## Special Report: The New Look in RF Circuits — Packaging

INFO/CARD 1

# Modulation measurement reaches new peaks in performance

For sheer performance there is nothing to compare with the new Marconi 2 GHz Modulation Meter.

- Outstanding accuracy of  $\pm 0.5\%$  on FM and  $\pm 1.0\%$  on AM.
- Direct tuning to a known input signal, or set to automatic to locate any signal in a fast 500ms.
- A total measurement package that includes AM, FM, and phase modulation, frequency, noise, r. f. power, frequency response and signal to noise ratio. Options provide distortion

**A MODULATION  
METER THAT'S  
A COUNTER,  
R.F. POWER METER  
AND  
AUDIO ANALYZER**

and weighted noise measurements.

- A non-volatile memory, built-in auto-calibration, extensive self-diagnostic facilities, and optional GPIB interface... all further reduce test time and cost of ownership.

This latest modulation meter from Marconi reaches new peaks in performance, and sets new standards in value-for money. Call Marconi to evaluate how cost-effective the new Marconi 2305 will be for you.

# GOING THE DISTANCE

*In 1888—Sailors navigating the treacherous passage between New Zealand's main islands learned to rely on a mysterious dolphin to pilot them past the shoals. The dolphin, known as Pelorus Jack, stayed on the job for 24 years, going the distance to save countless ships and men.*

## ACRIAN GOES THE DISTANCE IN HIGH-REL PRODUCTION CAPABILITY

Acrian's high-rel production technology allows us to go the distance, to meet the toughest military requirements with consistently high repeatability.

Here's a good example—the TAN250A, delivering 250 watts of pulsed power across the entire 960–1215 MHz TACAN band. With features like gold metalization, gold controlled-loop wire bonding (256 bond wires), low thermal resistance, and a hermetically sealed package. To date, we've delivered more than 75,000 worldwide.

Thanks to our produc-

you the most comprehensive line of transistors, FET's, associated devices, and higher-level assemblies from 2MHz to 4.5 GHz—and beyond.

To get complete information on the TAN250A or any of more than 500 Acrian products for communications, radar, and avionics, call (408) 294-4200 or TWX (910) 338-2172.

Acrian Inc. 490 Race Street  
San Jose, California 95126

**ACRIAN**

## Cover

This month's cover features a representative sampling of Metaramics/W.R. Grace Co.'s line of advanced ceramic-metal packaging assemblies, including standard high power RF and microwave designs and custom designs for Gallium Arsenide, Indium Phosphide and specialized integrated circuit packaging.

## Features

### 21 Special Report: The New Look in RF Circuits — Packaging

In the final article in this series we let representatives of two packaging design companies tell us about their products and operations. Current design considerations and some future trends are among the topics discussed. A general description of standard package types is included. — James N. MacDonald.

### 29 Wide Dynamic Range Linear Detection

This article describes a design for a wide dynamic range linear detector, with the rectifier output directly proportional to the input signal level over a wide range. The design uses an op amp with nonlinear feedback to achieve detection exceeding 60 dB of dynamic range. — William C. DeAgro

### 44 Measuring a Dipole Antenna Radiation Pattern Using Time Domain and Gating

This article describes how the HP8510 network analyzer can be used to reduce the effects of reflected signal paths when measuring the far field radiation pattern of an antenna by measuring the swept frequency response of the antenna and computing the Inverse Fourier Transform to give the time domain impulse response. — John W. Boyles

## Departments

### 56 Designer's Notebook — A New Approach to Op Amp Design

The usefulness of conventional op amps in very high speed applications is limited. Comlinear Corporation says their new design provides better high speed performance than conventional op amps. — Scott Evans

## Broadband Power Divider 10-1000 MHz

PD-1000 Series Power Dividers are broadband, low loss, high isolation units available with BNC, TNC, SMA and N connectors and usable to 1300 MHz.

Check these specifications:

Frequency Range: 10 MHz-1 Ghz

Isolation(output):

10-20 MHz	25dB Min
20-500 MHz	35dB Min
500-1000 MHz	30dB Min

Insertion Loss:

10-500 MHz	0.4dB Max
500-1000 MHz	0.6dB Max

Return Loss:

10-20 MHz	14dB Min (1.50:1)
20-1000 MHz	20dB Min (1.22:1)

Impedance: 50 Ohms

Amplitude Balance: 0.2dB Max

Phase Balance: 2° Max

Input Power: 2.5 Watts

Temperature Range: -50°C to +85°C

Other UHF/VHF products available are directional couplers and impedance transformers. Send for catalog.

## rf editorial

# Growing With The Industry We Serve

James N. MacDonald  
Editor

**G**ary Breed joins our staff this month as Technical Editor. He has been Chief Engineer at four radio and/or television stations during the past 10 years, and we look forward to the viewpoint he will bring to the magazine as a result of this experience. He also has published 13 articles in *Broadcast Engineering*, from which he has gained an understanding of the requirements of magazine writing. He will assist with staff written articles and will work with authors to prepare their manuscripts for publication.

The addition of a technical editor is part of a substantial increase in Cardiff Publishing Company's commitment to *RF Design* over the past year. First, the magazine went from bimonthly to monthly publication; now we have, in fact, doubled the editorial staff. The latter action is, of course, largely a consequence of the earlier decision. It is also a testimony to the correctness of that decision. There is far too much knowledge being generated in this field to be adequately exchanged every two months.

A business can grow for two reasons — in anticipation of a larger market or as a result of it. Usually both reasons are influential in the decision to expand, and this has been the case with *RF Design* magazine. Publisher Keith Aldrich's faith and understanding of the industry pro-

vided the impetus to double the publication frequency. The encouraging response of readers and advertisers has convinced us that the growth has just begun.

The growth of the magazine is not just due to the appropriateness of its content for our readers, although we take a great deal of pride in that content and know from reader comments that it is appropriate. We are part of the growth of the RF electronics industry, in general. We talk about this growth often, because there is much gloom in some parts of the general electronics industry. We want our readers to know that the slump is not industry-wide. Typical of the kind of news that crosses this desk almost every day is the following paragraph from a news release announcing that Raytheon Company's second quarter earnings were up 10.7 percent over a year ago.

"The company's improved performance for the quarter was generated principally by Electronics, Raytheon's largest business segment, which continued to be paced by defense electronics systems."

Most defense electronics systems operate in microwave frequencies, but we have mentioned before the increasing interest of the military in the lower frequencies. Other news releases tell similar success stories about commercial RF products. It is our observation that most companies are doing quite well, although some segments of their operation may be curtailed because the particular industry they serve is in a slump.

With this addition to the staff, *RF Design* will be able to expand the scope of its coverage of the electronics industry, and one expansion will be into economic news. In the near future you will see reports on economic activity in the RF sector, helping you keep up with trends.

Many of you will be receiving telephone calls and visits from Gary about technical matters. For you hams, Gary's call is K9AY. Mine, by the way, is NØFXB.

*James N. MacDonald*

# ROTARY ATTENUATORS

**Model: 50DR-001**  
**Frequency Range:** DC-1000 MHz  
**Attenuation Range:** 0-110 dB in 1 dB steps  
**Ratio:** DC-500 MHz 1.2:1 maximum  
 500-1000 MHz 1.4:1 maximum  
**Return Loss:** 5 dB maximum @ 1000 MHz  
**Attenuation Accuracy:**  
 DC-500 MHz  $\pm 2$  dB or 1%  
 500-1000 MHz  $\pm 3$  dB or 2%  
**Connectors:** BNC, TNC, N or SMA

## Getting Ready For Tomorrow

By Gary Breed  
Technical Editor

*Publisher Keith Aldrich has given his space this month to RF Design Technical Editor Gary Breed for an introductory column.*

In a lifetime, each of us may get only one or two opportunities to make a major impact in our chosen field, taking part in a major discovery or an important achievement. For many RF design engineers, such an opportunity will present itself in the next few years. Technological knowledge is still growing at an exponential rate, markets for RF-related products continue to expand, and the integration of RF functions into the design of traditionally non-RF equipment continues at a rapid pace. We need to be ready to meet the challenges which are coming our way, to be ready for the rare opportunity to make our mark.

To be able to make such a personal impact on the world of RF, the engineers and managers who are responsible for "getting the work done" need every available tool at their disposal. We all know that engineers need the support of current-generation test equipment, computers and software. We know that ongoing education in the field of RF is necessary. We know that advanced components are becoming available almost daily. But sometimes we forget that the human mind is still the most important tool in the creative design process, and the most im-

portant role of the human mind is *COMMUNICATION* with others.

This is where I have seen my own opportunity to make an impact in my chosen field. As Technical Editor, my primary duty will be to see that communication between engineers takes place. *RF Design* is an important participant in the exchange of ideas among the most capable minds in the field of RF: Your minds!

RF Design will be expanding its role in the coming months, with your help. I want to hear from you about your work, and the unique problems you have had to solve in achieving a successful design. In turn, I'll try to find out everything I can about the industry that might affect your work, and see that it is reported to you.

Just as there are no limits to the imagination of mankind, there are no limits on the applications of RF. The boundaries between analog and digital realms become blurred at high frequencies, as is demonstrated by GHz-speed logic devices which have 50-ohm input/output impedances. The combination of optical, digital, video, and RF functions in a single system has taken place in Local Area Networks and common-carrier telecommunications. Automotive electronics, test equipment, consumer electronics, as well as communications equipment will all have combinations of technologies in the future, and RF is the common denominator. We will be exploring in depth these areas of interface between RF and other technologies as our growth allows us to add to our present coverage of RF topics.

Start your own process of communications by sharing your ideas with us. Somebody has the need for your insight, and you can take advantage of the ideas of other engineers. Let's keep the lines open.

## CTS Hybrid VCXO

Actual size:  
.860" x .830" x .350"

### End the trouble of designing your oscillator— now you can specify this highly reliable CTS component!

Solve your space limitations and put an end to specifying a crystal and designing your own oscillator. This CTS hybrid VCXO comes in a package that is 50% smaller than usual—and you can simply specify and order the oscillator as you do any other component. Because CTS Knights Division specializes in precision crystal products, we have the largest staff of engineers in the industry. We even make our own crystals to assure precise uniformity.

This subminiature JKVXO-100 voltage

controlled crystal oscillator is available today, with the specs listed here. Or, if you have a special application, we will customize a design to meet your requirements. Either way, you'll get traditional CTS reliability at very competitive prices.

**WRITE TODAY** for full specifications on this CTS subminiature crystal oscillator. Contact: CTS Corporation, Knights Division, 400 Reimann Ave., Sandwich, IL 60548. Phone: (815) 786-8411.

Now, you can make your broadband receiver system totally automatic with the TCK Series—a computer controlled, programmable bandpass filter system from Telonic Berkeley—the originator of multi-octave filter systems.

The TCK Series multi-octave system contains a step motor for remote digital control, virtually eliminating the use of manually tuned filters for remote site applications. The complete TCK Series system can provide continuous tuning over as many as six octaves. It includes two to six TCD Series tunable bandpass filter subassemblies, coupled with two multi-position RF

bandswitching units; two power supplies; and an interface card for RS-232, IEEE-488 (GPIB), or 8-4-2-1 parallel BCD.

A self-contained microprocessor-based control provides easy interface with your digital system, and the unit is

automatically tunable to any center frequency within the range of the filter array. Specific frequencies can be requested directly in MHz, eliminating the need for specialized user software.

Contact Telonic Berkeley for this complete, state-of-the-art, automatic multi-octave filter system. Call or write today for information on the TCK Series and our complete line of RF and microwave products.

# From Test to Toys

## Plastic MMIC gain blocks. Avantek 4-Pac amplifiers. \$1.80 each\*.

Avantek's series of MODAMP™ silicon monolithic microwave integrated circuit amplifiers are ready to drop into your 50-ohm circuit, with no design problems — virtually no concern for what comes before or after. These MMICs are unconditionally stable and provide cascadable gain blocks at any frequency up to 2 GHz.

4-Pacs are small (140 mil) plastic packages suitable for PC board or stripline applications in products ranging from instrumentation to toys, from fiber optic systems to mobile communications. They're simple to use and readily available.

### Available in volume.

Avantek 4-Pac MODAMP MMICs are available today from your nearest distributor. Prices start at \$2.75 and go to \$1.80 in 10,000

piece quantities. Don't forget — because of their very wide operating range, the same amplifier can work from DC through video all the way up to 2 GHz. And you can stack them like building blocks to add whatever gain you need. Avantek innovation — designed to make your design job easier.

Gain vs. Frequency

\*price in 10,000 piece quantities.

Avantek MODAMP MMICs are the most universal low-cost RF amplifiers available. Try some today. Contact your nearest Avantek distributor or call us for complete details.

Editor:

I look forward each month to receiving your magazine, *RF Design*. You have been publishing some excellent articles which I find useful in my work.

In order to better utilize the information in some of your articles I clip and save many of them. One obstacle occasionally arises. Two articles which are of interest to me may be located consecutively in your magazine. The last page of the first article is printed on the flipside of the first page of the next article. Would it be feasible to organize your advertisements in such a way as to separate design oriented articles. I do appreciate your keeping individual articles together instead of scattering them out as "continued on pp." throughout your mag. Thanks for the great mag which fills a need.

By the way, have you or are you going to collect the papers presented at the L.A. show and publish them under one cover? It would certainly help us unfortunate souls who did not have the opportunity to attend. Thank you.

E.E. Truckenmiller  
Applied Automation, Inc.

*The Proceedings of Expo 85 are available for sale. You probably already noticed the ad in last month's issue. — editor*

Editor:

In the July 1985 issue, in the article on materials, I take exception to the statement, "Anyway, below 200 MHz GaAs noise increases." There are many amateur radio operators that use high frequency GaAs devices that have low noise figures at, say, 1 GHz, and use them at 144 MHz and get less noise figure.

Most certainly there is a knee in the curve somewhere. I would like to see a more definitive report on this subject.

Lawrence Joy  
Magnavox

### Photo Credit

*We have been informed by the photographer that two of the photographs used on the cover of the July issue are copyrighted. They were not so identified when we received them. It is always our practice to print appropriate credits when we know material is copyrighted. The photographs of the filter and the engineer looking through the microscope were taken by Ken Thompson, 200 E. 95th St., New York, NY 10028. — Editor.*

RF Design

### RF Technology Expo 86 Exhibit Space Sells Out Early

Every exhibit booth for the RF Technology Expo 86 was taken as of August 1. Although the number of booths was doubled from the January 1985 show, they were claimed quickly after promotion began for the 1986 show.

"I've never seen it happen before," said Kathy Kriner, Convention Manager for Cardiff Publishing Company. "Six months before the show and we're sold out."

Nearly half the 150 booths were reserved at the end of the 1985 show by exhibitors there. Exhibitors at the show were pleased with the RF focus of the program and the fact that nearly all attendees were RF design engineers.

The Cardiff Convention Management staff have started a waiting list for booths that may become available. Kriner said a letter would be sent to those who have not returned signed contracts with a deadline for doing so. This amounts to about 30 exhibitors, she said.

*RF Design* publisher Keith Aldrich said the response shows how difficult it is to judge the demand for this type of show.

"We doubled the exhibit space for this second show and sold it almost immediately. Who knows how many booths we could have filled?"

Aldrich, the show's organizer, will be studying the demand for Expo 86 to try to judge the size of future shows. "We might have to move to a wing of the Anaheim Convention Center in 1987," he said.

### OK Industries Forms 'Electronics Division'

OK Industries Inc. has formed the OK Electronics Division to develop and market the company's new family of electronic bench test instruments. To date, the line includes function, sweep and pulse generators, frequency counters, DMMs, digital thermometers and accessories. The division is located at the company's New York headquarters.

Commented David Weltman, OK president: "This division represents a major commitment by OK Industries to the customers and distributors of our new family of test instruments. Rather than being absorbed within our existing production equipment lines, the test instrument program will be separately staffed, marketed and financed to ensure the highest possible levels of product quality as well as customer service and support."

Many of the instruments include capabilities which are not available on other

equipment in the same price class. Most of the instruments are list priced at under \$500, and even the more sophisticated generators are under \$1,000.

"Our objective is to put test instruments within reach for the thousands of lab technicians and design engineers at smaller to mid-size firms who have had to make do with less — or worse, simply do without," Weltman said.

The new family of products will be featured at Wescon '85, November 19-22, in San Francisco.

