touch with the customer streamlines the process, providing a cost savings that more than justifies the new position.

This strategy will let you focus on your competencies — delivering quality, cable programming while enabling you to save money. Also, if the outside contractor is completely responsible for the work order, routing the job and the installation, the contractor will be the one who pays for late installations. Another assurance that the contractor will develop efficiencies, giving you an incredible customer service advantage and cost savings. These cost savings can be used for additional investments in customer service.

Using an outside contractor for all of your installation services may not be the best solution for you. Each cable company will need to find a healthy balance between using its own staff and an outside service. But, eliminating all duplicate processes for the work you do give to a contractor will save you money. →

**OUR CABLE TV TEST TOOLS CAN ENSURE THE QUALITY OF ANY VIDEO SIGNAL.**

When it comes to providing a quality cable television signal, Tektronix has you covered.

Whether you're installing and maintaining your cable plant, verifying RF carrier parameters or making baseband measurements at the head-end, Tektronix has the broadest line of cable TV test solutions.

Our tools have a reputation for superior accuracy,

**WHETHER IT'S PRODUCT SUPPORT OR TECHNICAL ADVICE, OUR WORLDWIDE SERVICE ORGANISATION IS HERE TO HELP.**

**[NOT NECESSARILY THE CONTENT.]**

quality and reliability. What's more, they're easy to use.

Our newest signal level meter, for instance, provides superior measurement accuracy with automated test sequences, giving you detailed results in seconds.

For a free catalogue of all our cable TV test products, call your local Tektronix sales representative. We're here to help you deliver a clear signal. What your subscribers watch, however, is up to them.

## Five benefits to streamlining processes

1) *Use activity-based costing to budget exact costs.* Cable companies can stop guessing at service charge costs. Contractors use unit-pricing — fixed costs that tell you precisely what each service call will cost you in advance. There are no quantities on the contract — you pay only for the installation services you use.

2) *Improve the quality of your service calls.* Most reputable contractors use full-time technicians, not temporaries, who undergo continuous training, improvement and quality education programs that keep them in step with new technology.

3) *No more delays for free-in-*

*stall marketing specials.* If you use a regional or national contractor, it can pull its own full-time technicians from other regions to help you handle increased installation demand and service problems — without delays and overtime charges.

4) *Save payroll, workers compensation and insurance costs.* The support staff needed to support unnecessary processes can be eliminated.

5) *Reduce capital expenses.* You'll be able to avoid investments in vehicles, equipment, tools, warehouse facilities and costs related to lost and damaged equipment.

The Saturn car company already has a Deming-based system in place. An outside contractor, Ryder, delivers components from the supplier directly to the customer. Saturn eliminated communication barriers by linking Ryder to a central computer that directs Ryder to make component deliveries straight to the factory and to dealerships. This streamlined operation eliminates the need for Saturn to maintain a warehouse of components and keeps Saturn employees out of an unnecessary loop.

"We need to integrate the contractor work force with our in-house work force to fully serve our customers," says Warner's Moel.

## Making quality decisions

But how can you be assured quality will improve? Deming tells companies to stop awarding business on the basis of price alone and rather build long-term relationships of loyalty and trust with suppliers. Before you select a contractor, try to understand how this company measures quality. What systems does the contractor already have in place to build quality into the total job? Some contractors have ongoing quality programs that include a series of questions addressed to the subscribers that give them instant, direct feedback. They use this information to help them continuously improve and enhance

their service for you and your subscribers.

When you begin looking for an outside contractor, before you even talk about price, find out if the contractor is willing and able to invest in the training your company will need to improve overall quality. Measure the improvement capabilities in your customer services along with the cost savings benefits to your company. Then, and only then, should you begin having discussions about price.

## Conclusion

The idea of creating a new position, investing in training, closing warehouses and giving contractors direct access to customers requires re-engineering your systems. This idea presents opportunities for the cable industry — opportunities that improve quality and save you money. "We won't be able to stay competitive unless we can find ways to drastically improve the way we allow our customers to get our services," says Charter Communications' Santangelo. Streamlining processes will bring a timely transformation to the cable industry.

The bottom line is that to meet the NCTA's Customer Service Guarantee Program we must improve the quality of the work order, and eliminate duplicate costs. The money you save can be turned into customer service programs aimed at keeping your customers. After reviewing this strategy, Santangelo says, "This is an idea we should consider." **CT**

## Well-built, Rugged Outdoor Type With Great Features Looking To Hook Up.

The new OTDR Plus™ Multitester from SIECOR has just about everything you'd ever want in a very portable package. It's easygoing and attractive for quick, reliable field testing.

Want equipment with a future? Start with the basic OTDR, then upgrade when your needs change. Add a power meter, single-mode source, visual fault locator, even another OTDR to the durable metal housing. Or, commit to complete field testing by getting all the options right away.

You'll find the OTDR Plus Multitester quite easy to get along with. Auto Test evaluates and summarizes an entire cable span with the touch of a button, while Auto Increment is the key to fast dual wavelength testing. Plus, the Windows®

based PC software extends analysis and documentation from the field to your desk.

We listened and learned what you wanted in field test equipment, and built the OTDR Plus Multitester to your specifications. As the pioneer in fiber optics, it's only natural that we respond to those who rely on us for their cable, management, connectorization, splicing and testing needs.

So call 1-800-SIECOR 4 for details. And hook up with the OTDR that will truly live up to your expectations – today and the years to come.

# Benefits of an inexpensive multipurpose remote monitoring system

**T**he ability to be aware of problems when and where they occur without having to rely on angry customers for this information seems like a better way of doing business in our industry. Most system problems are located by information supplied by the affected customers and can result in excessive downtime related to locating the exact source of the problem. Many potential problems also can be prevented if certain information relating to system operation is sensed and relayed to the appropriate person. I will discuss a system that is capable of doing both these operations at a nominal cost

while providing extreme flexibility and features.

## Reasoning behind monitoring

The need for remote monitoring capabilities came about in our system after we relocated our over-the-air receiving site to a location quite distant from our main headend. I wanted the ability to monitor parameters like AC power, RF presence to the optical transmitter used for transportation of signals back to our headend, site door security, cabinet temperature and backup power operation. I also wanted to be informed of problems by several methods, no matter where I was at the time.

## The system

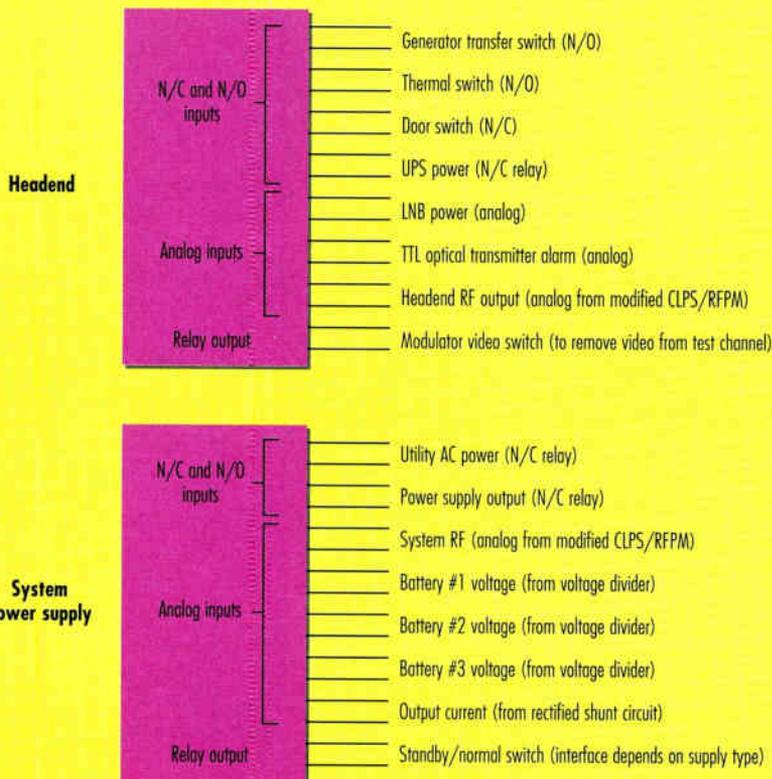

Pacific Research's PET-820 proved to be an ideal unit that would accomplish these ends (along with the help of a few simple sensors). See the accompanying figure for application examples. It is a complete stand-alone system that provides both remote monitoring and control via a standard phone line, radio link or serial I/O port.

The standard unit provides eight dry contact (switch) inputs, one programmable relay contact and one digital output. Each of the inputs can be connected to any type of switch or sensor that contains a switch contact. This can include a temperature limit switch, optical transmitter/receiver alarm switch, door ajar switch or AC operated relay.

While the equipment is unattended and one of the sensors detects an error condition, the PET-820 initiates a telephone call to one or more numbers and sends a preprogrammed voice message describing the source of the error such as "Location 2 AC power is out." (I programmed my units to first call a special number in my office. If I don't answer there, then they will call my pager and send a special number code advising me of the problem. They will then call my cell phone and my home, in that order.)

After being advised of the type of problem, I can decide whether to respond and correct it or disable the alarm and continue to monitor. An example of this is if I was advised that an AC power interruption occurred at the site, which has about eight hours of uninterruptible power supply (UPS) backup power. I would call back the unit in 15 minutes and see if the power had been restored. If not, I would call the power company and advise it of the problem. Periodically, I would check back to see if the power

## Application examples

# We Stock Canusa and So Much More.

**TVC**  
**INCORPORATED**

Canusa heat shrink tubing is a fast, reliable way to protect connectors and equipment from moisture. Stripes change color when the correct temperature is reached and, if necessary, removal is easy since Canusa strips clean leaving no residue.

Call TVC today for fast delivery of shrink tubing and well over 8,000 other top quality products. Now, with offices around the globe, we reach farther than ever. But TVC is still as close as your phone.

## Modifications to CLPS/RFPM

The Cable Innovations Model CLPS/RFPM is available in two versions. One is a surge protection unit (CLPS-35) and the other is a combination power inserter/surge protection unit (CLPS-35PI). Selection of either unit will depend on the application and location within the system.

There are several modifications that can be made to the unit. One will provide a DC voltage to the remote monitor to indicate presence of RF. Another will provide a DC voltage to indicate presence of AC system power. A third will allow the CLPS/RFPM to be powered by a source other than the 60 volts AC provided by the cable system. (This will simplify use in headends and locations where system power is not available.)

The first modification involves soldering a wire to the hot side of the RF indicator LED. This will provide about 1.7 volts DC to indicate RF presence. The common ground connection for all modifications can be made at the indicated position on the small circuit board that also is connected to the ground side of the RF indicator LED.

The second modification involves soldering a wire to the hot

side of the AC indicator LED, which will provide about 1.7 volts DC to indicate presence of AC power. This is located behind a disk capacitor on the main circuit board next to where the AC indicator LED is soldered to the board. There are two LED leads soldered to the board at this location. The proper connection is the one nearest the resistor.

The third modification involves soldering a wire to the side of the resistor connected to the trace on the main circuit board that is connected to the positive side of the electrolytic capacitor located next to the large RF choke. This will allow the RFPM to be powered by an external 9 VDC source (if required for the application).

A connector to allow interface to the remote monitor can be installed on the flat portion of the RFPM housing next to the strand clamp. Be sure that the connector is weatherproof and that it provides adequate internal clearance from the circuit board and RF choke when the plate is reassembled to the housing.

The CLPS/RFPM is available from Cable Innovations Inc., 288 King Arthur Dr., Lawrenceville, GA 30245; phone, (800) 952-5146.

had been restored. If after several more hours the power was still off, I would have someone respond with a generator to supply power to the site until the utility power returned. Several benefits of this scenario are as follows:

- 1) I was aware of the location of the problem (Location 2).
- 2) I was aware of the cause of the problem (AC power failure).
- 3) I was aware of the time it occurred (rather than finding out when the batteries in the UPS went flat and the customers started calling in by the hundreds).
- 4) I was able to determine if it was a problem of short duration (by calling the unit back and checking the status of the error).
- 5) I was able to contact the utility company if it had been required in the event of an extended power outage.

### Options

All of this could have taken place from the office or my home via the telephone and not required a response to the site for any reason. The unit that I installed in the headend monitors the air conditioning system, room temperature (by using an inexpensive thermostat), AC generator power transfer switch (which has several unused status contacts), UPS operation (by using a relay on its output), six optical transmitters (by using the status logic outputs), and driver amplifier RF output (by using a modified sensor described later).

I am advised of any problems that arise via a telephone-relayed voice message that describes the location and type of problem or via my pager that displays a number code that relates to the problem type and location. The voice messages are programmed from a large list of preprogrammed

words and numbers contained in the unit's ROM. Custom ROMs can be ordered to supply additional words, if desired. Up to 10 telephone numbers can be programmed into the unit. Several options are available to customize operation and add versatility.

The addition of the analog and data logging option to the PET-820 can be used to monitor up to eight analog voltages. Once limits are set for each of the analog inputs, the PET-820 can respond to them as an alarm in the same way it responds to the switch inputs. I use these inputs to monitor status logic outputs as found on some type of optical transmitters. I also have devised a method of modifying an inexpensive RF/AC power monitor (Model CLPS/RFBM from Cable Innovations Inc.) that will allow monitoring of AC power or RF presence from any location in the system that is accessible by a phone line. See the accompanying sidebar. This is an ideal method of monitoring node locations and major trunk end-of-lines.

The addition of a simple voltage divider circuit will allow the unit to monitor battery voltages in standby power supplies and the relay output can be used to force the power supply into standby to read the voltages while the batteries are under load. This can help cut down drastically on standby power supply-related outages and power supply maintenance time. The addition of a relay on both the AC input and the AC output will advise if power is interrupted to or from the power supply. The power supply will call you if a problem arises, or you can call the location to check its parameters at any time.

The standard PET-820 allows the monitoring of eight dry contact inputs and the control of one relay output (5 ampere) and one digital output. In this mode, only two of the 16 messages can be modified.

The addition of the RAM and real-time clock option will permit all 16 message buffers to be modified and also allows for date- and time-stamping of the most recent alarm condition, which can be interrogated at any time. The addition of a 12 volt battery enables operation in the event of a power failure for about 8 hours (or more if a larger external battery is used).

The analog input and data logging option adds inputs for monitoring up to eight analog voltages. These inputs can be programmed for single-ended

(0 to +5 volts) or differential-ended (-5 to +5 volts) use and provide a 1 millivolt resolution. These inputs can be scaled to represent what the connected sensor is really seeing. An example of this is if a voltage divider is connected to a battery to provide 5 volts to the analog input with a battery terminal voltage of 13.8 volts, then the unit will return a reading of 13.8 volts DC.

If the battery terminal voltage drops to 12 volts, the voltage applied to the analog input will be about 4.37 volts and the unit will return a reading of 12 volts. Voltages supplied by a temperature sensor or other low voltage device with an output in the range of 0.1 to 0.5 volts can be read by using a low-range programming mode. This allows a 100 microvolt resolution. If the temperature sensor output was 0.3 volts at a temperature of 75°F, the unit could report back with a phrase like "The temperature is 75°."

Again, limits can be set for maximum and minimum voltages, causing the unit to initiate an alarm if one or both limits are exceeded. The unit also keeps track of the date and time in which each reading took place as well as high, low, average readings and when they occurred for each input. An optional expanded input/output board has 16 independent lines. Each line can be configured as an input or an output. Each output can be controlled remotely and each of the inputs can be configured to operate in the same manner as the standard eight loop circuits.

### Easy programming

Programming of the unit is quite simple and can be accomplished via a telephone connection, radio link or serial link (direct or modem). Any of the parameters, including stored telephone numbers, can be changed remotely. An optional keypad and display unit allows local operation and control of the unit.

The versatility of this unit is limited only by the imagination of the user and the availability of appropriate sensors for special applications. One unit can pay for itself easily by preventing a large outage, cutting down on troubleshooting time during outages or preventing a headend from overheating because of failure of the air conditioner.

The PET-820 is available from Western CATV. For more information, contact (800) 551-2288 or (310) 539-8030. **CT**

# Light up your fiber with the best broadcast quality video possible.

**W**ith more broadcasters and CATV operators realizing the benefits and switching to fiber optic networks, the demand for "signal purity" and higher signal quality transmission has increased.

DX sheds a new light on high performance for today's cable operators with the new DIR-657 integrated receiver/ descambler. With a long list of features, including RS-250B broadcast quality performance and optional RS-232C interface for remote operation, the new DIR-657 outshines all other satellite receivers in delivering the sharpest video and soundest audio signals possible.

For more information write to DX Communications Inc., 10 Skyline Drive, Hawthorne, NY, 10532 or call (914) 347-4040.

By Kevin Quinlan, Product Line Manager, Network Management Systems, Antec Corp.

# An integrated broadband network management solution

**A**s broadband operators position their networks to deliver advanced interactive services — including telephony, data communications and video-on-demand (VOD) — the need for a more cohesive and function-rich network management solution becomes paramount.

## Paradigm shifts

Currently, network management solutions rely largely on proprietary, hardware-based implementations. To meet Federal Communications Commission testing requirements, for example, some broadband operators use end-of-line monitors to collect information on test points and communicate that information through telephone modems. Status monitoring systems utilize transponders to communicate status changes over the return path to a central point. Simple, stand-alone software supports these limited management applications using closed, nonstandard communication protocols.

Today, these proprietary hardware solutions are migrating toward inte-

grated, full-featured software solutions using standardized communication protocols, operating systems and data base management capabilities. Isolated proprietary status monitoring systems are no longer as attractive as building an integrated network management system that will ultimately provide a global view of the end-to-end broadband network. Integrated network management will give broadband operators a competitive advantage by providing the capability to anticipate potential failures, ensure effective equipment servicing and minimize system downtime through real-time monitoring and control of critical network equipment.

## Long-term strategy

One way to look at integrated network management is to break it down into three distinct layers of management. See the accompanying figure.

The *element management layer* provides a complete set of management features for a specific set of network elements or "subnetworks." Equipment managed at this level includes headend

and distribution plant elements, interconnect equipment and interactive video and data service elements.

Next is the *network management layer*, which binds multiple element management systems together to provide a seamless, global view of the end-to-end broadband network.

Finally, the *service management layer* integrates various network management systems to provide enterprisewide operational support applications such as customer service, billing and fleet management. These applications can provide value-added information needed to manage the overall business and service offerings of the network.

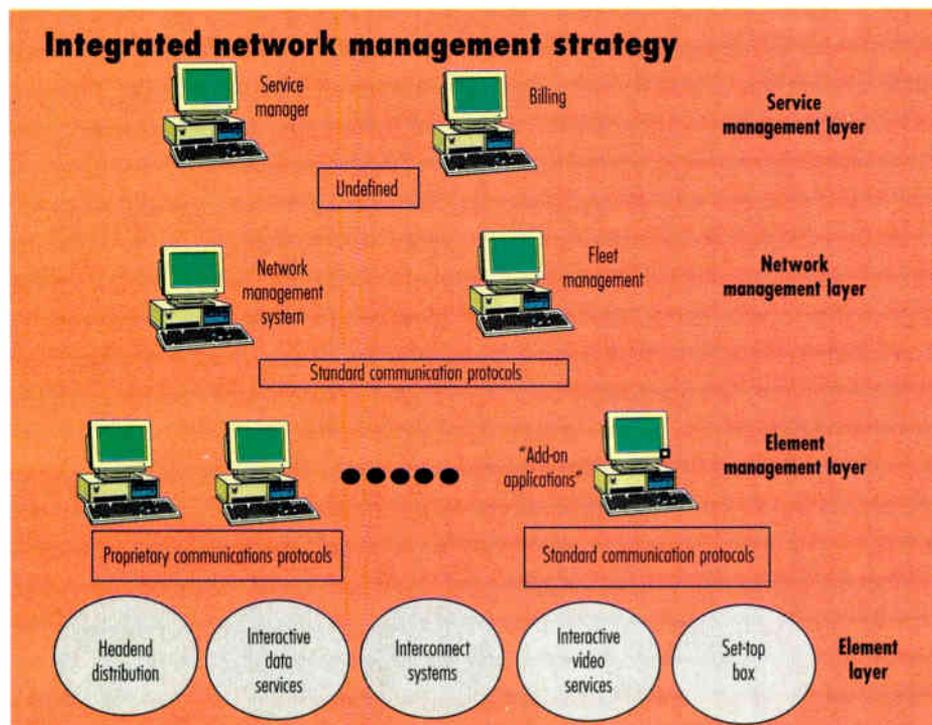

Each ISO (International Standards Organization) management layer builds on information and features of previous layers. Thus, establishing the initial element management system to easily incorporate new network management and service management functions over time remains the most critical concern.

## Open, industry-standard

Incorporating open protocols in the initial element management platform will allow for continued network management interoperability over time and easy third-party integration of value-added applications.

The element management system establishes an open, standards-based architecture that extends well beyond the limited status monitoring capabilities of present systems. The element management system provides a rich feature set as outlined in the ISO network management hierarchy. Functions include:

- *Configuration management capabilities define, obtain and maintain data on the complex array of equipment that monitor and control elements of the broadband network.* This function gathers information about the current network's physical plant configuration and uses this data to provision, modify and monitor the configuration of each piece of network equipment. Data is stored to allow users to generate reports and graphi-

**THE FUTURE IS REAL**

## ***A Natural Migration***

Leadership and vision. That's what sets us apart in today's environment of converging technologies. ADC Video Systems is leading the migration to advanced video and telephony network services with a clear vision and solution for your future — all while meeting your most demanding requirements today.

ADC Video Systems offers complete end-to-end solutions in hybrid fiber/coax video/telephony transport and distribution, high speed digital fiber backbone transport, distance learning, Px64 multipoint video-conferencing, TV1 broadcast quality video and cellular telephone transport.

The flexibility to meet the needs of today's market will ultimately determine tomorrow's success. Whether you're migrating to digital video and telephony services, rebuilding your CATV network, installing state-of-the-art distance learning facilities or building videoconferencing networks, ADC Video Systems has the technology you need. Call us to find out why the future is real. We'll help keep you flying in the right direction.

**ADC Video Systems**  
Formerly American Lightwave Systems, Inc.

cal diagrams of the network equipment configuration.

- *Fault management helps manage problems in the network by isolating and resolving their root cause.* This subsystem immediately reports problems so technicians can correct the fault before the end user is aware of the problem. In many cases, this system will automatically resolve the problem without technician involvement. Alarm monitoring and filtering, event correlation and notification and predictive analysis can all help network operators anticipate failures before they occur.

- *Performance management provides the ability to collect, store and analyze data related to the past, present and future condition of the broadband network.* Real-time and historical data analysis is accomplished through easy-to-understand graphical displays and report-generation capabilities. Users can produce statistical and trend analyses, conduct automatic and on-demand measurements, perform diagnostic and compliance testing, maintain performance logs, and monitor remote equipment performance. Operators can monitor distur-

tion, RF levels, audio/video frequencies and other device parameters for real-time and historical analysis.

- *Accounting management collects detailed data records to measure the use of various network resources.* This transaction-based information can be used to bill or charge-back customers/users, monitor system use and control costs.

- *Security management maintains system security by controlling access to system features, network equipment and data.* A multitiered security system provides various layers of security at the user level, equipment level, and network and domain levels. It also provides audit trails of attempted and actual breaches of security.

For network operators, the element management system is designed for ease of use. Hierarchical topology and geographic maps and submaps provide a "big picture" view of the network and allow operators to zero in on a particular area of interest. Since each management tool is integrated, system users can easily generate custom reports and network performance analyses. Complete on-line help is standard.

## Investment protection

An integrated network management strategy based on open standards incorporates a robust feature set with powerful management tools at the element management layer that fully protects present investments. The element management system remains compatible with installed equipment and interfaces with all installed status monitoring hardware of today. Operators protect their present investments and will not be required to change out transponders, end-of-line monitors, headend controllers or other equipment.

In the future, this same scalable platform allows operators to add new network equipment and management functions. When new telephony, data and video services emerge, the operator will be fully positioned to manage, control and add new services to the interactive broadband network more efficiently and profitably.

