- 12, 16, 20, or 24 inputs. 4 bus, 6 bus, 8 bus or more bus systems.
- All digital waveform and quad split generators.
- Digital key edging, border, shadow and outline available on all ME's.
- Vari-key. Soft, hard, shadow, or see-thru key.
- Digital quad split. Wipe or dissolve in each quadrant.
- Electronic vignette. Adjustable soft pattern edges.
- Superb linear chroma keyer. RGB or encoded.
- Automatic transition control on each ME.
- Ready to interface for computer aided operation.
- Many more state of the art and operational features described fully in series 114 brochure.

Do not fear to discover a superior product in the VIX-114 series switchers. Ask to see the demo tape for a sample of what we can do for users of switching equipment. You'll like it.

Choice of over 80 exciting patterns

such as star, heart, binoculars, keyhole, rotary clockwipe and more

Vital Industries, Inc. is the first manufacturer to introduce extensive use of digital circuitry in switching techniques in addition to superb electronics, we furnish a control panel that allows easy and frequent use of all features you buy Example is the separate illuminated pushbutton showing pattern in use on each ME. No secret coding or delegation is used.

Automatic transition on each ME is furnished for professionally smooth transitions of wipes, keys and dissolves.

The VIX-114 is the only switcher in the world that gen-

The VIX-114 is the only switcher in the world that generates the star, heart, binoculars, keyhole and many useful and creative effects.

December, 1976/By Howard T. Head and Harold L. Kassens

CB Expansion Takes Effect

Beginning January 1, 1977, the Class D Citizens Band at 27 MHz will be expanded from 23 to 40 channels. The expansion of the band is expected to extend the already severe harmonic interference problem now affecting TV Channels 2 and 5 to include TV Channel 6 as well.

At the same time, the requirements limiting CB harmonic radiation will be tightened from the present 49 dB below carrier to 60 dB. Broadcast and receiver interests have maintained that this limit falls far short of that necessary to provide adequate protection to TV reception insisting that suppressions on the order of 100 to 110 dB below carrier are needed.

The CB people maintain that much of the problem of CB interference arises from audio rectification, affecting not only TV receivers but other home entertainment instruments as well. Whether this is so may very well be determined by a series of indepth investigations which the FCC's Field Operations Bureau (FOB) is undertaking in the field, as well as other testing under way. In the meantime, the Commission has insisted that much of the blame lies in the inadequate performance of TV receivers, although it is hard to see how a receiver can be designed to reject a radiated r.f. harmonic. Hopefully, the tests now under way will provide at least some answers to this question.

FM Height/Power Reduction Formula Challenged

The FCC Rules established a maximum limit of 100 kW ERP for Class C FM broadcast stations. Exceptions are provided, however, in the case of stations operating prior to the existing classification scheme employing power in excess of this value. In a recent case in Florida, a Class C station requested authority to increase its antenna height from 205 to 598 feet and to change site while retaining its (above-maximum) power of 160 kW. The application was granted by the Commission's staff, but was taken back when opposition was filed. On reconsideration, the Commission granted the application for the new location and the new

Continued on page

This is probably a terrible conversation to have during the dead of winter (Eastern style, that is), but Broadcasters who have visited our California marketing headquarters on the beautiful Santa Barbara coastline tend to identify us as the "Sea-Tek" Broadcast Group.

Curiously, we actually pronounce our name "SEA-TEK" . . . with an S, and an E, and an A, for your S-E-A . . . with a T, and an E, and a K, for your T-E-K—SEA-TEK.

However, when we print it, we spell it Cetec . . . with a C, and an E, and a T, and an E, and a C.

Well, enough of this. There's a lot more from the good group at Cetec on the following page.

Read on . . .

DIRECT CURRENT FROM D. C.

Continued from page 4

height but reduced the power to the $100~\rm kW$ maximum. The reason for the action was the rule that super-power stations cannot extend the distance to the $1~\rm mV/m$ contour.

Reinstatement of TV Translator Channels Urged

The Council for UHF Broadcasting (CUB) has requested the Commission to restore the use of UHF TV channels 70-83 for use by UHF TV translators. These channels were originally part of the UHF TV band, but were eliminated when this frequency space was vacated for land mobile use. Existing translators above Ch. 69 were permitted to continue operation on a secondary basis to land mobile, but no new authorizations are being issued.

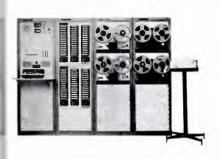

CUB, noting that it is already difficult to find frequency space for translators in the preferred range of Channels 54-69, has urged the Commission to resume licensing of translators on the higher channels. One of the arguments advanced in favor of such an action is that the principal use of the band for land mobile operation is likely to be near large metropolitan areas while the greatest need for TV translators is in outlying areas where land mobile requirements can be satisfied at lower frequencies.

Short Circuits

10-Watt non-commercial educational FM broadcast stations may now use Third Class Radio-telephone operators without broadcast endorsement or holders of restricted radio operator permits - under certain conditions...The Commission has reminded all stations that, in cooperation with the FAA, the painting requirements for antenna structures were changed in October, 1970 with the proviso that all towers must comply with the new requirements by November 1, 1977...From now on, when you file papers in rule-making proceedings, you only have to file an original and five copies instead of the 12 copies formerly required.

You may not know that Cetec is one of the major wooducers of radio broadcast equipment.

waybe you should.

for outstanding and meritorious ability and intelligence demon-strated in the decision to install Aural Studio - Transmitter equipment and the high degree of knowledge exercised in making the equipment selection."

Why STL?

- 1. No "lost air" time due to cut, wet or electrically charged telephone lines.
- 2. Better Sound Quality Than a Class AAA telephone line.
- 3. EVENTUAL COST REDUCTION in operating expense.
- 4. Complete control of entire broadcast

Why Dual Channel?

- 1. A Dual-Channel costs less than a Composite
- 2. Better Reliability than a Composite. Built in Backup.
- 3. Greater Channel Separation than a Composite.
- 4. Less Signal Drive Required to Receivers means additional system Fade Margin.
- 5. Less Test Equipment Necessary and more Positive System Diagnosis.
- 6. Stereo Generator is away from Studio and Unauthorized Tampering.
- Stereo Generator and Broadcast Transmitter Compatibility without Interface.
- 8. Having a Dual-Channel STL is like having a Spare Link
- Two Remote Control and Two Sub-Carrier Capability.

Why MARTI?

- 1. Channel Separation more than 65
- 2. Channel Response matched to 0.25 db.
- 3. Distortion less than 0.5%
- All Solid State.
 A Simple, True Direct FM Plug-in Modulator.
- 6. Complete accessibility to Modules without removal from rack.
- 7. The Marti System Delivers Top Performance with Transmitter manufacturer's Stereo Generator.
- 8. Marti STL Systems Log over TWO MILLION (2,000,000) Broadcast Hours each Year.

 9. AVAILABLE FROM STOCK.

The Stereo STL with "Built-in Backup."

Dual Channel System (Stereo) \$4160.00 Single Channel System (Mono) \$2290.00

(Does not include cost of Antennas or Transmission lines)

NDUSTRY NEWS

NAB Is Booked Solid For March Convention

All exhibit space for the 1977 annual convention of the National Association of Broadcasters in Washington, D.C. has been sold.

The convention will be held March 27-30 at the Washington Hilton, Shoreham Americana and Sheraton Park hotels.

NAB Exhibit Manager Edward L. Gayou said at the annual NAB exhibitors' meeting, that 188 associate members have signed up to exhibit broadcast equipment at the three hotels. At the 1976 convention at Chicago's McCormick Place, the total was 182.

Gayou said a total of 84,502 square feet has been assigned and a waiting list of firms will be established in the event of cancellations. He added that this is the first time all space has been sold by the time of the exhibitors' meeting.

Meanwhile, the National Associa-

tion of Educational Broadcaste held their annual convention Chicago. Attendance reached a ne low, and the exhibitors who di show up did little business. One tabbed the "little NAB", the Assi ciation saw a near shutdown of the exhibit area on the second day the meet.

The problem runs in sever directions, not the least of which the Association's emphasis on func ing and other strictly education television problems. From the e hibitor's standpoint, the conver tions should have allowed motime for floor traffic in the exhib area. The feeling toward the clos of the convention was that e. hibitors would not show next year A second exhibitors' meeting wa held on the last day of the cor vention. While it served to clear th air, it was already too late.

SMPTE Winter Conference Will Focus On ENG's Future

Beyond ENG—the future of Electronic News Gathering, and Digital Television will be the subjects of the Eleventh Annual Winter Television Conference of the Society of Motion Picture and Television Engineers. The Conference will be held Friday and Saturday, January 28 and 29, at the St. Francis Hotel in San Francisco.

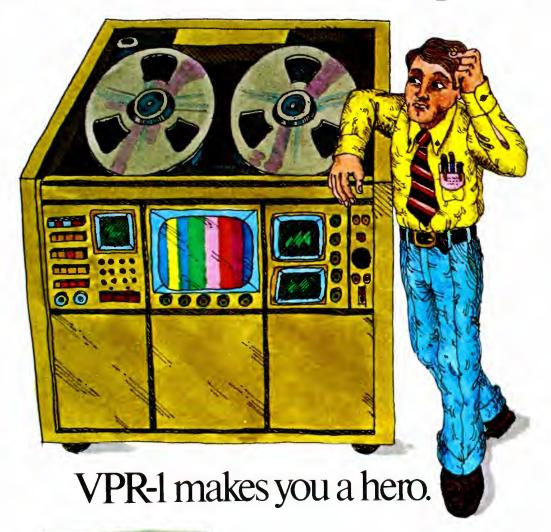

The ENG session will explore current production methods and take a look at this rapidly advancing technology. A panel discussion by ENG users should provide a lively exchange of ideas and experiences.

The session on digital television will cover a variety of subjects including digital disc recording, progress on digital video standardization, and digital and analog video enhancement techniques.

Beyond ENG is the topic for Friday's sessions. Lee Marvin, Telu vision Research International, an David Fibush, Ampex Corporation are the session chairmen. The top for Saturday's session is Digita Television. The chairmen for the session are William H. Orr, Orre Corporation, and Louis Pourcial International Video Corporation.

NCTA Hits Restrictive Rules

Burt 1. Harris, Chairman of the National Cable Television Association, has urged the Federal Communications Commission to do away with its restrictive rules that have served as "copyright" substitutes.

He also outlined the industry's recommendations on several cable television issues scheduled for action by the FCC this fall. Specifically, Harris focused on the 1977 refranchise deadline, redefinition of cable, and subscriber rate regulation.

Appearing before an en banc meeting of the FCC, Harris told the Commissioners that with the recent passage of the Copyright Revision Bill, syndicated exclusivity and signal carriage restrictions base cable's failure to "pay" for programming it received coullonger be justified.

"The Commission's rational these rules was the alleged u competition provided by cable tems using products for which didn't pay," he said. "Irrespect of the original merits of position, it is now moot."

Harris said fears of ca adverse economic impact on tablished broadcasters—the F other major regulatory ration; were virtually groundless.

"The difference which previor existed between parties who is copyright and parties who did have been eradicated," Harris the Commissioners. He urged agency to eradicate the now collete regulatory differences between the cable and broadcast television.

The 1976 Copyright Law, we becomes effective in January, 18 grants CATV systems a computation of the carriage of all read and television broadcast state whose carriage is authorized by FCC. The new law also requestant CATV systems to pay for carriage of all distant non-net television programs.

Harris also focused on set cable issues now pending before FCC, among them the 1977 franchise deadline, redefinition cable, and subcarrier rate regition.

In March 1977, Harris said, s 5,000 CATV systems will be quired to file "amended franchi with the Commission in order meet the certification requireme

Harris said that while NCTA in accord with the Commissi proposal to conform to the rule has "grave concern about Commission's requiring that trules must be reflected in franciprior to the normal date of franchise."

Irrespective of what action Commission takes on the 1 refranchising issue, Harris s three important public interest i cerns must be considered.

• No cable operator should I his ability to serve the pu jeopardized as a result of the C mission's desire to obtain franc uniformity.

Nobody has it like the new Spotmaster 3000 Series

Here's the 3200RPS — a stereo cart machine with all the standard features: large air damped solenoid, a direct drive synchronous motor; and a rugged machined deck.

PLUS the Spotmaster exclusives: Phase Lok III head bracket for optimum stereo phasing; a superior, up-to-date, modular electronic package; a unique cartridge guidance system; and a full range of options including manual fast forward.

The 3200RPS is a full feature, top quality, stereo record/playback machine yet it is only 7¾" wide. Two Model 3200's go side-by-side in a standard 19" rack. Available for stereo or mono in playback and record/playback models.

Chicago Will Host CATV '77

Chicago's Conrad Hilton Hot the site and "CATV 77: The Chof 11,000,000 Families" the thror the National Cable Televi Association's 26th annual contion, April 17-20, 1977.

More than 5,000 attendees expected at the nation's lar CATV trade show, which feature a full array of technical management sessions, pre and proposed convention activities, and well 100 hardware and software exhibited.

"This year the Convention Comittee is working hard to prese program which is topical exciting, but which also of plenty of practical experience information," said Marc Nathson, President of Falcon Comunications and Chairman of NCTA Convention Commit "Also for the first time, the NC Convention will include a mosession devoted to the internationable television scene, feature cable representatives from architecture."

According to Nathanson, 1977 Convention Program will organized around five basic couples: System Operations, Fina Regulation, Pay Cable, and Teccal. Throughout the convent eye-opener and major sessions focus on different aspects of the basic topics.

Convention activities will activities begin on Saturday, April 16, 1 with the NCTA Convention Te Tournament at Chicago's MidT Tennis Club, and a Saturday e ing reception. The convention officially open with a keyladdress on Sunday afternoon, 1/2, by a prominent national offi

Beginning Monday, April each day's program will incearly morning eye-opener sess followed by major management technical sessions each mornand afternoon.

The new International Consession on April 19 is believed by NCTA in cooperation with the International Broad-Institute and its executive directly Jean D'Arcy.

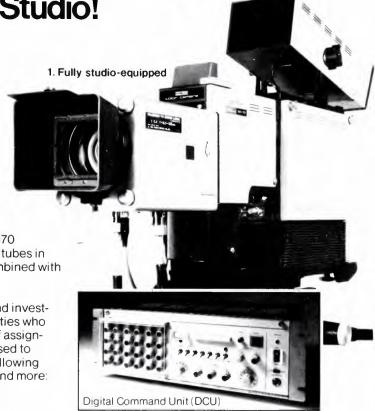

HITACHI SK-70

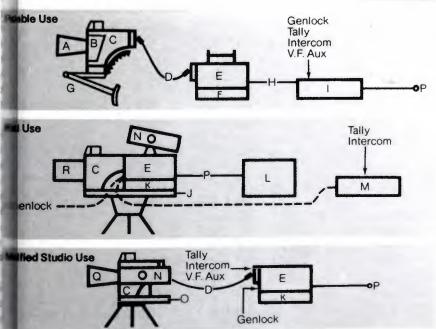

te One Camera That Can Do The Work Of Four...
side Or Outside The Studio!

andular SK-70 converts easily from a fully ed, self-contained color studio camera to a self-contained color studio camera to a self-contained color studio camera to a self-contained connected directly to a VTR rely a co-axial cable. And for hand-held portaine camera head features a shoulder mount, an exportable zoom lens, and a 1.5" viewfinder, with a DC and process pack. The Digital Compliit (DCU) with up to 3000 feet of single co-axial autrongly enhances the capability of the SK-70. The striking option is a 22:1 zoom lens that can ed for the studio version of the SK-70 in the field.

ter which configuration you choose from those in the photo and three diagrams, the Hitachi SK-70 he precision and reliability of three 2/3" Saticon tubes in the photo insure excellent picture quality, combined with atest advances in broadcast camera technology.

vican see, our outstanding Hitachi SK-70 is a sound investment reproduction studios, and universities who advantage and the price of a single camera. We'd be pleased to the ademonstration of how the SK-70 can fit the following requirements inside or outside your TV studio, and more:

A)	Portable lens
B)	1.5" viewfinder
C)	Camera head pack
D)	Camera cable (300 ft.)
E)	Process pack
F)	D.C. pack
G)	Shoulder Mount
H)	Co-axial cable (3000 ft.)
1)	DCU
J)	Mount adapter
K)	A.C. pack
L)	VTR or FPU
M)	Operation panel
N)	5" viewfinder
O)	5" V.F. Mounting Plate
P)	Co-axial cable (video)
Q)	Portable lens w/conversion adapter
R)	Studio lens

SBE Journal

We believe that those stations stalling ATS control equipment sho be required to submit a proof performance to the FCC before panent authority is granted for stoperation. Further, the Commiss should demand suitable inspection adocumentation, on an annual basis, the performance of the ATS in ore to regularly confirm the integrity the system.

The SBE concurs with the Comission's view that, during periods temporary failure of portions of system, an absolute go/no-go semay not serve the public interestather, "failsafe" circuitry, coup with a reliable alarm system, sho adequately insure against those sit tions which could cause interfere to other stations, as long as transmitter would shut off if eit the circuitry or alarm system sho fail.

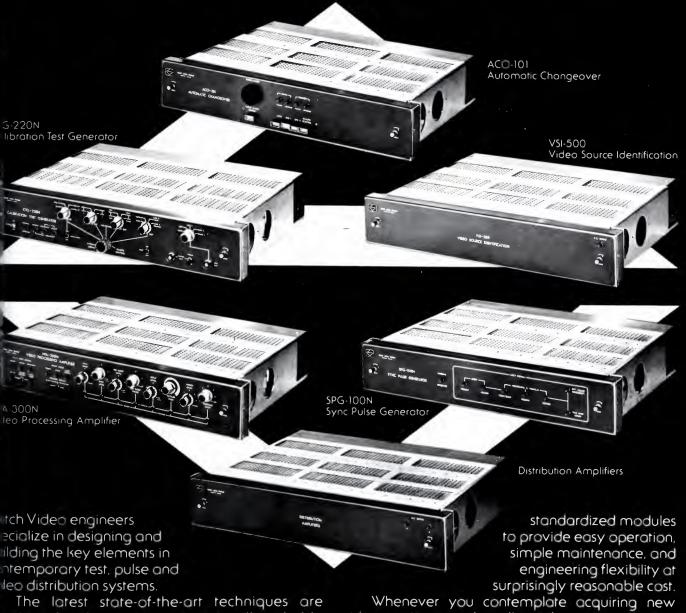

The alert signal, indicating a c dition, an alarm level, or a turn should be mandatory, and the S proposes that it be located at studio along with the control cent A responsible station employee sho monitor and exercise control over ATS, and the system should equipped with the capability for hi quality, off-air monitoring, as well, the means for that person to turn transmitter on and off in response indications that any operating para eters are out of, or back with tolerances. Upon an alarm indicat a qualified operator would be immi ately sent to the transmitter locati

The test circuitry incorporated is the ATS controller should be so that when an operating parameter which had been out of toleral returns within tolerance, the unit instantly revert to its normal state. On the other hand, if that operate parameter had been so far out tolerance as to cause a shutdown the transmission system, then all the condition had been corrected, system would have to be reset better station could return to the air

The SBE believes that ATS traiters should continue to meet existing requirements of design, stallation, safety, and intruder protion. A high limit of output pomust be established to prevent inference to other stations. The quiton of a low limit merely related the desirability of a low-power

Mix an ENG camera with a studio camera, and what do you get? A Sony.

The Sony BVP-100, to be exact. A new cind of portable color video camera, from Sony Broadcast.

There have been portable ENG cameras before. Field production cameras, too. But he BVP-100 is a camera deliberately lesigned to give you the best of both worlds.

The BVP-100 combines the lightweight body, economy, and simple setup procedure of an ENG camera with the broadcast picture quality, manual controls, and built-in professional features of a field production mamera.

It's like having two cameras in one.
In the field, the BVP-100 is fully
contable, easy to handle, completely
mutomatic. You can depend on it to cover
mast-breaking news, sports events, any ENG
mituation you run into.

But when you're in commercial or slocumentary production, you need more than an automatic ENG camera. You need a mamera you can control manually. A camera ou can interface with other cameras. A mamera like the BVP-100.

Take a look at some of the special dvantages the Sony BVP-100 can offer you:

1. Beam-splitting prism optics. Three 2/3" Plumbicons* with beam-splitting prism optics provide broadcast quality signal esolution, high sensitivity, low registration error, and extremely stable operation—at a ignal-to-noise ratio of better than 50db.

2. Built-in masking generator. Unlike nany portable color cameras, the BVP-100 has built-in masking circuitry. This insures optimum predictable colorimetry at all times,

and of course allows matching the BVP-100's colorimetry to that of other cameras.

