Two editing technologies for the price of one

**SMPTE
Time Code or
Control Track**

\$7,600*...

**Start with one—expand to the other
—all for less than it ever cost before.**

The TEMPO 76 Editor... featuring TIME SYNC™ and *VaraScan™*

Here at last is a new concept in videotape editing systems... Datatron's truly universal Tempo 76 Series.

Now you don't have to compromise between the economy of Control Track and the speed and precision of SMPTE Time Code. Datatron's Tempo 76 Editor puts both technologies at your fingertips and at a price no one else can touch.

Tempo 76 allows you to start with a basic Control Track or SMPTE system and economically expand capabilities as you need them. And you never have to scrap

the system you initially started with. It offers you the best of both worlds in videotape editing technology.

Datatron's Tempo 76 Editor offers you economy, flexibility, versatility and adaptability. *VaraScan*, with slow motion, reverse and freeze-frame capability, makes the Tempo 76 Editor a perfect companion for 3/4" cassette editing in ENG, educational, industrial and production house applications.

For complete information on the Tempo 76 Editor and the Tempo 76 Series of editing systems, write phone Datatron today!

BROADCAST INDUSTRY NEWS

Microwaves, TV/Studio Cables, Telco Lines Enmesh Democratic Convention Site

Getting the Democratic National Convention Committee to pick New York City was considered something of a coup for Mayor Beame and Gov. Carey. And you might think the three networks would be pleased having the event in their backyard. As it turns out, NYC, and particularly the Madison Square Garden site, is probably the last place in the world that network engineers would have picked. There just isn't enough room to set up. CBS and NBC had to negotiate cable right-of-ways with four different entities (including two railroads) and pierce 30-inch concrete barriers to get set up. Both CBS and NBC have complete TV complexes in the area. ABC decided to leave its VTRs at home and will con-

nect to them via leased telco lines. This means ABC gets away with only three video control center vans which they managed to snake into the arena having a whole two-inch clearance to play with!

NBC, with a fleet of 12 trailers—six video vans, six temporaries—had a real job jigsawing them into place on the pedestrians plaza to One Penn Plaza across the street from the Garden. CBS was able to pull two switching trailers plus one video mobile unit into garage space at One Penn Plaza (replacing a garbage compactor) but elected to rent 15000 square feet of space on a lower level for its elaborate video control setup—by far the most extensive of the three networks. CBS also rents another

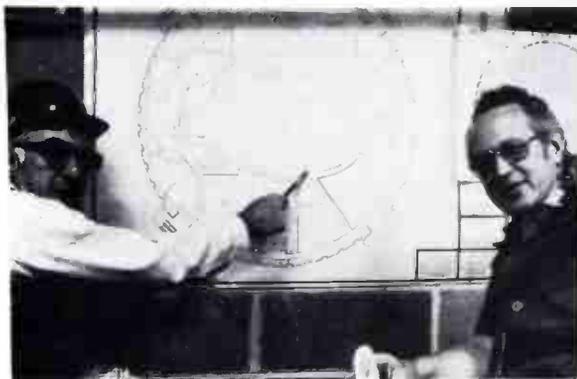

2000 sq. ft. for a lounge/VIP area.

There was plenty of room in the main arena for the construction of separate and quite elaborate anchor booths by ABC, CBS, and NBC, but to accommodate radio networks, the European Broadcasting Union and other foreign broadcasters, AP, UPI, and newspaper reporters, the entire rotunda area is circled the Garden delegate area is taken up. All this was necessary despite the use of the permanent Hughes Sport Network video control room setup that is normally used to broadcast sporting events from the Garden. But because the convention focus is not just on a few players on the central podium but on the thousands of delegates as well, new

NEWS

camera locations had to be found and extra lighting had to be added.

If it were not for the fact that pools of equipment are set up, the demands of the various broadcasters could not be met. Therefore, as a result of a drawing, NBC is in charge of the inside pool and CBS the outside pool. (At the Kansas City Republican Convention, CBS again handles the outside facilities and ABC the inside.) Of course, once off the convention floor, the broad-

casters are on their own and it's a real free-for-all consisting of big vans, mini vans, portable VTRs, handheld cameras, portable editors, microwave and pre-leased teleco lines.

On the floor itself there are five Ikegami studio cameras making up the pool. Bob Daniels, NBC's engineer in charge of the pool, reports a special 22 × 1 Canon lens will be used for closeups of podium speakers. Two cameras flanking the podium can catch profiles or "beauty" shots of podium personalities and can be swung around to televise delegates. A "caboose"

View from 34th St. sidewalk shows three NBC video vans of a total 12 vans and trailers hoisted into place on a pedestrian plaza.

ABC was able to get three technical van inside Madison Square Garden.

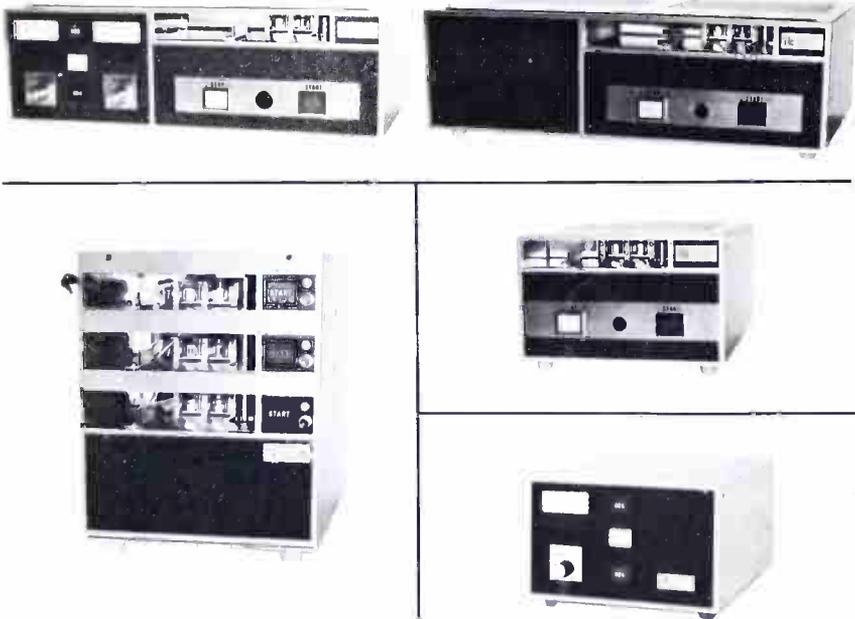

Hy Badler inside two switching vans located in garage. (One wall from each van is removed to create one room).

camera is aimed only at delegates. Audio on the convention floor (deleg mics, etc.) is handled by NBC and the direction of the convention chairman and an audio control van is located in the rotunda area. Helicopter TV coverage is provided for under the outside pool arrangement. As outside pool coordinator, CBS is also in charge of lighting of press rooms at all of the hotels, CBS will do the tabulations (votes cast are fed nearby CBS data processing computers and supplied back to the inside pool via character generators.) The pool has 21 audio and video output lines feeding its various subscribers.

Pooled cameras are only a fraction of the total. The three networks will have two hand held, RF equipped cameras

VIX-114 production switcher with STAR studded features

Choice of over 80
exciting patterns
such as star, heart,
binoculars, keyhole,
rotary clockwipe and more

- 12, 16, 20, or 24 inputs. 4 bus, 6 bus, 8 bus or more bus systems.
- All digital waveform and quad split generators.
- Digital key edging, border, shadow and outline available on all ME's.
- Vari-key. Soft, hard, shadow, or see-thru key.
- Digital quad split. Wipe or dissolve in each quadrant.
- Electronic vignette. Adjustable soft pattern edges.
- Superb linear chroma keyer. RGB or encoded.
- New digital, drift and jitter-free proc. amp on output.
- Ready to interface for computer aided operation.
- Many more state of the art and operational features described fully in series 114 brochure.

The VIX-114 series video switching systems are conceived and designed by the largest specialized independent video switching company in the USA. Vital Industries, Inc. is holder of US patents on digital effects and analog rotary effects. Vital VIX-114 series switchers open new vistas in production of television commercials and programs to yield maximum pleasant visual impact.

Do not fear to discover a superior product in the VIX-114 series switchers. Ask to see the demo tape for a sample of what we can do for users of switching equipment.

NEWS

each on the floor (the maximum allowed by the convention) and there are 18 other cameras in 8 positions on the perimeter of the floor divided up amongst the three networks.

The unilateral activities off the convention floor is where the competitive spirit begins. CBS and NBC, both providing gavel-to-gavel coverage, will be battling head on. ABC will do a taped recap at night and will, therefore, try to jam into its on-air hours highlights that will steal viewers to it. All three will be reconnoitering the city for hot stories and can move in with tanks or light combat vehicles as the case may be, to get a story back to their respective anchor rooms for live or taped playback.

CBS, reports Hy Badler, will have five "flash" units and five electronic film replacement (ENG) units. All of the flash units incorporate switcher and 2 GHz microwave equipment. All ENG units will have 13GHz "window" microwave equipment. CBS has just added to its microwave system and has relay points from the Chrysler Building, Gulf and Western, Empire State and One Penn Plaza. In addition each of the major hotels has been equipped with AV phone taps so any mobile unit

can wheel up and get to the control center via leased telephone lines. CBS's elaborate control center includes four separate control areas: central control, perimeter control, remote coordination, and auxiliary control (for specials). Several of the ENG units will be equipped with the new Thomson CSF Microcam. New Sony BVU-100 portables will be used. Back at control center, CBS has five edit booths to handle ENG produced tapes. New Sony BVE-500 editing consoles will be used.

NBC will have eight outside vehicles—one big mobile unit outside convention hotel headquarters, the Statler Hilton, plus three mini-vans, three sedans and one roving mobile unit. The mini-vans are microwave equipped. The mobile unit has a switcher for multiple camera operation. Mini-vans and sedans will be equipped with six new RCA TK-76 cameras. Clay Ackerson, NBC engineer in charge of unilateral broadcasting, predicts they will give NBC an edge. He reports, "Control people can't tell whether a studio camera or the TK-76 is on the air." One of the vans in the NBC trailer park is equipped with five electronic journalism editing booths using the new Sony BVE-500 editor.

ABC, according to Joe DiGiovanna, "will have one dinosaur, two antelopes and five bambis on the job." The "di-

An ABC ENG van (microwave dish collapsed). Others will be brought in from Chicago and L.A.

nosaur" is a four-camera unit that will be parked outside the Statler Hilton. The "antelopes" are two-camera Dodge campers including a switcher console, editors, and microwave. The "bambis" are single camera units but all microwave equipped. Cameras will be Ikegamis, either HL33s or HL35s.

Among some of the new equipment that will be highlighted, in addition to new ENG cameras and editors, are synchronizers—Badler says he will be using six (two NECs and four Quantels)—wireless mics, character generators, microwave, and fancy switchers. ABC says it could keep its VTRs at home because of a fantastic routing switcher which permits dial-up of any VTR from anywhere. ABC will have a full capability Grass Valley

Harris' new TF-100 for highest quality color film reproduction.

You won't find another top-of-the-line automatic color film camera that equals the TF-100 for quality, adaptability or overall performance.

But you will find that a basic TF-100 camera system is priced considerably below the major competition.

Like all Harris products, the TF-100 is built in accordance with strict standards of quality, and offers such unique features as:

- multiple input port locations for interfacing with any film island;
- true film gamma correction for uncompromised scene reproduction;
- optional internal diplexer to allow dual inputs without additional multiplexing.

Compare the performance. And the specifications. And the price. See for yourself that the TF-100 is unsurpassed in quality and value. Write Harris Corporation, Broadcast Products Division, 123 Hampshire Street, Quincy, Illinois 62301.

Transmitters Love Our Modulimiter.

The Competition Will Hate Your New Sound.

The BL-40 Modulimiter is a unique automatic AM broadcast limiter, which will maximize modern transmitter performance. Whatever your format—hard rock to classical, Modulimiter will increase transmitter efficiency and extend coverage.

The BL-40's patented electro-optical attenuator provides smooth, unobtrusive, true RMS limiting. An ultra fast F.E.T. peak limiting section assures absolute protection from unwanted over modulation without peak clipping. Attack time is essentially instantaneous.

Three separate meters indicate RMS LIMITING, PEAK LIMITING AND OUTPUT LEVEL, simultaneously. All critical adjustments are behind a front security panel. A "phase optimizer" maintains most favorable signal polarity permitting up to 125% positive modulation without negative undershoot. "Its the limit" in todays broadcast limiters. switcher in its arena anchor rock Chyron character generators will be used by several since they have much computer control flexibility. New RF Thomson CSF 960 MHz diversity mic will be used by CBS. Tracom, Nurad, and Microwave Associates are names mentioned in conjunction with microwave.

How much radio/video investment back of these four days? We do not know for sure but it has to be a lot. CBS obviously spent the most. Over at NBC, where they had just come out of a strike, one engineer said, "we're plating pipe rack compared to them" but he said it somewhat proudly and not enviously. ABC said it must have saved "a million dollars" by virtue of it using only three video vans on site and going back to its New York City broadcast center for recording. The effort in Kansas City will be less costly. ABC is in charge of the inside pool there, and bring in some NBC vans from Burbank because other equipment will have been tied up in Montreal as ABC covers the Olympics. NBC will drive its New York trailers and vans to Kansas City. CBS will pack up its gear and ship it to Kansas City for installation in trail there. All three networks will bring in ENG gear from its O&O stations.

And in addition to network coverage by ENG, there will be much more independent and affiliate broadcast

FCC Actions

Do Broadcast Stations Need Licensed Operator

That is just one of a score of questions the FCC has thrown open in an inquiry on the "relevancy of its radio operating rules to the current state of the communications industry." The inquiry covers every class of communication activity, but on broadcasting the primary question seems to be: should the licensee, who is basically responsible for proper operation, be allowed to act that by any means he considers best the requirement for licensed operator to continue, to what extent should operator be responsible for proper operation? Calling the first or second class operator-licensee, required to adjust, repair and maintain, "service operator," the FCC wants to know if the present examination producing qualified persons. A few other questions: should the "service operator" be required to notify the licensee, or the FCC, or both, in writing of technical discrepancies? Should the FCC have further "sanctions" for

ricing service operator responsibility?
ould the service operator be required
have an apprenticeship period?
ere are many other questions.
Every broadcast station manager and
ngineer needs to study this inquiry in
ail (Docket 20817); it goes to the
art of the broadcast engineer's posi-
n as a central figure in the broadcast
ustry. Comments are requested by
ptember 1st, replies, September 15.

following reports are in ab-
viated form so that, as in the June
e, more of the FCC's very high
out of important actions could be
ered:

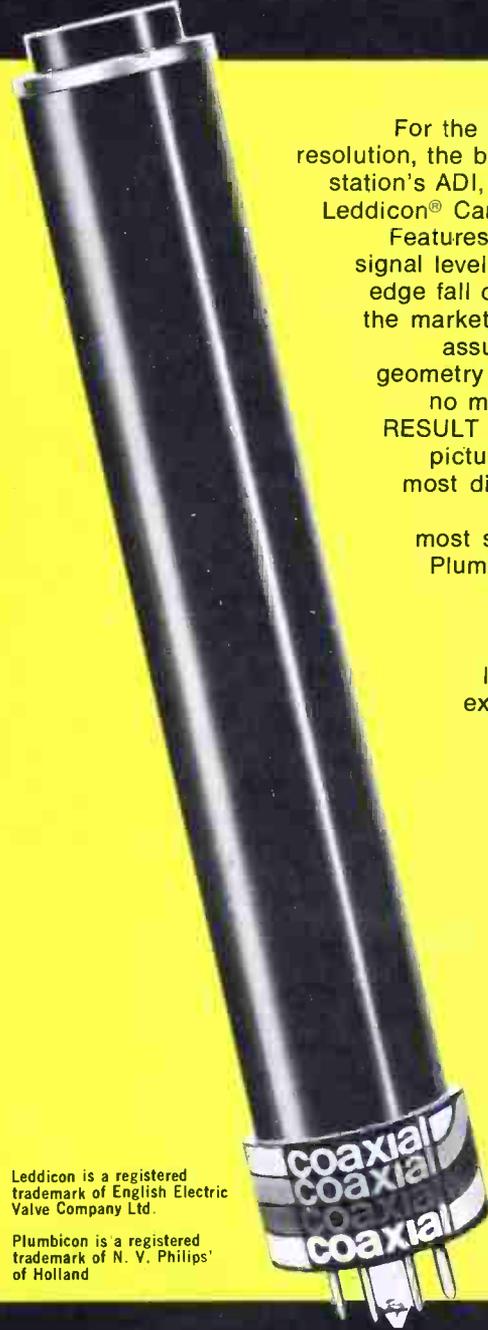

**Circular polarized antennas for
television: proposed rule making.** As
redicted in earlier stories, (see
I/E's comprehensive March cover-
ge of CP for TV), the FCC has
igned a proposed rule-making to
low CP transmission in television.
The FCC asks for any additional data
eyond those submitted on the WLS
as) on the actual results of CP trans-
mission. (Docket 20802).

**M-FM non-duplication is made
more stringent.** The FCC has an-
nounced a further limitation on
M-FM duplication by commonly
owned stations. Effective May 1, 1977,
whether station serves a community of
more than 100,000 the limit will be
5% FM duplication in an average
market (down from the present 50%);
in communities of 25,000 to 100,000
the limit will be 50% (now no limit),
with this second class also going to
M-FM on May 1, 1979. (Docket 20016).

**Sister-station promotions are to be
logged as commercials.** A rule
amendment makes promotional an-
nouncements for sister stations—
commonly-owned stations in the same
community—material to be logged as
commercial. The requirement is not
applicable to educational stations.
(Docket 20558).

**Obscenity: new law proposed,
rule rules clarified.** The FCC asked
Congress to pass a law making it a
criminal offense to disseminate ob-
scene or indecent material by means of
radio communication or cable televi-
sion. "Obscene" would be defined ac-
cording to recent decisions of the US
Supreme Court—material which
appeals to the prurient interest of the
average person applying contemporary
community standards and which lacks
serious literary, artistic, political or
scientific value." "Indecent" would
be representation or verbal description
of human sexual organ or function
which is "patently offensive under con-
temporary community standards."
The law would give the FCC power to
impose sanctions; it is necessary, says

NEWS

the FCC, because the electronic media comes directly into the home and the audience is in a sense "captive." Thus the law would make it a defense if the material involved a per-program charge, or otherwise minimized the risk to children and to those who might not wish to receive the material.

As to cable "access" material, the FCC says the operator is not responsible for a first offense slipping in but must exercise reasonable care, based on advance information or experience, that the material is acceptable. The actual promulgator of obscene access material would be liable to criminal action.

No change in rules on political broadcasts. The FCC turned down a number of requests that: free air time be mandated to each qualified candidate for office; short political spots be at least 4 minutes 30 seconds long. The FCC elected to continue the rule that rates for candidates are limited to the lowest unit charge, with no requirement for free time. Furthermore, "spots" can be any length, said the FCC.

FCC Briefs

The date for **comments on the inquiry on radio network rules** was extended to July 9 (replies August 6) All applications for **equipment authorizations** are now on one form, #731, (effective May 17th) A report, "**Regulatory Developments in Cable Television**," summarizing major rule-making actions since 1972, can be had at the FCC's Information Office, Room 207, 1919 M St., NW, Washington, D.C.

Romance sprang alive in the FCC as **cross-ownership taboos were waived** for owners of two broadcast stations who plan to marry, Lady Sarah McKinney-Smith (WDXR, Paducah, Kentucky), and J. Shelby McCallum (WCBL, Benton, KY): the FCC's cool language did not conceal its warm heart The **sixth pay television system** was approved. "PTV System 3," a development of Pay Television Corporation.

WNYC Faces Takeover Proposals

“The National Academy of TV Arts and Sciences has honored Eastman Kodak Company with the EMMY award for technological achievement in film — notably for developing Eastman Ektachrome video news film 7240 (tungsten).

“We’re delighted. We’re proud. And we’re grateful to all who made it possible...to the Academy...to the television stations that participated in the early trade trials...and to all stations using film in their news operations.

“EMMY is beautiful. We welcome her to the Kodak family. And we thank you — every one.”

Accurate Field Strength Measurements Can Be Easy

With the Model FIM-21, electromagnetic field strengths can be measured to within 2% across the entire 535 to 1605 KHz AM band. And to intensity levels as low as 10 μ V/m. Its integral shielded antenna in the cover, front panel speaker, large illuminated mirrored meter, and ganged oscillator/receiver tuning, make it easy to operate in the field. An optional telescoping stand adds convenience. It's also a versatile instrument — use it as a tuned voltmeter for RF bridge measurements.

Contact us now for complete details on our line of field strength meters.

takeover of the city facilities and the conversion of the AM and TV station to an "Open University" concept of educational programming. Mayor Beame, on the other hand, favors a plan that would transfer the station license to a new Public Benefit Corporation and continue the WNYC tradition of community related programming.

Though the budget for WNYC has already been slashed to the bone, it still costs the city \$2.1 million a year to operate it. The plan favored by Beame would put the station in a position of competing for contributions from foundations and the public, much the same way as WNET already does.

