THE NIGHT LETTER TELEGRAM

HAS MADE

A GOOD WORD COUNTER

a practical necessity for every telegrapher. One of these devices is now as essential a part of his equipment as a typewriter. On account of the increased demand for the HUDSON WORD REGISTER, which is the only counter on the market suitable for this class of work, the manufacturers have been able to reduce the price from \$5.00 to \$3.00 each.

Mailed to any address upon receipt of price. Remit by express or post office money order to

J. B. TALTAVAL

Telegraph and Telephone Age

253 Broadway : : : New York

Furnished with attachment for any standard make of typewriter. In ordering be sure to state what machine is used as attachments differ.

MINIATURE KEY AND SOUNDER

Furnished Complete at \$4.00

THE KEY—Same as presented at the memorable 1905 Reunion in New York of the Old Time and Military Telegraphers, \$1.50.

**Perfect Mechanism
Beautifully Finished
Emblematic in Character**

A REFINED GIFT

THE SOUNDER—Same as presented at the Carnegie "73" Birthday Dinner in New York on November 27th, 1908, \$2.50.

Either or both of these beautiful miniature instruments will be sent, carrying charges prepaid, on receipt of price. Address

J. B. TALTAVAL
Telegraph and Telephone Age

PLEASE MENTION TELEGRAPH AND
TELEPHONE AGE WHEN WRITING
TO ADVERTISERS.

Interesting Subjects Treated in Back Numbers.

Telegraph and Telephone Age publishes the best articles which can be obtained anywhere upon telegraphic subjects. We enumerate herewith a few of the many important subjects treated in our columns during the past few years, together with the dates of the papers containing the same. We have a limited supply of the back numbers containing these articles which we will send to any address upon receipt of price, 25 cents each. Any of these issues less than six months old are not regarded as back numbers, but will be sent upon receipt of the regular price, 10 cents. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

The publisher of Telegraph and Telephone Age urges upon subscribers to this journal the desirability of having the paper sent to their home address rather than to their place of business. The reason is obvious. If it goes to your home it reaches you without danger of obstruction or abstraction by your office associates who are sometimes prone to borrow your copy to your discomfort and their edification, but at your expense. This naturally is a source of irritation and of course you don't like it. If a man wants Telegraph and Telephone Age he should pay for it, and the individual who is paying for his copy should be guaranteed in his rights.

As we regard our subscribers as our friends, and believe we are supplying them with a telegraph paper the like of which does not elsewhere exist, we dislike to see them disappointed, and wish to protect them in their prerogative so far as we are able. We believe that a good many disappointments of non-receipt of the paper might be averted if our suggestion of sending it in all cases to the homes of its subscribers were adopted. Changes of address will be made as often as desired.

Directory of Annual Meetings.

Association of Railway Telegraph Superintendents meets at Boston, Mass., June 19-23, 1911.

Commercial Cable Company meets the first Monday in March, at New York.

Great North Western Telegraph Company meets the last Wednesday in September, at Toronto, Ont.

International Association of Municipal Electricians meets at St. Paul, Minn., 1911. Date to be named later.

Old Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps, will meet at Atlantic City, N. J., 1911. Date to be selected later.

Postal Telegraph-Cable Company meets the fourth Tuesday in February, at New York.

Telegraphers' Mutual Benefit Association meets the third Wednesday in November, at New York.

Train Despatchers Association meets in Baltimore, Md. June 20, 1911.

The stockholders of the Western Union Telegraph Company meet the second Wednesday in October, at New York; election of officers occurs on the third Wednesday in October.

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Questions and Answers.

Question: What do the figures 4, 8, 16, 32, and 40, respectively, on the brass bar of condensers signify? I notice that the same combination or groups appear on all multiplex condensers, regardless of size.

Answer: The figure or figures immediately over each hole in the brass bar indicates the percentage of the condenser's full capacity that may be placed in commission by inserting a metal plug therein. It will be seen that the sum of the respective groups of figures is 100, which represents 100 per cent of the condenser's capacity regardless of its size. When all holes are utilized the full capacity is in commission.

Question: Why is it necessary to use four ohm sounders on multiplex apparatus in an office where fifty ohm sounders are used with the relays on all the single line circuits? Why not install one uniform winding for all?

Answer: It is necessary to use low wound sounders on duplex and quadruplex apparatus in order that when a loop is cut in its resistance will not be great enough to decrease the strength of the local current sufficiently to interfere with the operation of the loop. The sounders in branch offices on duplex loops are also four ohm instruments placed in series with others in the conductor of what is called a "built-up" loop. If the sounder on a multiplex set was wound to fifty ohms, its connection in series with the four ohm sounders on the loop would add so much resistance to such loop that the local current would be too feeble to operate the branch office sounders properly. On the other hand, if fifty ohm sounders were made the standard type for both multiplexes and branch office loops it would require a much greater expenditure of electrical energy than the present method to maintain the local battery as well as require many alterations in the system.

The most important reason, however, for preferring four ohm sounders in built-up loops is that the lower the resistance of the sounders the less will be the alteration in the volume of current flowing in the loop when a branch office cuts out his instrument temporarily. The removal of a 50 ohm sounder would obviously make a great difference.

Question: Which type of quadruplex apparatus and battery equipment do you consider the most efficient in extremely wet weather, the old gravity battery arrangement, or the dynamo and proportion box outfit?

Answer: For a given conductor with other conditions equal, the gravity battery equipment, if in good condition, should certainly give the best service. Not that the chemical battery current itself is necessarily more steady or effective than that mechanically generated, but principally because of the mechanical construction of the pole-changer employed which minimizes the period of "no magnetism." Where the walking-beam pattern of pole-changer is used, as is required in the dynamo arrangement, the duration of the period of break is actually increased during wet weather

owing to the then greater volume of current prohibiting a close adjustment of contact points of that apparatus.

It must not be understood, however, that for year in and year out service the gravity equipment is preferable. For reliability and constant service the dynamo is undoubtedly the superior method of the two. Gravity batteries require a great deal of attention and offer innumerable opportunities for openings at the binding posts of one or more of the many jars, not to mention high resistance due to evaporation of the liquid, imperfect contact and other ills such batteries are subject to.

Question: What is an enclosed arc light, and what advantage, if any, has it over the open arc method?

Answer: A closed arc light is one in which the carbons are enclosed within an air-tight globe, which latter is itself enclosed in a larger globe open at the top and bottom. In the open arc ordinary arc light carbons are burned in the open air, being merely enclosed within a large open globe for protection.

The advantages derived by the enclosed over the open arc lamp are that they not only usually give out a somewhat steadier light but the life of the carbons themselves is greatly prolonged by being thus shut off from the oxygen of the air.

It is also claimed that enclosed arc lamps give out a greater candle power in a useful direction, that is to say, downward, than the open arc method with the same watt expenditure.

Each type of lamp requires practically the same number of watts, yet the enclosed arc light burns with but half the volume of current required by the open arc type, but requires an electromotive force twice as great.

watt and a watt-hour? Also between an ampere watt and a watt hour? Also between an ampere and an ampere-hour?

Answer: A watt, or an ampere merely represents the expenditure of one unit of electrical power, or current volume, respectively, without any reference to the length of time such energy is maintained. In order to calculate the maintenance of expenditures of electrical energy, charges for the same are usually based on a certain rate per hour. Hence we get the terms watt-hour and ampere-hour.

A watt-hour represents the continued exertion of one watt of electrical energy for a period of one hour. In like manner one ampere-hour means the maintenance of one ampere of electric current for one hour.

Question: What advantage is derived by running two dynamos in parallel, and how are they connected together?

Answer: The benefit derived by coupling two generators possessing identical voltages together in this manner lies in being thereby able to deliver a greater volume of current during certain active periods of the day or night, as the demand may require, than either machine singly could

supply. Each machine connected in parallel adds its own current capacity to that of its companion or companions, and thus increases the possible output in the same manner as when two or more storage battery cells are coupled for a greater quantity.

Two or more generators in parallel are preferred to one large machine possessing a capacity equal to the combined capacities of those in parallel, for the reason that while the load is light the machines not required may be disconnected and the demand still supplied by a comparatively small generator.

Recent Telegraph and Telephone Patents.

A patent, No. 941,839, for a telephone exchange system has been secured by Charles L. Zahm, of Los Angeles, Cal.

A patent, No. 942,208, for duplex cable telegraphy has been secured by Isidor Kitsee, of Philadelphia, Pa. A duplex telegraph in which the receiver includes a transformer with the primary in the line, a receiving instrument controlled by the transformer secondary and a third winding on the transformer for neutralizing the effect of the impulses in the transformer secondary.

A patent, No. 942,332, for an electrical conductor has been awarded to I. Kitsee, of Philadelphia, Pa. For telephone currents and the like, comprising conductively independent conductors arranged together, the resistance of the conductors being half of that between the conductors, and the mutual capacity twice that of the absolute capacity of the conductors.

A patent, No. 942,620, for electric telegraphy has been taken out by J. A. L. Dearlove, of London, Eng. For duplexing cables in which the artificial cable is made independent of variations in temperature. The cable is in strip form, having a negligible temperature coefficient, a series of inducing sheets attached thereto, earth plates and dielectric arranged between the conducting and inducing sheets.

A patent, No. 942,807, for telegraphic repeating apparatus has been issued to W. F. Athearn, of New York. A telegraph repeater with two sections, each comprising a pole changer, a polar relay operable by the pole changer with one section, a neutral relay controlled by the pole relay, extra contacts upon the pole changer and a repeating sounder controlled by the contact and controlling the neutral relay.

A patent, No. 942,814, for a multiple-telegraph has been granted to S. D. Field, of Stockbridge, Mass. Main and artificial lines, a differentially wound relay with one winding in the main line and the other in the artificial line and the other relay with the coils in the main and artificial lines in bridge relation with the first relay and with an inductive capacity greater than the main line and artificial line coils of the first relay.

A patent, No. 942,815, for a relay has been awarded to S. D. Field, of Stockbridge, Mass. For multiplex telegraphs. Has a movable arma-

ture, a main electromagnet and a holding electromagnet therefor and an auxiliary electromagnet acting in the same direction as the holding magnet.

A patent, No. 942,844, for an automatic telegraph has been secured by L. M. Potts, of Baltimore, Md. Page printing telegraph, in which the sending form consists of a sheet of paper carrying perforations and the transmitter is a polarized relay and segmental ring forming a sending commutator, the brushes being driven by a motor. The receiving circuit includes a main relay and receiving commutator, and controls printing magnets.

A patent, No. 943,115, for a selective signaling apparatus, has been secured by O. M. Leich, of Rochester, N. Y. Supplies currents of different frequency, each to a substation and uses a selective signaling apparatus responsive to alternating-current of a given frequency, and also a second signaling apparatus with a non-resonant path and a serial impedance to cause a selective operation between the frequencies.

The following patents have expired:—

A patent, No. 486,051, for a telegraph sounder held by James Maret, of Mount Vernon, Ky., and William L. De Graff, of Homer, Mich.

A patent, No. 487,154, for telegraphic apparatus held by Josiah A. Parker, of St. Louis, Mo.

Patents, Nos. 487,981, 487,982, 487,983, 487,984 and 487,986, for a printing telegraph, held by the estate of Chas. L. Buckingham, New York.

Patent, No. 487,984, for a synchronous multiple-telegraph, held by the estate of Chas. L. Buckingham, New York.

Investigation of Telephone and Telegraph Companies in New York.

The special committee appointed by the New York State Legislature to investigate the telegraph and telephone companies in the State to determine whether they should be placed under the supervision of the Public Service Commission, which began looking into conditions in Greater New York and vicinity December 1, has held several sessions during the past two weeks. Since taking the testimony of Theodore N. Vail, president of the American Telephone and Telegraph Company, which appeared in part in our issue of December 16, a large part of the time has been spent in examining the officials of the Postal Telegraph-Cable Company. Mr. Theodore L. Cuyler, assistant treasurer of the company, was a witness before the committee on several occasions, answering questions in regard to the various companies comprising the Postal system.

Mr. Edward J. Nally, vice-president and general manager was also examined in regard to rates charged by his company and other matters pertaining to operating conditions. In regard to the

organization of the Postal system Mr. Nally said that the Postal Company of Connecticut acts as a holding company of practically all of the forty-one Postal subsidiaries. It, in turn, is owned by the Commercial Cable Company, a majority of the stock of which is held by the Mackay Companies, a Massachusetts business corporation.

Being asked what he knew about a suggested community of interests existing between the Western Union and the Postal, Mr. Nally said:

"I do not know exactly what you mean by community of interest. But I do know that there is the hottest sort of competition between the Western Union and the Postal. This hair of mine is gray—what there is of it. What of it is gone, is gone because of the strife and effort of that competition. Never, I believe, was there a hotter fight in the way of business competition than has existed between the Western Union and the Postal.

"To me the whole thing has resolved itself into a point of service. There is little sentiment among the people. They will not take the Postal service simply because that company is fighting another. They go, and go only, where they can get the best and quickest service. They want good service, and if our company can give better service than another, we get the business."

"You make quicker deliveries than other companies?"

"Yes."

"To what extent have you succeeded?"

"I feel secure in saying that no such excellent service was ever given before in the world as is put up by the Postal today," said Mr. Nally, proceeding to relate how the Postal, at a large expense, during the past summer has instituted a special rush service for the large cities. He read several letters from users of the wires, voluntary contributions, he said, testifying to the good work done. No extra charge is made for this service, although it costs the company much money. Mr. Nally said that, as a whole, the Postal companies were prosperous ventures, but some of the constituent corporations individually had lost money, particularly in the West.

"What do you think of public or governmental control of public service corporations?"

"Proper control is not bad."

"Well, good or bad control is a matter of adjustment. What do you think of control?"

"We are not opposed to it."

"There has been talk of a merger between the Western Union and the Postal. If your company were to absorb the Western Union, could you use their equipment?"

"All of it that is fit. I think the Western Union is a pretty good company."

"Could the Western Union use the Postal equipment?"

"Yes; I can testify to that."

Mr. Nally said that about 80 per cent. of the telegraph business of the country was competitive business, and that his company and the West-

ern Union split the competitive business practically in half.

"You say your company operates along the right of way of the Pennsylvania Railroad in the East. Do you plan extensions along other railroad lines?"

"We do not want the railroad business. Railroad service is too exacting. The railroad companies want both ends and the middle. I think the present condition of the Western Union is due to the unprofitable railroad business they carry."

"Do you not consider your Pennsylvania Railroad contract a profitable one?"

"I do not. It is impossible to divide the income so that one can tell that with any degree of accuracy. Our feeling, however, is that it is not a profitable business."

Upon being asked the reason for the raising of telegraph rates two years ago Mr. Nally said:

"Everything went up in price and we had to raise our prices, too. We even had to pay the messenger boys more. Usually they make from \$25 to \$35 a month. Years ago, when I worked as a messenger, we made only \$13 a month. The boys are paid by piece, a cent and a half or two cents for each message delivered. We offer them two cents each for 'pick-up' messages—that is, those they get in answer to messages delivered."

Mr. Nally could give no idea of the improvement of gross income from the increase in rates, nor could he tell from a percentage basis exactly what it aggregated. In New York State, out of 7,138 Postal rates in effect among various offices, 3,957 were raised from twenty-five cents to thirty-five cents, and 3,141 were left unchanged. Rates to offices within 150 miles of one another were left at the twenty-five cent figure, generally speaking.

In answer to the question as to whether there was not an understanding between the companies in regard to rates Mr. Nally said:

"It is true that there is an understanding as to rates, but this does not in any sense mean that the companies are working together. If there were no standard of rates one company would get all the business and the other would die. It is exactly the same as the New York Central Railroad and the Pennsylvania Railroad charging the same fare from New York to Chicago.

"I can cite you an instance showing the practical application of this matter of rates. One of the Southern States passed a law compelling the Western Union to give a rate of fifteen cents for messages everywhere in the State. They thought the Postal, being a new company, should have some encouragement. The State authorities consented to the Postal charging twenty cents. We figured it out and decided we would not take advantage of the opportunity. We said we would rather charge fifteen cents, the same as the Western Union, than have the Western Union take all of the business. The Western Union would

probably have been willing to adopt the fifteen-cent rate, so as to monopolize the business, although my experience has shown that a fifteen-cent rate is profitless."

Mr. E. J. Page, counsel for the committee, asked how much it was necessary to charge for the telegraph companies to make a profit, and Mr. Nally replied, that at a twenty-five-cent rate the profit, generally, would not be over one cent on a message of ten words. He declared that in Brooklyn, with a twenty-five-cent rate, the Postal lost \$4,518 in 1907 and \$849 in 1908, and this did not take into account depreciation of wires and plant. He thought the company lost money on messages sent and delivered to Manhattan, but that on messages originating in Manhattan and going outside the State there was a substantial profit.

Mr. Nally informed the committee that in messages sent from Postal stations to towns where the Postal has no stations the Western Union, which delivers the messages from the nearest Postal office, charges such high rates that the Postal frequently loses on the transaction. Sometimes the loss is two cents and sometimes more. The Western Union, he said, always charges the full local rate, and this, with additional words placed in the messages in transfers, for which the Postal has to pay, often raises the total above the amount the Postal charges its customer. He considered this an unfair advantage on the part of the Western Union.

Personal.

James L. Rand has been appointed correspondent of the Associated Press in Boston, succeeding S. M. Barber, resigned. He will have charge of the assembling and distribution of news for that association in all the New England states, except Connecticut, in the Maritime Provinces of Canada and Newfoundland.

Mr. Stephen C. Mason, who entered the telegraph service in 1850, and who held many official positions in the service of the Western Union Company at Chicago and elsewhere, but who retired from active service about three years ago and is now living in Lockport, Ill., celebrated the golden anniversary of his wedding December 7. Among the presents received were fifty "American Beauty" roses from telegraph friends in Chicago.

Mr. Percy W. Miller, of the Kerite Insulated Wire and Cable Company, New York, and Mr. Frank R. Whall, of C. F. Whall and Company, of Boston, were passengers on the Southern Railway train which was wrecked near Greensboro, N. C., on December 15. Both gentlemen were considerably bruised and had a miraculous escape from death. The car in which they were sleeping plunged off a high trestle into a creek and the passengers who escaped had to climb through a broken window.

Mr. Francis W. Jones, formerly electrical engineer of the Postal Telegraph-Cable Company, who retired two years ago is, with his wife, spending the winter at West Palm Beach, Florida.

Major Walter A. J. O'Meara, chief engineer of the British Post Office Telegraphs, sailed for England December 22 on the Mauretania, after a stay of three months in this country. Part of Major O'Meara's time while here has been spent in investigating the telegraph and telephone systems and the remainder in traveling in the West for the benefit of his health.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Colonel Robert C. Clowry, president and general manager, spent the Christmas holidays with friends in Trenton, N. J.

Mr. George J. Gould and son Jay were passengers upon the train upon the Southern Railway which was wrecked December 15. Although several persons were killed and many injured, both Mr. Gould and his son escaped without injury.

Mr. C. R. Tilghman, of the electrical engineer's office, who installs the ticker service for the company in the different cities, was a recent New York visitor.

The annual meeting of the Eastern Telegraph Company was held at Portland, Me., on December 15. The following directors were chosen: R. C. Clowry, B. Brooks, J. B. Van Every, G. W. E. Atkins, of New York; C. F. Ames, of Boston; Hon. Frederick Robie, of Gorham, Mass.; H. H. White, of Portland. The directors elected Hon. Frederick Robie president and H. H. White clerk.

RESIGNATIONS AND APPOINTMENTS.

Mr. S. P. Jones, district inspector, has been appointed manager at Houston, Texas, vice Mr. C. W. Gribble. Mr. W. Y. Nolley has been appointed to succeed Mr. Jones.

Mr. J. W. Sharman has been appointed manager at Alexandria, La., vice Mr. J. G. Hamilton, resigned on account of ill health.

Mr. Kenneth Stiles, formerly of Chicago, has been appointed manager at Monroe, La., vice Mr. Eugene Stamard, resigned.

Mr. Thomas Atkinson has been appointed manager of the office at Springfield, Mass., vice B. A. Cratsly.

Postal Telegraph Cable Company.

EXECUTIVE OFFICES.

Mr. W. D. Francis, superintendent of supplies, has returned from an extended business trip to California and Oregon.

Among recent executive office visitors were Mr. T. W. Carroll, general superintendent, and Mr. C. M. Baker, superintendent of construction, Chicago.

Handsome new branch offices have been opened in San Francisco in the Palace Hotel and in the Mining Exchange.

A new and enlarged office at Tacoma, Wash., is now being arranged for.

A special blank for greeting purposes was distributed by the company during the holidays. The blanks have an attractive heading with a wreath of holly and the words "Merry Christmas and Happy New Year."

On the afternoon of the day before Christmas, the officers and employes of the company, to the number of over one hundred, enjoyed a Christmas entertainment in the reception room, on the tenth floor of the building. The room was suitably decorated for the occasion, with Christmas bells and festoons of red and green.

The effect of the table decoration was a field of snow, on which were arranged tiny Christmas trees and toys of various kinds, and at one end a huge snowball, in the hollow of which were favors for every one present, each one accompanied by a line or two of a humorous nature touching on the characteristics of the person for whom they were intended.

Mr. G. W. Fleming, of the office of the superintendent of traffic, impersonated Santa Claus, and in a happy manner, reading aloud the inscriptions on the tags, presented the favors.

Refreshments were served by Mr. Howlett, the restaurateur.

The affair was in the nature of a surprise to those assembled, being arranged and carried out by Miss T. N. Brown, of the office of the vice-president and general manager, who was ably assisted by Miss Benz, Miss Vivian, Mr. T. E. Fleming, Mr. F. E. d'Humy, Mr. J. H. Flood, Mr. G. W. Fleming and Mr. F. H. Hollenbeck.

Invitations of a mysterious nature, which had been furnished with the compliments of Superintendent Smith, of the Tariff Bureau, had been issued some days before, and all were on the quiver to know what was really going to happen.

The entire force was represented, from the president to the Messenger Department. Greetings were exchanged, toasts were given to Mr. Mackay, Mr. Nally and others present, and a rousing vote of thanks was tendered to the ladies who so admirably carried out the splendid affair. It was altogether a happy and enjoyable occasion, and a general good time was participated in by all.

RESIGNATIONS AND APPOINTMENTS.

Mr. L. L. Apperson has been appointed chief operator at New Orleans, vice E. E. Cord, deceased. Mr. S. W. Harvey has been appointed chief operator at Mobile, vice Mr. Apperson.

District Foreman J. F. Heard has been transferred to the office of J. P. Edwards, division electrical engineer, Atlanta, Ga.

The Cable.

The twenty-fifth anniversary of the establishment of the Commercial Cable Company was appropriately celebrated on December 23 by Mr. Clarence H. Mackay, president of the company, inviting all of the officials and heads of departments and employees and their families to a theatre party at the New Theatre, of which Mr. Mackay is one of the founders and vice-president. Among those present besides Mr. Mackay were Mr. George Gray Ward, vice-president and general manager, Mr. George Clapperton, traffic manager, Mr. S. S. Dickinson, general superintendent, Mr. Albert Beck, secretary, Mr. E. C. Platt, treasurer, all of the Commercial Cable Company, and Mr. Edward J. Nally, vice-president and general manager, Mr. Charles C. Adams, second vice-president, Mr. Charles P. Bruch, third vice-president, and Colonel A. B. Chandler, chairman of the Board of Directors of the Postal Telegraph-Cable Company. The performance of "The Nigger" was thoroughly enjoyed by the four hundred cable and telegraph people present.

President Mackay, on December 27, was to give a banquet in the spacious dining hall of the Hardware Club, which occupies the top floors at 253 Broadway. This, however, was postponed on account of the death of Dumont Clarke, a director of the Commercial Cable Company.

Dumont Clarke died December 26 at his home in Dumont, N. J., aged sixty-nine years. Mr. Clarke was president of the American Exchange National Bank of New York, and one of the foremost financiers in the metropolis. He was a director of the Commercial Cable Company and a trustee of the Mackay companies.

Dominion Government Telegraphs.

The report of the Public Works Department of the Dominion of Canada for the year ended March 31, 1909, shows that the amount expended on Government telegraph lines was \$434,845.18, and the receipts \$113,175.34. The system now embraces 6,973.75 miles of land lines and 259 knots of cables. There are 401 offices, at which were received and despatched 149,649 messages. The fact that signal service messages, meteorological service messages and reports and fisheries bulletins are handled free of charge accounts in a measure for the large deficit. There was constructed during the year an extension of the Eskasoni branch line on Cape Breton Island, N. S., to the Grand Narrows, sixteen miles. The Grand River branch to Enon, also on Cape Breton Island, was extended twelve miles towards Victoria Bridge, and it is proposed to extend this line to Gaberous. In Quebec, the Chicoutini-St. Charles line was extended to Peribonka, a distance of thirty-eight miles. In Alberta, a line is under construction, from Athabasca Landing, for 70 miles toward Peace River. Contracts for the supply of poles and material for the extension of this line for 100 miles have been awarded.

Municipal Electricians

Mr. Frank P. Foster, of Corning, N. Y., secretary of the International Association of Municipal Electricians, has been suffering from an attack of erysipelas for the past month, but is now convalescent.

Considerable dissatisfaction is being expressed in Los Angeles over the award of a contract for fire alarm and police telegraph apparatus in that city for about \$30,000 to the Cregier Signal Company of Chicago. Politics alone determined the award of the contract to this company which has never installed a similar system, and the head of which is usually occupied as the leader of an orchestra. Several reliable concerns submitted bids for the apparatus, and the opinion of a board of experts which condemned the Cregier system absolutely was entirely disregarded. The Insurance Press in commenting upon the award says:

"To say the least it is amusing that a violin player, the manager of a humble orchestra, should work part of the time as the promotor of a system for transmitting fire alarms. Possibly, the Cregier orchestra could be hired for grand opera with as much propriety and regard for the fitness of things as the Cregier system of fire telegraph could be installed in any self-respecting city, desiring the best apparatus."

Counting Code Words in Canada.

After the telegraph companies in Canada gave notice to the public that an amendment to the rule concerning the counting of code words would be put into effect on December 1, an appeal was made by the Canadian Manufacturers Association of Toronto to the Board of Railway Commissioners, for Canada, to disallow the amendment. An order was therefore immediately issued by the Board to the telegraph companies restraining them from putting the amendment into effect until judgment had been rendered by the Board after hearing evidence, December 21 being selected as the date on which the case would be tried. Owing to a number of other cases taking precedence, the matter did not come up until December 22, when the Board thoroughly went into the subject, occupying over three hours with the case. After hearing evidence from both sides, judgment was finally rendered authorizing the amendment to the rule, but stipulating that between offices in Canada it should not go into effect until July, 1910. This delay was made to give those having cipher codes a chance to make alterations if they so desired, the complainants having objected that many of their codes would be seriously affected.

The amendment was the same as that put into operation in the United States by both the Postal and Western Union Telegraph Companies on December 1, by which arbitrary combinations of letters will be charged for at the rate of five letters per word instead of ten as heretofore.

At the hearing of the case there were present on behalf of the Canadian Pacific Railroad E. W. Beatty, solicitor of the company, James Kent, manager of the telegraph department, and W. J. Camp, electrical engineer. Representing the Great North Western Telegraph Company was G. D. Perry, secretary-treasurer, and representing the Western Union Telegraph Company was D. C. Dawson, superintendent at St. John, N. B.

H. P. Dwight Eighty-One Years Old.

On December 23 Mr. H. P. Dwight, of Toronto, president of the Great North Western Telegraph Company, celebrated his eighty-first birthday. Mr. Dwight has been a resident of Toronto for nearly sixty years and is one of the most popular and best-known men in that city, as well as in the Dominion. He is especially active, alert and clear-headed for a man of his age and is just as much interested as ever in the affairs of every-day life, and always has a cordial greeting for his friends. He was the recipient upon his birthday of many congratulatory messages from leading and distinguished men throughout the country who united in wishing him many more birthdays.

Purchase of Independent Telephone Lines by J. P. Morgan and Company.

One of the most important developments in the independent telephone situation in the middle west occurred December 15 when it was announced that J. Pierpont Morgan and Company, New York, had secured a controlling interest in the United States Telephone Company and the Cuyahoga Telephone Company. The former company covers Ohio and a part of Michigan and has long distance connections in Buffalo, Pittsburg, Indianapolis and Detroit. The Cuyahoga company operates in Cleveland. On December 17 further announcement was made that the same interests had secured a majority of the stocks of the Toledo Home Telephone Company, the Citizens' Telephone Company of Columbus, the Indianapolis Telephone Company, the New Long Distance Telephone Company, of Indiana, and the New Telephone Company of Indianapolis.

The system thus acquired embraces 101,500 telephones and 40,000 miles of long-distance lines, covering Ohio, Indiana, and Michigan.

The companies have an aggregate capitalization of \$12,500,000 bonds, \$4,500,000 preferred stock, and \$11,000,000 common. The actual value of the physical property is estimated at \$23,000,000. Morgan and Company are said to have paid approximately \$10,000,000 for their holdings.

Because of the relations existing between the American Telephone and Telegraph Company and Morgan and Company, it was at once rumored that the purchase had been made with the idea of turning the properties over to the Bell interests. A letter, however, addressed by Mr. Clarence Brown, general counsel for the independents to the presidents of the various companies, does not

confirm this view of the situation. The letter reads in part:

"I am authorized by J. P. Morgan and Company to advise that while they do not wish to dictate to the officers and directors of the company, they would like you and them to be advised as to their views concerning the proper policy to be pursued in the interest of all stockholders and of the public.

"In their opinion, the business should be conducted precisely as it has been in the past, in reference to the construction, maintenance and operation of the property, with a view to securing the best possible results for the stockholders consistent with the duty which the company owes to its patrons and the public.

"The properties should be not only fully maintained, but improved and developed as business warrants. Nothing should be done to impair their earnings or securities."

A representative of J. P. Morgan and Company has also confirmed Mr. Brown's statement, saying: "The stock has been purchased by the firm for its own account, and the lines are to be operated as heretofore, as far as I know. They have always been in competition with the Bell system, and the information I have does not lead me to believe they will be operated otherwise in the future. We have been in communication with Mr. Clarence Brown, and the statement given out by him is authorized."

Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company, when questioned in regard to the matter said: "The Morgan firm was not acting for our company. It saw a good chance to get the stock cheap and took advantage of it. Indeed, we had been offered a chance to acquire the companies, but were prevented under the law from doing so. The companies have been competitors of the Bell, and doubtless will continue to be. I hardly think they will constitute the basis of a rival combination. Even Mr. Morgan, I think, would hesitate to attempt the founding of a telephone system, calculated to rival the Bell in extent."

It is likely that an investigation of the sale will be made by the State authorities of Ohio.

A resolution has been introduced in Congress by Representative Hitchcock of Nebraska, directing the Secretary of Commerce and Labor to have the Bureau of Corporations prepare for Congress a statement of the physical valuation of the telegraph, telephone and cable lines and other tangible property belonging to the Western Union Telegraph Company, the Postal Telegraph-Cable Company, and the American Telephone and Telegraph Company.

The resolution calls for the data to be complete to December 1, and is to embrace the subsidiary concerns, include the capital stock and the bonded debt of each of the three corporations and approximately the market value of the stock and bonds. It also authorizes the bureau to employ surveyors and appraisers for this work.

Automobile Line Repair Wagon.

The Postal Telegraph-Cable Company's new motor wagon for line repair work, mention of which was made in our previous issue, and which is being tried out in the mountains of Pennsylvania between Baltimore and Pittsburg is giving very satisfactory service. This is probably the first motor truck ever used for this purpose by a telegraph company, and the result of the experiment is being watched with interest by many. The Postal wagon was furnished by the Chase Motor Truck Company, of New York, and weighs 1,650 pounds. Its body is ten feet long and forty-two inches wide, and it is designed to carry a load of 1,000 pounds. The wagon has, however, carried from 1,700 to 1,800 pounds over sandy and

POSTAL TELEGRAPH LINE REPAIR WAGON.

hilly roads without any difficulty. The New England Telephone and Telegraph Company has used a similar equipment for some time with very satisfactory results, and it is said that they are now contemplating the purchase of several more.

It is estimated that such a vehicle will give five years service without any excessive cost for repairs, and it is believed that it will show enough saving over a horse drawn wagon to pay for itself in two years. The engine used is a fifteen horsepower, two cycle, three cylinder, air cooled engine of very simple construction. In fact, the construction and operation of the motor are so simple that a lineman of the company came to New York and after receiving a few hours instruction in handling the wagon drove it to the territory where it is being used without any difficulty. The machine has solid rubber tires and to prevent racking the driving mechanism is so geared that it cannot run at a rate exceeding fifteen miles per hour. It will go from ten to fourteen miles upon one gallon of gasoline, thus making the cost of its operation much less than that of a horse-drawn vehicle. If after a thorough test the new equipment fulfills all present expectations the use of these wagons by the Postal as well as other telegraph and telephone companies will no doubt become very general.

Radio-Telegraphy.

At the regular monthly meeting of the Wireless Institute of New York, to be held in the Engineering Societies Building, January 5, Mr. L. R. Gleason will read a paper upon the subject of "Measuring Instruments and Measurements in Wireless Telegraphy."

The Telefunken Wireless Telegraph Company has been recently awarded a contract by the Argentine Government for the construction of 105 ship and shore wireless stations. The contract calls for the completion of all of these stations by July, 1910.

At a meeting of the Armour Institute of Technology branch of the American Institute of Electrical Engineers, held in Chicago December 16, Professor G. E. Marsh presented an interesting paper upon "Wireless Telegraphy," in which he explained in considerable detail the fundamental principles involved in the generation and receiving of electric waves.

At the regular monthly meeting of the Society of Wireless Telegraph Engineers, held at Boston December 6, Mr. Sewall Cabot gave a working demonstration of wireless transmitting apparatus employing a spark gap which consisted of synchronously rotating aerial subdivisions. Electrical measurements were made indicating in a general manner the amount of electrical energy in the antenna circuit and the amount of damping in the radiated wave.

The use of wireless for advertising purposes was instituted by a New York department store during the Christmas holidays. The vessels of the Atlantic fleet of the United States Navy were at sea on their way to New York, where the sailors were to be given shore leave for Christmas. Knowing this and also that the sailors would have a good supply of money to spend in buying Christmas presents for their friends, the advertising manager of this store caused a wireless message to be sent to all of the vessels of the fleet to be displayed upon their bulletin boards, calling the attention of the sailors to their Christmas announcement in the Army and Navy Journal.

The scout cruisers, Salem and Birmingham of the United States Navy have been cruising in the North Atlantic during the past month in connection with the wireless experiments being conducted by the Navy Department at Brant Rock, Mass. The first experiments have been made for the purpose of testing a method for determining the location of vessels at sea. The two cruisers will soon start for West Indian waters and will there engage in tests of long distance communication with the Brant Rock station. This station is one of the most powerful in existence, and has a range of 3,000 miles across the sea. The tower has a height of 490 feet and a message sent from this place was recently intercepted by a station at Omaha.

THEODORE NEWTON VAIL.

Theodore Newton Vail.

Theodore Newton Vail, president of the American Telephone and Telegraph Company, is a man most prominently before the public eye at the present time. He is the head of a great system of telephone and telegraph organizations whose combined capital nears the billion dollar mark. Mr. Vail has the distinction of being the first man to head a system of that magnitude, every dollar of whose capitalization represents actual value, the physical valuation of the property of his organization at the present time being conservatively estimated at \$85,000,000 in excess of all capital obligation. The remarkable part of it all is that this great telephone industry has sprung up from nothing in a period equal to just about half the span of Mr. Vail's life and Mr. Vail himself laid the foundations upon which it has been built. The story of the telephone is a story of a large part of his life. In all of his business career the word failure has not been found in his vocabulary, in fact, it has been said that the only failure he has ever made was his failure to stay retired from active life when he bought a large farm in Vermont and settled down several years ago to enjoy the remainder of his years in rest from the cares of the business world.

Mr. Vail was born in Ohio July 16, 1845, the son of Daniel R. and Phoebe Vail, his paternal ancestors being English Quakers, some of whom were among the pilgrims who came early to this country and settled in Massachusetts.

Branches of the family later drifted to Westchester County, New York, and then to Morris County, New Jersey, where the ninth generation is now living.

Mr. Vail's mother's people were Dutch and French, and were among the early settlers in New York and New Jersey. His uncle, Alfred Vail, was a partner of Professor Samuel F. B. Morse, the inventor of the telegraph and it was in his workshop at Morristown that the first telegraph instruments were built.

As a boy Mr. Vail attended the Morristown common school and then the Morristown Academy. He then studied medicine for a while, but gave that up to learn telegraphy. He had a position as an operator in New York for a while and was then sent west of the Missouri River to work for the Union Pacific Railroad in the same capacity. Just after the Civil War he was appointed to the Railway Mail Service and had a run from Omaha to Ogden for six years, making his home in Omaha. In 1873 he was appointed to a position in the office of the General Superintendent of Railway Mails at Washington, and one year later became assistant superintendent of that department. He was made assistant general superintendent in 1875, and general superintendent in 1876. In this office he re-organized the railway mail system and brought it to a higher level of efficiency than it had ever before attained. His work in this line brought him to the attention of the public and it was but natural in 1878, when the promoters of the original telephone

company wanted a man to place the telephone upon a business-like basis and push its development, that they should choose Mr. Vail as their organizer.

In 1877 an association had been formed to take over the telephone patents of Professor Alexander Graham Bell and develop them. Of the three other men besides the inventor who formed the company, Gardiner G. Hubbard, Professor Bell's father-in-law was somewhat of a promoter, but his capital limited. Thomas Sanders was a man of some means and Thomas A. Watson was a mechanical genius. The next year it was decided to form two companies, one in New England which was known as the New England Telephone Company, and another to cover the territory outside of New England to be known as the Bell Telephone Company. All of the partners in the enterprise felt the need of an organizer and they accordingly called in Mr. Vail to become general manager of the Bell Telephone Company.

In 1879 the two original companies were consolidated under the name of the National Bell Telephone Company. By this time public attention had been attracted to the telephone and its possibilities were beginning to be realized. Mr. Vail, recognizing the fact that the patents held by his company would become more and more valuable, followed the policy of giving only short licenses for the use of the patents reserving the right in most cases at the end of five years to go into the field and take over the business itself. He believed that the Bell interests were so important that there was a partnership right in them which had value independently of the patent rights and that a permanent business could be established which would outlast all patents. For this reason instead of selling the right to use their system he followed the policy of taking a partnership in the business as extended represented by a certain stock interest. In pursuance of this policy The American Telephone and Telegraph Company was formed in 1885 to take control of the long-distance business and eventually to absorb all of the constituent operating companies by taking over their franchises. Before this was accomplished, however, Mr. Vail withdrew from participation in the management of the telephone business and embarked in enterprises of his own in South America and elsewhere. Success followed his efforts and having acquired a handsome fortune he retired to his farm in Vermont, cutting loose from all business cares.

In the spring of 1907, however, Mr. Frederick I. Fish, who had been president of the American Telephone and Telegraph Company, retired. The directors were in a quandry to find a successor. The business had grown by leaps and bounds in the last decade and the trouble was to find a man broad enough to fully grasp the magnitude of the position and solve the vastly important problems connected with its direction. The only man who measured up to the standard which they set was Theodore N. Vail, and he was accordingly asked to accept the trust. At first he refused, saying

that he was too old, being sixty-two years of age. The directors were insistent, however, and as he was one of their number, having always retained his position on the board, he finally yielded and went back into the harness.

The original idea of the American Telephone and Telegraph Company to absorb the various operating companies had not been carried out, and as a result the service in the territory of some of the companies was in a flourishing condition, while other companies lacking funds for development were not so prosperous. Mr. Vail at once took steps to remedy this condition. Soon after he assumed control the panic of 1907 came and upset business generally. The year of depression which followed was signalized by Mr. Vail, by establishing a record for his company as the only industrial organization which at the end of that year showed an increase in net earnings.

When he took up the direction of the telephone affairs Mr. Vail recognized at once the advantages which might accrue to both companies by a union of the telegraph and telephone facilities and interests. Because of the litigation between the American Telephone and Telegraph Company and the Western Union Telegraph Company, which had been drawn out for over twenty years, no advantage had been taken of the splendid opportunities for exchange of facilities between the two organizations. The only feasible way in which this could be brought about was for the telephone company to secure a controlling interest in the telegraph company. This Mr. Vail set out to do, and his efforts, as usual, met with success.

Mr. Vail has said that half a billion dollars would be spent in the next ten years by the telephone companies, and if he remains at the helm there is no doubt but that this prediction will come true. Though sixty-four years of age, Mr. Vail is remarkably well preserved, and from present appearance will be able to conduct for years to come the great organization which he is building up. Unlike many of the heads of large interests, he is a firm believer in publicity, and all of the various transactions involved in the formation of the parent and subsidiary companies are public property. Instead of shunning investigation he rather courts it and with good reason, for the system of which he is the head has not been built merely for the present but for the future, and thanks to his great foresight in rearing the structure, will endure long after he has finally laid aside the reins for other hands to hold. Mr. Vail is to-day, without doubt, the foremost telephone and telegraph man in the world.

Theodore N. Vail Upon Business Training.

The following contribution in "System" of Theodore N. Vail, president of the American

Telephone and Telegraph Company is well worth reading by all young men, containing as it does some most valuable hints as to necessary qualifications for success.

All business as now conducted—particularly those lines of business which embrace the so called industries—requires specialized training and technical education, in fact so much scientific knowledge that the distinctive line between "business" and "profession" is fast disappearing.

Anyone who hopes to achieve success, even the average, must know more, or at least as much about some one thing as any other one and not only know, but know how to do—and how to utilize his experience and knowledge for the benefit of others. Broad success depends on singleness of purpose, clear perception of what is to be desired and to be accomplished, and capacity to recognize true values of men and things and properly place them.

Thorough preparation in elementary knowledge wherever and however acquired, development and training of the powers of concentration and application, is the best, in fact the only, foundation upon which to build this special or technical training. After this the willingness to persevere in the effort to accomplish something for the purpose of accomplishment, the ambition to do whatever is to be done and whatever is undertaken and do it right—making personal ambition secondary to everything else—will bring about great success, providing the God-given, or inherent, capacity to do great things exists; but in any case success up to the full measure of capacity.

Without this preparation and training failure is absolutely certain.

The crying evil of the young man who enters the business world today is the lack of application, preparation, thoroughness, with ambition but without the willingness to struggle to gain his desired end.

Mental and physical strength comes only through the exercise and working of mind and body.

There is too little idea of personal responsibility; too much of "the world owes me a living," forgetting that if the world does owe you a living you yourself must be your own collector.

The cause of all this is the lack of and continual letting down of both domestic and social discipline. Convention and morals are purely a matter of discipline; discipline need not necessarily be brutal or even severe, but better brutal than none at all.

It is for the parents to see that the youth has the foundation training and discipline. If the youth is given that, he will get for himself every bit of the rest to the limit of his capacity.

Opportunities never were more plenty than now, but one must have the training and development not only to recognize opportunity but take advantage of it when recognized.

Which?

Shall I work for a corporation, or shall I go into business for myself? That is the question. Very often the benefit of the doubt is accorded to the latter alternative, but the flesh is weak. The individual lacks the decisive courage of conviction or the necessary capital to experiment and remains with the corporation ever after. Providence usually works in a way that is strange and misunderstood, and, like babies who cry for things injurious, the grownups are denied many doubtful blessings.

The popular opinion that energy is best rewarded when applied to a business in which the individual is the sole profit sharer does not always give due consideration to the opposite desideratum; the sole profit sharer is also the sole loss sharer. If we inherit an established business or if we inherit enough capital to buy a "sure thing" (if there is such a thing) why then there is no doubt but that we should apply our energy to a self-owned business. Even if our early experience has fitted us for the opportunity to go into the trade of our calling doubtless we should take advantage of the opportunity. But when we have none of these things to depend upon the surest and the safest market for our inexperienced ability and untrained energy will be found among the well established corporations. Especially when we have spent the younger years of experience in the service of a corporation, great must be the inducement to warrant us in cancelling its value and taking up a new business without knowledge of its detail or surety of our aptitude. The percentage figures of men who fail in business is appalling. When we consider that most of even these failures are men who have been brought up, trained and experienced in the very enterprises they fail to make a success of for themselves, then the chances of a man leaving a corporation to take up an untried venture in which he has had no practical experience must be extremely precarious. The man who leaves the corporation to buy out a business or run a hotel is taking the wrong end of a big bet.

The opinion that corporation service is ungrateful is not always well founded, and its grounds for justification are getting less every year. The day of corporate abuse is fast passing, the "big stick" cowed the tyrant, in spite of demagogues and jaundiced journalism the corporations are adjusting themselves to the tenets of the Golden Rule. They began to because they had to, then they kept on because they found it paid. Honesty has always been the best policy, but until lately no one ever dreamed that it is as true of corporations as it is of men. Reasonable profits honestly earned are paying dividends today where unreasonable profits dishonestly mismanaged paid them yesterday. That is why it takes brainy men instead of blood-relations to run a corporation today.

Under these conditions energy and ability are paid commensurately with their producing power. If you can really do the job better than the next man and the boss finds it out—and it won't take him long—you are going to get the next man's job sooner than later, for the boss has got to have that job done the best to pay six per cent on the investment. At public, legislative and competitive censured rates it takes the very best kind of men to pay six per cent. There is your chance—if you are of the very best—for a salary that will make the net profits of many a self owned business look like a boy's pocket money after the circus. Mediocrity will never reach the executive chair—at least not to stay. But mediocrity would starve to death in business now-a-days—if the sheriff didn't close up the business first. Even something much better than mediocrity or mediocrity in the best of luck is taking long chances in self-owned business. There are so many unforeseen contingences like fire, storm, bad years and financial depressions which beset the pathway to old age security. After twenty years of affluence one fell swoop might land you high and dry on the mercy of your relatives or, what is better, on the desolate shoals of penury. The lap of luxury isn't as willing as your mother's used to be. In a corporation many twenty dollar a week mediocrity has paid for a little house and lot on the installment plan and reared up a family of children to bless old age and shoo the wolf from the door. When the final summons came there was a couple of thousand dollars benefit insurance to settle for the obsequies and reward the children for their trouble.

If it lays a flattering unction to your soul to imagine what you would be if you were in a business for yourself, then dwell in the air castle and spin in the fairy red automobile, but don't forget to lay aside four or five week's salary every year for the proverbial and probable rainy day and spend much of what's left on a little house and lot. By so doing the chances are that you will be mighty sure of a comfortable if not stylish overcoat when the winter time of dotage comes. That's more than many a man, as good, or even better, than you or I can bank on in business for himself!—Michigan State Gazette.

For the convenience of our readers we have prepared and published in our catalogue, together with prices, a carefully selected list of standard books treating on wireless telegraphy. These volumes which include the most up-to-date works upon the subject, furnish the best information obtainable, the kind giving the most efficient aid and direction to the student. Orders for the books enumerated, or indeed for any others that may be required, which must be accompanied by the cash, will be filled on the day of their receipt, and sent with all the carrying charges prepaid. Address J. B. Tallavall, Telegraph and Telephone Age, 253 Broadway, New York.

The Ready Messenger

The quickest way to transmit a telegraph message from the wire to paper is

"VIA SMITH PREMIER."

This typewriter has for twenty years held first place with telegraph operators as the easiest and speediest "mill" to operate. The **New Model No. 10 Smith Premier** is even better suited to the use of telegraphers.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

JANUARY 1, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

New Year's Greetings.

In coming to our readers, beginning with this first issue of the New Year, under a changed heading, we trust that they will recognize an old friend, even under a new name. In the twenty-seven years which have elapsed since the founding of this publication great changes have come about in the telegraph and allied industries. At that time the telegraph, having been in operation for over thirty-five years, had already covered the country with a network of wires, while the telephone, which had been invented but a few years previous, was regarded as little more than a plaything. The telegraph had been tried and its value proven, and any one who expressed the opinion that the new invention would some day become a serious competitor of the telegraph and possibly in time supersede it would have been regarded by most people as a fit subject for the insane asylum. Yet since that time the telephone has been gradually improved, some of the brightest minds of the past quarter century having spent all of their energies in investigating and

solving the many questions which had to be answered before the telephone could become a commercial success. The results of their efforts are apparent in the remarkable growth of the telephone industry in the past few years. It has long since surpassed the telegraph in the number of miles of wire operated, gross income, etc., and, as is admitted by the telegraph officials themselves, has cut into the business of the telegraph to a considerable extent. While it does not at this time seem probable that the telephone will ever entirely supersede the telegraph, still this is an age of wonders, and no clear thinking person will deny that this very thing is one of the possibilities of the future. The president of the American Telephone and Telegraph Company, who has probably done more than any other man living to develop the telephone, believes that in a short time a person in New York or Boston will be able to exchange conversation satisfactorily with a person in San Francisco. If this can be accomplished it will be a great advantage for the telephone in enabling it to handle the long-distance rapid communication which has heretofore been monopolized by the telegraph.

Whatever may be the developments in the years to come there is no doubt but that the bond between the two systems which has lately been strengthened by the combination of interests of the Western Union Telegraph Company and the American Telephone and Telegraph Company, will continue to grow in strength, and out of this union it is hoped may be evolved an ideal system of transmitting communication, if an ideal can ever be attained in any line of endeavor.

In coming to our readers under the heading Telegraph and Telephone Age we make recognition of this bond of common interest, believing that the same is appreciated by the majority of those to whom we appeal. To those who have supported our efforts during the past years, we would say that our concern in the telegraph and all connected with it is as great as it ever was and that we will strive as heretofore to serve their interests as efficiently as possible. We believe we can do this best by including in our reading columns matter pertaining to telephone equipment, operation, maintenance, etc. We accordingly extend hearty New Year's greetings to our readers and trust that the year now beginning may be a prosperous one to all. A year ago the country had not yet recovered from the financial panic of 1907, and conditions of uncertainty prevailed in business circles. Now, however, our former prosperity seems to have returned and unless the industries of our country receive further setbacks by reason of adverse legislation, which does not now seem probable, there is no reason why we should not enjoy a long period of commercial and individual prosperity, for the well-being of the individual depends directly upon progress in the industrial world.

In looking over the events of the past year, by far the most important happening in telegraphic

circles was the buying of a minority interest, amounting to practical control, in the Western Union Telegraph Company, by the American Telephone and Telegraph Company. The economic advantages of this union have been thoroughly discussed. The year now beginning will undoubtedly see many important changes made in the telegraph service in order to secure those possible benefits and adjust the operation of the two systems to each other. While it probably cannot be said that any marked advance in telegraph methods and practices has been made in the past year, still the executive officers and engineers of the companies have shown themselves to be ever alert to take advantage of any opportunity for improvement in the conditions of telegraphic operation.

The use of the Barclay printing telegraph system has been widely extended and many other steps have been taken to render the service more rapid and reliable. The Commercial Cable Company has spent a large amount in diverting to Newfoundland one of their cables which formerly landed at Nova Scotia, in order that they can render more efficient service to their customers. The assertions of those critics who claim that telegraphic methods are growing less progressive each year can easily be refuted by anyone at all conversant with actual conditions.

The development of wireless telegraphy has been most rapid since January, 1909. The utility of this wonderful art being shown so conclusively at the time the steamer Republic was run into and sunk by the Florida last January gave a great impetus to its extension, so that now there is hardly a passenger-carrying vessel in which any great number of people will entrust their lives, that is not equipped for communication with other ships and the shore from mid-ocean. Over-enthusiastic supporters of this new art believe that in a few years we will do away with the use of wires altogether for the distribution of electric current in any form. This seems to be a most visionary view to take, but who can tell? As with the Atlantic Cable, the jest of one day became the fact of the next, and this has been repeated so often that conservative men have ceased to declare anything impossible.

As in the past, we will endeavor to keep abreast of the times and give our readers an accurate and straightforward resumé of happenings of interest to them. In recognition of this aim our paper is constantly gaining a wider reading both at home and abroad. Its news columns and the educative influences it exerts, beginning with the student and the operator at the key, are becoming more generally recognized, understood and appreciated. All this makes for stability and power. The paper has readers in every part of the world. Its foreign subscriptions are growing in number; included among these are the telegraph departments of every government abroad maintaining such administrative offices, without a single ex-

ception. This is a record of which we are pardonably proud.

In extending congratulations and well wishes to our readers at this time we feel a personal interest in everyone who has favored us with a subscription. We are not speaking to strangers, but to friends, many of whom we know personally and whose friendship we cherish as one of our most valued possessions. Not a few of these have been subscribers to *Telegraph Age* since its inception, and have learned to look for its coming twice every month as for the coming of a dear member of the family. Of all these we bespeak the same hearty support for *Telegraph and Telephone Age* which they have accorded us in the past and trust we may enjoy many more years of the same cordial relationship which has existed heretofore.

Proposed National Wireless Telegraph Board.

To meet the need for regulation of the hundreds of wireless stations which are being established both by commercial companies and by amateurs, Representative Roberts, of Massachusetts, has introduced a resolution in Congress providing for the creation of a wireless telegraph board. The demand for some kind of regulation is apparent to all who are conversant with the situation in the wireless field and unless something in this line is not done soon the extension of the industry will be seriously hampered.

Mr. Roberts's resolution authorizes the appointment of a board of seven members, one expert each from the War, Navy and Treasury departments, three experts representing the commercial wireless-telegraph and wireless-telephone interests and one scientist well versed in the art of electric wave telegraphy and telephony.

The duties of the board, according to the resolution, shall be to prepare a comprehensive system of regulations to govern the operation of all wireless plants afloat and ashore which come under the cognizance of the United States, with due regard alike for Government and commercial interests.

It is provided that within 30 days of the organization of the board it shall submit its report and recommendations to Congress. To defray the expenses of the board \$2,000 is appropriated.

Disastrous Sleet Storm in Kansas.

A severe sleet and wind storm swept over a part of the State of Kansas on December 4, breaking down the telegraph and telephone poles by the thousand. As is usually the case in such storms the wires were broken in hundreds of places, so as to be rendered valueless for reconstruction purposes. Iron wire and copper wire suffered alike in the storm, No. 6 iron wire being literally torn into shreds. The telegraph and telephone companies all suffered alike, one of the telegraph companies alone losing over five hundred poles in a distance of one hundred miles.

DIRECTORY OF THE TELEGRAPH

THE FOLLOWING PAGES EMBODY A DIRECTORY OF THE LAND LINE TELEGRAPHS, THE SUBMARINE CABLES, WIRELESS TELEGRAPH COMPANIES, THE SIGNAL SERVICE OF THE UNITED STATES ARMY, AND OTHER INFORMATION OF COMPANY AND ASSOCIATION INTERESTS ALLIED TO THE TELEGRAPH. THE DETAIL OF THIS WORK, WHICH HAS BEEN CAREFULLY COMPILED UNDER OFFICIAL AUTHORITY, AND WHICH IS FURNISHED IN RESPONSE TO A GENERAL DEMAND, IS THE ONLY GROUPING OF TELEGRAPH INTERESTS OF NORTH AMERICA EVER ATTEMPTED. THESE PAGES POSSESS A REFERENCE VALUE OF DISTINCT WORTH, USEFUL ALIKE TO THE INTERESTS CONCERNED AND TO THE BUSINESS WORLD.

WESTERN UNION TELEGRAPH COMPANY.

Executive offices, 195 Broadway, New York; incorporated 1856; capital \$100,000,000; London offices, Broad Street, House, New Broad St., E. C.

The system of this company embraces 1,125,549 miles of wire, and 24,432 offices.

OFFICERS.

Robert C. Clowry,
President and General Manager.
George J. Gould,
J. B. Van Every,
Thomas F. Clark,
G. W. E. Atkins,
J. C. Willever, secretary, and chief clerk executive offices.
F. J. Scherrer, assistant secretary, and private secretary to the president.
A. R. Brewer, treasurer.
Lewis Dresdner, assistant treasurer.
J. B. Van Every, auditor.
John F. Dillon, general counsel.
G. H. Fearons, general attorney.
Rush Taggart,
H. D. Estabrook, } solicitors.
J. C. Barclay, assistant general manager and electrical engineer, New York.
C. H. Bristol, general superintendent of construction, New York.
G. F. Swortfeger, assistant general superintendent of construction, New York.
Wm. Holmes, superintendent of tariff and check bureaus, New York.
H. E. Roberts, superintendent of supplies, New York.
F. A. Gentry, storekeeper, Chattanooga.
M. M. Rust, storekeeper, Chicago.
H. H. Wynn, storekeeper, San Francisco.
L. D. Beall, storekeeper, New York.
W. J. Dealy, superintendent of commercial news department, New York.

BOARD OF DIRECTORS.

Robert C. Clowry,	John Jacob Astor,
Theodore N. Vail,	Oliver Ames,
George J. Gould,	Harry B. Thayer,
Edwin Gould,	John I. Waterbury,
Jacob H. Schiff,	James Stillman,
Edward T. Jeffery,	Robert Winsor,
Edward J. Hall,	Paul Morton,
Union N. Bethell,	Henry P. Davison,
Joseph J. Slocum,	Robert S. Lovett,
Thomas H. Hubbard,	John J. Mitchell,
Henry S. Howe,	Henry A. Bishop,
Charles Lanier,	Harris C. Fahnestock,
J. Pierpont Morgan,	Henry Walters,
Chauncey M. Depew,	William H. Moore,
Henry M. Flagler,	Robert M. Gallaway,

EXECUTIVE COMMITTEE.

Edward J. Hall, chairman.
Robert C. Clowry, Jacob H. Schiff,
Theodore N. Vail, Harris C. Fahnestock,
Union N. Bethell, Henry A. Bishop,
Joseph J. Slocum.

TIME SERVICE

Charles H. Murphy, manager, New York; F. W. Brainerd, manager, Chicago.

EASTERN DIVISION.

B. Brooks, general superintendent, New York.
A. G. Saylor, assistant general superintendent, New York.
W. N. Fashbaugh, electrician, New York.

EASTERN DIVISION DISTRICT SUPERINTENDENTS.

1 E. M. Mulford, New York.
Herbert Smith, J. A. Hill, asst. supts.; Richard O'Brien, asst. supt., Scranton, Pa.
M. W. Hamblin, city supt., New York; P. J. Casey, J. Simmonds, J. F. Nathan, asst. city supts.
2 E. P. Griffith, Jersey City, N. J.
3 N. E. Church, Pittsburg, Pa.
4 W. A. Sawyer, Philadelphia, Pa.
5 C. F. Ames, Boston, Mass.
6 D. C. Dawson, St. John, N. B.
7 F. E. Clary, New Haven, Conn.

WESTERN DIVISION.

Theodore P. Cook, general superintendent, Chicago, Ill.
L. McKisick, asst. gen. supt., Chicago, Ill.

WESTERN DIVISION DISTRICT SUPERINTENDENTS.

1 W. J. Lloyd, Chicago, Ill.
A. R. Lingafelt, asst. supt., Oklahoma City, Okla.
2 G. J. Frankel, St. Louis, Mo.
3 J. C. Nelson, Omaha, Neb.
4 J. C. Smith, Dallas, Texas.
5 John Fitzpatrick, Cleveland, O.
6 John F. Wallick, Indianapolis, Ind.
7 I. N. Miller, Cincinnati, O.
8 James Swan, Minneapolis, Minn.
A. D. Bradley, asst. supt.
9 S. E. Leonard, Denver, Col.

SOUTHERN DIVISION.

J. Levin, general superintendent, Atlanta, Ga.
S. R. Crowder, electrician.

SOUTHERN DIVISION DISTRICT SUPERINTENDENTS.

1 L. J. Maxwell, Richmond, Va.
J. B. Faulkner, asst. supt.
2 G. W. Lloyd, Atlanta, Ga.
J. S. Calvert, asst. supt.
3 B. F. Dillon, Jacksonville, Fla.
W. G. Peebles, asst. supt.
4 J. R. Terhune, Nashville, Tenn.
F. O. Nourse, asst. supt.

PACIFIC DIVISION.

Frank Jaynes, general superintendent, San Francisco, Cal.
I. N. Miller, Jr., asst. gen. supt., San Francisco, Cal.

R. W. Gillette, electrician, San Francisco, Cal.

PACIFIC DIVISION DISTRICT SUPERINTENDENTS.

1 A. H. May, San Francisco, Cal.
2 R. T. Reid, Seattle, Wash.
H. J. Jeffs, asst. supt., Seattle, Wash.
3 F. H. Lamb, Los Angeles, Cal.

EUROPEAN AGENCY.

T. W. Goulding, European general manager, London; George Crighton, superintendent at London; T. Healey, superintendent at Liverpool, and E. Chambers, superintendent at Penzance, J. P. Spanier, agent for Southern Europe, Naples, Italy.

POSTAL TELEGRAPH-CABLE COMPANY.

Executive offices, 253 Broadway, New York; incorporated 1886.

(See Mackay Companies.)

BOARD OF DIRECTORS.

Albert B. Chandler, Chairman.

Clarence H. Mackay	James W. Ellsworth
Charles R. Hosmer	Edward Reynolds
Charles P. Bruch	Edward J. Nally
George G. Ward	Charles C. Adams
Edward C. Platt	George Clapperton

Clarence Mackay, President.

Edward J. Nally, vice-president and general manager.

Charles C. Adams, second vice-president.

Charles P. Bruch, third vice-president.

George G. Ward, fourth vice-president.

Edward C. Platt, treasurer.

Theodore L. Cuyler, assistant treasurer.

Edward Reynolds, auditor.

Welcome I. Capen, general superintendent of plant.

Isaac Smith, superintendent of tariffs.

Walter D. Francis, superintendent of supplies.

Minor M. Davis, electrical engineer.

John F. Skirrow, associate electrical engineer.

Ferdinand E. d'Humy, assistant electrical engineer.

John O. Stevens, secretary.

Henry F. Hawkins, assistant secretary.

John Doran, superintendent complaint and claim department.

Stephen B. Haig, superintendent of traffic.

Charles Shirley, assistant superintendent of traffic.

Christopher A. Rhodes, traveling auditor.

Edward S. Butterfield, general agent, money transfer service.

Thomas E. Fleming, contract message bureau.

EASTERN DIVISION.

Edward B. Pillsbury, general superintendent, New York.

Leona Lemon, division superintendent, New York.

Charles H. Lane, superintendent of construction, New York.

DISTRICT SUPERINTENDENTS.

1 Christopher F. Leonard, supt. offices Greater New York.

2 Edson Kimmey, New York.

3 Chas. E. Bagley, Philadelphia, Pa.

4 Arthur L. Edgecomb, Boston.

5 Harvey D. Reynolds, Buffalo.

6 Henry Scrivens, Pittsburg, Pa.

WESTERN DIVISION.

Thomas W. Carroll, general superintendent, Chicago.

Frederick W. Conger, division superintendent, Chicago.

Charles M. Baker, superintendent of construction, Chicago.

John F. Looney, division electrical engineer, Chicago.

DISTRICT SUPERINTENDENTS.

1 Hiram G. McGill, Chicago.

2 Edgar W. Collins, Cleveland, O.

3 Solomon H. Mudge, St. Louis, Mo.

4 Henry J. Kinnucan, Detroit, Mich.

5 Alpheus B. Richards, Kansas City, Mo.

6 Hiram G. McGill, Chicago.

OFFICERS.

C. C. Wilson, president; S. S. Bogart, first vice-president; C. C. Galbraith, second vice-president; Frederick I. J. Hanson, third vice-president; W. A. Diboll, treasurer; Cloyd Marshall, secretary and purchasing agent; L. C. Wallace, assistant treasurer; E. P. Davis, assistant secretary and purchasing agent.

DIRECTORS.

George H. Parker, Seattle, Wash.; S. S. Bogart, and C. C. Galbraith, New York; C. N. Fickert, San Francisco, Cal.; Rev. D. J. Starr, Columbus, Ohio; Frederick I. J. Hanson, Philadelphia, Pa.; C. C. Wilson, Denver, Colo.; Cloyd Marshall, New York; G. Ross Eshleman, Lancaster, Pa.; W. A. Diboll, Denver, Colo.

EXECUTIVE COMMITTEE.

Geo. W. Allen, chairman; S. S. Bogart, C. C. Galbraith, W. A. Diboll, C. C. Wilson, Cloyd Marshall, secretary.

OPERATING DEPARTMENT.

C. C. Galbraith, general manager, New York. Atlantic and Gulf Division: H. J. Hughes, superintendent, New York, Great Lakes and Northern Division: F. C. Anderson, district manager, Harvester Building, Chicago, Ill. Pacific Coast and Western Division: R. H. Armstrong, manager, Peoples Bank Building, Seattle, Wash.

FOREIGN OFFICES.

London, England, 70 Cornhill, E. C.; H. J. M. Ellis, European manager. Shanghai, China; Kegan and Rosencrantz, Asiatic agents.

ENGINEERING AND MANUFACTURING DEPARTMENTS.

Harry Shoemaker, chief engineer; C. D. Babcock, general superintendent of factories.

MASSIE WIRELESS TELEGRAPH COMPANY.

(Manufacturing and holding company.)

Executive offices, 4 Market Square, Providence, R. I.; incorporated 1905; capital \$300,000, actual property, stock on hand, and office and shop equipments.

OFFICERS AND DIRECTORS.

Walter W. Massie, president and general manager; Frank H. Cranston, vice-president; William R. Arnold, Jr., secretary and treasurer; James S. Kenyon, John G. Massie.

MARINE TRANSMISSION COMPANY.

(Holding exclusive right to operate the Massie system in the United States.)

Incorporated in New Jersey, 1904. Equipment consists of 26 boat installations, 6 land stations.

OFFICERS AND DIRECTORS.

Walter W. Massie, president and general manager; Frank H. Cranston, secretary and treasurer; Wm. R. Arnold, Jr., assistant treasurer; Frederic Culver, Granville Whittlesey.

THE TELEFUNKEN WIRELESS TELEGRAPH COMPANY OF THE UNITED STATES.

New York office 111 Broadway. Philadelphia office 1001 Chestnut street.

Gesellschaft für drahtlose Telegraphie, m. b. H. (Telefunken System) Tempelhofer Ufer No. 9, Berlin, Germany.

Branches in all parts of the world.

The following Telefunken stations have been installed and are in operation:

*Argentine Republic, 7 land, 25 ship and 12 portable stations. Austria-Hungary, 8 land, 16 ship and 4 wagon stations. Brazil, 4 land, 6 ship and 2 wagon stations. China, 13 land, 6 wagon and 5 portable stations. Cuba, 7 land stations. Denmark, 7 land and 10 ship stations. England, 2 wagon and 2 portable stations. Finland, 4 land stations. France, 2 land stations. Germany, 44

land, 156 ship and 16 wagon stations. Greece, 3 ship stations. Holland, 4 land, 14 ship and 2 portable stations. Japan, 1 land, 2 ship, 2 wagon and 2 portable stations. Mexico, 6 land and 2 portable stations. Norway, 4 land and 8 ship stations. Peru, 5 land stations. Philippine Islands, 2 land stations. Portugal, 1 land station. Roumania, 5 land stations. Sandwich Islands, 1 land station. Sweden, 4 land and 20 ship stations. Switzerland, 2 land and 2 wagon stations. Spain, 6 land, 6 ship and 2 wagon stations. Tunking, 2 land stations. Turkey, 2 land stations. Uruguay, 1 land station. United States, 20 land stations, 45 ship, 1 wagon and 8 portable stations. Russia, 26 land, 126 ship, 8 wagon and 2 portable stations. Kamchatka, 1 land station. Siberia, 1 land station. Total: Land stations 190, ship stations 439, wagon stations 43, portable stations 35.

The wagon and portable stations are used for military purposes.

105 additional stations under construction in Argentine to be completed by July, 1910.

MARCONI'S WIRELESS TELEGRAPH COMPANY, LIMITED.

Executive offices, Watgate House, York Buildings, Adelphi, London, W. C., England; capital, £750,000, of which £250,000 are 7% cumulative preferred, and £500,000 common.

DIRECTORS.

Sir Charles Euan-Smith, chairman; G. Marconi, managing director; J. F. G. Bannatyne, H. Jameson Davis, Albert L. Ochs, Major S. Flood Page, Henry S. Saunders, H. Rial Sankey, Alphonsus Marconi, Henry W. Allen, secretary.

MARCONI INTERNATIONAL MARINE COMMUNICATION COMPANY, LIMITED.

Executive offices, Watgate House, York Buildings, Adelphi, London, W. C., England; capital, £350,000.

DIRECTORS.

G. Marconi, managing director; J. F. G. Bannatyne, Albert L. Ochs, Major S. Flood Page, Henry S. Saunders, Sir Charles Euan-Smith, Charles Roux, Edgar St. Paul de Sincay, H. Jameson Davis, H. Rial Sankey, Alphonsus Marconi.

MARCONI WIRELESS TELEGRAPH COMPANY OF AMERICA.

Executive offices, 27 William street, New York; capital \$6,650,000; incorporated 1899.

OFFICERS.

J. W. Griggs, president; G. Marconi, vice-president; John Bottomley, vice-president and general manager; directors, inclusive of the officers: James M. Townsend, James W. Pike, Major S. Flood Page, Charles A. Terry, George T. Campbell, George W. Fishback, H. Jameson Davis.

MARCONI WIRELESS TELEGRAPH COMPANY OF CANADA, LIMITED.

Executive offices, 1724 Notre Dame street, Montreal, Que.; capital \$5,000,000.

DIRECTORS.

Andrew A. Allen, president; G. Marconi, vice-president; J. N. Greenshields, Robert Bickerdike, John Bottomley.

LA COMPANIA MARCONI DE TELEGRAFIA SIN HILOS DEL RIO DE LA PLATA.

Executive offices, 132 San Martin, Buenos Aires, Argentina; capital \$6,750,000.

DIRECTORS.

Dr. Manuel Quintana, president; G. Marconi, vice-president; Commendatore Tomas Ambrosetti, Ventura G. Coll, Commendatore Tomas Devoto, Henry Beauteemps, Antonio Terrarosa, Captain Guillermo Jose Nuñez, Sir Charles Euan-Smith, Colonel Sir Thomas Holdich.

LA COMPAGNIE DE TELEGRAPHIE SANS FIL.

Executive offices, 19 Rue Brederode, Brussels, Belgium; capital 600,000 francs.

DIRECTORS.

Lieut.-Col. Albert Thys, president; Maurice Travailleur, managing director; Charles Balser, Isidor Loewe, Berlin; Baron de la Chevrelière, Paris; G. Marconi, Albert L. Ochs, H. Jameson Davis, Major S. Flod Page, Gaston Perier.

LA COMPAGNIE FRANCAISE MARITIME ET COLONIALE DE TELEGRAPHIE SANS FIL.

Executive offices, 35 Boulevard des Capucines, Paris, France; capital 100,000 francs.

DIRECTORS.

Baron de la Chevrelière, managing director; John Dal Piaz, Cie Générale Transatlantique; Alfred Musnier, Charles Roux, Messageries Maritimes, G. Marconi.

Marquis L. Solari, 315 Corso Vittorio Emanuele, Rome, Italy. Branch of London Marconi Wireless Telegraph Company, Limited.

Marconi's Wireless Telegraph, Rue da Quitanda, 133-A, Rio de Janeiro, Brazil; Agency of London Marconi's Wireless Telegraph Company, Limited.

The property of the various affiliated companies of the Marconi system consists of 33 stations on the Atlantic Coast north of New York City, and on the Gulf of St. Lawrence; 37 in Great Britain and Ireland; 37 in Europe; 4 in Brazil; 3 in Chile; 3 in China; 5 in Egypt; 1 in Gibraltar; 5 in the Hawaiian Islands; 1 in Malta; 2 in Mozambique; 1 in Uruguay. There are 253 steamers and steam yachts fitted with the Marconi system. In addition to these, ships of the navies of the following countries are likewise fitted; Great Britain, United States, Italy, Brazil and the Argentine Republic.

THE MURRAY AUTOMATIC SYSTEM.

Some remarkable results have been obtained recently with the Murray automatic page-printing telegraph system.

During a trial on the Glasgow Herald private wire from London to Glasgow a speed of no less than 180 words a minute (simplex) was reached (5 letters and one space per word). The actual speed was about 200 words a minute, as a considerable number of contractions were used. Several columns of news were transmitted and successfully printed at this rate. To reach this speed the receiving mechanism had to punch 90 successive holes per second in the receiving tape. Working on short circuit, a speed of no less than 224 words a minute has been achieved, or 112 successive holes perforated in tape per second.

The typewriters are the weak point of high speed printing telegraph systems, as these machines are only constructed for hand use. Mr. Murray has constructed a special typewriter of his own, which works satisfactorily at 200 words (1200 letters) per minute, printing in page form.

Telegraph and telephone traffic was badly interrupted by the recent storms in Germany. The Berlin Tagliche Rundschau of November 27, 1909, quotes a long semi-official article from the "Deutsche Verkehrs-Zeitung" in regard to the traffic interruption, in which the following paragraph occurs:

"Great service was derived from the machine telegraph of Donald Murray, introduced some years ago, through the remarkable carrying capacity of which alone it was possible to utilize the cable connections between Berlin-Hamburg and Berlin-Frankfurt so fully as was done on this occasion. As an example, during one day more than 5700 (five thousand seven hundred) telegrams were exchanged between Berlin and Hamburg on one Murray duplex circuit."

The use of the Murray automatic system is chiefly for long lines, heavy traffic and news work.

It is hoped that it will be possible in a few months to make an announcement about a new Murray Multiplex printing telegraph that is specially suited for average traffic on average lines.

A blue book has been issued containing an appendix to the report of the International Conference on Electrical Units and Standards, of 1908, consisting of notes on the methods adopted in various standardizing laboratories, to realize the international ohm and ampere, and to prepare the Weston Normal cell. While the methods described fall within the general international specifications, the details of the procedure differ; the various methods, however, give very nearly identical results. The bulk of the matter relates to the procedure followed at the official laboratories of the United States, France, Germany and Great Britain, in the preparation of the Weston Normal cell. —London Electrical Review.

WIRELESS TELEGRAPHY AND TELEPHONY.*

BY H. S. WEBB.

Wireless telegraphy may be defined as the process of transmitting telegraphic signals between two points that are not connected together by any wires; and wireless telephony as the process of transmitting articulate speech between two such points. Wireless telegraphy has been gradually developed since about 1842, and may be divided into three classes. The first depends upon electric conduction, the second, upon electromagnetic and electrostatic induction, and the third upon the use of so-called Hertz, or electro-magnetic waves.

The term "wireless telegraphy" as now generally used, however, refers to the more recently devised methods like Marconi's, De Forest's, and so forth, in which electric or other waves, in free space, are utilized to transmit the signals between the sending and receiving stations. It is very seldom that a successful system, machine or method of any kind is entirely the invention of any one man; so with wireless telegraphy, it is impossible to say, in many cases, who invented this or that system.

Between the years 1864 and 1867 Maxwell of England predicted by a complete mathematical demonstration that electricity would be found to have the same nature as light, and hence that electrical disturbances would be propagated as waves through space with a velocity equal to that of light. The predictions of Maxwell were later proved experimentally by Hertz of Berlin. Hertz's experiments clearly demonstrated the fact that electromagnetic waves could be propagated through space and make their presence known in suitable currents hence it only remained for his successors to produce sufficiently powerful waves and to discover a sufficiently sensitive instrument that would detect such waves, in some manner, as our eyes readily detect the presence of light.

Electromagnetic waves, although identical with light waves in many respects, have different rates of vibration, different wave lengths and other different properties. For instance, while wood, brick, and many other substances are not transparent to light waves, they are transparent to electromagnetic waves. Most metal, however, is opaque to almost all waves. Our optical nerves are capable of detecting light waves but they cannot detect electromagnetic waves. On the other hand we now have various devices that are insensitive to light waves, but are sensitive to electromagnetic waves.

Research, within the last thirty years, tends to demonstrate that all electrical phenomena are due to a peculiar strain or stress of a medium called ether; that when in this condition the ether pos-

sesses potential energy, as is manifested by attractions and repulsions, by chemical decomposition, and by luminous, heating and various other effects. We do not know what electricity is, any more than we know what gravity is, we only know the effects due to it, and the laws that follow it.

Ether is assumed to be a medium having the properties of matter of infinitely small density. All space, including the most complete vacuum, the space between the planets and the stars, as well as the infinitely small spaces in the hardest crystal and the heaviest metal, in short, matter of every kind—is permeated by ether. It is comparable to an all-pervading jelly of almost perfect elasticity. An electrical disturbance produces a strain in this all-pervading jelly, or sets it into rapid vibration, thereby producing waves that travel through space and pass from one body to another with the velocity of light. When these waves in the ether reach a body sensitive to their particular rate of vibration their motion is imparted to the molecules of that body, which in their turn begin to vibrate; that is, the body becomes electrically excited. Light, heat, electricity and magnetism, are supposed to be transmitted through space by some active condition of the ether, usually in the form of vibrations.

Marconi, to whom much credit is due for the best results so far obtained in wireless telegraphy, uses in some cases electromagnetic waves generated by a powerful induction coil and a coherer which was invented by Branly about 1890, and later other devices for detecting the existence of the waves. Marconi was the first to use, for wireless telegraphy, the long wires projecting into the air at the sending and receiving stations.

To explain the action of the coherer, suppose we have two fairly clean pieces of metal in light contact connected in series with a single electric battery; a film of what may be called oxide intervenes between the surfaces so that only an insignificant current is allowed to pass, because the electromotive force of a single electric battery is insufficient to break down the insulating film of oxide. Now, if the slightest surging of electricity occurs across this contact, the film at once breaks down, perhaps not completely—that is a question of intensity—but permanently. Apparently more molecules get within range of each other and a momentary wave seems to weld them together. It is a singular variety of electrical welding. A stronger wave enables more molecules to hold on, and the change in the electrical resistance of the coherer seems to be proportional to the intensity of the electric radiation from a transmitting device. It is to be especially noted that the battery current does not cause the cohesion, but only shows that cohesion has taken place. The battery can be applied after the spark has taken place, and the resistance will be found to have changed as much as if the battery had been on all the time. The cohesion electrically caused can be mechanically destroyed.

*Abstract of paper read before the Engineers Club of Central Pennsylvania.

Any feeble mechanical disturbances such as scratches or taps are well adapted to restore the contact to its original high resistance and sensitive condition. The more feeble the electrical disturbances the lighter is the corresponding mechanical jar needed for restoration or decohesion.

Experiments of Marconi across the Atlantic Ocean seem to prove that the curvature of the earth has little or no effect upon the transmission of signals. The electromagnetic waves sent out by the transmitter seem to slide over the surface of the earth instead of following a straight line from the transmitting to the receiving station through the earth. A straight line through the earth from St. Johns, New Foundland, to Poldhu, England, would show that the summit of the ocean was about 142 miles above this line at a point midway between the two places. Either the electromagnetic waves or disturbances must slide over the surface or through the air, or else the earth must be transparent to them. Otherwise if the transmitter and receiver had to be on a straight line which would clear the surface of the ocean one or the other would have to be elevated about 650 miles. In fact the vertical wires are seldom more than 200 feet high. The best explanation seems to be that the electrical waves slide or bound in immense steps, probably about 1,200 feet high, over the surface of the ocean. It is possible that the surface of the ocean forms one reflecting surface and the rarefied atmosphere, some 1,200 feet above the surface of the earth, another reflecting surface and the waves are reflected back and forth between these two surfaces. The surface of the ocean acts apparently as a good reflecting surface and the long vertical waves seem to bound along like a marble that is thrown at an angle upon a smooth stone sidewalk.

While it is possible by suitable devices to set up disturbances in the ether, very much as disturbances can be set up in the air, nevertheless, we are still ignorant of the action of the ether when so disturbed and know nothing definitely about it.

If it is assumed that waves are radiated in all directions in space from the spark gap or antenna or both, then the electrical energy received on a surface one foot square at a distance of but one mile from the transmitter is less than one three-hundred-and-fifty millionth of the total energy radiated and furthermore the energy actually radiated as electric waves is perhaps not more than six or eight one-hundredths of the energy developed in the oscillator, the remainder being lost in the induction coil as heat and at the spark gap as heat, light, and sound. Hence, it is evident that signaling by wireless telegraphy is very inefficient compared with signaling through connecting wires in the ordinary way. Experiments show that it requires about 150 watts to signal twenty miles. To send a signal through an ordinary telegraph line wire and relay, a distance of

200 miles requires about three watts (allowing for all losses), or one-fiftieth of the power required to send a wireless signal only twenty miles.

We know that it is much more difficult to transmit electromagnetic waves the same distance over the irregular surface of the land. With the same apparatus and conditions the distance over which it has been possible to transmit messages over land has only been about one-third the distance over water.

While wireless telegraphy systems may be successfully operated over land, the largest field for its use is certainly on oceans and lakes where wires cannot be maintained.

As the field for wireless telegraphy and telephony is mostly between the shore and ships, stations are being continually constructed along the coasts and more vessels are being continually equipped with suitable wireless outfits. It is now quite common for vessels to keep in communication with the American or European coast stations all the way across the ocean, as well as with passing vessels. The United States now proposes to compel all passenger ships to carry wireless signaling outfits.

In December, 1901, the first signals, which consisted only of the letter *s* in the continental telegraph code, were sent by the Marconi system across the Atlantic Ocean from Poldhu, England, to St. Johns, Newfoundland. In February, 1902, messages were sent from Poldhu to the ship *Philadelphia*, as the latter proceeded to the United States. The signals were recorded on a Morse register. Readable messages were received up to a distance of 1,551 miles from Poldhu, and simple signals as far as 2,099 miles. In December, 1902, Marconi sent messages both ways between Poldhu and Glace Bay, Nova Scotia. Between these points this company claims to be competing to-day with the cables between America and England.

In July, 1908, messages were exchanged between Admiral Sperry's flagship and Point Loma, California, a distance of 2,900 miles, up to that date the longest distance for the transmission of a wireless message without intermediate relaying stations. The longest distance with one relaying station was from Savannah, Georgia, to the armored cruiser *Pennsylvania* on its way to Honolulu, a distance of 4,000 miles with a relay at Point Loma. The message travelled 2,070 miles over land and 1,930 over sea.

A serious fault that prevents wireless telegraph systems from competing with systems using connecting wires, is the fact that with the arrangement of apparatus so far devised it is impossible to obtain, at the same station, two independent communications; every receiver placed in the radius of action of a transmitter is acted upon by the waves sent out by that one transmitter. Various systems have been proposed to avoid this fault. If a circuit having certain electrical resistance, inductance and capacity be placed in a region in which waves are passing, so that succes-

sive waves can induce currents in it, then each wave will tend to slightly increase the intensity of the preceding wave, providing the waves have a certain frequency; that is if they are in tune with the receiving circuit. The oscillations will increase in intensity, just as small pushes given to a pendulum at the proper times will make it swing violently. In such a system the receiving circuit is said to be in tune, resonance, or sympathy with the waves and the transmitting circuit that emits the waves.

Research has shown that in some circuits the electric oscillations die away very rapidly and are said to be damped. In order to set a heavy pendulum vibrating with a large amplitude by means of small thrusts or impulses, the latter must be timed to agree with the period of oscillation of the pendulum, since otherwise its oscillations will not acquire any appreciable magnitude. The same effect is obtained in a very small fraction of a second when undamped oscillations are caused to induce electrical impulses in a circuit tuned or adjusted to the frequency of these undamped oscillations. Electrical resonance, like mechanical resonance, essentially depends on the accumulated effect of a large number of small impulses properly timed.

That under certain conditions various receivers will respond to one transmitter, even if the receivers are not in tune with that transmitter, may be due to the fact that all the energy of the transmitter is radiated in only one or two impulses that are intense enough to start sufficiently strong oscillating currents in all the receivers to operate them, whereas, if the same amount of energy be distributed in a great number of more feeble impulses, their combined effect can only operate that receiver which is tuned to respond to only that one particular frequency. The tuned receiver will not respond with sufficient intensity to the first two or three oscillations, if not too strong, but only to a longer succession of properly timed impulses, so that only after an accumulation of a number of impulses will the effect become sufficient to actuate the receiving device and cause the production of a signal.

The electrolytic wave detector consists essentially of a very minute platinum point dipping into a small metal vessel containing an electrolyte whose products when decomposed by electricity are gases. The vessel may be made of platinum or some other metal or it may be made of carbon, glass or porcelain, with a sheet or flat spiral of platinum, or some other metal as one electrode. When an electromotive force is applied to such a cell, powerful polarization or a back electromotive force ensues, so that scarcely any current passes, if the electromotive force is kept below a certain critical value. When electric oscillations pass through this cell, the resistance is decreased and the current is momentarily increased, only to return to normal conditions as soon as the oscillations cease.

The cell made by the National Electric Signal-

ing Company is said to consist of a minute platinum cup, containing the electrolyte into which dips a platinum point about .002 millimeters in diameter. This platinum wire, called a Wollaston wire, is drawn with a coating of silver and the silver is finally dissolved in acid, leaving the very fine bare platinum wire. The potential applied to the circuit containing this electrolytic cell may vary from 1 to 2.7 volts, but the best pressure across the cell seems to be 1.6 volts. For the electrolyte, a fifty per cent. solution of hydrochloric acid, a twenty per cent. solution of nitric acid or a thirty per cent. solution of sulphuric acid may be used. The hydrochloric acid seems to be the most sensitive. The resistance of the detector for small alternating currents varies from about 20,000 to 400 ohms, according to the polarizing electromotive force applied by means of the battery. When the electromotive force is changed .02 volts, using a solution of hydrochloric acid, the resistance changes 13,000 ohms.

The audion, so-called by De Forest, consists of an exhausted incandescent lamp, preferably a four to six-volt tantalum lamp, to which is added two metal parallel wings. The battery must be suitable to keep the filament incandescent and for the battery enough dry cells must be used to give from six to eighteen volts. De Forest, in 1906, said that tuning with his audion was sharper than with any other form of detector, and that the same signals for practical distances were louder than with the electrolytic detector. The oscillating waves passing from the wings to the filament reduce the conducting power of the attenuated gas between them, and hence the current through the relay is decreased.

In addition to those already considered there are quite a number of other devices for detecting the waves produced by wireless telegraph or telephone transmitting apparatus. The carborundum detector consists of a crystal of carborundum clamped between two adjustable springs. This detector is connected in the circuit in the same manner as the coherer, but a telephone receiver is used to receive the signals in place of a relay.

The silicon detector consists of a piece of pure silicon held with suitable pressure between two low-resistance metal electrodes. The incoming oscillations in passing across the contacts heat one silicon-metal contact more than the other, thereby causing a direct thermoelectric current impulse for each oscillation and producing a sound in a telephone receiver as long as the oscillations persist. The silicon detector requires no battery in the telephone receiver circuit although some state that it works much better with a battery and is claimed to be twice as sensitive as the carborundum detector and about as sensitive as the electrolytic detector. Tellurium, fused sulphide of copper, the natural variety of the latter called, chalcosine, sulphide of molybdenite, and Becquerel's alloy (10 parts of bismuth and 1 part

of antimony) may each be used in the same way, requiring no battery. These thermo-electric detectors respond, not in accordance with the variation of potential, but in accordance with the mean energy impinging upon the system.

Most oscillations produced by wireless telegraph transmitters are very much damped, that is, succeeding waves decrease greatly in amplitude, so that only the first few waves have sufficient intensity to affect the distant receiver. Poulsen has succeeded in producing waves that are so much less damped that they are called "undamped waves." Undamped oscillations are very desirable for selective or tuned systems, but it seems to have been difficult to produce damped waves that are as powerful as undamped waves. Poulsen's transmitter for producing undamped waves, is a so-called singing or flaming arc maintained between a positive copper and a negative carbon electrode. When the capacity and inductance that shunt the arc are suitably adjusted, rapid oscillations of nearly uniform amplitude are produced in the circuit, including the antenna and ground. The energy emitted by this method is low, but will undoubtedly be increased by improvements.

Wireless Electric Power.

In a recent newspaper interview Mr. Nikola Tesla discussed the subject of wireless transmission of electric power, a subject upon which he has been working since 1893.

The popular idea, he said, is that the wireless system of transmission is just one invention, but the fact is that it involves in its present state of perfection six fundamental discoveries, or inventions, in combination. They are as follows:

First.—The method and apparatus for transforming ordinary currents into electrical oscillations of great intensity.

Second.—The apparatus for intensifying those vibrations immensely, so that they penetrate into the distance.

Third.—A receiving apparatus which collects and focuses energy which a transmitter supplies to a large territory. For instance, if such a receiver, properly constructed, be placed in Ireland it will collect practically the entire energy conveyed to that country from the transmitter.

Fourth.—The method and apparatus for making the electrical impulses secret and non-interferable. That is to say, making it impossible to prevent their passage or to read them. The energy of the transmitter, which is collected by the receiver, only can be released by a sort of safety lock or combination.

Fifth.—The production of stationary waves. That is, waves which excite the entire earth and pass through it under a vibration much the same as though you were to draw a string tight and then strike it. With these waves the distance is absolutely eliminated, as the effects are the same whether the receiver is thousands of miles away or close to the transmitter.

Sixth.—A number of inventions which cannot very well be described in a short interview, but which go together to make the system practically operative.

With a plant constructed under the observance of these principles, it will, he said, be just as easy to telephone from here to Melbourne, Australia, as across a room, and there will be absolutely no distortion of the voice, such as is observable now in communicating by wire. This, he added, is not a theory, but a fact absolutely demonstrated by his experiments, which have shown that the current passes without loss over the entire extent of the globe and through the globe. He has carried the construction of such an installation very far and hopes to be able to complete its construction during the coming summer. From that moment every telegraphic, telephonic as well as every wireless station will, he said, be ever so much more valuable, as they will be able to receive messages from any part of the world. All this will be done without the slightest change in the existing equipment.

"Will it be necessary under your plan, Mr. Tesla, to build high towers on the shores of the countries using it, and also in interior points?" the inventor was asked.

As to large towers these, he said, are comparatively ineffective. The tower he has built near Port Jefferson, L. I., is only 187 feet high, but the plant will produce an effect which can be pushed up to a rate of 1,000,000,000 horse-power, which is more than all the wireless plants that have been put up so far altogether. This enormous activity is secured by the use of certain artifices on which he also bases a confidence that it will be possible to flash signals through interplanetary space.

As to his wireless system for the transmission of electric power, he said that if had not been for unfortunate circumstances a plant of this kind would long ago have been in operation. Just one single plant of, say, 10,000 horse-power, would be sufficient to drive several thousand flying machines, aeroplanes and dirigibles anywhere in the world. While supplying them with wireless power it also would keep them in constant touch with the earth by wireless telephone and telegraph.

Referring to interplanetary signals, he said he had in his experiments in Colorado discovered certain planetary disturbances, and attained with his transmitter activities which surpassed in power in many ways those of lightning. In his present plant he will be able to reach a rate of energy-delivery of about 1,000,000,000 horse-power. A simple calculation will, he said, convince any expert that with such an intensity and energy reaching a certain area of the planet Mars, it is ample to produce a perceptible effect in a delicate instrument there.

In answer to a question as to return signals, he said he believed that these signals are being flashed now and waiting for us to answer.

The Military Telegrapher in the Civil War.

PART XXXIII.

Among those prominently connected with the military telegraph service during the Civil War was William G. Fuller, who was identified with this important branch of the army through the entire war, being at one time in charge of the Department of Tennessee, and at the close of the war having supervision of the Department of the Gulf. In writing to Colonel William R. Plum, historian of the United States Military Telegraph Corps in 1878, Mr. Fuller told in part the following story of his war time experience:

"At the outbreak of the Rebellion I was in charge of the telegraph lines from Grafton, in West Virginia, to Cincinnati, O., on the Baltimore and Ohio, and Marietta and Cincinnati railroads. In May, 1861, the Confederate forces occupied Grafton, taking possession of the telegraph office. This force was understood to be in command of Colonel Porterfield. In common with the citizens of Marietta, O., my place of residence, I was much alarmed at the threatening aspect of affairs. Reports came to us that the Confederate forces were moving towards the Ohio River, threatening Parkersburg. A meeting of citizens was called and a committee sent to Columbus to urge upon Governor Dennison the importance of organized forces to protect our homes. The telegraph at this time was the center of attraction, and the principal agent in facilitating operations. For two or three weeks I scarcely slept at all, watching every movement night and day. The committee sent to Columbus returned with Captain Barnett's battery of six guns from Cleveland, O. On May 26 the Fourteenth Ohio Volunteer Regiment, Colonel James B. Steedman commanding, arrived from Toledo. On the same day I received a despatch from Colonel Anson Stager instructing me to take the first train for Cincinnati. Monday, May 27, I spent part of the night at General G. B. McClellan's house, learning the use of the first army cipher to be used in telegraphing. Tuesday, May 28, I entered West Virginia at Parkersburg with Colonel Landers of General McClellan's staff. Mrs. Fuller endeavored to obtain a promise from me before leaving home on Monday, that I would not go to West Virginia. I replied that I could promise nothing, as I was a public servant. So anxious was she in regard to the matter that she followed me on the next train to Cincinnati to endeavor to prevent me from taking such a step. Not being advised of her movements we did not meet. I went home to say good-bye, but my wife was not there. She did not see me until six weeks had passed.

"We followed the troops out along the line of the railroad, repairing the wires and keeping open communication with Cincinnati. The night after our troops started along the line of the railroad was very dark. I was in the office at Parkersburg watching for communication from the front when there were several muskets fired across the

Little Kanawha River. Colonel Landers came rushing into the office, pistol in hand, apparently much alarmed, and said: 'Fuller, are you armed?' I said, 'No, I have had no time to procure arms.' He said, 'I believe we are attacked. I want some one to go with me to see what it is. Here, take this pistol and follow me.' I took the pistol and followed through the long dark depot to the bridge and across the Little Kanawha, where he turned laughing and said, 'Well, I see you are not badly frightened. I just wanted to try you. We will go back.' Many of the railroad bridges having been burned and the telegraph wire destroyed, the progress was slow towards Clarksburg. We finally reached that place June 18, and Webster Station, June 20, when I met Mr. T. B. A. David, who had advanced with the forces under Colonel Kelly from Wheeling, W. Va. From Webster we commenced extending the wire to Phillipi, but the first real skirmish at that place being over this line was abandoned, and Mr. David and myself returned to Clarksburg. Mr. David took charge of the operating of the lines and I took the advance towards Buckhannon. When about twenty miles out Mr. David took the advance and I returned to Clarksburg. He had reached a place within two miles of Rich Mountain with the wire July 9 when that battle occurred. After the battle the line was extended to Beverly, where an operator was left in charge, and Mr. David returned to Clarksburg. This exhausted our immediate stock of building material.

"While waiting for more building material the battle of Bull Run was fought. This gave the foe great encouragement, but it made our troops very determined. General McClellan was ordered east and General Rosecrans succeeded to the command in West Virginia. The bringing up of troops and supplies so overcrowded the limited and disjointed means of transportation that our supplies were very much delayed. Both Generals McClellan and Rosecrans gave us every possible facility for our operations, at once recognizing the importance of the telegraph to hasten military operations. An Indiana regiment coming up the road shot our wires in two in several places, but we could not ascertain who the offender was. General McClellan thereupon issued an order forbidding all firing from trains, and making the shooting at the telegraph wires punishable with death. This checked the matter. We had received orders to construct a line to Weston, a distance of twenty-four miles, as soon as our material should come to hand.

"We started this line on Friday, July 26, proceeded three miles and exhausted supplies, waited until Sunday noon, then went three miles further. Monday we went seven miles; Tuesday, seven miles, and on Wednesday reached Weston. This line was on a turnpike road and in several places we had to haul poles three and four miles, there being no trees that we could use. At Weston we halted for orders, the country beyond being infested with bushwhackers, who sent threats to us

that if we attempted to extend the wires they would shoot us from the rocky hills and mountains. General Rosecrans detailed a company from the Fifth Ohio Infantry, under command of Captain Theophilus Gaines, to act as our escort and flank the road as we proceeded with the wire. This company was composed of machine shop, foundry and rolling mill hands from Cincinnati, O., and they were very efficient soldiers, being light and pluck to the core. Captain Gaines had a misunderstanding with Colonel Dunning, commander of the regiment, which was the immediate, and to us, very fortunate cause of our securing so efficient a company to escort and assist us. I remember one of our first despatches was from a captain who had been sent by General Rosecrans to disperse a band of unarmed Confederates at a rendezvous somewhere in Gilmer County, W. Va., stating that he had learned that said Confederates had received arms and were marching in large numbers, intending to surround and capture his force; that he was on a hilltop and entrenching, and would hold out until General Rosecrans could send him assistance. In a moment this reply came back:

Sir: You were sent into the field to become a terror to the enemy, and not to be terrified by them. March out of that entrenchment and disperse the enemy and report at these headquarters.

(Signed) W. S. Rosecrans,
Brigadier-General Commanding.

The following despatches will explain my movements during the next few days following this incident:

Clarksburg, W. Va., August 10, 1861.

To W. G. Fuller, Superintendent Military Telegraph, Weston, W. Va.

Proceed with your lines. Tell Captain Gaines to scout well in front of you and keep the road well flanked.

(Signed) W. S. Rosecrans,
Brigadier-General Commanding.

Clarksburg, W. Va., August 13, 1861.

To W. G. Fuller, Superintendent Military Telegraph, Near Imboden's.

Proceed with line cautiously. Tell Captain Gaines to scout well in front until you arrive at Bulltown. By the time you get there I think the country will have been well cleared out.

(Signed) W. S. Rosecrans,
Brigadier-General Commanding.

Clarksburg, W. Va., August 14, 1861.

W. G. Fuller, Superintendent Military Telegraph.

The Commanding General directs me to tell you to halt your company at Bulltown. Send forward the despatches to Colonel Smith and await the arrival of Lieutenant Colonel Mathews by order.

(Signed) George S. Hartsuff,
Assistant Adjutant General.

"While at Bulltown our wire was cut at Imboden's and about a mile of wire taken away. Captain Gaines and I went down to examine into the matter. Old man Imboden professed innocence, claimed that he knew nothing about it, or who did it. We simply told him that we would give

him until ten o'clock next morning to find and return the wire; if not found we should burn his home, and shoot him if we could find him; that if the wire was not permitted to stand there should be no houses or inhabitants left in that section of the country. We returned at ten the next morning and found the wire in the woods near by. The line was not disturbed again in that vicinity as long as I remained in charge. This Imboden was father of the famous Confederate general by that name.

Clarksburg, W. Va., Aug. 21, 7:20 p. m.

W. G. Fuller, Superintendent Military Telegraph, Bulltown, W. Va.

General Rosecrans wishes you to continue line to Flatwoods, W. Va., and then await orders.

David.

Clarksburg, W. Va., August 27, 1861.

W. G. Fuller, Superintendent, Flatwoods.

Proceed with telegraph line to Sutton with all possible speed.

(Signed) George S. Hartsuff,
Assistant Adjutant General.

Sutton, W. Va., August 28, 1861.

Brigadier-General Rosecrans, U. S. A.,
Clarksburg, W. Va.

General: I have the honor to report that we broke the camp at the Flatwoods Mountains yesterday at two o'clock and reached this place with the wire at two o'clock to-day.

Very respectfully,

(Signed) W. G. Fuller,
Superintendent Telegraph.

"We remained at Sutton some days until General Rosecrans with his army had arrived, when the orders were given to proceed towards Summerville with the wire. Two companies of infantry were sent in advance of us to clear the road and protect us from attack. We started at day-break with instructions to push the work as the column was expected to move forward the next morning. About five o'clock in the afternoon we found the two infantry companies in camp nine miles from Sutton. We requested them to advance, but they refused. Captain Gaines said: 'Mr. Fuller, if you want to go further I will scout the road until dark.' He did so. The next morning we started early and reached the summit of the small mountain between Little Birch River and the ford of Big Birch. Here a citizen informed us that the Confederates were at Birch Ford, and that their pickets left where we now were about two hours before. I put on my instrument and sent the following report:

To Brigadier-General W. S. Rosecrans, Sutton, W. Va.

General: I have the honor to report that we are on the summit of Little Birch Mountain and my instrument is on the rock occupied by the Confederate pickets last night. There is a Confederate force reported at Birch Ford, four miles ahead of us. We have not seen the two infantry companies since passing them at five o'clock last night in camp. What are your orders?

Respectfully,

(Signed) W. G. Fuller,
Superintendent Telegraph.

Sutton, W. Va.

To W. G. Fuller, Commanding Telegraph.

Keep your teams hitched ready to fall back at a moment's notice and await further orders.

(Signed) W. S. Rosecrans,
Brigadier-General Commanding.

"A few moments after receiving this despatch the wires were cut behind us. We started a party back to examine. They soon returned and reported the enemy in the road four miles back. In this situation we remained that night watching the Confederates down the mountain.

"About four o'clock the next morning we heard a force coming up the mountain. We were prepared to give them the best reception we could, but we soon discovered that they were cavalry sent to our relief. We remained here until noon, when General Rosecrans dined with me on a rock. We had chicken, potatoes and other vegetables procured by our scouts on the side of the mountain where spots were under cultivation. The road being very narrow our work was much delayed by the column passing us, but we did our best to keep up and were about four miles back when the battle at Carnifax Ferry was fought on September 10. After that battle we were instructed to continue the line to Gauley bridge. On reaching Cross Lanes I received permission to return to Clarksburg to adjust my railroad and commercial business, which had been neglected.

"I returned to Clarksburg over the line in company with a cavalry lieutenant, leaving the charge of extending the line with Captain Gaines and his company. On the first night out we stopped with a family, who had assisted me and I thought we were safe, telling them that we wished to start at four o'clock in the morning. We retired to a small room in the log cabin with one small square window and one door. We were awakened in the night by strange noises. The Lieutenant was alarmed, and thought we were betrayed. We looked out of the window and saw a man some distance down the hillside, moving about the stable where our horses were. The dog was walking around the house growling, and we could hear whispering in the house, but not loud enough to hear what was said. We barricaded the door and prepared to make as good a fight as possible at the window, and then stood guard for an hour until morning began to dawn. We then found that the man at the barn was feeding our horses, and the women were dressing and cooking chickens for our early breakfast, and to give us for lunch the next day. Between this and Sutton, however, in the vicinity of Birch River we passed dead soldiers in the road shot by bushwhackers, but we were not molested; we stopped at Sutton that night, took dinner next day with my friend Imboden, near Bulltown, and reached Weston next evening, where we left our horses and took coach and went through to Clarksburg.

"I continued the line down the Kanawha to Charleston, then went to Point Pleasant and laid

the cable across the Ohio River, first covering the cable with wire at the Fair Grounds near Gallipolis in Ohio.

Cleveland, O., December 10, 1861.

To W. G. Fuller.

Can you go into Kentucky for three or four weeks? If so, please come here Tuesday morning prepared to go direct to Kentucky.

(Signed) Anson Stager.

In response to this message I reported at Cleveland and arranged with Captain Samuel Bruch, whom I now met for the first time, to go into Kentucky with him, Mr. T. B. A. David remaining in charge of affairs in West Virginia with Captain Gaines and his company at General Rosecrans' headquarters, and a Mr. Cushman, sent by Mr. Stager to complete the line between Charleston and the cable at Point Pleasant."

(To be Continued.)

United States Military Telegraph Corps.

Colonel William Bender Wilson, of Holmsburg, Philadelphia, Pa., president of the Society of the United States Military Telegraph Corps, sent out the following letter of holiday greeting to the surviving members of the corps:

Dear Comrades:

In the spirit of the season and the affectionate impulses of my heart, I dearly wish that the remnant of a fast disappearing band who gallantly and exceptionally served their country in the hours of its greatest need may have a "Merry Christmas" and spend a "Happy New Year."

Lovingly,

William Bender Wilson.

To this David Homer Bates, secretary of the society, added:

To my Comrades of the United States Military Telegraph Corps:

The undersigned heartily joins in our beloved President's holiday greetings and wishes you another year of life and all the comfort and happiness you are entitled to receive in return for the loyal and valuable service rendered by you to your country in your early days.

Let us cherish more tenderly than ever before the memories of those stirring and eventful times as one by one we drop from the ranks.

Cordially yours,

David Homer Bates.

On Monday evening December 20 the Pennsylvania Reserve Association held its forty-eighth anniversary in commemoration of the Battle of Dranesville, Va., in 1861, at Odd Fellows' Temple in Philadelphia. Captain John Jack presided and paid a glowing tribute to Morse's invention of the telegraph and to its invaluable assistance in war. Colonel William Bender Wilson, president of the Society of the United States Military Telegraph Corps, responded in his well-known enthusiastic vein, illustrative of his loyalty to his old craft and to the interests of the military boys.

The Writing Machine That's Ten Years Ahead is the Writing Machine for You

Every operating device inbuilt where it should be—under the operator's hand. Shift-key, shift lock, space-bar, tabulator, spacer, back-spacer and margin-release—all handy, convenient, right at your fingers' ends.

The One Big Reason why the New Model

L. C. Smith & Bros. Typewriter

ALL THE WRITING ALWAYS IN SIGHT

has sprung so surely, so rapidly into popular use is the fact that typewriter users and typewriter buyers are recognizing, more and more every day, the need for a writing machine that measures up *at every point* to the highest scale of modern business needs. All the writing *always* in sight, ball-bearings at every frictional point, a biller inbuilt, a quicker automatic ribbon reverse—four only of many equally vital advantages that make this machine the *first favorite always* of the person who has to pay for it and the person who has to use it.

Better work and more of it, greater efficiency through and through, the L. C. Smith & Bros. Typewriter is ten years in the lead. The writing machine that's ten years ahead is the writing machine for *you*. Send for the book and read it.

THE CHASE MOTOR WAGON FOR LINE REPAIR WORK

Simple in Construction

The CHASE has a valveless two-cycle, air cooled motor which has more than two hundred fewer parts than the ordinary motor.

No Tire Troubles

High wheels make it a good hill climber. Solid tires eliminate all tire troubles.

Easy to Operate

The CHASE is extremely easy to operate. The lineman can learn to run it in an hour and is just the man to make it give maximum service at minimum cost.

Costs Little to Maintain

The CHASE MOTOR WAGON will do considerable more than twice as much work as a horse at about one-half the cost of maintenance. The Leyland Motors, Ltd., the largest manufacturers of heavy commercial vehicles in England, recently placed an order for 1,200 Chase Motor Wagons, after a careful investigation of all makes of commercial vehicles both in America and abroad. This order, amounting to nearly \$1,000,000.00, is the largest ever placed in the commercial vehicle field. If you value efficiency and economy in making your line repairs, investigate the CHASE.

Thomas A. Edison Makes a Speech.

Mr. Thomas A. Edison, at a dinner tendered him by the representatives of the moving picture companies, given at the Plaza Hotel on December 20, did something out of the ordinary. Mr. Edison actually made a speech, which is something he had never previously attempted, no matter what the occasion was. In the course of his remarks he told his friends what sort of a financier he had been in his early days.

He told them how he had come from Newark to Wall Street one day with a faint hope of being able to market his first invention of the duplex system in telegraphy. He knew nothing of Wall Street or its methods, but he had the acquaintance of General Lefferts, of the Seventh Regiment, then at the head of the ticker service, in the days when there was plenty of excitement in the gold market.

The General did not see his way to do anything with the duplex patents and Edison, disconsolate, was waiting around to see the General again when the ticker broke down as Edison was watching it. Consternation prevailed in the office and presently brokers came rushing in to find out what was the matter that they did not receive the quotations. General Lefferts was as much distressed as anybody else. Pretty soon Edison, who had been studying the mechanism, told the General that he thought he could fix it so that it would work again. Lefferts told him to go ahead and try. Edison succeeded, to the immense relief of the General and the local community.

The next day General Lefferts sent for Edison and told him that he thought the company could employ him and offered him \$400 a month, a sum that staggered the inventor, as the largest pay he had received up to that time had been \$100 a month. The stagger was the greater because he had felt himself down and out. While in the employ of this company Edison set himself to perfecting details in its mechanical instruments in connection with his other studies in the line of practical invention, and the next he knew General Lefferts sent for him and wanted to buy his patents in telegraphy. Edison was stumped, for he had no idea what value to set upon his inventions. He also had a wholesome dread of Wall Street, knowing it only by reputation.

He had never even had a bank check nor had he ever been inside a bank. He went home and spent the night awake thinking the matter over and finally arrived at the conclusion that the most he dared to ask for his patents was \$5,000. When he went back to see General Lefferts the next day he did not dare speak this figure aloud, and when General Lefferts asked him what he had decided on he was silent, trying to screw his courage up. General Lefferts finally broke the silence and offered him \$40,000.

Staggered, Edison pulled himself together as soon as he could and agreed that he thought that would be a fair amount for his patents. Lefferts

prepared a contract for him to sign, and he was so agitated that he signed it without even reading it. The General presently gave him a check for \$40,000, and Edison, not having seen a check before or at least not having had occasion to use one or see one used, did not even know what to do with it. He even thought that he had been buncoed, receiving a piece of paper for all his work.

He asked General Lefferts what to do with it and the General advised him to go to a bank with it and open an account. Edison went to the bank and did not even know what window to go to, but finally went to one where his piece of paper was accepted and taken away. As nothing was said to him he presently departed, sure this time that Wall Street had buncoed him, and wended his way back to his friend the General, who smiled and sent him back to the bank.

Edison was now awfully sore, as he said, and he was perspiring freely although the thermometer recorded five degrees below zero. Back at the bank they laughed at him, but the president came out and asked him how he wanted his money. He responded in any way that was convenient to the bank and they gave it to him, the whole \$40,000, in small bills, which Edison took home in bulging pockets, only to sit up all night with it in his anxiety.

Then on advice he went back to the bank and opened an account.

"And," said he, "I bought a lot of machinery that I thought I wanted and in six weeks I was down and out again without a cent. That's the kind of a financier I was in those days."

Mr. F. N. Roberts, chief operator of the Postal Telegraph-Cable Company's main office at Chicago, in the "Postal Telegraph" for December gives the following scraps of good advice to those in the service, but most of which apply equally well to those in other lines of endeavor:

"Do your work well and cheerfully.

"Do not give too much thought to the present.

"Give some thought to the future.

"Do not think your superior officer does not notice good work.

"The worker requires recreation, but recreation does not provide for the future.

"Map out a future where recreation and study will combine, not conflict.

"Many young men starting out in life see nothing but the present.

"The young boy enters the service as a check clerk. Because present advancement is not fast enough or on account of too much recreation and not enough application to study, a change in work is made. The result: In the future, no trade, no steady position, no savings.

"The boy who fights the battle of the present bravely wins out with a steady position, work all the year and promotion.

"Let us be cheerful and pleasant with our present duties."

Meeting of Technical Publicity Association.

The Technical Publicity Association, of New York, held its regular monthly meeting on December 9. After the usual informal dinner a lively discussion ensued over the subject of circulation and the introduction of a proposed uniform advertising contract for trade papers. The attendance was large, and the participation in the discussion of the prominent technical advertising men and trade paper publishers who were present made the session a most profitable one.

William H. Taylor, treasurer and manager of the Iron Age, opened the discussion, giving it as his opinion that the true measure of a publication is its editorial quality. He said there was no more discriminating class of people in existence than subscribers to a publication.

Mr. Taylor said that advertisers should put themselves in the proper frame of mind in approaching the circulation question. He granted their perfect right to know how many and who read a publication, and he said no good publication refuses such information. The trouble has been, he said, not that the publishers have been ashamed of their circulation, but that wrong deductions may be made when a reputable publisher's statement is placed in comparison with an untruthful one. Mr. Taylor made the first public announcement of the circulation of the Iron Age.

H. L. Aldrich, publisher of International Marine Engineering and The Boiler Maker, exemplified his papers as an instance of necessarily small circulation with intensified buying power in which quality was by far the greater consideration.

C. S. Redfield, advertising manager, Yale and Towne Manufacturing Company, and president of the Technical Publicity Association, here explained how members considered the circulation statements of publishers, being in some cases absolute sworn statements, also the possibility of detecting the liars.

John McGhie, of the American Machinist, told about the passing of old-time advertising solicitation in which the hypnotic eye played an important part, and said that after trying all other policies, publishers have learned that the truthful policy is the best. He said the advertiser buys reputation and editorial force quite as much as circulation.

O. C. Flann, advertising manager of the National Lead Company, said that every good advertising man was perfectly aware of the value of quality in circulation, but said that, nevertheless, it came down to quantity after all, but based on judgment of that quantity from a quality standpoint.

F. R. Davis, of the General Electric Company, said that many publishers seemed to feel that advertising men know their own business, and tried to lead them into unprofitable contracts.

H. M. Swetland, publisher of Automobile, said it was his purpose as a publisher to furnish maximum quantity, but that for a class paper to go beyond a certain quantity was simply to vitiate it-

self. A phenomenal solicitor, he said, once got a thousand subscriptions within a radius of twenty miles, but after two years only one more subscriber was on the list for that district than there was prior to his solicitation.

J. George Frederick, managing editor of Printers' Ink, spoke for known circulation, and the good prospects for a uniformly high standard of circulation statement.

The question of a uniform advertising contract was then taken up with a great deal of interest. A committee of the Association, headed by H. M. Davis, distributed the proposed uniform advertising contract. The matter will be taken up for final action at the next meeting January 21.

The President's Message and the Press.

Long in advance of its transmission to Congress the annual message of the President of the United States becomes public property for pretty much everybody except the newspapers, says the New York Times. Mr. Taft's message, sent in Tuesday, and published Wednesday, was no longer news. Wall Street had it the week before; some parts of it were on the tape.

Printed copies had been passed from hand to hand, and no trust magnate anxious for early news about the attitude of the Administration toward the corporations, no broker or speculator concerned about his present or future market commitments had been at all in the dark as to the recommendations in the message.

To the newspapers the message is delivered some days in advance by the Associated Press under the seal of confidence, which they uniformly respect. Mr. Taft's message had been in the offices of the newspapers belonging to that organization for four days. Although information concerning its contents had been readily accessible to them from other sources, and had been continually given, they had respected that pledge to say nothing about it until it was released at Washington.

This is not just to the newspapers or to the general public, who must depend upon them for knowledge of the document. It would appear that a reform is necessary. If the President of the United States—not this President particularly, for these breaches of confidence have for years been habitual—is unable to guard his communications to Congress from such irregular disclosure, it would appear that he ought to subject to rigid revision the list of persons at Washington whom he takes into his confidence and intrusts with advance copies of the message.

Perhaps it would be found necessary to abolish the custom of sending out advance copies altogether. Rather than that the present loose practice should continue, the newspapers would much prefer that the entire message be telegraphed from the capital simultaneously with its reading in Congress, and not before.

KERITE

Insulated Wires and Cables.

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

The Railroad.

The January meeting of the Western Division of the Association of Railway Telegraph Superintendents will be held in Chicago January 19 or 20, probably in the office of Superintendent Wm. Bennett, of the Chicago and Northwestern Railway. At this meeting a further report of the high tension wire crossing committee will be presented and discussed together with such other matters as may be of interest.

The Grand Trunk Railway has authorized the equipment of three telephonic despatching circuits as follows:

North Parkdale Junction to Burlington, Ont., via Allendale, 148 miles, twenty-one stations, with despatcher located at Allendale. Allendale to Nipissing Junction, 160 miles, twenty stations, with despatcher located at Gravenhurst. Midland to Belleville, Ont., 164 miles, nineteen stations, with despatcher located at Lindsay. The lines will be of 210 pound copper transposed every quarter of a mile.

The Pennsylvania Railroad will within a short time equip the main line of their road between Altoona and Philadelphia with telephone circuits for train despatching, for block signaling and for local message work.

For block signaling purposes there will be a separate telephone circuit between each two offices. Selectors will be used, but on short lines on which there are not more than four or five offices, bells will be used in the ordinary way. For messages to be transmitted long distances, as from headquarters of one division to that of another, the telegraph will be used.

The Norfolk and Western Railroad has recently placed orders for four complete telephone train despatching circuits from Norfolk to Crewe, twenty-seven stations, 130 miles; Crewe to Roanoke, thirty-three stations, 126 miles; Williamson, West Virginia, to Portsmouth, Ohio, twenty-two stations, 113 miles; and Portsmouth, Ohio, to Columbus, Ohio, twenty-two stations, 100 miles. These circuits, in addition to the two circuits now in operation between Roanoke and Bluefield and between Bluefield and Williamson, West Virginia, will complete the telephone train despatching equipment for the entire main line between Norfolk, Va., and Columbus, Ohio, approximately 700 miles, with about 125 stations equipped. Mr. W. C. Walstrum, superintendent of telegraph, reports that the two circuits now in operation are giving excellent service.

The Indiana Railroad Commission has issued a circular calling attention to dangers arising from wires crossing the railroad tracks and common causes of defects in the construction of overhead wire crossings. They also quote the following extract from the statutes of that State: "All telegraph, telephone, electric light and all other wires of any kind hereafter constructed over the tracks of any steam railroad within the State of Indiana

shall be supported by good, substantial wooden poles of a size not less than twelve inches in diameter at the bottom and not less than six inches in diameter at the top, or iron or steel poles not less than five inches in diameter at the bottom and three inches in diameter at the top, such poles to be set in the earth to a depth of not less than six feet, and to be well tamped. All such wires shall clear the top of the rails at least twenty-five feet, and shall be secured to the poles in such a manner as will properly hold them; provided, that in case of the trolley feed and other wires of any electric railway extending over the tracks of any steam railroad in this State the height of such wires above the tops of the rails of such steam railroads shall be not less than twenty-two feet."

New York Central Pension System.

President W. C. Brown, of the New York Central Lines, announced after a recent meeting of the directors of the New York Central and Hudson River Railroad Company, the Lake Shore and Michigan Southern Railway Company and the Michigan Central Railroad Company, that the boards had adopted a plan for a pension system for the employes of all these lines. Its extension to the other principal lines of the system is also under consideration.

More than 100,000 employes will come within its provisions and it means an expenditure by the system of \$500,000 annually.

Under the plan employes on becoming seventy years old will be retired. If they have been in the service of one of the companies continuously for ten years immediately preceding their retirement they will be entitled to a pension. An employe who has been twenty years in continuous service and has become unfit for duty may be retired with a pension, although he has not reached the age of seventy years.

The amount of the pension is one per cent for each year of continuous service, based upon the average rate of pay received for the ten years preceding retirement.

This means that an engineer, for instance, whose salary has been \$1,500 a year and who has been in the service forty years, will receive a pension of \$50 a month, or \$600 a year. And it does not in any way restrict his future activities. He may go into any business he chooses to.

The pension system becomes effective January 1, and within the next year 1,765 men will be retired.

There have been pensioners on the New York Central, but they were taken care of at the discretion of the Board of Directors. There has been no system. The one adopted is similar to that of the Pennsylvania Railroad.

The idea, it is stated, originated with E. H. Harriman. The resolution calling for the creation of the fund was introduced by J. Pierpont Morgan.

An Effective Lightning Arrester.

The pictures herewith illustrate a new, low-priced lightning arrester which has a most remarkable record; 1,400 of them having been in use for the past three years without a failure due to lightning. That lightning protection is required is indicated by the condition of the plates, many of which show unmistakable evidence of heavy discharges. This remarkable service is on automatic block signal circuits, and has resulted in the exclusive use of this arrester by three of the most prominent Western railway systems, on one of which the record is still being made.

GENERAL VIEW OF ARRESTER.

The arrester is designed for use on signal, telephone, telegraph, crossing alarm or any other circuit using a small volume of current. It is small (15-16" x 4 3/4" x 3 3/4"), simple and easily installed, and may be assembled in banks on 15-16" centers.

It has no delicate or easily broken parts. The reactance coil (No. 29283) is connected in series between line and instrument, is exceptionally

DETAILS OF ARRESTER.

efficient, and is so constructed that it does not saturate under service conditions. Its ohmic resistance to alternating current within the range of frequencies of telephonic talking current is negligible, while its resistance to the frequencies of lightning discharges is higher than that of any other small current arrester on the market.

The use of a carbon ground plate prevents bridging the air gap to ground under lightning discharges, and grounding through the accumu-

lation of carbon dust is prevented by providing ample space for all dust to fall clear of the ground and line plates.

All binding posts are one-quarter of an inch in diameter and provided with knurled nuts. All connections are in front. The connectors, 29728, form a buss bar of ample carrying capacity for all ground plates and require but one ground connection for any group.

The arrester is manufactured by the General Railway Signal Company, of Rochester, N. Y. Bulletin No. 106, giving a complete description, will be sent free upon request.

New Home of Rock Island Battery Company.

From a handsome, modern, new factory The Rock Island Battery Company, of Cincinnati, is sending New Year greetings to their customers and the trade in general. The rise of the Rock Island has been phenomenal. From a modest start in the Illinois city, from which the dry cells take their name, the Rock Island Battery Company accepted the opportunity to broaden its field of business activities and went to Cincinnati. In that Ohio city the company has grown and prospered. Increasing demand made several changes of quarters imperative until necessity compelled the abandonment of the down-town plant and the acquisition of a steel and concrete structure on Spring Grove avenue at Winton Place, within Cincinnati's suburban limits.

The new factory is five stories in height and the main building covers 150 by 50 feet. It is well lighted on all sides by seven foot windows, arranged on pivots and located three feet apart all around the building. This insures plenty of air as well as light. The general offices on the second floor are conveniently equipped.

Besides this main factory, there are two adjoining buildings, which increase the total floor space to approximately 100,000 square feet. The company will have shipping facilities that are not excelled. Their own private switch runs to the doors of their factory and is directly connected with the Baltimore and Ohio, Big Four and Cincinnati, Hamilton and Dayton Railroad tracks, while the belt line enables quick transfer to every fast freight line out of Cincinnati. They will have their own Postal Telegraph branch office, and the Winton Place Postoffice is within 300 feet of the factory.

The Telepost Company gave a demonstration of their system recently at Detroit, a temporary line being used between the Mayor's office and the Chamber of Commerce, to demonstrate the operation of the Delany system.

The United States Civil Service Commission will hold an examination on January 19 at various places throughout the United States to secure eligibles to fill a vacancy in the position of telegraph operator (male) at the Navy Yard, Pensacola, Fla., at \$2.80 per day.

SURVIVAL OF THE FITTEST

Most or all of the spurious sending machines incited to life by the phenomenal success of the MECOGRAPH have been consigned to oblivion by the law of the "SURVIVAL OF THE FITTEST."

THE FIRST MECHANICAL TRANSMITTER ON THE MARKET—THE MECOGRAPH—SURVIVES

Patented Feb. 13, '06; May 28, '07; May 5, '08; Nov. 9, '08.
Over 60 per cent. more movements required to send on a Morse key than on a MECOGRAPH.

More MECOGRAPHS are in use than all other automatic transmitters combined.

THE BEST TELEGRAPHIC TRANSMITTER IN THE WORLD.

Sending on a Morse key is an exception to the rule "Practice Makes Perfect," for a large per cent. of operators filling good positions get telegraphers paralysis—the glass arm—the nightmare of operators.

A writer in the RAILROAD TELEGRAPHER of October, 1909, referring to the typical operator, said: "In middle life he is confronted with a physical breakdown, the result of the continuous drafts upon his mental and nervous energy."

Practice sending on a Morse key instead of making his sending perfect, ruins it.

THE REMEDY

Use a sending machine!
NOT A SINGLE OPERATOR EVER INJURED HIS ARM OR NERVE USING A SENDING MACHINE.

Be sure to get the very best transmitter—the MECOGRAPH.

Don't wait till your arm and nerve fail you before getting one.

The best time to save nervous energy is while you have plenty of it.

The time to take care of your arm is while it is SOUND.

Price of MECOGRAPH, \$7.50 Carrying Case, \$1.00 extra SEND FOR OUR NEW CIRCULAR

WE WANT A GOOD LIVE AGENT IN BOSTON

CAUTION—We shall continue to prosecute to a finish all infringers of the rights we have already established with four strong patents and three broad U. S. Court decisions.

OLD AND RECENT TOURNAMENTS.

General Information as to Early and Late Speed Trials, with Incidental Comments on the Persons Concerned in Them, and Unnecessarily Complete Reports, Perhaps, as to the Part I Myself Played in Them and in Other Related Events.

BY WALTER P. PHILLIPS.

(Continued from page 862, December 16, issue.)

Five years later, in May, 1898, the Grand National Morse Telegraph Tournament took place in Madison Square Garden, New York. The New York Electrical Society was holding its electrical exhibition there, and T. Comerford Martin, editor of the Electrical Engineer, and chairman of the Auxiliary and Educational Committee, asked Mr. Catlin to manage a telegraph tournament for which he would guarantee the financial support of the Electrical Exhibition Company. Elaborate preparations were made, the J. H. Bunnell Company and the Manufacturers and Inventors' Electric Company kindly contributing all kinds of necessary apparatus in the way of keys, sounders, repeaters, megaphones, etc. The judges' room from whence the messages were sent by the contestants was at one side of the main hall, and here during the progress of the contest were seen during the evening session many of the leading lights of the telegraph companies, including Thomas A. Edison, who was riveted to a chair convenient to a good sounder to which he turned his resonator stick and remained an eager listener during the whole session. Mr. Edison could "take anything any wire could fetch," as Pat McCauley once described his ability to A. S. Brown when questioned as to his capacity as an operator. And there was not lacking sufficient evidence of Mr. Edison's ability to fill perfectly the position of judge, as back in the sixties he used to copy Manager Catlin, who was in his prime, without a break. When Mr. Edison was asked to act with the judges in this tournament, he answered the summons in his usual characteristic way, as follows:

Orange, N. J., April 9, 1898.

Friend Catlin:

Yours of March 30 received. I may come over and act as a judge of fifty-word-a-minute Morse, but I am afraid I would not understand it. The Morse that I was brought upon was about as perfect as the record slip on a deep sea cable. But if such fossils as Bunnell, Brown, Delany and Martin are going to pretend to read copper-plate Morse, then I may come over and look wise.

Yours,

Edison.

Mr. Edison said the best of the senders had not rushed him a bit, and that he had just had the time of his life, that it was splendid stuff, etc. There were also in the judges' room, Hon. James D. Reid, Colonel A. B. Chandler, A. S. Brown, E. A. Leslie, F. W. Jones, Thomas F. Clarke, P. J. Tierney, Frank J. Scherrer, J. H. Bunnell, T.

Comerford Martin, and many others. Prizes for contestants were all in cash, amounting to \$1,500, of which the Postal and Western Union companies each contributed \$250.

Seth M. Barrett, ably assisted by George Worzel, had charge of the electrical arrangements, which were admirably managed, and Mr. Tierney, of the Central Cable office, attended to the adjusting of repeaters and condensers, and taking of the phonetic records by a machine which was sent by Mr. Smith, of the Manufacturers' and Inventors' Electric Company.

The judges were: Thomas A. Edison, William Maver, Jr., E. H. Curlette, Charles Shirley, S. F. Austin, Gardner Irving, F. F. Norton, E. W. H. Cogley, A. E. Marr, P. B. Delany, A. S. Brown, P. T. Brady, A. E. Sink, W. D. Weaver, J. B. Taltavall—Master of ceremonies, Thomas J. Smith; official timer, A. E. Sink. Transmissions were of five minutes' duration, and the matter used was "The Command of Gideon."

Afternoon Session—Ladies' Class—Miss J. McManus, 239 words, eight errors, superior Morse, first prize.

Miss Emma R. Vanselow, 241 words, eight errors, good Morse, second prize.

Miss McManus was a Postal, and Miss Vanselow a Western Union operator.

Other contestants in the Ladies' class were:

Rose Feldman, L. Phillips, Alice Mead, M. Baxter, K. Newman, Mrs. T. V. Brice, M. Welton.

230 Word Class, for all who have not a record of more than 230 words in five minutes.

Charles F. Edney, 233 words, one error, excellent Morse, first prize.

F. M. McClintic, 242 words, five errors, good Morse, second prize.

David C. Grant, 225 words, made a very fine showing; no third prize.

Mr. McClintic was with the Associated Press at Memphis, and Mr. Edney with the same association in New York, and Mr. Grant with the same association in Toledo, Ohio.

Other contestants in the 230 Class were:

E. V. Wedin, Jr., Fred E. Keene, and L. F. Jamison.

240 Class (Limited)—J. D. Hinnant, 252 words, four errors, good Morse, first prize.

F. M. McClintic, 243 words, five errors, good Morse, second prize.

D. C. Grant, 229 1-2 words, excellent Morse.

Mr. Hinnant was from the Anglo-American Telegraph Company, New York.

P. J. Faulkner, Fred E. Bunnell, Frank English and David C. Grant also sent in the 240 Class, and Mr. Grant, who sent 229 words, 3 characters, was again praised by the judges for excellent Morse.

EVENING SESSION.

Receiving Class—Frank L. Catlin, sent the 50 messages in 32 minutes. H. V. Emanuel won first, and P. J. Faulkner, second prize. The work

of each was highly praised by the judges, but Mr. Emanuel got first prize, as he added the month and year to each message, as it came along.

J. Rosenbaum won the third prize, under difficult circumstances, using an old No. 1 Smith Premier typewriter so badly worn out that fourteen of the letters were no longer visible on the buttons. His facility with the machine was so great that he spelled out the names of all states that were abbreviated by the sender and indulged in other elaborations that violated the rules and counted against him as errors.

Mr. Emanuel was with the Western Union Company in Philadelphia, and Mr. Faulkner from the American Telephone and Telegraph Company, New York.

Other contestants in this class were: E. J. Hart, G. W. Dickinson, R. Scales, J. M. Purcell, F. W. Dunn, W. I. Taylor, J. B. Waddell, J. C. Bishop, J. P. Conway, W. N. Butt, W. C. Evans, T. F. Kelhoe, W. H. Miles, J. P. Mitchell, and J. M. Ryan.

Phillips Code Class (new matter)—G. W. Conklin, 345 words, with two errors, first prize.

William M. Gibson, 330 words, with two errors, second prize.

Mr. Conklin was with the Laffan Bureau, and Mr. Gibson with a broker.

In the Code Class, C. F. Edney sent 279 words, and was complimented by the judges for his excellent Morse.

Championship Class (sending). Matter used, "The Command of Gideon." W. M. Gibson, 254 words, one error, perfect Morse.

Frank L. Catlin, 253½ words, one error, perfect Morse.

Mr. Catlin was with the Municipal Telegraph and Stock Company, at Albany.

Other contestants in this class were:

J. E. Kane, F. M. McClintic, Frank English, J. D. Hinnant, David C. Grant.

Mr. Hinnant received favorable mention by the judges for his excellent Morse.

Championship (receiving)—E. H. Curlette, three errors, first prize.

P. J. Faulkner, five errors, second prize.

Mr. Curlette was with the Postal Company, of New York.

