There seems to be a tendency throughout the country to use the telephone system for reporting fires instead of turning in an alarm through the fire alarm system. The former method is not always satisfactory, as often the person using the telephone is in an excited condition and little information can be gained at headquarters regarding the whereabouts of the fire. Municipal fire authorities are consequently attempting to educate the public to use the fire alarm system where possible, and thus insure a prompt and accurate report of the location of all fires. Among others, Deputy Fire Commissioner O'Keeffe, of Brooklyn, is making an effort to have the people of that city well instructed in turning in fire alarms.

Before a recent meeting of the Brooklyn League the commissioner exhibited two varieties of alarm boxes, in general use, one with a key and the other without, and then explained minutely the manner in which an alarm is transferred to the firm alarm bureau and from there to the various company houses.

Telegraph and Telephone Companies Under Jurisdiction of Interstate Commerce Commission.

The railroad bill which was passed by the House of Representatives has been amended by the Senate and been placed in the hands of a joint committee of both houses to come to an agreement on the amendments. One of the provisions of the bill, which has been concurred in by both the House and the Senate, extends the jurisdiction of the Interstate Commerce Commission to cover the telegraph and telephone companies. The Senate amendment covering this point provides that telegraph and telephone charges shall be just and reasonable, and authorizes the commission to determine when they are not so. Special night rates and special rates on press dispatches are authorized. Telegraph passes are prohibited to all persons. The penalty for disobeying this provision is fixed at from \$100 to \$2,000. This gives the Interstate Commerce Commission much more power than the amendment passed by the House.

Indictment in Bucket Shop Case.

The Federal Grand Jury on June 10 returned an indictment against the Western Union Telegraph Company, charging it with forty-two violations of the bucket shop law of March 1, 1909. The charge is made that the Western Union Company, by means of a telegraph wire and a ticker, aided and abetted the conduct of a bucket shop in the District of Columbia. The forty-two counts in the indictment vary only in the dates on which the offenses are alleged to have been committed.

The testimony on which the indictment was secured was furnished to the Grand Jury by former employees of the company and by several of its officials, who were subpoenaed by the Government. No person in the Western Union was named in the indictment. It was a company offense and will be so pressed for trial.

What Our Friends Say About this Publication.

Mr. G. H. Corse, Jr., general Oriental agent of the Chicago, Milwaukee and Puget Sound Railway, with headquarters at Shanghai, China, formerly a member of the telegraph profession in this country, in a recent letter ordering us to continue his subscription for another year, states: "As I am so far away from home, I always look forward with pleasure to receipt of the Age, which is the only means by which I can keep in touch with what is going on in the profession I was personally associated with for several years, in both railroad and commercial fields."

The Telephone.

The laying of the new loaded telephone cable between England and France has been completed.

The New England Telephone and Telegraph Company has declared its regular quarterly dividend of one and one-half per cent., payable June 30.

An issue of \$1,250,000 of six per cent. preferred stock has been authorized by the Lincoln Telephone and Telegraph Company, of Lincoln, Neb.

Bids have been asked for by the Southwestern Telegraph and Telephone Company for the construction of a three-story exchange building at Dallas, Tex.

The Washington State Railroad Commission is investigating the subject of telephone rates in Seattle, the authority of that body having been extended by the 1909 Legislature to cover the telegraph and telephone.

The State Road Commission of Maryland has granted permission to the American Telephone and Telegraph Company to lay underground conduits along the road from Baltimore to Philadelphia. A similar request has been made to lay conduits along the road from Baltimore to Washington.

The report of the American Telephone and Telegraph Company and associated holding and operating companies for April, shows gross earnings of \$13,794,283, an increase of \$1,423,901 over the corresponding month last year and net revenue of \$4,210,146, an increase of \$30,426. The gross earnings for the first four months of the year amount to \$53,327,564, an increase of \$5,684,150, and the net earnings were \$16,407,258, an increase of \$1,290,635.

By a patent granted recently in England to Mr. J. Sayers for the protection of telephone circuits against alternating current traction systems, both electrostatic and electromagnetic induction are neutralized by providing an auxiliary insulated conductor parallel to the trolley wires and the telegraph or telephone wires to be protected. In the case of a double-line railway with a trolley wire over each track, two insulated wires run parallel to the trolley wires and are connected at both ends so as to form a closed circuit. At the point where current is fed into the trolley wires, the auxiliary circuit is connected to one pole of a small alternating-current generator, which charges it at the same frequency as that of the system, but at a lower pressure and 180 degrees out of time-phase. The other pole of this generator is grounded. In order to neutralize farther the electromagnetic induction the auxiliary circuit includes the secondary coil of a transformer, the primary of which is connected to the secondary of another transformer, the primary of the second transformer being in series with the main trolley-wire circuit. By this means a low-pressure current proportional to the main traction current, but 180 degrees out of time-phase with it, circulates in the auxiliary circuit.

At a recent banquet of the Pittsburg section of the American Institute of Electrical Engineers, Mr. Malcolm C. Rorty, division manager of the Central District and Printing Telegraph Company, spoke on "The Relation of the Public Service Corporation to the Public."

The proceedings for the appointment of receivers of the Continental Telephone and Telegraph Company have been dropped by agreement of counsel for the company and the applicants. The application for receivers alleged mismanagement by certain officers of the Continental Company, but it has since been found that these charges were untrue and the proceedings were started through a misunderstanding.

Judge Rellstab, of the United States District Court, at Trenton, N. J., has named Charles West of Philadelphia and Frank D. Houck, of Harrisburg, Pa., receivers of the American Union Telephone Company. It was stated that this company, which operates about 70,000 telephones in Western Pennsylvania and Southern New York, would soon have \$700,000 of indebtedness, which they could not meet. It was charged that this condition of affairs had become acute through the failure of the Continental Telephone and Telegraph Company to take care of the indebtedness in the arrangement by which the Continental Company was to acquire the American Union and other companies.

It is reported that a number of important reforms have been introduced in the Paris telephone service. In future, subscribers will not be obliged to maintain a deposit at the exchange to pay for trunk calls; the regulations defining the rights and duties of subscribers, hitherto kept strictly secret, will be made accessible to the subscribers; the telephone directory will be improved; subscriptions will be made payable at the nearest post office; the rule empowering the superintendents to cut off a subscriber without warning or explanation will be abolished; and compensation for loss of service will be paid for any breakdowns lasting more than a week instead of a month.

At a meeting of the Nebraska Association of Independent Telephone Companies, held in Lincoln June 1, Mr. Charles H. Hood, of that city, was elected secretary and treasurer of the association. A committee was appointed to confer with officials of the Postal Telegraph-Cable Company looking to a uniform basis of charges to enable the telephone companies to transmit by telephone, telegraph messages which reach territory not touched by the telegraph lines. W. E. Bell, of York, T. H. Pollock, of Plattsmouth, C. C. Deering, of Omaha, Warren Pratt, of Kearney and F. H. Woods of Lincoln, were appointed a committee to make the first draft of the proposed agreement.

The Military Telegrapher in the Civil War.

PART XII.

Miss Louisa E. Volker was one of the few lady operators who were connected with the United States military telegraph service during the Civil War. She was the first lady operator connected with the corps west of the Mississippi and although exposed to great danger at times performed her duties with that same zeal which was a general characteristic of those employed in that branch of the service. In writing to Colonel William R. Plum, historian of the United States Military Telegraph Corps in 1878 she told in part the following story of her military telegraph experiences.

"I entered the service as operator on the United States military telegraph lines at Mineral Point, Washington County, Mo., December 5, 1862, after the office had been closed about six months. The Point was a small town of about one hundred inhabitants and situated sixty-one miles from St. Louis on the line of the St. Louis and Iron Mountain Railroad which then extended from St. Louis to Pilot Knob, a distance of eighty-six miles, where was stationed the headquarters of the advanced line of the army in southeastern Missouri with smaller forces thrown forward to Patterson, twenty-three miles farther south, and flanked on the east by the posts at Frederickstown, Marble Hill, Jackson, and Cape Girardeau. Up to this time no woman had ever been employed in telegraphing west of the Mississippi river and I felt almost discouraged and my friends feared for my success but I was determined to succeed. I entered upon the duties of the office with an enthusiasm that never flagged amid all the danger and chances of the war.

"The principal industries of Washington County were lead mining and lumbering, the southwestern portion of the county being a yellow pine region. There were a number of slaves in the county and a strong if not bitter feeling prevailed among the owners of that class of property against the Lincoln government and from them the poor whites, as they were called, generally took their views, some from fear, and some from policy or principle. Still there were a few who adhered to the Government and they took steps to stay the torrent of secession sentiment that seemed as if it would bear down all opposition. Under the leadership of these men and their associates the friends of the Government rallied and the tide of secession was held at bay.

"As the feeling of the opposing parties became more and more embittered many acts of violence were committed upon Union people in unprotected situations amid all this turmoil of contending factions. I continued in the discharge of my duties often with fear and trembling as the news of preparation for the strife flashed over the wires.

"On the night of July 10, 1863, I was called up at midnight to telegraph to headquarters at Pilot Knob for a detachment of troops to intercept the noted guerilla Hildebrand and his gang who had rode into Irondale eight miles south from Mineral Point and robbed the store of a Union man who on that account was considered a fit subject for plunder. The guerillas, however, crossed the Mississippi and escaped into Illinois. About this time General McCormick came to Mineral Point and established his headquarters for the purpose of completing the organization of a provisional regiment. This filled the village with blue coats and brass buttons and as most of them had never been away from home before the general had to furnish me with a guard at my office, as it was besieged from morning to night by the wonder stricken crowd who could not comprehend the great mystery of the telegraph. Some likened it to a sewing machine and many were the quaint speculations indulged in by the veterans of the provisional regiment. The general was a pleasant officer full of business, but as a scribe he stood unequaled even by the great Greeley. Of course it was his business to write and the operator's to read and I found it a most difficult task.

"No day passed without its alarm, rumors of surprise and attack seemed to pervade the air. No one felt safe even within the cordon of the picket line. The wires were often grounded or down, the lines south from Pilot Knob being strung to the forest trees that skirted the road to Patterson then to Cape Girardeau, and points still further south. The lines so placed were disturbed by every storm; to repair them was a task of no little danger, from the prowling bands of guerillas that infested the county intent on murder and robbery. Many were the narrow escapes of the hardy repairer as he travelled through all kinds of weather, often at night and by lonely paths, at times concealed, then again pushing forward, testing his line, startled by the snapping of a twig, or the sound of a hoof on the road, again concealing himself until assured no enemy was near. It was a life of constant peril. While not surrounded with the glory that attaches to the soldier's life, the telegraph repairer discharged his duty with a fidelity and courage of the highest order, and his labors contributed their full share to the grand result.

"In October, 1863, a small post at Lamson's Station six miles north of my office was attacked, the wires having been first cut, by Jefferson Thompson, who had quite a large force of cavalry under him. The guard of about 100 men which was under the command of Captain Lippincott of Illinois—was surprised at breakfast and being overpowered broke to the woods, losing several in killed and wounded. After our men fell back Thompson burned the bridge, and then proceeded to burn the bridge across Big River still further north. Captain Lippincott col-

lected his men at Mineral Point and having provided for his wounded, returned to his post with his command. In the meanwhile, I had telegraphed to Pilot Knob for relief. The wires to St. Louis having been cut, I then started the repairers out to put up the line. It was dark but the work of getting the wire repaired was pushed throughout the night, and at an early hour the next day communication with headquarters at St. Louis was restored. It was an anxious night and I did not leave my office until nearly day-break.

"In January, 1864, I was called before a court martial to testify in the case of a Lieutenant in regard to the delivery of a telegram. The court met in St. Louis, and I did not wish to go but Colonel Robert C. Clowry thought it best that I should report as ordered and I did so, although my notion of a court martial was that it was something terrible. I however found it a courteous and dignified body of officers whose only aim seemed to be the execution of justice on evil doers.

"In May I was ordered to headquarters at Pilot Knob to relieve J. H. Byrne, who had a furlough, and I remained there for about three weeks. During this time an attack was threatened at Patterson twenty-three miles south of the Knob, where our outpost was stationed. The wires were cut, and my repairers had to have a guard to enable them to put up the line. When Mr. Byrne reported for duty, I returned to Mineral Point.

"In September, 1864, rumors of an invasion of the state by the forces under General Price reached us and I was again ordered to Pilot Knob. Major Wilson was now in command of that post. About the 21st of September it became certain that the invasion was in progress. Shortly after, our advance posts near the Arkansas line were driven back to Patterson and from thence fell back to Pilot Knob, where our forces under Major Wilson made preparations to give them battle. I was ordered back to Mineral Point, and found the place full of soldiers concentrated for the expected conflict. General Ewing soon arrived and telegraphed to Major Wilson at Pilot Knob as to his ability to hold the post and the same evening the General and his staff left by special train for Pilot Knob. In the meantime troops continued to arrive at the Point. They belonged to General A. J. Smith's command. Although fighting was in progress at and near Pilot Knob the wires were not interrupted until September 27. Our forces abandoned the fort at that point on the night of the 26th retreating westward while General Price pushed forward, as was supposed for St. Louis. On the 27th we were prepared at Mineral Point to receive General Shelby who was now known to be moving in our direction from Pilot Knob with 2,500 cavalry. Before the enemy appeared, however, General Smith had

orders to call in all of his outposts. This was done and the guns placed in position to resist the anticipated attack on the Point. All communication with Pilot Knob was now cut off and the woods swarmed with the Confederate advance under General Shelby.

"An operator who came on a train from Irondale relieved me after I had been on duty for two days and two nights. About noon, General Smith was ordered to fall back toward St. Louis and by 3 o'clock all were on the trains ready to start. Every male citizen in the town joined the soldiers fearing the conscription. My father and mother and sister with her small children also got on the train. Finally the last train moved off with a few saluting shots from the Confederates as it passed Cole's Bridge half a mile north of us. Then all was quiet for a short time. My sister and myself remained behind hoping to be able to protect our home from being burned or destroyed. We now hurried to hide all signs of the telegraph and watched for the coming of the enemy. From our window we could overlook the village and my office at the depot. Suddenly the Confederates deployed from the timber, and rushed upon the town from all directions.

"We felt our hearts sink as we saw them go from house to house. At last as we saw them coming toward us, we hastened to meet them at the door, and learn what we had to expect. The man who first addressed us was not in uniform, but spoke civilly, and assured us that our property would not be harmed if we would give them something to eat. We happened to be well supplied with food, as our house was a sort of headquarters for the Federal troops, and we hastened to put before the invaders the best and all we had. The house was soon filled and the intruders looked into every nook and corner of the premises, and appropriated what suited them in the way of blankets and clothing. Some of the men were bare-footed and ragged; others clothed in queerly colored patterns of curtain damask. A more motley command could not be imagined. Each trooper and his horse was a traveling country store loaded with all manner of plunder. What they could not carry they threw into the street, and their trail could be followed by the numerous articles dropped by the way.

"By 5 p. m., after firing the railroad buildings they had all passed and it was quiet again. The raiders inquired for the telegraph operator and I told them that he had gone with the train to St. Louis. As they did not seem to know or suspect they were conversing with the real operator, I escaped detection, or it would have doubtless proved worse for me, as they would have taken me to headquarters.

"It was several days before we received any information concerning the Union troops. Then I was informed that they were rebuilding the

ber started along the line of the railroad towards Desoto, determined to reach headquarters. On mounting an elevation near Blackwell's Station, we discovered in the road before us a party of mounted men, coming in our direction. We soon found the party to consist of a Union Lieutenant, a repair party repairing the wires, and my brother, R. C. Volker, accompanied them as operator. They were on their way to Pilot Knob. We soon pushed on toward Big River while the repair party continued south along the line of the railroad.

"After various adventures we arrived at Desoto and took the next train for St. Louis, where we arrived in the evening. The next day we started back for Desoto and arrived at Mineral Point the following afternoon. I then found an instrument set up at our house, and the familiar tick of the telegraph sounded sweet to my ear. I almost forgot the terrors of the past week, at again being in communication with headquarters at St. Louis and Pilot Knob, where my brother, R. C. Volker, was in charge of the telegraph office. October 21 the Point was again made a military post, and garrisoned with state troops and hundred day men.

"In March, 1865, the railroad was washed out and communication cut off, save by telegraph. On April 15 the news of the assassination of President Lincoln flashed across the wires and the troops were terribly excited while the people seemed stupefied with horror at the act. Peace being now assured, my services were no longer required by the Government, but I continued in the service of the Iron Mountain Railroad Company, finally leaving their employ in 1886. I afterward entered the employ of the Western Union, but finally retired from the service in December, 1875."

How Telegraph Messages Came to be Read by Sound.

Editor Telegraph and Telephone Age:

I notice on page 351, of your issue of May 16 an article headed: "How Telegraph Messages Came to be Read by Sound," consisting of an interview with Alonzo B. Cornell, wherein he claims to have discovered in the early fifties that he could take press dispatches by sound, and considers that he was the first telegraph operator that made this discovery. The interview does not state in what year of the early fifties this occurred. It may not be amiss for me to state, however, as a matter of early telegraphic history, that in 1848 I took by sound the returns of the election of President Zachary Taylor, in the village of Marshall, Mich. I was then thirteen years of age, and was operating at that place under the management of Mr. Jabez Fox, on the old Speed Line, the first telegraph wire that was strung west of Detroit to Chicago.

Inasmuch as this ante-dates Mr. Cornell's claim by at least two years we will need to go back to 1848 to find the first person who discovered that the Morse alphabet could be read by sound.

Alfred Weller,

Laporte, Ind. May 25, 1910.

Editor Telegraph and Telephone Age:

Telegraph and Telephone Age of May 16 contains an interesting article on "How Telegraph Messages Came to be Read by Sound," by Mr. E. J. Edwards, placing Mr. Alonzo B. Cornell in the post of honor, as, perhaps, the pioneer of the corps of Morse "sound readers." The reference made by Mr. Cornell to the date of his first attempt (and success) at reading by sound, as in the early fifties, permits me to solicit the favor of a distinct mention of which one of the "fifties" is alluded to, for I have a clear recollection of witnessing the most superior possible receiving by sound which was emitted from a Chubbuck (Utica) register, in the second half of 1852, or during the early part of 1853, in the City of Montreal, and I know that the operator referred to had been receiving by sound for at least eighteen months before I witnessed his work. Furthermore, I can give you his name and at the same time I conscientiously believe, produce a certificate from a very well known person who was his chief and knows to the day when the operator referred to commenced reading by sound.

"Montreal."

Guatemala, May 25, 1910.

A New England farmer believed that the telegraph company meant what it said when it advertised that it would deliver messages free within a radius of a mile from the telegraph office. He accordingly addressed a message to a friend living less than a mile distant from the office and was greatly surprised, upon presenting it to the receiving clerk, to find that if he wanted the message delivered he would have to pay for it.

Suggestive of the song of the goat who ate a red flannel shirt and afterward saved his life by coughing up the shirt and flagging the train, is the story of an Ohio railway telegrapher who inadvertently accomplished the same purpose by means of a pair of red hose, which he was wearing. It was a warm day and forgetting the color of his hose he had thrust his feet out of the window to cool them. A fast train coming along about this time the engineer saw the danger signal and immediately stopped his train. Thereupon the operator getting up to see why the train had stopped removed the signal and the block being clear the train proceeded.

June 16, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

The Los Angeles Convention.

The Association of Railway Telegraph Superintendents will next week meet at Los Angeles for the twenty-ninth annual convention. As is usual with the gatherings of this body there are many important subjects which will come up for discussion. The list of papers which will be found elsewhere in this issue indicates to some extent the multiplicity of the problems which will be considered by those who are present. A comparison of this list with the subjects which were discussed when the Association was formed in 1882 or even ten years ago, would show that nearly all of the questions which are of moment to the railway telegraph superintendents now are of recent origin. This condition of affairs has been largely brought about by the adaptation of the telephone for uses which it was formerly thought the telegraph only could serve. For any one superintendent to solve all of these problems successfully would be a task which few men would be able to perform but

by the co-operation which is secured through this association all of the superintendents throughout the country are enabled to profit by the failures and successes of their fellow men who have to conquer the same obstacles.

That this co-operation is effective is shown by the fact that there have been no failures among the many telephone train despatching installations which have been placed in service during the past three or four years. Considering the fact that there are now over forty-five railroad systems which use the telephone for despatching purposes this record is most remarkable. It is true that in many cases apparatus originally installed has been replaced but this has usually been done not because of failure of the first equipment but by reason of improvements over the original which were discovered by studying the problem from the operating standpoint. While no special attempt has been made to standardize telephone train despatching there are certain features of construction and operation which will be found on practically every telephone despatching system in use to-day. This is because the individual superintendents have each been seeking the best methods of construction and operation to be found and when they have themselves hit upon something of value been glad to impart their knowledge to others. If it were not for this the use of the telephone for train despatching instead of being extended to over twenty-four thousand miles of railroad to-day would probably be limited to a few isolated instances as was the case a few years ago.

Since the convention at Detroit a year ago the mileage of railroads on which the telephone is used for despatching purposes has doubled. From present indications the same comparative increase will take place during the next year. Several of the larger railway systems and in fact all of the more important ones are extending the use of the telephone as fast as is practicable. It should not be inferred, however, that telephone despatching has been perfected so that there is little chance or need of improvement. The defects can only be discovered by actual operation. Just what these faults are and how to remedy them is one of the principal questions with which the superintendents have to deal at present and one which will occupy a part of their attention at the coming convention. It is no longer a question of why should the telephone be used for directing train movements but rather how can it be used to the best advantage.

When a system and apparatus has been devised which is as near perfection as human ingenuity can make it other inventions may in turn do away with the use of the telephone in much the same way that the telegraph is now being superseded. Ten years ago the possibilities of wireless communication were not very highly regarded. Now the value of this inven-

tion for some purposes has been thoroughly demonstrated and there is a strong possibility that it will in the future be improved so that it can be adapted to many purposes for which it is not now available. Its use as a supplement to the telegraph and telephone service in case the latter fails, is already being investigated by two of the principal railway systems of this country. While it may not seem probable at the present time no thinking person will deny the possibility that the railroads will, in the future, be able to do a great deal of their more important telegraphing and telephoning without wires. Whatever may be accomplished along this line, however, it seems safe to predict that as long as the railroads are the principal means of transportation, one of the departments most essential to their safe and economical operation will be that of the telegraph superintendent or at least one whose functions correspond to those now exercised by that department.

Patent Reform Legislation.

There are quite a large number of bills now before Congress designed to effect reforms in our present patent system. Among these are several bills designed to correct the injustice of the United States appropriating patents without proper compensation to the patentee. While the United States Supreme Court has said that a patented invention cannot be appropriated or used by the Government without just compensation, on the other hand, it was held that Congress has never provided for suits founded upon wrongful acts, and that, therefore, the United States is not liable to suit for infringement of patents, no matter how wanton such infringement may be.

Another bill provides for the creation of a court of patent appeals to sit at Washington and hear appeals from the nine United States Circuit Courts throughout the country. It is stated that patent litigation as at present conducted, with nine courts of appeal with equal authority and with separate jurisdiction, involving the necessity for many independent suits on the same matter, frequently followed by diametrically opposed final decisions in the various jurisdictions, is an intolerable burden to the owners of patents and to manufacturers, regardless of the side of the litigation with which they may be connected.

President Brown on Governmental Regulation.

In the annual report of the New York Central Railroad, recently issued, President W. C. Brown included a statement of his views regarding government regulation of railways of which the following is an extract:

"The relations of the road with its patrons and the communities served by it have been harmonious and pleasant. This mutually satisfactory condition has been fostered and encour-

aged by the efforts of the Public Service Commission in New York State and the Massachusetts Board of Railroad Commissioners in composing and adjusting differences which, handled with less wisdom and moderation, might have resulted in serious friction and controversy. The influence and the co-operation of these commissions have been uniformly beneficial to the road, and have done much to improve the service for the public. Does not this very desirable result emphasize the advantage of appointing to positions so vitally affecting every business interest of the country, men qualified by experience, temperament and ability to discharge the important duties of their office. Governmental regulation of railroads, within proper limitations, is of benefit to the public, to the railroads and to those who hold their securities; but, in order to secure the maximum benefits for all interests, it is important that there be natural breadth and ability, and in addition thereto a willingness to undertake the conscientious, painstaking study of conditions necessary to enable them to deal intelligently with the complex and delicate questions affecting transportation that are constantly arising. General conditions were never more favorable, and every visible indication points to renewed and increasing prosperity for the country at large, in which the railroads may hope to participate."

Annual Convention of A. I. E. E.

The twenty-seventh annual convention of the American Institute of Electrical Engineers will be held at Jefferson, N. H., June 27-30. Among the papers which will be presented will be "Notes in the History and Practice of American Telegraph Engineering," by Messrs. William Maver, Jr., and Donald McNicol of New York, and "Telephone Engineering Around the Golden Gate," by Mr. Arthur Bessey Smith, of Chicago. The newly elected officers of the Institute are: Mr. Dugald C. Jackson, president; Messrs. P. H. Thomas, H. W. Buck and Morgan Brooks, vice-presidents; Messrs. H. H. Barnes, Jr., C. E. Scribner, W. S. Rugg and R. G. Black, managers; Mr. George A. Hamilton, treasurer; Mr. Ralph W. Pope, secretary.

Among the pictures painted by Professor Samuel F. B. Morse, the inventor of the telegraph, which are still preserved, is the fine oil painting of Lafayette, which hangs on the wall of the governor's room in the New York City Hall.

The Continental Telegraph Company, which is the telegraph department of the Chicago, Milwaukee and St. Paul and the Chicago, Milwaukee and Puget Sound Railroad Companies, has opened an office in Spokane, Wash., and is now prepared to handle commercial business between any points reached by their lines.

What is a Selector?

BY EDWARD E. BACKUS.

In these days the question, "What is a Selector?" or its practical equivalent in one form or another is heard from many quarters, particularly from those who contemplate the installation of selective signaling devices in connection with the departmental service under their management or control.

Not more than three or four years ago one was more often challenged to reply to the inquiry, "Why is a selector?"

In those days the answer was not always convincing and one's reasons why were not always received with entire credence or even tolerance.

The extensive adoption of the telephone in lieu of the less flexible and slower telegraph as a means for despatching trains, with the consequent rapid increase in railroad telephone lines with which the selector has kept pace, indicates that the selector itself has proven a sufficient and convincing answer to that question.

In the "other days" there were a few railroad men who were not incredulous, to whom the arguments advanced in favor of the selector appeared sound, and who with the courage of conviction, albeit in the face of skepticism, criticism and opposition, went ahead and tried out the selector. The results obtained with these early experimental installations were not only such as to warrant substantial extensions of the selective system by the first users, but were so excellent as to attract the attention of railroad men generally, and in the comparatively short time that has elapsed since the first experimental selective telephone despatching circuit was put in operation the use of the selector has become quite general. If the growth in the use of the selector were not sufficient answer to the inquiry, "why is a selector?" the articles that have from time to time appeared in electrical and railroad journals from the pens of Mr. S. L. VanAkin, Jr., of the New York Central, Mr. W. F. Williams of the Seaboard Air Line, Mr. C. H. Gaunt of the Santa Fé System, Mr. J. B. Sheldon of the Union Pacific, Mr. R. H. Corson of the Erie and others, have effectually disposed of it.

It is therefore, no longer necessary to reason why. However, it appears that we are now confronted with the question: "What is a selector?"

To the layman the obvious and sufficient answer to this question would doubtless be, "one who, or that which, chooses from a number by preference." The telegraph superintendent, the signal engineer, the selector user in short; the man charged with the choosing of a selector for use in connection with the service for which he is responsible, and by the reliability and success of which service his personal reliability and success must be measured, demands, however, a more comprehensive answer, and the writer has been requested to reply to the general question in some measure of detail.

THE DEVELOPMENT OF SELECTIVE SIGNALING.

The desirability of developing devices to enable the selective operation of bells or other audible or visual signals on telephone party lines was recognized by engineers and others engaged in the early development of the commercial telephone and beginning in the early eighties numerous selective signaling systems have from time to time been evolved by the telephone people.

By far the greater number of these devices have been so complex or have contained such fundamental faults or weaknesses of one kind or another, that, for these reasons, and also because such selective devices invariably increased maintenance and operating costs and reduced speed of switchboard operation, the telephone companies have as a rule given them only brief and often perfunctory trial, and have then discarded them. The wonderful development of the telephone industry and of the telephone habit has had a steady tendency to reduce the length of lines, to reduce the number of party lines, and where party line service is given to reduce the number of stations per line. This is of course particularly the case in cities and thickly settled communities. Selective signaling has therefore been regarded as of steadily diminishing importance by the telephone companies.

The selective problem as presented to the telephone people, was never the same as that which is involved in the railroad train despatching and message service.

It was never necessary for the telephone people to consider or provide for the selective calling of more than say ten or twelve party line stations, and there was never a necessity for the use of selective calling devices on long telephone trunk lines.

The application of the telephone to railroad train despatching and message circuits, however, created a demand for a selector that would be reliably operative on long lines, and a system capable of selectively signaling an indefinite number of stations, a number, in fact limited only by the telephonic limitations of the service.

Previous to the introduction of the telephone on railroad lines a reliable selector had been developed for use on telegraph lines by means of which bells could be selectively rung at telegraph stations calling the operator promptly to attention, and avoiding the necessity of interrupting service while his office call was indefinitely repeated on the telegraph circuit. It required merely a step ahead for the engineer who had developed the reliable telegraph selector to adapt the same instrument to telephone circuit requirements, and the selector referred to is in successful operation on many circuits operated by a large number of railroads in the United States and Canada.

It has been stated that previous to the advent of the long railroad telephone line, a great many

selective devices applicable to short lines and a small number of stations had been devised by the telephone people and it is a matter of common knowledge that subsequent thereto a great many arrangements and combinations of electrical and mechanical apparatus have been offered to the consideration of selector users all designed for use on the long lines. It seems evident therefore, that to one somewhat skilled in the art the arrangement of electro-mechanical apparatus in combination to enable the selective operation of signals more or less perfectly or imperfectly is by no means a difficult matter. In fact one is inclined to the belief that the number of different ways in which selective signaling may be more or less successfully accomplished is practically limited only by the number of skilled individuals who may give the problem sufficient consideration.

SELECTOR ESSENTIALS.

It used to be said that there was never a "sure enough" telegrapher who did not invent a repeater, and the saying was not far from the truth; but the old timers will all remember that not many of the repeater devices were good, and all telegraphers know that very few indeed have survived. I venture to say that the numerous selector devices will fare much as did the many telegraph repeaters. One or two will live—the rest will be consigned to the junk pile.

Just now, however, the superintendent or other official who is called upon to choose a selector for use in connection with a service for which he is responsible, is confronted with such a multitude of devices, all of which lay claim to superior or superlative merit, that it may not always be entirely easy to choose, hence the inquiry: "What is a selector?"

It would seem that a selector to fulfil all that is expected of it, and the service requirements are exacting, should be reliable, free from troublesome complications, such as numerous electro-magnetic devices and contact points, brushing contacts, dash pots and permanent magnets. It should be durable, inexpensive to maintain and conveniently operative.

It should be reasonably rapid in operation, but should have a good factor of safe operation with which excessive speed is not consistent.

It should never require adjustment or lubrication, should be immune to climatic and atmospheric variations, and should be dust and damp proof.

The selector should require very little current for its successful operation but should be safely operative through a very wide current range.

The electro-magnetic system should be so constructed that the number of selective stations possible for a single circuit will be practically without limit and so that the selector equipment will not sensibly impair telephonic transmission.

The controlling apparatus at the calling station should be so arranged that the calling device as-

sociated with any one selector may be quickly removed or changed for repairs or other purposes without interrupting service between the calling station and other selector stations.

The selector should be adaptable to the many uses, on telephone, telegraph, and signal circuits for which selectors are now employed extensively, and to other purposes for which they are beginning to be used. To insure durability and reliable action moving pivoted parts should never be under strain; and all moving parts should be as light as possible consistent with necessary mechanical strength in order to minimize wear and consequent changes in action. The restoring spring should be subjected to the least possible strain, the retractile spring should be practically a constant and the magnet armature should move between fixed limiting stops.

To further insure reliability and uniformity of action, and to prevent unnecessary drain upon the line battery it is important that the resistance of each selector bridge should be so proportioned to the difference in potential across the line at the point of attachment, that the flow of current in each selector magnet will be approximately the same.

To accomplish this it is of course only necessary to insert resistances in the bridge in series with the selector magnet, the greatest being placed in the bridge nearest the source of energy, and diminishing gradually at other stations dependent upon the resistance of the line or distance from the source until at the most distant station or group of stations no additional resistance is required.

In order that the selector may be satisfactorily operated with a very small amount of current and through a great current range it is important that the electro-magnet be of the highest possible efficiency, and also that it be a highly efficient retardation coil.

To insure both, the best practice would seem to be to construct the electro-magnet with a continuous or closed core of substantial size and to wind it with the greatest possible number of turns within saturation limits under normal working conditions.

A magnet so constructed is of course capable of powerful action under the influence of the very feeble direct current impulses for which it is designed, and at the same time offers an apparent resistance or retardation to the high frequency telephone currents greatly in excess of its ohmic resistance, so that the shunting effect of the selector bridges is practically negligible in so far as the telephone currents are concerned.

The history of both the telegraph and telephone and the experience of all who have been closely concerned with the development, operation and maintenance of telegraph and telephone appliances seems to justify the conclusion that an instrument embodying a sound selective

principle that has withstood the most severe and critical service tests and also embodying the structural and electrical details and principles that have been briefly described, is a selector, and moreover, a reliable and satisfactory selector, and one that will survive as becomes the fittest.

The Hazardous Work of a Telephone Cable Splicer.

Mr. Edwin Nicol, writing for a western publication remarks that few people know enough about electric appliances to understand the transmission of the telephone current. Fewer, in fact, realize the complexity of knitting together the wires of our modern telephone system. But absolute necessity, nowadays for more telephones, which means more wires, more branches, more intricate knitting and joining into compact masses, has evolved a method for accomplishing this end, known as cable splicing.

When Gardiner G. Hubbard financed Professor Bell, after the first public telephone demonstration in 1876, he paved the way for cable splicing. At first, however, telephone possibilities were not fully realized. The only lines were individual ones, connecting a man's office with his factory or his town house with his country house. Telephones with exchange facilities first began in 1878, thus inaugurating a national system.

In 1880 a so-called long-distance line was built between Boston and Lowell, Mass., followed by one, more serviceable, between New York and Boston. Upon the formation, in 1884, of the American Telephone and Telegraph Company for long-distance messages, began the first efforts in cable splicing. Comparatively slow growth of their business until 1899 limited, however, the number of men versed in this art. At that time, only large cities had underground conduits. The first connections between subscribers and exchange were made by "open" or overhead single wires. Then the metallic circuit necessitated wore wires. Growing need called for so many connections that they were put in cables to save space. So cables were made containing fifty copper wires, insulated with paper and incased in lead. When overhead cables proved inadequate to meet the demand for more telephones, all large exchanges installed underground ones.

The number of men who knew how to knit telephone wires grew from ten in 1880 to thirty in 1890 and in 1900 there were 300 engaged in this industry. Up to 1895, cable firms, like the Western Electric Company and Roeblings, in their own factories, taught men how to splice. But these men knew more about plumbing than electricity. Local telephone companies would borrow these factory-trained men whenever important extensions or repairs required. As the amount of work increased, this habit became too expensive, so, like the Southwestern Telegraph and Telephone Company of Texas, others soon

organized and trained their own staffs. To-day, as a result, the number of splicers throughout the country approximates 3,000.

Many personal dangers confront these men. Their work requires calm nerve and ready presence of mind. Crawling out on spans between poles, sixty feet from the ground, without support, is perilous. Yet added danger lies in imminent shocks from electricity or lightning. Especially hazardous is cable work over trolley wires, where a fall means death. Dreaded are the "joint construction" poles, which carry both telephone cables and power lines, the telephone cables on top. Only a few years ago such poles ran out Market Street of San Francisco. St. Louis, also, up to 1894, had poles with fourteen cross-arms, holding ten cables each. The telephone cables on top, being only six feet from the power leads, men working there were electrocuted at the rate of one a week. But by placing telephone wires underground, inventive genius arrested this death-harvest.

The paraffine used by splicers to boil out the moisture will sometimes cause explosions, fatal to those handling it. Gas, too, accumulates in manholes, endangering the life of him who goes down with lighted torch. Often the splicer's torch ignites some pocket of gas, the odor of which he has failed to detect. The atmosphere in both manholes and river mains exposes splicers to disease or asphyxiation. Well do they appreciate the improved system of drainage in many cities where they are forced to work.

But whether splicing high in the air, or in deep water mains; whether surrounded by death-dealing currents, or standing on threadbare supports, splicers are of one mind in their loyalty to duty in perfecting the great telephone systems. Daily they risk limbs, and even life itself, brave almost to a fault.

Railway telegraphers who work nights at lonely points along the road and who do not care to keep a revolver for protection should provide themselves with a nickle-plated bicycle wrench, as this is said to be just as effective and certainly is not so dangerous. A girl who was employed as night operator at an isolated point in Massachusetts used this weapon recently upon a burglar who was trying to break into the station and succeeded in holding him at bay until she summoned assistance from a station ten miles away to come and take the intruder into custody.

Mr. M. H. H. Duvall, until recently superintendent of the Postal Telegraph-Cable Company at Augusta, Ga., but who is now engaged in the real estate business at the same place, in renewing his subscription for another year, writes: "While no longer identified with the telegraph service, I have by no means lost interest in either my old friends of the former days or in matters pertaining to the telegraph, and I find the Age an excellent medium to keep one in touch with both."

Some Predictions of Thomas A. Edison.

In a recent interview Thomas A. Edison expressed the belief that there will be found at some time a new power, a force to be drawn from the ether, an as yet undiscovered something that will cause as great a revolution as electricity has caused.

"I cannot guess what this power will be," he said, "nor how it will be discovered, but its discovery will be an accident. There are many forces at work around us, but we shall not find them unless something happens that will reveal them to one of our five senses. Something will have to happen to agitate or excite this force and transform it into light, or heat, or some other manifestation that we can understand through our senses.

"There are any number of undulations in the ether right here in this room, but what they are we don't know. To illustrate our ignorance: Once when dining with a learned physiology professor of the University of Berlin I shook my forefinger at him and asked him what made it move. He couldn't tell. There you have a form of motion that we don't know anything about—we don't know what it is.

"And so, there is yet to be a discovery in the domain of motion in the ether, something that we shall be able to carry on wires to great distances, and that, perhaps, will afford us power, but I cannot guess what it will be."

In the mean time, while this hypothetical force remains undiscovered, what may we expect electricity to accomplish in the immediate future?

"Lots of things," said Mr. Edison in reply to a question along this line. "It is the power of to-day and nearly everything which requires power or motion will soon be in the form of electricity. It will almost entirely displace gasoline in automobiles. In vehicular transportation in the cities of the United States it will bring about a complete revolution. The railroads cover this country with a vast network, yet almost everything that is now pulled to them or pulled away from them is drawn by horses. People do not realize the magnitude of horse traffic, and that is why I say electricity will revolutionize this phase of motive power.

"The greatest invention in the electrical field, in my judgment, was the dynamo; then the telephone, and then the incandescent light as a unit. Of all human inventions, not my own, I should rather have invented the steam engine, because of what it has accomplished for civilization.

"There will be a vast improvement in the telephone, especially as to volume of sound and clearness of articulation. To-day you cannot send over the telephone a message which contains a lot of, say, Hungarian names. The articulation ought to be better than on the phonograph and it must be made. I believe the telephone will eventually displace the telegraph on railroads."

Replying to a question as to which of his inventions he thought most likely to receive the homage of posterity, Mr. Edison said at once:

"The phonograph, because of its sentimental side. In the development of the phonograph and the moving picture we have now reached a point at which we can make the picture sing and speak very naturally, and the public will get this invention in the near future.

"Another big advance in the electrical field will most likely be along the line of high efficiency in the wind motor, which will produce power for isolated communities, and there is also hope for the sun motor in the arid regions."

"Progress in electricity will continue during the next twenty-five years," he declared emphatically. "The demand for everything is unlimited. The more light you have the more light you want. And in its possibilities electricity seems unlike almost anything else—unlimited. What the farmer produces is limited, but the demand is always strong upon him.

"As to the various methods of applying the means, there is, of course, a question as to which is best. It is likely that there will always be a tussle between the slot, the trolley and the storage battery car, for instance."

In reply to a question Mr. Edison declared that of all his work the incandescent light and motor system was the most difficult.

"The public sees only the electric light," he said. "It does not appreciate the difficulties of the details. I sweat blood for six years, and took out 130 patents on various systems," he said, "but the light itself is all that is apparent to the general public."

He expressed the belief that steam has reached the point of its highest development, especially on the railroads, unless they widen the gauges, and declared his opinion that the use of electricity will become general in railroading.

An order has been issued by the War Department that hereafter telegraph operators who served in the federal army during the civil war cannot be buried in the national cemeteries. The ruling is based on the fact that these men were not enlisted soldiers, but employes of the quartermaster's department.

The manager of a branch district messenger office in New York was called upon one evening recently to furnish a messenger to deliver a baby which was brought to the office by a young man of name and address unknown. The boy detailed for this duty found the designated address without any difficulty, but careful inquiry failed to discover anyone of the name to which the infant was sent, or, in fact, anyone who was expecting a baby. After inquiring at every house on the block the messenger finally gave up in despair, and took the baby back to the office, vowing that he would resign before he would accept another such commission.

The Poulsen System of Wireless Telephony and Wireless Telegraphy.*

BY C. F. ELWELL.

As soon as the methods of signaling through space first given to the world by Marconi were well understood, scientists throughout the world recognized the shortcomings of both the transmitting and receiving apparatus. Transmission was first effected by means of strongly damped oscillations generated by means of powerful sparks from condensers charged by means of large induction coils, in the primary circuit of which a suitable telegraph key was inserted.

Many improvements have been made in this type of transmitting circuit. Commercial transformers working at a frequency which would give the maximum sensitiveness to the telephone receivers at the receiving station have been substituted for inefficient spark coils. Many attempts have been made to suppress the noise of the sparks, which with the increased use of large amounts of power became distressing to the operator besides betraying the message to unauthorized parties. Apparatus doing this successfully also decreases the efficiency of the apparatus. Keys had to be devised to break the necessarily large primary currents and quite an array of electromagnetic and oil-immersed keys are now in use. For heavy power working the speed is limited by such apparatus. Sending condensers have been improved both as to bulk, durability and cost.

Signals were received by means of the Branly coherer on which much time and money were fruitlessly spent. Then came the magnetic, electrolytic and thermo detectors with increased sensitiveness and automatic decohering features. But these detectors have not the well defined resistance which is necessary for accurate resonance tuning effects.

The Danish inventor, Valdemar Poulsen, took up the study of the wireless transmission of signals and recognized the fact that further advance depended on decrease of the damping of the oscillations and increase of sensitiveness of detectors. He determined to follow up the generation of undamped waves as being the line on which more selective telegraphy would be obtained and telephony also be made possible. After a profound study of the "singing arc" following in the footsteps of Elihu Thomson and Duddell, he evolved his present type of arc generator. This generator, with suitable capacity and inductance in shunt to the arc, sets up trains of practically undamped waves of frequencies from 200,000 to 1,000,000 per second, according to the values of capacity and inductance in the shunt circuit. Not only this, but he has been able to transform as much as thirty kilowatts of direct current to high-frequency current in the shunt circuit.

This generator applied to telegraphy gives improved selectivity of the instruments to an extent never reached by spark methods, permits of duplex working, gives great range with small amounts of power, better results over land, better daylight working and, last but not least, a great increase in speed. For the purposes of telegraphy he had to invent a new type of detector which is now known as the "ticker" and which has been shown to be much more sensitive than any other detector. This detector was necessary in order to render the telegraph signals audible because the alternations take place at a speed much above the limits of audibility.

In the Poulsen generator the arc takes place between a water-cooled copper anode and a revolving carbon cathode. The anode and cathode project through two opposite sides of a water-cooled chamber. The arc takes place in the presence of a powerful magnetic field at right angles to the flow of current. A small motor revolves the cathode very slowly and prevents a deposit of carbon taking place and so shortening the arc gap, which is maintained at from three to five millimetres in length. The chamber is equipped with an inlet and outlet for supplying the arc with a hydrogen-containing gas. Drops of alcohol on being introduced into the chamber are immediately vaporized and this method of gas supply is in use on shipboard. In the chamber there is a yoke which is attracted by the magnetic field when the current is switched on and a small copper tip serves to strike the arc. This automatic arc-striking feature was devised for wireless telephoning, so that talking and listening could be carried on with ease.

A large amount of heat is produced in the water-cooled chamber which is removed by means of the cooling water. A certain amount of power is absorbed in the regulating resistance in series with the arc. Of the power which is converted into high-frequency oscillations, part is dissipated as heat in the capacity and inductance and part is radiated by the antenna.

A wattmeter may be used to measure this radiated energy by using a direct-coupled antenna and measuring the watts at some point in the condenser circuit with and without the antenna. The difference will be the watts radiated.

Fleming has shown that if W represents the energy in ergs radiated per second, when the oscillations are persistent, $W = 128 A^2$, where A is the current read on a hot-wire ammeter. Thus a current of two amperes would give a radiation of 512 watts, showing that when working with persistent oscillations and open antennas, we can use very small antenna currents, and obtain powerful radiation effects.

The generation of high-frequency alternations in a shunt circuit to a continuous-current arc is somewhat as follows: If the arc is steady and is then shunted by a condenser, the current rushes into the condenser and momentarily robs

*Abstract of a paper read before the San Francisco Section of the American Institute of Electrical Engineers.

the arc of current, causing the potential difference in the carbons to rise and continue charging the condenser. When the condenser is full the arc current returns to its former value, the potential difference falls, and the condenser discharges from the arc, and the cycle repeats itself. A part of the energy of the continuous current arc is thus changed into the energy of electric alternations in the condenser circuit.

The characteristic curve of the arc is, as is well known, a falling characteristic, i.e., the voltage decreases as the current increases, and for a carbon-arc is comparatively flat. It has besides a persistency which renders it irresponsive to rapid variations of current. Hence only slow alternations can be obtained from a large-current carbon-arc.

With the Poulsen arc, with its carbon negative and cooled copper positive, immersed in hydrogen, a very steep characteristic is obtained and one which responds to exceedingly rapid variations of current through it. A condenser of small capacity may be employed in the shunt circuit and yet convey to it a considerable amount of energy because of the large variation of the difference of potential at the arc caused by small arc current variations. So alternations of high frequency can be produced.

This theory is confirmed by the study of small-current carbon-carbon and carbon-aluminum arcs in air. For they have steep characteristics and can produce alternations of high frequency. The theory of the part played by the hydrogen on large-current carbon and metal arcs is not yet well understood. It appears to be partly due to its greater conductivity compared to air, thus helping to cool the arc electrodes. Poulsen also considers that hydrogen increases the conductivity of the arc.

Practically, the "ticker" consists of two fine crossed gold wires, which are vibrated at the rate of 100 vibrations per second, by means of an electromagnet or clockwork. This may be connected to a secondary circuit which is coupled electromagnetically with the primary circuit.

The rapid telegraph transmitter is operated by means of a punched tape. The tape has a series of small holes down the center. The holes on each side of this central line are punched by hand and those on one side represent the dots, while those on the other represent the dashes of the Continental code. The central line of holes engages the teeth of a sprocket wheel which serves to feed the tape forward at a regular rate. The tape gear wheel has a number of very small and light radial pins, which tend to fly out except when they are held in position by the tape. Wherever a hole occurs a pin is allowed to spring outwards. These pins are mechanically connected to larger pins on a further attachment of the spindle which fly out when the smaller pins are actuated by the tape. Spring contacts are in series with a set of brushes which press on the

segments of three rotating commutators, one of which has a comparatively large number of alternate conducting and insulating segments, and is reserved for the dots, while the other two have longer spacings of commutator segments, which are kept for the dashes. In this way all the actual making and breaking of the current is accomplished on these larger segments, while the tape controls the whole apparatus by means of the lightest possible form of mechanical construction. This reduces the effect of inertia to the lowest limit. There are seventy-two pins, each representing a dot and space. An average word has five letters, so it is possible to transmit three words for one turn of the transmitting combination, and the speed of the machine, which is driven by a direct-current motor, can be varied between the limits of ordinary hand speed to a transmission of 300 words or more per minute. The practical limit at present is in the receiver and not in the sender.

A complete rapid receiver consists essentially of a form of string galvanometer in which a gold string is used in connection with a thermocouple. The absence of inertia permits the string to follow the rapid impulses sent out by the rapid sender. A coating of soot is placed on the wire, and the wire itself is mounted in the beam of a Nernst or arc lamp. A suitable optical condenser throws the light on a narrow slit behind which moves a band of photographically sensitized paper. The shadow of a small portion of the wire as it vibrates to and fro in response to the signals from the sending station is thus imprinted on the band, which is then drawn, first through a developing bath, then through a fixing bath, and then through water to wash it. The message may be read on the developed band as soon as it emerges from the light-tight box and may be kept as a permanent record. The signals are read above the zero line which is traced by the shadow of the wire when no impulse is present. A short impulse makes a dot and a long impulse a dash.

The problem of wireless telephony involves essentially three things: (1) The production of undamped or persistent waves in a transmitting antenna. (2) Means for modulating these waves in accordance with the wave form of the spoken voice. (3) Means for detecting the waves at the receiving end and their reproduction into articulate speech.

The Poulsen generator offered a means of supplying the undamped waves in the transmitting antenna and it was only necessary to connect a microphone at or near a node of current in the antenna to supply a means of modulating these waves in accordance with the wave form of human speech.

At the receiving end almost any self-decohering detector will do, but the production of good clear articulation depends quite a little on the degree of coupling of the primary circuit with the secondary circuit. This also applies to the send-

ing circuits in which quite loose coupling is employed.

Poulsen has transmitted good, clear, articulate speech over the 180 miles between Esbjerg and Lyngby, Denmark. Majorana claim to have talked 312 miles over water with a specially constructed microphone of his own devising. More recently I have carried on successfully two-way working between Stockton and Sacramento, Cal., a distance of fifty miles over land, and while working between these two stations was heard by St. Helena and Palo Alto, distances of seventy-five and eighty-five miles respectively.

There is no doubt that wireless working gives telephony of a higher grade than wire working. There is absolutely no noise in the receiver until spoken words are heard. To one who has talked over long-distance wire lines with considerable induction this feature readily appeals. Low-resistance receivers are not necessary.

With the Poulsen generator of continuous waves it is possible to telegraph at hand speed, i. e., twenty-five words per minute in many ways. For example, it is possible to signal by: (1) Short-circuiting a resistance in the generator circuit; (2) short-circuiting a resistance in the antenna circuit; (3) making and breaking the arc; (4) altering the length of the arc; (5) altering the strength of the transverse magnetic field; (6) altering the flow of gas through the arc.

In practice the inventor short-circuits a turn or two of the sending inductance by means of an ordinary Morse sending key. The absence of the spark permits the use of an ordinary key when telegraphing 2,000 miles, for the current is even then quite small. For receiving, Poulsen uses the ticker which has the great advantage of not being receptive to ordinary damped wave signals.

The tuning possible with the Poulsen arrangement for telegraphy is extremely close. One-half to one per cent. change in the capacity of the resonant circuit is readily noticed on the received signals. Duplex working has been carried out with 3.9 per cent. change in wave length.

The rapid wireless-telegraph transmitter and receiver have already been described. In practice the transmitter is connected in, just where the Morse key would be for hand-speed telegraphy. Good, clear, readable records have been received over 180 miles, mostly land, at the rate of 300 words per minute. Over 600 miles good records have been received up to 150 words per minute. As a means for handling large quantities of business and with a record at both transmitting and receiving stations the rapid system has a good future. Poulsen estimates that he can handle 100 words per minute across the Atlantic with a sixty kilowatt generator and suitable antenna.

In the first place the absence of all noise is brought home forcibly in a Poulsen station. It seems hard to believe that anything is being done at all. The key may be of the ordinary Morse type, for the currents handled are quite small even for large distances. There are no insulation difficulties, for the voltage at the top of the antenna is not estimated to be over 3,000 volts. The sending helix may be handled without shock, even though the voltage be over 1,000.

Very small capacities are used with heavy-power working, eliminating a source of expense and a very bulky part of large "spark" stations. The capacity in connection with a twelve-kilowatt set is about 0.0017 microfarad. At the Cullercoats (England) station the condenser takes up less than a tenth of the space occupied by the condensers for a "spark" system of the same power installed in the same stations.

Undamped waves of small amplitude are less obstructed by atmospheric conditions and suffer less absorption over land than damped wave trains. For example, in coming around the north of Scotland the undamped wave signals are picked up long before the damped wave signals of equal power.

The form of the resonance curve of the receiver circuit depends on the decrement of the transmitter and receiver. If the transmitter is undamped, a very small change in the period of the receiver will put it out of tune, hence, a receiver circuit can be employed which is sensitive to undamped waves of some exact period, but which is exceedingly unresponsive to waves differing by a very small fraction of one per cent. in wave length from the syntonie value.

In the matter of energy, good signals have been transmitted over 500 miles with one kilowatt, and over 2,000 miles with six kilowatts and a limited antenna. The efforts of Marconi and others to reduce the damping of their wave trains is evidence that undamped wave trains will be the means of communication of the future.

In telephony at the present time better articulation is obtainable than with wires and it is quite probable that a method of obtaining secrecy will soon be devised.

In telegraphy there is no doubt that the Poulsen system has great range for little power and that it works readily over land and in daylight. I look to see the present records of distance now held by spark methods broken by stations using the continuous waves. The present speed of the rapid telegraph sender is dependent on the receiver, but a newer type of rapid telegraph detector is coming out which will no doubt result in the handling of greater speed than 300 words per minute. Great advances can be expected in the next five years in wireless working, but they will be along the lines of work with continuous wave trains.

The Delany Telegraphic Keyboard Transmitter.

Patent No. 957,312, for telegraphic keyboard transmitting apparatus, granted recently to Patrick B. Delany, of Nantucket, Mass., covers a form of transmitting apparatus of the keyboard type in which the details of operation seem to be worked out very carefully. As described by the inventor the equipment comprises an arrangement of multiple branch circuits, each in series with a controlling device at which they are in succession closed and opened. The signal to be made or transmitted is formed by closing the signal circuit in advance of the actuation of the controlling device. In the particular form described the controlling device has a contact maker or trailer traversing a series of insulated contact pieces to each of which one of the branch circuits is electrically connected. The branch circuits include a series of parallel contact bars and the signal forming contacts are carried upon a series of endwise moveable contact making bars, arranged at right angles to the parallel branch circuit bars and of which there is one for each letter or signal to be formed. Each of the series of parallel branch bars, when a signal forming contact is brought into connection with it, furnishes the circuit for transmission of a dot signal. To transmit a dash a succession of two, three or more of such bars are connected into the circuit and as the trailer of the controller bridges the contact pieces traversed by it, such prolonged closure of the circuit is thereby effected as may be desirable for the transmission of a dash. Spaces are formed between the component parts of the signal by leaving on open circuit one or more of the branch current bars lying between those which are connected on either side for the formation of the successive component parts of the signal.

The keyboard has the appearance of an ordinary typewriter keyboard and may have, of course, as many characters as desired. The key levers are all pivoted on a horizontal bar, and each has a downward bifurcated extension between the arms of which extends an upright piece on the end of the horizontal contact carrying bar which is arranged to slide in supports or standards near its two ends. The contact pieces are adjusted by clamps on these bars by means of set screws and extend downward in order to make contact with the parallel branch circuit contact plates or bars, which are placed directly below and at right angles to the contact carrying bars. When the key lever is in its normal position, the contact pieces stand between the contact plates. When a key lever is depressed the corresponding bar is moved laterally so as to bring the contacts which it carries into contact with the plates below. These plates are each insulated, being mounted upon a plate of insulating material. They are consecutively connected by circuit connections to the insulated contacts of the controller. The contact carrying bars are

all electrically connected to the frame of the instrument.

The contact maker, trailer or brush, has a reciprocating motion over the insulated segments which form an arc of a circle and normally rests on the first segment of the circle, which is always dead. The contact brush is carried on a radial arm fastened to an insulated vertical rotatable shaft which is connected to one pole of a local battery, the other pole of which is connected through the winding of an electromagnet, relay or transmitting device to the frame of the instrument. If a key lever is depressed its endwise moving bar is caused to make contact with certain of the branch circuit contact plates. If, for instance, we desired to send the letter J in the Morse Code, contacts would be made on plates 1, 2, 3, 5, 7, 8, 9 and 11. If then the trailer was set in motion the circuit of the local battery would be closed while the brush was passing over the segments named, but would be opened when passing over segments 4, 6, 10, 12 and the succeeding segments. The closing of the local circuit would energize the relay therein, which, in turn, would transmit impulses from the main battery to the line, the duration of these impulses, of course, depending upon the length of time that the circuit was closed. The time required for the brush to pass over three segments corresponding to the length of a dash, it will be seen that we would, in this case, transmit to the line the required signals for the letter J, namely, dash, dot, dash, dot.

To prevent a second key being depressed before the first signal is completed the first one, upon being depressed, strikes the lower arm of a pivoted yoke extending the whole length of the keyboard and rocks its upper arm into engagement with notches in the ends of the undepressed levers thereby locking against depression all of the key levers except the one then being operated. At the same time another device in the form of a latch catches the end of the depressed lever in order to hold it down until the signal is completed. This latch, which extends the length of the keyboard, carries at one end the armature of an electromagnet which when engaged withdraws the latch and permits the lever under the stress of a retractile spring to return to its normal position.

The depression of the key also closes the circuit of a local battery through a magnet, the armature lever of which carries an idler gear meshing with a continuously driven gear. Turning with these gears are two grooved rolls between which is an endwise moveable bar formed with rack teeth which mesh with a gear on the trailer shaft. A coiled spring acts normally to hold this bar in a retracted position with the trailer upon the dead segment as previously mentioned. When, however, the magnet is engaged by the depressing of a key and the consequent closing of its circuit the grooved roll carried by its armature is forced

toward the companion roll so that the bar is frictionally grasped between them and is by the action of the continuously driven gear drawn forward causing the rotation of the trailer shaft and the traversing of the trailer over its contacts. As the key returns to its normal position the circuit of the magnet being broken the grip of the rolls on the bar is released and the trailer is automatically returned to its normal position by the coiled spring mentioned.

For the purpose of releasing the depressed key when the signal is completed the branch circuit connected with the segment upon which the signal is completed or some succeeding segment is also connected, through an extra contact made by depressing the key lever, with the magnet previously mentioned which is used to release the latch which holds the key down. From this magnet the circuit is traced through a local battery to the trailer arm. Hence, when the trailer makes the contact which closes this circuit the magnet being energized the key is released and this in turn opens the circuit which allows the trailer to return to its normal position.

A keyboard of this type may be easily adapted for cable working. In this case each endwise moveable bar would be replaced by a composite bar composed of two metal conducting plates separated and insulated from each other by blocks of insulating material. Each conducting strip carries contacts which co-operate with the branch circuit bars as previously described. The operation is as has already been described except that instead of being electrically connected to the frame of the instrument each conducting strip of the composite bar is connected through a separate magnet to the local battery and thence to the trailer arm. When contact is made by one side of the endwise moveable bar the magnet connected in circuit with that side is energized and by operating a pole changing device sends an impulse of a certain polarity to the line. When contact is made by the other side of the bar an impulse of the opposite polarity is sent to the line.

The number of branch circuit contact bars required depends of course on the length of the signal to be transmitted. If the Morse alphabet is used the longest character, the period, will require fifteen contacts. As the contact for releasing the key is in the plan outlined the second one following the last signal contact seventeen bars will be required. If the Continental code is used its longest characters will require nineteen contacts, hence twenty-one bars would have to be provided.

To provide against the possibility of failure of the automatic device to return the trailer arm to its normal position when the signal is completed provision is made that when the trailer has passed over all of the segments it shall be dis-

connected from its driver and returned to normal position by its spring.

It is claimed that the principles of this invention are applicable not only to direct transmission as described but also for the transmission of wireless signals; for use locally for making a record as for instance by perforation of a tape to be used for transmission in an automatic or machine rapid telegraph system and for various other purposes.

So far as signal transmission is concerned it is, of course, adapted to any code, whether the transmitted signals be composed of component parts represented by impulses of long and short duration, of uniform duration or variable polarity.

A Story of Sir William C. Van Horne.

The retirement of Sir William C. Van Horne from the Chairmanship of the Board of Directors of the Canadian Pacific Railway on May 9 recalls the following story of this great railway executive who started his railway career as an operator on the Illinois Central:

"One day a stout, bearded, elderly man was a passenger on a Canadian Pacific local running into Montreal. By his side sat a very pretty young woman.

"The attention of the bearded man was attracted by the audible maneuvers of two young men who sat behind him. The two sat on opposite sides of the aisle, and first one and then the other would tap on the metal arm of his seat with his pen-knife.

"Presently it dawned upon the bearded man that his fellow passengers were holding a conversation in Morse.

"How do you suppose old Whiskers got the lulu?" said the taps.

"She's a bird," was the reply, 'the old man's darling, probably.'

"Isn't it disgusting?"

"After the tapping had continued in this vein for some minutes, the bearded man suddenly began rapping sharply on the arm of his own seat with the seal ring that adorned his little finger.

"Whiskers is doing his best not to look around at the two Canadian Pacific telegraphers behind him. Ask the conductor.'

"Dismayed, the two young men sat a while, like statues. Finally one arose and hurriedly left the car. The other soon followed. In the baggage-car they found the conductor, and told him what had happened.

"It's lucky for you fellows said the conductor that 'Whiskers' is who he is. If he was somebody else, you'd be out of your jobs right now. Know why he didn't look around?"

"It was because he wanted to spare you the humiliation of knowing that he had identified you. That is Sir William Van Horne, president of this railroad."

Telegraphic Development in the Northwest.

Mr. Z. G. Simmons, who died February 11 at his home in Kenosha, Wis., and who was for twenty-five years president of the Northwestern Telegraph Company, was regarded as one of the best business men in that state. In a series of articles appearing in "System," which were prepared before his death, he gives an interesting resume of his business experiences. Early in life he was a storekeeper in Kenosha and while thus engaged became interested in the telegraph. His connection thereafter with the industry is told as follows:

"Charles Sholes, brother of the typewriter inventor, was one of my customers. He owned half of the stock of the Wisconsin State Telegraph Company, then operating a line between Milwaukee and Madison. In common with other telegraph lines in the west, it was losing money and Mr. Sholes was trying to get rid of it. He had promised to settle his bill at the store when he closed the sale of his stock. The deal falling through, he asked for further time, explaining his difficulty. Yielding to the fascination the telegraph had always exerted over me, I offered to buy his stock.

"So important a means of communication, it seemed to me, must be susceptible of development and management on a paying basis. Mr. Sholes accepted my offer and transferred his interest to me for \$500, only a fraction of the cost of construction. My bargain, I soon discovered, was a white elephant. Not enough messages were sent to pay operating expenses; business men had not yet learned to use the lines. My task was to cut expenditures squarely in two or find some new use for my wires and operators. This was in 1856.

"Revolving my dilemma, it struck me that the railroads ought to employ my service in handling their traffic. The telegraph would enable headquarters to keep in touch with trains out along the line, to give conductors running orders, to meet emergencies, to frame up a schedule much faster than the current, go-it-blind method allowed. I carried the idea to E. H. Goodrich, the president and manager of the road from Milwaukee to Prairie du Chien. He derided it.

"'Preposterous,' he said. 'The idea of trusting a railroad train to telegraphic orders! I'd be sent to an asylum if I attempted a thing like that.'

"I hung on, however. The scheme was so safe and simple; it met the needs of the railroad and my own necessity to reduce expenses so exactly that I was sure it would succeed. In the end Goodrich capitulated and agreed to try the plan on one hundred miles of his road between Milwaukee and Portage. Literally it proved itself in a day. Goodrich gave me no peace until I carried my wires to Prairie du Chien.

"'We've got to have the telegraph,' he declared.

"Between here and Portage it's daylight and safety. Beyond Portage it's midnight until each train returns and reports itself safe.'

"That was the beginning of a quarter century given chiefly to the extension of the telegraph. I sold the store to my brother, my construction work leaving me no time to give it the personal attention which, I had learned, was the basis of success in merchandizing. With the railroads eager to co-operate, the opportunities in telegraphs were endless. Virtually our outlay ended with the establishing of the lines. The contracts gave us a free right of way and provided for all minor repairs by section gangs. The operators were paid by the railroads and we received all the money taken in for commercial messages. When these reached twenty a day we agreed to start a company office. Later when our lines began to cover the whole northwest, the railroads were given franking privileges up to a certain amount each year, not only over our own lines but over those of other systems with which we had reciprocal agreements.

"With one exception, marrying railroads and telegraphs was to be my sole business for many years. I borrowed money and strung wires wherever the iron rails led and traffic promised. I organized the Northwestern Telegraph Company and effected a connection at Chicago with the Western Union, which Hiram Sibley and J. H. Wade of Cleveland had evolved from a tangle of wild cat lines in Ohio, Indiana and Michigan, rehabilitating the best of them. Pushing on to Minneapolis, I went thence to the coast along the Northern Pacific and up into Canada.

"In all I built 20,000 miles of lines and managed the Northwestern for twenty-five years. But the value of my original idea—co-operation with the railroads—outweighed all my later service. It bridged the barren years when trade and industry were learning to utilize, but failing to support, the new engine of communication. It freed the railroads from guesswork and initiated modern railroading.

"It was not a march from success to success by any means. At one time the Minneapolis office, for instance, would have been closed but for a citizens' subscription to pay the operator's salary. But progress was fairly uniform. The important lines were built along railroads: the only exception being the line from Minneapolis to Winnipeg, then Ft. Geary, the stockaded trading post of the Hudson Bay Company. This I constructed along the old trail of the Red River carts through the woods and across the prairies before the railroads pushed northward. Even that was not a speculation, our contract with the Hudson Bay Company guaranteeing us profits from the outset. When I retired from the Northwestern presidency in 1881 to manage my manufacturing business at Kenosha, the Northwestern had 1,800 offices, 300 of them supported entirely by commercial messages, the others operated in conjunction with the railroads. My original investment of \$500 had grown to be a \$4,000,000 property.

Passions are as easily evaded as impossible to moderate.

How Edison Solved a Difficult Problem.

In a recent newspaper article Mr. E. J. Edwards tells the following story of how Thomas A. Edison solved a problem which was puzzling the minds of many inventive geniuses over twenty years ago.

When New York city, back in the late eighties, passed an ordinance forbidding the stringing of telegraph and telephone wires overhead and ordering the miles of wires already overhead to be placed underground a commission was appointed to take charge of the work of burying them. A member of this commission was the late Jacob Hess, at one time very prominent as a Republican organization leader in New York, and one of the group of very energetic young men who were trained in politics by Chester A. Arthur when he was a power in New York city politics.

"The most impressive evidence I ever had of Edison's genius I received when I was a member of what I believe was the first authoritative body to deal with the problem of laying a city's wires underground," said Mr. Hess to me a few years before his death.

"When we started out we knew that it wouldn't do just to place the wires in trenches and let it go at that; anybody knows that wires so placed would not work and would soon be destroyed. So we had authority to spend money to make experiments in order to get at least one satisfactory system of burying the wires, and to enter into contracts with inventors of satisfactory systems. One of our first moves, therefore, was to advertise our needs.

"You can't imagine the number of inventions that were brought to our attention—they simply were legion, as the saying is. Most of them were worthless.

"One day, after we had been struggling with the problem for weeks, and were as far away from solving it apparently as when we first tackled it, it was suggested that we call on Thomas A. Edison and ask him to invent something that we could use, or, at least, give us a suggestion that we could have worked out. We wrote him, and he invited us to visit him at his laboratory in New Jersey.

"Presenting ourselves before him at the appointed time, we found him wearing an old linen duster and a much battered straw hat. As we stated the object of our call a queer little smile passed over his features. Finally, he said: 'I suppose you have had all sorts of inventions offered to you?'

We nodded acquiescence.

"Well," he said, 'chuck them all out. Most of them are no good, and, besides, you don't need any invention.'

"We looked surprised, and Edison was clearly amused at our astonishment. Then he proceeded to elucidate. 'All you have to do, gentlemen, is to insulate your wires, draw them through the

cheapest thing on earth, lead pipes, run your pipes through channels or galleries under the street, and you've got the whole thing done.'

"There he was telling us in that simple, offhand way how to do the thing we had spent the best part of a year puzzling over; for none of us doubted that he had solved the problem, and afterwards the experiments which we conducted proved conclusively that he had.

"Before we left Edison we asked him what his bill was for the advice he had given us.

"Not a cent," he replied. 'Do you suppose I'd stick you for so simple a thing as that?'

"And yet," concluded Mr. Hess, "the plan that Edison gave us offhand and free gratis is the one now universally employed when wires are to be placed underground."

How to Locate a Break in a Telegraph Wire.

A magazine which claims to have over a million readers in ten cities spreads broadcast the following remarkable information regarding the location of a break in a telegraph line.

"When a telegraph wire is broken or damaged, say several hundred miles away, how does the operator sitting in his office, know exactly where the accident occurred?

"The explanation is simple. It requires, as everyone knows, considerable force to send electricity through a wire. The longer the wire, the greater, of course, must be the force required. This force is measured in units called by electricians ohms. Let us suppose that a wire between a New York office and a point one hundred and fifty miles away has broken somewhere. The telegrapher knows that when the wire was intact there were required, say, twenty-one hundred ohms to facilitate the current, or fourteen ohms to the mile. He now finds that he can send a current with only seven hundred ohms. Dividing seven hundred by fourteen, he finds that the break in the wire is fifty miles from his end.

A Possibility of the Future.

An exchange, in speaking of the recent approach of Halley's Comet to the earth, and commenting thereon remarked that when this comet visited the earth in 1836, seventy-four years ago, there was not a railroad on earth. There was no telegraph, telephone or trolley car. There was no electric lighting or applied electric power. There were no subways for public travel, no suspension or steel bridges, no coal as fuel, no artificial ice, no cold storage, no beef trust, no Standard oil, no Barnum and Bailey show, no seedless oranges or grape fruit.

If like advance is to be made within the next three-quarters of a century along the line of scientific research, the comet may find itself captured when it returns in 1984 and made to stand and contribute of its energies and heated aerolites toward power for transportation and communication.

More Reminiscence of the Boston Office.

Editor Telegraph and Telephone Age:

It has afforded me great pleasure to read the article in your June 1 issue, speaking of the presentation to Mr. J. S. Redlow, who was later superintendent of the Western Union Telegraph Company, at Portland, Me., of an album containing the pictures of and giving the names of my old associates in the Boston office of the American Telegraph Company in 1863.

In looking over the names of those men, with all of whom I was so closely associated in the telegraph service, fifty years ago, in Boston, I have had the pleasure of seeing their faces, in my mind's eye; and almost realize the joy of actually meeting them.

Having, with my family, occupied part of a house with Mr. G. F. Milliken we shall ever have cause to remember with pleasure his genial face, and the many happy hours enjoyed in his home, with his estimable wife and family.

The year 1853 brought me to the first steps in the telegraph service in Boston. I first had three weeks experience in pulling up the dummy boxes which carried the messages between the receiving department and the operating room, the case for which was outside of the building and exposed to the cold northeasters, so well known in Boston. I many times enjoyed the luxury of having blistered hands while thus employed.

During the succeeding two weeks, the care of the operating room, on the third floor of the Traveller Building on the corner of Devonshire and State Streets, devolved upon me, while the manager, Mr. James N. Ashley, with his assistant, Mr. Thomas Miler (both long since dead) with the linemen were called out to repair the two-wire line, which a sleet storm had carried down, and buried in the ice between Boston and Providence.

In the meantime the public were attended to by the receiving clerk, Mr. Gilson, who took business subject to indefinite delay. The customers were told that the other line (Union Morse line) was working but many persisted in leaving messages for New York with us, saying, "we want them to come out at the other end printed."

Working direct with New York, at that date, was considered an interesting experiment, and undertaken only during exceptionally favorable weather, the regular service, being a repetition of all business at Springfield, Mass., of which office, Mr. George B. Prescott was manager, with Mr. J. L. Edwards, William Blanchard and Charles Simonds, operators. Mr. A. A. Lovett was superintendent between Boston and New York, Mr. Prescott acting as assistant superintendent from Springfield to Albany.

A northeast storm was the signal to prepare duplicates of business to go by train to Spring-

field; and to New York if Springfield failed to work south. In 1862 Superintendent C. F. Wood came to New York and in response to the very flattering picture drawn by him of the position offered at Boston, the writer was led to accept, and became night manager and Associated Press operator, relieving from that post one of the most expert operators of his day, that most estimable gentleman, Mr. Henry H. Ward, who for many years until his retirement from the service about seven years ago was cashier for the Western Union Telegraph Company, at 195 Broadway, New York.

The following three years found the night press operator at Boston on duty daily at five-thirty p. m., and during this most exciting period of the Civil War, the pen was scarcely dropped from eight p. m. until four or five the following morning, the Associated Press matter alone averaging forty-five to fifty pages of foolscap and a pause in Associated Press matter being filled in with long specials to Boston papers.

Following, what were known as the draft riots, at New York, when all wires throughout that city were torn down, and temporary offices were established at William's Bridge, Boston became the scene of a similar attempt by the riotous element. The crowd besieged the telegraph office, about eight o'clock in the evening, but before any well defined plan to interfere with the wires was decided upon, some leader of the mob cried out "Forward to Faneuil Hall Square and get fire arms." This pleased the mob and all started for the Square. Before any of the gun shops had been broken into, the city authorities had come upon the scene, the riot act was read, and the crowd refusing to disperse a charge of grape shot was sent into them, which put an end to rioting in Boston.

For several weeks succeeding the streets were thoroughly patrolled at night by the police.

At 8.30 p. m. intermediate offices except those taking press report, were closed, thus enabling us to detach relays, keys, etc., and release a sufficient number of operators to go to Roxbury and other suburban points to keep up communication with New York in case the rioters interfered with us.

The writer's health beginning to fail, efforts were made to find a relief, which was finally accomplished by inducing a robust young man and an excellent operator, Mr. A. W. ("Win") Todd, from Bangor, Me., to accept the position which I held with the understanding that he was to be relieved one night (Saturday) each week. After three weeks service two extra operators were called on duty nights to relieve the Associated Press man, of Boston specials. Thus began an increase of the night force which not long after became nearly as large as that employed during the day, with a manager responsible only for the proper conduct of business.

Mr. Walter P. Phillips, so well known and highly esteemed by the entire telegraphic fraternity, from an intimate knowledge of the Associated Press service on this circuit familiarly known as No. 4 east has told the story so well in his series of article on "Old and Recent Tournaments" appearing in *Telegraph and Telephone Age*, from October 1, 1909, to March 1, 1910, that very few words of interest may be added thereto.

Mr. Phillips has, through the medium of a Morse register and an embossed tape, given us a complete reproduction of the service on this wire. The writer calls vividly to mind having sat back in his chair and laughed until the tears came, listening to this record. From eight until eleven p. m. the operators at New York were apparently selected at random from the force, some good, others, indifferent senders.

The relief came, when at about eleven o'clock a touch at the New York key was at once recognized, and welcomed by all. The initial "M" (Mr. D. F. Marks, the well known and honored night manager), was the signal for a general bracing up along the line. Thereafter, a break had to be acknowledged or the receiver left to beg for the last words, during a rarely occurring interval of service.

Our esteemed friend Mr. Potter at Fall River, Mass., the eastern terminal of the circuit, having so often to dispute a charge of breaks by some office signing "P. F." Boston was the point always called upon to settle disputes as to the cause of the frequent breaks.

During heavy weather, the service would often lag, much time being lost by breaks and requests for New York to go back half a dozen words or so. To the question: "B. are you getting this?" Boston could easily answer: "Yes," notwithstanding that Bridgeport or New Haven the two nearest offices to New York failed to get signals.

The unfailing success at Boston was due to the fact, that when report ("Rep." "Rep.") was announced the wire was switched to one side of a set of Milliken repeaters having a 500 ohm relay with cores about five inches long and a local circuit made up of any desired portion of a combination local system in use at that date.

Gerrit Smith.

Astoria, L. I., June 5, 1910.

A Reminiscence of John W. Mackay.

Mr. J. D. McLelland, manager of the Postal Telegraph-Cable Company of Texas, at Houston, Texas, sends us the following story told him by a broker of that city concerning the late John W. Mackay. As far as we are aware this has never before appeared in print but is well worth publishing, illustrating as it does one of the characteristic traits of that great telegraph developer, namely his love and devotion for his comrades and friends of his earlier days before

he became wealthy. In the late eighties there lived in Galveston a wealthy coffee importer and sugar dealer named Isaac Heidenheimer. One day he suddenly took a notion that the price of wheat was going to advance and told his bookkeeper to buy one hundred thousand bushels. Following this there was a sudden rise in the price of wheat and the bookkeeper was told to repeat the order. Wheat kept advancing and Mr. Heidenheimer kept buying more. This continued until he had purchased one million bushels. Thereupon telling his bookkeeper to repeat his original order again Mr. Heidenheimer was very much surprised to learn the amount which he had purchased as he supposed that he had bought ten lots of ten thousand bushels each. Wheat had been going up all the time, however, and he was able to dispose of the whole amount at a substantial profit.

The fascination of speculation was strongly rooted in him by this deal and he again began to trade and his entire fortune was soon swept away. About this time an elderly gentleman arrived in Galveston and inquired for Mr. Heidenheimer stating that he was an old friend. The newcomer was John W. Mackay the founder of the Commercial cables and the father of the Postal Telegraph-Cable Company and there was a happy reunion between him and Mr. Heidenheimer whom he had met in California in 1849, when both were prospecting for gold. In those days Mr. Heidenheimer had rendered Mr. Mackay a great service and when the latter learned his friend's misfortune he immediately gave him a check for one hundred thousand dollars telling him to make a fresh start.

The two friends parted and Mr. Heidenheimer plunging into speculation again soon lost the hundred thousand dollars which had been given him. Mr. Mackay learned of this and made a substantial loan to Mr. Heidenheimer. This was well invested and the proceeds were sufficient to enable that gentleman to live in comfort the remainder of his life.

That in some lines of endeavor men of practical experience have the advantage over those whose training is largely theoretical is generally admitted. That it is true in regard to smoking has now been proven conclusively. Several Cornell professors held a contest recently to determine who could smoke a cigar the longest. The best that any of these men of science could do was about eighty-four minutes. Almost immediately and apparently without any special training for the event a Washington telegrapher established a record of ninety-four minutes and thirty seconds. Now a Chicago operator has made the efforts of the professors look small indeed by raising the record to one hundred and fifteen minutes and thirty seconds.

Annual Convention of Railway Telegraph Superintendents

The telegraph department of a railroad is often looked upon by other departments as of little consequence, because of the fact that it is not a revenue producing branch of the service. Those connected with the passenger or freight departments are likely to forget that it is only by reason of the existence of a telegraph or telephone system that they are able to move their trains to the best advantage and operate their departments at the highest efficiency. It is hard

I. T. DYER, LOS ANGELES, CAL.

First Vice-President of the Association of Railway Telegraph Superintendents, and Presiding Officer of the Convention.

to imagine the condition which would prevail in railroad circles to-day if there was no telegraph or telephone available for use in directing train movements. A slight indication of what would be the result if these two agencies were suddenly done away with is sometimes afforded when we see railroad traffic practically crippled by reason of the breaking down of the wires by sleet, or wind storms. Upon the efficiency of the service of the telegraph department depends not only the safety of every passenger carried over the railroad, but also the efficient operation of the freight service as well.

Hence, a great responsibility rests upon the shoulders of the superintendent of telegraph of a railroad and if he is wide awake to the importance of his position he will use all means within his power to maintain a service which is as safe and reliable as any human agency can make it.

The result of this natural desire on the part of the superintendents of telegraph of the railroads of this country to use every known means to increase the efficiency and reliability of their systems was the formation twenty-eight years ago of the Association of Railway Telegraph Superintendents. The various superintendents at that time realizing the advantages of co-operation, banded together to assist each other and the

members of this association all agree that the information which they have derived from their associates through the discussion of important problems at their annual meetings has been of incalculable value to them.

The twenty-ninth annual convention of the Association of Railway Telegraph Superintendents which meets in Los Angeles June 20 to 24 will afford those superintendents who are able to attend an opportunity to discuss with each other many important problems which confront them at the present time. In spite of the great advances which have been made since the association was formed and the many interesting problems which have been successfully solved the coming assemblage will probably have as much business of importance to occupy its attention as any convention which has ever been held.

Twenty-eight years ago the use of high voltages in the transmission of electric currents had not been thought of. In the last decade, however, high tension transmission systems have been

G. A. CELLAR, PITTSBURG, PA.

Second Vice-President of the Association of Railway Telegraph Superintendents.

springing up like mushrooms all over the country and the telegraph superintendents have been confronted with the problem of how to avoid any possible contact between these deadly wires and the low voltage telegraph and telephone lines in places where the one crossed or came in close proximity to the other. For the past two years a committee of members of the association has been carefully studying this question. Their report, which will be presented at Los Angeles for discussion and adoption, will recommend to meet various conditions the safest types of construction which human ingenuity has yet devised.

Although the telephone was coming into use at the time the association was formed, it was not until many years afterward that it had been

perfected so that anyone realized that it had great advantages over the telegraph in the way of facility in directing train movements. Now its value has been recognized and the introduction of this new system of train despatching has brought before the superintendents an entirely new set of problems, the more important of which will be carefully considered at the coming meeting. With the rapid increase in the use of the telephone it has been recognized that it would be of advantage to have some standard to go by in the interchange of business with the telephone companies. With this end in mind the American

P. W. DREW, CHICAGO, ILLS.
Secretary and Treasurer of the Association of Railway Telegraph Superintendents.

Telephone and Telegraph Company has proposed a standard agreement to be entered into between the two parties and a committee of the association which has been carefully investigating this contract during the past year will report on the same to the convention and the subject will come up for discussion and action.

The following is the complete list of papers which will be presented before the convention: "Wireless Telegraphy," by William Maver, Jr., of New York; "Education for Efficient Railroad Service," by D. C. Buell, head of the electrical bureau of information, Union Pacific Railroad, Omaha; "Protecting Telephone Lines from Lightning and other Disturbances," by M. E. Launbranch, of the United States Electric Company, Chicago; "Automatic Block and Highway Crossing Signaling," by H. P. Ryner, of the Hoeschen Signal Company; "Telephone Train Despatching," by E. E. Dildine, assistant superintendent of telegraph of the Northern Pacific Railway, St. Paul; "Testing of Telegraph and Telephone Circuits," by V. T. Kissinger, superintendent of telegraph of the Chicago, Burlington and Quincy Railroad, Chicago; "Telephoning to and from Trains," by E. P. Griffith, superintendent of telegraph of the Erie Railroad, New York; "Composite Telephone Blocking," by W.

F. Williams, superintendent of telegraph of the Seaboard Air Line, Portsmouth, Va.

The best informed men available have been selected to lead the discussion on these papers and there is no doubt but that in the discussions and questions which follow the presentation of the various papers many points of information of great value will be brought out.

The association is now in the most prosperous condition it has enjoyed at any time in its history. Twenty-three active and eleven associate members have been added to the roll since the last annual meeting.

The Hotel Alexandria, the headquarters of the convention, is one of the finest and most handsomely equipped hotels in the west and the rates given to those who attend the convention are as reasonable as could be obtained for similar accommodations in most eastern cities.

The majority of the eastern people who will attend the convention left Chicago on Tuesday evening, June 14, over the Santa Fé route. They were joined by others at Kansas City, June 15. This early start was made to enable them to stop off one day at Williams, Arizona, to visit the Grand Canyon.

The entertainment committee, of which Mr. I. T. Dyer, superintendent of telegraph of the San Pedro, Los Angeles and Salt Lake Railway, Los Angeles, is chairman, has worked hard to give the visitors the best entertainment possible and from the program prepared it is evident that their labors will meet with great success. Other members of the committee are F. S. Rawlins, E. A. Klippel, B. F. Frobes, B. A. Kaiser and P. W. Miller. The Ladies' Reception Committee consists of Mrs. B. F. Frobes, Mrs. I. T. Dyer, Mrs. F. S. Rawlins, Mrs. E. T. Raymond, Mrs. H. C. Chace and Mrs. J. B. Sheldon. The visiting ladies will be given an automobile ride around the city on the afternoon of the first day of the convention. Among the other features of the entertainment will be a trip to Mt. Lowe, with a stop-over at the Ostrich Farm and in Pasadena going, and at Mt. Lowe Observatory returning; a trip over the Kite-shaped track, through the orange groves, Redlands, San Bernardino and Riverside; returning via "Lucky Baldwin's" ranch; the Balloon route trip over the Los Angeles Pacific Railway to Redondo Beach via Hollywood, Soldiers' Home, the Palisades, Santa Monica and Ocean Park, returning via Venice and the short line to Los Angeles; and, a trip to Avalon, Catalina Island over the Salt Lake Route to San Pedro and from there on the ship Cabrillo. The last business session of the convention will be held on Friday and the trip to Catalina Island will be made on Saturday for the reason that some of the party may wish to remain over until Sunday or possibly longer. Many of those attending the convention will return via the Southern Pacific.

STATISTICAL INFORMATION REGARDING THE USE OF THE TELEPHONE.

The information which we collected a year ago in regard to the use of the telephone for train despatching was the first comprehensive data that had ever been published showing the extent to which the telephone was used for the purpose of directing train movements. These statistics were received with so much interest by all who saw them that we decided to gather and publish similar information to show the extent to which the telephone is now used in order to keep our readers informed as to the extent to which the telephone is superseding the telegraph. In compiling the table which we present herewith we pursued the same course as was followed a year ago, namely a printed slip was prepared containing several questions in this connection about which information was desired and which would be interesting to all concerned. These slips were sent to every railway telegraph

superintendent in the United States, Mexico and Canada together with a personal letter explaining in detail our object in asking for the answers to the questions. The responses to our request showed that the various superintendents had a lively interest in this subject and were glad to assist us in accomplishing this very desirable object. As a result the table which we have now prepared is more complete than the one which we published in 1909 containing reports from about 5,000 miles more of road than the former one. The information which is given therein is accurate and up-to-date showing the extent to which the telephone is now used for despatching purposes. In the personal comments which follow the table will be found much additional information in regard to what the different superintendents are doing at the present time and what they contemplate doing during the present year in the way of extending their telephone systems.

NAME OF RAILROAD.	Head of Telegraph System.	Total Mileage.	No. of Miles on which Trains are Despatched by Telephone.		No. of Miles on which Trains are Despatched by Telegraph.	Is an extension of the telephone system contemplated?

Mr. C. H. Gaunt, superintendent of telegraph and assistant general manager of the Atchison, Topeka and Santa Fe Railway Company, Topeka, reports that his company is preparing to double the mileage this year of telephone despatching circuits in use on their system.

Mr. Charles Selden, superintendent of telegraph of the Baltimore and Ohio Railroad Company, Baltimore, has had no experience with telephone despatching, but states that his company is contemplating the installation of a trial circuit of 104 miles.

Mr. F. W. Smith, chief train dispatcher of the Bessemer and Lake Erie Railroad, Greenville, Pa., says that his company is making an installation of 75 miles and that the question of extending the use of the telephone upon their lines will depend upon the satisfaction given by this trial circuit.

Mr. F. G. Sherman, superintendent of telegraph of the Central Railroad of New Jersey, New York, in answer to the question as to which system he regarded as most useful in meeting all around business demands from the standpoint of the railroad,

said that he considered the two systems as about equal, everything being considered, and that his company would try the telephone when conditions made it advisable.

Mr. J. S. Stevens, superintendent of telegraph of the Chesapeake and Ohio Railroad Company, Richmond, Va., regards the telephone as superior to the telegraph in so far as the despatching of trains is concerned.

Mr. V. T. Kissinger, superintendent of telegraph of the Chicago, Burlington and Quincy Railroad, Chicago, states that his company considers the telephone as superior to the telegraph for handling trains and will gradually extend its use.

Mr. A. T. Hollenbeck, superintendent of telegraph of the Chicago Great Western Railway, Chicago, writes: "We have no telephone train despatching system at all as yet. We are figuring on installing such a system covering 245 miles of our line this season. I am personally very favorable to the telephone."

Mr. George Boyce, superintendent of telegraph of the Chicago, St. Paul, Minneapolis and Omaha Railroad, St. Paul, reports that while his company has not yet authorized any telephone despatching circuits, they have about 400 miles of main line on which trains are blocked by telephone, about 65 telephones being used in this service.

Mr. U. J. Fry, superintendent of telegraph of the Chicago, Milwaukee and St. Paul and of the Chicago, Milwaukee and Puget Sound Railway Companies is strongly in favor of the telephone for despatching purposes. He is now engaged in constructing 647 miles of new telephone circuits on the former system and 488 miles on the latter.

Mr. C. S. Rhoads, superintendent of telegraph of the Cleveland, Cincinnati, Chicago and St. Louis Railway Company, Indianapolis, considers the telephone as far superior to the telegraph from the railroad standpoint and says that his company expects to install about 850 miles more of telephone despatching circuits during this year.

Mr. J. L. Henritzky, superintendent of telegraph of the Colorado and Southern Railway, Denver, states that while they use the telephone at present on only 119 miles of track, which is operated jointly with the Santa Fe system, they expect to install it on 400 miles more of road later in the year.

Mr. C. E. McKim, general superintendent of transportation of the Delaware and Hudson Railroad Company, Albany, states that for certain territory he considers the telephone the better from the railroad standpoint, while for other territory the telegraph is superior. His company expects to install the telephone between Wilkes-Barre and Carbondale, Pa., a distance of 35 miles.

Mr. L. B. Foley, superintendent of telegraph of the Delaware, Lackawanna and Western Railroad, New York, is the first superintendent to report his entire system equipped with telephones. It is hardly necessary to say that Mr. Foley considers the telephone preferable to the telegraph for handling trains.

Mr. C. A. Parker, superintendent of telegraph of the Denver, Northwestern and Pacific, Denver, states that the telephone and telegraph are used jointly for despatching purposes on the entire 217 miles of the system with which he is connected. As soon as they get a first-class metallic circuit the telephone will be used exclusively.

Mr. H. W. Cutshall, superintendent of telegraph of the El Paso and Southwestern System, El Paso, Tex., says:

"At the present time no definite plans have been formed, but this company is investigating the merits of different makes of apparatus and as soon as some standard is established will probably equip the entire system. At present, about seven hundred miles of the telegraph line is equipped with composite sets and the trainmen carry portable sets, which they attach, whenever necessary and have found them to be dependable and save much time and delays. So from this

limited experience I do not hesitate to recommend the use of the telephone altogether."

Mr. E. J. Little, superintendent of telegraph of the Great Northern Railway, St. Paul, says that his company contemplates installing telephone train despatching circuits on 2,400 miles of road in addition to those already in service. This will give them approximately 4,300 miles of such circuits in operation by January 1, 1911.

Mr. W. L. Oakley, superintendent of telegraph of the Gulf and Ship Island Railroad, Hattiesburg, Miss., reports that his company contemplates installing the telephone system on their main line, a distance of 160 miles.

Mr. H. L. Bennett, superintendent of telegraph of the Houston and Texas Central Railroad, Houston, Texas, states that his company recognizes the advantages of the telephone, but on account of the expense of the change have not as yet begun its use.

Mr. W. S. Brand, superintendent of the Georgia Railroad, Augusta, Ga., reports that his company is constructing 249 miles of telephone lines which, when completed, will be used exclusively for handling trains.

Mr. F. E. Martin, chief dispatcher of the Iowa Central Railway, Oskaloosa, Iowa, states that while his company has had no experience in the use of the telephone for despatching trains the subject has been under consideration by them for some time.

Mr. E. C. Keenan, superintendent of telegraph of the Lake Shore and Michigan Southern Railway, Toledo, Ohio, says that his company expects to extend the use of the telephone to cover the entire system.

Mr. J. F. Caskey, superintendent of telegraph of the Lehigh Valley Railroad, South Bethlehem, Pa., writes as follows: "In addition to the circuit we now have installed, I have just received authority to equip the entire road in the states of New Jersey and Pennsylvania, a total geographical mileage of 337 miles. These circuits will not be in service before the summer months, and the time when they will be completed will depend entirely upon our ability to obtain material and apparatus. It is the intention of the management to equip the entire road as rapidly as possible."

Mr. L. S. Wells, electrical superintendent of the Long Island Railroad, New York, states that although that company does not at present contemplate the adoption of the telephone the question is being carefully considered.

Mr. C. P. Phelps, superintendent of transportation of the Louisville and Nashville Railroad, Louisville, says that the system with which he is connected is extending the use of the telephone, having three new circuits under construction.

Mr. E. A. Hall, superintendent of telegraph of the Maine Central Railroad Company, Portland, Me., reports that the use of the telephone for train despatching is not being seriously considered by his system.

Mr. G. O. Perkins, superintendent of telegraph of the National Lines of Mexico, states that the tele-

phone despatching system is not feasible for his company to use as their despatchers speak English and their operators Spanish. Their train orders are handled in English, which is easily done by telegraph but could not be done by telephone without English-speaking operators.

Mr. J. J. Ross, superintendent of telegraph of the Michigan Central Railroad, Detroit, reports that there are 425 miles of telephone despatching circuits under construction upon the lines over which he has charge.

Mr. E. A. Chenery, superintendent of telegraph of the Missouri Pacific, St. Louis, states that for local service he considers that the telephone is without doubt the most useful. The system with which he is connected is now installing a telephone circuit 124 miles in length.

Mr. W. H. Hall, superintendent of telegraph of the Missouri, Kansas and Texas Railway, Denison, Texas, says that while he has had no experience with the telephone, his company expects to install two circuits this year.

Mr. A. B. Taylor, superintendent of telegraph of the New York Central Railroad, New York, states that the trend of opinion on his system is toward the telephone and that its use will be largely extended this year.

Mr. O. C. Greene, superintendent of telegraph of the Northern Pacific Railway, St. Paul, considers the telephone system as the best, although not the simplest. There have been authorized on his system 734 miles of new circuits to be installed in the near future.

Mr. L. A. Lee, superintendent of telegraph of the Pittsburg and Lake Erie Railroad, Pittsburg, reports that it is likely that the question of adopting the telephone on that road will be taken up this year.

Mr. I. T. Dyer, superintendent of telegraph of the San Pedro, Los Angeles and Salt Lake Railroad, writes that the telegraph is entirely satisfactory, but that his company is in favor of the telephone and will adopt it when they are in better position financially.

Mr. H. D. Teed, superintendent of telegraph of the St. Louis and San Francisco Railroad, St. Louis, writes as follows: "We have two paralleling metallic circuits over 750 miles of our line, and as soon as the selector equipment arrives the entire 1500 miles of circuit will be put in operation, one of the circuits for the train despatchers' use and the other for message service. We have not placed any of these circuits in operation to date as we are doing a great deal of experimental work." Since this letter was written a large part of the equipment mentioned has been placed in service.

Mr. F. H. Van Etten, superintendent of telegraph of the Southern Indiana Railway, Chicago, says that as the lines of that road are now operated the telegraph is most beneficial and most economical and useful in meeting all around business demands. Personally, however, and under different conditions he favors the telephone.

Mr. F. S. Rawlins, superintendent of telegraph of the Southern Pacific Railway System, San Francisco, states that his company is now installing an additional telephone despatching circuit of 291 miles, which will be completed before June 30. He also has authority for equipping 216 miles more, on which work has not commenced. In addition to this he has requests pending for 909 miles more, which he expects will be authorized soon.

Mr. G. C. Kinsman, superintendent of telegraph of the Wabash Railroad, Decatur, Ill., has had no experience with the telephone, but has submitted estimates for four circuits between Chicago and Kansas City, a distance of 552 miles. It is uncertain whether approval will be secured for these, but at any rate, they can hardly be placed in operation before the end of the year.

EXHIBITS AND REPRESENTATIVES AT THE CONVENTION.

John A. Roebling's Sons Company will be represented by Mr. G. W. Swan, of Buffalo, N. Y.

The Sandwich Electric Company of Sandwich, Ill., will be represented by Mr. H. O. Rugh, who will exhibit a full line of Sandwich selectors and other appliances peculiar to the art of railway telephone train despatching.

J. H. Bunnell and Company, Incorporated, of New York, will be represented by Mr. J. J. Ghegan, president. Mr. Ghegan has, for many years, been an associate member of the association and is a familiar figure at the annual conventions.

The General Railway Signal Company of Rochester, N. Y., will have an exhibit of their selector, No. 32,800, and automatic caller, No. 33,000. They will be represented by Mr. G. H. Groce, assistant to the president and the inventor of their selective system, Mr. M. F. Geer, sales engineer and Mr. E. Parsons, special agent.

The exhibit of the Western Electric Company will be in charge of the San Francisco and Los Angeles houses of the company. They will display a full line of telephone apparatus for use in connection with telephone train despatching, including the new selector which they have recently placed on the market.

The United States Electric Company of New York will display a full line of their Gill selectors and will also show the application of their selective system for use in connection with semaphore equipment. Mr. Charles N. Sigison, treasurer of the company, New York, and Mr. M. E. Launbranch, Chicago representative, will have charge of the exhibit.

The following is a list of the places at which the conventions have been held and the officers of the Association since its formation.

Year.	Place.	President.	Vice-President.
1882	Chicago	W. K. Morley	William Kline
1883	Chicago	W. K. Morley	Charles Selden
1884	Philadelphia	Charles Selden	E. C. Bradley
1885	Cleveland	C. W. Hammond	Geo. L. Lang
1886	St. Paul	A. R. Swift	Geo. L. Lang

1887	Boston	George L. Lang	G. C. Kinsman
1888	New York	G. C. Kinsman	C. A. Darlton
1889	Washington	C. A. Darlton	G. T. Williams
1890	Niagara Falls	G. T. Williams	G. M. Dugan
1891	Cincinnati	C. S. Jones	L. H. Korty
1892	Denver	L. H. Korty	U. J. Fry
1893	Milwaukee	U. J. Fry	O. C. Greene
1894	Detroit	O. C. Greene	E. R. Adams
1895	Montreal	M. B. Leonard	J. W. Fortune
1896	Old Ft. Comfort	G. M. Dugan	J. W. Lattig
1897	Niagara Falls	J. W. Lattig	W. W. Ryder
1898	Omaha	W. W. Ryder	L. B. Foley
1899	Wilmington, N.C.	L. B. Foley	W. E. Williams
1900	Detroit	W. E. Williams	C. F. Annett
1901	Buffalo	C. F. Annett	F. P. Valentine
1902	Chicago	J. H. Jacoby	W. J. Holton
1903	New Orleans	C. S. Rhoads	C. P. Adams
1904	Indianapolis	H. C. Hope	E. E. Torrey
1905	Chattanooga	E. E. Torrey	E. A. Chenery
1906	Denver	E. A. Chenery	E. P. Griffith
1907	Atlantic City	E. P. Griffith	W. J. Camp
1908	Montreal	W. J. Camp	J. B. Fisher
1909	Detroit	J. L. Davis	H. T. Dyer
			G. A. Cellar

C. S. Jones was the first secretary and treasurer of the Association. In 1883 Mr. P. W. Drew was elected to this office and has served continuously since that time.

SOMETHING ABOUT LOS ANGELES.

Los Angeles has probably grown more rapidly in the past ten years and is now growing faster than any other city of its size in the United States. Although it was first settled in 1781 one hundred years later it had only about 11,000 inhabitants. The first railroad from the east was completed in 1885 and since then its growth has been remarkable. In 1900 its population was 100,000 and to-day it is over 300,000. The three features to which this remarkable progress may be attributed are climate, soil of the surrounding country and location. While it is situated a short distance from the coast, San Pedro Harbor which is now included in the city is being improved so that it will be one of the best harbors along the Pacific coast. Los Angeles is also reached by four different railroad routes. The visitor will be impressed by the numerous fine residences in Los Angeles and the surrounding suburbs.

Twenty years ago there was not a single paved street in the city. Now there are over 450 miles of graded and graveled streets and 63 miles of paved streets. It was the first city in the United States to entirely abandon gas for street lighting and replace it by electricity. This was done twenty-five years ago and it is now one of the best lighted cities in the Union.

Among the buildings which will attract attention may be mentioned the Auditorium, County Court House, Pacific Electric Railway Terminal and the new Government Building now in course of construction at a cost of \$1,250,000. The Auditorium is a reinforced concrete structure containing an assembly hall which will accommodate 4,000, two large concert halls and a large number of offices. The

Pacific Electric Railway Terminal located at the corner of Sixth and Main Streets is the starting point for electric cars to Long Beach, San Pedro, Pasadena and many of the other suburbs of the city. It is also the largest office building west of Chicago.

The street railway system of the city comprises over three hundred miles of track and the suburban lines radiating in all directions aggregate 767 miles of single track.

There are about a dozen parks within the city limits aggregating over 600 acres. Westlake Park, thirty-five acres in area at the end of the Seventh Street car line is one of the most popular open-air resorts. It has a lake with boats, fine drives, and extensive views from the adjacent hills. The oldest and best improved of the city parks on Sixth Street, not far from the business center is known as Central Park.

The temperature at Los Angeles is probably as nearly uniform as at any place in the world. Weather Bureau observations covering a period of over thirty-one years show that during that time the lowest temperature recorded was twenty-eight degrees and only twenty-three times did the thermometer drop to freezing. On the other hand during this period the number of days on which the temperature rose to one hundred degrees or above was only thirty-four. The monthly average temperature of July is but fifteen degrees above that of January.

At the Chamber of Commerce Building, 122 South Broadway, the visitor can obtain any desired information. The exhibit of natural and manufactured products which occupies the second and third floor of this building is well worth visiting, showing as it does the great variety of vegetable products which can be grown in the semi-tropical climate of Southern California.

Taken altogether it is doubtful whether the Association has ever met in a city which affords more of interest to the visitor than Los Angeles and those who are unable to attend the coming convention will miss a fine opportunity to see the attractions of the metropolis of Southern California.

The twenty-fifth annual convention of the National Electric Light Association, which met in St. Louis May 23 to 27, was the most successful in the history of that organization, over 2,600 being in attendance. The membership of the association during the past year, during which Mr. T. Commerford Martin has been secretary, increased from 3,215 to 5,533. The following officers were chosen for the ensuing year: W. W. Freeman of Brooklyn, president; J. F. Gilchrist, of Chicago, and F. M. Tait, of Dayton, Ohio, vice-presidents; General George H. Harries, of Washington, D. C., treasurer and T. Commerford Martin, of New York, secretary.

The Railroad.

The annual convention of the Train Dispatcher's Association of America will be held at Spokane, Wash., June 21.

A meeting of the Railway Signal Association was held in New York June 14. A paper was presented by J. M. Waldron on "Speed Controlled Signals," and a description of the World signal was given by J. H. Wisner, Jr. The sub-committee on standards presented several designs for consideration and proposed standard specifications for various signaling materials and appliances were discussed.

Mr. C. McCormack, whose appointment as superintendent of telegraph of the Chicago and Eastern Illinois Railroad was briefly mentioned in our June 1 issue, was born at Perrysville, Ind., August 10, 1867, and entered the telegraph service in 1883 as operator for the Chicago and Eastern Illinois at Otter Creek Junction, Ind. With the exception of one year spent with the Evansville and Terre Haute Railroad, Mr. McCormack has been employed by the Chicago and Eastern Illinois during his entire telegraphic career. From 1886 to 1896 he served as train despatcher and since the latter date has been assistant chief despatcher, night chief despatcher and chief despatcher, which position he held at the time of his recent advancement.

The railroad telegraph profession has lost a valuable member in the retirement from the service of Mr. Nelson C. Griswold, from the position of manager of the Northern Pacific Railway's telegraph office at Tacoma to engage in the lumber business, as was briefly announced in our June 1 issue. Mr. Griswold was born at Springfield, Mass., October 30, 1850, and has been actively engaged in the telegraph service since 1864, when he entered the ranks as an operator at Cleveland, Ohio. He was afterward employed at Chicago, Cincinnati, Erie, Pa., Buffalo, New Orleans and Pittsburg, as manager for the Western Union Telegraph Company at Portsmouth, Ohio, and as assistant superintendent of telegraph of the Baltimore and Ohio Railroad at Pittsburg.

Apparatus necessary to equip about 4,600 miles of its line with telephones for despatching trains has been ordered by the Atchison, Topeka and Santa Fe Railroad. The outside construction work is already well under way. Eventually all traffic and train movements on the Santa Fe will be directed by telephone. At the present time 2,275 miles of their system are equipped with telephones. The Santa Fe was one of the very first to supplant the telegraph for this kind of work, and the accuracy of its operation has strengthened the belief of the officials of this road in the value of the telephone despatching system. Telephone circuits will soon be installed from Newton, Kan., west to Mojave, Los Angeles and San Diego, Cal.; from Newton south to Gainesville, Tex.; from Temple, Tex., to Galveston, Tex.; from Temple to Brownwood, Tex., and from Wichita, Kan., to Clovis, N. M.

Mr. W. E. Harkness, sales engineer of the Western Electric Company, New York, has resigned to accept a similar position with the United States Electric Company.

At the annual convention of the Order of Railroad Telegraphers, Despatchers, Agents and Signalmen, held in Baltimore May 16 and 17, the following officers were elected: President, J. R. T. Auston, Philadelphia; secretary and treasurer, Adam Reed, Philadelphia; vice-presidents, G. Q. Eppelimer, Philadelphia; H. T. Biddle, Elkton, Md.; R. I. Hunter, Jersey City; J. Webb Richman, Washington, and J. E. Stebbins, Williamsport, Pa.

Mr. T. W. Evans, who has recently been transferred from the superintendency of the Rochester division of the New York Central Railroad to a similar position on the Buffalo division began his telegraphic career in 1881 as a telegrapher on the Fall Brook Railroad. He was afterward employed as operator, train despatcher and chief train despatcher on the New York Central Lines until 1901 when he was appointed trainmaster.

Canadian Notes.

The Dominion Parliament has appropriated \$278,000 for renewals, improvements and extensions of the Government telegraph system during the current year.

Wm. Jenkins, father of B. S. Jenkins, general superintendent of western lines of the Canadian Pacific Railway's telegraph at Winnipeg, died at Madoc, Ont., May 14, aged ninety-one years.

Mr. R. H. Hathaway, chief clerk in the press and commercial news department of the Great North Western Telegraph Company, Toronto, has been promoted to the position of superintendent, vice M. R. F. Easson, retired, as announced in our June 1 issue.

The Grand Trunk Pacific Railway now has 1,118 miles of pole lines and 3,871 miles of telegraph wires in operation. During the present year 600 miles of new lines will be constructed. Four wires are in operation between Winnipeg and Edmonton.

Annual Reunion of Old Time and Military Telegraphers.

The Auditorium Hotel, Chicago, will be the headquarters of the twenty-ninth annual reunion of the Old Time Telegraphers' and Historical Association, and of the Society of the United States Military Telegraph Corps, which will be held in that city September 8, 9 and 10. President William J. Lloyd, of the Old Time Telegraphers' and Historical Association, Chicago, is busily engaged in making arrangements for the reception and entertainment of the visiting members of these two organizations and a most enjoyable time is assured for all of those who attend. The convention headquarters is centrally located and faces the lake. First-class accommodations at reasonable rates can be secured by all visitors and taken altogether, a more desirable place for holding the reunion could not be found.

KERITE Insulation has proved its
Everlasting durability under all conditions.
Records of all its performances
Instantly convince the expert
That it is the insulation for
Economy and safety.

KERITE INSULATED WIRE AND CABLE COMPANY

Incorporated by W. R. Brixey

Hudson Terminal, 30 Church St., N. Y.

Western Representative, WATSON INSULATED WIRE CO., Railway Exchange, Chicago, Ill.

Kerite Insulated Wires and Cables Insure Reliability

The reason that KERITE Insulation is more durable and reliable than other compound insulations is that it includes in its composition an active insulating material (crude KERITE) which acts as a preservative for the rubber.

The presence of this material makes the insulation retain its initial characteristics and prevents it from drying out or becoming brittle through the action of time, temperature or weather.

The use of KERITE Insulation in the Signal System of the Pennsylvania Tubes and Terminal on whose reliability is dependent the safety of the traveling public and the terminal facilities of an immense railroad, is significant of the high regard which this insulation has earned in the railway field.

KERITE INSULATED WIRE AND CABLE COMPANY

Incorporated by W. R. Brixey

Hudson Terminal, 30 Church St., N. Y.

Western Representative, WATSON INSULATED WIRE CO., Railway Exchange, Chicago, Ill.

Radio-Telegraphy.

It is reported that a wireless station will be established soon on the top of Pike's Peak, to be used as a relaying station for messages from the Atlantic to the Pacific Coast.

The Great Lakes Radio Telephone Company is installing a wireless station at Houghton, Mich. They have stations already working at Duluth, the Soo and Escanaba.

A patent, No. 958,181, for a receiver for wireless telegraphy, has been issued to W. Schloemilch, of Berlin, Germany. A detector is combined with a thread galvanometer acting as an indicator.

A patent, No. 958,209, for a portable station for wireless telegraphy, has been awarded to G. Von Arco, of Berlin, Germany. A metal mast made of sections with an umbrella-shaped aerial.

At the regular monthly meeting of the "Wireless Institute of New York, held June 1, Mr. Frederick W. Midgley presented a paper on "The Obtaining and Influence of a Good Ground in Wireless Telegraphy."

At the annual meeting of the Marconi Wireless Telegraph Company of Canada, held in Montreal May 20, the following officers were elected: Andrew A. Allan, president; G. Marconi, vice-president; and Robert Bickerdike, J. N. Greenshields, H. Jamieson Davis and John Bottomley, directors.

A patent, No. 959,510, for receiving apparatus for wireless telegraphy, has been granted to R. R. Goldthorp, of Hartford, Conn. This comprises a hollow tubular coil, a condenser located within the coil and a condenser regulator on the coil, together with a detector within the coil.

Mr. Raymond Phillips, an English inventor, has exhibited recently at the London Hippodrome a model of a dirigible balloon controlled by wireless. The balloon was provided with four propellers, two on the vertical and two on the horizontal axis. Each propeller was operated by a separate motor and any motor desired could be started by sending out electric waves for a certain length of time.

In a recent lecture on Wireless Telegraphy and Wireless Telephony before the Schenectady section of the American Institute of Electrical Engineers, Dr. A. E. Kennelly pointed out defects and errors in early experiments, and improvements and corrections that have been made. In simple terms he explained the action at the receiving station of a wireless telegraph system, comparing it to a single commutator bar in a generator in which the moving field is a succession of magnetic flux lines produced by the progression of ether waves. Dr. Kennelly expressed the belief that it will be possible in the near future to arrange apparatus so that interference by crossing messages may be satisfactorily prevented.

A patent, No. 959,100, for an aerial conductor arrangement for wireless telegraphy, has been granted to G. Von Arco, of Berlin, Germany. A central conducting support insulated from the ground, such as a tower and an umbrella-shaped group of wires running toward the ground, connected at one end of the support and the other to ground.

The aerial of the high-power wireless station recently established by the Austrian Government at Pola is supported by a mast over 300 feet in height. The range of this station extends to Rome, Paris, Berlin, Nauen and Norddeich, 720 miles distant. Messages are occasionally received from the Poldhu, England, station which is 900 miles distant.

The Chilean Government, after a careful study of the relative cost of the two systems of telegraphy between Santiago and Punta Arenas, has decided that the wireless is the most practical, as it will cost less for up-keep, as most of the route is through a wild and rough country. At present the only telegraph line between the two points is via Buenos Ayres. The Chilean Congress has been asked for an appropriation of \$243,000 to install the wireless system.

Under the provisions of the International Radio-Telegraphic Convention of Berlin, all French wireless telegraph stations are now open to receive home and international communications for or from ships at sea. The following stations in France are open day and night: Boulogne, Ushant, Porquerolles, St. Marie de la Mer (Marseilles), Fort de l'Eau (Algiers), Ajaccio (Corsica), Brest, Cherbourg, Dunkirk, Lorient and Rochefort. Boulogne is equipped with the Bellini-Tosi system for determining the position of ships at sea. The rates for messages transmitted to ships at sea have been fixed at forty cents a word, except in the Mediterranean stations, whence messages for vessels plying regularly between France, Corsica, Algeria and Tunis are accepted at fifteen cents a word, and from vessels at sea to these stations at ten cents a word.

In a recent paper in a German publication, Count Arco described several new devices used in the Telefunken system of wireless telegraphy. Among these is a mechanical apparatus for demonstrating sounds, and a device for demonstrating at the same time acoustically the sound and optically the regularity of the spark discharge. A sending station of eight kilowatts primary power was described; the power at the antenna being 5.8 kilowatts, the efficiency was 72.5 per cent. Duplex wireless telegraphy is possible with two transmitters of equal wave-length, the pitches differing by twenty per cent. At the receiving end a single detector receives simultaneously the two messages, the currents received pass through the two series-connected primaries of two resonators tuned to the sounds with the two pitches. One resonator increases the sound of the one transmitter and the other the sound of the other transmitter.

Trade Notes.

The Electric Storage Battery Company of Philadelphia has recently issued two new bulletins entitled "Attitude of Central Stations toward Electric Automobiles" and "The Exide Battery in Emergency Service." A little booklet which they are also circulating, entitled "The Story of the Storage Battery," gives some valuable information and interesting facts concerning the manufacture and use of storage batteries.

The General Railway Signal Company of Rochester, N. Y., has prepared a new bulletin, No. 119, which will be distributed at the Los Angeles Convention of the railway telegraph superintendents. This bulletin contains illustrations of and describes the telephone despatching system developed by this company. This system can be arranged for calling from the despatcher's office only, or for calling between stations, in either of which cases the instruments are bridged on the line, and calls are made without the use of local battery. Alternating or direct current ringers may be used in either case.

Elsewhere in this issue will be found the announcement of the American Telegraph Typewriter Company, which is now placing on the market a telegraphic typewriter which serves both as a sender and receiver. Tests have been made on this device extending over a period of two years past. For eleven months some of the instruments have been in successful use on the Long Island Railroad. Mr. L. S. Wells, superintendent of telegraph of that system makes the following statement in regard to the new system of telegraphic transmission.

"We have had in continuous use during the past eleven months on a circuit between Long Island City and the Brooklyn terminals, two telegraph typewriters manufactured by the American Telegraph Typewriter Company.

"These typewriters are connected on a telephone circuit and the operation is being carried on simultaneously with telephonic conversation, without in any way interfering with the latter. The system, which is economical, flexible and rapid, having no complicated mechanism, will prove a most valuable substitute for present methods and its use will undoubtedly be many times greater than that of the "Morse." We are anxiously awaiting delivery of a quantity of the typewriters ordered some weeks ago."

This typewriter is in daily operation between Philadelphia and New York and orders have already been received for instruments from the Government and from several railroad and terminal companies.

Laying Submarine Cables in San Francisco Bay.

All wires of the Postal Telegraph-Cable Company out of San Francisco, says the Postal Telegraph, are carried through four and a half miles of submarine cables in San Francisco Bay 8,000 feet of which is between San Francisco and Yerba Buena Island commonly known as Goat Island,

on which is located the Government Naval Training Station and 16,000 feet between Yerba Buena Island and West Oakland. A mile of pole line fills the gap across the island.

Recently, new ten pair (twenty wire) cables have been laid between those points. This cable is dry paper core, covered with lead sheathing over which is laid an armor of twenty-four strands of No. 4 gauge galvanized iron wire, separated from the lead by a heavy jute cushion. Over the armor wire is spun two layers of marine, which is soaked with tar; this outer covering is put on to prevent chemical action on the armor wire. The cable is two and a half inches in diameter and weighs nearly ten pounds per foot.

It was shipped in approximately 4,000-foot lengths, making one intermediate splice necessary in the 8,000-foot section and three in the 16,000-foot section. The work was handled in this manner: First, the large cable reel, which is eleven feet in diameter over all with a six foot four-inch drum, eight feet six inches long, was loaded on a barge, together with a donkey engine to operate it. The first 4,000-foot section was then reeled on and a splice made, after which the next section was reeled up, and so on.

The reel could hold but 12,000 feet, making it necessary to lay that amount from the Island to a point in the Bay towards Oakland, where it was buoyed, when the barge was towed back for the remaining section. After this had been laid, the last splice was made on the barge.

Two tugs were employed to tow the barge, one piloting and the other alongside. Owing to the swift current in the Bay, when the tide is flooding or ebbing, the trip across must be made at the turn of the tide, usually at high water, and as quickly as possible, so that a straight course may be maintained.

The work was handled without any trouble and the men who had it in charge are entitled to great credit.

Among the recent gifts to the library of the American Institute of Electrical Engineers was one by Thomas A. Edison, of manuscript of the daily journal of Professor Samuel F. B. Morse, containing the correspondence of Mr. Morse and the secretary of the treasury and others, relating to the installation of his original telegraph line. It also includes a description of his meeting with Mr. Bain, the inventor of the Bain alphabet.

A recent number of Leslie's Weekly contains an interesting article by Mr. Marion H. Kerner, in which he gives some of his experiences while employed as a military telegrapher during the Civil War. Among the stories which he relates is the one of his capture by the Confederates and how his life was saved by Nancy Hart, a Confederate spy, who was also the cause of his capture and confinement in Libby Prison.

QUESTIONS TO BE ANSWERED.

[The lists of questions which we published under this heading in previous issues, the answers to which may be found in the first four chapters of Jones' Diagrams, were much appreciated. Students in telegraphy have found them of great assistance in helping master the contents of this standard text book of telegraph engineering. We will continue to print similar lists of questions, taking up each chapter in turn. If students will carefully study the subject matter to which each set of questions applies until he is able to answer all of them without referring to the book, he will, by the time he has gone through the book in this way have gained a thorough knowledge of all the principles underlying telegraphic operation.]

CHAPTER V.

For what two reasons should we not always equalize the current in circuits by regulating the electromotive force?

What danger would arise if we should attempt to do this?

What is the rule for the amount of heat produced in a conductor by a current flowing therein?

What would happen if a long high resistance circuit supplied by a high electromotive force should become grounded near the source of supply?

Why are high resistance relays used in connection with weak currents?

Upon what does the magnetic strength of a relay depend?

Does a variation in the size of the conductor at different points in a circuit cause a variation in the strength of the current at those points?

What is the chief advantage of using fine wire for the winding of a relay?

Why could not the same magnetic effect be obtained in a relay by using an equal number of turns of coarser wire as we do of the fine wire?

What is the practical limit for the thickness of the winding of a magnet?

What is the reason for this limit?

CHAPTER VI.

What is a switchboard?

Why does the construction of a switchboard intended for a terminal station differ from that of one intended for an intermediate station?

Describe and draw a sketch of the simplest form of intermediate switchboard?

Sketch the switchboard arrangement necessary for two wires in order to make the instruments at the intermediate station interchangeable for either circuit desired?

How would you locate an "open" in your office west with this arrangement; (a) with the instruments cut out of the line and (b) with the instruments cut in?

What is the purpose of the ground wire at the top of the switchboard?

How would you locate an "open" in a circuit by means of this ground?

How would you locate an "open" in your office by this means?

How can you determine very quickly whether the "open" is in your office?

What is the object of a lightning arrester?

What principle governs the action of a lightning arrester?

How are the plates of a lightning arrester usually made to facilitate its action?

Why does not the lightning arrester interfere with the normal operating current?

Obituary.

Elbridge G. Fish, a member of the United States Military Telegraph Corps, died at his home in Kansas City, Mo., May 9.

Patrick J. Burke, an old time telegrapher and a pioneer in electric railway construction, died at Cheshire, Conn., June 1, aged sixty-four years.

Walter T. Mulholland, a telegrapher who was employed for many years in brokerage offices in New York, died May 21, of cancer, aged fifty years.

Frank E. Reid, manager of the Pittsburg Stock Exchange branch office of the Western Union Telegraph Company, died in that city May 24, aged fifty-five years.

Joseph R. Powers, an Associated Press operator employed on the Evening Eagle, of Pittsfield, Mass., died of blood poisoning in that city, May 30, aged thirty-two years.

Albert F. Kelly, whose death occurred May 27, as briefly announced in our June 1 issue, entered the service at Syracuse, his birthplace, as a clerk in the office of Superintendent S. B. Gifford, of the Western Union Telegraph Company. He was soon appointed chief clerk and held that position until the superintendency in that city was abolished seven years ago. He then came to New York, where he entered the office of District Superintendent E. M. Mulford as a clerk, and later chief clerk. Two months ago the company decided to divide the Syracuse district and restore the superintendency at that point. Mr. Kelley was chosen for the office and went to Syracuse to make arrangements for assuming charge May 1. A few days after returning to New York, however, he was taken ill with what is thought to have been cerebro-spinal meningitis, which caused his death.

Book Review.

"Telephone and Telegraph Engineers Handbook" (Technical Supply Company), Scranton, Pa.; 398 pages; illustrated) is a handy reference book, three and a half by five inches in size. The aim in preparing this work was to present to the public a pocket-size book containing the rules, formulas, tables and circuits that are most generally used and needed by linemen, wiremen, troubleshooters, operators, foremen of construction, manufacturers of and dealers in telephone and telegraph apparatus and supplies, wire chiefs, managers and superintendents of telephone and telegraph companies. A large number of useful tables are

given and the formulas shown are, wherever possible, illustrated by practical examples. Considerable space is devoted to electricity, magnetism and storage batteries. The section on electrical measurements, comprising over seventy pages, is especially complete, giving much practical information on the subject of testing both telegraph and telephone lines. Circuit diagrams of the more common telephone connections are given, including magneto, common battery, intercommunicating and automatic systems. Another section of the book describes and illustrates the general principles of telegraphy, wireless telegraphy and telephony, simplex and composite telegraph and telephone circuits and duplex and multiplex telephony.

The price of this work is \$1.50, and a copy will be sent to any address upon receipt of that amount by J. B. Taltavall, *Telegraph and Telephone Age*, 253 Broadway, New York.

Legal.

The Court of Appeals of New York State has reversed the judgment of the lower courts granting Stephen M. Weld and others \$10,000 damages against the Postal Telegraph-Cable Company, due to a mistake in a telegram. A new trial has been ordered. Weld and his partners are New York cotton brokers, and members of the New York and New Orleans Cotton Exchanges. They sent a telegram to New Orleans brokers to sell 20,000 bales of cotton at 12.70 cents a pound. When received the telegram read 12.07 cents. Damages aggregating \$27,565 were claimed because of the mistake.

Telepathy, mind reading or mental acquiescence across intervening space cannot affect a contract according to the Supreme Court of Indiana.

To be binding on two parties, in the opinion of that court, a mental process working through the brain of the party of the first part must be communicated to the party who is to be affected.

In addition, acquiescence in a contract to make it binding, must be communicated by the agreeing party to the person making the offer.

Michael Shea, of Indianapolis, sought to collect from the Big Four Railway for materials furnished and work done for the Ohio Contracting Company. Shea failed to get his money from the contractors and threatened to sue the road, but an engineer in the railroad's employ is said to have told him that the railroad company would pay him for his work.

The Supreme Court declares that the contract was imagined by Shea and his mental processes were not transferred to the intelligence of the corporation. Further, the court says that the engineer had no power to create any new contract for his company if the telepathic agreement suggested by Shea actually had been entered into. The effect of the decision is that a person cannot make good imaginary contracts in Indiana.

Postal Telegraph Club of Atlanta.

The Dutch lunch given by the Postal Telegraph Club of Atlanta, Ga., at the Merchants' and Manufacturers' Club rooms on the seventeenth floor of the Candler Building, in that city on the evening of May 28, was a success in every respect, nearly the entire membership being present.

Short speeches and anecdotes of the profession were given by each member, and a general good-fellowship prevailed.

The club is prospering and expects to give another dinner in the near future, to which the ladies will be invited.

The club sometime ago decided to take up a course in electricity and accounting, as those subjects apply to the telegraph business. At the Dutch supper this question was discussed, and text books were decided upon, Mr. J. P. Edwards, electrical engineer, and A. D. Holcomb, chief operator of the Atlanta office, were chosen as instructors of the electrical course. Mr. W. C. Daviet of the general offices and Mr. G. W. Oliver, cashier of the local office at Atlanta were elected instructors in the accounting course. Arrangements were made to hold classes once a week in each course.

LETTERS FROM OUR AGENTS.

NEW YORK, WESTERN UNION.

A. J. Reader has returned from his wedding trip.

J. Harold Morecroft, professor of electrical engineering at Columbia University, lectured to the Electrical Society June 3, on "Electro-magnetism."

A number of night and summer offices are being opened in Superintendent Mulford's district and operators for these offices are being furnished from this department.

The decorators have finished painting the operating room. Tungsten and arc lights have been installed, the tables have been cleaned and revarnished, the walls have been kalsomined, a vacuum cleaner has been installed for keeping the room clean, the brass work on the switchboards has been burnished and everything possible done to brighten up the appearance of the room. The employees of the department greatly appreciate the improvements in their working quarters.

David W. McAneeny, assistant eastern wire chief in this office, died May 28, aged sixty-three years. Mr. McAneeny was one of the veteran operators of this office and was well known as a fine tenor singer. He had the honor of being the first person to sing through a telephone. Mr. McAneeny was born at Toronto, Ont., and entered the service at Utica, N. Y. He has been continuously employed in the New York main office since 1865. The funeral and interment were at Utica, where a high mass of requiem was celebrated. The floral tributes from his associates were numerous and beautiful.

Boston Electric Club.

The second banquet of The Electric Club of Boston took place in the Western Union Building in that city, May 26. Seventy-five members were present and after a talk on several different topics connected with telegraphic apparatus by Professor Burnham, Superintendent C. F. Ames and Manager A. Woodle, of the Boston office made short speeches which were very timely and much appreciated. A vote of thanks was given Messrs. Burnham, Ames and Woodle for the assistance given the club both in lectures and facilities. Following this the caterers took charge and until 11 p. m. the members enjoyed a lobster supper with all the accessories.

Supplementary meetings of such members as may be at liberty to attend will be held occasionally on Sunday mornings in the main operating room under the guidance of a chief, to study and become acquainted with the practical working and care of quadruplexes, duplexes, repeaters and kindred apparatus.

General Mention.

The National convention of the Commercial Telegrapher's Union began its deliberations in Chicago June 13.

The Goddard Telegraph Transmitter Company has been incorporated at Dover, Del., with a capital stock of \$500,000, to manufacture and sell a telegraph transmitter. The main office of the company will be in New York.

The Publishers' Press, a news-gathering and disseminating agency, has been chartered in New Jersey, with an authorized capital of \$500,000. The incorporators are C. N. Jones and Frank C. Coleman, Jr., of New York; W. F. Downs and John R. Turner, of Jersey City, and E. L. Heydicker, of Mount Vernon, N. Y.

The report of Mr. James E. Cole, commissioner of wires of the city of Boston, for the year ending January 1, 1910, has just been issued and shows that about fifty per cent. more underground construction work was done in 1909 than in 1908. During the past year the New England Telephone and Telegraph Company installed 111,015 feet of underground cable. During the past fifteen years over 59,000,000 feet of wire or about 11,000 miles have been removed from overhead service.

The second census bureau report covering central electric light and power stations is now on the press. Mr. T. Commerford Martin, secretary of the National Electric Light Association, New York, is the author of a chapter in the report dealing with the technical side of the industry. This report, which covers the year 1907, shows that the telephone companies of the country, at that time, had a capitalization of \$814,616,004. This figure does not include over 17,000 independent farmer's telephone lines. The capitalization of the telegraph companies was \$253,019,817, including \$32,726,242, which represented the capital stock of wireless telegraph companies.

The annual convention of the Canadian Electrical Association will be held this year at the Royal Muskoka Hotel, Muskoka Lakes, Ont., on July 6, 7 and 8. Mr. T. S. Young, Toronto, is secretary of the association.

Mr. Ralph W. Pope, for the past quarter of a century secretary of the American Institute of Electrical Engineers, was previous to that time in the telegraph service. In 1873 he was an operator identified with the Western Union Telegraph Company. He was engaged by the "Telegraphice" to report a game of baseball played between two contending telegraph clubs, but before the manuscript reached the publication office that paper had suspended. Mr. Pope sends us his report which he wrote at that time and thinks it is not yet too late to appear in print, although many of the participants have long since died. On examining the copy we find that among those who took part in this memorable game, which was played June 7, 1873, in Brooklyn, which was then a country town, were: George L. Wiley, now eastern representative of the Standard Underground Cable Company in New York and P. H. Shaughnessy, now of the quadruplex department of the Western Union Telegraph Company, at 195 Broadway, New York. All of the others mentioned are now dead.

WANTED—Financial assistance to extend the business of manufacturing a well known telegraph device which has a good field of usefulness. Address, Financial Assistance, care of Telegraph and Telephone Age, 253 Broadway, New York.

The Serial Building Loan and Savings Institution, 195 Broadway, New York, has given thousands their first lesson in saving money. It will teach you how to be thrifty. Through its assistance many men have been able to provide their families with homes much more artistic and comfortable than they could have procured by any other means. Write for particulars.

TRANSMITTING MACHINES

I am placing on the market improved **YETMAN TRANSMITTING TYPEWRITERS**, and **KEY-BOARD TRANSMITTERS** without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Elementary Lessons in Electrical Measurements.

PART V.

In the formulas previously given for determining the value of current, resistance, and electromotive force by means of Ohm's law, $\frac{E}{R} = C$ the student should understand that under some conditions the results obtained merely show the apparent value of the factor measured. The answer however, will be correct in the way of representing the effective value under the conditions existing in the circuit in which the measurement is made. In some circuits the value obtained, say, for R , will represent the true ohmic resistance of the conductor itself, while the same wire placed in another circuit subjected to different electrical influences will give a somewhat different value. Ohm's law is correct in both cases, but the apparent discrepancy calls attention to the importance of first understanding the electrical and other conditions existing in a circuit before accepting the results obtained as final. In other words, while the value obtained for R will represent the resistance of the circuit under any and all conditions, it does not always represent the actual ohmic resistance of the material conductor itself. The interaction of currents flowing through the coils of magnets in a working circuit retards, diminishes or impedes the development of initial values, so

that R in Ohm's formula really represents not only the ohmic resistance of the conductor, but also the apparent resistance called impedance. In some circuits the impedance is greater than the ohmic resistance of the wire itself.

In order to understand this statement the student should study the electric properties of a working circuit, which consists of inductance, capacity and ohmic resistance, each of which creates an individual effect of its own.

In one circuit each of these factors may exert a detrimental influence, while in another the introduction or enlargement of one factor often gives beneficial results. The usual method of dealing with them is to cause one factor to offset the effect of another by exerting equal values of forces in opposite directions. The manner in which this is done will be apparent after the student understands the actions of inductance and capacity respectively, in an electric circuit.

INDUCTANCE

Every conductor carrying an electric current is surrounded by a whirlpool of magnetic lines of force. The space they occupy is called the magnetic field. In a straight line conductor the air immediately surrounding the wire constitutes the field. Now, we know that whenever the lines of force in one field are cut across by another similar group an electromotive force will be developed. Hence, if two separate circuits, each carrying a current are extended in parallel close enough together to permit the intermingling of the two magnetic forces in one field, an additional electromagnetic force will be developed in each wire, the polarity of which will not only be opposite to the original, but the potential developed in each circuit will oppose the impressed electromotive force of the dynamo which creates the current in the conductors.

This phenomena is called electro-magnetic induction. When it is caused by two or more currents in separate parallel conductors, it is called mutual induction in contradistinction to self-induction, which refers more properly to induction created by one and the same current reacting on itself in one field, as it flows through the many convolutions of wire side by side in the coils of a relay or other magnet.

In a straight conductor the magnetic field, owing to the absence of iron as a medium for the circulation of the lines of force, is not only very weak, but there is no clashing of forces, hence, such circuits are called noninductive. A noninductive circuit, therefore, is very fast, because the current is not retarded in building up to maximum value when a signal is made.

When a coil of wire is inserted in the circuit, however, each set of magnetic lines of force cre-

ated by the current flowing in the various convolutions of the winding cuts across the field of every other convolution in the coil and, therefore, creates a back pressure, or counter-electromotive force in the conductor. The effective value of the electromotive force at a given instant is, therefore, only equal to the initial voltage of the dynamo minus the back pressure, hence the value of the current flowing is diminished.

Now, as it is evident that the dynamo is still impressing its full value of electromotive force in the circuit, and the resistance of the conductor itself has not altered, the counter electromotive force developed in the coils must be considered as so much ohmic resistance having been added to the circuit, in order to account for the diminished volume of current flowing. Hence this back pressure is merely apparent resistance, or impedance.

When the coils surround an iron core, as they do in the case of a relay, the counter effect is greatly increased, because that metal being the natural conductor of magnetic lines of force, the number of such lines is correspondingly increased. This fact is nicely demonstrated in the regulation of a medical battery device. When the length of the iron core is lessened by pulling the moveable core out the "shock," which is due to counter-electromotive force, is diminished correspondingly for the reason that air is not so good a conductor as iron.

For fast transmission, therefore, inductance is harmful, but, as previously stated, under some conditions it is beneficial and purposely inserted in a circuit. Without it simultaneous telegraphy and telephony would be almost impossible. The explanation illustrates another peculiar property of an electric circuit through the action of inductance.

Every circuit in which an electric current flows acts as though it possessed magnetic inertia. It seems to resist every change in the volume of current flowing, and is particularly opposed to sudden changes. Self-induction in the coils of a magnet, therefore, tends to oppose every rise or fall in the strength of the current in the circuit in which such coil or coils are placed. The consequence is that the final value of the current is not reached at the instant the maximum electromotive force is impressed on the circuit, but lags a little behind. Obviously it must also be a little late in disappearing when the next signal is made.

The degree in which the current falls behind the electromotive force varies with the conditions of the circuit, and is expressed in terms of having a certain angle of lag.

In simultaneous telegraphy and telephony sudden rises and falls in the value of the current in a Morse circuit create a noise in the telephone which is readily heard, but by smoothing out the changes by means of inductance coils inserted in the Morse wire, the noise is practically eliminated.

Another property of an electric circuit is that of capacity, or ability, to absorb current, so to

speak. Now, the action of capacity is just opposite to that of inductance, inasmuch as the current leads the impressed electromotive force instead of lagging behind. The student should readily see, therefore, that by means of a proper combination of inductance coils and capacity in one circuit, one may be caused to neutralize the effect of the other, and an otherwise slow wire be rendered fast. Indeed it is somewhat on this principle that Dr. Pupin solved the great problem of rendering ocean cables much less inductive.

A condenser is an excellent capacity device, and being adjustable, is an ideal and convenient apparatus for all demands of this kind, and its angle of lead and other characteristics described explains its presence in all kinds of electric circuits where a "lead" is required to offset a "lag."

(To be Continued.)

Recent Telegraph and Telephone Patents.

A patent, No. 959,485, for an automatic telephone system, has been granted to A. H. Dyson, of Chicago, Ill.

A patent, No. 959,498, for a telephone exchange system, has been secured by S. B. Fowler, of Lafayette, Ind.

A patent, No. 959,765, for a telephone system, has been awarded to A. D. T. Libby, of Elyria, Ohio.

A patent, No. 960,176, for an automatic distributing system, has been issued to L. D. Kellogg, of Chicago, Ill.

A patent, No. 960,458, for a telephone repeater, has been taken out by N. G. Warth, of Columbus, Ohio.

A patent, No. 960,482, for a multiple telegraph system, has been granted to Eugen B. Batzel, of Buffalo, N. Y.

A patent, No. 960,495, for a current reinforcing means, has been secured by R. C. Brown, of Salem, Mass.

A patent, No. 960,731, for a telephone receiver, has been awarded to W. F. Taylor, of Brookline, Mass.

A patent, No. 960,856, for a duplex telephone connection, has been issued to A. W. Ebeling, of Charlottenburg, Germany.

A patent, No. 960,925, for a combined synchronizing and telephone system, has been taken out by G. E. Hoglund, of Chicago, Ill.

A patent, No. 961,146, for a portable telephone and testing instrument, has been secured by N. Macking, Wilkesbarre, Pa.

The following patents have expired:

Patent No. 498,808, for a telephone switchboard annunciator, issued to Frank R. McBerty, Downer's Grove, Ill.

Patent No. 498,911, for copying telegraphic apparatus, issued to Sylvester P. Denison, Belleville, N. J.

Patent No. 498,919, for a telephone, issued to Barton Pickering, of Dayton, Ohio.

Patent No. 499,108, for a telephone, issued to Edward M. Harrison, of Fort Smith, Ark.

Personal.

Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company, accompanied by his wife, returned to New York, June 23, on the Adriatic, after a two months' absence in England.

Mr. John H. Fahey, who is an old time telegrapher, and was formerly publisher of the Boston Traveler, has recently sold his interest in that publication and is now spending several months in Europe.

Mr. C. H. Morris, formerly manager for the Western Union Telegraph Company at Montgomery, Ala., but at present engaged in the fruit and produce business at Atlanta, Ga., was a recent New York visitor.

Major Daniel J. Carr, of the Signal Corps, United States Army, who has been stationed at Fort Wood, New York Harbor, for three years past, has been transferred to Fort Omaha. The many friends of Major Carr in New York will regret his departure to his new post of duty.

Mr. Thomas F. Clohesy, an old time member of the telegraph profession, at one time prominent in telegraph circles at Toledo, St. Louis and Kansas City, and who has been in New York for some time past representing the Blaisdell Machinery Company, manufacturers of vacuum cleaning apparatus, has accepted a position with the Taber Pump Company, and will hereafter make his residence at Buffalo.

The National Press Bureau, of New York, has prepared for publication in the National Encyclopedia of American Biography, an interesting biographical sketch of Mr. John Franklin Howell, the well known old time telegrapher, who has, for the past nineteen years, been engaged in the brokerage business. Mr. Howell has been a member of the New York Consolidated Stock Exchange since 1895 and for several years has been one of the governors of that body.

Mr. Robert H. Prender, a former member of the telegraph profession, who began service in the Post Office Department several years ago as stenographer to Assistant Postmaster-General De Graw, and was subsequently promoted to take the office of Chief Clerk in the Bureau of the Fourth Assistant Postmaster-General, has been assigned to other important and intricate duties in Mr. De Graw's Bureau, namely, those of Assistant Superintendent of Rural Delivery. The service which will now engage Mr. Prender's attention involves the expenditure of more than forty millions of dollars per annum and requires the exercise of exceptional capacity and thought. Mr. Prender's

complete successes in former positions forecast great achievements in his new field.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. E. J. Nally, vice-president and general manager, and Mr. C. C. Adams, vice-president, were invited guests of the Pennsylvania Railroad Company on its special train through the new North River tunnel on June 24. The new terminal located at Seventh Avenue and Thirty-third Street, was inspected. The Postal Company will have in this great railroad station two of the most up to date branch offices to be found anywhere in the country.

Mr. W. I. Capen, general superintendent of plant, has returned to his office from a trip of inspection of the new transcontinental lines which are now being constructed between Salt Lake City, Utah, and Reno, Nev.

Mr. L. Lemon, division superintendent at New York, is looking after the duties of the superintendent at Pittsburg, while the incumbent of that office Mr. H. Scrivens, is on a vacation.

Mr. C. A. Rhodes, traveling auditor of the company, has returned to his office after a two months' trip, covering the principal offices in the eastern division.

Mr. F. C. Smith, manager at Wilkesburg, Pa., was a recent New York visitor, coming here to see his daughter, who had just graduated from college, start for Europe.

Mr. William S. Spencer, manager of the company's office at Marion, Ohio, is also judge of the Probate and Juvenile Courts of Marion County.

A new office has been opened by this company at New Castle, Ind. Mr. J. P. Randall is manager.

On the arrival of Colonel Theodore Roosevelt from England on June 18 on the steamer Kaiserin Auguste Victoria the newspaper people on board lodged a large volume of press matter to be transmitted from the quarantine station. Two phantom circuits were speedily pressed into service and the newspaper matter was moved without a moment's delay.

The summer offices are now being opened along the Atlantic Coast. Mr. F. G. Lightfoot, of the New York office, has been appointed assistant manager of the Asbury Park office. The other resort offices are being supplied with help from the various large cities in the eastern division.

Quad. Chief W. E. Todd, of the New York office, with an ample force of operators, took care of the large newspaper service at Poughkeepsie, N. Y., during the recent boat races. Three portable quadruplex sets were placed in commission, which afforded the company ample facilities to take care of the large volume of traffic for transmission. Mr. J. H. Hess, of Superintendent Kimmey's office, had charge of the quadruplex sets.

Owing to an increase in business the forces at Wilkesbarre and Scranton have each been enlarged by an additional operator.

The New London, Conn., office has been entirely refitted with new furniture and switchboard, and the room completely renovated, which makes the office first-class and up to date in every particular.

This company has obtained an injunction against the subsidiary Bell Telephone Company in New Mexico for violation of a contract with the Postal Company made by an independent telephone company last July for five years by which the Postal Company reached a number of towns in New Mexico by an extension of its service from El Paso to Silver City, N. M. That contract still has more than four years to run. A few weeks ago the subsidiary Bell Telephone Company bought out the independent telephone company with which the postal had this contract and then the Bell Company notified the Postal that the contract would be repudiated July 1 and connection cut off.

The Postal Company has obtained an injunction against such repudiation from the District Court at Silver City and has set up that this action is due to a conspiracy between the Western Union and the Bell Telephone companies to suppress telegraphic competition between El Paso, Silver City and intervening towns and other parts of the country. The validity of the combination of the American Telephone and Telegraph Company and of the Western Union is directly attacked.

Postal messengers are given a bonus for all "rush" messages delivered inside of five minutes. One afternoon recently it happened that one of the messengers at Wilmington, N. C., had a "rush" message for a customer who was located on the wharf on the bank of the Cape Fear River. The boy, seeing that his time was about up, rode on his bicycle at a rapid rate to deliver the message on time. As he reached the addressee's place of business he noticed that his brake would not work and before he had time to stop himself he dashed into the water, where it was twenty feet deep. His whole mind was apparently centered on delivering his telegram on time, however, as he swam rapidly to the bank, dashed up to the addressee with the message and delivered it right on the minute.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. E. J. Hall, chairman of the executive committee of this company and vice-president of the American Telephone and Telegraph Company, sails for Europe July 9 on the steamer Minnewaska. Mr. Hall's trip is for rest, and during his absence of two months he will endeavor to avoid all business.

Mr. Belvidere Brooks, general manager of the company, attended the graduating exercises at Williams College, his son, Belvidere, being among those who secured diplomas.

Mr. A. G. Saylor, general superintendent of the eastern division, has returned to his office from a trip of inspection through his territory.

Mr. C. H. Gaunt, assistant general manager and superintendent of telegraph of the Atchison, Topeka and Santa Fe Railway, Topeka, Kansas, has been appointed general superintendent of the Pacific division of this company at San Francisco, vice Mr. Frank Jaynes, appointed special agent.

Mr. William N. Fashbaugh, formerly electrician of the eastern division, but who, for some time past has been in charge of the traffic, has been appointed traffic engineer.

The office of the general superintendent of construction has been abolished, and the duties appertaining to that office have been assumed by Mr. R. E. Chetwood, engineer of construction. Mr. Charles H. Bristol, who since 1902, has been general superintendent of construction, has been retired. Mr. George F. Swortfeger, assistant general superintendent of construction, has been assigned to the staff of the engineer of construction.

Mr. Isaac McMichael, vice-president and general manager of the Great North Western Telegraph Company, Toronto, Ont., was a recent New York visitor, coming here in the interest of the service. Mr. McMichael was accompanied by his wife.

Colonel William Bender Wilson, of Philadelphia, president of the Society of the United States Military Telegraph Corps was also a recent executive office visitor.

Mr. H. C. Worthen, assistant chief operator, at 195 Broadway, New York, has been assigned to special duty in the office of the traffic engineer.

The auditor's department is now located in the new quarters which have been provided for it on the sixth floor. Partitions have been removed so that with the exception of the offices of J. B. Van Every, vice-president, E. Y. Gallaher, auditor, and H. W. Ladd, assistant to Mr. Gallaher, all of the Dey Street side of the building has been made into one large room. The walls of this room have been redecorated, tungsten lamps installed, and new oak tables and desks provided. All of the employes of the department have ample working space and several large windows furnish excellent light to the room. The check bureau and the free message bureau have been added to the auditor's department which now numbers about 180 employes. The check bureau remains in its former quarters on the ninth floor. An improved system of accounting is being developed and uniform methods will soon be adopted for the service throughout the entire country.

The annual outing of the Morse Electric Club will be held at Donnelly's Hotel, College Point, Long Island, Saturday, July 9.

Mr. Frank Kitton, of the office of the engineer of equipment has been spending a well earned vacation at Buffalo and other points.

Mr. Belvidere Brooks, general manager of the company, has issued a notice that the company would not furnish news bulletins either by special wire, by messengers or on its tickers relating to the progress of the Jeffries-Johnson prize fight at Reno, Nevada, on July 4.

Numerous applications have been made for such service in various parts of the country. This company will confine itself to the handling of such messages as may be filed for regular transmission in the ordinary manner at Reno, by press associations, by newspapers and by individuals. Mr. Brooks supplemented this statement with the following explanation:

"The Western Union Telegraph Company is not in the business of gathering news. That is a function of press associations and of newspapers. The telegraph company is a transmitting agency, and as such will confine its activity in this Reno affair to the transmission of news despatches gathered by other agencies and filed with it for delivery to various points.

"The company will endeavor to place at the disposal of the public, and of the newspapers, the very best facilities for transmitting quickly and accurately their despatches, so that people interested in the fight may obtain desired information. A large number of wires are available for such use at Reno, not only on July 4 but at all other times. In addition, such extra facilities will be provided as to render convenient the duties of the reporting agencies.

"The various ticker services of the Western Union Telegraph Company are for the reporting of quotations and matters of official record. They will not be used for giving news descriptions of this prize fight."

RESIGNATIONS AND APPOINTMENTS.

Mr. E. D. Edwards has been appointed manager of the Reno, Nev., office, vice A. E. Littler, resigned. Mr. Edwards has been succeeded as chief operator by L. B. Dobyns, formerly night chief operator, whose position has been filled by the appointment of T. A. Long, advanced from the all night chief operatorship. Mr. E. P. Hearn, of the operating force has been appointed all night chief operator.

C. H. Gaunt, General Superintendent, Western Union Telegraph Company, San Francisco.

The appointment of Mr. C. H. Gaunt as general superintendent of the Pacific division of the Western Union Telegraph Company as announced briefly elsewhere in this issue, brings back to the commercial telegraph service, after an absence of twenty-one years, one of the best known telegraph men in the United States, and one who has for many years occupied a prominent place in the railway field. Mr. Gaunt was born in Steuben County, New York on August 29, 1867. He was educated in the grammar schools in Brooklyn and finished the high school course at Red Bank, N. J. On the completion of this course Mr. Gaunt learned telegraphy

and in 1884 secured employment with the Western Union Telegraph Company in New York City. During his first year of work he continued his studies at the Brooklyn Polytechnic Institute. He worked for four years in minor positions in the offices of the Western Union and Postal in New York and also in the telegraph department of the Baltimore and Ohio Railroad.

Believing that the opportunities for a young man were greater in the west than in New York, Mr. Gaunt, in 1888, joined the telegraph forces of the Northern Pacific Railway at Helena, Montana.

He worked his way through all the successive positions in the telegraph department of this road, such as wire chief, manager of the larger relay

C. H. GAUNT.

General Superintendent of the Western Union Telegraph Company, San Francisco.

offices, agent, despatcher and division chief, and in 1898 was appointed assistant superintendent of telegraph of this road, which position he held until 1902, when he was appointed superintendent of telegraph of the Atchison, Topeka and Santa Fe Railway. As assistant telegraph superintendent of the Northern Pacific, Mr. Gaunt assisted in reorganizing and rebuilding the telegraph system on this road and bringing it up to date.

In December, 1905, he was also made assistant general manager of the Santa Fe, and he has discharged the duties of the two positions since that time.

Under his direction the telegraph system of the company from Chicago to San Francisco and to the gulf has been reorganized. He has replaced all the obsolete machinery in the department with new and up to date apparatus and he rebuilt the entire telegraph property along all of the lines of

the system at a great expense. This reorganization and rebuilding of the telegraph system has practically quadrupled the operating capacity of the lines. Under the supervision of Mr. Gaunt, the Santa Fe was one of the first railroads to begin the use of the telephone for train despatching and the results have been so very satisfactory that as soon as practicable the entire system will be thus equipped. Several important improvements in telegraphy have also been devised by him.

The Western Union Telegraph Company is to be congratulated upon securing for the important post which Mr. Gaunt now assumes a man of his ability. Though the greater part of his executive experience has been in railway lines there is no doubt but that he will apply his talents with equal success in the commercial field.

W. N. Fashbaugh, Traffic Engineer, Western Union Telegraph Company, New York.

Mr. W. N. Fashbaugh, who has been appointed to the newly created position of traffic engineer of the Western Union Telegraph Company as announced briefly elsewhere in this issue, is well known in telegraph circles and his many friends throughout the country unite in congratulating him upon his promotion. Mr. Fashbaugh was born in Denver and at an early age entered the railway telegraph service with the Union Pacific and later was employed by the Denver Pacific

W. N. FASHBAUGH.

Traffic Engineer, Western Union Telegraph Company, New York.

and South Park Railway. In 1882 he joined the forces of the Western Union at Denver and there displayed such ability as an electrician that in 1884 he was made chief operator of the Denver office. In 1889 he was compelled by poor health

to retire from the telegraph service and for a time engaged in other business at Salt Lake City. In 1890, however, he again put on telegraphic harness, joining the operating force of the Western Union at Salt Lake. Two years later he went to Helena, Montana, as wire chief, that office then being the principal relay point for all of the traffic for the northwest. In 1896 he returned to Denver as electrician at that point. He retained this position until 1902, when he came to New York as superintendent of the leased wire service of the company. He was afterward made electrician of the eastern division, which post he occupied until about four months ago when he was attached to the office of the general manager and given charge of the traffic, which duty he continues to fulfil under the new title.

Mr. Fashbaugh has long been considered one of the best electricians in the service and as he is also recognized as the possessor of a high degree of executive ability, there is no doubt that his administration of the affairs of his new position will be eminently successful.

Municipal Electricians.

A new ten-circuit repeater has been purchased for the fire alarm system of Norfolk, Va., and will be installed under the supervision of Mr. R. A. Smith, city electrician.

The Gamewell Fire Alarm Telegraph Company is installing a police and fire alarm system, including call boxes, automatic switches and flash-light signal service in Victoria, B. C.

Extensive improvements are being made in the fire alarm system of Macon, Ga., under the direction of City Electrician Humphreys. A new switchboard has been installed in more commodious quarters and the majority of the wires have been placed underground.

The fifteenth annual convention of the International Association of Municipal Electricians, which meets in Rochester, N. Y., September 6 to 9, ought to be well attended. Rochester is an ideal convention city and those who attend the gathering are sure to have an enjoyable time. Mr. Frank P. Foster, of Corning, N. Y., is also arranging an unusually interesting and instructive program for the business sessions of the convention.

The Board of Aldermen of New York have appropriated the sum of \$2,200,000 for the general improvement of the fire department. Fire commissioner Rhinelander Waldo announces that \$207,000 of this amount will be spent in bringing the fire alarm telegraph system of the Boroughs of Manhattan and Richmond up to date. This will include a thorough overhauling of the system in the two boroughs. To put the fire alarm telegraph wires underground in Brooklyn will take \$150,000 of the appropriation. The work will be begun immediately.

The Cable.

The new cable which the Commercial Cable Company has been laying between Waterville, Ireland and Weston-Super-Mare, England, was completed June 15 and has been placed in service. The new cable is of unusually heavy construction, the armor varies from a minimum of nine tons to a maximum of fifteen tons to the mile. It is hoped that this type of cable will be heavy enough to resist the attacks of the trawlers.

Charles Trippe, superintendent of the Anglo-American Telegraph Company, at New York, died June 16, aged sixty-seven years. Mr. Trippe entered the telegraph service in England in 1857, and in 1864 joined the forces of the Anglo-American Telegraph Company, which was then preparing to lay a trans-Atlantic cable. Two years later he was on the Great Eastern when the first successful cable was finally laid. He was then appointed superintendent of the cable station at Heart's Content, Newfoundland. He remained there until 1887, when he was transferred to the station at St. Pierre, Miquelon, off the Newfoundland coast. In 1894 Mr. Trippe again took charge of the station at Heart's Content, where he was on duty until 1897, when he was appointed superintendent of the New York office, which position he has since held. By his conduct of the affairs of the company in New York, Mr. Trippe has made a host of friends among those who have occasion to use the cables.

Annual Reunion of Old Time and Military Telegraphers.

Plans are now nearly complete for the twenty-ninth annual reunion of the Old Time Telegraphers' and Historical Association, and of the Society of the United States Military Telegraph Corps, which meets at the Auditorium Hotel, Chicago, Michigan Boulevard and Congress Street, September 8, 9 and 10. The program, which has been arranged by President W. J. Lloyd and his corps of able assistants in Chicago, is as follows: Thursday, September 8, 10 a. m., business meeting of United States Military Telegraph Corps, Auditorium Hotel; 11 a. m., business meeting of Old Time Telegraphers' and Historical Association; 3.30 p. m., baseball game, National League, Cincinnati vs. Chicago. In the evening tickets to various amusement parks of the city will be provided for the visitors. Friday morning a special train on the Chicago and Northwestern Railway will be taken to Highland Park, where all will be the guests at a luncheon at the Hotel Moraine, given by Mr. Frederick W. Cushing, vice-president of the Old Time Telegraphers' and Historical Association, whose home is at that place. On Friday evening a theatre party is on the program. Saturday morning will be given over to sight-seeing, including a visit to the Union Stock Yards, and other points of interest about the city. Saturday afternoon will be free for each one to go

where he may desire. The reunion will come to an end with the banquet at the Auditorium Hotel, Saturday evening at 6.30.

The following rates obtain at various hotels, all being conducted on the European plan:

AUDITORIUM HOTEL,

Michigan Boulevard and Congress Street.
Single rooms without bath, \$2.00 and up.
Same if occupied by two persons, \$3.00 and \$4.00
Single rooms with bath, \$3.50.
If occupied by two persons, \$5.00 and up.

GRAND PACIFIC HOTEL,

Northwest Corner Clark Street and Jackson Boulevard.
Single rooms without bath, \$1.50 per day.
Same if occupied by two persons, \$1.00 per day each.
Single rooms with bath, \$2.00 per day.
Same if occupied by two persons, \$1.50 per day each person.

GREAT NORTHERN HOTEL,

Dearborn Street and Jackson Boulevard.
Single rooms without bath, \$1.50 and \$2.00.
Same if occupied by two persons, \$1.50 per day each person.
Single rooms with bath, \$2.50, \$3.00 and \$3.50.
Same if occupied by two persons, \$4.00, \$5.00, and \$6.00.

KAISERHOFF HOTEL,

270 Clark Street.
Single rooms, \$1.00 and \$1.50.
With bath, \$2.00 single and double, \$3.00.

HOTEL GRACE,

Jackson Boulevard and Clark Street.
Single rooms, \$1.00 per day.
With bath, \$2.00 single, and double, \$3.00 per day.

Any other information desired may be obtained by addressing Mr. F. J. Scherrer, 195 Broadway, New York, secretary of the Old Time Telegraphers' and Historical Association, or Mr. D. H. Bates, 658 Broadway, New York, secretary of the United States Military Telegraph Corps.

United Wireless Being Investigated by the Government.

Two of the officers of the United Wireless Telegraph Company and the president of the New York Selling Agency were arrested on June 16 by the Post Office authorities charged with using the mails to defraud by sending out literature designed to mislead the public in regard to the Company's stock and capitalization. A hearing before United States Commissioner Shields in New York was appointed for July 12. In the mean time a Federal grand jury has begun an investigation of the affairs of the company and has subpoenaed several persons supposed to have an intimate acquaintance with the business of the company to appear and testify.

As the result of the advertising campaign carried on the United Wireless Company soon became well known. Its executive committee met at regular intervals and arbitrarily increased the price of its stock, jumping it from \$12.50 to \$15, to \$25, to \$35, and so on up to \$50 per share.

For a short time the stockholders in the defunct American DeForest Company had an offer

from the United Company to exchange their stock on a ten for one basis. Soon after this the officers raised the price of the United stock and declined to accept any more exchange from the holders of the DeForest stock except at \$10 premium or more per share.

It is alleged that there are 28,000 stockholders throughout the country, many of whom have placed their savings in the stock of the company through representations that have been made by its officers. A portion of the business has been done by soliciting agents in a house-to-house canvass, but the greater portion of the stock selling has been done by the use of the mails, either through newspaper advertising or circulars."

In the statement issued to the stockholders on December 31, 1909, it was stated that there was a surplus of \$6,882,329, when it is claimed by the post office authorities, as a matter of fact the company had not made its operating expenses the year before.

President Wilson issued a reply to the claims of the postal authorities in which he said that the statement that the operating expenses have been much greater than the receipts is untrue, and that the receipts from operation of the active land and boat stations for commercial business have exceeded the expenses of operation, and the surplus of receipts has been invested in additional stations and equipment.

"The Company," said Colonel Wilson, "is, and for the past three years has been engaged in conducting a commercial wireless telegraph business, and for all practical purposes it may be regarded as the only wireless telegraph company on this continent. It has equipped 310 ships plying the waters of the Atlantic and Pacific Oceans and the Great Lakes with its system of wireless telegraphy. These ships are in actual daily operation and communicating with the company's 100 land stations, which are also in daily operation. The United Wireless has more land and boat stations than all the other wireless companies of the world combined, and the equipment of the United Wireless Telegraph Company does by far the largest percentage of the world's wireless telegraph business."

Since the action against the company was started the following announcement has been made to the stockholders:

"Inasmuch as certain charges have been preferred against certain officials of this company, the management would prefer to have judgment in this matter passed upon by such Directors of the company as are not officers, and to that end a special meeting of the Directors has been called to appoint a special committee to institute a thorough investigation of the company's affairs to ascertain whether there is any basis in fact for the charges in question, and to make their report to the stockholders and the public.

"In order that the Directors may be unhampered in the choice of the investigating committee, none

of the Directors who are officers in the company will take any part in the selection of the committee."

What Our Friends Say About This Publication.

Mr. F. W. Conger, superintendent of the Postal Telegraph-Cable Company, Chicago, in renewing his subscription, says: "Telegraph and Telephone Age is what we need and must have in this age."

Mr. P. W. Drew, superintendent of telegraph of the Minneapolis, St. Paul and Sault Saint Marie Railway Company, Chicago, writes: "Telegraph and Telephone Age is better than ever."

Mr. B. F. Thompson, telephone inspector of the Baltimore and Ohio Railroad Company, Baltimore, Md., in remitting to cover his renewal for another year, writes: "Your paper gets more interesting with every issue."

Mr. G. F. Wilson, of the Western Union Telegraph office at Ashland, Ore., when asked recently if he wished to continue his subscription to Telegraph and Telephone Age, replied: "Yes, please keep it coming, sure."

Mr. J. W. Tillinghast, manager of the Western Union Telegraph Company, Cleveland, Ohio, writes: "It is with pleasure that I enclose check renewing my subscription to the Age. It is a valuable publication and should be read by every one in the telegraph and telephone service."

Mr. C. H. Simpson, manager of the Western Union Telegraph Company, Niagara Falls, N. Y., writes: "To keep well informed a manager must read Telegraph and Telephone Age. I can't get along without it; therefore, keep it coming along regularly."

Major J. Orton Kerbey, of the South American Correspondence Bureau, Washington, D. C., an old time and military telegrapher, in a recent letter has this to say regarding Telegraph and Telephone Age: "I congratulate you on the work you are doing in making the Age better if possible every year. I confess I was one of those who entertained the view that our fraternity would not sustain a paper in the interest of telegraphy, but you have succeeded and I give you personally the glory and congratulate you on getting out a good looking as well as an interesting publication."

A former telegraph official, who is now retired, in renewing his subscription, says:

"I don't think there is one of your readers who takes such pleasure in the paper as I do. There is always something interesting in the news department, and the special articles are so valuable to the profession that the telegraph companies should see that their employes are supplied with the journal even if the dividends had to be reduced in order to pay for it. It is impossible to exaggerate the importance of Mr. Jones' articles, especially the current series on electrical measurements, and that was a fine display of technical mastery given by William Finn in his description of the Barclay system."

Radio-Telegraphy.

The New York State Wireless Telephone and Telegraph Company has been incorporated with a capital stock of \$2,500,000 by Harry Darlington, E. R. Devine and E. R. Cochra, Jr., all of Wilmington, Del.

The amateurs in wireless telegraphy throughout the country, under the lead of those in New York and Philadelphia, are organizing to resist the proposed Federal legislation restricting wireless operation.

The North German Lloyd Steamship Company has recently ordered Telefunken wireless equipment for fifteen of its ships on the Eastern Asia and Australian lines, and other German steamship companies are rapidly equipping their vessels with wireless.

A patent, No. 960,304, for wireless telegraphy, has been issued to Roberto C. Galletti, of Rome, Italy. A closed oscillating circuit is used to accumulate energy which is emitted periodically by an antenna, the duration of the emission of the energy by the antenna being continued until the emission reaches the steady condition.

A patent, No. 961,645, for a receiver for wireless transmission of signals, has been secured by Valdemar Poulsen, of Copenhagen, Denmark. An oscillation circuit, an electromagnetic apparatus and a device for intermittently connecting and disconnecting the device to and from the oscillation circuit.

The United Wireless Telegraph Company has applied for a license to erect and operate wireless stations in Canadian territory bordering the Great Lakes. They propose locating stations at Port Arthur, Colinwood, Sarnia and St. Thomas. In order to secure its Canadian franchises the company agrees to exchange messages with any other systems or companies.

The bill of Senator Frye, of Maine, requiring ocean going vessels carrying more than fifty passengers, after July 1, 1911, to be equipped with wireless telegraphic apparatus before being permitted to leave any port in the United States, has been passed by both branches of Congress. An amendment to the original bill passed by the Senate was added by the House of Representatives, requiring such vessels to exchange messages with all shore or ship stations using other systems of wireless telegraphy.

A recent illustrated article in an English technical journal gives a description of the Helsby wireless telegraph and telephone systems, the principal feature of which consists in the production of a spark discharge with a high and uniform group frequency by an electric method instead of by mechanical means. The method consists in rectifying high-tension alternating current and charging condensers with a high unidirectional potential, a small proportion of the charge being withdrawn continuously to energize the actual oscillatory circuit.

A patent, No. 959,967, for a wave receiving device, has been secured by F. G. Sargent, of Westford, Mass. Wireless receiver or coherer having a zinc electrode and a carbon electrode.

A patent, No. 961,265, for apparatus for determining the direction of space-telegraph signals, has been granted to J. S. Stone, of Boston, Mass. Two separated elevated receiving conductors, two receiving circuits, each associated with a different one of the conductors; two artificial lines, each connected with a different one of the circuits, and an oscillation detector connected with said lines.

The Marconi Wireless Telegraph Company has obtained the consent of the French Government to the erection of a wireless station at St. Lazaire, and has agreed with the Spanish Government to take over stations already erected by Spanish companies at Cadiz, Teneriffe and Las Palmas, besides constructing new stations at Cape Finisterre, Barcelona, the Balearic Islands and other places on Spanish territory.

New equipment of Fessenden wireless telegraph apparatus has been installed in the United States Navy's wireless station at Colon, Panama. The new outfit has a twenty-five kilowatt generator and the transmitting apparatus is of the high frequency 500 cycle type, with rotating spark gaps. Key West, New Orleans and Guantanamo are within the working range of the new station, which is much more efficient than the one formerly in use.

A patent, No. 960,631, for wireless signaling, has been awarded to R. A. Fessenden, of Brant Rock, Mass. For producing and receiving wireless signals without interference, by means of a generator of continuous impulses at the sending station, a generator of continuous impulses at the receiving station, and means at the receiving station whereby the impulses silence the locally produced sound, except when the sent impulses are interrupted by signaling.

At a recent meeting of the Washington, D. C., section of the American Institute of Electrical Engineers, Mr. Hayner Gordon gave a talk on "Wireless Telephony," with particular reference to the theory of high-frequency oscillations and their generation and application to the wireless transmission of signals and speech. The meeting then adjourned to the engineering building, where an elaborately equipped wireless telephone station had been installed for the purpose of carrying on experimental work between that point and the laboratory of the United States Signal Corps. Mr. E. R. Cram, of the Signal Corps, assisted by Mr. Bermann, discussed and exhibited the singing arc and various other apparatus and accessories and with Mr. E. F. W. Alexanderson, gave an exhibition of the 100,000 cycle alternator of the latter's design. An interesting discussion accompanied the exhibit, participated in by General James Allen, chief signal officer, United States Army, General H. C. Dunwoody, retired, General George H. Harries and others.

The Telephone.

The Cumberland Telephone and Telegraph Company has declared a regular quarterly dividend of two per cent., payable July 1.

The Pacific Telephone and Telegraph Company reports a gain of 10,033 subscriber's stations during the first three months of 1910, an increase of 2.8 per cent.

Mr. James G. Wray, chief engineer of the Chicago Telephone Company, has been elected an honorary member of the Wisconsin University Chapter of the engineering fraternity Tau Beta Pi.

Mr. John Schlarb has been appointed district commercial manager of the Pacific Telephone and Telegraph Company at Tacoma, Wash., vice Mr. C. H. Moore, transferred to a similar position at Portland, Ore.

Arrangements have been made by the United States Weather Bureau in Texas whereby all telephone subscribers in that state may be supplied with the weather reports free of charge by application to their central office.

The annual report of the Mexican Telephone and Telegraph Company for the year ending March 1, 1910, shows gross revenue of \$480,609 and net earnings of \$251,017, an increase of \$94,842 and \$69,581 respectively over the previous year.

The report of the Cumberland Telephone and Telegraph Company for April shows a gross revenue of \$565,054, and net income after paying all charges, including interest and taxes of \$195,084. The gross revenue increase for the month over the corresponding month last year was \$33,168.

It is reported that the American Telephone and Telegraph Company is preparing to build a new long distance line between Omaha and Denver and thus give more direct communication between these two points. Telephone service from Omaha to Denver at present is by way of Kansas City.

A new telephone line has recently been completed by the Missouri and Kansas Telephone Company, the Kansas Telephone and Telegraph Company and the Pioneer Telephone and Telegraph Company between Wichita, Kansas and Oklahoma City. Additional facilities will soon be provided from the latter place to Dallas and other points in Texas.

The statement having been made that about 900 kilowatt hours of electrical energy are required for the handling of a million telephone messages in this country, one of our English contemporaries has figured that one English ton of coal would be required to furnish this amount of power. As the telephone business in this country is now said to amount to about 11,000 million messages per year, the power needed for transmitting the entire number would require the consumption of 11,000 tons of coal annually.

An ordinance has been passed in Norfolk, Va., permitting the Southern Bell Telephone Company to take over the franchise of the Southern States Telephone Company in that city. Following this action it is announced that the Southern Bell Company will expend \$200,000 in extending and improving the telephone service in Norfolk, Portsmouth and vicinity.

The report of the Kansas City Home Telephone Company and of the Kansas City Long Distance Telephone Company for the year ending March 31, 1910, shows gross earnings for the two companies of \$1,263,975, and net earnings of \$569,474, an increase of \$163,894 and \$59,592 respectively over the previous year. These two companies now own and operate 32,697 stations.

The agreement whereby the Continental Telephone and Telegraph Company was to acquire a controlling interest in the Rochester Telephone Company not having been carried out, the Consolidated Telephone Company, of Buffalo, has purchased a large interest in the Rochester Company. The Consolidated Company is the holding company for the Federal Telephone and Telegraph Company of Buffalo and controls several other independent telephone companies in Western New York.

A concession has recently been granted to a syndicate of American, French and English companies for the exclusive operation of telephones in Constantinople and the surrounding country, for thirty years. The construction may be done by the syndicate, but the operation must be conducted by a Turkish company, the syndicate being the stockholders. The government is to have the right to purchase the concession and plant, after ten years, upon a valuation placed thereon by appraisers, whose mode of selection is set forth in the contract.

The city council of Chicago has referred to a special committee the report on the business of the Chicago Telephone Company, which was made by Messrs D. C. and W. B. Jackson, and a summary of which was given in our June 1 issue. This committee has recommended that the report be gone over by other experts and checked up in connection with any data on hand, or which can be secured bearing on the case. Another expert has accordingly been engaged to go over the report and no action will be taken on the question of revising rates until the various items in the original analysis have been carefully checked up. Mr. B. E. Sunny, president of the Chicago Telephone Company, has recommended the abolition of the flat rate service and neighborhood exchanges, the increase of the charges for residence service from five to six cents and the abolishing of rebates. These changes, he believes, would put the service on a more satisfactory basis.

The Marconi Wireless Telegraph Company has commenced action in England against the United Wireless Telegraph Company and the British Radio Telegraph and Telephone Company for alleged infringement of some of its patents.

Telegraph and Telephone Age

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

July 1, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

The Los Angeles Convention.

The twenty-ninth annual convention of the Association of Railway Telegraph Superintendents has passed into history and those members of the association who were fortunate enough to be able to attend have returned to their duties with new ideas and new zeal to increase, if possible, the efficiency of the systems over which they have charge. Enough matter of interest was brought out in the papers read and in the discussions which took place to furnish ample food for thought for the next year to those who were present as well as to those who have to depend upon the printed accounts of the affair for their knowledge of the information which was brought to light at this annual gathering. Many of the members of the association will be very busy during the next year in extending the telephone despatching service on their lines. To these the facts and experiences given in the convention on that subject will be of special value. Practically all of the superintendents are experiencing the same difficulty,

namely, that of securing a sufficient number of operators and station agents to keep the service up to the required standard. On this account the paper on "Education for Efficiency in Railroad Service," which tells how one of the great railroad systems in the country is meeting this difficulty, will undoubtedly form the basis of much work along similar lines in the future. Everyone who is concerned with the maintenance of a railroad telegraph system will agree that the deliberations of the association in the past have been of assistance to him in the performance of his duties. The convention just closed will be no exception to the rule, but will be remembered as one of the most important of the series.

System Necessary for Efficiency.

The higher officials of the telegraph companies frequently find in their trips of inspection that many of their managers, even in the larger cities, lack efficiency because they fail to systematize their work. This fault is not due to any lack of energy on the managers' part, for in the majority of such cases the manager is the hardest working person on the entire staff. The difficulty seems to lie rather in the fact that the managers burden themselves with a large amount of detail which could just as well be cared for by some of the subordinates in the office. Their time is so taken up in trying to wade through this mass of routine work that they do not have time to look after the more important things which would make their administrations more successful. If the work of the office was systematically divided among the various employes, each one being given certain tasks to perform the manager could so organize the force under his charge that his duties would be chiefly of a supervisory nature. The position of manager of a telegraph company in a large city office is one of great responsibility and one which requires high executive ability in order that the incumbent shall be entirely successful in the conduct of the affairs of the company which are intrusted to his charge. This is a qualification which many do not possess. There are some who may be said to have been born with a natural gift in this direction. There are more, however, in whom this asset has been developed by experience and perseverance. The greatest captains of industry are those who have the faculty of throwing the burden of the work upon their subordinates, leaving their own time free for developing plans for future increased work and supervision. As soon as a manager can be made to realize this fact, and to develop the organization of his force along such lines he is on the road to a better position. Outside interest, in many cases, seem to offer greater attractions to the young man than he can find by remaining in the employ of the commercial telegraph companies. Both of the great companies, however, are showing an inclination to make the service sufficiently attractive to retain

the interest of progressive young men and make the field one in which they can remain with profit throughout their lives. Before he can expect promotion, however, the employe must show that he is worthy. Executive positions, because hard to fill, command good salaries. The manager of a small office who systematizes his work so as to build up an efficient organization will always have an opportunity to show what he can do with larger things. In every issue of our paper we record changes in the official personnel of the different companies, the majority of which are in the nature of promotion. In choosing the men to fill these positions those who have the selection naturally look for the best man to be found for each place. Thus it is that the opportunity comes to the efficient manager. The one who has difficulty in keeping things moving when he has only two or three employes in his charge will hardly receive favorable consideration when a vacancy occurs in a larger office. If, however, he so arranges his work that the traffic is handled with despatch, all reports are sent in on time, all correspondence is answered promptly and he is still able, when called upon, to meet customers of the company, show them any desired courtesy and impress upon them the dignity and stability of the institution which he represents, then his superiors will, when the occasion arises, judge that he is capable of exercising authority and will give him the opportunity to prove their opinion. The way to the top of the ladder in the telegraph service is slow and tedious, but is probably as easy now as it ever was. If in going up the first rounds, however the climber learns to systematize his efforts the remainder of the way may be comparatively easy. If he does not learn this lesson, the ascent is impossible, and if he remains in the service he will always occupy a minor position.

A High Telegraph Official Urges Education Among Employes.

Mr. S. M. English, president and general manager of the Postal Telegraph-Cable Company of Texas, ascribes his success in the service to the fact that he has always been a student and has used all of the means at his command to increase his knowledge of the technical side of telegraphy. Mr. English always encourages the same spirit among his subordinates and in furtherance of this idea recently issued a circular letter to all employes of the company, which reads in part as follows:

I want to make one more personal appeal to you to learn more of the business you are in. Telegraph and Telephone Age is now running an educational column which is better for you than anything it has yet undertaken and you should take advantage of it even if you are "going out of the business" or think you are, as almost every man in the business has thought at one time or another. Subscribe for this paper and read the articles of instruction and you will learn something which will advance you. I know a lot of good fellows who felt as some of you do when I was studying every article published in the Age many years ago and trying to induce them to do so, but instead they ridiculed my efforts. I remember once while I

was explaining the advantages of the knowledge to be gained from Mavor and Davis' Quadruplex and Thom and Jones' book of diagrams, in an effort to induce an early morning Chief to buy them and learn why he did certain things, the Night Chief Operator "batted in" and said: "Don't waste your money, the more you read that stuff the less you will know," and proceeded to explain all that was necessary to know about quads. Both of these men were failures. One is now a Branch Office Manager and the other is working at the key. You must do something that others cannot do if you want to be pushed ahead.

While I was working in an undershirt and pair of overalls with the thermometer around 100 degrees, putting in a dynamo plant at New Orleans, I was engaged by the Texas Postal as Electrician. I am sorry to say only a very few of you understand the electrical end of the business and unless some who do not, learn more about the apparatus, I will be forced to go outside of our service for men who can handle the quads and repeaters. There is hardly a day that we are not short some of our facilities because of a lack of knowledge of the apparatus on the part of the man in charge of it. And you can understand the apparatus, if you will take the trouble to study it. It is not so complicated as it appears to be after you once understand the principles.

The articles now running in Telegraph and Telephone Age and the Postal Telegraph, together with two or three inexpensive books, will equip you for something better or to fill your present position more satisfactorily to yourself and to the Company. Won't you try? I want to help you.

The higher officials of all the telegraph companies will subscribe to what Mr. English says in regard to the difficulty of finding men in the service who are well enough acquainted with the construction and operation of the apparatus to be promoted to positions of responsibility. They also agree with Mr. English as to the value of Telegraph and Telephone Age as an aid to telegraphers in learning more about the business with which they are associated. Anyone who has the mental ability to become an efficient operator is capable of mastering without great difficulty any of the electrical problems connected with telegraphic operation and as soon as he does increase his knowledge in this direction he is putting himself in line for promotion. Mr. English has very aptly pointed out to his employes a way in which they can learn more of the technical side of the industry and, as he states, Telegraph and Telephone Age is published in the interest of telegraphers and is always ready to assist ambitious operators in their efforts for advancement.

International Telegraph Tournament.

The Italian Government has decided to hold in the summer of 1911 at Turin, in connection with the International Exposition of Labor and Manufactures an international competition of practical telegraphy. This competition, which has for its aim the awakening of a new interest among all telegraph employes and to encourage them to perfect themselves in the use of the apparatus is open to telegraphers in the service of the government administrations and the companies belonging to the International Telegraphic Union, as well as to the other administrations and private companies.

The competition will consist of a trial of sending and receiving by Morse apparatus, Hughes or Bandot, either individually or between representatives of the Administrations or private companies who take part.

The trials will be judged according to special rules by a jury in which the visiting administrations will be equitably represented.

The jury will have at its disposal as a reward for the winners prizes of money, medals and objects of art. Letters of invitation to take part in this tournament have been sent out to all of the administrations and private companies. A committee has been appointed to draw up a set of rules and this committee will be glad to receive suggestions from any of those interested. This competition is being planned with the object of strengthening the feeling of friendship which already exists between telegraphers of different nations. M. Ferdinand Geronimi, minister of posts, Rome, Italy, is in charge of the plans for the affair.

It would seem that this would be an excellent opportunity for the telegraph profession in this country to show its proficiency to the foreign brethren. At the Volta Centennial, which was held in Milan, Italy, in 1899, a large gathering of telegraph people took place and on that occasion telegraphers in the United States were represented by Mr. Walter C. Burton, of New York. Mr. Burton was kindly greeted and was the recipient of many favors at the hands of the other telegraph people present and in a series of articles which we published after this event he pointed out the good that was accomplished by that gathering. We have always encouraged telegraph tournaments in this country because we believe that they promote efficiency in the service and we will be very glad indeed to encourage the one to be conducted by the Italian government. We hope that the profession at large in this country will see to it that the United States is represented by at least one delegate in the proposed tournament. There are enough men of the standing in the profession of G. W. Conkling and F. M. McClintic, who are highly proficient in the use of the key from which number could be chosen one or more representatives who would reflect great credit on the operating force of this country if they were given the opportunity to participate in the proposed international event.

Administration Railway Bill.

The so-called Administration Railway Bill, entitled "An Act to Create a Commerce Court," which has been under consideration in Congress for some time has finally been passed and on June 18 was signed by the president. By the provisions of this measure, the telegraph and telephone companies are placed under the jurisdiction of the Interstate Commerce Commission. That part of the bill which applies directly to these interests reads as follows:

"The provisions of this act shall apply to * * * telegraph, telephone and cable companies (whether wire or wireless) engaged in sending messages from one State, Territory or District of the United States to any other State, Territory or District of the United States, or to any foreign country, who shall be considered and held to be common carriers within the meaning and purpose of this act * * * Provided, however, that the provisions of this act shall not apply to * * * the transmission of messages by telephone, telegraph or cable wholly within one State and not transmitted to or from a foreign country or to any State or Territory as aforesaid.

"All charges made for any service rendered or to be rendered in the transportation of passengers or property and for the transmission of messages by telegraph, telephone, or cable, as aforesaid, or in connection therewith, shall be just and reasonable, and every unjust or unreasonable charge for such service or any part thereof is prohibited and declared to be unlawful; Provided, that messages by telegraph, telephone or cable, subject to the provisions of this act, may be classified into day, night, repeated, unrepeated, letter, commercial, press, Government, and such other classes as are just and reasonable, and different rates may be charged for the different classes of messages: And provided further, that nothing in this act shall be construed to prevent telephone, telegraph and cable companies from entering into contracts with common carriers, for the exchange of services.

"No common carrier subject to the provisions of this act shall, after January first, nineteen hundred and seven, directly or indirectly, issue or give any interstate free ticket, free pass, or free transportation for passengers, except to its employees and their families, its officers, agents, surgeons, physicians, and attorneys at law, to ministers of religion * * * and provided further, that this provision shall not be construed to prohibit the privilege of passes or franks, or the exchange thereof with each other, for the officers, agents, employees, and their families of such telegraph, telephone and cable lines, and the officers, agents, employees and their families of other common carriers subject to the provisions of this act."

The portion of this measure relating to the telegraph and telephone companies which are now classed by the government as common carriers takes effect sixty days after the passage of the bill.

An effort is being made in Massachusetts to pass a bill prohibiting the employment of boys under sixteen in the night messenger service.

Ohio evidently is not ready for state control of public utilities as the several bills introduced in the Legislature of that State during the session recently closed, having that end in view, have all failed of passage.

The Beginning of Telegraph Train Despatching.*

To Charles Minot belongs the honor of having made the first practical application of the telegraph to railroading, either in this or any other country, by his adopting it in the early autumn of 1851, as near as the date can be now fixed, to the running of a train by telegraphic order, which led to a system that was adopted by railroads throughout the world, and remained the standard signal and reporting system of railroads until the automatic block system began to take its place, ten years or so ago. Up to the time of Minot's initial experiment with telegraph orders, trains on the railroad were run on what was called the "time interval system." The rule was that a ruling train had right of one hour against the opposing train of the same class. Trainmen were anxious to get through. As an instance of this, once Conductor Henry Ayres had lost his hour at Pond Eddy. He took the switch, and after waiting ten minutes, as was the rule, and the opposing train not being in sight or hearing, he started a brakeman with a red flag, and giving him twenty minutes' start, followed with his train. A little west of Shohola he caught the flagman, who had stopped on enough straight line to make it safe. The exhausted man was taken aboard the train and a fresh man started on with the flag, which operation was repeated until the train expected was met at Callicoon, thirty-four miles from Pond Eddy. Captain Ayres used to say that he had flagged the entire length of the Delaware Division more than once.

W. H. Stewart was running the westbound express train on the day when Superintendent Minot made his astounding innovation in railroading, he happened to be going over the road on that train. The train, under the rule then existing, was to wait for an eastbound express to pass it at Turner's, forty-seven miles from New York. That train had not arrived, and the westbound train would be unable to proceed until an hour had expired, unless the tardy eastbound train arrived at Turner's within that time. There was a telegraph office at Turner's, and Superintendent Minot telegraphed to the operator at Goshen, fourteen miles further on, and asked him whether the eastbound train had left the station. The reply was that the train had not yet arrived at Goshen, showing that it was much behind its time. Then, according to the narrative of the late W. H. Stewart, given to the author in 1896, Superintendent Minot telegraphed as follows, as nearly as Stewart could recollect:

To Agent and Operator at Goshen:

Hold the train for further orders.

Chas. Minot, Superintendent.

*Extract from Edward Harold Mott's History of the Erie Railroad entitled "Between the Ocean and the Lakes," published by John S. Collins, New York, in 1900, read by Mr. E. P. Griffith, superintendent of telegraph of the Erie Railroad, New York, at the convention of the Association of Railroad Telegraph Superintendents, Los Angeles, June 20-25.

He then wrote this order and handed it to Conductor Stewart:

To Conductor and Engineer Day Express:

Run to Goshen regardless of opposing train.

Chas. Minot, Superintendent.

"I took the order," said Mr. Stewart, relating the incident, "showed it to the engineer, Isaac Lewis, and told him to go ahead. The surprised engineer read the order, and, handing it back to me, exclaimed:

"Do you take me for a d—d fool? I won't run by that thing!"

"I reported to the Superintendent, who went forward and used his verbal authority on the engineer, but without effect. Minot then climbed on the engine and took charge of it himself. Engineer Lewis jumped off and got in the rear seat of the rear car. The Superintendent ran the train to Goshen. The eastbound train had not yet reached that station. He telegraphed to Middletown. The train had not arrived there. The westbound train was run on a similar order to Middletown, and from there to Port Jervis, where it entered the yard from the east as the other train came into it from the west."

An hour and more in time had been saved to the westbound train, and the question of running trains on the Erie by telegraph was at once and forever settled.

When the system of running trains on the Erie by telegraph was well established, a code of signals or signs for stations was adopted, such as "PO" for Port Jervis, "XN" for Lackawaxen, and so on. With some modifications this abbreviated nomenclature is in use to-day.

After reading this story of the birth of the system of telegraph train despatching, Mr. Griffith introduced the following resolution, which was passed by the association:

"Whereas, The fact has been established that Railroad Operation by telegraph was conceived by Charles Minot, general superintendent of the Erie Railroad, in the autumn of 1851, and the first telegraphic train order was issued from Turner, N. Y. station in that year, it is befitting the Association of Railway Telegraph Superintendents, and the Old Time Telegraphers' and Historical Association to recognize that great epoch in Railroad and Telegraph History. And, whereas, the story of the passing of the old Turner, N. Y., station on the Erie Railroad is now going the rounds of the press, awakening in the minds of the pioneer Railroad and Commercial Telegraphers, fond recollections of their early days. Therefore, be it

"Resolved, That the Association of Railway Telegraph Superintendents, and the Old Time Telegraphers' and Historical Association, the latter concurring at their next annual meeting in September, shall appoint a joint committee of five to raise a sufficient fund by popular subscription, to erect, and shall erect, a monument with suitable inscription commemorative of the event, on the site of the original Turner, N. Y., Erie Railroad station.

"And be it further resolved, That John B. Taltavall, Editor of Telegraph and Telephone Age, shall be a member of that joint committee, and is hereby authorized to receive and acknowledge subscriptions through the columns of his journal or otherwise."

The Late Charles Trippe.

BY MICHAEL FITZGERALD.

By the death of Mr. Charles Trippe the telegraphic world has lost one of its brightest ornaments, and in that branch of it to which his useful and honorable life was devoted, submarine cable telegraphy, his absence will be severely felt. The Age will undoubtedly deal with the principal events in the career of this estimable English gentleman, but it seems to me that, perhaps, a few words expressive of the respect and affection with which he was regarded by his old colleagues in the service may not be out of place.

When the writer was being initiated into the mysteries of cable working at the Valentia, Ireland, station of the Anglo-American Telegraph Company, Mr. Trippe had already achieved distinction in the service, having reached the responsible position of clerk-in-charge at Heart's Content, N. F. Those were the halcyon days of the operator's life, and the future had no terrors for them. The veriest prophet of evil never ventured to forecast the strenuous competition of the present day. The high tariff naturally restricted the business and three hundred messages a day was considered good work. The old mirror system was still in use, though Thomson's recorder was daily winning fresh victories over its time-honored rival, and the battle for supremacy was many a heated argument between those who fiercely denounced the recorder as "too slow," and those who vehemently declared that the mirror was doomed! As everybody knows, the mirror was eventually consigned to the scrapheap, and the recorder stands today without a peer—a living witness to the brilliant genius of the late Lord Kelvin. Mr. Trippe quickly adapted himself to the changed conditions and he became keenly interested in the development of the new instrument.

As time went on, the writer was promoted to the operator's desk and frequently had the pleasure of working with Mr. Trippe, who was always willing to take a turn at the wire in an emergency. I well remember his kindly comments on my working; now pointing out how my spacing might be improved, and again, having a generous word of commendation when an improvement was apparent.

Soon after this the Commercial Cable Company was started and the easy time were gone beyond recall. A star of the first magnitude blazed forth in the cable world, and that incomparable organizer of victory, George Gray Ward, came into his own. Backed by the lamented John W. Mackay, he was given a free hand and a wide field for the exercise of his superb talents, and he soon made cable history. Tariffs were reduced and a bitter war waged between the new company and the "pool." The volume of business was enormous and the call for

endurance and skill on the part of the operators was insistent.

During all this time Mr. Trippe was a tower of strength to his employers and his ceaseless vigilance in the performance of his arduous duties won for him the favorable recognition of Mr. J. H. Carson, the able chief executive of the Anglo. Mr. Carson is not so well known on this side of the Atlantic as is his rival, Mr. Ward, but his commanding position and influence in European cable circles is recognized by all who are interested in this great industrial enterprise which has done so much to preserve the peace of the world. Mr. Carson soon saw that something was out of joint on his machine and he completely revolutionized the plant, installed the latest mechanical devices for expediting the business, and ruthlessly obliterated the "caste" which made seniority of service the stepping-stone to advancement.

In his search for the best men to forward his plans, Mr. Trippe was not overlooked, and when a superintendent was wanted for the Anglo station at St. Pierre, Miquelon, he was selected by Mr. Carson for this important position. After a few years' splendid work at St. Pierre he was further honored by being chosen to be representative of his company in the United States, with headquarters in New York. Here the writer met him personally for the first time and it seemed strange to both of us that fate should so have planned this meeting far from the scenes where we first got to know each other on the wire.

Mr. Trippe's position in New York was one of great responsibility, and called forth all his diplomatic ability. He had energetic competitors on all sides. The Western Union was splendidly represented by M. H. Redding and P. J. Tierney, and, besides, it had the benefit of the valuable services as cable engineer of Mr. David Lynch. The Direct United States Cable Company was ably served by the lamented Messrs. James Brown and A. C. Frost. The French Cable Company was making great headway under the fine management of Mr. L. A. Lurienne, and the Commercial Cable Company, was, of course, reaching out for business in all directions. Truly, this hustling hive was a complete change from the comparatively serene atmosphere of an out-of-the-way cable station, but Mr. Trippe soon got accustomed to his environment and his unswerving integrity and gentlemanly demeanor made him a favorite with all.

I met him frequently during my stay in the city and we had many a pleasant chat about old times. It seemed to me, somehow, as if he often thought with regret on the promotion which had separated him from the old life of intimate association with the colleagues who shared his fortunes in the remote cable stations. He had the disposition of a student and the detachment of his former life was conducive to the gratification of his tastes in this direction. He was thoroughly versed in the science of electricity so far as it applied to submarine cable working. He was a master of every instrument at pres-

ent in use, and his knowledge of testing, the location of faults, and the thousand and one things that the superintendent of a cable station is supposed to know, was exhaustive.

Perhaps the greatest compliment which I ever heard paid to Mr. Trippe came from Patrick Bernard Delany. When I was at the Valentia station, Mr. Delany was trying some of his inventions on the Anglo cables, and, meanwhile, endearing himself to everybody who had the honor to be associated with him. The astonishing success of his apparatus in getting the best results in practical work was a matter of wonder to us at the time, and we could never quite understand why his system was not adopted by the company. Mr. Delany had, before this, been experimenting on the old St. Pierre-Brest cable, and while at St. Pierre he had the assistance of Mr. Trippe. I asked him how he liked Mr. Trippe. "Mr. Trippe," said the inventor, "is a fine man, a very fine man—a perfect gentleman."

A Record in Reading Tape.

BY J. W. LARISH.

Electrical Engineer of the Telepost Company.

In these pulsing days of extraordinary achievement, both above and below the earth, it is well, perhaps, to note and record at least one marvelous performance within our own ranks.

Telegraph tournaments have been held at which astonishing things were done in hand "sending."

Few cases are mentioned, however, where this prize-winning transmission has been "copied" legibly at its speed of 50 to 52 words per minute—which, by the way, can only be sustained for about five minutes, under the strain of forced effort—so that when I tell you of seeing recording telegraph tape transcribed into print, by hand, at 75 words a minute. I am prepared to hear not only your own voice in protest and incredulity, but that of the whole tape-reading craft, at home and abroad, because it is a record in telegraphy never before approached.

I doubt if even abroad, where tape systems are universal and long established, any transcriber could do more than half this at best, taking into account rolling up and managing the tape, even if the characters were as good as on the records from which the performances I mentioned are rendered.

Mr. B. H. Taylor, our electrician at Boston, is repeatedly transcribing new matter from constantly moving tape, without the error of a single letter, at 75 words per minute, from the current newspaper pages, and stands ready to demonstrate this to anybody, on call.

I had my attention attracted to this extraordinary feat last April, during the Portland, Maine, exposition, where we made an exhibit of which Mr. Taylor had charge.

During the ten days of the exposition Mr. Taylor was often asked as to the rate at which the tape (actually received over the wire from Boston at 1,000 words per minute) could be gotten ready for delivery in print. His announcements that he could typewrite it at 75 words a minute were frequently

challenged and as promptly verified before the critic's eyes, which it was known, were not always those of the layman.

I desire first of all, to see Mr. Taylor's talents and skill recorded in the pages of the craft's "clearing-house" as a matter of simple tribute to his exceptional qualities and modesty; and secondly that this astonishing performance may reach the eyes and ears of our brethren across the seas, where, at present, it will no doubt find greater interest than at home.

Naturally, to be sure, I must mention that it was primarily essential that Mr. Taylor should have perfectly clear, legible, correctly spaced tape characters for easy reading to do these things, which he surely had, though transmitted automatically over the regular working circuit from Boston to the Exposition Building in Portland, at full 1000 words per minute.

Of course, we are not all endowed with the talents for this sort of thing as is Mr. Taylor, who, by the way, is an old American Press Association operator, but his exploits do certainly tend to raise the average for tape-reading speed to high levels.

To paraphrase a well observed legal dictum, "Verum in uno, verum in multis."

Much might be said about how much speed of transcription may still further enlarge the claims in advantage of efficient automatic telegraph systems as against what may justly be termed the lingering hand methods.

Book Review

Major J. Orton Kerbey, the old time and military telegrapher, who is connected with the South American Correspondence Bureau in Washington has been engaged for some time past in writing a book entitled "An American Consul in Amazonia," in which he has described most entertainingly some of his experiences in South America while he was serving as United States consul in Brazil, and has given the first hand impressions which he obtained of that marvelous country during his extensive travels on foot, by canoe, on mule back and by steamer through all of the territory, from the source of the Amazon River to its mouth, a distance of 3,800 miles. One who has read the manuscript of the work says:

"The chapters on rubber, railway building, immigration, climate and scenery, ashore in Para, ethnology and religion, yellow fever, and a Sunday excursion with the '400,' read as if penned in the language of a delightful romance. There is not a chapter in the entire book of 500 pages with 100 illustrations that fails to interest and delight the reader."

Dr. David Homer Bates has read the new work and is assisting Major Kerbey in preparing the manuscript for publication.

Telegraph and Telephone Age is headquarters for telephone, telegraph and wireless books and cable codes. All orders accompanied by price filled promptly upon receipt. Write for catalogue.

The Military Telegrapher in the Civil War.

PART XLII.

Mr. Louis H. Korty, who is at present living in retirement in Omaha, Neb., was a military telegrapher during the Civil War and afterward became prominent in railway telegraphic circles. In 1881 he was appointed assistant superintendent of telegraph of the Union Pacific Railway, and in 1887 succeeded to the superintendency which position he held until he retired in 1908. In writing to Colonel William R. Plum, historian of the United States Military Telegraph Corps in 1878, Mr. Korty gave the following account of his military experiences:

"I joined the United States Military Telegraph Corps during the fall of 1863. I served until after the close of the war in the Department of the Tennessee, Mississippi, and Gulf under Colonels W. G. Fuller and W. L. Gross, and later under General Thomas T. Eckert. I was operator and cipher clerk at the headquarters of Generals C. C. Washburne and N. J. T. Dana at Memphis. I took part in the campaign of General Canby against Mobile. After the close of hostilities, I took an active part in the re-establishment of telegraphic communication in Mississippi, Alabama and Louisiana and with the north. I administered the oath of allegiance to such of the Southern telegraphers as were not politically disqualified and who were willing to work for the government. I was chief operator of the joint military and commercial telegraph office at New Orleans from the spring of 1865 until the lines were turned over by the Government to the telegraph companies, after which I was ordered to Shreveport, Louisiana, as cipher operator at the headquarters of the northern division of Louisiana, where I remained until the final disbanding of the military telegraph corps in 1867 and wound up my career in the south by having the yellow fever in Texas in 1868, after which I came north.

"My connection with the telegraph corps during the war fortunately, or unfortunately, was principally of a peaceful and quiet nature, at points where the danger was not very great and I cannot therefore lay much claim to any mention in the history of the military telegraph, but I will, however, give a few facts as I can recall them with the aid of a brief diary and incidentally add something of an exploit of mine, which may be of interest.

"General Richard Taylor, commander of the Confederate forces in Alabama and Mississippi, surrendered to General Canby, at Citronelle, Alabama, on the Mobile and Ohio Railroad, on May 4, 1865. With the cessation of hostilities, however, the services of the telegraph corps had by no means ended. There was still an important task for them to perform, namely the restoration of telegraphic communication throughout the interior country and with the north, which had almost entirely disappeared on most of the routes.

Orders were immediately given for active operations. W. O'Neil's telegraph pack mule train which had previously rendered most efficient service, was brought out of its temporary quarters and sent into various directions with telegraph material for reconstruction purposes. Connection with the north over the Mobile and Ohio Railroad was completed on the evening of General Taylor's surrender. Colonels Fuller and Van Duzer, superintendents of military telegraph of the departments of the Gulf and Cumberland, respectively, sent operators to the principal points in their newly extended territory to assume charge, with instructions to retain in the service such of the Southern telegraphers as were willing to take the oath of allegiance as well as the oath prescribed for all Government telegraphers. In some instances telegraph construction parties met with no little resistance and opposition from straggling parties of Confederates who had not yet heard of Taylor's surrender, or who were not reconciled to such a fate.

"Samuel Cochran, assistant superintendent of military telegraphs, at Vicksburg, had begun rebuilding the line between Big Black River and Jackson, Mississippi, when he was taken sick. I was ordered to Vicksburg to take his place, but upon my arrival found him sufficiently recovered to resume his duties. The construction gang here consisted of a company of colored troops and were under the immediate charge of John F. Ludwig, an old member of the telegraph corps, who had just been liberated from a Confederate prison. The poles of the old line had almost entirely disappeared and the wire was strung on trees wherever it was practicable. The railroad track was also entirely obliterated by the ravages of the terrible events for which this locality had become so famous; where the armies of Grant and Sherman against those of Pemberton and Johnson had contended for supremacy in many hard fought battles, making the country as it were a vast burying ground. Now and then a chimney would mark the spot where once stood the mansion of some wealthy planter. Occasionally a ragged embankment, in many places washed to the level of the ground and now and then a telegraph pole faintly traced the route where once had been a great and prosperous railroad. The surrounding country was infested by guerillas and desperate characters from the Confederate army who had left their commands with their arms without waiting to be paroled, many of them encouraged to continued deeds of violence whenever opportunity offered, by the defiant proclamation of the Confederate General E. Kirby Smith, in command west of the Mississippi who proposed to keep on fighting as long as there was a Yankee left in the country.

"It was during this state of affairs that I was ordered to return from Vicksburg to Jackson to take charge there. I left Big Black River, the end of the railroad, on horseback in company

with a Captain Turner of a New York regiment. Before starting we discussed the propriety of only two travelling by night over a country of which so many stories were told about guerrillas and robbers, but there was no available escort at that time to accompany us. The officers in the camp at the river expressed doubt as to our courage to undertake the trip. This was the climax for us and off we started. The road before us had been sadly neglected during the past few years and was badly broken up. In many places it was crossed by deep ditches that compelled us to go some distance around over fields and through woods, altogether making our ride long and tedious. I soon found the Captain a very congenial travelling companion, full of stories of battles in which he had participated over the very ground we were then traversing. He pointed out to me the scene of the battle of Big Black River, the positions occupied and part taken by him, etc. At about midnight, we reached the celebrated Champion Hill battleground where, my companion informed me, he had been wounded. He described the terrible fight between Grant and Pemberton on this spot when the latter attempted by a strategic move in conjunction with Johnson, to annihilate Grant's army, but which resulted in Pemberton's being driven back into Vicksburg, thereafter being shut up in the beleaguered city tighter than ever before. The night was clear and mild, the bright full moon at this midnight hour gave the surroundings a weird and sublime effect. Bleached skeletons of horses scattered in every direction, numberless headboards of rude construction marking the irregular lines of graves of dead soldiers of both armies; wrecks of caissons, pieces of shells, etc., all clearly indicated that a terrible strife had taken place here. And I will admit that the sight, particularly at an hour 'when graveyards yawn,' was anything but pleasing to me and I was anxious to be off. My companion felt as I did. The recollections of the spot, brought back, under such circumstances and at that hour, caused him to shudder, brave as he was. We had just resumed our road leading through the thick woods when suddenly we were completely surrounded by eight or ten men coming out of the thicket with pistols drawn calling us to dismount. One of them had caught my horse by the bridle, another made a similar attempt at my companion's horse when the Captain opened on him with his revolver. This was the signal for a lively fire from our assailants. Before I could draw my revolver my horse which, fortunately for me, was very spirited and unmanageable, reared and broke from the grasp of the man who was holding it, and turning round dashed away with me at a terrific speed. In the meantime my friend with great odds against him engaged the guerrillas in a regular battle, emptying both revolvers at them, laying out at least two of them, and himself com-

ing out unscathed. I brought my horse to a stop with the utmost exertion, after he had run at least a mile, when I returned in the direction of the attack with a faint hope that the Captain had escaped injury. After a short time I heard him hailing me. As soon as we came together again we held a council of war as to the best way of proceeding on our journey, but hearing at this moment the neighing of a horse coming from the direction of the woods where we were attacked, we knew that the guerrillas were mounted and would probably pursue us. As they outnumbered us and knew the country better than we, we were completely at their mercy. Concluding therefore that discretion was the better part of valor we took an elevated position on the Champion Hill battleground, tied our horses, and threw up a barricade of a few fence rails and pieces of wood, confidently expecting to be besieged, and that we would be compelled to add to the fame of the historical spot by another battle, with chances against us far greater than they had been against Pemberton. The guerrillas seeing our purpose, that we were ready for a fight, and they having already fared badly at the hands of my brave friend, let us alone. We waited until sunrise and resumed our journey. That was the longest night I ever experienced in my life. The four hours spent behind our barricade seemed an age to both of us. We reached Clinton unmolested and breakfasted at the house of a professor, before the war the principal of a female seminary at that place. He related to us the circumstance of finding the bodies of two men murdered by guerrillas, two nights before, near where we had been attacked.

"One important service performed by the telegraph corps, was the clearing of torpedoes and other obstructions from Mobile Bay. Several of the members of the corps were assigned to this duty; they had a steamer at their disposal and were furnished with a plan, from the Confederates, of the location of the torpedoes. They sunk one hundred and two hundred-pound cans of powder with wires connected to a battery on board of the tug, and at the proper time exploded the powder near the torpedoes by means of the electric current from the battery. The bay and harbor were in this way cleared of obstructions of every kind placed there by the Confederates.

"Mobile was evacuated by the Confederates on the 11th of April, 1865, the army fleeing towards Montgomery. The city was surrendered the next day by the civil authorities to Admiral Thatcher. Among the telegraphers that took part in this campaign and were among the first to enter the city on the day of the surrender were I. A. Sherman, Z. P. Hotchkiss, S. L. Robinson, G. W. Baxter, George R. Penn, B. H. Upham, C. B. Smith, J. R. Frank, myself and others. We found the following southern operators awaiting our

arrival at the telegraph office: Edward Leloup, John Bohanna, Thomas Eastland and one or two others, who, tired of war, had quietly stayed behind when the army moved out. As operators were scarce all of these persons were immediately employed by the Government in the Mobile office."

The Wonderful Speed of a Russian Telegram.

The difficulties of sending a telegraph message from Russia are amusingly described by Antonio Scarfoglio in "Round the World in a Motor-Car." Upon asking the telegraph operator at Pogradichaya to receive his message, the official announced gravely that he could not accept a cipher message unless assured that the key was deposited in St. Petersburg. Signor Scarfoglio assured him that the message was not in cipher, but in Italian.

"Italian? Italian? First of all, what is Italian?" questioned the operator.

"Italian, my worthy sir, is a very well-known language which is spoken in Italy, a country which enjoys a constitutional monarchy, a liberal government, an army, navy, macaroni."

"Ah, yes, yes, macaroni. I remember the country of macaroni."

"So now you can transmit the message at once, so that it shall arrive at Torino at once."

"Did you say Torino?" he asks.

"Torino, Torino."

He began to look through a book, chanting "Torino, Torino, Torino. Here it is, Torino, in Texas, United States of America. Why did you want to talk about Italy?"

"But it is not Texas; it is Torino in Italy." Then I ventured, they make vermouth there."

"Ah, I understand now; but if you pronounce the names of towns so badly nobody can understand you. It is Turin; Turin, not Torino."

"What is the cost?"

"But why do you want to pay me? You must understand that your telegram cannot go."

"Why not?"

"If my dear sir," he resumed, "you had allowed me to speak, I should have told you from the first that I cannot telegraph in Latin characters for the simple reason that I do not understand them."

"But there is a tablet hung up here saying that the office accepts telegrams written in Latin characters."

"That is very true, but it only accepts them when the employe who is able to transmit them is present. Now he is not here."

"Where is this gentleman?"

"He is on holiday. A poor workman has a right to his repose. Russia, as you will admit, is a civilized and progressive country."

"I am profoundly convinced of it. But can't he be found and asked as a special favor?"

"The permission of the director is necessary."

"And where is the director?"

"In the country. To-day is St. Prosdemo, a great Russian feast; to-morrow is St. Nicodemus, another great feast. The day after to-morrow is St. Pancracius, and no office in Russia is open."

"So that?"

"So that you have some chance of finding him next week; on Monday or Friday, because the other days are feast-days."

"And my telegram will remain here?"

"Until Monday at least."

The Future of Electricity.

In the June number of Popular Electricity Thomas A. Edison discusses "The Tomorrows of Electricity and Invention," and declares that if he thought the possibilities of electrical development were exhausted he should not give it a moment's consideration. Were he to begin his life over now, even when it is assumed that all the great electrical inventions have been made, he would like nothing better than an opportunity to do original work where others have left off.

"The chances for new electrical inventions are much greater now than before the telegraph, the telephone, the electric light and the electric motor were invented; while each of these things is far from perfect. We shall have easily \$50,000,000,000 of money in electrical service in 1925, and five times as many persons will then be employed in electricity as now, most of them in branches for which we have not yet found even a name. I often pick up my laboratory note books, of which I have hundreds, full of hints and suggestions and peeps into nature, and realize how little we have actually done to set electricity at work, let alone determine its secret.

"Look at the simple chances of improvement in what devices are known today. They are endless. About one hundred million carbon filament lamps are made here every year, much the same in all essentials as a quarter of a century ago. We must break new ground. Lately the art has gone back to metallic filaments bringing down to one-third the amount of current needed for the same quantity of light. That is only a step. The next stage should be to one-sixth, and, as Steinmetz says, carbon is still in the game, for many of its qualities render it superior to metal. It is the same way with electric heating and cooking appliances, very ingenious even now, and better than any other means; but ten years hence they will be superseded and in the museums with bows and arrows and the muzzle-loaders. As for the electric motor, it will not be perfectly utilized until everything we now make with our hands, and every mechanical motion, can be effected by throwing a switch. I am ashamed at the number of things around my house and shops that are done by animals—human beings, I mean—and ought to be done by a motor without any sense of fatigue or pain. Hereafter a motor must do all the chores."

Protecting Telephone Lines from Lightning and Other Disturbances.*

BY M. E. LAUNBRANCH, CHICAGO.

The protection of telegraph lines from lightning and other disturbances is assuming more and more importance with the increasing use of high voltage power transmission; and as the telephone is extending into new fields.

Although the telephone is in a high state of development at the present day, there is still a great deal to be desired; and each time a new field is entered, new conditions arise, so that the telephone engineers are kept constantly busy meeting such conditions and developing new schemes for improvement of service. The rapid development of other branches of electrical transmission such as power transmission lines, lighting circuits and trolley roads, in all parts of the country, has multiplied the troubles of the telephone circuit; which, not many years back, held undisputed sway throughout the rural districts, and literally possessed the earth and compelled it to do part of its work, as ground circuits were most common then. These ground circuits are rapidly being driven out of existence, by these other circuits of high potential taking possession of the territory.

In addition to these we have the ever present atmospheric conditions to contend with, such as lightning and other static disturbances. All high tension lines are circuits for the transmission of electrical currents with inanimate machines to transmit and receive the power while the telephone line is a circuit for the transmission of human intelligence and a human being is the generating and receiving machine.

In the first group of circuits we must protect property from injury or destruction caused by the atmospheric disturbances or disturbances created within themselves. But on a telephone line we must provide protection not only against disturbances, injury or destruction of property, but against injury and annoyance to the user.

As stated in our subject, we shall confine ourselves to the protection of telephone lines, and more especially to lines in railway service. Let us first take disturbances from lightning. These are of two kinds, direct, and indirect or induced. Fortunately the most destructive is the least experienced; namely, the direct flash. And this is certainly very fortunate when we realize that no very effective protection has ever been designed to guard against its destructive effects, such as destroying entire cable terminals, melting heavy copper leads and instruments. By far the greatest amount of lightning disturbance is caused by induced charges, and these range from those that burn out the coils, transmitters and

receivers, to the annoyance experienced by a despatcher getting a crack in the ear from the static charge passing from one wire to the other through his receiver, or the surging and snapping one hears on long lines during electric storms, and even in dry snow storms.

PROTECTION FROM DIRECT FLASH.

As stated previously, no real successful protection against direct lightning flashes has been designed for telephone lines, or at least none which would be considered commercially economical considering the small per cent. of loss due to such causes. A protector for such a purpose must have large carrying capacity and low resistance to lightning discharges. Such protectors have been designed for use on power transmission lines and are of two types, electrolytic, and multiple air-gap combined with resistance. Such arresters are not only for the protection of lines from lightning, but from excessively high potentials created within themselves.

It is a question whether protection can be provided to guard against such disturbances, when we consider the enormous energy in a discharge which has pierced through an air-gap often times over a half mile in length, so that the remaining distance after it hits the line amounts to very little. It will often not even go down the ground-lead, but will melt the wire it first hits and then shoot off through the air and hit some adjacent object, no matter how good a ground you may have, although a ground should always be of the best. Of course, these direct flashes vary in intensity and every possible means should be provided to take care of them; and there is no doubt that a despatcher's line or message wire is far better protected against such disturbance than the ordinary single station telephone line, due to their being equipped with arresters at every station which act like a long drawn-out picket fence of grounds which do a great deal towards dissipating the charge by assisting in preventing its concentration toward one point.

As stated before, destruction from a direct flash is very rare, and even when a line is struck, the energy of the flash is so great that it does not always follow the turns and twists of the wire entering a building. This is the reason one so seldom hears of a person being injured by lightning while using a telephone, which speaks well for the present day protection; and this is especially true of the despatcher's line, as the writer has heard of only one burnout in two years on any such circuits, and no one was injured in the slightest degree at that time.

PROTECTION FROM INDUCED CHARGE.

It is oftentimes hard to distinguish between a direct flash and an induced discharge from the damage done, as an induced discharge is sometimes so intense that it causes as much destruction as a direct flash—at least, its practical results are just as serious as far as putting the line

*A paper read at the convention of the Association of Railway Telegraph Superintendents at Los Angeles, June 20-25, 1910.

out of service, and also, as to its being dangerous. As stated before, that although this trouble, due to induced discharge, constitutes by far the greatest per cent. of all the disturbance experienced on telephone lines, only a small portion of this is dangerous to persons; the greater portion being such as to cause annoyance to the service. The majority of these troubles may be enumerated as follows: burned out coils in relays, bells, and receivers; punctured condensers; conductors in cables destroyed; insulation in cables reduced by charring of insulating material; blowing holes through sheaths of cables, thus letting in water and putting cables out of business.

The so-called burning out of coils often consists of discharge taking place between different layers of the winding, and either short circuiting the coil or fusing of the wire, as it is often very fine; and thus opening the coil. Very often, however, the energy of the discharge is so great that the coil is entirely destroyed in dissipating the heat. In puncturing condensers it often occurs that after the discharge takes place, enough current follows to burn out the cross between the plates, leaving it as good as ever, so that the trouble-man is mystified when he sees evidence of lightning having passed through the condenser and still finds it O. K.

I have gone somewhat into detail in the foregoing, so that we may have clearly before us just what we must protect against.

PROTECTION OF APPARATUS.

To protect our apparatus it is very evident that we must provide a path for the static charge, of a lower resistance than that found between windings of fine wire, with thin insulation on the coils and between plates of condensers, as these are the weakest spots that must be protected. The first attempt at lightning protection to telephones was the toothed plates mounted closely to the ground plate, similar to that used in telegraph service. This served the purpose to some extent, but was not as efficient as protectors of later design. The protector now most used consists of carbon blocks separated by very thin sheets of mica. Although these protectors are of various designs, the principle is the same; namely, the flashing of the discharge between the carbon blocks across the intervening air-gap. Some such arresters are provided with a piece of fusible metal set into the center of one of the carbon blocks so that in case a discharge is followed by a volume of current the carbon becomes heated enough to melt the metal, which in turn forms a solid conducting path to ground, thus putting a dead ground on the line and blowing the fuse. This type of arrester has proved very efficient on the lines of telephone companies, and is used almost exclusively in exchange service.

As the telephone commenced to be used more extensively in railway service, new conditions arose which gave trouble and had to be met. One

trouble with the regular carbon mica arrester is that it does not always clear itself after each discharge. The consequence is that after a discharge there is generally left a dead ground on the line, or one of high resistance which is often enough to cause a noise. This is not of so much consequence on the ordinary exchange line where there are only few arresters, which are so located that the carbons are easily removed and cleaned.

On railway telephone lines another condition is met with; namely, that instead of from two to a possible ten telephones being on the line, there are from twenty to even a possible sixty, with an arrester at each station. Under such circumstances it becomes necessary to have an arrester which will remain clear after each discharge, as here it is not only a question of protection, but that the service shall continue uninterrupted, as the business on these lines is of such vital importance compared with what might be going over a farmer's line which can stand having poor service for a possible half day, due to some protector being grounded.

About seven years ago, in making a study of telephone requirements on trolley roads, this question of high resistance grounds was one of the first difficulties we had to deal with. It was found that the regular carbon-mica arrester, although it might not always become heavily grounded, would still give a high resistance ground due to fine particles of carbon lodging on the edge of the mica. These high resistance grounds would not be noticeable where there were only two or three instruments on the line; but when a greater number were connected these grounds having multiplied, they produced heavy noises on the line, this also being intensified because of the fact that these lines run parallel with high tension circuits, often on the same pole. To do away with this trouble a great deal of experimenting was done to find a substitute for the carbon block, by trying different kinds of metal such as aluminum, zinc, brass and copper. Sand blasting the surface to produce points was tried. The outcome of these experiments was the present copper block and mica arrester, which is at present quite extensively used. This arrester although it has cleared away a great deal of the trouble due to carbon dust, still has a path on the ragged edge of the mica for the accumulation of dirt, and possible carbon dust from smoke. It also does not fully take care of the discharge from one wire of the circuit to the other, which more frequently finds escape through the despatcher's receiver than across the air-gap of the arrester. To do away with the trouble caused by the accumulation of dust on the edge of the mica, and also, to take care of heavy flashes, a number of arresters have been designed in the last few years. As an example of this type might be mentioned the O'Connell which is quite extensively used on train des-

patching lines. This consists of large carbon blocks widely separated by insulation and set in V position in relation to each other, so that at the point of the V the edges nearly meet, this being the point of discharge. This arrester has proved quite efficient as it not only clears itself quite readily on a small discharge, but it has a capacity to carry heavy discharges and of caring for heavy flashes by blowing them out by means of its V-shaped air-gap. There are also other types of arresters which are designed to carry heavy discharges of different designs.

Of two later arresters put on the market one uses a partial vacuum for an air-gap between two carbon plates known as the "Vac-M"; the other is a departure from the air-gap principle entirely, and might be termed a direct contact arrester and consists of carbon blocks being separated by means of a composition block instead of an intervening air-gap, and it is known as the Brach arrester. As these two arresters are of quite recent origin we are not able to give any extensive data as to their efficiency under all conditions on the telephone lines. It might be stated, however, that these two seem to be lightning arresters pure and simple, and will not protect against power circuits of low potentials. However, they have the advantage of taking care of lightning discharges repeatedly, without leaving any ground on the line.

In the "Vac-M" the discharge takes place in the form of a brush discharge between two carbon plates across a partial vacuum. In the Brach arrester, the discharge takes place between two carbon blocks through the intervening static conducting composition block. It would seem that an arrester of this type gives promise of quite an improvement for taking care of the greater percentage of troubles and annoyances on railway telephone lines. The composition acts as a nearly perfect conductor for highly oscillatory current such as lightning and static charges, while it is of high ohmic resistance for direct currents.

This composition arrester has been in service on block systems for two years and has given very satisfactory service. A number have recently been put in service on telephone lines and we see no reason why they should not clear away considerable of the trouble not being cared for by the present air-gap arresters; namely, the annoyance of minute static discharges on railway telephone lines, and toll lines, and at the same time keeping the line clear of grounds.

At this point, I again wish to call attention to the fact that a train despatcher's and message service lines on railroads are far better protected than the regular long lines of telephone companies, on account of their having a number of arresters distributed all along the line; and I believe I am making a conservative statement when I say that injuries to apparatus on these lines have been very rare.

If an arrester can be produced which will care

for static discharges without permanently grounding, and of high enough ohmic resistance to prevent leakage, there is no reason why this system of protection, namely, distributing arresters along the line, should not be adopted on regular long distance lines.

PROTECTION FROM HIGH TENSION CIRCUITS.

Railway telephone lines being run on the railroad's private right of way are probably more free from the dangers of high tension crossings than the lines of telephone companies; still with the ever increasing growth of high tension circuits the protection against these sources of danger is becoming more and more necessary in the more populous districts. The chief step to be taken in connection with protecting these lines is, of course, the high tension crossing which has already been thoroughly covered by the association specifications for these crossings. This, however, does not remove the necessity for providing protection on the lines themselves, where crossing from such circuits are made possible by their presence. The methods in use for such protection are the lightning arrester and fuses.

The same lightning arrester discussed under protection from lightning, serves this purpose quite well; namely, the carbon arrester, with small enough air-gaps to permit the flashing across of potentials, say 350 volts and over, and to fully protect the apparatus. In such cases a fuse should be provided which will open when the current flows which follows the discharge.

As the standard commercial fuse will not always take care of the opening of a circuit where crossed with a very high tension wire, other methods have been employed to protect the line; namely, where the dangers of such possible crosses occur, a section of the line is so constructed that in case it is crossed by the high tension wire, that section will disconnect itself and drop out, thus making a break long enough to extinguish the arc.

SUMMARY.

Taking the whole subject of arresters we have the following conditions; the carbon air-gap arrester is necessary to protect lines from crossing with other circuits of 350 volts and over, and the heavier lightning discharges followed by current. An arrester of efficient static carrying capacity is desirable to take care of the larger percentage of troubles and annoyances due to static discharges. It would, therefore, seem that an arrester which would take care practically, of all the troubles on railroad telephone lines should consist of large carbon blocks with a small air-gap at one point the blocks to be insulated from each other by means of a highly efficient static carrying material; such material to be of high ohmic resistance, to prevent leakage to such an extent that it will not produce noise on the line; or a combination of two types of arresters could be used; namely, the static arrester connected

direct to the line without fuses and the carbon arrester connected through fuses to protect the instruments.

LOCATION OF PROTECTORS.

The most desirable location of protectors is, no doubt, outside of the buildings, although the greater number of them are located on the inside, and apparently without very much risk, as the number of cases of disturbances from lightning and high tension circuits which would cause danger to buildings are very few. However, the best place to locate an arrester, especially for protection against lightning, is on the pole. A very efficient way of connecting such an arrester is to mount it on the cross-arms between the pins of the wires to be protected, connecting the carbon block directly to the line wire; and at this same point connecting the drop wire which is to enter the building. This drop wire, immediately after leaving the connection on the lightning arrester or line wire, should be wrapped several times, either around the pin below the insulator of the wire to which it belongs or around the cross-arm before it is extended into the building. This you will observe gives you a highly efficient choke coil that in case of lightning discharges, forces the current to ground through the lightning arrester instead of permitting it to enter the building. If a fuse is desired, one side of this should be connected directly to the line wire, the other side can act as the terminal for connecting the one side of the arrester and the drop wire.