- 3. Built-in test generators. On location, you can make many necessary balance and test monitoring adjustments without accessory equipment. And the less accessory equipment you need, the faster you can move.
- 4. Quick adjustment to changing light. The BVP-100 special black stability circuit and automatic white balance help maintain correct color proportion levels. Even in rapidly changing lighting conditions.
- **5. Flare compensation.** The BVP-100 has fully adjustable flare compensation circuitry to remove any annoying distortion in black balance created by an optical disturbance.
- 6. Recorder playback through viewfinder. For field situations, the recorded video signal is switchable to the BVP-100 viewfinder. You can monitor and review instantly.
- **7. Easy access to controls.** The BVP-100 is designed with all setup and operating controls conveniently located for quick adjustments while the camera is in use.

And there's more. Much more. Built-in filters. Image enhancement. Easy setup. Operation with battery or AC adaptor. Plus a single 10-pin connector cable that links to the new Sony BVU-100 Portable Videocassette Recorder, or to any other Sony portable recorder.

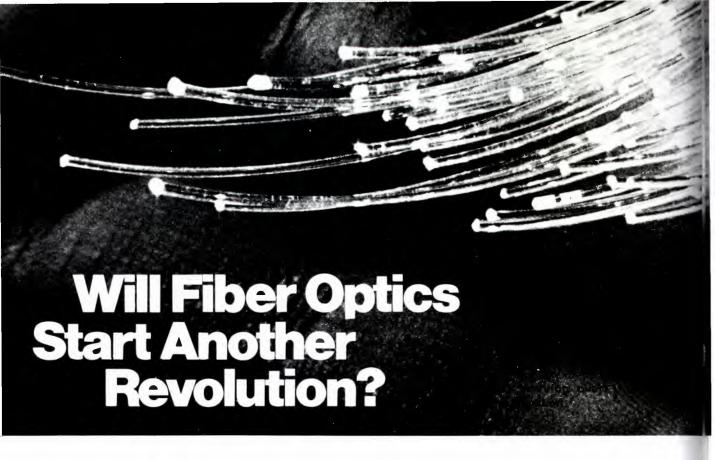

For further information on the BVP-100 Color Video Camera, write to Sony Broadcast.

By Ron Whittaker

Now that many of us are convinced that fibers in our **diet** can improve our health, we are learning about some revolutionary advantages in another fiber for **video**—fiber optics.

The term "revolutionary" is a bit trite by now—so many things have gotten to be "revolutionary" these days—but with fiber optics we in television may just be facing a new technology which could fully qualify as being revolutionary. Some engineers, in fact, are viewing the new fiber optics technology as being as significant as the development of the transistor in the early 1950's.

Consider the advantages given for an optical fiber (OF) "cable" when it is compared to a standard coaxial cable:

- •Broadband; up to 1 GHz or more per 90 micron fiber
- •Uniform attenuation over very wide frequency range (no equalization needed)
- •As little as 4 dB loss per mile (2 dB per kilometer)
 - •Highly resistant to interference
 - •No problems with "leakage"
- Insensitivity to temperature variations

- •Extremely small size
- •Not nearly as fragile as coax
- •Lower cost than coax
- •High reliability

Optical, or light-conducting glass fibers have been around for quite some time. You probably first saw them used in the little fiber optic "fountain" lights with their 100 or so fibers "spraying" out of the top. Since they normally require dim lighting to be appreciated (which means that they are rather dim, themselves) many of these lights ended up sitting on the top of TV sets being used as "TV lights."

But now it appears that these fibers will be going from the top of TV sets to inside TV systems, as optical fiber (OF) technology very rapidly takes hold. In fact, things are moving much faster in OF research (and application) than many "experts" predicted several years ago.

In a rather well-publicized application of OF, Teleprompter, in cooperation with Fiber Communication Co., has put into regular use an 800-foot (250 meters) link from their microwave receiver to the head end of a cable system. Six fibers were packaged in a single cable, which ended up being about

the size of a piece of standar RG-59 drop cord. The fibers themselves, are only 90 microns is diameter each, or about the size of a human hair. Each of the fibers is capable of over 1 GHz bandwidth which means that a six-fiber bundly would, theoretically, be able to carry about 1,000 TV channels.

In actual fact, however, the fiber are capable of a much broade bandwidth than present technolog can handle. The Teleprompter system is now limited to 20 MH bandwidth because of limitations in the light-emitting diode (LED) going into the fibers. However, need devices have been announced which could extend this 20 MHz limit to 200 MHz. In the next few year even newer technology could well extend this into the GHz range.

How It Works

Before going further, it would probably be appropriate to take look at how OF works, at least as it is now being applied in video cable. It must be kept in mind that this it only one of a number of potential TV-related applications of OF Optical fibers will probably find their way into such things a picture tubes and camera tubes, it name just two applications not

All-Plastic OF Cables

The Du Pont Company has developed two new all-plastic fiber optic cables for data transmission use.

They are PFX-P140R, a single plastic optical fiber reinforced with "Kevlar" 49 aramid fiber in a protective jacket of flame retarded "Hytrel" polyester elastomer, and PFX-P240R, a dual optical fiber cable designed for two-way communication. The two inner cables of PFX-P240R are color coded for easy identification and each is protected and reinforced by "Kevlar" and "Hytrel".

Both products feature attenuation of 470 decibels per kilometer at a wavelength of 656 nanometers. They transmit visible light over twice the distance of other currently available plastic optical fibers, according to Du Pont.

The cables are tough, flexible and crush resistant, Du Pont said, and the all-plastic make-up of the cables allows preparation of the ends with a simple razor cut for coupling to a light source and detector. The all-plastic construction also simplifies re-

pairs, which can be made in the field by a technician, usually on the first try.

Du Pont expects the two fiber optic materials to be used in military applications, in ships, submarines, helicopters, chemical plant or refinery control instrumentation, and in mining communications, as well as for optical links in computers and for the transmission of other data without electromagnetic interference. PFX-P240R, with its dual cables, allows two-way communication between computer and peripheral unit.

These two products join PFX-S, a plastic-clad, pure-silica-core cable announced earlier this summer. PFX-S features attenuation of 80 decibels per kilometer at a wavelength of 800 nanometers. Its attenuation is below 60 decibels per kilometer throughout the range 650-750 nanometers, assuring its compatability with systems designed for red-transmitting PFX-P. It was developed to approach the mechanical toughness of plastic fiber optics with the run length capability of silica.

big experimented with.

rigure 1 shows how the OF miciple is being used for video le. The video and audio signals milulate the light from an LED unlike the LED's being used in wew hundred-thousand pocket ulators and digital watches right w). The light then passes through in optical fiber, which acts as a weguide for the modulated light. Athe terminal end of the fiber the is a P.I.N. diode sufficiently bled (50 volts or so) to be monsive to the high-speed fluctuin modulation. After being blified about 20 dB, the signal on its way as a normal 1-volt tevision signal. The concept is sublicity itself.

How About Losses?

he optical fibers used for the smission of video signals are le to far more exacting specificans than the fibers in the lamp may sit on your TV set. The awing" of glass fibers to the dispecifications needed for tical video applications has an a number of years of intenresearch and work—work that level page-long formulas and rences to such things as meridings, dielectric waveguide

energy flux and Fresnel losses.

Although the light attenuation in the Teleprompter installation is listed as 10 dB per kilometer (0.62 mile), losses in newer-type fiber is reportedly down to less than 2 dB per kilometer. Of course, in the short 250 meter (800 foot) "hop" from the rooftop antennas to the central processing center 34 floors below in the Teleprompter installation, the attenuation involved is negligible.

Using the 2 dB per kilometer figure, 20 dB amplifiers would make possible 15 km (9 miles) spacing between amplifiers. Depending upon the efficiency of the coax used in comparison, this would probably end up being somewhere near 10 times as efficient as ordinary coaxial cable. Equalization devices can be eliminated as well as automatic gain control (AGC) equipment, since OF is blind to both frequency and temperature variations.

The present 20 MHz bandwidth used in the Teleprompter installation represents only a fraction of what would be possible if the full potential of OF could be used. Current speculation is that with the adoption of digital processing of video, a bandwidth of a few

hundred or even thousand MHz would not be out of the question. What is needed at this point is small, inexpensive digital processers which could be mass-produced. If the video signal(s) could be digitized, you could conceivably move up to the potential afforded by a type of electromagnetic energy (visible light) which has a frequency of close to 1,000 terahertz (THz). (By the way, a THz is one step above a gigihertz and is equal to 1,000 GHz or 1,000,000,000,000,000 Hz.)

Lasers and OF

Another important contribution to OF-video technology will be the perfection of small, inexpensive lasers, which will greatly improve the efficiency of the fiber optic light transmission process. The scattered light of the LED causes the light to "ping-pong" its way along the walls of the OF waveguide in a way that hardly represents an efficient and orderly transfer process.

The coherent light from a laser has already proven itself to be a much more efficient "light launching" device for OF. However, because of the imperfections in the best of today's fibers, there are still certain ping-pong effects, even when a laser is used. It is only

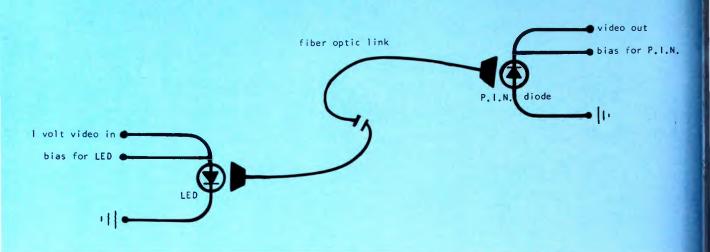

Fig. 1 The basic concept for an optical fiber (OF) system is illustrated here. Even with today's limited OF technology, it is estimated that it is possible to send video signals six to nine miles before re-amplification is necessary. No frequency equalization or AGC processing is necessary.

when this effect becomes great enough to result in a lack of resolution between discrete bits of information that the process breaks down. Fortunately, the extremely short wavelength of light (10⁻⁶ m.) coupled with the extremely high speed (about 29¹⁰ cm./sec.) gives phenomenally high limits to work with. Some idea of the relative information capacity of OF compared with other electronic media is shown in Figure 2.

Numbers this big have very little meaning for most people until they are broken down into recognizable quantities. To give you some idea of just how removed these laser frequencies are from ratio frequency (RF) energy, consider the following.

20-Million TV Channels?

Laser emissions run from about 80 to 1,000 terahertz (THz). If we were to put 6 MHz-wide television channels throughout the region of possible laser emission we would have room for about 20-million separate TV channels!

The region on the electromagnetic spectrum which can be used by lasers starts considerably below the visible light region. In numbers, laser emissions run from a wavelength of about 5.3 to 0.4 microns, and visible light runs from about 0.7 to 0.4 microns. (In case you are having trouble with "microns" and don't have a dictionary handy, a micron is equal to one one-thousandth of a millimeter, or 10,000 angstroms.) When you get down to these wavelengths, missing some-

thing by a "hair" can put completely out of the ballpark, since the length of these waves is about 100 times the size of a hair!

To put it another way, the electromagnetic range theoretically possible with lasers would be capable of carrying about 300-billion telephone conversations simultaneously.

Back To Earth

Although it's interesting to speculate, such astronomical channel capacity is completely beyond present television needs. So, returning to some numbers that are a little more down to earth and in line with current technology and needs, we find that with the best of LED-fiber-PIN combinations we can now transmit about 30 6 MHz signals through one of today's 90 micron "glass hairs" with plenty of room left over for guard bands. With a 1 volt video signal fed into the fiber optic link, you can expect a loss of about 2 dB per kilometer (0.62 mile) using the best of today's OF, which means that over a long distance you would need (20 dB) amplifiers about every 10-15 km (6-9 miles).

The receiving PIN diode and amplifier currently being used by Teleprompter is very lightweight and small—only about 10 cm (4 inches) square. The signal-to-noise ratio of the installation is reportedly 57 dB. The biggest current limitation appears to be the frequency response of the LED light launcher. The Teleprompter LED's are manufactured by Bell Northern and have

a response of 20 MHz, but the state-of-the-art appears to be the 200 MHz LED's recently announced by RCA.

Other Current Applications

The Teleprompter installation isn't the only communication-related OF application. Rediffusion in England has installed an underground video link which they are currently testing. Japan is wiring a small community with OF, which will probably represent the first full-scale test anywhere. France is reportedly anxiously awaiting the outcome of such tests before launching an extensive OF project for Paris.

If rumors can be believed from France, that country plans to take a quantum leap into state-of-the-arl communications by wiring the entire city of Paris with OF (instead of coaxial cable), thereby giving it the most modern broadband communications system found in any of the world's major cities.

Future Possibilities

The adoption of digital signal processing will undoubtedly be a major step forward for OF technology. At the same time, however this will vastly complicate the "cable"-to-home CATV interface. A digital-to-analogue-to-RF converter would undoubtedly necessitate a very sophisticated and costly "black box"—at least with today's technology.

The first approach, and the one that seems most practical right

Quality, Reliability, Service...

Excellent Reasons for Choosing ADM®

When you buy an ADM Console, you buy a company. You buy our skilled engineers and design personnel, our professional know-how and more than ten years of experience in building consoles that are unexcelled for quality and reliability.

Audio Designs[®] has consistently been a leader in innovative concepts and "state-of-the-art" techniques. Our principals have worked on the studio side of consoles—they know what professionals want and to do their demanding jobs faster and easier. And customers know that ADM Consoles are engineered for consistent high performance. That is areason why our customer list reads like a "Who's Who" of the industry.

consoles are manufactured with the finest components for long life and ble-free operation. Hopefully you will never need service, but if you do, we will provide assistance promptly and without question. Our five-year arranty is the most liberal in the industry. Before you buy any consolestandard or custom—let us give you some more reasons why an ADM Console is your best buy. Call or write us soon.

BY AMPEX INTERNATIONAL OPERATIONS, INC.

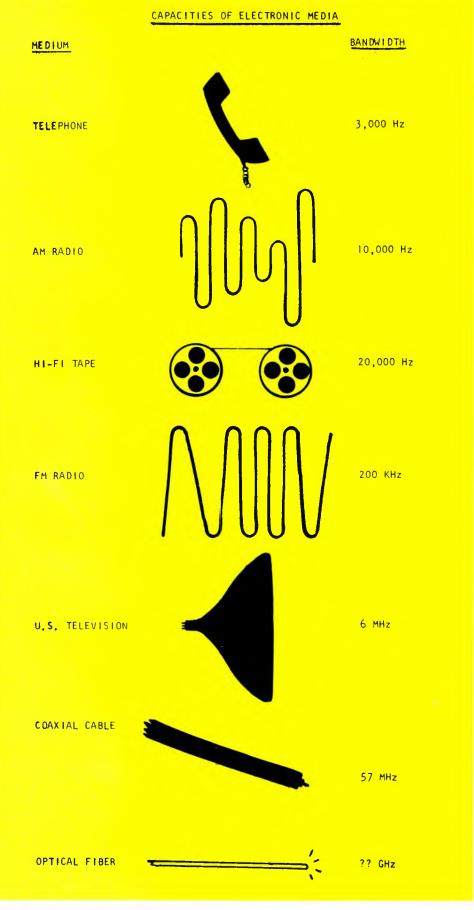

Fig. 2 The bandwidth and information-carrying capacity of electronic media continues to grow. From a bandwidth of 3 kHz (telephone), we now have developed a medium (OF) which, with the help of lasers, could (theoretically) have a bandwidth in the trillions of Hz. Right now the theoretical is a long way from the possible, since the maximum bandwidth attainable is reported to be 200 MHz. However, as the technology develops, we might someday see bandwidths of ten and hundreds of GHz.

now, would be to use OF trans sion only for major long-dist links. From this point the diglight-frequency signals could converted into analogue RF and into branch lines for local dibution. In the case of CA existing coaxial hardware would become obsolete. By making long-distance hops by OF, cer quality and cost advantages show be possible.

Another possibility would be take the OF cables directly into home. Receivers would have to manufactured which could accommodate the digital OF signal (a with standard RF).

For starters we could ini channels which operate on do our current 525 line standard. Vi 1,050 or so lines we could achie video resolution which would en the resolution the 35 mm mo picture film we see at thear Large-screen television project systems would then become meaningful in terms of incre: image detail. With "bandwidth" burn," we could even transfe three separate 12 MHz picture one for each of the primary coll Why compromise anything? I let's not forget audio. We wi want two audio channels minin (stereo) and would probably wan throw in the provision for a more for other languages, diffe age levels of comprehension, etc

In the beginning, even if on few entertainment centers had a receiving equipment, it would matter, since such "narrowcast gramming" could be inexpensited distributed, once the OF systems a reality. The programm would not crowd anything else of the hand.

of the band. As a final note, it should be I in mind that at this early stage OF technology there are m claims and counter claims at what it can and cannot do. I withstanding some confusion specifications present OF limitations, what we do known that fiber optic technology is definitely on the scene in bro casting—both in this country in Europe and Asia. The future these little hair-sized fibers 10 good, and they may even (as dicted) have the impact on 6 tronics and broadcasting which

be equal to that of the transisto

NTENNA AND RANSMITTER ISER REPORT

M-AM, NEW YORK CITY, MS 50 kW AMPLIPHASE ANSMITTER

H-AM delivers great sound and the clock," reports Bob In, Chief Engineer of this station.

Ir RCA 50 kW Ampliphase smitter comes through with a mut signal in the tough New market," Mr. Walton says. "It's BTA-50J, located at the tena site in East Rutherford, and remote-controlled from anhattan studio.

operate the Ampliphase and r transmitter as an Alternateystem, with a weekly over. The common point oce presented no matching of the Ampliphase transfor does our directional

W Ampliphase mitter delivers a standout

WBEN, BUFFALO, UPGRADES WITH REMOTE-CONTROLLED TV AND FM TRANSMITTERS

"We used RCA on our TV-FM modernization program for good reason," says Frank Maser, Director of Engineering for WBEN, Inc.

"When you're investing nearly a million dollars in new plant facilities, more than equipment is involved. Technical expertise in system design and installation is important—and RCA was able to provide this

valuable support.

"The automated transmitters for

"Technical expertise in system design...important"

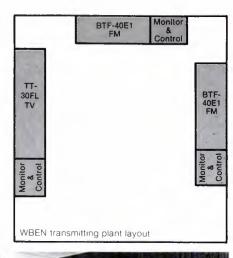

FM and TV completed our initial master updating program. Both systems are remote-controlled from the studio, with full redundancy in circuitry, STL, power, and transmitter functions.

"For TV, we installed a TT-30FL, 30 kW transmitting system with OPTO-Switcher and bi-level switching capability. This arrange-

antenna system.

"I like the BTA-50J's wideband sound and low distortion. It doesn't use a modulation transformer or any audio transformers—which gives us a cleaner signal over a wider frequency range. And, although we operate at 100% modulation, it is good to know that the transmitter is capable of 125% modulation.

"The RCA transmitter sounds great and gives no trouble."

ment gives us full flexibility to operate in parallel, or one side only, maintaining optimum VSWR without need for re-tuning.

"Rock 102, our 24-hour-a-day automated FM stereo station, operates twin BTF-40E1 40 kW transmitters as Alternate-Main systems. With this configuration and our custom logic systems, we're well protected against transmitter outages. The transmitters are fully automated, including automatic power level control. Our FM plant also includes a new BFG-8 circularly polarized antenna with de-icers.

"With the new transmitting systems behind us, we're moving on into the next phase of our master plan for improving technical operations."

"...transmitters are fully automated, including automatic power level control"

At the Olympics, we saw coverage from a helicopter. Here you see Larry Scheer (left) of KNBC, Los Angeles, working as possibly the only U.S. newsman to pilot and report from what is, in effect, a mobile, remote color TV station mounted in a helicopter.

What's Ahead For Broadcasters?

By Ron Merrell

Don't get caught looking. It's nice to look down the pike, but if we dream too long of tomorrow, we'll lose today.

If there is any one thing you can say with certainty about the broadcast industry, it's that changes will confront us just about the time we settle down to the task of digesting the last twist or turn in the technology.

In this issue of **Broadcast Engineering** we've put together some of the changes that are likely to affect the industry. Fiber optics, by far, is the most distant and mind boggling. But fiber optics is only one of the shadows on the horizon with new challenges we could be facing. Even if fiber optics is still years away from making inroads on the broadcast industry, it already is being introduced to cable television.

But not all changes are technical. OSHA appears on the scene, the environmentalists throw up roadblocks, the FCC gives and takes away, the FTC puts advertising under the microscope, and even the professional and trade associations

find themselves pressed to keep their rails straight.

On a day-to-day basis, the industry is on the edge of its chair. Which way will it go and will the trend last? And one of the greatest dangers is that the broadcaster can get caught waiting. ENG is a fine example.

Most of the early ENG equipment was not designed for broadcast applications. But innovators at the network and local station level opted for experimenting and doing it their own way. When improvements in equipment began to hit the market, they were the ones in the best position to make judgments on what features were relevant. Meanwhile, this doesn't mean that film is dead. There still are situations where film is more appropriate. What's more, the conversion costs may be inconsistent with profits vs. investments at some stations. Of this you can be sure. the industry will gain from the competition.