WNET feels that this plan would merely split the funds available from contributors and in no way benefit either station. Its own plan, however, still requires the city to make sizeable contributions to the station's operating expenses over a period of years following any takeover.

'Tug-of-War' over CATV Continues Before House Subcommittee

The House Subcommittee on Communications continued to hear arguments from NAB, NCTA, and public interest groups over regulation of the CATV industry.

Robert L. Schmidt, president of NCTA, told committee members to enact legislation that would create a separate title in the Communications Act to provide "broad policy guidance" to the FCC in its treatment of not just cable television, but other new broadband communications technologies. If the fundamental policy issues raised by CATV were not resolved soon, Schmidt said, the positive opportunity could well be lost.

NAB president, Vincent T. Wasilewski, told the committee that broadcasters were not afraid to compete with CATV, provided that competition was fair.

Wasilewski pointed out that cable has built an \$800 million industry through the strength of the programming originated by broadcasters without payment for the product. He referred to a provision in the pending copyright bill, he said, it is not a competitive situation "when one industry takes the product of the other at prices set by the government far under marketplace values, and then uses the product to injure the public interest and those operating in the public interest."

Numerous public interest groups testified generally expressing fears of poor regulation of CATV and pay-

PRIME TIME

ANTENNAS AND TRANSMITTERS

WTAF-TV, PHILADELPHIA, BROADCASTS THE WORLD'S MOST POWERFUL OMNIDIRECTIONAL TV SIGNAL.

When we put our new system on-air in 1974, Ch. 29's 'A' market coverage went up 68% to 9,870 square miles," reports Taft Broadcasting Corporate Vice President Bill Hansher.

"'A' market coverage up 68%."

Viewer reaction was extremely favorable—we were even getting responses from Manhattan, Baltimore and Western Pennsylvania.

Our 5 megawatt signal makes WTAF-TV the most powerful omnidirectional TV station anywhere—but we achieved our maximum ERP with operating savings of 25%, thanks to RCA engineering.

We selected their TTU-165c transmitter and a 40-gain TFCU-40 antenna. Since this 165 kW UHF transmitter needs less primary power, it cost us less than a 220 kW transmitter would have, we realize welcome economies.

"operational savings of 25%."

More than two years later, we're fully pleased with the RCA system's performance."

For more about the WTAF package, see **Broadcast News #155.**

RCA READY WITH THREE CIRCULARLY POLARIZED ANTENNAS.

When FCC approval is granted, RCA will be able to help stations improve their signals with three circularly polarized TV antennas.

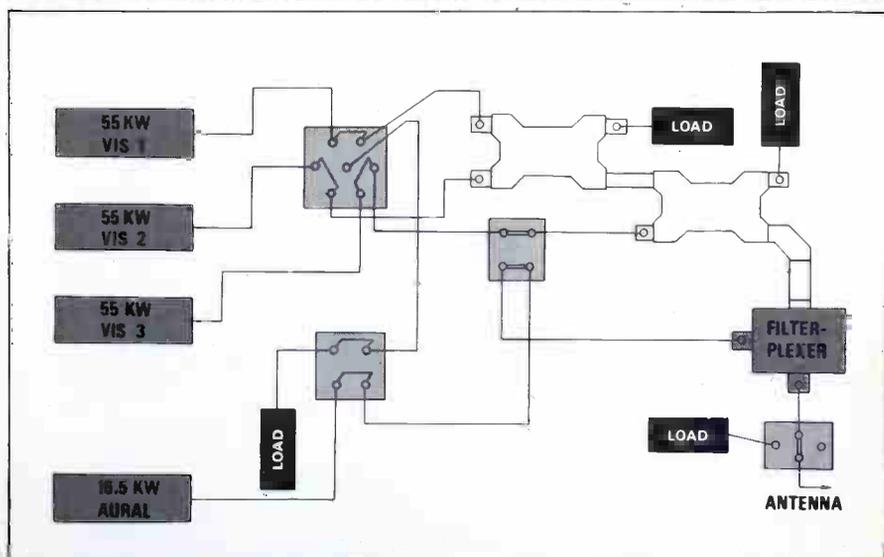

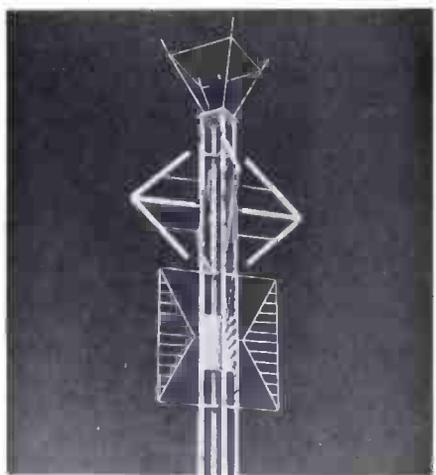

One is a top-mounted Fan-Vee for Channels 2 through 6. It uses individual radiators for horizontal and vertical polarization. They are phased to produce the circularly polarized pattern.

Another circularly polarized antenna, the End Fire Helix, is for Channels 7-13. It uses three small reflecting dishes mounted per layer around the top-mounting pole to

produce an omnidirectional circularly polarized pattern.

A panel antenna for face mounting on the tower (Channels 7-13) may be installed as a horizontally polarized antenna, with the ability to be converted to circular polarization.

Ask your RCA Representative for full antenna information.

Four 55 kW vapor-cooled klystrons are used in the TTU-165c. A unique triplexing system developed for the WTAF-TV transmitting plant combines the outputs of three of the klystrons. As shown in the diagram, visual amplifiers 1

and 2 are combined through a 3 dB combiner to produce 110 kW peak power. The signal is fed through a 4.77 dB combiner where it is added to the output of visual amplifier 3 for combined visual peak power of 165 kW.

RCA

could result in the draining away of sports, and other major programming from free broadcast television, to leave shut-ins, persons on fixed income, rural residents, and other persons, locked out from a source of entertainment and information upon which they depend.

Sun Sets on 'Midnight Blue'
Manhattan Cable Television, Inc. cancelled the controversial program "Midnight Blue" which ran on a public access channel.

The program which has been variously described as "soft core," or "hard core" pornography was the only show affected by a ruling of Manhattan Cable that said, "in order to protect the valuable community service provided by public access programming, (Manhattan Cable) is suspending all public and leased access programs which have exhibited a regular pattern of flouting governmental requirements related to obscenity."

"Midnight Blue" producer, Al Bennett, claimed that Manhattan action caused "a growing fear of intimidation on the part of access producers." He called his program "a satire on TV" portrayed "in a loving manner . . . with taste, with art . . . It never intended to be indecent and obscene." As for the criticism that the show offended local community standards, in New York, said Bennett, "there's a hooker on every block."

Food Advertising Proposal 'Incompatible With Broadcast,' Says NAB

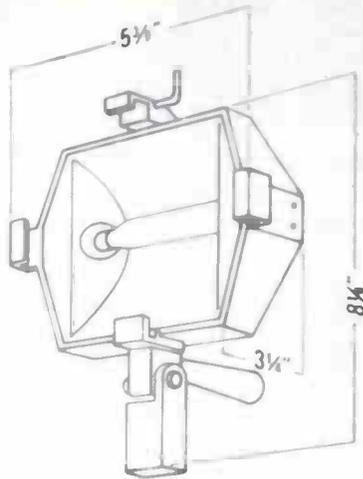

The proposal by the Federal Trade Commission which would require advertisements to convey specific nutritional data to consumers, was called "incompatible with broadcast media," the NAB.

In its filing, NAB said the proposal "raises substantial and significant questions both as to its legal validity and its appropriateness as a means to cure the alleged nutritional deficiencies."

The FTC proposal would prohibit nutritional claims unless the average portion of the product contains at least 10% of USRDA (Recommended Daily Allowance). It would further require listing of serving sizes, amounts of nutrients, fat content, and other data. NAB contends such information, even if it could be given in short commercial spots, would tend to confuse nutritional information rather than clarify it, especially when several such commercials

■ New from Colortran . . . a miniature version of the old-time Broad. A good strong fill light in a tough, compact, lightweight package, economically priced.

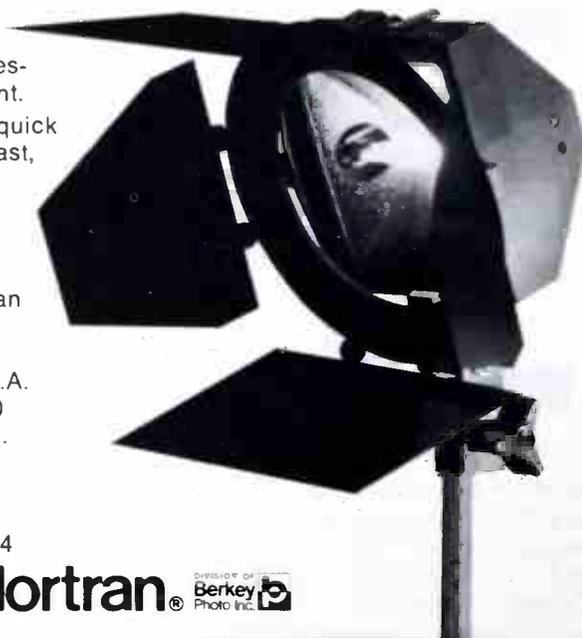

■ Minibroad utilizes the latest technology for powerful and efficient light output. With 73% field efficiency, its 650 watt quartz lamp delivers a maximum amount of light with a minimum amount of heat . . . lets you get in close to your subject.

■ Minibroad's handsome cast aluminum shell reflects its rugged professional quality. Thanks to new aluminum construction the Minibroad weighs only 29 ounces! Compact size and light weight make the Minibroad an easy traveler. (You can almost slip it in your coat pocket.) Great for newsmen, photographers, cinematographers — everyone on the move who needs rugged professional lighting equipment.

■ Minibroad features a quick pan and tilt handle for fast, convenient adjustment. (Full 180° vertical tilt.)

For more information contact: Berkey Colortran Department BME-776 1015 Chestnut St. Burbank, CA 91502, U.S.A. Telephone 213 843-1200 or Berkey Colortran U.K. P.O. Box 5, Burrell Way Thetford, Norfolk IP24 3RB, England Telephone Thetford 2484

Berkey Colortran® Division of Berkey Photo Inc.

Its yoke accommodates both a 1/4 - 20 tripod thread and a 1/2 inch stud. A full line of completely detachable accessories is available, including dichroic filters for daylight shooting and 230 volt lamps for foreign and domestic locations. Minibroad uses the same accessories you're now using with your Mini-Pro.

■ The price? Far less than you'd expect to pay for such rugged professional Colortran quality. Each Minibroad complete with 12 feet of cord and in-line switch . . . only \$49.00.

■ PRO KIT IV—For the pro on the go. A new four light kit featuring two Minibroad and two Mini-Pro lights plus everything you need for a complete lighting set up . . . all for \$629.00.

The JVC challenge. Who's really No. 1 in video?

JVC Challenge is reversing the established order of the video industry, long dominated by a single company. What is the nature of the JVC Challenge? In a word, competition. JVC products offer a combination of specs, features and prices that constantly amaze the competitors. For you, this combination amounts to value. And value is becoming more and more people are turning to JVC.

In fact, since entering the marketplace, nationwide sales of video products have soared 50 per cent each year. So that today, JVC, the number one value in video, is fast becoming the number one product line in the country.

JVC is backing its Challenge with one of the most sophisticated electronics research and

development centers in the world. Through the engineering teams of its parent, the Victor Company of Japan, a company representing nearly one-half billion dollars in sales in some 100 countries, JVC has made significant contributions to video, including pioneering patents in the development of the popular $\frac{3}{4}$ -inch U-standard videocassette format and introduction of the first successful $\frac{1}{2}$ -inch EIAJ color portable system in the country. This JVC team will continue to change the face of video with innovations to come.

And with every product JVC develops, you're assured built-in value. You can look to JVC to get better specs and more features for the dollar.

So when you're considering your next purchase of video equipment—cameras, portable field systems, monitors, videocassette recorders—check first with JVC. We're sure you'll agree there is no better value on the market today.

Datatek video sweep generator

TYPE D-630 A

Features:

- Self contained video sweep generator with internal or external sync and blanking.
- Wide sweep range, variable up to 10-0-20MHz or 20-0-10MHz. Excellent linearity.
- Variable sweep rates from 20 sec. to 1/60 sec. Fixed rates at power line and video field (locked) frequencies. Manual sweep.
- Sweep range set by separate start frequency and finish frequency controls. Sweep reversible.
- Built in frequency readout, switchable to show start, finish, variable marker and sweep output frequencies.
- Comprehensive marker facilities. Fixed markers at 1MHz and 5MHz intervals, color and aural subcarrier frequencies. Two continuously variable stop markers. External marker input.
- Symmetrical marker blanking in sweep output. Separate marker pulse output.
 - Internal or external sweep modulation, for applications including envelope delay measurement, detected amplitude displays, etc.
 - Conveniently small unit, with signal connector facilities for either front or rear access.

A. Modulated sweep, non-comp., 2-0-20MHz, marker blanking 5MHz intervals, variable stop markers at 7.5 and 17.5MHz.
B. Composite video sweep, 2-0-20MHz, marker blanking at 1MHz intervals.
C. Detected non-comp. sweep, variable stop markers at 7.5 and 17.5MHz.
D. Marker pulses output, 1MHz intervals (5MHz intervals evident).

Other Advanced Datatek Products:

- Transmitter Phase Equalizers and Waveform Correctors
- Differential Phase & Gain Measuring Sets
- Envelope Delay Measuring Sets
- Video Waveform Equalizers
- Video-Audio Routing Switchers
- Video, Audio & Pulse D.A.s

are run in clusters.

NAB Urges Caution in Adopting Captioning Rule

The NAB urged the FCC to "use caution in considering rule changes submitted by Public Broadcasting Service (PBS) to reserve all of line 21 of the vertical blanking interval for the exclusive purpose of transmitting captioning information to the hearing impaired.

NAB pointed out that, before captioning can be practicable, a reasonably priced decoder must be developed. The uncertainty of the decoding device and its price could undermine the whole concept of captioned programming, according to NAB.

NAB also stated that the PBS proposal says a capital investment of \$25,000 to \$50,000 would be necessary plus cost of about \$1,000 per program hour for actual captioning. At that rate, according to the NAB, to caption 5 hours of program material a week would cost more than \$250,000 annually and is too expensive for many broadcasters.

NAB also said that line 21 should not be exclusive to closed captioning but must be made available for other broadcast related uses. NAB suggested "a more efficient use of line 21" evaluating a data rate of between 4 and 5.0 Mbs. "Future technological advancements cannot just be locked out," said the NAB.

FCC Embroiled in 'Format Change' Squabble

A citizen's group, WNCN, Listens Guild, charged that the FCC "operated on false assumptions and ignored an important federal court decision in attempting to disengage itself from issues relating to changes in radio program format changes."

The NAB, on the other side of the issue, complained that any involvement by the FCC in radio format changes would be "contrary to several sections of the Communications Act and to the First Amendment to the Constitution."

The citizen's group, which mounted a successful campaign last year to have WNCN return from a rock music format to classical music, asserted that licensees are "moving more and more toward a bland uniformity of programming," and that such FCC regulation is needed to assure diversity in programming for minority audiences. NAB took the opposite viewpoint, suggesting that "experimentation would decrease" as a result of FCC interference.

ENG Equipment Moves Out of News

Recent months have seen minicams and portable VTRs move outside of the instant news arena and into the production of commercials, drama, promos, and documentaries as well. In June, BM/E described Barry Rebo's experiences in using ENG-type equipment in producing Time Life's syndicated feed, "Money News Inserts."

KSTP-TV, St. Paul, flagship station of Hubbard Broadcasting, recently used its minicam ENG gear to shoot a specially-produced pre-Easter program, a half-hour remote of a Lenten ballet, "Los Seises." This historical religious piece performed by the Andahazy Ballet Borealis Company, was shot completely with minicams at the Incarnation Catholic Church in Minneapolis.

Producer Steve Hammergren said of the cameras, "Their adaptability for such usage is tremendous. Because of their mobility we could shoot camera angles impossible with fixed cameras. We were able to shoot every area of the church used by the dancers and take angle shots which were truly unique. And we were able to monitor the entire shooting as we went along." *Variety*, in a review, said "Los Seises provided a touch of artistic class seldom seen on

"Los Seises" hammers and nails danced at church was shot by KSTP with minicam equipment . . .

Commercial TV."

Hubbard stations use the minicam for such diversified production work as instant promos, regular promos, commercials, and cameo segments in the station's Minnesota Memories Bicennial effort. Hubbard station TOG-TV, Tampa-St. Petersburg, uses ENG gear specifically for commercials.

An aggressive user of ENG gear for commercials is O.J. Reiss of KTVU, Oakland. Reiss uses his Ikegami/Sony 3000 system about three times a week. Clients include such names as Macy's (\$2.5 million TV retail customer), Property House (a large local retailer), and RCA. Although film (both 16mm and 35mm) is the predominant medium at KTVU some customers are showing preference for videotape because of its immediacy and quality (they know what's going on the air). Reiss says he's more comfortable working with film (and cinematographers as opposed to video engineers) but says final ENG production is fine if care is taken in lighting and editing to quad.

Another station to use the portable minicamera for commercials at least once a week is WBTV, Charlotte, N.C. Lately, WBTV's camera (a LDK-11) is too busy producing news on a regular basis to be allocated to commercial work. SMC/E reported in April the produc-

WTOG shoots commercial for Hoods milk with a minicam.

tion of commercials for the South Carolina Arts Council. The producer, Daniel Kennedy, used a Sony Tricon camera and the VO 3800 portable recorder. Kennedy's next project will be a documentary series for an Ivy League university. Kennedy sees the trend to ENG gear increasing because the equipment lends itself to producing "film style" videotape. Video cassettes are easy to use and can produce good quality at very low costs, says Kennedy, making it a strong competitor with film. With frame accurate

editing now quite readily available, one has creative flexibility and can get the desired "tape look" simultaneously. Kennedy works with commercial production company Ross-Gaffney Films to offer on-location, film-style videotape production to advertising clients.

Although commercial production at many stations is a big and growing business, according to Roger Rice, president of TVB, because of the success of stations in converting retailers from newspaper advertising to TV use of ENG equipment is still in its infancy. Shelly Schwab, WAGA, Atlanta, says 16mm film is fine. "We call a client on Monday, do storyboard on Tuesday, film on Wednesday, and air it Friday. We don't see the need for ENG equipment right now."

Arts Council Urges Improved TV Sound

The National Council on the Arts recommended that the National Endowment for the Arts join PBS in developing a new system for delivering greatly improved network television sound.

The council called on manufacturers, common carriers, broadcasters, and the FCC to cooperate in improving TV audio.

After a briefing on the PBS Digital Audio for Television (DATE) system by PBS officials, Endowment Deputy Chairman, Michael Straight said, "It is appropriate that the National Endowment explore this vital area of technology . . ." in connection with its commitment to making fine arts available to all Americans.

Effects Of TV Not Understood

The effects of TV on the attitudes and intellect of viewers is not yet fully understood, according to Vernone M. Sparkes, an associate professor of mass communications at Syracuse University. But the possibilities are serious enough that both producers and viewers need to become more conscientious about the content of all TV programming, he said.

"The critics of American commercial television often asked the wrong questions, measuring the medium solely in terms of the traditional functions of high culture and the fine arts, but failing to appreciate the medium's value as a source of relaxation and respite," Sparkes said in a recent interview. "The pressures of modern life have made this function of entertainment and cultural self-

...ession particularly valuable."

In recognizing and accepting the entertainment functions of TV, however, is easy to overlook the fact that TV is a medium of communications and that even in the content of entertainment values are being endorsed, ideas argued and biases expressed," he said.

NAB Radio Board Members to Assist Radio Committee

Four members of the Radio Board of Directors of the NAB have been named to work with NAB's Research Committee to conduct a study of the future of radio. Appointed are John R. Anderson, president-general manager, WCCW, Traverse City, Mich; Walter May, president, WPKE, Pikeville, Ky.; Donald A. Thurston, president-general manager, WMNB, North Adams, Mass. and Virginia Pate, president-general manager, WASA, Havre de Grace, Md.

FCC To Expand Citizens Radio Service

The FCC, in a recent action, has committed itself to expansion of the citizens radio service, John Sodolski, Vice President Communications Div., Electronics Industries Assoc. said. The increase discussed in a new FCC proceeding (FCC News Release dated March 10, 1976) will increase the number of channels available to the citizens radio service from the current 23 channels to a larger number.

Because of the widespread use of CB radio, some broadcasters have found a new way of getting valuable drive-time traffic reports. CBers do a better job in a helicopter traffic watch in getting timely information, according to some broadcasters.

Five Years Of Lightning Strike Prevention

Lightning Elimination Associates, Downey, Calif., recently celebrated its fifth year of guaranteed lightning protection and has installed 180 systems. Each customer is given a guarantee which stipulates that in the event of a lightning strike to the protected area, the company will either pay the damages or increase the protection at no additional cost to the customer. Although several of the protected facilities required some work, none required warranty payments and all are now functioning satisfactorily.