The objection to having a fuse located on a pole is its inaccessibility. It is, therefore, recommended that for railway service the fuses be omitted on the pole arrester, but that it be installed ahead of the instrument in the building. Another advantage of having arresters mounted on the pole is that it permits a most direct and straight lead, as this is most desirable to take care of lightning discharges and prevents side flashing to quite an extent.

For ground leads iron wire is just as good as copper. Another objection to a fuse on a pole arrester is that these arresters are primarily intended to take care of the greater per cent. of static discharges which are mostly of such a character that they do no serious damage, only cause annoyance, and still are often severe enough to blow a fuse, which proves a source of great trouble and is of no practical service.

PROTECTING CABLES.

In the protection of cables, lines before entering the cables should be provided with fuses to prevent excess current getting in and destroying the conductors, or charring the insulating material, which would reduce the insulation; where cables leave terminal boxes a loop or goose-neck should be formed, as it has been found that where lightning succeeds in entering a cable at a terminal box and there has been such a loop or goose-neck,

the charge has, nearly without exception, discharged itself out through the sheathing at this loop or goose-neck, leaving a hole very much as though a bullet had been shot from the inside. It is better to have this occur at this point, where the cable can be easily repaired or boiled out in case of water having entered, than to have it penetrate further in. Such blow-outs are generally caused by heavy discharges which destroy the fuses and get beyond them.

In a study made several years ago, on damage done by lightning on cables of one of the telephone companies, it was found that this was a fact nearly without exception. In one case where the cable came straight down the pole out of the terminal head and went under ground, it was found that the discharge through the sheathing had taken place where it made the turn in the man-hole and entered the conduit, making it necessary to pull out the cable to make repairs.

OTHER DISTURBANCES.

As we have made lightning protection the principal feature of this paper, we will just briefly mention other disturbances. Of course, such other disturbances will chiefly be induction due to paralleling circuits. Transposing of lines take care of the ordinary disturbances due to adjacent telephone and telegraph disturbances. Such transposition will, of course, depend upon the paralleling circuits to be contended with. The most extreme cases to handle are paralleling high tension circuits, and especially if these high tension circuits are very close and have a large carrying capacity. We have met with cases where the induced effect from such circuits on a telephone line have been such that it has produced a current to ground direct from the telephone wire, of as high as three and four amperes; and in taking a volt meter reading to ground it has amounted to 200 volts, and in one case in attempting to take a volt meter reading the meter was burned out.

This will be appreciated when it is realized that a telephone wire being adjacent to a high tension A. C. transmission line is simply a good conductor directly in the magnetic field. The consequence is that the telephone wire will not only have a high static charge but will also be a conductor of electro magnetic current, being in reality one coil in a transformer. A very efficient way of caring for this trouble has been the drainage coil. This consists of a well balanced retardation coil bridged across the line, the center being connected to ground. These coils are connected at intervals along the line, depending upon the amount of induced current it is necessary for them to carry off. Of course, the wire in these coils must have enough carrying capacity to take care of the current to prevent burning them out. This coil also keeps down the static charges.

Education for Efficiency in Railroad Service.*

BY D. C. BUELL, OMAHA, NEB.

Chief of Educational Bureau of Information, Union Pacific Railway.

Never before in the history of our country has greater attention been paid to industrial education than during the past ten years.

Railroad managers, especially, have realized the need of educational work throughout their entire organization, and have, from time to time, attempted to accomplish something along this line. The attempts thus far made have been confined principally to the education of special classes of men employed in the shops. In some cases co-operative arrangements have been made with universities, business colleges, Y. M. C. A. schools or correspondence schools to secure their assistance in the education of special classes of employees.

It remained, however, for the Union Pacific Railroad Company to blaze the trail of real railroad educational work by establishing the first comprehensive educational plan for an entire railroad organization, viz: its Educational Bureau of Information.

I. Shirley Eaton, in a recent monograph published by the United States Bureau of Education, and after an exhaustive study of present railroad educational plans, draws seven conclusions which it would seem pertinent to quote, regarding education for efficiency in railroad service:

"(1) Railroad financial managements should incorporate an educational scheme as a definite part of their policy on the ground of business prudence. Such policies should be inaugurated for periods of not less than five years, preferably ten, otherwise the money appropriated will be largely wasted.

"(2) Railroads should extend the principles of definite apprenticeship to every department of service. Between these grades should be more grades of apprentices in order to take account of differences in capacity and work done elsewhere, either in properly accredited schools or by experience, and leading to different grades of service. Between these grades should be free movement, so that no individual should be arbitrarily designated to any class from which by his own effort he cannot advance (or by his own default automatically drop out). To assure this, the tenure in any apprenticeship status should be periodically tested.

"(3) There should be formal provisions for movement among departments under proper conditions, and the comity of railroads should be so far extended as to formally provide for some interchange of officials under special restrictions.

"(4) In executing the policy of education announced by the directors, there should be a superintendent of education reporting directly to a higher official, such superintendent to be thor-

oughly informed of the educational policy of the railroad and the broad considerations on which it rests. His department should systematically recruit the employes throughout the service and certify, on request, to their records and general efficiency in the early stages of promotion.

"(5) Efficiency should be recognized by an efficiency wage, stated distinctly apart from the seniority wage.

"(6) Employes should be encouraged to take outside courses of instruction or experience without forfeiting their tenure, and, so far as possible the educational department should systematically turn to account every outside educational agency, by suggesting courses, uniting in co-operative courses, and recognizing the work done in those courses, to the end that theory and practice be joined.

"(7) The educational opportunities of the service should be utilized to the utmost by encouragement of perfect freedom of study and criticism, and interchange of ideas concerning accidents, bad work, and all the details of practice. Annual or semi-annual meetings of employes by classes of work, and the preparation and circularization of papers and discussions should be a feature."

It will be noted in the following description of the Educational Bureau of the Union Pacific, which was organized some months before the publication of this government monograph, that the plan of the Bureau conforms to all of these conclusions, except the second and the fifth, the practicability of which two are considered doubtful by many of our leading railroad officials.

The Educational Bureau of the Union Pacific had its origin in the idea of Mr. Harriman, that with the amount of mileage and number of employes of the affiliated lines it never should be necessary to go outside of the organization for men to fill vacancies to which employes might be promoted if qualified. Consequently he asked the officials of the different companies comprising the affiliated lines to work out some educational plan, whereby there would always be employes in the service ready for promotion when vacancies occurred.

There were no precedents for guidance in establishing this Bureau. The industrial education of particular classes of employes was being carried on by some firms. A number of railroad companies, the Union Pacific included, had classes in arithmetic and mechanical drawing for shop apprentices, and in some cases special apprentice systems. The Southern Pacific had a course of training in railroad operation which had been in effect for four years. Their plan was to have a special class of from five to ten men, preferably college-bred, and not necessarily employes. These men were put through a special course of about four years' duration during which time they were paid from eighty to one hundred dollars per month. The course took up station

*Paper read at the convention of the Association of Railway Telegraph Superintendents, Los Angeles, June 20-25.

work, track work, storehouse work, train service, yard service, despatching, and trainmaster's work. At the end of the four years students were supposed to be qualified to take official positions.

The Union Pacific had contracts with certain telegraph schools to prepare students for the position of station helper. Railway wires had been cut into these schools and station forms were furnished. None of these plans, however, was broad enough to cover what was wanted, although it was decided that the education of station helpers, which had proved highly successful, was to be made a feature of the new Bureau.

After a period of careful study on the part of Mr. Mohler, vice-president of the Union Pacific, Mr. Park, then general superintendent of the Union Pacific, but now vice-president of the Illinois Central, assisted by the heads of various departments, and the writer, the Bureau was organized on September 1, 1909. In formulating the plans, two cardinal principles were kept constantly in mind; first, the Bureau was to be for employes of all departments, each employe being equally entitled to all benefits as far as his position and qualifications warranted, all instruction was to be free, and in no way compulsory—its aim being to assist those who desired to benefit by it. Second, the Bureau was to be kept entirely separate from the general organization. It was to assist employes, but was to have no voice as to the advancement of any of the students. If a student desired to advance, it would depend the same as heretofore, upon his immediate superior in the department to which he was attached. If he desired to advance in some other department, it would depend upon the recommendation and approval of those who had charge of the department concerned.

It can be readily seen from this that the idea was to eliminate favoritism and "pull" and let each man know that the opportunity was offered to him to prepare himself for better things, without regard to his station in life.

It was not the object of the Bureau to make officials, but to make more efficient employes from whom would naturally come those who were qualified to become officials.

The plans of the Bureau as announced, set forth the three principal objects which it was to accomplish; first, to assist employes to assume greater responsibilities; second, to increase the knowledge and efficiency of employes; third, to prepare prospective employes for the service.

It was further announced that the privilege of using this Bureau was open to all departments and employes free of any charge, the Company maintaining the Bureau for the benefit of the entire service.

The Bureau as organized, is controlled by a Board of Supervisors consisting of five of the general officers.

The Bureau is directly in charge of the writer, who reports to the Vice-President and General Manager.

An Advisory Board acts with the Chief of the Bureau in handling all matters relating to the various departments, holding meetings each week, and enjoying the active co-operation of the Vice-President and General Manager and the General Superintendent—the latter representing the Board of Supervisors.

The Advisory Board plans the courses of reading and study; passes on applications for courses, and assigns the work each student is to take up; approves questions answered by individual members of the Board; advises the Chief of the Bureau on such matters as may be brought before it; and plans the policy to be pursued in handling new matters that arise from week to week.

The Board is made up of a representative official from each of the various departments, such representatives being selected on account of their special fitness for the work.

The scope of the work now being carried out by the Bureau will naturally have to be considered under three primary objects which it is desired to accomplish.

ASSISTING EMPLOYES TO ASSUME GREATER RESPONSIBILITIES.

Courses of reading and study, especially prepared under the direction of the Advisory Board are being issued to cover as much of the "unwritten law" of railroading as is possible, and to include such existing instruction and written matter as will assist an employe to assume greater responsibility in the line of his work. Regular courses are offered on the following subjects: Telegraphy, telephony, maintenance of automatic block signals, interlocking signaling, railway mechanical engineering, track work in both English and Japanese, station accounting, general accounting, railway operation, freight passenger traffic, electricity in its various branches, locomotive operation, air-brakes, shop practice, car building, gasoline motor car construction and operation, railway civil engineering, refrigeration, the analysis of statistics, and mechanical drawing.

These courses are all conducted somewhat on the method of existing correspondence schools. Any employe is eligible to take up one or more of these courses, and while employes are expected to take up a course that applies to their actual work, nevertheless, they are allowed, under certain conditions, to take up subjects in which they are most interested. Certain reasonable rules apply to the assignment of courses so as to make the work of such a nature as will benefit both the student and the company.

It is not the intention to teach elementary or rudimentary subjects, such as arithmetic, spelling, grammar, etc., except in certain particular cases, like shop classes for apprentices, or where

an employe is located at such a point that there is no other way for him to get this training, and the training of this man in the particular subject would be of benefit to the company.

All students are required to familiarize themselves with preliminary papers covering the history and geography of the road, before taking up definite courses.

Special papers are issued at frequent intervals to various classes of employes, whether students of the Bureau or not. These papers deal with live subjects of general interest.

It was realized, when first planning the work of the Bureau, that to meet these requirements, practically all instructional matter would have to be prepared and published by the Bureau, there being practically no books issued that could be used for work of this kind. This was due to the fact that all instructional matter put out by the Bureau deals specifically with Union Pacific methods and standards; is approved by the heads of the departments interested; and can be accepted by the student as authoritative information, applicable to his daily work. The lessons are divided into small units, and a set of questions accompanies each lesson. Written answers to these questions must be submitted, and must show a satisfactory understanding of the work before additional lessons will be furnished.

The lesson papers are prepared in outline by officials, or other employes of the road, who are selected for this work as a result of some special fitness they possess to handle the subjects which are assigned to them. Material from which to prepare the Station Course, for instance, was in part collected as follows:

Outline of the subjects it was desired to cover in this course was made to certain station agents best qualified to write upon these subjects. These agents prepared papers on the subjects assigned to them, following which all who had submitted papers were called together for conference at the Bureau Headquarters. The papers were discussed and compared, and from the material submitted, selections and eliminations were made until the nucleus for each of the several units of the course was established. From this, as a starting point, the subject matter is written up by the editorial department of the Bureau to conform with a standard method of presentation.

Complete records are kept of the student work done by employes; and the names of those making good progress, together with their records, are furnished the officials interested.

A summary of the first seven months' work of the Bureau as regards the results accomplished in this first object just described, will undoubtedly be of interest. It must be borne in mind, in this connection, that the proposition was a new one and the texts, in some instances, could not be put out as rapidly as students were prepared to receive them. It should also be remembered that—in view of the fact that the Bureau was not

in shape to handle an unlimited number of students,—no attempt was made to urge employes to take advantage of the opportunity; all men receiving instruction have voluntarily applied for the courses which they have taken up. From September 1, 1909, to March 31, 1910, inclusive, 937 employes enrolled for courses. In addition to this number, 15 relatives of employes were allowed to take up studies of various kinds, and 46 "outsiders," who were considered promising material for prospective employes, were given studies along the line of work they desired to take up when they entered the service of the company, making a grand total of 998 receiving instruction up to March 31st. A total of 1422 lesson papers were sent in and corrected during this same period. The total enrollment of the Bureau at this writing is 1200, the lesson papers are being sent in and corrected at the rate of about 500 per month. Those enrolled are distributed among the various departments, and all classes of employes are received, from laborers up to officials of the rank of assistant superintendents. The most popular courses are those in signal work, railway mechanical engineering, track work, station work, traffic, accounting, railroad operation and railway civil engineering. Twenty-eight regular courses are in the process of preparation, and more may suggest themselves as the work progresses.

In connection with this part of the Bureau work, men selected for advancement to minor official positions, are afforded an opportunity before their final appointment is made, of acquiring a knowledge of the practical workings of departments with which they have not been intimately connected. This is accomplished by securing such employes a temporary connection with the various departments, under the direction of the heads of such departments, and at a salary fixed by the Board of Supervisors.

(To be continued.)

* The Erie Railroad Employes Magazine relates the following joke which passed between an agent of that road and Jay Gould while the latter was president of the Erie:

"One day a man with flowing beard approached the window of the ticket office. Train No. 1 was standing at the station, having just pulled in. Assuming that he wished to buy a ticket the agent queried, 'What place?' The reply was 'Nowhere.' 'You are on the wrong road, we don't run there,' responded the agent. 'You are right,' said the man. It was Jay Gould, whose private car was attached to the express, but the agent knew nothing of this until after the train had passed on."

"Pocket Edition of Diagrams," etc., the latest revised edition, 334 pages and 160 illustrations, published by Telegraph & Telephone Age, contains just the information every telegrapher requires.

Wireless Communication as Applied to Railroad Lines.*

BY DR. LEE DE FOREST.

A subject of this type must necessarily deal largely in futures, yet the demonstrated possibilities of the radio telegraph and telephone and the strict requirements of the railway service are today so well known by the experts in each separate field, that, by conferring and co-operatively working together, it is reasonable to suppose something tangible, and of real value to both may rapidly result. The possibility of telegraphing wirelessly to moving trains over considerable distances by means of the old fashioned spark telegraph, was, I believe first demonstrated in 1905 over the Chicago and Alton Railroad out of Chicago and St. Louis.

Thanks to the enlightened interest which the officials of that road took in my proposals, I was allowed the privilege of experimenting on the fast daylight express between St. Louis and Chicago. Two horizontal antenna wires were first run on insulators along the top of the train and connected to a receiving instrument installed in the parlor compartment of that coach. Earth connection was made to the trucks, the fifteen kilowatt station at East St. Louis, about two miles from the track side and the ten kilowatt station at Chicago, a quarter mile from the rails were used as transmitters. No attempt was made at that time to transmit messages from the train. But unfavorably situated as both these stations were, so far from the tracks, messages were clearly received on the flying train when 30 to 35 miles from these stations.

Subsequent experiments at New Haven, Conn., and Toronto, Canada, demonstrated the correctness of my view, that the track rail system, including the mass of telegraph or telephone wires along the right of way served not only as a conducting zone or wave chute along which the electric waves preferred to travel; but also acted as a net to catch waves coming transversely and obliquely towards the right of way, and then distributing in both directions along the track a surprisingly large amount of electric energy.

On account of this directive action of the telegraph wires it is easy to pick up strong wireless telegraph signals by a wave detector connected to a short horizontal wire stretched parallel and near to the telegraph wires, and at a surprisingly large distance from the wireless transmitting station.

Now, given this phenomena, it is easy to understand how a track side wireless station, using a horizontal antenna wire say 100 feet long fastened to two or three telegraph poles, can communicate with another trackside station similarly arranged, and distant twenty or even more miles from the first.

Obviously one or both of these stations can be located on board a train, and in such case the hori-

zontal antenna wire can, as I have demonstrated, be run inside the cars, of heavily insulated wire, parallel to the bell cord. This is, of course, providing that the cars are of wood and not of steel. In the latter case wires would need be supported on insulators a few inches above or at one side of the roof of the cars.

By this arrangement it would be a comparatively simple matter to telegraph regularly to and from express trains, over a distance of say forty miles (twenty miles on each side of the track side station). However, the commercial applications of such a wireless telegraph service would be generally confined to a few limited trains, where for the benefit of traveling business men, a news or stock report service could be made a feature. The expense of carrying a telegraph operator on board more than the cost of the equipment entailed, would greatly limit such application.

With the radio (or wireless telephone), however, the case becomes very different, so different in fact that it is my firm belief that ere many years the telephoning to moving trains, and especially to locomotives, will become a very common, or well nigh universal adjunct to our elaborate railroad safety appliances.

For such a purpose long distance of communication will be quite unnecessary, in fact, undesirable. Consider a railroad system equipped with the block system, with signal stations or towers at mile intervals; a small wireless telephone transmitter capable of half mile communication and utilizing the inductive or "wave-chute" action of the existing telegraph wires would cost little to install, little to operate, and be so simple as to add practically nothing to the training of the signal operator. A horizontal antenna wire would be extended to the first or second telegraph pole stretched three feet below the lowest telegraph wire, the earth connections would be direct to the track rails. On the locomotive or over the locomotive and the first coach will extend an insulated wire as easily coupled up when making up the train as is the air brake at present. In the cab a small box is fastened containing a tuning coil and a simple crystal wave detector; connected to this is a single head telephone receiver with head band attached, or a telephone receiver with rubber air pad is fastened to a short arm, at a point where the engineer can easily rest his ear against it. The body of the locomotive, of course, supplies the earth connection.

This system would enable the signal man to talk direct to the engineer for a period of one to four minutes, and add immensely to the probability that he will perceive the proper signal, or enable him to receive orders or information which the semaphore cannot possibly communicate. The engineer could not, of course, reply, except to O. K. by whistle.

It would appear that by this appliance it will be generally quite unnecessary for a train to stop merely to receive despatcher's orders. What value this saving of time of hundreds of trains would

*Paper read at Los Angeles Convention.

aggregate to the railroads in a year. I have no means of estimating. Surely it would total very large figures.

Arrangements have already been made with the New York Central for carrying out a series of experiments in telephoning thus to moving trains, from a track side station at Spuyten Duyvil, on the Hudson; and I expect soon to be able to publish some very interesting results.

A short range wireless telephone transmitter for such service as I have just described is operated from a few cells of Edison-Leland battery, and the entire transmitting outfit will occupy less than three cubic feet of space.

Now consider the application of such wireless telephone instruments to freight train service, on roads like the Santa Fe, for example, without block signal stations at short intervals.

It frequently happens that a train awaits on a siding for long periods the passing of another which has been delayed by accident or other cause and with no means whereby the train crew can be notified to proceed. A portable telephone set installed in the caboose could be quickly brought into action to call up the nearest despatch station.

To facilitate this work a length of flexible antenna wire can be very quickly spiked up on two or three telegraph poles as high as a man can reach, parallel to the telegraph wires or directly connected to a wire through a small condenser, the capacity of which is too small to allow any detrimental grounding of the wires. This "emergency antenna" can be strung up and taken down again in two minutes' time. Such means for getting quick communication with stalled freights will mean an immense saving in costly delays to freight and to all trains affected by the tie up, to say nothing of loss in wages to idle train crews, this latter item where the 16 hour law is operative.

I believe that the railroads will soon see this method demonstrated, and be quick to admit the economy to them of equipping every caboose or a car on every accommodation train with such portable wireless telephone transmitting and receiving sets, whether or not the locomotive carry the receiving apparatus, which I have already described.

Ideas as to the possibilities of our land, wireless telegraph for commercial purposes have been generally founded on the all too plainly demonstrated failures and short comings of the spark systems. Such service is limited to relatively short distances over land by daylight, on account of the sad inefficiency of the spark wireless transmitter. The best of the spark systems can radiate generally less than ten or twelve per cent. of the energy taken from the dynamo, then the trains of electric waves which the spark transmitter sends out are "strongly damped" as we say—i. e., rapidly tail down to zero. Sharp tuning at the receiving station to cut out interference from other stations or from atmospheric causes is really quite impossible when

one has to work with these strongly-damped waves from a spark transmitter.

Hence, in addition to the short ranges necessitated, the spark system is not, and cannot be made reliable and "interference-proof." Such means, therefore, as supplementing the wire service of a railroad at times of emergency as when long stretches of wire are mowed down by sleet and wind storms is quite impracticable because so altogether unreliable.

During the last year, however, a new epoch in wireless telegraphy has been entered, marked by the Radio Telephone Company's new sparkless, wireless telegraph system, this "Radio-tone" transmitter (as it is called) is sparkless and noiseless, in place of the noisy, crude and inefficient old spark gap, it employs a silent discharge from the antenna wires and emits trains of waves which are very little damped, i. e., which tail down to zero very slowly.

Moreover, we can now radiate fifty to seventy-five per cent. of the energy derived from the alternating current dynamo instead of the ten to twelve per cent. of the spark system. This means that ranges two or four times greater than those given by the old spark method are possible and that wireless interference from natural or artificial sources can be completely and successfully eliminated.

As proof of my statement note the work daily carried on between our New York and Philadelphia and Washington stations where, in each case, a spark station of the United Wireless Company is operating within one to nine city blocks from our own, yet an hourly commercial wireless service is continually maintained by our Company.

I have here a photograph taken last week in San Francisco of a two kilowatt installation of the sparkless radio tone system on board the United States Army transport "Buford." The first day this apparatus was put in operation the "Buford," lying at her wharf in San Francisco, communicated in bright daylight with a Naval Station at Point Aguillos, nearly 300 miles south, a new daylight record on the coast.

A number of other army transports are now being equipped with this system, replacing the spark apparatus.

The art has now actually reached the stage where we can begin to handle overland business in competition with wire lines.

Therefore, the sparkless, wireless telegraph possesses immediate interest to railroad telegraphers as ready means for communicating over long distances between division headquarters, especially at times of emergency when storms and washouts have cut wide gaps in the wire system.

I foresee this use of the wireless telegraph coupled with short range telephone safety signaling and emergency service as occupying a very extensive field of usefulness to railroads and the traveling public.

Annual Convention of Railway Telegraph Superintendents

The twenty-ninth annual convention of the Association of Railway Telegraph Superintendents assembled in the convention hall of the Hotel Alexandria, Los Angeles, Cal., June 20-25. It proved to be one of the most important meetings in the history of the association, and was largely attended by railway telegraph officials and associate members from all parts of the United States, Canada and Mexico. Nearly all of the leading railroads of the country were represented and important topics pertaining to railroad operation were discussed at each one of the sessions.

Monday, June 20, at 1.30 p. m., Mr. I. T. Dyer, superintendent of telegraph of the San Pedro, Los Angeles and Salt Lake Railroad, and first vice-president of the association, called the meeting to order. After greeting those assembled and welcoming the visitors to the city, he read letters of regret from a number of the members who, on account of pressure of business and other reasons could not be present.

Mr. Joseph Scott, president of the Los Angeles Chamber of Commerce then extended the freedom of the city to the visitors. The response to the welcome was made by Mr. E. P. Griffith of New York, superintendent of telegraph of the Erie Railroad.

Mr. F. H. Van Etten, superintendent of telegraph of the Southern Indiana Railroad, Chicago, in the absence of Secretary P. W. Drew, was elected secretary pro tem, and Mr. William Bennett, superintendent of telegraph of the Chicago and Northwestern Railway, Chicago, was elected treasurer.

Courtesies to the members of the convention were extended by the Pacific Telephone and Telegraph Company, Western Union Telegraph Company, Postal Telegraph-Cable Company, Home Telephone and Telegraph Company, United States Long Distance Telephone and Telegraph Company, Southern Pacific Railroad Company, United Wireless Telegraph Company and the Canadian Pacific Railroad Company's Telegraph.

Mr. I. T. Dyer then read the programme of entertainment.

The report of the secretary and treasurer, Mr. P. W. Drew, was read, and the affairs of the association were shown to be in a very satisfactory condition.

On account of the resignation of Mr. J. L. Davis, president of the association, some two months ago when he severed his relations with the railroad telegraph service, George A. Cellar, superintendent of telegraph of Pennsylvania Lines west of Pittsburg, of Pittsburg, and John B. Sheldon, superintendent of telegraph of the Union Pacific Railroad, of Omaha, were added to the executive committee.

There being nothing new to report on the subject of telephone train despatching and wireless telegraphy that has not already appeared in print,

the papers promised by E. E. Dildine and William Mavor, Jr., were omitted by the committee on topics.

Secretary Van Etten announced that at the present time there were 116 active and 63 associate members of the association, making a total of 179.

A report was presented by Mr. E. A. Chenery, superintendent of telegraph of the Missouri Pacific Railroad, St. Louis, covering the work of the western division of the association during the previous year.

Mr. W. F. Williams, of Portsmouth, Va., was then called upon to read his paper on "Composite Telephone Blocking."

A paper written by Mr. S. P. Ryner on "Automatic Block and Highway Crossing Signaling," was then read by Mr. William Bennett.

The following new members were elected: F. S. Worth, chief despatcher, Lehigh and Hudson River Railway, Warwick, N. Y.; H. C. Chace, assistant superintendent of telegraph, Atchison, Topeka and Santa Fe Railway, Los Angeles, Cal.; J. H. Lindsey, superintendent of telegraph of the Northern Railway, Costa Rica, Central America; J. Wilson, superintendent Canadian Pacific Railway's telegraph, Vancouver, B. C.; E. D. Hubbard, general foreman, Grand Trunk Railway, Battle Creek, Mich.; J. F. Caskey, superintendent of telegraph, Lehigh Valley Railroad, So. Bethlehem, Pa.; E. W. Mason, superintendent of telegraph, Western Pacific Railway, San Francisco, Cal.; C. T. Day, assistant superintendent of telegraph, Southern Pacific Railway Lines in Mexico, Sonora, Mex.; G. H. Leverett, telegraph and telephone engineer, Chicago, Milwaukee and Puget Sound Railway, Seattle, Wash.; J. C. Johnson, superintendent of telegraph, Pennsylvania Railroad, Philadelphia, Pa.; G. J. Bayliss, general foreman, Southern Pacific Railway, San Francisco, Cal.; Wm. Knowd, telegraph manager, Gulf, Colorado and Santa Fe Railroad, Galveston, Tex.; Geo. N. MacDonald, signal engineer, Virginian Railway, Norfolk, Va.; J. W. Murphy, superintendent of telegraph, Mobile and Ohio Railroad, Jackson, Tenn.; T. M. A. Haston, superintendent of telegraph, Toledo, St. Louis and Western Railroad, Bloomington, Ill.; A. T. Hollenbeck, superintendent of telegraph Chicago Great Western Railroad, Chicago, Ill.; J. T. Nolan, chief operator, Washington Terminal Company, Washington, D. C.; H. L. Husted, division operator, West Jersey and Seashore Railway, Camden, N. J.; F. S. Fender, assistant superintendent of telegraph, Southern Pacific Railroad, San Francisco, Cal.; W. F. Taylor, division operator, Pennsylvania Railroad, Altoona, Pa.; J. H. Ditch, telegraph inspector, Pennsylvania Railroad, Altoona, Pa.; E. C. Keenan, superintendent of telegraph, Lake Shore and Michigan Southern Railroad, Toledo, O.; J. H. Mahon, superintendent of Canadian Pacific Railway's Telegraph, St. John, N. B.; E. W.

Mersereau, superintendent of construction, Canadian Pacific Railway's Telegraph, St. John, N. B.; W. H. Hall, superintendent of telegraph, Missouri, Kansas and Texas Railway, Denison, Tex.; P. Robinson, chief train despatcher, Algoma Central and Hudson Bay Railway, Sault Ste. Marie, Mich.

The following associate members were elected: G. W. Swan, representative, John A. Roeblings Son's Company, New York; G. M. Marshall, engineer, National Carbon Company, Cleveland, Ohio; C. H. Fuller, commercial superintendent, American Telephone and Telegraph Company, New York; G. W. Peck, commercial department, American Telephone and Telegraph Company, New York; F. R. Chambers, Jr., vice-president, Duplex Metals Company, New York; W. M. Page, manager, Duplex Metals Company, New York; H. D. Currier, engineer, Duplex Metals Company, New York; R. A. Peterson, vice-president, Watson Insulated Wire Company, Chicago, Ill.; P. J. Eubanks, sales manager, Sandwich Electric Company, Sandwich, Ill.; J. H. Kinnard, Bell Telephone Company, Philadelphia, Pa.; A. F. Ormsbee, special agent, New York Telephone Company, Brooklyn, N. Y.; Wm. Prescott Hunt, vice-president and secretary, Buda Company, Chicago; E. K. Dyer, salesman, Western Electric Company, San Francisco, Cal.; R. W. Gillette, electrician, Western Union Telegraph Company, San Francisco, Cal.; C. N. Sigison, United States Electric Company, New York.

The following honorary members were elected: J. B. Fisher, ex-superintendent of telegraph, Pennsylvania Railroad; G. H. Groce, ex-superintendent of telegraph, Illinois Central Ry.; S. K. Bullard, ex-superintendent of telegraph, Missouri, Kansas and Texas Ry.; William Kline, ex-superintendent of telegraph, Lake Shore and Michigan Southern Railway; John L. Davis, ex-superintendent of telegraph, Chicago and Eastern Illinois Railway; E. E. Torrey, ex-superintendent of telegraph, Mobile and Ohio Railroad; W. T. Gentry, president, Southern Bell Telephone and Telegraph Company; E. J. Hall, chairman, executive committee, Western Union Telegraph Company; E. C. Bradley, vice-president and general manager, Pacific Telephone and Telegraph Company.

The second day's meeting was called to order at 9 a. m. Tuesday.

Mr. E. P. Griffith, chairman of the committee from the eastern division of the Association of Railway Telegraph Superintendents which was appointed at the meeting held in Washington, March 25, to formulate a system for delivering messages to passengers on trains, whereby a receipt can be obtained and returned to the telegraph company then read the report of that committee. Other members of the committee were Mr. J. C. Johnson and Mr. C. M. Lewis. The report was as follows:

"Your committee, appointed by the Chairman of the eastern division of the Association of Railway Telegraph Superintendents, to confer with the telegraph companies' officials for the purpose of

establishing an adequate and uniform system for the delivery of commercial telegrams to passengers on trains, met in conference with Mr. A. G. Saylor, general superintendent, Western Union Telegraph Company, and Mr. M. M. Davis, electrical engineer of the Postal Telegraph-Cable Company, in New York City, on May 24 last, and discussed the various phases of the subject. It was shown by the reports of the commercial telegraph companies that the methods of making deliveries to passengers on trains, varied considerably, and a large percentage of the telegrams of that character failed of delivery, such failures causing the addressee, as well as the sender, to criticize both the railroads and the telegraph companies.

"The railroads generally are alert to adopt any safeguards suggestive of the protection, comfort and contentment of their patrons. They endeavor to give the traveler ease of mind and all the comforts of home. The commercial telegraph companies are equally anxious to perform a perfect service and thereby please their patrons.

"Your committee, in their search for information on the subject, are indebted to Mr. G. A. Cellar, superintendent of telegraph, Pennsylvania Lines west of Pittsburg, and Mr. J. C. Johnson, superintendent of telegraph, Pennsylvania Lines east of Pittsburg, for copies of a general order issued by the Pennsylvania Lines in 1905, entitled 'Handling of commercial telegrams addressed to passengers on trains,' which instructs their agents, conductors and employes generally to co-operate with the commercial companies in their efforts to make deliveries. The action taken by the Pennsylvania Lines in 1905, has, no doubt, enabled the telegraph companies to effect a larger percentage of deliveries on that line than on any other road, and if all the railroads will do no more than adopt the Pennsylvania Lines' General Order of 1905, great progress will be made in the right direction.

"It has been suggested to your committee, however, that this association may be able to go further in the matter, by recommending to the General Managers' Association and the General Passenger Agents' Association, that a general order be issued by the railroad companies, instructing their agents and other station employes to aid the telegraph company's messenger to reach direct the conductor of the train and instruct the conductors to receipt, on the telegraph company's regular delivery receipt forms, for the messages addressed to his train, or in his care, and in case the conductor is unable to find the addressee on his train, he shall note on the telegraph company's envelope 'Unable to find addressee on train No. —, between Poland and Podunk, James Smith, Conductor, 11.10 a. m., June 22.' He shall then place the telegram in a railroad envelope, address it to the agent of the station where the message was delivered to him, and send it back by train mail. The station agent receiving such undelivered tele-

gram shall immediately notify the telegraph company, over whose lines the message was handled, as indicated by the envelope, to call at his office for undelivered telegram, addressed to James Smith, care of Conductor, Train 10. Should there be a second section of any train, the conductor of the first section, failing to find the addressee, shall endorse on the envelope, 'Cannot find on first section Train 10, try second section,' and put the message off at his next scheduled stop. The agents at all stations shall comply with the endorsements on such telegrams, the same method should apply should there be a third or fourth section, the conductor of the last section, failing to locate the addressee, shall return the message in a railroad envelope, addressed to the agent at the station where the message was handed to the conductor of the first section. The telegraph company shall issue a general order to all managers to procure full address from the sender: for example—'To John Jones, en route Washington to St. Louis, B. & O. R.R., Train No. 10, care Conductor, Parkersburg, W. Va.' The telegraph company's receiving office shall place full address on the envelope as a guide to the railroad conductors in returning undelivered messages to the proper station.

"It has been suggested by the commercial companies that all telegrams for passengers on trains should be addressed in care of the railroad company's station agent, who should receipt for and deliver the same to the conductor of the train mentioned in the address. Your committee is of the opinion that such an agreement might lead the agent to believe that the addressee would call at his office for the telegram, and a complete failure result. It is therefore the conclusion of your committee, so far as the address on such messages is concerned, that they should be addressed in care of the conductor of the train, and the telegraph companies should make the delivery to the conductor. The old method of having the telegraph company's messenger page the trains, while stopping at a station, is, in the opinion of your committee, unreliable. At stations, where a stop of five minutes or more is scheduled, the passengers, as a rule, take advantage of the stop to exercise themselves on the platform, while the messenger is passing through the train.

"The Pennsylvania Lines' general order, already referred to, says: 'The messenger should also, for the purpose of delivering such telegram, be permitted to pass through the train, if the stop thereof be of sufficient duration to enable him to do so and leave the train with safety.'

"A direct delivery to the conductor of the train eliminates the danger to the messenger, releases the railroad company from liability of injury to such messenger, and finds all the passengers in their proper seats, when the conductor passes through the train after leaving the station. Your committee recommends that the Association of Railway Telegraph Superintendents, now in an-

nual convention, appoint a committee to communicate with the General Passenger Agents' Association, forwarding to them a copy of this report, and requesting their endorsement of our efforts in this direction, and if their endorsement shall be favorable, the same committee shall take the matter up with the General Managers' Association, with a view to the promulgation of a general order through the railroad operating departments, on the lines indicated in this report, and if the General Managers' Association shall acquiesce in the matter, the committee shall then notify the commercial telegraph companies and request them to instruct their managers accordingly."

The following communication on this subject from A. G. Saylor, general superintendent of the Western Union Telegraph Company, New York was then read:

"Referring to the copy of the report of the Committee of the Association of Railway Telegraph Superintendents in connection with the delivery of telegrams to passengers on trains I am advised that the report as drafted covers the matter admirably and is entirely satisfactory to the Western Union Telegraph Company, except that it is pointed out that the proposed regulations make no provision for marking on the message envelopes the names of stations at which messages are received and delivered, to check the recollection of the conductor in returning the same if undelivered, or as a guide to conductors of following sections to whom the message may be handed for disposal if delivery is not effected by the conductor of the first section. This is a matter which we can cover in our own instructions on the subject in case the proposed regulation is adopted at the meeting and followed by the railroad companies. However, it is suggested that it might be well to include this additional detail in the committee's report if it is acceptable to them."

In the discussion which followed, Mr. F. H. Lamb, superintendent of the Western Union Telegraph Company, Los Angeles, said that the report covered the ground satisfactorily, but suggested that the announcement by trainmen of addressee's name be made more audibly.

Mr. M. M. Davis, electrical engineer of the Postal Telegraph-Cable Company, New York, suggested that the conductor be made responsible for the delivery of messages addressed to parties on trains and offered on behalf of his Company to co-operate in efforts to make proper delivery of such messages.

Others taking part in the discussion were Mr. W. J. Camp, electrical engineer of the Canadian Pacific Railway, Montreal; Mr. J. B. Sheldon, superintendent of telegraph of the Union Pacific Railway, Omaha, Neb.; Mr. William Bennett, superintendent of telegraph of the Chicago and North Western Railway, Chicago; Mr. H. C. Chace, assistant superintendent of telegraph of the Santa Fe System, Los Angeles; Mr. F. S. Rawlins, superintendent of telegraph of the Southern Pacific, San Francisco.

After the subject had been thoroughly gone over, a committee of five was appointed to consider the subject and formulate a plan within the next ninety days, which would insure proper delivery and notice of non delivery of messages. This committee consists of Messrs. E. P. Griffith, C. M. Lewis, W. J. Camp, William Bennett and J. C. Johnson.

The meeting then adjourned for one hour for the inspection of the exhibits. Upon reconvening, Mr. M. E. Launbranch read his paper upon "Protecting Telephone Lines from Lightning and Other Disturbances." Mr. Launbranch's paper is found in full elsewhere in this issue. In the discussion which followed, Mr. M. M. Davis described the standard protection in use by the Postal Company. This consists of carbon arresters with heavy fuses between the line and the arresters and light fuses between the arresters and instruments. This system is quite effective for all ordinary disturbances, but does not protect the relays from high tension induction of long duration and insufficient current to blow the lighter fuse or from a direct cross with a high tension line that forms a heavy arc at the arrester and in the cartridge type fuse. In his opinion the proper place for arresters is on the poles. Others taking part in the discussion were Messrs. J. B. Sheldon, B. F. Frobes, William Bennett, R. W. Gillette and F. S. Rawlins.

Wednesday morning the meeting was called to order at 9.45 a. m. Mr. William Bennett read an interesting paper on "Education for Efficiency in Railroad Service." written by Mr. D. C. Buell. Part of Mr. Buell's paper appears elsewhere in this issue.

Mr. F. D. Mackay, manager of the Southern Pacific General Telegraph School of shorthand and telegraph operating, was called upon for a few remarks. He stated that while the school received the co-operation of the Southern Pacific Railroad Company, it is not actually conducted by that company. Out of 347 examinations for efficiency in accept positions since the school was established, 300 were accepted and 47 rejected. 100 graduates of the telegraph department have been employed by the Southern Pacific Company.

A committee on resolutions was appointed to send expressions of regret to members who could not be present. This consisted of J. J. Ghegan, J. B. Sheldon and W. J. Camp.

A committee was appointed to extend thanks to the various telegraph, telephone and railroad companies for courtesies extended. This committee was composed of E. P. Griffith, J. M. Walker and W. F. Williams.

An auditing committee was then appointed consisting of B. F. Frobes and E. W. Mason.

Some discussion on high tension crossings was then listened to, and the plan adopted at the last session of the Association was accepted.

An instructive paper on "Wireless Telegraphy as applied to Railroad Lines" was then read by Dr.

Lee DeForest. This paper is printed in full elsewhere in this issue.

In the discussion on this paper Mr. Camp inquired whether it would be possible for two passenger trains travelling in opposite directions to carry on telephone communication over distances of say two miles. Dr. DeForest replied that it would, and that if limited passenger trains were equipped with a dynamo in place of batteries, a much longer distance would be possible.

Mr. Dyer inquired what experiments had been already carried on in telegraphing to moving trains. The first experiments with the wireless telegraph were made on the Chicago and Alton in 1905. Last year the Frederic Thompson theatrical special "Via Wireless" train from New York to Chicago was equipped with a telegraph transmitter and several trackside wireless stations installed for the purpose of keeping in touch with this train throughout its journey. These tests, it is understood, were very successful.

In reply to inquiries as to how the proposed wireless service would effect the existing telephone and telegraph instruments, Dr. DeForest said it would be possible to hear in the telephone receiver the wireless signals of the telegraph and possibly the telephone, but only faintly and not to interfere at all with the present service.

The wireless waves acted strongly only on special detectors, like the crystal silicon, the "audion" and others similar to these, if necessary, choke coils without iron cores, can be inserted in the telephone wires outside of the stations to effectually prevent the electric waves from entering the wire telephone and telegraph instruments, the wireless signals can be thus taken off from the lines through very small condensers into the wireless instruments intended for their reception.

On Thursday evening, after a delightful trip over the kite shaped track of the Santa Fe System, which consumed the entire day, the meeting was called to order at 7.30 p. m., and the subject of high tension crossings was discussed.

In the absence of Mr. G. A. Cellar, chairman of the committee, Mr. William Bennett outlined the position of the association in their plan of specifications for a safe crossing.

Among those taking part in the discussion which followed were, Messrs. W. J. Camp, J. W. Gillyson, Minor M. Davis, Dr. Lee De Forest, G. H. Groce and others. Mr. F. H. Van Etten suggested that the specifications prepared by the committee be put into effect and other associations be asked to take similar action. The discussion of this subject consumed considerable time, the convention not adjourning until a late hour.

At Friday's session the committee appointed to draw up resolutions thanking the various telephone, telegraph, railroad and other interests for courtesies extended made its report, which was unanimously adopted.

A committee was then appointed to handle miscellaneous matters for the association and the following were named: W. F. Williams, of Portsmouth,

Va., S. A. D. Forristall, of Boston, Mass., S. L. Van Akin, of Syracuse, N. Y., W. W. Ryder, of Chicago and J. M. Walker of Denver. The following subjects were referred to this committee: Western Union Telegraph Company numbering of telephone wires; the establishment of a working agreement between the American Railway Association and the Association of Railway Telegraph Superintendents.

A paper was then read by Mr. E. P. Griffith, of New York, relative to the establishment of a monument at Turners, New York, to commemorate the birth of the telegraphic train orders.

A committee of five was appointed to handle the matter, namely: E. P. Griffith, of New York, Charles Selden, of Baltimore, W. J. Camp, of Montreal, E. A. Chenery, of St. Louis and J. B. Taltavall, of New York.

Boston, Mass., was selected as the next place of meeting the date to be June 19-23, 1911, and the following officers were elected President, I. T. Dyer, of Los Angeles, Cal.; first vice-president, John B. Sheldon, of Omaha, Neb.; second vice-president, Wm. Bennett, of Chicago; secretary and treasurer, P. W. Drew, of Chicago.

Among those present were:

Altoona, Pa.: J. H. Ditch.

Battle Creek, Mich.: E. D. Hubbard.

Chicago, Ill.: Wm. Bennett, wife and daughter C. H. Bull, Albert Douglass, E. Parsons, M. E. Launbranch, Mrs. W. W. Ryder and sons Earl and Perry, F. H. Van Etten and F. T. Wilbur and wife.

Denver, Col.: J. F. Dostal, C. A. Parker and John M. Walker.

Lamar, Colo.: R. A. Beck.

Houston, Tex.: A. S. Foote.

Kansas City, Mo.: Val. B. Mintun.

Los Angeles, Cal.: H. C. Chace and wife, Mr. Eccles and wife, J. W. Gilkyson, H. B. George, I. T. Dyer and wife, E. Kendrick and wife, C. L. Lewis and wife, J. E. MacDonald, L. C. McIntosh and wife, R. H. Miller, F. E. Redline and wife, A. E. Roome, L. G. Sloane, B. M. Stanley, V. V. Stevenson and wife and C. J. Steinel and wife.

Montreal, Que.: W. J. Camp.

New York: Wm. H. Baker, M. M. Davis and wife, Dr. Lee DeForest, Richard A. Fanto, J. J. Ghagan, E. P. Griffith, wife and son, E. Kleinschmidt and wife, George W. Peck, G. M. Seeley, and Chas. M. Sigison.

Omaha, Neb.: J. B. Sheldon, wife and son.

Pittsburg, Pa.: L. A. Lee, wife and daughter.

Portland, Ore.: E. A. Klippel and wife.

Portsmouth, Va.: W. F. Williams, wife and two daughters.

Redlands, Cal.: S. K. Bullard.

Roanoke, Va.: W. C. Walstrum, Miss Margaret Walstrum.

Rochester, N. Y.: M. F. Geer and G. H. Groce.

San Francisco, Cal.: W. F. Birt, E. K. Dyer and wife, W. S. Fender, R. W. Gillette, S. B. Gregory, E. W. Mason, E. Miller, F. S. Rawlins and wife and A. B. Saurman.

Salt Lake City, Ut.: B. F. Frobes.

St. Louis, Mo.: Mrs. E. A. Chenery, and Alan MacEwen.

Seattle, Wash.: Mrs. Henry Alexander.

Sonora, Mex.: C. T. Day.

Tucson, Ariz.: B. M. Stanley.

Toronto, Ont.: W. Marshall and wife.

ENTERTAINMENT OF VISITORS.

The entertainment committee of the Association is to be congratulated upon the success of this feature of the convention. The program was so arranged that although the time which the visitors had to devote to sight-seeing was very limited, what time they had for this purpose was occupied to the best advantage. On Monday afternoon, the visiting ladies were met by a local ladies reception committee and taken for an automobile ride around Los Angeles and near-by suburban points. Tuesday afternoon, the visitors, through the courtesy of the Los Angeles Pacific Railway, enjoyed a trip over the Balloon Route to Santa Monica, Ocean Park, Venice, Redondo, and other points of interest. Dinner was served at Bristol Pier, Ocean Park, and the party did not return to Los Angeles until late in the evening. Wednesday afternoon a special train on the Pacific Electric Railway conveyed the members of the association, their friends and guests to Mt. Lowe. A banquet was enjoyed at the tavern and after dinner the party went for a moonlight ride and a visit to the observatory. Numerous speeches were made at the banquet, among those who favored the diners were Messrs. J. J. Ghagan, R. W. Gillette, E. P. Griffith, John M. Walker, A. E. Roome, F. H. Van Etten and C. L. Lewis. Thursday was devoted to a trip over the kite shaped track of the Santa Fe Railway, a special train being provided for the purpose by the management of that system. Luncheon was served at the famous Glenwood Mission Inn, Riverside, and the return to Los Angeles was made in time for dinner. On Saturday, the business of the convention having been brought to a conclusion, the visitors, early in the morning, boarded a special train on the San Pedro, Los Angeles and Salt Lake Railway and were taken to San Pedro, where the steamer Cabrillo was chartered for a trip to Avalon, Catalina Island. Dinner was served at that place and the day was spent in bathing, fishing and other outdoor sports. All of those present at the convention agreed that taken altogether, the entertainment provided for them could not have been improved upon in any respect.

EXHIBITS AND REPRESENTATIVES AT THE CONVENTION.

Numerous interesting exhibits of up to date electrical apparatus were displayed in the large and commodious rooms provided for the purpose.

Mr. J. J. Ghagan, president of the J. H. Bunnell and Company, New York, represented the interests of that corporation.

The National Dictograph Company of New York had an interesting exhibit in charge of Mr. Richard A. Fanto, manager of the company.

The Kellogg Switchboard and Supply Company of Chicago, Ill., had an interesting exhibit of their equipment for use in connection with telephone train despatching, including their selective system. They were represented by H. C. Goldnick and C. F. Hartung.

The National Carbon Company of Cleveland, Ohio, were represented by an exhibit in charge of Mr. F. H. Murray, Pacific Coast representative.

The National Telephone Selector Company of New York had an exhibit in charge of G. M. Seeley and E. Kleinschmidt. The selector which they displayed is an alternating current device.

The Buda Company of New York, Chicago and St. Louis exhibited an excellent motor car which received much favorable comment from those required to use cars for line inspection. Mr. C. H. Bull, of Chicago, was in charge of the exhibit.

The Western Electric Company displayed numerous and interesting electrical devices, among them the new Western Electric selector which received many favorable comments from the visitors. Mr. E. K. Dyer, Pacific Coast salesman of San Francisco and H. G. George, Los Angeles representative, were in charge of the exhibit.

The Railway Safety Signal Company had an elaborate exhibit consisting of miniature locomotives and rails equipped with effective signaling devices for prevention of accidents caused by mistaken or neglected train orders, front or rear end collisions, open or partially open switches, side wipe from cars on sidings, destroyed or defective bridges, broken rails and land slides.

The Standard Underground Cable Company of Pittsburg, Pa., had an elaborate display of underground, aerial and inside wires and cables for fire alarm and police telegraph systems, sub-marine telegraph and telephone cable and steel core copper sheath line wire. Messrs A. B. Saurman and C. G. Pyle were in charge of the exhibit.

The exhibit of the United States Electric Company of New York was in charge of M. E. Launbranch of Chicago and Chas. M. Sigison of New York. They displayed a full line of their Gill Selectors showing how they may be used in connection with semaphore signaling as well as in telephone despatching.

The Western Engineering Specialties Company of Denver, Colo., exhibited a device for the protection of telephone lines or other circuits at transmission line crossings protecting the lower circuits from being subjected to the high potentials in case the transmission lines should break. It eliminated the basket form of protector which is often an additional source of danger, especially where the baskets are made of metal. Mr. J. F. Dostal was in charge of the exhibit.

The exhibit of the General Railway Signal Company of Rochester, N. Y., was in charge of G. H. Groce, E. Parsons and M. F. Geer. The system which they displayed can be arranged for calling the dispatcher's office only or for calling between stations in either of which cases the instruments are bridged on the line and calls made without the use

of local battery. Alternating current or direct current ringers may be used in either case.

The Intensifier Company was represented by Mr. R. A. Beck, of the Atchison, Topeka and Santa Fe Railway, Lamar, Col., and Mr. C. A. Parker, superintendent of telegraph of the Denver, North Western and Pacific Railroad, Denver, who showed the operation of the telegraphic intensifier. The use of these intensifiers makes it practicable for the operator to copy with a typewriter direct from the standard relay without the resonator, local sounder or battery, using this instrument and the stroke of the armature of the relay to produce the sound. No change is made in the relay. The main line is not affected in any way by its use. Mr. Beck is the inventor of this device.

NOTES OF THE CONVENTION.

At the dinner, Tuesday evening, at Ocean Park, Mrs. W. W. Ryder in behalf of the association presented the daughter of Mr. I. T. Dyer with a beautiful gold watch, the occasion being her eighteenth birthday.

Mr. L. C. McIntosh, of the Southern Pacific Railroad, Los Angeles, an old and esteemed friend of Telegraph and Telephone Age, looked after our interests at the convention in a most satisfactory manner.

It was the general consensus of opinion of those present at the convention that more actual work was accomplished and more entertainment enjoyed at this meeting than at any which has been held since the association was organized.

Canadian Notes.

All telegraphers in the employ of the Canadian Pacific Railway have been granted an increase in pay of \$5 per month.

The associated boards of trade of Western Canada, at their annual convention, held recently at Brandon, Manitoba, passed resolutions endorsing the Winnipeg Board of Trade and Grain Exchange's application to the Railway Commission for a reduction in commercial telegraph rates from Eastern Canada.

Mr. J. T. Phelan, superintendent of the Yukon system of the Canadian Government telegraphs, is supervising the construction of about two hundred miles of new line which is being built in northern British Columbia, through a wild and practically unknown territory between Fifth Cabin and Stewart.

On account of the great expansion of the Canadian Pacific Railway's telegraph in western Canada a re-arrangement of the divisions has been made that territory being arranged into four divisions corresponding to the four provinces of Manitoba, Saskatchewan, Alberta and British Columbia. A new division with headquarters at Moose Jaw, Sask., has thus been established and Mr. R. N. Young, assistant superintendent at Winnipeg, has been appointed to the superintendency at that point. Mr. J. Fletcher has been appointed superintendent for the British Columbia division, with headquarters at Vancouver, vice Mr. James Wilson, retired. These changes are effective July 1.

The final hearing by the Canadian Railway Commission of the case between the Western Associated Press and the Canadian Pacific Railway Company's Telegraph was commenced at Ottawa, on June 8. Press representatives were in attendance from newspapers at Vancouver in the west and Halifax in the east, besides various other cities between these points. The great North Western Telegraph Company was represented by Mr. I. McMichael, general manager, and Mr. G. D. Perry, general auditor. The Canadian Pacific Railway Company's Telegraph was represented by Mr. James Kent, manager of telegraphs, W. J. Camp, electrical engineer, and E. W. Beattie, general solicitor of the company. On the opening of the case, Mr. Beattie addressed the Board, and was followed by Mr. Camp, the two speaking for about an hour and a half, when the Chief Commissioner, Judge Mabey, suggested that the Board adjourn, in order that the two sides might hold informal meeting and endeavor to get a little nearer a solution. This was agreed to by all parties, and meetings were held almost continually, from Wednesday evening until Friday, when the agreement was reached about noon.

This agreement proved very satisfactory to all the representatives of the press, who will continue to have, in spite of the increase, what is probably the lowest press rate in the world for the distribution of general press association news. At the same time, the companies are satisfied, in view of the fact that the increased rates given will prevent, in the future, the actual loss on the carriage of this news service which they have suffered in the past.

Census Report on Telephones.

The Census Bureau report on the census of the telephone industry taken in 1907 which is now being printed shows that in the five years from 1902 to 1907 the use of the telephone in the United States more than doubled, or, to be exact, increased 124 per cent., for only five billion conversations were reported in 1902 as against eleven billion in 1907. The miles of telephone wire in use in 1907 were 12,999,369, or over two and a half times the 4,900,451 miles strung in 1902.

The capital stock and funded debt of the telephone companies outstanding in 1902 was \$348,031,058, while five years later it was \$814,616,004, an increase of 134 per cent. During the same period the earnings of the companies increased from \$86,825,536 to \$184,461,747. The increase in revenue was therefore 112.5 per cent. But the increase in operating expenses and fixed charges during the five year period was but 108.4 per cent.; from \$61,652,823 in 1902 to \$128,456,196 in 1907.

Of a total wire mileage of 14,570,142 in use for telephone and telegraph purposes in 1907, only eleven per cent. belonged to the telegraph. In 1880 the telegraph companies reported 291,213 miles of wire compared with 34,305 miles reported for the telephone companies.

Between 1902 and 1907 there was an addition of 8,098,918 miles of wire for the use of the telephone systems of the country, as compared with an increase of 259,611 in the mileage of owned and leased wire for the use of commercial telegraph systems.

The report divides the telephone business of the country into two classes, Bell and Independent. Of a total number of 22,971 systems and lines in 1907, only 175 belonged to the Bell system. The latter system, however, had 3,132,063 stations or telephones, which was 51.2 per cent. of the total, and the non-Bell operated 2,986,515, or 48.8 per cent. In addition to the stations belonging to the Bell, independent companies comprising 13.7 per cent. of the total number of telephones in the country, had connection with their lines, thus making the whole number of telephones connected to their system equal to 64.9 per cent. of the total for the country.

The telephone companies had 144,169 employees in 1907 and the pay roll amounted to over sixty-eight million dollars.

The Telephone Industry of the World.

Under this heading the Electrical Review and Western Electrician has presented some very interesting figures showing the extent to which the telephone is used in various countries. These show that on January 1, 1910, there were 10,269,000 stations in service and 24,075,000 miles of wire. Two-thirds of the telephones and wire mileage are in the United States. There are 7,083,900 stations in the United States, 239,200 in Canada and 2,627,200 in Europe. Of the European countries, Germany heads the list with 910,900. Great Britain has 615,900, and France has 211,600. In reference to the number of telephones in proportion to the population, the United States leads with 7.6 stations per hundred inhabitants, Canada is second, with 3.7, Denmark has 3.3, Sweden 3.1, New Zealand, 2.6, Norway, 2.3, Switzerland, 2.0, New South Wales, 1.6, Germany, 1.5 and Great Britain, 1.3.

New York State, with 745,900 stations, has more telephones than any foreign country except Germany. In January, 1909, there were nearly as many telephones in Greater New York as there were in London, Paris and Berlin combined. Los Angeles, Cal., has the largest number of telephone subscribers per inhabitant of any city in the world, having 25.4 telephones per hundred inhabitants. The nearest approach to this number is Stockholm, Sweden, with 17.2 per hundred. Copenhagen has 6.9; Berlin, 4.8; London, 2.5; and Paris, 2.3.

In 1907 there were 11,372,605,000 telephone conversations in the United States, and 4,264,819,000 in Europe. The total telephone investment of the world January 1, 1908, was estimated as \$1,251,119,000, of which \$819,667,000, or over sixty-five per cent. was in the United States. On January 1, 1910, this total had probably increased to \$1,500,000,000 or \$146 per station.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIDKEY

Sole Manufacturer

Hudson Terminal, 30 Church St.

NEW YORK

Western Representative

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

Mr. W. W. Ryder, general superintendent of telegraph of New York Central Lines west of Buffalo, was a recent New York business visitor.

Mr. W. L. Cook, formerly railway sales engineer of the Western Electric Company at Chicago, has resigned to accept a similar position with the United States Electric Company, manufacturers of the Gill Selectors, in their Chicago office.

A patent, No. 960,586, for a signaling system, has been secured by H. O. Rugh, of Sandwich, Ill. Selective signaling system with a telephone at each substation for the train despatcher, so that he may call any desired station.

The June meeting of the Railway Signal Association was held in New York, June 14, about 250 members being in attendance. Recommendation was made that the next annual meeting be held at Richmond, Va. Papers were read by J. H. Wisner, Jr., on "The World Signal," and by J. M. Waldron on "Speed Controlled Signals." Reports of several committees were also read and discussed.

Mr. J. C. Johnson, superintendent of telegraph of the Pennsylvania Railroad, Philadelphia, accompanied by a large number of the division operators, inspectors, repair foremen and train despatchers, on June 24, came to New York on a special train through the new North River tunnels and made an inspection of the new Pennsylvania terminal at Seventh Avenue and Thirty-third Street, and also of the new Sunnyside yards at Long Island City.

According to the Block Signal and Train Control Board of the Interstate Commerce Commission, there were, on January 1, 1910, 65,758 miles of railroad in the United States operated under the block system. Of this mileage 14,238 was automatic and 51,520 was manual. For the year 1909 there was an increase of 2047 miles in the length of road covered by the automatic block system and an increase of 4162 miles in length of road covered by the manual system. With the manual system the telegraph is used on 39,477 miles of road; the telephone on 8105 miles; electric bells on 945 miles.

The Santa Fe Telegraph and Telephone System.

We are in receipt from Mr. C. H. Gaunt, assistant general manager and superintendent of telegraph of the Atchison, Topeka and Santa Fe Railway, Topeka, Kans., of a blue print prepared under his direction, showing all of the telegraph and telephone circuits found on the entire system. This print, which is twenty-eight by fifty-two inches in size, gives a most comprehensive outline of the telegraph and telephone system of the Santa Fe, and gives a large amount of information in regard to the various circuits. Western Union, joint Western Union and railway, railway copper, railway iron, Postal, joint Postal and railway and telephone wires are all distinguished on the drawing by different kinds of lines. Distances from Chicago to the important points in

the system are indicated as well as the equipment found on the different railway circuits. A map of this nature would be of great assistance in the operation of any railway telegraph system, and other superintendents who are not already provided with a similar guide to the system over which they have charge, would find that such a map would, in many cases, save them much valuable time. There are now in operation on the Santa Fe, 3004 miles of despatching circuits and 2645 miles of new circuits are under construction. In addition to these 285 miles of second despatching circuits are in use and 158 miles more of such circuits under construction. These together with 875 miles of railway and commercial message circuits will increase the telephone system of the Santa Fe to a grand total of 6969 miles.

A New Lightning Arrester.

Every telegraph official who has been interested in apparatus connected with train despatching, has found the type of lightning arresters in connection with this work is an important matter. The successful operation of despatching service may be greatly impaired by an inefficient instrument or one of poor construction.

The carborundum arresters eliminating the air gap have met with considerable favor among telegraph superintendents. The arresters are known as the "Brach" Types Nos. 20 and 21, and are built in single unit form with an interlocking brass plate to connect one unit to the other at the same time joining them electrically to a common ground. The arresting feature is accomplished through the medium of a carborundum block supported between a carbon electrode. The carborundum block is of such resistance as to thoroughly insulate the line to ground, avoiding the dangers of cross-talk or other trouble, and at the same time it will permit static current or heavy induction from lightning or other causes to dissipate through the material.

The efficiency of this arrester has been demonstrated to show that it would protect insulation on magnet wire under conditions that the air gap type of arrester would not, since the distance of opposing electrodes would be of greater dielectric resistance than that of the carborundum plate.

Of a number of these arresters in use in connection with train despatching work, additional favorable points have been noticed: It has the ability to take off the sharp clicks from the receiver which are caused by static current and are of so much annoyance to the operator. In connection with the mechanical design, the elimination of porcelain or slate from the base makes them more substantial and less liable to breakage. The binding posts are large and well made and afford substantial connection.

The instruments are the product of the L. S. Brach Supply Company, No. 143 Liberty Street, New York City.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Mayer and Davis' "Quadruplex" and other standard works on telegraphy and treat them in the same manner.]

CHAPTER VII.

What means is used to operate the armatures of the relays and other instruments in a single circuit?

How is a local circuit operated?

Does the direction in which a current flows make any difference in the operation of a single line circuit?

Does it make any difference in the efficiency?

What is the effect in an electro-magnet if we cause two electric currents of equal strength to traverse the two coils through an equal number of convolutions in opposite directions?

What material is usually employed for the artificial line of a duplex set and why is this used?

How is the resistance for the artificial line arranged so that it can easily be made to balance the resistance in the main line?

How is the main line circuit of a Stearns duplex kept constantly closed?

Why does not the current from the home battery affect the relay at that station but does cause the relay at the distant station to operate?

Draw a sketch of the theoretical connections which illustrate the action of the Stearns duplex.

What is the action when a key at one end is closed and the key at the other end is open?

What is the action when both keys are closed at the same time?

What steps are taken in balancing the Stearns duplex?

CHAPTER VIII.

What is the effect of wet weather on the operation of a Stearns duplex set?

What magnetic principle was made use of in designing the polar duplex?

Why is a polar duplex set immune from the harmful effects of a wet weather escape?

Draw a sketch illustrating the connections of a polar duplex.

What is the action of the polar duplex when the key at the home station is closed and the one at the distant station is open?

What is the action when both keys are closed at the same time?

What is the first step to be taken in balancing a polar duplex?

What is the object of doing this?

How is the relay of a polar duplex constructed? What is the second step to be taken in balancing?

How is the effect of the static discharge of the line eliminated?

Obituary.

Samuel Perrin, a press operator, employed at Atlanta, Ga., died at Augusta, Ga., June 8.

J. V. Baskerville, until recently manager of the Postal Telegraph-Cable Company at Scranton, Pa., died suddenly on June 9.

Prescott S. Watson, aged seventy-one years, for many years superintendent of fire alarm telegraphs at Brooklyn, N. Y., died at Wurtsboro, N. Y., June 19.

Mrs. Helen M. Mills, aged seventy-two years, said to have been the first woman regularly employed as a telegraph operator, died June 17, at Rock Island, Ill. She was a telegrapher in Greenville, Pa., in 1848.

Samuel C. Potts, a telegrapher in the employ of the Atlantic Coast Line, died at Lake Waccamaw, N. C., May 28, aged sixty-five years. Mr. Potts was an operator in the Confederate service during the Civil War.

Henry Frank Tracey, chief train despatcher of the Chicago division of the Santa Fe System, died June 11 at Chillicothe, Ill., aged fifty-eight years. Mr. Tracey was born in Newark, N. J., and entered the service of the Western Union Telegraph Company at New York, as messenger, when thirteen years of age. He afterward became a first-class press operator, being employed in that capacity in many of the larger cities throughout the United States. Since 1884 he has been in the Santa Fe service at Chillicothe.

Convention of Commercial Telegraphers' Union.

At the national convention of the Commercial Telegraphers' Union, held in Chicago, June 13 to 17, the following officers were elected: S. J. Konenkamp, Pittsburg, president; Durward Warner, Winnipeg, vice-president; Wesley Russell, Chicago, secretary-treasurer; executive board, Charles E. Hill, Toronto; James B. Finan, St. Louis; E. M. Moore, Chicago; J. F. McMasters, New York; George C. Towne, Akron, O.; delegates to the American Federation of Labor convention, James B. Finan and S. J. Konenkamp. The executive board will select the next place of meeting.

According to measures adopted by the convention steps will be taken to organize the telephone girls throughout the United States, the new organization to be known as the Commercial Telegraphers' Union of America and the Telephone Operator's association.

It was decided at the convention that the commercial telegraphers would follow the policy of the railroad brotherhoods and not press for the closed shop, but the officers of the union would represent them in any negotiations with the telegraph companies.

Representatives of the Canadian branches of the union and the Order of Railroad Telegraphers were at the convention and arrangements were made to organize the wireless operators the pay of whom, it is claimed, is lower comparatively than in any other branch of telegraphy.

United Press Election.

At the annual meeting of the United Press, held in New York recently, the old board of directors was re-elected. It is composed of H. B. Clark, C. D. Lee and R. W. Howard, New York; J. C. Harper, Cincinnati; B. H. Canfield, San Diego; H. N. Rickey and W. B. Colver, Cleveland. At the annual meeting of the board of directors held in Cleveland June 11, the following officers were elected: C. D. Lee, president; Roy W. Howard, first vice-president; Oliver S. Herschman, second vice-president; Alexander Dodds, third vice-president; J. C. Harper, secretary and C. J. Stein, treasurer. H. P. Clark, the retiring president, was elected to serve as chairman of the board of directors for the next year. Roy W. Howard was re-elected to the office of general news manager. According to the annual report the United Press is now operating over 40,000 miles of wire circuits in its work of disseminating news for afternoon and Sunday morning newspapers.

Increase in Capitalization of Publishers' Press.

The Publishers' Press, in order to extend its business, has been re-incorporated in New Jersey, as briefly announced in our June 16 issue and has increased its capital stock to \$500,000. The growth of the business of this organization has convinced its backers that there is a field for a first-class, up-to-date Feature News and Syndicate Service, along the lines it has been working, and uncontrolled by any newspaper or combination of newspapers. The business has developed so rapidly that in order to meet the call for its extension promptly and satisfactorily, it was determined to increase its capital stock.

The meeting of the Board of Directors, which decided upon this action, re-elected Mr. Curtis J. Mar, president and general manager, and he was given charge of the work of the further extension of the service.

Many of the leading papers in the country are now taking either the News or Syndicate Service of the Publishers Press, and its list of clients is steadily growing.

Legal.

According to a decision of Judge Pendleton of the Superior Court of Georgia, telegraph operators in that state are classed as day laborers and are exempt from garnishment. This opinion was

based on a ruling of the Supreme Court which had declared a stenographer exempt from garnishment. The Supreme court held that as a stenographer learned only a certain number of characters and put these in use in his business daily he was a day laborer and exempt. Judge Pendleton, in making his ruling, pointed out that an operator learned a certain number of characters in the telegraph code as does the stenographic code, and was therefore exempt under the ruling of the supreme court.

A Problem for Our Readers.

Possibly some of our readers who have had extensive experience in line testing will be able to give a satisfactory solution of the following problem which has been given by Mr. D. B. Grandy of the American Telephone and Telegraph Company, St. Louis. If so, we would be glad to hear from them:

"A lineman is out after a cross. In testing with him he puts a cross on the pair which is in trouble and the measurement to his cross is higher than the original cross. I have known of such cases and doubtless others have experienced the same difficulty. I have a theory in regard to it, but it is not entirely satisfactory."

LETTERS FROM OUR AGENTS.

PHILADELPHIA, WESTERN UNION.

Mr. F. H. Shriner has been appointed assistant manager in place of R. A. Black transferred to the General Superintendent's office at New York.

Mr. John McCoy, from Carlisle, Pa., but now in this office, and Miss Isabella Ferguson were married on April 6.

Mr. John C. Landin, of this office, while hurrying to get out of a severe electrical storm, June 18, dropped dead in the street from heart disease. Mr. Landin was forty years of age and came from Atlanta, Ga., about a month ago. His parents reside at Belleville, Ontario.

The Electrical Aid Society of Philadelphia gave an outing at Woodside Park on Saturday, June 18, at which about four hundred were present. Athletic sports of all kinds were indulged in, including a game of baseball, sack races, etc. Though the sports were interrupted by a severe thunder shower at about 3.30 the event, so far as it proceeded, was pronounced a success, and will probably be repeated.

Recent arrivals in this office are: John L. Vale, from Pittsburgh; Wm. F. Wilcoxon, from Chicago; E. M. Lewis and H. N. Lewis, from Cape Charles, Va.; L. W. Arwell, from Trenton, N. J.; Miss Olive Boyce, from the Baltimore and Ohio Railroad; C. G. Danenhower, J. A. Donahue and D. A. Coyle, from brokerage offices; J. P. Simons, A. J. Ryan, F. H. Lytle, Miss Elizabeth Fitzgerald and Miss Anna Bloomfield.

E. Standifer has gone to Boston; L. Neigut and F. Engle have been transferred to Wilmington, Dela.; A. B. Cain and W. E. Lowe to Atlantic City and G. A. Truit to a broker's office.

NEW YORK, WESTERN UNION.

The electrical class held a very instructive meeting on June 24. Mr. Charles Thom, of the Quadruplex department, and Professor Williams, of Erasmus Hall High School, delivered lectures of an interesting nature. The class, owing to the extreme warm weather decided to postpone further meetings until September.

Business in the operating department is unusually heavy, presaging a very busy summer.

OTHER NEW YORK NEWS.

The Magnetic Club, of New York City, has decided not to hold any outing during the present summer.

Assessment No. 510 has been levied by the Telegraphers' Mutual Benefit Association to meet the claims arising from the deaths of E. Frank Blanchard, at New York; Charles E. Chandler, at Los Angeles, Cal.; Edward Gordon, at Hudson, N. Y.; Charles A. Tommaney, at Albany, N. Y.; William H. Hartman, at Indianapolis, Ind., and Tunis H. Fisher, at Brooklyn, N. Y.

Trade Note.

If you wish to save money, there is no better way than to purchase a diamond on the Loftis Confidential Credit System. As a safe investment, diamonds excel even banks for security. They pay a higher rate of interest than any bank, because they increase in value 10 to 20 per cent. each year.

For wedding, graduation, confirmation and birthday gifts nothing is more appropriate than a fine diamond or high-grade watch.

A sample copy of the Loftis Magazine, devoted to "Styles and Stories of Diamonds, Precious Stones, Fine Watches, and Artistic Jewelry," will be sent free, postage paid. Address Loftis Bros. and Co., Dept. G 795, 92 to 98 State Street, Chicago, Ill.

General Mention.

It is reported that about 4,300 miles of new telegraph lines will soon be constructed in Brazil.

Telegraphic communication has been established between Cape Colony and German South-West Africa.

Some experiments have been carried on recently in telephonic transmission through the earth with a view of facilitating communication with miners in case of accident.

The Order of Railroad Telegraphers is having plans prepared for a new sixteen-story building which will be erected by them in St. Louis on land which has recently been bought for this purpose. It is said that this will be the only building owned by a labor organization in the country. Mr. Leon W. Quick, secretary and treasurer of the organization, who is city treasurer of St. Louis and president of the Washington National bank of that city, is in charge of the movement to erect the new building.

Twenty-five Western Union messenger boys in a western city went on a strike recently because of a quarrel between one of the night clerks and Nils Jensen, one of their number, and refused to work until the clerk was discharged. One of the boys explained the cause of the strike as follows: "Dey tried some rough stuff but dey couldn't get by wit it. Dey tried to slip de crutcher to Nifty (meaning Jensen) but we crabbed de game. We're out 'til dey slips de hook to dis brow, an' if we need any help de rest of de gang at de Postal and de other joints will ramble wit us."

The Serial Building Loan and Savings Institution, of 195 Broadway, New York, is assisting hundreds of telegraphers to buy their homes, instead of paying rent all of their lives. Most men with families pay enough for rent in the course of their lifetime to buy several homes as good as the rented one. The Serial was organized for the purpose of assisting telegraph and telephone people to buy their own homes, so that when they had paid for the same they would have an opportunity to save something for their old age. Write for particulars.

Advertising will be accepted to appear in this column at the rate of fifty cents a line, estimating eight words to the line.

Will buy or sell, in one to ten-share lots, Western Union Telegraph Company and Mackay Companies stocks. Remittances by New York draft or express money order are requested. Address "Stock Investment," care Telegraph and Telephone Age, 253 Broadway, New York.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. This renders the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEYBOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Elementary Lessons in Electrical Measurements.

PART VI.

In the preceding installment of this article it was shown that when measuring a conductor for resistance, while Ohm's law $\frac{E}{C}=R$ is strictly correct for the final answer everything depends upon the conditions existing at the instant the measurement is taken. For example, it has been shown that inductance, in the shape of a coil of wire, and capacity in the form of a condenser, either singly or in combination, when inserted in a circuit play a very important part and must be considered in the computations.

In a closed circuit wherein a direct current is flowing neither inductance nor capacity can affect the value of the quotient obtained by the formula $\frac{E}{C}=R$, because they are not developed or present except during the period in which the current is actually rising and falling. Hence the value of R is somewhat different for a closed circuit than it is when the latter is working. The faster such a circuit is worked the greater becomes the apparent resistance, and vice versa, the slower, the less resistance. This fact explains why slow sending is necessary on certain long railroad wires containing a great number of relays, or inductance developers. Obviously the actual resistance of

relays and the wire itself does not alter in the least owing to the speed.

If any one doubts the harmful effect of inductance in a fast working circuit and should attempt to belittle its importance, let him study its value when inserted in an alternating current circuit where the changes in the value of the current are rapid and frequent.

The first thing he will discover is that in a straight conductor, that is to say, one containing no inductance, such as an incandescent electric light circuit, the current, or heating effect, as well as the ohmic resistance will be the same with an alternating current, as it is with a direct current provided the electromotive force is the same.

If an inductance of four or five ohms, say a four-ohm sounder, is then inserted in the direct current circuit, in series with a sixteen-candlepower lamp, the brilliancy of the latter will scarcely be altered but should the same coil be inserted in the alternating current circuit the lamp would barely glow. This proves that while actually but four ohms resisting material was added, there was really a great deal more resistance inserted. The actual amount of resistance developed by the coil is called the impedance or apparent resistance, and where the frequency of the current is great this apparent resistance is often much more than that of the wire itself. Hence for alternating current circuits an entirely different formula is required for electrical measurements. The formulas for ascertaining the value of the current in a circuit fed by an alternating current machine, therefore, vary according to the conditions existing in the circuits measured and which must be known in advance. That is to say, one must know whether the conductor contains merely ohmic resistance, coils or inductance, capacity, or the three in combination.

As this subject is too deep to be treated in an elementary lesson of this kind, the various formulas should be studied separately when the student has reached the chapter relating to the theory and actions of alternating currents. The facts given in this article should partially prepare the student for what follows and help him to grasp the true meaning of the formulas he will later come across.

MEASURING THE RESISTANCE OF WIRES WITHOUT BATTERY OR CURRENT.

If manufacturers of telegraph wires had to wait until the conductors were constructed before being able to tell their resistance per mile after making the $\frac{E}{C}=R$ test, it would be rather a difficult task to furnish conductors to order which would meet given specifications. Fortunately there is a way of knowing in advance just what the ohmic

resistance of any conductor will be when carefully drawn.

The necessity of some such method of ordering wires constructed should be apparent when the fact is considered that the various gauges of coils now in use differ somewhat in the ohmic resistance per mile for the same number with different manufacturers. Thus a twelve-gauge copper wire made by Brown and Sharp (B. & S.) is a smaller wire than a twelve-gauge manufactured by Birmingham (B. W. G.), while the British standard and others also differ slightly. A chief operator therefore should not depend solely upon the rated ohms per mile of any particular gauge of wire unless he knows who manufactured it.

Wire measuring without battery or galvanometer is accomplished by comparing a conductor with the weight, length, diameter, and resistance of one foot of the metal drawn out into a circular wire possessing a uniform diameter of exactly on thousandth of an inch.

For example, a copper wire of these dimensions has 10.79 ohms resistance. Hence the resistance of a longer wire possessing the same diameter would be found by simply multiplying 10.79 by its length in feet.

If the wire to be measured was two thousandths of an inch in diameter we know that the resistance of one foot will be only one-fourth as great as a foot of wire of half its diameter because the resistance varies directly with the length and inversely with the cross section.

From the knowledge of these facts to begin with it is possible to construct the following formula:

$$R = \frac{K+L}{D^2}$$

Where R=Resistance of wire measured.

L=Length of wire in feet.

K=Resistance of one mil foot, i. e., of a piece of wire one thousandth of an inch in diameter and one foot long.

D=Diameter in thousandths of an inch.

As D represents a fraction of one thousand the area or cross section of a wire is usually expressed in whole numbers as so many mils. A mil, therefore, is the unit of area and refers to the diameter, and not to the length of the wire. As wires are round the area is computed in circular mils and the number of circular mils in any wire is equal to the square of the diameter in thousandths of an inch. Hence $CM = D^2$.

Suppose it is desired to determine the resistance of 5000 feet of copper wire having a diameter of two-tenths of an inch.

Now, two-tenths of an inch means 200 mils and the square of 200 is 40,000, which represents D^2 . Hence according to the formula the total resistance of the wire is 1.34 ohms, because substituting these figures in the formula given we have:

$$\frac{10.79 \times 5,000}{40,000} = \frac{53,950}{40,000} = 1.34 + \text{ohms}$$

If the wire is iron instead of copper the same

formula is used, but K for iron is always 63.35. The value of K is different for different metals, but always the same for the same metal of standard grade.

The weight per mile of any copper wire is found by dividing its area in circular mils by the constant 62.5.

For iron wires divide by 72.13.

If the reader will work out a few examples of his own he will readily see how simple the problems are. Remember that CM and D^2 are of equal value and that there are 5280 feet in a mile.

(To Be Continued.)

Recent Telegraph and Telephone Patents.

A patent, No. 961,815, for a telephone relay or repeater, has been granted to L. W. Southgate, of Worcester, Mass.

A patent, No. 962,082, for a printing telegraph, has been awarded to T. M. Foote, of Allston, Mass. An independent printing wheel parallel to the main printing wheel, one for printing the title and the other the quotations and a third wheel for printing the numbers of past quotations.

A patent, No. 962,431, for a type carriage propelling mechanism for printing telegraph receivers, has been issued to G. S. Hiltz, of Brooklyn, N. Y. For effecting the return of the carriage from any point to its initial position.

A patent No. 962,645, for a telephone system, has been taken out by R. C. Livingston, of Spring Valley, N. Y.

A patent No. 962,604, for a printing telegraph receiver, has been secured by Marie Burry, of New York, executrix of John Burry, deceased. Type carrier setting mechanism including an electro-magnet and a printing mechanism with actuating magnet, with a third magnet for causing the first two to actuate their mechanisms in the order named.

A patent No. 962,709, for telegraphy has been granted to I. Kitsee, of Philadelphia. For telegraphing on lines such as submarine cables with great capacity, by means of an alphabet having heavy lines above an imaginary zero line, the space consisting of a heavy line below and above the zero line.

A patent No. 962,800, for a telephone system, has been awarded to J. B. Taylor, of Schenectady, N. Y. Transmission circuit and switch, a transformer with one winding connected to the receiving and transmitting apparatus and a second winding connected through the switch to the transmission circuit and a bell connected across the circuit between it and the switch.

The following patents have expired:

Patent No. 499,748, for a telephone exchange, issued to Alfred E. McClaren, of Joplin Mo.

Patent No. 499,811, for telegraphy, issued to Pierson J. Wicks, of Brooklyn, N. Y.

Patent No. 500,545, for a telephone system, issued to George L. Anders, of London, Eng.

Personal.

Mr. W. T. Gentry, president of the Southern Bell Telephone Company, Atlanta, Ga., was a recent New York visitor, coming to this city in the interest of the service.

Mr. E. C. Bradley, vice-president and general manager of the Pacific Telephone and Telegraph Company, San Francisco, is in New York on company business.

Mr. Ernst Halling, assistant manager of the Government telegraph office at Stockholm, Sweden, has returned to that place after visiting this country for the past four months for the purpose of inspecting our telegraph systems.

Dr. Robert B. Lawson, formerly a member of the telegraph profession at Lynchburg, Va., but for some years past a member of the faculty of the University of North Carolina, Chapel Hill, N. C., accompanied by his wife and daughter, is spending the summer at East Orange, N. J.

Mr. L. W. Storrer, special representative of the Postal Telegraph-Cable Company on the Pacific Coast since 1907, before which time he was for many years general superintendent at San Francisco, has resigned to accept the position of supervisor of telegraphs of the Pacific Telephone and Telegraph Company.

Mr. A. C. Terry, for many years identified with the Western Union Telegraph Company at Buffalo, but for the past ten years district manager of the American Telephone and Telegraph Company, Pittsburgh, Pa., was a recent New York business visitor. While in the city Mr. Terry took occasion to call on his numerous friends.

A recent number of the Electrical Review and Western Electrician contains a large engraving and biographical sketch of Mr. Ralph W. Pope, who has for the past twenty-five years been secretary of the American Institute of Electrical Engineers and who was formerly a prominent figure in telegraph circles. Mr. Pope is one of the most widely-known men connected with the electrical industry.

Mr. John A. Townsend, a forty-niner of the telegraph, for many years, and until four years ago, manager of the Western Union Telegraph Company, at Dunkirk, N. Y., now living in retirement at Rochester, N. Y., is spending the summer at Akron, O. Mr. Townsend was born at Akron, April 24, 1837, and became an operator at the same point in 1849, since which time he has been one of the most honored members of the telegraphic fraternity.

Postal Telegraph-Cable Company.**EXECUTIVE OFFICES.**

Mr. E. J. Nally, vice-president and general manager of the company, left July 11, for a three weeks' vacation.

Mr. L. Lemon, division superintendent, after spending two weeks at Beach Haven, N. J., will relieve Mr. C. E. Bagley, superintendent at Philadelphia, while the latter goes on a vacation.

At a recent meeting of the New York State Welfare Committee of the National Civic Federation, Mr. E. J. Nally, vice-president and general manager of this company, told how his corporation kept its employes from falling into the hands of loan "sharks." The company's Mutual Investment Association, he said, is a savings association organized by the employes in New York, and has for one of its features the lending of money to employes at the legal interest rate of six per cent. per annum, the money to be repaid in small weekly installments. The company also has an organization which provides for employes who are incapacitated.

A large photograph of Manager F. F. Norton and twenty-eight of the chief operators comprising the official staff of the operating department, was recently taken in the vestibule of the building on the Broadway side. It is a handsome picture, and one of them suitably framed has been placed on the wall in the office of Mr. E. B. Pillsbury, general superintendent of the eastern division.

Mr. J. B. Coggins, manager of the Denver, Colo., office was a recent executive office visitor.

A charter has been issued at Oklahoma City to the Postal Telegraph-Cable Company of Oklahoma City. The capital stock is \$10,000 and the directors are A. B. Richards and George Rheem, of Kansas City, and W. A. Logan, of Oklahoma City.

Mr. Charles Kiryon, of Newton, Iowa, has accepted a position in the Davenport, Iowa, office of the company. Mr. Kiryon is a man of some experience in the service, having been employed in the main office in Chicago and acted as manager of the Marshalltown, Iowa, office temporarily.

RESIGNATIONS AND APPOINTMENTS.

Mr. R. H. Cook has been appointed manager of the Pittston, Pa., office, vice J. Mondeau, resigned.

Mr. W. W. Morrison, formerly manager at Des Moines, Iowa, but who has been out of the service for some time past, has been appointed manager at Lincoln, Neb., of this company's interests.

Western Union Telegraph Company.**EXECUTIVE OFFICES.**

Many of the friends and business associates of Mr. E. J. Hall, chairman of the executive committee, were at the dock on Saturday, June 9, to see him start for Europe on the steamer Minnewaska. His trip abroad is for rest.

Mr. E. J. Hall, chairman of the executive committee; Mr. Belvidere Brooks, general manager; Mr. S. M. Williams, special agent; Mr. A. G. Saylor, general superintendent, and Mr. E. M. Mulford, superintendent of the first district of the eastern division, all of New York, recently inspected the New York Central lines between this city and Buffalo, including the various important offices of the company at Buffalo, Rochester, Syracuse and Albany.

The general superintendents of the company, consisting of Mr. C. H. Gaunt, of San Francisco; Mr. B. F. Dillon, of Atlanta; Mr. T. P. Cook, of Chicago, and Mr. A. G. Saylor, of New York, together with other executive officers of the company, held conferences in New York several days last week. The matters discussed related to general service methods.

Among recent executive office visitors were, Mr. Charles H. Gaunt, general superintendent at San Francisco; Mr. T. P. Cook, general superintendent at Chicago, accompanied by his secretary, Mr. M. T. Cook; Mr. B. F. Dillon, general superintendent at Atlanta, accompanied by his secretary, Mr. R. L. Barnes; Mr. John C. Nelson, superintendent at Omaha, Nebr.; Mr. D. C. Dawson, superintendent at St. Johns, N. B.; Mr. J. S. Calvert, superintendent at Richmond, Va., and Mr. W. P. Cline, superintendent of telegraph of the Atlantic Coast Line, Wilmington, N. C.

At a meeting of the board of directors of the American District Telegraph Company of New Jersey, held July 12, Mr. William H. Baker was elected a member of the board of directors and of the executive committee and vice-president of the company. He will at once assume active administration of the duties of that office with headquarters at 195 Broadway, New York. Mr. Baker still retains his connection with the American Telephone and Telegraph Company as special agent.

Mr. E. D. Hall, son of Mr. E. J. Hall, chairman of the executive committee, has been appointed a special agent of the company and attached to the general manager's office. Part of Mr. Hall's duties consist in looking after the commercial end of the business. Mr. Hall for some years past has been identified with the service of the New York Telephone Company.

Mr. H. W. Ladd has been appointed assistant auditor of the company with offices on the sixth floor.

Commencing August 1, two new field divisions of this company's service will be established as follows:

The Mountain division—Mr. J. C. Nelson, general superintendent with headquarters at Denver, Colo., embracing the lines and territory in the states of Montana, Idaho, Wyoming, Colorado, Utah, Nebraska, Kansas and New Mexico.

The Gulf division—Mr. L. McKisick, general superintendent with headquarters at Dallas, Texas, embracing the states of Texas, Oklahoma and Louisiana.

The boundaries of the Western, Pacific and Southern divisions will be changed accordingly.

Mr. John W. Reed, manager of the Philadelphia office, has been advanced to the superintendency of the seventh district, eastern division, with headquarters at New Haven, Conn., to take effect on August 1, vice Mr. F. E. Clary, who has resigned to engage in commercial business at Los Angeles, Calif.

Mr. J. S. Calvert, superintendent at Richmond, Va., and T. P. Cummings, manager of the New Orleans office, will be the guests of Mr. F. E. Clary, superintendent at New Haven, during the next week. Before their return to the south, Messrs. Calvert and Cummings will visit many points in New England, including a trip to Mount Washington in company with their host.

Mr. J. A. Hill, assistant superintendent of the first district, New York, has been transferred to the office of the general superintendent of the eastern division. Mr. L. D. Beall, storekeeper of the company at New York, has been appointed assistant superintendent to succeed Mr. Hill.

The cable steamer, Robert C. Clowry, which has for some time past been engaged in overhauling the company's Atlantic cables, has completed her work on the long sections and is now working on the New York-Canso ends, and has succeeded in greatly improving their working conditions. Mr. C. B. Dunham, manager of the Canso cable station of the company, had charge of the expedition.

At the annual meeting of the Maine Telegraph Company, held June 25, the following board of directors was chosen: R. C. Clowry, B. Brooks, G. W. E. Atkins, A. R. Brewer and J. B. VanEvery, of New York, and Franklin A. Wilson and Charles E. Bliss, of Bangor.

RESIGNATIONS AND APPOINTMENTS.

Mr. R. D. McMillan, manager at Sydney, N. S., has been temporarily appointed to a position on the staff at Halifax, N. S. Mr. Parker Whitney of St. John, has been appointed temporary manager at Sydney to succeed Mr. McMillan.

Mr. John D. Steele, manager of the Nashua, N. H., office has been appointed to a position in the Boston office. He was relieved at Nashua by Mr. F. M. Headle, of Lincoln, N. H.

Mr. E. C. Davis, electrician of the Kansas City, Mo., office, has accepted a position in the Los Angeles, Calif., office. Mr. Davis is a telegraph engineer of ability.

Mr. C. J. Raby has transferred his services from Tampa, Fla., to the Dunnellon, Fla., office.

Mr. Oscar Marshall, of the Savannah, Ga., office, is now Associated Press operator at Lexington, Ky.

Mr. J. W. Reed Becomes Superintendent at New Haven, Conn.

Mr. John W. Reed, manager of the Western Union Telegraph Company at Philadelphia, has been advanced to the position of superintendent of the same interests at New Haven, Conn., to succeed Mr. F. E. Clary, resigned. Mr. Reed, during his incumbency of the managership in the Quaker City has made a splendid record for himself, his ability and excellent judgment in the management of a large telegraph center naturally qualified him for advancement and his superior officials wisely selected him to take charge of the seventh district of the eastern division.

Mr. Reed was born at Urbana, Ill., May 11, 1866. It was in September, 1881, that young Reed, then a lad of fifteen, entered upon his telegraphic career, at Rosendale, Mo. He was quick to learn the meaning of the dots and dashes, and from the first was a good operator, so that when he reached the position of telegraph operator and station agent of the Kansas City, St. Joseph and Council Bluffs Railroad, he was accounted a

JOHN W. REED.

Superintendent, Western Union Telegraph Company, New Haven, Conn.

"good man for the place." The commercial service, however, was more attractive to Mr. Reed than that of the railroad, and seeking employment therein was given a position as an operator for the Western Union Telegraph Company at Muscatine, Iowa. He subsequently served in the same capacity at Cedar Rapids, Iowa, Omaha, Neb., Butte, Mont., and Helena, Mont. During this period he had steadily gained reputation, and in many ways had demonstrated his capacity for executive direction.

His next position was that of manager at Durango, Colo., followed by a transfer to the head of the office at Colorado Springs, that state. Here his record was of such character as to lead to his appointment to the important office at Philadelphia, which position he has held for the past seven years.

Canadian Notes.

Mr. Wm. J. Camp, electrical engineer of the Canadian Pacific Railway's Telegraph, Montreal, Que., is making a trip of inspection of the system from the Pacific Coast eastward.

The Canadian Railway Commission has given notice that the question of commercial rates into and out of Winnipeg will be taken up for settlement at the meeting of the board in that city in September. The onus of proof will rest with the telegraph companies in regard to the tariffs which have been filed by the companies.

The Canadian government telegraph system is being extended westward from Edmonton, Athabasca, to the Peace River district. This work has been interfered with to a great extent by forest fires and windstorms.

The Great Northwestern Telegraph Company and the Canadian Pacific Railway's Telegraph have issued instructions that night telegrams written in French as well as in English would be accepted for transmission to any point of the company's service in Canada.

The development of the plant of the Canadian Pacific at Moose Jaw will necessitate the stringing of a number of new telegraph wires in and out of that city. In all about two thousand miles of wire will be strung immediately. The work will include four new wires from Moose Jaw to Regina, and two new wires from Regina to Winnipeg. There will also be strung a new direct wire to Prince Albert running via Regina and Saskatoon.

R. N. Young, Superintendent, Canadian Pacific's Telegraph, Moose Jaw, Sask.

We frequently have the pleasure of recording the advancement of Canadian born telegraphers who have come to the United States and been successful in their chosen profession. Fortunately, however, for the telegraph companies in Canada, some of the best of their operators remain in their native country and assist in developing the Canadian telegraph systems. Among these is Mr. R. Nelles Young, whose appointment to the superintendency of the Canadian Pacific Railway's Telegraph at Moose Jaw, Sask., was briefly announced in our July 1 issue. Mr. Young was born at Cayuga, Ont., September 4, 1870. At the age of nineteen he joined the forces of the Canadian division of the Michigan Central Railway as operator. The next year he transferred to the Canadian Pacific Railway in the same capacity and has been in their employ since that time. He soon became a train despatcher and next was advanced to the position of circuit manager. In 1903 he was appointed inspector of telegraphs for the central division with headquarters at Winnipeg, Man. In March, 1907, he was again advanced, this time to the assistant superintendency at Winnipeg, which position he held until his recent promotion. When the expansion of the company's business in Western Canada rendered a readjustment of the divisional lines necessary and required that another division be created, Mr. Young was the logical choice for the position of superintendent of the new division and was accordingly selected. The territory over which he now has charge is developing with astonishing rapidity and he will find many important matters to occupy his time and attention in the new field of labor.

His many friends, however, predict for him a high degree of success in the discharge of his new duties.

The Cable.

The Commercial Cable Company has finished overhauling its trans-Atlantic cables, replacing some of the shore ends with much heavier cable.

It is reported that France and Germany have concluded an agreement covering the South Atlantic Ocean, according to which each country guarantees to the other the use of its cables in the event of breakdown of the other's cable system.

The report of the Mexican Telegraph Company for the quarter ending June 30, part of which is estimated, shows gross operating receipts of \$207,000, an increase of \$42,000 over the corresponding month last year, and income available for dividends amounted to \$181,000. After paying the regular quarterly dividend of two and one-half per cent. there was left to be added to the surplus \$91,265. The total surplus of the company now amounts to \$2,399,139.

Municipal Electricians.

The members of the International Association of Municipal Electricians will regret to learn of the death, on July 5, of Mrs. A. W. Kittredge, wife of Mr. A. W. Kittredge, superintendent of police telegraphs of New Haven, Conn.

The work of placing the fire alarm telegraph wires in Brooklyn underground will not be started until a new fireproof building for the central office has been erected. An appropriation has been made for this purpose, but a site for the building has not as yet been selected.

A patent, No. 961,853, for a fire alarm system, has been granted to J. H. Garratt and W. J. McGovern, of Rochester, N. Y. A line circuit and a source of current connected therein within a signaling instrument and electromagnetically operated devices responsive to the line current for connecting the signaling device with the actuating means.

The annual convention of the International Association of Fire Chiefs will be held in Syracuse, N. Y., August 23 to 26. Among the papers which will be discussed will be one on "The Necessity of Quick and Accurate Notice of Location of Fires in Connection with Rapidly Moving Fire Apparatus," by William L. Riehl, superintendent of fire alarm telegraphs, Cincinnati, Ohio.

Plans for the fifteenth annual convention of the International Association of Municipal Electricians, which meets at Rochester, September 6, 7, 8 and 9 are now well under way. Among the subjects upon which papers will be presented are: "Wireless Telephone and Telegraph," "Lightning Protection," "Mercury Arc and other Rectifiers," "Relation of the Telephone to the General Organization of Fire Department Service," "Underground Work" and "Modern Police Telegraph Systems."

All of these are live subjects of vital importance to fire alarm and police telegraph superintend-

ents, and will bring out discussion, that all, who expect to keep abreast of the times, should hear.

Mr. Frank P. Foster, of Corning, N. Y., secretary of the Association, is busily engaged in the finishing details of the arrangements and is prepared to answer any question relating to the coming convention.

Obituary.

E. J. Lane, an old time press operator of Dayton, Ohio, died in that city on June 16.

William McInnes, aged eighty years, who was a member of the operating force at 195 Broadway, New York, until the time of the strike in 1883, died at Belvidere, N. J., on July 10. Mr. McInnes was the inventor of the hotel annunciator for which he received \$30,000.

Frank T. Howser, an old-time and military telegrapher, died at Landham, Md., July 2, aged seventy-three years. Mr. Howser rendered important service to the Government during the war, being located at that time at Frederick Junction. He was for a long time after the war ticket agent for the Baltimore and Ohio Railroad at Washington.

William Martin, aged sixty-six years, an old time and military telegrapher, died at Irondale, Mo., July 3. He was born at Baltimore, Md., and entered the service of the Iron Mountain Railroad as telegraph lineman under Colonel R. C. Clowry, now president of the Western Union Telegraph Company. He remained in the employ of that company for upwards of fifty years. He was a member of the United States Military Telegraph Corps and was present at the battle of Pilot Knob in September, 1864.

Benjamin Franklin Bush, an old time and military telegrapher, died at Denver, June 25, aged seventy years. Mr. Bush, after serving with distinction in the United States Military Telegraph Corps during the civil war, went west, and in 1869 became manager of the Denver office of the Western Union Telegraph Company when the telegraph was first extended to that point. Since that time, with the exception of two years in the early eighties, when he was engaged in other business, Mr. Bush has been continually employed in the Denver office until two years ago when he was retired on a pension. E. C. Bush, a brother, who was also a well known old time and military telegrapher, died in 1896.

Mr. E. W. Collins, superintendent of the Postal Telegraph-Cable Company at Cleveland, Ohio, in remitting to cover his subscription says: "During the past twenty-eight years I have become so accustomed to renewing my subscription to the Age that it has become a habit with me. It gives me pleasure to remit for same. Telegraph and Telephone Age is an education, an inspiration and a convenient ready reference on matters telegraphic. More power to it."

The Telephone.

The Tri-State Telephone and Telegraph Company of St. Paul has declared a quarterly dividend of one and one-half per cent. on its common stock.

It is reported that the Pacific Telephone and Telegraph Company is preparing to expend \$700,000 in improving its facilities in Spokane, Wash., and vicinity.

The Mexican Telephone and Telegraph Company is making preparations to double its facilities in the city of Mexico by installing a second central office having the same capacity as the one now in service.

In pursuance of its policy of forming a closer union of its subsidiary companies the American Telephone and Telegraph Company has offered to exchange its shares for stock of the Nebraska Telephone Company on the basis of three shares of American for four shares of Nebraska.

The New York Telephone Company on July 8 certified at Albany to the Secretary of State that it had merged the New York and Pennsylvania Telephone and Telegraph Company. The latter company was capitalized at \$1,000,000 and operates telephones in the southern tier of counties of New York State and some of the adjoining counties of Pennsylvania.

An innovation in telephone practice has been introduced by the Home Telephone Company of Detroit. What are known as wayside telephone stations or connection jacks, are installed at various street corners and public places. Regular telephone subscribers are furnished with a pocket telephone set for connection to these stations at a cost of fifty cents per month. This portable set weighs but a few ounces and is provided with a cord and plug which fits in any one of the wayside jacks and thus gives the user connection with a central office.

The Public Service Commission of the second district of New York is gathering information concerning the telephone companies of the state preparatory to assuming jurisdiction over them on September 1 under the law recently passed by the Legislature. All companies or persons engaged in the telephone business and having less than \$10,000 worth of property used in the service or which do not operate for a profit are exempt from supervision. There are over 1,100 telephone corporations in the state, but it is probable that less than half of these will come under the control of the Commission.

The Cumberland Telephone and Telegraph Company has been fined \$175,000 by the Chancery Court of Mississippi for alleged violation of the anti-trust law of that state. The Cumberland Company was charged with entering into a contract with an independent company for the purpose of shutting out competition. As the contract in question is the usual one which has been effected by the Bell companies throughout the country for traffic exchange with independent interests and its legality has not before been questioned, the case will be appealed to a higher court.

At a conference of Western Union and telephone officials at Kansas City a few days ago an arrangement was reached whereby the wire of the telegraph company will occupy the underground conduits of the telephone company.

The New England Telephone and Telegraph Company has bought on a mortgage foreclosure the property, franchises and rights of the People's Telephone Company of Exeter, N. H., which has operated for the past ten years in Exeter and nearby towns.

The telephone telegraph is the idea of three Danish engineers, and its purpose is to leave a recorded message for any subscriber called when away or otherwise prevented from responding to the call. The transmitting apparatus includes a keyboard like that of the ordinary typewriter. The receiving apparatus prints the message on a tape in ordinary characters, and single communications or a series of them can be sent at any time, to await prompt attention on the subscriber's return.

Mr. George F. Preston, general manager of the London telephone service, who accompanied Major Walter A. J. O'Meara, engineer-in-chief of the British Post Office, to this country last fall on his trip of inspection of our telegraph and telephone systems, upon his return to London, gave an interesting resumé of the impressions which he received of our telephone system. He did not hesitate to admit that the service in New York was unquestionably superior to that in London and attributed this condition largely to the fact that in New York there is only one organization responsible for the provision of telephone service, while in London there are two.

Items of Interest.

A son was born on June 18 to Mr. J. A. Crawford, manager of the Western Union Telegraph Company at St. Joseph, Mo. To make sure that the newcomer gets a proper start in the telegraph field Mr. Crawford will a little later have his name entered as a subscriber of Telegraph and Telephone Age.

Three employees of the Postal Telegraph-Cable Company at Salt Lake City were married on one day recently. Miss Anita Green, delivery clerk, was married to F. L. Thomas, a lineman and W. E. Bouma, a bonus operator, was married to Miss Perle Z. Hall, of Grand Rapids, Mich.

A New York Postal messenger boy was probably the means of saving the life of a man who was suddenly taken ill with appendicitis in a downtown subway station recently. Other passersby thought he was intoxicated and paid no attention to him, but the messenger boy discovered that he was sick, helped him to a bench in the station and asked him if there was anything he could do for him. The man gave the messenger his brother's telephone number and the boy disappeared. Within fifteen minutes the brother came and in less than an hour the stricken man was on the operating table and the operation was performed in time to save his life.

Morse Electric Club Annual Outing.

The annual summer outing of the Morse Electric Club, which occurred at College Point, L. I., July 9, was a most enjoyable affair, all present voting it to be one of the pleasantest outings ever held by the club. Special cars from Long Island City carried the party to the picnic grounds. The first event on the program was a ball game between two picked nines. This proved to be a closely contested affair, the umpire, Mr. F. J. Scherrer, assistant secretary of the Western Union Telegraph Company, doing his best to make allowances for any differences in the ability of the opposing players.

The scorekeeper, M. J. Hayden, manager of the Western Union Telegraph Company in Brooklyn, was unable to tell the exact score but it was evident that the team captained by W. C. Merly, secretary to General Manager Belvidere Brooks, of the Western Union, had beaten the other team whose captain was Mr. Gardner Irving, manager of the commercial news department.

The ball game was followed by several foot races, the most exciting of which was the hundred-yard dash for fat men. The first race was won by Mr. J. F. Nathan, but as some dissatisfaction was expressed because he did not carry as much weight as some of the other contestants the handicaps were readjusted and another heat was run. This time the race was never in doubt as Mr. W. E. Athearn led the field from the start and acquired such a momentum that he ran to the top of the steep bank beyond the finish line, before he could stop.

Further honor came to the department of the engineer of equipment in the next race when Mr. Frank Kitton won with ease from a large field. In the last race three sons of William Finn, also of the same department, were the prize winners. Mr. W. E. Athearn, engineer of equipment, expressed himself as highly pleased with the work of his staff in securing a majority of the honors of the day, and rewarded his faithful workers with good cigars.

At the conclusion of the sports all present did justice to the excellent dinner that had been prepared for them at Donnelly's Boulevard Hotel. After the dinner came the drawing for prizes. The committee having this matter in charge had secured enough prizes so that every member present was the recipient of something of value.

Among those present were: J. B. Van Every, F. J. Scherrer, R. J. Murphy, H. F. Van Every, J. Piccolo, L. D. Beall, H. E. Roberts, B. M. Downs, J. Forson, Gardner Irving, J. A. Dierks, J. W. Connolly, J. B. Taltavall, H. E. Dunham, F. E. Fitzgibbon, George Schreiner, Lewis Dresdner, Charles Jacobson, Patrick Mulhauser, B. H. Reynolds, J. F. Nathan, E. A. Baird, C. F. H. Johnson, W. L. Geehr, F. J. Sheridan, C. A. Kilfoyle, Joseph McCusker, E. F. Howell, M. J. O'Leary, William Finn, William Finn, Jr., T. A. Finn, Walter Finn, W. E. Athearn, F. Kitton,

M. J. Hayden, G. C. Atkins, J. W. Behre, J. A. Berry, J. J. Creamer, A. M. Lewis, J. Cahill, J. Veitch, Alex. Kline, H. V. Shelley, T. G. Singleton, M. H. Kerner, F. W. Lienau, G. W. Messer, H. Durland, T. A. Moore, T. Singer, W. C. Merly and T. Story, all of New York; F. E. Clary, of New Haven, Conn., and J. S. Calvert, of Richmond, Va.

Outing of Postal Branch Office Managers.

On June 25 the Branch Office Managers of the Postal Telegraph-Cable Company, New York, had their third annual outing at Witzel's College Point grounds, College Point, L. I., and every one present voted it the most enjoyable of any of the series of outings held so far. The guest of honor was Mr. C. F. Leonard superintendent of the first district, who, at the conclusion of the dinner, complimented his staff, and in his speech dwelt on the importance of the messenger boy in the telegraph field, pointing out that an obligation devolves upon those having to do with the boys to promote their physical, mental and moral welfare, so that those who in the course of time become our officials and those who may select another field of endeavor will have had the proper example and training to be good men and good citizens. Mr. Leonard was accompanied by Mr. J. B. Coggins, manager of the Denver, Colo., office, who was visiting New York, and who said he would take back West with him a very pleasant impression of the intelligence, loyalty and warm good fellowship of the personnel of the New York staff.

Twelve prizes were competed for in the field events. The first baseball game was won by the uptown managers under the captaincy of William Finley of the 703 Broadway office. The second game between two picked nines proved an interesting event.

E. S. Butterfield, general agent of the money transfer service, who distributes the company's millions and who is treasurer of the Serial Building Loan and Savings Institution, also chairman of the finance committee of the mutual investment association, played center field. Nothing got by him. No fly was too high to catch and his one handed stops were marvelous. He wielded the wagon tongue in Ty Cobb style, bringing in several runs. In fact, he made a hit each time he went to the plate. His base running made the old-time baseball players who were present gasp in admiration.

Superintendent Leonard, who is an enthusiastic baseball player, had to take orders from the captain of his team and was assigned to second base. He picked up grounders cleverly and as rapidly as he picked up messages in his earlier days, and he was voted by those present as good a ball player as he is a telegraph official.

The other positions on both sides were filled by the various branch managers, and the contest was exciting. We are still waiting, however, for the returns from the artist on the adding machine as to the complete footing of the runs and the total of the hits and errors columns.

The Military Telegrapher in the Civil War.

PART XLIII.

Mr. William K. Smith was a telegraph operator before the outbreak of the Civil War, but at the beginning of that conflict left the key to take up arms for his country. Later having been incapacitated for duty in the field he continued to serve the Union cause by joining the United States Military Telegraph Corps. In writing to Colonel William R. Plum, the historian of that organization, in 1878, he gave in part the following account of his military telegraph career:

"On October 27, 1864, while I was a member of the Forty-seventh Ohio Volunteers I was ordered to report to Colonel S. G. Lynch, assistant superintendent of United States Military Telegraphs at Cleveland, Ohio, for duty in the telegraph corps. Although ostensibly a member of the regiment mentioned, I had never joined my company or ever known of its whereabouts as I entered the service at this time for the sole purpose of joining the United States military telegraph, having been incapacitated for active service in the field on account of having been severely wounded in the battle of Antietam, while connected with the Seventh Michigan Volunteers in which regiment I had served in various positions from the time of its organization until I became disabled. A gun shot wound in the left shoulder kept me in the hospital for over a year. During the campaign in front of Richmond, Va., and the retreat of McClellan's forces to Harrison's Landing, I had frequently rendered important service in connection with the signal, telegraph and hospital corps. On account of the wounds received I was discharged from the Seventh Michigan.

"At the solicitation of Henry W. Stager, then train despatcher of the Lake Shore and Michigan Southern Railway between Cleveland and Toledo, I left the office in which I was then operating at Elmore, Ohio, and again braved the dangers of the war. I was assigned to duty in the department of West Virginia, and reported on the morning of November 7, 1864, to Charles O. Rowe, who was then assistant manager in charge of the Clarksburg office. On my arrival at that place, I was directed to proceed to New Creek Station, 201 miles west of Baltimore, and open a telegraph office at that point as it was deemed important that, inasmuch as numerous Confederate raids had recently been made in that direction, the department should be kept posted as to the movements of the Confederates in that locality who consisted mainly of small bands of guerillas. Before, however, I had started for my assigned post of duty, the order was countermanded and I had the pleasure of a ride on horseback to Bulltown, about fifty miles south of Clarksburg, and which was the outpost of our army in that direction. Another operator was sent to New Creek which, as events afterward showed, was very fortunate

for myself. In company with an escort of cavalry the journey to Bulltown was made in two days. The weather was stormy and the roads very bad. At Weston, a halt was made on the evening of the 7th of November, and the party remained in town that night. On the morning of the next day an early start was made, although the rain descended in torrents, completely drenching the operator and his escort. As it was the day on which the Presidential election took place, and there being quite a number of voting precincts along the road to Bulltown, and the means of transportation was limited, I was prevailed upon to carry a good supply of tickets for the admirers of Lincoln and McClellan, respectively, which I distributed along the sparsely settled valleys of Lewis and Braxton counties. The telegraph office at Bulltown I found was established in the house of an old resident near where the sutler held forth and the officers lodged.

"Soon after my arrival at Bulltown, I learned that the Confederates had made a raid on New Creek, sacked the place and captured the telegraph operator, W. H. H. Lancaster, taking away his boots, hat and coat, in which condition he was forced to travel on foot to Richmond, where he was incarcerated in Libby Prison and almost starved to death. After the close of the war, he was liberated and returned north, looking somewhat worse for wear but glad that his life was spared.

"The telegraph line from Clarksburg to Bulltown ran through a very rough country, but few poles were used between Weston and the southern terminus of the line, the wire being strung along from tree to tree through the woods. It required constant care and watchfulness on the part of the operators and repairers to keep the circuit clear. The wire near Bulltown was frequently cut by bushwhackers and parties hostile to the advance of civilization. While at Bulltown, I discovered that the wire was very often tampered with at a certain point in the woods on the Weston road, and on one occasion, I determined to investigate the matter, so giving directions for my telegraph repairer who took care of my horse to get ready late one evening, I provided myself with plenty of ammunition for my Colt's revolver and such other articles as were necessary and started for the neighborhood of the trouble. Having the countersign and a pass, I had no difficulty in passing the pickets. After a tedious ride along the dark and winding way, I arrived just at daybreak at a part of the road which wound its way around the side of a rough and rugged hillside at the bottom of which ran a small creek. At this point, I plunged into the thickly wooded upland and tied my horse to a sapling in a dense thicket. Approaching the road along which the telegraph wire was strung, by the aid of a pair of creepers I climbed a high tree where I could observe matters some distance. I had been in that position but a short time when

I heard a faint noise as if some one was approaching on horseback. I had not long to wait for in a few minutes I discerned a party of three persons on horseback dressed in butternut and armed with carbines leave the road and approach the place where I was seated in the tree top. Just as they came within hearing one of the party who seemed to be the leader suggested that inasmuch as they had learned that a raid was to be made in the direction of the Baltimore and Ohio Railroad, it would be a good thing to destroy the telegraph line as much as possible, and it was arranged that one of the party should cut the wires while the other two watched the road in both directions. The party then separated, one passing directly under the tree in which I was secreted, without observing me. I was prepared, however, for the worst and had my revolver all ready with the intention of firing the very instant I was discovered.

"This man who passed my hiding place made his way to the telegraph wire, and riding up onto the steep bank stopped his horse directly under the wire which at that point sagged considerably. Standing up on the back of his horse he attempted to cut the wire with the sharp edges of a pair of small plyers. Just at that moment I took deliberate aim and fired, the bullet striking one of the glass insulators which had been detached from a tree and was hanging on the wire. The glass fragments flew in all directions, some into the man's face and others striking the horse. The sharp report and the commotion made by the flying glass startled both horse and rider and the former started off at a gallop, throwing its rider who rolled down the steep bank into the road. That gentleman gathered himself together started as fast as he could in the direction his horse had taken and was soon lost to view. Nothing further was seen of either of the men, and I concluded that thinking they were caught by a scouting party of the Union forces they had scampered off as fast as they could. Satisfied that the coast was clear, I descended from the tree, mounted my horse and retraced my way back to camp.

"We had but little trouble after that with the wires while I remained at Bulltown. The latter part of February, 1865, I was transferred from Bulltown to Webster, a small station on the Parkersburg branch of the Baltimore and Ohio Railroad, four miles from Grafton, W. Va., where I established an office for the accommodation of the troops then stationed at Phillippi, the county seat of Barbour county, and about eight miles from Webster, where the Eighth Ohio Cavalry was looking out for the numerous bands of bushwhackers that infested that country.

"Nothing startling occurred until the morning of April 15, when the news was flashed over the wires that President Lincoln had been shot the evening before and had died that morning at 7.22. While at Webster, as well as at other points, I always slept by the side of my telegraph instru-

ment, and on the morning in question, I was awakened from my slumber by the words clicked out on the instrument, 'President Lincoln died at 7.22 this morning,' at first I thought that I had been asleep and dreamed it for I could not realize for an instant that such was the fact. But it was indeed too true. When I announced this news in the village and to the troops none believed me.

"The war having closed, telegraphic operations were at once opened with the principal cities of the south and on the second of May it was announced to 'all offices' that messages for the south would be received at the tariff then given.

"Upon the withdrawal of the troops from Phillippi the Weston office was closed, and during the latter part of July, I was assigned to duty at Red House Shoals on the Kanawha River, relieving Robert Wirth. Here the telegraph office was in an old frame building on the road to Charleston facing the river.

"It was while here that Alfred Gunn, employed in the quartermaster's department at Charlestown was discharged, the record of the department standing against him thus: 'A. Gun discharged for making a false report.' The regiment to which I had been attached having been on August 11, 1865, mustered out of service, I was notified in October to report to the mustering officer at Columbus, Ohio, to be mustered out. I accordingly did so and on October 30 received my discharge and returned to my home in Cleveland."

A patent has been granted recently in England to Mr. R. K. Gray, which has for its object the increasing of the self-inductance and the reducing of the capacity of submarine telegraph or telephone cables. The conductor is formed of wires of two different metals, one of which is magnetic. Thus a solid central copper core is braided with two sets of strands of copper and iron, respectively, the two sets being interlaced and insulated from one another.

In a recent paper presented before the British Institution of Civil Engineers Sir John Gavey gave a resume of the progress of electrical communication since the earliest days. In discussing the Wheatstone system the author pointed out that the limit of speed in connection with this system is set by the self-induction of the receiving apparatus. A speed more than double that of the Wheatstone recorder has been attained with an electrochemical receiver, which can be worked at 1,000 to 1,200 words a minute under favorable conditions, but in practice the difficulty of supplying the sending apparatus with the perforated slip, and of distributing the slip at the receiving end, constitutes a very serious obstacle to the commercial use of such high speeds. Even momentary contacts due to linemen at work result in the loss of several words at these high speeds.

Telegraph and Telephone Age

Entered as second-class matter, December 27, 1909, at the Post Office at New York, N. Y., under the act of March 3, 1879.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

July 16, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

A Future Possibility of the Telegraph.

The great business expansion of the past twenty-five years and the accompanying consolidation of small and widely separated interests into large corporations has resulted in such greatly changed methods of doing business that the methods in vogue a quarter of a century ago would mean failure for any great enterprise to-day. The growth of our industrial systems has gradually forced upon the leaders the adoption of a more systematic way of carrying on the work in order to reach the goal of success for which all are striving. In former times there were no companies of any kind so great but that one man could look after all of the details of their management in a general way. As expansion and consolidation have progressed, however, necessity has been the mother of invention and systematization of efforts has been the natural result until to-day the most successful industries are without exception, those in which the most perfect system has been developed. The success of the late E. H.

Harriman in welding together the separate units of the great railroad system which he founded was due to his recognition of the fact that all of the separate units must be made to work together in harmony for the good of all and to his ability to so organize the forces under him that this result should be accomplished. The railroads were the leaders in this line and to-day furnish models from which other enterprises may well pattern. Each department has its own particular work to do and in performing its tasks endeavors to assist the other departments in every way possible and not to hinder. Thus the various branches of the work are carried out in unison and the motive which guides all concerned is the best interests of the company at large.

Leaders of other industries have gradually come to recognize the fact that in order to win out in the race for supremacy and make their administrations a success they must adopt similar methods. The telegraph companies especially at the present time are making rapid strides in this direction, and are almost daily putting into effect new plans for increasing the efficiency of the service.

The days when telegraph officials were satisfied with the operating methods in use in the systems under their jurisdiction is past. Haphazard ways of handling the traffic, of keeping the accounts and of conducting the business in general no longer prevail. The best way to do each particular part of the work is being sought and each employe is having the fact impressed upon him that he is one unit in a great whole and that his duty first of all is to pull with and not against each of the other units. His own success as well as the success of his employing interests depends upon this one thing. We believe that this spirit of co-operation is more prevalent in the telegraph ranks to-day than it ever was before and not only that, but it is growing fast. If this continues and there is no reason why it should not, it will not be very many years before the people of our country will point with pride to their telegraph systems as models which other industrial enterprises may follow with profit.

Annual Reunion of Old Time and Military Telegraphers.

Those who expect to attend the twenty-ninth annual reunion of the Old Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps, which meets in Chicago, September 8, 9 and 10, should notify the committee on hotels as soon as possible, in order that reservations may be made in ample time to secure satisfactory accommodations. This committee consists of A. C. Murphy, Western Union Building, Chicago, chairman, E. S. Williams, F. V. Moffitt and M. J. Kenyon. The schedule of rates at the various hotels was given in our July 1 issue. In a circular letter sent to the military telegraphers, Colonel William Bender Wilson, of Holmesburg, Philadelphia, Pa., president of their organization, urges all to make a special effort to attend the com-

ing reunion. In his letter Colonel Wilson says in part:

"Already nearly thirteen hundred from our ranks have crossed the 'dark river' and for the few of us who remain, the march to its shores is daily becoming so rapid that it is evident none can hope to linger very far behind. Therefore, let us meet around the hospitable board of Chicago, look into each others faces and gather strength and courage to make further efforts to secure the recognition and rights which have been so long denied to our corps.

"While national legislation in our favor is in fair shape, I regret to say that our bills now in the masterful charge of Hon. E. L. Taylor, Jr., in the House and Hon. N. B. Scott in the Senate, did not pass during the recent session of Congress—I look for certain success, however, in the short session beginning next December. It behooves us therefore to present a strong front and battle with all our might until the cause is won and victory perches on our banners."

Any additional information regarding the reunion may be secured by addressing Mr. F. J. Scherrer, assistant secretary of the Western Union Telegraph Company, New York, who is secretary of the Old Timer's Association, or David Homer Bates, 658 Broadway, New York, secretary of the Military Telegrapher's Society.

A Record in Handling Press Matter.

It is estimated that the Western Union and the Postal Telegraph-Cable Companies transmitted 800,000 words over the wires from Reno during the eight hours after Johnson won the pugilistic championship at Reno, Nev., on July 4.

The five press associations and seven newspapers in New York City received, it is estimated, 300,000 words from their staff correspondents. The other big cities of the country shared in the remaining business over the direct wires.

There were over one hundred extra operators on duty and every transcontinental wire was in use. From the big cities the fight story was relayed to the smaller cities and towns, so that every telegraph operator did a share of the gigantic work.

Five direct wires flashed bulletins of the fight to the press associations from the arena. The temporary telegraph offices in Reno were used by special sporting writers who represented nearly every large newspaper in the country. In this way Reno set a record as a centre for distributing news of one single event.

In the seven New York newspapers who had staff correspondents at Reno 121 columns of space were devoted to the story of the fight.

Because of the holiday the telegraph companies had little commercial business, so they were enabled to give a large proportion of their wires over to the fight news. At night special operators were required to handle the thousands of fifty-word messages which were sent from Reno to every city in the country.

The cable and wireless companies sent reports to Europe, Cuba, South America and to ocean steamships wherever they could be reached. Special wires carried the stories of the fight to Canada and Mexico. The Panama Canal Zone also received direct news from the press associations.

The Telephone in the Philippine Islands.

Mr. A. E. Noble, general manager of the Philippine Islands Telephone and Telegraph Company, who has been visiting in this country for some time past, gives in a recent number of the Pacific Telephone Magazine some interesting facts in connection with telephone service in our island possessions.

A modern telephone system was installed in Manila in June, 1906, and the exchange now numbers 2700 subscribers. About one-third of these are natives and the appreciation and demand for service on their part is rapidly increasing. The company occupies its own two-story concrete building with a switchboard of eighteen positions, the whole outside and inside equipment being of the latest pattern. There are twenty-three private branch exchanges in the city. The government has no telephone system of its own, but is served through the local company.

On account of tropical conditions, plant construction is as yet practically in experimental stages. About one-third of the outside construction is underground and plans have been approved for a plant entirely of this character. The poles used are imported white cedar, and single wire with rubber covering makes up the aerial construction. It is impossible to use duplex on account of the rapid changes from bright sunshine to heavy rains. Mr. Noble states that probably more cable is used in proportion to the size of the exchange than in any city in the United States. On account of the humidity of the climate, the terminal room of the exchange is entirely enclosed in glass and is kept at a constant temperature of 112 degrees.

At present twenty-four young ladies constitute the operating force. They are all natives, and they have shown adaptability and efficiency in their calling. They all speak the native Tagalog, Spanish and English. It is a fact worthy of remark that this company is the first to avail itself of the labor of women in any capacity in the islands. At first there was difficulty in securing operators on account of the fancied lack of dignity in labor; an idea fostered by our Castilian predecessors. However, the situation is now entirely changed and there is a large waiting list for positions as operators. Every young lady is chaperoned to and from her work by a vigilant parent or duenna.

The Bolivian Government has appropriated \$33,000 for the construction of new telegraph lines during 1910 and \$18,000 for the repair of existing lines.

American Telegraph Engineering---Notes on History and Practice.*

BY WILLIAM MAVER, JR., AND DONALD MCNICOL.

Although there may not be any startling technical announcements to make relative to recent progress in American telegraph engineering practice, yet within the twenty-five years past, in common with the progress in other lines of engineering, substantial developments have been also made in the telegraphic art along numerous lines, such as the standardization of equipment, and the adoption of improved apparatus and methods of operation which have generally resulted in increased efficiency of the plant, greater reliability of operation, a more rapid handling of the traffic, and consequent improvement in the service rendered the public; and which developments have, in fact, been adequate to meet the demands made upon the telegraph.

The time has been deemed opportune to record some of the salient features of present telegraph engineering practice in this country, but first in order more clearly to illustrate the differences between past and modern practice a resumé of the early history of telegraph practice in this country will be essayed in which resumé certain more or less interesting items of information relating to that history, perhaps not hitherto published, or in any event not readily available, may be recounted.

The first electric telegraph line in this country was constructed by Morse in 1844 between Washington and Baltimore. The progress of this art into public favor was slow; due mainly to the high rates for service and to more or less imperfect service, the latter due mainly to poorly constructed lines and the former largely to heavy legal expense incurred in the effort to maintain for the Morse interests a monopoly of the telegraphic art. Morse gradually endeavored to obtain a British patent for his electro-magnetic telegraph, but failed on the score of previous publication. Bain of Edinburgh came to the United States in 1848 to obtain a patent covering his chemical telegraph which was refused on the allegation that his device infringed the patents of Morse. Bain's telegraph consisted of a device for perforating long and short holes in a strip of paper, which were used to transmit long and short impulses of current over a wire. At the receiving end he used a sheet or strip of paper saturated with a chemical solution consisting of nitric acid two parts, prussiate of potash twenty parts and pure liquid ammonia two parts, which solution was decomposed by an electric current from the sending station thereby leaving long and short marks on the receiving paper sheet or strip. Bain pressed his claims in the United States Supreme Court and in the year 1849 a patent was finally allowed. A British patent to Morse would have been of doubtful value at that time, as during the life of the United States patent the Morse telegraph was but sparingly used in Great Britain, vari-

ous needle and dial telegraph systems having obtained a strong foothold in that country.

The maximum speed claimed for the Bain system was about 1,000 words per minute, but as a writer of that day remarked, "The process of preparing the message to be transmitted, took quite as long as to transmit it" by the Morse method, and while "Mr. Bain's plan was entirely successful as far as it went it was found that after the quick receipt of a long despatch, it would take about as long to copy it into manuscript as it would have taken to transmit it in the ordinary manner in the first place." Following the granting of the United States patent to Bain, numerous telegraph companies were organized and lines built on which the Bain automatic chemical system was employed, in opposition to the Morse companies, but in 1850 an injunction was obtained, based on the charge that Bain's apparatus infringed the Morse telegraph patent of 1840. A consolidation of many of the chemical automatic companies with the existing Morse lines soon followed, and subsequently the Morse manual system (in which the Morse stylus recorder, or register was used) went into almost general use. The Morse register was gradually displaced by the reading sounder, but not without opposition on the part of the superintendents of telegraph who were apprehensive, needlessly as experience proved, of the introduction of errors thereby. The first printing telegraph was that due to Royal E. House, of Vermont, the use of which was begun in 1847-1848 and continued for many years in this country. This system employed a key-board, the depression of a key of which resulted in the printing of a given letter on a strip of paper at the receiving station. The speed of transmission by this system was about fifty words per minute. It was operated on lines 1,000 miles in length. The Morse interests endeavored to bring this telegraph printer within the scope of the Morse patents, but were over-ruled by the courts.

In the early days of the electric telegraph the methods of line construction were naturally crude, but every year saw improvements in the direction of

*In a personal letter to Mr. Maver dated August 22, 1890, Mr. D. H. Craig, who was a prominent figure in the early annals of American telegraphy, writes: "I used Bain's system on lines between New York, Boston and Portland between 1850 and 1853 and was able often in stormy weather to send to the Boston press columns of news when the Morse lines would not telegraph a word. We frequently, however, had trouble with 'tailings' when the dots and dashes all ran together and made the record partially or wholly unreliable, so that in a message or series of messages of 500 or 1,000 words there would be yards of record that would have to be discarded and the messages repeated. The later use of artificial resistances or magnets largely eliminated this trouble. Bain used on his early lines (for his chemical solution) nitrate of ammonium, two pounds to a gallon of water, and muriate of ammonia one pound to a gallon of water, and one-half ounce of yellow prussiate of potassa. This makes a fair solution, but we discarded it. (date not given) and substituted one half ounce red prussiate of ammonia and one pound of muriate of ammonia dissolved in one gallon of pure rain, or distilled water—iron pins were used with this."

*A paper presented at the Twenty-seventh Annual Convention of the American Institute of Electrical Engineers, Jefferson, N. H., June 28-July 1, 1910.

workmanship and materials used. Wooden poles were used from the first in this country, but the forms of insulators and the materials used in their construction were multitudinous, and it was not until much bitter experience was had with various "improvements" in insulators that practice converged on the glass petticoat form now universally employed in overhead electric telegraph work in this country. One of the so-called improvements termed the "brimstone" insulator was especially defective and nearly ruined several of the competing companies that employed it. This insulator consisted of an iron arm which screwed into an augur hole in the pole, the outer end of the arm carried a hollow pendant filled with sulphur into which an iron hook that upheld the line wire was inserted.

The civil war in this country, 1861-1865, again directed the attention of the world to the great utility of the electric telegraph in war, and while its use at this time did not perhaps materially aid in the advancement of telegraph engineering it emphasized the value of the Morse telegraph system for this purpose because of its simplicity and reliability in operation.

The source of electromotive force for telegraph purposes in this country up to the year 1855 was the Grove cell, which was displaced by a modification of the Smee cell known as the Chester battery, and this battery in turn gave way to the Callaud or gravity battery, of which up to the introduction of the dynamo machine in the year 1882, many thousands were in use. In some of the main telegraph offices 5,000 to 15,000 such cells were employed; entire floors of large office buildings being set aside for their occupation.

To meet the increasing demand for additional telegraph facilities in the decade 1870-1880, without resorting to the continual construction of additional line wires, the thoughts of inventors were directed to means for increasing the capacity of existing wires. To this end the chemical automatic telegraph, and the duplex and quadruplex systems of telegraphy were called into service. Thus in 1870 a compound wire of steel core and copper was erected between New York and Washington, a distance of 275 miles on which a chemical automatic system due to Mr. George Little was employed. This system was a modification of the Bain chemical telegraph previously mentioned herein. Originally, adequate means were not provided in the Little system for diminishing the "tailings," or prolonged currents, due to the static capacity of the line, at the receiving instrument, in consequence of which the speed of signaling was low. Subsequently Little introduced a plain resistance in shunt around the receiver with beneficial results.

The Varley devices consisting of electro magnets in shunt with the receiver, and of condensers in series with the receiver for the purpose of eliminating the tailings were subsequently employed, the electro-magnets probably first by H. Grace, to great advantage in this and certain other later automatic chemical

systems in which a single row of holes in the perforated paper (and a uni-directional current) was employed; the condenser as thus employed virtually giving the equivalent of the double current method. Still later the speed of transmission on this New York-Washington line was increased to 900 words per minute by the substitution of an iodine solution and by using a platinum needle in place of a nitric acid solution and an iron needle.

An important contribution to the art of chemical automatic telegraphy at this stage, was the Edison key-board perforator, which by the depression of a key perforated in a moving paper tape the characters necessary for any given letter. By the Little method of preparing the perforated tape not more than seven or eight words per minute was feasible, while with the Edison keyboard perforator the tape could be prepared at a maximum rate of forty words per minute, the average being about twenty-five words per minute. This key-board perforator while highly ingenious from a mechanical point of view was somewhat cumbersome in operation. The key board was about eighteen inches in length, and the keys had a drop of about two inches, requiring strong pressure to carry them down. As a writer of the period remarked "An hour's work on one of these punches is a severe strain on the muscles of a strong man." An important test of this system was made between Washington and New York, January 27, 1874, when the President's message on the Spanish "Protocol," consisting of 11,130 words, was transmitted. This matter was prepared for transmission by ten perforators in 45½ minutes. The message was transmitted in 59 minutes. Time from the beginning of perforation until message received at distant end of the wire, 53 minutes. The time consumed in translating the characters by ten operators in New York was about 45 minutes, or roughly it required 72 minutes for the entire operation. Four Morse operators on 4 single wires, it may be remarked, are capable of transmitting a message of this length in 55 minutes. In the practical operation of this system by the Automatic Telegraph Company on its single wire from New York to Washington, D. C., during 1873-1874 business was frequently badly delayed by the breaking of the wire, there being no emergency wire, or alternate route. This fact undoubtedly detrimentally affected the commercial success of this system, a result that must obviously follow in all cases where but one route or only a limited number of wires between the important business centers are available. This automatic system was subsequently employed, more or less in combination with the Morse manual system, on the lines of the Atlantic and Pacific Telegraph Company until the year 1876, when it was gradually displaced by the Morse manual method of transmission.*

*About the years 1875-77, the widely advertised claims of the Atlantic and Pacific Telegraph Company relative to the advantages of the chemical automatic and Wheatstone automatic telegraph systems controlled by that company were having a depressing effect on the stock of the Western Union Telegraph Company. Presumably to offset this effect Presi-

From about 1880 to 1884 the American Rapid Telegraph Company and its successors the Banker's and Merchant's, and United Lines Telegraph Companies, operated a chemical automatic system known as the Foote and Randall system. These companies lines (compound copper coated wires) extended from Boston and New York to Washington, Pittsburgh, Buffalo, Cleveland and intermediate points. In this system the double-current method was employed. The prepared paper was perforated in two rows.

Dots were represented by one hole on either side of the strip, the dashes by two holes. Consecutive dots, and dashes, were perforated diagonally on alternate sides of the paper strip. Two metal drums connected with the positive and negative poles, respectively, of a battery were placed side by side in such a manner that one drum came under the holes on one side of the paper, the other under the holes on the other side. Transmitting needles or brushes connected jointly to the line wire were arranged so that each was in line with one row of holes on the paper. By the arrangement of the holes each consecutive character of a letter, and the first character of a following letter were made by a different polarity to that making the preceding character, and consequently all letters containing more than one character were represented by dots and dashes on alternate sides of the received paper strip. At the receiving station needles were arranged in series in the line circuit as outlined, and rested on the sensitized receiving paper. As the chemical solution is decomposed only by a current of positive direction, marks were made by one needle with currents from one battery, and by the other needle with currents due to the other battery. In this system advantage was taken of the retardation of current due to the static capacity of the line in forming the dashes; the short perforations, all of uniform length, also limiting the time of contact of battery with the line, and thereby limiting the charge imparted to the line at each contact. The records thus produced were easily read by copyists. This system was capable of transmitting clear, legible characters between New York and Boston at the rate of 1,000 words per minute, and 500 words per minute were ordinarily so transmitted. Messages were prepared by operators using the Anderson key-board by means of which thirty to fifty words per minute could be perforated, the

dent Orton of the last named company contracted with Messrs. Craig, Randall and Foote to pay \$500,000 for a chemical automatic telegraph system that would be superior in every respect to that operated by the rival company. Tests were made of the new automatic system and the experts reported that all the technical conditions of the contract were fully met. Upon the sudden death of President Orton shortly thereafter, however, complications arose, a compromise offer of \$250,000 being declined, whereupon the contract was annulled and the inventors' interests in this system were turned over to the American Rapid Telegraph Company. It may be added on the authority of Mr. C. A. Landall that the inventors finally received about \$15,000 as their portion of the amount received for the patents covering the automatic system bearing their name (W. M. Jr.)

machine operating with the ease of an ordinary typewriter. In June, 1883, the American Rapid Company had in operation over 2,400 miles of pole line and 14,000 miles of wire. As already intimated this company began operations with the use of compound wires (six ohms per mile) consisting of a steel core covered with a copper strip each weighing 200 pounds to the mile. This compound wire proved unsatisfactory, owing it was claimed to imperfections in manufacture which led to breaks or openings in the copper strips admitting moisture and ultimately causing the copper to peel off in long lengths. Subsequently No. 6 iron wire was employed as line wires by this company. The rates charged by this company in 1881 for transmitting messages was \$1.00 for 195 words between New York and Boston, but experience showed this rate to be unprofitable and it was increased to fifteen cents for twenty words. The Foote and Randall automatic system was set aside in 1884 upon the financial failure of the company.

In 1881 the "Leggo" chemical automatic system was installed by the Postal Telegraph Company between New York and Chicago (1,000 miles) on its two 1.7-ohm-per-mile wires (compound steel and copper) on which by the Leggo system 1,000 words per minute were commonly transmitted. Taylor found by experiments on these wires that up to 400 miles, a speed of 400 words per minute was possible by the old Bain method; that is without compensating for the line static (see article by Theodore Taylor in *Electrical World*, May 24, 1884), but at a distance of 700 miles the signals arrived in a continuous black line. To remedy this defect Taylor introduced an extra battery at the receiver in opposition to the transmitting battery. The e.m.f. of the extra battery was one third that of the transmitting battery. With this arrangement a speed of 1,200 words per minute was possible on this New York-Chicago circuit.

The method of preparing the messages for transmission by the Leggo automatic system consisted in depositing an insulating ink spirally on a revolving metallic cylinder by means of a spout attached to the armature of an electro magnet operated by a relay or Morse key in a main or local circuit, somewhat analogous to the method by which speech is now indented on phonograph cylinders. The dots and dashes thus recorded were transmitted from the metallic cylinder at high rates of speed over the line circuit. An advantage claimed for this method of recording signals for re-transmission by Morse telegraphy was that the business originating at branch offices and way offices could be transmitted over through wires automatically without further preparation. The extra battery was kept constantly to the line during operation and at the instant when the transmitter needle or brush passed onto the insulated ink on the drum this negative polarity cut short the tailings. The Leggo automatic system was abandoned for lack of patronage after a comparatively short period of operation.

(To Be Continued.)

Education for Efficiency in Railroad Service.*

BY D. C. BUELL, OMAHA, NEB.

Chief of Educational Bureau of Information, Union Pacific Railway.

(Continued from Page 460, July 1 issue.)

INCREASING THE KNOWLEDGE AND EFFICIENCY OF EMPLOYEES.

In order that any employe desiring information, on any particular question or problem that arises from day to day, can obtain such information promptly, it has been arranged that such question or problem may be sent to the Bureau for an answer. There is no formality connected with this matter; all that is necessary is that the employe mail the question to the Bureau. The information requested is furnished through the Bureau in a simple, practical manner, as promptly as possible. All answers are passed on by the Advisory Board, thus insuring the accuracy of the information so furnished. As the Bureau has its own telegraph office, officials can get information direct by wire, using cipher code if desirable.

In cases where questions asked the Bureau are of such a nature that the questioner would be benefited by practical demonstrations or personal instruction, arrangements are made either to bring the questioner to a point where he can be given authoritative and thorough information on the subject, or to have a representative of the Bureau call on this man and give the information personally; e. g., questions on filing systems have been asked and the questioner has been brought to headquarters where he can familiarize himself with filing systems in effect in the different offices. To make sure that the questioner has absorbed the information, it has been a practice to make such a man write a report of his observations in a case of this kind. This serves the double purpose of giving assurance that the man has profited by his opportunity, and at the same time, puts on record information that will answer similar questions that may be asked in the future. In other cases the Test Department has been asked to arrange apparatus to demonstrate practical problems which the questioner has had difficulty in understanding.

While this part of the Bureau work has not met with the response that was expected, it is, nevertheless, an important adjunct to a proposition of this kind, and serves a useful purpose, in allowing certain classes of men who want information about a few practical points connected with their work, to obtain this information without going through the long course of study necessary by other methods. It is well to observe that this feature is separate from the ordinary

correspondence school feature, which allows students to ask questions about their lessons, the questions about points in the lesson being answered by the Instruction Department in the regular routine of the instructional work.

PREPARING PROSPECTIVE EMPLOYEES FOR SERVICE.

In order not only to increase the efficiency of the men in the service, but at the same time to improve the class of men taken into the service, it was decided that the Bureau should assist in whatever way possible in selecting and preparing prospective employes for the service. It was not intended that any official should feel that his help must be hired through the Bureau, but it was felt that if the Bureau could keep in touch with good material to fill minor positions, the officials would be glad to take advantage of such an opportunity to get a better grade of help into their organization. With this end in view, the Bureau keeps in touch with universities and other schools, and with such other sources of material as produce good men for minor railroad positions. In a great many cases, applicants for position with the road are referred directly to the Bureau, and all applications received by the Bureau are carefully investigated by it as to the personal history, references and physical qualifications of the applicants, so that the Bureau is practically assured, when recommending a man for a certain position, that the man can pass both the physical examinations and the mental examination, and has a good character and a clean record. In certain cases where prospects of this kind show up well, and it is expected that they can be placed in service at a not too distant date, they are allowed to start in studying on the history and geography of the road, and even on the more advanced courses along the lines of the work in the field which they desire to enter. Since the Bureau was established, 388 applicants for positions with the company have been investigated, 73 of these have been recommended for positions, 36 of these having been put into the service. This is exclusive of station helpers. In all cases of applications for employment, preference is given to those coming from relatives of employes.

The Bureau does not solicit positions for any of these applicants, it being understood that a request will have to be made to the Bureau if its assistance is desired in furnishing help, but the Bureau is glad to assist in any way possible, when requested to do so. It is also understood that the interest of the Bureau in the men furnished ceases when they are employed, unless they later take advantage of the privilege of the educational features of the Bureau work.

Applications of experienced railroad men, when received, are looked up by the Bureau, and if their records are satisfactory, their names are placed on file so that in case it should be necessary to go outside of the organization for help of this kind, the Bureau will have records of

*Paper read at the convention of the Association of Railway Telegraph Superintendents, Los Angeles, June 20-25.

suitable men. It is expected, however, that all positions of this kind will be filled from our own ranks, and with this end in view, the names of students making marked progress in their studies are placed before the General Superintendent, so that, in this way, men who are available for promotion will have a better chance to connect with vacancies which they may be qualified to fill when the opportunity is offered. This obviates to a great extent the necessity of ever going outside of our own ranks for men to fill advanced positions.

In addition to the foregoing, there has been established under this third object a station training school at the Bureau's headquarters for the preparation of station helpers who will be available for promotion to operators. This feature of the work, gentlemen, is of particular interest to you.

Conditions met with on the Union Pacific, in common with other roads, in obtaining satisfactory material from which to make operators, led to the experiment of making an arrangement with telegraph schools along our line to furnish their graduates for our station work. Such arrangement was made some two years before the establishment of this Bureau. These contract telegraph schools were furnished with main line telegraph wires. Station blanks and forms were also furnished, the authorities of the schools agreeing to teach the station work to their telegraph students. The company appointed an instructor to make regular visits to these various schools and to keep in touch with the situation and also to assist the students after they got out on the line. The results obtained, while more satisfactory than before any systematic effort had been made to recruit material for operators, had many objections, the principal objection being that the schools would not teach the station work properly. When these students were sent out it was found they were of but little assistance to the agents, and the agents would not help them with their station work, nor give them much opportunity for practice on the wire. Our figures show that we lost about fifty per cent. of all such telegraph school graduates before they had served long enough to be promoted to operators. When the Bureau was established, plans were immediately made to organize a station training school in connection with the Bureau work. With the active co-operation of Mr. J. B. Sheldon, our Superintendent of Telegraph, a model local freight station was equipped at the Bureau headquarters; main line wires were cut in; the station posted as a regular telegraph office, both for railway and Western Union business; sounders connected to the main line circuits were distributed about the room; practice circuits were arranged; a regular station switchboard and cut-out plugs were provided; and a five-station telephone-despatching circuit, with the dispatcher's selector set, was installed.

In addition to this a complete set of regular station forms and record books, letterpresses, tariffs, baggage checks, tickets, etc., etc., were provided. One of the older station agents who had had particular success with station helpers was selected as the instructor, and a regular course of training was outlined for the students, five hours a day being devoted to station work, and three hours a day to copying off the main line wires or to sending and receiving on the practice circuits.

Telegraphy is not taught in this school, no one being admitted who cannot receive at least twenty words a minute. Candidates for admission must also be 18 years of age and must have had a good common school education as proven by their ability to read and write legibly, and to figure simple arithmetical problems correctly. They must also pass the required physical examination before being admitted to the school. A course of training is laid out for the student on the basis of four weeks' attendance. This course takes up in a regular order all the simpler station work, such as the making of bills of lading, the making of way-bills, a correct understanding and use of the tariffs, copying, abstracting, baggage and ticket reports, etc., etc. Experience has demonstrated that in four weeks the average student becomes well informed in the simpler routine of station work. Sometime during the course he is sent to the freight house at Omaha, and is given two days' experience in trucking, piling, stowing, checking and receiving freight in actual service. This school has an average attendance of about 20 students, which has proven sufficient to supply the needs of the entire Union Pacific system, practically all station helpers being furnished from this school. During the first sixty days of its organization, 37 students had been in attendance, 19 had qualified and been sent out as helpers, and 18 were still in attendance at the school. Of the 19 who were sent out to qualify as helpers, three were promoted to operators within thirty days of the time they had left the school, none of the three having had any previous railroad or telegraph experience. From present indications there will not be more than ten per cent. of the men trained in this station school who will drop out before being promoted, as against fifty per cent. by the old method. The saving made in sending out trained men for these positions will more than pay for the comparatively small expense of maintaining the school. The success of this work has been such that every superintendent of telegraph who has had trouble in getting efficient operators or material from which to make operators should be greatly interested in investigating the work being done in this station school, and I take pleasure in joining Mr. Sheldon in extending an invitation to each of you gentlemen to visit this school at Omaha at any time.

In addition to the plans which are under way, and which have been described, numerous other plans for practical educational work among the employes are under consideration. It is expected that local classes will be organized at various points on the line. It is the intention to have a lecturer on the road equipped with stereopticon and lantern slides, who can stop at various points where students are located and lecture on various propositions connected with the work. The Bureau also expects to co-operate with the present apprentice classes which are being successfully conducted by the Motive Power Department at the larger shops, and assist in establishing apprentice instruction at some of the similar shops. An extensive library of scientific and technical books is being established at the Bureau headquarters, which is expected will be available for circulation among employes.

It was stated early in the paper that men selected for advancement to minor official positions would be afforded an opportunity, before formal appointment was made, to acquire a knowledge of the principal workings of such departments as they had not been intimately connected with, through a temporary connection therewith under the direction of the heads of such departments, and at a salary fixed by the Board of Supervisors. This might be likened to the post graduate course of the ordinary university, or the winning of a scholarship. The practical working of this plan can best be explained by an example of how it is actually being put into effect. One of our train masters had shown by his work that he possessed qualifications that would ultimately assure him promotion; in fact, he was selected as a man who later would be promoted to be an assistant superintendent. He was relieved from service as train master on his territory, and is now taking this course of training at his same salary. This course will embrace three months' work on track as laborer under a competent foreman, three months' work as a handy man in the roundhouse and back shop, two months in the Auditor's office at the desk, where the mistakes made by passenger and freight conductors pass, one month in the station school, his training ending with a couple of months in the general offices. At the end of his training this man may be sent back to his original position as a trainmaster, or may be put in a similar position in some other territory, but wherever he is placed, he is an employe who has been proven in actual service and trained for promotion when the first vacancy occurs. Men from other departments are receiving similar opportunities.

The expense of the Bureau, which is quite reasonable, is divided between the various departments, so that the proportion of the expense borne by each is nominal.

CONCLUSION.

While it is impossible to show in dollars and cents the value that is derived from this educational plan, it is plain to see that a scheme of this

kind founded on practical principles is bound to create increased loyalty throughout the organization, is certain to set a number of the employes thinking upon and considering problems connected with every day work which they would otherwise pass over without proper attention. It will bring out the latent good qualities of employes, making them more efficient and capable workers; it is producing a supply of qualified men who can be promoted to fill vacancies as they occur; and at the same time it is giving a wider field from which to draw promising material into the service. Six months ago it was an untried experiment; to-day it is an assured success, receiving the support and approval of the entire organization. It is increasing the safety of travel and making better citizens for our commonwealth.

Composited Telephone Blocking.*

BY W. F. WILLIAMS, PORTSMOUTH, VA.

Superintendent of Telegraph of the Seaboard Air Line.

The Seaboard Air Line has been blocking its trains by telephone over one of its most congested districts, a distance of 154 miles, four years, using an iron wire solely for this purpose with one telephone, two bells (one bell for north block and one for south block) and a switching key arrangement at each station. This circuit proved so successful that a little more than two years ago, we were called upon to extend the telephonic block 53 miles south to be operated under the same conditions, i. e. one telephone at each station with bells or howlers, north and south, and a switching key arrangement to throw the telephone over on the north or south block as occasion would require.

Not having a spare wire available to do this, and wishing to avoid the expense of stringing one, we selected a circuit 175 miles long with 35 telegraph stations thereon and composited an intermediate 53 miles. On the 53 mile stretch are located ten intermediate telegraph stations and eleven telephone stations, both operated simultaneously. The telegraph circuit works as well now as it did before, and while we know there is lag, we have not discovered it in the operation. The scheme has been a success from the first. This has been very gratifying because the iron wire that makes up this circuit has been in service for about forty years, and it would not be unnatural to expect some bad effects from this on the telegraph service. As a matter of fact, there has been no failure on this circuit since the telephone equipment was added to it, two or more years ago. The transmission obtained is perfect.

The line is composited in such a way that each station can call only the two adjacent stations,

*Paper read at the convention of the Association of Railway Telegraph Superintendents, Los Angeles, June 20-25.

one north and one south, without calling any other station. At each station a portion of the windings of two repeating coils are cut into the telegraph line and the composited telephone sets are wired from the secondaries of these. These coils are for the purpose of reducing noise on the line and preventing interference between the telephone and Morse circuits. Whenever one wire is to be used for simultaneous telephony and telegraphy it becomes necessary to provide some means of preventing the telephone currents from passing off over the telegraph lines and thereby reducing the transmission of speech in the telephone. This is ordinarily accomplished by the use of a retardation coil connected in series in the telegraph line.

The retardation coil offers a high impedance to the high frequency telephone currents thereby preventing them from passing through to the next station, but because of the low resistance to direct current telegraph impulses allows the telegraph currents to pass on.

The condensers wired from the coil to ground are for the purpose of preventing telegraph currents being diverted from the line to ground.

Retardation coils usually employed are used purposely to choke out the telephone currents, whereas in the Seaboard circuit this is not accomplished by the repeating coil alone but also by the telegraph relay which has a high impedance.

These repeating coils have shown up most satisfactorily for block service, where it is not of great importance if the conversation in blocks adjacent to the one in use is interfered with; it is not but if the line is quiet, conversation one or two blocks away can be faintly distinguished.

Telephone signaling is accomplished in block work in the same way as with the ordinary composite set. The operator wishing to call the adjacent block presses a button in the set which places high frequency current on the line by means of an interrupter and induction coil.

The current of the signal station passes through a condenser and howler to ground, causing the howler to produce a sufficiently loud sound to be heard in the station.

Block wire compositing differs from the ordinary through composited line in that it is only necessary to be able to talk to the two adjacent blocks on either side of a tower or station at the utmost; ordinarily any operator does not talk over more than one block on either side of him. This is one reason which made it possible in our case to omit some of the apparatus usually necessary and to use repeating coils in order to divide the line into blocks. The condenser and resistance usually bridged around the telegraph keys on a composited line are omitted because a by-path around these keys is not required. In no case in block work is it ever necessary to signal telephonically past a telegraph relay.

There are two causes of trouble to be consid-

ered in reference to the telegraph circuit: (a) Drag, i. e., decrease in speed of telegraph signaling, (b) Interference of telephone signaling current with the telegraph line relays.

The increased load of the line occasioned by the introduction of the repeating coils used and one-half microfarad condensers to ground at each station, is not sufficient to cause any perceptible drag on the telegraph circuit.

The high frequency telephone signaling current from the induction coil does not interfere with the operation of the line relays at all.

In reference to the telephone circuits the following things must be considered: (a) Morse thump; (b) Interference with conversation on any block in the circuit by telephone signaling current in any other block; (c) Interference with conversation on any block in the circuit by cross-talk from conversation on any other block.

The Morse thump is at no time of sufficient intensity to be disagreeable or to interfere with the talking circuit. The howlers we are at present using are being operated on four cells of dry battery and are unnecessarily loud, these will be reduced, as under ordinary conditions two or three cells are sufficient to secure good signaling.

If it is desired to cut out one or more stations at night or extend the block during light load periods, this can be done and the two blocks on either side thrown together for operating purposes. It simply becomes necessary to short circuit the apparatus (both telephone and telegraph) of the way station being cut out. On the Seaboard this is done by a small knife switch in the telephone ground to prevent a possible leakage and the wire cut out at the telegraph switchboard.

The electrical features of the telephone blocking scheme have here been given in some detail. This is in order that a fairly clear idea may be obtained as to just how the equipment is operated and the simplicity of it for the purpose. It operates with us under very severe conditions, namely the heavy load of telegraph stations along the line. If these could be cut out, and in many cases this would be possible, the grade of service would be equal to much of that obtainable today either in commercial or train despatching service. The wire could still be used for through telegraph business and undoubtedly would be so used, the advent of the telephone merely making it possible to do without the local telegraph stations.

It is not necessary to go into the advantages of this method of blocking. The same arguments apply to it as to the case of despatching trains by telephone and railroad men are becoming thoroughly acquainted with those. The greater speed of operation obtainable, the advantages of direct personal communication between the operators, the quicker the response to the sound of a howler or a bell than to the telegraph sounder, all of

these work for the better efficiency and therefore better service.

There is another and an important advantage of this system of blocking. It enables a railroad to get one hundred per cent. more service out of existing block wires. A railroad can change over a block wire telegraph line to a through circuit, while at the same time operating the blocks as efficiently, if not more so, than before. For this reason it seems worth while bringing the advantages of this system before the Association in order that, when necessity for its adoption arises, it will stand as a ready solution of a problem which otherwise might prove both complicated and expensive.

A New Selector.

BY K. W. ENDRES.

The new selector of the Western Electric Company which has recently been placed on the market, is a high speed, individual call mechanism, and consists of two electro-magnets or relays, which are connected in series across the line;

changing its adjustment if such a thing becomes necessary in case of an emergency.

The selector is normally operated on the central energy principle—that is, the battery for stepping it around as well as the battery for ringing the bell is located at the despatcher's office. It can, however, be arranged for local battery service if so desired.

The operation of the selector is as follows: In front of the despatcher are a number of keys, one for each equipped station on the line. These keys are practically noiseless, and each one sends out a number of rapid direct current impulses on the line when it is operated. The number of impulses which are sent out can be regulated by adjustable cams on the rear of the key so that a standard key is employed in all cases and adjusted for the particular station desired.

The first impulse which one of these keys sends out is a long impulse, the tooth being three or four times the width of the ordinary tooth. This impulse operates one of the selector magnets, which is a slow acting relay; it pulls up the arma-

ture of this magnet, which in turn causes the two pawls to engage with the ratchet wheel. The remaining quick impulses which the key sends out operate the magnet on the opposite side of the selector, but do not affect the slow acting magnet, which remains held up; these quick impulses work the pawl and step the ratchet wheel around the proper number of teeth, at which point the two contacts make and the bell in the station is rung.

The moving parts consist of a ratchet wheel to which is fastened a contact; this wheel is stepped around by means of a hardened steel spring pawl. This pawl and a corresponding one on the under side of the ratchet wheel are connected directly to the armatures of the magnet and therefore as long as the magnet operates, the pawl must move.

The contact is adjustable so that one standard form of selector is supplied at all stations. The position of the moving contact with reference to the ratchet wheel and the stationary contact determines which station shall be called, and this adjustment is simple and can be made without difficulty. It is thus seen that a selector can be taken out of one station and used in another by

ture of this magnet, which in turn causes the two pawls to engage with the ratchet wheel. The remaining quick impulses which the key sends out operate the magnet on the opposite side of the selector, but do not affect the slow acting magnet, which remains held up; these quick impulses work the pawl and step the ratchet wheel around the proper number of teeth, at which point the two contacts make and the bell in the station is rung.

The remainder of the revolution of the key, after the signaling impulses are complete, keeps the key contact closed and therefore keeps battery on the line during a period of about five seconds. As long as this battery is on the line, the bell at the way-station rings.

By installing a simple strap key, the despatcher can hold this down and make the way-station bell ring as long as he pleases, this strap key merely taking the place of the key contacts and keeping the circuit closed.

The selector is rapid in its operation. It requires approximately three seconds to call the

thirtieth station on the line, and any one of the first ten stations will be called in one second or less. It is possible to place as many sets on the circuit as may be desired, this number being limited by the size of the ratchet wheel. The present selectors which are installed are equipped to care for fifty stations, which would cover the majority of train despatching districts.

The diagram herewith shows how the selector is wired across the circuit, and also illustrates some of the auxiliary apparatus which is used in connection with it. Retardation coils are employed to choke back any lightning which may get by the protectors at a station. A variable resistance is required at each selector, since each must receive approximately the same current and voltage, and if this were not installed, the high voltage near the despatcher would give the stations adjacent to his office much more current than they should obtain. The selector requires approximately eight milli-amperes to operate and ring the bell and thirty volts across its terminals.

It will be noted on the diagram that two contacts on the selector are shown. One of these is the station signal contact which normally rings the bell at the station when the train despatcher wishes to call the operator, and the other is a time signal contact which is operated by a special key in the despatcher's cabinet and which makes on all selectors along the line simultaneously. The despatcher can, therefore, with this key give all the way stations along his division a time signal whenever he may so desire. It also permits of his calling all the stations at once if this ever becomes necessary on special occasions.

The condenser and resistance shown bridged around the contacts of the Faraday bell and in series with the windings of the bell are for the purpose of eliminating any spark at this contact and also serve to render the answer back signal of the proper loudness.

A New Alternating Current Telegraph System.

Patent No. 960,482, for a multiple telegraph system, which has been granted to Mr. Eugen P. Batzel, of Buffalo, N. Y., is based upon the principle that electric currents of different frequency or periodic intensities may be passed over a conductor or circuit independently of each other. This principle has already been employed in multiple telegraph systems, but not in the manner in which it has been adapted to the present system.

The new invention may be briefly and generally described as follows:

Each station is equipped with one or more single-phase alternating current generators, one generator being supplied for each transmitting key or device. The transmitting generators are preferably driven mechanically by gear transmission and each generates a current of different periodic intensity from the currents developed by all of the other generators so that the currents from all of said generators may pass over the line

without interfering with each other. As many generators may be employed as may be desired, each being supplied with its signal-transmitting device. The transmitting generators at one station will, of course, develop currents having periodicity of alternations different from those developed by the transmitting station at the other end of the line so that messages may be sent from both ends of the line simultaneously and without interference. The receiving apparatus at each end of the line consists of a series of wattmeters or wattoscopes, one for each transmitting generator at the other end of the line. For each wattoscope is provided an alternating current generator, each of said generators working in harmony with and developing a current corresponding in periods of intensity, or alternation, with one of the transmitting generators at the other end of the line. Through the tension coil of each wattmeter is passed current from one transmitting generator to the other end of the line and through the current coil is passed a corresponding current from the local or receiving generator. These corresponding currents passing through the coils of the wattmeter, causing a displacement of the moveable coil thereof. The moveable coil of each wattmeter acts as the armature of a relay to close a local circuit in which is placed a suitable receiving apparatus. It is to be noted that the transmitting generators at each end of the line operate synchronously and in harmony with the local or receiving generators at the other end of the line, suitable synchronizing apparatus being employed.

From the foregoing it will be seen that each wattmeter will be influenced by currents from the transmitting generator having a periodic intensity corresponding to the periods of alternation of the receiving generators connected to said wattmeter, and that said wattmeter will not be affected by current from any of the other transmitting generators connected to the line. In order to displace the moveable coil of a wattmeter it is necessary that the current or currents passing through the current coil and the tension coil must be of the same periodic intensity. It is, therefore, evident that by providing what are termed receiving generators developing currents corresponding in such intensity with the transmitting generators at the other end of the line each wattmeter will be affected by the current of only one of the transmitting generators. It is, therefore, evident that as many transmitting devices may be employed as desirable, it being only necessary that the periods of alternation be varied in each transmitting generator and correspondingly varied in the receiving generators.

Any suitable synchronizing apparatus may be employed for securing the synchronous operation of the motors for driving all of the transmitting and receiving generators at both ends of the line.

The House Printing Telegraph.

BY JOSEPH L. EDWARDS.

Reading with much pleasure the article of my old and honored friend, Gerrit Smith, in your June 16 number recalls the fact that in due course of time, in 1855, it became my lot to sit within a few feet of that dummy in the Boston office the ups and downs of which he presided over so faithfully in front of a House Printing instrument, supplying the guests of the Nahant Hotel at Nahant with their telegraphic pabulum. This was within a few months after having studied the intricacies of the telegraphic instrument at the factory where it was made, at the foot of Grand Street, New York, and emerging as a first-class plug from the office of the New York City and Suburban Telegraph Company, located at No. 4 Chatham Square.

To the writer's knowledge this company has never had honorable mention in public print, but as one of the telegraph projects of the nineteenth century, it ought to be chronicled before all of those identified with it have passed away. Its history is brief. It was made up of ten offices scattered throughout New York City and two in Brooklyn. Mr. John Hecker, originator of Hecker's flour, was the president. Thomas K. Austin was the superintendent. His main function was to feel sorry every Saturday night that he was unable to pay the operators and messengers in full and to receive delegations of messenger boys at his home periodically, demanding their due. My salary was eight dollars per week, of which I received about five. The balance is still due.

The corporation's chief characteristics were lack of patronage, paucity of funds and ultimate failure.

The survivors of the wreck now living are John K. Calvert, Leonia, N. J., Joseph Knittle, Brooklyn, N. Y., and the writer. The late Henry Bentley, municipal telegraph promoter of Philadelphia, began his telegraph career in the office of this company at the Irving Hotel, Broadway and Chambers Street.

Retiring from the scene of these experiences, my services were engaged by the Commercial House Printing Telegraph Company, New York to Boston, Springfield to Albany and Troy, and Boston to Nahant with twenty-two offices all told. There were two wires from New York to Boston, a through and a way wire, and one from Springfield to Troy. The latter was an unfortunate affair, constantly breaking at the joints from the effects of use, by an ignorant constructor, of strong acid as a cleanser in the process of jointing, thereby eating away the wire. The magnet of the House instrument would be considered a monstrosity in this age of enlightenment. It was a spool wound with many miles of No. 36 wire charged by a battery of one hundred Grove cells at each end of a circuit of about one hundred miles with a reserve of more cells for wet weather. If it would not work with the battery at hand more

wire was added to the magnet. The law of proportioning battery to line was unknown to us.

The Commercial Company transmitted all of the Associated Press reports.

This association was composed in New York of the four leading papers. D. H. Craig, always vivacious, vituperative, virulent and vitriolic in business affairs, genial, generous and gentle socially, was the general manager.

The four papers also supplied special reports. These specials were very remunerative to the New York operators, each of them, as well as the Associated Press, paying fifty cents an hour extra after 10 p. m.

During the trial in Washington of Daniel E. Sickels for the shooting of Barton Key in 1858 the writer was in Springfield, the repeating station between New York and Boston. The Associated Press handled the report of the trial in full, which occupied a single through wire from early in the evening till three o'clock in the morning. One night a newspaper, not a member of the association, pre-empted the wire by tearing pages from the Bible and presenting them for transmission while he was preparing his report, thus effectually shutting out the Associated Press until late at night. A repetition of this display of journalistic enterprise was afterward guarded against. Another instance of reportorial shrewdness occurred in the winter of 1857. A noted prima donna was to sing at the Academy of Music in New York but the performance was postponed in consequence of a severe snow storm. The following report, however, went over the wire late at night, with the spicy comment of Charlie Simmons at the end of it which my spirit of ingenuousness (or maybe for a joke) impelled me to leave on the end of the printed slip for the information of the night editor of the Springfield Republican, who permitted it to be printed as part of the reliable news of the day.

Mozart's great opera of "Marriage-Figaro" was performed last night at the Academy of Music, New York, for the first time in America. The house was filled to overflowing, notwithstanding the continued storm, and Piccolomini achieved, in the character of Susannah, another splendid triumph.

[Private Commentary on the Above—By Telegraph Operator:—Ths ben hre sins fiv klock. Nose dmsit abt it.]

The staff of the Springfield office at the time of the absorption of the company by the American Telegraph Company in 1859, was John E. Selden, manager; Rufus B. Bullock, John G. Tobey, James F. Gormley and myself.

The office as a repeating station was abandoned and the House instrument was succeeded by the Phelps combination printing instrument which worked direct from New York to Boston.

In 1858 a line was built from San Francisco to Sacramento by a brother of A. A. Lovett, superintendent of the Commercial Company, to operate the House Printing instrument and William Blanchard, formerly of Springfield and Charles F. Sim-

mons, of New York, were employed to work it. It did not succeed and in a few month the system was abandoned.

Another individual ownership line was supplied with House instruments in 1856 by Mr. Joseph Hale, of Montreal, Canada, running from Troy, N. Y., to Montreal. Alfonso Prescott, a brother of George B. Prescott, one time manager at Springfield and later author and electrical engineer for the American and Western Union Telegraph Companies, was the superintendent, the writer working the Troy end in connection with his services on the Springfield line.

The undertaking never paid and was abandoned after a brief effort.

Thinking over the personnel of the Commercial Company it would appear that for so limited a number of operators it turned out a goodly percentage of individuals of more or less distinction. There were Rufus B. Bullock, of Springfield, who became superintendent of express in the South and later Governor of Georgia; James N. Ashley, Washington correspondent of the New York Herald; Frank Ashley (his brother), editor and proprietor of a newspaper at Providence, R. I.; J. W. Stancliff, of Hartford, an artist, a painter of marine scenes; John E. Selden, inventor of improvements of the stock ticker and of a self steering electric toy boat; Samuel J. Burrell, of New York, electrical constructor and mine promoter, and the writer, angler for black bass, which is "Inch for inch, and pound for pound the gamest fish that swims."

Collingswood, N. J., June 20, 1910.

Some More Reminiscences of the Boston Office.

BY G. F. MILLIKEN.

The articles on the old time Boston office, contained in the June 1 and June 16 issues of Telegraph and Telephone Age have recalled many pleasant recollections and I heartily thank my old friend Gerrit Smith for his friendly allusions to myself and family which are fully reciprocated.

Fortunately I have one of the albums similar to that owned by Charles Bedlow, as described in the first article, and prize it highly.

In connection with events occurring at about the time of which Mr. Smith writes, I am reminded of a little practical joke in which the operator at Springfield, familiarly known as "Jack," was made the victim. If he is still living and happens to see this article, he will recognize the occasion.

At the time referred to, the House printing lines (two wires between Boston and New York via Springfield) were located on one side of the Boston operating room, and the eastern Morse lines on the other side. Troubles on the "House" lines were frequent, and "Jack" was often called up on one wire to test the other and report.

Frank H. Palmer, a prominent telegraph man of that period, was manager or superintendent and it was he who proposed the little diversion from regular business to perpetrate the joke.

We had just installed a new switchboard and additional battery equipment of the "Grove" type, the switchboard enabling us to easily pile up a high voltage on any one wire.

The then universal method of testing was by touch of moistened fingers, which fact suggested the conspiracy.

Several batteries having been placed in series on No. 1, "Jack" was then called up on No. 2 and requested to test for trouble on No. 1. Then we waited expectantly for his report, which, in due time, came as follows: "No. 1 O. K. south, but I should think H --- was in it east."

J. N. Ashley was one of the conspirators and was the "House" operator who called "Jack" to make the test.

We imagined Jack's surprise and possible remarks when he got that voltage.

The time at which this incident occurred was undoubtedly a few years later than that of the experience of Mr. Smith in the same building, as repeating at Springfield on the "House" lines at the time to which I refer was the exception; due probably to improvement in line conditions.

The operating forces as given by Mr. Smith are also somewhat different from those I remember, which include "Jack" Selden, in charge at Springfield, but who is not included in Mr. Smith's list.

Boston, Mass., June 21, 1910.

The Philosophy of a Business Man.

Grievances voiced are half cured.

The door of achievement is never left open.

The easiest thing to cultivate is suspicion.

The "sharp" man generally cuts his own fingers.

The best working formula to success is "concentrated energy."

The sunny side of your make-up best lights the road to success.

Orders given aggressively are usually obeyed just the same way.

You can improve your own business by keeping out of other people's.

Simple hard work has made a garden out of a wilderness many a time.

An ounce of directed enthusiasm is worth a ton of constrained effort.

System is like money—useful when you master it; ruinous when it masters you.

Failure anticipated jolts hard the plank of opportunity across the stream of success.

When you see your employer cheating a customer, resign before he tries his hand on you.

Don't forget how vast is the number of subjects on which you are highly qualified to keep silent.

It's possible to worry so much about what you ought to do that you never find time to do what you might.—Bookkeeper Magazine.

EAST SLOPE,
SIERRA-NEVADA MOUNTAINS.

DONNER LAKE, CALIFORNIA.

AT THE TIMBER LINE.

An Interesting Telegraph Publication.

In the Postal Telegraph for July will be found several interesting articles written by officials of the company. The first of these contributions was prepared by Mr. Welcome I. Capen, general superintendent of plant, who describes the difficulties of line construction. Mr. Capen deals particularly with the line recently erected between San Francisco and Reno, Nev., and now in course of construction to Salt Lake City. This line crosses the Sierra Nevada mountains and the illustrations are unusually interesting and are reproduced here.

Colonel Albert B. Chandler, chairman of the board of directors, contributes an interesting bit of reminiscences of the early days of telegraphy.

Mr. Charles P. Bruch, second vice-president of the company, under the heading of "Always on the Lookout," describes in an entertaining way the marine station at Fire Island, L. I., N. Y., of which we present a picture herewith.

"THE HOUSE AND TOWER ARE SEPARATE."

Mr. Walter D. Francis, superintendent of supplies, in a contribution on "Imagination" shows how the name or brand of an article seems in the minds of some to be incontrovertible evidence of good quality while the absence of the name is

taken as indicating inferior quality, while, as a matter of fact the reverse is often the case.

Mr. Minor M. Davis, electrical engineer, discusses the question "Why Don't Telegraph Oper-

SUMMIT OF SIERRA-NEVADA MOUNTAINS.

ators Learn the Telegraph Business?" Mr. Davis shows that telegraphy offers many opportunities to ambitious young men either in the service or as a stepping stone to positions of responsibility in other business.

FIRE ISLAND BEACH, MARINE STATION IN THE DISTANCE

Mr. Edward S. Butterfield, general agent, money transfer service, who is an experienced amateur photographer, writes of "Photography for Telegraphers," showing how a camera may be a source of much pleasure and benefit to others as it has to him.

New York Telegraph Reminiscence.

BY W. H. SAWYER, OF WEEKAPANG, R. I.

I entered the telegraph service as office boy, May 16, 1861, in the office of the American Telegraph Company, at 145 Broadway, New York, at the age of sixteen.

J. C. Hinchman was manager of the office at that time, and after looking me over critically, decided that I would probably fill the bill. He was informed by my brother that I wished to become an operator.

My salary was to be three dollars per week and as I paid two dollars and fifty cents per week for my board, there was little danger, from a financial point of view of my getting out of the straight and narrow way in the great city of Gotham.

My duties consisted mainly of collecting messages from numerous operating desks and dropping them down a chute, which connected with the delivery department on the ground floor.

As I was anxious to give satisfaction, I followed the old saying, that whatever was worth doing, was worth doing well. I endeavored to keep the desks clear and managed to get all of the messages on the way down stairs and not on the floor or in the waste paper baskets. I was a small boy, fresh from school and was anxious to become a telegraph operator, which profession seemed to me to be something above the ordinary. After a month of day work I was given a night trick, from 5 p. m. until "good night" was received from Washington. This was a decided change for me and occasionally I found it difficult to keep awake, until the call for "boy" in loud tones, brought me to a realizing sense of my importance.

After the delivery department closed, at 11 or 12 o'clock, my services were in demand to carry installments of press matter to the editorial rooms of the Herald, Times, and Tribune, and this gave me a chance to see the venerable Horace Greeley, in his editorial sanctum, as well as other editors of the great papers. As my salary of three dollars per week would not allow me to dine at Delmonico's, I usually resorted to Blane's bread and milk refectory, just around the corner from the office, or the old Belmont Hotel on Fulton Street, when I was flush with the scrip of war days.

The force was then and later composed of the following: Doctor Josiah A. Cure, William Porter, John Horn, Jr., Dixon F. Marks, Wm. B. Clum, M. H. Redding, O. W. Willis, James L. Lillis, Jesse H. Bunnell, C. H. H. Cottrell, Robert M. Mattocks, Joseph L. Edwards, P. H. Shaughnessy, J. M. Fairchild, A. C. White, Irving S. Fitch, Thomas P. Scully, Fred. J. Grace, B. F. Ely, Gilbert Simmons, Edward A. Calahan, James J. Calahan, Robert J. Cunningham, Waldo Collins, Julius Finney, Charles B. Noyes, Gerrit Smith, Edward W. Gibbons, T. B. Fulton, William Blanchard, Stanley MacNider, W. G. Wilkie, Charles Ferris, Wm. H. Hoyt, D. W. McAnecny, Frank L. Pope, Ralph W. Pope, Henry W. Pope, Louis H. Smith, Mike Sherman, Frank G. Beach, Geo. Warren, Samuel H. Edwards, Edward Hall, A. W. Pearkes, Henry Cowan, Richard Schutt,

R. W. Martin, E. E. Beardsley, Geo. Clark, A. S. Downer, David R. Downer, H. H. Ward, Ransom Phelps, Robert H. Smith, J. W. Pitfield, K. S. F. Randolph, Mike J. Lillis and others, many of whom I can remember, but cannot recall their names.

Old Doctor Cure was a person of peculiarities. He worked No. 2 South, also the Astor House wire. He was unable to read by sound and would start his Morse register and depart for the back part of the office with a brush and comb and a bottle or two of hair dye and hair invigorator to arrange his toilet. When he returned he would be confronted with a few hundred feet of paper tape from his register, from which he would laboriously copy off the messages. He was in the habit of giving a string of good advice to the various operators on his wires, in a fatherly way and sometimes when he was started in on this line some operator at the switchboard would plug in and make some personal remark which irritated him.

Mr. M. S. Roberts became manager of the office, succeeding J. C. Hinchman. Mr. Roberts was a perfect gentleman, and was held in the highest esteem by all. He was exceedingly kind-hearted, and did everything in his power for our comfort. He would, upon request, issue an order on John Horner (who was cashier) for a single day's pay, and some of the boys frequently availed themselves of such daily orders on Mr. Horner.

Waldo Collins, who worked on the southern wires usually, was possessed with the idea that steel pens as manufactured, were imperfect, at the best, and before starting his work spent considerable time with a small oil-stone, getting the point of his pen in shape for business, while some of the rest of us, who were capable of turning out a copy, equal if not superior to his, could work with any old pen found on the floor.

On the city lines connecting the various hotels, were: Joseph Brunham, Fifth Avenue Hotel; Henry Fairchild, Everett House; J. B. Page, Metropolitan Hotel; F. Marsh, New York Hotel; Thomas Brennan, Stock Yards, Forty-fourth Street; Mr. Clark, Madison Square; Joseph Knittle and Fred. Seibert, Williamsburg, L. I.

In the ordinary course of events I acquired the art of sending and receiving slowly and became what is known as a "plug" operator, and was kindly allowed by the regular operator on the city lines (who probably wanted a rest) to send for him, and later to receive. I owe my thanks to those on the city lines, who had the patience and kindness to tolerate me. Joseph L. Edwards kindly allowed me to take his seat at the House Printing instrument and I soon learned to read by sight of the letter wheel, which was no great feat compared with the fact that Edwards himself could read considerably by the sound of the instrument. I then considered, and do now consider this a wonderful performance.

It is a known fact that there exists a period in the life of the young operator when advancement is very rapid. My advancement was satisfactory, at least to

myself, and must have been to others, as I was soon transferred from the city lines to the southern side of the office, to receive press from Washington. It made me scratch, especially when Morrell Marean, F. A. Stumm and other speedy senders "salted" me. However, I managed to keep my place, and my salary was soon raised from sixty to one hundred dollars per month, which was not an everyday occurrence at that time, and I doubt if at present. During the war we were kept busy. I remember upon one occasion, having worked my day trick from 8 a. m. to 5 p. m., my relief failed to put in an appearance, I was compelled to work his trick until about 6 a. m., and then continue my day trick from 8 a. m. to 5 p. m. We frequently worked almost steadily from 5 p. m. to 5 and 6 the following morning, with only supper relief.

After the Battle of Bull Run, when the soldiers reached Washington, in their flight from the battlefield, J. A. Swift, at Willard's Hotel, sent me 125 messages at his usual rapid gait, each one of which conveyed to some relative, or friend in the east, the fact of a safe arrival at the capital.

When the Confederates were north of Baltimore I was receiving press from Washington and immediately after copying the words "The Confederates are now north of Baltimore and communication may be severed at any instant," all southern wires opened and remained so for nearly two days. Battery was kept on all wires at New York and Washington, in the hope that two wires would get in contact. Such an event finally happened, and through the cross, one operator at New York and one at Washington took turns at sending and receiving the most important messages, dropping out "from," "to," "sig.," etc., to make time. I was one of these who took turns, and we did our best, until tired out.

When President Lincoln was assassinated I received the first information from Washington of the sad occurrence. I was in the New York office when "S. F.," San Francisco, first called up "N. Y.," the through connection being made with numerous repeaters.

There existed a fascination in the telegraph business which I think was more generally enjoyed in the early days than now. I have known of operators, working a through wire on press, to refuse to go to supper, knowing full well that their relief would hold the through wire, in preference to working a way wire. I have been there myself, but perhaps I was not hungry, or anticipated a poor meal.

In 1866 I resigned my position as assistant night manager of the New York office, under D. Wilnot Smith, and went to Philadelphia as assistant manager of the Insulated Lines Telegraph Company, in the Philadelphia office of which Suel Smith was manager, and P. B. Delany, chief operator. Delany, who has won fame as an inventor of various electrical devices, was an operator of marked ability, especially as a receiver. I have seen him keep seventeen words behind on press matter for a long time without getting things mixed. I returned to New

York in 1868 and worked a while for the People's Telegraph Company. In 1869 I accepted a position as inspector with the Gold and Stock Telegraph Company, just started by E. A. Calahan with P. H. Shaughnessy, who is still in the harness at 195 Broadway, as his assistant. In the Gold and Stock Telegraph Company I first met Thomas A. Edison. In those days he wore a linen duster. The Calahan stock printer required three wires, one for letters, one for figures and one for printing. Mr. George B. Field, president of the company, asked Edison if the work could not be done on one wire. Edison replied to the effect that he would see what could be done. In a few weeks he brought over from Newark (under his arm) an instrument, which had a polarized attachment and a shifting pad, and worked finely.

The three-wire Calahan instrument circuit would be frequently thrown out printing X, Y, Z, etc., and when this occurred on a whole circuit, operations would be suspended, until all instruments on such circuit, or circuits were properly set by hand. Edison devised a unison, by means of which all instruments could be set from the main office. What he cannot do would be hard to tell.

After this Henry Van Hovenbergh and myself devised unisons, which was an easy matter after Edison paved the way.

In 1872 I resigned as superintendent of the Gold and Stock Telegraph Company, and accepted a position as general superintendent of the American District Telegraph Company. In 1875 I was appointed superintendent of the Bureau of Telegraphy for the Centennial Exposition, and in 1878 I went to Providence, R. I., as superintendent for Eugene F. Phillips, in the manufacture of insulated telegraph wire. This business was growing, and Mr. Phillips saw the necessity of having some one more familiar with electrical affairs. I used the first coil of covered wire made by Mr. Phillips, at his small factory, and had used a considerable amount of his wire in construction work for the Gold and Stock Company and the American District Telegraph Company. The Phillips' product was appreciated and his business rapidly increased. In 1882 the American Electrical Works was formed, and the business has constantly increased, and at the present time is one of the largest manufactories of insulated and bare wire in the country. Mr. Phillips' genial disposition made for him numerous friends and his product was regarded as the best in the market. In the early days the business was confined to covering of copper wire, which was purchased, principally of Wallace and Son, Ansonia, Conn. Later the drawing of copper wire from the medium sizes down to finer sizes was inaugurated, and at the present all of the copper wire used is rolled down from the bar to rod size and then drawn through metal dies, and finally through diamond dies, down to one thousandth of an inch diameter, with multiple wire drawing machinery. The hole in the diamond is drilled at the factory, and in the case of the finest size is quite a delicate operation.

In the early days of the telephone it was thought desirable, by Theodore N. Vail, who was president of the Bell Company, to make exhaustive experiments on a long length of underground cable, and he gave an order to Mr. Phillips for five miles, of a twenty-one conductor cable, to contain copper wires of different sizes and various styles of insulation.

This cable was made in sections of 500 feet and covered with lead pipe, and the lead pipe drawn down snug to the cable, by means of dies. The reels holding the fifty-two sections were shipped to Attleboro, Mass., by rail, and after a trench had been made between the tracks of the Providence and Boston Railroad, by means of several ploughs, for a number were actually worn out, pulled by a locomotive, the sections were deposited in the trench and then covered over. After connecting the sections, various tests were carried on by Prof. Jacques and his assistants, between Attleboro and a point near West Mansfield, Mass. The cable was afterwards removed and sold for junk, the Bell Company being out of pocket financially, but rich with added experience electrically, and Mr. Phillips probably having the best of the bargain. At the present time a cable five miles long could be made in one section and then continuously covered by a lead press, but of course it would be rather bulky to handle to advantage.

In 1899, after forty years of hard work I decided to take a rest, and since that time have been living in Pasadena, Cal., during the winter and in Rhode Island the remainder of the year. Nothing pleases me more than to meet an old timer and talk over the good old days.

Radio-Telegraphy.

The Marconi Wireless Telegraph Company reports that at the present time over 350 vessels are equipped with their apparatus.

A wireless telegraph station having a radius of from 800 to 1,000 miles has been established in the Crystal Palace, London.

The Radio-Telephone Company is preparing to establish a wireless telephone system between Catalina Island, Cal., and the mainland, a distance of about sixty miles.

It is stated by the Electrical Review of London that the British War Office is negotiating with the Marconi Wireless Telegraph Company for the purchase of 300 sets of apparatus for army use.

It is reported that the experiment which has recently been tried by some of the steam turbines in the North Sea to utilize wireless telegraphy in their fishing operations has not proved successful.

The Massachusetts Volunteer Signal Corps has been provided with a portable wireless telegraph outfit similar to those in use by the signal corps of the United States Army.

A patent, No. 962,262, for a wave detector for wireless telegraphy, has been issued to W. Schloemilch and P. F. Pichot, of Berlin. Two contact bodies, one of manganese compounds.

A patent, No. 961,855, for a detectorium, has been awarded to H. Gernsback, of New York. Means for tuning and acting as a detector, being a sliding contact for tuning—coil tipped with a material to form the detector.

A patent, No. 961,914, for a wireless lighting system, has been taken out by E. B. Tustin, Jr., of Bloomsburg, Pa. For lighting a series of lamps by wireless which actuates an electrical circuit closer for the lighting circuit.

The British Post Office has issued a notice to the effect that radiotelegrams intended for transmission to ocean liners through Post Office coast stations in the United Kingdom, are now accepted with simplified addresses, consisting of the name of the addressee and the name of the ship, with the addition of the word "wireless." The name of the appropriate coast station is still necessary in the address of radiotelegrams to packet steamers.

The annual report of the Marconi Wireless Telegraph Company, Limited, of London, the parent Marconi company, for the year ending December 31, 1909, shows a profit for the year of £11,432. The French and Belgian subsidiary companies have during the past year declared dividends of five per cent. and ten per cent. respectively. At the annual meeting of the company it was voted to pay the cumulative seven per cent. dividend on the £250,000 of preferred stock of the company up to July 30, 1909.

The following patents have been granted to R. A. Fessenden, of Brant Rock, Mass.:

No. 962,014, for a method of electric signaling. For wireless waves by producing a bubble in a body of liquid by the action of the waves and utilizing the movement of the bubble to give a signal; No. 962,015, for a receiver for electric signaling. A wave detector consisting of a constricted conducting fluid path with means for producing a bubble therein; No. 962,016, for a receiver for electromagnetic waves. A liquid barretter having two fine terminals, a large terminal and an electrolyte; No. 962,017, for an electrical apparatus. A receiver for electromagnetic waves having a coil the ratio of whose self-induction to its mass is greater than one hundred thousand, with a movable element controlling a local circuit, and No. 962,018, for a method of signaling. Transmits waves continuously except for interrupting them to present dots and dashes and reinverting the signals at the receiving station by causing the interruptions only to be sensible.

The civil service commission of an eastern city is seeking a man for appointment as chief's driver in the fire department. This is a possible chance, according to the announcement, for a man who holds a chauffeur's license, who can take care of horses and pass a good examination in telegraphy to command a salary of \$1.75 a day. This announcement is only equalled by the action of the British Navy and some steamship companies in classifying wireless telegraphers with coal passers.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIKEY

Sole Manufacturer

**Hudson Terminal, 30 Church St.
NEW YORK**

Western Representative

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

The next annual meeting of the Railway Signal Association will be held October 11, at the Hotel Jefferson, Richmond, Va.

The Chicago, Milwaukee and St. Paul Railway is installing telephones for train despatching between Marion, Iowa, and Council Bluffs, a distance of 260 miles.

Mr. A. B. Kratz has been appointed superintendent of telegraphs and telephones of the Panama Railroad. Mr. Kratz has been acting superintendent for the past four months since the resignation of Mr. J. Beaumont.

Mr. L. M. Jones, assistant superintendent of telegraph of the Atchison, Topeka and Santa Fe system at Topeka, Kans, has been advanced to the position of superintendent of telegraph, vice Mr. C. H. Gaunt resigned to become general superintendent of the Western Union Telegraph Company at San Francisco. Mr. Jones is eminently qualified to take entire charge of the telegraph department, as he has the various details of this great system thoroughly embedded in his memory, he having risen to his present official position through various stages in the telegraph department from the ranks as an operator.

The twenty-third annual convention of the Train Despatchers' Association of America was held at Spokane, Wash., June 21, 22 and 23. Among the papers read and discussed were: "The Train Despatcher's Office: How It Should Be Equipped and Furnished"; "Train Despatching by Telephone" and "Inconsistencies of Instruction in Train Rules." Over seventy members of the association from all sections of the country were present, and the convention was one of the most successful ever held. F. C. Dow, Sheridan, Wyo., was elected president; J. B. Alvey, Fulton, Ky., vice-president; J. F. Mackie, Chicago, secretary, treasurer and editor. The members of the executive committee elected were B. S. Sperry, S. H. Brow, S. S. Conley and T. W. Kane. Baltimore, Md., was selected as the place for the next meeting, the date of which will be June 20, 1911. The re-election of Mr. J. F. Mackie to the position of secretary-treasurer and editor recalls the fact that he has occupied this post for the past twenty years. It is largely due to his sturdy manhood and unfailing energy that the association has been brought to the successful position which it occupies to-day, and the members are to be congratulated upon being able to retain the services of Mr. Mackie during such a long period.

Echoes of the Los Angeles Convention of the Railway Telegraph Superintendents.

Those who attended the convention are loud in their praise of the hospitality and kindness extended to them at Los Angeles. President Dyer was continually on the lookout for the comfort of the visitors and the local reception committee co-operated with him in his efforts to

make the week one which would long be remembered by those in attendance.

One of the most enjoyable events of the week was the day spent at Avalon, Santa Catalina Island. A most appetizing dinner was served at the Hotel Metropole, the menu for which was arranged in the form of a telegram. Mr. D. E. Riordan, the proprietor of this hotel, who was once a telegrapher himself, welcomed the visitors, giving them a cordial reception and extending to them the freedom of the city of Avalon.

The following committees have been announced by President Dyer:

Executive Committee—I. T. Dyer, chairman; J. B. Sheldon, William Bennett, C. Selden, E. A. Chenery and P. W. Drew.

Entertainment Committee—S. A. D. Forristall, N. E. Smith, W. Marshall, M. Magiff, B. A. Kaiser, P. W. Miller and A. P. Eckert.

Auditing Committee—A. B. Taylor and L. A. Lee.

Topics Committee—W. C. Walstrum, W. L. Connelly and E. A. Klippel.

Committee on High Tension Wire Crossings: G. A. Cellar, chairman, G. H. Groce, W. W. Ashald, W. P. Cline, C. Selden, C. A. Parker, J. M. Walker, Wm. Bennett and S. A. D. Forristall.

Committee on Miscellaneous Matters—W. F. Williams, chairman, S. L. Van Akin, F. T. Wilbur, W. W. Ryder and Geo. Boyce.

Committee on Resolutions—E. P. Griffith, W. J. Camp and E. W. Mason.

The committee appointed by the eastern division of the association to consider the proposed standard railway telephone agreement, made its report. The committee consisted of Mr. E. P. Griffith, chairman, Mr. L. B. Foley, Mr. F. G. Sherman and Mr. A. B. Taylor of New York; Mr. J. C. Johnson, of Philadelphia; Mr. N. E. Smith of New Haven. The report of the committee was as follows:

"At the regular quarterly meeting of the eastern division of the Association of Railway Telegraph Superintendents, held in Washington, D. C., November 18, 1909, the 'Standard Telephone Operating Agreement' for Railroads was taken up for discussion. After listening to the telephone company's representatives' explanation of the agreement, and considerable discussion by the members present, it was agreed that a careful analysis of the proposition should be made by a committee of five, who should report their conclusions to either division, or in annual meeting.

"It is clear to the committee that the document in question is ably prepared with a view to standardization, and to meet any existing laws, or contemplated legislation with respect to discrimination, and at the same time provide amply for railroad telephone service. Particular care is taken, in every clause of the agreement, to state that the rates to be applied shall be the regular charges of the telephone company to

its business subscribers and lessees in similar service, under substantially similar conditions. It takes away nothing that we now enjoy, except possibly a few comparatively low rentals for apparatus, which would be more than offset by the substitution of the flat rate for measured service at a few points where the railroads, under the present Standard Telephone Agreement, are placed on a measured basis and other subscribers or lessees in similar service under substantially the same conditions, have a flat rate.

"It permits the use of any apparatus the railroad company may elect for use on private lines, not connecting with any public or private branch exchange, or mileage line furnished by the telephone company. It requires the railroads to use only apparatus approved by the telephone company when such apparatus is for use on lines likely to be connected with their system. There is no objection to such restriction, if it can be termed a restriction.

"The commercial department of the American Telephone and Telegraph Company, Mr. Geo. W. Peck and Mr. F. A. Baker, in particular, have been untiring in their efforts to aid your committee. They have furnished us with extracts, and marginal notes showing how each phase of our service, under the present contract, would be taken care of under the proposed new agreement.

"The Standard Railroad Contract, under which most of the railroads are now operating, was introduced nine years ago. Great progress has been made with the telephone in railroad service since that time, and possibly the conditions of to-day may require some readjustment of the old agreements. The Standard Telephone Operating Agreement, otherwise known as the new agreement, which is now before you for consideration, was conceived, we believe, about two years ago, and brought before this association at our last annual meeting in Detroit. The new agreement is presented now as originally prepared by the telephone company.

"Within the current year a new and important feature has entered the telephone and telegraph field. The telegraph company, which controls the lines on a majority of the railroads represented by this association is working in harmony with the American Telephone and Telegraph Company, or the parent company, of the various telephone systems, forming a part of the proposed new agreement. Within the past few months we have noticed, and we believe, all classes of business, or users of the telephone and telegraph, will agree with your committee, that the development of the telegraph and telephone, under such harmonious workings, has been a great benefit to the public generally. If such benefits show themselves so conspicuously under a few months of operation, it is hard to estimate what the development will be within a year, or two years. It is, therefore, Mr. President, the conclusion of your committee that this association

should postpone action on the acceptance of the Standard Telephone Operating Agreement for Railroads until the telegraph and telephone companies have further developed their traffic arrangement, in order that we may be in a better position to judge as to the service of the various railroads. When such time shall arrive, a committee representing this association can meet, in joint session, with a committee representing the American Telephone and Telegraph Company, and formulate an agreement suited to the new conditions."

This report was discussed and adopted with the amendment that such railroads as may require some form of a contract before the next annual meeting of the association accept the proposed agreement for one year and thus give it a trial. The same committee having the matter in charge was continued for another year.

Mr. L. C. McIntosh, of the Southern Pacific Railroad, Los Angeles, who attended the convention, after listening to the discussion in regard to the proposed plan for delivering telegrams to passengers on trains offers the following scheme:

"It was quite manifest from the discussion that the greatest difficulty was to find the addressee and it occurred to me that if a small bulletin board were placed in each passenger coach at either end, having the words 'Telegram for' printed in large letters across the top with a blank space underneath for addressee's name, the public would soon become educated to this mode of announcement and delivery could be made by the conductor.

"As a general rule only passengers traveling long distances receive messages on trains and are on the alert for anything that distracts from the monotony of a long trip and are not likely to overlook any notices or instructions posted en route."

A New Insulator.

A new form of insulator, intended to eliminate leakage and cross-fire troubles in electric wires, is soon to be placed on the market. This consists of two parts separated by an area of still air, in such a way as to maintain at all times a clean and dry space between the tie wire and pin. Floating particles of dust, carbon or moisture do not enter beyond the first arm of the zig-zag separation between the two parts. This insures good insulation, particularly in a wet country. It is stated that this will obviate all troubles usually occurring in foggy districts. This insulator is the invention of Mr. Leonard W. Storrer, formerly general superintendent of the Postal Telegraph-Cable Company, San Francisco, whose practical experience showed him its necessity. It is to be manufactured by The Brookfield Glass Company, of New York.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Mavor and Davis' "Quadruplex" and other standard works on telegraphy and treat them in the same manner.]

CHAPTER IX.

What principles have been combined to produce the quadruplex?

What is the fundamental basis of producing signals at a distant point?

Why is it necessary to employ two relays at each end of a quadruplex circuit?

What is the difference in the action of the two relays?

How is the battery arranged for varying the strength of the current sent to the line?

Why is extra resistance inserted in the tapwire of the battery?

What is the path of the home current after reaching the tongue of the transmitter?

What is the function of the pole changer?

Why is the construction of a pole changer more complicated when gravity batteries are used than when dynamos are used to supply current?

How is the equivalent of two batteries obtained?

Does a reversal of the pole changer affect the "long" or "short" ends of the battery?

How would you proceed to balance a quadruplex set?

CHAPTER X.

What was one of the first difficulties experienced in quadruplex operation?

How was this difficulty overcome by Thomas A. Edison?

Draw a sketch of the connections and describe the action of the Edison repeating sounder.

What principle is involved in the Jones inductorium method of accomplishing the same results as are secured by Edison's repeating sounder?

What principle is employed in the Smith arrangement?

Why is it necessary in this scheme to have a few ohms resistance between the relays and the tap for the artificial line?

Is there any objection to the insertion of this extra resistance?

In what direction have all of the later improvements in quadruplex apparatus been made?

How is the neutral relay constructed in order that the magnetism in its cores shall rise quickly to its full value?

Draw a sketch of the arrangements of F. W. Jones and Gerrit Smith and explain their action.

Trade Notes.

The Western Electric Company has recently issued an interesting illustrated bulletin, describing their telephone and signaling apparatus designed for use in mines.

Mr. M. J. Kenna, whose advertisement appears on the last reading page of this issue, is a well known and respected old time telegrapher. Mr. Kenna, who has recently embarked in the real estate business, is handling property in the territory adjacent to greater New York and is prepared to buy or sell real estate of any kind.

Bulletin No. 1008 describing telephone power plant equipments for non-multiple switchboards, has just been issued by the Western Electric Company. It contains twenty-four pages and is illustrated with many diagrams and cuts. This bulletin presents some features of power apparatus designed especially for telephone plants. The subject matter covers only such apparatus as is required for non-multiple switchboards having a capacity up to 800 lines.

On another page in this issue will be found the announcement of Mr. J. E. Albright, who is engaged in the business of furnishing typewriters, typewriter supplies and sending machines for telegraphers' use. Mr. Albright is a well known member of the profession and hence is thoroughly conversant with the operators' needs. He has been engaged in the typewriter business for a long time past and the experience he has gained qualifies him to provide for the requirements of any operator in a satisfactory manner. He sells typewriters on the installment plan and will make arrangements for payment in a way which will meet the convenience of the buyer. Mr. Albright has the reputation of giving everyone a square deal and is worthy of the patronage of any telegrapher.

LETTERS FROM OUR AGENTS.

NEW YORK, WESTERN UNION.

Several of the lady operators of the eastern division have been assigned to summer offices.

Mr. R. J. Murphy was in charge of the force as usual at the Poughkeepsie and New London boat races and a vast volume of business was handled without the slightest hitch.

Miss Mabel Green, daughter of wire chief Maxwell Green, was married to Mr. Percy Varian, of the Brooklyn Eagle staff, on June 30. The newly married couple are now enjoying an extended western trip.

The veteran operator, Mr. Matt Scanlan, of the eastern division, is still confined in St. Francis Hospital, Jersey City, suffering from injuries received while attempting to board a trolley car.

Mr. J. Harry Haworth has been appointed assistant traffic chief. Mr. Haworth was formerly connected with the Boston Herald staff.

Mr. R. W. Matherson, wire chief of the western division and Miss Frances Haberstroh, were married in Brooklyn on July 5. After the ceremony a wedding supper was served at Raub's. Mr. and Mrs. Matherson went to the Thousand Islands and Toronto on their wedding trip.

Edgar N. Tomlinson, a forty-niner of the telegraph, died at Jamaica, N. Y., June 30, aged seventy-nine years. Mr. Tomlinson was born at New Haven, Conn., and entered the telegraph service at Hartford, Conn., in 1846. During the war he served as operator for the Confederates at Corinth, Miss., and Memphis, Tenn., until the latter place was captured by the Union forces and he was required to take the oath of allegiance. He then engaged in other business and was for many years employed by the government as special agent for various difficult duties. About thirty years ago he returned to the telegraph service, accepting a position in this office, where he was employed until a few years ago, when he retired from active service.

CHICAGO, WESTERN UNION.

Mr. M. Levey of the operating department who has represented Telegraph and Telephone Age for some time past, has resigned to accept a position in other business. His numerous friends unite in extending best wishes and hope that he may be successful in his new field of endeavor.

Mr. J. J. Welch, traffic chief of the office, has accepted the agency of Telegraph and Telephone Age. Those desiring to place orders for books, subscriptions, etc., with this paper can do so through Mr. Welch.

Mr. Frank Richardson, the well known old timer of this office and an annual visitor at the reunions of the Old Time Telegraphers' and Historical Association, has gone to Pasadena, Cal.

General Mention.

One of the greatest feats in telegraph transmission which has ever been accomplished was the sending to a Spokane, Wash., newspaper from Washington, D. C., on the night of June 29 of the Interstate Commerce Commission's findings in the Spokane rate case. This report consisted of 23,748 tabulated figures and 9,120 words and was all sent from Washington and relayed at Chicago between 6 p. m. and 3.30 a. m. The work was divided between the two commercial companies and the part handled by the Postal Company was carried over a circuit by way of Omaha, Denver and San Francisco, a distance of 6,500 miles. This accomplishment shows that the transcontinental telegraph facilities are ample to meet any requirement.

An injunction seems to be a rather expensive luxury in Kansas. Some time ago one of the telegraph companies secured an injunction in that state to prevent the collection of a tax which had been levied on them which they considered excessive. The injunction was afterward dissolved

and a penalty of five per cent. was added to the amount of the tax. There is a law which provides that if any person or corporation obtains an injunction to prevent the collection of a tax and the injunction is dissolved the party obtaining the same is liable to a penalty of fifty per cent. of the total tax. The state authorities are now seeking to collect this penalty.

Systematic saving of small amounts has been the basis of some of the largest fortunes. The Serial Building Loan and Savings Institution of 195 Broadway, New York, offers a safe place of deposit for savings of any amount weekly or monthly, no matter how small, and pays a higher rate of interest than any bank. This association has been doing this for over twenty-five years and is now in better condition financially than ever before. Inquiries, either by mail or in person, will receive careful attention.

Will buy or sell, in one to ten-share lots, Western Union Telegraph Company and Mackay Companies stocks. Remittances by New York draft or express money order are requested. Address "Stock Investment," care Telegraph and Telephone Age, 253 Broadway, New York.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

If you are interested in Suburban Homes, and Investment Property on Long Island or in New Jersey, write for Booklet.

Mailed Free. Address,
M. J. KENNA, 206 Broadway
Room 62 New York

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Elementary Lessons on Electrical Measurements.

PART VII.

Electro-Plating.

Another property an electric current possesses is the ability to decompose a solution through which it flows and thereby cause the separated molecules of which it consists to move onward and either reunite with some other element, or attach themselves bodily to some object placed in their path.

We are all familiar with the fact that in an ordinary cell of bluestone battery the negative electrode in time becomes heavily coated with copper. This is because the blue stone consists of crystals of copper sulphate, which, after being dissolved in the water contained in the jar, are caused to move forward, and the negative plate is, of course, their natural goal.

Hence an electro-plating outfit consists primarily of a bath in which the solution contains the particular metal to be deposited, while the object to be coated must be connected to the negative pole of the battery.

Iron, steel, zinc and tin, cannot be coated with silver or gold until they have first been plated with a thin film of copper. This fact is well worth remembering during the students period of experimenting.

Almost any substance other than metal can be electro-plated if first properly treated. The usual method is to give such objects a coat of powdered graphite, which substance readily takes a deposit.

Again, in electro-plating the deposit should not be made too rapidly, as the coating under this condition is apt to be rough and present a powdered appearance. On the other hand a comparatively low current density usually gives a hard, close-grained finish. The necessary amperage required per square foot of area of the object to be plated differs for different metals and baths, but this information may be found in almost any book treating on this subject.

It will thus be seen that the art of electro-plating is also governed by a set of rules and formulas, the principal factors of which are weight time and current density.

For instance, one ampere of current flowing for a period of one second will deposit .0003286 gram of copper on an object, or .001118 gram of silver, while other metals will each have a particular weight value. From this we get the working formula:

$$\text{Amperes} = \frac{\text{Weight gained}}{\text{Gain per sec. X Time}}$$

or $C = \frac{W}{KT}$ Where K represents the gain in weight per second for one ampere. The letters of this formula, like those of $C = \frac{E}{R}$, are, of course, capable of being transposed according to which factors are known.

SHUNTS.

The object of a shunt is to provide a means of diverting part of the current flowing in a circuit into another channel where its volume may be regulated to suit certain requirements.

For instance, in using a galvanometer for the purpose of making different tests the normal volume of current flowing is often too strong to give the needle a proper deflection. In this case a shunt is placed in parallel with the coils of the galvanometer. As the current in the multiple circuits divides inversely in proportion to the resistance it is evident that the resistance of the shunt may be given such a value that the current flowing through the galvanometer will be, say, one-tenth, one-hundredth, one-thousandth, or any other desired fraction of the total volume flowing. The results obtained in this case must be multiplied by the shunt in order to get the correct answer.

The resistance of the shunt bears a definite relation to the value of the galvanometer resis-

tance and is determined by the ratio desired. Example: If with a galvanometer of 1800 ohms resistance the current is to be reduced tenfold what must be the resistance of the shunt?

The formula for determining this is:

$$\text{Shunt} = \frac{G}{R-1}$$

Where G = resistance of galvanometer.

Where R = the ratio or multiplier.

$$\text{Hence shunt} = \frac{1800}{10-1} = 200 \text{ ohms, and } 10$$

would be the multiplier.

To find the multiplying power of any shunt, use this formula:

$$\text{Multiplier} = \frac{\text{Res. of Gal.} + \text{res. of shunt}}{\text{Res. of shunt.}}$$

Example: Using the values in the previous example we get:

$$\text{Multiplier} = \frac{1800 + 200}{200} = 10.$$

FIG. A.

FIG. B.

The original manner of connecting the shunt coils with a galvanometer is shown in Figure A, while Figure B shows the more approved method quite generally used where great accuracy is required. The latter arrangement is called the Ayrton method and is known as the universal shunt. Its superiority over the former type is due to the fact that the arrangement of the coils is such that a shift from one multiplier to another will not alter the total resistance of the circuit to so great an extent as the arrangement in Figure A would bring about, because in the universal shunt that coil of the shunt which is displaced by any change made is shifted so as to be placed in series with the galvanometer coils, thereby causing the joint resistance of all the coils to remain practically the same at all times.

(To be continued.)

Recent Telegraph and Telephone Patents.

A patent, No. 13,130 (reissue), for a telegraphic transmitter, has been granted to P. Dinger, of

Cleveland, Ohio. A vibrator transmitting dots and a short lever pivoted adjacent thereto, a spring checking it, dash contacts and key lever controlling the lever and contacts.

A patent, No. 963,062, for a secret telegraph system, has been secured by W. P. Phillips, of Bridgeport, Conn.

A patent, No. 963,192, for a combined telephone and control system, has been issued to H. G. Webster, of Chicago, Ill.

A patent, No. 963,213, for telegraph apparatus, has been awarded to R. L. Dean, of Kansas City, Mo. Receiver and recorder consisting of a stylus propelled by a screw with shifting mechanism therefor.

A patent, No. 963,298, for a telegraphic relay, has been taken out by I. Kitsee, of Philadelphia, Pa. The contacts of the relays consist of graphite in a metallic housing.

A patent, No. 963,374, for a relay, has also been secured by I. Kitsee. Cable relay, including a plurality of pairs of magnets with a movable coil for each pair, the coils being secured together on a single moving system, each coil being in its own field and also in the field of another coil.

A patent, No. 963,480, for a switchboard for electrical conductors, has been issued to J. F. Skirrow, of East Orange, N. J. For telephone system in which the back board carries metal straps and buttons and is perforated so that the conducting pin may pass through it, and is received and held by converging sections of sheet metal.

A patent, No. 963,875, for a telephone system, has been secured by William W. Dean, of Elyria, Ohio.

A patent, No. 963,954, for a telephone receiver, has been taken out by Sol. S. Sonneborn, of New York.

A patent, No. 964,145, for a microphonic transmitter, has been awarded to C. L. Chisholm, of Marysville, New Brunswick, Canada.

A patent, No. 964,214, for a telephone transmitter, has also been granted to C. L. Chisholm.

The following patents have expired:

Patents Nos. 501,085, for a telephone circuit and apparatus, and 501,086, for station apparatus for telephone circuits, issued to Sherwood J. Larned, of Evanston, Ill., and Frank A. Pickernell, of Newark, N. J.

Patent No. 501,087, for electric signaling, issued to Thomas D. Lockwood, of Melrose, Mass., and Sherwood J. Larned, of Evanston, Ill.

Patent No. 501,102, for telephone signaling apparatus and circuit, issued to Frank A. Pickernell, of Newark, N. J.

Patents Nos. 501,168, for a telephone switch, and 501,169, for telephone exchange apparatus, issued to Charles E. Scribner, of Chicago, Ill.

Personal.

Mr. Jacob Levin, formerly general superintendent of the Western Union Telegraph Company, at Atlanta, Ga., was a recent New York visitor.

Mr. John Newlands has been appointed controller of the central telegraph office, London, England, vice Mr. A. E. Eames, retired. Mr. Eames had been connected with the English telegraph service for over fifty years.

Mr. T. Thorne Baker, of London, England, the inventor of a system of transmitting photographs by wire, who was a recent visitor to this country has been awarded a silver medal by the British Society of Arts for a paper on the subject of photo-telegraphy.

A recent illustrated bulletin of the Department of Architecture of Syracuse University is dedicated to Mr. Sidney B. Gifford, who was for many years superintendent of the Western Union Telegraph Company at Syracuse. Mr. Gifford's father was an architect and in his memory Mr. Gifford founded the Luther Gifford scholarship and prize in the Department of Architecture of Syracuse University.

Postal Telegraph-Cable Company.**EXECUTIVE OFFICES.**

Mr. Clarence H. Mackay, president of the company, accompanied by his wife, sailed for Bremen July 19. They expect to tour Holland and the Black Forest of Germany in an automobile and will be away about six weeks.

Colonel Albert B. Chandler, chairman of the board of directors, who is spending the summer at his country home at Randolph, Vt., was in New York a few days recently on company business.

Mr. S. M. English, of Dallas, president and general manager of the Postal Telegraph-Cable Company of Texas, was a recent executive office visitor.

Mr. Minor M. Davis, electrical engineer of the company, has returned to his office after a two months' absence in the west.

This company gained a point recently in its attempt in the Superior Court of California to secure a right of way along the Southern Pacific Railroad, when Judge Post of that court decided that the company's complaint asking for the right of way contained sufficient grounds to constitute an action.

James P. McBurney, manager of the branch office at 1397 Broadway and other offices in the theatrical district, died July 21, as a result of an operation for appendicitis. Mr. McBurney was thirty-nine years of age, and had been employed by this company for seventeen years. He was highly regarded by both his associates and his employers.

Extensive changes have been made in the New Haven office, a general remodeling having been effected in order to better utilize the space.

Mr. J. McGuckin, manager at Lake Placid, has had his office improved so that it is now one of the finest in the country for an office in the woods.

RESIGNATIONS AND APPOINTMENTS.

Mr. J. B. Coggins, manager of the Denver office has been appointed manager of the San Francisco office, vice Mr. G. W. Holt, transferred to the management at Denver.

Western Union Telegraph Company.**EXECUTIVE OFFICES.**

In the readjustment of divisional lines which has been made and which is effective August 1, all changes have been made on state lines on account of the differences in state laws and regulations governing telegraph operation. Under the new arrangement, indicated by the foregoing, the division territory will, with minor exceptions, be as follows:

Eastern division: New England States and New York, New Jersey, Pennsylvania, Maryland, Delaware, District of Columbia. Headquarters, New York City. General Superintendent, A. G. Saylor.

Southern division: Virginia, West Virginia, North Carolina, South Carolina, Kentucky, Tennessee, Georgia, Florida, Alabama, Mississippi. Headquarters, Atlanta, Ga. General Superintendent, B. F. Dillon.

Western division: Ohio, Indiana, Michigan, Illinois, Missouri, Arkansas, Iowa, Wisconsin, Minnesota, North Dakota, South Dakota. Headquarters, Chicago. General Superintendent, T. P. Cook.

Gulf division (new): Texas, Oklahoma, Louisiana. Headquarters, Dallas, Texas. General Superintendent, L. McKisick.

Mountain division (new): Montana, Idaho, Wyoming, Colorado, Utah, Nebraska, Kansas, New Mexico. Headquarters, Denver, Colo. General Superintendent, J. C. Nelson.

Pacific division: California, Arizona, Nevada, Oregon, Washington. Headquarters, San Francisco. General Superintendent, C. H. Gaunt.

The following appointments have been made, to be effective August 1, in the eastern division: Mr. E. M. Mulford, superintendent of the first district, to be division commercial superintendent; Mr. M. C. Allen, formerly of the American Telephone and Telegraph Company, to be division plant superintendent; Mr. J. A. Hill, of the general superintendent's office, to be division traffic superintendent. The headquarters of all of these officials will be in New York.

In the western division, with headquarters at Chicago, Mr. Morris T. Cook, secretary to the general superintendent, to be division commercial superintendent; Mr. W. J. Lloyd, superintendent, to be division traffic superintendent; Mr. W. H. Clapp, to be division plant superintendent.

In the southern division, with headquarters at Atlanta, Mr. J. M. Stephens, superintendent, to be division commercial superintendent; Mr. D. M. Therrel, to be division traffic superintendent.

In the Pacific division, H. F. Dodge, to be division commercial superintendent; H. B. Chace, assistant superintendent of telegraph of the Santa Fe system to be division traffic superintendent.

Among recent executive office visitors were Mr. L. McKisick, general superintendent at Dallas, Tex.

Mr. A. B. Cowan, assistant superintendent at Chicago, has been made superintendent of the first district, western division at that point, vice Mr. W. J. Lloyd, appointed division traffic superintendent.

Mr. E. Boening, of San Francisco, has been appointed superintendent at Seattle, vice Mr. R. T. Reid, resigned to enter commercial pursuits.

Mr. T. P. Cummings, manager of the New Orleans, La., office, has been promoted to be superintendent at that point.

Mr. C. B. Horton, Jr., assistant superintendent at Omaha, has been advanced to the superintendency at Omaha, vice Mr. J. C. Nelson, appointed general superintendent of the Mountain division.

Mr. A. R. Lingafelt, assistant superintendent at Oklahoma City, has been made superintendent at that point.

Mr. J. C. Hubbard, formerly division supervisor of lines of the American Telephone and Telegraph Company, New York, has joined the staff of the Engineer of Construction of this company and will supervise construction work throughout the plant. Mr. Hubbard has had many years experience in line construction and in conduit and cable work and his duties with this company will be largely of the same character. Mr. Hubbard's headquarters are now with Engineer of Construction, R. E. Chetwood, at 195 Broadway.

Mr. R. A. Black, of the office of General Superintendent A. G. Saylor of New York, has been appointed manager of the Philadelphia office, vice J. W. Reed, transferred to the superintendency at New Haven. Mr. Black was formerly manager of the York, Pa., office, and previous to his being attached to the general superintendent's office three months ago, was for a time assistant manager at Philadelphia.

Mr. A. C. Kaufman, of the general superintendent's office, New York, delivered an address before the Board of Trade of Pittsfield, Mass., on July 13 on the "Evolution of the Telegraph Service."

Mr. George W. Naile, a military telegrapher and an employe of the Omaha office of the Western Union Telegraph Company, has been retired on a pension. Mr. Naile established the first telephone exchange in Sioux City, Ia., in 1879, having secured the franchise in that city from Colonel

John J. Dickey and L. H. Korty, who established the first telephone system in Omaha.

Mr. H. L. Waterbury, manager of the office at Saratoga Springs, N. Y., representing the city, delivered the address of welcome to the New York Press Association, which held its fifty-seventh annual convention at that place recently.

J. C. Nelson, General Superintendent Western Union Telegraph Company, Denver.

Mr. John C. Nelson, who has been appointed general superintendent of the newly created Mountain division of the Western Union Telegraph Company, is the youngest of the six general superintendents of that company. Mr. Nelson was born in Denmark, December 14, 1875. He came to this country when but a young lad and, like thousands of others of our immigrants from the Scandinavian countries, has developed into the highest type of an American citizen. His entry into the telegraph service dates from May 3, 1888, when he began at the bottom of the ladder in the Omaha office of the Western Union, starting as check boy. He soon attracted the favorable attention of Colonel J. J. Dickey, who

J. C. NELSON,
General Superintendent, Western Union Telegraph Company,
Denver.

was superintendent at Omaha at that time and Colonel Dickey took Mr. Nelson into his own office as office boy. Here he was encouraged by his superintendent to take up the study of stenography and typewriting. He made such progress that in 1890 he was given a position as stenographer. He later became chief clerk and private

secretary to Superintendent Dickey. In the meantime he mastered the art of telegraphy and occasionally served as relief operator and temporary manager at various points. In this way and by frequently accompanying Colonel Dickey on inspection trips he gained a thorough knowledge of telegraphic affairs so that in 1902 when the office of assistant superintendent at Omaha became vacant Mr. Nelson was the natural choice for the post. In 1907, he was advanced to the superintendency, which position he has since held. The territory over which he now has jurisdiction comprising the States of Montana, Idaho, Wyoming, Colorado, Utah, Nebraska, Kansas and New Mexico, extends from the Canadian to the Mexican border, and in view of the rapid expansion of business in that part of the country is an important one. Mr. Nelson, however, is well qualified to discharge the duties of his new position and enjoys the confidence of both his superior officials and his subordinates.

**Mr. L. McKisick, General Superintendent,
Western Union Telegraph Company,
Dallas, Tex.**

Mr. Lewis McKisick, who has been appointed general superintendent of the newly created Gulf division of the Western Union Telegraph Company, at Dallas, Tex., as announced briefly in our

L. McKISICK,
General Superintendent, Western Union Telegraph Company,
Dallas, Tex.

July 16 issue, is especially well qualified to discharge the duties of the new position. Mr. McKisick was born at Memphis, Tenn., November 17, 1866. He went to California in 1879 and attended various institutions of learning, finally receiving the degree of Ph. B. from the University

of California in 1890. In August of that year he entered the service of the Western Union Telegraph Company, at San Jose, Cal., but in November he transferred his services to the San Francisco main office. His natural ability and his educational advantages soon brought him advancement and he was appointed chief operator in the Sacramento office. His next promotion came in 1899, when he was appointed assistant superintendent at San Francisco. In 1902 he was transferred to Chicago as electrician of the Western division. This position he held until 1907, when he was again promoted to be assistant general superintendent at Chicago, which post he has since filled. In the supervision of the large territory comprising the States of Texas, Louisiana and Oklahoma, Mr. McKisick will find ample opportunity for the display of the high executive ability which he possesses and there is no doubt but that his administration will be a most successful one.

The Cable.

It is reported that the Japanese government is preparing to lay a new cable between Nagasaki and Formosa.

According to a German publication the essential condition of the Franco-German cable agreement is the laying of a cable between Emden and Brest. The apparent object is to render the two countries independent of British cables for communication with Africa.

The report of the Central and South American Telegraph Company for the quarter ended June 30, shows gross earnings of \$435,000, an increase of \$70,000 over the corresponding period last year, with an equal increase in net revenue. The surplus now amounts to \$2,017,836, an increase of \$561,309 during the past year.

The second three-conductor cable which the Canadian Pacific Railway has been laying between Vancouver and Vancouver Island, near Nanaimo, has been completed. The laying was successfully performed by the Commercial Cable Company's cable ship "Restorer," on June 20, and the cable tested out very satisfactorily. This provides the company with six conductors between Vancouver and the Island, and as the cables were laid at different points, it is unlikely that any interruption should occur which would entirely cut off the island from the outside world.

The Pacific Cable Board has practically completed the arrangements for organizing its trans-continental service over the wire which it has recently leased from the Canadian Pacific Railway between Vancouver and Montreal. Mr. A. S. Baxendale, manager of the Board in London and Mr. Joseph Milward, manager in the Pacific, at Sydney, N. S. W., have been in Canada for some time past looking after the installation of the necessary apparatus. The wire will be operated

by the Wheatstone system, the Continental code being used, thus avoiding the translation from Continental into Morse, which was necessary under the former arrangement, whereby the Canadian Pacific handled the traffic. Relay stations will be located at Vancouver, Calgary, Winnipeg and White River. Mr. Milward will supervise the operation of the wire until the middle of September, when he will return to his headquarters at Sydney. The operating staff for the new wire will be composed of experts from London. At Montreal trans-Atlantic business will be exchanged with the Commercial Cable Company and the Anglo-American Telegraph Company.

Municipal Electricians.

A storage battery plant will be installed at Sandusky, O., to replace the gravity batteries now in use for the fire alarm telegraph system.

The Gamewell Fire Alarm Telegraph Company has been awarded the contract for installing a new fire alarm system in Grand Rapids, Mich.

Mr. B. W. Collins has been appointed city electrician of Tacoma, Wash., and has charge of all municipal electrical work in that city.

The Civil Service Commission of Los Angeles will, in the near future, hold an examination to secure eligibles for appointment as linemen, operators and an assistant superintendent in the fire alarm bureau.

Mr. Clarence R. George, city electrician of Houston, Tex., is engaged in installing a new switchboard in the fire alarm bureau which will increase the efficiency and double the capacity of the fire alarm system. About five miles of underground cable will soon be added to the system and additional street boxes will be installed.

A committee which has been investigating the condition of the fire alarm service in New York has recommended the abolition of private fire alarm companies and that the city take over and operate their properties. There are five such companies and they have a total of over 6,000 subscribers. It is urged that the revenue which would be derived from the operation of these plants by the city would be sufficient to defray the expense of the entire fire alarm system.

Everyone who is in any way interested in municipal electrical affairs should, if possible, attend the fifteenth annual convention of the International Association of Municipal Electricians, which meets at Rochester, N. Y., September 6, 7, 8, and 9. Some unusually interesting papers will be presented for discussion and a first-class entertainment will be provided for the visitors. Mr. J. B. Yeakle, superintendent of fire telegraph of Baltimore, Md., and president of the association, will be prepared to answer any questions concerning the Baltimore underground system. Mr. Frank P. Foster, of Corning, N. Y., is secretary of the association.

An appropriation of \$11,000 has been made in San Antonio, Tex., for improvements to the fire alarm system during the present year. Mr. W. A. White, city electrician, will have charge of the work.