J. E. Walsh, C. F. Edney, E. J. Hart, J. M. Purcell, W. I. Taylor, J. B. Waddell, M. E. Moser, R. Scales, H. Peters, Melville Fisher, James P. Mitchell, F. W. Dunn and H. G. Martin were also contestants in the Receiving Class.

The work of Mr. Martin in this class was most highly commended by the judges. He was unfortunate, through a misunderstanding, in omitting to copy the names of the senders on his sheets, which caused him to be charged with six errors.

David C. Grant, of Toledo, also received most favorable mention for his fine work in receiving.

Four years later, in March, 1902, a large gathering of the fraternity from all points of the

country, met at Atlanta, Ga., to witness or participate in a tournament given under the auspices of the American Telegraphers' Tournament Association. W. B. Stuart, chairman.

The following named gentlemen officiated as judges:

Charles C. Adams, Horace G. Martin, John Scott and I. N. Miller.

AFTERNOON SESSION.

Meeting called to order by chairman of the executive committee. Addresses of welcome. Governor Allen D. Chandler, Mayor Livingston Mims, S. A. Duncan for the Telegraphers. Response by S. M. English, of Dallas, Texas.

Conditions of the various events, with results:

First Event—Straight Morse sending. To the fastest and most perfect sender for five minutes, formation of letters, and spacing, being conditions of judgment.

First prize, championship gold medal and \$35 cash, won by E. E. Bruckner, of Dallas, Texas.

Second prize, silver medal and \$15 cash, won by F. M. McClintic, of Dallas, Texas.

Second Event (message contest.) To the fastest sender of messages of not more than ten words for five minutes, messages to be numbered and timed, and quality of Morse as condition of judgment.

First prize, championship gold medal and \$35 cash, won by E. E. Bruckner, of Dallas, Texas, with nine messages of ten words each.

Second prize, silver medal and \$15 cash, won by F. G. Johnson, of Louisville, Ky.

Third Event (special.) The Atlanta Journal Gold Medal for the cleanest copy on a typewriter of five minutes' receiving by the Phillips code.

F. M. McClintic won this event.

EVENING SESSION.

First Event (transmission according to the Phillips code.) To the fastest sender for five minutes, of matter by the Phillips code, grouping of letters and spacing being conditions of judgment.

First prize, championship gold medal and \$35 cash, won by F. M. McClintic, of Dallas, Texas, 326 words.

Second prize, silver medal and \$15 cash, won by F. C. Matthews, of the Associated Press, Atlanta, Ga., 300 words.

W. C. Murray, Associated Press, Atlanta, was third, with 288 words.

Second Event (receiving of messages on typewriter)—To the person receiving the greater number of not over ten-word messages in thirty minutes, copy considered, and all messages to be timed.

First prize, championship gold medal and \$35 cash, was won by H. V. Emanuel, of Philadelphia, with fifty and a half messages in 30 minutes, breaking the world's record.

Second prize, a silver medal and \$15 cash, won by E. E. Bruckner, of Dallas, Texas. The mes-

sages were sent by C. W. White, of Richmond, Va.

Third Event (special)—The Atlanta Constitution Gold Medal for the most rapid straight Morse sending, to be governed by conditions of the first event. Won by F. M. McClintic, with 252 words, in five minutes.

Fourth Event (special)—To the best "all-round" telegrapher, sending and receiving. The Carnegie Diamond Medal, valued at \$400, contributed by Andrew Carnegie.

Mr. McClintic won this event, sending 517 words in ten minutes, and he also scored the greatest number of points in the various classes for all-round telegraphic work, and was therefore awarded the much-coveted prize as his just desert from every point of view.

C. W. White, of Richmond, was second, with 503 words, and F. G. Johnson, of Louisville, Ky., third, with 490 words.

J. I. Hilliard, of Memphis, won the consolation prize—a Graphophone Grand, valued at \$100, presented by Walter P. Phillips.

Mr. Carnegie takes much interest in matters telegraphic, having also subscribed liberally to the prizes at the Hardman Hall Tournament of 1890, when he and J. D. Reid expressed much interest in the ladies' class. This was a distinctively McClintic tournament. The young man from across the border line took the gathering by storm, his phenomenal work being the main topic over the wires for days and months to come. It was a popular victory everywhere, and especially so to Mr. Carnegie, the donor of the medal, who wrote from Skibo Castle:

June 1, 1902
SKIBO CASTLE,
ARGAY,
N. B.

Heartly Congratulations
My Dear Mr McClintic
upon your great victory
In fact it's a Mc. that
won the Medal, much
to be hatched blood in the
Victor - 4734

Yours always
Andrew Carnegie

(To be continued.)

Obituary.

Andrew S. Barber, an old-time telegrapher, died at Auburn, N. Y., on December 5.

John W. Haines, identified with the telegraph at Macon, Ga., died at Chattanooga, Tenn., on December 15.

Mr. John H. Ryan, aged thirty-two years, formerly an operator employed by the Western Union Telegraph Company at Denver, Colo., died at that place on December 17.

Michael Smith, a member of the United States Military Telegraph Corps, who was employed as a lineman during the Civil War, and who has since been in the Western Union service, died on December 16, at Jersey City, N. J.

W. S. Evans, editor of the Orrville, Ohio, Courier, and formerly in the telegraph service at Toledo and at other places, was shot and killed while hunting on December 3. His body was found hanging over a fence, and it is supposed that while climbing the same his gun was accidentally discharged.

James F. Cunningham, of Brooklyn, N. Y., formerly operator in the Cotton Exchange office of the Postal Telegraph-Cable Company of New York, and for many years past identified with Hubbard and Brothers, died at Saranac Lake, N. Y., on December 19 after an illness extending over the past four years, during which time his employers saw to it that he wanted for nothing to make him comfortable.

Serial Building Loan and Savings Institution.

The annual meeting for the election of officers and directors of the Serial Building Loan and Savings Institution will be held January 18 at the office of the corporation, 195 Broadway, New York. The following have been nominated: President, J. C. Barclay; vice-president, James R. Beard; treasurer, E. S. Butterfield; secretary, E. F. Howell; directors, J. B. Taltavall, F. J. Scherrer, C. A. Kilfoyle, M. J. O'Leary, G. W. Blanchard, W. H. Jackson, T. M. Brennan, F. D. Giles, W. J. Quinn, M. W. Rayens, M. S. Cohen, T. J. Laidlaw, E. E. Brannin, J. F. Nathan, F. C. Leubuscher, E. Reynolds, P. J. Casey, H. A. Konninger, and R. J. Marrin.

The twenty-fifth anniversary of the organization of this institution will be celebrated at a dinner to be held at the Hotel Astor on Thursday, January 20.

LETTERS FROM OUR AGENTS.

CLEVELAND, O., WESTERN UNION.

Mr. Harry D. Jones, formerly chief clerk in Superintendent E. P. Wright's office, also under Superintendent C. Corbett, in this city, was a recent visitor in this office, being called to Cleveland by the death of his mother. Mr. Jones holds the position of chief clerk in Superintendent May's office in San Francisco.

PHILADELPHIA, WESTERN UNION.

About three months ago the Philadelphia Times announced that they would give away prizes amounting to \$4,500 to guessers in a motto contest consisting of pictures representing mottoes which were to be translated by the guessers. The contest was very animated, thousands joining in the guessing. Among the prizes was a lady's diamond back set gold watch won by Miss Kathryn C. Leahy of the clerical department of this office. Another prize was a lady's diamond set bracelet won by Mr. H. Wobensmith, chief clerk.

NEW YORK, WESTERN UNION.

A son was born to Martin O'Donnell, of the Southern Division, December 21.

James L. Young, employed in the office of Superintendent Skelton, of the American District Telegraph Company, had a daughter born to him on December 21. Mrs. Young was formerly Miss Josephine Hopkins, of the Long Island Division.

The wife of W. H. Hoyt, assistant Southern wire chief, died on December 20.

OTHER NEW YORK NEWS.

John B. Moran, recently of this department, and who was formerly connected with the Race Bureau, died at his home in this city on December 18.

John Topping, for many years employed in the Jersey Division, and at one time stationed at Sag Harbor, N. Y., as agent for the Long Island Railroad, died on December 20, at his residence in Brooklyn.

All makes of typewriters \$10 up to \$55. Rentals \$2 and \$3 monthly. ALL rental applies on purchase. Rebuilding and repairing at moderate prices. Central Typewriter Exchange, 203 Broadway, New York.

Assessment No. 502 has been levied by the Telegraphers' Mutual Benefit Association to meet claims arising from the deaths of George F. Durant, at Boulder, Col.; Derrell C. Sanders, at Adams Run, S. C.; Silas W. Rankin, at Springfield, Mass.; Thomas H. B. Van Keuren, at Toledo, O.; Stephen B. Russell, at Augusta, Ga., and Henry F. Higginbotham, at St. Louis, Mo.

Telegraphers' Aid Society Quarterly Statement.

The New York Telegraphers' Aid Society's financial statement for the quarter ended December 6, 1909, is as follows:

Balance on hand September 6, 1909.....	\$24,108.92
Receipts	1,768.00
Total	\$25,876.92
Disbursements:	
Sick benefits	\$781.45
Death benefits	300.00
Expenses	166.96
Balance on hand December 6, 1909.....	24,628.51
Total	\$25,876.92

Relief Fund.

Balance on hand September 6, 1909.....	\$4,138.17
Receipts	530.40
Total	\$4,668.57
Disbursements	42.40
Balance on hand December 6, 1909.....	4,626.17
Total	\$4,668.57

Trade Notes.

Mr. H. Seaman, who has been connected with the Electric Storage Battery Company of Philadelphia for several years, and for the past two years as manager of their Atlanta office, has accepted a position as assistant manager of the electrical department of the H. W. Johns-Manville Company at New York.

Another telephone switchboard order from the far East, in addition to that of the Chinese Government for two telephone exchanges for the city of Peking, has been placed with the Western Electric Company. The Japanese Department of Communications is the purchaser in this case the apparatus being used to extend the service in the capital city of Tokyo.

Holiday Greetings.

During the Christmas season just passed we have received an unusually large number of Christmas cards and other tokens from all parts of the world, from far away Japan, Australia, England, Ireland and many other foreign countries, as well as a great number from our friends at home. One which was sent by the Association of Irish post office clerks is especially worthy of mention because of its unique design. Wires stretch around the card from poles at each corner and upon the wires at the top is placed the word "greetings." Another very attractive card was one received from the officials of the Postal Telegraph-Cable Company of New York, and having the signatures of twenty-one of the officers of the company.

The Serial Building Loan and Savings Institution, 195 Broadway, New York, in common with other institutions of the same character, has enjoyed a large measure of prosperity during the past year. This association is an institution of the purely co-operative type, is run solely for the members, and has started hundreds of men and women both in saving and home owning.

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Concerning Quadruplex Disturbances.

The following letter from an Iowa subscriber is herewith published, not because there is really anything new in the action which puzzles him, but because his experience is of so common an occurrence; and furthermore for the reason that every new quadruplex attendant is at first perplexed in a similar manner. A few suggestions may be helpful to the latter, as without proper instruction it often requires a great deal of time and experience for them to ascertain the true source of a disturbance.

"I would like to ask the following question through the columns of your valuable paper if it is considered of enough importance to all concerned to be worthy of the space.

"The question has to do with the irregularities of certain quadruplex circuits and is as follows:

"With all home keys closed and the transmitter open at the distant station, the signals will come light or heavy, as the case may be, on our polar side when the home pole changer is reversed. The signals can be evened up by inserting from one to four hundred ohms in the rheostat, but this throws the home neutral relay just that much out of balance, and in order to

work the common side satisfactory it is necessary to keep the home transmitter open. With transmitters closed or open at both stations, the signals will come even, but as soon as the home transmitter is closed, the signals from the distant office on the polar side will be light or heavy, as regards the position of the home pole changer. Can a ground balance be made to overcome this evening up feature, and how can it be done?"

In reply to the correspondent we will state that the real source of the peculiar results obtained by his reversals is due to an improper balance. That is the true explanation. The problem for him to solve is, "What causes the discrepancy?", and "Where and how can he find the defect?"

As a rule false balances are caused principally by a defective ground coil at the distant station; an unevenly wound relay; a line wire that is carrying a leakage current from another source, or due to some condition that develops trouble only after both batteries are cut in.

Without being on the ground it is rather difficult to determine just which of the disturbing elements is perplexing our friend, but it is probably due to one of the sources mentioned. He can determine this point himself, if he possesses an ammeter, in the following manner.

First ascertain the condition of the wire by inserting the ammeter in the circuit while both the home and the distant station are grounded. If the wire is clear the needle will not be deflected. If the needle shows a current the latter is going to cause a disturbance in a degree measured by its volume. In wet weather and on many circuits exposed to the influence of trolley and other high electric pressures there is nearly always to be found a slight current of this kind, but if its strength is not greater than 4 or 5 milliamperes the multiplex apparatus may be adjusted over this fault, with, of course, just that ratio of reduced working margin. In passing we might say that to-day there are but few wires along our big trunk lines that do not show more or less current due to outside influences in wet weather.

Second, a false balance may be due to a defective ground at the distant end, because the latter may contain more resistance than that of the distant battery resistance which is supposed to be the same value as that of the ground coil you balance to. In this event after the distant battery is cut in, the home station is out of balance in degree measured by the discrepancy between the "ground" and the battery resistance. Hence the necessity of altering the plugs in the home rheostat in order to compensate the difference existing under the actual working conditions of the circuit.

Third, a false balance may be due to an unevenly wound polar relay, because in this event it requires more current in the coil possessing the fewer number of turns of wire than it does in the companion coil to make them both magnetically equal.

If the neutral relay is evenly wound it is obvious that the home current is stronger both in volume and magnetic strength in one coil than in the other when the balance is false. Hence that relay is out of balance and necessarily must be affected by the home current to a certain extent. That is to say, by the difference between the values of the two volumes of current flowing through the main and the artificial line. When our friend readjusted the rheostat to even up the neutral relay coils he obtained a true balance.

and then in the main line circuit. If the current in each is not of the same value the polarized relay may be justly suspected. The evidence of a defect in that instrument will be still stronger if in addition to the discrepancy in current volumes the rheostat must be altered in order to even up the neutral relay coils.

On the other hand should the two currents be equal and a rheostat alteration become necessary to prevent home reversals interfering with the neutral relay when the spring of the latter is turned down low the number two relay is probably at fault.

Of course there are other sources of multiplex disturbances that bring about similar effects, but those we have mentioned cause nearly all the trouble we experience in daily practice.

but he threw the polarized relay out of balance magnetically to the same extent. As the polarized relay possesses quite a wide degree of working margin a defect of this kind is not always fatal, provided the unevenness is not too great. A little bias to one side given the lever will usually offset this weakness and render the polarized instrument still workable.

A quadruplex attendant may easily determine which relay is defective in the following manner without removing them from the circuit.

After a true balance to the distant ground coil has been obtained (assuming that the wire is clear), before asking the distant station to cut in insert the ammeter first in the artificial line

Postal Telegraphic Apparatus.

BY JOHN F. SKIRROW.

Associate Electrical Engineer of the Postal Telegraph-Cable Company, New York.

POLAR DUPLEX REPEATER.

The accompanying diagram shows the latest standard method of wiring a polar duplex repeater. It will be noted that the repetition is made directly upon the relay points without the use of locals. A polar relay in a leak circuit is used upon each side of the repeater for reading the passing signals.

The switches are arranged so that communication may be maintained from the repeater station in one direction, while a balance is being taken in the other direction.

Recent Telegraph and Telephone Patents.

A patent, No. 942,885, for a method of and apparatus for repeating telephone-currents, has been taken out by Percy A. Campbell, of Bloomfield, N. J.

A patent, No. 943,033, for a telephone-receiver support has been awarded to William J. Mo-gridge, of Spokane, Wash.

A patent, No. 943,081, for a telephone-call-registering system, has been secured by Willard J. Kibbe, of Canandaigua, N. Y.

A patent, No. 943,149, for a mouthpiece for telephone-transmitters, has been granted to John A. Jameison, of Harrison, N. J.

A patent, No. 943,386, for a sanitary telephone-transmitter, has been issued to Marvin Y. Calcutt, of Seattle, Wash.

A patent, No. 944,259, for an insulator, has been awarded to A. G. Denner, of East Hampton, Conn. For telegraph wires. The usual insulator has a groove for the main line wire, converging slots intersecting the groove for receiving a tie wire.

A patent, No. 944,460, for a selecting apparatus for telephone systems, has been taken out by C. E. Nichols, of Columbus, O.

A patent, No. 944,540, for a heat coil, has been secured by W. L. Coursen, of East Orange, N. J.

A patent, No. 944,545, for an electric signal, has been granted to A. F. Dixon, of Chicago, Ill. For telephone toll trunks.

Personal.

The wife of J. W. Crews, general commercial superintendent of the Southern Bell Telephone Company at Richmond, Va., died January, 3.

Mr. E. C. Bradley, vice-president and general manager of the Pacific Telephone and Telegraph Company is in New York on business connected with the service.

Mr. W. C. Furness, manager, of the Great North Western Telegraph Company, at London, Ont., and one of the best known old-timers in the Dominion, is confined to his home by serious illness.

Mr. Charles R. Underhill, the well-known electrical engineer and author, of New York, has accepted a position as telephone and coil engineer for the American Electric Fuse Company, of Muskegon, Mich.

Mr. C. R. Hosmer, director of the Canadian Pacific Railway, and formerly general manager of the telegraph department of that system, accompanied by his wife and daughter, is spending the winter in Italy. Mr. Hosmer will soon have erected an additional pavilion to the Alexandra Hospital, Montreal, to be used for the treatment of erysipelas.

Mr. Isaac McMichael, vice-president and general manager of the Great North Western Telegraph Company, Toronto, is stopping a month or two at his Florida orange grove, located at Alamoonte Springs. Mr. McMichael celebrated his seventieth birthday on January 7. A number

of his friends took occasion to send him congratulatory telegrams. Though he has reached three score and ten, Mr. McMichael is still hale and hearty, and gives evidence that he will be able to take an active part in business affairs for many years to come. He is regarded as one of the ablest telegraph executives in the service to-day.

Canadian Pacific Railway's Telegraph.

Mr. F. C. Robertson, chief operator at Toronto, has been appointed Inspector of the Ontario Division, with headquarters at Toronto. Mr. H. J. Lillie, assistant wire chief, succeeds Mr. Robertson as Chief Operator of the Toronto office, and Mr. M. J. Bayley succeeds Mr. Lillie as assistant wire chief. Mr. H. A. Shambrook has been appointed manager of the Toronto office vice Mr. D. G. Sturrocks, resigned.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. E. B. Pillsbury, general superintendent of the Eastern Division, has returned from a trip of inspection to the Western part of the state.

Mr. S. B. Haig, superintendent of traffic, is making an inspection trip to Washington, Columbus and other cities in the South and Middle West.

Mr. H. A. Tuttle, president and general manager of the North American Telegraph Company, spent a few days in New York the first of the month.

The wife of Mr. Isaac Smith, superintendent of tariff, died suddenly, January 13, at her home in Little Falls, N. J.

Mr. William M. Fitzgerald, manager of call circuits and burglar alarms at Philadelphia, was a recent New York visitor, coming here to inspect the call circuits in this city.

Among the recent executive office visitors were E. S. Washburn, wire chief at Buffalo; J. W. Weed, manager at Syracuse, N. Y., and W. J. Martan, manager at Niagara Falls, N. Y.

The new tariff book which has just been issued contains over forty pages of matter more than the previous one. Mr. Isaac Smith, superintendent of tariff, has introduced several new features which tend to convenience in using the book. Information concerning the money transfer service is printed on green paper; the rules and instructions concerning cablegrams are printed on pink paper, and the rules of the company are printed on yellow paper. The color of the cover has been changed to a dark blue, which will not be easily soiled upon handling. Taken as a whole, the work reflects great credit upon Mr. Smith.

RESIGNATIONS AND APPOINTMENTS.

Mr. V. Galas wire chief at New Orleans has been appointed acting chief operator, vice E. E. Cord, deceased. Mr. L. L. Apperson, chief operator at Mobile, has been appointed wire chief at New Orleans and not chief operator as recorded in our January 1 issue.

Mr. Frank H. Jacobs, chief operator at Peoria, Ill., has been appointed manager to succeed S. S. Lacey, who on account of ill health has resigned to accept a position at Galveston, Texas, in the telegraph department of the Gulf, Colorado and Sante Fe Railway. Mr. Jacobs entered the telegraph service in 1876 as operator on the Burlington system. His connection with this company dates from 1890, when he became chief operator at Peoria.

Mr. W. L. Meeker, manager at Clarksville, Tenn., has been appointed manager at Paducah, Ky., vice W. B. Harris. Mr. R. O. Forbes succeeds Mr. Meeker at Clarksville.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Frank Jaynes, general superintendent at San Francisco; Mr. Theodore P. Cook, general superintendent at Chicago, and Mr. Jacob Levin, general superintendent at Atlanta, were in New York during the past week holding a conference for the good of the service.

Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company, entertained at dinner at the University Club on the evening of January 13 the general superintendents who are visiting New York together with several of the other telegraph officials.

Among the recent executive office visitors was Mr. P. G. Kern, superintendent of the American District Telegraph Company, at Louisville, Ky.

RESIGNATIONS AND APPOINTMENTS.

Mr. E. E. Robinson, manager at Charlottesville, Va., has been appointed manager at Bristol, Tenn.

Mr. Frank R. Webb, night manager at Philadelphia, has been appointed chief operator, to fill the vacancy caused by the death of Mr. James P. McLoraine. Mr. Webb learned telegraphy with the old Franklin Telegraph Company in Philadelphia in 1875, and was afterwards with the American Rapid and the Bankers and Merchants Telegraph Companies, and with a broker. In 1887 he joined the forces of this company and by reason of his good work, was appointed night wire chief, which position he filled with great credit to himself and the company. In 1902 he was appointed night manager, which position he has since filled.

Mr. William C. Shugar has been appointed night manager to succeed Mr. Webb. Mr. Shugar began his telegraph career with the Philadelphia and Reading Telegraph Company in 1879, and was employed by that company until 1886, when he accepted a position with this company. In 1903 he was made wire chief, which position he filled so acceptably that he was selected to fill the vacancy caused by the promotion of Mr. Webb.

Mr. S. S. Peck, who has been an assistant to Mr. Shugar as wire chief, has been appointed night wire chief.

Miss D. McNeece has been appointed manager at Plymouth, Mass., vice W. J. Waterson, who has been transferred to the management of the Barre, Vt., office, vice C. M. Howell, resigned.

The Cable.

Charles A. Gill, manager of the office of the Commercial Cable Company at 16 Beaver Street, New York, died at his home in Brooklyn, January 2, aged forty-nine years. Mr. Gill was born in Canada, and had been in the service of the Commercial Cable Company for the past twenty-five years.

T. Finnis, general manager and secretary of the Direct United States Cable Company, London, England, died January 1, aged fifty-nine years. Mr. Finnis entered the employ of the Eastern Telegraph Company at the age of sixteen, and in 1877 became accountant for the Direct United States Cable Company. In 1887 he became secretary, and in 1899 general manager.

President Clarence H. Mackay, of the Commercial Cable Company, in honor of the twenty-fifth anniversary of the company on December 27, gave a dinner to the staff at London. On the same day representatives of the company at Liverpool, Manchester, Bradford and Newcastle-on-Tyne gathered at Liverpool, and members of the staff in Scotland dined at Glasgow in commemoration of the same event.

A cable despatch from London states that the central board of the Imperial Pacific Cable Company is making satisfactory progress in its work. It is at present engaged in an attempt to carry out proposals for taking over the land telegraphic line across the Dominion of Canada. It is anticipated that the scheme will shortly be approved by all the co-partner Governments which will be responsible for the cable.

The Western Telegraph Company has filed a protest with the Brazilian Government against the concession made recently to Mr. R. J. Reidy for a submarine cable connecting Para, Fernando de Noronha, Algoas, Rio de Janeiro, Sao Paulo and Chuy. It is claimed that this concession is an infringement of their rights. According to a Consular report the concession authorizes the establishment and maintenance of a coastwise cable service extending from the mouth of the Amazon to the southernmost point of the Brazilian coast. Such a cable service, if actually established, will prove a serious competitor of the Western Telegraph Company, which now enjoys the exclusive privilege for submarine cable service along the Brazilian coast, except for the telegraph service of the Government.

The concession provides for making land connection necessary to the operation of the service and also for connection with the government telegraph company's lines. The term of the concession is to be twenty-five years, the first section of the cable, from Para to Nitheroy, to be in operation within three years, and the rest of the line nine months later.

The concessionaire must pay to the Government for each word transmitted in international messages two cents and one cent if the message is official. The rates must be authorized by the Government. The Company may reduce its rates without authority, but to increase them again it must have government sanction. Government messages must be given preference over others and will be sent at 50 per cent. discount over regular rates. The concession provides that authorization to no other concern shall be given to establish submarine cable communication between Para, Fernando de Noronha, Alagoas, Rio de Janeiro, Sao Paulo, and Rio Grande de Sul, or between any points of the coast of Brazil and Rio de Janeiro, or between the latter port and any foreign port, during the term of the concession or so long as communication by the lines authorized is properly maintained. The company is prohibited from combining in any way with other similar concerns now operating in Brazil without special authorization by the Government. All privileges and favors granted by the Government to other similar companies operating in Brazil are conceded also to the concessionaire of the new company.

Municipal Electricians.

The contract for installing a fire alarm telegraph system at Ilion, N. Y., has been awarded to the Utica Fire Alarm Telegraph Company.

Plans have been completed for a new fire alarm system at Palo Alto, Cal., and bids will soon be advertised for.

A patent, No. 944,575, for a combined telephone and protective alarm system, has been granted to J. G. Nolen, of Chicago, Ill. Makes use of an ordinary telephone line to act as a fire alarm. The ordinary bell and line signal give the alarm.

Morse Electric Club.

The annual election of officers of the Morse Electric Club occurred January 12. The officers elected were: J. B. Van Every, president; J. C. Barclay and B. Brooks, vice-presidents; F. J. Scherrer, secretary, and R. J. Murphy, treasurer. The directors are: Gardner Irving, M. H. Kerner, M. J. O'Leary, John A. Hill, P. J. Casey and A. G. Saylor. The next annual dinner of the club will take place at the Hotel Savoy, Fifth Avenue and Fifty-ninth street, Saturday evening, February 5, when it is expected that a large gathering will be present.

Election of Officers of Magnetic Club.

The election of officers of the Magnetic Club occurred January 13, at the annual meeting held at 253 Broadway, New York. The following were the officers elected: Mr. Charles P. Bruch, president; Mr. Marston R. Cockey, first vice-president; Mr. B. M. Downs, second vice-president; Mr. D. W. McAneeny, third vice-president; Mr. Theodore L. Cuyler, Jr., fourth vice-presi-

dent; Mr. W. H. Mathews, secretary; Mr. J. J. Cardona, treasurer; Governors J. J. Whalen, E. P. Tully, Isaac Smith and C. F. Leonard. The governors whose terms of office hold over to another year are: W. H. Baker, E. B. Pillsbury, F. E. McKiernan and Charles Shirley.

Military Telegraphers' Pension Prospects.

BY COLONEL WILLIAM BENDER WILSON,
Holmesburg, Pa.

In response to your letter making inquiry as to the status of Congressional legislation relative to the pension claims of those telegraph operators who served in a military capacity during the civil war I would state:—

The agitation of those claims is going on and will go on until the last survivor has passed away. The difficulty at present which postpones action rests in the fact that the policy of the House of Representatives as now organized is adverse to the extension of the pension laws to any persons not now eligible to their benefits, that there are a number of different groups more or less entitled to consideration demanding recognition, and that the expenditures of the Government must be scaled down to come within the revenues or close to them. If the military telegraphers were the only claimants it is more than probable that a relief bill would be passed for the sum of money involved granting them their rights. This would be small, but if it was passed the leaders fear that action in their case would establish a precedent for the other claimants to demand recognition of their claims.

There is no doubt that the claims of the military telegraphers are based on as solid grounds as the enlisted men stood upon, but the advocates in Congress of the other groups would seriously and effectively prevent any bill passing which did not embrace their clientele, for the leaders and controllers of legislation will not permit the passage of an omnibus bill extending the pension laws.

Such is the condition, but the military telegrapher must not despair, on the contrary he should put on a bold front and be more clamorous than ever for the recognition of his rights. He should see his Congressman whenever he can, write to him at all times, and enlist all his friends in doing the same. If to that could be added the united voice of the telegraph operators in America of to-day demanding that justice be done those veterans of their craft who rendered exceptional service to their country in the most perilous hour in its history there would such a volume of influential sound reach Congress that proper legislation would ensue. The people are all powerful and the voice of the telegraph people would be a power indeed.

Several bills are in preparation to be presented to this Congress, for it is essential that no break must be permitted in the continuity of the demands. Agitation, however, and agitation in its strongest expression is the duty of the hour.

The Telephone.

Articles were filed in the office of the Secretary of State of New Jersey on December 30 completing the merging of the New York and New Jersey Telephone Company with the New York Telephone Company.

The Delaware and Atlantic Telephone and Telegraph Company, operating in New Jersey, filed an amended charter with the Secretary of State December 31, increasing their capital stock from \$400,000 to \$10,000,000.

At the weekly luncheon of the Chicago Electric Club, December 22, Mr. J. B. Ware, of Grand Rapids, Mich., secretary and treasurer of the National Telephone Association, gave an address on "Telephone Development and the Benefits of Competition."

Employees and officials of the Southwestern Telegraph and Telephone Company have organized a club at Dallas, Texas, which has for its object the improvement of the service and the cultivation of a better relation between the public and the company.

The board of directors of the National Independent Telephone Association have elected Mr. Frank H. Woods, president of the Lincoln Telephone and Telegraph Company of Lincoln, Nebraska, president of the Association, and Mr. Joseph B. Ware, Grand Rapids, Mich., secretary and treasurer.

On December 15 an interesting experiment in long-distance telephoning was successfully carried out between Washington and New York. In the former city were Commander Peary, Andrew Carnegie, Dr. Alexander Graham Bell and Admiral Chester, as speakers, and in the latter eighty-two people who were dining with the directors of the Associated Press. Every New York auditor used a watch-case receiver. The service over 225 miles was perfect. The strength of the current was augmented at Philadelphia by repeaters in the circuit.

The United States Telephone Company and the Cuyahoga Telephone Company, of Cleveland, the majority of the stock of which was purchased recently by J. P. Morgan and Company of New York, have been reorganized and representatives of Morgan and Company have been elected to the directorate of both companies. Mr. F. A. Davis, president of the Columbus Citizens' Telephone Company, has been elected president of the United States Telephone Company, which controls the long distance telephone lines connecting the various local companies in which Morgan and Company have a controlling interest.

Figures issued by the American Telephone and Telegraph Company and its associated companies for the past year show that on December 31 about 5,000,000 telephones were included in their system. 3,500,000 of these were directly owned, and 1,500,000 were controlled by sub-licensees. The increase for the past year amounts to about 600,-

000 telephones. The total mileage of wire at the end of the year was 10,250,000, about 400,000 miles of which was added during 1909 and over half of which was underground.

The Continental Telephone and Telegraph Company has obtained control of the Rochester Telephone Company, the Syracuse Telephone Company and several other smaller independent companies operating in New York State. This gives the Continental company control of all the important independent telephone systems in Pennsylvania, New Jersey and New York, with the exception of the Federal Telephone and Telegraph Company of Buffalo, and the Keystone Telephone Company of Philadelphia.

One advantage of the union of telephone and telegraph interests was shown recently when the telegraph wires in some of the Western states were broken down by a severe wind storm. The business rapidly piling up, the telephone wires were utilized to patch out the bad spots in the telegraph wires in no less than a dozen cases, thereby making clear circuits. Thus wires from New York to Cincinnati and Chicago via Pittsburgh and Louisville were "patched" with telephone wires in several places, permitting telegrams to be transmitted without interruption that would otherwise have had to wait until the damaged wires could have been repaired.

Unless additional evidence, not now known of, is forthcoming, it is unofficially announced that there will be no suit by Attorney General Deussen, of Ohio, to dissolve the sale of stock of the independent telephone companies to J. P. Morgan and Company, on the theory that the American Telephone and Telegraph Company is the real purchaser of these properties. This decision has been reached by reason of the direct assurance of J. P. Morgan and Company, President L. G. Richardson, of the Central Union Telephone Company, with headquarters at Indianapolis, and President Theodore N. Vail, of the American Telephone and Telegraph Company, that there is no agreement or understanding of any kind by which the Bell interests will ultimately procure control of the independent companies.

It appears from statistics presented in a recent number of a German publication that there were in January, 1909, more than twice as many telephones in the United States as in all the rest of the world together. The proportional preponderance is not, however, being maintained, for, according to the figures, there were in 1900, or nine years previous, three times as many telephones in the United States as in all other countries combined. In regard to the recorded use of telephones, there is little relative difference, for the figures allotted to the United States and to the rest of the world. Each telephone was credited with 1730 annual conversations in the United States, and of 1945 annual conversations in all other countries together.

Radio-Telegraphy.

At a meeting of the Pittsfield section of the American Institute of Electrical Engineers, held on December 21, Dr. A. E. Kennelly presented a paper on "The Mechanism of Wireless Telegraphy."

It is reported that the British post office telegraph engineers and the officials of the Marconi Wireless Telegraph Company are making extensive experiments with the use of wireless for inland telegraphy.

It is announced that the United Wireless Telegraph Company will soon establish a factory in the neighborhood of Liverpool, England. This action has been rendered necessary because of the British patent law requiring them to manufacture their patented goods in that country.

A patent, No. 943,969, for space telegraphy has been granted to L. DeForest, of New York. A space telegraphy system provided with a discharger for an opened or closed circuit, an electrical condenser which shall permit of a regular and constant spark frequency.

A patent, No. 943,960, for a system of directed wireless telegraphy, has been awarded E. Bellini and A. Tosi, of Paris, France. A wireless system employing electromagnetic waves and which permits a receiving station provided with a plurality of dirigible aerials to radiate mainly in any given direction without it being necessary either to turn the aerials or to employ a great number thereof.

Mr. Willis L. Moore, chief of the United States Weather Bureau, stated recently that when all the nations of the earth should agree upon one central autocratic wireless station that would have complete power over the whole Atlantic Ocean to determine when vessels in certain portions of the ocean should send, and when they should keep quiet, it would be possible to get a weather map of the ocean and to transmit and receive messages to and from any place desired. He did not believe, however, that any such international agreement would ever be effected. He feared that we would soon have such a babel of wireless voices on the ocean that most messages would be drowned out.

At a recent conference between representatives of Australia, New Zealand and the Fiji Islands, the subject of a wireless system to bind up all of the British possessions in the Pacific was discussed and a recommendation made that high-power stations, to be controlled by the British Government, be established at Sydney, Doubtless Bay, New Zealand, Suva, the capital of the Fiji group, and Ocean Island, and medium-power stations in the New Hebrides and Solomon Islands.

In England all operators of wireless stations afloat or ashore are required to pass an examination in the elements of their duties, and to receive a certificate of capability. They likewise conform to an international code of regulations controlling the reception, transmission and delivery of messages.

Secretary of Commerce and Labor Nagel has recommended the passage of a bill requiring wireless installations on passenger steamers carrying more than a certain number of passengers over more than a given distance. Of the 282 steamships that carried steerage passengers to and from the United States during the first half of 1909, 143 were equipped with wireless telegraph apparatus. Of the 167 prominent coastwise vessels 97 are provided with wireless equipment.

In a paper which was delivered recently before the Institution of Electrical Engineers, London, Professor J. A. Fleming described "Some Quantitative Measurements in connection with Radio-Telegraphy." One of the most important measurements necessary for a study of radio-telegraphic circuits is that of the high frequency resistance. Professor Fleming explained the apparatus which he devised for making such measurements. He also discussed the measurement of wave length, spark frequency and overall efficiency of a transmitter.

A contract has been entered into between the Compania Espanola de Telografia sin Hilos and the Spanish Government whereby wireless telegraph stations will be established at Cadiz, Vigo, Barcelona and the Balearic and Canary Islands, including six of the principal of the last named, which, with the Santa Cruz de Tenerife and Gando stations, will embrace a radius of 2,500 kilometres, thus establishing communication with Cape Verde, and thence with Pernambuco in South America. The company has just completed the erection of a station at Santa Cruz.

In a recent paper delivered before the Institution of Electrical Engineers, London, by W. H. Eccles and A. J. Makower upon the "Efficiency of Short Spark Methods of Generating Electrical Oscillations," the authors described apparatus which they used for measuring the efficiency of the form of dischargers used in the Lepel system. They also explained their method of making the tests. The overall efficiency, which is obtained by dividing the energy radiated by the energy taken from the direct current mains, they found to be as high as 14.4 per cent under certain conditions. As the current taken increased, however, the efficiency rapidly decreased.

Serial Building Loan and Savings Institution.

The twenty-fifth anniversary of the organization of the Serial Building Loan and Savings Institution will be celebrated by a dinner at the Hotel Astor, Thursday January 20. This should be a most interesting and enjoyable affair for every member and it is hoped that there will be a large attendance. The committee having charge of the arrangements consists of George W. Blanchard, chairman, F. D. Giles, E. E. Brannin, J. F. Nathan, M. W. Rayens, E. S. Butterfield and M. S. Cohen. A meeting of the shareholders to consider several amendments to the constitution will be held January 31 at the office of the corporation, 195 Broadway, New York.

Heroes of the Telegraph Key.

The article in Everybody's Magazine for December entitled "Heroes of the Telegraph Key" contains several interesting stories of men who have risked their life in the service, in addition to the story of Richard Spillane, which we published in our December 16 issue. Among these the story of Edward V. Wedin, who is now a gray-haired employe of the Western Union Telegraph Company at 195 Broadway, New York, and his action in going voluntarily to New Orleans to what seemed almost certain death at the time of the yellow fever epidemic in 1878 is one which reflects great credit upon the profession and is well worth reprinting. The story is as follows:

"Another great historical catastrophe, in which telegraphers played a heroic part, was the yellow fever epidemic which swept New Orleans, Memphis, and Grenada in 1878—the most frightful epidemic in the history of our country—when thirty thousand went down in the grip of "Yellow Jack" and six thousand died in less than sixty days.

"About the middle of August of that year it was feared that the entire South would be swept by the pest, and the announcement was made that a cordon of guards with shot guns would be stretched around the affected districts. The stampede that followed the announcement beggars description. Within less than ten days the white population of Memphis was reduced from forty thousand to less than thirty-five hundred. In the mad scramble for self-preservation sons fled stricken mothers, wives abandoned doomed husbands, and mothers deserted their dying children. Clergymen, physicians, nurses and town officials fled in terror of being pent up in the live rat trap, leaving their duties to a few brave ones who stayed behind, or to outside volunteers.

"To risk entering this circle of death was all but certain destruction. More than four thousand were attacked in a single week and taken to makeshift hospitals where nurses with glassy eyes and fire-red faces trembled with the "shakes," but stayed until the black vomit overtook them. More than six hundred died in a single week. They died so fast that coffin makers and gravediggers could not keep up with them. Trenches forty feet long were scooped out with horse scrapers, and victims were buried four bodies deep, without coffins and without even a relative to stand by and murmur a prayer.

In this gigantic charnel house, abandoned by the Government through the cutting off of the mails, eleven out of fifteen Western Union Telegraph operators who had stuck to their posts were under ground by August 20, while messages piled up on the four survivors—messages of heartbroken mothers, wives, and sisters pleading for scraps of information about children, husbands, and brothers; messages of anxious mothers, wives, and sisters in the city of death

trying to assure loved ones without that they were still alive; messages from convalescents begging for money; messages from the Howard Relief Association clamoring for doctors and volunteer nurses, and for drugs, cots, supplies, and funds; messages from newspaper correspondents describing the plight of the sufferers and the horrors of the Yellow Death, and appealing broadcast for help. How long the four operators would last before the thousands in the pest crater would be cut off from sending cries of distress to the outside world, was problematical. Therefore the company issued from its New York headquarters a general call for volunteers.

"But sticking to one's key in time of danger was one thing, volunteering deliberately to expose one's life another. Out of fifteen hundred operators in New York only one responded—Edward V. Wedin, twenty-two years old, a slim, slightly built, quiet young man, a crackerjack operator who feared not man, pest, nor devil. On August 28 he stepped aboard the train bound for New Orleans, an army of friends grasping his hand for a last good-bye.

"Gazing from the car window as the train neared the fever district, Wedin could see for himself the ravages of the epidemic. Entire villages were deserted, half-starved dogs the sole signs of life. Doors and windows of houses stood wide open, showing bodies stretched under sheets, candles burned to their sockets in the sole death watch. Graveyards he saw that looked like newly planted truck farms, with white sheets of lime covering the mounds to "keep the poisons down."

"When he stepped off the train in New Orleans, the station was deserted. At the telegraph office the men were thunderstruck to see him. Work had piled feet high in the short-handed office, and he sat down at once in front of a key. He sent more than five hundred messages at his first sitting. Food and drink were brought to him, and he ate with one hand and worked with the other, worked for twelve hours, until his wrist ached, and the copy danced before his eyes, and he had to sit on the arm of a chair to keep awake, worked until his arm was as if paralyzed to the elbow, and he fell forward on his key fast asleep. For two hours they left him there because they could not waken him; then they aroused him and he staggered home through the night, through the sickening stench with which the epidemic reeked to heaven, past trucks, express and farm wagons jouncing dead bodies to graveyards, past hundreds of bonfires of stumps and tar, burning, for disinfection, in front of houses where people had just died.

"The next morning, and the next, and the next, other volunteer operators arrived from other cities—young men like Wedin, for the most part without family ties. They dropped like flies. One of these arrived of a morning and by twilight of the next day they were covering him up in the trenches. Others lasted only forty-eight hours.

Some dropped on their way home after work and lay dying in the streets; others who went home of an evening in seemingly good health failed to report the next day and were found dead in their beds. Numbers were stricken in the office. The wire chief alongside Wedin collapsed early one afternoon and was lifted out of his seat, his lifeless hand still clutching the key.

"Yet only once did Wedin falter. That was when this man who had unflinchingly looked death in the face found himself unexpectedly talking to his sister, hundreds of miles away in his own cool North. Lord! It was as if suddenly her soft, cool fingers were laid across my forehead, he said. He himself took this message, sent from Jersey City:

"Is Edward V. Wedin still alive? His death is reported. His sister waits here in the office for answer."

"Tell her Ed himself is answering this. Tell her God bless her and that Ed sends her a kiss," Wedin answered, hot tears welling from his eyes.

"Throughout September to the first of October the dread weeks dragged; and then there came an early, sharp frost—and men fell into each other's arms and wept and raised haggard faces in thanksgiving, and church bells pealed joyously, for this was the death of Yellow Jack.

"Of all the men who sacrificed and risked their lives in the epidemic, Wedin is most famed; as he says, solely by virtue of escaping unharmed. A list of men who died about him would read like the absent list of a regimental roster after a hot skirmish. In unmarked Southern graves they lie; but memory of their names is green among their brethren, for they died the death of heroes of the key in Honor of the Service."

Office Management.

No manager or head of a department can hope to make a satisfactory showing for his particular office or department, in these days of strenuous competition, unless the methods of himself, as well as his subordinates, be systematic.

By system it is not to be understood that every manoeuvre or transaction of the office must be burdened with so-called "red tape," as this latter item used too excessively will prove a hindrance rather than a help in facilitating prompt and satisfactory handling of business matters.

By injecting a proper amount of system into the work, cutting out the non-essentials, the office man may not only economize in the matter of time and money for his employer, but will save in addition much wear and tear to his own physical health as well as to whatever gray matter there may be stored in the labyrinths of his attic.

The office end of a business requires regulation just as essentially as any other branch of that business; the best methods should be adopted for facilitating and improving the work, the of-

fice force should be lined up so that each individual member thereof may do his full duty, and any "dead-wood" that may be permitted to exist will only serve to retard the smooth and successful operation of that office the same as a broken cog on a mighty wheel will throw out of gear the balance of the machinery.

In adopting a system, plan something that will suit the conditions and necessities of that particular business, a system that will accomplish in the shortest and most simple manner possible the ends desired; avoid all elaboration that will tend toward a duplication of action not only as regards the large items of the business, but also the minor details as well, as unnecessary use of either time, labor or material, means just that much waste of money.

Great care should be exercised in handling all the details of correspondence. Letters should be addressed in manner refined and courteous to all correspondents, they should be accurate in description and detail, be as concise as possible, but not so brief as to rob the communication or leave in doubt any of the essential facts intended to be conveyed; all unnecessary information, however, which is foreign to the subject, should be omitted. Make one letter cover the subject in hand, and if another subject needs attention write a separate letter.

To successfully handle the affairs of an office connected with a business of any magnitude the men in charge must be on the job every minute, they must be energetic, tactful, faithful to their trust, courteous, punctual, and capable to perform the duties required of them.

The work of a good office man very readily shows itself that man's capacity for holding his position. A glance at his desk will indicate just how he does the stunt; you will not see his papers all piled and jumbled up in a miscellaneous mass, but you will note the evidence of system; his correspondence will be neatly arranged, every subject to itself with every letter in proper sequence; you will find on his desk only such implements as are necessary for his work, and will note the absence of gaudy pictures and bric-a-brac which might be an attraction on the mantel at home, but not serviceable on the desk of a busy man.

The good manager is invariably a hustler, he is awake not only to the duties of his particular position, but he is in touch with other things both in the business and out of his line of work; he is socially a good fellow, and commands the respect not only of his superiors but also his subordinates as well.—W. Magill in Michigan State Gazette.

Orders, if sent to Telegraph and Telephone Age, Book Department, for any book required on telegraphy, wireless telegraphy, telephony, electrical subjects, or for any cable code books, will be filled on the day of receipt.

The Ready Messenger

The quickest way to transmit a telegraph message from the wire to paper is

"VIA SMITH PREMIER."

This typewriter has for twenty years held first place with telegraph operators as the easiest and speediest "mill" to operate. The **New Model No. 10 Smith Premier** is even better suited to the use of telegraphers.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

JANUARY 16, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Insulation of Telephone Lines.

The prediction of Mr. Theodore N. Vail that within a short time we would be able to talk successfully from New York to San Francisco, while it may seem visionary to some, is, if we reflect seriously and consider the march of progress in the past decade, even in the improvement of telephonic communication, a result that is bound to be attained. Telephone engineers are working to bring this about, and with the many brainy men employed in solving this problem there is no reason why the desired results should not soon be attained. One thing which has seriously hampered the development of long distance communication by telephone is low insulation on the lines. With the ordinary glass insulators in use the insulation of a long line is so low even in dry weather that a large percentage of the feeble telephone current fails to reach its destination.

European engineers discovered long ago the superiority of porcelain to glass for insulating purposes, and even though it was much more ex-

pensive, equipped their lines with porcelain insulators, with the result that low insulation is not the bugbear to them that it is to engineers in this country where, in contrast to the operation of the Government controlled public service utilities of Europe, the demands of commercialism have prevailed, and the chief aim has been to construct as cheaply as possible a line that would work after a fashion most of the time, and not to build a line that would give the best possible service at all times.

The telephone engineers working upon the long-distance problem are now taking cognizance of this situation and are considering the equipment of lines with porcelain insulators. While the expense of building lines in this manner is considerably greater, there is no doubt but that the increased efficiency of the line and the improvement in the service gained will justify the additional expense in many cases, and it is probable that within the next few years we will see most of the long-distance telephone lines insulated much better than at present. Thus one condition necessary for the fulfilment of Mr. Vail's prophecy will be brought about.

For many years past telegraph engineers in this country have recognized the superiority of porcelain insulators, but have not been able to persuade the financial management of their companies that the improvement to be gained would justify the added expense.

Twenty-fifth Anniversary of Commercial Cable Company.

Upon another page we give an account of the celebration of the twenty-fifth anniversary of the establishment of the Commercial Cable Company. This was an event of which the entire force in charge of this system ought to be proud. The guiding hand of Mr. George G. Ward has managed the affairs of this company from its inception, when the first cable was laid and a little band of invited guests gathered at the cable hut at Coney Island on October 16, 1884, to witness the ceremonies incident upon landing the cable. Now that cable hut accommodates a score of cables and the system radiating from it is practically world wide in extent. President Clarence H. Mackay is to be congratulated upon the great success which has been the lot of the cable company of which he is the head, and Mr. Ward and his able lieutenants are to be congratulated upon the fact of their active connection with such a flourishing enterprise, made possible by their loyalty and the indomitable courage and perseverance of the late John W. Mackay.

The watchword of the company has always been "progress," and this has been clearly demonstrated during the past year, when the company has spent a large amount of money and gone to a great deal of trouble merely for the sake of increasing the speed of operation of one of their cables. Some wireless enthusiasts pre-

dict that within a few years the cables will be rendered useless by reason of the perfection of wireless communication. Personally, we do not share in this opinion, but believe, on the other hand, that the usefulness of the cables is going to increase as a result of increasing harmony and closer trade relations between the different nations. We trust that this will be the case, and that twenty-five years hence this company may celebrate its golden anniversary, after having enjoyed another quarter century of abundant prosperity.

Favorable Comments Upon Our Change in Name.

In the many favorable comments which we have received from our friends upon the enlargement in the scope of our publication we feel that our action in giving the telephone interests recognition in our columns has been completely vindicated. In fact, many of our readers have asked why we did not take such a step long ago. They point out the fact that many telegraph men have occupied prominent places in the telephone field for a long time, and for this reason alone the community of interests between the two industries has been great enough to justify us in devoting our energies to both fields. Among the names which might be mentioned in this connection of those who have left the telegraph and taken an active part in telephone affairs are Theodore N. Vail, president of the American Telephone and Telegraph Company; Bernard E. Sunny, president of the Chicago Telephone Company; H. J. Petten-gill, president of the Southwestern Telephone and Telegraph Company; William T. Gentry, president of the Southern Bell Telephone Company; L. B. McFarlane, president of the Bell Telephone Company of Canada; E. C. Bradley, vice-president and general manager of the Pacific Telephone and Telegraph Company; J. G. Splane, vice-president and general manager of the Pittsburgh and Allegheny Telephone Company; Charles H. Wilson, general superintendent of the American Telephone and Telegraph Company, and a host of others too numerous to mention.

In spite of this great number who have transferred from one field to the other the telephone and telegraph have remained distinctly separate in their operation. When only recently the obstacles in the way of a closer alliance between the two industries had been surmounted it seemed to us that the opportune time had come for extending our field to include the telephone. We believe that we will be able to serve those interested in telephone operation as efficiently as we have served their telegraphic brethren in the past and bespeak their hearty co-operation in our efforts.

Regulation of Telegraphs and Telephones in New York.

Governor Hughes of New York, in his annual message to the Legislature again recommends that the Public Service Commission law be ex-

tended so as to bring telegraph and telephone companies under the jurisdiction of the commission. "The events of the past year," says the Governor, "have served to emphasize the importance of adequate supervision and regulation."

Control of the operations of telegraph and telephone companies to the extent that these operations affect the public (viz., in the matter of rates and service) by the public service commissions, but freedom from control in their financial management, will be recommended by the legislative Committee which was appointed at the last session for the purpose of investigating the advisability of putting these corporations on the same basis as other public service concerns as regards Government supervision.

It may be several weeks before the committee renders its final report and submits the draft of a bill to carry out its recommendations to the legislature. In the meantime it is not believed that the recommendations of the committee will go far enough to meet the ideas entertained on this subject by Governor Hughes.

Members of the Legislative Committee, however, feel that the recent decision of the Court of Appeals limiting the powers of the Public Service commissions in passing upon the financial management of railroads has furnished ample ground for relieving the telephone and telegraph companies from the supervision to which other public service corporations have been subjected since the public service commissions law went into effect.

It has been intimated that the decision to exclude the finances from supervision was due partly to the complexity of the problem which confronted the committee and the lack of time to devise a suitable scheme of regulation on the financial side of the operations of such companies.

The number of telephone companies operating within the State is very large. Many of them are in a stage of formation, and naturally have exerted all the influence at their command to escape supervision, which may hamper them considerably in developing along the lines planned. In addition to this, the committee is said to have found a baffling lack of uniformity in the respective charters of the many small local companies in the field.

Troubles of the Telephone Companies.

In an address before 400 members of the New England Telephone Society December 14, Edward K. Hall, attorney for the New England Telephone and Telegraph Company, told of some of the difficulties encountered by that company. "Most of our troubles," he said, "do not come from actions of the company as a corporation, but are the result of individual carelessness and failure to carry out the rules of the company. Questions like telephone rates do not cause one-quarter the trouble occasioned by impertinent operators and slipshod workmen."

OLD AND RECENT TOURNAMENTS.

General Information as to Early and Late Speed Trials, with Incidental Comments on the Persons Concerned in Them, and Unnecessarily Complete Reports, Perhaps, as to the Part I Myself Played in Them and in Other Related Events.

BY WALTER P. PHILLIPS.

(Continued from page 63, January 1, issue.)

On October 30th and 31st, 1903, the second contest under the management of the American Telegraphers' Tournament Association took place in the National Export Exhibition Building in Philadelphia, the leading feature of the affair being the struggle of the giants for possession of the Carnegie medal for best all-round telegraphic work, which was won by F. M. McClintic, at Atlanta, in March, 1902. The officers of the association were: Clarence A. Stimpson, chairman; C. B. Wood, secretary; A. S. Weir, chairman committee on prizes; D. A. Mahoney, chairman finance committee.

Secretary Wood made an address of welcome and read letters of regret from Thomas A. Edison, Col. Robert C. Clowry, Col. A. B. Chandler, Clarence H. Mackay, W. H. Baker, and others. After a very interesting speech by Mr. Weir, the regular business began.

The gentlemen most actively associated in the undertaking were John Winthrop, vice-president, who also represented the president; W. A. Connor, who was absent; Clarence A. Stimpson, C. B. Wood, A. S. Weir, F. E. Maize, D. A. Mahoney, G. W. Dunn, R. C. Murray, Jr., E. C. Abrahams, J. P. Altberger, L. Lemon, C. M. Shaeffer, C. M. Lewis, S. S. Garwood, C. E. Wilson, F. M. Griffin and others. J. W. Benckert did the electrical work, which was managed without a hitch.

The following were the general rules for the guidance of judges:

Speed, formation of letters, spacing, and adherence to copy, will determine the winners in all sending contests.

Cash prizes aggregated \$1,600. Prizes also given were a handsome loving cup, valued at \$100 by the New York Consolidated Stock Exchange, won by George W. Conkling; Fay-Sholes typewriter, won by H. V. Emanuel, and a handsome roll top desk, won by W. C. Murray, of Atlanta, second prize in the thousand-word receiving contest.

First Event (railroad operators.) Sending and receiving 20 railroad messages.

Sending Class—First prize, R. C. Bartley, Pennsylvania office, Philadelphia.

Second prize, C. J. Cone, Pennsylvania office, Pittsburg, Pa.

Receiving Class—J. W. Harrison, Pennsylvania office, Philadelphia, first prize; G. A. Hodgson, Pennsylvania office, Philadelphia, second prize.

Judges—Andrew Keiser, J. L. Osmond, S. W. Graham, C. M. Lewis, J. J. Mishler, all of Philadelphia.

Ladies' Contest—Class A (sending twenty commercial messages.

First prize, Miss K. N. Stetson, Postal Telegraph Company, New York, 14 minutes, one second.

Second prize, Mrs. B. V. Gillespie, 15 minutes, five seconds.

Class B (receiving the same.) First prize, Miss R. Feldman, New York, Postal.

Second prize, Miss L. McKenna, New York, Western Union.

Judges were: M. A. Baker, J. A. McNichol and H. C. Robinson, Philadelphia, and A. C. Thomas and F. E. Crawford, of Chicago.

Third Event (Old Timers, 60 years of age or over.)

Class A—No entries.

Class B—Receiving ten messages and 300 words of press on machine, won by I. D. Maize, of Philadelphia.

E. Payson Porter, "the veteran" from New York, was second.

Judges—F. G. Lamb and J. W. Dwyer, of Philadelphia, and J. F. Ahearn, New York.

Carnegie Medal—Fourth Event (for best all-round operator.) Sending twenty-five messages and 500 words of press and receiving the same. The contestant having the highest total average to be declared the winner.

First prize, Carnegie medal and \$300 cash; second prize, \$150.

Entries were: F. M. McClintic, of Dallas, Texas; W. M. Gibson, New York; E. E. Bruckner, Chicago; Harvey Williams, Philadelphia; W. C. Murray, Atlanta, Ga.; G. W. Conkling, New York; C. J. Chryst, New York; D. Roy Newcomb, Boston.

First prize, William M. Gibson. Time sending press, 9 minutes, 52 seconds, and 25 messages, 13 minutes, 49 seconds.

Second prize, E. E. Bruckner. Time sending press, 10 minutes, 39 seconds, and messages, 14 minutes, 20 seconds.

The judges were: J. V. Berger, L. Lemon, C. E. Bagley, A. Higgins, S. S. Garwood, F. G. Lamb, J. A. Moran, and V. G. Hudgins, of Philadelphia; Thomas R. Taltavall and Frank Kitton, of New York.

Fifth Event—Phillips Code. Class A (sending one thousand words.) Won by George W. Conkling. Time, 15 minutes, 55 seconds.

Other contestants were: W. M. Gibson, George B. Pennock, W. C. Murray, F. M. McClintic and D. Roy Newcomb. Honorable mention was made of the work of W. C. Murray and F. M. McClintic.

Class B (receiving one thousand words from hand transmission, by George W. Conkling.)

First prize, F. M. McClintic.

Second prize, W. C. Murray.

Other contestants were: A. A. Gilson, Louis-

ville; H. R. Clark, New York, and D. Roy Newcomb.

The judges were: E. C. Boileau and J. J. Belzer, Philadelphia; A. E. Marr and G. R. Allen, New York.

Sixth Event (for broker operators.) Sending ten minutes.

Entries: W. T. Dawson, Harvey Williams, R. C. Taft, Philadelphia; W. M. Gibson, Frank L. Catlin, New York.

Won by Harvey Williams. Judges: A. S. Weir, A. W. Wallace and R. C. Mcreedy, Philadelphia.

Seventh Event (Yetman transmitter, special.)

Class A—Sending press, won by C. P. West, New York Postal.

Other contestants were: A. A. Gilson, Louisville; J. B. Stilwell, Karl E. Wilcox, E. C. Watkins, J. P. Gallagher, New York; C. J. Cone, Pittsburg; H. N. Babcock, Atlanta, Ga.

Class B (receiving 30 messages on any typewriter.) Messages sent by George W. Conkling with Yetman transmitter. Won by J. P. Gallagher, of New York.

Judges: J. P. Williams, Robert Morton, J. T. Collins, A. E. Marr and Fred Catlin, New York.

A Yetman transmitter was presented to winners in each class of this event.

Eighth Event—Championship of America. (Sending 500 words of straight matter, hand transmission.)

First prize, Harvey Williams; time, 11 minutes, 30 seconds.

Second prize, George W. Conkling; time, 12 minutes, six seconds.

Other contestants were: E. F. Dougherty, C. H. Labonte, W. M. Gibson, D. C. Lawrence, Frank L. Catlin, George B. Pennock, J. D. Hinant, J. M. Becker, and Frank E. English, New York; F. M. McClintic, Dallas, Texas; A. A. Sullivan, Pottsville, Pa.; W. C. Murray, Atlanta, Ga.; Harry C. Martin, Baltimore; E. E. Bruckner, Chicago; Earl L. Boner, Tamaqua, Pa.; J. H. Abdill, R. C. Mcreedy, H. P. Hemingway, Philadelphia.

Judges: F. G. Lamb, J. W. Reed, A. H. Spracklin, Philadelphia; H. A. Yoell, W. H. Jackson, T. A. McCammon, George H. Usher, J. J. Ghegan, Sid. H. Flagler, New York.

Ninth Event (receiving commercial messages, 30 minutes' trial.) Sent by George W. Conkling with a Yetman transmitter. Fifty-three messages were sent in 30 minutes.

First prize—J. P. Gallagher, New York.

Second prize—H. V. Emanuel, Philadelphia.

Messrs. Gibson, McClintic, Bruckner, Murray, West, Wilcox, of New York; Babcock, of Atlanta, and Lenahan, of Philadelphia, were also contestants.

Tenth Event—A special contest was arranged for the handsome silver loving cup presented by members of the New York Consolidated Stock Exchange, to be awarded to the best Morse sender. The entries were: George W. Conkling,

Harvey Williams, F. M. McClintic, W. C. Murray, and E. E. Bruckner, and the prize was won by Mr. Conkling. More than a thousand persons attended the sessions of the tournament, which was a great success in every respect. New matter was used by the senders, so that no exact comparisons with the work at other contests can be made, though by counting the thousands of characters used it might be pretty closely approximated.

In December, 1904, a telegraphic contest was held in Madison Square Garden, New York, which was limited to feats in typo-telegraphy. While the prizes were small as compared with former telegraph speed tests, much interest was noted, and a very creditable showing was made by some of the contestants.

Judges were: A. P. Velie, S. J. Small, W. J. Ryan, J. H. Nance, and S. C. Dodd.

F. M. McClintic won first prize and R. I. Smith second in the Philips Code Class. The matter was sent to the receivers from a Yetman machine, and the rate of speed was 58 words per minute.

In the Message Receiving Class, F. M. McClintic won first and D. J. Ellington second prize—50 messages in 31 minutes.

D. J. Ellington sent 500 words in 10 1-2 minutes to F. M. McClintic, C. P. West, T. L. Elder, J. P. Gallagher and R. I. Smith. First prize won by F. M. McClintic; second divided between J. P. Gallagher and R. I. Smith.

Mr. McClintic sent on trial, 25 messages in 13 minutes, the same that was sent at Philadelphia the year before in 13 minutes, 49 seconds.

P. A. Gersbach, expert manipulator on the Martin Vibroplex, sent 49 words per minute, perfect Morse, for fifty consecutive minutes.

Boston was the scene of the next tournament, which was held in the early summer of 1906, under the auspices of the International Telegraphers' Tournament of New England. The Carnegie diamond medal, held by W. M. Gibson, of New York, which he won from F. M. McClintic in 1902 at Philadelphia, was not put up for competition, but a new emblem from Mr. Carnegie, known as the Carnegie International Trophy, a cup valued at \$250, was the much-coveted prize for which the giants strove under about the same conditions which governed the contest for the Carnegie medal at Philadelphia. The object of the tournament was the endowment of a hospital bed, and it proved most successful. The officers of the meeting were: President, James J. McGarty; vice-president, Michael J. Reidy; electrician, J. P. Donohue, of the Postal Company; Sid. F. Shirley, manager. Mr. Reidy acted as master of ceremonies. Mayor Fitzgerald made a speech of welcome in the happiest strain, which was appropriately responded to by the master of ceremonies. Visitors were present from many cities, and the occasion was a most enjoyable one. A delightful trip on the bay in a palace tug laden with refreshments, placed at their dis-

posal by the Mayor, was another feature of the occasion. Results follow:

Railroad, Class A (sending 20 messages.)

First prize, typewriter, Richard C. Bartley, Philadelphia; second prize, mecograph, James F. Beegan, Everett Junction, Mass.; winner's time, nine minutes, 36 seconds.

Railroad, Class B (receiving same.)

First prize, typewriter, William F. Bannister, Pennsylvania Railroad, Philadelphia; second prize, mecograph, James W. Harrison, Pennsylvania Railroad, Philadelphia.

Brokerage Class (sending brokerage and financial business, 10 minutes.)

First prize, solid silver punch bowl, presented by the association, David J. Ellington, Postal, New York; second prize, \$40, Harvey Williams, Philadelphia, (broker); third prize, F. M. McClintic, New York, (broker).

Team Match (sender transmitting twenty-five commercial messages to his receiver.)

First prize, solid silver cups, donated by Clarence H. Mackay. Won by David J. Ellington, sender, and H. J. Finn, Postal Company, Boston, receiver; time, 11 minutes, 44 4-5 seconds; second prize, \$40, Edward Dougherty, of the Logan and Bryan broker firm, New York, sender, and J. P. Gallagher, same concern, receiver; time, 12 minutes, 7 4-5 seconds; third prize, won by Charles F. Edney, of H. W. Poor and Company, Boston, sender, and John J. Bell, of Wrenn Brothers, Boston, receiver.

Press, Class A (sending 350 words, straight press matter.)

First prize, \$100 gold, won by D. J. Ellington, New York, perfect Morse; time, eight minutes; second prize, \$40, won by Charles F. Edney, Boston, superior Morse; time, seven minutes 54 1-5 seconds; third prize, won by F. M. McClintic, New York.

Press, Class B (receiving 350 words straight press matter, sent by George W. Conkling, of New York.) Time, eight minutes, 56 1-5 seconds.

First prize, chest of solid silver, valued at \$150, donated by Gen. Charles H. Taylor, of the Boston Globe, won by Charles F. Edney, Boston; second prize, typewriter, won by F. E. Howe, New York, (broker); third prize, P. J. Faulkner, New York.

Press, Class C. (receiving 500 words, Phillips Code.)

First prize, \$100, won by Edward J. Coleman, Providence, R. I.; time, nine minutes, 31 1-5 seconds; second prize, Willard E. Brown, Boston Herald; third prize, F. M. McClintic, New York.

Mr. Ellington having received a majority of the points, five for each first prize, and one for each third, was declared the winner of the world's championship for all-round telegraphing. Mr. Ellington, having won the most points, as prescribed by the International Telegraphers' Tournament Association, (under whose auspices the tournament was held), was declared winner of the Carnegie international trophy for the championship of the world, a cup valued at \$250.

Judges in the various classes:

Railroad, Class A—R. P. Lindsley, C. E. Mahoney, Boston; George W. Conkling, New York.

Railroad, Class B—A. D. Price, J. F. Mickler, F. S. Hollis, of Boston.

Brokerage Class—H. A. Hanley, of Charles Head and Company; James P. Seeley, of Harvey Fisk and Sons; J. Stewart Carr, Hornblower and Weeks; James J. Benelisha, of Towle and Fitzgerald, all of Boston.

Team Match—George D. Boursey, of Lee, Higginson and Company; F. B. Travis and J. A. Coughlan, Postal Telegraph Company; George H. Bell, Long Distance Telegraph Company, Boston; Robert Murray, Jr., of the Western Union Company, Philadelphia.

Press Sending—George F. Thuman, Long Distance Telephone; J. H. Johnson, Associated Press, Boston, and C. B. Wood, Western Union Telegraph Company, Philadelphia.

Press Receiving—C. A. Richardson, Allen Woodle, and Fred N. Bassett.

Phillips Code—Chester D. Rodgers, and Frank B. Dumas, Boston; George R. Allen, New York.

All of the matter used by senders was new.

(To be continued.)

An Unusual Request.

A young man entered a New Jersey telegraph office recently and said to the operator in charge with as little concern as though he were buying a newspaper, "I want you to click off a message for \$1,000,000 to a firm in New York."

"What?" asked the telegrapher, in surprise.

"Come now, there is no reason why you should grow excited over the matter of a paltry million. Here, have a cigar. It may settle your nerves."

"Let me understand this," said the telegrapher. "Do you want to send a million or do you want the million sent to you?"

"Oh, the money is coming to me from a firm in New York," replied the man who said he was Roscoe Conkling. "The firm doesn't mind a little thing like a million. Besides, I need the money."

The telegrapher, however, thought it a case for the police and called an officer. The next day when questioned in court the alleged Conkling said he had been cutting down trees in a nearby town for telegraph poles.

Fearing that he might wish to continue this work with the shade trees in that vicinity the stranger was requested to leave town without delay.

The telegraph is an important factor in operating a large business, but employing it to run a family is something of a novelty and also represents a large item of expense. In a marital unpleasantness which is being aired in court down on Long Island, it appears that the husband was in the practice of directing household affairs by wire and that the wife was also a generous patron of the telegraph. Tolls amounting to \$10,000 figured in the exhibit.

The Telephone in Chicago.

Mr. Bernard E. Sunny, president of the Chicago Telephone Company, Chicago, Ill., was a speaker at the weekly meeting of the Chicago Electric Club, December 15.

As an indication of the conditions to be found in the early days, Mr. Sunny read the list of rules and regulations printed in the telephone directory of 1878. These rules, which required the calling party to wait ten minutes before repeating a call if unsuccessful in obtaining the desired party, and which specified various rings of the signal bells for different purposes, etc., afforded much amusement.

In 1878 Chicago was served by two telephone companies, namely, the Bell Telephone Company and the Western Union Telegraph Company, which was also engaged in the telephone business at that time. Each of these companies had in operation one exchange. Reasonable progress was made during the succeeding years until 1882 when the two existing companies were consolidated and the present Chicago Telephone Company organized.

That the growth of the telephone business in Chicago since that time has been phenomenal was demonstrated by statistics presented by Mr. Sunny, showing that there are at present 205,000 telephones in use with over thirty exchanges.

To accommodate subscribers in various financial circumstances, and also for the purpose of classifying according to the needs of the subscribers, the telephone service in Chicago is divided into the following classes: Ten-party lines, four-party lines, two-party lines, single-party lines and private branch exchanges. Each division, with the exception of the ten-party lines, which are now almost obsolete, represents 85,000, 31,000, 43,000 and 4,375 subscribers, respectively. The latter figure represents the number of private exchanges, to which an average of forty separate lines are connected.

During the average day approximately 1,300,000 calls are handled, which necessitates the services of 3,750 operators. The average speed in answering calls is four seconds, although this varies greatly according to the nature of the call, and the total time required to complete a telephone connection is about twenty-five seconds.

To show that the efficiency of the service has increased in proportion to its growth, Mr. Sunny gave some very interesting statistics. For the average day 78.5 per cent. of the calls handled are completed satisfactorily; thirteen per cent. receive the busy signal; three per cent. receive the wrong number; and 1.5 per cent. are unable to be connected due to errors on the part of the subscribers.

Another interesting phase of the subject which demonstrates the greater efficiency of the service now as compared with that of a few years ago is the number of complaints reported. During the present year, out of 1,250,000 cases received by the general manager, upon investigation resulted

in there being only 452 cases of actual trouble. Mr. Sunny gave figures showing the increased amount of trouble reported from lightning during heavy storms in the summer, and also demonstrated the damaging effects of heavy storms in the winter. The former is being overcome to a large extent by the installation of efficient protective devices which, with few exceptions, have performed their functions entirely satisfactorily.

Other interesting data given was that the busiest part of the telephone day is between ten and eleven o'clock in the morning, the operators handling during this hour about ten per cent. of the entire day's business. The number of requests for the time of day has reached 60,000 in a single day, the larger per cent. of these calls coming in between seven and eight o'clock in the morning.

Regarding the question of a public service corporation's having a monopoly on the business, Mr. Sunny expressed the opinion that such corporations should have a monopoly. He stated that the Chicago Telephone Company is a municipally controlled monopoly, its bookkeeping department being under the direction of the City Comptroller and its service being under the supervision of the Commissioner of Public Works. By reason of an ordinance passed not long ago the city has reserved the right to purchase the telephone company in ten years and again in fifteen years after the date of passing the ordinance. Also after thirty months from the date of the passage of this ordinance the city will appoint a committee to regulate the service of the telephone company for a period of five years, and it was Mr. Sunny's opinion that this committee, co-operating with the telephone company, would establish a system of rates which would be fair to the subscriber, fair to the telephone company, and would result in the general betterment of the entire service.

Electric Current Direct from the Sun.

The production of electric current from the direct heat of the sun is a problem which has engaged the attention of many inventors, and the claim of G. H. Cove, a British experimenter, that he has succeeded in transmitting sunshine into electric energy for his workshop must re-awaken old visions.

His apparatus as described consists of a steel framework which receives the solar rays. This is divided into sixteen squares of one foot each, and each square contains sixty-one metallic plugs of a secret composition, which are set with one end under glass, the other being exposed to the air and screened from the sun.

The difference in temperature between the two ends of the plugs generates a thermo-electric current, which charges a storage battery.

When the voltage drops below that of the storage cells, on the setting of the sun or its passage behind a cloud, the plugs are cut out automatically.

GEORGE GRAY WARD,
Vice-President and General Manager, Commercial Cable Company,
New York.

Presentation to George G. Ward.

December 24, 1909, marked the twenty-fifth or silver anniversary of the opening of the Commercial Cable Company's cables. The officers and staff of that company, to make known their high regard and esteem for Mr. George Gray Ward, who, as vice-president and general manager, has piloted the company throughout its successful career, December 24 presented him with a handsome silver centerpiece purchased by voluntary contributions from the members of the staffs at all the company's stations and the officers of the cable steamer "Mackay-Bennett." The presentation address was made by Mr. Thomas M. Drew, and was attended by a committee of about forty employees who have been with the company almost since its inception.

Mr. Drew's address was as follows:

"Mr. Ward, a committee representing the members of the different staffs, and departments throughout our service, including our friends on board the 'Mackay-Bennett' has highly honored me by selecting me as their spokesman.

"It was intended that this little ceremony was to have taken place at our Annual Staff Dinner; but on account of the company's coming celebration, the plans for our dinner have been temporarily put aside. As the matter which we have in hand is one which concerns the employee's, it occurred to the committee, that there could be no better or more appropriate time for us to pay our respects to you than the present, it being Christmas Eve, and the twenty-fifth anniversary of your connection with our company.

"Twenty-five years ago to-day, you opened the Commercial Cable Company to the public and which, under your management and firmly established principles, has developed into one of the most important commercial institutions in existence, and which will be looked upon for all time as a creation of your skill and diplomacy.

"It would be futile on my part to attempt any praise of your twenty-five years' service with us, before the gentlemen present. They are acquainted with your unparalleled achievements and have observed with pride, the masterful way you have handled problems, in the history making of our company.

"The world owes you a great debt for what you have done in the way of bringing great nations more closely together, and for the many benefits derived from the present methods of exchanging intelligence between the old and new world.

"We must not forget the important field for labor which your policy of expansion has created, not only with the cable systems, but the land line systems as well, for I believe that had it not been for the Commercial Cable Company and your advice the public would not have the excellent telegraph facilities which they have in the Postal Telegraph Company to-day.

"While in latter years, your duties have somewhat prevented you from coming in contact with

the members of the staffs, as was your custom in the early struggles of the company, the sentiment has not changed. There is never a time that you take a trip abroad but what your return is anxiously awaited, and there is a feeling of rejoicing when we know that you are back home safe and sound.

"It is that interested feeling which your men have for you that brings us together this afternoon. On more than one occasion, men of high rank have seen fit to honor and reward you for your fidelity, and now your men wish to honor

Silver Center Piece presented to Mr. Ward.

you by showing their appreciation of your administration and your efforts in their behalf and on behalf of the employees of the Commercial Cable Company from New York to good old Dundee, and from sturdy St. Johns to sunny Havana, I take great pleasure in presenting you with this token of their friendship, love and esteem in honor of your twenty-fifth anniversary with our company. It has been purchased by voluntary contributions, and the feeling with which it is given is as sterling as the metal of which it is cast. It is quite emblematical of the things that have figured so prominently in your life's work. The sea, which you have crossed so often on delicate and important missions, and old Mother Earth, which you have so skillfully and successfully girdled with our lines. We hope that this gift will not only be an ever pleasant reminder of your own noble acts and achievements, but a constant reminder of the deep feeling

of regard which your men have for you, and now, Mr. Ward, on behalf of the men of the service allow me to congratulate you upon this your twenty-fifth anniversary with our company. It is our sincere wish that you will be with us for many years to come and we all join in wishing you and your family all the compliments of the season, long life, prosperity and happiness."

The presentation came to Mr. Ward as a complete surprise, and the true spirit of loyalty and friendliness manifested in the message which Mr. Drew brought from the staff filled Mr. Ward with too much emotion to make anything but a brief acknowledgement. His remarks in substance were as follows:

"Gentlemen—I can find no words to express my appreciation for this beautiful present and your kind thoughts and complimentary remarks. I am sure you all understand how such a surprise as this must affect me. It deprives me of the power to thank you as I should like to. I would be untruthful if I were to accept the whole credit which you wish to bestow upon me for the building up of this institution. Its success was in a larger measure due to your ability, devotion and perfect co-operation with the management. When I recall the early days of our existence and the struggle we all went through, when we had practically no land lines in this country and were greatly discriminated against in Europe, I think we can all claim some credit for the present prosperous condition of the company. The work of the rank and file, perfectly in union with the management, made a force which spelled success and broke down all barriers impeding its progress. My thanks are due to you for your splendid support at all times, and I give them to you from the bottom of my heart.

"I feel, my friends, that I can say no more under the circumstances, except to again ask those present, as well as your absent colleagues, to accept my grateful acknowledgement for the great honor you confer upon me to-day by this presentation, which makes this the proudest moment of my life, fifty years of which I have now spent in the telegraph and cable service."

Ocean Cables and Trawlers.

Much has been said and written about the great damage to ocean cables occasioned by steam-trawlers upon the fishing grounds west of Ireland, where the ocean cables have been broken forty times in the last ten years and at other points near the European coast. A description of the methods of operation of these fishermen may be of interest at this time. The boats are generally about 120 feet long, with a few hundred tons displacement, and with engines of eighty horsepower. They operate either singly or in fleets of half a dozen, all over the shallow waters of western Europe, from the Arctic circle to the southern limit of Morocco. They have gradually increased their range of working until now they operate at depths of 300 fathoms or

over. Each boat usually carries a crew of nine men.

The methods employed to keep a steam-trawl net moving over the sea bottom are very interesting. The net is commonly about sixty feet wide at the bottom, and is fastened to two boards, one at each end of the foot-rope, or lower edge of the net. These boards, called otter boards, are about the size of a billiard table, and are made up of wood slabs, some three inches thick, rimmed with iron. They are water kites, being held near the center of one face by a steel rope and fastening. The steel rope forms the kite string, the otter board the kite, and the trawl net the kite tail. When the steamer goes over the ground at a speed of two and a half or three knots the two otter-boards skim over the bottom, each towed by a steel rope. They keep nearly in a vertical plane and tend to pull apart like a pair of kites heading away from each other, but kept in harness by the trawl net between and behind them. Such fish as come within the scope of the advancing net are unable to escape the rush of water, and are finally hauled up by winding in the steel ropes.

The trawlers naturally work along and across the numerous ocean telegraph cables, the nets and otter-boards passing over them hundreds of times without any interference. Occasionally, however, an otter-board engages a cable. This is either because there is some slight projection on the edge of the board, or possibly because the cable may be festooned from one submarine hillock to another, thus permitting the otter-board to work underneath the cable. When a trawler is unlucky enough to engage a cable it is a battle between rope and rope. The trawler winds in her warps as best she can. If the cable is very strong and taut, and the water deep, the warps break and the trawler loses net, catch, otter-boards and warps, to say nothing of time and temper. If, however, the cable is not very strong, the warps may hold and the cable may break, involving the cable company in much loss of money for traffic and repairs. Or the cable may be raised to the surface and be disengaged by the fishermen without rupture, but yet be injured, and put out of working order, by reason of the sawing and chafing it is subjected to under the plunging of the trawler in a heavy sea.—*Electrical World*.

The Nobel prize for physics has this year been awarded to William Marconi for his extended researches and developments of wireless telegraphy, and also to Professor F. K. Braun of Strasburg University, Germany, for his researches in radio-activity. The Swedish Academy of Science, to which is given the duty of annually selecting the scientists and great public leaders whose work has been of the greatest value to the human race, was unable to decide in regard to the prize for physics between these two men, and therefore decided to award the honors between them. This prize amounts annually to about \$10,000. Since it was divided this year, each of the two recipients will receive \$20,000.

CLARENCE H. MACKAY.
President Commercial Cable Company,
New York.

CELEBRATION OF TWENTY-FIFTH ANNIVERSARY OF ESTABLISHING OF COMMERCIAL CABLE COMPANY.

Mr. Clarence H. Mackay, president of the Commercial Cable Company, gave a dinner to the New York officers and staff of the Commercial Cable Company on Saturday evening, January 8, at the Hardware Club, Postal Telegraph Building, to commemorate the company's twenty-fifth anniversary. The dinner was to have been held on December 27, but on account of the death of Mr. Dumont Clarke, a director of the company, it was postponed.

While it was essentially a staff dinner, a few of Mr. Mackay's personal friends were invited guests.

The occasion was a most enjoyable one. Its completeness in every detail was characteristic of the way Mr. Mackay does things.

The dining room was decorated with a profusion of flowers and festoons of smilax. Flags and shields of all nations adorned the walls. Two large illuminated translucent geographical globes showing the Commercial's cable systems were hung from the ceiling about fifty feet apart and were connected by five silver cables, emblematical of the five transatlantic lines of the Commercial Cable Company.

Messages of congratulation and sentiment were exchanged with the Company's stations in Europe and the Far East, by means of a special wire operated in the dining room, connected to the Atlantic and Pacific cable systems of the company. The rapidity with which messages can be flashed from one end of the world to the other was exhibited. A message was sent to Europe and a reply received thereto in less than three minutes. A similar message sent to the Philippines and China was answered in five minutes.

The table decorations were particularly suggestive of the occasion, everything possible being finished in silver.

The menu cards were of a very handsome and appropriate design, richly embossed. An orchestra, screened by palms, played popular tunes that helped to bring good cheer to the diners.

Several favors were given, the most interesting and unique of which was a small piece of the Commercial Company's original cable, which was recently recovered from the bottom of the Atlantic, after having been submerged twenty-five years. Although the cable has been lying in water under a great pressure for so many years, very little deterioration has taken place, and the sheathing wires are in almost as perfect a condition as the day the cable was laid. A finely illustrated brochure, giving the history of the company was also presented to each one present.

After coffee had been served Mr. Mackay arose and proposed a toast to the President of the United States and the King of England. After this had been drunk, he said:

"Gentlemen of the Commercial Cable Company, and guests of the evening:—I esteem it a great

privilege to bid you welcome on this, the twenty-fifth anniversary of the Commercial Cable Company. The occasion is one for which we have every reason to rejoice, and it is with the warmest feeling of good will to you all that I extend to you my heartiest greetings.

"Twenty-five years brings great changes in the march of Time, and no better illustration can be drawn than that of the organization of which we are so justly proud, the Commercial Cable Company. I do not propose at this time to retrospect or recite the evolution of the company, for its history and development I will leave to others who have been connected with the company since its inception. Time has thinned our ranks; the founder of this company has been taken from us, his spirit has passed beyond the Great Divide, and only recently Death has laid its heavy hand on two of our number,—Mr. Dumont Clarke, associated with this company for nearly twenty years, a loyal, staunch and trusted adviser,—and Mr. Chas. A. Gill, who joined the company in 1885 and remained at his post until the day of his death, leaving a record unsurpassed for fidelity and trustworthiness. Gentlemen, I wish to propose a silent toast: 'To those who have passed from us, and whose memory we will revere for all time.'

"As I look around this room tonight, I see gathered about me the familiar faces of those whom it has been my good fortune to come in daily contact with for a number of years, men whom I have learned to admire and respect for their loyalty, zeal and uprightness. Never has any company had an abler or finer executive staff than that of the Commercial Cable Company. For bringing together and moulding an organization such as I see here tonight, the credit belongs more to one man than to another, and that is, to George Gray Ward.

"Gentlemen, you should be proud of George Gray Ward, as I am. For twenty-five years he has devoted himself untiringly to the interests of this company, and by that I mean your interests. In good times or bad, in sunshine or storm, he has always been imbued with the same spirit, to zealously safeguard the interests of the company, and to see that every man was given a square deal. To you, Mr. Ward, I give credit in a large measure for the results that have been achieved by this company, and I am glad, old and trusted friend, of the opportunity to pay you this tribute tonight, for, gentlemen, to know him is to love him."

Mr. Ward then spoke as follows:

"Mr. President, and gentlemen, we are assembled here to-night, by the invitation of our President, to celebrate the company's twenty-fifth or silver anniversary. As I look around the tables, it is pleasant to see so many familiar faces, and especially those whose qualities and devotion

to the company's interests in the early days of its existence, helped so materially to establish the company as an important factor in Atlantic telegraphy.

"When this company was incorporated by the late Mr. John W. Mackay (whose name we shall ever revere), and Mr. James Gordon Bennett, and it first became public, the companies then operating in the Atlantic, were not very seriously alarmed, doubtless because they felt that their combined strength was sufficient to overcome any threatened competition.

"I am quite sure, that whatever views of that character may have been entertained then, have been entirely replaced by a more wholesome respect for our strength.

"I think this occasion is an appropriate one to review the company's history and development during the past twenty-five years, and in doing this I shall relate briefly the steps of progress from its inception.

"After Mr. Mackay's work of developing his great mining interests, he devoted himself largely to other business enterprises, chief among which was the establishment of an Atlantic cable system. This system was designed to oppose the monopoly existing at that time.

"On December 13, 1883, the Commercial Cable Company was legally born, and steps were immediately taken to launch the new enterprise on its active career. Landing places were selected, cables and apparatus were contracted for, arrangements for the establishment of stations were made and all other details necessary to the organization of a high class institution were thoroughly mapped out. There was some doubt at that time as to the Company's purpose and its strength to introduce and maintain competition, but this was dispelled by Mr. Mackay in a letter to the press, which read as follows: 'We have no intention of entering into any agreement or coalition whatever with the existing companies. We are in a position to take our stand and defy all attempts at coercion. In founding this new trans-Atlantic cable company, we were of the opinion that the time had come to give the public, on a permanent basis, a somewhat cheaper and at the same time a thoroughly reliable and prompt cable service.'

"You all know how well Mr. Mackay carried out these promises. Weaker men than he would have yielded to the pressure of the powerful forces united to crush out our existence. Although the matter is now cobwebbed with age, it must not be allowed to be forgotten, especially in an epoch so filled with 'trusts and combinations.'

"Recent events have brought forth inferences of a combination between our land line properties and the telephone interests, but our President, Mr. C. H. Mackay, has, I am sure, set all such thoughts at rest by his public statement the other day, in which he reiterated the policies of his father, namely, to maintain independence and competition.

"I am, however, turning out of my course. The

landing places selected as stations for the company's trans-Atlantic cables, as you are aware were Waterville, Ireland and Dover Bay, Nova Scotia.

"Our first trans-Atlantic cable was completed on July 20, 1884, the cable from Nova Scotia to Rockport, Cape Ann, Mass., having been completed shortly before that date.

"On October 9 the laying of a second trans-Atlantic cable was completed, and on October 18 the cable from Nova Scotia to New York City was successfully laid, thus forming the first all cable route between New York City and Europe.

"In the midst of our enthusiasm over the success thus far attained, first one and then the other of our main cables became interrupted on ground over which the cables should never have been laid. These cables were repaired in December, 1884.

"Our New York-Canso cable has the distinction of being the first submarine cable landed and operated in a large city, and has proved a great boon to the business people on many occasions, notably the blizzard in 1888, when all communication to places outside of New York City was entirely interrupted except by this cable.

"I distinctly remember the impression my words made upon a number of the representative business men in a few remarks I made to them at Coney Island, at the time this cable was landed, in which I ventured to say that a cablegram could be transmitted between New York and London inside of three minutes. That prophecy seemed too sanguine to some, but it is unnecessary for me to tell you that we have carried out this prognostication and, in fact, very materially reduced that time.

"On December 24, 1884, the cables were opened for public use, at a twenty per cent reduction, from fifty cents to forty cents per word and from the first were well patronized. The first paid message that passed over the line from America was sent by Mr. J. C. Reiff of Woerithoffer and Company and this gentleman I may say, has always been very proud of the fact. The other companies naturally met our reduced rates. Scenes of unusual activity and stern expressions were visible everywhere in the cable offices as the fight for prestige and supremacy began.

"To be prepared at all times to restore interrupted communication without undue delay, the cable ship 'Mackay-Bennett' was contracted for, and launched in 1883, and was put into commission in the winter of 1884.

"On February 1, 1885, our cable between Waterville and Havre was opened for business, thus establishing direct cable communication with France.

"On June 26, 1885, the first cable was laid between Waterville and Weston-Super-Mare, England, thus establishing direct cable communication with England, the manifest advantage of which was reliability of service.

"The company operated its lines in undisturbed tranquility until April 20, 1886, when placards and

circulars were issued by our pooled competitors, announcing a reduction in the rates from 40 cents per word to 12 cents per word. The object was perfectly clear. The popularity of the Commercial Cable Company's service and its firm establishment of independence, from which it could not be swerved, became a serious menace to the prosperity of the other combined forces, and in their desperation they determined to make a strong effort to free themselves of our opposition by commencing a ruinous war of rates. It was a war waged at a great financial loss to Mr. Mackay and others, not only for our own existence, but for the benefit of the public who now enjoy a competitive cable service unequalled in any part of the world.

"Our opponents, however, miscalculated the resources and character of their antagonist. We met the first attack by reducing our rate to twenty-five cents per word and secured a good deal of public support by giving a faster service.

"In September, 1887, we decided to meet the twelve cent rate. We were seriously handicapped by not having adequate and suitable land line facilities in the United States and Canada and our opponents made use of every message we handed over to them for further transmission, for canvassing purposes. We were also at a great disadvantage in Europe because the old companies had the exclusive right to all unrouted messages. The rate war lasted two years and five months, both sides suffering very heavy losses. It however, as you well know, ended in a decided victory for the "Commercial," which maintained its independence and gave the public a superior service through keen competition at a twenty-five cent rate, saving them hundreds of thousands of dollars annually.

"From that time onward, our progress has been steady and rapid. Under the able direction of our friend Colonel A. B. Chandler, whom we are all delighted to see here tonight, land lines were gradually acquired throughout the United States, rebuilt and organized into the great Postal Telegraph system, which with its connections now comprises over 330,000 miles of wire. A connection was also established at Canso, Nova Scotia, with the Canadian Pacific Railway Telegraphs; the largest telegraph system in Canada.

"In 1894 we laid our third cable between Canso and Waterville.

"In 1901 our Canso-Azores-Waterville cables were laid, thus completing our fourth trans-Atlantic route to Europe and establishing connection with the great systems of the Eastern and Western Telegraph Companies at the Azores. We also laid an additional cable between Canso and New York City the same year.

"For many years we were unjustly discriminated against in our efforts to secure traffic in Germany, but our prestige increased in proportion to our strength and when the two German cables were laid in 1900 and 1904 they were brought into our New York office and operated

by us through the successful business relations arranged with the German enterprise.

"In 1901 we laid a second cable from Waterville to Weston-Super-Mare, England. We now felt that we had an adequate, up-to-date cable and telegraph system in the Atlantic and United States and Canada respectively. We then shifted the scene for our activities to the Pacific. You all remember the governmental agitation for an American Pacific cable; how for years the matter was debated in Congress; that private interests offered to lay the cable conditional upon receiving a large annual subsidy, and when finally Mr. John W. Mackay agreed to lay the cable without subsidy or guarantee of any kind, we had to overcome strong and influential opposition. But we finally conquered, and in 1902-3 the Commercial Pacific cables between San Francisco, Honolulu, Midway Islands, Guam, and the Philippines were laid, and the long cherished desire of the government and public was realized.

"When we laid our fourth trans-Atlantic cable, there was a sufficient margin of facilities available, to make it doubtful in our minds whether we should require any further cable facilities for many years to come, but only four years elapsed before another cable was found necessary, and in 1905 the company's fifth trans-Atlantic cable was laid.

"In 1906 the Commercial Pacific extensions to China and Japan were made.

"For some years the company had been endeavoring to extend its system to Cuba, but was prevented from doing so by other interests which held an extensive monopoly of the telegraph privileges on that island. This monopoly expired in 1907, however, and a cable was at once laid from New York direct to Havana. The introduction of our competition again resulted in a much improved service and a large traffic.

"Our present systems in the Atlantic and Pacific comprise 28,379 miles, compared with 6,922 miles in 1885, a development of over four hundred per cent.

"During the past year we have diverted our two 1884 trans-Atlantic cables from a point in the Atlantic known as the Flemish Cap into St. Johns, Newfoundland, and have also laid a cable from St. Johns to New York, and a second cable from St. Johns to New York already partially laid will be completed in due course. The diversion of these two cables removes them from dangerous locations, shortens their length and gives us a practical transmitting speed between New York and Europe faster than the speed of any other trans-Atlantic cable route.

"This review would not be complete without a few words concerning the relations between the staff and the company. No organization can attain its highest success without harmony and confidence between the management and the employees, and I want to say that I am unaware of any institution where the harmony, zeal, fidelity and keen devotion to the company's interest exists in

a greater measure, than in the service of the Commercial Cable Company. Our gratifying success is the result of twenty-five years of arduous and unremitting activity, resolution and unity of purpose. The Commercial Cable Company will continue to expand and prosper.

"We have made it a power in the submarine telegraph world. It is looked up to by every other cable company as the company to follow.

"I heartily thank you, my friends and co-workers, for the unsurpassed co-operation you have always given the management; without your co-operation, loyalty, devotion and determination to make our institution the leading Atlantic cable company we could never have succeeded, and I am sure you will never relax your efforts to maintain this supremacy, of which we are all so proud.

"The requirements of the service are exacting, and those who would succeed in it must display loyalty and zeal. There is no duty, whether performed by office boy or by superintendent, that does not require intelligent execution. The efforts of its employees are reflected in the company's success. The company on its part has treated you generously, and notably in its establishment of a pension by virtue of which any of you shall be entitled to a pension upon attaining the age of sixty years after forty years service or before attaining such age any of you who may become physically incapacitated through no fault of your own shall after ten years continuous service be entitled to a pension based on the length of such service.

"The company will continue this policy towards you and I know that you on your part will continue to give the company a full measure of loyalty and co-operation.

"In conclusion, I desire to thank the President most cordially for this celebration which, through his liberality, I am happy to say, has extended throughout the service, and for the exceptional kindness and interest he has always shown to the whole staff, and to warmly congratulate him on the exemplary manner in which he has pursued his father's policies, honored his name, and enhanced the prosperity of the company by his active association in the administration of its affairs.

"Mr. President: Your kind remarks concerning me personally are indeed very gratifying. It has always been my great pleasure to serve the company, but whatever success may have resulted from my administration could not have been achieved without the confidence your late father and yourself have always placed in me and the able and loyal assistance at all times afforded me by my lieutenants, with whom I gladly share the honor which you do me. We have all worked together toward one objective point—success, and the realization that this has been attained, is my greatest reward.

"Gentlemen, I ask you to fill your glasses to the brim and drink to the continued prosperity of the Commercial Cable Company and I hope that you

will be able to drink to the toast of its golden jubilee. I couple the toast with the name of our President and friend, Mr. Clarence H. Mackay.

Mr. Mackay then responded to the toast proposed by Mr. Ward, saying:

"Gentlemen of the Commercial Cable Company and guests:—I will gladly respond to the toast, "Prosperity to the Commercial Cable Company," and, please God, I hope to continue to do so for many years to come.

"In my previous remarks I mentioned that I would leave to others the telling of the company's history, but in view of the times we are living in, it seems to me it would not be inopportune if I should dwell on certain matters as directly affecting your interests.

"The last quarter of a century has witnessed momentous events in the history of nations; the world seems to have been passing through a peculiar process of evolution—the whole tendency of the age has been directed towards a desire on the part of every civilized country to have closer intercourse, and which year by year seems to be accumulating momentum.

"Twenty-five years ago, important news was confined to the few great capitals. To-day we are not satisfied with that; we must be kept informed of all that is passing in every quarter of the globe; the statesman, banker, merchant, journalist and man of affairs all wish to know what is transpiring daily, and whether their interests are affected.

"To tell what the cable has done for the progress of the world would be to tax the imagination of the poet and the historian, but the fact remains that the cable has been the greatest human agency for bringing nearer to each other the civilized nations of the globe, and the part you have played in this development cannot be overestimated.

"I attribute the successful results which have brought about the present efficiency in the transmission of intelligence, to the aggressive competition of the Commercial Cable Company and its allied interests. When I look back and think of the time before the Commercial Cable Company entered the field, when rates were double what they are today, and when the whole cable and telegraph situation of the United States was in the hands of an iron-clad monopoly, I sometimes wonder how this company ever managed to live through it all. Wherever the arm of the Commercial Cable Company has stretched forth, whether in the Atlantic, Pacific or Cuban waters, invariably there has followed a reduction of rates, better facilities and better service. If ever there should exist any doubt in the mind of the public as to the benefits of competition, one has only to take what I have just stated as an example.

"If this company, through the untiring efforts and loyalty of its officials and staff, has been able to create a system extending two thirds of the way around the globe, it has been due in my opinion primarily to the fact that it has always endeavored to deal with the public fairly and squarely, and let it be said, gentlemen, to your

everlasting credit, that of the thirty million messages that have passed over the cables of our Atlantic system in the last twenty-five years, there is not a single instance on record of the contents of a message ever having been divulged. As your President, it is a source of great satisfaction to me to say this, and I always believe in giving credit to the 'man behind the gun.'

"And now, gentlemen, I trust I may be excused if in concluding my remarks, I should make a personal reference to our relations. Situated as we are, both engrossed with the affairs of the company, it is but natural that the time for intercourse should be limited, and that consequently we are unable to have as close a view of each other as we might wish, but I do wish to say this to you, and I am addressing particularly the rank and file, and that is I most earnestly desire your welfare—that at all times I will do all in my power to promote it, and further, if there should arise an occasion regarding which you would like to see the President of this company, the door of my office will always be open to you and I shall be glad to welcome you.

"Because we have prospered, gentlemen, this is no time to relax our efforts. Already a large opposition is looming up ahead of us, and while I have no fear of the result, nevertheless I say to you 'buckle on your armor and see that there are no loose joints.'

"There have been momentous changes of late in the telegraph world, and for all we know there may be more to follow; but there is one change that will never take place, gentlemen, and I can give you my positive assurance that as long as I live the Commercial Cable Company will never lose its identity. The Commercial Cable Company was created independent and so it shall remain, and as long as we will pull together, shoulder to shoulder, creating and building greater things, I have no fear of any competitive system that has been devised or will ever be devised.

"So with every hope of the future, with grateful appreciation of your loyalty and zeal, with every wish for your happiness, I say to you, gentlemen of the Commercial Cable Company, 'well done, good and faithful servants,'—may you all live long and prosper!"

Mr. Mackay then introduced Colonel Albert B. Chandler, Chairman of the Board of Directors of the Postal Telegraph-Cable Company. Colonel Chandler said:

"Mr. President, and my Comrades of the Commercial Cable and Postal Telegraph Companies: Having been somewhat closely related, almost from its inception, to the progress and development of the great enterprise projected and carried out by our rare and ever-to-be-remembered friend, Mr. John W. Mackay, which gave to the world one of its most important, extensive and valuable means of communication—the Commercial Cable Company, I am glad to join in this commemo-

ration, and hope it may interest you to learn something of a generally unknown feature of the initial work necessary to the bringing of the cable itself into this great commercial center of the new world.

"Early in the year 1884, at the instance of my friend your Vice-President and General Manager Mr. George G. Ward, whom I had well known as Superintendent of the Direct United States Cable Company for nine years previously, I undertook to obtain the right of way for laying an underground conduit from the sea shore at the eastern end of famous Coney Island, to receive the new cable, which was expected to be completed before the end of that year. I supposed it would only be necessary to make the proper officers of the three towns to be traversed, of the then City of Brooklyn, and of the wonderful Brooklyn Bridge, which had only been opened for traffic one year before, acquainted with the facts concerning our project to secure recognition of its importance to the public, and ready consent to our application, upon reasonable terms. I found, however, that it required many interviews and much explanation and persuasion to finally succeed, as we fortunately did just in time to complete the connection with the cable which, in the meantime, had been safely brought to its landing place, a short distance east of the Oriental Hotel. In securing this result I had the efficient aid of my friend Mr. Chas. C. Martin, then Chief Engineer of the Brooklyn Bridge; of the Honorable Seth Low, then Mayor of Brooklyn, and of a young lawyer of my acquaintance, who was familiar with the conditions in the towns of Flatbush, Flatlands and Gravesend, and who was only a few days ago duly installed as Mayor of the Greater City of New York—the Honorable William J. Gaynor.

"Within that same month of December, 1884, I was invited to examine into and report upon the conditions surrounding the many-sided competition with the Western Union Telegraph Company then existing, and this led to my undertaking, by Mr. Mackay's request, to "bring order out of chaos," as I think I may fairly express it, and this I have no doubt most of those here present know was accomplished during the following sixteen years, to a degree beyond the expectations of any one living at that time, and which I wish to testify here and now would have been quite impossible but for the full confidence, co-operation and friendship of the senior Mr. Mackay. The close alliance of the cable and land line service, from the beginning, and their practical oneness since 1896 have enabled these appropriately named "Mackay Companies" to perform a service to the public, and especially to the business public of the commercial centers, of such merit as had never before been deemed practicable, and which is not likely to be surpassed, except perhaps by themselves, in their own further development. And we are glad that the

mantle of their founder has fallen upon a worthy son as his successor, in administering their affairs.

"Singleness of purpose, uniform, yet moderate, rates; the determination on the part of officers and employes throughout the whole extent of our system to render a superior service, combined with personal courtesy towards and interest in our patrons, together with our unsurpassed equipment in every department, have placed us in the front rank of all telegraph enterprises; and I feel that we may justly felicitate each other at this time upon the completion of a full quarter of a century of useful endeavor, and that we may reasonably expect from our present ground of vantage to continue for a long time to come, to deserve, and hence to receive, an increasingly large share of public favor."

Colonel George W. Harvey, who was the next speaker of the evening, entertained those present by his ready wit and humor.

Mr. George Clapperton, vice-president and traffic manager of the company, was the next speaker introduced. In introducing Mr. Clapperton, Mr. Mackay characterized him as "Mr. George Clapperton, the Phil Sheridan of the old guard, midst the din of battle and the peace of victory, our little General who ever kept his seat in the saddle with that poise of temperament born of courage, determination and confidence that marks the able man." Mr. Clapperton said:

"The speed of the electric current remains the same as before, but cable transmissions have been improved, they have been made more certain, we do not have to make so many twice to get them done once, and we have eliminated delays at initial, intermediate and terminal points. As was to have been expected, there has been a steady natural growth of cable communications, and this growth has been stimulated as never before by multiplied instrumentalities, greater efficiency of operation and better business organization.

"Since 1884, not counting the original cables, the Commercial Cable Company has laid one half of the new cables in the Atlantic and Commercial Cable employes have contributed to the art of working cables two of the three really notable improvements since the siphon recorder and the application of the duplex. The principle discovered by Cuttriss, and it was pure discovery, is the principle that has survived, and the work of Wilmot remains a monument to his patience and his persistency. The results of the work of these Commercial Cable men have been of world-wide adoption. Their contributions, first, so helpful to the separate and individual advance of the Commercial Cable Company became in time their contributions to the common progress of cable telegraphy.

"The third improvement was contributed by one not previously identified with our branch of applied electricity and this makes the names of Cuttriss and Wilmot still more conspicuous in cable history.

"The company has always provided cables equal to the need and generally in advance of the time. The first cable ever brought from under seas into a great seaport was the cable brought by the Commercial Cable Company into New York City in 1884. Before that time it was settled practice to lay cables to some out-of-the-way place and to make the connection between the cable and the real objective point by land line. It was thought to be courting disaster to lay a cable in the track of commerce on the way to a great city. Bringing a cable into New York City is a commonplace nowadays, but it was an extraordinary step forward in 1884, a step that had to await the event for its justification. The event justified it so amply that what had been called foolishly adventurous became the evidence of foresight and courage.

"Now, gentlemen, cables do not do anything themselves. If the continents are not to remain as wide apart as ever the cables must be operated. It is only when animated by the informed touch of the operator that the dumb lifeless thing becomes the living, speaking thing expressing the current thought and telling the story of the current action of and to the peoples of the hemispheres. The operator is the living medium between the men of the one side of the world and the men of the other, and largely it rests with him whether by his skill and diligence the energy, the labor and the anxiety of negotiation that go to the making of world transactions shall be fruitful and their objects advanced or attained, or whether by his indifference they shall be marred and their objects delayed, if not defeated. Gentlemen, the cable operator as we know him is skillful, diligent and self-respecting, he approaches his task with feelings of responsibility and pride, responsibility because he knows the importance of his work, and pride because of his mastery of the craft that enables him to perform that work. Cable telegraphy is not a precise and definite art. It cannot be performed in a perfunctory, machine-like manner. At every step the operator has to deal with indefinite conditions that call for judgment and decision, and he cannot be successful unless he have in large measure in what he does a keen interest that amounts to inspiration, makes work worth while and distinguishes the man from the trained creature, wonderful in its way, but only because its trainer has made so much out of so little.

"Gentlemen, there is not much the matter with a man who is proud of his calling. We have good reason to be proud of ours. It is no humble place that has been assigned to us in the march of civilization, and we prove our right to it by keeping up with the procession. Temporary successes may be achieved by accident or expedient. Permanent successes must depend on real worth. The factors that have made the success of this enterprise are the only factors that can be relied on to continue it; a good plant and

a good staff that is what has given the company its eminence among cable companies; intelligent work under the direction of a leader who knows how, himself, that is what we have had for twenty-five years, and that is why we are here to-night celebrating and receiving congratulations from the ends of the earth.

"Gentlemen of the Commercial Cable Company, we have come to the end of a quarter of a century. We are engaged in a great competing enterprise. The best we can do to-day is only sufficient for the day and only marks the line below which we must not fall to-morrow. Our master, the customer, is exacting, often intolerant. If we do not suit him he goes, if we only suit him as well as somebody else, he divides. To hold him complete we must suit him best. We want to suit him best because we are jealous of the credit of our institution, but no Commercial Cable man ever abases himself. He has caught the spirit of his surroundings, and he is saturated with the sustaining conviction that he himself is as honorable as any adversary and that no adversary represents anything more honorable than the thing he himself represents.

"We have entered our twenty-sixth year. We cannot stand still, we must move, if not forward, then backward; if we do not expand we shall contract, and as it is with the aggregation so will it be with the individual. So long as he remains a part of it he cannot separate his fortunes from the whole, and it is of the utmost importance to him and his associates that this aggregation, a reliance for the present and a hope for the future, shall continue its onward march, and this it will surely do if everyone of us, living up to our traditions, continues to do his share resolutely and faithfully, each one aiming with real active loyalty to make his work the best work, his department the best department, his company the best company."

At the conclusion of Mr. Clapperton's remarks, Mr. Mackay took occasion to read cablegrams received from the staffs at Boston, Rockport, Mass.; Hazlehill, N. S.; St. Johns, N. F.; London, Liverpool, Manchester, Bradford, Newcastle, Waterville, Glasgow, Edinburgh, Hull, Dundee, Havre, Paris, the Azores, Havana, San Francisco, Honolulu, Midway Island, Guam, Manila and Shanghai; from Mrs. John W. Mackay, in Paris; from the staff of the steamer "Mackay-Bennett"; from the staff on duty in New York; from many of the European agents of the company, and from many of Mr. Mackay's personal friends, congratulating him upon the anniversary of the company and wishing it a long continuance of its present prosperity.

Mr. E. L. Cohn, of the operating staff, was then called upon. Mr. Cohn proved to be a first-class humorist, and told many stories and anecdotes which created much amusement.

Mr. F. A. Pirie, the head of the Commercial Cable Company Athletic Association, then spoke in the interest of that organization, and took oc-

casional to thank the President for the many benefits conferred by him upon the association.

Seated at the President's table were:

C. H. Mackay,	E. J. Nally,
G. G. Ward,	Geo. Clapperton,
Col. A. B. Chandler,	Capt. P. J. Lydig,
Morton Paton,	Albert Beck,
Col. Geo. Harvey,	F. L. Polk,
E. C. Platt,	S. S. Dickenson.

Messenger Boys as Nurses.

The district messenger office in a western city is mourning the loss of one of their best messengers, Mr. "Reddy" Burns.

Mr. Burns, aged fifteen, answered a call recently to an apartment house. The young woman who had sent in the call had lately arrived from England. There were just three in the family—Mrs., Mr. and the baby. If there had been no baby Mr. "Reddy" Burns might still be a star messenger.

The young woman who sent in the call had received an urgent summons to the bank. Following a custom of London matrons, she sent for a messenger. The messenger was to care for the baby until she returned.

The messenger arrived and as usual stood with his book in his hand, wetting the point of his pencil in his mouth. The lady of the flat explained briefly Mr. Burns' duties-to-be. He didn't understand.

"Where'm I to take 'im?" he asked.

"Take him!" cried the lady, "You're not to take him anywhere. You're to tend him."

Mr. Burns nearly swallowed his pencil.

"Tend 'im?" he gasped.

"Yes. Tend him," replied the missus. "I'll get you his bottle."

When she returned to the room Mr. Burns was gone.

The office has not seen him since. A note was received from him the following day, but it gave little information. All that it said was:

"I quit. I am no nurce. I am a messingur."

No London messenger boy would consider such a duty as unusual. There messenger boys know how to tend babies. They have to.

If a mother wants her baby tended she goes to a telephone, calls up the messenger office and says:

"Will you please send me a nice, capable messenger boy?" Yes, I want him to take care of baby while I am gone. Please send me a real motherly sort of one. The last one was not at all careful about the temperature of the milk. Yes, that's all, thanks. Goodby."

Right afterward comes the messenger. He doesn't look like the American variety. He has an official air and an atmosphere of solidity that could never grow in the climate of the states.

"'Ere Ii am, lydy," he says. "Hany special instructions, and 'ow hoften do you feed hit?"

Instructions are given and madame sallies forth with an easy mind.

The messenger rocks the cradle, he even sings. If he has been told, he takes the baby out for a walk, pushing the perambulator with all the dignity of a father. He knows just what temperature the milk should be and he feeds the nursling at the right times.

What Our Friends Say Regarding This Publication.

Mr. L. Derrick, of Philadelphia, says: "I always consider a subscription to your paper one of my best Christmas presents and would as soon do without my Christmas turkey rather than miss a single issue."

Mr. B. F. Dillon, superintendent of the Western Union Telegraph Company at Jacksonville, Fla., writes: "I enjoy reading it too much to let my subscription expire."

Mr. James Wilson, superintendent of the Canadian Pacific Railway Company's telegraph, Vancouver, B. C., in renewing his subscription for two years, says: "I am always pleased to receive my copy. You are turning out a nice paper, well worthy of the support of all telegraphists."

Mr. Alfred Weller, now of Laporte, Ind., a forty-niner of the telegraph, for many years previous to ten years ago manager of the Western Union Telegraph Company at Milwaukee, in renewing his subscription states: "I value the Age very highly, as it keeps me in touch with the electric world."

Boston Should Honor Morse.

The Charlestown, Mass., Enterprise in a recent article strongly recommends that the City of Boston erect a statue to the memory of Professor Morse, the inventor of the telegraph. After commenting upon the many statues erected in that city to the memory of warriors and statesmen the writer speaks of the many literary men, artists and scientists who have received no permanent public recognition in the city which they honored. Professor Morse was one of the most prominent among the latter and of him the article says:

"Among the many inventions of the last century none had a greater effect upon civilization or did more to make the world what it is to-day than the telegraph, with its elimination of space and time. As the inventor of the modern telegraph, the man who first made possible the practical sending of messages between points far distant, stands Samuel Finley Breese Morse, born in Charlestown fifteen years after the battle of Bunker Hill. The story of his life is no less romantic than that of any general or sea captain. Like them he fought his battles and won his victories, victories the importance of which can even yet hardly be realized. He began his career, as did his brother inventor Robert Fulton, as an artist, and in his struggles with the hardships and obstacles of the profession learned the courage and energy that stood him in good stead when he left the path of art for that of science. Enemies could not down him nor disasters dismay. Step by step he went on until he attained his goal and gave to the world the fruit of his labors, the first working telegraph.

"Congratulate the Monmouth judge on the birth of a grandson. Next Sunday he is to be loaded with names, not quite so many as the Spanish ambassador who signed the treaty of peace of 1783, but only four! As to the child, I saw him asleep, so can say nothing of his eye or his genius peeping through it. He may have the sagacity of a Jewish rabbi or the profundity of a Calvin or the sublimity of a Homer for aught I know. But time will bring forth all things." So wrote Dr. Belknap of Boston to Postmaster General Hazard in New York. The 'Monmouth judge' was Samuel Breese, and his grandson Samuel Finley Breese Morse, who was born April 27, 1791, in a house still standing on Main Street, near Hathon Square, Charlestown, figuratively at the very foot of Breed's Hill.

"The boy was fortunate in his parents. The father, Rev. Dr. Jedediah Morse, was pastor of the First Congregational Church in Charlestown, a man renowned for his 'astonishing impetus.' Daniel Webster spoke of him as 'always thinking, always writing, always talking, always acting.' A former Yale tutor, his school books gave him the name of 'the father of American geography,' while besides his preaching he established a religious periodical, the Panoplist, and a religious newspaper, the Boston Recorder. The Andover

Theological Seminary, the American Board of Foreign Missions and the American Bible Society are only three of the many institutions in the founding of which he played a prominent part.

"Very different from the sanguine, impulsive spirit of this man was that of his wife, the future inventor's mother, Elizabeth Ann Breese Morse. Of Scotch descent, a granddaughter of Rev. Dr. Samuel Finley, the Presbyterian president of Princeton University, she possessed the judicial mind that is the attribute of her race. The best of housewives, the wise provider of the parson's sparse income, her influence was no less than that of her talented husband in shaping her son's career.

"Finley Morse, as the young boy was commonly known, was the eldest of eleven children, of whom only three, however, survived infancy. His birth year, 1791, was a propitious one for the future telegrapher, for it marked the birth also of the great Faraday, and saw the experiments of Galvani, which led nine years later to the invention of the voltaic pile. One year earlier, Benjamin Franklin had died, himself born in Boston, a bare mile distant from Morse's own birthplace, the first great American electrician.

"The boy's first years were as uneventful as could be expected. When four years old he was sent to a dame's school kept by 'Old Ma'am Rand' in a small building a few hundred yards from the parsonage. Here Finley manifested his first artistic impulse by scratching with a pin a supposed likeness of his teacher upon a chest of drawers, an effort which the model so little appreciated that she gave the artist a very thorough rattanning. Later he attended Mr. Foster's school at Andover and in 1801 entered Phillips Academy in the same town. His attainments in general scholarship were remarkable, and at the age of fourteen he stood ready to enter the freshman class of Yale.

"In his college course, which lasted from 1807 to 1810, the boy formed his first attachment for the two presiding deities of his later life, art and science. On the Yale faculty at the time were Jeremiah Day and Benjamin Silliman, the former teaching natural philosophy and the latter chemistry. Both of these men dealt to some extent with the little known subject of electricity. Professor Silliman dissected and explained the different types of battery then in use, while his colleague conducted experiments to demonstrate the proposition of Enfield that 'if the circuit be interrupted the fluid will become visible and when it passes it will leave an impression upon any intermediate body.'

"Writing in 1867, nearly fifty years later, Professor Morse said: 'The fact that the presence of electricity can be made visible in any desired part of the circuit was the crude seed which took root in my mind and ripened into the invention of the telegraph.'

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIXEY

Sole Manufacturer

**Hudson Terminal, 30 Church St.
NEW YORK**

Western Representative

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

Among recent New York visitors were, Mr. E. J. Little, superintendent of telegraph of the Great Northern Railroad, St. Paul, Minn.

Mr. W. W. Ryder, superintendent of telegraph of the Burlington system, has been appointed general superintendent of telegraph of New York Central lines west of Buffalo, with headquarters at Chicago, taking effect January 1.

Mr. J. Beaumont, superintendent of telegraph telephones, signals, and electric light and power of the Panama Railroad, is spending some time in this country visiting friends and inspecting telephone train-despatching systems.

The many friends of Mr. William Kline, of Toledo, who, for over forty years past, has been superintendent of telegraph of the Lake Shore and Michigan Southern Railroad, will regret to learn of his serious illness, he having suffered a stroke of apoplexy.

The Gulf, Texas and Western Railroad is installing a telephone train despatching circuit on its line between Jacksboro and Benjamin, Texas, a distance of 105 miles. This is a new road, located to the northwest of Fort Worth and joining the Chicago, Rock Island and Gulf and the Wichita Valley railroads at Jacksboro and Seymour.

The Pennsylvania state eight-hour law having been declared unconstitutional, telegraph operators in that state employed upon the Erie Railroad have resumed the nine-hour day provided by the Federal statutes. Similar state laws in Texas and other states have been declared unconstitutional because of conflict with Federal laws.

In the twenty-third annual report of the Interstate Commerce Commission to Congress mention is made that the operation of the hours-of-service law has been carefully watched. The railways are required to make monthly reports of all cases where men work beyond the statutory number of hours, but a few companies have refused to do this and the question is before the courts. During the year 336 complaints of violation of this law have been received, the large majority of which have been settled by correspondence; but ten cases are being prepared for submission to district attorneys. Several of these cases are of two telegraph offices near together at the same station, one office being operated during the day and the other during the night. The roads claim that such stations are not one office within the meaning of the law.

The minutes of the meeting of the Eastern Division of the Association of Railway Telegraph Superintendents, held at Washington November 18, 1909, have been printed and distributed among the members. The discussion at this meeting, which occupies twenty-four pages, was principally in regard to the standard railway contract of the American Telephone and Telegraph Company, several representatives of that company being present to explain the features of this contract.

The document is a very interesting one and well worth the careful study of all railway telegraph officials. The matter of the standard contract was placed in the hands of a sub-committee, mentioned in our December 16 issue, which will present a report to the Western Division which meets in Chicago at the office of Superintendent Bennett, of the Chicago and Northwestern Railway, January 19.

Annual Report of the Block Signal and Train Control Board to Interstate Commerce Commission.

The annual report of the Block Signal and Train Control Board presented recently to the Interstate Commerce Commission contains some very interesting information. It shows that this board which was appointed in July, 1907, to investigate and report to the Commission upon the use of and necessity for appliances and systems for the promotion of safety in railway operation, has not been idle but has obtained much valuable data upon this important subject.

Extended inquiry has been made into the conduct of the manual block signal stations and the telegraph offices on a considerable number of the principal railways of the country; this with a view to gaining information as to the efficiency and character of the men employed in these departments of the railway service. Incidentally to this inspection, information has been gathered concerning experience with telephones on those roads which have introduced telephones in the place of the Morse telegraph for the communication of train orders from the dispatcher's office to the stations along the line; and in the next statistical report of block-signal mileage on the railways of the country it is proposed to include a statement of the mileage of road on which telephones are used for sending train orders.

This inquiry has afforded a large amount of information, leading to the conclusion that, in the employment and discipline of telegraph operators and signal men, the practice on many roads is open to grave criticism. Men lacking in experience; others having considerable experience, but lacking in character, and boys too young to have had satisfactory experience, have been found in all parts of the country. Bad methods have been found to exist in the running of trains on a number of single-track railroads, and in a few such cases the faults of practice have been such as to warrant the use of the term dangerous.

The report says that the time of the board during the past year has been taken up in examining plans, drawings, and models of inventions calculated to insure greater safety in travel, nearly all of which were lacking either in merit or novelty. Of 328 inventions of various kinds which have been examined, only twelve have been held by the board to be of sufficient merit to warrant conducting tests of them at government expense if satisfactory installations for that purpose are offered by the proprietors.

The Military Telegrapher in the Civil War.

PART XXXIII—CONTINUED.

The story of Captain W. G. Fuller's war-time career was begun in our January 1 issue, and in that number was related his experiences in West Virginia until December, 1861, when he was ordered to Kentucky. His story of subsequent events reads in part as follows:

"I reported to Brigadier-General D. C. Buell at Louisville, Ky., December 20, 1861, and was provided with a pass for myself and my men through the Union lines to Lebanon and points beyond. On my arrival at Lebanon I found it very hard work to organize an efficient building party and was obliged to send to Ohio for reliable men. I could not obtain any good teams, so selected some wild mules and set my men to breaking them. My foreman, W. L. Tidd, forbade the use of the whip in breaking and after a week of hard work we had two first-class six-mule teams. We also hired a team, with negro driver, from a doctor living near Lebanon.

"Two or three days after all of my arrangements were completed General G. H. Thomas arrived and I received orders to construct a line to Danville, Ky. We reached there January 4, 1862, and then were ordered to proceed to Somerset, Ky., via Stanford. The weather was very wet and rainy, and in consequence of the heavy army transportation the roads were badly cut up, and after we passed Stanford the wagons sank so deep in the mud that we had to corduroy the road before we could proceed. This, together with the army trains which frequently blockaded the road for miles, delayed us greatly in getting our material to the scene of operations. We finally reached Somerset January 19, and one of the first messages I sent from there was one from General Thomas to General Buell at Louisville announcing the defeat of the Confederates at Logan's Cross Roads, in which engagement the Confederate General Zollicoffer and Bailey Peyton were killed.

"The same day I received orders to return immediately to Lebanon and push the line south from that point. I started for Lebanon the next morning, leaving the following operators upon the Somerset line: A. Ellison at Somerset, James Meagher at Stanford, D. E. Martyn at Danville, and William H. Drake at Lebanon.

"On reaching Lebanon we at once started the line toward Campbellsville, Ky. Everything went well until we reached Pleasant Hill church, thirteen miles south of Lebanon, where we camped on the night of January 29. The next morning I started the builders to work and, leaving my pistols, fur cape and gloves behind, started in light marching order for Lebanon to get some funds that had been forwarded from Louisville for our use. I left orders for the camp party to remain where they were until about eleven o'clock, and then start forward, giv-

ing the builders their dinner as they passed them, this being our usual routine.

"On my way back from Lebanon after transacting my business there I met a cavalryman who reported that my whole telegraph party had been captured. The camp of the First Ohio Cavalry, the colonel of which, Mr. T. C. H. Smith, was an old friend of mine, being near by, I applied to him for aid and he at once started a force in pursuit of the raiders. We found that the camping party had been captured by a Confederate force under General John Morgan. They also secured all of my personal effects, including a new pair of boots, my fur cape and gloves, a field glass, and my revolvers, all of which General Morgan appropriated for his personal use. The building party did not learn of the affair until, their dinner failing to arrive, they sent back to learn the cause. Colonel Smith pursued Morgan for two days, but without result; at Green River he arrived on the north bank of the river just as Morgan left the south bank.

"This disaster caused several days' delay in my work. As soon as we could replenish our camping and commissary outfit we completed the line to Campbellsville and thence to Columbia. On our arrival at Columbia we discovered that a box supposed to contain instruments had nothing but battery materials in it, and as Morgan had captured my field instruments, we had none to open the office with. When General Boyle, who was in command at this post, learned of this he became very angry and abused everyone and everything connected with the telegraph, saying that the superintendent ought to be shot, etc. While he was raging I tested the wire and sent word of my trouble to Lebanon. A messenger was at once started with the necessary instruments. I then notified General Boyle that I would be ready to send any despatches for him as soon as the messenger arrived. The General at once came to my office and wanted to know how I could operate the wire and send for the instruments without any key. I explained the matter to him and sent a despatch to Louisville, receiving the answer on my tongue. The General at once said to me, 'You are too useful to shoot yet,' and from that time forth showed me every consideration.

"After two days' delay waiting for material, we started for Jamestown, Kentucky. This section of the country was infested with guerillas and we were shot at several times, but none of the party was even wounded. We reached Horse Shoe Bend on the Cumberland River February 10. On February 12 I received orders from Captain Samuel Bruch to return to Lebanon and build a line toward Cumberland Gap. The operators upon the line which I had just built were John A. Cassell at Jamestown and W. R. Plum at Columbia. The fall of Fort Donelson and Nashville about this time, however, rendered the building of this line of little value.

"February 24 I reported to Captain Bruch that I had my building party organized to build the

line to Cumberland Gap and asked him to ascertain how far this line was to go and to keep us in material. Brigadier-General George W. Morgan was about this time appointed to the command of the Cumberland Gap wing of General Buell's army, and as he passed us on his way to the front urged me to complete the line with all possible speed. We reached Mount Vernon March 11 and Rock Castle River March 12. Between this point and New London the country was completely stripped, having been occupied by both armies. The weather was wet, we were for two weeks without dry clothing and twice we camped in buildings which we afterward found had been used as smallpox hospitals, but all of my party escaped contagion. We finally arrived at London March 20.

"I then received orders to extend the line to Cumberland Ford. We extended the line about four miles and were then compelled to wait for more wire. I went back to Lexington, secured the needed wire and other supplies, and on April 5 we again started the line forward, via Colliers' Ford, to Barbourville and thence to Flat Lick, which place we reached April 20. On April 27 we reached Cumberland Ford and extended the line to the advance posts.

"May 3 a Confederate sortie from the Gap drove in our pickets and destroyed seven miles of our line. This was immediately rebuilt, and May 15, by order of General Morgan, we extended the line ten miles to Clear Creek, at the foot of Pine Mountain, where I maintained my headquarters for ten days. May 25 General Morgan ordered me to build a second line connecting Collins' Ford and Flat Lick, a distance of thirty-five miles, this time running seven miles north of Barbourville, the object being to get the line upon a road which was better protected. We then took down the first line through Barbourville and connected that place with the new line by a seven-mile loop.

"June 3 I received orders to construct a line from Barbourville to Lambdin's, near Roger's Gap, and we completed this line June 5. Cumberland Gap being occupied by our forces, June 19, 1862, I was ordered to complete the telegraph line to that place as soon as possible and take up the line which I had built to Lambdin's.

"Soon after this I was taken suddenly ill, and after a week of severe sickness, was much reduced in strength. General Anson Stager advised me to go home to Ohio and recuperate. I placed Charles Lehr in charge of the operators and D. E. Newton in charge of the line builders in that part of Kentucky, and was about ready to start for Ohio when the Confederate General John A. Morgan made a raid through Kentucky. This delayed my departure somewhat, but as soon as he had left the State I started for Cincinnati."

The remaining part of Colonel Fuller's manuscript, with its interesting detail, from this point has been lost. Referring to Colonel Plum's history, however, we find him again in active service, in February, 1863, at Memphis, Tenn., where

he had charge of telegraph operations as assistant superintendent under Captain Samuel Bruch. On October 27, 1863, he was commissioned by President Lincoln as captain and assistant quartermaster. He was afterward transferred to New Orleans and placed in charge of the Department of the Gulf, where he remained after the close of hostilities, rebuilding the lines in that section. He retained this position until he finally left the service in July, 1865.

Progress of the Telephone.

In its review of developments in the telephone field during the past year the *Electrical World* says in part:

"On the technical side of the telephone industry there have been no developments this past year of an epoch-making character. The industry as a whole has shown a healthy growth, and the manufacturers have been busier than during the preceding two years. They have, however, on the whole, contented themselves with bringing out improvements in design rather than any radical devices or changes. Such improvements must not be underestimated as of value in the art, as they are continually necessary in order that the cost of giving service may be reduced to meet the popular demands for lower rates.

"With the growing importance of the long-distance service there is a natural interest in factors likely to affect its efficiency. In this category falls the telephone repeater, announcement of the commercial attainment of which was made a year or two ago. The repeater principle was discovered in the early years of the telephone, but in spite of the fact that inventors were made well aware of its value through the sensational offering of an enormous but doubtful prize for a successful repeater, and in spite of a vast amount of work, their efforts were in vain. It therefore seems all the more strange that the successful apparatus should be but a refinement of the repeater first suggested. Improvements in the commercial repeater have not been very rapidly introduced, and it seems almost as if its progress will be as slowly accomplished as was the reduction of the first suggestion to commercial requirements. The reason for this probably lies in the very minute limits of mechanical and electrical action and the consequent difficulty of studying the factors. Thus far the repeater is strictly an intermediate apparatus adapted for permanent connection in a through line, it being necessary to adjust each repeater to the electrical constants of the the sections of the line on either side of it. The chief improvement thus far seems to have been an increase in the allowable unbalance of the two line sections."

A gentleman entering the executive offices of one of the telegraph companies recently asked to be directed to the office of the chauffeur of the company. He was accordingly taken to the general manager's office.

Mercadier's System of Telegraphy.

The Mercadier system of telegraphy by the use of vibratory currents, says a foreign contemporary, has now entered upon a very successful stage of development, since the tests which were carried on by the French Government with a view of using it on the existing telegraph lines in France. Messages were sent between Paris and Havre, Paris and Marseilles, and between Paris and Lyons, and from twelve to eighteen messages, and even more, can be exchanged on the line at the same time.

M. Mercadier, who is one of the leading engineers of the French Telegraph Department and director at the Polytechnic Institute of Paris, designed his system so as to work the transmitters and receivers upon vibratory currents. Each transmitter gives a current of a different pitch, corresponding to a musical note, and each of the selective receivers will respond to this particular note and to no other, so that the current can be exchanged between one transmitter and receiver without affecting the other instruments. In this way it is possible to operate a multiple system and to send a number of messages over the line at the same time.

At the transmitting end of the line there is used an instrument which is designed to produce the vibratory currents. When in operation the instrument sends into the line a vibratory current which is produced continuously. In order to make the signals, dots and dashes, or the impulses for working a printing telegraph, a key is used to give the make and break of the vibratory current just as for continuous currents. The vibrating device is based on the action of a tuning-fork, which is kept in constant vibration by an electromagnet. An electromagnet is mounted in a fixed position between the prongs of the fork. Each of the prongs carries a steel wire contact piece of 1-28 inch diameter, which is designed to make contact with a platinum plate mounted on an adjusting screw. One pole of a battery is connected to the electromagnet, and the other pole to the metallic mass of the interrupter, while the other end of the magnet is connected to the mass of the tuning-fork. When the fork is in the normal position there is a contact between each of the steel points and the corresponding platinum plate, but this causes the current to flow into the electromagnet, attracting both prongs of the fork at the same time, thus causing the fork to vibrate at a definite rate, corresponding, for instance, to the note *sol* in the musical scale.

Owing to the effect of the battery current, there is produced a magnetic field in the electromagnet core and also in the ends of the prongs lying next it. When the fork vibrates this causes the distance between the prongs and the iron core to be greater or less, and the magnetic field is alternately increased and diminished thereby. Such a fluctuation of the field reacts upon the wire of

the coil and generates in it an undulatory current whose rate of vibration is naturally the same as that of the fork—that is, if the fork represents the note *la*, corresponding to 435 vibrations per second, the resulting current will also have 435 undulations or periods per second—and experience shows that this current has very regular waves, such as are found generally in alternating currents. Such waves exist along with the direct current which comes from the battery. Owing to the fact that there is always a spark between the point and the plate, the current dies down gradually and in this way it has a regular wave form.