SONY
VIDEOREORDER BVH-1000

SONY
DIGITAL TIME BASE CORRECTOR

The Sony BVH-1000. Consider the concept.

The BVH-1000 brings a new, two-in-one concept to professional high band video recording. It meets current broadcasting needs for a top-of-the-line recorder, and does it in an economical package without compromising video or audio quality.

But more than that, the BVH-1000 is the machine of the future. Designed for production and post-production applications, it is a 1" video recorder that can compete with 35mm film techniques.

It wasn't easy, but we have combined transparent picture quality, plus two professional quality audio tracks with advanced editing techniques. That combination simply is not available in any other recorder, no matter what the format or tape width.

Before considering another recorder, examine these eight BVH-1000 features:

1. Exclusive 1.5 head. This completely avoids the problem of missing information caused by head switching of single head machines. It also insures, for the quality user, a continuity of video information, as well as VIRS record/playback, which may be required of all machines in the future.

2. Advanced servo design. The BVH-1000 incorporates drum servo, capstan servo, tension servo, reel servo. This servo system, combined with dual capstan drive, provides highly accurate tape speed and quality interchange, plus gentle tape handling in fast forward and reverse modes.

3. Five stations. These eliminate the use of unreliable and inaccurate belt systems for drives.

4. Standard VH and color framing modes. Both are standard equipment on the BVH-1000. Two high quality audio tracks, a separate cue track, plus 400Hz time generator also standard.

5. Bidirect search control. Built-in bi-directional search control allows jogging the video tape in either direction from 1/4" jog to high speed rewind and fast forward. Non-segmented formats allow the operator to see the picture and make fast editing decisions manually or with computer control.

6. Standard tape timer. This features special memory that prevents the tape from unthreading. SMPTE reader/generator is a plug-in option.

7. Versatile mounting. A flexible mounting system and built-in wave front guide enable the BVH-1000 to be adapted to any number of mounting or console configurations. The BVH-1000 is at home in a small video studio.

8. New Sony time base correction. The BVH-1000 can be used with Sony's new BVT-1000 time base corrector or any other quality TBC. If you don't require time base correction, an optional heterodyne recovery board is available.

This is just the beginning of the BVH-1000 concept. To learn more about the economic, technical performance and specifications, contact your Sony Broadcast representative, or write Sony Broadcast.

News Briefs

The New York State Senate voted 46-9 to repeal a tax levied on the state's 800,000 cable TV subscribers. Russell Karp, president of Teleprompter, applauded the action saying the tax would "throttle" development of cable TV in the state.

Broadcasters told the U.S. District Court of Appeals in Washington D.C., that a response by the FCC to charges that its order relaxing rules against duplication of local programming by cable systems "is inadequate in several respects." NAB asked the court to vacate the FCC action as "arbi-

trary and capricious." . . . In other actions the NAB opposed a new FCC rule proposal that would require broadcasters to notify all legally qualified candidates of free time given to a candidate 72 hours before an election. NAB suggests, instead of a new rule change, that would allow broadcasters to place information regarding such donated political time in their public files.

The **Small Market Radio Committee** of the NAB unanimously passed a resolution calling on the Radio Board to go on record opposing the licensing of radio stations with power in excess of 50 kW . . . The FCC was **petitioned by NAB** to return the 94.7-97.3 MHz band to broadcasters, exclusively. Broadcast Studio-To-Transmitter and intercity relay links are needed for such remote pickups as traffic reports from helicopters, news, etc. and could be carried in this band.

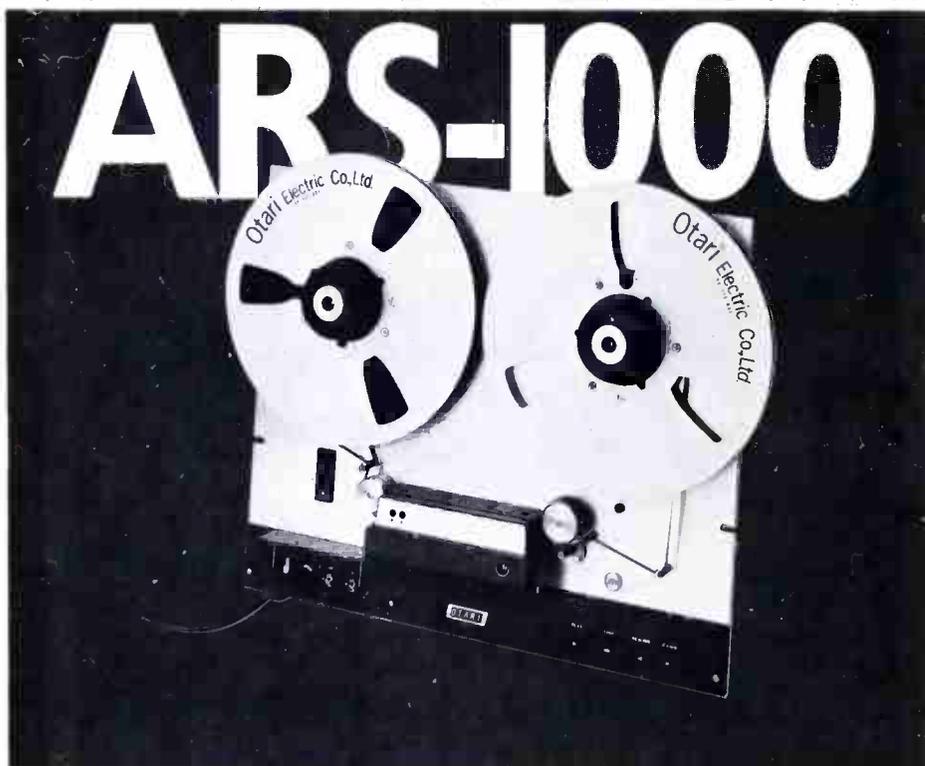

Eastman Kodak Company, accepted an Emmy for the firm's development of its video news film Ektachrome 7240.

The **National Advertising Division** of the Council of Better Business Bureaus resolved ten challenges to national advertising in April. Seven matters were resolved when advertisers either discontinued the ads or agreed to copy changes. Three cases closed when NAD found the claim "substantiated."

The **elderly are portrayed fairly and realistically** in national advertising according to the findings of the National Advertising Review Board . . . There were **657,370 pay TV subscribers** as of March 31, in the U.S. according to a census performed by Paul Kagan Associates, of Rockville, New York . . . Ampex Corp., announced it has completed delivery of the first production run of its MM-1200 multi-channel recorder for domestic and international customers. The recorder was first introduced to market on March 2nd.

KETC-TV, Channel 9, will come the first associate member of the Rocky Mountain Public Broadcasting Network, opening up a new membership category for the organization . . . **Overseas press coverage** of French president Valéry Giscard d'Estaing's 2-day visit to New Orleans channeled through RCA's new communications gateway in that city. Under criticism from the government over increasing subsidies, the **P. Opéra** completed the first successful closed circuit transmission of a performance to 3,700 viewers of a live screen projection system in an

Specifically designed for automated systems

Otari, Japan's leading producer of professional recorders, announces the ARS-1000 Automated Radio Station Reproducer. This new machine is based on the successful MX-5050 professional recorder, with several components modified to meet the special needs of the automated broadcaster for consistent quality and greater reliability under heavy duty continuous operating conditions.

Compare these features:
2500 hours MTBF; 7½ or 3¾ ips;
front switchable speeds; preamp in

head assembly for minimum RFI and improved S/N; optional 25 Hz sensor; improved low frequency response for reliable 25 Hz sensing; +4dB 600 ohm output; improved flutter performance; plug-in boards with gold-plated contacts; nationwide parts and service from Otari MX-5050 service centers (mechanical parts are interchangeable); one year parts and labor warranty.

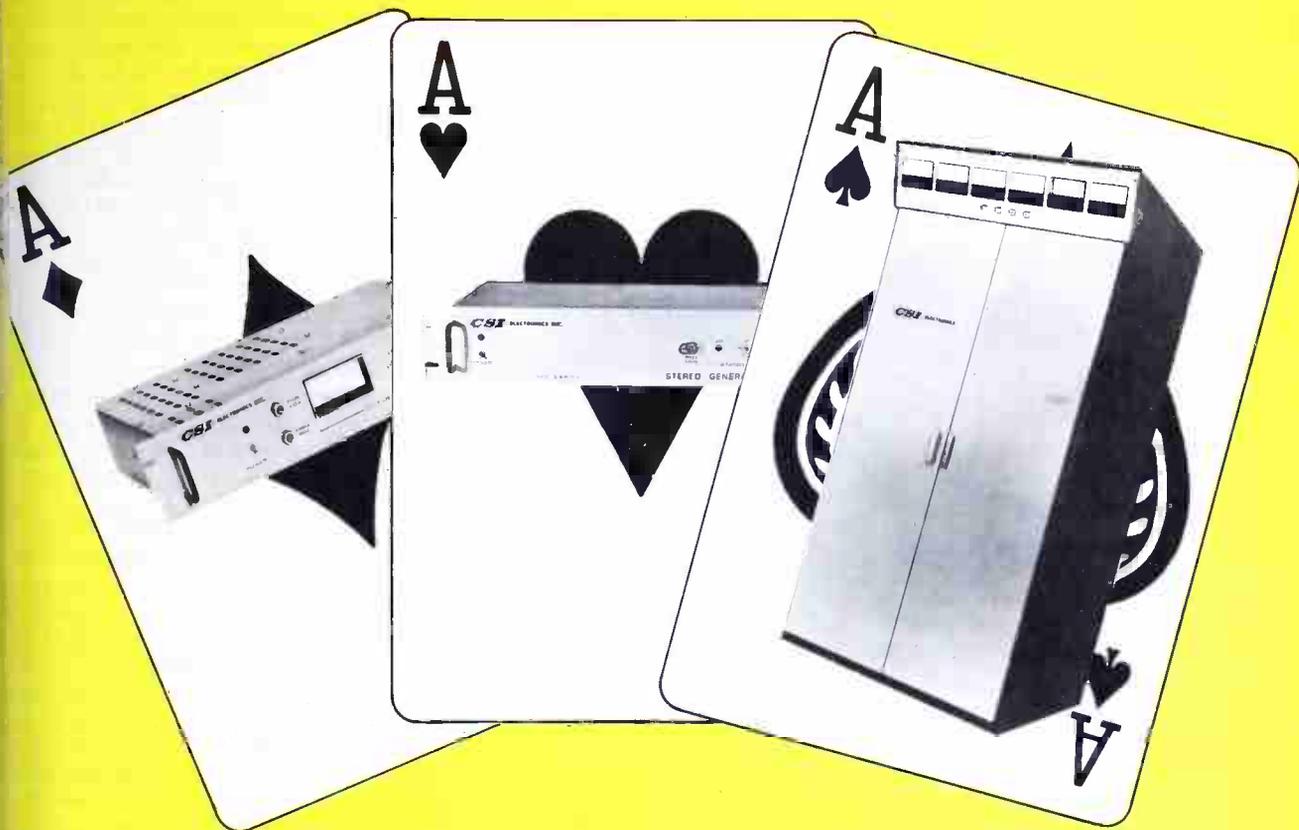

If you're considering automation, ask your automated system supplier for full details on the ARS-1000 or call Otari.

WE'VE GOT A WINNING COMBINATION

THREE ACES FOR THE STEREO FM BROADCASTER

- Time Division Multiplex Stereo Generators
- Solid-State Phase Lock Loop Exciters
- FCC Type Accepted FM Transmitters

The Stereo Generator is an all solid-state unit that meets or exceeds FCC requirements for stereo multiplex transmission. The composite signal is generated using the time division technique to reduce the complexity of the circuit and the number of components. There is negligible crosstalk and noise, excellent 100 Hz suppression, and excellent channel separation. Includes built-in tracked pre-emphasis, remote mono/stereo switching and optional phase equalized input filters.

The FM Exciter is an all solid-state, phase locked, frequency synthesized exciter. It may be programmed to operate on any 0.4 MHz increment in the FM band using a single 8 MHz crystal.

No oven is used and stability is ± 500 Hz over a wide temperature range. Power output is adjustable from 5 to 20 watts.

Our FCC Type Accepted FM Transmitters have new design features that increase efficiency, provide greater reliability and reduce maintenance. Sliding shoring contacts are used for tuning and loading—and all these adjustments are from the front panel. The final stage uses a grounded grid, zero bias triode for stability without neutralization. Output power is directly adjustable without changing tuning or loading. Low voltage control circuitry, with provision for remote control, is standard.

DEPENDABLE AND EFFICIENT, WITH INNOVATIVE DESIGN FEATURES FOR TODAY'S BROADCASTER

ditorium on the outskirts of the city. The criticism had been based on complaints that the opera benefited only a few elite, and that most viewers were shut-out of the small opera house due to its size.

The world record for continuous single broadcast was broken on May 7th, when Robb Capp, WELM morning announcer ended a five day broadcast from a shopping mall. Capp went 112 hours without sleep, drinking only

one cup of coffee a day and consuming only high protein foods and large quantities of ice cream, his favorite food.

Business Briefs

The Electronic Components Group of GTE Sylvania, Inc., reported that it does not intend to "embrace the glass technology" recently announced by Rauland Division of Zenith Radio Corp. The decision was made after consultation with Sylvania tube customers had determined that the new

tube technology developed by Zenith and Corning Glass, did not, in the words of a spokesman, "offer our customers (Sylvania's) any economic advantage."

Commercial electronics will remain the profit forerunner for **Conn Corp.**, according to Donald Putnam, president. Putnam pointed out that electronics has provided the most consistent growth pattern for the company, showing a gain in each of the years the firm has been involved in the electronics field. . . . **Microware Power Devices, Inc.**, (MPD) announced the receipt of an RCA contract in excess of \$115,000 to build space qualified solid state power amplifier.

In a move that "will result in greater effectiveness of the sales and marketing force and increased engineering and manufacturing efficiency," all marketing activities of **Clare-Pendar**, have been assigned **C.P. Clare & Company**, according to James A. Yunker, senior vice president of **General Instrument Corp.** The move is effective immediately.

International Video Corp. announced the sale of IVC-9000 video tape recorders to clients in Mexico, Bangladesh and order in excess of \$200,000 for three IVC-7000 studio cameras from Radio Television Singapore. . . . **Acrodyne Industries**, announced that nine of its television transmitters will be installed at several locations in the Republic of Sudan as that country expands its television network.

Sola Basic Industries completed acquisition of **Corotek Corporation** April 1, according to Frank H. Reardon, chairman and president of **Sola**. . . **EMI Gencom** has acquired Vacuum Photodiode range formerly manufactured by **Tung Sol Division Wagner Electric Company**.

VIZ Manufacturing Co., announced that it has formed a new group to handle its line of electronic test instruments. The line of products originally acquired from RCA, will now be handled by **VIZ Test Instrument Group**. . . . **Omega Video Inc.**, moved to a 10,000 square-foot facility at 14326 Isis Avenue, Lawndale, California.

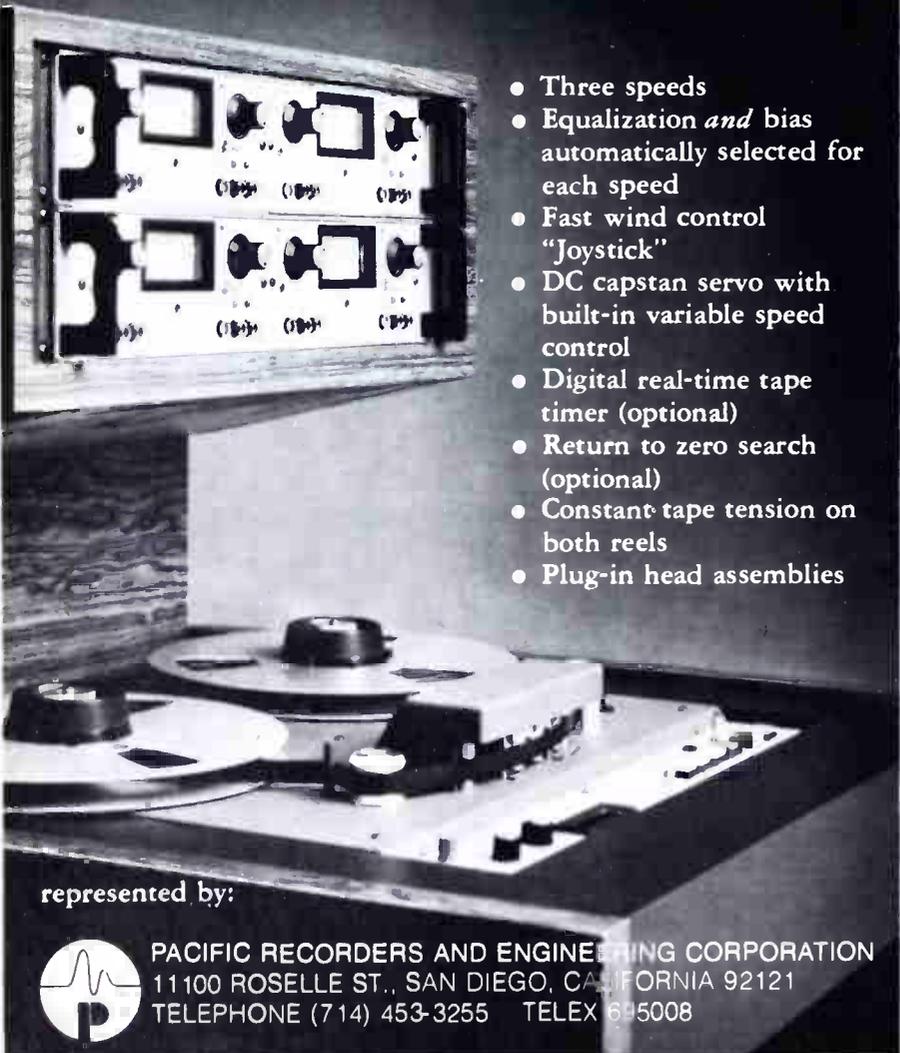

RCA Broadcast Systems announced a number of developments including orders for seven BTA 10L2, 5 and 10-kW AM radio transmitters; a \$642,000 order for a complete tv transmitting system from the State of Tennessee; \$580,000 order for color tv transmitting systems from Itapoan, Brazil, and the first regular station operations by **KARD-TV** in Wichita, Kansas.

Stockholders of **Wabash Mathematics, Inc.**, authorized the company

From now on, all other multi-cart machines are out of date.

Beaucart 4D.

Even if you've just purchased a multi-slot broadcast audio cartridge reproducer, you're already behind the times. Because Beaucart has introduced a revolutionary four-slot machine with features so advanced that existing units can't come close.

While standard 3-deck machines use a single motor and power supply to drive three carts, the Beaucart 4D is really four completely independent cart reproducers in one housing. Not only are key operating specs, like wow and flutter, easier to uniformly maintain, but the failure of an operating component will put only one slot out of service. Each machine may be individually removed from the 4D housing, leaving the other three still on the air. Try that with a 3-deck!

Other features? Dozens. 4D is the only

multi-slot machine with the new, patented Beau pancake drive motors. And fast forward is available in any (or every) slot. But most important of all is the cost. The Beaucart 4D mono single cue, at \$2,537 list, is only \$71 more per slot than an ordinary 3-deck machine, which typically lists for about \$1,690. And that \$71 is a terrific investment.

Let us tell you more about the exciting Beaucart 4D. Models available in Stereo and with built-in recorders. Call today.

Your new automatic distortion measuring system for balanced measurements

REDUCED OPERATOR ERROR

Here's something you'll like — Sound Technology's new distortion measuring instrument for use in balanced work.

The new 1710A is much more than a distortion analyzer. It's a system. It contains its own ultra-low-distortion generator tracked with the analyzer. It's a system that greatly simplifies measuring — gives you fast measuring in a simple operation that reduces operator error.

For example, push the frequency button and you set both generator and analyzer. Push "Distortion" and you have a reading. Automatically. No slow, tedious manual null-searching.

Features in the new 1710A include:
 • a balanced, floating output (600/150 ohms)
 • a balanced (bridging) input
 • a high-level +26 dBm signal

- +26 to -90 dBm attenuator
- distortion measurements to .002%
- fast 5-second measuring speed
- automatic nulling, optional automatic set level.
- both harmonic and optional intermodulation distortion measurements.

SPECIAL OUTPUT CIRCUIT

In the 1710A you get a transformerless audio generator output that's balanced and floating. No transformer means no transformer distortion. Floating and balanced means you can connect to virtually any audio circuit regardless of configuration. And you can set the output from +26 to -90 dBm in 0.1 dB steps.

FAST, SIMPLE MEASURING

Automatic nulling and the automatic set level option (ASL) give you ex-

remely fast measuring and little chance for operator error. You can measure in 5 or 6 seconds. With ASL you can measure distortion vs. frequency, and distortion vs. voltage or power without resetting level.

IM OPTION

An additional optional bonus is that the 1710A also measures intermodulation distortion. After you've made a harmonic measurement, just push the "IMD" button. In 3 seconds you'll have the IM reading. With this option you'll be ready for future IM requirements.

