GRASS VALLEY GROUP

INTRODUCING...

Model 1600-7K Switching System With *Rotational* Wipe Transitions

Model 1600-7K is a 24-input, 8-output, production switcher with 3 mix/effects systems, plus program and preset buses with flip-flop mixing. Each mix/effects system provides both rotary and conventional wipe effects.

Several types of rotational transitions are possible, for example wipes which pivot about a fixed point to produce a clock, windshield wiper, or fan effect. The rotational feature can also be applied to many conventional patterns to produce either a rotational effect or a splitting effect. A square or a group of 4 squares can be made to rotate as they expand in size. Separation of the transition control

levers allows *independent* control of size and rotation. Soft wipe and bordered wipe operation is available with most rotary patterns.

Selection of a pivotal wipe is obtained by depressing a unique pattern button. Selection of the rotational mode (R) or splitting mode (S) for conventional patterns is achieved by first selecting the conventional pattern (e.g., a square), followed by operation of a "shift" key. A total of 54 patterns is available.

Model 1600-7K is also available in PAL and PAL-M versions. For additional information on the system, including a demonstration video tape, contact your nearest Grass Valley Group field office.

BROADCAST INDUSTRY NEWS

Reregulation Marches On As FCC Issues Changes

As part of the reregulation process, the FCC recently made the following rule amendments (among a number of others—broadcasters should make sure they have all releases on rule amendments in this period of tremendous FCC activity):

Freed station operators to put static current drain and lighting components across the antenna terminals *following* the point of resistance measurement;

Eliminated the requirement for AM stations operated by remote control to make antenna monitor readings at the tower every second day, if the station is using an approved antenna sampling system and a type-approved antenna monitor;

Changed the rule to allow station licenses to be kept in binders or folder

rather than on the wall, if the licensee so prefers;

Removed a requirement that direct-controlled stations make more frequent base current measurements than remote-controlled stations, if they use a type-accepted monitor;

Added a new section to the rules covering "skeleton proof of performance," and "partial proof of performance," allowed in certain circumstances for directional antennas;

Made more specific the requirements for FM field strength measurements, beyond the earlier statement, "in accordance with good engineering practice;"

Amended remote control requirements for Class D, educational FM stations—since transmitter meters are not required, there is no need for remote control metering. (Report No. 14225).

'Stereo AM' Urged on FCC

A petition has been filed with the FCC calling for a Rule Making Proceeding to look toward a change in regulation that would allow AM broadcasters operate stereophonically on a permissive basis.

The petition, filed by Kahn Communications, Inc., a Long Island, N.Y. manufacturer of communications, telephone, and broadcasting equipment, states that the patented AM stereo system, which has been developed over a sixteen year period, is: "Complete compatible with standard AM broadcasting . . . (and) will allow radio listeners to enjoy stereophonic reception with little or no additional investment in receiving equipment."

The petition cites on-the-air tests made over a 3½ year period at [unclear] continued on page

44 TV Markets Receive Live Stereo

The largest live stereo-network in the history of broadcasting was established for the *Live From Lincoln Center* nationwide television broadcast of American Ballet Theatre's "Swan Lake" on the Public Broadcasting Service (PBS), June 30th. The program reached 44 television markets, representing a potential audience of over 107 million—more than half of the nation's television viewing audience.

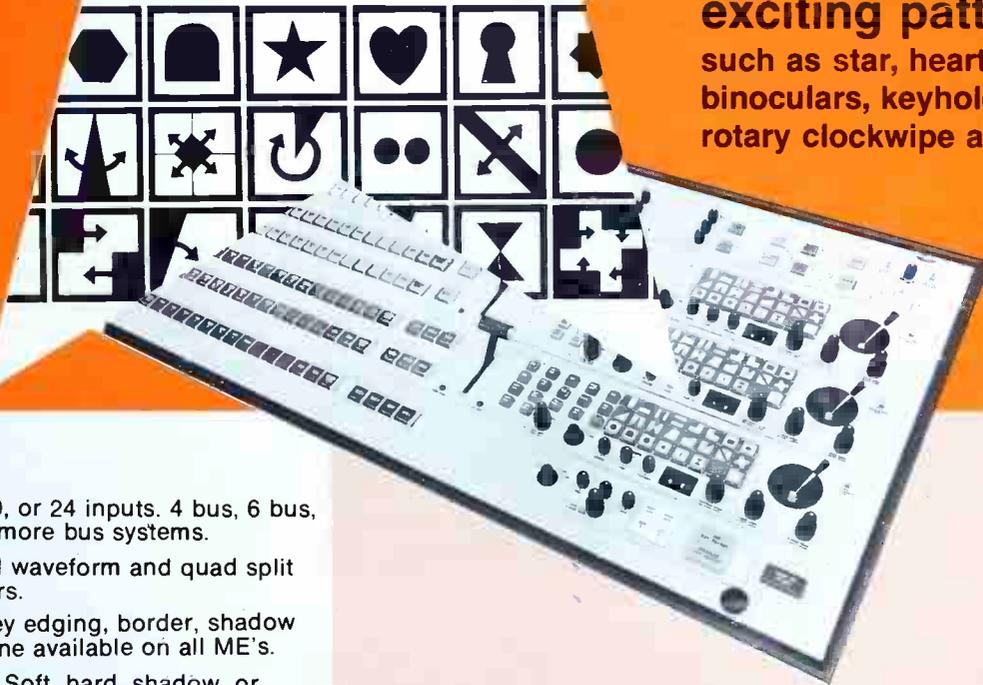

The stereo sound portion of "Swan Lake" was distributed by microwave, land line and satellite. The signal was received by cooperating FM stations in the corresponding markets. This stereo network, recently nominated for an Emmy award for outstanding technical achievement, was created by the Lincoln Center Media Development Department, under the direction of John Goberman.

Photos show Mark Schubin, consultant to Lincoln Center before the audio control rack and two Sony audio mix consoles (one for the orchestra, the other production). Recorders are Ampex (for audio) and Sony (video cassette). Stereo channels were located above the video signal (5.8 MHz, L, and 6.6 MHz, R). Subcarriers were set at 0.1Vp-p; diplexer was made by Leaming Industries.

VIX-114 production switcher with STAR studded features

Choice of over 80
exciting patterns
such as star, heart,
binoculars, keyhole,
rotary clockwise and more

- 12, 16, 20, or 24 inputs. 4 bus, 6 bus, 8 bus or more bus systems.
- All digital waveform and quad split generators.
- Digital key edging, border, shadow and outline available on all ME's.
- Vari-key. Soft, hard, shadow, or see-thru key.
- Digital quad split. Wipe or dissolve in each quadrant.
- Electronic vignette. Adjustable soft pattern edges.
- Superb linear chroma keyer. RGB or encoded.
- New digital, drift and jitter-free proc. amp on output.
- Ready to interface for computer aided operation.
- Many more state of the art and operational features described fully in series 114 brochure.

The VIX-114 series video switching systems are conceived and designed by the largest specialized independent video switching company in the USA. Vital Industries, Inc. is holder of US patents on digital effects and analog rotary effects. Vital VIX-114 series switchers open new vistas in production of television commercials and programs to yield maximum pleasant visual impact.

Do not fear to discover a superior product in the VIX-114 series switchers. Ask to see the demo tape for a sample of what we can do for users of switching equipment.

radio stations, WFBR, Baltimore, and XETRA, Tijuana, Mexico. The results indicate "complete compatibility" for the system with existing FCC rules and other AM broadcasting systems.

Teleprompter Inaugurates Lightwave Era For Cable Television

The first step by the cable industry into

the era of lightwave communications was taken on July 9th when the Teleprompter Company switched on line, at their New York headquarters, an 800-foot section of "fiber optics" cable to carry pay-cable programming over a part of the regular haul to subscribers all over the United States.

Coming to the Teleprompter head-end in Upper Manhattan by microwave from HBO's midtown programming center, the programs were demodulated and fed at baseband to an LED unit designed specifically for lightwave communications by Bell of Canada.

The LED, directly modulated by a signal, injected about 100 microwatts of light into a single glass fiber, about 90 microns in diameter, at a wavelength of 8200 Angstroms, or just beyond the visible spectrum into the infrared.

The cable, with glass fiber made by a new firm, Fiber Communications Orange, N.J., and with jacketing Belden Company's research center Geneva, Ill., exhibited the characteristics that hold such immense promise for the cable industry (as for all point-to-point telecommunications). The cable loss is about 10 dB per kilometer or 16 dB per mile, compared with about 2 dB per mile for standard coax. The cable does not discriminate against high frequencies: there is no "slope" to compensate for. The cable used by Teleprompter, about a quarter-inch diameter, easily held six of the fibers (only one was being used in this experiment), and could be pulled into conduits that would not hold another coaxial assembly of anything like the same channel capacity. Moreover, in quantity production the cable will be cheaper than coax: the base materials for glass are among the most abundant in the earth's crust.

The lightwave signal, too, is immune to interference from electrical and magnetic fields, a great boon for cable operators who must get signals through areas crowded with electronic apparatus.

At the other end of the Teleprompter optical run, a PIN photodiode converted the light signals back to electrical signals, and they continued on Teleprompter's regular delivery route. *BM/E* watched monitors at the Teleprompter head-end as they were switched back and forth between input and the output of the optical system, and saw absolutely no change in quality. The bandwidth of the system as now being used is 20 MHz; however, this can readily be increased almost at will and a single fiber eventually be able to carry 10, 20, 30 or more cable channels. Alternatively, a cable company could use cabling with 20 or 30 fibers, one for each channel, with simplification of head-end equipment.

Teleprompter plans to expand its use of optical transmission at an evolutionary pace, as expansion makes it desirable. William Bresler, president of Teleprompter, said in a statement to *BM/E*: "Many think lightwave communications is something that won't be here for another 20 years. They are wrong: it is here now. We have a working application of our cable television system and hope that others in our industry will embrace this new technology and do what we have done."

PROFESSIONAL IN ALL BUT PRICE

MONO \$1800
STEREO \$1950

ITC's 750 Series
open-reel
recorder/reproducer

A marvel of simplicity, yet built like a tank. ITC's 750 Series record/playback equipment compares in cost to semi-professional or consumer-type machines. But it's so quiet, so dependable and so flexible in operation that you can use it daily in live studio work and heavy production and editing operations. Many of its features are normally found in only the most expensive open-reel machines.

- Monitor control with automatic meter switching
- Play/Record Synchronization system
- Motion sensing and start memory
- Flip-top head cover
- Straight-line tape threading
- Manual tape lifter defeat
- And much more . . . all backed by a complete 2-year warranty on all parts and factory labor, plus ITC's famous 30-day money-back guarantee of satisfaction

How can you lose? For more details on the "professional" 750 Series recorder/reproducer, phone ITC collect at 309/828-1381.

CANON'S NEW P18X16B2* 'INSTANT CLOSEUP' LENSES HAVE TURNED WPIX'S YANKEE BROADCASTS INTO A WHOLE NEW BALLGAME". Otis Freeman

Vice President/Engineer, WPIX-TV

When WPIX, in New York bought 5 of our new lenses for their Yankee Stadium installation it was the biggest news for us since instant replay.

For a lot of reasons:

P18x16B2* lenses have easy access to all range exposures. Because they don't have a diaphragm, the director isn't

forced to cut away to another camera when he's already in the best angle... and he needs to move in for a tight closeup.

The lenses also have automatic compensation for different light levels, which means there's less to worry about when the action down on the field is fast and furious.

The fact that they've got the best relative aperture in the business is frosting on the cake. P18x16B2 lenses can go from 16 to 216 millimeters without losing aperture... where other lenses are already falling off at 160 millimeters.

And to top it all off the extreme wide angle of our new lens

gives WPIX the best panoramic shots they've ever sent down the pipe

If all this sounds good to you, seeing what our new lens can do is even better. No matter what kind of camera you're using—or contemplating—call us to arrange a demonstration.

*for 1 1/4"/30mm Plumbicon†. Also available: PV18x12B2 for 1"/25mm Plumbicon.

OUR NEW "VIDEO CRASH CART" TAKES A LOAD OFF YOUR MIND AS WELL AS YOUR SHOULDERS.

Since nobody's invented a bionic cameraman, we direct your attention to our safe, strong, versatile and highly mobile "Video Crash Cart."

It's custom-designed to carry and protect the Sony VO-3800 videocassette recorder, two extra cassettes, a Sony AC-3000 AC adapter, the backpack for an Ikegami HL-33 or HL-35 color camera and up to 50 feet of connecting cable (whew!)—in transit and in use.

Plus these options: VO-3800 carrying case, a VO-3800 to Ikegami backpack interconnect cable, an AC adapter extension cable and a Triax adapter for an Ikegami backpack (double whew!).

The Crash Cart goes virtually everywhere a crew can go—even up and down stairs.

Which not only reduces fatigue, but drastically cuts down set-up and strike time, too. Making our most popular ENG package even more portable... thus more popular with producers and crews alike.

What's more, we can customize it on special order for other equipment configurations.

The Crash Cart is available for sale or rental, exclusively from us. And it's one of the best ways yet to do a lot more shooting with a lot less sweat. For more information, contact Hal Rainey.

IBC and Vidcom in Sept.

Back to back conferences in London and Cannes this September will represent the latest in broadcast and video disc developments.

The Sixth International Broadcasting Convention will be held at Grosvenor House, Park Lane, London, Sept. 20-24 and features a heavy technical program covering automation, electronic journalism, satellite broadcasting and distribution systems plus the latest on recording, production and transmission. The IBC exhibit ranks one of the important international market places. For more info write Secretary, IEE, Savoy Place, London, UK, WC2R 0BL.

Starting Sept. 23 and running through Sept. 28 will be the Fifth Vidcom held in Cannes (France) Palais des Festivals. Vidcom, billed the international market of video communications, will explore the latest in video cassettes, video discs, cable TV, production equipment and duplication equipment. It incorporates Marketcom, the market for communication programs. Program caters to producers, publishers, distributors, and users such as communications specialists, training directors, cable TV operators and equipment specialists.

Program details include video company training, in schools and universities, in information and market and in consumers markets. For more details contact Vidcom c/o Jonathan Nathan, 30 Rockefeller Plaza, Suite 4535, New York, N.Y. 10020, (212) 489-1360.

RCA CCTV Helps Olympics Coverage

Some 3500 Colortrak and XL-100 sets were loaned by RCA Ltd. Canada to the 1976 Olympics Committee to help the press, television media, spectators and athletes watch the games last month. The closed circuit TV system permitted viewers to monitor seven different events as they happened. Sets were distributed among the 27 different locations in Canada which were sites of events.

This elaborate closed circuit system was an additional facility over and above that provided by the Canadian Broadcasting Corp. and its ORTO affiliate as described in *BM/E* in April. Eighteen hundred of the sets served radio and TV broadcasters and others were installed in press rooms, newspaper and magazine reporters' quarters, the Olympic Village (living accommodations for the athletes), in athletic dressing rooms and in public lounges.

This is all you need to get moving with Dolby FM

Remember the first time you came across compressed cassettes? And how surprised you were that music could sound so good in such a convenient form?

Now the same principles are being used to improve FM broadcasting. The overall effect of the Dolby system as used in FM is a bit more subtle than with

cassettes. But the overall results are just as important. Dolby FM is cleaner, with sparkling high frequencies free of limiting. And, of course, noise is reduced, which often increases the area of good reception.

The only extra station equipment required is the Dolby Model

334 FM Broadcast Unit. The unit accurately compresses the signal in accordance with the Dolby B-Type characteristics and changes the effective transmission time-constant to 25 microseconds. This allows the station to reduce or eliminate any high frequency limiting required previously.

Already moving with Dolby FM in the US:

**140 FM stations
now equipped
to transmit
Dolby FM signals**

**33 consumer products*
now available
to receive
Dolby FM signals**

Listeners can hear for themselves, as Dolby FM signal is compatible when received on their normal equipment without Dolby decoding.

However, some listeners like to take advantage of every opportunity for improvement. If they use Dolby circuitry during reception, they can bring the signal even closer to the quality of the original source material used at the transmission.

Naturally, the noise is reduced. But that's not all. Dolby compression is standardized, recoverable compression. By using Dolby encoding instead of the conventional high frequency limiting normally required during transmission, the station gives the listener at home the opportunity of recovering the full frequency range and dynamics of the signal. Furthermore, depending on the amount of limiting previously used, many stations find that Dolby encoding permits them to increase their level – which is good for both the listeners and the station.

If these prospects excite you, we think you will soon be wanting to check out the Dolby Model 334 FM Broadcast Unit. \$1,350 and 1½ inches of rack space are all you need to get moving with Dolby FM – an improvement we think both you and your listeners will appreciate.

*July 1976. The products are tuners, receivers, and music centers with designed-in Dolby decode circuits, requiring no extra wiring, adaptors, or calibration procedures. Write for the latest list of FM products made by Dolby licensees. Technical literature describing these developments is available.

Just A Friendly Reminder

ANTENNA MONITORS

In case it happened to slip your mind and you are one of the few remaining directional stations yet to comply with paragraph 73.69 of the FCC Rules... you have until June 1, 1977 to have in operation a "Type Approved" antenna monitor.

WE CAN HELP YOU

We have supplied over 90% of all "Type Approved" antenna monitors (both meter and digital readout) now in service.

We invite your questions concerning installation, operation, remote control, sampling systems, etc.

YOU CAN HELP US

When the last deadline rolled around our order backlog resulted in an eight month delivery cycle. If you order now, you can avoid the last minute rush; we can deliver as required; and you will not risk missing the June deadline.

ASK THE EXPERTS!

NEWS

TV sets used by media at Velodrome

hospitals areas and rest areas.

This loan of TV sets brought the RCA Olympics investment in equipment and services to over \$10 million. As reported in *BM/E* in April, O made extensive use of RCA broadcast equipment—16 VTRs, 7 telecines, character generators and overhead cameras. In addition, RCA provided the parabolic antenna for a new satellite station transmitter installed in Montreal's Mt. Royal by Teleglobe Canadian Crown corporation which will broadcast the Olympics games around the world via Intelsat.

'Trial by Fire' for New Olympic Antenna System

A helicopter-borne antenna system for use in the Summer Olympics in Montreal got a surprise trial by fire when an on-board engineer noticed what proved to be the early stages of a fire that consumed the U.S. pavilion at the Expo '67 fairgrounds.

As the helicopter hovered over the fairgrounds, Duncan Nicholson, an engineer from ORTO who was testing the system for Nurad, noticed the fire immediately radioed the Canadian Broadcasting Co. ground station to arrange for a live feed. Within a few minutes the blazing scene of the fire was on air and at the same time it was recorded and edited for national television programs scheduled for 7 and 11 o'clock that evening.

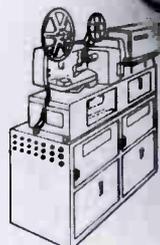

Kansas City Stations To Learn ENG Under Political Fire

The Kansas City stations will learn to use ENG equipment at the Regional National Convention this month. Like it or not, all will be involved in live action news cams but only KCTV is really fully prepared. It has two RCA TK-76s for microlinkup to the studio or for feed into the JVC 4400 portable VTR. The equipment has gone through a shakedown period. Of course the stations that are not affiliates will have their respective

work feeds but each wants to supplement that with timely local news.

KMBC-TV also has taken delivery

of two RCA TK-76s but it does not have a microwave linkup as yet. (It will use Sony 3800-2850 recording systems for ENG but will also rely on film.) WDAF-TV was not certain what equipment it would use as of late June.

It has a Sony Trinitron camera but it probably end up using gear borrowed from some sister Taft station.

KBMA-TV, the UHF independent KC, has already been in the news
continued on page

Traveling TV Station

The Hughes Television Network, which over the past several years has stamped itself as a creative developer of independent network programming, has contributed to the state-of-the-art of remote TV broadcasts with its use of its HTN-MOD lightweight mobile television broadcasting system.

Designed by John Koushouris, HTN Vice President and Executive Producer, the HTN-MOD is a completely miniaturized and modularized television system of enormous flexibility and mobility. It is in Koushouris' words, "A traveling television station." It comprises all the equipment and services of the conventional 14-20 ton remote van in a weight of ¾ tons. It can be shipped anywhere in the world by air for virtual instant transmission.

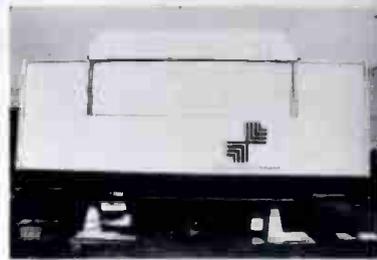

Parts of the system* will be used in Madison Square Garden and also Kansas City to help cover the Democratic and Republican Conventions. Then all of the elements will be brought together in Philadel-

phia to cover the gigantic Colgate Federation Cup tennis matches in which players of 32 nations will assemble.

One can best put the HTN-MOD TV system into perspective by envisioning a collapsible camper-trailer that can be pulled by a Pinto as contrasted with a 16-wheeler tractor trailer rig. The pod itself is patterned after a 747 shipping container. Inside it go separate mods containing cameras, VTRs, switchers, etc. When the pod is unloaded at the airport of its destination, two wheels are added and the unit is towed to the on-location site. Then the roof is raised, the ends extended and the gear unpacked and set up for instant operation.

Perhaps the most dramatic use of the system was the coverage of the Ali-Foreman fight in Zaire. A more typical on-site location would be a golf course.

Another key factor in the usefulness of the HTN-MOD TV system is the incorporation of light weight production equipment. The cameras, according to Koushouris,

are in "intermarriage" of Dutch, German and Japanese systems. The Norelco LDH 1 was totally restructured and the Fernseh KCP 40 revised. Both were trimmed to 25 pounds. The Japanese Ikegami HL33 was redesigned to produce a hand-held camera of 12 pounds with a backpack of 18 pounds. The pod is prewired to cut to a minimum unwieldy cables.

*The Hughes supplied equipment will be used by NBC in New York and ABC in Kansas City to provide an exclusive feed to the European Broadcast Union. Since Hughes has a permanent facility in Madison Square Garden and since there is ample room at Kansas City, the pod carrier was not necessary for these assignments.

A67... the NEW STUDER

'portable professional'

Now from STUDER comes a versatile and compact studio mastering recorder for under \$3,000.

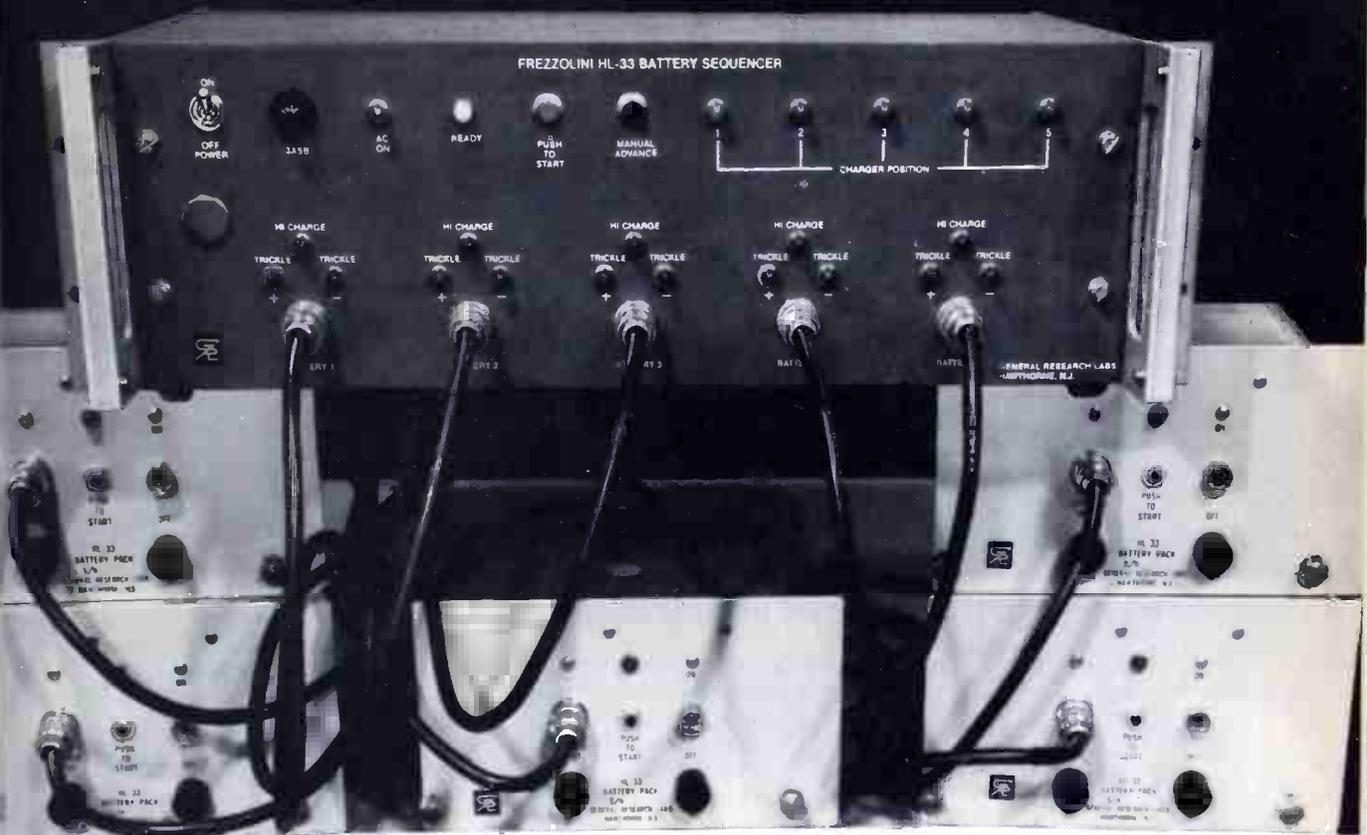

The A67 Tape Transport contains many features found on the world famous STUDER A80 which provides for optimum tape handling ability in all modes of operation.