From each of the terminals of the fork device a wire is connected to the primary of a small transformer, so that the vibratory current flows in the transformer, and is given out at the same rate of vibration by the secondary of the transformer. The secondary is connected to the line through a contact key of the usual kind, and, in consequence, the vibratory current corresponding to that of the fork is sent into the line and into the distant receiving station. There are a number of tuning-fork instruments connected to the same line, but the tuning-fork of each one is selected to give a different note of the scale. Morse signals can consequently be sent from any one of the keys, and the current will go to the distant station, where the signals will be taken by a suitable receiver designed to be affected only by currents of a certain frequency. As it is well known that a number of alternating currents of different frequencies can be sent at the same time over a line without interfering with each other, it is evident that each key can send independent signals at the same time, and each message will be read in the corresponding receiver and in no other. Thus a number of messages can be sent over the line at the same time and these will be quite independent.

One of the most difficult problems to be solved in the use of a vibratory system of this kind is to find a selective receiver which will work properly on such currents. M. Mercadier uses for the purpose a vibrating device known as a *mono-telephone*. An ordinary telephone can be employed to take the messages by ear, but it would not serve for the present system, as it would respond to the signals of any pitch of the scale, and would not, therefore, be selective for a certain pitch. On the other hand, it is desired to have the device work as a relay, so as not to be obliged to take the message by ear, but to use a sounder in the usual way, or else a Morse register or a printing telegraph apparatus.

The action of the *mono-telephone* depends on the principles of vibrating discs, which sometimes give quite complicated effects. In the present case, however, the effect is a simple one, and is analogous to the well-known effects of vibrating cords, which will vibrate with different harmonics according to the conditions. Round discs—as, for instance, a steel disc—will also give musical sounds, but as they can be struck differently their

modes of vibration are more varied. Taking a case where the disc is about one twenty-fifth of an inch thick, and is acted upon like a telephone disc by an electromagnet giving a regular vibrating current, if such a disc is allowed to rest upon three points lying on the circumference of a circle concentric with the disc, the diameter of the circle being .68 of the total diameter, this circle is the nodal line for the first harmonic of the disc. In this position the disc can be made to vibrate in an analogous way to a string clamped at its centre, and the disc will give out a sound corresponding to this harmonic and no other, so that it only vibrates at a certain fixed rate, in the same way as a tuning-fork can give only a certain fixed note. A disc of this kind will furnish a high or low note according to its diameter, so that by using discs of various diameters, each in a suitable apparatus, a series of mono-telephones or selective receivers can be formed. A receiver tuned for the note sol will thus respond to currents of this pitch, but not to any others. A second mono-telephone tuned for the note la will receive only this note, and so on.

The design of the mono-telephone relay such as is used by M. Mercadier is as follows: Mounted in a cylindrical case is an electromagnet, properly supported on a base, while above it is the circular metal disc, which is separated from the magnet by a small space, as in a telephone receiver. In this case the disc is much thicker than the usual telephone disc, being one millimeter in thickness, and instead of being held around the edge it is laid upon a support, so as to hold it at three points on the circumference of a circle. This is carried out by metal pins the supports of which are free to slide in and out in a groove and upon a radial line of the disc. As there are different diameters of disc used for each mono-telephone, we can thus have the right adjustment of any disc upon such a base. The circle containing the three supporting points lies so that the diameter of the nodal line is .68 of the disc diameter, as already mentioned, so as to use the first harmonic of the disc. A series of discs are chosen so that the mono-telephones give a series of musical notes, and each mono-telephone is tuned to exactly the same note as one of the tuning-forks of the transmitters.

Supposing that at the transmitting end the keys are operated so as to work the various tuning-fork circuits over the line one after the other, the mono-telephone tuned for the note sol will give a loud sound when the waves from the tuning-fork sol are sent, but the waves from tuning-fork la would have no effect upon it, and the disc is not vibrated. Such an action is a very positive one, as when the note received falls short of the required note by only one-sixth of a tone the mono-telephone will not respond, so that the selective effect of such a device is very good. It is now necessary to use the mono-telephone as a relay, and make it open and close the contact of

a local circuit and sounder, etc. On the center of the disc is a small silver plate, and bearing on the plate is the end of a curved lever. To the end of this lever a special form has been given. The lever is mounted on an upright, and it works on a pivot so as to rise and fall, the weight on the disc being lightened by a counterweight and the lever is designed so that its own rate of swing is less than the vibration rate of the disc. There is a very small pressure between the lever and the disc, and this contact is used for the local battery circuit. In order to work the device properly there is mounted above the lever a tongue carrying a special felt washer, and by applying a suitably mounted set screw a very slight pressure from the fibres of the washer can be given upon the end of the lever. By this means the lever falls more quickly after it has been raised. When the proper vibratory current is sent in the coil, the disc sets up a strong vibration, and, as the lever (having a slower rate) cannot follow it, the lever is repelled upwards, and there is a partial separation between the two which results in an imperfect contact, so that the local battery current is broken. Thus when one transmitter key is worked currents are sent from the tuning-fork transmitter connected to that key over the line, and this current is received in the corresponding mono-telephone relay, whose plate is the only one to vibrate. Contact is thus made and broken for the sounder belonging to this mono-telephone, and the operator takes the signals made by the corresponding key. Owing to the fact that the vibrations do not interfere with each other, several keys can be operated at the same time, and the messages will be selected out by the corresponding mono-telephones.

By a device consisting of a combination of transformers and condensers, the current sent from the transmitters can pass out to the line, but cannot pass into the mono-telephones of the same station. Owing to this arrangement the transmitters of one station may be operated at the same time that messages are being received from the distant station by means of the mono-telephones, so that by employing six different frequencies six messages may be sent over the line while six messages are being received, making thus twelve transmissions at the same time and over the same line.

The range of the Mercadier system is considerably increased by operating it along with one of the usual telegraph systems which use a direct battery current. For instance, a duplex, quadruplex or sextuple Baudot printing telegraph, such as is commonly employed on the French lines, can be used along with the different Mercadier instruments which work on the vibratory system.

In the official tests which M. Mercadier carried out under the direction of the State Postal and Telegraph Department during the year 1907 between Paris and Havre, on one occasion there were used six Hughes printing telegraphs at each

end of the line, working upon mono-telephone relays, and at the same time a Baudot sextuple printing telegraph system using the ordinary battery current, making eighteen messages on the same line and at the same time. The messages were all received on the printing telegraphs without any difficulty. About the same results were obtained over a longer distance, working from Paris to Marseilles, and there is no doubt that the number of messages can be still further increased as well as the distance.

Further tests were carried on recently between Paris and Lyons, a distance of 525 kilometers, over a line consisting of a single wire and the earth, whereas telephonic circuits with double wires had been used for the preceding experiments. The tests were supervised by the French Telegraph Department and the best results were obtained with the following telegraphs working on the line: Six Hughes printing telegraphs working with vibrating currents, and one Baudot quadruple printing telegraph working with ordinary direct current.

In the course of these tests, Wheatstone telegraphs were, moreover, substituted for the Hughes telegraphs and they were worked on the line with perfect success, at a speed corresponding to emissions of one-fortieth of a second.

The Robert W. Martin Fund.

Since our previous acknowledgement in our December 16 issue, of contributions to the fund for the assistance of the well-known old-time telegrapher, Robert W. Martin, only a few contributions have been received.

The committee in charge of the fund consists of J. B. Taltavall, of Telegraph and Telephone Age; Charles W. Price, of the Electrical Review; T. Comerford Martin, of the National Electric Light Association, and T. A. McCammon and Fred Catlin, of the Western Union Telegraph Company, New York. All contributions should be addressed to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Mr. J. Rosenbaum, telegraph operator in the Southern Pacific Railway's office in New York, in sending \$2.00 to be added to the R. W. Martin fund, says, "Just a little Christmas cheer for our old comrade." Mr. Rosenbaum won third prize in the Madison Square Garden tournament in 1898, in the receiving class. He made a very fine record and is justly proud of it.

The amount received to date is: Previously acknowledged, \$566.25; J. B. Austin, \$5.00; John Boyle, \$5.00; P. V. DeGraw, \$5.00; Richard V. Oulahan, \$3.00; Herbert S. Wright, \$1.00; H. J. Staley, \$5.00; Ernest W. Emery, \$5.00; Edward A. Conroy, \$5.00; G. P. Howe, \$1.00; R. H. Prender, \$2.00; W. H. Allen, \$5.00; L. A. Leech, \$1.00; all of Washington, D. C.; J. Rosenbaum, New York, \$2.00. Total, \$611.25.

Obituary.

Hamilton McKown Twombly, the well-known financier and banker and a son-in-law of the late William H. Vanderbilt, died January 11, aged sixty-two years. Mr. Twombly was in 1877-78 a vice-president and director of the Western Union Telegraph Company.

Thomas D. Carroll, a well-known telegrapher of Pittsburg, died December 28, aged fifty-four years. Mr. Carroll learned telegraphy in Canada, where he was born, and in 1883 moved to Pittsburg, where he remained in the service until a short time before his death.

William B. Shaw, the dean of the Washington newspaper correspondents, died December 31, aged eighty-one years. Mr. Shaw was the first newspaper man to induce his paper to establish a telegraphic news service from Washington, this service being inaugurated by the New York Herald in 1856, when Mr. Shaw represented that paper.

Henry L. Shippy, for about forty years identified with the John A. Roebling's Sons Company and for the past twenty-five years treasurer and New York manager, died at his home in New York, January 2, after an illness of a year, which caused his retirement from active business. Mr. Shippy was sixty-four years of age, and one of the best-known men in electrical circles throughout the world. He was a man of most amiable disposition and attracted all with whom he came in contact. He was a great lover of the sea and yachting, and in the pursuit of this inclination formed a warm friendship with Lord Charles Beresford and Sir Thomas Lipton. He was always a prominent figure at Magnetic Club dinners and other electrical functions.

J. P. McLoraine, chief operator of the Western Union Telegraph Company at Philadelphia, died of anaemia December 31, aged forty-six years. He had suffered from this disease for some time, and realizing his condition, predicted that he would not live the year out. Mr. McLoraine was always loyal to his employing interests. He entered the telegraph service in 1876 as a clerk for the Franklin Telegraph Company at Philadelphia and afterward served as messenger for the Atlantic and Pacific Company and operator for the American Union Telegraph Company. After the consolidation of this company with the Western Union he was operator at Atlantic City and Chester, Pa., and test operator at Conowingo, Md. In 1882 he became connected with the Philadelphia office and has been employed in that place continuously ever since, serving as operator, night wire chief, all night chief, night manager and finally day chief operator, which position he has held since May, 1903.

Telegraph and Telephone Age is headquarters for telephone, telegraph and wireless books and cable codes. All orders accompanied by price filled promptly upon receipt. Write for catalogue.

Legal.

In an opinion rendered December 10, the Supreme Court of Michigan denied the petition for a writ of mandamus in the case of the American Telephone and Telegraph Company of New York against Secretary of State Martindale.

When the company applied to the Secretary of State for a certificate to do both telegraph and telephone business in Michigan under a single head, the request was refused by Martindale, as he held that such a procedure would be a violation of the laws of the state governing the admission of foreign corporations. The company refused to abide by his decision and applied to the Supreme Court for a writ of mandamus to compel him to issue the certificate. In refusing the writ, the court said:

"For more than a quarter of a century the legislature has seen fit to keep separate these two lines of activity. This course has been followed, too, during a period in which the telephone business of the state has grown from an insignificant enterprise to one of great magnitude. Wherever the telegraph line is, there, too, is the telephone. In the hands of the independent agencies, it may well be that a healthy competition for the transmission of information by electricity will ensue. We are of the opinion that the legislative enactments touching the question indicate a policy on the part of the state to afford its people a choice of two agencies of independent ownership."

In the United States Circuit Court of Appeals at Chicago recently, Judges Grosscup, Baker and Seamon decided that the federal hours-of-labor law, fixing nine hours as the day's work for a telegrapher in a railway office kept open continuously, does not mean that the nine hours shall be consecutive. This reverses a decision of the lower court given by Judge Landis, in the case of the Atchison, Topeka and Santa Fe, which was tried last April. It has been the custom on the Atchison for day operators to work twelve hours with three hours out at noon, and night operators twelve hours with three hours out at midnight. Judge Landis held this to be a violation of the law. Judge Grosscup says that the statute was enacted in view of the customs of the land, and that our customs do not include such an intermission as a part of the working hours. The case was remanded to the lower courts and a new trial ordered.

LETTERS FROM OUR AGENTS.**NASHVILLE, TENN., POSTAL.**

Mr. C. V. Maslin, a former Nashville boy, now in the cotton business at Dallas, Texas, was a recent visitor.

The employees of the company in the Fourth District, Southern Division, on Christmas day

surprised Superintendent and Mrs. Chas. B. Arrington with a very handsome china cabinet and presented to Mr. Arrington a walrus skin travelling bag equipped with toilet case. The fact that every employe contributed towards these remembrances is evidence of the high esteem in which all hold Mr. Arrington. The superintendent took occasion while the managers were in Nashville to thank each of them for their token of esteem, with a heart to heart talk which all highly appreciated.

Superintendent Charles B. Arrington inaugurated a year ago a conference of all the managers of his district embracing the States of Tennessee and Kentucky to be held in his office in Nashville once a year and pursuant to call these managers were in Nashville on December 27. The meeting was held in the office of Mr. Arrington in the afternoon and evening of that day. Mr. Arrington having given the managers notice of this meeting in advance and having requested that they bring memoranda of subjects, thoughts and suggestions for discussion, all came prepared with new ideas for presentation. The following subjects were discussed in detail; cleanliness of office inside and out, courtesy, promptness, efficiency, business getting, opportunity, condition of property, arrangement and operation of circuits, efficiency of wire service, cost of handling traffic, requisitions, charged account, competing companies, telephone companies, operation and maintenance of call box system, new offices, error sheets and cards, signs, changes in forms, traffic inspection, care of circulars and general orders, surplus stock, office reports, service changes, proper vouchers, etc. In addition all were invited to submit anything they had for general discussion. Several excellent suggestions were offered by the managers and discussed by Mr. Arrington. All who were present agreed that the meeting was a most excellent one from the standpoint of experience and knowledge gained and expressed a determination to "Get it all" at their respective stations and make the year 1910 the banner one in this district. Those present were F. S. Meek, Owensboro, Ky.; L. W. Jones, Louisville, Ky.; S. D. Howard, Lexington, Ky.; J. J. Downing, Frankfort, Ky.; A. P. Martin, Nashville, Tenn.; J. S. Greever, Chattanooga, Tenn.; J. J. Barnett, Knoxville, Tenn.; J. F. Wilson, Memphis, Tenn., and W. L. Meeker, Paducah, Ky., all managers. Mr. Chas. B. Arrington, superintendent, J. F. Livingston, chief clerk to Mr. Arrington and M. J. Herbolzheimer, district foreman.

SPRINGFIELD, ILL., POSTAL.

The employees of this office all enjoyed their annual banquet which occurred on Christmas Day at noon. For two hours the messengers and other employees feasted on turkey and other delicacies of the season, and after the dinner the messengers responded to toasts, which were very

expressive and to the point and showed their appreciation of the efforts of Manager Shute in their behalf.

Those present were: George H. Shute, manager; Mrs. G. H. Shute, Master Clyde Shute, John P. Troy, wire chief; Edward O'Connor, Associated Press operator; William A. Kenney, night wire chief; F. J. Moyes, operator; Miss Addie Withrow, desk clerk; Miss A. Cherney, bookkeeper; Messengers John Harrison, Raymond Melton, Joseph Creighton, Hazel Armstrong, Leslie Robinson, Earl Meyers.

PHILADELPHIA, POSTAL.

The sympathy of all in this office is extended to O. C. Balmer of Manager McNichol's office on account of the sudden death of his wife.

Night wire chief Zecher has returned after a weeks absence on account of the death of his grandfather.

Joseph Eder, is among those on the hospital list.

James W. Dunn, of the force in this office, died January 3, after a brief illness having been on duty the morning of January 3.

Harry Bell of this office died January 9.

OTHER NEW YORK NEWS.

The proceedings of the forty-third annual meeting of the Telegraphers' Mutual Benefit Association, held November 17, 1909, have been printed for distribution among the members. The report gives an itemized account of the financial condition of the association and shows the securities in which the reserve fund is invested, all of which are first class bonds and mortgages paying from four to six per cent on the investment.

William P. Sheridan, a well-known New York policeman, who was a telegraph operator before he joined the police force in 1886, was retired recently because of defective eyesight.

Philadelphia Electrical Aid Society Annual Meeting.

The twenty-second annual meeting of the Electrical Aid Society of Philadelphia was held Tuesday evening January 11. The following officers were elected: president, A. S. Weir; vice-president, Wm. R. Harinstad; recording secretary, W. E. VanArsdall; financial secretary, R. C. Murray; treasurer, H. W. Hetzel; executive committee, Frank E. Maize, George G. Wells, Mary McFadden, Nellie F. Hayes; trustees, George J. Wells, chairman, R. H. Conway, H. C. Leahy. Reports showed a total of 851 members in good standing. Sick benefits paid during the year amounted to \$2,919.00; death benefits, \$800.00; reserve fund, \$6,148.56. About 250 members were present and after adjournment of the business meeting a banquet was enjoyed.

Trade Publications.

Bulletin No. 1105, recently issued by the Western Electric Company, describes in detail their intercommunicating telephone systems and contains wiring diagrams necessary for the installation of these systems. Bulletins Nos. 1001 and 1002 take up the operation and construction of the Western Electric Magnetic Non-Multiple Telephone Switchboards with self-restored and manually restored line signals. These two bulletins are the first of a series of the switchboard bulletins which they will issue describing their newest and latest designs of switchboard and telephone apparatus. Among other publications recently issued by this company are folders describing their various types of portable telephones for railway service, the Gill Selector for train despatching and the use of the telephone in railway terminals.

Over 1,000 miles of telegraph poles in full blossom are to be seen in Uganda, Africa. The wires are strung from a species of fig tree which has extraordinary powers of germination.

Every telegrapher can own a home.—The Serial Building Loan and Savings Institution, of 195 Broadway, New York, has assisted more than a thousand telegraphers to save money and buy homes and will assist others who have a similar ambition. Address them at their place of business, 195 Broadway, New York, and they will tell you how you can own a home of your own by saving a small amount monthly.

Advertising will be accepted to appear in this column at the rate of fifty cents a line, estimating eight words to the line.

Will buy or sell, in one to ten-share lots, Western Union Telegraph Company and Mackay Companies stocks. Remittances by New York draft or express money order are requested. Address "Stock Investment," care TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. This renders the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Encouraging Facts for Students to Consider. A Few Secrets Revealed.

Possibly the greatest hindrance experienced in an endeavor to induce young men to take up a course of electricity, or in fact, any other scientific pursuit, is due to the self-belittlement on their part of their own capacity and an exaggerated estimate of the degree of general knowledge they magnanimously attribute to those who rise to distinction.

Now both of these conclusions are wrong. The fact is nearly every normal man possesses a potential energy and capacity far greater than he utilizes, while on the other hand comparatively few men of distinction are as gifted as the public at large believe them to be.

Emerson made no mistake when he said, "We have our Washington, our Napoleon, our Franklin, our Shakespeare, and other great men known to fame, but there never were such persons."

What he means is that their well-merited acts and achievements, viewed solely from a distance and disconnected from all other affairs of life, cause the public to associate large proportions to every other part or phase of their individuality and thus paint a picture with too glowing colors.

He then goes on to say that while he does not belittle their fame in the least, it is more than

likely that if we could meet them to-day and through daily association become thoroughly acquainted with their respective ways and habits of life, they would after all probably seem not much different from ordinary people, after full measurement was taken of every part. Hence the well-known saying, "No man is a hero to his own valet."

The student should therefore realize that in the pursuit of knowledge the gulf between him and his teacher is not nearly as great as he imagines and at once cease self-belittlement.

Don't forget that the world always takes us at our own estimate and one seldom rises above his own valuation.

In order to bring the merits and glory of honest achievements down to their proper level let us take, for example, the facts in the case of, say, a writer of high-class articles, or the authors of standard technical books of a scientific nature.

The student sees and reads the finished product and naturally jumps to the conclusion that the man whose head can contain so complete and accurate a knowledge of the multiplicity of subjects he treats must necessarily be blest with an abnormal craniological development.

By this magnanimous but erroneous measure he ascribes to such persons he belittles his own standing. The disparity between the two levels is not always as great as it at first appears. There are probably but few men whose ready knowledge is as voluminous as that indicated by the contents of their books.

It should be readily realized that while an author may temporarily possess accurate information and knowledge concerning each subject singly at such time as his mind is centered solely thereon, it does not by any means follow that he is as familiar with all the subjects all the time.

Neither should he be credited with being the originator of all the information the book contains. Much of it is merely compiled matter and as old as the hills, but being necessary links in the chain, is retold in different words.

What an author really deserves credit for, and that upon which his glory principally depends, is the incorporation in his work of an originality of some kind. It may consist of either or all of the following features:

Original ideas; new matter; a characteristic and comprehensive style of writing; the knack of building up to the objective point of a story or explanation by an easy step-by-step process; a unique arrangement of diagrams and style of drawings. At any rate, it must contain something which will immediately attract the eye and hold the reader's attention closely to the subject treated.

As to homage due the author as a master of

literature, measured by the graceful and fluent manner in which the words seem to flow from his pen, sometimes the less said the better. In fact, it would often be actually embarrassing to have the reader accidentally discover the waste-basket and see the mass of blue-pencilled, revised, and discarded "first copies" it contains. Nor would the author probably care to confess how much time he devoted to such revisions and corrections. Not for the world, would he deign to admit that possibly much of final lustre is due to the efforts of the editor or publisher himself, whose chief joy in life consists in discovering flaws in one's manuscript and after regilding the scar, flaunting his victory in one's humiliated face!

The same tendency to overmagnify the halo naturally due to the heads of all other exploits and achievements exists quite universally. The dazzling light itself is not necessarily too brilliant, taken as a measure of the value of such attainments, but it usually blinds the unaccustomed eye of the student to such a degree that he fails to see that it may possibly be made up of many parts representing the accumulative expended energies of many helpful lieutenants in the way of valuable assistance. The halo, however, invariably hangs over the head of the man whose name appears at the top of the list.

Hence, the lesson to be learned from these facts is that the world helps him only who helps himself, and that the actual distance intervening between Somebody and Nobody is not so great as to be unsurmountable by almost any one possessing ordinary intelligence and health.

The sole qualifications to attain success are persistence and a determination to do something. Then go right ahead and do it, but do it now. The hardest part of the proposition will be in making up one's mind to follow the advice given in the last three words of the previous sentence.

Recent Telegraph and Telephone Patents.

A patent, No. 945,023, for a telephone transmitter has been granted to S. A. Duvall, of South Bend, Ind.

A patent, No. 945,069, for a multiple telephone transmitter, has been secured by F. W. Wood, of Newport News, Va.

A patent, No. 945,293, for a lightning arrester, for telephone systems, has been awarded to William C. Shinn, of Lincoln, Neb.

A patent, No. 945,438, for an automatic telephone pay station, has been secured by Francis X. Bee, of Philadelphia, Pa.

A patent, No. 945,480, for a combination telephone instrument, has been taken out by A. L. Sohmn, of Whittier, Cal.

A patent, No. 946,287, for a lockout device for a telephone, has been issued to C. W. Throckmorton, of Pittsburg, Pa.

A patent, No. 946,372, for a keyboard telegraphic transmitter, has been granted to E. E. Kleinschmidt, of New York. A series of key bars, a series of selective bars with lugs in arrangements with telegraphic symbols, a series of wires moved by the lugs when a key bar is operated, one lug representing a dot and two dashes.

Patents, Nos. 946,380, 946,381 and 946,382, for a telephone meter system and apparatus, have been issued to R. H. Manson, of Elyria, Ohio.

A patent, No. 946,410, for a portable telephone transmitter and receiver or testing instrument, has been awarded to H. F. Thomas, Jr., and C. E. McGrew, of Chicago, Ill.

A patent, No. 946,418, for a combination switch and lightning arrester for telephone lines, has been taken out by S. W. Wood and E. T. Thomas, of Lookaba, Okla.

A patent, No. 946,528, for apparatus for telephone lines, has been secured by C. D. Enoch, of La Crosse, Wis.

The following patent has expired:—

A patent, No. 489,435, for telegraphy, held by Leroy P. Hotchkiss, of Oak Park, Ill.

Investigation of Telegraph and Telephone Companies in New York State.

The legislative committee of New York State, which is inquiring into the wisdom of placing the telephone and telegraph companies under State supervision has held several sessions in New York during the past two weeks.

Colonel Robert C. Clowry, president of the Western Union Telegraph Company, was one of the witnesses.

E. C. Page, counsel for the committee, who was doing the questioning, asked him: "Would the ability to transmit at a uniform rate of 1,000 words a minute have an effect on the rates?" Colonel Clowry replied that it would if the company was sure of having enough business to keep up that speed on a twenty-four hour basis. He said that while newspaper offices sent their matter by code abbreviation the company could not do that with regular messages. It was and had been for twenty-five years very common to deliver messages in some cities and villages by telephone. The company objected to having the filing time put on as that would mean a great increase of cost on the 80,000,000 messages annually, without any increase of revenue. He never had known why it was that the practice of sending addresses and signatures free had ever been instituted. The average cost per message was 28.5 cents, and the average return 34.1 cents.

"What have you to say," Mr. Page asked, "of Governmental or State control or regulation of corporations of public utility?"

"I have had no experience with it," Colonel Clowry replied; "I don't object to it if it is reasonable."

Mr. Page asked Vice-President Thomas F. Clark, of the Western Union Telegraph Company, why the company's accounts were not so kept as to show due credit to the States as to business within them and business between them, and particularly with reference to New York. Mr. Clark said that Mr. Page's proposal would not be fair, as in that event "New York would get all the sirloin and the other States the chuck steak." It was money from the other States that made it possible for New York to get as much as it does, he said.

Mr. Clarence H. Mackay, president of the Postal Telegraph-Cable Company, was also a witness before the Committee. As part of his testimony, Mr. Mackay made the following statement:

"I wish to say that the Postal Company has been free and independent from the time of its organization, in 1886, and purposes to remain so. It has not the slightest influence or control over the American Telephone and Telegraph Company or the Western Union Telegraph Company. It took no part in the recent purchase of the Western Union Telegraph Company by the American Telephone and Telegraph Company and was not consulted and knew nothing about it until after it had been accomplished. The Postal Company will now have to compete with both of them, instead of competing with the Western Union alone, as heretofore.

"The recent statements in the press that the change of name of the Postal Telegraph-Cable Company to Transcontinental Telegraph Company is a part of the combination is incorrect. Confusion has resulted from the fact that we have a company known as the New England Telegraph Company, while the Bell Telephone interests have a company known as the New England Telephone and Telegraph Company, with which company we have nothing whatsoever to do.

"We are proceeding now to change the name of our company, the New England Telegraph Company, to Postal Telegraph-Cable Company, so that the business may continue to be done in the Postal name. I would again say that there has never been a time in the history of the Postal company that it has not competed, and that competition will continue. We shall not take part in the combination, and we feel confident that we shall be able to retain our telegraph business, and even to increase it gradually by extensions and by good service.

"The Postal is the only company that has ever succeeded in competing with the old land line telegraph monopoly, and it has done so for twenty-five years. If the Postal Company were united with the telephone and Western Union there would never be another competing telegraph company, because no telegraph company can succeed unless it reaches every state and every important city and town, and not only would that require a vast sum of money, but it would be physically impossible.

"Between many of the important commercial centres, as, for instance, between New York and Philadelphia, it is impossible now to find another right of way on the highways for a through line. The Postal Telegraph Company will be the last competitor in telegraphy, and when that competition ceases there will be a choice only between monopoly and government ownership."

In reply to questions Mr. Mackay said that he considered eight per cent a fair net profit for a company after paying operating expenses, maintenance and all fixed charges. He also said that, though president of all the companies in the system, he drew no salary for his services, and that, allowing for cost of materials and work, for the fact that addresses and signatures are sent free and for the great distance covered, the service in this country was the cheapest in the world.

Personal.

Mr. Louis de Goll, president of the Rowland Telegraphic Company, Baltimore, was a recent New York visitor.

Mr. J. Frank Howell, formerly a well known telegrapher but for many years past in the brokerage business in New York, accompanied by his wife spent the holidays in Bermuda.

Mr. Bernard E. Sunny, president of the Chicago Telephone Company and vice-president of the American Telephone and Telegraph Company has been elected a director of the First National Bank of Chicago, the largest bank in that city.

Mr. Charles A. Tinker, formerly general superintendent of the Western Union Telegraph Company, New York, will leave February 3 for Empalme, Sonora, Mexico, where he will spend two months with his daughter, Mrs. W. T. Smith, whose husband is an official of the Southern Pacific Railway at that point.

Mr. J. H. Shearer, division operator on the Northern Central Railway at Elmira, N. Y., and a well-known old-time and military telegrapher, gave an address before the Young Men's Christian Association at Elmira recently upon "Reminiscences of a Telegraph Operator during the Civil War."

Colonel J. C. Reiff mentioned by George G. Ward in connection with the celebration of the Commercial Cable Company's twenty-fifth anniversary as sending the first paid message over the Atlantic cable system of that company being then connected with the firm of Woerishoffer and Company is still actively engaged in business being interested in the copper mining industry and having an office at 20 Broad St., New York. Mr. Reiff has been for the past thirty years engaged in a legal contest with the Gould estate over the patents for the Edison automatic system of telegraphy which he owned and sold to the Atlantic and Pacific Telegraph Company which was afterward absorbed by the Western Union.

Mr. Stephen D. Field, the well-known electrical engineer and inventor, of Stockbridge, Mass., was a recent New York visitor.

Dr. J. Emmett O'Brien of Scranton, Pa., is about to publish a book dealing with events in connection with the military telegraph service during the civil war. The book will be written largely from Dr. O'Brien's personal experiences and from the diary of his brother Richard O'Brien, who is assistant superintendent of the Western Union Telegraph Company at Scranton, and who was chief operator in the military telegraph service at Norfolk, Va. It will be well illustrated with pictures of many of those prominently connected with the military service during the war and with several maps showing the scene of operations.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. M. W. Hamblin, New York city superintendent, has returned to his office after a long illness.

Mr. William Finn, of the electrical engineer's office, sailed for England on January 22, to be absent for some time on business connected with the service.

RESIGNATIONS AND APPOINTMENTS.

Mr. A. F. Waitz, of the Houston office, has been appointed manager at Temple, Tex., vice Mr. W. B. Tyer, transferred to the position of chief clerk in the Houston office.

Mr. E. V. Easley, manager at Big Springs, Tex., has been appointed manager at Abilene, Tex., vice Mrs. J. M. Watson, resigned. Mr. F. R. Wallace has been appointed manager at Big Springs, to succeed Mr. Easley.

Mr. Fred G. Bromm has been appointed manager at Mount Clemens, Mich., vice Mr. J. Schanher, resigned. Mr. Schanher was well and favorably known to most of the telegraph officials who were occasional visitors at Mount Clemens.

Mr. O. L. Perry, manager of the Fort Wayne, Ind., office, has resigned after having served in that capacity at Fort Wayne for thirty-seven years. Mr. Perry expects to reside in the future in San Francisco.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

The funeral of Mrs. Isaac Smith, wife of the superintendent of tariffs, which occurred at her late home in Little Falls, N. J., January 16, was attended by many of the officials of the company.

A new and up-to-date office has recently been installed at Tacoma, Wash.

A new large and handsomely equipped branch office is being established by this company on West 30th Street, near Broadway, New York.

A patent, number 944,612, for an electro-magnetic punch, has been issued to F. E. d'Humy, assistant electrical engineer of the company.

Time signals from the Naval Observatory at

Washington, D. C., are transmitted at noon daily to all of the New York branches for the purpose of maintaining uniform time in all of the various offices of the company.

A circulating library is being established for the benefit of all employes of the company in Greater New York. The cost to members is ten cents per month. The library is located on the tenth floor, where books may be obtained at any time. A large number of instructive books are already on the shelves and others are being added daily. Vice President and General Manager E. J. Nally is encouraging the enterprise.

All of the superintendents of the eastern division, including Charles E. Bagley, of Philadelphia, Arthur L. Edgecomb, of Boston, Harvey D. Reynolds, of Buffalo, and Henry Scrivens, of Pittsburgh, together with the New York resident superintendents, met in the office of General Superintendent E. B. Pillsbury on January 29 to award the Mackay prizes to the managers and messengers for the past year.

Arrangements are being made to move into new quarters at Atlantic City, N. J. This, like all other new offices of the company, will be handsomely fitted up with a view to providing every possible facility for the prompt handling of business and the convenience and comfort of both patrons and employes.

The New York Telephone Company recently constructed and installed within ten days a new telephone switchboard for the executive offices. The board has a capacity of twelve trunk lines and seventy-six locals.

The company vigorously denies that there is any truth in the statement that the change of name of the Postal Telegraph-Cable Company to Transcontinental Telegraph Company has any connection with any plan for a merger with the Bell Telephone Company or the Western Union Telegraph Company. They state that the change of name is solely to enable their local company in New York State, known as the New England Telegraph Company, to transact its business in New York State in the name of the Postal Telegraph-Cable Company, and they ridicule the item which has been sent broadcast over the country that that simple change has anything whatsoever to do with the telephone interests or the Western Union interests. The Postal people say that they have been independent and will continue to be independent and that they have nothing to do with the telephone company or the Western Union and do not propose to have.

RESIGNATIONS AND APPOINTMENTS.

Mr. W. H. Stansell has been appointed manager at Wilmington, N. C., vice Mr. E. H. Bass. Mr. Stansell was for several years manager for the Western Union Telegraph Company at Johnson City, Tenn., but resigned that position to accept the managership of a steam laundry in that city. After nine months separation from the service, however, he decided to return to the work which was more to his liking.

The Cable.

According to its usual custom the Direct United States Cable Company distributed its desk calender pads at the beginning of the year. The familiar form is still adhered to and the new calender fills very acceptably the space reserved for its predecessors in so many business houses, offices, banks and other public places.

The negotiations between the British telegraph authorities and the Norwegian Department of Public Works resulted in an agreement that the cable line between the two countries should in the future be carried on by themselves, the British administrative authorities making the necessary agreement with the telegraph company for the sale of the cable at its actual value. It is the intention to reduce the rate from six cents to four cents per word.

Director Hefstye, of the Norwegian state telegraph system, has been in London for some time arranging the details of an agreement between the British and the Norwegian Governments for the establishment of a new British-Norwegian telegraph cable between Peterhead, in Scotland, and Egersund, Norway. On February 2, 1905, the two Governments agreed that the franchise of The Great Northern Telegraph Company should not be renewed after January 1, 1911, without negotiations between the two Governments for the establishment of a new line. The original franchise was given in 1869 and renewed January 1, 1881, for thirty years.

Lower Cable Rates for Canada.

The Hon. Mr. Lemieux, postmaster general of Canada, has had introduced in the House of Commons of the Dominion a bill having for its object the substantial reduction of cable rates charged by companies handling messages to and from Canada.

The bill proposes to place the control of rates for wireless and cable messages under the railway commission on the same principle as now obtains in the case of telephone and telegraph companies. It is expected that concurrent legislation will be passed in the British Parliament, enabling the Canadian law to apply to all messages received in Canada as well as those sent from Canada.

Pending the establishment of a state owned cable between Canada and the motherland, which is the ultimate object of the postmaster general, the present measure will go a long way toward securing the desideratum of cheaper cable rates. It is asserted the present rate of ten cents a word on press messages can be considerably cut down and still leave a fair margin of profit for the cable companies, which have now by agreement an arbitrary rate.

Mr. Lemieux believes that the rate for press messages can be cut down to six cents a word and the rate for deferred commercial or personal messages to twelve cents per word.

Municipal Electricians.

Mr. T. C. O'Hearn, city electrician of Cambridge, Mass., has asked for an appropriation of \$4,500 to repair the fire-alarm and police telegraph system of that city.

The police commissioner of Binghamton, N. Y., has recommended the installation of a police telegraph system in that city for the protection of outlying districts, which are not frequently patrolled by policemen.

Mr. Clarence R. George, city electrician of Houston, Texas, states that the new underground fire-alarm system which is being installed in that city will be adequate to care for the needs of a city of 300,000 population.

The fire-alarm and police telegraph system of Peoria, Ill., which has been in use for the past twenty-five years is in a badly dilapidated condition and City Electrician W. E. Wolgamott has recommended that a new system be installed at a cost of \$18,000.

Several important improvements have been added to the fire-alarm and police telegraph systems of Reading, Pa., during the past year under the direction of Superintendent W. C. Matthias. A red light system for calling patrolmen has been installed and the local battery police telephone system has been changed to a common battery system and a new switchboard placed in service.

At the annual meeting of the Gamewell Fire Alarm Telegraph Company, held January 18, the following officers were elected: W. H. Woolverton, president; William Gellatly, vice president and general manager; W. W. Bowes, treasurer, and Charles W. Cornell, secretary. The retirement of Mr. Joseph W. Stover from the presidency and active connection with the affairs of the company is viewed with great regret by his many friends. Mr. William Gellatly, who, in addition to his former duties as general manager, now assumes the vice-presidency of the company, is well known in telegraphic circles, having been prominently identified with the Western Union time service before becoming connected with the Gamewell Company seven years ago.

A conference of company agents was held at their executive offices, New York, on January 24 and 25, at which representatives were present from Seattle, San Francisco, Kansas City, Chicago, Cincinnati, Pittsburg, Boston and Montreal.

Mrs. Isabelle McMurray Freeland of Marion, Ohio, wife of Mr. J. W. Freeland, the well-known old time and military telegrapher, has recently issued a very attractive little booklet containing about sixty short poems of which she is the author. Among these are the two poems dedicated to Colonel Robert C. Clowry and Colonel William Bender Wilson, respectively, and read at the 1908 Niagara Falls reunion, and the 1909 Pittsburg reunion of the Old Time and Military Telegraphers.

The Telephone.

The Railroad Commission of Pennsylvania has directed its attorney to make an investigation of the telephone companies in that state in order that such recommendations as they may consider proper in regard to the control of these corporations may be made to the next session of the Legislature.

Some of the business men of Rochester, N. Y., are circulating a petition asking that the city government take steps to acquire the franchise of the Rochester Telephone Company and operate their system. This action has been taken as a result of a proposed increase in rates by the Telephone Company.

The British Post Office authorities have made arrangements, whereby letters posted in the provinces on Saturday, with a special superscription, may be telephoned to subscribers in the London district early on Sunday morning. A special fee of three pence per thirty words is charged for this service.

It is reported that Pittsburg will be the headquarters of the Continental Telephone and Telegraph Company, the recently incorporated \$50,000,000 concern whose object is to merge all of the independent telephone interests in the United States. This company, of which Mr. John A. Howard, of Wheeling, W. Va., is president, has already acquired the majority of the independent telephone plants in Pennsylvania and some other Eastern States.

The receivers and re-organization committee of the Illinois Tunnel Company of Chicago have authorized a plan to expend \$2,500,000 in establishing an independent telephone system in Chicago. The Illinois Tunnel Company holds a franchise to use the streets for the purpose of establishing a telephone system but the franchise becomes void if at least 20,000 telephones are not in service by June 1, 1911. As soon as the financial plan is approved by the courts work will be started. An automatic system will probably be installed.

Mr. Wilson S. Chapman, secretary and treasurer of the Central Union Telephone Company, Indianapolis, is one of the pioneers in the telephone business as well as being formerly in the telegraph service. Mr. Chapman was born at Tiltonville, Jefferson County, Ohio, August 20, 1842, and first entered the telegraph service at St. Louis in 1862 as clerk in the United States Military Telegraph Corps, later becoming cashier and serving with that organization until the close of the war. He then acted as supply agent for the Western Union and later chief clerk in the office of the general superintendent at Chicago where Colonel Robert C. Clowry occupied that office. In 1879 when the Bell Telephone Companies were being organized he became secretary and treasurer of the Western Telephone Company, afterwards the Central Midland and finally the present Central Union Telephone Company. This position he has occupied continuously to the present time.

The Western Telephone and Telegraph Company, a subsidiary of the American Telephone and Telegraph Company has sold \$10,000,000 of five per cent. two year notes the proceeds of which are to be used to refund the floating debt of the company which is held by the parent concern. The notes were offered at 99½ and found a ready sale. The Western Telephone and Telegraph Company is a holding concern owning eighty per cent. of the stocks of the Northwestern Telephone Exchange Company of Minneapolis, the Southwestern Telephone and Telegraph Company, the Wisconsin Telephone Company, and the Cleveland Telephone Company.

Among the recent New York visitors coming here in the interest of the telephone service were: Mr. E. C. Bradley, vice-president and general manager of the Pacific Telephone and Telegraph Company, San Francisco; Mr. B. E. Sunny, president of the Chicago Telephone Company, Chicago; Mr. W. T. Gentry, president of the Southern Bell Telephone Company, Atlanta, Ga.; Mr. H. J. Pettengill, president of the Southwestern Telephone and Telegraph Company, Dallas, Tex.; Mr. C. S. Gleed, president of the Missouri and Kansas Telephone Company, Kansas City, Mo.; Mr. L. G. Richardson, president of the Central Union Telephone Company, Indianapolis, Ind.; Mr. B. L. Kilgour, vice-president and general manager of the Cincinnati and Suburban Bell Telephone Company, Cincinnati; Mr. E. B. Field, president of the Colorado Telephone Company, Denver; Mr. J. F. Caldwell, president of the Cumberland Telephone and Telegraph Company, Nashville, Tenn.; Mr. C. E. Yost, president of the Nebraska Telephone Company, Omaha; Mr. G. E. McFarland, president of the Iowa Telephone Company, Des Moines; Mr. N. C. Kingsbury, president, and Mr. B. W. Trafford, vice-president and general manager of the Michigan State Telephone Company, Detroit; Mr. E. D. Nims, president of the Pioneer Telephone and Telegraph Company, Oklahoma; Mr. H. B. Lane, president of the Rocky Mountain Bell Telephone Company, Salt Lake City; Mr. A. Burt, president of the Wisconsin Telephone Company, Milwaukee; Mr. F. H. Bethell, vice-president of the Bell Telephone Company of Pennsylvania, Philadelphia; and Mr. J. N. Keller, vice-president of the New England Telephone and Telegraph Company, Boston.

All of those mentioned, together with Mr. Edward J. Hall, vice-president of the American Telephone and Telegraph Company; Mr. H. B. Thayer, vice-president of the American Telephone and Telegraph Company; Mr. U. N. Bethell, vice-president of the New York Telephone Company; and Mr. C. G. Du Bois, controller of the American Telephone and Telegraph Company, left New York Friday morning, January 28, to spend the week end as guests of Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company, at his country home at Lyndonville, Vt.

Mr. E. G. Tillotson, president of the Cuyahoga Telephone Company, Cleveland, Ohio, has resigned and will be succeeded by Mr. Charles A. Otis, a well-known financier of Cleveland.

According to the terms whereby the Continental Telephone and Telegraph Company will obtain control of the Rochester Telephone Company, the Continental Company pays \$100 per share for 3,000 shares of stock in the treasury of the Rochester Company upon condition that they also be given the privilege of buying 1,000 shares of the outstanding stock at \$30 per share. This will give them 4,000 shares of stock out of a total issue of 7,894.

Press Association Changes.

Two new press associations, with headquarters at 200 William Street, have been organized recently. One of these, the International News Service, supplies reports for morning papers, and the other, the National News Association, supplies reports for the evening papers.

Simultaneously the Hearst News Service, the American News Service and the Hearst Syndicate have ceased to exist.

S. S. Carvalho is president of the International News Service and E. H. Clark of the National News Association, and the two new organizations have as their general manager Richard A. Farrelly, who had been general manager of the three old organizations since the retirement of Curtis J. Mar from that position.

General Mention.

The thirty-second annual ball of the Boston Telegraphers' Mutual Aid Association occurred in that city January 28. Like the preceding occasions of this nature it was a great success.

The International Bureau of the Telegraphic Union, Berne, Switzerland, has recently issued a new list of the telegraph offices of the world. They have also prepared a map showing the telegraph cables and lines of the world.

At the annual meeting of the Atlantic Telegraph Company, held January 12 at Portland, Me., the following officers were elected: Dr. Seth C. Gordon, Portland, Me., president; John J. Hogan, Lowell, Mass., vice-president; and Howard Winslow, Portland, Me., clerk.

The sixth annual meeting of the Wood Preservers' Association was held at the Auditorium Hotel, Chicago, January 18. A large number of papers bearing upon different phases of the subject of wood preservation were presented for the consideration of those present.

Trade Notes.

The total sales of the Western Electric Company for the fiscal year ending November 30, 1909, amounted to \$46,000,000, as compared with \$33,000,000 for the preceding year.

Among the recent publications issued by the Western Electric Company is a booklet describing their latest type of magneto telephone set.

Press Rates in Canada.

On November 15 the Canadian Railway Commission held a hearing at Winnipeg of a complaint of the Western Associated Press against the Great Northwestern Telegraph Company and the Canadian Pacific Railway Company's Telegraph regarding rates. The Western Associated Press is a combination of the Winnipeg daily papers, which does not take the report of the Associated Press, but gets specials from St. Paul and other points addressed to the "Western Associated Press." These they distribute to the different papers. On this incoming matter they claimed that they were entitled to the regular rate charged individual specials to single papers, instead of Press Association rate. The Board decided in favor of the telegraph companies on this point.

In order to offset to some extent the expenses incurred by the Winnipeg papers in getting specials from the United States, they arranged to forward these despatches to certain other papers at different points in Western Canada. At first the telegraph companies charged regular newspaper special rates on these despatches, but later on agreed to handle a daily service to certain papers for a specified number of words at flat rates. These rates were the same as those for which the Canadian Pacific Railway Company were supplying regular Associated Press despatches at different points in the same territory but with this exception that the Associated Press service was not limited to any number of words. The contention of the Canadian Pacific Railway Company was that it bought and owned the news of the Associated Press throughout Canada and sold it at different points to newspapers at certain rates, that these rates were not for carrying the despatches, and they could even give away the press news free if they so desired; but that for the Western Associated Press the charge was a carrying charge. The Board has decided that these weekly and monthly flat rates, which have been in use throughout Canada for thirty-five years or more, are in violation of the tariff clause of the Railway Act and has prohibited their further use and instructed that a tariff of tolls must be filed not later than February 1 covering this class of work.

The result of this decision will mean that the newspapers throughout the whole of Canada (which have been enjoying exceedingly low rates on their Associated Press despatches) will have their expenses very largely increased and they are expressing great dissatisfaction. The Winnipeg papers apparently never realized that their complaint might prove to be a boomerang.

Mr. A. H. Ginman, manager of the Marconi Wireless Telegraph Company's station at Siasconset, Mass., in renewing his subscription recently says, "We subscribe to numerous publications but I may add that Telegraph Age is the one paper that we feel we cannot do without."

Radio-Telegraphy.

A new wireless station equipped with the Bellini Tosi directive system has recently been constructed by the French Government at Boulogne.

A patent, No. 946,230, for a keyboard operating mechanism for type printing by wireless telegraphy has been secured by H. Knudsen and H. Barta of London, Eng.

At the Chicago Electrical Show, which began January 15 and lasted until January 29, the United States Signal Corps gave an interesting demonstration of the use of wireless, having two complete sending and receiving stations in use, one on the ground floor and the other on a Wright aeroplane which was suspended near the roof of the large Coliseum annex in which the show was held.

To prove his assertion, which was doubted by some that a high and widely extended aerial was not necessary for a wireless receiving station. Mr. E. N. Pickerill, manager of the wireless station on the roof of the Waldorf-Astoria Hotel, New York, recently received messages by connecting his receiving outfit to a typewriter in a large office building and using a nearby steam radiator as a ground.

Mr. Lee DeForest has been engaged for some time past in developing a telephone transmitter for use in connection with radio-telephony. The new transmitter is operated by direct current at 600 volts in series with a resistance. A water circulating system is combined with the apparatus which allows it to carry a current of two to four amperes without appreciable rise in temperature.

Rear Admiral Cowles, chief of the Bureau of Equipment of the United States Navy has recommended to Congress that wireless apparatus of the latest type be supplied to all of the new vessels of the Navy including torpedo boat destroyers and all auxiliaries. A shore station at Dutch Harbor, Alaska, is also recommended to connect with the station at Nome and thus enable vessels from Nome to California to keep in constant touch with the shore.

At the regular monthly meeting of the Wireless Institute of New York held January 5, Mr. L. R. Gleason presented an interesting paper upon "Measuring Instruments and Measurements in Wireless Telegraphy." Various forms of wave meters were described and discussed. Fleming's cymometer was described as representing a typical wave-length measurer, and the fact that its scales give direct readings of the three interdependent functions, wave-length, frequency and oscillation constant, was emphasized. It was also brought out that in this instrument the scale divisions are uniform, which characteristic allows equal accuracy in readings throughout the range of the apparatus, and renders calibration a simple matter.

A patent, No. 945,475, for an aerial for the transmission and reception of electromagnetic wave energy has been granted to Richard Pfund, of New York. A hollow structure poorly conducting with the energizing machinery located in and around its face and an aerial symmetrically supported from the top to earth connections symmetrically arranged around the base.

The New Zealand House of Representatives has authorized the adoption of regulations requiring passenger vessels to carry wireless telegraph apparatus. The New Zealand Government, however is standing out against the recent movement to connect up the Pacific Islands, Australia, and New Zealand by a system of wireless telegraphy, as they wish to await new developments in the art.

In a recent article in the "Physical Review" Mr. G. W. Pierce describes the action of various substances used as crystal rectifiers for electric oscillations. Anatase, an octahedral crystal of titanium oxide, was found to rectify very readily when subjected to a contact pressure of about two kilograms, giving much larger currents with a smaller applied voltage than carborundum. Extensive experiments with molybdenite showed that the rectification effect was more nearly perfect when one of the contacts between the molybdenite and the electrode had a high resistance. At a current of ten milliamperes the rectification was practically perfect, the current in the opposite direction being only about two hundredths of a milliampere. While it is generally believed that the rectification effect of this class of detectors is due to a thermo-electric effect the author brought out in his experiments with molybdenite evidence to show that in this case rectification could not be accounted for by thermo-electric action.

Patents Nos. 946,166, 946,167 and 946,168 for space telegraphy have been granted to J. S. Stone, of Cambridge, Mass. The first is for a power circuit, a sonorous circuit, a radiating system, and a circuit connected across the generator of the power circuit, including a condenser with a metal connection from one armature of the condenser to the frame of the generator. Protects electrical apparatus from excessive currents. The second is for developing waves by a plurality of oscillating circuits, each having a condenser and an inductance coil and in parallel with a spark gap, together with an elevated conductor having a plurality of parallel branches, each associated with a different oscillating circuit; also a circuit of large resistance and high unidirectional e. m. f. connected to the terminals at the spark gap. The third is for increasing the power factor of the primary power circuit. A space telegraph with a sonorous circuit, a discharger therefor, a power circuit and a transformer with primary connected to power circuit and secondary to sonorous circuit, together with means associated with the power circuit for increasing its power factor.

A Comparison of the Telegraph and Telephone.

BY D. B. GRANDY, ST. LOUIS.

As one who gives advice is always gratified when it is adopted, I am pleased to see the Age expand. The change of name is in line with the new policy, and better expresses the aims and ideals which the Age seeks to attain.

As an old telegrapher, I cannot but regret the passing of the telegraph. In the old days, before the advent of the typewriter and the various sending machines, it possessed a fascination such as no other occupation offered; a fascination which always lingered. And though the telegrapher might rise to great wealth and high position, as he frequently did, he never escaped that fascination, or forgot the associations of the days at the key.

I use the expression "passing of the telegraph" in its larger sense. Already it is far outclassed in mileage and importance as a means of communication by the telephone; and while I believe it will remain for an indefinite period an important factor in communication, its relative importance as compared with the telephone will steadily diminish.

For communications not requiring an answer, or to which a definite answer can be given in a few words, and for which the mail is too slow; for press telegrams over long distances; and for private leased wires, it could not, under present conditions, be dispensed with economically. But for communications for which a personal interview would be advantageous, or in which sentiment is a factor, and for press telegrams over short distances, where telephone transmission is distinct, the telephone is immeasurably superior, both practically and economically.

On a good telephone circuit of say not exceeding 250 miles, a reader at one end and stenographer at the other easily handle from 1000 to 1500 words in twenty to thirty minutes.

For railroad work, especially train orders, I was at first prejudiced in favor of the telegraph, but, with the safeguards used to insure correctness in the transmission of orders, the telephone is apparently answering every requirement of safety in this kind of work, and its use is rapidly extending.

With these facts in view, it would be a bold prophet who would, under present conditions, venture to predict the future. I believe the present distance limitations of telephone transmission will be steadily extended, with an accompanying improvement in all branches of the service. While the field of the telegraph is, and must necessarily continue, limited, that of the telephone is, apparently, absolutely unlimited, or if there are limitations, they are so vast that it is difficult to form a conception of them.

Report of the Chief Signal Officer of the United States Army.

The report of the chief signal officer of the United States Army, Brigadier General James Allen, for the year ending June 30, 1909, is an interesting document comprising twenty-eight pages and illustrated with a large-sized map

showing the cable and land lines of the United States Signal Corps in Alaska and the lines in Canada connecting therewith. The receipts of the lines for the year amounted to \$222,888, and government business to the volume of \$188,782 was handled. Because of the increasing business over the land lines between Valdez and Fairbanks it was found necessary to construct an additional line between these two points, a distance of 367 miles. Ten kilowatt wireless stations were established at Nome and Fort Gibbon, three kilowatt stations at Fairbanks, Fort Egbert and Circle, and one kilowatt stations at Wrangell and Petersburg. The wireless service has been so satisfactory that it is believed when a few contemplated improvements have been completed it will be possible to abandon a land line between Fort Egbert and Gulkana, a distance of 291 miles. This line is an especially expensive one to maintain. The amount appropriated for maintaining this branch of the army was \$285,000. \$236,368 was spent in improvements and extensions of the Alaska Military Telegraph and Cable System and \$145,578 in maintenance of fire control installations at seacoast defences. In extending these installations \$205,612 was expended. The report is very complete in its details of the work accomplished and shows the efficiency of this branch of the military service.

What Our Friends Say Regarding This Publication.

Mr. J. W. Atkins, manager of the Western Union Telegraph Company, Key West, Fla., in renewing his subscription for another year, says: "You are publishing a first class paper, full of both pleasure and profit to an appreciative mind."

Mr. S. B. Gifford, of Syracuse, N. Y., formerly and for many years superintendent of the Western Union Telegraph Company at that place, writes concerning this publication: "I am pleased to note the enlargement and steady improvement of the Age."

Mr. T. P. Masters, of Vancouver, B. C., in renewing his subscription, says: "I doubt if any publication is looked forward to with more interest than the coming of the 'Age,' and congratulate you on being the Editor of a publication of which this can be truthfully said."

Mr. Charles Shirley, assistant superintendent of traffic of the Postal Telegraph-Cable Company, New York, in renewing his subscription recently, says: "I have been saying a good word for the Age twenty-six years. I don't see how any telegraph man can get along without it."

Mr. Edward W. McKenna an old timer and military telegrapher, who has been prominent in railroad circles for many years and is now vice-president of the Chicago, Milwaukee and St. Paul Railway, in renewing his subscription recently, writes: "I find your paper very valuable in keeping me in touch with the associates of my early life."

The Ready Messenger

The quickest way to transmit a telegraph message from the wire to paper is

"VIA SMITH PREMIER."

This typewriter has for twenty years held first place with telegraph operators as the easiest and speediest "mill" to operate. The **New Model No. 10 Smith Premier** is even better suited to the use of telegraphers.

WANTED

Operators and Electricians to
know that

X-RAY

will positively prevent Eye-
Glasses from Steaming by
change in temperature. A pack-
age will last six months. Price
25 cents. Sample 10 cents. Send
to-day to the

X-RAY

191 Genesee St., Utica, N. Y.

"How to Construct a Practical Wireless Telegraph"

With illustrations, diagrams and fine copy
of the Codes. 25c.
A 2c. stamp brings our bulletin of wireless
supplies.

CHICAGO WIRELESS SUPPLY CO.
Room 52 Auditorium Office Bldg., Chicago, Ill.

Please mention *Telegraph
and Telephone Age* in com-
municating with advertise-
ments.

Any electrical or telegraph book
published for sale by *Telegraph
and Telephone Age*, 253 Broad-
way, New York.

EDISON BSCCO PRIMARY BATTERIES

No matter what your
battery requirements
are, EDISON BSCCO
PRIMARY BAT-
TERIES will give you
more efficient and re-
liable service, at a lower
operating cost, than any
other batteries you have
ever used.

Write today for booklet giving full particulars.

**SUBSCRIBE FOR TELEGRAPH
AND TELEPHONE AGE**

Telegraph and Telephone Age

Entered as second-class matter at the New York, N. Y., Post Office.

Published on the 1st and 16th of every month.

TERMS OF SUBSCRIPTION.

One Copy, One Year, in the United States, Mexico,
Cuba, Porto Rico and the Philippine Islands . \$2.00
Canada 2.50
Other Foreign Countries 3.00

ADDRESS ALL COMMUNICATIONS TO
J. B. TALTAVALLO, - Editor and Publisher,
263 BROADWAY, NEW YORK.
H. E. DUNHAM, Associate Editor.

CABLE ADDRESS: "Telegraph," New York.

Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

FEBRUARY 1, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

New Methods Will Benefit Operators.

The increase in the use of machine telegraphy and the probability that the telephone will in the future be used to a large extent in handling messages between points which are not far apart or between which the business handled is very small ought to be looked upon with satisfaction by the profession at large. The use of these methods cannot help but prolong the life of the operators and render the performance of their duties easier and pleasanter. At the present time a man working on a busy circuit in a large office has to remain at his desk for eight or ten hours at a time with, in many instances, a rest of only a half hour or even less. The position which he must assume when receiving is necessarily a cramped one, as he has to bend over to keep his ear close to his sounder in order to hear its sound above that of the many others which are in the same room. The necessity of assuming such an unnatural and unhealthy position for long periods every day for years cannot help but tend to shorten the life of the operator.

With machine telegraphy all of this is changed.

The attendant does not have to assume any fixed position in order to discharge his duties successfully. He can assume a natural position, and does not have to fear having to interrupt the sender every time he moves. In using the telephone, too, either in receiving or sending, the operator has his receiver held closely over his ear and can move about freely without any fear of interruption. In sending he can even stand if he desires, and thus change his position practically at will. He will thus be enabled to perform his duties with much less nervous, as well as bodily strain, than at present, and will live longer and enjoy better health in general.

Unfortunately, the younger operators, those who are now in their prime and are able to perform the strenuous duties required, do not realize this phase of the situation, but are rather inclined to view anything which tends to do away with the use of Morse as something which is going to take away their livelihood. That this view of the matter is not by any means the correct one has been shown in the case of the railroads who have adopted the telephone for train despatching. When this innovation was first suggested it met with much opposition on the part of the railroad telegraphers who believed that if the change was made they would lose their positions or be required to accept lower wages. As the new system has come into operation on many railroad systems, however, and the companies have shown no inclination to reduce the wages of their employees or to call in cheaper help to take the place of the telegraphers this feeling of hostility on the part of the operators has gradually disappeared and we find that some of those who were at first most opposed to the adoption of the telephone are now among its strongest supporters.

There is no reason why a similar state of affairs should not result in the commercial field. One of the principal requirements of the telegraph service is accuracy and this cannot be obtained except by employing in the service as good a class of labor as is now employed, even though machine telegraphy or the telephone come to replace the Morse operation of the wires.

Will Large Cities Always Exist?

A writer in a New Orleans daily comments editorially upon the claim put forth by some economists that there is no longer any need of people living in large cities; that because of the development of the telegraph, telephone and railway facilities and of long-distance power transmission our factories could be located much nearer the points where the raw material is produced and in this way a great saving effected in transportation charges. While admitting the truth of this part of the proposition, it is pointed out that on the other hand if this scheme were carried into effect we would have our entire population divided up into small communities each one engaged in one particular pursuit. In one town we would have nothing but cotton mill operatives, in another no-

one but shoemakers, and in another no one but steel and iron workers, etc. This would largely narrow the outlook and opportunities for everyone. It is by coming in contact with men who are engaged in other businesses than ours that we acquire a broader view of life and receive inspiration for our daily tasks. If we were constantly surrounded by those doing the same things that we were doing our tasks would soon seem to us mere commonplaces and the carrying on of one's labors would become merely a mechanical action and life would lose a large part of its interest. There are thousands of people living in New York who have to work long hours and under the most unfavorable conditions in order to make only the poorest kind of a living, yet these same people would absolutely refuse to go to the country or a small town if they knew that there they could have comfortable homes without working nearly as hard, but would not be able to see nearly as many people as they do now. In summing up the question it is evident that no matter to what extent telegraphic, telephonic or railway facilities may be developed the large city will always be a social necessity if not an economic necessity. Man's nature is essentially social and anything which tends to destroy this will be a step backward toward barbarism rather than an advance toward a higher degree of civilization.

Messenger Boys Do Not Become Tramps.

The statement regarding messenger boys being thrown out of employment by the telegraph and messenger companies and becoming tramps after they reach the age of eighteen, made by Mrs. Florence Kelly, Secretary of the National Consumers' League to the Legislative Committee Investigating Employers Liability and the Problem of the Unemployed, is arousing a storm of protest. Her statements are far from being correct. Mr. John C. L. O'Reilly, manager of the United District Messenger Company, New York, has written the following reply, which has been published in one of the daily papers:

"I am inclined to think that Mrs. Kelly has either been misinformed or did not investigate the matter thoroughly.

"I will admit that some messenger boys go astray, just the same as boys employed in other lines of business, but how many tramps are there to-day who never were messenger boys?

"Some of our most prominent men of to-day were messenger boys, and they are not ashamed to admit it. Andrew Carnegie, for instance, will tell you that he worked for \$3.50 per week as a messenger boy. If you want to see some ex-messenger boys who are holding good positions at present pay a visit to Wall Street. There are about twenty members of the New York Stock Exchange who started as messengers. There are cashiers of brokerage houses, also of banks and commercial houses. There are many men holding public offices at Washington, Albany, and Boyst, James F. Crate, W. M. Gove and Morris in our own City Hall who were messenger boys.

One-third of our brave firemen and patrolmen were messengers.

"Time will not permit me to mention the names of men in all walks of life who were messenger boys and are not ashamed to admit it. The statement that boys were thrown out when they reached the age of eighteen is far from being correct. It is ridiculous. I have in my employ one boy who is under eighteen, all the others are over nineteen. I have never heard of a manager throwing a boy out because he was getting older.

"All officials of the telegraph and messenger companies have been messengers, and they are all over eighteen years of age, and have not been thrown out. Many of our newspaper men were messenger boys, and they are not tramps either.

"If boys do go astray and become tramps, who is to blame? Certainly not their employers. Sometimes it is the fault of the parents, who do not know how to bring children up. They never think of sending them to church or Sunday school, but they always manage to find time to let them attend some moving picture show or a dance hall.

"I was a messenger, and am over eighteen and am not a tramp."

How to Make the Telegraph and Telephone Systems More Valuable.

With the consolidation of telegraph and telephone interests the problem which confronts many of those concerned with the operation of these two great industries is how the two can be operated in such a way as to confer the greatest possible benefit upon each other. While some of the higher executive officials of the two industries are already actively engaged in studying this question there is no reason why those occupying minor positions should not also devote some of their energies to the solution of this problem. The men who are in the operating end of the business and are constantly coming in contact with the public often see opportunities for improvements in the service which would never be discovered by one who was studying the situation from a theoretical standpoint. The columns of *Telegraph and Telephone Age* are open to anyone in either the telegraph or telephone service who has suggestions to offer upon this subject. Many good ideas emanate from those engaged in handling the business at the smaller points and we will be glad to publish any of these for the benefit of the service at large, giving the author due credit therefor.

Mr. Willis H. Jones, the well-known author of the articles entitled "Some Points on Electricity," appearing in this publication for the past fifteen years, is the possessor of several very interesting scrap books containing samples of handwriting of those who were connected with the telegraph service thirty-five years ago. Some of these specimens, all of which are written on telegraph blanks, are fine examples of penmanship. Among the most noteworthy are those of J. F. Shive, Thomas J. Bishop, Robert W. Martin, Jerry Borst, James F. Crate, W. M. Grove and Morris Brick.

Anniversary Dinner of Serial Building Loan and Savings Institution.

The twenty-fifth anniversary of the founding of the Serial Building Loan and Savings Institution was most fittingly celebrated by a dinner held at the Hotel Astor, January 20, which was attended by over one hundred and thirty-five members and guests. After those present had enjoyed a most appetizing repast and coffee had been served, President John C. Barclay gave the following brief outline of the history of the organization:

"We are gathered here to-night to celebrate the twenty-fifth anniversary of the Serial Building Loan and Savings Institution. The thought, out of which this Association grew, had its inception in the organizing of the Telegraphers' Mutual Benefit and Gold and Stock Associations for the insurance of telegraphers and of the Aid Society for their assistance in time of sickness. To afford him an opportunity to save and to stimulate him to the effort to put away in a safe place for the rainy day or old age, that percentage of his earnings which every man ought to save, as a duty to his family, this Loan and Savings Institution was organized. It took five years of agitation and education to put the organization on its feet, as co-operative saving was at that time unknown in New York.

"That success soon attracted widespread attention in the city and many successful associations now doing business in New York, testify to the timeliness of its organization. During its twenty years of existence the Serial Association has preferred to do business for, with, and by telegraphers, although sound financial judgment from the outset decreed that its clientele should not be exclusive.

"Upwards of 5,000 people have been members of the Serial during the past twenty-five years, and 1011 persons are on its roll at this time. Those people have contributed in small systematic savings in sums of one to fifty dollars a month, or a total of over \$4,500,000. No man who ever entrusted a dollar to its safekeeping has received back less than a dollar, and over \$4,000,000 have been returned to those who have withdrawn. The Institution has never lost or misused a single dollar placed in its hands by a member and has, in fund, \$110 for every \$100 that is due our members. It has encountered two great general financial panics and one building loan panic, due to the errors of management in other similar institutions whose names are now lost to history. It did not close its doors for a single day and, thanks to the great confidence of the members in the Institution itself, we have met promptly their necessary demands upon us.

"Our investments are made solely on the security of first mortgage loans. These loans are made almost entirely upon homes occupied by members of the Institution. Over eleven hundred of these loans have been made, of which a great

number have been repaid by our systematic saving plan and their homes cleared of all encumbrance.

"In the early years of the association it was the aim of the Institution to have the members clear their homes of the encumbrance in ten years. This was found to be too great a burden, and the system has been gradually changed so that a member practically has the option of clearing his home in from twelve to twenty years.

"The Institution is still young and vigorous. We enrolled during the past year 87 members, more than we lost by withdrawal and maturity. We made a gratifying gain in new business, which speaks volumes for the future, and are bound to keep the old Institution in the front rank.

"The management of the Serial Building, Loan and Savings Institution is performing a noble work and deserves the recognition and support of every one connected with the telegraph and telephone companies, including the presidents and other high officials, not only because it stimulates saving and has been the means of providing many homes for its members, but also for the reason that seventy-five per cent of its members are employed in the telegraph service.

"I am proud to report that during my term of office the membership has increased considerably. Of course this growth has not resulted from my individual efforts alone, but the credit is largely due to the perseverance of our Secretary, Mr. E. F. Howell, the directors and their associates, as well as to the hearty co-operation of every member of the Institution. Mr. Howell is recognized as one of the best informed men in the United States to-day on matters pertaining to building associations, and it is to his untiring efforts, to his conservative methods and great knowledge of its affairs that the Institution is largely indebted for its position at the head of all associations of its kind.

"We are honored by the presence of a number of gentlemen, some of whom have been prominently identified with the Institution in the past and instrumental in laying the foundation for a success that every member should be proud of, and it is my privilege and pleasure to extend to these gentlemen the thanks of the Institution, not only for what they have done for it in the past, but also for the kindly interest manifested in honoring us with their presence to-night. Among these gentlemen is one I desire to mention in particular, one you all know, love and respect, because of his sterling qualities, of his kind and righteous dealings with all mankind, including his associates and employes when he was filling a high position in the telegraph service, and his devotion to all with whom he comes in contact to-day. To this gentleman our Institution, which has been the means of providing over eleven hundred homes for the families of our members, is greatly indebted, for he was one of the founders and its

first President. I feel it an honor to have later served the Institution as President and to share with him the pride he must feel in realizing that to-night we are celebrating the twenty-fifth anniversary of the Serial, and that it is on the road to greater success than it has achieved in the past.

"I refer to James Merrihew, and ask you to join me in a toast to his good health."

Mr. Merrihew spoke briefly upon his part in the founding of the Institution and the objects of the founders. He was followed in the order named by Mr. W. J. Dealy superintendent of the commercial news department of the Western Union Telegraph Company; Mr. D. B. Hutton, formerly president of the New York State League of Co-operative Savings and Loan Associations; Mr. C. P. Bruch, vice-president of the Postal Telegraph-Cable Company; Mr. R. H. Davis, Hon. W. L. Durack, Mr. U. N. Bethell, vice-president of the New York Telephone Company; Mr. T. J. Skuse, president of the Metropolitan League of Co-operative Savings and Loan Associations and former State Senator Walter C. Burton. All spoke in most favorable terms of the work of the Institution, and expressed the belief that the next twenty-five years would show much greater advancement and greater usefulness for the Serial than the past twenty-five. Mr. W. J. Dealy took occasion to pay a tribute to the ladies, many of whom were present, and ascribed the large measure of success of the Serial to their co-operation. He said that the association had not only built homes, but had built character among its members as well. Mr. R. H. Davis stated that he was celebrating the twenty-fifth anniversary of his entrance into the telegraph service, having graduated from the rank of messenger to that of operator at Virginia City, Nev., twenty-five years ago. While in that office he was often in charge owing to the incapacity of the manager, and one day Mark Twain came into the office for the ostensible purpose of paying a sum of money which he owed the manager. The characteristic way in which the well-known humorist told of his business convinced the young operator that he must be crazy, and soon after he left the telegraph to enter the newspaper field. That he has always kept in close touch with the telegraph, however, was evidenced by the many stories he told of the late John W. Mackay, Thomas A. Edison and others prominently connected with the service.

Mr. U. N. Bethell, in a very entertaining manner, contrasted the means of communication of to-day with those existing before the telegraph and telephone were invented. He expressed the hope that the recent tie formed between the telephone and the telegraph would grow closer and stronger in the years to come. He said that those engaged in the transmission of intelligence were concerned in the most important factor in our commercial life.

Among those present were the following:—

Miss C. L. Ames, Mr. and Mrs. W. E. Athearn, J. Austin, J. C. Barclay, U. N. Bethell, Mr. and Mrs. James R. Beard and daughter, George W. Blanchard, E. E. Brannin, T. M. Brennan and daughter, C. P. Bruch, T. A. Brooks, Mrs. H. P. Brown, W. C. Burton, E. S. Butterfield, W. H. Butterfield, John Schuyler Casey, P. J. Casey, Col. A. B. Chandler, Miss M. G. Charlock, J. F. Cleverdon, Fred Cleverdon, Martin S. Cohen, Miss Sophie Cohen, Mrs. F. Cudmore, Miss E. Currie, R. H. Davis, W. J. Dealy, Frank J. Dealy, John Doran, L. F. Dowling, Hon. W. L. Durack, H. E. Dunham, Mark L. Dunn, W. Diegan, Mrs. J. E. Esray, James T. Farrelly, Miss Maude Finley, Miss Emily Finn, Miss Adelaide Finn, A. V. Finn, Mr. and Mrs. T. E. Fleming, W. E. Fleming, Mr. and Mrs. Fries, Mr. George Griswold, W. L. Gechr, F. D. Giles, Mrs. Kate Gillier, Maxwell Green, Stanley Gross, Miss Haberstroee, Samuel Hecht, George B. Hewlett, Miss Higgins, William Holmes, Miss E. Holmes, Mr. and Mrs. E. F. Howell and daughter, Mr. and Mrs. D. B. Hutton, Henry Hyde, Miss E. Hons, Mr. and Mrs. G. Irving, W. H. Jackson, Chas. Jacobson, F. J. Kernan, Mr. and Mrs. C. A. Kilfoyle, H. A. Konninger, G. H. Kemp, J. T. Laidlaw, F. Cyrus Leubuscher, T. A. McCammon, Mr. and Mrs. G. F. McCammon, Mrs. E. McCollum, Mr. and Mrs. A. W. McEwan, Arthur L. McEwan, J. T. Mulhall, Mrs. M. Marker, Mr. and Mrs. R. J. Marrin, R. Matherson, James Merrihew, Mr. and Mrs. W. A. Moore, W. J. Morrison, W. J. Morrison, Jr., R. J. Murphy, C. R. Mignon, Mr. and Mrs. J. F. Nathan, Charles Neuman, Jr., Joseph M. O'Connor, Mr. and Mrs. M. J. O'Leary, Miss Organ, W. J. Quinn, Miss Elsie Rankin, W. E. Rath, Mr. and Mrs. M. W. Rayens and daughters, Mr. and Mrs. J. J. Riley, C. Smearer, Mr. and Mrs. J. B. Sabine, F. J. Scherrer, T. J. Skuse, Miss M. H. Snieder, Miss J. F. Spicer, George F. Stainton, Mr. and Mrs. Stanton, Miss L. H. Thain, J. B. Taltavall and daughter, Charles A. Tinker, Miss E. Tighe, J. B. Van Every, Leonard Van Every, and Mrs. Gertrude Welty.

That a telegram from the King of England to his eldest daughter should go astray seems unlikely, yet this happened to a message sent to the Duchess of Fife, the Princess Royal, who with the Duke of Fife and Princesses Maud and Alexandra recently left London for Egypt. At Marseilles the Duchess asked if a telegram for her had arrived from King Edward. The reply was that no such telegram had been received. The Duchess insisted that it must have come and a diligent search was made at the central telegraph office. This resulted in the discovery of a message addressed "The Princess Royal," which had been indorsed with the official formula stating that although the docks of Marseilles had been thoroughly searched this ship was unknown.

The Military Telegrapher in the Civil War.

PART XXXIV.

Mr. W. H. Eckman, who was well known to the telegraphic profession and who died in 1901, was a prominent member of the United States Military Telegraph Corps during the Civil War, joining the same in 1861 at Cleveland, O., at the age of sixteen, and serving throughout the war and until the disbanding of the corps in 1865. Throughout his connection with the service, Mr. Eckman kept a diary, and in 1878, when Colonel William R. Plum was compiling his history of the United States Military Telegraph Corps, he wrote for him from his diary an outline of the important events which came to his notice in connection with the military telegraph service. His letter in part is as follows:

"What I remember of the dial telegraph, which was used for a time in the military telegraph service, is as follows: In the Army of the Potomac it was in charge of Lieutenant Beardsley of the Signal Corps and was operated principally by non-commissioned officers of that corps. Their officers usually connected corps with division headquarters while the military telegraph lines connected Washington with the base of supplies, the headquarters of the army and the several corps headquarters. They were entirely separate and independent of us until after the battle of Chancellorsville. At that time winter quarters near Falmouth was in connection with headquarters in the field on the south side of the Rappahannock near United States Ford, the Signal Corps people having put up the wire (rubber-covered wire on small poles or lances), and it being turned over to Morse men between these points. The Signal Corps people then extended the line further towards the front to near Chancellor's house, where General Hooker remained during the battle. All business from Falmouth, where part of the staff remained, and from General Sedgwick, who crossed at Fredericksburg, lower down, came to us (James Murray and myself). We handed the messages to the signal people for retransmission. For the two days of the battle business was very heavy, and Harper Caldwell and C. W. Jaques¹ at Falmouth sent it to us so rapidly that we handed the signal folks as much matter every five minutes as they could transmit in an hour. We were obliged to send most of the messages to General Hooker by orderlies, half a company of regular cavalry being detailed for that purpose. The consequence was that the commanding general and his subordinate commanders became totally disgusted at the inadequacy of the Beardslee telegraph, and it was immediately after turned over to our people, that is Dennis Doren, our chief of construction, took charge of all the material and the operators were directed to report to him. The Beardslee dial system was never used to any extent afterward, but their men, under Doren's direction, put up field lines for us to operate and proved in this way a valuable auxiliary to us, especially in the campaign of 1864.

"I arrived at Washington December 26, 1861, in company with operators E. P. Alexander, and Daniel V. Ferris² and reported to Thomas T. Eckert for duty. January 12 I was assigned to duty at McDowell's headquarters at the Arlington House, relieving W. J. Holmes. Charles Douglas was in the office there with me. Two months later I was transferred to Fort Corcoran, opposite Georgetown, some of the operators there being ordered to hold themselves in readiness to accompany McClellan to the Peninsula. On April 7 I was ordered to the Alexandria, Va., office, where I found operators O. H. Dorrance and John McMullin. Later I started by water to join the Army of the Potomac on the Peninsula in company with Operators James B. Norris, H. A. Bogardus and W. H. Shreffler. We arrived at Ship Point April 18, where we all came near losing our lives by being run down by a steamer while crossing Cheeseman Creek in a row boat. On April 20 I was assigned to duty with George Nail at the headquarters of Richardson's division on the left of Yorktown. Yorktown was evacuated early on the morning of May 4, after heavy cannonading by both sides. The operators nearest to the place of course entered as soon as possible with the troops. D. B. Lathrop, one of our operators, had a leg blown off by a torpedo, the enemy having planted large numbers inside the works, and died in a very short time. Two of the operators were selected to accompany his remains to his home in Mount Vernon, Ohio, and a subscription started to erect a monument to his memory.

"On May 7 I was ordered to Yorktown, where I remained awaiting orders. Among other operators here were Thomas Dolan, E. H. McGintey, George B. Cowlam, Joseph Schnell and Andrew Schnell.

"May 10 Dolan and myself walked to Williamsburg, a distance of about ten miles, to find a break in the wire. We had the choice between walking and accepting horses without saddles or bridles. The commanding officer at Williamsburg refused to give his permission to our returning without escort as the country was infested with guerillas and an officer had been ambushed and killed the day previous. We finally concluded to take our chances and returned without a pass and without adventure, not meeting a living soul between Williamsburg and Yorktown. We found and mended the broken wire. May 26 I was ordered to White House and from there to the depot of supplies of the Army of the Potomac at Despatch station, arriving at the latter place on May 27. I was alone at Despatch station until June 1, when Theodore E. Moreland³, from Pittsburg, arrived to assist me. Business was so heavy as to keep me busy night and day. We were in the midst of the Chickahominy swamps and several operators had

(2) Daniel V. Ferris is at present chief operator for the Western Union Telegraph Company at Syracuse, N. Y.

(3) Theodore E. Moreland is now in the Western Union Telegraph service at Pittsburg.

(1) C. W. Jaques is in business at Asthabula, O.

gone home sick, making us very short-handed. The enemy's cavalry under Jeb. Stewart raided our rear between us and our base of supplies at White House on June 13 and our station was in great danger of capture for a few hours. The climate and surroundings soon had their effect upon me and June 20 I was too sick to do duty. Between then and July 3 we passed through the seven days' fight and retreated to Harrison's Landing. I was too sick to care whether I fell into the enemy's hands or what became of me. I was with the headquarters of the army after we left Savage's Station and made my part of the retreat in the headquarters' ambulance. The boys were very kind to me, especially Frank A. Stumm⁽⁴⁾, who was constantly making raids in the country we passed through in search of such things as I might be able to eat. At Harrison's Landing we had no wires and our operators were scattered around considerably, but not at all demoralized. I started for Washington on sick leave on the first steamer from Harrison's Landing, only two or three other passengers being on the boat as it was strictly against orders to permit any one to leave the army. Through the kindness of Chief Quartermaster Ingalls and the strenuous exertions of Harper Caldwell, our beloved Chief Operator, however, I was smuggled through.

"On August 4 I was back on duty at Aquia Creek, Va. J. H. Glazier was there with me and on August 24 we were joined by Thomas Dolan. August 31 Fredericksburg was abandoned by General Burnside, who concentrated his troops at Aquia Creek preparatory to going to Alexandria.

"September 1 Theodore E. Moreland, F. H. Fonda, C. H. Lithgow, J. L. Cherry, W. H. Parsons, and W. D. Gentry⁽⁵⁾ started for Washington, leaving only Doyle and Brodnacht Burnside's operators at Aquia Creek. On September 2 Shreffler and myself were assigned to duty at Chain Bridge, one of the defences of Washington, General Pope having been defeated and the enemy supposed to be making their way into Maryland. We had no supplies except what we succeeded in foraging. My associate, Schreffler, however, was an expert in the latter branch of army life.

"On September 12 I went to join the headquarters of the Army of the Potomac at Rickville, Md., McClellan being again in command and following the enemy towards Frederick. I was accompanied by C. H. Lithgow. We found Caldwell, Parsons, Cherry and J. H. Bunnell at headquarters.

"September 13 we all arrived at Frederick City, where I was assigned at the headquarters of the Army of the Potomac, with Caldwell and Bunnell. We there witnessed the battle of South Mountain. The telegraph corps builders under L. D. McCandless extended the line from Frederick City and we moved with the army as fast as the wire could be put up.

"By September 15 the line had been extended to a point near Boonesboro and we had established an office at McClellan's headquarters. We were then in communication with Washington. September 17, with McCandless I viewed the battle of Antietam from a splendidly commanding and comparatively safe position. On September 21 I moved with the headquarters and established an office one-half mile west of Sharpsburg.

"On September 28 I moved to a new headquarters, camp three miles west of Sharpsburg. The whole army, including the telegraphers, was by this time pretty well tired out, the fighting being very heavy and the telegraphing correspondingly so.

"On October 13 I was transferred to a new camp in Pleasant Valley and sent to General Burnside's headquarters, where I opened an office. While there I received a message from the War Department for General Burnside, offering him the command of the Army of the Potomac, which he declined and expressed the hope that McClellan who, in his opinion, was the best fitted for the post, would be retained.

"On October 17 I was sent to Charlestown, Va., to open an office, but the order was countermanded before I arrived there and I was ordered to General Couch's headquarters on Bolivar Heights, Harpers Ferry, to relieve Charles H. Lounsbury. While there I did not have much to do and made frequent calls on the operators at the Harpers Ferry main office, where Edward Conway and Charles W. Moore⁽⁶⁾ were located. I was next ordered to Sharpsburg, Md., to assist Thomas Dolan, and remained there until December 31, when I was ordered to Washington for duty in the War Department office.

"January 18, 1863, I went to the headquarters of the Army of the Potomac at Falmouth, Va. January 20 I started on horseback with my pocket instrument, for Banks Ford, General Hooker expecting to attack Fredericksburg from that point. This campaign proved a failure. It rained hard continually, entirely defeating the movement of artillery and wagon trains. Until a tent arrived, I had my office on a caisson which was stuck in the mud and abandoned. Lineman Joseph Finnegan and myself had to rough it in the fullest sense of the word, wagon or artillery trains knocking down our wire as fast as we could repair it, and we had to live on hard tack, and sleep with only blankets between us and the mud. January 24 I returned to the headquarters of the Army of the Potomac at Falmouth and thence went to Aquia Creek, where I was assigned to duty with F. T. Bickford and James Murray, relieving Theodore Moreland, who went away on leave of absence.

"On March 1 Operator Charles W. Jaques having resigned and R. H. Ryan being on leave, I was on duty at Aquia with Thomas Dolan. Two days later J. D. Tinney at Stoneman's Siding was

(4) Frank A. Stumm is now a resident of New York city.

(5) W. D. Gentry is now a clergyman residing in Chicago.

(6) Charles W. Moore is at present in the employ of the Western Union Telegraph Company at Omaha, Neb.

relieved by John H. Dwight, who had been detailed from Berdan's Sharpshooters and assigned to the telegraph corps. Tinney went on leave because he was caught napping by General Burnside himself, which so exasperated the latter that he placed him in confinement on a prison ship at Aquia. He released him, however, after a short time. March 8 R. R. McCaine was assigned to duty at the Aquia office and W. H. Shreffler sent to Falmouth Depot to relieve Frank Drummond, who left the service to return to his home in Canada. On the same day the Confederates made a raid on Fairfax Court House and captured Operator Robert F. Weitbrec.

(To be continued.)

(7) Mr. Weitbrec was confined in Libby prison during the remainder of the war. He is at the present time a railroad contractor and resides at Denver, Col.

Early Telegraphy in Belfast, Me.

An interesting account of the early history of the telegraph in Belfast, Me., is related in a recent letter by Mr. E. B. Pillsbury, general superintendent of the Postal Telegraph-Cable Company, New York, to Miss R. T. Newell, manager for the Western Union Telegraph Company at that point at the present time. Mr. Pillsbury says, in part:

"I acted as messenger at Belfast during the latter part of the exciting war period and later I was advanced to the proud position of manager at the age of thirteen, turning the office over to my sister Adelaide when I went to college.

"The original line, carrying one wire through Belfast, was built by the Maine Telegraph Company, which was chartered in 1848, and completed from Portland to Calais, via Belfast, in March, 1849; and the service opened with the late Hiram O. Alden, of Belfast, as president. It was doubtless due to his interest in the undertaking that Belfast was included in the route. This line was a link in the extension of the telegraph from Portland to Newfoundland for the purpose of forming a connection with the first Atlantic cable, which was then in contemplation and which was unsuccessfully submerged in 1855. Up to the time of the successful laying of the second Atlantic cable in 1866 it was customary every two weeks, when European steamers arrived in Halifax, to telegraph the European news from Halifax to New York and, while this long newspaper message of some three thousand words was being transmitted over the wire, the offices where the news was then copied were closed, the doors locked and the public telegraph business through the whole State suspended. At that time the speed of transmission was very slow as the majority of operators could not read the signals by sound but were dependent on the embossed tape. In 1856 the Maine Telegraph Company leased its property to the American Telegraph Company, and in July, 1866, the Western Union Company (a Western corporation)

leased the entire property of the American Telegraph Company. The first office in Belfast was opened in 1849.

"The first operator was William Henry Simpson, afterwards the brilliant and versatile editor of *The Republican Journal*. He was followed by Erastus A. Austin. Mr. Austin taught the art to my brother, Fred A. H. Pillsbury, and turned the office over to him in 1859. He held it until 1863, when he resigned in favor of my sister, Arabella F. Pillsbury, who had been in training but six weeks, and the responsibilities devolving on her were strenuous on account of the establishment of the Provost Marshal's headquarters in Belfast. She resigned in 1869 in my favor, and in 1870 I turned the office over to my sister Adelaide, who held it until 1881.

"The entire telegraph business of Belfast, Rockland, Bath, and the smaller towns, with Portland, Boston and the West, was transacted over the one wire built by the Maine Telegraph Company until the merging of a competing line, known as the International Telegraph Company, with the Western Union Telegraph Company in 1872 or 1873.

Your Part.

John F. Skirrow, associate electrical engineer of the Postal Telegraph-Cable Company, New York, is the author of the following which appears in the January number of the *Postal Telegraph*.

"Are you satisfied to drift with the tide, to idly wait for things to come your way, wondering meanwhile, perhaps, why they delay their arrival so long?

"Are the tools you use good enough for you because they are the kind your forefathers used?

"Do you consider your methods of doing business all right because your predecessor managed to get along that way?

"Do you see no use in wasting your time experimenting?

"If that's the way you feel about things in general and your business in particular you are not on the road to progress, achievement or success.

"If Watt, Stevenson, Fulton, Morse, Bell and Edison, and the tens of thousands of other originators had felt that way—what conditions would you be living and working under to-day?

"It doesn't follow that you must be an inventor in the patent office sense of the word to be a factor in the march of progress; a little thought given to your local problems may enable you to devise new or improve upon old methods, or to eliminate useless expense or work.

"Don't you think it's up to you to do your part towards improving the conditions in your field of action, so that your life will be of some real use in the great scheme of things; and so that you may feel when the time comes for you to depart that your efforts have helped to leave the world better than you found it?"

The Dispatcher's Telephone Circuits.

The telephone has now been in service on the Delaware Division of the Erie Railroad since February 15, last, and on the Meadville-Corry subdivision of the Meadville Division since April 1, and has demonstrated its utility in the most satisfactory manner. Its success on the divisions mentioned, one a double track division and the other single track, is largely responsible for the recent order to equip the Genesee River Railroad with the same apparatus, with a view of still further benefiting by its time and labor saving qualities. These two points in telephone operation have received a remarkable demonstration in the Meadville-Corry installation, where, in telegraph operation with the Mosier Block, the life of the despatcher was indeed strenuous with but ten offices to handle; while under telephone operation the ten offices are handled with ease and at the same time all concerned are kept in closer touch with the constantly changing situation. The rapidity with which orders can be handled under the same safeguards which apply to the telegraph and the almost total absence of labor connected with the selective calling devices fully justify the claims of the telephone engineers as to the superiority of their equipment.

Paralleling each train circuit is a message circuit. The latter shows to the better advantage on the Delaware Division, where the message business of about forty-nine stations and towers is handled with the vim and dash so satisfactory to the telegrapher. The Meadville Division message circuit, serving but ten offices, has little opportunity to show its capacity, but when telephone despatching shall have been adopted for the Corry-Salamanca subdivision the message circuit will probably be extended to Salamanca and more thoroughly prove its value.

While the telegraph has been a splendid system for train despatching it goes without saying that had the telephone and the selector been inventions of priority to the telegraph the latter never would have been used for handling trains. Long ago the telephone engineers claimed for their instrument many of the functions of the telegraph. But telegraph engineers, realizing the futility of speedy calling under code ringing conditions on circuits serving as many offices as division train and message wires do, raised that potent objection. Time has brought forth the selective calling device in many forms whose advantages far outweigh all the objections legitimately to be raised and thus the telephone takes the place to which by right of conquest, it is entitled.

The circuits referred to are almost identical in equipment, the only difference being that the Meadville-Corry despatcher's circuit is arranged with a break contact in the primary circuit of each station transmitter, the contact being

broken when the block signal blade is thrown to a "proceed" position, thus preserving the safety feature of the Mosier Block System by rendering the operator's transmitter dead except when his signal blade is at the "stop" position. This feature is operative without rendering the receiver useless, the operator being able to listen and hear all business transacted on the line. Otherwise a description of one circuit applies to all. The wires are 210-pound hard drawn copper throughout, transposed against the telegraph circuits on the same poles and against each other to eliminate induction and cross-talk; each station is equipped with a 7-wire test panel containing the four wires of the telephone circuit and two iron telegraph wires available for short patches in case of trouble on either telephone circuit; test panels protected by lightning arresters, which also protect the selectors which are of the series type. The instruments are of the desk stand type with special hook to support the special receiver with leather head-band. These instruments are still further protected by arresters.

The test panels are made up of 35 jacks in 7 rows of 5 each, two rows for each telephone circuit, one row for each telegraph wire and the seventh row for the ground. The jacks are numbered serially from 1 to 35 and each test panel is equipped with a full set of cords and plugs. Throughout the entire installation the same wires are invariably brought to the same numbered jacks so that the manipulation of the circuits, the tests, the transfer of instruments or selectors or both from one circuit to the other and the patches are effected under unmistakable directions by numbers from the Wire Chief at headquarters.

In the Delaware Division installation the message circuit is carried to the private branch exchange telephone switchboard at Susquehanna and Port Jervis and is available for communication between all points at both division terminals when not otherwise occupied by message work. This makes practicable a modification of the staff meeting as it becomes possible during the light business of the evening hours for the Superintendent to get several of his yard masters together, or for the Division Engineer to communicate directly from his own desk with his corps of Supervisors and thoroughly cover situations impossible to handle as well by telegraph.

On both divisions the wrecking trains have been provided with portable sets and line poles by means of which the wires can be reached from the ground and the Delaware Division through passenger trains are similarly provided. Thus entry into the field of communication is afforded in emergencies to those outside of the Telegraph Department. The great benefit to be derived by personal communication between the office and the foreman of the wrecking outfit or the conductor of a crippled express train or a

supervisor or a yard master is a distinct gain for the general service.

Troubles which oftentimes hamper and occasionally prevent communication by telegraph such as heavy and extended fogs, general rain storms, etc., are not felt on the telephone.—*Eric Railroad Employee's Magazine.*

Report of High Tension Wire Crossings Committee.

The Committee on High Tension Wire Crossings of the Association of Railway Telegraph Superintendents has prepared a report supplementary to that given at the annual meeting in Detroit, June 23, 1909.

The report in part is as follows:

"Preceding the presentation of any license or agreement form requiring specified methods of construction to be followed in the building of wire lines across the railroad at streets, highways or other public service crossings where the rights of all concerned are equal, it is necessary to emphasize the fact that the execution of any such agreement must be accomplished by conciliation, by reasoning, and by persuasion, until the time arrives when our laws shall compel adequate safety in the construction of such lines.

"The committee's investigations have covered the country East, West, North and South. The committee has inspected crossing plans of many forms, including bridges (which are too costly for universal use); cradles or baskets placed underneath the transmission wires and designed to catch them in case of rupture; short spans; etc., but has unanimously agreed upon the construction plans recommended in the Detroit meeting as best calculated to cover the diversified wants of the situation in all parts of the country. It has, therefore, no hesitation in affirming that the plan it offers will be less objectionable to the crossing constructors than any other known scheme, and, from its flexible composition, more easy of adoption through the readiness with which it may be modified to meet local details than any other plan of sufficiently comprehensive scope to cover all types of crossings.

The plan of agreement, with construction specifications, recommended by the committee for wire crossings over railroads consists of:

"1. Agreement form." (To be executed by the superintendent of telegraph, general manager or other designated officer.)

"2. Specifications for crossing, of the particular type to be constructed, to be attached to and made part of the agreement upon written identification by the superintendent of telegraph or other designated officer of the railroad company, and a designated officer of the electric company.

"3. Location drawing, showing in detail the railroad property to be crossed, and the plan of crossing, together with such modifications in the specifications as local conditions or inadequacy of the laws require; this drawing to be identified

in the same manner as the specifications referred to in item 2.

"The crossings are divided into six types—three for low voltages and three for high voltages; two of them underground and four aerial.

"The rules and regulations adopted by the National Board of Fire Underwriters, for the installation of electric wiring and apparatus, separate electric lines into three systems, viz.: Low potential systems, 550 volts or less; high potential systems, 550 to 3500 volts; and extra high potential systems, over 3500 volts.

"Trolley wire voltages made difficulties in adapting the Standard Code specifications line of demarcation between low potential and high potential voltages to the plans advocated by the committee, and, in order to not become involved in difficulties, unavoidable, were we to include the trolley circuits in the high potential classification, it was decided to include all voltages under 700 in the low potential system, and currents of 700 volts in the high potential class. Thus, specifications have been prepared (a) for undergrade crossings of electric wires carrying less than 700 volts; (b) for undergrade crossing of electric wires carrying 700 volts or over; (c) for overhead crossing of electric wires carrying less than 700 volts; (d) for overhead crossing of electric wires carrying 700 volts or over; (e) for overhead crossing of electric cable line carrying less than 700 volts; (f) for overhead crossing of electric cable line carrying 700 volts or over.

"The plan provided will secure in the crossing span of overhead wires or cables the strength sufficient to insure that it shall not fail from natural causes, as the factor of safety employed is sufficient to guard against any breakdown from load received by accumulations of natural deposits, or from load occasioned by wind pressure. The poles are to be located at such distance from the track as to insure immunity from damage by train derailments. Modifications to fulfill local wants, or in details to comply with opposition, are, when necessary, readily made by notation on Exhibit "B."

"Altogether the scheme is so comprehensive and yet so mobile that the committee believes it adapted to the uses of each and every railroad in the country; therefore it entreats your co-operation in securing its adoption by all the railroads of the association, and the resultant united effort for execution that will insure the greatest measure of impression upon the wire constructing companies and eventually upon the powers regulating such construction, of the necessity for bettered conditions, until finally regulation by law shall provide the necessary safety in construction methods which are not now possessed and which are so necessary."

Mr. C. H. Cadwallader, manager of the Western Union Telegraph Company at Detroit, Mich., in renewing his subscription for 1910, said: "I cannot get along without the Telegraph Age."

The Telephone for Local Message Work.

BY W. W. RYDER, CHICAGO.

Late Superintendent of Telegraph of the Burlington System, Now General Superintendent of Telegraph of New York Central Lines.

One success with a piece of mechanism usually suggests hope of another, and our experience on the Burlington System with the telephone as a substitute for the telegraph in train despatching early suggested to me that possibly we could use it to advantage on message circuits. Therefore, as soon as possible after securing a train despatching circuit, we provided a second circuit and equipped it with similar selectors, using the single set of telephones in common with the train despatching circuit. The results were far beyond our expectations, it being found possible to handle as high as 350 ordinary messages in a nine-hour day on a circuit cut into thirty-two offices, and of these messages one-third were Western Union, which are always repeated but only count as one message.

One reason we were able to handle so large a number of messages was the greater promptness of the operator in answering calls, the ringing of his four-inch vibrating bell (plainly hearable in the freight house or even outside the building) compelling his attention far quicker than the oft repeated telegraph call generally does. Then, too, the operator on a busy telephone circuit while finishing with one office puts out a call for the next one desired, and keeps right on working with the first office. The result is the second man is waiting when the first finishes.

So far as the actual transmission is concerned, our experience has been that as soon as the way station operators and the operators in the relay offices become acquainted with the slightly different methods of handling the business, especially in regard to reading the message in phrases—one phrase at a time, so that the receiving operator has the advantage of not only hearing each word spoken, but getting the sense of the message in addition—that ordinary business can be handled at the rate of one message per minute, and on the shorter ones sometimes a speed of two per minute can be attained. The average message, except where it contains hard names or difficult combinations of figures and letters, is not spelled out, but is read in phrases, a pause being made at the end of each phrase for the receiving operator to finish putting it on paper whether by pen, pencil or typewriter. In handling Western Union messages where more frequently hard names and code words occur, these are spelled out carefully, and in addition all Western Union messages are repeated back.

The question of the operators using pen, pencil or typewriter and the speed which they make is entirely dependent upon their individual ability to use their tools. We insist that the operators in relay offices be first class typists and hence they have a speed in receiving of not less than

sixty words per minute, while some of them run up to eighty words a minute.

Another interesting point is the fact that as in train despatching the telephone circuits frequently work through bad weather or other troubles where the telegraph is absolutely inoperative,—for instance, broken wires, crosses or grounds which would completely kill the telegraph often have little effect on the telephone circuit.

In cases of emergency the telephone provides a means of direct personal conversation between officials and others who oftentimes are not telegraph operators, thus giving a clearer and quicker comprehension of existing conditions, and at the same time eliminating the intermediate parties necessary for telegraph communication.

So great has been our success in handling the message circuits, that we are now endeavoring in every instance to secure a message circuit wherever we install a telephone for despatching. Frequently this is easily accomplished by simply using the abandoned train wire and the message wire, the only limitation being that of distance over which he can get satisfactory transmission, as the old wires are almost invariably iron.

With greater speed, at least equal accuracy, and ability to work the circuits through more unfavorable conditions, I feel the telephone scores again heavily over the telegraph and I predict a rapid extension of its use for message work.

[It will be interesting to note that the Burlington system now has in operation twenty-six telephone despatching circuits of a total length of 2,387 miles out of a total mileage of 8,948 for the entire system. The total number of stations thus equipped is 457. They also have twenty-five message circuits with a total length of 2,333 miles and 429 offices on such circuits. 2,287 miles of block wire with 474 offices are also equipped with telephones.]

Telegraph and Telephone Service in the Future.

BY HENRY W. POPE OF NEW YORK.

Making the telephone a feature of Telegraph Age was the obvious thing to do. The personal element of the telephone business should, in my opinion, receive the more attention because of the greater opportunities and promotions, the more frequent conferences between officials, closer relationship to each other and the public than is the case in telegraph circles.

I believe, and I have frequently so stated, that the existing telegraph methods will not be recognized in a few years, so marked will be the improvements in the collection, transmission and delivery of telegrams, and the industry will take on new fields of usefulness and become more a factor in business than ever. The time will rapidly approach when the large telegraph user will transmit and receive very generally his own telegrams, from special terminals, the universal keyboard making possible the trans-

mission and the reception or translation either through the employment of printing or automatic devices—the company simply making the switch and “hauling” the telegram. The messenger boy should long ago have been largely eliminated through the use of the printer, telephone or telautograph rather than kept or utilized as a by-product—to the delay and detriment of rapid transmission.

The possibilities of the telegraph seem to be too numerous to treat of within the limits of this article.

So, too, it may be said of the telephone business—the present standard of transmission will appear crude enough in a few years and there is the possibility of unexpected results by reason of these improvements. It is now possible with existing conditions within limited distances to outstrip the telegraph both in speed and accuracy, as stated in your issue of November 16. With improved transmission the speed will be beyond the capacity of any method of recording other than shorthand, and distance will not cut much of a figure. Every man's telephone will be a telegraph office, open continuously, with availability to obtain information as to all matters concerning the transmission or reception of telegrams. Small telegraph offices and existing duplications will become obsolete, by reason of these increased facilities and advantages and gradually disappear.

The telephone possibilities are considered twenty years in advance, so, too, will the telegraph be considered. Each interest will find its own field of usefulness, and with greater improvement in each, will follow the increased use. The telephone will handle the business of a more important and more instantaneous character; the telegraph will, in addition to its present class of business, eventually develop into communications of greater scope, closer to the lines of postal service.

The public should appreciate the possibilities of greater convenience, more rapid and more accurate transmission; that the telephone and telegraph are in the hands of the most progressive and aggressive men not hidebound by impossible theories nor so ambitious for wealth as to sacrifice or ignore the interests, requirements and necessities of the public.

The Telegraph of the Future.

BY PATRICK B. DELANY, NANTUCKET, MASS.

I think the time has come for a more comprehensive name for Telegraph Age and am glad to note that you have added the Telephone to your title. Its scope of survey in the past certainly entitles it to a more inclusive designation.

Not only do I think the telegraph will always remain “a factor in the transmission of intelligence,” but I am firmly of the opinion that it will be the principal medium of correspondence, except for short distances. Even if the telephone was perfect, and all users blest with faultless enunciation, the speed per wire of thirty words per minute, absence of record, faults of memory, delays and difficulties of getting correspondents together, and lack of secrecy, will always confine it to the place it now occupies. It may be used to advan-

tage for collection and delivery of telegrams in suburban and rural districts, and by repetitions can be made as accurate as telegraphy. The telephone will undoubtedly maintain its present rate of growth numerically for a long time, but it cannot in the nature of things carry an appreciable amount of correspondence between cities. It is expensive, but almost indispensable in emergencies, requiring quick exchange of views. In fact the conference feature is the only warrant for long distance telephony.

Morse telegraphy will continue to carry exchange and private wire business, but when it comes to general mercantile and social traffic and newspaper correspondence the machine method will surely get it all—owing to its great capacity, adaptability to all conditions of wire, weather and distance, its simplicity and independence of trained labor it can telegraph profitably at a rate seventy five per cent lower than the living rate for Morse telegraphy or the telephone.

The telegraph has never been developed, but it will be when a ten-word postcard for ten cents or a fifty-word message for twenty-five cents can be dropped in a distant postoffice within half an hour by wire, and when every business concern will put its correspondence in perforations on a tape in its own office, wire it and have it delivered at the distant station on tape in plain inerrant dots and dashes for private transcription by typewriter—100 words for twenty-five cents.

This service will develop correspondence by wire to an extent never dreamed of by the old companies and will make the telephone simply an adjunct of the telegraph.

Writers' Cramp Affecting Operator's Ability to Use Typewriter.

Editor Telegraph and Telephone Age:

Will you please give me the benefit of your experience and knowledge through the columns of your paper.

I am an operator of twenty years' experience, working a private wire for a Wall Street house, using a typewriter and a sending machine. I am considered first-class on both. Lately, however, I have been losing my grip. Strangely enough, it only affects me when typewriting. I experience no trouble whatever in sending on a wire, even for hours at a time, but it is torture for me to strike the typewriter keys, and it would appear to be only a question of time when it will be impossible for me to work on the receiving side of a wire. I have tried writing with a ball of paper in my palm, massaging with hot water and Omega Oil, and various other expedients, none of which seem to afford relief. Anyone who has experienced this trouble can appreciate what I am going through, and I write in the hope that you or some of your readers may know of a cure or remedy other than a long rest for my arm, which, of course, it is impossible for me to take.

An Old Subscriber.

Rapid Cable Telegraphy.

Few people realize the great amount of matter which can be handled by an ocean cable in a short time. The system of the Anglo-American Telegraph Company for handling their Stock Exchange traffic is a good illustration.

This system has been rendered necessary, says the London Electrical Review, owing to the difference in time between New York and London. The American Exchange opens at 3 o'clock by London time, and the London Exchange closes at 4 o'clock. There is, therefore, but one hour during which business is in progress in both exchanges simultaneously, and it is of first importance that intercommunication between the two centers shall be as rapid, reliable and unfettered as it can possibly be made, in order that the transaction of business may be facilitated to the utmost.

Accommodation in the neighborhood of the Stock Exchange in London is necessarily scarce and costly, and for this reason, the Anglo Company formerly occupied a small office in a nearby building. Recently, however, the manager, Mr. J. H. Carson, succeeded in obtaining from the Stock Exchange authorities accommodation within the Exchange itself, and developed the system to the highest pitch attainable.

The space at the disposal of the company has been divided into a decoding room and an operating room. The former is occupied by the decoding clerks of the firms utilizing the special service—necessarily a small number, on account of the limited space available. From this room pneumatic tubes convey the messages direct to the floor of the Stock Exchange or to Shorter's Court.

In the operating room the receiving and transmitting apparatus is arranged for duplex working, with Morse recorders, and communicates through repeating stations with Valentia, Ireland, whence the cable runs to Newfoundland and on to New York. In the ordinary course one set of apparatus is in use, the other being held in reserve, with operators at all four instruments.

The procedure is very simple. The telegrams are short, being prices as they fluctuate on the New York Exchange; all free matter in the preamble is cut down to the lowest limit, and the address in most cases consists of a single letter. As each message is received and written down by ear (the recorder being in circuit only for the purpose of providing a permanent record) it is instantly handed to an attendant and passed rapidly through to the decoding room, whence it proceeds within a few seconds to its final destination. Two receiving operators are necessary at each instrument, as the loss of time in changing the carbon with which a duplicate is made would introduce delay—the instant that one message is through, the second operator commences taking down the next message, and this goes on continuously. A record of over 200 messages in

ten minutes has been attained in this way. At the same time, of course, messages were being transmitted to Valentia on the same wire and at the same speed.

To attain to this high-water mark of efficiency has naturally involved a great deal of organization and experiment that does not appear on the surface, and Mr. Carson is to be congratulated on this unique demonstration of the capabilities of the trans-Atlantic cable system.

Rapidity of communication is the watchword of the company, and to this end every possible means is utilized. High-speed automatic punchers, for example, are installed at certain points of the system, and though faulty at first, have now attained a degree of efficiency which enables Mr. Carson to speak highly of their performance. Manual punching, however, at the terminal stations is preferred to the keyboard instruments now on the market, though the company will not fail to take advantage of these when they have reached a satisfactory stage towards perfection. Every message is carefully checked to ensure accuracy.

Comparing the splendid work done by the cables with the fitful performances of the wireless trans-Atlantic system, one cannot but feel that the epoch when the latter will displace the former—if ever—must be far in the future. Wireless in its own sphere is unexcelled; but in long-distance working it is not yet a competitor with cables.

Bound Volumes of Telegraph Age.

For those of our readers who desire to have the past year's issue of Telegraph Age in a form in which they can readily preserve all of the copies for future reference we would recommend a bound volume. We are now able to supply these containing the twenty-four issues of 1909 for the nominal price of \$3.00. There are several features in one of these volumes which comprise nearly 900 pages of reading matter, which are alone worth much more than the amount asked. The series of articles by Willis H. Jones entitled "Some Points on Electricity" are in themselves worth the price of the book to any student. We have also published articles by the best informed authors upon the developments in wireless telegraphy, and, in fact, there will be found recorded in this book all of the important improvements in the wireless art during the past year. The use of the telephone for train despatching has largely increased since January, 1909, and we have kept pace with its development by presenting to our readers many articles upon this subject, written by some of the best posted men in the railway and telephone world. These are but a few of the many features presented in Telegraph Age, during 1909, and those interested in any branch of the telegraphic industry will find much valuable information in one of these bound volumes. A copy of this work will be sent to any address upon receipt of price, \$3.00, by J. B. Taftavall, Telegraph and Telephone Age, 253 Broadway, New York.

An Interesting Electrical Problem.

Editor Telegraph and Telephone Age:

Will you or some of your readers be good enough to offer some solution to an electrical problem, which exists on a block wire circuit between two offices situated six miles apart?

These two offices are twenty miles from any power plant, or high potential wires or gas or water mains.

The block wire is operated on the closed circuit system and was set up in regular gravity battery style, zinc to ground at one office and copper to ground at the other office, yet it would not work, the circuit would not close with a mile of copper wire submerged in a thirty-foot well as a ground at each end.

We discovered a positive current coming from the ground and by reversing the poles, putting coppers to ground at each office, the circuit closed and operated beautifully until recently, when a telephone office was opened within a hundred feet of one of the telegraph offices. Whenever the telephone generator is rung, it interrupts the telegraph instruments, the fifty ohm sounder on the telegraph line vibrating the same as the bell on the telephone instrument.

The telephone and telegraph ground wires are situated separately about one hundred feet apart, and the telephone line does not cross this telegraph line at any point, but runs in the opposite direction from the telegraph line.

I would thank you for any information you can give upon the peculiar results obtained.

R. L. Stultz.

Manager Western Union Telegraph Company,
Alexandria, Va.

Mr. Hearst Upon Journalism.

At a recent dinner Mr. William R. Hearst, publisher of the New York American and several other daily papers in different cities, was asked to speak upon the subject of journalism, and said in part:

"I regard a newspaper publisher as an attorney retained by the people to protect their rights and their interests.

"I believe it to be as much the duty of a newspaper publisher to place the interests of the people above all questions of personal advantage as it is the duty of an honorable attorney to place the interests of his clients above all such considerations.

"If journalism is sometimes found in active and critical opposition to certain business interests, it is merely because these business interests have come into direct conflict with the rights of the public, which it is the main duty of journalism to defend.

"If journalism maintains an attitude of greater approval toward other business interests, it is because of the disposition of the business men in control of these interests to entertain a broader and higher conception of their duties and responsibilities to the public.

"It is the difficult duty of journalism to distinguish between what is good and what is bad, not only in business methods, but in all other matters which vitally affect the interests of the people.

"In these complex and difficult situations I feel that the conscientious publisher should have the support of the people and also of that higher element in the business world which recognizes its own duties and obligations to the people."

Postal Club Formed at Atlanta.

The employes of the Postal Telegraph-Cable Company in Atlanta and surrounding towns met in the general offices of the company in Atlanta, January 21, and organized a social club, to be known as the Postal Telegraph Club of Atlanta, Ga.

A constitution and by-laws were adopted and the following officers elected: President, W. C. Daviet; vice-president, A. D. Holcomb; secretary, L. A. Minor; assistant secretary, F. F. Pursley, and treasurer, G. W. Oliver.

The following committees were appointed: Publicity Committee: A. M. Beatty, chairman; A. D. Holcomb, H. W. Pearce, F. F. Pursley, Lee Minor. Committee on Entertainment: C. G. Knapp, chairman; B. C. Delaney, J. P. Edwards, H. W. Pearce. Board of Governors: W. C. Daviet, chairman; A. D. Holcomb, L. A. Minor, F. F. Pursley, G. W. Oliver, J. P. Edwards, B. C. Delaney. Committee on Membership: A. M. Beatty, chairman; A. D. Holcomb, Robert Pope, Jr.

The object of the club is to promote social intercourse and friendship among the employes of the company. The club expects to give a banquet in February and to be addressed by prominent men both in and out of the profession.

The club was started with thirty-five charter members, and it is expected the membership will soon reach fifty.

The following is the complete list of members: G. H. Usher, H. W. Pearce, W. C. Daviet, C. G. Knapp, W. E. Sitton, F. F. Pursley, L. A. Minor, B. C. Delaney, A. M. Beatty, G. W. Oliver, E. S. Reeves, R. A. Paschal, H. A. McKinnon, G. W. McCaughy, A. D. Holcomb, J. T. Goodrum, R. S. Pope, Sr., H. P. Thornton, C. E. Harrison, R. S. Pope, Jr., J. E. Arnold, G. E. Paine, O. E. Hickman, J. P. Edwards, F. J. Poundstone, F. H. Robinson, P. A. McMullen, J. M. Manning, and B. B. Price, of Atlanta; S. E. Dorsey, of Gainesville; W. S. Scruggs, of Covington; J. H. Merrihew, of Marietta; W. H. Milam, of Cartersville; O. T. Moore, of Macon, and M. M. Morgan, of Greensboro.

The telegraph companies are now started upon what promises to be the most prosperous year in their history. The renewal in business prosperity which has become general throughout the country has affected the telegraph most favorably and now none of the various companies have a single wire which is not needed to properly handle their business.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIDGES

Sole Manufacturer

**Hudson Terminal, 30 Church St.
NEW YORK**

Western Representative

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

Mr. G. A. Cellar, superintendent of telegraph of the Pennsylvania Lines west of Pittsburgh, was a recent New York visitor.

The Chicago, Burlington and Quincy Railroad has just completed the equipment of its Hannibal division from Hannibal, Mo., to St. Louis, with a telephone train despatching circuit.

The Georgia Railway will in the near future install telephone train despatching circuits upon three hundred miles of their road, practically the entire mileage.

Mr. V. T. Kissinger, assistant superintendent of telegraph of the Chicago, Burlington and Quincy Railroad at Lincoln, Neb., has been appointed superintendent of telegraph, with office at Chicago, to succeed Mr. W. W. Ryder.

Mr. J. B. Fisher, superintendent of telegraph of the Pennsylvania Railroad, has been appointed superintendent of the New York division. Mr. J. C. Johnson, chief clerk in the office of the superintendent of telegraph, has been appointed to fill the vacancy caused by Mr. Fisher's promotion.

The Cleveland, Cincinnati, Chicago and St. Louis Railway has recently placed in service a telephone despatching circuit between Cincinnati and Columbus, a distance of one hundred and twenty-five miles. They will soon add similar equipment to one hundred and ninety-eight miles more of road.

Encouraged by the success of their school of telegraphy at Bedford, Pa., the Pennsylvania Railroad Company has provided a library containing books upon all branches of electrical science. They have also installed an automatic sending machine with a transmitter that can be set at any speed desired. This is for use in teaching the students to receive messages.

The Delaware, Lackawanna and Western Railroad Company, Mr. L. B. Foley, superintendent of telegraph, is now despatching trains by telephone on the entire 957 miles of their system, and also has several additional telephone message circuits along their line. The dispatchers on this road are well pleased with the change, all agreeing that the work is much easier for them than under the telegraphic method. The Lackawanna is the first important railroad system to adopt the telephone exclusively for this purpose, though probably within the next year several other roads will complete the change.

A pension system for employes has been adopted upon the Rock Island lines. The plan is similar to that in force upon the Pennsylvania Railroad. All officers and employes who have attained the age of seventy years will be retired, and those in certain lines of work who have reached the age of sixty-five may be retired. Such as have been in continuous service twenty years at the time of their retirement will be pensioned and anyone who has been continuously in the service for twenty-five years or over and who has become permanently incapacitated may be retired on a pension regardless of age.

The telephone despatching system of the Santa Fe railroad will be largely extended during the present year. It is said that an appropriation of \$195,000 has been made to cover the cost of this work. Two new circuits will be installed from Albuquerque, New Mexico, to Los Angeles, Cal., and additions will be made to present circuits so that there will be two complete circuits from Bakersfield to Oakland, Cal.

Mr. Eugene H. Coapman, who has been appointed first vice-president of the Southern Railway, began railway work on the Chicago, Milwaukee and St. Paul when he was fifteen years old. From 1880 to 1883 he was operator and train dispatcher, and then went to the Iowa Central as train dispatcher. After serving as chief dispatcher and superintendent of telegraph he returned to the Chicago, Milwaukee and St. Paul in 1887 as train dispatcher. Since then he has been connected with the Illinois Central and Santa Fe systems and with the Southern Railway since 1902.

The Lehigh Valley Railroad, in addition to the Mahanoy and Hazleton Division, upon which a telephone train despatching circuit was placed in service December 6, is now equipping the Lehigh Division with telephones for train despatching. The new circuit will be fifty-four miles long, with fifteen stations. In the way stations special equipment, composed of a swinging arm with the transmitter and receiver mounted in a fixed position on a yoke, is utilized. When the operator pulls the arm forward a special switch closes the telephone circuit. When he wishes to talk he depresses a foot switch, which closes the primary circuit through the transmitter.

Mr. W. W. Ryder, whose appointment as general superintendent of telegraph of New York Central lines west of Buffalo was announced in our January 16 issue, is one of the best and most favorably known telegraph superintendents in this country. Mr. Ryder was born at Aurora, Ill., April 6, 1865, and in 1883 entered the employ of the Burlington system in the freight department. He remained here until 1887, when he took a position at Chicago as stenographer with Mr. Frank A. Vanderlip, now president of the National City Bank of New York. The same year he entered the offices of the superintendent of telegraph of the Burlington system as stenographer and soon became chief clerk. From 1890 until 1893 he acted as superintendent of telegraph and in the latter year received the permanent appointment to that position, which he has held until his present advancement. Under Mr. Ryder's supervision the telegraph system of the Burlington has been made one of the best in the country. He was one of the first to recognize the possibilities of the telephone for train despatching and some of the best results attained with this system have been secured under Mr. Ryder's supervision on the Burlington. His many friends predict that this advancement is but the forerunner of greater promotions.

At a meeting called in New York January 19 by W. E. Harkness of the Western Electric Company an organization was effected of the supply men who furnish goods used by the railway telegraph superintendents. The object of the association formed is to promote the social features of the annual meetings of the telegraph superintendents. Mr. A. P. Eckert was made chairman of the new organization. Others present at the meeting were: P. W. Miller, of the Kerite Insulated Wire and Cable Company; E. R. Gill, of the United States Electric Company; Mr. E. Chambers of the Duplex Metals Company, and A. T. Smith, of the American Telephone and Telegraph Company.

Great Northern Railway Despatches Trains By Telephone Over 2,100 Miles of Line.

The equipment of the Spokane Division of the Great Northern Railway with telephone train despatching apparatus will complete a total of 2,100 miles of line which this road is now operating in this manner.

The Spokane Division extends from Troy, Mont., to Leavenworth, Wash., a distance of 337 miles. On account of the length of this division, and the amount of traffic passing over it, two despatchers are required to handle the division. They will have on their despatching circuits 45 way stations.

The standardization of this apparatus for the railroads of the country has included a testing device which is installed throughout the Great Northern system. This is a panel somewhat similar to the well known telegraph peg board but containing telephone jacks and plugs. The circuits looping through an office, both telephone and telegraph, are wired through these jacks and by the operation of two keys and using the plugs at the despatcher's orders, it is possible to patch up temporarily a line in case of trouble, to interchange circuits, to locate a break or a cross to the nearest station—in fact, to make all the simple tests ordinarily required on a circuit of this character. These test panels have been found an important and useful portion of the despatching equipment of railroads. Their simplicity makes them especially valuable, as they may be operated by the most inexperienced employees.

Another interesting feature of the Great Northern installation is the use of siding telephones on the Spokane Division. Seventy of these are to be installed. As the use of the telephone for despatching has increased, the railroads, as in this case, have come to appreciate more and more the advantages of being able to allow the train crews to talk directly to the despatcher at all important sidings. A siding telephone is sure to be at hand in case of emergency, as a large number of them have been installed. The fact that these siding telephones enable the despatcher to reach train crews waiting at the sidings and give them orders to pro-

ceed permits him to take advantage of all changes in the schedule, prevent congestion and keep traffic moving, thus effecting economies in motive power and reducing overtime expense. Any of these uses warrants the installation of the telephone system, as the saving effected in one emergency will more than pay the cost of the installation.

When this equipment is put into service the Great Northern will have a telephone train despatching system the entire distance from Minneapolis to Seattle, with the exception of two short sections.

Gold and Stock Life Insurance Association Annual Meeting.

The thirty-second annual meeting of the Gold and Stock Life Insurance Association, at which there was a large attendance, was held in the Western Union Building, New York, January 17.

Mr. G. W. E. Atkins, president, in his report, stated that the Association strikingly illustrates the value of co-operation effectively and economically applied to protection of the home and family, and that undoubtedly a great privilege is afforded to all engaged in electrical pursuits to take membership in the Association, and that he is convinced that very many more would gladly avail themselves of the advantages if they were more widely known. The disbursements for death claims during the year were \$7,825, making a total of \$128,825 paid to the beneficiaries of deceased members.

Mr. Chas. P. Bruch, a former president, wrote that although unable to be present, he did not wish his absence to be understood as indicating any diminishing interest in the Association and its work. He urged all to find a way of getting the younger men interested, and of making the benefits of the Association more highly appreciated and valued, by those who are eligible for benefits.

Mr. Michael Breslin, the Association's first president, said that membership seemed to be conducive to long life, that he had been present at every one of the thirty-two annual meetings, and was sure that those who could say the same would be found engaged in active work for the association's welfare.

Mr. M. J. O'Leary, auditor, forcibly called attention to the good that is being done by beneficial societies generally, and said they should be constantly kept before the eligible young men and women, of all the telegraph and telephone companies, so that the result may be an ever increasing membership, and extension of usefulness.

The old board of officers were re-elected as follows: George W. E. Atkins, president; Gardner Irving, vice-president; W. J. Dealy, secretary; Lewis Dresdner, treasurer; executive committee, G. W. E. Atkins, Gardner Irving, Herbert Smith, Lewis Dresdner, W. J. Dealy, Michael Breslin, Charles Shirley, T. A. McCammon and Albert J. Driver; auditing committee, M. J. O'Leary, F. J. Nurnberg and J. J. Frederick.

General Information as to Early and Late Speed Trials, with Incidental Comments on the Persons Concerned in Them, and Unnecessarily Complete Reports, Perhaps, as to the Part I Myself Played in Them and in Other Related Events.

BY WALTER P. PHILLIPS.

(Continued from page 79, January 16, issue.)

In the forty years—1866-1906—embracing the widely separated achievements of William E. Kettles and David J. Ellington, and of all their nimble-fingered associates, many important records have been made, but there is one man who has been in but a single tournament, whose telegraphic work, both as sender and receiver, has ranked with that of Kettles, Burns, Shape, Wright, Catlin, Curtis, Waugh, Gibson, McClintic, Conkling, Bruckner, Ellington, and all the blazing lights from first to last. I refer to George M. Eitemiller. When he had been working around a switchboard for many years he came on from Pittsburg, without practicing up for the contest, and perfunctorily sat in, at the Hardman Hall tournament, in the Old Timers Class, in 1890. But it was plain to be seen that he made no effort to compete with Ayres and Catlin. It was evident that he regarded tournaments as in-artistic and that he was inclined to treat them as a joke. Personally, I was very much disappointed, for I had heard him send messages, in previous years, at the rate of from forty-five to fifty-five words per minute, on many occasions, on a duplex on which the men who received from him one night—DeGraw, Boileau and Moore—sent to me the next night and I was, therefore, in a position to know that, aside from Eitemiller's wonderful sending, his receiving was superb and his handwriting of the very best. I asked him once, when I was quite new on the Philadelphia wire, where DeGraw, Boileau and Moore were on the nights when one of the three was missing, and he replied: "The three take turns working a slow wire, to get rested up so they can come back at us, fresh and hearty, when it comes their turn to send. Any time, Walter, that you would rather receive than send, I'll swap jobs and round the Quakers up for you." Though we were supposed to work the sending and receiving sides on alternate nights, Eity did most of the sending and more beautiful Morse never went to Philadelphia from any direction. Once in a while I got ambitious to send—ambitious not to receive might be a more honest way to put it—and it was then, when George took the receiving side that some one of the famous trio sought to be revenged. But the extreme facility with which the sender was copied often attracted quite an audience to the vicinity of the Philadelphia duplex and the intended victim just smiled and

smiled and was a telegraphic villian still. From his first appearance in the business, out in Pennsylvania, where he worked a wire with Joseph W. Larish, through the days when he was a protégé of Patrick B. Delany's, in Savannah, to the time of the great fire in Boston, in 1872, when he was sent there and proceeded to teach a number of people in New York who had always underrated him, the particular kind of a telegrapher he was, and for many years afterward he went on springing more surprises on the profession than any of his contemporaries, and even now, in the evening of his life, although he no longer works as an operator, he sometimes takes the wire for a night in such a youthful and spirited manner as to remind those who observe him of the maiden of whom Longfellow said:

"To me ye never can grow old,

But live, forever young, in my remembrance."

Another operator, Charles H. Davis, who figured in but one tournament (that of 1885) was none the less a master of his profession and he would have been heard of afterward, but he took up photography and was almost immediately recognized as an artist of the first class. But Mr. Davis was more than an operator and, very early in his career, he and Frank B. Rae, published the first book of diagrams ever issued, showing how quadruplex and many other connections should be made. While in the service of the United Press (No. 1) he beat everybody in competition with him, by drawing a wire up the bluff at Fort Wadsworth, during the yacht races, and establishing an office on the top of a cannon, where he operated a telescope with one hand and a foxy eye and a telegraph instrument, which he held in his lap, with the other hand, furnishing graphic reports which were distributed to all parts of the world, far in advance of those supplied by others. Mr. Davis is a graceful writer, an expert with the telescope, a student of the stars and is talented in almost every direction. His photographic work commands the highest prices and is undoubtedly of the very best. He has made thousands of exquisite pictures and his name is known throughout this country and in many others, but the most interesting to telegraphers is the group picture, taken in 1907, in which General Eckert, Charles A. Tinker, Albert B. Chandler, and David Homer Bates appear. General Eckert, now approaching his ninetieth year, has but recently retired from his long term of service with the Western Union Telegraph Company; Mr. Tinker is leading the simple life in Brooklyn; Mr. Chandler divides his time between New York and his farm at Randolph, Vermont, and Mr. Bates is still actively engaged in business, being vice-president of the Gamewell Fire Alarm Telegraph Company and connected also with the long established house of Wilcox and Gibbs and besides that and his active service as secretary of the United States Military Telegraph Corps, he has written a charming book about the most

important man who has lived in the world since our Lord and Saviour came out of Nazareth and, after a brief sojourn here, returned to the Father by way of the cross. "Lincoln in the Telegraph office" is one of the great books of the time and while many volumes affecting the life and career of this wonderful man, many of them most excellent, have been written, no one who peruses Mr. Bates' work but will find that it is well that this particular book has been added to the others, for it settles many disputed points in a way that can offend no one and that will be helpful to many.

the use of copper wires, for telegraphic purposes, when he was the President of the Baltimore and Ohio Telegraph Company, but to my mind his book on Lincoln is his greatest triumph. He is fortunate in the possession of a strong masculine style of composition. Emerson said he liked the Flemish pictures because the figures in them stood on their feet and did not swing or float in the air. That is the way with Mr. Bates' assertions and situations. They are definite and would charm the old actor in "Trelawny of the Wells." He denounced the namby-pamby speeches the author had set down for him and

Photograph by Davis & Eckmeyer, New York

GENERAL T. T. ECKERT, C. A. TINKER, DAVID HOMER BATES
AND COLONEL A. B. CHANDLER

For example, there have been many theories as to when and where and under what circumstances Mr. Lincoln wrote the Emancipation Proclamation. It is conclusively shown in Mr. Bates' book that he wrote it in the War Department telegraph office, sitting at General Eckert's desk. This is only one of several matters that are elucidated and in treating of them the author brings the reader so close to the man of whom he is writing that his son, Robert T. Lincoln, wrote to Mr. Bates as follows, when he had perused his work: "I must thank you earnestly, for the pleasure I have had in your articles. They bring back very vividly, the most exciting and interesting days of my life, and the reminiscences of my father make him seem to me to be alive again."

Mr. Bates has done many things to endear him to his fellows and he has contributed his share to improve telegraphic conditions, one of his achievements being that he was one of the pioneers in

said to his wife: "Oh! for the good old speeches in Goldsmith's and Sheridan's times; speeches that you could stick your teeth into." A man who could write "Lincoln in the Telegraph Office" might have gone into fiction with success because it is plain that he possesses some of the qualifications for imaginative work—insight, sympathy, a sense of humor and the other charming qualities entering into the creation of literature. But to write history is much more important than to produce fiction. Even our "best sellers" are but ephemeral things, many of them reminding one of the unremembered songs of the forgotten poets. But all history from the inspired words of Moses, through all the written efforts of the Old Testament historians down to the limpid chronicles of Matthew, Mark, Luke and John and reaching forward so as to include the modern historians—Gibbon, Hume, Macaulay, Carlyle, Froude and our own Bancroft, Prescott, Irving and Motley—all his-

tory, if honestly and cleverly written, is of much greater value to the world than the fiction of even the greatest authors who have written it. I am therefore glad, as many of my readers must be, that a man so well fitted to write of the martyr President in the peculiar environment in which Mr. Bates knew him, has found the time and taken the pains to prepare such a carefully arranged and conscientiously written narrative affecting the greatest man of modern times as he seemed to those who looked and, as Hamlet says, saw that within which passeth show.