At The IBC

At the recent International

Broadcasting Convention in I don, ENG was one of the hot topics. Even the planning or mittee had not anticipated such interest, and several hund people were turned away. I general European and U.K. feel has been that image quality ENG pictures is just too poor serious consideration as a pict origination format in non-NT countries.

ABC's Julie Barnathan and seph Flaherty of CBS stood the ground, based on network news a special events coverage experient Actually, Barnathan was not member of the panel, but he makes opinions heard. Others on panel were: moderator E. R. Rof the BBC's designs department A. Protheroe, BBC News; M. Mizono, Sony; F. Van Poessel, Philiand J. Fielek of Microwave Asciates.

This meeting will be covered detail in the January issue. I from a what's ahead standpo Barnathan stated that ENG equipment must be easy to operate a ultra reliable. He added that cost had to be controlled becaevery \$1000 added to the Epackage cost would have to multiplied 100 times at ABC cause of the number of units thave in the field.

A Shopping List To Remember

The networks usually lead

RCBS was into electronic news mering at the network and n level in 1971. Today, more 400 stations are equipped with kind of ENG equipment. from the flagship stations, is not commonly known is metwork engineering, produchand management can have a effect on what the manuerrs will come up with next. It the only way innovations are but even when the manuerer develops something really n his own initiative, his initial induction often is made to the rks.

Athe recent Society of Motion the and Television Engineers (MTE) annual conference, CBS/rolcast Group president John A. The word was loud adlear.

e at CBS are now in our third position of ENG equipment. The minicam weighed 51 pounds, and for the 1968 convention.

73, we had the first camera and expressly for ENG. That the day pounds.

he latest newsgathering camure fantastic. They only weigh runds. And the development of ortable videotape cassette remer has been a major contributo the success of ENG. It is possible for journalists, apped with camera and remer, to report the news elecmally right on the spot—whereand whenever it happens.

tt even the best 'portable' coler weighs 32 pounds, a heavy und after a while. Thus, the first con our shopping list is a truly tible compact, reliable videoperecorder, weighing only about bunds. This may require a une in standards that CBS may aling to accept.

byond ENG, the next item on st involves the power source is portable equipment. Presity batteries are heavy, too They have also been known k and even to explode. Reing is sometimes unreliable too time-consuming. We need the resource with a capacity of tt-hours per pound of weight, can be re-charged reliably night, and which is safe and perate over a range of tem-

perature.

"Perhaps you can attack the problem from both ends, by reducing the power required to operate the portable equipment while reducing the weight of the battery.

"When a news event is covered abroad, we have to be able to edit and assemble the complete story on the spot. We must be able to transmit it by satellite, ready for broadcast. Thus, for the third item, we need smaller and lighter videotape editing machines and edit controllers which can literally be fitted into a couple of manageable suitcases. Once again, the editing equipment must be batteryoperated. It must have all the facilities needed for editing and assembling a complete story to be transmitted, ready for broadcast.

"Equipment with these characteristics obviously lends itself to the production of documentaries. In fact, many local television stations are already using ENG equipment for documentaries. The cost savings are enormously impressive, where a shooting ratio of 30 to 1 is common. The freedom to keep the camera running has made all the difference for the producer in the field.

"However, the high shooting ratio obviously means a very large number of edits, and this in turn requires more sophisticated editing equipment than is now available.

"And because the camera crew should be as unobtrusive as possible in both news and documentary shooting, we need greater sensitivity for the cameras to operate effectively in natural indoor lighting. Perhaps you can achieve a two-stop improvement in sensitivity in two ways. The pickup tube in the camera may be made more sensitive or the zoom lens may be made faster.

"Speaking of optics, cameras are approaching the point in development where we have to plug a camera into the lens. It used to be the other way around. In the new Microcam the lens weighs two and a half pounds; the camera weighs eight pounds. However, the type of lens needed for typical sports shots weighs more like 57 pounds and is 10 times the bulk of the Microcam. Even on full-sized cameras, the

marvelous and expensive 30:1 f/3.5 lens looks enormous, like an all-seeing eye in a science-fiction show.

"Can't you pass some new laws of physics—or make the electronics so good that a big part of the zoom range can be handled by signal processing? Somehow, we just have to have a smaller optical front end. The optics problems, by the way, are equally serious whether on film or tape.

"Now let's turn to sports coverage. Have you ever seen our mobile units heading for a football game? On the road, they look like an armored division on the move.

"There are two semi-tractor trailers, each 40 feet long and 8 feet wide. One of these has expanding sides to increase work space when operating at the event. We may use 6 or 7 cameras at a regular football game, and up to 14 cameras for a special event like the Super Bowl. The gross weight of just one of these loaded units is 31 tons. The cameras must be monitored, switched for live broadcast, recording and slow-motion replay. There are microphones, audio switchers, and miles and miles of cable.

"There is no hiding the fact that it takes tons and tons of equipment to cover a major sports event, not to mention conventions, elections and the like.

"Even covering an event such as a golf tournament is a monumental undertaking. CBS doesn't own the golf course in Augusta, but I sometimes wonder. We have 16 miles of cable buried beneath the sacred fairways to provide the hole-by-hole coverage that viewers expect of the golf classic.

"Why is all this needed?

"One major advance in reducing the weight and size that you have given us in the past few years is changing from a cable the size of my fist to one the size of my little finger. We truly appreciate that, but we need more, much more.

"We need a color-stable, high quality, motion-insensitive transmission system.

"Perhaps digitally encoded signals along with automatic digital reprocessing can be used to achieve a "walk-around" wireless camera. Perhaps frequency bands and bandwidths not now allocated to the broadcaster may be the answer.

Why Do We Have On Customers In 20 Countries C

10 Orders From Continents For BCN VTR's?

EN VTR's are superior:

They combine quality of uad's with economy of 1 inch TR technology and portability.

ICN VTR's are proven:

Thousands of hours of eration at many customer es, in studios and outside oadcasting.

ICN is really portable:

The light-weight version CN 20 operated successfully in ats, helicopters, cars and dring the Olympic's in Innsbruck d Montreal.

NCN 20 - 69 min tape reel

ICN 20 - 80 min battery

ICN 20 - 23 kg light-weight

ICN 20 – auto-take assemble.

ICN is the advanced solution:

3 high-quality audio tracks untinuous recording – no gap, aptable to digital recording, angle frame display, cassette eration etc.

BCN is available:

4 leading broadcast equipment manufacturers supply you with the BCN VTR's for NTSC, PAL, PAL-M and SECAM.

You don't have to wait ...

For further information contact your local Bosch-Fernseh representative or Robert Bosch Fernseh-Division in Darmstadt/West-Germany, POB.

e engineers have decided: System

For More Details Circle (120) on Reply Card

"Now if you do manage to create a lens-camera combination that is compatible in size and is as compact as we want, we come to another onerous problem on our shopping list.

"We have prompters which are in effect large 'portable' television receivers placed on the camera. The arrangement is in every respect a full-fledged Rube Goldberg contraption—and one must almost mount the camera to the prompter. It is an unbelievable rig. It adds an extra cable or two to be taped to the camera cable—or vice versa. It's time to do something about this.

"I understand a hologram produces an image right out there in space. That would be a good objective for a solution to this problem. I respect the problem; it's a tough one.

"That takes care of news and sports. But the largest part of our broadcasting operation is television entertainment. It is competitive, and we want to do it in the most effective and economic way.

"At present, we use both videotape and film—about two-thirds tape and one-third film. Film is more flexible, but it's twice as expensive to use. So, if we are successful in working out satisfactory labor agreements, we plan to start using tape at our Studio Center film stages in Hollywood, where many of our situation comedies are made before live audiences.

"However, film is still used in our nine weekly, hour-long primetime drama series. We would like to convert to tape. But that means that we will need an electronic editing device—something to handle the 300 to 400 edits presently made in each hour-long program by a movieola. Perhaps that is something that you, here in this room, can develop.

"That's our shopping list. Not too long, although perhaps demanding.

"As you see, all things have not been invented, and all techniques have not been developed.

"We have been in this business for a long time, by current standards, but in some areas we still use first generation equipment.

"This shopping list is not of the pie-in-the-sky variety. It's down to earth. It's something that the people in this room can fill."

Now the manufacturers are not always waiting with baited breath to hear what the nets want. Enough of them are leaders in their own right. But the fact remains that when the nets say they want something, it has a definite effect on what you're likely to see, sooner or later, exhibited at conventions.

CP Antennas

Although still in the wings, circular polarization for television was the subject of a petition of Rule Making filed in February of 1975 by the American Broadcasting Companies, Incorporated. The reply comment date was September 6. 1976. There was substantial response from the networks, the Corporation for Public Broadcasting, the NAB, the Association of Maximum Service Telecasters (AMST), equipment manufacturers and broadcasters. Apparently, there wasn't a consensus. In another section of this issue, you can read a report updating that situation.

There's Logic, Too

In recent issues, BE has been running a series on "Logic Illustrated". In recent times we've seen digital becoming a vital part of the broadcast equipment scene. A better understanding of how digital circuits work is a prime requisite for keeping up with what's coming down the pike. More importantly, since it will likely continue on its way to more widespread uses, a lack of at least basic digital logic theory will cause more problems than the equipment was designed to solve. The equipment manufacturers could be forced into increased costs, if they become too closely tied to equipment downtime. Troubleshooting digital circuits is a problem confronting both the broadcaster and the manufacturer. In 1977, Broadcast Engineering will start a monthly column called "Logic Lab". The first part will deal with where you can get more information on digital logic, and from there we'll be off into practical troubleshooting.

Up and Down

Up in the sky, satellites are and more a factor in everyday munications. Who knows how we are from seeing the network pumping programming down the sky to the local TV staryou'll be seeing more on the BE.

What About AM And FM?

In another section of this is our Radio Workshop editor is his look ahead. But looking at is not a private issue. Cox Brocasting, among others, has doing its share.

Cox's data show that:

- FM stations have been profisince 1973.
- FM revenues have grown ovel percent per year since 1963.
- In the Top 40 market, I share of radio listening will r 42 percent this year.
- In the country as a whole, FM audience should account about 35 percent of all radio living this year.
- FM revenues should grow a percent annually over the next years, while AM revenues will at 4 percent annually.

Parting Shots

Automatic and unattended to mitters will be in great evidence the future. TV stations will their chance at circularly polar antennas. And as you might pect, live news will find its way virtually every station.

Somewhere out there, we're g to see the solid state pickup de replacing tubes, especially in l cameras. Automation will bec an increasingly important facts daily operations at TV state. And you can expect to see r from the video disc and hear r about the digital VTR. Watch stereo. Of course there will be c innovations.

Before we pull the switch het word of caution is needed. You can't afford to say, "Well, if great stuff is coming, I'm goin hold off until it gets here." Tare station needs for today tomorrow. The danger is that to can be lost because tomor didn't get here soon enough.

will be glad to show you the 1480 and its benefits.

Broadcasting And The Environment

By Harold Dorschug*

One of the stories about the environment making the rounds recently purported to relate a conversation between the Lord and Moses.

According to the story, the Lord said to Moses, "There is both good news and bad news. The good news is that plagues small smite your Egyptian oppressors. The Nile shall be turned to blood, and frogs and locust shall cover the fields. Gnats and flies shall infest the Pharaoh's people, and their cattle shall die and rot in the pastures. And hail and darkness shall visit punishment upon the land of Egypt!

"Then will I lead the children of Israel forth, parting the waters of the Red Sea so that they may cross, and thereafter strewing the desert with manna so that they may eat."

And Moses said, "O Lord, that's wonderful. But tell me, what's the bad news?" And the Lord replied, "It will be up to you, Moses, to write the environmental-impact statement."

If you have filed recently to construct an AM directional array, or any towers or supporting structures over 300 feet, or any of four other FCC major actions, you may understand how Moses felt. Such construction requires submitting environmental information which may include an impact statement. *Chief Engineer, WTIV-TV, Hartford, Conn.

While this probably will be handled by your attorneys, there are certain aspects of the process which you, as an engineer, should understand in order to assist them. Your advice in pointing out areas in which broadcasting facilities are not as harmful to the environment as some other uses, and in offering suggestions for minimizing the impact of new construction, can be very helpful in persuading zoning and planning agencies to give approval.

The environmental issue is highly charged with emotion and often vague points of relatively minor importance are allowed to confuse a proceeding. Factual information, especially on some of the semimyths that laymen hold about the effect of electromagnetic radiation on the environment, should be presented in an authoritative manner as often as necessary. Later, the engineer has a very important role to play in making certain that the plans proposed have minimum effect on the environment and that the work performed follows the original proposal.

As a result of a widespread movement to end practices which were destroying many valuable and irreplaceable aspects of man's natural heritage, Congress passed the National Environmental Policy Act of 1969. The FCC implemented the Act by incorporating its provisions applying to communications in Subpart I of Part I of the Rules

and Regulations containing Stions 1.1301 through 1.1319. Before planning any new work, start reading this.

If your project comes within t provision, read everything you c get your hands on devoted to t subject, especially material coveri the legal aspects, stories of cas involving power lines and pi lines, and the effect of electr magnetic radiation on the enviro ment. Such reading won't make y an expert in the field and don't 1 to pass yourself off as suc However, it will acquaint you wi the language and processes e countered in opposing faciliti intended for critical areas. Abo all, don't deride your opponents you have any). The preservationis are usually sincere, intelligent, dec he cated members of your communi who want to keep your part of the earth in good condition for peop yet to come.

The Roadblocks

What are possible reasons for objecting to new construction? Het we are discussing how transmitted as studio plants located in down town areas must satisfy other criteria. In this former case, the tower is generally the first targe because of its visual impact. Admittedly, a tall tower can't be concealed and it is difficult to justify its presence in the desired location to laymen. This is free

How a Panasonic VTR elps WISH-TV eliminate make-good headaches. FAST! FAST! FAST!

ISH-TV, the CBS affiliate in Indianapolis, they're using eo tape system primarily designed to stop robbers... op another kind of loss—false claims for make-goods. The system is the new Panasonic time lapse video tape rder NV-8030. As Joe Missick, WISH-TV's director of neering, explains it: "When an advertiser refuses nent because he says his commercial didn't run, or 't go off right, we don't argue—we just show him a tape.

"Now there is no question of what was run. There it is ur advertisers to look at, and there are no areas of lention. We have already saved the cost of the isonic time lapse video tape recorder in the first lays by eliminating false claims for advertisers' e-goods."

The Panasonic VTR not only verifies that the spots ran, hat the video reception was good.

In addition to high resolution, the Panasonic NV-8030 is atile. WISH-TV also uses it for log verification, to check ommercial loudness and to pinpoint any transmitter ruption.

The NV-8030 can record pictures from an off-air itor, continuously in different time sequences—9, 18, 72 up to 108 hours (that's 4½ days) all on one reel of tape.

WISH-TV uses it in the 18-hour mode—so one tape monitors virtually an entire broadcast day.

Could the system work for you? The easiest way to find out is to call us. Or send us the coupon. That way, the next time one of your advertisers makes a false claim, instead of telling him he's wrong—you can show him.

quently one of the few choice open areas left. Engineering constraints often make it difficult to find a suitable alternative.

AM plants, by nature, require flat, level terrain, ideally of a moist character. Tower height is determined by frequency and efficiency. Painting and lighting must meet governmental regulations. There can only be one "best" answer to the problem. Even though during storms or other emergencies its critics may stay tuned to the station for up to date information, in good times it looks like a big piece of ugly steel standing right in the middle of a wetland ecosystem.

FM, TV and microwave towers are vulnerable to the same arguments. Here the best site seems always to be on a hill that creates the most objectionable silhouette on the skyline. However, some latitude does exist in meeting power-height combinations and your knowledge of this relationship may help in working out a compromise. In a number of hearings covering a broad field reported in the literature on the subject, it was shown that if there is no satisfactory alternative, a reasonable accommodation could be worked out if the problem is approached properly.

Positive Points For The Station

What are some of the positive points to be emphasized on behalf of broadcasting?

Compared with other users of an equivalent amount of land, such as industry or housing, a broadcasting facility does not create any of the following problems:

- It causes no air pollution, creates no oil slicks, nor are any toxic gases used.
- There is no noise problem.
- Waste disposal demands are minimal.
- No valuable resources are removed from the earth such as minerals, gravel or timber.
- It has one of the lowest use densities, resulting in maintenance of the greatest amount of open space. For example, a two-tower array with full half-wave ground system at 1 MHz requires about 30 acres, yet less than one-half acre would actually be used for building, tower bases and guy anchors. The

balance remains open space. With a ground cover of grass it would be a natural habitat for wildlife.

• Because of this low density use, minimal demands are made on community supported services such as police, fire protection, schools and roads.

The Big Myth

The matter of radiation sets broadcasting apart from other more common property uses and it must be considered because it is often confused in the layman's mind with nuclear radiation. With the current controversy over nuclear power stations, you should be in a position to adequately answer any questions about broadcast radiation.

Controlled laboratory tests on both plants and animals have demonstrated that electromagnetic fields produce observable effects. In the case of animals, "it is possible to observe agitation, excitement and increased motor activity sometimes going as far as turning tranquil animals into agressive ones". In the case of plants, "at large field intensities, for example in the vicinity of relay transmitters and ultra-short-wave links, growth is inhibited".

The authors of this reference work concluded, "if we keep in mind the fact that the biological effects of radio waves depend on a number of factors (the most important being intensity of the field, its nature, and the exposure time), it becomes clear that not even the final results will be unambiguous and will vary more or less (or even be contradictory)". These tests used high intensity fields with carefully focused exposures not usually found in or around broadcast facilities. Also, pulsed radiation was found to be more biologically effective than CW.

An excellent survey of the broadcast situation in the IEEE SPEC-TRUM of August 1972² reaches the conclusion that "Radiation levels found in the vicinity of high-power broadcasting stations, in most practical instances, are considerably lower than those usually associated with biologically hazardous fields."

This statement assumes that itinerent personnel will be kept away from areas of extremely high fields, such as AM tower bases, by fences or other protective closures, and that FM and radiation, because of the ver patterns of the antennas used, not be directed at people.

Very often transmitters locate suburban or rural areas suplarge populations of small vanimals such as skunks, squirfoxes and even deer, together vanakes and birds. It does appear that the RF fields contally saturating their habitat danges their life cycle.

Unfortunately, while reseat and study continue, opinions scientists often fail to agree. A result, standards for safety throughout the world are uniform. The greatest attention been given to effects of 3-30 G radiation, where tissue heating the primary hazard. Lower f quency phenomena have been 1 thoroughly investigated because the lack of evidence of damage.

Maximum Levels

In the U.S., maximum recommended levels for human exposition have been established by the Amicon National Standards Institute (ANSI) and adopted by OSHA. If a frequency range of 10 MF 100 GHz, these are a power dens of 10 mV/cm² for periods of 0 hour or more, or an energy dens of 1 mWhr/cm² averaged over a 0.1-hour period. There is no linestablished for radiation below MHz, although there appears to no reason why this same standa could not be used.

In the USSR a value of 20 V/has been adopted as the limit ov the frequency range of 0.1-1.5 MP but the Czechoslovakian Socialis Republic limit is only 10 V/m for range of 0.01-300 MHz for an hr/day exposure.

How Can The Broadcaster Help?

In summary, what steps shou the broadcast engineer follow protecting the environment? We suggest that he should use he specialized knowledge and ability and here are some ideas.

First, he must attempt to loca any new construction in the lead critical areas available and still to consistent with engineering requirements and statutory ordinances.

be sincere in his belief and de that the site he proposes is best available. However, he d investigate acceptable alterles, in case of controversial notion. He must convince his etects and engineers to design minimum facility required to hive the objectives and have the sting concept present a harmous blend with the surround-The lowest land density use is ne most likely to be accepted. scond, he should seek the we of a qualified advisor such professor in the ecology terrtment of a local college for memmendations on protecting the sensitive flora and fauna, nangered species list items, etc., how best to preserve them⁵. In action has solved at least one -on confrontation3. mangement must be persuaded to cize the plans in order to any possible criticism that thing underhanded is being prosed4.

hally, he must make absolutely

certain that during installation, everything is done which he agreed upon with the preservationists. He should keep approaches to the property as narrow as possible. He should keep heavy equipment and building material off delicate root systems. He should reduce dangers of erosion and siltation by disturbing ground cover and soil as little as possible, by reducing the time when raw soil lays open and by covering exposed soil with mulch whenever possible to prevent run off. He should keep in mind that what may look like a weed to him can be a very delicate and scarce part of the ecology.

A concerted effort by everyone concerned can achieve your goal if you follow an approach which proves that you are not trying to use the earth's resources for a narrow or selfish interest. Show that you acknowledge the generations of the past who have preserved what we now use and that you are not forgetting the many generations yet to come. Only in

this manner can life centuries from now become more than bare survival.