CALL/SEND NOW FOR LITERATURE

It's worth while getting the information on this major new distortion measuring system. Call Larry Maguire or Bob Andersen now and get our new product brochure. It's ready and waiting.

INTERPRETING THE **FCC** RULES & REGULATIONS

Revised Commercial Radio Renewal

Application: By Frederick W. Ford and Lee G. Lovett
Pittman, Lovett, Ford and Hennessey, Washington, D.C.
(Form 303-R): Part I

The Commission released its long-awaited *Report and Order** on May 3, 1976, revising the application form for renewal of broadcast licenses. Henceforth, FCC Form 303 will be used strictly for television renewal application. New FCC Form 303-R will be the radio (AM and FM) renewal application form.

While the two forms will be substantially similar, this column will be limited to analysis of FCC Form 303-R for radio renewal applications.

A sample Form 303-R is illustrated below. Readers should review each Form 303-R question before reading the analysis below.

Effective date

Commercial radio licensees whose renewal applications must be filed on or after December 1, 1976 (whose licenses expire on or after April 1, 1977) must use new FCC Form 303-R. Those radio licensees whose renewal applications are due prior to December 1, 1976 (whose licenses expire before April 1, 1977), must use present FCC Form 303 and *must comply with present Commission procedures for renewal application*.

Instructional pamphlet

The Commission's extremely thorough *Report and Order* contained in Attachment entitled an "Instructional Pamphlet" which contains a summarization of the different materials needed by a licensee to (1) prepare its renewal application and (2) fulfill its public interest obligations. This Instructional Pamphlet is an indispensable reference tool for licensees. Copies should be obtained from your communications counsel or from the Federal Communication Commission. An outline of the information contained in the Instructional Pamphlet is produced below.

Another TFT first in AM Modulation Monitors

THE EXTENDER

Extends coverage potential

TFT's new, competitively priced Model 753 precision wideband AM Modulation Monitor has a full complement of quality TFT features, for maximum transmitter modulation to the outer limits of coverage and for off-of-performance measurements. The Extender is class by itself.

- Linear phase filter
- Built-in meter attenuator
- Modulation meter and peak flashers calibrate automatically over a $\pm 40\%$ carrier level change
- Digital flashers for 100% negative modulation peaks and 125% positive modulation peaks
- Built-in -100% and $+125\%$ calibrators
- FCC Type Approval No. 3-234.

Extends Monitoring Capability

By adding the new TFT Model 754 Preselector, broadcast stations, consultants, and regulatory agencies can pre-program any four AM stations via wheel switches. Then, they can precisely monitor, on-the-air, any one of the four. Exclusive features include:

- Frequency synthesized digital tuning
- Digital read-out of carrier frequency deviation (optional)
- Unique IF filter design for optimum off-the-air monitoring.

For a free demonstration, call or write TFT at the address below.
In Canada: Orange County Assoc., Winnipeg, Manitoba.

TFT

TIME AND FREQUENCY TECHNOLOGY, INC.

3000 OLCOTT STREET, SANTA CLARA, CA 95051 (408) 246-6365 TWX No. 910-338-0584

Circle 130 on Reader Service Card

and not be separately requested. Separate renewal applications must be filed for each of the following: (1) Auxiliary Broadcast Service License, (2) Remote Pickup Station License, (3) Aural L Station License and (4) Aural Intercity Relay Station License. These applications may be filed on Form 303-R if there are no changes since the last license renewal; if there are any changes, Form 313 should be filed.

Financial

The Commission deleted the requirement that a balance sheet of the licensee be submitted with the renewal application. The Commission said: "The licensee's own ability to maintain the broadcast operation of [its] station over a period of times affords the Commission reasonable assurance of the renewal applicant's financial qualification."

Parts II to V, the Legal, Engineering, Programming and Equal Employment Opportunity sections of the commercial radio renewal Form 303-R, will be analyzed next month's column.

Clarification on PSA's and the Program Log

The duration of a Public Service Announcement need not be logged as indicated in BM/E, April, p. 26. However, Pittman Lovettford and Hennessey counsels "logging of time duration for PSA's is most advisable, especially where PSA's are broadcast during non-entertainment programming to permit accurate computation of program time. This becomes especially important for the Composite Week logs."

The computer that's backed up by people.

With Bias you get much more than a superior computer system. You also get your own personal consultant... one of nearly thirty highly qualified broadcast automation experts in our Broadcast Service, Communications, and Customer Service Departments. He's at your call from sign-on to sign-off.

There are also the Bias schools where continued training programs are always available to our customers. Bias also provides the industry's most complete operator's manual. So it's easy to look up the how-to on any program.

At Bias we're committed to you. That's why our customers are committed to Bias.

For more information about the industry's leading computer system, call 901-332-3544 collect; ask for Pat Choate, Director of Marketing, or Skip Sawyer, General Sales Manager.

PART IV - PROGRAMMING

1. Has applicant placed in its public inspection file at the appropriate times the required documentation relating to its efforts to ascertain the community problems, needs, and interests?
 YES NO If NO, attach as EXHIBIT 11 a complete statement of explanation.

DOES NOT APPLY.

2. Attach as EXHIBIT 12 applicant's community leader checklist for the preceding license term.
 DOES NOT APPLY.

3. Has the applicant placed in its public inspection file at the appropriate times its annual list of those problems, needs and interests which, in the applicant's judgment, warranted treatment by station and typical and illustrative programming in response thereto?
 YES If YES, attach those listings as EXHIBIT 13.
 NO If NO, attach as EXHIBIT 13 a complete statement of explanation.

4. Attach as EXHIBIT 14 one exact copy of the program logs for the composite week used as a basis for responding to the questions herein. Applicants utilizing automatic program logging devices must comply with the provisions of Sections 73.11(c) and 73.28(c) of the Commission's rules.

PROGRAM CATEGORIES	Previously Proposed		Composite Week Performance		Minimum Proposed	
	Minutes of Operation	% of Total Time	Minutes of Operation	% of Total Time	Minutes of Operation	% of Total Time
Public Affairs						
Other programs, exclusive of entertainment and sports						
PSAs						
Public Service Announcements	Number		Number		Number	

5. Attach as EXHIBIT 15 those programs in the composite week included in the public affairs and "all other" program categories lines 2 and 3 of the above chart, indicating the title, source, type, brief description, time broadcast and duration of each program.

6. The amount of time applicant devoted to non-entertainment programming (lines 1, 2 and 3 of the above chart) during the composite week vary substantially from the representations made in applicant's last application?
 YES NO If YES, attach as EXHIBIT 16 a statement explaining the variation.

7. The number of 60-minute segments in the composite week (beginning with the first full clock hour and ending with the last clock hour of each broadcast day) containing over 18 minutes of commercial matter: segments. List in EXHIBIT 17 each segment and the day and time broadcast with headings of "Amount of Commercial Time in Segment" and "Day and Time Broadcast".

8. The applicant's commercial practices for the period covered by this application vary from the representations made in applicant's last application?
 YES NO If YES, explain in EXHIBIT 18 the variations and the reasons therefor.

9. The maximum amount of commercial matter applicant proposes to allow in any 60-minute segment (Minutes:). State percentage of hourly segments per week this amount is expected to be exceeded (%:) and the limits per hourly segment that would then apply under those circumstances to regular commercial matter () and to political commercial matter (Minutes:).

10. Briefly describe applicant's program format(s) during the past 12 months.

11. Briefly describe applicant's proposed format:

21. Does the applicant's station duplicate the programming of another radio station?
 YES NO If YES, state:
 (a) the call letters of the duplicated station
 (b) the population of the community of license of the duplicated station
 (c) the population of the community of license of the station for which renewal is requested
 (d) the total number of broadcast hours in the composite week
 (e) the amount of programming duplicated during the composite week

22. Attach as EXHIBIT 22 any additional information which, in applicant's judgment, is necessary to adequately describe or to present fairly its services and operations in relation to the public interest.

PART V - EQUAL EMPLOYMENT OPPORTUNITY

23. Attach as EXHIBIT 23 a description of the specific practices undertaken by applicant during the past license term to assure equal employment opportunity for minorities and women and the practices applicant proposes to following during the coming license term to assure equal employment opportunity for minorities and women.

24. Attach as EXHIBIT 24 a brief description of any complaint which has been filed before any body having competent jurisdiction under Federal, state, territorial or local law, alleging unlawful discrimination in the employment practices of the station, including the persons involved, the date of filing, the court or agency, the file number (if any), and the disposition or current status of the matter.

CERTIFICATION

I certify that the statements in this application are true, complete, and correct to the best of my knowledge and belief, and are made in good faith.

Mr. Paul Warnock
President
TeleMation, Inc.
P. O. Box 15068
Salt Lake City, Utah 84115

Dear Paul:

The new TeleMation TCG3000 Character Generator has proven to be a very delightful surprise. It seems to measure up to just about all of our expectations and then some. I thought you would like to know that it has generated more genuine excitement and enthusiasm on the part of our employees than any other piece of equipment that I have purchased for the station in the last seven years.

May I extend our thanks to you and to those members of your staff who have contributed so much in the preparation, design and provision of this forward looking equipment and especially to Dennis Fraser, Tom Meyer and Leo Lewis. It was great having those people work with us on this project and we hope that they will continue to support us as we come to be more knowledgeable and familiar with the equipment.

I just thought you might appreciate our words of thanks.

Sincerely,

R. C. Smith
Chief Engineer

RCS:rg

introduced at the '76 NAB, the first *Compositor I* Titling/Graphics System was delivered to Time-Life station WOTV, Grand Rapids, Michigan, on April 17.

the results?

WOTV Chief Engineer R.C. Smith writes that the *Compositor I* "has generated more genuine excitement and enthusiasm on the part of our employees than any other piece of equipment that I have purchased for the station in the last seven years."

We wish to thank Mr. Smith for his appraisal, and extend an invitation to all Broadcast Managers and Engineers to compare these *Compositor I* features with any other multifont character generator:

Mixed-Font Pages. Some "multifont" systems can display only one font at a time. The *Compositor I* allows the operator to mix fonts on a single page, within a row or within a single word.

High-Capacity Disk Memory. Some character generators require a disk change between font changes, page storage, and program loading. In the *Compositor I*, all fonts, as well as the computer program and up to 800 composed pages, are stored on a single disk and are always available — from any keyboard location.

Camera Quality Characters. The *Compositor I* obtains maximum character smoothness by using character "elements" smaller than the limiting resolution of the television system itself. It incorporates line-by-line vertical resolution and provides horizontal elements of only 20 nsec width — in contrast to the 65 to 65 nsec element width typical of other comparably priced systems. The *Compositor I* thus provides on-screen characters that are virtually indistinguishable from camera reproduced artwork.

- **Automated Election Reporting.** With the addition of the TED (Television Event Display) software package, the *Compositor I* automatically compiles, formats, totals, and displays election returns. No additional hardware is required.

- **Selection of 28 Colors.** With the EC-3000 Colorizer/Background Option, characters and/or backgrounds can be colored any one of seven hues, with each hue available at any one of four luminance levels. Black, white, and two levels of gray are also keyboard-selectable. Each character can be colored separately. Background colors can be changed in four-scan-line intervals and background color can be substituted for character color to provide multi-hued characters.

- **Selectable Character Edging.** The basic edging option (EO-3000) provides a selection of border, "drop" shadow, or outline; while the EO-3001 Expanded Edging Option adds "slope" shadow and multiple border/outline widths proportioned to the font size.

For more information about the *Compositor I*, send us the coupon below or call TeleMation Broadcast Sales collect at (801) 487-5399.

Radio Automation Gives Extra Working Arms To Talented People

Once you free the creative people in a broadcast station from routine, they can do more creative and more profitable work, often handling two or more jobs easily and well. That is the gain from automation most frequently cited by radio broadcast managements.

Why is this the biggest year in the history of radio automation?

The scores of station managements who have adopted it give a variety of reasons: they wanted a "smoother," better-controlled "product"; or a "big city" sound in a rural community; or weekend programming without hiring extra help; or to keep the personnel list from growing out of hand; etc, etc. The station stories that follow give more than a dozen specific examples.

But a large majority of the managements interviewed by BM/E for the round-up, in addition to whatever other reasons they put forward, agreed on one thing: automation gives its greatest lift to a station by freeing creative people from the time-tyranny of routine jobs so they can really help the station improve its on air sound, or its relations with the community, or sell more time, or whatever else is needed to raise standards and profits that nobody had time to do before.

As one manager put it (typifying a lot of others): "With the automation, I got my main on-air 'personality' away from cueing up a record on the turntable every three minutes and let him make a voice track the whole day's music in an hour every morning. He correct mistakes, redo parts he doesn't like. Then he goes to the newsroom, does a beautiful job of putting local news items on the air: he's the best I've got for that. Finally, between news stints, he comes into our production room and does voice for some commercials, he's great on that too. He likes the variety—and the fact that I can pay him quite a bit more than before."

Every station will have its own set of talented workers, its own complement of jobs, but the principle will be the same: whatever talents the people on the staff have, automation can, in effect, multiply those talents and make them effective over a much wider range, with more than likely increasing the satisfaction the workers

(Above) Schafer 903E full-automation system, introduced at NAB in Chicago, has extended memory for three full days of automatic programming. System shown has six Audiophiles, each holding 48 carts all available for automatic play.

(Above) Collins new A7600 AutoPro, with memory for 2000 events, extendable to 8,000, can control rotary cart machine Instacarts, reel-to-reel machines.

(Left) Harris System 90, here being pitched through its paces at NAB, Chicago, has micro-computer control, memory for 1,000 events, expandable with memory optics.

from their jobs. Two other large benefits noted in the July and August, 1975 issues) are: the production of an on-air product that is free of errors, consistent in quality, and the supplying of the dominant type of disc jockey with a tool that takes all the chore out of playing records of cart or reel-to-reel music, freeing him to listen or play the music, at the push of a button. Automation can be the good right arm of this kind of DJ, giving him the ability to interpolate talk anywhere he wants into the sequence of music, with no necessity to load or change cart machines, cue up turntables, throw switches, etc.

Automation" does cover a pretty wide spectrum, as the May coverage of the NAB showed. The more complex end is represented by such machines as the IGM/NTI computer-controlled 700 series, with prices up to about \$90,000 for a basic system. At the other complex end are such systems as ESE's 780 Programmer-Controller which lets the DJ set up 32 events on a time insertion basis, and costs about \$1400. The amount of "freedom" that on-air personnel get will be directly related to the complexity, and cost, of the automation system—although even the least complex system gives an on-air worker a kind of scope he can't get any other way.

The stations that use automation cover a pretty wide spectrum too, from stations that have as few as 20,000 listeners in the market area (see KULY below) to those in the largest cities (see WBMX, for example). The stations listed that follow represent a random selection from more than a hundred that BM/E readily identified as now

using automation. The total is considerably above that number.

In roughly half the stations described here, the reader will note the use of syndicated programming, which is especially convenient with automated switching. A number of the syndicators tailor their material especially for automated use, but this is not invariable. In the August issue BM/E will consider the syndication industry in some detail, describing what a station buys with the various kinds of syndicated programming.

A development that looks important for the first time this year is *total automation in radio stations* (see stories on WRMN and WBEN below). By interfacing a data-processing, traffic-control system (PSI) with the switching automation (Harris), WRMN, for example, has machine control of the operation right through from the writing of a commercial order, to the airing of that commercial, the issuance of the bill, production of log, etc. This will come much more slowly in radio than in television where it is now a strong trend, but the door has been opened by development of the interface systems by several manufacturers: a number of the larger radio stations will move into this field.

A rationale that emerged in several of the interviews: a station in a small community on the edge of a large metropolitan area, in order to compete with the much heavier payrolls of the big-city stations, goes to automation and syndicated programming for a smooth, big-city sound it can afford (see WVIP and WKFM, for example). Such station managements complained that if they did manage to find and develop attractive on-air

AUTOMATION FREES PEOPLE

personalities, the "personalities" were almost sure to be grabbed off by big-city stations with lots more money. Syndication, of course, often includes much more than just a package of music: on-air personalities are a major part of the "buy," recorded in such a way that they can be integrated seamlessly into the station's programs, become in effect, part of its staff.

Here, then, are very brief descriptions of about a score of radio stations of great variety that are automated and glad of it: how they use it, what they have learned from it, how they made a real go of it.

KRIO, McAllen Texas—AM, 5 kW day and night

Charles Trub, president and general manager, depends on a "full-scale" automation system (Control Design) and a syndicator (Programme Shoppe) to help him put out a smooth Contemporary Top 40 format that has the station in a top rating bracket for a market of nearly 500,000 people. But he is emphatic on the point that a station cannot just feed syndicated programming to the transmitter and expect to stay in business against sharp competition (there are 10 other radio stations in his area). A station, he says, must have strong local "commitment" through an active local news department, deep involvement in community activity. KRIO has three full-time local newsmen; the AP national news is picked up on the hour; for state-wide Texas news, KRIO gets a feed from the Texas State network. Actualities from the Texas net are often recorded for later use. Local community spots and short programs go on the air as often as ten times a day. The station was a leading force, for example, in the building of a \$6 million hospital, financed with local bonds. A number of the "community" spots are made by the Programme Shoppe DJ's on the West Coast. Altogether, he seems to be getting the best out of each part of the operation, the automation, the syndication, the local activity: it's a combination for success.

WBMX-FM, Oak Park, Illinois—6 kW, 1170-ft. antenna

One of the most successful US stations programmed predominantly for a black audience, WBMX-FM uses an IGM/NTI 750 computer-controlled automation system, with six Carousels, six Instacarts, several reel-to-reel machines, automatic time and weather input. The DJ's make up voice tracks for six hours of programming in an hour, reports Program Director Earnest James. The programming is laid out for as long a stretch as the management wants with the help of the computer; the titles and a number of characteristics of each song are stored in the computer so the type of song wanted can be called up by pushbutton (see story on WEEI, Boston, BM/E July, 1975 for a similar use of the IGM/NTI system). The program list thus assembled is printed out by the computer as a "prelog" for the DJ's and the station management. This makes up the backbone; commercials, ID's, PSA's, etc., all on carts, can be changed, up-dated from hour to hour, inserted where wanted.

WBMX-FM, according to James, will soon join the total-automation trend with a Paperwork Systems "BAT" system that will be interfaced with the IGM/NTI system.

At WISM (left) engineering director Chris Cain operates SMC DP-1 automation system, which plays music on Technics reel-to-reel machines in foreground; programs are produced in the station. (Right) RCA DAP-5000A automation system. KMBS-FM, Harlingen, Texas, has 3 Kartwheels, 4 reel-to-reel machines, automatic logging and time.

WQHQ-FM, Andalusia, Alabama

Here is a newly-owned and revamped station, taken over in January of this year, already billing more than \$20,000 a month in a county-wide market of around 40,000 people. William Hoisington, president and general manager, started with an SMC DP-1 automation system, and the Drake-Chenault Hit Parade, syndicated rock programming. He reports that the smooth, consistent professionalism of this combination is getting "fantastic" results for him. Like all other stations that are successful with such a combination, he also places heavy emphasis on local news, local identifications. The new ownership also acquired WKYD, a 5 kW full-time AM on the same site, and Hoisington is strongly inclined to automation for that too.

WVIP, Mt. Kisco, N.Y. FM

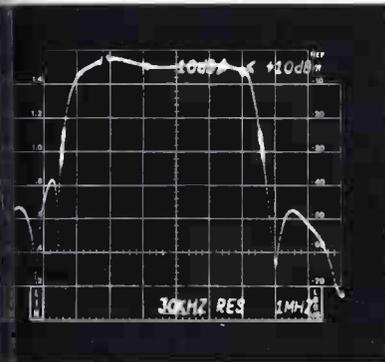

Ken Harris, vice president and general manager, uses a Harris System 90 automation system and syndicated MOR programming from Audiographics, with emphasis on "personalities," which come along with the music on a separate reel. Again, the station is heavily oriented to local interests, alongside the syndicated programming. He points out that he needs the smooth professionalism of the syndicated "voices" because the New York broadcast market is less than an hour away. Since syndication is the best way to compete on quality. He offers some advice for any station putting in automation: do not give up because during the first month or two the whole staff seems to be merely slaves to the machine, adjust their activities to "accommodate" it. After this shake-down period, he says, the people gradually take control and tell the machine exactly what to do. Then the station, and the people, too, get the planned-for boost in efficiency and morale.

WRMN, Elgin, Illinois—1 kW daytime

Here is the first total application of automation in radio broadcasting that BM/E has come across. Richard Jackle, president and general manager, has interfaced a PSI BAT system with his Harris System 90 switching system, for a total integration of time sales, scheduling, "rotation," programming, etc. For example: a 1-week's programming is set up on Computer "A" (P) which dumps daily sections into the Harris (Computer) for the switching. The actual material put on the air

Now you can have deband analysis, plus...

and lower sideband response at 10 dB/div. Intensity markers.

new capability by combining a high performance spectrum analyzer with a sideband analyzer:

- your regular sideband test —
- show a log amplitude display of sideband response.
- perform in-service testing and spectrum analysis of the transmitter.
- measure aural transmitter deviation.
- measure swept differential gain.
- measure antenna vswr (with directional coupler).
- measure baseband response and perform complete loop testing, including STL.