That the child is father of the man, as Wordsworth says, is being illustrated all the time, but it was never truer in any case than in that of William R. Plum. The spirit of determination that he showed when invited into the Burns-Kettles contest as a guest, as it were, and proceeded to beat both of the would-be champions, was just as notably in evidence in 1862, when he went to the Western Union office in Cleveland and applied to Captain Anson Stager for service in the United States Military Telegraph Corps. Captain Stager said: "Oh, no, I can't hire you to go down there; you are too little." An answer like that would have settled some boys, but not so the youthful Plum. Captain Stager had a superintendent, not far away, Captain Samuel Bruch, who had never seen Plum, knew nothing of his age or size, and who, furthermore, was ignorant of the fact that the youngster had already tendered his services to Captain Stager to have them rejected. So when he received a telegram decisive in tone and strictly business in its length and evident expectation of an answer equally to the point, Captain Bruch accepted Plum's services at once and told him to report for duty at Louisville. In the meantime the lad's father had telegraphed to him from Cuyahoga Falls, where William had attended high school and studied telegraph. On the side, to return home and go back to school but he was so imbued with an instinct for war that he proceeded to Kentucky, where he opened the first office that was established in Columbia, Kentucky, after a narrow escape from capture by Captain John Morgan. A little later, after various lively experiences with moving accidents by flood and field, he settled down, for nearly a year at Nashville, when both armies were moving up and down in Kentucky and Tennessee, and Nashville was almost constantly besieged. Finally he went with General Thomas and was with him at Chattanooga and upon the capture of Atlanta he was made manager of the office there. He was with General Thomas in the battle of Jonesboro, Ga., and also in the fight at Nashville, Tenn. Upon the evacuation of Atlanta he took charge of General Thomas's office and in that capacity continued until the end of the war, when he went to New Haven and studied law, as already related. The gait at which he piled in the dots and dashes on the morning of the

Burns-Kettles race was a surprise to all, though the style of his Morse was a little peculiar and it was of the old National style, which, as sent by the Duncan brothers, was not particularly unpopular. But Plum's style of sending in its higher attenuations was not impressive and he was ruled off the course by the judges. I believe that particular style of sending was said to have originated on the Cleveland and Pittsburgh Railroad, where Plum served a term as an operator. Edison's sending has the same swing, with a tendency to make the last dot in an *i* a little heavy until it resembles an *a* more or less intimately. When he first came to Boston I worked No. 4 East in Providence when he had the Boston end and we supposed, for a time, that he signed Slac, and wondered why he should. Later we learned that some one had dubbed him Victor Hugo and then it dawned on our groping mentality that Edison's sign was intended for Vic. Fred Seibert, with all the radicalism peculiar to new converts, acquired a style that was said to somewhat puzzle the Duncans, themselves, when they had to receive from him. He had followed in the footsteps in which Horace Greeley had been said to proceed when he abandoned regular operations at the Tribune office as philosopher and statesman and went in for scientific agriculture on his farm at Chappaqua. A flippant paragrapher once said that perhaps Mr. Greeley was carrying his advanced agricultural views too far afield when he seriously considered the feasibility of engrafting canned lobster on the tea plant. Seibert attempted to engraft on the pure National type of sending a canned lobster gait of his own and the resulting combination was not unlike the great architect, Richard Hunt's definition of the Queen Anne style of architecture, which he said was a bad imitation of a thing that was extremely undesirable in the original.

While Plum was studying law at New Haven he occasionally did newspaper work and on one occasion he came to Providence and reported the proceedings at the New England Agricultural Fair for the Journal. I have never forgotten how very excellent his work was and what an insight it gave me into the mystery of making even prosaic matters as interesting as fiction. It was the first real lesson I had ever had in the fine art of reporting. How much of a start his example gave me can be judged from the fact that in the early seventies I was tolerated on the reportorial staff of the New York Sun—an honor, indeed, for any man whether from the college or the farm. So many men ride for a fall in the Sun office that I hasten to add that I was not eliminated, but resigned, in 1874, to enter the service of the New York Associated Press.

(To be Continued.)

The annual Colonial Report for Jamaica for the year 1908-9 shows the receipts from telegraphs was £6,221, an increase of two per cent over the preceding year.

Serial Building Loan and Savings Institution Election and Statement.

At the annual election of officers and directors of the Serial Building Loan and Savings Institution, held in the office of the corporation, at 195 Broadway, New York, on January 18, the following were elected: J. C. Barclay, president; J. R. Beard, vice-president; E. S. Butterfield, treasurer; E. F. Howell, secretary; directors, G. W. Blanchard, E. E. Brannin, J. T. Laidlaw, M. S. Cohen, W. H. Jackson, J. F. Nathan, T. M. Brennan, J. B. Taltavall, C. A. Kilfoyle, M. J. O'Leary, F. J. Scherrer, W. J. Quinn, M. W. Rayens, P. J. Casey and Edward Reynolds.

The fiftieth semi-annual statement of the Serial Building Loan and Savings Institution for the six months ended December 31, 1909, was as follows:

ASSETS.	
Cash in bank.....	\$18,801 42
Mortgages	446,424 00
Stock Loans.....	7,985 00
Real Estate	12,718 07
Land contracts.....	8,730 17
Advances	2,495 48
	\$497,064 14
LIABILITIES.	
Shareholders, cumulative	\$312,468 81
Shareholders, prepaid.....	43,400 00
Shareholders, matured.....	42,600 00
Shareholders, Juvenile	440 87
Borrowed money.....	43,916 39
Due on loans.....	17,900 00
Surplus and undivided earnings.....	36,338.07
	\$497,064 14

The Robert W. Martin Fund.

Contributions to the fund for the support of the well-known old time telegrapher Robert W. Martin seem to have practically ceased. Unless more is received soon this brilliant member of the profession, who has been stricken helpless by paralysis for the past three years, and his family will be reduced to desperate straits, as the amount remaining of the sum which has been contributed for his support is rapidly diminishing.

The committee in charge of the fund consists of J. B. Taltavall, of Telegraph and Telephone Age; Charles W. Price, of the Electrical Review; T. Comerford Martin, secretary of the National Electric Light Association, and T. A. McCannion and Fred Catlin, of the Western Union Telegraph Company, New York. All contributions should be addressed to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Mr. F. W. Dillingham, a member of the firm of Hubbard Brothers Company, cotton merchants, New York, a former well-known telegrapher and a gentleman who has in his possession an excellent collection of autographs and autographic letters of the most prominent telegraph people in the country, in remitting \$5.00 to the R. W. Martin

fund, says: "73 to Bob Martin. I worked with him in 1882."

The amount received to date is: Previously acknowledged, \$611.25; F. W. Dillingham, New York, \$5.00. Total, \$616.25.

Of this amount the following sums have been paid to Mrs. Martin: July 10, cash, through Walter P. Phillips, \$15.00; by J. B. Taltavall, July 12, \$5.00; July 19, \$5.00; July 20, \$5.00; July 20, \$1.00; July 26, \$33.00; August 9, \$31.00; August 27, \$30.00; September 3, \$46.00; October 1, \$51.50; October 19, \$5.00; October 29, \$47.00; November 9, \$8.00; November 30, \$63.50; December 30, \$60.00; January 28, \$60.00; total, \$466.00.

Maver's Wireless Telegraphy and Telephony.

"Wireless Telegraphy and Telephony" by William Maver, Jr. (366 pages, 258 illustrations), is the most recent book published upon this subject and hence is probably the most up-to-date work to be obtained. The author outlines briefly the early forms of communication at a distance without the use of wires and the various systems of induction telegraphy devised by Phelps, Edison, Preece and others. He then takes up the propagation of waves through the ether, the production of oscillations in a circuit, the experiments of Hertz in detecting electric waves, the discovery of the coherer by Branly and Lodge's experiments with and improvements in the same, the various theories for electric wave propagation, syntonic wireless telegraphy, the various Marconi systems, Lodge and Lodge-Muirhead systems, Slaby Arco and Braun systems, the Telefunken systems, including the singing-spark system, the Von Lepel system, the Branly-Popp and Guarini systems, the DeForest, Fessenden, Stone, Shoemaker, Massie and Musso systems. After describing the principal features of all of these systems in considerable detail Mr. Marver discusses different forms of detectors, interruptors, transformers, spark gaps, condensers, antennae, tuning coils and other apparatus used in wireless communication. Another chapter tells of the attempts made in the line of directing the radiations to any desired point of the compass. Wireless stations for amateurs are also fully described and many useful hints given. The second part of the book devoted to wireless telephony describes the Ruhmer, Poulsen, DeForest, Telefunken, Fessenden, Collins and Majorana wireless telephone systems and gives a general outline of what has been accomplished in the way of transmitting articulate speech without wires. This book is undoubtedly the most complete and practical work upon this subject now on the market and is free from complicated mathematical formulae being written in a manner designed to be clear to the general reader. It is valuable to either the expert, the student, or the amateur. The price of this book is \$3.00 and copies may be obtained by addressing J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, N. Y.

Legal.

In a recent decision of the Supreme Court of the United States rendered by Justice Harlan, the right of the State of Kansas to tax the entire capital stock of the Western Union Telegraph Company was denied. This decision is of far reaching importance, as circumscribing powers of a state to tax foreign corporations doing an interstate commerce business.

The court laid special stress upon the fact that the license fee of Kansas equalled eight per cent on the capital stock of the company not only in Kansas, but everywhere else, and was consequently confiscatory. It was not only that, but it took a stated annual sum from the company regardless of the business done.

The Court of Civil Appeals at Galveston, Texas, recently decided that the law passed by the Legislature of that State, limiting a day's work of a railroad telegrapher to eight hours is unconstitutional.

The construction of the higher court is that the statute is in conflict with existing Federal statutes on the same subject, which statute allows nine hours as a working day, and the State's eight-hour law is in conflict for the reason that railroads are practically inter-state methods of communication, and necessarily the Federal laws must take precedence. This is the first appellate court construction of this law, and consequently the decision is of great importance.

Effect of Magnetic Storm on Government's Alaska Cable.

During the magnetic storm which affected telegraph operation so seriously on September 25 last, the operators on the Government cable between Seattle and Sitka and Valdez had considerable difficulty in operating that cable. At 9 a. m. on the morning of that day the operator at Seattle found it impossible to keep the siphon on the paper, the suspension being nearly broken with all resistance possible in the circuit. A voltmeter across cable and ground showed a variable voltage of from 30 to 150, the voltage at no time being steady but averaging about 60. After a careful examination of terminals in Seattle to see if by any possibility they had picked up a leak on a high power city line, the operator at Fort Lawton, eight miles from Seattle, grounded the cable at that point and it was impossible to get a reading with a "1/1000" shunt on the reflecting galvanometer. Not until 12:30 p. m. were they able to get in working communication with Sitka and Valdez. Valdez reported then that the land lines from that point were working satisfactorily without any batteries.

Earth currents occur occasionally on the Sitka-Valdez cable to a greater or less extent causing short interruptions until proper adjustment overcomes the trouble. They are always noticeable on the Seattle-Sitka section when testing, but before this time they had never been severe enough to cause any great inconvenience.

Obituary.

The wife of Mr. J. L. Adam, cashier of the Western Union Telegraph Company at New Orleans, died on January 6.

The wife of Madison Buell, of Buffalo, N. Y., a well-known old time and military telegrapher, died on January 20.

Christian C. Frey, an old time telegrapher, died January 8 at Seymour, Ind., aged sixty-nine years.

Alvin T. Allen, aged fifty-eight years, died at Bunkie, La., on January 9. Mr. Allen had been identified with the telegraph in Louisiana for many years past.

Mr. M. E. Washburn, an old time and United States military telegrapher during the Civil War, died at Indianapolis January 15, aged seventy-four years. Mr. Washburn had been identified with the Big Four Railroad for the past forty-four years.

Hiram A. Woodring, aged fifty years, a well-known telegrapher, and for the past eight years chief operator of the telegraph department of Haydon, Stone and Company, brokers, of New York, died on January 12. Interment was at South Bethlehem, Pa. Mr. Woodring was a well-known old time telegrapher, and had worked at his profession in Washington, Chicago and at other points.

L. A. Angel, night chief operator of the Postal Telegraph-Cable Company at Birmingham, Ala., died January 17, aged sixty years. Mr. Angel served with distinction as a telegrapher in the Confederate Army during the Civil War, being an operator for General Fitzhugh Lee at the age of twelve. For many years he was a prominent figure in telegraph circles in Richmond, but for the past fifteen years had worked in cities farther South.

LETTERS FROM OUR AGENTS

CLEVELAND, O., WESTERN UNION.

Wire Chief W. H. McCormick and Miss Lillian Winters, of the operating force, in this office, were married at Grand Rapids, Mich., during the holiday season.

Operator J. S. Martin, of this office, was also married recently, to Miss May Hartory, who has been the telephone operator at the Hollenden Hotel, in this city, for several years.

EL PASO, TEX., WESTERN UNION.

The force in this city at the present time is made up as follows: Norman Ringer, manager; J. W. Brooks, chief operator; J. W. Dudley, night chief; C. Vollertsen, wire chief; H. B. Nelson and C. G. Hull, first Dallas, quadruplex; T. H. Esperson and C. B. Woods, second Dallas, quadruplex; W. L. Young and J. A. Young, first Denver, quadruplex; L. W. Broyles and J. H. Cronin, second Denver, quadruplex; C. M. Blum and R. F. Campbell, Los Angeles, quadruplex.

On the way wires are: E. Lomasney, Mrs. A. V. Lomasney, Mrs. J. H. Ray, Miss B. Porter, L. V. Wortham, F. Vandervoort, W. R. Fitzgerald, W. J. Shea and W. J. Pokorney, the latter being assigned to the late night trick.

P. Humphries is chief operating clerk; L. Garcia, day check, and O. Hale, night check.

The branch office managers are: Hosmer Hill, Union Depot; Isabel Martin, Sheldon Hotel, and L. A. Etie, El Paso Junction. E. Espinosa is chief operator at El Paso Junction.

In the clerical department are: H. L. Esch, cashier; M. Fontain, book-keeper; I. Wimber, assistant book-keeper; and A. Mawhinney, S. Bigelow, N. Briggs, A. B. Weatherby and H. H. Dansboe, clerks. In addition to this force there are thirty-four messengers regularly employed.

NEW YORK, WESTERN UNION.

Leon H. Jordan, of this department, has resigned to accept the position of manager at Charlottesville, Va.

F. E. Wellington has resigned to accept a position in his home city, Detroit, Mich.

William H. Mayer, of the eastern division, has for a third time been reappointed Borough Recorder at Wallington, N. J.

Charles Thoms, chief of the quadruplex department, who has been seriously ill for the past three months, is much improved, now having resumed his duties.

M. W. Jones, for several years past in charge of the complaint bureau in New York, has resigned to accept a position as secretary to Vice-President Stewart of the Guayaquil and Quito Railroad at Ambato, Ecuador, and sailed for that place January 16.

Henry N. Miller, for many years connected with this department and lately employed by the United Wireless Telegraph Company on the steamer Manhattan, died suddenly on January 14.

Thomas G. Tice, a well-known telegrapher and for many years employed in the brokerage business, died at his home in Brooklyn, N. Y. Mr. Tice had been in poor health and unable to attend to his duties for the past year.

OTHER NEW YORK NEWS.

The annual dinner of the American Institute of Electrical Engineers will be held at the Hotel Astor, New York, February 24. Prof. Elihu Thomson will be the guest of honor.

The annual dinner of the Morse Electric Club will take place at the Hotel Savoy, Fifth Avenue and Fifty-ninth Street, February 5, at 6:30. The entertainment committee is arranging an interesting program and a large attendance is expected.

A messenger of the American District Telegraph Company in New York earned \$80 in three days during the holidays delivering messages at two cents each. A brokerage firm had 4,000 messages to be delivered and this boy answered the call. He worked night and day until all of the messages were delivered.

Assessment No. 503 has been levied by the Telegraphers' Mutual Benefit Association to meet claims arising from the deaths of Annette E. Collins Smith at Los Angeles, Cal.; John F. Keregan at New York; George B. McCoy at West Point, Ky.; Frederick Fairchild at New Haven, Conn.; William T. Mobley at Los Angeles, Cal., and Lewis M. Owings at Columbus, O.

The Serial Building Loan and Savings Institution, of 195 Broadway, N. Y., has in the twenty-five years of its successful existence assisted over eleven hundred telegraphers to secure homes. It was established by telegraph men for the benefit of those in the profession and has always been conducted in their interest. You can buy a home and have from twelve to twenty years in which to pay for it. Write for particulars.

The Hulit Standard Telegraph Sending Machine

Will not split a dot, shorten a space, or transmit "choppy" Morse.

Is a ONE-HAND Transmitter with ONE SOLID CONTACT for making all dots and dashes. The contact is operated by an INTERMITTENT SPRING MOTOR.

THE MOTOR DOES THE WORK; you only control it. The Touch is EXTREMELY LIGHT.

Has MOST CONVENIENT ADJUSTMENTS. Is SHOCK-PROOF. The sending is EASY, and, if you wish, FAST. The Morse is PERFECT.

Send for

"\$5.00 for a Split Dot"

and for Booklet giving description, price, testimonials, and OUR SPECIAL 30-DAY TRIAL OFFER.

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Locating and Determining Faults With and Without a Meter.

The attempt to locate and determine the nature of multiplex and other telegraphic faults today without the aid of a voltmeter or ammeter places one to about as great a disadvantage as an operator would experience trying to copy a code sender on a bonus wire without a typewriter. In each case the operation is obviously slow and liable to error through considerable guesswork.

Nevertheless there are many faults, and probably a majority of them at that, which can be determined with considerable accuracy without an ammeter if one goes about it in the right way; that is to say, first, does a little common sense thinking.

For instance suppose we suspected from the symptoms present that the failure of a quadruplex circuit to work is due to one of the poles of the distant battery being open, but having no ammeter at hand do not care to feel for the current with our fingers. The facts could be ascertained very quickly without leaving the set in the following manner.

Request the operator at the other end of the circuit to close the key on his polar side and make a series of dots on his transmitter. Then

if you hear the incoming signals on the number two relay, go to the "ground" on the home set. He will then be compelled to make his signals with his own battery. If the signals are silenced and your own neutral relay stands open, the indication is that the closed or negative pole of his battery is open, or at least the current is not getting through his pole changer. If the signals continue to arrive, however, while the distant polechanger is closed request him to open the key on the polar side. If the signals are then shut out you will know that it is the positive pole of his battery that requires attention.

If the fault cannot be remedied at once the quadruplex apparatus may still be worked as a duplex by using the number two or B side only. In this case all that is required is to instruct the distant operator to keep the key on his polar side closed or open, according to which position leaves the good pole to the line, and then operate the B side in the usual manner as a duplex.

Again, a meter is hardly necessary to determine the fact that a high resistance has developed in the points of a distant transmitter, or in the leak box coil or connection at that point. In other words, to know that the short end current of the distant battery is arriving in volume almost as great as that of the long end.

This fault should be detected the moment the home relay on the number two side of the quadruplex shows a marked decrease in its working margin. This very reliable sign is indicated by the inability to alter the tension of the retractile spring on the neutral relay to any great extent without interfering with the incoming signals. Of course, the reader should understand that we are not referring to wet weather margins but to abnormal margins which develop at times on apparently normal circuits.

In a case of this kind an ammeter would probably show that the short end value of the arriving current was in volume in the neighborhood of thirty or forty milliamperes instead of about fifteen or eighteen as it should be. Hence when the working margin on the neutral relay is small always suspect the distant transmitter adjustments as being the cause thereof.

An improperly adjusted transmitter very easily brings about this result and the majority of quadruplexes would give much better services if the importance of a finer transmitter point adjustment were more generally realized. An open or defective ground at the other end of a duplex circuit may be suspected when after a careful balance it is found necessary to give the armature lever of the polar relay a great bias in order to read the incoming signals. The necessity for altering the position of the lever indicates a false balance; that is to say, one that

is not true to the working conditions of the circuit when the distant battery is cut in. If there is no foreign current flowing through a conductor when both duplexes are on the "ground," the lever of the polar relay when centered should always lie at a distance exactly midway between the two magnets. If there is no defective ground or line disturbance its position should be normal at that midway point as long as the balance holds good. A biased armature lever therefore gives a strong hint that something is wrong, and the attendant should at once investigate the matter.

Again, if it becomes necessary, not only to balance to the distant battery on a quadruplex circuit instead of to the regular ground coil at that point in order to be able to read the incoming signals on the common side relay of the home apparatus, but also to give the home polar relay armature a bias to improve the incoming signals on the A side, the displacement of the latter lever indicates strongly that the two magnet windings of the polar relay are unevenly wound; or, as it is commonly expressed, the relay is lopsided.

Where a lopsided polarized relay is used on a quadruplex circuit, an ordinary line balance to the usual distant ground coil, although true magnetically so far as it applies to the polarized relay is concerned, is necessarily false to the evenly wound neutral relay because the former instrument requires more current through one of its coils than the other in order to even up the magnetic strength of the two divisions.

An ammeter would of course at once disclose the false balance by showing different volumes of current flowing through the main and the artificial line coils respectively and thus suggest the probability of a defective relay winding. In the absence of an available meter the mere necessity for lever displacement under the conditions stated should be considered good ground for suspecting the windings of the polar relay.

In like manner the presence of a foreign current in the line conductor may be ascertained by means of the armature of the polarized relay. If the volume of such a current flowing through the line conductor from the earth or other source while both the home and the distant duplex or quadruplex apparatus switch levers are on the ground, is great enough to interfere with the normal multiplex current to a harmful degree, it will be found that when the relay armature is finally centered, it is not midway between the magnet pole pieces by any means, but has a decided bias to one side.

From these simple examples it will be seen that while conditions often arise when the displacement of the polarized relay armature is temporarily unavoidable, the necessity for so shifting it is always a reliable sign that something is wrong.

A close observer of the mechanical arrangement of telegraph apparatus of all kinds while in active operation soon learns to detect with

great accuracy the principal troubles that arise, by the signs manifested in the disarrangement of the adjustable parts. The illustration cited is but one of many indicators of trouble which are available and in plain sight if one is but observing enough to detect them.

Recent Telegraph and Telephone Patents.

A patent, No. 946,664, for a vibrator for telephone transmitters, has been granted to J. P. Edwards, of Chico, Cal.

A patent, No. 947,148, for a telegraphophone, has been taken out by Ralph C. Browne, of Salem, Mass.

A patent, No. 947,244, for a telegraphic transmitter, has been secured by Patrick B. Delany, of South Orange, N. J. An auto-dot key for making dots automatically by current impulses of uniform strength and dashes by current impulses of uniform and less strength than used for dots.

A patent, No. 947,320, for auxiliary signaling apparatus for telephone lines, has been awarded to Charles S. Winston, of Chicago, Ill.

A patent, No. 947,335, for a connection-registering device for telephones, has been issued to David S. Hulfish, of Chicago, Ill.

A patent, No. 947,340, for a telephone switch apparatus, has been secured by Stanislaw A. Koltonski, of Boston, Mass.

A patent, No. 947,395, for a telephone transmitter, has been granted to William E. McCormick, of Chicago, Ill.

A patent, No. 947,772, for a selective ringing key, has been awarded to Burton W. Sweet, of Cleveland, Ohio.

Investigation of Telegraph and Telephone Companies in New York State.

The legislative committee of New York State which is inquiring into the wisdom of placing the telephone and telegraph companies under State supervision, has continued its investigations, holding several sessions recently. Among the witnesses examined was Mr. George Gray Ward, vice-president and general manager of the Commercial Cable Company, who submitted data showing how the Commercial Cable Company reduced the old Atlantic cable rate from fifty to twenty-five cents a word and how at that rate, which is the one now charged, is the lowest cable rate in the world except where deficits are paid by government taxation.

Moreover, he said, there is no combination between the Atlantic companies to maintain a uniform toll, and while in the last ten years the operating expenses of the cable companies have greatly increased, the use of code words and phrases, which are supplied gratis, has so increased within the same period as to minimize the cost of cable messages to a point far below a twenty-five cent rate.

"The disposition of cable companies to meet public requirements," said Mr. Ward, "is con-

spicuously shown in their attitude toward code language employed to reduce charges and so reduce the cost of cable transmission. Those who use the cables day by day are highly expert in devising cipher codes which enable them to express many words by one word. Originally these words had to be selected from dictionaries and were therefore genuine words, but owing to the complaint that restriction to genuine words did not give to merchants a sufficient range of words to make up efficient codes the rule has been gradually relaxed to admit artificial or manufactured words that are supposed to have some resemblance to real words. The extent to which this liberality has been taken advantage of may be judged from examples of artificial words which have been taken from actual cablegrams and are alleged to be pronounceable."

Mr. Ward gave to Senator Davis, chairman of the commission, the following list of code words composing a cablegram with the remark that where words of the kind were used a mistake in a letter of one of them had the effect of destroying the whole sense of the message:

"Nofebawuma phidvuztaf itacomelis kiuvwuv-gaw exsexaicgu eesawofyid zylemuzzop gabaga-bhaka pawyngicob wowiyihbow jorthpezut vrtfe-verd guasyabjcy, eqkeyefogi uqbijegotu ulhkyco-kklyz."

"Each of these so-called words," explained Mr. Ward, "really represents ten figures; the ten figures are two groups of five figures, and each group of five figures represents a separate code word and each code word easily represents, on the average, at least ten plain words. The net result is that each of the so-called code words, representing at least twenty words in plain language, is transmitted at a total cost of twenty-five cents."

"The cable companies are transmitting these notwithstanding that they are an imposition. The Postmaster General of Great Britain, in a letter to the London Chamber of Commerce, characterized them as an abuse. It will be noticed that the so-called words contain only ten letters each. This is only because the International Regulations fix that limit; were it not for this limit it is probable that the entire cablegram given would have been run together and presented for transmission as a single word of 160 letters, to be transmitted at a cost of twenty-five cents. It is almost impossible to transmit such words rapidly and correctly by cable, and yet any change or omission of even one letter would make an entirely different meaning. To transmit artificial code words by cable is most difficult."

"The point is made by agitators that codes are a luxury of the rich. That is not true. The cable companies have standard codes at their offices which the public are at liberty to use without charge, or, if the customer prefers, he may purchase an ordinary code at a small price. Travellers' codes are distributed free by bankers and merchants as advertisements. By the aid of these codes a message may be cabled from Europe

to America or America to Europe for seventy-five cents."

"When it is borne in mind that ninety-eight per cent of the cable messages are in cipher code and each code word, as explained, represents at least twenty plain words, it will be seen that cablegrams in code bring the rate down to less than two cents a word for the translated message."

"There is another very important thing to consider. Because of the difference in time between Europe and America the business hours common to both countries are only three or four. It is imperative that the cable companies shall have ample facilities to transmit with reasonable despatch all the business offered on both sides of the Atlantic during those hours."

"We are not in favor of either of the working of cables by the State at a loss or of the subsidizing of private cables on commercial grounds, both of which courses appear to us to burden the general taxpayer."

"The amount expended by all cable companies for maintenance and repairs," continued Mr. Ward, "is enormous; the total sum is little realized by the public. For instance, it is costing the Commercial Cable Company over \$70,000 a year to maintain a special seagoing repairing steamer at the wharf on the American side in readiness to put to sea at short notice, and in addition thereto a large amount is expended when the steamer puts to sea to repair a cable. Then, there is the expense of repairing the cables themselves. Sometimes a single break costs over \$50,000 for repairs. On one occasion it cost the Commercial Cable Company \$92,000 for a single repair."

"The twenty-five cent rate is a fair rate, it is no more than necessary to pay operating expenses and to keep the plant in thorough repair and readiness to furnish the best possible service in point of regularity, accuracy and speed and to pay a very reasonable return on the money invested. The service cannot be rendered for less."

Mr. James A. Scrymser, president of the Mexican and the Central and South American Telegraph Companies, testified that these two companies used one cable and charged a fifty cent rate, although in many cases messages sent through their cable did not travel half the distance of messages over the Atlantic cables of the Commercial Cable Company.

Mr. Union N. Bethell, vice-president of the New York Telephone Company, and Howard F. Thurber, its general manager, also testified as to telephone rates in the metropolitan district. Mr. Thurber said that the rates were as low as it was possible to make them and continue to earn a profit and that they were largely based on the density of population. He said that it was necessary to establish zones in which fixed charges were made, and for that reason local calls were made five cents in Manhattan and ten cents from Manhattan to the Bronx and Brooklyn. He said that a reduction of these ten-cent rates would

seriously affect the company's dividends. He explained the recent reduction in certain suburban rates by saying that the increase in business from these points made the reductions permissible. Mr. Bethell said that it cost more to carry a man's voice over a certain distance than to carry his person, because when a man telephoned he had the exclusive use of the apparatus. He also said that many protests had been received from business men against the installation of two telephone systems in the same city.

Several other telephone and telegraph officials have been before the committee, which hopes to be able to finish its work and make a report by March 1.

Personal.

Mr. Thomas A. Edison, accompanied by his wife and youngest son, left February 1 for his winter home at Fort Myers, Florida, where he will remain until April, as is his usual custom.

Colonel William Bender Wilson of Holmsburg, Philadelphia, president of the Society of the United States Military Telegraph Corps, was a recent New York visitor.

Mr. W. H. Hurst, president of the Stock Quotation Telegraph Company, James Rascovar, president of the New York News Bureau, Henry Myers, president of the Hamilton Press, and J. J. Walsh, director of the Stock Quotation Telegraph Company, sailed for England on the *Maurelania*, February 9, to inspect the system of the Central News Company, Limited, of London, in which they have a large interest.

Mr. Bernard E. Sunny, president of the Chicago Telephone Company, at the annual meeting and dinner of the Western Society of Engineers on January 12 read an interesting and instructive paper upon "The Engineering of Chicago," in which he outlined plans of proposed permanent city improvements relating to sewers, steam railroad terminals, pavements, subways, etc. Mr. Sunny is one of the most wide-awake and progressive citizens of Chicago, and is probably doing more than any other individual for the improvement of the city.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Among recent executive office visitors were Superintendents C. F. Ames, of Boston; W. A. Sawyer, of Philadelphia, and F. E. Clary, of New Haven, and Managers W. J. Higgins, of Buffalo; J. P. Doyle, of Oswego; E. A. Baird, of Binghamton; I. W. Copeland, of Troy; A. E. Reynolds, of Schenectady; J. E. Bierhardt, of Syracuse; T. J. Meade, of Albany; F. E. Howell, of Utica; H. F. Taff, of Washington; J. M. Creamer, of Baltimore; J. W. Reed, of Philadelphia; H. H. White, of Portland, Me.; E. Ryder, of Hartford, Conn., and F. H. Lamb, chief clerk to Superintendent Sawyer, of Philadelphia.

Mr. I. N. Miller, Jr., assistant general superintendent at San Francisco is expected to arrive in New York from Europe, February 16, on his

way home from a trip around the world which he has been taking, accompanied by his wife, during the past year for the benefit of his health.

The managers of the first district, Eastern division, Mr. E. M. Mulford, superintendent, held a conference in the office of that official in New York, February 5. Managers from Buffalo, Syracuse, Oswego, Utica, Schenectady, Albany, Troy, New York, Brooklyn, Newark, Jersey City, and Binghamton were present.

At the annual meeting of the American District Telegraph Company of New York, held January 27, Mr. Union N. Bethell was elected a director to succeed Phillip V. R. Van Wyck. All of the other officers and directors were re-elected.

At the annual meeting of the stockholders of the American District Telegraph Company of New Jersey, held at Jersey City, N. J., on February 8, Mr. Union N. Bethell was elected a director to succeed George J. Gould, resigned. All of the officers were re-elected.

RESIGNATIONS AND APPOINTMENTS.

Mr. W. E. Black, of the Cleveland, O., office, has been appointed manager at Fort Wayne, Ind., vice Mr. O. L. Perry, resigned. Mr. Black was born at Youngstown, Ohio, June 28, 1886, and entered the telegraph service in that city in 1900, as messenger boy. He afterward became clerk and then operator, and was later employed by the Erie Railroad, and also at Jacksonville, Fla. Previous to his present promotion he had served as relief manager at various places.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

President Clarence H. Mackay, accompanied by Charles C. Adams, second vice-president of the company, has been making a trip of inspection in the southern division that took them as far south as New Orleans.

Mr. W. I. Capen, general superintendent of plant, has returned from a business trip in the South.

The first banquet of the recently organized Postal Telegraph Club of Atlanta will be held in that city February 26.

Several changes have been made recently in the executive offices, giving Mr. E. J. Nally, vice-president and general manager and Mr. C. P. Bruch, third vice-president more room for their offices, and to provide space for a file-room and an employees library.

RESIGNATIONS AND APPOINTMENTS.

Mr. Howard Mayhall has been appointed manager at Lexington, Ky., vice Mr. Samuel Howard, resigned.

Mr. F. W. Jacobs has been appointed day chief operator and H. M. Barlow night chief operator of the Peoria, Ills. office; the former filling the vacancy caused by the advancement of Mr. F. H. Jacobs to the managership.

The Cable.

It is reported that the Western Telegraph Company has commenced legal action against the Brazilian Government and Mr. Richard Reidy, in connection with a concession granted to Mr. Reidy for laying and working submarine telegraph cables on the coast of Brazil. The cancellation of the concession is demanded on the ground that the company's rights are infringed thereby.

In the semi-annual report of the Direct United States Cable Company for the six months ending December 31, 1909, it was stated that the company had under consideration the plan of landing the end of their main cable at a point in Newfoundland. The cable for transmitting the Atlantic messages would then be shorter, and so capable of working at a greater speed. Another advantage would be that there would be less likelihood of interruption, and such interruptions as might occur would be of less importance with regard to the earnings.

A committee of the Australian Senate has reported that present conditions give an imperfect cable service and insufficient news of various parts of the Empire and has recommended the completion of the all-British cable, in order to bring about a reduction in the charges for press cablegrams. The restriction prohibiting newspapers supplied with cable news by the Cable Association from publishing news received through any other source is condemned as being exceedingly injurious, and it is recommended that steps be taken to make such restrictions impossible.

Mr. James A. Scrymser, president of the Central and South American Telegraph Company and Mexican Telegraph Company, together with Mrs. Scrymser, Mr. J. Montgomery Hare and Mr. Loyall Farragut will sail on the steamer "Vasari" for Buenos Aires February 19, where they will remain about two weeks visiting places of interest in Argentina and Uruguay. From Buenos Aires they will go to Valparaiso, across the Andes, thence to the Isthmus of Panama, visiting the stations of the Central and South American Telegraph Company. They expect to remain on the Isthmus of Panama for some time, arriving in New York about May 20.

Municipal Electricians.

The contract for installing a fire alarm system at Palo Alto, Cal. has been awarded to the Gamewell Fire Alarm Telegraph Company.

A new fire system alarm has recently been completed at South Bethlehem, Pa. The new system has four circuits and twenty-four stations.

A large increase was noted in the number of fire and police calls by telephone in Chicago during the past year. There were 8,825 fire calls, an increase of 986 over the preceding year and 62,005 police calls, an increase of 12,602 over 1908. Free service is given by the telephone company for all calls to fire or police headquarters.

The municipal authorities of Rochester, N. Y., having found that the telephone is used more in that city for reporting fire alarms than the fire alarm boxes are taking steps to mount the boxes in more conspicuous places, have them painted red, and have red lights placed above them.

Legal.

According to a recent decision of the Supreme Court of Oklahoma cities and towns in that state have no right to fix telephone or telegraph rates, such power being confined solely to the State Corporation Commission.

A suit has been brought against one of the telegraph companies in the State of Mississippi to recover damages alleged to have resulted from a runaway.

The declaration in the suit states that the rays of the sun caused the wire to "shine, flash and sparkle brightly" and the "shining and sparkling wire" frightened an "ordinarily gentle horse" when he came "suddenly and unexpectedly in view of and in close proximity with the said shining and flashing wire."

After this, the construction gangs will either have to blindfold all the horses in the vicinity or put a screen around the wires.

An interesting legal question now confronts the State officials of Michigan. Under the laws of that State telephone and telegraph companies have to be incorporated under a special act of the legislature, while all other companies doing business in the State are incorporated under a general act. The United Wireless Telegraph Company has applied for permission to do business in that State, and the authorities are in a quandary to determine under which classification the company should be incorporated. As they do not use wires for the transmission of messages, some are of the opinion that the wireless company should be incorporated under the general act.

According to an opinion recently rendered by the Fourth Court of Civil Appeals of Texas, telegraph companies which accept a message by telephone cannot claim that the conditions of their contracts as printed on the back of the telegram forms are applicable. In reversing the action of a lower court, the judge took as his ground the fact that the agent of the company cannot also be the agent of the sender and that the employee of the telegraph company becomes both in cases where messages for transmission over the wire are accepted by him orally or over the telephone.

As a result of the decision of the Supreme Court of the United States in the case of the Western Union Telegraph Company against the State of Kansas, in which it was held that the State could not collect a tax based upon the entire capitalization of the company, similar attempts on the part of Wyoming and other States to collect large amounts from the Western Union for doing business will be abandoned.

Radio-Telegraphy.

The United Wireless Telegraph Company is preparing to build a large addition to their manufacturing plant at Jersey City.

The vessels of the Chilean navy will soon be equipped with wireless telegraph apparatus of the Marconi system.

At the regular monthly meeting of the Wireless Institute of New York, held at the Engineering Societies Building February 2, Mr. A. R. Sharples presented a paper on "Resistance in Oscillatory Circuits."

Experiments have been made recently in conveying music by wireless telephone from the Metropolitan Opera House to the stations around New York within communicating distance by this method.

The New England Wireless Society at a meeting held in Boston February 4, passed resolutions protesting against the proposed appointment of a National Wireless Commission unless the interests of the manufacturer and experimenter are properly represented.

Mr. E. B. Moore, a student in the Massachusetts Institute of Technology and president of the wireless society recently formed in that institution, is endeavoring to develop a wireless telephone outfit small enough to be carried in the pocket. He believes that such apparatus can be produced with a range of fifty miles.

The Marconi Wireless Telegraph Company, it is said, expects to establish a chain of twenty or more stations at principal points throughout Canada, the object being to establish a cheap service between all parts of England and the Dominion. Messages to the less important points in Canada will be transmitted to those places by telephone.

Dodge's Institute of Telegraphy, Valparaiso, Ind., has established a wireless station to teach his branch of the art to its pupils, and each student being provided with a receiving outfit in his room, is required at certain times during the day to copy messages sent out by the central station. Mr. P. F. Godley, who has charge of the instruction in wireless was before connecting himself with this institution, one of the best operators of the United Wireless Telegraph Company, and is also an expert wire operator.

A novel arrangement for producing practically undamped oscillations has been developed by Professor W. Peukert, of Brunswick, Germany. For a park gap two iron discs are used slightly separated from each other and so arranged that when one of them is revolved a thin film of oil is formed between them. When the discs are at rest and a sufficient difference of potential is applied a discharge in the form of small sparks takes place. If the voltage is increased the discharge takes the form of a continuous arc. When the movable disc is rotated the arc is resolved into spark discharges between the two discs. The use of the oil between the discs gives a more regular effect than would otherwise be obtained.

The Spanish war department has ordered two new wireless telegraph stations. One of these, a high power station, will be installed at Madrid, and the other, a smaller power station, at Ceuta, thus establishing wireless communication between this island and the Spanish capital.

A wireless station has recently been installed on the Island of Angaur, belonging to the South Caroline group in the Southern Pacific. By this means the few hundred people living on this island have connection with the outside world through a station on the island of Yap, 310 miles distant, which is in direct communication by cable with San Francisco, Shanghai and Menado.

The Balsillie system of radio-telegraphy, the apparatus for which has been developed by the British Radio-telegraph and Telephone Company, has several novel and interesting features. A rotary spark gap is used which is so constructed that when rotated a large air pressure is produced at the points when they are in closest proximity. This gap is capable of interrupting the discharge from the condenser from 300 to 1500 times per second. The detector used is a very sensitive form of magnetic hysteresis transformer which is fully as sensitive as an electrolytic detector and is entirely automatic in its action and not subject to deterioration due to heavy static charges on the aerial.

Another Rescue by Wireless.

The value of wireless telegraphy as a lifesaver at sea was again demonstrated February 4. The steamship Kentucky left Newport News, Va., February 2, on her way to the Pacific Coast. Soon after getting to sea she encountered heavy weather and began to leak so badly that by the morning of February 4 the captain gave up all hope of reaching Charleston, the nearest port, and had W. D. Maginnis, the operator of the United Wireless Telegraph Company on board the vessel send out the distress signal "S. O. S." together with their location as near as they could determine it. The steamship Alamo, bound for Key West, the nearest vessel to the scene, was sixty-five miles away and she made all haste to reach the sinking vessel. Before the Alamo came in sight the water had risen so as to put the dynamo on the Kentucky out of commission and thus render the wireless apparatus useless, but the location given by operator Maginnis in the first messages had been accurate enough so that the Alamo had no difficulty in finding the sinking ship and taking off the crew, consisting of forty-seven men.

Mr. Maginnis has been a wireless operator for about five years and is considered one of the best operators in the United Wireless service. Before being assigned to the Kentucky at Newport News, after the operator who accompanied the ship to that point from New York had resigned, he was informed of the fact that the ship was not considered seaworthy, but this did not deter him from accepting the post.

The Telephone.

Mr. H. R. Swartz, of Trenton, N. J., has resigned from the presidency of the Interstate Telephone and Telegraph Company of New Jersey, which was recently acquired by the Continental Telephone and Telegraph Company, and Mr. John A. Howard, president of the latter company, has been elected as his successor.

The Cumberland Telephone and Telegraph Company having made extensive improvements and additions recently to their toll and long-distance facilities at Evansville, Ind., and vicinity, gave a reception to the business public in that city January 25, affording them an opportunity to see how promptly connections could be made over the new routes to distant points.

At a recent meeting of the board of directors of the Hudson and Middlesex Telephone and Telegraph Company at the headquarters of the company at Perth Amboy, N. J., it was decided to increase the capitalization from \$250,000 to \$1,000,000. The additional capital is for the purpose of extending the plant of the company and completing a line to Washington, D. C.

At the convention of the Wisconsin Electrical Association held in Milwaukee January 19 and 20, Mr. W. R. McGovern, chief engineer of the Wisconsin Telephone Company, presented a paper on "Inventories," in which he explained the methods followed in taking inventories of telephone exchange plants in Wisconsin to determine the estimated cost of replacing the existing plants as well as the estimated present value.

A bill has been introduced in the Ohio legislature requiring competing telephone and telegraph companies to interchange business in order that all points served by any company may be reached by a customer. The proposed statute places the regulation of these interests under the jurisdiction of a commission which also has supervision over electric light and power companies, railroads and other public utilities, with power to fix rates.

In a recent lecture before the Berlin Electrical Society Mr. A. Ebeling described experiments made by German engineers in the use of the Pupin system of loading telephone lines. As a result of the investigations with the use of Pupin induction coils on aerial lines they found that an economy of line conductor of fifty per cent could be obtained; in other words, that a loaded line could be constructed for about half the expense of an unloaded line having the same efficiency.

The regular monthly meeting of the American Institute of Electrical Engineers held February 11 at the Engineering Societies' building, New York, was under the auspices of the Telegraphy and Telephony Committee, of which Mr. William Maver, Jr., is chairman. Mr. W. L. Campbell presented for discussion an interesting paper upon "Modern Automatic Telephone Apparatus," in which he described at considerable length the operation of the principal automatic system in use at the present time.

At a meeting of the New York Telephone Society held February 15 Mr. G. Swopa, general sales manager; Mr. O. D. Street, general telephone sales manager; and Mr. W. E. Harkness, sales engineer of the Western Electric Company, gave short talks upon the relation of the telephone to railway service.

An interesting application of the intercommunicating telephone system has recently been made in the public schools of Haddonfield, N. J. From a master station in the principal's office any one of thirty-two stations scattered throughout five buildings may be called instantly by merely pressing a button, and the principal is thus enabled to get into communication with any of the teachers without delay.

In pursuance of the policy of consolidation of the smaller subsidiary companies of the American Telephone and Telegraph Company, papers have been filed with the Secretary of State of New Jersey, completing the consolidation of the Delaware and Atlantic Telegraph and Telephone Company of New York with the company bearing the same name in New Jersey. The Northeastern Telephone and Telegraph Company, the Hudson River Telephone Company and the Seashore Telephone Company have all been consolidated with the New York Telephone Company.

Mr. Gansey R. Johnston, formerly secretary and auditor of the American District Telegraph Company of New Jersey, but who has been since 1905 general manager of the Columbus, Ohio, Citizens' Telephone Company, has been made general manager of all of the telephone companies in Ohio, recently acquired by J. P. Morgan and Company, with the exception of those at Dayton and Toledo. The system over which Mr. Johnston now has supervision comprises fifty-eight exchanges, with about 42,000 telephones and a toll line system extending throughout the state with 3,000 miles of pole lines and 15,000 miles of toll circuits.

Evidence was taken recently in New York in the suit which has been brought by the minority stockholders of the United States Telephone Company and the Cuyahoga Telephone Company, to enjoin the sale of the controlling interest in those companies to J. P. Morgan and Company. Mr. E. J. Hall, vice-president of the American Telephone and Telegraph Company, was the principal witness examined. He testified that overtures had been made to him by James S. Brailly, Jr., and F. H. Goff, president of the Cleveland Trust Company to purchase the properties involved. Mr. Hall endeavored to bring this about but when he attempted to get a banking concern to finance a holding company for the stocks of the various companies, all of those whom he approached on the subject, including J. P. Morgan and Company, refused to have anything to do with the deal. Mr. Hall accordingly gave up his attempt to bring about the purchase and notified the holding interests that he would not buy the stocks. Shortly after this J. P. Morgan and Company bought the stocks on their own account.

Some Old Time Reminiscence.

Mr. J. J. Fowler, secretary of the Board of Civil Service Commissioners, at New Orleans, La., and an old time telegrapher sends us an historical document worthy of production. In forwarding the same Mr. Fowler says: "Time's flight has left few of the old clippers of space. I presume to send you the enclosed mile stone that you may measure your data of the kids whose foot prints have been lost in the shifting sands."

The document enclosed reads as follows:

Boston, January 23, 1865.

Mr. J. J. Fowler,

Norwich.

My Dear Sir:

By reference to the last number of the "Telegrapher" it will be seen that complaint is made that the Boston District of the "National Telegraphic Union" admitted to membership an operator under the age of eighteen, which is in violation of the constitution. This of course has reference to yourself, as I learn upon inquiry that you lack ten months of the necessary age.

I am instructed by the district to inform you that you were admitted under misapprehension as to your age and that we cannot consider you a member as we have pledged ourselves to support and sustain the provisions of the constitution. We very much regret this and have not the slightest fault to find with your qualifications as an operator.

Trusting that when you reach the required age you will present your name, which will be promptly acted upon without a dissenting voice, and with kindest regards to you, I am,

Yours,

T. A. Davin.

Secretary, pro tem.

P. S.—If you have sent the directors any funds on account of initiation fee or dues, they will be returned.

The writer of the letter, Mr. T. A. Davin, is still a resident of the "Hub," where he is employed by Richardson Hill and Company, brokers. When Mr. Davin wrote the letter he had just left the service of the Government having been a military telegrapher during the Civil War.

On receipt of Mr. Fowler's letter we mailed it to Mr. Davin for his information, and to recall the painful duty which he once had to perform and that gentleman replied, in part, as follows: "Mr. Fowler's letter was an agreeable surprise. Please present my sincere regards to our old friend, and say I always regretted that the trifle of a few months kept him out of the National Telegraphic Union, because if the institution had been run by men of his calibre it would be in existence today, and a source of comfort to many worthy operators. In these days we hear much of the younger generation, but very little of those of fifty years ago."

"I have read the published accounts of the trials of telegraphic skill that have been going on for a long time and have wondered why the early years of the quadruplex have not figured in these interesting historical writeups

"In the early days of the quadruplex a trial of speed was ordered by the officials between New York and Boston, in which it was my privilege to take part. The system was by no means perfected at the time and the result was so gratifying that mention should be made of it. Mr. E. B. Pillsbury, now general superintendent of the Postal Telegraph-Cable Company, New York, who was one of the night chiefs of the Boston office at the time, furnished me with the figures, accompanied by a note reading as follows: 'I enclose memorandum in regard to speed trials in which you were interested. I think you have every reason to be proud of the record, which is as follows:

Boston, Sept. 1876.

(Extract from Chief Operator's Register.)

Western Union Telegraph Company.

Quadruplex test of speed between Boston and New York.

Started 10:42 a. m. Boston time; closed 11:42 a. m.

	Mes.	Words.
No. 1 side—W. E. Kettles sent.....	61	1,936
No. 2 side—C. D. Stanford sent.....	69	2,264
No. 1 side—Chas. Finch received....	57	1,643
No. 2 side—T. A. Davin received....	65	2,151
	252	7,994

These figures may look small to the present generation of operators, but when we take into consideration that the quadruplex system was new and not perfected, and the operators were more or less subjected to interruptions, the trial was a good one and was so considered by all concerned at the time it took place.

Mr. Davin was born in 1837, and became an operator in 1852 in the Astor House office, New York. He has been in active telegraph service in Boston since the close of the War.

Mr. Fowler was born in Buffalo, April 4, 1848, and entered the telegraph service upon the Buffalo and Lake Huron Railroad in 1860, later being employed by the New York Central Railroad at Albany. In 1863 he became an operator for the American Telegraph Company, serving that company at Albany, Troy and Norwich, Conn. At the latter place he worked on the famous No. 4 East press circuit. At that time the sending operators at New York were Fred Seibert, now dead, and David W. McAneney, now one of the chief operators in the New York office, where he has been continuously employed since the early sixties. The receiving operators on the line besides Mr. Fowler, were Fairchild, at New Haven, Shean at Hartford, Pope at Providence, Delany at Worcester and Duxbury at Boston. Most of these operators have been immortalized in the telegraph world by Walter P. Phillips in his series of articles which have been appearing in our columns during the past few months. Mr. Fowler next occupied a position at Buffalo for a brief period, when he entered the United States Military Telegraph Corps, in which he remained until the close of the war, when he went to Memphis, Tenn., where

he remained until 1880, when he left the telegraph to enter the telephone field. In 1883 he became general manager and director of the company operating in Mississippi and Louisiana, which position he held until his retirement in 1897. In 1899 he was called upon to organize a municipal civil service department in New Orleans and he has, since that time, been secretary of that body.

General Mention.

Representative Cary, of Milwaukee, has introduced in Congress a bill to prevent telegraph companies from forwarding, except by telegraph or telephone, telegrams or messages which are accepted for telegraphic transmission by wire.

The rehearing of the United Press petition for a permanent injunction against the Associated Press to prevent it from compelling members to remove wires and operators of other news services from its offices, it is said, will be called soon in Chicago.

The Venezuelan Government is preparing to construct a telegraph line to a point near the borders of Colombia and Brazil and if possible extend this to connect with the Brazilian system. Telegraphic connection between Venezuela and Ecuador has recently been established via Bogota.

The telegraph and telephone service in Paris was badly demoralized as a result of the recent flood in that city and has not yet been restored to its normal condition. At one time all communication with London was cut off and the news from London and other European cities was received in Paris via New York.

A committee of the National Electric Light Association, with Mr. W. K. Vanderpoel as chairman, is now engaged in an investigation of the subject of preservative treatment of poles and cross-arms. In order to gather desirable data, a circular of inquiry has been sent out to those interested in this matter, containing sixty questions bearing upon the subject.

We are in receipt of a finely illustrated catalogue of the Port Arthur Business College, Port Arthur, Texas. This outlines in detail the various courses given in this college, including the one in telegraphy and telegraph engineering. The equipment includes a complete line of wireless apparatus, so that the students graduating from this department will be prepared to engage in the wireless field as well as in commercial or railway telegraphy.

Herr Ruhmer, the German inventor who has been studying the problem of television, has evolved a scheme whereby he believes that the image of a person or object or any picture can be instantly reproduced at a distant point. To produce only the head and shoulders of a person, however, would require four thousand selenium cells and a corresponding number of wires between the two points, and Herr Ruhmer estimates that the apparatus alone would cost \$300,000.

Telegraph Happenings Here and There.

A man entered a southern telegraph office one evening recently and asked the night chief operator if he was in charge of the wireless service. In spite of his reply that he was not, the intruder began to deliver a wireless message to the chief with his fists and it required the combined efforts of several of the operators to persuade him that his services in the office were not desired.

A man who claimed to be a telegraph operator from Newburg, N. Y., was taken in hand by the police of Wilkes-Barre, Pa., recently after telling them that he had had \$6,000,000 stolen from him. As he claimed to have \$14,000,000 left, however, he did not mind the loss very much. Later when questioned by the mayor he admitted that he had lost a large amount, but as he thought he had \$10,000 left he did not complain.

A telegraph lineman, who recently sued a telegraph company for damages as a result of a fall which he sustained, brought into court a six-foot section of the pole which he claimed broke and caused him to fall twenty-five feet to the ground. It is unfortunate in the celebrated controversy about a pole which has been before the court of public opinion for some time past, the contestants could not produce as conclusive evidence as this.

An Arkansas woman has entered suit against a telegraph company for damages caused by mental anguish which she suffered as a result of an error in a telegram which she received. A relative sent a message saying "Father died this morning" and when delivered it read "Mother died this morning." The mother referred to was a favorite aunt and the sorrow which she felt for her death was not alleviated even when she learned that it was her uncle instead of her aunt who had died. She thinks that a few thousand dollars now would heal her lacerated feelings.

Among the peculiar suits brought against the telegraph companies under the so-called "mental anguish" laws enacted in the various states was one in North Carolina where the plaintiff asked for \$2,000 because the telegraph company failed to deliver to him promptly a message notifying him of the birth of a daughter. Another suit brought in Kentucky by the wife of an actor is based on the failure of the telegraph company to deliver a message to her husband who was with his company playing in Chicago, notifying him of the illness of their daughter. Her damages were caused, she alleges, by failure to have her husband's companionship at such a time. An Iowa man, being delayed in getting home, owing to a telegraph company's not delivering a message promptly and as a result of the delay failing to arrive in time to be present at his wife's death-bed, was considered in that state sufficient cause for a judgment of \$600 against the company.

It is said that there are telegraph wires in Heaven but no operators to work them.

The Ready Messenger

The quickest way to transmit a telegraph message from the wire to paper is

"VIA SMITH PREMIER."

This typewriter has for twenty years held first place with telegraph operators as the easiest and speediest "mill" to operate. The **New Model No. 10 Smith Premier** is even better suited to the use of telegraphers.

POSTAL OFFICIAL DIAGRAMS.

The diagrams appearing in "Official Diagrams of the Postal Telegraph-Cable Company's Apparatus and Rules Governing the Construction and Repair of Lines" were made from the company's blueprints and are absolutely correct. This volume, which is published by TELEGRAPH AND TELEPHONE AGE, under official sanction and supervision, is of especial value to operators and linemen. It will be sent to anyone, postpaid, on receipt of fifty cents. Address J. B. Taltavall, TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York.

Any electrical or telegraph book published for sale by **Telegraph and Telephone Age, 253 Broadway, New York.**

EDISON BSC PRIMARY BATTERIES

Our book about EDISON BSCO PRIMARY BATTERIES gives full details as to their construction and shows why they are superior to whatever batteries you are using, no matter what your requirements. If you wish to improve your battery service and at the same time reduce the expense, you should have this book.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

FEBRUARY 16, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Iron Wire Versus Copper.

As a result of the many severe sleet storms which have visited different sections of the country during the past two years, and the resulting damage to telegraph lines, there are many who advocate the general return to the use of iron wire for telegraphic purposes. It is doubtful, however, whether the results obtained by carefully comparing the behavior of copper and iron wire under storm conditions, would actually show any good reason for reverting to the former general practice of using iron wire of a size large enough to get the required conductivity on long circuits. With the introduction of copper wire for telegraphic purposes one of the factors which made its adoption desirable was the greater conductivity which could be obtained with a smaller cross section of wire. The smaller weight of the metal which it was possible to use and still secure better conductivity for long circuits, together with the longer life of copper than iron when exposed to atmospheric conditions offset the increased cost of copper per pound over iron

wire enough so as not to make its use a financial burden upon the companies. As a result, the common practice in line construction has, in recent years, been to use a copper wire of No. 9 gauge, or even smaller, whereas, when iron wire was generally used No. 6 gauge wire or larger was commonly employed. Comparing the two lines constructed of No. 9 copper and No. 6 iron wire, respectively, we find that when first built the line of iron wire has a breaking strength of about three times that of the copper wire. Even when iron wire is well galvanized the zinc coating is soon broken off in places and the iron, being exposed to the corroding influences of the atmosphere, rapidly loses a large part of its original strength, so that in a few years the copper line is as strong as the one built of iron wire. That this is true is shown, in a measure, in nearly every case where there has been a chance to compare the behavior of the two types of line construction under abnormal weather conditions. It has been found at such times that No. 6 iron wire has suffered as severely as the smaller copper wire. Hence, from the standpoint of increased ability to withstand severe weather conditions, it is hard to see where iron wire has any advantage, in the long run, over the copper.

Another factor which has not heretofore received the serious consideration of telegraph engineers now enters into the problem of line construction. That is to build the lines so that they may be used for telephoning as well as telegraphing. It is a well known fact that the iron wire is not at all suitable for telephonic purposes, its low conductivity alone making it useless for long lines. Hence, in order to realize the greatest possibilities out of a pair of wires, that is to have them serve a dual purpose, it is necessary that they should be of copper. Taking into consideration all of the conditions which have to be met in line construction, there does not seem to be any probability that iron wire will ever supersede copper for use on either telegraph or telephone lines.

Regulation of Telegraphs in New York State.

The careful investigation which has been made recently by a legislative committee of the conduct of the business of the telegraph companies in New York State has failed to reveal any of the startling facts expected by some would be reformers who believe that telegraph rates in this country are altogether too high and that the companies are making exorbitant profits upon the business. In fact, if, as a result of the investigations of this committee, the telegraph companies are placed under the supervision of the Public Service Commission, it is very doubtful if that body will require any reductions in rates, or will suggest any changes in the methods of handling the business. According to the testimony of Colonel Robert C. Clowry, president of the Western Union Telegraph Company, the average cost to his com-

pany of handling a message is twenty-eight and one-half cents and the average return is thirty-four and one-tenth cents. Upon a business of 80,000,000 messages per year this shows a profit of \$4,480,000 or less than five per cent. interest on the invested capital of the company. This surely is not an exorbitant return for an investor to expect on his money. The system which is in use to handle the telegraphic business to-day is the result of over sixty years of experience, and of the labor of many men of high executive ability, combined with the best electrical engineering talent to reduce the cost of handling the traffic to a minimum. As President Clarence H. Mackay, of the Postal Telegraph-Cable Company, said in his testimony, allowing for cost of materials and work, for the fact that addresses and signatures are sent free and for the great distance covered, the service in this country is undoubtedly the cheapest in the world. The rates in this country are often compared with those in European countries, where the telegraphs are owned and operated by the Government, but it must be remembered that the distances covered in those countries are small compared with those in the United States, and in England, where cheap rates obtain and a charge is made for addresses and signatures, there is a large deficit each year, which has to be met by the Government.

Advocates of cheaper rates usually advance the theory that if the rates were reduced the business would increase enough so that the companies could still make a profit. Unfortunately, however, these would be reformers fail to show just how this could be done. To handle more business, the companies would have to provide additional wire facilities, more operators and more messengers, and it is hard to see how any of the items which go to make up the cost of a message, could be reduced enough to permit of any considerable reduction in the rates.

We have always contended that inasmuch as the greater part of the business of the telegraph companies is inter-state, that if any regulation of the conduct of their business is necessary for the public good, such control should be in the hands of a Federal Commission. The Public Service Commission of New York State, however, has not shown any inclination to change existing methods and rates in force among public utility corporations until they could show a way in which such change could be made without doing an injustice to the interests involved. Hence, the stand taken by both President Clowry and President Mackay that they were not opposed to state supervision if the people of the State desire such regulation of their business, is a good indication of the sincerity of these gentlemen in their belief that they are giving the public the best and cheapest telegraph service possible at the present time.

Taxation of Telegraph Companies.

It seems to be the general opinion of those outside the service who have anything to do with fixing the valuation of telegraph property that it is worth much more than is admitted by

those who are in the business and know the actual cost of everything that goes to make up a telegraph system. As a result the assessors in most small towns who have to fix a value on the property of the telegraph within the limits of their domain usually estimate it at much above its true valuation, in some instances multiplying the actual cost several times. If they really know the true worth of the telegraph system they will still make the assessment high, as they think the telegraph company is a foreign corporation and ought to pay a larger proportional share of taxes than the other property owners in their town, most of whom are friends of or at least are known individually to the assessors. When it comes to valuing office equipment some of the most extravagant ideas are entertained. In some instances bills have to be produced in order to convince the assessors that ordinary telegraph instruments do not cost \$150 a set or even more. In fact, so high a valuation has been placed on the instruments in some cases that the companies have found it cheaper to allow the equipment to be sold for the taxes and replace it by new apparatus rather than pay the exorbitant amount demanded.

The Field of the Telegraph and Telephone.

BY B. E. SUNNY, CHICAGO.

President Chicago Telephone Company.

I was very much pleased at the change in the name of the Telegraph Age, so as to include the telephone. This is a pleasant recognition of a large number of telegraph men who have been for years in the telephone service. It also recognizes what has been apparent for some time—that there is need for a closer alliance between the telegraph and telephone, if we are to get the best out of both for our commercial and domestic needs.

It has been clearly demonstrated that there is a field which the telephone alone will care for, and likewise there is a field for the telegraph, in which the telegraph alone can give the best service: but then again, there is another and a growing field, where the combination of the two will give the best results.

That the telegraph will always remain a factor in the transmission of intelligence is, of course, undisputed, for the reason that a very considerable portion of the traffic is made up of important communications which must be in writing; but, a more controlling reason is, that except for short distances, the telephone can scarcely ever hope to compete with the telegraph in the matter of rates, because of the necessarily higher cost of handling the telephone message. The development of the whole country is at such a tremendous rate that it will tax the ingenuity and enterprise of every one engaged in the task, to make the telephone and telegraph do their share. Every bit of usefulness that there is in both must be brought out and put to work.

I hope that the change in the name of Telegraph Age will add many new friends and subscribers to its list.

A New Keyboard Telegraphic Transmitter.

A patent, No. 946,372, has been granted recently to Mr. E. E. Kleinschmidt, of New York, for a keyboard telegraphic transmitter, as mentioned briefly in a previous issue.

The object of the new invention is to construct a transmitting machine which will continuously and automatically transmit telegraphic symbols at a uniform rate of speed independently of the speed at which the keyboard is operated, and which will enable the operator to accumulate or store up successive groups of telegraphic symbols in advance of their transmission, and which furthermore will allow of the transmission of the first symbol immediately after it has been set up, and the continuous transmission of the successive symbols so long as the keyboard is operated, thereby avoiding all loss of time in transmission.

The invention comprises a key board selective mechanism and a transmitting mechanism, the relation between the two being such that the selective mechanism acts to simultaneously set up all the parts of a telegraphic symbol, the regular transmission of successive groups of symbols by the transmitting mechanism not being affected by the speed at which the selective mechanism is operated.

The key board selective mechanism comprises a series of selective bars under the control of the key bars, said selective bars being constructed with projecting lugs arranged to correspond with the telegraphic symbol of the character of the corresponding key bar which controls it.

The transmitting mechanism by which electrical impulses of variable length are sent over the line, comprises a "storage wheel" which wheel is provided with a series of pins adjustably supported thereon and at equal distances apart. These pins which may be arranged to be moved longitudinally either vertically or horizontally, or pivotally mounted, are adapted to be moved by the operation of the selective bars in groups and so arranged that the pins of each group shall correspond with the telegraphic symbol of the character struck on the key board. The storage wheel is adapted to be rotated by a continuously driven source of power and is automatically controlled in its movement by the key bars, the construction being such that the wheel is held in a position of rest when a telegraphic symbol is being set up and released so as to be rotated when the operator releases a key bar. The pins which are acted upon by the selective mechanism are all moved a like distance and when adjusted in position are adapted to operate a make and break lever by which an electric impulse to transmit a dot or a dash is sent over the line. The normal positions of these pins with relation to the lever is such that should the storage wheel be rotated when the pins are in their normal positions the lever will not be actuated and no impulse will be transmitted.

The transmitter make and break lever referred to is so arranged relatively to the storage wheel

as to be rotated in the same direction as the direction of rotation of the storage wheel when the latter is intermittently advanced after the setting up of a symbol but at a less rate of speed than the wheel is advanced. The normal position of the lever when it and the storage wheel are both at rest is immediately in advance of the first pin of the first symbol about to be set up, and when the storage wheel is brought to rest after having been rotated to advance a symbol, the lever immediately begins an independent return movement toward its normal position. If the interval between striking successive keys on the key board is less than that of the period of transmission then the return movement of the lever will be arrested and it will again be given an advance movement with the storage wheel, only to begin a return movement when the storage wheel is again brought to rest. Under normal conditions of operation the make and break lever is kept oscillating upon its axis through variable arcs, returning to its normal position only at the end of a message or when the interval between the striking of successive keys is sufficient to allow it to travel the full distance to reach its normal position. By reason of the relative arrangement of the several parts and the speeds at which they are operated, the operator is enabled to accumulate symbols on the storage wheel so that the transmission of symbols is effected both when the storage wheel is being rotated to advance a symbol and when it is at rest while a symbol is being set up. The mechanism by which the storage wheel is alternately locked and unlocked is operatively connected with all of the key bars in such manner that the length of the symbols themselves determines the distance the storage wheel is rotated after it has been released.

Mr. James Kent, manager of the Canadian Pacific Railway Company's Telegraph, Montreal, Que., in renewing his subscription for another year, has these complimentary remarks to make concerning our publication: "It is most gratifying to note the high standard of excellence maintained in the articles published in the Age, which I always read with utmost pleasure and profit."

Experiments made on the Valtellina three-phase railway, described in *l'Industrie Electrique*, says the *London Electrical Review*, showed the general result that the effect of stray currents from the railway on the adjoining telegraph lines was quite negligible; electrostatic induction was also of small moment, but the electromagnetic disturbances were very serious. It was found necessary, when the line commenced electrical working, to provide metallic circuits for the telegraphs in the neighborhood of the railway, with translators at the terminal points, but this was both inconvenient and expensive, and required skilled attendance to keep the translators in good working order. Nevertheless, there seemed to be no better way out of the difficulty, short of compelling the railways to use continuous current.

The Military Telegrapher in the Civil War.

PART XXXIV.—CONTINUED.

In our previous issue we published the first instalment of this article giving credit for the same to W. H. Eckman. Upon comparing the details however with those given in Colonel Plum's history we find that the manuscript was written by John H. Emerick of New York, instead of Mr. Eckman. Through an evident oversight of Colonel Plum in indexing the story we were led to believe that it was that of Mr. Eckman. The continuation of Mr. Emerick's graphic account of his war experiences is as follows:

"On March 28, 1863, I was ordered to Alexandria and assigned to duty in place of John McMullin who was leaving the service.

"On April 21 H. W. Cowan and myself were sent with a construction train which started out to reopen the Orange and Alexandria Railroad. It went as far as Catlett's Station, where, the bridge being gone, we returned to Bull Run and spent the night. Cowan remained at Manassas Junction where he opened an office. General Stoneman who had been on an extensive raid was expected at Warrenton and the road was opened to supply him. After a few days spent at the war department awaiting orders, I went to Aquia Creek and thence to United States Ford on the Rappahannock above Fredericksburg. I crossed the river there and opened an office in a house. The army of the Potomac were also crossing the river at that point. John B. Pierce opened an office at Banks Ford below United States Ford, the wire having been put up by the Signal Corps. The wire between there and the headquarters at Falmouth was guarded by an entire regiment of infantry distributed along the line and having orders to shoot any one tampering with it.

"May 1, I was joined by James Murray, most of the army had crossed the river and the Provost Marshal General having made his headquarters in our house the telegraph business was very heavy. The next day the Battle of Chancellorsville was fought. The house we occupied was also used as a hospital and the yard and out buildings were filled with wounded, in fact there were some in the office itself. We did what we could to help them though the business was very heavy. Our ground wire giving out during the night I groped around in the dark for it under the window and found a dead man lying across it.

"Our forces being defeated a retreat was ordered and all of our troops moved back across the river to the old camps. Murray and myself had a narrow escape from being captured as we crossed, all but the very last of the troops having left the south bank. Nearly all of the army crossed on one pontoon bridge which on account of the swollen condition of the river threatened to give way at any moment. The office at Banks Ford was also closed and John Pierce and Samuel Ed-

wards returned to headquarters at Falmouth.

"On May 9 Generals Kilpatrick and Stoneman returned from a raid toward Richmond having been within one and one-half miles of that city. Operator J. L. Cherry accompanied them on this expedition. I was soon after ordered to the war department office to relieve Frank Stewart temporarily on cipher work. On the night of May 27 President Lincoln and Secretary of War Stanton kept me company a greater part of the night waiting for news from Grant at Vicksburg but none came.

"I was next sent to Warrenton Junction to await the arrival of General Stoneman who was out on a raid. Operator J. D. Tinney was with me. On June 7 about midnight, I was ordered to Bealton Station, a few miles south of Warrenton. I was accompanied by a cavalry escort and the night was very dark but I arrived without adventure and opened an office. The next day I was ordered back to Warrenton Junction, General Pleasanton having sent a saddle horse and escort after me but I returned again to Bealton in the afternoon with operator J. D. Flynn as an assistant. The cavalry was advancing to a ford of the Rappahannock near Bealton, just below the railroad bridge. Two days later there was heavy cavalry fighting across the river all day, the wounded being brought to Bealton.

"On June 11, 1863, I returned to Warrenton Junction. The army of the Potomac was arriving there and Dennis Doren was building a line from Falmouth to Bealton. The enemy was abandoning Fredericksburg and apparently moving toward Maryland. The next day I built a loop from Warrenton Junction to General Pleasanton's headquarters one-half mile distant and moved my office to that point. J. Kirby, an operator who had been detailed from a cavalry regiment, assisting me. We had a large quantity of cipher work to do. A few days later I moved to Union Mills near Bull Run with Pleasanton's headquarters the General having furnished me with a good horse and in fact with everything that could be expected in a cavalry camp.

"I proceeded with General Pleasanton to Addie, a hard days ride; about sixty miles by the route we took and the weather was very hot. We were there far distant from any telegraph line so I had a rest from the severe work of the past few days.

"Three days later I was given an ambulance to take me back to Fairfax Station and from there I went to Alexandria where I found many of the Army of the Potomac operators who were accompanying the army from Falmouth to wherever the enemy might lead them toward or into Maryland.

"On June 21 I returned to the War Department office where I was complimented by Major Thomas T. Eckert for the manner in which I had carried out my work during the recent tedious service. I was sick in Washington after my return from Pleasanton's raid until July 13

In the meantime some of the boys had been with the army at Gettysburg and were on their way back following the retreating enemy into Virginia.

"I joined the headquarters of the Army of the Potomac at Berlin, Md., below Harpers Ferry relieving John Pierce in assisting Harper Caldwell and L. A. Rose. I remained at Berlin until a new office was opened at Lovettsville on the Virginia side of the river and then joined headquarters at that point.

"On July 20 our headquarters having again moved, I started to overtake them but our wagons were blocked by moving trains and we finally went into camp at Philamont, this country not having been very thoroughly raided over, Dennis Doren's men succeeded in capturing a calf and a sheep which added materially to our somewhat limited bill of fare.

"The next morning we started at 5 A. M. and overtook headquarters at Union but we had no telegraphic communication. On July 25 we arrived at Warrenton and halted there for supplies. Our train consisted of an ambulance, a saddle horse for each operator and the chief of construction and a train of about a dozen army wagons carrying telegraphic material, forage, etc. Having no lines after leaving the Potomac we had a very comfortable march and lived on the fat of the land passing through the most productive portion of Virginia, an elegant rolling country abounding in beautiful springs of excellent water. On August 1 we moved into camp at Germantown on the Orange and Alexandria Railroad and re-established communication with Washington. We remained in camp at Germantown for some time, the weather being very warm and both armies appeared to be perfectly willing to rest. The Army of the Potomac was sending troops to suppress the draft riots in New York. The operators at Germantown and at the railroad stations had a very easy but uncomfortably warm time. The headquarters force at that time consisted of A. H. Caldwell, chief operator, John Pierce, James Caldwell and myself. Other members of the corps were scattered along the railroad at various stations.

"On September 16, our headquarters were moved to Culpepper and we established our office in Wallach's house a half mile from the village. A few days later orders were received by telegraph to General Meade to send the Eleventh and Twelfth Corps to join Rosecrans in the west. These troops were accordingly sent though General Meade strongly protested against it.

"On October 14, the enemy having attempted the same tactics which succeeded when Pope was beaten at Second Bull Run, the Army of the Potomac retreated to Centreville. The retreat was made in the most masterly manner and without losing a wagon, a position taken up on the heights of Centreville and a plan of defense completed, when the enemy came through Thoroughfare Gap expecting to get in our rear and be-

tween us and Washington. Generals Meade and Halleck who did not agree on the plans carried on a brisk cipher correspondence, Meade using very plain language in expressing his opinions and defending himself in such an able way as to cause Halleck to give way or rather to give up the argument.

"On October 19 we advanced from Centreville and two days later arrived at Warrenton and established communication with Washington. On October 24 I started on horseback at 8 P. M. with a cavalry escort to open an office at Catlett's Station for the use of General French, who was in camp at that point. I opened the office at 10:30 p. m. and during the night suffered considerably from cold as I had no blankets and had no provision for fire. After two days at this point I was relieved by operators Shreffler and Glazier and rode back to the headquarters of the Army of the Potomac at Warrenton.

"The next day the headquarters were moved to Auburn but I remained to keep the office open at Warrenton for the use of the Sixth Corps until I was relieved by operators Ryan and Samuel Edwards from Washington.

(To be Continued.)

Wireless Transmission of Photographs.

According to "Electricity" of London, G. J. de Guillen-Garcia, a Spanish engineer, has devised a new system for transmitting photographs or sketches by wireless. For the usual transmitter and receiver he substitutes two equal cylinders, rotated uniformly by clockwork or otherwise, and each carrying a tracing stylus, describing a helical path on the surface of its cylinder. The sketch placed on the metal cylinder at the transmitting end, is drawn in insulating ink. The current passing between the stylus and the cylinder is broken as the stylus crosses the ink, and this causes a relay to close the circuit sending out Hertzian waves. At the receiving end the cylinder is covered with paper moistened with potassium ferro-cyanide, or other solution. As the Hertzian waves arrive, a current passes through the stylus, giving a black line on the paper, and, as the two cylinders are turning in the same time, this line corresponds to the path of the sending stylus across the ink. When each cylinder has been completely traversed by its stylus, the lines received will have the form of the original drawing. For sending photographs, the positive or negative is produced in relief in bi-chromated gelatine, and the transmitting apparatus is somewhat modified. As the stylus traverses the relief, which varies in height for light and shade, a sensitive lever causes four different contacts to be made. One contact leads the current to the relay through a smooth-edged disc, and the other contacts lead through toothed discs having different spacings, so that the waves sent out are in a continuous series, or broken into different intervals. The long lines, and graded dotted lines received, reproduce the picture in its varied shading.

The Telegraph in the South During the Civil War—Two Telegraphers' Unions.

BY E. H. HOGSHEAD, MERIDIAN, MISS.

At the beginning of the Civil War two telegraph companies controlled nearly all of the lines in the Southern States. The American Telegraph Company covered Virginia, the Carolinas, Georgia, Florida, Alabama, and East Tennessee, while the South-Western Telegraph Company provided wire facilities for Western Kentucky, West Tennessee, Mississippi, Louisiana, Texas and Arkansas. A state of war necessitated a readjustment of the directorate of the companies. Doctor W. S. Morris, of Richmond, Va., a director of the American company, was made President of the new Southern Telegraph Company, taking over the lines of the American company within the Confederate States; and John Van Horne, general superintendent of the South-Western, became President of that portion of that company's lines in the Confederacy. Doctor Norvin Green, president of the South-Western, continuing as President within the Federal lines. This status was maintained until the close of the war.

Within a year or two the operators of the Southern Telegraph Company became very much dissatisfied with their condition, claiming that they were overworked, underpaid, and oppressed generally, and proceeded to organize for mutual protection. A convention, called by a circular letter addressed to all operators in the Confederate States, met at Augusta, Ga., on October 26, 1863, and organized the Southern Telegraphic Association, electing Charles A. Gaston, of Mobile, Ala., president; J. Sisson Clarke, of Charleston, S. C., vice-president; Charles F. Barnes, of Augusta, secretary; E. J. Saville, of Mobile, treasurer. Others present and participating in the meeting, whose names appear in the minutes, are: Wm. Sandford, of Mobile, W. H. Clarke, of Savannah, J. W. Kates, of Charleston, and W. A. McMurchy, location not stated. Resolutions were adopted providing for the issuance of an address by the President to the operators of the country explaining the purposes of the Association and inviting all to become members. When fifty or more operators should be enrolled, the constitution, by-laws and regulations adopted by the convention should become operative, and the President was to proclaim the Association duly organized thereunder.

The next move was devising plans for a strike, the only means that seemed to the members of the Association to give promise of relief. I do not know what demands, if any, were submitted to the Southern Telegraph Company, whose operators were the only ones concerned; in fact, I was never fully advised of their movements. But on the eve of the proposed strike the Confederate military authorities at Richmond became cognizant of the situation and proceeded to arrest all those known to be connected with the scheme. A brief statement of the facts is given in the issue

of the Telegraph Age of July 1, 1909, by Mr. James P. Cassidy, who mentions Charles A. Gaston and W. D. S. ("Billy") Anderson as being among the number of those sought for. This decisive action served as an effectual deterrent upon the other members.

But not all of the adherents of the Association were content to make a final surrender of their organization, and on the date previously fixed for the first annual meeting, at Augusta, in April, 1864, an effort was made to hold a meeting; but there were not enough delegates present to make a quorum, and nothing was accomplished. The writer was sent by the operators of the South-Western Telegraph Company as a fraternal delegate to this meeting, and on the way was joined by James C. Hueston, then employed at Selma, Ala., who was a member of the Association, but not a delegate. It was decided that there was nothing to be hoped for in the way of securing the results for which the Association was formed, and the meeting adjourned without day.

I will digress here for a moment to remark that, in the office of the Globe Hotel, in Augusta, where Hueston and I stopped, was conspicuously displayed a huge placard bearing in large letters this legend: "Rates Thirty Dollars a Day. No Deduction for Meals Missed." A month's pay of an operator would not have housed him three days in that hospitable inn. But such prices were not exceptional; everything else was proportionately high. Of course, the inflation of the currency was the cause.

On my return to Mobile, a brief report was sent by wire to the South-Western operators, my "constituents," who thereupon proceeded to get together and form an Association of their own; not for aggressive purposes, however, but for benevolent and social ends,—the officers and employees of the South-Western Telegraph Company being on the most amicable terms, and the operators having no grievances to redress. So, the South-Western Telegraphic Association was organized at Meridian, Miss., on May 1, 1864, with the following officers: John B. Morris, president; George W. Trabue, vice-president; E. H. Hogshead, secretary; G. W. McMurchy, treasurer. E. J. Marshall, E. L. Marchant, J. H. Henderson, directors. The archives of this association are still in my keeping, including a bound copy of the constitution and by-laws. But the close of the war brought so many changes that no effort was ever made to perpetuate the organization. The applications for membership, with the signatures of applicants, are interesting only as souvenirs. Only a small number of the signers now survive.

I also have a bound copy of the constitution and by-laws of the Southern Telegraphic Association, printed in Mobile, in 1863, and a printed copy of an address by President C. A. Gaston to the operators.

"Billy" Anderson, mentioned previously, was, in 1883, chief clerk to the Country Treasurer of

Cook County, in Chicago, where I met him.

Of the members of the South-Western Telegraphic Association I give the names of some who attained to prominent positions in the telegraph service, or other employment: George W. Trabue became general superintendent of the southern division of the Western Union Telegraph Company; M. W. Barr became southern reporter of the New York Associated Press at Washington, and at present holds a Government position in that city; George M. Dugan became superintendent of the Illinois Central Railroad telegraph system; James C. Hueston became general manager of the New York Associated Press. The following held Western Union positions: James T. Allyn, manager at New Orleans; Wm. A. L'Honniedieu, chief operator at New Orleans; Emmett Howard, manager at Memphis; E. J. Saville, manager at Montgomery, Ala.; John B. Morris, chief operator at Nashville; Matt Flippen, manager at Baton Rouge; George W. McMurchy, manager at Baton Rouge; Wm. E. Flippen, manager at Vicksburg; John A. Galbreath, manager at Jackson, Miss. But this list is not complete.

Joseph W. Kates, a member of the convention that organized the Southern Telegraphic Association, was afterwards a district superintendent of the Western Union, and, later, general superintendent of the Postal Telegraph-Cable Company. William Sandford, another member of that convention, was for many years manager of the Western Union at Mobile.

In this connection, I may state that Mr. O. C. Hatton, who succeeded J. C. Hueston in the Western Union managership at Meridian, afterward became agent of the Associated Press in New Orleans, and later assistant night manager in New York of the New York Associated Press, then Southern reporter of the Associated Press at Washington, then agent at Washington, of the Southern Associated Press. He is now with the Western Union Telegraph Company in New York.

Of the old Southwestern operators, Joshua R. Hull was appointed assistant superintendent of the New Orleans, Jackson and Great Northern railroad, and James Compton was promoted to district superintendent of the Western Union, with headquarters at Jackson and later at Nashville. Hull is long since dead. Mr. Compton, after long service, is now living in retirement at Nashville.

Of the members of these two telegraphers' associations but few are yet alive; while of the officers, I think the writer is the sole survivor.

The following extract from the address of C. A. Gaston, president of the Southern Telegraphic Association, which Mr. Hogshead mentions, is well worth reprinting, showing as it does the high aims and purposes of the founders of that Association:

"The practicability of organizing an association of telegraphers which should have for its objects the maintenance of a fair remuneration

for services rendered; the encouragement of the telegraphic fraternity; the relief and protection of members; and to use every means which may tend to the elevation of the profession in the social scale of life—has not, until recently, been freely discussed in the South. Since the outbreak of the present war, the necessity of such an organization has been made more apparent, by the continued increase in the prices of such articles as we find necessary to health and comfort, by the insufficient salaries paid by the various telegraph companies in the Confederate States, and by the restrictions and requirements of the managers of certain companies. Telegraphers are the only class of men who labor from seven and a half a. m. until ten p. m. six days out of seven; and they are the only class of men who are called upon to perform certain duties on the Sabbath and at such hours as to almost totally monopolize the day of rest which is even allowed the slave by his master.

"We seek to do good, and ask the co-operation of each and every telegrapher in the Confederate States. We would bestow our benefits on all alike. We would give to the needy, encourage the despondent, help the sick and afflicted, and fulfill our duties as brothers laboring in a common cause and seeking one common end. We have no salaried President to absorb our pecuniary gains; no august Superintendent to clip the reward of our toil down to a bare sufficiency for the most ordinary life. Our benefits fall on one and all alike, and our assessments are made with leniency and equity.

"In perfecting this organization, we disclaim any disposition to gain notoriety by the device and introduction of novel expedients to control the legitimate action of the telegraphic craft, and profess to be actuated by a simple sense of that necessity which has, in all past ages, operated on the minds of men of like vocation and identity of interest, to form societies for mutual aid and protection.

"Our first aim should be to secure credit and respectability to the vocation. The very nature of the vocation demands truth and faithfulness in the performance. There is no agency known to society that so fully challenges the confidence of man. It is entrusted with every one's secrets, and employed in the furtherance of every one's concerns, no matter whether public or private, trivial or momentous. Operators, therefore, should be good and true men; and such only, it will be seen by the provisions of our constitution, we endeavor to bring into and sustain in the service.

"Personal attachments, which usually elicit the kindly offices of a society in business, must be extremely limited in the telegraphic fraternity. It is, therefore, needful to supply such deficiencies by social organization, and although it may not be found convenient to convene the society oftener than the constitution designates, once a year, still it will be eminently conducive to the end proposed, and serve as a bond of union.

"It is the duty of all societies to make provision for the support of disabled, sick or superannuated members, and it will be felt incumbent on the association, as it may have the means to appropriate a portion to the relief of the unfortunate; hence, the tax of one per cent. per month, which will be levied upon the salaries of all members. If the tax should prove too extravagant, it may be lessened, and made to correspond with the expenses of the association.

"Let us, as operators and as members of the Southern Telegraphic Association, so conduct ourselves towards company officers, towards those with whom we may have to do business, and towards each other, as to deserve the confidence of the first, the esteem of the second and the respect and friendship of the last. Let our intercourse towards each other over the wires and elsewhere be courteous and gentlemanly, avoiding, as far as possible, the too common practice among operators of indulging in personalities over the lines. Let us remember to establish our reputation as reliable operators and make it to the interest of the managers of telegraph lines to secure the services of members of the Southern Telegraphic Association in preference to others.

"There is little or nothing in the avocation itself, but its utility and the respectability of its employers, to inspire deference and win the appreciation of the world. As a business of life it admits of no expansion and affords no lucre. If, therefore, we bemean our attainments and cheapen our services, it will soon be that a more despondent and subservient class of men does not exist. Let us, then, combine and co-operate in the laudable aim to merit the esteem and win the support of the world. The Supreme Arbiter of Right still so sways the judgment of an erring world, that it will concede claims based on pure and lofty aims."

Book Review.

Telephonology, by H. R. Van Deventer (McGraw Hill Book Company, New York, 586 pages, 700 illustrations) is the latest addition to the literature of the telephone. The number of books which have been written upon this subject, which are of value to the telephone engineer is very small, and most of those which have been published are now, by reason of the rapid advances made in this industry in the past decade, of little value to one who is connected with the operation of a modern telephone system. For this reason if for no other, the new book will appeal to the practical man who is looking for up-to-date information.

The new book is divided into sixteen chapters, upon the following subjects: first principles; talking equipment; signalling equipment; commercial talking equipment; magneto instruments and circuits, magneto switchboards; selective and lock-out systems; batteries; testing telephone parts; testing equipment and fault location; measuring instruments and their uses; common battery equipment; harmonic party line systems; line and cable construction; the automatic system;

composite systems and wireless telephony. The author very wisely refrains from attempting to give any history of the development of the telephone, but after a brief discussion of the general subject of telephony, devotes the remainder of his book to describing apparatus, systems and methods in common use at the present time. The subject which has ever appeared in any work on is one which is of the utmost importance to the practical man; yet is one which has received scant elucidation by previous authors. Over one hundred pages of this new book are devoted to explanation of methods of testing for trouble, instruments used, etc. The chapter upon composite systems is probably the best and most concise exposition of this question, of such importance at the present time to both telegraph and telephone people, that has ever been produced, being, in fact, the first general discussion of this subject which has ever appeared in any work on telephony. This chapter is well illustrated with circuit diagrams, showing the various combinations of apparatus which can be used to secure composite and phantom circuits. These are but a few of the many points contained therein which make the work a valuable one to the engineer or student. Copies of Telephonology may be obtained by addressing J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, N. Y. Price \$4.00.

The Vacuum Lightning Arrester.

The toothed-plate lightning arresters generally employed for telegraph and telephone lines, while efficacious in case of atmospheric discharges are not sensitive enough to protect apparatus and cables, if the circuit contains any, against the effects of static discharges which may take place in the lines. By means of the vacuum lightning arrester, says a French periodical, it is possible to insure the conduction to the ground of all charges having a tension of 300 volts or over. For this reason the arrester is particularly useful in protecting two-wire circuits, in which the formation of static charges is generally pronounced. The device consists of a vacuum tube containing the toothed electrodes. The rarefaction of the air facilitates the passage of the discharges, and the electrodes are placed at a sufficient distance to insure good working. As this lightning arrester is protected from humidity and dust, its operation is more reliable than that of the ordinary instruments. The device is constructed in the form of a cartridge, similar to enclosed fuses, and can be connected in the circuit by placing it between flat springs. Pointed lightning arresters and fuses may be used in connection with the same in order to protect it against very violent discharges and excessive currents.

Telegraph and Telephone Age constitutes a "school of instruction" to every would-be telegrapher. It is accurate and authoritative and worth many times the price of subscription (\$2.00) to any who would inform themselves respecting the telegraph.

The Collins Long Distance Wireless Telephone.

A plan for the extension of the wireless service for the United States Navy has been submitted to Congress by Rear Admiral Cowles, chief of the Bureau of Equipment, in which he advocates that wireless apparatus of the latest type be supplied to all the new vessels of the navy, including destroyers and all auxiliaries.

Wireless telephony will receive its share of consideration as well as wireless telegraphy and the conditions required is a system which will be operative over distances of 100 miles and to remain in adjustment for five minutes at a time. The Collins system will be one of those competing and as the result of recent tests it is believed that it will easily fulfil the requirements cited.

COLLINS LONG DISTANCE WIRELESS TELEPHONE SET

The transmitting apparatus in its entirety includes a Collins revolving oscillation arc-lamp, a high-frequency and high potential variable tuning inductance transformer, an adjustable tuning auto transformer, and the usual revolving variable condenser. These separate devices are designed to withstand potential strains of upwards of 5000 volts.

The initial current is 500 volts direct current, and this is increased to 5000 volts by a direct connected motor generator set. The latter high voltage current is used to energize the revolving oscillation arc-lamp which is an improvement on those previously employed. The lamp proper consists of a pair of hard carbon disk electrodes and these are mounted on parallel spindles so that they are in the same plane and are connected by means of bevel gears secured to an insulated shaft. The disks are insulated from each other by mica bushings fitted in the gearing, the casing forming one of the connections while the insulated bearing in the bottom of the casing forms the other.

The gearing is so arranged that the disk electrodes are rotated in opposite directions, the power being furnished by a small motor. One of the bearings of the shaft is mounted in a keyed sleeve which permits the spindle carrying one of the carbon disks to be moved towards or away from the opposite disk so that the length of the arc may be varied while the lamp is in operation. The carbon electrodes are placed in a metal casing while the rotating mechanism is attached to the bottom of the casing.

The casing is supported between the poles of an electromagnet and through the ends of the poles and at right angles to them are polar projections of soft iron which are threaded and these are screwed through the extremities of the magnet and at right angles to the arc, thus permitting the magnetic field

ROTATING OSCILLATION ARC.

to be varied within wide limits. The coils of the magnet are also used as a portion of the primary circuit of the transmitter serving the purpose of choke coils and so preventing the oscillations from backing up into the high-tension direct current generator.

The rotating oscillation arc obviates the disadvantageous features of the stationary arc in that a constantly fresh and cool surface is presented to the arc and in that it prevents the uneven burning away of the electrodes which give rise to untoward variations in the frequency of the oscillations and thereby throwing the circuits out of resonance and in that the optimum length of the arc, namely, the length at which the resistance of the arc is best proportioned to the capacity and inductance of the closed circuit, and finally in that a constant arc may be maintained for very much longer periods of time than is possible where the carbons are stationary.

The chief improvement in the combination tuning inductance transformer is that a new and novel means of contact is introduced whereby any variation of the inductance can be had and in tuning a wireless telephone transmitter this is vitally necessary. The contact is made by a ring provided with

three small grooved pulleys which press against the turns of the tubing forming the primary.

Having a spiral form, this coil causes the ring, when it is rotated, to travel back and forth from end to end. A small track under the coil serves to guide a carriage which in turn makes contact with the ring. With this arrangement the inductance can be varied, thus making it easy to put the closed oscillation circuit in resonance with the open radiating circuit. The secondary is arranged to slide in or out of the primary and making a loose coupling, which is another essential in the production of high frequency undamped oscillation. The adjustable tuning auto transformer is designed to be used in the aerial wire circuit and more or less inductance can be had by turning the wheel causing the contact spring to travel back and forth. The variable condenser consists of a number of semi-circular fixed plates of metal and built up in a cylinder of insulating oil, while a second series of movable plates is secured to a spindle meshed with the first set, but insulated from it. A handle attached to the rod permits any variation of capacity within the limits of the condenser to be obtained. A scale divided into thousandths and ten thousandths of a microfarad and a pointer indicates the value of capacity at any point.

The receptor comprises a thermo-electric detector of Mr. Collins' invention. It is said that this detector is sensitive to oscillations of one five-thousandth of an erg and is especially well adapted for the relaying of speech oscillations. A variable electrolytic potentiometer is used to control the source of current while the tuning inductance and condenser are very much the same as those employed in other systems.

Phantom Circuits.

BY J. H. AINSWORTH.

General Manager of Home Telephone Company,
Dayton, Ohio.

There is one branch of multiplex telephony which it occurs to me, is of quite vital importance to the Independent companies, most of which are operating magneto apparatus, and that is the phantoming of long rural lines.

It was my opinion, when the question first came to me, that to undertake to phantom these circuits a very considerable amount of both noise and cross talk would probably result. In preparation for that I took one typical case of two lines about ten miles long which paralleled each other to a point seven miles from the exchange, each of which had subscribers between the exchange and the seven mile point and beyond. The ten mile circuit had but three subscribers beyond the seven mile point.

As a natural precaution, knowing the predilection of phantom circuits to noise, I had my manager carefully go over both these circuits and clear them of grounds and insulate them well. I then mounted

repeating coils in the office and for experimental purposes persuaded a farmer at the seven mile point to let me mount the other coils on a board, with a lightning arrester around them, in his house.

When I had done this, I cut off the three mile end of the ten mile physical circuit and attached it to the phantom portions of the coil. These coils, are bridging coils and not repeating coils, or, at least, they are operated as bridging coils and not as repeating coils.

When this had been done, I found that my circuit was noisy, and in undertaking to discover the cause of this noise, I found that the physical circuits paralleled a street railroad company's lines for a distance of about one mile. I instructed my lineman to go to the middle of the distance and transpose the phantoms, which he did, without any very material benefit. That being done, I had him put a transposition in half way between the middle and each end, and this quieted the circuit.

The reason for the attempt to construct this phantom circuit was that I had five subscribers between the seven mile point and along the route of the ten mile circuit whom I desired to connect, but did not feel disposed to construct seven miles of circuit to get them.

I found the subscribers could ring in nicely and could talk well, and everything went along all right until I began to get complaints that when one of the subscribers on one of the physical circuits tried to talk to subscribers on the other physical circuit and some one tried to use the phantom circuit that we were in trouble, cross talk being almost as plain as if they were all on the same circuit. Hence it became necessary to equip each pair of cords at the exchange with repeating coils, and since that has been done we have had practically no trouble on these circuits.

I have made up my mind from this success that I probably will not again construct a long line for farm lines. It must be borne in mind, however, that the physical circuits must be of reasonable efficiency and clear of grounds.

I think the manufacture of the phantom circuit for telegraph purposes is simple enough that there need be no explanation of that, but it is one of the by-products of this business with which every manager should be acquainted.

It is amusing to the man who knows differently how many articles are printed in the course of a year, written to show conclusively how a telegraph company can greatly increase its earnings by reducing its rates. The authors are usually ignorant of telegraph methods or affairs. One author says the same rule applies to the telegraph as to the provision market. He states that if the price of lamb chops was reduced sufficiently to attract attention people would eat more mutton than beef if they can save money, and that if the telegraph companies reduced their rates low enough a greater number of people would use the telegraph instead of the mails.

*Abstract of a paper presented at the Ohio Independent Telephone Association convention.

A Comparison of the Telegraph and the Telephone.

BY CHARLES SELDEN, BALTIMORE.

Superintendent of Telegraph of the Baltimore and Ohio Railroad.

I believe that the telegraph will be continued in use for many years to come, and at the same time the growth of the telephone method of transmission of intelligence will increase to a very large extent, but they will go hand in hand, as both will be found necessary.

Until some genius develops a practical telephone repeater, or other improvements in the telephonic art admit of commercial transmission over longer distances, and with a less expensive character of line wire, I feel that the telegraph must fill the gap.

The comparative cost of transmission between points widely apart even now, undoubtedly, has a tendency to have the telegraph used more frequently than it would be if it were possible to maintain proper equipment for telephone service at as low a cost as that of the telegraph, and thus afford lower rates than now charged.

Where the conditions of a telephone circuit admit of perfectly clear transmission of speech, I consider it as safe and, of course, more rapid than the telegraph; even in exchanging messages between large centers, for the reason that the circuit could be manned by persons versed in the use of the typewriter, and a greater average of speed be had in transmission, even though it was necessary at times to repeat certain words which do not carry well, or to spell them out.

I have been for years impressed with the fact that railroads particularly have neglected to use the telephone for the transmission of train orders, at a very decided loss to them, and I have been a constant advocate, in personal communication, and in articles and papers which I have written upon that question, in favor of such use.

My second paper, read before the Association of Railway Telegraph Superintendents in Detroit in 1894, in order to overcome the conservatism of railroad people, indicated how certain words and figures could be transmitted telephonically with perfect safety.

In the last year or two railroad companies have been making rapid strides in the use of the telephone for train despatching, with the result that where it has been employed for this purpose the reports show it has been found fully as safe as the telegraph, and much more advantageous in many ways.

There is one feature largely in favor of the telegraph, which is its flexibility in times of wire trouble, especially upon large systems which ramify in various directions, and where their rails connect one division with another at quite a distance from the train despatching headquarters, and this connection made by a division entirely separated from the point from which the ramification began, for instance, with us,—train des-

patchers located at Connellsville, Pa. move trains upon track extending from that point to Fairmont, a general western direction. If the telegraph wire should fail between these two places, we arrange for the movement of trains by using a telegraph wire running east from Connellsville 95 miles, to Cumberland, Md., west from Cumberland to Grafton, W. Va., over another division, northwest from Grafton to Fairmont over still another division, a total distance of 125 miles, and connecting these wires from Fairmont to the point of the break.

By means of repeaters we have worked this 220 mile rambling circuit as quickly and successfully as if there was no break, reaching all of the points, and our trains were, therefore, moved promptly.

Recently we had several poles down near Chicago, and our train despatching circuits between Garrett and Chicago, a distance of 131 miles, were, therefore, out of service and could not be reached by the despatchers from Garrett beyond the point of the break, but we secured a wire over the Nickel Plate road, put it on repeaters at Chicago, used the Nickel Plate wire to Fostoria, which is east of Garrett, repeated there to a wire that lead to Garrett, making a round circuit from Garrett, east to Fostoria, west over the Nickel Plate to Chicago, east over the Baltimore and Ohio to the point of break, and thus were enabled to handle our trains, the length of such circuit being 377 miles.

We have had to use circuits for the transmission of our general telegraph business extending from Baltimore to New York, thence to Buffalo, and then to Pittsburg, instead of by our direct route, and these instances which I cite give the idea of the flexibility of the telegraph which I attempt to convey, and owing to the long distances and round about ways, it would be a difficult thing to secure clear transmission conditions for telephone service.

For the ordinary train despatching circuits, which as a usual thing do not extend over 150 miles, and many of them are much less, clear transmission can be arranged without difficulty and without using a very large gauge of copper wire, but it requires two wires instead of one, as does the telegraph, and it is not as easy to handle such circuits in wire trouble cases as it is those of the telegraph.

Briefly, it seems to me the situation is about as follows:

Under normal conditions for railroad service for train despatching and ordinary local message work, the telephone is better than the telegraph. Under abnormal conditions the telegraph is better than the telephone.

The normal conditions obtain in probably ninety per cent. of the time, and it is possible that the better service rendered under normal conditions by telephone would more than re-pay the constructive or actual losses in the movement of trains during the abnormal period.

It is also possible that the percentages named herein are not absolutely correct, and it may be that the abnormal conditions would not amount to over five per cent. of the entire time.

In expressing my opinion I have not taken into consideration any difference in rate of wage that might be applied, and have dealt with the question, therefore, entirely on the merits of the case so far as I can see, and the expressions in favor of the telephone are, therefore, based upon a condition carrying with it the same rate of pay for telephone operators as would be paid to telegraphers.

It is but fair and proper to state, however, that there is no doubt that perfectly efficient railroad men who can operate telephones can, and should be had for a less rate of wage, which would be but another argument in favor of the more general use of the telephone for the purposes indicated.

Perhaps in the future there may be evolved a comparatively simple electrical typewriter device which would enable communication to be had by this means between the long distances which the telephone does not now meet, in which event the use of Morse telegraphy would be reduced to a minimum, if not practically dispensed with.

The Telegraph and Telephone in the Future.

BY W. J. CAMP, MONTREAL.
Electrical Engineer Canadian Pacific
Railway Company's Telegraph.

I notice that the name of the "Age" has been changed to "Telegraph and Telephone Age." In view of the fact that the telephone is coming into such general use on railways, not only for the interchange of railway messages and intercommunications between officials, but for train despatching, I think the change in the title is a good one. In fact, in looking over the issues of the "Age" for some years back, we find that considerable space has been devoted to the telephone, more particularly with regard to its use for train despatching. It is also certain that the telephone will be, in a very short time, practically the only means for handling trains as it has been proven on every section where installed, that it is capable of handling at least fifty per cent. more traffic than can be done by telegraph.

When I was train despatcher in 1877 (in the early days of the telephone), I expressed the opinion that the day might come when the telephone would be generally used for ordinary telegraph business, but that it would never come into use for trains despatching. Shortly after joining the Association of Railway Telegraph Superintendents (in 1904) I began to change my opinion, and finally, two years ago, came to the conclusion that the telephone would very rapidly come into general use for train despatching, but that for a certain class of commercial telegraph business it is not suitable. To-day I have no hesitation whatever in saying that I consider the telephone far

safer for train despatching than is the telegraph, and that for general railway work its use results not only in an enormous saving of time, but in the various officials of the railway being able to obtain more accurate and definite information regarding the operation of the railway.

As regards the use of the telephone for handling commercial telegraph business, I believe that it will gradually replace the telegraph in all small places where most of the telegrams are in ordinary English language, but for through traffic and on important or heavy circuits, it will take a long time to replace the telegraph. On such circuits a very large proportion of the business today is in code or cipher, which is difficult to handle over the telephone and messages cannot be transmitted nearly as rapidly as by telegraph. In addition to this, we are able to work multiple circuits by telegraph. For instance, between Montreal and Toronto, the Canadian Pacific Railway has four wires worked quadruplex. On these four wires we are able to work sixteen operators at high speed, while if the telephone were adopted we could only obtain out of the four wires, three telephone circuits, which could not be worked at anything like the speed obtained by the telegraph on account of the code and cipher messages handled, the actual result being that only three-sixteenths of the volume of business could be handled and probably even less, and with a lesser degree of accuracy. Another point in favor of the telegraph for commercial work is that by its use we are able to work extremely long distances, for instance, New York to San Francisco, Montreal to Vancouver, etc., at almost the same speed as for short distance.

To sum up, my opinion is that the telephone, in the course of the next few years, will be in general use throughout the continent for both train despatching and general railway work and for commercial business with small unimportant points, but that the telegraph will continue to be used almost entirely for long distances and for commercial work between important points where traffic is heavy.

Among a number of books on the market treating of the general subject of train despatching, that bearing the generic title of "The Train Dispatcher," written by A. W. Early, a train despatcher himself, has gained a wide popularity, its value being based on the fact that it is one of the best books of the kind ever produced. It supplies a certain practical information of a class desired by the ambitious worker as a guide and inspiration to him in his daily work. Its 104 well printed pages are packed full of educatory matter, and the volume should be, as it has been, a welcome possession to every telegraph operator and train despatcher in the railway service. This book will be sent to any address on receipt of price, \$1.00. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Indianapolis Belt Railway Adopts New Selective Intercommunicating System.

The rapid growth of business upon the Belt Railway at Indianapolis in the early part of last summer caused the officials of that road to look for a faster and more efficient system for communication than the telegraph. In looking about they investigated the Sandwich System then in use upon the Chicago Division of the Big Four Railway, and considered the application of similar apparatus to their needs. The system desired was to be inter-communicating. The Belt Railway was at that time using a bridging telephone

telephones were used upon both lines by means of a patent cordless jack box.

The dispatcher's office is equipped with two sets of apparatus so that two men can work at once when business demands. The use of a jack box allows the one adjustable arm phone to be employed upon several circuits, which is a great advantage to the dispatcher who is a very busy man.

The Belt Line is over thirteen miles long, double track the whole length, four track more than half, and doing a very heavy business, as all trains of all roads entering Indianapolis pass over their tracks and they appreciate to the fullest the great saving in time gained by the use of the new apparatus.

DESPATCHER'S OFFICE.

system divided into two circuits, one east, the other west from the Stock Yards Dispatchers Office, with sixteen stations on the east and eight on the west. The code ringing was very unsatisfactory because the switch tenders were compelled to be very attentive to the bell in order to distinguish their calls, which manifestly was a detriment to the perfect performance of their duties throwing switches.

The engineers of the Sandwich Company took charge of this circuit, and installed selectors at each station. This eliminated the code signals. The east and west divisions were united as one, making a total of twenty-four stations. A call box was installed at each station, which, working on an entirely new idea, made it possible for any station to signal any other selectively. The Belt Railway is the first to use this system of calling. All battery is at the dispatcher's office.

The railroad constructed on the east end a short metallic circuit to be used between several stations in a congested district for local use as an auxiliary to the main or dispatcher's circuit. The same thing was done at a congested point on the west side. The bells in the telephones were connected to these short lines and the selector bells were upon the main line. The same

STATION IN SWITCHTENDER'S SHANTY.

The train master is supplied with a portable telephone and jointed connecting pole for use in emergency, and finds it a very valuable adjunct to the service.

They plan now to extend the service to the Union tracks, which form the network about the Union Station, and this equipment will be an important factor in handling the hundreds of trains that daily use the Union tracks.

Mr. G. C. Kinsman, superintendent of telegraph of the Wabash Railroad, Decatur, Ills., in renewing his subscription, says:

"I wish to express my appreciation and to congratulate you upon the appearance and contents of the Age, which shows continued improvement."

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

The Railroad.

Mr. W. P. Cline, superintendent of telegraph of the Atlantic Coast Line, Wilmington, N. C., was a recent New York visitor.

Mr. I. T. Dyer, superintendent of telegraph of the San Pedro, Los Angeles and Salt Lake Railroad, Los Angeles, Cal., has been appointed a member of the telegraphy and telephony committee of the American Institute of Electrical Engineers.

The Rock Island Railroad Company has instituted the regular news service of the United Press upon their fast train, the Rock Island Golden State Limited. Passengers upon this train are now able to keep in touch with events transpiring throughout the world during their overland journey as well as though supplied with the latest papers.

One of the longest telephone despatching circuits in operation is that of the Canadian Pacific Railway Company's Telegraph between White River and Fort William, Ont., a distance of 251 miles, with nineteen stations. This circuit is giving entire satisfaction, even when all of the stations are in on the line simultaneously, the transmission is all that could be desired.

Mr. William Kline, superintendent of telegraph of the Lake Shore and Michigan Southern railroad, with headquarters at Toledo, O., has been retired under the operation of the pension system, which went into effect on January 1, on the New York Central lines. Mr. Kline was the dean of the railroad telegraph superintendents, he having held his position for over forty years.

The Union Pacific Railway has established an educational bureau of information. The purpose of this bureau is to furnish courses of reading and study especially prepared under the direction of an advisory board to cover as much of the so-called unwritten law of railway operation as possible. The course will be conducted somewhat on the method of now existing correspondence schools. Any employe can state to the bureau the line of work he is ambitious to master, and if he has the necessary qualifications he is provided with books and given instruction along the line desired.

Mr. John H. McDonald has been appointed chief clerk in the telephone department of the Pennsylvania Railroad to succeed Mr. J. C. Johnson, recently promoted to be superintendent of telegraph. Mr. McDonald was born in 1875, and entered the service of the Pennsylvania in 1893 as telegraph operator. January 1, 1902, he became manager of the main office of the Middle Division at Harrisburg. July 1, 1903, the division headquarters were moved to Altoona and Mr. McDonald was made manager of the superintendents office at that place. November 1, 1909 he was appointed assistant trainmaster which position he held at the time of his present promotion.

The Railway Telegraph and Telephone Appliance Association was organized February 9 in New York. The object of this association is similar to that of the Signal Appliance Association, namely to provide suitable entertainment for the superintendents of telegraph and their friends who attend the annual meetings of the Association of Railway Telegraph Superintendents. About twenty firms have signified their intention of joining the new association and several others have expressed their approval and will probably join later on. The following officers were elected: Percy W. Miller, chairman; A. P. Eckert, vice-chairman; Hiram Buck, secretary-treasurer; executive committee, W. E. Harkness and H. E. Merrill, New York; H. O. Rugh, Sandwich, Ill.; C. E. Brown, Chicago; A. B. Saurman, San Francisco.

J. C. Johnson, Superintendent of Telegraph of the Pennsylvania Railroad.

Mr. J. C. Johnson, whose appointment as superintendent of telegraph of the Pennsylvania Railroad at Philadelphia to succeed Mr. J. B. Fisher, was announced briefly in our February 1 issue is by reason of long, intelligent and meritorious ser-

J. C. JOHNSON, PHILADELPHIA.

Superintendent of Telegraph of the Pennsylvania Railroad.

vice in the telegraph department of which he is now the head, well qualified to fill the new position. Mr. Johnson was born at Curtin, Pa., April 26, 1865. He first entered the telegraph service of the Pennsylvania Railroad January 5, 1885, as an operator on the Schuylkill Division. June 1, 1887, he became train despatcher on that division and on January 1, 1903, was appointed assistant trainmaster of the same division. November 16, 1905, he became division operator and assistant trainmaster on the Schuylkill Division. On October 24, 1907, he entered the office of the Superintendent of Telegraph as Chief Clerk, which position he held until his present advancement.

Morse Electric Club Annual Dinner.

The third annual dinner of the Morse Electric Club was held at the Hotel Savoy, New York, on the evening of February 5. There were about one hundred and seventy-five members and guests present a large number of the out-of-town members of the club being in attendance. At the head table were seated John B. Van Every, president of the club who also acted as toastmaster, Colonel Robert C. Clowry, Thomas F. Clark, Hon. J. J. Delaney, M. J. Drummond, E. T. Jeffery W. J. Dealy and M. J. O'Leary.

After coffee had been served and cigars lighted M. Van Every proposed a toast to Colonel Robert C. Clowry, president of the Western Union Telegraph Company. After this had been drunk toastmaster Van Every read a letter of regret from Theodore N. Vail, president of the American Telephone and Telegraph Company who had expected to be present but who was unable to attend because of business calling him west.

Mr. W. J. Dealy, the first speaker of the evening in his usual entertaining manner spoke of the sentiment of the wires which should inspire every one connected with their operation to do his best.

Hon. J. J. Delaney, ex-Corporation Counsel of New York City, the next speaker bestowed a most fitting tribute upon Professor Morse dwelling upon the great service which he rendered to mankind by his invention. He did not believe that Professor Morse labored for the perfection of his invention with the idea of personal advantage alone but that he looked forward to the elevation of mankind and the spreading of the idea of the fraternity of the human race by reason of easy and rapid communication between distant points. By his invention he helped to solve some of the greatest problems of the human race and caused a feeling of kinship to spring up between men of all nations the like of which was never seen before in the history of the world. The telegrapher has a high mission. His occupation is full of dignity and he should be proud of his calling. In closing Mr. Delaney advised all to not be disturbed by the clamor about the oppression of corporations, that in the end all of these things which seem wrong now will adjust themselves and justice will prevail. Mr. M. J. O'Leary who followed Mr. Delaney spoke of the spirit of loyalty which has always pervaded the service and dwelt especially upon the good work which had been done by the insurance organizations supported by and for telegraphers.

Mr. Thomas F. Clark spoke of former days in telegraphy in New York when the main office of the Western Union Telegraph Company was located at 145 Broadway, the wires were all overhead and Thomas A. Edison was developing his quadruplex system. Mr. Clark recalled the names of many of the former prominent mem-

bers of the staff and found that most of them were remembered by many of those present.

Mr. E. T. Jeffery, president of the Denver and Rio Grande Railroad, the next speaker referred to the recent union of telegraph and telephone interests and expressed his belief that it would be to the lasting benefit of the American public at large and of the two great corporations concerned. Unless it does advance the public interest it cannot be sustained. He said that it was now the duty of those connected with the telegraph to demonstrate the fact that this is a step for the benefit of the public at large and he expressed his confidence that they would respond to the occasion. Mr. Jeffery spoke of the great wonders which have been accomplished in the past fifty years by combinations of capital which could not have been carried out except by the co-operation of those concerned. He said that corporation and co-operation were practically synonymous terms. He also spoke of the struggles of his boyhood to get a start and contrasted the conditions which prevailed at that period with the opportunities which are open to a young man at the present time. Mr. Jeffery's remarks were listened to with great interest and in view of the publicity which is being given to the faults of combinations of capital, furnished those present with much food for thought on the other side of the question which receives but little attention.

Mr. M. J. Drummond, Commissioner of Charities of New York City, the last speaker of the evening told briefly of the way in which the Department of Charities of New York is conducted.

The speeches were interspersed with the singing of popular and patriotic songs and the occasion ended with the singing of the "Ode to Morse." Among those present were the following:

Albany, N. Y.—T. J. Meade.
 Baltimore, Md.—J. M. Creamer.
 Binghamton, N. Y.—E. A. Baird.
 Boston, Mass.—C. F. Ames.
 Buffalo, N. Y.—W. J. Higgins, W. J. Bagby.
 Hartford, Conn.—E. Ryder.
 Newark, N. J.—W. H. Spry.
 New Haven, Conn.—F. E. Clary and J. E. Jenkins.
 New York.—W. J. Austin, W. J. Ackerly, G. W. E. Atkins, T. M. Brennan, J. A. Berry, L. D. Beall, C. A. Bauer, W. P. Bowman, A. R. Brewer, H. C. Brewer, Orton Brewer, R. D. Brixey, J. R. Beard, J. B. Bertholf, F. W. Barth, G. R. Benjamin, A. T. Benedict, W. C. Bower, E. T. Burrill, H. S. Bullock, Jas. J. Brennan, Jr., W. H. Butler, Col. R. C. Clowry, M. R. Cockey, A. R. Carmichael, J. E. Coan, J. J. E. Creamer, J. W. Connolly, J. T. Carberry, S. M. Cullison, P. J. Casey, Thos. F. Clark, Harold Content, F. E. Coyle, E. G. Carley, L. Dresdner, M. deMendonca, J. A. Dierks, H. E. Washington, D. C.—H. F. Taff.

Wilmington, N. C.—W. P. Cline.

At a special meeting of the board of directors of the Associated Press held recently in New York it was decided to establish a sporting news service on a special wire, beginning in April at the start of the sporting season. This wire will be used for sporting news exclusively, the regular matter being carried as before, and will be operated between three and six o'clock for such morning and afternoon members as desire the service.

In a recent lecture before the Manchester section of the Institution of Electrical Engineers of Great Britain, Professor A. Schwartz described a machine which he had devised and methods which he used in testing rubber for electrical purposes. He told of numerous tests made to learn the behavior of rubber under various conditions and pointed out how the quality of the rubber could be determined from these tests.

OLD AND RECENT TOURNAMENTS.

General Information as to Early and Late Speed Trials, with Incidental Comments on the Persons Concerned in Them, and Unnecessarily Complete Reports, Perhaps, as to the Part I Myself Played in Them and in Other Related Events.

BY WALTER P. PHILLIPS.

(Continued from page 133, February 1, issue.)

It has been my weakness, always, to have "an outside job," and during the time I was night manager of the Western Union in Providence—1866-1871—I had more newspaper work to do, at certain times, than any three newspaper men in town. For several years I did all the race meetings at Narragansett Park for the New York Tribune, and I was constantly called upon to do for the Boston papers, race events that were not considered sufficiently important for them to cover by a special representative from the home office. Whether I inherited my taste for horse events, from some distant ancestor, I know not, but I maintained the reputation of the family name, which is made up of the two Greek words, *philos* and *hippos*, signifying a lover of horses. The Providence manager of the telegraph office, Henry Carpenter Bradford, was a character, in many ways, and my methods were, from the first, unfortunate in that they aroused his distinct disapproval. He was not a Morse operator, having come in with the consolidation of the American Telegraph Company, using the modified House printing telegraph, with the Union Telegraph Company, using the Morse system. The American Company being the stronger, dominated the Union interests, although Morse practically superseded, the printer on the combined lines. Once when racing was going on at Narragansett Park, and I had farmed out my task of working No. 4 East for three or four nights, Mr. Bradford had noted my failure to appear at 6 p. m., and it was clear that he did not like it. As he sat whirling in his chair, one afternoon, some friend of mine called to see if I were on duty, as I often was in the day time, and propounded an inquiry to which Mr. Bradford, or "Horace," as we called him behind his back, replied with a puzzled frown: "Phillips, Phillips? That name sounds familiar, and I am positive I have heard it somewhere. Bogle," he shouted to my brother-in-law, addressing that gentleman at the farther end of the room, "tell me, is there a man named Phillips still working for us?" He was full of these sardonic pleasantries. On another occasion he was equally jocose. Michael H. Crane, then a clerk and gradually becoming an operator, and I had a working arrangement by which we had a nocturnal luncheon on very simple lines. I bought the coffee, milk and sugar, and Mike brought

the food from home. One of the linemen had rigged us up a cupboard of rough boards, and the furnace heat was disastrous to it. Big cracks began to show and the cockroaches walked in and took possession. One day I arranged with a chap to come and caulk the cracks, change one or two shelves, etc., and he had been expressly told to come to the back door where Mike and I were lying in wait. But while we were out in the back alley having a smoke, our builder arrived in the front office and with a tray of saws, hammers, bits, augurs, hatchets and such, attempted to enter by a small, narrow door that was used only by employes. It was a sort of bear trap, under the most favorable circumstances, and there were those who thought that if Manager Bradford could have caught some intruding stranger and deprived him of an arm or a leg before he could be released, it would have been a cause of great solace to him. Anything that would have tangled up an intruder in a way rendering a surgical operation necessary would have delighted him. Our man's saw or the axe or something would not come through the door, and he at once started to swear and to bang away at things in a way that threatened the partition. Mr. Bradford was swinging about in his revolving chair when he fully realized the situation. He looked at the intruder and then down the long room where Crane and I stood wondering, not to say weeping, and then he inquired in a plaintive, hopeless sort of way, pointing to the carpenter who was still unable to free himself: "Hurlburt, this is—I suppose—some one—who has come—to engineer—the alterations—that Mr. Phillips desires—to have made—in the building?"

One day an office message was received, reading:

Providence Office.

Please give items on which you check me June 3rd and 10th.

Berry.

Everybody in the office knew that Berry, who had been an old operator on the House lines with Bradford, was now a clerk in the Washington office. Indeed, he and Bradford had been old friends and comrades in previous years, but that made no difference, and this is the answer that was returned:

To Huckleberry,

Wherever you are.

Check you nothing on June 3rd and 10th, nor any other date. Never heard of you before. How are you?

Bradford.

Your old House operator was a singularly difficult proposition. He would not believe that Morse was really read, but was guessed at, and the difference between a \$100 per month operator and one for \$50 was that the former was a better guesser. When the Grand Army met in Boston in the late sixties, and Henry Pope sent me a despatch in which he ran the initials A. N. into "an" and I succeeded in getting it that

Post No. 1 was commanded by an Irishman from New Bedford instead of by A. N. Cushman. Manager Bradford had his inning. I had been in the speed trials and had won renown and here I was making the worst bull that had ever been perpetrated. I could make no defence that would appeal to him, and for years he eyed me askance, but one day I wrote "Tip McCloskey" and attributed that old error of mine to Tip. Mr. Bradford was a reader and he knew literature as a warm and personal friend. He saw that Tip had come to stay, a thing that it has taken me many years to thoroughly believe. So Mr. Bradford and I buried the hatchet and smoked the pipe of peace. The fact that the bull that had disgraced his office for several years, as he viewed the matter, had been utilized for literary purposes, the humor that had been obvious to everybody else for a long time became excruciatingly plain to him the moment it was transferred from the realm of fact to the arena of fiction. With all his faults he was a good fellow at heart and now that he is gone, those who served under him and winced under his caustic speeches have no thoughts of him that are not kindly, and all that memory holds are recollections tinged with the remembrance of the pleasant and deliciously funny things he was wont to say when the sun was shining and the world seemed gay.

My work on No. 4 East during these numerous absences, was done to a very considerable extent by Albert L. Suesman and Preston J. Hurlburt. The former worked the New York wire, days, and had, one time and another at the other end of it, George F. Durant, Theodore Fullon, Robert B. Lown, David W. McAneeny and many others temporarily, but in 1868, William H. Hoyt was assigned to the circuit and he and Mr. Suesman continued to work together until 1880, when Mr. Hoyt was made a chief operator, a position he still holds with the Western Union. It is probable that this period of twelve years is one of the longest on record that two men worked together continuously. From the departure of Mr. Hoyt until the latter part of 1881, when Mr. Suesman was appointed manager for the American Rapid Telegraph Company, many operators of note were assigned to the circuit, and among them Charles P. Bruch and "Wallie" Grant.

Mr. Hurlburt worked No. 4 East in the day time and had for sending operators, in New York, George A. Gustin, D. W. McAneeny, M. C. Laven, William J. Landy, Charles Hambright, Thomas Allen and Robert H. Morris. Mr. Suesman is my oldest friend and one of my most fondly cherished. For fifty years we have alternately played the roles of Damon and Pythias. We were boys together, in 1859, and about the time he went to the War in 1862. I had served some fifteen months as a messenger, but became

an operator during his absence, and when he came home bronzed and full of ardor to get into some sort of business I taught him to telegraph. So he was rather under obligations to help me out and Hurlburt is built on principles that will not admit of his doing any less to assist than is being done by others, no matter what relation they may bear to the recipient of their favors—friend, grandfather or what not. These men had done a full day's work before they sat in for me on a vague uncertainty as to when they would be relieved. But they never complained and in a sleepy and weary sort of way I used to come to the office, in the day time, for weeks at a time, when there was nothing doing with the ponies and thus enable them to take their vacations. Loss of sleep and aching bones are uncomfortable reminders that we are not half such intangible beings as Mrs. Eddy and her followers would have us believe, but when one is younger—and come to think of it, the whole three of us were younger—working extra isn't hard and the spirit of accommodation is one of the graces of human kind that we should cultivate to the last—that should be practiced until the habit becomes a fixed one. There is no other logical foundation for the proposition we call the golden rule and to whatever the Saviour said we should give heed not tomorrow, or next month, or the day after never, but today and we should give that heed not only with promptness but with undaunted cheerfulness and splendid vigor. Both of these men were born to the purple in respect of their fealty to a comrade. Suesman had outside interests. For fifteen years he successfully conducted a newspaper advertising agency and performed his regular duties in the office; he wrote dramatic criticisms for one of the local papers and was more largely interested in outside things than he was in the telegraph business, though he worked his wire to the satisfaction of a first-class man at the other end. It was Hurlburt who concentrated his attention on the telegraph business, becoming manager of the Western Union in Providence, a position he held for years and until he entered the service of the United Press as an editor, in New York in 1896. He is now my fellow worker in the service of the Columbia Phonograph Company in Bridgeport.

Early environment has much to do with our development. Mr. Hurlburt was born in Great Barrington, Mass., where he had the benefit of the society in his youth of Frank L. Pope, one of the greatest men of his time, and of Frank's brothers, Ralph and Henry, and when he could telegraph fairly well he came to Bridgeport and improved so rapidly that he was invited to go to New Haven where he saw some real telegraphers at work—Fred Fairchild, Dwight B. Case and J. Murray Fairchild. Naturally he absorbed what was in the air and when he arrived in Providence to take the day press report, he

was perfectly equipped for his work and he grew as the years passed and became the most finished operator Providence had ever had, taking into account as a whole his sending, receiving and penmanship. Among the other really first class operators Providence had possessed was Julius J. Bates, the original of Pop Donaldson in "Sketches Old and New," but he was an inferior sender, though a beautiful penman and so intelligent that nothing ever got by him. He gave me the alphabet and some good advice, some of it brutally frank but well meant and always acceptable. Then there were Nelson D. Pratt and William H. Allen, the latter now secretary to Fourth Assistant Postmaster General DeGraw. Allen represented the sort of wine that needs no bush. As recently as when he was the manager of the Postal in Washington, he sent 5,000 words of encoded matter in one hour and forty-five minutes over the leased wire of the St. Louis Republic. Pratt was my ideal. He was a young fellow from Southbridge, Mass., who worked the Phelps Combination Printer as well as Morse. He was skilled in handling them both, a dressy, high-stepping, church-going youngster who carried his head very high and thought Sunday work a most reprehensible and unnecessary proceeding. He is now a successful wire merchant in Chicago, where all the theatres are open Sunday night—in fact the opening performances of all the new plays and light operas are reserved for Sunday. I wonder how Mr. Pratt's present viewpoint compares with the Congregational Church ideas he brought over to Providence from the neighboring Massachusetts town. But he could telegraph in his own peculiar way, better than any one I had ever seen, without even making a pretence of keeping his mind on his work. He could receive anything that anybody could send, and his penmanship was the easiest and most graceful achievement I have ever witnessed in any telegrapher. He was not only my hero, but my model. He could whistle "Marching Through Georgia," "Tenting Tonight on the Old Camp Ground," and other popular airs, when he was copying press reports. How many times I have tried it and failed! And when I recall the number of errors I made attempting to carry on conversations, when at work, with the delightful abandon and fluency that marked Pratt's conversation, I marvel that my youthful assistance was not dispensed with "for the benefit of the service." As for whistling when I was receiving, I abandoned that undertaking quite early in my telegraphic career. Only the Saviour, as far as history records, ever successfully walked on the water, and as far as my observation had gone, at that time, no one excepting Pratt ever whistled, for pastime, and faultlessly worked a telegraph wire at the same time. Later on, however, that youthful operator, John Perley Munroe, to whom I have already referred as being at Worcester in the late sixties,

likewise operated a sibilant attachment in connection with operating his wire. Munroe was musically inclined, and it was a common thing for a vocal quartette and a guitar player to come and lift up their voices and strum the tuneful guitar, while Ferley went on receiving without any added effort that was apparent to the beholder. When his ears were uncertain, however, he would give the sounder a quick inquisitive glance, seem to get an answer, proceed with his writing and continue to supply the newspapers with an accurate copy of whatever the Associated Press happened to be sending out. He also practiced writing with his left hand until he was practically ambidextrous, and in copying press reports he often changed from one hand to the other, as suited his mood, going so far, upon occasion, as to copy a full night's report with his left hand.

When Pratt went away he was succeeded by Frank Pope, the man who was criticized for writing in Scribner's Magazine, twenty years ago, that with the proper electrical equipment trains could no doubt be run between New York and Boston in five hours. His prophecy has come more than true, but alas! he is not here to witness the great developments in the railroad service as the outcome of using electricity as a motive power. He was killed at Great Barrington, Mass., several years ago while experimenting with a commutator that he had placed in the cellar of his residence in connection with the public lighting plant. He is survived by his brother, Ralph, for a quarter of a century the valued secretary of the American Institute of Electrical Engineers, and Henry W. Pope, of the Bell Telephone Company, both of them also operators at Providence in my time, and like Bates, Allen and Pratt, they ranked with the very best. After Bates had forsaken us, my tuition was taken up by Frank Pope, and through the combined aid of them all, I was made an acceptable operator in my teens, though, as I have already related, men like Fred Seibert were still an abomination in my eyes. In good time, however, I caught up with all of them, marching a little lamely, sometimes, when I got into the society of the Catlins, the Hutchinsons, the Kettleses, the Marcans, the Reynoldses and men of their class who never broke anybody and who were not quite happy if they were themselves broken more than once or twice a year. Reynolds, in particular, was quite a shock until one became accustomed to him. On the very second the sending operator said n. m., Harvey would start in and before one could find a pen he had sent his first message down to the period. It used to be very amusing to watch an operator, who knew Reynold's peculiarity, begin to get ready as he neared the end of his last message, saying "anr" and then stopping while he dated up a few blanks, got his pen dipped and then adding "msk" put his nose down on his desk as a wild stream of dots and dashes came drifting in from Buffalo, which resolved themselves into a message about

once in every forty or forty-five seconds. Seventy messages an hour was just play for Harvey. And play for the receiver? Well, we all know how it is ourselves.

This luminous idea of "anr" and "msk" was born in the fertile brain of "Dad" Benett and at once became popular. He was one of the most genial and resourceful of men and a splendid telegrapher. Once when I was speaking of something by Dickens that especially pleased me, he smiled and told me that they were both born on February 7th, though not in the same year, an interesting fact that a man of his modesty would never have thought of mentioning unless it were sort of surprised out of him in the course of conversation.

(To be Continued.)

Obituary.

Dr. William McGregor Ash, a military telegrapher, died at his home, Woodside Park, Md., January 26, aged sixty-five years.

Ellis W. Rhivers, an old-time telegrapher of Ogden, Utah, died on January 12 at San Francisco.

Walter C. Lee, a telegraph operator of Manchester, Va., who has lately been employed on a Chattanooga, Tenn., daily paper, committed suicide January 27.

Neil S. Brown, aged fifty-five years, for thirty-five years identified with the Western Union Telegraph Company at Nashville, Tenn., as wire chief operator and lately as repeater chief, died at that place on January 18.

John C. Reilly, who had been connected with telephone development in Brooklyn and throughout Long Island for thirty-two years, died February 5 at his home in Brooklyn, aged fifty-four years. Mr. Reilly was vice-president of the New York and New Jersey Telephone Company for many years, until the consolidation of that company with the New York Telephone Company about a year ago. Since that time he has acted as an associate of Vice-President U. N. Bethell, of the latter company.

B. R. McAlpine, a former vice-president of the Western Union Telegraph Company, died February 1 in New York, aged ninety-one years. Mr. McAlpine was born in Rochester, studied law, and was admitted to the bar at the age of twenty-one. Later he became a member of the legal staff of the telegraph company, and served as vice-president from 1865 to 1869, when he retired to go to Europe. He also served as general financial agent for the company for a time, being appointed to that position in 1866. At the time of his retirement the board of directors passed complimentary resolutions of thanks for his very efficient and faithful services. Mr. McAlpine also drew up the contract which appears upon the back of the message blanks. He had lived in retirement in New York for the past thirty-five years.

Trade Notes.

The plant of the Westinghouse Storage Battery Company, at Boonton, N. J., was destroyed by fire on February 6.

The Electric Storage Battery Company, of Philadelphia, has recently issued a bulletin, No. 119, describing their low reading pocket voltmeter, designed for battery testing.

The Stromberg-Carlson Telephone Manufacturing Company, of Rochester, N. Y., has issued a finely illustrated bulletin No. 1001 describing their "Despatcher's Signals for Electric Inter-urban Railroads," which are operated by their selective system.

The General Railway Signal Company of Rochester, N. Y., has recently issued an illustrated bulletin upon "The Use of Alternating Currents in Railway Signaling," which is a reprint of a paper upon that subject read by Mr. A. K. Howe, chief engineer of the company, at a meeting of the Railway Signal Association in New York.

The Western Electric Company has issued an attractively illustrated little booklet describing briefly their manufacturing plant in which they make lead-covered telephone cable. The factory has a capacity of 200,000,000 conductor feet or over 37,000 miles per week. Another booklet sent out by the Western Electric Company describes their intercommunicating telephone systems, which will henceforth be designated as "Inter-Phone."

At the recent annual meeting of the Kellogg Switchboard and Supply Company the capital stock of the company was increased from \$500,000 to \$1,000,000, a stock dividend of 100 per cent being declared out of the surplus. Several changes have been made recently in the Kellogg sales force. Mr. C. D. Boyd has been appointed Michigan representative, with headquarters at Grand Rapids. Mr. C. Norsman has been transferred from the Michigan territory to the newly created Rocky Mountain district. Mr. B. Woodbury has been transferred from Minnesota to the Ohio district, with headquarters at Columbus, and Mr. E. G. Lawrence has been appointed his successor in Minnesota. Mr. G. A. Joy has been appointed sales engineer for the territory west of Chicago.