The plug-in amplifiers feature contemporary design and contain individual record, bias, and reproduce adjustments for all three speeds.

For further information, contact Willi STUDER America Inc., 1819 Broadway, Nashville, Tennessee 37203. Phone 615-329-9576. Telex 55-4453. In Canada, STUDER REVOX Canada Ltd., phone 416-423-2831. Telex 06-23310.

News Dept.: You can automatically charge 5 Ikegami Battery Packs at one time.

Here's how: Just plug in [up to] 5 batteries, push the "Power" toggle switch to "On" and leave them alone.

Save time/save money. Your ENG Battery Pack logistics problem is solved! Only one Frezzi Battery Sequencer with built-in charger does the job, automatically. Hook in 5 (or less) Frezzi HL-33/35 Ikegami Battery Packs regardless of their state-of-charge. In 10 hours (or less), totally unattended, the Frezzi Sequencer will bring each Battery Pack in sequence to its full-charge state. When fully charged each Battery Pack will, automatically, go on a trickle-charge rate to maintain maximum readiness for use. When light indicator shows "Ready" simply unhook any one (or more) of the Battery Packs according to instructions, and run. For mobile units or fixed station operation. Call us or write for information and prices.

Battery Packs, Chargers, Sequencer Chargers, and Complete Systems available. In addition we manufacture for OEM application.

Network proven! Field-tested for 6 months.

Integra 3 is a complete system of audio processing components and accessories in modular form built around a large number of the highest quality, standardized PC boards which use the latest IC technology. The boards are compact in size (only 2½ by 7½ in.), use epoxy-glass 2-ounce clad material with precious-metal-plated contacts. The circuits are the latest IC op amps and other similar components which feature widest frequency range, lowest distortion, highest signal-to-noise ratios, best overall performance, maximum economy and reliability. Servicing is simplified by the slide-in/slide-out modular design.

For complete details, contact **Robins Broadcast & Sound Equipment Corp.**,* a Robins Industries Corp., Commack, N.Y. 11725. Telephone 516-543-5200.

Who's living together in Washington and making big news?

Film and tape at WTOP.

"Film and electronic journalism both have their strengths and limitations," says Dave Daughtry, assistant news director of WTOP-TV in Washington, D. C.

"Each complements the other—and we often use them together on the same story. With great results.

"But we do know there's a lot that we can do easily with film that's difficult for us to do with videotape. For example, we shoot and edit a complicated feature piece on film with an editor or the cameraman himself. Once when we tried to do a five-part series on tape, using IVC one-inch equipment, we found it was much too time-consuming.

"The bulk of our news work is shot on Eastman Ektachrome video news film 7240. We've had good luck pushing as much as two stops in processing, under low-light conditions.

"Not long ago, we covered a story

from two locations at the Philippine Embassy, simultaneously. We covered it live on the outside of the building, and we had a film cameraman on the inside filming the Ambassador's news conference. Then, when the film was processed, we were able to do the live report from the outside and roll the film of the inside into the piece. Worked just great.

"Most of the time, we cover an event with both film and the Mini-Cam because once you're set up for a live hookup with the ENG truck, you can't move it around. The film crews have mobility, and get into places we can't reach with the electronic cameras.

"Last December, when that airline crashed into the mountain, we sent out the videotape truck and two film crews. But the truck couldn't get a live signal through the mountains. And we couldn't get the truck up the fire road to the scene of the crash. So we sent up one of our film crews. And got a good story on film.

"So you see, in a market like ours, both film and electronic equipment are necessary. We haven't locked into either one. And using both has opened a new dimension in news coverage.

"You might say, at WTOP-TV, we think togetherness is making good things happen with the news!"

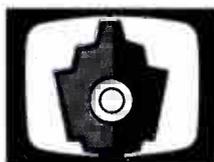

Film is good news.

April 23, 1976

Mr. Paul Warnock
President
TeleMation, Inc.
P. O. Box 15068
Salt Lake City, Utah 84115

Dear Paul:

The new TeleMation TCG3000 Character Generator has proven to be a very delightful surprise. It seems to measure up to just about all of our expectations and then some. I thought you would like to know that it has generated more genuine excitement and enthusiasm on the part of our employees than any other piece of equipment that I have purchased for the station in the last seven years.

May I extend our thanks to you and to those members of your staff who have contributed so much in the preparation, design and provision of this forward looking equipment and especially to Dennis Fraser, Tom Meyer and Leo Lewis. It was great having those people work with us on this project and we hope that they will continue to support us as we come to be more knowledgeable and familiar with the equipment.

I just thought you might appreciate our words of thanks.

Sincerely,

R. C. Smith
Chief Engineer

RCS:rg

roduced at the '76 NAB, the first *Compositor I* Titling/Graphics System is delivered to Time-Life station WDTV, Grand Rapids, Michigan, on April 17.

What are the results?

WDTV Chief Engineer R.C. Smith writes that the *Compositor I* "has generated more genuine excitement and enthusiasm on the part of our employees than any other piece of equipment that I have purchased for the station in the last seven years."

We wish to thank Mr. Smith for his praise, and extend an invitation to all Broadcast Managers and Engineers to compare these *Compositor I* features with any other multifont character generator:

Mixed-Font Pages. Some "multi-font" systems can display only one font at a time. The *Compositor I* allows the operator to mix fonts on a single page, within a row or within a single word.

High-Capacity Disk Memory. Some character generators require a disk change between font changes, page storage, and program loading. The *Compositor I*, all fonts, as well as the computer program and up to 800 composed pages, are stored on a single disk and are always available — from any keyboard location.

Camera Quality Characters. The *Compositor I* obtains maximum character smoothness by using character "elements" smaller than the limiting resolution of the television system itself. It incorporates line-by-line vertical resolution and provides horizontal elements of only 3 nsec width — in contrast to the 5 to 65 nsec element width typical of other comparably priced systems. The *Compositor I* thus provides on-air characters that are virtually indistinguishable from camera reproduced artwork.

● **Automated Election Reporting.** With the addition of the TED (Television Event Display) software package, the *Compositor I* automatically compiles, formats, totals, and displays election returns. No additional hardware is required.

● **Selection of 28 Colors.** With the EC-3000 Colorizer/Background Option, characters and/or backgrounds can be colored any one of seven hues, with each hue available at any one of four luminance levels. Black, white, and two levels of gray are also keyboard-selectable. Each character can be colored separately. Background colors can be changed in four-scan-line intervals and background color can be substituted for character color to provide multi-hued characters.

● **Selectable Character Edging.** The basic edging option (EO-3000) provides a selection of border, "drop" shadow, or outline; while the EO-3001 Expanded Edging Option adds "slope" shadow and multiple border/outline widths proportioned to the font size.

For more information about the Compositor I, send us the coupon below or call TeleMation Broadcast Sales collect at (801) 487-5399.

Compositor I

Please send additional information on the *Compositor I* Titling/Graphics System.

NEWS

form and also has a brand new 32 ft. van equipped with quads that will be in the Kemper Arena parking lot for video processing.

Also coming in on a loan basis will be portable cameras and video processing equipment supplied by Hughes Television Network for use by the European Broadcasting Union. See the accompanying box for more details.

As we mentioned last month, the three network news operations will be

there in force with a lot of ENG equipment of its own. As one local station engineer put it, "I've always assumed that ENG wouldn't be settled until *after* the convention—after we see how the competitive systems perform." Competition isn't allowing such a relaxed approach; ENG will be at KC beginning with the convention.

New EEO Guidelines

In a reaffirmation of its strong stance on equal employment opportunity, the FCC has issued new guidelines, embodying a strengthening of the rules

which were proposed in an inc opened on July 25, 1975. The "in program" has ten elements, including recruitment techniques, training efforts, the availability of women minority persons in the work force structure analysis (for licensees with or more full-time employees), analysis of hiring for 12 months, of promotion and of apparent disparities between personnel hired and the presence of minorities in the community. However, the threshold for such work reports was raised from five or more full-time employees to ten or more (Docket 20550; should be studied by every broadcaster).

FCC Briefs . . .

The FCC has refused to waive the rule that a station must notify a person called by telephone in an on-air program that the conversation is, in part, being broadcast or is being taped for later broadcast; a program producer proposed a program in which celebrities called individuals, without pre-notification . . . The FCC raised the limit on the ownership of broadcast and cable companies by institutional investors—investment insurance companies—to five percent from the earlier three and one percent respectively . . . The Commission turned down four requests for reconsideration of the elimination of the "leapfrog" rules in December, 1975, affirming the right of a cable operator to use signals from stations at any distance, even if closer ones have the same program.

Studies Find Cable Better And Worse

The on-again, off-again bright future of cable TV received further clarification from two reports recently completed.

The good news was contained in a report by the Arthur D. Little research firm which found that cable TV has weathered its recent storms and is entering a period of renewed vitality. The "Impact" study of the ten-year outlook for the industry estimates that revenue growth will average 14-18 percent per year through 1980. The growth in cable will be spearheaded by pay-per-view subscribers and supported by further penetration on existing systems. Slower growth is expected in the late 1980s.

The bad news came in studies formed by the John Hopkins University Center for Metropolitan Planning Research which concluded that cable TV in most urban areas does not provide a service that would make it economically viable. The study used a "demand model" in its computer

AUDI-CORD CORPORATION

ELECTRONIC DESIGNERS AND MANUFACTURERS

Dear Broadcaster:

After un-forscen delays in construction of our new manufacturing facility, I am pleased to announce that Audi-Cord is in limited production of the Modu-Cart 100 series cartridge equipment introduced at the 1976 NAB Convention. These delays were well spent; in assurance testing, improving assembly techniques and preparing for a smooth flow of materials to production.

Audi-Cord has built the "broadcasters" cartridge equipment in Modu-Cart 100 series. Needed technical improvements were made and include an unusual number of operator features. These are the result of many years of listening to you, the broadcaster who uses and maintains the equipment every day. You will like what we have done, and we hope that we earn your business by providing continuing good service to the industry.

Please review the highlights of our Modu-Cart 100 series below. They are available in 12 model variations. Please call or write us, or place your order for a trial unit for early delivery. Your satisfaction is guaranteed, of course.

Sincerely,

Carl L. Martin

Your new automatic distortion measuring system for balanced measurements

REDUCED OPERATOR ERROR
 There's something you'll like — Sound Technology's new distortion measuring instrument for use in balanced work.
 The new 1710A is much more than a distortion analyzer. It's a system. It contains its own ultra-low-distortion generator tracked with the analyzer. It's a system that greatly simplifies measuring — gives you fast measuring and simple operation that reduces operator error.
 For example, push the frequency button and you set both generator and analyzer. Push "Distortion" and you have a reading. Automatically. No slow, tedious manual null-searching.
 Features in the new 1710A include:
 • a balanced, floating output (600/150 ohms)
 • a balanced (bridging) input
 • a high-level +26 dBm signal

- +26 to -90 dBm attenuator
- distortion measurements to .002%
- fast 5-second measuring speed
- automatic nulling, optional automatic set level.
- both harmonic and optional intermodulation distortion measurements.

SPECIAL OUTPUT CIRCUIT

In the 1710A you get a transformerless audio generator output that's balanced and floating. No transformer means no transformer distortion. Floating and balanced means you can connect to virtually any audio circuit regardless of configuration. And you can set the output from +26 to -90 dBm in 0.1 dB steps.

FAST, SIMPLE MEASURING

Automatic nulling and the automatic set level option (ASL) give you ex-

tremely fast measuring and little chance for operator error. You can measure in 5 or 6 seconds. *With ASL you can measure distortion vs. frequency, and distortion vs. voltage or power without resetting level.*

IM OPTION

An additional optional bonus is that the 1710A also measures intermodulation distortion. After you've made a harmonic measurement, just push the "IMD" button. In 3 seconds you'll have the IM reading. With this option you'll be ready for future IM requirements.

CALL/SEND NOW FOR LITERATURE

It's worth while getting the information on this major new distortion measuring system. Call Larry Maguire or Bob Andersen now and get our new product brochure. It's ready and waiting.

National Radio Broadcasters Conference And Expo Fine-Tuned To Serve All

The Program In Brief

Some 2000 radio broadcasters are expected to converge on the magic city of San Francisco Sept. 19-22 to attend the 1976 National Radio Broadcasters Conference and Exposition taking place at the exciting Hyatt Regency. On hand to greet them will be over 85 equipment manufacturers and service organizations (programming, reps, etc.) who will either be showing their wares in the exhibit hall or hosting hospitality suites.

The conference committee this year has taken precautions in the scheduling of its "must do" sessions so that there will be ample time to take in the exhibits, hospitality suites and San Francisco's incomparable evening life. (Last year, at Atlanta, morning-to-night dovetailing sessions inhibited exhibit viewing.) For one thing this year, there are almost two hours each day (1:30 to 3:15 PM) scheduled for touring exhibits. There is no engineering session on Monday afternoon so that the entire afternoon can be spent in examining the latest radio technology. (There is a special single-day registration available to qualified engineers.)

The sessions themselves are shaping up to be the usual practical shirt-sleeves panels that have made the NRB Conference (and before that the NAFMB conferences) so worthwhile in attending. As the program below shows, interests of sales, management, programming, promotion and engineering are served. To cut down on the number of simul-sessions there is less fractionalization of the program into events exclusively for small market attendees

Sunday, Sept. 19
9:00 AM Registration; Hospitality Suites Open
6:30 PM Cocktail Reception
8:30 PM Armstrong Awards/FM Pioneers Dinner

Monday, Sept. 20
8:00 AM Registration
9:00 AM General Session
9:45 AM Four Simultaneous Sessions "Small Market Sales Ideas That Produce Big Results"
"Management Moxie That Motivates"
"Progressive Rock, Progressively Better"
"Engineering Innovations & Trends"
12 Noon Luncheon
1:30 PM Exhibits Open/Tour
3:15 PM Four Simultaneous Sessions "New, Non-Broadcast Ways to Produce Revenue"
"Research & Ratings—Ferment, Frustration, & Fate"
"Modern Country and City American"
"Engineers Tour Exhibit"
5:30 PM Cocktail Reception and Auction

Tuesday, Sept. 21
8:30 AM NRBA Annual Membership Meeting
9:00 AM Coffee Klatsch
9:45 AM Four Simultaneous Sessions "How to Change Rep Vs Radio Station Into Rep Plus Radio Station"
"Blockbuster Promotion on a Firecracker Budget"

and big market attendees.

A glance at the exhibits/hospitality suites list shows that all of the important names that one does (or might do) business with will be there. A detailed description of products and services of these companies will appear in *BMJE's Survival Guide: San Francisco*

"Top 40 That's Tops"
"Engineers Field Trip"
12 Noon Luncheon
1:30 PM Exhibit Opens/Tour
3:00 PM FCC Legal Afternoon: FCC Commissioners and staff chiefs meet up with Washington communication counsels. Audience asks questions
5:30 PM Cocktail Reception and Auction

Wednesday, Sept. 22
9:00 AM Coffee Klatsch
9:45 AM Four Simultaneous Sessions "Success Stories From Hard-To-Sell Formats"
"Employment Practices You Should Practice"
"Beautiful Music Makes Beautiful Sound on the Cash Register"
AM Stereo, Quad, and All That Jazz (Technical)
12 Noon Luncheon
1:30 PM Exhibit Opens/Tour
3:15 PM Four Simultaneous Sessions "101 New Sales Ideas That Work"
"Control, Supervision & Motivation Through Systems"
"There's Nothing Middle-Of-The-Road About MOR"
"New Measuring Techniques, Antenna Design, Height Vs Power (Technical)"
5:30 PM Closing Cocktail Reception and Final Auction

1976 National Radio Broadcasters Conference which will be mailed pre-registrants and available at the conference. For more information on program write National Radio Broadcasters Association, P.O. Box 41 Grand Central Station, N.Y., N.Y. 10017 or call (212) 869-8873.

Whose automation do they choose half-way around the World?

2M, Sidney, and 6KY, Perth, are two of the great radio stations in the largest markets in Australia. They both are successful AM stations with totally different formats. They both are using Cetec Schafer automation.

2M and 6KY chose Schafer automation because they knew it would perform any task they asked of it, and because they knew that Schafer stands behind its products... even 10,000 miles away!

Schafer automation is making stations happy all over the World, so if you're separating your FM operation, or looking for better control of your format and expenses, maybe it's time that you looked at Schafer automation.

Find out what Schafer automation can do for you. Call or write the Cetec Broadcast Group today. We've got the facts on the Cetec family of equipment: Schafer automation, Jampro FM antennas, and Sparta transmitters and audio products.

The Sony BVH-1000. Consider the concept.

The BVH-1000 brings a new, two-in-one concept to professional high band video recording. It meets current broadcasting needs for a top-of-the-line recorder, and does it in an economical package without compromising video or audio quality.

But more than that, the BVH-1000 is the machine of the future. Designed for production and post-production applications, it is a 1" video recorder that can compete with 35mm film techniques.

It wasn't easy, but we have combined transparent picture quality, plus two professional quality audio tracks with advanced editing techniques. That combination simply is not available in any other recorder, no matter what the format or tape width.

Before considering another recorder, examine these eight BVH-1000 features:

1. Exclusive 1.5 head. This completely avoids the problem of missing information caused by head switching of single head machines. It also insures, for the quality user, a continuity of video information, as well as VIRS record/playback, which may be required of all machines in the future.

2. Advanced servo design. The BVH-1000 incorporates drum servo, capstan servo, tension servo, reel servo. This servo system, combined with dual capstan drive, provides highly accurate tape speed and quality interchange, plus gentle tape handling in fast forward and reverse modes.

3. Five motors. These eliminate the use of unreliable and inaccurate belt systems for drives.

4. Standard VH and color framing modes. Both are standard equipment in the BVH-1000. Two high quality audio tracks and a separate cue track, plus 400Hz tone generator are also standard.

5. Biderex search control. Built-in bi-directional search control allows shuttling of the video tape in either direction from 1/3 frame jog to high speed rewind and fast forward. The non-segmented formats allow the operator to see the picture and make fast editing decisions either manually or with computer control.

6. Standard tape timer. This features a special memory that prevents the tape from unthreading. SMPTE reader/generator is a plug-in option.

7. Versatile mounting. A flexible mounting system and built-in wave form select enable the BVH-1000 to be adapted to any number of mounting or console configurations. The BVH-1000 is at home in a small van or big studio.

8. New Sony time base corrector. The BVH-1000 can be used with Sony's new BVT-1000 time base corrector or any other quality TBC. If you don't require time base correction, an optional heterodyne recovery board is available.

This is just the beginning of the BVH-1000 concept. To learn more about the economy, technical performance and specifications, contact your Sony Broadcast representative, or write Sony Broadcast.

INTERPRETING THE **FCC** RULES & REGULATIONS

Revised Commercial Radio Renewal Application (FCC Form 303-R): Part II

By Frederick W. Ford and Lee G. Lovett; Pittman, Lovett, Ford and Hennessey, Washington, D.C.

Last month's column presented Part I of an analysis of the Commission's new commercial radio (AM and FM) renewal application (FCC Form 303-R); that discussion is continued below.

Part II—Legal

Question 4: Form 323 (Ownership Report) must be submitted with the renewal application *unless* the licensee's last renewal Ownership Report (for the "subject station" or for a "commonly-owned station") is less than three years old and the Report is incorporated by reference into the renewal application. The *Report and Order* prohibits incorporation by reference if any ownership changes have occurred since the earlier-filed Ownership Report. This creates a potential conflict with the recently adopted ownership reporting requirements for large, publicly held licensees which (1) require submission of annual Form 323 Reports and (2) does away with supplemental reports of ownership changes. If no supplemental reports must be filed, can a large, publicly held licensee incorporate a Form 323 by reference despite ownership changes? The Commission must decide this question prior to dissemination of the new 303-R Form.

Question 5: This question merely asks if the licensee is in compliance with the Federal laws concerning interests of aliens and foreign governments.

Question 6: This question requests information concerning the "communications-related business interests of 1. the renewal applicant, 2. its officers, 3. its directors, and 4. its 25% or greater stockholders. "Communications-related business interest" is defined as an interest in 1. newspaper publishing companies, 2. cable television companies, and 3. other companies undertaking broadcast-related activities. If such interests exist, the following information must be attached to the

renewal application as Exhibit 6:

1. Business name;
2. Principal place of business;
3. Description of business;
4. *Extent and nature* of connection with this business by renewal applicant, its officers, directors or stockholders.

Question 7: Renewal applicants, including direct officers and stockholders (with exceptions for widely held public companies) must list (1) all suits brought (2) all convictions relating to (a) felonies, (b) crime moral turpitude, (c) lotteries, and (d) anti-trust violations. If any of the above have occurred, complete information concerning same must be attached as Exhibit 7. This is an extremely broad reporting requirement. The Commission is contemplating narrowing the scope of what must be reported. Renewal applicants should consult with their communications counsel to see if *Question 7* has been amended since this article went to print.

Part III—Engineering

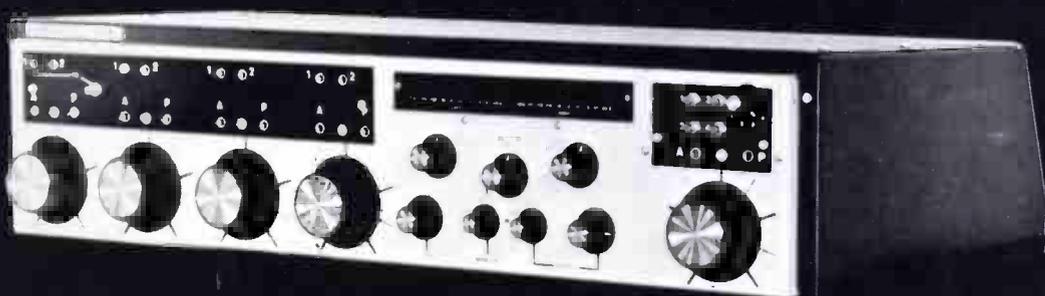

The Commission has undertaken a "sampling" program concerning station operating and maintenance records. Selected licensees will be asked to submit these logs for review by Commission personnel. Emphasis will be placed on those stations most likely to have more substantive problems (e.g., stations with directional antennas).

Question 8: This question asks if the following records are completed and available for inspection:

1. Equipment performance measurements;
2. Annual skeleton proofs of antenna performance (remote control directional AM's); and
3. One partial proof of antenna performance, and skeleton proofs for directional AM's operated by low grade operators.

**On the air...
Relax...
CDL is there!**

At WTCN-TV, Total Automation is a Reality

At the heart of the station is a CDL Operations Computer System, which handles all the program switching, effects, material verification, run-sheet printing, FCC logging and machine control.

The first installation anywhere to have a *direct-wire link* to a Kaman Sciences, BCS-Traffic/Accounting System, the CDL System commands the receipt of scheduling information from and the transmission of log verification to the Traffic/Accounting Computer.

Another impressive CDL first at WTCN, is the full closed-loop control and monitoring of two Ampex ACR-25 Video Cassette Machines . . . which don't even have to be loaded in the correct air-play sequence . . . the CDL Computer sorts that out!

CDL's New System 100 Operations Computer System may be configured for "Total" control or may be used initially to perform automatic switching and later expanded into a fully integrated system, with busin computer link-up and ACR-25 closed-loop control.

CDL's latest news . . . a System 100 with *direct-link* capability to a DCC "BIAS" Traffic/Accounting System.

A truly modular approach, the CDL System 100 is today's answer to **Total Broadcast Automation.**

FCC RULES & REGS

Although these need not be submitted with the renewal application, they must be maintained locally for inspection.

Question 9: Manufacturer and type of transmitters and actual operating values must be listed in this question.

Question 10: This question refers to AM's utilization of directional antennas. Present actual operating values must be listed as well as manufacturers' identity and type number of the antenna monitor employed to take the readings. If monitor point values exceed those specified in the AM's license, an explanation of same must be attached as Exhibit 10, including a description of measures taken to alleviate the problem.

Engineering Certification: Questions 8, 9 and 10 must be certified by a "qualified" individual familiar with technical operations. The title "Chief Engineer" has been changed to "Chief Operator" on the certification form. If the job title of the individual making the certification is not among the four listed, the correct title should be typed in.

Part IV—Programming

The Commission's needs ascertainment requirements have recently been amended for existing licensees. See the March 1976 "Interpreting . . ." column entitled "Community Ascertainment Guidelines For Broadcast Renewals."

Question 11: This question seeks to determine if the licensee has included the necessary community needs ascertainment information in its public inspection file. If not, the licensee is required to submit a complete statement explaining why not as Exhibit 11.