PERFECT TIMING

rogrammer/Comparators and Controllers

nether your station is based in New York, Honolulu or anywere in between, perfect timing of programs, station breaks d commercials is essential. To meet your exacting timing quirements ESE now offers two precision timing systems. In flexibility and economy with up to ten events, ESE has de-

gned the 750 Series of Programmer/Comparators. Igged thumbwheel programmers coupled with an E clock or timer to provide a single pole conct closure (1 Amp contact rating) for the length time program matches display. Low on cost, the liable Programmer/Comparators start at \$305. Tite, Wire or Call Today: 505½ Centinela Avenue

When you want to program more than ten events, consider the ES 780 Series of Programmer/Controllers: A Solid State Random Access Memory united with an ESE clock or timer to provide 32 user-programmed outputs. Ten minutes is all you need to program all 32 events. Manual override and ten sec-

ond re-programming provide maximum flexibility. All this in $5\frac{1}{4}$ inches of rack space! Internal crystal time-base and battery pack are standard features. Four digit, 32 event units are \$1,200. and Eight digit, 32 event units are \$1,500. Custom options and special orders are available.

What's Ahead For The Radio Broadcaster

By Peter Burk

Unless you've had your head buried in a transmitter for the better part of 1976, you're already aware that another technological revolution has descended on the broadcast industry.

Spin-offs from the computer and aerospace industries continue to spin into our domain, making it possible for us to deliver a better product more economically. In addition, the FCC is inching toward some changes that will enable us to take advantage of the new technology and offer our listeners exciting new aural delicacies. This month, as we tie the ribbons on 1976, we'll peek into the next three hundred sixty-five and beyond and see what effect these advancements will have on the back shop at your station.

No More Logs

By the time this issue goes to press, the commissioners at the FCC will be voting on the long-awaited Automic Transmitting System (ATS). If the men in the ivory tower put their blessing on the proposed system, many stations will be able to install a black box that will relieve the necessity of an operator on duty.

After approval by the commissioners, appropriate rules will have to be adopted and a magic date for going on the system established. It's hard to predict how long that may take, but if you have enough operating logs to last through the coming year, you probably won't have to get any more printed...ever.

AM Stereo

Stereo has probably done more for FM than all of its other assets put together. It's natural then that AM broadcasters would like to jump on the bandwagon. To date, two AM stereo systems have been proposed. The Commission isn't doing any testing on either system yet, but is interested in the results of outside studies now being conducted. Before any changes of this type can be approved, it must be demonstrated that the system is fully compatible with existing receiving equipment and that mono quality will not be degraded.

The receiver manufacturers are expressing a great deal of interest in AM stereo, and are providing some of the input to the broadcast industry. One of the interesting problems is the matter of lighting a 'stereo' light on the receivers. Most broadcasters agree with the manufacturers that it is almost imperative to inform the listener visually that both ears are being stimulated separately, but the limited bandwidth on AM makes the transmission of a pilot difficult.

It's not likely that any action on AM stereo will be taken in the near future, but it's something you might think about if you're planning a new AM studio. The transmitter conversion will be simple compared to the changes necessary at the studio.

Music For Four Ears

If you think stereo proof of performance is a task, dream for a few minutes about discrete four channel for FM. Let's see...left front into right ear, left rear into right front...twelve separation measurements at each frequency, not to

mention cross-talk!

Progress on quad at the FCC encouraging. Field tests on a corete system have already been conducted and are being analyzed the chief engineer at the comission's labs in Laurel, Marylal Results should be out in three six months, but don't hold yobreath waiting for a notice of place posed rule-making. Pacific FM Infiled their discrete four champapplication in 1971!

Several months ago, CBS fill for adoption of standards for F stereo quadraphonic transmissi and in all likelihood, Sansui w make a similar application. No ten have been filed yet on either mati system, so it's going to be a whole before any decisions are made.

The Commission isn't intentionally dragging its feet on the projects. The main concern is the any new system be the best posible, since we'll have to live with for a long time. On the bright side the people shortage that has han pered the Commission is beit rectified. Many new department hat have been short of warn bodies are hiring right now.

Fortunately, not all of our tecl nology requires commission approval before we can put it to worl Microprocessors are perhaps th hottest thing in radio automatio for 1977. Digital has become a wa of life, with applications blossomin in almost every corner of th station. 1977 should bring us 'smart' audio processor, more soph isticated tape handling equipment and a whole raft of improvement in almost every type of broadcas equipment. Ever increasing use 0

Old-New Reel Time Recorder

Telex/Magnecord series 1400 broadcast quality recorder/reproducer. An old name that spells reliability. A new design for today's state of the art.

• The Old. Telex/Magnecord products are still made in the USA so parts and service are always available. The series 1400 is still built on a solid die cast aluminum main frame for reliable operation around the clock. It's still available in full. half and

quarter track configurations, has fail safe differential brakes and accepts 8% inch reels. It also still comes with three motors—but then, that's touching on the new.

• The New. A brushless d.c. servo drive with a crystal oscillator control reference so accurate it virtually eliminates program timing errors. New, three speeds: 3¾ - 7½ - 15 ips. New catenary head block for straight tape loading, the convenience of one hand cueing and the bi-level illumination of push button controls. New DTL logic controls eliminate EMI and

provide fast,

spill

proof tape handling gentle enough for half mil tape. And new electronics, clean to 60 dB S/N at all speeds.

• If you're looking for a real time, reel recorder with old name reliability but designed for today's demands, you'll find it in the Telex/Magnecord series 1400. For complete information please

large and medium scale integration is responsible for much of the progress.

Electronic news gathering, television's claim to fame last year, will receive more attention in radio as we find ways to preserve the immediacy of radio without sacrificing quality. **Radio Workshop** will devote the next several months to ENG for radio.

Are You In The Picture?

Yes, the state of the art is advancing rapidly. Are you? 1977 technology requires 1977 engineering. The engineer who's still emptying grid leak pans had best keep an eye on the young fellow standing behind him. Sure, he's still a little wet behind the ears, and probably doesn't know a cat whisker from a 5Y3, but you can bet he won't get

lost on a Karnough map.

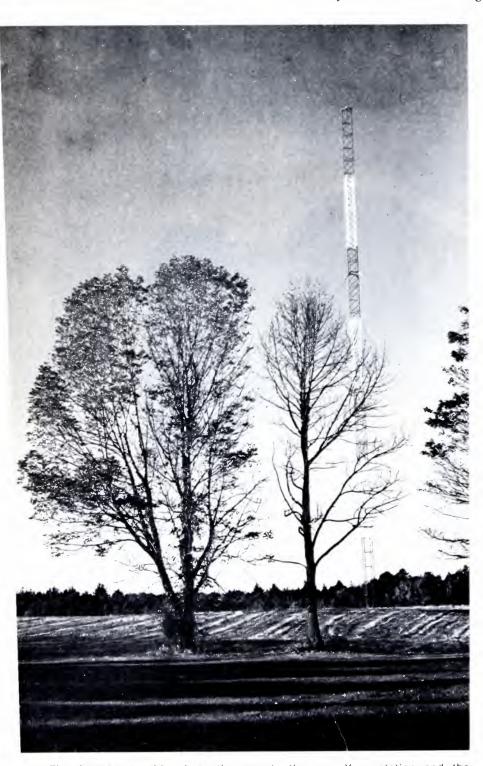

A comfortable working relat ship with digital logic is no lor just something nice to have, essential for survival. If you dealready feel at home in the lance true or false, now's the time to with the program. This mom Broadcast Engineering contains last installment of "Logic III trated" by Harold Ennes. No month, BE will begin anoth Ennes feature called "Logic Lal These articles are written on a let that a newcomer to digital logic cunderstand and are an ideal way tune into 1977.

Another way to improve yo grip on those little black cate pillars is to establish a referen library at your station using da books supplied (usually free) by t IC manufacturers. They usua contain applications notes as w as device ratings and pinouts. No. has made the best seller list yet, b they do make for good reading (cold winter nights. Even mo important, when you do have problem with a piece of equipmen you can find out a lot more abou the device in question from the data sheet than you can from the equipment instruction book.

Many colleges and universitic are now offering night courses of digital logic. If you're not at home with logic yet, consider taking course or two. Build or buy some sort of breadboard for experimenting with TTL or CMOS packages. Learning by doing is tough to beat

1977 is also the year to get you shop ready to handle a new breed of problems. A good triggered scope is absolutely essential with dual trace capability high on the nice-to-have list. A logic probe is a real time saver, too. Take a look all your hand tools, too. Removing an IC with a 250 watt soldering iron and a pair of vice grips just doesn't cut it!

If you're in a competitive market, don't forget the guy across the street has as much access to 1977 technology as you do. What worked for you last year might not be good enough this year. Change...like it or not...is the name of the game. If you have a need for informative articles in specific growth areas or if you have ideas to contribute, drop us a line in care of the Radio Workshop Editor.

There's more to this photo than meets the eye. Your station and the environment will be a subject you'll have to face the next time you change sites or plant towers. Note here that towers can blend with the surroundings. (Photo by Harold Dorschug, WTIC, Hartford, Conn.)

E will be running hard to keep up to date on what's happenbut it will be more important ever to make it to the connions. Next up is the annual 3 convention. Exhibition floor re is already sold out. And all acations are that it will set a new ord for attendance. Here is your ence to touch and compare the us you need most.

To doubt about it, there will be aral new pieces of equipment. what the manufacturers like ast is to have the broadcaster stop the booth and ask questions or for a demonstration. All too n the broadcaster walks the es, finds what interests him st, and then stands back and ks and looks and looks...what we ould all be doing is communi-

speaking of communicating, the eiety of Broadcast Engineers (E) will hold their annual meetduring the convention. Here's a den opportunity to meet and we with engineers from all parts of country. You'll learn more but the SBE's engineering certifinion program, and you'll have the vance to talk about the industry d the equipment in the exhibits h other engineers.

From the financial side, and bsed upon recently released FCC tures, FM had a great year in 75. Of over 180 markets report-2, about 160 showed gains, while ly 10 had losses. Eight markets, Il by Jacksonville, Florida, rerted revenue increases of more an 100 percent. AM growth was lod, but not dramatic.

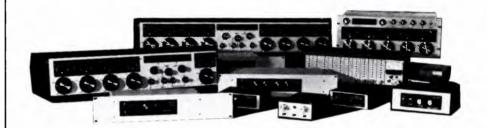

It has been reported (Broadsting, November 8) that NBC is repared to drop their all-news peration, News and Information ervice (NIS). Originally, NBC had anned on signing 150 subscribing ations. They're down now to a ported 62, with an audience of

bout 200,000.

While all-news is down for the ount at NBC, this format has met ith success at local stations. As ou might suspect, the key is etting into the local news and not elying solely on the national news.

Among the challenges to come or radio will be new and intersting ways of carrying the local ews. After all, ENG did start in adio.

An Update On C

By Robert E. Winn*

A subject of growing interest and importance to many broadcasters is that of circular polarization for television. This discussion does not argue the case one way or the other but tries to offer an objective overview on the subject. It briefly reviews the status of the proposed FCC Rule Making and the Circularly Polarized TV tests that have been conducted. It takes a look at the theoretical advantages of circularly polarized TV, discusses the WLS-TV experiment on the Sears Building in Chicago and concludes with a discussion of transmitting equipment requirements.

FCC Status

The Federal Communications Commission adopted a notice of proposed Rule Making on May 11,

*RCA Broadcast Systems.

1976 in Docket No. 20802 looking toward the amendment of Part 73 of the Commission's Rules and Regulations to permit television broadcast stations to employ circular or elliptical polarization.

This notice of proposed Rule Making resulted from a petition of Rule Making filed February 12, 1975 by American Broadcast Companies, Incorporated, that requested the Rules and Regulations be amended to permit the use, on a permission basis, of circular or elliptical polarization for TV broadcast transmissions.

The comment date for the Television Circular Polarization notice of proposed Rule Making was August 24, and the reply comment date was September 6, 1976. There was substantial industry response consisting of the National Association of Broadcasters, the Association

ciation of Maximum Service Tecasters, the three Commercial Tevision Networks, Corporation Public Broadcasting and seve equipment manufacturers. The sponses ranged from strong supp to opposition of the proposal various reasons.

Tests

Limited data on TV circul polarization had been attained an experiment some years ago Station WTAJ-TV, which was the WFBG-TV, Channel 10 in Altoon Pennsylvania. A recent experime was conducted during 1975 a Station KLOC-TV, Channel 19 i Modesto, California. A report of this test has been filed with the Commission.

The American Broadcastin Company obtained an experiment authorization to conduct televisio

The Manufacturers Are Saying...

It was one year ago that **Broadcast Engineering** ran a feature article on circularly polarized antennas. In that article, the CP antenna used in the KLOC-TV FCC authorized experimental tests was described and test procedures were explained. That was the Jampro antenna. And there are others.

Of course Broadcast Engineering is not supporting any one make or model. What most people want to know is (1) what tests have been run, and (2) what do the results reveal? Meanwhile, it's obvious that different designers will find different configurations and techniques. While these differences will

affect the results, what **BE** is trying to nail down is the feasibility. And so far as we can determine, the evidence seems to support the theory that CP antennas can help eliminate ghosting and co-channel interference.

CP antenna manufacturers are putting their money where their mouth is. The antennas are available from Harris Corporation, Jampro, RCA, CCA (marketing the Bogner antenna), Micro Communications and Alford Manufacturing. So it shouldn't be held up because we are talking strictly theory.

Harris Corporation, Broadcast Products Division, feels that their CP techniques will produce excellent results. A company spokesman told **BE**, "Published reports by well known consultants have proven that fact to our satisfaction, and we now feel it is our responsibility to see that this new technology becomes established as the state-of-

the-art in TV transmissions,"

The Harris Cavity Backed Radiator (CBR) CP TV antenna has unique feature. A broadcaster cainstall one now and transmit in thorizontal mode with excellent routs, and then, with a minor on site modification, broadcast consignals when authorized to do so the FCC. Harris, according Product Administration VP Jin Combs, has their antenna in supplication.

CCA is marketing the Bogner C antenna, and they also have one which can be field modified after installation for CP transmissions. Their antenna uses the same basis slot-director technique as their standard horizontally polarized units. Their UHF and VHF high power CP antennas were announced and demonstrated at the '76 NAB convention.

Thomas J. Vaughan, president of Micro Communications, Inc., com-

mlar polarization tests at WLS-M their owned and operated dision outlet in Chicago. The 15-TV transmitting plant was malled in the Sears Building in mago in 1974 and an interim mnna installation mounted on newest cylinder on the top of the mding was employed. Field meamments and observations were me for ABC by Smith and mostenko, Consulting Engineers. Hee engineering reports have submitted to the Commission. witional details of this antenna mem will be given later.

Is Circular Polarization Coming?

he question being asked by my broadcasters today is "Is ular polarization coming?" To no answer that question, it is prortant to look at some of the theoretical advantages of circular polarization.

These advantages might best be seen by first investigating the horizontally polarized signal. As shown in Figure 1, the radiated field lies entirely within the horizontal plane and with time traces out a sine wave. The received signal will be maximum when the receiving dipole is in the horizontal plane, and will diminish to zero as the receiving dipole is rotated to the vertical position.

By taking two dipoles mounted at right angles, as in Figure 2, and feeding them in phase quadrature, we find that we can produce a radiated field that rotates around the axis of propagation with the magnitude of the field vector remaining constant. This radiated signal is circularly polarized and is defined to be either right hand or

left hand, depending upon the rotation of the "E" vector when looking in the direction of propagation. We can see from this diagram that if we place a dipole receiving antenna in this field, the received signal will be constant as the dipole is rotated through 360 degrees. Thus, theoretically, circular polarization makes it simpler to adjust rabbit ear and whip type antennas since the antenna orientation will be less critical.

Ghost Reduction

Probably the greatest advantage of circularly polarized transmission is the theoretical ghost reduction capability. This benefit is based on two factors. First, the reflection behavior of circular polarized fields and second, the polarization discrimination by circularly polarized receiving antennas.

nating on the need for CP TV mennas said, "Some of the additual services that are being med will use TV for shopping, king, instruction, and business. BBC is presently transmitting ed signals to selected viewers are able to ask a computer for

sorts of information...

All these new services have two igs in common: (1) They will nand higher quality reception; (2) It will cost additional ds." He goes on to say that G is involved as well. He goes on conclude, "Our present method ransmitting linear horizontal arization (for TV) is very restricand does not permit the use of of the new Ghost Filtering hniques. CP is not only desired the broadcaster, but will be nanded by the viewer when the applications are implemented, I he has to pay for the service." ampro Antenna Company be-

lieves very strongly in CP antennas for television. In reply comment filed with the FCC, in favor of CP for TV, Jampro's president, Peter Onnigian, stated that none of the opponents for CP really had any substantiating arguments. The Association of Maximum Service Telecasters proposed a "go slow" attitude and more study of the matter to the Commission. The Corporation for Public Broadcasting on the other hand is concerned about a further disparity between UHF and VHF telecasters. CPB believes that VHF stations will switch to CP antennas, while UHF stations may not be able to do so economically. CPB therefore suggests a delay, and more study. Neither MST or CPB have indicated a desire to put money into tests of the matters they question. Onnigian says ABC television and KLOC-TV, Modesto, where Jampro conducted its CP tests, invited all interested parties

to make tests using the two facilities.

Jampro believes that adequate testing of this new type of TV antenna and its resulting mode of propagation has been accomplished. Onnigian says the results are in and are positive. Jampro therefore has urged the Commission to promptly act upon its own proposed Rule Making, and adopt it as written.

In the Jampro tests, they found existing home antennas were completely compatible with CP transmission. As a matter of fact the Jampro field tests indicated 66 percent of the homes tested, showed better pictures with CP, compared to normal horizontal polarization, using the same ERP. Indoor antennas, for UHF reception, which consist of rings, vees, bow ties or other electrically small pickup devices, perform much better with CP transmission than they do with the present mode.

Figure 3 illustrates the reflection phenomenon of electric fields. The right hand circularly polarized signal shown on the right is vectorially represented with the instantaneous horizontal and vertical components. Note that the vertical component is pointed upwards and the horizontal component is directed inward. When the signal is reflected from a horizontal reflector, the horizontal component will be reversed in polarity as shown in the left hand vector representation. Note that the horizontal component is now directed outwardly, and that the vertical component remained unchanged and directed upwardly. The result is that the sense of rotation is reversed, and the reflected signal is now left hand

The second factor contributing to

circularly polarized.

ghost reduction is that of polarization discrimination by the receiving antenna. To rephrase this slightly, a right hand circularly polarized receiving antenna responds only to right hand circularly polarized radiation. Figure 4 illustrates why.

Figure 6

Shown are two receiving and one transmitting antennas. All three use identical cross-dipoles connected in phase quadrature. The transmitting antenna radiates a right hand circularly polarized signal as a result of the connections to the feed lines. The receiving antenna on the left is identical to the transmitting antenna in the drawing, and it is also right hand circularly polarized. Since it is used as a receiving antenna, it faces the transmitting antenna.

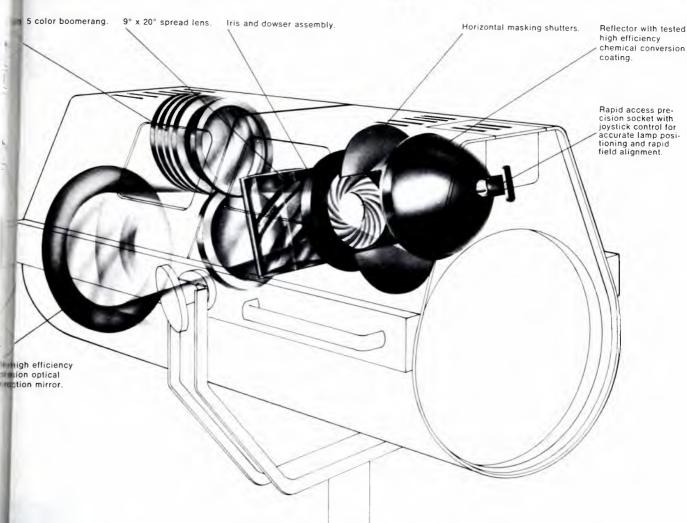

Note from the diagram that if either of the receiving antennas are

rotated 180 degrees to face awa from the transmitting antenna their direction of rotation is reversed. This fact is similar the realizing that the hands on a clock turn counter-clockwise when viewed from behind the clock. This reversal in front to back rotation gives rise to the potential advantage of circular polarization to reduce adjacent and co-channel interference.

The antenna in the center is wired for a left hand circularly polarized signal, but it is otherwise identical to the transmitting antenna. If we supply a signal to the input of the transmitting antenna we see it is first split between the horizontal and vertical radiators and that the horizontal feed contains a quarter wave, or a minus 90 degrees, phasing section. This

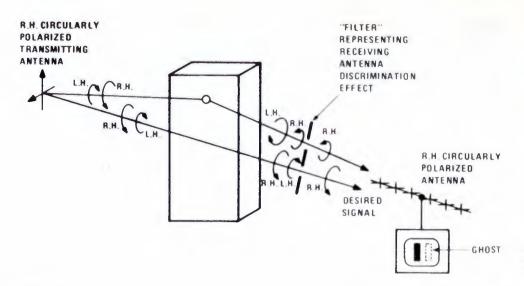

Figure 8

Figure 7

phasing section provides the required quadrature feed to the crossed-dipoles to transmit a right hand circularly polarized signal.