### RFD, Inc. Receives Contract for AWACS Radar Transmitters

RFD, Inc., Tampa, Fla., announces receipt of \$3.7 million in new contracts including \$1.8 million from Eaton Corp./AIL Division in Deer Park, N.Y., for production of AWACS radar transmitters and for design and production of dielectric resonator oscillators for the B-1B aircraft. RFD, Inc. also received contracts totaling \$1.2 million from SATT Communications AB, Stockholm, Sweden, for design and production of airborne radar transmitter systems.

RFD, Inc. is a Tampa-based designer and manufacturer of microwave transmitters, receivers, oscillators and amplifiers for radar and communications systems. RFD, Inc. also manufactures microwave transmitting and receiving components for satellite terminals and telecommunications systems.

### Rental Car Cellular Phones

Bell Atlantic Mobile Systems and Budget Rent-A-Car of Pittsburgh have established a new marketing partnership to put cellular mobile telephones in 300 Pittsburgh Budget rental cars by the end of 1985.

The new marketing plan is designed to promote the use of rental cars and cellular mobile telephone service. One hundred rental cars equipped with Alex<sup>SM</sup> cellular telephones are available at six Budget locations. There is no premium fee for renting the phone-equipped cars and customers pay only for their calls, billed at 95 cents per minute.

"Cellular telephones and rental cars are a natural match, since both serve customers who are on the move," said Richard J. Lyons, Bell Atlantic Mobile Systems vice president — marketing and sales. "Until today there has not been a successful plan to serve this market. This program will help make rental-car telephones commonplace, instead of a rarity."

Although cellular phone-equipped rental cars have appeared in various cities

# CUT YOUR RF CONNECTOR COST UP TO 50%!

When you need an SMA or SMB connector, but don't want to pay for the MIL-spec, you don't have to sacrifice performance. Johnson JCM miniature coaxial connectors give you a low-cost, commercial-grade alternative.

For communications, computer, office equipment and test and measurement applications up to 4 GHz, specify the JCM-B. For frequencies up to 8 GHz, specify the JCM-A.

Both can be interchanged and intermated with their MIL-spec counterparts. Both give you virtually the same electrical, mechanical and environmental performance. Yet both can save you up to half the cost of their SMA and SMB equivalents.

JCM connectors are available in gold or nickel-plated versions with beryllium copper and half-hard brass contacts. JCM-A bodies are screw machined half-hard brass. JCM-B bodies are die-cast zinc.

For complete specifications and pricing on JCM-A and JCM-B miniature coaxial connectors, contact your local distributor or E. F. Johnson.

## rf news Continued

since cellular mobile telephone service first became available in the fall of 1983, the Alex/Budget rental car plan is the first to offer customers a cellular phone without a premium charge in the basic rental price of the car. In the past, customers were not encouraged to use the phones because they were generally available only in luxury class models. The phone-equipped cars in the Pittsburgh Budget fleet are available in intermediate, full-size and luxury models, making the phones more accessible.

"Besides providing rental car customers with the convenience of cellular communications while they are on the road in the Pittsburgh area," said Lyons, "this marketing program also allows customers to get some experience using cellular phones before they make a decision to buy or rent one for their own car."

"There is an Alex in your Budget" is the theme of the joint marketing program. Alex is the trade name of Bell Atlantic Mobile Systems' cellular telephone service. Both companies will promote the phones in a variety of ways. Customers boarding the Budget shuttle buses at Pittsburgh airport will hear messages about the cellular phones over the bus audio systems.

Budget cars equipped with cellular phones come with a special sun visor display that tells customers how to use the phone, depicts the geographic coverage of the cellular system and lists important local numbers to call, such as airlines, hotels and information services.

### New HF Frequency Hopping Radio

An HF, frequency-hopping radio system, designed for maximum security and capable of evading jammed channels, has been introduced by Reunert Technology Systems (Reutech). Called the Lancer, it forms part of a radio family that has been used in active combat for over a decade.

A building block approach has been followed in the design of the Lancer system. The basic driver unit can be configured into a portable manpack, as well as 20W and 100W vehicle units with low and high power options. The range offers reliable communications across the complete HF band from 2 to 30 MHz.

The highly sophisticated frequency-hopping facility of the Lancer employs some 200 different code sequences on any one of the 28,000 available center frequencies and between frequency channel steps. The bandwidth employed by the

radio while engaged in frequency hopping tracks the bandwidth of the Antenna Tuning Unit. It provides at all times the largest possible number of channels to be included in the hopping coverage.

Together with the long-period non-linear pseudo-random sequences, the hopping facility of the Lancer offers a high measure of security while evading disturbed or jammed channels. The Lancer also has a late entry facility for other stations wishing to join the hopping net.

The Lancer operates in upper side band or lower side band and a CW mode with tone injection. Speech processing provides an increased average speech power at power outputs selectable as 6 or 20 watts (PEP) in the lower power configuration and 20 or 100 watts (PEP) in the high power configuration.

### Compact Software Curtails Operations

In a move company officials say is not caused by financial difficulties, Compact Software closed its Palo Alto offices Aug. 8. The company is owned by Comsat Technology Products, a half-billion dollar diversified corporation. Jeffrey L. Rubin, vice president and general manager for Compact Software, said the closure reflected a decision made some time ago by Comsat that the software company did not fit their long-range goals.

In a prepared statement, Compact Software pledged to honor all existing maintenance contracts and any other contractual obligations. "Money is set aside for honoring maintenance contracts," a Compact Software spokesman said. The company will complete its latest version of the PC program, version 3.0, and updates will be sent to qualified customers, the spokesman said.

A spokesman for Comsat verified that the company was seeking to divest itself of operations that did not fit into its corporate plan. Compact Software is one of several companies considered too small by Comsat.

Comsat issued the following statement:

"We are still assessing precisely what we are going to do about Compact Software. Earlier this year, we announced that Compact Software was being integrated into a new business, Comsat Technical Services. As this integration takes place we are seeking to strengthen Compact's capabilities and offerings. The business is definitely for sale; we have not reached a conclusion beyond this."

# The solution to FCC Part 15 is right at your fingertips.

Introducing the easiest solution to FCC Part 15 UHF transmitter requirements.

For the many applications that use low-power UHF transmitters under Part 15 — wireless security systems, garage door openers, wireless remote controls and short-range telemetry — RFM has developed an easy, rugged, cost-effective solution to transmitter design.

With our SAW resonator stabilized hybrid transmitters, you just add a simple antenna, 9V battery and digital input. Our hybrids do the rest. No need for a protracted rf design effort on your part.

Full operating range.

*Hybrid oscillators are designed for wireless security products and other remote control devices.*

RFM's hybrid transmitters can be easily adjusted to achieve full legal radiated power (operating range) with a variety of simple wound-coil or print-loop antennas.

Excellent stability and signal purity.

Quartz SAW resonator frequency control assures that our transmitters won't drift out of your receiver's bandpass — or into a military "forbidden band" — despite temperature or battery voltage

changes, component aging or body capacitance effects.

Also, our transmitters feature low harmonic output and tight modulation bandwidth

*Typical harmonic spectrum of hybrid transmitter.*

control. Harmonic radiation above 1000 MHz is well under 125 uV/m @ 3 meters when used with recommended antennas.

The right options. The right support.

Both pulse and FSK modulation options are available to match either super-regenerative AM or superheterodyne FM receivers. Matching hybrids are also available for receiver local oscillators (10.7 MHz i-f). Plus, we offer two transmitter output power ranges — for FCC Part 15 Subpart D or Subpart E. All RFM transmitters are fully compatible with CMOS encoder chip drive levels.

At RFM we have a staff of expert rf engineers ready to help you integrate advanced SAW technology into your product. And you can always count on an innovative, cost-effective solution. We didn't get to be the world's volume leader in UHF SAW resonators and hybrids by following the competition.

*Hybrid oscillators make low-cost AM/FM UHF-based remote control systems possible.*

# High Reliability RF MICs

## DAICO High Reliability RF Microwave Integrated Circuit Components

are products of state-of-the-art thin-film technology. Quality screened components, manufactured and tested to rigid Daico standards and numerous in-process quality tests, assures each device meets applicable MIL STD Specifications. Quantitative 100%

final electrical tests are made with HP8505 Analyzers and HP9825 Computer controlled automatic systems. These data assure Daico High Reliability RF MIC components meet all critical design parameters, thus saving costly incoming testing.

### MIC SWITCHES

- Thin-film MIC construction.
- DC - 4GHz
- SPST - SP24T
- Speeds < 5nS (10-90% RF)
- Internal TTL or CMOS drivers
- Internal 50 ohm terminations
- PC Board mount, Stripline or Connectorized

### MIC VOLTAGE CONTROLLED ATTENUATORS

- Thin-film MIC construction
- Linear attenuation to 60dB
- Linearity to  $\pm 0.75$ dB
- Internal drivers
- Constant 50 ohm impedance
- PC Board mount, Stripline or Connectorized

### MIC STEP ATTENUATORS

- Thin-film MIC construction
- Steps - 1 through 7
- Attenuation to 63.5dB
- Speeds < 5nS (10-90% RF)
- Internal TTL or CMOS drivers
- PC Board mount or Connectorized

# CONFIDENCE

**From design through compliance testing,  
HP's Spectrum Analyzer/EMI Receiver delivers  
unprecedented versatility and**

## **Your complete EMI measurement solution.**

HP's new Spectrum Analyzer/EMI Receiver delivers fast, accurate EMI compliance measurements *and* complete EMI diagnostic capabilities—all for the price of an EMI receiver alone.

Featuring the new HP 85685A RF Preselector—with improved sensitivity and overload protection—this versatile spectrum analyzer-based EMI receiver is designed to CISPR\* Publication 16 recommendations and meets the measurement requirements for military and commercial standards, including FCC and VDE. Which makes it the ideal instrument to conduct your final open-site EMI compliance tests with complete confidence.

And unlike EMI receivers that are dedicated solely to compliance testing, the HP Spectrum Analyzer/EMI

## **CISPR receiver accuracy.**

Receiver is also an indispensable EMI diagnostic aid throughout your product's design and evaluation stages.

## **The ideal EMI diagnostic tool.**

Using the HP8566B or 8568B Spectrum Analyzer and simple probes, you can quickly locate problem emissions and evaluate potential solutions. These powerful analyzers sweep quickly over a broad 100Hz to 1.5 GHz or 22 GHz frequency range, instantly displaying measurement results on the easy-to-read CRT, or as hard copy plots. Built-in capabilities include: multiple-trace digital storage for instant A vs. B comparison, frequency and amplitude markers, maximum hold for capturing elusive inter-mittents, and direct plotter control—to name just a few.

## **Perform open-site tests with confidence.**

When it's time for final compliance testing, the same HP spectrum analyzer used during the design and evaluation stages can be combined with

the HP85685A RF Preselector and the HP85650A Quasi-Peak Adapter. The result is an EMI receiver system with the sensitivity, overload protection and  $\pm 2$  dB amplitude accuracy you'll need for both indoor and outdoor compliance testing.

System features include multiple detection modes with peak detection for the fastest possible measurement time, quasi-peak detection for compliance with CISPR Publication 16 recommendations, and average detection for discrimination between narrowband and broadband signals.

**Automate your EMI measurements for increased productivity.**

With the HP85864B EMI Measurement Software, featuring an easily understood menu structure, you'll be able to quickly automate your

commercial and military emission measurements. Choose from a library of FCC, VDE and MIL-STD emission

tests, or design your own. Test results can be annotated and notes generated as part of the test documentation.

**Consider the HP advantage.**

Now is the time to discover the distinct advantages of HP's Spectrum Analyzer/EMI Receiver, a total solution for EMI measurements. After all, why invest in both an EMI receiver for compliance testing *and* an additional spectrum analyzer for design/evaluation, when you can accomplish both tasks confidently with a single, versatile system that costs far less?

For more information, call the Instrument department of your local HP sales office listed in the White Pages. Or write Hewlett-Packard, 1820 Embarcadero Road, Palo Alto, CA 94303.

\*CISPR (Comite International Special Des Perturbations Radioelectriques) Publication 16 is the "CISPR specification for radio interference measuring apparatus and measurement methods."

*A New Dimension in Portable, Digital Spectrum Analyzers!*

# The A-7550 Spectrum Analyzer

The A-7550 Spectrum Analyzer by IFR is the most advanced, low cost, portable spectrum analyzer on the market today.

Two powerful microprocessors, menu driven display modes and single function keyboard entry aid the user in the operation of all analyzer functions.

To further enhance the operational simplicity of the A-7550, the microprocessor system automatically selects and optimizes the analyzers bandwidth, sweep rate, center frequency display resolution and the rate of the frequency slewing keys. An operator override is also provided when non-standard settings are required.

**Features...Performance...Dependability...**The A-7550 portable Spectrum Analyzer by IFR—innovative accomplishments in design.

## Impressive Standard Features Include:

- 100 kHz to 1 GHz frequency coverage
- VRS™ [Vertical Raster Scan] CRT display
- Single function keyboard entry
- Menu driven display modes
- Automatic amplitude calibration
- Selectable linear/log display modes
- Digital storage of all displayed parameters
- 70 dB dynamic range
- 300 Hz resolution bandwidth
- 16 selectable scan widths
- Accurate center frequency readout
- Direct center frequency entry
- Automatically scaled electronic graticule
- Variable top scale reference (+30 to -95 in 1 dB steps)
- IF gain in 1 dB steps
- Line, bar, average and compare display modes
- 300 Hz and 30 kHz video filters

## Optional Features Include:

- Internal rechargeable 5 APH battery for portable operation
- Tracking generator with 10 dB step attenuator
- Tracking generator with 1 dB step attenuator
- FM/AM/SSB receiver
- IEEE-488 interface bus
- RS-232 interface bus
- 75Ω adaptor
- Quasi-peak detector

Contact your local IFR authorized distributor for a demonstration.

# The New Look in RF Circuits — Packaging

By James N. MacDonald

In this final part of our series on advancements in RF circuit design we take a close look at two companies specializing in miniature circuits. We interviewed sales and engineering executives at Metaramics and AvanteK, two Silicon Valley firms, to learn the directions their companies were taking. We believe what we learned applies to other design houses as well and shows one direction of development in RF circuits.

Metaramics is in Sunnyvale, Calif. We spoke there with sales manager B.J. McDaniel about the company's orientation in the industry.

"We are in our sixth year now, a spinoff from an RF transistor manufacturer," B.J. told us. "Our business started with the standard packages and then we expanded into special packages — hermetic packages with multilayer construction, window frames, alconite flanges for larger packages, good thermal dissipation, no cracking of the BeO — the next step of sophistication.

"Next we got into metallization and brazing of high reliability assemblies. We might metallize alumina, fire it, nickel-plate it and braze it into various housings for extremely high reliability connectors. They might be used in medical applications, ordinance, space or even well drilling.

"A fourth area that we are just becoming interested in is integrated circuit packaging. We are specifically looking for applications that require the use of beryllium oxide, rather than alumina. We're looking for thermal situations, where the chip is getting so large that the customer has to find some way of getting the heat out of the package that cannot be solved with conventional methods in alumina packages. Such a part might have a beryllium oxide base and some cofired layers on the top to form the area where the interconnects are.

B.J. explained the process of bonding metal to ceramic.

"In brazing two dissimilar pieces of metal together, a ceramic piece and a metal piece, care has to be taken because the ceramic is very rigid and metals seem to have more expansion capability at temperature. So, when we are building

A few of the PlanarPak devices produced by AvanteK, Santa Clara, Calif. For additional information circle INFO/CARD #110.

these packages we have to take extreme care that they are matched up in terms of temperature, otherwise as they are starting to cool down the metal may cool faster and crack the ceramic. Both ceramics, alumina and BeO, are susceptible to that problem. They are equal in terms of their modular elasticity.

"We use tungsten and moly-manganese metallization for refractory metal. This is to form an adhesion layer between the surface of the ceramic and the next step, which would be the brazed material. So, we put down the refractory metal, it forms a glassy face with the surface of the beryllium oxide, then we nickel plate that refractory metal, then we're able to braze the ceramic in a housing or lead frame onto the package using either silver or eutectic.

"We are a thick film technology house and we have some limits in how close we can make the lines. In terms of 'let's take a standard operation and make it as small as possible' we're not leading the market in that area. But when you are trying to make smaller RF power modules using chip carriers, we're in that field."

In Santa Clara we visited AvanteK and

spoke with David Herron, advertising manager for the MIC/Semiconductor Division, Northe Osbrink, publications editing manager and Bill Koehn, marketing manager for modular components.