New 1405 TV Sideband Analyzer is an adapter to be used with 7L12 or 13 to analyze the re-

sponse of a TV transmitter. The 1405 generates a composite video signal, the picture portion of which is a constant amplitude sine wave signal that sweeps from 15-0-15 MHz. When this signal is used to modulate the TV transmitter, the sideband response of the transmitter will be displayed on the spectrum analyzer. The 1405/spectrum analyzer combination can be used to display the frequency response characteristics of rf and if stages of any vhf or uhf transmitter used today in the world. Video circuits from 0 to 15 MHz can also be analyzed.

AUTOMATION FREES PEOPLE

recorded by the Harris system, "read-back" to the PSI at the end of the day, to prepare a list of discrepancies as well as the final log.

Another part of the operation: information on each commercial, entered into the system at the beginning in a simple manner, allows the PSI to work out the programming according to the conditions of the time sale. This allows the computer, using a specially-written program, to prepare a "load list," assigning tray numbers and positions for carts, so that the cart loader has a number immediately which makes loading fool-proof.

The examples given here are merely to convey the general nature of the operation: BM/E hopes to publish a more complete description of the WRMN operation at a later date.

WKFM, Fulton N.Y.—FM

Here is another station in a small community next to a large one (Syracuse), surviving by using automation, plus syndicated programming, for a smooth, professional "sound." The automation is the RCA DAP-5000; the program is TM Stereo Rock of TM Productions. In its two years on the air, the system has given the station much better control of its programming than it had before, says Robert L. Rooney, vice president, general manager and chief engineer. There are no mistakes and the "personalities" that come with the syndicated programs are far more effective than any he could find locally, or afford to import, says Rooney. Further, the automation makes it simple to extend over to WKFM the on-air work of top announcers on the sister AM station, WOSC. It's a clear case of talented personnel being engaged in two jobs, with no stress to them. And that has helped lift the station from 20th in the market to 5th in the two-year period.

WATI, Indianapolis, Ind. AM.

This station is using a much simpler form of automation, the Microprobe 100-A Programmer, which allows the sequencing of up to 24 events. This is com-

IGM's MARC VII ("manual assist remote control") allows DJ to pre-sequence up to 18 events in advance, interrupt sequence for talk or changes at any time; CRT screen constantly shows event on air, up-coming events.

bined, says Robert Lamb, general manager, with FM100 syndicated music programming supplied reel-to-reel tape which is called up by the programmer. Mr. Lamb likes the FM100 material because it includes good music not available elsewhere. He says that Programmer was installed, not to cut down on manpower, but to give the manpower he has the ability to a program of music going, then be prepared to do new stock reports, etc., without any panic about keeping music going. He also likes the fact that he doesn't have to stock up music. The new combination of Programmer and syndicated music, started in March, has brought many younger listeners, without losing the older ones that the station had before with its programming "standards."

KSFX, San Francisco. FM

Donald Platt, general manager, uses a Schafer 903 automation system to help put out effectively his format of adult-oriented contemporary rock music. The music on carts and is played from eight Audiofiles, giving the station a very long set-up time with the extensive memory of the 903. But voice tracks for current information—weather, traffic, etc.—are made 15 minutes to 30 minutes ahead of air time. A combination of current information with very popular "personality segments long established in the evening hours led Platt to operate during certain hours in what amounts to "live" programming. "Those particular hours were popular I didn't want to change them in any way," points out. "The automation has given us a tremendous lift in other parts of the program day, so that we are more consistent in drawing power throughout the day."

KULY, Ulysses, Kansas. AM

This 1-kW daytime, 500-W nighttime station in the southwest corner of Kansas has what its president, general manager, Sam Elliott, calls "one of the smallest markets in the United States." About 5,000 people are in the town, about 20,000 in the whole market area. The station is successfully using an MOR format, with a Schafer 903 automation system to help get the music on the air. Voice tracking is done right in the station; automation frees the station personnel to do this in a more creative, consistent way. "We used to sit and listen to records all day," says Elliott, "now we can do so much more useful things."

As an example, he says that he and his sales manager tape a "morning show" in a short time every day. The automation then puts it on the air, along with music and other material, while the two executives pick up other aspects of their jobs. Elliott also likes the fact that he has many more manhours for local news production and community "identification" programming, essential to the success of any station in a small market.

KRLT, Lake Tahoe, California. FM

Here is a brand new station, scheduled to go on the air around July 15th, built on automation—a Schafer 903 system—from the start. Ed Crook, vice president and general manager, says the management's reason for automation is that they must have a very smooth, "professional sound for their audience, made up largely of city folk who come to the lake for the prime recreation around the lake, including the several large gambling establishments on the Nevada side." continued on page 45

WHAT IS AMPEX DOING FOR AUTOMATION?

Automated Editing: The EDM-1

EDM-1 Computer Controlled Edit-System
Fast and versatile editing, with unrivaled creative capability, is as easy as touching keyboard. The computerized circuitry of the EDM-1 does away over many of the complications of editing, freeing your attention for artistic decisions. Typing audio and video edit instructions on the EDM-1 keyboard is easier than making notes to yourself. Then, when you know what you want, this machine does it all automatically.

Automated Teleproduction: The AVR-3

AVR-3, the "Intelligent" VTR
Automation begins internally with the AVR-3, where correct playback band and speed selection take place automatically. Add the optional Edit Controller, and the AVR-3 does its own "housekeeping" and interfaces with the remarkable new EDM-1 Editing System. And the added bonus of Super High Band Pilot gives you the best pictures you can get on any VTR today.

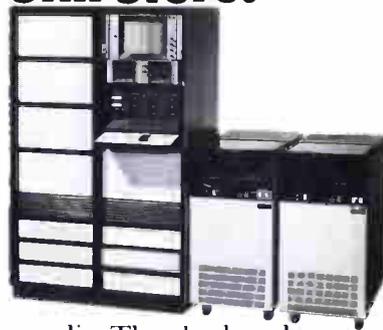

Automated Spot Play: The ACR-25

ACR-25 Automatic Video Cassette Reeler/Reproducer
In your station in total automation, it is the only cassette reeler that will do the job. Equipped with the Ampex ADA (Automatic Data Accessory), the ACR-25 accepts a Play List from your master automation system, then rolls spots for their short segments instantly and automatically. All that manually is load and unload cassettes.

Automated Still Store: The ESS

ESS Electronic Still Store System
Automation where you least expected it—in the slide/still files. All flat art is recorded digitally, along with addresses, on computer-type disk memory media. Then keyboard commands call up the images for instant display. "Browsing" through the files is as easy as watching a monitor, and there's never a slide to wash or an easel to get dog-eared from handling.

How Much Automation for You?

That's a personal decision. The equipment you need is available now from Ampex, ready for instant use in manual or semi-automatic mode, or for full automation if you're at that point. And Ampex is working on other developments to make automation more practical for more users.

For more details contact your Ampex Sales Engineer or write us.

AUTOMATION FREES PEOPLE

side. In addition to the visitors, working personnel in the gambling houses are largely well-educated young people, in the 20-to-38 age bracket. The programming planned for this audience is Contemporary MOR, and it will be mainly supplied by syndicator Chris Clauson. The station will also do heavy local news production, try to serve the community in a variety of ways. "Consistent quality control and economic control were two main motivations for our adoption of automation," says Crook. "We believe we are starting off with the best possible formula for success."

KWIX-AM, KRES-FM, Moberly, Miss.

This broadcast operation uses two kinds of automation. On the FM station (50kW) there is an SMC DP-1 full-scale automation system which allows the station to put out, according to Richard Womack, operations director and chief engineer, a very tight and error-free program compounded of modern country, hit country and old standards. The KRES audience has been responding strongly enough to keep KRES very high in the ratings. On KWIX (1 kW day, 250 W night) there is a completely different mix, consisting mostly of "information" programming: stock reports, prices on Chicago and Kansas City boards of trade, weather, crop information, many others. The music here, says Womack, is used mainly to bridge between segments of the information programming. The data material is done "live"; the music is pulled "through" by a Microprobe

100A controller, on which the operator can set up many as 24 events for automatic sequencing. This sided approach to automation, says Womack, has given the station just what it needs in the two areas. It highlights the *flexibility* of automation, its capacity to handle a great variety of broadcast requirements.

KSLN, Brownwood, Texas, FM

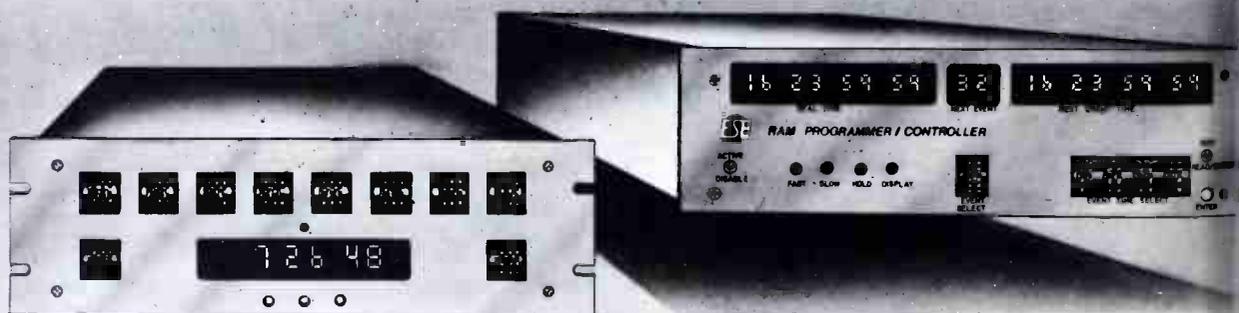

Stephen Pasquini, general manager, has chosen MOR format, produced with the help of an Autogram time-insertion full-scale system. The music is on reel recordings; announcements, commercials, PS etc., are on carts. The Autogram system was installed in December, 1975 to give the station payroll stabilization, and, according to Pasquini, has succeeded in that well as in improving the smoothness and consistency of the on-air sound. The programming is put together on 5 "sequential" channels and 3 timed entry channels; a combination is available with the Autogram system. The station also belongs to the ABC FM net, and has an active local news operation.

WXKW, Allentown, PA. FM

"Contemporary good music" is the way Craig Kaid, executive of the group owner, Rust Communications, describes the format of this station. The programming is put out with the help of a Control Design automation system, with four carousels to hold the reels on which commercials are recorded. The music is on reel-to-reel tape. Again, payroll stabilization, the difficulty of finding satisfactory manpower, and the

PERFECT TIMING

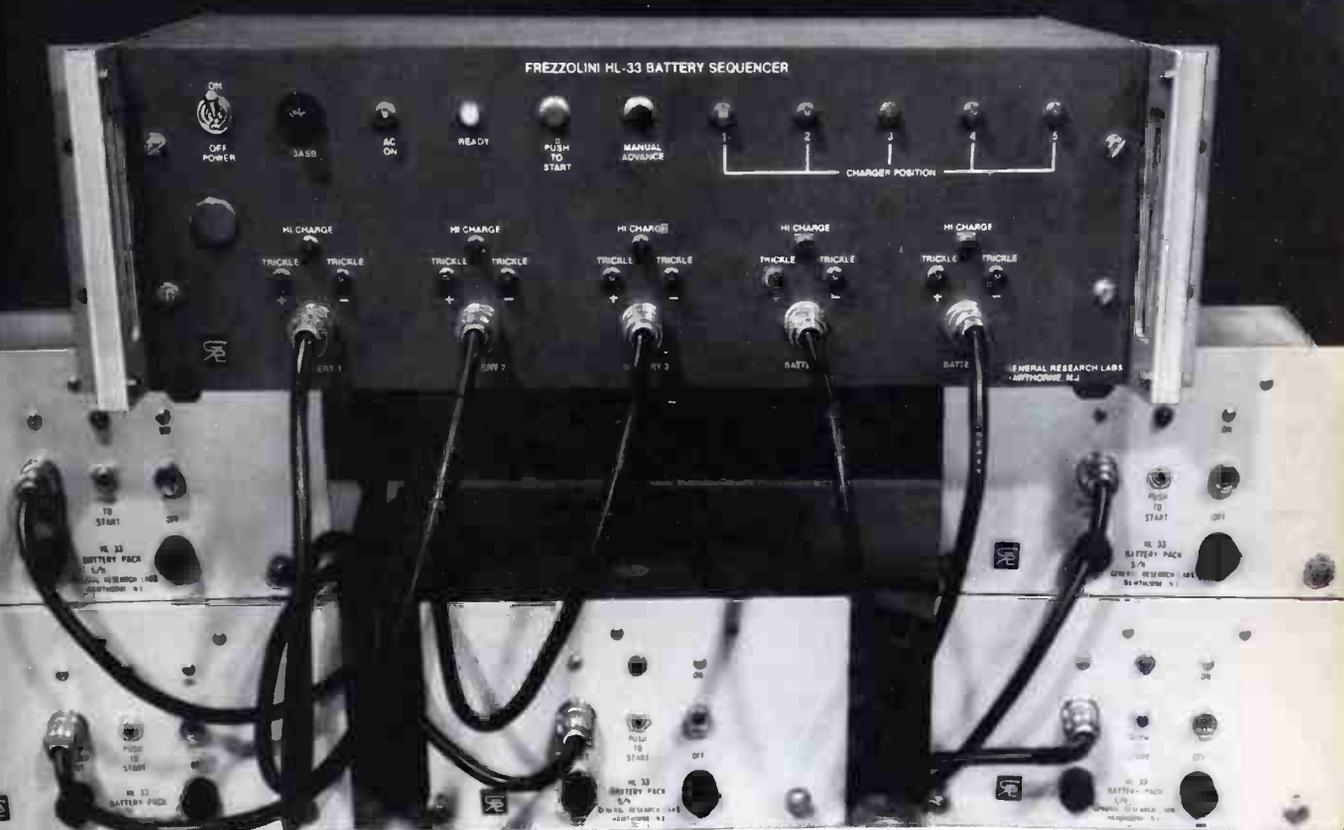

Programmer/Comparators and Controller

Whether your station is based in New York, Honolulu or anywhere in between, perfect timing of programs, station breaks and commercials is essential. To meet your exacting timing requirements ESE now offers two precision timing systems. For flexibility and economy with up to ten events, ESE has designed the 750 Series of Programmer/Comparators. Rugged thumbwheel programmers coupled with an ESE clock or timer to provide a single pole contact closure (1 Amp contact rating) for the length of time program matches display. Low on cost, the reliable Programmer/Comparators start at \$305. Write, Wire or Call Today: 505½ Centinela Avenue

When you want to program more than ten events, choose the ES 780 Series of Programmer/Controllers: A Solid State Random Access Memory united with an ESE clock or timer provide 32 user-programmed outputs. Ten minutes is all you need to program all 32 events. Manual override and ten second re-programming provide maximum flexibility. All this in 5¼ inches of rack space! In addition, crystal time-base and battery pack are standard features. Four digit, 32 event units are \$305 and Eight digit, 32 event units are \$450. Custom options and special orders are available. Inglewood, California 90302 • (213) 674-1212

News Dept.: You can automatically charge 5 Ikegami Battery Packs at one time.

Here's how: Just plug in (up to) 5 batteries, push the "Power" toggle switch to "On" and leave them alone.

Save time/save money. Your ENG Battery Pack logistics problem is solved! *Only one Frezzi Battery Sequencer with built-in charger does the job, automatically.* Hook in 5 (or less) Frezzi HL-33/35 Ikegami Battery Packs regardless of their state-of-charge. In 10 hours (or less), totally unattended, the Frezzi Sequencer will bring each Battery Pack in sequence to its full-charge state. When fully charged each Battery Pack will, automatically, go on a trickle-charge rate to maintain maximum readiness for use. When light indicator shows "Ready" simply unhook any one (or more) of the Battery Packs according to instructions, and run. For mobile units or fixed station operation. Call us or write for information and prices.

Battery Packs, Chargers, Sequencer Chargers, and Complete Systems available. In addition we manufacture for OEM application.

Network proven! Field-tested for 6 months.

MADE IN U

AUTOMATION FREES PEOPLE

for a consistent on-air sound were the major considerations behind the move to automation. It has met all those expectations, says Kingcaid, with the bonus of giving station executives time to think, plan, advance better than before.

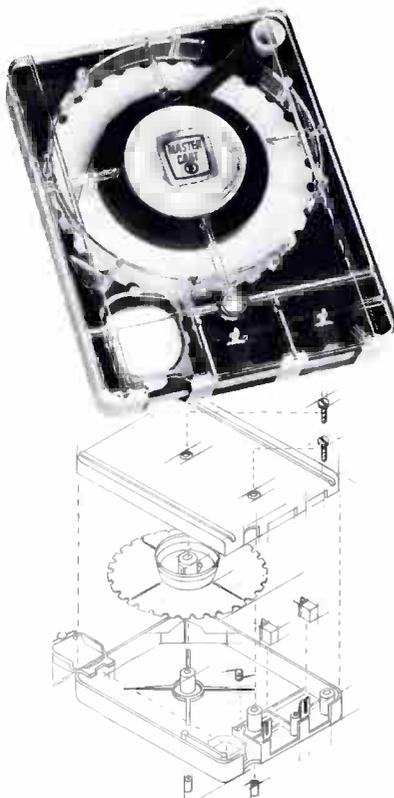

WBEN, Buffalo, AM and FM

These two radio stations use (or soon will use) a combination of automation operations that makes them good contenders (as far as BM/E can determine) for the title of "most automated AM/FM combo in the nation." As described in a detailed article in the July, 1975 issue by Gerald Klabunde, technical director, the AM operation is based on "live" work by DJ's, but with an automatic sequencing system for the music, on carts, allowing 15 to be set up in advance. The DJ has a simple pushbutton system for starting the sequence, interrupting it at any time, etc. About the time this article sees print the AM will have in operation, during the midnight to 6 AM period, a total automation system, an SMC DP-1, to let the staff, Klabunde says, "catch up on maintenance, creativity, sleep, etc." The FM station has been totally automated with an SMC DP-1 for several years, and will continue "happily" on that basis. But that's not all: the two stations will jointly use a Paperwork Systems BAT System for data processing—the equipment is already on hand—which will be interfaced with the SMC DP-1's for "total automation." When? "I'm not setting a

schedule," says Klabunde. "it will be when we everything connected together—the sooner the better

WISM, Madison, Wisconsin—FM

One of a group owned by Midwest Family, Inc., "flagship" station is the center of an unusual operation—a "self-syndication" through which the programs on three of the owned stations—and eventually more will be served—are all produced, on reel-to-reel tape, at WISM-FM. The program formats differ. WISM uses MOR music, some of the others using rock music. All production is at WISM. All three stations also use automation to put the programs on the air, in each case an SMC DP-1 system. Chris Cain, engineering director at WISM, describes the equipment setup he uses to produce the programming: "We have Technics direct drive turntables, and Scully tape machines, with a DBX noise reduction system to make sure the music gets on the tape with extremely high quality. Because we use noise reduction, we can record in quarter-track stereo with automatic reversing at the end of a reel, and for this Technics tape decks have worked out well as part of our automation system." The station's smooth on-air "personality" and sound have helped greatly in lifting it in contention with another station for top rating position in the large southern Wisconsin area. The automation, Cain points out, allows his skilled personnel to give more attention to the program production for the group of stations. BN

MASTER CART

For your FM stereo station today,
your AM stereo station of tomorrow.

STEREO PHASING—60° normal (45° typical) to 12,500 Hz.

REPEATABILITY—Phase performance repeatable with each cartridge and each stereo machine assuming correct guidance to NAB alignment dimensions.

TAPE PATH—Cone shaped rear corner post and longer tape path eliminate tape distortion at the head area.

CIRCULAR BRAKE—Positions the cartridge straight into the heads to minimize unequal head penetration pressure.

PRESSURE PADS—Individually replaceable . . . high flexibility and low friction for extended tape life . . . provides full surface tape contact for straight-path tape motion.

Master Cart is easy to maintain, comes in all lengths up to 10½ minutes. For details, contact your Fidelipac Distributor or

What To Expect When Shopping For Automation

Several hundred radio and TV stations have made the conversion to automated business operations. Many are making the conversion to full automation by adopting interfaces with their technical operations. Many more stations expect to automate within the next few years. As a result, any discussion of the pros and cons of station automation becomes almost academic.

Extensive interviews with broadcasters and suppliers of automation services reveal that there are only two reasons for a station to reject the idea of automation. One is simple economics. There are many stations, especially radio stations, that are just too small and do too small a volume of business to justify the rather impressive start-up cost for an automation system or to justify the monthly fees charged by the suppliers. The second reason is poor management.

Any station that is poorly managed or organized now, cannot expect that automation will bring order out of chaos. In each case, suppliers of automation services agreed, that the secret to successful automation was not their particular hardware package, nor the ingenuity of their software, but rather strong and aggressive leadership at the station.

Recent surveys indicate great satisfaction on the part of station management with automation. Most stations have experienced increases in efficiency of inventory utilization that more than justify the expense of their automation system. In short, most of the systems, and most of the firms that supply them, have lived up to, or beyond, original expectations.