J. Fletcher, Superintendent Canadian Pacific Railway Company's Telegraph, Vancouver.

Mr. John Fletcher, who has been appointed superintendent of the Canadian Pacific Railway Company's Telegraph at Vancouver, was born at London, Ont., January 4, 1856. He entered the telegraph service at Brockville, Ont., in May, 1872, being employed by the Dominion Telegraph Company. He afterward joined the forces of the Montreal Telegraph Company as operator at Ogdens-

J. FLETCHER,
Superintendent, Canadian Pacific Railway Company's Telegraph,
Vancouver.

burg, N. Y. He was next connected with the Montreal office of that company. Among other positions which he has held were those of operator and night chief of the Dominion Telegraph Company at Montreal, and night chief of the Western Union Telegraph Company at Ogden, Utah, in 1881. Since his connection with the Canadian Pacific he has served as chief operator and circuit manager at New Westminster and Vancouver, B. C., where he held the position of chief operator at the time of his present promotion. As he has acted as superintendent at that point at various times during the absence of the superintendent he is thoroughly familiar with the duties of his new office and is well qualified for the position.

Receiver for Rowland Company.

United States Judge Cross at Trenton, N. J., on July 25, named Mr. Louis de Goll, of Baltimore, Md., receiver for the Rowland Telegraphic Company, of Baltimore, a New Jersey corporation, upon the complaint of Edward J. Curran, a creditor of the company. This action will probably result in a reorganization of the company.

Annual Reunion of Old Time and Military Telegraphers.

The twenty-ninth annual reunion of the Old Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps, to be held in Chicago, Sept. 8, 9 and 10, bids fair to be a record breaker in the matter of attendance and interest. President W. J. Lloyd, on the part of the Old Timers and A. H. Bliss on the part of the Military Telegraphers, both of whom are looking locally after the entertainment of the gathering, are allowing no means to escape them to make the coming meeting one of extreme pleasure and enjoyment. We take pleasure in publishing the following letter of Chairman Bliss addressed to the military contingent, the committee mentioned being the wives and daughters of military members.

"At a largely attended Committee meeting of the Society of the United States Military Telegraph Corps, held July 11, the following Ladies Reception Committee was appointed for the Reunion, September 8, 9, and 10: Mrs. W. R. Plum, Mrs. E. W. McKenna, Mrs. A. H. Bliss, Mrs. Florence D. Niblock, Mrs. A. W. Nohe, Mrs. L. B. Parker, Mrs. Daniel Hogan, Mrs. Charles F. Gross, Miss Margaret Charles Gross, Miss Alice S. Pettit, Miss Livonia Ingram, Miss Nina G. Sloat, Miss Rose Marie Moore and Miss Frances Bliss Moore.

"The program which is being arranged will be elaborate—not tiresome. It will entertain every minute of your stay, giving you the time of your life."

From other sources we learn that great efforts are being made to insure a large attendance of the surviving military telegraphers, who, having been operators in the second decade of Morse telegraphy, are in reality among the oldest of the old timers.

Any additional information in regard to the coming gathering may be obtained by addressing F. J. Scherrer, 195 Broadway, New York, secretary of the Old Time Telegraphers' and Historical Association, or David Homer Bates, 658 Broadway, New York, secretary of the Society of the United States Military Telegraph Corps.

International Conference of Telegraph and Telephone Engineers.

The second international conference of telegraph and telephone engineers which meets in Paris, September 4 to 11, will probably be the most important gathering of telegraph and telephone officials which has ever been held, practically every government telegraph administration in the world will be represented. The list of topics which appeared in our March 1 issue covers many subjects of great importance to telegraph and telephone engineers and there is no doubt that much benefit will be derived by the interchange of views by those present.

Papers intended for presentation at the conference have already been submitted and are now being reviewed. Each administration has also submitted papers detailing the present state of practice in their respective countries in the subjects which are included in this year's list of topics to be discussed. These papers are being printed in Paris, and will be circulated to reviewers nominated by the several administrations, who will in turn summarize the papers and distribute them to the delegates, so that at the Conference they may be taken as read and discussed forthwith.

Mr. John J. Carty, chief engineer of the American Telephone and Telegraph Company, and Mr. Charles E. Scribner, chief engineer of the Western Electric Company, New York, will attend the deliberations of the convention.

Incorporation of Printing Telegraph Company.

Articles of incorporation have been filed at Olympia, Washington, by the Consolidated Printing Telegraph Company. The organizers are Benjamin M. Barr, Frank B. Rae, George F. Parker, Joseph D. Baucus, Gordon Mackay and C. E. Collier. The capital stock is \$15,000,000, and the general offices are located at 2 Rector Street, New York. The object of this company is to purchase patents covering printing telegraph machinery and to develop a workable printing telegraph system. To this end control of several partially developed printing telegraph machines has been acquired by the company and control of several others is now in process of negotiation. This company will have associated with it either actively or in an advisory capacity such well known experts in this line as its chief engineer, Frank B. Rae, Henry Mahnken, for years associated with the New York Quotation Company, and John C. Barclay, himself, an inventor of a successful printing telegraph machine, and for years electrical engineer and assistant general manager of the Western Union Telegraph Company. These gentlemen and others of like standing are, as before stated, interested in the bringing out of a successful and thoroughly practical and commercially operative printing telegraph system. Mr. B. M. Barr is the president and Mr. S. S. Glass is secretary and treasurer.

Conference of British Post Office Engineers.

A four days conference of superintending engineers of the British Post Office was held recently at Leicester, Eng. Major W. A. J. O'Meara, chief engineer, presided. Among the engineers present were J. W. Groves, W. Noble, J. D. Taylor, E. Catley, A. Moir, J. Sheridan, F. H. Machugh, J. M. Robb, G. B. Roberts, W. Slingo, A. J. Stubbs, D. M. Stewart, F. Tremain, I. Probert, A. L. De Lattre, J. F. Lamb, R. McIlroy and E. J. Eldridge. This is the second such gathering which has been held since Major O'Meara assumed the position of chief engineer and it is the intention to hold similar conferences more frequently in the future.

The Telephone.

The regular semi-annual dividend of two and one-half per cent. has been declared on the preferred stock of the Western Telephone and Telegraph Company, payable August 1.

The New England Telephone and Telegraph Company has begun the construction at Boston of a ten story building, which, when completed, will be occupied by the executive offices of that corporation.

The report of the American Telephone and Telegraph Company for the first six months of 1910 shows a gross income of \$17,595,895, an increase of \$2,383,063 over the corresponding period in 1909, and net earnings show an increase of \$1,915,531.

James Bigler, a pioneer telephone man, died at Newburgh, New York, July 16, aged ninety-two years. Mr. Bigler in 1879 organized the Newburgh Telephone Company. He was afterwards associated with the Hudson River Telephone Company, being president of that corporation for several years.

The number of independent telephone companies in New York State has been reduced by sixteen, that number of companies in the western part of the State having been merged with the Federal Telephone and Telegraph Company, of Buffalo, which owned all of the capital stocks of the companies merged.

Upon application of Mr. A. J. Howard, a stockholder of the National Telephone Company, W. C. Handlau and J. W. Ewing have been appointed receivers of that company. The application for receivers states that the Continental Telephone and Telegraph Company procured \$10,000,000 of the stock of the National Company without giving any consideration therefor.

A recent number of the Electrical Review and Western Electrician contains a biographical sketch and engraving of Mr. Jasper N. Keller, who was recently elected president of the New England Telephone and Telegraph Company. Mr. Keller entered the telegraph service in 1862 and served as operator at various points throughout the United States. In 1879 he established the first telephone exchange in the west at Ogden, Utah. He has been connected with the New England Company since 1885.

One of the most interesting telephone exchanges in the United States is that of the Pacific Telephone and Telegraph Company in Chinatown, San Francisco. All of the subscribers are Chinese and all employees in the exchange are Chinese. The operators are girls who speak both English and Chinese. When a call is made the subscriber gives the party desired instead of the number and the operators are trained so that they know the name of every subscriber. The exchange has a capacity of 3,500 lines and is rapidly filling up as the Chinamen are getting educated to the use of the telephone.

The American Telephone and Telegraph Company, following its policy of centralization, has made arrangements to exchange its stock for that of the Michigan State Telephone Company, on the basis of four shares of American for five shares of that of the Michigan Company.

Extensive improvements are being made in the telephone service in the Canal Zone, Isthmus of Panama. An up to date common-battery exchange will be installed at Empire and the present central offices at Culebra and Paraiso will be consolidated with the Empire exchange.

Mr. E. H. Heffernan has been appointed district commercial manager of the Pacific Telephone and Telegraph Company at Reno, Nev., vice Mr. J. F. Adams resigned to accept the general management of the Nevada-California-Oregon Telephone and Telegraph Company.

A Telephone Handbook.

"The Practical Telephone Handbook," by Joseph Poole, A.M.I.E.E. (Whittaker and Company, London, the Macmillan Company, New York, 606 pages, 500 illustrations, price \$1.75). has been revised and enlarged and brought up-to-date. Among the subjects treated in the book are batteries, receivers in general use, transmitters in practical use, sub-station apparatus and instrument connections, intercommunication telephones, switchboard apparatus, relay and lamp signaling, small switchboards, private branch exchanges, multiple switchboards, principles of common battery working, trunk line working, trunk line exchanges, party line working, exchange apparatus, power plant, traffic statistics, aerial line construction, underground work, long distance lines, Pupin system of line loading, submarine telephone cables, faults and their localization, electrical measurements, automatic exchanges and wireless telephony. The subject of telephony is thoroughly covered by this book with particular reference to English practice. As American apparatus and methods, however, have been introduced very largely abroad in the past few years and adopted with modifications to meet local requirements, there is much information in this work which will be of value to telephone engineers in this country. Copies of this book will be sent to any address, carrying charges prepaid, upon receipt of price, by J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

A Missouri telegrapher, in receiving a message recently which said "have taken position" made it read "have taken poison." This error, of course, caused the recipient of the message much anxiety and led him to make a long railway journey before the mistake was discovered.

The testimony of progressive operators is that Telegraph and Telephone Age is so thoroughly comprehensive in character as to make it absolutely indispensable to those who would keep informed. Its technical articles are of high practical value.

Testing the Insulation of Wires.*

BY MINOR M. DAVIS, NEW YORK.

Electrical Engineer of the Postal Telegraph-Cable Company.

Chief operators are aware that in wet weather the deflection of the measuring instrument is usually much greater when one pole of the measuring battery is to line than when the other pole is to line. The most common cause is the presence of foreign battery in the wire under test. If two wires rest upon a wet tree limb, one of them open for test and the other in operation, current will pass from the wire that is in use, along the tree limb to the wire under test and this current will augment or decrease the current from the testing battery. Upon open pole lines the insulation values are so variable in wet weather that readings taken within a few minutes of each other will differ considerably. In fact it is difficult to get two readings that agree. These changes sometimes appear to make it difficult to ascertain the exact location of the leak, but there is a very simple way of doing so. In my days of inexperience I took many readings with a tangent galvanometer that proved to be of no value when they were subsequently calculated; I read the plus and minus deflections to the most distant test station upon each wire of a pole line and then read the deflections to an intermediate station. When I got through I had a good deal of misinformation. The results, when checked by judgment, usually indicated the leaky spots; but Ananias would have blushed if he had seen some of the stories told by the galvanometer. After awhile I became conscious that my calculations were useless, that in most cases it wasn't material how many megohms per mile the needle indicated, that the essential question was: Where is the leak? Then this simple way of finding out was used. The wire to be tested was opened at a station beyond the leak and the pole of the testing battery that gave the greater deflection was left on the wire. As soon as the deflection became reasonably steady the needle was closely watched, while the wire was opened at the next station nearer the testing instrument. If the deflection suddenly dropped it was reasonably sure that the leak was between the two stations. If the needle did not change much the wire was opened at another (nearer) station, while the needle was carefully watched. A few tests showed where the leak was, and even when several sections were leaky it was easy to tell which they were. The advantage of this method is that you do not depend upon the value of any reading. It does not matter how much the deflection is, and variations do not matter provided they do not occur so suddenly that you cannot tell the effect of opening the wire at another test point.

By this method the leaky sections can be accurately determined even when the deflections are so variable that they do not remain constant long enough to compare them with a subsequent test to another station. There are more accurate ways of measuring insulation resistance, but it is usually much more important to know where a leak is than it is to know its exact resistance.

A Problem in Telephone Line Testing.

The problem which we published on page 473 of our July 1 issue and which was given by Mr. D. B. Grandy of the American Telephone and Telegraph Company, St. Louis has brought forth the following explanation from Mr. W. C. Stowell, assistant wire chief on the Santa Fe Railroad at East Las Vegas, N. M.:

"I have had considerable experience measuring a copper pair telephone circuit 126 miles long in Illinois, using either the voltmeter, milliammeter or bridge. With the former I used a line battery of fifty volts or more while with the Wheatstone bridge I used not more than fifteen volts. Under these circumstances measuring to a line cross the resistance was usually less when measured with the higher potential than with the small bridge battery. My explanation of the case given is that the lineman did not thoroughly brighten the wires when he put his cross on. Under this condition, the film of oxide left could not be broken down by the smaller potential applied. For with the line cross alone in the full testing potential was applied at the line cross, while with both crosses on, using the same testing potential, the voltage at each contact would be less, probably about half of what it was when the line cross alone was on. This lower potential would not break down as much oxide film, resulting in an increased resistance at the contacts. It is frequently found in both telephone and telegraph testing that application of a momentary high potential will greatly reduce abnormal resistance, either on line crosses or in instrument windings. The low pressure used on most bridge instruments gives at times some very strange figures, when compared with those obtained with regular line battery on voltmeter and milliammeter, when applied to circuits crossed or grounded outside of office where the wires are more or less covered by a film of oxide, soot or other material resulting from exposure to the air."

The theory which Mr. Grandy himself gives to explain the facts observed by him is as follows:

"My theory is that there is a film of oxide at the point of the original cross, which is broken down by the testing battery to such an extent, that there is practically no resistance in it when measured. When the lineman's cross is put on, however, sufficient current is deflected from the original path by the perfect connection formed by the new cross, to cause the film of oxide at

*Article appearing in Postal Telegraph.

the original cross to reassert itself and the resistance there rises, so that the current from the measuring battery practically all flows through the perfect cross put on by the lineman although that cross may be farther away than the original cross, and show the increased distance in a higher measurement reading. In all cases of this kind, of course, the lineman's cross is necessarily beyond the original cross."

If any of our other readers have had experience along this line and have any additional theories to advance or perceive any weak points in the theories of either Mr. Stowell or Mr. Grandy we would be pleased to hear from them.

How to Know How—In the Telephone Field.

The field of telephony is so broad and the types of equipment so many that already the telephone "specialist" is abroad in the land. We see the traffic engineer dealing solely with questions of traffic, the construction engineer with the plant equipment, and the manufacturing engineer with the design of apparatus. Then comes a host of lesser specialists, each man trained to do a certain thing, and having only a superficial knowledge of the other branches. For instance, a cable tester, or as they are commonly known, "galvanometer" men, while expert in the use of cable testing equipment and the location of faults in cables, know practically nothing of switchboard or instrument troubles and their remedies.

Unfortunately, the small exchange or the railway telephone system cannot have a group of specialists, but one man must do all the work from putting up the outside plant and installing the switchboard, to clearing line, cable, instrument, or switchboard troubles. This requires a general knowledge of things telephonic and it is surprising how many men in such situations succeed when the difficulties of obtaining a practical knowledge of the telephone business are so great. There are many men who have only been in the business a short while and who are greatly hampered by not knowing what has already been done, and who are therefore not in a position to take advantage of the "short cuts" and successful methods of others.

Perhaps in no other way can a man's efficiency be so increased as to carefully read the current telephone papers and such telephone books as are available. These, it is to be regretted are very few, but the latest one, "Telephonology," by H. R. Van Deventer, seems to have filled a long felt want and some of the comments on the same by practical telephone men are very enthusiastic.

The trouble with many electrical books is that they contain a great deal of matter of a historical nature which, owing to the rapid advancement of the art soon becomes obsolete as the equipment is no longer made and used, or they are too technical and hard to understand. This is not the case with *Telephonology*, which is simple, clear, and easily understood by the average lineman,

installer, or wire chief connected with a small installation, who has not had the opportunity to become expert on telephone matters, but who desires to inform himself carefully as to the location and remedy of various troubles in all kinds of modern equipment. Only modern apparatus and circuits are described, but trations being used, embracing circuit diagrams, cuts of circuits showing various tests, testing instruments, and information about making galvanometers, volt-meters, slide wire bridges, and other equipment from materials usually found around the exchange.

The book is unique inasmuch as it endeavors to answer accurately many hundred questions which have been asked the author by telephone men all over the country. This data was gathered during the author's connection with the telephone manufacturing companies as engineer, parties often writing these companies for information. A record was kept of this correspondence and a great deal of the data regarding trouble, was compiled therefrom. Copies of this valuable book will be sent to any address carrying charges prepaid upon receipt of price, \$4.00, by J. E. Taltavall, *Telegraph and Telephone Age*, 253 Broadway, New York.

Nothing New Under the Sun.

The recent invention in England by Mr. S. G. Brown of a telephone relay or repeater, mention of which was made in our June 1 issue, and extended descriptions of which have appeared in several publications both in England and this country has received favorable comment from many telephone engineers. It is interesting to note in this connection that Mr. Stephen D. Field, the well known electrical engineer and inventor of Stockbridge, Mass., in 1887, was granted a patent for a telephone which accomplished practically the same results as Mr. Brown has secured in a very similar manner. Mr. Field's invention made use of platinum points as does Mr. Brown's, although the application of these points is somewhat different in the two cases. No practical use was ever made of Mr. Field's invention though the original model of his device may still be seen in his laboratory at Stockbridge. Five different patents were granted to Mr. Field covering this idea, application for the first one, No. 433,128, being dated June 21, 1887, and for the last one, No. 496,513, being dated July 30, 1892. The expiration of the last patent was recorded in our columns May 16.

It is reported that Mr. Hans Knudsen a Danish inventor, has devised a new system of submarine cable telegraphy which, it is claimed, is also applicable to wireless telegraphy. The new invention is a keyboard printing system and the inventor states that it will quadruple the speed at which submarine cables may be worked.

Telegraph and Telephone Age

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

August 1, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

The Study of the Telegraph.

The plan which we have adopted of publishing in each issue a list of questions covering chapters in Jones' Diagrams has evoked expressions of approval from many sources. There is a strong desire among operators at the present time to secure a more extensive knowledge of telegraph principles and of the electrical reasons underlying the operation of the apparatus they are called upon to handle. It is generally conceded that Jones' Diagrams is one of the best textbooks on these subjects which has ever been written. Our plan enables the student to study intelligently and acquire a thorough grasp of the fundamental facts set forth in this book. When we have concluded the questions on this work we will, as previously announced, take up other standard works on telegraphy and treat them in the same manner. In this way our readers will have the opportunity to secure just the knowledge that they need to enable them to advance in their pro-

fession. A few of the results obtained by some of our agents will illustrate the appreciation of our plan of study by telegraphers.

Mr. W. L. Jones, agent of Telegraph and Telephone Age, in the office of the Postal Telegraph-Cable Company of Texas, at Dallas, Tex., writes: "You are to be congratulated upon the excellent idea of publishing questions based on Jones' Book of Diagrams. It was only necessary for me to call attention to this feature of the paper in order to secure fifteen subscriptions and get orders for eleven books of Diagrams, the other four new subscribers already having copies of the book."

Our Omaha, Western Union agent, Mr. W. W. Umsted, has sent us twenty-three yearly subscriptions most of which have no doubt been added to the list on account of these educational articles. Our Boston, Western Union agent, Mr. Allan Woodle, has also sent us eighteen names to be added to the list while our agents at many of the smaller places have added one to five additional names, all of which goes to prove that members of the profession are anxious to obtain all the technical information regarding the telegraph if it can be imparted in a simple manner and obtained at a reasonable cost.

Mr. S. M. English, president and general manager of the Postal Telegraph-Cable Company of Texas, of Dallas, Tex., in a circular letter recently issued to all employees of his company among other compliments paid our paper says: "Telegraph and Telephone Age is now running an educational column which is better for you than anything it has yet undertaken and you should take advantage of it."

A student in one of the electrical schools which have been formed among telegraph employees in various parts of the country stated that he had secured more information from one hour's study of Jones' Diagrams in connection with the questions which we have printed than he had from attending six lectures of the electrical school. This was probably not due to the fact that the lectures were not practical, but rather that they were somewhat in advance of the student and tried to cover too much ground at once.

These are a few indications of the general feeling in telegraph circles at the present time. Those operators who are taking advantage of the educational facilities which are thus brought within their reach will be among those who will direct our telegraph systems in the future. Never since we have been in the business has there been such a demand for electrical works as during the past few months and we have made large shipments to Washington, Boston, Pittsburg, Kansas City, St. Louis, and other important telegraph centres. The effect of these influences will be a general increase in the efficiency of the service as well as an individual benefit for each one who makes a diligent effort to increase his knowledge. There are among those working at the key, many whom we predict will in a few years be occupying official positions.

For the Welfare of Employees.

It is frequently asserted that large corporations have no regard for the welfare of their employes, their only care being to get the most work possible out of them at the minimum wage. This assertion may have been true with some concerns, but the great companies of the present are daily proving that such statements are unwarranted.

One of the most commendable movements in the direction of benefitting employes which has been brought to our attention in later years is an association organized by employes of the Postal Telegraph-Cable Company in New York, known as the Mutual Investment Association. This is a co-operative organization formed for the purpose of enabling its members to make systematic savings and to secure greater returns for the money invested than could be obtained through other sources.

Although this association is composed entirely of employes and is directed by them, it has been made possible by the sanction and co-operation of the officials of the company. Through this organization any employe in need of a typewriter can purchase one from any reliable dealer at the cash price and the typewriter will be paid for by the association. The employe in turn is permitted to repay the association in small weekly amounts taken from his wages, the association charging for the money advanced only at the legal rate of six per cent. interest per annum.

An employe can also buy his clothing, furniture, and all other household necessities, at certain stores with which the association has arrangements, paying for the same in small weekly installments. For this accommodation no interest charge is made; the employe securing his goods at straight cash prices. This arrangement makes it unnecessary for him to deal with installment houses at installment house prices.

The association also aims to assist those who, for one reason or another, have become indebted to a class of people who style themselves as loan brokers, but who are more fittingly described by the name of "Loan Sharks." The rate of interest charged by this class of brokers for small loans amounts, in many cases, to several hundred per cent., and the employe who once gets into the clutches of one of these vampires usually has an uphill fight ahead of him before he can secure his release. The Mutual Investment Association has started out by buying up all claims presented against its employes in New York, permitting them to pay back the money on easier terms without the imposition of any penalties or interest charges.

It is thought by giving every employe a fair start and by taking care of their urgent needs in times of emergency, that the loan brokers can be driven out of the Postal service.

If the movement which has been started among the Postal employes in New York is extended among other companies and through other cities,

the business of this one class of our "undesirable citizens" will be wiped out.

The typewriter proposition of the association mentioned enables an employe to secure his machine upon weekly payments of the same amount as heretofore he has paid for rental. In other words, he secures ownership in a machine upon rental terms, so that his small weekly payments represent a saving to him.

The arrangement for the purchase of clothing and other necessities upon the installment plan at strictly cash prices is a boon to those employes who heretofore found it necessary to buy from installment houses at fancy prices for inferior goods.

The association is also relieving the distress of the company's employes at New York by advancing cash loans for sickness and other special emergencies, and only charging the legal rate of six per cent. per annum, the interest charge being for the period taken to repay the loan.

It is to be hoped that the activities of this organization will be extended throughout the country and that similar organizations will be formed among the employes of other companies and thus put an end forever to the "Shylock" curse which has in the past absorbed so large an amount of the hard earned wages of telegraphers.

Proposed International Telegraph Tournament.

The announcement in our July 1 issue of the proposed international telegraph tournament to be held at Turin, Italy, in 1911, has aroused much interest among telegraphers in this country. Many have expressed the hope that means may be provided whereby some of our first class operators may represent the United States in the proposed contest. There is no doubt but that we have Morse operators in this country the equal, if not the superiors, of those in any other country in the world. As the use of Morse sending and receiving is more highly developed in this country than anywhere else it is but natural that this should be the case. It will be a pity if this opportunity to demonstrate to the representatives of all the other great nations the proficiency of American operators is lost and we trust that a movement will be started in the near future to select one or more representatives from this country to participate in the coming international event.

Mr. J. A. Cahoe, of the Louisville, Ky., office of the Postal Telegraph-Cable Company was a recent visitor at Chataqua Lake, N. Y.

Mr. W. A. L. Tarr, agent and operator on the Santa Fe System at Manuelito, N. M., having reached the age of sixty, has been granted a pension. Mr. Tarr has been employed by the Santa Fe for the past twenty-four years, and represented this journal in that section of the country for a long time.

Some Notes on a Trip to the North American Continent.*

BY MAJOR W. A. J. O'MEARA, C.M.G.
Chief Engineer of the British Post Office.

The varied character of my past experience has enabled me to realize that very similar undertakings are managed in widely different ways, and this has naturally led me to make a somewhat close study of organization. In this wise I have come to the conclusion, rightly or wrongly, that mediocrity can, by means of an efficient organization, command success, whereas the most brilliant men, in the absence of organization, can only expect to meet with failure. The success of the American in engineering and commercial enterprises is widely acknowledged, and I therefore endeavored to ascertain during my hurried journey through the United States and Canada to what this success could be fairly ascribed. I have no hesitation in stating that from September 16, the day I investigated the organization of the New England Telephone Company in Boston, and the methods adopted by its officers in handling telephone propositions, to December 21, that last day which I spent at the offices of the American Telephone and Telegraph Company in New York, with Mr. J. J. Carty, I was struck by nothing more than the broad-mindedness of the officials engaged in the telephone and telegraph industries of the New World, and the orderliness in the management of those undertakings behind the scenes of which I was, through generosity and kindliness, allowed to penetrate. I propose therefore to sketch briefly the organization which the largest single telephone interest, viz., the Bell, has adopted in recent years.

On the North American continent the telephone and telegraph systems are ranked among the engineering enterprises of the land, and it is therefore not surprising to find the prominent position which is accorded to the engineering department in the organization of the American Telephone and Telegraph Company. In the words of Mr. Theodore N. Vail, the president of this company: "The engineering department takes all new ideas, suggestions, and inventions, and studies, develops, and passes comments upon them. It has under continuous observation and study all traffic methods and troubles, improving or remedying them. It studies all construction, future development, and extension schemes, makes plans and specifications for the same, and gives, when desired, general supervision and advice."

While I was in New York I had many opportunities of closely watching the working of the great deliberative machine so ably presided over by Mr. Vail, and so well managed by Mr. H. B. Thayer—one of the vice-presidents of the company. The first thing which naturally attracted attention was the complete absence of the huge files of correspondence

so familiar to those who work in Government offices. The functions of the various departments of the American Telephone and Telegraph Company are very clearly laid down, and since decentralization exists in its completest form, the business of the company is transacted by the heads of departments in personal interviews with the president and vice-president. It is this procedure which accounts for the absence of the files of correspondence to which attention has been drawn, and to it is also due the fact that the staff attached to the offices of the president and vice-president are reduced to microscopical proportions. In the case of the American Telephone and Telegraph Company I understand that about half a dozen stenographers comprise the whole of what would constitute the administrative section in a large British public department. Another point which came under my observation was the close personal relationship which exists between Mr. Carty and the chief engineer of the Western Electric Company—Mr. C. E. Scribner. When one considers the character of the problems which telephone and telegraph engineers have to handle nowadays it is not difficult to realize how great must be the advantages which cannot fail to result from the close personal intercourse of the chief engineers of the manufacturing and operating departments of the American Telephone and Telegraph Company.

Both Mr. Carty and Mr. Scribner were good enough to give up a considerable amount of their time to discuss telephone matters, and it is hardly necessary to state that the discussions were not only interesting but most instructive. As Mr. Carty's mission is to provide for the handling of telephone traffic in an efficient manner, it naturally follows that one important subdivision of his department devotes itself to the study of traffic questions. A second subdivision deals with questions relating to equipment, etc., by means of which the traffic must be handled. The work of these two sub-divisions is closely associated, as the problems of the one interact on those of the other. In order to produce the highest efficiency with the greatest possible economy it is absolutely necessary to consider the traffic problems in relation to the design of equipment and vice versa. Mr. Carty put it well when he informed me that his responsibilities "covered the design of the guns and ammunition, and also the manner in which the ammunition was to be used and the guns fired." But he further impressed upon me the fact that his responsibilities did not end here. For, if a telephone undertaking is to be a commercial success, it is a further duty of the engineer to follow carefully every change in the commercial policy of the company with which he is associated, since matters relating to tariffs, concessions, etc., all in turn produce reactions both on the internal equipment and external plant, and such reactions often demand important modifications in the engineering plant to meet the altered traffic requirements arising from a change in policy.

The associated companies possess complete local

*Abstract of an article in the Post Office Electrical Engineer's Journal.

autonomy, but the services of the experts of the parent company are at all times at their disposal; further, the Western Electric Company stands in the same relation to the licensee companies as the stores department does to the engineering department of the Post Office. To these circumstances is due the fact that throughout the United States a high degree of standardization and uniformity has been reached by the telephone companies which compose the Bell interest.

The licensee Bell companies have in recent times devoted considerable attention to the subject of organization, and, having carefully weighed the advantages and disadvantages of the so-called territorial and functional methods, have, I think wisely, concluded that the latter arrangement is best suited to the modern-day requirements of a complex business such as their own. This organization certainly provides that officers having specific kinds of experience and corresponding mental faculties shall supervise directly only work which they are competent to judge and with reference to which they can make helpful constructive suggestions to their subordinates, which is one of the most important considerations to be borne in mind in framing any organization. So far as the telephone undertaking is concerned, there are three very distinct kinds of responsibility to provide for. Before any business can be started a market must be found for its wares, and a sufficient number of the public have to be tempted to purchase these wares. The telephone industry is no exception to the rule; and we find, therefore, that in America a commercial department has been instituted for selling telephone service. Secondly, in order to enable the telephone companies to fulfill their part of the contract after the bargain for the service has been entered into, the necessary equipment and plant have to be designed, installed, and maintained; the responsibility for this work is provided for by the plant department, i. e., the engineering department as known in our service. Finally, when the equipment and plant are in position it necessarily follows that measures have to be adopted for bringing them into service, and the responsibility for this work is placed upon the traffic department. A feature of this organization which struck me as admirable lies in the fact that the heads of these three departments have the same title, viz., that of superintendent, that is to say, they are on the same level as to rank, and thus human sentiment is very largely cared for. It is safe to say that with such an organization business getting will be much more effectively organized and carried on; the equipment and plant will be better designed and constructed, and maintained at lower cost, and the operating will be of higher quality and exhibit greater efficiency. The concentration of effort, the conserving of special skill, the co-ordination and co-operation within each functional department, will also tend naturally to the acquisition of the greatest efficiency in each department of work.

In my young days it was frequently impressed upon me that the best results would always follow if subordinates, however lowly in rank, were given an opportunity to do at least one thing on their own responsibility. This idea has been made a principal feature in the functional organization in the form in which it has been introduced in America. I found that every effort is made to push responsibility down the line, and hence it is that in every grade officials know that there are always certain things in which no further authority than their own judgment is required for the execution of prescribed works. I could not help noticing the spirit of enthusiasm which is thus engendered, and I readily believe that this results in work of so superior an order that the cost of the mistakes which may be made from time to time is paid for many times over by the greatly increased output of work of every official in the great telephone organization of the Bell interest. Such an arrangement also has the merit of developing the most useful attributes of a man, and hence there is no lack of the proper material for filling the highest administrative posts. It is in environment of this kind that the qualities of broad-mindedness are formed, and that high administrative talent is developed to perfection.

At every centre I visited I found that decentralization in administration had been as completely effected at the headquarters of every associated licensee company as I have already described as existing at Dey Street, New York—the headquarters of the American Telephone and Telegraph Company. The absence of files of correspondence on the tables of the general managers and the superintendents of the several operating departments would have led one to believe that these gentlemen had practically no work to do, but the production of their annual budgets told a different tale. This state of affairs is due to the fact that the personal staff of the general managers consists usually of three or four stenographers, who are also available for attending to any correspondence which the directors of the company may have to deal with. I may here remark that each department has to budget in advance for its own needs for a complete financial year, and the directors raise capital and arrange their programme on the basis of the estimates thus prepared for their guidance. Considerable attention has been paid to accounting matters by Mr. C. G. DuBois, comptroller of the American Telephone and Telegraph Company, and, in consequence, a suitable scheme of standard telephone accounts has been introduced for adoption by all the licensee Bell companies. It is hardly necessary to say that the accounting system is primarily designed for, and adapted to suit, the functional form of organization. This system of accounts will teach heads of departments, and even individual employes, the value of their work, and I understand that it is expected that it will not only throw light on the efficiency of administration of each department alone, but that the

relative efficiency of individuals will also be ascertained by its means. I have long held the view that the practical limits of the administrative checks which can be introduced by a suitable system of accounts has not yet been reached by a long way.

Before leaving the subject of organization, it may be useful to draw attention to the scheme introduced by the Manitoba Government in connection with the management of its recently acquired telephone system. An order in council provides that the control and management of the Manitoba Government telephones shall be vested in a commission of three members, one of whom must be a professional engineer, and, in consequence, a Commission, consisting of a chairman, commissioner engineer, and commissioner auditor, has been appointed and is doing all things necessary for the successful conduct of the telephone undertaking. It will not be a matter of surprise to learn that the commission has adopted an organization which is in its main features identical with that already described as existing in the United States in connection with the Bell companies. The territory under the jurisdiction of the commission is extensive but the undertaking itself is not at present one of very great magnitude, and certainly does not justify the appointment of highly-paid heads of the three departments. The commission acts in a deliberative capacity only, and it has decided that the commissioner engineer shall directly administer the three departments.

It seems hardly necessary for me to say much on the technical side of telephone engineering. We know how thorough our American cousins are in all they put their hands to. Their success is entirely due, in my opinion, to the scientific spirit in which they approach a subject. No changes are introduced until a complete investigation into each aspect of the situation has first been made. A novelty has to be "tested out" and "proved in" before it has any chance of acceptance. So far as service by means of the multiple switchboard is concerned, not much room for improvement has been left for some years past. However, American telephone engineers have not been content to rest on their oars, and many improved features of a minor character have been introduced into the service; for example, the study of traffic conditions has resulted in the introduction of the auxiliary jack, which provides for calls appearing at two or more positions, and thus facilitates team working.

The American engineers fully realize that in connection with the long-distance service it is not only the quality of the telephone service from the point of view of distinctness of speech which tells with the public, but also its availability at the very moment when it is required. The second of these requirements can certainly be met by the provision of a sufficient number of circuits in every case, but commercial considerations demand that the whole of the plant installed shall provide an adequate revenue to pay all expenses and to earn a profit besides. This clearly points to the necessity of effecting some com-

promise between an instantaneous service and a service involving unreasonable delays in providing the use of lines. The subject appears to have been approached in a very commendable spirit by both the telephone companies and the public. The provision of trunk circuits is based on the assumption that the public will tolerate a longer delay in connection with places very distant from one another than in the case of places close together, while, on the other hand, it is even admitted that in certain cases an almost instantaneous service may justly be demanded. In order to guide the administration in the provision of additional circuits between important centres, schedules have been prepared laying down the file and start time for the various circuits. In other words the file and start time is the maximum delay which it is expected that the public will, as a rule, submit to, or, in scientific terms, it is the "modulus of elasticity of the patience of the public." Should delays habitually exceed the scheduled times the question of the provision of additional circuits is at once taken in hand by the engineers. A study of this nature led to the provision of an underground cable between New York and Philadelphia, and the number of circuits provided is so ample that an almost instantaneous service between these centres is now being given.

As was to be expected, a very complete study has been made of "loading" problems, and practical trials are being made over "loaded" aerial circuits. Many difficulties have been successfully overcome, and during my stay in New York an opportunity was afforded me of talking with Chicago on a "loaded" aerial circuit. The distance is about 1,000 miles and the conductors are 420 pounds copper to the mile. Even under the adverse atmospheric conditions which prevailed it was quite possible to understand my correspondent in Chicago.

Thanks to the courtesy of Colonel R. C. Clowry, president of the Western Union Telegraph Company, and Mr. E. J. Nally, vice-president and general manager of the Postal Telegraph-Cable Company, I was afforded every facility for looking into the details of their organizations, and for inspecting the methods adopted in handling traffic at all the centres visited by me. The circuits of both companies are in the main equipped with sounders. The use of batteries for telegraph purposes has been almost completely abandoned; at all the offices I visited the current for the telegraph circuits was being drawn direct from the lighting mains, or was furnished at the voltages required from motor dynamos which obtained their power from the lighting mains. Typewriters were in practically universal use for recording the messages as they came in, and the almost leisurely manner in which the operators were able to strike the keys of the typewriters when receiving messages conveyed the impression that the use of this machine must enormously decrease the strain of handling telegraphic despatches. As the time at my disposal was all too short to cover a wide range

of investigation, I directed my attention particularly to the examination of the performances of the Rowland and Barclay printing machines.

When I first arrived in the United States the Postal Telegraph-Cable Company had a certain number of their circuits equipped with the Rowland machine, and I therefore had an opportunity of watching the apparatus in operation, while Mr. M. M. Davis, electrical engineer of the company, and his officers, kindly furnished me with all the explanations I required. I could not help being struck with the complicated nature of the local circuit arrangements and the large number of selecting relays (eleven in all) necessary to effect the transmission of signals. The operation of the key-board sends the current impulses direct to the line, and the messages are printed direct on blanks or message forms. Frequently I observed that much delay was caused, as when parts of a message had been wrongly signaled the "blank" had to be removed and the message sent again. Waste of two kinds was thus occasioned, viz., line-time and stationery, and I was not surprised to learn that the annual value of the stationery spoiled was quite an appreciable sum. When all things are going well the Rowland Octoplex has certainly a great carrying capacity. I was informed that 2,000 to 2,500 telegrams, of thirty words each, can be comfortably handled per day on such circuits, and at times of pressure about 4,000 messages have been handled in a day. Unfortunately the apparatus is not sufficiently reliable, and after a trial extending over two years and a half, the Postal Telegraph Company has discontinued the use of the Rowland machines. This company has now under trial a new invention—the Wright Printing Telegraph, and I understand that satisfactory results are being obtained with this apparatus on a circuit between New York and Washington; a circuit between New York and Boston was being similarly equipped during the last few days of my stay in New York.

The Western Union Telegraph Company has equipped a considerable number of its circuits with the Barclay Printing Telegraph machine, which operates on the polar duplex principle, and being a non-synchronous system, it has a wide range in line current values. In this system the messages are prepared on tape for transmission; experience has shown that the output of two perforators can quite easily feed a transmitter, and in consequence, the staff employed at the transmitting end of a simplex circuit consists of two operators for perforating tape on key-board machines, and one attendant for the transmitter. The operators' tables are placed adjacent to the right and left of the transmitter-attendant's seat, so that the tapes can be readily passed to the latter. The messages are typed direct on "blanks." I have been informed that on the day I sailed for England a test was made on one of the New York-Chicago circuits, 1,000 miles in length, and that by means of duplex working, 1,019 messages were sent from New York to Chicago during a period of nine hours fifteen minutes and 814

messages were sent at the same time from Chicago to New York during a period of eight hours thirty-five minutes. The test was made under ordinary working conditions, and the messages were of average length. The staff at each end of the duplex circuit consisted of one printer-clerk, one transmitter-clerk, and two punchers.

A comparison of the working of these two types of printing telegraph machines affords, I think, convincing proof of the advantages of tape transmission over the direct signaling to line. Theoretically, the former appears to involve a loss of time in handling individual messages, but in practice, the saving of time in the case of direct transmission can only occur if everything works with smoothness and the staff is so skilled as never to make a mistake of any kind. In practice I fear such conditions will never prevail, and it is for this reason that the tape transmission exhibits its superiority. The correctness of the tape can be verified as it is prepared, and all errors can thus be eliminated before the tape passes through the transmitter, while the loss of line time can be reduced to an absolute minimum. This is satisfactory, as, after all, it is the line (except in the case of the shortest circuits) that is responsible for the bulk of the annual costs in telegraph systems. Many other interesting features were shown to me in the telegraph offices which I visited, but I regret that I must omit reference to them for the present.

As I travelled through America I was astonished at the very large number of masts and antennæ which I saw. I was anxious to get into touch with the "wireless" situation, and I made frequent inquiries concerning the ownership, etc., of the aforesaid masts, but I invariably received the reply that the masts represented a "stock proposition," and that my thirst for technical knowledge could not be satisfied, as the only work these stations performed consisted in the radiation of the money of gullible investors. I did, however, have the good fortune to meet Professor R. A. Fessenden in New York, and at his invitation I visited Brant Rock at the beginning of December last. Unfortunately, just at that time the Nicaraguan imbroglio was a prominent question in the international situation of the New World, and all the operators had been withdrawn from Brant Rock to equip the American fleet. In the neighborhood of the 400-foot mast, Professor Fessenden has erected a much smaller mast for experimental purposes, and I was able to get some idea of the nature of the reception of uttered words by means of the "wireless" telephone. The articulation is certainly very good. The great hindrance to wireless telephony mainly arises from the difficulty of eliminating atmospheric disturbances, but I understand Professor Fessenden has succeeded to a large extent in overcoming difficulties of this nature.

Telegraph and Telephone Age is headquarters for telephone, telegraph and wireless books and cable codes. All orders accompanied by price filled promptly upon receipt. Write for catalogue.

American Telegraph Engineering—Notes on History and Practice.*

BY WILLIAM MAVER, JR., AND DONALD McNICOL.

(Continued from page 489, July 16 issue.)

Since the discontinuance of the American Rapid and the Leggo systems there has been no extensive employment of automatic chemical telegraphs in this country or elsewhere although workers in this field like Anderson and Delany have devised certain features designed to be conducive to greater reliability of operation and speed of translation of the received characters, notably perhaps the Anderson page method of recording the message which enables the attendant to observe the condition of the incoming signals as they arrive, and simplifies the reading of the characters by the copyist. It also lends itself readily to means for drying the paper speedily as received, thus obviating, or minimizing an objection to "wet" strip, namely the tearing of the strip.

The well known Wheatstone system of automatic telegraphy was introduced on certain circuits of the Western Union Telegraph Company in 1883, and its use was continued thereon up to a comparatively recent period when it was to a considerable extent displaced by the Buckingham-Barclay printer. Further reference will subsequently be made to this subject.

As previously stated the employment of duplex telegraphy began about the year 1868, and on short lines was practiced with a certain degree of success without any device to compensate for the static discharge from the main line. Stearns, however, applied the condenser to the artificial line for this purpose in 1872, whereupon the general use of the duplex ensued. Subsequently in 1873-74 the Edison quadruplex was placed in operation on the Western Union Telegraph Company's lines and after numerous modifications of apparatus and circuits finally reached its maximum efficiency about 1884. In the year 1886 there were about two hundred quadruplex sets in operation in the United States, these, it was estimated, providing additional, or "phantom" wire facilities equivalent to 150,000 miles of line wire, the value of which was approximately eleven million dollars.

Much of the success of the quadruplex system between the years 1885-1895 is no doubt properly ascribed to the extensive employment of hard drawn copper wire for telegraph purposes, beginning in 1885. The period indicated was also prior to the advent of high tension power transmission lines in proximity to telegraph circuits, the inductive disturbances from which undoubtedly have had a very detrimental effect upon quadruplex operation, and to which subject also further reference will be made.

As an instance of the extent to which duplex and quadruplex operation has been utilized in this country in proportion to existing wire mileage, it may be noted that in the case of the Baltimore and Ohio Telegraph Company which had a total of 50,978 miles of wire in operation in 1887, (reaching from Portland, Maine, to Galveston, Texas, via New York, Washington, Chicago, St. Louis, etc.) 23,482 miles thereof were assigned to the aforesaid duplex and quadruplex service, producing 56,553 miles of phantom circuits. Of the total miles of wire mentioned there were approximately 4,655 miles of No. 12 and 3,605 miles of No. 14 hard drawn copper¹, 12,726 miles of No. 6 iron, 25,345 miles of No. 8 iron, 3,944 miles of No. 9 iron, and 252 miles of No. 12 iron wire.

In the years 1885-86 the Delany synchronous multiplex system was in experimental operation on a circuit of the Baltimore and Ohio Telegraph Company's lines. On short lines this system gave the equivalent of six transmissions simultaneously, but owing largely to difficulties introduced by the static capacity of the line, its employment on long lines was not available at that time.

SOURCES OF ELECTROMOTIVE FORCE IN TELEGRAPHY.

As already noted herein gravity batteries as a source of e.m.f. for telegraph service have been almost entirely displaced in this country by machine generators. The type of generators used and the arrangement of equipment vary according to the local requirements.

In some instances the generators are driven by gas or steam power developed on the premises, but as a rule public service mains are utilized to operate the machines, either as motor-generators, or by means of separate electric motors. At points where the only commercial current available is alternating, it is customary to operate from this source an induction motor-driven direct-

¹This was doubtless the first extensive employment of hard drawn copper wire in telegraphy. At this time quite conflicting views were held as to the utility of this metal for overhead telegraph circuits. The advocates of silicon-bronze and phosphor-bronze wire claiming superiority for those materials. The experience of twenty-five years has, however, fully justified the favorable opinions of the pioneer users of hard drawn copper wire regarding its many advantages.

It may be further noted as an interesting item of telegraph history that owing to the expiration in 1880, through inadvertence of the Canadian patent No. 4608, of April 10, 1875, covering the Edison quadruplex, that system was unprotected by patents in this country after the first mentioned date. A legal contest was, however, waged by the Western Union Company against the Baltimore and Ohio Telegraph Company for infringement of Stearns' patent No. 126,847, of 1872, covering the application of the condenser to duplex and quadruplex telegraphy. An injunction pendente lite was denied by the courts on the ground that the original Stearns patent had been so broadened by successive reissues as to raise reasonable doubt as to its validity. The matter was still in litigation when the defendant company was merged with the Western Union Company in October, 1887.

*A paper presented at the Twenty-seventh Annual Convention of the American Institute of Electrical Engineers, Jefferson, N. H., June 28-July 1, 1910.

current generator which in turn furnishes power for the operation of direct-current motor-generators. In numerous cases where driving power to operate the motor generators is derived from public service mains, emergency gas or gasoline engines are installed to insure continuity of service in the event of prolonged interruption of the commercial power circuits. One method of arranging these machines in large terminal offices consists in connecting a certain number of them of equal voltage in series, thereby furnishing a range of e.m.f. from, say 40 to 400 volts, the machines being tapped by the various main line or local wires as required, the local and single wires taking from 40 to 150 volts, respectively, the duplex circuits taking current at 200 volts and the quadruplex circuits at about 350 volts. As currents of both polarities are used in these systems, two sets or gangs of machines in series, as stated, are employed. Another method of arranging dynamos in terminal offices is to employ from seven to fourteen machines which deliver e.m.f.s. ranging from 40 to 400 volts the lower voltage supplying current for the operation of sounder circuits, automatic repeaters, duplex and quadruplex pole changers, transmitters, etc., an e.m.f. of 125 volts is used for main line simplex operation, generally way wires having a number of offices on the circuit. Machines supplying respectively 200 volts of positive and negative polarity are allotted to duplex operation, while 385 volt machines of positive and negative polarity, respectively, provide current for quadruplex circuit operation.

Storage batteries also have been utilized quite largely in telegraph service as sources of current for the operation of main line and local circuits. In general these batteries are charged from public service direct-current mains, or by locally operated direct-current motor-generators. The comparatively large loss in transformation of power, from the mains to, and in the storage battery itself, together with the cost of attendance and maintenance of the motor-generators and the battery have acted as a deterrent to its extensive use in telegraph work, notwithstanding certain advantages in the way of constancy and reliability of current that such batteries may possess. The engineering departments of the commercial telegraph companies and of the larger railroad telegraph companies have therefore followed closely those developments in the electrical art which aim to procure equally efficient and more economical transformation of electric power for telegraphic purposes, and the claimed advantages of various alternating-current rectifiers—vapor, electro-mechanical, and electrolytic—have been considered and tested. At the present time, for example, quite an extensive application of the electrolytic rectifier is being made by the telegraph companies here, in order to determine what dependance may be placed upon these methods of

obtaining practically constant direct-current potentials from alternating-current sources. One of these rectifiers (the "Hickley") consists of a solution of electrolyte, say, phosphate of soda, and electrodes of carbon and aluminum, contained in a vessel, to which are attached radiator loops which permit circulation of the solution (necessary on account of the heat developed in the electrolytic cell) thereby preventing the weakening of any portion of the electrolyte more than another. The direct current supplied by the rectifier is, of course, pulsating, but owing to the condenser effect of the cells whereby a portion of the negative current is recovered, currents are derived which are sufficiently steady for average telegraph requirements. With this rectifier 80 volts direct current are procurable from 110 volt alternating current mains. The durability of the solution and electrodes of this rectifier depends largely upon the amount of energy delivered, but if not overworked the rectifier will not require renewal oftener than once each year; assuming daily operations of the device. A suitable transformer is utilized to give either higher or lower voltage than that supplied by the available alternating-current mains, the rectifier being constructed to supply e.m.f.s. ranging from 6 to 1,000 volts. It may be noted also that some use is being made of small step down transformers of the bell-ringing type for the purpose of obtaining low voltages to operate call circuits, etc., operated in connection with telegraph systems.

TELEGRAPH PRINTERS.

It has long been recognized by telegraph authorities, that an ideal system of telegraphy would be a simple and reliable page printer, capable of transmitting and receiving say from 600 to 1,000 words per minute on circuits of from 200 to 1,000 miles in length. To the inventor of such a system will ensue wealth and fame. It is hardly conceivable, however, that a telegraph printer can be devised that will not possess a number of prominent defects that will act against its general employment; for example, the necessity of preparation of the message for transmission, and its comparative expensiveness and complexity. The first defect would preclude its use on hundreds of stock exchanges and "broker" circuits; the second would debar it from thousands of small way wires. These disadvantages are inherent also in all automatic machine telegraph systems, electro-magnetic or electro-chemical. The superiority of the Morse manual system above all other systems in the foregoing respects is universally admitted.

Reference has already been made in the opening remarks of this paper to the "House" printer. This printer was followed in America by the so-called "Combination" printer, and by the Phelps printer, and in Europe by the Hughes and the Baudot systems, all of which retain the objection-

able features of printing the received characters on a strip of paper. Moreover these systems are comparatively slow in operation, not attaining a speed of more than sixty words per minute in one direction, or in each direction if duplexed, although the Baudot system when operated on the synchronous multiplex plan increases quite materially the carrying capacity of a circuit. For some time past in America efforts have been made to obtain higher speed page printing telegraph systems; that is, systems by which the received message will be printed on a regulation telegraph blank ready for delivery. Several different systems of this kind have been recently placed in operation in the United States, namely the Buckingham-Barclay printer on the lines of the Western Union Telegraph Company, the Rowland multiplex printer, experimentally on some of the lines of the Postal Telegraph-Cable Company and the Wright printer, to be briefly described presently. The capacity of the Buckingham-Barclay printer is about one hundred words per minute in each direction on a circuit 1,000 miles in length with repeaters midway. The capacity of the Rowland printer worked octoplex would be about two hundred and eighty words per minute on a circuit of moderate length, say 250 miles. The Buckingham-Barclay printer is quite extensively used at present and has been shown to possess marked advantages over its predecessors in printing telegraphy, and as previously noted has supplanted quite largely the Wheatstone automatic system in this country. It is possible, however, that a critical analysis now under way of the respective merits of these systems as regards rapidity, reliability, accuracy, and economy of operation may disclose results somewhat favorable to the Wheatstone system. It is not unlikely that, for the handling of the increased business due to public appreciation of the night "letter-gram" service recently inaugurated by the large telegraph companies in this country, resort may be had to the Wheatstone system or to one or other of the freely available rapid automatic telegraph systems mentioned herein, or to others that may be developed. The merits of the Wheatstone system for service of this general nature have long been recognized in Europe especially in the British Postal Telegraph department where it has attained a speed of from four hundred to six hundred words per minute on the shorter circuits.

One notable advantage over printing telegraph systems possessed by the Wheatstone or other automatic systems, in which the received messages are translated by a copyist (in common with the Morse manual method, but not by any means to the same degree), is that signals mutilated in transmission that would be beyond recognition in the printed record, may often be deciphered correctly from the tape by an expert copyist. Another important advantage of the Wheatstone system is that its main line apparatus is adaptable

either to manual Morse or to high speed transmission by the simple movement of a small switch.

It must be noted, however, that the conditions now surrounding telegraph circuits (referred to elsewhere in this paper), such as high-tension inductive disturbance, and excessive retardation due to the presence of stretches of underground cable, were non-existent when the high speed automatic systems referred to were in practical operation, and these conditions, it may be anticipated, will reduce the speed efficiency in at least direct proportion to the sensitiveness of the respective systems. The night operation of such circuits, would, however, have the advantage of a minimum disturbance from parallel circuits, the exciting cause of which, except the stretches of underground cables, would be less in evidence. Unfortunately this does not apply to static inductive disturbances from adjacent high-potential transmission lines, which are in constant operation.

The Wright printer, due to Mr. John E. Wright, may be operated by ordinary typists unfamiliar with the Morse code as the transmitter is equipped with a standard typewriter keyboard which may be operated at typewriter speed, and the depression of a key of which selects a combination of positive and negative impulses, which, passing to line select a corresponding letter for printing at the distant receiving typewriter. The electro-mechanism of the transmitter prints a tell tale duplicate of the outgoing message in page form. The transmitting potential is 385 volts of each polarity. The line instrument is a polar relay of the duplex type that operates locally a magnet which in response to given combinations of incoming currents is designed to control the movements of a type-wheel, capable in operation of selecting and printing a given letter, of revolving around its axis, moving perpendicularly in the line of its axis, and laterally across the message blank at right angles to its axis, all of which movements are reversible. The receiving typewriter prints directly in message form the received telegram, the blanks being fed to the machine by an attendant who watches the copy during the printing to guard against errors. The disposition of the letters of the alphabet, the numerals and punctuation marks on the periphery of the type-wheel is such that in practice it is found that regardless of the position of the wheel any letter may be selected and printed with an average of three and one-half current impulses from the transmitter. The speed of this printer in operation on lines up to 300 miles in length is about forty words per minute in each direction.

(To be continued.)

There is much for telegraph operators to learn respecting their calling which can be readily obtained by reading *Telegraph and Telephone Age*—\$2 a year.

The Military Telegrapher in the Civil War.

PART XLIV.

Mr. D. Wilmot Smith, who was employed in telegraphic circles in New York and elsewhere in the fifties and sixties, was, during the latter part of the War, a member of the United States Military Telegraph Corps. A few years after the close of that conflict he went to Breckenridge, Minn., for the benefit of his health and lived there the remainder of his life. In 1878, writing from that point to Colonel William R. Plum, historian of the United States Military Telegraph Corps, he gave the following account of his military service. Mr. Ransom Phelps, whom he frequently mentions, in the story, is still living at Breckenridge.

"About the end of October, 1863, I received an invitation from the signal service to come to Washington and be examined for a commission in that branch of the army. On my arrival there I learned that it was proposed to try and have the military telegraph combined with the signal service and placed under its control and direction. It was proposed if I passed the examination that a number of operators throughout the country should be carefully selected, examined, commissioned and a military telegraph organized as part of the signal service. I had been telegraphing since 1850 and had, for several years, been superintendent of lines, had been engaged in construction work and was extensively acquainted with operators throughout the country. I was to receive the first commission, and thereupon begin the organization of the department and invite operators of known ability to join.

"Other interests had, up to this time, controlled the military telegraph system and it was to be expected they would not willingly loosen their grasp. I passed the examination and my commission received President Lincoln's signature and got as far as Secretary of War Stanton's office. But there it disappeared. The other interests had got wind of what was planned and as their officers at the war department were in close and confidential relations with Stanton no ingenuity of the signal officers was equal to getting that commission from his office. After waiting a few weeks, I became satisfied we were not going to take the military telegraph into the signal service, and, being tired of inaction while such stirring scenes were going on around me, I offered my services to the government and on December 12, 1863, I found myself on board the steamer 'Star of the South,' at Alexandria, Va., bound for Port Royal, near Charleston, S. C. The boat was loaded with army horses, the only passengers being Mr. J. R. Dunlap, another operator, and myself. On December 17, we anchored off Hilton Head, S. C. The small-pox had broken out among the hostlers in the hold, but Mr. Dunlap and myself were allowed to land. We had only time to reach the telegraph office, deliver our credentials and begin to congratulate ourselves upon our arrival when

a provost guard filed in with orders to return us to the steamer, a special tug being provided for that purpose. We went of course but hoped to be allowed to land again in a day or two, especially as the authorities had sent some twenty men from shore to the steamer to assist in unloading the horses and forage, the latter having been the bed for the small-pox patients. Horses, forage and stevedores were permitted to land, but Dunlap and myself were forbidden. The steamer was ordered to New York and a few days later, we were at quarantine in New York Bay off Staten Island. We were permitted to go to the city under orders to report daily for two weeks to a doctor there.

"While waiting thus, Captain L. F. Sheldon, who had charge of military telegraphs in the department of the south came to New York and made arrangements for Mr. Ransom Phelps and myself to go south on the Steamer 'Argo,' January 7, 1864, Captain Sheldon and Mr. Dunlap sailing on another vessel a few days earlier. On January 11, Mr. Phelps and myself landed at Hilton Head, Mr. Phelps was placed in charge of the Beaufort, S. C., office, and I was ordered to General Tenny's headquarters on Folly Island, off Charleston, where I remained until spring. Of the operators who were there at that time, I remember the names of Edward McGinty, A. Chamberlain, Paul Haven and Mortimer Andrews.

"The cable between the islands gave out and a new one was ordered from the north; before it arrived, however, I had repaired the old one. I buried the new cable, which was about a mile in length, in a moist spot on Folly Island, placing plank under, around and over it. I presume it is still there today as good as ever. I had a squad of soldiers detailed to do the work and as I was the only person beside the soldiers who knew where it was buried, it may lay there for ages, to ultimately be discovered and wondered over.

"The line running across Morris Island especially between Fort Wagner and Battery Gregg at the head of the island opposite Fort Sumter, was liable to be broken by the Confederate shells. I have known a shell to break off a pole while two of our repairers were fixing the wire at the top of adjacent poles and thus jerk the boys from their perches to the soft sand below. Battery Gregg was an extremely unpleasant station; it being nearest to Fort Sumter and so frequently pounding away at that stone pile, the Confederates paid it marked attention from their batteries and McGinty, who was operator there, had to spend a large portion of his time in the bomb proofs. My horse, which, in spite of unlimited oats, was such a marvellous combination of bone, arches and curves that his name, 'Gothic,' seemed peculiarly appropriate, was an old campaigner, who had fixed ideas of his own upon military proprieties, some of which caused me considerable dissatis-

faction. My duties frequently taking me the length of both islands, I rode upon the hard beach. Occasionally when so engaged the Confederate batteries would begin shelling. No amount of urging at such times could induce 'Gothic' to increase his speed above a dignified parade canter. If I insisted that discretion was the better part of valor and that we must get along at a faster gait, he would go through a series of gymnastics upon one spot with an agility that if expended in a direct line would have taken him out of danger. I was accordingly obliged to ride out of the storm at the pace he thought best for our reputation, my only consolation being that to others I must have appeared unnecessarily cool and indifferent. Toward spring I was taken ill with an attack of acute dysentery brought on by my exposure to malaria in repairing cables and other duties. I was taken to Beaufort, where, after being given up to die, the kind nursing of my kinsman and fellow operator, Mr. Ransom Phelps, caused me to rally and I was placed on a steamer accompanied by Mr. Phelps with the comforting assurance of the doctors that I would probably not live to reach the north.

"In May, when we reached New York, I was enabled to proceed to the Catskill Mountains, where I passed the summer and in the fall I entered the American Telegraph Company's office at 145 Broadway, New York. Mr. Phelps was also employed in the same office and when General Butler was sent to New York to take command during the presidential campaign preceding Lincoln's second election we were detailed to take charge of the telegraph at his headquarters at the Hoffman House. Being strongly prejudiced against the General, I tried hard to be exempted from this duty, but failed, and from being bitterly prejudiced against him, my opportunities for knowing and measuring him during that time made me an enthusiastic admirer of him many excellent personal traits of character, as well as his commanding ability.

"During this time my commission in the signal corps had been obtained from the war office and sent to me at Hilton Head, thence to New York. As I was satisfied the telegraph could not be incorporated with the signal service during the war and as I had no taste for an army officer's life, I returned the commission with thanks. My final connection with the war terminated with the impeachment trial of President Andrew Jackson. Mr. Phelps was detailed as an operator in the senate gallery during that trial and I having left the service, attended the same as a spectator."

Andrew Carnegie's First Employment in the Telegraph Service.

It is surprising how many people were responsible for the success of some of our captains of industry. Every month or two we receive marked copies of some publication announcing the death of someone who gave Andrew Carnegie

his start in life. The latest of these stories reads as follows:

"Robert Irwin, who gave Andrew Carnegie his first job as a telegraph messenger boy more than fifty years ago, died July 9, at his home in Pittsburgh, in his eighty-eighth year. He encouraged young Carnegie to learn to be an operator, and watched the rise of the young man to high railroad positions before entering the steel and oil business."

As we had never before heard of Mr. Irwin in this connection we made a careful investigation to learn if this item was correct. In response to our inquiry Colonel William Bender Wilson, of Holmesburg, Philadelphia, Pa., has given us the following statement in regard to Mr. Carnegie's first employment in the telegraph service:

"I was familiar with the Pittsburgh operators as far back as 1852, and never even heard of Mr. Irwin. He may have had some subordinate position in the office, however. Reid doesn't mention him in his history. The late David Brooks, who was manager of the office in 1849, when Carnegie entered as messenger, was fond of telling the story that one night he was playing checkers with Carnegie's father when the subject of the boy's future came up, and he suggested a telegraphic career and offered to enter him in the service as messenger. Mr. Carnegie accepted the offer, and the next day Andrew reported and Mr. Brooks placed him at work. In these later days when Andrew Carnegie is one of our foremost citizens, it is astonishing how many sponsors for him are turning up in the face of the fact that he was his own sponsor and won his successes by the force of his own character; and would have won them if he had never carried messages as a boy."

A Telautograph Exchange.

What is claimed to be the first telewriter or telautograph exchange in the world was placed in service in London on July 1. At present about fifty subscribers are connected, but facilities have been provided for seven hundred and fifty. At the central office a switchboard similar to a telephone switchboard is provided and connection is made in the same manner as on a telephone board, the subscriber telling the operator the number desired by means of a telephone, which operates over the same line as the telautograph. An important feature of the system used is that messages may be delivered in the absence of the addressee and read on his return. The paper is automatically fed forward so that any number of messages may be written during the subscriber's absence. Arrangements have been made whereby subscribers of this system may send their telegrams to the central telegraph office by this means.

"Pocket Edition of Diagrams," etc., the latest revised edition, 334 pages and 160 illustrations, published by Telegraph & Telephone Age, contains just the information every telegrapher requires.

Recent Developments in Telegraphy and Telephony.*

BY SIR JOHN GAVEY, C.B.

We may select the ordinary Morse circuit as our starting point. With the simple form of this circuit the speed of working is limited by the skill of the operator, and rarely exceeds thirty words a minute. For many years this simple form of apparatus or its equivalents served the requirements of most countries, but as the telegraph service grew and the traffic rendered it imperative to erect long lines directly connecting distant cities, the problem of obtaining a greater revenue from the large capital expenditure involved became pressing, and progress was made broadly on three distinct lines of development. In the first, means were designed for the transmission of several messages simultaneously over the same conductor; in the second, the use of suitable mechanical and electrical devices, the actual speed of transmission was raised in overhead wires to ten or twelve times that possible by manual operating, and, finally, type printing and writing systems were invented with varying degrees of success.

SIMULTANEOUS TRANSMISSION.

In the duplex system, which admits of the simultaneous transmission of two messages in opposite directions over the same wire, at each end of the circuit is a differential receiver which comprises two equally-balanced electromagnetic coils, one of which is connected at its further end to the line wire and the other to an artificial line, which, in its electrical resistance and capacity, is as nearly as possible the equivalent to the actual line. The two inner ends of the magnet coils are connected together, so that when a current is sent from the point of junction it divides equally between the actual and the artificial lines, and the magnetic effect of one coil being neutralized by the magnetic effect of the other, the signals originating at either end pass through the home apparatus without affecting it. At the far end, however, the current passes through one coil alone of the receiving apparatus and the signal is recorded. When both keys are depressed simultaneously, if the batteries are so connected that they aid each other, then the current which circulates through the line wire and through both of the magnet coils connected thereto is doubled; but as the current which circulates through the magnet coils at each station connected to the respective artificial lines is unaltered a signal is recorded, because the balance at either end is destroyed by the action of the other operator.

The transition from duplex to quadruplex working—viz., the sending of four messages simultaneously over one wire—involved but a step. A single current key is connected to a powerful battery which is intended to work a non-polarized magnet, but the connections are led through a

reversing key, which latter is designed to actuate a polarized magnet. When the single-current key is depressed the powerful current that circulates through the apparatus actuates the non-polarized relay at the far end, leaving the polarized relay unmoved. When the reversing key alone is depressed, a weak current circulates which actuates the polarized magnet, but is too weak to act on the non-polarized instrument. If both are depressed simultaneously the powerful current from the single current key is reversed by the depression of the double-key, and both instruments at the far end are affected. The receiving apparatus at each end is arranged differently, as in the duplex system, so that the outgoing currents have no effect on either of the receivers at the home end. This arrangement admits of four operators sending four messages simultaneously over one wire.

Another method, based on entirely different principles, which in theory admits of sending as many as twelve simultaneous messages in one direction, or double that number if duplexed, depends on the superposition of musical vibrations on a telegraphic circuit at one end of a line. To effect this result a number of electrically-driven tuning forks, arranged to vibrate at different frequencies, are connected through telegraphic keys to a line wire, so that on depressing any one key a series of electrical vibrations of the frequency of its companion tuning fork are sent through the line. At the far end the receivers are of a type that will respond to musical vibrations only, and each receiver is constructed or adjusted to respond to the vibrations of one of the distant tuning forks alone and to no others. This system originated in America, but it has been developed and improved by Mercadier, in France, where it is said to have given good results recently. In the modern apparatus the receivers consist of so-called mono-telephones, each of which is so made and adjusted as to respond to only one frequency.

A method of multiplex telegraphy, based on entirely different principles, is the following: A large number of insulated metallic segments are arranged in a circle at each end of the line and divided into groups, say, of eight each. No. 1 of the first group is metallically connected with No. 1 of all the other groups, and, through the transmitting key, with No. 1 instrument, No. 2 with No. 2 series of contacts and instruments, and so on. Centrally-pivoted arms, provided with metallic brushes which ride over the segments, are joined one to each extremity of the line wire, and it is obvious that if both these arms, starting simultaneously from No. 1, revolve at precisely the same speed, then each segment with its instrument at one end is for a brief period placed in connection with its corresponding segment of the instrument at the distant end. If the sending key of No. 1 instrument is depressed, a brief current is transmitted to its corresponding instrument when the revolving arm reaches No. 1 contact of any group.

* Abstract from a lecture delivered before the Institution of Civil Engineers, London.

to be repeated when the arm reaches No. 1 of the next group, and so on throughout the series. Instead, therefore, of a dot being represented by a single current of continuous duration, it is replaced by three or four shorter impulses spread over the same period of time, and a dash by three times the number of impulses. By this means it is possible, under favorable conditions, to transmit eight messages simultaneously over one wire. This system, invented by Delany, was developed to some extent in this country, but owing to various causes it has recently been abandoned. It is, however, referred to here as the principle of revolving commutators is in use in other forms of apparatus to be dealt with later. The second method of increasing the output of telegraphic wires is the automatic or machine-transmitting instrument, which is typified by the Wheatstone apparatus adopted and perfected by the Post Office in Great Britain. In all instruments of this character a long paper ribbon is perforated by a suitable machine in an arbitrary manner, and the transmitting and receiving apparatus is so designed as to transcribe these perforations at the distant end into Morse signals, into similar perforations, into type printed messages, or even into written characters.

There are three rows of perforations in the tape, or slip, of the Wheatstone system. The centre row is continuous, as it is used for drawing the slip through the transmitter at the speed at which the latter is running, the upper and lower holes cause the transmitting key to send electrical signals, dots when these rows are vertical, dashes when diagonal. The actual apparatus which effects this object is comparatively simple. Two small vertical plungers, to which an up-and-down motion is imparted by the clockwork of the apparatus, are pivoted to two bent levers connected by horizontal rods with a small vertical transmitting key, which in one position sends a positive and in the other a negative current to line. When no slip is in the machine, the plungers as they rise and fall move the key to and fro and send reversals, which are received as dots at the far end. When the slip is inserted, if the plungers meet a series of vertical perforations they pass through at each movement and dots are still transmitted, but if they meet diagonal perforations the movements of the plungers are arrested by the unperforated portion of the paper slip, and the transmitting key is not drawn back until one of the plungers enters the lower diagonal hole of the slip, and withdraws the key from its sending position, thus recording a dash.

This Wheatstone system has been very fully developed in the United Kingdom. It is capable of dealing with traffic at a maximum rate of 450 words per minute, and it is invaluable for the transmission of news. Thus, in the central office in London, items of news may have to be transmitted to 50 or more towns simultaneously. Cir-

cuits are made up for news transmission, each providing for a number of towns, some of the circuits being of a permanent character and some formed temporarily to meet special requirements. As many as eight Wheatstone slips can be punched simultaneously in one operation, and each length of slip is run through the necessary transmitters at the highest speed considered judicious.

For ordinary public message traffic, on lines of moderate length, where each individual message is short, the Wheatstone has certain disadvantages—namely, the initial delay in perforating the slip, its distribution, and finally the re-distribution of the received slip among the writing telegraphers; for it is obvious that at the high speed at which Wheatstone is worked several operators are required at each end of the line to keep pace with the apparatus. In practice in this country, for circuits of moderate length, it is generally considered preferable to provide direct Morse apparatus worked simplex, duplex or quadruplex as circumstances may dictate.

With overhead lines the limit of speed in automatic working is that imposed by the receiving apparatus, which, owing to its self-induction, obstructs the reception of Morse signals at a higher speed than that named. This difficulty has been overcome by substituting a chemical for an electromagnetic receiver. In this form the current at the received end passes through a long paper ribbon saturated with a solution which is decomposed by a positive current. The Morse signals appear in blue lines on the received slip. It is said that with this method a maximum speed of 1,000 to 1,200 words is possible under favorable conditions, but the difficulty in working at such high speeds, where characters are received in Morse code, and have to be transcribed manually, is the division and distribution of the slips among the large number of writers necessary to keep abreast of the work, the precautions needed to avoid loss of messages, the injurious effect of brief contacts caused by workmen which result in the loss of several words, and last, but not least, the difficulty and delay in obtaining repetitions where errors, false signals or missing words render this necessary.

All the foregoing methods increase the carrying capacity of the wires; in other words, they reduce the capital expenditure per message, but none of these increase the output per operator, nor do they diminish the working cost in the instrument room; in fact, with high-speed automatic transmission this cost may be higher than with other methods described. The initial preparation of the transmitting slip will always, of course, be necessary in all automatic systems; but inventors have turned their attention to increasing the speed and reducing the cost of transcription at the received end, in the case of manual as well as automatic sending, by the substitution of typing apparatus worked mechanically or electrically for the manual

transcription. One of the earliest of such instruments, which has met with permanent success, and by means of which a very large proportion of the work in Europe, and nearly the whole of the trans-Continental work, is dealt with, is the well-known Hughes type-printing instrument. This consists of a disc, on the periphery of which are embossed the letters of the alphabet, numbers and other signals that have to be transmitted; a piano-like keyboard and a horizontal plate with a series of slots arranged in a circle. Enclosed in each of these slots, and connected with one of the sending keys, is a movable plunger, which is raised when the key is depressed, but which normally lies flush with the surface of the plate. An arm carried on a vertical shaft in the centre of the plate is caused to revolve above it by the motive power which drives the instrument, and when a key is depressed this arm is arrested momentarily by the protruding plunger, and a current is sent to the distant station. The printing disc and the revolving arms at both sending and receiving stations move in unison, this being effected mainly by the action of a governor, any slight want of coincidence being corrected mechanically each time a letter is printed.

The Hughes method of transmission has many advantages. It provides a clearly-typed message for delivery instead of a written one; it removes a possible source of error in transcription, and it increases the speed of working as compared with Morse by about twenty-five per cent. It can be duplexed, and it is used by the Post Office on all its Continental wires. It has, however, the disadvantage that a considerable interval of time elapses between the transmission of two consecutive signals, owing to the revolving arm having to traverse all the intervening letters. Baudot has obviated this waste of time by adopting the multiple system of telegraphy. He entirely abandons the Hughes method of transmission, and forms an arbitrary signal code, in which, by means of five consecutive currents, some plus some minus, in combination, he represents each letter of the alphabet, figures and other signals. By his method he can provide four or six channels simultaneously on one wire, each being worked manually. The translation of these arbitrary code signals into printed letters is effected in the following very ingenious manner: At each receiving instrument two discs, firmly fastened together, have on their peripheries a series of serrations, corresponding with the arbitrary code, which, in certain defined positions, represent the various letters of the alphabet. Riding on the periphery of one of them are five levers termed selectors, each of these levers being so pivoted as to be susceptible of a slight to-and-fro movement on its axle, and also of a transverse movement in the line of the axle. When all the electromagnets have their armatures raised the selectors rest on the inner disc, but if a certain number of the armatures are depressed, then, through the action of intermediate levers, the

corresponding selectors are shifted to the second disc. As the two discs revolve together the combined selectors at some point drop simultaneously, and for a brief interval, into the series of serrations which correspond with the letter code signaled from the far end, and this movement and the rapid jerk out of the serrations as the discs revolve cause the letter to be printed from a type wheel which revolves at the same speed as the discs. The uniform revolution of the contact arms, the coded discs and the type wheels is maintained by a clever adaptation of governors and brakes, partly electrical, partly mechanical. The Baudot system admits of the transmission of a much larger number of messages over each wire than the Hughes. It is also more flexible, inasmuch as the various channels it provides can be divided among an equal number of towns. It is largely used in France and has been introduced into this country.

Murray has devised a system which has undergone lengthy trials both at home and abroad. His slip has one row of perforations which gears into the moving mechanism of the transmitter, and below this a second series of perforations which represent his artificial signaling code, which is of the Baudot type. The transmitting and receiving apparatus are arranged to run synchronously. When the vertical plunger of the transmitter passes through a perforation a positive current is sent over the circuit, and when the plunger is stopped by the paper a negative current circulates. The result at the receiving apparatus is that an exact counterpart of the transmitted slip with its perforations is reproduced, and this perforated slip is passed through and actuates an automatic typewriter which prints the message. The typing machine is fitted with five horizontal plungers, which are prolongations of an equal number of slotted combs, to which in action a to-and-fro motion is imparted. The perforated slip acts on the principle of the Jacquard loom, and when at a given moment a series of perforations appear the corresponding plungers move forward and the remainder are arrested by the unperforated part of the paper. The slotted combs are at the moment so grouped that the one letter indicated by the code is actuated by the controlling motive power, and it is accordingly printed, and the combs restored to their normal position, ready for the next letter. The message is typed in page form.

(To be continued.)

"The Practical Management of Dynamos and Motors," by F. B. Crocker and S. S. Wheeler, as indicated by its title, affords a clear understanding of the use, care and operation of these important adjuncts of the well equipped modern telegraph office. There is a constant demand for this book, for telegraphers find it an invaluable addition to their working library. There are 206 pages, and 99 illustrations; price, \$1. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Train Despatching in the Philippines.

Good things developed to improve railroad service in the United States soon travel far beyond these shores. The telegraph discovered and improved in this country now is found almost wherever civilized men are found. The latest device for handling the movement of trains, the telephone, has been developed gradually in this country until now its perfection is realized by all railroad men and it is being adopted as fast as circumstances will permit.

Despatcher's Office, Philippine Railway, Iloilo.

In preparing for the handling of trains on the newly built Panay Island division of the Philippine Railroad, the telephone was installed along with other modern railway equipment. The despatcher has a call box and Sandwich selectors are used at the sub-stations. This road has an advantage over American roads in that one wire only is needed for the telephone. There is no disturb-

this division. The island is only partially developed for agriculture. The natives are still content to load an ox cart, climb in, light a cigarette, go to sleep and let the oxen do as they please, advance probably a mile in half a day, rather than pay the charges or go to the trouble of loading their freight on the trains.

The villages consist of native huts with thatched roofs, built on stilts three feet above ground. The best, and in fact the only house in many villages is the depot, which is also the agent's residence. The design is of the American bungalow type, with windows of small squares of pearl instead of glass—this is in order to keep out the sun and make the interior as cool as possible. To look out it is only necessary to slide the window open. It would seem strange to a despatcher in the United States to have no view of the track from the operator's chair.

Many natives speak English, hence they can qualify as operators.

Section Houses, Philippine Railway.

The telephone service has proven very satisfactory, and an extension of the line will make on this division a total of eighty miles with sixteen stations, the despatcher being at the south end, Iloilo, which is division headquarters.

Mr. L. G. Jackson, trainmaster, has furnished us with this interesting information regarding the line. He has become quite a "joy rider" with a gasoline speeder.

In whatever direction they turn telegraph officials seem to find trouble. The government prosecutes the companies for supplying alleged bucket shops with wires. As soon as the wire service is cut off those concerns turn around and sue the company which furnished the service and the courts compel the company to restore the connection. At the time of the Jeffries-Johnson prize fight, it was decided that it would be best not to furnish bulletins of the progress of the fight. Now the companies have to defend suits brought against them by newspapers for failure to supply those bulletins.

Sub-station Philippine Railway, Iloilo.

ing element to make two transposed wires necessary, no telegraph or electric light, and the earth currents are so slight that this grounded line is as quiet as our best transposed metallic lines.

Passenger travel forms the heaviest traffic on

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

Railway Exchange, CHICAGO, ILL.

The Railroad.

The installation of telephone despatching equipment on the Great Northern Railroad has progressed to such an extent that trains are now handled by telephone from St. Paul to Seattle. Mr. E. J. Little is superintendent of telegraph.

The Continental Telegraph Company, which is the telegraph department of the Chicago, Milwaukee and St. Paul and the Chicago, Milwaukee and Puget Sound Railways now has 130 offices open for commercial business along the line of the latter road.

Mr. U. J. Fry, superintendent of telegraph of the Chicago Milwaukee and St. Paul and of the Chicago Milwaukee and Puget Sound Railways, Milwaukee, accompanied by Mr. A. C. Adams, chief clerk in his department, was a recent New York business visitor.

The Missouri, Kansas and Texas Railroad is installing a telephone despatching circuit on its Trinity division between Trinity and Colmesneil, Texas, a distance of sixty-six miles. This is the first telephone circuit to be installed on the "Katy" system.

The superintendents of telegraph who attended the Los Angeles convention have returned to their duties much pleased with the results of that gathering. Many of them are already introducing improvements in their services as a result of information which they obtained from the papers read and the discussions which followed.

Ira G. Rawn, president of the Monon Railroad, died July 20, aged fifty-five years. He entered the railway service in 1870 as a telegraph operator on what is now part of the Big Four system. He afterward became despatcher and trainmaster on the same road. Previous to becoming president of the Monon last November he had served as assistant general manager, general manager and vice-president of the Illinois Central.

L. M. Jones, Superintendent of Telegraph, Santa Fe Railroad.

Mr. Luther M. Jones, whose appointment as superintendent of telegraph of the Atchison, Topeka and Santa Fe Railroad, was announced briefly in our July 16 issue, has been connected with the telegraph department of that system for the past twenty years. He was born at Creighton, Mo., January 23, 1870. His first employment in the railroad service was as station agent's helper at his birthplace in 1888. He soon qualified as an operator, his first appointment as such being in August, 1888, at Columbus, Kan., on the Kansas City, Fort Scott and Memphis Railway, now a part of the St. Louis and San Francisco system. In November, 1890, he transferred his services to the Santa Fe as operator at Neosho Rapids, Kansas. He next went to the despatcher's office at Arkansas City, Kansas, remaining there until April 30, 1891, at which time he accepted an appointment as a clerk in the office of the superintendent of telegraph at Topeka. Ambli-

tious to qualify and master the larger problems in the development of the telegraph and telephone service he acquired a thorough knowledge of technical telegraph and telephone engineering. He became chief clerk in the office four years later, and was appointed assistant superintendent

L. M. JONES,
Superintendent of Telegraph of the Atchison, Topeka and Santa Fe Railroad, Topeka, Kan.

of telegraph of the entire system in August, 1902, which position he has filled with ability and credit. His close touch with the details of the service, his wide experience and knowledge of the system qualifies him for the larger duties he now assumes.

That Mr. Jones has been a valuable assistant to Mr. C. H. Gaunt, who now retires, in building up one of the greatest railroad systems of telegraph and telephone service in the world is recognized by all, particularly by the management in selecting him to carry out the further improvements and development of the Atchison property.

Mr. E. A. Smith Honored.

Edgar A. Smith, assistant superintendent of the Fitchburg division of the Boston and Maine railroad and a well known old time telegrapher, was the guest of honor at a dinner given at Boston, July 12, to mark the forty-fifth anniversary of his entering the railroad service. Forty-five of his friends, railroad men and others, were present, C. E. Lee, general superintendent of the Boston and Maine, acted as toastmaster of the occasion.

F. O. Melcher, vice-president of the Chicago, Rock Island and Pacific railroad, formerly superintendent of the Fitchburg division of the Boston and Maine, was the first speaker and told in glowing terms of his years of association with Mr. Smith.

He was followed by George W. Bishop, railroad commissioner, who, in former years, served with Mr. Smith on the old Vermont and Massachusetts railroad. He described Mr. Smith's gradual rise

from his first position as telegrapher at Athol on that road.

Mr. Smith, he said, became in turn the Fitchburg telegrapher, clerk to the superintendent and train despatcher. After the Vermont and Massachusetts was absorbed by the Boston and Fitchburg he became chief train despatcher, superintendent of telegraphs and passenger trainmaster. In 1909, when the road was leased by the Boston and Maine, he was made assistant superintendent of the Fitchburg division.

Others who spoke in praise of Mr. Smith were Albert W. Martin, superintendent of the terminal division of the New York, New Haven and Hartford railroad; A. S. Cheever, superintendent of the Fitchburg division, and J. F. Chevalier. Telegrams of congratulation were read from C. N. Chevalier, purchasing agent of the Fitchburg division and C. A. Goodenow, assistant to the president of the Chicago, Milwaukee and St. Paul railroad, who was taught telegraphy by Mr. Smith.

Mr. Smith replied to the many congratulations in a well turned speech of thanks, and at the conclusion of the dinner was presented a gold watch by Mr. Lee in the name of his friends present.

The company was composed largely of officials of the Boston and Maine. In addition to those already named, there were present H. E. Folsom, superintendent of the Passumpsic division; W. F. Ray, superintendent of the Concord division; William Merritt, superintendent of the Portland division; G. L. R. French, superintendent of the terminal division; C. M. Burt, general passenger agent; S. A. D. Forristall, superintendent of telegraph of the Boston and Maine, and L. C. Todd, master mechanic. Others were County Commissioner E. B. Blake, of Greenfield, George Blodgett and F. C. Mayo, of St. Johnsbury, Vt., G. W. Cree of Lyndonville, Vt., F. C. Parby, John F. Muldoon and I. W. Copeland, manager of the Western Union Telegraph Company, Troy, N. Y.

Canadian Notes.

Mr. J. T. Phelan, superintendent of the Northern British Columbia and Yukon government telegraph service, has returned to his headquarters at Vancouver after an extended trip of inspection through a part of his territory where he has been locating a route for some new lines which will give telegraph service to a large district not reached at present. Mr. Phelan reports extensive growth in the business in his territory as the population is increasing very rapidly.

The differences between the Canadian Pacific Railway and its commercial operators have been settled by a Board of Conciliation. The majority of the telegraphers receive an increase of from five to ten dollars per month. The Company was represented before the Board of Conciliation by Messrs. J. Kent, manager of telegraphs; W. J. Camp, electrical engineer; B. S. Jenkins, general superintendent of western lines; J. F. Richardson, superinten-

dent eastern division, and W. Marshall, superintendent Ontario division. The operators were represented by Messrs. Konenkamp, Hill, Haralson, Mackay and Mergens. It is provided in the agreement that right of promotion is to be governed by merit and ability. In case of reduction of staff, the junior telegrapher will be dispensed with. Any telegrapher in good standing laid off in staff reduction is to be given preference.

If a telegrapher is taken off his work for any cause, he shall have the right of appeal to the general officers of the company. Current rules regarding holidays will continue. Where four or more telegraphers are employed, except repeater offices, nine hours shall constitute straight day duty, eight and one-half hours early morning duty, commencing between six and eight, seven and one-half hours early night duty, seven hours late night duty. At repeater stations nine hours shall constitute day duty; seven all night duty. The average minimum performance is to be thirty messages per hour, allowing thirty words to the average message. A long schedule of wages gives the prevailing and the new rates at each division from coast to coast. For Montreal the new rates are as follows:

- 15 per cent. of employees, \$85.
- 10 per cent. of employees, \$80.
- 15 per cent. of employees, \$75.
- 15 per cent. of employees, \$70.
- 10 per cent. of employees, \$65.
- 10 per cent. of employees, \$60.
- 5 per cent. of employees, \$55.
- 20 per cent. optional with the company.

Similar schedules are in force in other cities, the maximum figure at Vancouver, Calgary and Winnipeg being \$95, at Winnipeg station \$90, and at Toronto \$85. Managers, chiefs and assistants are not scheduled, but are taken care of individually by the company.

In other cities and towns there is a corresponding increase, averaging about \$5 per month. All telegraphers now employed in Vancouver, Calgary, Winnipeg, Toronto and Montreal shall receive an increase of not less than \$5 per month. This does not apply to those entering the service since June 30, 1910. The schedule is to remain in force for one year, and thereafter is subject to thirty days' notice from either party. The board was composed of Mr. F. H. McGuigan, for the company, Mr. D. Campbell, for the men, and Mr. J. E. Duval, chairman.

The Telepost Company has extended its system from Indianapolis to Louisville, and opened an office at the latter place.

According to their latest annual report the Indian government telegraph system now comprises 69,708 miles of line and 277,731 miles of wire. The number of messages handled during the year was 13,000,000 and gross receipts were about \$4,200,000, and net earnings \$450,000.

Radio-Telegraphy.

A wireless station having a range of 400 miles has been established at Durban. This is said to be the first wireless station in South Africa.

There are now nine wireless telegraph stations established in India in connection with the government telegraph system.

It is reported that the Russian Government is preparing to erect wireless stations at Libau, on an island in the Gulf of Riga and at the mouth of the Dwina River.

According to consular reports from Singapore steamship companies in the far east are equipping many of their vessels with wireless apparatus. The chief drawback to its more rapid extension seems to be the lack of shore stations.

Dr. Lee De Forest, while in Los Angeles, recently making preparations for establishing a wireless telegraph and telephone station in that city delivered an interesting address on the wireless telephone and telegraph before the Los Angeles Y. M. C. A.

Experiments with wireless telegraphy from an aeroplane have been in progress for some time at Fort Sam Houston, Tex. These experiments have been carried on by the army authorities, and have been under the direction of Lieutenant B. D. Foulois.

Poulsen wireless telegraph stations have been established at San Francisco, Stockton and Sacramento, Cal., and plans are under way for establishing similar stations at Seattle, Portland, Tacoma, Spokane, Eureka, Los Angeles and Fresno. During recent tests messages were received simultaneously at the San Francisco station from Stockton and Sacramento.

Preparatory to enforcing the Frye wireless bill recently passed by Congress the Bureau of Navigation has directed the collectors of customs to furnish a list of all vessels to which the act is applicable. At the same time they are to give particulars regarding those already equipped with wireless apparatus as to the system used, wave length, range, power, call letter, etc. It is estimated that about sixty per cent. of all vessels subject to the provisions of this act already have wireless installations.

The latest wireless plans of the Navy department call for the erection of four steel towers at Washington for wireless masts. These towers are to be four hundred feet high and will be located on the highest ground available in the District of Columbia. This scheme is now favored instead of the original plan of building one tower six hundred feet high. As a result of the exhaustive tests which have been conducted during the past year it is believed that with the apparatus which will be installed in the proposed station communication will be possible in the daytime with ships 1500 miles away and at night 3000 miles distant.

The Marconi Wireless Telegraph Company is installing wireless telegraph stations in both the New York and Philadelphia stores of John Wanamaker. When completed, it is announced, these stations will be opened to the public for commercial use for the transmission and reception of messages to and from ships at sea.

A bill has been introduced in the British House of Commons compelling all passenger vessels sailing from English ports to be equipped with wireless apparatus, capable of receiving and transmitting a distance of one hundred miles. A penalty of \$5,000 is provided for failure to comply with the law.

Book Review.

"Telegraphy for Beginners" by Willis H. Jones (Spon and Chamberlain, New York, 64 pages, 19 illustrations) is the latest addition to our literature on this subject. This is intended as a practical instruction book for beginners in learning the art of telegraphy or in wireless telegraphy. Among the subjects considered are: Introductory remarks and practical advice, order of study outlined, important rules to observe; the Morse alphabet and other characters; signals and abbreviations; examples of sporting events and market reports in tabulated form; the student's outfit and practice circuit; adjusting the instruments and putting up a line between two stations. The price of this book in cloth covers is 50 cents and in paper covers 25 cents. Copies will be sent to any address on receipt of price by J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

A Secret Telegraph System.

Mr. Walter P. Phillips, of Bridgeport, Conn., has recently been granted a patent, No. 963,062 for a secret telegraph system. This is designed to enable an operator to receive a message transmitted in Morse and prevent any one else from overhearing the same. To accomplish this a telephone receiver is placed in parallel with the sounder or relay and one stop or contact of that instrument is made silent by substituting a stop of rubber or other suitable material, thus mutilating the signals. A switch is provided for cutting the telephone receiver out when not in use. When a station is called the operator can recognize his call, even though the signals are mutilated. He then throws his switch, cuts in the telephone receiver, cuts out the sounder and receives the message.

Mr. W. T. Salisbury, manager of the Postal Telegraph-Cable Company of Texas, Ardmore, Texas, in writing to one of his officials regarding this paper states: "I have read Telegraph and Telephone Age for a number of years and I get lots of horse sense from its editorials and much information from its columns that I consider beneficial to myself and perhaps to the service."

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Mavor and Davis' "Quadruplex" and other standard works on telegraphy and treat them in the same manner.]

CHAPTER XI.

Can maximum efficiency be obtained from a quadruplex by balancing in the same manner as the polar duplex?

What influence aside from the period of "no magnetism interferes with the evenness of the incoming signals produced by the distant battery?

How may this influence be produced?

How can this inequality of magnetic strength in the two coils of the neutral relay be overcome?

What is the objection to this method of compensating for such irregularities?

What are the successive steps to be taken in balancing a quadruplex set according to the method outlined by Mr. W. H. Jones?

What is a good guide to follow in adjusting contact points of transmitting apparatus?

What is the proper adjustment for armature springs?

What special precaution should be observed in adjusting the spring on a pole changer?

CHAPTER XII.

What are some of the troubles which multiplex apparatus is subject to?

What general test should be made in each case in adjusting for these troubles to determine that a satisfactory adjustment has been reached?

How may a polar duplex set which has apparently been balanced correctly fail to work properly under actual operating conditions?

What is the best position for the relay contact points when adjusting to eliminate the static kick?

Why is this the severest test that can be made?

Why will the sound of the kick disappear with a less amount of the static eliminated when the lever rests on the back stop than when on the contact point?

What is the effect of giving the relay armature a bias?

When this is done what are the conditions under which the apparatus is usually expected to operate?

Obituary.

Herbert R. Sackett, a member of the United States Military Telegraph Corps, died at Columbus, Ohio, July 3.

John A. Gross, for many years an employe of the Washington Bureau of the Associated Press, died in that city, July 19, aged fifty-seven years.

Alois Wirsching, an inventor of many electrical devices, including stock quotation telegraph and fire alarm telegraph apparatus, died in Brooklyn, July 14, aged seventy-nine years.

John Petry, Jr., formerly connected with the Western Union Telegraph Company and recently with the New York, New Haven and Hartford Railroad, died June 23 at his home in New York, aged thirty-eight years.

Robert H. Roland, manager of the general telegraph department of the Southern Railway at Washington, D. C., died in that city, June 5, aged thirty years. Mr. Roland entered the telegraph service of the Pennsylvania Railroad in 1896, and has been employed by the Southern Railway since 1903.

Trade Notes.

What is said to be the largest order for railway telephone selectors ever reported has just been placed by the Atchison, Topeka and Santa Fe Railroad with the Western Electric Company.

The order calls for over 600 of the new selectors recently developed by Western Electric engineers.

Mr. J. C. Murray, sales engineer of the Kellogg Switchboard and Supply Company, has left on a six months' business extension trip in South America. Mr. Murray expects to visit Kellogg Company, customers, agents and friends in all the more important cities, stopping at Bahia, Rio de Janeiro, Sao Paulo, Montevideo, Buenos Ayres, Santiago, Lima, Colon and other cities. Mr. Murray is a practical telephone man of long experience and is at the service of operating companies for information, specifications, etc. Mr. Murray has with him complete apparatus, samples and literature, including a Spanish bulletin, which describes in Spanish and illustrates clearly the various types of apparatus. He will push the sale of his company's railroad telephones and dispatching systems, mining telephones and special equipment.

French Cable Employees Outing.

The French Cable Company Employees' Association held its fourth annual outing at Witzels' Grove, College Point, L. I., July 10. A special boat left for the grounds at 9 a. m. and after breakfast had been served a baseball game was played by teams representing the clerks and the messengers, respectively. The clerks won by a score of 16 to 5. Following this there were numerous races. Mr. Louis A. Lurienne, manager of the company at New York, was honorary president of the day. The arrangement committee consisted of F. J. Sherry, chairman; P. N. Farissy, C. Limbrick, N. Weiss, S. Desnouee and J. Standinger. Judges of the athletic events were E. C. Sweeney, C. A. Ronne and C. E. Shafer. Races were won by Messrs.

Sullivan, Gallagher, Kane, Ture, Peterson, Diejnon, Storigois, Chambert, Lavoissiere, Brooks and Fox.

At the conclusion of the athletic program dinner was served and the party returned to New York in the evening, after a most enjoyable day.

Some Old Time Reminiscence.

Mr. James F. Gormley, who was a prominent printing telegrapher as long ago as in the early fifties, contributes the following details of telegraphic history in addition to the articles which he has written previously and which we published two years ago. Mr. Gormley, after over fifty years spent in the service, is now living in retirement at Boston.

"When I was in the Springfield, Mass., office with Mr. George B. Prescott as manager, he and I worked the principal circuit, namely, the New York main wire. The arrangement was that Mr. Prescott took charge of the wire at 8 a.m. on weekday mornings and I came on and relieved him at noon to allow him to go to dinner. At 5.30 I took charge until 'goodnight.'

"When James N. Ashley came to Springfield from Boston, he attended to A. A. Lovett's duties when that gentleman, who was superintendent, was absent from the city on other business. Mr. Lovett's office adjoined the operating room on the third floor of the Western Railroad building. Hartford, New Haven, Bridgeport and Port Chester, would transact their business with Springfield on the way wire. At New Haven, a Mr. Webster was manager and John B. Oltman, a young man from New York, was assistant. Mr. Oltman later returned to Gotham, acquired wealth and became a member of the Stock Exchange. He died about ten years ago. He was receiving clerk for a while after he went back to New York, and was later appointed receiver of the Franklin Telegraph Company, winding up the affairs of that concern. When the wire over the Western Railroad was constructed, offices were opened at Westfield, Chester and Pittsfield, from thence the line went to Chatham Four Corners, East Albany, Troy and thence to Albany.

"A branch line was run along the Housatonic Railroad to Great Barrington and that place produced three great electrical students and prominent figures in the telegraph field, the Pope brothers, Frank L., Henry W. and Ralph W. Before the line was built to Albany all western business from the East was sent to New York City and turned over to the House Buffalo line until the latter was consolidated with the New York, Albany and Buffalo Company. When the line was finished from Springfield to Troy and Albany, the western business was sent via that route and I went to Troy and afterwards to Albany. When Mr. James D. Reid, who was a very religious man, was superintendent, the offices of his company were not permitted to be opened on Sundays.

"After I left Albany Superintendent Lovett made me useful in Boston and vicinity as relief operator. I later went to New York. At this time there were in that city the National and Magnetic companies both running to New Orleans, but by different routes. The National went from New York to Philadelphia, Pittsburg, Cincinnati and Louisville and thence to New Orleans. The Magnetic ran from New York to Philadelphia, Baltimore, Washington, Richmond, through the Carolinas, and so on to New Orleans. I next found employment on the New York and Washington printing telegraph line which was then known as the greatest telegraph company in existence. It was doing more business, had better wires, and rendered a superior service in every way. Later the American Telegraph Company took over the property of the three companies mentioned. The Western Union running west from Buffalo had in the meantime absorbed the New York, Albany and Buffalo Company, bringing them into New York. In 1866 the Western Union absorbed the American Telegraph Company and subsequent telegraph history is, of course, familiar to the readers of this journal.

"The old Boston House Printing Telegraph Company started with offices at Boston, Providence, Springfield, Hartford, New Haven and New York. They afterward opened offices at Port Chester, Bridgeport, Middletown, South Bridge, North Attleboro and Charlestown. At some places where offices were opened a hotel keeper would ask the operator to invite operators from other places to come and enjoy a feast. No passes were required on railroads in those days, a telegraph blank being sufficient to carry a member of the craft from one place to another."

LETTERS FROM OUR AGENTS.

WASHINGTON, D. C., WESTERN UNION.

This office is undergoing a thorough renovating and being brought up-to-date in every particular. A new telephone switchboard is being installed and new booths being placed in service. The telegraph switchboard has been cleaned and polished so that it looks as good as new. The tables are also being cleaned and revarnished, and chief operator, J. W. Collins, expects the operating room will be one of the finest in the south when all of the improvements are completed. Mr. William Niemeyer is engineering the work.

New apartments have been rented on the fifth floor for retiring rooms for the lady employes and rest rooms for the men.

A lecture room has also been provided for the electrical class, which now has about seventy members and is well attended.

LOS ANGELES, CALIF., POSTAL:

Mr. F. H. Griffith has been appointed manager of the branch office presided over by Glen Hummer, who has resigned.

Mr. P. A. Stafford has been appointed manager of one of our most important branch offices, vice S. Welper resigned.

Mr. J. H. Thompson is filling the position of night chief operator while F. H. Merrill is on an extended leave of absence.

Mr. P. R. Moore has found it necessary to resign his position in this office on account of ill health.

Mr. G. A. Dodson has been appointed representative for Telegraph and Telephone Age in this office and vicinity and those having subscriptions and orders for electrical books to place are requested to hand the same to that gentleman, who will give such orders his prompt attention.

NEW YORK, WESTERN UNION.

Miss Mary F. Lynch, city chief and Miss E. Vate have returned from a two months' trip to Europe.

W. H. Hoyt, southern wire chief, is confined to his home by an attack of pneumonia.

Edward Mesler has, as usual, been detailed to take charge of the office at the military camp at Sea Girt, N. J.

Frank E. Bryant, an employe of the American District Telegraph Company of New Jersey at 195 Broadway, New York, died July 14, aged forty-seven years.

Charles McParlan, a machinist in the employ of the Western Union Telegraph Company, died at New York, June 16, aged twenty-three years. He was a son of James McParlan, who, for many years, has been marine chief of the Western Union.

OTHER NEW YORK NEWS.

Mr. Frank Kane, a well-known old time telegrapher of Washington, D. C., was in New York recently, calling on old friends.

Assessment No. 511 has been levied by the Telegraphers' Mutual Benefit Association to meet the claims arising from the deaths of Elbridge G. Wever, at Loving, N. M.; John H. Manwaring, at New Haven, Conn.; David C. Sullivan, at New York; Alfred F. Kelly, at Brooklyn, and David W. McAneeny, at Brooklyn.

William A. Plunkett, an operator employed in the brokerage office of S. B. Chapin and Company, New York, dropped dead at his key of heart failure, July 20. Mr. Plunkett was thirty-three years of age and well-known throughout the country as a first class operator. He was formerly in the Associated Press Service, previous to 1907, having been chief operator for that organization at Louisville, Ky.

Daniel C. Donohue, an operator connected with the New York Fire Alarm Bureau in the Borough of Richmond, died of typhoid pneumonia, July 9, aged twenty-three years. Mr. Donohue learned telegraphy in the Western Union office in New York. He was afterward employed by the Postal Telegraph-Cable Company as operator and later as stenographer in the claim department. While

holding the position of operator and stenographer to the eastern passenger agent of the Southern Railway he passed the civil service examination and was appointed to the position which he held at the time of his death. His father, also Daniel C. Donohue, has for many years, been attached to the fire alarm bureau at the New York headquarters of the fire department and was formerly for many years connected with the Western Union Telegraph Company in New York.

Among sound and reliable insurance organizations the Telegraphers' Mutual Benefit Association of 195 Broadway, New York, occupies a foremost place. Organized in 1867, it has paid to beneficiaries of deceased members \$1,500,000. Reserve Fund, \$317,000, the largest Reserve in proportion to liabilities that is held by any similar Association. All persons engaged in Telegraph or Telephone service between the ages of 18 and 45 are eligible for membership, no restrictions after admission as to change of occupation or residence. The lowest possible cost consistent with security offered. Write for blanks and further information.

The Serial Building Loan and Savings Institution, of 195 Broadway, New York, is under the jurisdiction of the State Banking Department, and the work which it is doing has been commended by the head of that department. On this account it is an absolutely safe depository for your savings. Write for particulars.

A rare chance for someone. An established "Telegraph School"; also a "Business Exchange" business for sale. Receipts \$150 monthly. Life time business. Easy hours. Price \$350. Address Newark Telegraph Institute, 92 Park Pl., Newark, N. J.

Advertising will be accepted to appear in this column at the rate of fifty cents a line, estimating eight words to the line.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Elementary Lessons on Electrical Measurements.

PART VIII.

The preceding seven installments of this series of articles on electrical measurement give nearly every formula one in the telegraph service is likely to be required to learn. Each has been explained in language as simple and void of technical terms as the writer could possibly make it, yet no doubt there will be many who will find difficulty in memorizing the formulas.

There should really be no difficulty in this respect. If one understands a subject properly he is not likely to forget it soon. There is a knack in studying as there is in every other undertaking, but, unfortunately, comparatively few possess it.

In the writer's opinion the modern public school "short cut to graduation" method is much to blame for the so-called poor memory. The scholar is given a rule and a formula, from which he works out each example mechanically. Little or nothing is explained as to why he follows the directions.

For illustration, the modern method is somewhat like this:

Example: If apples cost two cents a piece, what will ten cost?

Formula: $2 \times 10 = 20$. Ans.

That's about all the information he gets, but he can work out all his examples quickly and progresses (?) rapidly. A year after he graduates he forgets nearly all the formulas and has to begin all over again if he has occasion to need the information.

In former days the scholar was required to stand up before the class and explain each example somewhat after this fashion:

"If one apple cost two cents, ten apples would cost twenty cents, because they would cost ten times as much as one apple."

No matter what the example was he would have to give the "because" properly, before the teacher would OK his slate. The result was that when he graduated the rule was a matter of small importance, because he understood the operation and could even afford to ignore the formula.

The expert is one who was never satisfied with one teacher's explanation, but turned to other text-books for the same version told in different words. Sometimes the alteration or substitution of but one word will make everything clear. Or the same idea expressed in altogether different words removes any perplexity that may exist.

For example, the conventional manner of explaining the phenomenon of an electric current is to say that it is due to different levels of electrical energy; that it flows from the higher to the lower level. Now this is true, but the words do not tell enough. In fact they do not express the full meaning. The words high and low suggest gravity, which in reality has nothing whatever to do with the flow of the current.

The student then turns to another author and reads, "A current of electricity will always flow in a conductor when the electrical pressure or e.m.f. is greater at one terminal than at the other and its direction will be from the greater to the lesser pressure."

Here he gets the full story. There is nothing suggested that might cause his mind to wander from the actual facts. He now readily understands why a current may flow up hill or down dale with equal facilities. The substitution of "pressure" for "high" and "low" makes everything plain and conveys an additional meaning. The habit of consulting different authors for information concerning any given subject cannot be too strongly urged. By so doing the student will almost invariably obtain additional enlightenment which will tend to produce a lasting impression.

Another helpful method of assisting memory to recall the definition of an electrical term or the significance of a formula, is to find some mechanical or other equivalent for it before passing on to another, and by such comparison minimize the tendency to forget.

To illustrate this point we will quote a question that the writer has actually been asked, not once, but several times, by obviously forgetful students, but which would probably never have been asked had they first compared the terms as suggested before leaving the subject. The question was: "How many amperes of current are there in a volt?" Of course the question is unintelligible. It is equivalent to asking, "How many apples can you buy for a dollar?"

Thus in the formula $\frac{E}{R} = C$ which covers the first question, had the student first compared each term with a financial transaction and thereby obtained a correct idea of the significance of the formula he would probably never have asked such a question.

The solution of both questions is the same. It is simply a matter of capital, price, and purchase, and the latter three terms should be paired with E, R and C, respectively. E in volts, in electrical problems, is always the equivalent of the capital to be invested, say the dollar; R, in ohms, represents the price, and C, in amperes, the purchase. If students will bear this fact in mind their problems will be greatly simplified. Nor should they stop with the formula mentioned. All other terms and formulas represent some similar equivalent with which they may be coupled and such comparison should be invariably sought.

(Concluded)

Recent Telegraph and Telephone Patents.

A patent, No. 964,513, for an intercommunicating telephone system, has been granted to W. W. Hawkins, of Cleveland, Ohio.

A patent, No. 964,622, for a telephone receiver, has been secured by W. W. Dean, of Elyria, Ohio.

A patent, No. 965,047, for a system and apparatus for measuring telephone service, has been awarded to Harold D. Stroud and Charles W. Mahon, of Chicago, Ill.

A patent, No. 965,417, for a telegraph instrument has been issued to Frank G. Slemmer, of Goldsboro, Md.

A patent, No. 965,453, for apparatus for measuring telephone service, has been taken out by Charles W. Greenslitt, of Cleveland, Ohio.

A patent, No. 965,748, for a combined telephone and telautograph exchange system, has been granted to Foster Ritchie, of Acton, England. A combined telautograph and telephone exchange system, comprising a local battery at each subscriber's station, circuit connections placing these local batteries normally in opposition and means operative when sending a written message whereby the polarity of the battery of the sender is reversed, substantially as described.

The following patents have expired:

Patent No. 501,472, for station apparatus for telephonic and telegraphic circuits, issued to Theodore Spencer, of Cambridge, Mass.

Patent No. 502,466, for a telephone circuit and apparatus, issued to James L. McQuarrie, of Boston, Mass.

Personal.

Mr. A. E. Littler recently resigned the management of the Western Union Telegraph Company at Reno, Nevada, to identify himself with the National Mining Company at National, Nevada.

Mr. Edwin I. Atkins, of Boston, has been elected president of the Westinghouse Electric and Manufacturing Company to succeed Mr. George Westinghouse. The retirement of Mr. Westinghouse marks the withdrawal from active participation in electrical affairs of one who has been a most prominent figure in the electrical field for the past thirty years.

Dr. W. D. Gentry, a well known forty-niner of the telegraph who at present occupies the pulpit of a Chicago church, accompanied by his wife, was a recent New York visitor and called on many of his old friends while in the city. Dr. Gentry, when in the service in New York fifty years ago, was one of the speediest and best operators in telegraphic harness.

We are in receipt from Mr. Theodore E. Moreland, of Pittsburg, of a card on which are mounted two pictures of himself, one taken in 1861, when he entered the United States Military Telegraph Corps, for active service in the field, and the second one taken in 1910. Although the latter picture was taken forty-nine years after the first, there is a close resemblance between the two showing how well Mr. Moreland has preserved his youth.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. E. J. Nally, vice-president and general manager, is again at his desk, much refreshed by his vacation.

Mr. Charles P. Bruch, third vice-president of the company, is spending the month of August in the Adirondacks.

Mr. Leona Lemon, division superintendent, is filling the position of General Superintendent E. B. Pillsbury, while the latter official is enjoying a trip up the lakes from Buffalo to Duluth.

Mr. John F. Skirrow, associate electrical engineer, is on a vacation.

Mr. J. S. Creegan, manager of the Williams, Ariz., repeating station, accompanied by his wife and son was a recent New York visitor.

The company will during September add to its list many new offices in Florida along the Gulf coast.

J. B. Coggins, Manager, Postal Telegraph-Cable Company, San Francisco.

Mr. Jerome B. Coggins, manager of the Denver office of the Postal Telegraph-Cable Company, who has been appointed manager of the

San Francisco office is one of the rising men in the telegraph service, and the fact that he has had a training of fourteen years in Denver, from which place so many prominent telegraph officials have graduated, is proof that he is well qualified for the new position. Mr. Coggins was born at Flint, Mich., August 29, 1873. He entered the service as messenger in his native

J. B. COGGINS.
Manager Postal Telegraph-Cable Company,
San Francisco.

place on April 1, 1888. In August, 1890, he qualified as operator and from then until 1896 served as operator for both the Western Union and Postal Companies at Detroit and for the Postal at Jackson, Grand Rapids, Saginaw and Bay City, Mich. In January, 1896, he went to Denver and has worked continuously in that office since that time as operator, night chief, chief operator and manager.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. W. E. Athearn, engineer of equipment, has returned from a two weeks' vacation spent at Martha's Vineyard, Mass., his old home.

Mr. C. H. Gaunt, who, on July 15, assumed the general superintendency at San Francisco, has been making a tour of inspection of his division in order to become thoroughly familiar with the needs of the service in that part of the country. Mr. Gaunt was accompanied by Mr. I. N. Miller, Jr., assistant general superintendent; Mr. J. L. Ord, superintendent of construction, and Mr. H. F. Dodge, division commercial superintendent, all of San Francisco.

Mr. J. C. Smith, superintendent at Dallas, Tex., has been appointed division commercial superintendent at that point.

The supply department of the company has been divided into two parts. Mr. H. E. Roberts will continue as general purchasing agent, and Mr. W. G. Higgins, for many years identified with the Western Electric Company, has been appointed superintendent of supplies.

A dinner was given to Mr. T. P. Cummings, on August 3, by his telegraphic associates in New Orleans in honor of his elevation to the superintendency at that point. As Mr. Cummings will have to travel a great deal in the discharge of the duties of his new position his friends presented him with a handsome traveling bag.

Mr. W. A. Porteous has been appointed manager of the New Orleans office, vice T. P. Cummings promoted to the superintendency at that point. Mr. Porteous was formerly superintendent of the Postal Telegraph-Cable Company at New Orleans but retired from that position in 1908 and has since that time been practicing law in addition to his position as solicitor for this company.

Mr. J. E. Van Berschot, formerly assistant superintendent of supplies at Chicago, but who is now engaged in other business, has been in New York recently visiting Mr. H. E. Roberts, general purchasing agent.

Among recent executive office visitors were Mr. Donald McLain, of the Canso N. S. cable station, and Mr. Dennis F. Brown, of the Washington, D. C., office. Mr. Brown was formerly in the service in New York and took occasion while in the city to call on many of his old friends.

Mr. N. A. Buell, at one time manager of the Cleveland, O., office, was in New York a few days recently calling on old friends. Mr. Buell has been identified with the Cleveland office of the company for forty-six years, that being the only office in which he ever worked. He has now been retired on a pension.

Among other improvements which will be made in the main office at Chicago will be the establishing of an up-to-date restaurant and rest rooms for the women employees.

RESIGNATIONS AND APPOINTMENTS.

Mr. W. H. Spain, manager of the Akron, O., office, has been advanced to the managership of the Cleveland office vice Mr. J. W. Tillinghast, retired.

D. M. Therrell, Division Traffic Superintendent, Western Union, Atlanta.

Mr. Daniel M. Therrell who has been appointed division traffic superintendent of the southern division of the Western Union Telegraph Company with headquarters at Atlanta has had an extensive experience both in the telephone and telegraph fields which admirably fits him for the duties of the new position. Mr. Therrell was born at Bennettsville, S. C., in September, 1868, and entered the telegraph service at Laurinburg, N. C., at the age of eighteen. He held various positions with the Western Union from operator to manager until 1894 when he retired to engage in the business of consulting and contracting electrical engineer. In 1900 he joined the forces of the Southern Bell Telephone and Telegraph Company, being placed in

charge of the toll line department. Later he became special agent of the company and then manager at Charleston, S. C. He afterward served successively as superintendent of the South Carolina and Georgia divisions of the company. In 1908 when the present organization was put into effect by the Southern Bell, Mr. Therrell was appointed

D. M. THERRELL.

Division Traffic Superintendent, Western Union Telegraph Company, Atlanta, Ga.

assistant general traffic superintendent with headquarters at Atlanta, which position he held at the time of his recent transfer to the Western Union. Mr. Therrell, is regarded as one of the best telephone and telegraph engineers in the south. He has made a specialty of the subject of long distance transmission and has been a frequent contributor to the technical press.

**M. T. Cook, Division Commercial Superintendent
Western Union, Chicago.**

Mr. Morris T. Cook whose appointment as division commercial superintendent of the Western

M. T. COOK.

Division Commercial Superintendent, Western Union Telegraph Company, Chicago.

Union Telegraph Company with headquarters at Chicago, as announced in our issue of August 1, was born at St. Louis, Mo., June 29, 1879. He entered the telegraph service at Chicago, on April 1, 1902, as secretary to his father Theodore P. Cook, general superintendent of the western division. He occupied this position until April 1, 1909, when he became general agent at Chicago of both the Western Union Telegraph Company and the American District Telegraph Company. In this position he has given special supervision to the service, revenues and expenses of the Western Union and to the messenger department of the American District. Mr. Cook's training in the telegraph field has thus been of a nature which admirably fits him for the duties of the important executive position to which he has now been appointed and his many friends predict that his administration of the new post will be a success.

**M. H. Clapp, Division Plant Superintendent,
Western Union, Chicago.**

Mr. Martin H. Clapp, whose appointment as division plant superintendent of the Western Union Telegraph Company at Chicago was briefly announced in our August 1 issue, was born at Montague, Mass., August 9, 1874. He entered the employ of the American Telephone and Telegraph Company in 1896 at New York. After a short time in the service of that company at New York he was transferred to the west and has since had his headquarters at various times at Cincinnati, St. Louis and Chicago. He has held the positions of equipment man, district inspector, special agent, supervisor of maintenance and division superintendent of plant, which office he filled at the time of his recent transfer to the Western Union service. Mr. Clapp's fourteen years' of experience in the plant department of the American Telephone and Telegraph Company have admirably fitted him for the duties of the new position which he has now assumed, and he will undoubtedly bring the telegraph company's plant in the territory over which he has jurisdiction up to the high standard which is maintained by the American Telephone and Telegraph Company.

**H. F. Dodge, Division Commercial Superintendent,
Western Union, San Francisco.**

Mr. H. F. Dodge, who has been appointed division commercial superintendent of the Western Union Telegraph Company at San Francisco, as announced briefly in our August 1 issue, was born in New York in 1863. He entered the telegraph service in 1883 as operator on the West Shore Railroad at New York. He later transferred his services to the Baltimore and Ohio Telegraph Company, serving successively as operator, quadruplex chief and assistant to the electrician of that company in New York. In 1886 he was appointed chief operator for the Baltimore and Ohio at Boston. The following year he spent several months in the employ of the Thom-

son-Houston Electric Company at Lynn, Mass., but in 1888 went to Denver to become manager of the Union Pacific Railroad's telegraph office at that point. In 1889 he accepted a position as chief operator of the Helena office of the Northern Pacific Railroad. Between 1900 and 1904, inclusive, he served as manager of the telegraph offices of that railroad at Tacoma and St. Paul. In

of the office of the Postal Telegraph-Cable Company at that place but the following year returned to Western Union employ as manager of the Greenville, Miss., office. In 1900 he returned to Jackson as manager. In November, 1902, he was transferred to the management of the important New Orleans office. There his record has been such that when it was decided to make the State of

H. F. DODGE,
Division Commercial Superintendent,
Western Union Telegraph Company,
San Francisco.

1895 Mr. Dodge left the telegraph service to become court reporter at San Francisco. The following year he was appointed clerk of the Committee on Post Offices and Post Roads in the House of Representatives at Washington. This position he held until 1903 and from 1900 to 1904 he acted as secretary and reporter of various congressional investigations. Since 1904 he has served as official reporter to committees of the House of Representatives. Mr. Dodge has thus had a wide telegraph experience as well as a close acquaintance with affairs of State. The combination of these two qualifications render him especially well fitted to discharge the duties of his new position.

T. P. Cummings, Western Union Superintendent at New Orleans.

Among the many promotions which have been made recently in the service of the Western Union Telegraph Company, one of the most popular and well deserved is that of Mr. T. P. Cummings, manager at New Orleans to be superintendent at that point. Mr. Cummings is another one of the large body of southern telegraphers who have attained prominence in the profession. He was born in New Orleans, October 25, 1868 and entered the service as messenger at Jackson, Miss., November 3, 1883. While thus employed he mastered the art of telegraphy and in 1886 qualified as operator at Jackson. In January, 1891, he became manager

T. P. CUMMINGS,
Superintendent, Western Union Telegraph
Company, New Orleans.

Louisiana a district, Mr. Cummings was the natural choice for the new superintendency thus created.

A. R. Lingafelt, Western Union Superintendent, Oklahoma City.

Arthur Robeson Lingafelt, whose advancement to the superintendency of the Western Union Tele-

A. R. LINGAFELT,
Superintendent, Western Union Telegraph
Company, Oklahoma City, Okla.

graph Company at Oklahoma City, was briefly announced in our August 1st issue was born at Davenport, Iowa, August 6, 1860. He became a messen-

ger in the Western Union service in 1873 and by close application to his work with the idea of thoroughly learning the business he soon advanced in the profession becoming successively clerk, bookkeeper, operator, wire chief and chief operator. After fifteen years in the commercial service he received the appointment of assistant superintendent of telegraph of the Chicago, Rock Island and Pacific Railway with headquarters at Topeka, Kan. This position he retained until November 4, 1902, when he returned to the commercial field as inspector for the Western Union at Chicago. February 1, 1905, he was appointed assistant superintendent at that point being afterward transferred to Oklahoma City where he was located at the time of his present advancement.

E. Boening, Western Union Superintendent, at Seattle.

Mr. Edward Boening who has recently been appointed superintendent of the Western Union Telegraph Company at Seattle is one of the younger men in the telegraph service who have succeeded in attaining prominent positions by reason of perseverance and hard work. He was born at Rolla, Mo., November 28, 1874 and became a messenger at Chicago for the Western Union Telegraph Com-

E. BOENING.
Superintendent, Western Union Telegraph
Company, Seattle, Wash.

pany, when only twelve years of age. From that branch of the service, he advanced to the delivery and bookkeeping departments and in 1899 was attached to the office of Superintendent F. H. Tubbs at Chicago. While there he held the claim, estimate and requisition clerkships thus gaining a valuable executive experience.

On March 1, 1903, he was appointed chief clerk in the office of Superintendent C. F. Ames at Boston, March 1, 1905, he became an inspector of the company and on December 1, 1906 was advanced to the assistant superintendency at Boston.

On August 1, 1909, he was transferred to the Pacific Coast as assistant to the General Superintendent at San Francisco which position he held at the time of his present advancement.

Canadian Notes.

Mr. E. Pope, superintendent of the Great North Western Telegraph Company at Quebec has retired from the service and the position of superintendent at that place has been abolished. Mr. C. E. Lillie, inspector at Toronto has been appointed manager of the Quebec office. Mr. J. Beauchamp has been made chief inspector at Quebec and Mr. R. G. Morean has been appointed assistant inspector at that point. Mr. W. G. Barber has been appointed inspector at Toronto. These changes were effective August 1.

Mr. James Wilson who recently resigned as superintendent of the Canadian Pacific Railway's Telegraph at Vancouver has gone to California and other southern points in hope of recovering from rheumatism from which he has been a sufferer for some time. Mr. Wilson had been superintendent for the Canadian Pacific at Vancouver for the past twenty-five years and previous to that was for over ten years superintendent of the Canadian Government telegraphs in British Columbia.

Mr. E. Paterson has received the permanent appointment of manager of the Vancouver, B. C. office of the Canadian Pacific Railway's Telegraph vice M. T. Quigley, deceased. Mr. Fred Swift has been appointed chief operator vice Mr. J. Fletcher promoted to the superintendency, Mr. Evan Goodfellow has been appointed assistant chief operator; Mr. Allan Clark night chief and Mr. W. Jamieson, all night chief. There are now thirty operators employed in the Vancouver office and the extensive use of the night letter service together with the natural increase of business of the past few years keeps the force busy all the time.

Municipal Electricians.

Mr. W. Y. Ellett, superintendent of fire telegraph at Elmira, N. Y., was a recent New York visitor.

Extensive improvements have been made in the fire alarm service of Denver, Col., ten new circuits having been installed.

The contract for a new fire alarm telegraph system at San Antonio, Texas has been awarded to the Gamewell Fire Alarm Telegraph Company.

Mr. John C. Rennard has been appointed electrical engineer of the New York Fire Department. Mr. Rennard was formerly connected with the New York Telephone Company.

The city electrician of Council Bluffs, Ia., has been engaged for some time past in overhauling the fire alarm system of that city. Considerable difficulty is experienced in its operation owing to the fact that the system is composed of three different types of apparatus.

The contract has been awarded for the construction of a fire-proof building at Oakland, Cal., for the headquarters of the police telegraph and fire alarm system. The new structure will cost about \$45,000.

The annual report of the Commissioner of Public Safety of Toledo, O., for 1909, contains the complete report of Mr. J. T. Greene, superintendent of police and fire alarm telegraph. This embraces much interesting information in regard to the police and fire alarm telegraph systems of Toledo and shows that both of them are being operated and maintained at a high state of efficiency.

The Cable.

Mr. P. W. Rieb has been appointed assistant superintendent of the Rye Beach station of the Direct United States Cable Company.

The revenue of the associated cable companies for all of the South African traffic during the year 1909 amounted to £283,054. This was an increase of about seventeen per cent. over the preceding year.

A patent, No. 965,368, for submarine-cable telegraphy, has been granted to Sidney Geo. Brown, of London, England. In a system for receiving signals from a cable in cable code the combination with a receiving instrument of means for enabling the discharge currents to be utilized to give amplitude to the signals and a suitably adjusted reaction circuit for modifying such signals to receive increased definition.

It is reported that the German cable between Emden and Valentia, Ireland, which was thrown out of service when the first German cable to the United States was laid, will be utilized for the proposed connection between Emden and Brest, which will be established as a result of the recent Franco-German cable agreement. The portion of the present cable which will be used will be that leading from Emden to the mouth of the English channel, from which point France will make the connection to Brest.

The report of the Direct United States Cable Company for the first six months of 1910 shows a gross revenue of £58,556, an increase of £2,111 over the corresponding period last year. During the same period the net earnings amounted to £33,279. The work of diverting the trans-Atlantic cable of the company landing the same at Harbor Grace, Newfoundland, is now under way and will soon be completed.

The Council of the Empire Press Union, of Great Britain, in its first report, notes the concessions that have been secured in press rates since the formation of the Union, but considers that further reductions are necessary. In regard to the Marconi trans-Atlantic service, which offers a rate of three and one-half pence per word, the report states that but only a limited amount of press work can at present be accepted, and that the speed of transmission is slower than that of the cable.

The Western Union Telegraph Company is now laying a new trans-Atlantic cable from Penzance, Eng., to Bay Roberts, N. F., from which point it will be extended to New York. The new cable which is of 700-pound copper per mile and 350 pounds of gutta-percha insulation per mile has been made by the Telegraph Construction and Maintenance Company of London, and the cable ship "Colonia" is now engaged in laying the trans-Atlantic section. The new cable will be the largest in the North Atlantic service. When the Colonia has finished laying the trans-Atlantic section, which will be about August 18, she will go to London and take on board the Newfoundland-New York section and proceed with the laying of that. It is expected that the work will be completed to New York about November 1.

Semi-Annual Report of Anglo-American Telegraph Company.

At the semi-annual meeting of the Anglo-American Telegraph Company held in London recently, Mr. Robert H. Benson in moving the adoption of the report said that he would like, in view of recent events to recapitulate the strategic position of the Atlantic cables. There were sixteen cables laid between Europe and America controlled by four different parties. Seven of the sixteen cables, including four which they owned, were in partnership for the purpose of mutual assistance and better service to the public. One of their partners was the Direct United States Cable Company, who owned one cable and the Western Union, who possessed two cables, and had besides 1,140,000 miles of land lines in North America. The Commercial Cable Company who owned five cables, had 330,000 land miles, which reached most important cities, and controlled the Postal Telegraph-Cable Company. In England, as they were aware, the land cables were the property of the Government, who distributed its favors impartially to all parties. In America, however, the cables were owned by private enterprise, and in addition to the Western Union and Postal Companies, which were telegraph companies only, there had grown up a still more powerful company—the American Telephone and Telegraph Company with over £100,000,000 capital, and which paid eight per cent. on some £50,000,000 or £60,000,000 of ordinary capital. Last winter this concern became financially interested in one of their partners—the Western Union. It happened that the president of the American Telephone and Telegraph Company was in England in May, and they were glad of the opportunity to make his acquaintance, not only because he pursued the same kind of business, but because of the ability he showed in the directing of his own affairs. While he was here that gentleman gave an order for the laying of another cable in the Atlantic and they were glad to find that it was done with no idea of introducing competition into the ocean business, and in fact, the order given by the presi-

dent of the Telephone Company was given with the intention of using it on behalf of the Western Union, and in anticipation of their coming to terms.

It was possible if they succeeded in identifying themselves with the American Telephone and Telegraph Company, that they might participate more largely henceforth in the growth of the cable business. The board were unanimous in desiring an agreement on the basis of not jeopardizing the dividends and of securing a fair share of whatever increase in the cable business the arrangements might bring about. They also wanted more unanimity of management—complete harmony of the component parts in the organic whole. If they gave the public better facilities, he had no doubt they would respond by giving them more messages to carry. They had arrived at an agreement with the American Telephone and Telegraph Company on principle, but the details have yet to be settled. There remained a lot to be done. Their agreement with the Western Union and the Direct Company had to run another ten years, and it could not be modified without the consent of everybody concerned. If they succeeded in carrying this to an agreement, it would immediately be put in print and submitted to the shareholders.

A Telegraph Circuit Closer.

Mr. Frank G. Slemmer, of Goldsboro, Maryland, has recently been granted a patent, No. 965,417, for a unique device for closing a telegraph circuit where a key has carelessly been left open by the operator. To accomplish this a contact is provided at the back end of the key lever which contact, when the key is left open, closes the circuit of a small motor. This motor upon revolving, by means of a combination of gears and contact springs, closes a shunt circuit around the key, thus closing the line. The motor required is operated by a few cells of local battery and the device is so arranged that the motor has to make several revolutions before it will close the circuit. It is also, by means of a coiled spring, caused to return to its normal position as soon as the key is closed and the motor circuit thus opened. The ordinary opening and closing of the key in the operation of a wire consequently has no effect on the shunt circuit.

Night Messages and Word Counters.

When an operator has to receive a night message containing from fifty to possibly several hundred words the attachment of a word counter upon his typewriter is a great time saver. Many do not appreciate this, but, instead, when through receiving will take the time to count each word in checking up with the sender. This is wasted effort, as, in most cases, if he had a word counter on his machine he could check as soon as the sender had finished. In view of this fact, it seems strange that more operators are not provided with these useful devices. The Hudson word register is simple in operation, can be provided with attachment for any standard typewriter and is ab-

solutely accurate. There is no limit to the continuous forward movement of this device. It registers up to 1,500 and then automatically begins counting again from 1 upwards. The additional tension placed on the space key to operate the counter is so slight as to be scarcely noticeable. The price of this useful adjunct to a telegrapher's equipment has been reduced from \$5.00 to \$3.00, and orders may be addressed to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York. All orders should state the make of typewriter for which the counter is desired, as attachments differ.

An Electrical Book for Practical Men.

"Lessons in Practical Electricity," by C. Walton Swoope, which has been selected as an official text book by the electrical schools organized among the employes of the eastern division of the Western Union Telegraph Company, is, as its name signifies, an elementary text book for the practical worker. It contains nearly five hundred pages and has over four hundred illustrations. It is divided into thirty-one chapters dealing with magnetism, batteries, electrolysis, current measurement, resistance, Ohm's law; circuits, galvanometers, electromagnets, measuring instruments, electrodynamics, induction coils, dynamos, motors, electric lighting and alternating currents. At the end of each chapter, there are given several questions for the student to answer and practical problems for him to solve. Numerous interesting experiments are also described, which can be performed by the aid of simple apparatus. The book was written especially for the use of evening classes in practical electricity and is admirably adapted to that purpose. This work, together with Jones' "Diagrams," Maver and Davis' "Quadruplex" and Thom and Jones' "Telegraphic Connections" seems to meet all of the requirements of the student who desires to acquire a thorough knowledge of the principles underlying the operation of the telegraph system. The prices of these books are: Swoope's "Lessons in Practical Electricity," \$2.00; Jones' "Diagrams," \$1.50; Maver and Davis' "Quadruplex," \$1.50; Thom and Jones' "Telegraphic Connections," \$1.50. Any of these books will be sent, carrying charges prepaid, upon receipt of price by J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, N. Y.

The Postmaster General of England is urging that the telephone be used in that country for the delivery and collection of messages. Some experiments along this line are now being carried out.

A demonstration was given in London recently of the new system of rapid cable telegraphy devised by Mr. Hans Knudsen, the Danish inventor. By this system only one impulse is required per letter, the identity of the letter being established by the distance of each dot on a recording tape from the preceding dot.

The Underground Conduit System of Baltimore.

The underground conduit system which is constructed and operated by the City of Baltimore was provided for by ordinances of the Mayor and City Council, adopted in August, 1898. These ordinances were based upon an authorization by the State Legislature to create such work, passed in the legislative session of 1892, and subsequently passage of additional legislation in 1896 authorizing the City of Baltimore to borrow an amount not exceeding one million dollars for the purpose of carrying out the provisions of the act passed in 1892.

This authorization by the Legislature required ratification by vote of the people which was done at the election in November, 1897. Subsequent authorizations have been made by the State Legislature and similarly approved by vote of the people until at this writing the total amount of loans authorized for the sole purpose of providing underground conduits is three million dollars.

These acts of the Legislature and ratifications by vote of the people are provisions of the Constitution of the State of Maryland making them conditions precedent to the pledging of the credit of any municipality in the State.

The Electrical Commission was organized in October, 1898, and started actual construction in March, 1899, which work has been conducted uninterruptedly to the present time.

During the interim mentioned, that is, from the time of the original authorization by the Legislature in 1892 down to the organization of the Commission in 1898, there was much opposition from the interested public service corporations. Many times progress was interrupted and on more than one occasion the project seemed doomed to be defeated. Through consistent and sturdy advocacy by the friends of the measure all opposition was finally overcome; the technical objections raised by the corporations were met and successfully answered; the claim that it meant bankruptcy for the city, which seemed to be the argument of the opposition which secured the greatest amount of support, it was agreed could only be answered through experience.

Even after the organization and beginning of the work the opposition to making it effective still existed and delayed, to a considerable extent, the benefits which were ultimately secured to the public.

After the first installations of underground cables by the several corporations and their experience gained in the use of the city's underground system, particularly in the design of the manholes where they found that their property was amply safeguarded, the former opposition completely vanished and the relations between the Electrical Commission representing the city on the one hand, and the public service corporations who were required to use the system on the other, came upon a more co-operative footing, so that it is safe to say that in the past five or six years

the corporations have been not only willing, but eager to follow the plans of the Commission. On numerous occasions the Commission has extended its conduit system at the instance of the corporations and in all its more recent history there has been that complete co-operation between the two interests which has resulted in the maximum of advantage to each.

By this is meant that the City of Baltimore has secured removal of poles and overhead wires from practically all the important streets and districts in the built-up section of the city and at the same time in such a manner that the system is self-supporting; that is, that it takes care of its operating expenses, maintenance, and fixed charges with something over for safety and on the other hand the corporations have secured underground accommodations at a minimum of expense to them in the way of rentals and installation, consistent with the permanence necessary in this class of installation.

A summary of the operations of the Electrical Commission up to December 31, 1909, given herewith, will, at a glance, show the results which have been attained: total length of duct, 1595 miles; lineal feet of conduit, 129 miles; number of trunk manholes, 823; number of junction and service boxes for house to house distribution, 2404; number of separate buildings served entirely by underground connections, 5624.

The net cost of construction to that date was \$2,164,180.

The total length of cable installed of all classes was 1,967,320 feet. This was divided as follows: For electric light and power, 1,393,090 feet; for telephone and telegraph and low tension signaling services, 574,230 feet.

The cables for electric light and power embrace those used for transmission and distribution, transmission being by alternating current at 13,000 volts, 25 cycles, and distribution by alternating current at 2,300 volts and direct current 250 volts.

The first report of the chief engineer of the Baltimore Electrical Commission, Mr. C. E. Phelps, Jr., made in 1900, together with the succeeding annual reports furnishes much valuable information in regard to the preparation of the plans for the underground system.

The scheme adopted comprises two general classes of conduits, main and distributing, the former being laid in the street for the use of main cables only and the latter being laid as near the building lines as possible, with openings at frequent intervals for making house service connections. Both of these classes of construction provide for all kinds of wires. The upper part of manholes in the main distributing system is reserved for electric light and power cables while the lower part is given over to telegraph, telephone and signal wires.

The construction work was done so carefully and well that after the great fire in Baltimore in 1904 it was found that all underground cables

had escaped injury. The main office of the Postal Telegraph-Cable Company was burned, but the next day after the fire was under control, by means of a new underground connection outside of the burned district all of their transmission lines were restored to service. This was accomplished without stringing any temporary overhead wires. This fire was about the severest test which an underground conduit system was ever called upon to meet and the fact that the Baltimore system withstood the trial successfully proves that such a method of distribution of wires in large cities is without doubt the most reliable that can be devised.

The revenue which the city receives from the rental of conduits is steadily increasing, amounting in 1909 to \$91,870. The rentals are figured on the basis of paying operating expenses of the system, interest on the bonds issued for construction and providing a sinking fund for the retirement of the bonds at the end of twenty-five years. In addition to paying these charges the city derives a revenue from the system. The rental paid, however, is so low that it is probable that it would cost any one of the companies using the system much more to maintain a system of its own.

Annual Convention of International Association of Municipal Electricians.

Judging from the program which has been arranged for the fifteenth annual convention of the International Association of Municipal Electricians which meets in Rochester September 6, 7, 8 and 9, the coming gathering will be one of the best ever held by the association. On the first day the visitors will be welcomed to the city by Mayor H. H. Edgerton and the usual routine business will be disposed of. The fire alarm telegraph system of Rochester which is one of the best in the country will also be inspected. The morning of the second day will be devoted to the reading of papers and discussion of the same. In the afternoon an automobile ride around the parks of Rochester will be enjoyed. Two sessions on Thursday and one on Friday will be devoted to the reading and discussing of papers, Friday afternoon being left for the transaction of general convention business and the selection of a place for the next meeting. After the business of the convention has been concluded those present will take a trolley ride of several miles along Lake Ontario to one of the lake resorts where dinner will be served. The Powers Hotel has been selected as headquarters and anyone desiring reservations at that or any other hotel, may secure the same by notifying Mr. Joseph B. Smith, superintendent of police telegraph, Rochester, N. Y. Ample space has been provided for exhibitors and Mr. Frank P. Foster of Corning, N. Y., secretary of the association announces that the exhibits will be up to the usual standard both in quantity and quality.

New Plan of Organization of Western Union Telegraph Company.

Generally speaking, the plan for reorganizing the Western Union Telegraph Company as now arrived at is a modified form of what is known as the three column organization, that is: it will be adapted to giving expression to the company's functional activities relating to the plant, traffic, and commercial departments respectively.

It is purposed that the accounting shall follow the organization. This is a natural procedure inasmuch as it is an elementary principle that the accounts must fit the business, and not the business the accounts.

The accounting organization is, at the present time, in a formative condition, and many details have still to be worked out. It is intended, however, that inasmuch as the plant, traffic, and commercial departments are responsible for the transactions relating to the company's business which they respectively supervise, that they shall also be responsible for the basic accounting represented for the most part by reports which give reflection to these transactions.

This is particularly prescribed to the end that: Economy may be exercised, and departments may be given every opportunity of proper supervision of their affairs, and not be allowed to relieve themselves of responsibility therefor.

In the course of time the auditor of the company, Mr. E. Y. Gallaher, will appoint division auditors who will report directly to him, and who will bear the same relative position towards the general superintendents of division as the auditor does at New York to the general manager of the company. These division auditors will each be furnished with an adequate staff of traveling auditors, and will carry such accounts as will enable them to centralize under their supervision all accounting matters relating to the company's business in the division, and also to prepare monthly statements to be forwarded to New York which will be in such shape as to admit of being combined with the other division statements, and the accounts kept at the home office, thus by combination of statements an account of the whole company's business can be arrived at.

Mr. Floyd Wilson, a telegraph operator on the Chicago, Milwaukee and Puget Sound Railway, in Idaho, recently shot a four hundred pound black bear, which, a few days previously, had treed him near his station and compelled him to remain there several hours until the despatcher sent a relief.

It is always a good idea for the recipient to examine a telegraph message before dismissing the messenger. In several Western cities it is reported that people have been victimized by a boy delivering telegrams marked collect. After they have paid the charges and the boy has left the victim opens the supposed message and finds that it is a "fake."

Telegraph and Telephone Age

253 BROADWAY, NEW YORK.

H. E. DUNHAM, Associate Editor.

CABLE ADDRESS: "Telepage," New York.

Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

August 16, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Major Walter A. J. O'Meara on American Telephones and Telegraphs.

Major Walter A. J. O'Meara, chief engineer of the British Post Office, who spent several months in this country last year in an inspection of our telegraph and telephone systems, in his report which is now made public and an abstract of which appeared in our August 1 issue, states that the chief thing which attracted his attention in the management of the business of the Bell Telephone Company and which distinguishes it from the administration of the government owned systems in England was the absence of red tape letters.

Major O'Meara was surprised to find down in the Dey Street headquarters of the company in New York, an absence of the huge stacks of letters and reports that are so conspicuous in all English Government offices. Commenting on this Major O'Meara says:

"The functions of the various departments of the American Telephone and Telegraph Com-

pany are very clearly laid down, and since decentralization exists in its completest form the business of the company is transacted by the heads of departments in personal interviews with the president and vice-president. It is this procedure which accounts for the absence of the files of correspondence, and to it is also due the fact that the staff attached to the offices of the president and vice-president are reduced to microscopical proportions. In the case of the American Telephone and Telegraph Company I understand that about half a dozen stenographers comprise the whole of what would constitute the administrative section in a large British public department."

The observations of Major O'Meara are of particular interest at the present time, owing to the fact that the same plan of organization which he has described as prevailing with the American Telephone and Telegraph Company is being adopted to a certain extent by the Western Union Telegraph Company. The present is an age of specialists and the functional form of organization is one which is rapidly being adopted by large corporations as being the most efficient. In the telegraph field however, up to the present time the efforts of our telegraph administrations have been chiefly directed toward building up the most economical system possible and still give good service. The introduction of the functional organization means the addition of a large number of comparatively high salaried officials to the staff of the company and it has not before been thought that the increase in efficiency to be gained by the adoption of such a system would compensate for the additional expense involved. Hence the results obtained by the new system now being introduced will be watched with interest by those closely connected with telegraphic affairs. Among other things in his report Major O'Meara commends heartily the American system of placing responsibility on all employees, no matter how humble their positions. He believes the system develops the most useful attributes in men and women and produces plenty of able candidates for promotion to the higher executive posts.

He also admired the American system of keeping tabs on delays in making telephonic connections. Londoners hope he will induce the officials there to copy that system, for now they often have annoying delays in getting connections.

In England no telegraph operator uses the typewriter in receiving messages, either commercial or press, nor is there any code like the Phillips code in use for increasing the capacity of a wire by using abbreviations of words and phrases in common use. Major O'Meara praises the use of the typewriter in American telegraphic offices and comments on the expedition and legibility it imparts to messages received and the reduction of fatigue to the receiving operator.

It is apparent that Major O'Meara thinks that the American telephone and telegraph systems are far in advance of those in England.

What Constitutes a First-Class Operator?

This is a question which is often asked and is one upon which many opinions have been given, scarcely any two of which would agree in all of the details. As we understand the meaning of the term, first-class indicates one of the best. There are many requirements which a telegrapher may be expected to fulfill at various times although comparatively few operators are ever called upon to meet all of these requirements. Among these we would mention the ability to use a typewriter with accuracy as well as to write copy which can be easily read. The ability to read copy quickly and accurately is also an essential. A first-class operator should be able to send or receive press report, baseball news, stock and grain quotations or Phillips' Code, in fact any matter that is habitually sent over the wires by means of Morse signals. Speed and accuracy in the performance of any of these functions is of course necessary as well as proficiency in adjustment of the apparatus generally used. Combined with these qualifications we would expect a man of more than average intelligence and of strong enough physique to be able to work continuously if necessary for ten hours without excessive bodily fatigue.

It may be argued that these requirements are rather severe and that there are few who can meet all of them. This is probably true but at the same time it will be admitted that there are men in the service who possess all of these qualifications. This being the case it seems but right that the man who possesses them all should be given a higher classification than the man who is lacking in one important particular. Take for example a man who can meet all of the other conditions but is unable to produce legible copy. Ordinarily a typewriter is available on which he can receive and he will render first class service, but in case a man is wanted to fill an important place hurriedly where a typewriter can not be used he is not available and has to give way to the man who possesses the ability to write copy which can be read.

To sum up the situation it would seem that a really first-class operator is one who is always available to fill satisfactorily any position in the operating line in which a telegrapher might be placed. Those who lack only one of the qualifications which we have mentioned might be denominated second-class operators, those lacking two qualifications, third-class, etc. By following out this plan the telegraph operating force might be divided into as many classes as desired.

Annual Reunion of Old Time and Military Telegraphers.

As the time approaches for the twenty-ninth annual reunion of the Old Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps, which meets in Chicago, September 8, 9 and 10, the plans for the

gathering are rapidly being perfected and from present indications the coming reunion will be one of the best attended of any in the series. Mr. A. C. Murphy of the Western Union Telegraph Company, Chicago, who is chairman of the hotel committee announces the following rates for the Hotel La Salle in addition to the other hotel rates which are given in our July 1 issue: One person, room without bath, \$2.00 to \$3.00 per day, with bath, \$3.00 to \$5.00 per day. Two persons, room without bath, \$3.00 to \$5.00, with bath \$5.00 to \$8.00 per day.

Those who contemplate attending this gathering should make their hotel reservations through Mr. Murphy at once in order that they may be sure of securing satisfactory accommodations. Colonel William Bender Wilson of Holmesburg, Philadelphia, Pa., president of the Society of the United States Military Telegraph Corps expects that the coming reunion will be a banner one in attendance for the military telegraphers, owing to the fact that Chicago is so centrally located. He has already received assurances from a large number of the survivors of the military corps that they will make special efforts to attend this gathering. Mr. William J. Lloyd, division traffic superintendent of the Western Union Telegraph Company, Chicago, and president of the Old Time Telegraphers and Historical Association has also been notified by many old timers throughout the country of their intention to be present so that he is confident of an extra large attendance. The program of entertainment arranged for the visitors is an elaborate one. Any one desiring further information should communicate with Mr. F. J. Scherrer, assistant secretary of the Western Union Telegraph Company, New York, who is secretary of the Old Timer's Association, or David Homer Bates, 658 Broadway, New York, secretary of the Military Telegrapher's Society.

In the July number of the *Journal Télégraphique* of Berne, Switzerland, there appears the first installment of a very interesting illustrated article by Mr. A. Ebeling, on the Pupin system of loading telephone circuits as applied to aerial lines. This paper describes the experiments which have been conducted by the German Government in this direction and which have been very successful. The *Journal Télégraphique* being published by the International Bureau of the Telegraphic Union is the official journal of all of the government telegraph administrations. One feature of this paper which is of especial value to engineers is a list printed monthly of all articles relating to telegraphs and telephones which have appeared in the technical press of the world during the preceding month, including *Telegraph and Telephone Age*.

Telegraph and Telephone Age is headquarters for electrical, telephone and telegraph books. Write for catalogue.

American Telegraph Engineering—Notes on History and Practice.*

BY WILLIAM MAVER, JR., AND DONALD McNICOL.

(Continued from page 525, August 1 issue.)

It may be noted that in America, telegraph operators during recent years have adopted extensively a keyboard, and other semi-automatic devices for the transmission of the Morse alphabet, which devices quite largely increase the rapidity and facility of transmission over the regulation key method. American operators have also very generally adopted the typewriter for transcribing received messages. Primarily these instruments were adopted as labor saving devices, greatly reducing the mental and physical strain on the operator, and making it possible for operators who had "lost their grip" of key or pen, to return to the ranks of first class operators. The public appreciation of the typewritten copy was such also that the telegraph companies encouraged the use of the machine by increasing the compensation of type writer telegraphers. Further, the use of the typewriter in combination with the marvelous abbreviations employed in the transmissions of press matter, by code considerably diminished the demand for rapid automatic or printing telegraphs, at least for that service, by bringing the performance of Morse working well up to what might be expected from printing telegraph systems. The semi-automatic transmitting key termed the *mecograph* or modifications thereof is used by perhaps four-fifths of the operators of this country. It consists of a vibrating rod or pendulum which when moved to one side manually by the operator makes a dash, and when moved to the other side automatically vibrates (until stopped by the operator) in the act of so doing making any desired number of dots. It is estimated that sixty per cent more movements are required in sending by the ordinary Morse key than by this device.

DIRECT POINT REPEATERS

During recent years a demand has grown up for fast duplex telegraph service, in order to provide direct communication between large centers remotely separated. For instance, a vast amount of traffic which arrives at, and which originates at the large eastern cities of this country destined for China, Japan, the Philippines and other Asiatic countries requires that these cities shall have direct communication with the Pacific cable office in San Francisco. Formerly the arrangement of apparatus used in repeating from one multiplex set into another was that whereby the receiving relay controlled the sending transmitter through local connections, but the mechanical inertia of these instruments and the increased number of local contact points through which the operation was controlled did not conduce to high efficiency. The duplex repeater now used on both the Western Union and on

the Postal Telegraph lines is known as the "direct point" repeater, and is similar in operation to the Wheatstone duplex repeater. It is now customary to wire up polar duplex and the polar side of quadruplex sets so that this efficient method of repeating may be utilized. Inasmuch as the local contact points of the polar relays are in this case employed to deliver line currents, special devices are provided to control local circuits for operating the reading sounders. For instance, in the Western Union type of duplex repeater the polar relays are equipped with double armatures, mechanically jointed together, but separated electrically, one contact controlling the line potentials, and the other the local circuit. The method employed by the Postal Telegraph Company is the well known "leak" arrangement. A single tap is taken off the armature contact of each polar relay and led to ground through a polar relay and a 20,000-ohm coil. Another method of accomplishing the same result is to substitute a 0.5 microfarad condenser for the 20,000-ohm coil thus obtaining the same response in the polar relay without any loss of current through the leak coil to ground. Indeed when the condenser is used in place of the leak resistance, the polar relay may be done away with, the circuit leading directly from condenser through a sounder and to ground. In this latter case the armature and stop adjustments of the sounder are set so that the signals are all made on the upper stop screw.

The type of duplex telegraphy now universally employed in this country is that in which the well known double-current principle is employed, and by means of the direct repeating relays mentioned, very long distances are spanned, for instance across the continent from New York to San Francisco, by many diverse routes. Ordinarily from four to six repeaters are used in these transcontinental circuits and the speed of transmission is at least equal to the ability of the operator to manipulate the key. Ordinarily the differentially-wound polarized relay is employed.

SUPERIMPOSED SYSTEMS. "PHANTOPLEX" AND VAN RYSELBERGHE.

Since Varley there have been many workers whose aim it has been to increase the capacity of a single wire or a wire already in operation as duplex or a quadruplex by superimposing thereon one or more pulsatory phantom circuits.

By one such arrangement of a "phantoplex" circuit on a quadruplex circuit that is in actual operation in many places in this country a sextuplex is obtained.

In many cases Morse duplex circuits or portions of them are used simultaneously as telephone circuits, the wires of two such duplex telegraph circuits being employed as one metallic circuit for telephonic purposes.

Composite circuits (originally the Van Rysselberghe simultaneous telegraph and telephone system) are employed in this country and Canada very extensively; notably by the American Tele-

*A paper presented at the Twenty-seventh Annual Convention of the American Institute of Electrical Engineers, Jefferson, N. H., June 28-July 1, 1910.

phone and Telegraph Company, also by the telegraph departments of large railway systems. Between New York and Boston alone at least fifty leased telegraph wires are in daily operation on long distance telephone circuits, and this dual use of circuits is being rapidly extended in telegraph practice, all new line construction being designed with this end in view as noted elsewhere herein, the increased earning capacity of the wires gained thereby being the obvious incentive thereto.

INDUCTIVE DISTURBANCES ON TELEGRAPH CIRCUITS

In the pioneer days of telegraphy when routes were being sought for pole lines, the rights-of-way of the existing steam railroads were utilized wherever possible for the obvious reason that, as the proper movement of trains required the constant use of the telegraph, the questions of construction, maintenance, and prompt repairs were thus solved to the best advantage of the railroad and the telegraph companies. The growth of telegraph traffic was however, rapid, and between the larger centers, at least, duplicate pole lines on highways were soon required to carry the constantly increasing number of wires, and thereby one of the advantages of railroad routes for commercial telegraph lines was largely diminished. In the course of events also the time arrived when the displacement of the steam locomotive by the trolley car and electric locomotive for train haulage, introduced the high-tension transmission circuit, which, being naturally erected along the railroad tracks, at once menaced the value of a railroad right-of-way for telegraph purposes. It developed, also, that long distance transmission lines carrying high-tension alternating currents in numerous instances began to parallel the railroad rights-of-way as generally affording the most direct and favorable routes between cities, thereby adding another disturbing factor to telegraph lines following the same routes.

Apart, however, from the serious inductive disturbances due to the close proximity of high-tension lines, the subject of inductive disturbances on telegraph lines is not a new one, for mutual inductive disturbances between telegraph circuits were encountered as remotely as 1876 in the dry climate of some of the western states, on lines operated as simplex Morse circuits extending from Omaha, Nebraska, to Salt Lake City, Utah. Upon the introduction of the quadruplex shortly thereafter mutual induction between parallel wires manifested itself as a disturbing factor at numerous points, due to the comparatively high e.m.f.s then used on quadruplex circuits, about 300 volts; and as in the ordinary operation of telegraphy single wires grounded at each end are employed, the well known method of transposing the wires at intervals to obviate mutual induction effects was not available as a remedy. Fortunately the reduction of efficiency due to this source of inductive disturbance was not very marked, and could, generally speaking, be overcome by an increase of e.m.f. at the terminal stations to 375 or 400 volts.

One of the first methods suggested to eliminate, or ameliorate the disturbances due to mutual induction was devised and tested by Mr. Chas. H. Wilson in 1876, in the western part of this country. The object of this arrangement is to set up by means of small transformers, currents in wire *A*, opposite to those induced in wire *A*, by wire *B*, and contrariwise. This arrangement was subsequently used on quadruplex lines between Chicago, Buffalo, and Pittsburg, but not very successfully owing to the lag caused by the employment of the transformers in the circuit which augmented the period of reversal to such an extent that the No. 2 side of the quadruplex systems was detrimentally affected thereby.

The continual extension of power transmission and other high potential circuits in close proximity to telegraph circuits however created inductive disturbances so inimical to the operation of the telegraph that further means were sought to effect a remedy, short of changing the route of the telegraph pole lines, and a number of corrective devices have been suggested some of which in practice have been fairly successful under certain conditions and in certain localities, but have not always met the requirements elsewhere.

One of these means of obviating harmful induction from high tension power circuits on single Morse wires is due to Mr. E. W. Applegate. In this scheme, a resistance, consisting of a carbon stick is connected across the main line contacts of the relay. By means of this shunt the rapid induced currents from neighboring alternating current circuits are given a path past the relay, and chattering of the armature is further avoided by increasing the tension of the retractile spring. It was found that these devices tended to impede the action of the armature to overcome which tendency an extra battery of six cells are added, which by partly magnetizing the relay cores when the armature is on its back stop, effects this result. This device which is termed a "static pick-up" has been successfully used on a number of telegraph circuits where metallic circuits had been resorted to owing to the inductive disturbances from a frequently unbalanced 60,000-volt three phase system that parallels the telegraph circuits for a distance of eleven miles. The employment of this arrangement made it possible to resume single wire operation.

A brief description will now be given of one of the more recent methods put into practice for the purpose of offsetting inductive disturbances on telegraph circuits due to the close proximity of high tension electric traction circuits resulting from the electrification of the New York, New Haven and Hartford Railway. To nullify electro-magnetic induction, current transformers with a 1:1 winding, are inserted in the telegraph lines at intervals of two miles. To neutralize electro-static induction the secondaries of potential transformers are used in connection with condensers. The

primaries of the transformer are placed in a special neutralizing wire or in the disturbing wire itself. By placing a number of secondary coils in multiple one neutralizing wire may suffice for a number of telegraph wires. As the neutralizing wire is subject to the same inductive effects as the telegraph wires, the currents developed in the former may be arranged to oppose those due to the disturbing wire.

It has been found in practice that the neutralizing of inductive effects by the foregoing arrangement is seriously interfered with by escapes from direct current trolley lines which enter and energize the transformers. Variations in load on the alternating current line, phase distortion, etc., also add materially in preventing anything more satisfactory than an amelioration of the harmful inductive effects. Furthermore, in this particular case, the slight improvement noted is obtained at the loss of three copper neutralizing wires, in addition to the first cost and maintenance of the additional apparatus required. In general it may be stated that the various devices offered hitherto as inductive disturbance correctors have been rather of a palliative than of a positive remedial nature, and inasmuch as the tendency is to increase the use and the potentials of high tension transmission circuits, it appears evident that to meet or evade this situation successfully constitutes the most serious problem now confronting telegraph engineers. The basis of a solution of the problem may possibly be found in subsequent remarks herein.

MAIN LINE RELAYS

The ohmic resistance of relays used in Morse telegraphy has undergone numerous variations during the past forty years in this country. Relays wound to 1200 and 1500 ohms were not uncommon. At one time the resistance of main line relays was calculated on the assumption that for the best results the total resistance of the relays in a circuit should be equal to the resistance of the line wire. Thus on a circuit 300 miles in length, measuring, say 15 ohms per mile, with fifteen stations on the line, the relays would be wound to 450 ohms. There was, however, little or no uniformity in the winding of the relays and but little supervision of the quality of the copper used in the winding of the relays and but little supervision of the quality of the copper used in the winding, which in the early sixties of the last century varied in commercial copper from 14 to 85 per cent. that of pure copper. Measuring instruments of accuracy were at the time referred to a rarity in this country and no proper methods of ascertaining the condition of the lines as regards electrical resistance and insulation were in vogue. In 1867 the late Mr. C. F. Varley, the well known English electrician, was retained by the Western Union Telegraph Company to visit the United States for the purpose of making a thorough investigation of

the electrical conditions of the lines and apparatus of that company.

Following a thorough study of the subject supplemented by hundreds of tests of the lines, insulators, relays, batteries, etc., Mr. Varley presented a voluminous report to Mr. William Orton, president of the company, December 20, 1867.

The report detailed in extenso, the condition of the equipment as disclosed by the tests, and made numerous recommendations for the improvement of the general service, among others, the making of soldered joints, a reduction in the resistance of the relays used, and their re-winding to a uniform resistance of 130 ohms, the wire used to be the best copper obtainable. He also recommended that fewer poles per mile be used in line construction and that a smaller number of wires be worked from one main battery—in fact that a separate battery be provided for each wire.

Prompt action was taken upon Mr. Varley's report and recommendations, and very marked improvements followed thereafter. Mr. Madison Buell, for instance, in an article on "Low Resistance Relays," recounts that on the important circuit on which the Atlantic cable traffic between New York and Plaister Cove, N. S., was transmitted the repeaters were found to have relays ranging in resistance from 500 to 1,500 ohms. The relay of the "Milliken" repeater at St. John, N. B., has a resistance of 1,500 ohms. The relays at Boston, Portland, and Bangor had an average resistance of 1,200 ohms. All of these relays were rewound to 80 ohms. Also, many improvements were made in wire jointing, insulators, and leading-in wires at all offices, with the result that whereas on this circuit before these changes were introduced six repeaters were necessary in bad weather and in clear weather three to four repeaters, after the aforesaid improvements were made but two repeaters were required in bad weather and only one in clear weather to operate the circuit at top speed.

(To be continued.)

A Valuable Telegraph Book.

"The Hughes and Baudot Telegraphs," by Arthur Crotch, of London, the well-known electrical engineer and author, is a book that everyone interested in printing telegraph systems should possess. The volume contains a very full description of the two mentioned type-printing telegraph systems used so generally in Europe, the Baudot in France and the Hughes elsewhere on the Continent. The illustrations are numerous and clear, and all together, the book furnishes a fund of carefully stated information valuable to the student and also of interest to the lay reader. This book may be obtained of J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, and will be sent to any address, carrying charges prepaid, on receipt of price, \$1.00.

Recent Developments in Telegraphy and Telephony.*

BY SIR JOHN GAVEY, C.B.

(Concluded from page 530, August 1 issue.)

Creed has worked in the same direction, but he uses the ordinary Wheatstone alphabet and Wheatstone transmitter. At the receiving end a perforated Wheatstone slip is reproduced by a punching machine, which, controlled by the reverse currents from the transmitter, and, using compressed air as a motive power, perforates the received slip at considerable speed. This slip is then passed through an automatic typewriter adapted to work with the Wheatstone alphabet, which types the message on a long slip, to be gummed on the telegraph form. In both these cases the received slip can be inserted in a second automatic transmitter and the message sent on to another town—an advantage in the transmission of news. Both these systems are in use in the British Post Office.

Siemens and Halske, in Berlin, have devised an automatic system in which, by means of suitable apparatus, the message is printed by the receiving apparatus direct by photographic methods, an electric spark momentarily illuminating the required letter. The alphabet is stencilled on a revolving disc, and the arrangements are such that the electric spark passes only when the letter corresponding with the arbitrary signal is in the right position for printing.

The Western Union Telegraph Company, in America, have introduced extensively a system known as the Barclay automatic type printing apparatus. At the sending end the code of electrical signals adopted consists of long and short intervals, either marking or spacing, representing the various letters of the alphabet. Every letter is represented by six current alternations, but the receiving apparatus is so designed that, although every current acts on an escape wheel that makes a momentary contact with certain selecting relays, only those of long duration effect any movement in the latter. There are thirty-two printing magnets which act as the keys of a typewriter, and cause the message to be printed direct on the receiving instrument.

Although any one of the systems described or referred to can be made to do excellent work, the actual selection of the apparatus best calculated to meet the requirements of any country depends entirely on local conditions. To what extent uniformity of practice is likely to arise in the future is a doubtful question, as each country is likely to progress on the lines which have been firmly established as best adapted to its wants.

Writing telegraphs, based on the fact that two ordinates at right angles to one another can be made to describe any curve, have been designed. The telewriter is well known. At the receiving

end two pivoted electromagnets, placed in a very powerful magnetic field, are deflected over arcs dependent on the strength of the current circulating at any moment. Two arms at right angles to one another are connected to the transcribing pen, one arm being pivoted to each magnet and the writer's movements are reproduced.

In the writing apparatus designed by Pollak and Virag a slip is perforated by suitable means with nine rows of holes of varying sizes. Suitable flexible brushes make contact through these holes between batteries and the line wires, and thus cause currents of different e.m.f.s and duration to circulate over the line, and to act on two telephone receivers at right angles to one another. Rays of light are reflected from one to the other and on to a photographic slip, and the written messages, which can be transmitted at 600 to 1,000 words a minute, appear developed and fixed on the sensitized paper, which emerges from the dark closet of the apparatus.

There are numerous type-printing instruments for the distribution of news, which, however, are so well known that further reference to them is unnecessary.

The effect of conductor-resistance, electrostatic capacity, self-induction and insulator-resistance (or its reciprocal leakance) was next discussed by the lecturer. Overhead wires, for many years almost exclusively used for telegraphy, and even now the only conductors that serve satisfactorily for really long-distance telephony, possess the advantages of low resistance, which can be diminished to any reasonable degree by the use of copper and by increasing the size of the conductor. Their electrostatic capacity is small, say from .013 to .014 microfarad per mile, and their self-induction is relatively great. Their use admits of attaining the maximum speed in telegraphy; and perhaps the most important limiting factor in this case is the self-induction of the receiving apparatus, which would be a useful factor if distributed over the line, but which tends to act as a choking coil when massed at the extremity. This self-induction in the case of the Wheatstone receiver amounts to as much as one henry, and its effect in prolonging the current, combined with that due to the capacity of the line, is neutralized to some extent by inserting a shunted condenser between the instrument and the earth.

Overhead telegraphs are subject to serious interruptions. But on the other hand, until recently, underground wires, owing to their capacity, which reached .3 microfarad per mile when insulated with gutta percha, and the great cost of the material, were only used in special cases where strategical or other imperative reasons rendered such a course necessary. The introduction of dry paper as an insulating material profoundly modified the situation. The electrostatic capacity of suitable paper is not very much greater than that of air, and wires wrapped with paper, cabled, thoroughly dried and enclosed in a lead sheath

* Abstract of a lecture delivered before the Institution of Civil Engineers, London.

are not only available for long underground telegraphs, but it is not too much to say that without them the modern development of the telephone would have been wholly impossible. The Post Office has within the last few years laid 138,000 miles of paper insulated wire underground for telegraph purposes alone, and to illustrate the bearing of this material on telephone progress it may be added that, between 1900 and 1902, before a single subscriber had been secured, the Post Office laid 24,000 miles of wire underground as the first step in the development of the London system. The mileage of underground wire laid by the Post Office in Great Britain for telephones is now increased to 521,000 miles. By no other known means could such a service have been provided, and these facts emphasize the connection between paper insulation and telephone development.

Submarine telegraphy is not susceptible of the many developments that have been possible with land-lines. The high electrostatic capacity, varying from .3 to .4 microfarad per mile, and the very long lengths that are necessary to connect the great continents of the world, rendering the use of any but the most delicate apparatus impossible on long cables. The receiving instruments originally invented by the late Lord Kelvin, then Sir William Thomson, are still the only apparatus available for the reception of messages on long transcontinental cables, and so far it has not been found possible materially to increase the speed of working except, of course, by increasing the dimensions and cost proportionately. Attention has been devoted to eliminating disturbing elements and perfecting the signals by the use of automatic transmission and by the use of curbing devices at the receiving end. The introduction of repeaters at intermediate points where cables land at suitable localities has recently become possible, and it may be that methods of distributed induction may ultimately be of some value.

In ordinary telegraphy when transmitting through an overhead line the frequency of the current alternations is only 180 per second for 450 words per minute, and the current has actuated the apparatus at the further end before the battery connection has ceased. Another condition, however, is introduced when a conductor is used for telephonic speech in which a maximum frequency of 1,800 to 2,000 vibrations per second has to be dealt with. In these cases the transmission from the telephone assumes complex wave-forms, and the effect of even a moderate capacity becomes far more marked than in the case of telegraphic transmission. If the capacity be sufficiently great and the line sufficiently long, the following wave overtakes the lagging tail of the previous one, they blend more or less together, and having lost their distinctive character they fail to impress on the receiving telephone the distinct character of the sound from which they emanate. A few years ago I had, in conjunction

with the Engineer-in-Chief of the National Company, Mr. Gill, to fix certain standards of speech which had to be maintained by the two administrations working the telephone system in this country. By endowing a circuit in which an electrical wave was in movement with sufficient self-induction to prevent the tailing and consequent distortion of the wave, the limit of speech would be materially increased, as the attenuation due to resistance alone would have to be provided for. The British Post Office has recently laid a cable with distributed inductance between England and France which will increase the range of speech about four times as compared with a similar type of unloaded cable.

The problem of connecting two subscribers' lines at an exchange is a very simple one when a small number of subscribers only are concerned. An electrical indicator of the shutter type to announce a call, flexible conductors to connect any two lines by means of plugs and spring jacks, electrical bells to call up subscribers, and the equipment is complete. The problem is a serious one, however, when, as is now the case, the number of telephone subscribers in a large city runs into five or frequently six figures, when the area covered, like that in London, amounts to 640 square miles, when it has to be served by sixty to one hundred separate exchanges, between all of which intercommunication must be provided with the minimum amount of delay. Add to this the interurban communications between all the principal cities in the country, and the fact that practically the major part of the business of the twenty-four hours is concentrated in about two and one-half hours in the morning and a similar period in the afternoon, and the difficulties to be solved become faintly apparent, even to the uninitiated.

Apart from minor improvements in the calling indicators and other details, each of which added its quota to the gradual perfection of the service, perhaps the most marked advance that was made, when exchanges grew in size, was the introduction of the so-called multiple switch. Before its introduction, each operator had the care of, say one hundred subscribers whose lines terminated in front of her. She could connect any two of these one hundred directly, but as soon as a connection had to be made to another position a subsidiary junction line had to be brought into use and the services of another operator invoked to complete the connections. To obviate this difficulty as the number of positions and subscribers increased, the multiple switch was designed. The lines of, say, one hundred subscribers are then terminated on one operator's position; but on a large panel above these local jacks the whole of the 10,000 or more lines are connected to a series of jacks within reach of the operator, and this is repeated at every operator's position, so that a line on any position can be directly connected with any of the other lines on the exchange by the operator who answers the call.

A further improvement was the common battery system. In this, the form of manual exchange equipment now considered the most satisfactory, the shutter indicators are replaced by glow-lamps placed immediately over the jacks. When a lamp lights it indicates a call, and the operator, without doubt, hesitation or delay, forthwith inserts the answering plug into the jack. At the subscriber's office no special calling apparatus is needed. The lifting of the telephone from the hook automatically lights the lamp. The electrical energy in common battery systems is provided by accumulators at the exchange, instead of by primary batteries at each subscriber's office, and not only is the cost of the exchange infinitely small as compared with the old system of providing separate batteries for each subscriber, but the further advantage follows that the full energy is always maintained and available on every circuit, a condition almost impossible to fulfill even under the best organization when thousands of primary cells scattered over a great city have to be looked after by linemen. Similar automatic arrangements are in use on the junction lines connecting the various exchanges necessary for the effective service of large cities.

In the period during which the ordinary telephone equipment has undergone the modifications mentioned, inventors have turned their attention to the design and perfection of an automatic telephone in which each subscriber, by a simple method of manipulation, may, without the intervention of an operator at the exchange, obtain direct access to any other subscriber connected with the service. In the principal automatic system in use each subscriber's line terminates on a line switch which forms part of a group of 100 switches. This switch is connected by ten circuits, the equivalent of the plugs and cords in a manual board, with a series of selectors each accommodating 100 junction lines. According to the size of the exchange there may be two or three sets of selectors connected similarly by means of junction circuits, and finally, there is a connector, a somewhat similar instrument, which makes the connection between the two subscribers. Each telephone has a dial with finger holes and numbers. On removing the telephone from the hook the procedure is as follows: If, say, No. 4852 is wanted the caller inserts his finger in hole 4 and revolves the dial up to the limiting stop. This actuates the line switch which causes a connecting plug to enter the springs of the first disengaged junction leading to the selector group of 4000. The same action follows in sequence with 8, 5 and 2, the final movement of the connector making the connection if the required subscriber is disengaged. If he be connected with another, a busy back signal (a vibratory current) is given. When the connection is made and the conversation is complete, the hanging up of the telephones restores the connections to the normal.

Time does not admit even of reference to many subjects of interest, such as combined telegraph and telephone working on the same wires, the use of repeaters to increase the speed of working on long lines, modern fire-alarm systems, railway signaling, etc., but I trust that what I have said will show that this, one of the earliest branches of electrical engineering, is not stagnant, but, on the other hand, is very much alive; it is served by some of the keenest and most advanced of electricians, and it is absorbing annually a large amount of capital which it is turning to good and profitable use.

How the Western Union Handled Telegraph Reports of the Reno Fight.

The handling of press specials and regular messages at Reno, Nevada, on July 4, and the two weeks preceding the Jeffries-Johnson fight, amounting to more than a million words, demonstrated the efficiency of the Western Union service under extraordinary conditions.

The regular plant at Reno consists mainly of repeaters on the through circuits, the only local circuits being with San Francisco, Salt Lake, Goldfield and way wires east and west, but when the company's officials received assurance that the fight would be held at Reno, equipment for automatic and Morse circuits were started for Reno by express from Chicago, San Francisco, Los Angeles and Seattle. Men experienced in the setting-up and operation of the various instruments were detailed from Chicago, Kansas City and San Francisco, and as fast as the different shipments were received, the instruments were placed on temporary tables ready for service.

The regular operating force of the Reno office consists of the manager, three repeater chiefs, nine operators, five clerks and six messengers, but as the Fourth of July approached, the Reno office saw an increase in the number of employees until on the day of the contest there were sixty-nine operators, sixteen clerks and eighteen messengers on duty.

A. H. May, district superintendent, and J. V. O'Brien, manager of the San Francisco office, were among the early arrivals, with the first of the newspaper correspondents. A few days later L. McKisick, assistant general superintendent of Chicago, arrived to supervise the installation of extra equipment, assisted by R. W. Gillette, electrician of the Pacific division, San Francisco. Superintendent of Construction Ord and General Foreman Quinn, of San Francisco, were on the ground early and had two cables strung to the arena several days before the contest.

Recognizing the inconvenience employees would experience if they were lodged in overcrowded hotels, the Company ordered two Pullman sleeping cars, with dining cars, placed in the yards at Reno for the accommodation of the force. The meals were superior to hotel fare, and nothing but

praise has been heard from the men for the provisions made.

There were about 150 correspondents in Reno, many papers of foreign countries having special representatives on the ground. These correspondents filed a total of 1,000,003 words during the two weeks, the filings on July 4 being 206,000 words, all of which was handled in such a manner that not one special reached its destination too late for publication in the edition for which it was intended.

In addition, there was a very heavy message business to be handled promptly, more than triple that of normal days. On Saturday and Sunday, July 2 and 3, hundreds of messages were received at Reno for city delivery, and several thousand were sent out.

On July 2, at noon, a complete change in the overland circuit arrangement went into operation, to be effective until the morning of July 5. This gave Reno twenty-eight circuits, of which three were Wheatstones.

In addition direct wires were assigned to the press associations, as follows: Reno to New York, three; Denver to San Francisco, one; Reno to Denver, one; Reno to San Francisco, two.

Riders were placed on all circuits at each repeating station; linemen stationed at intervals over the mountains between Reno and Sacramento and at important junction points to be close at hand in case of interruption to the circuits; and extra operators were on duty at test stations to insure perfection of service.

The popularity of the night letter service necessitated the placing of extra clerks at the office counter every afternoon and evening. So great was the crush that the public could not be accommodated inside of the office, so a shelf was placed outside the building on the sidewalk with two receiving clerks to accept messages from the crowds. The minute the decision in the contest was known, people began pouring into the office faster than ever to file messages to friends giving the result. This required sixteen receiving clerks to handle the business offered.

There were few interruptions to circuits, and those for the most part being from causes over which the company had no control and all being of short duration. A few were due to operators in the way stations cutting their Morse sets in on the long leased circuits from the ringside trying to get news of the progress of the fight.

There were seven circuits at the ringside, all of which were leased to press associations. No bulletin service was handled by the company, although Western Union wires were the only ones within the arena.

The furnishing of leased wires from the ringside to the four principal press associations greatly reduced the volume of separate press specials which would otherwise have been filed.

The Wheatstone played a very important part in the handling of press matter. While many wires pass through Reno, their general assignment is for handling Pacific Coast business, and being well filled with traffic under normal conditions there was no decline in that business prior to or during the contest. Three terminal and two repeater Wheatstone sets were available; also five automatic typewriter keyboard perforators and thirty mallet perforators were in readiness and in use a great part of the time. Practically all of the Chicago, Kansas City and San Francisco employes taken to Reno were combination Morse-Wheatstone operators.

In addition to the supervising officials already named, the assignment of the force was as follows:

Loops: Manager E. D. Edwards, Reno. Wire chiefs: L. B. Dobyns, T. A. Long, Reno. Repeaters: E. P. Hearn, C. R. Parkinson, Reno; E. A. Wood, R. O. Burke, Kansas City; A. W. Kirk, C. J. Killick, L. R. Gladdin, A. H. Iliohan, San Francisco. Wheatstone chief and assistants; J. J. McCormick, Fred Thomas, Chicago; T. J. McDonald, Los Angeles; T. McGuinness, San Francisco. Traffic chief and assistants: J. R. Pierce, Chicago; J. L. Pember, San Francisco; F. E. Wells, Reno. Solicitor: Herbert Brown, Chicago. Numbering clerk: R. J. Mullin, Chicago. Mechanician: H. C. Probst, Chicago.

Operators: F. M. Andrews, B. H. Dougherty, S. T. O'Connell, E. O. Hildebrand, Kansas City; H. W. Horstman, T. A. Egan, C. E. Willoughby, L. W. Head, C. Congdon, L. B. Landry, J. Guerin, Wm. F. Otto, Chicago; E. H. Graham, L. Barnes, Salt Lake; W. Goldberg, J. W. Biller, O. G. Morgan, R. S. Vallespin, E. J. LaSalle, G. L. Kirshmeier, H. J. Gallagher, H. Newlander, S. W. Brewer, S. T. Smith, J. O. Newman, A. Lughamer, A. J. Grassell, J. E. Whipple, W. Simpson, W. A. Smith, C. C. Christian, O. L. Holloway, W. H. Jackson, H. Marks, M. Charles, D. C. Paisley, San Francisco; Miss B. L. Stagner, C. Riley, Miss E. Stout, Matt Reilley, Mrs. M. Reilley, H. B. Richards, F. M. Conehay, Miss H. Youngman, C. V. Relyea, J. A. Busse, Reno.

Clerks: C. H. Ackerson, A. C. Gibbons, San Francisco; A. L. May, Homer Comstock, B. Weck, H. Pion, A. Axt, Mrs. E. D. Edwards, Miss Fanita Edwards, Mrs. Irma Sedgwick, J. G. Smith, Miss Mollie Hogan, W. F. Sedgwick, Roy Sedgwick, Ralph Hearn, J. J. McCabe, Reno.

Mr. Frank B. Knight, of the Southwestern Telegraph and Telephone Company, of Dallas, Texas, writes "I am glad to note the change of title of the paper, as well as the many items of telephone news, which you are publishing. The paper is a most welcome visitor and is always read with much pleasure, especially items pertaining to the old telegraph days and the men connected with the business in ancient times."

The Military Telegrapher in the Civil War.

PART XLV.

BY S. L. ROBINSON, HARBOR SPRINGS, MICH.

In the main the incidents, dates, etc., in this article are from memoranda made at the time and preserved by me. Of a necessity, however, much has been from memory and the passing of from forty-five to fifty years since the incidents related occurred, must be my excuse for errors.

My telegraph career began on the Michigan Central Railroad at Niles, Mich. in 1859. I was operator at New Buffalo, Mich. when Abraham Lincoln was first nominated for president and at Chelsea, Mich. when he was elected.

In September, 1861, I went to Detroit and enlisted as regimental drummer in the First Michigan Lancers.

I had just about learned to play on a drum when our band was mustered out. I then re-enlisted as bugler in Company A of the same regiment, serving as such until March 20, 1862, when for some reason unknown to us, our regiment was mustered out, never having left Detroit or that vicinity. I made several unsuccessful attempts to re-enlist, but was rejected on account of my height, being less than five feet. To pass the mustering officer when mustered in as bugler I stood on a brick in the rear rank in order to get in.

I then after a short stay at home started for Cairo, Illinois, and entered the military telegraph service as operator June 21, 1862. I was at Cairo until October when I was ordered to open an office at Union City, Tenn. In November I was sent to Kenton, a few miles south.

At that time a few companies of soldiers were located at stations between Columbus, Ky., and Corinth, Miss., to guard the Mobile and Ohio Railroad, our army depending on the railroad for supplies. At Kenton three companies of the One Hundred and Nineteenth Illinois were camped on the north side of the town while my office was quite a distance south of them. The first news of pending trouble was reported from Humboldt about twenty miles south of us. J. C. Holdridge the operator there reported that the line had been cut between Humboldt and Jackson and that firing could be heard south of Humboldt.

The next day J. S. Lyle, operator at Trenton said that the Confederates were coming and then the line opened. I told the officer in command at Kenton that I would stay at my office as long as the troops staid but if they started north to let me know in time to go along.

I remained until dark and then found that our troops had broken camp and started up the railroad some time before. Already the natives had perceived the situation and but for the darkness would probably have captured me. I took my telegraph instruments under my arm, covered by an old shawl and going around the little village

struck the railroad on the north side of town and started on a record walk down the tracks.

It was an hour before I caught up with the rear guard of our soldiers but before we reached Crocket I was in front and speaking my mind to the commander for leaving me behind. At Crocket I cut in at a pole, raised Columbus, Ky., and reported the condition of affairs between Kenton and Crocket. The railroad was built on trestle work for miles passing over swamps, so that the cavalry in order to reach Crocket would have to go a long distance around. The commanding officer at Columbus accordingly sent a train to meet us, we marching northward in the meanwhile. When we heard the whistle of the relief train it was about as sweet music to us as any ever heard.

I believe I was the only operator between Columbus and Jackson, who was not captured by Forrest, on this raid. I staid at Columbus from December 20 until January 2, when I was sent with a construction train to open up the railroad again.

As escort we had two regiments of infantry and a battery of artillery under command of Colonel Moore of the Twenty-second Missouri.

I first opened the office at Union City and by the ninth the railroad was passable to Crocket. On the sixteenth I walked to Kenton to see if any of my belongings had escaped capture.

I had taken my meals at Kenton with a Mrs. Chambers, whose husband was an officer under Forrest. At one time she was very sick with malaria and I tried to get some whiskey and quinine for her from our medical department, but the surgeon would not give me any. I then had our manager at Columbus send me a demijohn of whiskey and some quinine marked acid and material for battery purposes, and I gave this to Mrs. Chambers.

The whiskey, quinine or faith cured her. When I heard of General Forrest's coming I told that lady that I would leave my clothing and other things with her and, that if she could save them without getting herself into trouble I would appreciate it.

She had them all safe upon my return and I felt well repaid for the little trouble I had taken for her.

I then went on to Trenton and re-opened an office there, staying until orders came to abandon the Mobile and Ohio Railroad north of Jackson.

I left Trenton for Cairo on the last train, an engine and a flat-car with a field gun called a gun car. We narrowly escaped a wreck some one having partly cut the timbers of a bridge which we had to cross, but we passed over before the bridge went down.

I was next ordered to Memphis and from there to Corinth. After a few days at headquarters I went to Chewalla an outpost on the west, and remained there until June.

An experience I had at Chewalla one night is still fresh in my mind. A company from our post, which was out foraging were surrounded in a

swamp by a force of Confederate cavalry. One of our men made his way through their lines and reported the situation. Our colonel did not dare weaken his command by sending help, hence the only hope for relief was to call on General Dodge at Corinth to send a body of troops to their rescue.

It was during one of the most severe thunderstorms I ever saw. My office was fairly a mass of fire. I had cut out the instruments but regular fire balls jumped from the wires to the floor and seemed to chase each other around the room.

I put the glass tops of nigger head insulators on the bottom of the legs of a chair, and winding a silk handkerchief around my right hand and wrist, had a soldier push my chair with me in it to the table, I cut in, and was able to raise Corinth and get a message through. Our men held out, until the force from that place arrived and the Confederates were driven off. Ordinarily it would have looked like courting suicide to do as I did, but in those days and places we had to take all kinds of chances.

About the middle of June I was ordered to Memphis and on the twenty-third with Wayne Parsons and Edward Butler, started for Vicksburg on the steamer Luminary.

Our cargo consisted of ammunition for the army. As we rounded Cypress Bend the enemy opened fire on us, with a battery of artillery stationed on the bank of the river. All we could do was to put on steam and do our best to get out of range. Fortunately none of their shot injured the boat, but for an hour we were anything but comfortable for if a shot had struck the magazine or boiler it would have blown up the boat with all on board. We finally reached Chickasaw Landing, above Vicksburg at 9 a. m., June 26.

We arrived at General Grant's headquarters that afternoon. I was ordered to report to General Herron on our extreme left, where I staid until the surrender, going into Vicksburg July 5.

The day our army entered Vicksburg it was very hot and the dust in the roads was ankle deep. In looking about we found a large cistern under a porch which from appearances had recently been in use for drinking purposes. Finding a pole I brought up a pail of water and as it tasted all right and cool I drank a cup of it. As it went down it felt strange, however, so taking some out where there was more light I found that the water was fairly alive with wrigglers. Still history records that the Confederates in Vicksburg were without fresh meat of any kind.

On the ninth of July I started with Solomon Palmer and a crew to build a line to Jackson, Miss., to keep in touch with General Sherman's army then marching in that direction. By the eleventh the line was working to Edward's Station, by the twelfth to Boulton, the thirteenth to Clinton and the fourteenth to General Sherman's headquarters at Jackson.

After a few days I returned to Black River

Bridge taking charge of that office where I was stationed until May, 1864. The office at Black River was in the only house left standing.

General Grant realizing the importance of telegraphic communication gave us an order saying that the house was to be left entirely under our control for an office and operators' quarters.

During my stay there the command was changed a dozen times or more, after nearly every change I would be ordered to vacate the house for some more important party and I had some lively word battles with quartermasters, but no one in the west was of enough importance to countermand the order in my possession, General Grant having gone east as commander of the army.

In May I was ordered to Memphis where I remained part of the time in the main office and part at various headquarters. There was a lively lot of operators at Memphis. "Doc" Johnson, L. H. Korty and Dorsey Berry, stuttering Dorsey who kept us all in good humor. He could play the banjo, dance and sing and was always ready for any lark.

(To be continued.)

Some Early New York Telegraph Reminiscence.

BY JOHN K. CALVERT, LEONIA, N. J.

The Bain Chemical Telegraph Company had the honor of introducing me to the telegraph world. This momentous event in my career occurred in 1852, and the office of the company was at 29 Wall Street, New York.

Mr. Augustus Swan, to whom I made known my desire to push along things telegraphic, being no doubt impressed by the rakish tilt of my new Kossuth hat and its adorning ostrich feather (a very popular headgear in those days) and thinking I might do, engaged me as messenger to be placed among half a dozen others already in harness.

The operating room, which was on the first floor, back, measured about fifteen by twenty-five feet. This space was occupied by both the operating and delivery forces, and as I recall it, we got along peaceably and without much friction. The force consisted of Mr. Swan, manager, and operators: Messrs. William Porter (champion of the key in those days), Al. Reeves, Alfonso Prescott, and a Mr. Lumm, whose initials I have forgotten—a genial, young and gentlemanly set. Marshall Lefferts was president, and John McKinney, superintendent.

At my enlistment in the delivery corps, I found already there, and even then a veteran among the messengers, one who, like myself, took root—later becoming a permanent cog in the huge telegraph machinery. I refer to Thomas A. Davin who has but recently "closed his key" for, let us hope, a wireless rest of eternal bliss. Mr. Davin up to his death had been continuously employed as operator in a banking house in Boston for approximately thirty years, a record that speaks for itself.

Although it occurred nearly sixty years ago, many pleasing memories connected with my advent in the service linger. One little episode may not be out of place, and I give it as a specimen of wit from Mr. Swan which I, then a boy, thought very clever. In those days the term "bull" for an error had not yet come into use, "corn" was its predecessor; an error of whatever nature was commonly called a "corn." In the basement of our building was the office of N. L. Cobb and Company, brokers. One day their clerk brought in a message to be "rushed"; Mr. Swan himself rushed it. He had hardly finished "Sig" when the clerk reappeared in hot haste, saying there was a fatal mistake in the message and asked to have it recalled; this was easy and the message was "killed." On the retirement of the clerk, Swan turned to the force and, in quiet tones, exclaimed: "That, I think, was a 'corn' on Cobb!"

Our division of the Bain system worked two wires to Boston. I should have said worked two wires some of the time, one wire part of the time and no wire most of the time. The chronic condition, according to my memory, was "down." Down or up, the operators' salaries were stationary, but not so with the messengers, the stoppage of business stopped our income. On many such occasions Mr. Swan, no doubt to be rid of us for the time being, would give passes to Barnum's Museum (then located at the corner of Broadway and Ann Street) to half the delivery force, and though our earnings diminished, we spent many happy hours at that world-renowned caravansary.

The first uptown office was opened by Mr. Swan at the Astor House in 1851. He later took John W. Lewis as assistant. Together they made of the Astor House office the institution it is today. Death retired Mr. Swan a few years ago, when Mr. Lewis took charge and still holds command. Mr. Lewis has thus served fifty-six years in the same office and appears to be good for many years more.

The uptown march of the wires next reached, by way of the house-tops, the Metropolitan Hotel, at Broadway and Prince Street, a famous hotel in its day. This venture was financed by a Mr. Beatty, and though he was good enough to take me as his assistant, messenger, and general utility man, I find I can speak of him but vaguely. The enterprise not proving the immediate success anticipated, he found a purchaser and turned over the plant (together with the writer) to its new owners. With this change the House printing system was substituted for the Morse at the Metropolitan Hotel, and subsequently was installed in several other city offices opened later.

About this time, 1854 I think, the World's Fair opened at the Crystal Palace, on the site of the present Bryant Park, at Sixth Avenue and Forty-second Street. A space six by ten feet being secured, an office was therein opened and the House printing telegraph and myself shared the interest

and curiosity of the wonder seekers. Very little business being done (the visitors not paying fifty cents admission to the fair to telegraph), the attempt to make it a paying proposition was abandoned and I, after a few weeks' attendance, was called back to the Metropolitan Hotel, where S. C. Hendrickson was manager. Soon after my return Mr. Hendrickson was made superintendent of the City lines and I became manager of the office, retaining that position until 1862 when I was transferred to the main office at 145 Broadway and assigned to the Philadelphia printing circuit.

During my occupancy of the Metropolitan Hotel office many notable and some historical events occurred at that house. Conspicuous among them was the banquet in celebration of the successful laying of the first Atlantic cable, in 1857, at which Cyrus W. Field was the guest of honor. The feast was held in the large ball-room of the hotel, which was handsomely and appropriately decorated. Among the guests were the Governor of New York, the Governor of New Jersey, many United States senators, judges, members of Congress, the Mayor of New York, and a large number of other dignitaries. I may be pardoned if, being much in the lime-light on that occasion, I bring my own personality into this foreground. In the northwest corner of the room a generous space was roped off with a silken rope, and inside the enclosure the telegraph was temporarily established. The apparatus was of the printing pattern. Mr. Hendrickson superintended and I did the operating. Here, at intervals during the ceremonies, I was receiving, not only messages from our own country's high officials, but, as it was said, cable despatches of a congratulatory nature from kings, queens, and other potentates of European countries. Each message, when read by the toastmaster, was received with vociferous enthusiasm, and mutual felicitations were in evidence. Had the fact been known that these precious cables originated at 21 Wall Street the enthusiasm would, perhaps, have been less pronounced. The cable had broken down some time prior to the banquet, this I did not then know, but learned later.

That I was useful, in my modest way, in these proceedings, goes without saying, but that I was also ornamental was proven by the presence of a large structure of the confectionery man's art representing the Printing Telegraph machine, with the writer as its operator. This "piece de resistance," about three feet high, occupied the centre of the principal table and was, of course, much admired. I don't know that Mr. Field was envious, but certain it is that he failed to congratulate me on my saccharine and statuesque prominence at his jubilation.

In 1854 Commodore Perry, accompanied by a flotilla, made a ceremonious call on Japan, and after some hard knocking induced her to open her door. One of the results of this visit was a return call from Japan, in the form of an embassy.

sent to our government to effect a treaty between the two countries. This was the first embassy ever sent from Japan to a foreign power. On its way to Washington it stopped in New York as guests of the city staying at the Metropolitan Hotel. It numbered probably thirty members and was received with much honor and attention. Attired in their native dress, flowing silk and embroidered robes, drawn in at the waist by a broad sash, through which were thrust two swords, their appearance was unique.

The telegraph being to them a miraculous invention of the barbarian outsiders, they were much interested, and their curiosity brought me in frequent contact with many of their party. One in particular, called "Tommy," was so persistent in his search for telegraphic lore, that we became quite chummy. "Tommy" was a bright, sprightly lad, under twenty years of age, and for some unexplained reason had immediately jumped into popular favor; whenever the embassy was spoken of, "Tommy" held the centre of the stage. What his rank was no one seemed to know, but his popularity was remarkable.

In due course the City Line had become a big feeder and distributor. It was taken over by the American Telegraph Company and was included in the district over which J. C. Hinchman was superintendent. On one of Mr. Hinchman's frequent calls at my office he asked me how many messages I was handling in a day. I replied that the day before had been my best day, that I had sent and received ninety-three messages. He appeared pleased and said: "John, when you have reached one hundred, draw on me for a new hat." I wanted that hat; I knew it would be a good one when it came, and Genin's silk hats cost eight dollars in those times. The next few days I did some extra hustling. It was not long before I had reached my goal. I wired that fact to Mr. Hinchman asking to be favored with the address of his hatter. I never received the hat, however, or even the hatter's address.

I had better luck on another hat proposition. E. L. Davenport, the then eminent tragedian, was filling an engagement at Niblo's Garden, and one day had an important message for John T. Ford, at the Holliday Street Theatre, Baltimore. Mr. Davenport's many demands on the telegraph had brought us into friendly intimacy; this day he said: "Calvert, this message is very important to me. If you will rush it and get me an answer inside an hour I will buy you a new hat." It did not take long to inform the boys along the line of the status of things and secure their co-operation. Suffice to say Davenport got his reply within an hour—and I the hat.

An Invention Paid For Principally in Experience.

Mr. E. J. Edwards, writing recently, tells the following story of Thomas A. Edison's sale of his patents of the carbon telephone transmitter. In reply to the question as to whether he did not

receive a large amount of money for this patent which made the modern telephone possible, Mr. Edison said:

"I suppose I got paid in large part for that in experience. I had a good many things to learn about business in those days.

"You may remember that the Western Union Telegraph Company, after the telephone was demonstrated to be a practical invention—that was about 1876—planned adding a telephone system to its telegraph lines. To everyone it seemed certain that there was to be severe competition between the Western Union and the original telephone company for the telephonic business of the country. I don't remember much of the detail of this threatened competition, but I do know that at the time the transmitting apparatus of the telephone was by no means perfect, so I set to work to make a perfected telephone in this respect, a vital matter for the future of the invention. Well, after a good deal of hard work, I got what I was after. There it is."—and Mr. Edison pointed to the telephone which stood on his desk.

"With my carbon transmitter ready for a demonstration I went to the offices of the Western Union; I had previously sold that company my stock ticker invention and my quadruplex system of telegraphy, and quite naturally, I suppose, I gravitated to it with the transmitter. I saw the general manager and one or two other gentlemen, showed them the transmitter, and told them that I was pretty sure that, with my apparatus in their possession, they would have the bulge on the Bell instrument. I tell you, they were an interested lot of men, and as soon as I gave them a chance they asked for some kind of an option on the invention, and I gave it to them without further ado.

"It was only a little while later that they sent for me and made me a proposition to buy my apparatus outright. They said they were willing to pay me about a hundred thousand dollars in annual installments covering a rather lengthy period. I thought that was a lot of money, and how nice it would be to count with perfect certainty upon an income of several thousand dollars a year for quite a number of years, and, do you know, I let them have that invention on their own terms?"

"A few weeks later," he continued, "I heard that the Western Union had sold my improved transmitter to the Bell people for \$800,000, simply by proving to the latter that it had the bulge on them.

"But I have never regretted the deal I made with the Western Union people, or, rather, the deal they made with me. I gained a lot of experience in that transaction, and it was worth all it cost. I have never let anybody get the better of me since, and I am certain that the experience I got then has made me far more money than I lost through inexperience when I didn't dicker back and forth between the Western Union and the Bell people with my transmitter."

A New Improvement in the Belin Process of Picture Telegraphy.

BY DR. ALFRED GRADENWITZ.

Few problems of recent years have assumed the same degree of popularity as the telegraphic transmission of pictures and handwriting. Among the inventors concerned with the solution of this problem there are many who only consider it as a preparatory stage in the fulfillment of a task far more difficult, though incomparably more interesting, viz., the problem of electrical television, that is, a process enabling any kind of objects or animated scenes to be made visible at the other end of a telegraph or telephone line, which in spite of its undoubted attractiveness, possesses very limited practical possibilities. Tele-photography proper, however, is likely to prove of extraordinary value especially for the purposes of the illustrated press. As soon as a faithful picture of an event, in addition to the news itself, is transmitted to any distance without any loss of time worth speaking of, photographs will assume the same degree of actuality as the reports of newspaper men. The tele-photographic process invented by Professor Korn seems to be quite suitable for such purposes. In fact his apparatus has already been used occasionally for the telegraphic transmission of pictures.

It will be remembered that a French inventor, Mr. Edouard Belin of Paris, some time ago designed a new tele-photographic process. This has recently been brought to such a degree of perfection by the surprising sharpness and effectiveness of its reproduction as to excell anything so far done in the same line.

Already, in the first experimental apparatus, as well as in the second outfit constructed for use in transmission between Paris and Lyons, the vital organ of the Korn apparatus and the scheme of most other inventors, viz., the selenium cell, had been replaced by a variable rheostat arrangement.

A photographic print in bicromated gelatine, presenting a series of marked elevations and depressions (corresponding to the shades of the picture), was wound round a cylinder rotating in front of a tracing point carried by the short arm of a lever. The long arm of the lever carried a little wheel rolling upon a series of silver plates alternating with minute sheets of mica of an aggregate thickness of only one-tenth of an inch. By sliding on the elevations and depressions of the picture the double arm lever, with the wheel affixed to its end, thus inserted into the circuit a variable resistance depending upon the depth, and accordingly the shades of the various portions of the picture. The fluctuations in current intensity thus introduced into the circuit were transmitted over the telegraph or telephone line, in order to be reconverted at the receiving station into fluctuations of luminous intensity.

In spite of its relative accuracy and the richness of details obtained with a rheostat of sufficient

gradation, there still remained a certain hardness of shades in the reproductions obtained at the receiving station, because of the step-wise alteration in resistance on which the process was based. The inventor, therefore, replaces in his new apparatus, the graduated rheostat by a microphone of special construction.

The apparatus installed at the sending station outwardly resembles a phonograph. The picture to be transmitted is wound upon a rotating cylinder which, like a phonograph roller, at the same time performs a progressive motion in the direction of its axis. The microphone referred to is substituted for the phonograph membrane, converts those slight elevations and depressions in the photographic print (corresponding to the shades of the picture) into fluctuations of current intensity, which, like telephone currents, are transmitted over a line of electrical conductors, to the receiving station situated at any distance, in order there to be reconverted by a sensitive galvanometer (oscillograph) into fluctuations of luminous intensity. In fact, this galvanometer carries a mirror which, according to the intensity of the current flowing through it, undergoes a variable deflection, thus controlling, in conjunction with a scale of graded shades, the intensity of light acting upon the photographic film or paper. This is how, with an extraordinary sharpness, are reproduced in succession, all the various points of the picture, even the slightest shades being fully rendered without any abrupt transition.

The most interesting part of the apparatus, viz., the microphone, which also lends itself for use in long-distance telephone communication, is constructed as follows:

To a flat cylindrical box is fixed an insulated carbon bottom, and to this is attached another insulating plate, perforated with holes two millimeters in diameter, that are arranged at equal distances apart, on three concentric circles. Into each of the holes is tightly fitted a carefully shaped spherical carbon grain, and against these grains is applied a carbon membrane ninety millimeters in diameter, and seven hundredths of a millimeter in thickness. This membrane is substantially encased at the edges and communicates directly with the microphone box, to which one of the terminals of the circuit is connected, while the other terminal communicates with the bottom plate.

The exact position of the membrane is adjusted by properly tightening some paper rings on which it is resting. The system constituted by the bottom plate, the grains and the membrane, thus is conductive, and if the resistance of the contacts were nil, would short-circuit the two terminals. However, each grain obviously forms a shunting of the circuit, the internal resistance of the microphone being lower as the number of grains is more considerable. In actual practice Belin has found three grains to be quite sufficient, provided these grains be located at the three summits of an equilateral

triangle, but the sensitiveness of the system could obviously be increased or diminished at will by altering the number of grains and distributing them either over the three circles, or any one of them.

For the sake of its application to tele-photography, the microphone is so adjusted that the membrane will tighten the grains sufficiently to prevent any motion between them and the bottom plate. As soon, however, as any pressure is brought to bear upon the center, the flexibility of the membrane between the three summits of the triangle will enable it to give way without breaking.

The contacts between the grains and the membrane on the one hand and the grains and the bottom plate on the other, are the more perfect, as the pressure exerted on the membrane is more considerable, and their resistance, as well as the total resistance of the microphone, will be reduced in proportion.

Experience has shown this apparatus to resume with absolute safety its initial resistance as soon as the pressure is relieved; a given pressure always corresponds to a given variation in the resistance of the microphone. This can be ascertained by means of a micrometrical outfit similar to a spherometer, provided the external conditions be left unaltered.

The only difficulty to be overcome was that the microphone being in itself of very low resistance, any variations in its resistance are quite negligible as compared with the absolute resistance of the circuit. In telephone work this difficulty is avoided by using an induction coil, but such an apparatus could not be used in connection with tele-photography, lest the dark and light portions of the picture be mixed up.

Belin therefore devised the following arrangement:

The microphone was substituted for the resistance to be measured, in a Wheatstone bridge formed by the transmission line, the galvanometer being replaced by the receiving station. The three remaining branches of the system can be chosen at will; and by a proper regulation, allow the intensity and sensitiveness of the arrangement to be readily controlled. A very important advantage of this scheme is the fact that the receiving and transmitting apparatus are maintained in absolute agreement independently of the length of the intervening line.

On account of the extraordinary sensitiveness of the microphone, it is not only possible but it is indispensable to resort to extremely slight differences in relief. In fact, the best results are obtained with ordinary photographic carbon paper, the relief of which is perceptible neither to the eye nor to the touch.

The fluctuations in current intensity produced by variations in the microphone resistance (which in turn correspond to the different shades of the original photographs), are transmitted to the receiving station situated at any distance, in order there to be reconverted into fluctuations of light.

The receiving station is identical in principle with the arrangement used in the original apparatus, a Blondel oscillograph being used to produce this conversion.

The oscillograph, as is well known, mainly consists of a strong electro-magnet including between its pole pieces two extremely thin wires. These wires are connected together at one end, and constitute a loop closing the circuit. In their center is arranged a small mirror of about one square millimeter, which by the torsion of the wires, as produced by the passage of the current, is deflected more or less, according to the actual current intensity. On this mirror falls the converging beam from an intense lamp, the reflected rays being projected on the surface of the film on which the reproduction has to appear. By inserting an aplanatic lens, these rays are always concentrated in a given point, and by arranging a scale of light filters of regularly increasing transparency, the reflected rays are varied in intensity in proportion to the actual current intensity (and accordingly to the shades of the original picture), so that the rendering on the film gives a faithful reproduction of the last. Any diffraction is avoided by arranging an extremely thin opening one-sixth millimeter in diameter above the sensitive surface so as to be in immediate contact with the latter.

As the original photograph can be made ready within fifteen to twenty minutes, and as the time of transmission does not exceed three to four minutes (which is very much shorter than in connection with any other process), it may be said that the Belin process allows any event to be reproduced by a faithful photographic picture, twenty to twenty-five minutes after its occurrence, at a distance of up to 1,500 miles.

The same process obviously, is excellently adapted for the transmission of handwriting and drawings. The reproduction of a photograph as telegraphed by means of this apparatus frequently possesses even more strikingly artistic effects than the original itself, as the minute traces of indistinctness still left, will impart to the picture the very appearance of a painting.—*Scientific American*.

Weber's Handy Electrical Dictionary is a practical handbook of reference, containing definitions of every term or phrase used in the electrical industry. This vest pocket size indexed handbook contains over two hundred pages and over three thousand definitions. Notwithstanding the limitations of space, the work is so clear and lucid in its definitions, and so comprehensive in its scope, that it is not only an indispensable guide to the electrician in the intelligent performance and understanding of the duties of his profession, but is a work of the highest order of educational merit as well. Price, 50 cents. Address orders to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, N. Y.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIDGEMAN

Sole Manufacturer

**Hudson Terminal, 30 Church St.
NEW YORK**

Western Representative

**WATSON INSULATED WIRE CO.
Railway Exchange, CHICAGO, ILL.**

The Railroad.

Mr. C. A. Parker, superintendent of telegraph of the Denver, Northwestern and Pacific Railroad has resigned.

Mr. J. H. Lindsey, formerly superintendent of telegraph of the Northern Railway of Costa Rica, at Port Limon, Costa Rica, is now associated with the Union Switch and Signal Company with headquarters at Springfield, Mo.

W. C. Muir, superintendent of the Canadian Northern Express Company and the Canadian Northern Telegraph Company at Winnipeg, Man., has been appointed general superintendent of both companies, with headquarters at Winnipeg.

Mr. J. L. Orbison, superintendent of telegraph of the Cincinnati, Hamilton and Dayton Railroad has been granted an indefinite leave of absence on account of ill health. Reports heretofore made to him will be made to the general superintendent.

Carlton Lewis Bretz, general manager of the Cumberland and Pennsylvania Railroad, died at Cumberland, Md., July 31, aged sixty-three years. Mr. Bretz began his railroad career as a telegraph operator on the Pennsylvania Railroad at Newport, Pa.

A patent, No. 965,017 for a selective signaling system, has been granted to H. O. Rugh, of Sandwich, Ill. For railways to call up selectively stations from the central office by means of step-by-step selectors at the sub-station with electromagnetic means for operating them.

Mr. M. W. Jones, formerly manager of the complaint bureau of the Western Union Telegraph Company at 195 Broadway, New York, but who for the past year has been secretary to Vice-President Stewart of the Guayaquil and Quito Railway at Ambato, Ecuador, has been appointed chief train despatcher of that road with headquarters at Huigra, Ecuador.

General Mention.

Mr. Martin Dauer who has represented our publication in the Syracuse, N. Y. office of the Western Union Telegraph Company for the past twenty years has retired from the service to engage in other business.

An experimental installation of the Murray Printing Telegraph, the invention of Mr. Donald Murray, of London, England, has been placed in service by the Norwegian Government between Christiana and Bergen.

The administration railway bill which places telegraph and telephone companies under the jurisdiction of the Inter-State Commerce Commission, goes into effect August 17. In accordance with the provisions of this act regulating the giving of franks the telegraph companies have issued notice of the cancellation of all franks held by persons not authorized to use them. A fine of not less than one hundred dollars or more than two thousand dollars is the penalty provided for giving or using a frank unlawfully.

Another claimant of the honor of first reading telegraph messages by sound has appeared in the person of Mr. William H. Phillips, of East Amherst, Mass. Mr. Phillips, who is now eighty years of age, learned the art of telegraphy when a boy at Bennington, Vt. He and George Harrington, of Troy, wishing to use the wire for personal communication to escape detection, were driven to adopt a scheme whereby they learned to read by sound. The fact that he could read messages that way was discovered by others, when in 1850, he read from the sounder the news of the death of President Zachary Taylor. As Mr. Alfred Weller, now of Laporte, Ind., as recorded on page 404 of our June 16 issue, took by sound the returns of the election of President Taylor, his achievement seems to antedate Mr. Phillip's by at least two years.

What Our Friends Say About This Publication.

Mr. R. H. Bohle, manager of the Western Union Telegraph Company, St. Louis, Mo., in renewing his subscription writes: "Telegraph and Telephone Age is the most welcome publication that comes to my home where I enjoy it hugely."

Mr. C. W. Casperson, superintendent of the government railway telegraphs, Queensland Railways, Brisbane, Australia, in a recent letter has this to say, among other things: "I am a constant and appreciative reader of Telegraph and Telephone Age, and find much of value in its columns regarding railroad management, etc."

Mr. W. P. Cline, superintendent of telegraph of the Atlantic Coast Line, Wilmington, N. C., under date of July 14 writes: "I would enter a life subscription if it were not that by doing so I would miss the convenient opportunity of telling you, on the occasion of my annual renewal what pleasurable and profitable entertainment the Age affords. Your readers are to be congratulated upon the excellence of the journal you are placing before us. Personally, I thank you, and extend my sincere best wishes for continued increasing success and prosperity for the Age and yourself."

The following notice which has been sent by Mr. C. S. Rhoads, superintendent of telegraph, of the Cleveland, Cincinnati, Chicago and St. Louis Railroad, to all construction foremen and linemen in his department is an indication of the way in which our publication is regarded in the railway field.

"The advent of the telephone in train despatching and general railroad service together with the improvements in telegraph equipment means additional linemen trained to fit these new conditions. In order to keep abreast of the times, I want to suggest that every lineman should be a subscriber to Telegraph and Telephone Age, a sample copy of which will be sent you by the publisher. A valuable addition to this is a copy of Jones Pocket Edition of Diagrams, which also can be purchased of Telegraph and Telephone Age."

The Telephone.

Mr. Charles M. Nininger has been appointed district commercial manager of the Southern Bell Telephone Company at Atlanta, Ga.

Mr. W. G. Rauch of Atlanta, Ga., has been appointed division plant superintendent of the Southern Bell Telephone Company with headquarters at Charleston, W. Va.

Mr. W. A. Baker, division commercial manager of the New York division of the New York Telephone Company has been transferred to a similar position in the New Jersey division.

Mr. H. P. Storkerson, district manager of the Michigan State Telephone Company at Grand Rapids has been appointed superintendent of equipment with headquarters at Detroit.

At a recent meeting of the board of directors of the United States Telephone Company held in Ohio, Mr. F. H. McKnight of the firm of J. P. Morgan and Company, New York, was elected a director to succeed Mr. E. G. Tillotson, resigned.

Mr. W. C. Poage, of Houston, Texas, has been appointed division plant superintendent of the Southwestern Telegraph and Telephone Company with headquarters at Little Rock, Arkansas vice Mr. Fred Linnington, transferred to a similar position at Fort Worth, Tex.

Mr. R. W. Keeley has been appointed manager of the Southern Bell Telephone Company at Pensacola, Fla., vice Mr. A. C. Hobson, appointed district commercial manager at Columbus, S. C. Mr. Hobson in turn succeeds Mr. S. D. Lucas who has been appointed special agent at Charlotte, N. C.

At the annual meeting of the United River Plate Telephone Company, of Buenos Ayres, held in London July 19 it was voted to increase the capital stock from £1,000,000 to £1,500,000. This company now has 21,000 subscribers in Buenos Ayres and La Plata of which number 4,339 were added during the past year.

The Pacific Telephone and Telegraph Company has purchased the property of the Midway Telephone Company of Klamath Falls, Ore. The system of the Midway Company will be connected to that of the Pacific Company and extensive improvements made at Klamath Falls, and nearby towns.

The Wisconsin State Telephone Association has been organized at Madison, Wis., by representatives of a large number of telephone companies in that state. The object of the association is to advance the interests of telephone companies and to oppose the enactment of laws detrimental to the telephone business. The association as at present formed represents the interests of sub-licensee and Independent companies, but it is planned to carry the work forward on a strictly non-partisan plan, according to the announcement of the promoters. The officers are as follows: President, J. A. Pratt, Menominee Falls; vice-president, R. M. Richmond, Evansville; secretary, Paul J. Weirich, Monroe, and treasurer, W. F. Goodrich of La Crosse.

The Peruvian Telephone Company of Lima, Peru, has spent \$250,000 in the past two years in placing their wires underground and in adopting the common battery system. The company now has 1,600 subscribers in Lima.

The Minister of Posts and Telegraphs of Italy has recommended the expenditure of \$148,000 in improvements to the telephone system of that country, \$12,000 of this amount is for the purchase of apparatus for experimental purposes.

Tests made on the new loaded submarine telephone cable laid by the English Government across the English Channel have been very satisfactory proving that the new cable will fulfill the expectations of the engineers.

A new common battery telephone exchange has recently been opened in Hamburg, Germany in which seven other exchanges have been combined. The new exchange has 35,000 working lines at present and an ultimate capacity of 80,000, thus being, it is claimed, the largest telephone exchange in the world.

A conference of managers of the Rocky Mountain Bell Telephone Company for the good of the service was held recently at Salt Lake City. A feature of the meeting was the organization of what is known as the Ninety Club. The requirement for membership in this is that the manager shall have made a record of ninety per cent. or better in collections in his district.

During the six months ended June 30, the American Telephone and Telegraph Company and associated holding and operating companies earned \$80,634,614 gross, an increase of \$8,522,522 over the first half of 1909. Total expenses and appropriations were \$56,357,833, an increase of \$6,974,633, and net earnings, \$24,276,781, were an increase of \$1,547,859.

The city authorities of Los Angeles recently passed an ordinance fixing telephone rates in that city. This ordinance is being contested by both the Pacific Telephone and Telegraph Company and the Sunset Telephone Company. The city has accordingly appropriated \$15,000 for the purpose of making a thorough investigation of the properties of the two companies to determine whether the proposed rates are justifiable.

Mr. Bela Gati, engineer in chief of the Hungarian telegraphs and telephones is at present engaged in the development of telephone apparatus with the view of developing equipment which can be used successfully for speech transmission between London and Constantinople. He has produced a water cooled microphone which takes one ampere of current and which transmits speech experimentally with excellent results over 2,500 kilometers of line.

Telegraph operators in Asia Minor receive from \$12 to \$20 per month. Small as these wages may seem, they are one-third greater than the wages of five years ago.

Radio-Telegraphy.

The Chilian government is preparing to install a wireless station on the island of Juan Fernandez.

The Newfoundland government is planning to erect wireless telegraph stations at Fogo, Grey Islands, Belle Isle and along Labrador, to enable communication to be kept up with sealing steamers, and for general purposes.

It is reported that the Australian Government is planning the installation of wireless stations at Cape York and Port Moresby thus providing communication between British New Guinea and the mainland of Australia.

A patent, No. 965,960, for space telegraphy has been granted to C. D. Babcock of New York. An oscillation producer in which the discharge is muffled, having electrodes, one of which is provided with a plurality of points contained in a vessel holding gas under pressure. The electrode is rotated.

The United States Civil Service Commission will hold an examination August 24, to secure eligibles for appointment in the government wireless service. The only vacancy at present is in the position of assistant in wireless telephony in the signal service at large at a salary of \$1,080 per year.

The wireless operator of a Los Angeles paper was startled one day recently while receiving a message from Catalina Island to hear first the strains of music in his receiver and then a woman's voice. The message which he was receiving was interrupted several times in this way, much to his bewilderment. Inquiry afterward revealed the fact that at this time Dr. Lee De Forest was experimenting with his wireless telephone between Venice and Ocean Park, eighteen miles from Los Angeles.

An English inventor has recently produced a liquid microphone for use in connection with wireless telephony. In this device the high frequency telephone current is led through an electrolytic path of small dimensions, so arranged that its resistance is varied considerably by the vibrations of a diaphragm, the liquid being maintained in a state of continuous flow. The advantages claimed include absorption of energy, faithful speech reproduction, and constant normal resistance with facilities for adapting this to suit requirements. Models have proved capable of taking energies up to the value of five hundred watts.

Since wireless telegraphy came into general use on shipboard it has shown its utility for many purposes. The latest illustration of its value was brought to light recently when Dr. Hawley Crippen who was wanted in England for the murder of his wife succeeded in getting on board the steamer Montrose bound for Canada. By the aid of wireless telegraphy he was apprehended and arrested before he had a chance even to land on Canadian soil. Formerly if a criminal was fortunate enough to secure passage on a vessel bound for a foreign country his chances for evading the law were very good. Now however, it appears that he is just as likely to be apprehended on sea as he is on land.

It is stated that the Postmaster General of Argentina has submitted to his government a scheme for replacing the telegraph system of the country by wireless telegraphy, as he considers atmospheric conditions in that country most favorable for wireless operation.

Rear Admiral Schroeder, commander-in-chief of the Atlantic fleet of the United States Navy in his annual report recommends government control of all wireless plants. He says that the wireless operation on his flagship, which frequently took 200 messages a day, was often interrupted by commercial operators and amateurs.

The New Zealand Government has invited tenders for the construction of two high power wireless stations being a range of 1,250 miles and which can communicate with the high power stations being erected in Australia and the Fiji Islands. They will also erect three medium power stations with a range of 500 miles for local communication throughout the islands.

It is now proposed to equip all vessels of the U. S. Lighthouse Service which go out of sight of land with wireless telegraph outfits. There are at present about twenty tenders in the service which come under this classification and six lightships located thirteen miles or more from shore which are not already equipped. Four lightships have wireless apparatus and an outfit will soon be installed on the tender Kukui which is in service in Hawaiian waters.

Mr. J. R. Irwin, of the Marconi Wireless Telegraph Company, has been assigned to the Wellman dirigible balloon expedition, which expects to make an attempt to cross the Atlantic in September. The balloon will be fitted with a Marconi wireless outfit, and Mr. Irwin will have charge. His position on the steamer St. Louis has been filled by Mr. M. McIntyre, formerly at the Sea Gate, Coney Island, Marconi station. Mr. Irwin, it will be remembered, was the operator who was on duty at Siasconsett when the steamer Florida sank the Republic in January, 1909, and who received the first news of that disaster.

The Federal Grand Jury which has been investigating the affairs of the United Wireless Telegraph Company, on August 3 found indictments against seven officials of the company on separate charges of conspiracy to defraud and fraudulent use of the mails. The officials indicted are Christopher Columbus Wilson, president; Sam'l S. Bogart, vice-president; Wm. A. Diboll, treasurer; Francis X. Butler, director and general counsel; George H. Parker, director; Charles C. Galbraith, general manager, and William W. Tompkins, president of the New York Selling Agency. The indictment for conspiracy contained one count, while that for fraudulent use of the mails contained three.

Telegraph and Telephone Age contains much of interest to wireless operators. \$2.00 per year

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works on telegraphy and treat them in the same manner.]

CHAPTER XIII.

In looking for faults in a quadruplex circuit how would you determine whether the line was open?

If in making this test your signals are broken up what does it indicate?

In this case how would you tell if the wire was simply grounded?

What condition of the apparatus would indicate a foreign current on the wire due to a cross with some other line?

How can you determine on which side of a repeating station, the wire is at fault?

What effect at the distant end of the circuit may be produced by an improperly adjusted pole-changer at the home station?

How may this trouble be eliminated?

Where would you first look for trouble if the distant station can not hear your signals on his neutral relay?

What will be the effect if the adjustment of the transmitter points is such as to prevent the tongue from being pulled away from the upper post when the transmitter is closed?

What will be the effect if the adjustment is such that the tongue remains in contact with the lower post when the transmitter is open?

In this case what will be the effect if the wire attached to the 900 ohm leak becomes broken?

What trouble would you suspect if the battery at the distant station interfered with the incoming signals at that point, one pole causing the signals to be light and the other pole having the opposite effect?

How would an open ground coil cause this trouble?

In case the fault can not be quickly repaired how would you proceed to balance the set?

What fault might indicate that one pole of your local battery was open or the current from it was not passing through the polechanger?

How would you determine quickly if this was the case?

If you can not restore the battery at once how can you adjust the apparatus so as to get a duplex out of it?

If after carefully adjusting a quadruplex set and balancing, it is found that the incoming signals on the neutral relay are still more or less interfered with when the distant office begins to send

on the polar side, at what point would you first look for the trouble?

If you should prove conclusively that the difficulty was not in the polechanger and was sure that the wire was clear, where would you look next for the trouble?

How may the proper battery proportions be destroyed?

How are the proper battery proportions obtained when current is supplied by a dynamo?

What is the effect on these proportions of extra resistance added by dirty transmitter points?

What would be the effect of a loose connection at the binding post of the leak coil?

How would you proceed to measure the battery of the distant office to determine if its proportions were incorrect?

What should be the approximate strength of the short end current?

How can you determine the presence of earth currents in a circuit?

How can you compensate for earth currents if they are steady and permanent?

How can you determine easily the number of cells of battery necessary for this purpose and how they should be connected?

What type of cells are best for this purpose?

Obituary.

G. W. Babbitt, chief train despatcher of the Michigan Central Railroad at St. Thomas, Ont., died July 12, aged sixty-seven years.

Charles E. Drew an employe of the Gold and Stock Telegraph Company died at Rockville Centre, L. I., July 26, aged fifty-three years.

Hugh H. Craig, a member of the United States Military Telegraph Corps, died at Tompkinsville, Staten Island, August 5.

Thomas Neilon, formerly an operator for the Postal Telegraph-Cable Company at Chicago, and other points, died July 14 at Tomah, Wisconsin, aged forty-six years.

John E. Payne died at Denver, Col., August 2, aged sixty-five years. Mr. Payne was identified with the Philadelphia office of the Western Union during the seventies.

James B. Watt, who for many years had been in the employ of the Associated Press as an operator died at Nashville, Tenn., August 4, aged sixty-two years.

Laurence F. Dowling, an old time telegrapher, who for many years was identified with the Western Union Telegraph Company at 195 Broadway, but who for the past fifteen years has been a warden in the Criminal Courts Building, New York, died July 28.

Joseph Landis, a member of the Old Time Telegrapher's and Historical Association and a veteran of the Civil War died at Mount Pleasant, Pa., July 21, aged seventy-five years. Mr. Landis, accompanied by his wife, was a well-known figure at the annual re-unions of the old timers.

Hints for Students.

A writer in "The Katipo," the official journal of the New Zealand Post and Telegraph Officer's Association, gives in a recent issue some very useful hints for the aid of students which, in part, are as follows:

"Every student knows, or should know, that it is necessary to understand his work before he attempts to memorize. To venture to memorize before understanding is being dishonest with oneself. The first and foremost object is to see that we understand that which we wish to memorize. What is understood is more easily remembered than that which is unintelligible. Never pass anything that is not clearly understood. Keep at it until you do understand it. If you should find it beyond you, go on to something else, but come back to the difficulty again and again until it becomes clear. Too great stress cannot be placed on this point. Many students try to memorize half-digested material, and find they do not get the results desired, that they are forgetting continually, and that no amount of application makes them perfect—and they wonder why. The reason is obvious—the memory has not been given a chance. We may well say, 'With all thy getting, get understanding.' Assume that we have our material properly prepared, that we understand thoroughly and clearly, that when we read the text-book we follow intelligently and understand without any trouble, and we also know exactly what we should commit to memory, what then? All this has to be learned. It must be clear that in the effort to understand and the constant endeavor of the mind to master what has been placed before it, that half the task has been accomplished. There only remains the fixing of such parts as slip out of the memory notwithstanding one's understanding them, and such parts as are mere facts that have to be learned as facts. One of the best and most effective means of memorizing is constant repetition, which means going over a fact or definition a hundred times every week, every day, even two or three times a day, if there is no other way. And when you have mastered it you must test yourself at intervals. The mode of testing may be either by repeating to oneself or to another, or by writing out the work. The latter is laborious, but it is the most effective in the long run. The fundamental principles of any subject must be so well understood that all a student has to do in the examination room is to write the answer to any question on these principles without any mental effort to speak of. This understanding can only be attained by persistent, steady effort always directed to the one end. Drudgery, you say. Well, drudgery pays. Drudgery is not ignoble if you drudge at the right thing in the right way with the right spirit.