The founders of AvanteK started the company in 1965 to serve the market for solid state amplifiers. The technology existed to produce a transistor to operate at 1 GHz, although most higher frequency amplifiers at the time were tube type. They developed their own transistor facility and eventually began doing their own thin film hybrid construction. The company maintains this concept of vertical integration.

Osbrink told us, "We now offer at very economical pricing essentially a complete amplifier in a transistor package. What could be more miniaturized than that? Instead of having to take a transistor and incorporate components around it to turn it into a circuit, you now have something that only needs an input and output voltage to operate as a complete amplifier."

Herron said the Semiconductor Division is taking the functions of these amplifiers and putting them on a single

chip. It is the company's vertical integration that allows them to incorporate these building blocks into various sizes of devices for various functions, he said.

"We're making microwave technology for the RF price. We're taking that expensive sub-micron, semiconductor geometry and selling it to the RF world for the RF price. To do that we have to come up with more functions per block. There are many marketplaces opening up that require the 1 to 2 GHz or 3 to 4 GHz frequency range — TVRO, GPS. Those types of programs perform a lot better if they have the microwave technology. That is why we're moving that way. That is why the whole industry seems to be moving that way."

One of the company's most recent developments is the PlanarPak. This design does not put the substrate in the package, the substrate becomes the package.

Koehn told us, "We're not starting out with a header and putting a substrate on it, we're adding the surface mount lead-frame to the ceramic substrate itself."

"It is indeed a surface mounting package up to a certain frequency range, so you don't have to go through other things on your PC board. It lends itself to automated insertion, and the package itself lends itself to automated assembly."

Built around a ceramic substrate, the PlanarPak is compatible with larger substrates of MICs. Designers can add these ready-to-operate amplifiers directly to a circuit. In addition to the hybrid amplifiers already available, AvanteK hopes to have switches, detectors, mixers and limiters ready for distribution about the time this issue is published.

AvanteK is one of the modern electronics companies moving as fast as possible to meet the future. Company literature says, "Future integrated assembly products will include both microwave and digital processing functions. With this integration, requiring ultrahigh speed digital integrated circuits to support these products, AvanteK began expansion of its existing GaAs technology into digital integrated circuits in 1984."

Osbrink summed it up, "The long-term future is absolutely incredible in terms of size and packaging."

## Package Types

From the east coast, Howard Levine, vice-president for marketing for Synergy Microwave, Paterson, New Jersey, provided us with a description of traditional package styles and some of their advantages and disadvantages. He concluded with a description of the company's surface mounted package for double-

## Putting it Together

Throughout this series we have described miniature components and the designs developed to mount and connect them on boards and substrates. There comes a time, however, when these devices must be connected to other devices. The advantage gained by miniaturization may then be lost by the space occupied by connectors and cables.

Connector companies are well aware of the need to reduce the size of their products. In this part of the Special Report we look at a new design by a connector manufacturer to allow multiple interconnections in a minimum space. This, too, is part of the new look in RF circuits.

M/A-Com, Omni-Spectra, has developed a modular plug-in connector that allows the system designer to make a variety of connections to a printed circuit board. The OSP module uses low profile, blind mating, plug-in connectors in modules that can be combined as the designer wishes. The connection system can be redesigned easily by rearranging the modules. Omni-Spectra says the modular plug-in concept allows flexibility in packaging design and access for repair without

*M/A-Com Omni Spectra's family of OSP™ blind mating connectors offer a space saving alternative for the packaging designer. OSP™ connectors are designed for blind mating of modules and components, eliminating cables and threaded RF coaxial connectors. A unique contacting mechanism permits both axial and radial misalignment and low mating forces.*

sacrifice in electrical performance or mechanical reliability.

The OSP modular blind mating design is being tested and studied by the Defense Electronics Supply Center as a possible new military standard. For additional information circle IN-FO/CARD #109.

balanced mixers.

In the world of "lumped-element" double-balanced mixers (DC-3.5 GHz), Levine told us, many different package styles are available. To a great extent, the industry has standardized around seven different PC mountable configurations. Examining manufacturers' specifications on the same basic device offered in several packages, one often sees no perceptible difference. However, these performance specifications do not address such issues as ease of mounting, ease of achieving a good "ground" when used in a production environment and quality assurance concerns that may come into play in production.

Mix these details with pricing and space considerations and the user is faced with a maze of choices. When realizing that the packaging represents anywhere from 10% to 85% of the materials cost in a mixer, the decision-making process becomes critical. The selling price of the "same" device in different PC board packages can vary

200%! The following explanation attempts to unravel this situation.

## Eight-Pin Relay Header (Full Sized)

Without a doubt, the lowest cost packaging is the 8-pin Relay Header. This traditional package is rectangular, .4" x .8" and varies in available heights. The most typical (and lowest cost) are those of approximately .4" in height.

The Relay Header offers the additional advantage of having the widest diameter (.030") pins. This rigid pin pattern makes production insertion an easy matter. These pins do not bend easily, and the possibility of a bent pin causing a defect in its surrounding glass-to-metal seal is reduced.

From an electrical performance point of view, the relay header offers (typically) four ground pins spread out around the package, allowing good, consistent grounding. The package's large size does cause some excess wiring length internally, causing 0.5-1.0 dB more conversion loss at the high band edge of devices

The 8-pin Relay Header is the lowest cost standard package. The rigid pin design (.030" dia.) makes production insertion easy. Pins do not bend easily, minimizing risk of damage to the glass-metal seal around them.

The 8-pin miniature package (right) is the smallest user of PC board space. It is available in 4-pin or 8-pin configurations. The flatpack (left) offers the advantage of horizontal leads but is the most expensive package.

operating at frequencies above 1 GHz compared to the same circuit in a smaller package. However, the exceedingly low cost allows one to "trade-up" to a more broadband or higher frequency device at a still attractive cost.

What is the drawback? The Relay Header requires two to three times more PC board surface area than any other PC board package. Its "cubic" volume is two to five times that of any other package. However, if the space causes no grief, *this* is the package to use.

### Miniature Relay Headers

These devices are .230" x .500", with typical heights from .25" to .4". Devices are available covering most frequency ranges in the .25" height package. Traditionally available in both 4-pin and 8-pin configurations, the 4-pin unit has become much more popular. This package has the unique position of being (along with the TO-5) the smallest user of PC board space, yet it is only second in cost, behind the full-sized Relay Header. This is due primarily to its rectangular configuration, allowing simple and rapid internal construction.

Many users are concerned about the grounding of a 4-pin package. This is a valid concern. However, the 4-pin header traditionally uses ground studs placed at approximate locations (internally only) to keep ground leads short. These pins (again due to rectangular construction) do not really limit useable internal space and, therefore, do not affect cost. The fact is that there are only four pins coming out, but circuit grounds are established at several points internally (due to the ground studs), yielding *good* ground performance (unlike other 4-pin packages such as TO-8/TO-5s).

Lastly, the package uses sturdy .020

pins which, though not as "stiff" as the .030 pins of the full-sized relay header, are very good mechanically.

The trade-offs here are cost. The 4-pin miniature costs 30-90% more than the Relay Header. However, this is *still* lower than all other packages. If one can accommodate the .25" height and "plug-in" format and needs small board area and volume utilization, this is the package.

### TO-8

TO-8 packages are an old carry-over from the "discrete" transistor packaging of earlier years. They are the next price bracket up from the miniature headers and use typically twice the volume and 70-150% more surface area. The 4-pin TO-8 (.5" diameter) costs more because of the smaller internal space (round shape vs. rectangular), making assembly costs higher.

The presence of only one ground pin often necessitates internal grounds being soldered right onto the header surface. This meets all military requirements, if done properly. However, the susceptibility to damage due to poorly controlled user production process control (reflow overheating in hand soldering operations) is obvious.

The typical .25"-.30" height offers no special advantage compared to lower cost devices, and the configuration requires resistance or laser welding to seal the cover. The hermeticity yield of these processes is not nearly as high as the solder seal of the various relay headers.

The 12-pin version of the TO-8 (.6" diam.) still has the overall volume and surface area detriments of the 4-pin package. However, its larger diameter (.6" vs. .5") allows the typical height to be reduced to .2", shorter than the relay headers or 4-pin TO-8's.

The 4-pin TO-8 offers no real user advantages. Its thinner (.018" diam.) pins are another drawback. The 12-pin does offer a height advantage and is useful where a round package fits the board space better. However, getting proper alignment on twelve .018" pins can sometimes be quite a trick.

### TO-5

The 4-pin TO-5 uses roughly the same area and volume as the 4-pin miniature header. The round configuration (as opposed to rectangular) reduces internal usable space by 50% compared to the miniature relay header, driving up the cost. Along with its thinner pins (.018" vs. .020") and Q.A. considerations, this creates a particularly undesirable option.

### Flatpacks

Historically, flatpacks are the highest cost of the PC mounted devices. However, they offer many useful features. A .150" height (allowing closely spaced PC cards) and "radial" leads instead of perpendicular "down-pins" allows the part to be assembled by accessing only one side of the board. Flatpacks offer unique performance advantages that justify the high cost (twice the price of the Relay Header).

### SMD (Surface Mounted Device)

In June, 1985, Synergy Microwave introduced the first true surface mounted package for double-balanced mixers. The package is approximately the same size as a traditional flatpack, but *without leads*. The mounting surface of the device is an alumina substrate with "wraparound" (top, side, bottom) contacts for RF, IF, LO and GROUND. The device meets all MIL-STD requirements and has several critical advantages:

- 1) No pins to use up space. Flatpack pins mounted on the surface can take up a space as large as the device itself.
- 2) No glass-to-metal seals. The traditional stress points for hermeticity and mechanical integrity are the glass-to-metal seals in a flatpack.
- 3) No need to drill holes or cut notches to achieve true flush surface mounting.
- 4) Simple production handling — "pick and place," then reflow.

The SMD package is equal or lower in cost than the traditional flatpack. The only tradeoff is slightly higher loss at the high frequency band edge due to the non-metallic package forming an "incomplete" ground-plane. For additional information about these surface mounted mixers and other Synergy Microwave products, circle INFO/CARD #108. 

# WE CAN DO THINGS WITH A SIGNAL TRANSFORMER YOU NEVER DREAMED POSSIBLE!

We can accommodate signals from 3.5 Hz to 1000 MHz!

We can minimize signal distortion, with less than 1 dB flat loss from 0.2 to 125 MHz!

We can handle a 1 kW signal over a 2 to 32 MHz range!

We can provide over 140 dB noise isolation in video, high-speed data, and process control lines!

We can match impedance ratios of up to 25:1 with a 1 kHz to 5 MHz bandwidth!

Let's face it. Even in a digital world, many of your design problems are still analog. Like the need to match transmission lines of different characteristic impedances. Or to eliminate ground-loop currents in video lines. Or to filter out common-mode noise in data lines.

Applications like these call for specialized signal transformers.

That's where we come in. Wideband transformers are our business. We offer over 400 models. All available from stock. All 100% tested to insure specified performance for any of the following applications:

**Impedance Matching**—Balun and unb/unb designs for maximum signal strength and minimum distortion when connecting circuits of different impedances.

**Isolation**—To eliminate transmission problems due to differences in ground potential or induced common-mode noise.

**Power Combining/Dividing**—For low-loss distribution of signals to or from multiple isolated ports.

**Data Bus Coupling**—To protect data networks or signal busses from shorts and spikes at each port per MIL-STD-1553 or IEEE 802.5 LANs.

**Pulse Transmission**—To insure clean, high-speed data. Nobody offers a wider choice

of off-the-shelf wideband transformers. Nobody! And, if necessary, we'll custom design to meet your specific needs.

Just call Sales Engineering: 516-671-5700. Or write for our free catalog.

# What Good Are Good Electricals If They Don't Stay That Way?

## Milacron all-glass laminates.

### Electricals that are reliable... over the long run.

As a designer, you know that one of the most important functions of a PWB laminate is to provide good insulation resistance. So you want to be sure you specify a laminate that performs well in this crucial area. That's where Milacron laminates excel.

As illustrated in the test results above, Milacron laminates maintain stable insulation resistance over time, even in conditions of high temperature and humidity. *More stable than the FR-4.*

That's right — over the several weeks of the test period, the FR-4 lost a considerable amount of its insulation resistance, while Milacron laminates remained steady throughout the test period.

Take them into the harsh environments of high temperature, high humidity, and high voltage (50V or more), and Milacron laminates give you an added advantage: they provide *10 times* more resistance to conductive anodic filaments (CAF) than typical FR-4 laminates!

*Our conclusion: Milacron laminates — single- and double-sided — perform exceptionally well in these difficult environmental applications.*

And that's not all. Take a look — over high and low frequencies — at our stable dielectric constant and dissipation factor. Our excellent dimensional stability and processing performance. And our cost-effectiveness: one customer, for example, reports a 25% savings in cleaning and touch-up costs, due to the superior solderability of Milacron laminate. *Milacron laminates save you money, both upfront and in use.*

#### **Milacron laminates. The reliable choice.**

But don't take our word for it. Contact the Cincinnati Milacron Marketing Company, P.O. Box 246, Blanchester, Ohio 45107 for samples that best fit your applications. Or call toll-free 1-800-221-7084; in Ohio call 513-783-2464.

# Wide Dynamic Range Linear Detection

By William C. DeAgro,  
Hazeltine Corporation

In many signal processing applications, it is desired to extract the AM of a signal accurately over a wide dynamic range. Such applications may include high fidelity audio and video systems, high accuracy direction finding systems or any signal processing application where signal amplitude is important. Ordinary series diode-resistor detectors are not very linear and can only achieve roughly a 20 dB dynamic range in the linear region; an active detector, however, using nonlinear feedback can yield linear detections exceeding 60 dB dynamic range. The following is a brief discussion and some results of a scheme using an op-amp with nonlinear feedback to achieve a linear detection exceeding 60 dB of dynamic range.

The basic AM linear detector is composed of two parts: a linear half or full wave rectifier and a low pass filter, in succession. In order to achieve wide dynamic range linear detection it is necessary for the rectification portion of the circuit to have an output directly proportional to the input signal level over a wide dynamic range. Therefore, most of this discussion will concern the rectification portion of the circuit.

The schematic in Figure 1 shows the structure of a wide dynamic range linear half wave rectifier. Its function is to produce an output ( $e_o$ ) that is a linear function of the input ( $e_i$ ) when the input is negative and no output when the input is positive. The ideal transfer characteristic,  $e_o$  vs.  $e_i$ , is shown in Figure 2.