Looking at the center receiving antenna, it will have zero output since the signal arriving from the crossed-dipoles at the combiner junction will be 180 degrees out of phase.

Looking at the right hand polarized receiving antenna we see that the signals received by the two crossed-dipoles add in-phase at the combiner and produce an output.

To see how these factors provide ghost reduction, let's examine a simplified illustration of a typical transmission system.

Typical Transmission System

Figure 5 illustrates a transmitting

antenna on the left and two receiving antennas on the right, the top right being a horizontally polarized antenna and the lower right being a right hand circularly polarized receiving antenna.

Looking at the upper signal, and assuming the transmitted signal to be horizontally polarized only, we see that the horizontally polarized receiving antenna receives two signals—one a direct path signal and the other a reflected path signal. Provided that the path length of the reflected signal is sufficient, and that its reflection amplitude is high enough, a ghost will be seen on a TV set connected to this antenna.

Looking now at the lower signal path and assuming that both the transmitting and receiving antennas are right hand circularly polarized, we see that again two signals a present at the receiving antenr. The direct path and the reflect path. However, this time the reflected path changed polarity up reflection and is now left has polarized. Due to the polarizatic discrimination of the receiving a tenna, only the direct path will I received, and the ghost signal whose eliminated.

Circular Polarization

In practice, rarely is anythin perfect, and the same holds true for the term circular polarization. Let examine the quality of the circuit polarized signal.

The term Polarization Ratio typically used to describe th

Larry Fraiberg, Vice President & General Manager WNEW, powering-down as phasing out "yesterdays" automation system in preparation for the BCS/CI Total Automation System. 1975.

If You Get People Involved...

You Can Take The Surprises Out Of TV Automation

Part 3 of a 3-part series/By Bob Hueffed

In the November issue of **BE** we traced the history of automation at Metromedia from 1961 to 1974. The November article started in the era of tubes and transistors and ended with the introduction of a digital computer, in 1969, at Metromedia's Los Angeles station, KTTV.

Incubation Period

From 1969 to 1974, the industry went through an incubation period, and some tough times, and then came on stronger than ever. "Things" had changed, and at a revolutionary pace. To compete and

maximize profits, a station's communication system had to operate in "real" time. To illustrate, in January, 1970, WNEW-TV averaged 1200 commercials per week of which 550 were "60's". In January, 1976, they averaged about 3000 commercials per week of which 200 (approximately) were "60's". In December, 1976, WNEW is estimating 3500 commercials per week. Adding more people to a manual system could not handle this load effectively. In fact, just adding people could be self-defeating. Fortunately, the broadcaster and

hardware suppliers were gettin prepared for the "better-days-to come". The minicomputer grew t a giant in its industry, and manu facturers and computer program mers were learning more (in som cases for the first time) abou avails, orbits, rotations, aged receiveables, logs, makegoods, demo graphics, etc., etc., etc.

In the middle of this industry in cubation and development period 1973, WNEW's Bill Kelly was read for a giant step forward in "Total automation. After Kelly made hipreliminary investigations, Dic

NOTE Broadcast Engineering pays the postage on all orders!

Anderson formed an engineering team to define a Technical Operations automation system that could be hard wired to a Business Computer system, and the Metromedia master plan was modified. The "plan" now required that "Total" automation systems be installed at WNEW-TV, WTCN-TV and WTTG within a period of two years. And at the same time WTCN-TV, a newly acquired property in Minneapolis, had to design, build and move into a new building with all new equipment.

Early in 1974 Hal Christiansen formed a team to define and select a Business Computer system for five of the Metromedia stations... WNEW-TV, WTTG, WTCN-TV, KMBC-TV in Kansas City and WXIX-TV in Cincinnati. (Metromedia acquired the WXIX-TV property a few months after they purchased WTCN-TV.) All five installations were to be complete within two years.

In 1973 Metromedia selected the CDL System 200 Technical Operations Automation system WNEW, WTCN and WTTG. Concurrently, they purchased Ampex ACR-25's. The ACR-25's were to become another link in the "Total" automation chain. Metromedia. Westinghouse, Ampex and CDL jointly defined an intelligent interface to permit CDL's System 200 to automatically program and control the Ampex ACR-25. These two interfaces are better known as the Ampex ADA (Automation Data Accessory) and the CDL ARCH (Automatic Remote Cassette Handler).

In 1974 the Kaman Sciences BCS-1100 Business Computer system was selected. Although it was a relatively new system, it was backed up with experience, and more adaptable to communicate directly with CDL's System 200. Both systems used the DEC PDP-11/05 minicomputer and random access mass storage discs for data.

It is next to impossible to describe in detail the operational features and advantages of these two systems in less than 100 pages and a two day seminar. More important is to describe why and how.

Metromedia recognized "real" time and accurate communications were essential for operating a TV station now and in the future. particularly independent stations in major markets. They were following their master plan and in 1974 they saw that they could approach a "real" time data and communications system for a TV station. The BCS-1100 could effectively handle Sales/Service Department's work load and problems. They could communicate directly with Traffic because both departments use CRT terminals and a common data base that are controlled by the same computer.

The BCS computer can "talk" directly to the CDL computer; therefore, the Program Log can be transferred directly to Technical Operations. The CDL system can automatically schedule and control

ACR-25's, verify material, m machine assignments and con the machines, perform complicated audio/video sequences with a vatty of effects, print the F "As-Aired" Log, and then transithis back to the BCS system automatic invoicing.

Over-simplified, but adequated illustrate the full circle of the communications paths that you now control with computer system and why Metromedia selected the systems.

Why Automate?

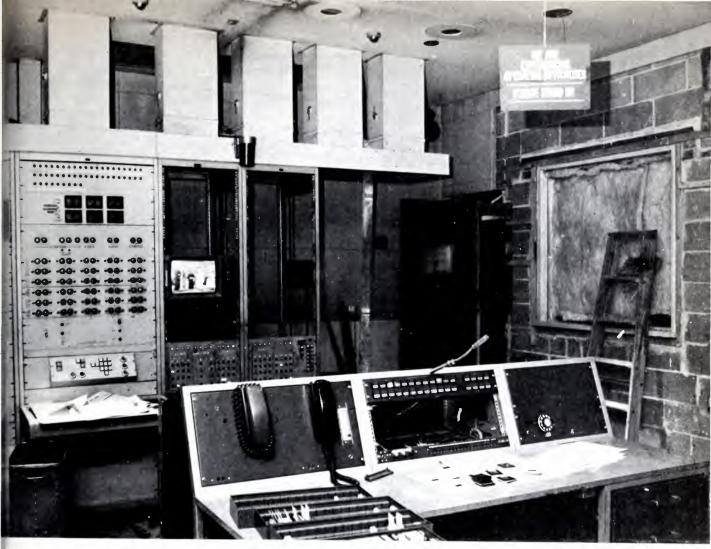

Predictably, the Sales Service partment asked the question 'Why automate?" "Change" always present in their operati and their clients are becoming me unpredictable. They are well aw of computer horror stories, and there probably is not a sales partment anywhere, in any indus that is anxious to convert to a conputer operation. But as Bill 119 Vice President Meehan, General Sales Manager for WNF said..."We had one of the best most copied manual systems in business...had to because we are independent station in the Num 1 market with a National S Manager, two Local Sales Marager agers, 11 salesmen and two red store specialists...but we could continue to use a manual systla forever...we have to learn to want before we can run, and we'll ready to run when we have to... in that day is rapidly approaching Meehan added..."Ratings measured electronically in 114 York, and when 0.1 of a rail point changes the price of j inventory, you have to know exa what you have in inventory."

Ed Petrosky, Traffic Manager In WNEW, was anxiously looking ward to the day the system work be installed. With a staff of e people since 1967, he had to with an increase in the aver number of commercials per w from 700 in 1967 to 3500 in 11 and during this period the nun of 60's decreased from 650 week to about 200 per w Besides that workload there are •35 to 60 new tapes and 10 to new films delivered to his dep ment each day that have to screened, timed, and classified.

About The Author

Bob Hueffed is a management and advertising consultant with offices in Rye, New York. He was formerly with Central Dynamics Corporation as Vice President and General Manager. Bob is not new to automation—in 1969 he pioneered and conducted broadcast automation seminars for Central Dynamics in major cities throughout the U.S. and was personally involved with the CDL automation systems at the Metromedia and Westinghouse TV stations. In fact, he is credited with coining the name "Total" Automation.

Bob has been an active member of many organizations in our industry including: a Trustee and Founding Director of the Broadcast Engineers Educational Advisory Committee, SMPTE ad hoc committee for standardizing and establishing the SMPTE Edit Time Code, IRTS computer and automation standards, co-chairman of the original NAB ad hoc Exhibitors' Committee, and has authored and contributed to many trade journal articles. He graduated with awards from Case Institute of Technology, and prior to joining CDL, he spent 15 years in the aerospace industry in sales and management positions.

ing preparations at WNEW master control room for installing the new CDL Technical Operations system. Note sign... are experiencing operating difficulties—please stand by."

average of 35 to 40 letters and ne calls per day that usually the changes to the original inactions. That is the average for days a week, but the majority hese requests arrive on Friday affect the weekend and Mons log.

any of the spots require addial production work at the on, such as adding an audio or slides.

ou may question how eight ic people could handle such an ease in workload...500 percent ease! When Petrosky was on the inal "System Analysis" team in I, he learned the importance of oughly understanding all other artment operations. The Traffic artment has to accept and distite data and interact with more artments, more often than any r department. As Petrosky said Ve are the traffic cops of the on, and if we didn't understand other guy's job and problems.

communications would halt...you cannot second-guess anyone, and if you don't have the answer, you have to know where to find it ... and quickly...you have to have awareness to anticipate and execute accurately and timely". This attitude and training permitted a smooth and rapid transition to the computer systems. The WNEW traffic people are specialists that understand and operate the BCS and CDL systems (both systems have terminals in the Traffic Department), and they have firm control.

Traffic can now comfortably prepare the Log over a period of two days vs. five days with the punch card system. Machine assignments and film, tape, and slide rundown lists are produced by the CDL System 200 in a fraction of the time. A commercial material inventory crosscheck routine can be called up on a CDL CRT terminal to check if a commercial is on a reel or an ACR-25 video cassette—important for scheduling people and machines.

The BCS-1100 and CDL System 200 computer systems became operational between May, 1974 and July, 1976.

The First Total Automation System

WTCN installed the CDL system first and it was operational in May, 1974. In January of 1975 the first ACR-25 was interfaced to the CDL system using the ADA/ARCH interfaces. That was a "first". In May, 1975 the BCS-1100 Business Computer system was hard-wired to the CDL System 200 Technical Operations Automation System, and with that connection the first "Total" Automation system became operational.

WNEW was operating their CDL System 200 in June, 1975, and the BCS-1100 was installed and connected to the CDL system in August, 1976.

KMBC and WXIX had their BCS-1100 systems operating by September, 1975.

WTTG installed the BCS-1100 in December, 1975 and completed their "Total" Automation system when the CDL System 200 was installed in 1976.

The installations produced a few tears and some frustrations, but that was anticipated. WNEW and WTTG had the advantage of learning from WTCN's experiences, and the WTTG system was installed "easier than expected and according to plan". This learning curve also applied CDL and BCS, and their training programs were modified and intensified during this twoyear period. Engineering departments visited CDL during the final stages of in-plant system assembly and test, and after the system was installed, maintenance and system operating courses were conducted at the station.

All agreed that training programs were essential to reduce the on-thejob learning curve cycle. Good training coupled with an understanding of your data and communications system will go a long way to eliminate frustrations, surprises and compromise.

WNEW installed their BCS system one month before the Fall season and the operator training programs had to be conducted on location during the hectic business hours. (BCS usually trains at their facility and provides additional in-

struction and "hand holding" on location.) Richie Witkin, Sales Service Manager at WNEW, had some rough days and long hours trying to convert from an established manual system to a computer system, but by October 1... "everything started to fall into place...we now feel comfortable with the system, understand how to manipulate it, and are looking forward to some of the new BCS operating programs".

Witkin's "wish list" will probably continue to grow, but many items are being developed now by BCS and will probably be available within the next six to nine months.

Wish List

According to Jack Finlayson, BCS Marketing Manager, BCS is developing some new powerful software for the Sales Service department.

- 1) The Avail format will be changed to allow for average cost per spot for a program or daypart and for each rate section or level. Specials can be reported separately. Customers can call for overlapping dayparts on the same run; i.e., 9:00 AM to noon and 10:30 AM to 11:00 AM. The customer can select the number of weeks wanted for each daypart. (This first phase has actually been completed and tested at the time of this writing.)
- 2) The Phase 1 data will be stored in the station's resident computer system to permit on-line manipulation that can be displayed on the CRT terminals or printed.
- 3) Allow a station to play management computer games to experi-

ment with raising or lowerin certain rates or dayparts, and hav the system recalculate values, etc using the information of what i sold, available, preemptible, etc.

4) Add rating booking information to the station's resident computer and merge it with availabilities to prepare sales proposals analyze orbits, compute cost perating points, etc. These proposal could be printed for presentation to the client.

It is probably safe to say the these computer programs are o everyone's "wish list".

And there are more. The industris changing every day as is technology. Digital techniques, microprocessors, Super LSI will force uto change, but if you do your home work now, you will recognize the opportunities.

To repeat Hal Christiansen opening comment in this article. "the journey is not complete be cause 'Total' Automation is moving target...to cope with it, yo have to have a master plan fe somewhere down the road". And hadded..."get good hardware cortrolled by good software that work in your business environment...it the only way to maintain control of your business".

The author is taking the liber to append to these quotes excerp from the October 15, 1976 issue Forbes Magazine.

"New York-based Metromedia Inc. owns six TV stations, all b one of them unaffiliated. Says i chief executive, John Kluge: 'Rev nues from our five independe stations are running at an avera 50 percent higher than last year some of them up to 80 perce higher.' Reflecting this, Metr media's earnings more than doubl in the first half of 1976; its stoll zoomed from five in 1975 to as him as 30 this year. [the article co tinues]...Metromedia bought ind pendent WXIX in Cincinnati for million four years ago; today it worth at least \$9 million."

These are probably some of treasons why Hal Christiansen looking for the P&L's on Mondrather than Wednesday...and probably being nudged just a lit by John Kluge.

(Editor's note: What a way to to black")

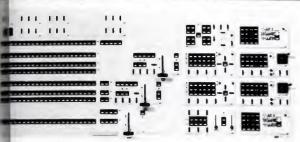

Lottie Bryan, Assistant Traffic Manager WNEW, and Skip Aldrich, system specialist WTCN-TV, training on the CDL System 200 traffic terminals at WNEW.

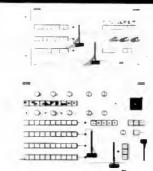

Central Dynamics. International pacesetter in television broadcast equipment.

lideo switchers.

Super Powerful CD 480 The Smart Switcher

utionary modular switchers with unprecedented production . They outperform the largest conventional switchers, yet tremely simple to operate. Their power and ease of tion are due to CDL's new Sequential Effects (SFX) Amplifier can cut, mix or wipe between two Background Sources vo separate Key Sources either individually or in any ination. Models with one or two SFX Amplifiers provide all andard and optional features you need, including Rotary & om wipes, RGB Shadow keys, Hard and Soft Color Border, Color Border keys, Quad with Color Borders, Encoded ma keying, Key Mask generator, and 16, 24 or 32 inputs ety of modular accessories will continue to keep your ner smarter than the rest as new technology develops

.

TOTAL DESIGNATION OF THE PARTY OF THE PARTY

a crace concentration of

VS-10

An inexpensive broadcast quality 8-input switcher that features flexibility and ease of operation. Self-contained electronics for rapid installation in ENG and other small mobiles

VS-14

Sophisticated enough for large studio production, yet compact and inexpensive enough for small mobiles Soft wipes and keys – even a Downstream keyer – are standard Self-contained and remote versions available

VSP-1260S An amazing value

Now the smallest station can afford a conventional 20-input mix effects switcher of the highest quality and reliability and get it in under 30 days! All features, including an Encoded Chroma keyer and Bordered keys. are standard (not optional, as is often the case) And the price is astonishingly affordable

bout the AFM-10 Audio Mixer/Switcher—an ideal companion to the CDL VS-10 and VS-14 video production switchers.

utomation.

System 100

Computer controlled automation system for Technical Operations that communicates directly with a Business Computer System Stores and retrieves the schedule with entry error checking, makes automatic time corrections, performs complicated audio video switching sequences (including dissolves fades wipes and keys), assigns machines, verifies material, and prints the "As-Aired" log

Master Control Switchers

Ranging from CDL's new CD 480 MC to a 2 Bus MCS-829 or a 3 Bus MCS-770 All 3 can be interfaced to System 100 Technical Automation System

pe editing systems.

PEC-120 Video Tape Editor

A computer editing System with easily operated control panel and CRT display for rapid and precise control of VTR's & Switcher CDL's unique Self Learning Cueing Software Program is a new feature

EDS-200 Video Tape Editor

A two machine Time Code microprocessor Editor that interfaces to Quad or Helical VTR's

Also a complete line of production and TV terminal equipment, including:

- SMPTE Time Code Generators and Readers
- Video and Pulse Distribution Amplifiers
 Chroma Keyers RGB and Encoded
- Processing Amplifiers
- Audio/Video Routing Switchers
- Pulse Assignment Systems
- Machine Control Systems

Logic Illustrated

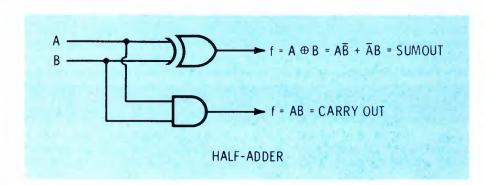

Part 4 of a 4-part series/By Harold Ennes

Logic networks are used for binary addition and subtraction. Multiplication can be accomplished by over-and-over addition; division by over-and-over subtraction. Any arithmetic function can be accomplished digitally by logic networks. Such functions are basic to all decision-making logic systems.

	BASI(BINARY	ADDITION	TABLE
	A PL	US B	SUM OUT	CARRY OUT
	0	0	0	0
i	0	1	1	0
	1	0	1	0
	1	1	0	1

4-1. This is the basic bina addition table. (To review bina addition, see "Digital Math Pa 1," BE June '74.)

Two outputs are required: Sum out; 2. Carry out.

4-2. This circuit satisfies the bina addition table of 4-1. This termed a half-adder because the is no provision for a carry input Only a carry output is provide. This becomes a previous carry any following stage.

The boolean relationship for half-adder:

$$Sum = A\overline{B} + \overline{A}B$$

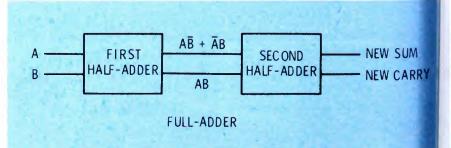

$$Carry = AB$$

CARRY	FULL BINARY ADDITION TABLE									
A PLUS B PLUS CARRY SUM NEW CARRY (Cn)										
0 0 0 0	0									
0 0 1 1	0									
0 1 0 1	0									
0 1 1 0	1									
1 0 0 1	0									
1 0 1 0	1									
1 1 0 0	1									
1 1 1 1	1									

4-3. Expands the binary addition table for a **carry input** (previous carry). Where:

$$C = previous carry.$$

 $C_n = new carry.$

4-4. The circuit for a half-adder (4-2) simply represents the function required. In real life, 2-input or 4-input adders are constructed in a single **chip** (IC), usually with provisions for true or inverted inputs, and true or inverted outputs.

A full adder is, in effect, two

half-adders in cascade as shown 4-4. Note that for the final su output to satisfy the binary addititable 4-3, the previous carry fur tion (C=AB) must be incorporat in the logic. The following sections show the boolean development.

Introducing a Color Corrector for Electronic News Gathering.

Electronic News Gathering makes tough demands upon the broadcaster. Color imbalance and colorimetry problems are frequently encountered. Matching remote camera shots to indoor studio programs or assembling tapes from different locations or cameras is "chancy" at best. Often that fast-breaking story doesn't allow for camera rebalancing!

Thomson-CSF Laboratories now provides a solution to such difficult encoded signal color problems. With the Model 5500A Color Corrector, you'll be able to rebalance and match video signals *after* encoding. It can be used either after the play-back tape machine or following the microwave receiver during live coverage. In most cases, a noticeably improved color picture will result. For ease of operation, a Remote Control unit is included as standard equipment.

As an added feature, an optional automatic Sensor unit is also available to control the Color Corrector for telecine use.

Whether for Electronic News Gathering, tape production or telecine use, the Thomson-CSF Laboratories Color Corrector System should be working for you. Interested? Give us a call.

THOMSON-CSF LABORATORIES, INC.