As the overall network management system grows and incorporates the network and service management layers, the bottom line will be a more reliable, flexible network, a more proactive approach to customer service and, ultimately, more satisfied, long-term customers. **CT**

# Tools for Today and Tomorrow

Make safe, accurate connector assemblies every time knowing that your Ripley Cablematic tool is designed and built to help you do quality work. There's a durable Ripley Cablematic tool for every type of CATV and telecommunications cable. If we

# OF BROADBAND.

## **End-To-End Broadband Solutions**

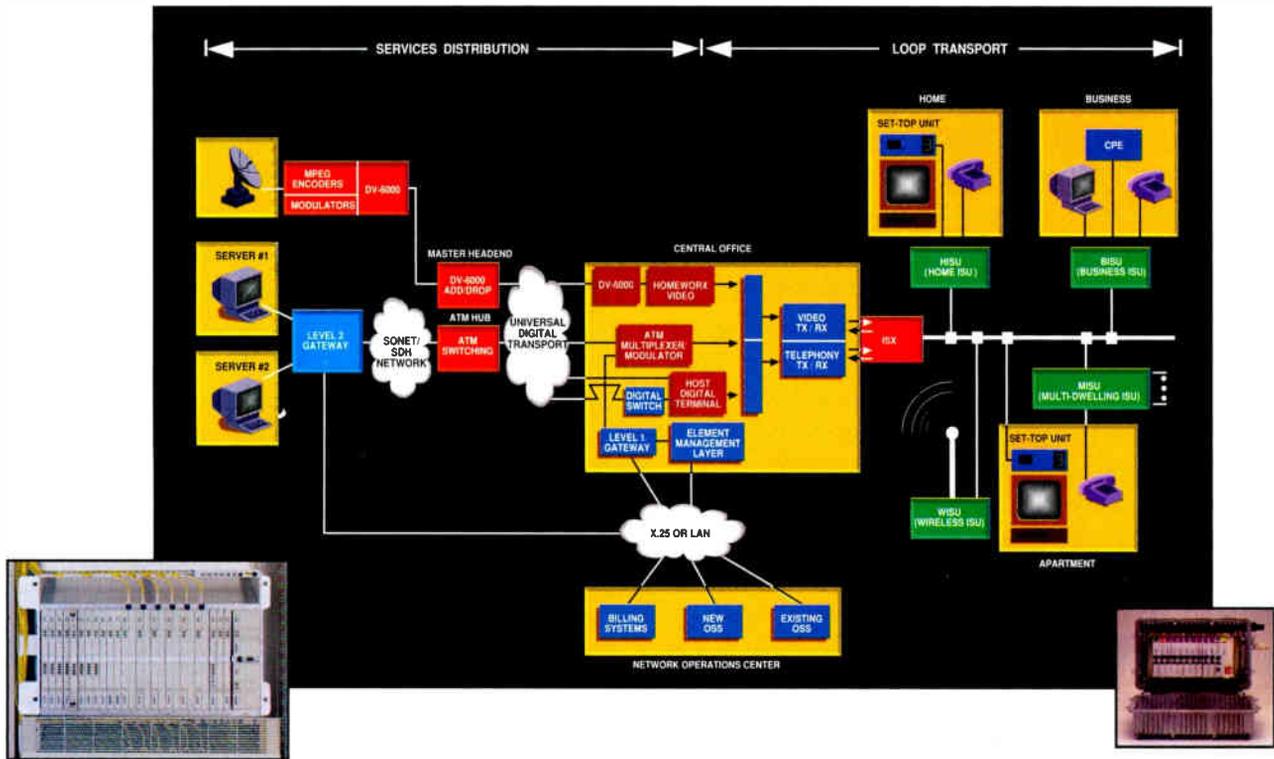

There's only one company that delivers the complete global end-to-end solutions you need for today's converging world of video, data and telephony. ADC. Our innovative Homeworx™ access platform features today's most advanced hybrid fiber/coax (HFC) architecture plus the flexibility to provide integrated wireline or wireless support for analog and digital video, telephony and data services.

## **Systems Engineering Expertise**

ADC's ability to integrate product solutions gives you single-source simplicity for building or upgrading broadband network. And our engineering support is with you every step of the way, from network design to deployment. So whether you're bringing service to the home of the future, or to the business of tomorrow, ADC is where you'll find the most flexible, practical broadband solutions. For more information call us at **1 800 366-3891**.

**ADC Telecommunications**

# Innovative Solutions For Delivering Residential Broadband Services.

ADC is the leader in the development, design and deployment of residential broadband networks. Whether you're upgrading an existing telephony or video network or building it from scratch, ADC's Homeworx HFC access platform is the most cost effective, end-to-end transport solution available today. With flexible sizing and service components, the Homeworx platform permits a "pay-as-you-go" method of responding to changing technology and market demands.

Maximum deployment flexibility is ensured with the fiber-fed Homeworx ISX integrated services access node. Surrounding the ISX package is the video services node cabinet, an aluminum housing for the RF amplifier, power supply, transmitters, receivers and status monitoring modules.

For regional video networks and video trunking, ADC's digital transmission system provides unmatched flexibility. Compatible with the widest range of video formats and scrambling techniques, the

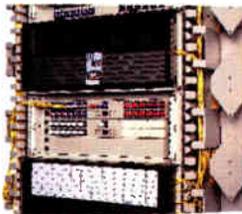

system carries up to 16 channels of digitized, uncompressed video over fiber at speeds up to 2.4 Gbps.

To manage your network, ADC offers a complete suite of broadband service assurance hardware and software. These systems integrate seamlessly into any service environment.

And the software-based, centralized administration and management system also improves performance, allowing preemptive responses to problems before they impact users.

ADC's high performance video signal distribution coax interface products provide critical test and access points for broadband and baseband RF transmission signals.

Committed to innovative practical solutions, ADC is the home of broadband. For more information on end-to-end solutions for residential broadband services, call us at 1 800 366-3891.

# Future-proofing investment in HFC plant construction

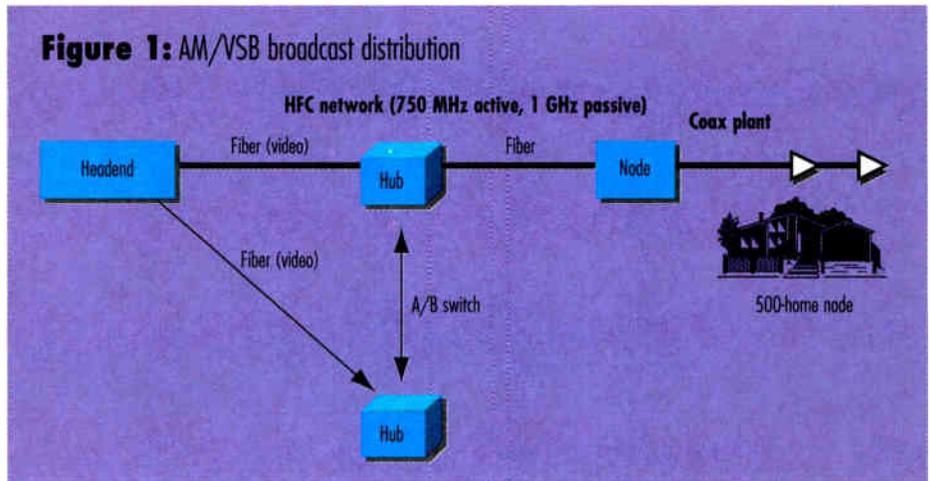

**C**onsiderable engineering and management efforts are being expended as CATV operators prepare to defend their traditional video distribution business against the telcos and to position themselves to compete head-on with the telcos in the yet unfamiliar technologies of telephony, data, wireless and undefined future services.

The design objectives are clear, however. Design a network that is the following: reliable, cost-effective, salvages to the best extent possible existing plant, supports new services with minimal incremental cost, meets or exceeds all prevailing industry standards regarding signal quality, reliability and availability, and will permit service expansion on an incremental cost basis. All factors are prerequisites to succeed in a dynamic and ever more sophisticated communication market.

A consensus has developed in the CATV industry that the hybrid fiber/coax (HFC) network is the preferred means of achieving the defined objectives. This article proposes an architecture based on HFC coupled with synchronous optical network (SONET) transport technology to realize a solution that is compatible with the stated objectives and ensures that the anticipated near-term and future services will always be supported in a cost-effective and reliable way.

## Headend, hub, optical node

For the distribution of broadcast signals, a headend, hub and optical node arrangement as shown in Figure 1

is proposed. Large headend service areas are subdivided into hubs that support nominally 20,000 homes passed. For short headend-to-home spans, a full bandwidth AM-VSB signal is launched over fiber from the headend to the hub. This signal is then cascaded with a second optical span at the hub for delivery to the node. For longer spans, where the critical parameters of carrier-to-noise (C/N), composite second order (CSO), and composite triple beat (CTB) are not met, a split-band arrangement could be employed for downstream broadcast signals, or alternatively, hybrid optical cascades comprised of distributed feedback (DFB) and YAG technology devices could be used. (See "Increasing Flexibility and Performance in Optical Networks," Patrick Harsham, *CED*, September 1994.)

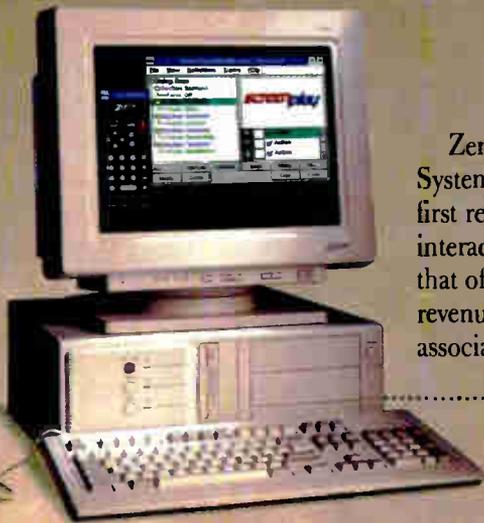

Provision has now been made for the insertion and extraction of advanced future services at the hub location. The hub is a physical location in which transmission electronics will be installed to position services near the customer and to reduce the possibility of bandwidth blockage.

Hub signal reliability is achieved by equipping the hub with A/B switches to select the same signal from the adjacent hub by means of an interhub fiber link. Adjacent hubs thus configured provide reliability equivalent to a three-node ring. This configuration also has the advantage of reducing the needed fiber count to the individual network elements. Typically, 12 fibers are deployed between the hub and the optical node to support up to 2,000 homes in clusters of 500 homes each. The node could be configured to serve single home, multiple dwelling unit (MDU) and even business applications.

Since the headend and hub eventually will house hardware needed to support telephony, data, wireless

**"The high bandwidth offered by systems such as OC-48 (2.4 Gb/s) should not be feared since it reflects the success of the operators new business endeavors."**

# Introducing Zenith MultiMedia. Power your way to new cable revenues. Today.

Zenith Network Systems has developed the first real-time, two-way interactive analog system that offers you nearly every revenue-generating service associated with digital.

And, since it's analog, you can install it at a fraction of the cost.

What's more, it's technology that's here, technology you understand, technology that's ready to install. Today.

## The MM2500™ Set-Top

Our MM2500 set-top is an addressable, broadband, stereo-compatible unit that offers you two distinct advantages.

It is the only fully-downloadable, software-driven set-top, so you get full, diverse control from the headend.

And the MM2500 set-top is the only analog unit that supports revenue-generating real-time, two-way interactive services...the unregulated sources of revenue so essential to your growth and survival in today's competitive environment.

## The ScreenPlay™ Authoring Tool *Reader Service Number 188*

The ScreenPlay Authoring Tool is an easy-to-learn, easy-to-use Windows™ based system that lets

you creatively customize on-screen displays downloaded to the MM2500 set-top.

It comes with a wide variety of characters and other graphic devices built-in, while allowing you to scan in virtually any graphic you might choose.

## Real Revenues Today. And Tomorrow.

While getting ready for the digital future, the MM2500 set-top can begin to generate new sources of real revenues today.

- Expanded promotion of PPV
- Interactive program guides
- Bulletin boards and messaging
- Interactive shopping and games
- New advertising options
- Near video-on-demand

Equally important, the MM2500 set-top can be a pathway for you — and your customers — to the digital future.

## Plug In To The Power.™

New technologies make way for new ways of making profits. And leading the way in technological advancements is, of course, something Zenith has been doing for over 75 years — another reason to plug in to the power of Zenith.

To learn more and to receive our free information kit, just call us today at 1-800-239-0900.

COMING TO  
A TOWN  
NEAR YOU.

## CABLESPAN™

While others continue to promise, the trialed and true **CABLESPAN™** telephony-over-cable system delivers.

While others talked, we listened. While others still promise, we deliver today. We deliver an advanced telecommunication system that provides basic and advanced telephony services over your broadband cable network.

The CABLESPAN system provides the flexibility to economically serve a wide range of residential and business applications. It integrates seamlessly with your existing CATV architecture while offering one of the lowest start-up costs in the industry. It provides incremental growth apace with your subscriber penetration rate – with a host of unmatched options to keep per-subscriber-cost low.

All of this and more. To assure quality service, the CABLESPAN system provides robust fault recovery and comprehensive monitoring, maintenance and diagnostic capabilities. To meet the future needs of your subscribers, the CABLESPAN system provides a platform supporting tomorrow's multitude of advanced telephony services.

Twenty-first century communications technology is here. For a glimpse at the future of your network, see the CABLESPAN system at:

and SONET transport, which rely on DC power (typically -48 volts) with a battery for backup in the event of power failure, it is recommended that serious consideration be given to having the AM-VSB optoelectronics also operate from the same DC power source and thus eliminate the need for inverters. Minimal inverter capacity can be provided if the locations support local coaxial nodes.

The next crucial element in the proposed network architecture is the introduction of an interhub SONET ring with ATM that will transport advanced services from the hubs to the headend. The SONET ring can be deployed with bandwidth granularity from as little as OC-3, OC-12 up to OC-48 depending upon the bandwidth needed to support the hub.

The high bandwidth offered by systems such as OC-48 (2.4 Gb/s) should not be feared since it reflects the success of the operator's new business endeavors. The SONET transport is generally available with DC powering and will be readily accommodated by building infrastructures supporting this feature as recommended earlier.

The bandwidth granularity of the SONET equipment also has the advantage of permitting a variable cost, since bandwidth is purchased and added on an as-needed basis only. SONET is recommended for this portion of the network because of the universal acceptance of the SONET standard, its inherent attributes of survivability, and a prescribed OAM&P standard that can interface gracefully to a network OSS (operational support system) to play a vital role in meeting the initial design objectives pertaining to signal quality and availability.

The SONET ring topography will establish signal presence near the customer base and permit the operator to pursue CAP (competitive access provider) business by offering quality, reliable digital connectivity to the headend and beyond by means of DS-1 or higher rate tributaries for relatively low incremental cost. Providing CAP service also will become a significant source of revenue to defray some of the initial cost associated with this network architecture. These same ring nodes located at the hub also will serve as a platform to provide reliable service to high-capacity MDUs by providing SONET tributaries to support DLC applications located in cabinets near the MDU to be served.

**Powering**

Before advanced services equipment to support telephony, data and wireless is deployed at the hubs, consideration must be given to how the coaxial portion of the network will be powered. Power to feed the amplifiers can be provided in the traditional way, but the demand for better grade of service associated with telephone, wireless and data services will compel the operator to look at more sophisticated approaches to powering. In essence, the operator will have to provide considerably more power to the coaxial portion of the network.

Proposed telephone wall boxes (approximately 2 to 4 watts each), personal communications services (PCS) wireless distributed antenna and transmitters (approximately 50 watts each), and the need to compensate for additional cable losses will result in power requirements in proportions not before experienced in the CATV industry. Power consumption isn't even the biggest issue. That distinction goes to the distribution and backup of power.

See us at SCTE Cable Tec Expo, Booth #443 & 445

Possible scenarios include: home powering (with and without battery); and Siamese power feed or coaxial feed with standby power source.

**Service hardware**

Now that a physical HFC plant has been established, service hardware can be positioned at the hub. Considering telephone service, cable modems with supporting infrastructure will be used to transmit robust frequency agile RF carriers to wall units at subscribing homes. Signals originating from the subscriber wall box will be transmitted upstream to be received by the receiver portion of the modem located at the hub location, and processed by the supporting infrastructure.

TDM/TDMA concepts will be used for downstream (typically 350-750 MHz)/upstream (typically 5-42 MHz) transmission respectively in bands of approximately 2 MHz when using robust QPSK (quadrature phase shift keying) modulation techniques.

The transmission of three such RF carriers in a 6 MHz equivalent video channel will yield 72 lines of telephony to be distributed amongst participating subscribers of the optical node. Incremental capacity can be provided by assigning additional bandwidth to the node, or the introduction of RF concentration, which will significantly increase the number of subscribers supported by the initial 72 lines deployed. The improvement factor is a function of grade of service and subscriber usage.

The DS-1 traffic derived from the telephone supporting infrastructure can now be carried by the SONET ring to the headend, or to the local supporting switch. It is considered beneficial to select a telephone access product that has an OAM&P compatible with the SONET ring to facilitate network integration and overall operation of the network. The telephone access product selected also should support the Bellcore TR303 standard to permit concentration information resulting in reduced DS-1 count and inherent reduced transport cost.

Data service hardware also will be placed in the hub location to transmit high-speed downstream data in 6 MHz bands using typically 64-QAM (quadrature amplitude modulation) to realize throughput data speeds of approximately 28 Mb/s. Upstream data will be at a lower speed and be supported by a more robust modulation technique. It is anticipated that access to the data modem common infrastructure will be in increments of approximately 155 Mb/s or at the OC-3 rate. This rate again justifies the deployment of the SONET ring topography.

Wireless service hardware also will be placed in the hub location. The physical hub site could be used as a macro cell, if tower and antenna are permitted, but will be used primarily to launch RF signals to the nodes over the HFC plant. Radio transmit frequencies (nominally 1.9 GHz) will be downconverted at the hub to a compatible HFC downstream frequency (typically 350-750 MHz). At a specified location in the plant, the signal will be up-converted to the original transmit frequency to drive a distributed antenna to illuminate the equivalent of a "mini" cell. Several such antennas, operating in simulcast will establish the basis of a cell. The size of the resultant cell, will depend upon terrain, grade of service, signal obstruction and degree of in-building signal penetration, etc.

The introduction of wireless technology brings back

**Figure 2:** Overall system architecture

the issue of powering as described earlier. Network powering tends to support this application favorably.

This same SONET ring also could be used to support digital "advertisement insertion" capabilities, which could be programmed for either broadcast to the entire hub population or focused to address only a targeted node or subnode element depending on the coaxial network configuration. Other possible future uses of the SONET ring include the support of video-on-demand (VOD) capabilities with signals originating at the headend and managed by means of ATM functionality.

Signals derived from the proposed new services can be aggregated at the headend for transmission to a centralized location for switch processing for wireline and wireless telephony before interfacing with the public switched telephone network.

Data services also need to be transported and processed to interface with information sources. For this application, the proposed solution is to integrate the SONET hub ring with a subsequent ring to aggregate all possible services for delivery to a common processing location.

The use of a ring to consolidate advanced service signals from diverse headends suggests the possibility of also using SONET technology to consolidate headend locations for the support of video signals. High-capacity SONET rings, when carrying bidirectional telephone and data signals can be extended to carry high-quality digitized video signals from a "super headend" or redundant "super headend" at a relatively competitive incremental cost using full-motion video CODECs. DS-3 CODECs are now available with BTSC capability to significantly reduce integration to the overall network. Transporting the video signals digitally eliminates the distance sensitivity of analog transmission and permits the eventual connec-

tivity with other networks with similar interface at the universal North American DS-3 rate.

### Summary

The proposed architecture (Figure 2), through the extensive use of SONET ring technology establishes a cost-effective, survivable network to transport advanced services nearer to the served customer. Rings with their inherent survivability attributes permit the reduction in home-run fiber costs, yet present no blockage potential since electronic upgrades to higher bit rates are available and proven.

The OAM&P protocols of the SONET standards will permit interface to a network OSS with relative ease and ensure that network reliability and customer service is maintained at the requisite level.

The use of DC power to operate AM/VSB electronics at headends and hubs results in improved power efficiency through the elimination of inverters and improved network reliability with reduced overall operating cost.

High-capacity SONET rings can be used effectively for headend consolidation and the transport of advanced signals cost-effectively while offering flexibility and universal networking possibilities.

The introduction of the hub location with SONET connectivity permits services to be deployed nearer to the customer base and provides extensive flexibility for the deployment of telephony, data and wireless, as well as the eventual introduction of local digital ad insertion and VOD, etc., in addition to supporting a CAP business platform.

This architecture fully meets expectations and objectives of the industry and ensures that future features can be readily accommodated. **CT**

# TAKE A GOOD LOOK AT OUR NEW POLYETHYLENE ENCLOSURES.

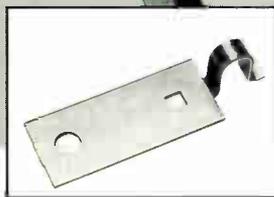

Channell Commercial's high quality ABS plastic enclosures are well known in the industry and are used extensively throughout the world. Now, we've added a new series of enclosures to meet the needs of our economy-minded customers: The Economy Pedestal Housing (EPH™) Series of high production, injection-molded polyethylene enclosures for housing taps and splitters. They're engineered and manufactured to our usual high standards in our own facilities, but designed for applications where security is not a major concern.

EPH Series enclosures feature constant wall thicknesses and include many of the other features found on our most popular Signature Series (SPH™) enclosures. These cost-competitive polyethylene enclosures have the highest possible UV protection, yet are far superior in design to any existing polyethylene enclosures found in the industry today.

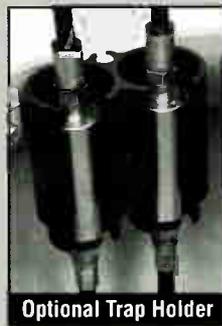

When economy is a factor and security is not a major concern, take a good look at Channell's EPH Series of polyethylene enclosures. Call toll-free today for complete information.

## Think reliability before you construct

**P**lanning and constructing a communications system requires an analysis of several different factors such as how and where the system will operate. Two of the most important capabilities for consideration are information-carrying capacity and reliability. Of course, cost is always a major consideration. However, paying more for a system does not automatically alleviate the other considerations.

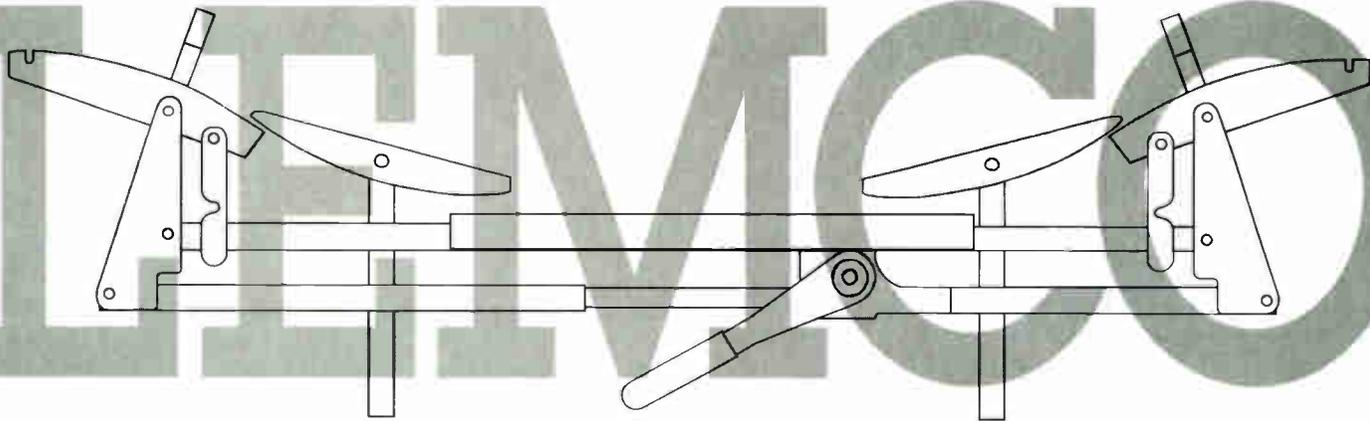

System reliability is usually defined as the percent of time a system is capable of meeting its design standards divided by the amount of total time in a period. Reliability, or

lack of it, in a system is often thought of as outage time. Actually, any time the system does not meet its design standards, such as a poor signal-to-noise ratio (S/N) in an analog system or high bit error rate (BER) in a digital system, it is falling below its reliability standards. A client paying to have data transported on the network will certainly expect and demand that the system be online and meeting its design standards a high percentage of the time. One hour of down time per year equates to 99.99988% reliability. This is in the range of what a paying client will expect from the network. Obviously, a requirement

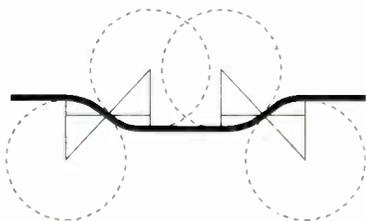

for redundancy exists if these standards are to be met.