"Many a student sits down and remains at his books for two or three hours and rises from his work with the impression that he is a good student. Does he sit and read in a cursory manner,

not bending all his mental energy to the understanding of his work, and reading aimlessly and vaguely? Or does he, under the pretext of thinking, every now and then fall into day-dreams, building castles in the air? Of all temptations that beset a student this dreaming is one of the greatest. It is one of the first essentials to a student that he should acquire the habit of fixing his mind on the work before him and keeping it there for a length of time.

"Every effort should be made by the student to cultivate this habit of steady concentration. This will come by application, and it is a mental power of the highest value. Frequently it means to men the difference between success and failure.

"In order to obtain the best results from any work the work must be systematically carried out. An hour every day, week in, week out, is of more value than three hours to-day, three hours on Friday, six hours next Wednesday, and so on. To have a regular time for working, to know how much time you have to spare, and stick rigidly to that, are matters of the highest importance. Having a fixed time for work helps one frequently to avoid the temptation to neglect work for pleasure.

"Economizing time is an art that should be cultivated to the utmost. System is the great time-saver and great labor-saver. Systematic arrangement of your time, systematic arrangement of your labor, giving a fair diversity without too much change, sorting out your work over a long period and endeavoring day by day to do your tale of work: these are the ways to get through your work. The secret of success may be expressed in various terms and in greater or less length, but in the end it will boil down to system and concentration."

Trade Notes.

Among the latest publications of the Western Electric Company is Bulletin No. 1004, describing their central energy non-multiple switchboards with lamp signals designed for use in exchanges of 500 lines or less.

The business of the Western Electric Company for the seven months ending June 30, indicates that the sales for the present fiscal year will amount to \$61,000,000, an increase of \$15,000,000 over the year ending December 1, 1909. The company now has 22,000 employes on its pay roll, an increase of nearly 4,000 since January 1. A new supply headquarters has recently been opened at Milwaukee on account of the rapidly increasing business in that locality.

The R. W. Martin Fund.

We have received from Mr. H. C. Richardson, of Metuchen, N. J., \$5.00 to be applied to the R. W. Martin fund and have turned the same over to Mrs. Martin. This makes a total of \$628.25 which has been collected on this account, all of which has been given to Mrs. Martin.

LETTERS FROM OUR AGENTS.

PHILADELPHIA, WESTERN UNION.

Mr. E. V. McElroy is acting as assistant to Mr. M. G. Moyer, traffic manager.

Mr. Lewis A. Riley, of the operating department, and Miss Mabel G. Slattery, of the Barclay department, were married on August 10.

Henry Wobensmith, chief of the bookkeeping department in this office, died August 9, aged forty-two years. He is survived by a wife and two children.

Mr. Joseph Fendius, has been placed in charge of the bookkeeping department temporarily vice Mr. Wobensmith.

The telephone department has been moved from the first to the seventeenth floor and placed in charge of Miss Clara Grimley transferred from the operating room. Miss Agnes Johnson has been transferred from the Barclay department and added to the telephone department.

ST. LOUIS, WESTERN UNION.

Chief Operator W. E. Bellman is absent from his post of duty enjoying tent life upon the campus and among the brilliant faculty of the "Sheldon Summer School" at Libertyville, Ill.

Mr. H. G. Gosting, assistant chief operator, is filling the vacancy occasioned by Mr. Bellman's absence.

A number of official changes have taken place, among which are the following:

Mr. O. L. Turner, formerly chief clerk in Superintendent Chapman's office, has been appointed to a similar position in General Superintendent McKisick's office at Dallas, Texas. Mr. W. J. Armstrong, manager of the Missouri District Telegraph Company, has assumed the position vacated by Mr. Turner.

Mr. Geo. F. Stewart, house electrician in the main office, succeeds Mr. Armstrong as manager of the Missouri District Telegraph Company, with headquarters in the Fullerton Building.

Mr. W. H. Schroeder, formerly claim clerk in Superintendent Chapman's office, goes to Oklahoma City as chief clerk to Superintendent Lingafelt.

NEW YORK, WESTERN UNION.

Mr. E. T. Burrill, general traffic chief, has been appointed assistant day chief operator vice Mr. H. C. Worthen who has been attached to the office of the traffic engineer.

Mr. W. A. McAllister, day chief operator on the city lines, has been appointed general traffic chief to succeed Mr. Burrill.

The enormous amount of matter occasioned by the attempted assassination of Mayor Gaynor, on August 9, kept the force in this office unusually busy, but the large volume of traffic was handled without delay, the facilities being equal to the occasion.

OTHER NEW YORK NEWS.

The telegraph department of the New York Times is now one of the best equipped newspaper telegraph offices in the country. It has recently been moved to the fifteenth floor of the Times building and occupies commodious quarters on the Forty-third Street end of the building. Accommodations are provided for twenty-five operators and the facilities are ample for the large amount of business which is being handled daily in this office. Mr. George F. Hoyte is manager for the Western Union and Mr. Edward Byron is manager for the Postal.

The Telegraphers' Mutual Benefit Association, 195 Broadway, New York, has for nearly half a century proclaimed the absolute necessity of life insurance and provided a safe and economical form of protection for the home and family within the means of every telegraph and telephone employee. A certificate of membership affording protection of \$500 or \$1,000, or both, is easily obtainable by every one in good health engaged in telegraph or telephone service, either commercial or railroad, between the ages of 18 and 45, and should be held by all employees not otherwise provided with adequate life protection.

The Serial Building Loan and Savings Institution, 195 Broadway, New York, can provide you with a bank account and a home. If you are employed in the telegraph or telephone field let them do for you what they have done for more than a thousand others who now own homesteads free and clear. Write for information.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fit snugly over the hard rubber key knob, forming an air cushion. This renders the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

A Study of Telegraph Apparatus.

PART I.

There is a passage in the Scriptures which says, "Ye have eyes to see, yet ye see not."

How true these words are may be readily seen by a close study of almost any instrument or telegraph apparatus an operator uses in his daily employment.

THE SOUNDER.

Take, for example, an ordinary sounder from which he copies incoming messages and press matter. He is so familiar with its general appearance that he could probably draw an accurate picture of it from memory if he possessed any knowledge of the art of drawing, yet probably ninety out of every hundred "see not." In other words they do not realize the significance and purpose of what they see.

A sounder seems like a very simple affair, yet it is constructed on strictly scientific principles and the very things the operator sees and yet "sees not" offer one of the most interesting and useful studies an electrical student can find.

No doubt the majority of operators understand that the crossbar armature over the magnet is invariably made of iron, because iron alone will carry

magnetic lines of force from one pole of the magnet to the other. But do they all understand that brass or some metal possessing similar properties is actually necessary for the binding post, and all the other parts of the sounder? Iron posts and levers would certainly be cheaper.

Brass or aluminum is used for the sole reason that these metals will not attract or carry any magnetic lines of force, yet are able to conduct a current of electricity. If the lever and other parts were made of iron, the lines of force would wander in useless directions and the number that would pass through the armature and thus attract it be greatly diminished. With a given magnet and current, the attractive strength of the magnet increases as the leakage decreases. Hence brass is used to prevent leakage.

Again, every iron armature placed across a properly constructed magnet is not only made the exact width of the diameter of the polepieces, but each end of it is rounded off in a semi-circle the exact size of the round core. Comparatively few, however, notice this fact, or at least wonder if there is any significance attached to this feature of the construction. Probably a still smaller number ever dreamed that the protruding ends of the polepieces are purposely extended beyond the windings for a really useful purpose, or that the rounding off of the edges of the ends of the magnet core was ordered for any other reason than that of creating a more artistic appearance. Yet there is a very good reason for the constructions described. In fact these details are absolutely necessary in order to obtain a magnet of maximum efficiency, as we shall presently see. Every thing that creates leakage should be eliminated.

When the magnetic lines of force flow through an iron core, on reaching the ends they concentrate most thickly wherever there is a sharp edge or corner, and leakage is always greater at such points. Hence, the polepieces used in sounders have the sharp edges of the ends smoothed off and made slightly convex, not only to prevent leakage, but to distribute the lines more uniformly through the armature above them.

For similar reasons the ends of the armature are rounded and fitted as described, in order to convey the lines of force which come out of one polepiece to its companion via the shortest possible route and this end can only be attained by clipping off all corners, extensions or lapovers that tend to divert the lines from the most direct course. The polepieces are made to protrude from the coils in order to remove their points of action from the influence of the current flowing through the last tier of the windings which would tend to diminish the total magnetic output through the armature on account

of leakage or conflict. Otherwise it would be better to wind close up to the ends with larger gauge wire. By this means the total resistance would be less, or, leaving the winding as it is and clipping off the protruding ends, we would get a quicker acting magnet.

Another feature, which may possibly not have been observed, is that in all magnets the thickness of the coil is never greater than the diameter of the iron core.

The explanation is that beyond that distance from the core, the outer layers and convolutions of wire wound thereon do not give returns in the way of magnetism in proportion to the additional energizing current expended.

Hence a rough rule for constructing an electromagnet is to use no greater length and thickness of iron for the core than is absolutely necessary to hold the amount of wire required to give the proper number of turns within the prescribed sphere permitted.

If with a given strength of current and gauge of wire for the windings a stronger magnet is desired, the core should be lengthened and more convolutions added, instead of adding another layer over the original winding.

A longer core, however, creates a slower acting magnet, and vice versa, a short core insures quick action. The explanation is that magnetic lines of force flowing through iron are governed largely by the same rule that applies to a current of electricity in its conductors, viz.: the longer the circuit, the slower the action; and the larger the conductor, the greater the output.

In measuring the current in a conductor, we have the formula $\frac{E}{R} = I$.* In a magnetic circuit practically the same rule applies, only the equivalent of the current is called magnetic flux and the magnetic resistance of the core is called "reluctance."

Thus we get the formula

$$\frac{\text{Magnetic force}}{\text{Reluctance}} = \text{magnetic flux}$$

The magnetic force is to the latter formula as E or volts is to the former, and is developed by the current flowing through the coils.

With a given strength of current and one turn of wire, the core will acquire a certain amount of magnetic flux, or magnetism, two turns will create twice as strong a magnet, while 10, 100, or 1,000 turns will increase its strength in the same relative manner.

The reluctance or resistance of the iron to the flow of the lines of force depends upon the size and quality of the metal.

A great deal more might be said concerning a magnet, but what has already been stated should

[*As I has been officially adopted by engineering societies throughout the world as the symbol to represent current, that letter will hereafter be used in all of Mr. Jones' articles where C has been used previously.]

suffice to show that students should study the construction of electrical apparatus closely, especially those which have certain uniform features common in different patterns.

(To be continued.)

Recent Telegraph and Telephone Patents.

Patent No. 965,876, for a telephone system, has been granted to O. C. Dennis, of Chicago, Ill.

Patent No. 965,973, for a telephone trunk circuit, has been secured by C. S. Winston, of Chicago, Ill.

Patent No. 965,976, for a telephone exchange system, has been awarded to J. L. Wright, of Washington, D. C.

Patent No. 966,013, for a telephone exchange system, has been issued to C. E. Hague, of Rochester, N. Y.

Patent No. 966,247, for a telephone receiver, has been taken out by E. Schwartz, of Antwerp, Belgium.

Patent No. 966,467, for a telephone receiver, has been granted to K. and I. Nichols, of Newark, N. J.

Patent No. 966,490, for a telegraph repeater, has been secured by R. H. Tudor, of Corinth, Miss. Telegraph relay including two relays of the standard type with connections so arranged that when the main line circuit on the one side of the repeater is broken a circuit through the other main line is maintained closed.

Patent No. 966,733, for a service meter circuit for telephone exchange systems, has been taken out by A. M. Bullard, of New York.

Patent No. 966,882, for an attachment of telegraph and similar wires to insulators, has been issued to W. E. Bandfield, of Wolverhampton, Eng. A clip having wire receiving leads on its terminals with retaining devices engaging the wire and a member coupling the devices together.

Patent No. 967,113, for a combined telephone and alarm or kindred service system, has been awarded to W. W. Dean, of Chicago, Ill.

The following patents have expired:

Patents Nos. 502,768, for a test-circuit for multiple switchboards; 502,769, for a lock-switch for electric switchboards; 502,770, for telephone-exchange apparatus; 502,771, for a transfer system for switchboards; 502,772, for a test signal for multiple switchboards; 502,773, for a testing system for multiple switchboards; 502,774, for a test-circuit for multiple switchboards; 502,775, for testing apparatus for multiple switchboards; 503,090, for a multiple switchboard system, issued to Charles E. Scribner, of Chicago, Ill.

Patent No. 503,252, for an electric switchboard signal, issued to Frank A. Pickernell, of Newark, N. J.

Patent No. 503,372, for telegraphic apparatus, issued to Albrecht Heil, of Frankisch Crumbach, Germany.

Personal.

Mr. B. E. Sunny, president of the Chicago Telephone Company was a recent New York visitor and while in the city secured the acceptance of ex-President Roosevelt to an invitation to make a Washington's birthday address in Chicago, February 22, 1911.

Mr. Louis Caspar, head of the department of telegraphy of Port Arthur Business College, Port Arthur, Texas, accompanied by his sons is visiting in New York. Mr. Caspar has recently been conducting some experiments with a view of preventing the ignition of oil in tanks by lightning and has secured some very satisfactory results.

Mr. Thor. J. Benson of Chicago a member of the Old Time Telegraphers' and Historical Association is an aspirant to a seat in the Illinois Senate. A petition to the Democratic Central Committee endorsing his candidacy has been signed by several hundred of his telegraphic brethren including most of the officials in Chicago.

Mr. F. E. Clary, who on August 1 retired from the superintendency of the Western Union Telegraph Company at New Haven to engage in other business at Los Angeles, Cal., was before leaving New Haven presented with a fine "Swiss Repeater" gold watch with his monogram on the case and on the inside the following inscription "Presented to F. E. Clary by Employees of the 7th District, Eastern Division, Western Union Telegraph Company, July 31, 1910." He also received a gold chain with a charm set with diamonds.

Postal Telegraph-Cable Company.**EXECUTIVE OFFICES.**

Mr. Charles C. Adams, second vice-president of the company sailed for Europe August 23, on the steamer Princess Cecilie to meet his family who have been spending the summer in France. Mr. Adams will be absent from his office until about September 20.

Mr. Charles P. Bruch, third vice-president, is again at his desk, much invigorated by his vacation of a month.

Mr. E. B. Pillsbury, general superintendent of the eastern division, New York, resumed his duties on August 29 after an extended vacation trip on the Great Lakes.

Mr. C. A. Richardson, manager of the Boston office is acting superintendent at that point vice Mr. A. L. Edgecombe who has been absent from his office for several weeks past suffering from a nervous breakdown. Mr. Edgecombe is at his old home in Portland, Me., and is reported to be slowly improving.

RESIGNATIONS AND APPOINTMENTS.

Mr. Paul S. Maisach, manager at Norwich, Conn., has resigned to accept a position as wire chief for the American Telephone and Telegraph Company at Providence, R. I.

Western Union Telegraph Company.**EXECUTIVE OFFICES.**

The following officials of the company have recently made a tour of inspection through the New England States: Mr. B. Brooks, general manager; Mr. W. H. Baker, vice-president of the American District Telegraph Company; Mr. F. A. Pickernell, assistant to the president of the American Telephone and Telegraph Company; Mr. A. G. Saylor, general superintendent; Mr. E. M. Mulford, division commercial superintendent; Mr. J. A. Hill, division traffic superintendent and Mr. F. D. Giles, of the general superintendent's office, all of New York; Mr. J. W. Reed, superintendent at New Haven and Mr. C. F. Ames, superintendent at Boston.

Mr. S. E. Leonard, superintendent at Denver has been appointed division commercial superintendent of the Mountain division with headquarters at Denver.

Mr. R. L. Brooks has been appointed division traffic superintendent of the Mountain division.

Mr. J. R. Terhune, superintendent at Nashville, Tenn., has been making a general inspection of his district accompanied by G. W. Lloyd, special inspector of Atlanta; H. C. Worthen, inspector, New York; W. K. McClarin, general foreman, Nashville, and A. T. Raymer, secretary to Mr. Terhune.

Mr. A. D. Bradley, assistant superintendent at Minneapolis, has been promoted to the superintendency at that point, vice James Swan, deceased.

Mr. W. H. Spain, who has been promoted from the management of the Akron, O., office to a similar position at Cleveland, was before leaving for his new post of duty presented with a pair of fine gold cuff buttons by the staff of the Akron office.

Twenty-four offices in New England, which were not heretofore in that classification, have been made all-night offices for the convenience of patrons who wish to make use of the telephone for sending their messages to telegraph offices.

The use of the new quadruplex sets which give perfect satisfaction on each of the four corners is being rapidly extended. The Buffalo quad, which has been in operation for some time past, works as well as the installation on circuits of not half the length. An installation in the Chicago circuit with repeaters at Buffalo is now being arranged for and it is thought that equally as good results will be obtained on this thousand mile wire.

The annual report of the company for the year ending June 30 will show gross receipts of approximately \$33,000,000, the greatest aggregate income ever received in one year. This is an increase of about \$3,000,000 over the previous year. The net earnings will amount to about \$5,800,000 or approximately 5.8 per cent. on the capital stock. The night letter service which is at present producing from 20,000 to 25,000 messages per day has not been in use long enough as yet to determine what the financial results will be.

The superintendents of the Eastern division together with several of the chief operators held a conference for the discussion of improvements of the service on August 26 in the office of General Superintendent A. G. Saylor in New York.

Mr. E. Y. Gallaher, auditor of the company, announces the following appointment:

Mr. J. J. Clunan to be division auditor of the Eastern division with headquarters at New York.

Mr. David Lynch, the cable expert, has been appointed division cable electrician. Mr. Lynch's headquarters will be at 16 Broad Street, New York.

RESIGNATIONS AND APPOINTMENTS.

Mr. Laurence D. Gagen, chief operator of the Akron, O., office has been appointed manager vice W. H. Spain, promoted to the management of the Cleveland office.

Mr. George H. Card has been appointed manager of the Poughkeepsie, N. Y., office vice Mr. Samuel K. Rupley, retired. Mr. Rupley who served during the war both as an enlisted man and as military telegrapher, had been manager of the Poughkeepsie office ever since the war.

Mr. Hugh McPhee, chief train despatcher of the Santa Fe Railway at Emporia, Kan., has been appointed manager of the San Francisco office, vice Mr. John V. O'Brien, who has been promoted to be special agent of the company in charge of the commercial business of the first district, Pacific division, with headquarters at San Francisco.

M. C. Allen, Division Plant Superintendent, Western Union, New York.

Mr. M. C. Allen, whose appointment as division plant superintendent of the Western Union Telegraph Company at New York was briefly mentioned in our August 1 issue has had a wide experience, both practical and theoretical, in all phases of plant work and being a specialist in that line is well fitted for the duties of the position which he now holds. Mr. Allen's experience began with the American Telephone and Telegraph Company at Boston in 1895. While employed in that city he served as inspector and district inspector. In 1903 he was transferred to New York where he was engaged in the traffic department and on inside and outside plant work. In April, 1908, he was appointed division superintendent of plant of the New York division of the American Telephone and Telegraph Company, which position he held at the time of his recent transfer to the service of the Western Union Telegraph Company.

W. A. Porteous, Western Union Manager, New Orleans.

Mr. William A. Porteous, who has been appointed manager of the New Orleans office of the Western Union Telegraph Company, is one of the most popular and capable men in the telegraphic service in the South.

Mr. Porteous started in the telegraph business as a messenger boy on the floor of the New Orleans Cotton Exchange and went from there to the Western Union Telegraph Company, serving that concern as messenger.

He was next advanced to check boy, later became an operator, and while thus employed he acquired a superior knowledge of all branches of the telegraph. After several years spent in the railway service, he returned to New Orleans in 1890 and remained with the company until 1891,

W. A. PORTEOUS,
Manager Western Union Telegraph
Company, New Orleans, La.

when he went with the Postal company and opened an office in the Cotton Exchange on condition that he make a success of the office. It was understood that his salary would be increased and he would be promoted if he succeeded.

He went to work and made a success of the experiment. In a short time several operators were employed and many messengers needed to take care of the business.

He was made assistant manager of the New Orleans office and ultimately became superintendent. Resigning the latter position after a creditable showing in July, 1908, he entered upon the practice of law, being at the same time a solicitor and special agent of the Western Union, which place he held until his recent appointment.

He is a graduate of the Tulane law department and while practising law has built up a good business, which he now relinquishes to get back into telegraphic harness.

W. H. Spain, Manager, Western Union, Cleveland.

Mr. William Howard Spain, whose appointment as manager of the Cleveland, O., office of the Western Union Telegraph Company was briefly announced in our August 16 issue, was born near Kenton, O., February 17, 1871. He entered the telegraph service as messenger at Belle Centre, O., May 1, 1886. In July 1887, he qualified as an

operator, taking a position in the railway service. In 1888 he entered the employ of the Rock Island Railroad and between that time and 1890 served at various places in the west and southwest for that company and for the Santa Fe and Missouri Pacific. In 1891 he entered the commercial field becoming an operator for the Western Union Telegraph Company at Joplin, Mo., and later at Kansas City. In 1896 he was appointed manager, of the Webb City, Mo., office, which position he held until 1902, when he was transferred to the management of the office at Fort Scott, Kansas.

W. H. SPAIN.
Manager, Western Union Telegraph
Company, Cleveland, Ohio.

In April, 1904, he became manager at Akron, O., where he was located at the time of his present promotion. Mr. Spain's advancement in the profession has been well deserved and is the result of careful, conscientious work in behalf of his employing interests. His many friends predict that future advancements are in store for him.

The Cable.

Mr. S. S. Dickenson, general superintendent of the Commercial Cable Company is spending his vacation at Lake Placid, N. Y.

Mr. Charles Priest, electrical engineer of the Commercial Cable Company, New York, is in Nova Scotia on a vacation.

The cable steamer Admiral Caubet, belonging to the French Cable Company engaged in the repair of the United States and Hayti cable broken off Cape Hatteras, put into New York a few days ago for supplies.

The cable steamer, Mackay-Bennett, belonging to the Commercial Cable Company, made a quick repair of the New York-Havana cable broken off Hatteras, July 29 in two thousand fathoms of

Through the intercession of the American Ambassador at Rio de Janeiro, Irving B. Dudley, the application of the Western Telegraph Company, an English corporation for an extension of its exclu-

sive rights for twenty years has been defeated. This leaves the Brazilian government in a position to grant concessions for cables to American companies on the expiration of the Western Company's present concession in June, 1913.

The new Western Union cable between Bay Roberts, N. F., and Penzance, Eng., has been completed. The two existing Western Union cables between Penzance and Canso, N. S. have also been repaired recently and are now in excellent working condition. The Western Union cable steamer "Robert C. Clowry" has returned to New York having completed the work on that company's cables in the vicinity of Nova Scotia, where it has been working for the past two or three months.

The Morkrum Printing Telegraph.

The Morkrum Company of Chicago, have developed a new printing telegraph system, which is now in operation on the regular service of the Postal Telegraph-Cable Company between New York and Boston.

The system is operated duplex with standard telegraph equipment of rheostat condensers, etc., and is equipped with a Morse set that can instantly be thrown in, and the line is balanced in the usual manner.

It is a selective system operated with a single strength of current and accomplishes more than was ever before attempted, in that it transmits and prints both small and capital letters, and also twenty-eight figures and characters, a total of eighty letters, figures and characters, and delivers a message that cannot be distinguished from typewritten copy.

The system is direct acting, the letters or characters struck on the key-board being printed on a home-recorder, and on the distant receiving printer. In case of an interruption the receiver at the sending station operates the same as a sounder, giving instant notification of line trouble. A principal claim made for it, is its simple unit system. The printers for both the home-recorder and receiver being identical and interchangeable, and the transmitting and selective system being divided into units so that removal and substitution of any part can be accomplished within from one to two minutes.

The system is the joint invention of Charles L. Krum and his son, Howard L. Krum, and it takes its name in part from Mr. Joy Morton, who has given his support to its development.

A Way of Saving Money.

Judging from the reports of the Serial Building Loan and Savings Institution financial conditions in telegraph and telephone circles are improving. From January 1 to July 1 of this year that organization has added eighty names to its membership and list of depositors and the number of its shares outstanding has increased from 5,567 to 6,034 or

nearly nine per cent. There are thousands of telegraph and telephone employes who could buy their own home or save money through this association if they would but make a start. The Serial is conducted for the benefit of the members of the telegraph and telephone professions and seeks to encourage thrift. One of the most pitiful sights is that of an old telegrapher who has broken down so that he can no longer work at his profession and who has not saved anything for his old age. Every young man should save a portion of his earnings so that when old age comes he will not be dependent upon the charity of others. The Serial makes it easy for anyone to save a small amount weekly or monthly as may be most convenient.

Trade Notes.

The Western Electric Company reports that during the past twenty months it has sold over a quarter of a million rural telephones. This is an unprecedented figure for these sales, and it is a certain indication that the rural telephone movement is progressing rapidly.

The United States Electric Company, manufacturer of the Gill selector, for telephone train despatching, announces that it has recently made arrangements with the Kellogg Switchboard and Supply Company of Chicago, manufacturers of high grade telephone apparatus to act as their exclusive agents in the sale of telephone equipment to railroads. This combination will, no doubt, result in the production of a very superior grade of selector and telephone equipment especially adapted for railway services. This company, on August 26, gave a public exhibition of their selective system for telephone train despatching and for operating semaphore signals. The exhibition, which was held in the company's showrooms at 284 Pearl Street, New York, was witnessed and commented upon most favorably by the metropolitan press.

Insulating Material.

Before the telegraph came into use, over sixty years ago, the question of wire insulation was one which had received little attention because of the fact that there was practically no demand for insulated wires. With the advent of the telegraph, however, the question of insulation became an all important one. Para rubber, the best insulating material known, soon deteriorated and became useless. The problem which confronted those who wished to make use of the electric current was where they could procure a compound which would combine the insulating properties of Para rubber with a long life.

Mr. Austin G. Day made a careful study and investigation of this problem, performing hundreds and thousands of experiments before he found a solution. The result was "Kerite," and the test of over fifty years has proven how well

the problem was solved. The excellence of Kerite as an insulating medium was quickly recognized, and in 1868 Professor Samuel F. B. Morse, the inventor of the telegraph, after having seen the new compound thoroughly tested wrote a commendatory letter to Mr. Day in which he said in regard to Kerite: "Its quality or rather property of resisting the deteriorating causes which tend to destroy sooner or later the insulation by gutta serena, or caoutchouc, makes it an invaluable discovery in aid of telegraphic extension. The tests to which it has been submitted and by which it has been proved to resist the deteriorating effects of ozone of the atmosphere appear perfectly satisfactory, and I therefore most cheerfully and cordially join with those who have tested its efficiency in congratulating you on your success in introducing so valuable an aid to the telegraphic enterprise of the world."

The opinion of Professor Morse has been seconded by thousands of others since that time and the use of Kerite has extended from the telegraph to other fields which require an insulating material with high insulating properties together with a long life. The reason for the excellence of Kerite as an insulator is not hard to find. In the usual rubber and mineral compounds the Para gum is, by long-continued working on the rolls, mechanically mixed with sulphur and dry mineral ingredients, none of whose constituents have any real insulating value but act simply as a filler to the gum which is the only active insulator in the compound, except the small percentage of wax (not over five per cent.) that would be permitted under the usual specifications for such compounds. In Kerite insulation, on the other hand, the Para gum is mixed with crude Kerite, the result of twenty years of experimentation to produce a preservative for rubber gum, which by itself is a highly perishable commodity. Not only does crude Kerite possess to a marked degree the ability to amalgamate closely with Para gum in such a manner as to prevent its deteriorating, but it is in itself an active insulator of a high order, so much so, in fact, that were it feasible to spread crude Kerite upon a wire, a highly satisfactory insulation would result, as there would then be a maximum of the imperishable material, crude Kerite. Its resiliency, however, is such that it requires the admixture of a considerable amount of Para gum to cause it to flow properly through the dies of the tubing or covering machine.

Kerite has been advertised continuously in *Telegraph and Telephone Age* almost from the beginning of this publication in 1883 and has always made good any claims advertised. Kerite insulated wires and cables have done continuous service for the past forty to fifty years and there are in operation to-day many such cables that have given the highest service for this long period of time.

Telegraph and Telephone Age is headquarters for telephone, telegraph and wireless books and cable codes.

Radio-Telegraphy.

The Navy Department has purchased twelve sets of wireless apparatus from the National Electric Signaling Company, of Pittsburg.

It is reported that as soon as the high power wireless stations, which the Australian Government is about to install, are completed many of the vessels which visit Australian ports will be equipped with wireless.

It is reported that the White Star Line has commissioned one of their vessels as a training school in wireless telegraphy for operators to be employed on their vessels and those of associated companies.

Two of the sealing vessels of the Newfoundland fleet were equipped with wireless during the past season. By co-operation, each notifying the other when they sighted a seal pack, both vessels made larger catches than they could have secured if they had been obliged to depend alone upon their individual efforts to find the seals.

Three of the steam trawlers of the North Sea fleet have for some time been equipped with wireless apparatus, and it is now reported that the results obtained by this service in the way of assisting in the marketing of the fish have been so satisfactory that steps are being taken to extend the use of wireless on this class of vessels.

A patent No. 966,475, for space telegraphy, has been awarded to C. R. Saffell, of the United States Navy. The speed of the alternating current generator which energizes the oscillation circuit is kept constant by a motor and connection from the transmitting key for increasing the torque of the motor.

A patent, No. 966,539, for transmitting apparatus, has been taken out by Lee DeForest, of New York. For maintaining a uniform length of arc in a vapor of ethyl alcohol and methyl alcohol supplying carbon to the electrode.

A patent, No. 966,555, for a variable self-inductance coil, has been awarded to J. R. Jesse, of Birmingham, Ala. For wireless telegraphy one coil sliding within the other forming primary and secondary, together with sliding contacts to make the connection.

A patent, No. 966,560, for an arc mechanism for space signaling, has been granted to R. Kent, of New York. Electrodes, a drip pan beneath and means for dripping a vaporizing fluid into the pan.

A patent, No. 966,705, for signaling by wireless telegraphy, has been issued to V. Poulsen, of Copenhagen, Denmark. A generator supplying an arc connected with a self-induction and capacity, with means for damping the oscillations so that they may be caused to cease periodically.

A patent, No. 967,118, for a device for detecting waves in wireless telegraphy, has been secured by G. C. Ellwood, of Arbutle, Cal. A variable inductance with indicators and means for connecting the inner and outer coils to give the desired inductance.

It is reported that the Marconi Wireless Telegraph Company has made an offer to the Portuguese Government to establish wireless stations in all of the colonies of Portugal, and that the government is favorably disposed toward the proposal.

Major Samuel Reber, chief signal officer of the Department of the East has for some time past been conducting experiments at Sheepshead Bay, Brooklyn, in exchanging wireless messages between an aeroplane in flight and a nearby land station. Major Reber has been assisted in his experiments by ex-Sergeant Horton and a sending apparatus devised by Mr. Horton has been used on the aeroplane.

The application of an American wireless telegraph company for a concession to establish a wireless station at Hongkong has been refused by the English Colonial office. According to consular reports there is a strong desire in commercial circles in Hongkong for the establishing of a wireless station at that place as many of the vessels which call at that port are equipped with wireless.

The Johnson Wireless Holding and Manufacturing Company, of St. Louis, has filed articles of incorporation with a capital stock of \$100,000, for the purpose of manufacturing and dealing in devices for wireless telephones. The company expects to establish a factory in San Antonio, Tex., for the manufacture of telephones and equipment for wireless stations. The incorporators are: Charles P. Johnson, Ralph Jones, Alexander Young, Max F. Ruler and Ralph O. Johnson. Headquarters of the company will be at St. Louis.

Telephone Rates in Boston.

The Massachusetts Highway Commission, which has been investigating the question of telephone rates in Boston and vicinity for some time past, has drawn up a schedule of rates which it is believed will be equitable to all subscribers and to the company and will distribute the cost of telephone service among the various classes of subscribers more fairly than it is now distributed. In making up the proposed schedule the commission has had the assistance of Messrs. D. C. and W. B. Jackson, consulting telephone engineers, and the schedule which has now been submitted to the New England Telephone and Telegraph Company is largely based upon the report which those gentlemen made several months ago. It is figured that the proposed revision would mean a reduction in revenue to the company of \$400,000 per year and require the expenditure of between one and two million dollars to make the changes. This expense would be largely caused by the elimination of the multi-party line and substituting for such service two-party lines.

Mr. Carl V. Snow, first class sergeant, United States Signal Corps, who has been located at Circle, Alaska, has been transferred to Fort Wood, New York Harbor.

The Telephone.

Mr. A. B. Conklin has been appointed general manager of the Atlanta Telephone and Telegraph Company vice Mr. C. J. Simmons, resigned.

Mr. H. R. Van Deventer, of Sumter, S. C., author of "Telephonology," has been ill with typhoid fever for some time past, but is now well on the road to recovery.

Mr. A. G. Mackenzie formerly publicity agent of the Rocky Mountain Bell Telephone Company at Salt Lake City, has been appointed division commercial superintendent with headquarters at Helena, Mont.

Mr. Herbert W. Drake, formerly division supervisor of leased wires of the American Telephone and Telegraph Company at New York, is now assistant to Mr. George E. Hudson, special agent in charge of the leased wire service.

Although the telephone service of Copenhagen is better developed than in most European cities, it will be a surprise to many to learn that only recently has the main exchange in that city been changed from the magneto to common battery system.

Mr. John J. Carty, chief engineer of the American Telephone and Telegraph Company, New York, accompanied by his wife and son and Mr. Charles E. Scribner, chief engineer of the Western Electric Company, have gone to Paris to attend the second international conference of telephone and telegraph engineers which meets in that city September 4 to 11.

M. Bela Gati, chief of the Hungarian telegraphs and telephones of Budapest, Hungary, expects soon to make a tour of inspection of the telegraph and telephone systems of the United States. Before coming to this country M. Gati will attend the second international conference of telephone and telegraph engineers at Paris and will present a paper before that body.

During the first six months of the current year the American Telephone and Telegraph Company and associated companies added 308,000 stations to their system of which 73,000 were sub-licensee stations and 235,000 belonged to the Bell companies. The company is spending during the present year \$28,000,000 in new construction and during the first half of the year eighty per cent. of the construction requirements was financed out of earnings.

The telephones used on the steamship *Lusitania*, as well as on other trans-Atlantic liners are of special design. The induction coil, condenser and bell of the instrument are inclosed in a small box, and the switch hook which projects from one side is provided with a special retaining device to prevent the receiver from being knocked off by the motion of the ship. The receiver is allowed to rock on the hook, otherwise the lever would lift and make a false connection when the ship was pitching and rolling.

Mr. E. J. Wehrley, special agent in the general commercial department of the American Telephone and Telegraph Company at New York sailed August 27 on the steamer *Philadelphia* for a month's vacation in France and England.

The second annual convention of district managers of the New England Telephone and Telegraph Company was held in Boston, August 11 to 13. About one hundred managers were in attendance and several interesting papers were read and discussed upon topics connected with the extension of the telephone service.

The Chesapeake and Potomac Telephone Company has announced a reduction of rates in the city of Baltimore averaging about ten per cent. The Public Service Commission of Maryland will soon give a public hearing at which complaints of telephone users will be investigated and the new rates will be considered to determine whether they are equitable to all telephone users.

It is reported that the Automatic Telephone Company, of Chicago, will begin service about October 1 with over 20,000 subscribers. \$3,500,000 of receiver's certificates of the Chicago Subway Company were issued to pay for the construction of the new telephone system and it is stated that \$3,000,000 of this amount has already been expended.

The City of Seattle has appointed Messrs. Frank B. Hall and C. H. Judson, telephone experts, to make a valuation of the two telephone plants in that city to determine whether the companies are charging fair and equitable rates. The result of this investigation will be brought before the Washington Railroad Commission on September 26 at which time the commission's engineers will also make a report on the independent telephone company in Seattle.

The following changes have recently been made in the staff of the American Telephone and Telegraph Company: Mr. A. W. Drake, division superintendent of plant of the Philadelphia division has been appointed to a similar position in the New York division, vice Mr. M. C. Allen, appointed division plant superintendent of the Western Union Telegraph Company at New York; Mr. W. J. Hoar, division superintendent of plant at Atlanta has been transferred to Philadelphia to succeed Mr. Drake. Mr. L. R. Jenney, district plant chief at Indianapolis, has been made division superintendent of plant at Atlanta, vice Mr. Hoar; Mr. H. H. Hamlen, division superintendent of plant at St. Louis has been transferred to Chicago to succeed Mr. M. H. Clapp, appointed division plant superintendent of the Western Union Telegraph Company at Chicago; Mr. W. D. Staples, district plant chief at New Haven has been appointed division superintendent of plant at St. Louis, vice Mr. Hamlen. Mr. G. A. Watson, district traffic chief at Pittsburg has been transferred to a similar position at Atlanta, Ga.

A Canadian Telegraph Feat.

BY D. R. SHEEHAN, MONTREAL.

What has perhaps proven itself to have been one of the biggest undertakings in the recent annals of any telegraph company to enlighten the outside world upon the facts of an all-absorbing topic of International interest, has been the recent work of the Great North Western Telegraph of Canada, in supplying the entire press of the world with the reports of the identification and arrest, on board the steamer Montrose, of the now notorious Dr. Crippen.

Acting upon the wireless reports received from Captain Kendall of the Montrose, voicing his suspicions of two mysterious characters on board his ship who had booked their passage from Antwerp to Canada, the leading dailies of the entire world assigned some of their most expert correspondents to Father Point, Quebec, where all steamers coming up the St. Lawrence river stop to take on their pilots. For the two or three days preceding the arrival of the steamer, these shrewd newspaper men flocked into this little hamlet, and it may be safely said that there were a sufficient number of correspondents gathered together here to write up the daily happenings of the world at large. Excitement ran at fever heat during the days of waiting, and every speck which loomed up on the horizon caused a rush to the wharves. Here men could be seen all day long, and during the greater part of the night, keeping a vigil watch upon the sea, watching and waiting for the slightest hint of the coming of the Montrose. Meantime Inspector Dew of Scotland Yard had arrived on the steamship Laurentic, a much faster steamer than the Montrose, and he was immediately besieged with newspaper men and camera fiends. Never were so many questions put to an individual before, the ultimate result being that the noted detective was obliged to lock himself in his room and refuse to be interviewed. Nevertheless these scribes found plenty to write about, and the little Great North Western office, with its three wires, was "swamped" from morning till night with "copy," making it necessary for some of the correspondents to drive to Rimouski, a distance of seven miles, to work some of their specials off from the railroad station.

Upon the arrival of the writer at the seat of action, he learned that the local staff, consisting of two operators, had had practically no sleep for the previous three days, and when he offered to "sit in" and relieve the manager, who was working a wire, his services were gratefully accepted. On Sunday morning, July 31, the patience of all was rewarded. At about 9 o'clock the top-masts of the Montrose could be distinguished piercing a dense fog, and a cheer went up from the waiting throng. It had been arranged that the newspaper men should board the government tug "Eureka," which hitherto was assigned to the placing of pilots on incoming steamers, and that Inspector Dew, with two provincial detectives, disguised as

government pilots, put out to the Montrose in a row boat beforehand and identify and arrest their man, should he prove to be the right party. Up to this time the only information to work upon was the alleged suspicions of Captain Kendall, and everyone, even the inspector himself, carried their doubts as to whether or not they were on a wild goose chase. As soon as the steamer hove well in view, the detectives jumped into a waiting row boat and started out to meet her. After they had gotten well under way, the small army of scribes boarded the tug Eureka and, in order to avoid any suspicion from the Montrose, steamed away out into the fog banks. It had been arranged that at the sound of three blasts of the Montrose whistle we were to go alongside, this also indicating that the arrest had been made and that Dew had secured his man. Anxious indeed were the minutes spent in suspense and waiting. The coming signal from the Montrose would soon make known to the representatives of the world's press whether or not they had come thousands of miles only to be disappointed and robbed of "a big story" for their respective papers. Once we thought we heard the cue, but it was only the echoing blasts of a huge fog horn down the coast, and the hopes of all dropped for a moment.

However, after having waited close on to a half hour, three sharp, distinct blasts of the Montrose whistle told the story that Captain Kendall's suspicions had been confirmed, that Dr. H. Crippen, and his stenographer, disguised as a young boy, were now securely gripped in the hands of the law, and had been placed in custody as fugitives from justice.

Our tug immediately drew alongside, and in the face of a drenching down pour of rain and severe thunder storm the thirty or more correspondents scrambled up the rope ladder, which had been dropped down to them, from the deck of the Montrose and scattered helter-skelter in all directions gathering fragments of news to flash to the waiting world. The manner in which these inexperienced seamen made their way up the ladder presented a humorous spectacle, which, however, might have taken on a very serious aspect had anyone missed his footing.

Just as the big freighter got well under way, loaded bottles were hurled over the side, containing meagre news of the arrest. These were later picked up by a motor boat which had been chartered and hurried back to Father Point, where the news was flashed in all directions.

One of the most important features of the little drama, at least as far as these newspaper boys were concerned, was yet to come. A special tug had been chartered by the Great North Western Telegraph Company to run down from Quebec to Grosse Isle, a small government quarantine station, where inward bound ships take on the government physician. It was arranged that this tug should pick up "all the copy" on board the Montrose, and then, if possible, beat this steamer

on to Quebec City, where a full staff of operators were kept in waiting with their wires all made up to give the Monday morning editions throughout the world the full and complete story. The government maintains a small one wire office at Grosse Isle, and here the Great North Western had placed an expert operator with a direct Associated Press wire made up to handle promptly their correspondent's copy. The operator here also waited patiently through the long hours of the night for a sight of the slowly approaching steamer. At last we steamed into the river off Grosse Isle and each one of us strained our eyes and ears for some sign of the telegraph tug, and sooner than perhaps was expected she came in sight, a tiny black spot on the dark waters of the river, with her red lanterns agleam. It was truly a welcome sight, and again a cheer was sent up, this time in favor of the telegraph company, which had carried out their arrangements up to this time in such a satisfactory manner.

As the little tug, "The Spray," drew alongside, the question arose as to whether or not she could possibly make Quebec City ahead of the Montrose, and in spite of the views of several experienced seamen which indicated that the undertaking was an impossible one, the little French-Canadian captain on board "The Spray" assured us that he would either lead the big boat into Quebec harbor by a good margin, or blow up his little tug in the attempt. Upon hearing this, many of the "Scribes" who had shown much pluck during the past few days, and who had decided to go up on this little "spit-fire," changed their decisions, and rather than risk their lives in such a venture, they remained with the Montrose, but literally kissing their precious copy good-bye, entrusted it to the hands of a telegraph representative on board the tug. Only one of the whole crowd volunteered to accompany the copy back to Quebec, this being "Jack" Ross of the Toronto Globe, who, despite the protests of his newly made friends, cautiously slipped down the ladder and jumped aboard the little black object alongside. He alighted right side up and crawled on hands and knees down into her little cabin. With a fond good-bye and all sorts of good wishes for a safe and successful trip up the inky river, "The Spray" started on her race against time, upon which so much depended.

After having been gone from the side of the Montrose for some little time, all that could be seen of this little messenger was, a streak of sparks and flame leaping from her funnels, and Mr. Ross has since stated that she barely "touched the high spots" on the journey to Quebec. The woodwork around her boilers had become so warm that he feared that neither he nor any of the special matter on board would ever reach their destination. But this little captain knew just what his mite of a tug could endure, and his instructions were to his engineer: "Empliez l'engine autant qu'elle peut contenir."

On board the Montrose all sorts of predictions as to the fate of the "Telegraph Tug" were circulated and the nerves of every correspondent on board were strung up to the highest pitch. Their plight would certainly have been a sad one if their copy had gone astray, and later when we drew into Quebec wharf, and learned that "The Spray" had beaten us by nearly an hour and a half, and were assured that all the copy was on the wires and being rushed ahead, every man breathed a heavy sigh of relief. Upon landing we rushed to the Great North Western Telegraph office, and again resumed the writing up of any new developments which had taken place on the trip up from Grosse Isle.

In all there must have been close on to a hundred thousand words of special matter filed in Quebec office at the one time, and the manner and despatch with which it was handled, was surely a credit to those who made the arrangements. After the excitement had subsided and the last few words of the story were being ticked out, each and every newspaper man in the party stated enthusiastically that they had received the best possible service, and they all voiced the one unanimous opinion, viz.: "The Great North Western Telegraph Company and the little French-Canadian captain, had sure made good."

The Quadruplex.

"The Quadruplex," by Maver and Davis, is doubtless the most thoroughly practical low-priced work treating on this subject ever published.

It is clear and lucid in its style, a text-book free of all technicalities and easily comprehended. It contains 128 large pages, is copiously illustrated, bound in cloth and well printed on heavy paper.

It embraces just the ideas that should find a place in every telegraph office, and no telegrapher who desires to acquire a complete knowledge of multiplex telegraphy, the perfect understanding of which is so essential in these days, should fail to promptly obtain a copy of this important book.

Its chapters include: Development of the Quadruplex; Introduction and Explanation; The Transmitter, Rheostat and Condenser; Stearns Duplex; Instruments of the Polar Duplex; The Polar Duplex; The Quadruplex; The Dynamo-Electric Machine in Relation to the Quadruplex; The Practical Working of the Quadruplex; Telegraph Repeaters; The Wheatstone Automatic Telegraph.

It will be seen at a glance that such chapters as these fully cover the modern apparatus found in the telegraph offices of to-day. Copies of this book can be obtained from us at \$1.50 each, express charges prepaid. Address J. B. Taltavall, 253 Broadway, New York.

As there are only a few copies of this important work on hand and as a new edition of the book is not contemplated, it will be well to secure a copy before the supply is exhausted.

Telegraph and Telephone Age

Entered as second-class matter, December 27, 1909, at the Post Office at New York, N. Y., under the act of March 3, 1879.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

September 1, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Securing Business for the Telegraph.

Under the new scheme of organization which is being adopted by the Western Union Telegraph Company, the administration will be divided into three branches, making what is technically called the three column organization. These columns will be designated commercial, traffic and plant, each under the direction of a superintendent. For the present the geographical unit is the division, but it is probable that later the same system of columns will be extended down to the smaller districts. The United States is divided into six divisions and in charge of each is a general superintendent, who has a larger degree of individual executive authority than in the past.

Each general superintendent will have as his assistants the superintendents at the head of the three columns. These men are specialists each in his own department, and will report directly to the general superintendent. The managers will as heretofore report to the district superin-

tendents. The district superintendent reports all matters relating to the procuring and reception of business to the division commercial superintendent, the division traffic superintendent receives reports in regard to the operation of the system, and to the division plant superintendent are referred all matters relating to the plant in the way of new equipment, repairs and maintenance of existing equipment.

Probably the most radical change in this scheme of organization over the one which has existed heretofore is the creation of a department the duties of which consist in looking after new business. Where a superintendent has to discharge the duties of all three of these branches of the service there is a natural tendency to devote the larger part of the time to the plant and to the handling of such business as may come in without solicitation. As a result the efforts made to procure new business are often very limited and not being conducted according to any fixed rules are very often barren of results. With the new scheme of organization, however, work along this line will be systematized and this branch of the service instead of occupying a secondary place will take equal rank with the other departments.

This is an important change and one which ought to be productive of excellent results. Heretofore the telegraph has been regarded by the majority of people rather as a necessity than a convenience and as a consequence its use has been largely limited to cases of extra importance. It will be the business of the commercial superintendents to educate the public to the fact that there are many times when although the mails might serve their purpose, it would be largely to their advantage to make use of the telegraph. There is no doubt but that a vigorous campaign along this line will result in a large increase of traffic and we predict for the telegraph a great expansion in its recognized field of usefulness as a result of the new Western Union organization.

Life Protection.

Protection by life insurance for one's family and dependents, against financial loss through death, has not only come to be the recognized duty of every man and woman of to-day, but the great necessity of modern life, to which the world no longer holds guiltless those who neglect so obvious a duty. The question is therefore not only shall we insure, but where can we do so at the least possible cost, consistent with safety and permanence, and how much insurance shall we carry?

The business aspect of the situation has gradually forced itself on the community, till finally, it no longer is so much a question which society or company is promising the most for the least money, or has paid the largest amount to beneficiaries of deceased members, but rather, simply a question which is the safest and most economi-

cal, and for that reason is the best able to redeem its promises, when the certificate becomes a claim.

In the light of the fact that The Telegraphers' Mutual Benefit Association has for close on to half a century, proclaimed the absolute necessity of life insurance and has provided a safe and economical form of protection for the home and family, within the means of every telegraph and telephone employe, it is surprising that there are so many who have not as yet fulfilled their duty in this respect.

It limits its field and extends its advantages only to those engaged in the service of the great public utilities, the telegraph and telephone, which includes railroad telegraph service, and after admission wisely places no restriction on the membership, either as to occupation or residence.

No other existing society is in such strong financial condition, nor can show like results achieved at such low cost to the persistent member. It is a good association to work for, and it is a good association to belong to, and all members of the electrical fraternity should deem it a privilege to bring the advantages of membership to every eligible acquaintance and aid in every way to increase the membership.

THE "NEW YORK POSTAL."

Its Room and Its Chiefs.

BY J. P. WILLIAMS, ASSISTANT CHIEF OPERATOR.

The operating room is located on the twelfth floor of the building at 253 Broadway. That the designers intended this department to reflect the highest type of electrical knowledge, was amply shown on its completion and is well known to telegraphers generally, but it is of especial interest to know that this high standard has been maintained. Improvements of various kinds have been introduced, all that had become obsolete removed until the facilities for handling the enormously increased traffic are considered perfect. Visitors, representing foreign telegraph administrations, have pronounced it the finest telegraph operating room in the world. Not alone is this true of its equipment, but in point of ventilation, sanitation and light and shade, it is, perhaps, not surpassed anywhere.

The personnel of the operating department is remarkable for lengthy continuous service. Night Manager D. F. Mallen, Chiefs C. J. McCarthy, F. E. McKiernan and J. A. McNulty having each served 24 years, indeed the average term of service for the nine principal chiefs is recorded at 20½ years.

The department is in charge of F. Frederick Norton, who, entering the service in 1888, has advanced step by step to his present position.

John J. Whalen is assistant manager and has been in the service since 1892.

John B. Rex is general traffic chief, having entered the service in 1895. He is assisted in his

work by Messrs. J. T. Ewing, W. C. Morris and W. F. Stirling.

The city division is in charge of Charles B. Obst, assisted by P. L. Riley. T. J. Kreger supervises the New Jersey division.

The "two Macs," Messrs. Frank E. McKiernan and Joseph A. McNulty, preside, respectively, over the West and South and the East switchboards, having charge of the wires extending in these directions. Both gentlemen who have occupied these positions for over 20 years deserve to be especially mentioned for their ability and popularity. They have grown with their work and if personal appearance is an indication, they are good for many years to come. Mr. McKiernan is assisted by Messrs. J. J. Fredericks, O. J. Nourse, and T. P. Smith. Mr. A. J. Ward assists Mr. McNulty.

W. E. Todd is quad and equipment chief. Mr. Todd entered the service in 1887 and has filled various positions in the department.

The night service is supervised by Daniel F. Mallen, who, as stated previously, entered the service in 1886. Mr. Mallen is assisted by Charles J. McCarthy, another veteran, who fills the role of assistant night manager, and the following traffic chiefs, Messrs. W. W. Wilson, T. H. Tierney, F. R. Huppe, and J. M. Mearns. E. A. Coney is night wire chief, assisted by Messrs. S. C. Dodd, W. J. Kavanaugh and W. W. Albright.

John H. Twyford has charge of the all night force, assisted by J. P. Williams.

Harmony is the keynote which sets this department alive with rythmical activity and a keen desire to do one's best animates the entire force.

In connection with this subject it is pleasing to note that the physical comfort of the employes has not been forgotten. Aside from a tastefully furnished rest room for the women, a smoking room has been provided for the men, containing comfortable chairs where one can enjoy a cigar and peruse current periodicals, a book from the library or quietly enjoy the ever-changing marine life on the lordly Hudson River, a beautiful view of which may be had from the windows.

Indeed, it can be truthfully said that on the proposition of looking to the comfort of its employes, this company has kept abreast of, if not anticipated, like efforts of other large corporations.

—*Postal Telegraph.*

Weber's Handy Electrical Dictionary is a practical handbook of reference, containing definitions of every term or phrase used in the electrical industry. This vest pocket size indexed handbook, which contains over two hundred pages and over three thousand definitions, is so clear and lucid in its definitions that it is an indispensable guide to the electrician in the intelligent performance and understanding of the duties of his profession. Price, 50 cents. Address orders to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, N. Y.

The Military Telegrapher in the Civil War.

PART XLV.

BY S. L. ROBINSON, HARBOR SPRINGS, MICH.

(Continued from page 559, August 16 issue.)

About the tenth of July I was ordered to report to General A. J. Smith who was leaving on an expedition after the Confederate General Forrest. We reached Tupelo, Miss., without meeting opposition but just beyond found the enemy ready for battle.

It was a lively one too, and the only time that General Forrest was whipped. I never saw as many dead bodies on a battle field in so small a space, where first one side and then the other had charged. For want of rations and ammunition General Smith could not follow up his advantage, so we started on our return trip to Memphis.

The first evening after starting back, as our men had fairly got settled in camp the enemy commenced dropping shells among us from a battery, but a cavalry charge started them on the run and we met no further trouble.

In order to rest his infantry General Smith decided to send the cavalry under General Grierson on to Memphis, while he with the remainder of his command went into camp, when they reached the Memphis and Charleston Railroad.

General Smith granted my request to go ahead with the cavalry and giving me some despatches for General Grierson with two orderlies I started to catch up with the cavalry who were several miles ahead.

To shorten our route we followed a bridle path through a piece of woods where we had to ride single file. I was in the rear when, without warning several shots were fired and my horse being hit stumbled and threw me off. My two orderlies not knowing how many there were of the enemy rode on to meet our forces and get reinforcements.

As soon as the bushwhackers saw that I was alone and wounded, they came up to me saying "hands up," for I was trying to pull my revolver out of my bootleg, but my right hand was paralyzed from one of the shots so that I could not move it.

After stripping me of all but my shirt and trousers they told me to stay there and they would be back after me. They ordered me to get up at first but I told them I could not, and seeing that I was covered with blood they evidently thought I was badly wounded. As soon as they had gone I got up and tried to walk. It was hard work but I would go a few feet, fall and then try it again. In trying to cross a creek I fell off the log used as a bridge landing in about six inches of water and as much mud. At first it seemed a bad accident but the water refreshed me and after hard work in getting to the bank on the other side I started ahead and soon heard a bugle call. It was a squad of our cavalry looking for me. I made all the noise I could and was picked up by them and taken in to General

Grierson's headquarters where I received medical attention. Lying on an old straw tick I saw four bullets cut out of me. One in my knee, two that passed through one leg stopping just under the skin on the other side, one that went through my right arm near my elbow, then striking a rib ran around and was cut out on the other side of my body. One went through my shoulder and two lodged in my right hip where they are still, and yet officially I was not in the army. When I was shot my pocket telegraph instrument was in the saddle bags on my horse, and thus the guerillas did not know I was an operator. They captured cipher book number 12, that being in my blouse pocket but being unable to read thought it merely a memorandum book. Had I been captured by regular soldiers and taken to the enemy's headquarters, the cipher book would have been all the evidence necessary to convict me as a spy being inside their lines. Generally we dreaded being caught by guerillas but for once it was my salvation.

The pain at the time I was shot was not bad, but the next day riding in an ambulance over rough roads was a severe ordeal and when we reached the railroad at Lagrange and I was put on a car for Memphis it was a pleasant change.

When the train arrived at Memphis the boys from our office met me at the depot and carried me to our headquarters on a stretcher.

I kept out of a hospital, the boys taking care of me in our rooms. With their company and attention I was able to get out with a crutch and cane in less than two weeks. I then went home for a short furlough the only one while I was connected with the corps.

For the few months I served as a bugler in a regiment that never left Detroit, I am entitled to a pension and to join the Grand Army, but my four years of actual service a great part of the time in the field, as a result of which I carry a lead mine in my body, and ran the risks of being shot as a spy does not count. It has been left for a private citizen to grant the pension which we deserve from his own purse until such time as a generous Congress shall wake up to the fact that we were of some use.

Perhaps our heirs may get a leather medal to hang up and look at after the few remaining ones of us have been called in.

In September I was back again in Memphis, staying there until December 21, when I was ordered to go with General Grierson on a raid to destroy the Mobile and Ohio Railroad south of Corinth and otherwise, damage the enemy as much as possible. At that time the Confederate general, Hood and his army was at Corinth and with our cavalry brigade we could not chance any general engagement. It was strike and get away.

When we reached Ripley, Miss., General Grierson sent me with a battalion of the Second New Jersey cavalry as an escort to reach the railroad and gain as much information as possible. Then

we were to destroy bridges, etc., and go south until we found our main command.

We struck the railroad at Rienza, an outpost of the enemy a few miles south of Corinth. We captured the picket post, set fire to the bridges and then started south along the line of the railroad.

We were in the saddle two days and nights. It was a ticklish situation, the Confederate cavalry being behind and we guessing as to what was in front.

The second night about ten o'clock after crossing a big swamp over a corduroy road we reached our main command and it was a very welcome meeting.

I was so tired I could not sleep, in fact we were all about as exhausted as possible and still be able to go.

General Grierson's command destroyed the railroad in many places, also army stores at various points. We were only routed once and then by a drove of hogs, that we captured as they were being driven by some Confederates to feed their army.

Our men tried to drive the hogs on to Vicksburg, but after vain attempts, hogs and cavalry did not seem to mix well, the hogs were driven into a yard shot and burned to keep the enemy from getting them.

We met little opposition and finally reached Vicksburg, where I remained until about the twentieth of February, 1865 when I was ordered to New Orleans. From there I was sent to Fort Morgan at the mouth of the river below Mobile, after staying there and at Navy Cove for two months, I was ordered to Mobile.

On our trip from New Orleans to Fort Morgan our boat was caught in a storm and came near going down. Charles W. Pearson who is now living in New York, and I were the only passengers. When daylight appeared we were close to shore near Pensacola, Florida. About our only work at Fort Morgan was fishing and swimming, eating oysters, crabs, etc.

I staid at Mobile until the first of May when I was sent to Citronelle to open the line. The last army of the Confederacy had arranged to surrender and it was my privilege to stand in the doorway when General Taylor surrendered to General Canby at Citronelle, Ala., May 4, 1865.

The middle of June I was called to New Orleans and ordered to Shreveport, La., to take charge at that place. I found L. C. Baker, superintendent of the Confederate lines at Shreveport who turned the same over to me.

There I also found my old commander, General Herron in charge. Here I remained as manager until the government lines were turned over to the commercial companies, December 1, 1865. I was then retained as cipher clerk and government supervisor of telegrams until March 31, 1866, when I was honorably discharged.

I staid at Shreveport and Marshall, Texas working for the Southern Telegraph Company until September, 1866, when the cholera and yellow

fever combined made me feel like again seeing the north so I severed my connections with the company and came north.

The only Shreveport operators who are still alive to my knowledge are L. H. Korty, my brother, B. L. Robinson, and myself.

Before saying "30" I want to express myself as to the treatment I received at Shreveport and Marshall after the close of the war. It was well known that I was a northerner and in the northern army, but I was never treated better among strangers and made many warm friends. If my vote would do it I would have every man who served in the Confederate army receive a pension from our government.

They were as patriotic as we were, they simply saw things from a different standpoint, and to-day they would fight for our flag the same as we. Let us forget our past little family quarrel and stand for one government, one people, and one principle of good citizenship.

(Concluded.)

Some Confederate Telegraph Reminiscence.

Mr. George M. Dugan who served as a military operator in the Confederate Army during the Civil War and was for many years thereafter superintendent of telegraph of the Illinois Central Railroad but who is now living in retirement at Tip Top, Ky., in a recent article in the New Orleans "Picayune" gives some interesting reminiscences of his war time experience.

Mr. Dugan gives in part the following account of his military career:

"I find that it is much easier to talk about incidents of the war than it is to write about them. I will begin by telling a circumstance which will interest some people in north Mississippi. I received the following order:

Bolivar, Tenn., April 2, 1864.

Special Order No. 1.

Geo. M. Dugan, superintendent Southwestern Telegraph Company, is directed to proceed to north Mississippi for the purpose of repairing the telegraph wires to reconstruct it northward.

The commanding officers of the forces along the Tallahatchie River will furnish Mr. Dugan a sufficient detail of men to assist him in reconstructing the line and render him any other assistance he may need.

By order of

J. R. CHALMERS,

Brigadier General.

L. T. LINDSEY, A. A. A. G.

"The next day I received the following message:

Geo. M. Dugan, superintendent, etc.: General Forrest desires the wire between Grand Junction and Memphis taken down and brought off to some available point on the Central Railway, to be used in carrying out General Chalmers' order to you. Captain Lindsey will aid you; confer with him. All goes well.

FRANK C. WHITTHONE,

Telegrapher Forrest Cavalry.

"I picked up a detail from Mabry's command and proceeded to carry out the order without delay. It must be remembered that the Memphis and

Charleston Railroad was in possession of the enemy and great caution and quickness was necessary to get the wire. I struck the line near Moscow, Tenn., and took down all the wires thence to Collierville and then east to Grand Junction. We impressed the necessary wagons and forwarded the wire to safety, after which we burnt several bridges, doing most of the work at night, often almost in sight of the enemy's camp.

"On the return trip, near Holly Springs, we came to a camp composed principally of ladies in carriages, buggies and wagons, who had been about the enemy's lines buying supplies in exchange of a few bales of cotton. Several of the ladies were from Columbus, Miss. It was about 10 o'clock at night when we reached the camp. I found that the guard around the camp was two men whom I had sent with the wagons of wire, and called to them to know what it all meant. They told me that captain—I have forgotten his name—who was a secret service man, had ordered them to guard the party. I knew several of the ladies, who appealed to me for assistance, saying that they had been arrested by the said captain, and they feared that he would confiscate their goods. The captain had fallen asleep, and I asked the ladies if they had any liquors, and, getting a bottle, I called up the captain and proceeded to entertain him with stories of my raid for wire. It was not long before he was again sound asleep, so soundly I had no fears that he would wake for several hours. I then went to the guard and said there was no further need for them. So we hitched up the horses and mules and hurried towards Oxford, leaving the captain to enjoy his repose. I never met him or heard of him afterwards, but the ladies were a long time expressing their gratitude.

"At another time I was moving along the Central Railway on an old push car, and reaching the Tallahatchie, found it out of its banks. I found also a courier on his way to west Tennessee with important dispatches for Colonel Richardson; I knew the young man, who asked me for whatever assistance I could give in getting across the river. The old car was 7 x 9 feet. I told him there was but one thing I could do—mount his horse on the car and push him over the railroad bridge. It was very dangerous, barely sufficient room for the horse to stand and, even if he kept quiet, it would be a desperate risk. We got the horse on the car and he seemed to be aware of his risk, for he never moved until we had crossed. This will give an idea of our facilities and the risks we had to take.

"While sitting in the telegraph office at Water Valley, Miss., when General A. J. Smith, with his 40,000 men, was pressing our little force back, I heard a message pass over the wire reading thus:

Grenada, Miss.:

General Forrest, Oxford, Miss.: Where would it be convenient for me to meet you to-morrow?

(Signed)

"R."

(An infantry colonel from the Virginia army who was at home on leave of absence.)

"In a short time I heard the answer:

Oxford, Miss., etc.

Colonel R.: You will find me on the skirmish line in front of the enemy, where you are invited with a musket on your shoulder.

(Signed)

N. B. FORREST.

"Another time I heard General Forrest, who was in the telegraph office at Oxford, say: 'Whit, send a telegram to my wife at Grenada. Tell her to come up to-morrow and fetch Willie and my roan horse. That's all; now read it.'

"Mrs. Forrest, Grenada: Come up to-morrow and bring—' That was enough.

"You — fool, I told you to say fetch. I don't want my words changed."

"A few days afterwards I was in the office at Oxford and found a lot of messages for Forrest and took them up to his quarters. As it was late and getting dark, he needed a light. He said to Pete, his servant: 'Go get me a candle. Pete returned in a short time and reported he could not find a candle. 'Go back and tell Major Severson to send me a candle.' Pete again returned and reported that Major Severson said, 'The mess chest had not been unpacked.' Then there was trouble. He thundered at Pete: 'Go tell Major Severson if he don't send me a candle in two minutes I will burst his — mess chest over his head. There was a bright light in the tent in a minute.'"

The House Printing Telegraph Company.

BY J. E. SELDEN, CHICAGO.

If my testimony will help to settle any discussion regarding the working of the old "House System" between New York and Boston, you are welcome to it; and it is to the effect that the office at Springfield, Mass., was certainly a repeating station and as collateral evidence I will give an instance where one message was repeated once too often for the comfort of the parties interested.

One day during July, 185— a Mr. Colt, a prominent and wealthy citizen of Pittsfield, Mass., and a dealer in wool received from his agent located at or near West Brookfield the following message:

"Meet me at West Brookfield to-morrow, Answer."

Wondering what should require his presence Mr. Colt promptly answered: "I will meet you in West Brookfield to-morrow." This was duly delivered to the agent. Mr. Colt took an early train and when he arrived at West Brookfield the agent was waiting for him. After the usual greetings and unfavorable criticisms of the weather the conversation grew slack, each waiting for the other to state the object of the meeting until at length Mr. Colt said, "Well, what did you want to see me about?" The answer was, "Why nothing in particular, what did you want of me?"

It rather surprised Mr. Colt and, of course, led to an exhibit of the two despatches.

"I have not sent you a message in the last two months" was the claim of the agent, which the operator at the station confirmed. "I received this

message yesterday saying, 'I will meet you at West Brookfield to-morrow'—and here I am." The situation was somewhat confusing, and Mr. Colt took the next train for Pittsfield at a temperature several degrees above that registered by the thermometer, Frank Palmer, who was then superintendent, received a letter by the next mail which was also warm and the matter came to my hands for investigation. And here it is necessary to digress somewhat in order to prepare the way for the solution of the tangle.

In those ante-cable days the foreign news was obtained by intercepting the in-bound steamers as they passed Cape Race, where the commercial news previously prepared in cipher by an agent on the other side was thrown overboard in a water-tight case to be picked up by someone in a small boat—on the watch for it and rushed ashore to the telegraph office as soon as possible thus anticipating the arrival of the steamer in New York by sometimes two days. Whenever a steamer was due we were required to hold the line open until we got "good night" from D. H. Craig, then Associated Press agent at New York. This was a sleepy job as there was "nothing to do," and the "grinders," (whose functions I have described before) and messenger boys would bunk in any corner they could find and sleep until further orders.

The copies of repeated messages being on a paper tape about an inch wide and of various lengths were not very convenient to file away, but were disposed of by rolling them up into disks the size of a dinner plate and piling them in a closet adjoining the operating room. The pile being a little softer than the floor was used by messengers and grinders to sleep on during the waits for steamer news. The disintegration of some of the disks was inevitable and the one containing Mr. Colt's message—filed away a year before—furnished the key to the problem. That particular message escaping from the roll found its way to the floor of the operating room just one year from the date of its first appearance. It was picked up by a messenger boy who seeing the date was correct, supposed it had blown off the file of messages to be sent and carefully replaced it, with the result stated. The wrath of Mr. Colt was finally appeased by an explanation, apology and the refund of his railroad fare, and the incident probably only survives in the memory of the writer.

Many pleasant memories linger around my sojourn in Springfield, and I left there many old friends whom I should like to meet again, but never shall.

There was Uncle Dan Kingsley, the genial host of the American Hotel where I boarded, to see him at the front door whenever a train came in wiping his shining pate with one hand and the other reaching for the travellers' grip, would make a stranger feel "at home" before he got within ten feet of the door.

Henry Gray, the popular superintendent of the Boston and Albany Railroad, who hailed me the morning after the great auroral display (of I forget what year), with "Hello, Jack, did you see the 'Oreëlius Boreëlius' last night?" I did.

The old pioneer baseball club which I organized was quite a social feature of that time and I believe was the first club to play the modern game in the State and we used to play to quite respectable-sized audiences on "Barnes' Lot," and "Hamptden Park" when it was first opened to the public. If I had foreseen at that time the financial possibilities of baseball, I could have dropped telegraphy and become a professional "batter" to my advantage—but gate money and curved balls were unknown quantities then and the price of admission was within the reach of all.

Submarine Telephone Cable Across Chesapeake Bay.

The many interesting features of the installation of a sixteen-pair submarine telephone cable beneath the waters of the Chesapeake Bay have attracted considerable attention. The cable is now in place and is giving service, affording a short cut of fifty miles in any telephone conversation between Baltimore and Cape Charles.

The cable was laid from Love Point, on Kent Island, to Sandy Point, northeast of Annapolis. The cable is five miles long, and the installation, because of the great weight of the load on the cable barge, was a difficult one.

When this cable left the New York plant of the Western Electric Company, which manufactured it, it was in four sections, each of which, strung on an immense reel, contained 6,600 feet of lead covered and armored cable. Each spool with its load weighed 58,000 pounds.

The cable was taken from the four reels at the dock on West Street, New York, and wound in a "figure eight" on board a barge. The barge was towed to Chesapeake Bay and the cable was then laid without mishap.

The installation of this cable makes possible a short cut for telephone subscribers in Baltimore who may wish to talk to people in Delaware or on the eastern shores of Maryland and Virginia.

The Bell Telephone Company of Pennsylvania has run additional wires to the terminals of this cable from points in the southern part of the eastern shore, and from Baltimore and Annapolis to the other end.

The lead covered cable is armored with alternate layers of jute and wire. This outer covering is believed to be capable of withstanding the ravages of the deep for many years.

Mr. S. V. King, manager of the Western Union Telegraph Company, at Charleston, W. Va., in renewing his subscription for another year writes: "The semi-monthly visitation of *Telegraph and Telephone Age* is very cordially welcomed."

International Association of Municipal Electricians Meets in Convention at Rochester.

The fifteenth Annual Convention of the International Association of Municipal Electricians will be held in Rochester, N. Y., September 6, 7, 8 and 9. Rochester offers many attractions as a convention city, and the assembly at Atlantic City in 1909 chose wisely when they selected the place for this year's meeting. A good time as well as a most instructive gathering is assured for all of those who attend. Ample space has been provided in Convention Hall, where the business sessions will be held, for exhibits and the displays of prominent manufacturers will be up to the usual standard in quality, quantity and interest.

The following program has been arranged for the business sessions and the entertainment features of the convention.

The following papers will be presented and discussed: "Wireless Telephone and Telegraph," by John W. Kelly, Jr., chief of the electric bureau, Camden, N. J.; "Lightning Protection," by Walter M. Petty, borough electrician, Rutherford, N. J.; "Mercury Arc and other Rectifiers," by H. G. Kennedy, superintendent of fire telegraph, Rochester, N. Y.; "Relation of the Telephone to the General Organization of Fire Department Service," by H. C. Bundy, superintendent of fire telegraph, Watertown, N. Y.; "Underground Work," by J. B. Yeakle, superintendent of fire telegraph, Baltimore, and Clarence R. George, city electrician of Houston, Texas; "Modern Police Signal System," by Joseph B. Smith, superintendent of police telegraph, Rochester, N. Y.; "City and National Code Rules and the Relation of the City and Underwriters' Inspectors," by R. A. Smith, city electrician, Norfolk, Va.; "Inductive Loads of Low Power Factors," by A. S. Hatch, of Detroit, Mich.

J. B. YEAKLE, BALTIMORE.

President of International Association of Municipal Electricians.

Tuesday, September 6—10 a. m., opening exercises, including the address of welcome by Mayor Hiram H. Edgerton, of Rochester; 2 p. m., business session; 8 p. m., inspection of fire alarm telegraph system of Rochester.

Wednesday, September 7—10 a. m., business session; 2 p. m., automobile ride around the city and through the parks, preceding which the official photograph of the convention will be taken; 8 p. m., business session.

Thursday, September 8—Business sessions at 10 a. m. and 2 p. m. In the afternoon the visiting ladies will be conducted on a shopping tour and a street car ride around the city.

Friday, September 9—Business sessions at 10 a. m. and 2 p. m. When the business of the convention is completed those present will take special cars to Manitou Beach on Lake Ontario, where dinner will be served.

FRANK P. FOSTER, CORNING, N. Y.

Secretary of International Association of Municipal Electricians.

The officers of the association are: J. B. Yeakle, superintendent of fire telegraph, Baltimore, president; J. S. Craig, superintendent of fire telegraph, Toronto, first vice-president; A. L. W. Kittridge, superintendent of police telegraph, New Haven, Conn., second vice-president; A. J. Bell, superintendent of fire telegraph, New Rochelle, N. Y., third vice-president; C. S. McCosker, city electrician, of Mobile, Ala., fourth vice-president; Mr. Frank P. Foster, superintendent of the electrical department, Corning

Glass Works, Corning, N. Y., secretary; C. E. Diehl, superintendent of fire and police telegraph, Harrisburg, Pa., treasurer.

The executive committee consists of H. G. Kennedy, chairman, Rochester, N. Y.; S. W. Manning, St. Paul, Minn.; L. L. Kingsbury, Baltimore, Md.; O. M. Schafer, Trenton, N. J.; A. L. Pierce, Wallingford, Conn.; J. C. Simpson, Washington, D. C.; Clarence R. George, Houston, Tex.; C. S. Downs, Altoona, Pa., and J. W. Kelly, Jr., Camden, N. J.

CLARK E. DIEHL, HARRISBURG, PA.
Treasurer of International Association of Municipal Electricians

New Fire Alarm System in Brazil.

An up-to-date fire alarm and police telegraph system is being installed in Sao Paulo, Brazil, by the Gamewell Fire Alarm Telegraph Company. The fire alarm system consists of 160 boxes with twenty-four circuit central office equipment so that the number of boxes can be largely increased from time to time as required without any reconstruction of the system.

The central office is equipped with all of the latest and most improved apparatus, consisting of relay and annunciator, joker and gong, circuit boards, protector boards, dial transmitters, punching registers and time stamps, and a 24-circuit automatic line tester. The system will be operated by a 30-circuit storage battery equipment, with all of the latest approved switchboards, cells and battery racks. The office will be provided with all of the minor accessories and appliances necessary to make it as complete and perfect as any fire alarm central office in the world. The police signal system consists of 160 seven-call patrol boxes, which are to be installed in sixteen circuits.

The Sao Paulo system will also include a complete flashlight and gong connection with every

patrol box. The wiring and outside construction for these systems will be done by the authorities of Sao Paulo. The installation of the apparatus will be under the supervision of one of the Gamewell Company's constructing engineers. The population of Sao Paulo is now 400,000, an increase of 160,000 in the last eight years.

Addresses of United States Military Telegraphers Wanted.

Mr. David Homer Bates, 658 Broadway, New York, secretary of the Society of the United States Military Telegraph Corps is anxious to know whether any of the following named operators who served in the telegraph corps during the civil war are still living, and if so their present address. The places given after the names are their last known addresses:

George S. Albright, Fayetteville, Ark;
S. T. Armstrong, Tacoma, Wash.;
Philip Bashford, Alexandria, Va.;
Philip Bowers, Paoli, Ill.;
W. H. Chaddock, National Military Home, Wis.;
Robert Cowell, Franklin, Tenn.;
M. D. Frisbie, Cynthia, Ky.;
Edward Fuller, ————;
James K. Gulliver, Salt Lake, Utah;
Charles A. Homan, Reading, Pa.;
George S. Holmes, ————;
Maynard Huyck, ————;
F. W. Kennan, ————;
Joseph D. McCleverty, ————;
John H. Purnell, Opelika, Ala.;
W. H. Sisson, Chicago, Ill.;
I. G. Webb, ————;
F. C. Long, ————;
James Meagher, ————;
B. McMurtry, ————;
C. D. Montanye, ————;
C. H. Spellman, San Antonio, Tex.;
John L. Sponagle, Port Orchard, Wash.;
D. N. Stewart, Detroit, Mich.;
John N. Stewart, Chicago, Ill.;
Ellis Stone, Bloomington, Ill.;
F. G. Waddell, Columbus, O.;
Orin J. Waddell, Cincinnati, O.;
D. A. Williams, Kansas City, Mo.;
J. W. Wickard, Monclova, Mex.;

Should any of these persons be identified as now living or if known to be dead, Secretary Bates will be thankful for the information.

Mr. H. H. Ward, a forty-niner of the telegraph a gentleman who is frequently mentioned as being active in telegraph circles in New England and New York City since 1849, having for many years been cashier in the main office of the Western Union Telegraph Company in New York, and who now resides in East Orange, N. J., in renewing his subscription for another year, says: "Like many others, I appreciate your publication and should not like to be without it."

The Reunion of the Old-Time Telegraphers' and Historical Association and of the Society of the United States Military Telegraph Corps.

The twenty-ninth annual reunion of the Old Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps will be held at Chicago, September 8, 9, and 10. The headquarters of the convention will be at the Auditorium Hotel which faces the lake front on Michigan Boulevard and which is admirably situated for the convenience of the visitors. The coming reunion is the fourth in the series which has been held in Chicago, that city having entertained the annual gatherings of 1883, 1888 and 1893. The central location of Chicago, together with the fact that so many of the old time telegraphers have their residence in that city gives ample assurance that the twenty-ninth annual reunion will be well attended. Since this is the first reunion to be held as far west as Chicago since 1903, when Milwaukee was the host, many who have not been able to meet their comrades of former days since that time will be able to attend the coming gathering.

From present indications there will be an unusually large number of military telegraphers present at this meeting. The members of this gallant band are fast dropping from the ranks, but it is expected that a goodly percentage of the survivors who now number less than three hundred will grasp the hands of old comrades at Chicago next week. Since the reunion at Pittsburg, last year, nineteen have been stricken from the roll by death, namely, Dr. Wm. M. Ash, at Woodside Park, Maryland; G. W. Baxter at Pittsburg; B. F. Bush, at Denver; Charles E. Chandler at Los Angeles; H. H. Craig, at New York; Thomas A. Davin at Boston; E. G. Fish at Kansas City; Charles W. Hammond at St. Louis; Wm. H. von Hartman at Westville, Okla.; George P. Lennox at Belleville, Ill.; David W. McAneeny at New York; William Martin at Ironton, Mo.; Herbert R. Sackett at Columbus, O.; Michael Smith at Jersey City; H. C. Vincent at Marietta, O.; M. E. Washburn at Indianapolis; Joseph Finegan at Baltimore; Wm. R. Woodard at Springville, Tex., and Levi C. Weir at New York.

Though many members of the Old Time Telegraphers' and Historical Association have passed away during the last year the ranks of this organization are continually being swelled by new recruits from among those who each year reach the twenty-five year mark of time since they entered the telegraph service. The Association now has a membership of 1,360. Five forty-niners of the telegraph have died during the past year, namely: William Arnoux, Emory Cobb, Charles H. Haskins, A. B. Talcott and E. M. Tomlinson. As all of the forty-niners are now well past three score and ten, it is only a question of a few years when the last links joining the first telegraphs to the telegraph systems of the present day will have been severed.

Several of these veterans will attend the Chicago reunion and their presence will greatly enhance the old time aspect of the occasion.

Other old timers who have died since the Pittsburg reunion are Laurence F. Dowling, E. G. Cochrane, Mrs. G. M. Eitemiller, Joseph Landis, J. R. Van Wormer, H. L. Shippey, L. A. Angel, G. J. Frankel, C. H. Schermerhorn, Edward Curry, M. T. Quigley, J. B. Twiford, Paul Sheehan, B. D. Chandler, C. A. Darlton, J. C. Reilly, D. C. Sullivan, P. J. Burke, J. H. Converse, W. H. Glover, W. C. Furness, Lyman McCarty, Jesse Knight, A. M. Musser, and James Swan.

Those who visit Chicago to attend the reunion will find many things of interest in the second city of the land which will attract their attention. The program includes visits to some of the most prominent places in Chicago and in addition to these trips, which will be taken by the gathering as a whole, there will be opportunity for individuals to visit any other places which may strike their fancy. The reunion will open Thursday morning, September 8, in the parlors of the Auditorium Hotel, with a joint meeting of the two associations, at which the new president, Mr. W. J. Lloyd, will be installed in his office, and those in attendance will be welcomed to the city. Following this will be the separate business meetings of the two organizations. An opportunity for shopping will then be taken advantage of by the ladies and at 3 p. m. a ball game between the Chicago and Cincinnati teams of the National League will be attended by the visitors. In the evening tickets will be provided for the various amusement parks of the city.

Friday morning a special train on the Chicago and North Western Railway will convey the party for a ride of twenty-three miles to Highland Park, one of the beautiful suburbs of Chicago. There Mr. Frederick W. Cushing, a vice-president of the Old Time Telegraphers' and Historical Association will be the host at a luncheon served at the Hotel Moraine. In the evening the entertainment will consist of a theatre party.

Saturday morning will be spent in sight seeing. Among other points of interest the famous Union Stock Yards will be visited. No special entertainment has been provided for the afternoon, as the Committee of arrangements thought it best that this time should be left free for each one to go wherever his inclination might lead him.

The crowning feature of the occasion, the banquet, will be held at the Auditorium Hotel, Saturday evening, beginning at 6.30. This is a part of the program which is looked forward to from year to year by those who attend all of the reunions, and the banquets of the past have been

WILLIAM J. LLOYD, CHICAGO.
President of Old Time Telegraphers' and
Historical Association.

BERNARD E. SUNNY, CHICAGO.
Vice-President of Old Time Telegraphers'
and Historical Association.

THOMAS W. CARROLL, CHICAGO.
Vice-President of Old Time Telegraphers'
and Historical Association.

FREDERICK W. CUSHING,
HIGHLAND PARK, ILL.
Vice-President of Old Time Telegraphers'
and Historical Association.

FRANKLIN J. SCHERRER,
NEW YORK.
Secretary of Old Time Telegraphers' and
Historical Association.

JOSEPH UHRIG, CHICAGO.
Member Executive Committee, Old Time
Telegraphers' and Historical Association.

WILLIAM E. BELL, CHICAGO.
Member Executive Committee, Old Time
Telegraphers' and Historical Association.

ADAM W. REIDLER, CHICAGO.
Member Executive Committee, Old Time
Telegraphers' and Historical Association.

JOHN McROBIE, CHICAGO.
Member Executive Committee, Old Time
Telegraphers' and Historical Association.

occasions long remembered by those who were fortunate enough to be present. Many notable speeches have been made at these events and the record of them all forms an important part of telegraphic history.

Mr. Bernard E. Sunny, president of the Chicago Telephone Company and a vice-president of the Old Time Telegraphers' and Historical Association, will preside as toastmaster of the occasion.

COL. WM. B. WILSON, HOLMESBURG, PHILADELPHIA.
President of the Society of the United States Military
Telegraph Corps.

WILLIAM L. IVES, NEW YORK.
Vice-President of the Society of the United States Military
Telegraph Corps.

CHARLES A. TINKER, NEW YORK.
Vice-President of the Society of the United States Military
Telegraph Corps.

DAVID HOMER BATES, NEW YORK.
Secretary and Treasurer of the Society of the United States
Military Telegraph Corps.

The first speaker will be Mr. Bernard J. Mullaney, who will address the gathering in behalf of the city of Chicago; Colonel William Bender Wilson, president of the Society of the United States Military Telegraph Corps, will respond to Mr. Mullaney. Among others who will make remarks befitting the occasion will be W. R. Plum, Frank J. Loesch, Charles S. Holt, M. J. O'Leary, and J. B. Taltavall.

The officers of the Society of the United States

Military Telegraph Corps are: Colonel William Bender Wilson, Holmesburg, Philadelphia, president; William L. Ives, New York, and Charles A. Tinker, Brooklyn, vice-presidents; David Homer Bates, 658 Broadway, New York, secretary and treasurer. The executive committee is made up as follows: Colonel Robert C. Clowry, New York; William R. Plum, Lombard, Ill.; Colonel Albert B. Chandler, W. J. Dealy and David

Homer Bates, New York; Charles A. Tinker; Brooklyn; Richard O'Brien, Scranton, Pa.; John Wintrup, Philadelphia, and Marion H. Kerner, New York.

The officers of the Old Time Telegraphers' and Historical Association are W. J. Lloyd, Chicago, president; T. W. Carroll, B. E. Sunny and F. W. Cushing, all of Chicago, vice-presidents; F. J. Scherrer, 195 Broadway, New York, secretary and treasurer. The executive committee consists of

COL. ROBERT C. CLOWRY, NEW YORK.
Member Executive Committee of the Society of the United States
Military Telegraph Corps.

COL. A. B. CHANDLER, NEW YORK.
Member Executive Committee of the Society of the United States
Military Telegraph Corps.

G. A. CELLAR, PITTSBURG, PA.
Member Executive Committee, Old Time
Telegraphers' and Historical Association.

ABEL H. BLISS, CHICAGO.
Member Executive Committee, Old Time
Telegraphers' and Historical Association.

JOHN C. BARCLAY, NEW YORK.
Member Executive Committee, Old Time
Telegraphers' and Historical Association.

JOHN WINTRUP, PHILADELPHIA.
Member Executive Committee of the
Society of the United States Military
Telegraph Corps.

RICHARD O'BRIEN, SCRANTON, PA.
Member Executive Committee of the
Society of the United States Military
Telegraph Corps.

W. J. DEALY, NEW YORK.
Member Executive Committee of the
Society of the United States Military
Telegraph Corps.

G. A. Cellar, Pittsburg; H. D. Reynolds, Buffalo, N. Y.; John C. Barclay, and Charles C. Adams, New York; W. E. Bell, Joseph Uhrig, John McRobie and Adam W. Beidler, Chicago.

The committees having charge of the arrangements for the reunion are:

Reception Committee of the Old Time Telegraphers' and Historical Association—Joseph

bank, J. P. Heffernan, W. H. Mann, G. A. Keil, J. E. Haskell, C. H. Kehnroth, G. W. Dailey, M. T. Cook, W. W. Ryder, C. H. Finley, W. Bennett, J. G. Jennings, A. J. McGrath, D. S. Anderson, H. S. Waters, J. C. Duffy, F. T. Wilbur, F. W. Conger, Leo Peters and H. L. Reno.

Reception Committee of the United States Military Telegraph Corps—A. H. Bliss, chairman.

CHARLES C. ADAMS, NEW YORK.
Member Executive Committee, Old Time Telegraphers' and Historical Association.

MARION H. KERNER, NEW YORK.
Member Executive Committee of the Society of the United States Military Telegraph Corps.

HARVEY D. REYNOLDS, BUFFALO, N. Y.
Member Executive Committee, Old Time Telegraphers' and Historical Association.

ANDREW CARNEGIE, NEW YORK.
Founder of the United States Military Telegraph Corps.

Uhrig, chairman, A. B. Cowan, Warren Baker, E. W. Mayfield, C. W. Potter, John K. Crawford, Frank J. Vlazny, M. J. Kenyon, C. H. Shedd, F. V. Moffitt, H. T. Price, John P. Boughan, Addison C. Thomas, T. N. Powers, Claude Powell, J. E. Applegate, P. W. Drew, J. A. Cummins, F. E. Serfass, C. M. Baker, E. S. Williams, S. T. Fulton, John F. Butler, H. T. Reneau, H. C. Bur-

E. W. McKenna, Hon. A. W. Nohe, Wm. R. Plum, H. P. Darlington, Daniel Hogan, Rev. W. D. Gentry, John R. Dixon, H. D. Sloat, John D. Voltz, Z. P. Hotchkiss, Chas. F. Gross, S. E. Ingram, Cass G. Sholes and Henry W. West.

Ladies' Committee of the Old Time Telegraphers' and Historical Association—Mrs. W. E. Bell, chairman; Mrs. B. E. Sunny, Mrs. G.

W. Dailey, Mrs. T. W. Carroll, Mrs. W. J. Lloyd, Mrs. Joseph Uhrig, Mrs. A. W. Beidler, Mrs. F. W. Cushing, Mrs. A. J. McGrath, Mrs. C. W. Potter, Mrs. M. T. Cook, Mrs. F. V. Moffitt, Mrs. F. W. Conger, Mrs. J. A. Cummins, Mrs. D. S. Anderson, Mrs. H. S. Waters, Mrs. C. H. Finley, Mrs. A. B. Cowan, Mrs. E. S. Williams, Mrs. A. C. Murphy, Mrs. T. N. Powers, Mrs. H. T. Price, Mrs. T. P. Cook, Mrs. J. G. Jennings, and the Misses Mary Cowan, Annabelle Cowan, Helen Bell, Bessie Lloyd, Alice Robinson, Pauline Murphy, Helen Cook, Charlotte S. Pendry and Nellie Hope.

WILLIAM R. PLUM, LOMBARD, ILL.
Member Executive Committee of the Society of the United States
Military Telegraph Corps.

Ladies' Reception Committee of the Society of the United States Military Telegraph Corps—Mrs. W. R. Plum, Mrs. E. W. McKenna, Mrs. A. H. Bliss, Mrs. Florence D. Niblock, Mrs. A. W. Nohe, Mrs. L. B. Parker, Mrs. Daniel Hogan, Mrs. Charles F. Gross, Miss Margaret Charles Gross, Miss Alice S. Pettit, Miss Livonia Ingram, Miss Nina G. Sloat, Miss Rose Marie Moore and Miss Frances Bliss Moore.

Committee on Badges—F. V. Moffitt, chairman, George Smallbone, and A. B. Cowan.

Committee on Hotels—A. C. Murphy, chairman, E. S. Williams, F. V. Moffitt and M. J. Kenyon.

It is now thirty years since the Old Time Telegraphers' and Historical Association or rather the Old Time Telegraphers' Association as it was first called was organized. The first meeting was held at Cincinnati, O., September 7, 1880. Of the eighty-five who were present at the first meeting there are now living: Nathaniel Hucker, John A. Townsend, Wm. C. Long, George T. Williams, E. W. McKenna, Philip Bruner, John F. Wallick, J. W. Tillinghast, George W. Irwin, George T. Gilliland, Edward H. Hogshead, Colonel Robert C. Clowry, Z. P. Hotchkiss, W. R. Plum, George M.

Dugan, George J. Goalding and Jules J. Guthridge.

The following is a list of the places of meeting and the officers of the Association since its organization:

1880—Cincinnati, O., president, *O. H. Booth; vice-president, G. M. Dugan; secretary, *J. C. Mattoon.

1881—No meeting on account of the death of President Garfield.

1882—Niagara Falls, N. Y., president, *O. H. Booth; vice-president, G. M. Dugan; secretary, *J. C. Mattoon.

1883—Chicago, Ill., president, W. R. Plum; vice-president, W. B. Wilson; secretary, *J. C. Mattoon.

1884—St. Louis, Mo., president, G. M. Dugan; vice-president, *E. Rosewater; secretary, *S. B. Fairchild.

PROFESSOR SAMUEL F. B. MORSE.
The Inventor of the Telegraph.
Born at Charlestown, Mass., 1791. Died at New York 1872.

1885—New York, N. Y., president, *C. W. Hammond; vice-president, *Chas. E. Taylor; secretary, *S. B. Fairchild.

1886—Cleveland, O., president, *J. D. Reid; vice-president, *C. S. Jones; secretary, W. J. Dealy.

1887—Philadelphia, Pa., president, *C. C. Hine; vice-president, *Chas. E. Taylor; secretary, W. J. Dealy.

1888—Chicago, Ill., president, *David Brooks; vice-president, *Irwin Dugan; secretary, W. J. Dealy.

1889—Louisville, Ky., president, *Chas. E. Taylor; vice-president, *Day K. Smith; secretary, W. J. Dealy.

1890—Kansas City, Mo., president, *Day K. Smith; vice-president, *B. Hughes; secretary, W. J. Dealy.

1891—Washington, D. C., president, G. C. Maynard; vice-president, *D. A. Williams; secretary, W. J. Dealy.

1892—Omaha, Neb., president, *E. Rosewater; vice-president, G. M. Dugan; secretary, W. J. Dealy.

1893—Chicago, Ill., president, A. H. Bliss; vice-president, *W. D. West; secretary, W. J. Dealy.

1894—Baltimore, Md., president, Chas. Selden; vice-president, *M. Marean; secretary, W. J. Dealy.

1895—New York, N. Y., president, *E. C. Cockey; vice-president, *R. J. Hutchinson; secretary, W. J. Dealy.

* Deceased.

1896—Pittsburg, Pa., president, S. A. Duncan; vice-president, *J. D. Flynn; secretary, W. J. Dealy.

1897—Nashville, Tenn., president, James Compton; vice-president, *Martin Barth; secretary, W. J. Dealy.

1898—Omaha, Neb., president, *J. J. Dickey; vice-president, L. H. Korty; secretary, W. J. Dealy.

1899—Boston, Mass., president, H. J. Pettengill; vice-president, E. B. Baker; secretary, *John Brant.

1900—St. Paul and Minneapolis, Minn., president, *H. C. Hope; vice-president, H. A. Tuttle; secretary, *John Brant.

1901—Montreal, Can., president, L. B. McFarlane; vice-president, J. E. Hutcheson; secretary, *John Brant.

1902—Salt Lake City, Utah, president, *G. H. Corse; vice-president, B. Brooks; secretary, *John Brant.

1903—Milwaukee, Wis., president, U. J. Fry; vice-president, Wm. J. Lloyd; secretary, *John Brant.

1904—Atlanta, Ga., president, C. C. Adams; vice-presidents, W. H. Adkins and J. M. Stephens; secretary, *John Brant.

1905—New York, N. Y., president, John C. Barclay; vice-presidents, F. W. Jones and F. Pearce; secretary, *John Brant.

1906—Washington, D. C., president, *W. H. Young; vice-presidents, *C. P. Adams, G. W. Ribble and J. B. Yeakle; secretary, *John Brant.

1908—Niagara Falls, N. Y., president, H. D. Reynolds; vice-presidents, *G. A. Burnett, I. McMichael and G. F. MacDonald; secretary, *John Brant.

1909—Pittsburg, Pa., president, G. A. Cellar; vice-presidents, W. J. Camp and C. E. Bagley; secretary, F. J. Scherrer.

*Deceased.

American Telegraph Engineering—Notes on History and Practice.*

BY WILLIAM MAVER, JR., AND DONALD McNICOL.
(Concluded from page 553, August 16 issue.)

In the course of time, however, relays of 150 ohms were adopted for simplex Morse circuits. For duplex and quadruplex service the neutral relays were wound to 200 ohms, the polar relays to 400 ohms, (each coil of the differential windings) and for many years these resistances have been the standard. Within the past eight or ten years, however, there has been a still further reduction of the resistance of main line relays (to $37\frac{1}{2}$ ohms) on many of the commercial and railway telegraph way wires with a very pronounced improvement in the operation of the circuits, especially in bad weather. At the present time the tendency of American practice is to the employment of lower e.m.f.s at the terminals of the circuit and to lower resistances in the relays for multiplex working. During the period when No. 9 iron wire was the standard for telegraph purposes, and when the insulation resistance of the lines, was far below present day standards, a high e.m.f. was necessary in order to maintain proper current values, but by the substitution of low resistance copper conductors in place of iron wire and with improved line construction, the way has been paved for the employment of lower voltages, and relays of much reduced resistance in multiplex operation. Thus some very satisfactory results have been obtained recently in different parts of the country on quadruplex circuits using e.m.f.s as low as 200 volts on well insulated lines of comparatively low resistance (two ohms per mile) and with polar relays wound to 100 ohms and neutral relays to 50 ohms. The length of the cores of these relays has been somewhat increased. The "potential" resistance of 600 ohms (usually inserted between the current generators and the multiplex apparatus) in these instances has also been reduced to 300 ohms, and the "proportion" resistance and "leak" shunt in the field key system from 1200 to 600 ohms, and from 900 to 450 ohms, respectively. The objective in these modifications of the prevailing practice is to reduce the inductive effects upon parallel circuits and to render the relay less sensitive to inductive disturbances from any source.

SOME TELEGRAPH ENGINEERING DETAILS.

It might be supposed that telegraph engineering has to do mainly with purely physical and technical questions, but the close relationship existing between the handling of traffic (telegrams, leased wires, etc.), and the machinery employed in handling it, is such that the telegraph engineer, perforce finds himself involved in the study of traffic details which he cannot well omit without loss to the economies of operation. This for example obviously

requires keeping in the engineer's department an accurate record of existing wire facilities, data as to the daily efficiency of operation of all circuits (especially multiplex and automatic circuits) and information as to their electrical condition, together with carefully prepared tabulated records of details pertaining to methods of traffic movement and the amount of traffic handled on the respective circuits throughout the system, in order at once to enable the engineers to determine whether existing facilities are being utilized to the best advantage, or whether additional facilities, or modifications of the arrangement of present facilities may be deemed advisable. Information of this kind is especially important as a guide in the matter of underground construction and cable work extension. Thorough engineering organization and the application of engineering principles to all work under way or prospective also results, among other things, in placing the engineer's department in a position to intelligently and promptly decide all strictly engineering and related traffic questions that are continually arising in the operation of a large telegraph system.

GRAPHIC METHOD OF MAPPING TELEGRAPH CIRCUITS.

The graphic method of mapping circuits indicated in the accompanying diagram to show at a glance the routes of the various wires, their allotted numbers, how operated, offices entered, material of wire, by whom owned, etc., has been found of great utility wherever used. The scheme which is clearly susceptible of many amplifications was probably first employed in the engineering department of the Baltimore and Ohio Telegraph Company in 1885-88 by one of the present writers and it may be of interest to note that details of the nature indicated relating to over 50,000 miles of actual wire were shown on a map four feet long by three feet wide.

Blank forms for certain reports were also used in the operation of the same company, the information derived therefrom enabling the engineer's department to maintain an intelligent supervision of the circuits, that resulted in a clearly perceptible enhanced earning capacity in the case of numerous circuits. Somewhat contrary to expectations these reports were prepared by chief operators or clerks at no additional expense. As will be readily understood, the knowledge that the operation of all circuits was under constant impartial supervision was not overlooked by those directly in charge of the operation of the circuits.

A knowledge of the condition of the insulation resistance and conductivity of every circuit, open or in cables is manifestly of great importance to the engineering department and reports of the tests of

*A paper presented at the Twenty-seventh Annual Convention of the American Institute of Electrical Engineers, Jefferson, N. H., June 28-July 1, 1910.

conductors for these properties are promptly forwarded to the engineer's department periodically.

THE TELEPHONE IN ELECTRICAL TESTING.

In America the tangent galvanometer has long since been set aside and simpler and quicker methods of circuit testing and fault localizing have been adopted. Many tests, such as those for insulation resistance and conductivity are now made with high resistance voltmeters, especially where earth currents from adjacent grounded trolley circuits (which frequently indicate an e.m.f. of fifteen to twenty volts) are not troublesome. The milliammeter is also used for making insulation resistance measurements not exceeding one megohm and for other electrical tests. The telephone receiver is used as an indicator in many tests. This instrument in connection with an "exploring" coil is largely utilized for localizing faults in aerial cables and in underground cables, especially where the latter are laid in conduits. In making these tests a high frequency current is established in the defective conductor and the exploring coil, a semi-circular coil of fine wire in circuit with the telephone, is moved from point to point along the cable sheath, the indications in the telephone increasing or diminishing as the defect is reached. The telephone receiver as a testing device is particularly advantageous for practical purposes as it places in the hands of the electrical worker or "trouble hunter," an instrument at once portable, and easily understood, and one that is not readily deranged by rough handling. Where a head-band is used to support the receiver, the hands of the workman are free.

POLE LINE CONSTRUCTION—AERIAL VERSUS UNDERGROUND CONDUCTORS—NOTES ON DUPLEX AND QUADRUPLER OPERATION.

Owing to the confusion and general disarrangement of business that usually follows the prostration of the telegraph wires by severe sleet or wind storms in this and other countries, every notable occasion of this kind has been followed by insistent demands on the part of the interested business communities that measures be taken to prevent a recurrence of these disarrangements. So much has this been the case that in Great Britain, at least, where such storms are quite frequent, and where owing to the geographical shape of the country the loss of telegraphic communication due to the effects of such storms has been felt with peculiar force, these demands have been met by the British government in the laying of an emergency telegraph cable between London and North Britain. The fact that such unanimous demands are made for the prevention of even a temporary loss of the telegraph between important centers is, it may be remarked, a rather notable acknowledgment of the indispensability of this public utility as a part of the commercial and social structure of a country.

Apart from the very important matter of maintaining uninterrupted telegraphic communication regardless of weather conditions in the interests of

the general public, it may safely be assumed that the various telegraph authorities in this country have not been unmindful of the financial losses sustained by the telegraph upon the occasion of each recurring collapse of poles and wires, and that every possible remedy therefor has been most carefully considered. Furthermore, telegraph lines are not only subject to widespread damage from abnormally severe sleet and snow storms, but are also in many places exposed to the ravages of forest fires, avalanches of snow, washouts due to floods, and to destruction by lightning. Again, the average life of a pole line in all parts of the country probably does not much exceed ten years. Consequently, if the financial and engineering difficulties in the way of placing telegraph wires underground on a large scale had not been practically insurmountable, that solution of the problem unquestionably, would have long ago been adopted. But it is well known, for instance, that the increased static capacity and mutual induction of the conductors carried in cables reduces very materially the length of circuit that may be used in satisfactory telegraph operation. Already indeed the presence of a comparatively limited amount of underground cable in the circuits passing through the principal cities of the country has very perceptibly reduced the speed of signaling, and the general efficiency of automatic and multiplex telegraph circuits in this country. Being therefore aware of the great technical and financial difficulties that would attend the placing of wires underground generally between cities and towns over the expansive territory of this country, the question of building stronger pole lines, and of employing larger and stronger wires has been frequently proposed by telegraph engineers. The well known "A" and "H" methods of setting wooden poles have of course received due consideration, and in trials have been found to add considerably to the stability of lines. In addition, however, to doubling the expense for poles, further objection to the use of these methods, especially where the telegraph lines are on a railroad right of way, is the extra space required for setting, which very often is not obtainable. Another plan tested was that of using worn out track rails, set up in "H" form and braced one foot apart. The cost of setting these rails is, however, rather high, being about eleven dollars per unit. In especially exposed places the plan of doubling the number of poles from say fifty to one hundred per mile, has been adopted with considerable success. A reduction of the height of poles and an increase of their girth has also been advocated and there is now a tendency in that direction. It is very probable that pole lines built in the future will, when possible, be built of poles considerably less than 35 feet in height (the present general practice) with head and side guys located about every half mile regardless of the contour of the line. On heavy loaded lines with the poles set about 100 feet apart reduction of the leverage obviously increases the efficiency of guy-

ing. In the construction of a thirty-wire line by using ten-pin cross arms, a 25-foot pole would generally leave sufficient clearance.

The employment of re-inforced concrete poles for telegraph purposes has been suggested as offering a solution of the problem as regards durability and reliability, but has not gained much headway hitherto, principally owing to the present high cost of such poles and also to the excessive cost of transportation. Even, however, if experience should show that cement poles will possess the ability to withstand the strains brought to bear on them by wires heavily coated with sleet, there still remains the unfortunate fact that the wires themselves may break under the strain. It would of course, be a decided gain to avoid the total loss of miles of pole line by the collapse of the poles, like bricks in a row—a not infrequent occurrence under present conditions.

In relation to the immediately foregoing remarks, it may not be amiss to digress here to suggest that since the telegraph lines are not put up merely for a day or a year, that a combination of concrete poles, or towers of equal strength and durability with perhaps some form of housing for the wires along permanent and isolated rights of way may be among the possibilities of future telegraph engineering; since such a plan offers promise of reliability of operation without the detrimental accompaniment of impaired efficiency of the telegraph service that follows the placing of telegraph conductors underground. In view of the importance of the subject further reference may here be made to the reduced efficiency of quadruplex telegraph operation within recent years, in some cases amounting to fifty per cent., due to the increased amount of telegraph conductors placed underground in cables in cities. In other cases certain quadruplex circuits have been abandoned because of inductive disturbances from parallel high tension transmission lines. It is a well established fact that prior to the introduction of these disturbing factors, duplex and quadruplex telegraphy in this country had attained a high degree of efficiency. Thus, for instance, it was formerly common practice to operate four, six or more quadruplex circuits between New York and Boston on open parallel lines, each with an efficiency equivalent to four wires worked simplex, and certain quadruplex circuits between New York and Chicago were operated as a rule with an efficiency of at least 9 per cent.

In the equipment of the quadruplex circuits to which special reference is now made, the ordinary horse-shoe polarized relay, with flat armature, and short cored neutral relay were employed without any devices to aid the operation of the No. 2 side excepting the Edison device of the back contact and repeating sounder attachment to the neutral relay. It is well known also that in isolated sections at the present time quadruplex circuits are still operative at high efficiency. It would appear evident therefore that a restoration of the original

efficiency of this exceedingly important arm of the telegraph service would be alone an aim worth the best efforts and thought of telegraph engineers and executives. A return to the former or greater freedom from inductive disturbances would also vastly enhance the opportunities for the utilization of some of the readily available rapid automatic telegraph systems, which as previously intimated the introduction of night letter telegram service may render imperatively necessary in the very near future.

Returning briefly to a consideration of the matter of obtaining a permanent, non-inductive, non-retarding system of telegraph routes, it is clear that utilizing the suggested towers or reinforced concrete poles, with housed wires to afford mechanical protection against storms, incidentally thereby guarding against undue variations of insulation resistance (a great desideratum for numerous reasons) and by the proper selection of routes at a suitable distance from high-tension lines thus evading their disturbing inductive currents, an immediate improvement in the operation of circuits would be obtained. There would, however, still remain to be dealt with, the detrimental effects due to the presence of conductors in underground cables leading into and out of cities and towns. This difficulty could, however, be obviated by placing the main operating departments of telegraph offices on the outskirts of such cities, from which offices loops might be run from duplex and quadruplex circuits to the various branch and brokers offices without detriment to the operation of the multiplex main circuits. All wires not required for the actual handling of traffic in a given town would in such cases enter the main operating room on the outskirts of the city and pass on without entering the city proper. In many small towns the telegraph lines following the highways enter at one end of the town and pass out at the other end, a custom that has frequently involved placing a comparatively large amount of cable in an unimportant locality considered from a telegraphic standpoint. By the plan suggested, only wires needed locally would enter the place by the shortest route to the business center, thereby minimizing the amount of cable required for the proper transaction of telegraph business at that point.

It is unnecessary here to comment on the economies and improvement of operation that could be rendered possible by even a partial adoption of the foregoing suggestions, further than to remark that a proper consideration of the subject will show them to be manifold and of great value.

It had been intended to include in this paper a general reference to recent improvements in the interior equipments of telegraph offices and also to describe the methods and materials now employed in aerial and underground telegraph cable work in this country, but owing to the brief time available for the preparation of the paper it has not been practicable to carry out that intention.

High Resistance Measurements by a Direct Reading Instrument.

BY ARTHUR J. ROWLAND, PHILADELPHIA.

Professor of Electrical Engineering, Drexel Institute.

The measurement of electrical resistance is one of the most important in electrical engineering, whether it is done in a research laboratory or in connection with tests to determine the efficiency and safety of a line or piece of apparatus. A number of methods are in use; some better adapted to the measurement of low resistance and some to high resistance determinations. In all of them indirect methods are almost invariably employed; and yet the advantage of being able to make a reading by direct observation when measuring resistance is as great as for any other things capable of being measured. And while everyone knows this, there are enough different good reasons to make it worth while to remind ourselves of what they are by tabulating some: (a) The satisfaction in taking a direct reading; no waiting for the result. (b) The speed of reading and of checking results. (c) Anyone can make the readings. (d) Errors are much less likely than by other methods. But the instruments which have been available for directly measuring resistance are ohmmeters which are either electro-dynamometers, or those which are voltmeters marked off in ohms.

The electro-dynamometer instruments are built with a fixed coil and a movable coil; the fixed coil being in series with the apparatus whose resistance is to be determined, while the movable coil is connected across its terminals. Such instruments are subject to all the faults of this class; having very uneven scales, a peculiar sensibility to stray magnetic fields and the near presence of iron; while they are not at all dead beat. They are also of quite limited range; at best reaching a high limit of resistance measurement at a few thousand ohms.

The voltmeter instrument must be supplied with a constant voltage (a condition which is practically almost impossible to obtain) and then a given instrument is available over only a very moderate range.

It must be partly because of the difficulty found in the design of a good instrument for direct resistance measurement that so little has been done in the past in the way of producing one; while nothing has been done in planning one for the direct measurement of dielectric or insulation resistance. The very fact that no instrument has been available for measurements may give the reason why so little real knowledge of insulation and insulation resistance has been gained.

It is true that a voltmeter can be used in an indirect way, and is used very extensively in telephone engineering, for determining insulation resistance. But it is not direct reading; changes its indication with the amount of e. m. f. in use; for a given change in resistance the change in scale reading is very different at different points along the scale; at the lower end of the scale where the

needle stands for most observations of insulation resistance the inaccuracy of a determination is very great. Besides all this, the person having insulation measurements to make on telephone systems seems commonly to have very curious ideas of what he is doing when making them by the aid of a voltmeter, and no notion at all of what the real insulation is or ought to be. Furthermore, for cable testing and all kinds of work where insulation resistance is important and no constant source of e. m. f. like the storage battery of the central office is available, it is necessary to carry a bulky equipment of cells and voltmeter if insulation resistance tests are to be made at all.

Ten or a dozen years ago, Mr. Sidney Evershed, after much experiment with ohmmeters of a fixed coil type, some of which were made and sold in this country, turned his attention to the develop-

FIGURE 1.—THE MEGGER.

ment of a portable ohmmeter for high resistance measurements which would have moving coils only and include the valuable features of permanent magnet instruments. Some four years ago the perfected instrument (the Evershed Megger) was put on the market. The Megger has a dead beat movement and enormously increased sensibility above that of former ohmmeters. It is available in standard instruments in various ranges between 1000 ohms and 2000 megohms.

It is rather remarkable that this instrument has not been brought prominently to the attention of American engineers until this present year; and up to the date of writing this article there has been so little detailed information regarding it given to the public, that the author feels sure of interesting his readers by the following description.

The Megger complete and ready for use is illustrated in Figure 1. This shows the instrument one-sixth of its full size. The insulation resistance to be investigated is connected between the binding posts, one of which is marked "line"

and the other "earth." The crank is turned at fair speed and the amount of insulation resistance in megohms read from the scale. The whole process requires a few seconds; the operation can be conducted by anyone; the results have an accuracy usually considerably higher than that ob-

FIGURE 2.—DIAGRAM OF INSTRUMENT.

tainable with other apparatus available for such measurements. The Megger is portable, weighing about twenty pounds. It is self contained. It is not affected in any way by its surroundings.

In Figure 2 is shown diagrammatically the arrangement of the interior parts. Figures 3 and 4 show the interior construction and the moving system respectively. Referring to Figure 2 we see that permanent magnets, M , M , are so arranged that a closed magnetic circuit is formed. In this magnetic circuit at one end a pair of pole pieces are placed, between which a dynamo armature revolves. At the other end is another pair of pole pieces, within the field of which the mov-

FIGURE 3.—AN INTERIOR VIEW.

ing system works. The dynamo, driven by the crank placed as shown in Figure 1, furnishes the e. m. f. by means of which the instrument operates. It may supply 100, 250, or 500 volts. Careful designing has brought the torque to be supplied for driving this machine to so small an amount that very little effort is required on the part of the operator.

The moving system is made of three coils rigidly connected to each other (see Figures 2 and 4). Tracing out the connections it will be found that the coil, A , of the moving system is in series with the apparatus under investigation through resistance R' . It is the deflecting coil and it exerts a deflecting force in the field where it is placed proportional to the current in it. Coils B and B' are connected in series. They, with resistance R in series, are put directly across the dynamo terminals. They constitute the controlling coil of the instrument, the amount of their restraining force being a function of the position they take. As shown in Figure 2, the indicating needle points to zero on the scale; coil A has a large current in it and coils B B' are exerting a maximum restoring force. Reference to Figure 4 will show how the moving system is assembled. The current is led in and out of the coils through very slender copper ribbons which produce no torque; there are no springs; the needle takes a position determined wholly by the torque of current in a magnetic field.

The proper relation between deflecting and restoring forces is secured through the use of the $\odot$ shaped iron piece within coil A which may be seen in Figures 2 and 4. It is mounted securely in place on the frame which supports the moving system.

Since it is the plan of this article to merely

FIGURE 4.—THE MOVING SYSTEM.

give an outline of the nature of the Megger no attempt will be made to further describe the many details of construction which go to make the instrument the reliable piece of apparatus it is. The fact that it is an instrument of the moving-coil-permanent-magnet type gives it all the good points which belong to this class, while being an ohmmeter it is even more constant in cali-

bration. For some purposes the variable e. m. f. derived from the dynamo operating at various speeds is very useful; for cable testing (on account of the capacity present) it is bad. For the last sort of testing, therefore, a constant pressure megger is made. In it a friction clutch is interposed between the last gear and the dynamo armature, so contrived that when operated above slipping speed the e. m. f. is constant within negligible limits.

Among the many direct applications of insulation resistance measurements one or two may be mentioned. Periodic examination of apparatus for insulation resistance, as is done so readily with a megger, will reveal depreciation, whether due to moisture or to the development of some permanent defect. A skilled observer can even tell from the behavior of his megger whether the fault is due to moisture or proximity of conductors, for example.

Meggers are also supplied in such form that by throwing a simple switch the instrument, along with an accessory rheostat, becomes a Bridge Megger. That is, a Megger available for all sorts of Wheatstone Bridge work, including Varley loop tests. For the last named purposes it has some merit in using so considerable an e. m. f. that contact potential differences existing at faults or along lines become nearly or wholly negligible. For general work the bridge rheostat has points of special merit. American users have pronounced it the most rapid rheostat made. Under test by well-known American engineers, the Bridge Megger when used for measurements between one ohm and a megohm shows a high accuracy; as high as the best American made testing sets. The accuracy of the Megger, also, is limited only to the accuracy with which the scale can be read.

A Story of the Days of the Early Telephone.

Mr. E. J. Edwards told recently the following story of the early days of the telephone, a part of which he saw acted in the early spring of 1877, when he was staying at the United States Hotel in Boston for a few days.

"After breakfast, on the second morning of my arrival at the hotel, I went to the men's parlor to look over the morning papers. Presently there entered two elderly men who seemed to be warm friends. In appearance they were typical of the dignified, cultivated, quiet-mannered merchant of Boston. Any one seeing them would have said at once that they were owners of vessels plying between Boston and China or the West Indies. One of them jingled some coins in a pocket; the other tossed a ring of small tools back and forth in his hands. They took their stand near where I was seated.

"I wouldn't give a sixpence for the whole capital stock,' I could not help hearing one of them say. 'I wouldn't have gone into it if So-and-So had not asked me to do it as a sort of favor to him.'

"But I hear that Dr. Hubbard has at last worked out a plan for marketing the stock, and he is a pretty clearheaded business man,' spoke up the other.

"Before the first speaker could reply a third man, whose appearance and manner also indicated the successful merchant engaged in the China trade, came into the parlor, walked with as rapid a step as his dignity would permit up to the two men, and extended both hands first to one of them, then to the other.

"This is very surprising,' he exclaimed radiantly. 'It has all happened over night. What do you think our stock is quoted at to-day?'

"The pair looked at the newcomer as though they felt that their friend was trying to have a little fun with them.

"No, I'm not joking,' the man protested. 'It's a fact. Dr. Hubbard has worked out his plan. It's going to be a great success. Everybody will be rushing to buy stock. Two hundred and fifty was offered for it this morning, and that's a jump from almost nothing over night.'

"The two dignified listeners actually gasped when they heard that announcement. They said nothing; they were struck speechless, apparently; and as they stood there, staring at their friend in a most undignified manner, the latter turned to one of them with: 'I had perfect confidence in Dr. Hubbard. I knew he'd do it. Aren't you glad I persuaded you not to drop out?'

"The next day, in conversation with the famous Tilly Haynes, proprietor of the hotel, I learned the sequel of the little scene I had beheld the morning previous in the men's parlor.

"I have three permanent guests who together made a million overnight this week. They are old-time Boston merchants who, with their families, live with me in the winter and spring. Somebody persuaded them to take stock in the original Bell Telephone Company, and for a long time they were in the dumps over the investment. Then Dr. Gardiner Hubbard took hold of the company and put it on its feet. Night before last the stock went up like a balloon literally over night, and two of those three men aren't quite certain yet whether they are dreaming or whether it is a real experience for them. I wish I had bought some of the stock six months ago, when people wouldn't look at it at any price,' concluded Mr. Haynes, regretfully."

TELEGRAPH AND TELEPHONE AGE.

PUBLISHED ON THE 1ST AND 16TH OF EACH MONTH.

Telegraph and Telephone Age is the leading telegraph newspaper of the world. The technical side of the telegraph, as well as a complete digest of telegraph news and information, is presented in each issue, and events discussed editorially, all in a manner to aid, instruct and interest every individual telegrapher. Sample copies sent on application. Terms of subscription: United States, Philippine Islands, Cuba and Mexico, \$2.00; Canada, \$2.50; all other foreign countries, \$3.00 per year.

Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

The Railroad.

The telephone will be used for train despatching on the new Oregon Trunk Railway.

The Bessemer and Lake Erie Railroad will soon begin despatching all trains by telephone between Pittsburg and Conneaut, O.

The Lehigh Valley Railroad has begun the installation of telephone despatching circuits between Jersey City and Easton, Pa., and between Penn Haven Junction and Wilkes-Barre.

The Erie Railroad is installing telephone booths made of concrete at sidings and other places along their lines where trainmen frequently have occasion to communicate with their headquarters for orders.

Mr. John Matthews, formerly wire chief and manager of the telegraph office of the Gulf, Colorado and Santa Fe Railway at Temple, Texas, has been appointed telegraph manager of that system vice W. M. Knowd with headquarters at Galveston.

Mr. J. Beaumont, formerly superintendent of telegraph, telephone and signals on the Panama Railroad, is now assistant to Mr. W. H. Finley, signal engineer, of the Chicago Great Western Railway.

James E. Hurley, general manager of the eastern lines, of the Atchison, Topeka and Santa Fe Railroad died at Carlsbad, Austria, August 16, aged fifty years. Mr. Hurley had been connected with the Santa Fe system for the past thirty years being at one time a telegrapher in the service of that railroad. He was regarded by his acquaintances as a prince among men and was universally respected.

M. Roy Strong, son of Arthur W. Strong, a telegraph operator on the Cleveland and Pittsburg division of the Pennsylvania Railroad was one of the successful competitors for two \$600 scholarships which are awarded annually upon a competitive examination to sons of Pennsylvania Railroad employees. Mr. Strong will take a course in the Case School of Applied Science, Cleveland.

Mr. G. A. Lawrence has been appointed assistant superintendent of telegraph of the Atchison, Topeka and Santa Fe Railway at Los Angeles, to succeed Mr. H. C. Chace, who has been appointed division traffic superintendent of the Western Union Telegraph Company. Mr. Lawrence has for some time past been chief clerk in the office of Mr. Chace and was formerly wire chief and manager of the Los Angeles relay office.

Many of the railway telegraph superintendents are very busy at this time in pushing the installation of telephone despatching equipment, and it seems to be a question of only a short time now when the telephone will be used more than the telegraph for this purpose. The next important electrical problem which the railroads will have to solve will probably be that of electrification of their lines. The larger cities of the country are bringing much pressure to bear upon the railroads to make them do away with the smoke which is such an objectionable feature around large railroad terminals. As a consequence many of the railroads will probably have

to make a start at least in the electrification of their lines during the next few years. Already the telegraph superintendents of several large railroad systems have been asked to gather statistics covering this subject. The carrying out of this work will introduce many interesting problems in the operation of telegraphs and telephones along the electrified lines.

A Problem in Telephone Line Testing.

Editor Telegraph and Telephone Age:

Referring to the question put by Mr. Grandy in a recent issue, I wish to give the following solution:

In making the tests Mr. Grandy may have used different poles of the battery at each test; or the contact surfaces of each cross may have been dissimilar, in either case he would have obtained different readings.

It requires but very little difference in the contact surfaces to cause a very great difference in the resistance offered by each cross.

If a positive pole of the battery was used during the test, a copper oxide was formed at the contact. this copper oxide is an insulator; if a negative pole was used, the effect would have been just the reverse, as a negative pole would have broken down any oxides which may have formed, thereby lowering the resistance.

The effect was not entirely due to one particular cause, it may have been caused by a difference between the contact surfaces and using different poles at each test.

In making comparison tests of this kind it is always best to use the same pole at each test, otherwise there will be difference in the readings that are misleading.

This peculiarity of the poles explains why it is possible to get different readings during wet weather, using both poles, even when the leakage from other sources is very small. It also explains why it is always best to make an insulation test with a negative pole to the line.

Owing to this peculiarity of the positive and negative poles, I have succeeded on several occasions in successfully working long single telegraph wires of several hundred miles length during excessive rainy periods, by putting a positive pole at one end and grounding the other (no repeaters being available) when those same wires would practically go grounded with battery at both ends or a negative pole at one end and grounded at the other.

S. R. Beatty.

New York, August 20, 1910.

The testimony of progressive operators is that Telegraph and Telephone Age is so thoroughly comprehensive in character as to make it absolutely indispensable to those who would keep informed. Its technical articles are of high practical value. Write for a free sample copy.

are secure invest-
ments yielding
permanent
service

Possibilities of Telegraph Development.

In the year 1950, John Doe, commercial emperor of the world, sat in his office chair, busily thinking. A metal attachment pressed upon his temples, and a series of clicking instruments surrounded him. And with the whirring of the machine his thoughts sped along the wires directing great enterprises in the remotest parts of the earth. John Doe did not need to descend to the antiquated media of speech and writing. He employed no clerks and no stenographers. He merely thought.

That is the bizarre conception of the future of the telegraph and electric communication to which Mr. Belvidere Brooks, general manager of the Western Union Telegraph Company, smilingly nodded approval as it was presented to him recently by a newspaper reporter.

Mr. Brooks' smile was rather quizzical, but just as quizzical might have been the smile of the man to whom was presented fifty-two years ago a prophecy of the actual achievement of the telegraph to-day.

Fifty-two years ago the first message was flashed across the cable Cyrus Field and his associates stretched beneath the Atlantic from Hearts Content, N. F., to Valentia, Ire. The cable broke the second day and not until 1866 was permanent communication established between the two continents. Since then the trans-atlantic cable, in connection with the telegraph, has become one of the first essentials of world commerce. What will be its future furnishes a tremendous field for speculation, and Mr. Brooks, in discussing the question, said:

"Within five years the telegraph business of the United States will have trebled in volume.

"The cable service will follow a corresponding rate of increase. At present only five per cent. of the population of the United States use the telegraph at all. Within a decade, at least, this proportion will have doubled. The grasp of the telegraph and the cable upon the business of the world is as yet imperfect. Tremendous opportunities lie in the extension of electric communication to unexplored and unexploited countries. The telegraph will play an important part in the opening of the great empire of China to world commerce.

"With the extension of the system will come a cheapening of rates and increased power and service to commerce. I do not think the wireless will ever achieve much on land. As a means of communication between ships and between ships and shore stations it has demonstrated its value. It is unlikely that it will ever supersede the cable.

"Experts in the employ of telegraph and cable companies are constantly inventing new devices with which to quicken the service and remove mechanical difficulties in the way of the growth of electric communication. No one can say that the experimentation of the next twenty-five years may not bring forth results as startling as the first flight of an aeroplane."

It is peculiarly significant that within a year telegraph and telephone companies have ceased to war and now work to each other's great advantage. What may happen when the interrelation of all devices of communication is perceived and an immense system formed, embracing all of them, is hard to conceive. Jules Verne never ventured anything more startling in the way of prophetic imagination than the suggestions which the general manager of the Western Union Company offers as the possible future of world communication. Here are some of them:

A simple arrangement of tap-stations in mid-ocean whereby liners passing on the sea or passenger aeroplanes cruising overhead might pick up or send messages from the land or from other ships of the air or the sea.

A system of electric communication so complete that the commerce king of the next half century may sit at ease in his office chair and conduct gigantic campaigns embracing every country in the world in their scope, by merely conversing with his stenographer.

Transmission so simple and instantaneous that the King of England in his palace could converse familiarly in cipher with his royal consort vacationing in the foothills of the Himalayas; that politicians, envoys, ministers of state, could transact international politics as effectively as though closeted in an embassy of either nation.

The combination of Tesla's theory of wave transmission, telephony, telegraphy and the cable—the result a device whereby the intellectual financial giant of the future need only think to give his schemes world-currency.

Mr. Brooks became general manager of the Western Union Telegraph Company last February. One of the innovations in telegraphic service for which he is primarily responsible is the fifty word night letter which has already done much toward achieving the popularizing of the telegraph, which is one of his ambitions.

International Telegraph Tournament.

The rules for the international telegraph tournament to be held in Turin, Italy, next year have been decided upon by the committee having the matter in charge, and a list of events prepared. This tournament which will be held in connection with the International Exposition of Labor and Manufactures will begin August 22. The competition is open to employees of either sex of any of the government telegraph systems as well as to those employed by the cable companies or the private telegraph companies. Telegraphers connected with the navy, army engineering corps, or government railways of any of the countries are also eligible.

Those who desire to take part in the contest should make application through their respective government administrations. In this application which should be presented to the Minister of Posts and Telegraphs at Rome, not later than June 15, 1911, the contestant should indicate the events in which he wishes to take part.

The contest will be in three parts, for the Morse, Hughes and Baudot systems respectively. The Morse trials will consist of sending with the key and receiving on the sounder or from Morse writing apparatus. The duration of the Morse trials will be twenty minutes for sending and thirty minutes for receiving.

The text to be transmitted will be composed of words taken from a language agreed upon and of groups of letters and of figures. It will be printed on sheets, containing fifty words each. The text will be different for each system but will be the same for all of the contestants of the same system.

A special trial of receiving from the sounder and writing with a typewriter will be given if before June 15, 1911, at least ten contestants belonging to at least three different administrations shall make application at Rome for such a contest. In this case the typewriter will have to be provided by the contestant.

In the trials of the Morse system the speed will be as desired by the contestant, and to this end the text for the receiving trials will be transmitted by means of the Wheatstone. The matter received must be written in roman characters for the letters and arabic for the figures. For writing pencils, ordinary pens or stylographs may be used. These will be provided by the contestants themselves. In case of any breakdown for which the contestant is not responsible and by reason of which the sending or receiving by any of the systems is interrupted that test will be thrown out and the contestant will be given an opportunity to repeat his trial. The sending must be carried on according to the rules of the International Telegraph Regulations.

For the purpose of classification each word, group of figures or letters or punctuation mark sent or received will be given a value of five points for the Morse and three points for the Hughes and Baudot systems.

Errors will consist of words, groups of letters, or figures and punctuation marks changed in any way whatever and not corrected by the contestant in the course of the trial and all words, groups of letters or figures and punctuation marks omitted.

The value of each error not corrected will be as follows: Twelve points for each word or group of letters or figures containing only one wrong letter or figure and for each punctuation mark that is changed or omitted; fifteen points for each word or group of letters or figures containing two or more wrong letters or figures; eighteen points for each word or group of letters or figures omitted.

The number of points made by each contestant will be established for each system by multiplying the number of words sent and received by Morse or the words sent by the Hughes or Baudot systems by the co-efficients given and subtracting from the product obtained the points corresponding to the errors made in the respective trials.

In the award of prizes there will not be included any who fail to make at least 2,500 points in the

Morse system, 3,400 points with the Hughes system or 3,200 points with the Baudot, or any who make uncorrected errors in the Morse trials greater than 250 points or 300 points in either the Hughes or Baudot trials. In case of a tie between two contestants they will be given a second trial at a time selected by the judges in order to determine which should be given the priority in the classification.

Prizes awarded will be of three classes; individual prizes for each system; an all-around championship prize and a prize of representation given to the representatives of the government making the best showing.

Contestants will be given only one trial in each system but may take part in the trials of one, two or all three systems, provided they have previously signified their intention of so doing. Ten individual prizes will be given in the Morse class, eight in the Hughes and eight in the Baudot. The prizes will consist of gold and silver medals and objects of art.

The list of prizes will be definitely fixed before the closing of entries to the contest.

There will be fifteen judges, five in each class chosen from the nations competing and a president who will preside over the awards in all three classes. All contestants should be at Turin two days before the trials begin in order to receive the necessary instructions. The trials will all be public, but all precautions will be taken to see that the contestants are not interfered with in any manner.

General Mention.

Jurisdiction over the telephone and telegraph companies operating in New York State will be assumed by the Public Service Commission of the second district on September 1. A chief will soon be appointed to take charge of this work.

The Telepost Company has opened offices at Kansas City and Omaha for commercial business, their lines having been extended to those points from St. Louis.

A thousand messenger boys of Chicago were given a free excursion on August 7 by boat to Waukegan, Ill., where dinner was given to them and supper was served on the boat on the return trip. This excursion was made possible by the efforts of Mrs. Frederick W. Packard, of Chicago, who founded the Chicago Messenger Boy's Humane Association.

Peter Delaney, an operator employed in the Detroit office of the Western Union Telegraph Company, in a fit of insane rage at a supposed affront while on duty in the main operating room fired five shots from a revolver one of which slightly wounded William Schwartz, another operator and a second one of which hit Arthur McArdle, assistant night chief, inflicting a serious wound in the chest. Delaney who is well known throughout the United States has been declared insane and ordered to be confined in an asylum.

Mr. H. E. Merrell, general manager of the United States Electric Company, New York, accompanied by his wife, sailed August 23 on the steamer Princess Cecilie for a vacation in Europe.

The American Telegraph Typewriter, the invention of Dr. G. A. Cardwell, was given a trial recently at the New York Police Headquarters to enable the police officials to judge as to the advisability of installing it in that department. Machines will soon be installed in the office of the New York City News Association and in the offices of all the newspapers in New York and Brooklyn which that association serves.

A final agreement has been reached between the United Press of Washington, D. C., and the United Press Associations of New York in the controversy that has been going on in the courts for several years over the rights to the name "United Press." The settlement is the dissolution of the Washington corporation by the court on the petition of William Wolff Smith and Ernest H. Pullman, the proprietors, thereby giving the rights to the New York organization.

Mr. Herbert Laws Webb, the well-known telephone engineer and author of London, England, in commenting upon the decision of the Postmaster-General of England to make a trial of delivering telegraph messages by telephone suggests that if telegrams were addressed to the subscriber's telephone number instead of to the street number such service would be expedited and at the same time at least two words and sometimes more would be saved in the address.

The second annual convention of the Association of Railway Electrical Engineers will be held at the Hotel La Salle, Chicago, September 27-30, inclusive. An interesting program is being prepared. The entertainment will be in charge of the Electric Supply Manufacturers Association of which Mr. George H. Porter, of the Western Electric Company, Chicago, is secretary. Mr. George B. Colegrove, chief electrician of the Illinois Central Railroad, is secretary of the Association of Railway Electrical Engineers.

A new invention for transmitting photographs by wire consists of a screen with a number of square openings at regular intervals. A duplicate screen is provided for the distant point. The various shades of the picture are reported by telegraph with the duplicate square number in the screen. The operator at the distant point shades the squares accordingly and thus makes a duplicate picture.

The St. Louis Republican, of August 15, 1860, of which we have received a copy, notes that in the "Nebraskian," of April 28, the same year, is found a notice of the Missouri and Western Telegraph Company, at St. Louis, of which Edward Creighton, of Omaha, was treasurer and Robert C. Clowry, of St. Louis, secretary and superintendent. It is announced that the company intends to construct a telegraph line to Omaha and Council Bluffs immediately and to extend it westward to the Pike's Peak region.

What Our Friends Say About This Publication.

Mr. C. A. Stimpson, of Philadelphia, formerly and for many years identified with the telegraph service now with the Philadelphia Electric Company, writes: "You will never make a mistake in renewing my subscription. Of all the electrical journals on file in my office, the Telegraph and Telephone Age is pre-eminent."

Mr. F. C. Hackett, of Toledo, O., who devoted many years of his life to telegraph interests, occupying official positions at Cleveland, Toledo, Pittsburg, and in other cities and who is now engaged in commercial pursuits, writes in renewing his subscription:

"I have been a continuous subscriber for your journal for a good many years, and find that it is very interesting and instructive. While I am not now engaged in the telegraph field, I am still interested in matters pertaining to the telegraph, and look forward with pleasure to the coming of each issue of your valuable paper."

Mr. J. Grant Riach, in charge of the telegraph at Plumtree, Southern Rhodesia, in a recent letter has this to say:

"We are far removed from the noises of varying kinds that are always associated with busy industrial and commercial centres. There is little diversion, indeed, in this remote part of the globe. To be able to shoot an antelope, a buffalo or even an old crocodile after office hours becomes tame and monotonous sport."

"It is when one becomes (as we all do at times) sick of the office atmosphere, sick at the sight of the Morse, sick at the eternal click, click, click of the armature, sick at having to say good morning to a pal, in fact sick at the very knowledge that one is alive, that one suddenly realizes what a comfort it is to pick up a copy of Telegraph and Telephone Age."

"Despondency vanishes like a drink. It seems that the more often each copy is perused the more interesting 'Age' becomes. It is instructive, educative and the best intellectual tonic on the market for those in the profession."

"Enclosed find fifteen shillings to cover the cost of a bound volume of your publication for 1909."

Telegraph Opportunities in Canada.

Since the recent adjustment of wages of telegraphers in the commercial service of the Canadian Pacific Railway's Telegraph, the operators connected with that system are probably paid better than those of any other company employed under similar conditions. The rapid expansion of business in Canada and especially in the western part of the country has created a demand for operators which exceeds the available supply. It is the general consensus of opinion of operators who have gone from the United States to Canada that living conditions are much more favorable there than in this country. Any good telegrapher who is looking for employment should have no difficulty in finding the same at satisfactory wages in Canada.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works on telegraphy and treat them in the same manner.]

CHAPTER XIV.

What is the chief objection to the use of gravity cells as a source of current for telegraphic purposes in a large office?

What is the general construction of the pole-changer used by the Western Union Telegraph Company?

How are the long and short ends of the current supply obtained without extra dynamos?

What rule governs the fall of electromotive force in a conductor?

Why is it important that the resistance of the tap or leak should be proportioned to a permanent artificial circuit and not to the external line?

How can you find the joint resistance of any two conductors?

Draw a diagram illustrating the connections of the polechanger and dynamos.

What is the path of the current when the transmitter is open?

What is the path of the current when the transmitter is closed?

If the short end current is too weak how can you increase it?

CHAPTER XV.

Of what does the standard Western Union quadruplex set consist?

Why is the Freir self-polarizing relay so called when it is in reality a neutral relay?

How is the action of this relay produced?

Why is this relay not affected by the home battery current?

What means is used to prevent the relay from being operated by the short end current?

What should be the relative position of the armature between the two magnets of the relay?

Which force of a magnet begins to act at the greater distance, the attractive or the repelling force?

Why is the Freir relay more efficient than the ordinary relay with the horseshoe shaped yoke?

Under what conditions will a weak current develop more quickly a higher degree of magnetism than a stronger current?

How does the use of the Freir relay do away with the necessity for the condensers which are used to help some other relays over the period of no magnetism?

Obituary.

Joseph Finnegan, a member of the United States Military Telegraph Corps died at his home in Baltimore, Md., August 1. Mr. Finnegan served in the Army of the Potomac construction corps, under Mr. Dennis Doren.

Edward Stager Wright, son of the late E. P. Wright, formerly superintendent of the Western Union Telegraph Company at Cleveland, O., died in that city, August 16. Mr. Wright was a former newspaper man, having at various times been an editor of the New York Times and of papers in Cleveland, Cincinnati and St. Louis. Having an ample fortune he retired from active duty, however, in 1908, and since then he had devoted himself to the study of law as a pastime.

James Swan, superintendent of the Western Union Telegraph Company at Minneapolis, died August 14, aged fifty-six years. Mr. Swan was born at Londonderry, Ireland, and entered the telegraph service at that place as messenger. When twenty years of age he came to New York and entered the employ of the Western Union and became one of the best known operators in the service in this city. In 1886 he was appointed chief operator of the Helena, Mont., office, and later became manager, which position he held until his promotion to the superintendency at Minneapolis in 1903. Among those of his official associates who were in attendance at Mr. Swan's funeral were: M. T. Cook, division commercial superintendent; W. J. Lloyd, division traffic superintendent and A. B. Cowan, superintendent at Chicago; P. W. Drew, superintendent of telegraph of the Minneapolis, St. Paul and Sault Ste. Marie Railway, and Wm. Bennett, superintendent of telegraph of the Chicago and Northwestern Railway, Chicago; J. Fitzpatrick, superintendent at Cleveland; W. R. Chapman, superintendent at St. Louis; U. J. Fry, superintendent of telegraph of the Chicago, Milwaukee and St. Paul Railway, Milwaukee; E. J. Little, superintendent of telegraph of the Great Northern Railway and George Boyce, superintendent of telegraph of the Chicago, St. Paul, Minneapolis and Omaha Railway, St. Paul; C. A. Crane, manager and N. Lee, chief operator of the St. Paul office; E. E. Kelley, manager of the Duluth office; A. D. Bradley, assistant superintendent at Minneapolis and L. F. Wise, manager; Miss M. O'Brien, chief clerk; W. H. Young, chief operator; J. M. Diegel, manager of the American District Telegraph Company; W. J. Durand, manager of the Chamber of Commerce branch office; E. F. Young, general foreman; C. M. Ferguson, attorney for the company and D. G. McIntosh, manager of the North American Telegraph Company, all of Minneapolis.

"Pocket Edition of Diagrams," etc., the latest revised edition, 334 pages and 160 illustrations, published by Telegraph and Telephone Age, price \$1.50, contains just the information every telegrapher requires.

LETTERS FROM OUR AGENTS.

LOS ANGELES POSTAL.

Mr. C. L. Lewis, superintendent at this point, is enjoying a much needed rest of a month.

Mr. H. J. Thompson, of this office, has been appointed chief operator; Mr. J. H. Dorsey, night chief operator; Mr. W. Ogden, assistant day chief operator, and Mr. A. B. Fountain, late night chief operator.

NEW YORK WESTERN UNION.

Mr. E. T. Burrill, assistant chief operator, has charge of the operating room during the absence on vacation of Mr. T. A. MacCammon, chief operator.

Mr. John Morrison has been appointed assistant general traffic chief.

Mr. L. C. Anstrom, has been appointed assistant night traffic chief in the Overland division.

Mr. E. E. Brannin, chief of the Jersey division has resumed duty after a severe illness from ptomaine poisoning.

Miss Bessie Eichler, of the Eastern division, was married at Middletown, Conn., August 25, to Mr. Henry C. Morgan of that city.

John J. Shaughnessy of this department died suddenly at his residence in Brooklyn, on Saturday, August 20.

J. F. Byrne, an operator employed in the main operating room, died August 17, aged forty-eight years. He was a brother of Dr. P. J. Byrne, a former telegrapher, who is now a prominent physician in this city.

OTHER NEW YORK NEWS.

Mr. W. O. Snyder, a well known member of the telegraph profession in New York and Philadelphia recently broke his leg by falling down stairs, which mishap will cause his confinement to the hospital for several weeks.

Assessments Nos. 512 and 513 have been levied by the Telegraphers' Mutual Benefit Association to meet the claims arising from the deaths of Charles A. Colwell at Buffalo, N. Y.; Dorman P. Bristol, at Elmwood Place, O.; Henry F. Tracey, at Chilli-cothe, Ills.; Arthur C. Jones, at Fleming, Pa.; Prescott L. Watson, at Wurtsboro, N. Y.; Frank E. Bryant, at Brooklyn, N. Y.; Nathaniel Mortell, at North Sydney, N. S.; John J. Larwood, at Albion, N. Y.; James P. McBurney, at New York; Charles E. Drew, at Rockville Centre, N. Y., and Crayton W. Black, at Columbus, O.

John J. Barry, aged sixty-two years, identified with the telegraph service in the superintendent's office of the Western Union Telegraph Company at New York for many years until 1900, when he retired from active business, died on August 24 as a result of an operation. For the past ten years Mr. Barry had devoted most of his time to benevolent work. For several years past he was commissioner of correction for the city, which position he resigned last February on account of failing health. Mr. Barry was a foremost citizen of

the Bronx, was president of the North Side Savings Bank and an important factor in politics. He was a member of all the telegraph organizations, and his untimely death is regretted by all who had the pleasure of his acquaintance. He is survived by a wife and nine children.

Advertising will be accepted to appear in this column at the rate of fifty cents a line, estimating eight words to the line.

The Telegraphers' Mutual Benefit Association, 195 Broadway, New York, enables telegraph and telephone employes to provide for their families life insurance in reasonable amounts, at a cost so low as to be within the reach of all. It has already paid beneficiaries of deceased members \$1,500,000, at an average annual cost per \$1,000 of about four cents a day, and has also accumulated \$317,000 Reserve Fund securely invested, to provide against excessive cost in the future. Membership is easily acquired and cannot be invalidated during life for any cause except failure to pay the necessary mortuary calls.

The Serial Building Loan and Savings Institution, 195 Broadway, New York, is assisting over one thousand telegraph and telephone people to save money, and is one of the safest possible depositories for your savings. Its stability is shown by the fact that it has a surplus reserve fund of over \$35,000, and its dividends have never been less than five per cent. Inquiries for information, whether in person or by letter, will receive prompt attention.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taktavall, Telegraph and Telephone Age, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

A Study of Telegraph Apparatus.

PART II.

In the previous installment of this article in addition to pointing out various possibly unappreciated points of uniformity in the construction of the different parts of the ordinary sounder each of which possessed an individual significance, it was stated that the length and diameter of the iron core of a magnet are actually regulated to suit the winding; that is to say, made no longer than is absolutely necessary to hold the required number of convolutions wound within a distance from the core not greater than that of the diameter of the metal itself.

As the total magnetizing force depends upon the number of convolutions in the coils as well as upon the strength of current, it follows that for equal results with the same size core, finer wire must be used in the coils for a weak current than with a strong current.

For example, a core and winding for a four ohm sounder having been used which is ample to produce the magnetic energy required to operate the lever bar properly with the current available, it follows that the same size core will do for any other magnet, regardless of the winding, provided

the same work is required of it, and the same magnetizing force is developed in its coils. Thus a 4 ohm sounder and a 50 ohm sounder perform identical work inasmuch as each actuates the lever bar with practically the same strength. For this reason the 4 and 50 ohm sounders, respectively, are usually constructed practically alike as to size and appearance, the difference being in the winding alone. As the higher wound instruments are used in connection with circuits where the current is comparatively weak, the additional number of convolutions of fine wire the spool contains makes up for such weakness and provides an equal magnetizing force.

In like manner the number of convolutions of wire required, and consequently the ohmic resistance of all telegraph magnets, is increased as the current in which they respectively operate are normally weaker.

The following information regarding the present Western Union standards for winding sounders and relays may be useful as well as interesting.

Instrument	Resistance	Convolutions in each spool	Size of wire used
Sounder	4 ohm	470	24 B & S
Sounder	50 ohm	1250	31 B & S
Single Relay	150 ohm	3400	30 B & S
Polar Relay	400 ohm	2780+2780	36 B & S
Neutral (Freir)		1900+1900	35 B & S
Third Coil		1900	35 B & S

It will be noticed that these figures give the number of convolutions in each spool only, the total number of course being just double that stated, as the two coils in separate spools are connected in series.

A comparison of the figures in this table also furnishes an observant and inquisitive student with a few facts that may possibly perplex him. For instance, he must not imagine that because the respective coils of a four and a fifty ohm sounder are wound with a view of being equally efficient on different circuits, owing to possessing identical magnetizing force, that the still higher windings of relays and other apparatus will give the latter magnets an equal value of exciting current.

The fact is, other pieces of apparatus do not require as much energy as a sounder because the operation of their armatures or movable parts requires less. For instance, it is obvious that more energy is required to bring a large sounder lever down properly than is demanded to actuate the small armature and shaft of a relay. In the latter case all that is required is merely such a magnetic strength as is necessary to move the lever across a small air gap and close a local circuit. Hence, although there are 6800 convolutions of wire around a relay magnet, against 940 for a sounder

the former is not nearly so strong a magnet, but is equally able to do the work required of it.

A neutral relay and a single line relay operate on practically the same principle and perform identical work, but on account of the former having to first overcome the short end value of current flowing in multiplex circuits before getting any "margin" or working energy the coils are wound to approximately 8,000 convolutions, thus requiring a different winding for identical work.

Again, the polarized relay, although the most sensitive instrument of the lot to the influence of a current of electricity, is wound higher than any of its companions.

This is due to the fact that on multiplex circuits it must be able to operate by the very feeble strength of the "short end" of the battery which at times may fall as low as ten milliamperes of current.

The figures given in the table of windings are not given for the sole purpose of furnishing new information, but rather to impress the student with the importance of becoming a close observer. The finished electrician is always the man who makes a point of reading between the lines, and not one of those who have eyes to see but see not.

(To be continued.)

Recent Telegraph and Telephone Patents.

A patent No. 13,146 (reissue) for a telephone transmitter, has been issued to W. E. Harkness of East Orange, N. J.

A patent No. 967,204, for a magneto telephone, has been taken out by O. M. Leich, of Genoa, Ill.

A patent No. 967,276, for a microtelephone has been secured by J. N. Wallace, of La Crosse, Wis.

A patent No. 967,409, for a telephone signal attachment has been awarded to W. F. Mikolasek of Scotland, S. D.

A patent No. 967,476 for a telephone system has been granted to C. W. Winston of Chicago, Ill.

A patent No. 967,692 for a telephone system, has been taken out by H. G. Webster of Chicago, Ill.

A patent No. 967,719 for a telephone noise excluder and current saving device, has been issued to W. E. Burt, of Uba, Wis.

A patent No. 967,747 for a transmitter mouthpiece has been granted to O. F. Falk, of Belleville, N. J.

A patent No. 967,748 for a telephone dictating machine or apparatus has been secured by O. F. Falk, of Belleville, N. J.

A patent No. 967,773 for a private branch intercommunicating telephone system, has been issued to N. H. Holland, of Chicago, Ill.

A patent No. 968,007 for a coherer for wireless telegraph systems, has been granted to C. Walker, of Knoxville, Tenn. Compensates for temperature variations, having a screw adjustment for terminals sealed in a tube and magnetically controlled for maintaining the adjustment.

A patent No. 968,396 for a telephone system, has been awarded to C. T. Patterson, of Albany, Ore.

A patent No. 968,402 for a lightning arrester, has been taken out by J. E. Petree, of Richmond, Mo.

A patent No. 968,405 for a lightning arrester, has been issued to W. E. Phelps, of Colebrook, Ohio.

A patent No. 969,095 for an intercommunicating telephone system, has been granted to A. Ekstrom, of Stockholm, Sweden.

The following patents have expired:

Patent No. 503,590 for telegraphy, issued to Stephen D. Field, of Stockbridge, Mass.

Patent No. 504,011 for an automatic telephone granted to Josef Wratitsch and Stefan Gergacsevic, of Graz, Austria-Hungary.

Patent No. 504,103 for a system of telephonic intercommunication, taken out by Frank R. Colvin, of New York.

Patent No. 504,250 for a telephone-exchange testing apparatus, awarded to Charles E. Scribner, of Chicago, Ill.

Personal.

Mr. Gerard Swope, general sales manager of the Western Electric Company, New York, has returned from a four months' trip through Europe in the interests of his company.

Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company, has made a gift for the purpose of establishing a secondary school of agriculture for Vermont boys, to be opened in connection with Lyndon Institute, Lyndon, Vt. A two-year course in scientific and practical agriculture will be given, designed to prepare young men for successful farming under Vermont conditions.

Mr. Fred G. Boyer, superintendent of telegraph for the Standard Oil Company, who is located in Oil City, Pa., was a recent New York visitor, as was also Mr. John Darr, assistant superintendent of telegraph for the same interests.

Mr. J. A. Sutherland of Newark, N. J., a forty-niner of the telegraph, contributed some interesting telegraph reminiscence in a recent issue of the Newark Sunday Call. Both Mr. Sutherland and his wife are members of the Old Time Telegraphers' and Historical Association and are frequent attendants at the annual reunions of that body.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

President C. H. Mackay, who has been in Europe accompanied by his wife for the past two months, will return to this country about October 1.

Mr. Edward J. Nally, vice-president and general manager, left September 14 for Chicago on business connected with the service. He will be absent about a week.

Colonel A. B. Chandler, chairman of the Board of Directors, on August 20 celebrated his seventieth birthday at his home in Randolph, Vt. Among the telegraph people to congratulate him personally was Mr. C. A. Tinker, of Brooklyn.

Mr. E. B. Pillsbury, general superintendent, and Mr. E. Kimmey, superintendent, of New York, have returned to their offices after a trip of inspection through portions of New York State.

A three days' conference of the superintendents of the eastern division, recently took place in New York to discuss ways and means of improving the service. Those present were: E. B. Pillsbury, general superintendent, and Superintendents E. Kimmey, and C. F. Leonard, of New York; H. Scrivens of Pittsburg; H. D. Reynolds of Buffalo; C. E. Bagley of Philadelphia; and C. A. Richardson of Boston, acting superintendent, vice A. L. Edgecomb, absent on account of sickness.

Mr. L. Lemon, division superintendent, New York is acting superintendent at Buffalo, vice Mr. H. D. Reynolds, on vacation.

Mr. C. F. Leonard, superintendent at New York has returned to his office after an absence of two weeks.

Among recent executive visitors were: Mr. H. J. Pettengill, president of the Southwestern Telegraph and Telephone Company, Dallas, Tex.; Mr. George H. Usher, general superintendent, and Mr. James P. Edwards, division electrical engineer of this company at Atlanta, Ga.; Mr. Charles F. Mason, commercial engineer of the Pacific Telephone and Telegraph Company, San Francisco, Cal., and formerly an attache of the executive offices; H. J. Colebrook, assistant manager and A. J. Eaves, night manager of the Pittsburg, Pa., office of this company. Mr. Colebrook continued his trip to Bermuda where he will remain for a week or two.

A new line with four copper wires is being constructed along the Western Pacific Railroad between Salt Lake City and San Francisco.

This company has succeeded in securing a branch office in the Union Station at St. Louis, Mo., and now occupies similar privileges with the Western Union at that place.

RESIGNATIONS AND APPOINTMENTS.

Mr. C. W. Weber is acting manager of the Warren, O., office vice Mr. O. N. Maxwell, resigned.

Mr. James Cady has been appointed manager of the office at Vincennes, Ind., vice Mr. Frank T. Himler, resigned to engage in other business.

Mr. R. M. Robinson has resigned from the management of the office at Salt Lake City to engage in other business.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Colonel Robert C. Clowry, president of the company, celebrated his seventy-second birthday on September 8. The Colonel is in excellent health and

spirits and bids fair to live to a good old age. He was the recipient of many congratulatory messages.

Mr. Edward J. Hall, chairman of the executive committee, has returned from Europe where he has been for the past six weeks.

Mr. John C. Willever, secretary of the company, is again at his office after two weeks' spent in auto-mobiling through the New England States.

Mr. A. R. Brewer, treasurer of the company, has returned from New Hampshire where he enjoyed with his family a well earned vacation. Mr. L. Dresdner, assistant treasurer, accompanied by his wife is in the west for two weeks.

Mr. Wm. Finn of the office of the engineer of equipment has returned from Buffalo and Toledo where he has been for some time past conducting quadruplex tests.

Among recent New York visitors were Superintendents W. A. Sawyer of Philadelphia, N. E. Church of Pittsburg, and C. F. Ames of Boston, and Chief Operators W. G. Wetmore of Boston, W. J. Dodge of Pittsburg, and L. D. Wilbourn of Baltimore.

Mr. James J. Morris, manager of the Chamber of Commerce office of the company at Milwaukee, was a recent New York visitor coming here on his way home after a month's vacation spent at Atlantic City and other points.

The following appointments went into effect on September 1:

Mr. J. F. Nathan, assistant city superintendent, 16 Broad Street, New York to be district commercial superintendent of the first district, eastern division, with headquarters at 195 Broadway, New York.

Mr. Herbert Smith, assistant superintendent, New York, has been appointed district traffic superintendent of the first district, eastern division with headquarters at New York. He entered the service in 1866 in New York as a messenger, since which time he has occupied almost every position up to a superintendency. He is regarded as one of the best equipped telegraph officials in the service to-day.

Mr. W. J. Higgins, manager of the Buffalo, N. Y., office has been appointed district plant superintendent of the first district, eastern division with headquarters in New York. Mr. Higgins entered telegraph employ at Buffalo in 1884 at the age of eighteen and his service has been continuous since that time, occupying the positions of manager of a branch office, repeater chief, automatic chief, assistant chief operator, chief operator and manager of the Buffalo main office, which latter position he held until his present promotion. Before leaving Buffalo for his new post of duty Mr. Higgins was presented with a traveling bag and a handsome stick pin by the members of the Buffalo force.

Mr. T. A. McCammon, chief operator of the general operating department, New York, has been appointed district traffic superintendent, general

operating department, with headquarters in New York.

Mr. L. K. Whitcomb, formerly and for many years chief operator of the company at Chicago, Ill., has been appointed division traffic superintendent with headquarters at Dallas, Tex. Mr. Whitcomb is considered a very efficient telegraph official and his return to the service pleases his old friends.

Mr. E. E. McClintock, superintendent of telegraph of the Colorado and Wyoming Railroad, Denver, Colo., has been appointed superintendent of the first district mountain division with headquarters at Denver.

Mr. W. R. Gray has been appointed division plant superintendent of the Pacific division with headquarters at San Francisco and will assume the new position October 1. He has for many years past been associated with the Pacific Telephone and Telegraph Company.

Mr. J. G. Lay, inspector at San Francisco has been attached to the office of H. F. Dodge, division commercial superintendent at that point.

Mr. Sheldon M. Custer, manager of the branch office in the Land Title Building, Philadelphia, has been appointed district commercial manager of the seventh district, eastern division with headquarters at New Haven.

Mr. John A. Chapman for many years manager of the branch office at Third and Chestnut Streets, Philadelphia, but for some time past engaged in telephone work has been appointed district plant superintendent of the fourth district, eastern division, with headquarters at Philadelphia.

Mr. William E. L. de la Motte, manager of the Sandy Hook, N. J., observatory of the company was a recent New York visitor and took occasion to call on his numerous friends, while in the city. "Count" de la Motte as he is known, is one of the best posted men in marine telegraph circles, having been identified with that service since the early seventies.

Mr. Lawrence D. Gagen, whose appointment as manager of the Akron, Ohio, office was reported in a previous issue, is another young member of the profession who is rapidly forging to the front because of executive ability. He was born at Sandusky, Ohio, on January 15, 1884. He entered the telegraph service at that point as messenger on June 1, 1899, and soon graduated as an operator. He has occupied the positions of messenger, operator, wire chief, and manager and has profited by the experience obtained while filling each of these positions.

In recognition of the loyal services of the staff at the North Sydney cable station during the past year when both of the Canso-Penzance cables were out of service the company has granted to those employes a bonus of a month's salary. During this time over 3,500,000 messages were relayed at that point.

RESIGNATIONS AND APPOINTMENTS.

Mr. G. E. Woods, manager of the office at Jackson, Miss., has been appointed manager at Memphis, Tenn., vice E. T. Moore, resigned, to be later assigned to other duties. Mr. A. M. Stanley, manager at Corinth, Miss., succeeds Mr. Woods as manager at Jackson; Mr. B. Osborne, manager at Tupelo, Miss., succeeds Mr. Stanley; Mr. G. L. Tucker, manager at Leland, Miss., has been transferred to Tupelo to succeed Mr. Osborne, and Mr. F. L. Anglea has been appointed manager at Leland.

Mr. J. H. Jarvis, manager at Morristown, Tenn., has been appointed manager at Decatur, Ala., vice A. T. Cocke, acting manager, who has been transferred to the Memphis office.

Mr. R. E. Griffey has been appointed chief operator of the Memphis, Tenn., office vice B. A. Harris, transferred to the New Orleans office. Mr. W. D. Bard has been appointed wire chief to succeed Mr. Griffey and Mr. Fred Cord of New Orleans has been appointed all night chief to succeed Mr. Bard.

Mr. John A. Pferd has been appointed manager of the Buffalo, N. Y., office, vice W. J. Higgins, promoted to be district plant superintendent at New York. Mr. Pferd began his telegraph career at Buffalo as a messenger in 1873. Loyalty to his employing interests and faithful service always rendered in the positions filled by Mr. Pferd have resulted in his gradual elevation to the highest telegraph position in Buffalo. In 1894 he was made assistant manager and cashier of the Buffalo office which position he held at the time of his present promotion.

Mr. H. A. Knight, formerly chief clerk in the superintendent's office at Omaha, has been appointed manager of the office at Salt Lake City, vice A. W. Long, resigned to engage in other business. Mr. G. B. Slagle of the Denver office has been appointed chief operator at Salt Lake City.

Mr. L. H. Jordan has been appointed manager at Pittsfield, Mass., vice Miss J. M. Hamilton, resigned.

Mr. J. M. Hammersley, of Charlotte, N. C., has been appointed acting manager of the Winston-Salem, N. C., office, vice S. W. Tise, deceased.

B. L. Brooks, Division Traffic Superintendent, Western Union, Denver.

Mr. Belvidere Lee Brooks, division traffic superintendent, mountain division of the Western Union Telegraph Company, Denver, Colo., was born at Houston, Tex., November 30, 1880. He was first employed as a clerk in the Denver Western Union office, July 1, 1892. He later became a messenger in the Union Depot office at Denver. He was next employed as clerk at El Paso, Tex., being promoted later to the position of operator at that point. In 1902 he was advanced to the managership of the Las Vegas, N. M., office, resigning to go to San Francisco as operator. Later he worked in this capacity for the Western Union in St. Louis and for the Postal in Dallas, as well as for brokers and rail-

road companies. In 1904 Mr. Brooks was appointed assistant chief operator for the Western Union at El Paso, Tex., and advanced to the position of traffic chief, Denver, Colo., in 1906. Within a short time he was appointed night chief operator

B. L. BROOKS,
Division Traffic Superintendent, Western Union Telegraph
Company, Denver.

in the same office, in which capacity he served until the early part of 1910, when he was made inspector in the ninth district Western division which became the first district of the new mountain division when the latter division was created. This position he occupied at the time of his recent advancement.

**A. D. Bradley, Western Union Superintendent,
Minneapolis.**

Mr. A. D. Bradley, who has been appointed superintendent at Minneapolis to succeed James Swan, deceased, as briefly recorded in our September 1 issue, is by reason of the experience

A. D. BRADLEY,
Superintendent, Western Union Telegraph Company, Minneapolis.

which he has had in the telegraph service, especially qualified for that position. Mr. Bradley was born at Pittsburg, Pa., January 22, 1873. In 1895 he went to Minneapolis and entered telegraphic employ by accepting a position in the superintendent's office at that point. While thus engaged he devoted all of his energies to becoming familiar with the details connected with the office, mastered the art of telegraphy and proved to his employers that he was worthy of trust. After filling several minor positions in a most acceptable manner he was, on June 1, 1905, made assistant superintendent, which post he occupied until his recent advancement.

During his residence in Minneapolis Mr. Bradley has made for himself a host of friends and he is regarded by those who know him as one of the most capable telegraph officials in the west.

**J. F. Nathan, Commercial Superintendent,
Western Union Telegraph Company,
New York.**

Mr. James F. Nathan, who has been appointed commercial superintendent of the first district eastern division of the Western Union Telegraph Com-

JAMES F. NATHAN,
District Commercial Superintendent, Western Union Telegraph
Company, New York.

pany with headquarters at New York, was born in Chicago, November 11, 1870. He entered the telegraph service as messenger at Baltimore in 1884 and later became clerk, mastered the art of telegraphy and accepted a position as operator in the Western Union office at Baltimore. In 1892 he returned to Chicago and accepted a position under Mr. A. C. Murphy, superintendent of the city lines. In 1894 he was attached to the office of Mr. E. M. Mulford,

who was then manager at Chicago and served successively as clerk, solicitor and assistant to the manager. In 1903 he was appointed manager of the Boston, Mass., office. In 1905 he was transferred to New York as an inspector at 195 Broadway. On June 1, 1907, he was appointed assistant city superintendent in charge of the central cable office at 16 Broad Street, where he has since been located.

Mr. Nathan has long been regarded as one of the most energetic and capable officials in the service. His elevation to the head of the commercial department of the first district, which is probably the largest and most important in the United States, will afford him ample scope to display his executive ability.

The Cable.

Mr. George Gray Ward, vice-president and general manager of the Commercial Cable Company, New York, accompanied by his wife, will sail from Liverpool for home on the steamer Baltic September 17.

The Right Hon. Lord Strathcona and Mount Royal, K. C. M. G., High Commissioner for Canada in London, who is a director of the Commercial Cable Company and who has for many years been interested in telegraphs and cables, recently celebrated his ninetieth birthday.

Mr. F. H. Nichols is acting superintendent of the Anglo-American Telegraph Company, New York, vice Charles Trippe, deceased.

Mr. A. C. Forshaw, superintendent of the Direct United States Cable Company, London, England, after a service of thirty-six years has been retired on a pension.

The report of the Pacific Cable Board for the year ending March 31, 1910, shows total receipts from the British Columbia-Australia cable of £111,723. Of this amount £63,767 was expended in operation and £30,000 was assigned to renewal account. Interest and sinking fund charges amounted to £77,544, leaving a deficit of £59,588 to be met by the various governments which support the cable. In order to minimize the possible delays to traffic across Canada the board decided during the past year to lease a wire from the Canadian Pacific Railway from Vancouver to Montreal and operate the same so as to have at all times the exclusive use of one wire for the accommodation of the cable traffic. The rates for press matter between Australia and the United Kingdom were reduced on August 1, 1909, from one shilling to nine pence per word and this reduction together with the establishment of a new service between Canada and Australia increased the amount of press matter handled although the total for the year of this class of traffic was only 126,081 words.

Canadian Notes.

A. T. Nourse, for many years manager for the Great North Western Telegraph Company at Sherbrooke, Que., died August 29.

Mr. E. F. Bailey, formerly cashier of the Vancouver, B. C., office of the Great North Western Telegraph Company has been appointed assistant manager of that office. Mr. A. I. Morgan succeeds Mr. Bailey as cashier.

Mr. A. J. Clarke, night chief operator of the Vancouver office of the Canadian Pacific Railway's telegraph, has been promoted to the managership vice Mr. E. Patterson, resigned to engage in other business.

Mr. Charles Ernest Lillie, whose appointment as manager of the Quebec office of the Great North Western Telegraph Company was briefly mentioned in our August 16 issue, was born at Toronto, April 19, 1878. He entered the telegraph service in that city in 1893 as messenger boy and has gradually worked his way up in the service occupying successively the positions of check boy, operator, assistant wire chief, traffic chief and inspector, which position he held at the time of his recent advancement.

Trade Notes.

Messrs. Brown and Murray, Ltd., Mildmay Park Works, London, N., England, are the manufacturers of the inventions of Mr. S. G. Brown and Mr. Donald Murray. Mr. Brown's cable relay (which has no connection with the Brown and Allen relay) is now largely used by most of the large cable companies, which also make extensive use of the Brown magnetic bridge and shunt. Messrs. Brown and Murray, Ltd., also make the new and remarkable Brown telephone relay, an advertisement of which appears in another column. In addition to a variety of other instruments and machinery, they are also the makers of the Murray automatic page-printing telegraph and the new Murray multiplex apparatus, an announcement in regard to which appears elsewhere in this issue.

At a recent meeting of the stockholders of the Chase Motor Truck Company, of Syracuse, N. Y., the following directors were elected: Mr. A. M. Chase, Mr. A. C. Chase, Mr. H. P. Bellinger, of Syracuse, Mr. L. O. Bucklin, Little Falls, N. Y., and Mr. G. A. Brockway, of Homer, N. Y. These directors later elected Mr. A. M. Chase, president, Mr. H. P. Bellinger, vice-president, and Mr. E. A. Kingsburg, secretary and treasurer.

This is the concern which is accomplishing so much in its efforts to furnish the telegraph and telephone interests with an adequate motor truck for their line repairing and construction work. Chase Motor Trucks are used by both telegraph and telephone companies with most excellent results in saving time in effecting repairs. This motor truck is economical to operate, averaging fifteen miles per gallon of gasoline. These motor cars have given satisfaction wherever used, and have been subjected to unusually severe tests in running over sandy and mountain roads.

The Telephone.

Mr. F. H. Bethell, vice-president of the Bell Telephone Company of Pennsylvania and controlled companies, is spending a vacation in Europe.

The Pacific Telephone and Telegraph Company on July 1 had 379,513 subscribers' stations connected, an increase of five per cent. during the preceding six months.

The Federal Telephone and Telegraph Company of Buffalo, N. Y., has filed certificates with the secretary of state increasing its capital stock from \$6,000,000 to \$10,000,000.

Mr. Thomas W. Wilkinson of the Kansas City Long Distance Telephone Company has resigned to accept a position with the Missouri and Kansas Telephone Company.

Mr. Kendall Weisiger, assistant chief engineer of the Southern Bell Telephone and Telegraph Company, has been appointed traffic engineer of the company with headquarters at Atlanta.

Mr. L. M. Brown, district manager of the Pacific Telephone and Telegraph Company at Redding, Cal., has been promoted to a similar position at Chico, Cal. Mr. C. Olstead succeeds Mr. Brown at Redding.

Mr. L. D. McLean, formerly general contract agent of the Southwestern Telegraph and Telephone Company at Dallas, Texas, has been appointed general commercial superintendent of the Interstate Consolidated Telephone Company of Butte, Mont.

The Pacific Telephone and Telegraph Company has placed in service a new common battery telephone exchange at Riverside, Cal. Between \$175,000 and \$200,000 has recently been expended in improvements in the telephone system at that point.

The stockholders of the Southern New England Telephone Company will soon be asked to subscribe for a new issue of stock amounting to \$1,099,100. This will increase the total capitalization of the company to \$8,792,800. The issue of new stocks is for the purpose of raising money to carry on improvements and extensions of the plant.

A recent decision of an Arkansas court holds that it is negligence for a telephone company to fail to have its lightning arresters equipped with ground wires. The plaintiff was using his telephone in the ordinary manner when lightning entered the instrument and gave him injuries for which he was awarded a verdict of \$5,900.

The New England Telephone and Telegraph Company has announced that it has accepted the ruling of the Massachusetts Highway Commission in connection with its investigation of telephone rates in Boston and suburban district. The company will begin at once to prepare for the changes in its system which the establishment of the new rates will bring about. About 100,000 contracts will probably be rewritten. The company expects by November 1 to be able to offer service in any exchange, in accordance with the new schedule, to those who desire it.

The report of the Cumberland Telephone and Telegraph Company for the seven months ended July 31 shows gross revenue of \$3,931,564, an increase of \$229,808 over the corresponding period in 1909 and net revenue of \$1,693,938 an increase of \$110,710 over the first seven months of last year.

A new telephone transmitter invented by C. Lorenz of Berlin, employs carbon silicide or silundium in place of carbon. It is said that the new transmitter is more efficient than the carbon type and in addition has a longer life when operated at high voltage.

According to the latest statistics Dallas, Texas, holds second place among the cities of this country in regard to the number of telephones in service for every one hundred inhabitants, having 16.3 telephones for every one hundred of population. This number is exceeded by Los Angeles only.

The Southwestern Telephone News for August has on its front cover a large half-tone engraving of Mr. Frank B. Knight, the well-known old time and military telegrapher, who is now special agent in charge of publicity of the Southwestern Telegraph and Telephone Company at Dallas, Texas. Mr. Knight has been connected with the telephone service for the past thirty years.

Mr. John J. Carty, chief engineer of the American Telephone and Telegraph Company who has been in Paris attending the International Conference of Telegraph and Telephone engineers described before that body the work which is being done by his company in establishing underground connections between the principal eastern cities of this country in order to do away with the possibility of communication being entirely cut off during severe storms. The underground system at present contemplated includes Boston, New York, Philadelphia, Baltimore and Washington.

The Union Electric Telephone and Telegraph Company operating at Davenport, Iowa, and neighboring cities has applied for an amendment to its franchise to permit it to sell its property to the Iowa Telephone Company. The manager of the Union Company states that his company is losing money at the rate of \$1500 per month and the permission to sell is desired in order that the stockholders may realize about fifty per cent. on their original investment. If the permission is not given it is said that the company will soon be driven to bankruptcy.

Mr. H. R. Van Deventer of Sumter, S. C., author of "Telephonology" has compiled a Telephone Hand Book which is designed primarily for the use of those desiring to install a farmer's telephone line or establish a small exchange in a rural community. To meet the needs of such persons this work gives a model constitution and by-laws for a small telephone company and much valuable information in regard to pole line construction and the installation and care of the apparatus used in small exchanges and on magneto lines. The book has 127 pages and 80 illustrations. Price fifty cents.

A convention of the contract and commercial men of the Associated Bell Telephone Companies will be held at the Windsor Hotel, Montreal, September 20-23, inclusive. An interesting program has been prepared consisting of papers dealing with various phases of the work of the commercial department. Mr. H. S. Brooks, general commercial superintendent of the American Telephone and Telegraph Company, New York, together with all of the division commercial superintendents of that company will be present. At the conclusion of the convention those in attendance will be given a banquet by the American Telephone and Telegraph Company.

John T. Mulhall, Telegrapher and Lawyer.

The many friends in the telegraph service of Mr. John T. Mulhall will be glad to learn of his election as attorney for the Serial Building Loan and Savings Institution. The members of this association are also to be congratulated upon securing Mr. Mulhall's services to safeguard their interests in legal matters.

JOHN T. MULHALL, NEW YORK.
Attorney for the Serial Building Loan and Savings Institution.

Mr. Mulhall was born in Ireland in March, 1868. On October 4, 1882, he entered the telegraph service as a messenger and was assigned to the executive offices of the Western Union Telegraph Company at 105 Broadway, New York. While thus employed he mastered the art of telegraphy. He was soon promoted to the position of record clerk and on April 17, 1885, he became time clerk. This post he filled until February, 1899, when he retired to en-

gage in the practice of law having been admitted to the New York Bar after three years of study in the New York Law School and the New York University Law School. He has been remarkably successful in his practice and is regarded by those who are acquainted with his abilities as one of the bright lights of the legal profession in New York.

Philadelphia Electrical Society.

A meeting of the Western Union Philadelphia Electrical Society was held on August 12. The evening was given over by the instructor to explanations of dynamo currents, connected in series and multiple, and to arc and incandescent electric lights.

The lecturer then gave illustrations on resistance and conductivity, and explained quadruplex leakage. These subjects, being matters of practical information, were very interesting to the members of the society.

The last subject under consideration was insulation testing with the voltmeter and leakages on the various conductors of a line.

Lightning Protection.*

BY WALTER M. PETTY, RUTHERFORD, N. J.

The question of lightning protection for fire-alarm and police signal circuits is one that is of more or less interest to us all. I say more or less because to those fortunate ones whose wires and cables are all underground, the necessity for protection is much less than to the others who have combinations of aerial and underground wires, and still others who have nothing but aerial wires.

In a paper read by me before this association some years ago. I went into this question somewhat elaborately and while feeling that great progress has been made since that time in all classes of construction, I still am of the opinion, based on experience that some of the protective devices mentioned in that paper are still effective. It should be borne in mind that the actual danger of lightning is very remote. It may not be generally known, but statistics prove that when it comes to human life but two persons in every million are killed by lightning, and the actual damage done to property throughout this country is comparatively very small indeed. The same proportion holds good as I previously remarked with regard to the lines that are actually struck. All of us know of the enormous energy of a lightning flash or discharge and with our knowledge of the inductive influences of both static and dynamic in the neighborhood, it is reasonable to suppose that wherever a lightning discharge occurs with its enormous potential and current, everywhere in the neighborhood on every conductor will be induced current of more or less quantity according to the conditions of the circuit. If this

*Paper read at the fifteenth annual convention of the International Association of Municipal Electricians, Rochester, N. Y., September 6-9.

current is of such magnitude as to injure the apparatus in the circuit, and of course the apparatus of fire-alarm and police telegraph systems is in the majority of cases liable to be so injured; then comes the necessity of protection. The best and ideal method and like all ideal things impossible to attain, is to have our lines permanently grounded, that is, to keep them at the same potential as the earth; then an inductive discharge passing into the ground will do no damage, but of course, we know this is an impossibility.

The next best thing is to provide a ground connection with some sort of an air-gap between the lines and the earth. About this air-gap there is a difference of opinion, some authorities making it very small, and others, larger. The reason for this is that, besides dealing with the inductive discharge caused by lightning, we now have the possibilities of currents from other sources which under ordinary conditions are not dangerous, but which may follow on to outlines and cause as much damage as the lightning or inductive discharge itself. We therefore have not only to provide air-gaps of sufficient size, but also some sort of protective devices that in the event of high tension currents reaching our lines, the circuit will be open and no damage result.

The Underwriters' National Electrical Association has prepared in the Code, rules that cover protective devices for signaling systems. Of course, it is intended that these rules shall be general in character and the manufacturers of fire-alarm and other apparatus carrying small currents, have devised many schemes to comply with them. It is not my intention in this paper to mention any particular one of these devices. I would refer those interested to my previous paper on the subject, and also to the many manufacturers, especially of telephone apparatus who have put the devices on the market. I cannot pass this subject without speaking of apparatus which is not covered by the Code. I refer particularly to fire-alarm and police boxes, which being placed out of doors and seldom if ever protected by insurance policies, do not come strictly under the jurisdiction of the Underwriters' National Electrical Association. There has been in days gone by much discussion as to the advisability of grounding these boxes. The writer was at one time opposed to this, but like many a better man, he has seen the error of his ways, and now believes that not only is it advisable to ground these boxes for the safety of the public, but also as a precaution against lightning and high potential currents.

With the old style of boxes using fingers, the danger of welding of these fingers was very great. To a certain extent they were protected by the non-grounding of the boxes, but with the modern cutout devices installed in the boxes together with the new type of brake wheels this danger of welding the parts is very remote and in fact it is hardly necessary to be considered. On the other hand, if the box is not grounded there is always great danger of

a static charge seriously injuring anyone who attempts to open the door. The writer is of the opinion that the most important part of a fire-alarm or a police telegraph system is the box, and too great precaution cannot be adopted to protect this in every way. As mentioned in his previous paper, he has installed over every box a lightning arrester composed of five cylinders of non-arcing metal, spaced about one-sixteenth of an inch apart, the center one of which is grounded, and the two outer ones are connected to positive and negative legs of the line respectively. Since the installation of this type of arrester eight years ago, he has never had any damage result to his fire-alarm boxes notwithstanding that some of them are still of the finger type.

In discussing this question of Lightning Protection with some superintendents and also electric light engineers, the question has arisen as to the possible danger to apparatus from high powered wireless telegraph stations in the neighborhood. It would be interesting to find out from some of our members who have boxes in the neighborhood of some of these high tension stations whether they had had any trouble. The same protective devices which would be effective in the case of lightning should also be useful under the circumstances.

City and National Code Rules and the Relation of the City and Underwriters' Inspectors.*

BY R. A. SMITH.

City Superintendent of Electrical Affairs, Norfolk, Va.

The necessity for city rules, in addition to the National Electrical Code, is due to several reasons: 1st—The city rule is necessary to take care of the life hazard, as the National Code only takes care of the fire hazard. 2nd—There is need for rules that require better construction and protection for wiring in business sections, where wires are more exposed to mechanical injury and where the most clandestine work is found; and the only sure remedy for protection against interference is to prohibit open work and require all wires to be placed in conduits, this of course requiring special rules. There are many other reasons why cities should have additional rules to those embodied in the National Code, as there often arise emergencies that need an immediate remedy, and a rule has to be made to cover same without waiting for a new issue of the National Code. There are also many recommendations in the National Code: such recommendations not being binding, are not heeded, and as many of these suggestions would make excellent rules, it is necessary for the city to incorporate them in their rules in order to make them effective.

The rapid growth of the electrical business and the consequent changes in method of construction and materials, require frequent changes in the rules governing the installation of electrical wiring and apparatus, it is therefore not wise to attempt to

* Paper read at the fifteenth annual convention of the International Association of Municipal Electricians, Rochester, N. Y., September 6-9.

embody these rules in city ordinances, owing to the necessity for hurried changes and additions, and the slow and uncertain routine of the average council committee in handling these matters, and being altogether technical has to be left largely to the expert in charge and a committee. With a committee on Electrical Affairs, empowered to adopt such rules as they see best, and a clause prohibiting said committee from adopting any rule that allows anything prohibited in the National Code, the ideal inspection department would be approached.

The National Electrical Code is the outcome of years of study and experience of some of the ablest electrical and mechanical engineers in this and other countries, and is conceded to be thoroughly reliable, and has been adopted by all electrical inspection departments as a basis, and such other rules added as local conditions required.

It is well to bear in mind that in every fire insurance policy there is a clause stating that when any electric heat, light, or power wiring, or apparatus used on same, is installed in or on any building covered by said policy, the same shall be installed in conformity with the rules of the National Electrical Code, this therefore making it imperative that these rules be followed if property is to be insured; and it is for this reason that the city taxpayer is very much interested, or should be, that these rules be carried out. The failure of local inspection departments to properly observe this has cost citizens large sums of money and much annoyance, as the underwriters' inspectors are bound to uphold their rules, and require changes in work whenever they find rules have not been observed.

The writer after having had twelve years' experience in inspection work, and having had a chance to observe the methods of the insurance inspector, has come to the conclusion that every municipal electrical inspector can, in the interest of the taxpayer, give strict attention to the National Electrical Code, and that their relations with the underwriters' inspector can well afford to be cordial, at least, as this will enable all to have a better understanding of what is required.

The city inspector can also serve the interest of the taxpayer and his department by insisting that he accompany the underwriters' inspector when re-inspections are made in his territory, as this will facilitate the work of correcting defects and enable the city inspector to point out clandestine work. It is also advantageous to the taxpayer to get notice from the city inspector along with that of the underwriters', in case any defects exist, he then being assured that his interest is being looked after.

The new National Electrical Code, dated 1909, contains many changes, when compared with the 1907 issue, and in order to show this to those who have not looked into the matter, I have with me a few copies with new sections marked, and will try to explain these verbally.

I also have a few copies of the supplement on fit-

tings and signaling systems, the latter containing regulations for fire alarm systems.

Mr. R. W. A. Horner, a Veteran in the Service.

Mr. R. W. A. Horner, chief operator of the Western Union Telegraph Company at Lynchburg, Va., which is the repeating office for many of the New Orleans and other southern circuits, in a recent letter renewing his subscription makes reference to his forty-four years of service in that office, beginning as a messenger boy and occupying every position in the office including the managership as well as chief operator, which position he now occupies. While Mr. Horner is quite deaf he is regarded as one of the ablest chief operators in the south. His affliction, if anything, increases his power of concentration on the work in hand, and there is not a call made on any of the repeaters that escapes his immediate attention. Mr. Horner was all night wire chief of the office in the seventies, when A. S. Ayres, better known as "Patsy Ayres," and W. D. West were the star operators in the New Orleans office. "Their Morse," writes Mr. Horner, "was beautiful and the masterly sending of Mr. Ayres was always worth listening to. He invariably cleared his hooks one or two hours ahead of any of the other operators. He was no doubt the most rapid sender I ever heard. It was like sweet music to listen to him, every character being perfectly formed. It must have been a great task for the New York receiving operators to copy Mr. Ayres."

At that time Lynchburg and Rome, Ga., were repeater stations on the New York—New Orleans circuit, and while Mr. Horner was night attendant at Lynchburg Dr. P. E. Murray, until about a year ago manager of the Atlanta office, was the night attendant at Rome.

In his letter Mr. Horner states that "when Chattanooga, Tenn., in the seventies, was the relay office for the south, as Atlanta is now, Mr. J. B. Norris of that office was another bright star in the telegraphic firmament. His manipulation of the key was perfect and it required such fine boys as the Mareans, Morell, Fred and Dell, and William Harvey cutter to hold him down on the Washington wire. Mr. Norris is an old-timer and still in the harness at Chattanooga. I meet him sometimes on the wire."

Among the graduates of the Lynchburg office of whom Mr. Horner may well be proud are Mr. W. T. Gentry, president of the Southern Bell Telephone and Telegraph Company, Atlanta, Ga., and Mr. J. W. Crews, commercial superintendent of the same company at Richmond, Va. Of these two gentlemen Mr. Horner says: "Both are personal friends of the writer and both are first-class operators. Mr. Gentry was a number one base ball player, and but few of the boys could hold his swift curves."

Telegraph and Telephone Age

Entered as second-class matter, December 27, 1909, at the Post Office at New York, N. Y., under the act of March 3, 1879.

ADDRESS ALL COMMUNICATIONS TO

J. B. TALTAVAL, - Editor and Publisher,
283 BROADWAY, NEW YORK.
H. E. DUNHAM, Associate Editor.

CABLE ADDRESS: "Telepage," New York.

Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

September 16, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Printing Telegraphy.

This is a subject which has always had a certain fascination for those interested in telegraphic affairs and is one which has provided a great field of research and experiment for inventors since a commercial telegraph system was first made possible by the inventions of Professor Morse. The installation of the first telegraph apparatus was followed within a few years by a printing telegraph system, the invention of Mr. Royal E. House, of Vermont. This system which was used for some time but was finally discarded as impracticable for general use, was the forerunner of many other systems most of which have been abandoned. Some of these have performed very satisfactorily under normal operating conditions and have given promise of effecting the usual revolution in telegraphic methods. In the final analysis, however, all have fallen short in some detail of the requirements for a printing telegraph which should be-

come a universal success and as such should generally replace Morse operation.

The failures have been so numerous that even some of the more optimistic in telegraph circles are beginning to feel that Morse transmission will always occupy the important place that it does today and that an ideal system of telegraphy will never be developed. Messrs. Maver and McNicol, in the article on "American Telegraph Engineering" which has been appearing in our columns for some time past summed up the situation and voiced the opinions of many very concisely in these words:

"It has long been recognized by telegraph authorities that an ideal system of telegraphy would be a simple and reliable page printer, capable of transmitting and receiving, say, from 600 to 1,000 words per minute on circuits of from 200 to 1,000 miles in length. To the inventor of such a system will ensue wealth and fame. It is hardly conceivable, however, that a telegraph printer can be devised that will not possess a number of prominent defects that will act against its general employment; for example, the necessity of preparation of the message for transmission, and its comparative expensiveness and complexity. The first defect would preclude its use on hundreds of stock exchange and "broker" circuits; the second would debar it from thousands of small way wires. These disadvantages are inherent also in all automatic machine telegraph systems, electro-magnetic or electro-chemical. The superiority of the Morse manual system above all other systems in the foregoing respects is universally admitted."

There are, however, at the present time no less than three different printing telegraph systems in progress of development in this country in which transmission is effected directly from a keyboard thus obviating the necessity of special preparation of the message for transmission. In regard to the expensiveness and complexity of any of these devices debaring them from use on the thousands of way wires it is now urged that the extension of the use of the telephone as an auxiliary to the telegraph will remove the necessity of maintaining these thousands of small offices.

The two objections named thus being disposed of the fact still remains that with any system of direct transmission the capacity of the wire is limited to the speed at which an operator can send from the keyboard. Though some of these systems can be worked duplex they still do not bring the capacity of the wire up to that of one which is operated by Morse quadruplex. Such a system does, however, possess the advantage of not requiring a skilled operator. This is a point of great importance to the telegraph companies at the present time, as the traffic which they are required to handle is rapidly increasing and the supply of Morse operators is not increasing in the same proportion, but has rather decreased in the past few years, be-

cause so many telegraphers have deserted the key to engage in other business. This condition of affairs is being taken care of by the railroads by adopting the telephone to meet their requirements. The commercial telegraph companies may deal with the situation by introducing into general use a keyboard transmitter printing telegraph system. Another alternative which many believe will solve the problem is the extension of the use of the Wheatstone automatic system. This largely increases the capacity of the wire but has the disadvantage of requiring a preliminary preparation of the message by perforating a tape and the translation into writing of the dots and dashes on the recording tape at the receiving end.

Some of the brightest engineering minds in the country are attempting to solve this problem of how to handle the telegraph business most efficiently. Even those who are in closest touch with the situation hesitate to predict what the future will bring forth. Present indications, however, seem to point to a great change in telegraphic practice during the next decade.

Service.

Mr. W. A. Porteous, manager of the New Orleans office of the Western Union Telegraph Company, in presiding over a banquet given to the former incumbent of his office, Mr. T. P. Cummings, who has recently been advanced to the superintendency, struck the keynote of success in the telegraphic profession. He said that the success of Mr. Cummings' administration would depend entirely upon the service rendered throughout his district. This means the service of every individual employe of the company. If one operator slights his work, is careless and makes many errors he will do more toward making the telegraph unpopular with the public than a half dozen employes who always try to perform their tasks as well as possible, can do toward popularizing the telegraph. The success of every employe depends entirely upon the support which is given to the telegraph industry by the public. Every employe, no matter how humble his station, can assist in increasing this support and in the same way every employe can help to weaken this support. Thus the success of everyone engaged in telegraphic work depends directly upon his own efforts, as unless the company which employs him is prosperous he cannot expect to receive any advancement. It is a fact worthy of note and one which has been proven many times that those who receive any important advancement in the ranks of the telegraph are those who always try to render the very best service in their power and are always looking for some way in which they can give a little better service than before. On the other hand those who are always bewailing the fact that there are no opportunities for advancement belong almost invariably to the class who frequently slight their work and are always afraid that they are going to do something that they will not get paid for.

This question of service applies with even greater force to managers and other officials of the telegraph than to their subordinates. The upbuilding of the business at every point depends largely upon the way in which the managers cooperate with their superintendent and assist him in his plans for extending the usefulness of the telegraph by always carrying out his instructions. The progressive manager, however, will go farther than this. He will be on the lookout for new ideas and when he discovers something of value will not hesitate to communicate the same to others who might be benefited by his knowledge. The manager represents the company in the mind of the public and is consequently a moulder of public opinion although he may not appreciate that fact. If he makes the customers of the company feel that he is anxious for their business and that he will use every means in his power to get their messages through with all possible despatch that part of the public with which he comes in contact will feel that the company is always ready to serve them and will be encouraged to make use of its facilities. A successful manager always makes those whom he meets in a business way feel that he is their friend and is straightforward in his dealings with them. If there is any interruption in the service so that messages are delayed he will be frank in stating the facts and will not try to make the customers believe that their telegrams have gone through without delay. While delays are always annoying they will usually be excused if their cause is known and it is shown that they could not be prevented. The best advertisement for any business is a satisfied customer and the successful manager is the one who uses every effort in his power to satisfy his customers by giving them the best service possible.

Postal Company Acquires Telephone Property.

Deeds have been recorded in Nashville, Tenn., by which the Postal Telegraph Company acquires the property of the Alabama & Tennessee Telephone & Telegraph Company. The property was sold by order of Chancery Court at Clarksville, Tenn., and the Federal Court in Alabama. The Postal company has lately acquired a line from Louisville to Decatur, Ala., and it is reported that it will extend the line to Huntsville, Ala., and open an office there.

In the list of old timers who have died during the past year which we published in our September 1 issue was the name of W. H. Glover. The person whose death was thus recorded was from a western city and was not the W. H. Glover who is employed in the Central cable office of the Western Union Telegraph Company at 16 Broad Street, New York. The latter gentleman is still very much alive and does not wish his friends to think that he has passed away.

Telegraphs and Telephones in New York State Under Public Service Control.

The public service commission of the second district of New York State assumed jurisdiction over the operations of telephone and telegraph companies operating in that state on September 1. All telephone companies, corporations, associations, partnerships or persons owning or operating any telephone line in the state for profit, whose property is in excess of the value of \$10,000, will come under the jurisdiction of the commission. All telegraph companies, however, are within the jurisdiction of the commission.

Telephone and telegraph companies are required to afford adequate service at just and reasonable rates, and discrimination in favor of any particular person or corporation, and in giving any unreasonable preference of any kind is prohibited. No free or reduced service or free pass or frank can be given except to the employees of the corporation and their families and persons engaged in certain lines of charitable work.

The corporations are required to file with the commission schedules showing rates, rental and charges for services, also all contracts and agreements in writing between companies affording telephone and telegraph service relating in any way to construction, rentals or use of lines of telephone or telegraph companies. The companies are required to file each year an annual report which is a public record, and may be examined at the office of the commission upon request.

Complaints may be made to the commission by any person or corporation aggrieved as to rates, rentals and service by petition or complaint. The commission may also, upon its own motion, make inquiry upon actions of telephone or telegraph corporations as to any act done or omitted to be done by any telephone or telegraph corporation. The commission has power to order necessary repairs and changes. All franchises and privileges hereafter granted must be approved by the commission before they can be lawfully exercised. Issues of stock, bonds and other forms of indebtedness must be consented to by the commission. The commission has power to enforce its orders, rules and recommendations, and failure to comply with same may result in actions to recover penalties.

Out of about 1,200 telephone companies in this state, 115 will come under the jurisdiction of the commission, all of whom have property in excess of \$10,000. The New York office of the commission which will have charge of matters pertaining to the telegraph and telephone in New York and vicinity is located in the Metropolitan Building.

Frank W. Stevens, chairman of the commission, issued a statement to the effect that the commission would proceed slowly with its new work, as it was unfamiliar with the subject. The telephone and telegraph companies had been circularized, so that the commission might obtain data on which to base investigations.

Edward B. Rogers, of Elmira, a telephone man of twenty-two years' experience, has been appointed chief of the division of telephones and telegraphs with an annual salary of \$4,000. Mr. Rogers commenced service as a clerk for the New York and Pennsylvania Telephone and Telegraph Company and for six years prior to its absorption by the New York Telephone Company was general manager of that corporation. At the time of his appointment by the commissioner he was special agent for the New York Telephone Company at Buffalo.

General Mention.

The Stock Quotation Telegraph Company has filed certificates with the Secretary of State increasing its capital stock from \$250,000 to \$3,000,000.

Mr. Klem Madden, of the Telepost Company, St. Louis, has been appointed manager of the Omaha, Neb., office of this company which has just been opened to the public.

Mr. Frederic Allen, formerly an operator of Washington, D. C., has been appointed Head Room Clerk of the Waldorf-Astoria, New York. Mr. Allen learned the hotel business primarily from observation while serving the Postal Company at a branch office in a hotel in Washington. He is a son of W. H. Allen, an old time operator and manager.

The postmaster-general of Australia at a dinner of telegraphers given recently in Melbourne took occasion to speak in commendatory terms of the telegraph service of that country, comparing it with that rendered by private companies. "Until recently," he said, "messages via the Pacific cable had to go over a privately owned land line in Canada. An investigation showed that while 1,000 mistakes were made on the privately owned line ninety-seven were made on the Government owned lines in Australia. That was one of the reasons why pressure was brought to bear to get that privately owned line transferred to the control of the Pacific cable board." He also stated that he was in thorough accord with the principle by which a man's fitness for an appointment was determined by a Commissioner, and he hoped the time would never come again when a man would get a position in the service or promotion simply because he had been longer in the service than some other officer.

Probably the smallest sum of money ever sent by telegraph was forwarded recently by a New York stock brokerage concern to Seattle. Having been advised by the post office authorities that there was an unstamped letter addressed to them in the Seattle office, the brokers immediately sent by wire the two cents necessary to have the letter forwarded. The letter when received was found to contain a good order together with a check, so they were well repaid for the extra expense involved in getting the letter.

The Military Telegrapher in the Civil War.

PART XLVI.

BY THEODORE E. MORELAND, PITTSBURG, PA.

Shortly following the end of the war, and knowing the important part played in it by the United States Military Telegraph, Mr. W. R. Plum began his collection of the individual parts performed by the operators of that corps. I was asked at that time to write up my experience but neglected to do so,—something I have regretted very much ever since, as at that time places and incidents were fresh in my memory and could have been more accurately stated, now I will have to trust alone to memory as to the part performed by myself and other comrades in that greatest of wars.

In September, 1861, I was the third choice from "OD", Pittsburg, to follow David Homer Bates and Samuel H. Brown to Washington, I being at that time operator in Mr. Andrew Carnegie's office on the Pennsylvania Railroad. Mr. Carnegie was superintendent of the western division but had been called away sometime before to assist Thomas A. Scott, who had been made Assistant Secretary of War by Simon Cameron. Mr. Scott knew Mr. Carnegie's great ability as a railroad man, hence his selection of him as an assistant in organizing the military railroad and telegraph service.

I might state at the beginning that I was not a number one operator or nearly a number one, in fact, I might admit now that some of us railroad fellows, were, at first, what Emerick, Dwight, and others of the eastern crowd dubbed "railroad plugs;" but as Uncle Samuel's optics were being closed by many, many others at that time, we also took chances and won out. Time brings around many changes and by the following March, J. Hervey Nichols, who had been my chum at Fort Lyon General Heintzelman's headquarters, since September 20, and myself, had become (in our opinion) ready and fitted for bonus or any other kind of telegraph work.

When I reached Washington on September 16, and reported to Messrs. Bates, Gilmore, Wilson and others, I was thought to be about the size to fit in at Fort Lyon, which place I reached and successfully opened the office amid the plaudits of an admiring crowd of staff officers who accompanied the general to the services of dedication, as it were, of that office. After getting "DI" or "WD" and asking if they had any rebellion crushing orders for the general and getting a negative, I settled down to the arduous duties and dangers of a war operator.

When I tell the present generation of operators, bonus and otherwise, they will hardly credit it that from September until March, J. Hervey Nichols and myself combined and unaided, took one message. Talk about halls of fame and missing names, Nichols and myself still live and look Uncle Samuel in the eye as men who have given an equivalent for their money, as all men should be able to do.

This one message was taken by me unassisted and brought around a little ill feeling on the part of J. Hervey as it came over the wire on his trick, but he was busy elsewhere and I received the message.

Early in March Nichols and myself were ordered to proceed to Baltimore thence to Fortress Monroe; we had noticed for a few days before the greatest activity around our headquarters and couriers galore reaching our place. At all events the orders did not come over the wires.

On our way down the Chesapeake Bay what a spectacle we witnessed, thousands and tens of thousands of soldiers, artillery, cavalry on all conceivable manner of boats, barges, schooners, etc., destined for the same place, Fortress Monroe. Such a sight might have been seen by Xerxes, Hannibal or some of the warriors of olden times, but it had never been seen in the United States before and will perhaps never be seen again.

Upon reaching Fortress Monroe, Nichols and myself found at once what it was to be soldiers, to forage for yourself, etc. We had thought that provision would have been made for our comfort at the Hotel Hygeia but such was not the fact.

Our assignment had not been made known to the Hygeia Hotel, George D. Sheldon or Richard O'Brien, and now came the tug of war, the first that we had sniffed.

I wonder if Nichols remembers that first night, there we were two orphans, homeless, without a morsel to eat and to add to this night of horrors to us, it began to rain, in fact it was a deluge.

Our first effort was to get shelter which was soon found. The ruins of a large church or hall in Hampton had been taken by some quartermasters for the storage of bales of hay, oats, etc. Between the apertures of the hay bales we got the snugest kind of beds and would have paid handsomely for the accommodations had it not have been we had unthinkingly taken berths very high up in the pyramids of hay bales which were fifty feet high. Our retreat was found by others and our lodging house was undermined by some enterprising soldiers below, and Major (as he was then), Thomas T. Eckert's United States Military Telegraph Corps came near being two short at roll call the next morning. Had it not been for the agility displayed by Mr. Nichols and myself in dodging hay bales, bags of oats, etc., we would not be on the pension roll to-day.

Nichols and myself are young yet and may live to get even with those great practical jokers, General Thomas T. Eckert (who was likely promoted for this practical joke on us), Charles A. Tinker, D. H. Bates and others.

The day following we got our first glimpse of war. General Lee's men began to fall back and we captured their camps with all their stores at Big Bethel with a lot of prisoners, who, by the way, were a much different set from those captured months later. No wonder the Southern girls bedecked them with all kinds of laurels when they sent

them forth to battle. Their uniforms were new, they were a handsome lot of fellows and like our men were proud of their trappings.

Nothing eventful occurred after Big Bethel until we reached Yorktown on the overland route;—there our army massed and the long siege of Yorktown began.

Within a radius of probably three to five miles, our army of possibly 150,000 men had been corralled and now the war was surely on. All efforts toward peace had failed and bloody war was to be ours for years to come, and the best, the very best, of our people both North and South were to yield up their lives.

I do not remember exactly, but we had possibly about thirty or forty operators in this Yorktown siege stationed at the headquarters of the different Major-General's, Brigadier-General's and sometimes Colonel's. We had enough operators to go around. During this siege we did not have much more telegraphically to do than Nichols and myself did at Fort Lyon. Some of us being poetically inclined amused ourselves on the wire by rhyming different names, etc. Among those names was that of A. H. Bliss, that giant of the West who helped entertain us last week in Chicago. I was sending out some of my stuff on that name when the flaps of my tent opened and I felt a stinging sensation around my ears. Looking up, Mr. Bliss stood before me, looking, I think, as George Washington looked when he told Cornwallis to give up that knife and sail abroad.

I had forgotten that I was the nearest neighbor, as I was but a block away, and would naturally be the first reached. Bliss was not as large nor as good a man then as he is to-day. I learned afterwards that he had traversed the entire block on his hands and knees determined that the poet should be found and he was, in me. All of us thereafter took off our hats to Bliss as this piece of detective work deserved the greatest praise and respect from us all. His name was never mentioned on the wire after that, at least not by myself.

After McGruder's evacuation of Yorktown and our occupation of that rat permeated place, thousands and thousands of the rodents occupying it jointly with us, all of the operators congregated in a large building occupied in part by General Van Allen, who had been appointed commandant. Some thirty or forty operators had established themselves in one room; we still had telegraph wires to Fortress Monroe and the North and were following our army overland with hastily constructed wires built by Dennis Doren and Levi D. McCandless. A day or two afterward a number of the operators had their assignments and had gone up the James River or overland with our army in pursuit of the retreating enemy; half a dozen of us were left to hold Yorktown. Among this crowd was J. H. Emerick, Charles Lithgow, J. H. Nichols, John Tinney, Henry Cowan and I think,

C. A. Tinker. Both Generals McClellan and Eckert knew that this force could hold the town or any other place as long as it was well provisioned.

The battle of Williamsburg occurred while we were at Yorktown and a great number were killed and wounded. I had two brothers in the One Hundred and Second Pennsylvania Regiment and as that regiment was engaged and lost heavily I was very uneasy, of course.

Just at this time luckily, General Eckert sent an order detailing me as an escort to Mr. O'Reilly, an old telegraph friend of General Eckert's whose son had been killed at the Williamsburg battle, to go with him to Williamsburg and give him all the assistance I could. Ambulance accommodations were secured and we reached our destination safely. We had very little trouble in finding the grave as his comrades had it plainly marked and we soon began our return journey to Yorktown. This country was sympathetic and was infested by guerrillas and bushwhackers. I learned on this trip that my brothers had come through the battle all right.

Later Lithgow and myself were detailed to take charge of the Williamsburg office and stayed there about a week. Nothing occurred while there except that it had become known among the contrabands that Lithgow had a diploma as a doctor and he afterwards figured successfully in a few cases and proved that he was not only a doctor but a number one operator and an all around good fellow.

While we were besieging Yorktown I was stationed at General FitzJohn Porter's headquarters and a rather thrilling incident occurred there. Professor Low, the aeronaut who was at our headquarters made almost daily ascensions and allowed some of us to ascend with him and overlook the Confederate camps. Early one morning General Porter went up alone and the balloon broke loose. The balloon sailed right over one part of the Yorktown fortifications and the general could have easily been picked off by their sharpshooters, but thinking they had a valuable prize they waited a little and lost their man. That brave and unjustly treated officer was equal to the occasion and in a couple of hours alighted safely in our lines. There was great rejoicing in the army as he was one of our best generals and much beloved by all.

After closing the Williamsburg office we were ordered to report to Chief Operator Harper Caldwell in front of Richmond. I was assigned to General Sedgwick's quarters and afterwards to those of General Warren.

The Fair Oaks and Gaines Mills battles occurred the day before our retreat was decided upon. At this time I was stationed at Dispatch Station on the railroad. The wounded by hundreds were brought in from the front and as we occupied part of a large mansion for telegraph purposes, part of this building was taken for the wounded, while the sanitary and Christian commissions camped along side

of us and cared for thousands; several of our operators were nearby and we gave a good deal of assistance to the wounded among whom were many Confederates.

A little incident occurred here which I have never forgotten. In helping the wounded to water, coffee, etc., I came across a wounded Confederate officer who had a badly injured arm caused by a shell explosion. After asking him if he needed anything, he thanked me for some coffee and told me that he was a North Carolinian. He asked me if I thought it possible to get word to any of his friends as to his fate as his wife and two babies would be glad to hear he was in good hands and not badly hurt. As the order had been given for our retrograde move then, I told him I would do all I could for him and thought he would soon be with his friends. This turned out to be the case next day, as thousands of our own men also fell into the hands of Lee's army as we had been badly whipped the day before. Our retreat was rather a hurried one and we did not stand on ceremony but began the seven day retreat and fight at once. During the seven days fighting on our retreat to the James River, we had some of the roughest experience I had met with up to this time. A Canadian operator who had joined us the day before, and who rather regretted having come at all, after witnessing the sights forced on him, was in my company. We were then going about as we pleased having lost McClellan's headquarters where Harper Caldwell our chief operator had ordered us to report, he having with him Charles W. Jacques, Jesse H. Bunnell, John Emerick, T. H. Fonda, W. H. Nichols, R. F. Weitbrech and several others whose names I have forgotten. My Canadian friend and myself had started with very light rations and we soon experienced the first pangs of hunger. Sitting down to rest under the shade of a large tree one afternoon, and as we thought in perfect safety, a battery of artillery out in front of us unlimbered and got ready for action. Scarcely had this been done when the Confederates opened up and that battery was working mighty lively. After that as my Canadian friend and myself were very green at artillery work we did not volunteer to give our batteries any help. Our branch of service at this time was the cavalry and we mounted horses and got out of danger as soon as possible. This was the opening of one of the heaviest fights during the retreat. I never met my Canadian friend after this. I saw a letter from General Eckert some days after to Caldwell that was very laughable. Caldwell had reported the Canadian and one of our Pennsylvania operators as missing—taken prisoner or killed. The general received later information from the absent ones which he put in the shape of a horse race, describing their positions in the race home; at Harrison Landing, the Canadian leading by a length, at Fortress Monroe the Pennsylvania man got his second wind and the Canadian was away to the bad. He finally landed both

individuals safely at home in Pennsylvania and Canada. (To be continued.)

Italy Reduces Telegraph Tolls.

The telegraphic service in Italy, like that in other European countries, is owned and controlled by the Government and is under the direct management of the Ministry of Posts and Telegraphs. According to consular reports, the rates in force were established by laws of 1870, modified in 1882. The cost of an ordinary telegram sent to any part of the kingdom is 1 lira (\$0.193) for a minimum of 15 words, including the address and signature, with a charge of 5 centesimi (\$0.01) for each additional word. These rates have been for many years considerably higher than those in other European countries, especially for brief telegrams of less than 15 words, and for a long time the commercial interests and the press have attempted to persuade the Italian Parliament to reduce them. Important obstacles to this action were that the lines, with their limited capacity, could not properly handle the increased business resulting from lower rates, and that diminished receipts were feared.

The ministry has overcome the first obstacle by adding fully 25,000 miles of wire during the past three years, with thirty-nine additional direct communications between the large centers of commerce and industry, and by installing over 1,200 new high-capacity instruments (262 Hughes and Baudot and 1,000 Morse). A careful estimate of the amount of increased business to result, based upon the experience of other European countries, showed that in the next five years from a total of 58,060,000 telegrams, yielding an income under existing rates of about \$14,000,000, the traffic probably will show a total of 86,990,000 telegrams, with an income of over \$16,000,000, a gain for the administration of fully \$2,000,000 in five years. Increased business will, of course, result in some additional expense for employees, but it is argued that the result of reducing the minimum number of words in a telegram from fifteen to ten will be proportionately less work for the personnel, and therefore the increase in expense for operators will be less in proportion than the increased income from additional traffic. These considerations have prevailed upon Parliament to approve a law granting a material reduction in the rates charged. The new law goes into effect on December 1 next.

The rates to be charged are as follows for messages sent anywhere within the Kingdom: Ordinary telegram, minimum 10 words, 60 centesimi (\$0.115), with \$0.01 for each additional word; urgent telegrams (former rate three times that for ordinary message), 1.8 lire (\$0.347), with \$0.03 for each additional word above 10. The rates for ordinary and urgent telegraphic money orders are respectively the same as above. Ordinary telegrams directed to newspapers or press agencies from 9 p. m. to 6 a. m. are charged \$0.115 for 20 words and \$0.01 for each additional two words.

International Association of Municipal Electricians Meets in Convention at Rochester.

The fifteenth annual convention of the International Association of Municipal Electricians was held in Rochester, September 6, 7, 8 and 9. It was undoubtedly the most interesting convention of the series and more points of information of value to the members were brought out than in any previous convention. In fact every business session of the four days was crowded with matters of interest to the members present. All of those in attendance agreed that they would go back to their respective homes much better equipped to carry out the duties of their positions. The visitors also carried away with them a good impression of Rochester, both as a thriving, progressive city and as a first-class host.

The papers presented showed great care and thought in the preparation and gave proof that the members of the association are fulfilling the object which the founders had in mind when it was organized, namely to be of assistance to each other in the solution of difficult problems.

The convention was called to order at eleven a. m., September 6, by President J. B. Yeakle, of Baltimore. The visitors were welcomed to the city by Mr. H. F. Ogden, secretary to Mayor H. H. Edgerton, that official being unable to be present and greet the guests of the city in person. Mr. Ogden, in the course of his remarks, advised all those engaged in municipal electrical work to try and do their best to make good in their positions irrespective of the way they were secured and as far as possible avoid political manoeuvrings. Mr. C. E. Diehl, of Harrisburg, Pa., who responded to the welcome, said that he expected that out of the meeting would come many things which would help the members to make good and would aid not only in the conservation of life and property, but in the safety of both life and property. President Yeakle then read his annual report which was as follows:

"Opening the fifteenth annual meeting of the International Association of Municipal Electricians, I feel that you may congratulate yourselves that we are making progress, and that the ambition to secure recognition of the value and importance of this organization to the communities represented promises a well merited future.

"During the year, from such limited correspondence as was afforded, I have no reason to abate my enthusiasm or confidence that we are moving forward to the time when the city or municipal electrician will be recognized as the source of knowledge on all subjects affecting electrical interests in which his town may be concerned.

"To succeed in this much work is to be done, many problems attacked and solved, many hours of study and experiment are to take the place of time given to the consideration of subjects of less im-

portance than the improvement of ourselves in technical knowledge.

"From the many text books and papers, moderate in price, but covering modern practice most thoroughly, the state of the electrical business of today, both in theory and practice, may be well enough mastered to inspire confidence in the most diffident and secure the esteem of those whose influence you may seek to help in your progress to the more desirable positions.

"In one of these periodicals which has been liberally distributed at our annual meetings, an excellent series of articles by a well informed writer will be found valuable to one anxious to improve his position by adding to his knowledge of the business in which he is engaged.

"I read these papers with interest and so would many of the members of this association if they would profit by the advantages they provide.

"I am anxious to see the municipal electrician recognized as meriting a place in that distinguished class known as engineers. You are equal to the task of securing that distinction and you will not measure up to the line of your capacity if you fail to show progress in this duty.

"Watch developments, not only in the fire alarm and police telegraph offices, or at the inspector's desk, but at every point where electrical work is going on. Secure catalogues and bulletins of the manufacturers of electrical devices, make such experiments from time to time as opportunity affords, do away with some of your unprofitable modesty and begin to exalt yourself in your own opinion, being assured that others will measure you by your own standard of worth.

"From some of my correspondents I am inclined to believe that too many drop their interest in the work of our convention with the close of the last session. The papers and discussions are not valued as containing important information to be considered at leisure hours in the office or at home.

"Some means should be devised to continue inquiry and criticism after the convention adjourns. It could be made interesting and profitable and we could have more papers and more discussions and find the association improving both as an organization and as individuals.

"Your work at Atlantic City has been commented on in the most complimentary manner. I believe the programme arranged for this meeting will still further your interests and those whom you represent."

At the afternoon session papers on "Underground Work" were read by Mr. Yeakle and by Mr. Clarence R. George, of Houston, Texas. In the discussion which followed many interesting facts were brought out. Mr. R. A. Smith, of

Norfolk, Va., told of his experience with a special type of underground cable made of rubber-covered wires with one bare copper wire in the center. It was found that this wire served admirably the purpose for which it was intended, that is if the lead sheathing was punctured at any point so that water could enter the cable a test on this bare wire would immediately reveal the defect while because the other wires were rubber insulated the defect might not appear in them until a long time afterward or until the rubber insulation had been destroyed and great damage done to the cable. Mr. Louis Gascoigne, of Detroit, Mich., told of a cable which he had used in which the same results were obtained by using a few pairs of paper-covered wire in the cable along with the rubber-covered wires. These wires were used for telephone purposes where a breakdown would not be disastrous, while for the police and fire alarm circuits the rubber-covered wires only were used. Messrs. A. C. Farrand, C. E. Diehl and several others also took part in the discussion of this paper.

Mr. T. C. O'Hearn, of Cambridge, Mass., then read a paper on "Hazard to Firemen from Live Electric Wires and Streams from Fire Hose," in which he told of tests which had been made to determine whether it was possible for a fireman to receive a shock by holding a nozzle and directing a stream of water against a live wire. As a result of these experiments and other observations it was concluded that a fireman may receive a shock when playing a stream on live wires. With the voltages found in our cities, however, the shock received in this way would not be sufficient to injure or even inconvenience a man under ordinary conditions. Nevertheless, since some unforeseen and unknown factor might exist at any time it is advisable not to play on live wires if it can be avoided.

Before adjournment President Yeakle appointed as nominating committee Messrs. W. Y. Ellett, Adam Bosch, R. A. Smith, J. L. Pierce and W. H. Thompson. Tuesday evening the fire alarm telegraph system of Rochester was inspected. This is undoubtedly one of the best fire alarm systems in the country, and Mr. H. G. Kennedy, who is the superintendent, may well be proud of the system over which he has charge.

Wednesday morning Mr. F. C. Mason, through whose efforts the association was organized and made a success, was present and gave some interesting reminiscences of the early days of the association. Mr. Mason extended to the association a cordial invitation to hold the convention at his home at Washington Mills, New York, whenever the time might be convenient. Mr. Frank P. Foster, secretary of the association, also told of the early days and paid Mr. Mason a high tribute for the energy which he displayed in his work of organization.

As Mr. H. G. Kennedy, superintendent of fire telegraph of Rochester, found it impossible to prepare his paper on "Mercury Arc and Other

Rectifiers" in time for presentation at the convention it was announced that his paper would be given later to the secretary for publication in the annual minutes. A discussion of this subject by Mr. Walter M. Petty, borough electrician of Rutherford, N. J., was read by the secretary. The paper which Mr. Petty had prepared on the subject of "Lightning Protection" was then read by Mr. A. L. Pierce, of Wallingford, Conn.

This evoked an interesting discussion, the question of grounding fire alarm or police boxes being the point upon which particular emphasis was placed. In order that the association might go on record on this subject in some way Mr. C. E. Diehl introduced the following resolution:

"Resolved that it is the sense of this association that in all fire and police boxes the shell should be grounded and the inside box and mechanism safely insulated from the circuit; and that the shell of telephone receivers on all police patrol telephones should cover the terminal connections to the receiver and the hook should be properly insulated."

This resolution was referred to a committee of five to investigate the subject during the coming year and report at the next annual meeting.

Wednesday afternoon at two o'clock the official photograph of the convention was taken after which special cars conveyed the party to Charlotte and Ontario Beach. After inspecting this resort the return to Rochester was made in time for dinner. In the evening Mr. John W. Kelly, Jr., of Camden, N. J., read a paper on "Wireless Telephone and Telegraph." At the conclusion of his paper Mr. Kelly showed some interesting experiments in wireless telephony and also gave an exhibition of the "Sonorophone," an instrument invented by him for transmitting music over wires to a distance and receiving the same by a telephone receiver attached to a phonograph horn. This was located on the stage and the music could be heard plainly and distinctly throughout the large hall.

Thursday morning a paper on "City and National Code Rules and the Relations of the City and Underwriters Inspectors," was read by Mr. R. A. Smith, of Norfolk, Va. Mr. Joseph B. Smith, of Rochester, was unable to prepare his paper on "Modern Police Signal System" in time for presentation at the convention, but this subject was discussed at some length by Mr. John W. Kelly, Jr., of Camden, N. J., and others. A short afternoon session was held, at which officers were elected and St. Paul, Minn., was selected as the place for the next meeting. The party then boarded special cars for Glen Haven, on Lake Ontario, from which place a boat took them to Newport. After an exciting ball game between the east and the west supper was served, followed by dancing.

Friday morning was devoted to the reading of a paper on "Inductive Loads of Low Power Factor," by A. S. Hatch, of Detroit, Mich., to concluding the business of the convention and to an

inspection of the exhibits. In the afternoon the visitors were taken for an automobile ride around the city and through the principal parks.

The officers for the coming year are as follows: H. C. Bundy, Watertown, N. Y., president; J. S. Craig, Toronto, Can., first vice-president; John W. Kelly, Jr., of Camden, N. J., second vice-president; J. G. Kraetz, of Buffalo, N. Y., third vice-president; John Berry, of Indianapolis, Ind., fourth vice-president; Clarence R. George, of Houston, Tex., secretary; C. E. Diehl, of Harrisburg, Pa., treasurer; executive committee, C. S. McCosker, of Mobile, Ala.; S. W. Manning, of St. Paul, Minn.; J. B. Smith, of Rochester, N. Y.; A. S. Pierce, of Wallingford, Conn.; R. A. Smith, of Norfolk, Va.; W. H. Thompson, of Richmond, Va.; W. Arbuckle, of Bayonne, N. J.; Robert Quain, of St. Louis, Mo.; Louis Gascoigne, of Detroit, Mich.

Finance Committee: J. G. Kennedy, of Rochester, N. Y.; P. H. McManus, of Wilkes-Barre, Pa.; W. H. Flandreau, of Mount Vernon, N. Y.

Committee to Investigate Grounding of Fire Alarm Boxes: T. C. O'Hearn, of Cambridge, Mass.; W. H. Thompson, of Richmond, Va.; P. H. McManus, of Wilkes-Barre, Pa.; James Grant of New Haven, Conn.; A. C. Farrand, of Atlantic City, N. J.

Among those who displayed exhibits at the convention or had representatives present were: Gamewell Fire Alarm Telegraph Company, of New York; Frederick Pearce and Company, of New York; W. N. Matthews and Brother, of St. Louis; Crouse-Hinds Company, of Syracuse; Safety Insulated Wire and Cable Company, of New York; Standard Underground Cable Company of Pittsburg; National India Rubber Company, of Bristol, R. I.; Bishop Gutta-Percha Company, of New York; National Metal Moulding Company, of Pittsburg.

The Gamewell Fire Alarm Telegraph Company distributed a very attractive souvenir of the convention in the shape of a match holder representing a fire alarm telegraph box mounted on an ash receiver of wrought metal.

Among those in attendance were:
Allentown, Pa.—P. J. Beisel.
Atlantic City, N. J.—A. C. Farrand.
Baltimore, Md.—S. R. Boone, J. B. Yeakle and wife and Mrs. J. H. Gildea.
Bayonne, N. J.—W. R. Arbuckle, wife and son.
Bridgeport, Conn.—F. O. Snow.
Bristol, R. I.—P. J. Lyons.
Buffalo, N. Y.—J. G. Kraetz.
Cambridge, Mass.—T. C. O'Hearn.
Camden, N. J.—J. W. Kelly, Jr.
Chicago, Ill.—Frank F. Stover.
Cincinnati, O.—O. P. Crocker.
Cleveland, O.—H. H. Bowen.
Corning, N. Y.—F. P. Foster and wife.
Detroit, Mich.—Louis Gascoigne.
Elmira, N. Y.—W. Y. Ellett.
Erie, Pa.—Wm. Crane and wife.

Harrisburg, Pa.—C. E. Diehl and wife.

Houston, Tex.—C. R. George.

Indianapolis, Ind.—John Berry and wife and O. C. Trusler.

Louisville, Ky.—C. F. Gall and Chester Gall.

Meadville, Pa.—A. J. Balizet and wife.

Montgomery, Ala.—B. A. Blakey and wife.

Mt. Vernon, N. Y.—W. H. Flandreau.

New Brunswick, N. J.—Robert Stewart.

New Haven, Conn.—A. L. W. Kittredge, Miss F. G. Kittredge, James Grant and wife.

Newark, N. J.—Adam Bosch.

New York.—W. J. Bagby, H. E. Dunham,

C. C. Johnson, W. J. Mundell, Frederick Pearce, R. L. Smith and wife, A. L. Tinker, and G. L. Wiley.

New Rochelle, N. Y.—A. J. Bell and wife.

Niagara Falls, N. Y.—F. Curry, M. J. Donahue, and M. McKinney.

Norfolk, Va.—R. A. Smith.

Northampton, Mass.—Nelson F. Tetro.

Peoria, Ill.—W. E. Wolgamott.

Pittsburg, Pa.—C. W. Abbott.

Portsmouth, Va.—W. M. Smith.

Richmond, Va.—W. H. Thompson.

Rochester, N. Y.—Courtney Alcott, H. G. Kennedy and wife, and J. B. Smith.

Scranton, Pa.—W. J. Neave.

St. Louis, Mo.—V. L. Crawford and Robert Quain.

St. Paul, Minn.—T. W. Manning.

Springfield, O.—L. S. Bosley.

Syracuse, N. Y.—E. Shannon.

Toronto, Ont.—J. S. Craig and wife.

Toledo, O.—Mark Winchester and wife.

Wallingford, Conn.—A. L. Pierce.

Watertown, N. Y.—H. C. Bundy.

Wilkes-Barre, Pa.—P. H. McManus.

Winnipeg, Man.—J. S. Henry.

York, Pa.—W. E. Fastnacht.

Underground Work.*

BY CLARENCE R. GEORGE.

City Electrician, Houston, Texas.

The object of this paper is more to continue the investigation of the problem of underground installations than for the purpose of presenting anything original on the subject.