What then should station management look forward to when considering an automation system? First of all, management can expect a withering argument from various firms regarding the virtues of their particular system. There are time-shared on-line systems, off-line batch systems, in-house mini computer systems, network, and distributive systems, and systems that offer combinations of approaches. Some companies will sell the hardware while others rent it. All provide software support and arrange for maintenance of the hardware.

As far as reports go, they all offer multitudinous reports. Many of the systems will offer up to four different versions of the same report depending on how a station likes it. BIAS, a division of Data Communications Corp., has in its "plain vanilla system," 200 individual reports to select from.

Perhaps the most serious challenge to clear understanding of the virtues of various systems will be the use of the term "unique." All of the systems are unique. And that is as it should be since they all accomplish about the same thing but with subtle differences in method, price, speed, and equipment.

A station can, however, prepare to sort through all the information that is available and come up with its own best selection of an automation system. The secret is to know what you want and what you need. The major pitfall is to expect from the automation system something that it cannot do or do well.

Automation systems are really designed to perform

complex clerical tasks at high speed. To believe adoption of an automation system will lead to significant savings in labor cost, however, is to misconstrue what automation is all about.

Now that the systems have been in the field for some time, it is apparent that they do not eliminate jobs. One vendor put it, "we displace workers. When we win, we frequently have to rewrite a lot of job descriptions but rarely are more than one or two low-level clerical positions eliminated."

Most of the automation systems will do just about everything a station would want done. Each of these systems prides itself on its expertise in broadcasting as well as computers. Jefferson Data and Cox Data are extensions of broadcasting companies. Compu/Net is a division of Arbitron; while BIAS, BCS, and Colum are all point to the staffs they have built utilizing ex-broadcasters. PSI (Paperwork Systems, Inc.) was founded by a group of men with long experience in broadcasting. The understanding of broadcast operations that each of these companies offers is extensive. In addition, each firm has some method of continually up-grading its software packages based on the experience and demands of their clients.

Though each company would dispute the notion that there are no significant differences in their capabilities, the evidence of satisfaction from their clients tends to support it. The question remains, however, how do stations choose an automation system?

The first step is for station management to make an exhaustive study for its current operations. Consult with the department chiefs in engineering, traffic, accounting, sales, sales/service, and elicit from each a list of tasks that they would like automated.

Carefully determine the reports that are currently used and determine what reports each operation would like to have and what use they would make of the reports if they had them. This is the tricky part. There is a high probability that some reports are unnecessary and result mainly from a need to reassure yourself that certain functions are under control. Automation will provide such a volume of data that it is imperative for station management to make a clear determination based on actual utility they can derive from any given report.

David B. Ridge, vice president of Columbine, put it this way. "There is a distinction between the *requirements* of a station for data and the *features* of an automation system." When reviewing the available reports included in the features of a system, understand how each report can be used to improve the way the station operates. The automation firms have developed their programs from an interchange of experience with many broadcasters and their features may well include reports that were not on your list but should have been.

Rick Aurichio, president of Compu/Net, suggests a fairly simple criterion for determining which reports are important. "Ask yourself," he said, "how can this report make me money?" Most of the systems clearly

CANON'S NEW P18X16B2* 'INSTANT CLOSEUP' LENSES HAVE TURNED WPIX'S YANKEE BROADCASTS INTO A WHOLE NEW BALLGAME". Otis Freeman

Vice President/Engineer, WPIX-TV

When WPIX, in New York, bought 5 of our new lenses for their Yankee Stadium installation, it was the biggest news for us since instant replay.

For a lot of reasons:

P18x16B2* lenses have instant access to all range extenders. Because they don't have to be changed, the director isn't forced to cut away to another camera when he's already in the best angle... and he needs to move in for a tight closeup.

The lenses also have automatic compensation for different light levels, which means there's less to worry about when the action down on the field is fast and furious.

The fact that they've got the best relative aperture in the business is frosting on the cake. P18x16B2 lenses can go from 16 to 216 millimeters without losing aperture... where other lenses are already falling off at 160 millimeters.

And to top it all off, the extreme wide angle of our new lens gives WPIX the best panoramic shots they've ever sent down the pipe.

If all this sounds good to you, seeing what our new lens can do is even better. No matter what kind of camera you're using—or contemplating—call us to arrange a demonstration.

SHOPPING FOR AUTOMATION

be sales oriented and seek to give station management the information it needs to efficiently "sellout" its inventory at the highest possible price. Each system does it differently but essentially the reports include several types of avails to provide information to sales managers, reps, and salesmen. Each member of the organization may need different types of information and a thorough questioning of each affected person may provide you with genuine insight into the relative advantage of each type of report.

In addition to daily sales operations, most systems provide data that are helpful in planning sales strategy. Director of Marketing for BIAS, Patrick Choate, said, "The name of the game today is not just 'sold out.' No smart sales manager is going to be happy just because all his available spots have gone. He wants to be certain that they have gone at the highest possible rate." One way BIAS hopes to make this possible is through the use of a new report they have programmed called the Base Rate Report.

The BIAS Base Report is an inventory evaluation program that compares actual performance to goals projected. If a sales manager can see that he is exceeding sales projections in time, rather than be merely sold-out, he can up the price of spots and achieve greater revenues. The Compu/Net system also provides this kind of historical analysis but achieves its purpose by allowing the sales manager to set priorities, usually determined by price, to assure that those high priced spots are not preempted or blocked out by lower price spots even though they might have been sold earlier. Each company, in fact, has many such "management reports" that will help to increase the effective use of inventory.

Accounting reports are also in abundance. And, they too, can help the station make money. One thing to consider is how long it takes to get those invoices out. Faster and more accurate invoicing will result in a better cash flow situation. All of the systems provide a variety of billing procedures but some are more tolerant than others of different accounting procedures that may exist at any given station.

Another important area to consider when shopping for a system is the support and training that the supplier will provide. The method of delivering this very important element varies from company to company. Some firms begin by performing a "station survey" in which they send a team to your station to analyze the way you operate now and to suggest how you might best organize to use their system. Then, the firm might have station personnel come to a seminar held at their headquarters to learn how to use the equipment and input data. Some firms believe that these training sessions are better conducted at the station. Reports from stations experienced with both approaches reveal no distinct advantages, one way or the other.

Top management involvement in the process is considered essential by all the automation firms. Some, like BIAS, BCS, and Columbine, insist that management personnel attend seminars specifically designed to show management how to get the most out of the system. It is also important that management fully understand the procedures of every department.

If a station has decided that it can benefit from auto-

mation, management should not begin by talking salesmen from the various firms. Instead, ask each to provide you with a customer list and talk to the management people who have already gone through automation and get their reactions. They will probably be quite satisfied with whichever system they have. They will let you in on the nature of some of the problems. Usually, the problems are of a human nature. Some personnel will resent the computers and not be able to adjust to new methods of doing jobs they they have been performing well for years.

It is important to convey to affected workers that adoption of the automation system is not a rebuke of poor performance. In fact, one station, KUTV in Lake, said that after adopting automation they were surprised at how efficient their old manual system had been. The new system just gave their highly motivated employees a better tool with which to do the job. Most stations report improved morale now that routine laborious tasks are being done by machines. Workers are finding that automation has reduced the pressure cooker atmosphere they were used to.

A new and developing area that could affect the choice of an automation system is its ability to interface with technical operations. Currently only BCS has an operational interface for TV at WTCN, Minneapolis. WNEB in New York, however, should be operational by the end of June with their BCS to CDL configuration. Cox Broadcasting Services is also scheduled to have a technical interface operational at WIIC in Pittsburgh when their new Grand Valley 2000 system goes on line. Each of the other firms are either working with the major switcher manufacturer developing software for the interface or are designing programs to accomplish such an interface. Columbine is the only major firm not racing toward a technical interface in the immediate future. David Ridge said that Columbine would wait on this phase until they had a specific request from a client to perform such an interface. He added, however, that they did view this as a likely development.

Choosing a system will become an almost subjective process. The choice will more likely be made on the basis of which system management perceives as easiest to adopt. Arguments for and against on-line or off-line in-house and shared, will no doubt rage for some time. Criticism of response time and telephone line cost levied against on-line systems while return volleys are fired at the limited capacity of in-house systems. The revealing nature of this combat, however, is that it is waged arduously by the competitors in the business while users of the services, whomever their suppliers seem quite tranquil and pleased with results. The occasional complaints from users that are heard usually occur during the trauma of conversion and subside after the birth pangs pass in a few months following installation.

Though some stations have switched allegiance from one firm to another, the losses and gains seem to be about even. BIAS has done a marvelous job of acquiring the lion's share of TV stations but the competition remains supremely confident that they will have their day. Those systems that started in radio are moving into TV. The major thing management cannot expect when shopping for automation, is an easy choice. On the other hand, no matter how specialized their need, management can expect to find a hardware and software package that suits them.

Who's Who In Automation

Each automation systems company has developed a strong assortment of programs and solid set of arguments for why their system is the best.

At first we considered making a comparative analysis of the various firms that offer specialized automation services to broadcasters. What we discovered, and what any broadcaster will probably find, is that there is really very little that can be accomplished by comparing one firm to another. The choice will likely depend more on the nature of the station than on the nature of the computer firm. Each broadcast station has its own way of doing business and, as a result, the firm it selects will probably be the one that most nearly conforms to the current operating and management style of the station affected.

In Memphis, BIAS uses its "super computer," Burroughs 6700, to handle most of the business computing for its clients. The machines are constantly on line to the station terminals (below).

Station personnel use a variety of equipment to communicate with the central BIAS computers in Memphis. Here, a member of the traffic department receives hardcopy over the station's printer.

The fact is clients of the various firms each rate the choice they made as the best. Each automation firm proudly suggests that you speak to its clients for an assessment of their performance, and when we did, we were frankly surprised by the uniformity of praise. Each client has problems adjusting to an automation system, but considering the scope and breadth of the change required by automation, it is surprising that few stations experienced trouble beyond their first few months of operation with the new systems.

So, instead of a comparative analysis, what follows is a series of brief sketches of each of the major vendors of automation systems and services:

BCS (Broadcast Computing Service) is a division of Kaman Sciences Corp., of Colorado Springs. Current BCS' client list includes 10 radio stations and 40 television stations. As of this writing, BCS is the only firm that has an operational interface between business automation and technical operations, at WTCN, Minneapolis, a Metromedia station. Metromedia stations in New York and Washington, D.C. are scheduled to go to automation shortly. WNEW, in New York, is to be operating with the interface in late June.

BCS uses a system they refer to as "distributed." Essentially, the system includes an in-house minicomputer at the station which performs many data routines such as data collection, data display and editing, including numerous types of audits, log manipulation, projections, and worksheets, billing address files, and the case of total automation stations, the interface is achieved in a "hard wired" set up with the technician's operation.

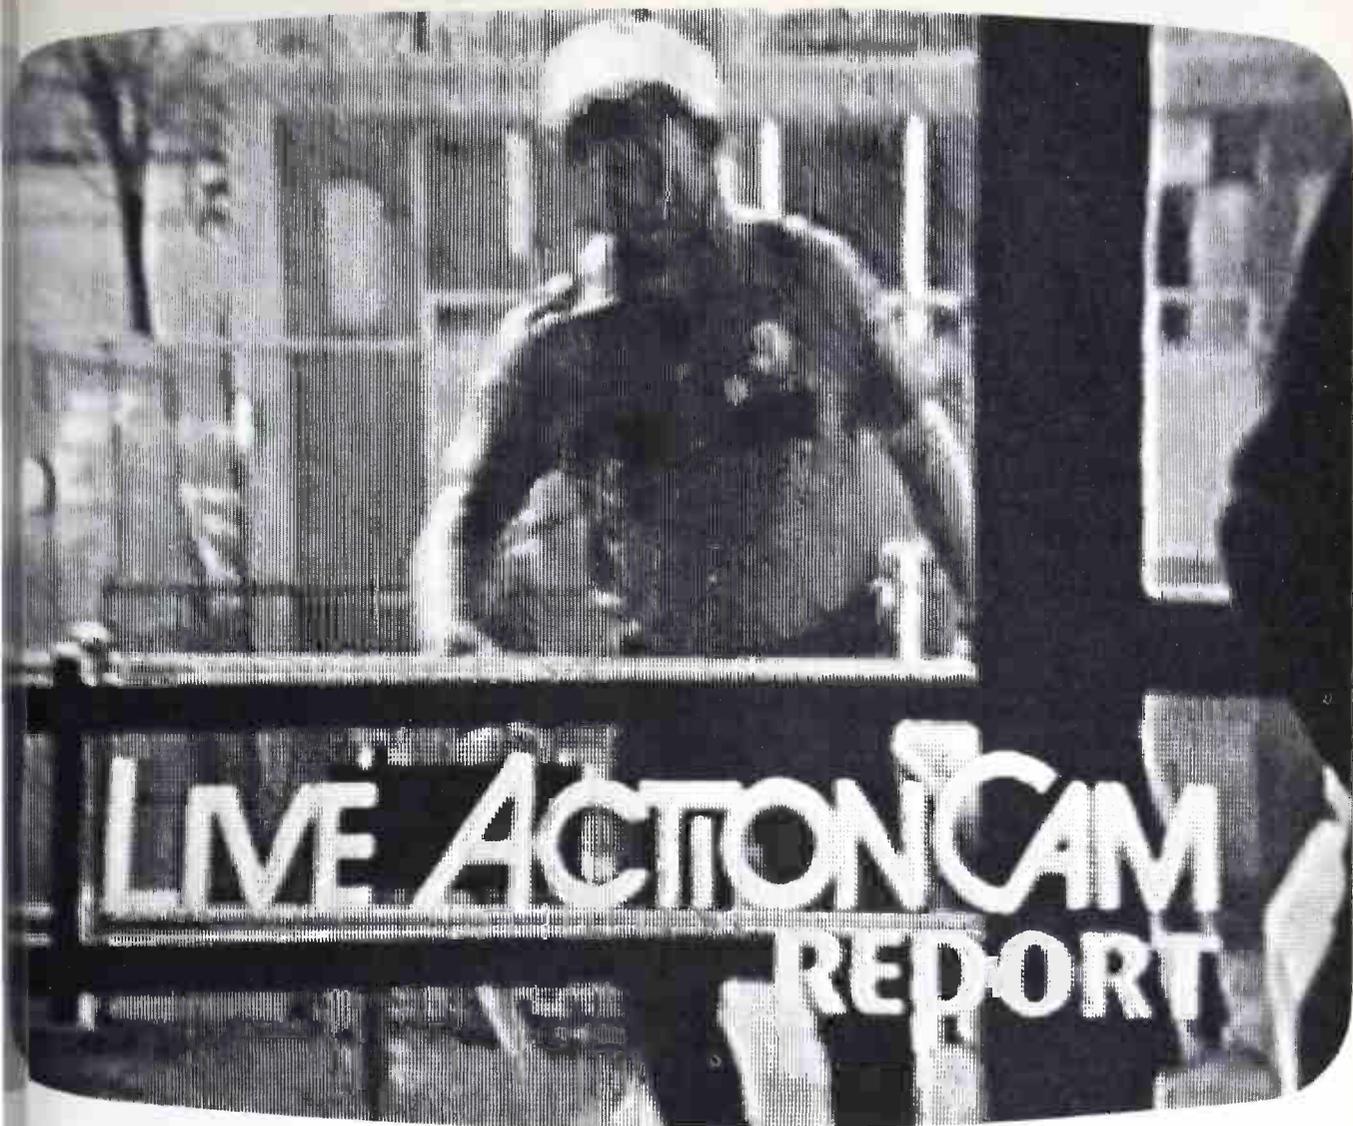

The minicomputer is also interfaced with the BCS Master Computer in Colorado Springs. Once a day, BCS initiates a contact between the master computer and the station mini for the handling of more complex routing such as rotations, minicomputer update, report generation, and compilation of the many BCS reports. Peripheral equipment in the station includes one or more printers, a number of CRT and keyboard devices, and a data phone for talking to the master computer.

The precise equipment configuration used by a given client station depends on the needs and budget of the station. BCS offers the 1100, its top of the line, for \$1,800 for the middle market, the 800B for smaller markets and the 100 for radio stations.

The software for the radio system was developed by Radix Corporation and was used and marketed by another major supplier for several years before becoming part of BCS.

BCS maintains a full training and installation team and provides for continual enhancement of its software package. Hardware maintenance is provided by BCS.

**ON SEPTEMBER 11, 1975,
THIS WAS THE SECOND HALF OF
"THE HOLLYWOOD SQUARES!"**

On September 11, 1975, WTVF scooped all the Nashville news media with live, on-the-scene coverage of a riot in progress at Tennessee State Prison. They did it using some of the most advanced Electronic News Gathering (ENG) equipment available today. Equipment which included, not surprisingly, an ENG microwave system from the Communications Equipment Division of Microwave Associates.

We at MA's Communications Equipment Division pioneered in microwave systems for ENG applications and are now the only company making a complete line of equipment. Everything from miniature battery operated transmitters to portable van models to fixed location transmitter/receivers. And we not only make them, we also do site surveys, installation, training, and servicing — nationwide.

Small wonder we're now number one in microwave for ENG.

WHO'S WHO IN AUTOMATION

BIAS (Broadcast Industry Automation System) is a division of Data Communication Corp., Memphis. The BIAS system is undeniably the leader in television station automation with more than 150 clients and showing no sign of slowing its growth.

BIAS is an on-line system featuring terminals at the station location for in-put and printout of data. The station terminals are constantly on-line to the host computers in Memphis over telephone lines. One of the major claims of BIAS is that no other firm can match the sophistication of its software. BIAS employs more than thirty computer programmers, full-time, who are always up-grading the software and developing new programs for BIAS clients.

The BIAS host computers are large Burroughs 6700 and 4700 machines. While the client station is on-line to these computers via "dedicated" telephone lines, the computers handle data on a time-shared basis. Companies that offer in-house stand alone systems make con-

siderable effort to point out that this time-sharing approach can lead to delays in turn-around time, but Blair points out that the slight delays due to time sharing or the comparatively slow data rate of telephone lines more than compensated for by the sophistication of the software. BIAS provides more than two hundred reports for each client to select from.

BIAS also asserts that as they have the hardware Memphis and maintain round-the-clock service to hardware, this relieves their clients of the bulk of work over hardware failures. BIAS also points out that no one can compete with the power of its large computers.

Nevertheless, where "response time" is a problem BIAS has offered an optional terminal package which offers the station a minicomputer CRT printer to perform some tasks off-line such as invoicing and month-end reports. Many of the BIAS clients have taken this option.

BIAS has been forging ahead in a number of areas. In addition to software enhancement that most firms offer BIAS has been experimenting with a tie-in between it and Donovan Data Systems, which handles agencies, and Blair, which represents a number of TV and radio stations. Eventually, this approach will match up the request of agencies for spots with the availabilities with demographics of Blair and complete a station/rep/agency cycle. Patrick Choate, Director of Marketing, however, indicated that this tie-in has had to take a second position to BIAS' effort to perfect a technical interface.

BIAS has been working closely, as have other automation firms, with the three major manufacturers of automated switching gear, Grass Valley, Centron Dynamics, and Vital. BIAS expects to announce a successful interface shortly.

Compu/Net, a division of Arbitron, is based in Los Angeles. Both Arbitron and Compu/Net are subsidiaries of the giant computer company, Control Data Corp. In the past year, Compu/Net has gone through some radical changes. In 1975 they had 47 radio station clients through a conscious program based on a restructuring of the organization, managed to shed 13 stations that they felt were unprofitable. Now, with 35 stations, Rick A. Richio, president of Compu/Net, feels they "are back on the road to pretty good health."

As a measure of confidence, Compu/Net is again building its sales staff and intends to reactivate its marketing.

Currently, 100% of Compu/Net's clients are radio stations. They utilize an on-line, time-shared system with large host computers in Los Angeles. Unlike other on-line systems, Compu/Net utilizes the network of Control Data Corporation's regional offices to provide the tie-in to the host computer through CDC "owned" lines. This means that clients are not subject to rising telephone charges since, for most of them, they need only dial up a local number.

Now that Compu/Net appears to have settled its management problems, they are establishing a major effort in the area of television automation. One of their first steps was to bring in Joe Chaplinski to head up their TV effort in Rockville, Maryland. Chaplinski had been intimately involved with the BIAS system when he was with Station Broadcasting. Compu/Net's plans, however, do not call for a "BIAS type" set-up. Instead, their television planning will use a combination of approaches. Virtually all planning and operations will be handled by the in-house company.

continued on page

How the Automation Sweepstakes Stand Now

The past year has seen phenomenal growth in the number of stations adopting automation systems. In addition to the growth there has been some juggling going on between systems companies.

Last year BM/E reported that Compu/Net had signed its first TV client through Nationwide Communications, Inc. Compu/Net already served all but one of NCI's radio stations. During the management upheaval at Compu/Net, however, NCI shifted WATE-TV, its Knoxville station, back to a manual system. Currently, another NCI television property, WXEX-TV, Richmond, VA, is using Jefferson Data systems. The NCI radio stations, to date, are still in the Compu/Net column.

With the move of KUTV, Salt Lake City, from BIAS to Cox, the first major shift of a station from one-line, to in-house has taken place and the change-over will prove interesting over the next few months.