The reason this circuit behaves this way is because when  $e_i$  is negative,  $e_B$  becomes positive, which places  $D_2$  and  $D_3$  in the forward bias region. The gain ( $e_B/e_i$ ) is given by:

$$\frac{e_B}{e_i} = -\frac{R_1 + r_{D2}}{R_2}; A \rightarrow \text{LARGE} + e_i < \phi \quad (1)$$

and the gain function ( $e_o/e_B$ ) is clearly given by:

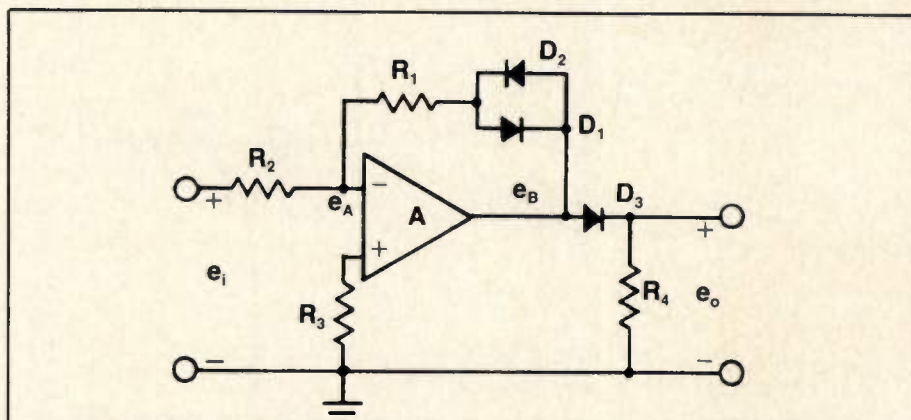

Figure 1. Schematic diagram of wide dynamic range linear detector (without filtering)

Figure 2. Ideal transfer characteristic of Figure 1

$$\frac{e_o}{e_B} = \frac{R_4}{R_4 + r_{D3}} = -\frac{R_1}{R_2}; e_i < \phi \quad (2) \quad (3)$$

Knowing (from feedback theory) that  $e_A$  is at virtual ground and setting  $R_4 = R_1$  and matching  $D_2$  and  $D_3$  leads to  $i_{D2} = i_{D3}$  and  $r_{D2} = r_{D3}$ , the overall gain ( $e_o/e_i$ ) when  $e_i < \phi$  is given by:

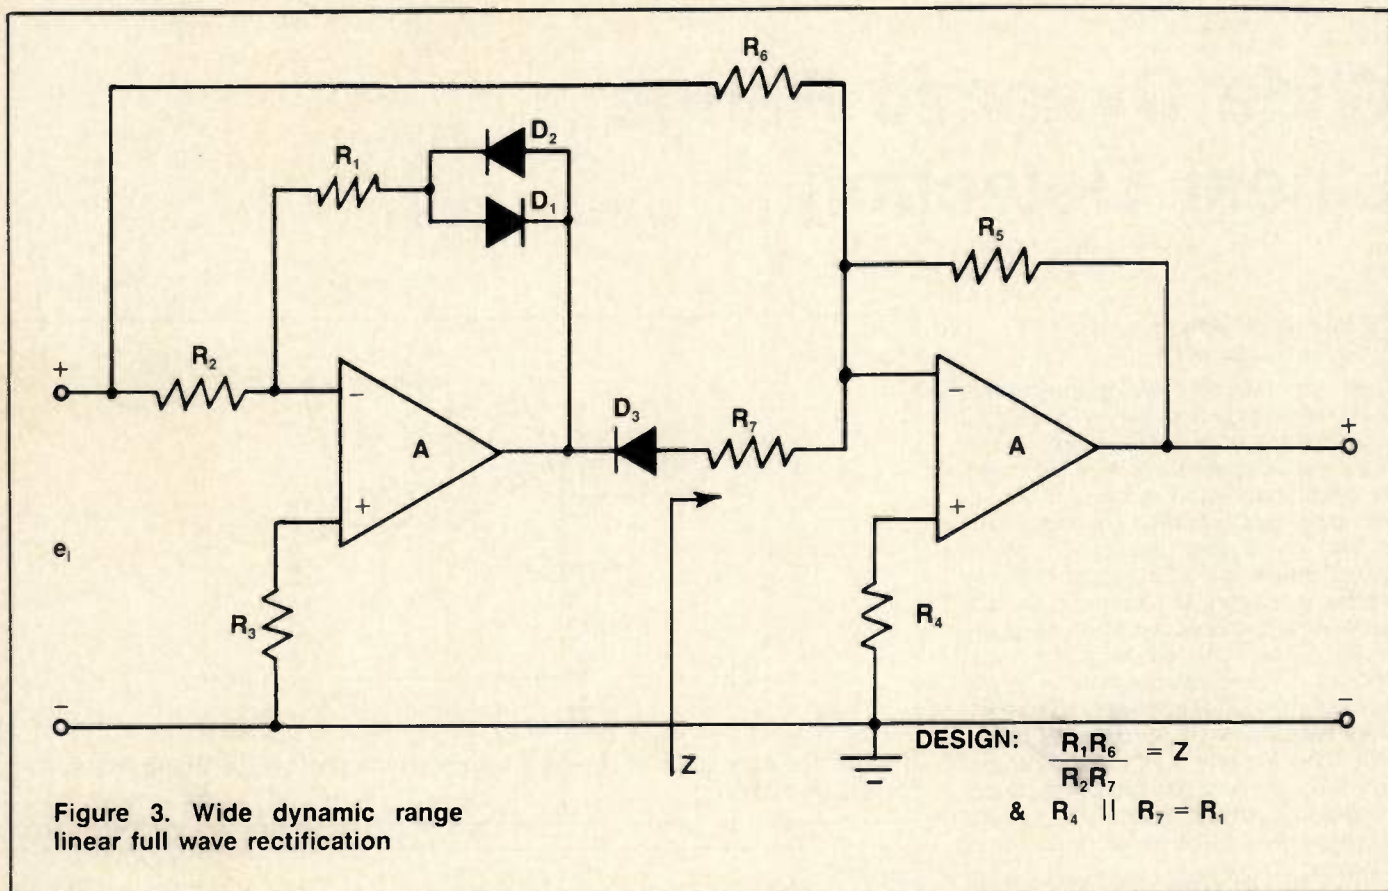

$$\frac{e_o}{e_i} = \left(\frac{e_B}{e_i}\right) \left(\frac{e_o}{e_B}\right) = \left(-\frac{R_1 + r_{D2}}{R_2}\right) \left(\frac{R_4}{R_4 + r_{D3}}\right)$$

Clearly when  $e_i > \phi$ ,  $e_B$  is less than 0,  $D_3$  is reverse biased and the overall gain is given by:

$$\frac{e_o}{e_i} = \phi; e_i > \phi \quad (4)$$

For large fractional bandwidth type signals sometimes it is desired to use linear full wave rectification to eliminate spectral overlap (with nonbaseband compon-

ents) without reconverting to a higher center frequency prior to detection, or to reduce the rolloff constraints of the succession filter, as would be required in the half wave rectification type detector. In order to obtain a wide dynamic-range linear full-wave rectifier circuit, an exten-

sion of Figure 1 (with  $D_3$  reversed) may be employed as shown in Figure 3. Note that the impedance  $Z$  looking into  $R_7$  is roughly  $R_7$ .

Therefore, the parallel combination at  $R_4$  and  $R_7$  should equal  $R_1$ .

In order to perform the complete detection, filtering of either  $e_o$  or  $e_i$  is necessary. This can be done by placing a capacitor across  $R_4$  for the half wave rectification type or placing a capacitor across  $R_5$  for the full wave rectification type. The 3 dB radian bandwidth of the filter is the reciprocal of the RC product. If it is necessary to use a sharper rolloff filter (for the larger fractional bandwidth type signals),  $R_4$  may be replaced by an n-pole filter with a passband impedance equal to that of  $R_1$  or an n-pole filter may be placed at the output  $e_o$ . Note that the ideal filter would be flat in the passband, have a linear phase characteristic and have a rolloff sharp enough to degrade nonbaseband components to a specified level. Implementation of these higher order filters will not be addressed here.

The circuit of Figure 1 was designed using an NE5538 op-amp made by Signetics. The values for  $R_1$ ,  $R_2$  and  $R_4$  were 1.1 k $\Omega$  and the value for  $R_3$  was 750

$\Omega$ . The diodes were all IN5712 Schottky barrier, which have a low turn-on voltage of 0.34V. The filtering was performed by placing a capacitor of 0.01  $\mu$ F in parallel with  $R_4$  to give roughly a 15 kHz audio bandwidth. A schematic diagram of the practical circuit is shown in Figure 9. Prior to placing the filtering capacitor on the output, the transfer characteristics were plotted on an oscilloscope in X-Y mode and are shown in the oscillograms of Figures 5, 6 and 7. From these figures, it is clear that the rectifier circuit is linear over a dynamic range greater than 60 dB.

To show the performance of the complete detector circuit, a 3 MHz carrier frequency was used with a 10 kHz AM signal with modulation index greater than 1. The input waveform along with the detected waveform is shown in Figure 8.

## Conclusions

It was found that the detector circuit built could detect signals in a linear region over a 60 dB dynamic range for roughly 11 kHz bandwidth signals of carrier frequencies ranging from 1 MHz to 4 MHz when using a simple RC succession filter. It is believed that much larger fractional bandwidth signals (e.g. 1/2) could be

# **Now! A low-compression electronic gasket that also provides environmental protection!**

## **New Instrument Specialties strips shield RFI/EMI; control noise, dust, moisture and chemical contaminants!**

These new Sticky Fingers® electronic gaskets combine beryllium copper finger strips with a neoprene rubber seal. Providing shielding characteristics comparable to other Instrument Specialties shielding strips, they also serve as an environmental seal. Thus, they are especially suited to applications where protection against noise, dust, moisture, and chemical contaminants is required as well as electronic interference protection.

The unique design of these sealing strips permits the use of extremely low compression forces, compared to conventional elastomers, to make contact with the surface of both the environmental and electromagnetic shield.

Complete continuity of the neoprene gasket is assured by using a straight joint coupler, or mitering or butting at corners. No special tools or soldering required. And as with all Instrument Specialties Sticky Fingers strips, installation is fast and secure with the strips' self-adhesive backing. The flexible series provide the same advantages, for use where a continuous shield must conform to irregular shapes and turn tight-radius corners in either direction.

Catalog E<sup>3</sup>-58 provides complete information, including exact specifications, dimensional drawings, etc., on these and other Instrument Specialties shielding strips. Use this publication's Reader Service Card, or write to us directly at Dept. RFD-19.

Straight strips available:  
.312, .450, .650 and .950 wide.  
Flexible series: .345 and .458 wide.  
(measured in relaxed position)

# SMDs for RF

## 10 MHz to 3000 MHz

The traditional quality of Alpha microwave products is now available for volume production operations in the form of low-cost SOT-23 and other surface mounted packages. This line includes many of our existing diodes (eg varactors, Schottkys, PINS, and capacitors), which feature the same high technology that goes into our high-rel military devices.

Backed by Alpha's extensive experience and its reputation for producing quality RF devices, these packages assure the highest levels of repeatability and specification conformance ... as well as excellent production yields. Furthermore, they afford a price/performance advantage that combines the essential ingredient of proven design with the latest in fully automated production equipment.

This particular combination, coupled with immediate availability, makes the new line of Alpha SMDs ideal for mass production commercial applications including mobile radios, cellular telephones, TVROs, and test equipment.

Detailed information concerning Alpha SMDs is available upon request. Send for our free brochure today!

**Alpha. Your commitment to quality starts with ours.**

## New MLCs with negative TC available from SFE Technologies combine excellent stability and tight tolerances with a wide choice of packaging.

With a temperature coefficient of  $-80 \text{ ppm}/^{\circ}\text{C}$  and  $-150 \text{ ppm}/^{\circ}\text{C}$ , our negative TL MLCs span a capacitance range of 1 pF to .056  $\mu\text{F}$  with tolerances to 1%, working voltages from 25 to 500 VDC, and have all other characteristics of standard NPO series ceramics. Their stable performance compared to plastic film capacitors makes them ideal replacements for polystyrene, polypropylene and polycarbonate components, in filters for modems, cable TV, RF amplifiers and other telecommunication applications. They are unaffected by high production methods of solder attachment such as wave solder. Available in leadless

chips, 2-pin DIPs, molded axials and radials, glass encased axials and conformal-coated radials. In all standard packaging methods including bulk, tape-and-reel for pick-and-place and automatic insertion.

Check these additional advantages:

- Cost effective — eliminates multiple capacitor trimming.
- Compensates for positive TC of inductive components, giving superior filter performance over temperature changes.

- Capable of high-density packaging in thick-film hybrid or printed circuits.

For more information, call Steve Klein at (818) 365-9411. Or write to SFE Technologies, San Fernando Electric Division, 1501 First Street, San Fernando, CA 91340-2793.

## PIEZO's Mini Wonder.

Superb performance in 3 cubic inches  
with an aging rate of  $5 \times 10^{-10}/\text{day}$ .

- ☐ Stress compensated (SC) cut crystal
- ☐ Single supply voltage
- ☐ Low power consumption

PIEZO's new Model Number 2850038 Series oscillators are designed for equipment requiring a miniature, rugged, precision frequency standard. The stress compensated (SC cut) crystal offers the advantages of a longer life and low vibrational sensitivity. This makes the 2850038 an ideal, cost effective oscillator for precision time keeping, instruments, communication and navigation equipment.

The PIEZO standard of quality guarantees you this kind of performance:

- Aging rates:  $< 5 \text{ parts in } 10^{10}/\text{day}$
- Phase noise: Better than  $-153 \text{ dBc/Hz}$  at 10 kHz offset

1.98" x 1.59" x .96" (LWH)

- ☐ High short-term stability
- ☐ Low phase noise
- ☐ Fast warm up

- Warm up: Within 1 part of  $10^7$  of final frequency in  $2\frac{1}{2}$  minutes at  $+25^{\circ}\text{C}$ ; within 5 minutes at  $-40^{\circ}\text{C}$
- Time domain stability: Better than 5 parts in  $10^{12}$  for a 1 second averaging time
- Power consumption: Approximately 1.5 watts after warm up at  $+25^{\circ}\text{C}$
- Output frequency: 10 MHz or 10.23 MHz standard, custom frequencies available.

PIEZO Systems is an affiliate of PIEZO Crystal Company, a leader in the production of piezo-electric crystals since 1936. For more information call your nearby PIEZO representative, or write to PIEZO SYSTEMS, P.O. Box 619, Carlisle, PA 17013. Telephone (717) 249-2151.

# One Antenna Kit with everything, to go please.

A complete line of kits with upper limits to 18GHz that satisfy FCC, VDE, and MIL-STD 461 specifications, and more.

Antenna kits that meet your specifications of high quality and frequency response, and that are also responsive to your demands of portability and easy use. A.H. Systems offers nine different kits that fill the bill. Each comes in a single, lightweight case. Just one kit can contain all the antennas, probes and cables to perform E-Field 1KHz-18GHz, H-Field 20Hz-50KHz and conducted 20Hz-100MHz testing. Antenna factor calibrations are provided with each antenna.

So order one to go, with everything, or one of our other tantalizing specials.

# “Outdoor” Emissions Testing Moves Indoors

*Submitted by Keene Ray-Proof*

**F**or years, electronic companies have tested their new devices for RF emissions outdoors, and FCC regulations supported that approach. But today, more and more companies are taking their “open field” testing indoors, saving money and actually getting better results. And the FCC is going along, tacitly.

“Ironically, it’s electronically ‘cleaner’ in today’s electronic testing chambers than in the great outdoors,” says the test engineer of a Colorado telecommunication company. “In fact, with all the satellites and aircraft navigation systems operating out there, and all the microwave telecommunication, the ‘pure desert’ air suffers from electronic clutter.”

The testing is being done in RF anechoic test chambers. “Basically, that means unwanted radio waves can’t get in or out; and further, those waves needed to run the test inside them don’t echo off any of the walls,” explains Keene Ray-Proof’s Brian Lawrence.

“We still do the final FCC compliance tests in open space as prescribed by the FCC,” says a spokesman for the telecommunications manufacturer. “But the preliminary testing, really the majority of the testing from an operational standpoint, is done in the RF anechoic chamber.

“Compared with driving out to the desert with two truckloads of gear, setting up and knocking down, indoor testing is certainly much more efficient. It’s easier to schedule, far more secure and actually ‘cleaner’ electronically. There’s a different ambient level almost every time we go outside, and that takes a lot of time to calibrate for.”

The Keene Ray-Proof indoor testing chamber may not appear imposing, but electronically it does the job. It’s been in

virtually continuous use, sometimes around the clock, for both preliminary FCC qualification testing and product development.

The chamber itself is essentially square with a high ceiling. A computer floor with built-in emissions absorber lets all wiring run underfloor without interfering with test readings. Two manual doors are for personnel entry and moving equipment in and out. The control room is adjacent and attached, but isolated electronically from the test area.

## **A Non-Reflective Environment**

To keep the test space electronically clean and free of RF reflections from the device under test or any instrumentation, the entire exterior of the chamber has a continuous metal skin hidden within it. Even electrical service and telephone lines, doors, ventilation ducts and other penetrations are designed to block passage of unwanted electronic signals.

Availability of such test chambers as pre-engineered modules is a recent development, according to Bob Barbour of Ray-Proof.

“We’ve built custom RF-shielded chambers for espionage-proof government and defense applications for decades,” he said. “It’s been a matter of distilling all we’ve learned into a more or less standard product for commercial application.”

Compared with custom RF-anechoic chambers of comparable size and features, the modular test chamber costs 25 to 40% less, and is in place and running in about half the time of a custom facility, he said.

“Considering that every electronic device from Donkey Kong to a space shut-

tle computer must pass FCC-type 15 testing, the modular RF shielded anechoic chamber should catch on quickly.”

The manufacturer’s indoor testing methodology is virtually identical to open space testing. The device to be tested is installed on a rotating platform, connected and brought up to operating condition. At the other end of the room, three meters away per FCC test procedures, is a sensing antenna. During the test, the device under test is operated as it rotates through a full 360 degrees. The antenna picks up any emissions and feeds it to analyzers in the control room.