Problems connected with underground service, which formed a part of very interesting proceedings at Atlantic City last year, may be adopted by this convention as a basis upon which the placing of wires below the surface shall receive proper consideration at successive meetings until we arrive at a point of understanding of the many important details connected with the work and develop, from a practical standpoint, a thorough knowledge of the methods, materials, cost, etc., from which the municipal electrician will be able to devise such plans,

* Paper read at the fifteenth annual convention of the International Association of Municipal Electricians, Rochester, N. Y., September 6-9, 1910.

with the necessary estimates, and execute the work from his own department without the necessity of calling upon and entailing on his city the expense of employing outside skill for the purpose of performing the very duty that he should be able to perform himself.

The paper prepared by Mr. Devlin, to which reference is made, shows commendable care and labor on the part of its writer. Many important essentials were gathered and arranged in such manner that the information imparted in this paper was so systematical that the paper may be considered a valuable reference for the members of this association.

It is evident from the number of inquiries that I have had during the past year that our smaller cities are awakening to the fact that the unsightly poles and wires must soon be a thing of the past, and their early removal is looked forward to—not only for the more desired purpose of removing that ever overhead danger to life and property, but for the purpose of clearing and beautifying the streets and public highways.

We all agree, without question, that the pole is a necessity, and at one time the overhead wires were the only method of construction, but the pole line, with its multitude of wires and other fixtures, is no longer a necessity in the business districts of either large or small cities; consequently the time is at hand when the city governments are asking that the unsightly and dangerous poles be removed and all wires be placed under the surface of the streets.

With this in view it is but natural that the municipal electrician comes in for his share of the work, and he should be equipped for whatever part his city government may call upon him to perform, and be able to devise plans, estimates and specifications that will add value to his department and place himself in such position that his work and efforts for the betterment of conditions electrically will show that he is ever ready to perform such duty as may be required by the city through his department, and that he is able to perform these duties.

It is sometimes necessary that the head of the electrical department of a city should place before his city council the existing conditions of the overhead wires and poles, especially as regards their danger to the public, and in so doing he should be able to advise the council with the proper reason and justice to the owners of such poles and wires why they should be removed and placed underground.

These reasons should be explained, I would suggest, in the several ways, such as immunity from storms, greater security in their maintenance, uninterrupted service electrically, the removal of the danger to the public and the elimination of the unsightly poles from the public thoroughfares. Either of the above reasons are in my mind sufficient to cause the removal of poles and wires from overhead to underground.

Now we come to a point where, in our positions as city electricians or superintendents of fire alarm

and police telegraph, it becomes our duty to care for our own wires, etc., as we know that this is a duty that we owe to our city and the public, and it becomes necessary as a part of our duty that we take advantage of the most skillful knowledge in the care and maintenance of the city wires and apparatus.

It is a natural trait of a great many fire alarm superintendents that I have come in contact with during my attendance at these conventions, especially those men whom I have found that are adapted to the positions they are in, to boast of the perfect service they give over their fire-alarm system or police system. However, you will find that these gentlemen are among those that are ever ready to give their system every advantage of improvement and proper maintenance. As an illustration I will quote you part of a conversation with a prominent member of this association regarding his system.

I asked him if he had much trouble with his system, and he replied that he never had any trouble, especially within the last two years.

Again I asked how he maintained the system in such way that he had had no trouble within the last two years.

His reply was that his system, both fire and police is underground, with the exception of a small part of it, and that it was also in cable.

Getting back to the subject of your city wires, it is natural in the management of your department that you should want to see the city that you represent advance, and it is your duty to see to it that all that applies to your department, electrically and mechanically, is placed before the proper authorities for the purpose of advancing with progress and advancements of the city government. If you fail to bring forward the advice and information and show the necessity of these improvements in your department as they are needed, there will come a day that some one in authority will want to know where you were, at a time when you were most needed, or was it that you feel that you were not competent to advise us or furnish the information that we should have had?

No doubt that there are a great many of you here that will be called on in the near future for plans, specifications and estimates for the installation of your fire or police telegraph system, or both, underground, and in that event it is but natural that you should want to provide your city with the most modern system devised to date, and it is the purpose of this association to secure and compile such information that will be beneficial and essential to you relative to underground.

While a general plan may be prepared, the foundation of which would be applicable to most any city, the general details would necessarily require modifications to suit the peculiar conditions arising, according to the city and the topography of the district to be covered.

The topography of the city, or that district to be covered by the underground, is a matter locally, and

the details should be drawn according to the use of the system to be installed, covering present needs and prospective developments.

Much of the information should be secured from time to time, in preparation for future use and to serve as a training period, becoming familiar with the subject by keeping in touch with the various phases of the work.

The manufacturers of cable, conduit, fibre and such other materials as are used in underground work will gladly furnish catalogues and other information pertaining to their products, which cover the ground so fully that a collection of them will furnish a valuable text-book on the subject, the study of which will not only furnish a considerable information of their own product, but will show its connection with other materials forming a part of the system, and the information gained thereby will be practical as well as technical.

From these sources preparation may be made by the superintendent of fire and police telegraph or city electrician, who further strengthens himself by the papers and discussions of the annual meetings and correspondence with the members who have had experience in the work, to the extent that if required to submit information to his officials regarding an underground system, in whole or part, he will be able to handle the matter so that his reputation will be benefitted and his municipality will profit by the application of his knowledge and the interest he has taken in the work.

This is one of the many subjects that this association is endeavoring to promulgate to its members, and the sooner that the work is accomplished the more appreciative will each become of their membership and the value of the association.

Underground Work.*

BY J. B. YEAKLE, BALTIMORE.

This is the most important of the several subjects that will engage your attention at this meeting. Modern construction and the future practice of the municipal engineer will have frequent opportunity for experiment and activity in this direction.

Although it may appear to the superficial observer that it is merely making a hole in the ground for the accommodation of a device that will render the opening permanently beneficial, it—like all other problems, seldom complete in themselves—compels a line of investigation which acquaints us with facts, the knowledge of which bears more or less upon the understanding of other features of our employment.

A proper knowledge of underground construction means some information regarding strength and ductility of armor, insulation and conductivity of conductors, proper means of drawing, splicing of joints, preparation of the metal and fluxes used to make joints water tight and other factors that are immediately concerned in underground work.

*Paper read at the fifteenth annual convention of the International Association of Municipal Electricians, Rochester, N. Y., September 6-9.

The question of strength and flexibility of the cable armor leads to a proper care in selecting material where other work is being considered and is a help in establishing a system that will lead to the best result in every department.

The lead armor common to all underground cable is strengthened by the addition of a small percentage of tin. Its flexibility is not reduced but its tendency to part from excessive strain is lessened.

Lubricating the armor by the application of soap-stone, tallow or common oil, prevents friction by which the protecting lead might suffer.

Cleaning the armor and sleeve, proper temperature of the lead to be used in wiping the joint, the quality of the solder is also important.

Careful handling of the molten solder, heating apparatus (to avoid injury to the men working in or around the manhole) and absolute cleanliness of all material used in making a splice.

All tools used in cable work should be set aside for that particular service and not used indiscriminately for line work, excepting, of course, shovels, digging bars and similar equipment, which belong to the inventory of construction and repairs.

The type and number of manholes is a factor in the lay-out to be determined after the territory has been selected and the accommodations to be provided. Concrete is becoming popular for this purpose and promises to give permanent and reliable service. The frames are easily prepared from inexpensive material and to one familiar with carpenter's tools, the construction will not be a difficult undertaking.

In very low places or where water is liable to settle, provision for drainage is important. Ordinarily, a small ship's pump will be sufficient to clear the manhole when necessary to enter.

Ventilation must not be overlooked. The practice for some time has not included special vents except in extraordinary cases.

The inner cover, at one time considered essential, has, for several reasons, been abandoned. They were found not to be essential. The interference from unauthorized entrance was rarely, if ever, a matter of concern and beginning with neglect to properly fasten them, they have finally been dispensed with.

The top cover is provided with vent holes near the edge where it lays in the supporting rim of the dome and although some dirt falls through, monthly inspection, even on streets of considerable traffic, is sufficient to keep them in good condition.

The person in charge should inform himself of the points most liable to the presence of gas and use the utmost care in entering manholes. In such places an exhaust pump should be in constant use while working in affected manholes, and no one should be allowed to go into them until after they have been open for ten or fifteen minutes and found to be clear of dangerous gases. Use of open lights for testing or working in manholes must be prohibited.

The presentation of a type of manhole is not in-

cluded in this paper. A number of maps of a system that has been referred to in complimentary manner by more than one interested, may be seen and perhaps some information obtained that will be of interest. Reliable maps of the territory involved should be the foundation of an underground system.

Test stations should be established at convenient points and observations made and recorded from the beginning of the drawing of the conductors. The testing device of Mr. Farrand will be found useful in connection with the voltmeter and milliammeter for keeping a close watch on the conductors and a speedy method of locating faults, especially to one who has the advantage of the early records suggested.

Nature of soil and the results of decomposition as it affects the materials of which the armor or conduits are composed should be a feature of the preliminary survey and subsequent information obtained from experience.

Electrolytic conditions are to be studied. Proximity of currents of abnormal strength. Their source and direction. The capacity of the return, whether track or bond wire. Frequent inspection to determine the polarity of the cable armor as compared with that of the leakage from the conductor likely to impair its efficiency.

For conductors, soft drawn copper wire is the standard. The insulation will depend on local conditions. Where only low voltages are to be provided for, the character of the compound and its diameter need not approximate the grade necessary where the cable is liable to interference from high potentials in its vicinity.

For fire alarm work a rubber compound only should be considered.

Paper, varnished cambric and other substances may afford the protection acceptable to some engineers, but only absolute conditions should be the rule for service of such vital importance as that in which we are engaged. A slight fracture of the armor in which rubber insulation is employed will give time for correction of the fault before it becomes obstructive. Paper is liable to cross or ground a loop, if armor is punctured or broken, before the fault can be reached.

This paper was written for the benefit of the cities and towns where underground work is only beginning to create attention and where the superintendent of fire or police telegraph has not had reason to devote any time to the consideration of the subject. But as much concern for the safety of the system during stormy periods and the increasing objections to overhead lines as disfiguring and dangerous spectacles in residential sections is becoming more frequent, it may contain some suggestion for those it is intended to serve which will give them some confidence in their ability to undertake the work which properly is a detail of their employment.

Telephone Relays.

Editor *Telegraph and Telephone Age*:

There was evidently some misapprehension in the mind of the writer of the paragraph headed "Nothing New Under the Sun," in your issue of August 1, 1910. In the first place the paragraph has run off the rails in its patent references. The numbers and dates are mostly wrong. I took the trouble to look up Mr. Stephen D. Field's patents, and I could not find any resemblance in them to Mr. Brown's telephone relay except the resemblance in the problem to be solved. Mr. Field's patents show that he was hovering round one solution; but as "no practical use was ever made of Mr. Field's invention" (according to the paragraph) I assume that it was not a success. Mr. Brown's solution of the problem on the other hand, judging by the way that the relays are selling, is a very great success. Mr. Field in his patents uses a "thermal wire." There is nothing of the kind in the Brown relay. It is dead cold. One of Mr. Field's patents says expressly that there are "intervals when the circuit is open and other intervals when it is closed, thus varying the resistance within extremely wide limits." This is never the case with the Brown relay. Also the Field arrangement according to the patents, is essentially a vibratory relay, and he claims a "thermic vibrator." There is no vibration in the Brown relay, when properly adjusted, special means being employed to damp out vibration. Also the Brown relay does not use platinum contacts, though the paragraph in question says it does. Platinum contacts are unsuitable and the statement in the paragraph that Mr. Field used platinum contacts shows (if the statement is correct) that Mr. Field was a long way from Mr. Brown's solution. One of the essential features of Mr. Brown's invention is the use of the extremely hard and refractory rare metals osmium and iridium. Soft metals and carbon are practically useless. Mr. Brown's relay is a highly novel and remarkable instrument, and I do not like attempts to rob a very ingenious inventor of the credit that is justly due to him.

DONALD MURRAY.

London, August 22, 1910.

The conveniences of the night letter telegram are appreciated in many unexpected quarters and new uses for this service are being found daily. A southern negro whose wife had evidently been away from home for some time went to the telegraph office and upon stating that he wanted to send a telegram the advantages of the night letter were explained to him. He accordingly expressed himself in the following effective manner: "When iz you gwine ter come home honie. Iz getting lonesom fer yuse, iz ter tell you I aint gwine ter wait much longer. Ben hangin roun dis foam office all der week. I nose yuse got nother nigger and iz coming down there wid my smoke pole to see about dat bisnes."

A History of New York and Pennsylvania Telephone Consolidation.*

BY U. N. BETHELL.

President of the New York Telephone Company.
TERRITORY.

First, I want to say a word about what our system is. As you know, the telephone system which we are all engaged in operating and running covers the two great States of New York and Pennsylvania, and the neighboring States of New Jersey, Maryland, Delaware and a part of West Virginia and Ohio. It has an area of about one hundred and twenty-four thousand square miles. It contains a population of about twenty millions. We have invested in it in plant alone over one hundred and seventy-five million dollars. The number of telephones is about a million two hundred and seventy-five thousand, and the number of employes over thirty-two thousand.

You will perhaps get a better idea of the extent of our system if I tell you that it is about one-third of the entire Bell plant in the United States; that we have over one-fourth of the Bell stations in the United States, a little less than one-third of the Bell employes in the United States and produce more than one-third of the Bell revenue from associated companies in the United States, both gross and net. Broadly speaking, our system is one-third of the whole Bell system of the United States.

Our territory is about equal in size to Great Britain. We have about one-half of the population in our territory that is in Great Britain. We have in our territory more than double the number of telephones in Great Britain. Our development, therefore, is about four to one of Great Britain. Our system is as large as the telephone systems of Great Britain and Germany combined, and about equal to all the telephones in the rest of Europe. In other words, our system is in size about fifty per cent. of all the telephone systems of Europe combined. It is the largest telephone system under one operating management in the whole wide world.

CONSOLIDATION.

If you will permit me, I will tell you a little as to how it came about. Only a few years ago—about four years ago—there were seven Bell companies operating in the State of New York alone. There were four Bell companies operating in the State of Pennsylvania. One of the New York companies referred to, and one Pennsylvania company, were operating in the State of New Jersey. A separate company operated in Delaware and another company in Maryland and the District of Columbia.

Now, it was desired to bring together all these companies into one organization in order that the business might be more efficiently handled and more economically administered, and the commencement

was made here in this territory. Some years ago, when Mr. Cutler, the then head of the New York Telephone Company, was in Florida, I was in the City of Washington one evening, with nothing to do. I wrote to Mr. Cutler, urging the importance of consolidation and concentration, feeling that the future success of this vast territory depended upon bringing its various parts into one strong unit. I happened to find the other day an old map on which, in 1906, I had, with great presumption, perhaps, drawn some broad lines around different areas in the United States. I found, somewhat, to my amusement and much to my gratification, that one broad line was drawn about the system which I, a moment ago, described to you—our system as it is to-day. I was connected with the Chesapeake and Potomac Company then, but not with your company—the old Pennsylvania Company—in a small way with the Bell or Philadelphia, and with the New York, but not with the New York and New Jersey or any of the other companies operating in New York State. We began about two years ago with an attempt to acquire the capital stock of the Chesapeake and Potomac Telephone Company, offering to exchange for that stock shares of the Bell of Pennsylvania—or rather Bell of Philadelphia, as it was then—at two shares of the Bell of Philadelphia, for three shares of the Chesapeake and Potomac. I had previously worked out a similar plan, but was unable to convince others that it should be carried out. With a great deal of trepidation, I presented the plan to Mr. Theodore N. Vail soon after he returned to the active management of the Bell companies. He took the plan and after a few days handed it back to me, saying, "Do you think you can do this?" I said, "Yes, I think so."

His only comment was, "You cannot do it too quickly for me." A little later he said, "What do you think of taking in the Pennsylvania Company?" Well, our covetous eye had not been cast upon this beautiful territory up to that time; we did not know Mr. Crosman and Mr. Kinnard and the rest of you as well as we do now. We had looked upon the territory as rather poor, and felt that it would be a burden on the other companies. We found very soon that you folks up here reciprocated by thinking that the Philadelphia Company might be a burden.

I was asked what I thought of taking in the Pennsylvania Company, share for share. I replied that I knew very little about the territory, that I would find out something about it and answer later. Then I took what to me has ever since been a memorable automobile trip—I had twelve blowouts in three days and was running my own car. I spent about a week running through the territory and, stopping in this beautiful city of Harrisburg, met Mr. Kinnard. I don't think he suspected that I was spying out the land, and therefore was as courteous and gracious as he always is. When I had gone through the whole splendid territory,

*An address delivered before the Western Pennsylvania Telephone Society at Harrisburg.

through its thrifty towns, its cities of wealth, its splendid agricultural and mining regions, I said to myself, "And they have only about five millions invested up here. All this territory needs is development." When I got back to New York there was no hesitation or uncertainty about the answer. The old Bell of Philadelphia by a change of name then became the Bell of Pennsylvania; the old Pennsylvania Company was acquired on the basis of share for share, and the Chesapeake and Potomac as well as the Delaware and Atlantic Company, which was practically owned at the time, came into the sisterhood of our happy family.

This narrative may be very dull, gentlemen, but I am stating plain facts, not attempting a word picture of any sort. These great properties were brought together in such a way that there was no increase in capitalization whatever. The old shares of the Bell of Philadelphia were represented by shares, dollar for dollar, in the Bell of Pennsylvania; old Pennsylvania shares were also represented by Bell of Pennsylvania shares, dollar for dollar. The Chesapeake and Potomac shareholders received two shares of the new issue for three shares of the old.

And thus was brought about the first great step in the building up of our system. Then it was necessary to bring together the companies in New York State. There was the Hudson River, the New York and Pennsylvania, the Empire State, the Central New York, the Bell of Buffalo and the New York and New Jersey, which was operating both in New York State and New Jersey. The Bell of Buffalo let us leave out for a moment. We proceeded first to get the Central New York and the Empire State to come into the family, because they operated in the very heart of the State. These shares were bought for cash at 65 for Central New York, and 40 for Empire. Then came Hudson River and New York and Pennsylvania. Many plans were discussed but no conclusion was reached. Mr. Vail was about to sail for Europe, and I urged him to give me authority to buy the stock of both companies at figures which I thought were fair. He finally said, "You can pay that if you take all or none." I knew that this all or none condition, with a scattered stock list numbering several thousand people, killed the proposition, and I felt quite disheartened. The next day Mr. Vail sailed. As I was coming in on the train to the office the next morning it occurred to me, "Why not trade Bell of Pennsylvania stock for Hudson River and New York and Pennsylvania." Then it also occurred to me that it might seem strange to Mr. Vail that that particular thought should flash into my mind the moment he got on a steamer bound for Europe. However, I thought it over carefully, and concluded that the matter would not wait, and then made the offer. It was, of course, necessary to have the stock to offer, so I went to Philadelphia and bought the stock from the Bell of Pennsylvania, paying one hundred dollars cash for each share of

it, and then offered it in trade for the stock of the up-State companies on a basis which was worked out with a great deal of care, taking into consideration the value of the properties, their earning power, their future, and all that sort of thing, and I am pleased to say that over ninety-nine per cent. of the holdings in each one of those companies came in. The basis of the trade was one share of Bell of Pennsylvania for one and one-half shares of Hudson River or two shares of New York and Pennsylvania. Having thus acquired practically all of the stocks of the Hudson River, the New York and Pennsylvania, the Central New York and the Empire State, it required only a rather simple legal proceeding to make the Central New York the owner of all the properties of these four up-State companies. Upon completion of this transaction, we still had four companies in New York State, the Bell of Buffalo, the Central New York, the New York and New Jersey and the New York Company and two in Pennsylvania—the Bell and that splendid company with the euphonious and significant name, the Central District and Printing Telegraph Company.

A plan was then worked out to bring the Bell of Buffalo, the New York and New Jersey and the Central District and Printing Telegraph Company into our growing family. We had our eyes on you, Mr. Buehler—we thought you were a good thing to get. We thought that the property you were so ably managing and the rest of the property could and should be mutually helpful and strengthening.

On the 1st of July last year, I was going to the Adirondacks with my boy. When about ready to start, Mr. Vail called me from Boston, and asked me to come over to explain and discuss the plan. I tried to beg off urging my engagement with the boy, but he said, "Bring the boy, and go from here to the Adirondacks." Mr. Vail has a faculty of telling you not only what to do, but also how you can do it, that is, if you tell him that you have other plans and cannot very well arrange it. The plan was discussed and approved, and then Mr. Vail quietly remarked, "That's two years' work cut out for you." I went up to Buffalo, and spent an entire day discussing the matter with the Board of Directors of the Buffalo Company, and our proposition was so fair that they accepted it, and recommended it to their stockholders. I went from Buffalo to Pittsburg, and Mr. Buehler will remember the strenuous day that followed. Fortunately, all the directors were in town and could be gotten together on short notice. We argued back and forth until the shades of evening fell, and then continued to argue, and the thing was not finally settled until the next morning, but it was settled then upon fair terms, terms that were acceptable to the Pittsburg people and acceptable to us. The terms also proved acceptable to the stockholders: all but a very few shares of the stock came in promptly. Practically all of the Bell of Buffalo shares came in also. The New York and New Jersey was brought

in by an exchange of one share of American Telephone and Telegraph Company for each share of that company's outstanding stock.

ONE HOLDING COMPANY.

Now, I have told you as briefly as possible how this great system was welded into one organization, having an investment to-day, including its working capital, of approximately two hundred million dollars. A feature of the broad plan was to have one operating company own the stocks of the other companies where it was impossible to amalgamate and put the properties under direct ownership because of the legal requirements of the different States in which we operate. To carry out this feature, a mortgage was placed on the property of the New York Telephone Company for seventy-five million dollars. Fifty million dollars of bonds were sold, and with the proceeds, the New York Telephone Company bought the stock of the Bell Telephone Company of Pennsylvania. As the matter stands to-day, the New York Telephone Company with a capital of one hundred and twenty-five million dollars, and a bonded debt of a little more than fifty million dollars, holds among its other assets, that is, besides its own telephone lines, plant and properties, the capital stock (all but a small part of it) of the Bell Telephone Company of Pennsylvania, which company in turn holds the Central District and Printing, the Chesapeake and Potomac, the Diamond State and the Delaware and Atlantic, a glorious grand division in that splendid national organization which proudly floats the banner of the Bell.

To expeditiously and effectively carry out a plan so complex and involving so many widely varying interests, it was necessary to acquire the stock of the New York Telephone Company held by others than the American Telephone and Telegraph Company. The Western Union Company owned about sixteen millions par value of the stock. The stock was encumbered by an issue of bonds which Kuhn, Loeb and Company had placed for the Western Union. The sale of the stock rested entirely with the board of directors of the Western Union, but that company referred the matter to Kuhn, Loeb and Company, of which firm Mr. Jacob Schiff, one of the greatest financiers in the world, and personally a most delightful man, is the head. It fell to my lot to endeavor to buy that stock. I went down one morning and called on Mr. Schiff. About the first thing he said was, "Well, what is in your mind?" I thought but did not say, "It is in my mind to find out what is in your mind first, if such a thing is possible." We had a very pleasant conversation for about an hour, when the matter was left in such shape that I could return later, if need be, after seeing some of the other directors and the President of the Western Union Company. I had come down from the Adirondacks, leaving my family there, and was very anxious to get back. I wished very much, therefore, to close the matter that day if possible. Well, that could not be done,

but next morning we were able practically to close it. The deal involved about twenty-three millions and it was closed satisfactorily to both of us and without the scratch of a pen. He said "We understand one another?" I said, "I think we do." Mr. Schiff then called his son Mortimer—Mr. Schiff, by the way, was sailing for Europe the next day—and turning to me inquired, "Will you need any money to carry out your plans?" I said, "I think not, Mr. Schiff, but possibly so." He turned to his son and said, "Mort, if Mr. Bethell wants any money while I am gone, you may let him have whatever he wants." Upon the opening of that door I felt about as near great wealth as I ever felt in my life. But when I reached the sidewalk, I felt as Hamilton did the other day when he went over in his biplane from New York to take his afternoon nap in Philadelphia. When Hamilton came to earth his first words were, "I am dying for a cigarette." I crossed the street, entered a cigar shop, went into my pocket, and found three cents.

REDUCTION IN OUTSTANDING.

I do not expect you to carry all these details in your mind, and I may not have told all that is necessary to make a complete story. I dare say there are a number of things which I have forgotten to mention, but what I have wanted to convey to you is this fact, that there has been the building up of a great financial organization with a capitalization of some one hundred and seventy-five or one hundred and eighty-five millions, a real investment you may say, of about two hundred millions of dollars, and in the process the capitalization, as represented by its capital stock and its bonds and its notes, was actually reduced, so that at the end of the transaction there were less securities outstanding as a burden upon the industry, and ultimately as a burden upon the public, than there were at the beginning of the transaction by more than seven millions of dollars. I am tempted to say that this is a unique feat in the building up of great corporations.

(To be continued.)

The delivery of telegrams by telephone which has been tried by the British Post Office in some sections of London for several months past has given very satisfactory results and this service is being gradually extended.

An exhibition was given to invited spectators at the Edison laboratories in West Orange, N. J., recently of the Edison kinetophone, a combination of the effects of the phonograph and kinetoscope, to which problem Mr. Edison has given attention for some years. A moving picture man appeared on the screen, who after announcing the subject of the demonstration performed a number of experiments. A plate was thrown on the floor and the sound when it was dashed into fragments coincided with the impact. Other similarly successful experiments were made.

The Chicago Reunion of the Old Time Telegraphers' and Historical Association and of the Society of the United States Military Telegraph Corps.

The twenty-ninth annual reunion of the Old Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps will go down in history as one of the best in attendance and from the standpoint of interest in entertainment of any in the long series of these annual functions. Mr. William J. Lloyd of Chicago, the president of the Old Timers, together with his many able assistants was indefatigable in his efforts to make everyone comfortable and happy, and that he was eminently successful was attested to by everyone who was fortunate enough to be present.

COL. WM. B. WILSON, HOLMESBURG, PHILADELPHIA.
President of the Society of the United States Military Telegraph Corps and President Elect of the Old Time Telegraphers' and Historical Association.

The visiting ladies were especially well taken care of under the able guidance of Mrs. William J. Lloyd, together with her committee associates.

The weather was clear and cool throughout the reunion which added greatly to the pleasure of the various functions. The program of entertainment was so extensive that every moment of the visitors' time that could be spared from necessary sleep was occupied with visits to the many points of interest including art institutes, observatories, ball games, theatre parties, dinners and suppers, automobile rides, excursions to Highland Park and the great stock yards and terminating with a banquet at which three hundred members and friends participated. Every section of the country, including Canada, was well represented.

BUSINESS MEETING.

Promptly at ten o'clock on the morning of September 8 the retiring president, Mr. George A. Cellar, of Pittsburg called the meeting to order in the parlors of the Auditorium Hotel and with a few appropriate remarks pinned the insignia of his office, a gold mounted miniature portrait of Professor Morse, on the breast of Mr. William J. Lloyd

the president-elect of the association. After thanking those present for the honor conferred on him President Lloyd introduced Mr. George M. Bagley, assistant corporation counsel of the City of Chicago, who on behalf of the municipality, cordially welcomed the delegates to the city. The response to the welcome was made by Mr. M. J. O'Leary of New York who took occasion to refer to the commanding position occupied by the City of Chicago; its rapid and ever increasing development as the inland capital of what is now a mighty empire and the influence it exerts on the commerce of the world and that in honoring the Societies of the Old Time Telegraphers' and Historical Association and the United States Military Telegraph Corps the city honored itself as many names famous in the world's history have been and are now on the roll of membership of both associations. Colonel William Bender Wilson, president of the Society of the United States Military Telegraph Corps, then assumed the chair to conduct the business meeting of that Society. He began the proceedings by reading his annual report, which recited the progress

W. A. SAWYER, PHILADELPHIA.
Vice-President-Elect of Old Time Telegraphers' and Historical Association.

made in congressional legislation in behalf of the members since last year's reunion. He deplored the fact that so many of the members were passing away, twenty having died since the reunion last year at Pittsburg. He called on all the members to redouble their efforts with their congressional representatives in behalf of favorable action on the measures now pending before both houses at Washington.

Mr. Marion H. Kerner of New York in the absence of the secretary and treasurer, David Homer Bates, read various communications and reports, all of which received favorable action. The roll call showed that thirty-eight of the war veterans were present, the largest number in attendance for many years. Resolutions of thanks to the various congressmen and senators for their earnest interest in promoting the pension legislation in behalf of the military telegraphers; also resolutions of thanks to President Lloyd and his associates for their splendid program of entertainment were passed.

C. E. BAGLEY, PHILADELPHIA,
Vice-President-Elect of Old Time Telegraphers' and Historical Association.

Mr. Andrew Carnegie was also the recipient of a resolution of thanks for favors received by the society. All of the old officers were re-elected as follows: Colonel William Bender Wilson, Holmesburg, Philadelphia, president; William L. Ives, New York, and Charles A. Tinker, Brooklyn vice-presidents; David Homer Bates, 658 Broadway, New York, secretary and treasurer. The executive committee of the society was reappointed by President Wilson.

Mr. T. E. Moreland, of Pittsburg, called the attention of the Society to the fact that the names of the Civil War telegraphers from Allegheny County, Pa. were duly inscribed in bronze on a tablet which occupied a prominent place in the new memorial hall located at Pittsburg.

Mr. William J. Lloyd, president of the Old Timers, then resumed the chair and called on the Secretary and Treasurer, Mr. F. J. Scherrer of New York to read the various reports, all of which were duly received and ordered printed in the minutes. Treasurer Scherrer's report showed an increased balance on hand over the previous year and the affairs of the association to be in a most gratifying condition.

Mr. E. P. Griffith of New York read a resolution to establish a monument at Turner, N. Y., to commemorate the sending of the first telegraphic

train order. This resolution was passed by the Association of Railway Telegraph Superintendents at their annual meeting in Los Angeles in June and was printed on page 448 of our July 1 issue together with some interesting historical facts relating to the sending of the first train order.

Mr. M. J. O'Leary in moving the adoption of this resolution moved that the names of the president and secretary be added to the list of members of the committee having the erection of the monument in charge and that the sum of at least ten dollars be appropriated as the contribution of the Old Timers' Association to this historical and worthy object.

FRANK E. MAIZE, PHILADELPHIA,
Vice-President-Elect of Old Time Telegraphers' and Historical Association.

The committee now consists of: E. P. Griffith, superintendent of telegraph, Erie Railroad, Jersey City, N. J. chairman; C. Selden, superintendent of telegraph, Baltimore and Ohio Railroad, Baltimore, Md.; E. A. Chenery, superintendent of telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railroad, Montreal, Canada; J. B. Taltavall, editor Telegraph and Telephone Age, New York; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia, Pa., and F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York.

The resolution was as follows:

Whereas, the fact has been established that railroad operation by telegraph was conceived by Charles Minot, general superintendent of the Erie Railroad, in the autumn of 1851, and the first telegraphic train order was issued from Turner, N. Y., station in that year, it is befitting the Association of Railway Telegraph Superintendents, and

the Old Time Telegraphers' and Historical Associations to recognize that great epoch in railroad and telegraph history. And, whereas the story of the passing of the old Turner, N. Y., station on the Erie Railroad is now going the rounds of the press, awakening in the minds of the pioneer railroad and commercial telegraphers, fond recollections of their early days. Therefore,

Be It Resolved, that the Association of Railway Telegraph Superintendents, and the Old Time Telegraphers' and Historical Association, the latter concurring shall appoint a joint committee of five to raise a sufficient fund by popular subscription, to erect, and shall erect, a monument with suitable inscription commemorative of the event, on the site of the original Turner, N. Y., Erie Railroad station.

And Be It Further Resolved, that John B. Taltavall, editor of *Telegraph and Telephone Age*, shall be a member of that joint committee, and is hereby authorized to receive and acknowledge subscriptions through the columns of his journal or otherwise.

The committee on time and place consisting of John B. Taltavall and W. L. Ives of New York, H. W. Plum of Denver and Jos. Uhrig of Chicago, reported in favor of Atlantic City, N. J. as the place for next year's reunion and recommended the following to be the officers for the coming year. Colonel William B. Wilson of Philadelphia, president; William A. Sawyer, Chas. E. Bagley, F. E. Maize, vice-presidents, and Mr. Franklin J. Scherrer of 195 Broadway, New York, secretary and treasurer. The report was unanimously agreed to and the convention after transacting routine business was then declared adjourned.

ENTERTAINMENT.

After the adjournment of the business meeting the visitors were conducted by the various local committees to the Art Institute and through the shopping district until 3 p. m. when the base ball grounds were reached. The delegates then witnessed an exciting base ball game which resulted in the victory of Chicago over Cincinnati. In the evening the entire party which consisted of over two hundred and fifty members and friends attended the Majestic Theatre where a very enjoyable vaudeville entertainment was presented at the close of which the party repaired to the Hofbrau where refreshments were served.

On Friday morning, September 9, a special train on the Chicago and Northwestern Railroad conveyed the party to Highland Park, Ills., where they were the guests of Mr. and Mrs. Frederick W. Cushing at their beautiful Moraine Hotel which with its spacious and beautifully laid out grounds is one of the finest hotel properties in the United States. The buildings are situated on a high bluff overlooking Lake Michigan and commanding a magnificent view. After an opportunity was afforded for a minute inspection of the buildings and grounds, a reception was held, the entire party being presented to Mr. and Mrs. Cushing after which a

sumptuous dinner was enjoyed. At the conclusion Mr. D. G. Ramsay of Chicago, a former telegrapher but now a member of the legal profession, in behalf of those present thanked the host and hostess for their generous hospitality.

Mr. Cushing who is also a former telegrapher, many of his old associates being among the delegates feelingly responded stating that it was a great privilege to Mrs. Cushing and himself to in any way contribute to the enjoyment of the visitors. He also recited some old time experiences while employed in telegraphy, stating that one of the delegates to the reunion, Mr. George M. Eitemiller, now of Detroit, Mich., one of the finest operators the country had ever produced, made him do some strenuous work while he manned the New York end of the Philadelphia local in 1876, centennial year, with Mr. Eitemiller, in the Quaker City.

The return to Chicago a distance of twenty-five miles was made in time to attend the Cort Theatre where the musical comedy "Jumping Jupiter" with Richard Carle in the leading role was presented. At the conclusion, the delegates to the number of two hundred and fifty were entertained at supper at Rector's restaurant.

At 9 a. m. on Saturday, September 10, a special train on the Lake Shore and Michigan Southern Railroad conveyed the visitors to the Union Stock Yards where many of the plants of firms engaged in the meat industry were inspected. In the afternoon the party was toured in automobiles for several hours through the magnificent parks, parkways and residential sections of the city, returning to take part in the crowning event of the reunion.

THE BANQUET.

When President Lloyd called on the Rev. Dr. Wm. D. Gentry now a divine of Chicago, a forty-niner of the telegraph who also served his country as an operator in the Civil War, to say grace, three hundred persons were seated at the forty tables arranged in the large banquet hall of the Auditorium Hotel. The floral decorations were of palms and gladioli. The electrical decorations were very extensive and tasteful, the prominent features being the large motto "73" in red, white and blue incandescent lamps at one end of the room which shone forth during the festivities, at the conclusion of which the symbol "30" in red incandescent lamps was displayed at the opposite end of the banquet hall.

After coffee had been served President Lloyd read telegrams of regret from many of the telegraph officials of both companies and others all of whom expressed the hope that the occasion would be one long to be remembered. Mr. Lloyd introduced as toastmaster, Mr. Bernard E. Sunny, of Chicago. The toastmaster who was also an old time telegrapher made most elaborate and appropriate addresses in introducing the various speakers.

Mr. B. J. Mullaney responded to the toast of "Representing the City of Chicago"; Colonel William B. Wilson of Philadelphia on "Heroes of the

War"; Mr. W. R. Plum of Lombard, Ills., on "A Few Thoughts"; Mr. Charles S. Holt of Chicago on "Legal Reminiscences"; Mr. A. H. Bliss of Chicago on "An Experience"; Mr. Frank J. Loesch of Chicago on "What the American Operator Has Accomplished"; Mr. M. J. O'Leary of New York on "Fraternity"; and Mr. J. B. Taltavall of New York on "The Press."

Resolutions were unanimously passed thanking Mr. William J. Lloyd and associates of Chicago, the Chicago and Northwestern Railroad Company, Lake Shore and Michigan Southern Railroad Company and Mr. and Mrs. Frederick W. Cushing of Highland Park for courtesies extended. During the dinner the party joined in singing the "Ode to Morse" written by Marion H. Kerner of New York, and also "The Signal of the Key" composed for the occasion by Mr. A. S. Hibbard of Chicago and arranged to the air of "Tramp, tramp, tramp, the boys are marching." At the conclusion of the singing of "Auld Lang Syne" the Chicago reunion of 1910 passed into history.

Among those in attendance were:

Buffalo, N. Y.—L. M. More and wife; N. Hucker.

Butte, Mont.—Mrs. W. H. Plum.

Chenoa, Ill.—A. H. Copeland.

Chicago.—Melvin J. Adams; D. S. Anderson and wife; C. M. Baker; R. C. Baker; W. A. Baker and wife; Miss Theda Baker; Henry Behl and wife; Miss Ada M. Behl; Miss Elizabeth Behl; W. E. Bell; A. W. Biedler and wife; Thor J. Benson; A. H. Bliss; Mrs. B. M. Bracken; A. D. Brewer and wife; C. E. Brown; E. A. Bryson and wife; John F. Butler; A. B. Carroll and wife; David A. Carroll; T. W. Carroll; John L. Corey; M. H. Clapp; M. T. Cook; T. P. Cook; A. B. Cowan and wife; Miss Anna Belle M. Cowan; Miss Mary Cowan; J. A. Cummins and wife; Alexander Crow; G. W. Dailey and wife; John R. Dixon; P. W. Drew and wife; A. C. Duffey and wife; Miss Grace Dugan; C. H. Finley and wife; C. Gallagher and wife; Geo. McGann; Rev. Dr. W. D. Gentry and wife; C. F. Gross and wife; Morgan G. Gross; H. B. Hamilton; F. W. Hans and wife; W. P. S. Hawk; J. S. Henderson; Mrs. M. K. Holligan; Charles S. Holt; John Hutchinson and wife; F. L. Jacobs and wife; J. G. Jennings, wife and daughter; C. H. Kehnroth and wife; M. T. Kenyon and wife; E. J. Knecht and wife; G. A. Kiel; Richard Ledwith; W. J. Lloyd and wife; Miss Bessie M. Lloyd; T. DeQuette Lloyd; Frank J. Loesch; C. S. Lowenthal and wife; Chas. M. McCann and wife; M. McCulloch; W. F. McDonald and wife; H. G. McGill and wife; A. J. McGrath and wife; A. R. McGrath; E. W. McKenna; J. R. Magill and wife; C. D. Meserve; F. V. Moffitt and wife; J. F. Morgan and wife; C. Moxam; Bernard J. Mullaney; A. C. Murphy and wife; W. H. Murphy; Miss E. M. Murphy; Frank Murphy; J. H. Pendry, wife and daughters; Leo Peters and wife; C. W. Potter

and wife; W. T. Plummer and wife; T. N. Powers; H. T. Price; D. G. Ramsay; Miss Estella W. Ramsay; Fred M. Randolph and wife; C. W. Ray; Wm. Record; H. T. Reneau; J. E. Schank and wife; G. D. Seward and wife; Mrs. Ora Sharp; Chas. A. Shedd; E. G. Sheckler and wife; C. H. Shell and wife; A. F. Sherwood and wife; George Smallbone and wife; E. M. Stanton and wife; Henry D. Sturtevant; B. E. Sunny and wife; Miss Helen T. Sunny; Joseph Uhrig and wife; H. G. Waters and wife; J. J. Welch and wife; F. T. Wilbur and wife; E. S. Williams, and Joseph K. Witzell.

Cincinnati, O.—R. C. Bliss and wife.

Cleveland, O.—Fred J. Dayman; John Fitzpatrick and wife; J. T. Hanford; Oscar F. Stow and H. W. West.

Columbus, O.—Otis H. Newell and H. E. Rawson.

Crater, Colo.—H. W. Plum.

Dallas, Tex.—Frank B. Knight and J. E. Rockwell.

Denver, Colo.—J. W. Brunton.

Des Moines, Ia.—Thad M. Schnell.

Detroit, Mich.—G. M. Eitemiller; Alfred Lowther; J. McArdle; Thos. A. Mears and J. Moxam.

Dowagiac, Mich.—E. M. Showerman and wife.

Dubuque, Ia.—James Leary and wife.

Geneva, Ills.—Harry D. Sloat.

NOTES OF THE CONVENTION.

The long military training of Captain William J. Lloyd formerly identified with the signal service of the State of Illinois and Captain W. E. Bell, formerly of the cavalry arm of the State stood them in good stead during the long and arduous duties which the arrangement of the details of the convention entailed.

Among their efficient lieutenants to whom various duties were assigned were T. W. Carroll, Jos. Uhrig, F. V. Moffit, A. C. Murphy, A. B. Cowan, C. W. Potter, G. Smallbone, J. J. Welch, and many others.

Owing to the regrettable illness of Mrs. W. E. Bell the duties of the Chairman of the Ladies Committee devolved on Mrs. William J. Lloyd who was untiring in her efforts to anticipate every wish of the visiting ladies. Her beautiful home in northern Chicago saw but very little of her during the entire week of the convention and she did not leave the hotel after the banquet until she had exchanged parting greetings with all the visitors. Mrs. Lloyd was very ably assisted in her efforts by Mrs. Moffit, Mrs. Uhrig, Mrs. Cowan, Mrs. Potter, Miss Bessie Lloyd and the other ladies of the committee did yeoman service and many warm expressions of admiration for the painstaking and thorough manner in which they conducted their work were heard on all sides from the visitors.

Colonel Wilson was the recipient of many hearty congratulations on his election to the presidency of both societies and on the selection of Atlantic City, N. J., for the meeting place of the convention in 1911. He has already placed himself unreservedly on record to arrange such plans for the entertainment of the visitors that no part of the Boardwalk will remain unexplored and that extra guards will be provided for the safety of the many daring swimmers like Messrs. Bliss, Bell, Ives, Dugan, Matlock and Plum, all of whom have promised to be present.

Among the youngest old timers in attendance were three forty-niners of the telegraph, namely Rev. Dr. W. D. Gentry of Chicago, Nat Hucker of Buffalo and G. W. Brownson of Toledo.

It is also worthy of note that four generations of Brownsons, three of them identified with the telegraph, were assembled in Chicago during the reunion.

The report of Secretary Scherrer showed that sixty names of telegraph people were added to the list of members during the past year. Among these was Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company, as well as many others prominent in railway and telegraph circles.

Mr. W. J. Camp, electrical engineer of the Canadian Pacific Railway Company's telegraph appeared at the convention minus the luxuriant moustache which he usually wears. The disguise was so effective that many of his best friends failed to recognize him. He succeeded in making one prominent New Yorker believe he was a Mr. Johnson of Chicago.

Strenuous work and late hours gave many of the visitors unaccustomed to Chicago activity a sleepy appearance in the mornings owing to having to arise early to commence the active work of each day.

Mr. Theodore P. Cook displayed in a striking manner his warm genial nature by mingling freely with the convention delegates, contributing much to the pleasure of the occasion by renewing acquaintances of frontier days and placing his automobile at the disposal of the committee.

The distinguished resident of Tip Top, Ky., Colonel George M. Dugan, was present with an unusually large fund of interesting stories of war days. Many wordy pleasantries passed between him and Colonel William B. Wilson as to the merits of the respective telegraph service of the south and north during the four years of the Civil War.

Mr. L. E. Rudd, manager of the Western Union Telegraph Company at Knoxville, Tenn., in a recent letter states: "You did exactly right in renewing my subscription for the ensuing year and I wish to thank you for your action, so that I will not miss any of the copies of your publication."

American Telegraph Engineering—Notes on History and Practice.

[Discussion by Mr. Ralph W. Pope, Secretary of the American Institute of Electrical Engineers, on the paper on the above subject, which was presented by Messrs. William Maver, Jr., and Donald McNicol at the twenty-seventh annual convention of the American Institute of Electrical Engineers at Jefferson, N. H., June 28-July 1, 1910, and which appeared in our columns July 1 to September 1, inclusive.]

I might indulge in reminiscences on the historical part of this paper, but I will not trespass upon your time to the extent that might be necessary. I note, however, that the early introduction of the Morse system was followed by what purported to be improvements, and that these improvements have practically passed out of existence. I refer more especially to the House and Hughes, and the "combination" printers, which followed, leading off with the House printer in 1847 and 1848. I was familiar with the work of that printing instrument, although I did not operate it. My printing telegraph work was confined to the Hughes printer, which was introduced, as you may say, experimentally in 1858, although it did not come into general service until the "combination" printer, so-called from the combining of certain features of the House and Hughes printers by the late George M. Phelps.

One of the defects of the House printer, which was an ingenious machine, was the limited distance over which it would operate, and I would call the attention of the author of the paper presented to the possibility of an error in regard to this having been operated on lines 1,000 miles in length. While that might be true, in a sense, as a matter of fact, it was not usually operated between New York and Boston, a distance of perhaps 225 miles, except in very fine weather. The ordinary practice was to repeat at Springfield, which was about half way.

One of the difficulties of the early printers in regard to their general adoption was their failure to meet the requirements for way-station work. This was met in the case of the House printer, as is not generally known, by the use of a simplified form of the printer. As the type wheel stopped the exposed letters could be followed by an expert operator without the use of the printing device—a simpler form was introduced which operated as a dial printer, the operator reading from the wheel, instead of the printing mechanism being used to print on the tape.

The question of high speed and the use of the chemical telegraph created considerable interest in telegraph circles at the stage referred to by the author. It is interesting to note that in one of the important experiments made, which is referred to in this paper, that the time consumed in perforating, in transmitting and translating, was more than would have been required by four Morse operators in transmitting the President's message referred to, a difference between seventy-

two minutes as against fifty-two minutes. The use of the chemical system raised so many objections that it is not strange it went out of use, but it was at one time quite successfully established in New England, but not using the perforated tape, simply hand transmission, the same as with the Morse system.

The improvements in the Morse telegraph have been largely due to the increased skill of the operators. The use of the typewriter, which has been referred to, brings to mind a rather peculiar relation between the rapidity of transmission by hand and the rapidity with which the operator could receive the same message with a pen. They kept hand and hand, or rather neck and neck, for years, until the introduction of the typewriter enabled the receiving operator to copy much faster than the sending operator could send by hand, and this has led to the use of a code for press despatches, which standardized abbreviations, but the use of the code is not permissible in ordinary private messages, and for this reason the typewriter is still ahead. When we consider the adoption of the mecograph, as it is called here, by the Morse operator for improving the rapidity of his sending, it appears quite possible that the introduction of the Continental code may be brought about some day, as it would require less time, perhaps to learn to operate by the Continental code used in the wireless system, than it does to learn to operate by these mechanical devices.

The improvements in insulation to my mind have not been so great as the improvements in the conductivity of the line. The early lines, as I recall, used No. 8 iron wire, and then No. 9, and with the introduction of the duplex and the quadruplex, as referred to by the author, wires of greater conductivity were introduced. The form of glass insulator now used has persisted for about thirty or forty years.

The possibility of the utilization of a more rapid system, with the introduction of the night lettergram practice, appears to be quite possible. I have talked with some of the telegraph men about that, but they do not see any probability of it yet. It must, however, take the form, in order to be practicable, of some system of perforation like the Barclay printer which transmits with only one repetition, that is, the perforation producing at the other end a page printed telegraph blank. It is rather remarkable that, although the objections to the form of printing tape were so well known in the early days, there appears to have been no attempt to bring about the introduction of a page printing system. When we consider the ingenuity of those early inventors, House and Hughes, it seems to-day as though, if their attention had been directed to this defect, that they might have invented a page-printer, and thus perhaps prolonging the life of the printing telegraph system, which has practically gone into disuse.

[In reply to Mr. Pope's question as to an error in

the statement that places the distance of transmission of the House telegraph system at 1000 miles Mr. Maver says: "This statement was made on the authority of the officials of the original House company, and may be found on page 112 of 'Electric Telegraph,' Jones, 1852, as follows: 'The longest line we have is about 1,000 miles, extending from New York to Cincinnati. Messages are transmitted that distance with ease.'"]

The Virginian Railway's Telephone Despatching Circuits.

BY K. W. ENDRES.

A telephone despatching circuit extending from Roanoke, Virginia, to Deepwater, West Virginia, has recently been put into operation by the Virginian Railway. The extensions of this system contemplated in the near future will cover the whole of the railroad.

The line construction has been installed in first-class shape throughout and is built of copper, weighing 210 pounds to the mile over a distance of 193 miles, with a branch twenty-four miles in length. Transpositions are installed at half-mile intervals, as is usual on all telephone train despatching circuits.

The dispatcher's office is located at Princeton, West Virginia, ninety-seven miles east from Deepwater. The dispatcher, therefore, has this stretch of line on one side of him and a ninety-six mile stretch east to Roanoke in the other direction, in addition to the branch mentioned.

On the line from Princeton to Deepwater, including the twenty-four mile branch, are fifteen selector stations and eighteen stations equipped with telephone sets. On the eastern end of the line, eleven selector stations are installed and nine stations with the telephones alone.

As the Virginian Railway is a comparatively new road, a number of the way stations on the line are not yet built and section tool houses, used as telephone booths, are temporarily taking the place of stations. Conductors and train crews are thus enabled to get in direct communication with the dispatcher at all times, as the telephone stations are only from three to five miles apart, and in a few instances less than this.

It would be difficult to operate this road by means of the telegraph, and it would be forced into a heavy additional expense in the way of operators and stations solely for the purpose of stationing telegraphers at certain points. With the telephone all this is avoided.

Mr. G. N. MacDougald, signal engineer of the road, solved the problem of having many stations which were not open at all times and some of which did not have operators in them at all, by building a special type of cabinet for mounting his apparatus. This cabinet shown in the accompanying illustration is divided into four parts or sections. The upper portion is equipped with glass doors and contains in one section the desk set box, a protector and

two knife switches, the latter to cut off the line east or west. The right hand section contains the selector, a choke coil arrester, and a single knife switch. This switch when opened cuts the telephone apparatus off of the line and leaves the line cut straight through. The two lower compartments contain the batteries and desk stand.

The section which contains the desk stand has no back and is arranged so that it is mounted on the wall of the station, and a hole is then cut through the wall, leaving a locked door on the outside. Thus, when a station agent goes home at night and locks up, any conductor can open this door, reach the telephone set and get into communication with the dispatcher without further trouble. The tele-

Way Station Telephone Equipment, Virginian Railway.

phone set switching key, which is used on all despatching circuits for the purpose of increasing the transmission efficiency of the line, has been mounted in conjunction with the telephone desk stand itself on a felt-covered board, so that when the set is handled by people outside the station everything required is available on it. This also is Mr. MacDougald's idea.

The dispatcher's equipment at Princeton was mounted on a board in the usual fashion and is enclosed in a glass cabinet which keeps out dust from the apparatus. A loop has been run from the dispatcher's wire to the superintendent's and the chief dispatcher's desk. This is for the purpose of supervision and enables either of these officials to listen on the despatching circuit at any time they may desire. The effect of this feature in telephone train despatching equipments has been of marked advantage in improving the character of service given on such lines.

In addition a loop has been run to the private branch exchange switchboard and terminates in a

jack at this board. In this way it is possible for other parties in the offices of the Virginian Railway to have access to the train wire in cases of emergency, but this wire is at all times under absolute control of the dispatcher on duty.

In planning the installation of this equipment, everything was mounted in the cabinets at the work-shops of the company in Norfolk. All apparatus was tested out here previous to installation under exactly the same conditions as would be met with on the line, and when everything was in final shape, it was put into a special car and installed at the various offices along the line in a remarkably short time, and at comparatively small expense. All the line wires leading into the office had, of course, previously been installed. The equipment covers the third and fourth divisions of the

ner in which the work has been done, and the high-grade apparatus which is employed, and has added much to the popularity of the telephone with the men who are handling it.

The maintenance man on the line—as a matter of interest—is perfectly able to hear a watch tick over the distance of 157 miles between Fagg, Virginia, and Page, West Virginia.

Mr. MacDougald was supervisor of signals on the Long Island Railroad for thirteen years. Later he became signal engineer with the Chicago and Alton Railroad, which place he left to take up his present position with the Virginian in 1906. He has charge of the signals and interlocking department and cares for the maintenance of the telephone and telegraph systems as well. Mr. MacDougald has installed all the automatic signals and a number of interlocking plants on the Virginian Railway. He also has charge of all of the electrical equipment on the road, with the exception of power plants, including draw-bridges, and storage batteries for signals and Pullman service.

[We are indebted to the courtesy of the Western Electric Company for the cuts to illustrate this article, the system described having been installed by that company.]

G. N. MACDOUGALD, NORFOLK, VA.
Signal Engineer, Virginian Railway.

Virginian Railway. An order has been placed for some time now for a similar equipment to cover the first and second divisions. This will be installed about September 15, and will complete the equipment of the whole road. These divisions extend from Norfolk to Roanoke and are about 250 miles in length. The same size of copper wire will be employed and along this route there will be thirty-one stations equipped with selectors and twenty-seven with telephones only.

The dispatchers have expressed themselves as being very well pleased with the working of the new telephone system. They had been using the telegraph and a code system telephone. One of them remarked, "It is like taking a vacation." The splendid transmission that is being obtained over the circuit is due undoubtedly to the careful man-

Municipal Electricians.

Mr. Arthur T. Stewart has been appointed superintendent of the bureau of fire alarm and police telegraphs at Los Angeles, Cal. Mr. William Morton has been appointed as his assistant.

A new fire alarm telegraph system has been installed at Penn Yann, N. Y. Plans have been prepared at Winnipeg, Man., for a new fire proof building for the fire alarm telegraph headquarters.

Allentown, Pa., is planning the installation of a new fire alarm system and a committee from that city has been inspecting methods in use in other cities before deciding upon the system to be adopted.

San Antonio, Texas, has appropriated \$11,000 for improvements in the fire alarm system. The contract for this work has been awarded to the Gamewell Fire Alarm Telegraph Company.

Among recent New York visitors were R. A. Smith, city electrician of Norfolk, Va.; W. N. Smith, superintendent of fire and police telegraph, Portsmouth, Va.; C. F. Gall, chief operator, fire department, Louisville, Ky., and his son, Chester Gall, inspector in the commercial news department of the Western Union Telegraph Company in that city.

The thirty-eighth annual convention of the International Association of Fire Engineers, which was held at Syracuse, N. Y., August 23-26, was the most successful and best attended convention ever held by that organization. Milwaukee was chosen as the place of the next annual meeting.

ments yielding
permanent
service

The Railroad.

Mr. W. C. Walstrum, superintendent of telegraph of the Norfolk and Western Railway, Roanoke, Va., was a recent New York visitor.

Mr. J. S. Stevens, superintendent of telegraph of the Chesapeake and Ohio Railroad Company, Richmond, Va., has had his jurisdiction extended to include the Chesapeake and Ohio of Indiana.

Mr. I. T. Dyer, superintendent of telegraph of the San Pedro, Los Angeles and Salt Lake Railroad, Los Angeles, accompanied by his family has been enjoying a vacation in northern California and Oregon.

An interesting application of the telephone in freight train operation was tried recently on the Vincennes division of the Vandalia Railroad on a train of 123 cars loaded with coal from the Indiana coal field to Mattoon, Illinois. The train was one and a half miles long and drawn by two locomotives. A telephone wire was run along over the top of the cars from the caboose to the engines and telephones connected. The movement of the train was directed by the conductor giving telephone orders from the caboose to the enginemen.

The Delaware, Lackawanna and Western Railroad now has 271 telephone stations along its lines and over 2,500 miles of wire devoted to telephonic purposes. The first trial of the telephone for despatching purposes on that system was made in 1908 and the change to telephonic despatching was entirely completed by the end of 1909. All of the officials of the road agree that a great saving of time and labor has been effected by the change and also agree with the opinion of Mr. L. B. Foley, superintendent of telegraph, expressed recently that the telephone is no longer an experiment but an established fact with them and has come to stay.

The September meeting of the western division, Association of Railway Telegraph Superintendents, will be called to order in the Chicago and Northwestern Railway general office building, 215 Jackson Boulevard, Chicago, at 10 a. m., Thursday September 22. The minutes of the annual meeting are expected to be distributed before that date and all members are urged to give them due consideration and come prepared to discuss such matters as may be brought up. A chairman and secretary of the division are to be selected for the ensuing year. The question of better interchange of telegraph facilities between connecting lines at Chicago is again suggested as a matter deserving of immediate solution. Arrangements have been made whereby representatives of the Western Union Telegraph Company will be present and will be given an opportunity to discuss with and explain to the Railway Telegraph Superintendents such matters as may be suggested for the benefit of the service generally. Such an opportunity should be productive of much good. It is also expected that the wire crossing agreement will be discussed.

Mr. Joseph H. Schaefer, formerly in the plant department of the Chicago Telephone Company, is now connected with the telegraph department of the New York Central and Hudson River Railroad Company at Syracuse, N. Y.

Mr. W. E. Harkness, well known in railroad and telephone circles and identified with the United States Electric Company, New York, will have conferred on him the third degree in Masonry on Wednesday, September 28, in Hope Lodge, East Orange, N. J. Many of his Masonic electrical friends will be present on this occasion.

Mr. George Alfred Lawrence who has been appointed assistant superintendent of telegraph of the Atchison, Topeka and Santa Fe Railroad with headquarters at Los Angeles as briefly announced in our September 1 issue, was born at Quebec, Canada, March 20, 1875. He entered the telegraph service at Los Angeles, October 4, 1892, as messenger and has steadily advanced in his chosen profession, becoming successively operator, wire chief and manager of the relay office of the Santa Fe at Los Angeles.

Mr. Charles W. Kouns, formerly general manager of the western lines of the Atchison, Topeka and Santa Fe Railroad, who has lately been appointed general manager of the eastern lines to succeed James E. Hurley, deceased, began his railway career in 1871 as a telegraph operator on the Kansas Pacific, now part of the Union Pacific Railroad. He next became train despatcher on that system and later on the International and Great Northern Railroad. His connection with the Santa Fe dates from 1888 when he became superintendent of transportation of that system.

Mr. John Matthews, whose appointment as telegraph manager of the Gulf, Colorado and Santa Fe Railway was briefly mentioned in our September 1 issue, was born at Clarence, Mo., April 27, 1875. He entered the telegraph service in 1891 on the Brookfield division of the Hannibal and St. Joseph Railroad, part of the Burlington system, and served as operator and agent at various places between Kansas City and St. Louis and as clerk to the superintendent of telegraph of that system. He later transferred his services to the Santa Fe and has been in the employ of that company as operator, despatcher, manager and wire chief, being located at Temple, Tex., as wire chief and manager at the time of his present promotion.

Mr. F. E. Patrick for many years identified with the Western Union Telegraph Company at St. Louis, now in the hardware business at Olvey, Arkansas, in renewing his subscription says: "The evolution of the telegraph as set forth in the news items of your journal is certainly interesting reading to one who has been connected with the telegraph for a span of years. Please accept my best wishes for your success."

THE NEW MURRAY MULTIPLEX.

I have pleasure in announcing the completion of the new Murray Multiplex page-printing telegraph. It is a companion system to the Murray Automatic, and the two together form one printing telegraph organization, the first and only thing of the kind in existence. The general principles are the same in both systems, and many of the instruments are the same and interchangeable. The same perforated tape is used for transmission over either system, and the same perforated tape may be reproduced at the receiving station by either system and retransmitted by either system. Both systems used the Baudot, the shortest and best printing telegraph alphabet or code of signals. The Murray Automatic is designed and is best suited for long lines with heavy traffic, for underground cables, and for press messages. It excels all other systems in the speed of transmission over long distances. Unfortunately it is too costly for use on average aerial lines.

The new Murray Multiplex has been designed specially for saving labor on average lines with average traffic. It is much less expensive than the Murray Automatic. It is extremely simple and most of the actions are mechanical. As many as six transmissions are possible simultaneously on one line without the duplex balance, and with the duplex balance 12 transmissions are possible, though not commercial. Four transmissions simplex or eight transmissions duplex on one wire simultaneously are easy and commercial on lines of not too great length. As many as 100 messages an hour have been transmitted by one girl on one of the channels of the Murray Multiplex on one wire. The maximum was 126 messages. Although there are enormous possibilities of shifting traffic on one wire with the new multiplex, the intention is to confine the system for the present to a "double" working duplex, giving four simultaneous transmissions on one wire with immense latitude of adjustment and very simple equipment. By sacrificing some of this latitude it will be possible to work commercially with the "double duplex" on a 1,000-mile line with an ordinary duplex repeater half way. The Murray Multiplex worked double duplex will be able to shift twice as much traffic as the Morse quad with the same amount of labor, and, unlike the quad, it does not suffer from rheumatism during bad weather. It will work through any weather that the Morse polar duplex will work through.

Tape transmission is used with the new system. There is no separate transmitter attendant. There is a tape transmitter for each keyboard and the keyboard operator looks after it. Transmission can be started or stopped instantly by pressing a lever without affecting the appearance of the printed message at the other end of the line. Errors in the transmitting tape can be corrected instantly and invisibly so that there is no trace of the correction in the printed message, not even a blank space. The transmitting tape, after running through the automatic transmitter, is automatically wound up on a spool so that there is no mess of tape on the floor. At the receiving station printing is direct from the line signals at a speed of 40 words a minute for each of the transmissions on one wire, and one attendant can look after two printers up to 150 messages an hour. Page-printing is completely automatic, and the attendant just pulls off the finished messages at his convenience. Also he can read them as they are being printed. If a message is being sent from city A through city B to city C, the sending operator at A can send a signal switching in a receiving perforator at B which will reproduce the sending tape.

If all goes well I hope to be able to exhibit the new Murray Multiplex and possibly also the improved Murray Automatic in New York either towards the end of this year or early in 1911.

Donald Murray

THE BROWN TELEPHONE RELAY.

This remarkable instrument, which is attracting attention in technical circles throughout the world, magnifies exceedingly feeble undulatory or alternating currents, greatly increasing the amplitude without affecting the form of the wave. It will successfully magnify and render clearly audible currents that are silent in a telephone receiver. It practically doubles the distance over which wireless telegraph and telephone signals can be heard. It is full of promise for telephone work not only by reason of its magnifying power but also on account of its clear articulation. In connection with an electrical stethoscope it magnifies to a remarkable degree the sounds of the heart's action. By

suitable tuning it can be made to select and render audible sounds resulting from other bodily actions hitherto not appreciable by the ear. By its aid the human heart has been heard over a telephone line clearly beating more than 100 miles away. It has given excellent results in connection with submarine bell signaling, and a modified form of the instrument has given remarkable help in assisting the deaf.

The Brown telephone relay, which is shown in the adjoining illustration with the cover removed, is closely analogous to an arc lamp. The "arc" in this case, however, is only a millionth of an inch long, and gives out neither heat nor light. The relay is self-adjusting on similar lines to an arc lamp, and in place of carbons it has osmium-iridium contacts. The contacts, when at work, are never open and never closed. They are self-adjusting so as to preserve an air-gap or conduction-space of approximately one millionth of an inch (by actual measurement). Extremely feeble currents vary the length of this extremely minute "arc," if we may so describe it, and in this way greatly vary the resistance and therefore the current flowing through the contacts. The relay is not vibratory and there is no heating effect or spark to cause trouble.

BROWN & MURRAY, LTD.

Mildmay Park Works, London, N., England.

Makers of the inventions of Mr. S. G. Brown and Mr. Donald Murray.

Radio-Telegraphy.

Mr. J. A. Mooth, formerly of Wichita, Kans., is now located at Denver, Colo., with the United Wireless Telegraph Company.

It is reported that three wireless telegraph stations will soon be erected in China, one at Canton, another near Kuong Chow Wau and the third on Protus Island.

The North German Lloyd Steamship Company has ordered wireless equipment for fifteen of their vessels engaged in the Eastern Asia and Australasian trade.

The bill introduced in the British Parliament, making it compulsory for all vessels of a certain class to be equipped with wireless telegraph apparatus, has been withdrawn.

It is reported that the Turkish Government is negotiating with the Marconi Wireless Telegraph Company for the equipment of all of the vessels of the Turkish Navy with wireless.

It is reported that a French inventor has devised a means for receiving wireless messages from sea directly on land lines and thus sending them on to their inland destination without requiring a receiving operator at the shore station.

About one hundred and fifty of the wireless operators employed by the United Wireless Telegraph Company recently presented their superintendent, Mr. H. J. Hughes, of New York, with a chest of fifty-four pieces of silver and twenty-two pieces of cut glass on the occasion of his marriage.

Although the wireless station at Durban, Natal, has been in service but a short time it has already been found to be of assistance to shipping in African waters. A merchant vessel from London suffered an accident while off the coast of Natal, and being equipped with wireless communicated the news of its trouble to a British warship which happened to be in the vicinity. This vessel rendered assistance and then communicated news of the accident to the wireless station at Durban, from whence it was sent by cable to the owners of the ship in London within a few hours after the accident occurred.

There are now twelve wireless stations on the Pacific Coast of Canada and Alaska. Of these twelve stations two owned by the United States Government are at Sitka Island and at Tatoush Island, eight owned by the Canadian Government are at Digby Island, Prince Rupert, the terminus of the Grand Trunk Railway in the Pacific; Ikeda Bay, Queen Charlotte Islands; Triangle Island; Esteven Point, on the west coast of Vancouver Island; Point Lazo, on the east coast of Vancouver Island; Tatchu Point, on the west coast of Vancouver Island, Point Grey and English Bay, Vancouver; and Victoria City; and two owned by the United Wireless Telegraph Company are at Vancouver and at Frida Harbor. The Canadian Government stations are all equipped with Marconi apparatus, the plant of these stations being of two kilowatts capacity and of 200-mile range.

The Telefunken Wireless Telegraph Company is installing for the government of Uruguay five land stations having a range of from 50 to 500 miles, three ship stations having a range of 60 to 250 miles and six portable military stations.

During the recent experiments which were conducted at Sheepshead Bay race track, Brooklyn, in sending wireless messages from an aeroplane Mr. J. A. D. McCurdy, one of the aviators who was a former telegrapher, succeeded in sending a message from his aeroplane while in flight which was received without difficulty at a receiving station placed on the grandstand. This is the first time that such a feat has been accomplished.

The wireless outfit which will be used on the dirigible balloon America, in which an attempt will soon be made by Walter Wellman to cross the Atlantic, will be of the Marconi portable type. Power will be supplied by a storage battery and the amount used in operation will be about 250 volts. The framework of the balloon will be used for the antenna and a steel drag rope trailing in the water will furnish a ground. The apparatus used will have a range of from 50 to 75 miles. In case it is found necessary to launch the life boat which will be carried, a large kite will be used to provide an aerial so that communication may still be maintained with transatlantic steamers.

In a recent paper read before the Physical Society of London, on "The Energy Relations of Certain Detectors Used in Wireless Telegraphy," Dr. W. H. Eccles gives a record of the results of an experimental examination into the physical properties of the electrolytic detector, the zincite rectifier, the carborundum rectifier, and a thermoelectric detector consisting of a light contact between graphite and galena. The conditions of the experiments have been generally identical with those arising in the ordinary employment of the detectors; in particular the quantities of energy given to the instruments, in the form of electrical oscillations, have been of the same order in these experiments as in actual practice. Three ways of investigation are followed. The first way consists in applying to the detector an e.m.f. which is gradually increased, and measuring the current at each step. The second way is to fix the e.m.f. at some particular value, to send trains of oscillations of various energy values through the instrument, and to measure the intensity of the sound produced in the telephone on each occasion. The third way is to send trains of constant energy value through the instrument while the steady electro-motive force applied to it is varied, and to measure at each step the intensity of the sound produced in the telephone. These modes of investigation give curves that may be called respectively the steady current curve, the power curve, and the sensitiveness curve. The chief fact brought to light is that the power curves of all the detectors are straight lines, which suggests that all the detectors are fundamentally thermal in their action.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Mavor and Davis' "Quadruplex" and other standard works on telegraphy and treat them in the same manner.]

CHAPTER XVI.

In what two points is the operation of the Postal and Western Union quadruplex systems the same?

Draw a diagram of the transmitter and pole-changer connection of the Postal quadruplex.

What is the path of the current from the large dynamo when the pole-changer and the transmitter are closed?

What is the path of this current when the pole-changer is open?

How does the opening of the pole-changer cut off the negative machines and connect the positive dynamos?

How does the closing of the transmitter cut off the short end machines and substitute the large dynamos?

Draw a diagram of the improved pole-changer arrangement of the Postal and trace the paths of the various currents through this apparatus.

What is the construction of the neutral relay employed by the Postal company?

What is the action of the inductorium used in this relay?

How does this differ from the device invented by Mr. Gerrit Smith?

CHAPTER XVII.

How is the use of a second dynamo for the short end current of the quadruplex avoided in the later apparatus of the Postal?

What is the construction of the pole-changer used with this apparatus?

Why is this system peculiarly adapted for variations in the speed of the sending operator?

Draw a diagram of the connections for this arrangement of dynamos, pole-changer, transmitter and relays.

What does Edison's "bug trap" consist of?

How does the Diehl "bug trap" arrangement differ from Edison's?

What is the action of the Diehl "bug trap"?

What signaling method is generally used to enable branch offices or broker offices working on loops from a main office to make their troubles known to the wire chief at headquarters?

What modification of this method is used for offices in which this is not practicable because they are situated at the end of the line?

What is the method devised by the author of this purpose?

Obituary.

S. B. Lee, a well known press operator of Jackson, Miss., died August 19.

S. W. Tise, aged thirty-five years, manager of the Western Union Telegraph Company, at Winston Salem, N. C., committed suicide on August 26 by shooting himself. The cause of the act was poor health.

Isaac W. Hallam, aged eighty-two years, a member of the United States Military Telegraph Corps and an employe of the Western Union Telegraph Company at Wilmington, Del., for fifty-two years, died August 31 at that place. During the Civil War Mr. Hallam relayed the telegrams between the War Department at Washington and the Army of the Potomac in Virginia.

Harry J. Daly, aged thirty-three years, of the Department of Agriculture, Washington, D. C., a former telegraph operator for the American Telephone and Telegraph Company at New York and Troy, N. Y., and wire chief for the Southern New England Telephone Company at New Haven, Conn. died recently at Trinidad, Colo. He was the son of D. W. Daly, quadruplex chief of the Western Union Telegraph Company at Washington, D. C., who was with him at the time of his death.

Letters From Our Agents.**WASHINGTON, WESTERN UNION.**

Roy Marean, forty-four years of age son of the late Morell Marean, for many years, manager of this office, died suddenly on August 24. He was employed in this office at one time and was a first class electrician.

Mr. A. L. Buchanan, repeater chief at Cincinnati, was a recent visitor at this office, coming to Washington on his wedding trip.

Mr. Wm. Dulin, an old time operator, who lost his position in the Pension office some time ago, has been reinstated.

Miss Stella McDuffie, secretary to Chief Operator Collins, has returned from a visit with friends in New York.

The Electrical Society has been holding only two meetings a month during July and August. The meeting on August 26 was well attended and Professor Mortimer gave a very interesting lecture.

PHILADELPHIA, WESTERN UNION.

Superintendent C. F. Ames and Manager Allan Woodle of the Boston office were recent visitors in this city and complimented the fine appearance of the main office since its renovation.

Mr. W. W. Charles, cashier in this office, has been appointed transfer agent.

Mr. W. E. Vanarsdale, for many years with this company but for some time past engaged in other business, has been appointed chief clerk vice Henry Wobensmith, deceased.

Mr. Frank R. Webb, chief operator, has been absent from duty several days with an attack of hay fever, but is now improving. Mr. R. C. Murray is acting chief in his absence.

Mr. Edward Smith, operator at the "Record" office, has been appointed manager of the branch office in the Land Title Building to succeed Mr. Sheldon Custer, appointed district commercial manager at New Haven.

Business continues unusually heavy, and the force at 936 Chestnut Street has been increased by the addition of Frank Baker, Jr. Mr. Harry Hahl is manager of this office, which is the busiest branch in the city.

Miss Elizabeth Cogley, one of the oldest woman operators in the country, visited in this city last week, and was welcomed by many friends while here. Miss Cogley was in the service of the Pennsylvania Railroad for over fifty-five years but is now on the retired list and is living with her brother at Lewistown, for whom she frequently substitutes allowing him a vacation. She is now seventy-seven years of age.

At the time of the announcement of Mr. J. W. Reed's promotion from the managership of this office to the superintendency at New Haven, Conn., there was not an opportunity to give any testimony of his popularity and kindness to his subordinates while here, but as soon as it became known that he was going to leave, a movement was put on foot to present him with a suitable testimonial. As a result a handsome diamond ring was sent to Mr. Reed and in appreciation of the gift Mr. Reed said in part: "I wish to thank you for the beautiful token and expression of good wishes contained in your letter. I can think of nothing that would have pleased me more than the handsome gift you sent me and it goes without saying that it will ever remind me of the loyal support and the earnest manner in which you assisted me while I was manager of Philadelphia office. I cannot remain unmindful of the fact that without your co-operation I could not have been successful in my undertaking."

NEW YORK, WESTERN UNION.

Mr. Charles S. Pike, assistant city chief, has been advanced to division chief of that department, vice Mr. W. A. McAllister, who has been promoted to be general traffic chief.

R. W. Chapman, head of the bookkeeping department of this company in New York for many years until last fall when he was retired on a pension, died suddenly of heart failure, on August 28, aged sixty-five years. Interment was at Chicago, in which city he was employed by the Western Union from 1862 to 1902.

Leslie T. Miller, aged fifty years, a well known New York telegrapher, where he has been employed for the past thirty years in this office and by brokerage interests, died suddenly, August 30, of heart failure.

Mr. Marion H. Kerner, the well known old time and military telegrapher of the commercial news department, was married on September 14. Mr. Kerner's friends extend hearty congratulations.

Commercial Telegraph Operators in Demand in Canada.

The telegraph companies in Canada are having considerable difficulty in securing an adequate supply of operators. Many operators have gone from this country to Canada during the past few years and found very satisfactory employment, none of them returning to the United States after they had once become settled in their new home. Because of the remarkable commercial development of the past few years, however, the supply has not kept pace with the demand and good operators now have little difficulty in finding employment in the Canadian service at perhaps better wages than obtain in this country when living conditions are taken into consideration.

The Serial Building Loan and Savings Institution, 195 Broadway, New York, pays five per cent. interest on deposits. Although paying this high rate of interest its business is managed in such a safe and conservative manner that it has received special commendation from the New York State Banking Department. The association will assist any telegrapher to acquire a home, being conducted in their interest.

The Telegraphers' Mutual Benefit Association, 195 Broadway, New York, combines fraternalism with sound business principles; it offers to the telegraph and telephone employe an absolutely safe form of protection, at a cost within the reach of all and lower than can be found elsewhere. Membership only open to employes in commercial or railroad telegraph or telephone service, and it is manifestly to the interest of those who are eligible and wish to secure life insurance within their means, to secure without delay a certificate for \$1,000 or \$500, or both, at rates based on present age.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

A Study of Telegraph Apparatus.

PART III.

MULTIPLEX RELAY.

The student has been shown the importance of a close observation of the mechanical construction of each piece of apparatus in order to be able to thoroughly understand its operation.

In the case of multiplex relays he is at a disadvantage owing to the fact that in some types, and particularly the standard Western Union patterns, the magnets and coils are concealed within a box-shaped casing.

The accompanying diagram shows the constructions very clearly, and while both types of polarized relays operate on the same fundamental principle they are constructed in a totally different manner. It is for the student to seek the object aimed at in each pattern. By so doing he will learn a few facts which are very instructive.

Of course the average student understands that in the old camel-back or horse-shoe shaped relay the long lever bar which plays between the contact points as shown in Figure C is simply the extension of the other pole of the large steel magnet and is attracted to one contact point because the latter is placed in close proximity to the opposite pole of the magnet. Each end of the large magnet being of opposite polarity the lever must necessarily move

from one side to the other whenever the main line current flowing through the coils of the two spools (not shown) overpowers the horseshoe magnet and changes its polarity. This is the principle of operation, but an alteration in the connection of the movable lever with the large magnet to which it is hinged is required which probably very few have observed. The lever and the magnet are not con-

Fig. A

Fig. B

Fig. C

Fig. D

nected magnetically, although they are joined mechanically. In other words the lever is not pivoted on a shaft of iron, but on one made of brass or some other non-magnetic metal, and is therefore practically detached from the horseshoe so far as magnetic continuity is concerned. The lever simply becomes polarized through induction from the horseshoe magnet across the air gap and the space the brass shaft occupies.

The object of thus mounting the lever is to diminish the permanent contact which the horseshoe magnet would otherwise hold over the armature against the action of the line current, and also to render it

more sensitive to the influence of the magnets around which the line coils are wound.

It is doubtful whether the relay would work at all if the armature were connected directly by means of a magnetic substance. At any rate the lever would have a tendency to stick to one side, and would be slow in action. Furthermore under these conditions if by accident the lever should happen to come into contact with the polepiece of one of the spools it would stick there with the tenacity of a keeper for an ordinary steel magnet and would require a greater force than the coils could produce to remove it from the polepiece.

THE FLAT TYPE POLARIZED RELAY.

The student will now realize the fact that magnetic strength alone is really not the most essential feature of a magnet, but that a means for controlling a suitable amount of magnetic force is of more importance.

It has been said by some that the camel-back type described is a stronger relay, magnetically, than the flat design now almost universally used. This is probably true, but a study of the construction of the latter shown in Figures A and B, will demonstrate why a weaker magnet may yet be more efficient in many respects than the former. One of the undesirable features of a strong relay is the possession of a large amount of self-induction. This means slow action in building up to its full strength. In other words it possesses a high time constant.

In the flat pattern nearly every alteration in its construction is made with a view of reducing the time constant, for, as previously stated it is not of so much importance to obtain a strong magnetic force as it is to be able to control it.

In the first place self-induction is reduced four-fold by eliminating the yoke which in the old relay connects the cores of the two spools. Magnetically, of course, the relay is weakened, but owing to the diminished retarding effect secured the magnetic action is greatly increased. Again the omission of the yoke creates shorter cores, hence there is a slight increase in the number of magnetic lines of force flowing owing to a diminished reluctance in the core itself. Magnetism, it should be remembered, like an electric current varies inversely with the length of the conductor. Hence shorter cores give a greater volume and quicker action.

Figure A shows the steel magnet with two iron armatures pivoted to the respective poles. The lever is connected to two non-inductive bars which are riveted to the two armatures. The two iron armatures although metallically connected are thus not joined magnetically.

Figure B shows this shaft and two armatures brought up between the four polepieces of the two spools containing the line coils. As the armatures stand in an upright or vertical position the mechanical inertia is very small, and they readily respond to the actions of the four polepieces the two pairs of which each act in unison.

(To be continued.)

Recent Telegraph and Telephone Patents.

A patent, No. 969,393, for a combined telephone and protective alarm system, has been granted to J. G. Nolen, of Chicago, Ill.

A patent, No. 969,403, for a holder for telephone receivers, has been issued to C. R. Phillips, of Philadelphia, Pa.

A patent, No. 969,498, for a protective means for electrical circuits, has been awarded to C. G. Scott, of Pittsburg, Pa. Means for neutralizing and preventing disturbances due to electromagnetic induction for protecting telephone and telegraph circuits from railway currents. The feeder and the rail return are divided into sections which are connected to conductors for a short distance parallel to the signaling conductor and nearer to it than the distance between the signaling conductor and the feeder conductor.

A patent, No. 969,499, for means for neutralizing induced disturbances in intelligence transmission circuits, has been taken out by C. G. Scott, of Pittsburg, Pa. Two electrical circuits are located within a magnetic field and a transformer with a primary winding is located in one of the circuits and a secondary winding in the other with an ohmic resistance in shunt with the primary winding and an inductive resistance in series therewith.

A patent, No. 969,527, for a printing telegraph, has been secured by A. C. Crehore, of Yonkers, N. Y. The transmitter and receiver are keyboard mechanisms and two line wires are used operating independently with a ground return for each. Each wire selects and operates one of six secondary relays.

A patent, No. 969,774, for an intercommunicating telephone system, has been granted to H. D. Currier, of Chicago, Ill.

A patent, No. 969,818, for a telephone drop, has been issued to A. H. Weiss, of Chicago, Ill.

A patent, No. 969,832, for telephone apparatus, has been taken out by G. Babcock, of Rochester, N. Y.

A patent, No. 970,066, for a telephone transmitter, has been awarded to O. M. Leich and N. Pedersen, of Genoa, Ill.

A patent, No. 970,169, for electrical protective apparatus, has been secured by J. A. Birsfield, of Rochester, N. Y. For telegraph lines to protect from sneak currents by means of a lightning arrester and ground springs and a thermal device or fuse operating between the apparatus spring and the second ground spring.

A patent, No. 970,288, for a telephone repeater, has been granted to C. Adams-Randall, of New York.

A patent, No. 970,449, for a telephone attachment, has been awarded to A. C. Hewitt and W. C. Thomas, of Philadelphia, Pa.

The following patents have expired:

A patent, No. 504,367, for a condenser telegraph system, issued to Charles H. Rudd, of Evanston, Ill.

A patent, No. 504,454, for a telephone transmitter, granted to Nathaniel Parks, of Deansville, N. Y.

A patent, No. 504,464, for a switchboard for telephoning purposes, issued to Upton H. Balsley, of Philadelphia, Pa.

A patent, No. 504,636, for telephone apparatus, issued to Alfred Stromberg and Andrew Carlson, of Chicago, Ill.

A patent, No. 504,732, for a printing telegraph, granted to Samuel R. Linville, of Philadelphia, Pa.

A patent, No. 504,801, for a telephone transmitter, issued to James A. Brown, of Moline, Ill.

Personal.

Mary Frances Baker, aged seventy-nine years, mother of Mr. William H. Baker, vice-president of the American District Telegraph Company, New York, died September 23, at the home of her son, at Bayside, L. I., with whom she had resided for many years. Interment was at Greenwood Cemetery, Brooklyn.

Mr. Arturo Montequin of the Government telegraph service at San Juan, Puerto Rico, who has been in this country for some time past in Washington, D. C., and in New York, has returned to San Juan to take up his duties in the Government service.

Mr. S. S. Garwood, of Philadelphia, for many years a member of the executive committee of the Telegraphers' Mutual Benefit Association, and a prominent ex-telegrapher of the Quaker City, was in New York a few days ago and made his visit the occasion to call on numerous old friends.

Mr. C. M. James, of the Hulit Transmitter Company, Topeka, Kan., has been spending some time in New York recently, and was in attendance at the National Encampment of the Grand Army of the Republic at Atlantic City, September 19 to 23.

Mr. Stanley MacNider, Guatemala, Guatemala, a former telegrapher, having worked at the key in Montreal, New York, and other places, has contributed his extensive library of electrical books to the school of telegraphy established at Guatemala by the government of that country.

Mr. Levi S. Wild, manager of the Western Union Telegraph Office at Butte, Mont., who is an old time telegrapher, was the operator at Corinne, Utah, at the time of the driving of the golden spike when the Union Pacific and The Southern Pacific lines met in 1869, thus forming the first transcontinental railway.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. Clarence H. Mackay, president of the Company, accompanied by his wife, returned to New York September 27, after a two months' European trip.

Mr. E. J. Nally, vice president and general manager, and Mr. S. B. Haig, superintendent of traffic, have returned from a trip of inspection to Chicago, St. Louis and other western cities.

Mr. Charles C. Adams, second vice-president of the company, returned from a month's trip to Europe, on September 24 on the steamer St. Louis.

Among recent executive office visitors were Mr. S. M. English, of Dallas, Tex., president and general manager of the Postal Telegraph-Cable Company, of Texas.

Mr. L. Lemon is acting as superintendent for Mr. E. Kimmey, of New York, while the latter is absent on a two weeks' vacation, which will be spent in the rural districts.

Mr. E. B. Pillsbury, general superintendent of the eastern division, was in Pittsburg recently on business connected with the service.

Mr. William Bernard Dunn has recently been appointed assistant secretary of the company. Mr. Dunn, although still a young man, is one of the oldest employes of the company in length of service, having started as a messenger boy at the old 187 Broadway office on June 30, 1889. His intelligence, alertness and diligence even then attracted attention, and he was soon regarded as a "star" messenger, and while still on the messenger force was always assigned to special work of more than usual importance.

WILLIAM B. DUNN,
Assistant Secretary, Postal Telegraph-Cable Company, New York.

In July, 1894, he was assigned to duty in the supply department, and was transferred to clerical work in the executive offices in 1895. In May, 1898, he joined the clerical staff in the office of the Vice-President and General Manager, where he became familiar with the files and the work of preparation of documents and correspondence. In March, 1908, he was appointed chief clerk in Vice-President Bruch's office, and now, has been appointed to the assistant secretaryship, for which office he is unusually well qualified by reason of his training, experience, reliable memory and good judgment.

Mr. H. L. Carpenter, manager of the Asbury Park, N. J., office, has had a strenuous season this year. The aviation meets and the usual general influx of visitors to this popular seaside resort which was greater this year than ever before, caused an unusually large volume of telegraphic and press matter to be filed at that point.

The new line of two copper wires connecting Salt Lake City, Utah, with San Francisco, which has been in course of construction for several months past, will be placed in commission by November 1. This will establish another transcontinental route connecting the Atlantic with the Pacific.

RESIGNATIONS AND APPOINTMENTS.

Mr. Frank E. Healey has been appointed manager of the Nashua, N. H., office, vice Mr. G. L. Lynch, who has been transferred to the Boston office.

Mr. C. A. Francis, manager of the office at 853 Broadway, New York, has been appointed manager at 1397 Broadway, vice J. P. McBurney, deceased.

Mr. J. J. Alcock, manager at 263 West 125th Street, has been appointed to succeed Mr. Francis at 853 Broadway.

Mr. H. J. Reinhardt, manager at the Thoroughfare Building at 58th Street and Eighth Avenue, has been appointed to succeed Mr. Alcock, at 263 West 125th Street.

Mr. F. W. Daly, formerly night operator at 42nd Street and Fifth Avenue, has been appointed to succeed Mr. Reinhardt at 58th Street and Eighth Avenue.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. E. J. Hall, chairman of the executive committee, and Messrs. E. B. Hall and S. M. Williams, special agents of the company, attended the convention of the contract and commercial men of the Associated Bell Telephone companies at the Windsor Hotel, Montreal, September 20-23. Mr. Williams read a paper on "Supplementary Relations of Telephone and Telegraph."

Mr. B. Brooks, general manager and Mr. E. M. Mulford, division commercial superintendent, addressed a meeting of the special agents and district commercial managers of the first district eastern division, held in New York on September 21. Mr. Brooks' remarks on departmental courtesy, etc., were well received and struck a responsive chord. Mr. Mulford's address was on modern methods of creating and securing new business.

At a meeting of the board of directors held September 14, a quarterly dividend of three-fourths of one per cent. was declared, payable October 15, to stockholders of record September 20.

The annual meeting of the stockholders for the election of directors will be held October 12. The annual election of officers will occur October 19.

On the occasion of the National Conservation Congress at St. Paul, which lasted from September 5 to 10, a large amount of press matter incident to the visits of President Taft and Ex-President Roosevelt, was handled. Manager C. A. Crane had direct wires to the Auditorium and the State Fair Grounds, where speeches were made by both of the distinguished visitors, and the extra traffic was easily taken care of. Mr. Crane prepared for distribution among the newspaper men a folder giving the program of the events of the two days when Taft and Roosevelt were in the city, together with a list of the press representatives who were covering the affair.

Miss Edith M. Scherrer, daughter of Mr. Franklin J. Scherrer, assistant secretary of the company, is a member of the freshman class at Vassar College.

Mr. J. H. Gates, manager of the office at Quincy, Ill., has been appointed assistant superintendent of the American District Telegraph Company, with headquarters at Columbus, O.

Mr. R. W. Whitehead has been appointed division superintendent of the Mountain division of this company, with headquarters at Denver.

Mr. L. B. Thompson has been appointed electrician of the Southern division, with headquarters at Atlanta, vice S. R. Crowder, transferred to the office of the engineer of equipment at New York.

Mr. L. H. Beck has been appointed division plant superintendent of the Southern division of this company, with headquarters at Atlanta.

Mr. A. H. May, superintendent at San Francisco, has been appointed district commercial superintendent of the first district, Pacific division, with headquarters in that city.

Mr. H. J. Jeffs, assistant superintendent at Seattle, has been appointed district traffic superintendent of the first district, Pacific division, with headquarters at San Francisco.

Mr. E. Boening, superintendent at Seattle, has been appointed district commercial superintendent of the second district, Pacific division, with headquarters at that point.

Mr. G. D. Hood, formerly chief clerk in the office of the superintendent of telegraph of the Atchison, Topeka and Santa Fe Railway, Topeka, Kan., has been appointed district traffic superintendent of the second district, Pacific division, with headquarters at Seattle.

Mr. Hugh McPhee, who was recently appointed manager of the San Francisco office, has been advanced to the position of district commercial superintendent of the third district, Pacific division, with headquarters at Los Angeles. Mr. McPhee has had twenty years' experience in the telegraph service, starting as operator for the

Western Union Telegraph Company. After serving in that capacity and as wire chief and manager, he became chief despatcher on the Norfolk and Western Railway, later transferring his services to the Santa Fe at Emporia, Kan., where he was located at the time of his return to the commercial service as manager at San Francisco.

Mr. Ralph H. Miller, manager of the Los Angeles office, has been appointed district traffic superintendent of the third district, Pacific division, with headquarters at that point.

Mr. F. H. Lamb, superintendent at Los Angeles, has been appointed special commercial agent for the company at that place.

Mr. W. P. Davis, chief operator at Dallas, Tex., has been appointed division traffic supervisor of the Gulf division, with headquarters at Dallas.

Mr. Norman Ringer, manager at El Paso, Tex., has been appointed acting superintendent of the first district, Gulf division, with headquarters at Dallas, Tex.

Mr. J. G. Hilbert has been appointed division plant superintendent of the Gulf division, with headquarters at Dallas, Tex.

Mr. O. L. Turner has been appointed chief clerk to General Superintendent L. McKisick, at Dallas, Tex.

Mr. F. H. Gurnoe has been appointed a special agent of the company at Dallas, Tex.

Mr. Robert Edward Griffey, whose appointment as chief operator of the Memphis, Tenn., office was announced in our September 16 issue, was born at Clinton, Ky., November 29, 1867. He entered the telegraph service as clerk and operator on the Illinois Central Railroad at Holly Springs, Miss., in 1886, and was at one time chief clerk to George M. Dugan, when that gentleman was superintendent of telegraph of the Illinois Central. For the past ten years he has been employed in the Memphis office of this company as operator, repeater chief and wire chief, which position he held at the time of his recent promotion.

New and beautiful offices are being arranged for at Atlanta and Memphis. The Atlanta office will be located in the new Constitution Building, which occupies one of the most central locations in the city. The first floor will be given over to the business offices of the company, the second floor to the Division and District headquarters offices, and the top floor to the operating department. Abundant light will be furnished through windows on three sides of the structure. The new office at Memphis will be located in the new Cotton Exchange Building. The receiving office will be on the ground floor on the corner of two of the principal streets, while the operating department will be located on the seventeenth floor. The equipment is being installed in these new offices, under the direction of the staff of Mr. W. E. Athearn, engineer of equipment. That gentleman has recently returned from a trip of inspection

of the two offices and states that they will be in every respect the equal of any offices in the country.

RESIGNATIONS AND APPOINTMENTS.

Mr. G. A. Lawrence, formerly assistant superintendent of telegraph of the Santa Fe system, has been appointed manager of the Los Angeles office of this company, vice Mr. R. H. Miller, appointed district traffic superintendent.

Mr. H. L. Burross, manager at Waco, Tex., has been appointed manager at El Paso, vice Mr. Norman Ringer, appointed acting superintendent at Dallas. Mr. A. S. McCollum, has been appointed manager at Waco to succeed Mr. Burross.

Mr. W. L. Strawbridge has been appointed chief operator at Dallas, Tex., vice Mr. W. P. Davis, promoted to be division traffic supervisor.

Mr. W. Y. Nolley has been appointed manager at Fort Worth, Tex.

Mr. J. J. Flanagan, manager of the Rockland, Me., office, has been advanced to the managership of the Bangor, Me., office, vice Mr. John H. Fahey, transferred to the Boston office. Mr. A. N. Saylor has been appointed manager at Rockland to succeed Mr. Flanagan.

Mr. W. E. Bellman, chief operator of the St. Louis office, has resigned to engage in other business.

Mr. W. D. McDonald, chief operator at Salt Lake City, Utah, has resigned to engage in other business at Hastings, Neb.

Mr. Frank L. Titus, formerly and for many years employed by this company at Chicago, but for several years past connected with the Santa Fe Railway at Los Angeles, has been appointed manager of the office at Reno, Nev.

The following appointments have been made in the commercial department of the first district, eastern division: M. W. Hamblin, special agent at 195 Broadway; P. J. Casey, special agent at 26 West 31st Street. District commercial managers: in New York City, J. Vietch, at 16 Broad Street; M. E. Pierce, at 91 Wall Street; J. J. Riley, at 323 Greenwich Street; J. Simmonds, at 195 Broadway; F. Spree, at 854 Broadway; J. W. McMahon, at 270 West 23rd Street; C. B. McCann, at 26 West 31st Street; J. Carberry, at 1363 Third Avenue; P. Kinman, at 263 Columbus Avenue; for Northern New Jersey, W. H. Spry, at Newark, N. J.; for Long Island, M. J. Hayden, at Brooklyn; for Northern Pennsylvania, G. R. Daniels, at Scranton; for New York State, E. A. Reynolds, at Albany, and A. O'Connor, at Syracuse.

Mr. R. J. Murphy, of the New York operating department, has been assigned to special work in the office of Mr. James F. Nathan, district commercial superintendent.

The following appointments have been made in the traffic department of the first district, eastern division: Mr. T. J. Meade, manager of the Albany, N. Y., office, has been appointed district

traffic manager in charge of the traffic in Northern, Central and Western New York, with headquarters at Syracuse.

Mr. Richard O'Brien, assistant superintendent at Scranton, Pa., has been appointed district traffic manager in charge of the traffic in Northeastern Pennsylvania and Northern New Jersey, with headquarters at Scranton, Pa.

Mr. P. J. Tierney has been appointed district traffic manager in charge of the traffic in the Central cable office at 16 Broad Street, New York.

Mr. B. F. Griffith, of the quadruplex department in the New York main office, has been appointed district traffic manager in charge of the traffic between Canal and Grand Streets, New York, and Sixtieth Street.

Mr. G. F. Smith, inspector, has been appointed district traffic manager in charge of the traffic from Sixtieth Street, north to Newburgh, New York.

The following appointments have been made in the plant department of the first district, eastern division: C. C. Lever, general wire chief and R. H. Morris, electrician at New York; H. F. Whetzel, district plant chief at Buffalo; F. H. Barth, district plant chief at Syracuse; A. G. Pettit, district plant chief at Albany; W. H. Collins, district plant chief at Scranton, Pa.

The Cable.

Mr. George Gray Ward, vice-president and general manager of the Commercial Cable Company, New York, accompanied by his wife, returned September 25 from England, where he has been for the past four months.

Mr. James Gordon Bennett, of Paris, France, proprietor of the New York Herald, and a director of the Commercial Cable Company, was a recent New York visitor. He has now returned to France.

Mr. A. S. Baxendale, manager of the Pacific Cable Board at London, who was in Canada for some time supervising the transfer to the Board of the Vancouver-Montreal wire leased from the Canadian Pacific Railway, reports that a considerable increase in the accuracy of transmission has already resulted from the change. It is stated by the London Electrical Review that the Board pays the Canadian Pacific £11,000 per year as rental, the latter company to maintain the line. The agreement made covers a period of five years.

Canadian Notes.

Mr. W. A. Cow has been appointed night chief operator of the Vancouver office of the Canadian Pacific Railway's Telegraph, vice Mr. A. J. Clarke, promoted to the managership.

The Canadian Board of Railway Commissioners has ordered a general investigation of telegraph rates throughout Canada.

Echoes of the Old Timers' Convention.

There are always items of interest connected with any great undertaking that are overlooked during the hurry and the confusion which always prevails when a large number of people from various parts of the country come together in one place. We present herewith a few such items which have been called especially to our attention in connection with the Chicago reunion of the Old Time and Military Telegraphers and which were brought to our notice too late to appear in our September 16 issue.

Messrs. A. H. Bliss and Joseph Uhrig, of Chicago were the choir leaders, whenever the occasion required music and that was very often.

Mr. D. W. Phelan, of Salt Lake City, was the tallest man at the convention, his measurement being over six feet.

Among those present at the convention whose names were omitted from the list given in our previous issue were W. W. Ashald, of Montreal, and A. G. Hancock of Chicago.

Mr. W. J. Lloyd, of Chicago, the genial president of the old timers, seemed to be everywhere at the same time. Everyone kept his eyes on him and he proved to be a good leader, especially when he led the way from the theatres to the Hofbrau and Rector's.

Some of the New Yorkers journeyed all the way to Chicago to attend the baseball game, and to many of them this was the first ball game they had ever seen, but, as one of the delegates of this number who is seventy-three years old said, it is never too late even to enjoy a game of baseball.

"Senator" W. L. Ives, of New York, was one of the best behaved men in attendance at the convention and amply sustained the dignity of his position as vice-president of the society of the United States Military Telegraph Corps.

Mr. C. M. Holmes, who was for many years executive office messenger at 195 Broadway, New York, did his part in making the convention a success. On one or two occasions when he arose to lead the singing everyone else remained quiet and Mr. Holmes had to sing alone.

The music at the banquet at the Auditorium Hotel was furnished by the distinguished violinist, Signor Antonio Frosolong and his orchestra, and was greatly appreciated by all present.

Colonel George M. Dugan, of Tip Top, Ky., reports his safe arrival home from the convention and states that he considers it the best of the series. Colonel Dugan was one of the founders of the Old Time Telegraphers' Association and a large amount of the credit for its successful formation is due to him. Of those who attended the first reunion at Cincinnati in 1880 there were present at Chicago, besides Colonel Dugan, Nat Hucker, John F. Wallick, E. W. McKenna and W. R. Plum.

The Child Labor Question Applied to the Messenger Service.

One of the reform waves which sweep over the country at intervals is now in progress and at present the attention of the reformers is directed toward improving the conditions of child labor with special reference to the employment of boys under twenty-one in the night messenger service. It is contended that the boys who are engaged in this service are constantly exposed to temptation to do wrong and thrown into contact with and made witnesses of vice of the worst description. As a result it is claimed that a large majority of them lose all desire to engage in honorable pursuits and become moral degenerates. If conditions are as bad as the reformers would lead their hearers to believe, they are engaged in a most worthy cause. There is no more useful service to humanity than the protection of children from injury, mental, moral and physical, incidental to unsuitable labor. The boys of to-day will be the men of to-morrow and the future of our nation depends upon the type of manhood into which they develop. In this instance the reformers seem to have pursued their specialty with such eagerness that they have lost their sense of proportion. In singling out boys employed by telegraph and messenger companies they have neglected to consider that there are hundreds of boys employed by tradesmen coming into contact with the evil side of city life for every boy employed in the telegraph messenger service. Perhaps it is the messenger's conspicuous uniform which causes them to choose him as the object of their reform. Nor do these reformers seem to recognize the impossibility in city life as at present organized of keeping unemployed boys from acquiring knowledge of evils that are deplorable, but which exist and will continue regardless of the age fixed for employment of boys, and the conclusion can scarcely be avoided that the same energy expended in correcting the evils would be productive of more far reaching benefits and would avoid the hardships that will follow to poor families of the boys whom it is proposed shall be refused permission to earn a livelihood and help support in many cases widows and those depending on them. They also overlook the fact that only a small percentage of the business of the telegraph comes from the so-called red light districts of our cities, and hence in the natural order of things, but a small percentage of the whole number of boys employed could be exposed to the evil condition which they point out. There are thousands of boys who have to begin to earn their living at an early age and it would hardly seem just to deprive them all of the opportunity to do this work for which they are well fitted and at which they can make as good wages as in any employment which they might obtain. What would the reformers have these boys do for a living if debarred from this work?

When we consider the subject from a physical

point of view it would be difficult to find an occupation for a boy which is as conducive to a sturdy physical development as is the messenger service. Even the reformers must concede that from this standpoint the work is infinitely better for the boys than the confinement which hundreds of thousands of children suffer who are required to work in mines, factories and the sweat shops of our large cities. From the mental standpoint the messenger boy is constantly thrown in contact with business affairs and with the methods of great leaders of industry and can always be learning new things and storing up facts which may be of great value to him in the future. In no other occupation does a lad have as great an opportunity for broadening his mind. For a boy who is necessarily deprived of the privilege of attending school it would be hard to find an employment in which he would have as good a chance to acquire a liberal education. This fact is amply proved by the great number of men prominent in political and business affairs to-day who began their careers as messengers.

The companies engaged in messenger service are common carriers and as such are required to accept any business offered to them. If, as the reformers contend, the messengers are asked to do things which are in violation of the laws it would seem that the evidence of such misdemeanors should be submitted to the guardians of the law that such conditions might be prevented. It is hard to see how that aspect of the situation would be improved by having men instead of boys to do the work. The companies, however, do not cater to this sort of business, and it is inconceivable that the conditions to which night messenger boys are exposed are as degrading as the reformers would have the general public believe.

As to the contention that this work makes moral degenerates of the boys and unfits them for future useful employment, we only have to turn again to the long list of our most prominent and highly respected citizens who started in life as messengers. Among the graduates of this service we find the great majority of our telegraph officials of to-day, railroad presidents, publishers and editors of many of our leading newspapers, captains of industry, United States Senators, Governors of States, Congressmen and thousands of men prominent in the professional and business world, all of whom are entitled to and receive the respect of their fellow men. It is hard to believe, too, that more messenger boys than idle boys are contaminated by immoral surroundings.

After all has been said in support of the present messenger system, however, if conditions are one-half as bad as the reformers contend there is need for reform. It seems probable, however, that in their efforts to secure evidence the reformers have allowed their zeal to overbalance their good judgment and have accepted as facts the tales told them by some imaginative

youths who, when they found what was wanted, invented from their fertile brains tales sufficiently thrilling to satisfy the most ardent searchers for the sensational.

Radio-Telegraphy.

Sir Charles Euan-Smith, chairman of the board of directors of the Marconi Wireless Telegraph Company, died recently in London.

The Russian Government is conducting extensive tests with various systems of wireless telegraphy with a view of establishing wireless communication across Siberia.

It is announced that the British Government authorities have made arrangements to establish high power wireless stations at Gibraltar, Malta, Aden and Perim Island, and that they are considering the establishing of stations at Cyprus, Alexandria and other Mediterranean points.

Experiments are being conducted by the British Navy with a view of developing a system of wireless telegraphy for communication with submarines. It is stated that messages have been successfully received by the submarine, although as yet no messages have been transmitted from the latter.

The New York Herald has installed an up to date high power wireless station in its ship news office at the Battery, and is thus able to receive direct news from ships at sea. It is claimed that the Herald is the first newspaper to install a wireless station of its own, the apparatus which has been installed in numerous other newspaper offices being owned by the wireless companies.

In a recent paper before the International Society of Electricians at Paris, Mr. A. Tosi gave a description of some of the results accomplished with the Bellini-Tosi system of directive wireless telegraphy at the Boulogne station. Messages have been regularly exchanged at night between Boulogne and Algiers, a distance of over 900 miles, with the use of only one half kilowatt of energy at Boulogne. Experiments made to determine the strength of received signals from a station two miles distant showed that such signals were six times as strong when received on the directive aerial as when received on the ordinary aerial.

The annual report of the directors of the Compania Marconi de Telegrafia sin Hilos del Rio de la Plata, of Buenos Ayres, shows that the income of the company for the past year was \$11,998, and the expenses amounted to \$24,640, making a deficit of \$12,642 for the year, which, together with \$52,526 from the previous year, makes a total deficit of \$65,168. The station at Punta del Este is working regularly, but it has been decided to install new and more powerful apparatus there in order to keep in communication with fast steamers at sea three or four days before arrival at and after departure from Buenos Ayres.

The Telephone.

The Pacific Telephone and Telegraph Company reports gross earnings of \$6,776,662 for the first six months of 1910 and net revenue of \$1,497,653.

The Chicago Telephone Company now has 285,691 stations in service, an increase of 14.9 per cent, during the first eight months of the year.

Mr. H. C. Brownlee has been appointed manager of the office of the Pacific Telephone and Telegraph Company at Oakland, Cal., vice T. E. Delury, who has been appointed district commercial superintendent.

Mr. H. N. Tyler, formerly architect for the Southern Bell Telephone and Telegraph Company, has been appointed to a position on the staff of the chief engineer of the American Telephone and Telegraph Company with headquarters in New York.

The British Post Office has recently placed in service at Willesden in the London metropolitan district a new telephone exchange which differs from all others in that district in that it employs a forty-volt battery instead of the usual twenty-two volt battery.

Professor Alexander Graham Bell, who is at present engaged in a tour of the world, has been recently entertained by the postal, telegraph and telephone service of New South Wales. While there Professor Bell pointed out to the administration that they were trying to run the telephone service at less than the actual cost and that much of the inefficiency of the service was due to the delay of subscribers in answering calls.

Officials of the contract and commercial departments of the Associated Bell telephone companies met in convention in Montreal September 20 to 23. One hundred representatives from all parts of the United States and Canada were present. The proceedings consisted of a series of papers on technical and commercial subjects, each followed by critical discussion of the points raised. Hospitable entertainment was provided by the Bell Telephone Company of Canada for the visitors, which included a smoking concert at the Snow Shoe Club, a luncheon on top of Mount Royal and shooting the Lachine Rapids.

Mr. Henry P. Thomas, division superintendent of traffic of the American Telephone and Telegraph Company, Atlanta, Ga., has been appointed a special agent in the office of General Superintendent of Traffic J. L. R. Van Meter, New York, to have general supervision of field traffic work throughout the country. Mr. G. A. Watson, who was recently transferred from Pittsburg to Atlanta as district traffic chief, has been appointed division superintendent of traffic to succeed Mr. Thomas. Mr. George B. Bayly, district traffic chief at Baltimore, has been transferred to Pittsburg to succeed Mr. Watson, and Mr. E. J. Padmore succeeds Mr. Bayly at Baltimore.

Inauguration of the Morse Statue.

Mr. J. J. Fowler, an old time telegrapher but at present secretary of the Board of Civil Service Commissioners of the City of New Orleans, sends us some very interesting historical documents in the shape of a ticket admitting the bearer to the inaugural ceremonies attendant upon the unveiling of the statue to Professor Samuel F. B. Morse in Central Park, New York, on June 10, 1871, and the reception in the Academy of Music which followed the same in the evening, together with the program which was carried out at the two functions. Mr. Fowler was sent as a delegate to the affair by the telegraphers of West Tennessee.

Governor Hoffman of New York presided over the unveiling ceremonies and made the introductory address. The ceremony of unveiling the monument was performed by Governor Claflin of Massachusetts and Mr. William Orton, president of the Western Union Telegraph Company at that time. William Cullen Bryant then made the inaugural address presenting the statue to the care of the city of New York in behalf of the telegraphers of the country by whose contributions the monument was erected. Mayor A. Oakey Hall, in behalf of the city accepted the trust. After prayer by Rev. Stephen H. Tyng, D. D., the ceremonies were concluded by the singing of the doxology. The inaugural committee consisted of Cyrus W. Field, Wilson G. Hunt, and General Thomas T. Eckert.

William Orton presided over the reception at the Academy of Music which commenced at 7:45 p. m. After the invocation by Rev. Howard Crosby, D. D., Chancellor of the University of New York, President Orton delivered the introductory address. Dr. George B. Loring, of Salem, Mass., then spoke on "The Telegraph, International Intercourse and Commerce." Rev. G. W. Sampson, D. D., president of Columbia College, Washington, the next speaker, took as his subject, "The Telegraph, Literature and Journalism." "The Telegraph as a National Defense," was the theme of an address by General Nathaniel P. Banks.

Direct connections by wire from the stage having been arranged by Mr. George B. Prescott, electrician of the Western Union Telegraph Company, with all of the principal cities of the United States and Canada and with foreign countries, a message was then transmitted by Miss Sadie E. Cornwell, conveying a brief sentiment from Professor Morse at the end of which he personally sent his name. After responses to this message had been received John W. Watson read a poem composed for the occasion.

Rev. H. M. Gallaher then spoke on "The Telegraph, Christianity and Civilization." Mr. G. K. Walcott, a prominent New York telegrapher, spoke for the operators and Mr. James D. Reid, who was chairman of the fund for the erection of the monument, spoke on behalf of the ladies of the telegraph. Miss Antoinette Stirling sang "Auld Lang Syne" and after an introductory address by Hon. Charles

P. Daly, Professor Morse spoke to the assembled thousands telling them of his early struggles and thanking them for the honors bestowed upon him. After the benediction had been pronounced a public reception was held and many of the telegraphers present embraced the opportunity to shake hands with Professor Morse. The committee of arrangements for the reception consisted of General Marshall Lefferts, chairman; John Horn, Jr., W. K. Applebaugh, J. W. Burnham and W. I. Reid. The ushers were: Messrs. W. K. Applebaugh, J. B. Page, J. W. Burnham, Charles Willis, F. H. Marsh, J. B. Oltman, W. C. Chapman, A. H. Watson, W. I. Reid, M. C. Lefferts, E. S. Sanford, Jr., Gerrit Smith.

The vice-presidents of the occasion were as follows: Messrs. A. Oakey Hall, E. D. Morgan, W. D. Dodge, William Kelly, Ezra Cornell, W. H. Kent, Sam Sloan, John A. Griswold, Horace F. Clark, William M. Evarts, Horace Greeley, Fernando Wood, F. O. J. Smith, Governor R. F. Bullock, of Georgia, Governor Jewell, of Connecticut, Major General Joseph Hooker, Major General McDowell, General E. S. Sanford, General Anson Stager, General Jefferson C. Davis, General Marshall Lefferts, General T. T. Eckert, General Charles Roome, Major J. M. Bundy, Cyrus W. Field, W. H. Aspinwall, Geo. W. Sampson, C. H. McCormick, Geo. H. Thurston, G. Granville White, A. A. Low, C. Livingston, C. Rathbone, Hugh Allan, S. B. Chittenden, W. B. Dinsmore, W. B. Ogden, Howard Potter, Hiram Sibley, J. H. Wade, Moses Taylor, Peter Cooper, Geo. B. Prescott, W. Cullen Bryant, Geo. Walker, A. B. Cornell, Wilson G. Hunt, M. O. Roberts, Lewis Roberts, E. H. Vankleeck, O. H. Palmer, Prof. B. S. Hedrick, A. T. Stewart, W. E. Dodge, Jr., James Stokes, A. S. Hewitt, James Lennox, P. C. Cornell, E. Creighton, Samuel J. Tilden, Thomas A. Scott, Andrew Carnegie, Henry Hilton, William H. Vanderbilt, David M. Stone, Chas. A. Dana, Samuel Sinclair, George H. Mumford, Manton Marble, George Jones, James Gordon Bennett, Oswald Ottendorfer, Dr. L. D. Gale, William H. Abel, Dr. C. C. Cox, W. S. Woodward, Frank Leslie, Fletcher Harper, Jr.

The First Woman Operator.

In our July 1 issue we recorded the death of Mrs. Helen M. Mills, who was said to be the first woman regularly employed as a telegraph operator. A brother of Mrs. Mills, Dr. P. S. Plummer, president of the Plummer Drug Company, of Portland, Ore., and himself an old-time telegrapher, in a recent letter gives the following facts concerning his sister and his own telegraph experience:

"My sister, Mrs. Mills, took the office at Greenville, Pa., near the end of the year of 1850, and as I recall she became a good paper operator. I did the delivering and line repairing and began to operate in 1851. Whether she was the first woman operator or not I cannot say. I do recall that

there was a woman operator at Conneaut, Ohio, in 1853. My sister was born July 4, 1831, and at her death was almost seventy-nine years of age.

"The salary at Greenville was \$125 a year. In March, 1852, I succeeded Mr. George T. Williams, at New Castle, Pa., at the munificent compensation of \$26 a month with no Sunday work. For that salary I attended to two instruments and a Grove main battery, which I took down every night and put up fresh every morning and did all the delivering of messages. I paid \$1.62 a week for board, room and washing, doing the marketing for the old lady, who had boarded Williams, and saved money. After spending eight months in New Castle I returned home to Greenville well clothed, had been well fed and took pride in handing my father \$64.

"The next salary I received was in Cleveland, Ohio, at the rate of \$400 a year, but I had to pay \$2.25 a week for board and had learned to be otherwise more extravagant.

"There were two Speed wires between Cleveland and Buffalo, Fred H. Tubbs and myself did the operating. The next spring I went west and my salary was increased to \$500 a year at Rock Island. I studied medicine as opportunity offered, during odd hours, and earned my support and tuition until I graduated in medicine. After coming to the Pacific coast I again entered the service, first at \$125 a month, but thirty-six years ago I resigned the superintendency of what was then known as the Oregon district because I felt that I could not afford to put in my valuable time for the compensation of \$2,000 a year and expenses when traveling or absent from home.

"Among the operators of the earlier times whom I recall G. T. Williams always heads the list as a dear good friend who was very patient with me when I was a green young plug operator, always assisting and encouraging me. Mr. Williams was superintendent of the Western Union at Cincinnati for many years, was superintendent of telegraph of the Nickel Plate Railroad, and is now living in retirement at Cleveland, O. I recall seeing a young man in the service in Pittsburg by the name of Andrew Carnegie, also a lineman in the Wade service, at Cleveland, by the name of Thomas T. Eckert. Fred H. Tubbs, until recently superintendent of the Western Union at Chicago, was a young man in 1853 and a very excellent operator. Marvin Hughitt, of Chicago, now president of the Chicago and Northwestern Railroad, was another good operator in those days.

"I transacted business with Robert Clowry, at St. Louis, quite extensively. He was a good operator and always a pleasant man to work with on the wire. I might name several others, very many of those in the earlier times with whom I was intimate, and whose memory I recall very pleasantly, but as they have long since joined the majority perhaps the present generation would not remember them."

A Problem in Telephone Line Testing.

Editor Telegraph and Telephone Age:

I note the communication of Mr. S. R. Beatty in your issue of September 1. Had it been a ground that was being tested, the action of positive and negative currents would have been as he states; but in the case referred to in my "problem," there was no ground, and of course the polarity of the battery used cut no figure. As a matter of fact, the results obtained were the same with two 90-volt taps + and - of grounded battery as with the 30-volt dry battery ordinarily used with the galvanometer. In both tests, the resistance of the original cross rose as soon as the lineman's cross was put on, and the measurement was higher to the latter cross.

The following will perhaps make my explanation clearer, it being assumed that no other wires are available for the test except the pair in trouble.

If the cross at A is a light one, and there has been no friction sufficient to break the film of oxide which forms on wires when exposed to the weather, there will be more or less resistance in the cross. This film may be punctured by the pressure of the battery current at A and an almost perfect connection formed measuring say 510 ohms, assuming the pair to be No. 12 copper measuring 10 ohms per mile. If the lineman is two miles beyond the cross at A and puts a good cross on at B, approximately one-third of the battery current will be diverted to B, thus relieving the pressure at A, which is not now sufficient to keep the path through the oxide film open, and a measurement will now show a reading to B. of 520 ohms. In this particular case the resistance of the cross at A after the oxide film had been broken down, is shown to have been 10 ohms. In such cases, it is impossible to know how much resistance there is in the cross. Therefore we know only that the lineman is beyond the trouble but how far beyond we cannot tell. In the case cited he was two miles beyond and there were 10 ohms resistance at A, but the measurements would have been the same, had he been ten miles beyond with 90 ohms resistance at A.

While these cases are not frequent, there are probably few wire chiefs who have not had them at some time in their experience, and the explanation here given seems to me the only reasonable one.

D. B. Grandy.

St. Louis, September 5, 1910.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

October 1, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

More Opportunities for Promotion.

The extensive changes which are taking place in the organization of the Western Union Telegraph Company are no doubt meeting with general approval. Many have already been advanced and have thus reaped the reward for their perseverance in the past in promoting their employer's interest and there are a large number of good positions yet to be filled. New officials are being appointed almost daily and possibly some of those who feel that they deserve promotion are afraid that they will be overlooked in the readjustment of the methods of directing the operation of their company's great system. To those who are well acquainted with the situation which confronts the executive officials, however, such fears seem to be groundless. The difficulty at present seems to be to find men in the ranks who are able to satisfactorily meet the requirements of the new positions. This difficulty is

probably due more to the fact that under the system which has been in vogue in times past the officials have not been able to form an accurate opinion of each man's ability than to a lack of suitable material for the positions of greater responsibility. Under the new regime this condition will be improved. A closer supervision will hereafter be exercised over the existing force and as far as possible each member will be assigned to that one of the three branches of the service in which he can work to the best advantage. His energies will then be concentrated in a specific direction rather than along general channels and he will be able to accomplish more satisfactory results than under the present system. Those who are capable of assuming more responsible positions will then be given the opportunity. It will take some time to carry this plan into effect, but when it is actually in operation every employe may rest assured that he will have a chance to demonstrate his ability to his superior officials.

The management of the company is fully alive to the fact that in order to achieve the highest measure of success in their undertaking they must have the co-operation of all of their employes. In order to secure this they must first have their good will. The best way to obtain this is to make each individual responsible for the work which he does and reward him accordingly. Because of the fact that individual responsibility has been limited in the past many who are undoubtedly worthy of promotion have not had the opportunity to show their capabilities to their employing interests. Heretofore many telegraphers have argued that the difference in pay between a skilled telegrapher and a chief operator is so small that it did not pay the skilled operator to study for advancement. The result was that good telegraphers were content to remain at the key. All of this will now be changed and the operator will find it to his advantage to study the technical side of telegraphy to prepare himself for advancement to a position as wire or traffic chief or chief operator, which positions will be sufficiently additionally remunerative to repay him for his efforts. The results should be an improved service and the better the service the more the public will use the telegraph. With an increase in the business there will be a corresponding increase in the opportunities for promotion. Hence, every employe upon the staff of the company ought to look with satisfaction upon the new order of things resting assured that his employing interests have a care for his welfare, are anxious that he should advance and will promote him as soon as they can consistently do so.

Quadruplex Operation.

The paper which appears in another column of this issue "On the Resistances to Use in the Field Key System," by Mr. Frank F. Fowle, of Chicago, will be of special interest to students of

telegraphy. The question which Mr. Fowle discusses is one which most wire chiefs and quadruplex chiefs have to answer at one time or another, and Mr. Fowle has shown by a comparatively simple mathematical process how a solution can be arrived at very easily under any working conditions. To those of our readers who are making use of the questions which we print in each issue covering chapters in Jones' "Diagrams" in their study of telegraphy, this article comes at an opportune time as the questions which appear in this issue as well as in several preceding issues deal with the quadruplex. From present indications quadruplex operation is coming into service again more generally than it has been used during the past few years, as the hindrances to quadruplex operation in the way of excessive earth currents and the presence of high tension power transmission lines in the vicinity of the telegraph wires seem to have been surmounted in the latest apparatus which has been placed in service.

Mr. Fowle has long been recognized as an authority on matters pertaining to the telegraph as well as upon general electrical questions, and our readers are fortunate in being able to profit by his experience and knowledge as shown in the paper which he has contributed to our columns.

New York Public Service Commission News.

The newly created division of telegraphs and telephones of the Public Service Commission of the second district of New York State is being organized preparatory to beginning active work in exercising the jurisdiction over telephone and telegraph companies which was conferred upon the commission last spring by legislative action. Mr. Walter I. Sweet, of Port Richmond, N. Y., has been appointed assistant chief of the division and is in charge of the New York office. Mr. Sweet is forty-five years of age, and has had an extensive experience in telegraph, telephone and railroad work. He entered the service of what is now a part of the Erie Railroad system in western New York as telegraph operator at the age of eighteen. He spent the next five years in the employ of that road as operator, station agent and traveling excursion agent. Twenty-two years ago he became chief clerk to the district superintendent of the New York and Pennsylvania Telephone Company, at Jamestown, N. Y., and since that time has been engaged in the telephone service. In 1906 he became district manager of the Jersey City district of the New York and New Jersey Telephone Company, and two years later, because of the merger of the functional and territorial organization with the New York Telephone Company, he was appointed local agent in charge of the Commercial Department of the Company, and was the senior officer of the Company in that district. Mr. Sweet has charge of the work of the commission in connection with telegraphs and telephones in the Metropolitan

district, including New York City, Long Island and some of the territory immediately adjoining New York on the north, reporting to Mr. Edward B. Rogers, chief of the division, whose headquarters are at Albany. Both of these gentlemen are well qualified to carry out the work which has been entrusted to their care and will undoubtedly be able to solve the problems with which they will be confronted in a manner satisfactory both to the public and to the corporate interests involved.

Telegraphs and Telephones in Mexico.

According to the annual report of Mr. Camilo A. Gonzales, director general of the Mexican Government telegraphs, for the year ending June 30, 1910, there were at that time in Mexico 491 government telegraph offices, six wireless stations and twenty-three telephone offices. The system embraced 22,402 miles of lines and 46,038 miles of wire, 462 miles of submarine cable, 11 miles of sub-fluvial cable and 47 miles of underground cable. During the year which the report covers 4,443,519 messages were handled, containing 70,108,888 words and 23,337 telephonegrams, containing 328,982 words. The total revenue of the telegraph system for the year amounted to \$2,205,646. A report of the private telephone enterprises in Mexico on August 31, 1909, shows 20,772 miles of wire in such systems and 15,789 subscribers. The majority of these systems use iron wire. Pine, cedar, oak, eucalyptus and other woods are used for poles, as well as iron in some instances.

Cuban Telegraphs and Telephones.

According to the official report of the Cuban Government Telegraph authorities, for the year ending February 1, 1909, there were in Cuba at that time 171 telegraph offices with 6,180 miles of wire, a gain of 14 offices during the year. During that period 643,059 messages were handled, of which 467,429 were private and 177,130 were official. In addition to these 21,275 messages were turned over to the cable companies, or received from them. Five new telegraph lines were built during the year and all of the offices were equipped with up to date apparatus. The central office at Havana was entirely refurnished and the general condition of the system was considered excellent. Although several severe storms visited the island during the year, causing much damage to the lines, all interruptions were speedily repaired. Extensions of the system at several points are contemplated.

The Government owns telephone systems at Havana, Santiago de Cuba and also at Cardenas. The two former systems have all together 435 miles of wire and 180 telephone stations. There are in addition 388 private telephone systems in Cuba.

A History of New York and Pennsylvania Telephone Consolidation.*

BY U. N. BETHELL.

President of the New York Telephone Company.

(Continued from page 635, September 16 issue.)

We were very fortunate, I think, in our efforts to make the general plan fair to all interests. There were so many interests involved—so many different companies—so many different lists of stockholders—so many different prices to offer, that it was a very difficult thing to get not only what was fair in our own judgment, but what would be fair and look fair to the other people. That is, that each offer would look so fair to each group, that that group would accept it, without at the same time swelling the total of securities beyond proper dimensions. I think the fact mentioned as to the up-State New York companies, which may now be stated as to all the companies, that ninety-nine per cent. or more, somewhere between ninety-nine per cent. and one hundred per cent. in each group of stockholders, accepted the offer made to it, shows that the several offers made were fair and reasonable. The fact that there was no overcapitalization, and nothing that looked like overcapitalization, made the plan proof against criticism from the public.

There was another thing. There was no question of "stifling competition" involved. Now I have no objection to blotting out competition, because I believe that two telephone systems in any place impose an unnecessary annoyance and burden on the public. I have no objection to buying a competitor's plant where the laws permit it if the competitor is willing to sell at a fair price and we can agree on terms, but the public does not always look at it in that way. Public sentiment in this matter is rapidly changing, but the fear of monopoly still exists to a surprising extent in many quarters. We had a decided advantage in bringing this great aggregation of companies together in the fact that the question of competition was not involved. True, we bought the Maryland Company, but that was a separate transaction, and had nothing to do with the consolidation. When we began the work of laying the foundations for a great system in Baltimore, the two companies operating there were neck and neck, and we found it necessary to do something that would tell. We simply pursued the constructive methods that have been followed with such excellent results here in our Pennsylvania territory, and the first thing we knew, the counsel for the Maryland Company said in one of his arguments for increased rates that the Maryland Company was losing money fast—and losing more per station as its stations grew—but that it was nevertheless putting in stations and was growing. When asked why, if growth increased its losses, it continued to grow, he replied

that it was like Uncle Remus's rabbit. Uncle Remus, you remember, was telling the boy that Br'er Rabbit when hotly pursued by Br'er Fox, in order to escape, had climbed a tree. The little boy interrupted, saying, "Why, Uncle Remus, a rabbit can't climb a tree." "Honey," said Uncle Remus, after a pause, "dis here Rabbit was 'bleeged' to climb."

Now I only know one place, and that was in Pennsylvania, where I think one of our friends on the other side has sized the thing up right—has said the right thing in regard to a place afflicted with two telephone systems, and that was down here at Coatesville. In a famous circular sent out by this Independent Manager to the public when the Bell people were getting busy down there, he said, "Competition is a good thing if it is not too keen." When it gets too keen the suffering public calls a halt and in some way the thing stops—or at least slows down.

Now, gentlemen, I simply want to say a word about the progress made in this division since it came over into the greater family, and I want only to point out that it has been able to do this because it has had the money to invest to develop its territory. The business was already here, you men were all ready to do the trick, but it was impossible with these little companies all standing alone and each attempting to do its financing, going out and peddling a little stock here and a few bonds there and raising some money on notes elsewhere, to do the thing in the great broad way that it ought to be done, and this particular part of the country has blossomed like a rose.

Your total plant—I am using only rough figures—your total plant in about four years has increased fifty per cent.; your total stations seventy per cent.; your plant per station has decreased twelve per cent.; your gross earnings have increased practically sixty per cent.; your total expenses have increased, excluding depreciation, fifty-five per cent., and including depreciation, ninety per cent.; the net earnings for the four years have increased eighty per cent.; and the net earnings to investment have advanced from about six and one-half per cent. to about eight and one-quarter per cent. A splendid showing.

I have here a copy of a report made in January, 1910, respecting the work of the Harrisburg Division in 1909. It is written by a man who deals in superlatives. He says, "The following facts are of extreme interest." I admit that they are of extreme interest. I will not read all this report because it would be like carrying "coals to Newcastle" or to Scranton, or to almost any other place in this territory. "New towns or communities reached, 470." Think of that in one year. "New towns or communities reached, 470." "Gains in stations, over 14,000, or twenty-four per cent."

Now this wonderful document closes with this

*An address delivered before the Western Pennsylvania Telephone Society at Harrisburg.

statement: "Taking it all in all, I think we have every reason to be thoroughly gratified with the results of last year, and I am, I think, well within bounds when I promise you an even better showing for the current year."

Now, gentlemen, all I have to say is that I hope that the Harrisburg Division will—I don't know whether to say be or become, or remain—I will say remain—that the Harrisburg Division will remain the pacemaker for the others under the gallant leadership of J. Highspeed Crosman, Jr.

In the statistics I gave you previously I said there was something more than thirty thousand employes in our organization. That is quite a large aggregation. How many girls there are in it I do not know, but I always welcome every opportunity to say a word about the American telephone girl. She is just as essential to the success of our enterprise as any other factor in it. Some years ago, when I was making my first study of telephone conditions in Europe, I remember that in one great city I went into a telephone office where a lot of men were sitting before the switchboard listlessly switching traffic, and graphically before my mind's eye now I see the picture of one ancient citizen, whose hoary beard fell flowing to his waist line and whose feet were encased in beautiful carpet slippers. He looked the very picture of the reverse of accuracy and expedition. I remember at another place seeing a girl operator leave her position at the board, run down the room and have a quarrel with another operator in language that was astounding. The toll operators in that room were shut off in a glass case at one end of the room because the din and turmoil were so great that they could not perform their work without being caged off from the others. That was on the other side and several years ago, but here in America for years and years, practically from the very beginning, we have had the efficient and able assistance of, in my opinion, the best corps of female workers that are engaged in any enterprise anywhere.

An illustration of loyalty came to my attention not long ago in Philadelphia. There had been a severe snow storm. The roads were blocked, the street cars could not move, but operators who were not expected to be on duty, in some way—in some way—managed to reach the offices and helped to handle the swollen traffic. That is what I call great loyalty. Even girls who were not at the time in the service of the Company; girls who had previously left the service, graduated from it as it were, came back to meet the emergency and offered their services, which were gladly accepted. Such loyalty you do not often find.

Not long ago—as I look back at it it was only a few years ago—I received a hurry call one Sunday, and leaving my home in New Jersey went down to Baltimore. The great city was

afame. There we had an exhibition of nerve, fidelity to duty, loyalty and courage seldom witnessed. In the St. Paul office the girls were busy handling traffic which meant perhaps life or death, and certainly the safety of great property interests. The fire was rapidly approaching, great firebrands were dashing against the windows, and the room was filled with smoke, yet those girls sat faithfully with their faces to the board, and with deft hands and quavering voices handled the traffic that meant so much of weal or woe. They worked faithfully until the final signal was given, and then, like the good soldiers they were, retreated in order. But one individual was left, a man, a brave man, a man who realized that in a very few moments that building perhaps, at least all that equipment, would be in ruins. He was there to obey orders. He drew the cord which let the tarpaulin down, closed the iron fire door, passed out of the switch-room and hastened to the street. That man was none other than the present efficient Plant Superintendent of this division, Burdette Stryker.

Now, gentlemen, I will detain you only a minute or two more. I see a great galaxy of talent here and I know they are all anxious to talk, especially Mr. Kinnard. In one of his beautiful works, a little book called "Through Nature to God," John Fiske points out that everything obtains its identity by contrast with something else. For instance, if the roar of Niagara were continuously beating upon the ear it would produce the same effect as absolute and continuous silence; if the tongue knew no taste except that of sugar there would be no such thing as sweetness and bitterness, and if all the eye ever beheld were red there would be no such thing as color.

I want to point a contrast between the olden days and the present. You know for years intelligence was transmitted between remote points only by the hand of man. It might go by a swift runner—in fact, way back in the days of Aztecs they had runners that could beat the American District messenger boy of to-day, and that is saying a good deal, but all news went by the hand of man. When Cornwallis surrendered a swift ship was sent to Europe with the news and in thirty-seven days King George was walking the floor. Thirty-seven days and the ship was swift. And when following that surrender a treaty of peace was concluded, it required sixty-two days for the news to get from Paris to Philadelphia. At the close of the war of 1812, in 1814, after the treaty of Ghent was signed, it took so long for the news to reach this country that the battle of New Orleans was fought and more lives were lost than in any battle of the Revolutionary War.

During what may be called the news-by-hand period which continued for many years, there was what you might call a lack of solidarity in this country. Local prejudices existed everywhere—one part of the country had little sym-

pathy with another, one section could not understand another and all were more or less critical and unfair. There was naturally great opposition to expansion. When in 1843 the Oregon Bill was under discussion in the United States Senate the very idea that we could have an interest in a country so remote, so far away, so difficult to reach or communicate with as Oregon, was declared to be preposterous by many leading statesmen, and yet in the following year, in 1844, there was the beginning of a change which one may fairly say has revolutionized the world, for in that year there came across the wires those thrilling words, "What hath God wrought."

That was the beginning of an era—the era of the transmission of intelligence by electricity. Lines of magnetic telegraph spread over the land and soon cables spanned the Atlantic. Then came the Civil War. John Fiske has said in one of his histories that except for the railroads and the telegraphs the Union could not have been preserved. I think we all realize, in a general way, what a tremendous influence in the preservation of the Union the telegraph must have had during those trying years, but if anyone wants to know something of how it was done and at the same time read a thrilling book, let him read "Telegraphing in Battle." Let him also, in "Lincoln in the Telegraph Office," read of the wonderful men, young telegraphers, who manipulated the keys and translated the ciphers in that little room in Washington, which Abraham Lincoln, when his soul was most sorely tried, was wont to frequent. Such names as Chandler, Tinker, Bates and Eckert will be immortal in that connection. But no name stands out and will stand out more brilliantly for heroism and bravery, for intelligence and patriotism as a military telegraph operator than that of a man who belongs to this division, who is a part of it, who has been a part of it for years, Richard O'Brien, of Scranton.

The spread of intelligence, the destruction of prejudices, the cementing of our vast country into a National unit, and the advance of civilization received a tremendous impetus in the invention and development of the telephone. It is not necessary to rehearse in this presence what the world has gained through the wonderful gift of the man whose name we have emblazoned on our banners—Alexander Graham Bell. To-day, for example, it is such a simple matter to get the election returns from all parts of our great country within a few hours after the ballots are cast, that we take it as a matter of course. Let any event of wide human interest occur and the eyes of the whole civilized world are concentrated upon it. Take, for example, the sinking of the Republic. Through the agency of the wireless telegraph, that is the electrical transmission of intelligence, aid was summoned, and through the telegraph and the telephone, the whole world

knew from moment to moment what was going on and was able to concentrate its mind and its eyes upon the tragic scene—and the inspiring display of heroism. When it was all over, thousands widely separated rejoiced together and the heart of mankind was softened and made better.

I have spoken of the slowness with which the knowledge of certain peace treaties concluded years ago came to this country. Think what happened after the close of the recent war between Russia and Japan. When the peace conference was being held at Portsmouth, the great African hunter, who has just returned to our shores, then the peace-loving and belligerent incumbent of the White House, was doing all he could to bring about peace, and the nations of the earth stopped, looked and listened. As soon as the articles were signed the whole wide world knew it and in a moment the wires were busy, were overloaded, carrying back messages of congratulation to the man who had done so much to bring about the peace,—the man who at that hour was perhaps the most widely known and popular individual in the universe—Theodore Roosevelt.

From the beginning of historic times, nations, principalities and cities have grown great only as they have paid attention to the development and proper use of means of transportation and communication. Damascus, the oldest city in the world, grew great because of the caravans that passed within her gates and tarried there to trade. Venice mounted her pinnacle of glory by sending her ships over all the known highways of the sea. Great Britain owes her greatness to her long sustained mastery of the sea, and what has enabled the United States to achieve her greatness among the nations of the world but her wonderful development in transportation facilities—transportation facilities broadly considered—that is, facilities for transporting people, things and ideas? These facilities are as essential to commerce and civilization as nerves, arteries and veins are to human existence. They cannot be crippled without crippling the whole country. Let each of us do what he can, however small it may seem, to accelerate the growth of that spirit of fairness and consideration which should actuate both the public and the men who are devoting their time, their intelligence and their energies to these public agencies.

Gentlemen, you are identified with a great and important industry. I congratulate you and thank you for your attention.

Mr. Harry Morlan, manager of the Postal Telegraph-Cable Company at El Paso, Texas, in renewing his subscription recently, says:

"The 'Age' has been a great source of pleasure to me, not only from an instructive point but from the fact that I meet many friends of bygone years in its pages. Success to you."

On the Resistances to Use in the Field Key System.

BY FRANK F. FOWLE, CHICAGO.
Consulting Engineer.

The extensive use of the Field key system in quadruplex work, for the purpose of deriving both the "long" and the "short" voltage from one dynamo or generator, makes it desirable to have a simple rule for finding the proper resistances to insert in the line and the leak. Most wire chiefs and quadruplex chiefs are familiar with this system, so that it need not be described in great detail. But it has perplexed many to know what values of resistance to use to obtain any desired ratio of voltages or currents. I have worked out a very simple rule in what follows and have also given a table showing some of the values that should be used.

It was originally the practice to employ two different E. M. F.'s for quadruplex working, one for operating the polar side and one for operating the neutral side. The ratio of the latter to the former is very commonly 3 to 1, and sometimes $3\frac{1}{2}$ to 1, or even 4 to 1. This necessitated four sources of E. M. F. in all, two of the higher value, one being positive and one negative, and two of the lower value, positive and negative. The Field system makes it possible to reduce the total number of E. M. F. sources from four to two, with consequent reduction in the number of dynamos necessary. In considering how this system works, the E. M. F. of one sign only will be used, because the actions are identical with either positive or negative E. M. F.'s.

The generator furnishes an E. M. F. suitable for the "long" or neutral side, and by means of suitable resistances it can be reduced to a proper value for the "short" or polar side, at will, by the manipulation of a key. The essential portions of the Field system are shown in theory in the accompanying Figure 1. The armature *a* which carries the make and break contacts is operated by an electromagnet not shown, which in turn is operated by the sending operator on the neutral side, by means of a battery and a key in a local circuit with the electromagnet. The resistances which comprise part of the Field system are designated *A* and *B* in the figure. The resistance *A* is arranged to be inserted in or removed from the line circuit, while *B* is arranged at the same time to be connected from line to earth or to be opened, respectively, by the movement of the armature *a*. When *A* is removed from circuit, *B* is open, which corresponds to closing the operator's key and sends to line the full value of the generator E. M. F. When *A* is placed in circuit, *B* is connected from line to earth, which corresponds to opening the operator's key and reduces the line E. M. F. to a value sufficient only to operate the polar side.

The problem here is to find the proper values of the resistances *A* and *B*, which, used in conjunction with particular resistances of the lamp in the generator tap, will produce the desired ratio of effective E.M.F.'s or line currents. This can be done with

the aid of Ohm's Law and simple algebra. The circuit is shown, stripped of keys, contacts, etc., in Figure 2, where the letters designating the different resistances are the same as in Figure 1. Let it be supposed, also, that these letters stand for the number of ohms in each of the resistances, respectively.

FIGURE 1.

There are two known conditions upon which the solution of the problem must rest. First, a certain ratio of long to short E.M.F. is desired, or what amounts to the same thing, a certain ratio of maximum to minimum line current. Second, whatever the position of the resistances *A* and *B*, in or out of circuit, the whole or joint resistance of the terminal must remain unchanged, or it will throw the artificial lines out of balance. We can proceed from these two conditions to solve the problem. No particular E.M.F. will be taken, but let it be supposed that the generator supplies *E* volts.

FIGURE 2.

When the resistances *A* and *B* are out of circuit, there are only the lamp and the line resistances in series with the battery, and by Ohm's Law the current is

$$I = \frac{E}{L+K} \quad (1)$$

When *A* and *B* are in circuit, we have first the resistance *L* and *A* in series, in the wire from the generator. The leak *B* and the line *K* are in multiple, however, and we must find their joint resistance, which is

$$\frac{B K}{B+K} \quad (2)$$

and the whole resistance in series with the generator is therefore

$$L+A+\frac{BK}{B+K} \quad (3)$$

In divided or multiple circuits, the total current divides itself among the branches inversely as their resistances. The current which goes to the line K will be only a part of the whole current coming from the generator, and the ratio of the line current to the generator current will be

$$\frac{B}{K+B} \quad (4)$$

The whole current flowing from the generator will be, by Ohm's Law,

$$I = \frac{E}{L+A+\frac{BK}{B+K}} \quad (5)$$

and the proportion flowing to line, or the line current, will be

$$I_2 = \frac{B}{B+K} \left[\frac{E}{L+A+\frac{BK}{B+K}} \right] \quad (6)$$

If we express the ratio of the maximum line current to the minimum as n , the value of n will be found to be

$$n = \frac{I_1}{I_2} = \frac{\left(\frac{E}{L+K} \right)}{\frac{B}{B+K} \left[\frac{E}{L+A+\frac{BK}{B+K}} \right]} \quad (7)$$

$$= \frac{\left(\frac{E}{L+K} \right)}{\left[\frac{EB}{(L+A)(B+K) + BK} \right]} \\ = \frac{(L+A)(B+K) + BK}{B(L+K)} \quad (8)$$

This gives the ratio of the line currents in terms of the four resistances L , A , B and K . The second condition imposed in our problem, that the terminal resistance must not change, will now be useful. In one case, when A and B are out of circuit, the terminal resistance is comprised of L alone; in the other case it is the joint resistance of B and the sum of L plus A . Therefore L must be equal to the joint resistance just given, or

$$L = \frac{B(L+A)}{L+A+B} \quad (9)$$

$$L^2 + AL + BL = BL + AB \\ L(L+A) = AB$$

$$\text{whence } B = \frac{L(L+A)}{A} \quad (10)$$

If now we substitute the value of B given by (10) in the value of n given by (8), we shall get

$$n = \frac{(L+A) \left[\frac{L(L+A)}{A} + K \right] + KL \frac{(L+A)}{A}}{\frac{L(L+A)(L+K)}{A}} \\ = \frac{L(L+A) + AK + KL}{L(L+K)} \\ = \frac{L(L+A) + K(L+A)}{L(L+K)} \\ = \frac{L+A}{L} \quad (11)$$

But the result of (11) can be converted to the form

$$A = L(n-1) \quad (12)$$

And by substituting the result of (12) in the value of B given by (10) we have

$$B = \frac{L[L+L(n-1)]}{L(n-1)} \\ = L \left(\frac{n}{n-1} \right) \quad (13)$$

This completes the solution of our problem, and to recapitulate, we have

$$\left. \begin{aligned} A &= L(n-1) \\ B &= L \left(\frac{n}{n-1} \right) \end{aligned} \right\} \quad (14)$$

This result can be expressed in words as follows: to find the resistance A in the line circuit, subtract one from the ratio n of the long to the short voltage and multiply the remainder by the lamp resistance L ; to find the least resistance B , divide the ratio n of the voltages by a quantity equal to one less than this ratio and multiply the result by the lamp resistance L .

It is interesting to note that the resistances A and B depend only upon the resistance of the lamp in the generator tap and the desired ratio of voltages or currents; they do not depend at all upon the resistance of the line. Therefore an adjustment of A and B to give a certain desired ratio will be operative for lines of any length, when L is not changed.

Before preparing a table of values of L , A and B , we may take note of another method of deducing the formulæ given in (14). In the first method we worked out the result from the ratio of line currents but we could as well have used the ratio of voltages. It can be proved by Ohm's Law that the fall of potential in a given portion of a simple circuit, composed of resistances in series, bears to the total

E.M.F. the same ratio as the resistance of the portion considered bears to the whole circuit. For example, consider the simple circuit composed of L , A and B , in series with the generator; the total E.M.F. acting on the line will be equal to the fall of potential in B , but the latter bears to the generator E.M.F. exactly the ratio that the resistance of B bears to the total resistance of L , A and B . Therefore we could express the ratio of short voltage to long voltage as

$$n = \frac{L+A+B}{B} = \frac{L+A}{B} + 1 \quad (15)$$

$$\text{or } B = \frac{L+A}{n-1} \quad (16)$$

Making use again of the fact that the whole terminal resistance must be the same whether A and B are in circuit or not, we have as before, in (10),

$$B = \frac{L(L+A)}{A} \quad (17)$$

Therefore,

$$\frac{L+A}{n-1} = \frac{L(L+A)}{A} \quad (18)$$

Or,

$$\frac{1}{n-1} = \frac{L}{A} \quad (19)$$

And

$$A = L(n-1) \quad (20)$$

This is the same result as we obtained before in (12) and (14). For the resistance of B we have,

$$B = \frac{L[L+L(n-1)]}{L(n-1)} \quad (21)$$

Or,

$$B = \frac{Ln}{n-1} = L \left(\frac{n}{n-1} \right) \quad (22)$$

And this is the same result that we obtained in (13) (14). Therefore the whole result expressed in (14) has been proved by two methods which give identical results. The expression of a rule in mathematical form is not convenient for many persons and therefore a table has been prepared to show actual values of L , A and B which give certain ratios of voltage. It is well to remember in this connection that the lamps used in the generator taps do not have a perfectly constant resistance. The resistance of carbon filament lamps decreases as the current increases, and hence their resistance should be measured with values of current equal to what they carry in actual service. This can readily be done with a voltmeter and an ammeter.

The values of L , A and B in the following table are all expressed in ohms and the table is ready for practical use. The choice of lamp resistance is an important matter, because it affects the efficiency of the line in bad weather. The working margin

on a line which has a large amount of leakage, will be made greatest by keeping the lamp resistance as small as possible. Of course, there is a limit to the lowest practical resistance which the lamp may have, fixed by the appearance of sparking at the transmitter contacts. The lamp resistances should properly be graded to correspond with the voltages of the taps, but often no attention is paid to this matter. It is important, however, and careful supervision of this feature will be amply repaid.

L. (LAMP)	VALUES OF THE RATIO, n.					
	A. 3.0	B. 3.5	A. 4.0	B. 4.5	A. 5.0	B. 5.5
100.	200.	150.	250.	140.	300.	133.
200.	400.	300.	500.	280.	600.	267.
300.	600.	450.	750.	420.	900.	400.

Table showing the resistances A and B (Figure 1) to use with various lamp resistances in the Field key system.

Relation of the Telephone to the General Organization of Fire Department Service.*

BY H. C. BUNDY, WATERTOWN, N. Y.

It is surprising indeed to note the rapid and enormous increase which the telephone has acquired in the last few years over the regular fire alarm system for fire calls.

I dare say that two-thirds of the fire alarms in the second and third size cities, as well as in some of the larger cities, come into the fire houses through the telephone.

If this rapid increase continues I wonder what will become of our present day fire alarm telegraph system.

It is fair to assume that the telephone has come to stay. It certainly has become an indispensable item in connection with all kinds of business, both commercial and private. With its thousands of uses its value can hardly be estimated.

Acknowledging all of these facts there is a remarkable and distinct difference, as between its use for fire calls and any other service it has to perform. The fire alarm telegraph which was designed absolutely and solely for fire alarm service, necessarily must be accurate and perfect at all times.

The custom and trouble that usually prevails on telephone systems would not be tolerated for one moment by any city, village or town on a fire alarm telegraph system. I mean by this, that if one had to

*Paper read at the fifteenth annual convention of the International Association of Municipal Electricians, Rochester, N. Y., September 6-9.

pull a fire alarm box three or four different times before he could arouse the fire department, after which he would have great difficulty in making the firemen understand what was wanted of them, and if it was as uncertain in as many ways as the telephone it would be considered absolutely inadequate and unfit for fire service, and would be thrown in the junk pile.

Fortunately, however, owing to brains, experience, with the expenditure of thousands of dollars, there has been installed in ninety-nine per cent. of the cities of the United States, fire alarm telegraph systems, supervised by an army of trained men, whose ever watchful brain and eye are strained that nothing can destroy its wonderful accuracy and efficiency.

It is unnecessary, I believe, for me to stand here before this body of men and dwell longer upon the accuracy and efficiency of the systems of which ninety-nine per cent. of you gentlemen are being held responsible throughout the cities and towns of the United States and Canada.

I believe, however, there are some methods whereby still quicker service can be obtained, and systems can be extended in headquarters at lesser expense than is now being done by many cities both large and small.

I am not going to repeat my language of a previous paper by enumerating the peculiar and perplexing difficulties and hazards which subject our fire departments throughout the country to criticism by being forced to receive telephone fire calls.

I remember that only a few years ago one of the most famous fire chiefs the world ever knew was removed from his position on account of his persistent attempts to install a telephone fire alarm system, so great was the prejudice against the use of telephones in fire service at that time.

I am also satisfied that even at the present day there is a decided lack of confidence in the accuracy of the telephone service, even by those who resort to it. As an evidence of this, you can all testify that many times in your own departments, you get your fire calls from your regular system, after someone has spent valuable time trying to get a correct and satisfactory message to your department over the telephone wire.

In many cities where overhead construction prevails, fire-alarm wires are subjected to wind and sleet storms and other difficulties as are telephone wires, but I have known many times, after the wind and storms have put them out of commission the fire alarm wire is the first one to be repaired as compared with the thousands of telephone wires which sometimes require a week to restore and put in commission. These troubles and many others occur on the telephone systems, they sharing no responsibility whatever; they consider with entire indifference the fact that hundreds of business places and residences have been temporarily deprived of their means of fire protection.

It is strange indeed that even the telephone companies themselves maintain in their own offices and equip their entire buildings with the Gamewell Auxiliary Fire-Alarm Telegraph System, connected directly with the street system of fire alarm telegraph.

This fact alone is conclusive evidence that even the promoters and maintainers of telephone franchises are alive to the fact of the superiority, accuracy and efficiency of the fire-alarm telegraph over the ordinary telephone system in case of fire calls where delays and misunderstandings might cost them hundreds of thousands of dollars.

My opinion after reviewing these facts is stronger than ever that every municipality should gain the right by some legislation (providing, where telephones continue to be used in fire-calls) that the telephone companies should be responsible in that they should keep in their employ expert operators especially for the fire service, thereby obviating a large portion of the trouble now existing, by reason of inexperience, nervous and excitable operators who become confused, and do not take or transmit the call of fire properly and distinctly.

In my city all of our department houses are connected with the central office on the bridge system, this is quite inexpensive and seems to me about as good a plan as can be adopted, as when there is a telephone call from any part of the city to an engine house the party making the call will be asked if it is to report a fire; if so, they must tell the operator the exact location of the fire. The operator immediately throws on the switch and each house or department 'phone is rung simultaneously, whereupon the operator conveys the message to each department.

My theory is that an operator should be maintained for this special work, with nothing else to do only attend to fire calls. The operator should be a person not excitable or nervous, with a goodly presence of mind, and one that has had considerable experience at the telephone board, and should insist upon the applicant being thoroughly understood before transmitting the alarm from the central office to the department.

The superintendent of fire alarms, in my opinion, should be one to which operators should be responsible. With this plan in operation, I believe much better results would accrue from the service which was not really intended to take the place of the regular fire alarm telegraph system.

In closing this subject I feel grateful that I have been considered as one to write upon this topic, as the question of responsibility should be placed upon some one for telephone fire calls equally as much as the superintendent of fire-alarm telegraph is held responsible by his city for the proper and accurate response of every fire alarm signal box no matter at what time of day or night it is pulled for a fire call.

The Passing of the Telegraph Frank.

When the new federal railway law which classifies telegraph and telephone companies as common carriers and places them under the jurisdiction of the Interstate Commerce Commission, went into effect on August 17, the telegraph companies were compelled to call in all franks held by persons who were not telegraph employees. This surrender of franks came hardest to the newspaper men and some of them took occasion to express in their editorial columns their indignation and remorse at this curtailment of their privileges. Many, however, took the matter philosophically and wrote in a humorous vein.

An Indiana editor wrote as follows:

"A wise government, more or less dominated by insurgency, has decreed that telegraph franks, issued by the Western Union and Postal companies, and perhaps by others that we have never had the pleasure of knowing and consequently are spared the present pain of parting from, must be no longer issued. Those now outstanding must, moreover, be called in. And with a patriotism that we have never been encouraged to believe these iniquitous corporations to possess, they have notified their perturbed beneficiaries to the same effect.

"This is a very moral and public-spirited performance, which must be commended in the heartiest possible manner. So take your old franks! Here they are—thirteen left in one book (ominous number!) and twenty-five in the other. Why not fire them all off at once, like the last bunch of firecrackers on the night of the Fourth, anywhere and everywhere, in the full consciousness of rectitude and also of the certainty that as soon as they are gone a perfect pandemonium of deaths, marriages, births and other occasions calling for instant telegraphic advices will break out over the entire circle of one's acquaintance?

"We repeat, the frank system, like the pass system, is iniquitous and should be done away with. This is a great victory no doubt for reform, and hurrah, of course, for reform! And one of the very worst features of the frank system was that they were so hard to get and so easy to use up. This will all be done away with now, thanks to the high moral quality of insurgent statesmen who will go on franking pianolas and donkey engines all over the civilized world and inserting magazine articles as a part of the congressional proceedings. Here is where the high cost of living gets back on the job with none so poor to do it reverence.

"Too long has the infamy of the telegraph frank weighed down the public conscience. The editorial profession in particular is certain to experience a great uplift and tighten its belt about two holes to meet the crisis. In the joy of this spiritual upshoot we can only wish that some such ennobling boost might be passed on to our dear, unselfish senators and representatives whose interest in other people's rectitude is always so touchingly on the job. No doubt this vicarious sacrifice will call for another

increase in their salaries, just as Mr. Rockefeller first gives \$1,000,000 to charity and then marks up the price of gasoline."

An Alabama editor penned the following touching obituary to the privilege which has gone from our midst forever:

"Died at midnight—August 16-17, 1910—the telegraph frank. There are tears in the eyes and wails on the lips of statesmen to-day. Poor Lo, the newspaper correspondent, is among the weepers. He has lost the last vestige of his quondam array of passes, permits, franks, licenses where the common herd had none, and open gates shut to the ordinary come and go of men. All telegrams hereafter sent must be paid for in coin of the realm.

"Newspaper men are born logicians or become so if they remain long in the game. They know that every up has its down and they cultivate a habit of mind that knows neither surprise nor regret. So with one short weep it is over with them. But the statesman has perhaps died harder. They always do. A statesman is chosen by the people, but after election he does what he chooses to do and is apt to literally consider himself one of the 'elect.' That the knife has been put to his telegraph frank is hard indeed.

"They have gone one by one, those blessed privileges. The legislator now pays his way to the capitol. The alderman must pony up his street car fare. The express companies regard with a look askance the 'man' who asks that his small package of butter and eggs picked up in rural districts at a song be sent free to his family in the city. Railroad superintendents do not annually assemble their friends and in the luxuriance of private car convey them free and well fed to points in Florida or the far west to fish for tarpon or chase the poor bruin.

"Every fellow is now paying his way. No one is getting something alleged to be free with a string tied to it. A fellow can say what he wants to about railroads, express companies or the telegraph lines. There are no presiding geniuses in the halls of state legislatures handing out passes with one hand and with the other delivering over a set of instructions regarding the legislator's vote on proposed statutes. There are no envious of the common herd 'cussing' the lucky fellow with the pass and wishing at the same time that he was as lucky. Railroad offices are no longer burdened with the pass seeker. In those sacred precincts now they talk about train running and rights of way instead of the good fellows that ought to have a pass. The newspaper man has always paid his way with a good stiff price in spite of the pass. He now pays his way with the stiff price minus the pass."

Another editor in returning his franks said:

"You will notice some discolorations upon the frank, and may think them caused by grape juice. Not so. They are the marks of my bitter tears; the print of my lips where I kissed Old Frank good-bye forever.

"Permit me in this hour of sorrow to thank you and the Company for the many courtesies extended to me, and to say that I believe that the parting gives you, as well as myself, pain—a pain for which, unfortunately, there is no balm in this land of the full fare and home of the slave."

A Texas newspaper man, upon receiving the notice calling in his franks, decided to make the most of his opportunities and use up all of the franks which he had before it was too late.

"In heaven's name," said he, "what sort of Congressmen and Senators have we, anyway, that they should thus deprive us of our rights, privileges and immunities? Didn't they do enough to us four years ago when they lopped off our free railroad passes and the sacred right of contract? Why should they now take away our means of communication? Prior to 1907, I wandered wherever I pleased, as free as a bird. Now I'm a goat. Since then I have been compelled to take my vacations within walking distance of home, and about all that I have had to distinguish me from the common herd were these telegraph franks, good only for interstate messages. Now they have lopped these off, except to officers, agents and employees of railroads, telegraph and express companies. As to these latter, our Congressmen and Senators have actually restored all the privileges which they had aforetime. Now all that I have left of freedom is a baseball pass which I seldom get to use for the reason that I must pay street car fare.

"One of the telegraph companies was fairly decent; it sent me a stamped envelope wherein to return my frank book. This, I assume, was intended to temper the wind to the shorn lamb, and I appreciate it; but it is not sufficiently consoling. I have an aching void that nothing but coin or franks will fill. But, ye gods, I will be avenged! Before surrendering these franks I will send my sweetheart and all my relatives and friends a farewell message, which the telegraph companies must handle free, gratis, for nothing. I will bid them good-bye forever and hand the telegraph companies a package which will hold them for awhile. And I will bide my time to get even with the Congressmen and Senators, who, having the privilege of franking their mail, and enjoying fat allowances from the Government, care not that much for what we common people must endure."

This newspaper man did not get down to writing his messages until August 16. He used up the last of his franks, and returned the empty covers to the telegraph companies. Then, while check clerks and operators swore over the procession of "deadheads," he leaned back in his easy chair and chuckled fiendishly.

This newspaper man had frequently sent telegrams to his sweetheart, relatives and friends. Moreover, he had bragged to them about his being privileged to use the wires free of charge, and had

invited them to "save postage by telegraphing to me, collect, and I will frank them."

In sending out his farewell messages on August 16, he had failed to remark that he was saying farewell because his fair sailing was over, and the franks as well as the passes had passed.

The next day answers poured in upon him. His instructions had been obeyed to the letter. His sweetheart, relatives and friends had "saved postage by telegraphing collect." But he could not frank the messages, for there were no more franks to frank with.

Book Review.

"Wireless Telephones and How They Work," by James Erskine Murray, D. Sc. (Norman M. Henley Publishing Company, New York, 68 pages, fully illustrated), is one of the latest books dealing with this interesting subject. This is a work free from elaborate details, and the author aims to give a clear outline of the principles underlying the operation of wireless telephones. It is intended for amateur workers and those whose knowledge of electricity is limited. Among the subjects discussed are: how we hear; the conversion of sound into electric waves; wireless transmission; the production of high-frequency alternating currents; how electric waves are radiated and received; receiving instruments and detectors. Professor Murray is one of the best informed men in the wireless field and the book which he has now produced should prove of special value to those for whom it is written. Price \$1.00. Orders may be addressed to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Telegraphs and Telephones in New Zealand.

According to the annual report of the New Zealand Post and Telegraph Department for 1909-10, the working expenditure of the telegraph department was £411,296. This exceeded the revenue by £16,786. Telephone messages have so greatly encroached upon the field of the telegraph that telegrams have barely held their own. Telegrams transmitted were 7,846,890, an increase of 421,197, and telephone communications were 1,757,869 as compared with 1,423,093 during the previous year. On March 31 last there were 10,901 miles of telegraph line and 34,788 miles of telegraph wire. Submarine cables within the Dominion were 368 miles. There were 291 telegraph and 1,580 telephone offices open.

Seventeen new telephone exchanges were opened during the year, the number of subscribers increased by 2,104, and the total number of connections by 2,848. There are now 153 exchanges. The total number of connections is 29,681, compared with 26,833 in 1909. On March 31, 1910, there were 1,270 miles of telephone line and 35,233 miles of wire.

The Military Telegrapher in the Civil War.

PART XLVI.

BY THEODORE E. MORELAND, PITTSBURG, PA.

(Continued from page 626, September 16 issue.)

Here is another one on me and one that most people would smother, but as I was entirely innocent I will tell the story. It was widely known at that time by our telegraph people. The last day of our retreat before reaching Harrison's Landing after the battle of Malvern Hill, where we whipped the Confederates badly but did not find it out for months afterwards, I had again fallen into company with Henry Cowan as a chum. In our travels, about dusk one evening we had strayed onto a deserted road or bridle path. Our march was interrupted by a runaway horse that came up to us on a gallop. We had no trouble in capturing him and soon discovered that he belonged to no ordinary officer as the magnificent animal was handsomely caparisoned and in the holsters and saddle bags were a very handsome revolver and a liberal supply of medicine in liquid form that was very frequently used for purposes not strictly medicinal when it could be had as the water was dangerously bad in that neighborhood. We, of course, put this liquid to work immediately and a half a dozen of us in that crowd decided that the war was not the failure that we had been led to believe it was. The horse became my property by right of capture. The saddle and bridle I gave to Cowan and some of the other trappings I generously gave to some of our orderlies who were always on the staff of the operators as couriers, etc.

Our appearance the next day on the march was superb and I think now, at this late day, that our soldiers may have been led into the belief that our troop might have been little "Mac" or Hancock, the superb, and staff. We were rudely awakened the following day when we were halted on our march by a provost guard and asked to explain how this horse and trappings came into our possession. They were given a truthful version of the runaway capture and we were given the laugh. We were told that this particular horse would stand for days, possibly weeks, at a time and would never run away unless told to do so by General O'Neill of the regular army. Bucky, as he was dubbed, got this name. I learned afterwards, by punishing his men by the buck and gag for their different offenses. We were told to dismount and consider ourselves prisoners and as we would likely be shot at sunrise, a little sprint before our execution would do us good. Cowan, whose brother commanded a battery in this division told our guard of this fact and he and our orderlies were released. I was dismounted and after a tearful farewell to Henry and the others, I marched to my doom. To make my disgrace and humiliation the greater, Bucky's squad marched me right through a corps where I was pretty well known and in which I had two brothers. All kinds of guessing was engaged in

as to the nature of my crime or offense. The best one was that I was a captured spy and that I would likely share the fate of Major Andre and a whole lot of other fellows of that kind. After a walk in a broiling hot sun for six or eight hours I was landed in the presence of his august majesty General O'Neill. The meeting between us was warm—very warm—I felt that a disgrace had been brought on this grand old corps of which I was a member. Bucky claimed, as did his men, that this particular horse wouldn't run away though pounded by all the shells in the Southern Confederacy—or tempted by all the oats or hay in the Northern Army. I told Bucky he lied and although my story was true, I was sent to the guard house. In the meantime Cowan had not been idle, he having reached McClellan's headquarters and told them the correct story. Harper Caldwell and Cowan came over at once with an order from McClellan for my immediate release. Harper had told McClellan that he knew I wouldn't steal a horse as I already had one. Bucky, when satisfied that I was a member of the telegraph corps which had rendered him and others such great service and who stood well with little Mac and those at headquarters, was very profuse in his apologies and said he would set them up had it not been for the fact that the liquid that was in the saddle bags had mysteriously disappeared.

All is well that ends well and I have partly forgiven Bucky for his brutal treatment of me and that the sun to which I was exposed for hours didn't lay me out was surprising as sunstrokes and exposures caused great havoc at this time.

History records the embarkation at Harrison's Landing and other nearby points of the Army of the Potomac to take up a new base of operations near Washington.

On my arrival at Washington I was again returned to Fort Lyon, and re-opened the office at that point under the same commander as previously, General Heintzelman. General McClellan having been removed, Pope had succeeded him. I was next sent to the old Bull Run battlefield and with Henry Cowan was assigned to General Fitz John Porter's headquarters, and here it was that Pope's famous order to move on the Confederates at once and annihilate them was received. Porter, finding that the enemy outnumbered him four to one (this being unknown to Pope) refused to, or at least did not obey the order. Charges were preferred against Porter for his disobedience and he narrowly escaped being shot. But the sentence was as bad or worse to a brave soldier. He was found guilty and forever debarred from holding any office of honor or trust under our government. This sentence was removed twenty or twenty-five years afterwards and Porter was vindicated, Grant and most of his generals and Lee, Jackson and Longstreet agreeing that Porter's action was right and his corps would have been slaughtered if Pope's order had been executed.

Cowan and myself were brought to Washington as witnesses in this trial for the purpose of identifying different despatches passing through our hands. Being very young—only seventeen—we did not see the possible impropriety of calling upon Porter as we both admired him very much as being one of the very best soldiers in the Army of the Potomac. At this meeting Porter told us to answer all questions truthfully and not to hide anything we might know out of our friendship to him. He also told us that he never expected to see us again. When the order came to retreat McCandless with his linemen and Cowan and myself were in the advance stretching our wires. General Porter was unable to reach us by couriers and as our gang was a mile or two outside of the lines it was a miracle we were not captured. I do not remember how word reached us—or if it reached us at all—that we were getting on dangerous ground, but McCandless, not hearing from any one in our rear, thought it would be good generalship to fall back and we acted accordingly. On our march back we nearly ran into a large body of Confederate cavalry that were in camp preparing to eat. They were camped just on the edge of the woods, about fifty yards from us and, of course, saw us. Our squad numbered about twenty-five and we were all mounted. Cowan halloed and waved his hat at them, which greeting was returned. We were not sure they were Confederates, but took no chance of getting near them. They evidently looked upon us as friends and made no effort to capture us. Cowan afterwards told us that he knew all of the time that they were Confederates and this was merely a little ruse of his to throw them off their guard. We, of course, did not believe him, but did not want to deprive him of the glory of saving us from capture and in all likelihood a trip to Libby or Andersonville prison. About this time we were getting considerably alarmed and thought it time to make inquiries. We had at times strayed out of sight of the telegraph wires as our general, Levi McCandless, had thought it unwise to expose ourselves too much. Luckily, shortly afterwards we stumbled on to our wires and the next thing in order was to cut in and seek information, and we then discovered we were not the only ones in search of the same thing.

Probably we were not the first discoverers of the horse telegraph office, but I think we were, and Cowan and myself were the first to open an office in the saddle. At this particular time I was acting as the pack horse—it being my turn to carry the telegraph instrument. Upon cutting in we found current and had scarcely closed the wire when "Who goes there?" was asked. It proved to be John Dwight at the war department office. I had opened an office on the pommel of my saddle and the horse was a little uneasy and made a rather unsteady telegraph office. The war department was glad to hear us and said they had had no communication from Pope or anyone

else for a long time and asked us what we knew and where we were. We told them that we had no knowledge of the whereabouts of the army and were not very sure where we were but thought we were near the Bull Run battlefield as we could hear an engine just below us blowing off steam.

At this time assembled in the war department office as we were told, were President Lincoln, Edwin M. Stanton and all of the prominent officials in Washington who were greatly alarmed and had their grips packed ready to make a start if that city was captured by the enemy. Before closing our office we were told that if the locomotive was still there Secretary Stanton had ordered us to board the engine and tell the engineer to pull the throttle open and come back to Alexandria at once and let our cavalry escort and linemen come back overland as best they could. This showed that Stanton appreciated the value of the war telegrapher and did not want to lose any of that scarce article just then. Many years afterwards Mr. T. B. A. David at that time our superintendent in Pittsburg and a native Pittsburger asked me if I had ever read a description of the ride taken by Cowan and myself from Bull Run to Alexandria by order of Secretary Stanton and General Eckert. One of the New York papers at the time devoted a great deal of space to it and looked upon it as marvelous. It must be remembered that at this time, our army was in a rout and was fleeing as fast as Pope could lead them to Washington. The line of the railroad, the Orange and Alexandria then, now, I think, part of the Southern, had been abandoned to the Confederates and our ride would likely prove a very hazardous one. The engineer declared that there were two routes open to us to get to the happy hunting grounds. The railroad route or to fall into Colonel John Mosby's hands and be hanged. As he had been a railroader all his life he preferred to make his exit from this world by the railroad route, and as no choice was left us we were compelled to take the same way. At this time the contraband and our soldiers were bringing in the most exaggerated stories of Colonel Mosby's barbarous and atrocious treatment of his prisoners. With the feeling that it would go hard with us if we fell into Mosby's hands, on the part of the engineer we started for Alexandria with our bare engine and tender. As it seemed to be taken for granted by the engineer that we preferred the guerrilla or Mosby route for our exit, we were provided with seats on the tender and made a good and conspicuous target for the Confederates, whom we supposed had possession of the railroad and had either removed the rails or destroyed the road entirely. This is one instance of where General Lee was asleep and lost some prizes that would have weakened General Eckert's telegraph corps a little. Our miraculous escape from death, as I said before, was commented on and our great speed ride broke the record and broke it badly. That trip of some-

thing over 21 miles was made, we thought then, in that many seconds. I don't know that I have yet recovered from the jolts and fright caused by that ride.

General Burnside having succeeded Pope, I was sent to his headquarters fronting Fredericksburg and remained there a short time, but was taken ill with fever and ague and that magnificent fatherly old soldier advised me to go home, as I could not get cured where I was. I took his advice and with General Eckert's consent and transportation, I reached home, staying there a couple of weeks, when I returned to take part in different localities with different generals. For a short time I was with Fred Bickford and Thomas Dolan, the ex-newsboy and a number one operator from New York, one of the most humorous and best natured fellows I ever ran across in my war experience, the most generous and unselfish and the life of the crowd. While taking part in the Hooker Wilderness campaign J. D. Tinney and myself again had a narrow escape. We had been well to the front when General Lee drove us back, but we turned the tables very shortly thereafter and drove the Confederates. Tinney and I were ordered to again re-open our office in the front which we had been compelled to abandon. Tinney, understanding the importance of getting to that office and re-opening it in a hurry better than I did, broke through our line of battle advancing two deep and over a mile in length, and by the way, one of the grandest sights I had yet witnessed. I, of course, could not show a white feather and was with Tinney at the opening of the office. We drove the Confederate pickets, they falling back slowly, giving way and contesting every inch. They were dropping our advancing men rapidly and why Tinney and myself were not picked off, as we made conspicuous targets on horseback, we will leave to them to tell. My war experience ended shortly thereafter as I was captured along the line of the railroad at Catletts Station by some of Mosby's men under command of Captain Lee, who claimed to be a nephew of General Robert E. Lee. They treated me splendidly with one exception and that exception was a telegraph operator whose name I have forgotten. As we reached the rendezvous of the guerrillas at dusk the first evening of my capture, Lee attempted to introduce me to this operator as one of the fraternity. He turned his back and said if I was a Yankee I was not in his set. Lee told me afterwards that this operator was assigned to his command as a wire tapper to operate inside our lines, but that it took a bayonet to keep him at his work.

I might meet that fellow at the other end of a wire some day and if I do, he will get a roast if I have a few hundred to send to him, that will make him regret his treatment of me on that occasion. To show how the respective governments looked upon the value of the telegraph operator in war times, while I was a prisoner we

rode up to a large mansion, where Captain Lee was well known, as he was everywhere over the route we traveled, upon the veranda of which sat a very old couple who had three sons in the Confederate Army. Upon the old lady asking Captain Lee who I was, what he intended to do with me and pleading with him to release me, Lee replied that he regarded me as one of the most important prisoners he had yet taken since he had been a free lance and had engaged in the "Yankee capturing business." He told the old lady that his Uncle Robert had issued orders that any one bringing in one Yankee operator would be promoted one grade and that I would make a Major of him. Bringing in two would make him a Colonel—three a General—and by capturing four, he could take his Uncle Robert's job as Commander in chief.

After Pope's defeat at the second battle of Bull Run and my return to Washington, I was assigned to the war department office for a few days by Major Eckert and Mr. D. H. Bates.

The night of the battle of Antietam the following relay message passed through the war department office and has always been stamped upon my memory:

Antietam.

Mrs. Geo. B. McClellan,
Orange, N. J.
My dear Nellie:

We are in the midst of the greatest battle of the age. Pray to God for our success.

Geo. B. McClellan,
General Commanding.

Some More Reminiscences of George M. Dugan.

In a second article in the New Orleans "Picayune," Mr. George M. Dugan gives some more of his war time experiences while employed as a Confederate Military Telegrapher in addition to those which appeared in our September 1 issue.

Mr. Dugan's experience was largely with the cavalry, much of the time with General Forrest. The only fun he had on his vacations was to accompany the cavalry when going on a raid, though it was not always, he states, so funny at times, and after a week or ten days in the saddle, Mr. Dugan was glad to get back to his duties, trying to keep the wires working, which was no easy matter at times when the Northern troops decided to pay them a visit.

Mr. Dugan tells the following story about a member of General Forrest's staff who is still living.

"After the capture of Fort Pillow, Generals Forrest and Chalmers, with their staffs and escorts, rode ahead to Jackson, Tenn., and awaited the arrival of the column. The boys in groups passed along the streets looking for something to eat.

"Lieutenant J. A. Taylor, Captain T. E. Lindsey and Lieutenant James Dinkins, of Chalmers' staff, were returning to the grove where our horses were resting and passed along by three young girls standing at a gate. Lieutenant Dinkins invariably

wore his coat buttoned, and, having a good figure, one of the girls, Miss Jennie Day, said after they had passed: "Oh! the one in the middle has got on a corset!" and all three of the girls screamed and laughed. So did Taylor and Lindsey, but Dinkins thought it was an insult."

The Captain Lindsey referred to was the father of Judge Ben Lindsey, of Denver juvenile court fame. Lieutenant Dinkins afterward became captain and is now living in New Orleans. To get even with Mr. Dugan for telling the joke on him, Captain Dinkins in a later issue of the "Picayune" relates the following incident in Mr. Dugan's military career.

"Colonel Dugan had a taste for the romantic, as well as an appetite for good things to eat, so one day he stole a march and hied himself toward the enemy's lines (which, at that time, were at Holly Springs), without so much as saying good-bye to the rest of us.

"As a matter of fact, he ran away from us. We afterwards learned that he spent a very pleasant day at the home of some friends, among whom was a very bright, attractive girl, just about the romantic age.

"While thus enjoying himself a troop of Union cavalry rode up and carried the young man off.

"It must have been that the Yankees thought he was a very bad, or, at any rate, a valuable rebel, because, to make sure, they put him in the Alton (Ill.), penitentiary, where he languished for about four months, after which they moved him to Gratiot Street prison, in St. Louis.

"I do not know how he finally managed to be exchanged, but he was, and came back to us with improved impressions of Yankee hospitality.

"I dislike to tell that he served a term in a penitentiary, but it is a fact.

"On his return to the command, after being exchanged, he stopped at Holly Springs to get a horse, and, incidentally, to see his friends again. He found the Third Mississippi Cavalry camped there on outpost duty. As luck would have it, the Yankees came out for a brush with our boys, and Colonel Dugan, hearing the guns, mounted his new horse and joined Colonel McGuirk. In the mix-up the new horse was killed, and he had to foot it back to our lines.

"We all forgave him, and he behaved very well from that time to the close of the war."

Speaking of the closing scenes of the war, Mr. Dugan says:

"The end came, finding me at Grenada, Miss. While sitting in the office alone, the operators having gone for the night, a rapid calling for "DA" (Grenada) came over the wire, which I paid no attention to at first but finally, through curiosity more than duty, I answered to see what was causing such a disturbance at this unusual hour. When Holly Springs, one of our remote outpost offices, spoke, his first words were: 'Hell's to pay; Lee surrendered.' I replied: 'Don't believe it; another Yankee lie.' He replied: 'Oh, it's so; I have an

extra Memphis Bulletin, brought in by one of Henderson's scouts. No doubt about it. A fast steamer has been despatched down the river to Vicksburg to convey the news, firing guns every thirty minutes. Can hear them from here.' With this information, I walked over to General Marcus J. Wright's headquarters, where I found several gentlemen sitting around the room, among them Governor Isham G. Harris, of Tennessee; Major Butler, Colonel Jesse Forrest and a few other gentlemen (Governor Harris having arrived only a short time before), discussing the situation. The first greeting was: 'Well, Dugan, anything new?' I do not now recall what I said, except to quote the Holly Springs message by saying 'Hell's to pay sure enough. Lee surrendered.' A bombshell with short fuse would not have caused greater consternation. Every man was on his feet, some wanting further information, others speaking in about the same language used by myself on hearing it, all discussing the news except Governor Harris, who retained his seat and composure until the question was asked him what his opinion was. He rose in his usual dignified and impressive manner, saying: 'I am prepared to receive just such information, and, in fact, have been expecting to hear it for the past several days. On leaving Richmond ten days ago, I—in fact, we all—felt that the end was near.' One of the gentlemen present asking him what would be the next move, he said that, if it was a fact that Lee had surrendered, it would end the war. Other commands must necessarily follow, 'and, gentlemen, my advice to you is to make up your minds to accept the situation. Make your arrangements to return to your homes; and build up again, become good citizens and go to work.'"

Some of the newspapers, in speaking of the recent death of a military telegrapher, have given that individual credit for sending from Rome, Ga., to President Lincoln, the cipher message from Sherman proposing his march to the sea. This statement is not correct, as according to Mr. D. H. Bates, the late Charles G. Eddy was Sherman's cipher operator at that time, 1864, and Captain Samuel H. Beekwith, now of Utica, N. Y., was Grant's cipher operator at City Point, Va. The cipher message from Sherman proposing the march to the sea, from the very nature of things, could not have been entrusted to any one but his own faithful cipher operator, Mr. Eddy. It was translated at the war department by one or more of the cipher operators there, C. A. Tinker, A. B. Chandler, D. H. Bates, Frank Stewart or George C. Maynard.

Mr. H. P. Dwight, president of the Great North Western Telegraph Company, Toronto, Ont., in ordering us to continue his subscription for another year, writes:

"I would not do without the Age for ten times the price. I should simply be lost without it."

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. E. BRIKEY

Sole Manufacturer

Railway Exchange, CHICAGO, ILL.**

The Railroad.

The annual meeting of the Railway Signal Association will be held at Richmond, Va., October 11, 12 and 13. Mr. C. C. Rosenberg, of Bethlehem, Pa., is secretary of the association.

Mr. I. T. Dyer, superintendent of telegraph of the San Pedro, Los Angeles and Salt Lake Railroad, Los Angeles, Cal., has been confined to his home by sickness for some time past but is now much improved.

Among recent New York business visitors were Mr. W. W. Ryder, of Chicago, general superintendent of telegraph of New York Central lines west of Buffalo, and Mr. W. F. Williams, superintendent of telegraph of the Seaboard Air Line, Portsmouth, Va.

The Big Four Railroad has placed in service an intercommunicating line in the Cleveland-Linn-dale yards connecting six offices, with a call box and selector at each station, so that anyone can ring any other station without disturbing those not wanted. No extra wires are used with this arrangement, only two telephone wires being required.

The Grand Trunk Railway has recently placed two telephone train despatching circuits in commission on the northern division, one line between North Parkdale Junction, Toronto, and Burlington Junction, via Allandale, a distance of 145 miles with twenty-one way stations. The despatchers are located at Allandale, about midway of the circuit. Another line connects Allandale and Nipissing Junction a distance of 165 miles with twenty way stations and with the despatchers at Allandale. Both circuits are giving satisfactory service and it is expected that additional circuits will be constructed in the near future. This work has been completed under the supervision of Mr. W. W. Ashald, superintendent of telegraph of the Grand Trunk.

Mr. W. C. Bassett, for several years past manager of the Kansas City relay office of the Atchison, Topeka and Santa Fé Railway and division operator at that point, has been appointed assistant superintendent of telegraph of that system with headquarters at Los Angeles, vice Mr. G. A. Lawrence, resigned. Mr. G. D. Criswell, personal record clerk in the office of Mr. L. M. Jones, superintendent of telegraph of the Atchison, Topeka and Santa Fé Railroad, Topeka, has been appointed chief clerk, vice Mr. G. D. Hood, resigned. Mr. L. L. Leech, night chief of the Albuquerque, N. M., office has been appointed wire chief and manager of that office, vice Mr. A. W. Douglas, resigned. Mr. L. A. Dickenson, night chief of the Fresno, Cal., office has been appointed wire chief and manager of that office, vice Mr. L. K. Whitcomb, resigned. Mr. E. C. Bruns has been appointed late night chief of the Los Angeles office, vice Mr. F. L. Titus, resigned. All of the gentlemen mentioned, who have resigned have entered the service of the Western Union Telegraph Company.

The Indianapolis Union Railway is extending the intercommunicating selector system to the Union tracks to give the switch tenders better communication facilities.

Mr. S. G. Gearhart, division operator on the Pottsville division of the Pennsylvania Railroad at Sunbury, Pa., is supervising the installation of a telephone despatching circuit on that division with a total of twenty-three stations.

Mr. Jas. Donnelly, division operator of the Pennsylvania Railroad at Baltimore, is supervising the installation of a telephone despatching circuit between Baltimore and Sparrows Point, Md.

A patent, No. 969,985, for a signaling system, has been awarded to H. O. Rugh, of Sandwich, Ill. Railway system with a central station and telephone system for signaling and substations along the line with a signal at each substation, a selecting device therefor, and an electromagnetic means for operating the selecting device in each line at each signal receiving station and a shunt circuit transparent to the telephone currents bridged around the electromagnetic means.

The printed proceedings of the twenty-ninth annual convention of the Association of Railway Telegraph Superintendents, which met at Los Angeles, June 20-24, are now ready for distribution. The large amount of work accomplished by that convention is shown by the size of the book, 268 pages being required for the complete record, which makes it the largest of any of the printed proceedings of the annual meetings. The papers and discussions contained in this report form a valuable addition to the library of any one interested in railway telegraph operation. The work of compiling the proceedings has been carried out under the supervision of Mr. P. W. Drew, of Chicago, secretary of the association.

Meeting of Western Railway Telegraph Superintendents.

The regular quarterly meeting of the western division of the Association of Railway Telegraph Superintendents was held in the general office building of the Chicago and Northwestern Railroad at Chicago, September 22.

The meeting was called to order at 10.30 a. m. by Chairman E. A. Chenery, superintendent of telegraph of the Missouri Pacific Railroad, St. Louis. In the absence of Secretary F. E. Bentley, Mr. F. H. Van Etten was elected secretary pro tem of the meeting. Messrs. Chenery and Bentley were unanimously elected to succeed themselves as chairman and secretary respectively of the division for the ensuing year.

The matter of establishing a "clearing house" for the interchange of telegrams between local railroad offices in Chicago was brought up and as there seemed to be no general need for such facilities at this time, it was finally decided by vote to allow the subject to pass.

The meeting was favored with the presence of Mr. W. J. Lloyd, division traffic superintendent, M. T. Cook, division commercial superintendent and M. H. Clapp, division plant superintendent of the Western Union Telegraph Company, each of whom in turn explained their aims and desires in the departments represented and solicited the co-operation of the several railway telegraph superintendents towards the upbuilding of the commercial service generally, so far as rested in their power. The remarks of each gentleman were listened to with interest and it was the consensus of opinion that mutual benefits would result from frequent meetings of the commercial and railway telegraph representatives and the commercial representatives were cordially invited to attend the Association meetings.

Considerable discussion was had on lightning protection for telephone circuits in which Messrs. Ryder, Bennett, Launbranch, Currier and others gave technical and practical experiences.

An invitation to luncheon at the La Salle Hotel was tendered by Messrs. Harkness, Currier, Wray and Rugh on behalf of the interests they represented, which was accepted by nearly all in attendance at the meeting.

At the afternoon session the matter of handling telegrams for parties on trains was taken up; Mr. Griffith, the chairman of the committee appointed at the annual meeting, stating that it was proposed to discuss the matter with the officials of the telegraph companies and after agreeing on a suitable method, report at the succeeding meeting.

The subject of high tension wire crossings was discussed, but as only a few of those present were at the Los Angeles convention or had had time to peruse the minutes of that meeting, the matter was laid over. It was suggested, however, that it would be of much benefit to all the members if a complete record was secured of the laws relating to wire crossings now in effect in the various states and the secretary of the western division was directed to assign one or more states to each superintendent of telegraph, the latter to be requested to secure from the railway commission or such other officer a copy of such laws or regulations now in effect and submit the same to the chairman. The eastern division would doubtless be glad to co-operate and with a complete record at hand the committee might decide to print the laws in pamphlet form and distribute them to all of the members.

Mr. Griffith called attention to the resolution passed at the annual convention on the proposition to erect a monument by popular subscription at Turner, N. Y., to commemorate the first train order by telegraph. It was suggested that pamphlets outlining the proposition might be furnished the several members who, in turn, would distribute them to the operators on their respective roads and any donation thus received be sent to the committee.

A vote of thanks was tendered Mr. Bennett for the commodious quarters provided for the meeting and to the gentlemen who acted as hosts at the luncheon, after which the meeting adjourned.

Among those present were:

Chicago: Wm. Bennett, M. H. Clapp, M. T. Cook, W. L. Cook, P. W. Drew, J. G. Jennings, W. J. Lloyd, M. E. Launbranch, W. W. Ryder, F. T. Wilbur, F. H. Van Etten, D. W. Dean, Albert Douglass, A. G. Francis and A. Wray.

Detroit, Mich.: J. J. Ross.

Danville, Ill.: W. L. Connelly

Indianapolis: C. S. Rhoads.

Kansas City: Val B. Mintum.

New York: H. D. Currier, E. P. Griffith, W. E. Harkness, B. A. Kaiser and J. A. Waugh.

Pittsburg, Pa.: L. A. Lee.

St. Louis: E. A. Chenery.

St. Paul: George Boyce, L. H. Merrill, E. J. Little and E. E. Dildine.

Sandwich, Ill.: H. O. Rugh, C. S. Rhoads, Jr.

Toledo, O.: E. C. Keenan.

Topeka, Kan.: L. M. Jones.

Train Despatching on the Louisville and Nashville.

The Louisville and Nashville Railroad has placed a large order for telephone train despatching apparatus. This equipment will cover the Cumberland Valley and Kentucky divisions from Cincinnati to Norton, a distance of 304 miles and will consist of six circuits in all, four train wires and two message circuits with a total of 162 stations. One circuit will extend from Cincinnati, Ohio, to Paris, Kentucky, with a branch to Maysville. This circuit covers 136 miles and will be equipped for 32 way stations. The train despatcher will be located at Paris.

Another circuit extends from Paris to Corbin, with a branch from Paris to Lexington, and another from Rushmore Junction to Rowland. The mileage covered by this circuit is 165 and 30 way stations will be equipped. The despatcher for this circuit will also be located at Paris.

In addition, there will be a telephone message wire circuit, used to handle general railway business, extending from Paris to Cincinnati and from Cincinnati to Corbin. This circuit is 195 miles in length and has 40 way stations.

The Corbin to Norton division consists of three circuits, the first a train despatching circuit extending from Corbin to Middleborough, the second a train despatching circuit from Middleborough to Norton and the third a telephone message wire circuit from Corbin to Norton. The circuit from Corbin to Middleborough is 41 miles in length and has 14 way stations, while the Middleborough to Norton division, 79 miles in length, is equipped with 14 stations. The train despatchers for both of these circuits are located at Middleborough. The message wire circuit is used to handle general railway business, is 120 miles in length and has 33 stations.

The Louisville and Nashville already has in operation a telephone train despatching circuit between New Orleans and Mobile, a distance of 139 miles, with 26 stations. Mr. C. B. Phelps, superintendent of transportation of this system and Mr. R. R. Hobbs, chief operator, will direct the work of installing the new equipment.

The Turner Monument Fund.

In our September 16 issue we recorded the passage of a resolution by the Old Time Telegraphers' and Historical Association at their Chicago reunion and the appointment of a committee to receive subscriptions for the erection of a monument at Turner, N. Y., to commemorate the sending of the first telegraph train order. The money for this purpose is to be raised by popular subscription and it is proposed when the project has been completed to issue a souvenir booklet giving the history of the event which the monument will commemorate, as well as the story of its erection, with the names of all contributors and the amounts given. Each contributor will also receive an engraved certificate suitable for framing or placing in a scrap book and specifying the amount paid to the fund.

The Erie Railroad Company is now constructing a new station at Turner and will, no doubt, aid the committee in the selection of a site near the old station whereon the proposed monument may be erected.

The committee which has the matter in charge consists of: E. P. Griffith, superintendent of telegraph, Erie Railroad, Jersey City, N. J., chairman; C. Selden, superintendent of telegraph, Baltimore and Ohio Railroad, Baltimore, Md.; E. A. Chenery, superintendent of telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railroad, Montreal, Canada; J. B. Taltavall, editor Telegraph and Telephone Age, New York; Colonel W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia, Pa., and F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All contributions should be sent to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who will act as treasurer of the committee. Acknowledgment of the amounts received will be made in the columns of Telegraph and Telephone Age as soon as possible after their receipt. The committee will be glad to receive any amount, large or small, from any person, whether connected with the telegraph service or not. Anyone should esteem it an honor to contribute to this object, which will perpetuate the memory of one of the most important railroad events in telegraphic history.

Trade Notes.

Sales of the Western Electric Company for the first nine months of the present fiscal year indicate that the gross sales for the year will amount

to \$61,000,000. The only year in the history of the company which has ever surpassed this was 1906, when the total business amounted to \$69,000,000. The number of orders for the present year, however, will be approximately 800,000, as compared with 475,000 in 1906.

The Sandwich Electric Company reports sales of their selectors to the Pennsylvania Railroad for equipping their new New York terminal and for telephone despatching installations on the Pottsville division and between Baltimore and Sparrows Point, Md. The Canadian Pacific Railway is also installing Sandwich selectors between Moose Jaw, Sask., and Broadview, Sask., a distance of 135 miles. The Indianapolis Union Railway is extending their Sandwich intercommunicating system which was described in our February 16 issue.

Municipal Electricians.

Plans are being prepared at Passaic, N. J., for the installation of the fire and police telegraph systems in the new fire headquarters and also for connecting all of the city telephones to a switchboard located at the same place. The cost of the entire work will be about \$25,000.

Bids have been received at San Bernardino, Cal., for the construction of a fire alarm telegraph system in that city.

At the concluding session of the convention of the International Association of Municipal Electricians, Mr. W. Y. Ellett eulogized the work of the retiring secretary, Frank P. Foster, and on behalf of the members presented him with a silver service.

Good Opportunities for Commercial Telegraphers in Canada.

A telegraph operator who went from New York to Canada three years ago and secured employment with one of the telegraph companies in that country, in a recent letter states that he is better off in every way than he would have been if he had remained in the United States. There are doubtless many operators in the large cities of this country who would make the same report if they appreciated the advantages which might be theirs if they should locate in one of the rapidly growing cities of Western Canada where the business is increasing so fast that the commercial telegraph companies are having considerable difficulty in securing an ample supply of operators. There seems to be a general impression that the Canadian climate is very severe and this undoubtedly deters many from making the change. Thousands of those who have emigrated to Canada from the United States, however, agree that the climate is more equable than in many parts of this country.

Mr. J. M. Carnahan, manager of the Western Union Telegraph Company at Missoula, Mont., in renewing his subscription, says: "I may be late, but I will sure be there with my renewal."

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works on telegraphy and treat them in the same manner.]

CHAPTER XVIII.

How are the higher electromotive forces required obtained in some offices?

What objection is there to this method when the lower potentials are not required?

Where only high potential machines are installed how is the lower potential required for duplex operation sometimes obtained by the Postal Telegraph-Cable Company?

Draw a diagram of the connections for this arrangement.

What changes in this arrangement for duplex operation would make it available for the higher voltage required for quadruplex operation?

What different voltages can be obtained with the arrangement shown and with an original dynamo voltage of 380?

CHAPTER XIX.

Why does not the use of the high potential duplex introduce any conditions which tend to unbalance the instruments at the other end of the line?

Why can not this arrangement be used to secure the two voltages required for quadruplex operation?

What is the formula by which the resistance value of the various coils in the Field key combination may be obtained?

Show by actual examples that by using the values obtained by this formula the joint resistance of the two routes for the incoming current is always the same when the transmitter is closed and is equal to the resistance of the current path when the transmitter is open.

How is a leak box arranged to provide for two different proportions of the long to the short end current?

Compare the formula given by Mr. Jones with the one worked out by Mr. Fowle in his article on page 666 of this issue.

Does the value of the resistances used depend upon the value of the line resistance in any way?

Obituary.

C. J. Casey, an operator employed by the Western Union Telegraph Company at Savannah, Ga., since 1882, died at that place August 15, aged forty-seven years. He is survived by a wife and six children.

William D. Lessing, Associated Press operator, died of Bright's disease, at Waco, Tex., on September 2. He was well known in press circles in southern and western states.

David Davis, for many years employed by the Western Union Telegraph Company, died at Syracuse, N. Y., September 18, aged forty-nine years.

John H. Beymer, who was identified with the Western Union Telegraph Company at Wheeling, W. Va., died September 16, aged forty-four years.

Charles N. White, an expert telegrapher, formerly employed at Memphis and New Orleans, died of consumption at Bouse, Ariz., on September 4. Mr. White was the son of Mr. W. N. White, of Covington, Tenn., a well known old time and military telegrapher, who is now in the real estate business at that point.

Jeremiah B. Boyer, a member of the Old Time Telegraphers' and Historical Association, died at his home in Pittsburg, September 19, aged seventy-six years. Mr. Boyer entered the telegraph service in 1853. For over thirty years, until his retirement from business two years ago, he was proprietor of a Pittsburg hotel.

John D. Voltz, a member of the United States Military Telegraph Corps, died at Elgin, Ill., September 19, aged seventy years. Mr. Voltz had been in the telegraph service for fifty-five years. He was for twenty-five years employed by the Chicago and Northwestern Railway at South Elgin, Ill., but was retired last fall on a pension.

John V. O'Brien, special agent in charge of the commercial business of the first district, Pacific division of the Western Union Telegraph Company, at San Francisco, died September 18, aged forty-six years. Mr. O'Brien was for several years manager of the San Francisco office of his company, having only recently been promoted from that position to the post he occupied at the time of his death.

Death of W. A. Van Orden.

W. A. Van Orden, a well known old time telegrapher of New York, died September 22, of paralysis, aged fifty-five years. Mr. Van Orden entered the telegraph service in 1871 with the Franklin Telegraph Company. In 1885 he joined the forces of the Western Union Telegraph Company, and was since employed by that company as operator, traffic chief, quadruplex chief, draughtsman, assistant general wire chief and general wire chief, which position he held at the time of his retirement five years ago on account of ill health. In addition to his telegraphic duties he served for over fifteen years as draughtsman for Telegraph Age.

Mr. E. P. Griffith, now superintendent of telegraph of the Erie Railroad, and for many years general wire chief of the Western Union Telegraph Company at New York, pays the following

tribute to Mr. Van Orden, with whom he was closely associated for many years:

"Mr. Van Orden has gone, but is not forgotten. A bright star in the telegraph firmament has dropped from sight, but the magnets of his personality will remain warm with the current of love induced by his brilliant career in the field he occupied. His associates for the past thirty years will remember him as the storehouse of knowledge pertaining to the great wire system of all telegraph, telephone, electric light, power distributing, police and fire alarm telegraph wires in New York City, and an encyclopedia of telegraph and cable circuits covering the world. It was Mr. Van Orden who made the map showing the land lines along the Atlantic and Pacific coasts, and the Gulf of Mexico, as well as the submarine cable connections in Cuba and the West Indian Islands which was a guide to the government and our enterprising American newspapers in keeping in touch with the situation during the Spanish-American War in 1898.

"Van, as I shall always remember him, was one who always did what was expected of him. It was only necessary to intimate what was required and then rest assured that the thing was done within the margin of time allowed. The same principle which characterized his telegraph business career, was shown in his domestic life, and old timers who have known Van in every phase of his work and home life, feel with the beloved widow that the loss is mutual."

LETTERS FROM OUR AGENTS.

PHILADELPHIA, POSTAL.

The vacation season among the chiefs in this office is about over, Assistant Wire Chief F. P. McElroy relieving all of the other chiefs while they were on vacation.

F. S. Barrett has returned from Atlantic City, where he has been helping to handle the heavy summer traffic.

A new telephone exchange is being installed in this office which will greatly assist in the handling of the large amount of business which is received and delivered by telephone.

CHICAGO, WESTERN UNION.

The following promotions have been made in this office:

J. J. Welch, general traffic chief, has been appointed inspector of traffic and J. W. Konigsmark, assistant chief operator, has been appointed division wire chief. Both of these gentlemen are attached to the superintendent's office.

Chas. H. Shell, general wire chief, has been appointed assistant chief operator.

W. F. Webber, western switchboard wire chief, succeeds Mr. Shell as general wire chief.

Roy R. Willhoit, wire chief west switchboard, becomes western switchboard wire chief.

James R. Pierce, assistant general traffic chief, has been advanced to be general traffic chief, vice Mr. Welch.

F. D. Bermke, division chief of the Cincinnati and southern division, has been promoted to be assistant general traffic chief.

Louis Konefsky, assistant division chief of the Cincinnati and southern division, has been advanced to the position of chief in that division.

NEW YORK, WESTERN UNION.

Mr. T. A. McCammon, district traffic superintendent, has returned from his vacation and judging from appearances, was much benefited by his stay in the North Woods.

"Senator" William L. Ives, the dean of the eastern division, on his return from the annual reunion of the Old Timers, spoke in high terms of praise of the hospitable reception accorded him at Chicago.

Mr. William B. Purcell, loop chief, was a delegate to the Eucharistic Congress held in Montreal recently.

A daughter has been born to Mr. George McCammon, son of district traffic superintendent T. A. McCammon.

A daughter was born to Mr. B. F. Griffith, of the quadruplex department on September 16. Mrs. Griffith, nee Marion Dobson, was formerly identified with this office.

A retiring room for the ladies of the operating force has been fitted up on the ninth floor and a reading and smoking room for the men on the same floor. These rooms have been attractively furnished and are much appreciated by all of the force. The latest periodicals and library books are accessible and as many as forty people are frequently seen in the rooms at one time.

Mr. Peter Ritter, formerly and for many years in charge of the elevator service in this building and well known to old time members of the profession throughout the country, was a recent office visitor. Mr. Ritter received a hearty welcome from his numerous old friends on the occasion of his visit. For over thirty years he had been a prominent figure in this building.

J. J. Barrett, of the night force, suffered a stroke of paralysis while at work on the evening of September 9, from the effects of which he died at St. Gregory's Hospital, the following morning. Mr. Barrett was of a genial disposition and highly esteemed. He is survived by a wife and four children. A delegation from both the day and night forces attended the funeral.

George H. Worzel, the veteran office lineman, who retired from the service recently, after forty years of continuous employment, died at his residence, at New Brighton, Staten Island, on September 10. Mr. Worzel was a man of excellent character and esteemed by a host of friends. The interment was at the Moravian Cemetery at New Dorp, Staten Island, and was attended by a number of his old associates from this department.

Milton Pope, of Atlanta, Ga., died suddenly in this city on August 30. Mr. Pope's parents had the remains forwarded to his old home in Atlanta for burial.

Altro Godman, who formerly worked for the old Atlantic and Pacific Telegraph Company, in New York, died in Bellevue Hospital, this city, on September 12, aged forty-five years. Interment was at Chicago.

The Electrical School connected with this department re-opened for the season, on September 16. Judging from the large number present and the lively interest displayed, the outlook is most encouraging. The officials of the company have kindly placed a spacious, comfortable, well lighted room on the ninth floor at the disposal of the students and this action is highly appreciated by all concerned. The school fills a long felt want and its advantages should be availed of by many more. The fees connected with the instruction are nominal.

OTHER NEW YORK NEWS.

The annual meeting of the Telegraphers' Mutual Benefit Association will be held in the Western Union Building, 195 Broadway, New York, on Wednesday, November 16.

Mr. Thomas J. Cusack, formerly and for many years one of the prominent figures in commercial telegraph circles in New York, but for the past twelve years identified with the fire alarm telegraph department of this city, has been enjoying a vacation in Maine, New Brunswick, and other eastern states and provinces.

Assessment No. 514 has been levied by the Telegraphers' Mutual Benefit Association to meet the claims arising from the deaths of William H. Plunkett, at New York; John E. Payne, at Denver, Col.; Harrison H. Smith, at Washington, D. C.; Harry Wobensmith, at Philadelphia, Pa.; James F. Grayson, at Kansas City, Mo.; Ferdinand E. Basler, at Sullivan, Ind.

Outing of Mackay Field Club.

The Mackay Field Club of the Commercial Cable Company held its annual outing at Young's Manor, Kingsland, N. J., on Saturday, September 17.

The executive office distinguished itself by winning every athletic event on the program. The 220-yard dash for single men was won by Charles Dedon, of the executive office, with Frank Brady, of the treasurer's office second and John Quinn, of the clearing house office third.

The executive office relay team, composed of J. McKiernan, Leroy Lilley, Henry Brinkmeyer and Charles Dedon, won the 440-yard relay race. The clearing house team finished second and the commercial pacific quartet was third.

Charles Mignon, of the executive offices, captured the 100-yard dash for married men, with Fred Rauh, of the clearing house office, second and Alfred Stevens, of the clearing house office, third.

The executive office defeated the clearing house office at baseball by a score of 8 to 3. The batteries were: executive office, Dedon and Brinkmeyer; clearing house office, Quinn and E. McKiernan.

After the games the forty-five members of the club who were present enjoyed an excellent dinner and the remainder of the evening was spent in singing, dancing and other amusements.

The Serial Building Loan and Savings Institution, 195 Broadway, New York, has total assets of \$500,000. The real measure of safety which it offers to depositors, however, is much greater than this, as they have \$450,000 loaned on first mortgages on real estate, the actual value of which is at least double this sum. Hence, the value of their assets is stable and unaffected by fluctuations of the stock market. Inquiries by mail receive prompt attention.

Life Insurance is based upon the certainty of death at some time and its possibility at any time. The splendid financial position of the Telegraphers' Mutual Benefit Association, 195 Broadway, New York, is shown in the Reserve Fund, of \$317,000, which, apart from current assets, amounts to nearly 6 1-3% of the total contingent mortuary liabilities, and yields an annual revenue of more than \$15,000; operating on sound and correct principles, with ample security, it offers to the telegraph and telephone employee the best and most economical form of protection for the family and dependents yet devised. Write for particulars.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

A Study of Telegraph Apparatus.

PART IV.

THE NEUTRAL DIFFERENTIAL RELAY.

The relay used on the common or "B" side of a quadruplex circuit is called neutral because it ignores the polarity of the current which operates it. That is to say it has no preference for either, all it asks is a certain quantity or volume of current.

It operates in the same manner that a single line relay does when working over an escape. In both cases the tension of the retractile spring is simply made stronger than the magnetic strength of the current due to the volume of the escape alone, and the operation of the relays depends upon the additional volume which flows when the key is closed. On quadruplex circuits, the "short end" current represents the equivalent of an escape.

There are peculiar features and connections in this relay that operators as a rule do not observe unless attention is drawn to them.

For instance the platinum contact points are not on the front or closed position of the lever as is the case with polar and single line relays, but on the open position. This alteration is made for the purpose of utilizing a repeating sounder, or "bug trap" as Mr. Edison's invention is called. The repeating sounder closes the receiving sounder when

the relay closes because the contact points of the repeating sounder are on the upper instead of the lower side of the lever. The object of this arrangement is to create an air gap between the back contact points of the relay which must be entirely closed again before the receiving sounder will be released. For this reason the periods of no current in the neutral relay when the distant battery is being reversed, which may be long enough to cause the lever of the relay to be partially released, are yet too short to allow the lever to close the platinum points on its upper side before normal conditions of current resume. Hence the receiving sounder does not record the kick that would obviously result without the help of this intervening gap.

Another unobserved feature is the dimensions of the iron core. One glance will show that the spools are much shorter than ordinary relays. The length of the core is lessened for the purpose of enabling the relay to act quickly. A short stumpy magnet always acts in this manner, but in order to get sufficient magnetizing force, the coils must have a greater number of convolutions of wire per linear inch, hence the wire used in winding it must be of very fine gauge, usually No. 36 B. & S.

The retractile spring, again, is usually larger and stronger in order to be less easily influenced by the short end current.

Of course the student knows that multiplex relays possess two coils, each having the same number of convolutions one of which is wound around the core in a direction exactly opposite to that of the other, the purpose of which winding is to prevent the home current from interfering with the incoming signals. This is the usual way of explaining the non-interference of the home signals. But did it ever occur to the student that as a matter of fact a great many of the letters received, or at least part of some letters, he imagines are made by the sender at the distant end and due to current from that point, are really made by the sender sitting by his side and by the home current at that? If not he does not fully appreciate the wonderful capacity of a differential relay. The fact is that the home current is only ineffectual on the home relay when the wire is grounded at the distant end and the balance is perfect. At all other times, that is to say, while the circuit is being worked double, the receiver can never tell whether he copies an L or an E from the man at the other end of the circuit or his side partner.

The following explanation will make this fact apparent.

Each incoming signal is due to a surplus of current in one of the home coils over and above that which flows in the other. This unbalanced condition exists the moment the distant battery is cut in after a line balance has been taken.

It is apparent that to a distant ground the same volume of current will flow through the home main and artificial line coils, and will produce no magnetic effect because the two currents balance each other. When, however, the distant battery is cut in the volume of current in the line and the spool containing the main line coil must obviously be either increased or diminished according as to whether the e. m. fs. of the two batteries assist or oppose one another. As the artificial line is grounded and the incoming current never traverses that coil the volume of current in the artificial line never varies nor can it be shut off by any changes of polarity occurring in the main line and companion coil.

mitting, but cannot do so as long as an equal amount of current flows through the main line. The moment, however, the line batteries oppose each other, this coil becomes instantly active and creates the intended signal.

(To be continued.)

[In describing the principle involved in the operation of the movable steel lever armature of a camel back polarized relay in the preceding installment of this article (third line, second column) the omission of a line from the original copy gives an erroneous explanation. The words "overpowers the horseshoe magnet," should have read "overpowers the induced magnetism in the soft iron spool cores or extensions of the horseshoe magnet."]

No. 13-12.

THEORY OF 60-CYCLE PHANTOPLEX.

Now what happens when operation begins? We know that at each end of the line when the key is closed the negative pole of the battery is to line, and the positive pole where the key is open. When like poles oppose no current can flow through the line coils, but each artificial line coil will get current from its home battery and operate the relay just the same. Hence each home battery and artificial line coil actually make the signal that would have come over the wire had the e. m. fs. combined and created a surplus of current in the main line spools. It is evident, therefore, that whenever the two senders happen to make the same letter or letters in unison the main line current is shut off and you are copying from the sender beside you.

The student should remember that the artificial line coil in his relay is always endeavoring to make the signals or letters the distant operator is trans-

Postal Telegraphic Apparatus.

BY JOHN F. SKIRROW.

Associate Electrical Engineer of the Postal Telegraph-Cable Company, New York.

THEORY OF 60 CYCLE PHANTOPLEX.

Phantoplex equipment is frequently set up upon lines which parallel nearby telephone circuits, or where telephone circuits are carried upon the same poles. In such cases a frequency of 150 cycles, the usual frequency employed in phantoplex work, interferes with telephone operation. Telephone apparatus is so designed, however, that it is not affected by frequencies below 60 cycles.

Where conditions exist as indicated, therefore, phantoplexes are operated at 60 cycles frequency. The accompanying print shows the theory of operation, the dotted line indicating the path of the A. C. current.

Recent Telegraph and Telephone Patents.

A patent, No. 971,237, for a telephone, has been granted to J. W. Atlee, of Riverton, N. J.

A patent, No. 971,352, for a party line indicating system, has been issued to C. C. Bradbury, of Chicago, Ill.

A patent, No. 970,821, for an automatic exchange selector, has been awarded to H. B. Holmes, of Park Ridge, and E. B. Craft, of Wilmette, Ill.

A patent, No. 970,975, for private branch intercommunicating telephone system, has been taken out by J. N. Wallace, of La Crosse, Wis., and Edward B. Craft, of Chicago, Ill.

A patent, No. 971,170, for telegraphy, has been secured by Charles G. Burke, of New York. A book for telegraphic purposes consists of words composed of letters agreeing or differing in the number of electric units constituting their individual telegraphic symbols, but the aggregate of whose units are divisible and convertible into number symbols all of which have a like number of units.

The following patents have expired:

Patent No. 505,087, for a telephone, issued to Joseph B. S. Booth and Ernest J. Falconner, of Manchester, Eng.

Patent No. 505,170, for a telephone switch, held by Thomas W. Ness, of Montreal, Can.

Patent No. 505,188, for a multiple switchboard apparatus, held by John J. Carty, of New York.

Patent No. 505,628, for a duplex telephone, issued to William Marshall, of New York.

Patent No. 505,917, for a transmitting telephone, issued to Silas W. Holman, of Boston, Mass.

Personal.

Mr. Stephen D. Field, the well known electrical engineer and inventor of Stockbridge, Mass., was a recent New York visitor.

Mr. Louis de Goll, president of the Rowland Telegraphic Company, Baltimore, was a recent New York visitor.

Mr. James Uncles, a well known old time telegrapher, formerly of New York, but now of North Adams, Mass., was a recent New York business visitor.

Mr. Charles E. Scribner, chief engineer of the Western Electric Company, New York, accompanied by his wife, returned October 7 from Europe, after attending the recent conference of telegraph and telephone engineers held in Paris.

Mr. D. W. Phelan, of Salt Lake City, an old time telegrapher, but for the past twenty years in the smelting business at that point, accompanied by his wife, sailed from New York for Europe a few days since to be absent two months.

The annual carnival of the Priests of Pallas, of Kansas City, occurred October 4-9. Mr. George M. Myers, a former telegrapher of that city, and at one time president of the Pacific Mutual Telegraph Company, is one of the moving spirits in this affair, and it is largely through his efforts that these celebrations have been carried on each year since 1887.

Mr. Ed. J. Mock, editor and publisher of the "Telephone Engineer," Chicago, was a recent New York visitor.

Mr. Russel H. Potter, manager of the National District Telegraph Company, of Buffalo, N. Y., has resigned to accept a position as sales agent for the Star Electric Company, of Binghamton.

Mr. Robert L. Dean, of Chicago, inventor of the Dean Rapid Telegraph System, was a recent New York visitor, coming here on business connected with printing telegraph development.

Mr. John Gennings, general manager of the Central News Company, and editor of the Telegraph Chronicle, London, England, has been spending some time in New York. He was entertained while here by many of his friends in the telegraph and newspaper service.

The report of the serious illness of General Thos. T. Eckert, of New York, formerly, and for many years president of the Western Union Telegraph Company, is without the slightest foundation. General Eckert has spent the summer at his residence in Long Branch, N. J., and contemplates an early return to his city home.

His Excellency, the Hon. R. Nakashoji, vice-minister of the Department of Communication of Japan, is visiting in this country. Since early in June Mr. Nakashoji has been visiting various cities in Europe for the purpose of inspecting railroad, marine, telephone, telegraph and electrical systems, and is now here to examine American systems of this sort.

Mr. Robert H. Smith, of Port Chester, N. Y., has recently received from the War Department a certificate of service in the United States Military Telegraph Corps. Mr. Smith served during the Civil War as operator in the War Department office and in the field for nearly two years. He and the late D. W. McAneeny, of New York, entered the military service at the same time.

Postal Telegraph-Cable Company.**EXECUTIVE OFFICES.**

Mr. C. A. Richardson, acting superintendent at Boston, accompanied by his wife, is spending his vacation at Norfolk, Va., and Washington, D. C. Mr. L. Lemon, division superintendent of New York, is looking after the duties of his office during his absence.

Among the recent executive office visitors were Mr. George S. Palmer, lately appointed wire chief of the Chicago office.

A Mutual Investment Association, similar to the one which has existed for some time among the employees of the Company in New York, has been formed by the members of the force at Washington, D. C. Mr. F. B. Travis, manager of the office in that city, has been elected treasurer of the new association.

RESIGNATIONS AND APPOINTMENTS.

Mr. C. E. Flint has been appointed manager at Northampton, Mass., vice Mr. R. W. Harrington, resigned.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. E. J. Hall, chairman of the executive committee, and Mr. Belvidere Brooks, general manager, of New York, are in Chicago on company business.

Mr. Charles H. Gaunt, general superintendent at San Francisco, and Mr. Edgar C. Bradley, vice-president and general manager of the Pacific Telephone and Telegraph Company, San Francisco, were recent executive office visitors.

At the annual meeting of the stockholders of the Gold and Stock Telegraph Company, the following were elected directors: G. W. E. Atkins, A. R. Brewer, B. Brooks, Thomas F. Clark, R. C. Clowry, George H. Fearons, J. C. Willever, Edwin Langdon, A. G. Saylor and J. B. Van Every.

Mr. George W. Blanchard, formerly superintendent of the Postal Telegraph-Cable Company, New York, but for the past three years in the real estate business, has re-entered the telegraph service and is now attached to the office of General Manager B. Brooks.

Mr. J. R. Hobson, commercial superintendent of the Southern Bell Telephone Company, Atlanta, Ga., was a recent executive office visitor coming here to perfect plans for the closer relations between the telegraph and telephone.

The following appointments have been made in the southern division.

FIRST DISTRICT, RICHMOND, VA.

J. S. Calvert, district commercial superintendent.
F. O. Nourse, district traffic superintendent.
J. B. Faulkner, district plant superintendent.

SECOND DISTRICT, ATLANTA, GA.

E. E. Williams, district commercial superintendent.
G. W. Lloyd, district traffic superintendent.
W. A. Neill, district plant superintendent.

THIRD DISTRICT, JACKSONVILLE, FLA.

L. J. Maxwell, district commercial superintendent.
J. E. Peacock, district traffic superintendent.
J. C. Duane, district plant superintendent.

FOURTH DISTRICT, NASHVILLE, TENN.

J. R. Terhune, district commercial superintendent.
W. G. Peebles, district traffic superintendent.
W. K. McClarin, district plant superintendent.

Mr. J. E. Scofield has been appointed a special agent with headquarters at Atlanta. Mr. Scofield is well known in the telegraph field having for ten years until 1908, been manager of the Atlanta office of the Postal Telegraph-Cable Company. Since that date he has been engaged in other business.

The districts of the southern division have been rearranged so that their boundaries now follow state lines. The first district now includes Virginia, West Virginia, and North Carolina; the second district, South Carolina and Georgia; the third district, Florida and Alabama, and the fourth district, Mississippi, Tennessee and Kentucky.

Salt Lake City has been made the headquarters of a new district in the mountain division, which will include the states of Utah, Montana and Idaho.

Mr. U. G. Life, of Denver, has been appointed district commercial superintendent of the new district.

The following appointments have been made in the western division.

SECOND DISTRICT, ST. LOUIS.

W. R. Chapman, district commercial superintendent.

W. J. Armstrong, district traffic superintendent.

C. R. Fisher, district plant superintendent.

The office of the company at Trenton, N. J., has been moved into new quarters and modern equipment installed, making the office up-to-date in every particular.

The American District Telegraph Company, of New Jersey, has declared the regular quarterly dividend of one per cent. payable October 29, to stockholders of record October 19.

Mr. James Hiram Gates, whose appointment as assistant superintendent of the American District Telegraph Company, for the State of Ohio with headquarters at Columbus, was announced in our October 1 issue, was born at Lyons, Iowa, April 29, 1881. He entered the service at Clinton, Iowa, in May, 1897, and since then has served as manager at that place and at Bloomington and Quincy, Ill., where he was located at the time of his recent advancement.

Mr. W. H. Collins, whose appointment as district plant chief at Scranton, Pa., was announced in our October 1 issue, was born in that city and has been connected with the telegraph service at that point since 1877, when he entered telegraphic employ as a messenger for this company. In 1880 he became an operator and in 1882 was made chief operator of the Scranton office. He was later made assistant manager which position he held at the time of his recent promotion, and has for many years been a valued assistant to Superintendent Richard O'Brien.

RESIGNATIONS AND APPOINTMENTS.

Mr. William H. Van Zant, has been appointed manager of the Albany, N. Y., office, vice Mr. T. J. Meade, appointed district traffic manager at Syracuse.

Mr. E. W. Malloy, manager of the Lansing, Mich., office, has been appointed inspector of the fifth district, western division, with headquarters at Cleveland, O.

Mr. F. H. Potter has been appointed manager at Lansing to succeed Mr. Malloy.

Mr. C. B. Jewell, of Denver, has been appointed traffic chief in the Salt Lake City office, and Miss Pearl Vandervoort, of Omaha, has been appointed chief clerk to the chief operator of that office.

Mr. W. L. Burger, chief operator of the Schenectady, N. Y., office has been appointed acting manager, vice A. E. Reynolds appointed district commercial manager at Albany.

Mr. H. A. Carroll, manager at Macon, Ga., has been appointed manager at Jacksonville, Fla., vice J. E. Peacock, appointed district traffic superintendent.

Mr. E. G. Folger, manager of the Oakland, Cal., office, has been appointed commercial manager of the San Francisco office.

Mr. F. Aubertin, manager at Berkeley, Cal., has been promoted to the management of the Oakland office, and Mr. W. I. Thompson, of Kalamazoo, Mich., has been appointed manager at Berkeley.

Mr. W. J. Savage has been appointed cashier of the Buffalo, N. Y., office, vice J. A. Pfend, promoted to the managership.

Mr. Raymond Alger has been appointed chief operator of the St. Louis office, vice W. E. Bellman, resigned. Mr. Alger is twenty-eight years of age and entered the service at Hannibal, Mo., as messenger thirteen years ago. He has been connected with the St. Louis office for the past ten years during which time he has served as operator and assistant chief in several departments. Since October 15, 1906, he has been manager of the Gold and Stock department in that office.

H. C. Chace, Division Traffic Superintendent, Western Union, San Francisco.

Mr. H. C. Chace, who has recently been appointed division traffic superintendent of the Western Union Telegraph Company at San Francisco, was born at Santa Cruz, Cal., July 2, 1872. He entered the employ of the Western Union Telegraph Company in his native city in

H. C. CHACE,
Division Traffic Superintendent, Western
Union Telegraph Company,
San Francisco.

June, 1886. From then until 1897 he served that company in various capacities from operator to manager at Watsonville and Fresno, Cal., Seattle, Wash., and Ogden, Utah. He then became wire chief of the Los Angeles office, which position he held until April, 1902, when he transferred his services to the Atchison, Topeka and Santa Fe Railroad, as manager of their general telegraph office at Los Angeles. In July of the same year he was advanced to be assistant superintendent of telegraph of the Santa Fe System, with head-

quarters at Los Angeles, where he was located at the time of his present promotion.

Mr. Chace, by reason of his executive experience both in the commercial and railroad fields, coupled with natural executive ability, is well qualified to discharge the duties of the post which he has now assumed and his many friends in the service believe that future advancements are in store for him.

E. E. McClintock, Western Union Superintendent, Denver.

Mr. E. E. McClintock, who has been appointed superintendent of the first district, Mountain division, with headquarters in Denver, is one of the most popular figures in telegraph circles in that city. His ability is attested by the fact that for several

E. E. MCCLINTOCK,
Superintendent Western Union Telegraph
Company, Denver.

years past he has served as superintendent of telegraph for both the Colorado Fuel and Iron Company and the Victor Coal and Iron Company. Although these two companies are keen business rivals neither was willing to dispense with Mr. McClintock's services so he continued to serve both interests up to the time of his transfer to the Western Union. Mr. McClintock was born at Wilmot, Ohio, January 2, 1864, and entered the railway telegraph service in October, 1883, as operator. He has since served as train despatcher, station agent, passenger and ticket agent, telegraph train clerk and superintendent of telegraph for the two companies mentioned and the railroads which they controlled.

R. W. Gray, Division Plant Superintendent, Western Union, San Francisco.

Mr. Roy, William Gray, whose appointment as division plant superintendent of the Pacific division of the Western Union Telegraph Company, at San Francisco, was announced in our September 16 issue and who assumed the duties of that position on October 1, is, by reason of his extensive experience in plant engineering and construction work, well qualified for his new position. Mr. Gray was born

at Nashua, Iowa, July 29, 1875, and his experience in plant work began in 1898 when he joined the forces of the Pacific Telephone and Telegraph Company. While employed by that company he held the positions of foreman of underground construction in the Southern division, division construction foreman of the Central division, superintendent of the Sacramento division, chief inspector in the engineering department and division plant engineer of the Northern division with headquarters at Portland, Ore., which position he held at the time of his transfer to the telegraph service.

L. B. Thompson, Division Electrician, Western Union Telegraph Company, Atlanta.

Mr. L. B. Thompson, who has recently been appointed division electrician of the Western Union Telegraph Company at Atlanta was born at Cortland, Ohio, January 20, 1864. He entered the telegraph service at Atlanta as operator for the West-

L. B. THOMPSON,
Division Electrician, Western Union Telegraph
Company, Atlanta.

ern Union on December 15, 1888, and served successively as night wire chief, night chief operator and chief operator in that office. In September, 1904, he accepted a position in the office of the Chief Engineer of the Southern Bell Telephone and Telegraph Company. In 1906 he became superintendent of leased wires of that company and on September 1, 1908, he was appointed general toll wire chief which position he held at the time of his return to the telegraph service. Mr. Thompson has always been a thorough student in electrical matters and is undoubtedly one of the best qualified men in the south for the position which he now holds. During his previous employment in the telegraph service he was a frequent contributor of technical articles to our columns, and his many friends are glad to welcome him back to the ranks of the telegraph.