### Design and installation

An engineer designing or upgrading a system must consider total system reliability before the physical construction begins. It is too late to consider reliability standards after clients have signed contracts. Evaluation of the reliability of the different parts, the quality of installation of the parts, the operating environment of the system and the speed of maintenance of the system components determine the total system reliability. The speed of repairing problems is the most important factor in establishing system reliability. →

Typically, the manufacturer will specify the individual system devices to meet or exceed a particular failure rate. On manufactured devices, the usual method is to specify the mean time between failure (MTBF). The MTBF is a specified number of hours arrived at by laboratory experiments on the devices. Warranties are often based, at least to some extent, on the expected failure rate of the discrete devices. The engineer designing a system must consider not only the reliability of the different system components on an individual basis but also their reliability

as a part of the whole system.

The quality of installation of the different components in a communications system can easily reduce the reliability of the complete system because of inferior workmanship. The engineer designing for a specified reliability standard must ensure that the procedure for installation work is stringent enough to force the installation group to have quality control.

Intermittent connections caused by poor workmanship is the most prevalent defect in installation. The only way to reduce this problem is by inspection

of the work. In addition, a penalty is mandated if poor installation quality causes delays in meeting the activation date. Therefore, if the completed system does not meet the specified reliability standards on the specified date and the cause is related to installation work, the contractor or person in charge of installation must be held accountable. If this expectation is noted in the beginning, higher quality work will result.

### Operating environment

The operating environment of the system itself must be known by the system engineer when reliability considerations are evaluated. The environment and environmental concerns are considered when the individual system components are evaluated.

Frequently, the system designer only uses the manufacturer's specifications and wraps them into considerations for the reliability of the whole system. A very important example of this is the heat dissipaters or heat sink fins on electronic equipment. The dissipaters are designed to transfer heat to the surrounding air. Therefore, the air must move continuously for proper cooling to take place. The movement of air will happen naturally by convection unless restricted by enclosures. Quite often, devices are placed in the uppermost slot of a cabinet with no louvers or vents, thus minimizing convection cooling. Since heat rises, any device placed higher in the cabinet than any vents or openings will suffer a severely reduced life expectancy. The manufacturer's specifications are valid only if the devices are installed and operated as intended.

Other considerations in reliability related to the environment will be the quality of the power feed. If the power supplied by the power company has a problem with power surges, spikes, brownouts or other anomalies, proper conditioning of the power is a necessity. In addition, backup power is necessary for reliability considerations. Bonding and grounding only to the NESC and/or NEC standards will not be enough in some high lightning environments. Bonding on every pole in outside aerial plant will reduce the inductive coupling from overhead power lines into the communications cable.

Here in the Florida environment, it is required that we consider the effects of salt spray on devices located outside in coastal areas. Each geographic area

has its own share of unique problems relating to the environment. A design engineer cannot ignore these different problems. Consideration factors for outside plant in California are different from those in Florida.

### Repair considerations

Another factor often overlooked by design engineers is the length of time it takes to repair a problem when it does occur. Many systems are supposedly built to "bulletproof" standards.

Quite often, no thought about the replacement time of a defective compo-

nent is given. Maintenance consideration is part of the reliability engineering process. In addition, maintenance cost must be a factor during decision-making on the overall system cost.

Using a five- or 10-year system cost analysis will include the maintenance cost factor. The equipment purchased, its location and the installation all impact the ability to maintain the equipment. Proper training, equipping and simulations for emergency repairs are a necessity for maintenance technicians.

Waiting until the first catastrophic outage occurs is not the time to con-

sider maintenance. On the contrary, during installation planning, and during purchasing decisions, the thought of "how long will it take to get to this device and replace it" must be at the forefront of reliability thinking. Therefore, the system design engineer must consult with the maintenance operation staff before final decisions on the purchase and placement of equipment.

### Conclusion

Cable companies are no longer just looking at entertainment TV for revenue sources. They are looking at building the information superhighway, or part of it, to increase revenue by carrying data traffic for other businesses or telephone traffic for the public.

The considerations of building the networks of tomorrow are different from those considerations of a few years ago. Reliability standards must now occupy a major role in our engineering thinking process.

Where a two-hour outage used to be acceptable, the network clients of tomorrow expect only a few minutes per year of downtime at the most. When the BER goes higher than specified or the S/N goes lower than specified, the reliability clock starts running.

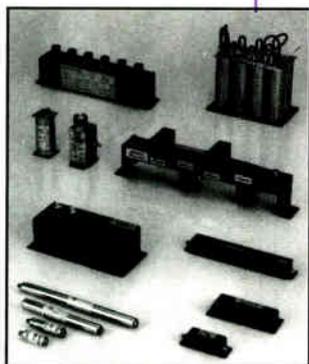

Several factors that are important to reliability go into the design engineer's thinking process. The quality of the individual devices in the network and their rated MTBF will have an effect on the total system reliability. Thus, this is the first consideration. The quality of installation of these individual devices is a major factor in system failures. Strict adherence to the device manufacturer and the system designer specifications is necessary during the installation process. Designing for the environment in which the system will operate and selection of the components that meet environmental considerations also are very important.

However, the most important factor in reliability engineering is the speed with which problems are solved. Technical problems are inevitable in mechanical and electronic equipment. Therefore, we must prepare our staff to repair these technical problems in the least amount of time. Reliability of the network has become an important part of the thinking process of engineers who are responsible for building the information superhighway. **CT**

**LOW POWER LOSS REGULATORS**  
Featuring just 0.5V dropout, built-in protection functions, a shut-off pin for high power-consuming circuits—and over 50 models in all.

**UP/DOWN TUNERS FOR DIGITAL CATV**  
With RF input from 50–750 MHz, phase-locked loop design, support for 16 VSB and 64 or 256 QAM modulation formats.

**MASK PROGRAMMABLE ROM**  
In 1M and 2M densities (128K x 8 and 256K x 8/128K x 16). A low-cost pin-compatible replacement for Flash, EEPROM and EPROM.

**RF MODULATOR FOR NTSC-M SYSTEMS**  
A compact, lightweight, 5V design, mountable directly on the motherboard, with built-in white clip circuit.

**FAST SRAM**  
In 1M and 256K densities (128K x 8, 256K x 4 and 32K x 8) with 20ns access time. Low-power standby when deselected.

**ASIC/ASSP WITH ARM7 CORE**  
The power- and real estate-efficient 32-bit RISC processor, with extensive software and design center support.

**DRAM MEMORY**  
1M and 4M densities in 256K x 4, 256K x 16 (with extended data access cycle) and 1M x 4 designs, in a variety of package options. Available Q4 '95.

**FLASH MEMORY**  
Enabling re-writable software storage in 4, 8 and 16M densities and access times to 60ns. Single and dual voltage for 8M and 16M. Available Q3 '95.

**CCD CAMERA MODULE**  
High-resolution, wide dynamic range, high sensitivity and small size: the perfect low-voltage interactive video solution.

**REMOTE CONTROL LIGHT DETECTING UNITS**  
Thin and compact, in various band pass filter frequencies, their power supply filters require no capacitors or resistors.

**SMALL CHARACTER MODULES**  
Highly reliable, highly integrated, with LCD controller/drive in chip on flex configuration. Thicknesses from 1.5–3.5mm.

**LEDs**  
For bright, efficient, reliable function key backlights. In low-profile surface mount or 4-pin package for stability during reflow.

60 Decibel Road / State College, PA 16801

companies are in the process of a number of trials. Northern Telecom has announced plans for a 1.5 Mb/s bidirectional modem. Jerrold PC LinX will one day deliver data to homes at 30 Mb/s. Scientific-Atlanta and Hewlett-Packard also are planning on creating their own data modem offerings.

But big questions remain. For starters, the cable industry has to figure out how to make these networks work on a highly reliable basis. On the other side, these modems by themselves will only allow cable operators to connect across a single cable network. Operators will probably need to connect to wide area networks (WANs) like the Internet or America Online to attract a large customer base. On the other side of the fence, technology is coming along that will enable broadcasters to put data onto their networks, perhaps in competition with some of cable's businesses.

### Putting business on the net

Businesses may be warming to the idea of using cable operators for data. An indicator of this trend can be gleaned from some statistics derived from a direct mail campaign conducted by Lois Levick, marketing manager of emerging network technologies at Digital Equipment Corp. Last October, she mailed out a multi-industry questionnaire to 73,000 businesses of all sizes that asked about their interest in using their local cable company to supply their data networking needs. By the end of December, 9,344 people had responded (or 12.8% of those surveyed). Levick says that 80% of the respondents indicated a moderate to high level of interest in using cable companies for their data needs.

This level of response is extremely high for a direct mail survey of this sort. Most surveys only bring in a few percent response rate over the course of the study. But perhaps their interest was piqued by DEC's offer to send out a free 20-page *Internet Access Guide* to the respondents. At any rate, Levick is planning on using the survey results to target cable operators in areas with a lot of positive responses.

At the moment, the largest single obstacle for businesses moving their data over coax are questions about the reliability and security in the field. Schools and institutional networks could provide an opportunity for cable operators to field test the technology and train their technicians on it with-

# Solutions Beyond Tomorrow

Looking for affordable MPEG-2 encode/compression technology? Vela Research, Inc. can provide it today.

## **REAL TIME MPEG-1 AND MPEG-2 ENCODING**

Vela Research MPEG-2 Encoders are capable of real time compression of video information into either the MPEG-1 ISO 11172 standard or the MPEG-2 ISO 13818 standard. This feature allows full interoperability with the next generation of MPEG-2-compliant decoder technology while offering full compatibility with today's MPEG-1-based PC and CD technologies.

## **VERSATILITY**

Vela's MPEG encoders accept a variety of video standards such as NTSC and PAL, and input signal formats that include composite, S-Video, Y/U/V or Digital D-1. This flexibility eliminates the need for expensive digital conversion electronics necessary to interface much of today's analog composite and component equipment to tomorrow's digital MPEG

encoding technology. The encoders support resolutions from SIF to ITU-R 601 at data rates from 1.158Mb/sec. to 15Mb/sec. A variety of audio signal formats are available from analog inputs to digital inputs based on the AES/EBU standards. The encoding workstation can be directly interfaced with computer/networking equipment such as Ethernet, Fast Ethernet, FDDI, CDDI, ATM and SCSI-2.

## **PROFESSIONAL WORKSTATION INCLUDED**

Vela Research MPEG encoder systems were designed and developed by digital encoding professionals with the video production professional in mind. An example of this attention to professional needs is found in the full-featured workstation included with the encoder. The workstation allows for complete external

control of a variety of VTRs, VCRs and laser disc players with on-screen controls for fast-forward, rewind, stop, play, cue and shuttle to timecode number. The internal 36GB disk capacity provides for capture and storage of compressed digital video files for later distribution.

## **CHECK US OUT**

Vela's MPEG encoders are available and shipping today! Call our Director of Sales,

Rick Chile, at (813) 572-1230, ext. 7171, to explore the "Encoding Solutions for Tomorrow" that

Vela Research can

provide today.

*Meeting Tomorrow's Needs - Today<sup>SM</sup>*

ject. The National Science Foundation is funding \$4.21 million over the next three years to train teachers how to use the network.

Goodish believes this type of network has some potential for business. He said, "But at this point, one of the concerns is the traffic-handling capability. If someone is in there doing huge file transfers, it could take very few users to create a latency problem that restricts your ability to commercial users. I think it is something that you complement with other technology. Switching could help, and we may implement switching in the headend, but this is too early to make a decision."

### How the Internet fits in

One of the most exciting applications for these modems will be high-speed connections to the Internet. The Internet is a network of computers that communicate using the TCP/IP protocol. It has been around in one form or another since the '70s when researchers turned on the ARPANET, a Department of Defense network designed to be reliable even if several of the switching centers were knocked out. The end result was a "network of networks" capable of tying together a large number of individual networks.

Until recently, the Internet remained an intellectual curiosity for schools and hobbyists. The nerds that surfed it all new the cryptic UNIX commands required to get around. One of the more interesting developments was the creation of the World Wide Web (WWW) in 1992 by Tim Berners-Lee at CERN in Switzerland. It provided an environment for creating hypertext documents on the Internet that contained references to other documents. However, the WWW remained an intellectual curiosity until March 1993 when a team of undergraduate students led by Marc Andreessen at the National Center for Supercomputing Applications in Champaign-Urbana, IL, created a graphical user-interface called Mosaic.

Mosaic and other browsers it inspired enabled people to view documents with text, graphics, audio and even video clips mixed together. According to the Internet index compiled by Win Treese, WWW traffic grew 443,931% in 1993 and another 1,713% in 1994 to about

Serving the industry since 1973

269 billion bytes of information.

Andreessen and his team have since graduated from the university and gone to California where they launched Netscape Communications. Initially the company created a better browser for the Internet. Mosaic was optimized for the high-speed 45 Mb/s links the team had access to at the University, but was a bit poky on the slower 14.4 kb/s modems common for most computer hobbyists.

The company created Netscape as a welcome improvement that uses a number of tricks to make Internet

surfing a far more enjoyable experience. The program is downloadable from the Internet and is free for individuals and schools but businesses are requested to pay a modest licensing fee.

### Securing the Internet for commerce

However, the most interesting thing about Netscape is not the browser but the server being developed for secure transactions on the Internet. The Internet has had a history of bad security. Hackers have shown that it is not too difficult to intercept data packets

as they travel down the net and look for sensitive information.

For example, Mark Mitnick was recently busted for putting sniffer programs on the Internet that tracked down credit card numbers and passwords. His sniffer had acquired 20,000 of them by the time he was found. A special task force finally managed to apprehend him in North Carolina last February where he was hacking from a cellular telephone.

One of the most exciting technologies for securing the Internet is the RSA encryption algorithm developed by a team of researchers at MIT in 1977. It is named after its developers, Ron Rivest, Adi Shamir and Len Adleman. The algorithm enables people to do very secure communication with digital signatures to ensure that messages are not tampered with or forged. Every person that uses it is given two keys — public and private. When you want to send a message, you use your private key and the recipient's public key to encrypt the message. When the recipient receives it, he uses your public key and his private key to decrypt the message.

Public key cryptography not only se-

cures communications, but also gives you a measure of proof of who sent you the message because a message from someone will only decrypt if the sender had access to the right private key. Consequently, it provides an authentication mechanism for financial transactions on the Internet. Netscape incorporates RSA's encryption algorithms to companies to put information on WWW servers that can only be accessed by authorized people. It also can enable credit card information to flow over the Internet without fear of hackers stealing or forging the information. In fact, Netscape already has negotiated a deal with MasterCard to provide vendors with secure connections for MasterCard transactions.

But how secure is RSA? It is so secure that the U.S. government is scared of letting it get into the hands of foreign governments and organizations. All software programs with RSA encryption technology are considered military-grade munitions and are illegal to export. By some estimates it would take several hundred years to crack a properly implemented RSA key using existing technology.

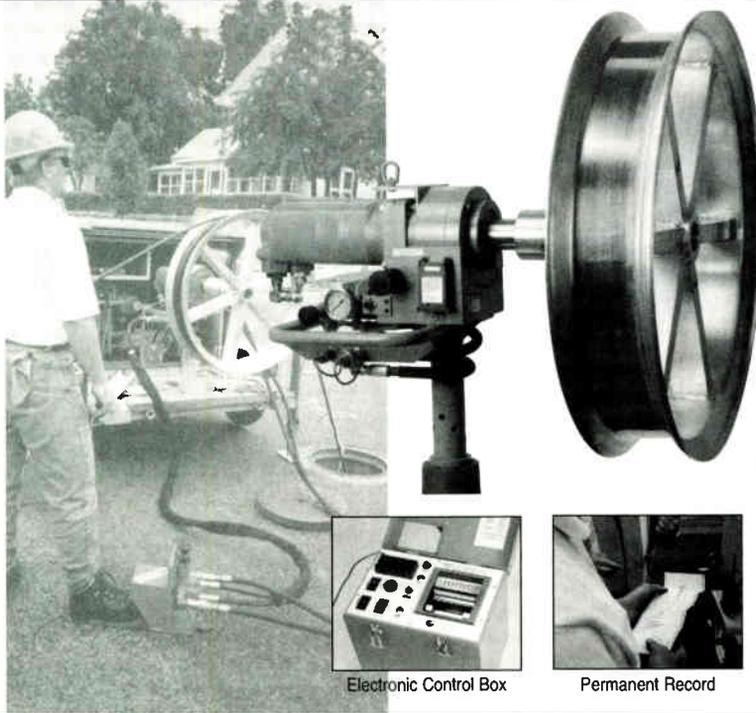

RSA technology also is making the

Internet secure for business networks as well. Businesses have traditionally shied away from the Internet for fear hackers might try to steal their data or corrupt their computers. The easiest way around this has been to set up firewalls that limit Internet access to a company's computers. But this also has meant that the company employees could not access their office computers from the Internet either.

The Internet promises to offer companies a far cheaper alternative for tying together offices than traditional value-added networks or leased lines. The key reason is that Internet usage is often priced by the capacity of the connection and not by the quantity of packets sent or their distance. In many cases a company could connect multiple offices through the Internet for as little as \$30 per month per office for a 28 kb/s dial-up connection, or \$150 a month for a full-time connection. Enterprising cable operators could offer them several megabits a second for a few hundred a month and still have a far more attractive alternative than anything else around.

Premenos Corp. is one software company going after this market. It

# To help you plant the seeds of progress, Janet Burton goes back to her roots.

*Janet Burton  
Sprint/North Supply  
National Market Manager – CATV*

Janet Burton's experience in cable programming is a special asset now that she's on the equipment side of the industry. It's helping her make Sprint/North Supply your best choice for a full-line national distributor.

As a marketing strategist, Janet identifies the best mix of products, so we can give you a complete selection from a wide range of suppliers. To provide the services you need, Janet draws on her own marketing experience and Sprint/North Supply's product expertise. She listens to our customers ... talks to manufacturers ... develops and studies market research.

Then we deliver it all through a system that incorporates friendly, knowledgeable service reps ... on-time delivery from 10 well-stocked distribution centers nationwide ... and growing data capabilities for rapid communications.

So as you branch out with new and better networks, let Janet Burton's know-how feed your progress. For broadband, telecommunications and data products, call Sprint/North Supply, your full-line national distributor. We've got what it takes to help you grow.

has developed Templar (an extension to its Electronic Data Interchange software) that enables companies to perform secure business transactions over the Internet using digital signatures. Templar has been a leading player of EDI software for mid-range systems, but it is just one fish in the pond in the overall EDI market. According to Daniel Federman, president of Premenos, the EDI market hit \$1.7 billion last year. Only \$250 million came from software. The big chunk of that came from value-added networks (VANs) (\$400 million) and direct connections (\$300 million). According to Federman, some companies will be able to cut their communications costs associated with EDI in half or more by using the Internet.

For businesses, the best news about the Internet is not just that they can send transactions to one another, but they also can send data, like CAD/CAM drawings used to build the products described in the EDI forms. Mike Gordon, manager of advanced systems at Avex Electronics, has been doing a pilot with Premenos for the last month. He said the key to EDI transactions is their ability to reduce

the cycle time for creating new products. Avex did not use VANs to send engineering data because it got charged by the byte, and with megabyte-sized CAD drawings it was cheaper to just pop them in the mail. But with the Internet system Avex can send any data back and forth to its customers and this has helped the company reduce cycle time from a few months to a week.

But Templar does nothing to prevent hackers from breaking into a company's network. Network managers often use firewalls that limit Internet access to a few publicity documents set up on the Internet. This also prevents employees from taking advantage of the Internet for doing work on the road or in an outside office.

For employees in a large fixed location, Semaphore Technologies has developed a line of products that enable companies to interconnect remote offices via dedicated lines, frame relay or TCP/IP over the Internet. The TCP/IP product has been shipping for about a year and the company is just getting ready to roll out a new version for frame relay. A single \$4,500 box

can handle 15 computers over a TCP/IP net.

The Semaphore technology is best suited for large offices, not the mobile worker. Virtual Open Network Environment in Rockville, MD, has been demonstrating a new concept in mobile firewalls. It is based on an interface it developed to Trusted Information System's firewall that enables employees to securely telenet into the system. It also supports WWW, FTP and Gopher transactions in a nonsecure way. The firewall costs about \$18,000 for all software and hardware. The card readers cost about \$100 each. The cards themselves are smart cards that are being adopted by the financial industry today. Tom McCreary, product manager of the Smart Wall, said that although these cards cost \$15 today, volume deployment by the financial industry will drive their cost to \$1 each in a few years.

The exciting thing about the Smart Wall is that it is cheap enough for a consumer purchasing model. McCreary pointed out that these cards have compartments for up to eight different pieces of data. People could store their ATM number, Visa number and infor-

## Build Your Network

# THE TELSTA WAY

TELSTA LIFTS, TOOLS AND TECHNOLOGY INCREASE YOUR NETWORK CONSTRUCTION PROFITS.

Telsta construction lifts and tools are the perfect match for today's high production fiber optic and broadband network construction. Nothing beats a Telsta when it comes to maximizing your manpower and lowering construction costs. Towering capability, more side reach and day-to-day dependability make every job faster and more profitable.

Now you can put Telsta's leading edge technology to work for you at a lower cost than you thought possible — even compared to used equipment. Telsta offers the lowest cost three, four and five year lease packages in the industry. Add to that Telsta's customized construction training and you can see the extra value you get when you choose Telsta.

Superior construction technology, super lease deals, high resale values and the best field service program in the industry...that's why the Telsta Way is the way to profit from the boom in network construction.

## The Answer Is Simple – Everything You Need Is Already In The SL750A “CHANNELIZER”™

On an average outage or service call, do you really know which instrument you're going to need to troubleshoot the problem? Do you need a DVM to check voltage levels at the amplifier? How about a signal level meter to test levels across the spectrum? Then for the final test, what does the picture really look like? Are there interference problems you can't see by looking at signal level or a frequency spectrum?