At the annual meeting of the Western Electric Company held in Chicago, February 3, directors were elected as follows: Messrs. E. M. Barton, Henry S. Howe, A. D. Wheeler, H. B. Thayer, Theodore N. Vail, John I. Waterbury, W. H. Miner, E. J. Hall, F. R. Welles, S. L. Schoonmaker, B. E. Sunny and C. G. DuBois.

At the meeting of the directors, held on the same day, the following officers were elected: Chairman of board of directors, E. M. Barton; president, H. B. Thayer; vice-presidents, H. A. Halligan; F. R. Welles and W. P. Sidley; secretary, G. C. Pratt; assistant secretary and assistant treasurer, R. E. McEwen; treasurer, J. W. Johnston; assistant treasurer, E. R. Gilmore and J. B. Forbes.

Miscellaneous Items.

It is reported that there is such difficulty in securing messenger boys in Lincoln, Neb., that the district messenger companies have had to discontinue the delivery of packages and use the telephone whenever possible for delivering messages.

The supply of telegraph poles in England is now obtained principally from Russia. Formerly Norway furnished most of the poles required, but the forests there, becoming largely exhausted, the English telegraph management was obliged to turn to other sources and in 1905 they began to import poles from the vast forests of Russia. To supply the needs of the English telegraph system about 50,000 poles are required annually.

In a recent lecture delivered before the Institution of Electrical Engineers of Great Britain, Professor J. A. Ewing spoke of the important work of the late Lord Kelvin in telegraphy and navigation, reviewing his accomplishments in those lines, referring especially to his invention of the mirror galvanometer, and the siphon recorder, and the means which he devised to neutralize the effect of the magnetism of the ship upon the compass.

In the course of a lecture delivered recently, on the Peary North Pole expedition, Professor D. B. McMillan, who was one of the party, told an amusing story of the efforts of an Eskimo to construct a telephone line. During a stop at a hut which had been occupied by the Greeley expedition an Eskimo found a long piece of wire. Never having seen a wire, he asked Professor McMillan what it was and what it was for. He was told that the white men strung wire like it on poles stuck in the ground and by talking into an instrument at one end the voice could be heard at the other end. Next morning the Eskimo was missing. After a search he was found carrying on some telephone experiments of his own. He had stuck some sticks in the ground and hung his wire on them. He held one end of the wire up to his mouth and talked to it at the top of his voice. Then he ran as fast as he could to the other end and held the wire to his ear expecting to hear his own words repeated. When he failed to hear any sounds the expression on his face clearly indicated what he thought of his white friend.

The Telegraph Situation in Canada.

In spite of the fact that operators' wages throughout Canada are as high, if not higher, than those in the United States, there is a great scarcity in the supply of operators all over the Dominion. There are comparatively few operators who go from the United States to Canada, perhaps because they think the conditions of living are much more severe than in the United States, but those who have tried the country generally found that not only the conditions of living, but the climate, are equal, if not better, than south of the line.

LETTERS FROM OUR AGENTS.

DULUTH, MINN., WESTERN UNION.

Manager C. A. Crane reports a large increase in both telegraph and district receipts for the month of January over the corresponding month of last year. If excellent service will get the business, Manager Crane is certain to secure his share.

Ernest Zender, formerly of the St. Paul force, has accepted the position as manager at the Marshall, Wells Hardware Company branch office, vice Miss Edith Hancock, resigned, on account of ill health.

OTHER NEW YORK NEWS.

The New York News Bureau gave a dinner Saturday evening, February 5, at Delmonico's, to celebrate their recent removal from 44 Stone Street to the new building of the Stock Quotation Telegraph Company, at 26 Beaver Street. Among those present were James Rascovar, president, W. H. Hurst, treasurer, Edward Rascovar, secretary, and J. J. Walsh, director, of the News Bureau, and Henry Myers, president of the Hamilton Press.

A New Sending Machine.

The Hulit Transmitter Company, of Topeka, Kansas, has recently placed on the market a telegraph sending machine, which is giving satisfactory results to those who are already using the device. The new machine, which is operated by a spring motor, has two finger keys, one for making dots and the other for making dashes, but all characters are made by the same circuit closer. A touch on either key starts the motor and thus makes the contacts. The machine automatically measures not only the dots and the spaces between the dots, but also the spaces between succeeding dots and dashes and between succeeding dashes. The operator may, by manipulation of the keys, make as long a space or dash as he desires, but he cannot make a shorter dot or space than that automatically made by the machine. By means of a thumb screw the speed may be quickly adjusted and in the same manner the contact may be set to give a light or heavy character, thus adapting the device for use on any circuit.

The terms of the competition for the design of the monument to be erected at Berne, Switzerland, to commemorate the formation of the International Telegraph Union, have been announced. The competition is open to the artists of the entire world. The artist chosen will be entrusted with the erection of the monument at a cost not exceeding 170,000 francs, all fees and charges included, with the exception of transportation expenses, customs duties and the cost of the foundation up to the ground level, which will be borne by the Federal Council. The jury will have at their disposal 20,000 francs to reward deserving competitors. Models must be deposited at the Federal Palace, Berne, before August 15, 1910.

Mr. Oscar Moll, managing director of the Deutsch-Atlantische Telegraphen Gesellschaft, in renewing that company's subscription for another

year, says: "We find that Telegraph Age, as regarding the scientific, commercial and personal information contained therein is in every way up-to-date. As a matter of fact, we frequently refer to it when in want of some information useful to our company or personally."

That the making of costly errors is not confined, as some people suppose, to telegraph companies, is shown by the fact that the United States Government some time ago destroyed 4,000,000 telegraph forms because of the misspelling of a single word. Several hundred thousand greenbacks were destroyed before issue at one time for the same reason.

The annual dinner of the American Institute of Electrical Engineers will be held at the Hotel Astor, New York, February 24, Prof. Elihu Thomson will be the guest of honor.

G. W. HICKEY, INSURANCE, All kinds, Coal for Family use. The best kind. 30 Church St., New York; 209 Jefferson Ave., Brooklyn.

Every Telegrapher can own a home.—The Serial Building Loan and Savings Institution, of 195 Broadway, New York, has assisted more than a thousand telegraphers to save money and buy homes and will assist others who have a similar ambition. Address them at their place of business, 195 Broadway, New York, and they will tell you how you can own a home of your own by saving a small amount monthly.

Advertising will be accepted to appear in this column at the rate of fifty cents a line, estimating eight words to the line.

Will buy or sell, in one to ten-share lots, Western Union Telegraph Company and Mackay Companies stocks. Remittances by New York draft or express money order are requested. Address "Stock Investment," care TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. This renders the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York.

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Brief History of Distinguished Persons Whose Names Represent Electrical Terms.

As may be easily inferred by noting the connection of some ones name representing an electrical term with certain achievements, the advancement of electrical knowledge in a given direction by such persons, no doubt led to the selection of the name which most fittingly recalls work done in a particular line.

Ampere—The Unit of Current Volume.

Andre Marie Ampere was a distinguished French electrician who was born in 1775 and who died in 1836. The name Ampere, representing as it does the unit of current volume, appropriately honors the man who originated the term electric current. After Oersted in 1819 made the great discovery that magnetism existed around the conductor only during the period during which electricity was actually flowing and ceased when the circuit was broken, Ampere in explaining the actions of a magnetized needle in being deflected in one direction when placed above a wire and in the opposite when underneath, said that the force which deflected the needle must be circular in motion and compared it to the manner in which a man's body floating or swimming in a circular current of water would be affected, hence the origin of the term "electric current" which he applied to the the force influencing the needle.

Electrical progress was also greatly advanced by Ampere's various discoveries, especially by the publication of a book by him in 1830 giving his theory* of electro-dynamics, and original views that electricity and magnetism are identical.

James Watt.

The watt, or unit of electrical power is so called in honor of James Watt, an inventor born in Scotland in 1736, and who died in 1819. His life work is identified with his persistent efforts to improve the steam engine during its early stages, hence his name is fittingly suggestive of power. When the electrical equivalent of a unit of mechanical power was found the said unit was called a watt.

Georg Simon Ohm.

Georg Simon Ohm, a German professor of physics at Cologne, and subsequently at the University of Munich, discovered the laws which govern the volume of current flowing through a conductor and formulated the rule $E/R=C$, which is the fundamental basis of electrical measurement. He declared that with a given electrical pressure in volts the resistance of the conductor determined the volume of current flowing therein. The unit of resistance is an ohm, so named in his honor. Professor Ohm was born in 1787 and died in 1853.

James Prescott Joule.

James Prescott Joule was born in 1818 and died in 1889. He was an English physicist. He discovered the mechanical equivalent of heat $C'R=W$. One W develops .24 calories of heat per second. From this he evolved the complete formula which is, $\text{Heat}=C'R \times t \times .24$ where t represents the time in seconds.

Joseph Henry.

Joseph Henry was an American electrician who was born in 1797 and who died in 1878. He is credited with having built in 1830, the first electro-magnetic telegraph line and which was one mile in length. He discovered the fact that the strength of a magnet could be greatly increased by winding the core with several layers of insulated wire and thus contributed much towards the improvement of that device.

Although up to that time the electro-magnet originally invented by Sturgeon in 1827 was much used in the way of experiments; the coil consisted of but one layer of wire and consequently required a great volume of current to create a strong magnet.

The term henry represents the unit of inductance, and is equal to the inductance of a circuit when the electro-motive force induced therein equals one volt, while the inducing current varies at the rate of one ampere per second.

The Leyden Jar.

The term Leyden is not taken from the name of the inventor or discoverer of that well known reservoir of electricity but from the city of Leyden where experiments with it by Cuneus during its early stage attracted considerable attention.

The original discovery was made by VonKleist in 1745 while endeavoring to isolate electricity by passing a charge from a frictional machine into a bottle filled with water, by means of a wire inserted therein. While holding the bottle in one hand, he received a strong shock when he accidentally discharged it during the course of his investigation.

Recent Telegraph and Telephone Patents.

A patent, No. 947,966, for a telephone-transmitter, has been granted to Evan T. Evans, of Westerville, Ohio.

A patent, No. 948,753, for a pay-station box for telephones, has been taken out by Clarence A. Anderson, of Salina, Kans.

A patent, No. 948,941, for a telephone call system, has been awarded to William E. Zabst, of Portage, Wis.

The following patents have expired:

Patent No. 491,133, for a printing telegraph receiver, issued to Major D. Porter, of Brooklyn, N. Y.

Patent No. 491,163, for vibratory telegraphy, held by Stephen D. Field, of Stockbridge, Mass.

Patent No. 491,347, for a telautograph, issued to Elisha Gray of Highland Park, Ill.

Patent No. 491,595, for a telegraph transmitter, issued to Robert S. Roberts, of Philadelphia.

Personal.

Colonel Charles S. Diehl, acting general manager of the Associated Press, New York, was a recent business visitor in Chicago.

Mr. Fred. G. Boyer, superintendent of telegraph of the Standard Oil Company, with headquarters at Oil City, Pa., was a recent New York visitor.

Mr. George E. Hudson has been appointed special agent in charge of the leased wire service of the American Telephone and Telegraph Company, New York, to succeed W. E. Athearn, appointed engineer of equipment of the Western Union Telegraph Company. Mr. Hudson was formerly connected with the telegraph service at Pittsburg, but for some time past has been chief assistant to Mr. Athearn in the service over which he now assumes charge.

Inauguration of Telegraph Letter Service by the Western Union Telegraph Company.

Announcement has been made by the Western Union Telegraph Company that they will shortly inaugurate a new service to be known as a "night letter service. This proposed service will permit any one to send fifty words at night for the price of ten words sent in the day, with one-

fifth of the day rate for each additional ten words or fraction of ten.

These letters will be handled in combination by the telegraph and telephone when that is the quickest and most convenient way. When the messages reach their destination in the early morning hours they will be put in the mails in time to be delivered in the first morning distribution.

In announcing the new service the company stipulates that only plain English letters will be received. Code words are excluded.

"We are inaugurating this 'night letter' plan in order to keep our idle wires busy at night," said an official of both the American Telegraph and Telephone and the Western Union Telegraph Companies. "It will be a great economy to business men and an additional convenience to them.

"Messages handed in a Western Union office in one city up to midnight will be transmitted to their destination with customary rapidity. The office of destination will place the messages in stamped and addressed envelopes and messengers will carry them to the local Post Office, depositing them before the first morning mail goes out.

"The 'night letter' service is really meant for letters. It insures quick transmission. If I send a letter from here to St. Louis, for example, by mail to-day it will reach its destination to-morrow afternoon, and may not be delivered until next day. If I send the same letter by our 'night letter' service this evening the letter will be delivered in St. Louis to-morrow morning in the first mail."

People who live remote from the telegraph office, where the telegraph office closes early in the evening, are to have city accommodations under the new plans that have been worked out. They may call up the Bell Telephone Company "central" in their locality and dictate their telegraphic messages. "Central" will communicate the message to the nearest office of the American Telephone and Telegraph Company, and it will from there be despatched to its destination over the telegraph wires.

As the American Telephone and Telegraph Company's offices in the large cities are open day and night, every private person who has access to a Bell telephone may send a telegram to any distant part of the country at any hour of the day or night. The answer also can be delivered to the sender over his telephone.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

At the weekly meeting of the executive committee, held on Wednesday, February 16, Colonel R. C. Clowry tendered his resignation as general manager of the company in order that as president, he may devote more time to administrative matters and to the working out of the broad progressive policies of the new management and

recommended the appointment of Mr. Belvidere Brooks as his successor. The resignation was accepted and Mr. Brooks was appointed general manager of the company in charge of its lines, offices and service.

Mr. A. G. Saylor, assistant general superintendent was appointed general superintendent of the eastern division to fill the vacancy created by the promotion of Mr. Brooks.

The resignation of Mr. J. C. Barclay, as assistant general manager has been accepted and that office has been abolished.

Mr. W. E. Athearn has been appointed engineer of equipment, a newly created position.

Mr. E. G. Gallaher, auditor of the American Telephone and Telegraph Company, Boston, has been appointed auditor of the company, vice Mr. J. B. Van Every. Mr. Van Every continues as vice-president in charge of the accounting and statistical departments.

Among the recent executive office visitors was Mr. I. McMichael, vice-president and general manager of the Great North Western Telegraph Company, Toronto.

Mr. C. H. Bristol, general superintendent of construction, has returned to his office after an extended trip of inspection through the southern division.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. Edward J. Nally, vice-president and general manager of the company, in speaking of the announcement made by the Western Union Telegraph Company, of the new service to be known as the "night letter service," stated that the idea was not a new one; that it was something that had been discussed by telegraph men for a number of years, and that for his company he had made a very exhaustive study of the question during the last few years, and that recently he had called in his general superintendents and superintendents in conference, when every feature of the proposed service had been discussed, and that, further, his officials, both directly and through the managers of their larger offices, had gotten themselves in touch with the large business interests throughout the country, and interviewed extensive users of the telegraph, for the purpose of finding out if there was a demand for such a service; and after a thorough canvass, the reports received were generally to the effect that what the public wanted was not a deferred service, but an instantaneous service; and that consequently his company last August inaugurated their "special rush service," under which they undertake to handle messages between all important places, from customer to customer within twenty minutes. That this service was an instantaneous and great success, and that his company was now giving the fastest telegraph service in the world.

As regards the announcement of the Western

Union that arrangements had been made by which all persons having a telephone, or using a telephone, could get in touch with the most remote telegraph office at all hours of the night, Mr. Nally stated that this was not new. On the contrary, such facilities had been furnished the public since the very inception of the telephone service; that his company keeps telephone operators on hand in their offices at all hours for the special purpose of accommodating the public who may desire to send a telegram from their homes or their offices and that messages are also delivered by telephone, and that bills covering the tolls for such telegraph service by telephone are rendered monthly.

Mr. S. B. Haig, superintendent of traffic, has returned to his office after a trip to Chicago on business connected with the service.

The first meeting of the Postal Telegraph Club of Atlanta held in that city February 26 was a success from every standpoint. Among the speakers were: Hon. R. F. Maddox, mayor of Atlanta, on "The Atlanta Spirit and Our Future;" Hon. Fred. J. Paxon, president of the chamber of commerce, on "Greater Atlanta;" Dr. John E. White, pastor of the Second Baptist Church, on "The Operator as a Happy Citizen;" Colonel W. B. Kenny of the Associated Press, on "Some Operators I have Known;" and S. W. Wilkes, commercial agent of the Georgia Railroad.

RESIGNATIONS AND APPOINTMENTS.

Mr. F. A. Bardwell is acting manager at Springfield, Mass., vice Mr. Charles H. Goddu, resigned.

Mr. W. C. Griffin, for twenty years identified with the Detroit office and for several years past, all night chief operator, has resigned his position to accept an appointment with the American Telephone and Telegraph Company.

Great North Western Notes.

Mr. S. B. McMichael, general assistant of the company, accompanied by his wife, is spending a vacation at Altamonte Springs, Fla.

Mr. David Adams, chief operator of the London, Ont., office of the company, has been advanced to the position of acting manager, vice W. C. Furness, deceased.

W. C. Furness, manager for the Great North Western Telegraph Company at London, Ont., died February 13, after a long illness, aged sixty-nine years. Mr. Furness was one of the best known telegraphers in the Dominion. He first entered the service with the Montreal Telegraph Company and was for a time local manager for that company at Hamilton, Ont. Forty-five years ago he became manager at London and when the Montreal Company was merged with the Great North Western he retained that position which he has since occupied.

Obstacles are regarded by men as but the stepping stones to successes.

The Cable.

Mr. William Miles has been appointed secretary of the Direct United States Cable Company, and Mr. S. Fenn, superintendent at Halifax, N. S., has been appointed manager at London to succeed Mr. T. Finnis, deceased, who held the position of general manager and secretary.

Mr. George G. Ward, vice-president and general manager of the Commercial Cable Company, has announced that on account of the increased demand for cable facilities his company will soon lay an additional transatlantic cable. This will be the sixth cable crossing the Atlantic owned by the Commercial Cable Company.

Legal.

In an opinion recently delivered by Judge Foster of the Municipal Court of Chicago, it was held that the law of the state wherein a telegram originates governs in an action for damages arising from a mistake in the transmission of the telegram, and not the law of the state in which the message is received.

Following the decision in the case of the Western Union Telegraph Company against the State of Kansas, Judge Day of the United States Supreme Court has declared that the Arkansas law seeking to impose an incorporation fee on foreign organizations, doing business in that State, based upon their entire capital stock, is unconstitutional. This decision was rendered in a suit brought by the Western Union Telegraph Company to enjoin the Secretary of State of Arkansas from ousting the company for failure to pay the fee.

Western Union Telephone Case.

The long drawn out case of the Western Union Telegraph Company against the American Telephone and Telegraph Company again came up February 15 when exceptions to the master's report were made at Boston, before Judge Colt of the United States Circuit Court. The report of Everett W. Burdett, as master in the case, was filed last August and allowed the Western Union \$2,579,914 in cash and 20,087 shares of stock as settlement of a claim which they had under a contract made November 10, 1879. Both companies have taken exception to this report.

Bound Volumes of Telegraph Age.

For those of our readers who desire to have the past year's issue of *Telegraph Age* in a form in which they can readily preserve all of the copies for future reference we would recommend a bound volume. We are now able to supply these containing the twenty-four issues of 1909 for the nominal price of \$3.00. There are several features in one of these volumes which comprise nearly 900 pages of reading matter, which are alone worth much more than the amount asked. The series of articles by Willis H. Jones entitled "Some Points on Electricity" are in themselves worth the price of the book to any

student. We have also published articles by the best informed authors upon the developments in wireless telegraphy, and, in fact, there will be found recorded in this book all of the important improvements in the wireless art during the past year. The use of the telephone for train despatching has largely increased since January, 1909, and we have kept pace with its development by presenting to our readers many articles upon this subject, written by some of the best posted men in the railway and telephone world. These are but a few of the many features presented in *Telegraph Age*, during 1909, and those interested in any branch of the telegraphic industry will find much valuable information in one of these bound volumes. A copy of this work will be sent to any address upon receipt of price, \$3.00, by J. B. Taltavall, *Telegraph and Telephone Age*, 253 Broadway, New York.

The Quadruplex.

"The Quadruplex," by Maver and Davis, is doubtless the most thoroughly practical low-priced work treating on this subject ever published.

It is clear and lucid in its style, a text-book free of all technicalities and easily comprehended. It contains 128 large pages, is copiously illustrated, bound in cloth and well printed on heavy paper.

It embraces just the ideas that should find a place in every telegraph office, and no telegrapher who desires to acquire a complete knowledge of multiplex telegraphy, the perfect understanding of which is so essential in these days, should fail to promptly obtain a copy of this important book.

Its chapters include: Development of the Quadruplex; Introduction and Explanation; The Transmitter, Rheostat and Condenser; Stearns Duplex; Instruments of the Polar Duplex; The Polar Duplex; The Quadruplex; The Dynamo-Electric Machine in Relation to the Quadruplex; The Practical Working of the Quadruplex; Telegraph Repeaters; The Wheatstone Automatic Telegraph.

It will be seen at a glance that such chapters as these fully cover the modern apparatus found in the telegraph offices of to-day. Copies of this book can be obtained from us at \$1.50 each, express charges prepaid. Address J. B. Taltavall, *Telegraph and Telephone Age*, 253 Broadway, New York.

As there are only a few copies of this important work on hand and as a new edition of the book is not contemplated, it will be well to secure a copy before the supply is exhausted.

"The Practical Management of Dynamos and Motors," by F. B. Crocker and S. S. Wheeler, as indicated by its title, affords a clear understanding of the use, care and operation of these important adjuncts of the well equipped modern telegraph office. There is a constant demand for this book, for telegraphers find it an invaluable addition to their working library. There are 206 pages, and 99 illustrations; price, \$1. Address J. B. Taltavall, *Telegraph and Telephone Age*, 253 Broadway, New York.

Radio-Telegraphy.

Experiments in wireless telephony under the water are being carried on by one of the submarine torpedo boats of the French Navy.

Thomas A. Smith, a student of the school of wireless telegraphy of the Brooklyn Navy Yard, has been detailed on the U. S. S. Paducah, now in southern waters.

The station of the United Wireless Telegraph Company at Manhattan Beach has been abandoned, the business formerly handled from that point being taken care of now by the station on the roof of the Waldorf-Astoria.

A patent, No. 948,068, for wireless telegraphy, has been granted to R. A. Fessenden, of Washington, D. C. Tuning antennae by altering the capacity by varying the electrostatic inductive relation between them.

The Southern Wireless Telephone and Telegraph Company of Atlanta, Georgia, has filed articles of incorporation with a capital stock of \$1,000,000. The new company proposes to establish a main office at Atlanta and install wireless stations throughout the surrounding country.

The United Wireless Telegraph Company is making arrangements to construct a high power wireless station at Montauk Point, Long Island, and a similar station on the coast of France with a view of establishing a regular trans-Atlantic wireless service.

Mr. William Marconi was in New York recently on his way to Cape Breton, N. S., where he is superintending the completion of the high power wireless station which is being installed to replace the one destroyed by fire last August. He expects to have the new station in operation by April 1.

A patent, No. 948,086, for directed wireless telegraphy, has been awarded to E. Bellini and A. Tosi, of Paris, France. Combines with the dirigible system a uniformly radiating system, the aerial part of which is substantially co-incident with the symmetrical axis of the aerial of the dirigible system.

G. J. deGuillen Garcia, a Spanish investigator, at his wireless station in Spain, records atmospheric discharges occurring during thunder storms anywhere within a radius of 500 miles. By noting the variation in the intensity of these discharges he is able not only to give warning of the approach of a storm but also to form an idea of the course which the storm is taking.

A patent, No. 948,156, for a system for the transmission of electro-magnetic waves with sound regulating frequencies, has been secured by W. H. Bathrick, of Somerville, Mass., for transmitting sound controlled radiant energy by means of a pair of secondaries, a pair of primaries, a primary generator of high frequency currents, secondaries connected with the conductors of electrical oscillations. Waves of sound actuate a diaphragm which vary the current strength of the primaries.

Patent, No. 948,348, for apparatus for producing high frequency oscillations, has been granted to I. Schonberg, of St. Petersburg, Russia. The apparatus is herein shown as provided with an oscillatory circuit having therein a sparking gap and a rectifier for arresting the oscillations when moving in one direction and for permitting them to move in the other direction.

Patent, No. 948,609, for a wireless telephone transmitter, has been taken out by A. A. Jahnke, San Francisco, Cal. A telephone transmitter adapted for wireless telephones, said transmitter having a chamber containing granular material, a porous wall, and means for supplying a volatile liquid through the walls to the chamber.

The wireless telegraph danger signal "S. O. S." which is now used by vessels at sea has been the occasion of much conjecture as to its origin and meaning. This call was adopted by the Berlin International Wireless Telegraph Convention held in 1906, and means "Stop other service." Previous to that time there had been no generally recognized distress signal in use. The signal "C. Q. D." signifying "Come, quick, danger," was devised by the Marconi Company, but was never officially adopted by other interests.

The United States Navy Department maintains at the Brooklyn Navy Yard one of the largest wireless telegraph schools in the country. Enlisted men in the navy are detailed to attend this school and learn telegraphy, including the construction, operation and care of instruments used in wireless telegraphy in order to qualify as operators on the vessels of the navy. At times as many as 250 students have been in attendance. The operators must attain a high degree of efficiency before they are assigned to take charge of apparatus on board a vessel of the navy.

Mr. C. J. Raby, of Estero, Fla., in renewing his subscription for another year, says:

"The Age is so valuable that I would feel lost if I were not to get it. The information given under the head of Radio-Telegraphy is in itself worth the price of the journal. May 1910 see it prosper beyond any previous year."

For the convenience of our readers we have prepared and published in our catalogue, together with prices, a carefully selected list of standard books treating on wireless telegraphy. These volumes, which include the most up-to-date works upon the subject, furnish the best information obtainable, the kind giving the most efficient aid and direction to the student. Orders for the books enumerated, or indeed for any others that may be required, which must be accompanied by the cash, will be filled on the day of their receipt, and sent with all the carrying charges prepaid. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

A New Repeater.

The following described repeater, the invention of R. H. Tudor, manager for the Western Union Telegraph Company at Corinth, Miss., possesses several novel features, requiring no extra magnet, repeating sounder or extra armature to keep the opposite transmitter operative.

The instrument slightly resembles the Atkinson repeater-transmitter. That is, in respect to the main line contacts, magnets, etc. It is a 6-ohm transmitter. Referring to Figure 1, the main feature is the shunting device, which is a little lever 22 carried by small standards 23 on a pivot just under the transmitter beam. The lever extends to the left through a passage 25

in over-hang 18 and carries a platinum contact 26. The lever is held down on contact 26 by its own weight assisted by spring 24, until it receives a stroke from the set-screw 27 of the transmitter beam on its short end near pivot 23. This stroke causes the little lever to raise at the left and break contact at 26, which takes the

shunt circuit from around the local posts of the opposite relay, but not until after the main line circuit has been closed at 7 and 12. Now, when the transmitter beam starts on its upward movement the little lever again falls on contact at 26 and puts the shunt around the opposite relay's local posts before the main line circuit is broken at 7 and 12, consequently one of the two circuits leading out from the instrument is always closed before the other is opened.

Referring to Figure 2, assume that an operator on the right is sending and some distant station on the opposite circuit, or the left, desires to break the sender. He first opens the circuit which opens relay 34, this in turn opens the transmitter at the left. As soon as this transmitter beam starts on its upward movement, its lever 22 puts a shunt circuit around the local posts of the sending relay 35 and closes the sending transmitter. Then as the transmitter on the left completes its upward movement it breaks the main line on which the sending operator is at work; thus completing the break through the repeaters.

It is immaterial how rapidly an operator may be sending, the man on the other circuit can break through the repeaters the instant he opens the circuit, for the shunt circuit of the sending transmitter is broken each and every time the transmitter closes, whether it be closed on a quickly made dot, or a dash. Then as the operator on the opposite circuit opens his transmitter, the sending transmitter is forced to close by the fall of lever 22.

The front-stop of the transmitter beam might be called a solid stop, since the short end of lever 22 can scarcely be seen to move; the long end having to move only enough to break contact at 26.

Tests of a New Telephone Transmitter.

Tests were made recently over the lines of the American Telephone and Telegraph Company, of a new form of microphone, patented by a French inventor. In the first test a line from New York to Pittsburg and return was used, the total length being 778 miles. With one cell of battery the sound of the voice came from the receiving instrument in greater volume and better quality than from the ordinary telephone with a battery of three cells. From Pittsburg the line was then connected with Chicago with a return wire to New York. Tests made with one, two and three cells of battery showed highly satisfactory results. Even when the repeating coil, which is generally used to carry the voice from New York to Chicago, was omitted the tones came back clear and strong.

In the new device the voice is received on a microphone, where a special combination of drums raises it two octaves and a third. It is sent over wire at that pitch. The receiver at the other end, by a combination of drums, brings the vibrations back to normal, so that the voice is heard in its speaking tones.

The diagrams appearing in "Official Diagrams of the Postal Telegraph-Cable Company's Apparatus and Rules Governing the Construction and Repair of Lines" were made from the company's blueprints and are absolutely correct. This volume, which is published by Telegraph and Telephone Age, under official sanction and supervision, is of especial value to operators and linemen. It will be sent to anyone, postpaid, on receipt of fifty cents. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Annual Meeting of Mackay Companies.

The annual meeting of the stockholders of the Mackay Companies was held in Boston February 15. In the annual report attention was called to the changes which have been made in the Atlantic cable system of the Commercial Cable Company during the past year. The part of the transatlantic cable from the Flemish Cap to Canso, N. S., which was released from use by the running of a new cable from the Flemish Cap to Newfoundland and thence to New York, was recovered, resheathed and retaped so that it was as good as new and was then joined to the second of the two 1884 cables, near the Flemish Cap, and laid to Newfoundland and southwards towards New York City, until it again met the second cable and was there connected with it, so that at present that entire transatlantic cable begins at Waterville, Ireland, and runs thence to Newfoundland; thence to Canso, and thence to New York. During the coming Spring the old cable released by this change will be reclaimed from the bottom of the ocean and will be resheathed and retaped and used again to complete the extension of this second cable to New York City direct from Newfoundland. The greatest development in the land line system, known as the Postal Telegraph-Cable Company, during the past year has been the building of a new line from Sacramento, Cal., to Reno, Nev. This line consists of two 435-pound copper wires which can also be used for telephone purposes and when completed to Salt Lake City, as it will be during the coming summer, will furnish an entirely new transcontinental route from the East to the Pacific Coast.

The following announcement in regard to the stock of the American Telephone and Telegraph Company held by the Mackay Companies was also made:

"The Mackay Companies will sell its entire holding of stock in the American Telephone and Telegraph Company. That step being in deference to public opinion, which views with suspicion this large holding of stock in a company which has recently purchased the control of the Western Union Telegraph Company. Moreover, that stock was acquired by the Mackay Companies with a view to bringing about economies in the construction and maintenance of joint-pole lines over long stretches of country, where the business was not sufficient to justify either company constructing an independent pole line by itself. Many such arrangements were made, each company owning one-half of the pole line, but having nothing to do with the business of the other company. Since, however, the American Telephone and Telegraph Company has acquired control of the Western Union Telegraph Company the time has come for the Mackay Companies to sell its holdings of stock in the American Telephone and Telegraph Company, and that will be done. The Postal Telegraph system will continue to be free and independent, prepared to maintain the competition which it has furnished for twenty-five years."

The financial report shows an income of \$3,808,779 during the year ending February 1. After paying dividends of \$2,000,000 on the preferred stock and \$1,758,667 on the common stock and operating expenses of \$32,335, a balance of \$17,777 was left. The present surplus of the company amounts to \$903,766.

The seven trustees were re-elected as follows: Clarence H. Mackay, William W. Cook, George G. Ward, Edward C. Platt and Milton W. Blackmar, of New York; Robert A. Smith, of Toronto, and H. Vincent Meredith, of Montreal.

Municipal Electricians.

Mr. James Grant, superintendent of fire alarm telegraphs, New Haven, Conn., has recommended the installation of a new fire alarm system in that city.

The fourteenth annual report of the International Association of Municipal Electricians giving a full account of the convention held at Atlantic City, September 14, 15, and 16, 1909, has been issued in book form and distributed among the members. All of the papers read at that gathering together with the discussion following the same are presented in this work which contains 153 pages. It is bound in the usual black cloth and contains engravings of the officers and members of the executive committee and numerous diagrams illustrating the papers delivered. Taken as a whole the report reflects great credit upon its compiler, Frank P. Foster of Corning, N. Y., secretary of the association and is a valuable addition to the library of every municipal electrician.

A Valuable Telegraph Book.

"The Hughes and Baudot Telegraphs," by Arthur Crotch, of London, the well-known electrical engineer and author, is a book that everyone interested in printing telegraph systems should possess. The volume contains a very full description of the two mentioned type-printing telegraph systems used so generally in Europe, the Baudot in France and the Hughes elsewhere on the Continent. The illustrations are numerous and clear, and all together, the book furnishes a fund of carefully stated information valuable to the student and also of interest to the lay reader. This book may be obtained of J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, and will be sent to any address, carrying charges prepaid, on receipt of price, \$1.00.

The South African Institute of Electrical Engineers has been formed at Johannesburg, Transvaal, for the purpose of promoting the general advancement of electrical science. The new organization has started with a membership of about one hundred and twenty-five, and hopes soon to increase this number to five hundred. Mr. C. W. R. Campbell is president and Mr. Fred Rowland, Johannesburg, is secretary.

The Telephone.

The Montevideo Telephone Company of Montevideo, Uruguay, has 4,594 telephone stations in operation and 11,767 miles of wire.

The report of the Pacific Telephone and Telegraph Company for the year ended December 31, 1909, shows an increase in the gross earnings of \$1,068,000 over the preceding year and an increase of \$68,000 in the net revenue.

The State Railroad Commission of Pennsylvania has decided that an exclusive contract between two telephone companies for the interchange of business in that State is illegal and recommends that there be an exchange of business between all companies in the field.

Extensive improvements will soon be made in the telephone service on the Isthmus of Panama. Existing iron wire circuits will be replaced by copper and old magneto telephones will be replaced by common battery instruments. The latest telephone directory of the Canal zone contains about 1,300 names.

The report of the Chicago Telephone Company for the year ending December 31, 1909, shows that the company has 262,359 telephones in operation, an increase of 31,179 during the past year. The phenomenal increase in the telephone service of that city during the past decade is shown by the fact that ten years ago only 27,773 stations were in operation.

One of the longest, if not the longest submarine telephone cables in the United States was laid recently across San Francisco Bay between San Francisco and Oakland. This cable, the submarine portion of which is 3.7 miles in length contains fifty pairs of No. 19 B. and S. gauge, double paper insulated wires. The armor consisting of twenty-six No. 6 B. W. gauge galvanized steel wires is laid over a serving of jute covering the lead sheath, and this armor itself is covered with jute treated with tar, sand and lime. The cable has a weight of seven and a half pounds per lineal foot and an outside diameter of 2.3 inches.

M. Millerand, minister of posts and telegraphs of France, has asked Mr. U. N. Bethell, vice-president of the New York Telephone Company, if his company would take six young officials from the telephone staff in Paris and give them a practical training in all the branches of the telephone business, so that the telephone system of Paris can be overhauled and put on a more economical and scientific basis. Mr. Bethell has advised the French Minister that the New York Telephone Company will be glad to give the French officials instruction and to aid the French telephone administration in every way.

The six men from Minister Millerand's staff will each spend six months in studying the telephone system in New York. They will be put through every branch of the service, beginning with the instrument setters and ending with observation of the administrative department in the main offices.

The annual report of the Cumberland Telephone and Telegraph Company for the year 1909 shows an increase of \$474,000 in the gross receipts over the preceding year and an increase of \$167,000 in the net earnings. In his statement to the stockholders President James F. Caldwell called attention to the fact that each year for twenty years without a break there had been an increase in the business of the company.

The transfer of the control of the Central District and Printing Telegraph Company of Pittsburgh, to the American Telephone and Telegraph Company was completed at the annual meeting of the stockholders of the former company February 10. The officers elected were: Union N. Bethell, president; D. Leet Wilson, vice-president and chairman of the board of directors; F. H. Bethell, vice-president and W. S. Piersol, secretary and treasurer.

At a recent meeting of the Chicago Electric Club Mr. August S. Hibbard, vice-president and general manager of the Chicago Telephone Company gave a very interesting talk on "Telephone Traffic and Problems." Mr. Hibbard discussed many of the problems which confront a telephone company with a large system such as that in Chicago, speaking especially of the necessity of forecasting the growth of the city in order to provide adequate equipment to handle the business.

The inquiry by the minority stockholders into the sale of the Ohio telephone properties to J. P. Morgan and Company which was begun in New York, February 9 and 10, and was to have been continued February 16, when Theodore N. Vail, president of the American Telephone and Telegraph Company and H. P. Davison of the firm of J. P. Morgan and Company were expected to testify, was on the latter date brought to an abrupt close without hearing any testimony further than that brought out at the first sessions. All of the testimony given substantiated that of Mr. E. J. Hall, mentioned briefly in our February 16 issue.

Mr. Charles H. O'Brien has resigned his position as manager of the Augusta district of the New England Telephone and Telegraph Company which he has held for the past sixteen years. Before entering the telephone field Mr. O'Brien was a well-known telegrapher. He was employed in the Augusta, Me., office of the Western Union Telegraph Company, when Frank A. Munsey, the magazine publisher, was manager at that place. He later became the first manager of the Postal office in Augusta. Mr. O'Brien has considerable inventive ability and has resigned his present position to devote his time to developing several ideas which he has for telephone and telegraph improvements.

Mr. U. W. Boggess, manager of the Western Union Telegraph Company, Clarksburg, W. Va., in renewing his subscription recently, says: "Telegraph and Telephone Age looks and sounds good to me. It is like a good old friend, always welcome."

The Hudson Word Register.

The Hudson Word Register for counting the number of words written on a typewriter is now on the market and may be obtained with attachments for applying it to the standard makes of machines. When properly attached, the greatest confidence may be placed in this invention. It can be rendered inaccurate only by the playful and careless operator who forces

the space-key far below the spacing point and allows the fingers to slip from the key, releasing it with a snap, causing the register lever to fly upward with uncalled for violence. This motion, which is unnecessary and unnatural, might cause the register to jump. The space-key may be struck with any force desired, but should be released in the usual manner with a smooth, even motion. This insures accurate results.

There being no limit to the continuous forward movement of this register, any number of words may be counted without re-setting by simply taking note of the first 1,500 words and adding thereto the number registered when the work is complete.

To ascertain the number of words written, add the amount registered on the dial to the number appearing through the face.

This useful device is easily set by, first, turning the lower button in the direction of the arrow until it locks, and the pointer rests at 50 on the dial. Next, turn the upper button in like manner until it reaches the stop and the number 1500 appears through the face.

For message work the writer disregards the upper numbers, using the dial and pointer only, which is set by simply turning the button forward until it locks, requiring but one movement, and as little attention as is given in returning the typewriter carriage to commence a new line.

The additional tension on the space key is very light, and in no way interferes with the working of the machine. The register being thoroughly made, nickel plated and of neat appearance, is an ornament to any typewriter and is practically indestructible. Every operator who uses a typewriter will find this invention of great assistance, and it has been the general testimony of those who have used these registers that they would not do without one.

Special directions accompany each counter telling how to attach it to the particular type of machine for which it is wanted.

The price of this useful adjunct to a telegrapher's equipment is \$5.00, and orders may be addressed to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, N. Y. In ordering,

be sure to specify the make of the typewriter for which the counter is intended, so that the proper attachments and directions may be sent with it.

Bound Volumes of Telegraph Age Covering a Memorable Year in the Telegraph.

The year 1902 was especially significant in the annals of the telegraph, inasmuch as that date marked the accession to office of the present official heads of the Western Union Telegraph Company. The story as told in *Telegraph Age* distributed over the months of that year, chronicling the numerous changes that eventful period witnessed, is of interest, one viewed with importance by many as being of high referential value, furnishing data and dates nowhere else so readily available. A portrait of Colonel Robert C. Clowry, the incoming president and general manager of the company, and of General Thomas T. Eckert, whom he succeeded, as well as others prominent in the Western Union service, were included in the issues of the paper during that year.

In that year, also, occurred the death of John W. Mackay, the head of the Postal telegraph and Commercial Cable companies. His passing necessarily wrought changes in the great telegraph interests under his control, their direction descending as a possession to his son, Clarence H. Mackay, their present head. Full-page engravings of both the Messrs. Mackay also appeared.

It was in 1902, also, that *Telegraph Age* printed a comprehensive, instructive and illustrated article descriptive of the famous Buckingham Long Distance Page-Printing Telegraph, a chapter covering nine pages and of profound interest. Again, it was in this same year that the notable telegraph tournament, known as the American Telegraphers' Tournament, was held at Atlanta, Ga., when some well remembered records for fast sending were established, an event altogether of achievement of which telegraphers are proud and delight to refer.

Enough has been indicated to show that the year 1902 was an eventful one in the telegraph. The bound volumes of *Telegraph Age* for that year possess a special value. A few are on hand and are offered for sale at \$2.50 apiece. These will be delivered to any address in this country, carrying charges prepaid, on receipt of price. Address all orders to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Mr. Richard O'Brien, assistant superintendent of the Western Union Telegraph Company, Scranton, Pa., in renewing his subscription writes: "You have made *Telegraph and Telephone Age* doubly interesting and valuable to us all."

The testimony of progressive operators is that *Telegraph and Telephone Age* is so thoroughly comprehensive in character as to make it absolutely indispensable to those who would keep informed. Its technical articles are of high practical value. Write for a free sample copy.

The Ready Messenger

The quickest way to transmit a telegraph message from the wire to paper is

"VIA SMITH PREMIER."

This typewriter has for twenty years held first place with telegraph operators as the easiest and speediest "mill" to operate. The **New Model No. 10 Smith Premier** is even better suited to the use of telegraphers.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to *Telegraph and Telephone Age* should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

MARCH 1, 1910.

The Book Department of *Telegraph and Telephone Age* has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Telegraph Letters.

The announcement of the fifty word night message plan of the Western Union Telegraph Company is strong evidence of the enterprize of the management which is now directing the affairs of that corporation. We predict that an enormous night traffic will be created between the large business centers, separate by distances of from one to three or four thousand miles. In the present age the question of time is a most important one and the possibility of sending a satisfactory business letter and receiving a reply to the same with a saving in time of from one to eight days or even more over the time required by the mails ought to make the new service popular. It will probably take some time to bring about the general use of this innovation which is intermediate between a postal and a telegraph service. As people become more accustomed to its use, however, and form a closer acquaintance with its operation and advantages the patronage is bound to increase.

When the acquisition by the American Telephone and Telegraph Company of the controlling interest in the Western Union Telegraph Company was announced last fall a cry of protest was at once raised by those who condemn, on general principles, all combinations of capital, without regard to their nature, and forces were at once set to work to prove that the new combination was in restraint of trade and in violation of the anti-trust law. The statement of the president of the larger company, that the merging of interests was brought about because of the advantages which might accrue to the companies concerned and for the improvement in the service rendered the public, which might be accomplished by an interchange of the facilities of the two great systems, was not taken seriously by the zealous guardians of our liberties. It would seem, however, that the questions of those opposing forces would be satisfactorily answered by this announcement and their fears that this combination is one contrary to the public welfare, would be allayed.

Wireless Legislation.

The resolution of Congressman Roberts for the appointment of a wireless board of seven members to draw up a comprehensive system of regulations to govern the operation of all wireless plants seems to be meeting with considerable disapproval among the many amateur experimenters who fear that the measures recommended by such a board would be calculated to entirely suppress all amateur stations. It will be surprising to some to learn that there are upwards of 60,000 such stations in the United States at least 1,000 of which are in New York and the immediate vicinity. Fortunately for the commercial systems, however, but a small percentage of these are equipped with sending apparatus powerful enough to reach more than a very short distance. If all were equipped with sending apparatus of even moderate power it is hard to imagine the wireless bedlam which would reign on the evening in the atmosphere around the metropolis when all were trying to work at once. For the greater majority of these amateurs, it may be said that they are entirely sincere in their efforts to learn all they can of the wireless art and improve upon the same if possible. If they do interfere at all with regular wireless service it is usually unintentional and much oftener due to lack of knowledge than to any intent to disturb legitimate service. That cases do occur, however, of intentional interference, the sending out of false messages as jokes, etc., is claimed by many expert operators and is admitted by those who have the opportunity of investigating the subject thoroughly. In the present status of the case there is no law which can prevent such interference or punish these offenders of common decency. It must be admitted then that there is need of legislation which will reach both the ignorant experimenter, who

does not know when he is interfering and the better educated one who does so maliciously. To suppress all experimenters would undoubtedly, as the opponents of this measure claim, work an injury to the development of the art. Hence, the adoption of a measure requiring all stations to take out a license and providing a penalty for misuse of the privileges accorded would seem to be the best plan of taking care of the situation as it exists to-day.

Perhaps the amateurs are unduly alarmed over the effect which the passing of Representative Roberts' resolution would have upon them. The board which he proposes to create would consist of three government members, three representatives of commercial interests and one scientist well versed in the wireless art. While such a board would naturally recommend a system of regulation which would safeguard commercial and government interests it is not probable that they would recommend any measure which would seriously hamper legitimate investigation. The commercial interests do not find it easy to secure all of the competent operators that they require and any thing which discouraged the learning of the art by young men would be an indirect blow at their own business. The Government also is spending much money at their two wireless schools at the Philadelphia and Brooklyn Navy Yards in training operators for their service. This extra expenditure would be unnecessary if they could secure enough operators in any other way. Hence it would seem that the chances are very good that the course which will be taken if this resolution is passed will be the one which ought to be approved by every well wisher of and laborer for the development of the wireless art—namely the adoption of a middle course which will insure justice to all concerned.

Status of Legislation for Military Telegraphers.

Little has been heard recently in regard to legislation in Congress recognizing the pension rights of the members of the United States Military Telegraph Corps. That vigorous efforts are being made to secure such recognition, however, is shown by the following letter issued recently by Colonel William Bender Wilson, president of the Society of the United States Military Telegraph Corps:

COMRADES:

The status of National legislation with a view of securing for you the rights of pension is as follows:—

The Hon. N. B. Scott, United States Senator from West Virginia, has introduced a bill in the Senate, having such object in view, and which has been referred to the Pension Committee of which he is a member. In addition he has introduced a resolution calling upon the Secretary of War to inform the Senate of the number of war telegraphers who were engaged in the war between the states who are not on the pension roll. That resolution is now before the Senate Committee on Military Affairs of which he is also a member. Senator Scott is a sincere and earnest advocate of your claims and can be relied upon to leave no stone unturned to secure them. In the House

the Hon. Edward L. Taylor, Jr., a representative from Ohio, has prepared a bill along the lines of that of Senator Scott and will introduce it at once. Mr. Taylor is thoroughly convinced of the justice of your claims, is a resourceful man of indomitable energy and has never been known to allow "sleep" to any measure in which he is interested. You thus have at least two active champions in Congress and it behooves you to put yourself in communication with the United States Senators from your state and the representative in Congress from your district urging them to join with Messrs. Scott and Taylor in securing the passage of the measure. Now is the time. Up and at it.

Fraternally,

William Bender Wilson, President.

Attest: David Homer Bates, Secretary.

Subjects for Discussion at the Paris 1910 International Telegraph Conference.

Among the subjects, which will be discussed, at the second international congress of telegraph and telephone engineers, which will be held in Paris during the Summer of the present year, are the following:

(1) Manual versus automatic systems of telephone working.

(2) (a) Simplification of telephone circuits; (b) selection of frequency and secondary potential (for purposes of theoretical investigation) with a view to facilitating the approach of the telephone current to the sine wave-form; (c) the circumstances conditioning the adaptability of telephone apparatus to the lines, induction coils, microphone resistance, etc.

(3) Precautions to be taken for the avoidance of mutual disturbance in the case of power circuits running in close proximity to telegraph and telephone lines.

(4) Telephony between places at great distances from each other. Construction of cables for long-distance use, relays, combination of aerial lines with cables.

(5) Wooden poles—new process for impregnation and preservation—and procedure described from actual practice as to staying and strutting.

(6) Party lines and selective calling upon telegraph and telephone lines.

(7) Telegraph systems for heavy traffic. Multiple type-printing telegraphs and the Mercadier system.

United Press Changes.

W. E. Hall, who has been in charge of the Indianapolis bureau, has been transferred to the Pittsburg bureau, relieving F. S. Ferguson, the manager there, who goes to the management of the St. Louis bureau. R. L. Hall, the present manager of the St. Louis bureau, has been transferred to the Pacific Coast territory.

E. O. Tomlinson, of the Seattle bureau, has been appointed manager of the northwestern division, with headquarters at Portland, Ore., vice Joseph W. Partridge, resigned.

John N. Beffel, of the Chicago bureau, has been transferred to New York as editor of the west-wire.

OLD AND RECENT TOURNAMENTS.

General Information as to Early and Late Speed Trials, with Incidental Comments on the Persons Concerned in Them, and Unnecessarily Complete Reports, Perhaps, as to the Part I Myself Played in Them and in Other Related Events.

BY WALTER P. PHILLIPS.

(Concluded from page 166, February 16, issue.)

Whenever I meet a young operator, I always ask him where he learned and how he happened to go into the business, so those two items may be of interest in my own case. I was visiting with my cousin, in Providence, one Sunday afternoon, and she said she was expecting a young man to call presently and if I would keep out of the parlor during his stay, she would ask him to take me down to the telegraph office and show me all about the wires. He was on duty at 7 p. m. and I went with him and thus began my acquaintance, fifty years ago, with that charming man, and septuagenarian now—Gerrit Smith. His first wife was the cousin who was responsible for my first appearance behind the railing of a telegraph office and my visits there have been pretty nearly uninterrupted from then till now.

Not long ago I passed a pleasant afternoon with Mr. Smith at his home on Long Island. Our conversation ran on the fact of the quadruplex to which Mr. Smith has devoted his attention for many years having been abandoned and the duplex having been substituted for it. Among the many interesting things that Gerrit told me was that the quadruplex would probably never have been a success, on long circuits, if it had not been for Fred Catlin. "When we had done everything we could think of to make it work through and the results were yet very unsatisfactory, George Hamilton, or somebody, would suggest finding Catlin and making one more effort to get the signals through on the second side. Fred never failed to bring us relief. Something about his sending, some gift not vouchsafed to other great senders, by which he lengthened his dashes or made his dots heavier than usual to meet the changeful conditions of the complex circuit, made him a success where others failed and, incidentally, the fact that Catlin could make our embryo quadruplex work under exacting circumstances encouraged us to go on trying to perfect it, with the result, as you know, that ultimately it was worked very successfully over long distances by all operators who were competent to work the duplex or an undivided wire in first class shape. The quadruplex owes much to the many men who took it up and pushed it forward from the point where Edison

left it, but I really think it was Catlin who saved the situation on many occasions and at junctures that were extremely critical."

Earlier in this article I spoke of there having been no official record taken at Philadelphia. This was due to the fact that on the day when the tournament was to open, Roderick H. Weiny, for many years my associate in all my inventions, died suddenly of apoplexy. He was about to start for Philadelphia to take the necessary records when the summons came. In his death a loss was sustained that can never be quite repaired. He was not only a very able and useful man but he was kind hearted and helpful to all in whatever walk of life he met them. The various railroad companies, the United Press (No. 1) and the Telephone Company, by which he was employed at the time of his death—all of his employers, at all times, felt that he was thoroughly in earnest and that he added to his surpassing integrity of purpose a degree of capability that rendered him a most valuable and resourceful employee. But aside from this he was a man in every sense of the word—steadfast in his friendships and kind and considerate in all his personal dealings. In his home life he was at his very best and his demise brought to his widow a measure of sorrow that only time can soften and a loss to his little son that is none the less great because he was too young to grasp the full meaning of the calamity that had befallen him.

When such a man as Mr. Weiny is abruptly called hence—a man so full of life, so useful, so greatly loved and so true withal, words do not come readily to tongue or pen. We stand appalled by the suddenness of the blow and with tears upon our faces and with aching hearts, we humbly murmur, "Thy will be done," as, still wondering, we resume life's burdens and try to school ourselves to believe that, in some inscrutable way, everything that happens is for our eventual good.

Very few men have done more than William R. Plum to stimulate interest in and to secure the progress of post-war undertakings, but there is one thing that he and his associates have seemingly overlooked and that is that the United States Military Telegraph Corps should establish some authority for creating memberships such as the colleges have to confer degrees. The man who fails of graduation and who distinguishes himself in later life often gets a college degree the same as if he had graduated and in some cases men who have won recognition as authors, poets, statesmen, soldiers and what not and whose college record was by no means satisfactory, have been loaded with honors in their later life. Eugene Field, for example, was the bane of the Faculty's existence when he was a student at the University of Missouri. To emphasize their objection to all his mischievous pranks the Faculty submitted to one escapade after another

and reserved his punishment for the very end of Field's final term. On the fateful day when he was to graduate and with honors, too, for he was a great student and a master in the Greek and Latin classics, as his poetry shows conclusively, the pig-headed Faculty expelled him. So the man who had made things lively in Springfield for four years went out into the world and gave his fellow men out of the abundance within him, such things as "Casey's Table d' Hote," and transmuted from their laughter the touching homage of their tears when he told us of Little Boy Blue and the little tin soldier that was covered with rust. Bye and bye which, according to Hamlet, is easily said, the State University of Missouri discovered that Eugene Field was her most distinguished son and very gracefully, indeed, the members of a new Faculty, with here and there one of the old misguided ones suffering perhaps a little pang of humiliation for his former blindness, sent for Field, fell on his neck and received him into the fold. I think the United States Military Telegraph Corps should do the same by Fred Catlin. He was offered, at the beginning of the war, a position by the man whom now we all reverence, almost—General Eckert—and fully intended to enter the military service. Some accident, some family bereavement—no one remembers what—changed the course of events, but he was no less a soldier of the wire, though serving outside the cordon that fixed the limits of military service. Really, Mr. Catlin, and possibly some others, are entitled to have the military degree conferred upon them for services of a high order, amid scenes of peace, it is true, but whose intention and expectation it was to follow where the soldiers led, and the value to our armies of those who served with the military cannot be overestimated. I once saw the autograph letter from the youthful Eckert to the man with whose services he has now been familiar for forty-five years, and who, now grown to be a veteran, should be honored with membership in the United States Military Telegraph Corps, even if such a proceeding does establish a precedent. It cannot be regarded as a dangerous precedent, for not many men have a record that would justify their aspiration to be enrolled, in an honorary way, and however many such there be, their names cannot but add to the honor and glory of a roster that is growing thinner and more fragmentary as the gliding years flash by. "Peace hath her victories no less renowned than war," has been wisely said, and those whose names are linked with achievement, whether of peace or war, cannot be too highly honored or too long cherished and remembered. There stands in Paris, the beautiful copy of one of the most perfect specimens of Athenian architecture. As he beholds it, the visitor may well exclaim, in wonder: "Am I in Paris or in Athens?" It has been called the Parthenon of Western Europe, and in it the student of archi-

tecture discerns those classic lines that had the Acropolis for a pedestal, Pentelic marble for material, and for a background the Athenian sky. Those noble Grecian models have conquered time. It was two thousand years ago that the Hellenic architects and sculptors placed before the world the best expression of their almost heavenly dreams. So strongly does this magnificent building, with its stately flight of steps, its long perspective of imposing columns and the grand height of its majestic roof, recall the temples of antiquity that it seems strange indeed that it should have now become the sanctuary of Christian faith, the wonderful church of La Madeleine. It was not always thus. In the great days of Napoleon he called it the Temple of Glory, and here were presented in bronze and stone, on canvas and in the perfect language of the French, an outward expression of those whose names were linked in glory—or infamy as you choose to think—with that of the invincible Napoleon, the names of soldiers, statesmen and citizens. Here, every year, the anniversaries of the battles of Austerlitz and Jena were celebrated, with imposing ceremonies, and eulogies were pronounced upon those who had fallen upon the never-to-be-forgotten fields of slaughter, heart-ache and—glory! To me, Napoleon was that imperial impersonation of force and murder that he has been described, and I reject him as no true son of God, but war was the element with which the United States Military Telegraph Corps was identified—a dreadful art in which the little Corsican, even in his retirement at St. Helena, "gazing out upon the sad and solemn sea," as Colonel Ingersoll expresses it, was the most heroic figure of the modern world, and the things he did, such as the paying of honors to those he deemed to be worthy, those acts to which he was urged by the gentler side of his nature as when he glorified the names of men, both great and small, who had served their country, not necessarily on tented fields or in serried ranks, but in civil as well as in military ways—that example the men of our time can well afford to follow.

Bridgeport, Conn., 1909-1910.

Weber's Handy Electrical Dictionary is a practical handbook of reference, containing definitions of every term or phrase used in the electrical industry. This vest pocket size indexed handbook contains over two hundred pages and over three thousand definitions. Notwithstanding the limitations of space, the work is so clear and lucid in its definitions, and so comprehensive in its scope, that it is not only an indispensable guide to the electrician in the intelligent performance and understanding of the duties of his profession, but is a work of the highest order of educational merit as well. Price, 25 cents. Address orders to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, N. Y.

EDWARD JULIUS HALL.

Vice-President of the American Telephone and Telegraph Company and Chairman of the Executive Committee of the Western Union Telegraph Company, New York.

Edward Julius Hall.

One of the most prominent figures in the telephone and telegraph field today is Edward Julius Hall, vice-president of the American Telephone and Telegraph Company and chairman of the executive committee of the Western Union Telegraph Company. Mr. Hall is one of the pioneers in the telephone industry having been connected with the development of the great system of the American Telephone and Telegraph Company since its inception and has probably been the most active and prominent executive leader in the extension, organization and management of the telephone business since the adaptation of Professor Bell's invention to commercial uses.

Mr. Hall was born in Perth Amboy, New Jersey, March 31, 1853. His father, also Edward Julius Hall, was a member of the firm of A. Hall and Sons, manufacturers of fire brick and other clay products. In 1866 Mr. Hall, senior, moved to Buffalo, N. Y., and there established a branch of the Perth Amboy works under the name of Hall and Sons. Edward Julius Hall, Jr., prepared for college in public and private schools in Buffalo and entered the Sheffield Scientific School, Yale University, in 1870, taking the prize for the best entrance examination in his class, and graduating in 1873 with the degree of Ph. B. He was a member of the Delta Psi Fraternity and of the Yale Glee Club, and was much interested in music during his college life and afterward.

After graduation until 1875, he devoted much time to metallurgy, with especial attention to blast furnace work. From 1875 to 1879 he managed the firebrick factory of Hall and Sons, Black Rock, Buffalo, and was also a contributor to the "Iron Age" of New York, and conducted a column in the Buffalo "Courier" devoted to "Business Enterprises of the City." This led to his being approached in regard to the starting of a telephone company at Buffalo in 1878. He found great difficulty in interesting people, and convincing them of the value and importance of the new invention, but finally induced Mr. Harlow C. Palmer to start with him under the firm name of Hall and Palmer. In 1879, he organized the Bell Telephone Company of Buffalo, to succeed Hall and Palmer, and was elected vice-president and general manager.

On February 1, 1882, he resigned that position to go to New York, and take the presidency of the Perth Amboy Terra Cotta Company, the successor of the old firm of A. Hall and Sons, which office he held up to 1906. In 1885 he gave up the active management of the Terra Cotta Company, and took up the organization and became vice-president and general manager of the American Telephone and Telegraph Company of which company he is still the vice-president. From December 31, 1896, to February 27, 1909, he was president of the Southern Bell Telephone Company, and is still a director. He is also a director

of the Atlantic Terra Cotta Company successor to the Perth Amboy Terra Cotta Company, the New York Telephone Company, the Bell Telephone Company of Pennsylvania and a number of other companies connected with the Bell system.

Unlike many of our industrial leaders, Mr. Hall finds time for recreation, being a first-class whup and also a good sailor, frequently spending his vacations on the water. He is a member of the New York Yacht Club; Larchmont Yacht Club; the University, Lawyers' and Railroad Clubs of New York; an associate member of the Press Club of New York, a member of the Exchange Club of Boston, the Institute of Electrical Engineers, London, the American Institute of Electrical Engineers, the American Institute of Mining Engineers, the Morristown Club, and of the Morris County Golf Club of Morristown, where he lives the greater part of the year.

In addition to his other accomplishments, Mr. Hall is a fine musician having served as organist in two of the leading churches in Buffalo while a resident of that city, from 1873 to 1879. He was married October 25, 1875, and has two daughters and one son.

When the duties of chairman of the executive committee of the Western Union Telegraph Company were added to his many other activities upon the merging of the interests of that company with the American Telephone and Telegraph Company, Mr. Hall at once began with great energy to make a study of the new problems which confronted him and since then has devoted a large amount of his time to investigating telegraph conditions. He has a faculty of getting through the surface of things down to the very root without any delay and it is safe to predict that his active connection with the telegraph business will result in substantial benefits to the service.

Danger and Daring in a Commonplace Calling.

BY CHARLES P. BRUCH, NEW YORK.

Third Vice-President of the Postal Telegraph-Cable Company.

The invention and development of the telegraph have made possible the marvelous progress in civilization that has rendered the times in which we live noteworthy beyond all others in the history of the world. Without the telegraph—and the applications of electricity that have been directly or indirectly the outgrowth of the telegraph—commerce, manufacture, science and art, as they are to-day, would not have been developed and could not exist. The pioneers in the world's progress during the nineteenth century were the men who on the foundation of the American Morse's invention built up the network of wires that encircle the globe, and upon the telegrapher of to-day depends primarily the carrying on of the world's affairs.

The story of the hardships endured and the dangers faced in the truceless fight against the elements by men whose lives are devoted to the telegraph service, would, if fully told, fill volumes, and its

thrilling incidents would surpass in vital interest any tale of adventure and daring ever written.

In mid-Pacific, a thousand miles from the nearest civilization and out of the track of vessels, is a coral atoll scarcely three square miles in extent. Its white sands gleam in the glare of the tropic sun, and are soaked with salty spray driven by the merciless storms that sweep those lonely seas. Fancy living on such an island, wholly dependent upon infrequent supply ships for every necessary of life, ever on the alert and prepared to defend with arms; and without news, save for meagre items gained in intervals when for a moment the passing stream of meaningless code messages ceases to flow over a fragile copper thread.

And yet this is what a little company of men are now doing in order that communication between the far west and the far east may be unbroken. There is no other way; no other available spot for the necessary repeating station could be found.

But these men are envied by many a member of the cable repair ships' crews, who are always waiting and ready at all seasons to put to sea upon a few hours' notice, uncertain as to their destination or how long it may take to finish their task and return to port. Under discipline more strict than that of a man-o'-war, the cable ship sailor spends long months in port, doing over and over from day to day the wearisome work necessary to keep the ship in perfect condition. At other times he tosses at sea—often for weeks together—in winter gale or smothering fog, waiting a clear day and smooth water to enable him to get his bearings and grapple and repair the damaged cable. His family ties, everything in his life, are all subject to orders to put to sea.

Even the marooned islanders and the sailors seldom or never have to face the discomforts, hardships and unseen perils that regularly fall to the lot of the land-line repairer. He must tramp by day and night, through flood, snow and summer heat, keeping up the wires. The worse the weather the more certain it is that he must "go out on the line," for sleet and gale are the wires' worst enemies and the lineman is their sole defender. Not only by exposure to Nature's dangers does he risk life and limb. On a peaceful summer day he climbs a pole to make some slight repairs, perhaps to replace an insulator that has been the target of a thoughtless sportsman. Miles away, where the village authorities have by law forced electric light wires to be carried on telegraph poles, his wire, normally harmless, is, by accident, in contact with a power feeder. He has no warning and cannot know that a deadly shock will follow his first touch; and he is dashed to the ground, a subject for the hospital or for the coroner.

Nor does the telegraph operator lead a life of ease. He is comfortably housed, as a rule, but upon his brain and nerves falls the strain of "keeping the traffic moving." He maintains a perpetual struggle with time; seconds and fractions of seconds count with him—none may be lost; and until his "hooks are clear" he knows no quitting time. At times he

also has his share of physical discomfort and even danger. He marches with the army, reeling out his wires, pausing now and again to send reports or receive orders while his clicking sounder plays an accompaniment to the songs of bullets. On the heaving deck of an anchored schooner, he grits his teeth in a seasick struggle to decipher the yacht race "copy" of a still more seasick reporter. He coolly transmits from the swaying basket of a captive balloon an account of the movements of yachts almost beneath him, heedless of the danger that the restive balloon will break away and drive to sea on the north-west gale. He stands on a scaffold under the July sun, translating dots and dashes into chalk marks that tell the yelling crowd of victory at Santiago. He sits, half frozen and unsheltered from drizzling rain, and flashes with stiffened fingers the story of a great football match. From the platform of the convention hall, calm and observant amidst excitement and din, he steadily ticks the details of the scene and announces results so promptly that all the country has the news sooner than those within the building itself. Amid the horrors of earthquake he calmly sends the news while the building crumbles. He sticks to his post in the plague-stricken town and falls down and dies beside his table. He continues to work in a burning structure until flames scorch him and drive him to safety. From a sinking liner he flashes messages of farewell from hopeless passengers to friends on shore until the waters choke him.

He is not only brave—he is trustworthy. In his keeping are the social and business secrets of the community. He never betrays them even for great personal gain.

It is the patient, self-sacrificing devotion to duty, not alone of telegraphers, but of all men in the service of the public, that makes possible the uplifting of the race by development of a mighty civilization. Their deeds are common, but not commonplace. Neither wishing nor seeking praise or great reward, they are intent only upon the tasks that each day brings and content in the satisfaction of work well done.—Postal Telegraph.

An astronomer of St. Paul, Minnesota, predicts that when Halley's Comet comes within 12,000,000 miles of the earth on May 19, or 20, as it has been estimated it will, the only perceptible effect will be an electrical display similar to the aurora borealis accompanied by great disturbances to the magnetic needle and all telegraph systems.

Miss Camille Sheppard, daughter of W. A. Sheppard, manager of the Postal Telegraph-Cable Company at Montgomery, Ala., is one of the contestants in a voting contest instituted by the Montgomery Evening Journal, which closes March 14. The prize for which Miss Sheppard is working is a one year scholarship in Judson Institute, Marion, Ala., and she is earnestly soliciting the subscriptions of her friends to the publication mentioned, to aid her in securing the coveted prize.

BELVIDERE BROOKS.
General Manager Western Union Telegraph Company, New York.

Belvidere Brooks, General Manager of the Western Union Telegraph Company.

Belvidere Brooks, who has now assumed the general managership of the Western Union Telegraph Company has during the last eight years been one of the prominent figures in telegraph circles in New York. As he is over six feet tall and proportionately large he naturally commands the attention of strangers, his personality attracts all, and his ready grasp of problems with which he is confronted impresses all who have occasion to do business with him. In the course of his career he has acquired a very comprehensive knowledge of the telegraph system of this country and a wide and intimate acquaintance with the personnel of the organization, which renders him especially well fitted to perform the duties which will now fall to his lot.

It should not be inferred from these facts mentioned, however, that the task which has been assigned to him is an easy one for Mr. Brooks. The general managership of such a large and far reaching institution as the Western Union Telegraph Company is a difficult position for any man to fill, no matter how well equipped he may be, but the new incumbent has a great capacity for hard work. His methods inspire the confidence of his subordinates, and he is what might be termed a conservatively aggressive leader: conservative in his conduct of the company's affairs and aggressive in his efforts to increase its business and give the public a first-class telegraph service.

Mr. Brooks was born at Wheelock, Texas, July 6, 1859. When but twelve years of age he became a telegraph messenger at Navasota, that state. Young lad that he was, he was early filled with an ambition to get ahead and succeed in life. He worked hard, was attentive and after serving for five months as messenger he was able to send and receive well enough so that he was given a place at the key. During the years of 1877 and 1878 he served in this capacity and in other positions of trust at various places on the Houston and Texas Central Railroad. His preference, however, was for the commercial telegraph service, not that of the railroad, and this prompted him to seek employment with the Western Union Telegraph Company. This he obtained in 1879. At twenty years of age, he was accounted a good operator and had already begun to display traits of executive ability that afterward rapidly developed as opportunity was afforded for their growth. In 1880 he was given the management of the Navasota office. Here he attracted such favorable attention that after an incumbency of but a few months, he was tendered a clerkship in the office of the superintendent at Dallas. From Dallas, he was selected to become manager of the Western Union office at Waco, subsequently being transferred to like positions, first at El Paso and afterward at Galveston, both being in the nature of promotions. On November 1, 1890, came the appointment as manager of the larger and more important office at Denver, Colo.

On January 1, 1893, when an assistant superintendent was wanted at Denver, Mr. Brooks was the logical man for the position and received the appointment. Denver, always an important point telegraphically as well as commercially, was growing rapidly in population and the extensive district, in the welfare of which he was now especially interested, was filling up; new towns were being settled, new telegraph offices opened and new lines of wire extended. It was a field of much activity and Mr. Brooks found abundant opportunity for the exercise and development of his executive abilities. He fulfilled the trust that had been reposed in him and met the exactions of his office.

It was a big jump from Denver to New York, from the position of assistant superintendent, to the general superintendency of the most important division in the entire telegraph system. Yet Mr. Brooks was equal to the demands placed upon him and when, early in the year 1902, he assumed the position which he has since held, it was with a spirit marked by courage, self-confidence and determination to succeed, the same vital force that animated the messenger boy thirty-one years before.

When the Executive Committee of the Western Union decided to relieve Colonel Clowry of part of the burdens which he has carried so ably since 1902, Mr. Brooks was the logical choice for the position and there was no hesitation on their part in offering him the important post.

According to a London paper a telewriter exchange will be opened in that city some time in March. Telewriters are already used by several London business houses.

A legislative committee in New Zealand has recommended that telegrapher's cramp should be added to the list of diseases for which the employer must compensate the workmen thereby incapacitated.

Congressman James T. McDermott, of Chicago, was a telegraph operator before being elected to Congress in 1906. Mr. McDermott is frequently seen around the telegraph offices in Washington, the click of the sounder still having a strong fascination for him.

An important improvement in the art of television, it is stated, has been discovered by Herr Ruhmer, the German inventor. The improvement consists in a selenium cell in which the sluggishness of selenium in responding to changes in the strength of light has been largely overcome.

It is not often that a telegraph operator, after being married, has the honor of being serenaded by a band and a large number of his friends all wearing high hats. Such, however, was the tribute paid recently to Mr. Frederick Snyder, a press operator of Wilmington, Delaware, by the members of a club to which he belongs.

ASHTON G. SAYLOR,
General Superintendent, Eastern Division, Western Union Telegraph Company, New York.

**Ashton G. Saylor, General Superintendent
Eastern Division, Western Union
Telegraph Company.**

The appointment of Mr. A. G. Saylor as general superintendent of the eastern division of the Western Union Telegraph Company to succeed Mr. Belvidere Brooks, promoted to the general managership, is one which meets with universal approval among those familiar with the telegraph personnel and brings to this high position a man eminently well fitted, both by reason of long training and personal qualifications, to fill the duties which now devolve on him.

Mr. Saylor is one of the large number of Canadian-born telegraphers who have achieved prominence in the profession of their choice. He was born at Bloomfield, Ont., June 11, 1859. From his earliest boyhood he showed a great interest in telegraph affairs. At the age of eleven years he graduated from the Ingersoll, Ont., Grammar School and then entered the service of the Dominion Telegraph Company as messenger at that point, and at twelve years of age was an operator, at Walkerton, Ont. In 1872, he returned to Ingersoll as an operator for the same company. In 1873 and 1874 he served the Montreal Telegraph Company at Ottawa and Montreal, in the latter year, transferring his residence to the United States and accepting a position as night operator for the Grand Trunk Railway at Portland, Me. He soon after entered the employ of the Atlantic and Pacific Telegraph Company and then that of the Western Union, with which company he has ever since been associated. In 1881 he transferred his services to the Philadelphia office. During the years of his apprenticeship at the key, Mr. Saylor not only became an operator of the highest class, but being of an observing turn of mind and a close student he acquired a thorough knowledge of the electrical branches of the service. As a result of this application to the mastery of the details of the business he was in 1884 advanced to the position of wire chief in the Philadelphia office and soon after became traffic chief and then chief operator. The marked ability which he displayed in the conduct of the duties of these positions brought him further promotion in 1887 to the position of manager of the company at Philadelphia. His next advancement was to the position of assistant to superintendent Gill at that point, which position he held until 1902 when he was transferred to New York as chief clerk to General Superintendent Brooks. On January 1, 1907 he was made assistant general superintendent, which position he held until his present promotion. Mr. Saylor's success has been due to hard and intelligent work, and close application to details. He is a close observer with a keen analytical mind and steadfastly adheres to the policy of fully understanding every subject that is brought before him, believing that if each detail is fully understood and the facts brought out, nothing is dif-

ficult and work becomes a pleasure as well as a duty. Mr. Saylor's parents were Quakers and he possesses many of the attributes of character derived from that source, chief among which are a well poised temperament and a personality which naturally attracts all with whom he comes in contact. His methods in conducting the telegraph business tend to inspire those under him with confidence in their leader and he for his part places confidence in his subordinates.

**William E. Athearn, Engineer of Equipment of
the Western Union Telegraph Company.**

The appointment of William E. Athearn to the position of engineer of equipment of the Western Union Telegraph Company brings back into the service after an absence of seven years one of the most competent electrical engineers who has ever been engaged in telegraphic circles. Mr. Athearn is especially well qualified for the new position as he has had a long training in the telegraph field and has always been a close student in electricity. His mastery of the problems involved in telegraphic operation is indicated by the large number of patents of telegraph apparatus which he has to his credit.

W. E. ATHEARN, NEW YORK.
Engineer of Equipment, Western Union Telegraph Company.

Mr. Athearn was born November 15, 1856, at West Tisbury, Martha's Vineyard, Mass. While pursuing a classical course in Williams College in 1877 he became interested in the study of electricity. As the most important field at that time in which electricity played a part was that of the telegraph, his attention was naturally turned in that direction and as a means of assisting him in his advancement in the study of electricity he learned the art of telegraphy. His first position was that of operator at Williamstown, Mass., in 1878. He afterward held positions as

chief operator, manager and electrician for various companies. He entered the service of the Western Union Telegraph Company in 1890 as night chief at the main office, 195 Broadway, New York. In 1894 he was appointed electrician of the first district. Later he was transferred to the electrical engineer's office and became assistant electrical engineer. In 1903 he resigned to accept a position on the engineer's staff of the American Telephone and Telegraph Company. About two years ago he was transferred to the plant department of that company as special agent in charge of the operation of the leased wire service, which position he held until his present appointment.

A New Telegraphic Transmitter.

The patent, No. 947,224, for a telegraphic transmitter, granted recently to Mr. Patrick B. Delany, as briefly mentioned in our February 16 issue, relates to a class of hand operated telegraph keys which the inventor designates as auto-dot keys for the reason that upon movement of the key into dot position, it will automatically transmit dots up to the maximum number required as long as it is so held, thereby relieving strain upon the operator and improving the quality of the transmitted signals.

Referring to the accompanying drawing the operation of the transmitter is as follows:

The dot key lever *a* pivoted at *b* and having a thumb screw piece *a'* engages in its outer end a shoulder or projection on a rocking part or block *c* having rigidly attached to it an arm *d* to which is applied a spring *d'* the reaction of which tends to carry the shoulder upon the block against the end of the key lever and hold the latter against its adjustable limiting stop *a''*. The block *c* also has rigidly attached to it a spring blade *e* carrying at its end a rigid rod *f* upon which is mounted an adjustable sliding weight *f'* and co-operating with which is an adjustable limiting or muffling stop *f''*. When the key lever is thrown to the right which is dot position, an impulse of rotation is imparted to the block *c* and impact of the arm *d* upon the line contact post *g* sets the parts *e, f*, in vibration causing it to successively make, at uniform periods, contact with a spring finger *h* connected through the transmitting battery *M B* to earth, the circuit being completed to line at each completion of the contact with *h* through the parts *f, e, c, d, g*. The maximum number of dots required for the Morse alphabet is six and vibration of the part *e, f*, will produce with relatively perfect uniformity and precision such number of dots as may be required. In order that the operator may know what signals are passing to line and govern the use of his key accordingly, the circuit wire from *h* passes through a relay *i* in the local circuit of which is a sounder *j*.

To transmit dashes a separate key is provided. This key is indicated in the form of a laterally movable flat spring supported at one end in a suit-

able post or block and at the other end, equipped with a finger piece *k'*. When moved to the left, it makes contact with a contact post *m* connected through a resistance *R*, that may be and preferably is adjustable, and the coil of relay *i* to earth through the main battery. Key *k* is connected by wire with the line contact post *g*.

Experience has shown that the key for transmitting dots constructed in the general manner described,—that is equipped with the rocking pivoted block *c* acted upon by the key lever and carrying the impact arm *d* and vibrating member *e, f*,—produces highly satisfactory and efficient results. This is believed to be largely because of the arrangement of leverages, the mounting of the vibrator being very firm, and the vibrations not being felt at the thumb piece of the key lever.

The introduction of the resistance in the circuit of the dash lever is an important feature. If a circuit has much capacity, the dash impulses leave a charge in the line causing the signals to run together and requiring a higher adjustment of the receiving relay than is necessary for the dot signals,—that is, ordinarily, in order to make the dashes clear, the dots are made unnecessarily light. This trouble is particularly noticeable on long circuits using repeaters and on underground and composite circuits. By using weaker current for dash signals than is used for dot signals, the receiver may be adjusted for the best dot condition and both kinds of impulses be equalized in clearness. The line discharge from a dash impulse of diminished strength does not deplete the next succeeding dot to anything like the same degree as it would were the dash impulses of the

same strength of current required for effective transmission of the dots. By using a resistance *R*, which is preferably adjustable, the most satisfactory conditions for any given circuit may be readily attained. It has been found in practice that a resistance of about five hundred ohms affords excellent results for substantially all circuits.

A further feature of this invention is the employment of a non-interfering device, shown in this instance as an adjustable screw bolt *n* mounted in and passing through the key lever into the path of and into suitable proximity to the dash lever *k*. With this device properly adjusted, the dash lever cannot make contact with *m* until by movement of key lever *a* the anti-interference pin or bolt *m* has been withdrawn from the path of the dash key. Similarly, the dot key lever *a* cannot be moved to its limit until the dash lever has returned to its normal retracted position.

A controlling feature of construction of the dot transmitting devices described is the impact arm *d* and vibrator *e* projecting from, or radial to, the axis *c'* of the rocking part or block *c*. As shown, the parts *d* and *e* are secured in the body of the block. This is a suitable arrangement but is not an essential one.

Wireless Telegraph Legislation.

The bill introduced in Congress by Representative Roberts of Massachusetts providing for the appointment of a board consisting of seven members to outline a system of regulations to govern the operation of all wireless telegraph plans in this country and other measures aiming to regulate the wireless art have aroused considerable opposition among the many amateur experimenters in the wireless field. One of these critics of the proposed measures characterizes them as un-American, impractical and opposed to the best interests of wireless telegraphy. He asserts that most of the interference which hinders the transmission of regular business is caused by inefficient operators in the Army and Navy service and that the equipment used by the Government is out of date and inefficient.

Brigadier-General James Allen, chief signal officer of the United States Army believes that the amateur wireless telegraphers are unduly alarmed, because it is not the intention of Congress to enact any legislation that will deprive any one of his just rights. "This hit-and-miss sort of business should cease, however," he declared emphatically; "there are too great interests at stake to permit every wireless operator to run unbridled. Regulation can be had that will correct all the present evils and interfere with no one that should not be stopped. A license would protect every legitimate amateur; and it would enable the authorities to get hold of the fellow who should be out of the work to the benefit of everybody, for indiscriminate use of wireless works great harm in many cases, especially when false calls for help are sent out from coast towns."

Rear-Admiral Cowles, who until recently was at the head of the Bureau of Equipment of the Navy which has charge of the wireless branch of the service, states that the bureau has kept pace with the growth of the art by purchasing new apparatus to stimulate the activities of the manufacturing companies, by standardizing as many parts of the apparatus as possible, and by carrying on tests leading to a more thorough understanding of the subject of all wireless communication.

Another prominent naval officer has made the following statements: The attacks of certain wireless interests in private life made upon the enlisted personnel in charge of naval wireless stations are not only unfounded but unjust. This personnel needs no defense, but since the force has been so gratuitously and savagely attacked it may be well to say:

"That wireless operators are specially educated for their work by the Government at the Brooklyn Navy Yard and at the Mare Island Navy Yard.

"That the schools are by no means elementary and the course of instruction is thorough.

"That the records of the Bureau of Navigation do not show a report questioning in the slightest degree the efficiency of an operator, but on the contrary nothing but praise.

"That for the fourteen months of the cruise of the battleship fleet not a ship was out of touch of its wireless chain.

"That Government operators are leaving the service continually to accept good positions with commercial companies."

A bill introduced by Representative Burke of Pennsylvania provides for licensing all wireless stations with penalties of fine and imprisonment; regulates the wave amplitude, prohibits false signalling, provides secrecy, all under drastic penalties, and authorizes the President in time of war or public danger to suspend the operation of any or all wireless stations within the jurisdiction of the United States.

Another measure introduced by Representative Peters of Massachusetts, makes it an offense punishable by a fine not exceeding \$2,000 and imprisonment not exceeding one year, or both, for the sending of a false message purporting to be official, and limits the wave lengths of commercial or private interests.

A bill introduced in the Senate by Senator Frye of Maine, provides: "That it shall be unlawful for any ocean-going steamer, certified to carry, or carrying, fifty passengers or more, to carry passengers between ports two hundred miles or more apart by sea unless on leaving her port of departure such steamer shall be equipped with an efficient apparatus for radio-communication in good working order and in charge of a person skilled in the use of such apparatus."

Telegraph and Telephone Age is headquarters for all electrical books. Write for catalogue.

The Military Telegrapher in the Civil War.

PART XXXIV.—CONCLUDED.

The interesting recital by John H. Emerick of his war time experience while a member of the United States Military Telegraph Corps which was begun in our February 1 issue and continued in our February 16 number is concluded as follows:

"On October 9, 1863 we advanced from Centreville and two days later arrived at Warrenton and established communication with Washington. On October 24 I started on horseback at 8 p. m. with a cavalry escort to open an office at Catlett's Station for the use of General French who was in camp at that point. I opened the office at 10:30 p. m. and during the night suffered considerably from cold as I had no blankets and no provision for fire. After two days at this point I was relieved by operators Shreffler and Glazier and rode back to the headquarters of the Army of the Potomac at Warrenton. The next day the headquarters were moved to Auburn but I remained to keep the office open at Warrenton for the use of the sixth corps, until I was relieved by operators Ryan and Samuel Edwards from Washington.

"On October 30 I was again selected to do the rough work and was sent on horseback and alone to open an office in the advance at Bealton Station. I found Bealton to be outside our picket lines and so returned two miles to the camp of our construction corps at Licking Run. The latter were building a line towards Culpepper as fast as our picket lines were advanced. Dennis Doren acted the good samaritan by caring for me and making me comfortable. I had been riding in the rain all day and could not boast of a single dry thread.

"On December 2 we moved back to Brandy Station over muddy roads the object of our expedition not having been accomplished. On January 7, 1864 I was assigned to cipher duty temporarily in the War Department office, C. A. Tinker, and D. H. Bates both being sick, A. B. Chandler and myself had to do the cipher work day and night. I remained here until February 28 when I returned to headquarters. James Murray started the same day with Kilpatrick's cavalry on a raid toward Richmond.

"On April 8 notwithstanding the protestations of Harper Caldwell and my own reluctance I was ordered to the War Department again for cipher duty. I remained there this time until April 29, when I returned to headquarters accompanied by James Murray. May 4 we broke camp and crossed the Rapidan at Germania Ford camping on the south bank. During the next two days the battle of the Wilderness was fought. No telegraph lines being in use we had a chance to witness the battle.

"On the night of May 7 we marched all night and went into camp early in the morning of the eighth between Tods' Tavern and Spottsylvania

Court House. While there I assisted General Grant's cipher clerk, S. H. Beckwith, the despatches coming across country by mounted scouts from long distances, some of them getting through and others falling into the enemy's hands. On May 11 General Hancock commanding the second corps proposed to General Meade to attempt a surprise on the enemy's works in his front at Spottsylvania Court House. The arrangement was made and the attack took place before day break on the morning of May 12. Hancock's attack was a complete surprise and General Edward Johnson, commanding a division of the enemy's forces was captured with his entire division numbering seven thousand men. The military telegraph played an important part in this movement, in fact the details could not have been arranged with sufficient promptness without it. The office at Hancock's headquarters was in a tent and consisted of two cracker boxes, one relay instrument, and two operators.

"On May 13 I went into camp at Hancock's House. There was considerable fighting going on every day. The military telegraph was at that time so thoroughly organized that though every corps of the army moved nearly every day each corps headquarters was in communication with the headquarters of the army and with each other every night. Field wire consisting of seven small soft iron wires coated with rubber was strung upon trees, fences or lances carried for the purpose the reels being carried upon mules' backs. A wire could be put up as fast as a mule could walk and sometimes he was urged to a sharper pace. We operators, three at the army headquarters and two at each corps headquarters were provided with a light wagon for carrying provisions, supplies, a tent, etc., and each had a saddle horse. A large battery wagon made for the purpose with porous cups of leather accompanied the army headquarters. This wagon also contained all the requisites of a telegraph office. When a movement was made, a portion of the battery was transferred to the light wagon and retained at the old headquarters, supplying the wire with current until the large wagon reached the new location and its battery was put in the circuit. The light wagon then made a rapid march to rejoin headquarters. Remaining back with this wagon often became dangerous business as perhaps the whole army had abandoned the surrounding country and the enemy's cavalry were close upon the operator and his attendants before he was at liberty to move. Often a portion of the wire in use was necessarily abandoned.

"On May 19 the Confederate General Ewell's corps attempted to turn our right but was repulsed after a sharp fight. The battle began in close proximity to our office which we moved a half mile to the left upon very short notice. May 25 we camped on the north side of the North Anna River. Our office was in full view of the enemy's pickets on the opposite bank though

there was no picket firing going on. On May 27 Caldwell, Doren and myself remained back with the battery wagon the headquarters having moved on. When we finally started and the wagon was moving along a road parallel to the river and where it was impossible to retreat the enemy opened a brisk musketry fire on us. The mules drawing the battery wagon became unmanageable and ran the wagon into a gate post badly damaging it, though the driver stuck to his team and finally brought the wagon inside our picket lines and out of danger. The rest of us claim to have made the quickest time on record in the telegraph corps, all being well mounted. None of us received a scratch but the manner in which the bullets whizzed around us was far from agreeable.

"On June 2 our headquarters were moved to a point near Cold Harbor. Doren and myself remained with the light battery wagon at the old headquarters until the new headquarters were established. The enemy's cavalry were close upon us when we finally started to join headquarters and we felt somewhat uneasy but arrived all right. Sergeant Carrigan, formerly of the signal corps and detailed to our construction corps, who went back with a wagon and a guard to take down wire we had just left was not so fortunate. Before he had arrived at the point we had left, his party was fired on. They retreated in good order and arrived back at headquarters with all their men and animals. The Sergeant, however, was shot through the knee and so badly wounded that he died the next day.

"The following day the battle of Cold Harbor was fought. The telegraph played an important part in this battle offices being opened at headquarters in the rear of the center of the army and at each corps headquarters. The operators at the ninth corps headquarters on the right were under heavy fire and one or two of them retreated in decidedly bad order. Operator Samuel Edwards was ordered to fill their place and did so fearlessly though exposed to great danger. I am not sure whether Edwards was alone or whether Edward Hall was with him. I do know, however, that these operators on several occasions during this and the following two days distinguished themselves by their bravery, being constantly exposed to heavy fire and in danger of capture.

"Two days later there was a strong attack on the front of the second corps commanded by General Hancock. The corps headquarters operators on occasions like this were always more or less exposed to danger of the most demoralizing character but with the exception of the case of the two operators of the ninth corps previously mentioned I do not remember that one of them ever flinched.

"On June 18 the enemy's works at Petersburg were attacked at all points but we were repulsed after most terrific fighting. The telegraphers at each corps headquarters and at the army headquarters did constant and most important service during this battle. General Grant was at

City Point a few miles away but in telegraphic communication with Meade who made his headquarters during the battle at the ninth corps headquarters near the right of the line. I was sent to that point to do the telegraphing for General Meade, he receiving occasional instructions from Grant at City Point and forwarding them by telegraph to Generals Warren and Hancock on our left. General Meade expostulated against the useless slaughter contingent upon attempting to carry the enemy's works which he deemed impregnable, as they really proved to be, Grant's reply to Meade's final appeal to give up the attack after successive bloody repulses was 'Pile in the men.' They were piled in and piled up by the thousands until Grant finally ordered the abandonment of the attack and telegraphed Meade, 'I am satisfied. Now we can rest and use the spade.'

"On June 20 I was ordered temporarily to the headquarters of the second corps. Two days later we were attacked and driven back. We had to move our battery wagon and in so doing got in the line of fire but none of us were hurt. On July 12, the army headquarters was moved to the rear of the ninth corps where we went into camp in a sort of permanent way and settled down for the siege of Petersburg.

"The second corps operators especially who were located in a house near the front were shelled constantly, shells often passing through the house. The enemy amused themselves often at night by shelling our headquarters but never got the exact range. Mortar shells, however, often dropped very near us and disturbed our sleep. A stray 'Whitworth' shot dropped into our next door neighbor's tent one morning while we were at breakfast but during the entire siege none of the telegraphers were hurt.

"On July 30 a mine was set off in front of the ninth corps. Those of us who were on duty at four o'clock that morning knew that this event was to take place, the correspondence concerning it having been carried on principally by telegraph. Though the headquarters office was less than a mile from the mine, the shock was scarcely perceptible. Our troops, principally colored, who made the subsequent attack through the breach were repulsed with heavy slaughter. The failure of this attack by Burnside's troops gave rise to dissatisfaction on the part of Generals Grant and Meade with Burnside's management. A spirited telegraphic correspondence on the subject was carried on between our headquarters and Grant's headquarters at City Point and General Burnside was soon after relieved of his command.

"On September 10 I was again ordered to the War Department for cipher duty. A few days later Hampton's Cavalry made a raid upon our cattle herd three or four miles below City Point capturing a very large number, the entire supply of the army. Our Fort Monroe wire ran past this point and MacKintosh then lineman at City Point, at this writing superintendent of construc-

tion at the Western Union Telegraph Company in New York, being out on a break was captured and taken to Libby prison, his second visit to that place, he having been captured with Robert F. Weitbrecht at Fairfax Station. I have in my possession a telegram from Lee to Wade Hampton conceiving the idea of this cattle raid. I found the telegram in Richmond after our occupation of that city. On November 29 I returned to duty at the headquarters of the Army of the Potomac in front of Petersburg and on December 22 I was left in charge there until further orders, Harper Caldwell having gone north and not being sure of returning. Major Eckert, however, induced him to go back and he returned to headquarters December 30. On February 3, 1865 I reported at the headquarters of the army of the James before Richmond, General Ord commanding, to take the position of chief operator, Richard O'Brien having been ordered to North Carolina. I found a line here about a dozen miles long, extending from Bermuda Hundred on the James River on the left, to Kautz's cavalry headquarters on the right, with offices at Bermuda Hundred, Varina Landing, headquarters of the Army of the James, twenty-fifth corps headquarters, twenty-fourth corps headquarters and cavalry headquarters. On March 23 by order from the War Department I made requisition for material for an independent field line of fifteen miles. March 28 General Ord and staff and a portion of the cavalry and infantry went to reinforce the Army of the Potomac.

"On April 1 I sent Operators Nichols, Snow and take charge of our construction train which was expected to arrive shortly. The next day I was ordered to send a portion of my operators to the Army of the Potomac. I had an argument with General Abbott who was located at the crossing of the Appomattox about closing his office which I had been ordered to do and being sustained by the War Department of course came out ahead.

"On April 1 I sent Operators Nichols, Snow and McKenna to join General Ord on the other side of the Appomattox. The same day our train of five four mule teams and a battery wagon with field material arrived. Palmer Gulick was in charge with Edward A. Eckert as wagon master and assistant.

"On April 1 I sent Operators Nichols, Snow and daylight and of course all of the operators were very much excited and it was very hard to keep them within bounds. Operator W. K. Applebaugh had the honor of being the first military operator in Richmond, he going in with the advance cavalry. Of course we turned our attention at once to extending our line into the city and succeeded in getting to the suburbs by night-fall but the circuit failed between us and City Point almost as soon as we had opened our office. The next day we got the wire into good working order and opened an office in the custom house building in the heart of the city. This building having been occupied as executive of-

fices by Jefferson Davis, and his cabinet, and hastily evacuated thirty-six hours previously, we of course found many interesting relics and were surrounded by piles of Confederate bonds, etc. The boys made haste to possess themselves of such things as struck their fancy. We all secured interesting official documents, etc., containing autographs of all the prominent Confederate leaders.

"On April 7, we commenced building a line toward Petersburg. The next day I had the pleasure of sending a cipher of 1,600 words for Assistant Secretary of War Dana. On April 9 we got our wire working to Petersburg and received the news of Lee's surrender.

"April 11 we commenced working to City Point via Petersburg, a much more desirable route than our old one. The next day our troops occupied Lynchburg and General Ord took command in Richmond. On April 14 we built a line to Rockett's Landing, the head of navigation at the lower end of the City of Richmond and opened an office there. The next morning the news of Lincoln's assassination was received but was kept from the people. Secretary of War Stanton ordered the arrest and confinement in Libby prison of Judge Campbell and all paroled Confederate officers but, at the solicitation of General Ord, afterward countermanded the order.

"On April 16 I opened an office in Manchester on the opposite side of the James River and did business from that point, our wire across the river being down. Lincoln's assassination becoming known that day the residents became exceedingly turbulent and extra precautions against riot or surprise of any kind were taken by General Ord. On April 20 we were obliged to refuse private business as with our one wire we were unable to handle it. The next day we received via Fort Monroe news of the cessation of hostilities between Generals Sherman and Joseph Johnson.

"On April 27 Solmon Palmer and his building party started to repair the line to Weldon, N. C. Two days later I was ordered by General Eckert to put the line in order to Fredericksburg. I started Palmer Gulick and his party with a hand car, operator Wm. B. Wood accompanying them.

"May 3 Harper Caldwell arrived at Richmond and assumed charge of the military telegraph affairs at that point. Two days later the Army of the Potomac passed through Richmond. J. B. Norris and Charles H. Mixer went with them overland to Washington. Charles Hammond went to Fredericksburg to assist W. B. Wood who was located at that point. By May 16 we had a line working south as far as Pascagoula, Fla. On May 20 we received the news of the appointment of General Eckert as Assistant Secretary of War.

"I remained in the service until the lines were turned over to the commercial companies and then took up my residence in New York."

Interesting Subjects Treated in Back Numbers.

Telegraph and Telephone Age publishes the best articles which can be obtained anywhere upon telegraphic subjects. We enumerate herewith a few of the many important subjects treated in our columns during the past few years, together with the dates of the papers containing the same. We have a limited supply of the back numbers containing these articles which we will send to any address upon receipt of price, 25 cents each. Any of these issues less than six months old are not regarded as back numbers, but will be sent upon receipt of the regular price, 10 cents. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

The publisher of Telegraph and Telephone Age urges upon subscribers to this journal the desirability of having the paper sent to their home address rather than to their place of business. The reason is obvious. If it goes to your home it reaches you without danger of obstruction or abstraction by your office associates who are sometimes prone to borrow your copy to your discomfort and their edification, but at your expense. This naturally is a source of irritation and of course you don't like it. If a man wants Telegraph and Telephone Age he should pay for it, and the individual who is paying for his copy should be guaranteed in his rights.

As we regard our subscribers as our friends, and believe we are supplying them with a telegraph paper the like of which does not elsewhere exist, we dislike to see them disappointed, and wish to protect them in their prerogative so far as we are able. We believe that a good many disappointments of non-receipt of the paper might be averted if our suggestion of sending it in all cases to the homes of its subscribers were adopted. Changes of address will be made as often as desired.

Directory of Annual Meetings.

Association of Railway Telegraph Superintendents meets at Los Angeles, Calif., May, 16-20, 1910.

Commercial Cable Company meets the first Monday in March, at New York.

Great North Western Telegraph Company meets the fourth Thursday in September, at Toronto, Ont.

International Association of Municipal Electricians meets at Rochester, N. Y., in 1910. Date to be selected later.

Old Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps, will meet at Chicago in 1910, date to be selected later.

Postal Telegraph-Cable Company meets the fourth Tuesday in February, at New York.

Telegraphers' Mutual Benefit Association meets the third Wednesday in November, at New York.

Train Despatchers Associations meets in Spokane, Wash., June 21, 1910.

The stockholders of the Western Union Telegraph Company meet the second Wednesday in October, at New York; election of officers occurs on the third Wednesday in October.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. E. BRIDGES

Sole Manufacturer

Hudson Terminal, 30 Church St.

NEW YORK

Western Representative

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

Telephone despatching equipment has been installed recently and placed in service on the Chicago, Indiana and Southern Railroad, between Gibson City, Ind. and Franklin Park, Ill.

The telegraph department of the Pennsylvania Railroad, it is reported, is about to begin experiments in wireless telegraphy with a view of determining its utility and practicability for railway work.

Mr. Charles T. Day, formerly of the Southern Pacific Railroad, at San Francisco, has been appointed assistant superintendent of telegraph of the Sonora Railway and Southern Pacific Lines in Mexico, with headquarters at Empalme, Sonora, Mexico.

The Georgia Railroad is preparing to install telephone equipment for despatching trains between Augusta and Atlanta, Georgia, a distance of one hundred and seventy-one miles, and from Camak, Georgia, to Macon, Georgia, a distance of seventy-four miles. There will be twenty-eight regular stations and five siding telephones on the line from Augusta to Atlanta, and twenty regular stations from Camak to Macon. This installation is the first one in that section of the country.

The next meeting of the eastern division of the Association of Railway Telegraph Superintendents will be held at the Ponce de Leon Hotel, St. Augustine, Fla., March 25. Among other things which will come up for discussion will be a report of the Committee on the Standard Railway Telephone Contract. The questions discussed at the January meeting of the western division will also be considered. A report will be made and those present will try to decide upon a route to be taken by those attending the next annual convention which meets in Los Angeles, May 16 to 20.

A reduction in the length of their working day from ten to eight hours, without decrease in pay, has been granted to the telegraph operators of the Illinois Central Railroad in the principal relay offices at Chicago, Memphis and New Orleans. This reduction in hours of service comes as a compromise of the recent demand made by the railroad telegraphers of that system for a ten per cent. increase in pay. The adjusting of the differences between the company and the telegraphers was brought about by an arbitration committee, appointed under the Erdman act, which included representatives of both the operators and the company. By the terms of the same award operators in the train-despatching offices are granted a decrease from ten to nine hours, and all operators on the system who are required to work ten hours or more a day are to be allowed an annual fifteen day leave-of-absence with full pay. The arbitration board consisted of Professor B. H. Meyer, of the University of Wisconsin, umpire; President I. G. Rawn, of the Monon Railroad, representative for the company, and John A. Newman, of the Order of Railway Telegraphers, for the operators.

The next meeting of the Railway Signal Association will be held at Chicago, March 14. Among the papers to be presented will be one on "Lightning Protection," by Otto Holstein, of the Central Railway of Peru, Lima, Peru. Mr. Holstein is well qualified to write upon this subject as the telegraph and signal wires of the road upon which he is employed and which reaches high elevations in the Andes, are especially subject to the effects of lightning, discharges upon the lines being of almost daily occurrence.

The Boston and Maine Railroad is equipping two additional divisions of its line with telephone equipment for train despatching. One of these extends from Concord, N. H., to White River Junction, Vt., a distance of seventy miles, and the other from Concord to Woodsville, N. H., ninety-five miles. Each circuit is to be equipped with twenty-five way stations. On the first of these divisions the dispatcher is located at Concord and on the other at Woodsville.

Among the papers which it is expected will be presented at the Los Angeles Meeting of the Association of Railway Telegraph Superintendents, May 16-20, will be one by Mr. D. C. Buell, chief of the educational bureau of information of the Union Pacific Railroad, outlining the work of his department. As the Union Pacific is foremost among the railway systems of this country in its efforts to educate its employes, Mr. Buell's paper will undoubtedly be received with great interest.

We are in receipt from Mr. E. P. Griffith, superintendent of telegraph of the Erie Railroad, of a photograph of a portable telephone set in operation upon his system. The picture shows a train which has stopped while the conductor is receiving orders by means of the portable instrument which is connected to the line by the use of a jointed pole carried for that purpose. The photograph was taken to illustrate an article which Mr. Griffith is preparing for the Erie Employees Magazine.

Telephone despatching equipment has been installed by the Pennsylvania Railroad upon the Buffalo, the Allegheny and the Monongahela divisions. On the last named division the double call system was installed, one selector operating one bell to call the operator to the dispatcher's circuit and the second bell being operated to call the operator to the message circuit. This is accomplished by means of two call boxes in the main office, each one controlling its own set of bells. Additional telephone despatching equipment is now being installed by the Pennsylvania Railroad on their Sunbury division between Mt. Carmel and Sunbury and Lewiston Junction and Sunbury.

The testimony of progressive operators is that Telegraph and Telephone Age is so thoroughly comprehensive in character as to make it absolutely indispensable to those who would keep informed. Its technical articles are of high practical value. Write for a free sample copy.

Meeting of Western Division of Association of Railway Telegraph Superintendents.

The January meeting of the Western Division of the Association of Railway Telegraph Superintendents was held in the office of Superintendent Bennett, of the Chicago and Northwestern Railway, on January 19.

After some discussion as to the best method for advancing the matter of high tension wire crossings, the following motion was carried by the meeting:

"That it is the sense of the western division, that Secretary Drew be requested to obtain a sufficient number of copies of the report made by the committee on high tension wire crossings, together with the forms submitted in connection therewith, and to distribute them to each telegraph department representative of the railroads throughout the country, whether a member of the Association or not, in order that they may secure through the management of their railroads, the universal adoption of the proposed uniform contract."

It was then decided that members of the western division should submit to the management of the railroad which each represents, copies of the report of the committee on wire crossings, recommending adoption of the specifications, and urging the need of action as nearly uniform as practicable by public bodies having jurisdiction in such matters.

The proposed new standard telephone agreement was then discussed, and Mr. E. P. Griffith of the eastern division said for the committee of his division which is considering this question that they had been busy and made considerable progress, but had not heard from a sufficient number of the members to make a final report. The committee has analyzed the proposition very carefully, but the members feel that a complete report cannot be made at present. He thought that by the time of the next eastern division meeting in March, they would have something definite to report.

The following letter from Mr. I. T. Dyer, superintendent of telegraph, of the San Pedro, Los Angeles and Salt Lake Railroad, regarding the annual convention to be held in Los Angeles, May 16-20, was read:

"Among the entertainment features arranged for are trips to Mt. Lowe, which include a stop at the Ostrich Farm and in Pasadena, going, and at Mt. Lowe Observatory returning, with dinner at Alpine Tavern. This means leaving the city at 12:30 p. m. The Kite trip contemplates leaving Los Angeles at 8 or 9 o'clock in the morning, the day to be consumed in going through the orange groves, Redlands and San Bernardino, dinner at the Glenwood Mission Hotel Riverside; returning via Baldwin's ranch, arriving about 5:30 p. m. On the Balloon Route trip over the Los Angeles Pacific Railway, we would leave Los Angeles at 12:30, going to Redondo, via Hollywood, Soldiers' Home, the Palisades, Santa Monica, Ocean

Park, Venice, arriving at Redondo Beach about 6:30, dinner at the Dolphin, returning along the beach to Venice, and thence to Los Angeles, arriving there at 9 p. m.

"On the trip to Avalon and Catalina, we would leave Los Angeles over the Salt Lake Route at 8:50 a. m., and take the boat at San Pedro, arriving at Avalon at 12:30. Those who desire may return on the next boat at 3 p. m., or 9 p. m., on the steamship Hermosa. I am figuring on Saturday for the Avalon trip for the reason that I expect a great many would like to remain over until Sunday, or possibly longer. All of these trips are delightful and I am only sorry that the short stay will not permit the arranging for several other trips around Los Angeles. The trip from the Tehachapi to Santa Barbara and return, and the trip to San Diego and Coronada Beach, would both be fine, and a half day to make the trip to San Gabriel Mission and back would be very interesting to a great many of the members and their families. Other trips are Baldwin's Ranch, Laurel Canyon, Mt. Washington, etc., but as Mr. P. W. Drew suggested, I do not want to propose a marathon endurance test for the ladies in the afternoon; on the afternoon if you will consider the Mt. Lowe, Balloon Route, Kite and Catalina Island trips.

"My idea for the arrangement of the program is as follows: On the 16th, the day the gathering convenes, an automobile trip around the city for the ladies in the afternoon; on the afternoon of the 17th the Balloon Route trip; on the afternoon of the 18th, the Mt. Lowe trip; on the 19th, the Kite trip; the 20th to be arranged for; on the 21st the Avalon trip. This will give the members a whole day for work on the 16th, one half day on the 17th and 18th, and a whole day on the 20th."

In connection with the convention, it was voted, that the secretary write the chairman of the eastern and western division transportation committees, advising that at this meeting members of the western division and members of their families, numbering about thirty-five persons, indicated a preference to use the Santa Fé route, going to the convention, leaving Kansas City in a body at 11:30 a. m., Thursday, May 12, on Santa Fé train No. 1, arriving at Los Angeles at 8:30 a. m., the following Monday, returning via such route as they may desire.

Among those present were the following: Wm. Bennett, John L. Davis, F. F. Fowle, J. G. Jennings, G. M. Jones, V. T. Kissenger, M. E. Launbranch, W. W. Ryder, F. H. Van Etten, F. T. Wilbur, Archibald Wray, Chicago; G. C. Kinsman, Decatur, Ill.; J. J. Ross, Detroit, Mich.; C. S. Rhoads, Indianapolis; R. L. Logan and Val B. Mintun, Kansas City; W. W. Ashald, Montreal; E. P. Griffith, New York; G. A. Cellar and L. A. Lee, Pittsburg; F. E. Bentley, E. A. Chenery and H. D. Teed, St. Louis; George Boyce, E. E. Dildine and E. J. Little, St. Paul; H. O. Rugh, Sandwich, Ill.

Train Despatching by Telephone.*

BY C. H. GAUNT.

Assistant General Manager and Superintendent of Telegraph
Santa Fe System.

We have not yet reached the stage of progress where one might ask, "Is the telegraph doomed?" Certainly it is not doomed when its application to the transmission of intelligence to great distances is taken into consideration nor when we reflect upon the great wireless projects of the future. But there is one direct use of telegraphy that is seriously disturbed, and that is its application to the necessities of modern train despatching.

The important invention of Morse had scarcely been offered for general use before it was seen that it could be availed of in the movement of trains upon railroads. The recognition of the assistance of the telegraph service in threading trains through the sidings, straight stretches and curved sections of a single-track railroad is practically coincident with the adoption of that service for sending messages of a social and business nature.

The year 1851 saw the first systematic attempt to telegraph "orders" from a central point to the engineers and conductors of trains, and, from that time down to the present, train despatching and the telegraph have been inseparable. Thousands of our youths who have looked with longing eyes and stimulated imaginations to the railroad as the goal of their ambitions, have started their careers by learning the art of telegraphy, because that seemed to be the most certain means by which they might sit in the chair of the train dispatcher, a most coveted place—a place from which great railroad generals are drawn, a position of responsibility well worth the metal of any man, and by far the most important single occupation connected directly with the movement of trains.

The trainmaster must be virtually a mistakeless man. He is the commanding general of train movements and the engineers and conductors are his field marshals. The great single-track railroads of the West have developed a body of serious-minded men for this work whose mental equipment is of a high order. The game that they play with the trains under their control is one that does not permit them to take a single chance. It must be played to perfection. The train dispatcher is the chess master of railway train movement, and he must win every game. Where a mistake means death or the great destruction of property, or both, then the absolute elimination of mistakes is the one great effort; and in no branch of railway operation has that effort been more fruitful of results than in the development of experienced men and first-class machinery to handle an indefinite number of trains in all kinds of intricate manoeuvres without accident and with the least delay.

*A reprint of an article published in the Santa Fe Employees' Magazine.

The telephone has been in general use just about thirty years. At the very start the question was asked: "Why cannot this improved means of transmitting words be used in the despatching of trains?" The grave and earnest men whose mental machinery seemed to work to perfection through the instrumentality of the telegraph said "No." The high officials of the railroads did not feel that the well working system was susceptible of change without risk, and risk is always to be avoided when there is no immediate and good reason for assuming it.

Hardly a man of large influence in the field of train operation advocated the supplanting of the telegraph by the telephone during the first twenty-five years of the latter's successful use. Even after the clear long-distance transmitter had been generally established the railroad managers hesitated to interfere with the long wedded union of the telegraph with train movement. But the fine, practical minds of our great railroad managers have to be suddenly changed sometimes when a combination of circumstances brings about a result that has not been foreseen. Some may claim that the use of the telephone in despatching trains has long been advocated. Possibly so, but only during the last few years have trials been made of sufficient importance, and upon a large enough scale, to prove anything. When proof is demanded by a practical-headed train dispatcher, it must be capable of but one construction—absolute.

The Santa Fe established its original telephone train-despatching circuit in June, 1908, in the dry climate of Colorado. It was not fitted with the improved apparatus now available, but there could be only one construction placed upon the reports received upon its operation—it was a success. As soon as this was realized immediate steps were taken to extend the introduction of the system to widely separated sections of the lines so as to test it in all conditions of climate. During the early part of 1909, 1,962 miles of telephonic train-despatching circuits were in operation upon the Santa Fe Railway in the states of Missouri, Kansas, Illinois, Colorado, New Mexico and California. The longest circuit reaches from Fresno, Cal., to San Francisco, 203.1 miles, contains thirty-two stations and is successfully operated through the "fog-belt" adjacent to San Francisco, where the telegraph is used only with great difficulty. The operating circuit upon all of these lines is a pair of 210-pound-per-mile copper wires carefully strung and costing in the neighborhood of \$100 per mile. There is at present under construction 1,520 miles more, which will give a total length of about 3,482 miles of telephone circuits.

The results of this extensive trial, while really astonishing, should hardly be so considered, for they are but the natural consequences of human tendency, and an analysis of the telephone method will convince anyone that it will almost completely displace the use of the telegraph in

moving trains, notwithstanding the expense of installation and the difficulty in overcoming the force exerted by the widespread use of the telegraph method.

The telegraph is used by the train despatcher in the intricate operation of his trains for one purpose only, that of communicating with the operators scattered along the stretch of railroad. Long use has developed a certainty of action in telegraph manipulation that commands the respect of all. But how often has a half frantic despatcher, loaded down with the complicated problems before him, wished he could use his voice to the men with whom he must communicate and thus avail himself of the rapidity of action, the definiteness and security that would follow?

To the despatcher time is the one thing that must receive the greatest consideration. It may be assumed that a man can utter words with a speed equal to the operation of his mind. But the train despatcher, in using the telegraph, has always been obliged to transmit his words at a speed but one-tenth his capacity to express himself, and also to receive a reply at the same rate. That being the case, of course a train-despatching system had to be adopted that would deal with a very small number of expressed ideas, and eternally and always the despatcher must come down to the limitations of the telegraph. In other words, the whole operation is inharmonious and does not tend to a result along the most natural channel. True, in the issuance of "orders" themselves, the speed, in telephonic manipulation, is limited to that required to write the words in longhand. But all directions of a collateral character, the receipt of important information and the instantaneous descriptions of situations that a despatcher must understand can be given and received at a speed limited only by that of human utterance.

And what does that mean? It means that the despatcher has been permitted to multiply the time within which he may form his plans of train operation fully three times. This, of itself, further means that his mental calculations are vastly improved in accuracy and general value. The despatcher is permitted to issue his orders at the times he originally outlined, and there is a coherence, a consistency and a union in his methods not possible where less time is available. This condition largely reduces the liability of error of action and, conversely, allows additional time for the discovery of error, important or unimportant.

By the use of the telephone the despatcher is relieved of that long continued and aggravating operation of calling an office by repeating over and over the telegraphic letter or letters used for that purpose. There is established at each office along the road, in the same circuit with the telephones, a small and compact instrument called a selector. Connected with the selector at each office is also an electric bell operated

by a couple of cells of dry battery. The despatcher has within easy reach a number of buttons upon a board, each button being designated by the name of the station that it is designed to call. By merely pressing such a button the selector in that particular station is operated, to the exclusion of all others, and in a few seconds the bell is ringing loudly. And, to show the completeness of this calling arrangement, the despatcher also hears in his telephone receiver the flutter of the bell and therefore knows that it is ringing. The despatcher can stop the call when he likes, and a short ring generally arouses an immediate response. But, if not, the call may be continued until the answer is received, something that does not often occur, because an excuse for not answering does not have the same weight where a bell rings loudly that it does where an instrument may be feebly ticking off the call. And if it were not enough that the time used in calling offices should be practically eliminated, there is the further advantage that these calls may be made upon the line at the same time telephonic conversation is being carried on, one operation not interfering with the other.

If the operator at the station wishes to communicate with the despatcher, he simply removes the telephone from the hook, places it to his ear, and if there is an opening for him he states the name of his station and the despatcher instantly replies by saying "despatcher." The "reporting" of trains—that is, the stating of the time of passing or of the arrival and departure of trains at stations—is made to the despatcher much more quickly than is possible by telegraph, and, where messages are necessary, they may be transmitted by telephone with the speed at which the operator and despatcher may be able to write longhand, and with equal accuracy to the telegraph. Information regarding derailments or other trouble is conveyed to the despatcher by verbal and complete narrative, either by the station operator or the conductor of the train involved, so that the despatcher is in immediate touch with the situation, while in using the telegraph for this purpose message after message is required before there is a complete understanding of details."

In transmitting "orders" by telephone, the despatcher spells out in full the names of stations, numbers of engines and trains, the times and the proper names involved. This, however, is done with speed and precision, and the despatcher writes the order in the record before him as he gives it, not waiting to make the record when it shall be "repeated" to him by the operator, as is done in the telegraph operation. This change in making the record of the order from a subsequent to an initial one is very important from the standpoint of absolute accuracy.

Unquestionably there are doubters still of the complete success of the telephone in train despatching and the allied services. The change—if it shall come—from the use of the telegraph to

the telephone in moving and making up trains, in the handling of the thousand and one details connected with the immediate motion of traffic and in giving to all the employes concerned in the work the benefit of the interchange of judgment through direct conversation, is revolutionary.

But it brings quick action where formerly it was slow. It takes from the despatcher the necessity for operating his trains through the medium of a large number of telegraph operators of varying ability. It brings to bear upon this most important of services direct conversational contact between all the interested parties, something of greater value to this particular work than can be fully described. There is harmony of action, harmony of temper, human understanding and personal relations of the most satisfactory character. There is the certainty that more movements will be better planned and executed, and that the art of direction of operation of trains will be greatly advanced and the work more safely rendered.

The Robert W. Martin Fund.

In remitting \$1.00 to be added to the fund for the support of the well-known old time telegrapher, Robert W. Martin, Mr. E. H. Hogshead, of Meridian, Miss., says: "I knew 'Bob' personally. He worked at Jackson and Vicksburg, Miss., in 1865 and he was my guest at Meridian for a day. Speaking of his ability as a receiver, the late J. C. Hueston, at one time general manager of the New York Associated Press, and a former well-known old time telegrapher, remarked that 'Bob Martin was one of the few men who can write with a pen faster than the Morse alphabet can be manipulated.' Mr. Hueston and myself were listening to him and John Galbreath, he at Vicksburg and Galbreath at Jackson seemingly trying to 'rush' each other. Neither could do it. Galbreath was as good an operator as ever touched a key. Bob's writing on the wire besides being perfect Morse, was so clear cut and firm that it always seemed to me that my local battery was stronger when he was sending, the strokes were so much like hammer and anvil. I had lost sight of him until Walter P. Phillips wrote him up as 'Cap Da Costa,' which Mr. Phillips informed me was a sketch of Mr. Martin."

The committee in charge of the fund consists of J. B. Taltavall, of Telegraph and Telephone Age; Charles W. Price, of the Electrical Review; T. Comerford Martin, secretary of the National Electric Light Association, and T. A. McCammon and Fred Catlin, of the Western Union Telegraph Company, New York. All contributions should be addressed to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

The amount received to date is: Previously acknowledged \$616.25; E. H. Hogshead, Meridian, Miss., \$1.00; Martin J. Kain, Washington, D. C., through W. H. Allen \$1.00; Total \$618.25.

Obituary.

Thomas W. Dewitt, operator for the Great North Western Telegraph Company, Montreal, died February 12, aged forty-two years.

George Newman Abbott, a telegraph operator of Lynchburg, Va., died at that place February 7, aged thirty-five years.

Gilbert McIntyre, who had been an operator for the Western Union Telegraph Company in Detroit for twenty years, died in that city February 5, aged forty-five years.

Professor A. E. Dolbear, the well-known scientist, author and inventor of telegraph and telephone appliances, died at his home in Medford, Mass., February 23, aged seventy-two years.

John Walker Richards, chief accountant of the American Telephone and Telegraph Company, died February 23, at Newton, Mass., aged forty-seven years.

Mrs. Katharine King Miller, wife of Dr. V. T. Miller, the well-known old timer of Pittsburgh, died recently. Mrs. Miller was a frequent attendant at reunions of the Old Time Telegraphers' and Historical Association and was well known by many of those in the profession.

John Perley Munroe, a well-known old time telegrapher and former state senator of Massachusetts, died February 7, aged fifty-nine years. Mr. Munroe's telegraph career has been referred to by Walter P. Phillips in his series of articles which have been running in our columns for some time past. He entered the service in 1865, at the age of fifteen, in Concord, N. H. Mr. Munroe soon became one of the most expert operators of that time being also noted for his fine penmanship. In 1872, after having taken the Associated Press reports for three years for the Worcester Spy, he became city editor of that publication and was connected with it in various capacities until 1898 when he retired to engage in the insurance business. Since then he has served two terms as representative in the Legislature of Massachusetts and three terms as state senator. Because of his great familiarity with public affairs acquired during his long newspaper experience he took a leading part in legislative proceedings.

What Our Friends Say Regarding this Publication.

Mr. A. H. Stewart, manager of the Western Union Telegraph Company at Nashville, Tenn., writes us: "No one can keep up with the telegraph procession nowadays without your paper."

Mr. R. V. Thomas, Illinois Central Railroad Company, Trimble, Tenn., writes: "I find your publication very valuable to me as an operator as it keeps me in touch with what is going on in the line of my profession."

Mr. S. H. Mudge, superintendent of the Postal Telegraph-Cable Company at St. Louis, Mo., in renewing his subscription says: "I cannot keep house without Telegraph and Telephone Age."

The Miniature Sounder at the Carnegie "73" Dinner.

The miniature telegraph sounder presented to each of the guests at the "73" dinner tendered in the fall of 1908 by telegraphers to Mr. Carnegie, in New York, in honor of his seventy-third birthday, aroused much enthusiasm. The device was regarded as an eminently fitting souvenir of an occasion which drew together in the spirit of *auld lang syne* so many distinguished members of the craft, past and present, especially so as it was a perfect piece of mechanism and fully capable of performing the work required of a like instrument of normal size. The little affair, which is beautifully finished, was highly prized by the recipients at the dinner as being emblematic of the profession.

In recognition of the sentiment that has prompted these inquiries, the utility of the device itself, and its appropriateness as a valuable gift to and by a telegrapher, Telegraph and Telephone Age has made arrangements by which it can fill orders for the same. The key alone, the smallest ever manufactured and which is the same as the one presented at the memorial reunion of the Old Time and Military Telegraphers in New York in 1905, will be sent in a box to any address, carrying charges prepaid, on receipt of \$1.50; the sounder at \$2.50, or both at \$4.00. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Phillips Code.

The popularity of Phillips Code, by Walter P. Phillips, was never more apparent than at the present time. Its acceptance by the telegraphic fraternity, as a standard work of the kind, dates from its first publication, and the constantly increasing demand for this unique and thoroughly tested method of shorthand arranged for telegraphic purposes, has necessitated from time to time the issuance of several editions. The present edition was carefully gone over by the A. P. Velie, an expert press and code operator, for many years identified with the Associated Press, New York, a few revisions made, and a number of contractions added, until now this "staunch friend of the telegrapher" is strictly up-to-date in every particular. It has been declared that an essential qualification of a "first-class operator" was a thorough understanding of Phillips Code.

The use of this system promotes rapid transmission and for press reports especially was long since declared to be the best ever devised. By common consent it is recognized as a standard and everywhere is regarded in the profession as indispensable in contributing to the operator's fund of practical knowledge. In fact, not to understand Phillips Code acts as a distinct embarrassment to the operator.

The price of the book is \$1 per copy. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

OTHER NEW YORK NEWS.

Assessments, Numbers 504 and 505, have been levied by the Telegraphers' Mutual Benefit Association to meet claims arising from the deaths of William S. Evans, at Orrville, O.; Edward M. Bliss, at Spencer, Mass.; Andrew S. Barber, at Rochester, Wis.; Simon Robertson, at Jersey City; John H. Ryan, at Denver, Col.; James F. Cunningham, at Saranac Lake, N. Y.; Lovejoy S. Landon, at Erie, Pa.; James P. McLorraine, at Philadelphia; Christian C. Frey, at Seymour, Ind.; Alvin T. Allen, at Bunkie, La., and Harry Bell, at Philadelphia.

Trade Note.

From the sales of the Western Electric Company for December and January, it is estimated that the gross business for the fiscal year ending November 31 will amount to \$61,000,000 an increase of \$15,000,000 over the preceding year.

G. W. HICKEY, INSURANCE, All kinds, Cool for Family use. The best kind. 30 Church St., New York; 209 Jefferson Ave., Brooklyn.

Advertising will be accepted to appear in this column at the rate of fifty cents a line, estimating eight words to the line.

The Serial Building Loan and Savings Institution of 195 Broadway, New York, will pay you five per cent. on your savings or will assist you in buying a home, which should be the ambition of every telegrapher. More than a thousand operators have secured homes through the assistance of this worthy institution. Why not you? Write for particulars.

Will buy or sell, in one to ten-share lots, Western Union Telegraph Company and Mackay Companies stocks. Remittances by New York draft or express money order are requested. Address "Stock Investment," care TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. This renders the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

A Layman's Perplexity Concerning the Windings of Magnets and Neutralization of Induction.

We are in receipt of the following communication:

"Will you kindly give a layman a few points on one or two things that perplex me somewhat although I think I understand the situation in a general way.

"For instance, what is the actual reason for using fifty ohm sounders and high voltage on some local circuits and four ohm with lower pressure on others when the latter method appears to be the most economical?

"Also, what is the real cause of our inability to successfully neutralize the inductive effects of high power electric systems?"

These questions have already been answered by the writer in this column at different times but the information is so valuable to many readers that the explanation will bear being referred to again.

The fifty ohm sounder is used for the following reasons: necessity, economy, and preference. It is necessary and also more economical to use the higher wound instruments where the only available electromotive force is high, such as that taken from an electric light system, in order to be able to use a minimum amount of current, the fifty ohm coil itself thus helping to reduce the volume.

It is also both necessary and preferable to use the fifty ohm sounders in circuits which have underground cable conductors in order to minimize the volume of current flowing and thus avoid overheating the cable.

It should always be borne in mind that fifty ohm sounders require but about one third the volume of current a four ohm sounder demands. In fact it may be stated generally that for nearly all similar apparatus the higher the winding the less current they require for operation. Furthermore, where artificial resistance is required to reduce what would otherwise be too great a volume of current, smaller gauges of conductors may be used, the resistance of the latter in such cases being helpful instead of harmful. For the same reason fifty ohm instruments offer the opportunity of using smaller cables for an equal number of wires placed in the ducts underneath the floors of operating rooms at the same time minimize the heat evolved. Hence for repeating sounders on multiplex apparatus and those for single line relays which are not subjected to any alterations in the ohmic resistance of their respective circuits it is customary, at least with the Western Union Telegraph Company, to employ fifty ohm sounders.

It is also obvious that where storage batteries supply the energy smaller capacity cells may be used for the reason that the hourly drain of current will be much less with fifty than with four ohm instruments.

Another reason why the higher winding is preferred is that the comparatively high electromotive force required for their operation more readily surmounts small accidental alterations in the resistance of the local circuit than lower pressures could overcome.

Practically the same factors regulate the use of four ohm sounders, viz., necessity and economy.

They are absolutely necessary in branch office multiplex circuits when placed in series with others in systems where all loops are built up to a uniform value of resistance by artificial means, such for example as the one hundred ohm loop system in vogue in the New York Western Union office.

The object is to have as little resistance in the sounder coil as possible in order that when such an instrument is removed or inserted temporarily by a branch office the resulting alteration in the total volume of resistance of the circuit will be so small that it will not cause any harmful change in the volume of current previously existing.

Thus the removal of a four ohm sounder from a 100 ohm loop circuit would only alter the strength of the current four per cent., whereas

the withdrawal of a fifty ohm sounder in such a circuit would make an alteration of fifty per cent., a difference which would tend to throw the other apparatus in the circuit out of adjustment.

While the layman may naturally conclude that the employment of so much artificial resistance in a built up loop system is a useless waste of energy in the circuits, when by reducing both such resistance and the electromotive force the same combination could be obtained, he should understand that the high resistance is placed therein not by choice, but from necessity. The value of the resistance and electromotive force used for built-up systems is governed as a rule by the resistance of the longest loop in the group and the electromotive force required to give such loop a proper volume of current. The shorter loops must then be artificially built up to the same value of resistance. The so-called wasted energy due to artificial resistance is merely the price paid for the advantages derived by the system.

The inquiry as to why the disturbing effects of high power inductance cannot be neutralized can be answered in almost one sentence.

It is because such external effects are of an inconstant value owing to constant variations in the load such systems carry. Hence no one tension or adjustment given to a mechanical device can follow the irregularities of the disturbing elements.

While transformers and other electrical devices have been helpful in a measure they are not altogether successful because many complications arise from unexpected sources.

Recent Telegraph and Telephone Patents.

A patent, No. 949,012, for a telephone system, has been granted to H. G. Webster, of Chicago, Ill.

A patent, No. 949,187, for a telephone transmission system, has been taken out by O. T. Lademan, of Milwaukee, Wis.

A patent, No. 949,235, for a telephone selecting system, has been awarded to D. W. Jones, of Dora, Tex.

A patent, No. 949,530, for a multiple station telephone line, has been issued to A. J. Farmer, of Detroit.

A patent, No. 949,593, for an automatic circuit closer, has been secured by T. W. McKenzie, of Hammond, B. C., Canada. For automatically completing a telegraph circuit if the operator should neglect to close the circuit at the key, by means of a movable contact co-operating with a projection on the key.

A patent, No. 949,690, for means for attaching telegraphic control mechanism to telephones, has been granted to W. H. Thompson, of Wheeling, W. Va. For making a record of ordinary telephone conversation by means of a switching device connected to a telegraph, whereby the re-

ceiver may be used for ordinary telephone communication or for listening to a record of the telephonic conversation.

A patent, No. 949,814, for a support for telephone receivers, has been awarded to Robert Zinsmayer, of Sandusky, O.

A patent, No. 949,821, for a telephone receiver, has been taken out by Claude D. Enochs, of La Crosse, Wis.

A patent, No. 949,836, for a selector, has been secured by James L. McQuarrie and Edward B. Craft, of New York.

A patent, No. 949,881, for an alarm and current-saving apparatus for automatic telephone exchanges, has been granted to Albert M. Bullard, of New York.

A patent, No. 950,047, for repeating mechanism for telegraphic circuits, has been issued to J. G. Kerr, of London, Ontario, Canada. Provides an extra local magnet in series with the battery and regular local magnet of the sounder and arranged to operate on the opposite end of the sounder bar from that upon which the regular sounder magnet operates.

A patent, No. 950,168, for a combined jack and drop for telephone switchboards, has been taken out by Claude D. Enochs, of La Crosse, Wis.

A patent, No. 950,220, for a telephone pay-station, has been secured by Francis X. Bee, of Philadelphia, Pa.

A patent, No. 950,229, for a telephone transmitter, has been granted to Felix Gottschalk, of New York.

The following patents have expired:

Patent No. 492,467, for long-distance electric telephony, held by Chas. M. Haynes, of Omaha, Neb.

Patent No. 492,471, for a system of combined telephony and telegraphy, held by Frank A. Pickernell, of Newark, N. J.

Patent No. 492,482, for signaling apparatus and circuit, held by Edward J. Hall, Morris and Frank A. Pickernell of Newark, N. J.

Patent No. 492,483, for a busy signal for telephone circuits, held by Edward J. Hall, Morris and Frank A. Pickernell, of Newark, N. J.

Patent No. 492,484, for a telephone central station circuit, held by Jas. J. McQuarrie, Boston, Mass.

Inauguration of Night Letter Plan by Western Union and Postal Telegraph Companies.

Final arrangements for the cut-rate "night letters" have been made by the Western Union Telegraph Company, and on March 7, the new system of sending a fifty-word telegram at night for the same price as a ten-word telegram in the day-time went into operation. This plan, in addition to the combined telephone and telegraph system which the company recently inaugurated through an arrangement with the American Telephone and Telegraph Company, is expected to greatly increase the company's busi-

ness throughout the country and afford a means of keeping the wires almost as busy at night as they are in the day.

Mr. Belvidere Brooks, general manager of the Western Union, thus explained the working of the "night letter" plan.

"The new plan will be a special inducement for sending letters at night by wire rather than by mail. These letters are to be filed before midnight. They can be filed any time in the day up to midnight, however, and they will be sent out during the night and delivered to their destination in the early morning. The night rate for letters will be one-fifth of the day schedule. In this way business men will save much time in conducting their correspondence, especially in cases where two days would be required to deliver a letter sent by mail. A letter of fifty words can be sent to Chicago for fifty cents. Now, under the day rate, only ten words can be sent to Chicago for that sum. And the cost for sending a letter-telegram to San Francisco would be about twice that amount."

Mr. Brooks in speaking of the great improvement in the system of handling messages which has been brought about by the combined telephone and telegraph plan said:

"Co-operation between the American Telephone and Telegraph Company and the Western Union, which has been the dream of Theodore N. Vail for so many years, has brought about added efficiency to the telegraph service, and it will be our aim to further work together so that the telephone shall be a strong auxiliary to the telegraph. In this general plan of co-operation between the two services, the very first step whereby telephone subscribers are given charge accounts with the Western Union has proved a great success. The public thought well of it from the start and the results have been even more encouraging than were anticipated. Of course, the volume of the service will grow with time, because in any new service it takes a little while for the general public to learn that a new facility has been afforded them. Under the new co-operative system, a telephone subscriber can dictate a telephone message to the office of the Western Union and the cost of the message is charged against the telephone."