37 Brownhouse Road, Stamford, Connecticut 06902 (203) 327-7700 / TWX (710) 474-3346

A	В	С	BOOLEAN SUM (f=1)	BOOLEAN NEW CARRY (Cn)
0	0	0	0	0
0	0	1	ĀĒC	0
0	1	0	ĀBĒ	0
0	1	1	0	ĀBC
1	0	0	ABC	0
1	0	1	0	ABC
1	1	0	0	ABĈ
1	1	1	ABC	ABC

4-5. To understand the full binary adder, re-write the binary addition table (4-3) in boolean form (4-5), showing f = 1 for sum and f = 1 for carry.

Where
$$C =$$
 previous carry.
 $C_n =$ new carry.

Then from the table (4-5) note that:

$$SUM = \overline{A}\overline{B}C + \overline{A}B\overline{C} + A\overline{B}\overline{C}$$

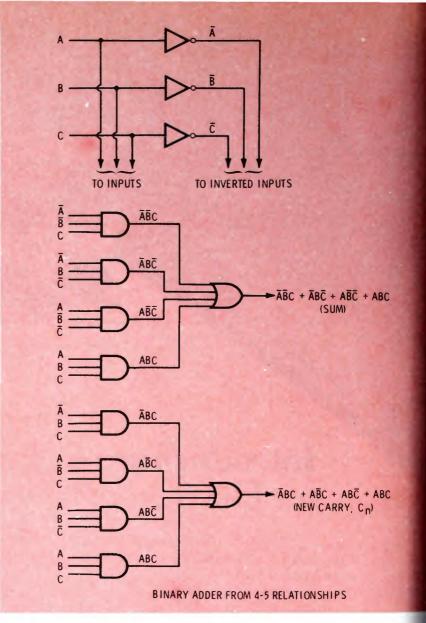

$$+ ABC$$

$$+ ABC$$

$$+ ABC + A\overline{B}C + AB\overline{C}$$

$$+ ABC$$

4-6. This constructs a full binary adder from the relationships of 4-5. Note that three inverter gates, eight AND gates, and two OR gates are required, for a total of 13 symbols.

			TRU	TH TABLE	PROVING:	SUM - C	AB + AB) +	CIAB + A	E) CARRY	- AB + CIAB	+ ĀB)		
A	В	С	T	B	ō	AB	ĀĒ	ΑĒ	ĀB		JM	ORED	CARRY
		· ·	A	D	·	AD	AD	AD	AD	C(AB + AB)	C(AB + AB)	SUM	AB+C(AB+AB
0	- 0	0	1	1	1	0	1	- 0	0	0	0	0	0
0	0	1	1	1	0	0	1	0	0	l	0	1	0
0	1	0	1	0	1	0	0	0	1	0	- 1	1	0
0	1	1	1	0	0	0	0	0	1	0	0	0	1
1	0	0	0	1	1	0	0	1	0	0	1	1	0
1	0	1	0	1	0	0	0	1	0	0	0	0	1
1	1	0	0	0	1	1	0	0	0	0	0	0	1
1	1	1	0	0	0	1	0	0	0	1	0	1	1
			WH	ERE C= PR	EVIOUS CA	RRY							

4-7. Simplify the **sum** and **carry** expressions of 4-6, and prove by a Truth Table:

$$SUM = \overline{A}\overline{B}C + \overline{A}B\overline{C} + A\overline{B}\overline{C} + A\overline{B}\overline{C} + A\overline{B}C + A$$

 $\begin{array}{ll} C(AB) \text{ rule } 20 \\ = C(AB + \overline{A}\overline{B}) + \overline{C}(\overline{A}B + A\overline{B}) \\ \text{grouping } C \text{ and } \overline{C} \text{ terms.} \end{array}$

 $C_{n} = \overline{A}BC + A\overline{B}C + AB\overline{C} + ABC$ $= C(\overline{A}B) + C(A\overline{B}) + \overline{C}(AB) + C(AB) + C(AB) \text{ rule } 20$ $= C(\overline{A}B + A\overline{B}) + AB \text{ grouping}$

and solving C and \overline{C} terms = AB + C(A \overline{B} + $\overline{A}B$) rearranged

Thus the simplified relationships are as follows:

 $SUM = C(AB + \overline{AB}) + \overline{C}(\overline{A}B + \overline{AB})$ $C_n = AB + C(A\overline{B} + \overline{AB})$

The Truth Table of 4-7 is derifted from the procedure outlined section 3-5.

THUS:

SUM = 1 when single 1 occurrence CARRY = 0.

SUM = 0 when 2 ones CARRY = 1.

SUM = 1 when 3 ones occur. CARRY = 1.

SOMETHING TO BUILD ON

DYNAIR'S
Audio/Video Switcher
will grow
as your system grows.

Expansion is easy — do it yourself! All you need is a screwdriver and additional expansion units to increase the number of outputs of your DYNAIR Series-X Switcher. Up to eleven outputs can be added to one master unit.

SHAMENGMEN

ARE MAGNETO

HARREST AND

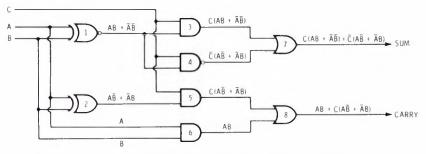

The unique three-way card edge connector and printed circuit card busing make it simple. Output expansion units receive power and signal distribution from the master unit automatically. No wiring required!

The Series-X Switcher can solve your routing problems today and in the future.

DYNAIR ELECTRONICS, INC.

DYNAIR

FULL ADDER FROM SIMPLIFIED BOOLEAN RELATIONSHIPS OF 4-7

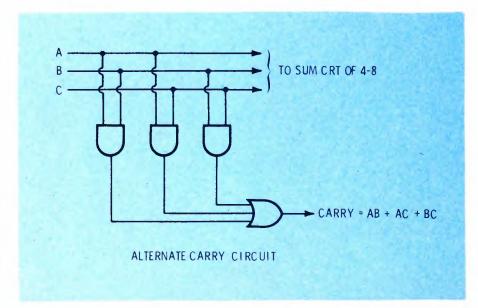

4-8. Constructs a full-adder from the simplified relationships of 4-7. Where:

C	=	previous carry.	
C_n	=	new carry.	

 $SUM = C(AB + \overline{A}\overline{B}) + \overline{C}(A\overline{B} + \overline{A}B)$ $C_n = AB + C(A\overline{B} + \overline{A}B)$

Gate 1 Exclusive NO
Gate 2 Exclusive (
Gates 3-5-6AN
Gate 4
Gates 7-8

This requires only eight symbol in contrast to 13 symbols for 4 This is only one of many possil combinations.

4-9. There may be more than c correct solution to a simplificati of relationships. Example:

CARRY of 4-7:

$$\overline{A}BC + A\overline{B}C + AB\overline{C} + ABC$$

= $\overline{A}BC + A\overline{B}C + AB(\overline{C}+C)$
= $\overline{A}BC + A\overline{B}C + AB(1)$
= $ABC + ABC + AB$

= AB + AC + BC Final sim fication

For the carry logic, this would quire the circuit of 4-9, replac gates 2-5-6-8 of 4-8. Note that it does not necessarily simplify 4-8 illustrates only that more than simplification procedure exists fo given set of terms, hence circle can vary for identical functions.

4-10. Proves 4-9 by a Truth Table. Thus sections 4-6, 4-7, 4-8, 4-9 and 4-10 are all equivalent functions (f). Drawings 4-8 and 4-9 are equally valid in design. The unsimplified version (4-6) would not be valid.

TRUTH TABLE PROVING VALIDITY OF AB + AC + BC FOR CARRY

BINARY			BOOLEAN	BINARY SUM	BINARY CARRY	
А	В	С	DUULEAN	(TABLE 4-7)	(AB+AC+BC)	
0	0	0	ĀĒĒ	0	0	
0	0	1	ÃĒC	1	0	
0	1	0	ĀBĈ	1	0	
0	1	1	ĀBC	0	1	
1	0	0	AĒĈ	1	0	
1	0	1	ABC	0	1	
1	l	0	ABĒ	0	1	
1	l	1	ABC	1	1	

WHERE C = PREVIOUS CARRY

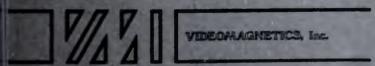

Refurbished video heads?

Videomagnetics has everything you need: superior product, experience and facilities, solid operational position, plus lower price.

It's a paradox, but the newest company in the refurbished video head business is also the most experienced. This comes about because the people who established Videomagnetics have been in the field for more than 20 years and have the kind of technical, manufacturing, and business know how that it takes to succeed and to meet your needs.

It all boils down to three basics: 1) a product better in all ways (including price), 2) experienced people and sophisticated facilities, and 3) a sound operational position coupled with business acumen. Videomagnetics has them all.

Want to know more about how you can improve your refurbished video head situation? Call or write Videomagnetics today.

1	1	1	1	1	ABC	ABC

WHERE Bn = NEW BORROW

C = PREVIOUS BORROW

D = DIFFERENCE

4-12. Shows the Truth Table for full binary subtraction, including boolean expressions for f=1. (To review binary subtraction, see "Digital Math" Part 1, BE June '74.)

Thus:

where $B_n = new borrow$

C = previous borrow

D = difference

 $D = \overline{A}\overline{B}C + \overline{A}B\overline{C} + A\overline{B}\overline{C} +$ $B_{n} = \overline{A}\overline{B}C + \overline{A}B\overline{C} + \overline{A}BC +$

Note carefully that the Table for the difference (D) coll is identical to the sum column 4-3, and 4-5.

How did these broadcasters get ahead of the competition?

"The Compositor has excellent fonts-- they're clean, they are sharp-looking, and they are distinctive... we have as much memory storage as we're ever going to need. You can change directly from any page to any other page without any problem whatsoever-- you don't have to stick with the original sequence. The Compositor gives you super flexibility."—Don LaCombe, KING Production Manager

"The Compositor's on-air display is a marvel... head and shoulders superior to the competition. We've virtually discontinued using hotpress for supers."—Galen Daily, KRON Program Manager

"We used the Compositor for the first time on election night. We were very pleased with the clarity and color. I'm sure we had the best election show in town that night."—Donald Loose, Manager WTMJ News Operations

"We used our new Compositor system during the election and were very happy with it. It seemed to me that the character edging made our display easier to read than the competitions". We moved ahead of the other stations soon after the election results started coming in." —Terry Harrison, KTVK-TV Engineer

"...the election went like clockwork--I couldn't have asked for anything better. The Compositor display is clear and easy to read...you just glance at it and you've got it. We were ahead of the competition getting numbers on the air." —Tom Craven, KGW Production Manager

"We were well ahead of the competition election night... the reason, I feel, was in large measure due to the Compositor. It's easy to use, and prevents a great deal of possible error. Where the TM unit really shines is its computer interface with the character generator, which eliminates the extra step of manually entering the election results."—Bill Gill, WOTV News Director

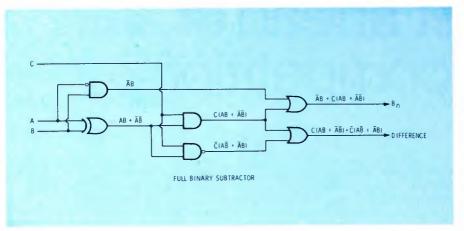

These broadcasters agree: with or without the TED election reporting option, the new Compositor I Titling/Graphics System offers a superior on-air look. With graphic-quality fonts and instant access to any page in memory at any time, the software-based Compositor I provides the fast on-air operation demanded by production personnel, the artistic quality demanded by advertisers, and the competitive edge that broadcast management is looking for. For details, please call Jack Daniels at (801) 972-8000.

P.O. Box 15068, Salt Lake City, Utah 84115

For More Details Circle (34) on Reply Card

4-13. Simplify the boolean expressions of 4-12, and construct a full binary subtracter from simplified relationships.

Let $B_n = \text{new borrow}$

 \ddot{C} = previous borrow

D = difference

 $D = \overline{A}\overline{B}C + \overline{A}B\overline{C} + A\overline{B}\overline{C} +$

 $= \frac{C(AB + \overline{AB}) + \overline{C}(A\overline{B} + \overline{AB})}{\text{rules } 20 \text{ and } 21}$

 $B_{n} = \overline{ABC} + \overline{ABC} + \overline{ABC} + \overline{ABC} + \overline{ABC} + \overline{ABC}$ $= \overline{AB} + C(AB + \overline{AB})$ rules 20 and 21

The difference (D) output is identical to that of the **sum** of 4-7, 4-8. This function is based on the fact that A-B is identical to A+(-B).

Figure 4-13 is one possible logic network to function as full binary

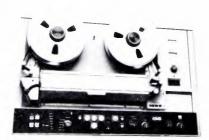

subtracter. The functions A+B and A-B are identical for two bits. The resultant functional difference by tween add and subtract is to action of the previous carry (to add) and the previous borrow for subtract. Carefully compare 4-with 4-8. Note how the following relationship is used:

A+B = Sum (reads A plus B sum).

A+(-B) = Difference (reads A pl a minus B = difference

This 4-part series has hopeful guided some readers into a bett understanding of logic circuitry at basic design. If sufficient interest expressed, we will continue at son future date with codes and conconversions, and design of mo complex broadcast logic systems.

R-MOD INTELLIGENT VTR

R-MOD now provides *AUTO-CUE*

R-MOD is the Reel-Servo Modification kit that makes old quads handle tape like the latest "intelligent" VTRs. Now with AUTO-CUE, R-MOD has the ability to remember, with frame accuracy, a cue point selected when the HOLD button on the timer is pressed. When the HOLD button is pressed again, anytime the VTR is not in play mode, R-MOD will search automatically and stop at the preroll position. Cost? This new feature is available at no increase in price to all R-MOD customers—past and future!

Leak checking tube prior to pump operation

ervice

conco's prompt 30 day repair service coupled with fast riable UPS handling makes getting tubes repaired probably a ocker method than ordering a new tube from a distributor. 6-90 day delivery on new tubes is not uncommon now. Econalso provides 7 day rush repair service and 1 day delivery for the stations that find power output down and no good spare milable.

feel we have both a cost and service advantage over new ues. Rebuilt tubes have proven that tube life equals and often useds that of new tubes.

Silver Plating
A rebuilt tube ready to be silver-plated

ocycle Used Tubes

want to encourage stations which are continuing to buy new tes to consider selling their used tubes to us. A price list is a ilable upon request. Save your packaging and when you get two rallot, send them to us for cash. We buy any amount of utd tubes you have if they are on our list.

rebuilt tubes are fully tested and must meet new tube speciintions or we do not ship them. Tubes which do not meet acs. are repaired again or scrapped if not repairable.

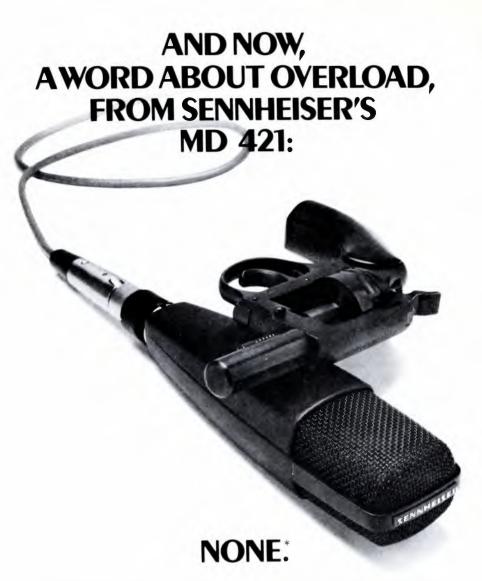

ECONCO BROADCAST SERVICE INC.

Tube Testing
A finished tube getting tested to factory specifications

A lot of engineers are worried about overload these days. And no wonder: Rock groups. Country groups. Jetports. And other high program and ambient sources make it more

necessary than ever for microphones to be overload-free as well as accurate.

Like our tough MD 421 cardioid dynamic.

In this test with a starter's pistol, we measured an instantaneous sound-pressure level of some 175 dB—well beyond what any musical instrument or voice can pro-

duce—while the oscillogram measured no clipping or ringing.

Whether you need a microphone to capture transient sound like this pistol shot,

or "face the music" on stage at 130+ dB in a disco or recording session, consider our MD 421. You'll discover its precise cardioid directionality, rugged design and wide, smooth response are ideal for rock-concert, recording and broadcast applications. The price won't overload you either.

Outdoor test with Tektronix scope, set for 10V/division vertical, 01. //isec/div horizontal
 22 cal. starter's pistol mounted 15 cm from MD 421 measured pressure of 111,000 dynes/cm² (175 dB SPL). Smooth, rounded scope trace indicates total lack of distortion.

Continued from page 64

Picture & Television Engineer Thanks to the generosity of Ko Mason, President of the SMPT and Dennis Courtney, its Executi Director, the ASTVC was able "set up shop" at their convention at the Hotel Americana in No York City.

At various times during the we of October 17th through the 22n members of the ASTVC staff coube found at our designated locatic enthusiastically "distributing" o latest information brochures.

We would be remiss in our duti if, at this time, we did not also githanks to those of our staff the manned the ASTVC desk. The are: Stuart Goodman (ABC), Ger Gander (CMI-Albany), Lois Filip (ABC), Joe Martini (Vizmo Pr ductions), and Gregg Suhm (Asso Dir. of Member Services). The above-mentioned would also like publicly thank the members of the Ikegami exhibit who very kind allowed ASTVC to "deposit" of crate of material with them ease evening at closing time.

To those of you who were for tunate enough to attend to SMPTE convention, we don't had to tell you a thing about all the delightful booths crammed with the latest new gear...and to all you who did not have a chance be there, we say you had better a to that next one! Jeff Friedman, the SMPTE staff, must be componented on the superb manner which he setup and ran the exhill area...

And lastly...for those who we given the ASTVC brochure at t convention, and for those of o members who will receive the copies in the mail, we wish to pol out that the brochure was conceived and produced by Gerry Ganc with the able assistance of t University Press at SUNY, Albai NY...

Take 3...Bits & Pieces

Malcolm Wall of the Office Programming, Mississippi Auth ity for Public Educational TV is be commended for his foresight a generosity. Through his instigati the Authority has sponsored a said the initiation fee for five of heir staff cameramen.

Wall said that he believes that is cameramen should be able o take advantage of every proessional / educational opportunity vailable to them. He believes that he ASTVC offers that opportunity o aid them in their professional evelopment. We certainly concur... 'hank you, Mr. Wall!

At a recent meeting in NYC, Bob Ienson, Regional Manager, and Dave Dever, Sales Engineer, both f IVC, have assured Bob Zweck nat their corporation looks forward) participating in a program of aining seminars with the ASTVC .As you may know, International ideo Corporation is one of the test in the industry to join us as a orporate Sponsor...

ASTVC staff members at the MPTE convention met with memers of the 3M staff relative to firming up" our planned seminar enerously offered by the 3M Co.... itto AMPEX and their kind offer an upcoming demo/seminar...

Latest correspondence from the tritish) Guild of TV Cameramen dicates that the time may be here r an International federation of V cameramen! Representatives om the ASTVC were extended vitations to attend the Guild's inual meeting in London, possibly discuss just that...We are excited bout the prospects of just such a ERGER.

The ASTVC wishes all of you a ry Merry Holiday and a Joyous ealthful New Year!!!

LO-Fade to black...

eligious iroadcasters ike New Law

President Gerald R. Ford has ened a comprehensive bill upting the nation's copyright laws. he new law, which goes into effect nuary 1, 1978, contains a section nich protects the interests of ligious broadcasters.

Section 112 (c) exempts religious ograms produced by non-profit ganizations from paying mechani-I reproduction fees for the use of pyrighted music on tapes or discs

which they distribute to broadcast stations.

National Religious Broadcasters (NRB) initiated Section 112 (c) and supported it in hearings before the House and Senate. NRB is an association of 700 member organizations which produce and broadcast more than 70 per cent of the nation's religious radio and TV programs.

NRB executive secretary Ben Armstrong commented, "Section 112 (c) benefits the creators of religious music as well as religious program producers. On-air performance greatly enhances consumer sales of records, cassettes, sheet music, and concert tickets. Christian artists particularly need the kind of widespread exposure they receive on religious programs. Under the new law, as before, copyright holders will continue to receive performance fees from stations."

ITC's ESL-IV

AUTOMATIC, ONE-STEP TAPE ERASER AND SPLICE LOCATER

Now you can erase cartridge tape and locate the splice in the same operation automatically - without chance for human error. Simply insert your cartridge and press the start button. There's nothing else to actuate or hold down. When the splice is located, the machine automatically releases the cartridge — fully erased!

The ITC ESL-IV Series machine is super-fast (25-29 IPS), but gentle with tapes in NAB size A cartridges. It is super-quiet, super-rugged and ITC engineered to outlast and out perform any other eraser or splice locater made. Pays for itself in time saved and consistent results. All this and our famous 2-year warranty plus a 30 day money-back guarantee of satisfaction.