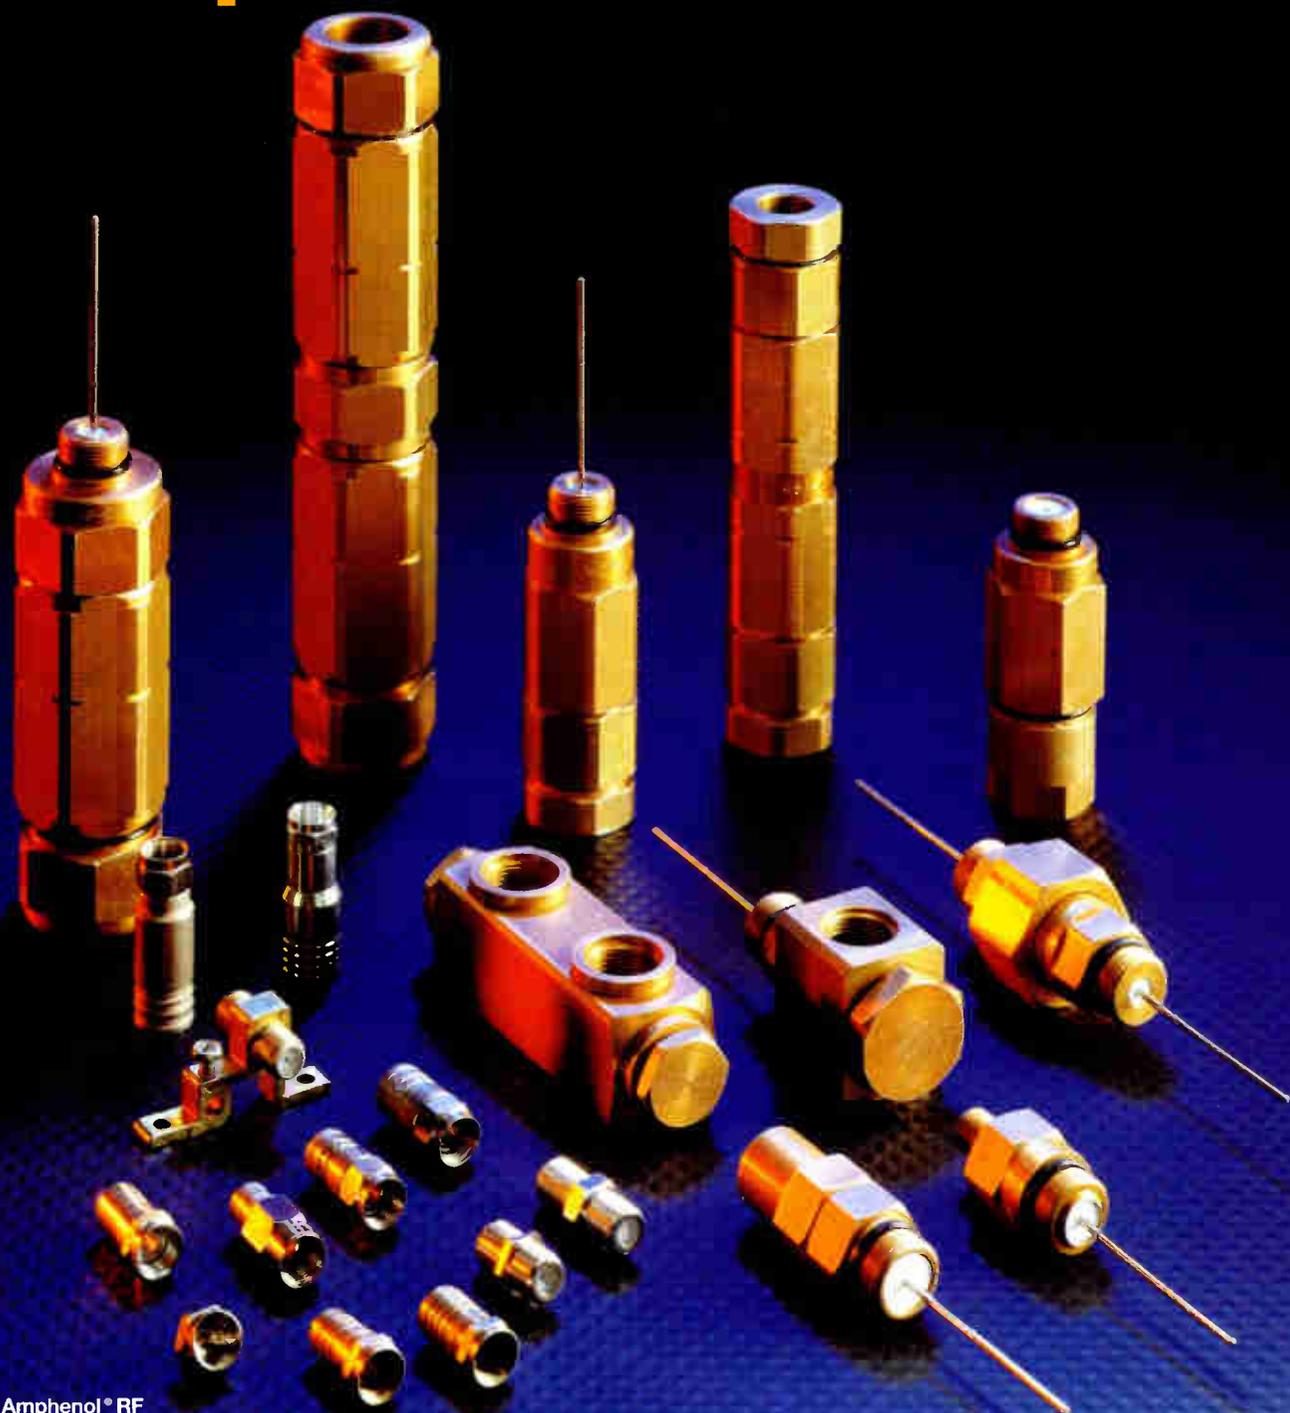

Sencore wants to make every service call easier and more convenient for you. That's why the SL750A “CHANNELIZER” covers all these requirements in one complete unit. You'll have every instrument you need at your fingertips. To find out how the SL750A answers your troubleshooting needs...

## You Asked. Amphenol Delivers.

### Amphenol Hardline Gold Series CATV Connectors -

You asked for a superior product at a competitive price. Amphenol delivers the industry's first true non-rotational, 3-piece, slim design hardline connector for CATV trunk and feeder system applications. Amphenol's Gold Series CATV Connectors deliver what you need, and much more.

You'll save installation time, enhance the quality of your connections, and provide years of installed performance in even the harshest conditions.

For more information and samples of Amphenol's CATV hardline Non-Rotational Gold Series connectors, call 1-800-881-9913.

**Amphenol® is the world's largest manufacturer of coaxial cable connectors.**

**No one offers so much. Or gives you more.**

\* Patent Pending

### Amphenol CATV Hardline

Feature	Benefit
True non-rotational design	Eliminates installation stresses and latent cable defects
Brass cable gripper	Provides harder material, to grip cable more firmly
Return loss to 1 GHz, guaranteed	Reduces need for repeaters on long runs
Attenuation, max. dB	Reduces need for repeaters on long runs
Hex nuts all same wrench size	Reduces costs for installation tooling and makes installation foolproof
Positive stop installation	Gives positive proof of proper installation
2" long pin as standard on all items	Reduces inventory when both short and long pins may be required
3-piece connectors, for visible conductor entry	Gives positive proof of proper installation - both insertion alignment and center conductor grip
Aluminum Finish	Superior corrosion resistance

#### Amphenol CATV hardline Non-Rotational Gold Series connectors

##### Electrical

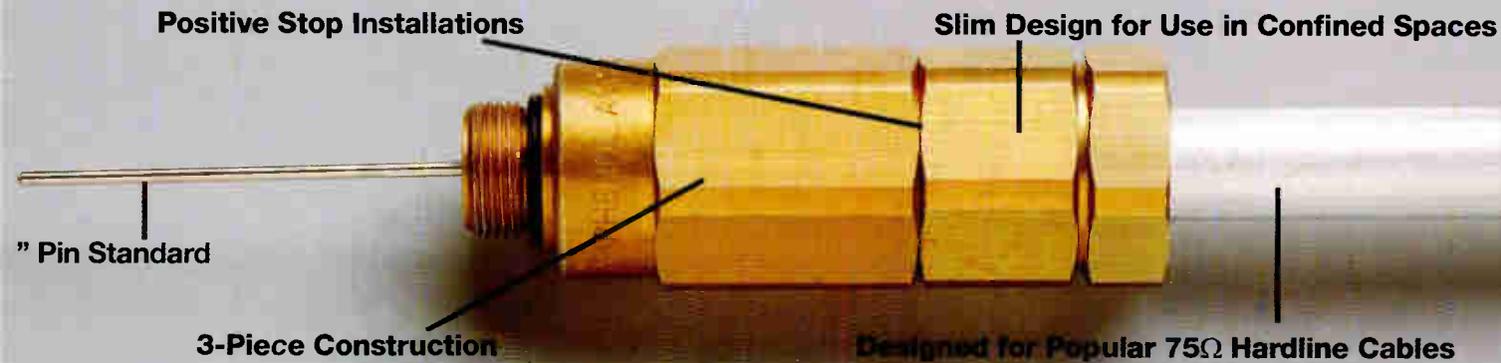

- Impedance: 75 ohms • Return loss:  $\geq$  typical 40 dB @ 1.0 GHz
- Insertion loss:  $\leq$  0.05 dB @ 1.0 GHz

##### Mechanical

Mating: Pin type has standard 5/8-24 UNEF thread. Full cable retention over temperature range. Designed to release cable prior to cable tensile failure.

Maximum attenuation 0.2 dB!

*Test Procedure - Launch off 75 ohm Amphenol precision lab connector into tested connector gating out cable. Test equipment used - Hewlett Packard 8753D.*

**Material & Finish**  
**Materials:** • Aluminum - 6262 type • Brass - Alloys to QQ-B-626  
 • Plastics to various specifications  
**Finishes:** • Aluminum - Chromate conversion • Brass - Nickel plate  
 • O-Rings - Ethylene propylene

**Environmental**  
**Temperature range:** -40°F (-40°C) to +140°F (+60°C)  
**Corrosion:** Designed to meet ASTM 368 CASS corrosion test when assembled onto cable.

# Amphenol Weatherseal CATV Connectors -

When you need a true round crimp, weatherproof CATV F connector, depend on Amphenol for your solution. Ideal for use where fully weatherproof interconnections are required, our one-piece, one-crimp assembly method is fast, inexpensive but so very effective. Our exclusive combination of corrosion-resistant Sulfamate Nickel Plating and weatherproof O-Ring combine to provide the ultimate in all-weather performance.

## Weatherseal F Connector Features:

- 59 and 6 series cable uses standard 1/4"-1/4" prep
- One crimp - with inexpensive hand tools that crimp 59, 6, 7, and 11 Series cable
- One-piece for easy, low cost installation
- Weatherproof at both cable attachment and mating face - no additional sleeves or sealing compounds are required
- Long life - Amphenol reliability reduces maintenance costs
- Terminates popular 59, 6, 7, and 11 Series CATV cables, including Times Regular, Underground, lifeTime™ and CATV listed - with Standard, Premium, Trishield and Quadshield braid coverage
- Excellent cable retention - minimum 40 lbs. pull-off force
- Mates with available CATV F female connectors and retains weatherproof characteristics
- Designed and manufactured to Bellcore SPEC (TA-NWT-001503)

## Amphenol Weatherseal CATV F series connectors

### Electrical

- Impedance: 75 ohms
- Frequency range: DC-1GHz
- RF leakage (screening effectiveness): -100 dB minimum @ 1 GHz
- VSWR: ≤ 1.06 @ 1GHz

### Material

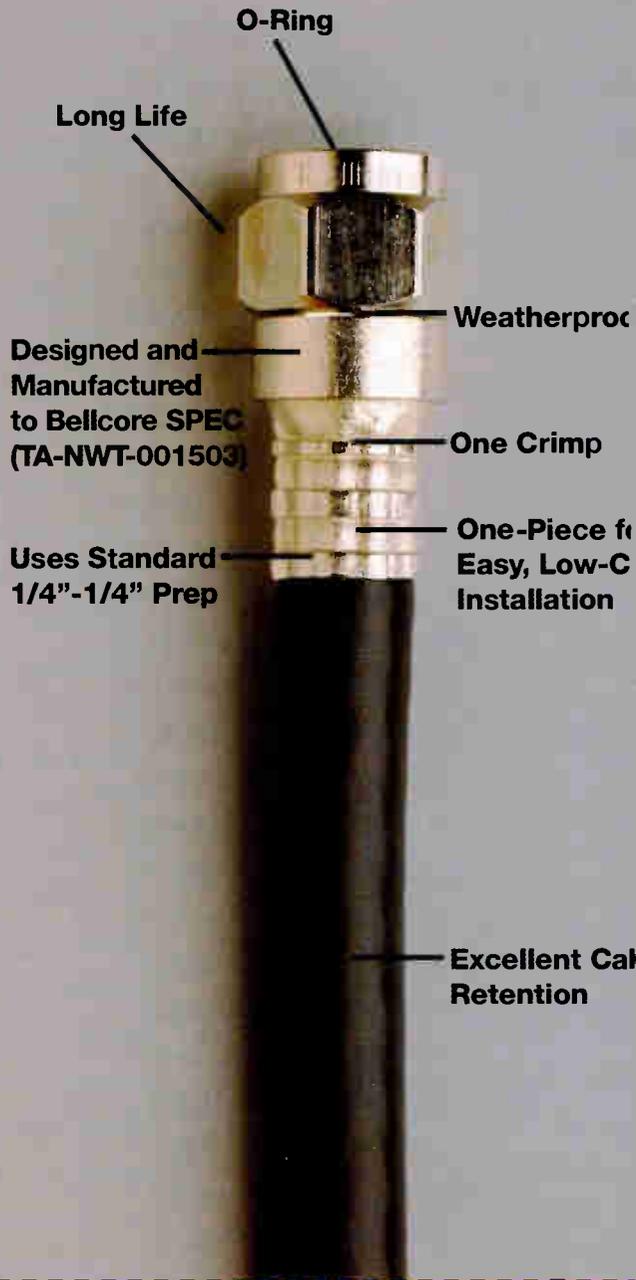

Coupling nuts and bodies: Brass  
 Plating: Crimp Ring: Tin-lead  
 Coupling nuts: ASTROPLATE® (Bright Nickel)

### Environmental

Temperature range: -40°F (-40°C) to +140°F (+60°C)  
 Weatherproof: At cable attachment and at mating face.

### Mechanical

Mating: 3/8-32 threaded coupling  
 Mating torque: 20 in.-lbs.  
 Cable attachment: Radial braid-crimp  
 Cable retention: 40 lbs. minimum

mation on the card. Then when they log on, they could transmit their data securely to the firewall where the payment could be processed. Of course, that will require the widespread distribution of the card readers to consumers.

### Some options for cable ops

In the business world, bidirectional communications is of course important. A company may want to shunt large files all over the network. But consumers may be quite satisfied with asymmetrical communications that enable them to quickly receive video and audio clips at high speeds, but only send data at a slower rate. Hybrid Networks has teamed with Intel to provide a 10 Mb/s downstream and 64 kb/s upstream network.

The companies are working on trials of the technology with both TCI and Viacom. Intel will sell the cable modem itself and Hybrid will work with cable operators to set up connections to WANs like the Internet, CompuServe and America Online. Notes Ed Moura, president of Hybrid, "We just want to make this available in large quantities. We have the high

speed and low cost plus the networking technology to put this together, and show the operator there is a business here."

The one limitation of this approach is that the bandwidth is shared between all of the users on the network at any given time. Jake Smith, president of Cactus Computer, believes the vendors are setting themselves up. Although several hundred people could still share the cable network and get much faster access to the Internet, the Internet would slow down significantly if a substantial number of people with higher speed modems were to plug into it.

Smith notes that most of the servers on the Internet are sized for 10 kb/s connections. Cable customer who pay more for high-speed access may feel cheated if they see little improvement because of the latencies inherent in the Internet itself.

Cable operators do have some options. They can set up a server that caches frequently accessed data locally on the network. Then when others want the same data, it only has to come across the local network to get to them.

Another option is for cable operators

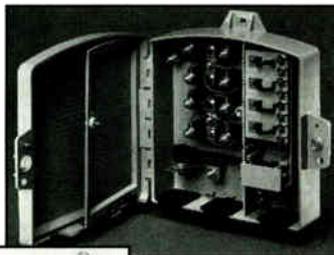

to set up their own Internet servers, and then sell the space to shops and businesses in each local community. At the last Western Show, Analytical Sciences Corp. demonstrated the Neighborhood USA system, which is a multimedia WWW server for delivering video, audio and text over a cable operator's data network. Hundreds of other companies are setting up shops on the Internet that sell everything from pizza to sex toys. There is a tremendous opportunity for server providers, particularly if they can guarantee merchants that potential clients will have enough bandwidth to view audio/video catalogs and ads without annoying delays.

### Subsuming it into the box

Even with the latest generation of PC-based graphical user-interface software, getting on to the Internet can still be expensive and complicated for many consumers. They have to buy a PC and then pay a minimum of \$10 a month for just casual surfing. But many of them just want to surf around, look at catalogs, weather maps and other goodies found freely on the Internet, without having to get a computer to do so. Perhaps this was be-

## BROADBAND NETWORK PROTECTION SYSTEMS

Joslyn offers products that solve your current Broadband Network Protection requirements at the subscriber drop. Our integrated Network Interface/Protection System is designed to protect both twisted-pair and coax drops, and offers easy installation and maintenance—all in one convenient housing.

**NETWORK INTERFACE DEVICE** The 7090 series Network Interface Device is designed for outdoor use in any single- or multi-pair residential or commercial installation. It can be configured in pair counts from 1 to 6 or 4 pair/2 coaxial lines.

**HYBRID STATION PROTECTOR** The 356H hybrid gas tube/MOV station protector provides protection against lightning surges, power-cross conditions and ground potential rises on twisted-pair conductors serving subscriber premises.

**COAXIAL PROTECTOR** The 1740-01-H18 coaxial protector provides protection against damaging surges and has a fail-short mechanism in the event of dangerous power-crosses on 75-ohm coax lines.

### YOU NEED JOSLYN PROTECTION

## He Can Find Drugs, Explosives, Termites and People...

*but this RF leakage thing has got him depressed.*

After a 6 year career in law enforcement with the Kinchlow, Alabama Police Department, Duke decided to hang-it-up. He put a lot of bad guys in jail and even found termites at the Mayor's house. Now he just watches the kids play, eats a little too much, and can still keep the postal guy a little off balance from time to time.

His tracking days are over, but the thought of trying to track RF leakage still intrigues him. It takes a special talent to find that stuff.

Cable Leakage Technologies has been in the RF leakage detection business for over 5 years and has patrolled over 4.8 million miles of cable all over the world. Wavetracker boasts positive identification, 2-5 meter positioned accuracy and one step prioritization. And all of that because CLT *invented* the original Wavetracker...it's that simple.

The Wavetracker won't meet you at the door and you can't scratch behind it's ear, but we're working on that.

#### *All New:*

- Trilithic Channel Tag Ready • 2-5 Meter Positional Accuracy
- 100% of the Time • Windows Based • One Step Processing
- All New Hard/Software • Solid State Nonvolatile Data Storage
- Upgraded Digital Mapping

#### *Standard:*

- Work Order Creation • Quality Control • Proof • Quarterly Monitoring/Comparison • Archiving • Time Management • GPS Tracking

*To some people, accuracy and consistency are worth it...the original.*

hind GTE's thinking in its mainStreet data service for cable TV systems. The service is being rolled out to 550,000 homes in New England by Continental Cablevision.

Although the service has no tie in to the Internet, it does enable a cable operator to put about 75 interactive data services onto a single 6 MHz cable channel. Consumers pay \$9.95 per month to access encyclopedias, stock quotes and interactive games. Interactivity is accomplished either over a two-way cable plant or a telephone line. A GTE chip in the set-top box converts the data into virtual channels that mouse potatoes can surf. However, according to Tom Grieb, mainStreet general manager, the company expects to get out of the hardware side of the business soon. "We are an interactive cable channel. We are not a hardware or systems provider," he said.

But at the moment, GTE is willing to do whatever it takes to get the service out on cable systems today. Grieb said, "We built the business model that assumed we did everything. Then we negotiate with the cable company a deal that makes sense to us and them. One example is billing. It would cost

us \$1 per subscriber to do a separate bill, but cable operators could add another line to their bill for about 5 cents. As long as the overall business model makes sense, you can split the revenues based on who pays the costs."

Grieb said his strategy is to work with the top MSOs. He is planning on rolling out mainStreet to the top 20 TV markets in the next five years.

The most popular application on mainStreet in terms of time spent are the games. Some of them, such as QB1 (a play-along football game) can last for hours. But information and financial applications receive far more accesses for short durations of time as people look for information. Grieb said that other applications help to sell the service, even though they may not get accessed very often or for very long. For example, a kid may look at the encyclopedia for 15 minutes a month but it obviates the family's need to go out and buy one.

Grieb believes the chief competition is the way people do things today. He said, "We have to change people's behavior in much the same way the ATM did. I think it will be a decade before interactive channels have to take cus-

tomers away from each other in order to grow. The real challenge will come from trying to get people to pay their bills over this instead of writing checks and sending them out. Cost and convenience are on our side and it will happen.

### The broadcasters are coming

Broadcasters may be getting into the data communications game as well. A number of companies are working on schemes for inserting data onto TV signals and one of them claims to have developed a bidirectional system that operates over the vertical blanking interval (VBI). Wavephore Corp. based in Tempe, AZ, has been developing a technology that is capable of piggybacking a 384 kb/s signal on top of a single TV channel without interfering with it.

The encoder costs about \$15,000 for a single channel, or \$75,000 for a version that can put a data transmission onto multiple channels. The decoders currently cost about \$1,995. Bruce Cross, vice president of sales and marketing, claims it will be reduced to a \$200 card or a \$100 chip set suitable for fax machines and

# Fuzzy Picture – Not With This!!!

## “THE CORRECTOR” CLEARVIEW 1000

“The Corrector” is a video processor which uses state of the art techniques to restore the video definition and eliminate the smearing and blurring commonly found in positive trapping systems. When used as a substitute for the internal pre-emphasis circuit found in most positive trap encoders, a dramatic improvement in crispness and clarity will result. Compensates for chroma distortions caused by non-broadcast quality head end equipment. If you are fed up with complaints like “Why are my basic channels so much clearer than my pay channels?” and answers like “That is the way positive traps work”, try “The Corrector” and see what happens.

other OEM applications by the end of 1995. Cross said the unit will be portable but not mobile for some time because it will require a tuner and antenna.

Wavephore has been conducting a trial in Phoenix for some time on Chs. 3 and 45 and some ITFS channels. The first commercial application will be WFLA in Tampa, FL, which will use the broadcast signal to transport digital programming to cable head-ends as part of a retransmission agreement. The signal will be decoded by the cable company and converted into a virtual channel on the cable system.

BleuMont Telecom in Montreal has developed a data broadcasting service called Skyway that also uses a TV signal's VBI. Information providers can put information on the service that can only be accessed by those consumers with the proper electronic key. The service can piggyback up to 150 kb/s onto a single TV channel.

Consumers can buy the decoders for C\$350. Then they must pay the information provider to have access to the information. The decoder can be programmed remotely by the data broadcasting to receive or exclude any broadcast data.

Twenty information providers have already signed up to sell to information about provisional government updates, news, traffic information and weather reports. They pay a monthly administrative charge of C\$500 per month, plus 20 cents to C\$1 per kilobyte depending on volume delivered.

Another company, Radio Telecom and Technology based in Riverside, CA, is working on a technology that is supposedly capable of bidirectional communications using the VBI of a TV signal. Louis Martinez, president of RTT, says its technology can transmit 20 watt peak pulses in the VBI of a channel but that the average power is a few mW. He said this enables a single transceiver to send and receive data over a 30-mile radius or enough to cover most cities.

Martinez believes a single transceiver could handle 20,000 to 30,000 subscribers using an omnidirectional antenna and as many as 120,000 subs with a directional antenna. Martinez said subscribers will pay \$5 per month for the service. RTT also will receive money from advertisers and a pay-per-view scheme.

However, there are serious engi-

neering questions about the feasibility of this technology. Although the company has done some small-scale trials with GTE, it has not done a field test with thousands of units. The company refused to disclose much technical information other than to say that it is able to send return path data over the VBI. But even if they were able to do a successful demo with a few field units, how would it respond to thousands of transmitters all trying to stay in sync with the VBI? And what about reflections or the unit that gets out of sync with the TV signal?