Question 12: The renewal licensee is required to attach as Exhibit 12 its Community Leader Checklist compiled during the preceding three-year license term. Of course, this does not apply to those stations which are not required to conduct formal community ascertainment interviews (e.g., located in communities with fewer than 10,000 residents and outside of Standard Metropolitan Statistical Areas).

Question 13: This question requires that the renewal applicant attach as Exhibit 13 its three annual lists of community problems, needs and interests that it proposes to serve. If the lists are not attached, a complete explanation is required.

Question 14: Part (a) of this question requires the composite week program logs to be attached as Exhibit 14 of the renewal application. Only one copy of the program logs need be submitted. Some renewal applicants may overlook this because an original and two copies of Form 303-R and exhibits must be filed.

Question 14(b) requires information concerning News, Public Affairs and "All Other" programs (e.g., exclusive of entertainment and sports) that have been 1. previously proposed in the applicant's last renewal application, 2. actually broadcast during the composite week, and 3. proposed for the coming license period. The 1. minutes of operation and 2. percent of total time broadcast must be indicated for each program type. Note that the time during each program taken up by commercial matter must be subtracted when listing "Minutes of Operation." However, when determining the per-

1976 Is The Year Of ENG And Electronic Field Production . . . This Is The Only Book That Can Prepare You For It And Help You Get The Most Out Of It!

Your station management and your operators need to know how to get the most out of the new ENG/EFP equipment and how to choose the equipment that can get the job done.

The low cost of the latest equipment makes it appropriate for educational and industrial applications. Planners, educators, trainers and students need to understand the basic criteria for choosing the right equipment at the right price—how it works and how it fits into current and future operations.

Ten skillfully edited chapters provide the fundamental information on the new cameras, recorders, editors, time base correctors, microwave links, program audio and intercom systems, and present it all in language for the technical and non-technical reader alike.

Graphs, charts, photos and technical drawings help bring into sharp focus the issues and information required for the systems user.

Fill out the coupon below to get your copy of the **ENG/FIELD PRODUCTION HANDBOOK**. Single copies are \$9.95 each.

FCC RULES & REGS

centage of total time that such non-entertainment programming is being broadcast, the "base" figure (e the total hours of station broadcast operation) should exclude commercial matter.

The number of 1. previously proposed, 2. actually performed and 3. minimum proposed future public service announcements must also be indicated. The Commission expects licensees to engage in "good faith" scheduling of PSA's. For example, airing the bulk of PSA's between 2 A.M. and 6 A.M. would not be deemed "good faith" scheduling.

Question 15: This question is new. Renewal applicants must submit as Exhibit 15 a complete listing of all composite week 1. public Affairs, and 2. "Other" programs. The listing should include the following information:

1. Identity of program,
2. Program source,
3. Program type,
4. Broadcast time, and
5. Broadcast duration.

To hear... performance to speak...

Why there's the rub. Or at least it used to be.

For now Beyer has come up with a headphone/microphone combination that's been designed never to rub you the wrong way.

Created to meet the stringent requirements of the broadcast industry, the Beyer DT 109 combines a hypercardioid microphone with wide, flat frequency response and a two channel high quality headphone that offers the kind of performance that has made Beyer the overwhelming choice of professionals the world over.

Together they provide excellent isolation from ambient noise, superb intelligibility, unfettered, hands-free operation and unexampled comfort.

Equally at home in the studio or the field, the DT 109 is built to withstand the rigors of hard, constant use. And in the unlikely event any part is broken or wears out, its modular construction permits on-the-spot replacement.

As for the price, it won't rub you the wrong way either. The Beyer DT 109 only \$95.00

Another innovation from Beyer Dynamic, the microphone people

only exception to this program listing requirement is stations which utilize an "Other" program format (religious or agricultural).

Question 16: This question asks whether composite non-entertainment programming "varied substantially" from representations made in the last renewal application. The Commission defines "substantial variation" as an actual decrease of 15% in any of these three categories: News, Public Affairs and "All Other" programs (this final category is exclusive of entertainment programs), or a 20% decrease in the total amount of least time devoted to all of these program categories.

Question 17: The number of "60-minute segments" in the composite week which contain in excess of 18 minutes must be listed and submitted as Exhibit 17, including information giving the amount of commercial in the particular hourly segment and the day and time of broadcast.

Question 18: This question asks whether the applicant's commercial practices during the past license period varied at all from its last renewal application representations. If so, Exhibit 18 must be submitted enclosed on page 32

continued on page 32

IV - PROGRAMMING

19. Has the applicant placed in its public inspection file at the appropriate times the required documentation relating to its efforts to ascertain and solve community problems, needs, and interests?
YES NO If NO, attach as EXHIBIT 11 a complete statement of explanation.

DOES NOT APPLY.

20. Has the applicant attached as EXHIBIT 12 applicant's community leader checklist for the preceding license term?
DOES NOT APPLY.

21. Has the applicant placed in its public inspection file at the appropriate times its annual list of those problems, needs and interests which, in the applicant's judgment, warranted treatment by standard and typical and illustrative programming in response thereto?
YES IF YES, attach those listings as EXHIBIT 13.
NO IF NO, attach as EXHIBIT 13 a complete statement of explanation.

22. Attach as EXHIBIT 14 one exact copy of the program logs for the composite week used as a basis for responding to the questions in 19. Applicants utilizing automatic program logging devices must comply with the provisions of Sections 73.112(c) and 73.282(c) of the Commission's rules.

| AM S | Previously Proposed | | Composite Week Period | | Minimum Proposed | |
|---------|----------------------|------------|-----------------------|------------|----------------------|------------|
| | Minutes of Operation | Total Time | Minutes of Operation | Total Time | Minutes of Operation | Total Time |

| 26 | | | | | | |
| 27 | | | | | | |
| 28 | | | | | | |
| 29 | | | | | | |
| 30 | | | | | | |

23. Attach as EXHIBIT 15 those programs in the composite week included in the public affairs and "all other" program categories 2 and 3 of the above chart, indicating the title, source, type, description, time broadcast and duration of each program.

24. State the amount of time applicant devoted to non-entertainment programming (lines 1, 2 and 3 of the above chart) during the composite week vary substantially from the representations made in applicant's last application?
YES NO If YES, attach as EXHIBIT 16 a statement explaining the variation.

25. State the number of 60-minute segments in the composite week beginning with the first full clock hour and ending with the last full hour of each broadcast day) containing over 18 minutes of commercial matter segments. List in EXHIBIT 17 each segment and the day and time broadcast with headings of "Amount of Commercial Time in Segment" and "Day and Time Broadcast".

26. Do the applicant's commercial practices for the period covered by application vary from the representations made in applicant's last application?
YES NO If YES, explain in EXHIBIT 18 the variations and the reasons therefor.

27. State the maximum amount of commercial matter applicant proposes to allow in any 60-minute segment (Minutes:). State the percentage of hourly segments per week this amount is expected to exceed (%:), and the limits per hourly segment that do then apply under those circumstances to regular commercial matter: () and to political commercial matter (Minutes:).

28. Briefly describe applicant's program format(s) during the past 12 months.

29. Briefly describe applicant's proposed format:

21. Does the applicant's station duplicate the programming of another radio station?
 YES NO If YES, state:

- (a) the call letters of the duplicated station
- (b) the population of the community of license of the duplicated station
- (c) the population of the community of license of the station for which renewal is requested
- (d) the total number of broadcast hours in the composite week
- (e) the amount of programming duplicated during the composite week

22. Attach as EXHIBIT 22 any additional information which, in applicant's judgment, is necessary to adequately describe or to present fairly its services and operations in relation to the public interest.

PART V - EQUAL EMPLOYMENT OPPORTUNITY

23. Attach as EXHIBIT 23 a description of the specific practices undertaken by applicant during the past license term to assure equal employment opportunity for minorities and women and the practices applicant proposes to follow during the coming license term to assure equal employment opportunity for minorities and women.

24. Attach as EXHIBIT 24 a brief description of any complaint which has been filed before any body having competent jurisdiction under Federal, state, territorial or local law, alleging unlawful discrimination in the employment practices of the station, including the persons involved, the date of filing, the court or agency, the file number (if any), and the disposition or current status of the matter.

THE APPLICANT hereby waives any claim to the use of any particular frequency or of the ether as against the regulatory power of the United States, because of the previous use of the same, whether by license or otherwise, and requests an authorization in accordance with this application. (See Section 304 of the Communications Act.)

THE APPLICANT acknowledges that all the statements made in this application and attached exhibits are considered material representations and that all the exhibits are a material part hereof and are incorporated herein as set out in full in the application.

CERTIFICATION

I certify that the statements in this application are true, complete, and correct to the best of my knowledge and belief, and are made in good faith.

FCC NOTICE TO INDIVIDUALS

The solicitation of personal information requested in this application is authorized by the Communications Act of 1934, as amended. The principal purpose for which the information will be used is to determine if the benefit requested is consistent with the public interest. The staff, consisting variously of attorneys, accountants, engineers, and application examiners, will use the information to determine whether the application should be granted, denied, dismissed, or designed for hearing. If all the information requested is not provided, the application may be returned without action having been taken upon it or its processing may be delayed while a request is made to provide the missing information. Accordingly, every effort should be made to provide all necessary information.

THE FOREGOING NOTICE IS REQUIRED BY THE PRIVACY ACT OF 1974, P.L. 93-579, DECEMBER 31, 1974, 5 U.S.C. 552 (e)(3).

Finally, a lightweight (under 7 oz.)

Portable SMPTE Time Code Generator

Our new miniature SMPTE Time Code Generator slips right into your portable VO 3800 VTR — and you don't have to go back to the studio for costly and time-consuming after-the-fact source identification processing.

Total weight — less than 7 oz. 9 volt D.C. battery operated. Full LED display. (Resetable.)

Peripheral equipment gives you finesse of SMPTE — even on a tight budget.

These units make excellent companions for an existing Datatron Control Track system you want to convert to SMPTE Time Code technology — or you can upgrade a basic SMPTE editing unit. They are all fully compatible with your current equipment and, also, with our new dual system Tempo 76.

Units are 1-3/4" high and fit standard 19" racks.

Check reader services card number listed below to receive details on:

New Portable SMPTE Time Code Generator (510 P) for use with portable VTRs. Mounts in VO 3800.

Code Generator (Model 5150) — Can be locked to station sync. Buffered parallel BCD time and status outputs.

Code Reader (Model 5250) — Reads code forward and reverse at speeds up to 60 times normal with no frame delay. Buffered parallel BCD time and status outputs. Automatic drop frame code direction.

Character Generator (Model 5450) 11 characters. Grey-to-black mask density. Adjustable character position and size. Compatible with 5150 or 5250.

Digital Dissolver (Model 5800) — Easy-to-program dissolves from 1 to 999 frames. Remote control available.

FCC RULES & REGS

plaining the variations and the reasons for same. The "old" renewal application sought information only for *substantial* variations from representations.

Question 19: This question is similar to Question 18 but relates to the *proposed* number of maximum commercial minutes per hour. A separate indication of maximum *political* commercial matter minutes per hour is solicited in response to recent Commission action allowing a slight increase in the maximum hourly amount of such matter.

Question 20: The renewal applicant should indicate *past* and *proposed* program format (e.g., Country, Western, Jazz, Rock, Folk, etc.).

Question 21: Information concerning duplication programming by commonly-owned AM and FM stations is elicited in Question 21. The Commission is seeking assurances that maximum permitted program duplication by co-owned stations has not been, and will not be exceeded. Licensees should review the newly decreased duplication maximums for certain AM/FM combinations.

Question 22: This is an *optional question* to be answered by renewal applicants designed to provide additional data or information concerning their programming and operations. The Commission gives an example of how this question might be used: A renewal applicant that believes that its composite week performance was *not typical* of its year-around programming service would use Exhibit 22 to analyze its programming for selected 30-day period.

Part V—Equal Employment Opportunity

Question 23: All renewal applicants must submit Exhibit 23 a *description* of actual practices undertaken during the past three year license term to assure equal employment opportunities for minorities and women. The description must include proposed practices to accomplish the same ends for the coming license period.

Question 24: Exhibit 24 must include a listing and description of all complaints (if any) before a court or administrative agency alleging unlawful discrimination with regard to employment practices. The description must include:

1. Names of persons involved;
2. Date of filing of complaint;
3. Court or agency;
4. File number; and
5. Disposition.

Conclusion

New FCC Form 303-R will, to some extent, simplify the paperwork that must be submitted to the Commission with a license renewal application. The Commission's instructional Pamphlet (See last month's column) is an invaluable reference source for completing Form 303 and for fulfilling a licensee's public interest obligations.

Copies of Form 303-R and the Instructional Pamphlet have not been printed at this writing, but should become available in the near future. Certain minor amendments may be made to Form 303-R prior to its final adoption. Licensees should consult with their communications counsel to determine the extent of these changes prior to preparation of data needed for completion of the renewal application.

You'll hear it from Harris loud and clear.

Our MW Series of AM transmitters have the loudest sound and the highest efficiencies of any transmitters in their respective power ranges. And, their advanced engineering concepts have proven reliable and practical.

For example, Harris offers:

- **PA efficiency approaching 90% instead of the usual 50% to 60%**
- **125% positive peak modulation capability with plenty of reserve**
- **Low distortion**
- **Excellent transient response**

- **Wide frequency response**

There's a lot more that proves our performance story. For complete information, write Harris Corporation, Broadcast Products Division, Quincy, Illinois 62301.

Trade up to a CP-16/A and save up to \$3990

Good news for small TV stations, freelance news/documentary cameramen and young independent filmmakers!

Our extremely popular Bicentennial Trade-In Special is extended until December 31, 1976.

You can still trade in any 16mm camera you presently own — no matter how old, whatever its condition — for a brand new CP-16/A (with built-in Crystasound amplifier) and save \$1250 off list. Or \$1000 off on a standard CP-16.

Spectacular savings on camera/lens packages.

And, for the first time, we are able to include in our camera/lens offer two outstanding Angenieux zoom lenses with Automatic

Iris Control at truly spectacular savings!

For example, trade in any 16mm camera together with lens for a brand new CP-16/A and Angenieux 9.5-95mm AV30 DA lens (with Automatic Iris Control). And, as an added bonus, we include a front-mounted VU meter at no extra charge. You save \$3990 off list!

Study the discount chart and pick the package deal that suits you best.

Trade in any 16mm camera and lens . . .

| PURCHASE: ↙ ↘ | CP-16 (Code #1C216) with one of the lenses listed below: | | CP-16/A (Code #1C272) with one of the lenses listed below: | |
|--|---|----------------------|---|----------------------|
| | YOU PAY ONLY: | YOU SAVE: (off list) | YOU PAY ONLY: | YOU SAVE: (off list) |
| with Angenieux 9.5-95mm AV30 DA Zoom Lens (Automatic Iris Control) | \$6835 | \$3575 | \$7685 | \$3990 |
| with Angenieux 12-120mm AV30 DA Zoom Lens (Automatic Iris Control) | \$6105 | \$2875 | \$6955 | \$3290 |
| with Angenieux 12-120mm AV30 Zoom Lens | \$5915 | \$1325 | \$6765 | \$1575 |
| with Angenieux 9.5-57mm AV30 Zoom Lens | \$6210 | \$1525 | \$7060 | \$1775 |

Consider. For a mere \$190 extra you can now have a camera/lens package with the Angenieux 12-120mm AV30 DA lens with Automatic Iris Control (instead of the standard 12-120mm zoom).

Plus two-year warranty and free "loaner."

This special offer is covered by an extended two-year factory warranty on all mechanical and electronic components when you purchase your camera from your authorized local CP-16 dealer.

Your local dealer will also provide you with a free CP-16 "loaner" for any down time on a warranty-covered repair.

NOTE: When you purchase a CP-16 with either one of the Automatic Control lenses, we include the front-mounted VU meter (Code #1M113) at no additional charge.

Special Magnetic Head Trade-In Offer

Trade in any professional 16mm magnetic head for a 3XL-IAZ magnetic head (with individual record and playback azimuth adjustment) at the special price \$270!

See your local CP-16 dealer now. And save!

How To Buy Syndicated Programming For Your Radio Station

o: how to decide if you need syndication. Included is the most complete directory of syndicators and their services that *BM/E* could manage. New firms appear and old ones disappear rapidly, but some have been there for a long time.

syndicators have buoyant names for their programs, but choice depends on careful listening to a large sample.

ething around a thousand radio stations in the United es, including both AM and FM, buy all the music put on the air, or nearly all of it, from a program licator. Why did so many managements make that ce? How has it worked out for them?

comparatively few firms, eight or ten, supply hly 90% of the syndicated programs used in this try; another 20 or 30 firms are on the fringes. Con- tly trying to break into the business are new ventur- in most cases individuals who have been successful rogramming one or more radio stations, who think it be just as easy and much more profitable to sell their s to many stations rather than to one. A few of the comers make it; most find the economics too rough r a year or so and drop out.

What have the old and new successes got that the also-rans did not have? How do you choose a syndicator?

In talks with a number of syndicators, and with stations using syndication and stations *not* using syndication, *BM/E* discovered that the rationale of syndication has some obvious and some not so obvious factors.

Broadly speaking, as might be expected, a station usually calls on syndication for help when its own programming efforts are failing to get the results the management wants. Or the station may want to change its demographics, get a more "professional," controlled sound: and there are other reasons as the station stories that follow show.

There are any number of success stories that prove syndication is a good route to substantially improved ratings. Every major syndicator will supply a prospect with a list of stations that have "made it" spectacularly after installing that syndicator's programming. It can and does happen. But there are some failures too, and the difference between success and failure seems to rest on a few main factors.

A number of these are actions the management itself must carry through: it is universally agreed that a station management cannot just feed some syndicated programs to the transmitter and wait for the ratings to explode.

First: the management must make a careful survey of the competitive situation in the market and decide what particular style of music has the best chance of success. A number of the larger syndicators will give advice during this part of the enterprise; their experience in "rescue" operations in other markets may well be of great value. But with or without help from a syndicator, the management has to decide early and clearly what the objectives are—what kind of programs it wants, and *why*. This may involve something as simple as filling a gap in local services—if there is no "country" music in the market, for example, there is an obvious operation plan with good probabilities of success.

But the improvement the station aims to make may be along more subtle lines. Suppose careful listening to the "beautiful music" put out by other stations in the market reveals that the music, in the opinion of the station making the survey, is too far in the background, too lacking in excitement, to really hold the audience as it should be held. Or alternatively, the music may be too

HOW TO BUY

obtrusive, too up-front, producing a tendency to tune the station out.

This goes to the heart of the quality that a good syndicator gets into his music. It must be lively, "reaching to the heart," to hold the audience—everyone agrees that the days of straight "elevator music" are nearly over on radio, so that a station still using such music will be vulnerable to competition from more "relevant" programming.

To get it right, the station management has to make a judgment for which there are no simple guidelines. It requires good knowledge of the market and consideration of demographics. For younger audiences, the more up-front music is usually right. To reach a spread of older listeners, something more like "easy listening" may be the ticket. The station's own expertise has to be added to that of the syndicator. There is no substitute for local programming judgment, seasoned by experience in the market the station serves.

With what he wants fairly well established, the station manager must listen with utmost care to samples of the syndicator's music. What the syndicator calls his programs is not necessarily a clear guide to what they are. The usual "format names" give only the most general guidance to character. Broadly speaking, "Beautiful Music", "MOR", "Rock", "Country", etc. have accepted and obvious meanings, but the variations within each are far more important than the classifications. Hearing a good-sized sample is the only way to know what you would buy.

A major factor in quality is the *sequence of numbers* established by the syndicator. Does this sequence supply the lift, the drive, the proper front-to-back alternation the station manager wants? How often will particular numbers be repeated? Is there a good balance between old and new music? Generally speaking, solo pop vocals will be more "up front," more easily remembered, and thus adaptable to fewer repeats, than instrumental music. But the character of each piece affects this strongly, and the syndicator's taste and sense of good balance, pleasing variety, are the most important factors. The station manager has to judge the music in these specific terms.

Next: the station management must be prepared to use the program in a smooth, professional way. And the station *must* establish a "local" character, an identification with the community, with a strong local news program, with PSA's, local "bill-board" service, community campaign help, or whatever else the community can make good use of, as service from a radio station.

For a "professional" sound, the syndicator of course has some responsibility too. The station management must make sure that the taping of the music is carried out with high attention to fidelity, far more than most stations apply to their own playing of discs on the air. The music must come from low-noise, pop-free discs, put onto 7½ ips tape, at no more than 1 generation from the disc, with duplication at 1 to 1 speed and the best equipment available. Only with tapes made with the utmost care can the full benefits of syndication be realized. The volume has to be balanced very carefully from one number to the next; a sharply different level changes not only loudness but also the apparent frequency response,

for a disturbing alteration of quality.

By the same token, the station's equipment for putting the tapes on the air has to be top notch. Tape machines with wide frequency response and very low flutter, distortion and noise are essential. Those are the main essentials. Below are some other factors to consider:

Does the programming allow for adjustment to different parts of the day? The morning drive time, for example, takes a different handling than mid-afternoon which in turn is different from night-time. The change can be made in two different ways—some syndicators lay out the whole programming day on their tapes, so the station simply plays the tapes in the order the syndicator indicates. Other syndicators supply "segmented" programming, with quarter-hour or half-hour segments that can be played in any order the station wants by setting up two or three tape machines that can be called on randomly. The station management has to decide which method is better for its own needs.

A very important decision which each manager has to make: should syndicated "voices" be used along with the music? Most of the larger syndicators are prepared to supply disc jockey talk along with the music using top radio "personalities" who have presumably proved themselves by long experience on the air. The "talk" service, as the directory shows, can be extended to "personalized" ID's, PSA's, weather, time, even commercials—the station sends the copy to the syndicator, and the syndicator sends back the tapes with its top "voices" performing for the station.

BM/E found two totally opposed opinions on the syndicated talk. Many stations, particularly in small markets, welcomed the syndicator's disc jockeys on their air as far more "professional" and interesting than any "voices" the stations could hire themselves. On the other hand, a few station managers were quite definite in finding the syndicated voices too "canned" for their taste; they believed that their listeners would be turned off by a "standardized" quality, and wanted something more particular and relaxed, with which listeners could completely identify. They used the option, offered by a number of syndicators, of taking the programs "unnounced"; as one put it, his own station is the one "personality" he wants to put on the air.

Each manager has to decide this one in the light of its own market characteristics and its station "identity." It will take careful listening to the voices themselves and careful consideration of what will "work" in the station's market.

On another front: in analyzing success stories offered by syndicators, it is desirable to look carefully at the market in which the success occurred. What kind of competition was there? Further: is there evidence on how much the station is spending to *promote* its programming? A leading station in Los Angeles, a user of syndication, is reputed to spend about \$500,000 a year on promotion; in a certain sense it is "buying" its top position (although it is clear that this would not succeed without excellent programming).

Of course very much smaller promotion costs are appropriate in smaller markets—Los Angeles may be the most competitive radio market in the United States—but every station taking on syndication *must* do promotion adequate to build its audience. Without it, no programming, no matter how good, can succeed fully.

An important reason for going to syndication, me

Coast to coast sales and service

The whole pie! – That's what we offer our customers when it comes to service. Whether it's sales, technical service, or just the right product for your needs, Microwave Associates puts it all together from coast to coast.

We also offer the full range of services for turnkey operation. If it has anything to do with microwave equipment, from miniature battery operated transmitters . . . to STL and city point to point systems, we not only make it, we perform site surveys, install it, and train your people to use it as well. And we've got service centers nationwide, so we're never very far away.

At Microwave, we're working to help you bring the nation closer together.

BUYING SYNDICATED PROGRAMMING

tioned by several station managers, is the great difficulty and expense of maintaining a collection of records large enough for full programming, particularly of "beautiful music." As everyone knows, records wear out pretty fast. A large body of music, both old and fairly recent, which many stations want to program simply cannot be replaced once the original records are worn out—the records go off the market as a result of the record com-

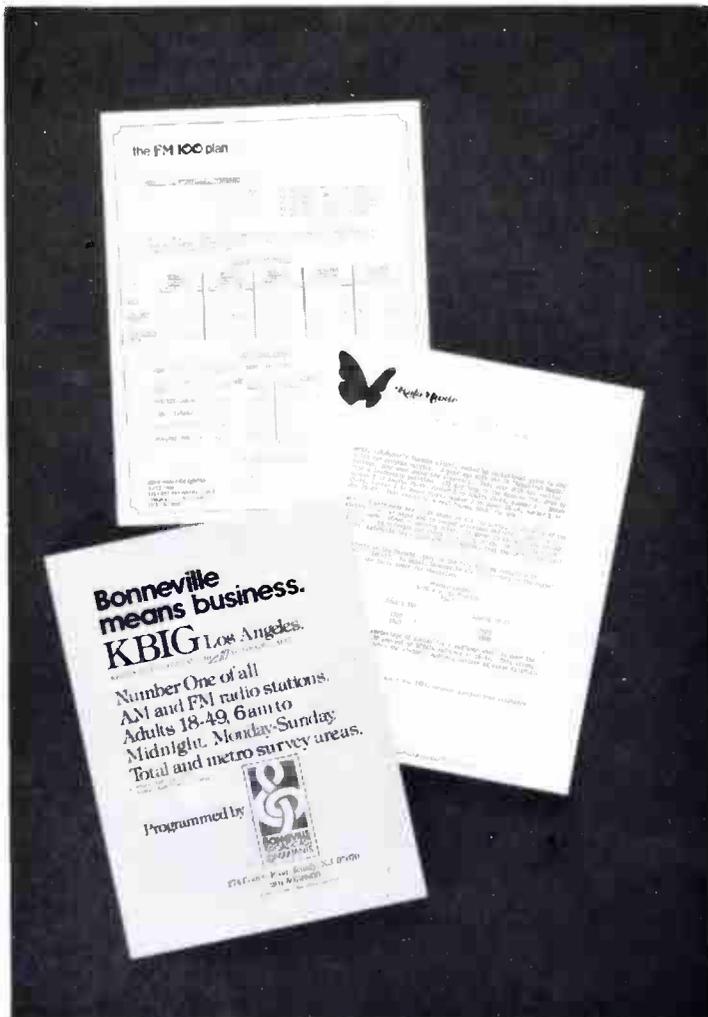

panies practice of concentrating on current hits. A couple of program managers told *BM/E* that before syndication they were spending 75% of their time simply looking for records, thus short-changing the station on creativity in programming.