Anechoic materials on the walls and ceiling of the chamber assure that the antenna receives only direct signals from the device under test. No mixture of direct and reflected signals, or any electronic “clutter” from the atmosphere, can affect the testing operation. So far, there has been excellent correlation between in-chamber tests and open space tests.

Whenever the chamber is not in use, calibrations tests are run to determine baseline levels of EM radiation and reflections. But there’s not much time for calibration. Sometimes it runs around the clock, something obviously not possible out in the back country.

Although final FCC testing is still done in open space, Keene Ray-Proof expects that to change shortly. The question of in-chamber testing as an acceptable substitute for open space emission testing is now before the FCC.

“Based on our experience so far, there’s every reason to allow in-chamber testing as an alternative,” the spokesman said. “The correlations between our indoor and open space tests are exceptional.”

**MICROWAVE CAD.  
INACCURATE SOFTWARE  
IS DIFFICULT  
TO DISGUISE.**

# SUPER-COMPACT PC

With competition growing in the technical software industry, you're bound to see more than a few promises.

You'll see promises of future developments, soon-to-be-here products and right-around-the-corner results. Initially, it may all look pretty exciting.

At COMPACT SOFTWARE we know you as an engineer are looking for something a little more exciting than promises.

You're looking for accurate and proven performance.

And proven performance is exactly what has made SUPER-COMPACT® the industry standard for computer-aided design tools in the development of high-frequency and microwave circuits.

SUPER-COMPACT can now run on your IBM® PC XT, AT, COMPAQ™, and other IBM compatible computers. It offers the same design and full modeling capabilities as our mainframe versions.

- Analysis of the simplest to the most complex circuits

- Two different optimizers, Random and Gradient, to help you achieve the best design. (You'll want to use the Gradient optimizer when optimizing for global optimum results in High-Q circuits.)

- Transmission Line Synthesis and Analysis (TRL)

- Statistical Analysis with Monte Carlo Simulation, yield prediction, histogram plotting and stability circles

- Synthesis for lumped and distributed networks

SUPER-COMPACT is unique in that it allows you to use formulas to define parameters in circuit design. And SUPER-COMPACT PC and the mainframe version offer the most extensive element model library available.

In addition to these standard features, our IEEE-488 Interface allows users to download measured S-parameters from the HP8510 Network Analyzer via the HP200 series computer to the IBM PC XT and compatibles.

You'll also be able to set up private data banks for S-parameters. The data bank information is stored on floppy disks and is part of the SUPER-COMPACT PC software distribution package.

## A TRADITION OF ACCURACY

As an engineer, competition demands that you keep up with the pace of technology. Your products must be brought to the market not only faster, but without costly remanufacturing time.

When you combine our AUTOART™ PC software, an interactive two-dimensional drafting program for microwave circuits, with SUPER-COMPACT PC, you have a fully complemented microwave design workstation.

SUPER-COMPACT and AUTOART give you the competitive edge you need by giving you the potential to significantly reduce your product design cycle.

Whether running SUPER-COMPACT on a mainframe or a PC, the proven accuracy, power and speed are there to save your company manpower, money and to deliver your product to the market before your competition.

## SUPER-COMPACT COMPATIBILITY

SUPER-COMPACT PC's compatibility with our mainframe versions means you save money by not having to invest in additional costly equipment such as photoplotters, printers, and terminals.

If you have large circuits to optimize, use SUPER-COMPACT PC for your circuit preparation and data graphics output, while using MAINFRAME SUPER-COMPACT for your analysis and optimization.

You can include input files as part of standardized reports and can

transfer designs to other design groups for further value-added customization.

## COMSAT LABS

SUPER-COMPACT, as well as our other software products, are designed and developed in a joint effort between our own and Comsat Labs' engineers.

It's an ongoing team effort that guarantees a long term commitment to service, support and innovation.

SUPER-COMPACT offers you a solution that saves time and money while providing you with the most accurate, powerful and reliable software available.

Call us today for detailed information about the new SUPER-COMPACT PC and AUTOART PC. And while you're at it, look around for our competition.

They're amazingly easy to recognize.

# Measuring a Dipole Antenna Radiation Pattern Using Time Domain and Gating

## HP 8510 Network Analyzer Can Remove Ground Clutter Effects

By John W. Boyles  
Hewlett-Packard Company  
Santa Rosa, CA

A classical problem encountered when measuring the far-field radiation pattern of an antenna in a medium-distance range is the degradation that occurs when undesirable reflections (from the ground or nearby objects) are present. To reduce this problem, the source and test antennas are often installed on towers to remove them from reflective objects, RF absorptive materials are used to reduce the amplitude of the reflected signals and diffraction fences are installed in the range in order to null out the reflections and "clean up" the range. These solutions are often limited in their effectiveness and can be prohibitively expensive to implement.

The HP 8510 network analyzer can be used to reduce the effects of reflected signal paths in an antenna measurement and determine the response of the antenna to the main path signal only, without costly range modifications. This is done by using the HP 8510 to measure the swept frequency response of the antenna and compute the Inverse Fourier Transform to give the time domain impulse response. The time domain response allows the user to identify the reflected signal path responses in time and then remove them with the gating feature. In converting back to the frequency domain, the effects of the responses outside the gate are removed. This article summarizes the results of using this technique to measure the radiation pattern of a standard gain dipole antenna at RF frequencies on a medium-distance antenna range.

The HP 8510 is a microwave network analyzer designed to make S-parameter measurements in the frequency domain. It also has the optional capability to compute the Inverse Fourier Transform of the measured data to give the time domain response. When used with the HP 8511A frequency converter, the HP 8510A can be configured as a general purpose four-channel phase-locked receiver, and it can simultaneously display in real time the frequency and time domain responses of any channel or the ratio of

any two channels. One channel of the HP 8511A frequency converter must be used as a reference to achieve phase lock and therefore must have an input signal level between  $-10$  and  $-50$  dBm. The other three channels can be used to measure signals at the reference frequency with a dynamic range of close to 100 dB ( $-10$  dBm max input).

A general block diagram for making antenna pattern measurements with the HP 8510 is shown in Figure 1. The required test equipment includes the HP

Figure 1. General Antenna Measurement Configuration Using the HP 8510 Network Analyzer.

8510A network analyzer, a synthesized source (HP 8340A or 8341A) and the HP 8511A frequency converter (test set). The source and test set are controlled by the network analyzer via the HP 8510 system bus. The output of the source is sent through a coupler to the source antenna. The secondary output of the coupler is used to provide the reference signal which is sent back via low loss cable to the HP 8511A. The signal received by the antenna under test is also input to the HP 8511A, and the HP 8510 is set up to display the ratio of the test and reference signals.

To illustrate the gating measurement technique with the HP 8510, consider measuring a dipole antenna (Scientific Atlanta model 15-115). The dipole antenna is particularly difficult to measure because its radiation pattern is only slightly directional in azimuth (with a figure-eight shape) and omnidirectional in elevation. Therefore, the dipole picks up reflections from almost every direction and is particularly sensitive to reflections from the ground. Because of its sensitivity to ground reflections and because it has a calculable (1) radiation pattern with which to compare measured results, the dipole antenna is a good device to test out the new measurement procedure.

The standard way to characterize the far-field radiation pattern of an antenna is to make the measurement at a single (CW) frequency as the positioner is rotated. However, in order to generate a time domain response, the measured data must be taken over a span of frequencies. The time domain representa-

tion of a CW signal is, by definition, a sine wave. In order to generate an impulse response, the measurement frequency span must be inversely proportional to the desired time domain impulse width.

The frequency domain response of the dipole from 50 to 175 MHz and the corresponding time domain impulse response (Band Pass mode) are shown in Figure 2. The antenna was tuned to 115 MHz. The large amount of ripple in the frequency domain response is caused by interference due to reflections from the ground and other reflective objects within the antenna range.

The time domain display shows the measured transmission response of the antenna as a function of time. Because no calibration was used in this measurement to balance out the phase difference between the test and reference signal paths, the absolute location of the time domain response is somewhat arbitrary. Because the reference signal is routed through cable and the test signal travels a shorter distance through air, the difference in electrical length causes the time domain response to arrive in negative time. However, it is the relative path difference between the time domain responses that is most useful.

### Identifying the Time Domain Responses

The plot in Figure 2 shows two major time domain responses that are separated in time by 33 ns, which corresponds to a physical separation of 9.89 m. The first time response is that of the main

path signal, and the second response is that of the signal reflected from the ground plane which, because it travels a longer distance, is lower in amplitude and arrives later in time. The 6 dB difference in amplitude between the two responses represents the additional path loss of the reflected signal and also accounts for the large amount of ripple in the frequency domain response.

The required measurement bandwidth and separation between the two responses are determined by the characteristics of the antenna under test. The 50 percent (-6 dB) impulse width of the time domain stimulus is inversely proportional to the frequency span, and for a span of 125 MHz it is calculated (2) to be 9.6 ns. This represents, in the best case, the absolute minimum separation in time that the two responses can have and still be distinguished from one another. However, to use the gating feature effectively to remove the second response, the actual separation should be several times this minimum value to prevent overlapping of the responses.

A second factor to consider, which affects the required separation of the responses, is the bandwidth of the antenna under test. The dipole is a narrow band antenna that has a dispersive phase characteristic which causes its time domain impulse response to be smeared out in time. The result, observable in the time domain responses of Figure 2, is that the actual measured impulse width is more than twice the calculated width.

Figure 3 shows the response of the

same antenna measured over a frequency range of 50 to 300 MHz. Because the measurement bandwidth is doubled, the width of the time domain impulse stimulus is reduced by one half, which results in an improvement in the time domain response resolution. Notice, however, that the overall shape of the two responses is unchanged and that the amount of overlap of the responses is also unchanged. This is because the distributed shape of the response is caused by the dispersive nature of the dipole antenna. This indicates that the only way to decrease the amount of overlap between the two responses is to increase the relative travel time between them by increasing the height of the antenna under test above ground. In this example, there exists some overlap between the two responses, however (as will be demonstrated) they are adequately separated to use the gating feature to remove most of the effects of the second response.

This also indicates that the gating operation can be used to remove only the effects of reflections that are far enough out in time to be beyond the distributed main path response of the antenna. In this measurement, the effect of any signals that are picked up from reflections from the antenna positioner or other close in reflective objects will not be removed. However, the major error is due to the reflection from the ground plane, which is far enough away from the main path response to be removed using gating.

The gating feature of the HP 8510 provides a way to remove the effects of unwanted time domain responses and view in the frequency domain the effects of only those responses that are inside the gate. A gate is a time filter. In Figure 4, the center of the gate is set to the peak of the first time domain response, and the gate span is increased to include all of the first distributed time domain response. With the gate turned on, the second time domain response is removed, and the resulting frequency domain response is that of only the main path signal. As expected, the gated frequency response very closely resembles the ungated response except that the ripple caused by the reflection from the ground plane has been removed.

The two major sources of error in this measurement are the tracking error between the test and reference signal paths and the interference error caused by the signal reflected from the ground. A simple model depicting these measurement errors is shown in Figure 5.

Figure 4. Gated Frequency and Time Domain Responses of Antenna Showing the Removal of the Ground Path Reflection.

Figure 5. Antenna Measurement Error Model.

The correction for these two errors is accomplished in two steps. The first step is to remove the interference signal ( $E_{refl}$ ) using gating. Then, assuming that the tracking error ( $E_{tr}$ ) does not change as the antenna is rotated, it is removed using normalization. The procedure for doing this is as follows:

First, the gated response of the antenna at boresight (main beam) is saved into a memory register of the HP 8510A. Then, as the antenna is rotated, the gated response of the antenna at each angle is normalized to the boresight trace (using the data-divided-by-memory feature of the HP 8510). This gives the response of the antenna relative to the boresight response. Because the tracking error is common to both the measured and stored responses, it is normalized out in the ratio.

To take advantage of the time domain capability of the HP 8510 the measured data must be taken over a sweep of frequencies at each angle of rotation. Therefore, the time to make a pattern measurement is greater with this technique than for a comparable CW measurement. Because of the difference in test and reference path lengths involved the frequency accuracy is critical, and

therefore the source (HP 8340A or 8341A) should be operated in the stepped (synthesized) sweep mode. The sweep time for this mode is 50 ms per point, so for a 201 point measurement each sweep will take approximately 10 seconds. However, in addition to the frequency stability of a synthesizer, the stepped sweep mode has the benefit of allowing up to 128 averages without significantly changing the sweep time, which greatly reduces the effects of measurement noise.

Allowing 10 seconds per sweep, 5 seconds to increment the antenna positioner and 1 second to perform the gating operation and record the data, the measurement time is approximately 16 seconds per positioner setting. For a full 360 degree rotation at 5 degree increments, the total measurement time is approximately 19 minutes. If the frequency data is taken at 101 points (5 second sweep time), the total measurement time reduces to 13 minutes. (If the test and reference channel paths are balanced, it may be possible to use the ramp sweep mode, which would reduce the measurement time to approximately 7 seconds per positioner setting (8 minutes total).)

This longer measurement time is a

tradeoff for being able to use time domain and gating. If CW frequency testing is desired, the HP 8510 can be used as a CW receiver. However, although the swept frequency measurement technique requires additional time, the radiation pattern of the antenna at 201 frequencies of interest from 50 to 300 MHz can be plotted after only one rotation of the antenna positioner, and the improvements derived from gating more than offset the additional test time.

## Measurement Results

The dipole was measured with 201 points from 50 to 300 MHz at each 5 degree increment of azimuth rotation (72 sets of 201 point data). The radiation pattern of the dipole was measured at several frequencies, and both the gated and ungated responses were compared with the theoretical response. (Because the antenna was boresighted visually, the measured antenna patterns were plotted with a small offset angle to correct for the resulting misalignment.)

Fig. 6 shows the measured radiation pattern of the dipole at 115 MHz with no gating, plotted in a log scale with the theoretical pattern. This is the CW measurement. The difference between the theoretical and the ungated pattern is due primarily to the reflected signal from the ground that causes the uneven side lobes and offset nulls.

Fig. 7 shows the same measured pattern using gating to remove the effects of the ground plane reflection, plotted together with the theoretical response in a log scale. The gated response is virtually identical to the theoretical response with an average disagreement of only 0.18

dB. This improvement in antenna pattern measurement accuracy is due only to gating. (The measured antenna pattern is plotted point to point at 5 degree increments, and because of the offset in alignment the actual nulls at 90 and 270 degrees were not measured.)

A more dramatic improvement in the antenna pattern occurred at 125 MHz. At this frequency, the effect of the ground path interference was more severe. Fig. 8 shows the ungated response. In this conventional CW plot, there is very little resemblance between the measured pattern and the theoretical pattern. Fig. 9 shows the measured antenna pattern obtained using gating. In this case, the gating technique has improved the measurement of the nulls by better than 25 dB.

Fig. 10 shows the antenna pattern measured at 100 MHz without using gating, and Fig. 11 shows the pattern obtained using the gating technique. The improvement with gating is again very dramatic, however at this frequency there is also larger disagreement between the gated and theoretical responses. The gated pattern has a symmetrical shape that is very close to that of the theoretical pattern, however, it also has a rotational offset. The cause of this offset is unknown. Because of the nearly perfect results that were obtained at the resonant frequency (115 MHz), it is assumed that the offset is the result of an imbalance in the antenna at 100 MHz. This would also account for the lack of symmetry in the original ungated (CW) pattern.

In all, the radiation pattern of the antenna at 201 frequencies can be plotted from the data taken from one rotation of the antenna positioner.

## Reduced Bandwidth Antenna Pattern

The actual measurement was made with 201 points from 50 to 300 MHz. The first 101 data points (from 50 to 175 MHz) were taken and used to re-compute the antenna pattern of the dipole at 115 MHz using gating. The resulting frequency and time domain responses at boresight are those previously shown in Figure 2. As mentioned, this bandwidth reduction doubles the time domain impulse width which reduces the response resolution, but it also reduces the measurement time. Fig. 12 shows the resultant gated pattern of the antenna at 115 MHz obtained with the reduced bandwidth data. This pattern is virtually identical to the one generated with the wider bandwidth information.

## About the Author

# Matrix keeps Coaxial Switching from turning into a Shell Game

## EXPERIENCE IS IMPORTANT. WE HAVE 15 YEARS OF IT

If you're buying a high frequency switching system, it pays to deal with a company who really understands the business. Matrix does. We've been designing state-of-the-art reed relay switchers for over 15 years. To the toughest electrical and packaging specs imaginable. Our customers include government agencies, defense contractors, the TV industry and more. So don't get burned by the old shell game. Deal with the leader and be sure.