## Conclusion

Data communications provide an opportunity for cable operators to get into new services with only an incremental investment, especially if they have already made their plant two-way capable. Schools, businesses and consumers are all discovering the Internet and other data services. Cable operators have the potential to make their bandwidth available for a variety of applications and possibly supply substantially more bandwidth at a reasonable price than any of the means available. **CT**

By Helen Chen, Development Engineer, Hewlett-Packard Microwave Instruments Division

## Testing digital video — Part 2

In Part 1 of this article (May 1995 "Communications Technology,") we saw that power and interference measurements are essential to both digital and analog cable systems. In addition to power and interference tests, digitally modulated cable transmissions create a need for new measures of signal quality. Emerging services, such as data transport and personal communications services (PCS), depend on the integrity of the bits transmitted. Digital modulation formats employ multiple strategies to preserve the clarity of the data, such as adaptive equalization and error correction. When these strategies fail, digital services abruptly descend from acceptable quality to complete failure. New digital modulation tests must permit service providers to spot performance trends and to prevent problems before they affect service delivery. We'll explore that in this part of the article.

**D**igital video modulation measurements are very different from those used in analog video. Analog signal characteristics such as FM deviation

and chroma/luma delay have proven over time to be practical tools for assessing the performance of the analog modulation system. Many digital modulation metrics could potentially be used in digital cable systems.

The key digital tests will be determined in practice as the setup and maintenance of digital cable systems increases. Several possible measurements are: bit error rate (BER), margin-to-critical BER, modulation error ratio (MER) and constellation/eye diagrams. Let's define each measurement and consider how to apply them to a digital cable TV plant. Using the right modulation tests at the right points in a digital cable system helps to ensure reliable service — a key competitive advantage.

### Probing layers of digital signal processing

Every digital cable format is designed to maximize the transportation of data through the linear and nonlinear distortions of the transmission channel. Figure 8 shows the layers of signal processing in a digital transmitter and receiver. The video

image is digitized and compressed to form a bit stream. Forward error correction coding and pre-equalization may be applied to protect the data from corruption because of impairments in the transmission channel. The bit stream then enters a digital modulator, such as a 16-VSB or 64-QAM modulator. The resulting baseband digitally modulated signal is up-converted to the desired RF carrier frequency. Each successive layer of processing transforms the signal, hiding the information of previous layers.

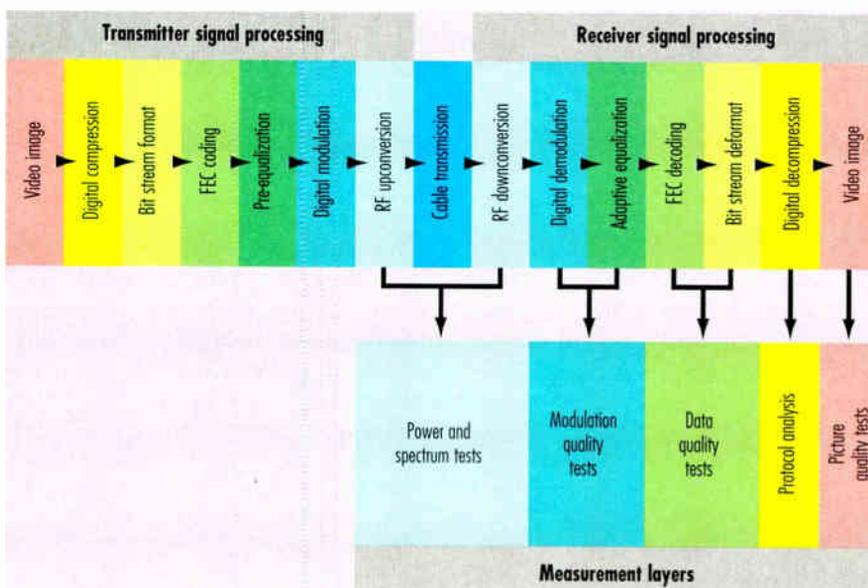

To recover the information hidden by the transmitter signal processing, the receiver must undo each level of concealment. The quality of the data bits retrieved by the receiver depends on how channel distortions have affected each layer of the transmission. To measure the transmission quality, a test instrument must recover the signal at the correct layer for testing. Each level of signal recovery holds a different view of the performance of the system. Figure 8 shows how each type of measurement corresponds to a signal recovery layer. As we have seen, power and interference tests are applied to digitally modulated RF transmissions. The next layers of measurement are modulation and data quality tests.

### Navigating test points

Choosing test points in the cable system requires considering what layers of signal processing are present in the signal and how much signal processing the test equipment must apply. Navigating the layers of signal processing in the digital cable plant is essential to any test plan. Figure 9 on page 82 is a block diagram of the components of a digital cable system highlighting possible test points in purple. Key layers of signal processing are shown in gray.

In the transmitter, bits are processed into digital transmission formats. Forward error correction (FEC) coding is often applied to the symbol

**Figure 8:** Layered signal processing in digital transmissions

# Can Your Architecture Stand the Test of Time?

Can your broadband architecture support video on demand, targeted ads and telephony — as well as help you compete effectively? Scientific-Atlanta's Fiber-to-the-Serving Area architectures not only accommodate today's expanded bandwidth needs, but offer the built-in flexibility and reliability for the interactive future.

And we provide much more than advanced architectures. It's a complete end-to-end solution. Fiber optic, distribution and headend systems to implement your new FSA architecture at a low life-cycle cost. With subscriber systems to bring it all home.

So make sure your broadband network will stand the test of time. Call Scientific-Atlanta today at 800-433-6222 or fax us at 404-903-3088.

**Figure 9:** Digital cable system test points

stream. FEC adds redundancy to the bit stream, making the correct data sequence recognizable even with one or more bit errors. The FEC is unique to each digital transport format. In the European 64-QAM digital video cable standard, a Reed-Solomon  $t = 8$

(204,188) error correction code is used. This 64-QAM code adds 16 Reed-Solomon parity bytes to 188 bytes of data, yielding 204 bytes of data to be transmitted. This code can correct up to eight byte errors. In the quadrature modulator, the coded data

is mapped to I/Q values (symbols) and filtered by a shaping filter to control the spectrum of the RF transmission. At a test point attached to the output of the headend modulator (A), the original bit stream is buried in the effects of the FEC, the digital shaping filter and the digital modulator.

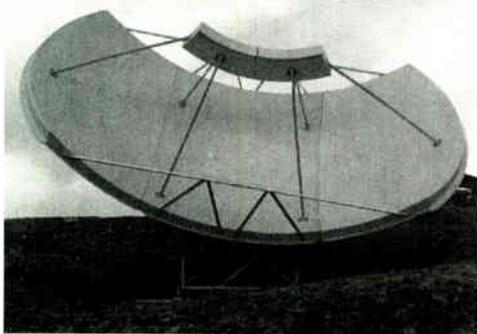

The transmission channel imposes linear and nonlinear distortion. Linear distortions include group delay and amplitude ripple. Nonlinear distortion can result from amplitude compression and spurious interference caused by ingress or intermodulation distortion products. Noise may be added. The impaired RF signal is probed at Test Point B in Figure 9.

In the receiver, the digitally modulated signal is downconverted and sampled. Digital transport systems often include an adaptive equalizer to remove the linear distortions of the transmission channel. An adaptive equalizer is a digital filter that continuously reprograms phase and amplitude characteristics to exactly compensate for the phase and amplitude distortions of the transmission channel. The 16-VSB digital cable format

# KINDA LIKE THE JAVELIN™ TRANSMITTER.

## Give your fiber optic signals a boost with the new Javelin Series Transmitters.

From ATx Telecom Systems come two powerful solutions for high performance analog video transmission. The revolutionary Javelin 1550 transmitter employs a 20.5 dBm optical amplifier and an externally modulated transmitter to let you send CATV signals of 80 AM-VSB plus digital channels over 80 km without a single repeater. And the new Javelin 1300 uses ATx's high power Whisper® laser technology for unmatched signal-to-noise ratios. Both transmitters give you the power and performance to economically consolidate headends, distribute signals or even link islands. All with the advantage of Windows®-based network management software. To launch a Javelin™ into your current system, call ATx today at (708)778-2900, or fax us at (708)369-4299. See how far we can jump.

uses a two-part adaptive equalizer: a feedforward transversal filter followed by a decision-feedback filter. Test Point D allows probing the received symbols after the adaptive equalizer. The equalized I/Q symbol vectors are demodulated to recover the coded symbol stream. FEC is decoded to recover the original data bits. Test Point F permits examination of the corrected bit stream. Test Point C and Test Point E represent information that can be made available from the adaptive equalizer and FEC chips.

Digital video metrics must be matched to the correct test point, optimizing the value of the measurement. First, we look at the overall quality checks provided by assessing the quality of the received data. Next, sensitive troubleshooting measurements of modulation quality will be examined.

#### Testing data quality: BER

BER is an overall measure of the quality of the received bit stream. BER is the ratio of the number of bit errors to the total number of

bits sent in a given time interval:

$$BER = N_e / N_t = N_e / b \times t$$

Where:

$N_e$  = number of bit errors in time interval  $t$

$N_t$  = total number of transmitted bits in time interval  $t$

$b$  = bit rate of signal

Measurements derived from BER provide a distant reflection of picture quality, separated from direct picture quality metrics by several layers of signal processing. Note that accurate measurement of BER requires long measurement times. For example, a BER of  $1 \times 10^{-8}$  in a digital video system with a bit rate of 30 Mbits/sec will experience a bit error every 3.3 seconds, on the average. Gathering enough bit errors to form a statistically accurate BER can take many minutes, or even hours, at low BERs.

Bit error rate is typically an end-to-end system measurement that includes the error correction processing of the FEC. Figure 10 (page 86) shows a block diagram of an intrusive BER test. A known bit stream is injected into the data to be transmitted. Standard pseudorandom bit sequences (PRBS), such as CCITT 2<sup>23</sup>-1, are often used. In the simplest version of BER test, the known bit stream passes through the transmitter FEC and the shaping filter. A bit error rate tester (BERT) measures the received bit stream after shaping filter compensation, adaptive equalization, digital demodulation and FEC decoding in the digital cable receiver in the set-top box. BERT input comes from Test Point F. Note that either the known bit stream must be transmitted on a separate channel or the BERT must know how to extract the known bit sequence from the program data stream. Since the known bit stream displaces cable TV program data, this is an intrusive test.

Measuring BER at intermediate test points (A and B) in the digital cable system requires more complexity in the test equipment. As shown in Figure 10 (page 86), a digital test receiver performs a high-quality down-conversion and demodulation of the digitally modulated signal to recover the symbol stream. The test receiver selectively applies the desired signal processing layers to reveal the bit stream. A BERT can then measure

**Figure 12: 64-QAM margin-to-critical BER test**

error statistics will not accurately reflect the true BER. Applying this method requires understanding the FEC limits.

BER reflects only modulation impairments severe enough to cause bit errors, remaining insensitive to subtle trends in the digital modulation. A good BER indicates proper service delivery. A bad BER highlights impaired service but does not identify the cause of the problem.

### Margin-to-critical BER

A single BER measurement is a performance measure of the digital cable system at its current opera-

tional level, giving no indication of how close the system may be to critical BER. At critical BER, the subscriber encounters severe impairments, such as freeze-frame of the received video. A margin-to-critical BER combines signal-to-noise (S/N) measurements with BER measurements to test the robustness of the digital cable system. Margin-to-critical BER, or margin test, is a stress test of the digital TV system.

Figure 11 (page 86) shows a block diagram for margin test. In addition to the test receiver and BERT required for BER measurement, a spectrum analyzer and calibrated noise

source are added. Margin measurement begins with obtaining the BER at the current operating point. The S/N is measured with the spectrum analyzer. Next, measured levels of white noise are then added using a calibrated noise source. The noise level is increased while the BER and corresponding S/N are measured. Noise obscures the bits recovered at the test receiver demodulator, degrading BER as noise is increased. When critical BER is reached, the S/N at critical BER is recorded. Margin-to-critical BER can then be calculated as:

$$\text{Margin-to-critical BER} = \text{S/N}_{\text{operational}} - \text{S/N}_{\text{critical}}$$

Critical BER must be separately defined for each digital cable format. Margin-to-critical BER indicates the amount of additional noise that can be tolerated by the digital cable system.

Figure 12 shows a margin test on a 64-QAM transmitter, performed at the output of the transmitter without adaptive equalization or FEC. The operating BER is  $1 \times 10^{-9}$ . 2.7 dB of noise could be added to reach a critical BER at  $1 \times 10^{-6}$ . Margin results must state which layers of signal processing are included. The adaptive equalization filter alters both the BER and the noise bandwidth. The FEC improves the measured BER, changing the margin test result.

Margin measurement offers an indication of the robustness of the digi-

Alcoa Fujikura deals in winners. Winners like our new rugged, cost effective field splicer, the FSM-15S. Small and lightweight, the FSM-15S is ergonomically designed for the unique demands of today's system requirements for fusion splicing. It offers the economies and ease of an automatic splicing system, and provides the more advanced features and functions that you've come to expect from Fujikura – the world's leader in fusion splicer technology.

Designed for accurate field splicing, the FSM-15S features:

- Splice loss estimation with storage functions
- X-Y viewing, 100X magnification
- Altitude compensation system
- A 3-inch LCD monitor with tilt adjustment and brightness control

- Several power options, including a standard video camera battery adapter
- Built-in tube heater capable of using 60mm or 40mm sleeves

The FSM-15S sweetens the hand of our other state-of-the-art splicers:

- The popular high precision single fiber FSM-20CSII
- The mass fusion splicer FSM-RSII12
- The polarization maintaining FSM-20PMII
- And the palm top FSM-05SVHII

tal cable system to noise and ingress. The margin test does not, however, give a calibrated picture of the quantity of spurious or compression impairments that might be tolerated. In addition, this test is cumbersome to perform, requiring multiple test instruments. Since several accurate BER measurements must be made, measurement time is long. The margin test is perhaps best suited to qualifying the performance of new digital cable installations.

### Constellation and eye diagrams

When using digital modulation to transport video, signal impairments do not affect the picture quality unless they cause uncorrectable bit errors. The error retrieval power of the adaptive equalizer and the FEC masks modulation distortion problems. BER tests will not expose digital modulation impairments. Direct measurement of the quality of the baseband digital modulation, however, permits the cable operator to assess the magnitude of the distortion being concealed by equalization and error correction. Understanding the source of the degradation of the digital modulation allows

**Figure 13:** 16-QAM eye diagram/constellation plot

the problem to be repaired before the BER is affected.

Eye diagrams and constellation plots are graphical views of baseband digital modulation. RF downconversion, digitizing, digital demodulation

and adaptive equalization are applied to the RF transmission to expose the baseband modulation layer for measurement. A constellation plot displays the modulation phase and amplitude points that correspond to bits

$$I = \text{Magnitude} \times \cos(\text{phase})$$

$$Q = \text{Magnitude} \times \sin(\text{phase})$$

The constellation plot shows the actual I/Q modulation values that were sent. An eye diagram shows how either the I or Q modulation component changes over time, superimposing segments of I or Q trajectory. Figure 13 (page 91) shows 16-QAM constellation plots and eye diagrams.

The constellation plots of the left side of the figure show the 16 target phase magnitude states of 16-QAM. The eye diagrams on the right side of the picture show the four amplitude levels of the Q component of the baseband modulation and the transitions between amplitude levels. In the upper section of the display, no impairments are seen in the diagrams. In the lower section of the display, a spur 35 dB below the average signal power level has been added at a frequency 1.5 MHz higher than the 16-QAM carrier. The spur disturbs the modulation phase, causing the transmitted states to form rings on the constellation diagram and closing the eye.

Figure 14 shows a test setup for

in a digital modulation format. For example, a bit stream passed into a 16-QAM modulator is first grouped into sets of four bits. Each set of four bits is a symbol, creating  $2^4 = 16$  pos-

sible symbols. Each symbol is mapped into a phase/magnitude, or I/Q plane position to be modulated onto an RF carrier. I/Q position is related to the modulation phase and magnitude by:

# FIBER OPTICS

## MOORE MAKES IT AS EASY AS 1-2-3!

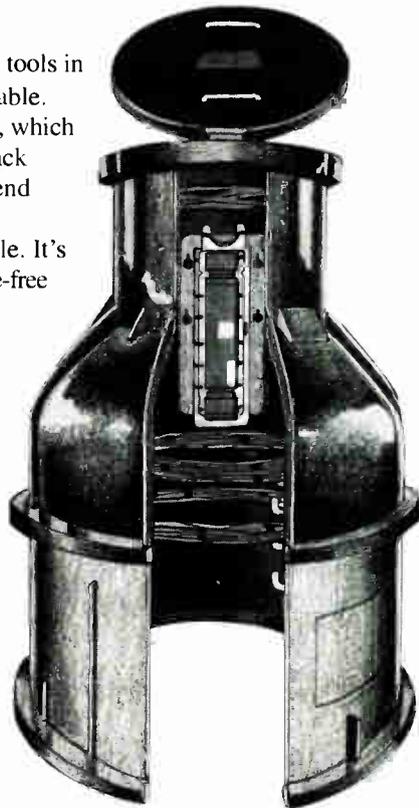

**1. INSTALLATION** Moore puts the proper tools in your hands right from the start for the installation of fiber optic cable.

For example the popular OptiRack, which provides for figure-8 looping of slack cable for aerial installation. The bend radius of this aluminum slack rack maintains the integrity of your cable. It's another way Moore ensures trouble-free performance right on down the line.

## 2. MANAGEMENT

At the heart of any cable network are its fiber nodes, and here again, Moore takes quality to heart. Our Fiber Node Cabinet combines easy access doors with a multi-point locking system for security. Rugged 12 gauge frame construction and a tough exterior polyester paint system stand up to any weather conditions. Universal Vertical Mounting Rods let you quickly install any brand amplifier or splice enclosure with strand mounting brackets. You can store up to 300 feet of cable for future deployment. Finally, a management concept you can rely on.

**3. STORAGE** Building a reliable fiber optic network requires equipment that is durable, safe and easily accessible. The Moore Surface Entry OptiVault offers a cost-efficient alternative to buried concrete chambers. Light enough to be installed by hand, yet durable enough to last for centuries, the OptiVault provides an excellent below grade, surface access chamber for storage of up to 800 feet of cable. Flexible design, in-field assembly, watertight fittings, and fiber storage racks make this unit an installers dream, and proof that Moore continues to build quality from the ground up.

# MOORE

*With innovative solutions like these, it's no wonder so many companies turn to Moore for all their fiber optic equipment needs. We offer a full line of durable, high performance products designed to make your job easier. If you count on quality, you can count on us.*

# Only One Sweep System Leads a Double Life!

Stealth Sweep...

Stealth Reverse Sweep...

## STEALTH REVERSE SWEEP

### PUT REVERSE SWEEP CAPABILITY INTO YOUR HAND

**The Stealth Reverse Sweep...** The latest sweep technology has been enhanced to meet your reverse sweep testing needs. Forward and reverse path alignment can now be done simultaneously – and by one person – with one instrument – the handheld Stealth.

Engineered for the interactive revolution, the Stealth 3SR handheld unit with the reverse sweep option both receives and transmits sweep for fast, precise, and accurate measurement of **both** the forward and reverse paths.

Eliminating awkward, complicated equipment setup results in simplified testing, reduced fatigue, and less time maintaining your system. You'll wonder how we squeezed in so much capability.

### Features include:

- Built-in sweep transmitter
- Simple, user interface
- Sweep any reverse band from 5 - 1,000 MHz
- Fast, continuous reference sweep
- Stealth Sweep ... a Wavetek exclusive, tests without interrupting viewer reception
- Signal analyzer for carrier levels, C/N, hum, tilt, and spectrum display
- Automated FCC 24-hour test capability

The Stealth Reverse Sweep provides all the accuracy, speed, and features you'd expect from the leader.

So, get the smallest, fastest, lowest priced, most capable sweep on the market. Get the Wavetek Stealth. **Call 1-800-622-5515.**

*Wavetek... partners in productivity for over 25 years.*

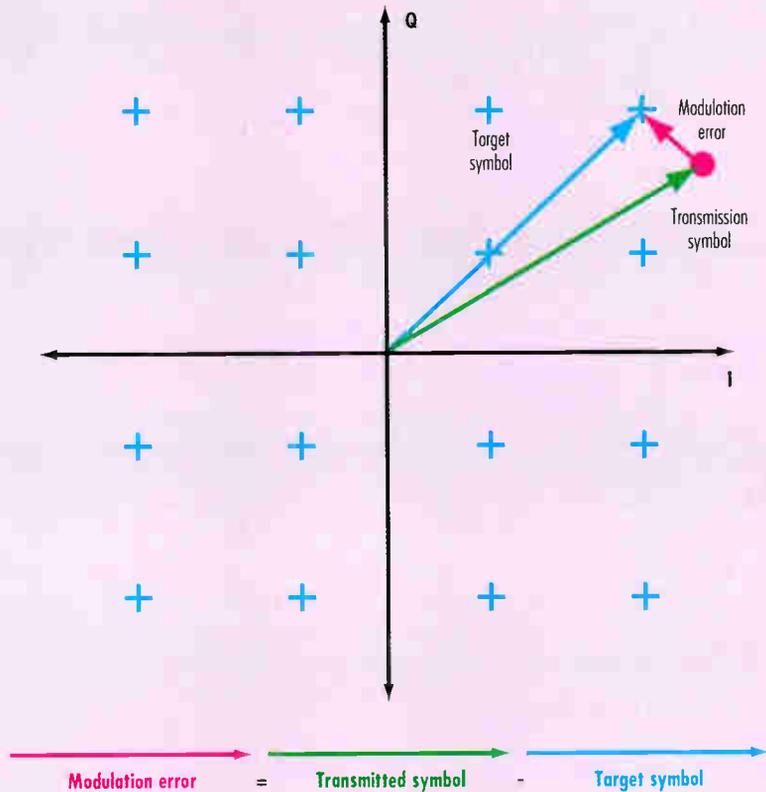

# WAVETEK

©Wavetek Corp., 1995

obtaining these diagrams. A test receiver with a digital modulation analyzer or a high-speed oscilloscope may be used. Eye diagram and constellation plots require signals with low distortion to produce defined graphical plots. Measurements done at the output of the headend (A) give a quick check on the quality of the digital video transmitter before cable channel distortions. If the test receiver can apply adaptive equalization, the linear distortion of the channel can be removed, permitting clearer views of baseband modulation impairments caused by noise, compression and spurs at the set-top receiver (B). Note that these graphical diagrams are limited by the display hardware resolution in the test equipment. A 64-QAM or 16-VSB eye diagram has many finely spaced levels requiring a very high-resolution display for quantitative measurements.

Eye diagram and constellation plots are most useful as fast, qualitative indications of modulation problems. Noise, group delay distortion, compression and spurious interference each have a characteristic effect

**Figure 15: QAM modulation error**

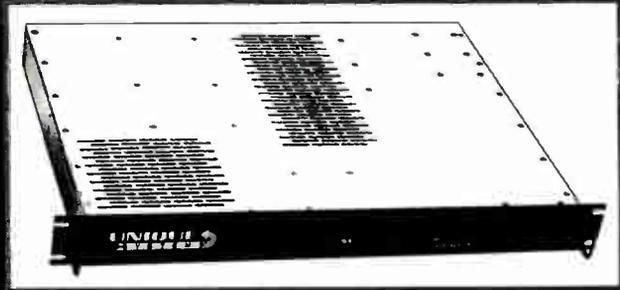

**Solid State M/W Transmitter UTX - xx family**

Upconverts VHF/UHF signals for point-to-point or multipoint transmissions. Use as a stand-alone or combine multiple units using a filter circulator hybrid. Upconvert AM, FM or digital signals from 2 to 18 GHz.

**Applications:** MMDS, Digital Radio, CATV AML

**Electrical Performance:**

Parameter	Specifications
VHF/UHF Input Frequency	50 MHz to 550 MHz
VHF Input Signal Level to Transmit Video Audio or FM	47dBmV 17 dB Below Video
Microwave Output Frequencies	12.7 to 13.25 GHz / 2.5 to 2.7 GHz
Microwave Power Output	+33(H) / 30(M) / 25(L) dBm
Two Tone Third Order Intercept Point	52 dBm (typ)
Frequency Response (broadband)	+/- 1 dB (50 MHz to 550 MHz)
Frequency Response (channelized)	+/- 0.4 dB VCF - 1.0 MHz to VCF +5 MHz
Frequency Stability	Better than +/- 0.0005%

**Features:**

- All Solid State
- Compact Chassis
- Low Power Consumption
- Broadband or Channelized

# PROTECT YOUR SOUND INVESTMENT

## PROTECT YOURSELF FROM CUSTOMER COMPLAINTS

**AUDIO LEVELS • STEREO SEPARATION • STEREO PHASE • SAP**

Your customer satisfaction is important, and more of your customers are installing high-end stereo TV and Home Theater Surround Sound Systems. That's why Learning Industries offers a full line of high quality BTSC stereo equipment:

• **TSD** - Television Stereo Decoder, for monitoring and maintaining BTSC stereo and SAP. When connected to speakers or headphones, you can listen and visually monitor audio levels and separation using the TSD's meters. Hooking a scope to the TSD gives a comprehensive view of your audio signal. Setting the baseband

deviation on the TV modulator can be done using the TSD.