The syndicator removes this burden. A couple of them told *BM/E* that they themselves have a lot of trouble in maintaining a full record collection, but that is the business they are in, the job they are getting paid to do.

A reason for going to syndication which will be even more relevant next year is the necessity for separate pro-

Why They Went To Syndication

The following stories represent a very small sample of the stations that are using syndicated programming, but they cover most of the reasons, the market situations, that convince station managements they should make that choice.

Each syndicator will supply success stories, stations that climbed to the top or near it with the syndicator's music

KEZU-FM, El Dorado, Arkansas

To split the station's programming off from AM sister KELD, manager Jerome Orr chose the Bonneville "Beautiful Music" programs. He says the choice and sequence of tunes met his requirement for enjoyable

music, but not background music; the tempo is upbeat but easy. He likes the total control of programming he gets; he says the DJs used to vary the quality of the music they played far too much; the listener can now depend on a consistent sound. The station is doing well.

WEZO-FM, Rochester, NY

Up until July, 1971, this station was simulcasting country music along with AM sister WNYR. The WEZO became one of the early users of the Bonneville "Beautiful Music-Easy Listening" format. This combined with a Sparta automation system, used in a way that maintains a "live" feeling for the station. With 13 stations in the market, program manager Dale Harnett reports that WEZO is No. 2, just behind 50 kW clear-channel WHAM. WEZO uses strong promotion to let listeners know what it is doing; one variation on the syndicated program is a "live interface" during the morning drive time, with local voices to supply frequent local information and news.

WASR, Wolfeboro, New Hampshire

This 1 kW daytimer on Lake Winnepesaukee started about seven years ago with IGM programming (later absorbed by Broadcast Programming International), and a Sparta automation system. The qualities the management (Alan Severy and his wife Sharon) wanted were a known, consistent "product" in the easy listening category, plus pro-quality announcers and DJs, not available in their community. Their town of 300 expands in summer to 20,000, with the total market around the Lake reaching 200,000 in summer, most of them city people on vacation. A very smooth, "professional" sound is required, especially with competition from about 22 other radio signals. The choice, says Severy, was right; their station is high in the ratings and their operation has the "polish" they want.

WPRS-AM/WACF-FM, Paris, Illinois

Manager Adlai Ferguson says that at a certain point he simply got fed up with having DJs spend their day cueing up records on one turntable after another—he wanted to use his air personalities in a more profitable way. The 1 kW AM station now uses the BPI AdMOR programs and an IGM automation system; the kW FM station uses the Modern Country format and SMC automation system, and manager Ferguson is happy with the results. The station, in a farming area, also uses a lot of agricultural programming—price and crop reports, weather, etc. He enhances his community "identification," in addition, with a local telephone

mming of an FM station that has been simulcasting with an AM sister, either partially or wholly. Putting the station on syndication has obvious economy as compared with establishing a whole new and separate program operation. A number of station managements gave this one important reason for their decision.

The cost of full-time syndicated programming is at a minimum of about \$400-\$500 a month for stations in the smaller markets, and goes up from there to match market rates. In analyzing cost, the station must look at how many hours of programming it gets for its money.

Finally: is automation a necessity with syndication? This depends on the way the syndicator arranges his material: some work only with automated stations, others with "manual" or automated. Syndication plus automation has obvious advantages for stations in certain situations, as some of the following station stories show. Others want syndication but not automation. The decision on this one, like most of the decisions on syndication, comes down finally on the station's management. Brothers, the responsibility is yours: use it right and the future will be good to you. **BM/E**

fill-in program: Ferguson says his station was among the first in the country to run such a program. He likes the influence of tunes, and his ratings suggest that his listeners do too.

PBS-FM, Philadelphia

This big-city station has gone through what must be about the largest number of program-origination changes in a station ever instituted. Hoping to forge ahead in the intensely competitive Philadelphia market, Edward McManhan, manager of this newspaper-owned station (*Morning Bulletin*) adopted a "beautiful music" syndicator in 1967—and the ratings plummeted. Starting in 1968, he "winged it" on his own assembling a large collection of records. Ratings went up spectacularly, moving ahead, he reports, of leading syndicators in the market. However, by 1972, he was having great trouble finding enough new recorded music to "freshen" the programs, and the ratings began to drop sharply. He tried another syndicator, and the bottom nearly dropped out. Very recently, he has gone to the FM100 Plan, and ratings have started to climb. He likes the variety of music supplied by FM100 and believes that his needs have been met at last. What lessons did he learn in this roller-coaster history? "In a market as competitive as Philadelphia, the quality of the music and its sequencing become vital—the format name is not important. You must know how to listen to your own product and that of your competitors. I think we have it now. Success takes total commitment, total discipline. You must maintain at all costs the *character* of your station—the station itself is the 'personality.' "

WRUF-FM, Gainesville, Florida

This FMer at the University of Florida competes with commercial stations in the area. One big problem is the lack of consistency, of uniform high quality, that resulted from the use of a stream of student operators, which is part of the rationale of the station. To get more control of the "product," the management took on the Master Broadcast Service, and is now well pleased with the quality of what they are putting on the air.

WCI-FM, New Haven, Conn.

Here is another "beautiful music" station that gave up trying to keep a record collection up to date and in good shape. Manager Bill Patrick says the attrition of his records was so high that going to syndication is actually saving him money. He has adopted the Master Broadcast Service programming, which lends itself well to his

non-automated operation. The music is in quarter-hour segments; by setting up three tape machines with three different reels, Patrick can switch between No. 1 and No. 2 for controlled variety, keeping No. 3 for fill-in. He works it this way because he wants to be as "live" as possible; he gets all the room he needs for the station's informational programming.

KDAB-FM, Ogden, Utah

Manager Mike Scott started out with syndication. His station went on the air in July, 1975, using syndicated programming from Peters Productions that he calls "soft rock." This choice resulted from a careful study of the market before the station ever went on the air. The management surveyed the market for "gaps," and wanted something in which they could have immediate confidence for general quality and as the needed class of programming. Their advance planning clearly was well done; the station, reports Scott, climbed to No. 1 in Ogden, No. 3 in the state before its first year was out.

WASK, Lafayette, Indiana

Here is another station that went to syndication after a careful study of their market. Manager Jerry Collins says the study, completed in early 1974, showed a "country" music gap—no station in the market was supplying this kind of music. He listened to the main syndicators with "country" and decided that, for him, Peters Productions had the best—he liked their "sound" the best of all checked, and the way they sequenced their programs. His decision and choice gave the station the jolt it needed: ratings have climbed several places on the list since the syndication went in, in July, 1974.

WRCH-FM, Hartford, Conn.

Program Manager Lee Manson took on the FM100 "beautiful music" programming in 1974 because he liked the tunes and the way they are sequenced; it is the kind of music, he says, that gets to the hearts of people, gives them a lift. The program uses a lot of "up tempo" music, and has clearly helped WRCH to advance several steps in the ratings.

The stations described, as already noted, are a small fraction of those using syndication; and not all the major syndicators are mentioned here either. No judgments are intended by these facts; *BM/E's* interviews were governed mainly by easy availability of management personnel at the stations during the period of the survey. As the directory of syndicators that follows shows, the station's choices are wide, and the variety of things he can buy is large.

Program Source Directory

Bonneville Broadcast Consultants
274 County Rd.
Tenafly, NJ 07670
201-567-8800

Type of Service

Full-time programming or shorter libraries. Also: special programs for holidays; 4-channel programs; custom ID's/logos; time announce with one to four voices; market studies; total review of station performance; promotional ideas; written air checks; etc. etc.

Format Names — Type of Music

1. Beautiful Music/Easy Listening (Unannounced)
2. Classic MOR
3. Traditional MOR (In preparation)

Broadcast Programming Intn'l

PO Box 547
Bellingham, Wash. 98225
206-676-1400

Type of Service

Full-time programming or shorter libraries. Custom ID's, logos, PSA's, news intros, etc. if wanted. Market Studies; format selection; air checks; consultation on full station performance.

Format Names — Type of Music

1. MOR (Announced or unannounced)
2. Beautiful Music (Bright n' Beautiful; Sounds for all Seasons; Easy

- Listening)
3. Rock-Album Oriented (Announced)
4. Rock "Gold" (Unannounced; intro-outro data supplied for these rock oldies)
5. Country (With country DJ's)
6. Spectrum (A mix of unannounced categories from soft MOR to lush instrumental)
7. Concert (Library of short classical pieces — back announced.)

Century 21 Productions

2825 Valley View Lane
Dallas, TX 75234
214-243-7621

Type of Service

Full-time programming. Also: Jingles, ID's, PSA's, commercial production, etc.

Format Names — Type of Music

1. "Z-Format" (contemporary music in separate demographic varieties — teens, young adult, adult, etc. — for mix wanted by station.)
2. "Progressive Country" (country hits new and old.)
3. Specials (6 to 8 hours, interviews rock stars plus music.)

John Doremus Inc.

Hancock Center
Chicago, Ill. 60611
312-664-8944

Type of Service

Special 1-hour programs (see below). Five to 30 55-min. each music programs weekly with comments by John Doremus. Production services (writers, producers, actors) for any program idea. Production of commercials, ID's etc.

Format Names — Type of Music

1. "The John Doremus Show" (music and comment.)
2. "Your Passing Parade" (Stories, interviews, people and events — from antiquity to present — narrated by Jo Doremus. Five to 30 shows weekly - 55 minutes each.)

DIR Broadcasting Corp.

445 Park Ave.
NY, NY 10022
212-371-6850

Type of Service

90-minute and 1-hour live rock concerts; some quadraphonic — on tape.

Format Names — Type of Music

1. "King Biscuit Flour Hour" (90-minute taped live rock, available twice a month)
2. "Best of the Biscuit" (60-minute taped live rock; available once/month)
3. "British Biscuit" (Live rock, 60 minute taped in Britain; once/month)
4. "Conversation" (two-hour special interviews rock stars, plus music; Four/year)

Drake-Chenault

8399 Topanga Canyon Blvd.
Canoga Park, CA 91304
213-883-7400

Type of Service

Full-time programming, mostly rock, "History of Rock," "The Golden Years of Country," and other specials.

Format Names — Type of Music

1. Hit Parade (Current rock hits)
2. Classic Gold (Older rock hits)
3. Solid Gold (Older hits)
4. TX 40 (Top 40 tunes)
5. Great American Country (With top country DJs)

Optimod FM

Optimod-FM is a revolutionary signal processing system for FM which replaces conventional compressors, limiters, and stereo generators with a single package. Optimod achieves up to 3 dB more effective modulation than conventional systems by eliminating stereo generator lowpass filter overshoot. Yet the unique Optimod lowpass filter fully protects the stereo signal from the distortion characteristic of stereo generators without filters.

The Optimod filter is complemented by broadband and high frequency limiters matched with unique psycho-acoustical accuracy to the characteristics of the ear. The result is unprecedented naturalness: bass is tight, midrange is detailed, and highs are open and transparent.

Installation is easy, and Optimod is fully FCC-authorized. For a reprint of our technical paper, and further information, we invite you to contact us directly at the address below. **Price: \$2950.00**

Spotmaster[®] CART MACHINES THE RUGGED ONES

SERIES 3000

- Auto release deck — massive, quiet operating air damped solenoid.
- Low power consumption — less than 45 watts.
- PHASE-LOK III head bracket — minimizes stereo phasing problems.
- Full range of mono and stereo models for A, B and C size carts.

SERIES 4000

- All the same solid features as the SERIES 3000 with added standard features — microphone inputs, dummy head in record position (on playback models) and many others.
- New styling for the discriminating broadcaster.
- Additional optional features include internal fault/splice detector.

SERIES 5000

- Modular design with fold down front panel and slide out direct drive decks.
- Auto release decks — massive, quiet operating air damped solenoids.
- PHASE-LOK III head brackets — minimize stereo phasing problems.
- Separate electronics for each deck on 2 PC cards.

OVER 40 CART MACHINE MODELS. ALSO AUDIO CONSOLES, AUDIO PROCESSORS, AND STUDIO ACCESSORIES.

Best Signals? Think of the Possibilities!

When planning or modifying a facility, consider the 1410 Series of modular generators for test signal generation. Using a modular approach, the 1410 Series offers you:

Reduced Costs—order just the test signals you need now.

Investment Protection—add modules later to expand your 1410's capabilities.

A 1410 test signal system starts as low as \$1,300 for a mainframe, timer, circuit, and a convergence pattern generator. Additional test signal modules include a color bars generator (\$600), linearity test signal generator (\$500), and a black burst generator (\$200).

A 1410 Series test signal system has several special features:

- **Signal Versatility**—For example, you can remove staircase chroma for luminance non-linearity measurements, or change staircase subcarrier levels to reduce noise effects on differential gain and phase measurements.
- **DC Bounce Test Signal**—A simulation of a switch between two AC coupled sources of radically different APL's. Useful in clamp design and evaluation and for measuring long time distortions.
- **Color Bars/Red Test Signal**—Especially useful in adjusting and evaluating VTR head equalization and noise.
- **The VIR Signal**—On line 19 of black burst or in full-field format to record on video-tape leaders. Use of full-field VIR signal makes playback adjustment as easy as 1-2-3.

- **Parallel Outputs**—Each module operates independently and has separate rear-panel outputs.

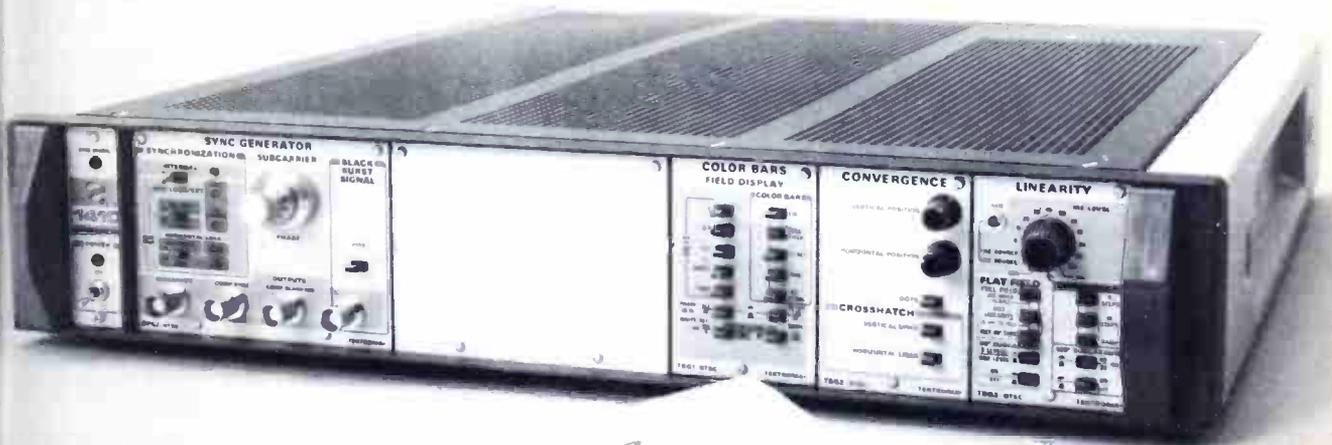

For more information about the 1410 Series, write us at P.O. Box 500, Beaverton, OR 97077; or use the reader service number below. Prices F.O.B. Beaverton, Oregon.

Total Automation: Where It Is Today. Where Will It Be Tomorrow?

“... after all these years” Business Computers are talking to Technical Operations computers and a rush to go “total” is on at a number of stations.

Last year there was just one TV station, WTCN, Minneapolis, (*BM/E*, Aug. '75) that could claim to be “totally automated.” As of this writing WTCN is still the only “on-line” and operating station that possesses “total automation.” By the time you read this article, however, WNEW-TV, New York, WTTG-TV, Washington, D.C., WBBM-TV, Chicago, KNXT-TV, Hollywood, and WNAC-TV, Boston, may all be operating “total automation” systems.

KTLA-TV, Los Angeles, and WIIC-TV in Pittsburgh are also very close to initiating “total automation” systems. Moreover, the various manufacturers of automated technical operations systems and the suppliers of business computer systems report nearly a score of additional stations that will be well on the path to “total automation” within the near future.

The ‘Big Three’ manufacturers of technical operations automation systems, Vital, Grass Valley, and CDL, have all worked closely with BCS, BIAS, Cox Data Services, and Jefferson Data Systems to establish the necessary protocol for interfacing their respective computers. Many are just awaiting common customers. In addition the technical operations people have established protocol with some business systems such as the CBS-Grass Valley interface which is about to be completed at both KNXT and WBBM. Demonstrations of several interfaces were performed at the NAB show, Chicago, this past March (*BM/E*, May '76.)

What is really going on here is not properly described as a “rush” since it has taken a number of years for things to sort themselves out. Automated business systems and automated technical operations systems have been around for a long time. They have not, however, been talking to each other until quite recently. The impetus for the dialogue has been provided by a number of factors, the most important of which has been the desire of station management to, at last, “achieve a closed circuit for all TV operations.”

The early vision called for the sales order to trigger a chain of events that would continue, with minimal human intervention, all the way from traffic, through broadcast and logging, to billing. Had it all been that simple, “total automation” would now be the rule, rather than the exception.

Broadcasting is, after all, a complex business and practiced by thousands of different people in different ways. Though the similarities from operation to oper-

ation are many, the differences are legion. Getting a business computer to talk to the technical operations computer is not as great a problem as determining, specifically, what they ought to say to one another.

A case in point is WIIC in Pittsburgh. WIIC was using the Cox Data Services' business automation system and already had a Grass Valley APC-2000 system. Each was being used successfully and the idea of interfacing the two systems was being worked on as far back as the early 1970s.

The Grass Valley system used a PDP-8 minicomputer and the Cox Data Services system used a Nova II. Cox, Grass Valley and station personnel worked together establishing protocol and determining how the two systems would ultimately control the various operations and complete the numerous tasks. Andrew Jackson, Chief Engineer at WIIC, said, “If I hadn't of come in (March 3rd, 1976) it would have been installed and gone on-line and been working. But when I arrived they asked me for my opinion and I asked, ‘What'll your system do?’ and that's when the proverbial fan got dirty.”

The system developed by Cox, Grass Valley and Jackson's predecessor was fine, but Jackson, through his previous experience in a Miami station, and having worked on radio automation systems, had a list of things that he thought the system should do that had not been included in the early concept.

Among the things Jackson wanted was to upgrade the PDP-8 to a PDP-11. With the PDP-8, WIIC could store only 256 lines of information in core. The PDP-11 would store information sufficient for an entire day's programming. He also wanted “automatic protection,” for certain categories of commercial spots. “We wanted to designate 15 min., 30 min., or 1 hour of protection. In other words,” said Jackson, we wanted protection, “that we do not have two automotive dealers within 10 minutes of each other and we want the computer to control this automatically and we want it to show up in master control,” in case of a manual override.

All of this involved modifying and/or writing new software and resulted in a delay before going on-line. Then, WIIC was hit by labor trouble and IBEW workers went out on strike. One of the issues in the strike, so it is alleged, is that prior to the interface the schedule, pre-log, prepared by traffic was typed into the master control computer five times a day by IBEW workers and they did not want to lose control of the keyboard as the

Special note: On June 27th, the BCS system and the CDL systems were interfaced and WNEW-TV, New York, became the second station to achieve "total automation."

WNEW-TV's old master control. Equipment had to be removed and functions handled at alternative sites until the CDL automation system could be installed.

The new WNEW master control room, prior to going on-line. It took many months of planning and smooth organization to complete the transformation without disturbing on-going operations. Minicomputers for controlling the CDL system are in two racks at left of photo.

... CRTs (background) provide operator with a layout of the scheduled events. Instant checks and comparisons are made between the typed schedule and data on the CRTs. Should any failure of system occur, a manual override can be executed instantly.

For several months prior to the installation of the BCS business system, the schedule prepared by traffic was typed into the CDL system using CDL terminals in traffic. Last minute changes are handled by the keyboard in master control (lower left).

TOTAL AUTOMATION

will when the computers are hardwired.

The delays and the strike have not been all bad, however, since someone can always think of something else they would like to do with an automation system if they have time. In this instance, said Jackson, "Maybe it (the strike) was a blessing in disguise." Prior to the strike they had the projectionist and the videotape operator tell the computer where the material was, and then the computer operator would put in this information "and sometimes, something would get lost in the translation." Now, the way they are working it, the computer operator is making the machine assignments and determining "if it's a film which film projector, and if it's a cartridge,

which TCR."

Now the projectionist and VTR operators take the and pull their commercial load or program load in quence and "then they stand back and look up at computer readout and say, 'O.K., now I'm holdin Colgate; where does this thing belong?'" The mach assignment is on the sheet and all the operator has know is how to follow the instructions.

One of the reasons that WTCN was first to go to "automation" was that it was in the process of moving a completely new plant. In effect, all the construction and installation could be carried out free from interference from on-going operations.

It has not been that way at other stations. Most, fact, must plan for the changeover with all the care, and logistics of a military maneuver.

Once the decision is made to go for total automation sufficient lead time must be allotted for all the necessary reconstruction and renovation. The actual interface the machinery will probably be worked out beforehand by the suppliers, as in the KTLA case where Golden Valley has installed a data line between a switcher their plant and the BIAS computer system in Memphis. The two systems will dry-run for some time before actual changeover at KTLA.

Automation systems 'prefer' video cart machine

Meanwhile, back at the station, decisions are made regarding the architecture of the system and additional machinery required. The usual plan calls for the construction of a parallel control system to the current station system. If a new switcher is required, space will be assigned for it, usually in a control room adjacent to the existing master control. All the wires required for master control are laid leading to the new master control location, from the various telecine islands, VTRs, camera machines, audio booth, and character generators.

Automation systems "prefer" to work with video cart machines so a station, if it has none, will usually purchase a pair of either the RCA TCR-100s or Ampex ACR-25s. One reason for this preference is that cart machines have computer based technology that automation systems can talk to more easily. Another reason is that fewer wires are required to control the machines. At NBC headquarters in New York, for instance, the cart machines are controlled by two connecting wires as compared to the fifteen wires required by the film islands.

During the early days of planning for a total automation system at WNEW-TV, Chief Engineer, Bob Kelley and Dick Munroe of KYW-TV, generated some ideas that eventually blossomed into a system developed between CDL and Ampex that is known as ARC (Automatic Remote Cassette Handler). The ARC system has a number of unique characteristics, chief among them are ADA and IDA.

Essentially, what happens is this: The ACR-25 can be loaded with 24 cassettes in random order. Each cassette has a material identification code encoded on its leader. Then ADA (Automatic Data Accessory) interrogates each tape by reading the identification recorded on the "pre-roll" segment of the cue track. The ADA then creates a table of contents listing the status and content of each bin. This is stored in the ACR-25's memory and also transmitted to the master control switcher computer which receives the table of contents and con-

continued on page 47

The PDP-11 that provides the computing power for the business system from BCS is housed in a special room in traffic. The construction of this room with special environmental controls was an accomplishment in itself.

In addition to the CRT terminals in traffic, here a worker uses a CRT terminal in sales/service for its purposes in requesting avails and entering sales information for traffic.

GREAT MOMENTS IN DIGITAL VIDEO HISTORY.

A SMALL FRAMESTORE SYNCHRONIZER IS DEVELOPED.

AND MICRO CONSULTANTS IS THERE WITH THE DFS 3000.

When our competitor NEC developed the first digital framestore synchronizer in 1974, they helped revolutionize the process of locking asynchronous television signals. It was a great moment in digital video history.

Now Micro Consultants has revolutionized the digital framestore synchronizer itself, dramatically reducing its size and cost and increasing its capabilities. Another great moment in digital video history.

The pioneering NEC unit occupies a full 81-inch rack and weighs over a quarter of a ton.

The new DFS 3000 occupies less than 9 inches of rack space and weighs a portable 58 pounds.

The NEC unit dissipates 1000VA of power. The DFS 3000 dissipates 250VA.

There's more. Micro Consultants gives you all the important options, including sync pulse generator, video compressor, and joystick control. They're plug-in modules, too. Which means you can have them from the start, or add them later as your needs change.