Reserve your unit now! Just call us collect at (309) 828-1381 for more information.

Now! Remote transmitter control

is this simple.

Now there's an all digital system that gives you direct, positive on/off control and status monitoring of remote AM. FM and TV transmitters. We call it the X-14, and there's nothing else like it.

Fourteen toggle switches give you direct on/off control of up to 14 different functions like: filament voltage, plate voltage, main power, overload reset, tower lights and program source selection. No longer do you have to dial them in one-ata-time.

In addition, fourteen status channels, each with its own, independent LED indicator, monitor such go/no-go functions and/or alarms as: power, voltages, temperatures, intrusion, VSWR and tower lights. You see a complete display of status and alarms, at-a-glance.

Besides all this, the X-14 is an economical way to add capability to an existing analog remote control system. It meets the FCC control failsafe requirements, and gives you a fully digital command system as

backup to your analog operation. So, the direct control switches on the X-14 can be used for critical "key" functions while, at the same time, you're using the analog system to read other transmitter parameters. With our optional Line Multiplex Filter, both the X-14 and your analog system will operate on the same

Exceptional data integrity is another advantage of the X-14. Both control and status information are updated every 400 MS, and a unique "double check" logic system virtually eliminates data errors. There are also fewer operator errors because there's no dialing and knob twisting. Each switch is labeled for a specific function. The X-14 is also ATS-compatible.

The X-14 is just one of the many new ways TFT is applying digital techniques to simplify and improve broadcasting remote control. For a demonstration, call or write. In Canada: Orange County Associates,

Winnipeg, Manitoba.

NANAS **SAG TAILS**

The Original Blue Banana!

Color television was in its in fancy. The stillbirth of the CB whirling filter wheel was superseder by a lively youngster called the a electronic NTSC1 standard that wa confirmed by the FCC in 1951 Transistors and ICs were still decade away and TV equipmen was full of vacuumized glass cyl inders with metal innards tha glowed brightly and were called "tubes".

A color camera of that era ha three image orthicons, took fou strong men to lift onto its pedesta and was controlled by a CCU that was connected to three or four over heated, seven-foot racks cramme with electronic chassis. Several dozen appropriately colored knob and a larger number of screwdrive slotted pots, ferrite cores and bras slugs, most with some interactive effect, completed the adjustmen picture. It was a formidable task t properly set up a color camera usually taking three to four hour of meticulous tweaking at bot ends of the system by a pair (patient and persistent engineers.

Inspired by the goal of an opera

1. National Television Systems Committee (Never Twice the Same Color

on based on electronic precision, the major network installed a color of studio without visual contact tween the camera operators and the knob twiddlers in the back from. The high light levels needed to the cameras of that period preceded the use of a live model for the long set-up periods and the hincians had to resort to still life tages such as children's toys or twist of fruit that didn't ripen too that 3200°K.

Fruit bowls were ideal on several conts—they didn't get union scale, by came in a wide variety of hues at saturation, even idiots knew at color they should be (or did by?), and you could eat them are you got through.

at was the early afternoon of a color spectacular and the crew we in lining up the cameras for at evening's production. After an her of prime adjustments of such mics as I and Q quadrature, subrier balance, gamma and apercorrection, video and pedestal lels, the real fun started. Regismion, gray scale tracking, corner ious and so on, were interspersed wn remarks on the intercom such give me a little more blue skew; you idiot, I said blue SKEW, nu blue Q! Now we will have to reign all over again".

pparently the color camera degn engineers who figured out adjustment nomenclature were ted to the fiends in Detroit who are spark plugs so inaccessible as ocquire an expensive special tool at the digital dexterity of Harry dini to remove them.

last we're ready for color mation, color bars look almost t, a little phase adjustment ings the magenta on target, and witch to camera position and wowl of luscious, mouth watering in front of it; red apples, on grapes, orange oranges and bananas. Blue bananas? It t be! A quick turn of the hue on the monitor renders yellow mnas, but now the apples are vn, the grapes are orange, and oranges look sick! There is a huddle in the control room, thty scientific opinions on ma shift due to cathode/heater age or screen grid saturation t in a new attempt to recheck reset all controls with more

rigorous waveform scope monitoring. This takes another precious hour of frantic effort and time is getting short as a report comes in that the talent is beginning to filter into the dressing rooms.

Everything is realigned with the utmost care, the switch goes from bars to camera position again, and the bananas are still an unappetizing shade of blue. In desperation, the camera control engineer

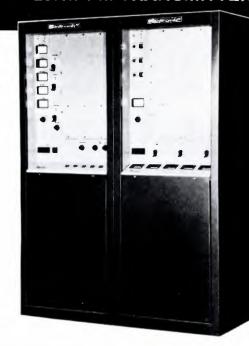

throws down his headset and stomps out into the studio to apply the last adjustment tactic he knows—a good swift kick to the side of the camera—when suddenly his problem is solved in one fell swoop. For what his eyes can scarcely believe is that nature's benevolent gift to the monkeys on top of this fruit bowl are the product of a prankster who had painted them bright blue!

Simplicity is Reliability

The Sintronic DFM-25K-B

25Kw FM TRANSMITTER

- Grounded Grid Driver
- · Grounded Grid Power Amplifier
- . Direct FM Solid State Exciter
- Self-Contained: No External Power Vault
- No Neutralization
- Front Panel Power Control From 2Kw to 30Kw
- Rectifiers Engineered to Transformer Characteristics
- VSWR Protection

The SINTRONIC DFM-25K-B FM Transmitter offers the simplicity of "grounded grid on grounded grid" — grounded grid driver and power amplifier — resulting in a considerable reduction of components and a greater increase in stability and reliability. The driver section of the DFM-25K-B is the SINTRONIC DFM-3K-A 3500 watt FM transmitter. This driver operates at 1200 watts for full 25Kw output power but can be used as a 3500 watt emergency transmitter. The DFM-25K-B is FCC type accepted and field proven. The unit is self-contained in two cabinets normally located side-by-side. However, they can be separated according to individual spacing requirements.

SINTRONIC manufactures a complete line of AM and FM Transmitters to satisfy every broadcast requirement. Highest quality components are used throughout. All our transmitters contain design features that increase efficiency provide greater reliability, and reduce maintenance time and costs.

KOMU-TV: A Commercial Success

I enjoyed the article in the October issue about WUFT in Gainesville, Florida. Particularly since our operation is somewhat similar. I must disagree, however, with the statement that the University of Florida offers "a unique experience in television news."

I'd like to point out some comparisons between the WUFT operation as described in the article, and our operation at KOMU-TV, which is owned by the curators of the University of Missouri.

While WUFT is a public noncommercial station with a potential audience of 460,000 viewers, KOMU-TV is a commercial NBC affiliate with a measured audience (ARB, Nielsen) of approximately 35,000 homes on major newscasts. KOMU-TV newscasts maintain a solid number one metro position in

this 3-station market, and are tied for number one in ADI, despite the inherent disadvantage of frequently changing student anchor persons.

The newscasts on both WUFI and KOMU-TV are produced entirely by students under faculty supervision. KOMU-TV uses students (this semester about 55) from the university's journalism school for all filming, editing, reporting, writing, production and air work. Directors, engineers and studic cameramen are for the most part full or part-time station employees. but students are also involved—to a lesser extent than in the news-with these and all other departments of the station.

While WUFT replaces commercial announcements with publical service announcements, the student

MBOL OF PROFESSIONAL TAPE HEADS

(612) 884-7393

MMI Replacement Heads are professional heads — designed for the machines they will be used with - direct retro-fits, both mechanically and electrically - not modified or adapted heads originally intended for "home" or "semi-pro" recorders. But there is more to MMI Heads than their professional performance: An all-metal face that virtually eliminates oxide loading ... More than twice the gap depth-of-metal of some original equipment heads, thus permitting relapping (under normal head wear) for greatly extended head life ... Individual testing and calibrating of each head to insure meeting or exceeding original equipment specifications ... MMI has 1/4-inch tape heads for Ampex, ITC, Magnecord, Revox A-77, and

Scully. Professional heads for professional recorders — from MMI.

ALSO FROM MMI (PROFESSIONALLY, OF COURSE) ...

REPLACEMENT AUDIO HEADS FOR AMPEX VR-1100, 1200 & 2000 VIDEO RECORDERS (Relapping and refinishing of the complete columns, too)

REFURBISHMENT AND HEAD ASSEMBLY REBUILDING (Loaner Assemblies available for only the shipping

 HEAD RELAPPING AND REFINISHING (No-Charge head evaluation)

NEW! MMI HAS HEADS FOR CART MACHINES!

Just A Friendly ANTENNA MONITORS Reminder

In case it happened to slip your mind and you are one of the few remaining directional stations yet to comply with paragraph 73.69 of the FCC Rules . . . you have until June 1, 1977 to have in operation a "Type Approved" antenna monitor.

WE CAN HELP YOU

We have supplied over 90% of all "Type Approved" antenna monitors (both meter and digital readout) now in service.

We invite your questions concerning installation, operation, remote control, sampling systems etc.

YOU CAN HELP US

When the last deadline rolled around our order backlog resulted in an eight month delivery cycle. If you order now, you can avoid the last minute rush; we can deliver as required; and you will not risk missing the June deadline.

ASK THE EXPERTS!

Antenna

Continued from page 46

quality of circular polarization for FM radio. This is the ratio of the maximum vertical component to the maximum horizontal component. This term describes the radiated power in each polarization, but does not necessarily describe the type of radiation formed when the two signals are combined. The combined shape may range anywhere from a circle, through a family of ellipses, to a straight line, without a change in the polarization ratio.

For antennas used in television broadcast, the term Axial Ratio has become the parameter to describe the degree of circularity. Axial Ratio is defined as the ratio of the major axis of the polarization ellipse to the minor axis. The axial ratio is typically expressed in dB.

Let's take a few minutes to see how the axial ratio of a circularly polarized TV antenna figures into the overall transmitting system. Figure 6 illustrates how an elliptically polarized signal can be represented as the vectorial sum of two circularly polarized signals that are rotating in different directions.

In the case of pure right hand circular polarization, there is, of course, no left hand component. As the amount of left hand component increases, the result of vectorial addition becomes elliptical as shown, and at the point that both the right hand and left hand components are equal, linear or sland polarization results.

To realize the effect of axis ratio, let's again refer to a simplified diagram showing a circular polarized transmitting antenna wit a less than perfect axial ratio, reflecting surface and a circular polarized receiving antenna.

Assume that the signal radiate from the transmitting antenna cortains a large right hand componer and a small left hand component shown in Figure 7. As before, threceiving antenna will receive twiginals—one from the direct patand one from the reflected path.

As we noted before, the reflecte signal will reverse polarity. How ever, this time there will be a sma right hand component from the reflected path present at the r ig antenna due to the imct axial ratio of the transng antenna. If this component rge enough, and if the delay is sufficient, a ghost will be non the receiver connected to receiving antenna. The axial of the transmitting antenna is core an important factor in mining the quality of a cirty polarized antenna.

eting Circular Polarization

the 1974 NAB Convention, conducted live demonstrations a circularly polarized TV set. horizontally and circularly zed transmitting and receiving mas were used with this test.

restem with a built-in delay and reitching between the horitotaly polarized system and the arrly polarized system the of ghost reduction could be red on monitors.

ng the horizontally polarized e., a great degree of ghosting the result of the multipath

ion could be seen.

en both circularly polarized unitting and receiving antennas employed, however, there was matic improvement.

zed TV test performed in go from the Sears Building by TV. Two 100 foot tall, 12 foot ter steel cylinders are mountable top of the Sears Building, the WLS-TV transmitting na located on the west cylinate the building.

o separate arrays were used at TV for their test—one a ciry polarlized three-layer system the other a two layer horilly polarized system.

azimuthal patterns of the intally polarized antenna, and ich component of the circularly ized antenna, were made as as possible to provide correlation the measurement data.

e supporting cylinder affects and performance, and had to imulated on the test range ag the initial design phase.

ter the testing cycle was comd, the antennas were shipped hicago and installed on top of building late in 1973. Each nna was provided with a sepafeed system to provide an easy ns of switching between hori-

FIXED TUNED TCM-5 SERIES

TerraCom gives you everything you want in 1-15 GHz portable microwave radio

FIXED TUNED, XTAL controlled 1.7 to 15.25 GHz for voice, video and data.

TUNABLE, direct reading calibrated dial in each frequency band.

MOBILE OPERATION, AC or DC in light weight rugged construction.

FIXED INSTALLATION, rack mount, R.F. multiplexed, hot standby and diversity.

When you operate TerraCom microwave radios, you know you have reliable and high performance equipment working for

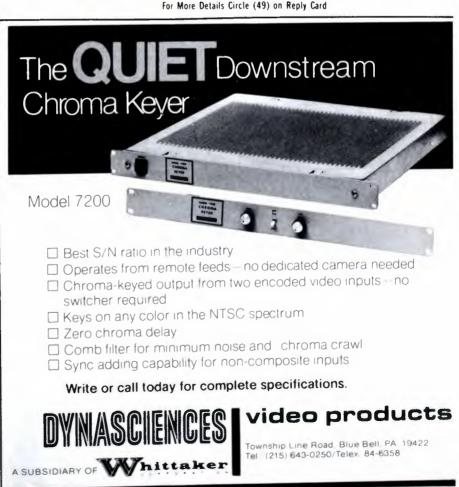

you. More than that, you have the best factory support in the business. TerraCom makes a special effort to know, and keep on knowing, everyone who has TerraCom microwave radios and to provide them with fast, responsive service, same day dispatch of free-loaner replacements worldwide, and leasing additional portable links.

TerraCom microwave gives you all frequency bands—all types of transmission—with the best in performance and maintainability and with friendly, personal customer service. We're a high quality company with high quality microwave radio systems. You should look into it—you will like the quality. Call (714) 278-4100 for

Continued from page 73

zontally and circularly polarismodes of operation.

The first on-air tests were start in January, 1974. AFter a series initial tests assured that there no increase in co- or adjacent in ference and the circularly polarisignal caused no degradation of received picture, the FCC gran permission in May to use circularly polarized antenna or continuous basis rather than c during off-air hours.

The off-air pictures shown ill trate measured comparisons tween the horizontal and circu modes of operation.

First, let me assure you that test pattern shown on the left is typical of the TV signals in Chicago area. It is one of the wo asseconditions and was obtained using the horizontal mode of trainission. In other words, both he zontally polarized transmitting a receiving antennas.

With the same conditions, and the same test site, but now usi the circularly polarized transmitting and receiving antennas we see improvement in picture quality the right.

Equipment Considerations In

Let's discuss now some equi ment considerations involved in c let cular polarization.

For the broadcaster conternation plating circular polarization, the equipment to be considered is, course, the antenna itself, the transmission line connecting the antenna to the transmitting static and the tower. The second item the transmitter.

Many possibilities are involved but we can discuss system packag on that will be useful to the majori in of broadcasters. The circular polarized antenna will have a approximate total gain of unity p wavelength of aperture-or approx imately one-half per wavelength for either the horizontally or vertical polarized component. Since mo broadcasters will probably maintal their present horizontal ERP usin a circularly polarized antenna wil the same aperture as their presen antenna, it follows that a trant mitter of twice the present ratin will be required.

A typical lowband VHF statio presently using a 6-bay horizontall

BROADCAST ENGINEERIN

rized antenna and a 25 kilowatt smitter, will now require a 50 vatt transmitter and a 6-bay ularly polarized antenna.

typical highband package for ular polarization may range a 100 kilowatt transmitter and ay circularly polarized antenna 50-kilowatt transmitter and an ay circularly polarized antenna.

ere are more options available e UHF broadcaster than to the broadcaster. Unlike most stations, who are operating at mum ERP, approximately 95 ent of all UHF broadcasters d more than double their ent horizontal ERP and still be at the maximum 5 megawatt

second UHF option would be icrease the illumination of the ripal market area through the llation of a new horizontally rized antenna with higher null. The new antenna might also lower overall gain and be led with a new transmitter of per power.

ne third option, of course, is to the circular polarization. Only a lough investigation on an indial basis will determine which on is best for the individual of broadcaster.

elevision is a subject that has considered by the industry as meers search for ways to imme television reception for the ing public. There is little or no ment about the theoretical fit of ghost reduction, but nd that, there is considerable proversy. The FCC has the ball and is weighing together the intial advantages, and the variation ments received as the result meir proposed Rule Making.

Gl becasting

The broadcasting and cablecasting explosion } reached Europe and most certainly Italy. Too with its 249 FM stations and 72 TV stations the broadcast throughout its 116,316 square miles, It is one of the most communicable nations in the firenterprise world (with its 12.8 million receivers, It is the sixth nation in the entire world with the most substantial number of TV sets).

Because of such a position it couldn't afford lack of an adequate news gathering and reportion service, therefore it has dictated the creation of Italian Communication Service Agency, that will known as ITALCOM.

At present ITALCOM, with its five reporters, with provide an Audio News Service from USA at Canada for the various Italian speaking radio-T stations in Italy and abroad (there are 48 Italian speaking radio-TV stations outside Italy).

In the immediate future ITALCOM plans provide a Video News Service.

Until two years ago the Italian broadcast w monopolized (since 1944) by the government controlled RAI-TV (before by another monopolist government agency).

With its two television networks (Channel 1 VH reaching 98.3 percent of the population, Channel UHF 91 percent of Italian citizens) RAI-TV transmits yearly 5,912 hours of TV programs followed adily by 26 million Italians, against 36,000 hours the independent TV stations. With its three AM rad an etworks RAI transmits yearly 46,296 hours and audio programs listened to by 17 million Italian against 749,278 hours by independent radio station. For watching the government censored black an white RAI-TV programs the viewer is taxed for cents per day plus sitting through a half dozen see of commercials (each set containing several at mouncements).

The independent Italian stations are based on the American model, supported by private industrialistic politicians and paid advertising. At present 1 D TV stations broadcast in color (PAL) and 20 other are ready to switch to color.

In the Peninsula there are 61 cable TV, there an annual Cable TV Expo in Milan and a T' of Federation called FILET (Italian Federation Inde of pendent TV Stations).

With manpower of 19,230 the new industry has practically forced 45 percent of Italian Electronic companies into manufacturing broadcasting equipment.

A prime time RAI-TV commercial cost 8,33 dollars for a 100 seconds spot (network). Italian territory is also covered by foreign radio-TV station that broadcast in Italian, they are:

Tele Capodistria (PAL) reaching 18.4 percent 0 the Italian population, has the second larges covered area. The color programs of Tele Capodis tria are transmitted from Yugoslavia, the cost for 30 seconds prime time announcement is 3,06 dollars.

PEOPLE IN THE NEWS

aul Bergquist is the new President of Philips adcast Equipment Corporation, a wholly-owned uidiary of North American Philips Corporation... rew Brakhan, Vice President of Philips Audio to Systems Corporation, has been appointed Vice ident and General Manager of that organization. arry W. (Bud) Pearson joins A.F. Associates, Inc. ingineering Manager... Charles P. Ginsburg, Vice ident-Advanced Development for Ampex Cortion, has been honored with membership in the nety of Motion Picture and Television Engineers IPTE) for his pioneering work in the development deotape recording.

seph Novik has been appointed Marketing nager at Belar Electronics Laboratory Inc. lederick B. Bundesmann joins the Robert Bosch poration as National Sales Manager for U.S. sales

ernseh television equipment.

hn Donnelly has taken the post of Marketing ices Manager of Ikegami Electronics, Inc....

Idon Lund is the IGM Western Sales Repremative.

hn Macfarlane, Eastern Regional Sales Manager, uputer Image Corp., Denver, Colo., has been regned to helm the new mid-west based Computer mge Production unit in Chicago...Gerald M. kerman has been appointed Chief on the Legal, disory and Enforcement Division of the Safety and urial Radio Services Bureau.

ce. C. Hanson has been appointed as Assistant cutive Director of the Association of Maximum ice Telecasters, Inc. by the AMST Executive mittee...Jack B. Chapman, President and Gen-Manager, KGAK, Gallup, N.M.; succeeds ne C. Cornils as a member of the Radio Board of ctors of the National Association of Broaders...Cornils, President and General Manager, KD AM/FM, Boise, Idaho; will join NAB as ector of Membership.

lathryn Hilton, Director of Research for the aonal Cable Television Association, has been used a Vice President of the Association...Don later has been added to the KOLO-AM, Reno, NV as News Director...John Gunn transferred to the

department of KOLO.

and Gottlieb has been promoted to Director of indeast Acquisitions for Cox Broadcasting Cortion...Louis J. Kaib has moved to the position of Signature Manager-Television Services for Cox Data ices.

Still Number One in cartridge tape splice finders.

With a Beaucart® splice finder it's impossible to erase what you want to keep. Covered by Patent No. 3,854,643, this unique system locates tape splices on A, B, and C-size cartridges and stops the tape within one inch beyond the capstan. The bulk erase function is entirely separate to protect the information on each cart. And on top of all that, our splice finders are priced up to \$100 less than comparable units.