Mr. Brooks said that striving to satisfy the public always brought good financial results to a company. "The good-will of the public is a most valuable asset to any concern," he said. "It is a strong safeguard against business failure. And realizing this we are simply going ahead with innovations that will prove beneficial to our patrons and ourselves."

The Postal Telegraph-Cable Company also put into operation at the same time a similar service between all offices on its own telegraph lines and the lines of its direct connections in the United States.

Investigation of Telephone and Telegraph Companies in New York State.

The Legislative Committee of New York State, which is inquiring into the advisability of placing the telephone and telegraph companies in this State under the supervision of the Public Service Commission, has held several sessions in New York recently spending most of their time in examining witnesses from the telephone companies. They will probably hold two or three more hearings and then prepare their report, which will be presented to the Legislature before its adjournment.

The principal witnesses examined were Edward M. Moister, assistant controller of the American Telephone and Telegraph Company, Union N. Bethell, president and Walter Brown, auditor of the New York Telephone Company.

President Bethell stated that the assets of the New York Telephone Company and the subsidiary companies recently merged with it, amounted to \$196,592,950, of which the plants represented \$175,711,296. The total capitalization of the merged companies was \$123,000,000, and that of the New York Telephone Company was \$85,000,000.

"If the company should take advantage of all its legal rights," said Mr. Bethell, "such as capitalization of all of its tangible property, good will, patents and similar things, New York City would have to pay higher telephone rates. The capitalization of our companies represents clean assets, and does not include anything else."

President Bethell said he did not believe in placing telephone and telegraph lines under the Public Service Commission, but that he favored supervision by the Legislature, and thought broad inquiries like the present one were the best kind of supervision.

Personal.

Mr. R. L. Dean of Chicago, inventor of the Dean Rapid Telegraph System was a recent New York visitor.

Mr. Paul Sise, general manager of the Northern Electric and Manufacturing Company, Montreal, Que., was in New York recently, coming here in the interest of his company.

Mr. W. A. Houghtaling, formerly identified with the telegraph service, now a member of the engineering staff of the Rowland Telegraphic Company, Baltimore, Md., was a recent New York visitor.

Colonel W. R. Plum of Lombard, Ills., historian of the Society of the United States Military Telegraph Corps, is spending the winter in the south, visiting various cities including; Selma, Meridian, Natchez, Vicksburg and other places. During the Civil War, Colonel Plum was a military operator in that section of the country.

Subscribe for Telegraph and Telephone Age, \$2.00 per year.

Postal Telegraph-Cable Company.**EXECUTIVE OFFICES.**

Reports relative to the illness of Mr. E. J. Nally, vice-president and general manager, have been exaggerated in the daily papers. Mr. Nally was not feeling well while in Chicago on an inspection trip, and was advised by his physicians to take absolute rest and quiet for a week or two. He has not been seriously ill and is improving daily, and is expected to be about again within a few days.

Mr. M. M. Davis, electrical engineer and Mr. F. E. d'Humy, assistant electrical engineer have returned from Chicago, where they have been in the interest of the service.

Mr. S. B. Haig, superintendent of traffic, is away from his office on an extended trip of inspection which will take him as far as the Pacific coast.

The handsomely equipped new office at Atlantic City has been completed and the business at that point is now being transacted in the new quarters. Mr. W. M. Phillips is the manager at that point.

A rectifier plant has been installed in the Malone, N. Y., office displacing 200 cells of battery.

Space has been leased at Scranton, Pa., in the recently constructed Miller block on Spruce Street for a new main office which will be equipped with modern apparatus and will be up-to-date in every particular.

Manager A. W. Rinehart of Pittsburg, winner of the first president's prize of \$250 awarded to managers of the eastern division, celebrated that event by giving a dinner at the Fort Pitt Hotel to fifty of his subordinates.

RESIGNATIONS AND APPOINTMENTS.

Mr. William E. Mathews, of the Boston office, has been appointed acting manager at Pittsfield, Mass., vice P. J. Mackin.

Mr. O. B. Plumly, manager of the office at El Paso, Tex., has been appointed assistant manager of the Chicago office. Mr. Plumly was awarded one of the second prizes which President Clarence H. Mackay offered last year for the best kept offices.

Western Union Telegraph Company.**EXECUTIVE OFFICES.**

Mr. Belvidere Brooks, the recently appointed general manager occupies a suite of offices on the fifth floor.

Mr. Frank D. Giles, assistant chief operator, has been attached to the office of General Superintendent A. G. Saylor.

Mr. H. E. Roberts, superintendent of supplies, has returned from a business trip to the Pacific coast.

Mr. W. N. Fashbaugh, electrician of the eastern division, has been attached to the office of the general manager. Mr. W. T. Rogers has been attached to the office of the general superintendent of the eastern division.

Mr. Robert E. Chetwood, of the American Telephone and Telegraph Company has been appointed engineer of construction of this company with headquarters in New York.

Mr. Chetwood was born at Elizabeth, N. J., February 15, 1873. He entered the service of the American Telephone and Telegraph Company July 1, 1895, and since that time has been engaged in engineering work on outside construction for that company.

Two conferences of the Superintendents of the eastern division for the benefit of the service, have been held in New York recently in the office of General Superintendent A. G. Saylor. Among those present were E. M. Mulford, New York; E. P. Griffith, Jersey City; N. E. Church, Pittsburg; W. A. Sawyer, Philadelphia; C. F. Ames, Boston; F. E. Clary, New Haven and D. C. Dawson, St. Johns, N. B.

Mr. I. N. Miller, Jr., assistant general superintendent at San Francisco, has returned to his office after a year's leave of absence, during which, accompanied by his wife, he has made a trip around the world for the benefit of his health. Mr. and Mrs. Miller visited Japan, China and all important European points and arrived in New York about the middle of February en route home. Mr. Miller is again in excellent physical condition.

Mr. William Finn, of the office of the engineer of equipment, returned March 12, from England where he has been for the past six weeks on business connected with the service.

Mr. J. T. Elliott, general foreman of construction at New Haven, Conn., has been transferred to Providence, R. I., in the same capacity, with supervision over territory east of the Connecticut River, including Vermont. Mr. S. L. Hays, foreman at New Haven, has been advanced to the position of general foreman of the territory west of the Connecticut River, with headquarters at New Haven. The two territories mentioned comprise the seventh district, eastern division.

New storage batteries have been placed in the Key West office. Mr. S. R. Crowder, electrician of the southern division, Atlanta, Ga., supervised the installation of the new equipment.

At the quarterly meeting of the Board of Directors held March 9 a quarterly dividend of three-quarters of one per cent. was declared, payable April 15, to stockholders of record March 19.

The following statement shows the condition of the company at the close of the quarter ended December 31, 1909:

Surplus October 1, 1909.....	\$18,017,998.86
Net revenues, quarter ended December 31, 1909	1,747,199.77
	\$19,765,198.63
Dividend of $\frac{3}{4}$ per cent., paid January 15, 1910.....	\$747,639.00
Interest on bonded debt.....	433,062.50
	1,180,701.50
Surplus December 31, 1909	\$18,584,497.13

The following shows the estimated condition of the company at the close of the quarter ending March 31, 1910:

Surplus December, 1909.....	\$18,584,497.13
The net revenues of the quarter ending March 31, based upon nearly completed returns for January, partial returns for February and estimating the business for March, will be about.....	\$1,750,000.00
Less interest on bonded debt	433,062.50

Leaves estimated net earnings for the quarter, less interest on bonded debt..

1,316,937.50

\$19,901,434.63

RESIGNATIONS AND APPOINTMENTS.

Mr. Frank Orchard has been appointed manager of the New London, Conn., office, vice Mr. C. B. Smith, resigned.

Mr. John F. Fleming, all night chief at Nashville, Tenn., has been appointed day chief operator in that office. Mr. Fleming was born in Nashville, May 27, 1862, and entered the service at that place as messenger May 13, 1879. He soon became an operator and was employed in that capacity until November, 1897, when he was appointed night traffic chief. He was later made all night chief, which position he held until his present promotion.

Mr. H. C. Worthen, night chief operator of the New York main office, has been advanced to the position of assistant chief operator, days, to succeed Mr. F. D. Giles, promoted. Mr. Worthen was born at Shelby, N. C., July 22, 1877, and entered the telegraph service with the Seaboard Air Line Railway December 5, 1890, at Clay, N. C. He remained in this employ until 1898, the last two years of that time serving as relief train despatcher. In the latter year he entered the service of this company first at Washington, and later at New York, where he has been employed most of the time since with the exception of about a year spent with the Laffan News Bureau of the New York Sun and a few months with the Atlantic Coast Line at Richmond, Va., in the train despatcher's office. While in New York he has been in charge of the company's interests at the Tribune office and has held the positions of traffic chief of the southern and eastern divisions, wire chief of the southern switch and that of southwestern wire chief. Early in 1907 he went to Buffalo as chief operator in that city but returned to New York January 1, 1908, as night chief operator which position he occupied until his present promotion.

Mr. James F. McGuire, assistant wire chief, has succeeded to the night chief operatorship vice H. C. Worthen. Mr. McGuire was born at Providence, R. I., in 1863 and began his telegraph career as messenger for this company in that city. He became an operator in 1879. He next joined the forces of the American Rapid

Telegraph Company and was transferred to the New York office of that company, where he remained until 1889 when he returned to the employ of this company. He has served in the operating room at 195 Broadway in various official capacities since that time.

Mr. A. J. Heldman, traffic chief, has been appointed assistant wire chief vice J. F. McGuire. Mr. Heldman was born in New York, November 23, 1863. He entered the telegraph service as messenger in 1879. He became a member of the operating force at the New York main office in 1884 and has been employed there since that time serving in various capacities.

Western Union Secures Control of American District Telegraph Company.

President Robert C. Clowry of the Western Union Telegraph Company on March 8 announced that his company had purchased what amounts to a controlling interest in the stock of the American District Telegraph Company of New Jersey, which is the holding company for about forty American District Telegraph organizations covering with messenger and signal telegraph service practically every city in the country outside of New York.

Colonel Clowry said that the interest acquired together with the shares already held by the Western Union constituted considerably more than one-third of the total capitalization of \$9,963,351 outstanding. This purchase of more than one-third of the American District Telegraph stock assures the purchasing company working control, in fact the stock holdings of the company now are practically identical with the shares previously held by the company's officers and large stockholders individually by which the Western Union had previously dominated the American District Telegraph Company.

Colonel Clowry also said that the purchase of the stock had no other significance than the carrying out of the Western Union's new policy of making certain its control of affiliated companies, which have hitherto been dependent upon the affiliation of their principal stockholders with the controlling interest in Western Union.

The American District Telegraph Company, upon its organization in 1901, made a twenty-five-year contract with the Western Union for the collection and delivery of messages. It does, besides, an independent business in the delivery of parcels, and maintains in a number of cities a burglar and fire alarm service. For the first three years of its existence the company paid five per cent. dividends, but reduced that rate to four per cent., which has since been maintained.

Earnings for the year 1909, with the month of December estimated, were \$3,600,000, against \$3,192,000 the previous year. Expenses of \$2,700,000 reduced net earnings to approximately \$900,000, an increase of \$115,000 over those of the previous year. The payment of dividends of \$389,088 left a surplus of \$501,504, estimated.

E. Y. Gallaher, Auditor of Western Union Telegraph Company.

Ernest Yale Gallaher was born in New York City in 1876 and has always lived there. He was educated in private schools and entered Columbia College, School of Arts, in 1891 but did not proceed with the course, electing to take a position with the First National Bank of New York. While there he obtained the degree of LL.M. and was admitted to the New York Bar in 1898, but has never practiced that profession.

In 1899 he passed an examination as a Certified Public Accountant in New York State and turned his entire attention toward that profession. He then entered the office of Smith, Reckitt, Clark and Company, certified public accountants, where he was employed for about one and one-half years. After that he was, for a while, in the office of Edward W. Sheldon, attorney at law, and now president of the United States Trust Company. Following

E. Y. GALLAHER.

Auditor of the Western Union Telegraph Company, New York.

this position he went with Price Waterhouse and Company, chartered accountants, where he traveled considerably and obtained a wide accounting experience. After leaving Price Waterhouse and Company, Mr. Gallaher was appointed Commissioner of Accounts of New York City by Mayor McClellan and retained that office for about two years leaving that position to go with the American Telephone and Telegraph Company, where he was employed in a special capacity for the eight months preceding his recent appointment as Auditor of the Western Union Telegraph Company.

Frank D. Giles Promoted.

Mr. F. D. Giles, assistant chief operator has been attached to the office of General Superintendent A. G. Saylor of the Western Union Telegraph Company, New York. Mr. Giles was born near Ovid, N. Y., July 28, 1849. He entered the telegraph service in the west in 1864 and held positions in various sections of the country including Pacific coast cities until 1885, when he entered the service of the Western Union in New York and has

been employed here since that time in various official capacities in the operating room. In 1901, he became assistant night manager and in 1903 was appointed assistant chief operator. Mr. Giles

FRANK D. GILES.

Western Union Telegraph Company, New York.

is well liked by all with whom he comes in contact and his associates in the operating room while regretting to have him sever his direct relations with them are pleased to see him advanced to a more responsible position.

W. T. Rogers Attached to the General Superintendent's Office.

Mr. William T. Rogers, formerly general wire chief of the Western Union Telegraph Company, New York, who has been attached to the office

WILLIAM T. ROGERS.

Western Union Telegraph Company, New York.

of General Superintendent A. G. Saylor was born at Cold Spring Harbor, Long Island, January 13, 1869. He first entered the telegraph ser-

vice in March, 1884, as operator on the Long Island Railroad. After two years spent with this system he entered the employ of the Baltimore and Ohio Telegraph Company in New York. In 1888 he transferred his services to the Western Union Telegraph Company in Brooklyn. January 1, 1891, he entered the operating room at 195 Broadway and has been employed there since that time. In June 1903, he was made a quad chief and two years later was again promoted this time to the position of wire chief. March 25, 1906, he was made assistant to R. H. Morris, electrician of the operating department, and on January 30, 1907, was further advanced to the position of assistant general wire chief. On January 10, 1908, he was appointed general wire chief, which position he held until the time of his present promotion.

Municipal Electricians.

The fire alarm system of Minneapolis, Minn., will be extended at a cost of \$8,728.

The 1910 convention of the International Association of Fire Engineers will be held at Syracuse, N. Y., August 23.

A new fire alarm telegraph system has been installed recently at Savannah, Ga. by the Gamewell Fire Alarm Telegraph Company.

A central office system of transmitting fire alarms to the different fire companies has been recommended by Superintendent of Fire Alarm Telegraphs Speicher, of Jersey City. By the present method of transmitting fire alarms whenever an alarm is sent in it rings simultaneously in every fire house in the city and also at fire headquarters.

A patent No. 949,970, for an electrically operated non-interfering alarm call box, has been granted to P. A. Brown of Denver, Col. The box has a door controlled by a spring and a latch therefor having a transparent and breakable seal, together with an alarm mechanism controlled by the door when the seal is broken.

A patent No. 949,699, for a signal box, has been awarded to H. W. Doughty and C. E. Beach of Binghamton, N. Y. The transmitting mechanism is manually released for sending impulses, particularly for fire alarm and police telegraph systems. Improvements in the motor-driving train, the contact devices and various parts of the system.

City Electrician, A. C. Farrand of Atlantic City in his annual report has recommended that the city council take steps to get the Legislature to pass a bill requiring all corporations to put their wires underground; that signs be placed on corners where there are no fire alarm boxes indicating the nearest box; that an ordinance be passed fixing a fine of \$50 for turning in false fire alarms, and that the Boardwalk illumination scheme be made permanent at a cost of \$15,000.

The municipal authorities of Rochester, New York, have begun the installation of a red light police signal system. At the first test made recently by Superintendent of Police Telegraph J. B. Smith it was found that the light was visible at a distance of 1,000 feet on all of the intersecting streets at which it was placed.

The Cable.

The annual meeting of the Commercial Cable Company was held at the main office New York, March 7. All of the old officers and directors were re-elected.

Mr. John Fraser, assistant superintendent of the Rye Beach, N. H., station of the Direct United States Cable Company, has been appointed superintendent at Halifax vice Mr. S. Penn appointed manager at London as mentioned in our March 1 issue. Mr. Fraser has been at Rye Beach for thirty-six years coming there from England on the cable steamship "Ambassador," assisting as electrician in the laying of the Torbey-Rye Beach cable and after the cable was laid remaining on the station staff.

It is reported that the governments of the Commonwealth of Australia and of New Zealand, and the Pacific Cable Board, have extended to press messages by the Pacific cable between Australasia and Canada the benefit of the reduction in rates that was conceded in August last to press messages between the United Kingdom and Australasia. At the same time the Canadian Pacific Railway has lowered its rate for the transmission of such messages and, as a result of these changes, the rate on press messages between Australasia and Vancouver has been reduced to three and one-quarter pence per word.

It is said that the Norwegian Storting has appropriated about \$300,000 for the purchase of the Great Northern Telegraph Company's cables between Egersund and Peterhead, and Arendal and Hirtshals, and for the construction of a new cable between Arendal and Newcastle-on-Tyne.

Trade Notes.

Although The Rock Island Battery Company have only been located in their new Winton Place, Cincinnati factory since early in the year, they are already looking about for more ground for a needed addition.

At the annual meeting of the J. H. Bunnell and Company, Incorporated, held in New York, March 8, Mr. J. J. Ghagan was re-elected president and secretary and Mr. Charles E. Graham of New Haven, Conn., vice-president and treasurer.

Mr. Charles Blizzard, third vice-president and general sales manager of The Electric Storage Battery Company of Philadelphia has just returned to that city after an extended business trip through the west, during which he visited all the western offices of the company.

Reinforced Concrete Poles.

At the Cement show held in Chicago, February 19 to 26, Mr. P. H. Wilson gave an interesting illustrated talk on "Concrete Poles." Mr. Wilson said that until recently, wooden poles have been so cheap that the use even of preservatives has not been widely or seriously considered, since the expense of treatment exceeded the benefit obtained. But the increasing demands of the telegraph, telephone and electric light and power companies, which purchase about 4,000,000 poles a year, has compelled engineers to look elsewhere for suitable substitutes possessing the desirable qualities of wooden poles.

For long, heavy poles, or when safety and permanence are prime requisites of the construction, reinforced concrete poles, even though expensive, will frequently prove economical. The life of these reinforced monoliths is indefinite, while their strength can be made equal to that of any other construction. As in the case of steel poles, they can be placed at greater distances than wood, and have superior fire-resisting qualities. By the insertion of pipes or internal passages during the construction of the poles, provision may be made for carrying wires from the pole tops to the ground, affording enclosed and well-protected runs. The natural taper of timber frequently results in putting its weakest section above the ground, the excess material in the butt being wasted except as it is useful in resisting decay. On the other hand, the concrete pole may be given any desired taper and need not have any excess of improperly placed material.

A pole carrying wires acts not as a column, but as a cantilever, deflecting to adjust itself to stresses due to the loading. Concrete poles have not the elasticity of timber, but will stand considerable bending, and even when severely strained do not break off, but are held by the reinforcement from falling to the ground. If proper unit stresses are employed, and care is taken to obtain a dense mixture and a good surface finish, there need be little fear of injury due to cracks, as has been shown by many successful installations in this country and abroad. The greater weight of concrete poles often renders advisable their manufacture at some favorably located point near the line where they are to be used. In many instances, concrete poles have been erected at a first cost below that of wood or steel.

The earliest concrete poles of which there is any record were built by an American engineer in Panama, in 1856. They were twelve feet in length, and reinforced by wooden cores. The latter swelled, however, cracking the concrete, and the type had to be abandoned. A French pole, originated in 1896 for the Le Mans, France tramway, is still in use. This was a solid pole of circular section, reinforced with small round rods and transverse wires.

A solid concrete pole, thirty-five feet long, and square in cross-section, seven inches at the top and fifteen inches at the bottom, reinforced with

round smooth rods, was another French design, and when tested to 4,000 pounds gave a maximum deflection of two feet, six inches returning to within three inches of its original position. This pole broke at 4,700 pounds, but was held by its reinforcement from falling.

A German process of manufacturing poles utilizes the centrifugal force of a revolving form. To a wet mixture of rich concrete, ground asbestos fiber is added, the mass being placed in a tubular form and revolved at high speed for a few minutes in a warm room. The asbestos fiber is said to increase the strength in tension.

An Italian company has constructed a novel pole made up with large round-bar reinforcement at the three corners, and tapered toward the top. These are asserted to be cheaper than iron poles.

A remarkable and successful form of a pole has been devised by Siegwart, a German. By means of a conveyor belt, the concrete is fed to and wrapped, under pressure, about a revolving steel core on which the reinforcement is fastened. The finished form is thus completely wrapped with concrete and canvas, which is allowed to cure in a horizontal position for 15 hours, after which the core is collapsed and withdrawn. These poles can be made in any size, shape or strength and have been successfully used in places where wooden poles soon succumbed.

Ocean Newspapers.

Travelers on the ocean can now have the world's news each day, says an exchange, as well as though on land, and the circulation of some of the daily papers published on shipboard is as large as that of some land dailies.

The circulation of the Cunard Daily Bulletin on the steamship *Lusitania* is over 2,000 a day and has reached 2,500. This journal has thirty-two pages, ten inches by six. It is excellently printed on fine, glazed paper and sells at five cents per copy. It goes to press at 1 a. m. and is ready for the breakfast table like the newspapers ashore. Many passengers have it delivered to their berths and read the day's news before they get up.

Practically everything of news value in the whole world appears in the ocean daily as soon as it is printed in the dailies on land. For instance, on the voyage during the English general election full returns were printed every morning of the results announced down to the previous night.

From Reuter's London wireless service the ocean daily editor gets plenty of material. Stock exchange quotations are given very fully. All notable events and the movements of famous people are recorded.

Moreover, the ocean daily often gets news that the land dailies cannot get. For the liners are in touch with one another as well as in touch with land all the way across the ocean and each vessel supplies items of news about itself and its passengers.

A very artistic production is the *Journal de l'Atlantique*, published on board the steamship *La Provence* of the French line. It has larger pages than the *Cunard Bulletin*, and each number is well illustrated, and the news is published in both French and English. During an ordinary voyage this steamer is in touch with thirty-two other liners and eleven shore stations in addition to the two regular long distance stations at Clifden and Cape Cod.

The daily of the steamship *Kaiser Wilhelm II* has twenty-four pages, and it has so many advertisements it can be given free to the passengers and still leave a profit for the steamship company. Humorous illustrations are a feature and a puzzle page gives much amusement on the voyage. Much use is made of the paper to keep passengers in touch with the land from a business point of view.

One of the simplest of the ocean dailies is the *Transatlantic American* issued on the steamers of the American Line. It is only a four-page news sheet, but it has editing reduced to a science. On one day during a recent voyage the steamship *St. Louis* had news from the Cape Race land station, the English warship *Inflexible*, the yacht *Iolanda*, the cableship *Cambria* and the liner *Kronprinzessin Cecile*.

The *Atlantisches Tageblatt* of the Hamburg-American Line is a sixteen page sheet and makes no pretension to elegance. It is printed partly in German, partly in English and has a story by some popular writer. It makes advertisements of hotels its strong feature.

On the other hand, the *Express Mail* published on board the Canadian Pacific Atlantic liner *Empress of Ireland* is a most elegant affair. It has twelve pages and is enclosed in a handsome wrapper stamped in gold with an emblematic design printed in the richest colors. It is delivered to the passengers free and has no advertising, unless one may consider as such the beautiful pictures given of Canada.

From all of this it may be inferred that the telegraph office on board an ocean liner is one of the busiest places on the ship and on some vessels three operators are employed. Needless to say the office is open at all hours of the day or night.

The Late Professor Dolbear.

The death of Professor Amos Emerson Dolbear on February 23, which has already been recorded in these columns, removes from the electrical field one of the most interesting figures ever associated therewith. He did not decide to go to college until he was twenty-eight years of age. At this time after he had worked as a machinist for several years his health failed him and he decided to secure a better education and become a teacher. He accordingly entered the Ohio Wesleyan University and completed the full course there in two years. After holding positions as teacher in several colleges he became

professor of physics and astronomy in Tufts College in 1874 and held that position until his retirement on account of ill health in 1906. Professor Dolbear was an early investigator of the possibility of telephony and contested the claims of Professor Bell to the invention of the telephone, claiming that the latter had obtained from him the idea of using a permanent magnet in the receiver. The courts, however, decided the case in favor of Professor Bell. He is said also to have anticipated by many years the invention of wireless telegraphy, as a patent issued to him in 1886 contained the basic principles of the wireless system of the present day. For financial reasons, however, no use was ever made of this patent. He was a pioneer in the investigation of electric waves in space anticipating Hertz's discoveries in that line, it is claimed, by at least six years. He also discovered the X-ray four years before Roentgen. It would appear from a list of his inventions that he initiated a greater number of electrical discoveries than any other man except Edison, but from none of these did he receive any great reward or even honor. He was also a frequent contributor to the scientific press and was the author of several standard scientific works.

An Appreciation.

Mr. Charles Bright, F. R. S. E., of London, England, the well known author and authority on submarine cables and the son of Sir Charles Tilston Bright of Atlantic cable fame in writing to us recently says:

"I want to write to express my appreciation of these little paragraphs which you frequently insert at the bottom of your pages. I can well believe that little homilies like the enclosed may often serve a very useful purpose to the young—aye and to those of us who can no longer claim to be young and it is nice to find at any rate one more or less technical journal a live journal."

The paragraph inclosed by Mr. Bright was the following:

"If it is worth while to do a kindness at all, it is also worth while to do it gracefully and cheerfully. If you are going to grumble while you do it, you rob it of more than half its worth and all its beauty. This rule is as good in the home, among the brothers and sisters, and between husband and wife, as it is anywhere else."

The Winnipeg, Can., Board of Trade is endeavoring to obtain from the telegraph companies a reduction in the tolls on commercial business. As the companies have declined to make any reduction the matter has been appealed to the Railway Commission.

A district messenger company which has been organized recently in a southern city will make a business of renting umbrellas. Another feature which they will introduce will be the delivery of mail on Sunday to those desiring such service and who do not wish to have to go to the post-office for it themselves.

The Ready Messenger

The quickest way to transmit a telegraph message from the wire to paper is

"VIA SMITH PREMIER."

This typewriter has for twenty years held first place with telegraph operators as the easiest and speediest "mill" to operate. The **New Model No. 10 Smith Premier** is even better suited to the use of telegraphers.

POSTAL OFFICIAL DIAGRAM.

The diagrams appearing in "Official Diagrams of the Postal Telegraph-Cable Company's Apparatus and Rules Governing the Construction and Repair of Lines" were made from the company's blueprints and are absolutely correct. This volume, which is published by TELEGRAPH AND TELEPHONE AGE, under official sanction and supervision, is of especial value to operators and linemen. It will be sent to anyone, postpaid, on receipt of fifty cents. Address J. B. Taltavall, TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York.

Any electrical or telegraph book published for sale by Telegraph and Telephone Age, 253 Broadway New York.

Telegraph and Telephone Age is a School of Instruction for Operators: \$2.00 per year.

**EDISON
BSCCO
PRIMARY BATTERIES**

Our book about EDISON BSCCO PRIMARY BATTERIES gives full details as to their construction and shows why they are superior to whatever batteries you are using, no matter what your requirements. If you wish to improve your battery service and at the same time reduce the expense, you should have this book.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to *Telegraph and Telephone Age* should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

MARCH 16, 1910.

The Book Department of *Telegraph and Telephone Age* has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Opportunities in the Telegraph Business.

The complaint is often heard among the younger members of the telegraph profession that there are no opportunities for a young man to advance himself in that field. That the reason so many do fall into a rut and serve at the key all of their lives lies with the men themselves rather than their occupation is proven by the many persons who now hold prominent positions in all walks of life who have graduated from the telegraph. As a matter of fact it is doubtful whether there was ever a time when the opportunities in the service were greater than at the present. What practically amounts to a revolution in the methods of handling the rapid transmission of communication in this country is now about to take place. The telegraph and telephone, which have heretofore been conducted as entirely separate propositions will now be combined in many ways and as a result a multitude of difficulties will arise which have not before confronted the telegraph or telephone managers. Some one will have to solve these many problems and the ambitious and

studious young operator will have ample opportunity to show his superior officials that he is capable of discharging higher duties than those attendant upon the manipulation of the key. Unfortunately there is a tendency among employees of telegraph companies to fall into a largely mechanical way of doing their work with little interest in the system beyond that particular part with which their duties are connected. This is a great mistake. If they would spend their spare time in studying the construction and operation of the apparatus they could soon acquire a thorough knowledge of the same and when the opportunity for promotion came they would be prepared. Often the managers have to promote men from the ranks who have not thus fitted themselves and as a result when they are required to perform the more important duties they are found deficient. The telegraph and telephone at the present time offer a field of endeavor of exceptional value, at least as a training school for the mind if for no other reason. The man who earnestly grapples with and masters the problems arising in these professions is developing his mind and fitting himself for better things. There is always need of men who have the initiative to look ahead of their present occupation at the same time fulfilling all the duties they are called upon to perform in the best possible manner. The telegraph service requires men of ability now as it never did before. If the man in the ranks who is capable of better things fails to be discovered and promoted by his superior officials there are ample opportunities for him in other vocations.

As we have often contended, no man's environment is narrow unless he himself makes it so, notwithstanding the pessimistic and essentially false reasoning sometimes heard to the contrary. An alert broad minded self respecting and intelligent man of capacity in whatever field he may be placed is bound to rise. The telegraph has use for such men to fill present and prospective places as there is no question but that the management of the telegraph from chief executives down will in the future as it always has in the past be recruited from the ranks of those filling minor positions. These remarks apply particularly to the young men now entering or who have recently entered the service. No one can be really successful in life unless he has a good foundation to work upon. If the foundations are not properly laid the superstructure is liable to fall. The gaining of a proper foundation for future success should be the first concern of every young man. If that foundation is not built upon faithfulness to employing interests as well as himself it will have little lasting value.

As we have often said before, the telegraph provides one of the most excellent schools in which to fit oneself for better things. Abundant proof of this may be had by examples of men who have risen to the top in the telegraph itself as well as by others in nearly every walk of life

who have quit the service of the key and found large success in other occupations. All of these bear testimony to the value and helpfulness to them in late years of their early telegraph experience. It is generally admitted that the college student remembers, after he has left the walls of his alma mater, but a small percentage of the specific information which he is supposed to have absorbed therein, the chief advantage to him of his long years of study being the development and broadening of his mind. Similarly, if the young man entering the telegraph service will take advantage of his opportunities, studying and mastering all of the intricacies of the system, he will be fitting himself for greater usefulness in many other fields as well as in the telegraph just as though he were enrolled in a regular institution of learning. Unlike other schools, however, there is no one behind him to push him ahead but he must depend upon his own efforts and his ambition to carry him forward to success. The policy of the present telegraph management, however, is to encourage the employes, particularly the younger members of the force, to prepare for advancement and it is to be hoped that all will take advantage of every opportunity to fit themselves for better things.

Letter-Telegrams.

The fifty word letter-telegram rate of the Western Union and Postal Telegraph Companies went into effect March 7. The new departure gives every promise of proving a success, as we predicted editorially in our March 1 issue it would. Under the new order of things, both telegraph companies will, at any time up to midnight, receive for transmission to any part of the United States and delivery early the next morning, either by mail or messenger, as is most convenient, messages of fifty words or less at the regular day rate for ten words. The new service is expected to prove a boon especially to business men, and it is believed that it will keep busy a large percentage of the wires of both telegraph companies, which are now idle from four o'clock in the afternoon until about eight o'clock the next morning.

Consideration of Wireless Legislation at Washington.

The necessity for immediate legislation that will prevent the interference by amateurs and others with Government wireless messages and also with messages affecting the safety of passengers at sea, was urged upon the House Committee on Merchant Marine and Fisheries by E. T. Chamberlain, commissioner of navigation, and Lieutenant John O. Walton of the United States Revenue Cutter Service, at a hearing held in Washington, March 7.

Agreeing that all regulations governing the use of wireless must invade an entirely new field, Mr. Chamberlain declared that Congress at this session should provide against two things, name-

ly, interference with Government business, and with messages of distress. The subject of commercial wireless business and inter-state messages, he said, could be settled later.

Lieutenant Walton said that a law requiring all ships to become equipped with wireless is not nearly so important as one to regulate the traffic of the air. Ships are voluntarily equipping themselves with wireless apparatus, he said, and the number of wireless stations is increasing far more rapidly than the perfection of the art itself. He suggested that all amateur operators shall be required to stand an examination and obtain licenses before they are permitted to indulge in wireless telegraphic experiments. This, he declared, will not discourage the ambitious amateur and will do away with the "practical joker" in wireless telegraphy.

Mr. Cloyd Marshall, of New York, secretary of the United Wireless Telegraph Company, told the committee of the inability of his company to obtain licenses in Canada and European countries on account of the policy of Governmental monopoly, which is enforced there.

This caused Representative Humphrey, of the committee, to suggest that any bill framed should include a proviso that no foreign company should receive a license to engage in wireless telegraphy in the United States. Mr. Marshall also protested against the proposed plan of issuing licenses to any and all applicants saying that this would result in the springing up of thousands of wireless stations and a consequent confusion of call signals and messages.

Other experts on the subject will be heard by the committee before any specific legislation is suggested upon the subject.

Sale of Mackay Companies' Holdings of American Telephone and Telegraph Stock.

Announcement has been made of the purchase by the American Telephone and Telegraph Company of the 82,000 shares of its own stock, recently sold by the Mackay Companies.

President Theodore N. Vail, of the former company stated that the stock was secured at a price of between \$11,000,000 and \$12,000,000.

It is the plan of the American Telephone and Telegraph Company, according to President Vail, to utilize the Mackay stock in exchange for the stock of several of the subsidiary companies which are being refinanced and reorganized in order to confine the physical property of the operating companies to established State lines.

President Vail denied that there was any basis for the assertions that a rate war between the Western Union and Postal Companies is impending.

On the other hand, in carrying out the plan for the increased use of the telegraph, he stated that the telephone company is prepared and expects to afford to the Postal the same advantages in handling telegraph messages over telephone wires as is extended to the Western Union, and at the same rate.

The Military Telegrapher in the Civil War.

PART XXXV.

Mr. Christopher Dougherty, who is at present living in St. Louis, entered the military telegraph service when a lad of sixteen. While connected with it he had many interesting and amusing experiences of which he wrote in part in 1878 to Colonel William R. Plum, historian of the United States Military Telegraph Corps, as follows:

"About the middle of May, 1862, I received notice to report to Captain Samuel Bruch at Nashville, Tenn. A few days later I was working at Columbia, Tenn., with Mr. G. M. D. Gregory, an old acquaintance, as manager. I had barely been there a week before I was called out of bed about two o'clock one morning by Mr. Gregory with the information that the town was about to be attacked by a band of guerrillas and the probabilities were that we would all be either captured or killed, all of which was to say the least, very dismal news to a youngster of sixteen. However, the sun rose at the appointed hour in the morning, the guerrillas failed to do more than fire on the pickets and my courage returned. After being called up in the middle of the night a few times more, I became used to the situation. The manager concluding that his road to happiness led toward Indiana, resigned and I was left alone. On the Fourth of July, while celebrating or rather racing in the suburbs, my horse fell, rolled me about forty feet over a macadamized road, disagreeing with me to such an extent that ten days in bed was the result. While I was disabled, Mr. E. W. Atwater took charge of the office.

"Soon after I resumed duty, I was ordered to Huntsville, Ala., and when I boarded the train I found Captain Bruch en route for the same place. We had only gone a few miles south of Columbia when bump—bump—bang! bang! we were bushwacked and the train was in the ditch. Our nervous system was considerably disarranged by the occurrence, in fact I am inclined to think we were pretty badly scared. Mr. Bruch and myself crawled out of the car as quick as we could and just in time to hear some yells and see the disappearing forms of our assailants. After doing all we could we started for Columbia afoot.

"Mr. Bruch returned to Nashville as soon as the road was cleared and I went south to Moorsville, Ala., at that time a repeating station near Huntsville in charge of Mr. Hamilton and guarded by a squad of soldiers. Life at Moorsville was rather dull, work was very light and we had a hard time amusing ourselves. One day while looking through my effects I found three or four old copper pennies. For lack of something else to do, I went to the battery room and amalgamated them. They resembled silver half dollars so much that they were in great demand by the natives who furnished us with watermelons and vegetables. As they had always charged us exorbitant prices for these things we had no scruples in resuming specie payment. When Gen-

eral Bragg and General Buell started on their grand foot race for the Ohio River, all of that southern country had to be abandoned and the telegraphers went with the army.

"Three trains traveling closely together containing the last of the Union soldiers left Huntsville one morning for the north picking up on the way all detachments of guards strung along the line of the railroad. At Moorsville we had one flat car for our squad and on it was myself and about half a dozen soldiers with our equipment. This consisted of a small amount of baggage and about a dozen barrels of mess pork of which we made a barricade that undoubtedly saved the lives of some of our party. Our train was next to the last and the flat car upon which I had the honor to ride was at the extreme rear end.

"We proceeded very slowly, numerous halts being made. Nothing serious happened, however, until we had got north of Pulaski, Tenn. It was about three o'clock in the afternoon, the one hundred soldiers aboard were trying to get a little sleep in the uncomfortable box and flat cars of which the train was composed, the train running along at a fair rate of speed about half way between Pulaski and Columbia, Tenn., when we were all roughly shaken up by the train coming to a sudden stop and thoroughly awakened by the cracking of shot guns and the shower of buckshot rained upon us from the woods we had just entered. My car being a flat one, was peppered pretty badly, but the barricade of pork barrels saved our lives.

"The attack came from the south side, and we all piled off the train on the north side and used the cars for breastworks. The fighting was very lively for about ten minutes, but the bushwackers soon retreated. A lieutenant calling for volunteers to reconnoiter, a half dozen of us went into the woods to see what had become of the enemy. While we were darting from one tree to another, we were again fired upon and one of our party killed. We then returned to the train carrying the body of our dead comrade, one wounded prisoner and several shot guns. While we were out we found that a bridge ahead of us had been burned and that the bridge we had shortly before passed over was burning. In addition we were off the track. The commanding officers threw out a line of pickets and after about two hours of hard work got the train and engine on the track. The pickets were called in and the train backed down to the burning bridge where the country was more open and where we were able to defend ourselves until help came to build the bridge.

"In the morning the train behind us with about a thousand soldiers reached the opposite side of the creek and proceedings at once commenced towards rebuilding the bridge. In their train were several cars of cotton bales belonging to some speculators. The General commanding seized the cotton bales, dumped them into the ravine where the bridge had been burned and be-

fore noon he had passed his train over the break and we moved to where the bridge ahead was burned. This was a more serious affair, cotton bales wouldn't reach this time, but on the other side was General Negley with trains to transport us northward. We were all transferred safely over the break and moved on to Columbia, where I joined General Negley's command in place of the operator then with him, who was in more of a hurry to get north than I was.

"Rail transportation not being sufficient, General Negley's forces had to march over the pike to Nashville. I overhauled my trunk, picked out my worst clothes for the march, shipped my trunk over the railroad to Nashville and never saw it or its contents again. I was provided with a horse and had a very pleasant march to Nashville, arriving there about five o'clock one evening. The next day I reported to the Nashville telegraph office for instructions. Negley's command being ordered to remain at that point, there was nothing for me to do, so I joined the squad of idle operators then at that place waiting for something to turn up.

"Communication with the outer world had ceased. Nashville was in a state of siege. We were in total ignorance of what was passing outside of the few square miles over which the stars and stripes still waved. General Negley was in command. Stringent orders were issued. All citizens and dwellers, telegraphers included, had to be off the streets and at home by nine o'clock or else pass a night in the guard house. Having a personal acquaintance with the General's staff, I had no trouble in obtaining a permit to remain out as long as I pleased and though I did not use it much myself it was a great convenience to the rest of the boys.

"One morning I was provided with an office outfit and sent out to one of the chain of forts that girdled the city to establish an office. As the fort was not finished, I merely located my office and placed all my things in one corner of the room and returned to the city to pass the night. I returned to the fort about ten o'clock the next morning. My instruments, clothes, pistol and office outfit had all disappeared and the only trace I ever got of any of them was one of the battery jars, which an enterprising soldier had filled with sand and was using as a cuspidor. There was no use complaining, however, so I concluded I was not needed at that particular fort and returned to the city office. As telegraph instruments and outfits were scarce, the proposed office was not opened.

"Mr. Con Dwyer was the manager at Nashville and for lack of higher authority we all looked to him for orders, likewise for sufficient money to supply our daily wants. As money was hard to get, he concluded it would be a fine scheme to ship a half dozen of us north. We were all willing, even anxious to go, provided transportation was furnished. This was no easy matter. Nashville was surrounded by the enemy, the railroads were de-

stroyed and more or less in the hands of the Confederates. The only way we could go was over the turnpike. Horses were accordingly furnished us and, to avoid being captured, Mr. Dwyer wrote a letter to Superintendent Bruch for us to take along with us. In this he stated that we were discharged from the service; that we were disgusted with the war and only anxious to reach our peaceful homes in the north. Of course, we expected that under such circumstances no one would molest us. Perhaps the Confederates might know Mr. Dwyer and such being the case we would be doubly protected. They might, owing to such a strong letter, furnish us with an escort, especially if they should read it all, for at the end of the letter was a paragraph saying that this story was written only to mislead the Confederates in case we were captured.

"Provided with this talisman we started. Our party consisted of Claude Knox, W. H. Kelsey, F. B. Tyler, S. P. Peabody, C. H. Pond and myself. Our mounts consisted of six of the worst plugs to be found in the quarter-master's department. They were evidently chosen with the idea that if our animals were so poor there would be no temptation for the enemy to take them away from us. If good ones were furnished they would be sure to be taken.

"We started bright and early one pleasant morning in October. It fell to C. H. Pond and myself to have the two worst horses in the lot and we were soon left in the rear. We jogged along smoothly until about three o'clock in the afternoon when we met and passed a native well armed and riding a horse that looked for all the world like the one we had seen F. B. Tyler mount earlier in the morning. However, we did not consider it any of our business to question him as to how he had got that animal or what had become of its former owner. In about an hour we overtook Tyler tramping wearily along afoot. We three then took turns walking and riding and hurried on to Springfield, Tenn., where we hoped to overtake the others and, if possible, travel all together, as it certainly would be much safer than straggling along as we had been doing.

"Night overtook us before we reached Springfield, still we poked along and had just arrived in sight of the town when we heard an ominous click, click, and a command to halt. We halted, dismounted, bade farewell to our horses and walked into Springfield just ahead of four or five shotguns. Our captors, taking us to a hotel, we were confined in a small room and searched. Everything that we had that was worth having was confiscated. The letter on Pond's person was seized and opened and one of the captors who secured it commenced to slowly spell out its contents.

"Pond was looking over his shoulder and quickly saw the damaging clause at the end, of which we were all in ignorance. Pond was, however, equal to the emergency and saying he was familiar with the handwriting, volunteered to read it

for them. Luckily for us, his services were accepted. It is hardly necessary to say he omitted the line that, if read out, would in all probability have settled our freedom for some time and when we were alone he destroyed the letter.

"In the morning we were paroled and allowed to go. Kelsey, Knox and Peabody had been paroled and started for Louisville the afternoon previous. Nothing remained for us to do but to follow suit or turn back to Nashville. We quickly decided to push ahead.

"All our available wealth consisted of about sixty or seventy cents in shin-plasters which we had managed to save during the march and a Smith and Wesson revolver that Pond had concealed in his inside vest pocket and which had also been overlooked. We marched very slowly the first day, F. B. Tyler having provided himself with a new pair of shoes just before starting from Nashville, was in constant misery. Pond and I were in good trim and could have walked a long distance had we been alone, but we decided to stick together. Four or five miles was all we made the first day.

"After a week of hardship with little to eat, we arrived at Bowling Green where we found soldiers and the next day got transportation as far as Green River. At Green River we found a man who, for the revolver which Pond still had in his possession, agreed to furnish us with three meals apiece and take us in his wagon to Lebanon Junction from which point the railroad was running to Louisville. We finally arrived at Louisville, ragged and dirty and without a cent in our pockets.

"Having been paroled, Uncle Sam had no use for us nor was he prepared to square accounts with us financially. We found kind friends, however, who helped us along until situations were obtained. Six or seven months afterwards, while I was working in the West, at Fort Laramie, I received notice that I had been exchanged, but I never entered the service again."

Banquet of Postal Telegraph Club of Atlanta.

The first annual banquet of the Postal Telegraph Club of Atlanta, Ga., was held in that city February 26, and was a most enjoyable and successful affair. Much credit is due the Publicity Committee of the Club of which Mr. A. M. Beatty is chairman and which made the arrangements, for the admirable way in which all of the details of the occasion were taken care of. Fifty members and guests were present. After the dinner had been served President W. C. Daviet called the assemblage to order and in a few well-chosen remarks told of the organization of the club and its purposes, saying that every employe of the Postal in the city of Atlanta and a few from towns in close proximity thereto had gladly joined the organization and had given it their hearty co-operation. He then introduced the following speakers in the order named:

Hon. R. F. Maddox, mayor of Atlanta, spoke

of "The Atlanta Spirit and Our Future"; Colonel Fred J. Paxon, president of the Chamber of Commerce, spoke of "Greater Atlanta"; Colonel W. B. Kenny of the Associated Press, took as his subject, "Operators I have Known"; S. W. Wilkes, commercial agent of the Georgia Railroad told of the "Progress of Inventions"; Mr. George H. Usher, general superintendent of the company discussed "Generalities"; Mr. Guy E. Paine, assistant general superintendent spoke on "An After Dinner Thought"; Mr. J. P. Edwards, division electrical engineer, spoke of "Good Signals." The menu and toast list were of an attractive and unique design, the speakers being given circuit assignments. According to the program, Mayor Maddox, Colonel Paxon and Captain Kenny were assigned to the quadruplex, Colonel Wilkes to the duplex and Messrs. Usher, Paine and Edwards to the bonus circuits.

As Mayor Maddox and Colonel Paxon both spoke upon subjects pertaining to Atlanta, their speeches were heartily appreciated and enjoyed by everyone. Colonel Wilkes and Captain Kenny enlivened the evening with anecdotes and their tales were listened to with great pleasure. The bonus circuit speakers spoke words of encouragement and appreciation of the hearty co-operation and good work of all departments of the service and predicted great success for the Club. Their remarks were received with great interest and enthusiasm by all present.

A feature of the evening was an automatic telegraph set, which was used to illustrate Mr. Edwards' speech on "Good Signals." Telegrams were received and read by Toastmaster Daviet from Mr. E. J. Nally, vice-president and general manager of the company; Mr. C. C. Adams, second vice-president and Mr. C. P. Bruch, third vice-president, New York; Mr. Jesse Hargrave, superintendent, Birmingham, Ala.; Mr. G. W. Ribble, superintendent, Richmond, Va., and Mr. C. A. Rhodes, traveling auditor of the company.

The following members and friends were present:

Hon. R. F. Maddox, F. J. Paxon, W. B. Kenny, Colonel S. W. Wilkes, G. H. Usher, G. E. Paine, W. C. Daviet, S. J. Poundstone, W. E. Sitton, H. W. Pearce, L. A. Minor, J. P. Edwards, F. H. Robinson, C. W. Dunlop, C. C. Knapp, F. F. Pursley, C. E. Harrison, H. A. McKinnon, G. W. McGaughey, W. W. Irwin, J. F. Heard, A. M. Beatty, G. W. Oliver, A. D. Holcomb, A. S. Holcomb, T. B. Sherman, A. L. Lee, J. C. Moore, Robt. Armour, R. S. Pope, Jr., D. C. Delaney, W. W. Delaney, E. S. Reeves, J. E. Arnold, P. A. McMullin, J. C. Ewing, J. W. Manning, L. L. Shivers, B. S. Price, E. J. Wallis, F. Spalding, and J. M. Plowden, of Atlanta; C. B. Arrington, of Nashville; O. T. Moore of Macon, Ga., and W. M. Milam, of Cartersville, Ga.

Lightning Protection.*

BY OTTO HOLSTEIN, LIMA, PERU.

Chief Train Dispatcher, Central Railway of Peru.

Having had a number of years experience in the Southern States and Western States and Territories in the United States, in the Philippine Islands, on the Isthmus of Panama, in Peru, and on ships at sea, my knowledge of electrical storms and the protections of wires and apparatus from their effects may be of interest.

From my observation in these widely-separated parts of the world, I can say that nowhere have I encountered electrical storms of such magnitude as those of the higher altitudes of the cordillera of the Andes. It is very probable that in the Rocky Mountains as well as in many other parts of the world, where altitude, temperature, latitude or geological formation, or whatever it is, that bears the most important relation to the phenomena in question, are as favorable as here, electrical storms of equal proportions will be encountered.

Inasmuch as the Peruvian Andes comprise the territory directly in question, some little description of this great range of mountains may not be out of place. The description of the Sierra in Peru will hold good for the whole west coast of South America, as the general character of the country is the same. The country on the western or Pacific Slope of the mountains is dry and barren, very much like the Mojave Desert in California and Arizona. There is little or no rain along the coast, but up above the foothills we get rains for six or seven months of the year. About the altitude of 10,000 feet, rain, snow and electrical storms are frequent and very violent, although usually of short duration during the summer. On the high peaks and in the passes and through the higher altitudes the storms, generally, both rain, snow and electrical, are of the greatest violence.

On the Cerro de Pasco Company's line, upon which I was formerly employed, the entire length of which lies above an altitude of 12,000 feet, the road follows the canyon of a river for the first thirty kilometers from Oroya and then opens out on a level plain, or, as it is known here, "pampa." The road crosses the entire length of this pampa, some 70 kilometers and then enters the barren mountains in which it continues for another 30 kilometers until Cerro de Pasco is reached. This is on the eastern or Atlantic water-shed of the Andes, and here, as well as other places of the same altitude (over 14,000 at Cerro de Pasco), the electrical storms are very violent.

These storms come with almost no warning. I found the telegraphone gave the best indication of the approach of a storm, the "howler"

would give notice of the presence of static electricity long before any sign was visible to the eye. To those who are familiar with wireless telegraphy and have sat for hours trying to read faint signals from a distant station or ship, I could best describe the noises made by the "howler" as very much like "bad static"—or, better, a sound like water spilled on a hot stove. The clouds seem to collect from nowhere, around some peak, and in a very few minutes the vicinity of the peak is ablaze in a terrific electrical storm.

Although these storms frequently come alone, they more often accompany heavy snow storms, frequently coming after it has been snowing quietly for a half hour or so, and, after from fifteen minutes to half an hour of blinding flashes and pealing thunder, disappearing as suddenly as they come.

Many horses, cattle, sheep, and llamas, and people as well, are killed each year by lightning. The lightning seems to find more victims on the pampa than in the more rugged country. The peaks are rich in mineral and probably offer a better conductor than frozen pampa covered with comparatively dry snow. I have noticed among the peaks static appears to be disposed of with greater facility than on the pampa where it plays more pranks before finally disappearing.

A lightning arrester, known as the "Argus," is used on the Cerro de Pasco line, for the protection of telegraph and telephone apparatus and also for the protection of the train staff machines, which are in use there. In the case of the telegraph, these arresters have done excellent work. During one storm at Carhuamayo, a station on the Cerro de Pasco Railway, the lightning arrester was completely destroyed by a heavy discharge while the telegraph relay was not damaged. During another storm at La Fundicion, on the same road, the helix of the arrester was fused, but no damage was suffered by the telegraph apparatus.

The results obtained in the case of the telegraphones were not so gratifying as in the case of the telegraph apparatus, for, although the current that got through the arrester before it reached an intensity sufficient to break down the resistance of the air gap between the helix and the ground plate, was not sufficient to cause any damage to the telegraph relays, it was sufficient to puncture the comparatively delicate oiled-paper tinfoil condensers used to bridge telegraph instruments in intermediate offices and in telegraphone circuits where these instruments were installed. I have spoken of the excitement of the "howler" on the approach of an electrical storm, and the "howlers" as well as condensers were destroyed almost every time we had a storm. The howlers, when not destroyed, seemed to become less sensitive after a storm and a large number of howlers and condensers had to be ordered to replace those damaged by the frequent electrical storms. The con-

*Abstract of paper read March 14 at a meeting of the Railway Signal Association at Chicago.

densers in way stations gave us a great deal of trouble and after a storm if a telegraph station did not answer after some hours of calling, it was almost certain that the office had been cut out by a short-circuited condenser. We finally put two-pole single-throw cut-out switches in all telegraph circuits as well as in condenser circuits at intermediate offices, with instructions to open switches on the first appearance of a storm. Naturally this put the telegraph out of commission during such storms, but it was just as well so, for things were usually so interesting in the offices upon these occasions that I never heard anyone express a desire to use the telephone during an electrical storm.

In the case of the train staff, the Argus arrester was also used, and, in addition, cut-out switches as in the case of the telegraphones. I never found out whether the staff machines were more susceptible to the action of lightning than the telegraph relays or not, as the machines were comparatively expensive, and as we had no spare ones to replace a damaged machine, we did not deem it wise to take a lesson from that all-wise teacher, "experience." During storms the telegraph was used to notify operators to close switches, to give or take a staff.

As stated in the case of the telephone, the Argus arrester gave excellent results, and I have in my possession at the present time, three arresters that have been all but completely destroyed by lightning discharges.

While the Cerro de Pasco line lies throughout its length in a country where the same conditions obtain, all imaginable weather as well as other conditions are found on the Central Railway of Peru. In Callao and in Lima, and for some distance from the coast, it seldom or never rains, and home-staying people of the coast know nothing of rains or electrical storms. Higher up in the cordillera of the Andes rain and snow and electrical storms are encountered the same as in the Cerro de Pasco Country.

I cannot do better than take three stations on the Central where electrical storms are very destructive: Ticlio at the entrance of Galera Tunnel, the highest point on the line at an altitude of 15,665 feet and on the continental divide. Casapalca, 18 kilometers west of Ticlio and on the Pacific slope of the mountains at an altitude of 13,606 feet, and Yauli, 22 kilometers east of Ticlio and on the Atlantic slope of the Andes at an altitude of over 14,000 feet. During the summer months, which are December, January, February and March, snow and electrical storms are of daily occurrence at these stations. The worst months for such storms are January and February and any person wishing to study electrical phenomena could not find a better field than the one outlined.

Here on the Central I found a type of lightning arrester that was entirely new to me. The arrester in question embodies so many good

features, and its performance has been so satisfactory on this road, where very trying conditions are to be met, that I consider it worthy of some further description.

The principal parts of this device are of cast iron, the arrester is the two-line type.

The ground plate measures 7 3/4 inches by 6 5/16 inches and stands on four legs cast with the plate. The whole upper surface of this plate is furrowed and sharply ridged. The line plates are likewise furrowed. The arrester, when assembled has these sharp ridges at right angles, making every point of intersection (of which there are thousands) a spark-gap with an air space of but one thirty-second of an inch to break down. As can be seen, thousands of small spark-gaps in multiple with but one thirty-second of an inch of air resistance to break down, impose but a negligible resistance to a static discharge of any intensity.

The line plates and ground plate are separated by hard-rubber or ebonite washers one thirty-second of an inch in thickness and the line plates are held in position by sentinels of the same material which are secured to the ground plate and which clamp the washers in position. On the line plates brass lugs are secured which also serve to hold the line plates in position; these lugs are insulated from the ground plate by a strip of ebonite that extends along the sides of this plate.

The plates to which the line is connected can be lifted from the ground plate for inspection or for cleaning without interfering with the working of the wires. The only fault that can be found with these arresters is that they are rather heavy, the weight of the two-line type being about fifteen pounds.

The records of this road show excellent performance for this type of lightning arrester. There are records of some violent storms where office and ground leads have been fused by static electricity but none of the instruments have been lost.

The original manner of arranging the arresters was to connect them in series with the line and instruments and, inasmuch as they appear to have done their work so connected, it might seem best to let well enough alone, but I have put choke coils in series with the line plates of the arresters and the instruments with a view of still further retarding the passage of the high frequency discharge causing it to bank up and break down the resistance of the arrester sooner than it would otherwise, thereby offering greater protection to the instruments. Good ground leads have also been sought and both binding posts of the ground plate have been connected with separate grounds. A flat copper ribbon being used for the ground conductor, this form appears to embody qualities not possessed by round conductors.

Composite Systems.

The chapter on "composite systems" in the new book "Telephonology" contains much information which is especially valuable to every telephone or telegraph man at the present time when the question of getting the maximum use out of a wire or pair of wire, is such an important one and is receiving such widespread attention. In this work many different methods employed to obtain composite simplex and phantom circuits are considered. A few extracts from this chapter will serve to show its value. After presenting illustrations of several different methods of applying telephone apparatus to a grounded line telegraph system the author says in part:

"From these illustrations it will be noted that on the composited portion of a line there may be three kinds of telephone stations: terminal stations, located at each end of that part of the telegraph line used for telephonic purposes; intermediate stations, located between the terminal stations; and portable stations, intended to be carried on a train for emergency use between the terminal stations while the train is at a standstill.

"To adapt a telegraph system to telephone operation requires no change in the telegraphic apparatus or in its operation. All that is necessary is to bridge the apparatus at each telegraph station with a condenser and a resistance, and at the telephone stations to connect the telephone apparatus between the line and ground. A condenser in each telephone set prevents the telegraphic current from passing through the apparatus to the ground."

Speaking of the limitations of the composite the author says; "the length of the telegraph line and the number of stations with which this composite system can be successfully employed, depend largely upon the character of the telegraph line. On a short line, service will be better and more stations can be operated than on a long line; the length, gauge, material of the line wire, and the amount of wire in cable are the more important features which govern the perfect operation of the system."

These paragraphs are but an indication of the comprehensive way in which the important subjects treated in this one chapter on composite systems are discussed. Every combination mentioned is also illustrated by a circuit diagram which shows just how the desired results are accomplished.

At the annual dinner of the American Institute of Electrical Engineers held at the Hotel Astor, February 24, Professor Elihu Thompson, the first recipient of the Edison medal for meritorious achievement in electrical engineering was the guest of honor. Mr. T. Commerford Martin acted as toastmaster. Over five hundred members of the Institute and friends were in attendance. Among the telegraph people present were: George G. Ward, Minor M. Davis, John F. Skirrow, F. E. d'Humy and D. McNicol.

The Manufacture of Lead Covered Telephone Cable.

Notwithstanding the large amount of lead covered telephone cable in use, only a few people, even among those connected with telegraph and telephone companies, are familiar with the process of manufacture, or even remotely acquainted with the manufacturing equipment to produce the cable used for this purpose.

Bare copper wires of No. 19 and No. 22 B. and S. gauges are most commonly used although considerable cable is manufactured using other sizes of wire. The coils of bare copper wire are put on spindles on the machines shown in Figure 1 and insulated with paper of various thicknesses according to the specifications.

All the insulating paper is manufactured expressly for this purpose and is subjected to a rigid test, which insures only the very best quality being used.

Figure 1.--INSULATING AND TWISTING MACHINES.

During the process of insulating, the wire is wound on spools and prepared for the next operation of twisting into pairs. The machines used for the twisting operation are also shown in Figure 1. All of the machine equipment is electrically driven by individual motors.

After the conductors have been twisted into pairs and rewound again on small reels or spools, they are ready to be mounted on the drum of the stranding machine, which is shown in Figure 2. The stranding machines are built of various sizes, capable of forming into a core cable having from two to six hundred pairs of No. 22 B and S. gauge conductors. The stranding operation consists of forming the several pairs of conductors into a compact core, over which is placed a wrapping of firm dry paper. In the foreground of Figure 2 on a portable reel, is shown a cable, which has just been stranded.

The core of the cable, after it has been stranded, is tested, then placed in the drying ovens and subjected to a temperature of not less than 212 degrees Fahrenheit for twenty-four hours or more. This drying operation insures all of the moisture being taken out of the cable before it is lead covered. After it has been

put into the drying ovens, the core of the cable does not again become exposed to the air until after it has been encased in the lead sheath, but is drawn from the drying ovens directly through the lead presses, which are shown in Figure 3.

Figure 2.—STRANDING MACHINES AND CABLES IN PROCESS OF BEING FORMED INTO CORE.

The sheath, or outside covering of the cable, is generally made up with ninety-seven per cent. lead and three per cent. tin. The sheath is forced on the core of the cable by the presses which are operated by hydraulic pumps, also shown in Figure 3, which have a pressure of 6,000 pounds per square inch. During the process of lead covering, the cable is automatically wound on

Figure 3.—LEAD PRESSES AND HYDRAULIC PUMPS FOR SHEATHING CABLE.

wooden reels which are placed directly in front of the lead presses. After the complete cable is wound on the reels, the ends are hermetically sealed with paraffine for a length of two feet. The cable is then ready for inspection and test in order to determine whether or not it meets, in every respect, the requirements of the specifications.

An armored submarine cable is made up with a core covered with the lead sheath, which is usually five-thirty-seconds of an inch thick. It is then covered with three layers of jute and tar, one layer of armor wire varying in size for different cables from No. 11 B. W. gauge to

No. 4 B. W. gauge, and then two more layers of jute and pitch and a dipping of whitewash.

[We are indebted to the courtesy of the Western Electric Company for the cuts to illustrate this article, the process of manufacture described being the one employed at their factory at Hawthorne, Ill.]

A Composite System for Railway Purposes.

Patent No. 949,188, for a composite system, granted recently to Mr. O. T. Lademan of Milwaukee, is an interesting application of the general principles of composite telephony and telegraphy to the requirements of a railroad desiring telephones at all stations and telegraph facilities at the more important points only. The invention contemplates the provision of a plurality of telephone circuits placed end to end electrically speaking, and having telegraphic devices interposed between these various circuits. Impedance coils which offer a high resistance to the telephonic currents are bridged across the ends of each telephone circuit which circuits may have bridged across them at the ends or at any intermediate points any number of telephone stations desired. A telegraph key, short circuiting switch and relay are interposed between the central points of the impedance coils of the two sections ending at a telegraph station. A telegraph circuit is thus formed using the two telephone line wires in parallel for one side and leaving the ends grounded to form a return circuit. With this arrangement only we would have a telegraph line equal in length to the total length of the separate sections with a way station at each dividing point. Communication by telephone, however, would be confined to each separate section. To overcome this difficulty the inventor inserts a repeating coil, switch and condensers to connect the telephone in case this is desired. The repeating coil may be omitted if the sections are short and the lines connected together by a switch and condensers. The telegraph current will have to pass through the telegraphic apparatus at that station.

The director of telegraph of Venezuela has been instructed to communicate with the Government of Peru with a view of extending the international service recently established between Colombia, Ecuador, Peru and Venezuela, to Bolivia, Chile, and thence to the Argentine Republic.

In a recent speech in Congress upon the postal situation, Representative W. C. Adamson of Georgia spoke in highly complimentary terms of the effective way in which the rural free delivery branch of the service is managed. He gave a large part of the credit for this to Mr. P. V. De Graw, fourth assistant postmaster general and a well known old time telegrapher, who has supervision over this feature of the post office administration.

TALKING AND TELEGRAPHING SIMULTANEOUSLY OVER THE SAME LINE.*

The Repeating Coil and the Simplex Circuit.

BY N. C. KISSELL.

To-day a person can talk over a long distance telephone line from New York to Chicago while four telegraph messages are being transmitted over the same wires, and under normal conditions there will be not the slightest annoyance from interference between any of these messages. The apparatus used to make this possible, while nearly perfect in action after having gone through a carefully directed process of evolution, is worked on such simple principles that the making up of "extra circuits" from existing telephone lines may be clearly explained without the use of mathematics.

A simplex circuit is an arrangement of a single pair of wires to form one metallic circuit telephone line and one grounded telegraph line. The basis

in the iron ring. This flux will have a definite direction, depending upon the direction of the electric current in the coils surrounding the iron. This magnetic flux, of course, forms a closed magnetic circuit through the entire circumference of the iron core, and consequently passes through the windings, *c, d*.

Under these conditions any change in the strength of the original current passing through windings *a* and *b* will vary the intensity of the flux passing through coils *c* and *d*, and, if they are in a portion of a closed metallic circuit, will set up in them an induced current. When an alternating current circulates in coils *a, b*, a corresponding alternating current is set up in *c, d*. The ratio of the strength of current induced in *c, d* to that of the original current depends approximately on the ratio of the numbers of turns in the two windings to each other. If the windings *a, b* each have fifty turns and *c, d* ten

Figure 1.—TELEPHONE LINE WITH REPEATING COILS CONNECTED IN CIRCUIT.

of this arrangement is ordinarily a repeating coil, and the efficiency of a circuit depends to a considerable extent upon the design and construction of this piece of apparatus. The coil used by the largest company engaged in this class of business, which has been developed by a series of careful experiments, and has been for some time in successful use in its present form, consists of an iron core, toroidal in shape, made up of a bundle of small iron wires, around which are wound coils of insulated wire. There are four groups of windings (*a, b, c, d*, Fig. 1) the resistance of windings *a* and *b* being thirty ohms each, while coils *c* and *d* are wound to thirty-five ohms each. In practice terminals of each set of windings are brought out to lugs on the wooden base, upon which the coil is mounted. When connected into a simplex circuit the windings *a* and *b* are connected together as shown, *c* and *d* also having their inner ends joined.

By tracing the effect of certain electrical currents in the repeating coil itself an understanding of many principles which determine the operation of a simplex circuit may be obtained. If an electric current is suddenly caused to circulate through windings *a* and *b* in series it will create a magnetic flux

turns each, then the E. M. F. induced in *c, d* will be one-fifth of the E. M. F. impressed on *a, b* for any change in the intensity of the lines of force. If the windings *a, b* had ten turns each and *c, d* fifty turns the E. M. F. induced would be five times that impressed on *a, b*. If *a, b* had fifty turns each, and *c, d* fifty, the E. M. F. induced in *c, d* would be equal to that impressed on *a, b*.

This is true providing there are no losses in the repeater itself. It would be the ideal equation, but is not strictly true on account of certain losses in the coil which are encountered. The losses in a repeating coil (or transformer) are (a) losses of E. M. F. in overcoming the resistance of the coils; (b) losses of power in the coils and (c) loss of power in the iron core due to hysteresis and eddy currents. From this it follows that the coils must be of as low resistance as possible to keep down the loss of power due to the current passing through the coils so that practically all of the E. M. F. induced in the secondary coil will be available at the terminals of that coil.

The primary and secondary coils must be wound very close together, so that no perceptible portion of the magnetic flux that is forced through the core by the magnetizing current may flow out of the core between the coils, instead of passing through

*Article reprinted from the American Telephone Journal.

the secondary as well as through the primary coil.

It will be seen that when an alternating current is passed through the coils the core is being constantly magnetized in one direction—then demagnetized and remagnetized in the opposite direction, this operation being repeated over and over again at a very rapid rate. This gives rise to what is called a "hysteresis" loss. When a piece of iron is subjected to an alternating increasing and decreasing magnetizing force, the magnetism for equal magnetizing forces will not be the same, and it is found that the magnetism lags behind the magnetizing force, or in other words, the metal has a tendency to maintain any magnetic state which it has once acquired. This property of iron is called "hysteresis" from the Greek word, meaning to "lag behind."

frequency, in order to reproduce a sound of the same pitch as was spoken into the transmitter. Sounds are distinguished in three ways; by loudness, depending on the energy of the vibrations of the air particles adjacent to the ear drum; by pitch, depending on the frequency of the vibration, and by character, the quality which distinguishes between human voices and musical instruments, or between one voice and another. The alternating current passing through the primary winding induces in the secondary an alternating current of a higher or lower tension (depending on the ratio of the two coils), but these alternations must be in perfect harmony with the original sound vibrations. As the current for talking is of very high frequency, it follows that if the iron in the core of the repeating

Figure 2.—THEORETICAL ARRANGEMENT OF REPEATING COILS IN TELEPHONE LINES WITH THE NEUTRAL POINTS CONNECTED BY A THIRD WIRE.

The actual change in the magnetic condition of the iron lags behind the state of variation in the magnetizing force, as if there were a certain molecular friction of the iron which had to be overcome. There is, therefore, a certain loss in energy due to hysteresis which is dissipated in the form of heat. The harder the iron the greater the hysteresis loss. This loss varies as the magnetic induction raised to the 1.6 power, and is also proportional to the rate at which the reversals of magnetism take place and, of course, the greater the amount of metal in which the reversals occur, the greater the total hysteresis loss. This loss, due to hysteresis, cannot be accurately determined. For very soft iron the loss of energy during a complete reversal of magnetism is slight; with hard iron the amount of energy wasted per cycle is greater.

In a telephone circuit the frequency of the alternating talking currents is enormously high, being from 300 to 600 vibrations or periods per second. When an alternating current of such high frequency is passed through the primary of the repeating coil it will be seen that the magnetic flux set up in the core by this rapidly varying E. M. F. must be in exact step with it, and induce an E. M. F. in the secondary of exactly the same frequency as that of the inducing current. Suppose we connect a telephone instrument to the primary of the coil and a receiver to the secondary. When speaking in the transmitter the high frequency talking currents passing through the primary must induce an alternating current in the secondary of exactly the same

coil is at all sluggish in its action, due to hysteresis, the transmission will be distorted so that speech will not be heard plainly. The core of a coil with a closed magnetic circuit is more sluggish than one with an open magnetic circuit, and the core composed of a large amount of iron more sluggish than one with a small amount, but a core with an open magnetic circuit would be subject to a large magnetic leakage. Obviously, then, the core to be used in a repeating coil to be adapted for the transmission of speech should have a closed magnetic circuit, and be as small in mass as possible, and made of very soft iron, in order to reduce the magnetic leakage and magnetic lagging of the core flux to prevent any distortion of the sound waves. Such a one is obtained by making the core of small annealed iron wires, and of such volume as will enable it to carry the greatest flux which it will be called upon to carry, without reaching its saturation point.

Figure 1 shows a telephone circuit with two repeating coils introduced. When station A is transmitting speech to B, an alternating current will be set up in a, b and in consequence, as has been indicated, an alternating current of the same frequency will be induced in the windings c, d. This induced current passes over two line wires and then through windings e, f, inducing in turn a current in windings g, h, which passes through B's instrument reproducing sound. When B is talking the action is reversed. It will be seen that the current which passes through B's instrument is not the same one that was set up by A, but an induced current, one

which has undergone two transformations, and it must be exactly the same as the one set up by *A* in frequency and other characteristics in order to reproduce the same sound as that imparted to *A*. In a simple telephone circuit, that is one where the two instruments are connected together only by the two line wires, the currents that are set up by *A* pass over the line wires through *B*, and suffer a loss due to the resistance and reactance of the line wires. When the repeating coils are introduced into the circuit the current still suffers the loss due to the line wires, and also the losses due to the repeating coils on account of the transformation of energy within them. From this then, a telephone circuit with repeaters in it is not as efficient for speaking as one without, and their effect is more pronounced on long lines than short.

There is another consideration to be taken up, and that is signalling on this circuit. This, of course, will have to be done with alternating current on account of the transformations to be undergone in the repeaters. The ordinary ringing generators used in exchanges of to-day are of low frequency, usually from 20 to 30 cycles per second. The hysteresis and eddy current losses in the iron cores of the coils depend a great deal on the frequency of the circuit, as also the magnetic flux. Here, then, the coils are called upon to operate several different frequencies. If they have an efficiency of 95 per cent. for talking, they will not be so high on low frequency and may be only 35 or 40 per cent. efficiency. This is offset to a certain extent, by the strength of the ringing generator current which is very powerful when compared to the talking currents. As transmission of speech is our most important consideration, it has been settled that the coil to be used is one which will transmit the high frequencies very efficiently, a generator of comparatively high voltage being used to ring. The writer has described the action of the repeating coil at some length, as in his experience he has seen several coils placed on a line through which speech could be carried on very well, but it was impossible to ring through the coils. This action could not be accounted for by those concerned. Also, what has been said concerning the coils will be frequently referred to later when taking up phantom circuits and superimposed currents.

If one connects up the repeating coils at their centers with a third wire, as shown in Figure 2, this arrangement will have a certain effect on the talking current. Assuming that *a*, *b*, *g* and *h* each have 1,000 turns of wire, and *c*, *d*, *e*, *f* each have 2,000 turns, if an alternating E. M. F. of 100 volts is impressed on *a* and *b* there will be an E. M. F. of 100 volts induced in each winding of *c*, *d*. As these are connected together in series and both windings wound in the same direction, a total voltage of 200 volts will be induced across points 1 and 2. At a given instant then, this current starting at point 1, will pass over wire *x*, to point 3, through coils *e*, *f*, to point 4 over wire *z*, back to point 2. This current, passing through windings *e*, *f*, induces a current in *g*, *h*. Assuming for the sake of

simplicity that there is no line loss the E. M. F. of the current passing through *e*, *f*, will be 200 volts. As *e*, *f* each have 2,000 turns and *g*, *h* each have 1,000, the E. M. F. induced in *g*, *h* will be 100 volts or the same as that impressed on *a*, *b*. Here then we have transformed the E. M. F. from 100 to 200 volts and again from 200 to 100 volts.

In the first case we have stepped up and in the second stepped down the voltage. This is done to give a higher pressure on the line wires to transmit the current without such a great loss in power. Point 5 will therefore be at positive-negative potential, minus for the 100 volts induced in winding *c*, and plus for the 100 volts induced in winding *d*. In other words, point 5 will be at neutral potential as will likewise point 6, consequently there can be no difference of potential between points 5 and 6, and no current will flow over wire *y*, but will flow over wires *x* and *z* as indicated by the arrows. The current would tend to flow in both directions in wire *y*, and as the two divisions are equal they neutralize each other. Therefore, it makes no difference whether the repeating coils are connected together at their centers by a third wire or not as far as the telephone circuit is concerned.

(To be continued.)

A Timely Study of Wireless Telegraphy.

There has been a steady demand for operators in the wireless telegraph service, as that system has extended its operations, until to-day hundreds who were formerly employed as Morse operators are now occupying lucrative positions in the wireless field, at seaside, or on steamer, stations. The rapid increase in the number of wireless stations both on land and sea makes it evident that a very much larger field of employment, and at good pay, in the immediate future is opening up to the telegraph operator who will adapt himself to the newer method of radio-telegraphing. Operators everywhere are earnestly investigating this branch of the telegraph, since as its vast opportunities to benefit the individual become more apparent with the development of the system now progressing so rapidly.

A good text book on wireless telegraphy is the first need of any who contemplate the study of that system. The sale of such works has increased enormously of late, clearly indicating the development of a widespread desire for knowledge on the subject.

For the convenience of our readers we have prepared and published in our catalogue, together with prices, a carefully selected list of standard books treating on wireless telegraphy. These volumes, which include the most up-to-date works upon the subject, furnish the best information obtainable, the kind giving the most efficient aid and direction to the student. Orders for the books enumerated, or indeed for any others that may be required, which must be accompanied by the cash, will be filled on the day of their receipt, and sent with all the carrying charges prepaid. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Annual Report of American Telephone and Telegraph Company.

The annual report of the American Telephone and Telegraph Company for the year ended December 31, made public March 12, shows gross earnings of \$137,112,700 for all of the associated operating companies in the United States, not including the American Telephone and Telegraph Company, an increase of \$9,995,000 over the previous year, and net earnings, after the payment of expenses of operation, maintenance, and depreciation and taxes of \$37,952,800, against \$35,655,600 in the previous year. The balance available for dividends was \$30,898,900, an increase of \$2,217,000, and dividends paid totaled \$22,609,900, leaving undivided profits of \$8,289,000. The earnings and expense account of the American Telephone and Telegraph Company itself, the holding company of the Bell system, shows an income of \$32,761,341, against \$27,898,970 in 1908. Of this the principal contributory item was the dividends received from its stock holdings, amounting to \$15,949,213.

Next in importance was the item of interest and other revenue from the associated companies, which amounted to \$10,661,431. Telephone traffic netted \$4,360,104.

The payment of expenses of \$2,570,575 left net earnings of \$30,190,765, against \$25,895,013 last year. Interest payment left a balance of \$23,095,388, out of which dividends totaling \$17,036,275 were paid. Of the balance after the payment of dividends, \$3,000,000 was carried to reserves and \$3,050,112 carried to surplus. In his annual report President Vail says that the gross revenue collected from the public for telephone service by the Bell system, not including the connected independent companies, was \$150,000,000, an increase of nearly \$12,000,000, and \$45,000,000, or nearly one-third of the whole, was appropriated for current repairs, maintenance, and depreciation. The surplus available for charges and so forth was \$48,400,000, of which \$24,000,000 was paid in dividends. The net obligations in the hands of the public were \$524,000,000, while the companies' property amounted to \$612,600,000, an excess of \$88,600,000, or seventeen per cent., of property above liabilities, without any account being taken of franchises, contracts, patents, rights of way of great value, and which would now be difficult to obtain at any price.

The report shows that the number of telephone stations in the Bell system was increased to more than 5,000,000, including 1,500,000 operated by connecting companies; the wire mileage increased to more than 10,000,000 miles, the traffic to over 20,000,000 connections a day, or 6,500,000,000 connections a year.

The acquisition of about twenty-eight per cent. of the stock of the Western Union Telegraph Company, which President Vail calls "a substantial interest," is indicated in the statement of assets which on December 31 were \$494,089,806, against \$440,932,821 in 1908.

President Vail devotes considerable space in

the report to an explanation of the company's policy in buying into the Western Union Company. His statement put briefly is that the two services are supplemental or auxiliary to one another rather than competitive. His argument on this point is that telegraphy is incomplete because the methods of collection and delivery are slow and primitive, and that telephony, while instantaneous in its connection of the sender and receiver, is too expensive for correspondence. On the combination of the two services he says:

"Line construction and maintenance are common to both the telephone and the telegraph, and can be combined or performed jointly with economy. The same wires may be used for both telephone and telegraph circuits and at the same time. The differentiation between telephone and telegraph construction and operation begins with the stringing of the wires.

"Where there is density of message traffic sufficient to keep busy an expert telegraph operator, the telephone cannot be used in competition with the telegraph in the handling of message traffic, but at some point of less density of traffic the telephone will gradually supersede the telegraph in handling message traffic.

"The elementary difference in the scope and operation of the telephone and the telegraph in the handling of telegraph traffic indicate that each will occupy a distinct and well-defined field.

"The Western Union telegraph lines reach over 22,000 smaller cities and towns and villages, at most of which the commercial telegraph traffic would not of itself support a telegraph office. This business is now being performed necessarily under some joint arrangement, for the greater part with the railroad companies. While these arrangements will be continued, a greatly extended and improved service will be given in connection with the Bell system with over 5,000,000 stations located in 50,000 cities and towns."

Other advantages to the public will follow the recent night letter rates, President Vail believes, but he indicates that it will not be manifest in any immediate reduction of rates. He says on this point:

"Before any change can be made in the existing rates for existing service it will be necessary to await the result of studies now being made, as it is claimed that the irreducible cost of handling is so near the revenue received for each commercial message that no reduction in rates would be justified by any probable increase in business.

"Improvement and extension of existing service and introduction of new classes of service will be the first effort of all interested. The first of these will be the introduction of the 'Night Letter,' and others will follow.

"The benefits and advantages from this complementary operation will come, but not all at once. Careful study and consideration are being given to all questions for all interested. The necessary safeguards for the protection of the company and the public will have to be worked out."

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIXEY

Sole Manufacturer

**Hudson Terminal, 30 Church St.
NEW YORK**

Western Representative

**WATSON INSULATED WIRE CO.
Railway Exchange, CHICAGO, ILL.**

The Railroad.

It is reported that plans are being made to equip several sections of the Lake Erie and Western Railway with telephone train despatching circuits, in the near future.

Mr. Lewis W. Landman who was recently appointed general passenger agent for the Lake Erie and Western Railway, began his railroad career in 1886 at Danville, Ill. as telegraph operator and station agent.

The eighth meeting of the International Railway Congress will be held at Berne, Switzerland, July 3 to 16. It is expected that about seventy-five American railway officials will be in attendance.

A patent No. 950,004 for railway telephone signaling apparatus has been granted to August A. Monson of North St. Paul, Minn. A selector is provided having two relays, one of high impedance and one of low impedance, and connections are made so that the action of a second local circuit is not completed until the line relay has permanently closed at the end of an interval.

The Pennsylvania Railroad has undertaken forestry work upon the most comprehensive scale of any railroad corporation. Since they first began this work in 1902, they have planted 3,482,186 trees, 1,054,010 being planted in 1909. They have also, during the past year established a large pressure timber treating plant at Mount Union, Pa., and a smaller experimental non-pressure plant at Greenwich Point, Philadelphia.

Mr. Charles T. Day, whose appointment as assistant superintendent of telegraph of the Sonora Railway and Southern Pacific Lines in Mexico with headquarters at Empalme, Sonora, Mexico was announced in our March 1 issue, was born in New York and first entered the telegraph service with the United States Telegraph Company in that city in 1865. He later served as division chief operator in the Chicago office of the Western Union Telegraph Company. For several years past he has been chief electrician in the telegraph department of the Southern Pacific Railway at San Francisco.

Arrangements are now well under way for the twenty-ninth annual meeting of the Association of Railway Telegraph Superintendents which will occur at Los Angeles, May 16 to 20. The plans already arranged give the assurance that the visiting ladies will be well entertained. As now outlined the arrangements call for two full days and two half days of the time to be given over to business sessions. This ought to provide ample time in which to discuss the many important questions which will come before the convention. The headquarters of the gathering will be at the Hotel Alexandria. The entertainment committee of the Association and a committee from the recently formed Railway Telegraph and Telephone Appliance Association which is composed of associate members of the former organization met in Chicago, March 12 to outline the program for the convention.

William S. Wood, assistant superintendent of telegraph of the Rock Island Railroad, died at Chicago, March 3, aged thirty-seven years.

S. B. Grimshaw, formerly superintendent of telegraph of the Denver and Rio Grande Railroad and later connected with the Santa Fé Central Railway, died at Santa Fé, N. M., February 27.

Mr. W. H. Hall, assistant superintendent of telegraph, of the Missouri, Kansas and Texas Railroad, has been advanced to the position of superintendent of telegraph with headquarters at Denison, Tex., vice Mr. S. K. Bullard, who has resigned on account of ill health.

At a meeting of the Omaha Railway Club held March 9, Mr. J. B. Sheldon, superintendent of telegraph of the Union Pacific, read a paper on "Despatching Trains by Telephone." He was followed by Dr. Frederick H. Milliner, experimental electrician of the Union Pacific, who spoke of the "Possibilities of Handling Railway Trains by Wireless Telegraphy." This is a subject to which Dr. Milliner has been giving his attention for some time.

The Santa Fé System has extended the use of the telephone for train despatching over its road from Denver to Pueblo, Colorado. There are about forty telephone stations along the 120 miles of single track between Denver and Pueblo. There are in the neighborhood of twenty-five to thirty trains a day over this division, and in the handling of these trains there are approximately seventy-five regular meeting points. It is estimated that the installation of telephones on this division will enable the dispatchers to handle the same amount of work as previously in about sixty per cent of the time.

The following telephone despatching circuits have been authorized to be installed at once on the Canadian Pacific Railway: Chalk River to Cartier, Ont., 2432 miles; Sudbury to Muskoka, Ont., 129 miles; Sudbury to Sault-Ste-Marie, Ont., 183 miles; Cartier to White River, Ont., 269 miles; Brandon, Man. to Broadview, Sask., 132 miles; Broadview to Moosejaw, Sask., 135 miles; Moosejaw to Swift Current, Sask., 111 miles.

The following circuits have already been installed and are in good working order: Montreal, Que. to Newport, Vt., 114 miles; White River to Fort William, Ont., 251 miles; Winnipeg to Brandon, Man., 133 miles; Swift Current Sask. to Medicine Hat, Alta., 147 miles. This will make a total of 1,836 miles of telephone despatching circuits on single track road which will be in operation in a few months. The circuits authorized will complete the equipment of the main line from Chalk River, Ont. to Medicine Hat, Alta., a distance of 1,829 miles with the exception of 419 miles between Fort William and Winnipeg which is double track; besides this the equipment of the branches to Muskoka and Sault-Ste-Marie is provided for in addition to the branch from Montreal to Newport already equipped.

Stock Quotation Telegraph Company in New Quarters.

The new home of the Stock Quotation Telegraph Company, at 26 Beaver Street, New York, has been completed and that company is now installed in its new quarters. The building is nineteen stories high and of the most modern fire proof construction. Each floor has an area of over 2,200 square feet. The executive offices are located on the seventh floor, the electrical equipment on the fourth floor and the telegraph

for negative pulses. The third dynamo is held in reserve and is so arranged that it may be thrown in to replace one of the others at a moment's notice. The motor generator sets are all controlled from the switchboard shown in the left of Figure 1. This switchboard is made of black enameled slate finely finished and it contains the most up-to-date apparatus for the safe and convenient control and operation of the power plant.

The tape ticker switchboard is shown on the

Figure 1.—POWER EQUIPMENT STOCK QUOTATION TELEGRAPH COMPANY, NEW YORK.

department shares the third floor with the New York News Bureau. The machine shop in which all the instruments used in the stock quotation telegraph system are made, occupies the nineteenth floor, probably the most lofty location of any machine shop in the world, at least of any so extensive as this one.

The electrical equipment is all new and of the latest improved type. The dynamos used for operating the stock tickers and page printing machines are all motor driven, the current supply for the motors being obtained from the New York Edison Company. Three of the dynamos operate normally at 150 volts and the other three at 220 volts. For running the tickers and page printers, one dynamo at each voltage is used for supplying positive pulses and one

right of Figure 2 and has sixty-five circuits in operation. The page printer switchboard shown on the left of the picture has forty-two circuits working at present. The maximum number of instruments which can be operated on a circuit is about twenty-five. The transmitting machines are shown mounted on the table in the center of Figure 2 and these are installed in duplicate.

The wire system comprises five one-hundred wire cables entering the building and ending at the terminal frame seen in the center of the illustration directly behind the power equipment in Figure 1. The wires are all fused at this point and carried from there in ducts provided in the floor to the switchboards shown in Figure 2. These ducts, it will be noted have removeable covers so that all wiring while it is concealed

and out of the way is still convenient of access for inspection.

The plant was designed and its installation was supervised by Mr. George S. Hiltz, electrician of the Stock Quotation Telegraph Company. It is safe to say that it is the largest and most up-to-date installation in the world, of apparatus for distributing stock quotations and general news by wire to hundreds of points at the same instant.

which will be continued on to Vancouver through a new three-core cable. This new cable is now under course of manufacture and will be laid about June next between Vancouver and Nanaimo. This provides an alternate cable connecting the main land with Vancouver Island, and was found necessary on account of the increased traffic on the Island. New wires may also be strung between Amherst and Truro, N. S.; Montreal, Que. and Ottawa, Ont.; Stanbridge and

STOCK QUOTATION TELEGRAPH COMPANY, NEW YORK.

Canadian Pacific Notes.

Mr. E. A. Patterson, cashier of the Vancouver, B. C., office of the Canadian Pacific Railway's Telegraph, who has been acting as manager since the death of M. T. Quigley last October has been appointed manager of the office.

In addition to the new telephone train despatching circuits to be installed this year, a 210 pound copper wire will be strung from Montreal to Vancouver. This wire will be used entirely for the trans-American traffic of the British Pacific Cable. It will be operated with the Wheatstone Automatic system duplexed. It is expected that only one relay office will be necessary between Montreal and the Pacific cable.

An additional copper wire will be strung between Cranbrook and Sirdar, B. C.; also two iron wires between Nanaimo and Victoria, B. C.

St. Guillaume, Que.; and Farnham and Drummondville, Que. In addition to the new construction there will be a large amount of rebuilding and general repairs requiring the employment of about 400 men during the summer.

No money was found in the pockets of a man frozen to death recently in Illinois. Consequently it was decided that he was a telegrapher.

Only a few years ago a large number of telegraph registers were in service on the Philadelphia and Reading Railroad and the great majority of the operators used them in recording all messages sent over the wires. It is stated that there are now but three such devices in operation. These are located at St. Peters, Keffer's and Centreville, Pa.

The Telephone.

The Commercial Union Telephone Company of Troy, N. Y., has absorbed four other independent telephone companies operating at Rensselaer, Saratoga Springs, Troy and Watervliet.

Mr. H. E. Milton, superintendent of the Paris, France, telephone system and Mr. Albert Thomas, chief engineer, arrived in New York, March 6, coming here for the purpose of making a study of the telephone equipment in this country.

According to the report of the telephone commissioners of the province of Manitoba for the year ending December 31, 1909, the telephone system in that province which is owned by the government now has 25,300 subscribers; an increase of 5,000 during the past year. Of the total number about 7,000 are farmers. Over 12,000 of the subscribers are in the city of Winnipeg and the additions contemplated in that city will provide for over 40,000 lines.

At the annual meeting of the stockholders of the New York Telephone Company February 25, Mr. Union N. Bethell was elected president and Mr. Theodore N. Vail was made chairman of the board of directors. Seven new directors were elected to replace those who formerly represented the stock holdings of the Western Union Telegraph Company which were sold by that company last fall. The new members of the directorate are: W. D. Sargent, Brooklyn; ex-Governor Griggs, Paterson, N. J.; James H. Manning, Albany, N. Y.; John F. Maynard, Utica, N. Y.; Benjamin L. Chase, Rochester, N. Y., and Henry M. Watson, Buffalo, N. Y.

At a recent meeting of the French Academy of Science it was suggested that it would be advantageous to employ the principles of wireless telephony to long distance transmission over wires. The chief difficulty at the present time in long distance telephony is due to the distortion of the higher harmonics composing the current wave. If regularly maintained waves of a single well-defined frequency such as are produced by a singing arc or a high frequency alternator, were sent over the wire, there being only one frequency the voice would no longer be distorted. This proposition is only theoretical however, and so far as is known no attempt has been made to put it in practice.

A German inventor is conducting extensive experiments and believes he has discovered a practical system of duplex telephony. The current is supplied by a high frequency alternator and the telephone sets are so arranged that one-half wave goes through one set and the other half wave through the other set. This is accomplished by means of an electrolytic or other form of rectifier placed in series with the instruments and thus acting as an electric valve. The telephone current of one set is superimposed upon one-half wave and that of the other set upon the other half wave. The inventor believes that the same principle can be applied to multiplex telegraphy.

Mr. W. T. Gentry, a well known old time telegrapher, but who has been connected with the Southern Bell Telephone Company for the past twenty-seven years, the past two years as president, has been re-elected to that position.

Mr. F. L. Gilman, of New York, has been elected general manager of the Missouri and Kansas Telephone Company, with headquarters at Kansas City. Mr. Sherman R. Hall, formerly general manager of that company has been made vice-president.

It is said that three Danish engineers have invented a device whereby telegraphic apparatus is used in connection with a telephone so that a subscriber, if he does not find the person called at home, can transmit his message written in ordinary letters by a typewriter transmitter.

The independent telephone plant at Rome, N. Y., was sold, March 10, by the Cleveland Trust Company on a mortgage foreclosure to the Utica Home Telephone Company for \$40,000. Control of the latter company was secured recently by the Continental Telephone and Telegraph Company.

The Chicago Telephone Company is making preparations to erect a new fifteen or sixteen story building, covering an area of eighty by ninety feet. Provisions will be made for increasing the height to twenty-two stories later. The cost of the new building will be about \$1,000,000. This company is now erecting a new seven story exchange building in which will be installed switchboards having a capacity of 30,000 lines.

Several bills have been introduced in the Ohio Legislature affecting the telephone companies. One of these, the Billingslea measure, would, if adopted, compel competing telephone companies to connect their lines in order to afford through service without actually merging the business. This is opposed by independent interests as they claim it would destroy competition. Another measure, known as the Elson bill would give competing companies the right to merge and suspends the operation of the anti-trust law so far as they are concerned.

Mr. Frank A. Davis, president of the United States Telephone Company, Cleveland, which was acquired last fall by J. P. Morgan and Company, has been authorized to reduce or adjust the toll rates of his company as he deems best. It is thought in some quarters that this will result in a telephone rate war in Ohio between the Morgan companies and the American Telephone and Telegraph Company. As the rates of the United States Company are higher in many cases than those of the latter company it is considered probable that the only action taken at present, at least by Mr. Davis, will be to lower the rates of his company so as to put them on a par with those of the American Telephone and Telegraph Company.

From the follies of youth usually spring many of life's after sorrows.

Radio-Telegraphy.

The United Wireless Telegraph Company has recently equipped several vessels on the Great Lakes with wireless apparatus.

A wireless station having a range of five hundred kilometers has been installed by the Austrian government at Pola.

The Chilean government is considering the establishment of a school of instruction in wireless telegraphy in order to train operators for wireless service in their navy.

A course of instruction in wireless telegraphy is being given at the Massachusetts Institute of Technology. The object of the course is to give students a practical knowledge of the workings of wireless telegraphy in all its branches.

The Chinese government has opened a wireless telegraph station at Shanghai which is restricted to messages in the English language. As this is contrary to the radio-telegraphic convention it will be possible to handle only local business.

It is stated that the Venezuelan government has decided, in conjunction with a coastwise navigation company, to establish wireless stations at three points along the coast and on board one of the vessels of the company.

Representative O'Connell of Massachusetts has introduced a bill in Congress requiring all government vessels which go out of sight of land; including tugs, barges, colliers, revenue cutters and similar craft to be equipped with wireless telegraph apparatus.

A patent, No. 949,518, for space telegraphy, has been granted to S. Cabot of Brookline, Mass. An open magnetic circuit transformer has its primary connected with a source of alternating-current and a secondary connected with a condenser circuit of the transmitting aerial.

The ordinary secondary voltage used in most wireless systems averages from 25,000 to 30,000 volts. In the Marconi system it may run up to 40,000 or 50,000 volts though 30,000 is more common. The new Telefunken "singing spark" system uses only 3,000 to 4,000 volts. Paper condensers are used in this system.

It is claimed that a new record for long distance overland transmission of a wireless message was made February 28 when the New York World sent a message to the Milwaukee Sentinel a distance of over 1,000 miles. The message was sent from a new station recently opened by the De Forest Radio Company in the tower of the Metropolitan building.

The United Wireless Telegraph Company has issued a descriptive folder, giving a list of the stations which have been established by them both on land and on shipboard. The folder contains a map showing the location of the shore stations. They now have 102 offices and land stations, and 262 stations on shipboard.

A patent, No. 950,258, for an electric connection for multiple wireless telegraphy has been

secured by S. Eisenstein of Kiew, Russia. An aerial conductor with a number of branches each connected at certain times to the anodal point of the vibration tension of the vibration circuit.

The North Atlantic Wireless Telegraph and Telephone Company has been incorporated at Portland, Me., with a capital stock of \$500,000 by H. M. Fairbanks and H. T. Waterhouse of that city, and N. Clifford, of Cape Elizabeth, Maine. The company proposes to operate a wireless telephone system.

The British Post Office Department now has thirteen wireless stations in Great Britain open for commercial use. Most of these are open both day and night and exchange messages regularly with ships from fifty to two hundred and fifty miles at sea, though this range is greatly increased at times when conditions of operation are favorable.

In an article by Mr. Paul Schwarzhaupt in a recent number of a German publication which has been digested by the Electrical World the author gives the results of extensive observations which he has made, from which, like other investigators upon this subject, he concludes that the ether has not always the same conductivity for electric waves, but that the conductivity changes at different hours of the day. The greater the radiation from the sun, the less the conductivity of the ether for electric waves. The fact that most atmospheric disturbances occur during the night is due to the greater conductivity of the ether, which conveys to us the oscillations from distant thunderstorms which would not be heard during the day. For the same reason wireless telegrams are transmitted during the night over a greater distance than during the day. It is really impossible to speak of the maximum limit to which a wireless telegraph station of a given design can transmit messages. A station of one and the same design may transmit messages very well in the Northern climate and be much less effective in tropical countries on account of the higher radiation from the sun in those regions.

At the regular monthly meeting of the Wireless Institute of New York, held March 2, Mr. Harold Veamans read a paper upon "Wireless Legislation and the Status of the Individual Operator," in which he contended that no legislation by Congress could be enforced in such a way as to affect the amateur wireless operator, who is not regularly engaged in transmitting messages from one state to another. In his opinion only state laws can affect such amateurs and he believed that the best results could be attained by the appointment of a commission to deal with wireless communication having powers similar to those of the Public Service Commission. Mr. L. R. Gleason spoke of the regulations imposed upon amateur operators in England, whereby interference is reduced to a minimum and said that these restrictions are not considered burdensome in that country.

Obituary.

Frank M. Jackson, manager of the Saranac Lake, N. Y., office of the Postal Telegraph-Cable Company, died February 20, aged fifty-three years.

Andrew O. Heydlauff, manager for the Western Union Telegraph Company at Lowell, Mich, for the past twenty-one years, died February 20, aged fifty-five years.

L. W. Caldwell, for thirty years editor and owner of a Warrenton, Va., publication, died February 27. Mr. Caldwell was one of the two original operators who despatched the first message over the Western Union Telegraph, then the Morse Telegraph Company's line between Warrenton and Richmond.

Smith Robertson, an old time telegrapher died at Minneapolis, March 2, aged ninety-five years. Mr. Robertson was born at Ithaca, N. Y. in 1815 and was associated with Ezra Cornell, Orrin S. Wood and other pioneers in the development of the telegraph in its earliest days. He was agent for the Cornell University land and had charge of its distribution. Mr. Robertson was one of the oldest members of the Telegraphers' Mutual Benefit Association, holding certificate No. 201 issued on December 23, 1867.

Charles H. Schermerhorn, an old time telegrapher, died March 1st at his home in Plainfield, N. J. aged seventy-seven years. Mr. Schermerhorn at the age of seventeen became an operator at New Hope, Penn. He was afterward the operator at the Barnum Museum, New York, and was next made manager of the Brooklyn office. He later served as manager for the Western Union Telegraph Company and the Central Railroad of New Jersey at Plainfield, serving in that capacity for forty years until his retirement from active service on a pension about two years ago.

Reason for Scarcity of Operators in Canada.

The principal reason for the present scarcity of operators in Canada, is the extraordinary development of the country. The Canadian Pacific Railway Company is operating through Canada from coast to coast with a net-work of branch lines, which are being increased and extended by hundreds of miles each year, particularly in Western Canada, and the Grand Trunk Pacific and Canadian Northern Railways, each building transcontinental lines with branches, creates extraordinary demands for the service of telegraphers both for railway and commercial work. Western Canada is simply being gridironed with railways, and only a commencement has been made in developing the various resources of this vast territory. There appears to be a general feeling in the United States that the climate in Western Canada is very severe and the conditions of living otherwise hard, yet there are many American operators who are employed in Western Canada and are satisfied and are doing well. There are also thousands of farmers

from the United States who come into the country year after year and who find the conditions satisfactory, so much so that there is an annual increase in immigration from the United States. This can only be due to the favorable reports sent by Americans who have been in Canada for some time. The climate is undoubtedly superior to that of many parts of the United States and the conditions of living are not otherwise more severe, while in a new and developing country there are many opportunities offered to thrifty operators to make more money. The Canadian West is certainly the young man's country, and the right place for men in good health who are willing to struggle along.

The Telepost.

The Telepost Company now has offices in active operation in the west at the following places: Sedalia, Mo., St. Louis, Terre Haute, Ind., Indianapolis, Springfield, Il. and Chicago.

These cities are connected by lines partly leased from independent telephone companies and partly built by the Telepost. Extensions, it is said, will be made to other large cities in the west.

This company sends a fifty word message for twenty-five cents between any two offices connected by its wires, provided the message may be delivered through the post office. This form of service is rendered at any time of the day or night.

An ordinance was recently granted by the Aldermen of Boston giving the Telepost the right to lay conduits in certain streets of that city. The passing of this ordinance was the last act of the Board of Aldermen of the Hibbard administration, and its signing was the last official act of Mayor Hibbard. With the passing of that administration all control of streets and wires was taken from the Aldermen and transferred to a Commission.

Every Telegrapher should have a savings account.

It is his best friend in time of sickness or necessity. If continued it is the highway to independence or the stepping stone, through opportunity, to success. The Serial Building Loan and Savings Institution, 195 Broadway, New York was organized for the especial purpose of assisting telegraphers to save money systematically and has always been conducted with that aim in view. Let them tell you how you can start a savings account.

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

The Practical Part of One's Electrical Education Given Along with Theory and Technique.

Now that official instructions in the art of telegraphy for beginners has proved so satisfactory in New York and elsewhere, there is at present strong indication that the next step will be the inauguration of a similar school wherein practical experience may also be added to that of the technical part of the students' electrical education.

Such knowledge would obviously be alike advantageous to both student and the telegraph company as it would eliminate to a great extent many possible delays due to the faltering and uncertain manner of handling working circuits on the part of those lacking practical experience although otherwise well informed.

The practical experience could be obtained in the Instruction Department, wherein idle or specially assigned multiplex and other apparatus would be available for experimental purposes. In this apparatus the different "troubles" to which it is subjected may be artificially created and explained for the benefit of the student. The experience he would thus gain in hunting for such troubles, as well as in being able to learn the actual location of each fuse, lamp resistance, and other parts of the apparatus would enable a new appointee to take hold with confidence of a working circuit in actual use.

A graduate from a school of this kind should be able to measure the current in multiplex apparatus, test lopsided and crossed relays, and adjust pole-changers and other apparatus in a satisfactory manner and by the most approved methods. Furthermore, such a school will not only stimulate ambition, but it will create a much needed supply of available material from which the company could draw when in need of new recruits.

As an illustration of what might happen through lack of actual practical experience to a new appointee who may otherwise be well informed let us take a simple case which is liable to occur almost any day in every large office.

Assume that an operator on the neutral or "B" side of a quadruplex circuit in the telegraph office where the system requires two differently wound sounders, reports that his receiving sounder fails to respond to the relay armature manipulations. The newly fledged chief with the technical education only may smile confidently and remark to himself, "Oh, that's easily remedied; merely a fuse burned out." He then gropes blindly about the table for the fuse and finally removes the first one he stumbles upon, but, strange to say, he only succeeds in opening a couple of other local circuits. Finding that fuse evidently all right upon examination he replaces it, and, with a little less confidence, begins to suspect that perhaps the fuse on the polar or "A" side of the table supplies both receiving instruments. The removal of that fuse, of course, results in stopping business on the "A" side also. He then returns to the "B" side of the circuit and after a somewhat prolonged search succeeds in finding a third fuse in a remote corner of the woodwork. Hopefully he removes this last find, only to discover that it also has no connection with the trouble, and still the offending sounder refuses to work. Nevertheless, to be doubly sure he inserts a new fuse, with, of course, no beneficial results. After further futile efforts he finally gives up in despair and sends for the expert. In the meantime business has been suspended all around. The expert, noticing that the receiving sounder remains constantly closed, while the lever of the neutral relay is active, knows instantly that the local circuit, containing the coils of the repeating sounder, is open, and immediately proceeds to the adjoining table and removes the defective fuse and replaces it with a good one, when instantly the receiving sounder begins to operate.

Now, the lesson to be learned from this is that in the absence of official blueprints or practical instructions showing the exact location and assignment of each fuse, there is no reason why a new chief operator should even suspect that the local battery arrangement for repeating sounders

is different from that of the other quadruplex local apparatus, as is true in certain systems, hence he cannot know until considerable delay follows his investigation, that the highly wound repeating sounders are arranged in multiple and fed by the same current that supplies the sounders for relays on single line circuits, and consequently require two fuses each—one for each polarity of the battery. Neither can he, without a proper guide, or prior experience, determine, except by trial, the normal location of the particular fuse belonging to a given set of instruments.

This illustration, of course, represents a very elementary, but nevertheless numerous, class of troubles which arise daily. The great benefit that all concerned would derive by a systematic method of instruction would be in the saving of time through the promptness with which chief operators would be able to locate and eliminate the many perplexing causes of multiplex interruptions without calling for expert assistance.

One object lesson of this kind, thoroughly explained at leisure in this school, would be more instructive and convincing than a dozen hasty experiments on a regular circuit where the source of a temporary interruption cannot always be verified, possibly for want of co-operation at the distant end, and the conclusion arrived at is frequently a matter of doubt.

Recent Telegraph and Telephone Patents.

A patent, No. 950,473, for a telegraph bulletin printer, has been secured by George L. Campbell and Harry G. Davis, of Williamsport, Pa. The selector contacts are electrically connected with the contacts of a sunflower controller, etc.

A patent, No. 950,799, for telephone apparatus, has been taken out by David H. Wilson, of Chicago, Ill.

A patent, No. 950,809, for a telephone desk-set, has been issued to Burton W. Sweet, of Cleveland, Ohio.

A patent, No. 950,896, for a telephone system, has been granted to William W. Dean, of Chicago, Ill.

A patent, No. 951,190, for a telegraph arm, has been awarded to Maurice Lachman, of New York. Pins are electrically welded to the internal face of one flange of a channel iron and project through holes in the other flange.

A patent, No. 951,319, for an adjustable telephone support, has been secured by Robert Krum and Henry Weingartner, of Lawrence, Kans.

A patent, No. 951,527, for telephony has been taken out by Reuben C. M. Hastings and Thurston Matheny, of Athens, Ohio.

A patent, No. 951,558, for a telephone system, has been awarded to Samuel H. Couch of Boston, Mass.

A patent, No. 951,623, for a relay for telephone lines has been secured by A. E. Stevens of Fall River, Mass.

A patent, No. 951,695, for telephonic apparatus, has been granted to Pedro M. Oliver of Barcelona, Spain.

A patent, No. 951,864, for a telephone transmitter, has been taken out by W. Whitten of Schenectady, N. Y.

A patent, No. 951,918 for a cordless jack box, has been issued to H. O. Rugh of Sandwich, Ill.

A patent, No. 952,104, for apparatus for telephone lines has been granted to C. D. Enochs of La Crosse, Wis.

A patent, No. 952,267, for a telephone exchange system has been secured by R. H. Manson of Elyria, Ohio.

The following patents have expired:

Patent No. 492,789, for a speaking telegraph, held by Thomas A. Edison of Menlo Park, N. J.

Patent No. 493,253, for a signaling telegraph, held by Wm. E. Decrow of Boston, Mass.

Patent No. 493,620, for a telegraph relay, held by Samuel P. Freir of East Orange, N. J.

For State Control of Telegraph and Telephone Companies.

The legislative committee in New York State, which has been investigating the conduct of the telegraph and telephone companies for the past four months, with the idea of deciding whether these interests should be placed under the jurisdiction of the Public Service Commission, has completed its labors and presented its report to the Legislature. In the opinion of all of the members of the committee the authority of the Public Service Commission should be extended to cover these two public utilities. The committee reports in part as follows:

"The State is already committed to the policy of controlling and regulating public service corporations. If the power of supervision is extended to the entire system and finances of a corporation operating in this State and throughout the United States, the commission would be required to have a system of inspection extending beyond the boundaries of New York State. Without such power a commission representing this State cannot pass upon issues of capital stock securities, the proceeds from the sale of which are to be used in the development of properties beyond the borders of this State. The committee believes that the commission should have power to regulate rates and services, and the merger of telephone and telegraph companies within this State, and the issue of capital stock securities, the proceeds from the sale of which are to be used in extensions and betterments to property in this State.

"The general tangible property operated by telephone and telegraph companies, and of the devices employed by them in carrying on their business, the relation of the business to the principal business centres, the necessity for complete systems of intercommunication between the various places of importance renders impracticable the division of the State into districts so far as concerns the regulation of these corporations. The division of responsibility for such regulation between two commissions, as is properly done in regard to other public service corporations, seems as to these corporations impracticable and unwise.

"Your committee recommends the passing of a law which will give to one of the existing Public Service Commissions of this State jurisdiction over and supervision of telegraph and telephone companies, and telephone and telegraph lines,

rates, service, and finances; and in view of the fact that the location of the office of the Public Service Commission of the Second District is in Albany, the State capital, and in view of the fact that this point is nearer the geographic and commercial centre of the State, your committee recommends that such jurisdiction and supervision be given to the Public Service Commission of the Second District. A further reason for giving such control to the Public Service Commission of the Second District is that it will be more economical in that there will be needed in that office only one bureau of telegraphs and telephones, and only one corps of inspectors, engineers, and statisticians looking after the detail of this work.

The committee recommends also that the law provide that the Second District Commission receive authority to hold public hearings in any part of the State, and that it be authorized, in its discretion, to maintain a branch office in any city of the first or second class.

It is further recommended by the committee that "there be exempted from the jurisdiction of the committee of all companies, associations, joint stock companies, partnerships and individuals which are not conducted or organized for the purpose of conducting the business for profit, and that the commission shall be given power in its discretion to exempt any other company, partnership, or individual engaged in the telephone or telegraph business from the necessity of reporting to the commission."

Speaking of the opposition telephone business, the committee says that several companies have sprung up throughout the State, held together by a contract which prohibits the interchange of business with the Bell Company without the consent of the other parties to the contract. These companies are called independent corporations, and claim to be doing business in opposition to a monopoly, but the committee declares it is clear that the parties back of these companies are seeking to build up one monopoly to take the place of another.

The members of the committee are Senators George A. Davis, John Kissel, and James J. Frawley, and Assemblymen E. A. Merritt, Jr., John R. Yale, Thomas B. Coughlin, J. Henry Walters, and Artemas Ward, Jr.

Personal.

Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company will sail for Europe during the latter part of April.

Senor Don Bernardo Sagasta has been appointed Director-General of the Spanish Posts and Telegraphs.

Mr. B. E. Sunny, president of the Chicago Telephone Company, in addition to his many other activities has recently been elected a director of the Chicago City Railway Company.

Captain Daniel J. Carr of the United States Signal Service, in command at Fort Wood, New York Harbor, has successfully passed the examination and has been advanced to the position of Major. Major Carr is well known in telegraph circles throughout the country.

Mr. Charles Bright, F.R.S.E., of London, Eng., has been appointed consulting electrical engineer to the Australian Commonwealth Government. Mr. Bright has for some time acted as electrical adviser to the Commonwealth upon wireless telegraphy and other matters.

Mr. George L. Lang, of Chattanooga, Tenn., formerly and for many years superintendent of telegraph of the Queen and Crescent Route, who retired from active railroad service three years ago is superintendent of exhibits of the Chattanooga Manufacturers Association, which maintains a permanent exhibit, consisting of about seven hundred articles made by three hundred manufacturers of Chattanooga.

On the eve of his leave-taking of the Postal Telegraph-Cable Company at Detroit, to accept a position with the American Telephone and Telegraph Company at the same place, Mr. W. C. Griffin was made the recipient of a very handsome gift at the hands of his former office associates in the shape of a gold and crystal parlor clock. Mr. Griffin's resignation terminates a record of twenty years continuous service with the Postal, during the last ten of which he has held the position of all night chief at Detroit.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. E. J. Nally, vice-president and general manager, has recovered from his recent illness in Chicago, and accompanied by Mr. W. I. Capen, general superintendent of plant, has resumed his trip of inspection which will take him to St. Louis, Memphis, New Orleans, Atlanta and other important telegraph centres.

Mr. J. H. Wilson, cashier at Philadelphia and G. H. Mills, manager at Providence, were recent executive office visitors.

The New England Telegraph Company has been authorized by the Supreme Court of New York to change its name to the Postal Telegraph-Cable Company.

The circulating library established for the use of employes of the company in New York is now open on the tenth floor. It already contains over six hundred volumes. Miss E. M. Allen, of the executive offices, is librarian.

Through the efforts of Mr. E. P. Tully, manager of the messenger service in New York City, a circulating library has been established in the delivery department at the main office for the free use of the messengers. The books selected are of an educational character, suited to the tastes of the boys, and the privilege is greatly appreciated by them. The books are donated by different friends of the boys and the library already contains upward of 200 volumes.

The office of the company at Portsmouth, N. H., has been moved to new quarters.

Miss Camille Sheppard, daughter of W. A. Sheppard, manager of the Company at Montgomery, Ala., was one of the successful candi-

dates in a voting contest which was recently carried on by the Montgomery Journal. The prize which Miss Sheppard secured was a year's scholarship at Judson Institute, Marion, Ala. Miss Sheppard was known as the "Postal Telegraph" contestant and was very materially assisted in her efforts by telegraph people throughout the country and Mr. Sheppard wishes to express his thanks to all of his friends in the service who helped his daughter win the valuable prize which she obtained.

RESIGNATIONS AND APPOINTMENTS.

Mr. W. W. Wagoner, manager of the Terre Haute, Ind., office has been appointed to the managership of the Fort Wayne office, vice E. J. Ehrman, resigned.

Mr. J. H. Lillie, chief operator at Grand Rapids, Mich., has been transferred to Butte, Montana, where he will assume the duties of night chief operator. He is succeeded at Grand Rapids by Mr. Charles C. Maxson, who is promoted from night chief at the same place.

Mr. E. W. Schieberl, manager of the Rock Island, Ill., office has been appointed manager at Moline, Ill., vice Miss Cora A. Piper, resigned. Mr. C. H. Hume of the Davenport, Iowa, office has been appointed manager at Rock Island to succeed Mr. Schieberl.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. E. J. Hall, chairman of the executive committee, Mr. Belvidere Brooks, general manager, Mr. F. A. Pickernell, of the American Telephone and Telegraph Company and Mr. S. L. Williams, special agent, accompanied by William C. Merley of the executive offices who acts as secretary to the officials, are on an extended trip of inspection through the southern and western states which will include visits to Washington, Richmond, Atlanta, New Orleans, Galveston, Houston, Dallas, Oklahoma, Kansas City, St. Louis, Indianapolis and Pittsburg. The general superintendent and many of the district superintendents of the divisions visited are accompanying the party through their respective territories. Mr. W. T. Gentry, president of the Southern Bell Telephone Company, Atlanta, Ga., accompanied the others through the states in which his company operates. Mr. A. G. Saylor, general superintendent at New York, accompanied the officials as far as Washington.

Mr. Samuel L. Williams has been appointed a special agent of the company with headquarters at New York.

Mr. B. F. Dillon, superintendent at Jacksonville, Fla., has been advanced to the general superintendency of the southern division with headquarters at Atlanta vice Mr. Jacob Levin, resigned.

Mr. L. J. Maxwell, superintendent at Rich-

mond, Va., has been transferred to the Jacksonville, Fla., district.

Mr. J. S. Calvert, assistant superintendent at Atlanta, Ga., has been promoted to the superintendency at Richmond, Va., relieving Mr. Maxwell, transferred.

Mr. A. B. Cowan, chief operator at Chicago, has been appointed assistant superintendent at that point to succeed Mr. W. J. Lloyd who was last June promoted to the superintendency.

Among the recent executive office visitors was Mr. H. J. Pettengill, of Dallas, Tex., president of the Southwestern Telegraph and Telephone Company.

Mr. J. E. Jenkins, electrician of the company at New Haven, Conn., was a recent New York visitor.

Mr. L. McKisick, assistant general superintendent of the western division at Chicago; S. R. Crowder, electrician of the southern division at Atlanta and R. W. Gillette, electrician of the Pacific division at San Francisco are in New York this week, and together with Mr. W. T. Rogers, electrician of the eastern division, are in conference with Mr. W. E. Athearn, engineer of equipment.

A lease has been made at Richmond, Va., for the two upper stories, part of the ground floor and part of the basement of a fourteen-story building which is to be erected in that city. It is expected that the new structure will be ready for occupancy by January 1, 1911.

Mr. Belvidere Brooks, general manager of the company, in the Journal of the Telegraph, has issued the following statement to all employees in regard to the future policies of the company and the possibilities of promotion which will be open to efficient workers:

"One of the disadvantages of a great organization lies in the inability of the heads to get in personal touch with the rank and file, particularly when separated by great distances, as in this country. No one can feel this more than I do, and I have been very glad to avail myself of the opportunity to say a few words on the subject of the status of employees, the policies of the company and the important part which employees play therein.

"We all know, and are proud of the fact, that ours is the largest telegraph system in the world, and we must now impress upon the public mind that it is also the most progressive and efficient—and maintain it so. We must popularize the telegraph and, by good service, encourage the habit of its use.

"The management of the property have gone far in this direction, in establishing the new Night Letter service at greatly reduced rates and by providing unequalled facilities for the unrestricted filing and delivery of messages by telephone and the projection of numerous other conveniences in the use of the telegraph. But these will avail little unless supplemented by the actual co-operation and zealous efforts of employees in all branches of the service.

"There has, I believe, been more or less apprehension that recent developments in the affairs of the company have presaged the subordination of the telegraph to the telephone, and that the future of employes trained in the telegraph business would be injuriously affected thereby. Nothing could be further from the truth.

"The new interests in the company have already made it clear that we are to have the benefit of their valuable active assistance in building up the telegraph business of this company to the greatest possible extent. The broad and progressive policies which they have inaugurated offer every encouragement to zealous and efficient workers, but leave no room for incompetents or shirks

"Let us, therefore, study the interests of patrons and seek new ways for serving them, being convinced that in so doing we are best serving the company and ourselves. Never before in the history of the telegraph have conditions been so favorable, not only for the up-building of the company, but for the recognition of individual effort and worth, and full advantage should be taken of the opportunity. One long, strong pull, all together, makes success."

RESIGNATIONS AND APPOINTMENTS.

Mr. Charles H. Finley, assistant chief operator, has been appointed chief operator of the Chicago office, vice Mr. A. B. Cowan promoted to the assistant superintendency. Mr. John W. Konigsmark, general wire chief succeeds Mr. Finley as assistant chief operator. Mr. Charles S. Shell, assistant traffic chief has been appointed general wire chief, vice Mr. Konigsmark.

Mr. W. J. Dermody has been appointed manager of the Ogden, Utah office to succeed T. McGuinness who resigned to go to San Francisco.

Mr. George A. Keet, has been appointed manager at Kalamazoo, Mich., vice W. I. Thompson, resigned. Mr. Keet was formerly manager of the Battle Creek office but went west for the benefit of his health which he has now regained.

Mr. A. T. Cooke, of the Clarksville, Tenn., office has been appointed manager at Decatur, Ala., vice Mrs. M. N. Abernathy, who has resigned to accept a position in the office of Superintendent J. R. Terhune at Nashville.

Mr. E. N. Williams, chief operator at Asheville, N. C., has been appointed manager at that point vice Mr. George R. Calvert, resigned. Mr. Herbert Howell, night chief operator, has been advanced to the position of chief operator to succeed Mr. Williams and Mr. Morris Clayton has been made night chief operator, vice Mr. Howell.

Mr. B. F. Dillon Becomes General Superintendent of the Southern Division of the Western Union Telegraph Company.

Mr. Benjamin Franklin Dillon, superintendent of the Western Union Telegraph Company at Jacksonville, Fla., was on March 23, appointed general superintendent of the southern division

vice Mr. Jacob Levin resigned. Mr. Dillon's headquarters will be at Atlanta, Ga.

Mr. Dillon was born in Screven County, Georgia, April 21, 1849. In 1870 he went west and accepted his first position as operator for the Western Union Telegraph Company at Kansas City, Mo. He soon returned to the south, however, and located at Lake City, Fla. From

B. F. DILLON.
General Superintendent, Western Union Telegraph Company,
Atlanta, Ga.

there he went to Augusta, Ga., where he remained until 1873 when he married and went to Savannah as chief operator. He was later promoted to the managership of the Savannah office and in 1887 was made superintendent at Jacksonville where he has been located since that time. Mr. Dillon has taken an active part in public affairs in that city having served as president of the city council and having held numerous other public offices. He has been recognized as one of the most progressive and wide awake citizens of Jacksonville and during his long residence has made a host of friends who will be sorry to have him leave but who will rejoice at his promotion to a higher position in the service of his company.

John S. Calvert, Superintendent, Western Union Telegraph Company, Richmond, Va.

Mr. John Strother Calvert, who has been appointed superintendent of the Western Union Telegraph Company at Richmond, Va., to succeed Mr. L. J. Maxwell, transferred to Jacksonville, is one of the younger men in the telegraph industry, who, by reason of ability, coupled with perseverance and hard study, has rapidly forced his way to the front ranks. His first position of responsibility in the telegraph service was accepted by him in 1891, when he became the manager, at Newmarket, Va., of the Rosenberger and

Shirley telegraph line, which was only one hundred and fifty miles long and had fifteen offices. The following year he took charge of the offices of the Western Union Telegraph Company, first at Newmarket and then at Natural Bridge Hotel. In November, 1892, he became clerk in the office of J. B. Tree, who was at that time superintendent

J. S. CALVERT.

Superintendent Western Union Telegraph Company, Richmond, Va. at Richmond. In 1895 he became auditor and error clerk under Mr. Tree, and in 1897 was again promoted, this time to the position of traveling auditor of the first district, southern division. In 1902 he received further promotion, this time to the position of inspector of officers and accounts of the first and second districts of the southern division. January 1, 1903, he became assistant superintendent at Richmond, where he remained until December 1, 1905, when he was transferred to a similar position at Atlanta. He has been located in that city from then until the present time.

L. J. Maxwell, Superintendent, Western Union Telegraph Company at Richmond, Transferred to Jacksonville.

Mr. Lewis J. Maxwell, who has been transferred from the superintendency of the Western Union Telegraph Company at Richmond to a similar position at Jacksonville to succeed Mr. B. F. Dillon, promoted to the general superintendency of the Southern division, is one of the best known figures in telegraph circles in the south. Mr. Maxwell was born at Griffin, Ga., May 27, 1865, and entered the service in 1878 as messenger. At the age of fourteen he became an operator. After two years' work at the key he spent two years in the University of the South at Suwannee, Tenn. In 1883 he returned to the service and soon acquired a reputation as a first-class operator. In 1885 he was appointed manager of the Southern Telegraph Company at Augusta, Ga., which position he held until 1888,

when that Company was consolidated with the Western Union Telegraph Company. Six months later he was appointed manager of the Savannah, Ga., office, where he remained until November 1,

L. J. MAXWELL.

Superintendent Western Union Telegraph Company, Jacksonville, Fla.

1902, when he was made assistant superintendent at Jacksonville. September 1, 1904, he was promoted to the superintendency at Richmond, where he has since been located.

The Cable.

Sir George Reid, high commissioner for Australia, has been appointed to fill a vacancy in the commonwealth representation on the Pacific Cable Board.

The Commercial Cable Company has made application for a license to lay and maintain another cable between Waterville, Ireland, and Weston-super-Mare, England.

The Telegraph Construction and Maintenance Company's cable steamer "Colonia" left London, March 12, to lay the cable of the Western Telegraph Company between Ascension Island and Buenos Ayres. This will be laid under a concession secured from the Argentine Government last year. The new cable has a conductor weighing 700 pounds per mile. The cable steamer "Cambria" left London, March 10, for Buenos Ayres to lay the river section of the cable.

The German South American Cable Company announces the successful laying and the opening for public business of its cable from Teneriffe, Canary Islands, to Monrovia, Liberia. This is the first telegraph cable or line to Liberia. It will be worked in connection with the German Company's cable laid last year from Emden, Germany, to Teneriffe. The route to Monrovia is via Azores, Emden and Teneriffe, and the rate is one dollar and twenty-one cents per word from New York. From Monrovia the cable will be extended to Pernambuco, South America and Togoland and the Cameroons in Africa.

The Indian Government has agreed to a reduction of the rate of press telegrams between Great Britain and Penang, Singapore and Labuan from one shilling, four pence to nine pence a word.

The steamship "Manilye" has been purchased by the Philippine Government, overhauled and refitted for use as a cable ship among the islands. The new vessel has a tonnage of 2,250 and an estimated value of \$175,000.

At a recent meeting of the Nova Scotia Society of Engineers, Mr. S. Fenn, superintendent of the Direct United States Cable Company, at Halifax, who has recently been appointed manager of the company at London was presented with a handsome brass and cut glass smoking set as a token of esteem, by the members of the society, of which he was president. A paper on "Submarine Telegraph Cables" was read by Mr. McKavannagh, chief electrician of the cable steamer "Minia" and Mr. Hamilton, chief electrician of the Mackay-Bennett spoke of the history of the Atlantic cables. Mr. Fenn is now in Newfoundland in the interest of the service. Before going to his new post he will visit the stations of the company at Rye Beach, N. H., Boston and New York, and will sail for London from this city. He has been stationed in Nova Scotia for the past thirty-six years.

Mr. John Fraser, assistant superintendent of the Direct United States Cable Company at Rye Beach, N. H., who has been promoted to the superintendency of the same interests at Halifax, was tendered a farewell reception by his friends before leaving for his new position. Mr. Fraser was presented with a traveling bag and Mrs. Fraser with a purse by the employees at the cable station.

Municipal Electricians.

A fire-alarm system will be installed at Texarkana, Ark., at a cost of \$8,900.

The Nebraska Telephone Company is installing an up-to-date fire-alarm system in Omaha.

W. C. Matthias, superintendent of fire alarm and police telegraph of Reading, Pa., is engaged in installing a flashlight police patrol system in that city. When completed there will be four circuits with a total of forty-two boxes.

Patents have been applied for by L. W. Miller, of Rochester, for an automatic police patrol and fire-alarm system, which it is claimed embodies several new and important features. The system comprises a central office switchboard, connected by telephone with every patrol box in the field, and so equipped that when the commander of a precinct wishes to talk with an officer on his beat he can summon him by gong or by colored lights, or both, by the pressure of a button. The response by an officer is automatically registered, whether he talks or not, by a specially constructed time clock. This record and all records of reports by officers are in constant view for twelve hours, and are instantly available by the commanding officer.

Providence, R. I., is considering spending \$40,000 in the near future in placing the wires of their fire alarm telegraph system underground.

The fifteenth annual convention of the International Association of Municipal Electricians will be held at Rochester, N. Y., September 6, 7, 8 and 9 in Convention Hall in that city. Secretary Frank P. Foster of Corning, N. Y. is already actively engaged in making preparations for the event.

A new fire alarm telegraph system is being installed at Springfield, Mass., at a cost of \$30,000, and the fire commissioners have now asked for an appropriation of \$50,000 to construct a fireproof building for fire headquarters in which to house the apparatus of the new system.

Mr. James Zeluff, superintendent of fire alarms of Paterson, N. J., has installed fire-alarm gongs at several street corners in that city where there is a congestion of traffic. These gongs are part of the regular fire-alarm system and are for the purpose of giving the traffic officers warning in case of a fire, in order that they may clear the streets for the apparatus.

Annual Reunion of Old Time and Military Telegraphers.

The twenty-ninth annual reunion of the Old Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps will be held in Chicago, September 8, 9 and 10. The headquarters of the gathering will be at the Hotel La Salle. Mr. William J. Lloyd, superintendent of the Western Union Telegraph Company, Chicago, is president and Mr. F. J. Scherrer, assistant secretary of the Western Union Telegraph Company, New York, is secretary of the Old Time Telegraphers and Colonel William Bender Wilson, Holmsburg, Philadelphia, Pa., is president and David Homer Bates, 658 Broadway, New York, is secretary of the Military Telegraphers.

Legal.

According to an opinion rendered at St. Louis recently by Judge McPherson of the United States Court of Appeals, a telegraph company is not responsible for the delivery of messages which are interfered with on the wire while a strike is in progress. A similar decision has recently been handed down by a Massachusetts court.

In the case of the State of Texas against the Western Union Telegraph Company the Supreme Court of that state has granted a writ of error to the telegraph company, based upon the recent decision of the United States Supreme Court, in the case of the State of Kansas against the Western Union, which was rendered in favor of the defendant. The State of Texas has been endeavoring to compel the Western Union to pay \$100,040 for a permit to do business in that state, this amount being based on the total paid up capital of the company.

The Telephone.

The Mexican Telephone and Telegraph Company recently sold in New York \$200,000 of five per cent. twenty-year bonds to provide funds for development.

Plans are being made by the Southwestern Telegraph and Telephone Company to spend over half a million dollars during the present year in improvements to their system at San Antonio, Texas.

The annual report of the Colorado Telephone Company for 1909 shows that at the end of the year that concern had 75,046 subscribers, an increase of 6,079 during the year.

According to the report of the Wisconsin Railroad Commission for the year ending June 30, 1909, there were at that time 569 telephone companies operating in that state.

Mr. H. L. Reber, general manager of the Kinloch Long Distance Telephone Company, St. Louis, has been elected vice-president and general manager of the same interests.

Mr. R. W. Dodge, traffic chief of the Lewiston, Me., district of the New England Telephone and Telegraph Company, has been appointed district superintendent, with headquarters at Portland.

The Pacific Telephone and Telegraph Company has sold recently \$3,000,000 of five per cent. bonds and \$7,000,000 of four and one-half per cent. two-year notes, payable at maturity, either in cash or bonds.

Mr. J. T. Quinlan, manager of the Green Bay district of the Wisconsin Telephone Company, has resigned to accept a position with the Pacific Telephone and Telegraph Company. Mr. F. M. McEniry has succeeded Mr. Quinlan.

A meeting of the directors of the National Independent Telephone Association, was held in Chicago, March 15. The evidence secured at the hearings held in New York, in regard to the sale of the Ohio telephone properties to J. P. Morgan and Company was carefully gone over and it was decided to present the facts to the attorney-general of the United States with a view of having him institute a suit to set aside the sale on the ground of its being a violation of the Sherman anti-trust law.

Many of the main test offices of the American Telephone and Telegraph Company are located outside of the city limits. In all such cases the legs or loops into the main city offices, on account of their length, are equipped with standard 150-ohm relays with local sounders. The Western Union main offices being located in the center of the city, in most cases their branch office and other loops usually contain merely a four-ohm sounder. Since the joining of interests of the two companies it has been found desirable in many cases to repeat from the circuits of one company to those of the other. Mr. E. Waldron, chief operator of the Western Union Telegraph Company, at Atlanta, Ga., has devised an arrangement which can be used successfully to meet this condition.

The Elson Telephone Merger Bill, allowing the

consolidation of competing telephone companies, has been passed by the Ohio House of Representatives after an amendment, requiring that all mergers be approved by the State Railroad Commission, had been added to the original measure.

At the annual meeting of the Central Union Telephone Company, held recently in Chicago, a plan was adopted to organize new companies in Ohio and Indiana and sell to them the property of the Central Union in those states leaving to that company only their properties in Illinois. On December 31, there were 591,228 stations connected to the Central Union lines, a gain of 139,271 during the year.