• **MTS-2B** - Stereo generator with AGC, dual inputs and frequency response flat to 15 kHz. Represents the top of the line.

• **MTS-2C** - AGC, dual inputs and frequency response to 14 kHz.

• **MTS-4** - Dual inputs, 14 kHz frequency response, compact design, 3 units per 1 3/4" rack space.

• **SE-1** - 14 kHz response and 3 units per rack space, most economical stereo generator.

• **SAP-1/SAP-2** - Second Audio Program generator.

• **AGC432** - Automatic Gain Control protects from over/under modulation.

It takes the right equipment to offer quality audio. With our excellent performance and unmatched features, Learning is your Sound Investment. Call or write today for information on our full line of audio equipment.

interference. MER caused by amplitude errors indicates amplifier compression problems. MER is most useful when considering digital video system margin or S/N issues.

Figure 16 (page 96) shows a modulation error measurement on an 16-VSB signal. In this example, the modulation error is expressed as a linear amplitude ratio called error vector magnitude (EVM).

$$EVM = \sqrt{\frac{\text{Average modulation error}^2}{\text{Maximum symbol magnitude}^2}} \times 100\%$$

EVM is a measure of the modulation error magnitude normalized to the peak symbol magnitude, expressed as a percent number. For 16-VSB, the maximum symbol magnitude is at the points on the I axis furthest from the I/Q origin. In the lower right quadrant of the picture, EVM and its phase and magnitude components are shown with the recovered bit sequence. EVM gives a measure of the size of the clusters of symbols about the target symbol points on the constellation.

Figure 14 (page 92) shows a modulation error measurement setup. The digital test receiver downconverts

**"Using the right modulation tests at the right points in a digital cable system helps to ensure reliable service — a key competitive advantage."**

and demodulates the RF digital video transmissions at Test Point A and Test Point B. Adaptive equalization may or may not be applied, depending on whether or not the desired modulation error reflects linear distortions of the transmission channel. The baseband digital modulation is routed past the FEC to a digital modulation analyzer. The digital modulation analyzer reconstructs the perfect baseband modulation trajectory and calculates MER and EVM. Unlike BER, MER or EVM can be measured over several hundred symbols, making measurement time very short. These metrics are fast and sensitive measurements of digital modulation impairments. Note that modulation error measurements reach a sensitivity limit when bit errors in the recovered bit stream cause the perfect baseband modulation reconstruction to use the wrong bit sequence.

Note that the adaptive equalizer also contains information about linear channel distortions, analogous to the magnitude and phase components of the MER. Since the adaptive equalizer compensates for channel amplitude ripple and group delay distortion, the shape of the adaptive equalizer filter reflects linear impairments of the digital modulation. Modulation error information can be drawn from the adaptive equalizer chip, if the access pathways are present. The digital modulation analyzer probes Test Point C or the adaptive equalizer in the test receiver.

Different adaptive equalizers have different compensation abilities. Cor-

rect interpretation of adaptive equalizer results requires understanding the limits of the exact equalizer used in the cable system or in the test receiver.

## Conclusions

We have explored four types of digital video measurements used to assess modulation and data quality. Setup and maintenance of digital cable services requires choosing a balanced set of metrics to provide both overall system checks and useful troubleshooting tools. Both intrusive and nonintrusive tests may be desired. Designing a test strategy for digital cable systems includes identifying key test points in the plant to apply the right tests to the right digital video signals.

Cable operators can look for new capabilities to be added to test equipment to probe the layers of a digital transmission. The exploding possibilities in the emerging digital cable services may place many different digitally modulated signals on the cable. Measuring the modulation and data quality of each one will require more capabilities in the equipment. Obtaining low-cost, flexible tools for digital video testing is a key challenge in implementing digital video services.

Digital transmissions on cable systems require new measures of signal quality. Understanding the advantages and limitations of the possible measurements is critical to tailoring a test strategy to a real digital cable system. As digital services are implemented, the key digital video tests and tools will be determined in practice. **CT**

# Increase your system capacity with AELINK laser transmission products

The AELINK line of laser transmission products gives you maximum operating capacity by offering the highest signal power

with the greatest subscriber reach available.

Broad bandwidth and high power allow AELINK products to provide superior performance with the lowest cost per subscriber. High-performance reliable system features include full channel and digital capability, 50+ km transmission, full duplex remotes, and wavelength selection – all of which multiply the capacity and enhance the revenue for both installed and new networks.

All AELINK products feature advanced external modulation plus proprietary signal conditioning and temperature

compensation for optimum transmission quality... even at maximum distance. Best of all, bandwidth for future service upgrades is already built in – making AELINK products “future-proof.” So call AEL today and find out how your system can work harder for you – now and tomorrow.

# Reflecting on service drops

**M**any of you have probably heard or read a lot recently about quality issues surrounding cable drops. The reason in part is the future services our industry will be carrying and providing to customers. Entertainment will eventually become just one of the many service offerings our systems will carry for customers.

As you may know, our future transformation may include telephony service to the residence, interactive services, computer online services, meter reading of utilities, and video-on-demand (VOD) or near-VOD (NVOD). Any or all of these services may be offered by your system.

These types of services bring very complex and state-of-the-art digital technologies such as MPEG, pulse code modulation, quadrature amplitude modulation (QAM), quadrature phase shift keying (QPSK), and a host of others. Most of the services I outline will indeed utilize or require some form of digital signaling.

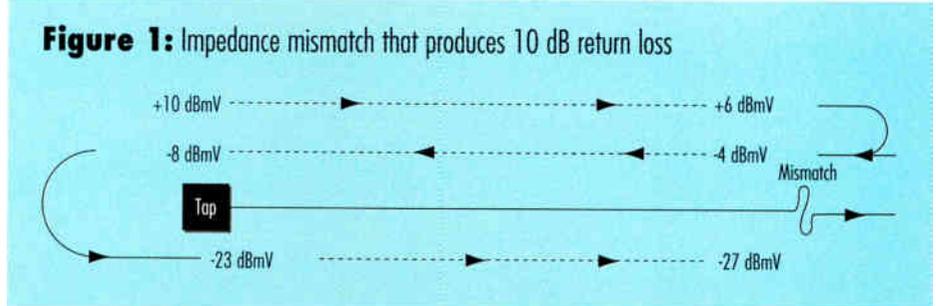

## The importance of installer/techs

I would bet about now you are probably thinking, "Well, I am an installer (or technician) and I have very little to do with all that is changing in our industry." If I am right regarding what the future holds for us, then you are dead wrong! It is our installer/technicians that play the important role in our goal to deliver new technology and provide quality service to our customers.

Your job is as important as the engineer who builds the technology. And in all truth, if an engineer designs a product that is capable of being transported through a fiber/coaxial transportation system, but it does not work because of craftsmanship problems through the cable plant, whose work is most important? One job is as equally important as the other in making the technology work.

## Is the drop ready?

There are many concerns today as

to whether or not the majority of service drops will be ready to carry the additional capacities and digital formats. This is a valid concern mainly because of the importance of low return losses and microreflections as related to digital delivery.

What is all this talk about return loss and microreflections? We must understand some basic electrical principles to comprehend in very simple terms their impact in digital delivery.

Our signals are introduced to a characteristic impedance of 75 ohms. For our broadband signals to have a maximum transfer of energy through a cable circuit, we must maintain the 75 ohm impedance. In essence, we must keep a very consistent electrical match from the start of the coaxial cable at the headend or fiber node all the way into the customer's home.

The impedance of cable is dependent on its physical dimensions. If a section of cable has a kink or structural change in the spacing between the center conductor and the outside shield, the capacitance of the cable at that point will change, also changing the characteristic impedance.

When this occurs, a portion of the signal is reflected back against its forward path toward its origin. This reflected signal power is measured against the original signal power in decibels (dBs) from the transmitting end. The difference in the two powers is a ratio known as return loss. A low return loss number means a stronger reflected signal. The higher this number in dB the better.

If there is more than one point of mismatch, a portion of the reflected

signal is again reflected in the forward direction where it bounces back and forth. Some of the energy that was reflected back again in the forward direction will continue to travel with the desired signal. If the mismatch is significant enough, this will have an effect on the delivered signal to the consumer interface. See Figure 1. In this figure we have a tap output level of +10 dBmV with 4 dB cable attenuation to a point of mismatch that produces a return loss of 10 dB. The signal is then reflected back to the tap output 10 dB below that at which it arrived. It then travels over the 4 dB loss back to the tap. The tap return loss is 15 dB.

The signal is then again reflected in the forward direction -15 dB lower than when it arrived at the tap. The signal travels through the cable over -4 dB of coax attenuation and becomes a delayed signal in the forward direction down -27 dBmV from the primary forward signal. This results in a 33 dB difference between signals and would produce objectionable trailing edges on video. Also, it would likely create extremely high bit error rates (BERs) in a digital signal.

In a periodicity scenario this example would be duplicated many times by each point of mismatch.

Because the reflected signals are bounced back and forth between two points of mismatch, they become delayed in time and are reduced in amplitude as compared to the desired signal. The result is one you are probably familiar with: It appears as a trailing edge on analog video picture.

The effect of a reflected signal on a digital signal can be potentially dev-

# A WHOLE NEW BREED C

# FIBER OPTIC CLOSURE.™

## ONE SIMPLE AND AFFORDABLE CLOSURE FOR AERIAL, UNDERGROUND, BURIED, VAULT, BUILDING ENTRANCE OR SPLICE BOX APPLICATIONS.

We started with a clean slate, then designed a closure unlike any other. One that goes wherever fiber optic cable takes you. The COYOTE™ Closure.

It's craft friendly. Saves installation time. Competitively priced. Built to ensure the reliability and quality of the signal – voice, video and data.

Use it for butt, branch, in-line, single or mass fusion and mechanical splicing. For sealed or free-breathing installations. For clean, simple, kit-free re-entry.

All components come in one carton. Packaged to order to meet your specification. And to expedite ordering and simplify stocking, you're assigned one closure order number for each of your applications, from aerial to splice box.

For information on the new and versatile COYOTE Closure, contact Preformed Line Products. Since 1947, the company known worldwide for reliability.

- ① Fiber management system includes splice trays for mass or single fusion and mechanical splicing.
- ② Three-section end plate has six cable entry ports, captive nuts and bolts, strength member tie off and isolated grounds.
- ③ Durable glass-filled high-density thermoplastic shells. Two diameters, 6.0", 8.5". Built-in shell stabilizers and air valve.
- ④ Field-proven, permanent neoprene gasket sealing system. No re-entry kits needed. No flame required to break the seal or to install.
- ⑤ LOCK-TAPE™ Sealing System ensures a tightly, permanently sealed end plate assembly and maximum shear strength to resist pull out.

astating. High BERs can occur as a result. A BER is the percentage of received bits in error as compared to the total number of bits received. This is usually expressed in powers of 10. When a digital signal becomes polluted with a reflected signal it can confuse the receiving device. A 1 bit that was sent by the transmitting end may now look like a 0 bit to the receiver or it may be indistinguishable.

If BERs are high enough and overrun a digital receiver's correction ability, the receiver throws up its hands and says, "I give up!" For those of you who have systems offering digital audio, you have probably experienced this.

If you feel digital music was a challenge, you have not seen anything! The amount of data we need to push through our pipes to do MPEG-2 digital video is a Goliath compared to the little bit of data transmitted for digital audio.

### Improving the drop

How can we make a difference today to deliver tomorrow's technology? Believe it or not, there are many

**Figure 2:** Outside force pushing against coax

areas we can improve upon in our installation practices or procedures. Let's take a look at a focus area that needs our attention: The drop.

Anytime moisture can enter a cable it will. Underground drop splices almost always fail electrically and reduce return loss in a drop cable. If it does not immediately, it is generally just a matter of time. When water migration occurs, we are set up for a change in impedance and that equals a reflected signal energy with potential significance in our drop system.

If at all possible, the best solution to prevent a future service call for a

grainy picture or digital service problem is to replace a damaged drop so it is seamless with no underground splices. Burying a drop at least 8 inches without any splices is today's best medicine for reducing future service calls and ensuring a full service drop.

Using staples to attach cabling to the residence or fasteners that push up real tight to the coax is old thinking and a bad idea. The reason is that staples typically squeeze the cable downward as do some other types of fasteners. As a result, it can be one of the worst things we can do electrically to the service line. Remembering that characteristic impedance is based on inner and outer conductor size and distance, this particular practice clearly indicates that changes in impedance are occurring in regularly spaced intervals since fasteners are generally attached at regularly spaced intervals in any clean installation.

See Figure 2. As outside forces push against the coax, the outside walls become elongated. As a result, the distance from the center conductor to the top and bottom outer shield

becomes shorter as the distance from side to side becomes longer. The result is a change in characteristic impedance.

The distance between discontinuities will end up as a half wavelength for some given frequency. And for this given frequency and all integral multiples of this frequency, the standing waves caused by reflected power are in phase and add to one another. As a result, most of the power at the primary signal and multiples of the primary is reflected and any signals at these frequencies become greatly attenuated. Now is a good time to re-evaluate your choice of fasteners and determine whether they are actually holding the coax too tight and causing periodic changes in structural circular size of the outer conductor.

There are a couple of other key points to consider when performing a technically correct install or rewire. Be careful not to overbend the cable into too tight a radius when forming a drip loop at the entry of the house. A 5-inch circular loop is a good general guideline that will ensure maintaining the designed diameters and electrical integrity of the coax.

Often, I have seen a few feet of coax stuffed and kinked into an outlet box inside the customer's home. This should be avoided. If you come across this in the course of your job, it is recommended that you cut back the compromised parts of the cable to the point of clean undamaged cable. If possible, trim the cable to a length that allows the coax to be properly stored within the confined space, leaving just enough space to be able to remove the wall plate and to cut a second fitting in the future.

Pay careful attention when reinstalling the wall plate so that extreme bending does not occur. The length of cable to be stored depends on how much coax can be stored properly within a limited amount of space.

If the F-connector is installed properly the first time at this location, the stored amount of cable is of infinitesimal use because this location is in a dry and protected environment. If your system requires additional storage, consider another loop at the exterior drip loop that can be taken out if needed. Wall plate boxes and walls were never de-

## Searching for success in CATV? Discover Power & Tel

Power & Tel has successfully navigated in the CATV industry for more than 20 years by assembling an experienced crew, recruiting the prime suppliers, and building a distribution network from 15 key cities.

signed to properly store lengths of coax.

### Summary

Perhaps you use one or more of the less than ideal electrical techniques I have mentioned. Keep in mind that we will not be delivering just video services anymore. Digital signals are believed to be much more susceptible to impedance mismatches and microreflections than analog signals. By making these simple changes toward quality in our installation practices today, we will be very successful in

delivering these new formats against our competition of tomorrow. Your system needs your help in adopting total quality practices.

There are some superb publications that cover characteristic impedance and return loss in more detail. While it is not possible to cover them all in this article, a few are worth noting. The most notable of these are *Broadband Basics* by Philips Broadband Corp., and the *SCTE Technology for Technicians II Training Handbook*, Third Printing, by Ralph Haimowitz. **CT**

By Norrie Bush, Plant Operations Manager, Columbia Cable

# The "perfect" install — or how to help your competition

**O**h man, they sure do try and get us out of there early every morning. Here it is 9:15 already and I've hardly had more than four cups of coffee.

Let's see here, what am I doing first today? Looks like Mrs. Neusbaum wants a little excitement in her life. New install, three outlets with boxes, HBO, Cinemax and Showtime. Oops, it looks like I spilt some coffee on this work order.

"586 to base."

"Go ahead Bob. Watcha need?"

"That printer messed up the address on my first job. Could you look it up for me?"

"Sure can. That would be 405 W. Elm St. According to the schedule, you

were supposed to be there before 9 a.m. Do you want me to call them and let them know you're going a little late?"

"Nah, I'm just around the corner from there, but thanks anyway."

Criminy! This job's over on the west side. I better get this rig turned around and head the other way.

"Hey! What are you all upset about?"

You'd think a guy couldn't turn around. Besides, he was obviously going too fast!

Man, I gotta go. I'd better stop up here for a minute and I can get a free refill at the same time.

OK, let's see now ... Birch, Cedar, Dogwood and of course, Elm. I wonder if they've had any nightmares over here? Ha ha. Dis must be da place!

Wow, this is a nice joint, but it sure is a long walk from the road.

"Base to 586."

Leave me alone, don't you know I'm working? You can't get anything done with those guys always bugging you.

Knock, knock, knock.

"Hi there, did you order cable?"

"Yes I did, but you were supposed to be here an hour ago! I just got done talking with your office to find out where you were."

"I'm sorry about that. I did two other jobs this morning and the last one ran longer than I had thought. Can you show me where you want the hookups?"

"Let me get my husband and please wipe your feet before walking on the carpets." →

## Put an End to Hum Modulation!

### Clamp-On Ground Resistance Testers

If you're looking for the easiest way to identify grounding problems causing Hum Modulation in your customers' homes, you're looking for the Clamp-On Ground Tester Model 3710. The Model 3710 provides you with direct reading of sheath currents and ground resistance so you can pinpoint your problem and put an end to Hum Modulation...simply, accurately, directly.

# Ham radio operators in the cable TV industry — Part 1

The following is the first part (A-M) of a list (in alphabetical order) of amateur radio operators employed in the cable TV industry. It was compiled by Steve Johnson, N0AYE. Please send any additions or corrections to his attention at Time Warner Cable, 160 Inverness Dr., W., P.O. Box 6659, Englewood, CO 80155-6659; fax (303) 799-5651; e-mail: [steve.johnson@twcable.com](mailto:steve.johnson@twcable.com)

I hereby apply for membership in the Society of Cable Television Engineers, Inc. and agree to abide by its bylaws. Additional member material will be mailed to me within 45 days. Payment in U.S. funds is enclosed. I understand dues are billed annually.

SCTE is a 501 (c) (6) nonprofit professional membership organization. Your dues may be tax deductible. Consult your local IRS office or your tax advisor.

Application without payment will be returned. Applications from outside U.S. enclose additional \$20 (U.S.) to cover mailing expenses.

# Here's something to remember next time you order cable.

Contrary to popular belief, cable isn't just cable. Like any other product, different brands can vary widely in quality and features. Take **new ABM2 Loose Tube Fiber Optic Cable** from Alcatel. ABM2 makes mid-span access easier than ever before, thanks to a new kink-resistant buffer tube material that's so flexible, it actually eliminates the need for closure routing tubes. It also makes for easier coiling and fiber access, even at low temperatures, and in the smallest of closures (check out the bend radius above). Other exclusive ABM2 features include both clearly marked ROL access points on the cable jacket. And Alcatel's patented long-life AFC3 coating on the fiber. So remember, all fiber cable is not created equal. For the Alcatel advantage, call **1-800-729-3737**.

GOULD FIBER OPTICS

# PACKAGING BREAKTHROUGH!

*GlasSolder™ Technique is Strong,  
Moisture Resistant and Provides  
Greater Long Term Reliability.*

Gould's innovative GlasSolder™ process makes a glass-to-glass bond between the optical fibers and a silica substrate. This bond demonstrates greater reliability and stability in a variety of harsh environments. Couplers tested to the Bellcore TR-NWT-001209 standard exhibit improved performance over an epoxy package in every test category. For more information on the GlasSolder™ Package call a Gould sales engineer at (800) 54-GOULD (4-6853).

# Hard case, easy equipment.

Our lightweight, rugged Fiber Optic Service Kits come with everything you need for your next field trip.

Choose from a variety of economical kits for all your CATV, LAN or Telco service needs. All offer NIST traceability with easy, hand-held power meters and dual wavelength laser sources. Some include fiber identifier, too. Operates on battery or AC power.

Call toll-free or write today for complete specifications

**laser precision**

We're easy to work with.

109 N. Genesee St., Utica, NY 13502  
315/797-4449 or  
**1-800/443-6154**

# Take it easy.

Our Optical Return Loss Test Set is the handy way to make fiber optic cable acceptance and bi-directional testing easy.

Setup and operation are easy with our lightweight, rugged LP-5025/S50 Test Set. You'll get exceptional accuracy and linearity, NIST traceability and up to 80dB of dynamic range. It's also dust and water resistant, and features a backlit LCD display.

Call toll-free or write today for complete specifications.

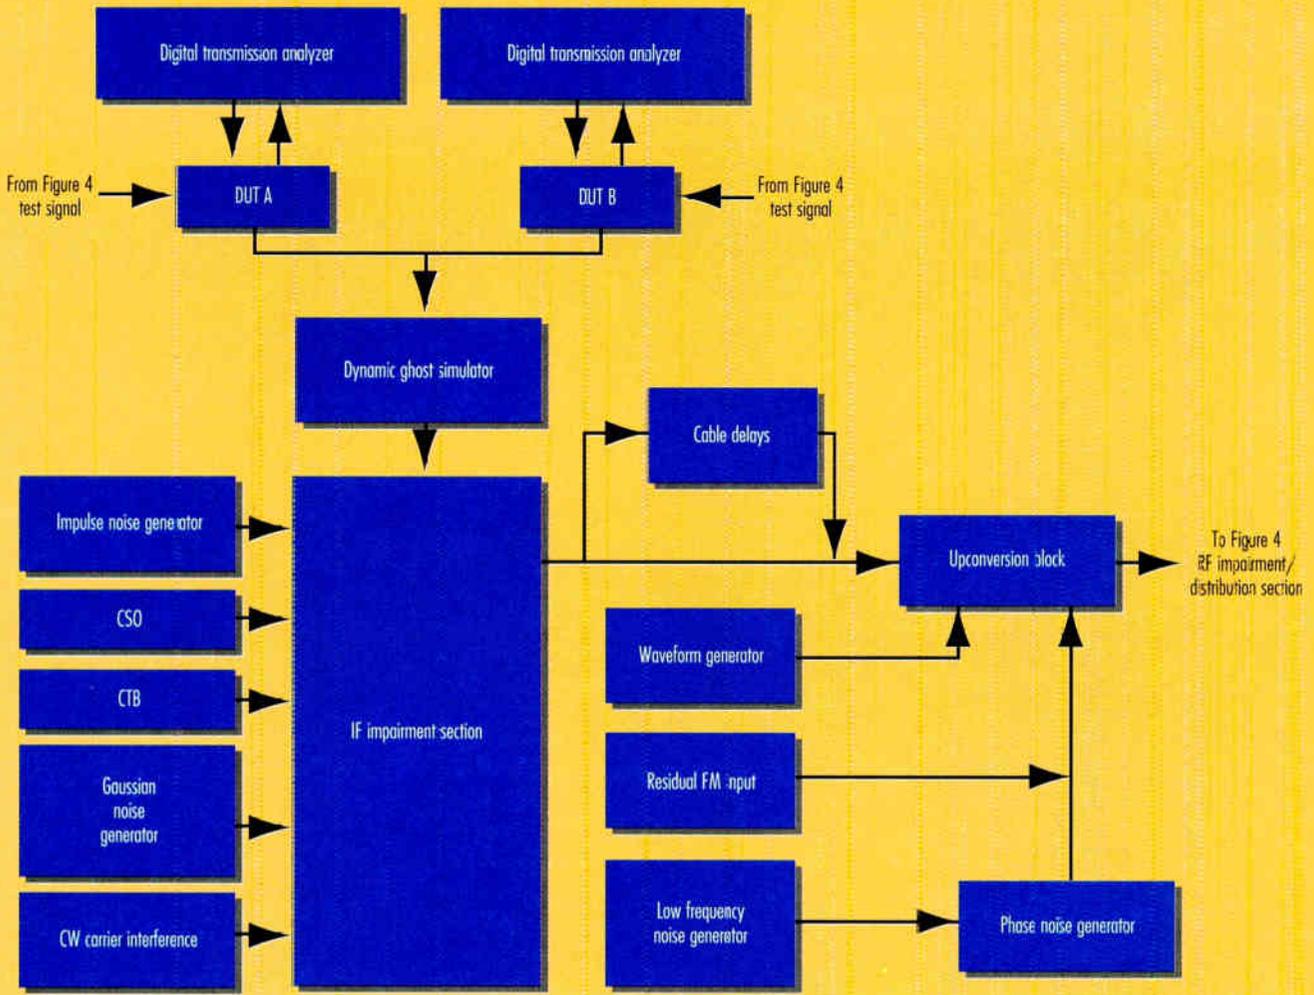

**laser precision**

109 N. Genesee St., Utica, NY 13502 315/797-4449 or 1-800/443-6154

**Figure 2: IF impairments/upconversion**

### IF impairment/upconversion

Figure 2 contains detail of the IF impairment/upconversion section of the CTS. Three standard IF frequencies have been designed into the system: 44, 70 and 140 MHz, with an expansion slot for one more IF frequency. The IF frequency is chosen by a front panel selector switch that determines the correct filter to be used. Many of the impairments are inserted at the IF frequency and upconverted along with the test signal. Selection of impairments are independently controlled with programmable attenuators and RF switches. This allows testing with multiple impairments simultaneously while providing a high degree of accuracy and isolation when the impairments are not used. The following impairments are inserted at IF.