Order now: Model SFE-1 Splice Finder with bulk eraser at \$395.00 or Model SF-1 without bulk eraser at \$370.00. For more information, call (203) 288-7731 or write today.

THE WILKINSON AM2500B 2.5 KW AM BROADCAST TRANSMITTER

FEATURES

- Solid State Modulator Driver
- Solid State Exciter
- Only One Tube Type (4) 4-1000A
- · Variable Vacuum Capacitor Tuning
- Motorized Variable Capacitor Loading
- Low Distortion, High Level Modulation
- Accessible Drawer Construction
- Solid State Timing Circuits
- Self-Testing Silicon Power Supplies
- Automatic Recycle
- Simplified PA Tuning Only two controls
- Double Duty Plate & Modulation Transformers
- · Pretuned at Customer's Frequency
- Power Cutback (optional)
- Designed for Remote Control
- · Ample, Roomy Cabinet for Ease of Service
- Completely Metered
- Uses Standard Parts with Original Maker Numbers

Editorial Billboard

What's Ahead For Bl

In all of us there's a spark of the gambler's sy That willingness to take a chance...to guess at who coming...feeling that luck is on our side. Esaturday's game is covered in probets and o pools. The smart dollars are seldom put on whim perennial underdogs.

Tapping the pulse of the broadcast industry the manufacturers who supply the industry, keeps running in high. We're not going to ask anyon take a flyer on the possibility of a trend develop While we all are betting our lives on broadcast BE's task is to make the risks minimal on all six How? There's no better way than to take a lool our game plan for '77.

There's a time to be theoretical and there's a 1 to be practical. In the past we have published articles on logic theory for digital circuits we're li to encounter in broadcast equipment. In 1977 we going to have Harold Ennes on the line with a feature called "Logic Lab". It's a monthly colubased on practical troubleshooting of digital circuits we hope it'll develop into a clearing house engineering problems at stations and at manufacturer's bench.

How about ENG? Well, we've got to rement that the history of broadcasting is based upon Elso we will expand our efforts into RENG! The right, radio electronic news gathering. And when for TV or radio, the approach will be practical. Testarts in January.

We'll be talking a lot more about audio and way it's processed and what you can do about it. I early in March we're going to deliver to you what consider to be the most complete pre-NAB conventissue ever.

Throughout the year we'll be paying a lot attention to production problems that have engineering base. Under a new feature head "Production Spotlight," we'll even go as far out improved makeup techniques. Engineering is still long suit, but we've found that more and more can't say any one broadcast activity belongs solely one department. They are interwoven and forgivingly related. This is why **BE** will talk ab what ATS, antennas, and facility changes mean the engineer and the station.

Yes, we're going to dig into automation, m computers, and new systems. We'll look at satelli radio and TV equipment roundups, and what FCC expects you to know. And if you feel we're cracking your toughest nut, drop a line to **BE** we'll get cracking. After all, this is a crossro magazine. Of course, we can't reach all our go without your help. This is **your** station magazine, if you want to make the most of it, send us y news, new ideas, even your Blue Bananas.

We're betting on a great year.

The Edi

Digital Still Store System

new Ampex digital recording em was unveiled election night the CBS Television Network.

he Electronic Still Store (ESS) em is capable of storing thouds of color slides and still ures magnetically on computer packs for use in television adcasting. It is the first broadt product to use digital reding techniques for videonges.

ISS is a joint development of and Ampex Corporation.

In this unique new system, siputer and video technology are abined to bring together the antages of high-density storage, id access, and reliability," said trles A. Steinberg, vice president the Ampex audio-video systems sion.

ISS electronically converts the log television signal into digital n and stores the information on gnetic disc packs. Slides and s can be randomly selected from k memory with an access time of than 100 milliseconds.

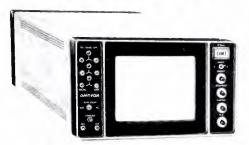

he basic ESS system can store to 1,500 video frames on-line for mediate random access. Disc k shelf storage is virtually united

ccess to the system is through board controls located at the etronics rack, or from remote ess stations. Up to eight access tions can be incorporated in the tem, each equipped with a board terminal and alphaneric readout.

Access priorities can be assigned any manner desired, depending the number and location of minals, and the operating rerements of the station. A keyivated lock out feature provides protection by preventing invertant or unauthorized erasures any images stored in the mory.

n addition to the record and roduce modes of operation, ESS

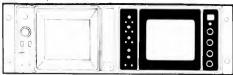

What's New?

Amtron AM-5

5-inch AC/DC Color Monitor

Professional in every respect, the Amtron AM-5 features the ultra-dependable, single-gun Trinitron* color system. Professional, too, are the extras—R-G-B gun switches, A-B selection of video input, internal/external sync, tally light and pulse-cross.

Digital Tape Timers

The TT-4 and TT-5 Digital LED Tape Timers have been introduced by Convergence Corporation, according to John Campbell, vice president of marketing.

Campbell stated that when used in combination with Convergence's ECS-1 Joystick Editor, they provide a continuous readout of tape time in minutes and seconds for both playback and record videocassette recorders in an ECS-1 editing system.

Both the TT-4 and TT-5 can be used in combination with the ECS-1 to facilitate rapid scene location or for measuring scene or program lengths on helical video-cassettes. ENG news stories can be

accurately timed while they being edited; educational, indus or medical training tapes can quickly assembled with randaccessed scenes on multiple solutions.

The large, bright LED dispersion of the large, bright LED dispersion of the large any number up to 59 minutes 59 seconds. Accuracy in 1 systems is maintained by councontrol track pulses from standideocassette tapes. The reconstant automatically switches the 60 Hz AC line in the asser record mode to constantly province adout of accumulated progetime on the edited master tape.

The BVT-1000 is sold in a

Jamieson No.1 in TV!

Why is the Jamieson Processor No. 1 in TV?
The best answer is from someone who owns one.
Someone you know owns a Jamieson. Probably a lot of people you know. Why not ask them about it? The best way to get an unbiased appraisal of its performance.

Or ask us ... we'll be more than happy to tell you about the Jamieson Processors and give you references.

JAMIESON'S ADVANCED DESIGN TECHNOLOGY FEATURES

- Film advance virtually tension-free. The demand top-overdrive film transport uses no clutches, floating rollers or film sprockets.
- Smaller machines take only half the floor space.
- Solution volumes reduced 15 times over open-tank designs.
- Temperature in primary solutions is controlled to an accuracy of a few hundredths of a degree.
- The eliptical shape of the tube protects the film and provides high induced turbulation.

Portable VTR, Camera Ensemble

Panasonic has introduced a porble VTR and camera ensemble, pdels NV-3085/WV-3085. The enmble features a full hour of intinuous record/play, instant and playback on the camera der, standard video output conactor, and the ability to record

BE Journal

Intinued from page 18

nal over no signal at all. We would posse limits of 110% for high power d 20% for low power.

It is also our opinion that automatic chnical logging be an essential part the ATS system. We submit that a presently required operating ameters be logged at intervals of t more than six hours. Since dern transmitters exhibit a high cree of frequency stability, concuous monitoring serves no useful pose. However, the various freencies should continue to be meased on a monthly basis and the ults entered in the station's mainance log.

The Society feels that, once a ble, fully automatic transmission tem is developed, it can provide h quality broadcast service to the olic, while relieving the licensee of

present operation log requirents and providing for better utiliion of the staff. However, the nsmitter should not be "locked and cotten." Rather, it should receive d maintenance, be inspected on a iodic basis, and have its integrity, well as that for the entire ATS tem, documented and certified e a year. This maintenance, inction, and documentation should, ourse, be performed by the holder a first class radio/television operats license.

in Wireless Microphone Systems

The Vega Model 63 Diversity Receiving System is designed to virtually eliminate problem noise and signal dropouts that are occasionally encountered when a wireless microphone is used on a set, in studios and in theatres. Send for complete details and specifications.

directly on five-inch reels of tape that have been removed from standard EIAJ half-inch cartridges.

Applications of NV-3085/WV-3085 include, among others, the production of educational tapes, the study of traffic patterns and industrial processes, the recording of news and community events, home recording of family, and the production of alternate media programming.

Synchronous video and audio is assured by a single trigger-grip control on the camera. Video and audio record levels are controlled automatically. The standard zoom lens and a full 32 minutes of recording capacity on 1200 feet of tape permit versatility in production and convenient full-sequence shooting. The camera's whole image 1½-inch viewfinder monitor allows a full view of subjects. Horizontal resolution is greater than 300 lines for image clarity and fidelity.

Three-Tube Camera

JVC Industries, Inc. has introduced the NU-1800U Color Camera, the newest in JVC's series of advanced three-tube, professional quality units with built-in camera control unit (CCU).

Designed to meet the standards of video studio use, even when operated by non-technical personnel, the self-contained camera offers a stable picture and compatibility with most color studio systems. Designed for industrial and educational A/V departments as well as cable TV companies, the versatility of the new camera provides capabilities that fit most operational growth demands.

The NU-1800U achieves sensitivity, resolution and precise color registration by combining the three-tube system with efficient dichroic-mirror color-separating optics. The color encoding system is NTSC-type. A high signal-to-noise ratio of 46 dB at f/2.8 with illumination of 250-foot candles assures sharply defined picture fidelity. A +6 dB gain switch instantly doubles sensitivity for low-light conditions. For reliability and ease of servicing, 2/3-inch electrostatic focus/electromagnetic deflection tubes are em-

ployed and all key circuits are or replacement plug-in modules.

A built-in color bar generato allows optimal adjustment of a color TV monitor and color balance can be adjusted by checking the reference indicator in the view finder. Color temperature compensation for 3200°K or 6000°K is accomplished by flipping a switch on the camera control panel.

The NU-1800U Color Camera is fitted with an f/1.8 Fujinon 12.5 75mm (6X zoom) lens with manual or automatic aperture control. Comount lenses in the one-inch of 2/3-inch tube formats also can be used interchangeably.

Automatic Switching Systems

Ward-Beck Systems Ltd., has recently designed and manufactured a series of computer controlled automated switching systems, for application in AM and/or FM radio master control areas. These systems provide control or signal routing, tape decks, transmitter, and radio plant supervision while operating either from a reatime program schedule, or sequentially, and logging all events as the occur.

The system pictured illustrates one of several smaller systems already installed and is used for the operation of a single FM and AM output bus. Other systems for the control of up to 11 stereo FM and AM buses are also in operation.

All systems utilize one or more and a General "Nova" Computer as the primary control element Input/output devices provided in clude keyboard, teletype, and tapt cassette. All audio switching is done by balanced solid state crosspoints which are both transient free and nose immune. Switching by "cut" fade-down-fade-up", and "crossfade" are all provided. Signal loss sensing and automatic fill are also available.

Remote Synchronizer

A new accessory for time base correctors is available from Micro time, Inc., enabling broadcasters to

eceive live or videotaped signals in ync with station timing direct form tobile units up to 59 miles away.

Called the RS-1 Remote Synchroizer, the new device generates adance timing references by genicking to the station's demoduted broadcast signal. These refernces are used to adjust or synchroize the signals transmitted back to be station. Reinsertion of station and on the incoming signal transission safeguards against any unesired closed loop effects.

The RS-1 eliminates the need for eld synchronizers, and can be sed with any wide-window TBC at he broadcast station. The resulting ignal can be put through a roduction switcher or special efcts generated and aired. Sync and urst LED's on the front panel are ctivated when the external refernce is present. A coarse range dial ljusts phasing to within one-half ile accuracy. Fine tuning to ithin 140 feet is accomplished ith a second control knob. A ystal oscillator provides internal ference when video reference is sconnected or lost. A camera/ TR switch provides three-line Ivance for VTR operation.

Control Track Editing System

Television Research International, Inc. has announced a new control track editing system for On-Line, Off-Line and Electronic Journalism markets. Designated the Model EA-3, the unit features ease of operation, frame accuracy, and portability.

The new editing system can be interfaced to a variety of VTR's, including SONY Models VO-2800/VO-2850, RCA HR-1060, and JVC Models CR-8500U/CR-9300 LU. The system does not require factory installation.

Soon a companion unit, Model EA-6, will be available, which will provide editors with a system which utilizes control track data or SMPTE Time Code (in either standard Bi-Phase or SUN Formats) depending on the encoded data from the BTR's.

Model EA-3 features LSL (Logarithmic Search Level) controls for simple tape transport control, "return to edit" capability for frame trimming, constant speed audio search for syllable accurate audio edits, transport speed, and a rehearse edit mode with automatic cue-back and rehearsal.

Remote Control System

A new digital remote control system, consisting of a TCT-150 Control Transmitter and up to eight TCR-150 Control Receiver(s) is now available from **TeleMation**, **Inc.** The system provides on/off or normal/alternate remote control of up to 15 functions at each receiver location. These functions can include operation of switchers (including non-duplication switchers), broadcast transmitters, microwave relays, security systems, and other equipment.

The TCT-150 transmitter will accept either front-panel switch commands or TTL logic/contact closure inputs generated by timers or computers. These signals are transmitted via a two-conductor

www.americanradiohistory.com

cable or telephone circuit to tl TCR-150 receiver(s), which in turnare connected to the equipment under remote control. Each TCl 150 can be addressed individually.

The TCT-150 transmitter wi interface with TeleMation TMI 1000 or TMP-2400B Digital Electronic Programmers; the TCR-15 receiver provides TTL logic coptional form "C" contact closur outputs and can be connected to TeleMation SI-2400 Switcher Interface/TMV-305 RF Switching Sytem.

Telephone connection between TCT-150 transmitter and TCR-1th receiver requires an optional factory-supplied modern within each unit and a dedicated voice-grade telephone circuit.

Mono Console

The McCurdy SS8400 mono co sole is a modular, profession audio mixing unit. The features the Series 8000 Module are integrated circuit technology, balance input and output stages, provision for insertion of audio processing equipment, front panel plug-capability and complete compatibility with other modules in the 8000 series, with available option suited to specific requirements.

Standard equipment on tH SS8400 mono console is 12 input mixing channels, complete wif A/B switching, allowing for 2 audio sources; each mixer equippe with specially designed "conductive plastic" slide attentuator (fader cue switching provided with fade in maximum attentuator position and front panel pushbutton 1 facilitate production procedure and output from each input mixe available to either program channel or both simultaneously.

Other standard equipment input sensitivity switching (two postions), to suit specific mix requirements; two identical program ou put channels, each equipped wit "channel-on" switching, rotary gai controls and VU meters; two montor preamplifier and control systems, complete with eight input selections; one cue/talkback syste allowing three-station communic tion; and extender module.

Color TV Studio Camera

A new color TV studio camera by egami uses an add-on minimputer for setup cycling. The gital add-on unit automatically cles the camera in 15 seconds rough all setup adjustments inding black-and-white balance, re and gamma correction, video in, and the eight registration actions.

The HK-312 color camera uses ree 1½-inch Plumbicon tubes; s a better-than 56 dB signal-to-ise ratio; and a zoom lens and mera tube combined in a single sembly for optimum accuracy of tical axis. Class A deflection uplifiers assure maximum line-ity.

Automatic black level and balree correction maintain picture lality and brightness in the event flares from the lens. Automatic rizontal and vertical detail corrector maintains optimum picture solution. A special comb filter inimizes color noise in the color annel to keep background noise a minimum.

A high-resolution, tiltable sevench viewfinder presents the camera erator with a large-sized, sharp wing image from any angle, low high.

The automatic setup cycling culty can be extended to as many five remote cameras with the use a separate computer-control unit CU), which accomplishes the task only 2½ minutes.

Reel-Servo Mod Kit

R-MOD, the reel-servo modificaon kit for quad VTRs from ecortec, has a new automatic arch feature which will be inuded in all R-MODs at no crease in price.

R-MOD provides constant tenon tape handling, improved locktimes, unrestricted remote conol in tape shuttle modes, autoatic stop at end of reel and a time accurate video tape timer for th RCA and Ampex quadruplex TRs.

To use the new automatic search

feature, the operator watches the monitor and depresses the hold button on the video tape timer when he sees the desired playback image to which he wishes to cue. The R-MOD "remembers" this point. After the operator stops the VTR or in the shuttle mode he can cause the tape to automatically cue up to a preroll position by pushing the timer's hold button again. When the operator puts the VTR in the play mode the R-MOD will roll the tape and provide an edit pulse ahead of the selected edit point to turn on the electronic editor.

Transmitter Remote Control

A modular system for digital remote control of AM, FM and TV transmitters has been introduced by Time & Frequency Technology, Inc. (TFT).

Called the 7600 Series, the new system is adaptable to ATS operation, and consists of three basic instruments which can be combined to provide from 10 to 80 channels of remote control. The system uses digital, pulse-code-modulated modems and can be linked by telephone wire, STL and SCA, or sub-audible telemetry.

The basic building block of the TFT system is the Model 7610 Digital Telemetry/Control System. It is a stand-alone unit with raise/lower functions and from 10 to 80 channels of telemetry. The 7610 can be expanded by addition of a Model 7615 Status and Direct Control System. This gives users 15 or 30 direct. on/off control func-

tions and 15 or 30 status monitoring channels. The third system component is the Model 7640, a microprocessor-controlled Digital Data Panel. It displays up to 40 meter readings simultaneously, and includes automatic limit alarms. Automatic logging is available as an option.

Users can purchase a complete system or just the basic 7610 and add other system components in the field as needed. A complete line of accessories is available for transmitter interface.

A quick disconnect rear panel allows users to remove instruments without disturbing any of the wire connections between the system and the transmitter or sampling points.

BROADCAST ENGINEERIN

Dolby FM was a classic chicken and egg situation. In 1973-74 we first had to convince broadcast engineers of the technical merits of our system. That got the first stations on the air. (And this without any available receivers, only a few enthusiasts with add-on Dolby decoders.) Then our licensees put new receiver designs into the pipeline. Eventually, in 1975, a trickle of receivers with built-in Dolby FM circuits began to appear. And the station list began to lengthen. Now, with the receivers pictured here, and with more than 140 broadcasters equipped with Dolby encoder units, it's no longer chicken and egg. Dolby FM is on its way.

See your hi fi component dealer for more information. If you would like technical details on how Dolby FM works, please write to us.

The Advantages of Dolby FM

- 1 High-level high-frequency signal recoverability
- 2 Noise reduction

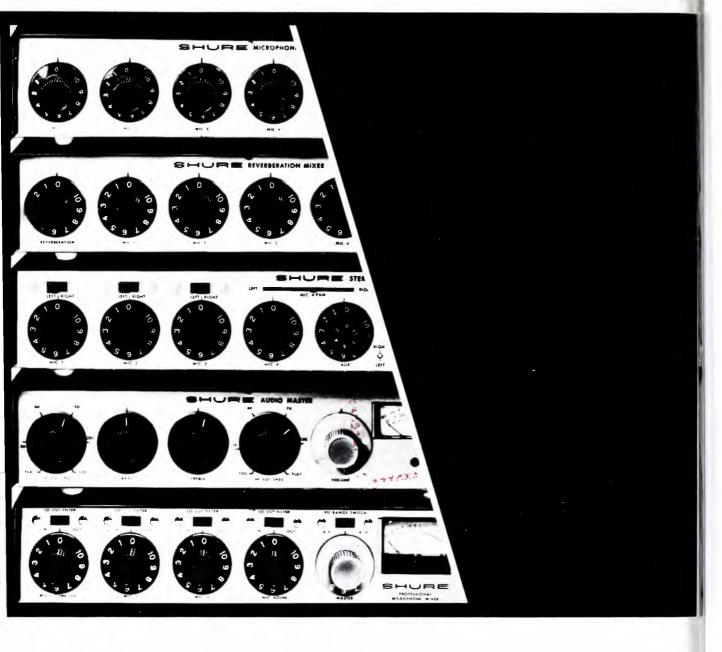

All FM transmitters have an inherent tendency to overload with high-level high-frequency signals. Conventional stations employ high-frequency limiting to avoid this problem. Such treatment is not reversible by the listener, which means that the limited high frequency components are lost. Instead of limiting, Dolby FM stations use a Dolby B-Type compressor in combination with reduced high-frequency pre-rimphasis. This solves the transmitter problem in a way which provides the listener with the opportunity of completely recovering the original signal. About half the Dolby-B capability is used in this way. The other half, not surprisingly, is used for noise reduction. These improvements represent a significant step forward in FM broadcasting quality.

For studio, broadcasting, recording, or public-address, Shure audio control components offer more features and more performance, dollar for dollar, than similar equipment. And—just as important—Shure audio components are easier to work with. Their compact size and versatility equip them for an extremely wide variety of audio control applications—and built-in input-output flexibility means quick set-up anywhere. For a permanent installation or a component system that can be adapted to meet any need, Shure has the right combination. To obtain a copy of the Shure catalog, see your dealer or write:

Shure Brothers Inc. 222 Hartrey Ave., Evanston, IL 60204 In Canada: A. C. Simmonds & Sons Limited

flanufacturers of high fidelity components, microphones, sound systems and related circuitry.