You'd think the DFS 3000, with all its advantages, would cost a lot more. It costs about one-third less.

The day you install a DFS 3000 in your station will be your great moment in digital video history. Make a start. Call your Micro Consultants representative. Or write us at P.O. Box 10057, Palo Alto, California 94303.

TOTAL AUTOMATION

pare it to the schedule. When the numbers of the contents match up with scheduled events a play list is compiled that is then relayed back to the ACR-25. The ACR-25, now informed of the scheduled play list, then plays back the cassettes on time in the order given; regardless of how the cassettes were loaded.

IDA (Identification Data Accessory) functions to keep personnel informed as to which event is playing and which event is scheduled to play next. This information can then be compared with the schedule to double check that the next scheduled event is, in fact, correct. If it is not, a correction can be made to conform to the actual schedule.

Another feature of the ACR-25 that some engineers cite as an advantage is that if a cassette contains a spot that is scheduled to play again in a short period of time, the random access capability of the ACR-25 permits it to return to that cassette time and again if called for. The TCR-100, on the other hand, plays its contents sequentially, bins 1 through 24. A cart that is scheduled to play, for example, in both the 5th and 15th positions, must be removed after its first play and replaced in the new position.

Some stations like WIIC, however, consider this an advantage rather than a drawback. Since the TCR-100s are open faced, the labels of the carts are always visible and numerous checks can be made to assure that things are in their proper order. With IDA, according to Jackson, the warning provided is on too short a notice.

Regardless of the cart machine selected, it appears that they are the source machine of choice by most engineers and systems designers. Gil Wyland of CBS states, that as far as WBBM is concerned, with the cart machines and an imminent move to a complete ENG operation, "everything will be on one medium; we're getting film

Automated Breaks in an Economy Package

For a station that would like to run those profitable and complex breaks that automated stations are running, but doesn't want to extend itself into the area of expensive cart machines and computers, the Video Spot Assembler, from Recortec is a possible alternative.

The VSA is a microprocessor based, special purpose editing controller that works with two VTRs to assemble complex spot reels. Using a system that identifies each event with a two digit code, the operator can assemble on a single reel up to 100 "breaks" consisting of 8 spots each. Each break can contain "repeated events" and "single events" and will run these events automatically when called for by break number.

The "repeat" events are pre-recorded on a "catalog-reel," grouped according to length. This "catalog reel" is used to automatically assemble a basic spot reel of all repeated events for that day in their scheduled sequence. "Single" events are then inserted into the proper breaks where they are required.

Eventually, with a savings in manpower and time, all spots are recorded and grouped into breaks that are aired in sequence as called for by the schedule.

The VSA is priced at \$8,950 and designed to interface with VTRs of the AVR-1 and AVR-3 type. Other VTRs will require the R-MOD (Reel-Servo Modification kit).

the hell out of there." As he sees it, "the industry is very far down the road, maybe three or four years, for when film is going to be an off-line operation." There, of course, some controversy on that point.

One criticism of film equipment when it comes, automation is the absence of an automatic material identification system. RCA, however, is considering the possibility of developing some such system for its TC 1624 film cartridge player and as long as film remains preferred medium for distributing commercials many stations will opt to retain a substantial on-line film capability. It should be noted that the TCP-1624 already has keyboard device that allows the operator to type in material identification and inform the computer system contents and sequence.

Once the equipment is selected, purchased, and installed, the technical operations computer will have to be provided with a description of this layout. The software will need to account for, know the location of, and understand the capacity of each piece of equipment. The equipment profile is central to software. Bill Kelly says that one thing engineers should be aware of is, that once the system goes on line, new equipment will require some fairly expensive and sometimes, time consuming rewriting of software. It is best to have the details of the system architecture completed well beforehand.

When the technical operations side of things is completed there is usually a period of trial when the new system is run parallel to the old system. Pending a successful shake-down cruise, the final step is the connection of the new system to the transmitter. This operation in itself is usually very simple, and as Andy Jackson said, "at WIIC it involved pulling a couple of wires and reattaching them from the new switcher to the transmitter."

The interface with the business system will vary from station to station depending on what the station has in the way of an automated business system and how they want the interface to work.

The biggest problem confronting the technical operations/business system interface is how the business system formats its data. All the technical system really needs to know from the traffic system at the outset is the name of the event, the medium it is on, the time it is to be aired, and some sort of house "ID" number so that the item can be recognized.

Some of the business systems have been fairly inconsistent, according to Bob Hueffed, vice president and general manager of CDL, "to keep their formats keying in the information and retrieving the information as close to the English traffic vernacular as they can."

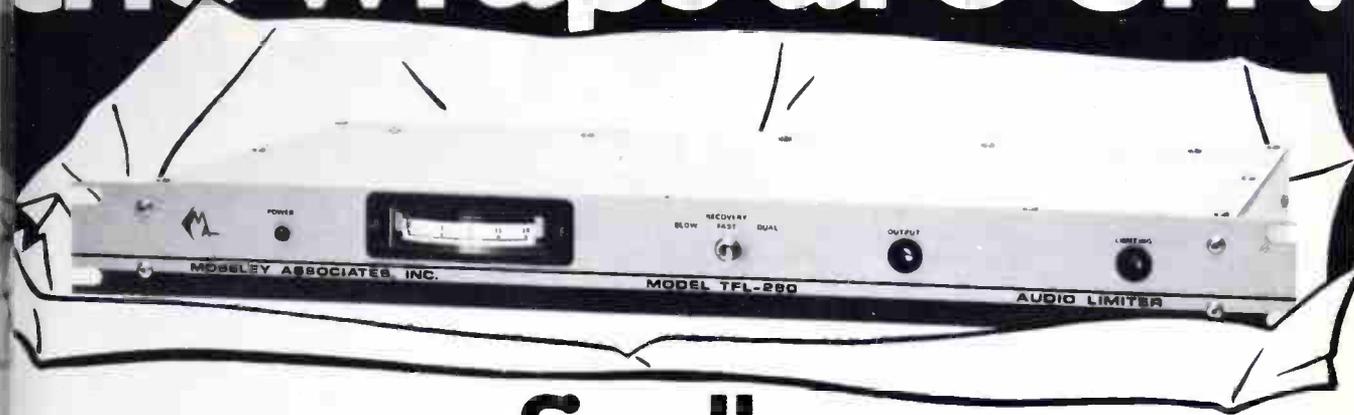

So, if traffic enters, "put a 5 second tag instead of slide on the end of this 30 second VTR," engineers have to take that and interpret it into VTR and slide projector language. An instruction of that sort would translate into three separate events for the technical operations computer.

With some business systems, particularly those that use distant computers, either on-line or through batch or distributive processing configurations, in-house data processing capacity is usually limited. This often requires the technical operations computer to use some of its storage capacity to hold contractual information not essential to operations.

Though this information will be handy for printing the

 without compromise!

**MOSELEY ASSOCIATES
 announces the
 MODEL TFL-280 AUDIO LIMITER***

For FM mono, stereo, quad — FM SCA — TV Audio • Excellent Leverage — greater than 50:1 • Extended Control Range — over 35dB • Clipping not routinely produced • Fast AGC attach times — less than 20 microseconds • Very low harmonic and intermodulation distortion • Optional plug-in audio low-pass filter • Operation over wide temperature range • No Test Mode — run proofs thru TFL-280

Loudness and clarity without compromise...the Moseley Associates TFL-280 Audio Limiter precisely controls the modulation levels of FM and TV aural transmitters. FM monaural, stereo, and quadraphonic, FM SCA, TV aural are all properly processed. This frequency-conscious limiter cleanly solves the

problems associated with the transmission of pre-emphasized audio, including the ringing (over-modulation) produced by low-pass audio filters. Using agile limiting circuitry, clipping and its attendant problems are essentially eliminated. Monolithic semiconductor arrays, wide-band operational amplifier circuitry and

distortion-reducing techniques are some of the technological advances incorporated into the TFL-280. Other features are accurate metering of limiting, optional plug-in audio low-pass filter, operation over wide temperature range, and thorough RF shielding and filtering of complete unit.

The TFL-280 Audio Limiter, when combined with the Moseley Associates SCG-9 Stereo Generator, make an unbeatable combination for FM stereo. If your FM transmitter is at a remote location, add the Moseley Associates PCL-505/C Composite Aural Studio-Transmitter Link for totally uncompromised performance.

The TFL-280 will be unveiled for the first time in Booth 109 during the NRBA Convention in San Francisco. See us there — or contact our Marketing Department for Product Bulletin 255 describing the TFL-280.

BROADCAST CARTRIDGE

A-2

BY CAPITOL.

Think of it as a car.

Because, in a sense, it is like a car. All of the major components are assembled to get you from point A to point B. With efficiency and precision. For example, the constant-force, foam pressure pad assures unvarying head to tape contact over the life of the cartridge. The positive, non-slip brake mechanism locks the tape, rather than the hub, assuring accurate cueing and timing. And, to assure you of premium performance, each cart is individually tested—100%—for wow and flutter,

electrical output, tension, and other properties. And because we manufacture the entire package—from tape to packaging—we can assure you of the highest possible quality control.

The Audiopak A-2 by Capitol Broadcast Cartridge. The car you drive probably *isn't* as reliable as the A-2.

Election Eve Reporting: Making It Count With Computers And Character Generators

There may be no 'sure winners' in politics this year but in broadcasting it's a landslide for character generators.

Reporting the elections in 1976 promises to provide the American public with more data and analysis than ever before. Two instruments have made this possible: the computer and the character generator.

It wasn't too long ago that election eve reporting of results was a tedious evening of television and viewers frequently went to bed in the early morning hours still unaware of the outcome. Now, within a few hours of poll closings, network news organizations and national wire services are providing reliable predictions and declarations of winners; sometimes based on what seems to be an impossibly small percentage of returns.

Moreover, with the development of sampling techniques and demographic profiles of precincts the viewer is getting more data to help understand the import of voting patterns. Television news organizations are offering analysis of women voters, ethnic voters, income groups and various historical patterns in various regions, districts, and neighborhoods.

All this boils down to numbers, names, and more numbers. Time was when a station would have to set aside a sizable budget for the construction of special sets, tally boards, and then hire or reassign numerous personnel on a temporary basis to tally just the votes in the various races.

Now, with computers and character generators, broadcasters are handling greater quantities of data and more types of statistical reporting with speed, ease, and clarity never before possible. Tony Mattia, 3M marketing coordinator for the Mincom Division which manufactures character generators, said, "This year we're probably going to see 70% of the election reporting handled by video graphics. Sure, you're going to see the talent, but more and more, the focus will be on the tally screen."

Stations, regardless of size, are able to improve their election eve coverage simply because of the wide variety of video graphics apparatus available. These machines can range from extremely simplex, storing only a few lines of information, to complex units aided by various memory storage devices with page after page of information. Some character generators are controlled by microcomputers or powerful central computers programmed to provide information that brings into focus all the nuances of modern political struggles as expressed in statistical data.

In its simplest form the character generator can, with

enough storage, list various races, the candidates and keep a running tally of returns as the totals are called in to the news room from various counting locations.

Formats For Races Set In Advance

The races are formatted in advance and the names are entered. Vote totals are typed in by the operator as the night progresses. If the station chooses to report the results only periodically, the character generator is also used to provide occasional messages superimposed over the evening's programming in crawl format either advising the viewers to "Stay tuned for election coverage beginning at 10 PM" or as election update information consisting of changes in the standings such as "Congressman Boondoggle now leads by 4% in the 14th Precinct. Stay tuned for complete results."

This rather pedestrian method of using character generators, however, is giving way to more complex reporting utilizing computers interfaced with the device. Such interfaces are available in a number of ways. Some character generators are equipped with special computer hardware and software packages specially developed for the election and some are interfaced with station computers normally used for business operations but containing election software designed by the supplier of the business system. Others are interfaced with computers operated by regional institutions, private and public, like banks and colleges. There are also a few firms that specialize in offering election reporting services that consist of either designing the software for reporting the data or arranging for the use of both software and hardware.

Storage Capacity Key to Election Reporting

The Mincom Division of 3M reports a brisk sale since the NAB show of its D-3000 character generators and Tony Mattia, marketing coordinator, attributes much of this to the up-coming elections and the demands being placed on stations to provide quick and efficient video graphics.

The D-3000 character generator itself has internal storage capacity of 4-pages in random access memory. A page consists of 10 lines of 22 or 24 characters each. Normally, 4-pages of storage would be insufficient for storing the amount of data generated during election coverage, but the 3M system has an optional storage system. The character generator can be equipped with the D-4000 Random Access Disc Memory which stores up to 1,000 pages of data on each "floppy disc."

ELECTION EVE REPORTING

The simplest mode of operation using such a system would require that each page be formatted prior to election eve, listing the various races and candidates. This information can be stored on as many diskettes as required. A typical format would list the title of the race (i.e. 1st Congressional District) and each candidate with his or her party designation. In cases where the number of candidates exceeds the number of lines on a page, sequential pages may be used and recalled automatically.

Use of the D-3000 and the D-4000 Random Access Disc Memory becomes designated the D-3400 system and includes a number of features in addition to the expanded memory that are helpful in reporting the elections. In this configuration the D-3000 becomes the primary I/O device for entering data into memory, editing it and commanding the display functions. The D-4000, however, is also equipped with a D-4050 Address Keyboard, for the purpose of assigning addresses to the various pages of data in memory. Because of the simultaneous 2-channel video output feature in the D-3000 and the nature of Random Access Memory of the D-4000, it is possible to constantly update election returns even while one page of returns is on air since any other page can be displayed at the same time on a separate monitor for editing and preview.

When using a system like this, it is suggested that incoming election returns be given first to the character generator operator so that it can be entered into the system and readied for use at the call of the director or talent.

Essentially, this system provides a good way to

present video graphic renditions of statistics. The life brought to the presentation, however, is largely dependent on the genius of the operator and the thought that goes into format preparation. Provided the news director and other station personnel can come up with interesting ways of presenting available information the viewer will get dynamic coverage of the elections.

Computers Help Provide "In-Depth Analysis"

Basically, any good character generator with sufficient storage capacity can be used to present statistics efficiently for election eve reporting. But, in this day of statistical consciousness, "a la" the Harris, Gallup, and numerous other polling organizations, the audience is prepared to expect more than a simple tally of voting results. People are interested in how various segments of the population are voting and on what issues the election is turning. They want to know how different regions view the various candidates and they are interested in such comparisons as can be drawn by looking at results from a number of vantage points rather than simply "who's winning."

To accomplish this "in-depth analysis" television news organizations have to be able to "massage" the results in a number of ways. This is where computers come in. Computers, of course, come in all sizes and capacities, and they require software that will express the results conveniently and meaningfully.

Several of the character generators can be had with special computer capabilities attached and software packages especially designed for election reporting. 3M, Mincom Division offers a microcomputer, the Data-

Production Power

Creating sound that stands out on the dial isn't easy. It takes creative people and powerful tools. One of the most powerful is the Orban/Parasound Parametric Equalizer. Unlike conventional equalizers, the Orban/Parasound Parametric gives you complete, continuously variable control over tuning, bandwidth, and amount of boost or cut. For the first time, you have the power to tune your sound exactly the way you want it. No more compromises.

The four equalization sections each tune over a 20:1 frequency range, and are cascaded to avoid interaction. All potential overload points are monitored by a "peak-stretching" overload indicator, and overloads are instantly correctable with the front-panel gain control. The overload/noise ratio is an outstanding 106 dB, and the harmonic distortion is typically 0.006% (1kHz at +18 dBm). This recording studio quality assures clean, transparent sound

whether you use the Orban/Parasound Parametric in production or live on the air.

Best of all, this versatility comes for less than \$370/channel in the dual-channel version, with Orban/Parasound's proven quality and reliability. This month, put the creative freedom and production power of the Orban/Parasound Parametric Equalizer in your station. You'll be well on your way to creating the audience-grabbing, sponsor-pleasing airsound you've always wanted.

5 Good Reasons to See the Datavision D-3000 Video Character Generator Before Making a Purchasing Decision.

The D-3000 Character Generator produces video-type characters with excellent clarity (1120-element character resolution). Each letter is smooth and precise. And, now you have a greater selection of type fonts including Upper and Lower Case, selected mathematical symbols, and accented foreign language characters. When used with the optional D-4000 Random Access Memory you can store up to 1,000 pages on each low-cost diskette. With our new Animation Mode (optional), you can play out full frames at a rate of 6 or more per second from the D-4000 Memory, creating video motion pictures.

OTHER FEATURES: • 2 INDEPENDENT OUTPUT CHANNELS • MULTIPLE VIDEO-TYPE FONTS • PERMANENT 4-PAGE MEMORY • CHARACTER SCROLLING.

MINCOM DIVISION COMPANY

Circle 142 on Reader Service Card

FOR TODAY'S GREATEST VALUE IN A STUDIO TAPE DECK, YOU'VE GOT TO COME TO A (PARDON THE EXPRESSION) HI-FI COMPANY.

Traditional broadcast and recording-industry suppliers, with their low-volume high-profit operations, are in no position to make a tape deck like the Pioneer RT-2022 at anywhere near its price.

Even though the RT-2022 competes with their best in versatility and performance:

It's a 3-motor, 3-head, 2-track deck, with speeds of 15 and 7½ ips. Its design is completely modular, with transport, controls and electronics on three separate chassis. The head assembly is interchangeable, so that 4-track heads can be snapped in for either quarter-track operation or quad. For quad, a second electronic section can be mounted.

Perhaps the most outstanding feature of the

RT-2022 is simultaneous sync monitoring for live overdubbing. Another is the built-in calibration oscillator (1000 and 10,000 Hz). It's front-panel controlled, just like the continuously variable bias and the multiple EQ. Head alignment is accessible right through the head cover. Some hi-fi machine!

If you're a professional whose budget is limited, so is your choice.

ELECTION EVE REPORTING

ision, M-8, with election reporting software. Though the Vidifont, Mark IV, from Thomson-CSF, does not come equipped with special computer devices or software specifically for the election, it is designed to interface with a computer for the purpose of election reporting. TeleMation offers special software and mini-computer options with its Compositor I titling and graphic system, which it has dubbed TED-1, Television Event Display System. Chyron and RCA also have systems that will be employed in the up-coming elections and during the conventions, though they chose not to disclose details at this time.

Each manufacturer, however, was careful to explain that the additional capacity available through computer interface should not be construed solely as relating to the elections. The interface, once established, could give the broadcaster additional power for utilizing their character generators 365 days a year. In addition to using the added power for large quantities of fast breaking weather and sports data, a few of the systems are powerful enough to be used for conducting some station business routines.

The heart of the 3M system is the display director which is a microcomputer terminal. It includes, in addition to the computer functions, a teletype style keyboard and a 5 in. CRT monitor. Through I/O connections the terminal interfaces directly with the character generator.

A peripheral floppy disc recorder is provided for storage of program formats and up to 10 remote entry terminals can be connected as well as a line printer and one remote display director. Any portion or all of this optional equipment may be required for reporting election results, depending on the volume of data generated by each particular race.

The software for this system allows the operator to format 100 separate races with a maximum of 26 candidates per race. According to Larry Plummer, Director of Engineering for Comtek Consulting Corporation, who helped design the software for this system, the basic formats that will be used are prepared ahead of time and stored on floppy discs. The night of the election the results are entered through any one or all of the possible entry terminals. Votes can be entered incrementally or cumulatively at the operator's option. "That process

ELECTION EVE REPORTING

of entering new numeric information or new vote totals for each candidate is handled wholly separately and apart from the process of . . . making a presentation on air," said Plummer. "They don't interfere with each other at all."

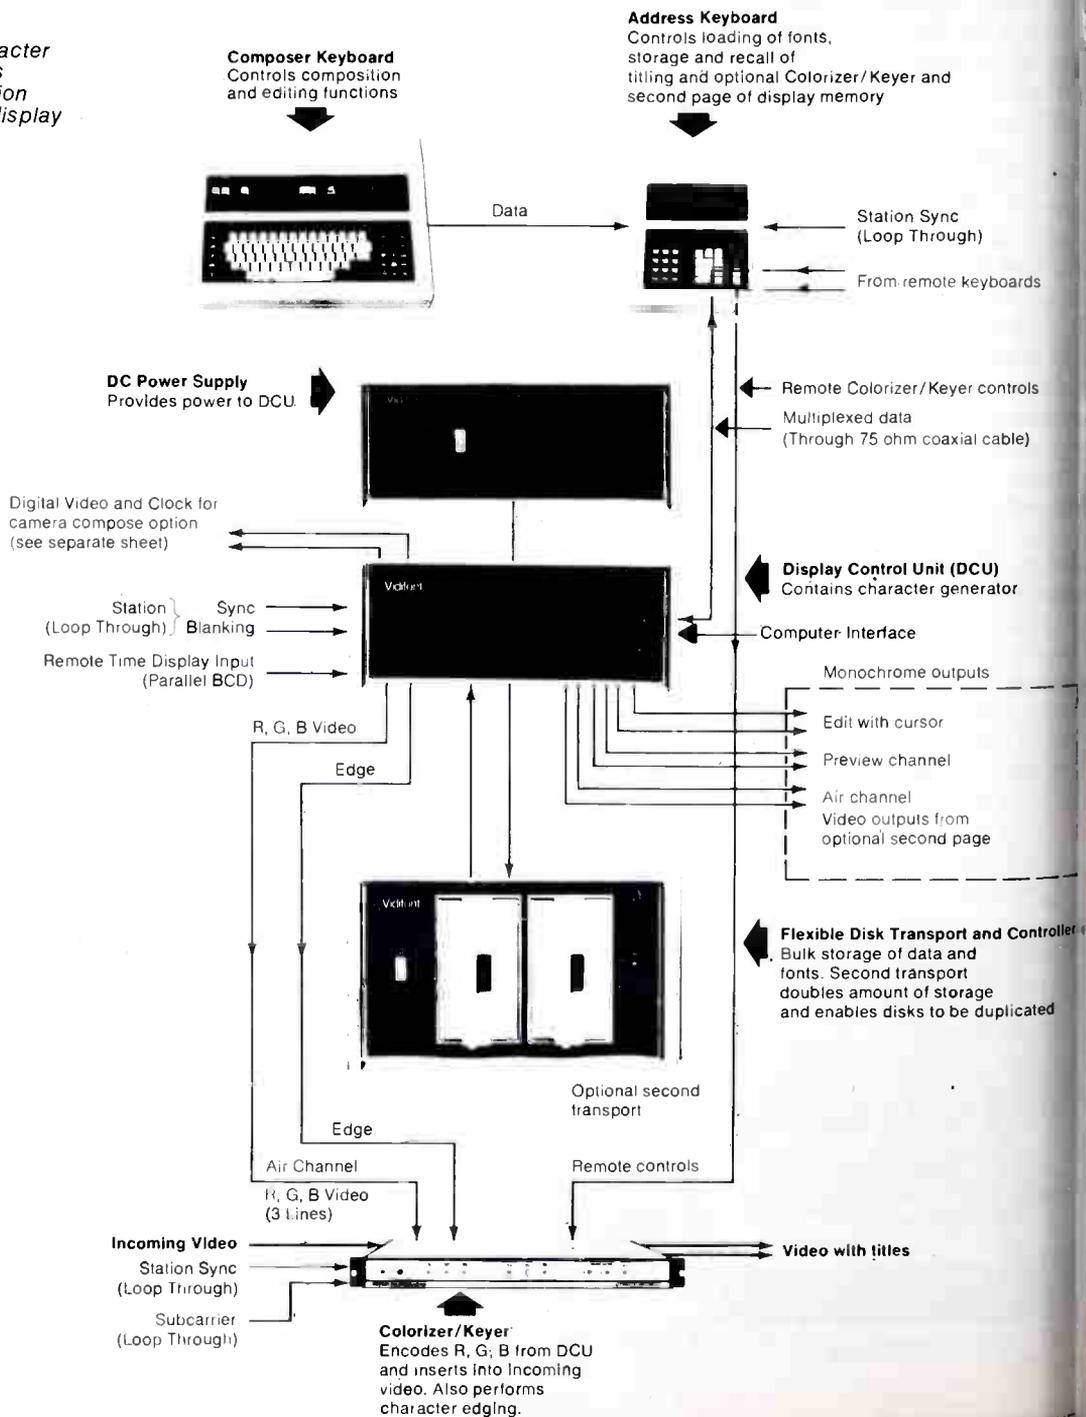

The system also has the ability to display pre-determined "strings of races," so that if you want to look at all races for the House of Representative," for instance, the computer will "think of it as a single race and sequence through multiple pages of data and display the data as if it were a single race." The program also automatically lists candidates in descending order of their recorded vote count, thereby eliminating any need to alter the files to show new race leaders. In addition to the 2-line heading for the race, each candidate's name and party affiliation is listed along with vote total and per-

centage of the total reported votes. The 3M system will also interface to other computers either in-house or via modum data set if so desired, and 3M will recommend people to the user for help with the necessary software.

TED-1 is TeleMation's preferred method of handling election returns and consists of one or more Compositor character generators interfaced to a minicomputer, 100-Display Selector Panel, Teletype keyboard-printer-tape-reader punch and standard computer programming. Voting information is entered into the TED-1 System via the Compositor-1 keyboard(s) and the teletypewriters by responding to computer-generated questions. The system's minicomputer groups this information in pages with each page containing the latest data on one contest as follows:

Name of district
Name of election contest
Type of voting poll (precincts, district, etc.) and
percentage reporting

Basic Vidifont character generator system is interfaced for election reporting through display control unit.