### Random noise

The test system is capable of introducing random thermal noise into the passband of the signal under test. Precise carrier-to-noise (C/N) measure-

ments may be measured. Random noise is inserted into the system at IF, as shown in Figure 2. The amplitude output and noise is controlled by attenuators capable of a range from 0 to 127 dB in 0.1 dB steps. The system used is a Noise COM 7109 noise generator.

### CW interference

The CTS is capable of inserting an interfering CW carrier either into or adjacent to the test signal. The susceptibility to interference from a single undesired carrier in or near the passband of the test signal then can be measured. The interfering carrier is produced by an HP8658B signal generator. This gives the test system the flexibility to place an interfering carrier at an arbitrary frequency and any chosen carrier-to-interference level.

### CSO and CTB

The limiting nonlinear distortions in cable systems are CSO and CTB products. The test system is capable of cre-

ating these distortions in a controlled manner. The distortions are generated using an amplifier cascade driven by either a Matrix signal generator or the CableLabs headend and then downconverted to the selected IF frequency. Figure 3 (page 122) shows how these distortions are generated.

### Microreflections and delay lines

The CTS has two paths capable of creating delay distortions. The first path is an HP11749D dynamic ghost simulator. This computer-controlled instrument allows the user to combine up to six delayed versions of the various delay times and input signal amplitudes. However, this system is limited to a 6 MHz bandwidth for testing. To accommodate systems having wider bandwidths, the CTS has eight fixed delay lines built into the range of 20 to 2,000 ns. Each delay line is balanced for the IF frequency.

### Upconversion block

The impaired IF signal is uncon-

**Figure 3:** CSO and CTB generation

verted to a selected channel using a Gigatronics 6082A signal generator as a local oscillator with a mixer. The signal generator has very low phase noise with amplitude, frequency and phase modulation capabilities. This permits additional impairments of hum and low-frequency noise, phase noise and residual FM to be added to the system being tested.

**RF impairment/distribution**

The RF impairment/distribution section of the CTS (see Figure 1 on page 118) is shown in detail in Figure 4. The upconverted signal is taken from the IF impairment section, RF impairments are added and then it is sent through a distribution system. Before the signal is

combined with RF impairments, it is passed through an image rejection filter. After filtering, the signal is sent through a combiner where RF impairments are added.

The CTS is capable of generating the following RF impairments: high-level sweep signal and a co-channel interference signal capable of producing a frequency agile signal at 0, ±10 kHz offset frequencies.

The option to add a Matrix generator signal or CableLabs headend signal also is available through the combiner. Four expansion ports are available for future impairments. Similar to the IF impairment section, each impairment is controlled independently. The signal passes from the combiner to the distribution

section, which has the ability to simulate different cable system configurations.

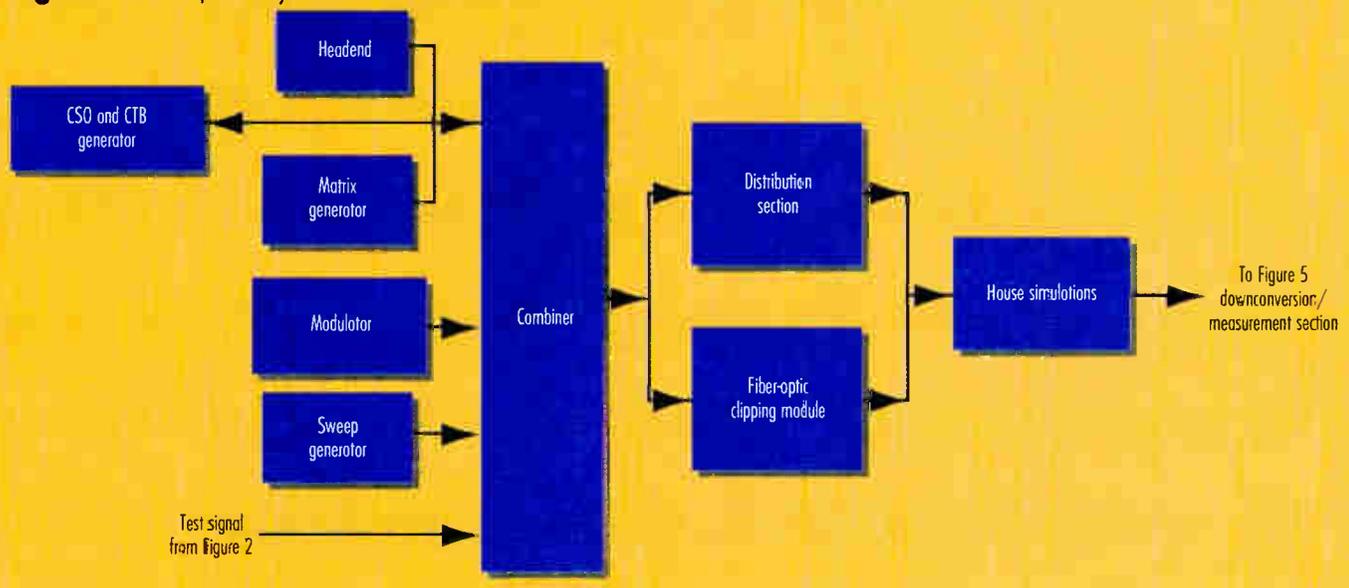

**Fiber-optic clipping**

Built into the test system is a fiber-optic clipping test. Clipping is a nonlinear distortion in a fiber-optic system that limits the total number of carriers that can be transmitted. This clipping is a fundamental source of distortion in a multiple-carrier system. The fiber-optic link is capable of being overdriven by an RF signal so that the effects of the laser diode clipping on the test signal can be determined.

**Distribution**

CableLabs has developed an exten-

# PROOF POSITIVE... TWO HEADS ARE BETTER THAN ONE!

## ***NEW FROM TEXSCAN***

The "Gatekeeper" — a truly scalable, broadband optical telecommunications node. All of the "bells and whistles" you'll need, when you need them, without the cost today!  
The "Gatekeeper" has all of the modular agility you'll need to keep pace on the "Information Superhighway."

### **"Gatekeeper" features include:**

- OPEN architecture for all CATV, TELEPHONY, and DIGITAL transmission requirements
- COMPLETE scalability to assure capital expenditures are matched to REAL revenue opportunities!  
No need to waste precious capital!
- Bandwidths of 550, 750, and 860 MHz in a 1,000 MHz platform.
- MULTIPLE failure-tolerant redundancy features with "on-board" switching logic!
- Individual RF busses may have their own optical receivers and transmitters — with FULL redundancy if desired!
- 2 and 4 output models with several mounting options.
- BOTTOM entry of all RF and optical cables for cabinet applications! NO MORE 90's and 180's to deal with.
- UNIQUE return Path Conditioning Module allows complete control of each individual RF buss and Bandwidth management of return paths. Optional plug-in return path switches.
- "Open Architecture" Network Management using "Vital Link" allows compatibility with most network protocols such as SNMP. Options for network controlled switching and ingress troubleshooting of return paths.
- Options for single fiber broadband (50 to 860 MHz) and dual fiber split band (50-550/550-860 MHz) architectures.
- Proven thermal management assures long life and higher MTBF.
- Dual-Dual redundant 40 to 90V, 1 to 60 Hz DC supplies
- Many, many more options . . .

If you want to keep up the pace on the information superhighway, the "GATEKEEPER" will give you the performance of a fine sports car, with all the features of a grand sedan for smooth (and sensible) acceleration into the fast lane!

Let us bring you up to speed! Contact your local Texscan representative for more information on this exciting new product . . . from Texscan, of course!

To learn more about the GATEKEEPER, stop by booth #265 at Cable Tec Expo '95.

## Fiber-optic fusion splicer

The new compact Fusion 2000 from Aurora Instruments Inc. is the first automatic fiber-optic fusion splicer featuring the company's advanced power alignment technology (PAT). The unit automatically aligns, gaps and fuses fibers with lower average losses and more accurate estimates than any existing splicer, according to the company, on single-mode or multimode fibers with any standard color buffer coatings, typically in 35 seconds.

Using a high-power light source, the technology guarantees core-to-core three-axis alignment and highly accurate estimates of splice loss. PAT combines the low loss and accurate loss estimation of a local injection and detection splicer with a profile alignment system splicer's ability to splice all standard colors of coatings.

Providing optimum light transmission, the unit has an average splice

loss of less than 0.02 dB on single-mode fiber, a position resolution of 0.05  $\mu\text{m}$ , and it estimates extrinsic splice loss within  $\pm 0.02$  dB 90% of the time. The company says the unit is the smallest (9 x 6 x 10.5 inches) and lightest (16 pounds) fully auto-

matic fusion splicer available.

The microprocessor-controlled, fully programmable system can be used on fibers with glass cladding ODs from 75 to 200  $\mu\text{m}$ . It makes automatic splices after the user places the fibers in the fusing mechanism and enters the splicing requirements. An LCD provides easy menus for splicing options, fiber profiles and control. The display also automatically shows splice loss in dB after the fiber has been fused.

The user can view fibers on a 45x magnification screen with calibrated 25  $\mu\text{m}$  markers and fiber alignment pointers. As new fibers are introduced, the unit easily accommodates the changes. It stores 20 fiber splicing profiles (prefuse, fuse, fiber gapping and fiber annealing) and holds the results of 100 splices for later downloading through the system's RS-232 port.

The unit also features a unique pigtail port system and PAT units that adjust for all commercially available buffer diameters. The splicing

## UNIQUE SYSTEMS™

### High Performance Dual-Band Dual-Pole Feedhorn

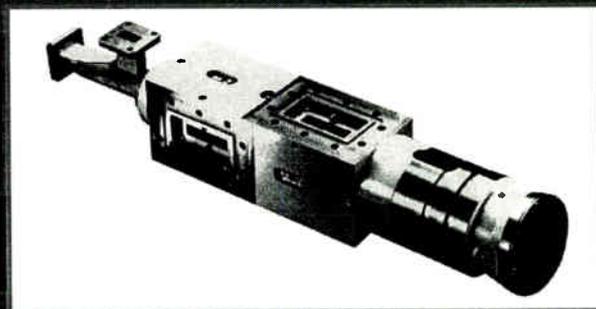

Unique Systems' feedhorns are designed as the cost-effective solution for multi-band dual-pole signal reception. Complements our integrated family of earth station products. Single band configurations available as well.

#### Applications:

Drop-in replacement for Andrews' Multibeam/Prime Focus Systems. Also available for other manufacturers' dishes.

#### Electrical Performance:

Parameter	C Band	Ku Band
Frequency Range	3.7 to 4.2 GHz	11.7 to 12.2 GHz
Port Return Loss	19 dB (min.)	20 dB (min.)
Port Isolation	40 dB (min.)	40 dB (min.)
Port Flange Size	WR-229	WR-75

#### Features:

- Provides superior isolation on both C & Ku band ports
- Permits use of less expensive LNB with no performance degradation
- Full range of brackets and ground planes available
- Simple installation

system includes data memory, RS-232 interface, built-in splice sleeve heater with auto heat and cool cycles, numerous data and diagnostic read-outs, and other features.

The system is furnished in a small, formed aluminum, shock-resistant, dust and watertight case with foam interior for the splicer, cleaver, portable battery, printer, accessories and work light.

Optional accessories include an adjustable splice tray holder, high-precision cleaver, portable thermal data printer that can print out a permanent record of splice history, and a built-in tension tester available in automatic low-level or manual infinitely variable options. The tension test confirms both mechanical and optical integrity before fibers are removed from splicer PAT units.

The unit also can be used for manual splicing, using positioner keys and a built-in throughput power meter system.

**Reader service #312**

## Cable reel

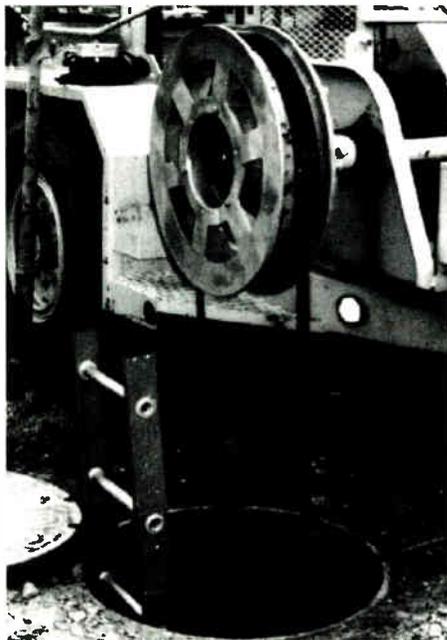

We Cousins Co. announced Reel Simple, a two-in-one product that ends hazardous carrying of heavy cable reels, making them easily portable while serving as a dispersing caddy.

The unit snaps into the center holes of a cable reel, which then can be pushed or pulled with minimal effort, avoiding the danger of back injury caused by lifting or carrying the reel. The unit is durable enough to roll easily over bumps, curbs, stairs and uneven surfaces. It serves as a dispensing caddy by simply flipping it

and positioning it on its handle and auxiliary feet. This two-in-one feature saves valuable time otherwise spent carrying the reel and stand.

Cable reels from 12 to 15 inches wide and up to 26 inches high can be moved with little effort using the device. It is fabricated as a single unit with no moving parts for greater durability. It is 30 inches in length and is made of rustproof aluminum magnesium. A heavy neoprene rubber grip with spring action ensures a firm handle. As a dispensing caddy, the unit remains skid-free with four weather-resistant neoprene rubber guards.

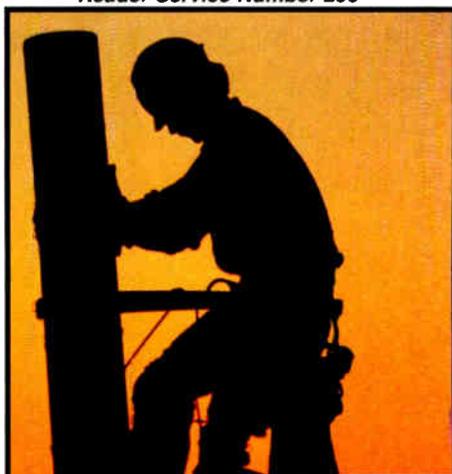

**Reader service #311**

## Fiber-optic pulling capstan

GMP introduced a fiber-optic pulling capstan for use with existing pulling equipment, winches and capstan drives in a special accessory approach. The unit can be mounted quickly on existing equipment without special modifications or new pulling gear. It is easy and safe to use, pulling the cable with synthetic rope or Muletape, or pulling the cable itself directly.

Durably constructed of aluminum alloy, the capstan has a 25-inch (635 mm) working diameter and pulls with 600 pounds (2,700 newtons) force and 600 fpm speed. The capstan can be set up easily as a mid-assist booster for use in pulling longer con-

“The Stealth SAM is weight off my back! I used to go home aching from lugging heavy

equipment up and down poles. The Stealth SAM is light and portable.”

### STEALTH SAM

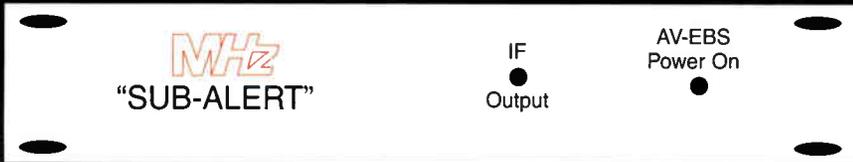

- Full-featured... broad scope of measurements; signal levels, hum, and C/N
- Built-in spectrum analyzer mode and Sweepless Sweep™

## Directional boring system

The Charles Machine Works Inc. unveiled the Ditch Witch JT3510 Jet Trac directional boring system. The unit features: 35,000 pounds of pullback in the size of a 20,000-pound machine; rubber tracks that offer minimal damage to turf, asphalt and curbing; a 22-horsepower engine that allows complete setup, including anchoring, without hooking up to the external power source; two-speed spindle rotation at 164 or 327 rpm that permits faster boring and pullback in softer soil; and a 500-gallon capacity mud mixing system that delivers mud at 15 gpm at 3,000 psi, or 30 gpm at 1,500 psi.

The unit can be detached from the anchoring system and removed from the job site, allowing next-day reconnection and completion of the bore. The exclusive monitoring system automatically adjusts thrust and pullback speed when soil conditions change. No other manufacturer offers this feature, according to the company.

The pipe rack holds 31 pipes. This

## Distribution frame

Fiber Optic Network Solutions Corp. unveiled the Light Express 3000 main distribution frame, designed for total management of backbone fiber. It supports, organizes and simplifies hundreds or thousands of fibers terminated in a central location. The modular shelf design accommodates over 1,000 connections utilizing modular connector panels or optical splitter cassettes. The unit can be direct terminated, stubbed or prewired. The modular design supports both terminating and splicing in various configurations.

The company developed the series in anticipation of the explosive demand for fiber-to-the-desktop as well as the growing demand for increased fiber management in CATV headends.

The series provides: fiber management radius guides on every shelf, floor and ceiling cable access; optional jumper management rings on the frame for each shelf location; and many other features that optimize fiber management.

**Reader service #306**

## Multivendor support system

Objective Systems Integrators announced loopMASTER, the company's multivendor broadband cable/telephony/video operational support system. It is the first of a family of modules for support of multiple cable/phone technologies, providing comprehensive fault, performance and configuration

# Channelmatic and SONY™ Bring You the Adcart/D and VideoStore...

See Us At the  
Cable Tech Expo  
Booth #537

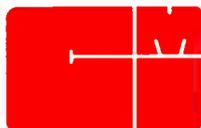

## Two Great Products, One Great Solution.

Adcart/D and the VideoStore offer cable operators the quality and reliability that have typically been reserved for broadcasters. By combining the power of VideoStore with our powerful Adcart/D, you get the best ad insertion solution on the market for a long time to come. In addition to redundant and hot swapable disk drives, circuitry, power supplies and fans, the VideoStore plays video directly from a Redundant Array of Independent Drives (RAID). This architecture provides extremely high fault tolerance against most any hardware outage. The VideoStore and Adcart/D combination offers economical scalability in terms of channel size and hours of storage.

### Features:

- Up to 12 Simultaneous, Independent Audio/Video Output Channels
- Capacity to More than 3,800 Commercials On-Line
- Economical Expansion to Hundreds of Channels
- SONY's Predictive Maintenance™
- Fault Tolerant RAID 3 Architecture:  
Never Lose a Spot Because of a Disk Drive Failure
- Redundant and Hot Swapable:  
Disk Drives, Circuitry, Power Supplies and Fans
- WAN Connectivity: Fiber, T1, Frame Relay
- Powerful Library Database Management
- Any Spot on Any or All Channels, Anytime
- All Channel Status Monitoring
- Full Traffic and Billing Interface
- 24 Hour Telephone Support

To find out how Channelmatic and SONY can offer their expertise in your ad insertion business, call (619) 445-2691 today!

Configuration

management for hybrid fiber/coax (HFC) cable networks. Additional technologies such as fiber-to-the-curb and fiber-in-the-loop are planned to complement the module.

The application provides monitoring, configuration and control of HFC telephony and video equipment and status monitoring systems. The system combines network events from multiple vendors and types of equipment utilized within the HFC infrastructure. The initial release of this rules-based application works with equipment from such manufacturers as ADC Communications, AM Communications and Superior Electronics (Cheetah).

The OSWorx NetExpert element manager is designed to manage ADC's Homeworx HFC system and will allow ADC to provide customers with an integrated, fully functional element management solution to support Homeworx, according to the company.

The system enables seamless flow-through provisioning of TR08 telephony services from the switch to specific vendor host digital terminals and network interface unit combinations. The company says this significantly re-

duces the cost of operating the network and enables the customer (cable/telephony systems) to deploy new services rapidly.

The system performs root cause correlation of problems detected in the network from any element in the HFC network. Correlated alarms are presented to network operations personnel through either a graphic display of the network or an alphanumeric alert window in the Motif graphical user interface display. Alternatively, alarms can be forwarded into the high level NMS console or directly routed to a workforce management application to automate dispatching of craft personnel to proactively manage the problem resolution process. The system has been integrated with Arrowsmith Technologies' Fleetcon workforce management application.

The system is a prebuilt, rules-based application implemented using the company's NetExpert technology framework, an object-oriented, expert analysis environment that enables rapid deployment of network management and new operations support systems. Through a series of 4GL "programmerless" editors, network experts

develop rules that define the behavior of an operations support system.

## Test data software

EXFO introduced the Fiber Test Manager (FTM) and DocuNet software packages in order to address the increasing need for efficient, timely management of fiber test data. The company says this offers a unique approach to network test documentation and that it is now providing fiber networks with a computerized data base system for test data.

These software packages form a complete and user-friendly system to organize OTDR traces and test data acquired in the field. FTM creates a central data base of fiber network test data and can act as a control center with instant test results from the field.

DocuNet is used in a test unit and is comparable to a roving reporter, collecting test data to be transferred centrally to FTM. It also can be used as a stand-alone unit and offers the FTM's same intuitive archiving of network test data.

**DON'T BE LEFT BEHIND!**

Keeping up with all the new technologies is a challenge in itself.  
There is a way to take advantage of the leap in technology.  
And it's called Fiberworks.

- ▶ Fiberworks is a comprehensive series of training courses about cable television, fiber optics, digital network systems, technology and deployment.
- ▶ Developed by ANTEC, the company that introduced fiber optics to the cable television industry, courses emphasize solutions for today's evolving networks.
- ▶ ANTEC training programs are accredited through the International Association for Continuing Education and Training (IACET) to award Continuing Education Units (CEU's) to participants.

For more information about course content, course customization and available dates, contact our Training Administrator at the ANTEC Technical Training Center in Denver, Colorado. Call 1-800-FIBER ME (1-800-342-3763).

## Atlanta Opportunities

Scientific-Atlanta is a Fortune 500 company with 1994 sales in excess of \$811M. The Atlanta-based Broadband Communications Group (BCG) is a world leader in providing top-of-the-line equipment to the cable television and telecommunications industries. We currently have the following opportunities for individuals with experience in designing cost effective products in a medium to high-volume design environment.

### Sr. Power Supply Engineers/Power Supply Engineering Managers

Both positions require a BSEE (MSEE preferred) and 5-12 years experience in the design of Switch Mode Power Supplies and Off-line Power Supplies in the 50 to 150 watt range. CATV design experience and knowledge of CATV Power Distribution preferred. Power Supply Engineering manager position requires 3+ years management experience in addition to design experience.