Professor Dugald C. Jackson and William B. Jackson have made an exhaustive study of the telephone situation in Boston and vicinity for the Massachusetts state highway commission. In their report which they have handed in recently they find that the present rates for service are, on the whole, not too high. They have recommended certain changes having as their object the equalizing of rates to make them more uniform between the large and the small users of telephone service. They find that the value of the plant of the New England Telephone and Telegraph Company is from ten to twelve per cent. in excess of its capitalization.

The Western Telephone and Telegraph Company, which is the holding company of eighty per cent. of the stocks of the Northwestern Telephone Exchange Company of Minneapolis, the Southwestern Telegraph and Telephone Company, the Wisconsin Telephone Company, and the Cleveland Telephone Company in its annual report for the year ending January 31, 1910, shows that at that date its subsidiary companies had 311,556 stations, an increase of 34,329 for the year. They also make connection with 1,970 other companies, operating 293,482 stations, making a total of 655,038 stations comprised within their system, as compared with 481,821 a year ago.

American Telephone and Telegraph Company Increases Capital Stock.

At a special meeting of the American Telephone and Telegraph Company which was held in Boston, March 29, immediately preceding the annual meeting it was voted to increase the capital stock from \$300,000,000 to \$500,000,000, as was recommended by President Vail in his annual report. None of this amount of new capital will be needed during the current year for ordinary expenditures. The limit of the authorized capital with what is reserved against the conversion of the convertible bonds, however, has almost been reached. The expansion of the business is continuous and probably will continue in the future at least as fast as in the past. It is believed that in the future much of the financing can be done locally, thus relieving the parent company of the burden and strengthening the local companies.

In addition to the increase in capital, it was also voted to increase the number of directors.

Annual Report of American Telephone and Telegraph Company.

The annual report of the American Telephone and Telegraph Company for the year 1909, a summary of which we gave in our March 16 issue, is a most comprehensive document consisting of forty pages and outlining in full the financial condition of the organization at the present time, together with a concise statement of the development of the company and its affiliated interests during the past year.

The number of stockholders of the company December 31, was 35,823, an increase of 9,453 during the year.

A feature of the report is a financial history of the Bell system which shows that in the days of early struggle, when money was not to be had, a few hopeful men put their time and work into the business to create its first assets, practically with their own hands. It shows furthermore that the capital of the American Telephone and Telegraph Company and its predecessor represents actual cash paid in by its stockholders in excess of the par value of all the outstanding obligations in the hands of the public, and that it is not represented by stock obtained for surplus earnings, inflated valuations, franchises or other intangible property, no matter how valuable.

The report shows further that improvements in plant and operating methods are more responsible for reduction in rates than competition; and that there is within reach of almost, if not every one desiring it, some kind of telephone connection;

That the organization is probably the most effective that could be devised for the business as a whole, and certainly is the only one possible under all the existing conditions;

That the administration and policy have been consistent and uniform from the beginning; that the interests of the Bell system are dependent upon giving the best possible service under existing conditions and anticipating as far as possible any improvement.

Telephone service in its close personal touch with every subscriber is a unique service, different from all other services, and efficient telephone service requires co-operation on the part of the user.

In every use of the telephone system three human factors are brought into action—one at each end, one or both anxious and probably impatient, the one at the central office, as nearly a machine as is possible, a trained expert with at least as much intelligence and reliability as the best stenographers, typewriters or bookkeepers. This central office factor is the personal servant for the time of the factors at the ends and is entitled to the same consideration that is given to their own personal staff. Perfect service depends on the perfect co-ordinate action of all of these factors—any one failing, the service fails. This should never be forgotten. All attempts

so far to eliminate the personal factor of the central office, to make it a machine, have failed in systems of any extent; there are times when, at the central office, action guided by intelligence, is absolutely necessary.

In speaking of the arrangements that are being made to extend the use of the telephone for the collection and delivery of messages, the report states that by this method the electrical transmission of messages will be extended from the actual point of origin to the actual point of destination.

There are comparatively few places where there is business enough to warrant a "night and day" telegraph service, but there is no place where "night and day" telegraph service is maintained that is not in the centre of a "Bell system." Practically no Bell exchange is ever closed, therefore there are few subscribers of the Bell system who cannot be placed within reach of night and day telegraph service.

Under the new conditions, when in full operation, each service, the telephone and the telegraph will find its level of use, its field of best usefulness, with a distinct improvement in, and advantage to, both services.

Such economies as follow will be taken advantage of to increase the facilities and where possible reduce the cost to the public.

The idea of operating the telephone and telegraph in accord, each supplementing the other, is not a new or untried one, but has been ineffective because of the lack of common influence in the control of the operations. With the employees of both companies actuated by a common purpose this can be effectively done; without a common influence in the operation it has been practically impossible.

As for the company's policy toward the independent concerns and competition generally, President Vail sums it up briefly in the report, saying:

"A large number of opposition and independent companies have been absorbed into the Bell system during the year. Our position has been consistent. Wherever any opposition company can be legally brought into and made a part of the Bell system, it is done if it can be done to the advantage of the public, by and with the assent of all parties interested, including not only the public served, but the public authorities."

Speaking of the general consideration governing the management and operation of public utilities, President Vail says:

"It is the duty and obligation, as well as self-interest, of a public service corporation to give efficient service up to the limits of reasonable practicability and to furnish such a service at a reasonable price.

"As a rule all capital invested in any public utility is permanently invested. It cannot be salvaged to any extent, nor can it be used for any other purpose. The chance of any return upon the capital is entirely dependent upon inducing

or educating the public to make use of the service so offered. To do this, whatever is offered must be offered at a price which leaves the user a margin of profit—if not in money, in comfort and convenience—at a price which the public will accept, and that must necessarily be below the actual value of the service to the public.

"Although there have been abuses in corporate management and in the manipulation of both property and securities, for which there is ample remedy if existing laws are enforced, yet it must be admitted that the tremendous development of utilities in this country as compared with other countries, with their contribution to the comfort and convenience of the public, is to a certain extent due to the lack of proscriptive restrictions.

"The profits that have been realized by public service corporations in the development of new and beneficial facilities are insignificant in comparison with, and are certainly justified by, the enhancement of values and the unearned increment which have accrued to the public and which could not have existed but for this development.

"The one attracts more attention because of its corporate character, while the benefits are of a private character, widely dispersed in smaller units and as a rule to individuals.

"It is but natural that corporations should have some misgivings about a control of internal management by a body without any responsibility that could be called accountability, and without the practical knowledge or experience or information which comes from the daily dealings with questions; a control which would undertake to decide upon questions widely different, complex and far-reaching, over which expert managers of lifelong study and experience are sometimes at a loss; a control over methods of business which usually are the evolution of years of practice, and are so interwoven with the fundamentals of business that they cannot be changed suddenly without great disturbance.

"Too much importance is apt to be attached to claims of theorists or inventors, as any one can judge by comparing the wonderful promises and claims made with the results achieved.

"All great developments in any line of industry have been from crude and imperfect beginnings by a process of evolution, by improvement in detail the result of suggestion from association, operation, or study.

"The original idea upon which may be founded great development may be revolutionary but it never springs full-fledged or perfect into the world.

"Public utility companies have obligations and are responsible both to the public and to their shareholders. It is responsibility with accountability. Prevent them from imposing upon the public with fictitious issues of securities, or with exactions on the public with which to pay dividends on those fictitious securities.

"As to their internal management, operating

methods, leave something to their self-interest, to their responsibility with accountability; do not impose upon them such control as might force upon them new methods, new apparatus, new ideas which have not been tried out, which have not been put through the crucible of practical experience. Theories and new ideas will be welcomed by any progressive corporation for without them development would be stayed, but all that is improvement must come through a process of evolution, by the gradual elimination of the useless and adoption of the useful, through experimental application modified to existing conditions.

"We believe that if there is to be control, there should be protection, and that beyond the lines set forth, any control ceases to be control and becomes management or operation. We believe that management or operation by a body without any accountable responsibility would be prejudicial to the best interests of the service and of the public, and destructive of property and the rights we are supposed to possess.

"Our company has a vital interest in the proper solution of the telephone problem, and we believe that we are working the problem out on the broad lines of the greatest benefit to the public as a whole."

Dinner of British Post Office Engineers.

The seventh annual dinner of the British Post Office Engineering Department was held at the Hotel Cecil, London, February 15. Postmaster-General Sydney Buxton, in speaking of the work of the Post Office Department, said that it was nearly forty years since the taking over of the telegraph system by the State from the telegraph companies. In 1869, the year before the companies were taken over, the actual number of telegrams dealt with was 6,750,000; in 1909 there were 85,000,000. The mileage of land wires at the time of taking over was 60,000 and it is now over 1,000,000. The total engineering force in 1873 was 630, and last year it numbered nearly 2,900.

Chief Engineer Major Walter A. J. O'Meara, in speaking of his recent visit to the United States, said that he desired to acknowledge publicly the exceedingly courteous manner in which he was received by the officials connected with the telephone and telegraph systems of America. That was one thing that impressed him, he said, and that was the very deep study that had been made of organization. In America the engineer was certainly very much appreciated, and had risen to very high positions. The art of administration was very highly developed, and he attributed the success of the American telegraph and telephone undertakings to the organization and to the power of administration possessed by their officials.

Telegraph and Telephone Age is headquarters for electrical, telephone and telegraph books. Write for catalogue.

Telegraph and Telephone Age

Entered as second-class matter, December 27, 1909, at the Post Office at New York, N. Y., under the act of March 3, 1879.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.

REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

APRIL 1, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

An Awakening in the Telegraph.

There seems to be in progress at the present time a general awakening among the rank and file of the telegraph service. Members of the profession throughout the country, especially those residing in the larger cities, are apparently becoming alive to the fact that the only way in which they can secure promotion is by applying themselves to studying and mastering the various electrical problems involved in the system with which they are concerned. The same thing is true in both of the great telegraph companies. A good indication of this spirit of desire to learn more is found in the increased sale which we are having of electrical and telegraph books. The telegraph has probably never had a more progressive corps of officials than those in charge of that industry in this country at the present time, and they are showing their progressiveness by encouraging their subordinates, in every way possible, to study and fit themselves for promotion. Night telegraph schools are being established and those

deserving are being given such assistance as they may need in their electrical studies. Clubs are being formed among telegraph employes in large cities having as their object the investigation of technical questions and the careful study of the problems entering into telegraph operation.

All of this cannot help but result in benefitting those who come within the range of these educational influences and make good use of their opportunities. If continued it ought to result in restoring to the telegraph a large measure of the prestige which it formerly enjoyed as the most important branch of the electrical industry.

A Compliment to Our Telegraph and Telephone Officials.

Elsewhere in this issue will be found a brief account of the annual dinner of the British Post Office Engineering Department at which Major Walter A. J. O'Meara, chief engineer, gave some of his impressions of the telegraph and telephone systems of this country, which he formed during his recent visit. The thing that impressed him most strongly was the deep study that has been made of organization, and he attributes the success of these enterprises in this country to the perfection of their organization and the administrative abilities of their officials. This is a fine compliment to the executive officials of the telegraph and telephone in this country, and they have good reason to feel proud of this impression which they have given the head of a telegraph and telephone system, which handles over 85,000,000 telegrams a year. This is an age of organization, and in a business like the telegraph which carries messages at rates which are but little higher than the actual cost of handling them, the difference between a profit and a loss is very easily a difference in the extent to which the idea of organization in every department is carried out. Our telegraph officials hence have an especial stimulus to do their best to make all of the component parts of the system work together for their mutual advantage. Upon their success in doing this depends the success of their administration. The same thing is true of the telephone officials as well.

In England, where the telegraph and telephone systems are not operated for a profit, but any deficit is made up by the government, the need of such thorough organization is not thrust upon the officials with the force that it is in this country. Other matters are considered of more importance and greater development has been made in other lines than in this country, especially in the underground system. The officials of this country were glad to welcome Major O'Meara upon his recent visit and to give him any information in regard to their systems that they were able. They realize that the same treatment would be accorded to them if they took occasion to inspect English methods, and perhaps in their broad-mindedness in this subject lies another reason for their success, besides those mentioned by Major O'Meara.

The Rating of Telegraph Messages.

Mr. Roland R. Dennis, of Auburn, N. Y., one of the representatives of the United States at the Lisbon Telegraph Conference of 1908, in a recent article, has this to say regarding the rating of messages:

"I am much interested to note that the telegraph companies are being urged to adopt some sane method of rating ordinary messages. The telegraph service of the United States, Canada, and Mexico is controlled, directly or indirectly, by the Postal and Western Union companies, and these are the only three countries in the world that use so antiquated and unpractical a system.

"Having been named, by the State Department, as a delegate to the Conference of the Union Telegraphique Internationale, which was held in Lisbon, Portugal, in 1908, I was brought in contact with most of the prominent directors and managers of the government telegraphs throughout the world. My fellow colleague, as delegate to the conference from the United States, was Charles Page Bryan, at that time our minister at Lisbon, and in our report, in referring to this subject, we said:

"We find in consultation with delegates to the conference that the whole world, with the exception of the countries served by our United States telegraph companies, has long since discarded as cumbersome and inequitable our manner of rating messages. Messages of ten words at a fixed rate, address, and signature gratis, in reality, means that the telegraph companies transmit, on an average, twenty-four words for the ten-word rate. The natural result of this is that the business world is paying much higher rates than are at all necessary. After discussing the question with gentlemen who have had life-long experience in telegraphs, we are confident that the introduction of a dual system of rating messages, continuing the present ten-word rating for those that prefer it, and allowing the great mercantile houses the benefit of a per-word rating, at a corresponding reduction, would result in a great decrease of expense to both the commercial world and the telegraph companies, at the same time considerably increasing the profits of the latter."

"The European managers of both the Commercial (Postal) and Western Union transatlantic cables, who were present at the conference, approved our suggestion, and the foreigners, one and all, expressed the greatest surprise that a nation so practical and progressive as we are supposed to be should adhere to our present system of rating."

In a note to the editor of *Telegraph and Telephone Age* Mr. Dennis adds:

"Having spent eighteen years in resident charge of European branches of important United States factories, my practical experience with the foreign telegraph organizations has been very extended. Their system of per word rating—universal throughout the world except in the United States,

Canada and Mexico—commends itself at once to any business man, and the more you have occasion to use it the greater becomes your astonishment at our persistent adherence to the ten-word rating.

"Many years ago I formulated a plan for a change of our domestic rating that I believe is perfectly practical and could be worked out without any very great opposition on the part of the public or trouble to the companies."

Book Review.

"Telegraphing in Battle," by Doctor J. Emmett O'Brien, of Scranton, Pa., is the latest addition to the literature dealing with the operations of the United States Military Telegraph Corps during the Civil War. Dr. O'Brien himself served as an operator in the military service for four years and his brother, Richard O'Brien, who is now assistant superintendent of the Western Union Telegraph Company at Scranton, Pa., occupied a prominent position in the telegraph corps throughout the war. From his own personal recollections and from the diary which his brother Richard kept during the war, together with some historical matter which he has collected from other sources, Dr. O'Brien has written a book which will be read with interest by every one who was connected in any way with the military telegraph service. It will also be appreciated by those who enjoy reading a good story of some of the thrilling events connected with the civil war, told in a pleasing manner. The charm of the story lies in the straightforward way in which the author narrates the personal experiences of himself, his brother and other military operators during the stirring events of that memorable conflict. The book, which is dedicated to Andrew Carnegie, founder of the United States Military Telegraph Corps, contains 312 pages, and is illustrated by numerous half-tone engravings of those prominently identified with the military service, as well as several maps of the territory in which the telegraph played a prominent part. The price of the book, which is a splendid monument to the military telegraph, is \$2.00, carrying charges seventeen cents extra, and copies may be obtained by addressing J. B. Taltavall, *Telegraph and Telephone Age*, 253 Broadway, New York.

A bill has been introduced in the New York Legislature appropriating \$27,000 for the expenses of the committee which has been investigating the telephone and telegraph companies in this state. This is in addition to the sum of \$10,000 which was originally appropriated for that purpose.

At the annual meeting of the Engineering Society of Wisconsin held in Milwaukee, February 23, 24 and 25, Mr. W. R. McGovern presented a paper upon "Protection of Telephone and Telegraph Lines Against High Potential Circuits," in which he considered the mechanical requirements for preventing low-potential circuits from getting into physical contact with high-potential lines at points of crossing or where they closely parallel each other.

TALKING AND TELEGRAPHING SIMULTANEOUSLY OVER THE SAME LINE.*

The Repeating Coil and the Simplex Circuit.

BY N. C. KISSELL.

(Concluded from page 226, March 16 issue.)

Conditions which would exist if the neutral points of the secondaries of balanced repeating coils at the terminals of a telephone line were connected together have been explained in connection with Figure 2. A more perfect analogy with the state of affairs which exists in a simplex circuit used for transmitting telegraphic signals can be worked out by observing what takes place when a battery is connected serially in such a third wire, as shown in Figure 3.

To make the explanation of the electrical and magnetic phenomena which occur in the coil itself clearer, consider only the windings on the iron core at the left of Figure 3. If current is passed through

netic flux set up in the core and the windings act simply as a conductor. The magnetizing force of the current flowing through one coil in one direction is neutralized by the magnetizing force of the current flowing through the other coil in the opposite direction.

This is what happens when the battery is connected in series with wire *y* as shown in Figure 3. Current flows from the positive pole of the battery to the point of connection of the windings *c*, *d*, and at this point divides, part going through winding *c*, wire *x*, winding *e* on the other repeating coil, and back to battery over the wire *y*; the other part goes through winding *d*, wire *z*, winding *f*, and back to battery over wire *y*. The resistance of these two divided circuits must be equal; that is the resistance through winding *c*, wire *x*, winding *e*, wire *y* must be the same as the resistance through winding *d*, wire *z*, winding *f*, and wire *y*. When this is the case, the current will divide equally through the repeating coils, and be in opposition in two sections of each coil, consequently the iron cores will not be magnetized. This condition is brought

Figure 3. Diagram used in tracing path of direct current which passes around cores of repeating coils without magnetizing them.

this winding in the direction from *a* to *b* the core will be magnetized and the magnetic flux will travel around through the core in the direction opposite to that taken by the hands of a watch. If current is passed from *b* to *a* the flux will travel in the opposite direction. If current is passed from a point between the two windings, through the winding *b* only, the magnetic flux will travel around the entire core, as the magnetic circuit is closed, in the same direction as when the current was passed through both the windings from *a* to *b*. If passed from the point between the windings through *a* only, the current will create a magnetic flux in the iron core in the opposite direction. Now if current be passed from this point between the windings through both *a* and *b*, it will divide half going through *a* in one direction, and half going through *b*, but in the opposite direction. This tends to create two opposing magnetic fluxes in the core, one winding setting up a flux in one direction, the other in the opposite direction. Both of these fluxes being equal (provided the number of turns and the resistance of both windings and their positions in relation to the core are exactly the same) they will neutralize each other, and consequently there will be no mag-

about in practice by winding the coils *c*, *d*, *e*, *f*, of the same resistance and number of turns, and using two line wires of the same resistance and properties.

The wire *y* being common to both divided circuits its resistance will not have to be considered, as the current in each wire will be the same. For instance, suppose there is one-half ampere flowing in each line wire and the resistance of the wire is five ohms per mile. Then for each mile of wire carrying this current, there will be a drop in potential of five times one-half ampere, which equals two and one-half volts. As the current is flowing in the same direction in both wires and the drop along each wire being the same, there will be no difference of potential across the two wires at any point and other telephone stations can be bridged across the line. Under these circumstances a second circuit can be made out of this telephone line without interfering with its use as a metallic circuit for transmitting speech, and the new circuit thus obtained can be used commercially.

In Figure 4 is shown a telephone line with repeating coils in the circuit. From the centers of these coils are taken taps which enter into a second circuit over the line wires. This circuit instead of going through an expensive wire (as *y*, Figure 3), is completed through the ground. In this second circuit

*Article reprinted from the American Telephone Journal.

have been introduced two sets of telegraph instruments, thereby creating a grounded telegraph line in conjunction with the telephone line. In this way a telephone company makes a telegraph circuit without actually building the line itself, and doubles the earning capacity of its wires. The telegraph current will divide equally over both line wires and will not

graph noise in any telephone instruments which may be connected to the line when the Morse signals are sent.

This action of the condenser is due to the fact that it has the property of absorbing a certain quantity of electricity, and this amount must flow before the current reaches its full value in the line.

Figure 4. Commercial type of Simplex circuit, comprising a metallic telephone and a grounded telegraph line.

interfere with the talking circuit provided the conditions are such as have been explained.

The circuit of the telegraph being completed through the ground, and as the ground connections are at points distant from each other, there may be a difference of potential between the two grounds which will cause earth currents to flow over the line. The latter will, therefore, flow just the same

The instant the key is closed, the condenser sucks in a certain amount of the current flowing, and, as it becomes charged to the potential of the E. M. F. impressed upon it, the current starts to rise in the line until, as the condenser becomes fully charged, it reaches its full value as determined by the resistance of the line. Therefore, instead of the Morse current reaching its full value instantly, it does

Figure 5. Retardation coil type of Simplex circuit.

as the telegraph current and will cause no annoyance in the telephone circuit. A one micro-farad condenser is placed in the Morse circuit as shown in the diagram. The action of the latter is to take off the sharp edges of the Morse impulses or to round off their corners to a certain extent so the rise and fall of the telegraph current will not be so abrupt and consequently there will be a great deal less likelihood of inducing a tele-

so more gradually on account of the condenser sucking in a portion of the current. When the key is opened, the E. M. F. which holds the charge in the condenser is taken off, and the latter discharges in a direction opposite to that in which the current flowed when it was charged, which will be out over the line to the ground at the distant end. The instant the key is opened the condenser discharges into the line and tends to keep the Morse current

from falling suddenly, so that it dies out gradually. This condenser placed as shown will have the effect of rounding off the corners of the waves produced by the instantaneous Morse impulses, by causing the current to rise and fall gradually instead of abruptly.

The circuit as shown in Figure 4 and described is called the simplex circuit and comprises a metallic telephone circuit with a grounded telegraph circuit superposed upon it. It is the principal one used commercially to-day, and is very satisfactory in operation when properly set up and maintained. It is not the only commercial type of simplex circuit, however, as the form shown in Figure 5 is sometimes used. This circuit likewise produces an extra telegraph circuit from a metallic telephone line.

Telephone terminals *A* and *B* are connected to the line through four condensers 1, 2, 3, 4, each having a capacity of four micro-farads. The talking current being alternating and of very high frequency will readily pass through these condensers. Two coils are bridged across each end of the circuit, on the line side of the condensers. These coils are of 500 ohms resistance each, and consist of many turns of wire wound on an iron core, which gives a very high impedance to alternating currents. Between these two coils the telegraph circuit is tapped in and completed through the ground. The action of this circuit is different from the one previously discussed. When *A* is transmitting to *B*, at a given instant, current passes through condenser 1, line wire *x*, condenser 2, through *B*, to condenser 3, line wire *z*, condenser 4, to *A*, and vice versa. Now, as the coils are bridged across the line, it might appear that some of the talking circuit would be shunted out. This would be the case if it were not for the property called self-induction, which the coils possess. When the current rises in the coil, the magnetic lines of force created in the iron core in turn cut all the turns of wire of the coil thereby inducing a current in the coil in an opposite direction to that which is flowing, thus tending to choke the original current back. The reactance depends upon the number of turns of wire on the coil, and the frequency of alternations of the current. The higher the frequency the greater the impedance, the number of turns remaining the same, and the lower the frequency the lower the impedance. Such a coil is called a choke-coil, impedance or reactance coil.

When *A* or *B* is transmitting practically all of the current that would tend to pass through the coils is choked back. The telegraph current passes through the two coils, 5, 6, over the line wires and through the other two coils 7, 8, to ground. The resistance and reactance of the coils and of the line wires on each side of the circuit being the same, the current divides equally over both sides of the line, and, the drop in potential along each wire being the same, there is no difference of potential existing across the line; consequently the Morse signals cannot be heard in the telephone circuit and other stations can be bridged across the line. The one micro-farad condenser answers the same purpose as in the

repeating coil circuit. In ringing over this circuit the alternating current passes over the line like the talking current, and no difficulty is experienced, provided the condensers are of large capacity, on account of the low frequency of the ringing generator. In many modern exchanges one side of the ringing generator is grounded and obviously this could not be used with this circuit, because current would pass through the Morse leg to the ground, thence back to the generator, and a metallic generator circuit will therefore have to be used. In the repeating coil circuit this feature makes no difference, as the two windings on the coil have no direct metallic connection with each other.

Crystal and Solid Contact Rectifiers.

In a recent number of the *Physical Review*, Mr. A. E. Flowers, in an article on "Crystal and Solid Contact Rectifiers," describes the characteristics of the galena rectifier of which he had made a study to ascertain the cause of rectification. Galena was chosen for his study because of the fact that it has a higher conductivity than most of the crystalline rectifiers used. The rectifying effect, however, is not as great as that of some other substances, only about half of the current being rectified. The author concludes from his experiments that the rectification is not due to a thermo-electric effect or to a difference in conductivity of the two materials in contact. He advances two possible explanations of the phenomena.

One is that the film between the two substances, when once formed, has unidirectional conductivity. The other explanation is that the film is produced in an infinitesimally short length of time by the passage of a minute quantity of electricity. The tendency of the resistance to rise when current is flowing to the crystal, the direction of highest resistance, and to fall when the current is flowing from the crystal, seems to favor this view. The sluggishness of change of resistance sometimes observed at high temperature and with some crystals also tends to strengthen the probability that the rectifying film is re-formed electro-chemically with each reversal. If the film is re-formed at each reversal, then there must be a definite quantity of electricity, however small, required for the production of the film, and one should find that the rectification is less perfect for very small currents or for very high frequencies.

Mr. F. B. Gerrard, superintendent of the Commercial Cable Company's station at Hazelhill, N. S., in renewing his subscription says: "Telegraph and Telephone Age is too good a paper to miss."

J. R. Terhune, superintendent of the Western Union Telegraph Company at Nashville, Tenn., in renewing his subscription recently said:

"I desire to congratulate you on the improvements in the Age. I find much valuable information in every issue."

The Military Telegrapher in the Civil War.

PART XXXVI.

Mr. T. E. Rawlins, who is at present living at St. Joseph, Missouri, is one of the many military telegraphers who were made prisoners by the Confederates during the war. Unlike some of the others however, he made his escape before he was confined in a prison. In writing to Colonel William R. Plum, historian of the United States Military Telegraph Corps in 1878, Mr. Rawlins gave the following account of his connection with the service:

"I enlisted August 12, 1862, at Dwight, Ills., and was mustered in September 8, 1862, at Pontiac, Ills., for three years in Company B, 129th Regiment, Illinois Volunteer Infantry. I served with my company until we reached Crab Orchard, Ky., some time during the following October where I was detailed to assist in the brigade commissary and remained there until we reached Bowling Green, Ky., when I was assigned to my company again and served with them until August 1863, when I was again detailed at Nashville, Tenn., to assist John P. Lathrop, operator at Wartrace, Tenn., on the line of the Nashville and Chattanooga Railroad. I remained with him about three months when I was sent to La Vergne on the same road to assist George Railton from Toronto, Canada. While I was at La Vergne on February 26, 1864, I was furloughed by order of E. M. Stanton, secretary of war to enter the United States Military Telegraph Corps until further order, I remained at La Vergne a few months and was assigned to Smyrna, the first station south, where I had charge with John T. Duell as assistant. August 13, 1864, I received permission to visit my home in Illinois for thirty days, during my absence the Wheeler Raid on the Nashville and Chattanooga Railroad was made and my office fixtures, instruments, etc., captured together with Duell and his assistant who was staying in my place. I learned of the raid while at home and, cutting my leave of absence short fifteen days, returned and reported for duty to Captain J. C. Van Duzer who, giving me a pocket instrument, assigned me a place with the repair force to repair the line and railroad from Nashville to Murfreesboro. I attached my instrument to the wire first about three miles south of Antioch. We then worked south repairing the line until we reached Smyrna where we found the depot so badly damaged that we established the office in a private house temporarily until the depot could be repaired. Operator Duell was now with me again, having been turned loose by Wheeler before he left the state. We remained here until the December following when Hood's raid through Tennessee was made. At the approach of Hood's army we remained in Smyrna, taking our meals at the boarding house of Charles Fox and lodging at Dr. Kennedy's. Our object in taking lodgings at one place and boarding in another was to better secrete ourselves. In this we

made a mistake from the fact that Hood's army needed recruits and they were conscripting all the men they could find. A party of three cavalymen came to Dr. Kennedy's looking for a brother of the doctor's and finding us in bed, took us without any ceremony. We were mounted on their horses in the rear of their saddles and conveyed to their camp, a distance of perhaps twelve or fifteen miles reaching there about sunrise. General Bates, the Confederate commander, immediately interviewed us in regard to the present outlook of affairs as viewed by the northerners, I informed the general that I knew very little in regard to army movements and scarcely anything as to how the north felt in regard to closing the conflict. Our answers to his direct questions were not entirely satisfactory to him and he directed the guard to turn us over to the provost-captain. We now went into camp as prisoners of war and were regarded as such. The treatment we received, as far as I was individually concerned, was all that I could expect. Boiled beef was given us in pound packages or pieces of near that amount for each prisoner without salt or bread. Not being used to eating my meat fresh without salt I did not relish that morning meal and threw it into the ditch. We were soon on the march in the direction of the railroad and came to a block house north of Florence where a battle ensued which lasted from early in the afternoon until dark. The wounded and dying were carried into camp and cared for. As yet we prisoners had eaten nothing except the boiled beef and I had not eaten that so that we were pretty hungry about sundown. The captain in command gave me a piece of corn pone, about three inches long by one and one-half wide and I have no recollection of ever eating food that tasted better than that little crumb of corn bread mixed with water and baked in the ashes. About ten o'clock that night we were sleeping soundly in a pile of leaves that we had gathered together when we were aroused and a full sized corn pone dealt out to us for our supper. We did justice to that meal without any loss of time and went to bed again. We were aroused early the next morning and moved in the direction of Murfreesboro. That day was spent in skirmishing and we camped in sight of the Stone River breastworks. The next day, the third day we had been with them, was spent similarly to the previous day and we camped within a mile of where we were the night before. The fourth day they skirmished until about four p. m., when they drew the Federal force from Stone River and Murfreesboro out and lines of battle were formed. They scarcely fired a gun, however, before the whole Confederate command was on the run and they kept up this stampede until they were out of sight. This I thought would be a good time to escape but the guard was faithful and proved too strong for us. They marched us north on the Nashville and Murfreesboro pike,

halted within a mile of Smyrna, the place where we were captured, and went into camp. The Provost Guard could not find headquarters so they camped by themselves regardless of the rest of the army and we built a log fire, laid down and went to sleep. Along towards morning I awoke and I was so cold I could with difficulty straighten myself. I discovered that some of the prisoners were already gone. All the guards were sound asleep except one and he was very busy at one end of the fire parching corn. Duell, was awake too and I said to him, 'Now is our time,' but he did not believe there was any chance. I made the attempt, however, was successful and went directly to Dr. Kennedy's and took quarters in the cellar. Duell stayed with the guard until they got to Pulaski when he too escaped and walked to Nashville.

"In the cellar at Dr. Kennedy's I had the company of John Kennedy who was avoiding the conscript. We remained in that cellar ten days until the southern army left that part of the country. We were fed by the mother of John and Dr. Kennedy and I never will forget her kindness. She was as regular as clock work in bringing us our meals except once or twice when she was afraid of being detected. One night General Bates had his headquarters in the doctor's room and we got no supper or breakfast then but by noon they had left and we got the well-filled basket as usual. We did not venture out until we heard that General Steadman with his colored troops had passed down the road. We came out of our hiding places then much to the surprise of the people in the town and vicinity who thought we were well on our way to Andersonville or some other southern prison. I secured a conveyance and went to Nashville and reported to Captain J. C. Van Duzer for duty. He gave me a pocket instrument and started me out with the repair force again. I remained with them until the railroad was rebuilt and then reopened the Smyrna office. I remained there until the next summer and was sent to Wartrace where I was located when the war closed. I accepted the agency for the Nashville and Chattanooga Railroad at that point and remained there until September 1, 1868 when I returned to the north."

A Military Telegraph Martyr.

Reference has been made in our columns several times, especially in the series of articles on "The Military Telegrapher in the Civil War," to the killing of D. B. Lathrop, a military operator at Yorktown, Va., by the explosion of a torpedo buried by the Confederates before they evacuated the place. In Colonel Plum's history of the United States Military Telegraph Corps it is stated that operator Lathrop was buried at Mount Vernon, Ohio, and that a fund was started to build a monument to his memory. As the history fails to reveal whether the monument was actually erected or not we began an investigation

to learn, if we could, any more facts in regard to this sad case. Upon communicating with telegraph people at Mount Vernon we found that nothing was known at that place in regard to this operator who met such an untimely fate.

With the assistance of David Homer Bates, secretary of the Society of the United States Military Telegraph Corps, however, we have secured some further information about the facts in this case which will clear up some points which have heretofore been in doubt.

Mr. Andrew Schnell, now of Guthrie, Oklahoma, writes that he started the subscription for the monument and afterward turned the money which he collected, together with the list, over to someone in General Eckert's office at Washington. His brother Mr. Joseph Schnell of Binghamton, N. Y., has written the following version of his recollection of the event:

"On page 314, in *Telegraph Age* for May 1, 1908, in an article headed, "United States Military Telegraph Legislation," by Mr. Jesse H. Robinson of Washington, reference is made to the death of D. Brainerd Lathrop by the explosion of a torpedo at Yorktown, Va. It quite interested me as I was by his side when he breathed his last. A few moments later I came very near meeting the same fate, as I discovered one of those torpedoes just in time to avoid stepping on it. Fortunately for me the rain had washed the sand from over it, exposing it to view.

"I have a clipping taken from a newspaper at the time, of which the following is a copy:

Death of D. B. Lathrop.

Washington, D. C., May 5, 1862.

D. B. Lathrop, operator in the United States Military Telegraph Corps, died last night from injuries caused by the explosion of a torpedo, placed by the Confederates, in the deserted telegraph office at Yorktown. Mr. Lathrop was a resident of Springfield, O., and highly esteemed by his brother telegraphers, and all who knew him. He was always one of the first to volunteer to fill the post of danger, and his services in the front ranks will be painfully missed.

"My impression is that his remains were sent to Springfield, O. I remember we started a subscription towards the erection of a monument to his memory.

"I never learned, however, what, if anything, was done in the matter. Mr. Thomas Morrison, who, I believe is in the State Department at Washington might be able to furnish you with any information desired concerning Lathrop.

"According to my recollection the explosion of the torpedo did not occur in the office as stated in the clipping, but outside, not far from the office."

Mr. Morrison who is chief of the bureau of accounts and disbursing clerk in the State Department at Washington, gives the following account of his connection with the affair.

"I accompanied the remains of D. B. Lathrop, from Yorktown, Virginia, to Springfield, Ohio. His residence was in Springfield where I believe

he was born and raised. I was at Yorktown, under General Fitz John Porter, and near Comrade Lathrop, when he was killed by the explosion referred to.

"Two or three years ago I fully explained the death of Lathrop to Mr. Jesse Robinson, of the Weather Bureau Service here, and I assumed that the information given him was for publication. The torpedo was placed by the Confederates at the base of a telegraph pole just across the street from the telegraph office, in Yorktown. Lathrop walked over to and was inspecting the pole when the shell exploded.

"I have no knowledge whatever of the monument fund. Evidently it failed, and no doubt the amount collected was turned over to Mrs. Lathrop."

Mr. John W. Parsons, superintendent and secretary of the board of trustees, of the Ohio Masonic Home at Springfield, Ohio, and a former military telegrapher has sent us the following letter in regard to his knowledge of operator Lathrop's death and burial.

"Mr. George R. Carter, manager of the Western Union Telegraph office in this city, has handed me your letter asking information concerning David Brainerd Lathrop, the operator who was killed at Yorktown, Va., in 1862, by stepping on a torpedo which had been placed near the telegraph office by the Confederates when they evacuated that place. Lathrop and an operator from Dayton, O., named Henry Smith, gained admission to the town by the use of an old military pass which Smith happened to have in his pocket, entrance having been forbidden by the commanding general except by special permission, on account of a report of the planting of torpedos in various places in the town by the fleeing Confederates. One of Lathrop's legs was blown off and he died within a few hours.

"His body was sent to Springfield, Ohio, accompanied by Thomas Morrison, now of the State Department, Washington, and buried in Greenmount Cemetery, where the remains still rest.

"I visited his grave to-day and found it in fairly good condition and surrounded by the graves of his parents and other members of his family. A modest marble slab, erected by his sister, his only living relative, marks his resting place. The slab bears the following inscription:

'A True Christian and Patriot

D. Brainerd Lathrop

Killed

At Yorktown, Va.,

May 4, 1862,

aged

21 Years, 8 Months and 13 Days

They Shall Walk With Me

In White For They Are Worthy.'

"David Brainerd Lathrop was born in Springfield. I knew him from his childhood and, in fact, was his instructor in learning the business of telegraphy. He was an excellent student; in

school always standing at the head of his classes; he quickly learned the business and became one of the best sound operators I have ever known. He was highly esteemed by the entire community and his untimely death was sincerely regretted.

"I was his partner in the United States Military Telegraph Corps, and for the first three months after entering the service in 1861, we were stationed at the Navy Yard, Washington. He was then ordered to the peninsula where he met his untimely death in 1862."

Thad M. Schnell Seventy-five Years Old.

Mr. Thad M. Schnell, the old time and military telegrapher of Des Moines, on February 16 celebrated his seventy-fifth anniversary.

Mr. Schnell was born in 1835 at Bellefonte, Pa., and spent his boyhood at that place. When but a young lad, he learned the art of telegraphy and is still working at that profession; having followed it throughout his entire life, at present being employed in the main office of the Postal Telegraph-Cable Company at Des Moines.

Many of those connected with the telegraph and intimate friends were invited to a dinner in his honor, which was given at the residence of his sisters upon the afternoon of his birthday. The centerpiece of the table consisted of a telegraph sounder and battery, surrounded by sixty lighted candles, representing the years of his telegraph service.

An enjoyable feature of the occasion was the presentation to Mr. Schnell of seventy-five postal cards, each bearing a message from some absent friend, marking the pathway from his boyhood at Bellefonte to his seventy-fifth birthday at Des Moines. This was in the nature of a surprise to him and was much appreciated. It made it seem that the guests of the occasion instead of being only a score numbered a hundred, and that time and distance made no difference.

The occasion was a most enjoyable one for those present and all expressed the wish that Mr. Schnell might live to enjoy many more birthdays.

"Doctor, there is something the matter with my right ear. There is something ticking inside of it and I cannot sleep. I have been sleepless for forty-eight hours," said a man who presented himself at the office of a New York hospital for treatment.

"It sounds like a telegraph operator sending a message and I hear it all the time," said he.

The doctor placed an instrument in the ear which enabled him to see to the ear-drum, and there in the very center he saw a small insect that appeared to be tapping on the drum with one foot.

The doctor flushed the ear and the "telegraph operator" floated out. "It is a very rare bug," said the doctor.

"What is it called?" asked a reporter.

"Well, you might call it a "telegraph bug," he replied.

The First Nantucket Cable.

Few people are aware of the fact that a submarine cable, fifteen miles in length, connecting Nantucket with the mainland was laid in 1856 two years before the laying of the first Atlantic Cable brought the possibilities of submarine telegraphy so prominently before the people of this country. This first cable was not a success but a description of the laying of this cable taken from the *Nantucket Inquirer and Mirror* will be of interest, showing as it does the great improvements which have been made in the art of cable laying since that time. This cable was laid on August 19, 1856, by the steamer "Telegraph," which at that time had been in regular service between Nantucket, New Bedford, and other nearby points for over twenty years.

This event was an important one, not only for Nantucket, but for the entire country, as the line of cable to be laid was heralded as "the longest American submarine cable ever laid." It was about fifteen miles long, was of No. 9 wire, covered with two coatings of gutta percha, and was about five-eighths of an inch thick. The cable was brought to Nantucket direct from New York, and was placed on board the schooner *Silas Parker* on reels, each reel containing a mile in length. On the deck of the schooner, back of the main cabin gang-way, a large reel was fixed in a most substantial manner, platforms being built outside the bulwarks, whereon the men stood who turned the cranks which wound the cable—a dozen men being necessary for this work. The cable was transferred to this reel on the schooner while she lay at the dock, each mile being properly joined as the winding progressed, the task requiring four days.

At 3 o'clock in the morning on August 19, the *Telegraph* took the schooner in tow, firing a signal gun as she rounded Brant Point, to let the inhabitants of the town know that the actual laying of the cable was to be started. At 5.30 o'clock the *Telegraph* brought the schooner to anchor off Great Point, fired a second gun, run up the American flag, and one from the schooner's mast-head on which was inscribed the words: "Nantucket Telegraph—the Longest American Sub-Marine Cable ever laid—August, 1856." Preparations for laying the cable went forward rapidly and at 8 o'clock one end of the wire was taken ashore in a boat and in half an hour connection was made with the land line, when the cannon again burst forth its exultation, followed by cheers on board and on shore.

A few minutes before 9 o'clock, the *Telegraph* started with her tow over the proposed route of the cable, which was run out from the schooner's stern over a roller fixed on the davits. It required the whole force to unwind the cable fast enough for the steamer to make any headway, and for a time her engines were stopped, the tide taking the outfit along as rapidly as necessary—at the rate of two miles an hour. The "log" kept upon that occasion

shows that at 10 o'clock the *Telegraph* had made about two and one-half miles. At 11 o'clock, five miles from Great Point, the cable was unreeling itself and the work progressing finely, with ten and a half fathoms of water. About noon a heavy swell set in and the work became more difficult. When the outfit passed the *Shovel* lightship, the crew of the beacon ran up flags, rang the bell and cheered, and the *Telegraph's* gun again pealed forth. At 1.30 in the afternoon the steamer anchored off Monomoy Point and fired a signal gun—less than five hours after she left Great Point.

Owing to a slight dragging of the anchor, while a sufficient amount of the cable was being stowed into a boat to be taken ashore, the wire became tangled and it was nearly an hour before the end was placed on the beach. At 3.05 o'clock, however, the end was joined to the land wire at Monomoy, and thus having connected Nantucket and America together, the *Telegraph* gave a few joyous toots with her whistle and started with her tow for Nantucket. To Nathan Manter, at that time mate of the steamer "Island Home," the credit for the laying of the cable without mishap belonged. Manter was given command of the *Telegraph* upon this important occasion, he being considered an authority on the shoals, tides, etc., and the *Nantucket Inquirer* of that week thus compliments him for his excellent work:

"It is but simple justice to say that Nathan Manter, mate of the steamer *Island Home*, who had charge of the steamer *Telegraph* on the occasion of the laying of the cable, discharged his onerous duties in the most efficient manner. Without competent help, he was obliged to act in various capacities, frequently executing his own orders, to be sure of promptness, the crew not being familiar with steamboating. He is a cool, active and efficient officer, and showed that he had well improved his opportunities to acquire a practical knowledge of the management of a steamboat."

From Monomoy Point (the terminus of the Nantucket cable) to Chatham Light, a distance of six miles, the line ran over a land wire. At the latter point, however, another cable one and one-half miles in length had previously been laid, connecting Monomoy Point with the main land on the Cape—thence running over a course of two and one-half miles to the telegraph office in Chatham. This first cable never worked very satisfactorily, and the project proved a complete failure, the cable being subsequently taken up and laid from Madaket to Tuckernuck and thence across to Martha's Vineyard. This second attempt was almost as unsuccessful as the first, and only one or two messages were sent over it. Nantucket did not get into actual cable communication with America until the government laid its cable across Vineyard and Nantucket sounds in 1886.

Award of President's Prizes of Postal Telegraph-Cable Company.

The annual prizes, amounting in all to \$2,500, given by President Clarence H. Mackay of the Postal Telegraph-Cable Company to managers and messengers of the company throughout the country for excellence in certain particulars, have been awarded for the year 1909. The following were the winners:

Second Prize, Class B, \$50, S. H. Flint, Bridgeport, Conn.

First Prize, Class C, \$50, W. C. Cassidy, Taunton, Mass.

MESSENGERS.

First Prize, Class A, \$25, T. F. Rice, New York Main Office.

Second Prize, Class A, \$15, J. Fox, New York Main Office.

Third Prize, Class A, \$10, W. L. Riley, Washington, D. C.

WINNERS IN THE EASTERN DIVISION. *

EASTERN DIVISION, MANAGERS.

First Prize, Class A, \$250, A. W. Rinehart, Pittsburg, Pa.

Second Prize, Class A, \$100, C. H. Newman, Buffalo, N. Y.

First Prize, Class B, \$100, J. W. Weed, Syracuse, N. Y.

First Prize, Class B, \$15, J. Crachola, New York Produce Exchange.

Second Prize, Class B, \$10, B. Schram, New York Produce Exchange.

WESTERN DIVISION, MANAGERS.

First Prize, Class A, \$250, C. A. Comstock, Milwaukee

*Engravings loaned by Postal Telegraph.

Second Prize, Class A, \$100, O. B. Plumly, El Paso, Tex.
 First Prize, Class B, \$100, Miss F. M. Law, Flint, Mich.
 Second Prize, Class B, \$50, G. L. Pierce, Evansville, Ind.
 First Prize, Class C, \$25, A. S. McKellar, Vandalia, Ill.
 Second Prize, Class C, \$25, Miss D. M. Becksted, Newark, O.

Third Prize, Class B, \$5, John Hubler, Benton Harbor, Mich.
 First Prize, Class C, \$15, Frank Johnson, Leavenworth, Kan.

SOUTHERN DIVISION MANAGERS.

First Prize, Class A, \$250, G. W. Phillips, Raleigh, N. C.
 Second Prize, Class A, \$100, L. A. Mitchell, Jacksonville, Fla.

WINNERS IN THE WESTERN DIVISION.

MESSENGERS.

First Prize, Class A, \$25, Julius Cohen, Chicago, Ill.
 Second Prize, Class A, \$10, John Klaric, St. Louis, Mo.
 First Prize, Class B, \$15, William Schindler, Cairo, Ill.
 Second Prize, Class B, \$5, J. Fortelka, Cleveland, O.

First Prize, Class B, \$100, V. S. Brown, Henderson Ky.
 Second Prize, Class B, \$25, C. A. Massenburg, Ft. Monroe, Va.
 Third Prize, Class B, \$25, J. J. Downing, Frankfort, Ky.
 First Prize, Class C, \$50, L. L. Armistead, Alexandria, Va.

PACIFIC DIVISION. MANAGERS.

First Prize, Class A, \$250, J. J. Dunne, Seattle, Wash.

Second Prize, Class A, \$100, V. V. Stevenson, Los Angeles, Cal.

First Prize, Class B, \$100, Mrs. H. H. Hall, Santa Barbara, Cal.

Second Prize, Class A, \$25, R. Saylor, Los Angeles, Cal.

First Prize, Class B, \$15, Archie Vignola, San Francisco, Cal.

Second Prize, Class B, \$10, O. C. Luelling, Fresno, Cal.

WINNERS IN THE SOUTHERN DIVISION.

Second Prize, Class E, \$50, S. S. Shea, Bellingham, Wash.

First Prize, Class C, \$50, Miss R. Blasingame, Chico, Cal.

MESSENGERS.

First Prize, Class A, \$25, Herman Miller, San Francisco, Cal.

Dinner of Pittsburg Postal Employees.

On Saturday evening, March 12, the chiefs, heads of departments and branch office managers of the Postal Telegraph-Cable Company at Pittsburg, assembled at a complimentary dinner given by Manager A. W. Rinehart, in the Fort Pitt Hotel, to celebrate the winning of the first prize offered by President Mackay, to managers of the

eastern division. As Mr. Rinehart does nothing by halves, the dinner was a success in every particular. The table was spread in the Dutch Room of the hotel and the arrangements were neat and artistic. Throughout the dinner, an orchestra rendered pleasing selections.

of New York, and Manager Newman, of Buffalo. Then, as toastmaster, he introduced Mr. C. E. Bagley, superintendent at Philadelphia, who spoke briefly on "The Value of Organization and Co-operation." Following Mr. Bagley's address, Superintendent Scrivens,

WINNERS IN THE PACIFIC DIVISION.

When the table was finally cleared, Mr. Rinehart made an address in which he said that it was by the united efforts of all the Pittsburg employes, that he was able to win the prize, and he urged continued co-operation. He read messages of regret from General Superintendent Pillsbury, Division Superintendent Lemon, Superintendent Kimmey and Superintendent Lane,

of Pittsburg, spoke on the conditions throughout the Pittsburg district and the necessity for continued hard work. Assistant Manager, H. J. Colebrook, the next speaker took as his subject, "Pillowcases"; Chief Operator A. M. Smith spoke of "The Relation of Main to Branch Offices"; Cashier W. H. Pennell discussed "The Right Thing, at the Right Time, in the Right

Place"; Chief Delivery Clerk Louis Mentzer told about "Sending out the Messages." Mr. Mentzer is said to have been with Noah in the ark, and is credited with having sent out the dove, but as no one present was there, it could not be verified. Following his remarks, Traffic Chief W. M. Munson spoke on the "R" business; Foreman Peckes on "The Linemens' Part of the Work"; Wire Chief Dull on "Fishing," and Night Chief, A. J. Eaves, on "Permanent Organization." The latter subject came in for some general discussion, and a committee of five was appointed to consider the formation of a permanent organization among the Postal employes in Pittsburgh.

Among those present were: C. E. Bagley, Mr. and Mrs. Henry Scrivens, Mr. and Mrs. A. W. Rinehart, H. J. Colebrook, A. M. Smith, A. J. Eaves, G. W. Dull, F. L. Bender, D. F. Lloyd, W. M. Munson, T. J. Hoge, A. J. Long, A. B. Lafferty, T. Peckes, W. W. Ryan, W. H. Pennell, Louis N. Mentzer, M. T. Finnell, C. E. Moreland, J. M. Burd, Mrs. J. M. Edwards, Mrs. Josie Rawson, Misses Katherine Early, Louise McFall, May Cartin, Louise Yetter, Emma Sellers, Bessie Fairgrieve; Messrs Archie D. Wise, C. A. Newhart, H. M. Kelleher, Joseph Frieman and Thomas Sinnott.

Dinner of Postal Employes at Milwaukee.

To commemorate the winning of the western division first-class prize offered by President Clarence H. Mackay, of the Postal Telegraph-Cable Company, the employes of the Milwaukee, Wis., office were given a banquet at the Hotel Blatz, Saturday evening, March 5, by Manager C. A. Comstock.

After an elaborate repast, the following toasts were responded to:

"Collections and Accounting," Philip L. Lee, cashier; "The Development of Electricity as it Pertains to the Telegraph," F. A. Villwock, chief operator; "The Delivery Department," M. F. Dunn, delivery clerk; "Making the Company Popular with the Public," C. A. Comstock, manager; "Work in the General Office as it Relates to the Local Offices," L. R. Thomas, chief clerk to the superintendent at Chicago. Mr. H. G. McGill, superintendent at Chicago, who was present, also made an address. Many suggestions of value were brought out in these talks which were an inspiration to those present.

Mr. S. E. Leonard, superintendent of the Western Union Telegraph Company at Denver, Colo., in renewing his subscription for another year, says: "It gives me great pleasure to enclose herewith my check for \$2.00 in payment of my subscription to your most valued publication, *Telegraph and Telephone Age*. I look eagerly forward to its receipt and would not under any circumstances do without it. I want to assure you further that I never miss an opportunity to speak a good word for the *Age* and know of several of our employes who have sent in their subscriptions on my recommendation."

The Development of Inventions.

There is a popular saying to the effect that any fool can think of a new device, but a clever man is required to make it in practical form, and a genius to sell it, says a writer in a recent number of the *London Electrical Review*.

There is something more than a basis of truth in this saying, and the patent records establish the fact that many good ideas have been protected without further development, while the difficulty of selling even an invention which has proved its utility, must have come home to the majority of patentees.

Unfortunately new ideas, and very often good ones, seem to occur more frequently to unpractical men as opposed to those having mechanical experience, with the result that the invention only reaches the protection stage instead of being carefully developed. It would seem that scope should exist for trained men to take in hand the ideas of others, and to put them into practical form.

The training required for those destined to undertake this work must be of the widest possible description, and not only should the aspirant be familiar with modern practice in all kinds of mechanical directions, but he should be a skilled worker in both wood and metal. In developing a mechanical invention a great deal of experimenting usually has to be done, and the appliances dealt with may often include several different kinds of material.

No doubt a number of ordinary workmen each skilled in one craft could be employed upon such work under the control of an experienced designer, but the risk of disclosure would be very much increased, and the work could not be so quickly carried out.

Such men are incapable of grasping an idea quickly, hence the designer would have to spend much time in explanation and the making of sketches before the parts required could be made.

On the other hand, a man skilled in almost any craft and possessing a wide experience of the devices adopted in many different kinds of machinery, would often be able to do the work in the time taken to explain the idea to an ordinary workman.

It must be admitted that men having these qualifications are difficult to obtain, and as time goes on the scarcity of those having an all-round training is likely to increase, owing to the spread of specialism; at the same time, it would seem that some of the younger generation who have an aptitude for invention might well consider the development of patents as a vocation for which they must fit themselves by an all-around training. The pay would be high for such services, and a demand for them is already apparent, this demand being certain to increase as the idea catches on and the existence of experts in this line becomes known.

Following the lead of New York State, recommendation has been made to the legislature of New Jersey that a committee be appointed to investigate the telephone and telegraph companies in that state.

Wireless Telegraph Tournament at Philadelphia.

The first wireless telegraph tournament in the history of that art was conducted by the United Wireless Telegraph Company at the Philadelphia Electrical Show on February 23. It was one of the best managed events of the kind that has occurred in many years. Every contest was called on time and there was no delay between the individual performances.

Clement H. Congdon of The International Bureau of Publicity, an old time telegraph operator, had entire charge of the tournament and it was due to his keen interest in telegraphy and telegraph men that the United Wireless Telegraph Company was induced to undertake the conduct of the tournament. Mr. Congdon acted as judge in all of the events.

A pleasing feature of the evening was the presentation of four loving cups to the operators of the Keystone Telephone Company for "courteous and efficient service," on behalf of all the exhibitors at the Electrical Show.

The official timer was Mr. Channing Eastburn president of the Philadelphia Market Street Business Mens' Association.

The contestants were: R. E. Scheirer, of Reed M. Morgan and Company; G. A. Hodgson, Pennsylvania Railroad; Richard C. Bartley, Pennsylvania Railroad, holder of the World's Championship for sending twenty messages in nine minutes and thirty-six seconds; W. V. Madden, Postal Telegraph-Cable Company; Harvey Williams of Ervin and Company, winner of the Championship of America at the Exposition Hall Tournament, Philadelphia, 1903; W. L. Street, Pennsylvania Railroad; W. F. Bannester, Pennsylvania Railroad; Edward M. Price, Postal Telegraph-Cable Company; J. L. Gilbert, S. M. and M. S. Fridenburg; Charles I. Kershner, Philadelphia and Reading Railroad Company; Miss Mary FitzGerald, Western Union Telegraph Company; Miss Edna Moyer, Western Union Telegraph Company; Robert F. Miller, United Wireless Telegraph Company; and David J. Heilig, United Wireless Telegraph Company.

The free-for-all class carried with it the Harr Prize Cup offered by Mr. M. K. Harr of the United Wireless Telegraph Company as well as four other trophies. In this competition wireless operators, amateur and professional, were permitted to enter but the showing of the wireless men was not considered in the awards made except as to the Harr Prize Cup. In other words the wire operators were permitted to try for the Harr Prize Cup but the wireless operators were not allowed to enter for any of the other prizes.

This test brought four world's champions into action. Harvey Williams and Richard C. Bartley, both medal winners and champions, divided the sending time while David J. Heilig and Robert F. Miller, rated as two of the fastest wireless operators in the service copied. When Bartley and Williams took this test Heilig and

Miller divided the sending time so that it is fair to say that no such quartette of telegraphers ever participated at one time in any tournament. Robert F. Miller won the Harr Prize Cup which was presented to him by Mr. S. S. Bogart, vice-president of the United Wireless Telegraph Company; the Sydney K. Allman Cup was won by Harvey Williams, the Philadelphia Electric Cup by Richard C. Bartley, the Philadelphia Record Cup by Charles I. Kershner, the Hotel Majestic Cup by W. F. Bannester.

In the class for ladies Miss Edna Moyer won the Keller-McManus Cup while Miss Mary Fitzgerald won the Frichoffer Baking Company Cup.

Three world's records were broken in the contests. One for sending messages, one for perfect score in receiving wireless messages and one for sending and receiving. Harvey Williams triumphed in two of these "record" events and Mr. Miller established a new high mark for wireless work.

The trophies awarded are valued at \$1,000 and they certainly are the most magnificent prizes ever offered in America for any free-for-all contest.

Two one kilowatt wireless outfits were installed in the Electrical Exhibition one at each end of the Armory in which it was held. One set was connected to the antenna on the roof. The working of this set was heard down the coast as far as Cape Hatteras and at stations in New York. The fact that these equipments were in continuous operation for five hours shows the ability of the apparatus to withstand constant use.

The Storage Wheel for a Telegraph Transmitter Not a New Idea.

We are in receipt of the following letter from a Norwegian subscriber concerning the new keyboard telegraphic transmitter which we described in our February 16 issue, the invention of Mr. E. E. Kleinschmidt, of New York. The principal feature of this transmitter is a storage wheel which stores up the symbols so that they will be transmitted over the wire at a uniform rate, independently of the speed of the sending operator. In regard to this device our correspondent says: Editor Telegraph and Telephone Age:

I have just received Telegraph and Telephone Age for February 16, with its interesting contents, among which I find on page 119, "A New Keyboard Telegraphic Transmitter." The "storage wheel" and the whole description points to an old friend which you will find described apparently like this one in the "Journal Telegraphique" of Berne, Switzerland, Volume II, 1874, page 423. One of these transmitters constructed by Messrs. Siemens and Halske was used more than thirty years ago between Norway and England on the North Sea cable.

Yours truly,

Joh Kjennerud,

Manager Government Telegraphs.

Voss, Norway, February 28, 1910.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIXEY

Sole Manufacturer

Hudson Terminal, 30 Church St.

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

Mr. A. B. Kratz has been appointed acting superintendent of telegraphs and telephones of the Panama Railroad, vice Mr. J. Beaumont, resigned.

The Los Angeles Convention of the Association of Railway Telegraph Superintendents which was to have been held from May 16 to 20, inclusive, has been postponed until June 20 to 24.

The New York Central Railroad is making preparations to equip its Ontario and St. Lawrence divisions with telephone despatching circuits.

Mr. W. L. Connelly has been appointed superintendent of telegraph of the Chicago, Indiana and Southern Railroad and the Indiana Harbor Belt Railroad, with headquarters at Gibson, Indiana.

The Michigan Central Railway is equipping four hundred and twenty-five miles of road with telephones for train despatching. They already have about three hundred and forty miles upon which the despatching is done by telephone.

The Lehigh Valley Railroad is making preparations to equip the entire mileage of their lines in New Jersey and Pennsylvania with telephone train despatching circuits. The total mileage embraced in these two states is three hundred and thirty-seven.

A meeting of the eastern division of the Association of Railway Telegraph Superintendents, was held at Washington, March 25. The Committee on the Standard Railway Telephone Contract made a report and this question was discussed preparatory to its final consideration at the Los Angeles Convention. Among those present were the following: Charles Selden, E. W. Day and B. F. Thompson, Baltimore; M. E. Launbranch, Chicago; N. E. Smith, New Haven, Conn.; E. P. Griffith, L. B. Foley, and H. E. Merrill, New York; J. C. Johnson, Philadelphia; W. F. Williams, Portsmouth, Va.; C. M. Lewis, Reading, Pa.; T. R. Gooch, Richmond, Va.; W. C. Walstrum, Roanoke, Va.; W. H. Potter, Washington, D. C.; W. P. Cline, Wilmington, N. C.

Mr. W. H. Hall, whose promotion to the position of superintendent of telegraph of the Missouri, Kansas and Texas Railway was announced in our March 16 issue, was born at Hannibal, Mo., October 31, 1869. He learned telegraphy at St. Louis and November 30, 1888, entered the service of the Missouri, Kansas and Texas as operator and clerk at the roundhouse at Hannibal. He served as operator and manager at various points on that system until February 28, 1896, when he entered the office of the superintendent of telegraph at Sedalia as clerk. The following year he became chief clerk, which position he held until April 1, 1905, when he was appointed assistant superintendent of telegraph. February 1 of this year, owing to the retirement of Mr. S. K. Bullard from the superintendency on account of ill health. Mr. Hall was advanced to his present position with headquarters at Denison, Tex.

The many friends of Mr. William Kline, formerly superintendent of telegraph of the Lake Shore and Michigan Southern Railway will regret to learn of his continued ill health. Mr. Kline, who is seventy-four years of age, has suffered two strokes of paralysis and is at present in a rather serious condition.

In a recent number of the Railway Age Gazette an outline is given of what is being done by the different railway systems in the line of pensioning employes. The figures given show that at present twenty-four railroads have pension systems of some kind in operation. It is estimated that over 7,800 persons are now on the pension rolls of the various companies. The Pennsylvania Railroad leads with 2,298 pensioners, and an annual expenditure of \$600,000 to which list the Pennsylvania Lines west of Pittsburg add 862 names and an annual outlay of \$222,500. Over \$2,000,000 is now being distributed annually by the different railroads to employes who have grown old in their service.

Mr. Edward C. Keenan has been appointed superintendent of telegraph of the Lake Shore and Michigan Southern Railway, the Lake Erie, Alliance and Wheeling Railroad and the Dunkirk, Allegheny Valley and Pittsburg Railroad, with headquarters at Toledo, O., vice Mr. William Kline, retired. Mr. Keenan was born at Toledo, April 20, 1868, and entered the telegraph service August 3, 1885, as a railway operator, serving in that capacity at various smaller stations and in the dispatchers' offices at Detroit and Toledo. In 1892 he accepted a clerkship in the engineering department of the Lake Shore and Michigan Southern at Toledo. He remained at that place until 1900, when he was transferred to the general offices of the engineering department at Cleveland. The next year he was appointed chief clerk in the engineering department of the Lake Erie and Western Railroad at Indianapolis. In 1906 he was made chief clerk of the engineering department of the Lake Shore and Michigan Southern Railroad at Cleveland, which position he held until his present promotion.

Recent numbers of a German publication contain a paper discussing the prospects of telephony and high speed telegraphy over ocean cables, contributed by the German Telegraph Experiment Station.

The new Federal Incorporation bill, which has been drawn up by Attorney-General Wickersham, and endorsed by President Taft, has been introduced in both branches of Congress. The proposed bill, which is over fifty pages in length, places great power over commercial enterprises in the hands of the Commissioner of Corporations, places restrictions upon the consolidation of different interests and requires all corporations to make semi-annual reports giving such information in regard to their business as the commissioner may require. If this act becomes a law it will affect all telegraph and most of the telephone companies.

Radio-Telegraphy.

Wireless telegraph apparatus will be installed on some of the steam fishing trawlers operating in the North Sea, the object being to keep the fishermen informed of the state of the market.

A project is on foot to install a wireless telegraph station at Ohio Wesleyan University and establish a course in wireless telegraph engineering at that institution.

One of the features at the electrical show which is now being held in Minneapolis, having opened March 26 and continuing until April 2, is a balloon which is directed in its movement overhead in the building by wireless.

The United Wireless Telegraph Company has opened its station on the Hotel Nassau at Long Beach, L. I., and will handle the marine business from that point until its new station at Montauk Point is ready for business.

During the recent British army manoeuvres at Aldershot, in which 12,000 troops participated, portable wireless telegraph stations were successfully used to keep the various commands in constant touch with each other.

The steamship Tennessee, on a recent voyage across the Pacific, when five days out from Honolulu, going westward, claims to have received by wireless a weather report sent out from Table Bluff, on the coast of California, 4,580 miles distant.

The Marconi International Marine Communication Company reports that since the first of the year they have received orders for the equipment of over thirty ships. Among these are some of the vessels of the Atlantic Transport, the Red Star, the White Star and the Leyland Lines.

At the annual meeting of the United Wireless Telegraph Company, held in Portland, Me., March 9, L. C. Wallace was elected a director to succeed I. Newton Snively, who died recently. F. X. Butler and E. P. Davis were added to the board. Other directors were re-elected.

It is reported that an American company is endeavoring to secure a concession to construct a wireless station at Singapore to connect with similar stations at Manila, Hong Kong and Bangkok. The station at Hong Kong would be capable of communicating with all of the others and with Shanghai and Yokohama as well.

Mr. L. H. Walter, in a recent article in an English contemporary, discusses the question of directive wireless telegraphy, taking up the methods of Artoni and of Bellini and Tosi. He gives the results of an examination of the radiation which could be expected from a single aerial of the Artoni type and shows that instead of propagating waves chiefly in a direction perpendicular to the aerial plane, it radiates waves which have practically the same intensity in all directions. He concludes that the method of crossed directive aerials employed by Bellini and Tosi appears to be the only one which actually accomplishes the desired results.

A patent, No. 950,781, for a detector for wireless communication, has been secured by J. L. Hogan, of New York. Ferro-silicon, consisting of a fused mixture of iron and silicon, is used.

A patent, No. 951,524, for a wireless controlling device has been granted to Charles L. Coleman, of San Leandro, Cal. A kind of make-and-break device co-operates with a coherer, etc.

A patent, No. 952,403, for wireless telegraph receiving apparatus has been granted to C. D. Babcock of New York. A receiver, a direct-connected syntonizer, and inductively connected syntonizer and means for connecting either one to said receiver.

The Grand Trunk Pacific Railway has asked the Canadian government for authority to erect wireless stations to communicate across the mountains and connect Edmonton with Prince Rupert. This would aid materially in construction work, and at the same time make it possible for the general manager at Winnipeg to communicate with the officials in charge on the Pacific Coast.

The annual election of officers of the Society of Wireless Telegraph Engineers occurred at a meeting held February 28. The following were elected: Dr. Lee De Forest, president; John S. Stone, vice-president; V. F. Greaves, treasurer; E. D. Forbes, secretary; W. H. Bathrick, J. H. Campbell and E. B. Moore, managers. A paper by Dr. Louis Cohen, entitled "Coupled Circuits in Which the Secondary has Distributed Inductance and Capacity," was discussed by Mr. O. C. Roos.

It has been suggested that one of the automobiles which participate in the Glidden Tour during the coming summer be equipped with a wireless telegraph outfit. A considerable portion of this year's tour will extend through territory where telegraph and telephone services are comparatively inefficient, and it is planned to have the car provided with the wireless apparatus follow in the wake of the tour so that any accidents may be promptly reported.

It has been decided to expend about £70,000 in constructing a wireless system to connect the British possessions in the Pacific. These stations will be under governmental control and the expense will be divided between the British government and the governments of Australia, New Zealand and Fiji. High power stations will be established at Sydney, Australia; Doubtless Bay, New Zealand, Suva, Fiji and Ocean Island, Medium power stations will be erected at Tulgai, Solomon Islands and Vila in the New Hebrides.

The bill introduced in Congress by Senator Frye, of Maine, requiring ocean-going steamers, carrying fifty or more passengers to be equipped with efficient wireless apparatus which shall be capable of transmitting and receiving messages over a distance of at least one hundred miles has been favorably reported to the Senate by the Committee on Commerce to which it was referred. Penalties are provided in this measure for failure to comply with its provisions and any fine assessed in this connection would be a lien upon the vessel.

The regular monthly meeting of the Wireless Institute of New York will be held April 6, in the lecture room of the department of physics of the College of the City of New York. A discussion on "Experimental Tests of the Radiation Law for Wireless Oscillators" will be opened by Professor M. I. Pupin of Columbia University.

Students of Harvard University have formed a wireless telegraph company having five stations in operation. The principal work of the company at present is in testing out interference preventing devices. The effects of varying the wave length of stations and their power of radiation is also being studied with reference to the interference problem.

The attorney-general of Michigan has decided that the United Wireless Telegraph Company may be admitted to that state under the telegraph incorporation act. As this company does not use wires for the transmission of its business there was some doubt as to the classification under which they should be incorporated. Although their apparatus is different, it has been decided that as their purpose is the same as that of the wire companies they must be incorporated under the same act.

The German Colonial Company of Berlin has announced that as a result of preliminary trials which have been made they believe that wireless communication can successfully be established between the high power station at Nauen, near Berlin, and the German Cameroons, 3,410 miles distant. To accomplish this a station of the same size as the one at Nauen would have to be erected in the colony and this would have to be at some distance from any high or wooded mountain.

Wilson Military Academy at FINDERNE, N. J., is probably the only college preparatory school in the country giving regular instruction in wireless telegraphy. This institution has a five kilowatt wireless station which receives messages from points along the Atlantic Coast as far south as Charleston, S. C. Both commercial and wireless telegraphy is taught by Mr. Walter M. Ronan, a practical telegrapher, who was for several years wireless operator on the Ward Line boats.

It is stated that the French Line is preparing to equip two of their freight steamers plying between France and the United States with the Bellini Tosi "wireless compass" system. This consists of a small directive receiving system by means of which the direction from which signals are arriving is easily ascertained for distances up to fifteen or twenty miles. A greater range is not considered necessary as the danger zone lies within these limits. It is believed that by this device much valuable time may be saved by the vessels because of their ability to find their way into New York harbor in foggy weather by the aid of signals received from shore stations of known location.

A patent No. 950,257, for apparatus for generating undamped electric oscillations has been awarded to S. Eisenstein of Kiew, Russia. A negative electrode, a plurality of positive electrodes, a condenser connected to each positive electrode with means for establishing oscillations between the condenser and negative electrode and for supplying alternating current separately to the electrodes.

Wireless Legislation.

The Committee on Merchant Marine and Fisheries has reported favorably to the House of Representatives the Greene bill which provides that all wireless operators, and the companies employing them, shall be licensed by the Department of Commerce and Labor, such licenses being revokable in event of the violation of any of the provisions of the proposed law. Messages and signals relating to the distress of ships at sea have priority over all other forms of wireless communication. The transmission of false and fraudulent messages is punishable by a fine of not more than \$2,500 or imprisonment for not more than five years.

The President receives authority to establish from time to time regulations by designations of wave lengths or otherwise, governing commercial companies, such regulations to be enforced by the Department of Commerce and Labor.

The House Committee on Naval Affairs has also reported favorably the Roberts resolution recommending the establishment of a wireless board of seven members, who shall make investigations and report to Congress, December next, what legislation may be necessary to prevent interference with wireless messages.

A Telegraph News Bulletin Printer.

In our column of recent telegraph and telephone patents in this issue it will be noticed that a patent has recently been granted for a telegraph bulletin printer. The device is designed primarily for press bulletins and is controlled by a key board telegraphic transmitter from which news bulletins may be printed simultaneously at as many points as desired. These bulletins may be of any width and the printing may be done with as large type as desired. It is claimed that the printing apparatus can be operated from a distance of one hundred miles or more over an ordinary telegraph circuit. The paper upon which the matter is printed is unwound automatically from a roll and the bulletin displayed may be of any length suitable for the space in which it is shown. A company has been formed to manufacture these machines and it is expected that they will soon be placed on the market.

A bill has been introduced in the New York Legislature forbidding the employment of minors as telegraph messengers between the hours of 10 p. m. and 5 a. m. in cities of the first and second class.

"Operators I Have Known."

At the recent banquet of the Postal Telegraph Club of Atlanta, Captain William B. Kenny of the Associated Press in that city, gave a most interesting talk upon the topic of "Operators I Have Known." His remarks upon this subject were in part as follows:

"I recall," said Captain Kenny "an incident after the Russian-Japanese War. A crowd of correspondents had returned, and among the number was one from Hungary. He was a retired army officer and very dignified. When they reached San Francisco, the Americans of the party talked earnestly to the Hungarian, who was in this country for the first time, explaining that everyone here was equal and that any attempts to domineer would probably mean trouble. It so happened that as soon as he had landed, the Hungarian desired to cable his paper at Budapest of his arrival. For this purpose, accompanied by one of the Americans he entered a telegraph office. There was the inevitable gum chewing young woman behind the counter. Our friend wrote his cable and passed it over with a courtly bow. The young woman seized a rate book and began to thumb the pages. When she seemed in trouble, the American newspaperman tried to help her but she glared at him, turned a few more pages and shouted, 'Ain't no such town as Budapest.' Do you blame that poor Hungarian for forgetting his warning?"

"But a much more amusing episode happened in one of the Western states during a big strike several years ago, which was marked with much rioting and not a little bloodshed. One of the correspondents had been up in the mountains with a body of soldiers and had a first class story of a running fight which he knew absolutely was exclusive. He reached the little telegraph office about nine p. m. and found all the other specials taking it easy and bemoaning the fact that there was nothing upon which to hang a good yarn. Now this man represented an afternoon paper, so he wrote his story deliberately and carefully and when it was concluded, saw that it was not yet midnight. So he walked over to the telegraph office, now augmented by a number of fast press operators from nearby cities and filed his stuff. 'It does not have to be hurried,' he told the old manager in charge, 'do not let it hold up any of the morning paper stuff, but get it off at night rate.' And the old fellow thanked him and promised. The night wore on and nothing new happened. About five o'clock in the morning, the special visited the office again. 'Have you cleared on my stuff, old man?' he asked. 'Not yet,' replied the guileless old manager, 'you see the Hearst man is not through with it yet, but the others have finished with it and I can start it in a few minutes.'

"And the special was beaten on his own story!"

Captain Kenny recited many instances of striking devotion to duty and courage of a high order dis-

played by the men who sit at the keys and whose names are seldom heard.

"Only last fall, during the big storm in New Orleans we had a splendid example of this loyalty. Paul Joyner of the Associated Press operating force at New Orleans and W. J. McFatter were hurried into Hattiesburg, Miss., where the only flickering wire out of the storm swept country was found. These men stuck to their keys for thirty-one hours at a stretch, because a train wreck delayed their relief, and never whimpered. Joyner fainted as the men sent to help him walked into the room. Both of them were offered large sums to give brokers the exclusive cotton quotations from New York and withhold them, only a few minutes, from the papers which were supplying the New Orleans cotton exchange, but they refused, as everyone knew they would."

The speaker closed with a tribute to these men of the key whose devotion and intelligent co-operation he declared was one of the boasts and the pride of the big newsgathering association.

Operators in Canada.

Editor Telegraph and Telephone Age:

I notice in the February 16 issue of your paper an article under the heading of "The Telegraph Situation in Canada." The statement is made therein that conditions of living and employment are as good, if not better, than in the United States. I can cheerfully subscribe to all that was said in that article as I consider the conditions of employment and living here much better in every respect than in the United States. Although I have been here only three years I find I am better off in every respect than I would be if I had remained in "Uncle Sam's" domain. As many as a score of operators that I know accepted positions in various parts of Canada in 1907 and not one of them has ever regretted the change. I can recommend this country to every man who likes honest people who are warm-hearted and are not troubled with swelled heads. Nobody here feels that he is the pivot around which the whole thing revolves. You cannot tell who is a millionaire and who is a ditch digger. Since coming here my health has improved greatly. I would urge all operators who are struggling along in the large cities of the United States to make a break and locate in Canada. There are plenty of opportunities here and the country is expanding rapidly.

A Former New Yorker.

A bill has been introduced in the House of Representatives by Congressman Smith, of Michigan, to impose a tax of five per cent. upon the gross earnings of the telegraph companies in the District of Columbia.

An Illinois paper speaking recently of the fact that there were two new telegraph operators in town, said: "but operators here are always new, as they linger only from one moon until the next."

Obituary.

Frank C. Ball, a telegrapher in the employ of the American Telephone and Telegraph Company, New York and who was formerly identified with the Postal Telegraph-Cable Company died at his home at Woodridge, N. J., March 23, aged forty years.

Charles H. Haskins, a forty-niner of the telegraph, died at his home in Buffalo, N. Y., March 22, aged eighty years. Mr. Haskins had charge of the first telegraph line established between Queenstown and Ilamilton, Ont., in the late forties. He was an expert in telegraphy and telephony and the inventor of several devices used in these industries. He was also well known as an author of electrical books.

Mr. Nectaire Rousseau who was formerly a prominent figure in telephone and telegraph circles in Chicago died March 17, aged seventy-two years. Mr. Rousseau was identified with the early development of the telephone in Chicago and was connected at different times with the American District Telegraph Company, the Western Union Telegraph Company and the Chicago Telephone Company. He retired in 1894.

Mr. William A. Ingham, who was the first vice-president of the New England Telephone Company, died in Lowell, Mass., March 17. Mr. Ingham with Charles J. Glidden and others in 1879, purchased from the Bell Telephone Company the Lowell exchange, one of the first exchanges in the world. Mr. Ingham became the head of the Lowell Telephone Syndicate which at one time controlled one-sixth of the telephone business in the United States. He retired from the telephone field in 1887.

J. Wilber Bender, son of R. W. Bender, of the Washington, D. C., office of the Western Union Telegraph Company, died March 16, aged forty-seven years. Mr. Bender entered the employ of the Western Union at Washington in the spring of 1876, continuing therein until 1902. He was the "Fast Stock" operator for fourteen years and was an expert in that branch of the service. The exactions of this work, however, broke down his health and he was compelled to give it up in 1902, since which time he has been an invalid. Mr. Bender was among those who volunteered and went to Charleston, S. C., at the time of the earthquake at that place, remaining there for some weeks after that terrible catastrophe.

Levi C. Weir, a military telegrapher and for fifteen years president of the Adams Express Company, died in New York, March 28, aged sixty-eight years. Mr. Weir was born at New Haven, Conn. He learned telegraphy and at the outbreak of the war joined the military telegraph forces. A sketch of his experiences in this connection appeared in our columns May 16, 1909. He severed his connection with the military service in 1862, went to Cincinnati and took a position with the Western Union Telegraph Company, where he earned an enviable

reputation as a press operator. He was one of the few telegraphers in the United States who could copy from twenty to twenty-five words behind the sender. In 1868 he became private secretary to the general superintendent of the Adams Express Company, at Cincinnati, and has been connected with those interests continuously since that time. In 1894 he was called to New York to assume the presidency. This position he held until about a year ago when, on account of ill health he retired, becoming chairman of the board of managers and trustees.

Trade Notes.

Pierson Roeding and Company of San Francisco are now sole Pacific Coast sales agents for the Electric Storage Battery Company of Philadelphia.

The Kellogg Switchboard and Supply Company, Chicago, has been awarded the contract for a new common battery switchboard at Dickenson, N. D., which will have three common battery positions and one toll position.

After long-drawn-out litigation the rights of the American Electric Fuse Company in patent No. 521,018, covering double tubed connectors for telephone and telegraph wires have been upheld by the United States Circuit Court.

The St. Louis office of the Electric Storage Battery Company, of Philadelphia, has been moved from the Wainwright Building to the Fullerton Building, at Seventh and Pine Streets.

The business of the Chase Motor Truck Company, of Syracuse, N. Y., is growing very rapidly. They have recently enlarged their plant by a building 200 feet long and 60 feet wide and have equipped a new suite of offices which include a director's room, sales department, sales managers' private office, president's office and general manager's office.

The business of the Western Electric Company for the quarter ending February 28 showed an increase of over fifty per cent. over the corresponding quarter last year and officials of the company believe that the sales of the present year will amount to at least \$61,000,000.

Announcement has been officially made that The Electric Storage Battery Company of Philadelphia, has acquired all the patents and rights of the Westinghouse Storage Battery Company. The Westinghouse Storage Battery Company owned all the rights of the General Storage Battery Company, and the storage battery interests and patents of the Westinghouse Machine Company.

The Electric Storage Battery Company now has the sole right to manufacture Westinghouse batteries.

Smith, meeting Jones with his gun over his shoulder—"Been hunting eh? What did you kill?"

Jones—"Was not hunting to kill anything. I did, however, break ninety out of every hundred insulators that I shot at."

Boston Aid Society Annual Election.

At the annual meeting of the Telegraphers' Mutual Aid Association of Boston, held in that city, March 6, the following officers were elected: Robert E. Tobin, president; John B. Gatins, vice-president; W. H. Sullivan, secretary-treasurer; W. J. Mahoney, recording secretary; F. M. Kelliher, sergeant-at-arms; C. L. Mooney, chairman relief committee, with these assistants—Miss M. A. Murray, J. J. Carney, D. O'Donnell and J. A. Ryan; executive committee—J. R. McLean, A. V. Losea, T. R. Melville, P. T. Haggerty and J. A. McClinchey.

Electric Club of Boston.

With a membership of seventy, including the officers of the company, the "Electric Club of Boston" has been organized by employees of the Western Union Telegraph Company. Lectures by electrical experts from the various Boston colleges will be given weekly with a view to educating the members on the mechanics of every branch of the industry of which they are a part. Talks will also be given from time to time by the different heads of departments of the company on their particular specialty when the course of study reaches such points.

Superintendent C. F. Ames presided at the opening meeting and delivered an address on the objects of the new organization. The officers elected are as follows: president, R. W. Hall, in charge of the Barclay department; vice-president, W. G. Wetmore, acting chief operator; treasurer, G. W. Tracy, western wire chief, and secretary, George Cunningham, eastern wire chief.

At the close of the meeting an unanimous vote of thanks was given Mr. Ames for the substantial aid he has given the Club in acting as Chairman pro tem and in other ways.

Electrical School Organized in New York.

An electrical school was, on March 25, started among the employees of the Western Union Telegraph Company in New York. Mr. T. A. McCammon was elected president of the new organization and Mr. A. J. Heldman, secretary and treasurer. The school will have sessions of two hours each every Thursday evening. Mr. Lewis C. Williams, professor of physics and electricity at Erasmus Hall High School, Brooklyn, who has taught classes among Western Union employees for several years has been secured as an instructor. He will lecture and quiz the school every other week for two hours. On the alternate weeks he will lecture one hour and the other hour Mr. Charles Thom will devote to teaching the practical side of the telegraph. The class starts with a membership of about fifty.

At the first regular meeting of the Club held March 23, Mr. G. S. Burnham gave a lecture on "Magnetism." Mr. Burnham will deliver a series of eight or ten lectures dealing with the different applications of electricity and in the last

few talks will consider especially the action of the electric current as applied to standard telegraph apparatus.

OTHER NEW YORK NEWS.

At a meeting of the directors of the Serial Building Loan and Savings Institution, held March 17, Mr. Ashton G. Saylor, general superintendent of the eastern division of the Western Union Telegraph Company, New York, was elected president, vice Mr. John C. Barclay, resigned.

The annual election of the Telegraphers' Aid Society of New York occurred at 195 Broadway March 29. The following officers were re-elected: R. J. Marrin, president; H. C. Worthen, vice-president; Thomas M. Brennan, treasurer and C. A. Kilfoyle, financial secretary.

Assessment No. 506 has been levied by the Telegraphers' Mutual Benefit Association to meet claims arising from the deaths of John W. Haines, at Ridgedale, Tenn.; Neil S. Brown, at Nashville, Tenn.; William M. Ash, at Woodside, Md.; Thomas W. De Witt, at Montreal, Que., and Edmund R. Willerton, at Slingerlands, N. Y.

The economical management of the Serial Building Loan and Savings Institution, 195 Broadway, New York is responsible to a large extent for the fact that they can pay a higher rate of interest on savings than any other depository. All investments which they make have to be approved by the Board of Directors which consists almost entirely of telegraph men of high repute for their good judgment and who at the same time receive nothing from the association for their services. Start a savings account with this Institution today.

Will buy or sell, in one to ten-share lots, Western Union Telegraph Company and Mackay Companies stocks. Remittances by New York draft or express money order are requested. Address "Stock Investment," care Telegraph and Telephone Age, 253 Broadway, New York.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. This renders the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Questions and Answers.

Among many questions received, the first one herewith presented offers an opportunity to state some interesting facts in connection with the action of an electric current in a conductor.

Question: When two wires are of the same length, or resistance, why is it that often one can be quadruplexed successfully while the other can not? According to Ohm's law the current strength or volume in each, when supplied by the same value of electromotive force, should be the same.

Answer: The working efficiency of a wire, single or duplex, does not depend solely upon the value of the current flowing, but more properly upon the speed with which the said current rises to its full value when an impulse is sent over or through the conductor; in other words, upon the factor called the time constant.

This point may be made clear from the following information:

When we send a current of electricity through a conductor it necessarily requires a fractional part of a second to dispose of itself throughout the entire length of the wire. Not that electricity when unhindered cannot travel fast enough to reach each part of the circuit in time to meet all practical requirements, but because there are some conditions existing in many circuits which tend to retard the manifestations of the work it is expected to do.

For example, if we take two wires of different gauges and lengths, but each having the same total resistance, and supply each with the same volume of current, the larger conductor will be a slower circuit than its companion, other conditions being equal.

The explanation is that owing to the greater superficial area of the larger conductor it takes longer for the current to fully charge the wire. It seems that the initial volume of current as it rushes through a circuit is partially swallowed up or absorbed for a moment, and as there is no manifestation of the current's activity on the relays until it reaches its final value, a signal is consequently delayed according to the capacity of the wire. The time lost, due to this so-called absorption, must be deducted from the duration of the period the current might have been effective had there been less or no absorption, in measuring the time constant, also the time lost due to the retarding effect of the line's discharge.

This property of a conductor is called its electrostatic capacity and its working efficiency is determined by multiplying the wire's capacity by the resistance in ohms of the circuit. When the product of the two reaches a prohibitive value, which latter has already been determined, we know, without trying, that it would be useless to attempt to quadruplex the circuit, or even work it single beyond a certain speed. It should thus be apparent why a very large wire, say between New York and Chicago, which possesses no more resistance than a No. 11 gauge copper wire half the distance in length, can not be quadruplexed while the shorter one can.

Another thing that retards the development of current in a circuit is the presence of one or more coils of wire in series with the conductor, such, for instance, as the windings of relays. The counter electromotive force developed, due to the interaction of the separate currents flowing side by side in the various convolutions of wire around the magnet, act as an impedance and thus add further to the retarding effect.

Hence the true efficiency of a wire depends upon percentage of effective current it delivers when in actual operation, and not upon the value of the current an ammeter would show while the circuit is closed and the current is at maximum strength. The more impedance there exists in a wire the greater will the tendency be to lop off a little time from the period or duration of the currents maximum strength, and lost time means so much lost power.

Question: In what way can I best determine whether the distant ground terminal of a ticker circuit is good or bad?

Answer: The inquirer does not state whether parallel wires are available or not for testing pur-

A patent No. 953,344, for a call-register for telephones, has been granted to John Merckens and Anton J. Herrick, of Chicago, Ill.

A patent, No. 953,361, for a mercury arc relay, has been taken out by J. B. Taylor, of Schenectady, N. Y. For telephone and telegraph lines, the relay including a vacuum receptacle, a vaporizable cathode such as mercury and two anodes with means for deflecting the arc stream from one or the other anode.

A patent, No. 953,550, for telegraphic apparatus, has been issued to H. E. Powell, of East Oakland, Cal. A main line sounder to be operated by weak currents.

The following patents have expired:

Patent, No. 494,185, for a printing telegraph, held by John E. Wright, of New York.

Patent, No. 494,385, for a telephone and signaling circuit, held by Frank A. Pickernell, of Newark, N. J.

Patent, No. 494,562, for a telautograph, issued to Elisha Gray, of Highland Park, Ill.

Personal.

Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company will sail for England April 20, on the Lusitania.

Captain Willard L. Candee, president of the Okonite Company, New York, is with Mrs. Candee enjoying a vacation in Bermuda.

M. Bela Gati, engineer-in-chief of the Hungarian telegraphs and telephones, expects to visit this country in the near future for the purpose of inspecting our telegraph and telephone systems.

Mr. H. H. Matlock, the well-known old time and military telegrapher, for many years past a telephone official of Springfield, Ills. who has spent the winter months at San Antonio, Tex. for the benefit of his health, has returned to Springfield, much improved by his sojourn in the south.

Mr. F. X. Cleary has been appointed advertising manager of the Western Electric Company. Mr. Cleary has been identified with that company for about twenty years and has held important positions in connection with the execution of sales campaigns of the company.

Mr. Hiram D. Rogers, manager of the Commercial News Department of the Western Union Telegraph Company at Cincinnati, O. in the late sixties and early seventies and for the past thirty-five years president of the Rogers Manifold and Carbon Paper Company of New York, has retired from active business and is now living with his son Albert R. Rogers in Boston.

Mrs. Mary H. Hall, mother of Edward J. Hall of New York, vice-president of the American Telephone and Telegraph Company and chairman of the executive committee of the Western Union Telegraph Company and of Sherman J. Hall, vice-president of the Missouri and Kansas Telephone Company, Kansas City, died in New York, April 1, aged seventy-six years. The interment was at Buffalo.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. E. J. Nally, vice president and general manager and Mr. W. I. Capen, general superintendent of plant, have returned to their offices after an extended trip of inspection through the western and southern States. Mr. Nally is in excellent health, having entirely recovered from the slight indisposition which he suffered while in Chicago.

General Superintendent E. B. Pillsbury has on permanent exhibition in his office one of the original Morse registers which has been used until recently at Suncook, N. H.

Mr. L. Lemon, division superintendent at New York has been visiting various New England offices of the company in the interest of the service.

Effective May 1, Mr. W. P. S. Hawk, superintendent of the eighth district, western division, will be transferred to Chicago, as superintendent of the sixth district, vice H. G. McGill, whose entire time will be devoted to the affairs of the first district. The present eighth district will be abolished, and the lines and offices west and north of Ogden will be transferred to the second district of the Pacific division, under charge of Superintendent J. A. Forehand, at Seattle. The lines and offices east and south of Ogden, including Ogden, will be transferred to the seventh district of the western division, in charge of Superintendent W. C. Black, at Denver.

Mr. D. McNicol, of the electrical engineer's office, New York is on the Pacific coast on company business.

A new line is being constructed between Kennewick and Seattle, Wash., which will materially shorten the length of the Spokane-Seattle circuit. Mr. J. J. Lynch, superintendent of construction of the Pacific division is supervising the construction work.

Judge Edward T. Sandford of the United States Circuit Court, at Nashville, Tenn. has handed down an opinion granting to the Postal Telegraph-Cable Company an injunction against the Cumberland Telephone and Telegraph Company, discriminating against the Postal in the way of use of telephones. A similar injunction was granted in behalf of the Postal against the East Tennessee Telephone Company, which is a subsidiary company of the Cumberland Telephone and Telegraph Company.

It was claimed that the telephone companies refused to furnish telephones to the Postal Telegraph Company for the same rental which was charged other subscribers to the telephone, and insisted on the Postal Telegraph Company paying to the telephone companies fifteen per cent. of the tolls taken in by the telegraph company on messages received over the telephone, and two cents on messages delivered by the telegraph company over the telephone. The Postal company refused to pay this commission and two cents a message, and the Cumberland Telephone

Company commenced taking out the telephones from the telegraph offices, the Postal Telegraph-Cable Company applied to the United States court for an injunction. This decision sustains the contention of the telegraph company and holds that the Postal Company is entitled to telephone service at the same rate charged other business subscribers and enjoining the telephone company from removing its telephones or otherwise depriving the Postal company of telephone service because of its refusal to pay a higher rate.

RESIGNATIONS AND APPOINTMENTS.

Mr. Percy Richardson has been appointed manager of the Clarksville, Tenn., office.

Mr. Thomas N. Powers has been appointed chief operator of the Chicago office, vice Frank N. Roberts promoted.

Mr. Elmer Cox, chief operator of the Denver office has been appointed chief operator of the San Francisco office. Mr. F. Arnberger becomes assistant chief operator and Mr. M. O'Neill has been appointed traffic chief of the same office.

Mr. W. W. Morrison, who was formerly manager at Des Moines but who for some time past has been acting as manager at Salt Lake City, has returned to Des Moines to engage in other business. Although he was in Salt Lake City only six months he became so favorably known that upon his departure the employees of the office presented him with a gold handle umbrella. Mr. R. M. Robinson, manager at Michigan City, Ind., has been appointed manager of the office at Salt Lake City, vice Mr. Morrison.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

The party of officials consisting of E. J. Hall, chairman of the executive committee; Belvidere Brooks, general manager; S. M. Williams, special agent and F. A. Pickernell, of the American Telephone and Telegraph Company, who have been making a trip of inspection through the south and middle west were well entertained at the different cities which they visited. At Atlanta Mr. W. T. Gentry, president of the Southern Bell Telephone Company gave a dinner to them at his club, which was attended by thirty Georgian gentlemen who gave the visitors a most cordial greeting.

In a famous old French restaurant in New Orleans a company of foremost citizens of that southern metropolis gathered around the dinner table to welcome their guests from the north.

At Dallas Texas Mr. H. J. Pettengill, president of the Southwestern Telegraph and Telephone Company, entertained the party at dinner at the Country Club where they were met by a dozen prominent business men of Dallas.

At Oklahoma City Mr. E. D. Nims, president of the Pioneer Telephone Company, gave them a dinner, which was attended by a large number of members of the Oklahoma City Chamber of Commerce.

At Kansas City Mr. Charles S. Gleed, president of the Kansas and Missouri Telephone Company, entertained the visitors at a luncheon which was attended by about fifty local telegraph and telephone officials and business men.

At all of these cities cordial speeches of welcome were addressed to the visitors by foremost men of the respective communities.

A conference of the superintendents of the eastern division for the benefit of the service, was held in New York April 8 and 9 in the office of General Superintendent A. G. Saylor. Among those present were E. M. Mulford, New York; E. P. Griffith, Jersey City; N. E. Church, Pittsburg; W. A. Sawyer, Philadelphia; C. F. Ames, Boston; F. E. Clary, New Haven and D. C. Dawson, St. Johns, N. B.

Mr. B. F. Dillion, recently appointed general superintendent of the southern division, was presented with a handsome gold ring, bearing the Shriners emblem and set with diamonds, by the employees of the company at Jacksonville, Fla., where he had been superintendent for twenty-two years.

Mr. W. R. Chapman, manager of the St. Paul office has been appointed superintendent at St. Louis, vice Mr. G. J. Frankel, who has resigned on account of ill health. Mr. Frankel has not been well for some time and has gone to Arizona hoping to be benefitted by the change.

Among the recent executive office visitors was Mr. J. C. Nelson, superintendent at Omaha, who was in New York on company business.

Mr. R. W. Gillette, electrician of the Pacific division at San Francisco, who was formerly located in New York, took occasion while on his visit here recently, on business connected with the service, to call on many of his old friends.

The Journal of the Telegraph is now issued in magazine size and in addition to the usual tariff notices, contains several pages of news matter of general interest to employees of the company. This publication is now produced under the supervision of Mr. William Holmes, superintendent of tariffs.

The executive committee at its meeting April 6 adopted the following resolution, indicative of the present policy of the company in the matter of dividends, employees, etc.:

"This committee recommends to the Board of Directors that no increase in the present rate of dividends be made until the plant of the company, wherever it may be found necessary, is placed in the highest possible condition, the working conditions of the employees improved and their salaries rearranged, recognizing in this readjustment merit, proficiency and length of service modified by location."

Colonel Robert C. Clowry, president of the company in explanation of the resolution of the executive committee said in part:

"All earnings of the company above the present dividend rate of three per cent. per annum will be put into the property in order to raise it to the highest standard of efficiency. Whenever renewals of trunk lines are necessary it is our intention to substitute copper for iron wires.

This will tend to improve greatly the efficiency of transmission. The speed of transmission of all messages is to be increased by the introduction of additional equipment in offices and additional direct wires between traffic centers.

"With the expansion of our business changes have become imperative in the physical condition of many offices, both for the accommodation of the public and the welfare of our employes. The capacity of operating rooms has almost been reached in many cities. We plan to enlarge and improve the offices in some of these places and to move into entirely new and better quarters in other localities.

"Our policy will be to treat employes individually as human beings and not in bulk as a mathematical problem, rewarding merit as it deserves in all cases."

General Manager Belevidere Brooks has sent out the following letter to the various superintendents of the company:

"The resolution of the executive committee is to be taken in connection with my recent letters on the subject of improved quarters and accommodations for employes and a higher standard of compensation if justified by the character and extent of service rendered, etc. No horizontal increase is contemplated or possible, but as stated in the resolution the working conditions of employes are to be improved and their salaries rearranged, without favoritism or prejudice, on the sole basis of merit as determined largely by the character and output of work.

"The management plans to greatly increase the business and usefulness of the company, and intends that zealous and efficient employes shall participate in the benefits therefrom. It desires it to be known that the hearty co-operation of all employes is expected and will be recognized and rewarded. To this end a careful record should be made and kept in each office showing for each employe the length and nature of employment, the character and extent of work done, the degree of interest and zeal displayed and any special points of merit or demerit having a bearing on the case. As far as possible, the record should be kept in such a way that the work of employes of the same class or grade can be compared, and each employe's record should be kept open to his inspection.

"Managers, chief operators, etc., should be on the look-out for employes who show an unusual aptitude and interest in their work, whether in the solicitation of business or the handling of traffic or any other branch of the service, and should encourage them by advancement as the circumstances warrant."

RESIGNATIONS AND APPOINTMENTS.

Mr. C. B. Kelly, manager of the Montpelier, Vt., office, has been appointed manager at Burlington, Vt., vice W. M. Martin, deceased.

Mr. R. T. Ledden, of Montpelier, has been appointed manager in that city, vice Mr. Kelly.

Mr. Guernsey Horton has been appointed manager at Hutchison, Kan., vice Mr. A. J. Knight, transferred to the Omaha office.

Mr. Frank O. Dwyer has been appointed manager of the office at Newport, R. I., vice Mr. H. J. Lockrow, resigned.

Mr. A. C. Cronkhite, formerly in the office of Superintendent J. F. Wallick at Indianapolis, and recently with Superintendent I. N. Miller at Cincinnati, has been appointed manager at Terre Haute, Ind.

The Cable.

The cable steamer "Colonia" began on March 31 the laying of the deep sea section of the Western Telegraph Company's cable from Ascension Island to Buenos Ayres.

The Direct West India Cable Company has established a wireless station at Kingston, Jamaica. This station has been erected to supplement the cable service in case of interruption by reason of severe storms as is often the case in the West Indies. The new plant was installed by the Lepel Wireless Telegraph Company and has a guaranteed range of 200 miles at day and 300 miles at night and communicates regularly with stations at Santiago and Guantanamo, Cuba.

To Control Cable Rates in Canada.

Postmaster General Lemieux has had passed in the Canadian House of Commons a bill to control the rates and facilities of ocean cable companies, and to amend the Railway Act with respect to telegraphs and telephones. The bill provides for placing under the jurisdiction of the Board of Railway Commissioners all matters pertaining to cable traffic with Canada, which shall include messages transmitted from Canada to any other country; to Canada from any other country; through, or into, or from any part of Canada, acting in conjunction with land lines; or by land lines acting in conjunction with cables, by means of a through route or otherwise.

This action has been taken in place of the proposition for the laying of a trans-Atlantic cable by the government. In connection with the bill a schedule of rates is proposed whereby urgent messages are to be transmitted at the present rate—one shilling a word; semi-urgent messages at six pence a word, and press matter at three pence instead of the present rate of five pence a word. The introduction of this measure followed consultations with the Right Hon. Sidney Duxton, former British Postmaster-General, who promised to pass concurrent legislation through the British Parliament, following which, upon a proclamation, the Canadian legislation is to become operative.

The annual dinner of the Metropolitan League of Co-operative Savings and Loan Associations will be held at the Marlborough Hotel, New York, on April 23. For the first time in the history of the league, women will be invited.

Some Recent Chicago Promotions in the Western Union Telegraph Company.

MR. A. B. COWAN BECOMES ASSISTANT SUPERINTENDENT.

Mr. Alexander B. Cowan, who has been appointed assistant superintendent of the Western Union Telegraph Company at Chicago, has been identified with telegraph interests since 1878, starting at that time as a messenger boy. He entered the employ of the Western Union in 1882 at Quincy, Ill., remaining at that place until 1894 when he entered the Chicago office as

A. B. COWAN,
Assistant Superintendent, Western Union Telegraph Company,
Chicago.

operator. His ability was soon recognized at that place and he was successively made loop chief, division chief of the St. Louis section, assistant night chief operator and night chief operator. In January 1907 he was promoted to the day chief operatorship which he held until his present promotion. Mr. Cowan is highly esteemed by his associates and his present advancement is a popular one as it is well deserved.

MR. CHAS. H. FINLEY PROMOTED TO CHIEF OPERATORSHIP.

C. H. FINLEY,
Chief Operator, Western Union Telegraph Company, Chicago.

Mr. Charles H. Finley, assistant chief operator of the Western Union Telegraph Company at Chicago, who has been appointed chief operator to fill the vacancy caused by the promotion of Mr. A. B. Cowan to the assistant superintendency at that point is one of the most popular members of the force in that city and his many friends rejoice at his advancement. Mr. Finley began his telegraphic career on the Chicago, Burlington and Quincy Railroad in 1880, but the next year entered the employ of the Western Union at Chicago. He soon established a reputation for himself as a first-class operator and has a record of handling five hundred ordinary messages in nine hours between Chicago and St. Paul, before the advent of the typewriter. He rose steadily from the ranks serving successively as division chief, quad chief and Sunday chief operator. May 1, 1901, he was appointed assistant chief operator, which position he held until his present promotion.

MR. J. W. KONIGSMARK BECOMES ASSISTANT CHIEF OPERATOR.

Mr. John W. Konigsmark, who has been appointed assistant chief operator of the Western Union Telegraph Company, at Chicago, as briefly announced in our April 1 issue was born in that city, November 21, 1873 and has spent all of his life there. He entered the telegraph service May 16, 1886, as messenger. April 1, 1890, he joined the operating force and by strict attention to his duties and a careful study of telegraphic problems he has advanced himself to his present responsible position having served first as assistant wire chief and later as general wire chief, which office he held at the time of his recent promotion. Mr. Konigsmark is very popular among his fellow employees in the Chicago office and they all join in congratulating him upon his advancement and hoping that further promotions are in store for him.

MR. C. H. SHELL APPOINTED GENERAL WIRE CHIEF.

Mr. Charles Howard Shell, whose promotion to the position of general wire chief of the Western Union Telegraph Company at Chicago was briefly mentioned in our April 1 issue, was born at Steeleville, Ills., June 3, 1865. He began his telegraph career in the railroad service at Chester, Ills., in April 1882. The next year he entered the commercial field in St. Louis. He soon became chief operator of the Baltimore and Ohio Telegraph Company at that point retaining that position until 1887 when that company was absorbed by the Western Union Telegraph Company. He was then made night manager of the Pacific Mutual Telegraph Company at Kansas City. He next served the Postal Telegraph-Cable Company as manager at Wichita, Kan., and later as manager of the Board of Trade office at Kansas City. In 1891 he entered the St. Louis office of the Western Union as assistant night chief, which position he held until 1902 when he was promoted to the position of

general traffic chief. In 1904 he engaged in the brokerage business at Cincinnati. He returned to the Western Union service in the Chicago office in 1908 as an assistant wire chief. He later became assistant traffic chief which position he held until his present promotion. Mr.

C. H. SHELL.

General Wire Chief, Western Union Telegraph Company, Chicago.

Shell is one of the most popular men in telegraph circles in the middle west and by reason of his long experience and faithful service is well qualified to perform the duties of the position which he has now assumed.

JOHN M. DIEGEL, MANAGER, AMERICAN DISTRICT TELEGRAPH COMPANY, MINNEAPOLIS.

Mr. John M. Diegel, assistant manager of the Minneapolis office of the American District Telegraph Company of New Jersey has been appointed

JOHN M. DIEGEL.

Manager, American District Telegraph Company, Minneapolis.

manager vice Mr. A. T. Williams resigned. Mr. Diegel was born in Minneapolis in 1873 and has always lived in that city. March 13, 1885 he

entered the service of the American District Telegraph Company as a messenger. His worth soon became apparent to Mr. Williams who had organized the company in 1884 and January 1, 1886 he was placed in charge of the other messengers and given further responsibility as collector. In March 1888 he became clerk and operator and in December 1892, was given the title of chief operator, this position having been made necessary by the greatly increased business. In 1894, he began soliciting business for the company with such good results that in May 1896 it was necessary to have a superintendent and he was appointed to that position. He held this office until November 1906, when the company was sold to the American District Telegraph Company of New Jersey and he became assistant manager of the Minneapolis office, which position he retained until his present advancement.

Mr. Diegel has thus been in the District Telegraph service in Minneapolis for a quarter of a century and is largely responsible for the success of the company in that city which at the present time is one of the best branches of the American District Telegraph Company of New Jersey in the United States in point of service and business, operating 110 signal circuits in addition to a large messenger, hack and baggage business. He is well and favorably known in Minneapolis and enjoys the entire confidence and respect of the company's patrons in that city.

Municipal Electricians.

A patent, No. 952,024, for a fire alarm intercommunication system, has been granted to Alden D. Wheeler of Hyde Park, Mass. Each station has a multiple-signal transmitting device for controlling the operation of the main circuit.

William H. Carpenter, who was the first operator in the electrical bureau of Philadelphia, and who was employed there for more than fifty years until his retirement in 1908, died in that city April 3, aged eighty-three years.

The fifteenth annual convention of the International Association of Municipal Electricians, which meets at Rochester, N. Y., September 6, 7, 8 and 9, promises to be one of the most successful gatherings ever held by the association. Mr. Frank P. Foster, of Corning, N. Y., secretary of the association, is especially anxious that there be a good attendance.

Complaint has been made in Brooklyn that various telegraph, telephone, electric light and street railway companies maintain overhead wires upon streets where orders have been issued to place all wires underground. The city has been unable to enforce such orders owing to the fact that its own fire alarm and police wires are all overhead in the same district and it can not make a private corporation obey an ordinance which it is itself violating. It is stated that \$100,000 would be required to place underground all of the city's wires in the various streets in question.

The Telephone.

The Pioneer Telephone and Telegraph Company is contemplating the installation of three new exchanges at Oklahoma City, increasing the capacity of their equipment in that place to 45,000 lines.

Mr. Sherman R. Hall has been elected vice-president and Mr. F. L. Gilman has been elected general manager of the Bell Telephone Company of Missouri.

Mr. J. S. Wiley, auditor of the Bell Telephone Company of Pennsylvania, has been appointed assistant comptroller of the American Telephone and Telegraph Company with headquarters in New York.

Mr. Martin H. Buehler, general manager of the Central District and Printing Telegraph Company of Pittsburg, succeeds to the position made vacant by Mr. Wiley's promotion.

Mr. M. C. Hurt, manager for the Pioneer Telephone and Telegraph Company at Muskogee, Okla., has been transferred to the main offices of the company at Oklahoma City. He is succeeded at Muskogee by Mr. Harry Lyon.

At the annual meeting of the Ohio Independent Telephone Association, held in Columbus, March 17 and 18, resolutions were adopted endorsing a state commission with full power to regulate the telephone business.

The Cumberland Telephone and Telegraph Company has declared its regular quarterly dividend of two per cent. Mr. J. F. Howell, of Nashville, Tenn., has been elected a director to succeed Mr. W. K. Phillips, deceased.

The State Telegraph and Telephone Company has been incorporated at Butte, Montana, with a capitalization of \$500,000 for the purpose of constructing and maintaining telephone, telegraph and wireless systems.

A concession has recently been granted by the Cuban government to the Cuban National Telephone Company to install and operate local and long distance telephone service in the six provinces of the island. It is stipulated that long distance lines must be in operation between Pinar Del Rio, Havana and Santiago, within eighteen months.

One of the largest and most up-to-date private branch telephone exchanges for railway use is being installed in the new Pennsylvania Terminal at New York. The switchboard has six positions and is equipped for four hundred lines and one hundred and twenty trunks. Direct lines will connect this board with the private telephone switchboard of the Pennsylvania at Philadelphia.

The Southwestern Telegraph and Telephone Company has established what is known as a half-hour service, which is coming into general use. The plan is to sell a certain firm or party thirty minutes use of a line between any two cities or more cities if desired, during a certain time of the day, during which time accumulated orders, correspondence and reports may be handled to the exclusion of all other use of the line. This service has met with considerable success from the fact that it eliminates the

necessity of delays in handling large amounts of business.

In connection with the merger of the various Bell companies operating in Pennsylvania, the executive offices of the Central District and Printing Telegraph Company of Pittsburg have been moved to Philadelphia. The officers of the company who remain in Pittsburg are M. C. Rorty, division manager; Sergius P. Grace, plant superintendent; F. T. Ewing, traffic superintendent; J. H. Boeggman, assistant auditor, and G. L. Herron, assistant secretary and assistant treasurer.

Mr. C. F. Mason has been appointed commercial engineer of the Pacific Telephone and Telegraph Company. In 1897, Mr. Mason entered the service of the Postal Telegraph Cable-Company in their executive offices, New York and remained there until 1907, when he went to San Francisco as secretary to Mr. E. C. Bradley vice-president and general manager of the Pacific Telephone and Telegraph Company. Since August, 1909, he has also acted as superintendent of leased wires for that company and has largely built up that branch of the service.

The New Anglo-French Telephone Cable.

At a recent meeting of the Physical Society, London, Professor J. Perry, presented an interesting paper on "Telephone Circuits" in which he discussed the use of the Pupin coils for loading telephone cables. In the discussion which followed, Major Walter A. J. O'Meara, chief engineer of the British Post Office, gave some interesting data in regard to the new submarine telephone cable which will soon be laid across the English Channel. The insulation of this cable is to be of gutta-percha, instead of paper which is the only form of insulation which has previously been used for loaded cables. On account of the high electrostatic capacity of gutta-percha it was contended that the formulae which have been worked out for the design of such cables would not hold good in this case. Before starting the manufacture of the new cable Major O'Meara and his staff conducted extensive experiments with artificial lines and proved that the formulae generally used were as accurate as in the case of a paper insulated cable.

As a result of their investigation the cable has been made with loading coils inserted one nautical mile apart. The coils used have a resistance of a little less than six ohms and an inductance of one-tenth of a henry at a frequency of 750 cycles per second. The conductors are of 160 pound copper and the insulation consists of 300 pounds of gutta-percha per mile. The capacity between the two conductors is twelve hundredths of a microfarad per mile. The attenuation constant of this cable unloaded is .045 per mile, while after being loaded and tested it was found to be less than .014 or in other words the efficiency is increased about three times.

The total length of the cable is twenty-four and two-tenths miles and it will be the first submarine cable in which the loading coils are distributed throughout its length.

Magnetic Storms.*

BY J. E. TAYLOR, A.M.I.E.E.

Magnetic storms, to designate them by their popular title, are exhibitions of electro-magnetic activity on a gigantic scale, which occasionally overwhelm this globe. The immediate effects produced are to disorganize telegraph working by the appearance of stray electric currents on lines operated with an earth return and to cause a very considerable fluctuation in the horizontal component of the earth's magnetic field. On the occasion of the magnetic storm of September 25 last, fluctuating currents of, in some cases, three or four times the strength of the working currents, made themselves apparent all over the globe. These currents maintained a constant direction of flow for prolonged periods (fifteen or twenty minutes being quite usual), with occasional reversals of direction, at irregular intervals throughout the period of duration of the storm. In England the phenomenon commenced at 11.40 a. m. and did not completely pass off until about 2 a. m. on the following day. Lines from London north to Newcastle-on-Tyne, south to Penzance, to the North Walsham Repeater Station, and to the repeater stations at Llanfair and Nevin, appear to have been specially strongly affected. Measurements taken at Nevin on a London wire of about 1,700 ohms resistance showed currents up to 120 milliamperes. As compared with the previous storm of October 31, 1903, the recent storm was much the more intense, though the duration was about the same.

At all times there exist on earthed telegraph wires fluctuating earth currents of a mild character, having roughly defined periods of maximum and minimum activity corresponding with the hours of daylight and darkness and with the seasons of the year, but between these ever-present disturbances and visitations such as that referred to, a strong line of demarcation is drawn. The primary cause is possibly the same in each, but while one is probably a direct effect the other is more likely an indirect or secondary effect.

Considering for a moment the electromotive force necessary to produce an earth current of roughly 100 milliamperes on a London-Penzance circuit of, say, 2,000 ohms resistance, it is evident that a difference of potential of about 200 volts is maintained between two points on the earth's surface about 300 miles apart. The earth being a conductor, this must involve stupendous electric currents circulating in the ground. In the case of the oceans, where the conductivity is far greater, it cannot be an exaggeration to say that millions of amperes of current are circulating during a magnetic storm of moderate intensity.

It is usual to connect together the phenomena of sun-spots, earth currents, and the aurora borealis. Not infrequently also volcanic eruptions and earthquakes are cited as possible causes of magnetic storms. At periods of magnetic storms, exceptional auroral activity is always apparent. Periods of ex-

ceptional sun-spot activity are not, however, by any means invariably periods of magnetic storms, though the converse appears to hold.

It may occur to many to ask why it should be necessary to seek an explanation outside the realm of the earth itself. That it is necessary, however, is fairly evident from elementary considerations. An electric circuit must always be closed or completed on itself. If the circuit were confined to the earth the currents could only be produced by electro-magnetic or electrostatic induction. But to maintain even weak currents continuously in one direction for prolonged periods would involve the continuous building up of electrostatic or electromagnetic fields of force of an intensity far beyond anything possible in terrestrial conditions. Even assuming a condenser effect between the rarefied upper regions of the atmosphere and the surface of the earth, the capacity would only be such that it would be charged or discharged up to or from the disruptive point of the air in a small fraction of a second, by a flow of current infinitely smaller than that which circulates in the earth's crust during a magnetic storm. Equally untenable are the assumptions that anything in the nature of electromagnetic induction is involved, whether it be held to be caused by telegraph wires cutting a magnetic field due to changes in terrestrial magnetism, or a projection of a magnetic field from the sun or other cosmic body. In other words there can be no doubt that an effect of conduction is concerned, and that both in view of its magnitude and sustained character it is of extra-terrestrial origin. Latter-day researches on effects occurring in high vacua under the stimulus of electric stress prove the possibility of the convective passage of large electrical currents in a medium which is otherwise perfectly non-conductive, by myriads of corpuscles each carrying its own quota of inseparable and invariable electrical charge and capable of moving with inconceivable rapidity through empty space. Such considerations led Fitzgerald, Birkeland, Arrhenius, and others to surmise that the phenomena of the aurora borealis and magnetic storms were due to streams of corpuscles in space occasionally entering the earth's atmosphere and being diverted towards the poles under the influence of the earth's magnetic field. The researches of Sir J. J. Thompson, and numerous other workers, bearing on the mechanism of electrical conduction in gases and in vacuum, combined with researches on radio-activity, not only shed much light on fundamental processes of electrical conduction, but have afforded a glimmering of the constitution of matter itself and its connection with the basic ether of space.

The most vital point in relation to the subject of magnetic storms, however, is the discovery that vacuum space can be traversed by electrical currents of considerable density, measurable in amperes per square centimetre of cross section, provided that a sufficient supply of the carriers variously known as corpuscles, electrons or disintegrated atoms of matter

*Article appearing in the Post Office Electrical Engineers Journal, London.

(not matter itself) can be brought into service. In these circumstances vacuous space becomes a very fair electrical conductor instead of a perfect insulator. Hence it is conceivable that the earth may be enveloped in the stream-path of an electric circuit in space. That such an event does occasionally occur appears to be the only tenable explanation of so-called magnetic storm visitations.

In a communication to the "Electrician" under date of January 11, 1901, Professor Elihu Thomson gives the outlines of a remarkable theory of magnetic storms, very complete and reasonable in its assumptions, though a little too materialistic, which does not appear to have attracted the attention it deserves. He points to the probable electrical agency whereby the sun's corona and coronal streams are formed in virtue of continually augmented electrical repulsion of ultra-fine-particles of matter due to shrinkage of an initially electrified nebulous mass. He further points out that the luminous corona is probably but a small part of the whole, and that invisible (because non-luminous) coronal streams may spread far away out into space. In the passage of the earth through such an invisible streamer, the phenomena of auroræ and magnetic storms would find adequate explanation. Some of the phenomena of comets' tails are also explainable on the same assumption.

The weak point in this theory is, of course, the extravagant expenditure of matter which would be involved in maintaining continuously the tremendous electrical effects concerned. But substitute for electrified material particles, disintegrated matter or corpuscles, and combine with the knowledge concerning the vast internal energy of atoms, rendered evident by recent researches in radio-activity and kindred studies, and the difficulty disappears. This internal energy is liberated in the corpuscular state, and if the invisible corona consist of streams of such corpuscles journeying, with tremendous velocity, from and to the parent solar body—an electrical atmosphere in which, perhaps, the whole solar system is immersed—occasional electrical displays on this globe are not surprising. Another difficulty may, at first sight, arise from this assumption, viz., that if the earth is always immersed in such an atmosphere there should be continuous auroræ and magnetic storms. But if it be considered that in such circumstances the earth must always possess a high negative charge, it will exert sufficient electrical repulsion on the corpuscular streams to divert them to a sufficient distance away and thus screen itself from their direct effect. It would then only be affected by exceptional increases in the density and potential gradients of the corpuscular streams in its neighborhood.

In support of the view of corpuscular atmosphere it is known that hot bodies are capable of ionizing gases, and that flames of all kinds contain and emit free corpuscles, though their presence is often only indirectly observed through ionization by collision with the gaseous molecules. It is, therefore, reasonable to assume that in an intensely hot body like the sun the emission of corpuscles may be extremely

great. It is also known that various substances can be made to emit corpuscles by the direct effect of light. In photoelectric effects it would appear that sufficiently intense luminous vibrations are capable of exciting corpuscles to which they may be attuned, to a degree which determines the dissociation of those corpuscles from the main system constituting an atom of matter. In the intense luminous vibrations at the surface of the sun the effect may be greatly magnified. The peculiar phenomena associated with comets coming within the range of influence of the sun, the rapid development of tails, the repulsion of the tails, which are always directed away from the sun, and are therefore in front when the comet is leaving, the apparent development of intense heat in the nucleus and self-luminosity which they do not possess when at great distances away, all appear to argue in favor of such an atmosphere. The late Professor Fitzgerald showed conclusively that repulsion by light from the sun is insufficient to account for the comets' tails being directed away from the sun.

Following the nebular hypothesis, instead of the heat of the sun causing atomic disintegration and emission of corpuscles, it naturally occurs that the reverse may be the case, i. e., the solar nucleus may be in a certain stage of formation, matter itself may be in process of formation by the slow agglomeration of corpuscles originally composing a vast nebular system. It is to be expected in such a case that highly attenuated gases would first be formed, and these would become self-luminous by reason of the electrical currents traversing them. As the action progressed the solid nucleus would form at a later stage. This, however, is at present but pure speculation.

The foregoing surmises may perhaps have an additional interest lent to them in view of the approach of Halley's comet into regions near the sun—an approach which may throw more light on interplanetary conditions, and indirectly on the cause of magnetic storms.

Increase in Price of Platinum

It is reported that a Russian commission, which has been investigating the platinum situation in that country, will recommend that the government fix a minimum price at which refined platinum may be sold each year, and that the price which will be fixed next year will be about \$710 per pound, or about twice the present price at which it is sold by the refiners in this country. As about ninety-five per cent. of the platinum supply of the world comes from Russia, this action will result in greatly increasing the price throughout the world. It is said that the demand of platinum has greatly increased during the past year. This action will, of course, affect the manufacturers of telegraph apparatus, as no material has ever been found which can successfully be used to replace platinum for contact points on telegraph instruments.

Telegraph and Telephone Age

Entered as second-class matter, December 27, 1909, at the Post Office at New York, N. Y., under the act of March 3, 1879.

Published on the 1st and 16th of every month.

H. E. DUNHAM, Associate Editor.

CABLE ADDRESS: "Telegraph," New York.

Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

April 16, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

The Rating of Telegraph Messages.

In our April 1 issue we published a letter from Mr. Roland R. Dennis, of Auburn, N. Y., who represented the United States at the Lisbon Telegraphic Conference of 1908, in which he advocated the rating of telegraph messages in this country on a per word basis. In this letter he stated that he had formulated a general plan for making the change from the present system, whereby the addresses and signatures are sent free, to the new system in which every word transmitted is counted and which is in vogue in all foreign countries. At our request Mr. Dennis has given the following rough outline of the plan which he proposes:

"Rating messages on the ten-word-address-and-signature-free basis, having been in use by us since the introduction of telegraphy, any movement looking to the successful acceptance of any other system must provide for the continuance of this rating for a term of years to the general, non-business public.

"All parties desiring the benefit of a per-word tariff would pay a tax of \$5.00 per year for the registration of their code address as is the established rule in foreign countries. Any messages forwarded to such registered addresses to be rated on the per word tariff. This tariff to be made up of a basic charge of, say, ten cents to cover the cost of receiving and delivering the message, and a per word rate adapted to the zone divisions as they now exist.

"The selective tariff privilege to be continued say three, or perhaps more, years and then, the public having meanwhile become educated to the new rating, the per word tariff to be made obligatory to all.

"While I fully appreciate how conservative our public is, especially regarding changes of any kind that affect daily routine, I am confident they would gladly welcome the introduction of a per word tariff by our telegraph companies."

Under our present system it is claimed that a shrewd business man can take advantage of the fact that the address and signature is not counted and insert code words as part of the same, thus compelling the companies to carry, for nothing, words which convey as much information to the recipient of the message as those for which the sender pays.

While a per word basis seems to be the most equitable one for both the telegraph companies and the public it is contended that the adoption of a code address system for domestic messages in the United States would lead to untold confusion. In Europe where the government owns the telegraph, the business man submits to paying \$5.00 per year for registering his telegraphic address. When the year has expired unless he has paid an additional \$5.00 no further telegrams are delivered to him and messages are reported back "party unknown." In foreign countries this course being taken by the government there is no redress. In the United States, however, such a course would be referred to the courts for adjustment and it is safe to say that the plaintiff in all such cases would be awarded damages. In any event if such action were taken by a telegraph company it would cause ill feeling on the part of the customer and he would be apt to not only transfer his own business to another company but would influence others to do the same. It is also claimed that the delay in decoding the address at the receiving end would be a source of annoyance. In this country the business man who makes use of the telegraph expects his message to be rushed through with all possible despatch. The introduction into the system of any operation which involves the least delay will lower the value of the service in his estimation.

If the Government controlled all of the telegraphs in this country or even if one private company had a monopoly of the business it would be comparatively easy to introduce the proposed change. With the conditions which

actually prevail, however, many complications would arise besides those mentioned which would render the adoption of a code address system extremely difficult if not absolutely impracticable. Where much of the business has to pass over the lines of at least two companies the result of such an innovation would be constant friction between the various interests involved as well as between the public and the companies.

Night Letter Telegrams.

The success of the night letter telegram service has been so marked from its first inauguration that those who established it are fully justified in their belief that it is an institution which was desired by the public. The traffic has steadily increased from the beginning and now the telegraph companies are confronted with the possibility that it may increase in time to such an extent as to make it impossible to handle this class of business with the present wire facilities and under the operating methods now in vogue. If this should prove to be the case, automatic telegraphy may have to be resorted to in order to take care of the vast amount of matter which will have to be transmitted over the wires. Will necessity be the mother of invention in this case as it has in so many others and will some one devise a printing telegraph system with sufficient capacity to cope with this service?

This is a question which is being asked by thinking men who are conversant with the telegraph situation and the chances seem very good that it will be answered in the affirmative. There are many men with inventive genius who are now working on this problem and from what has already been accomplished it seems safe to predict that one or more of these inventors will, in the near future solve the problem and produce a machine which will accomplish the desired results.

April 1, of this year, marked the sixty-fifth anniversary of the opening of the first telegraph line for commercial business between Washington and Baltimore. The possibilities of the new invention were so little realized that but one communication was sent over the wire during the first four days after it was placed in operation. From this beginning the great system which now reaches to the farthest corners of the globe and the receipts of which amount to many millions of dollars yearly, has grown. While the night letter telegram is not so much of an innovation as was the telegraph itself, the way in which it has been received by the public affords a striking contrast to the way in which they regarded the telegraph sixty-five years ago. The telegraph had to create a field for its use. On account of the widespread system of postal facilities which has developed along with the telegraph, the night letter telegram finds a field for itself already created. Under these circumstances it would not be an inconceivable state of affairs if the amount of matter which the telegraph companies may be required to transmit should double within the next

year or two. To handle so much business with the present wire facilities and the present corps of operators would be a practical impossibility. The man who devises a system which will meet such a situation and operate successfully at all times ought to have a place in telegraph history second only to that of Morse.

Efficiency to be Rewarded.

The resolution of the executive committee of the Western Union Telegraph Company, given in another column, to raise the wages of employes and improve their plant before increasing dividends will be hailed with joy by thousands of telegraph people throughout the country. The contention so often heard that corporations have no soul and care for nothing beyond the paying of dividends seems to be disproved in this case. It is recognized by the present management that the increase in wages of telegraphers has not kept pace with the increased cost of living and that as a result a young man about to choose a profession is not favorably impressed with an industry which offers him no more inducements than the telegraph does at the present time. Such a condition naturally lowers the efficiency of the organization and the executive committee has very wisely decided to make the announcement and have it generally understood that they will recognize merit among employes and reward them accordingly.

This action is but another proof of the contention which we have so often made, namely that the man who shows himself worthy of better things will receive them sooner or later. While to many it seems that in the telegraph the rewards are slow in coming they will find that the same condition exists at times in other industries as well.

This announcement in connection with the establishment of electrical schools among the employes in various cities is bound to increase the efficiency of the operating force of the telegraph, as now the assurance is given that as the efficiency is raised the reward will increase accordingly. Employes are being given a new incentive to do better work, and at the same time are afforded an opportunity to learn how to work to better advantage. The latter feature is one of the most important links in the chain and great credit is due Mr. Ashton G. Saylor, general superintendent of the eastern division, who is the guiding spirit behind this movement, for his good judgment in having these schools established throughout his division and for the business-like way in which their organization has been effected.

Promptness a Necessity for Success.

Mr. E. W. Collins, superintendent of the Postal Telegraph-Cable Company at Cleveland, O., in an article published in the Postal Telegraph complains of a condition which exists throughout the country among all companies. Some of the managers of offices in his district, he says, have to be repeatedly appealed to for information which could be pre-

pared in a few minutes time and are guilty of gross carelessness in other respects. As Mr. Collins says, the managers who are successful and are forging to the front can always be depended upon and are always prompt in supplying desired information. And yet those who do not get ahead complain that there are no chances for promotion and that they never have any good luck, while at the same time, they neglect even the smallest opportunity to create a favorable impression with their superior officials. The man who fails to make good with small things entrusted to his charge can hardly expect to be given greater responsibilities. When a superintendent asks his managers for information it should be taken for granted that the data desired is important and will have to be supplied at some time, otherwise he would not ask for it. How much easier it would be to look up the required information send it in at once, and thus be able to dismiss the matter from the mind, than to wait until to-morrow or the day after or until the superintendent repeats his request, frequently by two or three despatches. Some even seem to think that it is unbusinesslike to answer communications the same day they are received. The sooner they get this idea out of their minds the better it will be for them. The best interests of their employers demand promptness in all things and the best interests of the employe are coincident with those of the employer. Those who are mere hangers-on to the payroll have little chance to succeed, as Mr. Collins truthfully says. The only ones who receive any great promotion are those who take an interest in their daily work and look after the small details as well as the large.

Unrecognized Heroes.

Many stories have been written about acts of heroism upon the part of those employed in the telegraph service, but few people, when they see a telegraph lineman, recognize in him anything of the heroic. In a certain sense, however, every lineman is a hero, as he takes his life in his hands every time that he climbs a pole. With the many high tension electric light and power wires which cross or run on the same poles as the low tension telegraph and telephone lines, there is always danger that the latter wires may be charged with a deadly voltage and the lineman has no means of knowing this until he has touched the wire. And then the knowledge usually comes too late to do him any good. Almost daily we hear of linemen being killed by coming in contact with deadly wires. In one mail recently we received notices of three such accidents from our Boston agent. Because of the fact that these occur in the ordinary routine of the lineman's work all of the public notice which the unfortunate victim receives is a scant two or three inches in the newspaper columns and he is soon forgotten. Yet, he is as much a hero as the man who fights his country's battles and is entitled to much greater respect than he usually receives.

Government Makes Raid on Bucket Shops.

The government officials at Washington have been engaged for some time past in collecting evidence against bucket shops operating in various cities and on April 2 warrants were issued for the arrest of twenty-nine men who were connected with three different concerns. All three were members of the Consolidated Stock Exchange of Philadelphia, which they used as a clearing house for their operations. It is claimed that 250 bucket shops were maintained in cities throughout the United States. It is alleged that the business of these concerns has been carried on over leased wires and it has been suggested that action might be taken against the telegraph companies for furnishing the wires for this use. Mr. Belvidere Brooks, general manager of the Western Union Telegraph Company, when asked in regard to the contention that his company ought to be aware, at least to some extent, of the character of its clients, said:

"Telegraph companies are required to render service to the public without discrimination, and must accept all messages couched in decent language when offered at a telegraph office for transmission, and cannot and should not be permitted to inquire into the character of the message or its purpose, nor to compel any disclosure respecting it by the sender, and in most of the states this right of the public to have its business transmitted is provided for by severe statutory penalty. It is utterly impracticable for a telegraph company to investigate the business affairs of persons dealing with it or to establish any system of espionage whereby the telegraph company may determine the use which the person filing or receiving a telegraph despatch or the lessee of a wire intends to make of the same, and it is under no duty to make such an investigation.

"The same doctrine and right obtains as to wires furnished whether to individuals or corporations, inasmuch as telegraph companies are engaged in the business of leasing wires for telegraph purposes generally.

"These leased lines of wire are in the possession of and under the control of and are operated by the lessee. The telegraph company has no more legal right or moral right to ascertain the character of business sent over a leased wire making a large return annually as rental than it has to require the filer of a twenty-five cent message to disclose the nature of the contents and the purpose of sending it."

A Houston, Texas paper recently, in commenting upon the fact that Judge Robert S. Lovett, president of the Union Pacific Railway System and Belvidere Brooks, general manager of the Western Union Telegraph Company were both visiting in Texas, their native state, at the same time said: "Another half a century the head of everything worth talking about will be a Texan and when the universal republic appears, a Texan and his immediate democratic neighbors and friends will run that."

TALKING AND TELEGRAPHING SIMULTANEOUSLY OVER THE SAME LINE.*

The Composite Circuit.

BY U. C. KISSELL.