BIAS, which last year added its first radio station, now has 26 and is developing programs for medium/small market radio stations with which it hopes to increase that tally.

The automation system companies are not ignoring the smaller markets either. One company now has a television client in the 182nd market.

Though all the systems are still working out bugs and some stations still report complaints and demand more sophisticated software, it is clear that automation is here to stay and already out-performs manual systems to the point of "no contest." The field is competitive and the stakes are high. The situation, however, is fluid and no system as yet is the odds on favorite.

*Here's how they stand:

	Radio	TV
BCS	10	40
BIAS	26	126
Columbine**	72	36
Compu/Net	37	—
Cox Data Services	—	13***
Jefferson Data Systems	19	16
Marketron	34	—
PSI	170	10

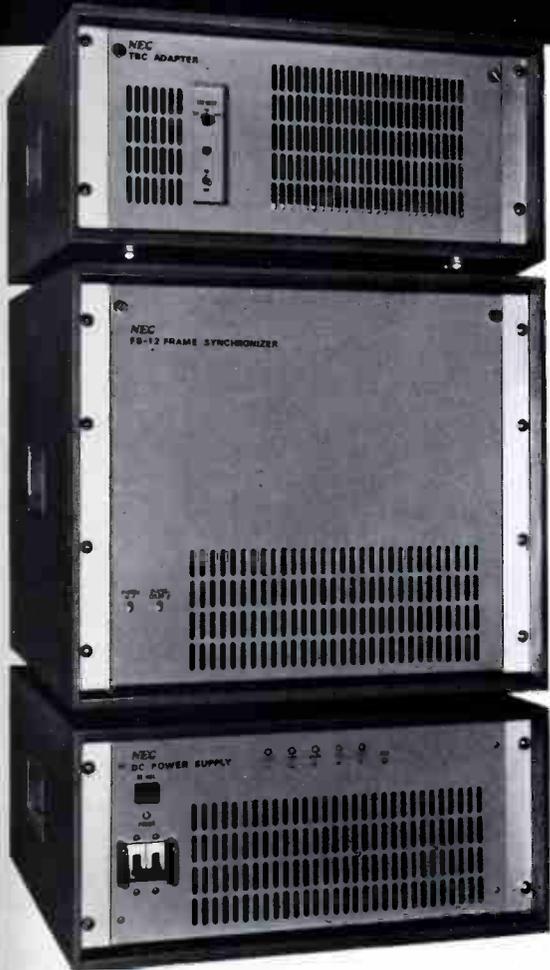

*The figures quoted for client totals in this "box score" are the latest information available and were obtained just prior to going to press. The totals quoted in Who's Who in Automation were obtained earlier and therefore, in some instances, differ from those above.

**Approximate, has an additional 36 stations signed, waiting to be installed.

***Stated that by the end of the year they expected to have 19.

EXCITENG NEWS!

NEC Presents Two Super Products for ENG Systems.

First, meet our new NEC Super Synchronizer

It's half the price of competitive units, yet you can mix, fade, wipe and super from U-Matic VTRs as well as from all other remote sources. Without genlocking.

How's it possible? Our FS-12 Frame Synchronizer is now augmented by our new Time Base Corrector adaptor to provide our infinity correction window. The combined unit allows operation with a non-

phased input video signal, so no control timing pulse is necessary for the VTR. Our Super Synchronizer lets you operate with a single connecting cable.

Now, all pictures from your remote ENG unit can be integrated as smoothly as if they originated in your studio. And we can help you get better pictures, too.

Now, meet our new NEC MNC-61.

This micro-powered, backpack-less ENG camera weighs in around 13.5 lbs, consumes only about 25 watts. And it's designed to balance neatly on the cameraman's shoulder.

It employs large-scale hybrid microcircuits for maximum reliability, gives you a choice of using three 2/3-in Plumbicon*, Saticon** or Chalnicon*** pickup tubes. Also you can choose lenses from two ready-made systems: C-mount and Arriflex.

Another super value from NEC. Write or phone us for details of the year's most excitENG news in ENG.

NEC America, Inc.

WHO'S WHO IN AUTOMATION

Some stations prefer to own their own computing hardware. Above, a BAT 1500 system from PSI, provides the station with all the computing power this customer needs. As the power and price of minicomputer technology improves the interest in in-house systems increases.

puters which may be of CDC design. Certain functions, however, especially those that can use the Arbitron type data, will be handled by a central computer, connected by the CDC local network system.

Much of the system's design is being handled by Greenwich Data Systems where the "Wizard of Avis" and the American Airlines "Sabre" system was developed. In addition, Compu/Net will be using the aid of the Service Bureau Corp., another Control Data sub-

subsidiary. When asked if Compu/Net's late entry in the area of automation might represent a serious problem, Aurichio said "one way to tell the pioneers is that they're the ones with the arrows in their hat. We intend to benefit from the experiences of those who venture into this field before us." Compu/Net's TV system should be available in late summer of 1977.

Cox Data Services, Inc. is a division of Cox Broadcasting Corp., located in Atlanta. Cox is the major proponent of the in-house minicomputer approach. Originally, Cox developed their data services for the Cox Broadcasting Stations. At the outset they used an on-line time-sharing system that eventually shifted to the in-house minicomputer when they came to believe that the development of low-cost, high-power minicomputer technology would provide certain advantages to the broadcaster.

According to Cox, on-line time-shared systems suffer from a number of disadvantages that stem from their dependence on telephone lines. In addition, the supercomputers were not living up to expectations. Additional clients were exhausting the capacity of the computers faster than anticipated. So, Cox made the decision to switch to minicomputers. They believe that many broadcasters will prefer the mini because of the security of controlling your own data on your premises.

They also believe that minicomputers will ultimately present advantages in the area of technical automation since their system will be "hardwired" and operate in conventional mode with the mini or micro-computer master control. Cox's competitors dismiss these advantages simply stating that whatever system a station uses

STILL the best buy ...DYN AIR's Series-X Switchers

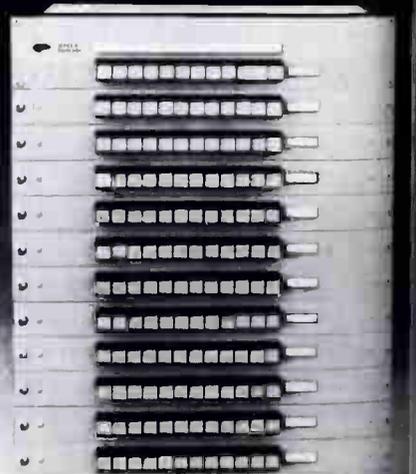

Forget about messy patch cables and the tedious task of re-patching to change distribution. DYN AIR's Series-X Switchers provide pushbutton distribution of 6 to 60 color sources to as many as 120 outputs. A high degree of input-to-output isolation allows any input to be switched to any or all outputs without loading the source.

These units are totally modular, allowing off-the-shelf assembly of almost any input-output configuration, either video-only, or audio-follow-video. Expansion is easy too... you simply add input or output expansion modules as required.

Wouldn't a Series-X Switcher solve some of your distribution problems?

Write today for full details.

Next best thing to a sound proof booth.

Shure's new headset microphones are coming through loud and clear. With their unique miniature dynamic element placed right at the end of the boom, Shure's broadcast team eliminates the harsh "telephone" sound and standing waves generated by hollow-tube microphones. The SM10 microphone and the SM12 microphone/receiver have a unidirectional pickup pattern that rejects unwanted background noise, too. In fact, this is the first practical headset microphone that offers a high quality frequency response, effective noise rejection, unobstructed vision design, and unobtrusive size.

WHO'S WHO IN AUTOMATION

all of the technical interface requirements will have to be met.

Cox Data Service is scheduled to complete a technical interface very shortly, at WHIC, Pittsburgh, where the system will utilize a Grass Valley 2000 automated technical operation. Cox has been working very closely with the major manufacturers of automated technical operation equipment and has been told by one manufacturer "that the interface with a Cox minicomputer system will cost the client \$25,000 less than an interface with some other business automation systems."

Cox Data Services now has 13 client TV stations and expects to increase that to 19 by the end of July. Though the in-house approach represents a small portion of all automated systems in use now, a recent survey indicated that a growing number of stations were interested in such an approach and expected that they would adopt it. If real advantages in technical automation do materialize with the in-house minicomputer system, then Cox can expect a real shot in the arm for their marketing effort.

Cox now offers two systems for lease or purchase. The System 2000 is a dual configuration using 2 Nova II minicomputers from Data General, 3 disc drives, 4 TEC CRTs for input, and 2 tally printers for output. The System 1000 is single configuration and uses 1 Nova II, 2 disc drives, 2 CRTs and 1 tally printer.

PSI (Paperwork Systems, Inc.) is based in Belingham, Washington and has become a major force in the broadcast automation competition in a very short time. PSI was formed in 1974 by Joe Coons, Lee Facto, and Christopher Young. The first BAT (Billing, Accounting, Traffic) system was installed under the IGM label in 1973. PSI was formed soon after and by the end of 1974 had signed 60 stations. Now, just two years later, PSI has a client list of more than 180 stations, all but about 10 are radio.

PSI offers five basic systems; BAT 1350, BAT 1400, BAT 1450, BAT 1500, and its most recent entry, BAT 1750. The BAT 1750 was demonstrated at the NAB convention in Chicago and made its first sale to WHK Radio, Cleveland, Ohio recently. (In BM/E's coverage of the NAB we incorrectly reported the price of the BAT 1750 as \$57,000. The correct price is \$78,950.) One major change in the BAT 1750 is a switch from a "diskette" to hard disc memory and the number of programs and reports provided.

The PSI systems feature an in-house concept with the core of the system, a video display unit and a Centronic's line printer. Each of the BAT systems, from the smallest up, can be up-graded with the addition of various pieces of PSI's hardware "family."

PSI sells its system through a lease/purchase agreement. Commonly, the lease is five years and the monthly charge varies, depending on the system, from \$702.90 to about \$1318. The price includes installation, training, and first year hardware service. There is no software service charge.

PSI is already interfaced with technical operations of both radio and TV according to PSI spokesman.

PSI is moving ahead in several areas to maintain the firm's standing, according to Joe Coons. "In the TV area," said Coons, "we've added a Film Inventory program which will be of interest and we're planning a

system to handle automatic scheduling of music selections for radio broadcasters. We're expanding our election reporting capabilities for all BAT systems and we're waiting for our first customer to give us the "go ahead" for installation of the BAT 1500 and 1750 systems. Station reps or agencies for limited scheduling functions."

Marketron, Inc. based in Menlo Park, California has been in the broadcast automation business for 8 years. It has only been in the past year, however, that Marketron has emerged as a major factor.

The company, according to its president, Jerry Cronin, maintained a low profile intentionally. The purpose was to sew-up as many major O&O station clients as it could without being committed to offering its system to large numbers of medium and small stations.

However, with all the CBS radio O&O stations on its client list, and with all the ABC radio stations with the exception of Houston accounted for, as well as the Metromedia stations and WMAQ-AM/FM, KNER-AM of NBC radio, Marketron has come out of its shell with a bang.

The firm was formed six years ago and until three years ago, was purely a time shared operation with its software package, ACT I, providing sales and research analysis of the standard ratings. Three years ago, Marketron went into ACT II, an in-house system concept for traffic and billing, featuring minicomputers and other stand-alone equipment and has been slowly up-grading its client list in the top markets.

Marketron primarily serves AM-FM stations and Jerry Cronin estimates it has systems in more than 100 markets, either radio, TV, or station reps. ACT III, for station reps, takes the rating oriented sales and research programs off time sharing and puts them in-house for major rep firms.

"We've had to move slowly," said Cronin, "because we were mostly shooting first for the owned and operated network stations. Some of the stations already had automated systems so we had to bide our time."

Marketron got a big break when Compu/Net started shedding some of its clients. ABC-AM-FM which was using Compu/Net in some of its stations at the time, was informed that the service would be withdrawn effective December 1st, 1975. ABC executives selected Marketron as a replacement and soon moved the rest of the stations into the Marketron camp.

The Marketron ACT II system is the core of the company's concept. It utilizes a Cincinnati Milacraon minicomputer, Cincinnati CRTs and a Tally line printer. The system is leased for between \$2500-3200 per month depending on the needs of the station.

Marketron plans a modified ACT II system for the in-house approach. Cronin believes that "with the state of the art in minicomputers changing rapidly we will be able to create a modified in-house system which will be well within the reach of smaller stations throughout the country."

Jefferson Data Systems, Charlotte, North Carolina is a Division of Jefferson Pilot Broadcasting Co. L. Cox Data Services, Jefferson began by developing an automation system for the Jefferson Pilot stations which then branched out to offer those services to other stations. The Jefferson system, however, is interesting because that, though it uses an off-line time sharing system, it is busy developing an in-house stand-alone system.

he System 80 that Jefferson began with uses station computers tied into a large host computer in Char-. The mini conducts daily business within the station is connected to the host computer during evening s for more complex functions. A new system from rson uses a Sycor 440 computer which is an exte-ly powerful mini. It will function completely as an ouse stand-alone system and will not rely on the lotte computers.

ere are no plans at Jefferson to abandon the System hich they feel is ideal for medium size stations and oe used in a number of configurations to handle any of broadcast operation including AM/FM/TV sta-

fferson will continue software enhancement for both ms and is also offering their System 80 software to ns regardless of what hardware they currently have. rson believes that many stations, especially those created their own software will welcome this way of the EDP business. Plans and programming for the nical interface are well underway. Jefferson is work- with Grass Valley and Vital and expects to have ed out the software problems in the near future. Jefferson Data serves 26 radio and TV stations and has duled 12 more installations for the remainder of

olumbine Systems, of Golden Colorado, is really erent in its approach. While Columbine remained if from the fray, it managed to sign 134 stations. Of total subscribers, 108 are installed, $\frac{2}{3}$ are radio and e TV.

olumbine is strictly a software house. Columbine ot sell or service equipment. Instead, they recom- d to their clients a hardware package, usually the System 32. The basic purpose behind this recom- ation said David Ridge, vice president of Colum- "is the reliability of IBM hardware and demon- trability of IBM to support their hardware around the d." There is no formal arrangement between IBM Columbine.

olumbine merely puts the client in touch with IBM nakes recommendations for the hardware the station require. The station does all the negotiating, decid- o lease or purchase, and IBM performs the in- tion.

olumbine trains station personnel and management maintains software enhancement. In addition, they h to the station from time to time as software con- ts and keep tabs on how the station is succeeding. r price structure is based on the annual gross billing e station for the year preceeding installation and ins set at that level from that point on. The cost of ware is determined between IBM and the station but ly runs in the neighborhood of \$1000 to \$1300 per h. The software charge for a station with an FCC ted annual gross billing of \$1 million would be monthly.

ftware development at Columbine is continuous. v 3 months Columbine provides a software update ents at no additional charge. Recent programs in- general ledger and accounts payable. Though did say that Columbine sees the development of a ical interface as a future requirement, they have not t devoted a great deal of time to it since they have received a request for it from any of their s.

Making A Heavy Radio Spot Load Easy And Economical To Handle

By Garry Schmidt

This system built for radio station WGPR-FM, Detroit, gives the operator, both in the studios and at remotes, easy, accurate access to any cart in four rotary multi-cart machines; playing is automatic in clusters of up to five carts. A novel feature is the use of the associated TV station's in-house monitor system to show cart status at all control positions.

Radio station WGPR, in Detroit, recently became radio-TV station WGPR, making history in the process as the first black-owned organization given a construction permit for a television station. The change involved moving to new, much larger quarters which would hold both radio and television facilities, with the radio facilities greatly enlarged because of the outstanding success of the radio operation.

As a part of the expansion plans for the radio station, WGPR's management specified an increase in the capacity and utility of a custom built cartridge handling system designed for the station by ASI some five years ago.

This system was described briefly in a November, 1973 BM/E article. Basically, the system allowed the selection, for play, of any cartridge in either of the station's two Carousel machines, via a telephone dial controller located at the console. The number of the cartridge (1 to 48, with 24 in each Carousel) was simply dialed in and the system commanded the correct carousel to rotate and tray the selected cartridge. A digital readout located in the studio verified the cartridge number and "cue up" status to the operator.

The system also had the unique ability of being controllable from a remote broadcast site, using phone lines to transmit data to the studio, and the station's SCA channel to send status verifications back to the remote site. In this way the man on remote could play all his own cartridges back at the studio via remote control, eliminating the need to have a studio "producer" perform the task. Because of the unusual audio switching and processing techniques we employed, a side benefit of the system was that the MCR studio could do double duty as a production studio during remotes since it was not required for cartridge playing.

While the system more than proved its worth, especially for the many remote broadcasts the station does, the ever increasing spot load at WGPR demanded an increase in capacity from two multi-play machines to four. This in turn required additional control circuitry. However, since the original system was designed so long ago, it performed its primary logic functions with relay/stepper circuitry. To add more of this type of circuitry would be both expensive and non-state-of-the-art, to say the least.

Mr. Schmidt is president, Audio Services, Inc.

It was decided at the outset by ASI's design engineer that the new control system would be centered around microprocessor circuitry. This revolutionary technology allows the creation of a small scale, pre-programmed on-board computer system economically and with only a handful of components. This approach in turn opened a tremendous amount of design flexibility as well as the realization of further circuit economies. For example, the need to provide a large number of discrete circuits to perform functions as a result of specific input data eliminated by simply "instructing" the microprocessor during its initial programming to carry out the designated functions itself. Thus, equipment control functions can be permanently stored in the microprocessor and carried out instantly upon receipt of the proper input conditions. What would have required complex circuitry simply becomes a computer programming function with microprocessor technology.

In addition, like its full scale counterpart, a microprocessor computer's memory functions are unaffected by power failures, brownouts or other disruptions. This is a tremendous advantage over conventional TTL flip-flop, latch-gate-shift register type memory circuitry which can be realized since these devices are all voltage dependent for proper memory functions.

By contrast, the only way a pre-programmed microprocessor can be made to "forget" its designated functions is by exposure to ultra-violet light. Otherwise it has been estimated that microprocessors can retain their memories for at least 20 years. Since ASI as a pioneer in the field of microprocessor technology for broadcast applications had already made the necessary commitments in equipment and personnel, work began immediately on a functional design for the overall cart handling system.

One area of the original system that needed updating was the handling of multiple spot breaks. When the original system was conceived, WGPR's spot load was such that the need to dial up each cartridge manually was an operational problem. However, the increased spot load the station carries today made a change necessary. Utilizing the memory capacity of the microprocessor, our engineers developed a more flexible control system in which a cluster of up to five cartridges can be entered into the system's memory at any time. As the number of each cartridge is dialed, the memory automatically commands the multi-play machine in which it is located.

THINKING ENG?

THINK CAMERA MART

Because you want the right equipment to do the job.

With all the experience we've accumulated packaging film equipment for the broadcast and industrial fields, you'd expect Camera Mart to be leading the way in ENG. And you'd be right.

CAMART CUSTOM IKEGAMI/SONY PACKAGE

Network-quality hand-held performance at surprisingly modest cost.

The camera: Ikegami's HL-33* complete with full-function backpack. High-fidelity color in a compact, lightweight three-Plumbicon*** package. All in a single low-profile 16mm-size camera with eye-level CRT monitoring on take and playback, plus many more features you'll appreciate.

The lens: The Angenieux f/2.0 10-150mm zoom, for wider wide-angles and tighter tele's. Manual or power zoom available.

The battery pack: Frezzolini's most advanced model, which charges in only 3 hours to give you more time on the go.

The recorder: Sony's easy-to-operate VO-3800—a 30-lb. package that gives you up to 20 minutes of NTSC color on a single U-Matic® cassette which can be edited on the 2850.

*Also available with HL-35.

**Plumbicon is a trademark of N.V. Philips

OPTIONAL ACCESSORY: "VIDEO CRASH CART"

Custom-designed to make production safer and smoother, with reduced set-up and strike time, easier transport and

fatigue-free shooting.

Sturdy, welded construction with 2-position handle lets you transport or operate in upright "handtruck" or horizontal "dolly" position. So it can go

virtually anywhere your crew can go.

Holds camera backpack, recorder, AC adapter, cables—even extra cassettes.

RENTAL-LEASE-PURCHASE:

Pick the terms that suit your budget (and tax situation) best.

OTHER PKGS.: TALK TO US ABOUT YOUR NEEDS

If we're known for anything, it's our ingenuity and flexibility. Talk to us about your needs, and we'll customize these packages to meet them—or come up with whatever else best fits your requirements, from the many major lines we carry. If you're just getting into ENG (especially from film), you'll find we speak your language. Write or call Ken Seelig or Hal Rainey for more information.

SUSTAINING
SMPTA
MEMBER

to seek and "tray" (cue up) the correct cartridge.

The only deviation in this procedure comes when two cartridges in the same machine are scheduled in the same cluster. Obviously, since rotary tray type machines are used, the two cartridges can't be played back to back without dead air. This is the only concession that must be made in the scheduling of carts. However, if the first of the two "same machine" carts is run first in the cluster and the second in the third, fourth or fifth position for example, the computer commands the machine to seek and tray the first cartridge while retaining the identity of the second one in its memory. As soon as the first cart has played and re-cued itself, the memory would then automatically command the machine to seek and tray the second cartridge.