STANDARD COMPUTER TERMINALS

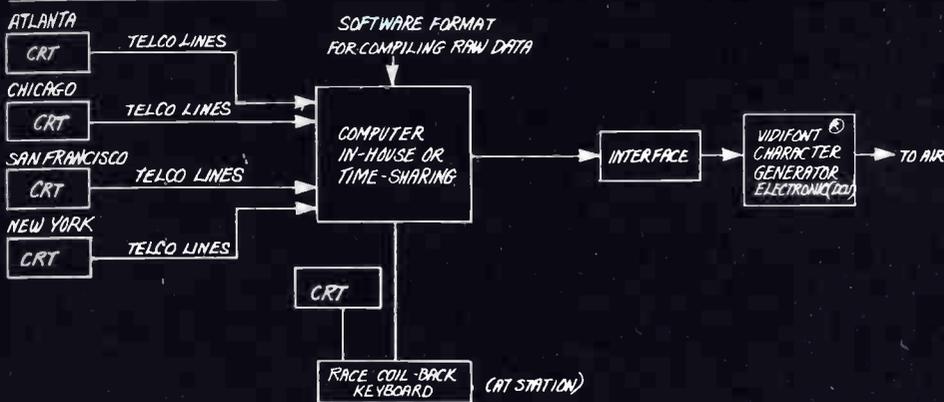

Diagram showing basic Vidifont system computer interface for covering national elections.

Names of candidates, with party affiliation of each
Number of votes for each candidate or percentage
of total vote, depending on which is selected for
display. Candidates are automatically arranged
according to the number of votes received, with
the candidate receiving the most votes listed first.

Like the 3M system, each page is assigned a "call
number" and can be quickly displayed by entering that
number. To preview the material prior to air, however, a
second Compositor-1 is needed. Key voting polls or dis-
plays may be placed on separate pages for trend analysis.
The TED language is a "high level" language which
commands the operation of the system by first querring
the operator in simple English and then translating the
English responses into machine language. Another
"high level" language, "BASIC" is provided with all
TED Systems and allows use of the computer for other
functions without interfering with the original TED pro-
gram.

The Vidifont Electronic Character Generator Systems
of Thomson-CSF, are also approaching the elections in
much the same way. The Vidifont system, however, will
be used by CBS for both national party conventions and
up-coming Presidential elections. Coupled with CBS
computers and huge memory storage capacity the Vidi-
font system will offer a formidable demonstration of the
power of character generators when interfaced with
computers.

Software is Available Separately

Stations that already have character generators and
computers but do not have them interfaced are ignoring a
very valuable potential. If they want to realize this poten-
tial assistance is available from a number of firms that
specialize in election services.

Comtek Consulting Corp. of Wichita, Kansas, offers
to perform the interface between computer and character
generator with the general capabilities described for the
3M system. Larry Plummer worked closely on the 3M
system and offers a similar software package through
Comtek for use with Chyron, 3M, and Vidifont character
generators. Almost any character generator with the
standard sort of capabilities as the three brands men-
tioned, can be interfaced, for about \$15 thousand. This
includes the MC-8 Microcomputer, software, and floppy
disk storage as well as the interface. Comtek also pro-
vides operator training. According to Plummer, Comtek
plans to develop a high level language in the near future

that will make it possible for operators to do some simple
programming of their own, using English language in-
structions.

As it stands now, the software offered by Comtek is
frequently altered to accommodate special requirements
of stations. Such alterations have included design of the
system to allow two stations operating in separate major
market areas within a state to have simultaneous access
to the same data base but to receive output formatted
separately for each station.

Election Reporting Service, Tuscon, Arizona provides
significant services to broadcasters especially for the
election. Essentially, ERS arranges for use of a large
computer on a time-sharing basis and completes the sta-
tion hook-up over telephone company lines, and the
interface with the station character generator.

ERS has been active mostly in the Southwest but is
beginning to branch out into other areas as demand for
their services increase. As Will McLain, Director of
Election Reporting Service, describes it, ERS strives to
provide the station with "network quality reporting."
ERS selects a computer within local telephone line dis-
tance of a station and arranges for the link-up with the
station.

Using its proprietary software, ERS collects data from
several locations and sources, then tabulates the results
"instantaneously." The results are readied for the sta-
tion's character generator and transmitted via telephone
lines and coupled through a data phone.

Results may be printed for commentator evaluation,
and coupled with historical data for comparison. The
tally may be of almost any manufacture and its normal
functions are not interfered with. The exact format and
style, whether crawl, lower-third or other is still com-
manded by station operations. The list of possible
formats is extensive and any or all of them can be used
depending on station demands.

Other software sources for election reporting services
include several of the business system suppliers such as
Cox Data Services and PSI. These programs are avail-
able to clients of the companies and can be quite in-
expensive. The PSI election program cost a mere \$80,
though it is limited to a simple tally type presentation.

The only predictions we care to make about this year's
elections are that the big winners are going to be the
character generator manufacturers and, hopefully the
viewing audience which is going to receive better and
more extensive coverage of the 1976 elections than ever
before.

BM/E

Meet the TK-46 from RCA.

Successor to the world's most successful TV studio cameras.

Chronology of a winner.

The TK-46 is a new camera.

But far from unproved.

It is actually the distillation of years of brilliant camera performance. With features introduced to the industry on the TK-44 and its successors.

Features proved in more than 1,300 of these cameras. In the largest camera universe of any manufacturer.

Features improved, where possible, for the TK-46. To make it the worthy successor to the world's most successful TV cameras.

| Feature | Year Introduced | 69 | 70 | 71 | 72 | 73 | 74 | 75 | 76 |

| | | | | | | | | | TK-46 |

Above are 25 good reasons why the new TK-46 produces such high quality pictures.

Innovation and improvement

The TK-46 includes the latest version of high efficiency prism optics for superior low-light pictures; the comb filter and coring that set a new standard for signal-to-noise ratio; and Chromacomp, RCA's colorimetry adjustment standard.

Chromacomp allows colorimetry adjustment without affecting picture luminance. Hue and saturation of primary colors may be changed without altering grey scale balance. Matching to other cameras is simple.

innovations made the TK-44A the best-selling camera in its class. And further improvements made sales leaders successors.

The automatics.

The TK-44B and TK-45 launched the automatic TV camera age. Features that simplify or assist the subjective operator were introduced on these cameras. They include automatic iris, operated by light levels; automatic contrast and automatic black

What's new on the TK-46?

Better signal-to-noise ratio, for one thing. In low light, a new, advanced preamp design improved signal-to-noise ratio by 3 dB—especially useful in multiple-generation tape production.

Also new for the TK-46 is a tiltable viewfinder with an 8" diagonal screen. The cameraman can hold a horizontal view while tilting the camera through a 30° arc.

Simultaneous in- and out-of-band contours with combing and coring are standard on the TK-46. Our

RCA

automatic centering

Another notable development is automatic bias light. It minimizes flare and permits camera operation at low light levels as few as five foot-candles of light.

Contrast Compression is another important feature. With this control, the cameraman can pull details out of dark areas (in sports arenas, for example) without a shift in color. He can pan into bright areas without overexposure, too. The improved performance features are also yours on the

TK-46. This chart will show you all the advantages and how long they have been performance proved. A look at the TK-46 will show how well it performs today, and for many tomorrows.

The one camera truly worth looking into.

If you are planning to invest in a quality TV camera, look into the TK-46 soon. You'll find it's the one state-of-the-art camera with outstanding proof of performance behind its many features.

To see what all the TK-46 excitement is about, see your RCA Representative.

A Proposal To Improve Radio Coverage In The U.S.: High-Power Stations At Low-Frequency

By Paul H. Lee

Following a study which showed large areas of the western U.S. with very poor radio broadcast service, the FCC has opened an inquiry to seek ways of improving coverage: Put more stations on the clear channels? Let the "clears" raise power to 100kW or 1 megawatt? The author of this article argues for another plan—a series of very-high-power stations on the unused 150 to 285 KHz band.

Editors Note: Comments on the clear channel inquiry, Docket 20642 are due Sept. 21. The FCC reports few replies so far. Make your views known.

The reopening of the Clear Channel Proceedings by the Federal Communications Commission has caused much interest and speculation among broadcasters, especially among the clear channel broadcasters, who have much at stake. Should the remaining twelve unduplicated clear channels, which the FCC has protected from encroachment for over a decade, be "diluted" by assignment of Class IB or Class II stations thereon, to provide coverage for areas which do not now have it? Or should these channels remain unduplicated, with the Class IA stations thereon being permitted to go to "super-power" of 500 or 1000 kW? What role can FM play in providing coverage to areas of the United States now lacking in coverage?

This article will touch only briefly on some of the economic aspects, and will concentrate on the engineering aspects of providing improved aural service to this country.

Recently, the FCC, as part of its study of radio coverage, has thoughtfully provided maps of existing FM coverage of the United States. One map shows the 1 mV/m areas, and the other shows the 50 uV/m areas. Both maps show very clearly what we here in the western states know, that the eastern states are quite saturated with FM coverage, whereas the states west of the Mississippi River are very lacking in FM coverage. There are vast areas of plains, prairies and mountains with few cities and towns of sufficient size to support a radio station commercially, so FM is not the answer to this problem. Yet people live in these areas and they deserve to have coverage.

Nor is local nor regional AM the answer. Such sta-

Mr. Lee is president, P.H. Lee Associates, Inc., consulting engineers of Thousand Oaks, CA.

tions must be limited in service area, especially at night to avoid interference with distant co-channel stations. Further, a tabulation of the AM Clear Channel stations makes it obvious that their distribution is very inequitable. Only KFI, Los Angeles and KSL, Salt Lake City, among the "clears" can be classed as western stations. All the rest are in the east or the midwest. There are vast areas of the west without adequate AM service, especially at night.

Is the best approach to this problem raising the power of the twelve Class IA stations, of which KFI and KSL are two, or is there a more sound engineering approach which will provide improved AM service to the entire country?

I believe there is a much more effective and practical solution to the problem. There is a forgotten portion of the frequency spectrum, from 150 to 285 KHz, which is used in Europe, ITU Region I, for high power broadcasting. In this hemisphere, ITU Region II, this portion of the spectrum is allocated to the fixed services. Listening in this band will show some use by the military, lighthouses, beacons, and by the old-time A-N radio range stations. The need for the latter is greatly diminishing due to increased use of VHF by the airways.

This low frequency band (LF) has a great advantage for high power AM broadcasting because of the greatly diminished effect of ground conductivity on ground wave propagation. Many broadcast engineers are aware of the advantage of a 550 KHz frequency vs one of 1600 KHz. The FCC's ground wave curves in Section 73.1 of the Rules show this very dramatically. What they do not show, and what may not be known to many broadcast engineers, is the even more dramatic effect of going even lower in frequency, down to 150 to 285 KHz.

Figure 1 shows this effect clearly. The

HIGH-POWER STATIONS

curves are taken from a Signal Corps publication which has been in existence for many years (unclassified), TM11-499, "Radio Propagation." They are based on the same basic formulae by Norton as are the FCC's curves. They show ground wave field intensity vs distance for various frequencies. For greater ease in use they are based on an unattenuated field at one mile of 186.3 mV/m for 1 kW. For a power other than 1 kW, it is only necessary to add or subtract the required number of DB relative of 1 kW, on the left hand scale, to find the resultant field intensity.

To illustrate, assume kW radiated power over good ground, and note that at 200 KHz the 0.5 mV/m ground wave contour will fall at 200 miles from the transmitter, whereas at 1000 KHz it will fall far short at only 53 miles! Over poor ground the difference is even more drastic, with the 0.5 mV/m contour at 200 KHz falling at 82 miles, whereas at 1000 KHz it falls short at only 16 miles!

If power is increased to 1000 kW, at 200 KHz the 0.5 mV/m contour will fall at 730 miles over good ground, whereas at 1000 KHz it will fall at only 190 miles. Over poor ground, at 200 KHz it will fall at 315 miles, whereas at 1000 KHz it will fall far short at only 82 miles. If a taller tower than one-quarter wave were used, with a higher radiated field, the results would be even better. Does anyone need further proof that this LF band is the place for super-power broadcasting? To increase the power of the present Class 1A stations in the existing MF band would be very wasteful of power and facilities,

for it would not provide the national coverage of which group of super-power stations should be capable, but would only serve to make an existing interference situation worse.

Fig. 2 shows how eight strategically located super-power LF stations could cover the entire United States with non-fading signals. This is not a new concept, in any means. Research in the old *Proceedings of the IRE* turned up an article by W.H. Wenstrom in June 1931, which he discussed the advantages and disadvantages of LF vs MF high power broadcasting, and showed clearly how LF is the answer. He proposed a group of seven stations, for national, non-fading coverage. Why nothing ever developed from this concept in those days we can only guess, but those knowledgeable in the frequency allocation field have suggested that it was due to pressure by the aviation interests who at that time were pushing for the LF A-N radio ranges, inasmuch as VHF had not yet come into being, for aviation uses.

Implementation of this concept would require that the FCC initiate action by the United States government to obtain action at the forthcoming World Administrative Radio Conference in 1979 to have the 150 to 285 KHz spectrum allocated for broadcasting in Region II. This would be a very desirable action from the standpoint of the clear channel broadcasters.

One may ask what types of antennas would be required. In these days of tall towers for TV broadcasting, tower height is not so great a factor as in former years. Towers of 1500 or 2000 feet are fairly commonplace. Fig. 3 shows tower heights in feet vs frequency in KHz over the band in question. Past studies and research
continued on page 6

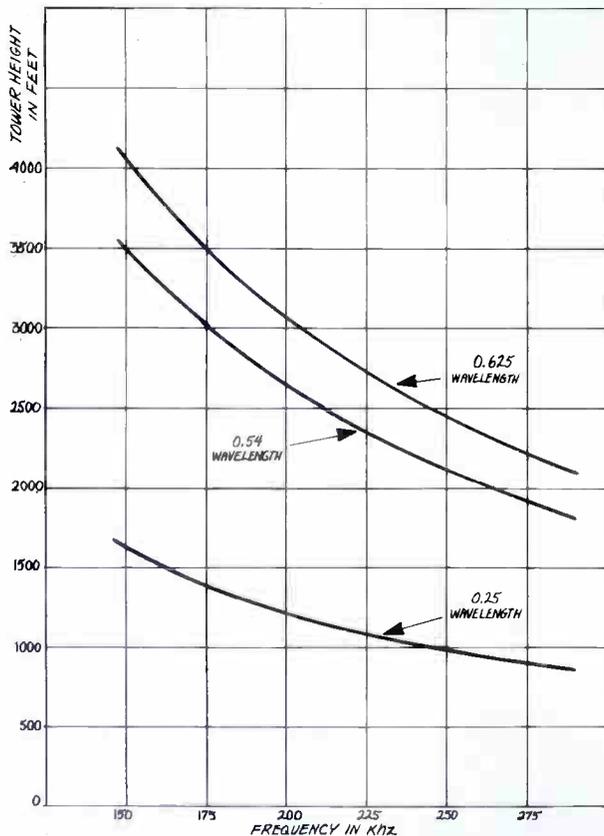

Fig. 3. Antenna heights for frequencies in the LF band, using standard 0.25 wavelength to 0.625 wavelength designs (see story).

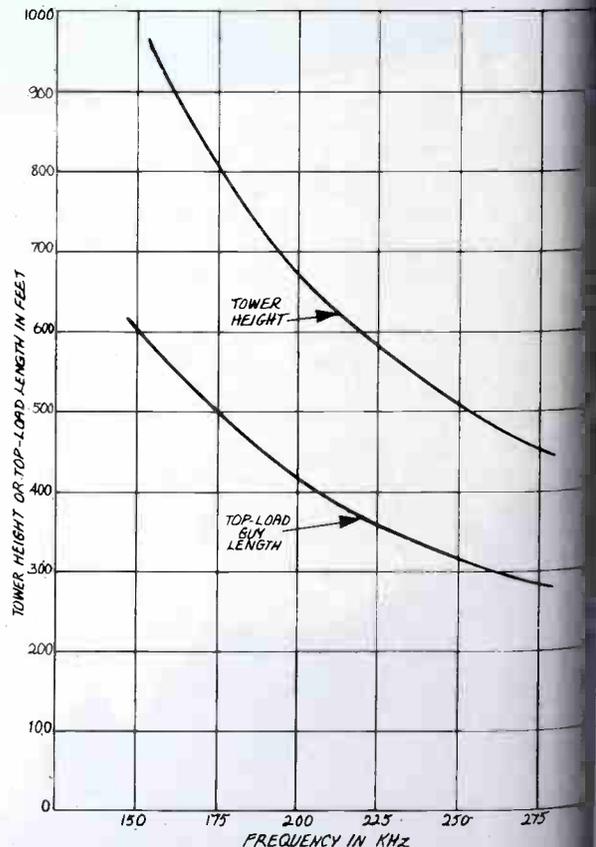

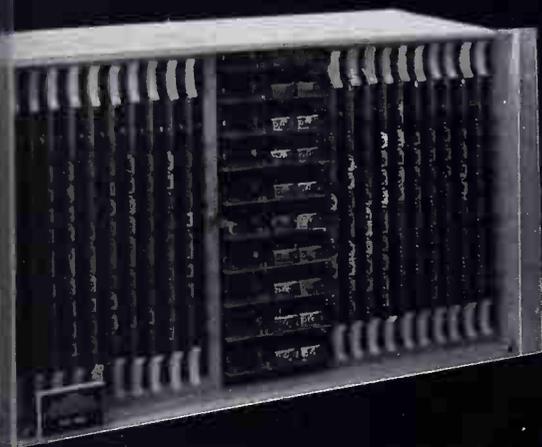

Fig. 4. Antenna heights for frequencies in the LF band, using special antenna design of the VOA in Munich, which has top loading to reduce height (see story).

THE ADC 900 IS

QUALITY!

RELIABILITY is the watchdog of quality management. With many 900 systems now approaching 20,000 hours of continuous operation with no significant downtime or maintenance required, we offer proven reliability.

Significant Features

Exclusive use of high reliability standard and multi-sourced proprietary components.

Only 10 crosspoints per crosspoint module allows in-service maintenance with minimum disruption.

Input oriented crosspoint modules which allow the superior shielding required to maintain extremely low crosstalk specifications between either synchronous or non-synchronous inputs.

Individual, horizontally oriented output amplifiers enable superior shielding between outputs and in-service maintenance with no disruption to other output channels.

Externally accessible control latching and decoding which allows in-service maintenance, no interaction between matrix frames and uses no unique codes or non-compatible addressing schemes. All active control components are plug-in devices.

External control interface to allow use of multiple control panels of different types on a single system.

Standard LED grid matrix status display on all systems gives visual display of crosspoint status at all times.

- Control hold system available to return matrix to a last state condition in event of power failure or dip. Hold times of 20 minutes to 12 hours available.
- Fully redundant power systems with visual, aural and remote alarms available.
- Vertical interval switching standard on all systems.
- Use of an external combining matrix on systems with more than 20 inputs allows complete isolation to the smallest matrix unit (10 x 10) for superb specifications. External matricing simplifies system timing, any input to any output, on large systems.

HIGH-POWER STATIONS

have shown that the height of 0.54 wavelength is the optimum for minimum ground wave vs nighttime sky-wave fading. Also, it is quite commonplace to use top-loading to allow the use of shorter towers with reasonable efficiency.

A good example of this approach is the Voice of America's 1000 kW station at Munich, Germany on 173 KHz. (cochannel with Radio Moscow). This powerful station uses a tower 837 feet high, top-loaded by twelve 512 foot cables which make an angle of 55° with the tower. On 173 KHz the measured base impedance of this radiator is $29.5 + j135$ ohms. The unattenuated field at one mile is 178.9 mv/m. This is not an unreasonable height for an antenna at this frequency. The ground system consist of 360 radials that extend out to $\frac{1}{4}$ wavelength, with 180 of them extending out to $\frac{1}{2}$ wavelength. A description of this installation can be found in the *Proceedings of the IRE* for August 1954, pages 1222 through 1235. Figure 4 shows antenna dimensions vs frequency.

There is also an antenna called the "NORD," used by the U.S. Navy for multi-channel RTTY fleet broadcast at LF. It is basically a folded unipole, with three top-loading guys which are tuned to ground at their far ends. By adjustment of the guy tuning the required bandwidth can be obtained with the use of a tower of approximately $\frac{1}{8}$ wavelength. This approach eliminates the base loading coil or *helix*, which is always a source of high voltage problems in a high power LF installation. The input

TOTAL AUTOMATION cont. from pg. 48

log, during the period when only technical operations are affected, most manufacturers of computer controlled switchers would prefer not to use their storage capacity for this type of information. On the other hand, though it may make the software for technical operations a little more tricky, storing contractual information is no major problem. In fact, some stations that have technical automation but not business automation, have required that the technical system be able to handle some traffic functions.

As it stands now, the interface has made it possible to realize, at least the original concept. Sales orders are entered into the traffic computer and scheduled. As the inventory is exhausted the broadcast day is compiled. Then, it is transmitted automatically to the technical operations computer and machine assignments are made, media is located and loaded, the events are cued and aired and as the data for an "as-aired" log are compiled and transmitted back to the traffic computer for reconciliation with the pre-log and the "FCC" log is printed and invoices completed. But the demands on the systems have grown.

With the "closing of the circuit" some things have been made possible or, at least, easier. Media inventory and film and videotape amortization programs are more feasible. Some engineers are talking about some sort of "automatic" filing system to help keep track of everything and to be certain that nothing gets lost. In some instances, the reconciled log will be so accurate it is

impedance of the NORD, due to its folded feed, is inductive ($R + jX$), and it can be matched to the transmission line with vacuum capacitors. Guy insulation problems are diminished also.

The transmitting plants of super-power stations produce tremendous field intensities close in to the site. For this reason, these plants require location in rural areas away from population centers to avoid environmental problems. Without actually visiting the existing plants and clear channel stations, one can nevertheless be fairly sure that many of them have been subject to residential and industrial encroachment in the years since they were built, and are not now suitably located for conversion to 500 kW or 1000 kW operation. Thus, new plants would be required, and they might as well be built for LF transmission as for MF transmission.

Existing Class IA stations could be converted to Class B's with channels being duplicated to provide limited regional coverage in areas now lacking. But a major sound means engineering-wise for providing national coverage would be the use of LF as outlined here. In the band 150 to 285 KHz 13 channels with 10 KHz spacing could be provided. If 9 KHz spacing like that in Europe were used, 15 channels could be provided. The United States could use 8 of them, with the remainder being allocated by international agreement to Canada, Mexico and other western hemisphere countries.

This LF approach to super-power broadcasting is one which merits serious consideration by the clear channel broadcasters, and one which should be pursued by the FCC through I.R.A.C. to the next world ITU conference. **BM**

expected that the engineer will merely have to sign it at the end of the day to satisfy all FCC reporting requirements. Already people are talking about fewer errors and therefore, fewer make-goods.

In some systems, especially the hardwired system where the computers are in continual conversation and if something should go wrong, the man in master control can query the traffic computer immediately to see whether or not running a make-good would pay off.

As rapidly as things are moving, much still remains to be done. One of the most important future steps in automation will be the integration of networks and locals.

In the opinion of Glenn Sirkis, of Cox Data Service, much of the potential of automation will depend on the type of network/local station integration. He believes that much is to be gained by having the nets provide some sort of cueing data for local automation systems. "Somewhere in the vertical blanking interval seems to be the most likely place," said Sirkis. He recommends that chief engineers and industry groups get together and start working out standards to perform this net/local interface. Another person who feels this way is Steve Smith of KCMO-TV, one of the first people in the industry to thoroughly study automation. Smith says that he is eager to go "total automation" but not until the networks and their act together and start to send some type of signal down the line. Smith believes that any system operating on "clock time" is bound to have a lot of trouble.

As one computer said to the other, "We've come a long way baby, but we've got a long way to go." **BM**

BUILDING FOR YOUR FUTURE.

Inside this facility the most advanced video switching systems you can own are being produced.

By Duca-Richardson.

This laboratory-like building near Denver is specially fitted out for Duca-Richardson, with the finest technical teams anywhere. We design and manufacture standard and custom video switching systems for the television industry. Duca-Richardson is a new name in video switching. Yet we're a company of television industry veterans. We have a long backlog of orders from major customers. And solidly behind us are two nationally-known banking and insurance companies.

Our product line of video switchers includes:

Production Switchers—The 4000 series of standard and custom systems are designed to satisfy most customer requirements. However, if you need

a special or modified switcher we are prepared to meet your exact specifications.

- **Master Control Switchers**—The Master Control switching panel integrates all audio, video, and machine controls on one panel. Audio follow video, separate audio, audio over and mixing is provided on the preset and program buses. Machine controls and computer control inputs are added as special options.
- **Editing Switchers**—These switchers are offered with audio follow video and/or audio breakaway. Special effects,

audio mixing, linear keys with matted and bordered edges are available. Automatic digital controlled transitions are included for generating precise dissolves or fades to black.