### Sr. RF Design Engineers

The ideal candidate will have a BSEE (MSEE preferred) and 5+ years experience in Commercial

Communication Design at the Circuit Level; RF and Analog Circuit Design including: Amplifiers, Filters and Auto Gain Loop; Design experience in the 5 to 1200 MHz range and a proven track record of RF Design for Manufacturing. RF/ASIC and CATV design experience preferred.

### Sr. Digital Design Engineers

Requires a BSEE (MSEE preferred) and 7+ years experience in the design of Digital Hardware, Microprocessor Control and Embedded Firmware. A/D and D/A Conversion experience also required. CATV design experience a plus.

### Sr. Mechanical Design Engineers

This position requires a BSME (MSME preferred) and 5+ years experience in mechanical packaging of RF and Digital Electronics and 2D and 3D CAD experience with Intergraph EMS. CATV design experience preferred.

We offer a competitive salary, benefits and opportunities for growth with a proven mainstay in the CATV industry. For consideration, please send your resume and salary requirements to: **Scientific-Atlanta, Human Resources, Dept. JK-695, 4311 Communications Drive, ATL-30-A, Norcross, GA 30093.** Appropriate department code must appear on all correspondence for consideration. No phone calls, please. We will respond only to candidates selected for interviews.

An Equal Opportunity Employer M/F/D/V.

Attn: General Manager

# WAVETEK

Wavetek CATV/Communications Division, a Division of Wavetek Corporation, is a world leader in CATV test equipment offering state-of-the-art test equipment for new and evolving markets. Our fast-paced entrepreneurial environment requires highly talented and flexible individuals with a penchant for results.

## PRODUCT MARKETING MANAGER

This challenging position is responsible for worldwide strategic and tactical marketing in our CATV product line. Candidates will be responsible for customer research, product definition, cost and price analysis, competitive analysis, and product promotion. Additional responsibilities include developing strategic partnerships with customers and suppliers in the CATV and Telecommunications arena, ensuring future products closely match the requirements of the pending information superhighway.

The ideal candidate will have a BSEE with at least 3 years experience in a marketing management role with a company that serves either the CATV or Telecommunications industry. An MBA/Marketing degree would be a definite asset. Must have excellent analytic and communications skills, knowledge of strategic planning, structured new product development background (I.E., QFD, conjoint analysis, or other formal training) and a proven track record in marketing.

## FIELD SALES SUPPORT SPECIALIST

In this position you will be responsible for field training, technical support and sales support of our CATV product line. Located in Northern California, you will travel across the Western U.S., supporting our sales force efforts by providing product demonstrations, technical training, field troubleshooting and trade show support.

The ideal candidate will have a minimum of an AS EET (BSEE preferred) with at least 5 years experience in CATV. Previous sales and/or technical support experience preferred. Must have excellent verbal, written, and presentation skills, and be comfortable making presentations to large audiences.

This position's compensation package includes a commission component and a car allowance.

## SALES MANAGER/CATV

We are seeking talented sales professionals who will be responsible for regional sales management for our CATV product line. You will develop relationships with industry leaders on the west coast to ensure that Wavetek products are specified throughout their organizations. You will also be responsible for developing new business and managing major accounts.

The ideal candidate will have a BS/BA or equivalent sales experience. Minimum 5 years sales experience and three years CATV sales. Must have demonstrated technical knowledge of the CATV industry, and have excellent verbal, written, and presentation skills.

This position's compensation package includes a commission component and a car allowance.

Qualified candidates may send a resume and salary history to: **Wavetek, 5808 Churchman Bypass, Indianapolis, IN 46203 or FAX (317) 788-5999, Attn: HR.**

**T**he following is a listing of some of the videotapes currently available by mail order through the Society of Cable Television Engineers. The prices listed are for SCTE members only. Non-members must add 20% when ordering.

☛ *Category III Review Course: Transportation Systems* — Dr. Tom Straus provides a technical look at transportation systems, including the benefits and trade-offs of different methods. This program begins with a basic discussion of the decibel and then goes on to cover baseband video and its waveform, distortion, harmonics, ingress and satellite transmission. It also deals with microwave transmission and refraction, including AM and FM transmitters and receivers. (1 hr.) Order #T-1063, \$35. (Reference for BCT/E Category III)

☛ *Developing a Technical Training Program* — Roger Keith discusses the

design and development of a system level CATV technical training program. (1 hr.) Order #T-1065, \$35.

☛ *High Definition Television* — Walt Ciciora, Ph.D., Wayne Luplow and Norman Hurst briefly review the basics of HDTV, going on to discuss intermediate technologies such as advanced TV (ATV) and ACTV. Delivery of these signals by cable, as well as competitive technologies, also are discussed. This program provides an understanding of how HDTV can affect your systems in the years to come. (1-1/2 hrs.) Order #T-1066, \$45.

**Note:** The videotapes are in color and available in the NTSC 1/2-inch VHS format only. They are available in stock and will be delivered approximately three weeks after receipt of order with full payment.

**Shipping:** Videotapes are shipped UPS. No P.O. boxes, please. SCTE pays

surface shipping charges within the continental U.S. only. Orders to Canada or Mexico: Please add \$5 (U.S.) for each videotape. Orders to Europe, Africa, Asia or South America: SCTE will invoice the recipient for additional air or surface shipping charges (please specify). "Rush" orders: a \$15 surcharge will be collected on all such orders. The surcharge and air shipping cost can be charged to a Visa or MasterCard.

**To order:** All orders must be prepaid. Shipping and handling costs are included in the continental U.S. All prices are in U.S. dollars. SCTE accepts MasterCard and Visa. To qualify for SCTE member prices, a valid SCTE identification number is required, or a complete membership application with dues payment must accompany your order. Orders without full and proper payment will be returned. Send orders to: SCTE, 669 Exton Commons, Exton, PA 19341 or fax with credit card information to (610) 363-5898.

# THE HANDHELD FLASH MINI OTDR

## Portability & Performance

Enjoy true field portability with the handheld *FLASH* fiber optic cable tester. It's small (6 1/2" by 8") . . . lightweight (less than 3 1/2 lbs.) . . . easy to use . . . and performs flash maintenance, fault location, fault analysis, and verifies repairs with the touch of a button.

The field based OTDR *FLASH* is the solution for all your construction

and maintenance applications with flexible software tailored to your needs for all stages of test operation. The *FLASH* provides instantaneous link evaluation to reduce repair time and improve efficiency.

## Engineered for full OTDR functionally:

- Dual wavelength capabilities - 1310, 1550 or 1310/1550 nm
- Fast acquisition time to analyze attenuation and reflectance
- Automatic injection level analysis
- Automatic ghost detection and cancellation
- Real-time analysis (less than a second)
- Splice location down to 0.05 dB
- PCMCIA memory storage to analyze each trace
- Choose between manual or an auto measurement
- Flexible software solutions for specific applications
- Low power consumption for over 8 hours of field operation
- Simple user interface guides you through the test process
- PC software for data analysis

You'll wonder how we squeezed in so much capability. The *FLASH* provides all the accuracy, speed, and features you'd expect from Wavetek. Get the Wavetek *FLASH*.

# NEW from ARNCO

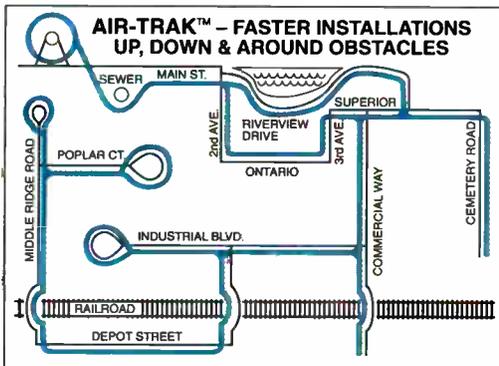

Introducing...  
**AIR-TRAK™**  
**AT-400...**  
 the fastest, most economical air-assisted  
 Fiber Optic and Coaxial cable installation  
 system available... anywhere!

Designed and made in the U.S.A. by the innovative cable installation experts at ARNCO, the AT-400 Push/Pull System\* is setting performance standards for LASB's (Low Air Speed Blow) in all kinds of terrain.

The AT-400 routinely installs up to 250 feet of cable per minute. A single model handles Fiber Optic, Coaxial and other types of cable from .435 to 1.065" OD for installation in duct up to 2.0" I.D. An AT-400 is hydraulic powered and air-assisted using a compact, economical 175-250 CFM compressor – No need for large, expensive models. The system includes an electronic monitor/display with: F.P.M., Totalizer, Cable-Slip and Emergency Stop features. Of course... the AT-400 also controls radial load for safe cable placement.

The AT-400 is a free-standing unit. It's also easily adapted and available truck or trailer-mounted to meet your precise needs. Like all field proven ARNCO products, the AT-400 is supported by our capable sales and service organization.

Call TODAY for further details or to arrange a demonstration – your place or ours.

## Ins and outs of fiber deployment

*This month our fiber expert answers your questions about fiber deployment in the cable TV market.*

☛ **Is it true that the cable TV industry could surpass the telco industry in fiber deployment in the near future?**

Yes. Cable TV is catching up fast with the telco segment. Corning's projections for fiber deployment, released at Corning's annual OFC Media Briefing, point to 1995 as the year when cable TV may pass telco as the largest North American market segment.

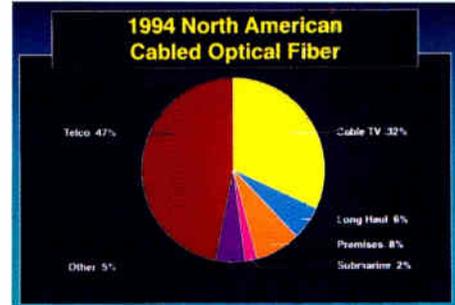

For the past several years, cable TV has been the fastest growing fiber market segment in North America. Growth for this segment has exceeded 100% three years running. Aggressive

fiber deployment continued in 1994 (see accompanying figure), bolstering cable TV's market share to 32%.

But despite its current growth spurt, fiber deployment in the cable TV industry will slow a bit in '95, with anticipated fiber consumption growth of about 43%.

☛ **How will cable TV's anticipated entry into the telephone market affect fiber deployment?**

In order to carry telephone traffic, cable TV providers are deploying fiber and establishing SONET ring technologies, which will help to ensure uninterrupted service in the event of fiber cuts. These steps will help designers build more reliable networks to meet the exacting telco network downtime requirements of

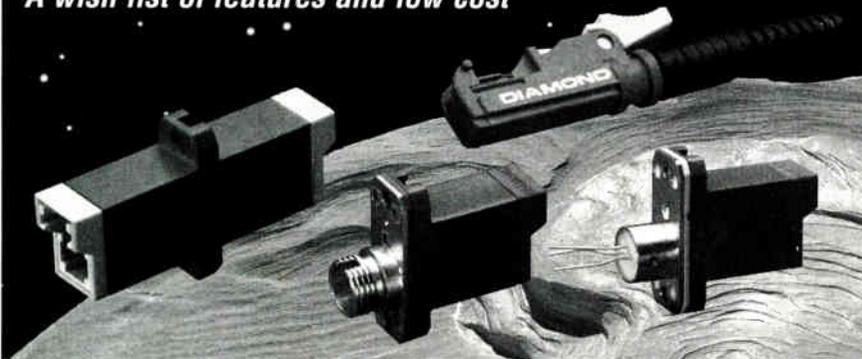

53 minutes of network downtime per year, which translates to 99.98% network reliability.

Increased fiber deployment isn't the only change we'll see this year. "Clustering" also will become more common as larger cable TV companies form agreements allowing them to establish neighboring networks for transferring telephone traffic. **CT**

### The E2000 Connector

*A wish list of features and low cost*

- Color-coding & mechanical keying
  - Compact footprint compatible with SC-panel cut-outs
  - Guide tabs prevent sleeve breakage
  - Built-in dust cap closes automatically
  - "Pull-proof" positive latching mechanism
  - Rugged injection molded housing
  - Internal spring-loaded shutter for laser safety
- IL 0.15 dB typ., RL > 50dB (PC), > 60dB 8° APC

# More Broadband, More Ways!

Belden is ready today with the bandwidth you need for your customers to access the Information Highway. Whatever the requirement — Personal Communications Services (PCS), interactive services (such as video on demand, home shopping, and distance learning), or digitally compressed signals — Belden can accommodate you with cable backed by ISO certification.

As the long-standing leader in data, networking and audio/video cables, Belden's ability is second to none in providing the right cable for the bandwidth you need. You'll also find our current lineup of broadband products without equal: Standard indoor, aerial, and burial coaxial drop cable.

CATV, plenum, and riser-rated coaxial cables. Heavy-duty coaxial aerial and burial cables. New multimedia composite cables (twisted pair and coaxial) in aerial and burial constructions, available in concentric or parallel designs.

Select the cable you need to fulfill your customer's advanced video, audio, and data needs by requesting a copy of the Belden Broadband Cables Brochure or Cable Television Catalog.

# Signs of SCTE growth

**A**s I write this, the Society's national staff is making final preparations for Cable-Tec Expo '95, which promises to be the most spectacular yet. This year, we will host more than 310 exhibitors, up from 250 last year. I look forward to seeing you in Las Vegas and sharing information on the latest developments in technology and the constantly evolving telecommunications industry.

Many exciting events will occur during Expo '95, including the recently elected directors taking their positions on the Society's national board. At the meeting set for June 13, prior to the start of Expo, the board also will elect the Society's national officers for 1995-96.

This meeting also will mark the official change of SCTE's name to the Society of Cable Telecommunications Engineers, a transition approved by the membership in a referendum vote held in conjunction with this year's board election.

I feel that the new name more accurately represents the Society's diverse members. Our industry is undergoing a transition from cable TV to the broader area of cable telecommunications, and the name of the organization will now accommodate this evolution.

This year, the Expo technical program begins for the first time with a series of preconference tutorials to be held June 13. Among these will be a special presentation on the industrywide public relations program, "The Future Is On Cable."

This tutorial, to be presented by Rob Flynn of the National Cable Television Association Public Affairs Department, will show how "The Future Is On Cable" can improve the cable industry's public image by offering on-time guarantees and is designed for the cable installers and technicians who will ultimately be responsible for carrying out its customer service guarantees.

Attendees will be updated on how the program is progressing and Flynn will review research conducted by the NCTA dealing with public perceptions of the cable industry as a technological leader. He also hopes to hear feedback from attendees to learn about their ex-

periences in the field implementing these customer service guarantees. We are very pleased to be making this preconference tutorial available to attendees, as it will provide a broad overview of a program that should benefit the entire industry.

Another special highlight of this year's Expo is sure to be the keynote address to be given by Federal Communications Commission Chairman Reed Hundt during the Society's 1995 Annual Engineering Conference. This prerecorded address will be presented just prior to our 1995 Annual Awards Luncheon. The Society is honored to have such a prominent official address Expo '95 attendees, and considering all of the current interest in FCC legislation and regulations, I am certain that his presentation will be a high point of the conference.

## Booming membership

Besides our preparations for Expo '95, there also is a great deal of activity in the Society's Membership Services Department due to the ongoing growth of our membership. By the time Expo '95 begins, SCTE's membership should exceed 14,000!

This figure should encourage our industry, because it shows a definite increase in its recognition of the importance of technical training, professional certification and industry standards. In order to compete and survive in the increasingly competitive telecommunications business, more and more people are turning to SCTE as an invaluable training resource. The Society will continue to strive to meet the changing needs of its membership, and we look forward to serving an even larger portion of the industry in the coming year as our membership continues to grow.

## Subcommittee update

Besides all of the excitement generated by Cable-Tec Expo '95 and our attainment of 14,000 members, the Society's engineering subcommittees also have been making news of late, with the Inventory/Material Management Subcommittee's recent announcement that it has issued an Interim Material Management Practice.

This practice recommends that the universal product code (UPC) should be used as the bar code standard for the cable telecommunications industry. When a wider-ranging material management practice has been defined by the subcommittee, it will replace this interim measure. Once an overall electronic data interchange (EDI) has been put into place, it will allow trading partners in the industry to use computer systems to the fullest extent in controlling inventory. With the adoption of this standard, material management will be much more efficient and less time-consuming. The cable industry will then be able to use electronic systems to maintain all aspects of company materials from placing orders to settling account balances. (See "SCTE News" on page 12 for more details.)

## New headquarters

I am happy to let you know that planning for the Society's new national headquarters building is moving along as we prepare to break ground soon. The building was first proposed by the Finance Committee as part of the 1995 budget, which was approved by the board in December 1994. Since then, the staff has been working diligently on details such as design, development and township approvals. The building, which will be located in an attractive, wooded lot in an upscale industrial park, will be represented in a display at Cable-Tec Expo '95, showing members the current status of the project.

With our growing staff and membership, the new building has become a necessity. We are currently planning to move our operations to the new location in December of this year. As more details become available, I will update you on the progress of this exciting enhancement to our organization.

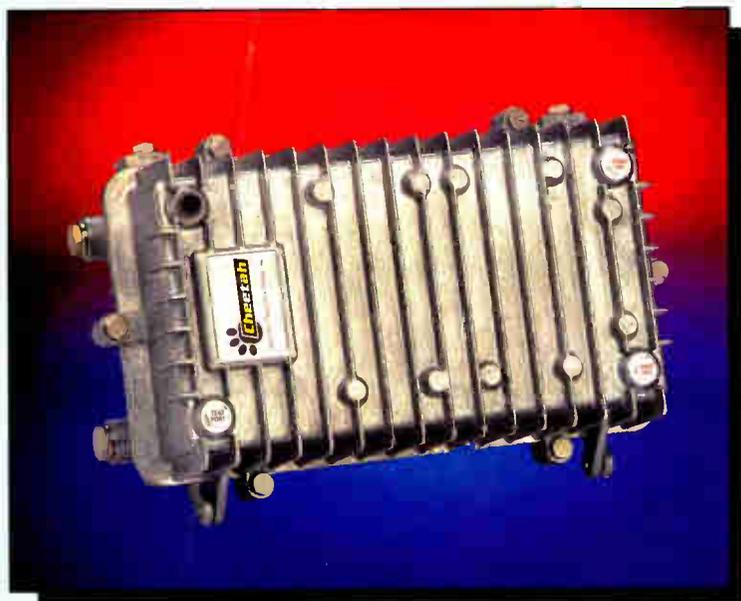

At a time when there is so much activity in the industry, there also is a great deal of activity within the Society. I will continue to use this forum to address the measures that we are taking to provide better services for the membership. I hope to hear your ideas for additional ways that the Society can become even more beneficial to you. **CT**

## STATUS MONITORING

S • O • L • U • T • I • O • N • S

# What The LC-1000 Line Monitor Can Do For You

- ▲ Measure up to 1 GHz
- ▲ Overcome ingress with frequency agile RF data modems
- ▲ Complete upgrades easily with remotely reprogrammable firmware
- ▲ Monitor what you need including: RF levels, AC power and temperatures

**F**inally, a line monitor priced for implementation throughout the cable plant. Place it just beyond fiber nodes, at splits or termination points for status monitoring applications. The Cheeatah™ LC-1000 provides a cost-effective automated solution for alarms, remote diagnostics and scheduled testing and analysis.

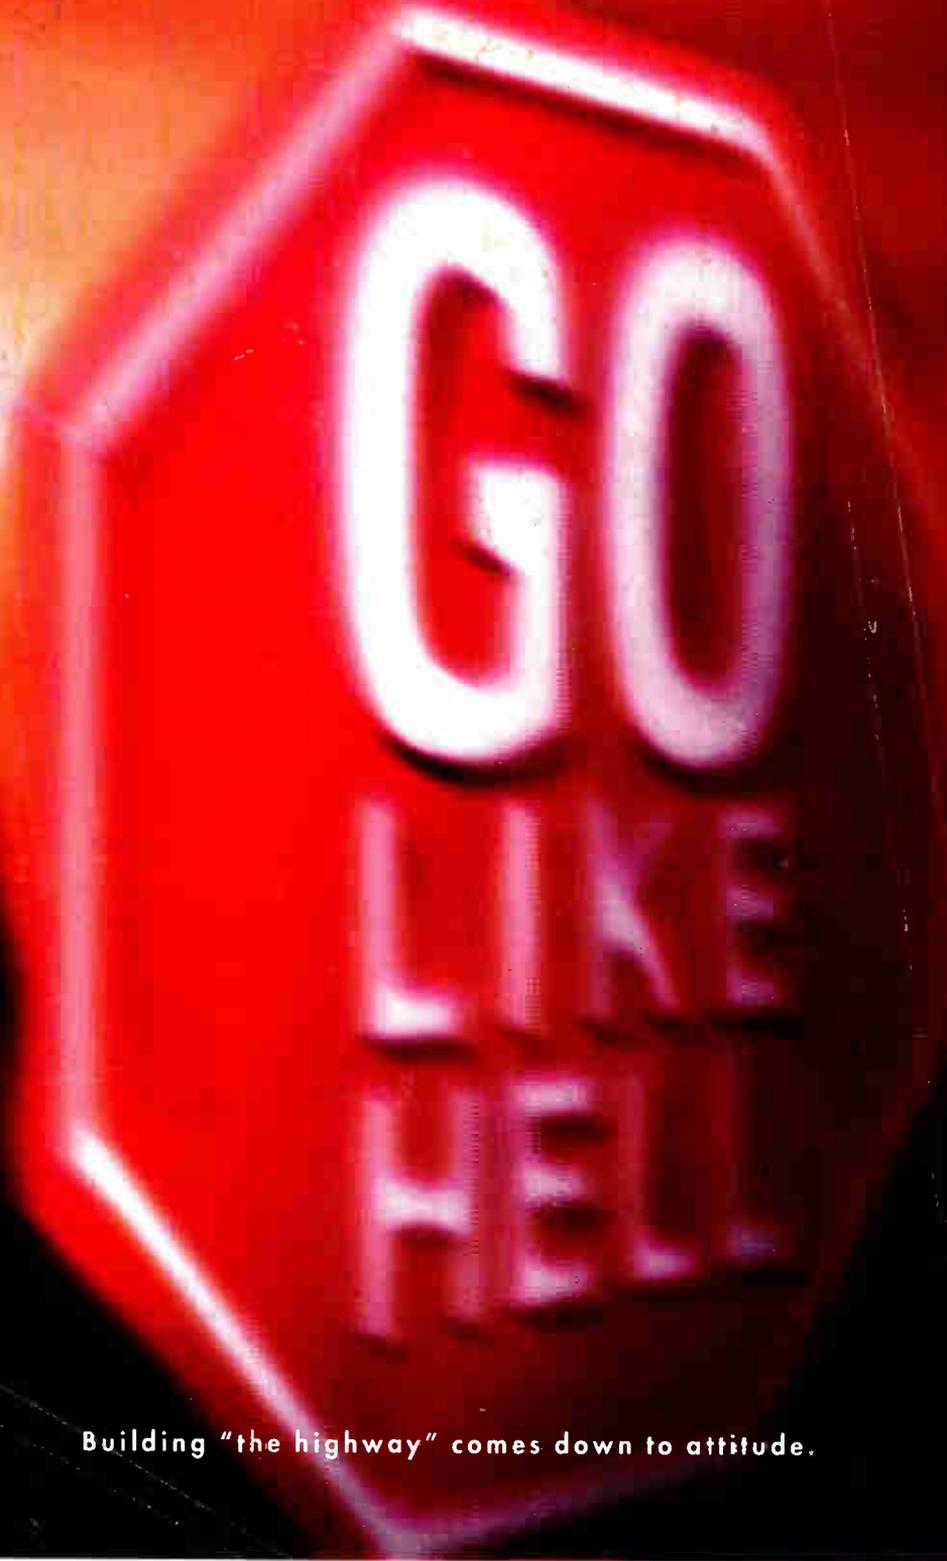

**T**he typical status monitoring system tells you only if the voltages on active devices are within specifications. With the LC-1000, you will receive alarms if RF levels drift beyond limits you set. You can continuously monitor the quality of the signal your subscribers are receiving.

**Before finalizing your status monitoring solution, be sure to evaluate the LC-1000.  
Call today for a demonstration.**