## WE BUILD TO YOUR SPECS AND MAKE 'EM WORK

Why spend months designing a custom switching system when we can do it faster and for less money using our standard reed relay modules. We assume total systems responsibility including computer compatibility, control panel, status indicators, scanning functions and power supplies. And we can switch any type of cable system - coax, twinax, triax, common ground, floating ground - you name it.

## 100 MILLION OPERATIONS WITH OUR REED RELAYS

We use hermetically sealed field replaceable reed switches with a life expectancy of 100,000,000 operations! And being modular, repairs can be made in minutes. That's also why our system never becomes obsolete regardless of how fast or how big your requirement grows. Talk about big systems, we're delivering a 4,000 point switcher to a major government agency.

So whether you're dealing with IF, RF, video, pulse, audio or dc, there's a Matrix switching system to meet your precise needs.

## COMPUTER COMPATIBILITY

Just apply a control input from your computer and the system will instantly route your signal to as many points as needed. Our IEEE interface is compatible with the General Purpose Interface Bus, with RS-232 and 16 bit parallel interfaces also available.

## NEW PRODUCTS

We have a lightweight portable system which is perfect for test, and service. Plus an ULTRA-FAST (microsecond range) pin diode coaxial system.

So don't get caught in the old shell game when Matrix has the answers to your switching problems.

# For a power resistor that stays non-X up to vhf, there's only one choice.

The Carborundum® Type SP. Only the Carborundum ceramic power resistor behaves like a pure resistance rather than an inductor and/or capacitor. It operates from low audio frequencies up into the vhf range. Each unit is a solid body of resistive material. No windings, no film. Ideal for frequency-sensitive rf applications like feed-back loops.

And it gives you extremely high power density, with great surge-handling capability because it's solid.

Our Type 234SP, for example, is about the size of a 2-watt carbon comp, but dissipates a full 10 watts in 40°C ambient air. Moreover, it can consistently absorb surges of over 10X rated power for several seconds and come back for more with very little  $\Delta R$ . Forced-air-cooled, water-cooled or

immersed in oil, it will handle even greater power overloads.

Other Carborundum Type SP resistors—including high-power, water-cooled configurations—are rated from 2.5 to 1000 watts. For further details, call or write us today.

## CONNOR-WINFIELD OSCILLATORS

# SHORT-ORDER SPECIALISTS

## But we can cook up a big batch, too!

Connor-Winfield is ready to serve. Whether the oscillators you need are in stock or custom designed or whether you need 1 or 10,000, our special of the day—everyday—is meeting your needs with the right combination of quality and low cost. Are you ready to order? Call or write us today for more information.

### ECL DIP High Frequency

Models: ECLA, ECLB  
Frequency: 8MHz—200MHz,  $\pm .01\%$   
Supply:  $-5.2\text{Vdc} \pm 5\%$  or  $-4.5\text{Vdc} \pm 5\%$   
Output: 10K ECL or 100K ECL  
Package: All metal, hermetically sealed

### DIP SINEWAVE Low Frequency

Models:	DPS1	DPS2
Frequency:	1KHz—75KHz	100Hz—100KHz
Tolerance:	$\pm .01\%$ , THD $\leq 5\%$	$\pm .01\%$ , THD $\leq 5\%$
Supply:	5Vdc $\pm 10\%$	8Vdc—15Vdc
Package:	All metal, hermetically sealed	

### TTL CLOCKS Tight Tolerance

Models:	S10C	S10D	S10E
Frequency:		31KHz—25MHz	
Tolerance:	$\pm .001\%$	$\pm .0025\%$	$\pm .005\%$
Temp. Range:	0°—50°C	0°—70°C	—25°—75°C
Package:	All metal, hermetically sealed 14 pin DIP		

### TTL CLOCKS Stock Frequencies Low Cost

Models:	S14R8	S15R8
Tolerance:	$\pm .005\%$	$\pm .01\%$
Supply:	$\pm 5\text{Vdc} \pm 10\%$ , 60mA max	
Frequencies:	1, 2, 4, 5, 6, 8, 10, 12, 16, 20, 24, 40, 70MHz	
Package:	All metal, hermetically sealed 14 pin DIP

INFO/CARD 36

# A New Approach to Op Amp Design

By Scott Evans  
Comlinear Corporation

This article describes a high speed op amp topology that offers high frequency performance an order of magnitude faster than conventional op amp designs. One of the results of this design is the elimination of the gain-bandwidth product. Bandwidth remains virtually constant as the gain is changed; as a result, ease of use and predictability of performance have been greatly improved.

Conventional op amps have a differential, high input impedance stage that feeds several subsequent gain stages. The open loop output of the amplifier is  $V_o = A(s) [V_1 - V_2]$ . (See Figure 1.)

With the feedback connection made, feedback in the form of a voltage is applied to the inverting input. The closed loop gain becomes:

$$\frac{V_o}{V_1} = \frac{\frac{R_1 + R_2}{R_1}}{1 + \frac{R_1}{A(s)}}$$

By letting  $(R_1 + R_2)/R_1 = G$ :

$$\frac{V_o}{V_1} = \frac{G}{1 + \frac{G}{A(s)}}$$

To see the effect that gain setting,  $G$ , has on the frequency response it is instructive to break the open loop gain,  $A(s)$ , into a ratio of a numerator,  $N(s)$ , and a denominator,  $D(s)$ .  $N(s)$  contains the zeros of the response and  $D(s)$  contains the poles of the response.

$$A(s) = \frac{KN(s)}{D(s)}$$

where  $K$  is the DC value of the open loop gain.

Substituting this ratio into the closed loop gain and rearranging:

$$\frac{V_o}{V_1} = G \frac{KN(s)}{KN(s) + (G)D(s)}$$

$G$  not only scales the magnitude of the gain (as desired) but also multiplies the effect of  $D(s)$  on the closed loop response. The locations of the closed loop poles are now a function of  $G$ ; thus, if an application requires a large  $G$ , the poles will be at a lower frequency than for a low value of  $G$ . This is the chief failure of conventional high speed op amp designs. This is a major cause of instability problems in conventional op amps, correcting the problem leads to performance far inferior to data sheet specifications.

Figure 2 shows the closed loop frequency response of a conventional single-pole op amp for various gains. Notice that increasing the gain decreases the bandwidth.

In addition to poor high frequency performance, there are several other severe problems with conventional op amp design.

**Compensation** — Conventional high speed op amps are unstable at most gain settings so compensation must be used. Compensation creates a very low frequency pole that limits bandwidth so severely that the problematic high frequency poles are no longer dominant. Unfortunately, compensation does not allow complete control of the pole and zero locations, so simultaneously optimizing bandwidth, gain flatness and settling time is difficult if not impossible.

**External Compensation** — Compensation is usually connected external to the amplifier so the designer can tailor the response to the application. Unfortunately, conventional op amps are very sensitive to stray reactance in the PC board layout, temperature, loading and variations in the transistors of the op amp itself that make reliable compensation difficult. In addition, production can become expensive since each op amp compensation network must be individually "tweaked" to the desired response or the op amps must be individually tested and selected.

**AC Feedforward** — In order to achieve faster rise times and wider bandwidths, conventional op amps often use a technique called AC feedforward. This techni-

Figure 1. Open loop output

Figure 2. Closed loop frequency response of a conventional single-pole op amp.

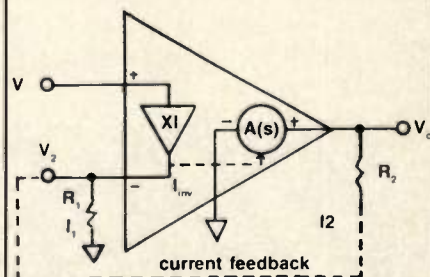

Figure 3. The Comlinear op amp

Figure 4. Gain vs. frequency response of the Comlinear op amp.

## The Fallacy of the Gain-Bandwidth Product

The gain-bandwidth product has for years been a key specification for op amps; in fact, the concept of the gain-bandwidth product is a major topic of op amp tutorials. Unfortunately, this often touted specification means little to the engineer who must work with very high speed op amps. For most high speed op amps the gain-bandwidth product is actually very misleading.

The basis for the gain-bandwidth product is the assumption that the open loop gain rolls off due to a single pole. When the assumption is valid, as is the case with some low frequency op amps, the gain-bandwidth product concept is also valid. Having frequency performance depend on gain is troublesome, but at least with a single pole rolloff the bandwidth is easily determined and stability is assured.

High speed op amps, however, have several poles before unity gain crossover is reached.

Clearly, a conventional op amp with a gain-bandwidth product of 1 GHz will not yield a bandwidth of 500 MHz at a gain of 2. This is why most manufacturers specify their gain-bandwidth products at very high gains, typically 1000.

A much more useful (and accurate) way to show frequency performances is to actually show the performance for various gains. This allows the engineer to fully characterize the amplifier without having to actually test the device. Although the performance of Comlinear amplifiers varies little with changes in gain, Comlinear provides complete specifications for at least three representative gain settings.

que cancels a low frequency pole by introducing a zero at the same frequency. Unfortunately, temperature, aging, loading and supply voltages affect pole locations. Pole locations also change with gain setting so the degree of cancellation depends on gain. This is part of the reason why conventional op amp performance is usually specified at a gain of -1. At this gain, the performance is optimal, but it deteriorates rapidly at other settings.

**Slew Rate Limiting** — In order to obtain high open loop gain, several internal gain stages must be used. As a result, transmit times through the amplifier are large. In addition to reducing the phase margin this also leads to problems when large or fast rise time signals are present at the input. These large or very fast signals can cause an internal gain stage to saturate or be cut off before feedback can propagate back to the input to reduce the error signal. To prevent this behavior the slew rates of the internal stages are simply limited so nonlinear behavior cannot occur before the signal propagates through the amplifier. Consequently, the slew rate and large signal bandwidth of the op amps are reduced severely.

## The Comlinear Innovation

Most of the problems with conventional op amps shown are either directly or indirectly caused by the limitation of having  $G$ , the gain setting, affect the frequency response. If  $G$  could be removed from the denominator of the expression, performance and ease of use could be extended dramatically. This is exactly what Comlinear designers have done. The drawing of the Comlinear op amp (Fig. 3) shows an unusual (and patented) circuit configuration.

The input buffer is a unity gain voltage amplifier that is connected across the inputs of the op amp. In operation, the buffer forces  $V_2$  to equal  $V_1$  independent of any external feedback through  $R_2$ . This causes the inverting input to have a very low input impedance. When feedback around the loop is applied, the impedance of this node is reduced further and  $V_2$  becomes a "virtual ground" with respect to  $V_1$ . This low impedance allows current to flow easily into or out of the inverting input.

The transimpedance amplifier is the gain block inside Comlinear op amps. In operation, the transimpedance amplifier senses the inverting input current (literally the current flowing into or out of the inverting input) and transforms this current into the output voltage. The transfer func-

$$I_{inv} = I_2 - I_1$$

$$I_{inv} = \frac{V_2}{R_1} - \frac{V_o - V_2}{R_2}$$

Then, since  $V_o = I_{inv} \cdot A(s)$  and  $V_2 = V_1$  (because of the buffer)

$$\frac{V_o}{A(s)} = V_1 \left( \frac{1}{R_1} + \frac{1}{R_2} \right) - \frac{V_o}{R_2}$$

Then, rearranging

$$\frac{V_o}{V_1} = \frac{R_1 + R_2}{R_1 \cdot R_2} = \frac{1 + \frac{R_2}{R_1}}{1 + \frac{1}{A(s) \cdot R_2}}$$

$$\text{Again, letting } 1 + \frac{R_2}{R_1} = G$$

$$\frac{V_o}{V_1} = \frac{G}{1 + \frac{R_2}{A(s)}}$$

$$\text{Letting } A(s) = \frac{KN(s)}{D(s)}$$

$$\frac{V_o}{V_1} = G \frac{KN(s)}{KN(s) + R_2 D(s)}$$

**Table 1. Mathematical justification of the Comlinear op amp design.**

tion of this transimpedance amplifier is  $A(s)$ ; the units are in ohms.

Feedback in the form of a current is applied through  $R_2$  to the inverting input.

## A Comparison: Conventional vs. Comlinear

Table 1 shows the mathematical justification of the Comlinear op amp design. As a result of these mathematical operations the closed loop gain equations are in the same form and can be compared directly.

For the conventional op amp:

$$\frac{V_o}{V_1} = G \frac{KN(s)}{KN(s) + (G)D(s)}$$

For the Comlinear op amp:

$$\frac{V_o}{V_1} = G \frac{KN(s)}{KN(s) + (R_2)D(s)}$$

$R_2$  has replaced  $G$  in the frequency-dependent portion of the transfer function. Since  $R_2$  can be held constant, whereas  $G$  cannot, the pole locations and hence the performance can be held constant. ( $G = 1 + R_2/R_1$ , so the gain setting can be varied by changing  $R_1$ ).

The results of this new approach to op amp design are dramatic:

**Elimination of the Gain-Bandwidth Product** — The frequency response of the Comlinear op amp changes very little when the gain is increased by a factor of 10, from a gain of 4 to a gain of 40. Other specifications are similarly unaffected.

# SPEED vs PERFORMANCE SAME OLD STORY?

## NOT AT M.S. KENNEDY... THEY GO HAND IN HAND!

You'll be way ahead with our High Speed OP-AMPS, because at M.S. Kennedy we believe performance means not only speed, but D.C. Accuracy and long term reliability. We don't sacrifice one for the other.

The M.S. Kennedy Corp. has been producing high speed operational amplifiers for military and high reliability industrial applications for over 10 years. Our quality and performance have led to the design-in of MSK products on nearly every airborne application in the U.S.A.

**Full Screening to MIL-Std. 883C**

You can rely on our products to finish the job they're designed for, time after time. The proof is in the performance of our units designed into these programs: F-14, F-15, F-16, F-18, F-20, F-111, EA-6B, B-1B, LAMPS, AH-64 APACHE, MAVERICK and AEGIS.

### **Winning Specs**

- Up to DC to 400 MHz Small Signal Band Width
- Up to 4000 V/ $\mu$ s Slew Rates
- Up to 140V Output Swings
- < 10 $\mu$ V/ $^{\circ}$ C Offset Drift Available.

# MSK

**M.S. KENNEDY CORPORATION**  
8170 Thompson Road, Clay, New York 13041  
Tel. (315) 699-9201 TWX 710-541-0465

ected by gain changes. A similar change in gain with a conventional op amp could reduce the bandwidth by a factor of 10, even under ideal single pole conditions. As shown in Figure 4, the -3dB bandwidth remains constant over a wide range of gains. Small second order effects explain the slight deviation in performance from that predicted by the equations.

**Excellent Performance** — The high speed performance of Comlinear op amps is dramatically better, usually by an order of magnitude, than conventional op amps. A typical rise time for a 5V output step can be as low as 1.6 ns, for example. With a conventional op amp rise times of 30 to more than 100 ns are common. Other outstanding specifications include settling times which can be as low as 10 ns for a 0.2 percent tolerance and slew rates that range from 3000 V/ $\mu$ s to over 7000 V/ $\mu$ s, depending on which model is chosen. (The slew rate was intentionally kept very fast so it would not limit the response of the amplifiers under large signal conditions. Bandwidth, not slew rate, controls amplifier response and keeps it linear.)

**Linear Phase** — Although phase linearity is a rarely mentioned specification, it is very important for signal fidelity. Comlinear op amps have excellent phase linearity, usually the deviation from linear phase is less than two degrees from DC to over 50 percent of the bandwidth. Conventional op amps, however, must use techniques like AC feedforward which increase bandwidth but degrade phase linearity; thus, signal fidelity is sacrificed.

**Predictable Performances** — Since most of the specifications are virtually independent of gain setting, the performance of Comlinear op amps remains consistent even with varying circuit configurations. As design requirements change, adjustments in gain usually can be achieved by a change in one resistor; with a conventional op amp a change in gain could require a redesign of the entire circuit.

**Internal Compensation** — With  $R_2$  fixed and the poles of the frequency response consequently fixed, internal compensation is provided to simultaneously optimize bandwidth, settling time, linearity and distortion. Since the compensation is internal, Comlinear op amps can save time and money in production with no compensation networks to "tweak." Although Comlinear uses an internal high precision resistor for  $R_2$ , on many models an external resistor of another value can be used. Since this

would change the pole locations, the internal compensation is made accessible to the user through one package pin. One external capacitor is then used to re-optimize the performance.