- **Routing Switchers**—Large routing systems of video and audio switching modules can be built up to whatever size is required. Dual channel audio is standard, with optional features such as vertical interval switching, input clamping and equalization.

For specifications, quotations and delivery dates write or call Carl A. Hedberg, Manager, Engineering Applications, Duca-Richardson Corporation, 11465 West Forty-Eighth Avenue, Wheat Ridge, Colorado 80033 (303) 423-1300.

Ed DiGiulio Speaks Out: "Let's be fair in our comparisons of ENG with news film."

In a recent interview, Ed DiGiulio (president of Cinema Products, the developer of the famous CP-16 and CP-16R news film cameras) asked for more objectivity by both magazine editors and chief engineers when it comes to evaluating the role of electronic news gathering. "Don't be guilty of knee-jerk reactions," he remarked.

BM/E: Mr. DiGiulio, you've obviously been aware of the extensive coverage *BM/E* has given to ENG during the last 18 months. Do you feel we have gone overboard?

DiGiulio: Certainly ENG is an important topic which you must cover. I do object, however, to what I term an innate or knee-jerk bias in favor of electronic cameras. I have participated in a number of panels discussing ENG developments at SMPTE and other meetings but I have never dealt with the gut issue. Plainly and simply, TV managers and engineers are electronics oriented. Up until now they've been forced to use film for news. All at once they have an alternative and they seem to be going wild in throwing film overboard.

This pro-TV bias is long and deep—and perhaps natural. After all, TV is still a first generation industry. That is, the guys who started it all are still active and calling the shots. But the prejudice against film is almost irrational. Did you know, for example, that for 20 whole years KNXT here in Los Angeles wouldn't buy a film processor . . . It kept hoping film would go away. What I'm objecting to is unbalanced editorial coverage.

BM/E: But news is news. Examples

of how electronic cameras are being used in news is news. How film cameras are used is not. You've got to expect the emphasis on ENG, do you not?

DiGiulio: Yes, but I don't think the kind of articles you are running are objective. Certainly the decision by CBS to make KMOX-TV an all-ENG news operation was rational and intelligent. The experiences gained could be very helpful. But there never was a re-evaluation. Instead, CBS people have gone around telling everyone to convert now to total ENG based on misleading economics. And you've helped their publicity mill.

BM/E: What do you mean misleading economics?

DiGiulio: Nobody can argue with Joe Flaherty and his charts and figures because he set the accounting rules! You can't really amortize both ENG and film across five years and prove ENG is cheaper because the film investment has already been made—the argument presupposes you start from scratch and pick one or the other system which just can't be so. We know, as a matter of fact, that KMOX-TV still buys film—if not for news, for documentaries or other purposes. It seems to me a discussion of economics can't give you a choice of *either* ENG *or* film when in fact both media are needed. Every station has some film equipment and you can add a film camera for \$7-8000. You can't get into ENG for less than about \$50,000.

Another factor is obsolescence. Who's really paying for camera development? Can the industry afford the Microcam after getting only two years out of Minicams? I'm afraid broadcasters are leading ENG camera manufacturers down the primrose path. How are manufacturers going to recover the cost of the earlier versions? There's going to be a hell of a shake-

out coming. The total world market can't support 16 or more ENG camera manufacturers.

BM/E: You do agree though that the

ENG cameras are doing a good job
DiGiulio: Certainly the \$35,000 ILL-gami Minicams and the RCA TK-7 are good cameras as are the more expensive ones—and perhaps some of the new models shown at this year's NAB show will be as good or better. But I do get incensed when I read about Channel 9 in New York winning a news award using a basically limited low quality electronic camera.

BM/E: That was a particular camera manufacturer awarding the station if you didn't read about it in *BM/E* though we did earlier report on the station's experiences using inexpensive cameras. We always try to make clear as to whether a station is achieving 16mm quality or not or at what light levels a camera will operate. In some smaller markets, if all are using lower-grade equipment they can get away with it.

DiGiulio: That's my point! Does the FCC care about color quality? It has technical standards on stability, etc., why not color fidelity? Broadcasters showed an interest in Super 8 a few years back but they rejected it as not comparable to 16mm. Now they eagerly accept something less just because it's electronic. That's what I mean by bias.

BM/E: Hopefully these stations use non-broadcast quality will be of grade. Right now they boast they can get instant news at less cost than film. Isn't that a valid approach?

DiGiulio: I wonder if all these glowing accounts are really valid. Certainly ENG cameras are valuable for instant fast breaking news—and ENG is necessary breakthrough on a score—but does every story call for

ED DiGIULIO SPEAKS OUT

electronic camera? ENG cameras were ideal for covering the LA cops stake-out/shoot-out at the SLA hideout but it was the one man roving film camera that captured Squeaky Fromme's attempt on President Ford's life. ENG camera systems may be mobile but they're not exactly portable. The film camera has a tremendous flexibility that won't be matched until the video camera comes with a built-in microwave transmitter or tape recorder and

that won't be for some time.

When you look at the cost of covering an event live versus the cost of covering an event for later playback, you'll find a big difference. One should take a hard look at these cost differences.

BM/E: Your point on flexibility is well taken. Do you feel film equipment is more rugged than electronic cameras?

DiGiulio: Well, you can literally throw a film camera into the trunk of your car. Electronic cameras need to be handled a little more gingerly, I'm

sure you'll agree. I watched ENG camera equipment manufacturers turn white when their cameras in inexperienced hands are headed into the sun—a burned out Plumbicon can cost thousands. I've seen tape lose contact with tape heads when the recorder is in motion. When you take into account portability and insensitivity to environmental factors, film cameras look pretty good.

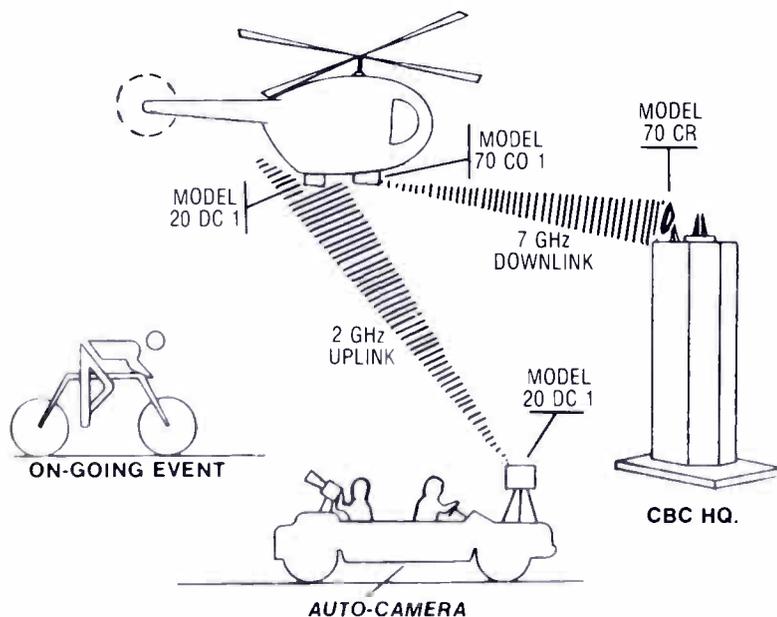

You can't pick your environment when covering the news. The real situation may not tolerate ENG cameras. It's your job to tell the folks that!

BM/E: You feel there will always be a role for news film then?

DiGiulio: I can foresee a day maybe 8-10 years from now when electronic systems will be as light and flexible as film system but for quite some time we should expect a mix. Stations that have gone heavily into ENG such as KSTP, St. Paul, which you write about, continue to buy film cameras. It's more important to know how to get the story than to use the most exotic equipment. Don't forget Eastman Kodak sold more news film in 1975 than ever before.

Look, ENG will grow, there's no doubt about that. My company will be participating in that growth. As you know, we came out with the Steadicam stabilized camera system (incorporating the Brown Stabilizer and using a modified RCA TK-76) at the NAB show (see *BM/E*, June, Page 62 for details). We'll adapt the Steadicam-TV system to more video cameras. The stabilizing support system and the CP-developed ultra bright 3 in. monitor, which can be viewed (with both eyes) even when bright sunlight is impinging directly on the viewing screen, will help promote ENG. We'll be part of the ENG scene even though we'll continue to manufacture the finest 16mm news film cameras. Our Steadicam-TV system featuring the modified TK-76 video camera is available exclusively through Cinema Products and RCA. And, as you may know, we're also authorized to sell the exciting new TK-76 ENG cameras without the Steadicam system. So, I don't want to come across as some rapier trying to cut the legs out from under ENG. My only point is that there are some shortcomings, some limitations to today's ENG equipment and that broadcasters ought to receive a balanced account of the situation from the trade press. I believe that broadcasters would be making a big mistake by committing their station to a *total* ENG news operation. I think that good equipment and dollar sense dictates a balanced approach—a marriage if you will, of the best features of ENG and 16mm film.

A NEW LIVE NEWS GATHERING TV SYSTEM FROM NURAD COVERS THE 1976 OLYMPICS

This system utilizes NURAD *circularly* polarized antennas throughout. Shakedown tests have proven that these antennas eliminate the signal dropout and multipath reflection effects that occur with *linearly* polarized antennas.

16. Simple "torque wheel" for measuring reel torque on audio tape machines.

Wayne Sward, Engineer,
KALL/KALL-FM, Salt Lake City, Utah

Problem: To adjust feed and takeup reel torque on audio tape machines quickly and accurately without resorting to strings and expensive spring scales.

Solution: A torque reel was fabricated by gluing a 3½ ounce lead automobile tire weight onto an empty 7-inch plastic tape reel. A cardboard scale was fastened to the tape reel and calibrated to read directly in inch-ounces of torque, both clockwise and counterclockwise. The tire weight was accurately weighed on a scale at the local Post Office, giving a weight *W*. With the center of gravity of the weight at distance *R* from the center of the reel, as shown in Figure 1, the torque exerted is given by:

$$T = (R) \times (W) \times (\sin \Theta),$$

provided the tape machine is mounted vertically.

The torque reel is used by placing it on the feed or takeup spindle of a

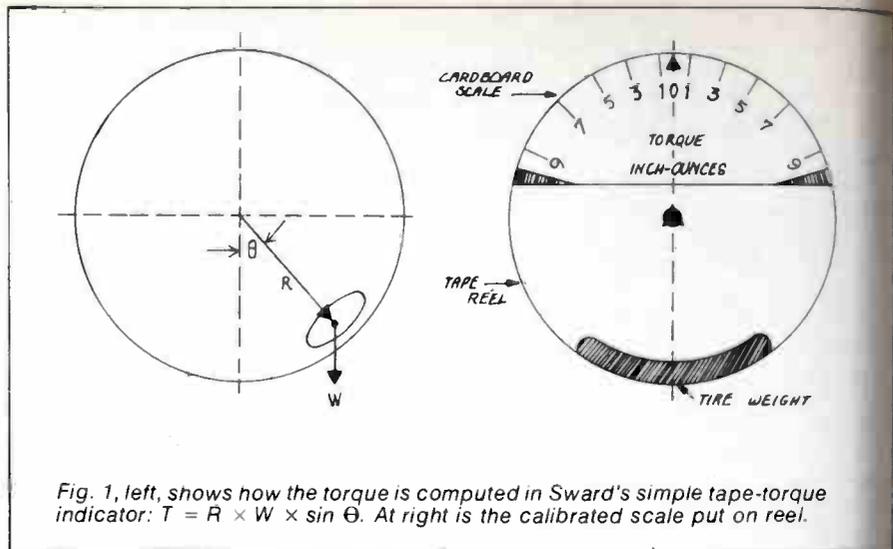

Fig. 1, left, shows how the torque is computed in Sward's simple tape-torque indicator: $T = R \times W \times \sin \Theta$. At right is the calibrated scale put on reel.

vertically-mounted tape recorder. The weight is placed vertically down and the position of "0" on the scale is marked with a piece of masking tape temporarily stuck on the recorder front plate. The recorder is then energized and the torque adjustments made until the reel torque measures within the recorder manufacturer's specifications. A higher maximum torque may be measured by using a heavier weight or a larger tape reel.

Caution: Do not allow the weight to rise above a horizontal line through the reel center during torque adjustments: a spinning unbalanced weight may damage the recorder!

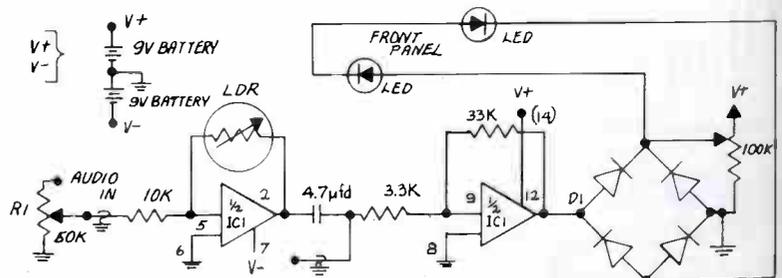

Torque reel simplifies torque adjustment of tape machines

17. Inexpensive High-Quality Audio Compressor Using LED and LDR.

Hue Beavers, CE, KRIZ, Phoenix, Ariz.

Problem: To design an audio compressor of broadcast quality using inexpensive components.

Solution: The heart of this compressor is an LED and LDR (light-dependent resistor). This pair serves as the gain rider in the circuit. LED's are quite inexpensive and easy to obtain. Coupling this with their frequency re-

COMPONENTS

- IC1—1458 OP AMP (DUAL 741)
- D1—BRIDGE (RADIO SHACK 276 1151 OR EQUIV.)
- LDR—PANCAKE CdS₂ (RADIO SHACK 276-116, CLAIREX CL-605L)
- R₁ 50K AUDIO TAPER POTENTIOMETER
- R₂ 100K MINIPOT
- LED'S—"JUMBO" PAK YELLOW, GREEN OR ORANGE [NOT CRITICAL]

Hue Beavers shows how to design an audio compressor using inexpensive components.

...onse from DC to ultra audio fre-
quencies, light emitting diodes are
...r ideal as radiators of light that
...ries linearly with applied audio volt-
...e. The cadmium sulfide photocell
...DR) serves as recipient of this light
...d has an inverse illumination-
...sus-resistance property.

Other elements of this compressor
circuit are familiar, no doubt, to many
experimenters. Referring to the sche-
matic, it is seen that the op-amp used
is a dual 741 or 1458. One half of the
1458 is the gain-controlled stage. The
DR is the feedback resistor of this
stage. The second half of the 1458 is a
linear amplifier used to drive the LED.
Rather than drive the LED directly
from the output of this stage, a bridge
rectifier is used to rectify the AC
(audio) to a pulsating DC. In this way,
the 1458 is partially protected from the
reverse short circuit the LED represents
while conducting. In actual use, there
is a second LED in series with the pri-
mary unit. This second unit is mounted
on the front panel, providing a relative
indication of the amount of limiting
occurring at any given time. (A 0-10ma
DC current meter could have been
used.) It can also be seen that there is a
potentiometer R2 connected to the
"+" output of the bridge rectifier.
This serves as a threshold adjustment
for LED conduction.

As this circuit is dealing with audio
and subaudio frequencies, layout and
wiring is not critical. Perf-board con-
struction with flea clips for ties points
is ideal. If space is at a premium, the
entire circuit may be constructed on a
9-pin Experimenter's IC Socket
adapter. (Radio Shack #276-024)

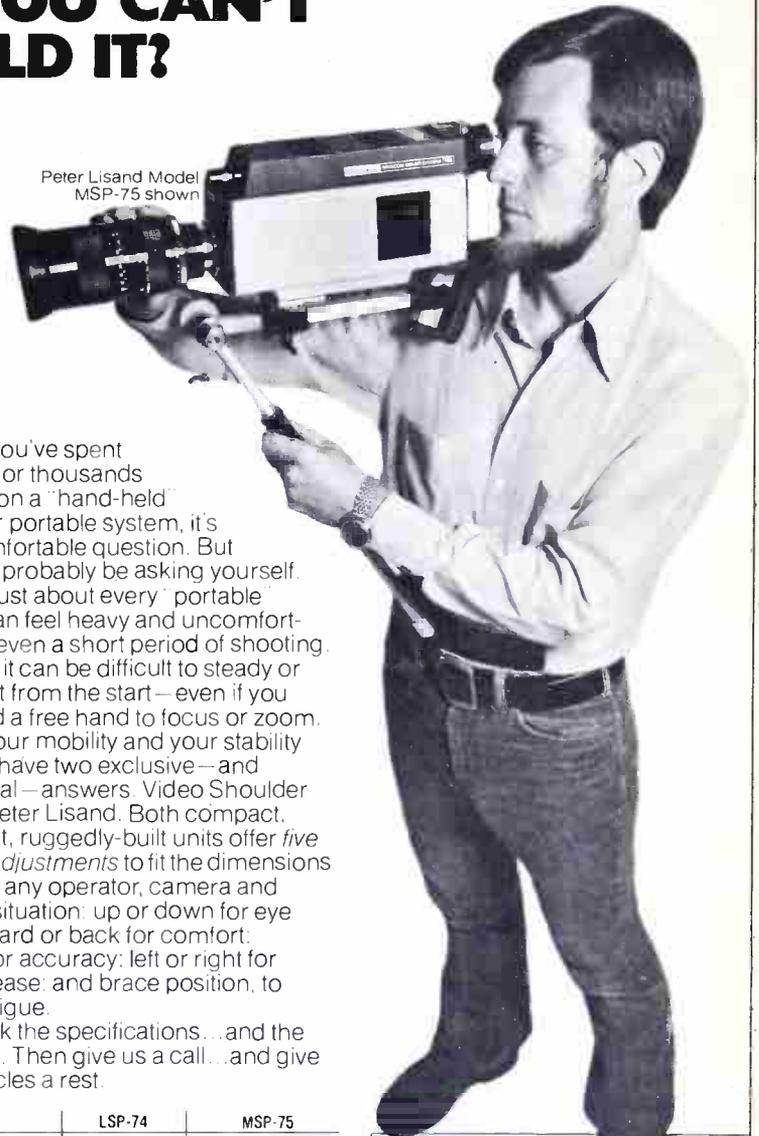

Care should be taken to wire the
bridge rectifier correctly. Failure to do
this will result in an inoperative LED
and no compression.

Coupling the LED and LDR to-
gether may be accomplished in many
ways. If a light-tight enclosure is used
for housing, the LED and LDR may
simply be placed physically close to-
gether. It should be remembered that
you need maximum illumination from
the LED on the sensitive surface of the
DR. For optimum performance, the
air should be fastened together with a
small section of heat shrink. This will
insulate much of the outside light
leakage and assure maximum light
transfer.

When the unit is completed, connect
two 9 volt batteries as shown in the
schematic. With no audio or input
signal applied, adjust R2 for a dim,
barely visible light on the front panel
LED indicator. This sets the threshold
of limiting. In this way you are assured
low level audio is treated in the same
manner as loud passages. At this point
make the input and output connections

WHAT GOOD IS A HAND-HELD CAMERA IF YOU CAN'T HOLD IT?

Whether you've spent hundreds or thousands of dollars on a "hand-held" camera or portable system, it's an uncomfortable question. But one you'll probably be asking yourself. Because just about every "portable" camera can feel heavy and uncomfortable after even a short period of shooting. Or worse, it can be difficult to steady or pan—right from the start—even if you don't need a free hand to focus or zoom. To keep your mobility and your stability intact, we have two exclusive—and economical—answers: Video Shoulder Pods by Peter Lisand. Both compact, lightweight, ruggedly-built units offer *five separate adjustments* to fit the dimensions of virtually any operator, camera and shooting situation: up or down for eye level; forward or back for comfort; leveling, for accuracy; left or right for shooting ease; and brace position, to reduce fatigue.

Check the specifications...and the low prices. Then give us a call...and give your muscles a rest.

| MODEL | LSP-74 | MSP-75 |
|---|-------------------------------------|--|
| Recommended cameras: (with or without pistol grips) | All "hand-held" monochrome cameras. | All "hand-held" color and monochrome cameras, including optional and non OEM lenses. |
| Recommended maximum capacity: (camera and lenses) | 8 lb. | 14 lb. |
| Shoulder pod weight, approx.: | 2 1/2 lb. | 4 1/2 lb. |
| Shoulder brace width: | 1 1/2" | 3 1/4" |
| Camera arm: | 1/2" square | 3/8" square |
| Strut shaft diameter: | 1/2" | 5/8" |
| Belly brace length: | 9" | 11" |
| Strut hand grip: | no | yes |
| Waist belt provided: | yes | yes |
| Price:* | \$129.95 | \$149.95 |

GREAT IDEAS

to the compressor. For proper operation input audio should be high level, such as the output of most pre-amps. The "tape out," audio available on most receivers and amplifiers, is more than sufficient to drive the compressor. When audio is applied and the gain control is advanced, expect 1-1.5 volts audio output. The front panel LED should be flickering and varying in intensity with relation to the loudness or amplitude of applied audio. Provided everything is functional, observation (on a VU meter or other suitable indicator) will indicate processed audio with high average content.

The attack time is such that the unit will not qualify as a "peak limiter." The attack time is rapid enough, however, to prevent excessive tape saturation or overmodulation: it is in the neighborhood of 5 m/sec and is dependent on the amount of compression. The LDR takes about 2 seconds to recover fully after 30 dB limiting. For lesser amounts of compression, release time is correspondingly faster.

The amount of compression used is certainly an individual choice. As a guideline, it is recommended that music with large dynamic ranges be

compressed only lightly so as not to upset the color and sonic balance of the work. Most popular music, on the other hand, may be compressed more. Poorly mixed or improperly recorded programming often benefits greatly from the use of compression.

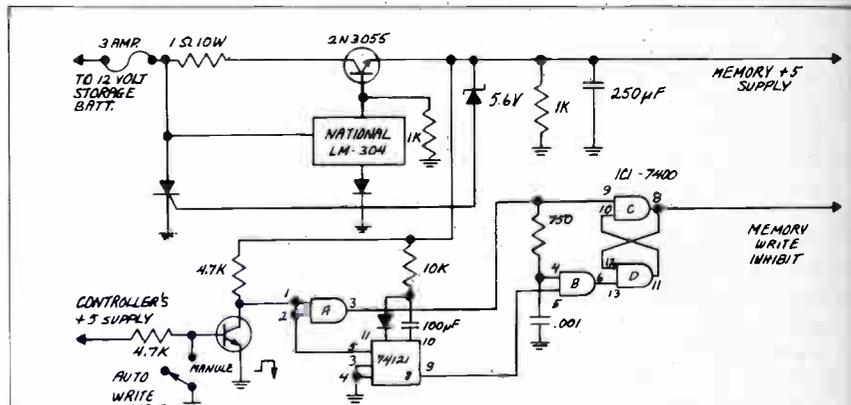

18. Extending the back-up battery on an automation system from 20 minutes to two hours or more.

John Hartwell, Production Engineer, KHSL-AM, Chico, CA

Problem: To extend the 20 min. back up battery to two hours or more, leaving capability to work on the digital controller without powering down the memory on an IGM RAM Automation system.

Solution: Install a second +5 volt regulator to power only the memory and change the back-up battery circuit over to power only the memory's +5 volt regulator.

I used the circuit in the figure provided for this modification. The +5 volt regulation is accomplished with a national LM-309 regulator with a diode in its common lead so that the voltage of the regulator is one diode

John Hartwell shows how to extend the back-up battery on an automation system.

Vega Wireless Microphone Systems Ahead of Their Time, And Still Improving

- Crystal controlled, VHF operation for stability and low interference.
- Ultra-sensitive, high performance receivers have 4-cavity, helical-resonator preselectors for sharp selectivity and low distortion.
- New Model 77 transmitter has many improved features, Lemo "Quick-Loc" mic connectors, sturdy noise-free sealed case to resist moisture and corrosive body acids, separate battery compartment, and selectable output power and dual-function meter.
- New single-package and 4-channel diversity receiving systems let you handle severe conditions with extra convenience.

From our low-cost "Orator" model, to our hand-held "Performer", Vega has always been the leader in frequency response, dynamic range, low distortion and effective operating distance. Our transmitters now have all-new compressors that gently avoid overmodulation without harsh clipping, yet won't "latch up" even on gun shots. The unit also has a dual-function meter and selectable power output of 25mW or 100mW. All receivers have multi-function metering and headphone outputs for complete monitoring capability.

In response to popular demand, the Lemo "Quick-Loc" mic connector is now standard, yielding positive contact and longer cable life. Additionally, the Lemo connector will supply bias voltage for electret-condenser mics, eliminating external battery requirements. You can use the professional mic of your choice.

Vega receivers operate from AC, battery, rechargeable battery, or external DC power. There are many more features and products we'd like you to know about, so SEND FOR OUR NEW CATALOG today.

Vega

Division of Cetec Corporation
9900 Baldwin Place — El Monte, California 91731
Telephone: (213) 442-0782 TWX: 910-587-3539

op higher than 5 volts. This over-
voltage is dropped in the base-emitter
junction of the 2N3055 transistor that
is used to increase the output current of

LM-309. Over-voltage protection
is accomplished by the 5.6 volt zenor
diode and SCR, so that when the +5
voltage rises above the 5.6 voltage level the
zenor diode will conduct, firing the
SCR thus shorting out the input voltage
to the regulator and blowing the 3
amp fuse and protecting the MOS
memory. The rest of the circuit in the
figure allows for the monitoring of the
digital controller's +5 volt supply and
inhibits any power-up noise pulses
from changing any of the data stored in
memory. The 74121 one-shot pro-
vides the necessary delay so the con-
troller's power-up reset pulse will not
affect the memory.