The Cable.

The American Telegraph and Cable Company, and the Western Union Telegraph Company, have applied to the English government for the renewal of their license to maintain and use at Sennen Cove,

Cornwall, England, two telegraph cables from America, and for a license to lay two additional cables. The applications will be considered on October 22.

It is announced that a concession has been granted by the Government of Costa Rica to English interests for the establishment and working of a submarine cable between Colon and Limon. The right to establish one wireless telegraph station in the Republic is also granted.

Wireless telegraphy is proving a valuable adjunct to the operations of cable laying and repairing steamers. An illustration of this occurred recently when one of the Western Union Telegraph Company's cables broke down about sixty miles from the English coast. The cable steamer *Colonia* was known to be on her way from the United States to England and was communicated with by wireless telegraphy, and informed of the location of the break. Captain Woodcock of that vessel, when he reached the proper position, made the repair with the loss of only a few hours' time and then proceeded on his way to London.

Annual Election of Great North Western Telegraph Company.

At the annual meeting of the stockholders of the Great North Western Telegraph Company held at Toronto, September 28, the following officers and directors were elected: President, H. P. Dwight; vice-president, Adam Brown; vice-president and general manager, I. McMichael; directors, H. N. Baird, James Hedley, Hon. J. K. Kerr, W. C. Matthews, Toronto; Colonel R. C. Clowry, J. B. Van Every, New York.

The Great North Western Telegraph Company has announced that after November 30 it will discontinue its news service which is known as the "Easson Service." The management of the company is taking this action as it believes that since telegraph companies are now classed by law as common carriers the collection and dissemination of news is not properly in their province.

Municipal Electricians.

A new fire alarm telegraph system will be installed in the near future at Chester, Pa.

Mr. Daniel W. Bowie, who has been assistant city electrician of Atlanta, Ga., for the past two years, has been advanced to the post of city electrician, vice Mr. Fred Miles, resigned.

A patent, No. 970,886, for a fire and police telegraph system, has been granted to F. W. Cole, of Newton, Mass. A signal transmitter with a winding member, a pivoted lever therefor, and a lever secured to the pivot shaft thereof, and two independent actuators for engaging the lever to turn the pivot shaft and operate the actuating lever. A patent, No. 970,887, for a fire alarm telegraph system, has also been granted to Mr. Cole. A signal transmitter with a ground circuit connected with the main circuit by the operating device and rewinding mechanism to restore the operating device and disconnect the ground.

The contract has been awarded at Rock Island, Ill., for installing improvements in the fire alarm system at a cost of \$11,265.

The Gamewell Fire Alarm Telegraph Company has been awarded the contract for installing the electrical equipment in the new fireproof building which is being constructed at Oakland, Cal., for the headquarters of the fire alarm and police telegraph systems. The cost of the new equipment will be \$12,805.

The Annual Meeting of the Western Union.

The annual meeting of the Western Union Telegraph Company, occurred at New York on October 12, when all of the directors were re-elected as follows: Robert C. Clowry, Henry Walters, George J. Gould, Joseph J. Slocum, Edwin Gould, Paul Morton, Charles Lanier, Robert M. Gallaway, J. Pierpont Morgan, Edward T. Jeffery, Chauncey M. Depew, Theo. N. Vail, Henry M. Flagler, Henry S. Howe, John Jacob Astor, John I. Waterbury, Oliver Ames, Robert Winsor, Jacob H. Schiff, Henry P. Davison, James Stillman, William H. Moore, John J. Mitchell, Robert S. Lovett, Henry A. Bishop, Edward J. Hall, Harris C. Fahnestock, Union N. Bethell, Thomas H. Hubbard, Henry B. Thayer.

The election of officers for the ensuing year will take place on October 19.

A detailed report of the auditors will be found on another page of this issue.

President Clowry, in his annual report to the stockholders, said in part:

"The number of messages transmitted during the year was the largest in the history of the company, and shows an increase of 7,081,966 over the number sent during the previous fiscal year. The increase in the number of offices was 504.

"There was added during the year 2,847 miles of pole and cable mileage, and 46,549 miles of wire, of which 30,515 miles were copper.

"The total wire mileage is now 1,429,049, of which 530,517 miles are copper.

"To meet the growing demands of the plant and traffic, the general superintendent of the first division, Mr. Belvidere Brooks, was appointed general manager, and the number of general divisions was increased from four to six. Greater authority has been given both to the general and district superintendents, and many changes have been made which will increase the efficiency of the organization and promote the welfare of employes.

"December 15, 1909, a contract was made between this company and the American Telephone and Telegraph Company, providing for the joint use of plant and operating facilities which will, when fully worked out, add greatly to the efficiency of the service and economical operation of both companies. It has not in the past been possible for this company to keep a large proportion of its offices open both day and night, Sundays and holidays, but under arrangements which are now in operation in some sections of the country, and which will soon extend

to all, it is expected that we will be able to maintain continuous telegraph and cable service twenty-four hours a day and every day in the year.

"Perhaps the most interesting if not the most important event of the year was the introduction of the "Night Letter." The response of the public to this new service has been most gratifying and it is manifesting itself not only in a large increase in our gross receipts but also in a generous recognition of the fact that we are striving to improve, extend and popularize our service in every way possible.

"The dividend has been continued at three per cent. because in the opinion of the directors no change should be made in this rate until it is determined what, if any, further charges should be made on account of depreciation or reconstruction and until such re-arrangements and improvements in the property shall be made as will enable new improved and extended facilities to be given to the public."

Legal.

By a recent decision handed down by the United States Circuit Court of Appeals, at Atlanta, Ga., in the case of the Western Union Telegraph Company against the State of Georgia it was held that as the telegraph company had already been taxed on a valuation of \$756,000 by the State, a further tax on \$950,000 federal franchise value was excessive.

By this decision every telegraph company in the United States which accepted the post roads act of 1866 is exempt from State taxation on its franchise. This means that States which have passed franchise tax laws will be prohibited from collecting such taxes from the telegraph companies."

Trade Notes.

The Western Electric Company has issued a booklet describing its composite telephone and telegraph system for railway service. The booklet contains fifty-four pages and is illustrated by many cuts of telephone sets, howlers, coils, condensers, protectors, batteries, line poles and a dozen circuit diagrams.

Mr. Walter G. Mullen, of Baltimore, Md., has accepted a position with the Morkrum Printing Telegraph Company, as their eastern representative, with headquarters at 253 Broadway, New York.

The new child labor law in New York State, prohibiting the employment of boys under twenty-one, as messengers between the hours of 10 p. m. and 5 a. m., went into effect October 1. This law also affects theatres and restaurants where boys are employed as check boys or ushers.

The Texas company which was organized by John W. Gates as a rival of the Standard Oil Company, and has refineries at several places in Texas, now has over 1000 miles of telegraph lines. They will soon have in operation a wireless station at Port Arthur, Texas, which will be established for the purpose of communicating with the company's ships.

The Telephone.

Mr. N. W. Harris, head of the firm of N. W. Harris and Company, New York, has been elected a director of the American Telephone and Telegraph Company.

Mr. J. F. Bratney, chief engineer of the Bell Telephone Company of Missouri at St. Louis, has resigned to become superintendent of plant for the Missouri and Kansas Telephone Company at Kansas City, Mo. Mr. Bratney has been with the Bell Telephone Company of Missouri for the last seven years.

Dr. Alex. Graham Bell, while on his tour around the world, recently gave evidence before the Postal Commission, at Melbourne, Australia, on the Sydney telephone service. While admitting that his observations of the Sydney service showed that much was still desired to make it efficient, many of the complaints of delay were due to the tardiness of subscribers in replying when called up. The average time occupied in giving the connection was 8 seconds, but the average time before a reply was obtained was 32 seconds.

A conference of officials of the associated Bell Telephone Companies was held in New York last week. On the evening of October 6, Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company, gave a dinner at the Hotel Astor to those present at the conference and to some of the telegraph officials. Those present at the dinner were Theodore N. Vail, president; E. J. Hall and H. B. Thayer, vice-presidents; J. J. Carty, chief engineer, C. G. Dubois, comptroller, F. A. Pickernell, assistant to the president, and George B. Leverett, general counsel of the American Telephone and Telegraph Company, New York; U. N. Bethell, president and H. F. Thurber, vice-president of the New York Telephone Company; Bernard E. Sunny, president of the Chicago Telephone Company; W. D. Gentry, president of the Southern Bell Telephone Company, Atlanta; H. J. Pettengill, president of the Southwestern Telegraph and Telephone Company, Dallas, Tex.; E. C. Bradley, vice-president and general manager of the Pacific Telephone and Telegraph Company, San Francisco; Jasper N. Kellar, president of the New England Telephone and Telegraph Company, Boston; Alonzo Burt, president of the Wisconsin Telephone Company, Milwaukee; C. S. Gleed, president of the Missouri and Kansas Telephone Company, Topeka; Caspar E. Yost, president, and G. E. McFarland, general manager of the Iowa and Nebraska Telephone Companies; H. Vance Lane, president of the Rocky Mountain Bell Telephone Company, Salt Lake City; E. D. Nims, president of the Pioneer Telephone and Telegraph Company, Oklahoma City; Colonel R. C. Clowry, president, B. Brooks, general manager, and G. W. E. Atkins, vice-president of the Western Union Telegraph Company, and W. H. Baker, vice-president of the American District Telegraph Company, New York.

Mr. H. W. Edelen has been appointed division commercial engineer of the Pacific Telephone and Telegraph Company with headquarters at San Francisco.

At a meeting of the Telephone Society of Baltimore, held in that city October 5, Mr. S. B. Williams, of the engineering department of the Bell Telephone Company of Pennsylvania, delivered a paper upon "Opening of a New Exchange."

At a meeting of the Philadelphia Telephone Society, held October 11, Mr. W. A. Tower, plant superintendent of the Bell Telephone Company of Pennsylvania read a paper on "Some Facts Concerning Construction Work."

The following district commercial superintendents have been appointed in the central division of the Pacific Telephone and Telegraph Company, which is now divided into five districts: Mr. L. M. Brown, at Chico; Mr. J. P. Noble, at Sacramento; Mr. J. T. Gross, at Fresno; Mr. F. L. McNally, at San Francisco.

Plans are under way for establishing telephone service between Germany and Italy, and a conference was held in Zurich recently at which delegates were present from Italy, Switzerland and Germany to agree upon rules, regulations and tariff for the new service which will connect Rome and Berlin and intermediate cities.

An attempt is being made to establish in New York a telephone news service whereby subscribers may be provided with news bulletins, lectures, or vocal or instrumental music by telephone as desired. A similar service has been in use in Budapest, Hungary, for several years.

The Pacific Telephone Magazine for September contains a fine full-page engraving of Mr. L. W. Storrer, formerly special representative on the Pacific coast and for many years general superintendent of the Postal Telegraph-Cable Company, but who was recently appointed commercial agent of the Pacific Telephone and Telegraph Company in charge of leased lines and inter-company relations.

Colonel David B. Parker, a former prominent telephone official, died at his home at Ellicottville, N. Y., September 22, aged sixty-seven years. Colonel Parker was one of the pioneers in the telephone field, being at one time general manager of the Metropolitan Telephone and Telegraph Company in New York, and later vice-president and general manager of the Bell Telephone Company of Buffalo, from which position he retired twelve years ago on account of ill health. Among those in attendance at Colonel Parker's funeral were R. W. Devonshire, general manager of the American Bell Telephone Company, Boston; H. F. Thurber, general manager, E. F. Sherwood, superintendent of traffic, and G. C. Allen, division plant superintendent of the New York Telephone Company, New York; H. W. Pope, special agent of the American Telephone and Telegraph Company, New York, and A. P. Roberts, of the New York Telephone Company, Buffalo.

Annual Report of Western Union.

The executive committee of the Western Union Telegraph Company, at a meeting held October 6th, received from a special auditing committee, consisting of Edward J. Hall, Jacob H. Schiff and Henry A. Bishop, a report on the property and business of the company.

The report was approved, ordered printed and a copy to be sent to every stockholder, in accordance with the present policy of the company that, as a public service corporation, all its affairs be given the fullest publicity for the benefit of both stockholders and the general public. The report, as approved, stated in substance that the auditing committee found that improvements could be made in the system of accounting, and particularly as no audit of the books had been made for some years it was decided to employ Messrs. Price, Waterhouse and Company, to make a thorough examination of the books and accounting methods and to value with the assistance of engineering experts the physical property and other assets.

For eight months Messrs. Price, Waterhouse and Company have been working on the books of the company. Their instructions were to make a thorough and complete investigation and to report the facts regardless of what results might be shown. It was the desire of the executive committee to learn the real status of company affairs and to place all the information gained before the stockholders. The chartered accountants called in as engineering assistants the well-known firm of Westinghouse, Church, Kerr and Company, to value the physical property.

In submitting their detailed report, Messrs. Price, Waterhouse and Company, said:

"We have audited the books and accounts of the Western Union Telegraph Company and have prepared therefrom the accompanying balance sheet.

"The cost of telegraph property is stated at adjusted book figures and, according to a careful estimate obtained by us from independent engineers, represents the approximate replacement cost new. No provision has been made for accrued depreciation, nor, on the other side, has any allowance been made for going value of the value of the company's organization as a going concern. Patents have been valued at cost less a deduction for the expired portion of the term for which they have been granted. Real estate and buildings represent the value of the company's holdings as appraised by competent real estate experts.

"We have inspected the securities owned and have satisfied ourselves that they are fairly worth the values at which they are stated.

"The materials and supplies as inventoried and certified by responsible officers have been carefully taken at approximate cost and due allowance has been made for depreciated or obsolete material.

"Full provision has been made for bad and doubtful bills and accounts receivable and for all ascertainable liabilities.

"We have verified the cash by actual count or by certificates from depositories.

"And we certify that in our opinion the balance sheet is properly drawn up so as to show the true financial position of the Western Union Telegraph Company at June 30, 1910."

In addition to the revised balance sheet, the accountants submitted a report on the business of the company for the fiscal year ending on June 30, 1910, as follows:

Total earnings	\$32,754,111.13
Operating expenses, including rent of leased lines, reconstruction, repairs and taxes	26,614,302.88
Balance	\$6,139,808.25
Additional income from loans and investments	1,135,091.80
Net profit	\$7,274,900.05
Interest on bonds	\$1,687,829.73
Dividends	2,989,696.50
	4,677,526.23

Balance transferred to surplus account.. \$2,597,373.82

The balance sheet is as follows:

PROPERTY ACCOUNT.

Telegraph lines and equip't	\$127,978,617.82
Real estate	5,908,445.58
Patents	102,108.57
Amount recoverable on expiration of long-term lease on respect of obligations assumed thereunder	1,180,000.00
Total	\$135,169,171.97

OTHER SECURITIES OWNED.

Stock of telegraph, cable and other allied companies operated under long-term leases (not including securities held as lessee amounting to a par value of \$2,280,292)	4,699,623.19
Stock of telegraph, cable and other allied companies not leased	4,478,678.08
Miscellaneous investments	355,338.74
Purchase money notes and obligations ..	20,500,000.00
Inventories of material and supplies	2,752,089.54
Current assets	4,613,188.58
Total	\$172,568,090.10

Many important adjustments have been required in the surplus account of the company, and in order to show these changes in a concise manner a schedule has been prepared and attached hereto. Briefly stated, the more important are as follows:

Reduction of the book value of telegraph lines and equipment to the estimated value of \$5,595,089. Liability to Gold and Stock Telegraph Company in respect of proceeds of sales of securities prior to June 30, 1909, understated in balance sheet on that date, \$2,219,874. Loss on revaluation of investments, \$1,709,546. Reserves required on June 30, 1909, for bad and doubtful accounts, etc., and for accrued liabilities, \$1,706,634. Reserves for depreciation on cables to date, \$2,000,000. Reserves for contingencies, \$500,000. Total, \$13,731,143. The reductions cut the surplus down to \$5,136,318. Adding to this the surplus earnings for 1909-10, the total surplus on June 30, 1910, was \$7,733,692.

Public Service Commission News.

Mr. James M. Kite has been appointed by the New York Public Service Commission, Second District, engineer of the division of telephones and telegraphs. Mr. Kite completed an electrical engineering course in the Drexel Institute in Philadelphia. Shortly after graduation he entered the engineering department of the New York and Pennsylvania Telephone and Telegraph Company at Elmira, N. Y., and by successive promotions became assistant engineer and traffic engineer.

Mr. Francis V. Wilcox has been appointed by the New York Public Service Commission, Second District, telephone and telegraph accountant. Mr. Wilcox was for several years special auditor for the Consolidated Frontier and Associated Telephone Companies, with offices at Buffalo, and was also formerly connected with the New York and Buffalo Auditing Company, examining accounts of various public service corporations.

Among the recent orders issued by the New York Public Service Commission is one requiring all telephone corporations to file schedules showing all rates and charges between points in New York State and between each point upon its line and all points upon every line leased or operated by it and all points upon the line of any other telephone corporation whenever a through service or joint rate shall have been established between any two points. Each company is also required to furnish the commission with a copy of every issue of its directory of subscribers. The commission has also made an order requiring all telephone and telegraph corporations to report all accidents happening in connection with their work.

The Postal Telegraph-Cable Company has made complaint to the Public Service Commission of the Second District of New York of the charges exacted by the Western Union for business originating on Postal lines, and has asked for an order restraining the Western Union Telegraph Company "from discriminating against competitors" in the matter of rates.

The complaint laid before the Public Service Commission, alleges that where the Postal has no offices and is obliged to send its messages over the Western Union wires for delivery, the latter company makes excessive charges. The practice is for the Postal, when it receives a message for delivery in a town where the Western Union has the only office, to collect from the sender of the message the same fee as is charged by the Western Union between the sending point and the destination. It transmits over its own lines to the nearest point possible and then turns it over to the Western Union. The latter, the complaint alleges, not only charges the local fee from the point at which it receives the message to destination, but adds a charge for four or five words indicating that the message has been turned over to the Western Union for further transmission. These additional words give the place where the message was taken over and the date. In

addition to the full local rate the Western Union makes a charge of from two to three cents per word for those in excess of ten; and the Postal Company complains that it is obliged to pay, "as a result of such discrimination and unreasonable charge," a greater sum than it receives from the sender of the message.

In the complaint it is further alleged that the Western Union does not charge cable companies sending messages from New York over its land lines for additional words indicating that these messages have been turned over for transmission.

In asking for relief the Postal Company states that it is obliged to accept all messages presented at its various offices whether the destination is located on its own lines or not. Further it complains that the reason it has not extended its lines to the smaller villages and towns in the State now tapped exclusively by the Western Union is because of the contracts the Western Union has made with the railroads reaching these localities by which the cost of constructing and maintaining the telegraph lines is jointly supported and the railroads are prohibited from making similar contracts with any competitor.

The Postal Company asserts that it is not able to support independent telegraph offices in the small villages because of the great cost of maintenance where the railroad has no share in the expense of construction or upkeep. Finally in its argument against the injustice of the Western Union's practice of adding words to messages the complaint recites that the Western Union has objected to being compelled to add words to its own messages and pay for them in cases where its business has been transmitted through the Postal Company.

The commission is asked to make an order permanently restraining the Western Union from charging for additional words as complained of, the Postal Telegraph-Cable Company making the statement that if the practice is continued it will be "necessary for it to refuse to accept a large proportion of such messages from the public."

It is reported that the question of doing away with the employment of boys as telegraph messengers in Great Britain is being seriously considered. It is proposed to employ instead of the boys men who, by reason of age or for other causes are incapacitated for performing manual labor.

Kansas' Republicans have adopted a platform favoring the placing of telegraph and telephone companies and other public service corporations in that State under the jurisdiction of a public service commission having authority over the issue of stocks and bonds, having means and power to obtain the physical valuation of the plants of these corporations, to fix and adjust rates upon their own motion and to regulate rates and services in the interests of the people of Kansas and the investors and employes of these corporations.

Telegraph and Telephone Age

ADDRESS ALL COMMUNICATIONS TO

J. B. TALTAVALL. - *Editor and Publisher,*
283 BROADWAY, NEW YORK
T. R. TALTAVALL, Associate Editor.

CABLE ADDRESS: "Telepage." New York.

Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

October 16, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

A Change in Our Editorial Staff.

Mr. Harry E. Dunham who, for nearly two years, has been associate editor of this journal, has resigned in order to accept a position as examiner in the Patent Office at Washington, D. C. During his connection with this paper, Mr. Dunham has made many warm friends among those identified with the telegraph and has rendered valuable service in bringing the paper up to the high standard it now occupies. The practical experience he has thus gained in technical journalism, combined with his education—he being a graduate of Syracuse University—eminently fit him for the duties of his new position.

It is Mr. Dunham's intention to take up patent law as a profession and we are sure that we express the sentiments of his many friends in the telegraph and telephone field in expressing our own in wishing him abundant success in his new line of work. He retires from his position on this paper

with our heartiest good will, and our best wishes go with him.

The position rendered vacant by Mr. Dunham's retirement will be filled by Mr. Thos. R. Taltavall, who, for over fourteen years, has been associate editor of the Electrical World. Mr. Taltavall needs no introduction to the telegraph profession, having been closely identified with telegraph interests some years ago. He began his business career as a telegrapher and was for several years superintendent of the leased wire service of the Associated Press. He entered electrical journalism in 1890 and has been engaged in that profession ever since. He brings to Telegraph and Telephone Age a wide and valuable experience in technical journalism which will find abundant opportunity for application in his new position.

The Status of Wireless.

It is a deplorable fact that a discovery which has such great possibilities of usefulness to mankind as that of wireless telegraphy, should have been used as a tool for so many get-rich-quick schemes of unscrupulous promoters and thereby actually been the means of much financial loss to unwary investors. This, however, is a fate which befalls many valuable inventions and in the end there is no doubt but that this branch of electrical science will assume its rightful place in the world's systems of communication.

At the present time, however, probably the only wireless operating enterprise which is worthy of any words of commendation, is the one which is headed by the man who has done so much to bring the art of wireless transmission to its present state of usefulness, William Marconi. While up to the present time even this organization has not been able to show any profit on their business; taken as a whole there seems to be no doubt but that the officials in charge of the Marconi companies are endeavoring to establish the business on a permanent commercial basis.

It has been our pleasure to meet many of the Marconi operators upon transatlantic vessels, and we have always found them to be of the highest type of operators in the telegraph service. They are well educated and are recognized as gentlemen, in fact, unless they can comport themselves as such they can not remain in the employ of the company. On ship-board they are classed with the officers of the ship on which they are stationed, and the importance of their labors is recognized by the steamship companies. None but highly experienced operators are entrusted with the care and operation of the equipment upon which the safety of so many lives depends. The connection of such a body of men with the wireless service has been in the past and will continue to be a great factor in the establishing of that service upon a permanent basis where it will command the respect of the industrial world.

In striking contrast to the status of the Marconi operators is that of those who are employed by the American wireless exploitations. The companies on this side seem to have made the establishing of a

large number of stations their chief aim and made the quality of the service rendered entirely subservient. Young men and, in fact, boys with little education and with no telegraphic experience, have been placed in charge of the ship installations in many cases, this being the only class of employees who could be hired to work for the meagre wages paid and who would labor under the conditions which they were in most cases expected to accept. Ship owners have not showed any great interest in the service, and the operators have usually been classed with the coalheavers and been obliged to mess with them. Where an occasional operator has been permitted to eat with the officers of the ship it has been because of the captain's favor. The employers of the operators have apparently had little care for their welfare. Such a condition of affairs cannot long exist, and the service rendered under such circumstances can be of but little value to anyone.

Now, one of the American companies has accused a rival corporation of wilfully interfering with the messages sent out by an operator on a vessel in Lake Erie, which was in trouble. It is hard to believe that any operator could sink his manhood so far as to stoop to such a despicable act, an act which might result in the loss of many lives, even though he was told to do so by his employers; but if the allegation is true it is merely additional evidence that the spirit which animates some of the promoters of wireless enterprises in this country is not one calculated to place the industry on a footing which will command the respect and support of the public.

What the final outcome of the present situation will be is hard to predict. Wireless telegraphy has proven of too great value to allow it to fall into disuse. It may be necessary for our government to assume control of this branch of communication as at present it seems rather doubtful whether any commercial company maintaining stations on all passenger-carrying vessels, large and small, can be made a paying enterprise. On the other hand inasmuch as a large percentage of the business handled between ships and the land has to be carried over land lines, the present telegraph companies may at some future day assume the management of communication between ship and shore. Up to the present, however, the prospective profits have not been great enough to tempt them to seek this business.

The Benefit of Co-operation.

The Mutual Investment Association, organized by employees of the Postal Telegraph-Cable Company in New York, the workings of which we described at some length in a recent issue of our paper, is almost daily finding new ways in which it can serve its members and is thus extending its field of usefulness. The movement thus inaugurated has without doubt greater possibilities for uplifting the social status of the telegraph operator than any plan ever adopted for their betterment. The loan shark, who

has for so many years been the bugbear of the telegrapher has been driven out of business in New York in so far as the Postal employees are concerned. The operation of this association, strange as it may seem, is making men out of many individuals who have for years been the slaves and tools of "Shylocks," whose greedy hands were always stretched out for their earnings. Once in the grasp of these human vampires it was almost impossible for the victim to release himself, and as a result pay day instead of being an event to look forward to with pleasure was a day to be dreaded, as the unlucky man knew that a large part of his wages must go to pay the usury demanded by his creditor. Now all of this is changed. When pay day comes the operator pays a small portion of his wages to the association as an installment on his typewriter, suit of clothes or whatever he may be buying and he knows that he is not only getting value received but that he is getting whatever he buys cheaper than he could under the former installment plan. He knows that in case sickness keeps him from his work for several weeks he is not going to lose what he has paid already. Many telegraphers are to-day purchasing pianos through the association, and they are buying better clothes and are living better than before.

When the loan sharks held full sway operators would sometimes go from one city to another without leaving any clue to their whereabouts in order to escape their persecutors and would often even change their names. Under the new plan, however, all feel that they are treated as men and meet their obligations accordingly, the officers of the association reporting that their losses due to operators leaving the city and failing to pay all that they owe have been practically nothing.

A similar association has now been formed among the Postal employees in Washington, and it is to be hoped that this idea will spread until everyone in the telegraph and telephone service will be able to benefit thereby. It is undoubtedly the most practical plan that has ever been devised among telegraph employees to assist each other and to secure the great benefits which may be derived from co-operation.

Another argument for the removal of overhead wires has been found in the rapid development of aerial navigation. In several instances recently aviators have run into overhead wires, which they could not see or were unable to avoid, and come to grief.

Mr. Donald Murray, of London, England, inventor of the Murray printing telegraph, has begun the issue of *The Murray Printing Telegraph Journal*, which will be published at irregular intervals, two or three times a year. In addition to news in regard to the progress of the Murray systems there will be published from time to time practical articles in regard to the Murray apparatus and technical discussions of the various theoretical and practical aspects of printing telegraphy.

The Military Telegrapher in the Civil War.

PART XLVII.

In our issue of June 1, 1908, we published a general description of the military experience of Mr. James E. Pettit, as Part IV. of this series of articles. After the death of that gentleman at his home in Chicago on February 22, 1909, there was found among his papers the story of his capture by the Confederates and of the hardships which he underwent while confined in a southern prison. This narrative, which was written in 1891, relates in a graphic manner the experience of Mr. Pettit which was similar in many details to that of thousands of others who were incarcerated in Confederate prisons during the war. Mr. Pettit's story, which was largely written from a diary which he kept at the time, is in part as follows:

"In 1863, I was stationed at an outpost of the army, in northern Alabama, at a little place by the name of Athens. Guarding the approaches of the town was a small, but well arranged fort, in which were garrisoned some six or seven hundred infantry (colored). I was filling the offices of express agent and railroad agent, and the more important one of military cipher operator, for the Government. My office was located in a railroad depot of the Nashville and Alabama Railroad, over a quarter of a mile from the fort.

"The 24th of September, 1864, was bright and warm, a typical day of old Alabama. The train from Nashville was due at 4.30 p. m., but it was half an hour late when it came in sight, and I knew that something was wrong, for it was reported on time at the last station it had passed, which was located but eight miles away, at a very high bridge named Sulphur Trestle, the subsequent scene of many lively engagements.

"As the train drew into the depot, the conductor ran hastily up to me and anxiously inquired if my wires were O. K. I answered, 'Yes, so far as I know.' He asked me to ascertain to a surety. I ran into my office and found my instrument silent; making the necessary tests, I found that the wire was open north of me, but that I could still work with the next station south, which consisted of a small block house, four miles down the road, erected for the purpose of guarding a bridge. The train had been fired on six miles north of us, and a large body of troops had been seen in the distance; the engineer had speeded forward, and the only damage done, was to severely scare several lady passengers.

"The troops in the fort were alert and upon consultation it was decided to disconnect the engine from the train, load it with troops, and run down the road and ascertain if the enemy had surrounded the town; it took but a few minutes to find that the greycoats were on the south of us also; the engine returning, quick preparations were made for repelling the enemy, who up to this time, had remained out of sight. We were not to remain long in ignorance of their whereabouts, however, for soon we heard the firing upon the pickets; it was but a few minutes before the ominous rattlesnake buzz of the

conical rifle bullets was heard, as now and then, one came dangerously near; I hastened over to my room, which was in an old deserted hotel, on the public square; gathering a few of my choicest valuables together, I started for the fort, and as I was just leaving the public square, imagine my surprise to see a number of Confederate soldiers enter my office, which was on the opposite side of the square; they caught sight of my rapidly disappearing form and fired several shots at me, but happily without effect.

"It took but a very few moments to place myself in safety behind the solid walls of the fort; although on the way over I was the unwilling spectator of as pretty a piece of fighting as was ever given to me to behold. A body of some 70 or 80 negro soldiers had stationed themselves behind the railroad embankment and the enemy were trying to dislodge them. I being on my way to the fort, was obliged to cross the line of the enemy's fire; without hesitation I placed the main body of myself behind a large oak tree, of ample enough proportions to safely cover me; there I watched the fight. It was very fierce, as to noise, but little execution was done by the enemy, because of the safe and strong position of our troops. Nevertheless, it required nerve for our colored troops to maintain their position, and they seemed to be possessed of the necessary grit, for awhile, but the attacking forces receiving reinforcements, the darkies were slowly driven back towards the fort. The lines of the enemy were slowly tightened, until at last we were all gathered into the fort. A count revealed the fact that there was in the neighborhood of eight hundred troops and non-combatants inside the walls of the fort; this was not very satisfying, for it was rumored that the enemy were in force to the number of ten thousand, afterward proven to be a little over six thousand, under the command of Lieutenant-General Forrest, of Fort Pillow massacre fame; this fact did not tend to ameliorate the fears of the colored troops. At this late date (1891) I cannot very well recollect the incidents of the night other than that my assistant, a big hearted and faithful friend, John F. Ludwig and myself, were allowed to sleep at headquarters, and if my memory serves me right, we both slept like logs, for we were both used to this sort of thing. We were up early, and after partaking of a soldier's breakfast, we strolled around the fort; wandering through the barracks we beheld many curious sights; one man I saw sewing money into the skirt lining of his coat, one I found covering over something that he had buried in the ground.

"At about 7.30 a. m. the enemy opened on us with a brisk fire from their field artillery; they having no siege guns, and as I recollect, they made it very uncomfortable for us. They had nine twelve pounders, and for about an hour they poured on our devoted heads the fire of their batteries, then, dividing their forces, they sent one-half of their artillery to the south of us, thus delivering

an enfilading fire for another hour. The scenes in the fort during this time were of fearful interest to us; the enemy were using both solid shot, shrapnel and shell, and their fire was mostly directed at our flagstaff for knowing that reinforcements were on the way to relieve us; which fact we were unaware of, at the time; their aim was to disconcert our reinforcements, as when they would arrive in sight of the fort they would be met by an apparently lowered flag. The casualties inside the fort were but few; thanks to the well built and solid walls. One conical shell struck the wall of the embrasure, near which I was standing, glanced against the gun, and landed in the centre of the parade ground; one of our Lieutenants went over to it and rolled it over with his foot. There was no danger in this apparently foolish act, for the shell was of the percussion kind and was harmless, and his act was to reassure his men. About 9 o'clock General Forrest sent us a flag of truce, demanding our immediate surrender, stating that his force amounted to 10,000 troops, and in order to save bloodshed, he requested the commander of the fort to come out and satisfy himself as to the truth of his statement, by an inspection of his forces. Our officer in command, a Colonel Campbell, accepted the invitation and after a brief absence, returned. I was standing near the flagstaff. Hearing a noise and a sound as of one in grief, I turned around and was horrified to see an officer in the act of lowering our flag. I cannot express the emotions that filled my breast at this sight; the officer that was engaged in performing this melancholy duty was the same one that I had noticed earlier in the morning push the loaded shell with his foot, and the tears were running down his cheeks; this, I quickly comprehended, was the signal of our capitulation; hastily running into the headquarters building, we commenced to mutilate and destroy the telegraph instruments that we had brought with us to the fort. Those of the troops who had revolvers, extracted the chambers and threw them into the well of the fort; and I suppose even to this day there lies at the bottom of that well, at least, a half peck of rusty revolver chambers. While in the hurly burly incident to the preparation for surrender, I was surprised to see the gates of the fort open, and there entered a man of commanding presence, surrounded by his staff. This I knew to be the celebrated Lieutenant-General Forrest of Confederate fame. The first one that he called for was the telegraph operator. After repeated promptings, I stepped slowly forward and was asked by him, if I was the man. When I replied in the affirmative he asked me to produce my instruments. I walked over to the building in which they were stored; there I found Ludwig still at work, disabling them. I took them up, with a great show of care and brought them out to the general. He took each instrument as carefully and handed one to each of his officers, near him; for these little telegraph instruments were worth their weight in gold, in the south, where they

could not be bought for love or money. I hardly think, with the talent that the Confederates were possessed of at this time, that these instruments could have helped very materially in any subsequent success of their forces. We were marshalled into ranks and marched outside the fort, where after a short delay, we took up what proved to be a very tiresome march; it was for a distance of only eight miles, yet my feet suffered very much at the halting place, for I had on a very snug-fitting pair of boots, and my feet became so swollen, that I could hardly remove my boots.

"We lay upon the ground without covering, and those who did sleep, awoke the next morning thoroughly wet with dew; hungry and jaded we started on our day's march, my feet causing me intense pain. We had no means of carrying drinking water, and had to depend upon what water we happened to come across; I remember drinking out of a hog wallow; this was not as bad as it may seem to be, as it was in nice blue clay, and the hog hadn't been there for a long time, and the water was very clear and cool, and last but not least, I was nearly perishing with thirst.

"That day we marched seventeen miles, unbroken by any startling incident. We camped on the banks of the Tennessee River at the foot of the celebrated Muscle Shoals; on the march, many of us were forced to give up our hats, coats, boots, shoes, jack-knives, blankets, and in fact anything that the Confederates coveted, and as it was done at the point of a revolver or carbine, accompanied by language that was plain, accurate and to the point, we complied without hesitation and without surprise.

"Again we slept, my feet giving me intense pain. In the middle of the night, Ludwig lost his treasure which consisted of a rubber blanket, it being stolen by one of the guards. The next morning we crossed the river on flat boats, and after a very fatiguing march of fifteen miles, we camped at Tuscumbia, Ala., on the banks of a stream about twenty feet in width, which was formed by a large spring that flowed from the base of a high crag of rock, which was crowned with a beautiful oak tree; some idea can be formed of the size of the spring by the fact that the water that flowed from it, furnished the power that drove two good-sized mills that were located in the city.

"The next day we marched to Cherokee, a station on the railroad. Thus far we had marched 56 miles and my feet were so swollen that I could not wear my boots. Here we camped out in the rain.

"All of this exposure and marching was hard on we two operators, as we had been closely confined to the office for many months, and were rather tender-footed. There was quite a body of troops here, and we were visited by two or three Confederate operators that were attached to the various commands in the near vicinity; one of these operators was a well known character in the south, by the name of William Ord; he was at this time attached to Forrest's command, but we received little

consolation from them. We remained at this station all day, waiting for a train.

"September 9, four days after our capture, we had scanty rations of beef issued to us; this was eaten without salt or bread, it was the first eatable that had been issued to us since we had been captured, excepting a small ration of bacon.

"The next day I destroyed all letters that I had about my person; we were crowded into cattle cars, and off we started for Corinth, Miss. We passed Iuka, Miss., at 1.30 p. m., and arrived at Corinth at 4 p. m. Here I had a good view of the celebrated battery Robinette, the scene of one of the fiercest battles and hand-to-hand conflicts of the war. We changed tracks here to the Mobile and Ohio Railroad and travelled all night; the wounded suffering horribly; at three a. m. we arrived at Okolona, Miss., which we found to consist of a town of chimneys, apparently, waiting for a town of houses to be built around them; this fact was accounted for, by a visit that General A. J. Smith had paid them, a short time before. At 7 a. m. we commenced the run to Meridian, Miss. When about four miles out of Okolona, in a driving rain, on a steep down grade, with a drunken engineer at the throttle, the track spread at the bottom of the grade where there was a short trestle; off we went. there was a short, snapping crash and we hastily picked our cold, stiff and dazed forms out of the debris of as complete a wreck as I ever saw. The bridge was entirely destroyed; five cars were one unrecognizable mass of ruins; five dead men and twenty wounded, some fatally, was the result; we lay at the scene of the disaster all day, on a low piece of ground, in tall weeds, infested with the greatest variety of insects that I ever saw outside or inside of a museum.

(To be continued.)

Telegraphs in the American Republics.

The bulletins of the International Bureau of American Republics for July and August give a large amount of interesting information in regard to the republics of South and Central America and among other things give a brief description of the telegraph system of each country.

In Argentina the government telegraph system comprises 613 offices and 36,716 miles of wire. In 1909, 10,800,000 messages were handled. Private companies also own and operate lines whose mileage is about equal to that of the government lines. The telegraph system of Bolivia comprises 3,979 miles of lines, of which the government owns 2,390 miles and has 124 offices.

Brazil has over 2,000 offices and 18,874 miles of government telegraph lines. There are thirty-nine private telephone systems of which the most important are at Rio de Janeiro, with 3,500 subscribers; Sao Paulo, 3,300; Rio Grande do Sul, 1,479, and Pernambuco, 631.

All parts of Chile are connected by the government telegraph system, which comprises 359 offices and 17,388 miles of wire.

Colombia has 524 telegraph offices and 10,676

miles of wire. This includes the lines owned and operated by the government and does not include the telegraph lines of the various railways. The Colombian system connects with the government telegraphs of Venezuela and Ecuador.

There are 119 government telegraph offices in Costa Rica, with 1,335 miles of telegraph lines in operation. In 1909, 505,375 messages were handled.

The Dominican Republic, which occupies the larger part of the Island of Haiti, has 52 telegraph offices, with 1,269 miles of wire and during 1909, 2,501,000 messages were transmitted over these lines.

Ecuador has 2,608 miles of telegraph lines with 60 offices.

The telegraph and telephone system of Guatemala comprises 4,196 miles of wire, with over 200 offices and a staff of over 800 employees.

Honduras has 3,600 miles of telegraph lines and 217 offices. The number of messages transmitted over these lines in 1909 was 886,697.

The telegraph wire mileage of Nicaragua amounts to 3,637 miles with 130 offices.

The telegraph system of Paraguay comprises over 2,000 miles of wire and reaches all points of importance along the southern frontier. It is expected that the service will soon be extended northward to the boundary with Brazil.

Peru has 5,986 miles of telegraph lines and 178 offices. 751 miles of this amount was constructed during the past year and 23 new offices opened.

The republic of Salvador reports 179 telegraph offices and 2,479 miles of lines.

During 1909, over 1,000,000 domestic and international telegrams were handled by the government telegraph system of Uruguay. During that year 248 miles of lines were reconstructed and 500 miles of new lines are contemplated.

Venezuela had in operation on January 1, 1909, 4,756 miles of telegraph lines with 169 offices. During the past year nine new offices were opened and communication established with Colombia.

Mr. Theodore E. Moreland, of Pittsburg, Pa., in renewing his subscription, says: "Enclosed find \$2.00 to cover another year's subscription to your good paper and long may it wave."

Major J. Orton Kerbey, the well known old time and military telegrapher, is the president of a newly formed company known as the Amazonia Rubber Exchange, the principal object of which is to deal in Para rubber and to cultivate the same in its native habitat, Brazil. Major Kerbey, by reason of his residence in Brazil as American consul and his extensive travels through that country which he has so entertainingly described in "The Land of Tomorrow," has acquired a vast amount of experience which will be of great value to him in conducting the affairs of the new organization.

Standard Time.

On the afternoon of September 21, at 5 o'clock, Washington time, summer had its official ending and autumn began. It was then that the sun made its annual pilgrimage across the equator on his journey to southern climes. It is true that, according to our method of measuring time, it was slightly ahead of his schedule. It takes the sun twenty and one-third minutes less than a complete revolution of the earth around the sun to complete the journey from one autumnal equinox to the next. Therefore, if we were to count a full revolution of the earth around the sun as the time between two autumnal equinoxes, in 13,000 years we would find ourselves in the northern hemisphere, having ice harvest in July and wheat harvest in January.

This question of time reckoning in one form or another, always has been a puzzling thing to humanity. "In bygone generations," says Mr. Frederic J. Haskin, "the problem was to adjust the yearly calendar so as to make the seasons conform to it. Before the days of Julius Caesar long distance time keeping was not a very accurate thing at best. He revised the calendar, but in the 1,500 years that it continued in force the dates got ten days ahead of the seasons and the equinoctial periods were all awry. Pope Gregory XIII, with a view to keeping the equinoxes and the calendar in harmony, instituted our present system of time reckoning, which is so nearly perfect that it will not vary more than a day in a thousand years."

Coming down to the smaller divisions of time, the basis of the Grecian and the Roman methods was the course of the sun across the sky from sunrise to sunset. As the length of the day varied in winter and summer, and as these two peoples insisted upon a twelve-hour day at all times, it naturally followed that their hours were shorter in winter than in summer. They had all sorts of peculiar contrivances to reckon the varying hours. One was a modification of the Egyptian water clock, in which water was used instead of sand, as in the hourglass. In the Greek and Roman timepiece the figure of a man with a pointer in his hand was mounted on a piece of cork. The scale varied for every day in the year, and was placed on a revolving drum that made a revolution in 365 days. The hours of proper length were thus kept before the man with his pointer as he descended with the ebbing of the water. It was the Egyptian who divided the day into twenty-four hours, reckoning a day and a night as one day. From that time the world got along very well with the day reckoning until the telegraph and the railroad made it important that time should be identical over widely distributed areas. This led to the agitation which brought about the adoption of standard time.

In the early part of 1883 there were time reckonings in the United States from no less than seventy different prime meridians. While the smaller communities got their time from adjacent important cities, there were upward of a hundred different

time standards in use in the United States. This produced no end of confusion, led to many accidents on the railroads, and in many ways was most inconvenient. Two railroads crossed each other. One had one time standard and the other another. What was more inevitable than that they should have a collision sooner or later? A traveller going west was continually setting his watch back, and from the standpoint of time never knew just where he was.

All these inconveniences led to the assembly of a convention of railroad men in Chicago on October 11, 1883. Following the suggestion of Professor Cleveland Abbe and Professor Sanford Fleming, then with the Canadian Pacific Railway, it was decided that North America should be divided into four time belts, and that in each of these the railroad time should be identical for every line operating within the belt. Eastern time was to prevail in all the region east of Pittsburg, Wheeling, and Bristol, Tenn. Central time was to prevail in all the region between eastern time points and such places as Dodge City, Kan.; El Paso, Texas, and Minot, N. D. A line approximately from Demin, N. M., through Huntington, Ore., and Laggan, British Columbia, was to form the western boundary of mountain time and the eastern boundary of Pacific time.

This program was agreed upon and recommended to the government. At noon on November 18, 1883, for the first time in history, standard time was sent out from the Naval Observatory at Washington to all the stations east of the Pacific time belt, and from the Mare Island Navy Yard to stations in that belt. From that day to this every properly regulated clock in the United States has pointed to the same minute and the same second at all time. Only the hour hand differs.

The accuracy of the nation's time is largely in the keeping of the Naval Observatory at Washington. The method by which that institution sets a nation's clocks is interesting and ingenious. In the first place, it has the co-operation of every national telegraph and telephone line in the country. At the hour of noon in Washington, eastern time, every railroad and telegraph clock in the country is set to correspond with the Washington noon. There is a great master clock, kept in an air-tight, moisture-proof vault, in which a uniform barometric pressure and a uniform temperature is maintained; the latter being accomplished by the aid of a little thermostat and a small electric light. This clock is checked up several times a week by observations of the fixed or clock stars through the transit telescope. The Nautical Almanac shows the exact position of each clock star for every hour, minute and second of the year, and with the transit telescope and the Nautical Almanac the astronomer making the observation is enabled to calculate the exact time to the minutest fraction of a second. He does this, and sets the master clock accordingly. There are three other clocks which are set by the master clock. These always are ready to be switched

into the telegraphic circuit. At 11.55 a. m. they are switched into the telegraphic circuits, and every connected clock in the country east of the Pacific time belt ticks in consonance with the clocks on Georgetown Heights. In the middle of each minute a second is skipped—the twenty-ninth—and at the end of each minute five seconds are skipped until the last minute is reached when there is a silence of ten seconds, and then every hand moves to 12 o'clock in the eastern time belt, 11 o'clock in central, and 10 o'clock in mountain. Thus is the country's time set right for another twenty-four hours.

There is said to be no government that maintains as many time balls as the United States. It has some twenty of these in all the principal ports and other important points throughout the country. It is said that the one in Washington is the most expensive small institution the government has. Every day at noon the majority of the government employees, from Capitol Hill to Georgetown stop to watch the time ball on the State War and Navy Building.

A Few Thoughts.*

BY COLONEL W. R. PLUM, LOMBARD, ILL.

The Old Time Telegraphers' and Historical Association grows stronger and stronger as the years roll by. The Society of the United States Military Telegraph Corps, like the Grand Army of the Republic, is passing away as the days fade into the mists of history.

The "Old Timers" now aggregate about fifteen hundred, a larger number of telegraphers than were engaged in one of the greatest struggles in history, and will continue to increase in membership, power and influence as it shall merit a larger measure of success. On the other hand, the cohesion and strength of the military society depends entirely upon duty done.

The one, with its resplendent history and present, looks to the future. The other glories in an heroic past with a hope of complete recognition.

Old timers represent a growth as phenomenal as education. The army operator represents a service, unique in warfare, that has become a universal military necessity.

The one entwines the Union with mystic cords, making a great people neighbors. The other made the Union a continuing certainty by the electric tongue.

Old Timers have furnished governors, generals, judges, presidents of railroads, honest legislators and others prominent in Federal, State and municipal affairs as well as in the professions and trades.

*Address delivered at banquet of Old Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps, Auditorium Hotel, Chicago, September 10.

The Civil War telegraphers reanimated the despondent, stood sentry at all vital points and kept the government, the armies and the people in touch with one another.

Nothing since the dawn of the Christian Era, with a possible exception or two, has so greatly conduced to the world's peace as the civil telegraph. Nothing since sin entered Eden so controls the activities of war as the military telegraph.

Nothing so promotes the world's business as its network of wires and nothing shortens war like the electric courier.

Civil telegraphy compressed editorials and multiplied facts; it compelled business readjustments and is the first aid in all great calamities. Military telegraphs supply the troops, avert surprises, strengthen the weak and consolidate armies.

One is an angel of peace; the other the thunderbolt of Jove.

In these days, when tense religious animosities are nearly unknown, when peace is the world's desideratum, when the telephone, for all practical purposes, has opened telegraph offices in our very homes, it is befitting that old men, telegraphers of the Civil War, and others, with uplifting achievements, should rejoice with one another over cemented friendships made possible by faithful service, and because from our ranks have sprung the most potent advocates of international peace and the wizards of electric progress.

Harmony is the law of the universe. The brotherhood of man is largely specialized harmony. Each vocation creates its own peculiar comradeships. To-night we are all old timers. All with garnered memories. The past rises before us. It cements one another. It is a certificate of character. Hence this reunion.

Dots, dashes and spaces,
Cadmus outdone,
Uniting all races
Under the sun.

Beating time, diurnal,
"What hath God wrought?"
Messenger supernal
Transmitting thought.

Brotherhood of the key,
Telegraphists,
Ignoring land and sea,
Telepathists.

Long may your hearts unite,
And virtues shine
Many years, ere good-night
Comes o'er your line.

I leave my "73,"
"30" retain.
Blest be this eve's mem'ry
Till we meet again.

The Necessity of Quick and Accurate Notice of Location of Fires in Connection with Rapid-Moving Apparatus.*

BY WILLIAM L. RIEHL, SUPERINTENDENT FIRE-ALARM TELEGRAPH, CINCINNATI, O.

The necessity of giving prompt alarm of fires has always existed throughout the entire history of organized fire-fighting. Prior to the advent of the fire-alarm telegraph as a permanent institution, notice of fire in large communities was given by citizens or street patrols to watchmen in watch towers located at various points throughout the city. The watchman first receiving the information as to the existence of a fire, rang an alarm manually upon his bell. This alarm was taken up by one watchman after another until in a short while the entire city was aroused. This old system of sounding alarms of fire gradually disappeared with the coming of the electric fire-alarm telegraph, and the fire alarm system as it exists to-day is the result of years of growth side by side with the wonderful increase in the efficiency of fire-fighting apparatus and fire department organizations. It may, of course, be stated without fear of contradiction that, notwithstanding the perfection to which the latter-day methods of firefighting have been brought, the necessity of quick and accurate notice of the location of fires is far greater now than it was in the early days, or than it has ever been since. The size of our modern buildings, the congestion of their occupancy, and the large volume of merchandise carried in them, as well as the solidly built-up blocks which characterize our large cities, makes it absolutely essential that our fire-fighting facilities should be quickly brought into action. It is also true that the full value and efficiency of our fire department apparatus and organizations cannot be realized unless they are rapidly concentrated at the point of danger. Efficient officers and men, modern engines, automobile chemical apparatus, quick-raising ladders, and all other devices and appliances used in the fighting of fire, demand, by reason of their very perfection, that prompt and accurate alarms of fire should be given. It therefore becomes the duty of fire department officials to see that the public is not only provided with adequate and reliable means for sounding alarms of fire, but that they are made fully familiar with the method of operating the system provided for that purpose. It being admitted as an elemental fact that quick and accurate alarms of fire are essential to the proper protection of life and property, those charged with the important public function of preventing and extinguishing fires should see to it that a proper system of notification is provided for public use. A fire-alarm system is probably the most important of all emergency signaling services, and should be so laid out and planned that the quickest possible advantage should be derived from it

in case of need. This necessarily means that a sufficient number of alarm stations should be provided to insure the least practicable delay in sounding an alarm. Street boxes should be so located as to be quickly accessible to all important risks and special hazards. The National Board of Fire Underwriters, in their reports on fire protection of the various cities of the country, recommend that not over 500 feet should have to be traversed from any important building before reaching a box. This recommendation, of course, should be regarded as a fixed one, as all special hazards, such as hospitals, institutions, theatres, etc., should be in closer touch with an alarm-giving station. The time lost in operating a street box for fire should be minimized, either by the use of the keyless door in many cases or by leaving the keys to boxes in the doors under a special key-guard. Instructions for turning in an alarm of fire should be placed at each box station, and information as to the location of the nearest street box to various buildings, hotels, apartment houses, should be given by means of cards placed in prominent positions, and bearing an inscription something like the following:

"The nearest fire-alarm box to this building is Box 612, Sixth and Vine Streets."

On this card should be a cut of the box, and directions for its operation. In other words, not only should a sufficient number of street stations be provided, but care taken to educate the public as far as is practicable, to the location of the box or boxes nearest them, and as to how to operate them. I think also that it would be part of wisdom for city officials to encourage the installation of private boxes in large and important properties, allowing the owners thereof to purchase boxes of the type in use by the city department and to pay the cost of connecting them into the city circuits, the city thereafter to maintain such private boxes as a part of its telegraph system. Such boxes, however, should not be placed in the interiors of buildings where access cannot be had to them, and to the circuits by the fire department employees at all times. Boxes should be placed on the outside of premises. As the street box is the basis of a municipal fire alarm telegraph system and the starting point of all department firefighting and actual operations, the sending of alarms of fire by any other means than through a street box should be discouraged as far as possible. The use of a telephone for this purpose involves certain delay, and is at times liable to cause confusion and uncertainty, sending the department to locations removed from the actual fire. I think that it will be self-evident that the nearer we can bring the sounding of an alarm to the discovery of the fire, the nearer we come to the minimum of loss, and unless every effort is made to accomplish this much-desired result, we can never realize the true value of our progress along the lines of fighting and extinguishing fire.

*Paper read at convention of International Association of Fire Engineers, Syracuse, N. Y., Aug. 23-26.

What the American Telegrapher Has Accomplished.*

BY FRANK J. LOESCH, CHICAGO.

In rising to respond to the toast proposed by the Master of Ceremonies I feel a certain embarrassment, due in part to lack of expert knowledge of my subject, as it is many years since I separated myself from the certainty of a Telegraph Company's pay roll to put my trust in the terrifying uncertainty of a professional income, and in part to the fact that I am but a youthful member of this Association, being indeed in my freshman year and yet have been given to do a full Professor's work.

Only a man in a lifetime's constant touch with the practical operation of the telegraph or one who had expended in it the expert study of years could do justice to the subject, and not then in less than a royal quarto volume.

And yet, confessing as I must, my inability to give this subject the treatment it rightly deserves at the hand of an expert, I wish to thank the committee for the honor conferred upon me in asking me to respond to this toast and in allowing to me the liberty of treating it as best suited the time at my disposal and my inclination.

I may be excused for stating that my work during the years of my service in my youth and early manhood with the rank and file of the men in one telegraph company and the years of association in an advisory capacity with the officials of another telegraph company made to me lasting friends who have maintained themselves in my heart with undiminished affection. It is a joy to meet so many of them at this annual meeting.

In the age in which we live new inventions follow so fast one upon another and their practical application to every day life and business is taken so much as a matter of course that we are apt to lose sight of the fact that the invention of the electric telegraph, scarcely more than two generations since, created, generally speaking, the present modern day world as distinguished from the ancient world. The inventions of the steam engine by Watts in 1763 and the traction engine or locomotive by Stephenson in 1829 needed only the invention of the telegraph by Morse in 1835 to 1844 to make the beginning of the transformation of civilization which has taken place in our own time and which to the student of the history of the world makes child's play of the story of Aladdin and his wonderful lamp. If we cannot erect a palace in a night, we can do what the slave genie of the lamp couldn't do—we can without a genie's aid, with a few movements of the fingers, light our auditoriums and residences as at the World's Fair and other similar exhibitions, light up a score of palaces in a moment's time, with a brilliancy exceeding that of clusters of diamonds and without the aid of hundreds of genii necessarily required in sticking diamonds, emeralds and other precious stones of fabulous value around the

window frames and door jambs for night illumination. Cities of millions of people can be lighted in every part so well that the terrors of darkness, the refuge of the criminal, have been well nigh banished. We do not have the genie carry one of us at a time through the air from one part of Africa to the Magician's Castle in another part in a night in fear, discomfort, hunger, sleeplessness and cold. We have improved upon that. Many scores of people on the eve of every day leisurely enter a palace on wheels, are by the aid of steam and the telegraph, whisked away and while smoothly gliding through the air eat a substantial dinner, go to bed in comfortable beds in a heated room, are served with running water, are waited on by colored genie of benign aspect and polite manners and at breakfast time on the following morning are landed at their destination a thousand miles distant in comfort, safety and content.

We might extend indefinitely the discussion of the advantages of electricity over the genie of the Arabian Nights and over the reality which the world had down to two generations ago, if we were to consider the use of the telegraph's younger sisters—the telephone and the wireless telegraph; and its stronger and dangerous brothers—the application of electrical energy to running machinery and swiftly propelling cars.

Naturally a force so mysterious as electricity and an energy of such possibilities to high civilization and commerce as the telegraph drew to its support the younger men and youths of quick intelligence, who, when they became expert telegraphers, were men of consequence and importance in each community.

The construction of a telegraph line upon the Erie Railroad about 1855 and its use for train despatching, increased the value of the single track railroads and decreased the dangers of their operation and its use to that end became at once general and opened a still wider field to the young men of intelligence and ambition.

The Civil War conclusively established on a large scale the inconceivable value of the telegraph to the commanding generals and their subordinates in the field, to the Executives at Washington and Richmond and to the people at home who were daily scanning with alternate fear, anxiety or joy the telegraphic news from the front. The Civil War did more than that. It proved the unflinching courage, the resourcefulness, the untiring energy, the endurance of the military telegraphers, most of whom were very young men, to be the equal of that of the bravest of the soldiers in the regular and volunteer armies.

To establish that fact where personal knowledge is lacking we have only to read the increasing number of histories of the period of the Civil War, the reports of the military commanders, and the countless memoirs of participants in that gigantic struggle and also as seen from the monographs of Bates, Chandler, Plum and others of the military telegraphers, some of whom are with us to-day.

*Address delivered at banquet of Old Time Telegraphers held at Chicago, September 10.

The telegraph had been constructed to the Pacific Coast prior to the Civil War and was maintained over vast waterless deserts, scarcely passable mountains, through dense forests in an uninhabited country and through hostile Indian camps. It is not too much to say, as I have heard it said, that California was saved to the Union largely by that single telegraph line in friendly hands.

So that by the end of the Civil War the telegraphers under the lead of such well known and progressive men as J. H. Wade, Marshall O. Roberts, Hiram Sibley, Norvin Green, General Anson Stager, William Orton, and others had become a recognized force in the commercial and social world of America.

The close of the Civil War, the turning back into civic life of a million soldiers whose places had in large part been filled by women and boys during their absence on field duty presented a seeming problem which was, however, soon dissolved. Every man found his place in the development of the material resources of the country, and the taking up of new lands—for the old soldier was now an intrepid pioneer and often a rover—and in building up the waste places or those neglected by reason of the exigencies of the war.

An unexampled era of construction of public works and notably of railroads was carried on west of the Allegheny Mountains and especially in the Mississippi Valley including the first transcontinental line. The new telegraph lines were keeping equal pace and it was the heyday of the roving expert telegrapher who could get a job at good pay wherever he turned up and at any time a railroad pass to any railroad point his imagination chose to long for.

The almost mystic operation of the telegraph has never ceased to have a strong fascination for many men and in the fifteen or twenty years following the war multitudes of youths were drawn into the telegraph service by reason of its great expansion and especially so by reason of the development of train despatching as a science and by the increase of joint commercial and railroad telegraph offices.

The telegraph service tends to develop every faculty of the mind in any intelligent and ambitious boy or young man. A long list can be made of successful men now living who are prominent in telegraph, railroad, telephone, and banking corporations, in brokerage, mercantile and manufacturing business and in the professions, who entered the telegraph service either directly or through the railroads between the years 1860 and 1885 or even later and spent most of their formative business years as telegraphers and in allied service.

There must be an underlying cause for a result so general. From no other business of which I have any knowledge have so many men been drawn into prominent positions in other lines of business than from the telegraph. It is to be expected that the executives in the telegraph corporations will be drawn from the staff promotions in the service, as is the rule in other businesses, but that does not ac-

count for the men who have withdrawn from the operating ranks and made successful careers otherwise.

Alertness of mind, quick comprehension, instant decision, a thorough knowledge of his own beautiful art, a wide acquaintance with the geography of one's country, a good idea of business affairs and conditions, a working knowledge of humanity, are quite apt to accrue to the intelligent, studious and ambitious operator, and to form the basis of unlimited improvement, development and progress in whatever position he may be placed.

It is only on such grounds that I can place the material accomplishments of such American telegraphers as

Marvin Hughitt, president Chicago and North Western Railway Company;

A. J. Earling, president Chicago, Milwaukee and Saint Paul Railway Company;

W. C. Brown, president New York Central Lines;

W. J. Underwood, president Erie Railroad Company;

Henry U. Mudge, president Chicago, Rock Island and Pacific Railway Company;

Henry R. Williams, president Chicago, Milwaukee and Puget Sound Railway Company;

C. A. Goodnow, assistant to president, Chicago, Milwaukee and Puget Sound Railway;

W. A. Gardner, vice-president Chicago North Western Railway Company;

Theodore N. Vail, president American Telephone and Telegraph Company;

Col. R. C. Clowry, president Western Union Telegraph Company.

Col. A. B. Chandler, builder and former president of the Postal Telegraph System;

E. J. Nally, vice-president and general manager of the Postal Telegraph Company;

W. H. Baker, vice-president American District Telegraph Company;

E. C. Bradley, vice-president and general manager Pacific Telephone and Telegraph Company;

B. E. Sunny, president Chicago Telephone Company; and

E. W. McKenna, vice-president Chicago, Milwaukee and Saint Paul Railway Company.

None of these are classed as rich men. If we must for the benefit of the aspiring operator, have an example of a rich telegrapher we may take Andrew Carnegie, but who by reason of having induced the Government to enter into partnership with him is a class all by himself.

See'st thou a man diligent in his business?

He shall stand before Kings.

When Solomon transcribed that sentiment into his Book of Proverbs for the benefit of future ages, he was but transmitting to us the wisdom of his ancients, which was still literally true in his time and for nearly thirty centuries later there was but one source of power, business favor and authority—

the King. In him was centered everything and beyond him there was nothing.

Now the political King has passed or is passing. It is all he can do to hold his own. Democracy is rapidly making him a mere figurehead still held in place by tradition, habit and privileged orders.

But inserting in place of the King, the People, the Capitalist, the Banker, the Merchant, the Manufacturer, the Board of Directors, the Superior, we have the proverb as literally true now as it was in the wise man's days.

Several years ago it was my fortune to be engaged in a legal contest in which experts made up of one class of men were introduced as witnesses by one side, and a totally different class of experts were offered by our side.

As our expert railroad witnesses came successively upon the stand it was a great lesson in human nature to watch the faces of the jurors—ten of whom were mechanics and clerks and two of whom were independent business men, as the business biography of each witness was outlined by him. As the first witness gave his beginning and rise from a telegraph operator through successive changes and promotions to the presidency of a railroad company running from New York to Chicago, the faces of the jurors showed their wonder and interest as well as the witness' rise in their estimation.

And when he was succeeded by a second man who gave his beginning as a telegraph operator and through many successive promotions his rise to the presidency of a railroad running from Chicago to almost the Pacific Coast, so the interest of the jury increased in intensity with each promotion and he became a man in their eyes whose experience gave controlling weight to his words.

And when a third witness came forward and gave his first employment as a telegraph operator and his final promotion by successive steps and in different corporations to the vice-presidency of a great railroad corporation, the jurors came to the conclusion that all railroad company presidents were by some mysterious law of nature made from telegraph operators.

To satisfy the curious in the room who are now speculating on the subject, I will add that the witnesses referred to were Messrs. Underwood, Earling and McKenna.

All of the men I have named are living illustrations of the truth of Solomon's proverb.

These men are constructive men of the highest ability in America. The result of their work has made homesteads and farms for millions of souls on former waste lands and deserts: has made towns where the savage roamed to obtain a precarious livelihood: has made great cities out of small villages: has developed mines of precious and indispensable metals the existence of which were unknown or inaccessible: has raised cheap food for millions of foreigners: has developed manufacture, has spread intelligence and quick communication; trade and commerce advanced high civilization and obtained

comforts for the millions unimaginable two generations ago. There has been spent under their initiative and by their authority for the success of their corporate undertakings and for the benefit of the public hundreds of millions of dollars without suspicion of a scandal connecting itself with their names by reason of it. Let the business world of Europe and America, if it can, and the heads of the private corporations and industries, produce examples equal to that given by these and other old telegraph operators in business integrity and efficiency.

That is a part of "What American Telegraphers Have Accomplished."

Yet another and more difficult part of the work of these men and others in similar positions is to conserve what has been created with so much labor and at such cost. Conservation is in the air. But it isn't the forest, the water power, the soil, the oil and the minerals which alone must be conserved. Capital, too, needs conservation if it is to continue to flow freely for the benefit of all. And so these old telegraphers are to-day in a more trying and difficult position than they have ever been in. Almost, if not in fact, the very life of their corporations is at stake in the economic and epoch making struggle to which they have been forced between the nether millstone of procuring capital for necessary betterments of their corporate properties and giving a proper return to such capital, and the upper millstone of government regulation, which in defiance of the lesson taught by Joseph in Pharaoh's time, seeks to limit capital returns in fat years but is unwilling to guarantee any returns in lean years, a jug handle regulation which would, if carried out as demanded by inconsiderate and singularly selfish extremists, be the practical destruction of investments in public utility corporations, and carry with it economic ruin and devastation to which we have had no parallel in this country.

But these men are not pessimists. They are loyal to themselves and to their past. They are stayers and they must be hopeful that a good cause if well sustained will in the end win out through the sense of fair play, which will come to their aid on the part of the public.

The young man looking about for a career in life and finding his lot cast in village or city has before him numberless examples of business and professional success, not in money making, but in character first. Let him note in what other calling without means, with a fair education, intelligence, courtesy, ambition and energy as his aids he is likely to do better than as a telegraph operator.

The leaders must in due course follow the law of nature, but promotion rarely waits upon death. It comes to the worthy one. The search is constant for the right young man—the demand is never satisfied. All good places are not even now preempted by the old telegraphers.

And let him also comfort himself with the examples of other men who spent years in telegraph

work and through the training and suggestions there received were given new direction for their energies and ambition, and so became able to maintain themselves acceptably as men of character and standing with abundant success in other fields of work. They may rest assured their experience so gained will always prove useful. And if he would be measurably happy he will reduce from the example of these old telegraphers the truth of the words of Theodore Parker, that:

"The earnestness of life is the only passport to the satisfaction of life."

The Telegraph in Alaska.

BY CARL V. SNOW,

First Class Sergeant, U. S. Signal Corps..

The telegraph service in Alaska, which is owned by the government and operated by the Signal Corps of the United States Army, is carried on principally over the land lines which connect the more important points in that country. These lines, however, are subject to frequent interruptions and are difficult to keep in repair on account of the severe cold in winter and the spring freshets. The line from Valdez to Fairbanks, a distance of 367 miles, is often interrupted from two to ten days at a time. In such an event the business is sent from Valdez to Fort Egbert, where it is transferred by wireless to Circle, and from there relayed to Fairbanks, where it is returned to the land lines. Three hundred messages per day are often handled in this way.

The wireless service has been found to be very reliable both at day and night in the winter, the northern lights having no appreciable effect upon it. During the summer, however, from May until August, static disturbances are very frequent and troublesome, rendering communication difficult. These disturbances often continue for 36 hours without a break, and make it almost impossible to read the incoming signals. At times these discharges add dots to the characters or make a dash out of two dots, thus completely changing the signals. The sound of these static signals cannot be distinguished from those sent by the distant station.

When the earth is frozen hard in the winter it is impossible to make use of it electrically and the snow being perfectly dry is also a non-conductor. The telegraph lines are then grounded in the river. Frequently in the spring when the ice in the river breaks up the telegraph line ground is broken and it is sometimes several days before a new ground can be secured. Serving the same purpose as a ground connection for the wireless, a system of wires is arranged parallel with the ground and about seven feet above it. This is called a counterpoise. The wireless station at Circle is the farthest north of any and furnishes the only telegraph service at that point. Prior to 1909 it was located in a log cabin and was probably the only wireless station in the world housed in this manner. During that

year new quarters were provided and the station, which is of three kilowatt capacity, was moved and placed in working order again in less than twenty hours, including the time spent by the men in sleep.

Messages for Alaska are sent to Seattle, where they are turned over to the government for transmission by cable to Sitka, a distance of 1,085 miles. There they are relayed by cable to Valdez, 599 miles distant. The paper tape of the siphon recorder is then pasted on message blanks and the messages are sent over the land lines in the Morse code direct from the cable record, which is made in the Continental Code. The entire cable, land line and wireless system is operated by the men of the Signal Corps. Over fifty offices are maintained along the coast and in the interior of Alaska. During the winter linemen utilize dog teams exclusively for transportation. In the summer the rivers are open for navigation for three or four months and during this time most of the supplies used are carried in. The telegraph offices are located at points along the river as far as possible, as most of the overland trails are impassable in summer. With the exception of Fairbanks, Tanana, Nome and St. Michael, all of the places in the interior have less than 100 inhabitants during the winter and hence are rather lonesome places for most telegraph operators.

The temperature of Alaska in summer is as in the United States, around 100°, and mosquitoes are plentiful. In winter the average temperature is from 30° to 40° below zero in the interior, though every year cold snaps come which bring the thermometer down to 70° below zero or even lower, these cold spells lasting at times for several weeks. On account of the dryness of the climate, however, this excessive cold is not felt as severely as would be imagined.

Freight which arrives at a river town in navigation season for miners or others located away from the towns usually waits until winter, when it is hauled over the snow by the freighters. Horses are never taken out of their stables when the weather is colder than 45° or 50° below zero. With the exception of freighters no one has horses in the small towns, the cost of keeping them being too great.

No places of amusement are to be found at the small towns, making reading practically the only winter diversion, and while magazines are a month or more old when received, they are always appreciated.

Carl Vivroux Warren Snow, the author of this interesting description of Alaskan Telegraphs, was born at Dayton, Ohio, April 5, 1878. He entered the telegraph service at that point in 1890, as operator for the Postal Telegraph-Cable Company. From 1895 to 1897 he was a student at Rose Polytechnic Institute, and upon his graduation went to Chicago and again entered the serv-

ice as an operator. In 1898 he enlisted in the Signal Corps for service in the Spanish American War, receiving his discharge in 1899. He then engaged in other business, but in 1901 returned to telegraphic ranks as operator on the Long Island Railroad. He was afterward employed by the Delaware, Lackawanna and Western Railroad and by the Brooklyn Rapid Transit Company. In 1904 he again enlisted in the Signal Corps as Sergeant and has been connected with that organization since that time. Over two years of his enlistment have been spent in Alaska, hence Sergeant Snow is well qualified to write about the service in that country. At present he is stationed at Fort H. G. Wright, New York.

Book Reviews.

"The History of the Telephone," by Herbert N. Casson (A. C. McClurg and Company, Chicago, 300 pages, illustrated), might well be called *The Romance of the Telephone*, as the author has told the story of the birth and growth of our great telephone industry in a way which makes the book more interesting to read than most novels. Beginning with the early experiments and trials of the young and almost penniless teacher, Alexander Graham Bell, which led up to the discovery that the transmission of articulate speech was a possibility, the author relates some of the many vicissitudes through which the youthful industry passed before it was finally placed on a paying basis. The book is not intended to be technical or statistical but the author has aimed rather to tell his story in such a way as to make it of interest to the general public and in this he has succeeded. Copies of this interesting work will be sent to any address carrying charges prepaid, upon receipt of price, \$1.50 by J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

"Principles of Wireless Telegraphy," by G. W. Pierce (McGraw-Hill Book Company, New York, 342 pages, 235 illustrations), is the latest book from the press upon this subject and is one which would make a valuable addition to the library of anyone interested in wireless telegraphy. The author discusses in an elementary way without the use of complicated mathematical formulae the principles underlying the generation of electric waves, the properties of electric waves and electric oscillations. He then shows how these principles have been gradually developed and applied to produce waves which are suitable and efficient for the wireless transmission of messages. The various forms of apparatus in commercial use at the present time are also discussed at some length. The book is written with the purpose of being useful alike to the amateur experimenter who has little knowledge of electricity and to the professional electrician who is engaged in the operation or construction of wireless apparatus. It has twenty-eight chapters and two appendices which give some useful definitions

of electrical units and formulas which will be of value in making electrical measurements. Taken as a whole this is undoubtedly the best book on the subject of wireless telegraphy on the market at the present time. While any book dealing with this new art necessarily grows obsolete to a certain extent in a short time because of the developments which are daily taking place, the work of Professor Pierce has undoubtedly a more permanent value than most of the books which have been written during the past decade owing to the fact that he lays more stress upon the basic principles underlying the art than upon their actual application. These principles are fixed although their application is susceptible of many modifications. Copies of this valuable work will be sent to any address, carrying charges prepaid, upon receipt of price, \$3.00, by J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

New Railway Telephone Cabinet.

The Kellogg Switchboard and Supply Company, of Chicago, is now furnishing a special cabinet for their No. 33 combined drop and jack for use on railway telephone despatching and message circuits. Where more than one circuit is used, it will be found very convenient and a saver of equipment. The apparatus is mounted in strips of five in a good substantial oak box, all connections being wired to terminals on the inside of the box. One telephone may be switched by means of a cord and plug, to any of the five jacks and lines.

KELLOGG DROP AND JACK CABINET.

When a call is received over a line on which telephone selectors are used, the circuit is so arranged that the selector throws the drop instead of ringing a vibrating bell, and the drop in turn rings a vibrating bell. These drops are so arranged, that by means of a switch, a ring on the bell until answered may be given or a ring of the same duration that the selector contacts are closed may be obtained.

When current is sent through the drop, the armature of the drop draws up and closes a pair of contacts, at the same time the shutter on the front of the drop is released and falls, closing another pair of contacts. The pair of contacts closed by the armature, are closed only while the current is passing through the winding of the drop, and in this way give the short ring on the bell. The pair of contacts closed by the shutter are closed until the drop is restored.

It is very convenient to be able to have two lengths of bell rings where an office is busy in the day time, and where an operator sleeps at night. With either method of ringing the drop always furnishes a visual signal, which is restored by simply inserting the plug in the corresponding jack below, the shutter being restored by means of a simple mechanical arrangement.

As an illustration: It is suggested that drop and jack No. 1 be used on a telephone despatcher's circuit; drop and jack No. 2 be used on a telephone message circuit; drop and jack No. 3 on block telephone east; drop and jack No. 4 on block telephone west and drop and jack No. 5 on a yard telephone circuit—or even the line to the city telephone exchange.

It will be seen from this that the operator can operate all the lines with one telephone from his chair. These drops may be arranged to operate on two cells of dry battery, or be bridged across any circuit in place of a bridging bell.

The Pennsylvania Railroad Lays Two Submarine Cables.

The problem of satisfactorily caring for the numerous telephone, telegraph and signal wires necessary for the operation of a large and important railroad at points where its tracks cross a navigable river, making a drawbridge a necessity, has recently been solved by the Pennsylvania Railroad Company at its new Hackensack "draw" at the point where the Pennsylvania Terminal and Tunnel Division crosses the Hackensack river, a few miles west of Jersey City.

UNREELING SUBMARINE CABLES FROM BARGE.

The accompanying illustrations show the laying of two submarine cables, one a 35-pair No. 13 gauge, triple wrapped paper insulation, to be used for telegraph circuits, and the other of 45-pair, No. 13 gauge, double wrapped paper insulation, having the wires of the inner core triple wrapped, and having eight pairs of this core twisted into double pairs, thus forming four phantom circuits. Each cable

was 1225 feet long, the 35-pair cable weighing eleven and a half, and the 45-pair twelve and a half tons. Each cable had a lead sheath $\frac{5}{32}$ of an inch thick. Each sheath was saturated with a non-corrosive preservative compound, over which was wound two layers of saturated jute put on in reverse directions. Over this jute was placed an armor of No. 4 B. W. G. iron wire, the armor being saturated with a preservative compound, and over this was placed two thicknesses of hemp rope, laid on in reverse directions and thoroughly saturated with preservative compound. The average mutual electrostatic capacity of this cable was between .06 and .074 microfarad per mile.

The work of laying these cables was carried out by the Postal-Telegraph-Cable Company, and was under the personal supervision of Mr. M. Keily, who represented Mr. J. C. Johnson, superintendent of telegraph of the Pennsylvania Railroad.

One very interesting feature aside from the laying of the cable was the very efficient and durable line of concrete poles which terminated on either shore. These poles were cast by the railroad company in accordance with its own specifications, and it is expected that they will be found much more suitable in the low, swampy ground where they are placed than wooden poles.

The weight of this cable was such that it was not considered necessary to do any dredging along the river bottom, as it is believed that the weight of the cable will sink it far enough into the mud to prevent its receiving any injury.

The engineers of the Pennsylvania Railroad Company, who worked in conjunction with those of the Western Electric Company, who manufactured the cable, were kept busy for some time designing and developing this cable, which is the latest product for submarine work.

The Telegraph in China.

All telegraphs in China are now entirely under government control, the interest in the Imperial Chinese telegraphs which was formerly held by private individuals having been taken over by the government. Extensions to the system are rapidly being made, the most important during the past year being the direct Peking-Hankow line along the railway, on which fast automatic Wheatstone working has been established. The statistics for 1909 show that there are 1,099 miles of submarine lines and 25,273 of aerial line. The head office staff number 112, the general staff 3,473 and the line staff 2,833. 807,841 telegrams were handled. The receipts were \$838,733, and the expenditures \$479,816. There are 1,171 instruments in use, of which 22 are Wheatstone and five wireless. A reduction of telegraph charges of 20 per cent. was effected in 1909. The program of the Board of Communications for 1911 includes preparations for installing wireless telegraphy along the coast.

Radio-Telegraphy.

One wireless experimenter has discovered that a large tin dishpan makes a very efficient aerial for the reception of wireless waves.

The New Zealand Government has asked for bids for five wireless stations to be erected at or near Doubtless Bay, Gisborne, Cape Farewell, Sumner (near Christchurch) and Bluff.

The United States Civil Service Commission will on October 19, hold an examination to secure eligibles for appointment as wireless telegraph operators in the Philippine service at a salary of \$1200 per year.

The Brazilian government has recently installed a four and one-half kilowatt Telefunken wireless telegraph station near Bahia, Brazil. The guaranteed range of the station is 400 miles, but communication has easily been carried on with Rio Janeiro, 730 miles distant, and with ships 1000 miles at sea.

With the aid of a kite to support the antenna, Mr. William Marconi reports that he has succeeded in receiving signals from Clifden and Glace Bay on board the Italian Lloyd steamship, *Principessa Mafalda*, at distances up to 3,500 miles, in the day time.

A patent, No. 970,592, for wireless transmission apparatus for controlling the movements of vessels, has been granted to V. C. De Ybarrondo, of Los Angeles, Cal. Electromagnetic means combined with the rudder and energized by impulses transmitted thereto from the generating apparatus under control of the operator.

A patent, No. 970,850, for wireless telephony, has been awarded to A. Plisnier, Jr., of Stuttgart, Germany. The Duddell oscillating circuit is fed by a mercury vapor spark gap or an electric arc, and the tension on the microphone may be varied by means of a self-induction coil, a shunt circuit including a microphone and capacity.

The Dominion Wireless Telegraph-Telephone Company, Ltd., has been incorporated in Ontario, with a capital of \$40,000 and offices at Windsor, Ont., to deal in wireless telegraph and telephone instruments, to erect and operate wireless telegraph and telephone systems, and to conduct a general wireless telegraph and telephone business. The directors are: J. Clark, A. Beckett, S. Anderson, Windsor; L. F. Boomer, Cleveland, O., and T. E. Clark, Detroit, Mich.

An effort is being made under the direction of Mr. G. H. Mann, a Washington lawyer, to form a national organization of amateur wireless operators. It is stated that the object of this organization is: first, to defeat the Depew bill requiring all wireless stations to be registered, and placing them under the supervision of the Secretary of Commerce and Labor; second, to secure the passage of the Roberts' joint resolution, which provides a commission to take testimony before any legislative action is adopted, and, third, to secure an expression on behalf of all the amateurs favoring some positive legislation which will give them protection.

Mr. William Marconi who, for some time past has been at Punta Del Este, Argentine Republic, supervising the construction of a high-power wireless station, reports that he has received at that point messages from Glace Bay, Nova Scotia, and Clifden, Ireland, a distance of at least 5600 miles.

The British Post Office Department reports that within three months the number of wireless messages received and sent has been doubled. Following the recent purchase of wireless telegraph stations along the coast it is the future plan to have a complete ring of such stations encircling Great Britain and Ireland.

The Australian Government has decided to change the location of the proposed wireless station at Sydney, which was to be erected near the coast, to an inland point, about thirteen miles distant. It is reported that this change will involve an additional expense of £2,000 in the construction of the station, but the Commonwealth authorities believe that the location now decided upon is much more advantageous.

The Canadian wireless telegraph service has been transferred from the Department of Marine to the Department of Naval Service. The officials of the telegraph service are C. P. Edwards, superintendent of radio-telegraph service, Ottawa, and E. J. Haughton, district superintendent of radio-telegraph service, Victoria, B. C. The latter has charge of the Pacific coast branch of the service, and reports to the superintendent.

Wireless in Japan.

In a recent issue of one of the London electrical papers, Mr. Wichi Toukatu, gives an interesting description of the Teishinsho system of wireless telegraphy which is used in Japan. This is a spark system, and makes use of a telephone and detector for its receiver. Many special devices are used to minimize the damping and get sharp tuning. Of detectors the Teppun, the tantalum and the Koseki are chiefly used. In the Teppun detector two steel poles are magnetized and arranged to be adjustable in their distance as in a coherer. Fine steel powder, oxidized on its surface by burning in a flame, is introduced between the poles so that the powder makes a bridge between them by the magnetic field of the poles. The powder must not be in too great a quantity, and each granule must be neither too large nor too small. The sensibility of the detector depends mainly upon the degree of the oxidation and also upon the adjustment. The tantalum detector of the author depends upon dipping a tantalum point into some alkaline or acid solution. The tantalum detector is very sensitive, and many samples which the author has made in his laboratory were more sensitive than the glass-shielded platinum-point electrolytic detector. The tantalum is not acted upon by ordinary acid or alkali, and the life of the detector is very long. The Koseki detector employs zincite, molybdenite or iron pyrite as a substitute for the oxidized iron-powder of the Teppun detector. Five land stations and eleven Japanese vessels are now equipped with this system.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

F. M. McKinney, a night telegraph operator on the Chesapeake and Ohio Railroad at New Richmond, O., was on September 30, shot and killed while defending his station from robbers.

Mr. W. L. Connelly, superintendent of telegraph of the Chicago, Indiana and Southern Railway, Danville, Ill., is installing telephone despatching and message circuits on the Kankakee division of that road.

The Missouri, Kansas and Texas Railroad; W. H. Hall, superintendent of telegraph, Denison, Tex., is preparing to install a telephone despatching circuit between Denison and McAlester, a distance of 97 miles.

The Canadian Pacific Railway has authorized the construction of two more telephone train despatching circuits, from Toronto to London, 115 miles, and from London to St. Thomas, Port Huron and St. Marys, 114 miles. When this equipment is installed it will make a total of 2130 miles of the Canadian Pacific system operated by telephone.

Mr. C. A. Parker, whose resignation as superintendent of telegraph of the Denver, Northwestern and Pacific Railroad was reported recently, is still employed in that capacity. At the time of his reported resignation several of the higher officials of the road resigned on account of the retrenching policy of the system. Mr. Parker, however, was not among those who resigned.

The Pere Marquette Railroad has ordered equipment for a telephone train despatching circuit between Saginaw, Mich., and Toledo, O., a distance of 135 miles. This circuit will have thirty stations, and the chief dispatcher will be located at Saginaw. This is the first telephone despatching circuit on the Pere Marquette and the work of installing the equipment will be carried out under the supervision of Mr. W. K. Tasker, superintendent of telegraph of the road.

The third annual convention of the Association of Railway Electrical Engineers, which was held at Chicago, September 27-30, was well attended, 150 active and associate members being present. This association now has a membership of nearly 500. The affair concluded with a banquet at the Hotel La Salle in which 350 participated. Mr. W. H. Bennett, superintendent of telegraph of the Chicago and Northwestern Railway, Chicago, was one of the speakers on this occasion.

The monthly meeting of the division operators and other telegraph employes of the Pennsylvania Railroad, was held in the assembly room of the Pennsylvania Railroad Annex Building, Philadelphia, on September 30, and was largely attended. Papers were read by Mr. J. D. Jones, electrical engineer in the department of the superintendent of telegraph on "Specification Requirements for Telephone and Telegraph Cable," and by Mr. H. F. Smith, chief transportation clerk and division operator of the Philadelphia, Baltimore and Washington Railroad on "The Telephone as Applied to Railroad Operations."

At the annual meeting of the Philadelphia, Reading and Pottsville Telegraph Company, held at Reading, Pa., October 3, the following officers were elected: president, Geo. F. Baer; treasurer, H. E. Paisley; secretary, W. R. Taylor; directors, Theodore Voorhees, Samuel Dickson, E. F. Smith and John F. Auch.

Arrests for Wireless Interference.

Ernest E. Goodwin and Elberon Holt, operators employed by the Continental Wireless Telegraph Company, were arrested in Buffalo, N. Y., on September 28, on complaint of Edwin C. Newton, superintendent of the United Wireless Telegraph Company at Chicago, who alleges that the two operators wilfully and maliciously prevented and delayed the transmission of a message from the steamship Western States on September 21, when that boat was disabled on Lake Erie off Long Point owing to the breaking of a shaft and cylinder head.

According to the affidavit, Charles Royal, the operator aboard the Western States, unsuccessfully tried from 4.10 a. m. until 9.40 a. m. to reach either the Erie or Buffalo stations. Royal states that the moment he began to send out a message asking for assistance, the operator at the Continental station, Buffalo, began to interfere.

The two operators arrested were charged with a violation of the penal code. At a hearing held in the Buffalo City Court, October 3, affidavits containing copies of orders alleged to have been sent to its operators by the defendant company were introduced. One alleged order read: "We wish to impress upon our men that the fight is not to allow the competing and complaining company to get a single word through."

Operator Royal was formerly employed by the defendant company. In his affidavit he said while working for the defendant he had both verbal and written orders not to let the opposition "get through a single message."

While in Detroit, Royal said in his affidavit, he was ordered to go to the laboratory of his then employer, the present defendant, and start an interference machine to prevent the rival concern from receiving messages sent to it.

"This machine was so arranged by having points on the shaft of a motor that as the motor would turn it would close the circuit and make dashes. My instructions were to interfere until 3 a. m. each day. I then went to the laboratory and started the interference machine; that ran until all their boats had docked. I carried out these instructions during the entire time that I was working for the company in Detroit."

The case will probably be carried to the Supreme Court.

The electric lights in the main office of one of the telegraph companies in one of the large cities failed one night recently, and for over an hour the operators were obliged to work by candle light. This reminded some of the old timers in the office of pioneer days.

American Telegraph Engineering—Notes on History and Practice.*

WILLIAM MAVER, JR., NEW YORK: I should like to say that this résumé is not by any means a full account of the history of American Telegraph Engineering. For instance, in the paper nothing whatever is said about lightning arresters, the forerunners of the switches of which we have heard so much. The early telegraph engineers had their troubles with lightning, and the methods adopted to overcome these troubles were numerous; finally coming to the method which is in universal operation to-day, that is, the short path to earth for the lightning current.

About twenty-five or thirty years ago the electric light was inaugurated, following which very quickly telegraph companies began to be troubled a good deal with crosses between the wires of the two systems, with the result that the telegraph switchboards were often burned out, and not the switchboards only, but the buildings of the telegraph companies also. To obviate these troubles as much as possible, the method was employed of coiling up fine German silver wire into coils the size of a pencil, consisting of ten or fifteen turns termed the spider wire. This was put in series with these telegraph circuits at the switchboard, in addition to the short air gap arrester. I do not think the engineers had any thought at the time that the coiling of the wire would have any effect in retarding the progress of the oscillating current towards the instruments.

JOHN B. TAYLOR, SCHENECTADY: One of the points I wish to raise is that this matter of delivering a telegraph message from a person in one part of the country to a person in another part of the country is something more than getting a code of signals through a given area. It involves a matter of readiness to serve at all hours of the day and night, frequently in small places only during certain hours of the day, and also a system of collecting and delivering messages, assuming that the office is open. This, as far as I can see, is the main reason why these automatic systems, which can send signals over the wire at a phenomenal rate of speed, sufficient to give a thousand or more words per minute, have not gone into anything like general use, and in fact they have gone into use only in very limited cases. Mr. Maver can, I hope, enlarge on this point a little more than I can, but we all of us here see frequently the statement that the telegraph people are not alive to the possibilities of sending messages at a great rate of speed over a single wire, and while a number of messages over a single wire is a good thing, perhaps, between two large cities, it is of practically no use at all

to the small towns, of which there are a great many in this country.

The telegraph line is rather apart from the work of most of the members of the Institute, I think, but I am glad that we have had another paper giving an up-to-date résumé of the present practice. It is difficult for a man out of the field to know just what is being done. We get hold of the old books and find descriptions of duplex systems, quadruplex systems, repeater systems, etc., but as a rule that is not interesting, and if a member of the Institute is interested in this subject, he is interested in knowing what is at the present time improved practice in the majority of cases, and for this reason I think it is very well that the matter is summed up in this way and spread on the Institute records at this time.

My own recent interest in telegraph and telephone matters has been due, more or less, because of my interest on the side of the disturbance feature from powerful lines, and one or two points occurred to me as Mr. Maver was abstracting his paper. It is plainly brought out by him that the practice of quadruplexing, which means to get four messages over a single wire at the same time, was not worked to an extent, which, at first sight, it would seem that it should be, and this is due to a number of reasons, possibly divided up between poor insulation, variable weather conditions, etc., and to a large extent due to inductive disturbances—I think only to a small degree from short circuits or low inductive disturbances from circuits of the same class on the same pole line, and this raises the question whether the telegraph companies could not afford to use metallic circuits, in which case the matter of inductive disturbances from their own wires, as well as foreign wires, would be obviated. The matter of insulation would still, perhaps, be troublesome, but I think this could be improved without an investment which would be very great, in comparison with the investment in poles, etc., by merely using a better grade of insulators.

There is also the question of using wires of greater capacity by the combined telephone and telegraph, composite and simplex, etc., according to the special system used. Now, if the demand for the telegraph wires and the demand for the telephone wires comes out in just a certain ratio, we might have metallic circuits between all the important points working as telephone wires and also perhaps a sufficient number to take care of telegraph service, perhaps as grounded lines and metallic lines between two pairs of telephone wires. Incidentally, two pairs of telephone wires would be used to make a third telegraph circuit by the phantom arrangement, and again, there might be some uncertainty as to the most economical division of wires between telephone and telegraph circuits, and that matter would be given attention at that time. However, the curve of demand probably varies to a very great extent during the day, the telegraph business of a certain

*Discussion of the paper presented by William Maver, Jr., and Donald McNicol, at the Twenty-seventh Annual Convention of the American Institute of Electrical Engineers, Jefferson, N. H., June 28-July 1, 1910, and which was published in our columns July 16-September 16.

sort going out in the daytime, probably at the peak of the telephone load—but with the introduction of the night lettergram, at day rate—the wires are probably not very busy for telephone work, at any rate since the night telephone rate has been abolished—and it is to be hoped that the recent active interest of the telephone people in the telegraph companies will give a more economical working of the conductors, so that it may appear that the telegraph systems can be worked out advantageously on the metallic circuit, and thus give us the full benefit of the quadruplex and other multiplex systems.

I did not have time to look the paper over very carefully, and do not know just what Mr. Maver said about the Rowland system, which in the last few years was written up in an interesting paper by Mr. Potts, I believe, where an octoplex capacity was claimed for it. This system used the tape printing device direct from keyboard to the message delivered at the other end, and if this device has been found to work out in practice, it would seem to have been a good thing, but I have not heard lately that any great extensions have been made with it, and if Mr. Maver can say a word or two as to the general reasons for the apparent inactivity, I should like to hear from him.

Incidentally, I believe my name has perhaps been taken in a way to give me more credit than is due. I find in the paper reference is made to the New York, New Haven and Hartford Railroad Company, and a paper presented by me to the Institute in October, 1909, on "Telegraph and Telephone Systems as Affected by Alternating Current Lines," is referred to at the bottom of the page in connection with this matter. While I was interested in the work on the New York, New Haven and Hartford Railroad, for the Western Union Telegraph Company, and described the scheme in actual use, I cannot claim any particular credit for it, but Mr. Scott of the Westinghouse Company, who is here, can tell you to whom the credit belongs better than I can. This cut with my name under it looks like some drawing in a patent application, but I do not think the write-up of the telegraph should be left in its present form, which would give the impression that the present development on the New York, New Haven and Hartford Railroad is to be credited to me.

GANO DUNN, AMPERE, N. J.: I heard Mr. Maver say that four-fifths of the operators in this country use the mecograph. Is this really so?

My observation as I travel around the country is that we do not see many of them, although I do not get into the central offices.

I have found them imperfect, probably because of my own lack of skill, but there seemed also to be certain inherent difficulties such as difficulty of adjustment and not enough certainty of action to cause all the dots to go through on a long and variable line.

It is also difficult constantly to change the adjustment of the mecograph to follow the rising and falling inductive and leakage changes that are found on a long and poorly constructed line, with many stations.

The wireless telegraph is introducing a greater than ever conflict between the Continental and American Morse alphabet. I should like to know whether there is any attempt towards a more general introduction of Continental Morse into this country, and if so, what Mr. Maver thinks of its probable success.

WILLIAM B. HALE, MEXICO CITY, MEX.: Perhaps a few remarks on the telegraph system of the Republic of Mexico may not be amiss. The system there is an extensive one, considering the comparatively few large centers of population. The telegraph lines extend to even the smallest towns and villages, because, being a telegraph controlled by the Government, its operation is not based upon the question of profit. The Government is ready and anxious to install a telegraph office in any town which has any need for such service, whether it will pay or not. The idea is to supply reliable telegraph service to the entire people at cost.

The general equipment of the system is practically that of the United States a few years ago. The Morse manual system, with simplex, duplex and quadruplex operation, is in use; and the lines are mainly constructed with No. 8 galvanized iron wire and a European type of porcelain insulator. Wooden poles are chiefly used, but some of the trunk lines have iron poles. There are a few Hughes printers in service in the Capital for communication between the central office and its branches. In the larger cities of the country duplex and quadruplex instruments are used, and in all other offices the Morse simplex is employed. The American closed-circuit system of operation is in use; also the regular Morse alphabet, with a few changes to adapt it to the Spanish language.

The telegraph is used very extensively in Mexico, not only for business purposes, but for social and personal matters as well. To a very considerable degree the Mexican makes use of the telegram where you would use the mail, or a messenger service. He sends telegrams from his place of business to his home, messages of congratulation to friends on their birthdays and telegrams of felicitation on such days as Christmas and New Year's. In the City of Mexico one finds a very convenient form of service for such social messages; we have a card, about the size and shape of your postal card, which can be purchased for five cents, Mexican currency, the equivalent of two and one-half cents in your money. On the front of the card is a space reserved for the address and a number of ruled lines for the message, which must not exceed ten words. These card telegrams, after being filled out, may be deposited in boxes, similar in appearance to letter-boxes, which are placed at the more important

street corners throughout the city, and from which frequent collections are made. The messages thus collected are delivered at the nearest branch office, telegraphed to the office which is within the shortest distance of the person to whom they are addressed, and from there delivered by the regular messengers. This is a prompt and efficient, as well as cheap, means of communication within the limits of the Federal District—in the center of which lies the City of Mexico—and it is very extensively employed for business and social purposes.

The rates for telegraph service in the Republic of Mexico are low. A ten-word telegram may be sent from one end of the country to the other for only one peso, or fifty cents in American currency. The rate for night messages, which are transmitted from 10 o'clock in the evening until midnight, is one-half that of the day rate.

We have been unable to use copper wire for pole lines to any extent, for the reason that it is cut down and stolen by the *peones*—the lower-class natives. Iron wire has so far been employed almost exclusively for the construction of pole lines, but I have suggested the use of a steel core copper-clad wire, which will improve the service and will probably not be stolen, as when cut down it will have very little, if any, value as scrap metal. This copper-clad wire will undoubtedly remain up, and it ought to prove especially valuable in a tropical country like Mexico, where even galvanizing does not protect iron wire from corrosion for any great length of time.

The success of the Federal telegraph system of Mexico would lead one to favor a government-controlled telegraph. The service is rendered at rates much below those which would be charged by a private corporation; and the despatch of telegrams is in every respect satisfactory, being prompt, efficient and thoroughly reliable.

(To be continued.)

Telegraphers' Aid Society Quarterly Statement.

The New York Telegraphers' Aid Society financial statement for the quarter ended September 6, 1910, is as follows:

Balance on hand June 6, 1910.....	\$24,902.39
Receipts	1,456.32
Total	\$26,358.71

DISBURSEMENTS.

Sick benefits	\$1,198.27
Death benefits	500.00
Expenses	173.43
Balance on hand September 6, 1910.....	24,487.01
Total	\$26,358.71

RELIEF FUND.

Balance on hand June 6, 1910.....	\$4,878.42
Receipts	5.38
Total	\$4,883.80
Disbursements	101.50
Balance on hand September 6, 1910.....	4,782.30
Total	\$4,883.80

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Mavor and Davis' "Quadruplex" and other standard works on telegraphy and treat them in the same manner.]

CHAPTER XX.

How could you best describe the Roberson alternating current quadruplex as regards the apparatus used in comparison with that employed in the ordinary quadruplex?

Is there a short end current employed in this arrangement?

What means did Mr. Roberson use to obtain a sensitive instrument which would operate during weather which would destroy the usefulness of other systems?

What is the purpose of the permanent magnet?

How does the strength of a magnet vary with the number of lines of force traversing its core?

What arrangement is used to send alternately positive or negative impulses to line when desired?

How is the incoming signal registered?

What apparatus is used which is not used on the polar side of a quadruplex?

Draw a diagram of the theoretical connections of the Roberson quadruplex.

What is the object of the high resistance carbon rods used?

How would you balance the Roberson quadruplex?

What is the object of the iron crossbar slide at the base of the steel horseshoe?

What strength of current is required for operating this quadruplex?

How does the adjustment of the pole changers or transmitters used with this quadruplex compare with those used on the ordinary quadruplex?

What kind of resistances should always be used in the circuit of this type of quadruplex?

What type of sounders are best for repeating sounders?

Draw a diagram of the actual connections of the Roberson quadruplex which were used by the Western Union Telegraph Company.

CHAPTER XXI.

What was one of the chief disadvantages first found in the operation of the Roberson quadruplex?

How was this difficulty overcome?

Draw a diagram of the connections for the transformer method of operating the Roberson quadruplex.

What is the frequency of the current alternations employed with this system?

Telegraph and Telephone Age is headquarters for electrical, telephone and telegraph books. Write for catalogue.

Obituary.

A. O. Boudreaux, for many years in the employ of the Postal Telegraph and Western Union Companies, having been manager of both companies at Lake Charles, La., at different times, died at that place, September 24.

George A. Hossbach, a well-known telegraph operator of Baltimore, Md., died in that city, September 25, aged fifty-two years. Mr. Hossbach had been employed for many years in the Baltimore Stock Exchange.

R. L. Sawyer, a telegraph operator on the Los Angeles Times, was killed by an explosion which wrecked the plant of that paper on the morning of October 1. Mr. Sawyer was at his key and was about to begin receiving the story of the Vanderbilt cup race from New York, when the disaster occurred.

Arthur E. Crocker, died at New York, September 13, aged seventy years. Mr. Crocker served throughout the Civil War in the Department of Military Railroads and was confined in Libby prison for nearly a year. He was engaged in construction work for the Postal Telegraph-Cable Company during the early eighties, and since 1885, had been connected with the American Telephone and Telegraph Company, being engaged in construction and right-of-way work.

The Electrical Club of Chicago.

BY E. C. DODGE.

In keeping abreast with the progressive era of the Western Union Telegraph Company, the Chicago Office can now boast of a live electrical club, and the increasing interest which is being taken in the work is truly encouraging to the officers and those who have been devoting their time and energies toward making it a success. The meetings are held every other Thursday evening and it should be gratifying to the officials to find that the Chicago office has been able to furnish instructors capable and willing to carry on the work.

Beginning with the elementary laws and phenomena of electricity and magnetism, the course of instruction and study has been carried along the lines laid out by the articles in the Telegraph and Telephone Age, the club having adopted those lessons as their regular course of study. The traders' room of one of the stock brokers is used as a meeting place and the large blackboard is made use of by the instructors for diagrams and explanations. It is proposed to follow out a line of study covering everything pertaining to telegraph and telephone work, and educate the members along lines which will enable them to fill positions where technical and practical knowledge combined will make them capable and efficient and worthy of the advancement which always comes to the man who knows how and why. I emphasize the word "why," because my experience with quadruplex and repeater men has been that while there are an abundance who have a superficial knowledge which enables them to perform their work with a greater or less

degree of satisfaction, so long as instruments and wires are all right, yet, the least abnormal condition arising puts them, so to speak, "up in the air." There are too many men in our line of work who are satisfied with an acquired knowledge of which switch to turn to produce a certain result, but when the result is not forthcoming, some one else must find the reason why. This was all right in former times, but under the new conditions there is a feeling that we must bestir ourselves. With the encouragement offered by the club, every one seems eager and willing to apply himself, and it is predicted that the Electrical Club of Chicago will produce some very gratifying results.

The first meeting for organization was held June 30, with an attendance of fifteen. The roster now contains ninety names and new recruits are coming in at every meeting. The officers are: C. H. Finley, president; J. J. Welch, vice-president, and E. C. Dodge, secretary and treasurer.

A Plea for the Cashier.

The cashier of one of the large city telegraph offices is desirous of knowing when promotion will come to the cashiers in the readjustment of telegraphic conditions which is taking place. He asks why cashiers are never promoted to have charge of offices and thus give those under them a chance for promotion. Cashiers are frequently kept in the same position with no advancement for thirty years, and they naturally get discouraged. They are the real men behind the business, he states, and are a credit to the managers. They do not, however, have time to set forth their capabilities to the higher officials as they are the hardest worked men in the service. They are little appreciated, however, and scarcely ever promoted. They would make first-class auditors and managers as they understand all of the details of the business. They have been forgotten all of these years, however, and he believes that now is the time if ever to give them the promotions that they deserve or to tell them what they may expect in the future. Probably nearly every telegraph cashier in the country will appreciate the force of this cashier's remarks.

Favorable Conditions for Operators in Canada.

The scarcity of competent commercial telegraph operators which has been remarked during the past year throughout the country is especially noticeable in Canada. This seems strange when the fact is taken into consideration that it is generally admitted that the wages paid in that country are better than the average in the United States. Operators who have had difficulty in supporting a family in some of our larger cities have removed to Canada and there been able to live in comfort. It is a significant fact that at the present time there are few telegraphers employed at the key in this country who have worked for any length of time in Canada, while there are hundreds of operators in the Canadian service who have emigrated from this country and are well satisfied with their present employment.

Letters From Our Agents.

DALLAS, TEXAS, WESTERN UNION.

Mr. W. S. Strawbridge, has been appointed chief operator of this office, vice W. P. Davis promoted to be traffic supervisor of the Gulf division.

Mr. R. E. DeLay has been appointed night chief operator, vice Mr. Strawbridge.

Mr. E. E. Lyon has been appointed late night chief, vice Mr. DeLay.

Mr. Burton D. Snyder has been appointed night wire chief, vice Mr. Lyon.

Mr. B. F. Lally has been appointed assistant night traffic chief, vice Mr. Snyder.

BALTIMORE, WESTERN UNION.

The electrical class of this office having had a recess during the heated term, resumed meetings October 6, with a good attendance.

Professor Arthur gave a review of the text-book used in the spring, and he announced that as the class had outgrown this book, he would suggest a more advanced text-book. The class acted upon the suggestion and Swoope's "Lessons in Practical Electricity" was adopted for the fall and winter course.

President Anderson spoke at some length on an editorial in *Telegraph and Telephone Age*, which dealt with "Opportunities for Advancement" to employes extended by the new organization of this company. In his remarks, Mr. Anderson said that there was no illusion about this editorial, that the writer stated actual facts, and that he firmly believed that every man who gave evidence of having developed technically along the new lines, would eventually rise in his profession.

NEW YORK, WESTERN UNION.

Miss Jane Powell, of the Jersey division, has returned from Saratoga after an absence of several months.

Mr. John E. Jenkins, assistant electrician, has returned from a vacation spent in Connecticut.

Mr. C. A. Meyer, eastern wire chief, has gone on a two weeks' shooting trip to the Adirondacks.

Miss Alice McCue, formerly of this department and an operator of ability, died of consumption in this city on October 4.

Dennis Harmon, a veteran in the telegraph service, having become an operator in 1865, and who has been employed in this office since 1873, died October 9, aged fifty-nine years. Mr. Harmon is survived by a wife and two daughters.

The Mansfield Dramatic Society, composed of telegraph operators and clerks living in South Brooklyn, will open their tenth season at Schwaben Hall, on October 21, with a revival of "Crawford's Claim." Miss Ethyl McCarthy, of this office, has been selected to portray the leading female character. Other members of the cast are: W. J. Keegan, Roy Templeton, B. C. Welp, F. A. Turner, R. J. Griffiths, Albert C. Edwards, R. J. Hall, Wilbur Lorraine, Louis Weber, Bert L. Sink, Miss

Margaret Ryan, Miss Mary M. Palmer, and Miss Iola Walton.

OTHER NEW YORK NEWS.

The annual entertainment and reception of the New York Telegraphers Aid Society, for the benefit of the Relief Fund, will take place on Wednesday evening, November 30, at the Lexington Avenue Opera House and Terrace Garden, 58th Street, near Third Avenue. Mr. J. C. Watts, of the main office of the Western Union Telegraph Company, 195 Broadway, has been appointed Chairman of the Entertainment Committee, and judging from the vigorous manner in which the committee is working this year's entertainment will be second to none, of those annual pleasant affairs.

Learn Watchmaking. Refined, profitable labor. Competent men always in demand. We teach it thoroughly in as many months as it formerly took years. Does away with tedious apprenticeship. Positions secured. Send for our free catalogue to-day. St. Louis Watchmaking School, St. Louis, Mo., Dept. N.

The Serial Building Loan and Savings Institution, 195 Broadway, New York, is steadily increasing the amount of business it annually transacts. It has in past years accomplished much in the direction of providing a safe place of deposit for the earnings of telegraphers, and has aided over one thousand in the purchase of homes. It pays five per cent. on deposits. Let us acquaint you with our facilities.

It is a valuable privilege to be eligible for membership in a sound and reliable Life Insurance Association which cannot afterwards cancel or alter the terms of the certificate issued. The payment of the sum called for in a benefit certificate blesses alike the recipient and the provider. The Telegraphers' Mutual Benefit Association, 195 Broadway, New York, now the oldest co-operative life insurance association having been in successful operation for the past 43 years, offers this privilege to all eligible employes of telegraph and telephone service. Write at once for application form and full particulars.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

SOME POINTS ON ELECTRICITY.—V.

A Study of Telegraph Apparatus.

BY WILLIS H. JONES.

THE FREIR NEUTRAL RELAY.

The Freir differential self-polarizing relay, which has been the standard "common side" instrument on Western Union Telegraph quadruplex circuits for many years, differs both in construction and principle of operation from that of the old style relay which it replaced.

However, the student must not be misled by the name to believe that it is a polarized instrument in the sense of the polar relay used on the "A" side of the circuit, or that it responds to the direction of current, as is the case with the former. It is still a neutral relay, despite its name, and responds to quantity or volume of current only, irrespective of polarity. It derives the name "self-polarizing" from the fact that the movable lever becomes polarized by the action of the current flowing through a third coil. The lever itself, therefore, really does respond to direction of current, but since the third coil is so arranged as to be always in series with that coil

of the relay proper which at the moment is carrying the marking current, it does not matter which way the current flows as it works in unison with the particular main or artificial coil which happens to operate the relay.

Under these conditions we obtain an instrument which in some respects operates after the manner of a polar relay, inasmuch as the lever and the magnet in the coil carrying the marking current are respectively opposite poles of that particular magnet temporarily, and the former is thus attracted to the contact point on that side. A reversal of the current itself cannot alter the relation of the polarity in the magnet because, being two extremes of one magnet, the poles will still be unlike and continue to attract each other.

In other respects this relay operates in the same manner as the old type, viz.: It demands a certain volume of current before the tension of the retractile spring, which is purposely made stronger than the magnetic strength of the "short end" current, can be overcome.

One of the chief merits claimed for this instrument is quick action due to the initial tendency the lever itself possesses to assist its own transit across the air gap owing to being a magnet itself. The moving energy thus begins simultaneously from both sides of the gap instead of from one side only as is the case with the former relay.

Again the Freir relay possesses no yoke, the cores of the main and the artificial line coils being entirely separate. This reduces the magnetic strength of the relay, of course, but as the self-induction is thereby quartered, the time constant is correspondingly reduced with the result that a very satisfactory and quick-acting relay is obtained.

The magnet on the left hand side of the lever armature of this instrument should be moved further back than its companion in order to prevent unnecessary magnetic leakage.

"DEAD BEAT" APPARATUS.

It will be noticed by a careful observer that the needles of some voltmeters or ammeters move across the scale, and suddenly come to a dead stop and remain quiet without any tendency to oscillate before stopping. When an instrument possesses a needle that will do this it is said to be "dead beat."

All of the finer types of electrical apparatus used for the purpose of testing are constructed with this end in view in order to avoid losing time waiting for the oscillations to cease, as would be the case if certain precautions were not first taken to prevent it.

The process by which this result is brought about is called "damping," the principle involved

in which is to make the needle create a force in opposition to its own motion by its own act of moving across the scale, and which opposition force ceases the instant the needle stops. That instant is called the "moment of inertia," because the two forces influencing the needle, one forward and the other backward, having both ceased at the same instant, leave the needle "dead" where it stopped.

The damping process may be accomplished in several ways. For example, if a small fan-shaped sheet of paper be attached to one end of a suspended needle the friction of the air will act as a brake or opposition to the needle's motion, but will cease to oppose it when such motion stops.

In like manner a needle caused to move through a somewhat sluggish liquid, such as oil, will also tend to stop "dead."

In galvanometers, voltmeters and ammeters, the usual method is to cause the needle, by its own motion, to create eddy currents in a copper or other non-magnetic metal casing, the influence of which currents oppose the needle's motion as long as the latter moves. When the needle stops, of course the eddy currents die out, and, as in the preceding case, there is then no influence of any kind present to cause the needle to oscillate or alter its position, hence the term "dead beat."

(To be continued.)

Recent Telegraph and Telephone Patents.

No. 971,572, to F. G. Slemmer, Goldsboro, Md., for a telegraph key, for working two circuits.

No. 971,598, to A. H. Dyson, Chicago, Ill., for a telephone system, avoiding the use of ground circuits.

No. 971,619, to J. T. Klugh, Madison, Mo., for a telegraph line insulator.

No. 971,650, to A. H. Weiss, Chicago, Ill., for a telephone party-line ringing key.

No. 971,651, to C. S. Winston, Chicago, Ill., for a telephone trunking system.

No. 972,329, to W. M. Bruce, Jr., for a lockout device for party line telephones.

No. 972,399, to J. W. Nilsson, Balfour, N. D., for an attachment for telephones.

No. 972,424, to L. A. Williams, Lynn, Mass., for an electrical relay.

No. 972,628, to A. D. T. Lubbey, Elyria, Ohio, for a central telephone system.

No. 972,634, to C. H. North, Cleveland, Ohio, for an electrical relay.

No. 971,785, to A. L. Pierce, Wallingford, Conn., for a tree insulator. The insulator is made in two parts, to which the wire is clamped.

The following patents have expired:

Nos. 506,269 and 506,270, printing telegraph system; No. 506,272, printing telegraph exchange system; No. 506,273, printing telegraph; No. 506,274, telegraphy, and No. 506,275, autographic telegraphy, all issued to Robert J. Sheehy, New York.

No. 506,294, telegraph transmitter, issued to Charles Willoughby, San Francisco, Cal.

No. 506,305, magneto-telephone, to James A. Brown, Moline, Ill.

No. 506,415, telephone transmitter, to John V. Capek, New York.

No. 506,658, multiple commutator apparatus for telephone systems, issued to Louis A. Berthon, Paris, France.

No. 506,841, electric alarm system, issued to George F. Bulen, Bayonne, N. J.

No. 506,884, apparatus for suppressing telephone disturbing currents, issued to Frank A. Pickernell, Newark, N. J.

Personal.

Dr. L. M. Rheem, who has been located in Helena, Mont., for several years, has returned to his former home at Minneapolis, Minn., where he is engaged in commercial pursuits.

Mr. C. D. Lee, president, and Mr. Roy W. Howard, general news manager of the United Press, New York, are on a trip of inspection and looking up new business in the West.

Mr. C. E. Sawtelle, for many years manager of the Postal Telegraph-Cable Company at Cincinnati, Ohio, but now vice-president and general manager of the Tool Steel Gear and Pinion Company of that city, was a recent New York visitor and took occasion to call on many of his friends in the telegraph service.

Mr. Béla Gati, manager of the Royal Hungarian Telegraph and Telephone Experiment Station in Budapest, Hungary, is in New York. Mr. Gati was a delegate at the second telegraph and telephone conference which was held in Paris, in September, and is in this country to study long-distance telephony, printing telegraphs and the wireless situations. After an examination of the telegraph and telephone plants in New York, he will proceed to the City of Mexico and return to New York a month later for further investigations. Mr. Gati has made several inventions along telegraph and telephone lines.

Mr. J. Frank Howell, a well-known old-time telegrapher, but who for many years has been engaged in the brokerage business being a member of the Consolidated Stock Exchange of New York, found, during the past summer, a most interesting way to spend a short vacation. Having heard of the possibilities of a trolley trip from New York to Boston, and having a three days' holiday at his disposal, he persuaded a friend to make the trip with him. Mr. Howell has written the story of this little journey and has described in a most entertaining manner the scenes along the way. The trip being made by easy stages, the travelers found time to stop and inspect the places of interest along the route. Mr. Howell evidently has that instinct which so few travelers possess, of being able to discover the beauties of the country through which he travels as well as to appreciate the historical significance of the things which he sees.

Mr. Andrew Carnegie arrived in New York on the steamer *Baltic*, October 23. When the steamer was 600 miles east of New York, he received an invitation by wireless to act as one of the honorary pallbearers at General Eckert's funeral. Mr. Carnegie replied that he would esteem it a great privilege to do so.

Mr. H. A. Tuttle, president and general manager of the North American Telegraph Company, Minneapolis, and Mr. J. H. Thatcher, general agent of the Pacific Telephone and Telegraph Company at Portland, Ore., met in the latter city recently for the first time in forty-four years. In 1866 Mr. Tuttle, then 20 years of age, and Mr. Thatcher, then 18 years old, worked together at Oswego, N. Y., as telegraph operators for the Western Union Telegraph Company. The same year Mr. Thatcher left and went to Buffalo and thereafter, until their recent meeting, the paths of the two men were widely divergent. In spite of the long lapse of years since they had seen each other, however, the recognition was mutual and almost instantaneous.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. E. J. Nally, vice-president and general manager of the company, started on a trip of inspection on Oct. 24, which will take him as far south as Atlanta and west to Chicago. He will be absent from his office about two weeks.

Mr. E. B. Pillsbury, general superintendent, New York, accompanied Mr. Nally as far as Atlanta.

Among recent executive office visitors were Mr. N. C. Hall, manager at New Haven, Conn., and Mr. G. H. Mills, manager at Providence, R. I.

Mr. Thos. E. Fleming, manager contract message bureau, has resigned to accept the position of commercial superintendent of the American District Telegraph Company in New York.

Mr. C. A. Rhodes, traveling auditor, has resigned to enter the service of the Western Union Telegraph Company in the auditing department.

Mr. S. B. Haig, superintendent of traffic, has resigned to enter the Western Union service in its traffic department.

Mrs. E. W. Collins, wife of Mr. E. W. Collins, superintendent of this company at Cleveland, O., was a recent New York visitor, and she made it the occasion to call upon many of her friends in the executive offices.

Mr. W. P. S. Hawk, superintendent at Chicago, but for several years past located at Salt Lake City, has just moved his family to Chicago, which will hereafter be his home.

Mr. J. E. Schofield, whose appointment as special agent for the Western Union at Atlanta, Ga., was noted in our issue of October 16, was not manager of the Postal office at Atlanta for the entire time mentioned. He retired from the management in 1905 to engage in other business.

Since that time Mr. A. M. Beatty has been manager of the Atlanta office.

This company has completed a new copper circuit between Seattle and Tacoma. It has also completed two all-copper circuits between Seattle and San Francisco.

Mr. Carl B. Turpin, who was recently appointed manager of the Salt Lake City, Utah, office, was born in New London, Ind., July 28, 1882, and entered the telegraph service at Kokomo, Ind., as messenger and clerk. He afterwards became operator of the Indiana Natural Gas and Oil Company at Kokomo, and later operator for the Western Union Telegraph Company at Kokomo, Logansport and Indianapolis successively. He returned to Kokomo on March 1, 1908, and opened the Postal office there, becoming its manager, which position he held until his present advancement.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

ELECTION OF OFFICERS.

At a meeting of the directors of the Western Union Telegraph Company, held at 195 Broadway, New York City, October 19, the following named officials were reelected: Col. Robert C. Clowry, president; J. B. Van Every, vice-president; Thos. F. Clark, vice-president; G. W. E. Atkins, vice-president; A. R. Brewer, treasurer; J. C. Willever, secretary; E. Y. Gallaher, auditor.

Executive Committee: Edward J. Hall, chairman; Union N. Bethell, Thomas H. Hubbard, Henry A. Bishop, Jacob H. Schiff, Robert C. Clowry, president; J. B. Van Every, vice-president and Theo. N. Vail.

Mr. E. Y. Gallaher, auditor of the company, has appointed Mr. J. Q. Pipkin division auditor of the Gulf Division, at Dallas, Tex., effective Nov. 1.

Among recent executive office visitors were Mr. Richard O'Brien, district traffic manager, at Scranton, Pa.; Mr. N. E. Church, superintendent at Pittsburg, Pa.; Mr. J. W. Reed, superintendent, and Mr. S. M. Custer, district commercial manager at New Haven, Conn.

Mr. M. B. Wyrick, superintendent of construction of the Postal Telegraph-Cable Company of Texas, at Dallas, has been appointed division plant superintendent of this company with headquarters at the same point.

Mr. John G. Sizer, of Richmond, Va., has been appointed manager of the Winston-Salem, N. C., office, vice S. W. Tise, deceased.

Mr. Clifton A. Fonville, for the past six years manager of the office at Montgomery, Ala., has resigned to engage in other business.

Mr. W. R. Jackins becomes chief operator in the Charlotte office. Mr. Jackins was born in Pickens County, S. C., August 10, 1874, and entered the telegraph service at Blacksburg, S. C., in 1888. He has held the position of night chief operator at Charlotte for the past twelve years.

Mr. Herbert L. Hilton has been appointed manager at Allentown, Pa., vice Mr. G. R. Daniels appointed district commercial manager at Scranton, Pa.

Mr. S. J. Gray of the San Francisco office has been appointed chief operator at Los Angeles, vice R. J. Vaughn, who has resigned to engage in the real estate business.

Mr. H. J. Carpenter, chief operator of the Charlotte, N. C., office, has been advanced to the position of District Traffic Chief for western and central North Carolina.

Mr. Aris Brown, chief clerk to superintendent T. P. Cummings at New Orleans, La., has accepted a similar position with W. K. McClarin, district plant superintendent at Nashville, Tenn.

Mr. F. H. Austin, chief operator at Mobile, Ala., has been promoted to the position of district traffic supervisor. Mr. F. E. Aunspaugh has been appointed to succeed Mr. Austin as chief operator.

Mr. W. W. Murphy, manager of the Chattanooga, Tenn., office, has been advanced to the position of Commercial Agent in the district presided over by Superintendent E. E. Williams of Atlanta, Ga. Mr. Murphy's headquarters will be in Atlanta.

Mr. R. H. Tudor, formerly manager of the Corinth, Miss., office, but for some months past an attaché in the office of Mr. J. R. Terhune, superintendent, at Nashville, Tenn., has been appointed manager of the Chattanooga office, vice W. W. Murphy promoted.

The following changes have been made in the Buffalo, N. Y., office:

Mr. T. H. O'Mara has been appointed day chief operator; Mr. P. J. Haley has been transferred to be night chief operator; Mr. C. A. Thulman has been transferred to be assistant day chief operator.

Mr. T. A. Worthington, formerly manager at Newport News, Va., has been appointed district commercial agent at Richmond. Mr. A. H. Cheek, formerly manager at Henderson, N. C., has succeeded Mr. Worthington at Newport News, and Mr. R. B. Crowder has succeeded Mr. Cheek at Henderson.

Mr. E. A. Bennett, formerly of the telegraph department in the general offices of the Atchison, Topeka & Santa Fe Railroad system, at Topeka, Kans., has been appointed inspector of the Third District of the Pacific Division under Mr. H. McPhee, District Commercial Superintendent. Mr. Bennett's headquarters will be at Los Angeles.

The following promotions have been made in the Western Union office at Nashville, Tenn.: Mr. John Fleming, formerly chief operator, has been appointed District Traffic Chief; Mr. Robert Hunt, formerly wire chief will succeed Mr. Fleming as Chief Operator, and Mr. J. M. Sanders, formerly sub-wire chief, has become wire chief.

Mr. F. R. Veale, formerly chief operator at Richmond, has been appointed district traffic chief at that place in charge of traffic in the state of

Virginia. Mr. M. S. Cline has been appointed chief operator at Richmond to succeed Mr. Veale. Mr. E. T. Moore, of Memphis, Tenn., has been appointed manager at Wilmington, N. C., to succeed Mr. W. J. Sale, promoted.

Mr. W. K. McClarin, a notice of whose appointment as District Plant Superintendent at Nashville, Tenn., appeared in the issue of October 16, was born in Granville, Tenn., April 17, 1859. He entered the telegraph service in Memphis, Tenn., in the spring of 1886, and has held positions successively as lineman, assistant to Mr. J. E. Fenn, electrician of the Southern division, foreman, general foreman, assistant superintendent of construction, and finally district plant superintendent.

Mr. George R. Daniels, who has recently been appointed district commercial manager at Scranton, Pa., was born at Pittston, Pa., July 19, 1871. He entered the service of this company as messenger at Plymouth, Pa., in 1886. He afterward became clerk and then operator. In 1896 he was transferred to Wilkes-Barre where he served for six years as branch office manager. In 1902 he was appointed manager at Allentown, Pa., which position he held at the time of his recent promotion.

Mr. John C. Duane, who has been appointed district plant superintendent at Jacksonville, Fla., was born at Goodwinville, Va., July 26, 1877. He entered the telegraph service at Alexandria, Va., in February, 1896, as a member of a construction gang under superintendent J. B. Tree of Richmond. He soon qualified as a first-class lineman and has successively been promoted to be assistant foreman, gang foreman, city foreman and general foreman of construction, which position he held at the time of his recent promotion.

Mr. Charles Raymond Fisher, who was recently appointed district plant superintendent at St. Louis, was born at Three Rivers, Mich., August 10, 1876. He entered the telegraph service in Chicago in 1891 as check boy for this company. He soon qualified as an operator and was later transferred to the Kansas City office where he became night quadruplex chief. He returned to Chicago to become a wire chief but was again transferred to Kansas City as night wire chief. June 1, 1903, he was appointed assistant chief operator of the Kansas City office which position he held at the time of his recent promotion.

Mr. W. G. Sale, manager of the Wilmington, N. C., office for the past eight years, has been appointed district traffic supervisor with headquarters at Richmond, Va. Mr. Sale was born at Richmond, Va., Nov. 29, 1874, and entered the telegraph service at Tate Springs, Tenn., in August, 1889. He held various positions on the East Tennessee, Virginia & Georgia, and Norfolk & Western Railways until 1892, when he entered the Western Union service under Mr. Horner, at Lynchburg, Va. At different times he worked for the same company at Columbus and Richmond, and latterly at Wilmington.

Mr. Herbert W. Drake, assistant of leased wire service of the American Telephone and Telegraph Company, New York, has been attached to the office of W. E. Athearn, engineer of equipment. Mr. Drake was born in Leeds, England, in 1878. He entered the Western Union service in this country at Tonawanda, N. Y., in 1890, and became an operator in 1894. In 1897 he went with the American Telephone and Telegraph Company at Buffalo as wire chief, and came to New York in 1904 to fill the position of chief equipment-man for the same company. In 1908 he was advanced to the position of division supervisor of leased wire service.

Western Union Tariff Book.

The midyear tariff book of the Western Union Telegraph Company contains several newly added features. It gives instructions regarding night letters, and contains very clear sectional maps showing all the submarine cable systems of the world. A number of connecting telegraph and telephone lines have adopted the Western Union night letter system. The work was produced under the direction of Mr. Wm. Holmes, superintendent of tariff.

F. O. Nourse, District Traffic Superintendent, Western Union, Richmond, Va.

Mr. F. O. Nourse has been appointed district traffic superintendent of the Western Union Telegraph Company at Richmond, Va., being promoted from the position of assistant superinten-

F. O. NOURSE,

District Traffic Superintendent, Western Union, Richmond, Va. Mr. Nourse was born in Littleton, N. H., October 3, 1859, and received his preliminary telegraphic education at Wing Road in that state, in 1876. He came to New York and passed through various positions in the telegraph service until he finally became general traffic chief of the operating department of the main office of

the Western Union Telegraph Company. After a temporary retirement from the telegraph service, he returned to it in 1903 and was soon placed in charge of the Western Union office at Macon, Ga., from which about three years later he was promoted to be general inspector of the southern division with headquarters at Atlanta. In July, 1906, he was promoted to the position of assistant superintendent at Nashville, Tenn., which position he held until his latest appointment.

Mr. Nourse possesses a pleasant personality and has, through his wide experience, gained a broad grasp of the telegraph business.

Norman Ringer, Acting Superintendent, Western Union, Dallas, Tex.

Mr. Norman Ringer, who has been appointed acting superintendent of the Western Union Telegraph Company at Dallas, Tex., is one of the youngest men in the service to attain such a responsible

NORMAN RINGER,

Acting Superintendent, Western Union, Dallas, Tex.

position. Mr. Ringer's promotion, however, is well deserved as throughout his telegraphic career he has been a careful, conscientious student of telegraphy and has always been on the alert to serve his employers to the best of his ability. Mr. Ringer was born at Hiawatha, Kans., March 3, 1883, and entered the service of the Postal Telegraph-Cable Company at Fowler, Colo., as operator and manager, May 14, 1897. Two years later he entered the railroad field and was employed first by the Santa Fe and later by the Union Pacific, Colorado and Southern, Oregon Short Line, and the Oregon Railroad and Navigation Company. On May 14, 1906, he re-entered the commercial field as manager for the Western Union Telegraph Company at Rocky Ford, Colo. October 22, 1907, he was advanced to the managership of the office at Colorado Springs. He was transferred to the management of the El Paso office on March 17, 1908, which position he held at the time of his recent advancement.

**G. D. Hood, District Traffic Superintendent,
Western Union, Seattle.**

Mr. George Doane Hood, whose appointment as district traffic superintendent of the Western Union Telegraph Company, with headquarters at Seattle, was briefly announced in our October 1 issue, is

G. D. HOOD,

District Traffic Superintendent, Western Union, Seattle.

another Canadian-born telegrapher who has achieved prominence in the profession. Mr. Hood was born at Yarmouth, Nova Scotia, November 16, 1875. In 1891 he entered the telegraph service as operator on the Intercolonial Railway at Truro, N. S. He later joined the forces of the Western Union Telegraph Company at Halifax, and from there came to the United States and entered the Western Union office at St. Paul, Minn. He next accepted service with the Northern Pacific Railway and was employed at Helena, Mont., as operator, city ticket agent and night wire chief. His next position was as wire chief and manager of the Atchison, Topeka and Santa Fe Railway. From this post he was promoted to be chief clerk to the superintendent of telegraph at Topeka, which position he held at the time of his recent return to the commercial service.

**J. W. McMahon, District Commercial Manager,
Western Union, New York City.**

Mr. J. W. McMahon, whose appointment as district commercial manager of the Western Union Telegraph Company, with headquarters at 270 West 23rd Street, New York, was briefly mentioned in our Oct. 1 issue, has had an interesting and valuable telegraphic experience which admirably fits him for the duties of the new position. Mr. McMahon was born at New Orleans, Aug. 24, 1879, and entered the telegraph service in that city as clerk in the Commercial News Department of the Western Union Telegraph Company in 1896, afterward becoming an operator. In 1898 he enlisted in the Louisiana Volunteer Artillery for service in the Spanish-American War. He later joined the United States Signal

Corps and served for three years in the Philippines. While there he was operator at the headquarters of Generals Grant and Funston and was with the latter when the insurgent leader Aguinaldo was captured.

After leaving the signal corps he was employed as press operator on various newspapers in New Orleans and New York. During the presidential campaign of 1904 he was in charge of the telegraph bureau of the Democratic National Committee. He next served as traffic chief in the New Orleans Western Union office under Mana-

J. W. McMAHON,

District Commercial Manager, Western Union, New York City.

ger T. P. Cummings, and, in 1906, came to New York, taking the position of assistant manager of the Central Cable office at 16 Broad Street. Subsequently he served as solicitor and assistant to Superintendent J. F. Nathan in that office. He left the service about a year ago on account of ill health, but returned on Sept. 15 to accept his present position.

Canadian Notes.

A special office was opened by the Great North Western Telegraph Company of Canada, in the Theatre Monument Nationale, Montreal, on the occasion of a testimonial meeting to Sir Wilfrid Laurier, premier of Canada, on Oct. 10. The details of handling the large amount of press matter incidental to the meeting was placed in the hands of Manager L. S. Humes. A staff of ten operators was in charge of Mr. D. R. Sheehan. Mr. Humes was complimented by the press correspondents, Hon. Mr. Gervais and Sir Wilfrid Laurier himself, on the excellent telegraph arrangements.

In a test case brought before a Toronto magistrate, it was decided that the transmission of horse race news by the Great North Western Telegraph Company is illegal. The case will be taken to the higher courts.

Mrs. Wm. Camp, mother of Mr. W. J. Camp, electrical engineer, Canadian Pacific Railway

Company's Telegraphs, Montreal, died on Oct. 15, in her 78th year.

Two of the wires of the Canadian Pacific Railway Company were crossed recently by being hit by a prairie chicken. The bird was found hanging on the wires. This is a new and interesting way of capturing prairie chickens, but, perhaps, an expensive one.

It is reported that at the next session of the Canadian Parliament, Postmaster General Lemieux, will bring up the question of a general reduction in telegraph rates throughout Canada.

The Cable.

Incoming steamers during the past few days reported severe electrical storms at sea. These storms were of such magnitude and violence as to affect the operation of the Atlantic cables during part of the day and night.

Municipal Electricians.

Recent New York visitors—Mr. J. B. Yeakle, superintendent of fire telegraph, Baltimore, Md.

Mr. John W. Kelly, Jr., chief of the Electrical Bureau, Camden, N. J.

A patent, No. 971,684, has been granted to Mr. W. C. Matthias of Reading, Pa., for a fire alarm.

No. 972,353, to P. W. Eskridge, Rutherfordton, N. C., for a fire alarm switch.

The Telephone.

Mr. C. F. Sise, Jr., general superintendent of the Bell Telephone Company of Canada, Montreal, Que., was in New York recently for a few days and called on many of his friends.

Mr. H. W. Pope special agent for the American Telephone and Telegraph Company, is making a trip throughout the west including Colorado and Oklahoma, in the interest of the Public News Disseminating Service of the Bell telephone companies.

President Theo. N. Vail; vice-president Union N. Bethell, of New York, and vice-president, B. E. Sunny of Chicago, all of the American Telephone and Telegraph Company, have been elected directors of the Michigan State Telephone Company.

Mr. Theo. N. Vail president; Mr. U. N. Bethell, vice-president, and Mr. H. B. Thayer, vice-president, of the American Telephone and Telegraph Company, New York, were in Chicago recently inspecting the plants of the Chicago Telephone Company and the Western Electric Company.

The Telephone Improvement Company has been incorporated at Albany, N. Y., with a capital of \$3,000,000 to manufacture and deal in telephone apparatus. This company is formed by the consolidation of the Telechronometer Company of Rochester and the North Electric Company of Cleveland, and of which Frederick C. Stevens is the organizer and president.

The Pacific Telephone and Telegraph Company has recently installed a loaded cable between Seattle and Tacoma, a distance of 38 miles. Of this length 31 miles is aerial cable and seven miles underground.

Loading coils are placed throughout the entire length at intervals of 8765 feet. By this means it is expected that communication between the two cities will be safe from interruptions by adverse weather conditions.

William M. Stewart, division equipment superintendent of the New York Telephone Company, died October 5 at his home in Westfield, N. J., aged fifty-four years. Mr. Stewart had been in the service of the New York Telephone Company for the past twenty years. During this period he supervised the construction of many new central offices, and did much to develop the telephone service to its present high efficiency.

The injunction issued a few weeks ago in Jeffersonville, Ind., against the Cumberland Telephone and Telegraph Company, enjoining it from furnishing race information to any point in Indiana, has been sustained by Judge Montgomery in the Clark Circuit Court. The company objected to the clause enjoining it from furnishing racing data outside of Jeffersonville. An appeal has been taken to the Supreme Court.

Obituary.

Mr. Milton F. Adams, well known to the telegraph profession throughout the country, but who, in late years, had been engaged in other business, died on October 12, in the hospital at North Wheeling, Va., from the effects of an injury sustained about two years ago, which necessitated the amputation of one of his feet. He was sixty-seven years of age, being born in Richmond, Va., June 7, 1844. He learned telegraphy at Bellaire, Ohio, and worked in many of the principal offices throughout the country for various companies. His remains were buried at Wheeling, on October 14. Mr. Adams is credited with having introduced Mr. Thomas A. Edison to the electrical world in Boston, in 1866.

Judge Lambert Tree, died at Chicago, October 13, aged seventy-eight years. Mr. Tree, who was a native of Virginia, entered the telegraph service in 1850, learning telegraphy under his brother, J. B. Tree, who was for many years superintendent of the Western Union Telegraph Company at Richmond, and is now living in retirement at that place. After about two years at the key, Lambert Tree took up the study of law and was admitted to the bar in 1855. He then went to Chicago and the following year was appointed a judge in the Circuit Court, serving four years. He has also, at different times, acted as United States Minister to Belgium and Russia.

Mr. Edmund J. Murphy, aged 48 years, for the past nine years superintendent of the Stock Quotation Telegraph Company, New York, died on October 18, after a brief illness. Mr. Murphy had been connected with the company since 1892 and from the position of bookkeeper was advanced to that of superintendent in 1901, which position he filled with great business ability and tact. The funeral was attended by a large number of telegraph officials.

The Western Union Telegraph Company's Improved Quadruplex.

BY WILLIAM FINN.

The new quadruplex system, now being introduced in various parts of the Western Union Telegraph Company's service, possesses many novel and valuable features, well calculated to make "four corner working" entirely feasible over long and difficult telegraph lines, and to greatly increase the carrying capacity of such circuits as have in recent years been limited to duplex operation only.

This improvement has been brought about, to some considerable extent, by the use of a pole-changing apparatus designed to minimize the "interval of no current," and a neutral relay provided with an auxiliary magnet that has proved very effective in holding the relay armature closed

FIG. 1.—WESTERN UNION NEW FORM OF POLE-CHANGER AND TRANSMITTER.

when the distant pole-changer lever is in transit from one to the other of its battery posts, during which period the signaling battery is entirely disconnected from the main line.

The new form of pole-changer (which form of instrument is also used as a transmitter on the common side) is illustrated theoretically in Figure 1, where *M* represents an electro-magnet having a solid iron core, and *M'* a shorter magnet with a laminated iron core. The magnetism developed in the two magnet cores is of such polarity as to oppose each other's action upon the armature, the cores imbued with *N* polarity, and those with *S* polarity being made to face each other in the manner indicated in the figure.

The armature *A* is placed between the opposing magnets and is provided with a light retractile spring which normally holds the armature in the position shown.

When the local circuit is completed by the

closing of key *K*, both electro-magnets become energized, but in the case of the short magnet the magnetism quickly attains a high value, whereas it rises relatively slowly in the long magnet because of its solid core, as also for the reason that a portion of the current is diverted through the resistance *r*, which forms a shunt across the long magnet coils. This difference of magnetic activity between the two cores, results in a rapid movement of the armature in the direction of the short magnet; the reverse of this taking place upon opening the local circuit, for now, the laminated core instantly parts with its magnetism and allows the retractile spring, together with the slowly disappearing or "residual" magnetism in the solid core, to smartly pull the armature in the opposite direction.

Notwithstanding the rapidity of the armature movements, however, the "interval of no current" is still sufficiently pronounced on long circuits to impair the efficiency of working on the common side. To obviate this, the auxiliary or holding coil, to which reference has been made, forms part of the neutral relay equipment. This coil *H*, Figure 2, placed in series with a condenser *HC*, is connected across the main and artificial lines in the manner shown, and is brought into action at the moment battery contact is broken at the distant pole-changer. For at that instant, the magnetism previously excited in the receiving apparatus suddenly collapses and in doing so generates an "extra current" that is utilized by affording for it a path through the holding coil, the direction of the current being made to correspond with the discharge from the holding condenser whose plates had been previously charged by the distant battery current. The path of this extra current (whose strength is greatly intensified by the presence of the impedance coil *5U*) also includes the main and artificial coils of the neutral relay, the armature of which—as the result of a combination of magnetic forces all acting in the same direction—retains its armature firmly on the front contact at a time when it would otherwise tend to fly open.

It will be noticed from Figure 2 that both the "differential" and "bridge" principles are involved in the operation of the new quadruplex system, the coils of the neutral relay being differentialized and connected with the main and artificial lines in the usual way, while the polar relay is placed in the cross wire of the "bridge," the arms of which are represented by the two windings of an impedance or retardation coil *5U*. This impedance coil (whose circular core of iron wire forms a closed magnetic circuit) not only operates to the advantage of the neutral relay in the manner already described, but has also a beneficial effect upon the working of the polar relay. This is due to the fact that the magnetic variations in the core of the impedance coil (brought about by the closing and opening of the distant pole-changer) give rise to momentary extra currents

which partly complete their circuit through the coils of the polar relay, and being in a direction coinciding with that of the incoming currents, aid and assist in the operation of that instrument.

A further incidental advantage of the impedance coil consists in the fact that, in combination with the grounded or "spark" condenser, *SC*, the rise and fall of the signaling currents become so graduated as to materially modify their inductive influences upon neighboring wires.

The balancing of the new quadruplex apparatus is effected in a manner precisely similar to that employed in the old standard system, the home apparatus being rendered insensible to the out-

balanced conditions for the reason that the electrical pressure or "potential" at each of the relay terminals is exactly of the same magnitude, and being oppositely directed, can produce no effect. The same is also true with regard to the holding coil.

In the case, however, of the impedance and neutral relay coils, the outgoing currents do actually traverse their respective windings, but as the magnetism excited in the one coil is exactly neutralized by that excited in the other coil of each instrument, the result in producing a null effect is practically the same as in the case of the polar relay.

At the receiving end of the line, the current

FIG. 2.—THEORETICAL DIAGRAM OF WESTERN UNION IMPROVED QUADRUPLIX SYSTEM.

going currents when an equality of potentials has been established at the terminal points of the polar relay, and an equality of currents through the two coils of the neutral relay.

The general arrangement of, and the underlying principles involved in the working of the new quadruplex, will be more clearly understood by reference to the theoretical diagram Figure 2, in which the polechanger *PC* at the left hand side is represented as sending out a positive or spacing current, the strength of which has been cut down to its "short-end" value by having to pass first through the added resistance *AR*, and then dividing between the leak resistance *LR* and the main and artificial lines. No part of this current will flow through the polar relay coils under well

enters the line coil of the neutral relay, and a momentary impulse traverses the holding coil without practically affecting either, in consequence of the neutral relay armature being "pulled up above the short end." After leaving the neutral relay, the current divides, a portion going through one of the impedance windings, and another portion through the polar relay and other impedance winding, after which the two parts reunite and complete the path to ground by way of the transmitting apparatus and generator.

The amount of current diverted through the polar relay is comparatively small, but this current, as previously stated, is reinforced by the action of the impedance coil, permitting in certain cases, and under favorable weather condi-

tions, a "multiple" arrangement of the relay coils to be employed with advantage. When, however, the strength of the current is considerably reduced by loss through leakage, or otherwise, the magnetic effect of the enfeebled current may have to be increased by connecting the coils in "series."

At the right hand side of Figure 2, the pole-changer, *PC'* is represented as sending out a negative or marking current, which passes directly into the main and artificial lines without encountering the added resistance *AR*, or following the path through the leak resistance *LR*, the former being shunted by the tongue of transmitter, *Tr'*, while the leak resistance is cut out of circuit at the open stop of that instrument. Under these conditions, the full strength or "long end" of the battery is transmitted to line actuating both of the receiving instruments at the distant station.

A current ratio of three to one is ordinarily employed on the longer quadruplex circuits, sixty milliamperes on the "long" end and twenty on the "short" end generally affording sufficient margin for all practical conditions of working.

The coil adjustments of both the polechanger and No. 2 transmitter should generally be such as to make the distance between the long coil and the armature somewhat greater than that between the short coil and armature. When signals are "light" at the receiving station, the long coil at the transmitting station should be pulled away from its armature, and vice versa, should be moved towards it when the writing is heavy.

The adjustment of the polechanger points should be as close as possible without creating a tendency to "arc," such tendency being greatly reduced by the use of a $\frac{1}{4}$ microfarad condenser in series with a twenty or thirty-ohm resistance lamp placed across the battery leads as shown in the illustration. Sparking is liable to occur at the polechanger points, both at the "making" and "breaking" of battery contact. The spark at the "make" represents the static discharge from the main and artificial lines, to modify the effects of which is the purpose of spark condenser *SC*, which opens a path for the direct discharge to ground. The spark at the "break"—which is due to the extra current arising from the high electromotive force of self-induction developed at that instant—is the more serious of the two, since it is likely to lengthen out and create an "arc" as the polechanger lever leaves its battery post. The particular function of the small condenser is to lower this electrical pressure or "potential" at the polechanger points, from which the "extra current" is thus safely diverted.

The method of adjusting the holding coil after a balance has been secured, is to first bring it as close as practicable to the relay armature, then with the No. 2 transmitter closed at the distant office, and while that station is "dotting" on the polar side, plug up the holding condenser until enough—but not more than enough—capacity has

been introduced to keep the neutral relay armature steady on its front stop under the distant reversals. From forty to sixty sheets of a 3-microfarad condenser should generally suffice for that purpose, as too much capacity would have a tendency to bring in inductive or other interference through the holding coil.

The repeating sounder of the old quadruplex system is still retained as a feature of the new arrangement, but the necessity for that instrument would seem to have disappeared with the advent of more efficient transmitting and receiving appliances, which, together with the impedance coils form a combination that has practically wiped out all tendency on the part of the neutral relay to "kick" during distant battery reversals. It is, therefore, possible to eliminate the repeating sounder, and operate the local sounder direct from the front stop of the neutral relay, as has been practically demonstrated in the case of several long quadruplex circuits.

A sufficient number of experiments, however, have not as yet been made to thoroughly test the feasibility of the front contact arrangement under all the various conditions of working; meanwhile all neutral relays will be provided with both front and back stops so as to afford facilities for further trials in the direction indicated.

A Prediction by Mr. Edison.

In a communication from Mr. Thomas A. Edison read before the first annual convention of the Electric Vehicle Association of America, held in New York City, Oct. 18, that gentleman stated that in fifteen years more electric energy will be sold for electric vehicles than for electric light.

The first telegraph instrument used in Grand Rapids, Mich., a Morse recorder, which was installed in 1858, has been presented to the museum of that city by a relative of Edward D. Benedict, who was the first manager of the office.

Mr. L. J. Maxwell, superintendent, Western Union Telegraph Company, Jacksonville, Fla., in renewing his subscription for another year says: "The Age has always been a good paper, but I am glad to note that of late it seems to have taken on additional energy and I congratulate you, and wish you continued success."

Mr. W. B. Eddy, commercial manager of the New York Telephone Company at Albany, N. Y., and a former old-time telegrapher, has been confined to his home by sickness for some time past, but is now entirely recovered. Mr. Eddy in renewing his subscription for another year, says: "Enclosed find check for my renewal. It affords me great pleasure to receive your good publication twice a month. It is the only way I have of hearing about so many of my valued friends in the telegraph and telephone service."

Telegraph and Telephone Age

Entered as second-class matter, December 27, 1909, at the Post Office at New York, N. Y., under the act of March 3, 1879.

Published on the 1st and 15th of every month.

TERMS OF SUBSCRIPTION.

One Copy, One Year, in the United States, Mexico,
Cuba, Porto Rico and the Philippine Islands . \$2.00
Canada 2.50
Other Foreign Countries 3.00

ADDRESS ALL COMMUNICATIONS TO

J. B. TALTAVALL, - Editor and Publisher,
283 BROADWAY, NEW YORK.
T. R. TALTAVALL, Associate Editor.

CABLE ADDRESS: "Telepage," New York.

Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

November 1, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

The Operators' Opportunity.

Never in the history of the telegraph in this country has there been a time when promotions have been so numerous and rapid as at the present. They are not made for the sake of advancing a favored few to higher positions, but for more utilitarian purposes. They are made in order to fill the positions created by the rapidly expanding business, whose growth has never been equalled in this country. The telegraph is growing by leaps and bounds, and the opportunities thus afforded to young, ambitious operators to better their condition by fitting themselves for positions of greater responsibility, with the attending advantages of higher salaries, has never been so great.

The demand is principally for men with technical and practical knowledge, and such men, wherever found, are being selected and placed in positions of trust where they can find a wider field for the utilization and expansion of their knowledge.

Every telegrapher in the country can fit himself to occupy such a position if he will. If he feels that he is not already qualified he can prepare himself by diligent reading and study of the technical and practical features of his work. Anyone neglecting these opportunities is simply doing himself an injustice, and if he finds that he is falling behind in the race he has no one to blame but himself.

The remarkable expansion of the telegraph has been indicated in our columns for several months past by the long record of promotions all over the country, and bright and capable men are being snapped up wherever they are found. The telegraph business is being conducted on a new basis, and the public is being better served thereby. It requires ability to manage and carry on a business of such large and widespread interest, and it behooves all the younger members of the profession to be alert and seize the opportunity to place themselves in the way of prosperity and happiness. This can only be done by close observation and study. The opportunity exists now and every eligible person in the profession should take advantage of it.

The Child Labor Question Applied to the Messenger Service.

The Child Labor Committee of the Charity Organization Society of New York, has published in the New York Evening Post an article criticizing the editorial in the October 1st issue of Telegraph and Telephone Age, entitled "The Child Labor Question Applied to the Messenger Service." Our article referred to the agitation in various states for legislation restricting employment of messenger boys, and particularly to the New York law recently passed forbidding the employment of messengers under 21 years of age after 10 p. m.

The Committee, after charging us with befogging the issue, states that the real issue is this: "Is the employment of minors after 10 o'clock at night as telegraph messengers a desirable occupation?"

There are several interesting points for analysis in this statement of the case.

Are the morals of youth any more in danger at the age of sixteen than at twenty-one?

Are the morals of a city more vicious at ten o'clock than at nine o'clock?

Is the delivery of a telegram at night a more undesirable occupation than the delivery of newspapers or the early morning milk?

We assume that the Committee now pressing this child labor legislation is actuated by motives to safeguard the morals not only of minors but also of those past legal age. We assume that the Committee takes into consideration the important feature of not destroying the earning power of the embryo citizen.

Therefore, we venture to suggest to the Committee that if the same degree of effort were applied toward the suppression of existing vices that

are supposed to menace messengers instead of restricting the opportunities of youth for earning his living, a great deal more effective reform would be accomplished.

The way to eradicate an evil is to root it out. Merely trying by law to keep people away from it is like attempts of the New York police department in days past to stop gambling and shut up disorderly houses by stationing policemen on the steps to notify visitors of the character of the place. This proved very valuable advertising to the evils.

If the Committee wishes to really benefit humanity, including boys who are unfortunate enough to be obliged to work to earn their living, let it seek legislation and, above all, enforcement of law that will render the city a safe place at night for the morals of old as well as young workmen.

The first great law of nature is *to live*. Legislation restricting opportunity to honestly earn a livelihood is vicious, cloak how you may with moral precepts. Punishment of the innocent victim of conditions instead of seeking to remove the cancer of evil is a reform method certain to prove not only ineffective but harmful. It is the method of the ostrich, hiding only its head in the sand. It is the action of men who seek to keep people from looking at evil instead of daring to go in and fight the dragon in its lair.

But if immoral conditions must exist, why should not the Committee ask to have them confined to a certain designated district from which young and tender messengers would be prohibited, instead of making the whole state forbidden ground to a large number of boys seeking to earn an honest and absolutely necessary livelihood?

If messenger boys are used to purchase drugs, as the Committee charges, it would seem the logical thing to enforce the existing law forbidding the sale of certain narcotics on the offending druggist instead of on the innocent messenger.

If messenger boys are occasionally called to immoral places, the common-sense citizen would be inclined to think that the way to real reform would be to close the immoral place instead of having a policeman chase the boy away.

Messengers are a necessity of urban life. Boys are best fitted for such work. It is healthful outdoor work, far better physically than indoor confinement. Of the total amount of duty which a messenger boy must do at night, more than 90 per cent. is of an advantageous character.

Men will not work as messengers—only the semblance of men will take the job. Ninety per cent. of the public service must suffer for ten per cent. of reform.

A Question of Dividends.

The newspapers, seconded by the public, are unmerciful in their criticism of the financial management of railroad, telegraph, telephone and other public service corporations and are determined to pre-

vent, as far as they can, such corporations from earning dividends of more than four to six per cent. This stand seems rather inconsistent with their attitude toward private corporations which, in many cases, earn from forty to one hundred per cent., which they commend. One of the leading newspapers of New York City a few days ago printed a list of enterprises that pay dividends ranging from forty to sixty per cent., most of them being engaged in the manufacture of the necessities of life.

New York Electric Lines Company.

Supreme Court Justice Bischoff on Oct. 17 denied an application by the New York Electric Lines Company for a writ of mandamus compelling the Empire Subway Company, which controls the subway through which the underground telegraph and telephone wires are run in Manhattan, to permit the plaintiff to run telephone and telegraph wires through the subway under a franchise granted by the State in 1883. The court said that to prevail on its application the plaintiff must establish its lawful power to operate the lines it proposes to construct and that a writ of mandamus cannot be granted if its legal right is in dispute.

During some field manoeuvres near San Francisco, Company E of the United States Signal Corps made a record of one minute and twenty-nine seconds in establishing a wireless station from the time they started to unpack until they could begin sending. This company also holds a record of one minute and forty-two seconds for laying a quarter of a mile of wire and sending a ten-word telegraph message.

The international jury which was charged with the duty of considering proposals for a monument to be erected at Berne, Switzerland, to commemorate the foundation of the Telegraphic Union, has decided not to recommend any of the designs for acceptance or reward, but to propose the opening of a new competition.

The recent Republican State Convention at Saratoga, N. Y., assumed a National aspect, there being so many newspaper representatives present from other states. Over a half million words of press matter were handled by both telegraph companies with entire satisfaction to all concerned.

Telegraph Line to Punta Arenas.

The Chilean government has under consideration telegraphic communication between Valparaiso and Punta Arenas and intermediate points. The wireless system seems to be considered the most practical, owing to the distance and the rugged and bleak country over which 700 or 800 miles of the line must be built.

The total distance between the two points is 1,220 miles and the estimated cost of the wireless system is placed at \$175,194, United States gold.

TELEGRAPH GROWTH.

Development of Service in United States— Advantages of Private Ownership.

BY S. M. WILLIAMS, NEW YORK.

Special Agent, Western Union Telegraph Company.

An extraordinary development of the telegraph service is taking place in the United States at a time when in some of the older countries of Europe a slow decline is noticeable. There are two general causes for the increase in this country, and one for the decrease in the old world.

In the United States system, under private ownership, an intense activity of science, skill and business organization is being manifested to increase the quality, the flexibility, the scope and the convenience of telegraphic communication. At the same time, the American public, always seeking means to save time and to set a faster pace, is showing a tendency to disregard the mails as too slow for both business and social communications, and turning to the electric wires both telegraph and telephone, for relief.

These two lines of progress, one for the public and the other by the public, moving along together, are producing in America the highest development of electrical communication of intelligence and setting standards for other nations to copy.

Next to the United States, the greatest use of the telegraph has been made in Great Britain. For the past eight years there has been a slow but steady decrease in the number of telegrams sent annually in that country. In the last two reports of the British Postmaster General, by whom the wire service is directed, it is pointed out that "this reduction is due to the increasing use of the telephone, especially for local communication."

France, which comes next in the list of telegraphic countries, has had such miserable Governmental telephonic service in the past, that people were forced to use the telegraph and the decrease, noted by the British Postmaster General has not yet begun in that country.

But in the United States the telephone instead of checking the use of the telegraph is serving, rather, to increase it and thus render dual service to the public. That is because these two services are being conducted along auxiliary lines. One is supplemental to the other. Neither alone would quite fill the public need for quick, convenient, universal communication. Each has its particular field—the telephone in and around centres of dense population; the telegraph connecting these centres.

The collection and delivery by telephone of telegraphic messages is the latest method in this country for saving time and trouble. It has been done here and there in the past, but now is being

developed along organized lines by both companies. The benefits are noticeable in both city and rural life, although each for a different reason.

The city user of the telegraph gains in convenience. He has only to dictate his message through the handy telephone for delivery in any part of the world. There is no need of going to a telegraph office, no necessity of bothering about making change for payment, no loss of time. The message is dictated as to a stenographer, and the charge is made in a monthly account that is accorded every telephone subscriber by the telegraph company.

In delivery of telegrams there is similar convenience and a greater saving of time. We in America do so much of our local business and social conversation by telephone that the adding of long distance communications that have come over the telegraph wires is accepted as a matter of course. The innovation of the past six months bringing these improvements about has met so completely the long felt want of the public that it has become a part of our daily life almost without comment.

An improvement that has met with the warmest commendation is the opening up of rural regions to continuous telegraphic service. This has been brought about by the co-operative action of the Western Union Telegraph Company and the Associated Bell Telephone companies. The ordinary business at thousands of telegraph offices in small communities does not warrant keeping them open all night or on Sundays. Yet, it often happens that telegraphic communication with such points, either in sending or receiving, is sorely needed by individuals in emergency cases during non-business hours.

A system has been worked out by the Western Union whereby certain centrally located points will be selected at which the telegraph office will never be closed. The telephone will be used as an auxiliary to cover the surrounding area so that messages may be sent in or deliveries made at any time without delay or inconvenience. The day and night of isolation are rapidly passing from every section of the country. The new development of the telegraph is bringing the whole world into close and continuous touch, making, as the "New York Times" recently remarked, "the backwoods the very seat and doorstep of civilization."

Another phase of American telegraphic progress is the Night Letter. It is barely six months since the Western Union Telegraph Company promulgated this new service, yet the novelty of last March has become to-day one of the accepted necessities of every day life.

The economic theory of the Night Letter is that it is a by-product of the telegraph business. In computing the cost of any by-product, a manufacturer can disregard many of the fixed charges that enter into regular production accounts. The

principal product of the telegraph company is high speed transmission of messages. Speed in telegraphy, as in a railroad train, a steamship, or automobile, increases cost.

The Night Letter is classified as a delayed service. There is the whole night in which to transmit it, as compared with the minutes and seconds of the day message. The wires are comparatively free at night from the rush of business. Therefore, the ever increasing volume of night letter traffic is moved along in a smooth, flowing current that filters into thousands of offices and homes in the early morning just as the public awakens and prepares for the business of the day.

It is these reasons that enable the Western Union to transmit a fifty-word night letter for the cost of a ten-word day message.

One of the most interesting phases of American telegraphic development resulting largely from the introduction of night letters, has been the new kind of messages now being sent over the wires, and the new uses to which the service is being applied. In the past England used the telegraph for social communications much more than did America. It is an every-day occurrence for the Londoner to invite by wire his guests to dinner, or to run down into the country for over Sunday. Here such a thing was of rare occurrence.

The receipt of a telegram in England conveys no shock to the household through fear that it contains unpleasant news. Here to the great majority of American women, a telegram means that somebody is dead. The idea that a social telegram can convey pleasant news has not been instilled into a considerable part of the public.

The night letter is accomplishing wonders in the transformation of the telegraph as a part of social life. As a means of communication between separated members of a family, its use has spread with lightning rapidity, and instead of a telegram causing momentary anxiety, it is now being welcomed in thousands of homes as an envoy of happiness. It is fair to presume that within another year, the United States will have passed Great Britain in social use of the telegraph.

In business affairs, this country has been telegraphically ahead of Britain for a number of years, but even at that general use of the wire has been confined to comparatively few lines of trade from which originated a very large volume of traffic.

The past six months have witnessed an extraordinary expansion in the business use of the telegraph. This is due to several causes. One is the American desire to do business at higher speed, impatience at the slowness of the mails, demand for instant answers and a breaking away from time-wasting methods of writing long letters and red-tape methods. Another phase is the discovery that use of the telegraph produces business; that spending money on telegraph tolls is not wasting it but investing it in business promo-

tion; that a dollar message often produces two dollars in return.

The clever minds of American business men are discovering a thousand practical advantages of the telegraph. Some very large firms are offering to pay the charges on orders sent in by wire, because in this way they induce new custom. Others use the telegraph as a medium of advertising, sending broadsides of messages proclaiming their wares, with the assurance that the messages will be read intently and not thrown into the waste basket like a mailed circular.

Business corporations having many branches, agencies and representatives are enlarging their use of the telegraph as a part of administrative efficiency and consequent economy. In all phases of American life this remarkable awakening to the advantages of communication by wire is apparent, and the advance has been most noticeable during the past six months.—*Financial America*.

His Distinguishing Mark.

One day a city bank received the following message from one of its country correspondents: "Pay twenty-five dollars to John Smith, who will call to-day." The cashier's curiosity became suspicious when a cabman assisted into the bank a drunken "fare" who shouted that he was John Smith and wanted some money. Two clerks pushed, pulled and piloted the boisterous individual into a private room away from the sight and hearing of regular depositors. The cashier wired the country bank:

"Man claiming to be John Smith is here. Highly intoxicated. Shall he await identification?"

The answer read: "Identification complete. Pay the money."

The state tax commissioners of Ohio, have fixed the valuation of the telegraph property in that state at \$2,734,725, an increase of \$424,517 over the previous year.

Mr. C. T. Currier, of the Central Union Telephone Company, Columbus, O., an old time telegrapher, who has been a subscriber to this publication for some twenty years, in renewing for another year, states that the paper continues to meet with his hearty approval and that it is a pleasure to him to hand in another subscription accompanied by the necessary \$2.00 to cover the same.

The United States Navy Department has ordered telegraph-typewriter equipment for the battleship Nebraska and expects to give this system a thorough test in order to determine its value as a means of communicating range and target observations and fire control orders to any part of the ship desired. The chief points which will be considered in deciding whether to adopt this system generally will be whether the danger to such an instrument from gun fire might not overbalance its advantages and whether it can be operated as speedily and efficiently as the telephone.

The Military Telegrapher in the Civil War.

PART XLVIII.

In our issue of October 16 we published the first part of the story of Mr. James E. Pettit's prison experiences during the civil war, which was found among his papers after his death. Continuing, the story goes on:

"We lived on parched corn that day which we gathered from a neighboring field. A train from Okoloona took us back to town, where we stayed over night; the next morning being Sunday, the boys amused themselves the best they could, sleeping, smoking, cooking and singing hymns. I sold my pocket-book for \$15 and gave the result of the sale to a native for three apples; the next morning we were pleased to learn that the track was repaired, and we started on our way to Meridian; we rode all day through a most miserable country; our efforts to purchase eatables at fabulous prices, were unsuccessful; we finally arrived at Meridian at 4 p. m. We were put into the stockade, a space so cramped and confined, that we were hardly able to all lie down at once. A mouthful each of corn meal, beef and bacon was issued to us here; I with my gloomy comrades composed ourselves as best we could in the mud, to try and sleep.

The next morning at three o'clock we rose from our mud beds and started for Demopolis, Ala. I bought a newspaper at Meridian (a small half sheet) for 50 cents. Meridian presented a most gloomy appearance, for Sherman, in his raid, had left but slight vestige of it; we reached Demopolis at eve; crossed the Tombigbee River and were housed in some old deserted cattle sheds where we slept.

"The next morning we were packed like so many dumb brutes into open cattle cars, and in a drenching rain, we started for Selma, Ala. We reached Selma at midnight, cold, miserable and wet to the skin, the sick and wounded wishing for death. At this point we were forced to wade through a pond of water for a distance of over 500 yards (the whole country was in a flooded state). We stopped in some old barracks over night, and at dawn, in a cold searching mist, we found the way to the boat, and embarked for our destination, the little town of Cahaba, Ala. Shivering with cold we stood around the boilers of the boat. I with many others, crawled under them, to get a little warmth into my benumbed frame.

"We left Selma at daybreak, having had nothing to eat. Gliding down the Alabama, which is one of the swiftest rivers of America, we quickly made the twelve miles, and arrived at Cahaba at 9 a. m. After we had disembarked we were thoroughly searched, and every valuable that escaped our former captors was taken from us. We were then marched to our prison, which consisted of an old cotton warehouse, capable of housing two thousand men, providing they were packed close-

ly. Some 700 prisoners were immured here and on our arrival, as we marched into our future home, we were greeted with cries of 'fresh fish, fresh fish,' and sundry orders were issued to invisible porters to 'take their baggage to parlör G' and kind inquiries were made as to whether our parents knew that we were out, some desired to be informed whether we had registered yet, others inquired as to what line of goods we were carrying in stock, and if the sales were good, also the more pertinent question was asked 'had we anything left'; the grim humor of all this chaffing was most emphatically apparent, when we looked about our miserable quarters, and saw the filth, the misery and despair, and viewed with horror the awful surroundings, and then the rags that formed the attire of these men, many of whom we found, subsequently, had been in this horrible place for many months.

"We looked about us and tried to familiarize ourselves with our environment; the building was a mere shed-like structure, a 'W' roof placed over the outside walls, one-fourth of this roof having been blown off by a tornado; large swinging doors on the north side, gave entrance to the main room, which extended the whole length of the structure, and for the greater part of the distance, the full width. About one-sixth of this space was separated from the main room by a high brick wall, and in this smaller space there had been built up bunks, three tiers in height, fashioned from rough unplanned boards; these were, of course, all occupied before our arrival. The north side of the building, where the door was located, we will call the front. On this front and on the two sides of the prison, were built up stockade fences twenty-five feet in height, enclosing a space, equal in area, to an acre, this was used as a cookyard; and gathered around little heaps of glowing coals, our comrades cooked their cornmeal, in the old-fashioned Dutch oven of our ancestors. On the outside of the stockade, four feet from the top, was a narrow sidewalk which formed the guards' beat, and on these beats marched incessantly the omnipresent riflemen; inside of the stockade, for the distance of six feet, was forbidden ground, and the thoughtless one who stepped over this imaginary line, called 'the dead line,' received not even a caution, but was mercilessly shot. On the inside of the prison also, there was a dead line, and on the space between this line and the walls of the enclosure were the beats of the inside guards.

"The redeeming feature of the prison was the water supply, which came from an artesian well that was located in the centre of the town, the water of which was brought to the prison by means of ditches on the side of the road, entering the prison, they discharged into two large boxes sunk in the ground three or four feet, one of which was used to wash our dishes; in the other was caught our drinking and cooking water; and after reading about the other prisons of the south,

I was satisfied that we were blessed in being supplied with this pure water.

"Six of us picked out a space about six feet square on which we located ourselves, and after this had been done, none dared encroach on our home. On one side next to the dead line was a box-like structure, some six feet square, in which a man, supposed to be a physician, located himself daily, and dealt out to the prisoners opium pills and calomel for every known ill that flesh is heir to. After the doctor disappeared a man would bring in a wheel-barrow load of salt rising bread, which he sold to the inmates at the very reasonable price of three dollars (Confederate scrip) per loaf, also yams at a dollar a yam. Tobacco was brought into the prison, that was so bad that it could not be sold outside and disposed of at three dollars per plug.

When we first entered a large number were half naked, but as winter approached they found means to cover their nakedness. Our little 'mess' consisted of John F. Ludwig (now, 1891, of Burlington, Iowa), a man named Sherman, from Ives Grove, Wis., John Kelley, of Racine, Wis., and myself; we had in our possession two rubber blankets, one of which we placed on the ground for a bed, and the other over us for a blanket. The season was well advanced and I well remember the night of October 10. It was simply impossible to keep warm as we had nothing but our rubber blanket to cover us, and to keep the breath of life in our benumbed frames, many of us were forced to walk all night. On October 12, 120 new prisoners arrived; that night I dreamed of home, and awoke to find myself in a Confederate prison. My hips were all calloused and brown from lying on the hard ground. To make our beds easier we would dig little cavities in the earth and fit our hip bones into them. Rumors of all kinds were rife, the capture of Forrest, that Richmond had fallen, that Sherman was on his way to the vicinity of the prison, and always the same old rumor, that we were to be exchanged; when all other rumors failed, this one always popped up serenely. October 26, 450 more prisoners arrived; the nights were bitter cold, and so many were afflicted with colds that the nights were rendered hideous by the constant coughing and sneezing of our comrades.

"November 4 a squad of citizen prisoners was called out for exchange and I wrote to my father. One of those to be exchanged was Samuel Wireman, my orderly, who had successfully imposed on the Confederates, making them think that he was a citizen, as he was wearing plain clothes, and he took my letter. November 7 I became very ill, it rained all day and I was correspondingly miserable; I had styes in both eyes. From this time to the thirteenth I was very sick, being deaf in both ears. I would fill my canteen three and four times a night and drink it all; I was burned up with fever, followed by freezing chills, and with no way to get warm. On the fifteenth

the prison surgeon took the names of the sick for the purpose of exchange. I stood in the line for half an hour, but being taken with a fainting spell, fell out of the line and thereby missed my chance. November 16, Ludwig, my chum, was taken sick also, with the usual symptoms of the dreaded camp fever. November 19 fifteen citizens were taken for exchange. Names were taken of the sick and wounded for exchange, but mine was skipped as before. Gresham H. Sherman, my mess mate from Ives Grove, Wis., then went to the surgeon and prevailed on him to send me to the prison hospital. When I entered the hospital they doused me in a big tub of ice water, soused my head under two or three times to get the soap out of my hair and eyes, and I became a member in good standing. I was informed by the doctor that I was dangerously ill, for which information I was duly and meekly thankful.

"After donning a coarse, boiled night shirt, I was put into a single cot, and I experienced the luxury of a mattress; as I sunk back on my couch I wondered if there was anything nicer than this in heaven, and I doubted it. I looked around me. I was in a building erected for the purpose of stores, five of them in a block; I was in one of these, a large fireplace occupied the whole space at one end of the room; at the other end, which faced the street, were large doors which were never open. Twelve cots were arranged along the walls, six on each side; in these beds lay the toughest-looking lot of mortals that I ever saw, that had any valid claim to a right to draw breath; I was one of them. The next morning I woke, and for some time I vainly endeavored to locate myself. I turned over and at once ascertained a fact that was not known by any one in the room; viz., that the boy in the next cot to mine had died during the night. I lay there in a semi-conscious state until the 28th, when I became unconscious, all was chaos to me except my many and vivid dreams; I will relate one or two of them, which I will never forget. I dreamed that I was lying in my cot, just as I really was; that my chum, Ludwig, was in the next ward to mine; this was also the fact; I thought that I slowly drew myself up and out of my body through my mouth, and after accomplishing that easy feat, I looked for a few moments down on my poor sick body, as it lay on the cot; I was seized with a desire to visit my chum in the next ward; to do this all I found necessary was to take hold of a beam, that acted as a brace just over my cot, and I could thus swing myself through the solid partition. After visiting with Ludwig for a while, I returned through the partition, the same way that I came, looked for a moment at my body, as it lay on the cot, and without hesitation I crawled in at my mouth, and asserted my rights as tenant of my body again. There was one other dream that remained a salient point in my memory for a long time; I thought that the old pre-historic round-house fort of Rhode Island

was located in this town; that the upper portion of it was occupied by General Sherman, who had captured the place, and I was engaged as his cipher operator; that the general desired me to go to Washington with secret despatches for President Lincoln; that I readily assented and started on my long and perilous journey via Atlanta and Cincinnati; a large portion of this journey remained quite vivid in my memory for several years.

"As I have before remarked, all was chaos until Dec. 4, when I regained my senses, so weak that I could not turn in bed. Until the eighth the doctor fed me on whiskey; it gave me strength to remember that my name had been called for exchange. The door had opened and a soldier in gray stepped inside, looked at a paper that he held in his hand and then spoke my name, as if he were miles away in a fog, but I was too weak to answer. The next twelve days I gained slowly and again my name was called for exchange, but again I could not answer. Afterwards I found that my father was moving Heaven and earth to get me exchanged; one man was held at Fortress Monroe, another was held at Cairo for my personal exchange, all through a powerful influence at Washington; all this was done for a weak, worn out eighty pounds of humanity, on a sick cot in a Confederate hospital, eating opium pills and taking 140 drops of laudanum per day. A week after I had gained much, still another week and I ventured to get up and go to the fire-place and sit on a bench, on returning to my cot I fainted and fell on a neighboring bed.

"Christmas I lay most of the day, ruminating and wondering what they were doing at home, what they were saying about me, what were their thoughts, where would I be a year from then. A dinner of turkey was brought in from a convent near the town, this was a surprise indeed. Two days after, Ludwig came in to see me, looking white as a sheet and the expression of a ghost; I had sufficient influence with the nurse to get him changed to my ward, until he became convalescent. This was indeed a comfort.

(To be continued.)

In Remembrance of the Late John D. Tinney.

BY E. H. HOGSHEAD, MERIDIAN, MISS.

It has occurred to me that a brief sketch of the post bellum life of the late John D. Tinney might be interesting to his comrades of the United States Military Telegraph Corps, among whom he was well known. His name appears in the articles by Mr. T. E. Moreland in the issues of *Telegraph and Telephone Age* of September 16 and October 1. With the view of preparing such a sketch I recently wrote Mr. William E. Flippen, for many years manager of the Western Union Telegraph office at Vicksburg, with whom Mr. Tinney worked most of the time after the war, for such data as he could supply, and I quote freely from Mr. Flippen's letter.

"'Jack' Tinney, as we called him, worked at Jackson, Miss., for a long time. There the writer first met him as a friend whose acquaintance had been made by the daily exchange of business over the wire. He was a manly, genial and generous fellow, honorable and fearless, and he impressed himself as such upon his associates at Jackson and Vicksburg. He became as one with the people of his environment, and their cause and their interests became his—and those were trying times in this part of the country.

"While in the telegraph service Mr. Tinney became well known to the fraternity in the south-west and numbered many friends among them."

Mr. Flippen states that Mr. Tinney was born in Philadelphia, Pa. My recollection is that he told me he was a native of West Virginia, or at least was from there. He had a brother, William E. Tinney, who worked at Vicksburg for some time while "Jack" was there, but of whom I have never heard since.

The last time I saw Mr. Tinney was in Meridian, some fifteen years ago. The tooth of time had furrowed his face; he was greatly changed in appearance, but he was full of vigor and business. He was in quest of laborers for a large contract job he had in south Mississippi. A few years later I saw in the papers an account of his sad end.

Following are extracts from Mr. Flippen's story:

"John D. Tinney was a native of Philadelphia, Pa. He entered the Union army when quite young and served with the Army of the Potomac in Virginia until the war closed. For a while he acted as a courier for General Hancock, and then at City Point, Va., he was one of the operators at General Grant's headquarters. After the war closed he and other army friends started for Mexico, and reached New Orleans on their way, and finding that France had agreed to withdraw the French troops from Mexico, he and his companions separated. Mr. Tinney entered the service of the old South-Western Telegraph Company at New Orleans, and was soon sent to Jackson, Miss., where he remained until he came to Vicksburg in November, 1866. He remained at Vicksburg in the employ of the Western Union until May, 1878, when the cut in salaries of operators occurred. In his case it was a cut from \$125 per month to \$75 per month. He remarked to me that he could go on the street and get more than that in a month. He did no telegraph work after leaving the service in 1878.

"Mr. Tinney married a Miss Emily Cordwent, whose father was a cotton planter living about eight miles north of Vicksburg on a well known plantation called 'Belle Isle,' and was living on this place when the house was burned and he was burned with it. Judging from his well known characteristic of always being ready for danger, which his service as a soldier taught him to be, it was thought by many that he was murdered

while asleep and the house was burned to conceal that fact. This suspicion led to the arrest of a negro who left the plantation soon after Mr. Tinney's death, but no evidence was found to convict him, and the negro was released.

"Mr. Tinney served a full term as postmaster at Vicksburg, and his reputation as such was of the best. He was endorsed by his old commander, General U. S. Grant, for the position.

"As a telegraph operator, particularly as a receiver with pen and pencil, he ranked with the best. I have seen him on presidential election nights receiving Associated Press reports with a room full of talking men, and nothing worried him, unless some one whistled to express his feelings about the news. That was the only thing that made him break. And I have heard him tell the gentlemen to talk as much as they wished, and as loud as they pleased, but not to whistle. That particular kind of noise apparently got on some nerve in his ear and knocked out the tick of the telegraph instrument.

"Mr. Tinney left a wife and two children—a boy and a girl. They are now living, or did live some years ago, at Spokane, Wash. His children are grown and I think both are married."

Mr. Jesse H. Robinson of Washington, D. C., in a recent letter to Mr. David Homer Bates makes the following interesting statement:

"Noting the article on page 675 of the October 1 issue of *Telegraph and Telephone Age*, relating to Sherman's last message to President Lincoln and Secretary of War Stanton at Washington from Kingston, Ga., in 1864, before cutting out for Savannah, I would say that the message was sent by Mr. Charles G. Eddy from Kingston, Ga., to myself at Chattanooga, Tenn., and relayed from there to Nashville. After Mr. Eddy finished sending the message he said, 'good-bye—you will not hear from us again until we reach the sea.'"

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' *Diagrams*. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' *Diagrams* in this way. We will then take up *Maver and Davis' "Quadruplex"* and other standard works on telegraphy and treat them in the same manner.]

CHAPTER XXII.

What is the chief distinguishing feature of the Morris duplex?

On what class of circuits is it most applicable?

What advantages are gained by its use?

Would it work satisfactorily in wet weather?

If not, state the reason.

What is the peculiarity of the relay used with this duplex?

Describe the action of the relay.

How is the Morris duplex balanced?

CHAPTER XXIII.

Why is it that a dynamo can generate sufficient current at one volt pressure to operate several sounders, while a like voltage from a blue stone battery is not sufficient to operate one sounder?

What proportion of the current generated in the cell is available for use outside of it?

Does the addition of cells of battery in series increase the available amperage? If not, why?

If the number of circuits fed by a dynamo machine is reduced or increased, what is the effect upon the other circuits connected with it?

How are cells connected in series?

How are they connected in multiple?

What is the effect of the series combination?

What is the effect of the multiple combination?

Are sounder circuits usually metallic or grounded?

How is the pressure at the distant end of dynamo leads maintained?

Why are fuses used in local circuits when several sounders are connected in multiple to the dynamo leads?

Does trouble on one local circuit affect the other local circuits?

The Wheatstone Telegraph System.

Now that the Wheatstone automatic telegraph system is receiving more attention at the hands of telegraph authorities in this country and is being brought into use more extensively, we are frequently asked by our readers for information concerning the principles of operation and the construction of Wheatstone apparatus. Probably the most extensive description of the Wheatstone to be found in any text book is given in Herbert's *"Telegraphy."* This book is the standard text book of English telegraphy and as the Wheatstone is probably used more in England than in any other country and has there been brought to its highest perfection the description given by Mr. Herbert, which covers seventy pages, will give anyone a good idea of the operation of this system and of the care of the apparatus employed. A chapter in *Maver and Davis' "Quadruplex"* is devoted to this subject and gives a very clear and concise illustrated description of the Wheatstone system. Twenty-five pages of *Maver's "American Telegraphy"* are also devoted to a description of this system and will supply the student with much valuable information. The prices of these books are: Herbert's *"Telegraphy,"* \$2.60; *Maver and Davis' "Quadruplex,"* \$1.50; *Maver's "American Telegraphy,"* \$5.00; and orders may be addressed to J. B. Taltavall, *Telegraph and Telephone Age*, 253 Broadway, New York.

Telegraph and Telephone Age is the leading authority in its line in America.

American Telegraph Engineering—Notes on History and Practice.*

(Continued from page 712, Oct. 16.)

LOUIS M. PORTS, BALTIMORE, MD.: The authors make the following statement:

It has long been recognized by telegraph authorities that an ideal system of telegraphy would be a simple and reliable page printer, capable of transmitting and receiving, say from 500 to 1000 words per minute on circuits of from 200 to 1000 miles in length.

This statement is not in accord with my understanding of the requirements demanded by practical men as far as such statements have been made. While it is possibly desirable in some cases that the ideal printer system should be capable of transmitting from 600 to 1000 words over a circuit yet in the great majority of cases the universal printer system would certainly be used at a very much less capacity than this. I take it that this statement of the authors does not necessarily mean a single mechanism to operate at this speed but apparatus capable of giving this capacity to a circuit. A single printer to operate at such a speed as this would certainly involve complications of construction and adjustment such as to preclude its use on short circuits requiring a speed of not more than 40 to 50 words per minute. I suggest that the ideal printer would not be a single printer capable of transmitting and receiving 300 to 500 words per minute each way, but that it would be a printer mechanism capable of operating at such a speed that the number of telegrams handled by the printer is that number of telegrams which can be economically and efficiently handled by a single operator. In a printing system with automatic transmission this number is determined by the capacity of the receiving operator rather than of the sending operator. Of course how many a single operator can handle depends very largely on the accuracy of the system and the traffic handling methods adopted, but from the present state of development of printing telegraphs it would appear that a printer system, manual or automatic, operating somewhere around 50 to 75 words per minute gives an amount of traffic which can be economically and efficiently handled by a single operator. A manual operator does not require a machine of a speed greater than 50 to 60 words per minute. The average operator could not send faster than this whatever the speed of the machine. In an automatic system a machine speed of 75 words per minute should give a sustained rate of about two telegrams per minute. A receiving operator will be fully occupied with this amount of traffic to care for. The operation of a number of printers of moderate speed

on a single wire by some method of multiplex operation appears to meet the conditions imposed by those circuits requiring a high capacity machine better than a single printer of high speed. The use of a moderate speed printer makes possible the construction of a simple, cheap and reliable printer which will be suitable for use on circuits having light traffic. This method of treating the problem results in a universal telegraphic printer, and a variation of the methods of line operation only, to meet the different conditions of traffic.

When a certain rate of transmission is reached on any given circuit, the wire cost is reduced to such a low figure that a further increase of rate is not justified, as the further reduction of wire cost so obtained will be more than offset by the more frequent interruptions and the greater amount of supervision required.

If such a system as the authors suggest, as far as the mechanism is concerned, were in a perfect state of development, I do not believe that it could be successfully operated on the wire plant of to-day on account of the variable electrical state of the wires, the lack of protection against inductive disturbances from foreign sources and a method of construction which also lacks protection against the induction between the different wires on the same pole line, which makes impossible the use of extremely high speed telegraph apparatus on more than a few wires, and which materially reduces the efficiency of even the Morse manual system. In order that a printer system operating at a speed approaching 600 to 1000 words per minute may come into use it is just as important that the wire plant be perfected as the machine itself.

W. J. CAMP, MONTREAL: I would say that the Canadian Pacific Railway used white porcelain insulators to a considerable extent in the years 1890 to 1898, but the cost increased so much that we reverted entirely to glass until three years ago. We found that the manufacture of glass insulators in Canada had deteriorated so greatly that the insulators turned out were altogether unsatisfactory, apparently they were not properly annealed, with the result that from a week to two months after being placed on the line they would go to pieces without any mechanical injury. The price of porcelain insulators had also been so much reduced that for the past three years we have used nothing but white porcelain.

Relative to Wheatstone Automatic operation it may be noted that the British Pacific Cable Board has leased a wire from the Canadian Pacific Railway between Montreal and Vancouver and is now equipping this wire with that system.

The Canadian Pacific Railway method for indicating circuits was adapted from the Japanese system and is by small circles at the ends of straight lines, different markings appearing in these circles to represent the different classes of circuits.

*Discussion of the paper presented by William Mayer, Jr., and Donald McNicol, at the Twenty-seventh Annual Convention of the American Institute of Electrical Engineers, Jefferson, N. H., June 28-July 1, 1910, and which was published in our columns July 16-September 16.

I consider a line of 40 poles per mile to be the most satisfactory, provided that poles are side guyed varying from every 5th to every 20th pole according to danger from storms, and head guyed every half mile. I do not like increasing the number of poles to more than 40 because, besides costing so much more for construction there is also greater reduction in insulation of the wires.

FRANCIS W. JONES, SPRING VALLEY, N. Y.: In addition to the historical and descriptive parts of the paper, allusion is made to disadvantages and defects in the construction of lines and in the operation of electrical systems of transmission, and suggestions for their improvement are advanced. Any ideal construction of telegraph lines, and the employment of the most improved and speedy systems for the transmission of telegrams must inevitably be limited in cost to the capital that can be secured therefor, and engineering suggestions of any value must keep within the limits of practicability, which is determined by several considerations, probably better known to the presidents and general managers of telegraph and railroad companies, as those officers are charged with the success and financial results of operation and maintenance, and are de-facto the engineers who decide all questions involved.

That those officers have been able to attain their ideals in these matters is extremely doubtful.

Capital is discouraged by the enormous difficulties encountered in the upkeep and extension of our American telegraph system, such for instance as securing suitable rights-of-way for trunk lines, with their constant demand for added wires; the frequent attempts in Congress to inaugurate a government system; the unfavorable legislation and taxation of the various states; the encroachment of the use of telephones and wireless telegraphy, not to mention the competition of a splendid mail service, besides the increasing cost of labor and materials, and the rigid account to which the proprietors are held by the Courts, for errors and delays which are practically impossible to avoid. Up to the present time the Morse Telegraph system has withstood the inroads of telephone and mail competition, and continues to be favored with an increasing patronage.

The grave situations in which both proprietors and public are placed by the present inability to obviate interruptions to operation between commercial cities, by reason of breakdown of wires and poles, due to storms, fires, floods, snow avalanches, falling trees, etc., besides the detrimental effects of electromagnetic and electrostatic induction upon the signals, are not confined to any one company, and their free discussion seems to be well within the purview of the Institute and cannot reasonably be considered gratuitous by telegraph proprietors. In my opinion there are insurmountable financial and engineering obstacles to placing entirely underground the trunk lines between all of the widely separated cities

of this continent, except that emergency underground cables may be found an advantage for short distances, such as between New York and Philadelphia (90 miles), yet an overhead structure that would be more elastic, built under rigid engineering rules as to strength, number of supports per mile, gauge and number of wires or cables, etc., with reference to the character of the country traversed, and the maximum stresses, (short of cyclones) to which such structure would probably be exposed, could undoubtedly be built at less cost than an adequate and reliable underground system. Upon engineers will devolve the solution of very important questions such as the proper tensile strength of the wires; their ohmic resistance; character of the insulation; and whether open individual wires, or cables be employed. It is obvious that the suggestions in the valuable paper of Messrs. Maver and McNicol, as to the kind and number of poles per mile, are indefinite. As there are great differences of topography and climate to be encountered, different construction is necessary for lines crossing mountains, prairies, mesas of shifting sand, through canyons subject to cloud bursts, and forests where trees are frequently falling, also along the sea coast indented by rivers and bays, and through the latitude where sleet storms frequently visit. A heavy trunk line in northern latitudes would require considerably different construction from a light trunk line in the south. The annual reports of telegraph companies show an expenditure of many millions of dollars for the repair and maintenance of pole lines.

It is open to engineers to calculate what would be the saving in electric operation, if the conductivity, and consequent tensile strength, were very largely increased over that of the wires at present employed overland. I believe that an increase of at least 50 per cent, in the conductivity of the largest hard drawn copper wires now in use, would much more than compensate for their additional first cost, but, of course, they must be supported by the ideal structure referred to. The average life of a pole line is given as 10 years; this may be true of wooden poles, but not of crossarms, insulators, nor wires.

It has generally been the opinion of engineers, that to secure reliable telegraph lines between the Atlantic and Pacific, over the Rocky Mountains in northern latitudes, it was necessary to have the protection of the railroad tunnels and snow sheds. The recent construction of a portion of an important trunk line over the summit of the Sierra Nevada Mountains, will be watched by engineers with interest.

A very vital question to be decided in erecting an ideal line is the kind and gauge of wire best suited for both trunk and side or way lines, also whether iron, or aluminum, or other metals or compounds could be advantageously used instead of hard drawn copper, in case the cost of the latter becomes excessively high.

The voltage of signaling currents at present in use, particularly for quadruplex, duplex, printer and fast Morse key operation, is at its maximum limits, on account of the detrimental sparks at the contact points of transmitters and of the heating of bobbins of relays, and of the serious menace to the insulation of office wires and underground and river cables.

The increased speed of signals within the last twenty-five years, particularly by the use of mechanical transmitters, and by the rapid electrical impulses required for printing and automatic systems on long circuits of comparatively high resistance, has demanded the highest voltages that could be used in order to actuate the relay armatures with sufficient force and celerity.

The mecograph illustrated in the article has a lever that may be moved by a slight motion, from a central or open position, to the right to transmit dots, and to the left for dashes; and is operated by about 30 per cent. fewer motions of the hand than in the case with the Morse key, but the motions of the mecograph being lateral instead of vertical, afford relief to the operator's muscles that had grown tired from long use of the Morse key.

The Wheatstone automatic system has been employed for several years on the long ocean cables, and on overland wires between London and Persia, and has produced more rapid and reliable signals, increasing the carrying capacity of the cables and wires by obviating the loss of time due to the hesitation of key operators in reading copy, and to other causes, thus changing the cable transmission of business from intermittent, to continuous.

Repeaters are placed anywhere from 250 miles to 600 miles apart in circuits having very widely separated terminal stations. Such repeaters have their location determined by the convenient position en route, of a town or city best suited for the maintenance of operators and machinery and not by the object of securing the best conditions for the electrical operation of the wires. The use of quadruplexes is most seriously curtailed by the false signals produced on the neutral relays when the keys on number two sides of several sets in operation on adjacent wires are simultaneously closed, which frequently occurs, the resultant electrostatic induction is then at a maximum.

It is to be hoped that the "ideal system of telegraph authorities in this country," capable of transmitting and printing from 600 to 1,000 words per minute on long wires will not lead any of our bright ambitious young engineers to chase an *ignis fatuus*. I am at a loss to understand why the limit was not placed at at least 5,000 words. It is obvious that the time-constant of all known line wires, electromagnets, and their connections, for over 200 miles, when operated by the very highest permissible voltage, would absolutely fail to actuate any page printing mechanism at such a speed; it is just as sensible for railroad engineers

to ask for a locomotive and cars to carry passengers from New York to Chicago in one hour's time, upon present tracks.

This ideal system must be required for press or similar service where the message contains several hundreds of words, and is prepared in some way for continuous transmission, on its being placed in the machine at the sending end. It is impossible for me to imagine how individual telegrams of an average of 30 words each can be prepared in any manner to be continuously transmitted over a wire at the rate of 33 messages per minute. At the time of Mr. C. F. Varley's visit, and of the subsequent modification of relay resistances by Madison Buell, comparatively nothing was known in the United States of farads, and henrys. It seems that our engineers were then trying to secure the maximum magnetic pull on relay armatures with a minimum electromotive force, and overlooked the tardy action of the apparatus due to high inductance. The adoption of a standard of 150 ohms for single relays was due to the impossibility of a large telegraph company regulating the resistance to suit each circuit. The late W. W. Smith in patent No. 106,418 in 1870 claimed the multiple connection of a 150-ohm relay to the reduced resistance of $37\frac{1}{2}$ ohms. He found such relays were not so sluggish in action on a wire equipped with a large number of relays, as were the same number of 150-ohm relays. The improvement was one of better service, and not of decreased cost for current.

G. A. CELLAR, PITTSBURG: The employment of reinforced concrete poles for telegraph purposes has not gained much headway hitherto, in this country. I believe the reason to be principally because of the still comparatively low cost of wooden poles, and the lessened expense of handling the latter as compared with that of handling concrete structures. In Europe, however, reinforced concrete masts are more largely used than in this country. The Deutsche Schleuderröhren-Werke has been making hollow concrete poles by machinery, utilizing centrifugal force, for about five years, and with a great deal of success. The Siegwart company, about a year ago, completed at its Swiss factory a contract for several thousands of hollow poles, averaging forty feet in height, for power lines, constructed by machinery utilizing centrifugal force. My information is that throughout Western Europe, especially Germany, Switzerland and France, and to perhaps a lesser extent in England, concrete poles are now considerably used in place of timber.

Until the time arrives when a permanent location can be secured for a telegraph line—and a telegraph line of large capacity—it may not pay to build an open line of wires supported by high concrete poles, unless their cost shall but slightly exceed that of wooden poles, for several reasons, among which are: first, possibility that the low voltage signaling systems now in vogue may be forced underground, or somewhere beyond the

present up-in-the-air location, by the multiplication of electric transmission lines; and, second, by the discovery of a process through which the elimination of retardation in aerial cables may be effected.

I believe that the increase in price of timber, and the advanced cost of handling concrete poles, will result in a revolution in the heretofore accepted models of pole and wire lines, through which there will be evolved a system of short pole lines of either timber or concrete, where reasonably level ground and policing arrangements permit the maintenance of such lines, and for which proper overhead crossings of highways and private roads encountered can be made without grading up and down from each one. It will not be feasible, however, to use extremely short poles in lines traversing rugged country and especially on railroad lines where the undulations of the surface of the ground are frequent and abrupt and the right of way a succession of deep cuts and high fills. Such lines are better calculated for use on highways where the roadway more nearly follows the form of the ground's surface and the ups and downs are not so abrupt. The objection to the use of the very short poles in the lines indicated is that the vertical pull on the pins and insulators is certain to loosen the contacts with the supporters and foster wire troubles in a degree not comparable with the saving in the lessened cost of the line. There is, however, a very considerable expanse of territory in this country in which the use of the short pole line is certainly feasible and desirable, not only through its lessened cost as compared with a line of high poles, but through its lessened exposure to wind pressure and the lessened strain at the ground line in a short pole as compared with a long pole. I am quite sure that for a comparatively small number of wires, a plan of construction can be evolved which will enable the large utilization of short pole lines with, perhaps, dead ended sections where it is necessary to abruptly raise the line in order to carry the wires over road crossings.

The item set forth in the paper as to the housing of insulators is one which I feel will be beneficial in many storms. No doubt the time will come when the expense incidental to such an installation will be more than warranted by the benefit thus to be derived. However, the driving storms of rain, wet snow and sleet which we experience in our western country preclude the entire protection from such storms by any small roofing protection that I think of at the moment.

(To be continued.)

Pigeon breeders in England have been complaining this season that many of their homing pigeons failed to find their way home. One scientific writer now advances the theory that the pigeons lose their way because of the many wireless waves which are passing through the air.

A Veteran Telegrapher.

Mr. I. D. Maize of Philadelphia, is probably the oldest telegrapher in point of service employed in that city.

For 54 years Mr. Maize has been regularly earning his livelihood at the key.

Mr. Maize was born at Millinburg, Union county, Pa., on February 28, 1842. In 1855 he learned telegraphing on the Pennsylvania Railroad, entering their employ on June 15, 1856. He remained with them until May 1, 1860, when he accepted a position with the Atlantic and Ohio Telegraph Company, in Philadelphia. At the time he began work for the Pennsylvania Railroad it had but one track and one wire.

When he went to Philadelphia there were but ten wires between that city and New York, eight between there and Baltimore and three between there and Pittsburg. The office force, which now numbers hundreds, then consisted of ten men. When the Civil War broke out he entered the service of the Government, serving as an operator in Eastern and Western Virginia.

Mr. Maize was employed with the Associated Press for ten years, then with the United Press for four years, until it failed, then with the Publishers' Press for four years. Several years ago he returned to the Western Union, where he has been ever since, and is working one of their first-class wires.

When President Lincoln was running for his second term, he had grave doubts of his election, and he thought it necessary that he should have the constitution of Nevada in his hands at once in order that he might sign the act taking that State into the Union in time to receive its three electoral votes. The constitution was accordingly sent to him by private message, amounting to 25,000 words, which took all of one night and the next day to handle. This message was handled by Messrs. W. S. Burleigh, W. P. Curl and Mr. Maize in relays.

In the tournament held in Philadelphia in 1903 he won the championship for old men, receiving ten messages in eight minutes and 500 words of press matter in thirteen minutes sent by Mr. R. C. Murray.

Mr. Maize has in his possession the "Philadelphia Bible," presented to the operators by Mr. J. D. Reid in 1849, in which are the autographs of 170 operators who worked on the lines at Philadelphia, Harrisburg, Lancaster, Columbia and Pittsburg between the years 1849 and 1882; of these but six are now living, namely, Colonel Joseph S. Greene, retired on a pension; Colonel William Bender Wilson, retired on a pension by the Pennsylvania Railroad; Winfield S. Burleigh, now with a brokerage firm; John W. Benckert, in the superintendent's office; William Porter Curl, still in active duty with the Western Union Telegraph Company, and himself.

Mr. Maize and his wife celebrated the forty-seventh anniversary of their marriage at their home recently, receiving congratulations from scores of old-time friends and acquaintances.

Telephone Service in America.

In the discussion on "Automatic vs. Manual Switchboards" at the International Conference of European Telephone and Telegraph Administrations, held at the Sorbonne, Paris, September 4 to 11, Mr. John J. Carty, chief engineer of the American Telephone & Telegraph Company, New York, made some interesting remarks on the telephone conditions in America.

After defining the meaning of the terms "Manual Switchboard" and "Automatic Switchboard," he briefly analyzed the method of operation of both to the disadvantage of the latter. The so-called manual system, he said, is really one composed of both manual and automatic operations. The so-called automatic system, properly speaking, is not an automatic system, but only partly so, and without the aid of human intelligence at the central office, and without the employment of operators, it has not been possible to operate it on any substantial practical scale. In order to see how thoroughly misleading is the term automatic switchboard as applied to these systems it is necessary to contemplate a telephone system more or less highly developed.

To do this we must consider the telephone system as a whole, taking into account all of the circumstances of the case, not simply one, or two, or three of them, but the whole multitude of factors which enter into such a complex problem.

We must give rigorous attention to a vast amount of data and requirements pertaining to the traffic upon which the design of the system is based, and we must take carefully into account all of those important commercial circumstances which have such a profound, though often unsuspected effect in broadly shaping the results.

It is only after we have done all of these things that we are prepared to begin to design the plant of the telephone company or administration. This word plant, which in the English language is applied to the structure constituting the physical property of the telephone company, is happily suggestive in connection with the point I wish to illustrate, for it brings to mind the idea of growth, and that in a problem such as ours, in order to attain successful results, we must contemplate a plant or system as it must exist at its different stages of development. We are not building something which, as it leaves our hands to-day, is in its final form. Each day, each month, each year, our plant is growing and we must so shape it, and so add to it, that as this growth proceeds it will have the highest efficiency which may be expected of it at each period of time. And above all, we must take care that the principles upon which this growth is planned will be such that when the system is fully developed, it will be working at its highest efficiency.

Our view is not comprehensive if it is confined to the central office switchboard alone. We must always have in mind, that while this is a vital

part of the system, it is by no means all, and that considering the telephone investment as a whole, the money invested in central office switchboards is a relatively small part of the total.

In our American practice we have for years endeavored, and I may say with substantial success, to take this view of the situation. In my office there is a large sub-department devoted to the study of the question from the standpoint of subways and cables; another for buildings; another for all telephone apparatus, including central office switchboards; another and very large department working upon the traffic parts of the problem; one devoted to development studies relating to growth of population and stations and kindred subjects; and still another whose sole duty it is to make fundamental plans based upon all of these data put together and co-ordinated.

These fundamental plans being based upon all of the factors in the case provide in outline for the location and number of the underground ducts and cables, the location and size of the central offices, and the size of the central office switchboards.

It is obvious that if to serve the needs of a given locality it is necessary at the present time to put underground a single duct, it would be a mistake to limit our construction to the immediate needs of to-day, provided, as is nearly always the case, further growth is to be expected. Some provision for the future must be made. To provide for the future, therefore, by adding duct by duct and digging up the streets each time a new duct is needed, would cause a great waste of money.

On the other hand, to take an extreme case, if a sufficient number of ducts were put down to provide for the needs of 100 years in the future (even assuming we could forecast correctly for such a long period), another waste of money would take place, for the interest and other annual charges upon the construction which must remain unproductive for so many years would more than offset the saving which would be made by avoiding the repeated excavations.

We must choose, therefore, in our construction, some point between these two extremes.

In the plans which we have made for New York and for the other cities in America, it has been found, all things considered, most economical when building new subways to plan for a period somewhere between 15 and 20 years ahead.

It should not be understood, however, that we can forecast with precision the requirements for so long a period ahead, but we have worked with these fundamental plans now for so many years that we know that they form a trustworthy guide, provided that they are continually kept under review and modified each year as the exigencies of growth demand.

With such plans before us for a given city, we are able to study the probable conditions of the plant at each period of its growth, and with such

a guide we are deterred from installing a switchboard or other system, however suitable it might seem to be at the moment, that would not be capable of growing into that form and to that magnitude which would be required of it by the conditions which it must encounter before its ille has expired.

Some idea of these conditions at New York so far as they are affected by magnitude may be obtained from the following data. The fundamental plans for that city, not including the vast suburban region outside of the municipal limits of Greater New York, provided in 1900 for a system of 51,398 telephone stations, served from 43 central offices, the population of the city being 3,347,000. In 1910 the plans provide for 376,000 stations, served from 52 central offices with an estimated population of 4,800,000. In 1930 the plans provide for 2,142,000 stations to be served from 109 central offices, with an estimated population of 8,800,000.

Without any commentary whatever these figures at once put us on our guard against the grave danger of assuming, even if the so-called automatic system was suitable for a small number of subscribers, that it would be a proper thing to employ in New York or any other city where it is expected that a proper development of the telephone will take place. It is the grand ideal of Mr. Theodore N. Vail, the founder of the telephone enterprise in America and still its active head, that we shall provide universal service. That is, that each person, firm or company in the United States that ought to have a telephone shall be provided with one, and that any person so provided wherever he may be located, can within a reasonable time be connected to the telephone of any other subscriber and talk satisfactorily.

We already have an effective long-distance service through underground cables of the Pupin type from New York to Philadelphia (90 miles) and good talking with prompt connections is an every day matter between New York and Boston (235 miles). Our long distance wires extend to Chicago and other more distant western cities, and to Washington, Baltimore, Atlanta, and other places in the far south. At the present time we are extending an underground cable of the Pupin type from New York to Washington (235 miles) and are making surveys and plans for an extension from New York to Boston. More than this, by the adoption of phantom loaded overhead circuits between New York and Chicago, and by similar extensions westward as far as Omaha and thence to the Rocky Mountains, we expect by the first of January next to have so greatly extended our long distance frontier that conversation may be held between Denver, Col., and New York City, a distance of 2,200 miles.

Referring to the private branch exchange development, Mr. Carty stated that it forms one of the most satisfactory and important features of the telephone in America.

In 1900, New York City had a total of 1,050 private branch exchange switchboards, located at subscribers' premises and serving 12,650 stations, connected with them. In 1910, there are 11,960 private branch exchange switchboards, to which there are connected 162,560 stations. In 1930, as a result of our studies on this subject, we are planning for 88,400 private branch exchange switchboards, having connected with them a total of 1,079,000 stations. These figures show that in the carrying out of plans upon which construction work is now being done, that we shall reach a point where more than half of the stations connected with the New York City system would require to be handled by operators, even if automatic switchboards were installed at the central office.

"All these things show that the automatic system which has so many alluring features about it when its application to simple conditions is considered, becomes more and more unsuitable as the plant grows. Even when the automatic system is applied to the simple case of a single office district we have yet to find an instance in which the total annual charges lying against it are less than the manual."

The following item taken from a Syracuse, N. Y., paper shows that the promptness of telegraph service is sometimes thought worthy of mention:

"Auburn, N. Y.—What is said to be one of the quickest telegraph messages ever sent over the wire was sent recently from Union Springs to Staten Island by way of Auburn. The message consisted of thirty-five words and was relayed three times from the sending point to its destination, and the answer was received at Union Springs within eight minutes. Operator Fred Grismeyer of the Auburn office of the Western Union sent and received the message and answer."

Mr. T. F. Sloan, who is located at a telegraph test station at McIlvaine, Pa., high up in the Alleghany Mountains, twelve miles from the nearest town, in renewing his subscription for another year, sends us a piece of the first wire run west from Philadelphia to Pittsburg, about 1847. This wire, which is made up of four iron wires twisted together, was abandoned after five or six years' use. Mr. Sloan states that there are now 88 Western Union and telephone wires crossing the mountain at his station. All of these with the exception of 13 are copper.

It is stated that tests are being made in New York City of an electric signal system devised to put a stop to the unauthorized use of automobiles for "joy" riding. When a car is run into the garage it is connected to the signal system and the indicator at the central station shows that the car is in. So long as the car is in the garage the fact is indicated at stated time intervals. If the car is taken out announcement is made of the fact, and of the time of departure.

Quadruplexes and Duplexes.

BY EDGAR C. DODGE, CHICAGO.

I once overheard one of the best quadruplex and repeater men in the service, Mr. B. M. Gosselin, quad chief of the Western Union Chicago office, remark that he would like to see the ground switch removed from every quadruplex and duplex set.

If this were done, the quadruplex men would be obliged to balance their wires under the conditions under which they are worked and not against a ground which is taken off when the wire is started—a ground which may or may not be in good condition as regards switch contact points and compensating resistance.

For illustration, the writer had occasion, only a short time ago, to go in on a duplex where there were two repeating offices. I was informed that the wire would double all right if the first repeating office could be induced to even it up east. It was one of those days when heavy rains had saturated the wires for a great distance and 50 ohms, one way or the other, would make a very perceptible difference. As is my custom, I felt of the polar relay armature and made a few reversals to see how our balance was before calling in the first repeater office and found that our own balance was over 300 ohms too short. I then asked the distant operator to write and found that it came clear and even. The men were started and it doubled without any complaint. My predecessor on the circuit had taken a careful balance to the ground and assured me that our end was all right, while I balanced to his battery and had the wire started inside of 30 seconds without waiting for anybody's ground.

Later I called up the first repeater on this wire and found that he had one of the old style rheostats. Someone had been sticking plugs in the compensating resistance until he was only giving us 250 ohms when he went to ground. After having him add enough to make it 600 I found practically no difference between a balance to his ground and a balance to either pole of his battery and since then have heard no complaint about the other man's balance east.

I relate this merely to illustrate one of the many causes of unnecessary delay by not only waiting for the repeating station to come in with his ground, but by disputes which very often follow when quadruplex men depend on a ground balance and insist that the other man is out of balance. The case I mention is not an isolated or unusual one. These things are happening every day and will continue to happen until quadruplex men discontinue the use of the ground for balancing. Another thing, the ground switches are often smeared with ink and badly corroded, which frequently makes perceptible differences during fog and rain.

By balancing to the battery I do not mean to have the distant man write his arm off while you

attempt to balance by ear. This is not a balance but a guess, and the accuracy of it is always subject to question. While I do not claim anything new in my method of balancing a quadruplex or duplex, I do claim that if it were universally adopted more than one-half of the delays, now directly traceable to the quadruplex department, would be eliminated.

Everyone in the business knows that balancing a quadruplex or duplex means, primarily, getting the battery through differential relays so that the main and artificial lines shall each receive an equal amount of current, thereby neutralizing the magnetic effect on the armatures. Then why not stop the senders for half a minute while you slowly reverse your poles; place your finger on the armature of your polar relay and gently hold it back from the influence of the distant battery; add or take out resistance in your rheostat until you feel no pull against your finger, either way, as you reverse your poles. It is a simple matter and easily mastered by a little practice.

At the same time you should be able to take a perfect static as well as ohmic balance. Try it. Take any quadruplex or duplex; throw it badly out of balance and then bring it gradually back by the method I have described, noting how the pull against your finger lessens by your reversals, until it disappears entirely when you have reached a balance. This takes practice, of course, but once you become familiar with it you will never ask a man to ground.

Now I hear someone say: "How about centering your armature?" "Forget it." How long does your armature stay where you centered it to the other man's ground if, when they start up, it is a little too light or heavy and you can help it by a little change one way or the other? Balance your wire and adjust your armature when they start. If it does not come up just right with a little manipulation you may be sure that the other man's pole-changer needs attention—your balance is O. K.

There are a great many factors, of course, entering into the proper working of a quadruplex or duplex, affording an almost inexhaustible source of study and investigation and I have found it intensely fascinating. The polar relay alone is a marvel in its action and functions, and there are too few men handling it to-day who are capable of giving a clear and concise description of the differentially wound polar relay; how and why it does the different things required of it under the different conditions. It alone affords opportunity for close study and wonderment, as one feels its varying pulsations under the different conditions existing along the wire which leads into it, and endeavors by reasoning and comparison to determine the cause and effect.

"Pocket Edition of Diagrams," etc., the latest revised edition, 334 pages and 160 illustrations, published by Telegraph and Telephone Age, price \$1.50, contains just the information every telegrapher requires.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. E. BRIDGES

Sole Manufacturer

Hudson Terminal, 30 Church St.
NEW YORK

Western Representative

WATSON INSULATED WIRE CO.
Railway Exchange, CHICAGO, ILL.

The Railroad.

The jurisdiction of Mr. J. J. Ross, Superintendent of Telegraphs of the Michigan Central Railroad, Detroit, has been extended to cover the Detroit and Charlevoix Railroad.

Mr. M. E. Launbranch, manager of the Chicago office of the United States Electric Company, was married at Herkimer, N. Y., on October 18, to Miss Carolyn Perkins.

Mr. J. S. Stevens, Superintendent of Telegraph of the Chesapeake and Ohio Railroad Company, Richmond, Va., is on a leave of absence of three months and is now in California. He will return to the East via Cape Horn.

The telegraph has been displaced by the telephone as the means of despatching trains on 246 miles of the Georgia Railroad. The line from Atlanta to Augusta, 171 miles, is equipped with 28 stations and 5 siding telephones, and the line between Camak and Macon, which is 74 miles in length, has 30 regular stations. Copper wire weighing 210 lbs. to the mile is used for the circuits. The total length of road operated by the company is 307 miles.

The Pennsylvania Railroad Telegraph School at Bedford, Pa., reports that up to September first of this year it had had 243 pupils, of which number 151 were graduated and are now employed as telegraphers. The students are taught all the duties of station agents, and as telephones are now used in train despatching on the Pennsylvania a course in despatching by telephone has been introduced. A pamphlet has just been issued giving a brief description of the work done at the school, and in which the company states that all graduates are given positions on the Pennsylvania.

The quarterly meeting of the superintendents of telegraph of the New York Central Lines occurred in New York, on October 20. Considerable business of a routine character was discussed and disposed of. Those present consisted of Mr. W. W. Ryder, of Chicago, General Superintendent of Telegraph of the New York Central Lines west of Buffalo; Mr. A. B. Taylor, New York, Superintendent of Telegraph of the New York Central Lines east of Buffalo; Mr. C. S. Rhoads, Superintendent of Telegraph of the Big Four, Indianapolis, Ind.; Mr. E. C. Keenan, Superintendent of Telegraph, Lake Shore and Michigan Southern Railroad, Toledo, Ohio; Mr. G. C. Todd, Superintendent of Telegraph of the Nickel Plate, Cleveland, Ohio; Mr. W. L. Connelly, Superintendent of Telegraph of the Chicago, Indiana and Southern Railroad, Gibson, Ind.; Mr. J. J. Ross, Superintendent of Telegraph, Michigan Central Railroad, Detroit, Mich., and Mr. L. A. Lee, Superintendent of Telegraph, Pittsburg and Lake Erie Railroad, Pittsburg, Pa.

Mr. I. T. Dyer, superintendent of telegraph of the San Pedro, Los Angeles and Salt Lake Railroad Company, Los Angeles, Cal., writes: "Your val-

uable and interesting paper, Telegraph and Telephone Age, I find is almost indispensable.

Meeting of Railway Signal Association.

The fifteenth annual meeting of the Railway Signal Association was held in Richmond, Va., October 11, 12 and 13. Reports were presented by the following committees: On signal education; signaling practice and standards; automatic block signals; electric railways; automatic stops and cab signals; wires and cables and storage battery.

Mr. Charles E. Denney, of Cleveland, Ohio, was elected president. Next year's meeting will be held at Colorado Springs, Colo., in October.

Telephone Despatching on the Louisville and Nashville Railroad.

In our issue of October 1, we printed an article regarding the introduction by the Louisville & Nashville Railroad, of telephone train despatching apparatus on its Cumberland Valley and Kentucky divisions, comprising 304 miles of road.

The company is now similarly equipping its Knoxville division. The despatching circuit from Knoxville, Tenn., to Corbin, Ky., a distance of 105 miles, is equipped with nineteen stations, and that from La Follette, Tenn., to Etowah, Tenn., a distance of 114 miles, has sixteen stations. A message circuit from Corbin, Ky., to Etowah, Tenn., a distance of 163 miles, is equipped with 36 stations. These circuits also connect with the Pine Mountain, Olive Spring and Marysville branches.

The selectors and the bells are operated by energy obtained from motor-generator sets operated directly from the primary sources of energy available, and on alternate days, so that the sets are always in an operative condition. All of the offices may be connected with either the train or the message circuit by this arrangement.

Test panels are furnished at all stations, making it possible to introduce a portion of the message circuit into the dispatcher's line, in case of trouble on the train wire. The patching panels employed in the larger stations are of special design, after specifications furnished by Mr. R. R. Hobbs, who has charge of the telegraph business of the entire Louisville & Nashville Railway system.

Work trains and repair trains on this division will be equipped with portable telephone sets, which, used in conjunction with special line poles, make it possible for the employes to get in immediate touch with either the dispatcher or the message operator.

The conduct of the business of this division is carried on under the jurisdiction of Superintendent R. C. Morrison, Trainmaster H. M. Brownie and Chief Dispatcher E. H. McIntosh.

Mr. C. M. Baker, superintendent of construction of the Postal Telegraph-Cable Company, Chicago, says: "I do not see how any one can keep well posted on telegraph and telephone affairs without the Age."

Death of General T. T. Eckert.

General Thomas Thompson Eckert, former president of the Western Union Telegraph Company, died at his summer home at Long Branch, N. J., at 7.30 a. m., Oct. 20. General Eckert was born at St. Clairsville, Ohio, April 23, 1818. His death was probably due to the effect of a peculiar accident which happened to him Sept. 2. He was preparing to retire and in turning around fell and injured his right thigh. He was assisted to his bed and suffered greatly from the shock. From that hour his decline was apparent. He was in a semi-conscious condition several days prior to his death.

In 1847, while residing with his parents at Wooster, Ohio, he read in the National Intelligencer of Washington, about the successful installation of the telegraph between that city and Baltimore. This awakened in him a desire to see and learn more of this new invention. He worked his way to New York and witnessed a demon-

THE LATE GENERAL THOMAS T. ECKERT.

stration of the operation of the telegraph at the Astor House, being present at the opening of the office in that hotel. He remained several days in New York devoting nearly all his waking hours to the study of the telegraph and, before he started homeward, he had mastered the rudiments and learned most of the alphabet. One year later, when the telegraph reached Wooster, he became the operator at that place where he also acted as postmaster.

In 1851 Gen. Eckert took a contract jointly with J. H. Wade, of Cleveland, Ohio, to build a telegraph line on the Fort Wayne Railroad from Pittsburg to Chicago. He afterward became identified with the Western Union Telegraph Company, remaining with it until 1859 when he resigned and went to North Carolina to superintend the affairs of a gold mining company. Returning to the North at the outbreak of the war he was called by Col. Thomas A. Scott to enter the government telegraph service at Washington, first as

manager of the office at McClellan's headquarters, and in January, 1862, as chief of the War Department telegraph staff and superintendent of telegraph lines of the Army of the Potomac. These positions he held until after the close of the war, receiving a commission first as captain, then as major, next as lieutenant-colonel, and on March 13, 1865, was made brigadier-general for "meritorious and distinguished service." He was also appointed assistant secretary of war under Edwin M. Stanton. He resigned from the government service August 1, 1866, to become general superintendent of the Eastern Division of the Western Union Telegraph Company. In 1875 he became president of the Atlantic and Pacific Telegraph Company and five years later president of the American Union Telegraph Company, both of which systems were consolidated with the Western Union Telegraph Company in 1881, when he went back to that company as vice-president and general manager. Upon the death of Dr. Norvin Green in 1892, he became president of the Western Union Company and in 1902 retired from active management and was made chairman of the board of directors, which position he held until the latter part of 1909 when he relinquished all active telegraphic duties.

General Eckert was a man of commanding presence and of great force of character. He possessed an excellent physique which he preserved by careful habits of living. He is survived by two sons, Clendenin and Thomas T. Their mother, nee Emma D. Whitney, of Wooster, Ohio, died in 1868. General Eckert in 1878 married Mrs. Seitzinger, of Reading, who died eleven years ago.

The funeral exercises were held on October 24, at St. Patrick's Cathedral, New York.

A solemn requiem mass was offered by Bishop James A. McFaul, of Trenton, N. J., an intimate friend of the deceased. Many other Catholic clergymen participated in the exercises.

The honorary pallbearers were Mr. Andrew Carnegie, Mr. R. M. Galloway, General Thomas H. Hubbard, Dr. John B. McMahon, Col. Albert B. Chandler, Mr. David Homer Bates, Mr. Charles A. Tinker, Mr. James Merrihew, Mr. P. J. Casey and Mr. William S. Hawk.

Large delegations from the Loyal Legion, the United States Military Telegraph Corps, and the Western Union, Postal Telegraph-Cable, Commercial Cable, and other telegraph and cable companies, were present.

Later in the day the body was placed in the family vault at the old St. Patrick's Cathedral in Mott Street, where the deceased's second wife is buried.

Mr. J. M. Barnes, manager of the office of the Canadian Pacific Railway Company's Telegraph at St. John, N. B., in renewing his subscription, writes: "The Age is as attractive as ever and is always a welcome visitor to my office."

The Turner Monument Fund.

The committee which has been appointed by the Old Time Telegraphers' and Historical Association and the Association of Railway Telegraph Superintendents, to secure funds for and erect a monument at Turner, N. Y., to commemorate the sending of the first telegraphic train order, is making preparations to begin a systematic canvass for subscriptions for this purpose. Circulars will be issued shortly setting forth the object for which the monument is to be erected and the plans of the committee. These circulars will be sent as far as possible to every one who may be interested in this worthy object in order that all may have the opportunity to subscribe to the fund. The committee has found that a very suitable monument may be erected for \$3,000, and will endeavor to raise that amount in order that one of the most important events in railroad telegraphic history may be worthily remembered by future generations.

The committee which has the matter in charge consists of: E. P. Griffith, superintendent of telegraph, Erie Railroad, Jersey City, N. J., chairman; C. Selden, superintendent of telegraph, Baltimore and Ohio Railroad, Baltimore, Md.; E. A. Chenery, superintendent of telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railroad, Montreal, Canada; J. B. Taltavall, editor Telegraph and Telephone Age, New York; Colonel W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia, Pa., and F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All contributions should be sent to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who will act as treasurer of the committee. Acknowledgment of the amounts received will be made in the columns of Telegraph and Telephone Age as soon as possible after their receipt.

Facts Regarding the First Railroad Telegraphic Train Order.

BY WALTER VAIL, DEPOSIT, NEW YORK.

In the Erie Railroad Employees' Magazine of January, 1908, there was an article regarding the first telegraphic train order ever issued in the world. That it was issued by Charles Minot, from Turner to Goshen on the New York and Erie Railroad in 1846.

In an article written by George F. Brigham of Sharon, Wisconsin, and published in the Erie Employees' Magazine of May and June, 1908, it was stated that the New York and Erie Railroad was completed to Middletown in 1846, and to Port Jervis, in 1848, and that there may be a grain of truth regarding Charles Minot's railroad telegraphic train order in 1846. The New York and Erie Railroad was completed to Binghamton in 1848 and was opened to that point on December 27, 1848, by running two excursion trains from Piermont to Binghamton on that date.

It is true that Charles Minot issued the first railroad telegraphic train order that was ever issued in the world, and that it was on the New York and Erie Railroad, and from Turner to Goshen, N. Y.

The two best reasons in the world why the telegraphic train order was not issued by Charles Minot in 1846, is because there was no telegraph line along the New York and Erie Railroad in 1846 between Turner and Goshen, also that Mr. Minot did not come to the New York and Erie Railroad until May 1, 1850.

The first telegraph line built west of the Hudson River, started down town in New York City, ran up the east side of the Hudson to Cold Springs, crossed the river to West Point, then up the river to Newburgh, then to Goshen along a turnpike highway; to Port Jervis, to Narrowsburg, to Honesdale, Pa., to Carbondale, to Binghamton, N. Y., to Owego, to Ithaca, to Buffalo, to Fredonia. It only paralleled the New York and Erie Railroad between Goshen and Narrowsburg.

The New York and Erie Railroad built a telegraph line from Piermont to Port Jervis, and had it the Fall of 1851 to Dunkirk. The line was not in operation in February, 1851, and completed it in through line. It ran from Piermont to Port Jervis, then to Susquehanna, to Hornellsville, to Dunkirk. It was built in four separate sections, and each section was operated independently.

One day in June, 1851, Charles Minot was going west on train 1, which was to meet and pass train 2 at Turner. After waiting about an hour, he went into the telegraph office and asked the operator to call up Goshen and ask him if train 2 had left Goshen yet. The operator replied "No." Then Mr. Minot wrote out that famous telegraphic train order, telling the operator at Goshen to hold all east bound trains there until he arrived on train 1. "Do you understand?" asked the Turner operator. The Goshen operator answered, "I understand that I am to hold all east bound trains here until you arrive on train 1, and will do so." Mr. Minot wrote out the order for the engineer and told him to go ahead; he refused to run on the order, so Mr. Minot took charge of the engine and ran safely to Goshen. That was the beginning of running trains by telegraph. It was adopted on the New York and Erie Railroad its entire length during the summer and fall of 1851. The system was not adopted by other roads until about 1855-6.

Mr. Minot was a railroad engineer, also a telegraph operator. He was on the Boston and Maine as engineer, and finally became superintendent of the road. He came to the New York and Erie from the Boston and Maine, May 1, 1850, as general superintendent.

The first railroad accident ever reported by telegraph was by Wilmot M. Vail, from Goshen to Port Jervis in the spring of 1851, and he was not a telegraph operator either.

When Ezra Cornell's line reached Goshen, the office was located in a store kept by Lebbeus L. Vail,

father of Hector, Nathaniel and Wilmot M. Vail. Hector and Nathaniel learned the telegraph business. Hector went to Port Jervis, and Nathaniel remained at Goshen. They operated the Cornell line. There was no railroad telegraph line at that time.