**Standard Usage** — Determining the gain for Comlinear op amps is the same as that for conventional op amps, where  $G=1+R_2/R_1$ . The same ease of use ap-

plies equally well to both inverting and differential configurations.

### About the Author

## Optimize MW circuit performance — without trying

**Our new digitally programmable attenuator automatically sets optimum dB values to adjust for varying signal strength. Compensate — not compromise.**

Why waste time and talent struggling to optimize your MW circuit for varying performance conditions. The best you can hope for is a compromise. And the solution is simple: our new Model EP 1248 24-pin DIP attenuator responds to your control signals and automatically adjusts attenuation values — from 1-15 dB in 1 dB increments — for optimum circuit performance. Regardless of circumstances. Think of how we can save your time, speed production, and help you make a better product with our new programmable attenuator. Let us know your frequency range and attenuation requirements.

Authorized distributors and technical sales representatives in all major metropolitan areas  
EMC TECHNOLOGY is a full line MIC product manufacturer. Our products include SMA connectors, terminations, attenuators, resistors and DC blocks for stripline, microstrip and SMA coax, and custom hybrid circuit packages for hi rel applications

# Take the guess out of rfi testing.

You've decided not to take chances with rfi susceptibility. Then why mix and match the tools you'll use to test for it?

Instead, you can equip your entire test loop with instruments from Amplifier Research that have been thoroughly tested and work well with our high-performance broadband rf amplifiers.

From 1W to 10kW, 10 kHz to 1,000 MHz, in 32 standard models,

AR amplifiers give you optimum power, bandwidth, and versatility for your cw, sweep, and pulse requirements. Each model provides instantly available bandwidth without bandswitching or tuning, is completely immune to load mismatch, and won't shut itself down when you may need it most.

But a high-quality test presumes

high-quality test equipment throughout.

So we also supply specialized antennas, leveling preamplifiers, field sensor systems, fiber-optic telemetry links, TEM cells, matching transformers, and directional couplers.

With this full-system approach, equipment variables are less likely to show up in your test results. It'll pay you to talk with us about all your rfi test requirements.

## 10 kW Power Tetrode

A compact power tetrode tailored to operate at 10 kW in FM and VHF TV broadcast service has been developed by Varian EIMAC. The EIMAC 4CX7500A, a ceramic-to-metal tetrode represents another advance in the development of in-

creasingly efficient power tubes for broadcasters who are seeking ways to cut power and equipment costs, and improve operating efficiency. Broadcast system designers will find that the compact, forced-air cooled tube features an advanced anode cooler design. The unique mechanical structure of the tetrode keeps RF losses low, permitting high efficiency operation at full ratings to 220 MHz. For FM broadcast service (86-108 MHz), a matching amplifier cavity, the EIMAC CV-2228 is available. It has a stage gain of up to 20 dB, and an overall efficiency of approximately 79 percent. **Varian EIMAC, San Carlos, Calif., please circle INFO/CARD #158.**

## FET RF Power Source

A new FET RF power source for plasma use occupies less than one-half the space and power of competitive units. The AMT Model 1010 boosts over 600 W of CW output power from 100 kHz to 400 kHz, and is capable of remote or local operation. The Model 1010 has a bidirectional digital power meter to monitor load and reflected power and an active power protection

## PICOSECOND—NANOSECOND PULSE GENERATORS

Our new free 70 page 1985 catalog describes over 100 models of pulse generators, pulse amplifiers, impulse generators, sample and hold amplifiers, delay generators, transformers, power splitters, bias tees and scope probes with specifications covering the following ranges:

- RISE & FALL TIMES TO 60 PSEC
- PW FROM 130 PSEC TO 100 USEC
- PRF FROM 0 TO 300 MHZ
- VOLTAGES FROM 5 TO 350 VOLTS
- PEAK CURRENTS TO 100 AMPS
- DELAYS FROM 10 NSEC TO 100 USEC

# Excite your entire shielded room...

even in the difficult  
30-150 MHz range

Our new Cavitenna® radiator turns your shielded room into a resonant cavity. Using a wall or ceiling as a groundplane, it delivers unprecedented high volts-per-meter to your susceptibility test item.

Operating from 30 to 1000 MHz, the Cavitenna can handle input power up to 3500 watts, producing field strength up to 600 V/m.

In the particularly bothersome 30-150 MHz band, where other antennas have little or no gain, the remarkable Cavitenna provides gain over 5 dB. Less than four feet wide, this little radiator does what you'd need a log-periodic antenna bigger than your room to accomplish. Mounting by magnetic clamps, it's easy to move from one wall position to another.

The Cavitenna, a truly exciting development. Call or write for complete information.

system to allow maximum power to be delivered into any load VSWR. System status and control lines can be accessed via rear panel connection. **American Microwave Technology, Inc., Fullerton, Calif., INFO/CARD #157.**

#### **Precision Laboratory Attenuator**

Alan Industries, Inc., now offers a low cost precision laboratory attenuator for measuring receiver sensitivity, signal

noise ratio and cross modulation. The first model, the 50BLA20, has a frequency range of DC-300 MHz, VSWR is 1:20 max, and accuracy is  $\pm 0.2$  dB or 2 percent indicated measurement. Other specifications include impedance, 50 ohm nominal; insertion loss, .6 dB max.; power average, 1 watt; available connector BNC, TNC and SMA and an attenuation range of 0-20 dB in 1 dB steps. Other attenuation ranges of 30, 40, 50 and 60 dB are

available. **Alan Industries, Inc., Columbus, Ind., INFO/CARD #159.**

#### **Front Panel Access Dip Switch**

Grayhill, Inc., has developed a unique terminal frame allowing front panel access for standard DIP switches normally back panel mounted. When edge mounted on a PC board that is perpendicular to the panel, Grayhill right angle

DIP switches can be operated through a panel cutout. The right angle DIP switch has grown in popularity due to an increasing variety of equipment functions that must be checked before actual operation. **Grayhill, Inc., La Grange, Ill., please circle INFO/CARD #143.**

#### **Microminiature D Series Connector**

With contact spacing of 0.050" the Series 50 Micro D Family of connectors from AMP Incorporated is a scaled-down version of the self-polarizing subminiature D connectors. Designed to meet the requirements of MIL-C-83513, the connector is available in eight shell sizes, ranging from 9 through 100 contact positions. All contacts are fully potted and connector assemblies are supplied with flying leads or solid solder posts in either metal shell or all-plastic housings. **AMP Incorporated, Harrisburg, Penn., please circle INFO/CARD #162.**

#### **Hybrid DIP VCXO**

The CO-400V Series Hybrid VCXOs are designed specifically for phase locking applications. They provide TTL output at any specified center frequency from 32 kHz through 24 MHz. Deviation over 0 to +5V control voltage ranges from  $\pm 30$  ppm to  $\pm 100$  ppm; this deviation is adequate to permit locking onto the specified center frequency over the operating environment (0/50°C to -55/+85°C) for 10-20 years without adjustment. These 0.2" (5.1 mm) high DIP packaged oscillators are available in both 4-pin (Model CO-401V) and 14-pin (Model CO-402V) configurations. They conform to MIL-O-55310 and are available level B screened. The

## **Shielded rooms with a roomful of benefits.**

#### **LECTROSHIELD® Clamp-Together Rooms — Shielding Effectiveness to 100 dB+.**

- 1.0 KHz to 10 GHz attenuation for MIL-STD-285, NSA 65 6, FCC and VDE testing, MIL-STD-461/2/3, etc.

- Prefabricated, modular.
- 48 standard room sizes... 8' x 8' to 24' x 48' (interior), standard interior heights to 8', 10' and 12', plus custom sizes.
- Easily assembled and dismantled.
- High reliability electrical and structural.
- Meets stringent building and safety codes, including Seismic Code Zone IV.

#### **All-Welded Rooms — Shielding Effectiveness to 120 dB- 140 dB+.**

- Meets TEMPEST and other secure requirements.
- Ideal for EMP hardening.
- Free standing; total structural and seam integrity.
- Patented sliding doors exceed MIL-STD-285 and NSA 65 5.
- MIG welding throughout.
- TEMPEST shielded security vaults.
- Standard and customized sizes.
- Maximum fire protection.
- Complete design and turn-key facilities.

Plus... shielded anechoic chambers, chambers for Nuclear Magnetic Resonance (NMR) imaging systems, and a complete line of RFI/EMI filters and filter panels.

with a 2.0 dB maximum loss and rejects the semi-adjacent channels (2nd channel down and up) a minimum of 25 dB. This bandpass filter can be used to clean up the desired channel at the input of the processor or at the output before combining. Impedance is 75 ohms and the 4930 comes with F connectors. **Microwave Filter Company, Inc., East Syracuse, N.Y., INFO/CARD #145.**

### Microwave Synthesis and Analysis Software

EEsof, Inc. announces the release of Linecalc™, the newest product in their expanding line of integrated engineering software. Linecalc is an analysis and synthesis program which provides microwave circuit designers with new ways to explore and adjust values of transmission line parameters. It works like a spreadsheet and provides highly reliable analysis and synthesis of transmission lines. The program uses the same transmission line models as Touchstone™, EEsof's computer-aided analysis and optimization program, to ensure consistent performance. Linecalc analyzes physical parameters and displays the correspon-

ding electrical parameters. The program also synthesizes physical parameters after the engineer specifies the desired electrical parameters. **EEsof, Westlake Village, Calif., INFO/CARD #143.**

### Coaxial Switches

RLC Electronics has introduced a line of terminated single-pole, double-throw coaxial switches for termination of the unused switch port. Electrical characteristics feature low insertion loss and .3 dB

max., VSWR of 1.3 max. and isolation of 60 dB min. over the entire frequency range of DC-18 GHz. **RLC Electronics, Inc., Mt. Kisco, N.Y., INFO/CARD #146.**

## HIGH DYNAMIC RANGE

# RF AMPLIFIERS

Janel offers a wide variety of high dynamic range RF Amplifiers. The chart below shows a sampling of what's available. All feature high *guaranteed* performance and yet are competitively priced. Many models are available from stock.

Model	Frequency	Gain	N.F.	3rd I.P.
PF811A	1-32 MHz	16.5dB	4.5dB	+42dBm
PF841	2-32	16.5	5.0	+46
PF804	215-320	27.0	4.0	+32
PF829	406-512	16.5	4.5	+38
PF833	800-920	26.5	2.8	+34
PF845	800-915	18.0	2.0	+35

In addition to RF Amplifiers, Janel manufactures a wide range of standard Power Dividers and other rf components. Custom designs can be provided for unusual applications. For detailed information, call or write Janel Laboratories, Inc., 33890 Eastgate Circle, Corvallis, OR 97333. Telephone (503) 757-1134.

### Line Impedance Stabilization Networks

Fischer Custom Communications, Inc. announces a new Line Impedance Stabilization Network developed for conducting EMI measurements in accord with FCC and CISPR standards. This new LISN is available in currents of 25, 50 and 100 amperes, and can be used for long periods of time without excessive heat generation. The shielded unit contains two LISN networks, providing the user with the capability of measuring a phase and neutral or two phases of a powerline. Fischer Custom Communications, Inc. Inglewood, Calif., INFO/CARD #144.

### MDS/ITFS Video/Aural Combiner

Series 4869 duplexers combine separate video and aural transmitters to a common antenna output. The design technique used results in high isolation and low insertion loss. Insertion loss for video and aural is .25 dB (max.) and 1.5 dB (max.) respectively. Video/aural isolation is 30 dB (min.). Power relay is 100 W minimum. Input and output connectors are 50 ohm, type N, female. The 4869 is available for any MDS channel (2150 to 2162 MHz) or ITFS channel group A through H (2500 to 2686 MHz). Microwave Filter Company, Inc., East Syracuse, N.Y., INFO/CARD #141.

### 4-Input, 8-Trace, 200 MHz Oscilloscope

Iwatsu Instruments has added a new high quality 4-input, 8-trace DC to 200 MHz oscilloscope to its SS-5700 Series. This dual trace unit, Model SS-5712 is designed to handle fast digital signals, stressing the basic characteristics of wider than specified frequency response, highly

accurate deflection factor and sweep rate, plus excellent linearity. For digital diagnostics, the SS-5712 offers an optional 4-bit combination trigger probe, which can specify 16 trigger conditions and extract the required sequence from a digital circuit when testing the right conditions of a microprocessor. Iwatsu, Carlstadt, N.J., INFO/CARD #151.

### Four-Section MIC Step Attenuator

A new Four-Section MIC step attenuator with 1, 2, 4 and 8dB bits is available from Daico Industries, Inc. Frequency range of 300-1300MHz is covered with typical switching speed of 300 nanoseconds. This device has an internal TTL driver and operates on +5 V at 40mA maximum DC supply. Other key parameters include insertion loss 2dB typical, VSWR 1.2/1 typical, 50 ohm impedance and +10dBm

RF power handling. Operating temperature is -55 to +125°C. Daico Industries, Inc. Compton, Calif., INFO/CARD #133.

### Microstrip Circuit Design Software

MICRO is an engineering program written for the microstrip designer. MICRO provides the microstrip designer with the ability to analyze and design microstrip circuits. With MICRO you can design

# Edison didn't need Modpak™

But modern electronics involves more than a bulb, a vacuum, and a filament.

Your vulnerable RF circuit needs the protection only Modpak can give: a sturdy, RFI-shielded enclosure, user-designed with a choice of four interchangeable connectors and more than 30 standard off-the-shelf sizes or custom-fabricated in virtually any size. Top and bottom covers are easily removed for access to both sides of your PC board. All this at an affordable low price!

Find out why you need Modpak, send for our complete catalog.

lowpass or bandpass filters, stepped impedance transformers and hybrid rings. MICRO will also analyze or synthesize single or coupled strips and at extreme S/H or W/H will perform a Bryant and Weiss analysis using a dielectric Green's function for better than 1% accuracy. All the synthesis programs in MICRO contain correction factors for fringing field errors and bandwidth shrinkage to provide you with a "real world" design the first time. **THS Engineering, Escondido, Calif., INFO/CARD #100.**

### **Coaxial Crystal Detectors**

The new Micronetics coaxial crystal detectors cover a frequency range of 0.01 to 12.4 GHz and a frequency response within  $\pm 0.5$  dB absolute. Relative mat-

ching excluding bias sensitivity, is within  $\pm 0.2$  dB. Other specifications include; output impedance, 15 ohms shunted by 10 pF; output polarity, negative (positive optional); connectors, RF input, type N, male; VSWR, values to 12.4 GHz maximum, maximum power, 100 mW peak or coverage. **Micronetics, Inc., Norwood, N.J., INFO/CARD #101.**

### **Precision Analog Array Family**

Solitron Devices, Inc. has announced the development of the first precision analog array family in the industry. Identified as the HTL Series, the devices offer a variety of components including precision thin-film laser trimmed resistors. The typical degree of precision is  $\pm 0.005\%$  with a temperature coefficient of 35 PPM/°C. Certain arrays in the family offer a selection of high current components ranging from 0.5A to 5A. The HTL Series is designed for use in military, aerospace, telecommunication, medical and precision industrial applications such as precision op amps, precision references, analog/digital circuits and high current drivers. **Solitron Devices, Riviera Beach, Fla., INFO/CARD #102.**

### Ultra Broadband Noise Generating Instrument

Noise Com's Model NC6111 Noise Generating Instrument has 24 octave wide, +10 dBm of Gaussian-white noise within -2.5 dB flatness. It operates from 115 V line voltage at temperature range -10°C to +60°C. It has an output im-

pedance of 50 ohms and the standard unit comes with 10 dB in 1 dB step attenuator. Options are; other attenuator values, 230 V, 50 Hz power-in, resistive power combiner, marker input and higher output levels. **Noise Com Inc., Hackensack, N.J., INFO/CARD #154.**

### Voltage Controlled Fundamental Oscillators

The new VCO-100 series of varactor tuned oscillators offer full octave tuning ranges from 25 MHz to 2 GHz in compact TO-8 packages. Model VCO-105 covers 200-400 MHz with a tuning input of 1 to 20 VDC. Power output is +13 dBm into 50 ohms flat to within  $\pm 1$  dB while power dissipation is less than 180 mW from -55 to +100°C. All units are encapsulated and welded closed for very low microphonic performance in severe military or commercial environments. **Vari-L Company, Inc., Denver, Colo., INFO/CARD #145.**

### Microwave Counter makes Automated Measurements Up to 40 GHz

New GaAs technology, combined with the latest concepts in microwave-instrument design, have resulted in a 10 Hz to 40 GHz microwave frequency counter. The HP 5352A offers the same feature set as the HP 5350A (10 Hz-18 GHz) and HP 5351A (10 Hz-26.5 GHz) counters introduced in January. This family of instruments which share the same

When you need more crystal filter performance in less space, we re-think basic assumptions.