In order to put this idea into use on
an IBM RAM Automation system
some modifications must be made to
the mainframe (DR.NO. 7513-9021),
the memory board (DR.NO. 7513-
1011), and the RAM I/O control board
(DR.NO. 7513-1051).

1. On the mainframe wire the +5
voltage regulator that will supply power to
the digital controller to the +12 volt
regulator that supplies the battery's
 trickle charge, thus bypassing D3.
Then connect the input to the
memory's +5 volt regulator through

the existing battery switch.

2. Move the +5 volt power on the
memory board from AA2, BA2, and
CA2, to AB2, BB2, and CB2, and add
the necessary wiring from the reg-
ulator to the audibuss.

3. Modify the memory board by
disconnecting IC-70 pins 13, 10, 5,
and 2 from IC-70 pins 12,9,4, and 1,
then reconnect them all to IC-72 pin
12. Then connect IC-72 pin 13 to BN1
of the audibuss with a .001 bypass ca-
pacitor to ground. BN1 of the audibuss
now becomes the write inhibit line and
must be connected to the added circuit
as in the figure.

4. So that when the digital con-
troller's power is restored the
clockskin flip-flop will reset (normally
reset when the memory clear switch is
closed) the following must be done on
the RAM I/O control board. Dis-
connect D20 from the memory clear
switch and connect it to the Power-up
Master Reset line. Break the trace be-
tween IC-19 pin 1 and IC-20 pin 1 and
add a diode across the break, cathode
going to IC-20 pin one. Then add a 1K
resistor from IC-19 pin 1 to ground.

A note about Great Idea No. 8 Videotape Delay

Al Szaglak of WKTV showed how to
use AVR-2's for videotape delay.
He reported Ampex 1200s wouldn't
work because of uneven tape ten-
sion. Recortec, Inc., 777 Palomar
Ave., Sunnyvale, CA 94086 writes
that if Ampex 1200s are modified
with Recortec's Reel Servo Mod-
ification (R-MOD), tape tension will
be improved so that these trans-
ports can be used for four seconds
of delay.

(John Linebarger, WREG-TV,
also writes that Szaglak's method
does not work with RCA VTRs.)

19. Hand-held demodulator for determining signal-free periods when reading antenna tower currents.

GREAT IDEAS

directional array during normal programming periods, by using a device that shows when the carrier is unmodulated (per FCC rules).

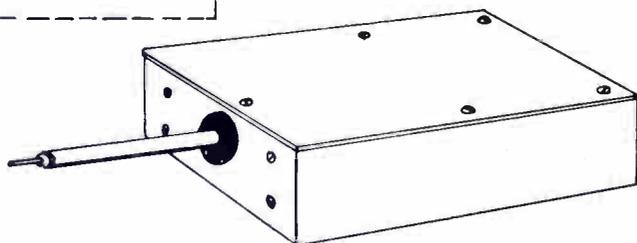

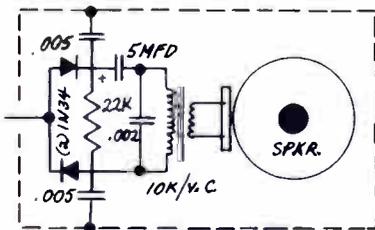

Solution: A demodulator was built in a small enclosure which fits in one hand and contains a speaker. Head phones are impractical as they make the device very unhandy to use or carry. It is compact enough to be car-

ried with the tower keys and, when reading the meters, held in the hand while touching the probe to a convenient ground (such as a bolt head on the tuning unit cabinet).

As indicated in the schematic the unit is enclosed in a metal 'handi-box' measuring $2\frac{1}{4}'' \times 3\frac{1}{4}'' \times 1\frac{1}{4}''$. A $1\frac{3}{16}''$ punch was used to make a hole in one end behind which a piece of rigid insulating material was bolted and a hole drilled concentrically for mounting the probe which is a $1\frac{1}{2}''$ length of $\frac{1}{4}''$

metal rod drilled and tapped for a 6-32 thread. A needle type test-probe was screwed onto the end. A probe could be more simply made of a 2" bolt filed to a point. The top face of the box was cut out leaving a $\frac{3}{8}''$ border for mounting a $2\frac{1}{8}''$ by $3\frac{1}{8}''$ piece of per board behind which the $1\frac{3}{4}''$ speaker was placed. Some of the small holes over the speaker cone were enlarged by drilling.

The component values specified provide adequate volume and clarity with our 5kW and 1kW powers. Higher power should cause overloading a pot can be substituted for the diode load resistor and/or a series padder can be inserted between the probe and the diode junction to limit the RF.

Hand-held demodulator by Ken Blake for determining signal free periods when reading antenna tower currents.

20. Readily-available high-accuracy calibration source for RF bridges.

Frank S. Colligan, A.D. Ring Assocs., Washington, DC.

Problem: RF bridges are highly reliable instruments but no instrument is infallible forever. Occasionally one needs to check the resistance ca-

tion of an RF bridge especially when a common point thermoammeter has been behaving suspiciously. In accordance with Murphy, the time of greatest need always seems to be within 15 minutes of sign-on time.

Solution: An excellent source of resistance calibration is contained within the modern-day antenna monitor at the input ports. The inputs are terminated in precision 50-ohm resistors that are well within 1% of 50 ohms. The RF bridge may be checked by measuring these input ports on the antenna monitor. As a precaution be sure the antenna monitor selector positions are set to read the usual information on the particular input the bridge calibration is being checked on at a given time. The value of 50 ohms is guaranteed when the rest of the monitor circuitry is bridged across the terminating resistor.

Full-time programming. Also: format consultation, market studies, ID's, promotion plans, engineering recommendations.

Format Names — Type of Music

"Beautiful Music" (Supplied on 10½ reels, each in four segments, 12 to 14 minutes each. Station can run A-B. Includes "beautiful music" orchestras of BBC on exclusive contract.)

Productions

49 Regal Row
Dallas, TX 75247
214-634-8511

Scope of Service

Full-time programming. Also: marketing research, sales development, commercial production services, total format concept."

Format Names — Type of Music

"Beautiful Music, Series 1000-C" (Sequence and blending adjusted to market, with mix of uptempo instrumentals, slow instrumentals, vocals. Package includes ID's, bridges, promos, etc.)

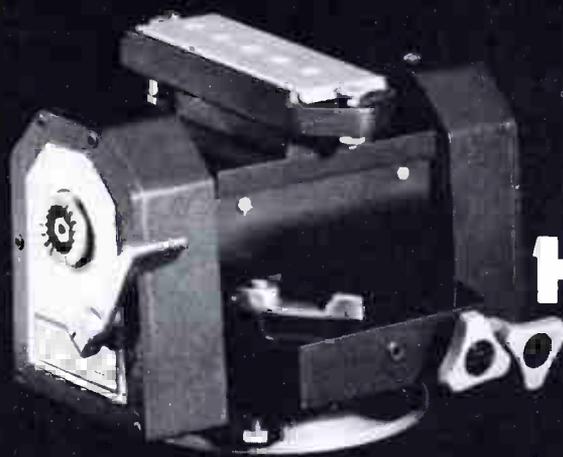

"Beautiful Music, Series 2000-S"

(Allows for control of intensity in difficult market situations)

"TM Stereo Rock" (Rock aimed at young adults — not hard rock)

"TM Country, Series 4000-C" (Blend of old and new country hits)

Some special-program suppliers: Good Music Co., Hollywood; Ray Norman Productions, Glenwood, NJ; O'Connor Creative Services, Universal City, CA; Progressive Radio Network, Bronx, NY; Purcell Productions, New York City; Wm. B.anner, Memphis, TN. A full-time programmer we missed above is Concept Productions, Sacramento, CA.

ITE's NEW HYDRO HEAD

**Control so smooth
it feels like your camera is floating.**

Ease into the smooth, effortless world of camera control with ITE's new H5 Hydro Head.

Designed specifically for today's portable, lightweight ENG and studio cameras, the H5's hydraulic dampening provides natural, jerk-free pans and tilts — especially in tight location assignments.

Compare these outstanding features against other heads and you'll see why the H5 Hydro Head is a natural choice:

- Low cost — only \$850
- Rugged cast aluminum construction handles up to 50 lb. camera load
- Lightweight
- Quick-release camera mount plate is permanently attached to camera.
- Independent lock-in friction controls for both pan and tilt
- Adjustable control handle
- Counter balance torsion spring for all center-of-gravity requirements

Make it easy on yourself *and* your camera. Start using the ITE H5 Hydro Head today . . . you'll find you've never had it so smooth.

Portable SMPTE Time Code Generator TCG-80P, measures to only 1 3/4 in. x 9 in. x 8 7/8 in., and is designed specifically for ENG. Allows on-the-spot edit code indexing of 'wild' videotape footage and is powered by an external 12V dc source, 110V ac, or self-contained optional rechargeable NiCa battery. **KAITRONICS 300**

Multipurpose Audio Test Set Model 4400, consists of a generator and a receiver. The generator section incorporates a multi-waveform function generator, pink noise source, log sine wave sweeper and comb generator; has facilities for tone bursts, a +30 dBm balanced output capability and very low distortion. The receiver section

contains an autoranging digital level meter reading in dBm RMS, an autoranging digital frequency counter, a spectrum analyzer, a band pass, band reject, high pass, low pass filter and a four channel digital memory to store response plots. Under \$3000. **AMBER ELECTRO DESIGN, LTD. 301**

Video cassette changer-programmer, Video Movie Player-6 (VMP-6), is designed for market needing more than three hours of automatic un-repeated programming. Plays from one to six 3/4 in. cassettes repeatedly, or on schedule, to a built-in 24-hr. timer. Cassettes play in automatic rotation, returning to the first cassette whenever an empty bin is encountered. Cassettes are automatically rewound and can be tone programmed to advance to the next cassette at any time, or go into a "wait" function while external source provides programming such as announcements or commercials. Player is intended for CCTV, cable, or industrial markets. \$3,495. **SYSTA-MATICS, INC. 302**

Fill Light of compact, die-cast design is equipped with a high brightness reflector that delivers 135 fc at 10 ft. covering a 12 ft. x 10 ft. area. Options include 4-leaf barn door, and uses a family 500-, 750-, and 1,000W, 120V lamps. **BERKEY COLORTRAN. 303**

Audio cartridge tape reproducer, Type 20, has been designed to accept all NAB standard A, B, and C size cartridges. Measures 3 1/2 in. high x 10 1/8 in. wide x 13 1/8 in. deep. Available in mono and stereo and are customarily stacked one above the other for desk or custom studio panel mounting. Furnished with a primary (1 kHz) cue and optional secondary (150 Hz) and tertiary (8 kHz) cue. Cue tone detectors use reliable L-C networks to provide relay contact output information. Precision head assemblies consist of 3 independent, non-magnetic tape guides and head mounting blocks with screw adjustments for height, zenith, and azimuth. **Beaucart Division, UMC ELECTRONICS CO. 304**

Video Noise Meter, Model VNM-428, permits rapid, accurate measurement of signal-to-noise in any standard video waveform, using only general purpose oscilloscope with bandwidth of at least 5 MHz. Stable design and built-in calibration insure accuracy to better than ±0.5 dB throughout range of 20 dB to 55 DB, with SNR shown directly on a

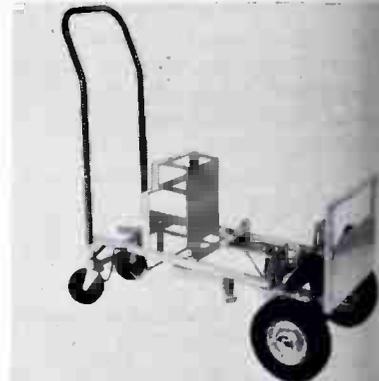

large LED display. **LENCO, INC. 305**

Equipment protector, will clean up transient-surge overvoltage on ac power lines, and provide protection for electrical and electronic equipment. The model ACP 100C will protect equipment from the destructive over-voltages arising from switching inductive loads, power company switching, contact arcing, static discharge, induced lighting and continuous over-voltage conditions. The 100% solid state dual stage protector during

hazardous transient overvoltage conditions automatically operates in 5 ns control up to 10,000W of transient overvoltage energy to within a safe level. **TRANSTECTOR SYSTEMS. 306**

Video Crash Cart, features rugged frame of welded, tubular steel, designed to transport and protect the Sony

VO-3800 video cassette recorder, two extra cassettes, AC-3000Ac adapter the backpack for an Ikegami HL-33 or HL-35 camera, plus 50 ft. of connecting cable. **CAMERA MART. 307**

Precision color picture monitors for NTSC and PAL Television standard models 670A-1 and 671 (PAL), use a 17 in. Trinitron® to present an enhanced picture using a variable aperture control. Consistency is achieved through use of simple-to-convert Trinitron, excellent clamp stability and a highly regulated EHT. Less than 1% change in raster size will occur with large APL changes; blanking and black level are extremely stable too. Factory set for an accurate white balance D6500 deg. but adjustable to US standards. \$2690. **TEKTRONIX. 308**

Solid state 10W UHF translator have been type accepted by the FCC and combine an existing 1W translator and a newly developed 10W UHF amplifier, containing hybrid-contained UHF amplifier modules. The UHF amplifier provides a minimum 1f 15 dB gain, requiring only approximately 3 mW of drive to reach its rated output. High gain figure insures that the driver translator is operating in a power region where it will not continue excess intermodulation or sync distortion. **ACRODYNE INDUSTRIES, INC. 309**

Dual Purpose light meter designed for television studio use is calibrated "low" and "high" range buttons. Range covers 0 to 50 fL, and is c

brated to suite raster light for setting peak white color and monochrome monitors. The other range is scaled from 0 to 10 fL, and is calibrated for continuous light so that it can be used for rapid checks and comparisons of set lighting. **POWER-OPTICS, INC. 310**

Wireless microphone system uses wallet-sized, 14 ounce transmitter which can be easily concealed on the body to provide complete freedom of movement. Circuit design techniques assure that the amplified sound will be

true high fidelity without any signs of fading, interferences or channel cross-talk. Fade-free reception is obtained by the automatic diversity switching of two antenna systems for optimum signal selection. Operates in relatively unused 947-952 MHz frequency band.

50 mW of transmitter output power permit the ultra-sensitive receiver to pick-up a usable signal within a minimum 500 Ft. range. Up to 15 channels may be used. Flat audio response from 50 Hz to 15 kHz and SNR greater than 60 dB. Two versions are available, RM-100 and RM-102. **THOMSON-CSF LABORATORIES, INC. 311**

Video filter has a unique response in the dc - 10 MHz frequency range which provides a flat frequency output when used with an ordinary envelope detector or in vestigial sideband transmission as found in television broadcasting. This Nyquist-Slope Video filter provides amplitude equalization at baseband and can be universally used without adjustment with detector circuits tuned to any VHF or UHF channel. **COMARK INDUSTRIES, INC. 312**

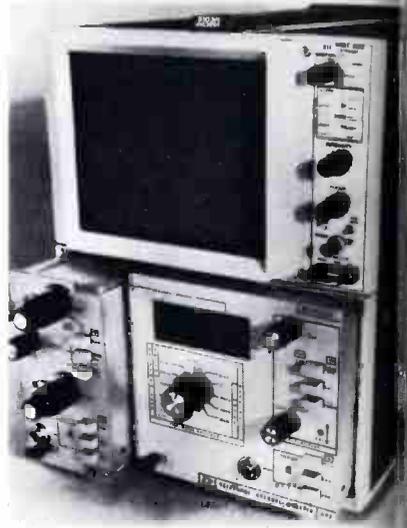

A **dc to ac inverter** designed to meet power and environmental conditions such as those required for microwave tv transmitting equipment on board mobile vans has been introduced. The equipment is designed to operate over a wide range of input voltages, especially low voltage as may be encountered in extremely cold weather or in the event of alternator failure or discharged vehicle battery. **ADVANCE CONVERSION DEVICES COMPANY. 313**

Stereo Sound Britener, designated Spotmaster CLE-FM, combines compressor/limiter/expander functions in one compact unit. Employs unique signal processing that simultaneously provides automatic level control and overmodulation protection. Requires only two controls: The Average/Peak

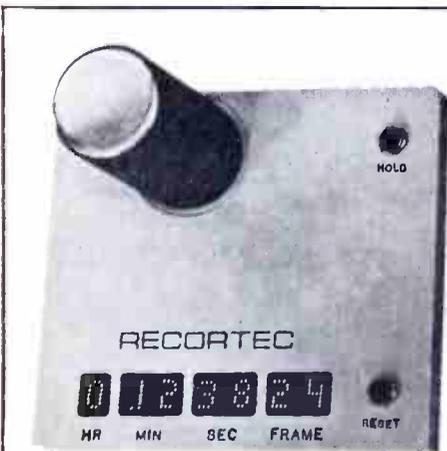

Ratio control and, The Return Ratio control; has three switch selectable models, Normal, Limit Only, and Te **BROADCAST ELECTRONICS, INC. 314**

Audio analyzer system with a combination of measurement modes, including stereo phase and level

ferences is offered in one compact instrument. The ROR 300 System provides a digital readout, for each type measurement, in addition to the instrument's scope display, so point-by-point as well as swept measurements are possible. It is suited for portable use in field maintenance with its built-in frequency meter, level meter, noise meter, and distortion meter. Numerous models with various configurations and prices are available. **W&G INSTRUMENTS, INC. 315**

(9 x 3) "Mic-Splitter," is designed to split up to nine microphones, three different ways. Each unit has three outputs for every input. Other features include male and female "XLR" type connectors, Sescom transformers with isolation resistors, phase reversal and ground lifter switches. \$1045. **SI COM. 316**

THEY'RE EVERY MICROPHONE YOU EVER WANTED.

We've taken the latest advances in electret technology one step further. By combining them with advanced acoustic technology to make professional condenser microphones more portable, more practical and less costly. A lot less. The secret is our "family" concept. One common powering module (PM) serves three different impact heads: omnidirectional (ME20), cardioid (ME40) and shotgun (ME80). Thus, for most studio and location situations, no longer necessary to carry three different microphones. Or buy three different complete units. Each head contains its own microphone capsule and "point-end" electronics, all exactly matched to its own precisely-controlled acoustical environment. Resulting in the first electrets with response and directionality to rival our famous RF condenser models. Small but the most critical applications.

The Powering Module, runs on a single 5.6V battery, or phantom-powered directly from your recorder, amp or other auxiliary equipment. A miniature LED monitors power and indicates proper voltage. Connection to amps, mixers, etc. is balanced* impedance via a 3-pole Cannon XLR connector. Best of all, of course, is the great versatility. In a matter of seconds, you screw on whichever head you need and go! If all this sounds good to you, call or write us. We have a lot more good things for you to hear.

Powering module and heads available separately. Prices subject to change without notice.

*Unbalanced version also available

lation rather than the more common average-cost type model.

In a study, "Estimation of an Urban Cable Demand Model and Its Implications for Regulations for Major Markets," supported jointly by the FCC and the Tele-communications Program of the National Science Foundation (NSF), findings indicated that there is not enough demand where there is basically good reception and a number of signals available.

According to the study, the real impediment to the development of urban cable is not federal regulation, but the higher market costs and reduced demand.

One of the few points of agreement in the conflicting studies was that pay TV appears to have the best future.

Theta-Com Drops Cable Line

Studies, such as the two reported above, could leave one wondering whom to believe. Theta-Com, a subsidiary of Hughes Aircraft and a major manufacturer of cable television equipment, has apparently made up its mind and decided to phase-out its CATV equipment operations.

James J. Sutherland, Hughes vice president and Theta-Com board chairman, said that the company will no longer actively pursue sales of cable TV products. It will, however, continue to provide spare parts and maintenance for existing customers and continue its AML microwave product line.

The decision, said Sutherland, was made because CATV operations have not been profitable for some time and conditions in the CATV industry do not indicate an improvement in this situation in the foreseeable future.

The AML product line will continue but be moved to the Los Angeles area.

FCC Amends Fraudulent Billing Rule

A new statement of the rule against fraudulent billing says, in part, that no licensee shall "knowingly issue or knowingly cause to be issued" any bill, invoice, affidavit or other document containing false information about the amount charged for broadcast advertising, about the quantity broadcast, or about the time of day or the date broadcast. A new subsection of the rules prohibits licensees from giving a program supplier any document with such false information. The FCC reiterated its seriousness on the subject of fraudulent billing, but said it might not

find a violation in cases in which a licensee did not have knowledge, or the false billing resulted from an occasional mistake, not indicating a pattern or where reasonable diligence on the part of the licensee would not have uncovered the matter. (Docket 20499)

\$199 USA TV Camera

GBC Closed Circuit TV Corp., long importer of cameras for closed circuit TV (and particularly surveillance) applications, has begun production of new high performance low cost units in its Princeton, N.J. plant.

Because of increased demand and changing world conditions—GE expects to sell 10,000 annually—the company says it can build a product with more features and better specifications at a low cost than can off-shore suppliers. The new solid state CTC-3000 camera has 600 line resolution, 10,000 to automatic light compensation, a justable white clip, automatic voltage regulation, and a 16mm f/1.6 "C" mount lens. It sells for \$199.50. The separate mesh vidicon tube is still imported.

B Blasts FCC on Fairness Rulings

the FCC found 8 of 13 California
stations and a West Virginia sta-
in a separate action, in violation of

the fairness doctrine, the NAB accused
the FCC of overstepping its authority
regarding the rights of broadcast jour-
nalists to exercise their "best judge-
ment and good sense."

In the California case seven activists
groups complained to the FCC that the
radio stations failed to fulfill their re-
sponsibilities under the fairness doc-
trine by airing certain paid announce-
ments by the Pacific Gas and Electric
Co. The complainants held that the
spots were controversial in that they
pertained to the construction of and use
of nuclear power plants and, as such,
the stations did not provide adequate
time to opposing viewpoints.

In the West Virginia case, WHAR-
AM, Clarksburg, was found to have
violated the fairness doctrine for failing
to cover "adequately the subject of
strip mining," a subject of vital interest
to that audience.

The NAB sees the FCC order in the
California case as a "radical depar-
ture" from its own Fairness Report
which states, in part, "we (the FCC)
firmly believe that the public's need to
be informed can best be served through
a system in which the broadcasters ex-
ercise wide journalistic discretion,"
and that the FCC role is limited to de-
termination of reasonable action and
good faith.

Reduce your replacement costs with Beau audio heads.

Mono Heads: \$19.00

Stereo Heads: \$69.50

From the maker of Beau motors and Beaucart cartridge tape machines comes a broad new line of long-life audio replacement heads. Cost savings techniques and quantity production permit the introduction of moderately priced, quality audio heads to the replacement market. Remember: These tape heads fully meet all applicable NAB cart machine standards.

Beau audio heads are available from stock and may be used in Ampro, ATC, Beaucart, Collins, Garron, Gates, ITC, RCA, Sono-Mag, Sparta, Spotmaster, and other popular machines. Order as follows:

The finest multi-core studio and field camera system ever produced by Philips.

... means the finest multi-core studio and field camera system ever produced.

... the decade since Philips re-invented color with the Plumbicon* tube, its PC-60 and PC-70 have successively set the reference standard for broadcast performance. Under Philips leadership, that standard has steadily improved to today's ultimate—the LDK-25.

... what Philips has again leapfrogged the competition can convince no one who knows broadcast cameras...since we used Plumbicon* technology. After a decade of refinement and improvement Philips is still the *only* company that manufactures all of the critical picture determining components—computer-matched yokes, beam splitting and deflection circuitry and Plumbicon* tubes. The *only* company that can design each component for optimum performance of the entire camera system. These advances of superior Philips design and in-house component capability, offer you unsurpassed stability, picture quality and value.

... her, at Philips, we offer you options that are optional. The LDK-25 you buy is a custom unit, equipped

with the automatic features you select...not a 'loaded' factory package.

But you can't just read about the LDK-25...you've got to experience it.

Only a demonstration can show you how our anti-comet-tail Plumbicon* tubes handle highlights up to 32x normal peak-white level without blooming or streaking—and without loss of our famous color rendition and resolution. 'Live' is the only way to learn what our Color Line-Up Equipment (CLUE) can do for ease of balance... what electronic color temperature control, auto white balance, flexible auto iris and contrast compression mean in use.

Only after you've seen it all—after you've actually handled this remarkable camera—will you understand why the Philips name is a guarantee of incomparable stability...why no one else can match our 1000-hour performance.

To get your hands on an LDK-25 or to get more information, call us today at (201) 529-5900; (201) 529-3800, or write: Broadcast Products, Philips Audio Video Systems Corp., 91 McKee Drive, Mahwah, N.J. 07430.

LDK-25 *IS DECADE TWO*

SS 8500 stereo package

The McCurdy package approach to the engineering of a system allows the user to easily determine the best selection of standard components to fulfill each requirement.

All aspects of the broadcast function from news booth to master control can be met with the maximum of flexibility between units.

A full range of modular enclosures allow for the integration of each component of the system into the most convenient working package.