Thus, with the exception of two spots in the same machine running back to back, any cartridge in any of the four machines can be dialed up in any order. Audio switching from one playback machine to the next in the order called for by cartridge selection is also automatic. The point at which switching takes place can be controlled via the standard NAB EOM tones recorded on the cartridge. Audio from the next machine is switched on via the leading edge of the tone while the first machine is switched off as a function of the tone's trailing edge.

Further flexibility within the memory system was added so that the spots could be pre-programmed to follow one another automatically after the sequence was manually started with the "Take" button. Alternately all or some of the spots could be programmed to play one at a time by hitting the "Take" button for each spot. In this way a cluster with a live tag after the third spot, for example, could be entered into the computer in such a way so as to cause the first three to run automatically and then stop. The live tag would be voiced by the announcer who would then hit the "Take" button again to allow the remaining two spots to run automatically.

Each cartridge is assigned a number which appears on the program log for ease of selection. There are three digit numbers; the machine number (first digit) and tray number of the cartridge (last two digits). Thus, cartridge 322 would be located in tray 22 of machine 3. Spot numbers as well as double spot/non-double spot and "Take" commands are entered into the memory via telephone-type keyboard remote control units (the old

system used standard phone dials) located in each of the stations' three new air/production studios as well as the new MCR and announce booth.

This remote control placement in itself offered several advantages. First, of course, was the ability to control the system from any studio in the station. Second, there were the cost savings realized by not having to equip each studio with a set of standard cart machines since each could access the centrally located cart system via the remote control. The third advantage was the elimination of the usual clutter of cartridges and cart storage racks as the multi-play machine is by its nature an automatic cart storage facility. In turn this central storage feature also meant that to move on-air operations from studio to studio was a simple matter of carrying the copy book and program log from one studio to another instead of also having to move all of the cartridges.

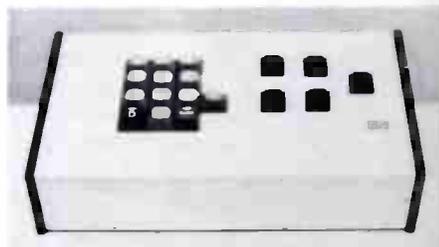

Playing news actualities

To facilitate operation of the system by the News Department, yet another function was programmed into the computer. Under normal operation, a cartridge commanded to play would do so only to the next stop cue recorded on it. It would then be ejected and the next cartridge to be played in that machine would be found and loaded on command of the computer.

However, for News Department use, when a number of actualities or outside reports are recorded on a single cart in sequence, this normal routine would be impractical. To solve this problem, the microprocessor was made to recognize the standard NAB 8 KHz tertiary tone as a command to not eject any cartridge with such a tone recorded on it.

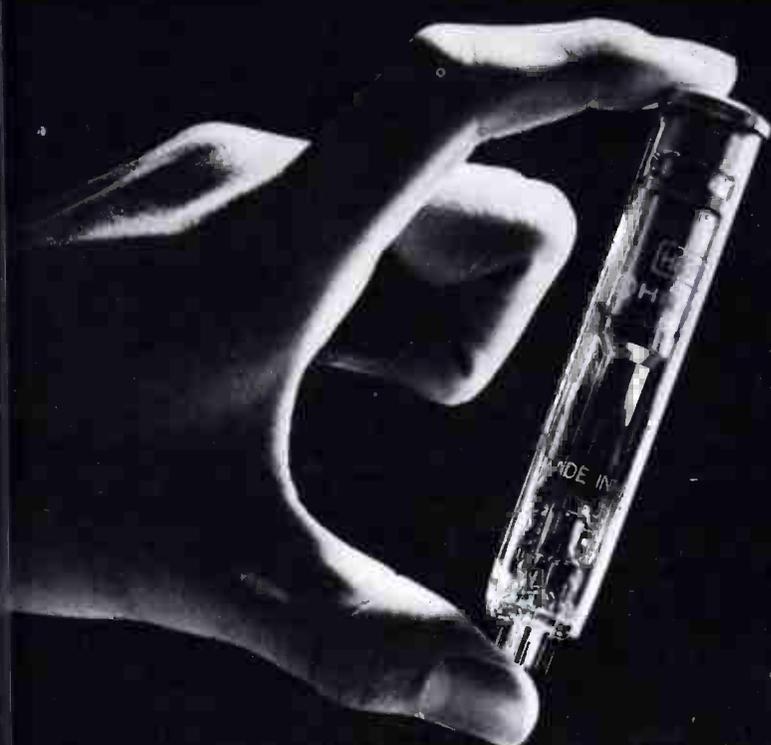

To return to normal operation, the 8 KHz tone is simply omitted from the last cut on the cartridge. In this way, the newsman can dial up his actuality cartridge and play each cut in sequence as he needs it simply by repeatedly depressing the "Take" button. After the last cut, the system automatically goes back to normal.

Of course, the system would be totally useless without a readout device to provide a status check to the announcer/operator. With the old one-at-a-time cartridge selection system, a simple digital readout showed the cartridge number dialed and whether or not it had been

(Left) Announcer has control box under his left hand, can enter five carts for automatic play, or interrupt play at any time for live tag. TV monitor on his right shows carts entered for play, cued up, next in line.

(Above) Close up of control box for automatic cart-play system shows buttons for entering cart numbers in microprocessor memory, and function buttons that start and stop play.

SATICON* catches the action live... ...with a small 2/3 inch color tube.

*Registration pending in U.S.A.

The Hitachi SATICON, a newly-developed camera tube, is characterized by heterojunction target between tin-oxide and selenium doped with arsenic and tellurium in its photo-conductive layer.

Model H8397 is the first in the SATICON series, a small 2/3 inch high-performance tube that is particularly suited for hand-held color television cameras. Size and weight are significantly reduced with no impairment in picture quality or color. In the studio or out on the field. The Hitachi SATICON makes for easy

versatile on-site TV broadcasting.

The Hitachi SATICON H8397 offers these excellent features:

- High resolution — amplitude response of nominal 45% at 400/TV lines.
- Low reflection coefficient of photo conductor throughout the entire visible light range — eliminates flare and the need for a flare tip.
- Well-balanced, highly sensitive spectral response — no R.G.B. tube selection required.
- Low lag — almost zero with bias light.

HEAVY RADIO SPOT LOAD

trayed. This arrangement would obviously be less than adequate for the new system which could dial up 5 cartridges in advance. Added to this came the need to indicate cue-up status, plus whether or not the cartridge had been flagged to double spot. The need for a more elaborate readout system was obvious.

It was here that the building of the TV station gave us an unexpected benefit. This was the decision by station management to simulcast the audio portions of some of the new TV station's programs in stereo and SQ Quad

Adapting The WGPR System To Other Stations

As a result of the success of the system at WGPR (see accompanying story), it was decided that other stations which employ multiple studios and/or originate a great deal of remote broadcasts could also benefit from such a unit. While remote broadcasting hasn't been used to any great degree by pop music stations in large cities for a number of years, our research showed that the "remote" is still alive and well at black, country-western, and ethnic programmed stations as well as the vast majority of small market stations.

And it is these very stations, most of which are smaller facilities operating on a tight budget, that could most benefit from the savings in equipment and personnel cost offered by the system. However, the original system was designed for one specific client's application. Therefore, some additional options were created in order to make it useful to a broader spectrum of stations.

For example, because WGPR plays all its music directly from records both in the studio and at remote sites, no provision was made in the system for handling music recorded on cartridges. However, since many stations do prefer to record music on cartridges, we developed two options that would facilitate this type of system utilization. One is a new remote controlled device that operates via the FSK data transmission system. This unit allows the operator/announcer on remote to fade under any music cartridge being played by the system back at the studio.

Alternately this could be done by the station itself by using the announcer's voice as a control input for a limiter which would pull down the audio level of the cartridge. However, if a slow fade is desirable, this method cannot be employed, tied as it is to the relatively fast attack time of most limiters.

The second device is actually a programmed function of the microprocessor. It's called the Format Follower and its function is just that. The station's record rotation is programmed into the system. This data is then used to guide the announcer/operator via the readout, allowing him to select music carts that fall within the group (hit, oldie, album cut, etc.) established by the format. If the station wants to exert a high degree of control, the Format Follower can also be made to prevent positively the selection of a music cartridge that is not within the proper rotation category.

For the station that requires only system data to be displayed in each studio, an LED type studio readout system was developed as an alternative to the more expensive TV readout. This unit displays all memory positions plus cue and double spot status. Interface units to match the microprocessor computer to the multi-play cartridge machines of a number of manufacturers were also developed. These include interfaces for the common-capstan non-rotary type units with which back-to-back cart playing in the same machine is possible. (The rotary-tray type machines employed at WGPR do not allow this, but offer greater capacity per machine which is why they were chosen.)

over the FM station. In turn, this necessitated TV monitoring facilities in the radio station's studios to keep simulcast operations coordinated. Therefore plans had already been made to run lines from the TV station in-house RF video distributor system into the radio studios.

The RF system was chosen so that inexpensive color or black and white home type TV receivers could be used for non-critical monitoring applications such as in office and the radio studios. This would also allow easy monitoring of competing TV stations plus WGPR's own closed circuit feeds on the vacant channels. Since the system would be available in all the radio studios and since there were still some vacant channels unassigned for closed circuit use, some interesting ideas began to develop.

We needed to display, for the announcer, a great deal of information about the cartridge handling system operation. This data was to include an "Edit" readout to show the number of a cartridge as it is punched up on a keyboard. This function allows the operator a chance to determine if he indeed selected the correct number. If he changes a number he would merely enter the correct number for automatic erasure of the first.

If the number is correct, however, he would then enter it into the "Next-To-Play" position of the memory by hitting the "Enter" key on the control unit. This procedure is repeated for the four remaining memory positions each of which would also require a readout of a cartridge number. Additionally, there was the need to display a "Cue" confirmation for the "Next-To-Play" cartridge and whether or not each cartridge was meant to play automatically at the conclusion of the proceeding one.

Our original intention was to use LED digital displays but then thoughts began to turn to those unused channels on the video distribution system. Why not use one of them in conjunction with a character generator to display system data? Not cost effective was the initial reaction. Discrete digital readout systems were still more economical despite the large amount of data they would have to display.

But then other ideas began to emerge as additional factors were entered into the equation. Factor 1: The station had purchased an ASI Synchron Master Clock system to display synchronous real time and "burn time" (for video taping purposes) at several points around both the TV and radio facilities. Additionally, an electronic thermometer option for the clock had been ordered so that outside temperature could also be displayed on any of the system's remote readouts. The design of the clock system was such that all of its functions could be displayed on a TV screen if another character option, a character generator, was also purchased. Factor 2: The station had also ordered from us a custom designed studio switching system that allowed remote control switching of any studio, the announce booth, the cartridge handling system and certain remote lines to the transmitter. This device also had status tally outputs which could be easily interfaced to a character generator.

Factor 3: The station had purchased a Moseley DC digital remote control system for transmitter operation which also possessed status outputs that could be easily interfaced to a character generator. Why not combine all of this information and turn the TV monitor into a complete station status center? At a glance the announcer/operator in any studio could not only see every mem-

tion, double spot or cue tally of the cartridge system, could also have digital readouts of time, temperature and transmitter parameters as well. It was further pointed out that tally outputs of the switcher could allow a readout in words as to which studio or other audio source was being the transmitter.

ing the system from remotes

The final result can be seen in the photos; the various elements are described in the captions. The concept of the original cart-play system was that it reduced the production of the large number of remote broadcasts the station did each week, with in-studio use as a benefit. Today the station maintains an even larger remote broadcast schedule. Add to this the extra burden of a large number of multi-spot breaks and it's easy to see why remote capability was just as critical for the new system as for the old. Thus, a great deal of time was devoted to making the new system an even more versatile remote-broadcast production aid than was the original.

The old system utilized a series of discrete, steady or pulsed tones (for cart number dialing) to trigger specific functions via phone line back to the studio. A similar system was used to transmit cartridge number and "next to play" status via the station's SCA channel back to the remote site. Obviously the new system's expanded controlling abilities plus the large amount of status information required meant that the old discrete tone approach could not possibly handle the data load between the remote and the studio. It was determined that frequency shift keying (FSK) techniques would be the only practical way to move this amount of data reliably.

We had gained considerable experience with FSK as a result of our Synchron Clock System which uses the technique to transmit time information from the master clock

to the remote units. Thus, it was a simple matter to interface the cartridge system to our already existing FSK designs. In fact, as a cost saving device, we decided to use a portion of the station's already purchased clock system FSK chain as the transmission medium between the studio and the remote. This was possible as a result of the Synchron design which sets aside a portion of the FSK chain for the transmission of user generated data via suitable interface options.

This link was used to transmit status data between the studio and the remote via SCA channel. Also, to save cost it was decided that the TV type readout would be replaced by an LED digital readout display. It was further decided that this display would consist of only two of the system's memory positions—"edit" and "next-to-play". These are the two most important positions in the system and represent the minimum information necessary for reliable operation. The readout unit also displays "Cue" and "Double Spot" status via individual LEDs.

The remote-to-studio data link was designed around a keyboard control unit similar to that utilized in the studio but with the addition of the FSK transmission circuitry. In this way, the entire system with its greater flexibility could be remotely controlled just as easily as its predecessor. The system was fed to the studio switcher as well as through normal console inputs in all of the studios. In this way both the remote broadcast's audio line and the four multi-play machines in the system can be fed directly to the transmitter through suitable audio processing gear. Thus, all studios are free for production duty during remotes just as with the old system.

The completed new cartridge handling system was greeted with a great deal of enthusiasm by the stations staff and management. All of the announcer/operators have been able to operate it flawlessly after only a short training period.

Audio Console, the Series 20A, is modular, with four chassis/enclosure sizes available. The design incorporates systems innovations that allow it to meet the realtime demands of television production, sound reinforcement, and theatre effects, together or separately. CETEC AUDIO. **300**

Production switchers, the ComTec 3000 series, for small to medium size studios and remote applications features 9 inputs plus color and black, 18 linear effects with soft wipes and blink keys, internal color generator, complete vertical interval switching, video pointer, optional chroma keyer, joystick positioner, spotlight pattern modulator. Prices range from \$2500 through \$8400. COMMUNICATIONS TECHNOLOGY, INC. **301**

Audio recorder/reproducer is aimed at the professional music recording industry for use in making disk masters for LP record albums and for AM, FM, and FM stereo radio operations, particularly those airing automated pro-

gramming. The ATR-100 features an exclusive tape handling system with fully servoed tape drive system. S/N ratio of better than 80 dB (full track at 30 ips) and an overall record and reproduce response of $\pm 3/4$ dB, 100 Hz-15 kHz at 15 ips. Prices start at under \$5000. AMPEX CORP. **302**

Hand-held color video camera, cv500 is a one-tube version, that offers improved stability, resolution, color-

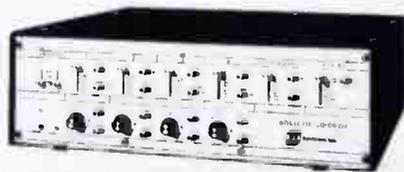

metry and lens interchangeability over earlier model. Features "total automatic color," weighs less than 7 lbs. including 4:1 zoom lens. PHILIPS AUDIO-VIDEO SYSTEMS CORP. **303**

Mixer — Amplifier, for Sony VO-3800 and remote broadcasts, Model MA 3CT, features tone oscillator, solid state VU meter, 3 mikes or 2 mike and hi-lvl input (XLR plugs), AGC with defeat switch, headphones amplifier, self-contained battery, weighs 2 lbs, and measures $2 \times 3 \times 4\frac{1}{2}$ in. TRANSIT-O-SOUND. **304**

Television transmitters in a new line, operate both UHF and VHF and are configured for both studio and remote control operation. They are totally self-contained, completely diplexed and ready for radiation from a single antenna. VHF models offered in 100 W, 250 W, 500 W, 1 kW, and 2½ kW. UHF models are 100 W, and 1 kW. A maximum of two tubes are used in all equipment 500 W and higher. 100 W and 250 W equipment use a single tube. ACRODYNE INDUSTRIES, INC. **305**

An Image Enhancer for ENG, the series 6100 unit is well suited for use with sources that have limited luminance bandwidth and time base stability. Other features include: automatic control and shutdown of detail signal in the presence of incoming enhanced signals, independent control of horizontal detail, allowing balance of horizontal and vertical contours, and rapid servicing through the use of plug-in modules accessible through the front panel. \$3800. CORNING GLASS WORKS. **306**

Video Colorizer, Model 135 for coloring monochrome video signals. Uses "Chromaton Depth Level System" and provides four "depth level planes," and a background, each is assigned a color from a selection of 20 preset colors. Accepts two video signals, composite sync, composite

blanking, and color subcarrier. \$3350. Optional sync generator, \$650. BJA SYSTEMS, INC. **307**

Multifont titling/graphics system,

ITC's 750 Series open-reel recorder/reproducer

PROFESSIONAL IN ALL BUT PRICE

MONO
\$1800

STEREO
\$1950

A marvel of simplicity, yet built like a tank, ITC's 750 Series record/playback equipment compares in cost to semi-professional or consumer-type machines. But it's so quiet, so dependable and so flexible in operation that you can use it daily in live studio work and heavy production and editing operations. Many of its features are normally found in only the most expensive open-reel machines.

- Monitor control with automatic meter switching
- Play/Record Synchronization system
- Motion sensing and start memory
- Flip-top head cover
- Straight-line tape threading
- Manual tape lifter defeat
- And much more... all backed by a complete 2-year warranty on all parts and factory labor, plus ITC's famous 30-day money-back guarantee of satisfaction

How can you lose? For more details on the "professional" 750 Series recorder/reproducer, phone ITC collect at 309/828-1381.

Cut cart handling in half.

Model SF-1 Splice Finder: \$370.00
Model SFE-1 With Bulk Eraser: \$395.00

Our automatic cartridge tape splice finder is a real labor saver. It cuts handling time by up to 50%, allowing busy engineers and DJ's to do other jobs at the same time. This superior machine processes all NAB standard A, B, and C sized cartridges by locating tape splices and stopping the tape within one inch beyond the capstan. The automatic process eliminates the noise effect of recording over the splice, which is especially annoying to broadcast advertisers. A handy bulk eraser is added to the Model SFE-1 splice finder to conveniently save additional studio space. Each machine is a trim 16½" x 6" x 10" rated at 15 IPS, 117 VAC, 60 Hz., 250 watts. Ask about it.

Collins' Generation 4 FM transmitters and EIMAC make beautiful music together.

Nine new FM transmitters from Collins—ranging from one to 40 kilowatts—use EIMAC tubes in PA stages. Collins' combination of the Phase 4 exciter and EIMAC tubes provide enhanced performance for today's new generation of radio audio—plus proven reliability for the station engineer. Make sure your new FM transmitter employs EIMAC power tubes. The transmission of fine sound,

brilliant tonality, and low harmonic distortion require the very best of power tubes in the critical high power stages. This means EIMAC, of course.

For full information on power tubes for any service, any power level, contact Varian, EIMAC Division, 301 Industrial Way, San Carlos, California 94070. Or any of the more than 30 Varian Electron Device Group Sales Offices throughout the world.

The finest multi-core studio and field camera system ever produced by Philips.

Which means the finest multi-core studio and field camera system ever produced.

In the decade since Philips re-invented color with the Plumbicon® tube, its PC-60 and PC-70 have successively stood as *the* reference standard for broadcast performance. Behind Philips leadership, that standard has steadily improved to today's ultimate—the LDK-25.

That Philips has again leapfrogged the competition can surprise no one who knows broadcast cameras...since we created Plumbicon® technology. After a decade of refinement and improvement Philips is still the *only* company that manufactures all of the critical picture determining components—computer-matched yokes, beam splitting prism, deflection circuitry and Plumbicon® tubes. The *only* company that can design each component for optimum performance of the entire camera system. These advantages, of superior Philips design and in-house component availability, offer you unsurpassed stability, picture quality and value.

Further, at Philips, we offer you options that *are* options. The LDK-25 you buy is a custom unit, equipped

with the automatic features you select...not a 'load factory package.

But you can't just read about the LDK-25...you've to experience it.

Only a demonstration can show you how our a comet-tail Plumbicon® tubes handle highlights up to normal peak-white level without blooming or streaking and without loss of our famous color rendition and resolution. 'Live' is the only way to learn what our Color Live Up Equipment (CLUE) can do for ease of balance, what electronic color temperature control, auto white balance, flexible auto iris and contrast compression mean in use.

Only after you've seen it all—after you've actually handled this remarkable camera—will you understand why the Philips name is a guarantee of incomparable stability...why no one else can match our 1000-hour performance.

To get your hands on an LDK-25 or to get more information, call us today at (201) 529-5900; (201) 529-3888 or write: Broadcast Products, Philips Audio Video Systems Corp., 91 McKee Drive, Mahwah, N.J. 07430.

LDK-25 *IS DECADE TWO*