John R. Irwin, Wireless Operator of the Airship "America."

Mr. John R. Irwin, who was the wireless telegraph operator on the Wellman airship "America," which started from Atlantic City on October 15 to cross the Atlantic Ocean and which was finally abandoned at sea October 18, has returned to *terra firma* with the rest of the crew, none the worse for his remarkable experience. He is now stopping at the Waldorf-Astoria Hotel, and is enjoying a degree of public attention that seldom comes to man.

Mr. Irwin's experience on board the "America" was naturally full of excitement and interest. He says that during the entire trip, which lasted seventy-two hours, the wireless worked perfectly, and that he was in communication with Atlantic City and Siasconsett, Mass., for thirty-five hours after leaving. The instrument he carried on the "America" was only strong enough to send messages 100 miles through the air.

After the "America" began encountering heavy winds and high seas off Nantucket and farther up the coast, Mr. Irwin got outside the sending zone, and found himself in a strange plight. He was able to pick up all sorts of messages, but could not answer any of them. Messages came from Mr. Wellman's wife, from steamers and land stations. All were messages of inquiry, but Mr. Irwin could not respond.

"It was a strange thing," said Mr. Irwin. "Here I was sitting in the lifeboat under the framework of the airship, getting all kinds of inquiries, and not being able to answer them.

"The longest sleep I got was on Monday night. On Tuesday morning I received a message from Cape Cod, and in my log wrote: 'It seems like home.' After that I went to sleep and did not wake up until they called me and said a steamer had been sighted."

Mr. Irwin's log, giving the wireless messages exchanged between the airship and the steamer "Trent" from the time the "Trent" was sighted until the rescue, is a deeply interesting one.

Mr. Irwin first tried to raise the "Trent" by wireless but failed. It was then nearly four o'clock in the morning. He concluded that the wireless operator on the "Trent" was asleep, and then he brought out a pocket electric light and began flashing the Morse code with it. The look-out on the "Trent" saw what Mr. Irwin was trying to do, and the following messages were exchanged between the airship and the "Trent" by this unique, improvised system of telegraphy:

Irwin: "We are in distress; have lost control

of our airship; we need help; am on the airship 'America.' I have wireless on board. Use your wireless." (This was kept up for half an hour, when the wireless apparatus on the "Trent" began working.)

The Trent: "Do you want our assistance?"

Irwin: "Yes, come at once. In distress. We are drifting; not under control."

The Trent: "What do you want us to do?"

Irwin: "Come ahead full speed, but keep astern, as we have a heavy trail dragging."

The Trent: "O. K. Am standing by wireless in case of trouble."

Irwin: "You had better pick us up by daylight. You will be better able to see us then. Come in close and put bow of your ship under us. We will drop you a line, but do not stop your ship or you will capsize us. Who are you, and where are you bound for?"

The Trent: Steamship "Trent," bound for New York."

Irwin: "Have you any of your boats ready to launch, as we will probably capsize when we launch our boat."

The Trent: "O. K. Boat manned. Are we gaining on you?"

Irwin: "Yes, we are getting ready to launch."

The Trent: "Shall we stop for you?"

Irwin: "Don't stop. We will drop a sea anchor, and try to check our ship."

Irwin: "Have a motor going above me. Can't hear your signals now. Will say when I can. We are pumping air into airship ready to bring her down level."

The Trent: "We are going at full speed, waiting for your orders."

Irwin: "We are going to launch boat. Stand by to pick us up."

Wireless communication was then closed.

Mr. Wellman, the head of the expedition, gives unstinted praise for his comrades for the courage and resolution displayed by them. "Jack" Irwin, he says, smiled and cracked jokes in the hour of greatest danger, and scored a remarkable technical feat for the Marconi Wireless Telegraph Company by being the first to send messages ashore from a ship sailing in the air over the ocean.

Mr. Irwin was born at Echuca, Victoria, Australia, in 1881, but his home, almost from infancy, was in West Australia, where he learned telegraphy. He worked in South Africa during the Boer War, and has been in this country five years in the service of the Commercial Cable Company and the Marconi Wireless Telegraph Company. During this time he has filled the position of wireless operator on several ocean steamers, his last being on the *St. Louis*, of the American line. At the time of the loss of the steamer *Republic* by collision with the steamer *Florida*, in February, 1909, he was the operator on duty at the Siasconsett, Mass., station when the "C. Q. D." signal of distress was sent out by "Jack" Binns, from the *Republic* as that steamer was sinking.

Mr. Irwin is a frequent caller at the office of *Telegraph and Telephone Age*, and is also a contributor to the paper. He is well known to the telegraph fraternity in Australia, South Africa, as well as in New York.

Radio-Telegraphy.

Mr. Robert H. Marriott, of Brooklyn, N. Y., has been granted a patent, No. 972,004, for an antenna.

A patent, No. 972,721, has been granted to Mr. O. Rochefort, Paris, France, for a receiver for wireless telegraphy and telephony.

A patent, No. 971,935, has been granted to Mr. E. J. Simon, of New York, for a spark gap for radiotelegraph systems.

The *Telefunken Gesellschaft* claims to reach in a normal plant an efficiency of 75 per cent., and the *Lepel Wireless Syndicate* claims to get higher than 60 per cent.

Mr. G. W. Pickard, of Amesbury, Mass., has been granted patent No. 972,715 for a telephone receiving apparatus for wireless telegraph and wireless telephone systems.

An international conference on radio-telegraphy will be held in Berlin in the spring of 1911. Invitations to participate have been sent to all the nations who were represented in the 1906 congress.

The *Deutsche Ost Afrika Linie*, of Hamburg, whose ships carry on trade around the African continent, is installing the *Telefunken* wireless telegraph system on its nine main-line vessels, and a new boat now approaching completion will be similarly equipped.

A committee representing the United States Navy, the Army and the Philippine Insular Government is making an investigation of the requirements and preparing plans for the establishing of a wireless system which will place every section of the archipelago in touch with Manila.

In compliance with the law passed by Congress requiring all vessels calling at United States ports which carry more than fifty passengers to be equipped with wireless, the owners of the *Blue Funnel Line* which plies between Tacoma, Wash., and Liverpool, England, have ordered *Marconi* wireless apparatus for all their vessels.

The revolution in Portugal has directed attention to wireless telegraphy in connection with its political value in a manner that has hardly been appreciated up to the present. Owing to the fact that the land telegraph lines had been cut wireless communication was maintained with foreign countries from the war vessels in the harbor at Lisbon.

It is reported that the *Fessenden Wireless Telegraph Company* of Canada, has made a proposal to the Royal Commission on Trade Relations between Canada and the West Indies, looking to the estab-

lishment of a chain of wireless stations to link together Great Britain, Canada and the English possessions in South Africa and the West Indies. It is stated that this company expects to be able to reduce the rate for trans-Atlantic messages to one-half pence per word.

In a recent number of a German publication Mr. Paul Schwarzhaupt gives the results of some extensive observations made of abnormal transmission of electromagnetic waves. The general results of these observations show that the phenomenon of abnormal range occurs only at night and that in regard to atmospheric troubles such disturbances always begin in the afternoon, reaching their maximum toward midnight, and disappearing almost completely by sunrise. They are most frequent in tropical climates. They are more violent in summer than in winter, in consequence of the more frequent thunderstorms. They are particularly noticeable in the neighborhood of high mountains, e. g., the Red Sea, the coasts of Italy and Spain. In the Mediterranean Sea the disturbances in winter are relatively weak. Frequently violent disturbances are observed when the sky is quite clear; it is assumed that these proceed from a distant thunderstorm.

Canada the Telegrapher's Opportunity.

Canada offers better opportunities today for the success of enterprise in business life than can, as a rule, be found on this side of the border, for the reason that it is a comparatively new and growing country. The wave of expansion is on the increase and many men in the "States" are seizing the opportunity to better their condition by taking up their abode in Canada. Telegraphers are no exception. The country is rapidly developing its great natural resources and business is expanding in a corresponding degree. Increasing business means an increasing demand for greater telegraph facilities, and the demand for operators is therefore naturally growing. Canada has unlimited power of absorbing telegraphers, and this demand results in a higher wage-level, as compared with the salaries paid in this country. Young telegraphers, and older ones too, even those with families, will find greater independence and comfort on Canadian soil than in the United States, where life and freedom are confined to comparatively narrow limits. Here is something for ambitious spirits to ponder.

LETTERS FROM OUR AGENTS.

JACKSONVILLE, WESTERN UNION.

Mr. F. M. Houser, chief operator in this office, has been promoted to be district supervisor with headquarters in this city.

Mr. R. L. Branton, night chief, has been appointed chief operator to succeed Mr. Houser.

Mr. C. A. Nichols, all night chief, has been advanced to be night chief operator to succeed Mr.

Branton, and Mr. J. H. Nelson has been appointed night traffic chief.

Mr. G. C. Harris, wire chief, has been appointed district traffic chief with headquarters in this city.

Mr. J. C. Wright has been appointed wire chief to succeed Mr. Harris.

Mr. W. J. Delaney, assistant day traffic chief, has been advanced to the position of day traffic chief, and V. T. Reynolds from operator to assistant day traffic chief.

Messrs. V. G. Shearer and T. F. Wallace have been appointed repeater chiefs.

Mr. W. R. Shearer has been appointed all night chief operator.

Mr. J. W. Ware has been appointed District Commercial Agent.

NEW YORK NEWS.

Assessment No. 515 has been levied by the Telegraphers' Mutual Benefit Association to meet the claims arising from the deaths of John J. Barry, at New York; Robert W. Chapman, at Brooklyn; Henry S. Bruner, at Oakland, Cal.; William H. Cohn, at Berkeley, Cal.; James S. Garwood, at Lynn Haven, Va., and Alfred T. Noarse, at Sherbrooke, Que.

The annual meeting of the Telegraphers' Mutual Benefit Association, will be held at 195 Broadway, New York, on the afternoon of November 16, and the visiting delegates will be the guests of the Magnetic Club at its fall dinner, which will be held in the evening of the same day at the St. Denis Hotel.

Signal Corps Camp Organized in Chicago.

A new camp, named after General A. W. Greeley, and composed entirely of Signal Corps men who served in the Philippines, Porto Rico and Cuba has been organized in Chicago, and has been affiliated with the United Spanish-American War veterans. The officers are: Captain J. W. McConnell, commander; R. S. Gill, senior vice-commander; H. S. Deacon, junior vice-commander, M. J. Connelly, adjutant; J. W. Konigsmark, quartermaster; D. F. Delahunt, chaplain; A. L. Ewing, surgeon; George Lee, L. H. Wilson, P. A. Johnson, trustees; S. W. Wooster, officer of the day; J. W. Bowen, officer of the guard. Colonel Glassford, chief signal officer of the department of the Lakes is a member of the new camp.

The object of the organization, which is composed principally of telegraphers employed in Chicago at the present time, is to enroll all honorably discharged Signal Corps men who served during the Spanish-American war.

Wanted.

A telegraph operator, single man, to fill the position of telegraph and telephone inspector in one of the Central American Republics. The salary is \$110 per month for the first year, and after that, if services are satisfactory, \$125 per month, and actual traveling expenses. The applicant must be experienced in construction, maintenance, etc., pertaining to telephone lines. The right man will be eligible for promotion within a year, to a more important division with increase of salary. Address "Inspector," care Telegraph and Telephone Age, 253 Broadway, New York.

The Serial Building and Loan Savings Institution is essentially a telegrapher's institution, conducted by and for telegraphers. Telegraphers can become their own landlords by paying to the association what they pay for rent and at the end of a certain period have their house entirely paid for. The association has been in existence for twenty-five years and more than 1,100 persons have secured homes through its aid. Think of this record and the good accomplished, then write to headquarters at 195 Broadway, New York, for information as to how to become a shareholder.

A certificate of membership in the Telegrapher's Mutual Benefit Association, 195 Broadway, New York, affording protection for the family and dependents in the amount of \$500 or \$1,000, which is at once available and cannot be diverted from its mission, should be held by every eligible person between the ages of 18 and 45 engaged in telegraph and telephone service, either commercial or railroad. If those not now members could realize and fully understand the stern necessity for beneficial help too often experienced by bereft families, would they not make earnest effort to secure such provision? Write for particulars.

This publication office is headquarters for all electrical and other technical books.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEYBOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

SOME POINTS ON ELECTRICITY—VI.

A Study of Telegraph Apparatus.

By WILLIS H. JONES.

THE POLECHANGER.

A polechanger, as the name signifies, is an instrument used for the purpose of reversing the polarity of the battery.

One might naturally conclude that almost any device possessing two contact points would answer the purpose, but a little reflection will show that such is not the case. Otherwise the present cumbersome walking-beam pattern would long ago have been discarded.

There are at present only three patterns that are used to any great extent, viz: The walking-beam, the clock-face, and the double-lever relay instrument used by the Postal Telegraph-Cable Company. These polechangers perform the same service, but do it in a different way, and the reason they do it differently is the point the student should study.

Every quadruplex attendant knows that where a sounder and a walking-beam pattern polechanger

are connected in series that the sounder will work solid and natural in nearly every case, while the polechanger will feel almost every alteration in the volume of current when a different loop is substituted, and require a different adjustment in many cases.

In view of this fact the writer has frequently been asked why the sounder itself, if provided with an upper and lower contact point, and the lever insulated, might not be made to serve equally well as a polechanger.

The explanation is that the sounder method would require so great an air gap between the one set of contact points in order to prevent excessive sparking that the period or duration of the break would be greatly increased.

It should be remembered that where the dynamo is used the tension across the air gap is always just twice as great as the value of the electromotive force which supplies current to the line. Thus, where each pole is, say 320 volts, there would be 640 volts across the air gap.

In order to minimize the harmful effect of this double pressure the walking beam pattern was adopted with the view of providing a second air gap, which, while creating twice the resistance would not necessitate widening the contact point space in so great a degree. Where the dynamo is employed the "break" is an unavoidable necessity, otherwise the old continuity contact preserving method would be preferable in many respects.

Apropos of this subject it may not be out of order to call attention to the fact that since the former long quadruplex circuits have been quite generally reduced to polar duplex circuits, the walking beam pattern has been giving considerable trouble for no other reason than that the attendants have grown somewhat careless in many instances in the matter of keeping the polechanger adjusted closely. On quadruplex circuits it was absolutely necessary to maintain a close adjustment of the contact points in order to not "break over" on the common side. Hence the mechanical inertia was so small that slight alterations in the volume of local current when different loops were substituted caused but little trouble.

Now-a-days, owing to the fact that a slightly wider play of the lever on duplex circuits does not materially affect the line work, the habit of giving the lever an abnormal play in order to better hear one's sending has increased the mechanical inertia so much that the polechanger feels every alteration in the local current when a loop is changed, and instead of remedying the fault by a proper readjustment the usual cry is for "more current." Where the volume of current is normal there is no reason why it should not be as efficient as heretofore and cause just as little trouble.

The polechanger used by the Postal Telegraph-Cable Company obtains the double break or two air gaps by employing two relays, which work in unison, the respective levers of which each furnish one gap. By this means each air space may be made very small and yet create sufficient resistance to prevent undue sparking at the contact points.

THE CLOCK-FACE POLECHANGER.

The clock-face pattern, so-called because of a slight resemblance to a clock, has four contact points instead of two, and was designed for the chemical battery system. No break or airgap results when the polarity of the battery is reversed, hence the name, "continuity preserving contact" polechanger. When the four contact points are properly adjusted it is the ideal polechanger for multiplex circuits, but unfortunately it cannot be used in connection with the dynamo and leakbox system except on very short circuits which require only a very low electromotive force.

With this polechanger only one battery is required, and when the polarity is to be reversed, the duty of this device is simply to turn the battery around, so to speak. It accomplishes this by connecting first the positive end of the row of jars to the line and grounding the other end in one position, and the negative to line and positive to ground when the position of the lever bar is reversed. Hence only one battery is required, and aside from a momentary shortcircuiting of the battery while the contact points are passing, there is nothing to cause excessive sparking.

The student will thus see that the different patterns are not merely selected through choice or fancy but that there is a good reason for each construction.

(To be continued.)

Recent Telegraph and Telephone Patents.

No. 972,814 for an electrical relay, to J. F. Cadell, Baltimore, Md.

No. 972,839 for a telephone attachment, to W. C. Fisk and H. L. White of Orofino, Idaho.

No. 972,874 for a self acting telephonic line connecting system, to B. Kugelmann of Bad Kissengen, Germany.

No. 972,988 for indicating means for party lines telephone, to J. H. Blythe of Denver, Col.

No. 972,994 for an insulator for telegraph and telephone wires, to J. H. Campbell, Ripley, Ohio.

No. 973,198 for a telephone receiver holder, to J. F. Hines, Pittsburg, Pa.

No. 973,898 for signaling system, to E. Parsons, Chicago, Ill.

The following patents have expired:

No. 507,170. Electric Signal Alarm for Railway Trains, issued to James M. Rupel, Kansas City, Kan.

Nos. 507,205 and 507,206. Electric Selecting Device, issued to Samuel S. Bogart, New York, N. Y.

No. 507,510. Railway Time and Block Signal, issued to Adelbert H. Thorp, Toledo, Ohio.

No. 507,518. Electric Apparatus for Controlling

Signals, issued to Michael B. Leonard, Richmond, Va.

No. 507,568. Telephone Circuit, issued to John S. Stone, Boston, Mass.

No. 507,604. Telephone-Transmitter Circuit and Apparatus, issued to John S. Stone, Boston, Mass.

No. 507,715. Telephone Transmitter, issued to James H. Mason, Brooklyn, N. Y.

No. 507,728. Telephone, issued to Stephen D. Field, Stockbridge, Mass.

No. 507,791. Machine Telegraphy, issued to Patrick B. Delany, South Orange, N. J.

No. 507,918. Electric Train and Switch Signal Device, issued to George E. Miller, Saugus, Mass.

Personal.

Mr. George C. Maynard, a forty-niner of the telegraph and a military telegrapher, for many years past identified with the Smithsonian Institute, Washington, D. C., was a recent New York visitor.

Mrs. John Brant, wife of the late John Brant, for many years secretary of the Old Time Telegraphers' and Historical Society, who died August 26, 1908, has just returned to New York after touring Europe for the past nineteen months.

His Excellency the Hon. R. Nakakogi, vice minister of the Department of Communication of the imperial Japanese government, and party, whose presence in this country was noted in our issue of October 16, recently visited Chicago on their way home. Mr. B. E. Sunny, president of the Chicago Telephone Company and Mr. Angus S. Hibbard, vice-president, showed the party through the main exchange. The visitors were afterward taken to the main operating room of the Western Union Telegraph Company where they witnessed the complementary operation of the telegraph and telephone. A luncheon was given to the party at the Union League Club, among those present being Mr. W. J. Lloyd, Division Traffic Superintendent of the Western Union Telegraph Company, Mr. J. G. Wray, chief engineer of the Chicago Telephone Company, and Mr. G. E. Cullinan, assistant manager in Chicago of the Western Electric Company.

Mr. Marvin Hughitt, of Chicago, who has retired as president of the Chicago & Northwestern Railroad, started his business career as a telegrapher. He went to Chicago from Buffalo when the late Emory Cobb became manager of the Western Union Chicago office in the early fifties. Mr. Hughitt afterward became train dispatcher on the Illinois Central Railroad and later general superintendent. He was in the service of the Chicago & Northwestern Railroad for thirty-eight years, twenty-three of which he was president. On his retirement from the presidency he was elected chairman of the Board of Directors of the company.

Mr. Hughitt has been succeeded as president by Mr. William A. Gardner, also a former telegraph operator. Mr. Gardner is fifty-one years of age,

and learned telegraphy on the Chicago & Alton, and Illinois Central Railroads. He spent the greater part of his life in the service of the Chicago & Northwestern Railroad, starting as telegraph operator and being rapidly promoted through every step of the operating department, until he now is regarded as one of the ablest railroad officials in the United States.

Mr. Thomas Ahearn, of Ottawa, Ont., well-known in the telegraph, telephone and electrical fields in the United States and one of the most able and successful promoters and managers of electrical properties in Canada, is the subject of a very interesting sketch in the *Toronto Saturday Night*, October 29. Mr. Ahearn started his business life as a telegraph messenger in Ottawa, and after becoming an operator he worked for two years in the New York office of the Western Union Telegraph Company. As a result of the great success of his many electrical enterprises in Canada he is now classed as one of the wealthiest men in the Dominion.

Mr. Francis W. Jones, formerly, and for many years, electrical engineer of the Postal Telegraph-Cable Company, New York, has gone to West Palm Beach, Fla., for the winter. Mr. Jones retired from active telegraph service three years ago.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. E. J. Nally, vice-president and general manager of the company, has returned to his office after a trip through the southern and western divisions. While in Atlanta he attended a conference of district superintendents of the Southern Division. The following named gentlemen were in attendance: Mr. E. B. Pillsbury, general superintendent, New York; Mr. George H. Usher, general superintendent; Mr. G. E. Paine, assistant general superintendent; Mr. B. S. Price, superintendent of construction and Mr. J. P. Edwards, division electrical engineer, Atlanta; Mr. G. W. Ribble, district superintendent, Richmond, Va.; Mr. Jesse Hargrave, district superintendent, Birmingham, Ala.; and Mr. C. B. Arrington, district superintendent, Nashville, Tenn. Mr. Usher entertained the visitors with a dinner at the Capital City Club, after the business of the meeting was disposed of.

Mr. Charles P. Bruch, vice-president, has been confined to his home for the past three weeks, suffering from an affection of the eyes. He expects to return to his desk within a week.

Mr. James P. O'Donohue has been appointed division electrical engineer of the Eastern Division, to succeed Mr. F. E. d'Humy, resigned.

The "Postal Telegraph" for November contains several pages of interesting and instructive reading matter of a general character, besides a good deal of information that every telegrapher should know. The article on "The Child Labor Question Applied to the Messenger Service," which was published in *Telegraph and Telephone Age*, October 16, is re-

produced. The frontispiece consists of a full page portrait of Mr. W. C. Lloyd, the manager of the New Orleans office.

This company has laid another large cable across the Hackensack River for the Pennsylvania Railroad Company, near the entrance to the New York tunnels.

Mr. D. H. Gage, Jr., district electrician at Philadelphia, has been attached to the Electrical Engineer's office, New York.

Mr. F. W. Towne, of Bridgeport, Conn., has been appointed manager of the Poughkeepsie, N. Y., office, to succeed Mr. C. E. Williams, resigned.

Mr. S. M. English, president and general manager of the Postal Telegraph-Cable Company of Texas, announces the following changes in the service of that company:

Mr. W. L. Jones has been appointed secretary and auditor to succeed Mr. J. Q. Pipkin, resigned.

Mr. L. A. Ott, manager at Austin, Tex., has been appointed manager at Dallas, vice W. L. Jones.

Mr. Ed. Bennett has been appointed superintendent of construction and equipment to succeed Mr. M. B. Wyrick, resigned.

Mr. S. S. Scothorn, formerly chief operator at Dallas, Tex., has been appointed manager at Austin, Tex.

James P. O'Donohue, Division Electrical Engineer, Eastern Division, Postal Telegraph-Cable Company.

Mr. James P. O'Donohue who has just been appointed division electrical engineer of the Eastern

JAMES P. O'DONOHUE,
Division Electrical Engineer, Eastern Division, Postal Telegraph-Cable Company, New York.

Division of the Postal Telegraph-Cable Company, at New York, was born in Ireland, June 2, 1873. He began his telegraph career as a messenger in Boston, Mass., in August, 1885, and has since held positions as operator, branch office manager, quadruplex chief and wire chief, and held the position of district electrician in Boston, and was in 1908 transferred to the office of the Electrical Engineer in New York, where he remained until his appointment as division electrical engineer.

Magnetic Club Aeronautic Dinner.

The autumn meeting of the Magnetic Club, to be held at the St. Denis Hotel, New York, November 16, will be an Aeronautic dinner. Mr. Clifford B. Harmon, the well-known American aviator and Mr. John Barry Ryan, commodore of the United States Aeronautical Reserve will be guests and speakers at the meeting. Many prominent telegraph people will be present on this occasion. An excellent entertainment programme has been arranged.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. E. J. Hall, chairman of the executive committee, has gone to London on business connected with the service.

The entire State of West Virginia has been added to the Eastern Division. Some portions of the State were formerly in the Eastern, Southern and Western divisions. General Superintendent A. G. Saylor, and division commercial superintendent, E. M. Mulford recently visited those offices in West Virginia which have been transferred to their territory.

Mr. William Finn of the office of the engineer of equipment, is making a trip in the South which will take him as far as Jacksonville, Fla., on company business.

The general superintendents and the division commercial superintendents from five of the six divisions are this week holding a conference in New York on business connected with the service. The Pacific division is not represented at the conference.

Mr. John F. Wallick, superintendent at Indianapolis, Ind., has been appointed general agent of the Company, with headquarters in that city.

The following appointments have been made in the Eastern Division:

THIRD DISTRICT, PITTSBURG, PA.

N. E. Church, district commercial superintendent.
E. W. Dodge, district traffic superintendent.
W. W. Oldheiser, district plant superintendent.

FOURTH DISTRICT, PHILADELPHIA, PA.

W. A. Sawyer, district commercial superintendent.

J. M. Creamer, district traffic superintendent.

R. J. Meigs, district plant superintendent.

FIFTH DISTRICT, BOSTON, MASS.

L. D. Wilbourn, district traffic superintendent.

SIXTH DISTRICT, ST. JOHN, N. B.

C. W. McKee, district commercial superintendent.

D. C. Dawson, district traffic superintendent.

A. D. Wetmore, district plant superintendent.

The following appointments have been made in the Western Division:

FIRST DISTRICT, CHICAGO, ILL.

A. B. Cowan, district commercial superintendent.

J. J. Welch, district traffic superintendent.

W. C. Titley, district plant superintendent.

FIFTH DISTRICT, CLEVELAND, OHIO.

J. Fitzpatrick, district commercial superintendent.

F. J. Dayman, district traffic superintendent.

W. W. Watt, district plant superintendent.

SIXTH DISTRICT, INDIANAPOLIS, IND.

A. C. Cronkhite, district commercial superintendent.

E. Parsons, district plant superintendent (sixth and seventh districts).

SEVENTH DISTRICT, CINCINNATI, OHIO.

J. N. Miller, district commercial superintendent.

A. A. Montgomery, district traffic superintendent (sixth and seventh districts).

EIGHTH DISTRICT, MINNEAPOLIS, MINN.

A. D. Bradley, district commercial superintendent.

R. W. Kean, district traffic superintendent.

A. Young, district plant superintendent.

The following appointments have been made in the Mountain Division:

FIRST DISTRICT, DENVER, COL.

George R. Allen, district traffic superintendent.

SECOND DISTRICT, SALT LAKE CITY, UTAH.

E. C. Labadie, district traffic superintendent.

R. P. Cowardin, district plant superintendent.

THIRD DISTRICT, OMAHA, NEB.

C. B. Horton, district commercial superintendent.

J. P. Barnhart, district traffic superintendent.

W. Salisbury, district plant superintendent.

The following appointments have been made in the Gulf Division:

FIRST DISTRICT, DALLAS, TEX.

W. P. Davis, district traffic superintendent.

SECOND DISTRICT, NEW ORLEANS, LA.

T. P. Cummings, district commercial superintendent.

H. Vandevender, district traffic superintendent.

THIRD DISTRICT, OKLAHOMA.

A. R. Lingafelt, district commercial superintendent.

These appointments are additional to those already noted in these columns.

Mr. E. S. Anderson has been appointed chief operator of the Baltimore, Md., office to succeed Mr. L. D. Wilbourn, transferred to Boston.

Mr. W. W. Murphy, who was recently promoted from the managership of the Chattanooga, Tenn., office to a position in the Atlanta, Ga., office, was presented with a handsome walrus hand bag by his associates in the Chattanooga office on the eve of his departure.

Mr. J. H. Therrell, of Thomasville, Ga., has been appointed district commercial agent in Georgia and South Carolina, with headquarters in Atlanta. He is a brother of Mr. D. M. Therrell, division traffic superintendent of the Southern Division.

Mr. B. P. Hancock has been appointed division traffic supervisor of the Southern Division, with headquarters at Atlanta, Ga. Mr. Hancock was formerly with the Postal Telegraph-Cable Company, at Birmingham, Ala.

Mr. J. M. Green, of San Francisco, has been appointed manager of the office at Sacramento, Cal., vice Mr. William Dumars, who was transferred to a position in the superintendent's office in San Francisco.

Mr. H. A. Emmons, formerly of the Boston office of the Postal Telegraph-Cable Company, and later with the American Telephone and Telegraph Company, has been attached to the office of Mr. W. N. Fashbaugh, traffic engineer, New York.

Mr. Walter A. Houghtaling, of the Rowland Printing Telegraph Company, Baltimore, Md., has accepted a position in the traffic department, New York. Mr. Houghtaling is 41 years of age and has had a wide experience in telegraph and telephone engineering. He graduated from the position of telegraph operator to be an assistant in the engineering department of the Postal Telegraph-Cable Company, New York. For the past eight years he has been identified with the Rowland printing system and did excellent work for the Company in introducing its multiplex apparatus in Germany and in the United States.

The Western Union Telegraph Company is building a copper wire circuit between Wichita, Kan., and Amarillo, Tex., on the Pan Handle branch of the Atchison, Topeka & Santa Fe Railroad for telegraph and telephone purposes. The line is to enable the Western Union Company to reach by wire those towns along the Panhandle line in which the railroad company does not keep a telegraph operator. Telephones will be placed in the several depots in lieu of telegraph instruments.

**T. E. Fleming, Commercial Superintendent,
American District Telegraph Company
of New Jersey.**

Mr. Thomas E. Fleming, who was recently appointed Commercial Superintendent of the American District Telegraph Company of New Jersey, and attached to the office of Vice-President W. H.

THOMAS E. FLEMING,
Commercial Superintendent, American District Telegraph Company
of New Jersey, New York.

Baker, New York, began his business career as a messenger in the Western Union Telegraph Company shortly after the removal of that company to

195 Broadway, New York. The advantages of an excellent common school education told in young Fleming's behalf, for he speedily received promotion, first serving as a clerk in the cable department, later going to the French Cable Company, afterwards to the American Union Telegraph Company and the American Telegraph and Cable Company, subsequently serving for a brief term in the superintendent's office of the Western Union Telegraph Company. After a further career of several years, both in and out of the telegraph service, during which time he served as chief clerk, first in the operating department of the Baltimore and Ohio Telegraph Company, New York, he was employed as chief clerk under Mr. W. J. Dealy, when that gentleman was manager of the operating department of the Western Union Telegraph Company. Mr. Fleming served from 1888 to 1897 as secretary of the Telegraphers' Mutual Benefit Association. On June 1 of the latter year he entered the employ of the Postal Telegraph-Cable Company, as chief clerk in the general manager's office. He was appointed special agent of the company in 1899.

In 1906 Mr. Fleming was elected assistant secretary of the Postal Company and in 1907 was appointed manager of the Contract Message Bureau. When the Postal Employees Association was formed he was elected its secretary and the detail work of the Association was under his direction. Notwithstanding his varied duties, Mr. Fleming found time to write several short stories and sketches, generally of a humorous character. He was a frequent contributor to, and later became editor of "The Postal Telegraph." It will be seen that he has returned as superintendent to the building where he started his telegraph career over thirty years ago as messenger.

F. E. d'Humy.

Mr. F. E. d'Humy, who has just been appointed to a position in the office of the engineer of equipment of the Western Union Telegraph Company, New York, was born in London, England, in 1873, and received his education in private schools

F. E. D'HUMY,
of the office of Engineer of Equipment, New York.

in England and France. He came to the United States in 1888 and entered the service of the Water Primary Battery Company. Early in 1890

he went to Nova Scotia as a photographer, but returned to the United States and accepted a position with the Western Electric Company, New York, as wireman.

In June, 1891, he entered the service of the Postal Telegraph-Cable Company at Boston and was placed in charge of the dynamo plant. During the Spanish-American war he was, in 1898, relieved from duty in Boston to accept an appointment as first lieutenant in the Volunteer Engineering Corps, in connection with electrical work for the defense of Boston harbor.

Mr. d'Humy was transferred to New York in 1904 as district electrician. In 1906 he was appointed division electrician of the Eastern Division of the Postal Company, and, in 1907, was promoted to the position of assistant electrical engineer, which position he held at the time of his resignation.

Mr. d'Humy's professional experience will be a valuable addition to the Western Union Company's engineering department, and with the wider opportunities offered in his new position he will make himself felt in the work of developing the company's large plans. He possesses an irreproachable character and is regarded as one of the most painstaking and active young men in his profession. His departure from the Postal Company's service was attended with many regrets on the part of his superiors and associates, all of whom wish him much success in his new field of work.

**J. E. Peacock, District Traffic Superintendent,
Western Union Telegraph Company,
Jacksonville, Fla.**

Mr J. E. Peacock, district traffic superintendent of the Western Union Telegraph Company at Jacksonville, Fla., whose appointment to this

J. E. PEACOCK,
District Traffic Superintendent, Jacksonville, Fla.

position was noted in our issue of October 16, was born in Decatur County, Ga., December 15, 1865.

In the summer of 1884 he entered the Western Union Telegraph Company's service as manager and operator at Waynesborough, Ga. He afterward went to Savannah, Ga., as operator for the same company, and later became manager of the St. Augustine, Fla., office. He was out of the telegraph service for two years, but returned to it, becoming manager of the Jacksonville Western Union office which position he held from January, 1894, until October 1, 1910, when he was promoted to his present position.

**R. W. Whitehead, Division Plant Superintendent,
Western Union Telegraph Company,
Denver, Colo.**

Mr. R. William Whitehead, whose appointment as Division Plant Superintendent of the Western Union Telegraph Company at Denver, Colo., was noted in our issue of October 1, was born in New York City, March 30, 1872. He was educated at Yale University, receiving a degree of Ph.B. from the Sheffield Scientific School in 1893.

In 1894, he went with the New England Telephone and Telegraph Company in Boston, being associated with the engineering and construction departments. He was finally made construction engineer. In 1902, he went with the Western Telephone and Telegraph Company, with headquarters in Detroit, Mich., where he occupied the position of construction engineer for one year. In 1903, he went with the Michigan Telephone Company in the same city as assistant engineer resigning in 1904 as acting engineer. In 1904, he became assistant engineer of the Southern New England Telephone Company, a position which he held until May 2 of this year, when he was appointed assistant superintendent of plant and plant engineer. On October 15, he received his present appointment.

**L. H. Beck, Division Plant Superintendent,
Western Union, Atlanta, Ga.**

Mr. Lewis Howard Beck, who has recently been appointed division plant superintendent of the Western Union Telegraph Company at Atlanta, Ga., has had an extensive experience in construction work which admirably fits him for the duties of his new position. Mr. Beck was born at Boston, Mass., September 15, 1872. In 1888 he entered the general offices of the American Bell Telephone Company at Boston. In 1890 he was attached to the engineering department of that company. In 1899 he became assistant engineer of the Bell Telephone Company of Buffalo, and in 1902 was advanced to be superintendent of construction. On January 1, 1910, when that company was consolidated with the New York Telephone Company, Mr. Beck was appointed district plant superintendent of the Buffalo district of the latter company. This position he held at the time of his transfer on October 1 to the Western Union service at Atlanta.

**U. G. Life, District Commercial Superintendent,
Western Union Telegraph Company,
Salt Lake City, Utah.**

Mr. U. G. Life, district commercial superintendent of the Western Union Telegraph Company, Salt Lake City, Utah, mention of whose appointment was made in our issue of October 16, was born in Virginia, Nov. 6, 1869. He entered the telegraph service at Beattie, Kans., in 1882, and has held positions as operator, manager, railroad agent and dispatcher at various points, and chief clerk to railroad general superintendent. He also occupied the position of adjuster and was engaged in transportation service, finally becoming assistant superintendent of telegraph of the St. Joseph & Grand Island Railway, from which position he received his present promotion.

**R. H. Tudor, Manager, Western Union Telegraph
Company, Chattanooga, Tenn.**

Mr. R. H. Tudor, whose appointment as manager of the Chattanooga, Tenn., office of the Western Union Telegraph Company was mentioned in our issue of November 1, was born at Paint Lick, Ky., February 1, 1885, where he began his telegraph

R. H. TUDOR.

Manager, Western Union Telegraph Company, Chattanooga, Tenn.

career at the age of fifteen. After mastering telegraphy he became the agent of the Louisville & Nashville Railroad Company at the same point. Later he left the railroad service to enter that of the Western Union Telegraph Company. He filled positions as operator at Memphis and Nashville, Tenn., and afterwards was manager at Barbourville, and Middlesboro, Ky., Baton Rouge, La., Johnson City, Tenn., and Corinth and Greenville, Miss., successively. He travelled through the fourth district for two years checking accounts, making transfers and acting as temporary relief to managers at various places. Mr. Tudor is a close observer, and is also of an inventive turn of mind. He has recently obtained patents on two telegraph repeaters,

which were described in these columns March 1 and May 16 of this year.

**Mr. S. J. Gray, Chief Operator, Western Union
Telegraph Company, Los Angeles, Cal.**

Mr. Samuel J. Gray, chief operator of the Western Union Telegraph Company at Los Angeles, Cal., was born in Hancock County, Miss., September 3, 1877. In February, 1899, he entered the telegraph service in the general offices of the Gulf & Ship Island Railroad, at Gulfport, Miss. He has been operator at many places in the South, Southwest and the Pacific Coast, for various railroads, both telegraph companies and the press associations. He was night chief and afterwards chief operator for the Postal Telegraph-Cable Company at Houston, Tex., and at the time of his appointment as chief operator at Los Angeles was wire chief in the Western Union office at San Francisco, where he had previously held various other positions.

Mr. Amos Young has been appointed district plant superintendent of the Eighth District, Western Division, with headquarters at Minneapolis, Minn. Mr. Young was born in Sittingbourne, England, September 1, 1875, and entered the telegraph service in Chicago, October 20, 1895, as lineman. He finally became superintendent of construction after occupying intermediate positions, and held this office until his present promotion.

Mr. Howard Lombard Esch, has been appointed to the position of chief clerk to Mr. S. E. Leonard, division commercial superintendent of the Mountain Division, at Denver, Col. Mr. Esch was born at Memphis, Tenn., September 12, 1888, and entered the telegraph service at Colorado Springs, Col., July 20, 1901, as messenger. He subsequently occupied positions as clerk, bookkeeper and operator and was cashier at the time of his recent promotion.

Mr. Albert A. Montgomery, district traffic superintendent of the sixth and seventh districts, Western Division, with headquarters at Cincinnati, Ohio, was born in Montgomery, W. Va., November 17, 1862. He entered the telegraph service in Ironton, Ohio, January 25, 1875, as a messenger, and has been continuously in the service of the Western Union Company since that time, filling the positions of operator, traffic chief and assistant chief operator. He has been in the Cincinnati office since 1885.

Mr. Emory Parsons, district plant superintendent, sixth and seventh districts, Western Division, with headquarters at Indianapolis, Ind., was born in Orland, Ill., February 2, 1870, and entered the telegraph service at Worth, Ill., June 6, 1888, on the Wabash Railroad. From that date until May, 1894, he worked as operator on various railroads. From May, 1894, until February, 1908, he filled the positions of night chief operator, chief operator and assistant superintendent of telegraph of the Illinois Central Railroad in Chicago. Mr. Parsons left the

telegraph service in February, 1908, and was engaged in commercial business in Chicago until his appointment as district plant superintendent, which brings him back to the telegraph service.

Mr. Robert Purcell Cowardin, wire chief of the Denver, Col., office, has been appointed district plant superintendent, with headquarters at Salt Lake City, Utah.

Mr. Cowardin was born in Nashville, Tenn., October 7, 1877, and first entered the telegraph service at Waverly, Tenn., in October, 1892. He held positions as operator on the Nashville, Chattanooga & St. Louis Railway, operator and wire chief in the Western Union Nashville office, operator in the New Orleans office, wire chief in the Norfolk office, chief operator in the Memphis, Tenn., office and operator in the St. Louis office. He has held the position of head wire chief in the Denver office for the past four years.

Canadian Notes.

Mr. S. B. McMichael has been appointed assistant general manager of the Great North Western Telegraph Company of Canada, with headquarters at Toronto, Ont.

On November 7 the Canadian Pacific Railway Company celebrated its twenty-fifth anniversary as a trans-continental railway system. On that date, in 1885, the Hon. Donald A. Smith, now Lord Strathcona, drove the last spike which united the eastern and western sections of the road. The railroad has worked marvelous changes in the development of the country through which it passes.

The Cable.

The Maritime Telegraph and Telephone Company of Nova Scotia has laid a 12-wire cable across Northumberland Strait, between Waterside, and Wood Island, near Charlottetown, P. E. I. The distance is 35 miles.

The report of the English Royal Commission of Inquiry into the Postal Telegraph services recommends, among other things, the appointment of a board of management to administer the department, and the nationalization of the cable services connected with Australia.

Various Boards of Trade and Chambers of Commerce in the United States are co-operating in the campaign inaugurated by the American Chamber of Commerce in Paris to secure quicker delivery of cablegrams in that city. Cablegrams are now delivered in Paris by letter carriers through the ordinary postoffice channels.

Reduction in Cable Rates.

Mr. Clarence H. Mackay, president of the Commercial Cable Company, on November 10 issued the following statement regarding a proposed reduction of rates for cablegrams:

"The Commercial Cable Company has been at work for some time past in formulating a plan by which the rates for cablegrams sent by the general public, in other words, cablegrams in plain language as distinguished from code language, be reduced about one-half. That plan has now been worked out, and inasmuch as it will require the co-operation of the telegraph lines in Europe, where the Governments own the lines, our plan involves a proportionate reduction in the land line rates, charged by the European Governments, and hence the co-operation of those Governments will be necessary. At present the cable rate is twenty-five cents per word. The proposed plan is to charge twelve and a half cents for every five letters in that class of cablegrams. We have found by careful investigation and examination of a great number of cable messages that plain language averages only five letters to the word and hence if we charge only twelve and a half cents for five letters, (every letter in the cablegram being counted as though the whole cablegram was one word), the result would be that the public in sending cablegrams would pay but one-half of what it now pays for those cablegrams, it being a part of the plan that these reduced rate messages will be subject to prior transmission of messages paid for at a higher rate. We hope to be able to put the plan into operation in a short time, it being necessary first to make the requisite arrangements with the European Governments. I would add that this new mode of charging for cablegrams will be of decided advantage, also to the business public which uses a code, inasmuch as it will be an inducement to them to put a portion at least of their cablegrams in plain language rather than use a very complicated code which requires a great deal of time on their part, first to code and then to uncode. After the most careful consideration and study of this whole subject, we are satisfied that this new method of charging for cablegrams will not only reduce the charges for ordinary cablegrams one-half, but that the plan itself will be logical, simple, workable and satisfactory."

Press Associations.

Mr. H. E. Maule, formerly manager of the Detroit office of the United Press, is now manager of the Boston Bureau. Mr. W. E. Hall, late of the Pittsburg office, takes Mr. Maule's place, and the Pittsburg office is now in charge of Mr. S. D. Bradley of St. Louis.

Col. Charles S. Diehl, assistant general manager of the Associated Press at Chicago, is on a tour of the South. He will visit Galveston, Houston, New Orleans and Atlanta.

Mr. T. L. Malone of the Star, Oneonta, N. Y., has transferred his services to the Albany, N. Y. bureau of the Associated Press.

During the recent storm along the Atlantic Coast states telegraph and telephone lines were badly damaged, particularly between Philadelphia and Washington. All companies suffered alike.

Career of the Late Milton F. Adams.

In the death of Mr. Milton F. Adams, at Wheeling, W. Va., October 12, which was announced in our issue of November 1, the telegraph profession has lost one of its most unique characters. Mr. Adams was a typical bohemian in his manner of living and frequently his friends would suddenly miss him to hear from him later in some far-off corner of the globe in a new role.

An account of his wanderings and doings, published in 1895, reveals a career of remarkable activity and versatility, and yet not one-tenth of his actual experiences has ever been recorded. Prior to 1870 he worked as a telegraph operator in nearly all the principal cities of the United States. He first met Mr. Thomas A. Edison in Cincinnati, in 1865, and it was through his instrumentality that Mr. Edison got a position in Boston as operator for the Western Union Telegraph Company, in 1867. Soon after this Mr. Adams first brought to public attention the promising genius of Mr. Edison, and about twenty years later introduced Mr. Nikola Tesla to the electrical world.

Mr. Adams left the "Hub" in 1869, and crossed the continent on the first through railway train. He arrived in San Francisco in 1870, during the strike among the operators. He aided their cause by selling patent medicine on the street corners and kept the strikers well supplied with pocket money for a considerable time.

When next heard from he was a tamer of lions in a circus. Later he went to Peru and joined the expedition to take charge of telegraph construction on the Oroya Railroad in the Andes. He was frightened away from this equatorial climate by the high death rate along the line, and went to Lima, Peru, where he sold maps. Travelling in Peru, Bolivia and Chili, he finally landed in Buenos Aires, Argentina, where he was engaged in commercial business. His prosperity here was great, but success and affluence did not mean everything to such a restless spirit as his. He sacrificed his prosperity to engage in civil and electrical engineering in Pernambuco, Brazil, in 1872, but he was ahead of the times, and while he did not make a particular success in scientific work the record shows that he succeeded in contracting a large hotel bill. The liquidation of this indebtedness called for a high degree of financial ability, and having more or less successfully met many such situations previously he was equal to this particular emergency. He bought the hotel and as proprietor cancelled the indebtedness. The hotel was reopened as an American house, and it is recorded that he made money, but the environments were not to his liking, so he went to Rio Janeiro and engaged in telegraph construction work, afterwards being appointed chief of government telegraph construction. He later resigned and ran a show, skating rink and bull pen.

It is related that during his experience as a show man in Brazil, he received an invitation to meet the Emperor, Dom Pedro. While waiting to be pre-

sented to the monarch, Mr. Adams became very friendly with the Emperor's secretary, and the two made frequent excursions to the imperial wine cellar to cement the friendship that had sprung up between them. The result of this diversion was that when the time arrived for the presentation ceremony, Mr. Adams was not to be found.

Mr. Adams' experiences in Brazil were extremely varied, but the country had now become too narrow for him so he next tried the unexplored regions of Africa. He started a "Paradise Lost" panorama in the diamond fields, but his efforts were not appreciated, nor were his attempts at journalism successful, his utterances probably being of too radical a nature. On one occasion he attended a banquet at which many high functionaries were present. In the course of the remarks Mr. Adams made an allusion to the then reigning monarch which deeply offended the loyal Britons and he was compelled to hastily depart from the locality.

He was next heard from in various European capitals engaging in projects of many sorts that would have made Col. Sellers hesitate on account of their audacity, and finally returned to New York in 1884, when he was employed by Mr. Thomas A. Edison to exploit the Edison electric light in Venezuela and Colombia, South America, which project was abandoned later. He tried his hand at developing a telephone, and afterward drifted into the store-carrier service business. He introduced the carrier system in the New York Western Union and the Baltimore & Ohio telegraph offices. Desiring to get rid of Mr. Adams the store-carrier service company sent him to Helena, Mont., with instructions to report to Lewis and Clark for further orders. Arriving at Helena Mr. Adams learned that there was no such firm there, but did learn that two men by that name had been in that vicinity in 1804 in the service of the United States Government, as explorers and engineers, but were then dead. He wired these facts to headquarters and requested a further supply of funds if he was to continue researches in ancient history. He suspected that the concern was trying to eliminate his personality from its employ, so he returned east and in attempting to maintain his legal rights he was arrested on the charge of breach of contract, but the charge was not sustained. He brought suit against the company for damages and this was compromised. He then turned his attention to the lecture platform as a means for gaining a livelihood and addressed audiences before the Drexel Institute, the Press and Clover Clubs in Philadelphia, with more or less success. However, success to Mr. Adams had no particular meaning.

He rendered valuable assistance to Mr. E. G. Acheson, of Niagara Falls, in the introduction of carborundum, the well-known abrasive. Mr. Adams had great faith in this new product and remarked that he had good prospects of being able to "scratch" along.

In comparatively recent times he sold patent medicines in New York, and introduced an electric water filter. On one occasion he represented a typewriter

company at a convention and in order to bring the merits of the machine to the attention of the association and gain its good will he presented each member with a typewriter with his compliments. This display of prodigality resulted in his release from further work in the company's behalf. He sold electric mine lamps in the Pennsylvania coal regions, and later went to the diamond fields in Arkansas. It was here, two years ago, that he received the injury to his foot which resulted in his death.

Mr. Adams had not the slightest conception of values. One hundred dollars did not appeal to him any more than one dollar did. The result of this deficiency in his nature was that money did not abide with him very long at a time. Some people called him extravagant, but parting freely with money does not necessarily always indicate extravagance. Mr. Adams helped many a friend more unfortunate than himself. He was strictly honest and was always willing to share his possessions with a brother in need.

He was never discouraged; he was an optimist at all times and under all circumstances and what has been here related of him does not begin to enumerate the variety and number of his experiences. His life was an extremely active one, such as it was.

Mr. Adams was a member of the United States Military Telegraph Corps and was frequently an attendant at social telegraph functions in New York, and was familiarly known to all of the older members of the profession.

Telegraphy and Telephony in Germany.

Telegraphy and telephony in Germany is the subject of an article by Mr. G. Dettmar in the *Elektrotechnische Zeitschrift* of Berlin, an abstract of which is given below:

There were at the end of 1908 in Germany 41,394 telegraph stations and 33,541 cities or towns with telephone connection. The total length of telegraph and telephone lines was 202,000 miles while the total length of telegraph and telephone conductors was 3,200,000 miles. There were transmitted 54,098,541 telegrams and 1,519,370,970 telephone messages in 1908. The number of parties with telephone connection was 560,016, with 849,784 telephones. The total receipts of the telegraph and telephone departments of Germany, except Bavaria and Württemberg, were \$36,250,000 in 1908. About fifty telegraph lines were equipped for duplex operation by means of the Hughes system and 178 telephone lines were also used simultaneously for transmission of telegrams, and 448 telephone lines were equipped for duplex telephony. Of high-speed telegraph systems those of Baudot, Murray and Wheatstone are employed at some places. The Siemens & Halske high-speed telegraph system, using a photographic method, has proven technically efficient, but there is no commercial need at present for such a high-speed system. The central battery system is gradually finding greater favor in German telephone stations.

What Is Electricity?

At a recent meeting of the Chicago Electric Club, Dr. Charles P. Steinmetz, of the General Electric Company, Schenectady, N. Y., who was the guest of the club, spoke on the subject, "Electricity." He said that if he were asked the question, "What is Electricity?" he would answer after his questioner told what gravity is. "In trying to reason out the ultimate nature of things," he said, "we get tangled up in contradictions."

"Electrical energy," he continued, "is that form of energy that has become familiar to us latest. It is convertible into other forms of energy. Without a continuous supply of energy civilization could not exist. Energy is not created; it exists in some place and form and time and there is need for it perhaps in some other place and form and perhaps at some other time. It is the function of the engineer to bring this supply and this demand together. Of the various forms of energy only two may be conveniently utilized, and these are chemical energy and mechanical energy. Chemical energy is represented by fuel and mechanical energy by water-power.

"The transportation of energy is often required to make it available. Chemical energy and electrical energy may be transported, the former as coal and the latter over wires as in the transmission of electricity. It is interesting to remember that we have practically no use for electrical energy as such. Intrinsically, electrical energy is almost useless; it must be transformed into some other form of energy for use; it is useful simply as an intermediate form of energy. Chemical energy can be converted easily only into heat. Electrical energy has the great advantage that it may be converted easily into other forms of energy as well.

Electricity cannot be stored. In the storage battery it is really chemical energy and not electricity that is stored. Electrical energy must be used when produced and produced as needed. Therefore the cost of electricity depends on the degree of uniformity with which it is used, in other words, it depends on the so-called load factor, which is the ratio of average use to maximum use."

In closing his remarks Dr. Steinmetz referred to the economy of supplying many varied utilities from a central source of energy, as has been so successfully done in the case of the central-station company in Chicago.

The Edison Medal Association which was formed five years ago by the friends and admirers of Mr. Thomas A. Edison to found a gold medal in the American Institute of Electrical Engineers celebrating the invention of the incandescent lamp and twenty-five years of its successful use has closed its accounts. Five thousand dollars were placed in the hands of the Institute for the medal award fund and this amount has since grown considerably. The recipient of the first medal awarded was Prof. Elihu Thomson this year for "meritorious achievement in electricity."

Telegraph and Telephone Age

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

November 16, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Development of the Telegraph.

The efficiency of any organization depends upon the strength of its component parts. If the foundation is solid and the component parts are sound then a corporation established along these lines should endure. The best results in any organization are obtainable through the mutual confidence established between employer and employe and in the case of a corporation such relationship cannot fail to be productive of good results in both directions, particularly if this confidence should permeate the entire organization from the lowest grade of employe to the highest. A public service corporation based on such principles is well equipped to maintain proper relations with the public and to render the public a service that will meet its requirements.

We have watched the evolution that is now going on in one of the telegraph companies and we have been astonished at the degree of harmony and co-operation that has been brought about. If our observation is correct it is evidently the intention to

place with officials full responsibility in connection with their respective duties and on the other hand to vest with them corresponding authority. This appears to be a broad and conservative policy and will be productive of good results. It likewise shows a disposition on the part of the management to place confidence in each official, it being a recognized fact that under a functional organization the weakness of the operation of any department is reflected in the character of the subordinate officers. With subordinate officials qualified to properly perform their duties, an opportunity is thereby afforded to obtain the best results. This action is not only a step in the right direction but is in recognition of the principle that without a competent personnel an organization, no matter how well planned in theory, is ineffective in practice.

In the welding together of the telegraph and telephone facilities the management will apparently leave nothing undone to give the public full benefit of its far-reaching plans. The combination of the two interests is creating an entirely new feature in the electrical transmission of communications which will unquestionably prove of inestimable value to the public. While it may be that the company is for the present adding greatly to its operating cost yet the result will be a universal telegraph-telephone service throughout the entire country whereby any telephone subscriber will be able, at any time, day or night, to send a telegram to all parts of the United States, or to foreign countries and receive a reply delivered over the telephone.

When such a comprehensive service is completely established, a telephone subscriber, no matter where located, has the same means available for the transmission and receipt of telegraphic communication as though a telegraph office was established in his place of business or residence. It brings to the use of those living in suburban or rural districts the same prompt and efficient service as those residing in the larger business centers. In fact, the plans of the operating company contemplate such a comprehensive service that it is difficult to at once realize its far-reaching effect.

If our review of the situation is correct the rank and file of the telegraph company's organization may feel assured that there will be ample opportunity in the future for each individual who will qualify to fill more important duties. It must be apparent that the plans as outlined will require not only the best thought and intelligent work of those engaged in perfecting such an extended service, but it likewise opens a field that heretofore has not existed in the telegraph business.

Mr. Owen R. Lovejoy, general secretary of the National Child Labor Committee is the author of an article in the November *Review of Reviews*, under the caption "A Six Years' Battle for the Working Child," in which he says: "We know that one Industrial School in New York State shows that of 378 inmates examined, 59 had been at one time

night messengers." Inasmuch as there are about 1,500 telegraph messengers employed in New York City alone the figures given are not very alarming. Mr. Lovejoy does not say, but probably it will be found, that an equal percentage of the 378 inmates of the Industrial School were at one time Sunday School boys, but we would not accept that statement as an argument against the Sunday School.

The Child Labor Question Applied to the Messenger Service.

BY AN EX-MESSENGER.

I have read with great interest the articles in your paper bearing on the child labor question, so called, as it relates to the messenger service of the telegraph companies.

The Child Labor Committee of the Charity Organization Society of New York agitating the question of the employment of boys under twenty-one years of age for night messenger service seems to forget that the messenger boy is the telegraph apprentice, and the best operators are those whose apprenticeship began between the age of twelve and seventeen. Very few acquire the art of telegraphy after the age of twenty.

There are upwards of 2,000 main and branch telegraph offices in New York State. With few exceptions every male manager is a graduate from the messenger ranks and investigation will show that almost every day and night delivery clerk, as well as thousands of operators, employed in New York State, started their telegraph career at the messenger bench. It is therefore certain that the telegraph companies, as employers, must of necessity and for their own protection encourage morality and personal cleanliness among their apprentices.

It must not be lost sight of that the telegraph is a public servant and hundreds of offices in the State are kept open until midnight and later as an accommodation to the public and in many places at a loss. Again the telegraph companies in response to request from landlords or tenants or both, installs, without charge or rental, its call boxes in residences and apartment houses as a convenience. Should the character of these houses change the telegraph companies are as much in the dark as the police department claims to be. The Association asks that men be employed for service after 10 p. m., for in its opinion the stroke of ten is the dividing hour between business and vicious activity. Such is not the case. There are many business activities in operation after 10 p. m., *i. e.*: newspaper offices, which must be served, public assemblies, hotels, etc., not to mention the many commercial houses whose work is carried on into the night.

But after all the chief reason for not employing men messengers day or night is because the duty is not men's work and the public would hesitate to entrust its telegrams or important communications to men who are capable of performing only boy's labor; such men are likely to prove very untrustworthy servants.

This is the age of quick service. Telegrams must be delivered as promptly as possible and the telegraph companies are doing all in their power to expedite delivery; and they must depend upon the enthusiasm of youthful messengers for this work. Satisfactory boys cannot at all times be secured for telegraph messengers—it is not a question of wages—in fact, in many cities, it is almost impossible to keep the messenger force up to the standard. Now it seems to me that the Committee, which is doubtless composed of public spirited men, should, instead of deterring, encourage the youth to seek employment in an occupation from which thousands of our best citizens have graduated.

Let the boy have an opportunity to develop into decent manhood by learning the great lesson of "value of time" and by instruction in honesty and alertness, as taught in the telegraph offices. Give him a chance to help the family as many a boy has done and is doing today. These are good things to legislate for, not against.

[This communication is from a telegraph official who graduated from the messenger bench. He believes in the boy; and has had experience with hosts of boys. He points with pride to a list of "boys" who ran messages with him in the early '80s, and whose successful careers he has watched with interest. The list includes: newspaper editors, two; telegraph officials, two; telegraph managers, two; telegraph operators, seven; telegraph clerks, two; theatrical stars, two; lawyers, two; bank cashier, one; post office clerks, three; brokers, two.—*Ed.*]

Legal.

The Court of Appeals of Kentucky, in the case of the Western Union Telegraph Company *vs.* Price, has decided that a telegraph company owes the duty to the public of exercising reasonable diligence in transmitting and delivering in due time messages received, and though the ordinary method of delivering messages is by messenger, and though the addressee is entitled to a delivery of the telegram received, the company must use the telephone, where its business and the settled rules of law do not require it to be prepared to promptly deliver the written message by hand.

Judge A. L. Sanborn, of the United States District Court, at Madison, Wis., has rendered a decision in the electrolysis case of the Peoria Water Works Company *vs.* Central Railway Company. The substance of the decision is that a street railway company having a defective return system, permitting leakage of current which causes electrolytic damage to property of other public utilities occupying the streets under equal rights, may be enjoined from operating the system in its defective condition after the lapse of a reasonable time for repairs.

The Telephone in Turkey.

It is reported that the Department of the Telegraph of Turkey intends to install telephone systems in all Turkish cities.

American Telegraph Engineering—Notes on History and Practice.*

(Concluded from page 736, November 1.)

DONALD McNICOL, NEW YORK: Mr. Jones questions the likelihood of the development of a printer system capable of transmitting 600 words per minute over ordinary circuits. That one cannot readily conceive of the probability of such speeds being attained, is probably due to the fact that he confines his speculations regarding mechanical operations and movements, to what it has been possible to accomplish in the past by means of electromagnets.

The KR limitations of circuits (including lines, and windings of instruments) where such circuits are spaced into repeater sections of approximately 500 miles, are in the case of aerial lines, of such consequence, that with ordinary voltages, with lines worked duplex; speeds of 300 words per minute are about as high as it is possible where the operations are dependent upon electromagnetic control. There is one printer system in use in Europe for which a speed of 350 words per minute is claimed.

It would be, as Mr. Potts implies, a highly desirable feature of a universal printer telegraph system if its operating capacity were as elastic as is the telegraphic traffic in volume on any given circuit, provided, of course, that its general application to circuits having varying loads at different periods of the day, would permit of economical operation as compared with Morse methods, when the volume of traffic is far below that of the maximum capacity of the machine. Flexibility of operating capacity, with a high maximum rate, would serve to take care of varying loads and of the accumulations of traffic due to temporary loss of wires.

With reference to Mr. Jones' remarks dealing with the fate of the engineer's recommendations.

The practical engineer realizes that even in the reconnaissance stage any engineering proposition must be worked out with practicability and economy as factors. Even if for temporary considerations an engineering proposition may not be adopted, it still remains that by virtue of the thought and effort devoted to its development, the proposition will survive as a basis for future undertakings along the same lines. Naturally where the engineer is a traffic economist he has given due thought to the requirement that any proposition he may submit calling for the outlay of comparatively large sums of money for new or for additional equipment, must provide for economical results, or in some manner for enhanced advantages over the methods it is intended to improve, which will insure adequate return on the investment. Although the live engineer is professionally zealous, his conservatism would seem to

be well established by virtue of the fact that the major number of the propositions submitted to him for investigation are found to be and reported as impracticable or unprofitable.

W. MAVER, JR., NEW YORK: The President is very desirous of getting to the other matters scheduled for the program this evening, and I shall therefore at present only say a few words in reply to the points brought out in the discussion.

Mr. Pope queries the statement that places the distance of transmission by the House printer at 1,000 miles. The statement is traceable to the officers of the original House telegraph company and may be found in "Electrical Telegraph," Jones, 1852, page 112, as follows: "The longest line we have is about 1,000 miles—extending from New York to Cincinnati. Messages are transmitted that distance with ease; and no doubt we shall be able to telegraph direct from New York to St. Louis as soon as our line, now building, is completed." Possibly the discrepancy between this statement and Mr. Pope's experience may be explained by a superior conductivity of the newly constructed wires in 1852 as compared with the wires of Mr. Pope's time. It was the common experience of those days, 1865-1870, that, owing to the manner of making joints then in vogue, (a simple twisting of the ends of the wire without solder), the resistance at the joints in a few years amounted almost to a break in the continuity of the wires. For instance, one of the New York-Bridgeport wires tested by Mr. Varley and mentioned in his report (see page 1289) showed it to have a resistance of 241 ohms per mile—normal resistance 13 ohms per mile.

In regard to early attempts to produce a page printing telegraph it may be noted that Charles Wheatstone, about 1840, devised a page printer telegraph system, but it was rather slow and did not get into general operation. Described Sci. Am., May 31, 1884.

Mr. Taylor expresses the opinion that some of the present trouble on multiple telegraph circuits is due to the mutual induction between parallel wires. About twenty years ago I had a very large experience in the practical operation of multiplex telegraph circuits while I was the electrical engineer of a large telegraph company in this country, and the statements on this point in the paper are based upon that experience—we operated circuits between New York and Boston, five or six quadruplex circuits on parallel wires at top speed, obtaining an efficiency virtually of one hundred per cent., except in very bad weather. I found, when we already had five or six parallel quadruplex circuits, the imposition of additional circuits did not have any detrimental effect upon the operation of the others. Hence, I feel safe in saying what is said in the paper—if it were possible to get rid of the stretches of underground cable and the inductive disturbances from high tension transmission circuits, it would be possible to restore the former conditions of multiplex operation.

The disuse of the Rowland printer in this country is probably due to a number of causes, chiefly per-

*Discussion of the paper presented by William Maver, Jr., and Donald McNicol, at the Twenty-seventh Annual Convention of the American Institute of Electrical Engineers, Jefferson, N. H., June 28-July 1, 1910, and which was published in our columns July 16-September 16.

haps the somewhat complex nature of the apparatus and its unreliability at times. Mr. Taylor himself suggests some of the causes for the present non-use of high speed chemical automatic systems, to which it is assumed he refers, having the phenomenal speed capacity of 1,000 words per minute. Numerous other causes have been cited at times without number by those who have had practical experience with such systems. It is pointed out in the paper that automatic systems capable of transmitting at the high speeds mentioned were in operation in this country 30 years ago and are still freely available when desired.

As to the statement relative to the extent of use of the vibroplex, mecograph, and similar instruments to which Mr. Dunn has referred, namely, that four-fifths of the operators now use such instruments, it may be said that investigation will probably confirm that statement. So far as the feasibility of transmitting speedily with this device is concerned, it can be stated that duplex circuits are being operated now between New York and San Francisco, with, I think, three sets of repeaters, by means of semi-automatic transmitters at the highest speed of manual Morse transmission.

CHARLES F. SCOTT, PITTSBURG, PA.: Is that repeating done automatically?

MR. MAVER: Yes, regular automatic repeaters, duplex repeaters. The method is described in the paper. The matter of displacing the spaced letter or American Morse alphabet as used in the United States and Canada, by the Continental Morse alphabet has been proposed frequently within the past 50 years without result. There is no question that for manual sending the American Morse alphabet is the speedier, there being 183 time units in the American to 214 time units in the Continental, exclusive of numerals, and the liability to errors due to the spaced letters of the American Morse alphabet is minimized by the fact that the operators by habit almost universally exercise extra care in the transmission of words containing spaced letters. In automatic transmission, however, as by the Wheatstone system, the use of spaced letters is a source of delay as it is virtually necessary to double space words containing spaced letters in order to avoid errors. Thus the situation stands at present. Possibly the use of the Continental alphabet by wireless telegraph operators may assist in leading to the general disuse of the spaced letter alphabet.

Exception may be taken to Mr. Jones' statement that the presidents and general managers of telegraph and railroad companies are de facto the engineers who decide all questions involved. They may act adversely or favorably upon the reports of their engineers for financial or other reasons, but that does not constitute them the engineers of the company. Apropos of this may be quoted the following sentences from a recent paper by Mr. George Westinghouse: "In view of the fact that there had

been no considerable demonstration of the single-phase system by actual use, and that the New Haven trains would be obliged to operate upon twelve miles of lines already equipped with the direct-current third-rail system, it must be conceded that the directors and management of the New York, New Haven and Hartford Railroad showed great courage and confidence in the judgment of their experts." Mr. Jones is quite in accord with the authors of the present paper in expressing his opinion that the financial and engineering obstacles to placing entirely underground the trunk telegraph lines between all of the widely separated cities of this continent are insurmountable.

Mr. Jones' statement that the resultant electrostatic induction is a maximum when the keys on the No. 2 sides of several adjacent quadruplex sets are simultaneously closed will bear considerable qualification. For instance, there must be a particular coincidence of polarities to line on the No. 2 sides to bring about this maximum. One can easily conceive of a condition of complete neutralization of ill effects, depending on the polarities to line at a given instant, when all the No. 2 keys are closed. Furthermore, instances are cited in the paper in which many adjacent quadruplex sets have been operated without any impairment due to the cause stated.

Concerning Mr. Jones' wonderment that the limit of transmission of an ideal printing telegraph system was not placed at 5000 words per minute, instead of 600 words per minute, the reason may be that the authors were desirous of keeping within limits that are at least eight times nearer attainment than Mr. Jones' system. Mr. Jones' arithmetic is perhaps astray in the computation that a transmission rate of 600 words per minute would involve preparing 30 word messages at the rate of 66 messages per minute. Twenty messages per minute is nearer the mark and twenty operators could easily prepare the messages at that rate. Mr. Jones seemingly bases his dictum that the time constant of all known line wires, electromagnets and their connections for over 200 miles would utterly prevent the operation of a printing telegraph system at the rate of 600 words per minute, upon the assumption that present methods must be strictly adhered to. This was not made a condition of an ideal printing telegraph system by the authors. The Buckingham-Barclay printer to-day has a capacity of 100 words per minute in each direction over circuits 1000 miles in length. In transmitting by this system each letter requires an average of nine time units made up of short and long pulsations of current of opposite polarities. The Murray printer of 150 to 180 words per minute employs five time units for the transmission of each letter. For the Creed printer, employing the Wheatstone alphabet, it is claimed that 225 words per minute may be transmitted.

The Wheatstone automatic telegraph system which employs an electromagnetic ink recorder is

*A paper prepared for the joint meeting of the Am. Soc. M. E. and the Inst. M. E., London, July, 1910.

capable of transmitting messages over regular telegraph wires at the rate of 600 words per minute, using the continental Morse alphabet, which requires an average of eight time units per letter; the equivalent of eight pulsations of minimum duration per letter. It is therefore perhaps not the time constant of the line or apparatus that stands in the way of a 600 word per minute printer so much as the present cumbersome methods of selecting the letter to be printed; together with the more or less cumbersome printing apparatus. Hence it is conceivable that by the use of a method in which the time units required per letter may be halved or quartered the speed of transmission may be doubled or quadrupled without any change in the line or receiving apparatus, a result that would bring the speed of transmission quite close to if not beyond 600 words per minute. So in this respect as in some others Mr. Jones' railroad analogy is not as apt as at first sight it might appear to be. But the suggestion of an ideal printer telegraph as noted in the paper does not confine the prospective inventor to existing electro-mechanical apparatus. Photography and other physical agents controllable by electrical impulses are open to the ambitious and qualified inventor, who, however, could not say that the context of the paragraph in the paper relating to an ideal telegraph system conveys the impression that the realization of this ideal system is devoid of difficulties.

Mr. Cellar's remark relative to the housing of insulators indicates that he misses the suggestion of the paper that relates to the housing of the wires for mechanical protection against storms. Mr. Cellar's immediately following comment on the destruction of open wires by storms however emphasizes the said suggestion; as does also Mr. Jones' mention of the annual expenditure of millions of dollars for the repair and maintenance of pole lines.

With reference to Mr. Pott's remarks concerning the impracticability of operation of high speed printing telegraph systems on wires subjected to severe inductive disturbances, it may be pointed out that a perusal of the paper will show that the authors are in strict accord with Mr. Potts in this view.

It is noteworthy that many of the important inventions in mechanics and electricity have not been due to men directly engaged in the industrial application of those arts. Watt, for instance, was an astronomical and mathematical instrument maker. Morse was an artist by profession. Stearns, Bell and Pupin were not in the telegraph or telephone service when they produced their notable inventions in telegraphy and telephony respectively. Murray, the inventor of the successful printing telegraph that bears his name, was a journalist. Creed left the telegraph service to devote his time to the development of his ingenious punching and printing telegraph, and the list might be continued almost indefinitely.

One explanation of this fact may be that in the majority of cases the active engineers in an art are fully occupied with the successful operation of existing apparatus or with problems connected there-

with, and are given neither the time nor the financial aid necessary to undertake original research for the advancement and betterment of the art with which they may be associated. Another explanation may be that in many cases the engineers in question are operating engineers, but not inventors. This suggests the question whether men thoroughly familiar with the requirements of telegraphy and of all the conditions to be met with in the technical telegraph service and largely endowed with the inventive faculty might not be selected to prosecute investigations relative to the improvement of the telegraph service as relates to the transmission of messages, analogously as selected men in the medical and other professions and arts are now exclusively employed in matters relating to the advancement and improvement of those professions and arts.

Railway Telephony.

Several systems of communicating with a moving train have been invented, but none has been very extensively adopted. Considerable interest, however, has recently been aroused in this country, says a London contemporary, by experiments on the London, Brighton & South Coast Railway. As a result of these experiments, the necessary equipment is to be installed to enable passengers travelling between London and Brighton either to send or receive telephone messages during a considerable portion of the journey.

The apparatus to be employed, which is known as the "railophone," is due to Mr. H. Von Kramer, of Witton, near Birmingham. It consists of a large coil of wire in a vertical plane installed on one of the coaches, the end of the coil being connected to a telephone instrument placed in a sound proof box on the train. The stationary circuit consists of a cable on the track connected to a telegraph wire as a return circuit.

Telephonic currents are induced in the wire fixed to the track in the case of messages transmitted from the train; and are induced in the coil when messages are being received. The coil, which consists of a number of turns, can be fixed in casing on the coach, and extends throughout the length of the latter in a vertical plane, as mentioned.

In the first experiments the track conductor was installed on insulators, but it is now proposed to lay the conductor in conduit close to one of the rails. One conductor is to be installed for each track, and the ends are to be connected to telephone apparatus at the stations. From these points the messages are telephoned or telegraphed to their destinations.

Harper's Weekly, of October 20, contains an interesting story headed "Western Union's Move Toward Co-operation Publicity." It is an account of the recent reappraisal of the Western Union Telegraph Company's property and readjustment of its finances. It required eight months to carry the work to completion.

Telephone Poles and Pole Lines.

BY F. L. RHODES.*

Adapting the design of pole lines to conditions to be met requires a study of the stresses on the poles, cross-arms, pins and wires under wind and sleet loads, and of the strength and durability of different kinds of timber. Recently the problem of prolonging the life of wooden poles and obtaining some practical commercial substitute, such as reinforced concrete, has received attention.

The annual cost depends upon the first cost and the length of life. The length of life depends upon a variety of factors, the principal of which are the character of the timber and the local climatic conditions.

Of the timbers used for poles, the white or eastern cedar, Idaho cedar, chestnut and the yellow pines are of the first importance; red cedar, juniper, cypress, catalpa, redwood and several varieties of oak are used locally to a limited extent. Throughout the New England and Middle Atlantic States chestnut is the principal pole timber, with, however, considerable use of cedar, particularly in Northern New England. In the South, yellow pine is the principal timber, with some use of chestnut, juniper and cypress. The yellow pine has to be creosoted. If this is not done, owing to the severe climatic conditions, not only the part near the ground line, but the whole length of the untreated pole will decay with great rapidity. On the Pacific Coast and in the Rocky Mountain States, Idaho cedar, Douglas fir and redwood poles are used. The redwood trees grow to great diameter, so that poles of this timber have to be sawed. In the Central West, the Mississippi Valley and prairie states, Eastern cedar, Idaho cedar and yellow pine are the principal species in use. The selection is governed chiefly by railroad connections with the timber regions and by freight rates. In long-distance lines, out of all the poles in use, sixty-two per cent. are cedar, thirty-one per cent. chestnut, five per cent. juniper and two per cent. creosoted yellow pine.

The comparative strengths of the principal pole timbers are as follows, the figures representing fair average values for the fibre stress in pounds per square inch: Cedar, 3,600 pounds; chestnut, 5,000 pounds; yellow pine, 6,000 pounds. From these figures it will be seen that, size for size, a chestnut pole is nearly fifty per cent. stronger than a cedar pole, and that yellow pine is a trifle stronger than chestnut.

There is considerable difference in the weights of the different pole timbers. This has a direct bearing on the cost of transportation and distribution, and to some extent affects the cost of erecting. Chestnut and creosoted yellow pine poles weigh about twice as much as cedar poles of the same size. In the case of yellow pine, the treating process adds about a third more to the weight of the pole.

Different kinds of poles taper more or less rapidly,

the average diameter taper being about one inch in six feet of length for cedar, one inch in seven feet length for chestnut, one inch in ten feet of length for Idaho cedar, one inch in ten feet of length for yellow pine.

Leaving out of account the compression load due to the weight of the wires, and considering only the horizontal load due to wind pressure on the poles and wires, a pole may be considered as a beam fixed at one end and loaded at a point at the center of the cross-arm system. Owing to the taper, a pole is a beam of non-uniform breaking strength. The section where the breaking strength is theoretically less than at any other section is at the point where the diameter is one and one-half times the diameter at the center of the applied load. Except in poles more than about thirty-five feet in height this section is at the ground line, and even in the case of very tall poles, the weakest section rapidly falls to the ground line due to decay at that point. For poles of a given length and kind of timber, the breaking strength varies with the cube of the diameter at the breaking section. This fact shows why stout poles are so very much stronger than slim poles.

Taking the strength of a pole ten inches in diameter as 1,000 the rate of increase in strength for each additional inch of diameter up to fifteen inches is shown by the following table:

Diameter, Inches.	Relative Strength.
10	1,000
11	1,330
12	1,730
13	2,200
14	2,740
15	3,280

Chestnut rots considerably faster than cedar. The results of measurements on more than a thousand poles indicate that the average annual decrease in diameter of sound wood is about 0.1 of an inch in cedar and about 0.15 of an inch in chestnut. The largest decay with chestnut poles is usually found from four to six inches below the ground line. With cedar poles the greatest decay usually occurs closely at the ground line.

PRESERVATIVE TREATMENT.

It is the increasing scarcity of timber which has brought the question of prolonging its life prominently to the front in this country. In the early days many schemes for preserving the butts of poles by charring, by coating with tar or asphalt or by setting in concrete were proposed and tried. Experience has demonstrated that these expedients are entirely ineffectual and useless. It is now generally accepted that an effective timber preservative must be of an antiseptic nature, that it should penetrate the wood to a considerable depth below the surface, and that it must not wash out.

The decay of timber is caused by the activity of low forms of plant life, principally in the form

*Abstract of a paper read before the New England Telephone Society.

of fungus threads, which produce ferments that exert a soluble action on the walls of the wood cells. These small organisms can grow either in light or in total darkness, but all of them require certain amounts of air, food, moisture and heat.

It is near the ground line, where the earth holds the moisture and keeps the wood damp for long periods in the presence of air, that decay is most rapid. Preservatives act antiseptically to kill the fungus growths that produce decay, and also to some extent by plugging up the pores of the wood, thus preventing the entrance of the moisture.

It is also a fact that creosoted wood poles are practically free from attack by woodpeckers. In some sections of the country, notably in the eastern central states, Texas, Arizona and California, the destruction of poles by woodpeckers is a serious matter.

The economy of treating pole butts with preservatives is closely connected with another question, namely, that of extending the life of poles, which have become rotted at the ground, by some form of reinforcement. These have consisted in general of setting a stub of new timber close alongside the old pole and binding the pole and the stub together by means of twisted wire wrappings. As a result of various tests three styles of stub reinforcement, differing from each other in the method of attaching the stub to the pole, have been adopted. The simplest form used for the lighter and less important lines makes use of the old plan of wire wrappings alone, although some improvements have been made in the method of applying the wrappings. For the more important lines, the wire wrappings are supplemented by two bolts extending through both pole and stub. Special tightening bolts are provided for the wire wrappings. In some portions of the country creosoted yellow pine stubs promise the best economy. In other places there are found local timbers which, although not growing in the proper size for poles, may yet possess good strength and long life.

REINFORCED CONCRETE POLES.

The great advances in the use of reinforced concrete which have been made in recent years have set many people at work designing and building concrete poles. The results thus far obtained show that the poles are remarkably uniform in strength, and that their actual breaking loads are close to the computed values. As a fair average of all the poles it can be said that the weight is about 2,000 pounds, of which about 300 pounds is steel and 1,700 pounds concrete. Cedar and chestnut poles of equal height and strength weigh about 500 and 1,000 pounds respectively. The poles will probably cost about \$10 as against \$5 for cedar poles. These figures do not take into account the costs of transportation and erection.

A considerable number of these poles will be made and erected, in order that experience may be had as to the effect upon them of stresses, vibrations, frost, lightning, and other actions of the

elements. If, as there is every reason to expect, the prices of wooden poles continue to increase, a stronger case can be made out in the future for concrete poles than at the present time. So far as can now be seen, for a number of years to come, their use will be restricted to especially important lines and to permanently located poles in exchange work, such as poles for interior block distribution.

CROSS-ARMS.

At one time Norway pine was used almost exclusively for cross-arms. About ten years ago yellow pine was introduced as a cross-arm material. This wood in its natural state does not have the necessary life, and cross-arms of yellow pine are therefore treated with dead oil of coal-tar. At the present day these creosoted yellow pine cross-arms form a large portion of the total supply. The strength of ten-pin creosoted pine standard cross-arms is such that they will sustain a downward load of about 250 to 300 pounds at each pin.

INSULATOR PINS.

Locust is pre-eminently the best wood for insulator pins. It is not only of high strength, but also of long life, and possesses the valuable property of high resistance to decay even when in contact with decayed wood.

Although steel insulator pins have been largely used in telegraph work, they have not commended themselves for use in telephone construction. Locust pins have an average breaking strength of about 1,200 pounds. The usual form of steel pin bends under a load of about 700 pounds. Moreover, steel pins cost from two to three times as much as wooden pins, are more expensive to place in the arms, and have a shorter length of life.

LINE WIRE.

The hard-drawn copper wire, which constitutes the bulk of the wire plant, has a tensile strength of from 62,000 to 65,000 pounds per square inch, and will elongate about one per cent. of its length before breaking.

On account of the fact that wires expand at high temperatures and contract at low temperatures, the temperature has to be taken into account in stringing wires. If wires strung in the summer are stretched too tightly, they are liable to break in winter as the result of contraction. Aside from the temperature effects the actions which occur in a span of wire under load are very complicated. For a span of given length the stress in the wire diminishes as the sag increases. Owing to the elasticity of the wire, when it is subjected to load, as by sleet, it stretches. The increase in length due to this stretch allows it to sag more than before. This increase in the sag tends to relieve the load. A condition of equilibrium is therefore reached where all the stresses are balanced.

The behavior of the wire under any given conditions can be very accurately computed. For the ordinary span of 130 feet the specified sag at

sixty degrees Fahrenheit is seven inches. Due to contraction this decreases to about four inches at zero Fahrenheit. The stretch of one per cent. is sufficient to allow the sag to increase six or seven feet before the wire breaks. The specified sags are such that the wires under the loads due to wind pressure and sleet have about the same factor of safety as the pole lines.

Complementary Operation of Telephone and Telegraph in Chicago.

The problem of making the telephone assist the telegraph to the best advantage by utilizing it as much as possible for the collection and delivery of messages has probably been worked out more

shown in the picture there is a private branch exchange with a two-position switchboard containing thirty incoming trunk lines and connected with the exchange system of the Chicago Telephone Company. The ordinary telephone business of the various departments of the telegraph company is conducted through this switchboard, which is also connected directly with the branch offices in the downtown business district within a radius of half a mile from the main office.

For handling telegrams, however, special arrangements have been made. In the telephone room are two recording tables, each with positions for ten telephone operators who sit five on a side facing each other. In front of each operator is a miniature lamp signal system, multiplied throughout, so that any incoming call flashes a

VIEW OF TELEPHONE GALLERY IN CHICAGO OFFICE OF WESTERN UNION TELEGRAPH COMPANY.

fully in Chicago than in any of the other large cities of the country. The accompanying illustration of the telephone room of the Western Union Telegraph Company in Chicago will give an idea of the extent to which the telephone is being used in that city as an adjunct to the telegraph. This department is placed in a gallery at one end of the main operating room, and is cut off from the noise of the telegraph instruments by a sound-proof partition. At the back of the tables

white light to all operators, while a red light shows that any particular outgoing line is in use. All incoming calls pass through the switchboard, and if the call is for general office business the switchboard operator makes the desired connection. If the call is to send a telegram, the operator connects with the recording tables. Instantly a white signal is flashed at each of the twenty positions, and the first free operator plugs in. This action extinguishes the lights on that line at the other

positions, so that all operators know that the call is answered and the message is being taken.

For the delivery of telegrams by telephone there are fifteen outgoing lines running directly from the recording tables to the telephone company's exchange. This provision obviates congestion of the private branch switchboard and provides an equipment capable of receiving a total of twenty messages and delivering fifteen at the same time. While the number of messages delivered by telephone is greatly in excess of those received in that way, the incoming equipment must be large, because an average of three messages can be delivered by telephone in the time consumed in receiving one.

There are about twenty employes engaged in this work, the department being in charge of a trained woman supervisor. The switchboard operators do nothing but make connections, while the operators at the recording tables receive and deliver telegrams only. An effort is made to concentrate the receipt and delivery of telegrams by telephone in the main Western Union offices in Chicago; that is, the public is being instructed to telephone its messages there instead of to the nearest branch office when there is no toll charge involved.

All telegraph messages addressed to Chicago received in the main operating room go directly from the wire to the distributing table in the city lines department, where they are routed to a branch-office wire, or a telephone number is written on the message and it is sent immediately by automatic carrier to the telephone room. The search for telephone numbers is made at the distributing table, so that the telephone operators are not delayed. Thousands of messages received daily are immediately telephoned to the person addressed, and later, on request, may be delivered by messenger. Thus the slowest link in the chain of telegraphing—that is, the messenger boy—is eliminated from the transaction to a large extent.

Preservative Compound for Poles, Etc.

Owing to the growing scarcity of timber suitable for telegraph and telephone poles, cross ties, etc., the problem of extending the life of available material by preservatives is becoming more and more pressing. Coal tar creosote oil has been very generally used for this purpose but the increasing cost of this substance has rendered it necessary to find an efficient substitute.

Decay of wood is generally caused by the entrance of destructive growths of bacteria from without at some time after the timber is cut and while it is seasoning. For the development of these growths the presence of moisture, heat and air are necessary. By eliminating any of these factors in whole or in part the life of the timber is prolonged.

Indian "Timberasphalt" Oil is stated to be a superior substitute for creosote, etc., and an unexcelled weatherproofing material, effectually and per-

manently preventing the entrance into the wood cells of moisture, heat and oxygen, without which elements the destructive fungi cannot thrive. The oil is stated to be very durable and not affected by the elements. It is composed of 65% asphalt and is practically non-inflammable, non-volatile and very stable in composition. The manufacturer asserts that it is equally as good a preservative as creosote, if not better. It plugs up the pores of the timber thus arresting and preventing decay. This asphalt oil is stated to be harmless to the workmen handling it. It is also stated that "checking" in timber treated with "Timberasphalt" Oil is reduced to a minimum.

It is claimed that timber can be treated with this substance at a cost of one-half that of creosote and one-tenth that of other preservatives compounded from coal tar.

The Atchison, Topeka and Santa Fe Railroad Company has been treating its ties with asphalt oil for some years, and tests have demonstrated its value. Ties thus treated lasted eight and one-half years compared with two years, in some cases nine months, for untreated ties, tested under like conditions. The National Railroad of Mexico is also using the asphalt treatment with like success.

The Indian Refining Company, Incorporated, Cincinnati, Ohio, is the manufacturer of this substance.

"Timberasphalt" Oil is particularly valuable for the treatment and preservation of telegraph and telephone poles. It may be used as a paint and is applied by brush, open tank and pressure methods.

New Book.

"Edison: His Life and Inventions" is the title of a new work just issued by the Harper Bros., in two octavo volumes with many rare portraits and illustrations. This biography is the work of Mr. Frank Lewis Dyer and Mr. Thomas Commerford Martin. Mr. Dyer is general counsel for the Edison laboratory and its allied interests, while Mr. Martin is a close friend of Edison's and former president of the American Institute of Electrical Engineers, and an editor of great ability and wide experience. Mr. Edison went over every page of their MS. and in the book is reproduced the characteristic Edison signature with: "This book is published with my consent." The life story of Mr. Edison is here told for the first time and there is much additional matter, including a complete list of the Edison patents and a technical description of a score of his most important inventions. The price of the work is \$4.25, and copies can be procured by addressing J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

In Belize, British Honduras, there are at the present time 176 telephone subscribers and 198 telephones and an independent fire alarm system. A line running in different directions from Belize is used for both telegraph and telephone purposes. The telegraph and telephone services in British Honduras constitute a governmental department, Mr. Morton Cuthbert being superintendent.

The Military Telegrapher in the Civil War.

PART XLIX.

(Concluded from page 731, November 1.)

The pathetic story of the sufferings and privations of the late Mr. James E. Pettit, and his comrades, in a Confederate prison during the Civil War, which was begun in our issue of October 16, and continued in the issue of November 1, is concluded herewith. Mr. Pettit's narrative continues:

"From this time on it rained every day; the river had risen 35 feet and now overflowed a part of the prison yard. January 20 was an eventful day; the inmates of the prison seized the guards that were inside the prison, disarmed them and put them under guard; the commandant of the post brought three cannon to bear on the prison, backed by a regiment of infantry; the prisoners were forced to deliver up the captured guards, and thus quickly was ended one of the most foolish attempts to escape, for the whole country was under water. The whole force of prisoners were obliged to strip to the skin; a close search was made and all weapons were seized. Rations were stopped and the Colonel commanding the post declared he would furnish no more until the ringleaders were surrendered to him.

"On January 23, my comrade Ludwig was remanded to the prison, convalescent and rations were given to the prisoners, five men having turned informers. There were twelve beds in my ward in the hospital and there were eleven deaths there during my sickness. January 25 was the coldest day of the winter and I was sent back to prison; I found my comrades on a top bunk of a tier of three. I was helped up to it, but I was weak and I am afraid I did not sufficiently appreciate the modern conveniences and comforts of my new home, at least I thought it was too open and draughty. On January 26 ice formed two inches thick and hundreds of the boys were forced to walk all night to avoid being frozen to death. Many were without blankets and poorly clad, having no other covering at night than the clothes that they wore in the daytime. January 27 it continued cold and frozen ears and feet were so common that they were scarcely noticed. After the outbreak barely sufficient rations were issued to sustain life; we then numbered 2,500 prisoners. About this time I again wrote to my father and sent the letter through the lines by one of my mess, who was the subject of a special exchange. It still continued to rain so that it seemed as if the windows of heaven were open; and all this time the same old rumors of exchange were repeated so often that they became sickening. It being rumored that the prisoners were going to make another attempt to break out, the Colonel commanding the post gave orders to shoot anyone seen up after bedtime.

"On February 25, at roll-call we were counted out into the rain where we were obliged to stand for nearly two hours, wet to the skin; the prison was one mass of mud and it was still raining.

Peanuts sold in the prison at \$3.00 per quart. On March 1, at 12 o'clock at night, all who were sleeping on the ground were routed out of their beds, and by daybreak the whole prison was under water; a small skiff came in containing a Confederate lieutenant and sergeant; both were tipped out in the deepest part of the water by the boys. Three days rations were issued the next day, consisting of a small piece of bacon the size of one's hand, and five hardtack. By March 4 the water had risen over 40 feet, so that the shallowest place in the prison was three feet under water; cordwood was floated in and platforms were constructed on which my companions perched themselves; chips, dirt and offal of every description, together with the two weeks collection of the prison sink floated around the bunks; these with myriads of dead rats combined to make the scenery anything but romantic; one thousand prisoners were taken out on that day, rumor said, for exchange, but we had been deceived so often that we did not credit it. On March 6 one thousand more were taken out. By March 7 the water had fallen about eight inches and two days rations were issued. I was again taken with a very severe attack of camp sickness. The boys began selling their mess pans, blankets, etc., to the guards at fabulous prices, as they began to think that it was a sure thing that we were to be exchanged soon.

"On March 7 we were ordered to clean up the prison, as the water had receded. On March 11 the water was still high enough to overflow our washing sink; the damp ground fairly steamed where the sun's rays struck it, and the effluvia arising from the offal ran the sick list up with rapidity, a variety of diseases being the result. On March 13 we were taken out to the office of the exchange officer to sign our paroles, agreeable to the exchange cartel. I was afflicted with a severe toothache, headache and ague pains, owing to the damp condition of the prison.

"On March 14 we were ordered to turn over all our blankets (heretofore considered personal property) all the pots, kettles, etc., and we marched out of the dreary place; it then began to dawn on us that it might be a real exchange this time.

"We received a salute of two guns from the prison battery and embarked for Selma, hardly knowing what to think; was it an exchange or merely a transfer to another prison? We reached Selma at 8 p. m., and were marched to the stockade. The next morning we were awakened early, marched a mile through the mud and rain, and then marched back again on account of the non-arrival of the train; everyone was wet, cold and miserable, for we had no blankets. On March 15 we were marched to the cars again, and after some delay we were off to Demopolis on the Tombigbee river. Several of the boys were sinking from fatigue, having just left the hospital; but the flowers were in full blossom, and the leaves of the trees were beginning to come out; the bright sunshine and warm bracing air combined to make our homeward journey pleasant and cheerful. We reached Demopolis at 4 p. m., and camped on the side of a hill, in a heavy rain storm.

After the storm was over the Confederate officers came out from their shelter and we were marched to an old stable on the river bank. Here two days rations were issued to us and the next morning we were aroused from our filthy beds at one o'clock, and stood in the cold searching mist two hours waiting for the boat to unload. We then embarked for McDowell's Station, four miles up the river, on the steamer Sumpter; disembarked; waited until 4 p. m. and then we boarded the cars and started for Meridian, Miss.

"When within four miles of Meridian we ran off the track, someone having purposely turned a switch, happily without disastrous effects this time and we were soon back on the road and no one hurt. Arriving at Meridian we were put in the old familiar stockade with all its filth, and there we lay down to sleep in the same old vermin-infested mud; the next morning we took the train for Jackson, Miss. We reached Pearl River at 5 p. m., and, the bridge being burned, we crossed on a pontoon. Entering the town we marched past the State capitol, and after waiting half an hour we started for an old camping ground some two miles out in the country. Everything wore the frightful aspect of war; blocks of buildings had been destroyed by fire, nothing remained but the blackened walls; fences torn down and grass growing in the streets were fit emblems of the hopelessness of the Southern cause. We each drew a half pint of meal and a small piece of bacon, the latter weighing about three ounces. This was to last us two days; we also drew clothing here which had been sent to us by our authorities at Vicksburg. The Confederates seemed very anxious that we should enter our lines well clothed.

"On Sunday, March 19, we started on our homeward march toward Vicksburg. We marched twelve miles that day and were thoroughly tired. The next morning we started on the hardest march that I ever experienced; the road was either flooded with water or else it passed over steep hills of red, slippery clay and for a quarter of a mile we marched through water ten inches deep. We passed over many a desperately fought battlefield, the trees showing unmistakably the signs of hard fighting, and every minute of this long, weary day, it rained. An accident that had happened to my knee many years before, developed a weakness in it, and I was compelled to walk with one stiff leg all day. We reached the Big Black River just at dusk, but on account of the exchange officers not being willing to labor that evening we were obliged to march back for half a mile, where we camped around log heaps which we set on fire to keep ourselves warm and cook what little provisions we had.

"Those log heaps were in a large field that had just been reclaimed from the wilderness; the ground, lately plowed, was a mass of mud. I, with my weary comrades, lay down in this mud and slept as I had never slept before. We had marched thirty miles, and I but a short time out of the hospital. The next morning we could see the exact impress of our forms where the mud had been dried by the

heat of our bodies. Here for the first time we experienced the exquisite pleasure of eating Uncle Sam's hardtack with coffee and sugar, which had been sent from our lines to us. At 9 a. m. we were counted off and took our joyous way over the pontoon bridge which crossed the Big Black River at this point.

"We were just twelve miles in the rear of Vicksburg; a Federal soldier guarded one end of the pontoon and a Confederate the other, and we accepted as a good omen the clear sky that showed itself after the storm. What sighs of relief passed from our bosoms as we were greeted by the sight of our old flag and trod the ground as free men again. We marched about two miles and boarded the cars for the parole camp, which was located four miles back of Vicksburg, and there we bivouacked without blankets or covering of any sort. Little did I think when I was there during the siege that I should be on this spot again in the guise of a prisoner on parole.

"The next few days were spent in righting our camp; for tents were soon issued to us, and the Christian Commission gave us pipes, tobacco, pens, ink, towels, reading matter,—in fact everything that we desired; and, as we found time to renew our prison acquaintances, we joked and laughed over our past experiences, and life took on a brighter hue.

"On March 26 I was informed that the authorities had detailed me for duty on the flag of truce line that ran from Vicksburg to the Big Black River. I also received that day a letter from Charles Goff (an old schoolmate) in which he conveyed the sad intelligence of the death of my brother Egbert, who had died at Nashville months previously while I was in prison, and this was my first knowledge of it.

"For the next week or so there was nothing of importance to record. There were about 6,000 prisoners on this strip of parole ground, 2,500 of whom were from Andersonville, many of them bearing the marks of the horrible usage of that lazaret house. On April 12 I took my little pocket telegraph instruments and went out to the Confederate exchange headquarters at the river. Here I was furnished a tent near the railroad, where I tapped the telegraph wire and was at once placed in direct communication with Vicksburg. Almost the first news that I received was the surrender of Lee and the fall of Richmond.

"I was occupying a rather queer position, being detailed by the Federal authorities as operator at the Confederate headquarters, while my comrade Ludwig, occupied the same position at the other end of the bridge in the Federal headquarters. Such an occurrence was never known during the whole war.

"On April 23 I felt a relapse of my prison sickness coming upon me, which was caused by exposure to the weather, in my tent. The prisoners were being sent North as fast as facilities could be furnished, and that day the last batch embarked on the ill-fated Sultana, leaving the camp deserted with the exception of the hospital. I was too sick to go with the boat; thus my life was saved, for it was on

this trip that the boat's boilers exploded near Memphis, and over 1,000 paroled prisoners lost their lives. Some of them had been in Southern prisons over two years and were almost in sight of home when this horrible accident cut them down. Many of them were my comrades.

"The next few days my fever ran high, and I was very weak, but I managed to keep my feet; growing worse, however, I accepted the kind invitation of Lieutenant Seymour (an officer in the Heavy Artillery) to make his quarters in Vicksburg my home. From this time I was on my back with the old camp fever in full possession of my worn out and emaciated frame. From April 23 until May 19 I struggled against this relapse. Thanks to my strong constitution, however—a result of persistent athletic exercise all my life—I was enabled to pull through safely. Through the good offices of my comrade, Ludwig, my transportation was procured as far as Cairo, and I started north on the steamer Clara Dolsen, on May 22.

"I reached Cairo at 3 p. m., on the twenty-fifth, where I was surprised to meet an old friend, a well-known telegrapher, John Q. Mason, by name, who was then manager of the telegraph office at that point. He procured a pass for me to Chicago, which city I reached the next evening. I stopped at the old Metropolitan Hotel, and on the morning of May 27, about 10 o'clock, I arrived at the depot in the city of Kenosha, Wis., my home, thus ending a captivity of nearly eight months in a Confederate prison.

"I cannot express the emotions which filled my heart as I approached my father's house, the dear old home of my boyhood days. All was quiet. I opened the gate, walked along the gravel path, and up the steps, where I hesitated an instant, and rapped timidly at the door. A moment after, it was opened by my cousin Alice, who met me with greetings of joy. My old father, hearing the noise we made, came hastily from a distant room and I was enfolded in his loving arms. After we had visited to our heart's content I learned of the persistent and almost superhuman efforts made by my father to enforce my exchange. Through all means and channels did he work for me, his youngest son; and although on account of my sickness his efforts proved fruitless, it explained the frequent calls for me while I was sick on my back, a living skeleton in a Confederate hospital."

Annual Report of Proceedings of Military Telegraph Corps Reunion.

The report of the proceedings of the twenty-ninth reunion of the Society of the United States Military Telegraph Corps, held at Chicago, Ill., September 8, 9 and 10, has been issued. It is a neat book of 38 pages and contains an obituary notice of the late General Thos. T. Eckert. It was produced under the supervision of Mr. David Homer Bates, the able secretary of the Society.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Mavor and Davis' "Quadruplex" and other standard works on telegraphy and treat them in the same manner.]

CHAPTER XXIV.

Given two parallel wires carrying electric current, what is the effect upon the wires of the action of one current upon the other?

How can the interaction of the currents be increased or decreased?

What is the cause of self-induction?

Why does an electromagnet develop self-induction?

Is self-induction in the magnets of ordinary telegraph instruments desirable or undesirable?

Describe the action of a relay magnet at the moment the circuit is closed. Does it attain its full magnetic strength at once? If not, why not?

On opening a circuit at the key why is a spark produced at the contact points?

How can self-induction in magnets be minimized?

What is the effect on self-induction of winding the wire on the magnet in parallel and cutting the yoke and armature across the middle?

Describe Dr. Sylvanus Thompson's experiments with relay magnets.

What benefit is derived by the insertion of non-inductive resistance in a circuit?

What is non-inductive resistance, and what effect has it upon the current?

Why do the four-ohm duplex and quadruplex sounders respond more quickly and clearly to the influence of the current actuating them than do those of the 100-ohm pattern arranged in multiple on single wire circuits?

What was the method adopted to make local circuits non-inductive without interfering with the plan of connecting sounders in multiple?

Describe the benefits resulting from the change.

What is the law governing the development of self-induction in magnet coils?

Examinations for Position of Government Operator.

The United States Civil Service Commission will hold examinations on Nov. 23 at various places throughout the country to secure eligibles to fill a vacancy in the position of telegraph operator at the Pensacola, Fla., Navy Yard. The salary is \$2.80 per day. Those desiring to apply for the position should write at once to the United States Civil Service Commission, Washington, D. C., for examination forms 304 and 1140. Applicants must be 20 years of age or over on the date of examination.

The Telephone.

Arrangements are being made in Peking, China, for placing the telephone wires in that city underground.

The Cumberland Telephone and Telegraph Company reports a surplus after charges for September of \$206,462, an increase of \$16,114.

There are now 939 telephones in use in Ceylon, and the average daily calls at the Colombo Telephone Exchange number 4,432.

The Australian Commonwealth on July 18, 1910, had 30,150 metallic telephone circuits, 34,947 single wire circuits and 350 exchanges.

The State Board of Tax Commissioners of Indiana has placed the valuation of the telephone lines and property in that state at \$11,146,832.

Mr. Henry T. Hall, traffic superintendent of the Bell Telephone Company of Pennsylvania, at Harrisburg, died in that city, October 10, at the age of 31 years.

The German Consul at Sao Paulo, Brazil, reports that concessions have been granted for the establishment of three important telephone lines in the State of Sao Paulo.

The American Telephone and Telegraph Company expects by January 1 to establish telephonic communication between New York and Denver, a distance of 2,200 miles.

Mr. C. M. Seeley, division commercial superintendent of the Pacific Telephone and Telegraph Company in southern California, resigned on November 1 to enter other business. Mr. J. W. Gilkison, division plant superintendent for the same company, with headquarters at Los Angeles, has been appointed to succeed Mr. Seeley.

The Hudson Terminal building in New York, contains 750 miles of telephone wire. To handle the telephone business in five of the largest office buildings in the city, 2,360 miles of wire are required.

The Independent Telephone Company of Seattle, Wash., has been bought by a syndicate of New York capitalists for \$2,000,000. The stock in the Seattle company was largely held by citizens of Youngstown, Ohio.

The gross income from the telegraph and telephone system owned by the Government of Sweden amounted in 1909 to \$458,000. The cost of maintenance amounted to \$266,000, leaving a balance to the credit of the system of \$192,000.

The American Telephone and Telegraph Company reports an increase in gross earnings for the nine months ended Sept. 30, 1910, of \$11,396,105, and in net earnings of \$1,556,369. The sum of \$8,186,210 was carried to the surplus account.

Mr. Frank J. Clarke, who was equipment engineer for the Southern Bell Telephone and Telegraph Company, resigned recently to accept a position in the southern division of the American

Telephone and Telegraph Company, with headquarters at Atlanta, Ga.

The joint liability for the diversion of a high voltage electric current due to the falling of a telephone wire across an electric light wire was sustained by the Indiana Appellate Court, in the case of Dolby against the Indiana Light and Heat Co., and the Indianapolis Telephone Co.

It is stated that a telautograph system will be used for transmitting and recording trouble reports from the trouble desk at the central office to the various substations of the new automatic telephone system now being installed for the Illinois Tunnel Company in Chicago.

Mr. Earle Harlan, for the past eleven years connected with the wire chief's department of the American Telephone and Telegraph Company at St. Louis and other points, has resigned to accept a position with the Atchison, Topeka & Santa Fe Railway at Albuquerque, N. M.

Mr. Volney Delos Cousins has entered the service of the Pacific Telephone and Telegraph Company, in the plant engineering department, with headquarters in San Francisco, Cal. Mr. Cousins was an instructor in telephone engineering at Purdue University, Lafayette, Ind.

The Board of Estimate, at New York, at a recent meeting, revived the old offer of the New York Telephone Company to pay the city a large amount of money annually if an exclusive franchise were guaranteed to it. The proposal was referred to the Corporation Counsel for investigation. The offer was first made in 1906.

The Illinois Tunnel Company, of Chicago, is wiring its automatic system and installing its switchboard equipment and it is expected that the system will be in partial operation by January, 1911. When the installation of telephones begins the company will install 400 to 500 daily. It is stated that there will be 30,000 telephones in service, or 10,000 more than the ordinance requires, by June, 1911.

The results of comparative talking tests, recently made by Messrs. W. R. Cooper, W. Duddell, W. Judd and J. E. Kingsbury, upon the new and the old telephone cables, laid between Dover, England, and Calais, France, were very satisfactory. Tests were first made on each over the cable alone, after which successive units of an artificial cable were added to the circuit until the limit of commercial conversation was reached. The range of variation on the new cable was found to be from twenty to twenty-four miles of test cable at each end, the average being twenty-one miles, while on the old cable the range was from twelve to thirteen miles, the average being twelve and one-half miles at each end.

An investigation into the telephone rates established by the New York Telephone Company between the Boroughs of Greater New York, to determine whether such tolls are unjustly discriminatory or unduly preferential, is to be made by the Public Service Commission. The com-

pany has been directed to appear before the commission in New York on November 28 for a hearing.

The Society of the American Telephone and Telegraph Company, New York, was addressed, on November 15, by Mr. H. B. Thayer, vice-president of the American Telephone and Telegraph Company. Mr. T. H. Lawrence is secretary and treasurer of the society, which meets occasionally to discuss matters of an educational and practical character. The society is made up of employees of the telephone company.

The committee on supplies of the New York board of education, in the estimates for the year 1911, requests the board of estimates to appropriate \$26,000 for installing a telephone service in the school buildings of Manhattan, the Bronx and Brooklyn, connecting them with the offices of the district superintendents and with the hall of the board of education in Manhattan and with the borough offices in Brooklyn.

Arrangements have been made by the Philippine Telephone and Telegraph Company to instal a long distance system including connections between Baguio, Batangas and Los Baños so that each of these points will be reached from Manila. After these extensions, representing an outlay of 300,000 pesos, it is the purpose of the company to connect Cebu, Iloilo and Zamboanga with the capital. In this connection it will be necessary to lay a submarine cable between those three points.

Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company, speaking of the telephone service in London, says it is faulty because Londoners do not know how to use the instrument. "They haven't been educated up to it," he said. He saw a person answer a call and then put the receiver down and keep the caller waiting several minutes. No matter how efficient the central station may be, he continued, the service must be bad if the public is slack.

The Pacific Telephone and Telegraph Company announces that it will soon instal an aerial telephone cable between Tacoma and Seattle, which will be the longest telephone aerial cable in the world. The total length of cable between offices will be 38.2 miles, of which 30.8 miles is 31 pair No. 16 gauge strung aerially, and the remainder 7.4 miles, being 70 pair No. 16 gauge and 37 pair No. 13 gauge full size composite cable in Tacoma and Seattle underground. The aerial portion is loaded at intervals of 8,763 feet with 18 loading pots, each containing 28 coils. The underground portion is loaded at the same intervals with 10 loading pots, each containing 35 coils, there being two pots at each underground loading point. The cable represents an expenditure of \$650,000.

A conference of officials and employees of the Cumberland Telephone and Telegraph Company was held recently at Memphis, Tenn. The fifty-three out-of-town delegates in attendance were

tendered a banquet at the convention hall by the Chickasaw Bluff Telephone Society, an organization composed of Memphis employees of the Cumberland Company. At the business session many subjects pertaining to the maintenance and betterment of the service were discussed, following the presentation of papers by officials in charge of each particular branch. Those who read papers were Mr. W. G. Pfingst, superintendent of telegraph; Mr. J. H. Atchison, manager of directory and advertising department; Mr. J. T. Jagoe, assistant superintendent of the Nashville plant; Mr. H. Blair Smith, general auditor; Mr. E. D. Reynolds, construction engineer; Mr. K. C. Hardcastle, toll traffic manager; Mr. C. L. Meyers, general contract agent, and Mr. T. W. Gardner, chief electrical engineer. Discussions were held on the subjects: "Handling Material," "Rural Line Construction," "Repairs" and "Duties of Managers."

Arrangements have been made for the transfer of Mr. A. C. Terry, district manager of the American Telephone & Telegraph Company, from Pittsburg to Philadelphia. The centralization of the executive offices of the Bell Telephone Company of Pennsylvania and controlled companies, including the Central District & Printing Telegraph Company of Pittsburg, at Philadelphia, has made it unnecessary to longer maintain a district manager's office for the American Telephone & Telegraph Company at Pittsburg. Mr. Terry was formerly employed by the Western Union Telegraph Company, at Buffalo, N. Y., for twelve years. In 1896 he assisted in planning and supervising the installation of the Western Union offices in the Ellicott Square Building, Buffalo, N. Y., which, when completed, were conceded to be the finest offices in the telegraph service. As a result of his work in connection with the equipment of the Buffalo offices he was, in 1898, assigned to superintend the reconstruction of the building and had full charge of the equipment and installation of the Western Union Telegraph Company's present offices in Fifth Avenue, Pittsburg. In 1899 he was transferred to Syracuse as electrician of the Fifth District, and in 1901 he was detailed to investigate the condition of the underground cable system for the Western Union at Pittsburg. In the latter part of 1901 Mr. Terry accepted the managership of the American Telephone & Telegraph Company, having charge of territory in Western Pennsylvania and parts of Ohio, West Virginia and Maryland, with headquarters at Pittsburg. When the functional organization of the American Telephone & Telegraph Company was inaugurated in 1908, he was made district manager, having charge of the commercial department in the same territory. He has made many friends in Pittsburg, particularly among the members of the Chamber of Commerce, because of his activity in the past in arranging for telephone service from the Trade Extension Excursion trains which have been periodically sent out by the Chamber of Commerce.

Proposed Reduction in Cable Rates by Western Union Telegraph Company.

Col. R. C. Clowry, president of the Western Union Telegraph Company, on November 11 announced that negotiations looking toward the adoption of a modification and reduction in cable rates were begun last June with the English transatlantic cable companies associated with the Western Union Telegraph Company, and with the English post-office authorities when Mr. Theo. N. Vail was in Europe. An agreement was practically reached with the English cable companies, but negotiations with the British postoffice authorities were temporarily held up, owing to the rules of the International Telegraph Convention. After Mr. Vail's return from Europe, Mr. E. J. Hall, chairman of the executive committee of the Western Union Company, went abroad to renew negotiations.

A cablegram from London, November 11, reports an interview with Mr. Hall, in which that gentleman said that the Western Union Telegraph Company early in the present year originated the system of the Night Letter in the United States which has proved to be very popular and a great commercial success. Having in mind the desirability of adopting for its cable service something of this nature, it some months ago took up the matter with the Post Office Department, in London, and there have been a number of conferences in relation to some form of special service covering deferred messages in plain language at a substantial reduction from the rates that prevailed for ordinary commercial business. To work out a suitable plan and safeguard it in such a way that only those who are entitled to be benefited shall have its advantages, involves many difficulties in detail and any plan must necessarily be acceptable to the Governments which furnish the connecting land lines through which the service is conducted. It is also necessary that it should be on lines within the conditions imposed by the International Telegraph Convention. The Western Union Telegraph Company, speaking for itself alone, is willing to carry deferred messages in plain language at a reduction of one-half from the existing commercial rates and it is desirous of putting such a service into effect whenever a plan acceptable to all concerned has been agreed upon.

Another cablegram from London states that a conference between the postal officials and representatives of cable companies relative to the plans for a concession in the tolls on deferred private messages was held at the postoffice in London, November 11. The discussion thus far has been of a preliminary character, and the Government officials have enjoined strict secrecy on all those concerned. It is expected that the local companies will agree to the plan, but in any case some time must elapse before it can be put into effect, as the consent of all foreign administrations involved must be obtained.

Telegraph and Telephone Age, 253 Broadway, New York, is headquarters for all electrical books.

Second International Conference of Telephone and Telegraph Engineers.

The second international conference of telephone and telegraph engineers which was held in Paris from September 4 to 10, was well attended, nearly one hundred delegates from twenty European nations being present as well as Mr. J. J. Carty, chief engineer of the American Telephone and Telegraph Company, and Mr. C. E. Scribner, chief engineer of the Western Electric Company, New York. M. Millerand, minister of public works, posts and telegraphs of France, called the conference to order, and after the preliminaries of opening the conference relinquished the chair to M. Eustanie, director of telephones in Paris, who presided over the succeeding sessions. The following subjects were discussed:

1. Manual versus automatic systems of telephone working.
2. (a) Simplification of telephone circuits; (b) selection of frequency and secondary potential (for purposes of theoretical investigation) with a view to facilitating the approach of the telephone current to the sine wave-form; (c) the circumstances of conditioning the adaptability of telephone apparatus to the lines, induction coils, microphone resistance, etc.
3. Precautions to be taken for the avoidance of mutual disturbance in the case of power circuits running in close proximity to telegraph and telephone lines.
4. Telephony between places at great distances from each other. Construction of cables for long-distance use, relays, combination of aerial lines with cables.
5. Wooden poles—new process for impregnation and preservation.
6. Telegraph systems for heavy traffic. Multiple type-printing telegraphs and the Mercadier system.

Thirty-eight papers were received dealing with these questions. Five of these dealt with "Manual Versus Automatic Telephone Service," and this question was considered at some length, Mr. J. J. Carty contributing on this subject an interesting discussion of telephone conditions in the United States. An exhibition, which was arranged by the French Government, was also given of several automatic telephone systems. The next conference will be held in 1913. A standing committee consisting of one member from each country represented will have charge of the arrangements and the selection of the place for the third conference.

Mr. F. J. Howell, of Corning, N. Y., an old-time telegrapher, but who for many years past has been identified with other commercial pursuits, in ordering a continuance of his paper writes: "Glad to see the improvement in the Age, particularly in the scientific description of all kinds of telegraph, telephone and wireless instruments."

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIXEY

Sole Manufacturer

**Hudson Terminal, 30 Church St.
NEW YORK**

Western Representative

**WATSON INSULATED WIRE CO.
Railway Exchange, CHICAGO, ILL.**

The Railroad.

Mr. H. O. Rugh, president of the Sandwich Electric Company, Sandwich, Ill., was in New York recently on business.

The telephone is soon to be substituted for the telegraph in dispatching trains on the section of the Queen & Crescent Route between Danville, Ky., and Oakdale, Tenn., a distance of 137 miles.

A meeting of the Eastern Division of the Association of Railway Telegraph Superintendents will be held November 16 in the Board Room of the new Pennsylvania Railroad terminal in New York. Officers of the division will be elected and other business transacted.

Mr. J. A. C. Kelman has been appointed chief operator in the Winnipeg, Man., office of the Grand Trunk Pacific Railway. He is well and favorably known in railway telegraph circles and has been in the service of the Grand Trunk Pacific Railway for the past three years.

The telephone method of dispatching trains has lately been adopted on the Shasta Division of the Southern Pacific Railroad, where telephone circuits have been installed over 291 miles of line.

The method is being used over a 206-mile section of the main line between Ashland, Ore., and Red Bluff, Cal., and a branch of 95 miles from Weed, Cal., to Klamath Falls, Ore. The dispatcher is located at Dunsmuir, Cal., which is 98 miles from Red Bluff, the southern terminal of the circuit. There are twenty-five stations on the entire circuit, twelve being located between Dunsmuir and Red Bluff, nine between Dunsmuir and Ashland and four between Weed and Klamath Falls.

The circuit is metallic throughout and is composed of especially drawn 300-lb. copper wire. During sixteen hours out of twenty-four it is cut into two sections and during the third "trick" the entire circuit is operated by one dispatcher. Passenger and freight trains on the Southern Pacific are equipped with portable telephone sets, enabling train men to get in touch with the dispatcher from any point along the road.

Mr. Fayette R. Rockwell, recently appointed general superintendent of the Colorado lines of the Denver & Rio Grande Railway, at Pueblo, Col., started his business career as a telegraph messenger and afterwards became an operator and train dispatcher. He is a railroad man by training and is forty-six years of age.

Mr. M. C. Roach, superintendent of the New York division of the Lehigh Valley Railroad at Jersey City, N. J., began work as an operator on the Pittsburg, Cincinnati, Chicago & St. Louis Railroad, and afterward held a similar position on the Erie Railroad. Later he became train dispatcher on the Erie. He is 40 years of age.

Mr. Thomas J. Foley, assistant general manager of the Illinois Central Railroad, Yazoo and Mississippi Valley Railroad and Indianapolis Southern Railroad, was formerly a telegrapher. He is a na-

tive of Ohio and began his telegraphic career on the Pennsylvania Railroad.

Mr. S. G. Strickland, the newly appointed general superintendent of the Chicago & Northwestern Railway, was formerly a telegrapher, having worked on the Canadian Pacific Railway in Canada and on several roads in the United States. He was born in 1859.

Mr. Willis E. Morse, general superintendent of the Chicago & Northwestern Railway, has been appointed assistant general manager with headquarters at Chicago. Mr. Morse began his business career as a telegraph operator on the Chicago & Northwestern Railway. He is forty-six years of age.

Mr. James M. Kurn, recently appointed general superintendent of the Atchison, Topeka & Santa Fe Railroad at La Junta, Col., was a telegrapher during the early stages of his business career, but his experience has been confined chiefly to the States of Colorado and New Mexico. He was born in Michigan forty years ago.

Trade Note.

Mr. J. C. Murray, sales engineer of the Kellogg Switchboard and Supply Company, has returned from a South American trip and will immediately take up his work in the telephone field in this country.

Western Electric Expansion.

The Executive Committee of the Western Electric Company, Chicago, has voted to expend \$1,000,000 in enlargements to the Hawthorne plant and the vote has been approved by the board of directors. The extensions will be in the nature of telephone and cable shops.

Extending Telephone Train Dispatching.

Within the ten days ending with the first week of November, the United States Electric Company of New York and Chicago has received orders for telephone train dispatching equipment from a number of railroads. Among them are, the Delaware, Lackawanna & Western, two circuits with fifty-eight selectors; Evansville, Terre Haute & Southern, one circuit, twenty-nine stations; Baltimore & Ohio, one circuit, nineteen stations; Atlantic Coast Line, one circuit, nineteen stations, and Chesapeake & Ohio, three circuits, fifty-five stations. In addition to the regular Gill Selector equipment the United States Electric Company is furnishing on these orders telephone and auxiliary apparatus. Orders received in the latter part of October include equipment for the Great Northern, the Northern Pacific and the Dunkirk, Allegheny Valley & Pittsburg. For the Louisville & Nashville this company has just completed the installation of two circuits covering fifteen dispatching stations and thirteen message stations, and the official report from the company is that both systems are working to their great satisfaction.

The Turner Monument Fund.

The sending of the first train order by telegraph, which took place at Turner, N. Y., by Charles Minot, general superintendent of the Erie Railroad in the autumn of 1851, may not have been attended by noisy demonstrations or pyrotechnic display, but in the light of later experience it was an event of large importance to the railroad, so large indeed that it has been wisely decided to commemorate the historical event in granite and bronze so that future generations may be impressed with its importance. The two societies co-operating in this laudable work—the Association of Railway Telegraph Superintendents and the Old Time Telegraphers' and Historical Association—deserve the grateful thanks of every one connected with the telegraph and the railroad for the inauguration of this worthy movement, and the committee charged with the work of financing and execution of the project should be aided in their work by liberal contributions from those who have pride in their profession, whether it be commercial telegraphy or railway telegraphy.

About \$3,000 will be required to erect a suitable monument at Turner, N. Y., and contributions are beginning to come in. They will be duly acknowledged in these columns.

The following named gentlemen constitute the committee in charge of the Monument Fund: E. P. Griffith, Superintendent Telegraph Erie Railroad, Jersey City, N. J., Chairman; Charles Selden, Superintendent Telegraph Baltimore & Ohio Railroad, Baltimore, Md.; E. A. Chenery, Superintendent Telegraph Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, Electrical Engineer, Canadian Pacific Railway, Montreal, Canada; Col. W. B. Wilson, President Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, Secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who has been elected treasurer of the fund.

The amounts received to date are as follows: E. P. Griffith, Jersey City, \$15.00; R. H. Corson, Jersey City, \$5.00; Luis Jackson, New York, \$1.00; George W. Hickey, Brooklyn, \$1.00; O. C. Camp, Tarentum, \$2.00; V. J. Harahan, New York, \$5.00; Mortimer Du Perou, Washington, \$2.00; Charles A. Bigler, Philadelphia, \$1.00; J. J. Ghegan, New York, \$10.00; Thomas A. Edison, Orange, \$50.00; E. Winter, Montgomery, \$1.00; F. F. Fitzpatrick, New York, \$10.00; H. P. Dwight, Toronto, \$1.00; G. W. Kertly, New York, \$2.00; D. A. Mahoney, New York, \$1.00; H. B. Perham, St. Louis, \$5.00; J. H. Faulk, Hackensack, \$1.00; J. B. Korndorfer, Brooklyn, \$2.00; G. T. Stade, St. Paul, \$5.00; Old Time Telegraphers' and Historical Association, \$15.00; R. C. Clowry, New York, \$25.00; M. M. Kirkman, Chicago, \$1.00; R. F. Eldridge, St. Paul, \$1.00; G. P. Blomeyer, Zalma, \$1.00; J. H. Shearer, Elmira, \$1.00; E. W. McKenna, Chicago, \$10.00; Walter Vail, Deposit, \$1.00; C. B. Mears, New

York, \$5.00; T. E. Moreland, Pittsburg, \$1.00; G. M. Dodge, Valparaiso, \$2.00; S. C. Mason, Lockport, \$2.50; H. D. Pheatt, Milwaukee, \$1.00; J. A. Edson, Kansas City, \$5.00; F. B. Hubbard, Centralia, \$5.00; F. J. Jones, Warren, \$1.00; J. Annand, Portland, \$5.00; H. R. Williams, Seattle, \$5.00; W. C. Hirschert, Salamanca, \$1.00; H. Sommers, Salt Lake City, \$1.00; W. G. Collins, Seattle, \$5.00; Wm. De La Motte, Sandy Hook, \$1.00; J. W. Fletcher, Custom House, \$1.00; P. J. McManus, New Haven, \$1.00; A. B. Taylor, New York, \$2.00; W. C. Humstone, Brooklyn, \$10.00; Louis Lee, Pittsburg, \$1.00; J. B. Richards, Tacoma, \$1.00; M. Magiff, St. Albans, \$5.00; J. G. Liven-good, New York, \$1.00; H. Otis Pond, Fayetteville, \$0.25; W. C. Walstrum, Roanoke, \$2.00; T. W. Galleher, Baltimore, \$1.00; G. C. Jones, St. Albans, \$5.00; R. J. Needham, Duxbury, \$1.00; J. Burke, Cleveland, \$5.00; J. Monahan, Elmira, \$5.00; G. B. Owen, New York, \$5.00; H. D. Estabrook, New York, \$5.00; M. H. Hall, Monroe, \$1.00; J. B. Yohe, Pittsburg, \$1.00; Charles G. Smith, New York, \$2.00; T. Lynch, Pittsburg, \$1.00; J. B. Hammatt, Peoria, \$2.00; J. B. Tree, Richmond, \$3.00; F. A. Clark, New York, \$1.00; R. W. Pope, New York, \$1.00; G. L. Potter, Baltimore, \$5.00; F. P. Eyman, Chicago, \$2.00; P. W. Drew, Chicago, \$1.00; D. O. Dunkle, Cleveland, \$5.00; J. M. Turner, Augusta, \$5.00; E. E. Sellev, Brooklyn, \$2.50; Wm. Marshall, New York, \$5.00; J. M. Warner, Chicago, \$3.00; W. H. Hornbeck, Passaic, \$2.00; L. D. Ward, New York, \$1.00; W. R. Collins, New York, \$2.50; W. H. Sawyer, Pasadena, Cal., \$2.00; R. S. Parsons, Jersey City, \$5.00; Total, \$319.75.

A movement has been started among the fellow operators of R. L. Sawyer, the telegrapher who met his death in the explosion which wrecked the building of the *Los Angeles Times*, to raise a purse to be presented to his widow. Mr. Sawyer was a native of Fiskdale, Mass., and formerly worked for the Postal Telegraph-Cable Company at Springfield, Mass., and Albany, N. Y., and as Associated Press operator at Torrington, Conn. Several years ago his health failed and he went to the Pacific Coast. He had been regularly employed by the Western Union Telegraph Company for some time past as operator at the office of the *Los Angeles Times*, General Superintendent, C. H. Gaunt of that company at San Francisco, has directed that all possible assistance be rendered to the widow and children of the unfortunate operator.

Much experimental work in wireless telegraphy has been accomplished during the past year in the Signal Corps laboratory in Washington, D. C. The laboratory was organized primarily to assist in the development and design of new equipment and the laboratory equipment has been added to with the view of preparing for research work along the lines of wireless communication.

Municipal Electricians.

Texarkana, Ark., is installing a new fire alarm system.

The fire alarm system of Toledo, Ohio, is under the supervision of Mr. J. T. Greene.

Oakland, Cal., has a fire alarm system with 170 boxes of the non-interfering spring actuated type.

Patent No. 973,627 has been granted to Frank Castle, of Auckland, New Zealand, for an electrical fire alarm system.

Patent No. 972,840 has been granted to J. E. Fogal, A. M. Crichton and A. C. Mowry, of Quincy, Ill., for a fire alarm system.

The City of Roanoke, Va., installed the Gamewell fire alarm system in 1892, with thirty boxes. Now it has sixty-one boxes and the system is modern throughout.

The Fire Commission at Los Angeles, Cal., has decided to move the central office of the fire alarm and police telegraph systems from the City Hall on account of the fire hazard in the present building which is not fireproof and practically without fire protection.

The biennial meeting of the Electrical Committee of the Underwriters National Electric Association will be held in New York, March, 1911. The day and place of the meeting will be announced later. The secretary of the Association is Mr. C. M. Goddard, 141 Milk Street, Boston, Mass.

Work on the new fire alarm system for Manhattan borough, New York City, on which Fire Commissioner Waldo plans to spend between \$1,750,000 and \$2,000,000, has been started, and within a few weeks the first of the new alarm boxes will be installed on the East Side. Two thousand alarm boxes will be installed in Manhattan alone. The entire service will be rehabilitated.

The *Philadelphia Record*, of Sunday, October 30, printed an interesting article describing the Camden, N. J., Electrical Bureau, of which Mr. John W. Kelly, Jr., is the head. The article is well illustrated, a portrait of Mr. Kelly being included. The Camden Electrical Bureau is modern in all respects and it is claimed that fire alarm and police signal officials in larger cities could get new and valuable ideas from Camden as to what an efficient system should be. Mr. Kelly is one of the most active members of the International Association of Municipal Electricians and has apparently profited by the exchange of ideas with his fellow members to the advantage of the Camden fire alarm and police signal department. The City of Camden may well feel proud of what has been accomplished by its up-to-date and progressive chief of the Electrical Bureau.

"Electricity" is the name of a three-act comedy now playing in a New York theatre. The plot is a combination of a millionaire's daughter, a suitor disguised as an electrician and socialistic doctrine.

Obituary.

William J. Bodman, aged fifty-two years, a well known telegrapher, died at Buffalo, N. Y., on November 5.

Joseph Weber, a former telegrapher, aged forty-three years, died at Brooklyn, N. Y., on October 28. Mr. Weber was the inventor of an electrical piano-playing device.

Mr. A. E. Chantler, well known in the Northwest as a telegraph operator and editor, and for years connected with Washington's Twin City papers, was found dead on his ranch outside Tacoma recently.

Myron D. Jones, aged sixty-four years, chief train dispatcher and train master for the Lake Shore & Michigan Southern Railroad at Toledo, Ohio, died on October 25, at Columbus, Ohio, where he had been located in other business for several years past.

Mr. H. H. Morrison, aged 60 years, manager of the Western Union Telegraph office at Concord, N. H., died recently after a long illness. He entered the telegraph service as messenger in 1869 and was appointed manager of the Western Union Telegraph Company in Concord in March, 1874, and held the position at the time of his death. He was a prominent Mason.

William A. Sheldon, aged seventy-one years, died on November 5 at New York. Mr. Sheldon was at one time a prominent member of the profession at 195 Broadway, New York. He was for many years past identified with the financial department of the City of New York. He was a member of the United States Military Telegraph Corps. The history of Mr. Sheldon's military career was printed in our issue of August 1, 1908.

Mr. James W. Pitfield, formerly district superintendent of the Intercolonial Railway, died at St. John, N. B., October 31. Mr. Pitfield had been afflicted with locomotor ataxia for about twenty years, and for the past nine years he was confined to his bed. He was an operator at New Orleans and other Southern points during the Civil War and was afterward general superintendent of construction of lines on the overland route in California for the Western Union Telegraph Company. Later he occupied many other important positions in the telegraph service.

Mr. Benjamin Nachmann, president of the International Cable Directory Company, New York, publisher of the Western Union Telegraphic Code, died at his home in Yonkers, N. Y., on November 2. Mr. Nachmann was born in London, England, April 8, 1855, and came to this country when a young man. He was the compiler of the Western Union Telegraphic Code and established the International Cable Directory Company for the publication and promotion of the same. He was well known to telegraph people of New York and throughout the country and was a member of various telegraph organizations. He leaves a wife and three children.

Reorganization of Private Telegraph Interests in Colorado.

The Mountain Telegraph Company, which operated over 1,300 miles of telegraph line in Colorado jointly in the interests of the Victor-American Fuel Company and the Colorado Fuel and Iron Company has been reorganized and is to be conducted hereafter independently of the two concerns named. It has retained for its use about 350 miles of wire along the Colorado and Southern Railroad and about 350 miles along the Denver & Rio Grande Railroad, reaching this company's various properties. Mr. J. K. Waltz has been appointed superintendent to succeed Mr. E. E. McClintock, who became district superintendent for the Western Union Telegraph Company at Denver, October 1, as noted in our issue of October 16.

Mr. Waltz was born at Terre Haute, Ind., in 1876, and entered the telegraph service at Indianapolis in 1892. He has been manager of the Western Union Telegraph Company, and for ten years was manager of private wire systems. For five years prior to his present appointment he was agent for the Victor-American Fuel Company, which is one of the largest coal producing concerns in the country.

The Colorado and Wyoming Telegraph Company has been organized to take over the properties of the Colorado Fuel and Iron Company in Colorado. It will operate about 1,000 miles of wire, extending from southern Colorado to the northern part of Wyoming and to the various mining properties of the fuel and iron company. Mr. Royal E. Fisher has been appointed superintendent. Mr. Fisher was born at Morrison, Ill., July 7, 1875. In July, 1894, he entered the telegraph service at Blue Springs, Neb., and held positions as operator, cashier, revising clerk and agent at various points on the Burlington system until 1902, when he was transferred to the Lincoln, Neb., relay office. From August 1, 1905, to October 15, 1907, he was manager of the Minnequa office of the Mountain Telegraph Company, and from the latter date until February 1, 1909, was general wire chief of lines west of the Missouri river on the Chicago, Burlington & Quincy Railroad. Between February 1, 1909, and October 1, 1910, he filled the position of manager of the Mountain Telegraph Company at Denver, Col., being promoted to his present position on the latter date.

General Eckert's Will.

The will of the late General Thomas T. Eckert, former president of the Western Union Telegraph Company, was filed in the Surrogate's office in New York, October 31. Practically the entire estate passes to the two sons of the deceased, Mr. Thomas T. Eckert, Jr., and Mr. James Clendenin Eckert. The value of the estate is about \$3,000,000. Thomas T. Eckert, Jr., receives the country place at Elberon, known as Heart's Content, together with other property at Elberon, the testator's coal lands in Schuyl-

kill County, Pa., all of the estate of Mrs. Eckert, which was left to her husband at her death, and the residue of the estate after other legacies have been subtracted. It is said to have been the wish of Mrs. Eckert that her property be left to Thomas T. Eckert, Jr., on the death of General Eckert.

James Clendenin Eckert receives \$50,000 absolutely and a life interest in \$100,000, which is to be divided among his children at his death. Five thousand dollars is left to the testator's brother, Mr. William H. Eckert, and the same amount is left to each of two nieces, Mary P. Taft, of Cincinnati, and Alice Baumgartner Hamlin.

Carlton Terrace, a cottage at Elberon, is left to Joanna M. Eckert, daughter of James Clendenin Eckert.

The executors are: Mr. R. G. Page, Mr. Thomas T. Eckert, Jr., and Mr. James Clendenin Eckert.

Mr. James Clendenin Eckert, son of the late General Thos. T. Eckert, has taken steps to have his father's will set aside on the ground that a fair distribution of the property had not been made. It is also charged that General Eckert was of unsound mind when he made the will of August 30, 1910.

Historian Plum's Tribute to General Eckert.

Mr. W. R. Plum, of Lombard, Ill., historian of the Society of the United States Military Telegraph Corps, pays an eloquent tribute to the memory of the late General Thos. T. Eckert, as follows:

"Even a splendid constitution carefully conserved under favorable conditions must give way to years.

"Ripe in point of time, full of honors, with a history that will make itself felt in the coming ages—for no successful man is dead at burial, much less those who have controlled great events—the passing of our great chief into the beyond, to that greatest reunion of comrades, cannot but bring sadness to those left behind.

"We cannot honor him again, but we will revere his memory; after all, deserved reverence for those who have gone before is a higher tribute than bouquets and monuments.

"I would rather that others write my name on their memory tablets than have it engraved in granite or bronze. We have thus written that of Thomas Thompson Eckert."

General Eckert was one of the four honorary members of the Society of the United States Military Telegraph Corps.

Brig.-Gen'l. James Allen, chief signal officer of the United States Army, in his annual report to the Secretary of War, deplors the confusion which he states exists everywhere in the transmission of Government wireless messages, notwithstanding the claims made by commercial wireless telegraph companies that they have efficient interference preventers. He urges that measures be taken at once to secure Government control of wireless telegraphy, both in peace and war.

Radio-Telegraphy.

A wireless telegraph station is to be established at Colombo, Ceylon.

Mr. Samuel S. Bogart, vice-president of the United Wireless Telegraph Company, of New York, has resigned.

It is stated that Mr. William Dubilier, of Seattle, Wash., has succeeded in conversing a distance of forty miles, between Seattle and Tacoma, by the use of a wireless telephone of his invention.

Seventy-five feet of the steel tower of the American Radio-Wireless Company in Washington, D. C., broke off during the recent sleet storm and crashed through the roof of an adjoining building.

The installation of wireless telegraph apparatus on the steamers of the Osaka Shosen (Japanese) line, has been decided upon as a result of the Tetsurei Maru disaster. Stations will be established at different points along the Korean coast.

The Brazilian Government has erected a wireless telegraph station at Amaralina, near the entrance of the harbor at Bahia. The new station is equipped with the Telefunken system and has a guaranteed range of 400 miles, although its actual range is greater.

A new automobile car, manned by six operators and equipped with a wireless outfit having a telescopic mast, is about to be supplied to certain regiments of the German Army. The radius of the wireless outfit is 100 miles, both for transmitting and receiving.

A reduction of telegraph charges by 20 per cent. was effected in China in 1909. The program of the Board of Communications for the nine years preceding the establishment of constitutional Government (1908-16) includes for each year the improvement and extension of the telephone system throughout the country, and for 1911, preparations for installing wireless telegraphy along the coast.

The British Consul at Kiangchow reports that the wireless installation there is so frequently out of action that it is of very little use either for typhoon warnings or commercial purposes. The typhoon warnings telegraphed from Hong Kong or Haiphong invariably arrive some days after the typhoon has passed, according to *Lloyd's Register of British and Foreign Shipping*. There are now 702 vessels fitted with wireless telegraph outfits.

The trans-Atlantic Marconi wireless station at Glace Bay, N. S., recently opened, covers 150 acres of ground. The fan-shaped aerial wires are 6,000 feet long and about 1,000 feet wide, and are supported by thirty masts, each 250 feet high. The instruments have a transmitting radius of 3,000 miles, although in communicating with the Clifden, Ireland, station the electro-magnetic waves have only 1,700 miles to travel.

The Italian Government has appropriated the sum of 433,000 lire for the erection of six new radio-telegraph stations in Italy's African Colony of Benadir. Within the past few years wireless telegraph

stations have been established at five points on the Italian Benadir coast and on the islands of Zanzibar and Pemba. The first five stations are owned and controlled by the Italian Government; the latter by the Zanzibar authorities. Additional stations are now being discussed for the mainland at Mombasa, in British East Africa, and in German East Africa. In the latter colony there are telephone land lines in connection with the railways, and there are also several heliograph stations which are open to the general public.

For many reasons the adoption of wireless telegraphy on board the large steam trawlers which are employed in trawling operations in and near our home waters, says a London contemporary, is a development which would lead to a considerable expansion of the wireless telegraph industry and would probably help towards solving the problem presented by the damage done to submarine telegraph cables by these vessels. Wireless telegraphy has been adopted on some of the German trawlers and is giving satisfactory results. The Germans find, however, that wireless operators are not obtainable to accompany the trawlers and put up with the rather rough time which they would meet with on those vessels. It will be necessary for the Government to come to the assistance of the fishing industry if wireless telegraphy is to be adopted in the manner suggested. From the social point of view it is generally regarded as a most desirable innovation, as it would keep the shore in touch with the ships and vice versa, and so tend to brighten the life of the workers at sea by keeping them in touch with their domestic circles.

The Bureau of Steam Engineering of the United States Navy has issued a wireless telegraph directory of the world. There are listed 1,520 bona fide stations. This total includes shore stations and ships, but does not take into consideration the war ships of foreign governments. The directory first lists the wireless telegraph shore stations throughout the entire world, according to country, giving call letters, wave length, range and character of station. There are about 700 of these shore stations scattered about the globe. Of this number 88 are on the Atlantic and Gulf Coasts of the United States, 3 in the interior, 48 on the Great Lakes, 51 on the Pacific Coast, and 16 in Alaska.

A separate list shows the 47 shore stations of the United States Navy and another the 344 ships of the Navy. The stations of the United States Army are listed separately, showing 30 land stations and 16 stations aboard vessels of that service.

In the list of merchant vessels, such as steamships, tugs, yachts, etc., 821 stations are listed. The vessels' call letters and owners and the apparatus' wave length, power and range in miles are noted. These vessels are scattered over the entire world.

As an index the final list contains the call letters of every station, arranged alphabetically. From this operators can distinguish the name of ship or station calling.

Mr. W. E. Neely, who for the past ten years has been with the Western Union at Nashville and Memphis, Tenn., is now located at Dallas, Tex., for the same company.

Mr. Edwin F. Howell, secretary of the Serial Building Loan and Savings Institution, New York, the well known old-time telegrapher, who has been absent on a vacation, has returned to his office.

Mr. Thad M. Schnell, the well-known old-time and military telegrapher of Des Moines, Ia., was in Binghamton and Elmira, N. Y., and Susquehanna, Pa., visiting friends recently. Mr. Schnell was manager of the telegraph office at Susquehanna in 1867, and it was his first visit to that city since that time.

The announcement of bankruptcy proceedings against a telegrapher is not an unusual occurrence, but a Columbus, O., operator seems to have established a record in this line which is not likely to be often beaten. The petition which has been filed by this operator states that his liabilities are over \$40,000 with no assets.

Among sound and reliable insurance organizations the Telegraphers' Mutual Benefit Association of 195 Broadway, New York, occupies a foremost place. Organized in 1867, it has paid to beneficiaries of deceased members \$1,500,000. Reserve Fund, \$317,000, the largest Reserve in proportion to liabilities that is held by any similar Association. All persons engaged in Telegraph or Telephone service between the ages of 18 and 45 are eligible for membership, no restrictions after admission as to change of occupation or residence. The lowest possible cost consistent with security offered. Write for blanks and further information.

All Makes of Transmitters.

The phenomenal success of the Night Lettergram in the telegraph business makes it imperative for operators to study new methods of transmission, and to learn to use a typewriter, if they hope to be placed on an equal footing with their more fortunate companions, who have mastered these machines.

We are General Agents for the Famous Duplex, which gives you a choice of two movements. Price, \$12.00.

The Martin Vibroplex can also be furnished to those desiring this make of transmitter. Price \$9.00.

The Mecograph is also carried in stock ready to fill orders at a moment's notice. Price \$8.00.

Lowest Prices on Typewriters in the United States.

You can buy brand new, up-to-the-minute typewriters and sending machines of all makes on little monthly payments—not a cent more than you would pay if you rented a new machine.

A booklet describing all the features sent free on request.

Money Back If Not Satisfied.
J. E. ALBRIGHT
253 Broadway, New York.

The annual entertainment and reception of the New York Telegraphers' Aid Society, for the benefit of the Relief Fund, will be held at the Lexington Avenue Opera House and Terrace Garden, 58th Street, near Third Avenue, on the evening of November 30. Mr. J. C. Watts, of the Western Union Telegraph office, 195 Broadway, is chairman of the Entertainment Committee.

Wanted.

A Telegraph and Telephone Inspector for one of the Central American Republics. Must be a telegraph operator and unmarried. The salary is \$110 per month for the first year, and after that, if services are satisfactory, \$125 per month and actual traveling expenses. The applicant must be experienced in construction, maintenance, etc., pertaining to the telephone lines. The right man will be eligible for promotion within a year, to a more important division with increase of salary. Address "Inspector" care Telegraph and Telephone Age, 253 Broadway, New York.

The Serial Building Loan and Savings Institution, 195 Broadway, New York, is steadily increasing the amount of its annual business. It has in past years accomplished much in the direction of providing a safe depository for the earnings of telegraphers, and has aided over one thousand in the purchase of homes, which are paid for in monthly installments. It pays five per cent. on deposits.

Martin's latest Vibroplex's \$9.00. Typewriter bargains, all makes. JAMES B. HAVICE, General Agent, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Leg Pattern \$2.50
Legless Pattern 4.00

SOME POINTS ON ELECTRICITY.—VII.

A Study of Telegraph Apparatus.

BY WILLIS H. JONES.

SPRINGJACKS AND CORD TERMINALS.

A switchboard springjack is about the most substantial-looking part of all the paraphernalia found in a telegraph office, yet it possesses its individual weak points in common with the rest of the equipment, as will be explained later. There is no apparatus absolutely perfect. A glance at Fig. 1 will show that the springjack proper consists of three parts, the upper and the under lip, and a strong spring to hold the two in a closed position. The lower lip is simply a solid plate of brass, while the upper or movable lip consists of a long S-shaped bar, one end of which is hinged by means of a pivot to another brass plate terminal. The weak spots in this device are the spring and the pivot. The spring sometimes stretches and does not hold the lips tightly together. But this defect is easily remedied. The most formidable defect appears when the springjack becomes old. The pin becomes rusty

and frequently causes temporary "openings" in the loop circuits connected therewith, which usually close mysteriously the moment the wedge of a test instrument is inserted. This defect is one of the most annoying sources of loop trouble we have to contend with, as the said pin, so far as the eye can

FIG. 1.—SECTION OF TERMINAL BOARD.

detect, is apparently faultless. It is only after a number of these openings occur successively that one is warranted in ordering the jack removed entirely and thoroughly overhauled, as many other things contribute to cause similar openings. Nevertheless, the frequent inspection of these pins is a point probably too often overlooked, and also too little appreciated when explanations are due. No one who has ever had charge of a loop switchboard, however, has any false idea on this point. It is evident that springjacks may be used for many different purposes. A number of them arranged in the manner shown in Fig. 1 and placed side by side would constitute a main line wire switchboard. If arranged as shown in Fig. 2, we have what is called a loopswitch.

In Fig. 1 we see the complete connections of one main wire. The external line-wire is connected to the lower lip and the upper lip connects with the vertical brass bar immediately above it by means of a short length of wire. In some offices the line is connected with the upper lip, but that is merely a matter of choice; either method will answer the purpose. The object of the long vertical brass bar is to provide a means of connecting the battery, or

a circuit with the wire permanently connected in the jack below it. All instruments or other apparatus that are to be inserted in the main line wire are connected by means of a wedge inserted in the springjack, as shown in the illustrations. This wedge always constitutes the terminals of the conductors of the house circuit which leads to the relay, sounder or other apparatus with which it happens to be con-

FIG. 2.—LOOP SWITCH.

nected. The connection is usually effected by a flexible cord, the other end of which in turn is connected with the sub-switchboard behind the main wire switch, as shown in the diagrams. Fig. 1 shows the Gardanier type of terminal switchboard used almost universally by the Western Union Telegraph Company. The cord itself is a permanent connection, but the terminal pins make it possible to extend the house connections to any location desired, or substitute one class of apparatus for another at will. The detached cut in the upper part of Fig. 1 shows how easily such alterations may be made.

In a loop switchboard, shown in Fig. 2, the terminal board is somewhat differently constructed, while the arrangement and connections of the springjacks are likewise dissimilar. In this board the two

lips of each springjack represent the terminals of a house circuit, which brings the local circuits of multiplex apparatus or some other circuit which may include still different apparatus, to this central point of the office, as shown in the upper jack of Fig. 1. Branch offices and various other local circuits are brought to this board through the terminal beneath the shelf and end in flexible cords and wedges, as shown. Connections, therefore, are made with house apparatus by simply inserting the wedge of an external circuit in the springjack circuit leading to any multiplex or other house apparatus.

The lamp resistance, when required for the purpose of regulating the current flowing in branch office duplex loops, is inserted in the sockets to which the terminals of the loops are connected. Each of these sockets is numbered and has a correspondent number for the hole in the shelf through which the flexible cord connected thereto comes up. Each row of lamp sockets also has a companion row of holes. By this means the lamp for any loop can readily be traced and located.

(To be Continued)

Terminal Office Wiring.

The engineers of the Postal Telegraph-Cable Company for some years have given special attention to the subject of office and switchboard wiring, and have developed systems that eliminate the objections of the older methods. In the old way wires were led to the switchboard through troughs or trenches, through which they were laid without particular order or system. The result was a tangled mass of wires, which rendered it practically impossible to readily find any particular one in case of necessity. Under the modern method all wires are cabled, and around the switchboard the cords are very largely eliminated. The work has been developed on the unit system, which permits of unlimited expansion without interference with existing equipment.

The accompanying diagrams show the Postal Telegraph Company's standard method of wiring terminal offices. A frame, shown at the right of Fig. 1, is located in the terminal room in the basement. All underground and other cables from outside the building are brought to this frame, and each conductor is connected to a terminal jack bar, this bar having looping, grounding and patching jacks in it for test purposes. From this frame cables are led to another frame, known as cross-connecting frame A, shown at the left of Fig. 1, which is usually located behind the switchboard in the operating room. Upon this frame, or between it and the terminal-room frame, the fuse blocks are carried. All main-line switchboard panels are also permanently cabled to cross-connecting frame A, and all changes in the assignments of line conductors are likewise made upon this frame.

Another cross-connecting frame, known as frame B, is located at the rear of the switchboard, or at any

other convenient place, and to this frame all operating and repeater tables, switchboard shelf connec-

The battery leads for the switchboards are connected to banks of resistance coils, and these coils are cabled to the switchboard discs.

The jacks in the frame in the terminal room serve both for cable terminals and for temporary cross-connecting work by cords when cables are in trouble. They also furnish a means for quick tests of cable trouble, and may be used as a temporary switchboard in case the main switchboards of operating rooms should be destroyed by fire or disabled in any other manner. In the latest equipment fire-proof table cabinets located at the ends of operating and repeater tables carry the resistance coils used in connection with local and multiplex sets.

All frames are of angle iron, including switchboard frames, and all switchboard connections, cross-connecting frame, and terminal frame connections are mounted upon either porcelain or slate. No wood or other inflammable material is used except for switchboard shelves. The wire used upon the cross-connecting frames is provided with flame-proof braid and is especially made from the Postal Company's specifications. All resistance coils are of fireproof materials mounted upon slate. In one of the most recent installations the repeater tables are made entirely of angle and sheet iron, with asbestos-wood tops, and the instruments, with the exception of sounders, are mounted upon slate bases. These include condensers, rheostats, relays and transmitters.

The main line instruments have undergone a change in design and construction, and are notable for their solid and serviceable appearance. The trunnions are provided with agate bearings to reduce the friction, and there is no lost motion in any of the working parts. In the latest installation of

tions, etc., are cabled, and the cross-connection of these cables is done at this point. (See Fig. 2.)

switchboards no cords are used, except for irregular assignments and for test purposes.

Recent Telegraph and Telephone Patents.

Nos. 974,866 and 974,955. Automatic Telephone System, to A. H. Dyson, Chicago, Ill.

No. 975,105. Semi-Automatic Telephone System, to C. R. Austin, Longbeach, Cal.

No. 975,338. Telephone System, to A. H. Dyson, Chicago, Ill. This system is of the automatic and semi-automatic type.

No. 509,219. Non-Interference Signal Box Mechanism for Fire Alarm Telegraphs. Issued to Thos. F. Gaynor, Louisville, Ky.

No. 509,290. Signal Telegraph. Issued to C. V. Boughton, Buffalo, N. Y.

Personal.

Mr. Stephen D. Field, the well-known electrical engineer of Stockbridge, Mass., was a recent New York visitor.

Mr. E. B. Saylor, of Pittsburg, was a recent New York visitor and called on many of his friends while in the city.

Mr. Thomas T. Eckert, Jr., son of the late General Thomas T. Eckert, former president of the Western Union Telegraph Company, was married November 22 to Miss Minnie Egan, of New York.

Mr. Thomas Commerford Martin, secretary of the National Electric Light Association, New York, has issued in pamphlet form his address at the unveiling of the memorial tablet at Forestdale, Vt., to commemorate the invention of the electric motor by Thomas Davenport.

Mr. Charles H. Boynton, formerly general superintendent of the Associated Press, New York, has formed a new stock exchange partnership under the name of C. H. Boynton & Company. Mr. Boynton has many friends in the electrical field and handles electrical securities. He is the son of Mr. Charles A. Boynton, who has been for many years general superintendent of the Associated Press at Washington, D. C.

In the previous issue we mentioned the fact that Mr. Francis W. Jones, formerly and for many years electrical engineer of the Postal Telegraph-Cable Company, New York, had gone to West Palm Beach, Fla., for the winter. We inadvertently failed to mention the fact that Mrs. Jones accompanied her husband. Mr. and Mrs. Jones are well known to the electrical profession, and their numerous friends are pleased to learn that the health of Mr. Jones has greatly improved since his retirement from active commercial life about three years ago.

Postal Telegraph-Cable Company.**EXECUTIVE OFFICES.**

Mr. E. J. Nally, vice-president and general manager of this company, has prepared an article entitled "Progress," which appears in the current issue of the *Postal Telegraph*. The article is as follows:

"Now that we are approaching the beginning of a new year, and are able to look back over nearly the whole of this year's work, we find that we have made very marked progress. We have more lines, and they are in better condition; we have more offices, and they are better equipped; we have more employees, and they are better paid; we are doing a larger business than ever before,—all this in the face of a very active competition on the part of the old company; hence, we have every reason to feel encouraged at the outlook for next year.

"This company was never in better shape in every way than now. We are financially strong,

our plant is the best, and our organization is compact and efficient.

"It is true that a few of our valued men have gone over to the opposition. We are sorry to lose them, but the success of no large enterprise is dependent upon the continued service of any one man or group of men, any more than the progress of the world at large is dependent upon the activities of any one man or group of men. Where there is organization there are capable under-studies, always ready and able to take up the work and carry it along. The number of changes and promotions of late, and the promptness with which they were made, and the general satisfaction which they have given, have obviously strengthened the service and given hope and encouragement throughout the ranks. It has been noted, and commented upon, that in every instance promotions were made and positions filled from Postal ranks, according to seniority and according to the fitness of the persons selected; in no case was it necessary to gather in recruits from any other telegraph company, any telephone company, any electric company, or any railroad company. This in accordance with the Postal policy—to give preference to our own people, and thus inculcate and foster the Postal spirit.

"Wise and conservative financial policies, up-to-date equipment and progressive, business-getting methods, the best possible service, and earnest co-operation on the part of all employes, from the president down to the messenger boy, must result in the continued success of the Postal Company in the future, as it has in the past."

Mr. Edward J. Nally, vice-president and general manager of the company announces that certain important changes will be made in district lines as a result of changes and promotions in the west and southwest, effective January 1, 1911, as follows:

Western Division: First District, Mr. H. G. McGill, superintendent, Chicago, will comprise the lines and offices in what is known as Greater Chicago.

Second District, Mr. E. W. Collins, superintendent, Cleveland, Ohio, will comprise the lines and offices in Ohio (except Toledo) and in West Virginia, as at present.

Third District, Mr. S. H. Mudge, superintendent, now in St. Louis, will later be transferred to Chicago, and will have the lines and offices in Illinois and Missouri, except Chicago, Kansas City and St. Joseph.

Fourth District, Mr. Albert L. Lafferty, superintendent, headquarters Chicago, will comprise the lines and offices in Michigan, and Toledo, Ohio.

Fifth District, Mr. A. B. Richards, superintendent, now in Kansas City, will later be transferred to Chicago, and will have the lines and offices in the States of Kansas and Nebraska, and also the offices in Kansas City and St. Joseph, Mo., and Council Bluffs, Ia.

Sixth District, Mr. W. P. S. Hawk, superintendent, Chicago, will comprise the lines and offices in the State of Indiana.

Seventh District, Mr. W. C. Black, superintendent,

headquarters Denver, will comprise the lines and offices in the States of Colorado, Wyoming, New Mexico, Eastern Arizona, also Ogden and Salt Lake City, Utah, and El Paso, Tex.

Eighth District. This new district has been created, which will comprise the lines and offices in Wisconsin, Northern Michigan, Iowa, South Dakota and Minnesota. Mr. John F. Looney, now electrical engineer of the Western Division, has been appointed superintendent of the new district, and will have his headquarters in Chicago. Mr. Looney will be succeeded as electrical engineer of the Western Division by Mr. Harry C. Shaw, now electrical engineer of the Pacific Division.

Pacific Division: Mr. H. C. Shaw will be succeeded as electrical engineer of the Pacific Division by Mr. Vail V. Stevenson, now manager of the Los Angeles office, with headquarters in San Francisco.

Southern Division: Mr. Jesse Hargrave, superintendent Third District, has been advanced to the position of division superintendent of the Southern Division, with headquarters in Atlanta, Ga.

Mr. G. W. Ribble, superintendent First District, Richmond, Va., has been advanced to the superintendency of the Second District, with headquarters in Atlanta, Ga., vice Mr. G. E. Paine, promoted. His district will comprise the States of Georgia and Florida.

Mr. Charles H. Ashburn, manager of the Norfolk, Va., office, has been promoted to the superintendency of the First District, with headquarters in Atlanta, vice Mr. G. W. Ribble. His district will comprise the lines and offices in the States of Virginia, North Carolina and South Carolina.

Mr. Wm. C. Daviett, chief clerk in general superintendent Usher's office, has been promoted to the superintendency of the Fourth District, with headquarters in Atlanta, vice Mr. C. B. Arrington, promoted. His district will comprise the lines and offices in the States of Kentucky and Tennessee.

Mr. C. B. Arrington has been promoted to the superintendency of the Third District, with headquarters at Atlanta, vice Mr. J. Hargrave, promoted. His district will comprise the lines and offices in the States of Alabama, Louisiana and Mississippi.

Mr. Howard A. Lanier, chief operator at Norfolk, Va., has been made manager of the Norfolk office, vice Mr. C. H. Ashburn.

Mr. J. R. Gilroy, chief operator at Toledo, Ohio, has been made manager of the Toledo office, vice Mr. A. L. Lafferty. Mr. C. B. Holley, night chief operator, has been made chief operator, vice Mr. Gilroy.

Mr. Edward J. Nally, vice-president and general manager of the company, was in Chicago last week on business incident to the appointment of Mr. Guy E. Paine as general superintendent at that point.

Mr. T. W. Carroll, general superintendent of the Western Division, Chicago, Ill., and Mr. J. P. Edwards, electrician of the Southern Division, Atlanta, Ga., have resigned.

Mr. Albert L. Lafferty, manager of the Toledo, Ohio, office, has been appointed superintendent,

Fourth District, Western Division, with headquarters at Chicago, vice Mr. H. J. Kinnucan, resigned.

On November 17 the company completed the construction of three wires between Salt Lake City and San Francisco. Congratulatory telegrams were exchanged between Mr. C. B. Turpin, manager at Salt Lake City, and Mr. J. B. Coggins, manager at San Francisco. Two of the wires are of copper, 435 lbs. to the mile. They are transposed for telephone service. They follow the Southern Pacific route, and the construction of the line is of the very best.

Mr. Chas. M. Baker, Chicago, has been appointed division general superintendent of plant of the western division, effective January 1, 1911.

Mr. A. W. Richerter, clerk in Superintendent Kimmey's office, New York, has been transferred to Boston as chief clerk in the superintendent's office.

Among recent executive visitors were: Mr. H. A. Tuttle, president and general manager North American Telegraph Company, Minneapolis, Minn.; Superintendents, C. E. Bagley, Philadelphia; H. Scrivens, Pittsburg; H. D. Reynolds, Buffalo, and acting superintendent, C. A. Richardson; Wm. Ryan, district foreman, and P. J. Farrell, quadruplex chief, Boston; F. B. Travis, manager, and G. M. Foote, assistant manager, Washington; V. J. Albert, manager, Baltimore; A. W. Rinehart, manager, Pittsburg; A. E. Zintl, assistant manager, and John Gorsuch, district foreman, Philadelphia; R. A. Barton, manager, Lancaster, Pa.; C. C. King, chief operator, and N. C. Pangburn, foreman, Albany; L. Bangert, district foreman, Buffalo.

PROMOTIONS IN THE NEW YORK MAIN OFFICE.

Mr. J. J. Whalen, assistant manager, has been appointed manager to succeed Mr. F. F. Norton, promoted.

Mr. D. F. Mallen, night manager, has been appointed assistant manager to succeed Mr. Whalen.

Mr. C. J. McCarthy, assistant night manager, has been appointed night manager to succeed Mr. D. F. Mallen, and Mr. E. A. Coney succeeds Mr. McCarthy as assistant night manager. Mr. S. C. Dodd, assistant night wire chief, has been advanced to the position of senior night wire chief, vice Mr. E. A. Coney, and Mr. J. H. Twyford succeeds Mr. Coney as senior night wire chief.

Mr. J. P. Williams, assistant all night chief, has been appointed all night chief in place of Mr. Twyford; Mr. T. P. Smith succeeds Mr. Williams as assistant night chief, and Mr. T. F. Kehoe has been appointed assistant day wire chief on the south and west to succeed Mr. Smith.

Mr. Harry R. Monahan, draftsman in the office of the electrical engineer, has resigned.

Mr. J. J. Fredericks, assistant day wire chief, has been appointed general traffic chief to succeed Mr. J. B. Rex, resigned.

Mr. A. E. Keighley, of the Dayton, Ohio, office, has been appointed assistant to manager F. J. Cunningham, at Richmond, Ind. Since Mr. Cunningham assumed charge of this office last August the business has materially increased as a result of his splendid management.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company, was, at a special meeting of the directors on November 23 elected president of this company to succeed Colonel Robert C. Clowry, resigned. Colonel Clowry remains a director and was elected a member of the executive committee. The directors also elected Newcomb Carlton vice-president of the company. Mr. Carlton was a vice-president of the Westinghouse Electric and Manufacturing Company, and in 1905 he went to London as the managing director of the British Westinghouse Electric and Manufacturing Company. He was born at Elizabeth, N. J., forty-two years ago.

A conference of the general superintendents and division commercial superintendents from five of the six divisions was held in New York recently to exchange ideas and suggestions for the benefit of the service. The discussion covered matters of importance, which naturally arise in connection with a rapidly expanding business. Those present were: Mr. J. C. Nelson, general superintendent, and Mr. S. E. Leonard, division commercial superintendent, Denver; Mr. T. P. Cook, general superintendent, and Mr. M. T. Cook, division commercial superintendent, Chicago; Mr. L. McKisick, general superintendent, and Mr. J. C. Smith, division commercial superintendent, Dallas, Tex.; Mr. B. F. Dillon, general superintendent, and Mr. J. M. Stephens, division commercial superintendent, Atlanta, Ga.; Mr. A. G. Saylor, general superintendent; Mr. E. M. Mulford, division commercial superintendent and Mr. S. M. Williams, special agent, New York.

The conference was also attended by Mr. Belvidere Brooks, general manager; Mr. W. H. Baker and other officials of the company.

A conference of district commercial and district traffic superintendents of the eastern division was held in New York November 22 and 23, at which were present the following: District Commercial Superintendents, J. F. Nathan, New York; E. P. Griffith, Jersey City; N. E. Church, Pittsburg; W. A. Sawyer, Philadelphia; C. F. Ames, Boston; C. W. McKee, St. John, N. B.; J. W. Reed, New Haven, Conn. The following district commercial managers were present: A. E. Reynolds, Albany, N. Y.; O. A. Connor, Buffalo, N. Y.; G. R. Daniels, Scranton, Pa., and W. H. Spry, Newark, N. J. The following district traffic superintendents were also present: Herbert Smith, New York; T. A. McCammon, New York; W. J. Dodge, Pittsburg; J. M. Creamer, Philadelphia; L. D. Wilbourn, Boston;

D. C. Dawson, St. John, N. B.; T. E. Russell, New Haven, Conn. District traffic managers present were: Richard O'Brien, Scranton, Pa.; T. J. Meade, Albany, N. Y.; E. F. Griffith, New York; G. F. Smith, New York; A. J. Heldman, New York; J. W. McMahon and others. Others present were: E. T. Burrill, general traffic chief; W. A. McAllister, general traffic chief; W. A. Houghtaling, traffic supervisor, and F. D. Giles, special agent, all of New York.

Mr. T. W. Carroll, general superintendent of the Postal Telegraph-Cable Company, Chicago, Ill., has been appointed assistant to the general manager, with headquarters in New York.

Mr. H. C. Worthen, of the office of traffic engineer, New York, has been appointed general superintendent, Southern Division with headquarters at Atlanta, Ga., to succeed Mr. B. F. Dillon, deceased.

Mr. H. J. Kinnucan, superintendent of the Postal Telegraph-Cable Company at Detroit, Mich., has resigned to accept the position of division general agent of this company with headquarters in the same city.

Mr. J. P. Edwards, division electrical engineer of the Postal Telegraph-Cable Company, Atlanta, Ga., has accepted a position in the office of the engineer of equipment, New York.

Mr. W. A. Stallings has been appointed manager at Natchez, Miss., to succeed Mr. G. H. Bobbitt.

Mr. W. R. Hollis, of Superior, Wis., has been appointed manager of the Fargo, N. D., office.

Captain Theodore A. Royan has been appointed commander of this company's cable steamer, "Robert C. Clowry."

Mr. Alonzo M. Pearson, manager of the Cambridge, Mass., office, has been appointed special agent, with headquarters at Boston.

Mr. H. B. Simonds, chief bookkeeper in the Boston office, has succeeded Mr. A. M. Pearson as manager of the Cambridge, Mass., office.

Mr. J. B. Rex, formerly general traffic chief of the Postal Telegraph-Cable Company, New York, has accepted a similar position in the Boston office of this company.

Mr. T. E. Russell has been appointed district traffic superintendent of the seventh district, Eastern division, with headquarters in New Haven, Conn.

Mr. Joseph Slater, for many years connected with the superintendent's office in Philadelphia, has been appointed chief clerk to Mr. R. J. Meigs, district plant superintendent.

Mr. George Boothby, of the Associated Press, Albany, N. Y., has accepted a position at Philadelphia as special solicitor, and is attached to the office of superintendent W. A. Sawyer.

Mr. H. F. Dodge, division commercial superintendent at San Francisco, was a New York visitor

last week, as was also Mr. H. J. Kinnucan, of Detroit, Mich., general supervisor.

Mr. E. C. Davis, formerly of Dallas, Tex., and Kansas City, Mo., but for some months past at Los Angeles, Cal., has been promoted to be wire chief of that office.

Mr. W. J. Francis has been appointed manager of the Montgomery, Ala., office, to succeed Mr. C. A. Fonville, resigned. Mr. Francis was formerly with the Western Union, at Richmond, Va.

Mr. Harry R. Monahan, formerly draftsman in the office of the electrical engineer of the Postal Telegraph-Cable Company, New York, has accepted a similar position in the office of engineer of equipment.

Mr. R. E. Scoriah, manager of the Muncie, Ind., office, has been advanced to a similar position at Terre Haute, Ind., to succeed Mr. A. C. Cronkhite, promoted to be district commercial superintendent at Indianapolis, Ind.

Additional space for the executive offices being required, an entire floor has been rented in the New York Law School Building, on Fulton Street. The offices of M. C. Allen, division superintendent of plant, and W. J. Higgins, district superintendent of plant, will be located in this new structure.

The following appointments have been made in the Pacific Division:

Mr. J. L. Ord, division line supervisor, with headquarters at San Francisco, Cal.

FIRST DISTRICT, SAN FRANCISCO, CAL.

Mr. G. S. Tulloch, district plant superintendent.

Mr. A. W. Douglas, district equipment supervisor.

Mr. M. L. Quinn, district line supervisor.

SECOND DISTRICT, SEATTLE, WASH.

Mr. E. L. Ritter, district plant superintendent.

Mr. E. R. Fisher, district equipment supervisor.

Mr. W. R. Wolgamot, district line supervisor.

THIRD DISTRICT, LOS ANGELES, CAL.

Mr. L. Messner, district plant superintendent.

Mr. G. E. Palmer, district equipment supervisor.

Mr. T. P. Smith, district line supervisor.

Retirement of Col. Clowry, as President.

The retirement of Col. R. C. Clowry from the presidency of the Western Union Telegraph Company, and the appointment as his successor of Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company, was announced November 23. Col. Clowry retires with the best wishes of all his former subordinates. He has been in harness for over fifty years, and his retirement was for the purpose of seeking a much-needed rest. Mr. Vail, his successor, was an operator in his early career, and, although his affiliations in latter years have been with telephone interests, he is thoroughly familiar with the telegraph. He is yet in the prime of life, and will make an efficient head of the great combined organization which he now represents.

The following correspondence bearing on the change will be read with interest.

The Western Union Telegraph Company.
New York, Nov. 16, 1910.

My Dear Mr. Vail:

I enclose herewith my resignation as President of the Western Union Telegraph Company, to take effect at the meeting of the Board of Directors on the 23rd instant, and shall be obliged if you will submit it to the Board on that date.

I have been continuously in the telegraph service for more than fifty years, occupying all positions from the lowest to the highest, and shall be glad to turn the work over to another.

I thank you most sincerely for your friendly and kindly consideration during our intercourse of the last year, and wish you success and happiness in your future career.

Very truly,

(Signed) R. C. Clowry.

Theo. N. Vail, Esq.,
President American Telephone & Telegraph Co., New York.

President's Office.

American Telephone & Telegraph Co.,
New York, Nov. 17, 1910.

Dear Col. Clowry:

I have yours of the 16th in which you announce your intention to resign the Presidency of the Western Union Telegraph Co.

While I am in hearty sympathy with your desire, yet I do most sincerely regret that the Company is to lose the services of one who has been so closely identified with and contributed so much to the growth and prestige of the great company.

I am sure that in your retirement you will carry with you the best wishes and good will of all who have been associated with you, not only in the telegraph, but in the telephone business.

Most sincerely,

(Signed) Theo. N. Vail.

The Western Union Telegraph Company.

New York, November 23, 1910.

To the Board of Directors,
Western Union Telegraph Company,
New York.

Gentlemen:

I hereby tender my resignation as President of your Company, to take effect to-day.

Having been continuously engaged in the telegraph business for more than fifty years, I feel that I am entitled to retire from the service and take a much needed rest.

Thanking you heartily for your confidence and co-operation in the past, I am,

Very respectfully yours,

(Signed) Robert C. Clowry.

To the Officers and Employees of The Western Union Telegraph Company.

After a continuous service of more than fifty

years in the telegraph business, I have to-day retired from the Presidency of The Western Union Telegraph Company, in order that I may hereafter enjoy a much-needed rest. The greatest regret I have, however, in so retiring, is that I shall miss the close and friendly business relations with my associates of so many years with whom it has been a pleasure and an honor to serve, and whose devotion to the interests of this great company has been unsurpassed. I am sure that your loyalty to my most worthy successor, Mr. Theo. N. Vail, will be as thorough and complete as it has been to me. I tender you all my best wishes for your good health and happiness.

(Signed) Robert C. Clowry.

New York, November 23, 1910.

Canadian Notes.

About 550 concrete poles are being erected in Toronto, Ont., by the Hydroelectric department for use in street lighting.

The Grand Trunk Pacific Telegraph Company now has in operation a continuous line of telegraph extending from West Fort William, Ont., via Winnipeg and Edmonton, to Edson, Alberta, a total distance of 1,400 miles. Twenty-three new offices have been opened between Fort William and Winnipeg. Construction work is now proceeding from Edson, Alberta, west, through the Yellowhead Pass to Tête Jaune Cache, which point it is expected to reach by December 31. From Prince Rupert eastward the line is constructed to "M. P. 100," and material is already distributed to continue the line to Aldermere, 245 miles east of Prince Rupert. During the season 1910, telegraph lines have been constructed on the following branches: Yorkton Branch, Melville, Sask., to Canora, Sask., 55 miles; Prince Albert Branch, Young, Sask., to a point 30 miles north; Regina Branch, Melville, Sask., to Balcarres, Sask., 31 miles; Calgary Branch, Tofield, Alta., to Red Deer, Alta., 87 miles. Mr. A. B. Smith, Winnipeg, Man., is manager of telegraphs, and this work is being done under his supervision.

The application of the various telegraph companies of Canada for the approval of their message forms was before the railway commission recently. During the discussion a question arose as to the liability of a company for a time schedule in transmitting a message. Up to the present time the telegraph companies have been liable for the cost only of an ordinary message in the event of a mistake being made, and of fifty times the amount in the case of a repeated message. It was suggested by the board that a maximum penalty of \$500 be fixed. The advisability of making the penalty \$200 for an unrepeat and \$400 for a repeated message was suggested. The board reserved decision.

In the Republic of Panama there are 32 telegraph offices, and during 1909 two short extensions to the telegraph system were completed.

Why Some Operators Are Unable to "Adjust."

BY J. I. MOSIER, CALAIS, ME.

We read a great deal about the operation and care of multiplex telegraph apparatus, but very little about the Morse simple circuit and relay, probably because the instruments are considered so simple that every operator should know all about them. The number of operators working simple Morse circuits must be far in excess of those working multiplex, and as there are certain conditions affecting the simple circuit and relay that are not understood by a majority of the operators, it would be well to point these out, especially since work of the most important character, *i. e.*—that affecting the movement of trains—is done on these circuits.

One quite general belief is "If I can adjust for you, why can't you adjust for me?" Many operators believe that the other operator does not know how to adjust properly. Although this is often the case, it is also due to abnormal conditions affecting the circuit which few operators understand, the principal one of which is the excess of battery power at one end of the line over that at the other end. The greater this difference the more difficult it is for the operator nearer the end of the wire with the stronger energy to adjust for the operator nearer the weaker end during wet weather, or when there is a leakage from any cause, the limit being reached, when the battery is all at one end of the line.

In the illustration we have, say, a simple telegraph circuit, twenty-four and one-half miles in length with battery at one end only, and with three stations, the apparatus consisting of 150-ohm relays. Let it be assumed that this circuit consists of iron wire having a resistance of 20 ohms per mile, and that there is a leak at *X*, one mile from *C*, having a resistance of 200 ohms, and caused by contact with a telephone, guy, or fence wire.

First consider the resistance from ground at *A* to the point *X*.

Ground connection,	30 ohms.
Battery, 50 cells, 2 ohms each,	100 "
23½ miles wire, 20 ohms per mile,	470 "
2 relays, each 150 ohms,	300 "

Total resistance, ground *A* to *X*, 900 ohms.

As the resistance of each path from *X* is 200 ohms (one path consisting of the 200-ohm leak, and the other, one mile of wire, one relay, and ground connection), the joint resistance from *X* to ground will be,

100 "

Total resistance of circuit, 1000 ohms.

When all of the keys are closed the battery will produce a current of $50/1000 = 1/20$ ampere, or $1/20 \times 1000 = 50$ milliamperes. At *X* this current divides into two equal parts, since the two paths are of equal resistance, 25 milliamperes going through the leak, and 25 milliamperes through the relay at *C*. This is ample current to operate the relay so that the operator at *C* will have no diffi-

culty in reading the signals sent by the operators at *A* or *B*.

Now what happens when the operator at *C* signals? When his key is closed 50 milliamperes of current flow through relays at *A* and *B*. When his key is open, the resistance of the circuit is made up as follows:

Ground connection at <i>A</i> ,	30 ohms.
Battery,	100 "
23½ miles wire,	470 "
Two relays (<i>A</i> and <i>B</i>),	300 "
Leak,	200 "

Total, 1100 ohms.

The current flowing in this circuit will be $50/1100 = 1/22$ ampere, or $1/22 \times 1000 = 45\ 5/11$ milliamperes.

Then with the key at *C* closed, 50 milliamperes flow through relays *A* and *B*, while with the key

DIAGRAM OF A CIRCUIT WITH BATTERY AT ONE END.

at *C* open, $45\ 5/11$ milliamperes flow through *A* and *B*, leaving a working margin of only $4\ 6/11$ milliamperes. It would be impossible under these conditions for the relays at *A* and *B* to be adjusted.

The same holds good in a lesser degree, when there is a higher voltage at one end of the line than at the other.

Although this explains one of the reasons why some relays can be more easily adjusted than others, there is no justification for other offices being thrown out of adjustment by either a decrease in current or a slight leak on the line. In either case the cause is invariably due to the armature having too much play. Such a condition necessitates a comparatively weak retractile spring, otherwise, the armature falling back so far from the magnets will not be attracted with sufficient force to move promptly to the front stop when the circuit is closed.

Now if the current is decreased by any of the various causes, all relay magnets in the circuit will be proportionately weakened, and the armature lever of the relay in question will remain against its back stop, the weakened magnets not exerting force enough upon the armature at such a distance.

Again, if there is a slight leak from the line to the ground at any point, the armature lever of this relay will remain against its front stop, even when a key

is opened beyond the leak, the weak spring being unable to overcome the magnetic pull caused by the short circuit resulting by reason of the leak. A good general rule to follow is to give the armature not more than $1/32$ inch play. This adjustment will prove satisfactory for practically all conditions.

Although the magnets and spring have to be adjusted to meet existing conditions, there is a medium in their adjustment for normal conditions to give the relay the greatest efficiency. The magnets should not be placed so near the armature that the increased self-induction will cause the relay to act sluggishly, or sticky. The spring should be stiff enough to pull the armature back promptly even if there be a slight leak on the line. For "high" adjustment during wet weather, it is better to pull the magnets well back, than to make the spring too stiff, as a weak spring is more sensitive than a stiff one.

With one or two exceptions the above applies to box relays and main line sounders, as well as the common relay. In wet weather, the magnets of box relays cannot be pulled back as far as those of the common relay, because the magnetic pull has to overcome not only the spring, but also the inertia of the heavy lever.

Generally speaking apparatus designed to be used without a sounder cannot be so well adjusted for a small working margin, owing to the weight of the lever.

Meeting of Eastern Division of Association of Railway Telegraph Superintendents.

A largely attended meeting of the Eastern Division of the Association of Railway Telegraph Superintendents was held November 16 and 17 in the board room of the new Pennsylvania Railroad Terminal, in New York. The discussion of the subject of telephone train dispatching and inspection of lines occupied a considerable portion of the time. On the subject of insulators, Mr. W. J. Camp, electrical engineer of the Canadian Pacific Railway, Montreal, related his experiences with glass and porcelain insulators. Those of glass were subject to frequent breakage, especially when fixed on iron pins, while those of porcelain were much more durable. He had tried three makes of porcelain insulators, two American and one German. The German product had given the best satisfaction. Compared with glass insulators, they cost about 50 per cent. more.

Mr. E. P. Griffith, superintendent of telegraph, Erie Railroad, Jersey City, N. J., and chairman of the Turner Monument Fund, gave an account of the work of the committee in securing subscriptions toward the fund of \$3,000 for the erection of a monument at Turner, N. Y., to commemorate the sending of the first telegraph train order. He also displayed a blue print of the proposed monument. The action of the committee thus far received the approval of those present.

Mr. Charles Selden, superintendent of telegraph,

Baltimore & Ohio Railroad, Baltimore, was re-elected chairman of the Eastern Division for another year. The following-named gentlemen were present at the meeting: Mr. Charles Selden and Mr. B. F. Thompson, Baltimore & Ohio Railroad, Baltimore, Md.; Mr. E. P. Griffith, Erie Railroad, Jersey City, N. J.; Mr. W. C. Walstrum, Norfolk & Western Railroad, Roanoke, Va.; Mr. W. P. Cline, Atlantic Coast Line, Wilmington, N. C.; Mr. L. B. Foley, Lackawanna Railroad, New York; Mr. A. B. Taylor, New York Central Lines, New York; Mr. J. T. Nolan, Washington Terminal, Washington, D. C.; Mr. W. H. Potter, Southern Railway, Washington, D. C.; Mr. W. J. Camp, Canadian Pacific Railway, Montreal, Que.; Mr. S. A. D. Forristall, Boston & Maine Railroad, Boston, Mass.; Mr. N. E. Smith, New York, New Haven & Hartford Railroad, New Haven, Conn.; Mr. W. F. Williams, Seaboard Air Line, Portsmouth, Va.; Mr. L. S. Wells, Long Island Railroad, New York; Mr. J. F. Caskey, Lehigh Valley Railroad, South Bethlehem, Pa.; Mr. W. F. Taylor and Mr. J. M. Dietz, Pennsylvania Railroad, Altoona, Pa., and Mr. C. L. Lathrop, Pittsburg, Shawmut & Northern Railroad, Angelica, N. Y.

At the conclusion of the meeting on November 16 the party inspected the magnificent terminal of the Pennsylvania Railroad, and later were entertained at luncheon at the Waldorf-Astoria Hotel by the Western Electric Company.

On November 17 Mr. Belvidere Brooks, general manager of the Western Union Telegraph Company, entertained the superintendents at a dinner at the Lawyers' Club, New York. Among those present, besides Mr. Brooks and the railroad superintendents, were Mr. H. B. Thayer, president; Mr. H. Halligan, general manager, and Mr. A. L. Salt, of the Western Electric Company; Mr. W. H. Baker, Mr. F. A. Pickernell, and all of the visiting general superintendents, and the division commercial superintendents of the Western Union Telegraph Company.

New York Electrical Society.

The New York Electrical Society will hold several interesting meetings during the present season. Among the topics to be considered are the following: "Electricity at the Panama Canal," by Mr. David B. Rushmore; "Wave Motion by Electricity and Other Energy," by Dr. Charles P. Steinmetz. A visit will be made to the laboratory of Mr. Thomas A. Edison at Llewellyn Park, West Orange, N. J., on which occasion it is stated that Mr. Edison will give a talk on "The Edison Storage Battery and Its Applications." Besides an inspection of the laboratory there will be an exhibition of moving pictures.

Mr. J. B. Prudhomme, manager of the Postal Telegraph-Cable Company, at Texarkana, Tex., writes in sending his subscription for another year, "Better late than never."

Telegraph and Telephone Age

Entered as second-class matter, December 27, 1909, at the Post-Office at New York, N. Y., under the act of March 3, 1879.

ADDRESS ALL COMMUNICATIONS TO

J. B. TALTAVALL, - Editor and Publisher,

253 BROADWAY, NEW YORK

T. R. TALTAVALL, Associate Editor.

CABLE ADDRESS: "Telepage," New York.

Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

December 1, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

The Telegraphers' Mutual Benefit Association.

The report of President Brooks of the Telegraphers' Mutual Benefit Association indicates that the association's affairs are in a very satisfactory condition. Notwithstanding the high death rate the reserve fund has been increased very substantially and there is every reason to believe that this progress and growth in stability will continue. But in order that it may be still more increased the individual members should take an active part in the association's work by aiding in enlarging the membership. An element of added strength is the proposal to create an advisory board consisting of members in different sections of the country to act with the Executive Committee. This was an important action and the advantages that the association will derive from it cannot be overestimated. In addition it was ordered that all past presidents be created ex-officio members of the committee. The wide experience and the accurate knowl-

edge of the Association's affairs possessed by its past presidents individually will, under the new order, be co-ordinated and rendered available for the benefit of the association.

President Brooks called attention to the importance of members having their certificates of membership made payable to some person or persons as beneficiaries. In the event of the death of the beneficiary named in the certificate before that of the policy holder a new beneficiary should be named. This will prevent delay in settling claims, and avoid the necessity of the estate being placed in the hands of an administrator which is a tedious and expensive method of settlement. The report advises that earnest efforts be made to interest telephone employees and acquaint them with the advantages of membership in the association. There is certainly a wide field here for effective work now that the telegraph and telephone interests are so closely allied. It would certainly be a great advantage to have the telephone interests represented on the official board, as President Brooks recommends. That alone would tend to secure the active interest of eligible telephone men, and such representation, supplemented by earnest and wide field work, should be very effective in building up the strength of the association. The success of this task however depends largely upon the individual members. The officers and agents of the association cannot do all the work; they need help from the members. The members themselves can accomplish much if they will only give the matter a little consideration and time. It is a work of humanity that all the members should participate in most heartily.

Government Ownership of Public Utilities.

The question of government ownership of public utilities has lost its old-time vigor, but some thought is yet being bestowed upon it in many localities generally unfavorable to the theory. This agitation, like all other agitations, may be likened to a swinging pendulum. After it starts it gathers momentum until it reaches a certain point in its progress, then its momentum decreases and it returns to the point where all forces are in equilibrium. So it is with all innovations. Sober thought throws light upon all human problems, and it is beginning to dawn upon some State and municipal officials that the effect of government ownership of railroads, telegraphs, telephones, etc., would wipe out a very large tax revenue derived from these private interests for the support of State administration. With these taxes gone who would come to the relief of the States' needs? The taxpayer of course. This would be an expensive lesson in government ownership and the taxpayer will probably have something to say about the matter if the question should ever be put to a test. He will think twice before taxing himself to support interests that are not neces-

sarily a benefit to all the people, and which should remain in private ownership and be taxed directly. Government ownership of these public utilities would therefore mean, in effect, the taxation of the many for the benefit of the few. The taxpayer is beginning to realize the truth about this matter and while the realities of the situation are becoming more widely known it is necessary to be on constant guard and ready to meet and elucidate the government ownership fallacy whenever it is revived.

As is well known, Kansas is the breeding ground of ideas of a populistic nature, and the following comment on this subject from the *Leavenworth Post* seems like a thunderbolt from a clear sky:

"Government ownership of the railroads would be a nice thing, wouldn't it? In Leavenworth county the railroads and telegraph companies pay almost one-fifth of all the taxes. Under government ownership they wouldn't have to and they wouldn't have to pay \$500 for every \$25 cow they killed either."

The Child Labor Question Applied to the Messenger Service.

As an example of how the child labor law is being enforced to the detriment of the ambitious boy desirous of assisting his family while working his way through school, an official of one of the telegraph companies has received letters from the manager of an office in a state where the laws forbid a boy under sixteen years of age from working unless he has permission from an official of the school department, which shows that during last summer's school vacation a boy aged fifteen years and six months applied for work as a messenger. In the absence of the school official, authorized to issue the certificate, permission was not obtainable. The mother assured the manager of the telegraph office that the boy was nearly sixteen years of age and needed what money he could earn. The manager gave him employment between the hours of 8 a. m. and 5 p. m. An inspector discovered the boy at work and had the manager arrested and fined for employing him. Later the proper official of the school department returned and issued permission for the boy to work until the commencement of school, at which time he was compelled to relinquish his employment and return to school. Under such laws and those certain philanthropists are seeking to write upon the statue books, it will no longer be possible for the youth of this country to be self helpful. He may run the streets as a vagrant but he must not perform honorable labor.

If such laws are to be enforced a public office should be kept open in each town and city where parents may take their boys and obtain permission for them to seek employment. Ill-considered legislation seeking to prevent boys from earning an honest livelihood will tend to discourage ambition and encourage idleness.

Old Time and Military Telegraphers.

Col. William B. Wilson, of Philadelphia, president of the Old Time Telegraphers' and Historical Association, has announced the executive committee for the management of the affairs of the association for the ensuing year as follows: Wm. J. Lloyd, Chicago, Ill.; G. A. Cellar, Pittsburgh, Pa.; H. D. Reynolds, Buffalo, N. Y.; John C. Barclay, New York; G. W. Deetz, Atlantic City, N. J.; F. W. Griffin, Philadelphia; J. A. McNichol, Philadelphia; A. S. Weir, Philadelphia, and John Wintrup, Philadelphia.

The next reunion of the Old Time Telegraphers' and Historical Association and of the Society of the United States Military Telegraph Corps, of which Col. Wilson is also president, will be held at Atlantic City, N. J., next September on a date yet to be chosen. Mr. David Homer Bates, 658 Broadway, New York, is secretary of the Society of the United States Military Telegraph Corps, and Mr. F. J. Scherrer, 195 Broadway, New York, is secretary of the Old Time Telegraphers' and Historical Association.

Secretary Scherrer is now busily engaged in putting the finishing touches on the printed proceedings of the Chicago reunion last September, and this valuable addition to the literature of the association will soon be ready for distribution.

Mr. Deetz, the Atlantic City resident of the Executive Committee, is manager of the Western Union Telegraph Company at that point and will be assisted by Mr. A. C. Farrand, superintendent of the Electrical Bureau of that city.

Division Reorganization of Postal Telegraph-Cable Company.

The Postal Telegraph-Cable Company has decided upon a radical move in connection with its division organization. Instead of scattering its superintendents throughout the country, they will, in due time, be located at the division headquarters, where they will form a cabinet, as it were, for the general superintendent. The new plan has many advantages over the old one. It will do away with the writing of many letters covering a multitude of subjects that can best be disposed of orally, in conference, and will enable superintendents to readily confer with one another upon all matters pertaining to their respective districts.

It is not intended that superintendents who are located at points distantly remote from headquarters shall be brought in, nor is it expected that the changes will be made at once. It will be done gradually, and so as to cause the least inconvenience to the interests of the men and the company. It will be noted that in the different promotions and changes announced in this issue, that wherever a new superintendent has been appointed, his headquarters will be the headquarters of his general superintendent.

Copies of electrical books covering the electrical industry may be purchased at the office of Telegraph and Telephone Age, 253 Broadway, N. Y.

Telephone Service in America.

We published in our issue of November 1 a portion of the address of Mr. John J. Carty, chief engineer of the American Telephone and Telegraph Company, delivered at the International Conference of European Telephone and Telegraph Administrations, held in Paris last September. Mr. Carty compared the manual switchboard and the automatic switchboard and pointed out the limitations of the latter in large plants. He also told of the plans of his company to care for telephone growth for the next twenty years. The concluding portion of Mr. Carty's address related to the experimental demonstration now in progress at New York of a semi-automatic telephone system. On this subject Mr. Carty said:

Having stripped our question of its verbal disguise, we see that the two systems [manual and automatic] are not so antagonistic as would at first appear. They both stand upon this common ground: Each recognizes the importance of manual operations guided by human intelligence; each recognizes the importance of automatic machinery; each system employs both agencies; each system is semi-automatic.

We are now prepared to formulate the question anew. We see that it becomes a problem of dividing the total operations to be performed, in such a manner that labor guided by human intelligence shall be employed where it is most effective, and that automatic machinery shall be employed where it is most effective. Properly stated, therefore, our question is "What is the best type of semi-automatic switchboard?"

The so-called automatic system, as I have shown, is found unsuitable for the demands of a comprehensive system. The so-called manual system has been tested by the most severe demands of a system composed of 5,000,000 telephones, and it has been found to answer every substantial requirement. By its means we are to-day giving an excellent service and our studies of the future requirements show that if nothing better is attainable, we can, with the manual system, supply in a satisfactory manner all the demands of the public.

But it would not do for us to rest content with this. We must at all times strive for improvements. These are the traditions of the American Telephone and Telegraph Company, added to which are the specific orders from President Vail frequently reiterated, that we must constantly seek for improvements so that we may at all times when it is reasonable and practicable, place at the disposal of the public that system which solid experience has demonstrated to be the best.

Pursuant to this policy we have spent hundreds of thousands of dollars in experiments and investigations pertaining to this subject.

We have, after many years of work, developed and are now installing at New York for an experimental demonstration, a system which is avowedly semi-automatic and not disguised under another

name. The advocates of this system contend that it is a mistake to place, as is done in the so-called automatic systems, complicated automatic machinery at each sub-station. (A sub-station is any telephone set at the subscriber's premises which may be connected to the central office.) They favor the use of a sub-station instrument identical with that employed in the so-called manual, and they assert that this instrument is really much more automatic than the instrument employed in the so-called automatic system itself.

We must admit that there is much force in this statement, for an analysis of the operation of the two instruments shows that the manual operations required at the automatic station are several times more numerous than at the manual station. In fact all of the manual operations required at the manual station are also required at the automatic station. To these must be added at the automatic station a number of other manual acts, depending upon the character of the call to be sent.

It is further asserted that the apparatus at the automatic sub-station is complicated to a high degree, whereas at the manual station it consists of simple elements, and that in consequence of this, with the vast multiplication of stations which must take place in a successful telephone system, the automatic system would be placed at a great disadvantage.

In this semi-automatic system about which I am now talking, a counterpart of the automatic apparatus which is required at each subscriber's station in the automatic system, is placed at the central office. Thus one of these pieces of apparatus is required for each "A" operator's position instead of one for each sub-station on the subscriber's premises. This greatly reduces the number of complications, and one of them being required for each operator's position only, much more money is available to be expended upon its construction. Hence it can be made with great precision and so as to give much more reliable working. Furthermore, these pieces of apparatus being at the central office, they are under the constant care of expert maintenance employees, who can instantly substitute a spare apparatus for one which should become defective.

It is contended on behalf of this semi-automatic system that the "A" operator's position (the "A" operator is the one who answers the subscriber in the first instance), is a point at which human intelligence is needed, because of the numerous exigencies of the service. I have carefully looked into this statement, and I am much impressed with the force of the reasons given in support of it. While the position of the "A" operator seems to be one where human intelligence is required, it is not so at the position of the "B" operator (the "B" operator is the one who receives the trunk call from an "A" operator at another office). When the work of this "B" operator is analysed it will be found theoretically that it can all be done by machinery and that the work to be performed does not require human intelligence. Consequently, in this semi-automatic system, all of the "B" operators are eliminated and

machines substituted. This very greatly reduces the total number of operators required, and if the machinery can be made to work satisfactorily, it is believed that greater precision of working will be attained. This expectation is based upon statistics which show that a large part of the errors made at the central office take place between the "A" operator and the "B" operator.

As the pieces of automatic apparatus needed in the semi-automatic system at the "A" operators' positions in the central office are relatively small in number, it does not seriously increase the total expense to design and construct them with the greatest care and with the best workmanship, so that the utmost degree of precision may be obtained in their working. On account of the enormous number of such pieces of apparatus which would be required if they were distributed at the subscribers' premises, one for each telephone station as is required in the automatic system, the same high degree of design and workmanship cannot be applied, because the costs would be multiplied exceedingly. Hence in respect to these vital parts of the two systems, the automatic system must always stand at a disadvantage.

The result of this has been to produce for the semi-automatic system an apparatus operated by a keyboard similar to that used on the typewriter. Working with such a keyboard, it has been experimentally demonstrated that the "A" operator can handle a very much greater number of calls than she could in the so-called manual system. This fact greatly reduces even the number of "A" operators.

The advocates of this system contend that they have made the best division of labor, the best distribution of automatic machinery, and that they can attain a higher degree of efficiency and much lower annual costs than are attainable with either the so-called manual system or the so-called automatic system.

Engaged upon this study and upon these experiments we have had a corps of capable engineers and experimentalists working for years, and I feel warranted in attaching great weight to their favorable expectations.

Soon after my return to America, I hope to be present at the opening of the semi-automatic switchboard, and until we have obtained the results of this working, there is not much more that I can profitably say upon the details of the subject.

In conclusion, the situation as I view it, is as follows: The so-called automatic system is not, in fact, automatic, it is only partly so. It has been fairly and exhaustively studied and found to be unsuitable for the comprehensive demands of our present service, and more and more unsuitable when considered with respect to the demands of the future.

The so-called manual system has successfully withstood the severe demands of a system comprehending 5,000,000 telephones, and all of our careful studies with respect to future growth have shown that if nothing better were obtainable, it would furnish to us a means whereby we could supply an ex-

cellent universal service to all the people of the United States.

As I have already stated, a third system, frankly called a semi-automatic system, is about to be practically tried. If the expectations regarding it are realized, it will be a system more efficient and more economical than either the so-called manual or the so-called automatic.

Before leaving this subject, I wish to speak briefly upon one point. It has been said by some that we have not generally adopted the so-called automatic system, because we have been deterred by the large expenditure of money which would be required.

I shall promptly show you that there is no truth in this. The history of the telephone in America has been that of rapid change from one system to another, as soon as improvements have been demonstrated. Pursuant to this policy, the plant at New York has been constructed and reconstructed three times. A similar story is to be told of the rest of the country. Our company has been so conservatively financed and our administration has been so keen to adopt new improvements, that ample depreciation funds have been accumulated so that just as soon as it is demonstrated that a better switchboard system is available, we are prepared to begin its installation and proceed with the utmost practicable speed to make the change. All of this could be done without the slightest disturbance in our financial arrangements.

While there rests upon us the responsibility of adopting as soon as it is practicable and reasonable to do so that which is best, there is a corresponding and most serious obligation of not throwing away what has been demonstrated to be a thoroughly efficient system, without having it conclusively demonstrated that there is something better. I do not see anything in the present state of affairs which need give any company or any administration any concern with respect to the possibilities of a sudden change, for even if it were demonstrated that a better system were now available, it would be impossible, taking into account the manufacturing and engineering resources of all the world, to make the change except in a gradual manner. We have already had so much experience with such changes that we know how they must take place. They are accomplished by a process of gradual evolution and not by sudden revolution.

In every administration there are from time to time switchboards which have been worked for the full period of their life. These must be replaced in any event, and when such cases arise, the new type of switchboard is installed. This does not involve the abandonment of apparatus having further usefulness. There are also constantly arising cases where new installations must be made. These can be installed on the new plan. Obviously, this does not require that any existing apparatus be thrown away. The manufacturers and the administration staffs would find themselves so fully occupied with this work that they would not for some years be able, even if it were desirable,

to disturb those central offices in which the switchboards have many more years of life. It will be found that by the time the old switchboards have been replaced and the new ones installed, those switchboards which have had to be removed in advance of the expiration of their life would be few and in those cases the work would not be anticipated by a great many years. Even where a switchboard is removed before its life has expired, this need only be done when it is found best, all things considered, to replace it by a new one rather than to continue it in service. There is nothing in this situation which demands a headlong rush, so without wasting any time, we should proceed with deliberate care. We, who are charged with the great responsibility of rendering such an important service to the public, cannot be justly criticised if we refuse to be carried away by the enthusiasm of manufacturers and inventors and thus to be led into a wholesale and probably disastrous experimentation upon the public.

In America we have pursued this subject for many years with the utmost diligence. An important practical demonstration is about to be made. We cannot foretell the answer, but we must accept it whatever it may be.

I have told some of the things we have done. It has been our constant aim to keep an open mind and to be free from bias. We are seeking only the truth, and from that we have nothing to fear.

Convention of the Bell Telephone Contract and Commercial Men.

The convention of the contract and commercial men of the Associated Bell Telephone Companies, held at Montreal, September 20 to 23, which was briefly noted in our issue of October 1, was an important one as to the number and variety of papers. The first day of the convention was devoted to the consideration of the subject of organization. Papers were presented by I. P. Sylvan, of the American Telephone and Telegraph Company on "Proper Scope of the Commercial Department," by C. H. Weber, division manager of the Chesapeake and Potomac Telephone Company on "Interdepartmental Relations," and by M. C. Rorty, division manager of the Central District and Printing Telegraph Company on "The Functions of the Commercial Engineer." Selling methods occupied the attention of the delegates on the second day. J. F. Greenwalt, publicity agent of the Colorado Telephone Company, discussed "Publicity Methods and Advertising Telephone Service." George C. Brooks, general contract agent of the Central Union Telephone Company, presented a paper on "Directory Advertising." A. Von Schlegel, general contract agent of the Michigan State Telephone Company, read a paper on "Methods of Selling Local Exchange Service." F. C. Monroe, commercial engineer of the New England Telephone and Telegraph Company, discussed "Methods of Promoting Toll

Service." J. H. Crosman, Jr., division manager of the Bell Telephone Company of Pennsylvania, presented a paper on "Standard Units for Determining Selling Efficiency." On the morning of the third day rural development was discussed and papers dealing with this subject were read by C. E. Hall, assistant general commercial superintendent of the Iowa and Nebraska Telephone Companies, and L. N. Whitney, division superintendent of the Central Union Telephone Company. In the afternoon S. M. Williams, special agent of the Western Union Telegraph Company, New York, read a paper on "Supplementary Relations of Telephone and Telegraph." J. R. A. Hobson, general commercial superintendent of the Southern Bell Telephone and Telegraph Company, discussed "Relations Between the Western Electric Company and Operating Telephone Companies."

The fourth and concluding day was given over to the consideration of collections. A. E. Berry, division manager of the Bell Telephone Company of Pennsylvania, discussed "General Collecting Methods," and James H. Barry, division commercial superintendent of the New England Telephone and Telegraph Company, read a paper on "Standards of Efficiency in Collection Work."

After the business of the convention had been concluded the delegates were given a dinner, at the Windsor Hotel, by the American Telephone and Telegraph Company, the arrangements for which were made by Mr. H. S. Brooks, of New York, general commercial superintendent of that company.

Supply of Telegraph Poles for England.

Up to comparatively recent years the main supply of telegraph poles for the British postoffice was drawn from Norway and Sweden, but latterly, owing to the supply from these countries falling short of requirements, recourse has had to be made to Riga, Russia, and the neighboring district, and, as a matter of fact, at the present time Russia is the principal source of supply. Home-grown larch poles are also used to some extent, especially where very long lengths—from seventy to eighty feet—are required. Sufficient data have not been obtained regarding the lasting properties of larch poles in England to warrant a very extensive use of this class of timber. The Department sometimes has recourse to pitch pine for square "terminal" poles. These are purchased locally, the timber being imported from the Eastern states of North America.

The total output of copper sulphate in the United Kingdom during 1909 was 63,000 long tons, valued at \$7,402,000. Of this quantity 26,000 tons were produced in chemical works, 36,000 tons from copper and brass factories, and about 1,000 tons in a number of other industries.

Telegraph and Telephone Age is headquarters for electrical books.

The History of Telephone Train Dispatching.*

BY G. K. HEYER, NEW YORK.

The year 1851 marked the first systematic attempt to telegraph orders from a central point to trainmen and conductors. From that time until within the last few years, to one familiar with railway operation, the thought of train dispatching carried with it the thought of telegraphy.

Very soon after the telephone had come to be generally used as a means of carrying on communication between distant points, some thirty years ago, the question was raised with regard to whether or not this new and improved method could be drafted into service for directing train movements. The controlling minds of the railroads who had expressed themselves by means of the Morse key had come to consider the telegraph as much a part of the regular operation of the system as to believe it synonymous with quick, safe and efficient operation. They were disposed to let well enough alone and could not feel themselves free to advocate the use of a system which, to them, was comparatively new and untried.

Another argument against the use of the telephone was the feeling among operators that the passing of the telegraph would seriously affect their positions. This fear, however, has not been borne out by subsequent events, and the railroads have shown every disposition to retain the operators in their old positions. On serious thought, this could only be expected, as the welfare of the railroads makes necessary the employment of men who know the railroad business and in few cases, if any, have operators lost their positions due to the use of the telephone, except as the result of some act of their own.

While there were those who believed that the telephone would be satisfactory in double and multi-track operation, there was much skepticism with regard to its use on single-track roads. This fear has, however, been proven to be groundless by the results obtained in actual practice, and when carefully considered, it will be found that any means which would allow the dispatcher to more clearly express himself and thus relieve the traffic problems on double-track roads would lend themselves with added benefits to the solving of the more complex operation on single-track systems. The fact that the use of the telephone had long been advocated did not prove anything and the level-headed railroad men were justly demanding absolute proof. This proof was forthcoming as soon as the first few installations of telephone and selector equipment had been given a practical trial.

The New York Central lines were the first to install equipment of this nature and in October, 1907, a section of the main line between Albany

and Fonda, a distance of 44 miles, with 16 way stations, was completed.

The installation on the New York Central was closely followed by a number of installations on the Chicago, Burlington & Quincy Railroad, in December, 1907, when the main line between Aurora and Mendota, Ill., a distance of 46 miles, was equipped with 11 stations. After this, a section from Aurora to Galesburg, Ill., a distance of 125 miles, with 16 stations, was equipped, and another section between Aurora and Clyde, the end of the Chicago terminals, a distance of 28 miles, with 15 stations. These circuits all covered double-track where reversed movements were made.

Within a short time after the completion of these sections, and convinced from the results obtained that single-track operation presented no problems which could not be solved by the use of the telephone, the Chicago, Burlington & Quincy Railroad, equipped a single-track section of road between Aurora and Savanna, Ill., a distance of 106 miles, with 23 way stations. These installations on the New York Central and the Burlington produced the proof for which many had been waiting, and these roads can justly be called the pioneers in telephone train dispatching.

The extent to which the telephone has been adopted by railroads is shown by the following list of roads, each having telephone circuits covering over 1,000 miles. These figures include in most cases equipment installed and under construction both on train and message circuits: Atchison, Topeka & Santa Fe, 6,083 miles; Lake Shore & Michigan Southern, 2,000; Pennsylvania Railroad (east of Pittsburg), 1,407; New York Central lines (including the Boston and Albany), 1,255; Big Four, 2,500; Illinois Central, 2,100; Canadian Pacific, 1,694; Great Northern, 2,000. (will eventually have 6,000); Chicago, Milwaukee & St. Paul System, 1,300; Louisville & Nashville, 1,261.

In addition to the above named roads, there are 47 which have one or more telephone train dispatching circuits in operation, the total number of roads being 57 and the mileage covered approximately 35,000.

The Lackawanna is the only railroad that has installed telephone and selector equipment over practically its entire system. This road, out of a total of 957 miles, has equipped 933, on which there are 271 stations. There are several other railroads, however, which will be fully equipped when plans already worked out are carried to completion. In fact, it is only a matter of a few years when the telephone will probably entirely replace the telegraph for the dispatching of trains as well as for the transaction of all local, commercial, message and routine business. This is proven by the fact that already a number of telephone circuits are owned jointly by the Western Union Telegraph Company and the railroads for the transaction of this class of business.

*Extract from an Address before the Engineers' Society, of Harrisburg, Pa., October 10.

Balancing Quadruplexes and Duplexes.

A correspondent in a western city writes us in substance as follows:

In the article by Mr. Edgar C. Dodge on the subject of balancing quadruplexes and duplexes, published in your issue of November 1, that gentleman makes the statement that magnetic balances are never maintained for more than a few minutes at a time, and that an operator will throw out his magnetic balance if it will improve the working of the circuit.

The rule has been to never do this except in extreme cases, as it simply means that another office is out of balance, and that as soon as he lines up you will be called in again to rearrange your balance because you biased your instrument. His recommendation of doing away with the ground in balancing is not advisable. At best his balance would be a guess.

With a view to ascertaining current practice in regard to balancing, we referred our correspondent's letter to Mr. Minor M. Davis, electrical engineer of the Postal Telegraph-Cable Company, New York, inviting him to make a statement on the subject. Mr. Davis says:

"It is certainly possible to get a pretty good balance in the manner Mr. Dodge describes, but I have never seen anyone get a perfect balance in that way.

"In the *Telegraph Age* of October 1, 1898, Mr. Willis Jones describes an excellent way to balance, and in the *Telegraph Age* of May 1, 1899, Mr. B. P. Hancock describes another method.

"In my judgment the quickest and surest way to get a good balance is to have the distant station ground until you centre your polar relay armature. This places the armature in the best position to indicate the effect of slight changes in the rheostat and condensers. You can find the centre in a very few seconds and then get an approximate balance upon the polar relay in the usual way. Even a wire of unknown resistance can be approximately balanced very quickly in this manner. Having secured an approximate balance it is very good practice to have the distant station cut in and dot on the neutral side. With the long end closed and the home keys quiet, the neutral relay should be turned down as low as it will go, and still clearly produce the dots from the distant station. The home battery should then be reversed. If this makes the dots from the distant station heavier or lighter, the rheostat should be changed until the reversal of the full home battery does not affect the incoming dots.

"After securing a resistance balance the static balance should be taken while the distant station has the short end to line. With the distant keys quiet, the neutral relay should be turned very low, and the condensers and condenser resistances then adjusted until reversals of the home battery, no matter how rapid, do not affect the neutral relay. It is vitally important to get a perfect static balance. Experience in balancing will soon teach an observant person to readily detect whether an unbalance is caused by the rheostat or by the condensers.

"I believe the above method will give the best obtainable balance under all weather conditions. It can be very quickly taken by anyone skilled in the art. It is a great advantage, however, to be able to balance without calling upon the distant station to ground and, upon the whole, I agree with Mr. Dodge that chief operators should learn to balance without doing so. They can readily learn, and the only risk is the possibility that the polar relay will not be at its very best adjustment. A very good procedure is to get an approximate balance by feeling the movement of the polar relay armature (see Mr. Dodge's article in *Telegraph and Telephone Age*, November 1, 1910) and then refine it by the methods described above. Another good way is to notice the effect of your own reversals upon the neutral relay, while the distant station has the short end to line and his keys quiet.

"Polar duplexes may be balanced without grounding by getting the distant station to write or dot and by carefully adjusting the relay so that it will be sensitive to slight disturbances. For instance, if the relay is adjusted to make the incoming signals very light while the home key is open, the signals will become lighter or heavier when the home key is closed, unless the balance is good. Having adjusted the relay to the position giving very light signals a balance can be secured by changing the rheostat and condensers until the signals are not affected by movements of the key. It is probable, however, that most repeater chiefs use the method described by Mr. Dodge. It is common practice to hold a pencil against the armature of the polar relay and thus feel the effect of reversing the home battery when the distant key is quiet. The pencil is soothing to the nerves when local current pressures are high or when the relay is a direct point repeater.

"The writer thinks it pays to equip duplexes with galvanometers or neutral relays to facilitate balancing. Certainly all chief operators should learn to balance without requiring the distant station to ground, and the article by Mr. Dodge ought to do good.

"While discussing the subject of balancing quadruplexes and duplexes I may take the opportunity to call attention to the great utility of a small wooden rod for use in listening to the signals. Relays and transmitters often appear to be doing their work properly when in reality they are not. If one end of a wooden rod is placed against the metal work of the marking contact of a repeating relay or transmitter and the other end of the rod is placed against the ear a much more accurate knowledge of the action of the points can be obtained than can be obtained in any other way. The use of wooden rods for this purpose was at one time very general, but during the past year or two a good many repeater chiefs seem to have discarded them. The rods seem to me to be of very great value, particularly in handling direct point repeaters."

The Military Telegrapher in the Civil War.

PART I.

One of the prominent military telegraphers during the civil war was Major Charles O. Whitney, who, after the cessation of hostilities, settled in Alabama, where he was honored by being elected to the State Legislature and to other positions of importance by his fellow-citizens. Major Whitney died at Blue Springs, Tenn., August 27, 1875, at the age of 42 years. His nephew, J. B. Hamatt, an old member of the telegraphic profession, now a resident of Peoria, Ill., has furnished us with some information concerning his uncle's career, which stamps Major Whitney as a man of unusual ability and energy for one of his age, and one who had a faculty of making friends with employers and employes alike. His life was a checkered one. Born in Brattleboro, Vt., January 31, 1834, his father died when he was an infant. He made one voyage at sea, and when yet a mere lad learned telegraphy. He was married in Deposit, N. Y., when twenty-two years of age, and served as an operator a year in Brooklyn, N. Y., and another year in Jersey City. He then spent some time in the south, whence he went to Michigan

MAJOR CHAS. O. WHITNEY.

City, Ind., in 1857, and remained there a year, following his profession. He next went to Minnesota, in 1858, where he engaged in agriculture and land speculation. In 1861 he removed to Clinton, Ia., where he was engaged as operator and superintendent of construction, until 1863, when he joined the army and went south. He was at once detailed as chief operator and superintendent of telegraph at the headquarters of the Seventeenth Army Corps, commanded by General Dodge. In this capacity he accompanied Sherman's army to Atlanta, rendering a very efficient telegraph service. After the close of hostilities he settled at Scottsboro, Ala., where he engaged in the merchandise business. He was chosen a member of the Alabama Constitutional Convention in 1867, and elected to the State Senate upon the adoption of the Constitution, which office he held four years. In 1869 he built a line of tele-

graph on the Alabama & Chattanooga Railroad, 300 miles in length; a line on the Brunswick & Albany Railroad, 200 miles long, and several small branch lines. He was superintendent of the first-named line, with headquarters at Chattanooga, Tenn., at the time of his death. Mr. Whitney's two sons became telegraph operators; one of them, Arthur Whitney, was operator, train dispatcher, and finally superintendent of the old Memphis & Little Rock Railroad, with headquarters at Memphis, Tenn., dying at that place several years ago. The other brother, Charles Whitney, was a railroad operator at Ogden, Utah, for the Central Pacific Railroad Company, and held other telegraph positions. He is now located at Bisbee, Ariz. The widow for some years past has resided with her daughter, Mrs. Lillie Whitney Scruggs, at 1298 Vinton Place, Memphis, Tenn. She has reached the ripe age of 72 years.

About the time of Major Whitney's passing away negotiations were under consideration looking to his taking hold of railroad and telegraph work in the Pacific Northwest, which, if he had lived, would have brought him into prominence on what has since become the Southern Pacific system. Thus it is we sometimes miss our highest aims because of premature taking away. Beginning as a poor orphan, he made his own way through life, serving his country on the battlefield in time of war and living an honorable life in time of peace. His record is one which all may emulate with benefit.

The Late Thomas T. Eckert.

In the list of honorary pall bearers at the funeral of the late General Thomas T. Eckert, published in our issue of November 1, the name of Mr. Richard O'Brien, of Scranton, Pa., was inadvertently omitted. Mr. O'Brien was one of General Eckert's chief operators in the field during the Civil War and they afterwards became warm friends. It was quite natural therefore that Mr. O'Brien should have been selected as one of the pall bearers to pay this last tribute of respect to the memory of his former chief. The other pall bearers were Mr. Andrew Carnegie, Mr. R. M. Galloway, General Thomas H. Hubbard, Dr. John B. McMahon, Col. Albert B. Chandler, Mr. David Homer Bates, Mr. Charles A. Tinker, Mr. James Merrihew, Mr. P. J. Casey, Mr. William S. Hawk and Mr. Thos. H. Poole.

One of the earliest methods of transmitting intelligence to a distant point was the semaphore. In 1795 the British Admiralty introduced a semaphore system on all the highest points of land from London to Dover, Deal and Portsmouth. By its use a message could, under favorable circumstances, be transmitted to any of the places named and a reply received in London in seven and one-half minutes.

Professor Korn's photo-telegraphic machine, which sends a photograph by wire, was exhibited at the recent Electrical Show at Madison Square Garden, New York.

Concrete Poles.

In a paper read by Mr. A. E. Dobbs at a recent meeting of the Texas Independent Telephone Association, at Dallas, Tex., the author gives some interesting and valuable information regarding concrete poles.

Cement at the present time, he says, is quite cheap, and concrete is proof against decay, fire, heat, water, woodpeckers, insects, fungus growths, cribbing horses, sign tackers, or even runaway automobiles. It is, when reinforced, lightning proof and to a great extent fool proof, for boys will soon tire of trying to climb concrete poles. When, in addition to all this, we consider that concrete poles are straight and slightly and will be better twenty years from now than when first set, they would seem to be cheap even though the first cost is four times as much as wooden poles.

Cement poles can be moulded any shape desired, round, square, octagonal, triangular or hexagonal; all of the same size and shape; can be made any length, and when set in position are all in perfect alignment. They will also carry much greater weights than wooden poles, will bend further than a wooden pole without breaking and have elasticity enough to yield considerably to sudden strains without losing shape, while their resistance to strain is nearly twice that of cedar poles. Thus a thirty-foot pole will yield about two feet at the top and spring back into place when the strain is removed.

A well-constructed pole line should not be subjected to any but vertical stresses, as all terminal and heavy side strains should be taken up by anchors and guys properly placed. In the resistance to downward strains, concrete poles cannot be excelled even by white oak. Anchor strains, however, should be taken care of by special appliances.

Concrete is composed fundamentally of Portland cement, which is used as a binder for other and harder materials, such as sand, rock or slag, and is used in varying proportions according to the kind and size of the other ingredients. Sand is added to the mixtures in order to create the greater hardness and save in the amount of cement used. Broken stone or gravel is also employed for the same purpose, while in reinforced structures steel rods are added in order to give greater tensile strength and elasticity. Where gravel or broken stone is used, sand is also employed to fill in the spaces and make a solid body.

Formulas for the composition of concrete vary in the proportion of their ingredients, but one general formula covers them all, namely: The proportions of sand, chat and cement should be such that all spaces shall be filled and every particle of sand or stone shall be well covered with a cement coating. When this is strictly adhered to the structure is as strong as it can be made, for, regarding the cement as a binder only, every particle of sand and stone covered with even a thin coating of cement adheres strongly to its neighbor

and you can get no more by increasing the proportion of cement. Thus, in a case where sand only is used, a proportion of one part cement and four parts sand makes the strongest possible mixture. Where chat is obtainable the following formula used by one company making concrete poles has been found thoroughly reliable: 1 sack cement (100 lbs.), 2 wheelbarrows chat, 3 wheelbarrows sand. This makes one sack of cement extend to about six times its original bulk.

Unless the handling of cement is well understood it is better to employ some thoroughly competent cement man, for in every case where good cement mixtures have proven unsatisfactory it can be traced to ignorance of its qualities or improper manipulation. There are two methods of applying water to cement which produces what are commonly called "wet" or "dry" mixtures and the methods of treatment are not exactly the same. In the wet method enough water is added to make a mixture about the consistency of mortar. There should not be too much water as in that case the cement will float to the top while the sand and chat settle to the bottom, which will result in weak spots in the finished product. The sand, chat and cement should be thoroughly mixed while dry either by being turned several times with shovels or in a mixing machine. When well mixed, water should be added and the mixture placed in the mold or form as rapidly as possible, as cement begins to crystallize or set within ten minutes, and once it begins to set it cannot be used and the batch will have to be thrown away. Once in the mold it should not be disturbed until it has hardened. The so-called dry mixture contains just enough water, sprinkled on, to hold it together; it does not require such swift handling as the wet mortar, but at the same time it should not lay around long. The difference between wet and dry may be summarized as follows:

1. The wet mixture crystallizes more quickly and makes a harder concrete. The dry mixture sets more slowly and hardens only after several hours.
2. Wet concrete should be left for at least an hour before the form is disturbed. The dry mixture molds may be taken apart immediately.
3. The wet form is quite well cured within two or three days. The dry product should be left for at least thirty days.

Cement concrete hardens continually for quite a long time and is much harder at the end of one year than it is even after thirty days' curing. Whether wet or dry mixtures are used, however, they should not be exposed to the sun while curing and should be kept damp. Cement sets best under water and a dry mixture must be wet pretty thoroughly before it will harden at all.

Concrete columns will stand an immense downward pressure, but under the stresses of expansion and contraction there is a tendency to crack. In order to overcome this tendency and permit of greater elasticity iron rods should be placed

through them at regular intervals. Concrete will cling to plain, clean iron as firmly as to the sand and chat composing the mixture. It will also cling to wood in the same manner, provided the wood has been well dampened, but wood shrinks in drying and its holding power cannot be relied upon. With iron, however, the case is different and as iron and cement have the same coefficient of expansion, there is never any deterioration of its holding power. The best size of rod to use in pole construction is about one-fourth inch chamfered plain steel without any galvanizing or paint upon it, as the concrete will not adhere so well to zinc which forms the coating of galvanized wire. These rods should be drawn tightly from end to end and tied together with wire at intervals of four or five feet in order to strengthen their holding power as well as prevent spreading while the concrete is being poured. Four of these rods are enough for any pole up to twenty-five feet in length, and their number increased in the larger sizes up to say ten in a forty-five foot pole, but the extra rods need not be extended all the way to the top, but spliced onto the other at from one-half to two-thirds of the way up from the bottom. The rods at the bottom end may be bent around the bottom of the pole—thus grounding them—while those at the top may be cut off and the top of the pole afterwards rounded off with a trowelful of cement mortar. As each quarter inch rod has a breaking strain of approximately 4,000 pounds, it will be seen that when buried in concrete that adheres firmly, four rods will constitute a pretty strong column, especially when they are all bound together by wire. Cement adheres to iron only when the iron has been wetted, which is necessary in dry mixtures.

In making forms for pole construction rather heavy planking is required if wood is used. This plank should be planed smooth with no rough spots or splintered projections. It should be filled with oil and when set up should be well greased on the inside to prevent the cement from adhering to the sides. When desired holes for the arm bolts as well as the through bolts for braces can be formed by placing a straight five-eighth inch rod where required. Should it be necessary to insert steps, holes can be bored in the side of the form and round bolts inserted the desired distance. When the form is taken down these bolts must be withdrawn, but steps can be put in when the concrete has set, with a little thin cement mortar which will harden and hold them in place. When steps are not used poles must be climbed with a ladder or a sling.

Concrete poles cannot be treated in all respects like wooden poles. Being heavier than wood, weighing about 100 pounds to the cubic foot, they can not be piled on an ordinary wagon nor set up with pikes. The poles must, therefore, be set by means of a swinging gin pole preferably one that can be attached to a wagon that will both load the poles and swing them into the hole, guide ropes being largely relied upon to straighten

the pole up when it is once in the hole. Arms may be put on by two methods: Either by a through bolt from the front of the arm to the back of the pole backed by two-inch washers, or by two bolts through the front of the arm to an iron strap back of the pole, the bolts passing outside the pole altogether. When properly tightened these bolts will hold the arm in position and make, in many cases, braces unnecessary. Guy wires must not be wrapped round the pole as has been common practice as they will crush the corners and tend to break the concrete unless a shield of one-eighth-inch sheet iron, is placed underneath.

The cost of poles that are not required to give service for more than thirty or forty years that can be manufactured at reasonable cost, using fifty-six cents a cubic foot as a basis to estimate upon square poles, is as follows:

Length	Top Inches	Butt Inches	No. of Rods	Cu. Ft.	Wt., Lbs.	Cost Set up
18	4	7	4	3.2	320	\$1.79
20	4	7	4	4.2	420	2.35
22	4	7	4	4.7	470	2.63
24	4	7	4	5.0	500	2.80
30	4	8	6	6.3	630	3.53
36	4	9	6	10.56	1056	5.91
40	5	10	7	15.62	1562	8.75
50	6	12	8	28.1	2810	15.73

In addition to these figures, hauling and the cost of forms must be taken into account.

Control of Weather by Electricity.

In a lecture before the British Institute of Electrical Engineers in London, November 12, Mr. S. Z. de Ferranti, the well-known English electrical engineer, declared that in the future the weather will be controlled by electricity, and that the sun will shine or rain will fall as needed. This is to be accomplished by encircling England's coast with an electrical defense which will force the clouds to descend into the sea in the form of vapor instead of drifting over the country and obscuring the sun. He predicted that before many years electricity will be produced at one-sixteenth the average cost of producing it now.