For instance, we've packed four-pole response—two networks—into a single can. (15-250 MHz, as small as .450"H. x .420"W.). It gives you the bandwidth selectivity and performance you need. In half the space.

Then there's our HC45 package, meeting or beating fundamental filter specs at one-third the usual size. And our sub-mini tubular (17-250 MHz, .12"D. x .32"H.). And our matched filter sets, smallest in the industry.

HC45, Sub-mini  
Actual size

Two minus one equals two. When you need more performance in less space, call on us. Our new formula can't be equaled.

INFO/CARD 51

## rf products *Continued*

package dimensions, also provides high-speed data transfer, optional low-aging-rate oscillators and a single-input connector for frequency measurements from 500 MHz to the upper limit of each counter. The HP 5352A derives its high-frequency performance from the GaAs sampler first used in the HP 5350A/5351A. The choice of GaAs over silicon (previously used in microwave-frequency designs) was made in anticipation of adapting the design to higher-frequency applications. A GaAs sampler down-converter allows greater control of circuit response. This results in dependable high-frequency characteristics, and, therefore, predictable and repeatable performance at millimeter frequencies. **Hewlett-Packard Company, Palo Alto, Calif., INFO/CARD #156.**

### Automatic Test Program Generator

AMS-Advanced MicroSolutions has introduced an Automatic Test Program (ATP) generator designed to automate the process of developing test programs and documentation. With the ATP generator, a test programmer familiar with BASIC language can generate simple ATPs in just a few hours and modify an ATP in

minutes. The Generator and ATPs are available for use with the HP 9000 Series 200 Technical Computers and GP-IB (IEEE-488) controllable instrumentation. **AMS-Advanced MicroSolutions, Menlo Park, Calif., INFO/CARD #150.**

### High-Speed Silicon-Gate DMOS Analog Switch in Surface-Mount SO-14 Package

The SD5400 family of DMOS analog switches with 1 ns switching time is now available from Siliconix in the surface-mount small-outline SO-14 package. This miniature 14-lead plastic DIP is ideal for hybrid design; it is one-third the size of the standard 14-lead DIP and has been pretested. The SD5400 quad switch array is built on the Siliconix-developed oxide-isolated, silicon-gate DMOS process, which provides greater device stability and reproducibility over metal-gate designs. Available in three grades — SD5400CY, SD5401CY, and SD5402CY — the device is specified for analog signals up to  $\pm 10$  V,  $\pm 5$  V, and  $\pm 7.5$  V, respectively. Drain-to-source leakage current is only 10 nA (maximum), while gate-leakage current is 1  $\mu$ A (maximum) for all three

## AEP...THE FULL LINE SOURCE

### FOR FIRST RATE COAXIAL CABLE ASSEMBLIES... FLEXIBLE & SEMI-RIGID

Expert techniques, sophisticated equipment and "no-hassle" service... all are yours with AEP cable assemblies. Flexibles are made to "spec" for any RG-178U to RG-214U cable size with any connectors. Semi-rigids are custom formed with any .085" to .250" size cables and with any connectors. Add rigorous quality control for precision and economy identical to our "High-Rel" Subminiature Coaxial Connectors. Call or write for details, now.

variations. Typical drain-to-source on-resistance is only 50 ohms at a gate voltage of 5 V. The operating temperature range is 0°C to 70°C, and maximum breakdown voltage at 25°C ambient temperature is rated at 20 V for the SD5400CY, 10 V for the SD5401CY, and 15 V for the SD5402CY. **Siliconix, Inc., Santa Clara, Calif., INFO/CARD #155.**

### Monte Carlo Analysis Program Offered with Touchstone

Monte Carlo analysis and yield prediction with the capability to vary substrate and measured S-parameters is now available to RF/microwave circuit designers using Touchstone, a computer-aided engineering program from EEsof, Inc. for the IBM PC/XT/AT and HP 200 computers. Manufacturing yield of RF/microwave circuits is projected by selecting certain circuit parameters for random variation. Any parameter that can be optimized can also be used as a toleranced value. For example, tolerances may be assigned to 1- and 2-port S-parameters and 2-port noise parameters to analyze how a random variation in transistor performance affects overall circuit

performance. One- and two-port data may be specified as s-, y-, z-, g- or h-parameter data in various formats. EEsof customers who have purchased Touchstone before July 1, 1985 will be sent the Monte Carlo program as part of their software support service. After July 1, Touchstone-MC will be available as an added-cost option to Touchstone. **EEsof, Inc., Westlake Village, Calif., please circle INFO/CARD #154.**

### Programmable Attenuator

Specs for Model 50P-076 of JFW Industries are: DC-1000 MHz; 0-127 dB in 1 dB steps; switching speed: 6

milliseconds; connectors: BNC, TNC, N or SMA. **JFW Industries, Inc., Indianapolis, Ind., INFO/CARD #148.**

### Main Frame Scope Accepts up to 3 Plug-In Units

Iwatsu Instruments has announced a new, plug-in type general-purpose oscilloscope which allows total flexibility in selecting or changing functions. The SS-8120 accepts up to three plug-in units that provide either a 4-channel 100-MHz oscilloscope, a 4-channel 1-GHz sampling oscilloscope, a 2-channel digital measuring oscilloscope or a 2-channel ultra-high-deflection oscilloscope. The mainframe features a 7 inch dome-mesh CRT and incorporates a character generator so data from the plug-in units can be displayed on the CRT in easy to read values. In addition, the versatility of the SS-8120 is enhanced with signal output terminals provided for the output of vertical signals, timebase signals, gate signals and calibration voltages. **Iwatsu Instruments, Carlstadt, N.J., INFO/CARD #153.**

### Bipolar Power RF Transistor

A new high power, class "AB" bipolar RF transistor for military communications and ECM applications is now available from the RF Devices Division of TRW Electronic Components Group. The MRA0204-60 device provides 60 W of CW linear power in broadband applications. Gain is 9.5 dB minimum at 400 MHz and 28 V. The device is usable over a 225 to 400 MHz frequency range. The MRA0204-60 can withstand a 5:1 VSWR load pull at 400 MHz with a power output of 60W. **TRW Electronics Components Group, Lawndale, Calif., INFO/CARD #152.**

### Intelligent Impedance and Gain-Phase Analyzer

A new impedance and gain-phase analyzer from Hewlett-Packard Company, the HP 4194A, is an intelligent instrument that makes both impedance and transmission measurements. Frequency coverage is 100 Hz to 40 MHz for impedance measurements and 10 Hz to 100 MHz for gain-phase measurements. The HP 4194A has a 7.5-inch (19 cm) color display for presenting measurement data, making it the first HP instrument with a color CRT. Designed for lab and quality-assurance applications of component manufacturers, and communications and consumer equipment manufacturers, the HP 4194A can be used to evaluate materials, discrete components, ICs and circuits. The analyzer's Auto-Sequence-Program (ASP) function easily can automate the measurement and analysis functions without using a separate computer. **Hewlett-Packard Company, Palo Alto, Calif., INFO/CARD #150.**

## NEW JUST RELEASED! FREE Delay Line Catalog Features Detailed Technical Data Section

Operating characteristics, design and usage are thoroughly discussed in this 32 page catalog (AC-37). Formulas and graphs cover delay time, impedance, rise time, bandwidth, figure of merit, attenuation and phase compensation.

The product section presents over 650 standardized active and passive delay lines including TTL digital and function modules. Manufacturing is at our off-shore Caribbean plants to assure

you lowest pricing. Request your copy today by calling (305) 883-5311 or contacting:

**Automatic Coil Corp.**  
Subsidiary of Designatronics, Inc.  
455 East 10th Avenue  
Hialeah, FL 33010

## Short Form Catalog

A new short form catalog from Ballantine Laboratories, Inc., describes key specifications and features for its broad line of precision electronic test and measuring instruments. Covered are oscilloscopes, both for portable general purpose use and laboratory units; scope calibrators; voltmeters and special purpose instruments; multimeters; counters and counter-timers; and AC calibration standards. Also included are the company's programmable instruments and automated computer-based systems for calibrating oscilloscopes and meters. **Ballantine Laboratories, Inc., Boonton, N.J. INFO/CARD #123.**

## Electronics Catalog

The 176-page 1985 edition of the Mouser Electronics Catalog offers over 17,000 items stocked in depth. It serves as an excellent guide for engineers, purchasing agents, or anyone needing quick access to up-to-date product data and pricing of standard stocked industrial electronic components. It includes potentiometers, capacitors, resistors, transformers, lamps, switches, battery holders, jacks, plugs, speakers, knobs, fuses, semiconductors, hardware, tools, test equipment, relays, cabinets, meters and more. **Mouser Electronics, Santee, Calif. INFO/CARD #122.**

## Low Pass EMI Filter Catalog

A new 36-page low pass EMI filter catalog is now available from Murata Erie North America, Inc. This new catalog contains complete technical information on the company's high quality EMI filters and filtering systems for MIL spec and other applications. Details on mechanical configurations, electrical specifications and environmental performance are thoroughly discussed. In addition, cross references for Military Part Numbers MIL-C-39014/16, MIL-C-39014/17, MIL-C-39014/18 and MIL-C-39014/19 with Murata Erie part numbers are given. **Murata Erie North America, Inc., Marietta, Ga. INFO/CARD #121.**

## Surge and ESD Handbooks

Two handbooks have been announced by KeyTek Instrument Corp., to help modern electronic equipment survive powerline and dataline surges as well as ESD (electrostatic discharge). The

Surge Protection Test handbook describes surges conducted via signal lines and the AC power line. The Electrostatic Discharge (ESD) Protection Test Handbook describes ESD itself, prevention techniques and a guide for diagnostic ESD testing. Written in clear basic terms, these handbooks will be helpful to both the experienced engineer and the newcomer to environmental testing. All the necessary information is included to assist a user in hardening his equipment, from the design stage through final acceptance testing. **KeyTek Instrument Corp., Burlington, Mass., INFO/CARD #120.**

## Conformal and Molded Axial Leaded Capacitors

AVX Corporation has published a new catalog on conformally coated and molded axial-lead multilayer ceramic (MLC) capacitors. The 20-page publication gives complete specifications for NPO, X7R, and Z5U dielectrics used in conformally coated (SpinGuard™) and molded axial-lead MLC capacitors. Although these MLC capacitors are ideal for low-cost, high-volume applications, redundant testing of capacitance and dissipation factors (D.F.) ensures parametric accuracy of these components. General specifications for each dielectric cover capacitance range and tolerances, operating temperature range and characteristic, and voltage ratings. D.F., insulation resistance, dielectric strength, life test, moisture resistance, thermal shock, and immersion cycling information are also shown for both SpinGuard and molded axial-lead capacitors to help design engineers specify the best capacitor for the application. **AVX Corp., Myrtle Beach, S.C. INFO/CARD #117.**

## Beam-Lead and Chip MIS Capacitors Brochure

Alpha Industries, Inc. has released a new 20-page brochure describing their beam-lead and chip MIS capacitors. The brochure includes technical information and data sheets on Alpha's complete capacitor product line, including MIS chip, binary trimming, FET chip mounting, beam-lead, and millimeter-wave beam-lead capacitors. An application note that covers bonding methods and packaging is also included. **Alpha Industries, Inc. Woburn, Mass. INFO/CARD #115.**

## *SAW Resonators Deliver Quartz Stability at Microwave Frequencies*

Lock your UHF  
and microwave oscillators on  
frequency with fundamental-  
mode SAW resonators...

- Quartz stability from 200 MHz to 1.3 GHz
- Typical phase noise—140 dB<sub>c</sub>/Hz at 10 kHz
- Compact TO-39 packages
- Low cost
- Large selection of standard models
- Fast turnaround on custom designs

# **RF Engineering Opportunities**

## **Join Sperry In Phoenix**

Sperry in Phoenix offers you an opportunity to help us develop the next generation of aviation electronics. Our relaxed southwestern location is also setting standards in Sunbelt lifestyles. We are looking for talented people. Openings exist in the following areas:

### **Microwave Engineers**

To qualify for these positions you should have a minimum of three to four year's experience and a BSEE degree. Your background should include experience in one or more of the following areas: Signal processing circuitry, analog design, digital design, microwave receiver design, microwave GaAs fet amplifier design and microwave power fet amplifiers. Experience with GaAs MMIC designs is highly desirable.

### **Microwave Packaging Engineer**

To qualify for this position you'll need two to six year's experience in two or more of the following areas: microwave circuit design, microwave circuit packaging techniques, microwave GaAs technology, high-speed digital packaging and use of CAE/CAD tools. Your experience will be utilized to develop interconnection and packaging of analog and microwave digital GaAs or ECL integrated circuits.

### **Join us . . .**

Sperry offers you a generous salary and benefits package, send your resume, in confidence, to John Gray (RFD-E610) Sperry, DV5C, P.O. Box 21111, Phoenix, AZ. 85036.

Equal Employment Opportunity Affirmative Action Employer

### RF ENGINEERS

We are a fast growing manufacturer of electronic RF amplifiers, and have an immediate need for Rf design engineers. If you are a cable TV engineer with design experience in amplifiers, or headends, we would like to talk to you. We are the pioneer in low distortion feed forward amplifiers, and we're looking for you.

Successful candidates must have a BSEE, preferably with a minimum 2-5 years experience.

Send resume in confidence to:

#### GENERAL INSTRUMENTS

Virginia McClain  
Jerrold/Century 3 Div.  
610 Neptune Ave.  
Brea, Ca. 92621  
(714) 671-2800

### RF/MICROWAVE ENGINEERS

Representing companies (in New England and National-ly) with hundreds of opportunities for RF and Microwave Engineers means we are the one contact necessary for that right position, whether it be a new challenge or career advancement.

**ENTRY TO 3 YRS. EXP** 22-35K  
**MID LEVEL** 30-45K  
**SENIOR AND MANAGEMENT** 40-70K

Professional, confidential, free resume preparation service. Client companies assume all interviewing, employment and relocation costs.

### RF ENGINEER Colorado

Manufacturer of RF products for TV broadcast, CATV and satellite TVRO needs EE's to design new products. Experience in RF/microwave circuit design required.

Based in Burlington, Iowa and recognized as an industry leader for 30 years, Winegard Company develops new products at its engineering and research division located in a scenic Colorado mountain community within commuting distance of Denver.

Our medium-sized, stable, independent company offers multiple benefits for its professional employees.

Phone or send resume to Jim Kluge, Winegard  
R&D Lab, P.O. Box 940, Evergreen, CO 80439.

(303) 674-5576

**WINEGARD**

### SINGLE LAYER PARALLEL PLATE CERAMIC CAPACITOR CHIPS

Featuring a single layer dielectric construction with associated low series inductance, this family of capacitor chips are ideal for applications ranging from DC to microwave frequencies.

Available in capacitance ranges from 0.25 pf to 15,000pf voltage ratings to 15KV, their high dielectric strength makes them resistant to damage from static discharge. Precious metal terminations are compatible with epoxy, solder or wire bonding assembly techniques.

# Yes. Silicon Frequency-Linear Tuning Varactors.

Eliminate costly linearizer circuits with FSI field proven Frequency Linear Tuning Varactors. The GC-15000 series FLTVAR is produced by state-of-the-art computer controlled epitaxial technology, which provides the resistivity gradient and resulting CV curve necessary for linear tuning.

The FLTVAR is well suited for use in bipolar and FET VCO's, Gunn VCO's and tunable filters for wideband tuning through KU band.

Engineering services are available to provide assistance in the event our standard catalog types do not meet your requirements.

## and GaAs Varactors too.

Where ultra high Q is desired, these GC-51000 series abrupt junction GaAs Tuning Varactors are available. These devices are ideal for tunable VCO's, frequency synthesizers, voltage tunable filters, phase shifters, as well as linear frequency and phase modulators for communications equipment.

Quality workmanship and reliability of FSI's GaAs Tuning Varactors are assured by our strict process control standards.

Write for complete details.