At the close of last year there were 1,437 miles of telegraph and telephone line, with 4,311 miles of wire, in the Federated Malay States. Of this, 2,380 miles were telephone wires. The cost of maintenance was \$64,953, and \$45,879 was spent on construction, including \$922 on police wires. The total expenditure on telephone construction was \$35,147. During the year 263,435 telegrams were transmitted, and 267,144 were received for delivery. The revenue derived from this source was \$66,443, an increase of \$10,848 over the corresponding figure of 1908. The value of telegrams sent free for government departments was \$46,100. The revenue from telephones was \$45,596, or \$11,387 more than the receipts in 1908.

Report of British Postmaster-General.

The following extracts from the fifty-sixth annual report of the British Postmaster-General will be of interest to our readers:

TELEGRAPHY.

During the year ended March 31, 1910, 86,884,000 telegrams passed over the Post Office wires, compared with 84,825,000 in the previous year, an increase of 2.4 per cent. The total value of the telegrams was £2,769,053, compared with £2,709,507 in the previous year. During the year 214 additional post offices have been opened for telegraph business. Guarantees have been given for 144 of these, in 80 cases by public bodies and in 64 by private persons. There are now 11,291 post offices in the United Kingdom at which telegraph business is carried on, as well as 2,419 telegraph offices at railway stations and other public places.

Improved forms of telegraph apparatus are still receiving careful attention. Modern keyboard perforators have greatly enhanced the utility of the Wheatstone system, and the use of printing telegraph apparatus also is receiving special attention. A satisfactory trial has been made of undulator apparatus on the Bristol-Cork circuit, with a view to avoiding the use of repeaters on the submarine cable. Additional pneumatic tube services have been introduced between the Central Telegraph Office and several London offices which were previously served by wire, and also at Hull and Aberdeen between the head office and certain branch offices. This will permit a saving of staff and a reduction in the number of wires. The practice of delivering telegrams by telephone, which will, when the public has become fully accustomed to it, be found expeditious and convenient, is also being extended.

The main underground telegraph line to the west has been completed, and the wires between London and the landing places of the important cables starting from the west of England have now been diverted to the underground route. The northern underground line has been completed to Edinburgh; a section of underground work from Aylesbury to Coventry has been laid, completing the second London-Birmingham underground cable; additional pipes and cables have been laid between Manchester and Warrington, Manchester and Ashton, and Manchester and Stockport; and pipes have been laid between Leeds and Stockton, Chatham and Canterbury, and Berkeley and the city boundary of Gloucester. During the present financial year it is hoped to lay pipes from Gloucester to Worcester, from Leeds to Hull, and from Canterbury to St. Margaret's Bay and Abbot's Cliff, the landing-places of Continental cables, and cables from Berkeley to Worcester and from Stockton to Leeds. The cable from Stockton to Leeds will complete the line from Warrington to Newcastle; and the pipe work from Gloucester to Worcester and the cable from Berkeley to Worcester will complete the underground connection between Bristol and Birmingham. There will then be a triangle of underground lines, with

the angles at London, Birmingham and Bristol, the underground lines to the southeast, the north and the southwest being extensions from these three towns. Alternative routes via two sides of the triangle instead of the third side may be of great value in time of breakdown.

The number of foreign telegrams sent to and from the United Kingdom during the year (exclusive of certain telegrams dealt with entirely by cable companies) was 10,259,000, an increase of about 838,000 as compared with the preceding year. As part of the practical trials of fast-speed apparatus mentioned in last year's report, quadruplex working with the Laudot type of instrument has been introduced experimentally on two of the Anglo-Netherland wires, and as a result of the success of this experiment it is proposed to make the arrangement permanent after the completion of certain rearrangements now in progress at the Central Telegraph Office, by which the space allotted to the Continental wires will be increased.

WIRELESS TELEGRAPHY.

During the year 1909-10 the Post Office acquired from the Marconi Company and Lloyd's their coast stations in the United Kingdom open for commercial communication with ships. The sums paid to the company and to Lloyd's were £15,000 and £2,400 respectively. The former amount covered, in addition to the stations in actual operation, certain plant at other stations, the working of which was suspended, together with the right to use, free of royalty, the existing Marconi patents and any future patents or improvements, for a term of fourteen years, for communication for all purposes between stations in the United Kingdom and ships, and between stations on the mainland of Great Britain and Ireland, on the one hand, and outlying islands on the other hand, or between any two outlying islands; and (except for the transmission of public telegrams) between any two stations on the mainland, and on board Post Office cable ships. The stations are open under the International Radio-telegraphic Convention (as they were before their acquisition) for communication with all ships, equipped with any system of wireless telegraphy, and the Post Office is free to use or to experiment with any system of wireless telegraphy at its discretion. The Marconi Company retains its license for its long-distance stations at Poldhu and Clifden, which are primarily intended for communication with America. In connection with the purchase of the short-distance stations by the Post Office, the Marconi Company and Lloyd's arranged to cancel an agreement between themselves which was made in 1901, and which had been found difficult to work, and so had tended to impede the development of wireless telegraphy. The negotiations and arrangements were conducted throughout with the knowledge of and in consultation with the Lords Commissioners of the Admiralty, who, like the Postmaster-General, considered that the stations should be in the hands of the Government and should be worked as part and

parcel of the general telegraphic system of the country.

My predecessor laid stress on the importance of allowing no private monopoly in wireless telegraphy to grow up, and expressed the hope that the new arrangements would result in an even more rapid extension of the use of this important invention than had taken place in the past. This hope seems likely to be fully realized. It is hoped that before long there will be a ring of thoroughly equipped stations round the coast of the United Kingdom. The system, when thus completed, is likely to prove of the greatest possible value to shipowners, as well as as to passengers by sea, and I think that shipowners will be well advised to proceed as rapidly as possible with the equipment of their vessels.

The number of radio-telegrams dealt with during the year at the stations which are now in the hands of the Post Office were as follows: Outward radio-telegrams to ships, 3,266, as compared with 1,817 in 1908-9; inward radio-telegrams from ships, 27,727, as compared with 22,732 in 1908-9. Apart from the Post Office stations, there are one or two stations carrying on a more or less restricted traffic with ships, especially packets owned by certain railway companies.

During the year 1909-10, sixty licenses covering seventy-nine installations have been granted for stations in the United Kingdom under the Wireless Telegraphy Acts. These (with one exception) were for experimental purposes. The total number of licenses for land stations in existence on March 31 last was as follows: Commercial, six licenses, eight stations; private business (including lightships), five licenses, eleven stations; experimental, 164 licenses, 242 stations; minor cases (experimental) in which permission has been given by letter, ninety-three licenses. Up to March 31 last, licenses had been granted to shipowners covering 130 ships. The majority of these are Atlantic liners, but a considerable number of other vessels, notably railway companies' packets and vessels trading to South America and to the East, have now been equipped.

TELEPHONES.

The total number of telephone trunk line exchanges open at March 31 last was 643, compared with 598 at March 31, 1909. The capital expenditure at the same dates was £5,596,756 and £4,682,796 respectively; the number of conversations over inland trunk lines, 26,566,318 and 23,502,024 respectively; the gross revenue from inland calls £662,845 and £573,883 respectively; and the receipts from Continental calls £24,135, and £22,125 respectively. During the year 127 post office telephone exchanges were opened in the provinces—100 in England and Wales, sixteen in Scotland and eleven in Ireland. Of these, sixty-two were opened under guarantee terms under which the State bears two-thirds of any loss on the expenses of working. The total number of lines directly connected with the Post Office provincial telephone exchanges on March 31, 1910, was 23,635, compared with 22,354

on March 31, 1909, and the number of exchange telephones rented increased from 30,937 to 33,330.

The number of telephones connected to the municipal systems at Hull and Portsmouth on March 31 last was 2,931 and 2,514 respectively, whilst 1,848 telephone stations were installed on the Guernsey State system. The number of telephones connected in the Metropolitan area with the Post Office system on March 31 was 64,200, a net increase during the year of 9,075; whilst the number of call offices increased from 682 to 766. The mileage of underground pipes in this area was 2,492 and the length of underground wires 479,899 miles.

Accounts for the year ended March 31, 1910, of the income and expenditure relating to the trunk system, the London service and the provincial exchange system are given in an appendix to the report. The income from the trunk line system was £660,399, and the expenditure £569,219, the balance available for depreciation or repayment of capital being £91,180. The expenditure on the London exchange system was £353,363 and the income £525,389, the corresponding figures for the provincial exchange system being £263,288 and £205,389, a deficiency of £57,899 being shown. The amount of royalty received during the year from the National Telephone Company was £317,807, and from other licenses £2,783.

The following estimated figures show the extent to which the telephone is being used for sending messages for onward transmission as telegrams and express letters: Telegrams, 4,926,000, an increase at 1908-9 of 9.98 per cent.; express letters, 163,400, increase 9.23 per cent. The number of messages sent to the Post Office by telephone for onward transmission as ordinary letters decreased from 4,400 in 1908-9 to 3,200 in 1909-10. The telegrams delivered during the year to addresses by telephone numbered 2,154,000.

MILEAGE OF WIRE.

The total mileage of Post Office wires, including spare wires, is now as follows: Public telegraphs, 310,039; telephones, 601,980; private and leased wires, 258,106; total, 1,170,125 miles. This length is apportioned as follows: Aerial, 428,570 miles; underground, 731,514 miles; submarine, 10,041 miles.

Reference is made in the report to telegraphists' cramp. The nature of the disease, the report says, is obscure, and there is a divergence of expert opinion about it. The Postmaster-General mentions that he has appointed a committee, under the chairmanship of Sir John N. Barran, Bart., M. P., and including Mr. R. H. Davis, of the Postal Telegraph Clerks' Association, Dr. J. Sinclair, the second medical officer to the Post Office, and Dr. H. Theodore Thompson, assistant physician to the London Hospital, to inquire into the prevalence and causes of the malady, and to report what means may be adopted for its prevention.

Telegraph and Telephone Age is the leading publication in its field. Subscription price, \$2.00 per year.

Annual Meeting of the Telegraphers' Mutual Benefit Association.

The forty-fourth annual meeting of the Telegraphers' Mutual Benefit Association was held in the Western Union Building, 195 Broadway, New York, Nov. 16, President Belvidere Brooks being in the chair. The attendance was the largest and most widely represented ever held during the Association's long and useful existence, and much interest was manifested in the plans for the future development of the Association work. After the Committee on Credentials, consisting of Mr. F. D. Bernike, Chicago; Mr. J. E. Gollen, Bradford, Pa.; and Mr. A. Watkins, Richmond, Va., had reported, Mr. Brooks directed that the secretary read the president's report. The report in part is as follows:

The record of the business of your Association during its forty-third year just closed, as presented in the reports of the Secretary and Treasurer about to be laid before you, will show in detail that notwithstanding that the amount paid for death claims was the largest in the history of the Association, it has been able to promptly meet all claims and to increase the Reserve Fund by more than \$10,000, and that the Association is in a healthy and prosperous condition. Seventy-eight claims in the Full Grade and thirteen in the Half Grade were paid during the year, making the total amount paid to beneficiaries of deceased members since organization \$1,567,207.

Several instances having occurred in which the payment of claims was delayed owing to failure of the deceased members to have necessary change made in their certificates on account of death of beneficiary of record, termination of trust of minor children, etc., I desire to call attention of the membership to the necessity of having certificates payable to the person or persons they wish to benefit, and to the preservation of certificate as being essential to the prompt payment of claims.

Under the By-Laws, when the beneficiary of record predeceases the member, the amount of the claim reverts to the estate of the member and can only be paid to the duly appointed administrator. The necessary proceedings involved are often very tedious and expensive, and can be avoided by return of the certificate during the lifetime of the member to the Secretary's office, for substitution of another beneficiary.

I would also suggest to such members as have named their "Estate" as beneficiary, the advisability of naming some person as trustee, and thus save the delay and expense referred to.

While the benefits of the Association can be availed of by all persons engaged in telephone as well as telegraph service, employees of the first named do not appear to have taken advantage of the protection provided under our plan, to any great extent.

This may in some measure have been due to the fact, that the personnel of your officers has been confined to the one service, and I would therefore recommend to this meeting for consideration that steps be taken to provide for representation of the telephone interests on your official board.

The many telegraph service changes during the past year which necessarily entailed numerous changes among the Agents is reflected in the comparatively small number of applications received. I wish to again repeat, that the Agents should not be expected nor required to do all the work of maintaining the membership, and that it should be a matter of personal interest as well as the duty of every member to be active and earnest in bringing to the notice of their eligible acquaintances the history and objects of the Association, and in securing their applications for membership.

The reports of the secretary, the treasurer and the auditing committee were also read, all of which were ordered printed.

The secretary's report shows that the total membership is 4,603 in the full grade, and 789 in the half grade.

The sum of \$10,000 was carried to the reserve fund, which now amounts to \$327,778.23. The assets of the Association were shown to be of an amount exceeding a reserve of six and one-half per cent. on the total amount of insurance carried by the Association.

The receipts for interest during the past year on investments of the reserve fund and current deposits amount to \$16,443.42. The income derived from interest is equivalent to three assessments on the entire membership.

After the election of officers and, inspired by the declination of Mr. W. C. Humstone in favor of Mr. W. H. Baker as member of the executive committee, Secretary M. J. O'Leary recounted the services of the presidents of the Association, the late Hon. J. D. Reid to 1881, Mr. Clarence Cary 1881 to 1883, Mr. A. R. Brewer 1883 to 1887, Mr. J. Merrihew 1887 to 1897, Mr. W. C. Humstone 1897 to 1902, in which year the present executive, Mr. B. Brooks, was elected to, and has since continued in office. He then went on to say that there are now four living ex-presidents who have at all times given generous aid and wise counsel to the Association, and that the official ties which bound these gentlemen so closely to the Association should not be severed, but continued, perpetuated and preserved. He therefore moved the adoption of a resolution, which was unanimously carried, that all ex-presidents of the Association be made ex-officio members of the executive committee. As Messrs. Brewer and Merrihew are still serving the Association as treasurer and a member of the executive committee respectively, Messrs. C. Cary and W. C. Humstone were named as ex-officio members of the committee.

Mr. S. S. Garwood, commenting on the part of the president's report relating to representation of telephone interests on the board, proposed a resolution, which was adopted, that the executive committee be empowered to create an advisory board, whose duties shall be to co-operate with the executive committee for the extension of the Association work in their respective territories.

The following were elected officers for the ensuing year: President, Belvidere Brooks, New York; first vice-president, Charles P. Bruch, New York; second vice-president, S. S. Garwood, Philadelphia; secretary, M. J. O'Leary, New York; treasurer, A. R. Brewer, New York. The members of the executive committee consist of President Brooks, W. H. Baker, A. R. Brewer, James Merrihew, Charles P. Bruch, T. A. McCammon, G. H. Fearons, E. J. Nally and M. J. O'Leary, all of New York; W. J. Lloyd, of Chicago; auditing committee, H. D. Reynolds, chairman, Buffalo; W. J. Dealy and Thomas E. Fleming, New York.

A discussion took place, during which all present were urged to do their utmost during the coming year to increase the membership among those in the telegraph and telephone fields who are eligible.

The following-named gentlemen were present:
New York.—B. Brooks, E. J. Nally, C. P. Bruch, W. H. Baker, C. C. Adams, J. B. Van Every, E. B. Pillsbury, W. C. Humstone, Wm. Holmes, A. R. Brewer, T. Brennan, J. F. Nathan, R. J. Doyle, M. M. Davis, A. G. Saylor, P. J. Tierney, J. A. Berry, T. J. Cusack, W. J. Dealy, W. J. Morrison, E. M. Mulford, L. Dresdner, R. J. Murphy, W. J. Austin, F. E. Hutchinson, George Roehm, J. Costelloe, F. E. Coyle, J. B. Taltavall, T. E. Fleming, M. J. O'Leary, H. T. Marks, W. L. Ives, W. O. Snyder, E. Y. Gallaher. *Boston*.—P. J. Farrell, S. A. D. Forristall. *Buffalo*.—H. D. Reynolds. *Hartford*.—S. B. Curtis. *Richmond*.—Ashby Watkins. *Philadelphia*.—C. E. Bagley, S. S. Garwood, W. P. Phelps. *Wilmington*.—W. P. Cline. *Chicago*.—T. P. Cook, M. T. Cook, F. D. Bermke. *Bradford, Pa.*—J. E. Golden. *Atlanta, Ga.*—J. M. Stephens, B. F. Dillon. *Roanoke, Va.*—W. C. Walstrum. *Washington*.—G. M. Foote, N. R. Young, F. B. Travis. *Woodshole, Mass.*—H. G. Haddon. *Pittsburg*.—H. Scrivens. *Dallas, Tex.*—J. C. Smith, L. McKisick. *Denver*.—S. E. Leonard, J. C. Nelson.

Magnetic Club Fall Dinner.

The regular fall dinner of the Magnetic Club was held at the St. Denis Hotel, New York, on the evening of November 16, and it was one of the most enjoyable affairs ever held by that organization. It was called an aeronautic dinner, by reason of the fact that Mr. Clifford B. Harmon, the well-known American amateur aviator, was the principal guest of the club. The visiting delegates to the annual meeting of the Telegraphers' Mutual Benefit Association, which was held during the afternoon, were also guests, and these, together with the regular members and friends, taxed the accommodations of the large banquet hall. In keeping with the character of the meeting, colored rubber toy balloons were brought into requisition to aid in giving a real aeronautic tone to the feast. Bunches of balloons were anchored to the tables, and single balloons were floating around against the ceiling. At one end of the room a model biplane hung from the ceiling, the propeller being driven by a small electric motor. By way of diversion, many of those present amused themselves by applying lighted matches to the balloons, which exploded with a loud report.

The dinner was an excellent one, and when it was finished Mr. Marston R. Cockey, first vice president of the club, in the absence of Mr. Charles P. Bruch, president, who has been confined to his home for several weeks by illness, appropriately introduced Mr. Harmon the speaker of the evening.

Mr. Harmon, in an easy conversational manner, told of his experiences in ballooning and with aeroplanes. In closing his remarks he referred to the

United States Aeronautical Reserve, and suggested that telegraphers interest themselves in aviation, as it offered great opportunities for the utilization of wireless telegraphy.

After Mr. Harmon's remarks, a programme of entertainment was thoroughly enjoyed, and the meeting was concluded by the singing of "Auld Lang Syne." The committee of arrangements deserve great credit for the splendid manner in which they handled the details of the dinner. Following is a list of those present:

Albany, N. Y.—N. C. Pangburn, C. C. King. *Baltimore, Md.*—V. J. Albert, C. Selden, B. F. Thompson. *Boston, Mass.*—C. A. Richardson, Wm. Ryan, P. J. Farrell. *Bradford, Pa.*—J. E. Golden. *Buffalo, N. Y.*—H. D. Reynolds, L. H. Bangert. *Chicago, Ill.*—T. P. Cook, M. T. Cook, F. Bermke. *Dallas, Tex.*—L. McKisick, J. C. Smith. *Denver, Col.*—J. C. Nelson. *Lancaster, Pa.*—R. A. Barton. *Minneapolis, Minn.*—H. A. Tuttle. *New York*.—C. C. Adams, W. J. Austin, J. J. Alcock, J. F. Bowd, F. E. Brumley, J. R. Beard, E. S. Butterfield, E. B. Bruch, W. P. Bowman, W. H. Baker, B. Brooks, W. I. Capen, T. L. Cuyler, Jr., M. R. Cockey, R. N. Cleverdon, W. S. Cleverdon, F. R. Cleverdon, J. F. Cleverdon, J. J. Cardona, T. J. Cusack, F. E. Coyle, Col. A. B. Chandler, J. Davidson, W. Deegan, B. M. Downs, J. Doran, T. J. Donovan, P. W. DeBaum, W. J. Dealy, M. M. Davis, J. S. Ellis, John Ellis, R. S. Eldridge, A. P. Eckert, W. Finley, J. H. Flood, T. E. Fleming, W. D. Francis, G. W. Fleming, L. B. Foley, E. Y. Gallaher, R. Gould, B. H. Gage, J. J. Ghegan, F. H. Hollenbeck, T. E. Heffren, F. E. d'Humy, Thos. J. Howlett, J. Henry Harper, J. Hennessey, W. R. Holligan, C. J. Hubbard, J. H. Hess, W. S. Hallett, P. A. Hickey, W. E. Harkness, Clifford B. Harmon, Dr. L. R. Hallock, E. Kimmey, H. Kitt, F. J. Kernan, A. Kavanaugh, Felix Kernan, C. F. Leonard, L. Lemon, C. A. Lane, R. J. Marrin, J. J. McCormick, D. J. McQuade, H. G. Madden, R. H. Miller, W. H. Matthews, J. McNeil, T. P. McGowan, E. F. Maher, Wm. Marshall, F. E. McKiernan, D. F. Mallen, A. T. Miller, F. M. McClintic, J. J. McDermott, J. Merrihew, J. Manning, H. T. Marks, R. J. Murphy, J. McCauley, F. F. Norton, E. J. Nally, S. E. Ostrom, J. B. Olson, J. P. O'Donohue, M. J. O'Leary, E. B. Pillsbury, Fred'k Pearce, A. E. Price, C. R. Pratt, C. F. Pearce, E. O. Purcell, W. F. Regan, E. Reynolds, E. J. Rankin, C. Shirley, J. F. Shugrue, F. A. Scheffler, W. Scrivens, J. O. Stevens, J. F. Skirrow, W. Scarborough, A. G. Saylor, T. Singleton, E. P. Tully, J. B. Taltavall, C. A. Tinker, T. R. Taltavall, Col. N. B. Thurston, J. B. Van Every, A. G. Williams, F. N. Whitney, H. Wiese, S. F. Ward, J. J. Whalen, H. Zweifel. *Philadelphia*.—A. E. Zintl, E. Snow, C. E. Bagley, S. S. Garwood, J. R. Gorsuch. *Pittsburg, Pa.*—H. Scrivens, A. W. Rinehart. *Roanoke, Va.*—W. C. Walstrum. *Richmond, Va.*—A. Watkins. *Washington, D. C.*—G. M. Foote, F. B. Travis, N. R. Young. *Wilmington, N. C.*—W. P. Cline. *Woods Hole, Mass.*—H. G. Haddon.

The Turner Monument Fund.

The committee in charge of the Turner Monument Fund is untiring in its endeavors to secure contributions from all those engaged in railway and telegraph work who have the interest of their profession at heart. The object of this movement, as was fully explained in our previous issues, is to secure a fund of about \$3,000 for the purpose of erecting at Turner, N. Y., a monument to commemorate the sending of the first telegraphic train order, which took place at that point in the autumn of 1851. The Association of Railway Telegraph Superintendents and the Old Time Telegraphers' and Historical Association are co-operating in the movement, and the subscriptions coming in are gratifying and encouraging to those having the matter in charge. It is earnestly desired that all those connected with the telegraph and the railway shall contribute towards the success of this worthy cause. The list of contributors published in the previous issue and that given in this issue show that interest in the work is growing, but there should be no delay in forwarding remittances by those who have decided to contribute. There is no limit placed on the size of contributions. The movement is national, not local, and all contributions will be duly acknowledged in the columns of *Telegraph and Telephone Age*.

All of the railway telegraph superintendents in attendance at the recent meeting in New York of the Eastern Division of the Association of Railway Telegraph Superintendents obtained a good supply of circular letters to distribute among the employes of their respective systems, with a view to obtaining a large number of small subscriptions and thus popularize the movement. Everyone should support this worthy undertaking and contribute \$1 or more, and it is hoped that interest in the project will become general, so that the plans of the committee will be carried to early success.

Mr. F. D. Underwood, president of the Erie Railroad, has manifested a personal interest in the matter, and has contributed \$25, besides promising to render any assistance needed to attain the end in view.

Mr. J. D. Purtell, chief dispatcher of the Erie Railroad, at Dunmore, Pa., in remitting a collective subscription says: "We are all glad to be able to contribute our mite toward the fund. Expect that we will be able to secure more contributions, which will be forwarded to you as fast as they are received."

The following named gentlemen constitute the committee in charge of the Monument Fund: E. P. Griffith, Superintendent Telegraph Erie Railroad, Jersey City, N. J.; Chairman; Charles Selden, Superintendent Telegraph Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, *Telegraph & Telephone Age*, New York; E. A. Chenery, Superintendent Telegraph Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, Electrical Engineer, Canadian Pacific Railway, Montreal, Canada; Col. W.

B. Wilson, President Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, Secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, *Telegraph and Telephone Age*, 253 Broadway, New York, who has been elected treasurer of the fund.

The contributions received up to date are as follows:

Previously acknowledged: \$319.75. United States Electric Co., New York, \$10.00; W. B. Williams, Wheeling, W. Va., \$5.00; W. E. Vanarsdall, Philadelphia, Pa., \$1.00; F. J. Loesch, Chicago, Ill., \$5.00; J. H. Taylor, Minot, N. D., \$10.00; J. McRobie, New York, \$2.00; C. A. Tripp, Redlands, Cal., \$5.00; E. T. Campbell, Chicago, Ill., \$5.00; I. H. Lewis, Salt Lake City, Utah, \$2.00; E. A. Chenery, St. Louis, Mo., \$3.00; T. M. Emerson, Wilmington, N. C., \$15.00; A. A. Allen, St. Louis, Mo., \$5.00; T. E. Callahan, Whitefish Bay, Wis., \$1.00; H. H. Matlock, Springfield, Ill., \$1.00; W. J. Camp, Montreal, Can., \$5.00; B. F. Thompson, Baltimore, Md., \$1.00; J. B. Bertholf, Monroe, N. Y., \$1.00; John Purtell, Dunmore, Pa., \$1.00; D. P. McCoy, Scranton, Pa., \$0.50; G. B. Madigan, Wimmers, Pa., \$0.50; G. R. Vining, Moosie, Pa., \$0.50; J. A. Wallace, Avoca, Pa., \$0.50; W. J. Sheehan, Scranton, Pa., \$0.50; L. E. Farley, Scranton, Pa., \$0.50; E. T. M. Carr, Long Branch, N. J., \$1.00; J. P. Costello, Binghamton, N. Y., \$2.00; L. S. Austin, Clifton, N. J., \$5.00; P. C. Friend, Morehouse, Mo., \$1.00; W. T. Boyd, Jersey City, N. J., \$2.00; L. J. Burkhardt, Lyons, Kan., \$0.50; W. H. Webb, Lyons, Kan., \$0.50; C. S. Greer, Columbus, Ohio, \$1.00; H. C. Holabird, Chicago, Ill., \$5.00; W. F. Taylor, Altoona, Pa., \$1.00; F. D. Underwood, New York, \$25.00; Lewis Dresdner, New York, \$1.00; J. C. Princell, Bismarck, N. D., \$0.50; R. S. Best, Bismarck, N. D., \$0.50; C. W. Welch, Bismarck, N. D., \$0.50; S. W. Derrick, Bismarck, N. D., \$0.50; E. J. Knecht, New Orleans, La., \$1.00; H. F. Farmer, New Orleans, La., \$1.00; Dispatchers' Office, Osawatimie, Kan., \$1.75; G. W. Brownson, Kansas City, Mo., \$1.00; T. H. Hahn, Chicago, Ill., \$1.00; J. B. Taltavall, New York, \$2.50; T. R. Taltavall, New York, \$2.50. Total, \$457.50.

Radio-Telegraphy.

The Marconi Wireless Telegraph Company is erecting a wireless station on the Magdalen Islands, in Quebec, for the purpose of securing constant communication with Charlottetown and other ports of the maritime provinces. The new station will render an important service to shipping in reporting ice conditions in the Straits of Belle Isle. Communication by cable between the mainland and the Magdalen group of islands is frequently interrupted.

Standard time will be announced by wireless telegraph daily at 11 o'clock from the Eiffel Tower, Paris, for the benefit of ships at sea within range of that station.

The students at the school of engineering at the

Pennsylvania State College are installing a wireless-telegraph station designed for communication with stations at Washington, New York, Philadelphia, Boston and elsewhere. Among the uses to be made of the apparatus will be the reporting of football games played by the college team in other cities where suitable wireless-telegraph equipments have been installed.

It is announced that the Government of New Zealand has decided to erect a wireless station at the southernmost point of that country, with a range of 2,500 miles, and it is thought possible, therefore, that Capt. Scott may remain within call of this station throughout his long winter in the Antarctic.

Patent No. 974,838 has been granted to E. H. Smythe, Chicago, Ill., for a receiving apparatus for electromagnetic waves.

Mr. William Marconi on November 13 exchanged wireless communications between the station at Coltano, Italy, and the stations at Clifden, Ireland, and Glace Bay, N. S. Mr. John Bottomley, vice-president and general manager of the Marconi Wireless Telegraph Company of America, New York, states that the chief purpose of the Coltano station is to establish close communication between Italy and the Argentine Republic. At the same time it brings Italy into wireless communication with England, America and other parts of the world.

On November 21 post office inspectors and city detectives raided the offices of the Continental Wireless Telephone and Telegraph Company, at 56 Pine Street, New York, and arrested Mr. Charles L. Vaughan, treasurer of the concern, on the charge of using the mails to defraud. The company is a holding concern, and is said to control the stock of several other wireless telegraph and telephone companies, more or less well known. Mr. Walter W. Massie, president and general manager of the Marine Transmission Company, which operates the Massie wireless system, informs us, however, that his company was not connected with the Continental Wireless Telegraph Company, as was reported. The specific charge against Vaughan is that he "devised a scheme or artifice to defraud by falsely representing" that the Continental Company was organized to operate, develop and control various wireless concerns in this country, and of having made statements concerning the earning capacity of these concerns which were considered false.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works on telegraphy and treat them in the same manner.]

CHAPTER XXV.

What are the chief advantages derived from the use of a storage battery in a telegraph equipment?

What is the difference in construction between a storage battery and a primary battery?

What is the difference in their chemical and electrical actions?

Who was the inventor of the storage battery, and how was the original cell constructed?

What is the exciting liquid in the ordinary storage battery?

How is a storage battery charged?

Does the storage battery store electricity as such?

In charging a storage cell what happens to the lead plates?

In what way was the original storage battery improved?

What is meant by "forming" a storage battery?

What advantage is gained by coating the lead plates of a storage cell with red lead?

Describe the method of charging a storage cell from loop currents.

In the process of charging how are the poles of a storage cell arranged with reference to the poles of the generator?

What is the voltage of a storage cell?

What is the resistance of the coils of sounders usually employed with storage battery supply?

Why is it necessary to insert additional resistance in a local circuit?

What is the usual current allowance per sounder?

Upon what does the life of a storage cell depend?

At what percentage of its capacity should a storage battery be worked to give the best results?

How are storage cells in intermediate offices charged?

Give a rule for calculating the amount of current required for a local circuit.

How may a storage battery be charged by the electric light current from the office lighting circuit?

How is the charging rate of a storage cell found when it is being charged by an electric light circuit?

How may a cell be charged while it is being discharged?

When a cell is fully charged, how is this fact indicated in the cell itself?

What are the advantages derived from the use of a storage battery in telegraph work.

Why is it preferable to use a motor-generator for charging storage cells, instead of connecting the cells directly to electric light wires?

Give rules for calculating the capacity of a storage battery for the operation of main line circuits.

Wire thieves are active again. The Western Union Telegraph Company recently reported that thieves had cut and stolen some of its wires in the vicinity of Tyler Park, along the Erie Railroad. Thieves also cut and stole some copper wire along the Baltimore & Ohio Railroad in the vicinity of Elizabeth, N. J. They took advantage of a severe storm to carry out their work.

The Telephone.

Mr. Herbert N. Casson delivered a lecture on "The Effect of the Telephone on Modern Industrial and Social Life," before the New York Electrical Society, November 16.

Mr. S. W. Ladd has been appointed receiver for the Interstate Telephone and Telegraph Company of Illinois, one of the largest and most important independent companies in the State.

Telegraph poles take root and sprout in Uganda, Africa. This phenomenon was observed by the Rt. Hon. Winston Churchill and is recorded in his book entitled "My African Journey."

The Pacific Telephone and Telegraph Company opened its new exchange in San Jose, Cal., on November 10, a public reception being held in the afternoon and evening of that day to celebrate the event.

Two new telephone lines are about to be opened for public use between London and Paris, and two others will be opened next spring. These lines will afford a capacity of 400 conversations a day between the two capitals.

An ordinance has been introduced in the Chicago City Council requiring telephone companies to instal meters on all telephones equipped with coin boxes, for the purpose of recording outgoing messages.

Mr. R. L. Lewis, district manager of the Pacific Telephone and Telegraph Company, at San Diego, Cal., has resigned to engage in other business. He has been succeeded by Mr. J. E. Franklin, of Los Angeles.

There are over 23,000 telephone companies in the United States, with upwards of 13,000,000 miles of wire, and some twenty-five commercial telegraph and cable systems, with over 1,600,000 miles of land lines and over 46,000 miles of ocean cables.

The Bureau of the Census, Washington, D. C., has issued its report of the telephone covering the year 1907. The report presents statistics concerning the physical equipment, service, and financial operations of the commercial and mutual telephone systems of the country and the independent rural telephone lines, for the year ending December 31, 1907.

Mr. Val B. Mintun has been appointed manager of the Missouri and Kansas Telephone Company at Kansas City, Mo., to succeed Mr. F. J. Dikes, resigned. Mr. Mintun was born in Kansas City, thirty-six years ago and has been in the employ of the Missouri and Kansas Telephone Company for the past six and a half years. Mr. Mintun is well known in railroad circles and has been a regular attendant at the meetings of the Association of Railway Telegraph Superintendents for many years past.

The Italian Minister of Posts, Telegraphs and Telephones reports that at the end of the fiscal year 1907-1908 there were 49 government city exchanges in the kingdom, 256 public telephone sta-

tions and 36,243 subscribers. The systems owned by private parties had 118 city exchanges, 87 county exchanges, 341 public telephone stations and 14,035 subscribers. Although a large number of the telephone systems in Italy were started under private ownership, the State has followed the policy of buying up the systems in the principal centers.

The only telephone company in Portugal is the Anglo-Portuguese Telephone Company, an English concern both as to its capital and its principal employees. Between 200 and 250 persons are engaged in the service and the company has twenty-three exchanges, Lisbon and Oporto being the principal points. There are about 2,500 subscribers in Lisbon and about 1,100 in Oporto. The Portuguese government controls and operates all the wires which run to or are connected with the forts, etc., and owns exchanges in various places around Lisbon.

Mr. Union N. Bethell, president of the New York Telephone Company, and Mr. John J. Carty, chief engineer of the American Telephone and Telegraph Company, New York, made addresses before the Telephone Society, in the Engineering Societies' Building, New York, on the evening of November 15. There were about 1,100 persons present including all of the visiting Western Union general superintendents, as well as the division commercial superintendents. Mr. Bethell gave a history of the consolidation of the various telephone companies in New York, Pennsylvania and other States, which was practically covered in our issues of September 16 and October 1. Mr. Carty gave a very interesting and instructive talk on the engineering aspects of the telephone business.

The American Telephone and Telegraph Company is making rapid progress in the construction of the underground conduit for long-distance telephone cables between Washington and Boston, by way of New York. The conduit between Washington, D. C., and Wilmington, Del., a distance of ninety-two miles, is nearly completed. The conduit work between Boston and Providence, New Haven and New York, and New York and Wilmington, is completed, and when the Washington-Wilmington section is finished direct underground communication between Washington and New York will be possible. The larger part of the conduit consists of four ducts of creosoted wood, the number of ducts being increased to five or six where the conduit passes through towns. A novel form of manhole has been adopted for this line. It is built up of concrete blocks and slabs. The purpose of this underground line is to preserve telephonic communication between the points named during stormy weather.

There is much for telegraph operators to learn respecting their calling which can be readily obtained by reading *Telegraph and Telephone Age*—\$2 a year.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIDGES

Sole Manufacturer

**Hudson Terminal, 30 Church St.
NEW YORK**

Western Representative

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

The Erie Railroad is constructing concrete telephone booths at sidings and other places along its lines.

It is stated the Erie Railroad will adopt the telephone system of train despatching on its main and branch lines.

An Edison storage battery car is being practically tested in railroad work on the Orange, N. J., branch of the Erie Railroad. The car was built for a speed of 25 miles an hour, but has attained 30 miles an hour without any apparent strain upon the batteries.

The initial installation of selective train despatching apparatus on the Missouri Pacific Railroad, of which Mr. E. A. Chenery is superintendent of telegraph at St. Louis, was recently completed. The circuit is made up of two No. 9 B. & S. gauge copper wires transposed every half mile on transposition brackets and covers the main line of the Illinois division of the St. Louis, Iron Mountain & Southern Railway, extending between Dupon, Ill., to Illmo, Mo., a distance of 118 miles. The dispatcher's office is located at Chester, Ill., the division headquarters, about midway on the division, and of the twenty-three way stations equipped, ten are north and thirteen are south of that point. The selective equipment consists of the latest type Gill apparatus.

Extension of Telephone Dispatching on the Illinois Central Railroad.

Ninety-nine miles of the Illinois Central Railroad, between Paducah and Central City, Ky., have lately been equipped with telephone circuits for handling train orders. On the new circuit sixteen way station subscriber sets have been installed, in addition to twenty-one regular telephone stations. These sets, which are somewhat similar in appearance to the standard magneto telephone set, are for use in connection with hand sets equipped with plugs and cords. Each subscriber's set is equipped with a jack, to enable connection to be made by means of a hand telephone.

The hand sets are numbered, and one is furnished each freight train conductor, when his train is ready to start out on a run. A receipt is taken from the conductor when the set is delivered, and the set is turned in when the conductor completes his run. To get into communication with the dispatcher the conductor goes into the booth, or station, throws a switch which connects the telephone to the line, and inserts the plug into the jack, thereby placing his receiver across the line. To speak to the dispatcher, it is necessary to press a button on the hand set, which closes the transmitter circuit.

The telegraph has been supplanted by telephones for dispatching trains on more than 2,000 miles of this road.

Telephone Train Dispatching in New England.

The New York, New Haven and Hartford Railroad has in operation telephone circuits

covering 100 miles of its road, from Northampton, Mass., to New Haven, Conn., with branches to Holyoke and New Hartford, Conn. There are twenty-nine telephone stations on this division, which is equipped with test panels, selectors and flexiphones. Sixty-eight stations are in operation on the Boston & Maine Railroad, covering the White Mountain Division and the Concord Division. These circuits extend from Concord to Woodside, ninety-three miles, White River Junction to Concord, seventy miles, and Boston to Fitchburg, fifty miles. The best grade of copper wire is being used, together with telephone arms, selectors, wrecking outfits and portable sets. The Central Vermont Railroad, has ordered telephone equipment to cover its northern division from St. Albans to Windsor, Vt. On this stretch of 150 miles there will be thirty-eight telephone stations, which will be equipped with telephone arms and circular loom cable. The Boston & Albany Railroad has in successful operation telephone equipment covering the whole of its main line and all branches from Boston to Albany. On these four circuits there are 165 stations.

Telegraphy has been added to the curriculum of the Carlisle, Pa., Indian School, and Indians are being taught the art. It is stated that they are apt students. They are patient and seem to grasp the details readily. It is thought that they will be especially useful in filling positions in lonely places in the west, where it is often difficult to keep white men.

Trade Notes.

The Evansville & Terre Haute Railroad Company has purchased equipment for a telephone train dispatching circuit between Evansville and Terre Haute, a distance of 110 miles. Gill main line bell selectors will be used for signaling, the dispatcher being provided with the new Gill silent calling keys. There will be twenty-seven train order offices on the circuit, and each will be equipped with telephones for block and train dispatching service. Telephones are to be installed at blind sidings to facilitate the operation of trains.

The telephone train dispatching equipment of many of the New England railroads was furnished by the Western Electric Company, which has supplied more than 90 per cent. of the railway telephone equipment now in use in this country. Other railroads are using the telephone for this service as far west as the Pacific coast and south as far as Florida and Texas.

Western Electric Business for 1910.

The Western Electric Company's old fiscal year ended with November, but the company's report will probably cover thirteen months in order to make the fiscal year hereafter correspond with the calendar year. October returns, gross, were 40 per cent. larger than those of October, 1909, and the twelve months ending with November will show gross sales of somewhat over \$61,000,000.

Death of B. F. Dillon.

Mr. B. F. Dillon, general superintendent of the Western Union Telegraph Company at Atlanta, Ga., died on November 21 from the effects of a stroke of apoplexy. Mr. Dillon had spent the previous week in New York attending the conference of officials of the company, and seemed to be in the best of health. The news of his death was a great shock to his numerous friends in this city and throughout the service.

Mr. Dillon was born in Screven County, Ga., April 21, 1849, and in 1870 accepted a position as operator for the Western Union Telegraph Company at Kansas City, Mo. He soon returned to the South and worked at Lake City, Fla., and Augusta, Ga., and later became chief operator at Savannah. He afterwards became manager of that office, and in 1887 was appointed superintendent at Jacksonville. In March this year he received the appointment of general superintendent, with headquarters at Atlanta, which position he held at the time of his death. He was a public-spirited man and took active interest in civic affairs in the various places of his residence.

Interment was at Jacksonville and all of the southern division officials were present out of respect to the memory of the deceased.

The Late William H. Cohn.

The death of Mr. William H. Cohn, of Sacramento, Cal., noted in a recent issue, marks the passing of an unusually interesting character. Mr. Cohn was one of the most genial and lovable of men. During the strike of 1883 his wide acquaintance and popularity served the little band of strikers well, and enabled them to not only gain the unanimous moral support and sympathy of the business men and public generally, but to raise over \$700 in subscriptions for the support of the strikers, which was deposited in the safe of the State Treasurer at the Capitol, and drawn as needed.

Mr. Cohn was something of a politician in those days, and through his influence the use of the opera house and the services of the best band in Sacramento were obtained free of cost for the mass meeting in which the Governor and other State officials and the prominent business and professional men of Sacramento took part.

All this is ancient history, but the memory of the events of that month of idleness and of Mr. Cohn, who contributed so much toward the welfare of the boys is one that must ever linger in the minds of those who were associated with him during that time.

Obituary.

A. B. Churchill, a telegraph operator, aged sixty-six years, died on November 5 at Boston, Mass.

Mr. Benj. T. Finch, late director-in-chief of the Indo-European Telegraph Department, died at

his home in Blackheath, England, October 22, at the age of 70 years.

The Cable.

Mr. T. G. Barker, of the executive offices of the Commercial Cable Company, New York, has returned from England, where he spent a vacation of several weeks.

Owing to the difficulty in maintaining the submarine cables connecting the Orkney Islands, at the north of Scotland, with the main land, wireless telegraph stations have been erected on the islands of Sanday and North Ronaldshay.

The cable steamer "Mexican," belonging to the Mexican Telegraph Company, has returned to New York harbor after completing some difficult repairing in the stormy season in the Gulf of Mexico. Mr. Otto Strubel, cable engineer of the company, accomplished some excellent work in connection with the repairing, which was made in record time. All of the trouble was caused by anchors.

A new submarine telegraph cable has been laid between Newbiggin, Northumberland, England, to Arendal, Norway, a distance of 420 miles. The cable was manufactured by Siemens Brothers & Co., London, and was laid by their cable steamer "Faraday."

Municipal Electricians.

Mr. Raymond N. Brace, operator at the police telegraph bureau in Rochester, N. Y., went duck-shooting on Lake Ontario, November 7, and has not been heard from since. It is feared that he was drowned. A new operator will be appointed December 1 to fill the vacancy.

In Shreveport, La., storage battery supplies the current for the operation of the fire alarm system. There are twenty-two miles of copper wire and forty-eight street alarm boxes. The alarm system and all engine houses are equipped with indicators. There is a four-circuit switchboard, with repeaters and indicators.

Wireless fire alarm messages from the steamship Falcon were received recently at various points along the Pacific coast and at San Francisco, and the fire tug Snohomish, of Seattle, Wash., was detailed to assist the vessel, which was on fire at sea.

The fire alarm and police telegraph systems in Chicago are maintained in an efficient condition, according to a recent investigation into the subject. The practice of the Department of Electricity, which has this service in charge, is to maintain about thirty alarm boxes on each circuit so arranged that there is no danger of two boxes on the same circuit being "struck" for the same fire, thus interfering with the alarm. In some cases, however, the number of boxes has been greatly increased, up to as high as seventy on a circuit nearly thirty miles long. It has been recommended that the system should be subdivided thoroughly to keep down the number of boxes on a circuit and the length of circuits.

New Book.

Edison; His Life and Inventions. By Frank Lewis Dyer and Thomas Commerford Martin. New York: Harper & Brothers. Two volumes; 988 pp. Illustrated. Price, \$4.25.

This book is the first complete, authentic and authorized record of the life and work of this great inventor and former telegrapher, and is published with Mr. Edison's consent.

Mr. Edison has for so many years stood before the world as an inventor of extraordinary ability and his name is so intimately associated with many of the greatest electrical inventions of the nineteenth century that there was a universal and insistent desire for a reliable and complete account of his life and work. These volumes were written to meet this demand and the work has been excellently done. Mr. Dyer, one of the authors, is general counsel for the Edison Laboratory and allied interests, and Mr. Martin, co-author, was formerly associated with Mr. Edison and has been for many years one of the most prominent and active workers in the electrical field. By reason of their long acquaintance with Mr. Edison and their wide knowledge of his character and work they were eminently fitted to undertake the task which they have so successfully brought to a conclusion. Mr. Edison himself aided the authors in their labors and supplied them with a great deal of material, which is incorporated in the books. This may be easily recognized by his characteristic and forcible language.

The work is designed to bring the reader face to face with Mr. Edison, and there are thousands of telegraphers and electrical people all over the world who will be glad of this opportunity to know him.

The story of Mr. Edison's life is an intensely interesting one. The portion that will, of course, appeal most strongly to telegraph people will be that relating to his career as a telegraph operator and inventor of telegraph apparatus. The story of his selling the quadruplex is a familiar one, but it is retold with such freshness and vividness that it seems like a new one.

There is no branch of the electrical industry that does not bear Mr. Edison's impress, and this record of his achievements is sure to meet with a hearty reception. The authors have handled their subject in a masterly way and deserve the thanks of the reading public for making it possible for the present and future generations to know of the life and work of this great genius.

Copies of this work can be procured through Telegraph and Telephone Age, 253 Broadway, New York.

It is likely that the telegraph system of Porto Rico will be abandoned next year. The Porto Rican Telephone Company has purchased the telegraph system of the island, and it has been found that the telephone is better suited to meet the requirements of the social and business community than the telegraph.

General Mention.

The Marconi Wireless Telegraph Company of Canada has applied to the railway commission for ratification of its tariff of tolls for messages delivered from a ship in the Gulf of St. Lawrence. The question of jurisdiction was raised and judgment was reserved.

Mr. J. W. Tillinghast, until recently manager of the Western Union Telegraph Company, at Cleveland, Ohio, is in Lorton Valley, Fairfax County, Va., where he is looking over some farming lands, with a view to locating permanently in that section. Mr. Tillinghast will retire from active duties after fifty years in the telegraph service.

Mr. Clarence H. Mackay, president of the Postal Telegraph-Cable Co., has been named as a member of the organization committee of the proposed permanent exposition in New York City. The plan is to establish the exhibition on the lines of Earls Court in London, but on a larger scale. The New York Permanent Exposition Company has been organized with a maximum authorized capital of \$50,000,000 to undertake the work.

The annual meeting of the International Congress of Inventors was held at Rochester, N. Y., recently, at which were read several papers on the subject of patents. Mr. Ludwig Gutmann advocated a revision of patent statutes, the institution of a lower patent court and a court of patent appeals. Mr. Keiper, former assistant examiner in the Patent Office, advocated the appointment of infringement examiners. His suggestion was endorsed by the meeting.

We take the following paragraph from the Jerome, Idaho, *North Side News* of a recent date. Mr. Annett mentioned therein is a well-known old-time telegrapher now in business at that place. He was at one time Assistant Superintendent of Telegraph of the Illinois Central Railroad, at Chicago; manager of the Western Union Telegraph office at New Haven, Conn.; manager of the Goldfield, Nev., office, and occupied other important positions in the telegraph service.

"A hundred guests were entertained by Mr. and Mrs. Chas. F. Annett on October 8, at Hale Hall, in honor of their daughter, Miss Annett, who is visiting them from Chicago. Mrs. Armstrong assisted in receiving, and later presided at the punch bowl. The hall was decorated with pumpkins, giant sunflowers and other such trophies of autumn as a new country affords. The evening was spent in dancing to excellent music. Mr. Heiss received first prize in the guessing contest, guessing within one the number of seeds in a pumpkin."

Mr. C. E. Stump, manager of the Dock Street office of the Postal Telegraph-Cable Company, Philadelphia, Pa., writes: "I cannot get along without Telegraph and Telephone Age."

Mr. Bert Asher, operator at Adair, Mont., saw a meteor flash across the sky recently. In falling to earth it set fire to a tree, the glare of the flames revealing its location. The stone, after cooling off, was picked up and taken to Missoula by Mr. Asher.

We have received from Mr. A. J. Hartman, manager of the North American Telegraph Company at Red Wing, Minn., a post card picture of the Postal Telegraph-Cable Company's office at that place, also one of the "73" camp 1910, of the Postal Company's operators and messengers on the banks of the Mississippi river. The camp was located in the heart of the forest.

The Interstate Commerce Commission will give a hearing to telegraph and telephone companies in Washington on December 7 with a view to determining the status of telegraph and telephone companies under the act to regulate commerce. The questions to be discussed are: What telegraph and telephone companies are subject to the act to regulate commerce? May telegraph and telephone companies subject to the act issue franks entitling persons to free interstate service, or may they grant free interstate service, and, if so, to what extent? Are these companies required to file their tariffs or charges under the sixth section of the act?

NEW YORK, WESTERN UNION.

Mr. Martin Durivan, who has had charge of the telegraph equipment at Long Branch during the past season, has returned to this office and has resumed his old position as assistant to Mr. J. B. Hurd, traffic chief.

Mr. Hector St. Jacques, of the Western Division, is spending a vacation in England.

Mr. L. H. Jordan, formerly of this department, is now located at Pittsfield, Mass., as manager.

Mr. George Alexander, of the Newspaper Division, died on November 12 of pneumonia. The remains were taken to his old home in Quebec for interment.

PHILADELPHIA, POSTAL.

Chief Operator E. W. Miller went to Princeton to oversee the handling of the heavy newspaper work during the Yale-Princeton football game November 12.

Manager Albert of Baltimore was a recent visitor while en route to New York.

Traffic Chief M. N. Redding has returned from a gunning trip to his home in Chestertown and was very successful.

Night Chief Operator E. H. Locke has returned to duty after a brief illness.

BALTIMORE, WESTERN UNION.

The following promotions have been made in this office: Mr. Samuel T. Shutt to be manager, vice Mr. J. M. Creamer, promoted to the position of District Traffic Superintendent, with headquarters at Philadelphia; Mr. Eugene S. Anderson, chief operator, vice Mr. L. D. Wilbourn, promoted to be District Traffic Superintendent at Boston; Mr. R.

L. Dryden, southern wire chief, vice Mr. E. S. Anderson; Mr. R. G. Simmons, all night chief, vice Mr. R. L. Dryden, and Mr. J. W. Waller, night traffic chief, vice Mr. R. G. Simmons. Mr. Shutt previous to his promotion was manager of the Light-street branch office. On their departure to take up their new duties Superintendents Creamer and Wilbourn were presented with handsome traveling cases by their office associates.

The Telegraphers' Mutual Benefit Association, 195 Broadway, New York, has for nearly half a century proclaimed the absolute necessity of life insurance and provided a safe and economical form of protection for the home and family within the means of every telegraph and telephone employee. A certificate of membership affording protection of \$500 or \$1,000, or both, is easily obtainable by every one in good health engaged in telegraph or telephone service, either commercial or railroad, between the ages of 18 and 45, and should be held by all employees not otherwise provided with adequate life protection.

Own Your Home.—The Serial Building Loan and Savings Institution, of 195 Broadway, New York, was organized for the purpose of assisting telegraphers to buy homes and encourage them to save systematically. It is managed by well-known telegraphers and has aided over eleven hundred persons to secure homes during its existence of twenty-five years. Write for particulars.

We are general agents for all makes of sending machines, also typewriters of all makes, new and second hand. Send for catalogue. Address: J. E. Albright, 253 Broadway, New York.

MARTIN VIBROPLEX, heavy base; the best sending key on market; \$9.00. James B. Havice, General Agent, 253 Broadway, N. Y. Agents wanted.

TRANSMITTING MACHINES

I am placing on the market improved **YETMAN TRANSMITTING TYPEWRITERS**, and **KEY-BOARD TRANSMITTERS** without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

SOME POINTS ON ELECTRICITY—VIII.

A Study of Telegraphic Apparatus.

BY WILLIS H. JONES.

SWITCHES.

The main line and local battery switches, the operator sees on the desks or tables in front of him are probably the simplest pieces of apparatus included in the equipment of a multiplex circuit, yet there is a "study" even in these.

It is easy enough to understand what they are for, but it is not always as easy to know just where each wire attached to the binding posts leads to.

The student should first study their mechanical construction, by tracing the wires underneath the base, and ascertaining the point to which the wire connected to each binding post or disk invariably leads. In all modern telegraph offices these connections are always the same on most switches used for like purposes. Two switches of identical construction, however, may be used for different purposes, yet there will be a uniformity in the connections for each class of service required.

Let us take, for example, an ordinary three-point switch, as it is usually called, such as those the operator uses when cutting in, or off, the branch office loops.

The theoretical connections for such a switch are shown at A in the accompanying diagram and at

Local Circuit Six-point Switch

DIAGRAMS OF SWITCHES, CONNECTIONS, ETC.

a glance gives the operator a correct idea of its purpose. The lever he pushes from one side to the other is always connected to the key and transmitter local connections, or with the receiving apparatus. On multiplex circuits there are of course two of these switches side by side on one base, one for the sending side, and the other for the receiving side. Thus when the lever is turned say to the right and rests on the brass disk on that side, the circuit attached to the lever is extended to the

terminal of the wire attached to that disk, and in like manner to the terminal of the other disk when the lever is turned to the left. On multiplex circuits the left hand disk on the operator's desk leads to the loopswitch and thence to the branch office. The disk on the right leads through the resistance lamp to a "ground."

If each switch was actually constructed with only three points, as the illustration suggests, no layman would fail to understand the connections at once, but the standard double lever and six post pattern possesses six disks and requires four short pieces of wire underneath the base, as shown by the dotted lines in diagram B. This, together with the two extra disks sometimes tends to mislead a novice to believe that possibly there are other external connections than those shown in A., but such is not the case. The middle disk in each double switch is "dead" and is used merely as a rest for the lever when the local battery and connections are desired to be left open.

The two disks on either side are connected with the binding posts by a wire because it is necessary to place the disks at such points on the base that contact may be made between them and the end of the lever.

Diagram C shows the connections of a seven-point main-line battery switch, such as is used for duplex and multiplex circuits.

The levers, as usual, connect with certain parts of the multiplex equipment which at times require shifting. Thus levers 1 and 3 connect with the positive and the negative poles of the batteries, respectively, while lever 2 carries that polarity of current which happens to be delivered via the bar of the polechanger to the relay and line, as indicated in the illustration. The disk at the right of the middle lever is connected to the 600-ohm ground coil, to which disk the lever is turned when the distant station takes a balance.

The connections of the battery and the polechanger binding post may be reversed on levers 1 and 3 without interfering with the operation of the circuit. In fact some offices use one method and others the reverse.

Students should make drawings of the connections of local and mainline battery switches and thus get the connections thoroughly impressed on the mind.

PROPER CARE OF SWITCHES.

Doubtless there are some who do not realize the fact that switches require considerable attention and proper treatment as does any other part of multiplex apparatus. A little spot of ink which has dried and become hard and covers one of the disks the lever rests upon may completely open the circuit. If not, it may at least cause a high resistance at that point and thus reduce the volume of current. If operators who complain of "weak locals" would first examine the brass disks, they would often be able to detect the source of trouble and remedy the fault themselves by means of a penknife.

Another source of trouble is loose binding posts. They will work loose at times, and they should be examined daily.

Sometimes the pressure of the lever upon the disk is not sufficient to make a good contact. When this occurs remove the lever from the base and bend it enough to insure a good contact and then replace it.

Never attempt to pound it down into contact while it remains in place. If you do, you will certainly make matters worse.

Recent Telegraph and Telephone Patents.

No. 976,216. Electrical Relay, to F. Ritchie, Acton, England. The action of the relay is reinforced by a local induced current so that it may be operated by a line current, a primary impulse being produced after the initial impulse which induces a secondary impulse in the same direction as the initial impulse.

No. 976,230. Telephone Receiver, to H. R. Stuart, Newark, N. J.

No. 976,241. Telephone Trunking System, to C. S. Winston, Chicago.

No. 976,208. Selective Party Line Telephone System, to H. J. Roberts, Evanston, Ill.

No. 976,380. Selective Signaling System, to O. M. Leich, Genoa, Ill. A railroad telephone system with a step-by-step signaling mechanism and a slower clock mechanism which overtakes the step-by-step mechanism to change the circuit conditions through the local signal.

No. 976,457. Telephone Mouthpiece, to J. A. Hall, Oakland, Cal.

No. 976,524. Automatic Telephone System, to H. G. Webster, Chicago.

No. 976,537. Telegraph Transmitter, to J. C. Barclay, Montclair, N. J. A rotary member with the projecting studs occupying different paths of rotation and distributed angularly, the studs having plugs screwed into the member, the plugs being stepped and beveled, together with finger keys which operate mechanism to stop the rotary member, the latter controlling circuits.

No. 976,586. Relay Magnet, to J. F. McElroy and J. E. Macomber, Albany, N. Y.

No. 976,791. Storage Battery Electrode, to Thos. A. Edison and J. W. Aylsworth, West Orange, N. J.

No. 976,792. Storage Battery, to Thos. A. Edison, West Orange, N. J.

No. 976,836. Electric Annunciating Apparatus, to H. J. Alther, Boston, Mass.

No. 976,961. Combined Telephone and Service System, to H. G. Webster, Chicago, Ill.

No. 976,962. Wall Set, to A. H. Weiss, Chicago, Ill.

No. 977,008. Telegraph System, to G. E. Hines, New York. The main line is grounded at each end, with closed transformers with secondaries in series with the line and key, controlled primaries and relays with polarized armatures in series with the line restrained against movements due to stray currents,

and an adjustable self-induction device in series with the conductor.

No. 977,067. Central Station Call System for Telephone Lines, to W. E. Butler, David City, Neb.

No. 977,086. Electrical Element, to A. T. K. Estelle, Fliseryd, Sweden.

No. 977,114. Relay, to R. H. Manson, Elyria, Ohio.

No. 977,142. Telephone System, to F. X. Staub, Fort Wayne, Ind.

No. 977,145. Primary Battery Plate, to A. O. Tate, Toronto, Ont.

Personal.

The Franklin Institute of Philadelphia has awarded Elliott Cresson medals to Dr. Edward Weston, of Newark, N. J., for work in electrical discovery and in the advancement of electrical application and to Ernest Rutherford, professor of physics, Owens College, Victoria University, Manchester, England, for his work in the advancement of the knowledge of electrical theory.

Officials of the western division of the Postal Telegraph-Cable Company, on December 3, gave a farewell dinner at the Bismarck Hotel, Chicago, to Mr. T. W. Carroll, former general superintendent, who resigned on November 30, to become assistant to the general manager of the Western Union Telegraph Company in New York. The subordinate officials presented to their retiring chief a diamond ring. There were about twenty-five persons present and Mr. H. G. McGill, district superintendent, presided.

Major J. Orton Kerbey, the well-known old-time and military telegrapher and former United States Consul to Brazil, but for many years past a resident of Washington, D. C., was a recent New York visitor on the invitation of his old friend Mr. Andrew Carnegie. Major Kerbey, David Homer Bates of New York and Theo. E. Moreland of Pittsburgh, are the only living members of the former staff of telegraphers who were associated with Mr. Carnegie in the office at the outer depot, Pittsburgh, previous to the Civil War.

Mr. Theodore N. Vail, president of the Western Union Telegraph Company and of the American Telephone and Telegraph Company, recently entertained at his country home at Lyndonville, Vt., Mrs. J. J. Dickey, wife of the late J. J. Dickey, superintendent Western Union Telegraph Company, of Omaha, Neb.; her daughter, Miss Bertha Dickey, Ralston Scobie and Miss Helen Scobie, nephew and niece of Mrs. Dickey. The party recently returned from a year's stay in Germany, where the young people attended school.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Colonel A. B. Chandler, chairman of the Board of Directors of the Postal Telegraph-Cable Company, was united in marriage to Miss Mildred Vivian, of New York, on December 13. The wedding was a

quiet one, only the immediate relatives being present. The couple are spending their honeymoon on a trip to Washington, D. C., and thence further South.

Among recent executive office visitors were: Mr. S. M. English, president and general manager of the Postal Telegraph-Cable Company of Texas, Dallas, Tex.; Mr. H. Scrivens, superintendent of this company at Pittsburg; Mr. W. H. Regan, manager of the Fall River, Mass., office.

Mr. H. W. Hetzel, chief clerk to superintendent C. E. Bagley of Philadelphia, has been promoted to be travelling auditor of the company with headquarters at New York. Mr. G. A. Deitrich of the Baltimore office succeeds to the position of chief clerk to the superintendent at Philadelphia. Mr. W. F. Brophy, chief of the bookkeeping department has been advanced to the cashiership of the Baltimore office vice Mr. Deitrich, promoted.

Mr. G. M. Purdy, manager of the Dayton, Ohio, office, has been advanced to the managership of the Cleveland office, vice B. J. Ross resigned. Mr. F. T. Bott, who left the service some time ago to enter other business, has returned to the Dayton office as manager.

This company occupies an elegant office in the main waiting room of the Pennsylvania Terminal, New York, from which direct wires run to all the principal cities of the country. This office will provide the best of telegraph facilities for the railroad company's patrons and for the section of the city adjacent to the terminal. As yet the permanent office fixtures have not been placed in position, but provision is being made to make this a model office in every respect. Mr. J. Sheffrey is in charge of the office. He was formerly manager at 624 Madison Avenue and was succeeded there by Mr. H. T. Barkman of the 853 Broadway office.

Mr. E. J. Nally, vice president and general manager of the Postal Telegraph-Cable Company, New York, is the author of a card addressed to the public, a copy of which is posted in the offices of that company. The card is under the head of "The Employee and the Company," and reads as follows:

"It is a fact that the public regards the representative it meets and with whom it transacts business as the Company itself. We know this from our personal experience in stores, for instance—if we are well treated by the clerks, if they are pleasant and affable, if they impress us by their alertness and their knowledge of their business, our trade naturally gravitates toward that store. We like to go there; we are glad to tell our friends about it and to influence their patronage in that direction.

"So it is with the representatives of the Postal Telegraph. The public receives its idea of the Company largely through you. You are the ones they meet and from whom, as a rule, they form their impression of the Company itself. Hence it behooves all to be efficient, alert, honest and obliging, since in so doing we not only build character for ourselves, but we likewise give character and reputation to the company we serve."

Mr. E. Y. Ouderkirk, of Johnstown, Pa., has been appointed manager of the Wheeling, West Va., office, vice E. H. Worden resigned.

Mr. L. A. Seaman, formerly of the Wichita, Kan., office, is acting manager of the St. Joseph, Mo., office vice manager W. G. Brinson granted an extended leave of absence on account of sickness.

Mr. C. M. Breese has been appointed night chief operator at Toledo, Ohio, to succeed Mr. C. B. Holley, promoted, and Mr. V. A. Gaiser, has been appointed all-night chief operator in the same office.

This company has for some time been using Wright printing telegraph instruments on circuits between New York and Boston and between New York and Washington, and is now introducing the system between Chicago and St. Louis.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Theo. N. Vail, president of the company, now occupies the office on the fourth floor of the building on Broadway front, formerly used by Mr. George J. Gould. The office vacated by Col. R. C. Clowry is now occupied by Mr. Newcomb Carlton, vice president. Col. R. C. Clowry's office is now in the Hudson Terminal Building, at 30 Church Street.

At a special meeting of the American District Telegraph Company of New Jersey, held Tuesday, December 6, the resignation of Col. R. C. Clowry as president was accepted, and Mr. Theo. N. Vail was elected a director, member of the executive committee and president of the company. Mr. Newcomb Carlton was elected a director, member of the executive committee and a vice president. The following named gentlemen now comprise the board of directors and officers of the company:

Board of Directors.—Messrs. Theo. N. Vail, Wm. H. Baker, Union N. Bethell, H. A. Bishop, B. Brooks, Newcomb Carlton, G. H. Fearons, T. F. Clark, G. W. E. Atkins, L. F. Loree, C. F. Patterson.

Executive Committee.—Messrs. Theo. N. Vail, Wm. H. Baker, Union N. Bethell, H. A. Bishop, Newcomb Carlton, B. Brooks, G. H. Fearons, T. F. Clark.

Officers.—Theo. N. Vail, president; Wm. H. Baker, vice president; Newcomb Carlton, vice president; A. R. Brewer, treasurer; L. Dresdner, assistant treasurer; I. B. Ferguson, secretary and auditor; C. F. Patterson, general manager; Geo. H. Fearons, counsel; H. D. Estabrook, solicitor.

At a special meeting of the American District Telegraph Company of New York, held Tuesday, December 6, the resignation of Col. R. C. Clowry as president was accepted, and Mr. Theo. N. Vail was elected a director, a member of the executive committee, and president. Mr. Wm. H. Baker and Mr. Newcomb Carlton were elected vice-presidents. The directors and officers of the company are as follows:

Directors.—Messrs. Theo. N. Vail, Wm. H. Baker, Union N. Bethell, Newcomb Carlton, W. C. Humstone, C. F. Patterson, P. V. R. Van Wyck.

Executive Committee.—Messrs. Theo. N. Vail, Union N. Bethell, Wm. H. Baker and Newcomb Carlton.

Officers.—Theo. N. Vail, president; Wm. H. Baker and Newcomb Carlton, vice presidents; A. R. Brewer, treasurer; I. B. Ferguson, secretary and auditor; D. Skelton, general manager, and W. A. May, chief clerk.

This company has inaugurated the "special ocean mail service," which is designed to save time in foreign correspondence. It is proposed to facilitate delivery of foreign mail to steamers by shortening the time it takes to carry on the trans-continental service. The night letter and other telegraphic service will be used to send messages from distant points to New York, from which place they will be sent to the first outgoing Atlantic steamship mail. The same plan will be carried on in San Francisco, Seattle and Vancouver for trans-Pacific mails. This will enable correspondents to dispatch telegraph letters from any part of the United States for an ocean mail within a few hours of sailing time. The only extra charge will be five cents for the postage. The great saving in time effected by this service will be appreciated when it is remembered that a letter from San Francisco to London requires as much time to cross the continent as it does to cross the ocean. A New York merchant writing to Yokohama must post his letter practically a week before the mail steamer sails from San Francisco or Vancouver.

Mr. Joseph Wilkes Brooks, recently appointed district traffic superintendent, with headquarters at Oklahoma City, Okla., was born at Wheelock, Tex., February 11, 1855, and began his telegraphic career at Navasota, Tex., in April, 1871. He has held positions as operator in many places in Texas, and was manager of the offices at Bryan, Corpus Christi, and El Paso; also at Las Vegas, N. M. He also occupied the position of night chief operator at Houston and Dallas, Tex., and all-night chief at Galveston. Mr. Brooks has been in the Western Union service continuously for nearly forty years, and his recent promotion is a well-merited recognition of his ability and of his long and faithful service. He is a brother of Mr. Belvidere Brooks, general manager of the Western Union Telegraph Company, and father of Mr. B. L. Brooks, division traffic superintendent, at Denver, Col.

Mr. B. J. Ross, manager Postal Telegraph-Cable Company, Cleveland, Ohio, has accepted the position of special agent with this company, with headquarters at Cleveland.

Mr. G. W. Fleming, chief clerk traffic department Postal Telegraph-Cable Company, New York, has accepted a position in the traffic department of this company in New York.

Mr. Marshall L. Bird, for sixteen years executive messenger for the Postal Telegraph-Cable Company, New York, now occupies a similar position in the office of Mr. W. H. Baker, vice-president of the American District Telegraph Company of New Jersey.

A conference of the officials of the Gulf Division of this company was held at Dallas, Tex., November 28 and 29. Those present were: Mr. L. McKisick, general superintendent; Mr. J. C. Smith, division commercial superintendent; Mr. L. K. Whitcomb, division traffic superintendent; Mr. M. B. Wyrick, division plant superintendent; Mr. Norman Ringer, district commercial superintendent; Mr. J. G. Hilbert, district plant superintendent and Mr. W. P. Davis, district traffic superintendent, of Dallas; Mr. T. P. Cummings, district commercial superintendent and Mr. H. Van Devender, district traffic superintendent, New Orleans; Mr. A. R. Lingafelt, district commercial superintendent, and Mr. J. W. Brooks, district traffic superintendent, Oklahoma City, and Mr. F. H. Gournoe, district commercial inspector. Besides the superintendents the following-named managers attended the conference: Messrs. H. G. Robinson, Oklahoma City, Okla., Gus Schultz, Galveston, Tex., J. L. Newton, San Antonio, Tex., S. P. Jones, Houston, Tex., W. Y. Nolley, Fort Worth, Tex., W. A. Porteous, New Orleans, and W. B. Tyer, chief clerk in the manager's office at Houston, Tex.

H. C. Worthen, General Superintendent, Southern Division, Western Union Telegraph Company, Atlanta, Ga.

Mr. H. C. Worthen, the new general superintendent of the Southern division of the Western Union Telegraph Company, with headquarters at Atlanta, Ga., is a Southerner by birth, and at the age of thirty-four has reached one of the highest positions in

MR. H. C. WORTHEN,

General Superintendent, Southern Division, Western Union Telegraph Company, Atlanta, Ga.

the telegraph service. He was born in Shelby, N. C., and being left alone by the death of his parents, was raised in the Oxford Orphan Asylum, where he learned telegraphy. When thirteen years old he started out for himself as an operator on the Seaboard Air Line Railway. In 1898 he joined the

Western Union Company as an operator and was stationed in various Western cities. His rise was rapid, and in the recent reorganization of the company he assumed a prominent position in the traffic department at New York headquarters.

Canadian Notes.

The legislature of the Province of Quebec, has instituted a Public Utilities Commission, with power to regulate public service utilities, including the telegraph and the telephone. It has authority to fix charges for public service and to regulate the use of appliances. The commission's decisions are final within its jurisdiction, the only grounds for appeal being upon a point of law or the question of jurisdiction. The Attorney-General is empowered to dissolve any corporation refusing to obey the commission's orders.

The case of the Imperial Press against the Canadian Pacific Railway's Telegraph was heard before the Board of Railway Commissioners of Canada, on December 2. The original claim was made that the Canadian Pacific Railway should transmit all messages of this party or firm at press rates or half rates. The Canadian Pacific Railway refused to do this as the association in question neither received nor forwarded newspaper despatches by wire but was engaged in a business of supplying matrices as fillers to newspapers and other publications, and therefore was not entitled to press rates on queries. When the case was called, Mr. Epstein, who practically constitutes the Imperial Press, changed his attitude and claimed that the telegraph company would not accept at press rates queries regarding despatches to be forwarded by telegraph, but he did not take up the original question, stating that that was not his claim. The Canadian Pacific Railway assured the Chairman of the Board that on any messages which had been forwarded referring to newspaper despatches by wire, a refund would be made if there was an overcharge. The case was thereupon dismissed.

General Manager I. McMichael, of the Great North Western Telegraph Company, held a meeting in Toronto, Ont., December 8 and 9, of the head-office officials and managers of the company's principal offices in Eastern Canada for the purpose of a thorough discussion of the company's business with a view of improving the service. Those present at the meeting were: Messrs. I. McMichael, vice-president and general manager; S. B. McMichael, assistant general manager; Geo. Hogarth, manager, and C. McConnell, auditor; W. J. Duckworth, superintendent of construction; D. E. Henry, chief clerk to general manager; Geo. Hogarth, manager; and C. E. McManus, chief operator, Toronto; L. S. Humes, manager, Montreal; C. E. Davies, manager, Ottawa; C. E. Lillie, manager, Quebec; J. Jamieson, manager, Hamilton, and D. Adams, manager, London.

T. W. Carroll Becomes Assistant to the General Manager of the Western Union Telegraph Company.

Mr. Thomas W. Carroll, general superintendent of the Postal Telegraph-Cable Company, at Chicago, Ill., has accepted a position with the Western Union Telegraph Company at New York, with the title of assistant to the general manager.

Mr. Carroll was born at Cleveland, Ohio, January 22, 1871, and began his telegraphic career in that city in 1888, when he entered the Western Union service. He afterwards made an excellent record as an operator at Cleveland and Pittsburgh, and later was promoted to the position of repeater chief in the overland service at Albuquerque, N. M., for the Postal Telegraph-Cable Company, subsequently going to Denver, Col., as day chief operator. He acquired an excellent electrical training, and

MR. THOMAS W. CARROLL.
Assistant to the General Manager, Western Union Telegraph Company, New York.

his proficiency in this regard led to his transfer to the headquarters of the Postal Company at New York, where he was attached to the electrical engineer's office. In April, 1901, he was appointed assistant electrical engineer for the same company at Chicago, and held that position until October 1, 1906, when he was promoted to be a superintendent. On January 1, 1908, he received the appointment of division superintendent, and afterwards was elevated to the position of general superintendent to succeed Mr. W. I. Capen, who was transferred to New York.

Mr. Carroll is a gentleman of high character and is extremely well liked by all who know him, whether he be superior or subordinate.

A. C. Cronkhite, District Commercial Superintendent, Western Union Telegraph Company, Indianapolis, Ind.

Mr. Albion C. Cronkhite, whose appointment as district commercial superintendent of the Western Union Telegraph Company, at Indianapolis, Ind., was announced in a previous issue, was born in Warren County, Ind., February 7, 1878, and entered the

telegraph service at Marion, Ind., as a messenger in November, 1893. He afterwards became an operator at Marion, Ind., and later went to Kokomo, Ind., as operator and acting manager. Subsequently he became operator and clerk in the Indianapolis office of the Western Union Company and relief manager in Superintendent J. F. Wallick's district. He was manager of the Mattoon, Ill., office from June, 1901, to May, 1905, after which he spent about a year in the brokerage business. On February 14, 1910, he returned to the Western Union as clerk and inspector in Superintendent Wallick's office, and afterwards became clerk in Superintendent I. N. Miller's office, at Cincinnati. On April 1, 1910, he was appointed manager at Terre Haute, Ind., which position he held at the time of his present promotion.

Mr. William J. Smith, district commercial agent of the Western Union Telegraph Company, with headquarters at Seattle, Wash., was born at Newport, R. I., May 21, 1882. After graduating from high school in May, 1897, he started his telegraphic career as a messenger in the Providence, R. I., office and advanced through the positions of chief delivery clerk, night chief operator, operator and assistant manager, during which time he took a commercial law course at a local business college. In 1903 he accepted a position with Dr. Lee De Forest in wireless work, and a year later became associated with the Marine Transmission Company, of Providence, R. I., as superintendent and assistant manager. Later in the same year he entered the service of the New England Navigation Company to take charge of its wireless department. In 1907 he was with the Massie Wireless Telegraph Company as Pacific coast manager, and in 1909 accepted a position with the Western Union Telegraph Company at San Francisco as operator. He was afterwards made manager at Klamath Falls, Oregon, but returned to San Francisco later as district inspector, which position he held until his recent appointment as district commercial agent.

Wm. J. Dodge, District Traffic Superintendent, Western Union Telegraph Company, Pittsburg, Pa.

Mr. Wm. J. Dodge, recently appointed district traffic superintendent of the Western Union Telegraph Company with headquarters at Pittsburg, Pa., was born in Utica, N. Y., in 1869. He first entered the telegraph service in his native city in 1885 as operator and all through his telegraphic career he has been in the employ of the Western Union Company. In 1889 he was appointed night chief operator in Utica, and afterwards day chief. In 1897 he became circuit manager of the fifth district, and in 1902 was transferred to Pittsburg, Pa., as day wire chief. In July, 1905, he was appointed night chief operator at Pittsburg, and in April, 1907, was transferred to the same position, days. He occupied this latter position at the time of his present appointment on November 1.

S. B. Haig, of the Traffic Department, New York.

Mr. S. B. Haig, whose appointment to a position in the traffic department was announced in our issue of November 1, was born in New York City in 1869. He entered the telegraph service at Cobourg, Ont., in 1884. He was connected with the Postal Telegraph-Cable Company in its New York office as night city chief, day city chief, general traffic chief, and assistant manager of the branch office at 20 Broad street. He was superintendent of traffic for that company when he received the offer to enter the Western Union service.

**MR. S. B. HAIG.**

Traffic Department Western Union Telegraph Company, New York.

Mr. Haig is one of the best posted men in the service and will carry with him a ripe experience that will be valuable in his new position.

Mr. Return J. Meigs, whose appointment as district plant superintendent, with headquarters at Philadelphia, Pa., was announced in our issue of November 16, was born in Washington, D. C., January 9, 1876. He entered the telegraph service in 1894 as block operator for the Baltimore and Ohio Railroad Company, and afterwards filled various positions with the Chesapeake and Potomac Telephone and Telegraph Company, at Washington, D. C., and the American Telephone and Telegraph Company, at Washington, Baltimore and Philadelphia. He was superintendent of traffic for the latter company at the time of his present appointment to the Western Union service.

**Ralph W. Kean, District Traffic Superintendent,
Western Union Telegraph Company,
Minneapolis, Minn.**

Mr. Ralph W. Kean, district traffic superintendent of the Western Union Telegraph Company, with headquarters at Minneapolis, Minn., was born at Pella, Iowa, November 30, 1878. He entered the telegraph service at Ottumwa, Iowa, in 1894, and has held positions at various places as operator, chief operator and traveling inspector. He received his present appointment on October 15 of this year.

**H. Van Devender, District Traffic Superintendent,
Western Union Telegraph Company,
New Orleans, La.**

Mr. H. Van Devender, whose appointment as district traffic superintendent for the Western Union Telegraph Company at New Orleans, La., was noted November 16, was born at Shuqulak, Miss., January 3, 1870. He entered the telegraph service as a messenger boy in his home town, mastering telegraphy during his spare moments, and in September, 1884, accepted his first position as telegraph operator for the Mobile and Ohio Railroad at Artesia, Miss., which position he resigned the following year to go with the Western Union Telegraph Company, at Atlanta, Ga. In 1896 he was promoted to traffic chief, which position he held until 1902, when he was again promoted to the managership of the same company at Mobile, Ala. In 1906 further recognition of Mr. Van Devender's ability was shown in his promotion to the managership at Atlanta, Ga., which position he held until 1908, when he resigned to engage in mercantile pursuits. "The call of the key" however, brought Mr. Van Devender back into the service in October, 1908, as traffic chief at New Orleans, which position he held up to the time of his present promotion.

Mr. Van Devender is considered one of the best all-around traffic men in the South, and his faculty of "getting the business through" has won for him the recognition he rightly deserves.

Mr. William Walter Watt, district plant superintendent at Cleveland, Ohio, is a Pennsylvanian by birth, being born at Sonman, Pa., October 27, 1873. He entered the telegraph service of the Pennsylvania Railroad, at Altoona, Pa., in January, 1889, and held the position of operator for that company until October 18, 1898. On this latter date he was appointed wire chief for the American Telephone and Telegraph Company, and was promoted through the positions of manager and district plant chief of the same company. On November 1, 1910, he received his present appointment.

Mr. Charles William McKee, district commercial superintendent, sixth district, Eastern Division, with headquarters at St. John, N. B., whose appointment was noted in the November 16 issue, was born in that city on April 7, 1860. He entered the telegraph service at East Weymouth, Mass., in 1876, on the Old Colony Railroad, and in 1877 returned to St. John, N. B., where he was engaged as operator until 1883. He went from there to North Sydney and then to St. John and was transferred to Halifax, N. S., in 1885, as chief operator. In 1892 he was appointed manager of the Halifax office, which position he held until his present appointment.

**M. B. Wyrick, Division Plant Superintendent,
Dallas, Texas.**

Mr. M. B. Wyrick, whose appointment as Division Plant Superintendent at Dallas, Texas, was

announced in our issue of November 1, was born at Olean, Mo., October 1, 1871, and began his telegraphic career in 1891 as lineman and operator for the Missouri Pacific Railway. He filled similar positions with the Postal and Western Union companies in the West, and prior to his recent appointment, was superintendent of Construction and Equipment for the Postal Telegraph-Cable Company of Texas.

The Turner Monument Fund.

The sending of the first telegraph train order is to be fittingly commemorated by the erection of a bronze and granite monument at Turner, N. Y., from which point the order was sent by Charles Minot, general superintendent of the Erie Railroad, in the autumn of 1851. The monument will cost about \$3,000 and to defray the expenses subscriptions are invited from all railroad, telegraph men and others who believe it proper and advisable to commemorate important events in such a manner that future generations may be reminded of what has been accomplished for them by pioneers. The telegraph and the railroad are two of the greatest civilizing agencies of the age and all connected in any way with these important interests should possess enough pride in their calling to aid in the realization of this worthy movement. The Association of Railway Telegraph Superintendents and the Old Time Telegraphers' and Historical Association have given the proposition their official endorsement and are heartily co-operating in the work of raising the necessary funds. Mr. Thomas A. Edison was one of the first to express endorsement of the movement and contributed \$50.00; Mr. F. D. Underwood, president of the Erie Railroad, leads the railroad subscriptions with a contribution of \$25.00; Mr. T. M. Emerson, president of the Atlantic Coast Line, at Wilmington, N. C., has subscribed \$15.00, and Mr. George T. Williams, of Cleveland, Ohio, formerly superintendent of telegraph for the Nickel Plate Railroad has subscribed \$25.00. These generous subscriptions, however, should not influence the man who would like to contribute, but who can afford only a small amount. No limit is placed upon contributions; the committee is glad to receive any amount, however small. The acknowledgments of subscriptions so far published in *Telegraph and Telephone Age* show amounts ranging from 25 cents to \$50, therefore there should be no hesitancy on the part of those who can afford but little.

All railroad, railroad telegraph men and others interested are urged to subscribe toward the fund, whatever they can afford, for the object is a worthy one and should receive universal support.

All contributions are acknowledged in the columns of *Telegraph and Telephone Age*.

The following named gentlemen constitute

the committee in charge of the Monument Fund: E. P. Griffith, superintendent telegraph Erie Railroad, Jersey City, N. J., chairman; Charles Selden, superintendent telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, *Telegraph and Telephone Age*, New York; E. A. Chenery, superintendent telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railway, Montreal, Canada; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, *Telegraph and Telephone Age*, 253 Broadway, New York, who has been elected treasurer of the fund.

According to the plan of the monument now before the committee for its consideration, the memorial will be 11 feet 2 inches in height.

The contributions received up to date are as follows: Previously acknowledged, \$457.50.

F. E. Bentley, St. Louis, Mo., and twelve telegraph operators, St. Louis, Mo., \$1.50; P. H. Leonard, Chicago, Ill., \$2.00; L. S. Wells, New York, \$5.00; D. L. Gray, New York, \$5.00; J. C. Stuart, New York, \$10.00; E. J. Pearson, Seattle, Wash., \$1.00; R. M. Calkins, Seattle, Wash., \$1.00; R. F. Weitbric, Denver, Col., \$5.00; Geo. T. Williams, Cleveland, Ohio, \$25.00; P. J. Flynn, New York, \$5.00; A. C. Elston, Buffalo, N. Y., \$5.00; E. W. Day, Baltimore, Md., \$2.50; F. J. Washburn, Malden, Wash., \$1.00; D. W. Cooke, New York, \$5.00; E. J. Nally, New York, \$5.00; G. W. Brownell, New York, \$10.00; J. W. Quackenbush, Waldwick, N. J., \$1.00; E. E. Dildine, St. Paul, Minn., \$1.00; W. H. Porter, Washington, D. C., \$2.50; B. H. Fox, Murphysboro, Ill., \$1.00; J. B. Murphy, Jackson, Tenn., \$2.00; G. Swope, New York, \$25.00; G. R. Hill, Jersey City, N. J., \$2.00; F. A. Mombert, Paterson, N. J., \$2.00; W. W. Ashald, Montreal, Can., \$1.00; E. A. Wescott, Meadville, Pa., \$1.00; Wm. H. Baker, New York, \$5.00; H. L. Lewis, Hohokus, N. J., \$1.00; C. A. Tinker, Brooklyn, N. Y., \$5.00; Chas. L. Seeley, Jersey City, N. J., \$1.00; W. H. Willis, Nutley, N. J., \$5.00; Theo. Mackrell, Salamanca, N. Y., \$5.00; W. J. Southworth, Washington, D. C., \$1.00; J. W. Fry, Seattle, Wash., \$0.50; Total \$609.50.

The Cable.

Mr. E. Heurtley, who was in the service of the Eastern Extension Companies for many years, has invented a device to be used in connection with the syphon recorder at cable terminal stations. It is designed to overcome the effects of retardation and get a clearer record of incoming signals. The instrument is being tested on the British Pacific Cables at Bamfield, British Columbia.

A telegraph pole on Banks street, New London, Conn., besides supporting the wires supports several growths of fungus, and is an interesting sight to passers by.

The Brown Magnetic Bridge.

BY DONALD MURRAY.

I was specially interested in the description by Mr. William Finn of the Western Union Telegraph Company's improved quadruplex published in your issue of November 1, because one of the essential features of the new arrangement is the Brown magnetic bridge. It is described in Mr. Finn's article as the impedance coil 5U. No mention being made of Mr. S. G. Brown's name in the article, I take it for granted that Mr. Finn did not know that it was Mr. Brown's invention.

The Brown magnetic bridge has been in use on long ocean cables all over the world, by the Eastern and most of the other great cable companies, for about ten years, the reason for its adoption being that it materially increases the speed of operating ocean cables. It may be mentioned incidentally that Mr. Brown's patents on the magnetic bridge were taken out only in connection with his other cable inventions, so that its use is free on land lines. The same arrangement is used in telephone work; but as far as I am aware, the improved

FIG. 1.—DIAGRAM OF BROWN MAGNETIC BRIDGE.

Western Union quadruplex is the first instance of its application to aerial line telegraphy, though the British and German Telegraph Administrations have been trying it for underground cables.

Like all inventions which prove of great financial value, the Brown bridge and cable-relay patents were the subject of a lawsuit in London a year or two ago, Dr. Muirhead challenging the validity of the patents. The judges, however, both in the court of first instance and in the court of appeal, upheld the patents, and Mr. Brown and his partners won their case.

For ocean cable work the Brown bridge is a very large instrument weighing about three hundred pounds and is built up like a transformer with sheets of transformer iron. The inductance in each arm of the bridge is also adjustable to a fine degree so that a very close magnetic balance can be obtained. One of the most valuable features of the bridge is the very low resistance combined with the relatively large inductance.

In Fig. 1, let us assume that there is an outgoing signal shown by the arrow *A*. The bridge being exactly balanced, there will be no inductive reactance to the outgoing current in the arms of the bridge. It will split and behave exactly as in the two windings of a differential relay. There will be a resistance of about 15 ohms. Compare this with

the old form of bridge with a resistance in each arm of 1,000 to 3,000 ohms or even more. Compare it also with a differential relay where the lowest resistance is not less than 100 ohms, and bear in mind the fact that any resistance at all at the entrance to the line is an impediment to speed and clearness of signaling. The sooner the current can pass into the line the sooner and more sharply does it reach the other end. The only limit to the speed of charging the line is the necessity for inserting sufficient resistance to safeguard the sending contacts from destructive sparking, especially on underground cables. The foregoing explanation gives a brief idea of the advantage of the Brown bridge for outgoing signals.

Now let us take an incoming signal *B*. The first part of this signal cannot pass the inductance of fifteen henrys in the upper arm of the bridge, because the inductance is like a flywheel. It has inertia and is slow to start and slow to stop. It takes time to create the inductance. The first part of the signal is therefore diverted and flows along *C* through the receiving relay. It is the first part of a signal that has most work to do in a relay, and it should therefore be the stronger part. As the signal continues the inductance gradually builds up and the signal current begins to flow through the upper arm of the bridge to earth. This prevents the receiving relay from being choked and clogged by more current than is necessary to operate the relay tongue. The signals that reach the relay may be described best as "tadpole" signals. They have a big head and a small body. The effect is almost like working through a condenser, with the advantage, however, that the magnetic bridge is an ideal duplex, while duplex working through a condenser is troublesome. The inductance flywheel has now started moving, and, as it does not stop readily, it not only short-circuits the receiving relay but also powerfully sucks out the remainder of the signal from the main line and leaves the wire more or less clear for the next signal. The Brown magnetic bridge in short has the same effect on the receiving relay as the old device of the shunted condenser (shown at *D*, Fig. 1) without any of the disadvantages of the shunted condenser for duplex working. The shunted condenser has a truly remarkable sharpening and strengthening effect on the received signals when working fast simplex, but it is more or less of a nuisance in duplex working.

The Brown magnetic bridge was unquestionably originated by Mr. Brown, a fact proved at great expense in the law courts; but the Brown inductive shunt is simply the old Edison idea in a new dress. Instead of a comparatively small coil of iron, the Brown shunt for ocean cables weighs from two to three hundredweight, and like the Brown bridge, is made up on the same lines as a transformer with sheets of transformer iron, and with a low resistance and high inductance. The inductance may rise to many henrys, and the resistance drop to a few ohms. It may be placed as a shunt round the

receiving instrument as at *E*, or it may be employed as a leak from the line to the earth as at *F*, Fig. 1. In each case it acts in the same way as the magnetic bridge. The inductance or magnetic inertia of the shunt deflects the first part of the signal through the receiving instrument, and then when the inertia is overcome it draws off the rest of the signal through what is practically a short-circuit of a few ohms to earth. The idea of connecting a telegraph wire direct to earth through a leak of only 15 ohms does not seem to be a very practical way of working a telegraph line, but the inductance makes all the difference and the scheme is all right.

The current curves shown in Figs. 2, 3 and 4 show clearly the actions of the bridge, shunt and shunted condenser. These curves are the result of observations with an oscillograph, and they are substantially accurate.

Why the Brown magnetic bridge has not been used before on land lines I do not know. It is simple and effective and there are no royalties to pay for its use on such lines. Just one word of caution to intending users, however. The mag-

FIGS. 2, 3 AND 4.—CURRENT CURVES UNDER DIFFERENT CONDITIONS.

netic bridge must be employed at both ends of the line or not at all. It may also be mentioned that in order to secure the best results it is necessary to adjust the resistance and inductance to suit the particular line to which the bridge is applied.

The curve in Fig. 2 shows an ordinary Morse dash after being received in a relay over a comparatively short line. In Fig. 3 the curve *ABC* shows the same Morse signal passing through a condenser. It is cut down to a short dot. The high-resistance shunt round the condenser *D* in Fig. 1 allows a little current to leak past the condenser, and we get the curve *ABE*. The peak *ABC* throws over the relay tongue and *E* holds it over. This is an ideal signal for working a relay, provided there is sufficient current at *E* to neutralize inductive interference from other lines.

The curve in Fig. 4 shows the shape of the original Morse dash after it has passed through the shunted condenser and the receiving relay. The inductance of the relay rounds the sharp condenser peak of Fig. 3. With the magnetic bridge and shunt the signal in the line more or less remains like Fig. 2, and it is through the relay only that the signal takes the form of Fig. 4. Inductive interference from other lines is therefore less important, with the bridge and magnetic shunt, than with the shunted condenser. The effect of the magnetic bridge and also the magnetic shunt is to send exactly the same kind of signal shown in Fig. 4 through the receiving relay. That is to say, the first part of the original Morse dash signal goes through the relay in full strength, and most of the rest is drained away through the bridge. The action of the relay is therefore not clogged by more current than is necessary to work it properly. The first part of the signal must be the strongest because it has most of the work to do. It has to throw over the tongue of the relay. The rest of the current has merely to hold over the tongue, and therefore does not need to be so strong.

Poles and Pole Lines.

BY C. T. DAY.

Assistant Superintendent of Telegraph, Ferrocarril Sud-Pacífico de Mexico, Ferrocarril de Sonora, Empalme, Sonora, Mexico.

I read with much interest the article by Mr. F. L. Rhoades in your issue of November 16, regarding pole lines, but wish to call your attention to the paragraph in which he says: "It is also a fact that creosoted wood poles are practically free from attack by woodpeckers."

In our section of the country on the Sonora Railway, between Magdalena and Torres, a distance of 236 kilometers, or nearly 147 miles, we have since last March put in 250 new burnetized poles with creosoted butts to replace other poles removed on account of the attacks of woodpeckers. The poles taken out are a variety of redwood and cedar, and creosoted pine. A section of one the latter poles now in my office, shows a hole four inches long by two and one-half inches wide outside measurement, and eighteen inches deep and five inches in diameter inside. The piece shows that the pole was well saturated with creosote and the pole had been in the ground only two years. We are spraying other poles with a solution of carbolic acid, but the birds are beginning to attack these. There are still about 100 more poles to be taken out on account of the damage done by these birds. The new poles have not as yet shown any evidence of attack. On the south end of our line the birds have started to pecking the poles, and they seem to grow fat on the creosoted ones.

If any of your readers can give us a solution of the problem outside of a shot gun it would be most gratefully received.

Telegraph and Telephone Age

Entered as second-class matter, December 27, 1909, at the Post-Office at New York, N. Y., under the act of March 3, 1879.

Published on the 1st and 16th of every month.

ADDRESS ALL COMMUNICATIONS TO

J. B. TALTAVALI, - Editor and Publisher,
253 BROADWAY, NEW YORK.
T. R. TALTAVALI, Associate Editor.

CABLE ADDRESS: "Teleage," New York.

Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

December 16, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Christmas Greetings.

Once more it gives us pleasure to extend Christmas greetings to our many readers and friends. In some parts of this great country we will have a white Christmas and in others a green Christmas, but in whatever clime, the Christmas spirit will prevail and joy and happiness will be the uppermost thoughts in men's minds.

As we approach a new year it is natural to look back over the old and note wherein we have been deficient, with a view to doing better during the coming year. This is true of a business enterprise as well as of an individual.

This journal has during the past year, more than ever before, applied itself diligently to the betterment of the class of readers which it especially represents. Its chief aim has been to be accurate in all its statements, for upon its accuracy depends its character and support. Accuracy, therefore, may be said to be the corner stone of the structure.

We have every reason to believe that our efforts to make Telegraph and Telephone Age a reliable mouthpiece of telegraph and telephone happenings is appreciated, and it is our purpose to make the paper of greater and increasing value to the subscribers and readers, for a paper of this character depends upon these for its material support. The advertising patronage of a journal of this class is necessarily limited because the telegraph and telephone fields are, in a sense, limited as to the amount of advertising obtainable therein. It is necessary therefore, to secure and hold the good will of every individual connected with these interests, so that they will feel that the paper is really theirs and will take personal interest in its affairs.

In the matter of advertising we have decided to confine our work henceforth strictly to telegraph, telephone and kindred interests and omit all advertisements of the popular magazine character. The paper, after January 1, will therefore reflect electrical interests alone in its advertising as well as in its editorial pages, eliminating everything of an irrelevant nature.

Altogether a higher standard has been set for the paper and we feel confident that all our readers and others interested will exert their influence to widen the circulation and usefulness of this journal in addition to giving it their individual support. In renewing our greetings we wish to express our thanks to all of our friends who have loyally stood by this paper during the past twenty-seven years and we assure them that during the coming year our constant aim will be to make the journal more serviceable and valuable to them.

As to Qualifying for Promotion.

During the past two months about forty of our active agents throughout the country have received recognition of their worth and been promoted to positions of responsibility by the Western Union Telegraph Company and the Postal Telegraph-Cable Company, many of them becoming superintendents and some of them attaining even higher positions. We do not claim that their advancement was due to the fact that they were our agents, but we do assert that it was largely due to broad knowledge of things telegraphic that they obtained through their studious reading of the columns of this journal.

Many of those who have received preferment have candidly stated that the information and encouragement received through our columns have been largely instrumental in fitting them for the higher positions. This is a compliment that is highly appreciated and these acknowledgments simply show what can be done by close study of the educational articles printed in the columns of this paper. The study of the articles does not in itself bring promotion, but it does fit the diligent student to fill higher positions when vacancies occur and, as a rule, the man best qualified receives the appointment.

The Davenport Memorial Tablet.

Considerable interest to telegraph people attaches to the recent dedication in Forestdale, Vt., of a memorial tablet commemorative of the invention of the electric motor by Thomas Davenport. The telegraph has been greatly benefited by this historical invention, which was the progenitor of the electric motor of to-day, and of its near relative, the motor-generator. Motors and motor-generators are now in use in all telegraph offices of importance.

Like many other inventors, Mr. Davenport died in comparative poverty, his invention having not been appreciated in his day. It is stated that Davenport gave some attention to the improvement of the telegraph, which was then being developed by Morse, and that Joseph Henry, the famous scientist, advised him to "go slow," when he proposed to build motors up to one horse-power.

Mr. Thomas Commerford Martin delivered the dedicatory address and paid a high tribute to Davenport and his work, touching at the same time upon the work of Franklin, Morse, the two Fields, Alexander Graham Bell and Thomas A. Edison. He also referred to the fact that Col. A. B. Chandler, chairman of the Board of Directors of the Postal Telegraph-Cable Company, New York, and Mr. C. A. Tinker, formerly general superintendent of the Western Union Telegraph Company, New York, were natives of Vermont, many of whose sons had brought distinction to American invention.

The monument was unveiled and dedicated September 28, the ceremonies being attended by a large gathering of electrical people.

It is worthy of note in this connection that Davenport was the editor and publisher of the first electrical journal in the world. In January, 1840, he established in New York a paper called "The Electro-Magnet and Mechanical Intelligencer," which was printed by electric power.

Military Telegraphers' Appeal to Congress.

Col. W. B. Wilson, of Holmesburg, Pa., president of the Society of the United States Military Telegraph Corps, is sending to the members of that Society a copy of an appeal to Congress to "grant a military status to the men who were enrolled in the United States Military Telegraph Corps." In a communication accompanying the appeal Mr. D. H. Bates, New York, secretary of the Society, requests each member to send a copy to his Congressman and both his Senators, with a brief but urgent request for effective support. It is thought that concerted action on the part of the members of the society will result in favorable legislation by Congress. The request of the Military Telegraphers is a just one, and Congressional action in granting the members of the Society a military status has been long deferred; but there is every reason to believe that success will be ultimately achieved. All the members and others feeling so disposed should act at once and impress their Senators and Congressmen with the justice of the appeal for a military standing for the war telegraphers.

A Plea for the Repeater Chief.

A repeater chief in one of the western offices writes to us complaining that a good repeater chief is never selected for promotion as are other members of the staffs in the various offices. The repeater chiefs are a class of employes, he states, of whom the general telegraphing public hears but little and thinks of but seldom. Our correspondent continues:

"Calling on an old friend in the middle west I learned that as an evidence of appreciation of his some years of close application in the study of general practical electrical matters, after a graduating course in electrical engineering, he had been promoted (?) from the operating table to the position of 'repeater chief,' and was in charge of one section of 'overland circuits.' Perhaps on the day I called on him it may have been an unusual day, with rain in one section and fog in another; certainly his lot was not a happy one. In spite of his fairly successful efforts to duplex and at times to quad, himself, orders, like those in the Exchange on a 'bull market,' accumulated in his hands rapidly. 'Come to third Pacific, quick.' 'Which way is Portland failing?' 'Second Seattle won't double, come to it quick.' 'S. F. local failed, which way.' All these were in his hands at one time I noted. The thought came to me then, and I have dwelt upon it since, of what his intelligent services meant in detail; of the many thousands of miles of wire in circuit; either idle or earning revenue for his company; of from four to a dozen first class operators, each one receiving greater remuneration for his services than this one man, either moving business to the full capacity of men and circuits, or sitting idle with business accumulating and delayed, and their full salaries credited to them; of the scant thanks, lack of appreciation for his successful work, criticism for the contrary, without full consideration of adverse conditions and circumstances.

"Somewhere in tale or story, I've read of a sarcastic query made by some jealous 'foot soldier' reading something like this: 'Who ever heard of a dead cavalryman?' I might say, 'Who ever heard of a repeater chief promoted to a higher, a more remunerative position?' Traffic chiefs, chief operators, even managers of small way offices, yes! But the repeater chief is lost to view.

"To my personal knowledge, there are in the employ of both companies a large number of men who are electrical and mechanical experts; who now see but little before them but a day's work for a day's wage; who are, as I have stated, receiving a less remuneration for their work than are the operators working at either terminal of the wires over which they have charge. It is to be hoped that the officials of the companies will make the lot of the repeater chiefs as comfortable as possible from the financial standpoint as well as in other respects."

Mr. L. Derrick of Philadelphia, in renewing his subscription for *Telegraph and Telephone Age*, writes: "I would just as lief do without my Christmas turkey as to do without the *Age*."

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Mavor and Davis' "Quadruplex" and other standard works on telegraphy and treat them in the same manner.]

CHAPTER XXVI.

Why has it not been possible to utilize polar relays on single line circuits at way stations?

What advantage would be derived by such use of a polar relay?

Describe the operation of an instrument devised to meet this requirement.

CHAPTER XXVII.

In selecting a dynamo for the operation of a definite number of circuits how is its capacity calculated?

Why does wet weather along the line call for a greater output of current from the dynamo?

In what respect does a dynamo constructed to give a large volume of current differ from one constructed to give a small volume?

Why cannot a dynamo of the latter class be used to generate a heavy current?

What is the general rule for determining the size of wire to use for the delivery of electric current?

If wires are too small for the current they should carry what is the effect upon the operation of the instruments?

What is the material used for office conductors?

In distributing current what is the primary object to be attained?

Will the same system arranged for a supply of dynamo current answer as well for a supply from a storage battery?

Give the reasons why.

Could such a wiring system be operated advantageously by current from a primary battery?

If not, why?

Describe the method of obtaining dynamo current of different voltages?

Describe the method of arranging the dynamos with reference to one another to give the different voltages.

In multiplex work why is it necessary to have duplicate "gangs" of dynamos in operation?

What is the name given to taps from the dynamo?

How should taps be formed and carried to the operating room?

What is the method of connecting taps with the dynamo brushes?

How are the battery disks arranged on the switchboard?

Why is it necessary to provide separate taps from the main battery leads to each individual circuit?

What is the purpose of inserting lamp resistance between the dynamos and the wires?

Can any other resisting material be employed besides the lamp filament?

What is the advantage of using lamps for resistance?

When a circuit becomes overloaded how is the fact indicated on the lamps used as resistance?

Give the rule governing lamp resistance.

CHAPTER XXVIII.

What is the method of choosing dynamos for the operation of local circuits?

Why is it desirable to use a separate set of dynamos to supply current for loop and local circuits?

What is the approved method of arranging dynamo local circuits in an office?

Why is it more economical to connect the sounders in parallel?

How is the proper electromotive force of the dynamo determined for local circuits?

Express the rule by formulas. What is the object of inserting non-inductive resistance in local circuits?

New Book.

Standard Hand Book for Electrical Engineers, New York: McGraw-Hill Book Company, Third Edition, 1500 pp. When this work was first brought out three years ago it met with an immediate popularity. A second edition was soon made necessary to meet the demand, and the third edition has been thoroughly revised and brought up to date. The book is divided in twenty sections, covering every branch of electrical application and miscellaneous matters, such as standardization rules, tables, statistics, etc. Each section was prepared by a specialist of broad experience. The sections on telephony and telegraphy are very complete, that on telegraphy having been revised and made to cover a greater scope than in the earlier editions.

This handbook will be found valuable to all electrical, telegraph and telephone engineers. It is a book of basic electrical facts, many of which every electrical engineer is constantly looking up, and as a work of reference it is in a class by itself.

Those of our readers who are studying electrical engineering will find this book of great service. It gives tables and formulas which are being constantly referred to, and the descriptions of electrical apparatus of all kinds are concise and complete.

This book is of pocket size and is strongly bound in flexible leather. The price is \$4.00, and copies are for sale by Telegraph and Telephone Age, 253 Broadway, New York.

Any book on the telegraph, telephone or any other electrical subject can be obtained at the office of Telegraph and Telephone Age, 253 Broadway, New York. Send for book catalogue.

Some Tests on Splices on Galvanized Iron Wire.*

BY C. T. RASHMAN.

Galvanized iron wire is used for guying and in some localities for telegraph and telephone circuits. The joints or splices between adjacent ends are usually made by twisting the ends one upon the other and are not ordinarily soldered. Several types of splices are in use, and to ascertain which is best a series of tensile tests was made on all of the commonly used types under the writer's directions. The desideratum was to find out which type of splice behaved best when subjected to tension, and if possible to determine a style of splice that would develop a tensile strength equal to that of the wire of which it is made.

Commercial wire cut from coils in the stockroom of a telephone company was used. It was probably of the grade known as "best best," or BB, although it was not possible to ascertain accurately what the grade was. The samples were tested in an Olsen testing machine.

First, a length of No. 12 (B. W. G.) wire was stressed to failure and was found to break at 475 lbs. This value is the average of several. Then splices of the typical forms of Figs. 1, 2 and 4 were made of No. 12 wire, and tested to destruction. None of the three was found to be as strong as the wire of which it was made. Finally, after some trials, splices like that shown in Fig. 5 were formed, and it was found that the wire would break before a splice of this type failed.

Splices like that shown in Fig. 1 are made by clamping the two wire ends to be joined in a pair of connectors—the tool used by linemen for holding wires in correct relation while they are being spliced—and, with a pair of pliers, forming the wire into close end-turns around the wire bodies. What is meant by "end-turns" can best be explained by the illustration, Fig. 2, whereon the end-turns of a certain splice are indicated. The neck—the portion of the splice between the end-turns in the type of splice shown in Fig. 1—is not twisted. This type of splice was largely used at one time, but does not appear to be used now. When a splice like that in Fig. 1 is subjected to tension the end-turns first pull together along the main wires and finally assume the position indicated in Fig. 3. Then, as the stress is continued, the end-turns gradually unwrap and the two spliced wires usually pull entirely apart. In some cases one of the wires will break before the end-turns entirely untwist. The break often occurs at a point where the wire is nicked in making the splice. Increasing the number of end-turns increases the load at which the joint will start to yield, but in no case could a joint having a reasonable number of end-turns of this type be made to develop the full strength of the wire of which it was made without yielding excessively.

In Fig. 4 a splice is shown which is frequently called in books the American Telephone joint. It has a short neck containing one turn and a num-

ber of end-turns varying with the maker of the splice. The idea appears to be prevalent among linemen that the strength of a splice is dependent almost wholly on the number of end-turns it has, and that the number of turns in the neck is of little consequence. It was shown by tests that this idea is erroneous. As tension is applied to a joint like that of Fig. 4 it will untwist entirely, or often, partially untwisting one of the wires, will break at a load considerably less than one equivalent to the full strength of the wire.

It having been shown definitely that increasing the number of end-turns of a splice does not increase its yielding point to any great extent, tests were made to ascertain the effect of increasing the number of turns in the neck. Several sample splices were made, each having but two end-turns, but the

FIGS. 1, 2, 3, 4 AND 5.—TYPICAL FORMS OF WIRE SPLICES TESTED.

number of turns in the neck was made different in each case. Each of these splices were tested to failure. The results of the test were as follows:

Turns in Neck	Failure: Tension, Lbs.	Cause of Failure
3	230	Splice slipped.
4	230	" "
5	475	Wire broke outside of splice.
6	475	" " " " " "

It is apparent from the above observations that if a joint has five turns in the neck the full strength of the wire composing it will be developed. The joints for the above-recorded tests were all made from No. 12 wire having a breaking strength of 475 lbs. The results in the table are averages of several.

Fig. 5 shows a joint having five turns in the neck, that is as strong as the wire of which it is made. When subjected to tension such a joint will at first yield slightly until it is "set," but as the load on it increases there is little yielding and finally one of the wires will break outside of the joint at about its normal breaking point. The length of neck of such a joint is determined by the size of the wire composing it. In each case the neck length should be such that it will just

*Electrical World.

safely contain five turns. If the turns be made too short the wires will be "burned" in twisting the splice and if the turns be made too long their power of resistance will not be a maximum. It was found that proper neck lengths to contain five turns safely for different gauges of wire are about as follows: No. 14 wire, $3\frac{1}{2}$ in.; No. 12 wire, $3\frac{3}{4}$ in.; No. 10 wire, 4 in.; No. 8 wire, 6 in., and No. 6 wire, 7 in. After the tests were completed on splices made from No. 12 wire, more were made on the other sizes just named and it was found that for each size the number of turns in the neck of a safe joint should be five. Although five end-turns are shown in the illustration of the typical safe joint, Fig. 5, the tests indicated that two are ample. A joint having five end-turns has a better appearance than one having two, hence five is suggested as a standard number.

A few soldered joints were tested and it was found that, at least for the wire sizes used, almost any joint if soldered would develop a strength greater than that of the wires composing it. Joints of No. 12 and No. 14 wire made with one twist in the neck and one end-turn at each end would, when subjected to tension, remain intact, while the wire from which the joints were formed would break outside of the joint.

Summarizing, the results of the tests may be stated as follows: (1) End-turns do not have much holding power. (2) Most of the holding power of a joint is due to the turns in the neck. (3) A joint having five properly made turns in its neck will be as strong as the wire from which it is made and will yield but little when stressed.

Impregnation of Standing Poles.

The preservation of telegraph and telephone poles is a problem that is receiving wide-spread attention, and, since the supply of poles is rapidly diminishing, the difficulties of the situation are becoming more pronounced. The impregnation of poles with creosote and other preservatives is usually effected before the poles are placed in position. This treatment lengthens the life of poles, as has been abundantly proven. Attention is now being directed toward prolonging the life of poles now standing, and a process invented by Mr. John C. Morin, of Brookville, Ind., is described by Mr. H. H. Bement in the November number of the *Telephone Engineer*.

Mr. Morin employs creosote as a preservative, just as nearly all the more successful systems have done, but the method of injecting it into the wood is quite novel. It reverses the old process of tree-tapping, pouring sap in instead of drawing it off. The instrument by means of which the creosote is injected is very simple, consisting merely of an iron reservoir in the shape of a good-sized pipe about two feet long. A three-quarter inch hole is bored well into the center of the pole, about a foot above the ground, and the reservoir is there attached. About a gallon of creosote oil is poured into the reservoir and left to stand. No further labor is necessary, as

capillary attraction does the rest. Diffusion of the oil gradually takes place until the pole is thoroughly saturated below the level where the reservoir is attached. When the pole is thus suitably saturated, the reservoir may be removed and used in the treatment of another pole. Or, in the case of large and valuable poles, the reservoir may be left permanently attached, so that treatment can be given annually or semi-annually. The process of diffusion works to some extent above the reservoir as well as down, so that if sufficient creosote were administered, the entire pole might in time become impregnated.

The advantage of this process lies in the fact that the pole becomes saturated from the core out. A recent United States Forest Service report states that the value of the preservative treatment is directly proportional to the depth of penetration.

Minor advantages claimed for the system are as follows: The poles may be treated at any time without removing them from the ground, or interfering with the service; the pole can be treated at the ground line where decay first takes place, without the expense of treating any other part of the pole; the treatment, being accomplished by absorption, or diffusion, does not weaken the fibrous strength of the wood. As to the cost of applying the treatment, it is claimed to be cheaper than the boiling method. According to government experiments, the protection afforded by the boiling method is sufficient to prolong the life of the pole for twelve years. We may surmise then that complete saturation would prove at least equally beneficial.

There is undoubtedly a large demand for a satisfactory pole-preserving process. The average cost of a pole set in line is \$7, and it lasts thirteen years. The annual charge, then, compounding interest at six per cent., is seventy-eight cents per pole. The same pole treated costs \$8.50, assuming that the average treatment costs \$1.50; but now the pole has a life of twenty-three years, and the annual charge is reduced to sixty cents. A preservative treatment, then, reduces the annual charge per pole by eighteen cents. As there are about 50,000,000 poles now in use in the United States, an annual saving of about \$5,000,000 would ensue from proper treatment of them all. These figures are based on the twelve-year prolongation of the life of the pole, due to three-fourth inch penetration. If complete penetration should prove to extend this period, the annual charge per pole would be further reduced, and a corresponding greater saving would result.

Another economy accruing from preservative treatment lies in the fact that the basal circumference of poles can be reduced. The government experts compute that the basal circumference of thirty-six inches considered necessary for thirty-foot poles, could be safely reduced to twenty-eight inches, and the extra eight inches now allowed for decay would be saved.

Balancing Quadruplexes and Duplexes.

BY EDGAR C. DODGE, CHICAGO.

I have read with great interest the article in the December 1 issue of *Telegraph and Telephone Age* by a correspondent in a western city, and the statement of Mr. Minor M. Davis, electrical engineer of the Postal Telegraph-Cable Company, New York. Notwithstanding the assertions of the writer, I maintain that if I cannot get as perfect an ohmic and static balance on quadruplexes and duplexes without a ground as they can with the ground, I shall be pleased to recede from the position and retract the statement which I have often made that incompetent quadruplex chiefs who stick to the old method of balancing quadruplexes and duplexes were costing the telegraph companies thousands of dollars every year by unnecessary delay in getting wires lined up that were out of balance.

The writer of the article misquotes me. He says that I make the statement that magnetic balances are never maintained for more than a few minutes at a time, and that an operator will throw out his magnetic balance if it will improve the working of the circuit. Further on, he speaks of biasing the relay. I made no reference to what an operator would do, or to biasing a relay. I was speaking of quadruplex chiefs and repeat that after you have your wire in balance and start up, if it is a little too light or too heavy, change your magnetic balance to bring it to the proper position. If you are in balance and the signals come "light," that has nothing to do with your ohmic balance. They will be light to your open pole or your closed pole, and the proper thing to do is to adjust your relay the same as you would an ordinary relay, until the signals come clear and distinct. Biasing a relay to compensate for an uneven balance beyond the repeaters is bad practice.

Now, let us consider this matter from an unprejudiced standpoint. Balancing a circuit means just one thing, and that is giving an ohmic resistance to the artificial line which shall equal the ohmic resistance of the main line and thereby neutralize the effect of the home battery on the differential relays. Of course we must consider the static balance, but this may be obtained perfectly in the same manner as I have described in taking the ohmic balance. Once you have obtained these balances the magnetic balance is simply a matter of adjustment, and if the man at the repeater point comes in later and balances beyond the repeaters and passes it to you you will not be called back to rearrange your balance, providing you have not tried to do his work for him by biasing your relay.

Let me again state that I claim nothing new. I simply took my cue three years ago by seeing Mr. B. M. Gosselin balance a duplex, and I have never asked for a ground since. The approximate balancing and refining method referred to is where all the time is wasted, and is what we want to get away from. Take half a minute to properly balance a wire in the first place and then get away from the circuit.

No doubt your correspondent is familiar with all the principles and electrical phenomena of quadruplexes and duplexes, and could intelligently explain the windings, whys and wherefores of the polar relay, neutral relay, proportion box, etc., but the fact remains that nine-tenths of the so-called quadruplex men cannot give a correct diagram of the local connections between the loop board and the operator's table, or a double loop repeater. I claim that a competent quadruplex man should know these things and be able to explain all the functions of the different instruments. Then, and not until then, will he be able to locate and remedy trouble with any degree of promptness.

A person of ordinary intelligence should be able to master the subjects satisfactorily in one year, if he will give them careful and conscientious thought and study, but the majority who take up the work acquire a knowledge of how to balance a quadruplex to a ground and let it go at that. They know the way they were taught is the right way, because that is what their instructor told them, and besides, "Didn't the book say so?" The great majority take it for granted that it must be right because it has been done that way for forty years.

In conclusion, permit me to make it clear, if possible, what prompted me to bring up this question. I had noticed that nearly all the wire messages received from the numerous repeating points between Chicago and distant cities were requests to come to this or that wire, and in the majority of cases I would find the circuit stopped and four operators waiting, simply for me to give the repeating station man a ground. If the weather conditions are bad and balances constantly changing, this means an enormous waste of time, from the fact that a normal force of quadruplex men cannot respond promptly to all the demands. It is, therefore, obvious that if men at repeating points would discontinue the use of the ground for balancing and master the simple method of balancing to the distant battery, it would mean the elimination of at least fifty per cent. of delays caused by waiting for the quadruplex man at the other end to get to you.

Keep your pole changers clean and properly adjusted, also your transmitters and neutral relays; keep your end in balance and let the other fellow do the same. This will not only save you a lot of time and make your work easier, but will double your efficiency, avoid a lot of unnecessary wire messages and keep the business moving with greater promptness.

Mr. S. E. Barton, of Boston, Mass., an old-time and military telegrapher, but now engaged in other business at that point, writes: "Although it is thirty-five years since I left the business, I can safely say that there is no publication out of the many which I subscribe for and read that I enjoy more or read more completely than I do *Telegraph and Telephone Age*, and I should not want to be without it."

The Field Quadruplex.

On November 15 Mr. Stephen D. Field, of Stockbridge, Mass., was granted a patent for a quadruplex.

The objects of the invention are to obviate the necessity for the use of an artificial resistance in the transmitter branch; to provide for informing the transmitting operator of the character of the transmitted signals at a point in the circuit between the transmitter and the main line; to provide for bridging the interval of no current incident to a reversal of the battery and apparent in the neutral relay; to provide for locating the transmitter which varies the strength of current in both the main and artificial lines at a point between the connection with the transmitter branch and the receiving relays; and to provide means whereby the transmitter operating magnets operate on both the up and the down stroke with equal force, so that the movements of the lever to make the space between the elemental parts of a letter or character is produced by the same force which produces the dot or dash; this obviates the use of a spring retractor. To attain these objects a lamp of high resistance is placed in each of the leads from the dynamo to the transmitter, and these lamps are normally cut out of circuit by a fusible section of conductor of low current carrying capacity or any other known automatic circuit interrupting device of negligible resistance may be used. There is a Hughes magnet in a branch circuit, in series with a condenser, connected to the transmitter branch at or about its junction with the main and artificial lines; this branch is grounded. The receiving relays are preferably differentially wound, and the neutral relay is provided with a supplemental holding coil connected in series with a condenser in a branch circuit, the opposite terminals of which are connected to the main and artificial lines at a point between the transmitter and the neutral relay. The receiving relays are arranged to receive one set of signals due to current reversals, and one set of signals due to variations in current strength. The transmitters are the ordinary pole changing transmitters and the "shunt and leak transmitter" characteristic of what is well known in the art as "the Field key system." In this improved arrangement this shunt and leak transmitter is duplicated at each station, or it may be said to be in two identical sections, one complete section being in the main line, the other complete section in the artificial line, both at corresponding points in the main and artificial lines, between the point of connection of the transmitter branch and the receiving instruments; this places the artificial resistances forming part of the key system in the main and artificial lines, and the static discharge resulting from a current impulse of charge flows back and is thus made effective in the branch circuit containing the extra coil on the neutral relay.

A special device is provided whereby the contact points of the two sections of the current varying transmitter are caused to engage at exactly the same time. This consists of a special pivoted lever re-

tained in set position by friction at the pivotal point of support; at opposite ends of this pivoted lever is fixed one contact of each transmitter section; the complementary contacts are mechanically united and carried by the armature levers of the magnet or magnets forming part of the transmitter. This pivoted lever resembles a whiffle-tree, as used in a single vehicle; the first engagement of the contacts sets the whiffle-tree lever in position, so that thereafter the engagement of the two pairs of contacts occurs at identically the same time.

The transmitter levers are operated in both directions by electromagnetism, and a spring or gravity retractor is avoided. Heretofore where retractile springs have been applied to the armature they have given rise to inequalities.

The space in Morse signals should be made in the same time and by the same agency as the dot or dash in order to obtain uniform and exact signals. The improvements provide for this and render the transmitter magnets self-adjusting, so that they can be changed from a local circuit into a city line or short line circuit without changing any springs or in any way changing the retractile force, no matter what variation in the current strength or polarity there may be. The improved arrangement consists in the employment of two electromagnets located on opposite sides of the pivoted transmitter lever; the coils of these magnets are in a local circuit in series with the manually operated key; both magnets have the same ampere turns, but one magnetizes and demagnetizes more rapidly than the other; the magnet to produce the down stroke of the transmitter lever has a short core and charges and discharges quickly. The magnet on the opposite side retracts the armature lever and is slow acting; it has a long core, and this core is in a copper tube. When the circuit is closed, the quick acting magnet draws the armature out of the field of the slow acting magnet to produce the down stroke of the transmitter lever, and when the manually operated key is opened, the quick acting magnet discharges, while the slow acting magnet holds its magnetism long enough to retract the armature lever with a firm and solid contact.

Claims 20, 21, 22, 23 and 24, which cover the apparatus, read as follows:

20. In a multiplex telegraph, a main telegraph line, suitable receiving and transmitting instruments at each station, and a transmitter consisting of a lever operated by a circuit and two electromagnets, one of said magnets being constructed to operate in advance of the other magnet, substantially as described.

21. In a multiplex telegraph, a main line in combination with suitable receiving and transmitting instruments, including a transmitter composed of a pivoted lever, a short core quick-acting magnet arranged to move said lever in one direction, a long core slow-acting magnet arranged to move said lever in the opposite direction, and an electric circuit containing a circuit changing device and said magnets, substantially as described.

22. In a multiplex telegraph, a transmitter lever

suitably pivoted and having suitable stops located on opposite sides thereof, a short core electromagnet to move said lever in one direction, a long core magnet having a copper covering on the core to move said lever in the opposite direction, both said magnets having coils with substantially the same ampere turns and a circuit containing said coils and a manually operated circuit controller.

23. In a multiple telegraph the combination of a main line, an artificial line, suitable balanced receiving instruments, and a self-adjusting transmitter consisting of a pivoted armature bar, a quick-acting magnet, and a slow-acting magnet arranged to move said lever in opposite directions respectively, a suitable circuit including said magnets, and means for retaining said armature bar at rest during no-current intervals.

24. In a multiple telegraph the combination of a main line, an artificial line, suitable balanced receiving instruments and a self-adjusting transmitter consisting of a pivoted armature bar, a quick-acting magnet and a slow-acting magnet, arranged to move said levers in opposite directions respectively, a suitable circuit including said magnets and a spring for retaining said armature bar at rest during no-current intervals.

Telegraph and Telephone Age a General Subscription Agency.

We are frequently asked if we will accept subscriptions for other publications and thus save individuals the trouble of writing to several different papers when their subscriptions expire, usually at the end of the year or the first of July. We desire to inform all that this publication acts as a clearing house for such matters. Those desiring to subscribe for or renew their subscriptions for any publication in the world can do so through this office without any expense or trouble to themselves beyond remitting to us the amount of their subscription and giving the particulars.

The practical side of the telegraph is discussed in every issue of *Telegraph and Telephone Age* in a manner to interest and aid every individual operator in the service. Why not secure the benefits of such information by subscribing for the paper—\$2 a year.

A Timely Study of Wireless Telegraphy.

There has been a steady demand for operators in the wireless telegraph service, as that system has extended its operations, until to-day hundreds who were formerly employed as Morse operators are now occupying lucrative positions in the wireless field, at seaside, or on steamer, stations. The rapid increase in the number of wireless stations both on land and sea makes it evident that a very much larger field of employment, and at good pay, in the immediate future is opening up to the telegraph operator who will adapt himself to the newer method of radio-telegraphing. Operators everywhere are earnestly investigating this branch

of the telegraph, since as its vast opportunities to benefit the individual become more apparent with the development of the system now progressing so rapidly.

A good text book on wireless telegraphy is the first need of any who contemplate the study of that system. The sale of such works has increased enormously of late, clearly indicating the development of a widespread desire for knowledge on the subject.

For the convenience of our readers we have prepared and published in our catalogue, together with prices, a carefully selected list of standard books treating on wireless telegraphy. These volumes, which include the most up-to-date works upon the subject, furnish the best information obtainable, the kind giving the most efficient aid and direction to the student. Orders for the books enumerated, or indeed for any others that may be required, which must be accompanied by the cash, will be filled on the day of their receipt, and sent with all the carrying charges prepaid. Address J. B. Taltavall, *Telegraph and Telephone Age*, 253 Broadway, New York.

Mr. L. W. Storrer, commercial agent of the Pacific Telephone and Telegraph Company, San Francisco, in renewing his subscription recently says: "I don't know just how the readers of the *Age* would manage to keep in touch with what is going on in the telephone and telegraph world were it not for your ever welcome paper."

Mr. J. W. McMahon, district commercial manager, Western Union Telegraph Company, New York, in renewing his subscription takes occasion to say: "Your columns, which I have followed for some time, have contained the careers of many famous telegraph celebrities, which have been an inspiration to me and I believe the *Age* has been instrumental in encouraging all employees of the telegraph toward a higher goal."

Mr. P. H. Burns, superintendent of the telegraphs, telephones, and electric lighting for the government at Nassau, Bahamas, in a recent letter says: "Do not on any account drop me from the list of subscribers to *Telegraph and Telephone Age*. I find it getting better every issue and keeping me advised of the advancement and location of many old friends, besides the great value of the technical notes published, as I am still 'going to school.'"

(Mr. Burns is a native of Cleveland, Ohio, and occupied many positions as operator in the United States before entering the service of the English Government, in January, 1892, since which time he has been located at Nassau in charge of the telegraphs, telephones and electric lighting. He has installed a 118-cell storage battery and is soon to establish a wireless equipment.)

Any book on electrical subjects can be obtained through *Telegraph and Telephone Age*, 253 Broadway, New York.

Fire Alarm Systems.*

In a report to the National Fire Protection Association on "fire alarm systems," Mr. Ralph Sweetland says:

"Special importance should be placed upon the necessity of designing, installing and maintaining municipal fire alarm systems so that alarms may at all times and under the most adverse conditions be promptly transmitted to the fire departments. To this end attention is called to the supreme desirability of providing headquarters, which, as far as practicable, will be free from liability of damage by fire, either by internal or external causes; of installing apparatus which may promptly and correctly transmit alarms, but which will be simple and easy of maintenance; of placing all wires outside of buildings, as far as practicable, underground; of having frequent and systematic tests of all apparatus, and of having in charge of such systems only men of known judgment and ability. These rules cover requirements for the construction and installation of appliances most commonly used at the present time. Any other types of apparatus which are judged to have merit should be submitted for examination and test and, if found efficient, will receive recognition accordingly.

(Note.—The portion of these rules relating to the design and construction of appliances are but a partial outline of requirements. A device which fulfills the conditions herein outlined, and no more, will not necessarily be acceptable. Samples of all appliances should be submitted to the Underwriters' Laboratories for examination and report before being introduced for use.) *

MANUALLY OPERATED FIRE ALARM SYSTEMS.

(For cities having a population of more than 100,000.)

Systems requiring operators in headquarters for the transmission of alarms.

(1) *Headquarters.*—(a) The building to be of fireproof construction. Note.—No wood should be permitted in the construction, even for top flooring, window or door trim, closets, instrument cases, etc.

(b) The building should preferably be located so as to be unexposed for a distance of at least 150 feet. If so located as to be exposed, then especial attention should be given to guard against damage from such exposure by protection of exposed openings, of so constructing roof as to resist damage which might be caused by falling walls. Note.—It is desirable to locate the building in a park or public square, where the conditions as regards exposure can be fully met. As the building, even for a large city need not be large, and since for a slight increase in cost it can be made artistic in appearance, objections to such locations should not be insurmountable.

(c) The building should be used for no other purpose than that relating to the fire alarm service.

(d) One approved three-gallon chemical fire extinguisher and six sand pails to be provided for

each 2,500 square feet of floor area. When any portion of the building is occupied as a stable, garage, machine shop or for storage purposes used in connection with the up-keep of the system, the part thus occupied to be protected by an approved system of automatic sprinklers.

(e) Approved registers and tappers speeded for "fast" time to be provided, on which box signals may be received. Approved time and automatic dating stamps by which time of receipt of alarms may be recorded also to be provided.

(f) An approved transmitter, speeded for "fast" time to be provided, by means of which alarms may be sent to the fire department houses by automatically repeating from box circuits, subject to the control of manually-operated interlocking switches.

(g) An approved manually-operated transmitter, speeded for both "fast" and "slow" time, to be provided, by means of which alarms may be sent over the "slow" time circuits to the fire department houses; also sounded on outside bells and whistles, if any, and arranged so that it may, if desired, be run at "fast" time and control the tapper circuit.

(h) There must be means provided for telegraph communication from central office over each box circuit, and there must be telegraph keys at central office by which signals may be sent, both over each alarm circuit separately, and also over all "fast" time circuits simultaneously, and over all "slow" time circuits simultaneously.

(i) An independent reserve source of electrical energy of proper capacity constantly available to be provided. The following sources of energy are given in their order of preference: (1) Storage batteries; (2) motor generators or rotary transformers.

(j) Approved heavy current protectors to be provided near the point of entrance of wires or cables into the building.

(k) Approved automatic devices to be provided, by means of which grounds or openings of circuits will be immediately announced by visual and audible signals. Manual tests of all circuits to be made at least four times during each twenty-four hours, a record of all tests being filed for reference.

(l) Approved slate or marble switchboards to be provided, on which shall be mounted the various switches, relays, protectors, etc. Switchboards should be located so as to be readily accessible from all sides.

(m) Plans of all outside circuits and records of all tests to be kept on file.

(n) To have at least two competent men on duty constantly, and in addition linemen to be available so that in case of derangement of outside circuits prompt attention can be given same.

(2) *Boxes.*—(a) To be of an improved keyless, non-interfering and successive type. Note.—Boxes may be of the key type, if key is properly attached to box.

(b) To be located so as to suitably protect the city. Note.—No definite rules can be given for the location of boxes. In general, it is considered that from any building in the mercantile and manufacturing

*From Fire and Water Engineering.

districts it should not be necessary to traverse over 300 feet in order to reach a box; in closely built-up residential districts this distance should not be over 500 feet.

(c) Circuits to be so arranged that not more than twenty boxes will be on any circuit, and no apparatus other than boxes to be connected on box circuits outside of fire alarm headquarters. Note.—It is desirable to so arrange circuits that adjacent boxes will be on different circuits. It is recommended that all circuits be brought to easily accessible terminals, mounted on slate or marble bases for testing purposes.

(d) The placing of municipal boxes inside of buildings should be discouraged as far as possible, and where private boxes are used, they should be conveniently located on the outside of buildings. Note.—When located inside of buildings they must be mounted on filled hardwood blocks not less than $1\frac{3}{4}$ inches in thickness; the supports of blocks and of the boxes must be independent of each other.

(3) *Wiring.* Note.—To secure the largest measure of safety and efficiency in the operation of municipal fire alarm systems, all wires outside of buildings should be placed under ground.

(a) Must under normal conditions employ only closed metallic circuits.

(b) Aerial wires should have an approved insulating covering; to be equivalent in conductivity and tensile strength to No. 10 galvanized iron when single wires are used, and to No. 16 B. and S. hard-drawn copper wire where cables are used.

(c) Aerial wires to be supported entirely on glass or porcelain petticoat insulators at least every fifty feet; run as far as possible under rather than over electric light or power wires, and especial attention should be given to preventing liability to accidental contact with such wires.

(d) Wires and cables inside headquarters to have approved insulated covering and to be so supported that they will be as free as possible from liability of grounds or mechanical injury.

(e) Wires inside fire department houses to have approved insulated covering and to be so supported in conduit, in armored cable, or on non-combustible non-absorptive insulators, and so arranged that the covering will come in contact with no other substances than the designed supports, the protecting bushings and the connecting instruments.

(4) *Fire Department Houses.*—(a) An approved perforating register and 6-inch gong for the "fast" time service to be provided by means of which alarms may be received.

(b) An approved 15-inch electromechanical gong for the "slow" time service to be provided, by means of which alarms may be received.

The Delaware Telegraph Company has been chartered at Dover, Del., to establish, it is stated, underground cables, subways and protected telegraph lines and despatch systems. The capital stock of the company is \$100,000.

Report of Chief Signal Officer United States Army.

The annual report of Brigadier-General James Allen, Chief Signal Officer of the United States Army, for the fiscal year ended June 30, 1910, is an interesting record of the work done in that branch of the service during the period named.

On June 30, the Washington-Alaska military cable and telegraph system comprised 2,629.35 miles of submarine cable, 367 miles of double and 996 miles of single land line and 934 miles of wireless. During the year "this line" receipts aggregated \$188,109.36 and "other line" receipts \$18,974.55. Official messages to the value of \$174,005 were transmitted and \$57,764.40 was transferred by telegraphic money orders.

Work on the Alaskan wireless telegraph system has been directed chiefly to the betterment of existing stations rather than to extensive new construction. "The operation of the wireless telegraph stations in Alaska has been of such a character," says General Allen, "as to warrant consideration being given to the abandonment of a portion of the land telegraph lines over the routes now covered by wireless, thus relying on this as the sole means of communication instead of as an auxiliary to the land lines as originally intended."

In the Philippine Islands the military telegraph system comprises thirty-four miles of line and twelve offices. There are twenty post telephone systems equipped with 473 telephones. There are four long distance systems with 106 miles of line. Five wireless stations have been established for the insular government. In the United States schools are maintained at Forts Omaha and Wood, for the instruction and training of the enlisted men of the Signal Corps. Both posts are equipped with wireless sets. A wireless station has been put in operation at the Army Signal School at Fort Leavenworth, Kan., and the School has been enlarged and improved. During the year the cable ships *Burnside*, *Joseph Henry* and *Cyrus W. Field* were actively engaged in cable operations. The wireless equipment furnished by the signal corps for installation on army transports has continued to give very satisfactory service.

At the close of the year there were 113 post telephone systems. On November 1, 1909, the electrical and telegraph divisions were consolidated. The army now has fifteen wireless telegraph stations located at military posts in this country and nine stations at points in Alaska.

An excellent map shows the United States telegraph and cable system in Alaska and United States cables and Canadian lines connecting with the United States.

Telegraph and Telephone Age constitutes a "school of instruction" to every would-be telegrapher. It is accurate and authoritative and worth many times the price of subscription (\$2.00) to any who would inform themselves respecting the telegraph.

The Military Telegrapher in the Civil War.

PART I.

In these days of profound peace, it is difficult to realize the hardships experienced by the brave military telegraphers during the war of the rebellion. The stories of these experiences published in past issues have excited universal admiration for the fortitude, courage and patriotism displayed by these men, and they constitute collectively a most interesting chapter in the history of that great struggle.

The late W. K. Applebaugh, a well-known member of the New York profession a few years ago and remembered by many living operators, gave an interesting account of his war experiences for Colonel W. R. Plum's book on "The Military Telegraph During the Civil War in the United States." The narrative, in part, follows: "I was Sergeant-Major of the Sixteenth Pennsylvania Cavalry, Col. John Irwin Gregg, when I was transferred on order by the Secretary of War, Mr. E. M. Stanton, January 6, 1864, and assigned to duty as a telegrapher at Warrenton, Va., where I remained until Spring. General D. McM. Gregg was in command of this post. In the Spring I was transferred to Belle Plains Landing, Va., a base of supplies, and remained there a few days. Then, as the army advanced, the base was transferred to White Plains, Va., on the Pamunkey River, where a number of army operators were awaiting orders. About this time, which was shortly after the battle at Cold Harbor, there was some trouble with telegraph communication at the mouth of the Mattaponi River, and a small party of us was sent down in a tug-boat to investigate. The break was repaired and on account of the enemy firing at us from the river banks on our downward trip, one of the boat hands abandoned the tug at Little York. On the return trip I acted as pilot so that the captain could attend to other duties. I took charge of the wheel for about sixteen miles up the Pamunkey River with occasional assistance from the captain. The pilot house was protected by bales of hay placed around its sides, so there was but little danger from the sharpshooters on the banks. Only a few shots were fired at us during the entire trip.

"A week or two later several operators, including myself, were sent to Bermuda Hundred, Va., to the Army of the James. While located there General Grant established his headquarters at City Point and as his regular operators had not arrived from Fortress Monroe, I was sent to his headquarters temporarily. Next, I think in July, I was assigned to General Brooks, commanding the Eighteenth Army Corps of the Army of the James, on the Bermuda Hundred front. In the Fall of 1864 the Army of the James crossed the James River at Jones Neck and advanced to within about six miles of Richmond. At this point I was assigned to General D. B. Birney's headquarters of the Twenty-fourth Army Corps. Our office was located for the Winter in a small log house on the Varina road, near the Charles City

road. We remained here until the evacuation of Richmond.

"On the morning of April 3, 1865, I was with General Weitzel and staff, and we were among the first to enter Richmond. As we passed up Main street the heat from the burning buildings was so great that we were obliged to protect our faces with the capes of our overcoats.

"As soon as the wires were reconstructed I opened an office at General Devens' headquarters, second division, Twenty-fourth Army Corps, at Mansfield, Va., on the south side of the James River, near Richmond. I remained there until the Department of Southwestern Virginia was established, with headquarters at Lynchburg. I was stationed at the latter place until March, 1866, when I resigned and came North. I have been in New York ever since and am at present general superintendent of this company."

[The company referred to by Mr. Applebaugh was "The Telephone Company of New York," whose offices were at 203 Broadway. Mr. Applebaugh's communication was dated June 6, 1878, thus taking us back to very near the time of the birth of the telephone.

In the spring of 1879, Mr. Applebaugh was sent to France by the telephone company and introduced the first telephone system in that country. He returned to America in the Fall of the same year on account of ill-health, which continued until his death in Philadelphia, October 21, 1883.

Mr. Applebaugh was a member of the Operators' Reception Committee at the inauguration of the Morse Statue in Central Park, New York, June 10, 1871, and in the evening of that day the memorable event took place at the Academy of Music, when Professor S. F. B. Morse sent the now historical message, "Greeting and thanks to the telegraph fraternity throughout the world. Glory to God in the Highest, on Earth Peace, Good Will to Men." All the telegraph wires in the country had been connected as one circuit for the occasion, and Mr. Applebaugh took a prominent part in the ceremonies attending the sending of this message.—Ed.]

"Spare Pair" Society of Philadelphia.

The "Spare Pair" Society of Philadelphia, which is composed of employees of the telephone service in that city, held its monthly meeting, November 16. Mr. P. G. Burton, division plant chief, of the American Telegraph and Telephone Company, Washington, D. C., gave a very interesting talk on "The Cable," dwelling upon its manufacture, installation and its effect upon speech transmission and signaling. He also referred to the Pupin coil, its advantages, etc. A discussion followed the address and was participated in freely by those present. The entire programme proved both instructive and entertaining and was enjoyed by all. About seventy-five persons were in attendance.

The Telegraph and Telephone Equipment of the Pennsylvania Railroad Company's New York Terminal.

The magnificent terminal station of the Pennsylvania Railroad Company in New York, which was recently opened, is provided with very complete and most modern telegraph and telephone equipment.

All of the telegraph apparatus employed is of special design and made from the company's specifications by Messrs. J. H. Bunnell & Co., New York. The work of installing the apparatus and all of the wiring was done by the railroad company's electrical department, under the supervision of Mr. M. J. Kelly, general foreman from the office of superintendent of telegraph, Philadelphia.

In the main telegraph office the switchboard is mounted in an elegant and highly polished mahogany cabinet case. It has a total capacity of 100 lines, being divided in two boards of fifty lines each. It is of the double spring-jack type, and the cords pass through hard rubber bushings mounted on the switchboard shelf. These cords are kept taut by means of weights and pulleys. There are forty wedges and connecting cords, the wedges being of the standard type. They are so constructed that the cord can be fastened to the wedge in such a manner that there will be no strain on the connection between the wedge and the cord when handling the wedge.

A special distributing rack is provided for bringing in the wires to the board through cables.

Two lamp resistance panels of marbleized slate are mounted on top of the switchboard. Each is 11½ inches thick, 54 inches long and 19½ inches high. Each panel is provided with 150 Edison base receptacles arranged in rows of twenty-five and connected in pairs, each double row being connected with a bus-bar. There are sixty tubular resistance lamps, twenty of 100 ohms, twenty of 200 ohms and twenty of 300 ohms.

The operating tables have twelve positions. The sounders are all placed in resonators of a special type made from the railroad company's specifications. They are mounted on iron standards, the cords running up through the standards to the resonator. The wires are not connected directly with the sounders, but terminate at a connector attached to one side of the box, and the binding posts of the sounder are connected with the connectors on the box by means of a short piece of flat brass. By this arrangement a very large contact surface is secured and all danger of breaking a wire is avoided.

There are four direct wires to Philadelphia and two telephone circuits, all used for handling the railroad company's business. One of the telegraph circuits is duplexed to Philadelphia.

The operating department is served with five pneumatic tubes which run into different parts of the great building. All the current used in the telegraph service for main lines and local circuits is generated by motor-generators, operated by energy taken from the railroad company's service lines at 440 volts. There are five motor-generator sets installed, three generating 115 volts and two eight volts. These machines also supply the energy to operate the seventeen telautographs, twelve pneumatic tubes and all the buzzer circuits. The motor-generators were made by the Holtzer-Cabot Electric Company, of Boston. These machines are located in the power room adjacent to the telegraph office. In this room there is also a three-panel slate switchboard fitted with the necessary switches, fuses, etc., for the control of the current. Weston ammeters and voltmeters are used. The board was furnished by Westinghouse, Church, Kerr & Co., New York.

One of the most interesting features of the train handling system is the equipment of the main switch tower, a little to the west of the station. This tower contains the most modern appliances and to the uninitiated the multiplicity of apparatus is bewildering. Communication to and from this tower is done by telephone principally. On the instrument table there are four flush type monitor telephone boards, each with two telephone sets, so eight men can handle business at the four boards. An interesting piece of apparatus is the telautograph which is used for receiving and transmitting information regarding train movements. Telautographs are installed in the other switch towers, the telegraph office and the train dispatcher's office, so that these various points can communicate with one another by this means. These instruments were supplied by the Gray National Telautograph Company of New York. In transmitting an order a copy of the message is reproduced before the operator's eyes, thus serving as a check upon his work.

Telegraph circuits run from this tower to the other towers, to the telegraph office, the train dispatchers' office and to other points concerned in the handling of trains. In the operation of the telephone system from this tower excellent provision is made for an emergency ringing current in case of interruption of the regular supply of energy. For this purpose a Warner pole-changer is provided. This instrument is operated by one cell of Edison-Lalande battery, and in producing the emergency ringing current it transforms the direct current from sixty cells of dry battery into alternating current, by the operation of a vibrator. This instrument is very effective in operation, and is manufactured by the Warner Electric Company of Muncie, Ind.

Sandwich selectors, made by the Sandwich Electric Company, Sandwich, Ill., are installed in the various towers on the train despatching

circuits, and enable the train despatcher to call any desired tower at will. All the selecting is done on one pair of wires.

The pole line along the right of way across the meadows, between the Hackensack portal and the Manhattan transfer station at Harrison, N. J., is of the most substantial character. It consists of 207 reinforced concrete poles of square section with the corners beveled off. The poles vary in length from thirty-five to sixty feet, according to local conditions. They are provided with steps set in the concrete. The cross arms are of wood and the insulators are of brown glazed porcelain. The poles carry forty telegraph and telephone wires besides one lead-covered and one rubber covered cable. The poles were manufactured by the railroad company, and were designed by Mr. R. D. Coombs, assistant engineer of the Pennsylvania Tunnel and Terminal Railroad Company. Some of the poles are equipped with double cross arms in situations where additional strains are exerted on the poles.

Time is transmitted all over the company's system by telegraph twice every twenty-four hours—at 2 a. m. and 2 p. m.—from the Allegheny observatory, at Allegheny City, Pa. Mr. C. G. Baird is manager of telegraph and telephones at the Terminal and to him we are indebted for the foregoing information.

The following description of the telephone service is given by Mr. J. N. C. Graham, in the *Electrical Review* and *Western Electrician*.

The telephone equipment of the new station represents the highest development in plants of this character, both as regards scope and flexibility. The apparatus was furnished by the New York Telephone Company, which has provided for three classes of service, i. e., commercial service, operating service and pay-station service.

The commercial equipment, as the name implies, has been installed to care for the telephone service between the railroad company and the public. It comprises: (1) A main private-branch-exchange switchboard, having trunk lines to the telephone company's nearest central office; tie lines to other private branch exchanges in offices of the Pennsylvania and Long Island Railroad Companies in New York and other cities; extension lines to the various offices of the Pennsylvania Tunnel and Terminal Railroad Company, and of the Long Island Railroad Company located in the Terminal Station. (2) A private-branch-exchange switchboard for use in connection with the Bureau of Information.

The operators' quarters and the room which contains the terminal equipment, auxiliary apparatus and power plant for operating the switchboards are adjacent to the switchboard room. These rooms overlook the main concourse and have been arranged with a view to caring for a 100-per-cent. increase in the already large telephone business of the railroad.

The switchboard is of the standard common-bat-

tery type, has a capacity of 1,000 lines, which are multiplied in every second position, and is at present equipped for 520 lines, of which 40 are arranged for trunk lines to the telephone company's central office, 80 are arranged for tie lines, 80 for magneto extension lines, and 320 for common-battery extension lines.

There are six operating positions, of which two and one-half positions are arranged for handling incoming traffic and three and one-half positions for originating traffic.

A day force of six attendants and a supervisor are necessary to handle the traffic on the board. A smaller number of attendants are required during the evening and at night. The work of the attendants is supervised from a regulation chief-operator's desk.

The instruments for the use of conductors and gatemen are contained in boxes located in the columns on the train platforms and at the gates opening off of the main concourse.

The switchboard serving the Bureau of Information has four positions.

The restaurant pay-station equipment consists of two switchboards, one located in each restaurant. Extending from these switchboards are a number of lines which terminate in jacks at each table in the restaurant. A person wishing to make a telephone call while dining, asks the waiter for a telephone. A portable telephone is brought to the table and connected with the jack referred to, and the call made in the regular manner. The amount of the charge for this call is placed on the restaurant check.

Lines extend from the main private-branch-exchange switchboard to jacks located at convenient points under the train platforms. The observation cars of the more important trains are equipped with telephones, which also terminate in jacks under the car. A flexible cable is used for connecting the train jack and the platform jack, thus making a connection to the private-branch-exchange switchboard and enabling passengers to make telephone calls until a few seconds before the departure of the train. These pay-stations are in charge of the stenographer in the observation car.

Adequate facilities have been provided for reaching any point within the terminal area or along the road where there is a possibility of a telephone being required. In the terminal building alone, there have been installed for use in connection with the commercial service, 6,900 feet of lead-covered telephone cables. These cables contain 450 miles of copper wire and weigh eleven tons. The largest cable contains 1,212 wires and weighs over seven pounds to the foot. It was necessary to make forty-three branch splices, in one of which 2,828 wires were connected. These branch cables connect to eighty cable terminals containing nearly 5,000 binding posts. To extend the lines from the cable terminals to the various instruments within the terminal building required 39,000 feet of twisted-pair wire.

In addition to the cable plant referred to, approximately thirty miles of lead-covered telephone cable, containing 240 miles of copper wire, has been installed in the terminal area and along the right of way to connect the operating equipment. This is all large-gauge cable and weighs over one hundred tons. In all cases this cable has been installed in ducts in the tunnels and along the right of way on the side opposite to the high-tension power lines.

The operating equipment has been installed primarily for use in connection with the dispatching of trains and the operation of the railroad. It is arranged, however, to permit of connections to the commercial system. Such connections may be made only in emergency cases.

The equipment comprises: (1) Twenty-five monitor switchboards, located in the offices of the train dispatchers, yard masters, station masters, switching cabins, power houses, etc. (2) A number of magneto telephones located at convenient points in the tunnels, yards and along the right of way of the railroad. Some of these stations terminate in the monitor boards referred to, and others terminate in the main private branch exchanges, all being arranged to permit of the greatest operating efficiency and flexibility.

Monitors which are intended merely for outgoing business or for use on an official's desk have no drops or signals. All of the monitors are really terminal switchboards. They provide a convenient method of terminating at one point a number of lines which are used by those who have to do with the dispatching and switching of trains from that location. The selective apparatus used in the new terminal is of the Sandwich Electric Company's make.

The convenient location of the many telephones on the station platforms and in the various yards, towers, cabins, offices and tunnels, makes it possible for any railroad employe to communicate promptly with any department, and thus care for any emergency which may arise.

The telephones used in the tunnels were designed to meet the unusual conditions experienced in submarine tunnels. The apparatus is treated to resist moisture and is contained in an iron case, the front of which forms two doors. Fifty-three of the tunnel sets are installed on the walls at intervals throughout the six tunnels. All of the wiring to the sets is done in conduit. Normally, the tunnel sets are not connected to any circuit. They are arranged so that connection can be made by means of switching keys to either one of the four circuits. These circuits terminate as follows:

One for each tunnel in the main private-branch-exchange switchboard.

One for each tunnel in the train dispatcher's monitor switchboard.

One for each tunnel in the power director's monitor switchboard.

One for each tunnel, spare.

In addition to the four circuits mentioned, there is a fifth circuit in each of the tunnels to which are

connected a number of loud-ringing bells used for signaling. Employes of the various departments having business in the tunnel may thus be called to the nearest telephone by means of code signals.

The pay-station service is of three kinds: (1) Standard pay-station service, where the patron makes a call from a booth. (2) Restaurant pay-station service, where the patron makes a call from the table while dining. (3) Train pay-station service, where the patron makes a call from a telephone located on a train.

Groups of booths for standard pay-station service have been furnished in the main waiting room, ladies' waiting room, exit concourse and Long Island concourse.

Electrical Conductivity and Temperature Coefficient of Resistance of Copper.

In Volume 7 of the Bulletin of the Bureau of Standards, Washington, will appear a paper by Messrs. F. A. Wolff and J. H. Dellinger, on "The Electrical Conductivity of Commercial Copper." After a thorough and precise investigation of the subject the authors conclude that the best value to be assumed for the resistivity of annealed copper, in the preparation of wire tables and in the expression of percent conductivity, etc., is the previously used standard value, viz.: 0.153022 ohm per meter-gram at 20 degrees C. The conductivity of hard-drawn No. 12 B. and S. wires was found to be less than the conductivity of annealed wires by a mean value of 2.7 per cent. The difference between the conductivity of annealed and hard-drawn wires increases as the diameter of the wire decreases.

The same publication will also contain a paper by Mr. J. H. Dellinger, entitled "The Temperature Coefficient of Resistance of Copper." In summarizing, Mr. Dellinger says that his investigation shows that for representative samples of the copper at present furnished for electrical use, the conductivity and temperature coefficient are proportional, to a high degree of accuracy for differences in physical condition, and to a fair accuracy for differences in chemical composition of samples.

This relation may be put in the following very convenient form for reducing the results of resistivity measurements to a standard temperature: The change of the resistivity per degree C. of a sample of copper is 0.000598 ohm per meter-gram, or 0.00681 micro-ohm per centimeter cube.

The distortions caused by bending and winding a wire are shown to produce no material change in the temperature coefficient; so that the temperature rise in machines and instruments may be calculated from measurements of the resistance of the windings with greater confidence than heretofore.

The measurement of temperature coefficient is shown to present an advantageous substitute for the direct measurement of conductivity in a number of cases.

Mr. Guy E. Paine Becomes General Superintendent at Chicago.

Mr. Guy E. Paine, assistant general superintendent of the Postal Telegraph-Cable Company, at Atlanta, Ga., has been advanced to the general superintendency of the Western Division of the same company, with headquarters at Chicago, to succeed Mr. Thomas W. Carroll, resigned. Mr. Paine was born at Madison, Wis., and entered the telegraph service in February, 1881, as a messenger for the Western Union Telegraph Company in that place. After passing through various positions, he finally became manager of the office. Mr. Paine entered the service of the Postal Company in November, 1891, as a clerk in general superintendent Parker's office, Chicago. He was afterwards promoted to be chief clerk in that office, and later became manager of the Chicago office. On January 1, 1898, he was appointed superintendent at Kansas City, the headquarters afterwards being transferred to St. Louis. In January, 1904, he was appointed general superintendent of the Southern Division, with headquarters at Atlanta, Ga., vice Mr. Charles C. Adams, transferred to New York. When Mr. George H. Usher assumed the general superintendency at Atlanta, Mr. Paine became assistant general superintendent, which position he held until his present advancement.

MR. GUY E. PAINE,
General Superintendent Western Division, Postal Telegraph-Cable
Company, Chicago, Ill.

Mr. Paine is an earnest and conscientious worker and has a wide grasp of the details of his duties. His personal qualities, which are of the highest character, combined with his varied experience, eminently fit him for the duties of his new position.

Jesse Hargrave Becomes Division Superintendent, Southern Division, Postal Telegraph-Cable Co.

Mr. Jesse Hargrave, for the past three years superintendent of the Postal Telegraph-Cable Com-

pany, at Birmingham, Ala., has been advanced to the position of division superintendent of the southern division of the same interests, with headquarters at Atlanta, Ga.

Previous to his assuming the superintendency at Birmingham, Mr. Hargrave was an assistant electrical engineer of the company at New York, where he made many friends, all of whom congratulate him on his present promotion. Mr. Hargrave was born

MR. JESSE HARGRAVE,
Division Superintendent Postal Telegraph-Cable Company,
Atlanta, Ga.

at Lexington, N. C., February 18, 1865, and began his telegraphic career at Laurel Hill, N. C., in 1884, for the Seaboard Air Line Railway, and later was with the Chesapeake and Ohio and the Pennsylvania Railroads. He was afterwards in the Western Union Telegraph Company's service at Augusta, Ga., at Nashville, Tenn., and at Chicago. In 1888 he went to Nashville for The Associated Press. Here he remained for three years, and then entered the Postal Company's service at New Orleans, soon being advanced to the position of chief operator. Later he went to Atlanta, Ga., as electrician and division assistant electrical engineer for the company. He was next called to New York and given the office of assistant electrical engineer, and was afterwards appointed superintendent at Birmingham, Ala., which position he now relinquishes to accept his new appointment. Mr. Hargrave will continue to direct the affairs of the third southern district of the Postal Company, with headquarters at Birmingham, until January 1, 1911, when he will remove to Atlanta to assume active charge of his new duties.

F. F. Norton Becomes Traffic Superintendent of the Postal Telegraph-Cable Company, New York.

Mr. F. F. Norton, manager of the operating department, main office, of the Postal Telegraph-Cable Company, New York, has been advanced to fill the position of superintendent of traffic, vice S. B. Haig, resigned. Mr. Norton is an Englishman by birth, having been born at Barton, Oxfordshire, July 23, 1858. He was engaged in the telegraph service in

Canada until 1881, when he came to New York and entered the employ of the Western Union Company. In 1888 he went with the Postal Company, and has been with it ever since.

MR. F. F. NORTON.

Traffic Superintendent, Postal Telegraph-Cable Company, New York.

Mr. Norton's long experience in various capacities that go to make up a telegraph company eminently fit him for the duties of this important office.

J. J. Whalen Becomes Day Manager of the Postal Telegraph-Cable Company, New York.

Mr. J. J. Whalen, assistant day manager, has been appointed day manager of the Postal Telegraph-Cable Company, New York, to succeed Mr. F. F. Norton, promoted. Mr. Whalen was born at Long Branch, N. J., June 11, 1872. He entered the tele-

MR. J. J. WHALEN.

Manager Postal Telegraph-Cable Company, New York.

graph service as messenger, and soon became an operator. He was a member of the New York police force for a time, but returned to telegraphy in 1897, and has been with the Postal Company ever since.

Mr. Whalen is extremely popular, and his method of handling men is one that fosters a kindly feeling which is necessary in these days to obtain the best results. Mr. Whalen is as popular with the rank and file as he is with his superior officials, and everyone extends best wishes to the new head of the operating department.

D. F. Mallen Becomes Assistant Manager of the Postal Telegraph-Cable Company, New York.

Mr. D. F. Mallen, night manager, has been advanced to the position of assistant day manager of the Postal Telegraph-Cable Company, New York, vice Mr. J. J. Whalen, promoted. Mr. Mallen began his telegraphic career as messenger for the Atlantic & Pacific Telegraph Company in Jersey City in 1876, and afterwards entered the service of the Western Union Telegraph Company in that city, and

MR. D. F. MALLEN.

Assistant Manager Postal Telegraph-Cable Company, New York.

later in the main office in New York. He went with the Western Union Company at 195 Broadway in 1881, and in 1884 with the Bankers' & Merchants' Company, which later became the United Lines, and finally the Postal Telegraph-Cable Company. He has held various positions with the Postal Telegraph-Cable Company since its inception, and for a long time was general traffic chief. His experience gives him an excellent grasp of the general run of the company's business, and he is therefore well qualified to fill his new position.

Mr. Walter L. Jones, secretary and auditor of the Postal Telegraph-Cable Company of Texas, was born at Belton, Mo., November 15, 1872. He entered the telegraph service in Kansas City, Mo., in March, 1888, as messenger and clerk in a branch office of the Western Union. He afterwards became an operator in the main office, and in 1892 entered the railroad service in Colorado on the Atchison, Topeka and Santa Fe Railroad. For two years, between 1893 and 1895, he was operator in the general offices of the St. Louis Southwestern Railway

in Texarkana, Tex. Later he was engaged in various newspaper and broker offices in St. Louis and Kansas City, and during the year 1898 filled the position of operator in the Western Union Chicago office. In October, 1898, he entered the service of the Postal Telegraph-Cable Company of Texas, when this company's lines were built into Texas, and has been in the company's employ ever since, first at Galveston as operator, then assistant chief operator at Dallas, and finally manager at Fort Worth. In June, 1906, he returned to Dallas as manager, which position he held until November 1, when he received the appointment as secretary and auditor.

Obituary.

William S. Worl, a forty-niner of the telegraph, died in New York, November 24, at the age of 76 years. He was born in Philadelphia and entered the telegraph service in 1849. Mr. Worl was in the service of the Magnetic Telegraph Company at Philadelphia, between 1849 and 1854, when he became assistant manager of the Philadelphia office of the New York and New Orleans Telegraph Company. In 1864 he and his brother, Mr. J. N. Worl, organized and constructed the lines of the Western Maryland Telegraph Company from Baltimore westward. They were the first to introduce private lines and built many of them, until the introduction of the telephone, when they abandoned that feature of the business. After this the two brothers conceived the idea of the American Atlantic Cable Company, after the failure of the first cable laid by Mr. Cyrus W. Field, and in 1867 received a grant from Congress to lay Atlantic cables. Mr. W. S. Worl was also interested in a plan to lay a cable from Philadelphia to New York, thence to Bermuda Islands and Europe. The company, however, suffered financial difficulties and the scheme was abandoned. Under the grant obtained by the Worl brothers the United States Direct Cable was laid by the Siemens Brothers, also the French Atlantic cable.

Edward F. Buchanan, an old time telegrapher, but for many years junior partner of the brokerage firm of A. O. Brown and Company of New York, which failed in 1908, died at Atlanta, Ga., on December 4. Since the failure of A. O. Brown and Company Mr. Buchanan had been indisposed, until recently when he accepted a position with the Western Union Telegraph Company as commercial agent at Atlanta. Mr. Buchanan was well and favorably known to the telegraphic profession throughout the country. While connected with the brokerage house of which he was a partner, he employed a large staff of telegraph operators, paying the highest wages of any concern in the United States for that class of service. Mr. Buchanan was born at Norcross, Ga., fifty-six years ago.

Mr. Edward B. Havis, a well-known telegrapher in the south and one of the oldest citizens of Birmingham, Ala., died in that city December 1, after an illness of several months. Mr. Havis learned telegraphy at Newnan, Ga., shortly after the close

of the civil war, and was in the service of the Western Union Telegraph Company as operator until 1889, when he entered the employ of the Postal Telegraph-Cable Company at Birmingham. He was in the service of this company at the time of his death. Mr. Havis is survived by his wife and two sons.

Mr. W. L. Butman, aged 55, for many years manager of the Western Union Telegraph office at Fremont, Ohio, died on November 21.

New York Telegraphers' Aid Society Entertainment.

The annual entertainment and reception of the New York Telegraphers' Aid Society, for the benefit of the Relief Fund, was held at the Lexington Avenue Opera House and Terrace Garden, on the evening of November 30. The decorations of the hall were very harmonious and attractive, and the enjoyment of the affair was greatly enhanced by the fine weather. There was a large attendance and an excellent program was provided.

The object of the relief fund is to assist those members of the profession, not members of benefit societies, in times of sickness and, in case of death, to provide means to secure proper burial. The officers of the Society are:—President, R. J. Marrin; vice-president, H. C. Worthen; treasurer, T. M. Brennan; financial secretary, C. A. Kilfoyle; recording secretary, Mary E. Saunders.

Executive Committee—J. A. Hill, E. F. Howell, J. F. Zeiss, E. Mesler, F. King, Miss S. Dougherty, E. E. Brannin, W. T. Rogers, A. J. Gillman, C. J. Lemaire, and H. M. Heffner.

Relief Fund—E. F. Howell, Miss S. Dougherty and E. E. Brannin.

Auditing Committee—F. J. Nurnberg, J. F. E. Hopkins and H. M. Heffner.

Trustees—T. M. Brennan, J. K. Calvert and J. C. Robinson.

Mr. J. C. Watts was the chairman of the entertainment committee and Mr. J. F. King, floor director, was assisted by Messrs. Wm. J. Gomber, F. J. Sheridan and Wm. H. Matthews.

The reception committee consisted of Messrs. E. E. Brannin, chairman; J. F. E. Hopkins, J. W. McMeen and W. W. Price, assistants.

Mr. R. J. Marrin, president of the society, wishes to thank the members and their friends for their generous support, also the officials of the Western Union and Postal Telegraph-Cable Companies, Mr. J. C. Watts, chairman of the entertainment committee, and the hustling financial secretary, Mr. C. A. Kilfoyle, and Miss M. E. Saunders, the recording secretary, for valuable services rendered.

Serial Building Loan and Savings Institution.

The regular December meeting of the shareholders of the Serial Building Loan and Savings Institution will be held at 195 Broadway, New York, at 5 p. m., December 20, for the purpose of nominating officers and directors for the ensuing year. The annual meeting of shareholders will be held at the same place on January 17.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

WATSON INSULATED WIRE CO.
Railway Exchange, CHICAGO, ILL.

The Railroad.

The telegraph office of the Boston and Maine Railroad at Clinton, Mass., was recently wrecked in a peculiar manner. A collision of trains occurred at the station and the impact drove a passenger coach through the walls of the telegraph office. Mr. Clarence M. Lenna, manager of the office, Mr. George Cordoniere, operator, and the messenger had warning of the impending danger and escaped in time.

The next annual convention of the Association of Railway Telegraph Superintendents will take place at Boston, Mass., June 19 to 23. Arrangements are now being made to take care of the visiting members and friends and ample space will be provided for exhibitors. Mr. P. W. Drew, 135 Adams St., Chicago, is the secretary of the association, and will be glad to furnish any information desired pertaining to the coming convention. Many new problems in connection with the railway telegraph and telephone service are constantly coming to the surface for consideration, and developments are taking place so rapidly that no member can afford to be absent from these meetings. There is much to learn by attendance upon these gatherings and it is hoped that the Boston meeting will be largely attended.

Mr. Francis M. Benning, recently appointed assistant superintendent of the Lackawanna Railroad, at Hoboken, N. J., was formerly operator and train despatcher on the Wabash Railroad. He was born in Hannibal, Mo., in 1865, and has been in the Lackawanna Company's service since 1889.

The Pennsylvania Railroad Company is replacing its old wooden telegraph poles in Union City, Ind., with concrete poles.

Mr. Fred. C. Fox, recently appointed general manager of the western lines of the Atchison, Topeka and Santa Fe Railway, began his business career as an operator on that road in 1880. He was born at Maysville, Ohio.

The Canadian Pacific Railway has authorized the installation of a telephone despatching circuit between Farnham and Megantic, a distance of 132 miles. This circuit will be completed about the end of the year and then the road will have a total mileage of despatching by telephone of 2,251 miles. This mileage will probably be largely added to next year.

International Control of Wireless Telegraphy.

The annual report of Brigadier-General James Allen, chief signal officer of the United States Army, for the fiscal year ended June 30, 1910, has this to say in regard to international control of wireless telegraphy:

The international wireless-telegraph business of the world is conducted under a treaty signed at Berlin on November 3, 1906. This treaty was the result of a convention which was participated in by twenty-six of the principal nations. Of these countries, the following have confirmed the treaty: Belgium, Denmark, the Netherlands, Norway, Brazil, Sweden, Mexico, Roumania, Germany and all its protectorates, Great Britain (under certain reserva-

tions), Japan (under certain reservations), Spain, Bulgaria, Persia, Russia, Austria-Hungary, Portugal, and Turkey.

As the United States up to this time has not given its adherence to the convention, ships flying the American flag find themselves without standing in international wireless telegraph, as none of the contracting countries is compelled to receive a telegram from the ship of a noncontracting country, and any coastal station in a foreign country may refuse transmission of a message to a station on shipboard subject to a noncontracting country.

In view of the difficulties which ships bearing the United States flag have in communicating with foreign ports, General Allen recommends that the matter again receive attention, and, through the proper channels, be brought anew to the consideration of the United States Senate.

Municipal Electricians.

Patent No. 976,578 has been granted to E. J. Kingsley, J. Greene and Wm. J. Sadleir, Salt Lake City, Utah, for a Police Signal Device.

Patent No. 976,645 has been granted to J. H. Field, Victoria, B. C., for an Electrical Fire Alarm System.

Patent No. 977,219 has been issued to C. H. Pool, New York, on an Electrical Signaling System.

Patent No. 977,295 has been granted to A. Goldstein, New York, for an Electrical Thermostatic Alarm System.

Patent No. 977,206 has been granted to A. Goldstein and C. H. Pool, New York, on a Central Energy Electrical Temperature Alarm System.

Legal.

The United States Supreme Court in a decision on November 28, held the telegraph company liable for damages for failure to transmit a message from Detroit, Mich., to Kansas City, Mo., after accepting it. Suit was brought against the telegraph company by a Detroit milling company for \$2,000 damages resulting from the failure to deliver the message. The suit was decided in favor of the milling company in the trial court, in the Michigan Supreme Court and finally in the United States Supreme Court.

It is stated that Governor-elect Dix, of New York, will probably recommend to the legislature that the two public service commissions of New York State be either consolidated into one body or a new commission be created, with a redistribution of duties.

The British Postmaster-General recently stated that the latest experiments of the Post Office engineers show that the leadless glaze insulators are less efficient for telegraphic and telephonic purposes than the insulators with lead glaze, and cannot, therefore, be used on long-distance lines; for that reason only about 20 per cent. of the insulators ordered by the Post Office during the last four years have been leadless glazed. The actual number is 4,600 gross out of 23,700 gross.

Radio-Telegraphy.

No. 976,500. Wireless Telegraphy, to F. G. Sargent, Graniteville, Mass. A coherer in which the tube is of elastic non-conducting material, and the electrodes at the opposite ends.

An order has been issued by the Austrian Minister of Commerce, providing that Austrian passenger ships whose service extends beyond Gibraltar or Aden must be fitted with wireless telegraph apparatus.

The United Wireless Telegraph Company of New York, has closed a contract with the Merchants and Miners Transportation Company of Baltimore, Md., for the installation on twenty-three of its steamers of this system.

At the meeting of the Wireless Institute, at the United Engineering Societies' Building, New York, December 7, Mr. J. Martin, expert electrical aid, Brooklyn Navy Yard, presented a paper entitled "Side Lights on the Navy Department Wireless Telegraph Specifications."

The operator of the naval wireless station at Newport, R. I., was in communication with the naval station at Colon, Panama, on the night of December 7. The distance between the two points is about 2,400 miles. It is stated that the two operators conversed with each other for twenty minutes without difficulty.

An electrical school is maintained by the government at the United States Navy Yard, Brooklyn, where an operator may take a course in general electricity and wireless telegraphy, provided he enlists for a term of four years. Everything is provided by the government and the course of instruction covers twenty-two weeks. Further information may be obtained by applying to Mr. George W. Hickey, Room 502, 30 Church street, New York.

A new idea has been worked out in the use of the wireless telegraph on the ships of the navy, according to the annual report of the Chief of the Equipment Bureau, Navy Department, Washington, D. C. A portable apparatus has been devised that will enable the long-distance aerial wires to be taken down in time of battle and replaced by a short wire running up to the yardarm, connected to a set of instruments carried by the operator behind the armor inside the upper deck. The shore wireless stations of the navy have been much improved, and communication is now had nightly between Colon and Key West.

A relay for wireless telegraphy has been patented in England by Mr. W. P. Thompson, of Berlin, Germany. In order to be able to receive very weak signals use is made of an oscillating relay in combination with a local telephone circuit. The relay consists of a light oscillating armature supported on two stretched wires and having fixed to it one electrode of a sensitive carbon microphone contact. The armature is tuned to the periodicity of the received signals and resonates to them, the resultant parallel movement giving a good microphone action

at the contact. Several such relays may be connected in series with their armatures tuned one to another. Magnetic control of the sensitiveness of the relay is provided.

In a recent article in the *Electrotechnische Zeitschrift*, of Berlin, Mr. G. Dettmar reports that wireless telegraphy in Germany is making progress. From stations on shipboard it has been possible to transmit wireless messages to a maximum distance of 2,300 miles and from stations on land to distances of 3,200 miles. Automatic and semi-automatic telephone systems appear to find favor at some places where they have recently been installed. Several long-distance telephone lines have been improved by the Pupin system, which has also been employed on a submarine cable of 7 miles length. This has been in operation for four years and has proved very successful. There are also in operation several telephone cables of an aggregate length of 75 miles, with extra self-induction uniformly distributed all along the line by means of an iron wire spun around the copper conductor.

The Telephone.

Patent No. 973,644 for an aeroplane, has been granted to L. De Forest, New York, N. Y. This is a wireless telephone system, including a singing arc circuit for creating oscillations in the aerial by means of varying the amplitudes by sound waves acting through a transformer.

Mr. M. C. Rorty, manager of the Pittsburg division of the Bell Telephone Company of Pennsylvania, has been promoted to important duties in the office of Mr. H. B. Thayer, vice-president of the American Telephone and Telegraph Company, New York. Mr. Rorty is a graduate of Cornell University and entered the telephone service in 1897. He has held important positions with the telephone companies in New York, Boston and Pittsburg.

Mr. Simon Baer, who organized the Atlanta Telephone and Telegraph Company of Atlanta, Ga., died in that city, December 4, of Bright's disease. He was sixty-three years of age.

In many cities when a telephone subscriber wishes to call up the Western Union Telegraph office it is not necessary to give the telephone number, but simply say "Western Union."

Fire insurance companies have decided upon a material concession in rates on telephone exchange property, including switchboards and other apparatus.

Consul-General E. D. Winslow at Stockholm, Sweden, reports that the Swedish Telephone Company has secured an order in Cape Town, South Africa, for 50,000 telephones, valued at nearly \$100,000.

Mr. Lloyd Espenschied, of the Telefunken Wireless Telegraph Company, New York, is now with the engineering department of the American Telephone and Telegraph Company, New York.

ST. LOUIS AMERICAN TELEGRAPH AND TELEPHONE NOTES.

Mr. E. A. Shelnutt, late night test board man, has been transferred to Nashville, Tenn., as test board man. Mr. J. D. Stephens of this office, and Miss Hattie Sprague of Bloomington, Ill., were married on Sunday, December 4, at the residence of the bride's parents at Bloomington. Mr. John J. Dale, for several years with the Postal Telegraph-Cable Company, and later in the brokerage business, is now a member of the test room force. Mr. J. C. Fallinger has accepted a position in the test room. Mr. J. L. Fennell, formerly of this office, and now agent for the Southern Pacific Railway, at South Vallejo, Cal., was a recent visitor in St. Louis.

For the third time within a few months a suit has been started at Trenton, N. J., against the Continental Telephone and Telegraph Company, capital \$50,000,000, which controls various telephone companies in different parts of the country, alleging mismanagement and insolvency, and asking for the appointment of a receiver.

Letters from our Agents.

OMAHA, WESTERN UNION.

Mr. H. C. Pierce, who has been appointed wire chief of the Omaha office, vice Mr. W. Salisbury, advanced to the position of district plant superintendent, Omaha, was born at Waterloo, Iowa, September 27, 1878. He entered the telegraph service for the Postal Telegraph-Cable Company, at Waterloo, thirteen years ago, and from there was transferred to Des Moines, Iowa, as night chief operator, serving in that capacity for two years. He then went to Davenport, Iowa, to work for the Associated Press and later to the Postal Company at Omaha as traffic chief. Later he was employed at Denver as night chief operator, and afterwards at Colorado Springs as chief operator. He returned to Omaha for the Western Union Company in August, 1903, serving as operator and later was placed in charge of the printer department from whence he was advanced to his present position November 10, 1910.

Mr. C. M. Trimble, who was appointed chief operator of the Omaha, Neb., office in place of Mr. J. P. Barnhart, promoted, was born near Meriden, Kan., December 27, 1874. He learned telegraphy when about seventeen years of age, and was employed by the Atchison, Topeka and Santa Fe Railway Company for eight years, as operator and agent, and as relay operator. After severing his connection with the railway, he entered the Western Union office at Wichita, Kan., in August, 1901, and was appointed to the position of chief operator in that office in 1904, which position he occupied until transferred to the Omaha office November 1.

Mr. B. Paul Powell has been appointed night wire chief of the Omaha, Neb., office vice Mr. J. P. Barnhart, promoted to be district traffic superintendent at the same place, and Mr. B.

Jaeger has been appointed wire chief, days, in the same office.

PHILADELPHIA, WESTERN UNION.

Mr. R. J. Meigs, district plant superintendent, has effected an organization of his district as follows: Mr. S. R. Crowder, supervisor of equipment, with Mr. John J. Richards as assistant; Mr. J. W. Benckert, inspector of equipment, Mr. C. M. Pennypacker, of the Barclay system, chief of equipment; Mr. Robert C. Murray, plant chief; Mr. John V. Berger, wire chief, with Messrs. E. L. Maize, G. Orem Gregg, Morgan G. Moyer, S. S. Peck, and O. M. Pennypacker as assistant wire chiefs; Mr. J. O. Edmonson, district foreman, with Mr. A. H. Yates as assistant.

The following-named gentlemen have been appointed as assistants to Mr. Mahlon G. Moyer, traffic chief; Mr. Edward V. McElroy, Mr. John Truitt and Mr. Joseph T. Wilde.

Mr. W. A. Sawyer, district commercial superintendent, has divided the city in three districts and appointed the following-named gentlemen district commercial managers to take charge of these districts: Mr. Harry M. Hahl, formerly manager at 931 Chestnut Street, Maurice Neipling, formerly manager at the Bourse, and Mr. E. H. Shriner, lately assistant manager.

Mr. Ernest Brenzel, clerk in superintendent Sawyer's office, has been promoted to fill the vacancy caused by the advancement of Mr. Joseph Slater as chief clerk to Superintendent Meigs.

PITTSBURG, WESTERN UNION.

The following appointments and promotions are announced: Mr. J. A. Larimore, chief operator; Mr. C. H. Rugg, assistant chief operator; Mr. D. D. Calvert, southern wire chief to succeed Mr. J. A. Larimore. Messrs. W. S. Philp, C. E. Wilson, J. C. Connor, Wm. Schragen and F. L. Wheeler have been appointed supervisors of traffic. Messrs. E. Fisher and W. W. Creahn have been advanced to the repeater department.

NEW YORK, POSTAL.

A complimentary dinner was tendered to Mr. J. J. Whalen, manager, and Mr. D. F. Mallen, assistant manager, of this office, by about seventy-five associates and friends at Monquin's Sixth avenue restaurant, on the night of December 7, to celebrate the recent promotions of these gentlemen. Among those present were: Mr. C. F. Leonard, superintendent; Mr. Charles Shirley, assistant superintendent of traffic, and Mr. E. P. Tully, city manager; Messrs. Wm. Carroll, John Costello, Frank E. McKiernan, Thos. J. Dunn, John Dempsey, Thos. Doyle, John P. Regan, E. J. Rankin, J. F. J. Murphy, Marion J. Pike, and Drs. P. Burns and William Davis. Mr. P. F. Larkins acted as toastmaster.

NEW YORK, WESTERN UNION.

Mr. O. H. Peacock has been transferred from this office to take charge of the winter office at Pinehurst, N. C.

Mr. A. M. Lewis, chief in the Eastern Division, Battalion Quartermaster, Twenty-second Regiment of Engineers, was presented last week with a hand-

some cup, inscribed as follows: "From Officers and Members of Co. F, Twenty-second Regiment, as a token of their regard and friendship."

Mr. Maxwell Green (assistant wire chief on South), who is quite a fraternity man, was recently elected to the Junior Warden's chair in his Masonic Lodge, "Eastward Ho." Mr. C. F. Van Winkle, of this office, received the appointment of Senior Deacon in the same lodge.

The Robert W. Martin Fund.

Mr. Charles Shirley, assistant traffic superintendent of the Postal Telegraph-Cable Company, New York, together with a few other friends of Mr. Robert W. Martin, have contributed \$15.00 for the relief of their old friend who has been suffering from a paralytic stroke for several years past and who has been for the past four years confined to his bed. "Bob" Martin, as he was familiarly called, was one of the best known and finest operators in the country during the past forty years. His illness has been of a lingering nature and his friends have generously contributed toward his support for some time past. Mrs. Martin in a recent letter to the editor of this publication stated that she was in needy circumstances and she hoped a few of "Bob's" old friends who could afford to do so would come to his relief in this hour of their necessity. No doubt many of Mr. Martin's friends will be glad of an opportunity to help their former fellow-worker in distress, and those who have already subscribed toward this worthy purpose may find it possible to make further contributions.

Assessment No. 516 has been levied by the Telegraphers' Mutual Benefit Association, to meet the claims arising from the deaths of James Swan, at Minneapolis, Minn., Isaac W. Hallam, at Wilmington, Del., John J. Barrett, at Brooklyn, N. Y., John V. O'Brien, at San Francisco, John H. Beymer, at Wheeling, W. Va., and David Davis, at Syracuse, N. Y.

WANTED—A draughtsman who understands electricity and can make himself useful in the construction of printing telegraph machinery. Address Printing, care of Telegraph and Telephone Age, New York.

American Telegraphy and Encyclopedia of the Telegraph

By WILLIAM MAVER, JR.

668 Pages, 490 Diagrams, \$5.00.

To facilitate the purchase of this valuable work on telegraph engineering and electricity and magnetism, the publishers will forward the book to responsible telegraphists and telephonists on receipt of order for same as follows:

"Please send me one copy of 'American Telegraphy and Encyclopedia of the Telegraph,' for which I agree to pay \$5.00; namely \$1.00 (plus 25c. postage) herewith and \$1.00 monthly for four months."

Reference Signature and Address."

Special discounts to agents. Write for terms.

Address

Maver Publishing Co., 136 Liberty St., New York

Mr. H. R. Cook, manager of the Postal Telegraph-Cable Company at Pittston, Pa., writes:—"Enclosed find \$2.00 for another year of the much looked for and helpful Telegraph and Telephone Age. Need it in my business."

DISAPPEARED

Information wanted as to the present whereabouts of William H. Bogar, a telegrapher. Last heard of at Hopkins, Michigan; formerly of Armington, Illinois. Important to him or his family: Write JOHN D. SAGE, Box 892, Cincinnati, O.

The Telegraphers' Mutual Benefit Association, 195 Broadway, New York, enables telegraph and telephone employees to provide for their families life insurance in reasonable amounts, at a cost so low as to be within the reach of all. It has already paid beneficiaries of deceased members \$1,500,000, at an average annual cost per \$1,000 of about four cents a day, and has also accumulated \$317,000 Reserve Fund securely invested, to provide against excessive cost in the future. Membership is easily acquired and cannot be invalidated during life for any cause except failure to pay the necessary mortuary calls.

The Serial Building Loan and Savings Institution, 195 Broadway, New York, should interest every sober-minded telegrapher in New York and vicinity. To married men it affords an opportunity to own a home on very easy terms. What is now paid for rent goes to your credit if paid into the Institution and in a few years your home will be entirely paid for. There are scores of men connected with the telegraph and telephone services who would like to have a home of their own. They should write to the Institution and find out what it can do for them in this regard.

MARTIN'S LATEST VIBROPLEX. \$9.00.
J. B. Havice, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

DEPENDABLE SERVICE

is the aim of every public service corporation. A reliable supply of energy is best procured by the use of the "Chloride Accumulator," the most widely used of all storage batteries.

THE ELECTRIC STORAGE BATTERY CO. Philadelphia Pa.

TELEGRAPH AND ELECTRICAL TRADES DIRECTORY

NOTICE

To Managers of Telegraph Offices and Users of the Wires:

On December 1 the Western Union and Postal Telegraph Companies put into effect new rules governing the transmission of domestic messages sent in code language.

Those who have been in the habit of using mutilated words will have to exercise great caution if they desire to get their messages forwarded promptly and at the same time avoid complications in the settlement of their accounts with the telegraph companies.

As the Western Union and Postal Telegraph Companies have given their stamp of approval on Official Vocabulary words, those who use the particular words referred to can feel absolutely safe.

The largest and most comprehensive Code in which Official Vocabulary words alone are employed is the WESTERN UNION TELEGRAPH CODE, UNIVERSAL EDITION, published by the

INTERNATIONAL CABLE DIRECTORY COMPANY
15 Pearl Street, New York

The most important corporations and firms in the world are using the

WESTERN UNION TELEGRAPHIC CODE

Price: \$16 per copy in cloth, and \$18 in flexible leather covers.
Pocket Edition (unabridged) \$10 per copy.

Buy the

INTERNATIONAL CABLE DIRECTORY OF THE WORLD

which is issued in conjunction with the Western Union Telegraphic Code.

A three years' subscription for \$16. The Directory contains the names, lines of business and cable addresses of upwards of 30,000 subscribers to the WESTERN UNION TELEGRAPHIC CODE.

It is the most valuable work of reference ever published.

The placing of your name in this book means a world-wide advertisement, and a rapid extension of your line of customers, both at home and abroad.

Maver's American Telegraphy.

The new and enlarged edition of Maver's "American Telegraphy and Encyclopedia of the Telegraph," known as the 1909 edition, is probably the most complete text-book on telegraphy which has ever been written. Among the important additions to the work in this edition are descriptions of the Barclay Long Distance Printer, as operated on the lines of the Western Union Telegraph Company, and the Murray Printer, as now used in Europe. This book is a library on telegraphy, simultaneous telegraphy and telephony, on wire and cable testing, etc. It is used as a text-book and a book of reference in many of the largest universities, and the large telegraph and telephone offices in this country. It contains within its covers a complete elementary treatise on electricity and magnetism, primary and storage batteries, line construction, etc. The beginner may successfully peruse his studies of these subjects by means of this book without reference to any other work. This statement is attested to by many successful telegraph and telephone engineers who gratefully term the book their Alma Mater. The book is written in simple English, and is practically without mathematics. No aspiring student in the telegraph or telephone ranks can afford to be without it. This fine work will be sent to any address, carrying charges prepaid, on receipt of price, \$5.00, by J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

THIS SOUNDER CAN BE ATTACHED TO ANY RELAY

THE

Reynolds' Relay Sounder Attachment

This sounder attachment successfully does away with the local battery and local sounder. It uses the main line current. You read from the relay sounder instead of from the local sounder. It gives a soft loud sound that can be read at a great distance, and over the click of any typewriter. Soon pays for itself in saving renewals and ruined clothing and job of caring for locals, etc. Has been tested out and approved by head officials of O. R. T. and some railroads. If there is any current going over the wire at all you can easily read from this sounder. Order one now before you forget it.

Margin of Operating Current in a Selector

is a most important factor of constant and reliable service.

"The least change in conditions will knock them out. . . . The jar of the towers puts them out of adjustment. . . . You cannot vary the current two milliamperes without choking. . . . The adjuster is not half-way home before trouble is again reported."

These expressions, from officials in railway train dispatching service DO NOT refer to the GILL SELECTOR, but to other makes.

The GILL SELECTOR is operating today, country-wide, under every possible climatic variation, and on wide ranges of current, with absolute constancy and reliability.

Its operative margin of current is far in excess of all probable variations. It is furnished in perfect adjustment, hermetically sealed, and its operation is guaranteed, unless tampered with.

Phillips Code.

THE STANDARD FOR YEARS

NEW AND REVISED EDITION ISSUED MARCH 16, 1909

PHILLIPS CODE FOR YEARS HAS EMBODIED the best method of short-hand or abbreviations arranged for telegraphic purposes. It has been brought strictly up-to-date; is modern, complete; has withstood all tests.

PHILLIPS CODE PROMOTES RAPID TRANSMISSION, and for press reports, especially, was long since declared to be the best system ever devised. By common consent it is STANDARD, and everywhere is regarded in the profession as indispensable in contributing to the operator's fund of practical knowledge. In fact, not to understand Phillips Code acts as a distinct embarrassment to the operator.

SANDWICH, ILL.

Some Valuable Electrical Books.

All of the books described in the following list embody a choice number from which selections may advantageously be made, and furnishes an excellent catalogue for the consideration of telegraphers desirous of selecting suitable books for study. Any book named will be sent upon receipt of price to any address, carrying charges prepaid. Address J. B. Taltavall, TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York:

POCKET EDITION OF DIAGRAMS.

"Pocket Edition of Diagrams and Complete Information for Telegraph Engineers and Students" is acknowledged on all sides to be the standard work of the telegraph. Speaking strictly within bounds, it is not too much to say that this volume presents the finest study of the complex subject of the telegraph ever attempted. There is no other book like it or even approaching it, in thoroughness, comprehensiveness, or in original detail of statement. The author, Willis H. Jones, is a practical telegrapher himself—an engineer in his profession of recognized ability, who knows exactly what other telegraphers want to know, and has the faculty of imparting that knowledge in a manner at once so clear, so simple, so bright, so entertaining, so free from needless technicalities, that his readers, even the least informed among them, readily understand his meaning. The helpful qualities of the work will be clearly manifest alike to the beginner, to the student, to the operator and to all telegraphers, whether in the commercial or in the railroad service.

"Pocket Diagrams" does not deal in theory; it is packed full from cover to cover of the common sense of telegraphy, the side which the ordinary every-day operator runs up against, and respecting which he desires information of the kind that will aid, not mystify him. The book contains 334 pages, and has 160 splendid diagrams. It has the unqualified endorsement of telegraphers everywhere.

The price of "Pocket Edition of Diagrams," etc., is \$1.50.

PHILLIPS CODE.

The popularity of the Phillips Code, by Walter P. Phillips, was never more apparent than at the present time. Its acceptance by the telegraphic fraternity, as a standard work of the kind, dates from its first publication, and the constantly increasing demand for this unique and thoroughly tested method of shorthand arranged for telegraphic purposes, has necessitated from time to time the issuance of several editions. The present edition was carefully gone over, by Mr. A. P. Velie, an expert press and code operator, for many years identified with the Associated Press, New York, a few revisions made and a number of contractions added, until now this "stanby friend of the telegrapher" is strictly up-to-date in every particular. It has been declared that an essential qualification of a "first-class operator" was a thorough understanding of Phillips Code.

Many expert code operators have examined the revised edition of this code, and all unite in pronouncing it perfect. Mr. George W. Conkling, who has won the championship for sending code in many tournaments, says:

"I have examined thoroughly the additions contained in the latest edition of the Phillips Code and most heartily approve of them. Every operator who is familiar with the code should find no difficulty in mastering the new contractions, as they 'fit in' smoothly and I think the ground has been entirely covered." The price of the book is \$1 per copy.

"Telegraphers of To-day," illustrating the personnel of the telegraphic profession, as it existed in 1894, with more than 900 biographical and historical sketches of leading members of the craft, is a unique and valuable work; it has become standard, being the only work of the kind extant. It contains 354 double-column pages 11 x 14 inches in size, has gilt edges and is bound in imitation morocco.

Of this fine publication, becoming more and more valuable as time passes, we have but a few copies left. The original price was \$5. In order to readily dispose of these remaining volumes, and place them where they rightfully belong, in the hands of every telegrapher who failed to secure a copy at the higher original price, we have cut the figure to \$2 a volume, express charges prepaid. At this low rate, a sum about the cost of binding the book, no telegrapher who desires to own a copy should fail to obtain one at this time, for this "bargain" price will probably never be repeated.

"The Life of Prof. S. F. B. Morse" is the standard work, authorized by the Morse family, and compiled from original papers and other authentic data in their sole possession. It is a clearly written biography, charmingly told by a trained newspaper man, a close personal friend, and presents the life of this great inventor of the telegraph in a broader, more intense, human and truthful attitude than ever before attempted or even made possible; 775 pages, illustrated; sheepskin binding. The original price was \$6, which we have reduced to \$3 on receipt of which the book will be sent, express charges prepaid.

"The Telegraph in America," by the late James D. Reid, the "father of the telegraph," furnishes an authentic and complete history of the telegraph, tracing out its early start, its development, the organization of the various telegraph and cable companies, etc. The book is bound in full Russia, has 846 pages, and is abundantly illustrated; a magnificent gift to any telegrapher. There are now but a few copies left of this great work and when these are gone the work will be out of print. The original price was \$7, but as the covers are a little shopworn the price has been reduced to \$5.

"Sketches Old and New," by Walter P. Phillips, is a handsomely bound volume of 164 pages of interesting and charmingly told telegraph stories; one of the very best works of the kind ever published and which will appeal strongly to every telegrapher; price \$1.

"Lightning Flashes and Electric Dashes," a book made up of bright, ably written stories and sketches, telegraphic and electrical, that should find a place in the home of every telegrapher; 160 large double-column pages; profusely illustrated; price reduced from \$1.50 to \$1.00 per copy.

Old Timers' Souvenir—Miniature Legless Key. This is a beautiful emblem for operators; an attractive charm for the watch chain; a perfect duplicate in every detail of the celebrated miniature steel lever telegraph key that attracted so much attention and which was distributed as a souvenir at the banquet of the Old Time Telegraphers' and Historical Association at the Waldorf-Astoria, New York, August 31, 1905. It has a French lacquered body and nickel-plated lever. Price, by registered mail, prepaid, \$1.50.

The diagrams appearing in "Official Diagrams of the Postal Telegraph-Cable Company's Apparatus and Rules Governing the Construction and Repair of Lines" were made from the company's blueprints and are absolutely correct. This volume, which is published by Telegraph and Telephone Age, under official sanction and supervision, is of especial value to operators and linemen. It will be sent to anyone, postpaid, on receipt of fifty cents.

By taking a little trouble when Telegraph and Telephone Age first comes to hand, it may be preserved to form a permanent and valuable addition to the reading matter of a kind which all telegraphers should be supplied. We furnish a neat and attractive cloth-bound binder, which will be sent by mail, prepaid, for \$1. It has good, strong covers, on which the name Telegraph and Telephone Age is stamped in gold, and means by which each issue may be securely held as in a bound book. One binder may thus be made serviceable for a number of years, and when successive volumes, as they are completed, are bound in permanent form, the subscriber ultimately finds himself, for a moderate cost, in possession of a most valuable addition to his library, embracing a wide variety of telegraph, electrical and general information.

GOS SELECTOR

No. 32800

Is provided for any number of calls per circuit, and can be equipped for any number of calls per station

Can be used for direct control of train order signals, and may be equipped with a visual indication to the dispatcher of the signal movement

Uses but a very small operating current and has an exceptionally high speed

There is but one contact between the dispatcher and the operator. No local battery is used. The bell has no vibrating contact. The calls are lightning-proof

The Solution of the Wood Preserving Problem

INDIAN TIMBERASPHALT

Makes it possible to treat timber thoroughly
and effectively *at low cost.*

"TIMBERASPHALT" costs one-half as much as Creosote—and
one-tenth as much as other Coal Tar Preparations. It is slower
running and not susceptible to weather changes. It excludes
moisture, heat and air, thereby preventing the attack of wood
destroying fungi. This insures the maximum life of the timber
under all conditions.

It may be applied by Brush, Open Tank or Pressure Methods.
Write today for detailed information and prices—

CATALOGUE SENT ON REQUEST.

THEY COST NOTHING
to maintain and but little
to install

C. E. TUNING COIL

This tuning coil is finished with solid mahogany ends, with nickelled brass trimmings, and in connection with an average aerial, will respond to signals 100 miles distant.

Price \$5.00

STANDARD TUNING COIL

Has three slides and is wound with a bare copper wire with about 300 convolutions. Size of drum, 1 3/4 x 3 inches. With suitable aerial will respond to wave lengths up to 500 meters, 100 miles distant.

Price \$4.00

FERRON DETECTOR

The Detector operates best without either potentiometer or battery and is exceedingly simple in operation.

"Ferron" is a metallic crystal and is held in a brass cup mounted on the detector stand and exceedingly fine adjustment of pressure is easily obtained by means of the triple spring operated by the hard rubber knob. With this detector messages have been received for distances of 800 miles.

Price \$5.00

TELEGRAPHERS OF TO-DAY.

"Telegraphers of To-Day," illustrating the personnel of the telegraphic profession as it existed in 1894, with more than 900 biographical and historical sketches of leading members of the craft, is a unique and valuable publication; it has become standard, being the only work of the kind extant. It contains 354 double-column pages, 7 x 11 inches in size, has gilt edges and is bound in imitation morocco—altogether a handsome volume.

Of this fine publication, becoming more and more valuable as time passes, we have but a few copies left. The original price was \$5. In order to readily dispose of these remaining volumes, and place them where they rightfully belong, in the hands of every telegrapher who failed to secure a copy at the higher original price, we have cut the figure to \$1 a volume. On receipt of this amount the book will be sent to any address, express charges to be paid by the purchaser. At this low rate, a sum below the cost of binding the book even, no telegrapher who desires to own a copy should fail to obtain one at this time, for this "bargain" price can never be repeated, as the book will soon be out of print. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

CATALOGUE OF BOOKS ON THE TELEGRAPH.

ARMSTRONG, J. P.—The Modern Service of Commercial and Railway Telegraphy, in Theory and Practice, including the Railway Station and Express Service; arranged in Questions and Answers; \$2.00.

BATES, DAVID HOMER—Lincoln in the Telegraph Office; Recollections of the United States Military Telegraph Corps during the Civil War; 432 pages; illustrated; price \$2.17.

BELL, JAMES, A.I.E.E.—Submarine Cable Telegraphy; 63 pages, 39 illustrations; \$1.00.

BRIGHT, CHAS., F.R.S.E., M.I.E.E.—Submarine Telegraphs; 800 pages; \$25.

BRIGHT, CHAS., F.R.S.E., M.I.E.E.—Story of the Atlantic Cable; 220 pages; \$1.00.

BRIGHT, CHAS., F.R.S.E., M.I.E.E.—Life Story of Sir Charles Tilston Bright; \$5.00.

CROCKER, F. B., AND WHEELER, S. S.—The Management of Electrical Machinery. Has a special chapter by H. A. Foster. Contents: Descriptions and Directions; Examination, Measurement and Testing; Localization and Remedy of Trouble in Dynamotors and Motor Generators. Fully illustrated; \$1.00.

CROUCH, ARTHUR—Hughes and Baudot Telegraphs; 83 pages, 41 illustrations; \$1.00.

DOUGLASS, G. M.—The Telegraph Instructor. This volume, now in its fourth edition, is admirably designed for the student and beginner, for in explanation and illustration it is clear and profuse; 260 pages, \$1.00.

FOWLER, F. F.—Transmission Line Crossings; treats of dangers to low tension lines from high tension transmission circuits and means of avoiding same; illustrated \$1.50.

GIBSON, CHARLES R.—How Telegraphs and Telephones Work. A simple explanation in non-technical language of the general principles of electricity as applied to telegraph, telephone and wireless operation; \$1.00.

GRAY, ANDREW, LL.D.; F.R.S.—Life of Lord Kelvin; 326 pages; \$1.25.

HERBERT, T. E.—Electricity in its Application to Telegraphy. A Practical Handbook Covering the Syllabus of the New Technical Examination. Adopted by the English Post Office Telegraph Department. Fourth edition, with forty-eight illustrations; \$2.60.

HOUSTON, E. J.—A Dictionary of Electrical Words, Terms and Phrases; 980 pages; 582 illustrations; \$7.00.

HOUSTON, E. J.—A Pocket Dictionary of Electrical Words; cloth, \$2.50.

JONES, WILLIS H.—Pocket Edition of Diagrams and Complete Information for Telegraph Engineers and Students. This standard work has been carefully revised and 74 pages and 30 diagrams added, including full descriptions of the newest apparatus lately adopted by the Western Union and Postal telegraph companies. It presents the finest study of the complex subject of the telegraph ever published; it explains clearly the equipment of a modern telegraph office, and is a text-book that no student, operator, engineer or official, no matter what his grade, can afford to be without; 334 pages, 52 chapters, 160 illustrations; \$1.50.

LOCKWOOD, T. D.—Electrical Measurement and the Galvanometer and its Uses; 144 pages, fully illustrated with diagrams of connections, engravings of apparatus, etc. \$1.50.

LOCKWOOD, T. D.—Electricity, Magnetism and Electric Telegraphy; A Practical Guide and Handbook of General Information for Electrical Students, Operators and Inspectors; 376 pages; 152 illustrations; \$2.50.

LYNDON, LAMAR—Storage Battery Engineering; 360 pages; 178 illustrations and diagrams; 4 large folding plates; \$3.00.

MARSHALL, PERCIVAL—Small Accumulators; How Made and Used; an Elementary Handbook for the Use of Amateurs and Students; 50 cents.

MAVER, WM., JR.—American Telegraphy and Encyclopedia of the Telegraph. This fine work, revised and enlarged, treats of the systems, apparatus and operation of telegraphy; 668 pages; 492 illustrations; \$3.00.

MAVER, WM. and DAVIS, M. M.—Quadruplex; 128 pages; 63 illustrations; \$1.50.

MEADOWCROFT, WM. H.—A B C of Electricity. This book begins at the very root of electrical science, and contains a vast amount of useful information; 50 cents.

MEYER, FRED L.—Twentieth Century Manual of Railway and Commercial Telegraphy. This work embraces all kinds of commercial messages, train orders, phrases, etc.; 269 pages; illustrated; \$1.00.

MEYER, FRED L.—Railway Station Service. A text-book for those who wish to become properly equipped station, baggage, freight or ticket agents; 216 pages; fully illustrated; \$1.25.

MONELL, D. S. H.—The Cure of Writers' Cramp, and the Arm Troubles of Telegraphers. This valuable treatise should be in the possession of every telegrapher suffering from this common annoyance; 50 cents.

OFFICIAL DIAGRAMS of the Postal Telegraph-Cable Company's Apparatus and Rules Governing the Construction and Repair of Lines. This book has been produced by authority of the Postal Telegraph-Cable Company, and under the personal supervision of John F. Skirrow, associate electrical engineer. All of the engravings are made from the official blue-prints of the Postal company, and are therefore absolutely correct; 134 pages; 105 full-page illustrations; 50 cents.

PHILLIPS, WALTER P.—Phillips Code. A popular, generally used and thoroughly tested method of shorthand arranged for telegraphic purposes, and contemplating the rapid transmission of press reports; also for general newspaper and court reporting; flexible leather cover, pocket size; \$1.00.

PRIME, S. ISENAEUS.—Life of S. F. B. Morse. The only work authorized by the family and executors of the great inventor, compiled from original data. This is the finest, most accurate and complete life of Prof. Morse, and includes the history of the invention of the telegraph and the many important business connections with those who were interested with Prof. Morse in the development of the telegraph, that has ever emanated in any shape or at any time from the press; sheepskin; 775 pages, illustrated. The regular price of \$6 has been reduced to \$3.

POPE, FRANKLIN LEONARD.—Modern Practice of the Electric Telegraph; a Technical Handbook for Electricians, Managers and Operators; 234 pages; 185 illustrations; \$1.50.

PRESCOTT, W. H., AND SIVSWRIGHT, J.—Telegraphy. A description of every telegraph system and apparatus used in the English telegraph department; ninth edition; with appendix; 504 pages; 272 illustrations; \$2.50.

REID, JAMES D.—The Telegraph in America. A complete detailed history of the telegraph, including the organization of the various telegraph and cable companies; 894 pages; illustrated; full morocco binding. Reduced from \$7.00 to \$5.00.

SCHNEIDER, N. H.—Electrical Instruments and Testing; with new chapters by Jesse Hargrave, of the Postal Telegraph-Cable Company, on testing wires and cables and locating faults in telegraph and telephone systems; how to use the voltmeter, ammeter, galvanometer, potentiometer, ohmmeter, the Wheatstone bridge, and the standard portable testing sets; 256 pages; 133 illustrations; cloth, \$1.00; full limp leather, \$2.00.

SCHNEIDER, N. H.—Model Library, comprising 4 books, viz.: Study of Electricity for Beginners; Dry Batteries; Electrical Circuits and Diagrams; Electrical Bells, Alarms, etc.; bound in one volume; cloth, \$1.

SMITH, E. W.—Electricians' Manual of Diagrams; 93 pages; 50 cents.

TALTAVAL, JOHN B.—Telegraphers of To-Day. Biographical and historical sketches of more than 900 leading telegraphers, living and dead; published in 1894; 354 double-column pages, 11 x 14 inches; gilt edges; imitation morocco binding; only work of the kind; of much practical value to those who would keep in touch with the personnel of the profession; reduced from \$5.00 to \$1.00, express charges collect.

THOM, CHARLES, AND JONES, WILLIS H.—Telegraphic Connections; Embracing Methods in Quadruplex Telegraphy and other Apparatus; 30 plates with circuits distinguished by being printed in three different colors; \$1.50.

WHEAT, W. L.—Handy Electrical Dictionary; 224 pages; 32 illustrations; cloth, 50 cents.

WILKINSON, H. D.—Submarine Cable Laying and Repairing; \$6.00, revised, 1909.

YOUNG, J. ELTON.—Electrical Testing for Telegraph Engineers; \$4.00.

TELEGRAPH SKETCH BOOKS.

LIGHTNING FLASHES AND ELECTRIC DASHES.—A book made up of bright, ably written stories and sketches, telegraphic and electrical, that should find a place in the home of every telegrapher; 160 large double-column pages; profusely illustrated; reduced from \$1.50 to \$1.00.

PHILLIPS, WALTER P.—Sketches, Old and New, by the author of Phillips' Code, containing a number of telegraph stories, told with all the charm of that delightful storyteller; 200 pages; illustrated; \$1.00.

BOOKS ON WIRELESS TELEGRAPHY.

BOTTONE, S. R.—Wireless Telegraphy and Hertzian Waves; diagrams and illustrations; \$1.00.

COLLINS, A. FREDERICK.—A History of Wireless Telegraphy, its Theory, Experiments and Results Obtained; 300 pages; 332 illustrations; \$3.00.

COLLINS, A. FREDERICK.—Manual of Wireless Telegraphy; 232 pages; 90 illustrations; cloth, \$1.50.

EICHORN, GUSTAV.—Wireless Telegraphy; 126 pages; 79 illustrations; \$2.75.

FLEMING, PROF. J. A.—Elementary Manual of Radio-Telegraphy and Radio-Telephony. 340 pages, numerous illustrations; \$2.50.

KENNELLY, A. E.—Wireless Telegraphy and Wireless Telephony; illustrated with 84 diagrams and pictures; 1910 edition; \$1.00.

LONG, PROF. OLIVER J.—Signaling Across Space Without Wires. A description of the work of Hertz and his successors. Contains numerous diagrams and half-tone illustrations; \$2.00.

MAVER, WM., JR.—Maver's Wireless Telegraphy; Theory and Practice; new edition, 368 pages and 258 illustrations; \$3.00.

PIERCE, PROF. G. W.—Principles of Wireless Telegraphy; valuable for the professional electrician as well as for the amateur with little knowledge of electricity; 10th edition; 342 pages, 235 illustrations; \$3.00.

ROBINSON, LIEUTENANT-COMMANDER S. S.—Manual of Wireless Telegraphy for the Use of Naval Electricians; 129 pages; 60 illustrations; \$1.50.

SEWELL, CHARLES H.—Wireless Telegraphy, its Origin, Development, Inventions and Apparatus; 229 pages; illustrated; \$2.00.

STORY, A. T.—The Story of Wireless Telegraphy; 215 pages; 56 illustrations; \$1.00.

TREVERT, EDWARD.—A B C of Wireless Telegraphy; 7 chapters; 20 illustrations; \$1.00.

VERLAND, F. K.—Maxwell's Theory and Wireless Telegraphy; 250 pages; illustrated; \$2.00.

BOOKS ON THE TELEPHONE.

DOLBEAR, A. E.—The Telephone. An account of the phenomena of electricity, magnetism and sound as involved in its action, with directions for making a speaking telephone; 50 cents.

HOMANS, JAMES E., A.M.—A B C of the Telephone; 350 pages; profusely illustrated; \$1.00.

MILLER, KEMPSTER B.—American Telephone Practice; fourth edition; entirely rewritten and greatly extended. This comprehensive study of the subject explains in detail every piece of telephone apparatus; 904 pages; 304 illustrations; \$4.00.

VAN DEVENTER, H. R.—Telephony; 586 pages; 700 illustrations; issued 1910; treats of magneto common battery and automatic systems, composite telephony and telephony and describes all kinds of modern apparatus; \$4.00.

CABLE CODES.

A B C CODE, fourth edition; \$5.00.

A B C CODE, fifth edition. This book is entirely different from the work known as the "A B C Code, Fourth Edition," and the two should not be confounded; \$7.00.

A 1 UNIVERSAL COMMERCIAL ELECTRIC TELEGRAPHIC CODE; \$7.50.

LIEBER, B. FRANKLIN.—Telegraphic Cipher Code; \$12.00.

MCMILL, BEDFORD.—Code; \$6.00.

MORRIS, C. A., AND NEAL T.—Telegraphic Mining Code; \$5.00.

OFFICIAL VOCABULARY, compiled by the International Telegraph Bureau at Berne, containing over 1,000,000 carefully selected words; four volumes, \$30.00.

POSTAL TELEGRAPH CABLE CODE; \$3.50.

WESTERN UNION TELEGRAPHIC CODE.—Contains 175,000 words and phrases, carefully selected from the official vocabulary; \$16.00; with flexible leather cover, \$18.00; Pocket edition, unabridged, \$10.00.

INTERNATIONAL CABLE DIRECTORY OF THE WORLD.—Contains the names, lines of business and cable addresses of upwards of 30,000 subscribers to the Western Union Telegraphic Code; a three-year's subscription, \$16.00.

Any other code can be furnished on order.

Express or carrying charges on Cable Code Books are not prepaid; these books are sent charges collect.

Any electrical book published, American or foreign, will be sent promptly to any address in the world on receipt of price, postage or express charges prepaid.

Address, and make post office money-orders, express orders, drafts and checks, etc., payable to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

TELEGRAPH AND TELEPHONE AGE

ESTABLISHED 1883.

A Semi-Monthly Journal devoted to land-line Telegraphs, Telephones, Submarine Cable interests, Radio-Telegraphy and allied industries.

Endorsed by every telegraph official in the railroad and commercial field. Contains interesting personals, educational articles from the pens of the most expert men in the service, scientific and technical articles descriptive of the latest inventions, reminiscence by the leading telegraph writers and much other matter of absorbing interest to everyone identified with the telegraph.

Terms of Subscription: For one year, United States, Philippine Islands, Cuba, Mexico, \$2. Canada, \$2.50. All other Foreign Countries, \$3.

Headquarters for all Telegraph, Telephone, Wireless and Electrical Books and Cable Codes. Orders invariably filled the same day they are received.

J. B. TALTAVAL, Publisher

253 BROADWAY - - - NEW YORK

Interesting Subjects Treated in Back Numbers.

Telegraph and Telephone Age publishes the best articles which can be obtained anywhere upon telegraphic subjects. We enumerate herewith a few of the many important subjects treated in our columns during the past few years, together with the dates of the papers containing the same. We have a limited supply of the back numbers containing these articles which we will send to any address upon receipt of price, 25 cents each. Any of these issues less than six months old are not regarded as back numbers, but will be sent upon receipt of the regular price, 10 cents. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Signaling Through Space, C. D. Babcock.....	Jan. 1, 1909

The publisher of Telegraph and Telephone Age urges upon subscribers to this journal the desirability of having the paper sent to their home address rather than to their place of business. The reason is obvious. If it goes to your home it reaches you without danger of obstruction or abstraction by your office associates who are sometimes prone to borrow your copy to your discomfiture and their edification, but at your expense. This naturally is a source of irritation and of course you don't like it. If a man wants Telegraph and Telephone Age he should pay for it, and the individual who is paying for his copy should be guaranteed in his rights.

As we regard our subscribers as our friends, and believe we are supplying them with a telegraph paper the like of which does not elsewhere exist, we dislike to see them disappointed, and wish to protect them in their prerogative so far as we are able. We believe that a good many disappointments of non-receipt of the paper might be averted if our suggestion of sending it in all cases to the homes of its subscribers were adopted. Changes of address will be made as often as desired.

Directory of Annual Meetings.

Association of Railway Telegraph Superintendents meets at Boston, Mass., June 19-23, 1911.
Commercial Cable Company meets the first Monday in March, at New York.
Great North Western Telegraph Company meets the last Wednesday in September, at Toronto, Ont.
International Association of Municipal Electricians meets at St. Paul, Minn., 1911. Date to be named later.
Old Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps, will meet at Atlantic City, N. J., 1911. Date to be selected later.
Postal Telegraph-Cable Company meets the fourth Tuesday in February, at New York.
Telegraphers' Mutual Benefit Association meets the third Wednesday in November, at New York.
Train Despatchers Association meets in Baltimore, Md., June 20, 1911.
The stockholders of the Western Union Telegraph Company meet the second Wednesday in October, at New York; election of officers occurs on the third Wednesday in October.

THE MOST SUCCESSFUL
ELEMENTARY WORK.

A B C OF ELECTRICITY

By
W. H. MEADOWCROFT

One volume, 12mo. cloth, 50 cents. Fully Illustrated.

This excellent primary book has taken the first place in elementary scientific works. It has received the endorsement of Thos. A. Edison. It is for every person desiring a knowledge of electricity, and is written in simple style, so that a child can understand the work. It is what its title implies, the first flight of steps in electricity.

ENTHUSIASTICALLY ENDORSED BY THE PRESS.

Sent postpaid on receipt of price by

253 BROADWAY, NEW YORK.

POCKET EDITION OF DIAGRAMS

And Complete Information for Telegraph Engineers and Students.

By WILLIS H. JONES,

BOUND IN FLEXIBLE LEATHER

334 Pages—160 Illustrations.

A TELEGRAPHIC CLASSIC—THE STANDARD OF THE WORLD.

THIS VOLUME is the finest, most complete and comprehensive book on the telegraph ever published. It is colloquial, simple and clear in style, copious in the amount and diversity of practical information furnished, and will be welcomed by every student, operator, official and engineer.

IT IS SPLENDIDLY ILLUSTRATED

NO SUCH THOROUGH TREATMENT of the subject of the telegraph, clearly explaining the equipment of a modern telegraph office, has ever before been accomplished.

IN ADDITION TO A VAST AMOUNT of other material it contains the most valuable portions of the articles pertaining to electricity, storage batteries, the duplex, the quadruplex, Wheatstone system, the principal types of repeaters and other telegraph apparatus that Mr. Jones has written for TELEGRAPH AGE during a number of years past.

THIS WORK COVERS the entire field of a practical telegraph course, and the subjects are treated with a conviction and simplicity, wholly free from entangling technicalities, such as to render the volume one of delight and absorbing interest.

A STRONG AND VALUABLE FEATURE the book lies in the diagrams, clearly drawn and of a large size, which show the apparatus of the systems of both the WESTERN UNION TELEGRAPH COMPANY and of the POSTAL TELEGRAPH-CABLE COMPANY brought up-to-date. Each apparatus described, in addition to the theoretical illustrations, is accompanied by a diagram of an "actual binding post connection," taken from the blue-print, something that all linemen especially will thoroughly appreciate.

THE TELEPHONE AND SIMULTANEOUS TELEPHONY AND TELEGRAPHY is explained in a particularly clear manner—just the thing for those possessing little knowledge of the subjects.

The Price of Pocket Edition of Diagrams, etc., is \$1.50

This includes the Prepayment of Express or Postal Charges.

HOMAN'S A.B.C. of the TELEPHONE

A Practical Treatise.

WITH ILLUSTRATIONS AND DIAGRAMS.

"It is surprising what an excellent book can be produced at such a low price. Many of the illustrations are excellent, and the diagrams are exceedingly clear. The theory of the subject is described and the practical details are given. * * * Typographically the book is a satisfactory one, and the binding, black with yellow type, is very effective."—The Scientific American.

"This book belongs with the best class of popular scientific literature. While it is strictly elementary, in the sense that it begins with the elements, it nevertheless gives a very comprehensive survey of the entire field of telephone apparatus and construction. * * * In order that the book may be fully comprehended by the beginner the discussion of the telephone proper is preceded by an admirable chapter on the theory of sound and another on the fundamental principles of electricity. While not a 'primer,' the book is thus one which anyone can read if he has enough interest in the subject to try."—American Machinist.

The volume contains 375 pages, 268 illustrations and diagrams; it is handsomely bound in black vellum cloth, and is a generously good book.

Price \$1.00

Express Charges Prepaid.

Official Diagrams of the Postal Telegraph-Cable Company's Apparatus and Rules Governing the Construction and Repair of Lines

This volume contains 134 pages, including 105 full-page diagrams; size 7 x 4½ inches; price 50 cents.

Fourteen pages are devoted to rules governing the construction and repair of telegraph lines; and four to the subject of standard tools. Submarine cable splices, underground cable splices, single-wire joints and aerial cable splices are also fully treated. Under the general head of Rules for Wiring Offices and Cable Boxes, the subjects of the terminal office, intermediate offices, submarine and underground cables, aerial cables, call circuits and call boxes, leased wire offices, branch offices, miscellaneous, are fully given. Then come rules for the care of motors and generators, explanation of and rules for the care of the Callaud battery, rules for the care of the Leclanche battery and resistance coils, following which is the table of Size and Insulation of Wire Cable for interior use, and that of Wire Gauges.

The nominal price for so large, important and complete a work, embellished with so many first class plates, made especially for it, makes the book a valuable acquisition, indispensable to every telegraph and electrical student. The book contains diagrams of the Phantoplex system, the latest development in the telegraph art. All of the engravings are made from the official blue-prints of the Postal company, and are therefore absolutely correct, and have been produced under the direct supervision of John F. Skirrow, associate electrical engineer.

COMMERCIAL AND RAILWAY TELEGRAPH SERVICE

This new edition of "The Modern Service of Commercial and Railway Telegraphy," by J. P. Abernethy, revised and brought up to date by the company that bears his name, starts in with the primary principles and instruction for beginners, including valuable hints relating to penmanship, the work proceeding in the form of questions and answers to the subject of electricity and its uses as plain as possible, treating of electricity in general, the action and composition of batteries and their application to telegraphic purposes. The relation of circuits and the various instruments employed, including the duplex and quadruplex systems, construction of lines, interruptions of and the means of locating the same, the telephone, the stock ticker, submarine telegraphy, etc., is fully discussed, followed by complete information regarding commercial and railway telegraphy in all its details, and concluding with much valuable and desirable information regarding the duties of railway station agents, express agents and station employees. The book contains 424 pages, 72 more than in previous editions. The price is \$2, which includes carrying charges. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

The 20th Century Key

Devised by practical telegraphers. Used on some of the longest press circuits without fatigue to the sending operator. The use of this key brings into play muscles which the operator never thought he had. It removes the fear of that dread visitor, writer's cramp.
 Price: Without base, \$10; with base, \$11.

The Mecograph

A transmitting device that can be operated with speed and ease and produces perfect Morse. Half the energy exerted in sending on a Mecograph yields faster sending and better Morse. It is easily adjusted to all wire conditions.

Price: \$8.00. Leather carrying case \$1 extra.

Secret Sounders for Telegraph Work

Invaluable in newspaper and brokers' offices. Easily adjusted, strong, durable and simple. Every Secret Sounder is furnished complete with Headband, Double Conducting Cord, Special Connecting Tips and fully descriptive circular. Price, without key:

In either 4 ohms, 20 ohms, or 25 ohms resistance....	\$5.00 each	
In 50 ohms.....	.50	} Net additional.
In 150 ohms.....	.75	
In 250 ohms.....	1.00	
In 300 ohms.....	1.50	

For Secret Sounders with key, add \$1 net additional to the above prices.

Any of these devices will be sent, carrying charges collect, to any part of the world upon receipt of price.

IF THE BABY BOOK were a popular novel it would surely take high rank among this season's "best sellers." During the past two months more than fifty thousand mothers have asked for and received it, and we have a nation wide assurance that the advantages offered by THE BABY BOOK are appreciated.

Read This Personal Word From the Editor:

Mothers:—

Baby clothes and materials of the very highest quality, as well as necessities and comforts for your own use, can be properly chosen only in the privacy of your own home, free from the confusion and publicity of the busy shopping centers. In The Baby Book I have given you this opportunity. Its pages are filled with the very things both you and the baby need.

Do not hesitate to ask for my personal advice and assistance in the selection of materials or garments, and, above all, don't fail to send at once for a copy of The Baby Book. No charge is made for it and it is mailed in a plain envelope. Write me personally.

Sincerely yours,

Eliza Emerson Buff

LIFE OF PROF. MORSE.

The life of Prof. S. F. B. Morse, the standard work, authorized by the Morse family, and compiled from original papers and other authentic data in their sole possession, is a clearly written biography, charmingly told by a trained newspaper man, a close personal friend, and presents the life of this great inventor of the telegraph in a broader, more intense, human and truthful attitude than ever before attempted or even thought possible; 775 pages, illustrated; sheepskin binding. There are only a few of these volumes left, and when gone the work will be out of print. Price \$5; on receipt of which the book will be sent, express charges prepaid. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Any electrical or telegraph book published, for sale by Telegraph and Telephone Age 253 Broadway, N. Y.

POCKET EDITION OF DIAGRAMS.

"Pocket Edition of Diagrams and Complete Information for Telegraph Engineers and Students" is acknowledged on all sides to be the standard work of the telegraph. Speaking strictly within bounds, it is not too much to say that this volume presents the finest study of the complex subject of the telegraph ever attempted. There is no other book like it or even approaching it, in thoroughness, comprehensiveness, or in original detail of statement. The author, Willis H. Jones, is a practical telegrapher himself—an engineer in his profession of recognized ability, who knows exactly what other telegraphers want to know, and has the faculty of imparting that knowledge in a manner at once so clear, so simple, so bright, so entertaining, so free from needless technicalities, that his readers, even the least informed among them, readily understand his meaning. The helpful qualities of the work will be clearly manifest alike to the beginner, to the student, to the operator and to all telegraphers whether in the commercial or in the railroad service.

"Pocket Diagrams" does not deal in theory; it is packed full from cover to cover of the common sense of telegraphy, the side which the ordinary every day operator runs up against, and respecting which he desires information of the kind that will aid, not mystify, him. The book contains 334 pages, and has 160 splendid diagrams. It has the unqualified endorsement of telegraphers everywhere.

The price of "Pocket Edition of Diagrams, etc." is \$1.50. Address J. B. Taltavall, TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York.