Two line wires are needed for a long distance telephone line to form a metallic circuit. Transmission of telegraphic messages is customarily carried on over a single wire, the circuit being completed through the ground. It follows that every metallic circuit telephone line has enough wires for two telegraph circuits. Each wire can actually be made to carry a two-fold burden without causing interference between the apparatus used for telegraphing by the electrical currents used for talking and signalling for telephonic purposes and vice versa. The circuit used for this purpose and known as a composite circuit is shown in an elementary form in Figure 2.

Considering the circuit first as representing only two telegraph lines the diagram shows a telegraph instrument placed at each end of each wire and connected to the "live" pole of a grounded battery common to both instruments at that end of the line. At each terminal an impedance coil is put in series with each line wire, between the line and the telegraph instrument. This impedance coil has a core containing a considerable amount of iron and is wound with a large number of turns of rather coarse insulated wire to a resistance of fifty ohms. Although the resistance to direct current is low the large number of turns of wire and the large amount of iron in the core make the impedance to alternating current high, and it is this quality which makes it possible to utilize the coil for the separation of telephonic and telegraphic currents. The precise reason why it performs this function depends upon a few simple principles of electromagnetic action and may be explained as follows:

An electrical circuit has a certain kind of inertia analogous to the inertia of water in a circuit of pipe, and this inertia of an electric current is called inductance. If an electric current in a circuit is made to change in value a portion of the electromotive force acting upon the circuit must be used to cause the current to change. The instant current is passed through the impedance coils a magnetic flux is set up in the iron core, and this flux will pass through all the turns of wire on the core. Now if a magnetic field is passed across a conductor an E. M. F. will be induced in the latter and this is what happens in the coil when current is turned on. Just as soon as the circuit is established the magnetic flux in the core, created by the magnetizing force of the current, changes

from zero to a certain positive value. The lines of force thus created spread outward, cutting all the turns in the coil and induce in it an E. M. F., which is opposite in direction to the impressed E. M. F. which is causing the current to flow. Here then is found an opponent to the very cause of its existence. This induced E. M. F. only appears or shows itself while there is a change going on in the strength of the magnetic field. When the flux is changing from a zero to maximum value there is an induced E. M. F. in the coil in a direction opposite to the E. M. F. which is sending the current through the coil. The difference between these two E. M. F.'s is the pressure which is actually causing the current to flow. When the current reaches a certain strength and remains so the magnetic flux will remain constant, and consequently there will be no opposing E. M. F. in the coil and the current will then encounter only the ohmic resistance of the coil.

If a current flowing through a coil is suddenly stopped the process is in a manner reversed, and

Figure 1. Wave forms corresponding to impulses of direct current passing through line without inductance (a) and forms corresponding to similar impulses passing through impedance coils (b.)

the magnetic flux in the core then changes from a maximum value to zero. This change or decrease in the number of lines of force induces a current in the coil in the same direction as that which was originally passing through the coil. The action of the coil therefore tends to oppose for an instant any rise of the current in the coil and to temporarily build or boost up any falling current. The effect of this action upon a train of electric waves is shown graphically in Figure 1. At a is shown an electric wave which would pass over a line or through a coil containing no self-induction without change of form if the effect of capacity, which does not relate to the immediate branch of the subject discussed in this paragraph, is overlooked. Starting from zero it rises to its maximum value almost instantly, staying at a certain strength until the circuit is broken, then falling abruptly to zero. At b is shown a wave created by application of the same electromotive force as that shown at a to the terminals of the line, but in this case the form is drawn as it would appear when the wave passes through a coil having inductance. When the circuit is established the current, instead of rising to its full value instantly, does so gradually on account of the opposing E. M. F. induced in the coil pushing it back. When the circuit is broken the falling off in value of the current also takes place gradually

*Article reprinted from the American Telephone Journal.

on account of the induced current due to self-induction being at this time in the same direction as the applied E. M. F. This tends to build the wave up, or add to it, to prevent it from falling abruptly.

For the foregoing reasons a coil of wire having the property of self-induction, when placed in an electric circuit, tends to flatten the electric waves or, in other words, would have the effect of rounding off the corners of any sharp electrical impulses which are passed through it.

There is something else to consider in relation to a circuit containing inductance, and that is time. It takes a fraction of a second to start a current flowing in a circuit, stop it and start it again in the opposite direction. For instance, suppose E. M. F. is impressed on a circuit and stops and reverses itself before the current has

of six micro-farads connected to ground as shown in the diagram. This condenser has the property of absorbing a certain amount of electricity and, as placed in the circuit, this amount must flow before the current passes on. The amount of electricity which it will hold or the charge it can contain depends upon its capacity (measured in micro-farads) and the E. M. F. of the charging circuit.

When, in operating one of the telegraph circuits the upper key at A is closed a current impulse starts from battery and passes through the telegraph instruments to point 1. Here it will suffer a delay on account of the condenser, as a certain amount of electricity must flow to charge this condenser before the current passes on. This will require a fraction of time, and the length of this interval depends upon the

Figure 2. Elements of Composite Circuit—two grounded telegraph circuits and one metallic telephone circuit worked on one pair of wires.

had time to get started on account of the inertia (inductance) of the circuit. No current will pass in this event, simply because the E. M. F. is stopped and starts in an opposite direction before the current has had time to flow. The amount of time necessary for the E. M. F. to overcome the inertia of the circuit depends upon the inductance and resistance of the circuit. These facts make it possible to introduce a coil in a circuit which contains a large inertia or inductance and alternate the current so rapidly that none will be able to flow through the coil. A coil which will bring about this result is termed an impedance or reactance coil.

The coils placed in series with the line wires and between the telegraph instruments and the line in Figure 2 have the effect of rounding off the sharp edges of the "Morse" impulses. Between these coils and the telegraph instruments are placed condensers, each having a capacity

capacity of the condenser and the resistance of the circuit. From this point current will pass through the impedance coil a, where it suffers another delay on account of the self-inductance of the coil. From here it passes over the line, through coil b, through the telegraph instruments at station B to battery, to ground and back to battery at A. Not only is the current impulse thus made to suffer a delay by reason of the charging of the condensers on each end of the line, but it has its wave flattened out on account of the inductance of the coils. In practice the key at A is opened almost as soon as it is closed. When the key is opened the coils a, b prevent the current from falling instantly and therefore, by placing the coils and condensers in the telegraph circuit, the sharp Morse wave is slowed down and altered in shape. The circuits on both sides of the telephone line being the same, of course their action is the same.

On the line side of each of the impedance coils in the main circuit is bridged another coil connected to the line wires by means of two condensers of two micro-farads capacity each, as shown in diagram. Directly across the terminals of the latter coil two taps are taken off, and these lead to the telephone circuit. The action of the latter coil in the circuit can also be explained in simple terms.

When A is transmitting speech to B the waves of comparatively high frequency talking current are choked back by the coil *e* on account of its high self-induction and pass through the condensers 3, 6 to the line wires in preference. Here the waves are again choked back by the coils *a* and *c* and prevented from passing through the "Morse" instruments, which, if ohmic resistance alone were considered, would seriously shunt the telephone line. The waves pass over the line wires *x* and *y* and, upon reaching the other end of the line, they pass through the 2 M. F. condensers 4, 5 to B's instrument, being confined to this path by the impedance of the coils *b*, *d*, *f*. Therefore at a given instant the high frequency talking current from A passes to point 2, through condenser 3, line wire *x*, condenser 4, through B's instrument, condenser 5, line wire *y*, condenser 6, back to A. The ohmic resistance of each of the coils *e* and *f* is 60 ohms, and they are connected at their centres to ground. Their action is to equalize any difference of potential between the line wires and to prevent this levelling of potential from passing through the telephone instruments. If in their absence the keys *g* and *h* were open and then key *g* closed, key *h* remaining open, the telegraph current upon reaching point 7 would pass over line wire *x* and also through condenser 3, telephone at A, condenser 6 to the other line wire. This would cause an intense click in A's instrument. As the circuit is actually wired coil *e*, being of low ohmic resistance and offering very little impedance to low frequency currents, shunts out practically all of the current that would tend to pass through the telephone instrument. This would also be the case if the batteries used on the two-line wires for "Morse" operating were not the same. For instance, if the voltage of the "Morse" battery on one wire was 110 volts and on the other eighty volts there would be a difference of potential between the line wires of thirty volts, providing the current was in the same direction in both wires. This difference of potential would be constantly shifting and equalizing itself through the telephone instruments if provisions were not made to shunt them out.

In the practical operation of a composite circuit it is very desirable that the currents flow in the same direction in both line wires and be of the same strength and voltage. If a line had 110 volts positive potential on one wire and 110 volts negative potential on the other as both batteries are grounded there would be a dif-

ference of potential of 220 volts across the two line wires, which is rather a high voltage to operate through ordinary telephone cable and wiring. If the voltage used on both line wires is the same and the current flowing in the same direction in both, with sets of terminal apparatus of the same resistance on each side of the line, there will be practically no difference of potential between the two line wires when both keys are closed. The best conditions for practical work and the maintaining of homogeneity between the two line wires in operating composite circuits will be taken up in another article.

General Mention.

The headquarters of the Associated Press at Atlanta have been moved and are now located in the Austell Building.

Arrangements have been made in Mexico City for placing all of the Government telegraph wires underground, during the coming summer.

Plans have been completed for installing at Rio de Janeiro a modern pneumatic tube system for transmitting telegrams and other messages to various parts of the city.

It is reported that the adoption of a night letter telegram system similar to that recently instituted in the United States is being considered by the telegraph companies of Canada.

The Telepost Company is securing rights of way in Delaware and Maryland for a line from New York to Washington. A bill has been introduced in Congress authorizing the entrance of the Telepost Company to the District of Columbia.

A bill has been introduced in the New Jersey Legislature prohibiting the employment by the telegraph or telephone companies of any person under eighteen years of age to deliver messages between the hours of 10 p. m. and 5 a. m.

At the annual meeting of the Montreal Telegraph Company, the following officers and directors were re-elected: H. A. Allan, president; W. McMaster, vice-president; other directors: W. R. Miller and W. Wainwright. The lines of this company are leased to the Great North Western Telegraph Company.

It is reported that experiments will soon be conducted between London and Paris with the Pollak-Virag system of high speed telegraphy. Similar experiments were tried several years ago, but were unsatisfactory because of interference from neighboring circuits. It is believed now, however, that this difficulty has been overcome.

By a strange coincidence four presidents, or former presidents of large express companies have died within the past seven months, all of whom were well known in the telegraph field. The first of these Colonel M. J. O'Brien of the Southern Express, died September 11; Thomas C. Platt of the United States Express, died March 13; Colonel Dudley Evans, of the Wells-Fargo Express, died March 27, and Levi C. Weir of the Adams Express, died March 28.

The Military Telegrapher in the Civil War.

PART XXXVII.

Mr. Sidney B. Fairchild was prominently identified with the military telegraph service of the Department of the Gulf during the last two years of the war. After the close of that conflict, he went to St. Louis and served the Western Union Telegraph Company at that place for nearly forty years, until his death, February 27, 1904. For many years of that time he acted as night wire chief. In writing to Colonel William R. Plum, historian of the United States Military Telegraph Corps in 1878, he gave the following interesting account of his war-time experience.

"In the spring of 1863, while manager at New Haven, Conn., I received a very pressing letter from Charles S. Bulkley, captain and assistant quartermaster at New Orleans, in charge of the government telegraph lines for the Department of the Gulf. It contained a tempting offer for me to join him. I had served with Captain Bulkley during the time he was superintendent of the old Washington and New Orleans line at Washington, D. C.; we had become good friends and it seemed that when he again entered the telegraph service, he remembered his former employes. The inducement of a salary double that which I was receiving was so great that after a little hesitation, I accepted his offer. My transportation papers were forwarded to me by General Stager and I sailed for New Orleans the day the New York draft riots were at their highest.

"Edward Conway, who had seen service in the army of the Potomac, was chief assistant to Captain Bulkley. Mr. Conway seemed especially adapted to out door work, field labor, line building and engineering, indeed I do not think he had his superior in the government service during the war. He would keep the lines working through the enemy's country where it seemed almost impossible to do so and was restlessly energetic in his department, but for office work and the indoor management of affairs he was not a success. After a few weeks an arrangement was made whereby Mr. Conway became the manager of the lines outside of the office and I became chief operator of the Department of the Gulf.

"The wires then extended up the Mississippi river to Morganzia at which point steamers from the north would touch and report their arrival to the general, commanding at New Orleans or, if the wires were not working to Morganzia they would report at Baton Rouge.

"A. W. O'Neil was the operator at Morganzia and S. L. Griffin at Baton Rouge. Down the river from New Orleans, the wires extended to South West Pass and Pass à l'Outre having offices at Forts St. Phillip and Jackson and at the quarantine station. There was also a line to Franklin, La., over the Brashear City railroad, another to Pass Manchac and in the direction of Mobile to a point I do not now remember. The fire department wires of the city of New Orleans were

also at that time under Captain Bulkley's jurisdiction. To keep the wire up the river in working condition was a most difficult task. Bushwhackers were continually interrupting communication. Finally the commanding officer, General Banks, issued an order which was proclaimed throughout that region that whenever the wire was molested every house or habitable building for a distance of twenty miles in each direction would be destroyed and I think in one instance this order was executed. After this became generally understood there was little trouble except from natural causes. Towards the close of the war the Confederate ram Arkansas in trying to reach the gulf hitched the wire onto its stern, tearing the line down for about half a mile before it broke. This was in the vicinity of Bonnet Carre, La.

"Early in the spring of 1864 the army of the gulf began its march having for its object the siege of Shreveport and the destruction of the forces of Generals Kirby Smith and Dick Taylor. Some disagreement having taken place between Captain Bulkley and Conway as to the management of field work in this expedition, Conway in a moment of anger resigned. I was then placed in charge. We had five wagons, three of them loaded with wire on reels and two containing the lighter paraphernalia, the traps of the line men, operators, etc. With me as operators were W. H. Munro, William Foley, Horace Nichols and one other whose name I cannot recall. We reached Brashear City by railroad, from thence we went to New Iberia by steamboat sailing up the beautiful Bayou Teche. We remained at New Iberia some days, having communication with New Orleans all of the time. I was glad enough one of these days to hail the arrival of Conway, who had made peace with Captain Bulkley, and was sent forward to relieve me of the command but with orders to me to keep along with the expedition. On the fifteenth day of March we had moved seven miles but were still in communication with New Orleans. Most of us had obtained horses and rode them in preference to riding in the wagons. Conway and Munro were good riders, but the rest of us were novices of the most awkward kind. An incident occurred after severing communication with New Orleans, which came very near terminating the telegraphic part of the expedition. We were placed for a day or so under the immediate care of the second New York volunteer cavalry. The officers in command, when they marched forward, overlooked us entirely. We were still in our office tent having received no orders to move and the army had gone on leaving us alone in the enemy's country. It was not long before the bushwhackers found us and realized our situation. We were startled by the report of rifle shots coming from an unknown source and realized that they were not accidental when one struck the pole of our tent. Fortunately, General Banks needed his cipher operator and sent to the Colonel of the second New York cavalry for him. When

it was discovered that we were left behind the whole regiment was immediately ordered to our relief. They came back with a rush and I will never forget the feeling of gladness which came over us all and even the Colonel himself seemed overjoyed to see us for a rumor had reached him before he met us that we had been captured. Indeed such a report reached New Orleans and was a cause of great suspense to our friends for many days.

"We arrived at Vermillion on the 9th of March. Here we found the first elevated ground we had seen. Riding along on level ground for so many days the drivers of our wagons had become careless. William Foley and myself were made aware of this fact by turning a double somersault to the foot of a hill the contents of the wagon following us. No one was injured however. On the twentieth, we reached Washington and rested a day. On the next day we covered twenty miles through a heavy rain. At night it became quite cold. Our tents were but little protection from the pelting rain, which poured down with an incessant patter. We slept in the mud and water with considerable discomfort, but with no harmful results. Captain Bulkley gave me this advice when I left him; 'Now some of the headquarters men are taking along cots and other absurd contrivances for keeping off the ground. You will find yourself far more comfortable and in better health if you sleep right on the ground in your blanket.' I had had trouble nearly all my life with catarrh and although I caught a severe cold the very first night out, that was my last. I recovered from it in a couple of days and it never returned. I was also completely cured of my catarrhal tendency and my health improved day by day amid all the exposures of camp life.

"Passing Holmesville and Cheneyville through magnificent plantations, constantly hearing of the enemy in front, slowly retiring as we advanced, we arrived on the twenty-fourth of March at Governor Wells' home within fifteen miles of Alexandria. The next day we reached Alexandria. Here we remained until April 3, receiving supplies via Red River. Thus far the general commanding had ordered that property along the line of march should be protected from pillage and non-combatants should not be disturbed. So far as I could observe, this order was sacredly carried out. Occasionally a barn would be sacked of its contents for the necessities of the forage department, but no dwelling was molested.

"On the third of April, the operators left their wagons and horses at Alexandria to accompany the army and took the steamer Laurel Hill for Grand Ecore. The steamer having been aground at the rapids all of one day and part of the next, our teams arrived at Grand Ecore before us. We reached that point on the night of the fifth. The next day Munro, Foley and myself obtained permission to ride outside the lines and visit the old town of Natchitoches. While on the edge of the town, passing through a grove of trees, Munro, who was familiar with the people discovered that

we were being followed by guerillas. Being outnumbered and not well armed we fled for our lives at a rapid pace, several shots passing harmlessly by. Upon our report of this fact Natchitoches was immediately occupied. On the eighth of April, the whole army began its march for Shreveport direct. The first day we made fifteen miles in a hard rain storm. By night the roads were in a wretched condition. The next morning, however, was clear. It seemed an auspicious day for us but it ended in gloom and defeat. We had reached Pleasant Hill without seeing any sign of the foe, but two miles farther on, at a place since known as Mansfield, we encountered the enemy and were badly beaten. We won a partial victory next day, but we did not, however, recover what we had lost and were obliged to retreat to Grand Ecore and ultimately to Alexandria and New Orleans. Conway left Grand Ecore on the twentieth with Admiral Porter, with batteries and other electrical apparatus to be used in blowing up the gun boats in case they could not pass over the falls above Alexandria. The rest of us continued our retreat to Alexandria by land. On the twenty-third the battle of Cane River Crossing which was a victory for us was fought. We were somewhat harrassed in front and rear, however, until we reached Alexandria. It will be seen that as telegraphers we had little to do but it must be remembered that we carried the cipher book and were continually in demand at the General's tent deciphering communications from Washington and from Commanders of other departments and other points. I remember I sat up one night in the general's tent at Grand Ecore from 6 p. m. until 6 the next morning trying to decipher a message from General Steele, which had been 'put up' wrong, but I succeeded at last.

"At Alexandria, I was ordered by Captain Bulkley to return to New Orleans by boat. Leaving there on the thirtieth of April I narrowly escaped capture by a Confederate battery, which destroyed the boat immediately in our rear, killing or capturing every one on board. I arrived safely in New Orleans on the second of May, where I remained until the war was over."

Humorous mistakes are sometimes made in sending telegrams. Such an error which was not attended by any serious results occurred recently in a western city when the secretary of the Board of Trade wrote a telegram stating the board's endorsement of the proposition for the government to erect embassy houses, intending to so notify each representative of the state. This message was addressed to the local congressman and a list of the other representatives in congress was left at the telegraph office with instruction to repeat the message to each. The telegraph clerk, misunderstanding the instructions, sent the message to the local representative with all the other names, those of his colleagues, most of whom were in Washington at the time, attached as signers.

Telephone Train Despatching.

BY J. B. SHELTON, OMAHA.

Superintendent of Telegraph of the Union Pacific Railroad.

GENERAL.

For the past two years, the subject of telephone train despatching has been prominently before the railroad world with ever increasing strength and popularity, and the inroads it has made, within so short a time, upon the time-honored and seemingly perfect and permanent system of telegraphic despatching, is really quite marvelous and nearly beyond calculation.

Trial circuits that were established by some of the more venturesome roads, but not without some misgiving as to the ultimate and complete success of the innovation, proved so thoroughly reliable, expeditious and economical in operation that telephone train despatching was soon adopted as standard by the very conservative American Railway Association, and, since then, upwards of forty of the leading railroads in the United States and Canada have gone into it and are constantly putting this system into more extensive use. It is likely to be only a comparatively short time before the telephone is used altogether, in place of the telegraph, for the despatching of trains.

Before the incipency of telephone train despatching over railroad operating districts, averaging from one hundred to one hundred and fifty miles in length, the telephone had been used quite extensively in the operation of large yards and terminals, and, what is known as railway composite telephony or simultaneous telegraphy and telephony on a single grounded wire, had been used considerably, with telephone sets on trains, or in booths at sidings, for use in helping trains along that would otherwise lose valuable time at sidings waiting for delayed trains to pass. The telephone was found so beneficial in these ways, especially by trainmen, who could not operate the telegraph, that its development and enlarged use in the movement of trains was naturally only a matter of time. There was some prejudice to overcome, as usual where any radical departure from long continued practice is proposed, but the benefits to be derived were so certain and indisputable that even the most conservative could not long hold out in opposition.

UNION PACIFIC INSTALLATIONS.

The Union Pacific management early became convinced, after careful investigation, of the desirability of this new system and authorized the construction and equipment of a circuit between North Platte and Sidney, a distance of 123 miles, that has been in successful operation for more than a year. Since then, other circuits as follows have been authorized and will soon be ready

for operation: Sidney to Laramie, 159 miles; Rawlins to Green River, 134 miles; Green River to Ogden, 176 miles; and it is predicted that comparatively soon this system of despatching will be in use along the entire length of the main lines of the road.

COST OF CONSTRUCTION AND EQUIPMENT.

The cost of these circuits, that consist of two copper wires, each weighing approximately 210 pounds per mile, is from \$105.00 to \$115.00 per mile; the dispatcher's telephone equipment costs about \$40.00; the telephone equipment for each station is valued at about \$20.00; the booths cost about \$60.00 and booth apparatus nearly \$50.00; and the selector equipment costs approximately \$40.00 for dispatcher's office and \$30.00 for each station.

TRANSPPOSITIONS.

The two wires, composing the circuit, are transposed, in respect to their locations on the cross-arms, as often as is found necessary to overcome cross-talk from other telephone circuits and the noisy effect of induction from the telegraph and other outside influences. It has been the rule on the Union Pacific to transpose every one-quarter mile, although one-half mile transpositions are more general on other lines. More frequent transpositions are necessary in some instances where there are paralleling high tension circuits that cause more than the usual amount of disturbance.

AUXILIARY CIRCUITS.

It is also customary to transpose the former telegraph despatching wire with the local railroad message wire, to form an auxiliary telephone circuit that can be patched into the regular despatching circuit between any two testing offices as may be necessary, to make the circuit good. Then the trouble is located and repaired, after which the circuits are restored to normal condition. This auxiliary circuit can be used in some cases to supersede the telegraph, if desired, for the handling of local railroad messages.

INSTRUMENT CONNECTIONS.

These circuits, with modern equipment, admit of the connection of quite a large number of instruments, at regular stations as well as for use of trainmen in booths at sidings where operators are not maintained, with very satisfactory results. Our present and proposed circuits have and will have from twelve to twenty-three station sets and from six to twelve booth sets. In some cases on other lines as high as forty-five sets are in satisfactory use on a single circuit.

DESPATCHERS EQUIPMENT.

The telephone equipment at the dispatchers office is largely of special design for this particular service, as the dispatcher, who is in constant connection with the line, so it is not necessary for stations to signal him, and whose duties

are very intricate and exacting, should have the benefit of the best available contrivances, consistent with good service in general, for the ease and comfort of his work.

His receiver is a standard one of seventy ohms, which is of fairly low impedance and provides him with what is considered the best possible receiving. The receiver is of the head pattern, which the despatcher wears constantly, and is in series with a condenser as well as an induction coil that is specially designed to permit the best transmission consistent with good receiving.

The transmitter is of the chest type and has a special button, designed to give the best grade of speech in this class of service. A locking key is provided for closing the transmitter circuit, to permit the despatcher free use of both hands for his work.

Battery power required for the despatchers transmitter on the average circuit is approximately four volts. As his transmitter is connected in the circuit most of the time, consumption of battery is high compared with station equipment. On this account storage battery can be used for this purpose with economical and more satisfactory results.

Each despatcher is furnished a separate telephone set, which he connects with the line by placing a plug connected with his set in a jack provided for that purpose. This is desirable where instruments are used so long and continuously for sanitation and health.

STATION EQUIPMENT.

Telephone apparatus at stations is of a design that was found necessary to overcome the difficulties experienced with a large number of telephones on a circuit and a number of operators listening on the line at once.

In some of the first circuits, impedance, or resistance of varying degrees, was inserted in the telephone bridge at the different offices, the highest impedance being placed at the offices nearest the despatcher and tapering down from there to the end of the line, with the object in view of equalizing the distribution of energy between all the instruments on the line, instead of the nearer offices receiving an abnormal volume and the farther offices receiving less than required for satisfactory results.

Then a great improvement was effected by the development of the high impedance receiver, of about 700 ohms resistance, now in use on our North Platte-Sidney circuit, that enables the use of a uniform style of receiver throughout the length of the circuit without other varying resistances to equalize, the additional winding of the receiver affording sufficient impedance to approximately balance the flow of energy all along the line and permit the use of a large number of receivers at the same time without deteriorating the service. The placing of most of the impedance in the receiver itself, in this way, instead of in the circuit outside of the receiver, as formerly, has considerably improved

the receiving and made it more uniform throughout the line.

With the use of the high impedance receiver, other changes in the make-up of the circuit were required, as follows:

Formerly the receiver, when in use for receiving, was bridged across the line in series with a condenser and the secondary of an induction coil. Under the new plan, in such case, the receiver is simply across the line in series with a condenser. The former arrangement would not do with a high impedance receiver, because, under that arrangement, all the secondary talking current passes through the receiver and a high impedance receiver, used in such a way, would cut down the transmitted current and produce excessive side tones.

A retardation coil has also been installed, which is connected into the receiver circuit while talking, and is for the purpose of preventing excessive side tones in the receiver at such times, as well as, by thus raising the impedance of the receiver, to compel more of the transmission current to pass upon the line. The retardation coil is constructed, however, so that enough current will flow in the receiver to enable the despatcher to interrupt the transmission of the operator if he should desire to do so.

Also, when talking, the secondary of the induction coil is bridged across the line in series with a condenser, instead of in series with the receiver and condenser as formerly.

According to up-to-date practice, the transmitter is not connected in the circuit while the operator is listening, but is so connected only when the operator wishes to talk and presses a push button key for that purpose that is located on the table convenient for operation with his left hand. In this way, by keeping the transmitter cut out except when actually talking, noise at stations, such as vibration of telegraph instruments and passing trains, conversations of people in offices, etc., which would otherwise make the circuit more or less noisy, is almost entirely eliminated from the line. This also reduces consumption of battery, as battery is consumed only when the transmitter is in the circuit.

The transmitter at stations is attached to an adjustable arm, called a "flexiphone," that is mounted on the operating table, or on the wall adjoining, and can be readily moved to a position so the operator need not be in a strained position while talking.

Head receivers are also used by operators so they may have both hands free.

The operation of a station transmitter requires three cells of dry battery, or their equivalent, for distances from the despatchers office of approximately 100 miles, beyond which, up to the end of line as now satisfactorily worked, four cells are required.

BOOTH EQUIPMENT.

Booths for sidings are of standard construction, without windows, that would likely become

broken, but ventilated, are 6' x 6' in size and the doors are fastened with switch locks so trainmen can readily secure access.

Wall type telephones, with the high efficiency transmission arrangement similar to station sets, are used. These sets are placed in boxes on the wall, which will also hold the transmitter battery, where dry instead of storage battery is used, and the doors are locked with switch locks. When the door is unlocked and swings open a switch is operated that automatically lights a four volt, six candle power tungsten electric lamp, from storage battery, which furnishes sufficient light for the booth. This same switch, when the door is closed, disconnects the telephone from the line in case the user fails to place the receiver back on the hook when through talking.

Egry registers are also installed in the booths, under and a little to the right of the telephone, where convenient for the conductor to write his orders as given by the despatcher. Each register contains four rolls of train order forms with carbon paper; three copies can be torn off for use of the train crew, while the fourth copy is automatically rolled up in the bottom of the register and is under lock so it can be removed only by an authorized person.

SELECTOR EQUIPMENT.

In the early stages of telephone train despatching, a satisfactory means of calling offices by the despatcher was found very essential. While nearly all ordinary railroad telephony is on a magneto basis for calling, on account of its simplicity, the satisfactory use of such equipment is limited to a comparatively small number of offices on a line, and then, it is undesirable in a way, because the code calls for the different offices come in at each station. This makes it necessary for each office to take note of each call to determine whether or not it is for them, and, where there are many different and frequent code rings, this is quite annoying and interferes more or less with other work. There are also limits to code ringing, as each bell forms a shunt across the line, thus limiting the number that can be satisfactorily used.

Although devices had been in use for twenty years or so on telegraph circuits, that permitted the despatcher to call offices selectively by the making of various combinations with a telegraph key, it was not long after the start of telephone train despatching that several improved styles of apparatus were specially devised to meet this new demand for the calling of each station, independently of the others, by the despatcher when wanted. This is technically known as selective signalling and the instrument that accomplishes it is called a selector. Some of these systems operate with clock works and others on what is called the step-up plan.

After careful investigation, the Union Pacific adopted what is known as the bridging system that is entirely controlled by the despatcher. In the old style telegraph selector, the

bell would ring until the operator stopped it; while with the new, the despatcher can stop it at will. With this new selector, it takes approximately eight seconds for the despatcher to start the bell at a distant magnet at the station that gives a faint answer-back in the despatchers telephone, so he knows whether the bell is ringing; and, after the despatcher has made a call, he or others can continue work by telephone without interference from or to the operation of the bell.

This system also has the advantage that, in case of trouble at any one station, that station only is affected. The remainder may operate normally. It is the same principle as that involved in the present day system of incandescent lighting, where the lamps are wired in multiple and the burning out of one lamp affects that lamp alone.

The despatchers calling keys are mounted in a cabinet placed before the despatcher, there being a separate key for each equipped station on the line. These keys can be readily taken out of the case and replaced by others, as may be desired, and a few extra ones for emergencies, as well as room for others for future growth, are provided.

The contacts of these keys operate two telegraph relays, one located in each side of the circuit, through the contacts of which the direct current impulses are sent out on the line. A resistance and condenser are bridged around the key contacts for the purpose of eliminating sparking at these points. Retardation coils and associated condenser are placed in series with the circuit for the purpose of eliminating the noise due to application of the high voltage line battery.

In the ordinary bridged magneto lines, the bells are simply connected across the line. For comparatively short circuits with but few instrument connections, bells of 1,000 ohms resistance are used, while on longer lines, or on lines with quite a number of instruments, bells of 1,600 or 2,500 ohms resistance are used. In the bridged selector, the bell is operated in a local circuit from the contacts of the selector itself, and the selector magnet is what is bridged across the line. This double wound magnet is part of the selector. It is wound to a resistance of 4,500 ohms and is so designed that it offers a very high impedance to telephone talking currents. Thus, a large number of selectors can be bridged across a telephone line without injuring the volume or quality of the transmitted speech. An equal number of bridged bells would affect the transmission appreciably.

Inductance coils, or "choke" coils as they are commonly known, are installed in series with this relay to choke back any lightning discharges that may come in over the line. These protect the selector by making such discharges jump across the lightning arrester spark gap to ground.

(To be continued.)

A Telegrapher's Election Job.

A humorous incident, says an exchange, happened on the night of the national election of 1896 in a little mining camp hidden away in the mountains of southwestern Colorado, where the only means of quick communication with the world were a single uncertain telegraph wire and a single more uncertain telegraph operator. Naturally only the merest scraps of election news reached the camp, but before the certain news of McKinley's election could have been received the uncertain operator had fallen a victim to his favorite vice and, further, had fallen beneath the table.

The only other person who knew anything about telegraphy was "Shorty," the local wit and humorist, who volunteered to write out the election returns as they clicked off from the telegraph instrument. Political sentiment was aflame for Bryan. News of his election was not only sought, but demanded, for the average American miner is as sanguine concerning the uncertainties of politics as he is concerning the uncertainties of mining. The volunteer telegrapher was noted for an obliging disposition. He was the "good fellow" of the camp.

The miners had placed stores of giant powder at various points. They had cleaned and oiled their six shooters and refilled their cartridge belts. Bonfires were ready to be lighted on the hill-sides, and natural enthusiasm had been stimulated at the Metropole, the Cosmopolitan, the Fashion, the Trocadero and less pretentiously named oases in the desert of mining camp existence—in fact, every preliminary to the grandest celebration the San Juan country ever had known.

Shorty was not the man to neglect an opportunity like that. The first bulletin he handed to the waiting crowd stated that New York and Indiana were in doubt and it looked like a close election, with the chances favoring Bryan. That whetted the crowd's keen appetite for returns to razor edge. The second bulletin sent their spirits up with a leap. "Bryan has carried Kansas, and the Democrats are claiming Iowa."

"Whoopee!" from the crowd.

Shorty bent his ear to the clicking sounder and inscribed "Bulletin No. 3—Illinois joins the Bryan column with 500,000 majority. Indiana certain, New York very close."

When the deafening chorus had died down a young member of the party asked the leader, "Hain't we better begin to set off the giant?"

Before the leader could answer Shorty reproved him by word and look. "Don't begin to soon," he said. "It's always best to wait until you are sure. You can't be too conservative in a case like this."

After a long pause, in which the crowd displayed much impatience the imperturbable and conservative Shorty transcribed bulletin No. 4, but before passing it out he said:

"Now boys, don't do anything rash. Wait for the actual returns."

Bulletin No. 4 read, "Senator Jones claims Ohio and Pennsylvania for Bryan."

Under ordinary circumstances a doubt might have been expressed concerning the probability of such states reversing their political records, but the crowd was convinced of an impending landslide for their favorite and yelled with delight, "Now we are beginning to get the news," remarked Shorty when the cheering ceased, and he began to write bulletin No. 5 as follows:

"New York gives Bryan 100,000 plurality; Indiana, 40,000. Returns from Wisconsin and Minnesota indicate large Democratic gains."

The crowd heard only the first sentence. Shouting, cheering, yelling, screaming, it broke for the street.

"Hold on!" called Shorty. Here's another."

Bulletin No. 6, "Quay concedes Pennsylvania to Bryan."

Another fragment broke from the crowd and ran down the street shouting the news. The new operator's pencil was traveling rapidly over the paper, while his friends and fellow citizens crowded closely upon him and read as he wrote bulletin No. 7, "Mark Hanna has locked up Republican headquarters and gone home."

The roar of the crowd was drowned by the roar of exploding giant powder. Buildings shook, windows rattled, accompanied by the crash of broken glass. The celebration was on and Shorty McIntyre was alone.

The celebration lasted for two days. The morning after election the regular operator had recovered sufficiently to transcribe messages announcing McKinley's victory. Those who were sober enough to understand them didn't believe them. After several warnings of what would happen to him if he didn't quit "trying to fool people" the operator desisted and joined in the general jubilation. Not until the arrival of the Denver papers on the second day did that camp awake to a realization of the outcome of the election, and then there was not sufficient energy left to vent even indignation upon Shorty, much less to take revenge. On the third day the volunteer operator was more popular than ever, for all admitted he had given them the time of their lives.

In a recent debate in the German Reichstag complaint was made of the working of the American-German patent agreement. In Germany patents must be worked to hold good. As German inventors in this country do not have to submit to any such regulation a concession has been obtained from Germany exempting American inventors from the compulsory part of the regulations. It is claimed now that American firms incorporated in Germany and having patented articles there, transfer their patent rights to their American branch to avoid being compelled to work those rights. This action is objected to by the German vice-chancellor and he expects to take measures to prevent it.

The Old Operator's Story.

It was one of those cold, blustery nights of the winter of 1903-4. A party of gentlemen were sitting in the waiting room at a small station on the Rock Island waiting for a belated, snow-bound train.

We had exhausted about all the subjects of conversation that were current at the time, and one huge fellow stretched himself, yawned, and said: "Well, I've been on the road in this territory for the past fifteen years, but this is the worst snow-storm I have ever encountered."

The old station agent, who happened to pass at the moment, smilingly addressed the speaker: "Your experience doesn't run back quite far enough, Mr. Dean. I tell you right now that this storm isn't a marker to one we had on the old Hannibal Road when I was night man at Cameron Junction in 1861." He hesitated and was about to pass on into his office, when he was besieged by several of us to tell wherein the storm of 1861 was more severe than the present one. Anything to kill time, we thought.

Excusing himself for a moment the old man went into his office, and, opening his key, called up St. Joe and asked if the eastbound train had left there yet. Upon learning that it had not, he came out into the waiting room again, and, lighting his pipe, he began the story, which I will try to tell just as I heard it.

It was early in December of '61, when the storm I speak of struck this part of the country. As I said before, I was night operator at Cameron Junction. When I came to work on this particular night the day man told me there was a theater train somewhere between St. Joe and Cameron, which would probably be along before midnight. I was only a lad of twenty-five at the time, and I mention the fact for reasons which you will understand later on. I examined my signal lights, orders and switches, and finding everything in good shape I opened my key and called St. Joe to learn something of the theater train. It had left that place at 7.45 p. m., and not yet been reported out of Maysville. So I seated myself in my chair to enjoy the evening paper.

Any operator can tell you that no matter what he is occupied in doing while in a telegraph office he always hears the general drift of what goes over the wires. As I sat there reading war news, I heard the despatchers talking of No. 407, which had been snow-bound near Seymour for several hours. It was before the day of rotary snow plows, and the only way we had to get the track clear was to buck the snow, and then buck it some more. They were speculating whether Nos. 407 and 408—which was also several hours late—would be able to make their regular meeting point, which was Cameron Junction; but no man could tell where they would meet that night.

Along toward 9.30 the show train rumbled in, and pulled on a side track. They could go no further until No. 407 had cleared the main track of snow.

The platforms and trucks of the theater train were thickly encrusted with snow, and only the small cleared spaces served to indicate where the windows were located. After a little while several of the party came up to the office and inquired as to the prospects of getting any further before morning. I explained the situation to them, and, as there was nothing that could be done to aid matters, they concluded to go back to the train and retire for the night, hoping to find themselves further east by breakfast time.

One of the gentlemen asked permission to come in and stay with me for a while, to pass away the time. I let him in, and, as he entered, I was struck with his magnificent appearance. Tall and dark, with pearly white teeth and magnetic black eyes, he was a man to attract attention anywhere. He threw off his overcoat, and, turning to me, took his card case from his pocket and handed me his card. As I read the name, I gave a slight start, for even at that time John Wilkes Booth was a famous actor. He seated himself in one of my chairs, and his eyes roved around the room and over the desk at which we were seated. Happening to notice a book which I had been reading, he picked it up, and, glancing at the title, said, with a smile: "Hugo's 'Les Miserables,' eh? Do you like Hugo?" I replied that I was not very well acquainted with the writer, but that I liked that particular book.

We talked along on various subjects, and I noticed that he had a great predilection for Edgar Allan Poe. We discussed psychology, as far as I understand it, and at the end of a couple of hours Mr. Booth got up from his chair, and, pulling on his great Astrakhan coat, said he guessed he would go to bed. The snow had ceased to fall, and the moon shone brightly as he walked down the platform to his car.

As I returned to the office a slight shiver—caused by our talk of Poe—ran over me. I went in, and to take my mind off the grewsome subject, I opened the key, and called Seymour to learn what I could of No. 407. The operator told me that a yard engine had been sent from Spickards to help No. 407 clear the track, and that they must be pretty near through by this time. No. 407 was a Rock Island train, which ran over the Hannibal track to Kansas City, and the theater train wanted to go east over the Rock Island Road.

I figured that if they did well they ought to be at Cameron about 3.30 a. m., and as No. 408—east-bound Rock Island train from Kansas City—was running, they would, in all probability, meet here, or near this point. I got out my snow shovel, and for about an hour I shoveled snow myself, trying to get the platform in some sort of shape for the work incidental to the coming of the trains. At the end of my task I went back to the office, and, taking up "Les Miserables," I leaned back and began to read. It was 1.45 a. m. No. 408 had the right of way over No. 407, and, unless otherwise ordered, would go through Cameron at about 35 miles an hour. It

had begun to snow again, and as the warmth of the office began to steal over me, my head leaned back against the signal lever, and I slept.

How long I was asleep I never knew, but all at once I heard the despatcher's wire begin to call me; "UD, UD, UD; are you there, UD?" I strove to answer, but seemed paralyzed in my chair. "Hurry, for God's sake, UD, No. 407 has got through the snow, and I am unable to raise the operator at Kearney to hold her for No. 408, which will pass you in a few moments. UD, UD, UD, for God's sake, answer!" came pealing from the machine. With a mighty effort I reached the key—and fell with a crash to the floor. A strange murmur came to me, and glancing through the frost-encrusted window, I saw a gleam of light on the rails—No. 408 was coming. With a single leap I reached the signal lever and threw the red light, and in another moment the whistle for brakes was shrieking—the engineer had seen my signal just in time. As the last car came grinding to a stop in front of the office, Joe Shafer, the conductor, came running up to me. "What the — is the matter here? Why did you stop us? "No. 407! No. 407! For God's sake get on the siding; she will be into you in a moment!" Joe seemed to grasp the situation and gave the engineer the high sign to go ahead. They ran up to the switch, and, backing in on the side track, had barely cleared the main line when No. 407 came into the yard with a crash and a roar. That's all I knew for a while. When I came to, Joe was bending over me in the office. "No. 407!" I exclaimed; "is she safe?" "Sure she is!" replied Joe, "and thanks to you, Charlie, we are all safe and alive." He wrung my hand and tears came to his eyes. "When you are able, my boy, get our orders and we will go on, and I will see that the superintendent hears of your conduct to-night!" Even as he spoke, there came a click from the instrument as though a ground wire had been taken off, and the despatcher at once began calling me. I answered, and told him that No. 407 was gone and 408 was ready for orders. I added that I had received his message in time to stop 408 with only a moment to spare, but all was well.

"My message! I sent no message; this wire has been dead since 3 o'clock!" I glanced at the clock; it was 4.15 a.m. A mirror near the clock showed me my hair as white as you see it now.

As the old man finished speaking, a whistle was heard in the distance. "All aboard for Altamont and the east!" he called. And we all filed silently out into the night.—*Express Gazette*.

Railroad conductors are not usually considered poetical, but that some of them have an inclination toward versifying is shown by the following message which a conductor on a western railroad sent to his superior official in Chicago, when the engine on his train had broken down and could go no further: "H. M. Ballou, Engine 102, bu'sted a flue, and can't come through, what will I do? C. H. Magrew."

The Passing of the Oldest Railway Station.

The oldest railroad station in the country will disappear when the Erie Railroad builds its new station at Turner on the ground donated by Mrs. E. H. Harriman. Furthermore, in this station was established the first railway dining room. From this Turner station also was sent the first order by telegraph for the running of a train in the history of railroading.

The Turner station was built in 1840, in anticipation of the opening of the New York and Erie Railroad, which was put in operation in September, 1841, between Piermont and Goshen. The Turner family had granted the Erie free right of way over their property and constructed the station building on condition that every passenger train stop there and that the station be recognized as an official stopping place for meals and refreshments.

Peter Turner established an eating place for railroad travelers that in time became famous. Although only forty miles from New York, every train on the Erie at any time of day or night stopped from ten to twenty minutes at Turner for refreshments.

In 1851, the Erie was opened all of the way to Dunkirk. Charles Minot was the general superintendent. The track was single. The telegraph was a comparatively new thing commercially and unknown as an auxiliary to railroading. The train that hadn't the right of way had to wait on a siding for the passing of the train that had. If a train with the right of way was late, there was no way of knowing how late, and the waits were often long and travel was slow and tedious.

In the summer 1851, Superintendent Minot going west on a train, as has before been related in these columns, was waiting at Turner for a train coming east. One of Ezra Cornell's telegraph lines which ran along the highway parallel with the railroad had recently been cut into the stations along the line so that the railroad agents could also act as agents for the telegraph company. Mr. Minot telegraphed to Port Jervis and found that the train from the west had not arrived there yet. The run between Port Jervis and Turner was more than an hour. Mr. Minot instructed the agent at Port Jervis to hold the train there when it came in until further orders and had the agent repeat the message, and say that he understood it. Then he handed the order to the engineer of the train and told him to go ahead. The engineer refused to run his train on the telegraphic order, and Mr. Minot ordered him from the cab and ran the train himself, arriving at Port Jervis before the train from the west, thus saving an hour and a half's delay to the west-bound train; and the worldwide system of telegraphic railroad train orders was born.

The general manager of a telephone company in Maine has resigned and is going to keep summer boarders, having decided that the latter undertaking is more profitable than the telephone business.

Radio-Telegraphy.

Professor R. A. Fessenden is in Europe on business connected with his systems of wireless telegraphy and telephony.

A wireless station will be established in the Orkney Islands, north of Scotland, which will communicate with stations on the mainland.

Mr. O. C. Roos who until recently was connected with the National Electric Signaling Company at Brant Rock, Mass., has been appointed by the United States War Department as wireless engineer for the Bureau of Insular Affairs in the Philippines.

The French Government is equipping with wireless telephone apparatus of the Colin-Jeance system the two battleships "Justice" and "Verite," which it will be remembered formed part of the fleet which visited New York last fall upon the occasion of the Hudson-Fulton celebration.

A patent, No. 953,635, for a wireless transmitting system, has been granted to John Muth and Christian F. Heinkel, of Cleveland, Ohio. A system of wireless transmission of electromagnetic waves has a source of power conductively connected to the oscillator circuit and inductively connected with the radiator circuit.

The navy department has recently been engaged in making tests to determine the extent to which the wireless service is interfered with by amateurs and others. The naval station at Newport, R. I., has been in constant communication with the Brooklyn Navy Yard during the course of the investigation. The results obtained will be used in deciding upon the legislation necessary to prevent such interference.

Five wireless stations have been erected upon as many different islands of the Azores by the Portuguese Government and are now open to public service. These should prove a great convenience to the inhabitants of the various islands which are thus connected as they are frequently cut off from all communication with each other for months at a time. They will also be a convenience to trans-Atlantic shipping as nearly all vessels plying between Europe and the United States come within range of these stations.

The English and German Governments have both been making extensive investigations of the utility of wireless for transmitting weather reports between ships at sea and the land stations. As a result of their experiments they find that an extension of the weather charts to cover the ocean, which they are able to make by means of reports received from all vessels which are equipped with wireless apparatus, is of great assistance to them in foretelling weather conditions on land. However, the greatest drawback to the successful working of this plan at the present time is the inability to get the reports from ships, at all times of the day and night.

Efforts are being made in shipping circles in Germany to secure the removal of some of the restrictions now placed upon the operation of wireless in that country. Among these is a rule prohibiting the lightships, which are all equipped with wireless outfits, from communicating with other vessels except in cases of necessity. The ship owners believe that if this regulation was abolished the lightships could be of much service by giving information to approaching vessels concerning questions of navigation such as storm warnings, floating wrecks, etc.

When a British military expedition invaded Tibet in 1903 they laid telegraph wires along the ground, and to prevent the natives from cutting them told them that they were clues whereby they could find their way home. So anxious were the Tibetans to be rid of their uninvited guests that they let the wires alone, with the result that the British encampments were in daily communication with London. Since then, however, the Tibetans have, it seems, learned something, and the Chinese, it appears, are aware of this fact. For in the latter's late invasion of the land of the Dalai Lama, which caused that potentate's precipitate exit from Lhasa and flight into India the penetrating column took no chances on benefitting from British experience. It therefore depended upon wireless telegraphy for keeping in touch with cities beyond the Tibetan border, and it is stated it was able to do this most successfully.

The Colin-Jeance System of Wireless Telephony.

The system of wireless telephony developed by Lieutenants Colin and Jeance of the French Navy, employs a number of arcs burning between copper and carbon electrodes in air or in hydrogen, coal gas, ammonia or acetylene or in liquids such as oils and the various hydrocarbons. The primary circuit which is fed by a direct current dynamo contains a variable inductance and capacity. The inductance forms the primary of a transformer the secondary of which is also variable, and has in series with it a variable condenser and another adjustable inductance which forms the primary of a second transformer. One end of the secondary of this transformer, which is also a variable inductance is grounded and a properly chosen point is connected to the aerial through another adjustable inductance. The transmitting microphone has one side connected to ground and the other side connected to a suitable point in the secondary of the last transformer through a variable resistance. Instead of one transmitter a large number are connected in series all being mounted on a single base and having a common chamber leading to the mouth piece. The number actually used may be varied at will by means of a commutating switch. On the receiving end any kind of detector can be used such as the electrolytic, audion or perikon. The upper electrode of the arcs, which is of copper is in the form of a cylindrical reservoir which is kept cool by water circulating through it.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIXEY

Sole Manufacturer

Hudson Terminal, 30 Church St.
NEW YORK

Western Representative

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

Mr. A. T. Hollenbeck has been appointed superintendent of telegraph of the Chicago, Great Western Railway with headquarters at Chicago.

Mr. E. D. Winslow has been appointed superintendent of telegraph of the Chicago, Rock Island and Gulf Railway, with office at Ft. Worth, Tex., vice Mr. A. B. Crowley, transferred to other duties.

Mr. W. W. Ryder, of Chicago, general superintendent of telegraph of New York Central Lines west of Buffalo was a recent New York visitor.

The Southern Railway is equipping its division from Greensboro, N. C., to Lynchburg, Va., a distance of 124 miles, with 36 way stations, with a telephone despatching circuit.

In the Erie Railroad Employees' Magazine for April, Mr. E. P. Griffith, superintendent of telegraph has an interesting illustrated article describing the use of portable telephones on the Erie and giving instances in which they have been a great time saver.

Mr. George H. Groce, for several years superintendent of telegraph and signals of the Illinois Central Railroad and for some time past assistant to the general manager, has resigned that position to associate himself with the General Railway Signal Company of Rochester, as assistant to the president. Mr. Groce will make his headquarters in New York.

At the meeting of the Eastern division of the Association of Railway Telegraph Superintendents, held in Washington March 25, Mr. E. P. Griffith, superintendent of telegraph of the Erie Railroad, New York; Mr. J. C. Johnson, superintendent of telegraph of the Pennsylvania Railroad, Philadelphia, and Mr. C. M. Lewis, superintendent of telegraph of the Philadelphia and Reading Railroad, Reading, Pa., were appointed a committee to confer with the general managers of all telegraph companies to formulate a system for delivering messages to passengers on trains, whereby a receipt can be obtained and returned to the telegraph company.

Annual Convention of Association of Railway Telegraph Superintendents.

The plans for the twenty-ninth annual convention of the Association of Railway Telegraph Superintendents which meets at Los Angeles, June 20 to 24, are nearly complete and the coming meeting promises to be one of the most successful ever held by the association. Among the papers which have been provided for by the committee on topics, of which Mr. J. B. Sheldon, superintendent of telegraph of the Union Pacific Railroad, is chairman, will be one on "Wireless Telegraphy," by Mr. William Mayer Jr., of New York, the well-known electrical engineer and authority on this subject. Mr. D. C. Buell, in charge of the educational bureau of information of the Union Pacific Railroad, which is probably doing more than any other railroad system in the line of educating its employees will

discuss "Education for Efficient Railroad Service." "Protecting Telephone Lines from Lightning and Other Disturbances," will be the subject of a paper by Mr. M. E. Launbranch, of the United States Electric Company, who has spent a large amount of time in investigating this question.

Mr. H. P. Ryner of the Hoeschen Signal Company will give a paper on "Automatic Block and Highway Crossing Signaling," and will explain a method of signaling that does away with storage batteries for block signals and crossing bells.

Mr. E. E. Dildine, assistant superintendent of telegraph of the Northern Pacific Railway, St. Paul, will discuss "Telephone Train Despatching." As the Northern Pacific already has over 500 miles of telephone despatching circuits in operation and is making preparations to install over 700 miles more, Mr. Dildine will undoubtedly be able to present some interesting information on this subject which he has gained as a result of his experience.

A paper on the subject of "Testing Telegraph and Telephone Circuits," will be presented by Mr. V. T. Kissinger, superintendent of telegraph of the Chicago, Burlington and Quincy Railroad, Chicago. Mr. Kissinger has had a wide experience in the use of various devices for testing and as this is a subject in which all of the members are vitally interested his paper will be gladly received.

Mr. E. P. Griffith, superintendent of telegraph of the Erie Railroad, New York will discuss "Telephoning to and from Trains." Mr. Griffith has made some extensive experiments along this line and will present some valuable information upon this subject.

Mr. W. F. Williams, superintendent of telegraph of the Seaboard Air Line, Portsmouth, Virginia, will present a paper upon "Composite Telephone Blocking." As such a system is successfully used upon the Seaboard, Mr. Williams is well qualified to discuss that subject.

Other persons well informed upon the various questions treated have been selected to lead in the discussion of these papers and it is evident that a large amount of valuable information upon each question considered will be brought before the convention.

The standard railway telephone agreement which has been under consideration for the past year, will come up for discussion and final action.

An attractive program has been arranged for the entertainment of the visiting ladies and of the members during their leisure hours. The general outline of this feature of the convention will be substantially as given in our March 1 issue. The headquarters of the convention will be at the Hotel Alexandria. This hotel is conducted on the European plan and the rates vary from \$2.00 to \$4.00 per day for one person in a room and from \$3.00 to \$6.00 per day for two persons in a room.

Arrangements have been made by the

members of the association in the middle West to go together by way of the Santa Fe System on the train leaving Chicago at 10 p. m., Tuesday June 14, and Kansas City the next morning, at 11:30, and arriving at Los Angeles Monday morning, June 20 at 8:30. This will give the party a day's stopover to visit the Grand Canyon. The eastern members will connect with this train at Chicago, or other points en route. It has also been suggested that the party return by way of the Southern Pacific stopping off at San Francisco, Salt Lake City and Denver on the return trip. The secretary of the Association, Mr. P. W. Drew, superintendent of telegraph of the Minneapolis, St. Paul and Sault Ste. Marie Railroad, Chicago, requests that all those who expect to take the special train notify him by May 20, in order that ample accommodations may be provided.

Annual Reunion of Old Time and Military Telegraphers.

Mr. W. J. Lloyd, superintendent of the Western Union Telegraph Company, Chicago, and president of the Old Time Telegraphers' and Historical Association is actively engaged with the preparations for the twenty-ninth annual reunion of the association which will be held in that city, September 8, 9, and 10, together with that of the Society of the United States Military Telegraph Corps. President Lloyd urges us to impress upon all members of the association and the society the importance of attending this year's gathering at Chicago. The committees there will do their utmost to make the reunion a banner affair. Mr. F. J. Scherrer, assistant secretary of the Western Union Telegraph Company, 195 Broadway, New York is secretary of the association and will furnish any additional information. Colonel William Bender Wilson, of Holmesburg, Philadelphia, Pa., president of the Society of the United States Military Telegraph Corps has appointed the following reception committee for that society: A. H. Bliss, chairman; E. W. McKenna, Hon. A. W. Nohe, Wm. R. Plum, H. P. Darlington, Daniel Hogan, Rev. W. D. Gentry, John R. Dixon, H. D. Sloat, John D. Voltz, Z. P. Hotchkiss Charles F. Gross S. E. Ingram, Cass. G. Sholes, and Henry W. West, Mr. David Homer Bates, 658 Broadway, New York, secretary of the society.

Mr. William J. Dealy, has been appointed by President Colonel William Bender Wilson, a member of the executive committee of the Society of the United States Military Telegraph Corps to succeed Colonel Levi C. Weir, deceased.

Bill Introduced for Control of Telegraph and Telephone Companies in New York State.

A bill has been introduced in the New York Legislature which, if passed, will place the telephone and telegraph lines of the State within the jurisdiction of the Public Service Commission of the Second District, in accordance with the report recently made by the special legislative

committee which investigated the subject during the last year.

Power is given to the commission upon complaint or upon its own motion to issue orders in relation to rates and service. This authority, the bill stipulates, shall not be construed as giving the commission power to make an order requiring a telegraph or telephone company to perform any act which is unjust or unreasonable or in violation of the requirements of its franchise or of any State or Federal law.

The commission receives the power of investigation and limited control over the forms of accounts and records of the companies, which are required to file annual reports with the commission. The commission is given the veto power over the exercise by the separation of rights and privileges under the franchises, which they have not exercised up to this time.

The measure contains provisions against discriminations in rates. It prohibits any corporation or association other than a telephone or telegraph company to acquire more than ten per cent. of the stock of any telephone or telegraph company. The bill prohibits the granting of reduced rates or free passes or franks for transmission of any messages except by officers or employees of the companies.

The bill requires that the permission and approval of the commission shall be given for issues of stocks and bonds, except that companies may issue notes payable otherwise than on demand for proper corporate purposes without the approval of the commission, and notes to be payable at specified periods of not more than twelve months.

Paris Conference of Telephone and Telegraph Engineers.

As we have received many inquiries from those interested in the United States and Canada in regard to the requirements for representation at the Conference of Telephone and Telegraph Engineers, which will be held at Paris in the fall of this year, we addressed a letter to Major Walter A. J. O'Meara, engineer in chief of the British Post Office Telegraphs and Telephones, London, and vice-president of the committee which arranged for the 1908 meeting at Budapest, for information concerning this subject. In answer to our inquiry Major O'Meara replied as follows:

"I regret that it is not possible for me to give you any information for publication which will lead to America being represented at the next conference. These conferences are convened by the principal European telegraph and telephone administrations and as the delegates are members of these administrations, the conferences necessarily have at present a semi-official character.

"Proposals for extending the scope and representation of the conference have reached me from time to time, but as you will readily perceive, no step could be taken without the full agreement of the various European administrations concerned."

Obituary.

Charles T. Melrose, a press telegrapher of Dayton, Ohio, died in that city March 29, aged forty-four years.

William M. Martin, manager for the Western Union Telegraph Company at Burlington, Vt., died March 27, as the result of a stroke of apoplexy.

Harry B. Apple, cashier in the office of R. T. Reid, superintendent of the Western Union Telegraph Company at Seattle, died March 31, aged twenty-four years.

Joseph W. Woods, an old time telegrapher, died in New York March 27, aged seventy-two years. Mr. Woods was in the service of the Western Union Telegraph Company for more than half a century, retiring in 1905. He served as manager of a number of branch offices in New York City.

Thomas R. Rusk, formerly superintendent of the Postal Telegraph-Cable Company, at Augusta, Ga., died March 17, aged fifty-eight years. Mr. Rusk entered the telegraph service at the age of fifteen and was employed at various places throughout the South. In 1889 he opened the office of the Postal at Augusta and served as manager until 1898, when he was promoted to the superintendency at that point. This office he retained until June, 1907, when he retired and engaged in farming.

Henry Clay Vincent, a military telegrapher, died at Marietta, Ohio, March 27, aged seventy years. Mr. Vincent was connected with the Marietta, Columbus and Cleveland Railroad from the close of the war until 1900, as operator and general freight and passenger agent. He was a frequent attendant at the reunions of the Society of the United States Military Telegraph Corps and the Old Time Telegraphers' and Historical Association, being present at the meeting held in Pittsburg last August.

S. W. Wingate, for the past twenty years identified with the Portland, Oregon, office of the Western Union Telegraph Company, died at Oakland, California, March 20, aged fifty-six years. Mr. Wingate was a well-known telegrapher. In the late seventies and early eighties, he was a member of the staff in New York. In 1884 he left this city for the Pacific coast, finally locating in Portland, where he remained until last fall, when, owing to sickness, he moved to California, thinking the change of climate would prove beneficial.

Matthew R. Wolff, a veteran telegrapher and a pioneer in the telephone business, died at his home in Wheeling, W. Va., March 19, aged sixty-seven years. He entered the telegraph service at the age of nine years as messenger and later became an operator serving at Pittsburg, Steubenville, O., and as manager of the Western Union Telegraph Company at Wheeling. About thirty years ago he became interested in the development of the telephone in the Ohio Valley and has been prominently identified with the Bell Telephone Company since that time.

John A. Casterlin, well-known by telegraphers throughout New York State, died at his home in Washington, D. C., March 31, aged sixty-seven years. Mr. Casterlin served in the army during the Civil War nearly three years, losing an arm at the battle of Cold Harbor. He afterward learned telegraphy under the instruction of the late Otis E. Wood. He was manager of the Waterloo, N. Y., office of the Western Union Telegraph Company for twenty-two years, being transferred from there in 1888 to Ithaca, where he remained until his retirement in 1906 on account of ill health.

Thomas A. Davin, an old time and military telegrapher, died suddenly of a stroke of apoplexy at his home in Dorchester, Mass., March 27, aged seventy-three years. Mr. Davin entered the telegraph service in 1852 at the Astor House office, New York. He was a prominent member of the Military Telegraph Corps during the war and afterward entered the employ of the Western Union at Boston, taking part there in the first speed tests of the quadruplex in 1876, a record of which was given in our February 16 issue. For nearly thirty years past he has been in the employ of the banking house of Richardson, Hill and Company in Boston. Mr. Davin is survived by a wife and one daughter, who is a teacher in the Phillips Brooks school, Boston.

Zalmon G. Simmons, who played a prominent part in telegraph development in Wisconsin, died at Kenosha, that state, February 11, aged eighty-one years. In 1856, soon after the organization of the Wisconsin State Telegraph Company, he secured a substantial interest in that project and took an active part in the extension of its lines, becoming president of the company in 1864. In 1865 the lines of the Minnesota State Telegraph Company were bought and the name of the enlarged company changed to the Northwestern Telegraph Company. Mr. Simmons retained the presidency of this organization until its final absorption by the Western Union Telegraph Company in 1881. He has led an active business life in Kenosha for many years, and was well-known to the older telegraph officials of the country.

The English telegraph management which abandoned the Wheatstone system for the transmission of messages a few years ago is returning to that method of handling the traffic. The reason for this is that a higher speed can be obtained by the use of the Wheatstone system on the long underground circuits than by hand Morse transmission.

Telegraph operators who wear celluloid eye shades should remove them before trying to light their pipes. A Port Deposit, Md. operator who neglected to take this precaution recently set fire to his shade and the flames were soon communicated to his hair and clothing. Fortunately a bucket of water happened to be nearby and the telegrapher threw this on himself and extinguished the flames before any serious damage was done.

Electrical School at Washington.

An electrical class has been organized in the Washington office of the Western Union Telegraph Company for the purpose of giving all interested an opportunity to pursue a systematic study of electrical matters pertaining to the present service, starting with the elementary subjects and gradually working up to the higher branches. Sixty-five employees have signified their intention of joining this class.

At a meeting held Saturday evening, March 26, the class was organized and the following officers elected: J. W. Collins, president; P. E. Brown, vice-president; J. D. Steele, secretary-treasurer. The officers and Wm. Niemeyer, R. W. Farrelly, E. R. Edmonds, and J. S. Conway, constitute the executive committee.

The class will meet each Friday night. There were present at the first meeting forty-two members.

The proposition of forming an electrical class was received with enthusiasm. It is the intention of the class to pursue a systematic textbook course and from time to time to secure prominent electrical engineers to deliver lectures. Not only telegraph and telephone subjects will be taken up and discussed, but also electrical matters generally considering first telegraph equipment.

Mr. Philander Betts, professor of electrical engineering, at George Washington University has been engaged for the lecture courses. It is believed that much electrical knowledge will be gained and that great good to the service and the individual members will result.

Organization of Electrical Club at Baltimore.

The members of the operating department of the Western Union Telegraph Company in Baltimore met Friday evening, April 1, and organized a class for the purpose of taking up the study of electricity, so far as it relates to the equipment in daily use by operators, and for the general purpose of increasing individual efficiency and interest in their work.

Twenty-seven were in attendance at the first meeting and a number of others have signified their intention of joining the club. Much interest was manifested by those present.

Mr. J. M. Creamer, manager, called the meeting to order, and a permanent organization was effected by the election of the following officers: Mr. E. S. Anderson, all night chief, president; Mr. Samuel T. Shutt, a branch office manager, vice-president; Mr. Charles E. Clagett, northern wire chief, secretary-treasurer. The officers named together with L. D. Wilbourn, chief operator, and Robert L. Dryden, assistant day traffic chief, constitute the executive committee.

This committee was instructed to draw up a suitable constitution for the organization, map out a course of study, arrange for instructors, lecturers, etc. and report at the next meeting.

Tuesday evening has been selected for the regular weekly meetings.

Pittsburg Electrical Society.

On March 29 the employees of the Pittsburg office of the Western Union Telegraph Company, met in the office of Superintendent Church for the purpose of organizing a class or society to take up the study of telegraph engineering. A permanent organization was effected to be known as the Pittsburg Society and the following officers elected: W. J. Dodge, president; F. C. Schiller, vice-president; E. R. Collins, secretary and E. R. Tilghman, treasurer.

There were fifty-two members enrolled at the first meeting. A standing committee was appointed by the president composed of the following: Geo. Kendrick, W. H. Maize, A. Kridel, E. R. Collins, and D. D. Calvert.

A committee to draft a constitution and by-laws was appointed, consisting of T. G. Gosden, F. C. Schiller, and E. R. Tilghman.

The society decided to hold its regular meetings on Tuesday evening of each week, at 8:00 o'clock. An instructor will be engaged and a standard text book has been adopted.

Great interest and enthusiasm was manifest in the undertaking by all present and the success of the society is assured.

Electrical School Organized at Philadelphia.

A meeting of employees of the Western Union Telegraph Company at Philadelphia, was held on the evening of April 1 in the Pennsylvania building for the purpose of organizing an electrical class.

Manager J. W. Reed acted as temporary chairman. A permanent organization was effected with the following officers: John V. Berger, president; Robert C. Murray, secretary; Mahlon G. Moyer, treasurer; executive committee: C. W. Pennyacker; H. V. Emanuel; D. Good; G. W. Wood; E. A. Dos Santos.

The following were present: J. W. Reed, Frank R. Webb, J. T. Wilde, J. Manlove Smith, A. W. Baldwin, A. H. Spracklin, R. C. Murray, J. V. Berger, J. T. Sheldrake, J. W. McIntyre, H. Lush, D. Good, J. W. Truitt, E. V. McElroy, Mahlon G. Moyer, Morgan G. Moyer, G. W. Wood, E. A. Dos Santos, C. W. Pennyacker, H. H. Swartz, F. G. Lamb, J. F. O'Neill, W. Carpenter, George L. Jack, H. A. Shinn, H. V. Emanuel, J. P. McGovern, G. O. Gregg, V. G. Hudgins, I. D. Maize, H. H. Peck, E. L. Maize, F. B. McCormick.

At a second meeting of the club held April 9, thirty-six were present. Professor W. J. Pollock of the University of Pennsylvania, has been engaged as a lecturer to speak three nights during each month. The fourth meeting night in the month will be set aside for general business, the interchange of ideas between the members and for social gatherings.

An Electrical Book for Practical Men.

"Lessons in Practical Electricity," by C. Walton Swope, which has been selected as an official text book by the electrical schools organized among the employees of the eastern division of the Western Union Telegraph Company, is, as its name signifies,

an elementary text book for the practical worker. It contains nearly five hundred pages and has over four hundred illustrations. It is divided into thirty-one chapters dealing with magnetism, batteries, electrolysis, current measurement, resistance, Ohm's law, circuits, galvanometers, electromagnets, measuring instruments, electrodynamics, induction coils, dynamos, motors, electric lighting and alternating currents. At the end of each chapter, there are given several questions for the student to answer and practical problems for him to solve. Numerous interesting experiments are also described, which can be performed by the aid of simple apparatus. The book was written especially for the use of evening classes in practical electricity and is admirably adapted to that purpose. This work, together with Jones' "Diagrams," Mayer and Davis' "Quadruplex" and Thom and Jones' "Telegraphic Connections," seems to meet all of the requirements of the student who desires to acquire a thorough knowledge of the principles underlying the operation of the telegraph system. The prices of these books are: Swoopes "Lessons in Practical Electricity," \$2.00; Jones' "Diagrams," \$1.50; Mayer and Davis' "Quadruplex," \$1.50; Thom and Jones' "Telegraphic Connections," \$1.50. Any of these books will be sent, carrying charges prepaid, upon receipt of price by J. B. Tahavall, Telegraph and Telephone Age, 253 Broadway, N. Y.

New York Telegraphers' Aid Society Election.

The following officers were chosen by the New York Telegraphers' Aid Society at their election, which took place on March 24: President, Robert J. Marrin; vice-president, H. C. Worthen; treasurer, T. M. Brennan; financial secretary, C. A. Kilioyle; recording secretary, Miss M. E. Saunders; members of executive committee: E. F. Howell, J. A. Hill, Miss S. Dougherty, E. E. Brannin, E. Mesler, A. J. Gillman, C. J. Lemaire, W. T. Rogers, A. M. Lewis, D. J. Condon and H. M. Heffner; auditing committee: J. F. E. Hopkins, and F. J. Nurnberg.

The statement of the society for the year ending March 6 is as follows:

President R. J. Marrin in his address to the society said in part:

"I beg to remind you that on March 7, this Society was in existence thirty years and I consider it an honor and a great privilege to address you this evening. If there are any charter members present, to them I desire to extend the best wishes of the entire membership, as their efforts and thoughtfulness made this grand organization possible; and for their associate charter members who have since joined the silent majority, we will always cherish their memories for their noble work in our behalf.

"In conclusion I wish to briefly call your attention to the immense amount of work carried out by this Society during these years. Thousands of visits have been made by our sick committees. We have disbursed \$87,434.51 in sick benefits, and \$21,500 to bury our deceased members, and in addition to these sums, and since the inception

of our Relief Fund, a most worthy charity, we have distributed \$9,843.85 among the sick and unfortunate. In all we have expended \$118,778.36 and our assets now amount to \$29,858.69.

"Surely these facts and figures should be a source of pride to each one of us, and I trust that each succeeding year will find our Aid Society progressing onward in the noble work instituted by our thoughtful brothers who laid the foundation of your society, on March 7, 1880."

Trade Note.

Mr. James Uncles, who was probably one of the most successful salesmen for the Yetman Transmitting Typewriter Company, has succeeded to the business of that concern at North Adams, Mass., as will be noted from his advertisement in another column of this issue. Mr. Uncles was born in England in 1867, and entered the telegraph service in that country. Since coming to America he has been employed by the Great North-Western Telegraph Company at Toronto and by the Western Union Telegraph Company and has had an extended experience with the Associated and the United Press and in the brokerage business. As a result of his wide acquaintance with the various classes of service as well as his former connection with the sales department of the Yetman company, Mr. Uncles is well qualified to push the sale of the Yetman transmitters and his many friends wish him success in his undertaking.

Letters From Our Agents.

PHILADELPHIA, WESTERN UNION.

Mr. N. E. Church, superintendent of the Pittsburgh district, was a recent visitor in the operating room.

Mr. John W. Benckert, for many years assistant manager of this office, has been transferred to the office of superintendent W. A. Sawyer.

Mr. R. A. Black, manager of the York, Pa., office since 1904, has been appointed assistant manager of this office, vice Mr. Benckert promoted.

Mr. Charles M. Pennypacker has been appointed assistant wire chief at night, vice S. S. Peck now first chief.

Mr. Harry V. Emanuel has been transferred from the Richmond wire to the first New York duplex, which has been started recently.

Mr. C. B. Wood, has returned to duty after seven weeks absence owing to several operations for the removal of a tumor on his cheek.

Mr. Thomas A. Maholland, an old timer, but for the last fourteen years engaged in other business, died in this city on March 31, aged 55 years.

Miss Edna Moyer, one of the winners in the recent wireless tournament, has resigned to engage in other business.

Mr. I. D. Maize, the well known old time and military telegrapher of this city had this to say regarding the story of the death of operator D. B. Lathrop, as related in the April 1, issue:

"The article in the Age of April 1, regarding D. B.

Lathrop was very interesting to me because of the fact that Mr. Lathrop was with me for six months immediately after his arrival at the front. He was studying for the ministry before he joined the military telegraphers, and was so extremely anxious to see active service, that when General McClellan moved to the Peninsula, he walked all the way from camp to Washington in order to get a chance to go to the front. The next I heard of him was his tragic death at Yorktown. He was a brilliant scholar and a gentleman and beloved by all with whom he came in contact."

NEW YORK, WESTERN UNION.

Mr. Alfred Winder, of the operating force, at 195 Broadway, has on account of failing health asked to be retired on a pension. His request has been granted and as a testimonial of his long and faithful service for the company, he has been given three months leave of absence on full pay before the pension goes into effect. Mr. Winder was born in 1834, and entered the telegraph service in 1851 at Indianapolis. He has been continuously engaged therein since that time. During the war he was employed in the military telegraph corps, was captured and confined in Libby Prison. For the past twenty years he has been identified with the New York staff of the company.

Mr. Wm. Levison, of the Jersey division, having passed a civil service examination, has resigned to accept an appointment as a mounted police officer of the Aqueduct Water Board.

William John Wilkie died recently in this city after a long illness, aged sixty-five years. Mr. Wilkie was well known and recognized as a gilt edge telegrapher of the old school.

Miss Lillian Lindquist of "Clarks" department, New York, and Mr. Andrew Turner, of the Associated Press, Holyoke, Mass., were married in this city, April 2.

Miss I. McGillis of the city line has returned to her duties after an extended trip throughout the far west.

OTHER NEW YORK NEWS.

The annual spring dinner of the Magnetic Club will be held at the Hotel St. Denis, New York, Tuesday evening, April 19, at 6.30. There will be no set speeches, but a first class entertainment will be provided for all who attend.

Mr. William J. Finn, a son of William Finn of the office of the engineer of equipment of the Western Union Telegraph Company, New York, was married March 30 at Orange, N. J., to Miss Gertrude C. Burt. Mr. Finn is a member of the cable staff of the Western Union at 16 Broad St., New York, and was presented by his fellow employes with a handsome silver service.

Business Notice.

Loftis Bros. and Company, the old reliable, original diamond and watch credit house, make it possible for every honest man and woman to own a genuine diamond, fine watch, or beautiful high-grade jewelry.

It is an easy matter to open a confidential charge account with this house. All you have to do is to make your selection from their large handsome catalogue, or any of their booklets, paying one-fifth of the purchase price as first payment, balance in eight equal monthly amounts. Diamond prices at present are higher than they have ever been, but lower than they will ever be again. The supply is growing smaller and the demand greater, yet by virtue of their immense purchases Loftis Bros. and Company are able to quote prices ten to twenty per cent. under those of cash stores, for goods of equal quality.

Every diamond sold by this house is accompanied by a signed guarantee certificate, attesting its value and quality. No broader guarantee was ever given by a responsible company. Write for their catalogue. Address Loftis Bros. and Company, E-795, 92 to 98 State Street, Chicago, Ill.

The secret of success of the Serial Building Loan and Savings Institution, 195 Broadway, New York lies in the fact that their funds are all invested in first mortgages, which have a stable unchanging value and that they keep no idle surplus on hand. They have sufficient assets at the present time to pay their depositors one dollar and ten cents for every dollar deposited. Write for their plan to assist any telegrapher to buy a home.

Wanted—Address of telegraph operator in city who wants railroad work in country. Address "Relief," care of Telegraph and Telephone Age.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. This renders the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

SOME POINTS ON ELECTRICITY.

Elementary Lessons on Electrical Measurements.

BY WILLIS H. JONES.

PART I.

If the writer should put down the fraction $\frac{E}{R} = 2$ there is probably not a telegraph operator who would fail to understand the formula. Not only that but if he gave them any two of those three factors they would know how to find the third. Yet should he substitute the letters E, R, and C, for those figures and ask them to work out the simplest example in electrical measurement the majority of them would immediately say: "Don't give me anything like that, I never studied algebra."

The word "algebra" and everything that looks like an algebraical formula seems to frighten the student at once and often causes him to leave out the fundamental, and really most necessary part of his education.

The fact is there is positively no difference between the two formulas $\frac{E}{R} = 2$, and $\frac{E}{R} = C$, except that the first is only correct as long as you use no other figures than the three given, whereas $\frac{E}{R} = C$ is absolutely correct for every example you work out regardless of what figure or figures are employed. $\frac{E}{R} = C$ is merely a picture of the positions you must place your figures in after you get them, and you always know two of the factors before you begin, no matter what example you wish to solve.

For instance, in every electric circuit there must

obviously be electromotive force, resistance, and current.

Now E stands for E, M, F, in volts, R stands for resistance in ohms, and C stands for current in amperes.

Each of these terms represents one unit of what it stands for. If we erase two of the letters and put in their places figures which show just how many such units of each we have to begin with, then we will have a plain example in arithmetic just like the first one given, viz.: $10 =$. All you have to do is to find the third factor in the usual way.

In order to illustrate this point, let us take the following example:

If we connect a battery possessing 140 volts electromotive force to a wire known to have a total resistance of 70 ohms, how much current in amperes will flow through the circuit?

Now just forget all about algebra and simply keep that picture of $\frac{E}{R} = C$ in your mind. All that is required is to substitute your figures for the letters they represent.

You have 140 volts, so rub out E and substitute 140 for your numerator. As 70 ohms means resistance, put down 70 in place of R. You now have a simple fraction $\frac{140}{70} = C$. Hence if we divide 140 by 70 we find the value of C to be 2. so we erase C and substitute figure 2, which latter is the correct answer.

Now suppose that you did not know the resistance of this wire but wished to ascertain that fact.

In this case you would insert an ammeter in the circuit and, as we have already proved, the needle will show 2 amperes of current flowing if you use the same battery. It is obvious that if $\frac{E}{R} = C$, then $\frac{E}{C}$ must equal R. Consequently change the formula to read $\frac{E}{C} = R$ and proceed as before. As E is 140 as in the first example there will be no change in the value of the numerator, but the denominator C is now 2. By dividing the 140 by 2 we find that the value of R is 70 ohms, thus again proving the accuracy of the original formula.

Next suppose you did not know the value of the electromotive force (or number of volts), but did know that the current was 2 and the resistance was 70, and wished to know the electromotive force of the battery.

In this case if $\frac{E}{R} = C$, then R multiplied by C should tell you what E is. You would then change the formula to read $R \times C = E$. Or you may omit the multiplication mark, as is frequently done, and make it $RC = E$.

Using the same example we find that E must be 140 volts, because 70, the resistance, multiplied by 2, the current, equals 140.

These three examples alone should suffice to

prove the simplicity of formulas as compared with long worded rules to be memorized. The student is only required to memorize three letters together with what each symbolize in order to be able to work out any example concerning current, electromotive force and resistance, where the value of any two of those factors are known.

There is one more letter to bear in mind, and that is W, but as it stands for Watt, the unit of electrical power, or work done, it is easy to remember. It represents the electrical equivalent of a unit of mechanical power. Of course, the student realizes that it requires more electrical power to force, say one ampere of current, through a high resistance than it does through a low resistance, hence the power expended in the way of work done differs in different circuits according to their respective lengths, or ohmic resistance.

The rule for ascertaining the work done in such circuits is to multiply the figures representing the electromotive force by those indicating the volume of current flowing. Thus in a circuit in which 2 amperes of current flows due to a battery of 140 volts the formula would be $E \times C = W$, or $EC = W$. Worked out we find that the energy expended is 280 watts, because $140 \times 2 = 280$.

In case you only know the value of the current and the resistance of the circuit, the power in watts is found by multiplying the square of the current by the resistance. The formula is $C^2 \times R = W$. Using the same example we get $4 \times 70 = 280$ watts, the same answer the previous formula gave.

Where a great deal of energy is expended and the horsepower value is desired, the fact is ascertained by dividing the total number of watts expended by 746 because 746 watts is the electrical equivalent of one mechanical horsepower. The formula is $H. P. = \frac{W}{746}$.

(To be continued.)

Recent Telegraph and Telephone Patents.

Patent, No. 953,701, for an alternating current telegraph system, has been taken out by C. Meyer, of Charlottenburg, Germany. For controlling the position of an indicating needle from a distance by varying the phase between the current and the electromotive force in the conductors used in transmitting the signals, thus reducing the number of wires.

Patent, No. 953,970, for a telephone receiver, has been granted to J. Noble, of St. Louis, Mo. A diaphragm with a circular iron disc carrying concentric superimposed iron discs of smaller diameter, thus increasing the bulk of the metal of the diaphragm.

Patents, Nos. 954,062, and 954,150, for a teleautograph, have been taken out by G. S. Tiffany, of Summit, N. J. The first consists of a main-line circuit, a second circuit, with circuit closer, the latter having loose contacts so that when vibrations occur in the main line circuit the contacts are disturbed and interrupt the second circuit. The second makes use of a master

switch, in one position of which the receiver is on and the transmitter off with relation to a distant station; in another position the condition is reversed, and in the third position both instruments are off. Also improvements in the paper feeding mechanism and in the relay and other parts.

Patent, No. 954,167, for a telephone bell or ringer, has been granted to P. C. Burns, of Chicago, Ill.

Patent, No. 954,298, for a telegraph instrument, has been issued to W. McL. Jackson, of Gastonia, N. C. A key, a pendulum and a lever arranged to be operated by the key for setting the pendulum in motion, thus giving dots by a single stroke of the key.

Patent, No. 954,340, for a lock-out device for party telephones, has been secured by D. W. Kneisly, of Dayton, Ohio.

Patent, No. 954,402, for a telephone repeater, has been awarded to P. Stragiotti, of Hurley, Wis.

Patent, No. 954,445, for a telephone system, has been granted to O. M. Leich, of Genoa, Ill.

Patent, No. 954,489, for a printing telegraph, has been issued to J. E. Wright, of New York. Column printing telegraph doing away with one transmission line, making use of a type wheel with a plurality of circles of type which is rotated step by step and moved along the line step by step and actuated by independent electromagnets included in the same circuit and actuated by independent electro-magnets included in the same circuit and actuated by positive and negative impulses.

Patent, No. 954,701, for an automatic telephone, has been secured by J. E. Rogers, of Danbury, Conn.

Patent, No. 954,734, for a combined telephone and telegraph system, has been taken out by G. T. Hiner, of New York. Eliminates the static discharge by impressing on the telephone line, rounded telegraph waves shading the impulses at the beginning and at the end, the waves being of such low frequency as to have no effect upon the diaphragms of the telephone.

Patent, No. 954,829, for telephone microphone, has been awarded to V. Tardieu, of Arles, France.

Patent, No. 954,931, for a receiver for sound transmitting instruments, has been granted to J. J. Comer, of Santa Monica, Cal.

Patent, No. 955,065, for an insulator, has been taken out by C. C. Hardin, of La Fayette, Ga. Telegraph and telephone line insulator which holds wires of different gages and consists of a block carrying different sized grooves and mounted on a stem between which block and superimposed plates and nuts the wires are clamped.

"Pocket Edition of Diagrams," etc., the latest revised edition, 334 pages and 160 illustrations, published by Telegraph and Telephone Age, contains just the information every telegrapher requires.

Personal.

Mr. Gerard Swope, general sales manager of the Western Electric Company, New York, has gone to Europe on business for the company.

Mr. Theodore N. Vail, president of the American Telephone and Telegraph Company, has contributed \$35,000 toward a teachers' endowment fund for Phillips Exeter Academy, to be used for increasing the salaries of the teachers.

Mr. M. Fitzgerald, formerly and for many years identified with the French and other cable companies in this country, but who retired from active service about four years ago is a frequent contributor of articles to the magazines. Mr. Fitzgerald now resides at East Brewster, Mass.

Mr. P. V. DeGraw, the old time telegrapher who is now Fourth Assistant Postmaster General at Washington, was paid a fine compliment in Congress recently when Representative Adamson, of Georgia, in speaking of the postal service said: "The most valuable branch of the entire department is the rural delivery, which under the management of General P. V. DeGraw and Mr. W. R. Spillman, two of the best business men I have ever met, is doing all the good possible to be accomplished with the money appropriated for the purpose. In my judgment those two vigilant public servants do their best to make the service satisfactory and efficient, and I believe that, with the money at their command they give to the rural population of this country every advantage possible."

Postal Telegraph-Cable Company.**EXECUTIVE OFFICES.**

Colonel A. B. Chandler, chairman of the board of directors, has left New York for his summer home at Randolph, Vt. Before going to that place he will visit his son Willis Chandler, who has been at Saranac Lake for some time past for the benefit of his health.

Mr. Minor M. Davis, electrical engineer, has returned from a trip to the west in the interest of the company.

Mr. S. B. Haig, superintendent of traffic, has returned to his office after an extended trip of inspection which took him as far as the Pacific Coast.

Mr. George H. Usher, general superintendent at Atlanta and Mr. T. W. Carroll, general superintendent at Chicago, were recent New York visitors. Among other executive office visitors during the past two weeks have been A. L. Edgecomb, superintendent at Boston; H. D. Reynolds, superintendent at Buffalo; C. E. Bagley, superintendent at Philadelphia; Manager C. A. Richardson and L. L. Howell of Boston; Manager V. J. Albert of Baltimore, Manager J. A. McNichol and A. E. Zintl of Philadelphia, Manager C. E. Diehl of Harrisburg and Manager F. B. Travis of Washington.

The litigation between the Company and the Southern Pacific Railroad for a right of way

across the State of Nevada having been settled work has been begun on the construction of the 600 miles of line between Salt Lake City and Reno. Many gangs of men with camping outfits have been sent out and the construction will be pushed with all possible speed. It is expected that a record job will be made of this piece of work. Right of way has also been secured for a trunk line between Seattle and Tacoma. All new lines will be built of 435-pound copper wires and will be transposed so that they can be used for telephoning as well as telegraphing.

Mr. C. H. Newman, manager of the Buffalo office, winner of the second prize of \$100 given to managers of the eastern division by President Clarence H. Mackay in 1909 has divided the amount received into prizes of \$4.00, \$3.00 and \$2.00 each for the messengers of the Buffalo force; these prizes to be awarded monthly during March, April and May. The winning of these is dependent upon the number of messages delivered, the number collected, number of answers received to delivered messages, behavior, appearance, etc. In a circular letter which he issued announcing these prizes Mr. Newman stated that it was only because of the loyal support which those associated with him gave that he was able to win the prize and that he could think of no better way of distributing the money than that outlined.

RESIGNATIONS AND APPOINTMENTS.

Mr. E. P. Tully, who for many years has been manager of the messenger department, in New York, has been appointed manager of the branch offices in the entire city. He is succeeded in the messenger department by Mr. John Hennessy who is promoted from the operating room.

Mr. J. M. Martin of the Birmingham, Ala., office, has been appointed manager at Pensacola, Fla., vice Mr. H. M. McClellan, resigned.

Mr. R. I. McConnell, of Concord, has been appointed manager of the office at Winston-Salem, N. C., vice Mr. J. M. Martin, who has been transferred to the Charlottesville, Va., office.

Western Union Telegraph Company.**EXECUTIVE OFFICES.**

Mr. I. McMichael, vice-president and general manager of the Great North Western Telegraph Company, Toronto, Ont., was a recent executive office visitor.

Mr. B. F. Dillon, general superintendent of the southern division, has been making a general trip of inspection through his territory in order to get better acquainted with the existing conditions and the needs of the service. Mr. Dillon was married on April 27 to Miss Emma F. Maxwell of Jacksonville, Fla.

Mr. J. M. Stephens, formerly and for many years superintendent at Atlanta, but who retired from that post about seven years ago, has been reappointed to that position, vice G. W. Lloyd transferred.

Mr. C. B. Horton, manager of the office at Lincoln, Neb. has been appointed assistant superintendent of the third district, western division, with headquarters at Omaha.

Mr. E. E. Williams, manager of the Birmingham, Ala. office, has been promoted to be assistant superintendent with headquarters at Atlanta, vice J. S. Calvert transferred to Richmond, Va., as superintendent.

Mr. Thomas E. Russell has been appointed assistant superintendent of the seventh district with headquarters at New Haven. Mr. Russell has been chief clerk in Superintendent Clary's office at that point for some years. Mr. Otto C. Faupel of Meriden succeeds Mr. Russell as chief clerk.

Mr. C. A. Crane, manager of the Duluth office, has been appointed manager at St. Paul, vice Mr. W. R. Chapman, promoted to the superintendency at St. Louis. Before leaving Duluth Mr. Crane was presented by the employees of the office with a diamond stick pin and a Knights Templar gold ring. Mr. E. F. Kelley, manager at Sioux Falls, S. D., has been appointed to succeed Mr. Crane as manager at Duluth.

Mr. John S. MacKearly, manager at Watertown, S. D., has been transferred to Sioux Falls, vice Mr. Kelley, and Mr. F. D. Nash has been appointed to succeed Mr. MacKearly at Watertown.

Mr. W. W. Murphy, traffic chief of the

A GROUP OF TELEGRAPH AND TELEPHONE OFFICIALS.

From left to right: S. M. Williams, special agent, Western Union; F. A. Pickernell, assistant to president, American Telephone and Telegraph Company; Belvidere Brooks, general manager and E. J. Hall, chairman of executive committee, Western Union; W. T. Gentry, president, Southern Bell Telephone Company, Atlanta.

RESIGNATIONS AND APPOINTMENTS.

Mr. Maurice J. Walshe, manager of the office at White River Junction, Vt., has been appointed an inspector with headquarters at New Haven. Mr. Walshe has been connected with the office at White River Junction for over twenty years, for the past eight years of that time as manager.

Mr. James Mahar has been appointed manager of the office at White River Junction, vice Mr. Walshe.

Mr. G. R. Calvert, manager of the Asheville, N. C., office has been advanced to the manager-ship of the Birmingham, Ala., office, vice E. E. Williams, promoted.

Atlanta, Ga., office for the past two years has been appointed manager at Chattanooga, Tenn., vice L. P. Taber, resigned. Mr. Murphy entered the telegraph service twelve years ago at the age of fourteen as manager of the office at Warm Springs, Va. He has risen rapidly having held responsible positions in Virginia, North Carolina and Georgia and is one of the most energetic members of the profession in the south. Before leaving Atlanta he was presented by his associates with a pair of gold cuff buttons set with diamonds.

Mr. A. A. Patterson, wire chief at Toledo, has been appointed manager at Bay City, Mich., vice Mr. T. J. Cooper who has resigned after a service of forty years at that place.

W. R. Chapman, Western Union Superintendent at St. Louis.

William R. Chapman, who has been appointed superintendent of the Western Union Telegraph Company at St. Louis, is another Canadian-born telegrapher who has come to the front in his chosen profession. Mr. Chapman was born at Brighton, Ontario, June 14, 1864. He entered the telegraph service with the Dominion Telegraph

W. R. CHAPMAN,
Superintendent, Western Union Telegraph Company, St. Louis.

Company at his native place in 1878. In 1880 he went to Toronto and entered the employ of the Canada Mutual Telegraph Company. He remained there until 1882, when he came to the United States. During the next three years he served the Mutual Union and American Rapid Telegraph companies at Buffalo, N. Y., and the Western Union Telegraph Company at Chicago, and Jacksonville, Ill., and La Crosse, Wis. Mr. Chapman became a first-class operator and in 1885 was given a chance to show his executive ability by being appointed to the management of the La Crosse office. His record at this place was so satisfactory that in 1904, when there was a vacancy in the managership of the St. Paul office he was appointed to the more important post, where he has been located until his present promotion.

E. E. Williams, Assistant Superintendent Western Union Telegraph Company, at Atlanta.

Mr. E. E. Williams, manager of the Western Union Telegraph Company at Birmingham, Ala., who has been appointed assistant superintendent of the same company at Atlanta, Ga., was born at Wilson, N. C., September 4, 1859. He entered the telegraph service in 1872 and was employed in various capacities by the Atlantic and Pacific, American Union, Southern and Western Union Telegraph Companies until 1889 when he became manager for the last named company at

Birmingham. This position he has held continuously until his present advancement. During this time Mr. Williams has made a reputa-

E. E. WILLIAMS,
Assistant Superintendent, Western Union Telegraph Company, Atlanta.

tion for himself as one of the most progressive and wide awake managers in the south and has repeatedly declined offers of managerships in larger cities. His present promotion is but a fitting reward for the many years of loyal and efficient service which he has rendered to his employing interests. Mr. Williams is a brother of Mr. W. F. Williams, superintendent of telegraph of the Seaboard Air Line, Portsmouth, Va.

C. A. Crane, Manager, Western Union Telegraph Company, St. Paul.

Mr. Charles A. Crane, who has been appointed manager of the St. Paul office of the Western Union Telegraph Company to succeed W. R.

C. A. CRANE,
Manager, Western Union Telegraph Company, St. Paul.

Chapman, promoted to the superintendency at St. Louis is one of the younger men in the profession who by reason of natural ability coupled with energy and perseverance are rapidly coming to the front. Mr. Crane was born in 1873 at Exira, Iowa. In 1885 he entered the telegraph service at Carson, Iowa as messenger. He has thus come to his present responsible position by way of the same path which most of those prominent in the telegraph today have followed. In 1902 Mr. Crane was made manager of the Duluth office and there his record has been such that when the vacancy in the managership of the St. Paul office occurred he was the logical candidate for the position.

Mr. E. Cox, Chief Operator, Postal Telegraph-Cable Company, San Francisco.

Mr. Elmer Cox, whose appointment as chief operator of the San Francisco office of the Postal Telegraph-Cable Company was briefly mentioned in our April 16th issue is one of the most wide awake and enterprising telegraphers in the west and his promotion to the position he now occupies is well deserved. Mr. Cox was born at Savannah, Mo., August 21, 1876, and entered the telegraph service September 1, 1892, at

E. COX,

Chief Operator, Postal Telegraph-Cable Company, San Francisco.

Oakley, Kan., as operator for the Union Pacific Railroad. He was afterward employed by the Wabash Railroad, by the Postal Telegraph-Cable Company at Springfield, Ills., and by the Western Union Telegraph Company at Dallas, Tex. October 7, 1903, he joined the forces of the Postal at Denver and in May of the next year he became night chief operator. On April 1, 1905, he was again promoted, this time to the position of assistant chief operator, days. He was appointed chief operator December 17, 1906, and served in that capacity until his transfer to San Francisco as previously noted.

The Cable.

John Oldham, agent for the Western Telegraph Company at Buenos Ayres, Argentina,

died April 18. Mr. Oldham has represented the Western Telegraph and other cable companies in Argentina and Uruguay for many years and was one of the best informed men, telegraphically, in those countries.

The bill which has been passed in the Canadian House of Commons to place all matters pertaining to cable traffic in the Dominion under the jurisdiction of the Railway Commission has been referred in the Senate to the Railway Committee. Before being passed the various companies involved were given a hearing in order to present any objections which they had to the proposed measure.

All of the telegraph and cable companies were represented at the hearing and as a result of their presentation of their objections to the measure passed by the House of Commons the Senate Committee has decided to amend the bill so that the Railway Commission will not be given jurisdiction over rates.

Municipal Electricians.

Fire Commissioner Rhinelander Waldo, of New York, has recommended that \$2,000,000 be appropriated for a new fire alarm system.

Plans are being considered at Passaic, N. J., for installing a police patrol flashlight system and four additional fire alarm circuits.

Mr. J. Elliot Smith, formerly superintendent of fire alarm telegraph in New York, but for many years past living in retirement at Portland, Me., was in New York recently and took occasion to call on many of his old friends.

Plans are being considered in Pittsburg for providing all of the policemen and firemen with portable telephone sets of a compact type easily carried, which may be connected, by means of a cord and plug, with a wire leading to headquarters. The stations at which connection could be made would be located at frequent intervals throughout the city.

Plans are being made to make the fifteenth annual convention of the International Association of Municipal Electricians, which meets at Rochester, N. Y., September 6, 7, 8 and 9, one of the most interesting gatherings ever held by that association. Mr. Frank P. Foster, of Corning, N. Y., secretary, urges all members to make arrangements to attend.

Patent, No. 955,056, for a combined telephone and fire-alarm or kindred service system, has been granted to William W. Dean, of Chicago, Ill. In combination with a telephone line are auxiliary signaling apparatus adapted to send signaling currents of high frequency over the line, and an alarm signal-receiving apparatus including a relay of high self-induction and a condenser of small capacity in the bridge of the line, both adjusted so as to be substantially resonant to the signaling currents, but impassable for steady currents or low-frequency alternating currents and opaque to voice currents.

Radio-Telegraphy.

"La Prensa," the principal daily newspaper of Buenos Ayres, has arranged to install a wireless telegraph station in its office.

Arrangements have been made by the British Admiralty for the filling of half of the vacancies in the naval wireless service by employees of the Post Office telegraph system.

Dr. A. E. Kennelly of Harvard University delivered an address recently before the Schenectady section of the American Institute of Electrical Engineers upon the subject of wireless telegraphy and telephony.

Announcement has been made of the re-establishment of trans-Atlantic wireless service by the Marconi Company by the completion of the repairs to their station at Glacé Bay, N. S., which was badly damaged by fire last August.

Colonel C. C. Wilson, president of the United Wireless Telegraph Company has turned into the treasury of the company, stock of a par value of \$3,000,000, which he held and other officials have turned in \$1,000,000 more of stock, thus reducing the outstanding common stock of the company from \$15,000,000 to \$11,000,000.

A patent, No. 952,403, for wireless telegraph receiving apparatus, has been secured by Clifford D. Babcock, of New York. Comprises a sensitive element, a direct-connected syntonizer, an inductively connected syntonizer, a switch for connecting at will either of the syntonizers, a circuit passing through the sensitive element and connected to the switch, and means for reversing the current through the element.

Patent, No. 954,619, for an instrument for detecting electric oscillations, has been granted to J. A. Fleming, of London, England. An electric glow lamp carrying a metal plate or cylinder on an insulator terminal constituting a rectifier, one electrode being composed of tungsten and one element of carbon.

With the completion of a wireless installation at Washington Harbor, Isle Royale, Lake Superior, that lake is covered by a chain of stations so that no vessel will ever be more than 100 miles from a shore installation. The other stations in the chain are at Port Arthur, Grand Marais, Duluth, Calumet and Marquette.

At a recent meeting of the Physical Society of London, Dr. W. H. Eccles explained a method of investigating detectors with special reference to the relations between the energy given to the detector in the form of electrical vibrations and the energy delivered by the detector as direct current to the circuit of the receiving instrument. The detector being examined is placed in a circuit containing inductance and capacity which is secondary to a primary circuit. A known amount of energy is delivered to the detector circuit and the response of the detector is measured by comparing the sound in its telephone with the sound produced in the same telephone by interrupting a measurable direct current.

Patent, No. 955,101, for spark gap apparatus, has been taken out by W. Penkert, of Brunswick, Germany. A shaft carrying a plurality of discs is rapidly rotated between electric terminals, leaving a thin layer of dielectric liquid between the terminals.

At the annual meeting of the Marconi Wireless Telegraph Company of America, held in Jersey City, April 18, it was voted to reduce the capital stock of the company from \$6,500,000 to \$1,625,000 by reducing the par value of the shares from \$100 to \$25. Two new directors were elected, Edward Young and George S. De Sousa.

In a paper upon "Experimental Tests of the Radiation Law for Wireless Oscillators" presented before the Wireless Institute of New York, April 6, Professor M. I. Pupin, of Columbia University, called attention to the advantages of employing sustained rather than damped oscillations and discussed the difficulties encountered in obtaining sustained oscillations except by means of alternators.

The headquarters of Mr. M. Musgrave, superintendent of the electrical department of the United Fruit Company have been transferred from Port Limon, Costa Rica to New Orleans, La. The United Fruit Company have equipped all their vessels with wireless telegraph installations and a chain of shore stations are maintained for the purpose of facilitating the business of the company and keeping in communication with their vessels at all times.

Wireless played a prominent part in the rescue on April 13 of the passengers and crew, consisting of ninety-five persons, of the North Pacific Steamship Company's steamer Santa Clara. The vessel was bound from Eureka to San Francisco. In leaving the harbor she ran aground but soon got off, however, and proceeded on her way. She began to leak so badly that the captain turned about to go back to Eureka but before he had reached the harbor the water put out the fires thus rendering the vessel helpless. Wireless signals of distress were sent out and a tug soon came to the rescue and took off all of the passengers and crew from the sinking ship.

Patent, No. 954,640, for an apparatus for wireless telegraphy, awarded to G. Marconi, of London, England, consists of a transmitter in which two parallel discs are rapidly rotated in opposite directions and carry studs and the discharge takes place between them. Another patent, No. 954,641, for wireless telegraphy, granted to Mr. Marconi, is for duplex wireless telegraphy in which the aerial is rapidly and successfully connected to the transmitting and receiving circuits and synchronism between the instruments at the two stations is avoided by arranging the operative periods of the transmitting apparatus considerably shorter than those of the receiving apparatus. Makes use of the transmitter of 954,640.

The Telephone.

The Michigan and Indiana Independent Telephone Associations will hold joint annual meetings at South Bend, Ind., May 11 and 12.

At the annual meeting of the Tri-State Telephone and Telegraph Company held recently at Augusta, Me., it was voted to increase the capital stock from \$6,000,000 to \$10,000,000.

The annual report of the English Post Office telephone system shows that at the end of 1909 they had 60,091 telephones connected in London an increase of 7,669 during the past year.

A special meeting of the stockholders of the New England Telephone and Telegraph Company will be held May 2 to vote upon a proposition to increase the number of directors.

Mr. Charles G. DuBois, comptroller of the American Telephone and Telegraph Company, has been elected an assistant to the president in addition to his duties as comptroller.

Mr. W. G. Olwin, manager of the Interstate Telephone and Telegraph Company at Peoria, Ill. has resigned to engage in other business. He has been succeeded by Mr. C. F. Hixon.

The Missouri and Kansas Telephone Company has purchased the plant of the Wichita, Kans., Independent Telephone Company, the transfer involves 4,300 telephones, 10,000 miles of wire and 60 miles of toll line.

It is reported that the demand for telephone service in Japan is increasing so rapidly that the Department of Communications is having difficulty in making installations as fast as desired. Over 3,000 new connections have been made during the past few months.

At a meeting of the stockholders of the Indianapolis Telephone Company and the New Long Distance Telephone Company held at Indianapolis, April 13, F. W. Stevens and F. H. McKnight of the firm of J. P. Morgan and Company, New York, were elected directors. The following officers were elected: William Fortune, president; Louis Hollweg, vice-president; Charles S. Norton, secretary and treasurer.

At a meeting of the Armour Institute Branch of the American Institute of Electrical Engineers held in Chicago, April 7. Mr. Arthur Bessey Smith discussed the "Automatic Telephone from the Commercial Standpoint." Mr. Smith after explaining the conditions of service which the telephone user of to-day expects, spoke of what he considered the mistaken attitude on the part of some telephone designers who assume that the subscriber is unwilling to share in the work of establishing connection with the party called. On the contrary he said that the average subscriber will gladly assist in any operation which will expedite his service.

Mr. Eugene V. R. Thayer has been elected a director of the American Telephone and Telegraph Company, vice Nathaniel Thayer, resigned.

Other directors elected to increase the number on the board from eighteen to twenty-five are Thomas B. Bailey, Harry H. Grigham, George L. Green, Henry L. Higginson, George Willis Pierce, Frank E. Warner and Robert Winsor.

The gross revenue of the associated operating companies of the American Telephone and Telegraph Company for the months of January and February amounted to \$26,039,253, an increase of \$2,704,052 over the corresponding months last year. The income of the American Telephone and Telegraph Company for the first three months of 1910 was \$8,889,351 an increase of \$1,285,055 over the same period in 1909.

The Home Telephone and Telegraph Company, of Portland, Ore., has asked that a receiver be appointed for the Puget Sound Telephone Company and the Northwestern Long Distance Telephone Company which operate in Seattle and Tacoma. The Portland Company alleges that it has claims against the other companies amounting to \$250,000 and that because of their heavy bonded indebtedness they are unable to pay fixed charges.

Plans are well under way and rates have been announced for the new automatic telephone system which will be installed in Chicago by the receivers of the Illinois Tunnel Company. According to the present announcement the maximum rates which will be charged will be \$84 and \$50 per year respectively for business and residence telephones. Business telephones only will be installed at first and the maximum rates will not go into effect until 20,000 telephones are in service.

Maryland Public Service Commission.

Telegraph and telephone companies in Maryland, as well as other public service corporations, have been placed under the jurisdiction of a Public Service Commission by a law recently passed by the Legislature of that State.

The Commission has power to determine rates to be charged by each public corporation. The rates are required by the act itself to be just and reasonable, and the Commission is vested with full powers to conduct investigations in order to enable it to ascertain what rates in the case of each particular public service corporation are just and reasonable.

The Commission is given power to enforce its orders in various ways provided by the act. Power also is given it, whenever it may deem it desirable to do so, to value the property of any public service corporation, but such valuation shall be so made that, as far as possible, it shall not affect the value of bonds heretofore issued by such corporation.

The annual convention of the American Institute of Electrical Engineers will be held June 27, 28, 29 and 30 at Jefferson, N. H., in the White Mountain district.

The Hughes' Printing Telegraph System.

Since the question of printing telegraphs is one which is attracting much attention at the present time the following brief description of the Hughes printing telegraph system abstracted from "The Hughes' and Baudot Telegraphs," by Arthur Crotch, may be of interest. While this system has never been used in this country it is quite extensively employed by several European government telegraph administrations. The receiving instrument consists essentially of a revolving inked wheel having the letters of the alphabet raised on its periphery and a paper tape upon which the characters are printed. When a current impulse is received, the tape is raised into momentary contact with the wheel and that letter printed which is opposite the paper at the time. By the rotation of the type-wheel every letter of the alphabet in turn is brought opposite the slip; the currents sent must therefore be so timed as to raise the slip when the required letter is opposite. At the sending end a contact lever when depressed makes the necessary connection between the battery and the line, and this lever is actuated by keys through the intermediation of another piece of apparatus which determines the exact time at which the signal shall be sent. In each complete instrument the means both of sending and receiving are included. When the apparatus is sending, its receiving portion is invariably actuated also so as to give the operator a check on his sending.

The electrical action of the instrument is limited to the releasing of the armature of a magnet; the reverse of the conditions usually met with in such apparatus. All of the rest of the work of printing, moving forward, the tape, and replacing the armature is effected mechanically.

A compound permanent magnet of horseshoe form is so fixed that its poles are flush with the upper surface of the instrument table or base. Over each pole is placed a soft iron fitting terminating in a cylindrical piece which serves as a core for the magnet coil wound upon it. The poles of the permanent magnet are thus transferred to the free ends of the soft iron coils and we have a powerful horseshoe magnet with coils placed on its extremities. If a current passes through the coils it will, according to its direction, increase or diminish the existing polarity. The armature of the magnet has two strong springs attached to it in such a way as to pull it away from the magnet. The tension which these springs exert may be varied by means of suitable set screws. This tension is so adjusted that when no current is flowing in the magnet coils the pull of the magnet is just sufficient to hold the armature against the pull of the springs. The incoming currents pass through the coils in such a direction as to weaken the attraction of the magnet and the armature is immediately pulled upward by the springs. The

upward movement of the armature operates a lever which by means of a suitable mechanism allows an axle bearing three cams to make one revolution. One of these cams causes the paper slip to be brought in contact with the type wheel, another causes the paper to be moved forward at the same time and at the same rate of speed at which the type wheel is revolving so that a clear impression will be made on the paper and the third cam corrects any slight deviation from synchronism between the sending and the receiving apparatus. While this is being done a fourth cam automatically brings the armature back into contact with the pole pieces of the magnet. This action of replacing the armature would, if the coils were left in circuit, create in them a momentary current, the direction of which would be such as to weaken the magnet and thus cause the armature to be again released. To avoid this the circuit of the coils is automatically broken while the armature is being replaced.

The keyboard which operates the sending apparatus consists of a set of twenty-eight levers mounted at the front of the instrument. The levers are pivoted beneath the table plate and their front ends form a kind of pianoforte keyboard on which fourteen white alternate regularly with fourteen black keys. Twenty-six of these form the letters of the alphabet, one of the extra keys is a space key and when the second extra key is depressed the other keys will form figures, punctuation marks, etc. A horizontal circular brass plate having twenty-eight slots cut radially near its circumference is mounted back of the keyboard. In each of these slots a steel pin works, whose lower end rests on the back end of one of the keyboard levers. When any key is depressed the back rises and pushes up its pin so that the head of the latter is above the surface of the pin plate. A vertical shaft rises above the centre of the pin plate having at its lower end a horizontal fitting which revolves with the shaft. A rocking piece is pivoted on this fitting so that normally it just clears the pin plate. When one of the key pins rises above the pin plate and this rocking piece in the course of its revolution comes in contact with it, the outer end of the rocking piece is tilted upward and the inner end correspondingly lowered. This lowering of the inner end of the rocking piece draws down one end of a contact arm the other end of which makes a contact which sends current to the line. At the same time a projection on the contact arm strikes off the armature of the magnet thus actuating the receiving apparatus. This is done in preference to sending the line current through the magnet coils of the home instrument. Means is provided to prevent a failure to send the signal by reason of the key being released too soon and also to prevent the same signal being sent twice by reason of the key being held down too long.

The vertical shaft has on it a bevel gear which

fits into another bevel gear of the same size mounted on the type wheel axle. Thus the fitting and rocker on the lower end of the shaft are kept continually revolving over the pin plate at the same rate of speed as the type wheel.

The type wheel carries the letters of the alphabet and two blank spaces alternating with the figures and punctuation marks used. When printing letters the type wheel always moves the distance between two letters or some multiple of that distance between each successive signal. When, however, it is desired to print a figure or punctuation mark the extra blank key previously mentioned is depressed and this automatically causes the type wheel to be moved forward one-half of the distance between two letters so that a figure or punctuation mark will come in contact with the paper slip, when it is raised in the usual way.

Means is also provided to stop the revolution of the type wheel or bring it to zero in order to synchronize the apparatus with that at the distant station.

To equalize the variation in the speed of the apparatus which would naturally result from the fact that more power is required to drive it when the operation of printing or sending is being performed than during the time between the signals when the machine is running light a governor is provided. This is of the fly ball type. The two arms which carry the balls revolve inside of a steel ring. Opposite this ring the arms each carry a brush. When the machine is turning at the proper speed these brushes just clear the inner surface of the ring. When the speed increases the balls and the arms which carry them fly outward and the brushes rub against the steel ring and the resulting friction acts as a brake and keeps the speed down to the proper limit. The speed at which the instrument usually runs is from 100 to 125 revolutions of the type wheel per minute.

Electric motors are used for driving the apparatus and a variable resistance is inserted in the motor circuit which permits very close adjustment of the speed. When the machine is at rest an auxiliary circuit is thrown in, which rings a bell, as soon as the distant station sends a signal and thus releases the armature of the magnet. To synchronize the two sets of apparatus, one operator presses his space key repeatedly, so as to send an impulse to the line with each revolution. If the two are not running in synchronism this will print some character on the paper slip at the other end. The operator there then adjusts his apparatus until at each impulse received the slip is opposite the blank space on the type wheel. He then knows that the two are nearly in synchronism, but as there is a correction at each impulse for slight deviations he cuts out his receiving apparatus and allows the type wheel to make several revolutions. If his instrument was slightly out of accord with the other the variation will now be multiplied by the number of revolutions

which he allows the type wheel to make without recording and hence will be apparent as soon as he throws the receiving apparatus back into operation. The adjustment is usually made so that the type wheel will make ten revolutions without correction and not fall out of synchronism with the other set.

For mechanical and electrical reasons, after one key has been depressed the next one which can be utilized in the same revolution of the type-wheel is the fifth one from it; that is, a maximum of five letters can be made in one revolution of the typewheel. Thus different words depending upon the order of their letters may take different numbers of revolutions. For example, the word "taint," containing five letters, can be sent in two revolutions, while the word "added," also containing five letters, would require five revolutions.

This system is worked duplex successfully either by the bridge or differential method. It is used in circuits from London to Rome with repeaters at Paris and Lyons, from London to Vienna with four repeaters and from London to Berlin, with repeaters at North Walsham and Emden. The Hughes printing telegraph, which is an American invention has never been thought suitable for use in the United States because of the fact that it prints the message on a tape. In European countries where it is used the paper slip is cut into short strips and pasted on message blanks. In this country, however, under the conditions of competition which obtain the delay which such an operation would cause is considered to be a serious obstacle to the successful use of this system.

Bill Introduced for Recognition of Military Telegraphers.

A bill for the purpose of granting relief to those who served in the United States Military Telegraph Corps during the Civil War has been introduced in the House of Representatives by Representative Taylor of Ohio, and referred to the Committee on Invalid Pensions. The proposed measure reads as follows:

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that in the administration of the pension laws and the laws governing the National Home for Disabled Volunteer Soldiers, or any branch thereof, any person who served ninety days or more as a military telegraph operator during the Civil War, and who has received, or is entitled to receive, a certificate of honorable service in the Military Telegraph Corps of the Army of the United States, as provided for in an act entitled 'An act for the relief of telegraph operators who served in the war of the rebellion,' shall be held and considered to have been mustered into the United States military service at the date of employment in said Military Telegraph Corps, and to have been honorably discharged therefrom at the date their employment ceased: Provided that no pension shall accrue prior to the passage of this act."

Telegraph and Telephone Age

Entered as second-class matter, December 27, 1909, at the Post Office at New York, N. Y., under the act of March 3, 1879.

Published on the 1st and 16th of every month.

ADDRESS ALL COMMUNICATIONS TO

J. B. TALTAVALA, - Editor and Publisher,
283 BROADWAY, NEW YORK.
H. E. DUNHAM, Associate Editor.

CABLE ADDRESS: "Telepage," New York.
Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

May 1, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Progress in the Telegraph.

The announcement made by the Western Union Telegraph Company that the present dividend rate will not be increased until the working conditions, etc., of employees are improved has aroused new interest in the rank and file of the service. The men now realize that their superior officials have an interest in their welfare which rises above any desire to make the company pay the highest possible dividends.

In every organization there are men inclined to lend a ready ear to the professional agitator. There are others who are only too ready to become disgruntled because improvements are not made immediately or to their particular liking. The hasty and the unthinking are prone to criticize and condemn before the ink is dry.

With large corporations whose ramifications extend over vast territory, with thousands of employees and millions of customers, with contractual relationships interwoven in the nation's business fabric, any important changes necessarily take time and consideration in the perfec-

tion of details before they can be put fully into effect.

The present management of the Western Union is composed almost entirely of men who have worked their way up from the ranks. Hence they naturally have an interest in the welfare of those who are following in their footsteps, engaged in the very same duties which they themselves at one time performed. It is scarcely reasonable to presume that they will delay improvements or attempt to keep the force from receiving just rewards.

The success of an administration, whether military, political or commercial, depends to a great extent on the hearty co-operation and loyal support of its organized army of workers. The public judges an administration like that of the telegraph not so much by the dollars and cents of dividends as by the efficiency of service and the potentiality of its operating forces. There can be no lasting efficient organization which is not based upon the two great fundamentals of success: Wisdom of administration, and co-operation of employees.

We believe that the next year or two will bring about great advances in the uses of the telegraph by the public. In the business world it will steadily supplant the slower mails for correspondence. In the social world, the envelope of the telegraph message will no longer be regarded as bearing unexpected tidings of unpleasant news, but will become the welcome messenger of electric greetings from friends far and near. In every path of our American life communication by wire is on the increase. The service must expand to meet the demand, and particularly in the telegraph every member of the organization is bound to have the opportunities of progress.

The Return to Wheatstone Operation.

The first result of the introduction of the night letter telegram service in the method of handling the business is the return of the Western Union Telegraph Company to the use of the Wheatstone system to handle the large amount of matter which must be transmitted over the wires. This system is now being used between New York and Chicago where the business is naturally heaviest and is being placed in service between other large traffic centres. Messages received at any terminal point, destined to other offices, are pasted on blanks and the sending operator reads the matter direct from the Wheatstone tape. In this way no time is lost and the operators are thus being educated to readily read the tape on which the messages are printed in Morse characters, the American alphabet being used with the exception of the substitution of the reversed figure 7, two dots and two dashes, for the letter I.

The value of the Wheatstone for handling a large volume of business in a short time has long been fully appreciated but the unavoidable delay incident to the translation of the tape has

heretofore prevented its general utilization in this country for the day business in which every minute counts. For the night traffic however which will not be delivered until the next morning, this objection does not apply. Hence it would seem that the Wheatstone is likely to prove of great value to the telegraph officials in solving the problem of how to handle the enormous traffic which is developing. It is very likely, however, that as the men become familiar with this class of service as good or better time can be made in sending messages by the Wheatstone than by the present method. It takes only about half the time to perforate a message that it does to send it by hand. The messages when thus prepared are transmitted over the wire at a speed of from 100 to 300 words per minute. As the tapes can be translated, after the operator becomes familiar with the work, at typewriter speed, it is apparent that excellent time can be made on all classes of service.

It is a singular coincidence that the English telegraph administration is at the present time returning to the use of the Wheatstone system after abandoning it several years ago.

To Raise the Standard of Operators.

For the purpose of increasing the efficiency of the telegraph personnel at least one of the companies has decided to increase the pay given to check boys and girls in order to make these positions sufficiently attractive to induce graduates of grammar schools and high schools to take up this work. Before being accepted all applicants for such positions will be required to pass examinations showing their ability to read and write and that they are perfectly familiar with the English language as well as the possessors of a good knowledge of grammar, geography and arithmetic. Those who so desire, being given an opportunity to learn telegraphy, this action ought to result in attracting to the profession many of the most intelligent of the younger generation and thus in the course of time raise the general standard of efficiency of the service.

Dinner of the Magnetic Club.

The annual spring dinner of the Magnetic Club, which was held at the Hotel St. Denis, New York, April 19, was well attended about one hundred being present. Contrary to the usual custom there were no speeches made. After dinner had been served President C. P. Bruch called upon two past presidents who were present, E. H. Johnson and W. J. Dealy for a few remarks, and both gentlemen expressed their pleasure at being present on that occasion and also their appreciation of the honor of having been president at one time of such a flourishing organization. The remainder of the evening was spent in enjoying a program of high class vaudeville arranged for by the entertainment committee of which Mr. Theodore L. Cuyler, Jr. is chairman. Those present agreed that the 1910 spring dinner of the

Magnetic Club was one of the most enjoyable ever held by that organization and united with President Bruch in the hope that the club might prosper for many years to come.

Among those present were:

Boston, Mass.:—L. L. Howell, C. A. Richardson and A. L. Edgecomb.

Buffalo, N. Y.:—H. D. Reynolds.

Baltimore, Md.:—V. J. Albert.

Harrisburg, Pa.:—C. E. Diehl.

Philadelphia, Pa.:—C. E. Bagley, A. E. Zintl and J. A. McNichol.

Washington, D. C.:—F. B. Travis.

New York:—E. S. Butterfield, J. R. Beard, C. A. Benton, C. P. Bruch, E. B. Bruch, C. M. Chapman, J. Costelloe, T. L. Cuyler, Jr., J. J. Cochran, M. R. Cockey, J. J. Cardona, W. J. Dealy, J. Davison, H. E. Dunham, F. W. Daly, T. J. Donovan, A. P. Eckert, G. W. Fleming, J. H. Flood, W. D. Francis, W. Finley, T. E. Fleming, H. S. Griffin, G. H. Gibbons, T. E. Heffren, J. Hennessy, P. A. Hickey, W. S. Hallett, T. J. Howlett, F. E. d'Humy, E. H. Johnson, E. Kimmey, F. J. Kernan, H. Kitt, C. F. Leonard, C. A. Lane, J. J. McCormack, R. H. Miller, E. F. Maher, F. E. McKiernan, P. Mallett, J. P. McBurney, J. A. Manning, W. H. Mathews, J. McNeill, J. J. McDermott, D. F. Mallen, J. P. O'Donohue, S. E. Ostrom, M. J. O'Leary, M. J. Pike, F. Pearce, E. B. Pillsbury, C. F. Pearce, W. F. Regan, E. Reynolds, C. A. Randall, M. W. Rayens, C. Shirley, F. A. Scheffler, J. F. Shugrue, W. Scrivens, W. Scarborough, P. J. Tracy, E. P. Tully, J. B. Taltavall, G. H. Tamlyn, D. Underhill, J. J. Whalen, H. Wiese, J. Western and H. Zweifel.

American Telephone and Telegraph Company Will Not Issue New Stock This Year.

In a circular-letter sent out to stockholders of the American Telephone and Telegraph Company recently, President Theodore N. Vail made the following statement in regard to the placing on the market of the additional stock which that company has been authorized to issue:

"It will not be possible for the company to offer any new stock to shareholders during the current year, as the cash resources available are sufficient for all current ordinary expenditures this year and well into the next year and will also leave a margin sufficient for all possible extraordinary expenditure.

"The work of reorganizing and readjusting the territorial lines of associated companies to conform more closely to commercial and geographical lines and bring together the naturally independent territory will be continued and some adjustment will be made through the exchange of shares of this company for shares of the associated companies. For this purpose the company now has in its treasury of its present stock issue sufficient to meet all its demands in the near future."

Possible Results of Adoption of Night Letter-Telegraph Service.

BY WALTER P. PHILLIPS.

In my opinion the adoption of the night letter rate will eventually very greatly increase the amount of night telegraphing. How rapidly this increase will take place depends altogether on how responsive the public is. While there can be no doubt that everyone who does any telegraphing at all will be glad to avail himself of the night letter privilege, it is one of the uncertainties that time alone can determine, how long the average citizen will require to get his eyes open to this new advantage that is his for the taking.

If it had occurred to someone and it had been feasible to make this bid for a part of the enormous mail business of the country twenty years ago, it would have resulted, by this time, in a phenomenal expansion of the business. Whether it will require another twenty years for the people who use the telegraph to sufficiently awaken to the situation to an extent that will keep the wires busy at night and possibly lead to the introduction of automatic machinery to dispose of the greatly augmented business, that is a conundrum than one man can guess about as well as another.

The lamp by which our feet are guided, according to Patrick Henry, is the lamp of experience and by that we have been taught that as the press rate by wire and cable has been reduced the amount of matter handled has been constantly on the increase until its proportions are now colossal. We naturally reason from this that night letters will increase in popularity and, in due course, the number of them will grow into overwhelming dimensions just as special delivery letters and many other time saving devices which, starting slowly, have come now to be so universally utilized that those who are between twenty-five and thirty-five years of age usually express surprise when they hear from their elders that we did not always have the numberless conveniences with which the present and preceding generations have been familiar from their youth up.

When the Broadway cable cars were introduced I remarked to an eminent lawyer that it was surprising we had depended so long on horse drawn cars when the cable cars could have been used any time these fifty years. He replied: "My boy, it took vain man just three hundred years to put a back on a stool and make a chair of it. What can you expect of him when it comes to replacing horse cars by those drawn by cable?"

Three hundred years is a long while, and before that length of time has elapsed nothing short of the nearest approach we can make to instantaneous communication will answer the world's purposes and in the meantime it is only a question of a little time, in my judgment, when nothing will go by mail that can be sent by wire, provided the cost of transmission is placed within reach of the multitude and the tendency seems to be strongly in the direction of improving and lowering the price of communication by wire.

A Tribute to Jacob Levin.

As an indication of the way in which the people of Atlanta have come to regard Mr. Jacob Levin during his incumbency at that point, of the office of general superintendent of the southern division of the Western Union Telegraph Company, from which he has recently retired, we print the following editorial comment from one of the Atlanta papers:

"The resignation of Mr. Jacob Levin as general superintendent of the southern division of the Western Union Telegraph Company brings keen regret to thousands of people in this city and section who have come to value him so highly as an official and to honor him so deeply as a man.

"We are sure that we voice a universal feeling when we say that no official in this territory has ever served the telegraph company more faithfully or efficiently than has Mr. Levin. During his residence of seven years in Atlanta he has discharged every duty of his complex and exacting office to the credit of his company and the cordial satisfaction of the public at large. A man of smaller calibre or of less incisive intellect would often have floundered and failed in face of difficulties he has brilliantly mastered. His work has been pre-eminent creative. He has brought to bear upon the administration of this vast business a constructive originality as well as energy and steadfastness. In many particulars he has done the hard labor of a pioneer, so that the perfection of the telegraph system in the South to-day is largely the fruit of his skill and intelligence.

"Mr. Levin has made scores and hundreds of warm friendships since he came to Atlanta. From the outset, his competency and obligingness appealed to business men everywhere. And in the course of years their confidence deepened into a personal esteem for him. He has become their friend for whom they will always cherish a sincere regard.

"We wish him high fortune and bespeak for him eminent success, whatever line of business he may pursue. We trust that he will continue to make this city his home, for his presence and personality are a credit to any community in which he may live."

Two young would-be telegraphers walked into an electrical store recently and handing the salesman a telegraph instrument requested that it be repaired. When asked what seemed to be the trouble, neither appeared to know, but finally one of them ventured his opinion "that the ohms were broken and needed fixing."

Much has been said from time to time in regard to the government of this country taking over the telegraph and telephone systems and operating them in connection with the post office as is done in foreign countries. This order of things appears to be reversed, however, as by their night letter plan the telegraph companies seem to be engaged in taking business away from the post office.

Telephone Officials Dine Telegraph Executives.

About forty-five telephone officials gave a dinner on Monday evening April 18 at the Hotel Astor, New York to fifteen of the higher officials of the Western Union Telegraph Company. The dinner was held for the purpose of giving the telephone and telegraph executives a chance to get better acquainted with each other and at the same time give them an opportunity to discuss informally the relations now existing between the two interests.

Mr. Union N. Bethell president of the New York Telephone Company, presided over the gathering and after the dinner called for remarks from the following Western Union officials: E. J. Hall, chairman of the executive committee; R. C. Clowry, president; T. F. Clark, vice-president, H. D. Estabrook, solicitor and S. M. Williams, special agent.

Mr. Hall outlined the future relationship of the telephone and the telegraph and showed how by working in harmonious co-operation with each other they would afford greater facilities and added conveniences to the public.

President Clowry's remarks were of a reminiscent nature recalling past days in the telegraph service.

Mr. Thomas F. Clark, spoke on the subject of "The Decadence of the Metropolis." He said, in the beginning, that perhaps this subject might seem foreign to the occasion and to the purposes of the telegraph and telephone companies, but that it really has a close relation to the development of electrical communication. He first reminded the company of the position of the ancient metropolis or mother city. It was the seat of Government whence issued all the laws of the nation, for the blind, uncomplaining obedience of the people. The institutions of learning were there, the powers of religion were centered there. Every form of extravagance grew under the favor of the court, and the more exquisite manners became, the more lavish was the extravagance of the ruling classes and their imitators. All these conditions drew upon the resources of the people, whose tribute was made in obedience to superstitious ignorance. Mr. Clark sketched the course of events up to the frenzied assault of Paris on Metropolitanism in the French Revolution, and passed on to the resulting desire of the people for knowledge in the consciousness of their newly found power, making the picture of the ripeness of the conditions for the magic touch of the electric current. The progress was slow because of great physical obstacles, but patience, energy and skill overcame them all. To-day public opinion is formed in no one particular centre, but is the outcome of individual daily interest in the affairs of the world, from which flows an independent judgment subject to no dictation of any kind.

Mr. Clark referred to the press transmission of the telegraph company and dwelt upon three

branches of the service that had been fruitful of great incidental benefits. The commercial news service, he said, had been, and is, a greater boon to the country than most people realized. It emancipated the farmer, north, south, east and west, from the trammels of the factor who before could do as he chose with the produce consigned to him. After that he laid stress upon the value of the transmission of the weather reports for the government. With the stimulus to individual effort and the banishment of collective indifference, not only are the growing crops protected, but mental alertness takes the place of vanished apathy. For the daily time service he also claimed the advantage of incalculable economy, through the harmonizing of the hour. To all of these departments of the service he attributed the incidental national benefit of the making of men and of character, the truth of which is shown by the intelligent verdict that is rendered by the country at large in great crises. The metropolis no longer governs except in fashion or art or literature; it asks now for the opinion of the man in the street, on the farm, in the mines, with a deference as great as the arrogance of its ancient dictation.

Mr. Clark also passed on to the social side of electrical transmission, which, although begun by the telegraph has been extended and amplified by the telephone. He declared that dumb, unsocial men and women, the victims of hopeless solitude, have been inspired as with a new life by means of the spread of the human voice from neighbor to neighbor in the most out of the way places.

"Now, all these things have not been done," he said, "by accident. They have been done by the highest intellectual endeavor, consciously or unconsciously. The joy of the inventor, limited by the final form of the efficient thing created, has been followed by the farseeing wisdom of the man of affairs, and he in turn, has been aided by the technical expert, the practical line builder, and the competent and zealous operator—all have made their contributions to the results I have tried to indicate. But I want to impress upon your minds as forcibly as I can, that the foundation and compelling power behind the achievements that we take pride in administering has been imagination. The men in whose brains have originated the great schemes that have moved the human race forward and made the last century the most marvelous in all history have been first and foremost, men of imagination. In the story of the telegraph there were two particularly striking examples of this. Have you ever thought of the courageous dream that impelled the early managers of the telegraph to send their expeditions to the unexplored wilds of British Columbia and Alaska to work towards the cruel waters of the Behring Sea, there to meet a similar expedition that had blazed the path of the civilizing current through the bleak wastes of Siberia? At the same time another set of men were work-

ing against discouragement and failure, but with ultimate success, in obedience to their imaginations to tie the two shores of the Atlantic ocean together, with the slender thread that their ships spun from day to day like busy spiders of the sea. Imagination made these great things possible in the early days, and has gone on with each successive development in the business and in none more so than in the telephone field, with its widespread and intimate wonders of efficiency. Imagination has been behind it all, and in the personality of Mr. Vail. I think I may say with your concurrence, it is behind the great plans of to-day to make the combined service of the telegraph and telephone more efficient than ever, both inherently and incidentally."

Mr. Estabrook said in part:

"When Jonah was swallowed by the whale, those who witnessed the absorption must have said good bye to Jonah. But we have Jonah's word for it that the whale never touched him; that so far from being an annihilation it was to be Jonah redivivus; and we know that centuries afterward the incident was used to symbolize a resurrection!

"Now it was lucky for humanity and the commerce of the world that as an embryo the telephone was not engorged by the telegraph, but was left to evolve along natural lines and to develop its natural genius and, incidentally, the genius of him who by a sort of affinity—perhaps I should say consanguinity, for he was related to Morse, the inventor of the telegraph—had linked his own destiny to the destiny of a colossal enterprise, and who lives to find himself a Colossus indeed; for to-day he bestrides them both, the telegraph and the telephone, and like a charioteer of the sun reins in these 'sightless couriers of the air.'

"In the beginning there was competition between them, poignant if not acrimonious; that sort of competition which always precedes a readjustment. There is no doubt but that the telephone greatly modified the uses of the telegraph, until finally it defined its jurisdiction and the radius of its influence. To-day the telegraph and the telephone complement each other, and in my opinion the recent document which affects to prescribe their relationship is only tentative. It is at most a sort of switchboard 'fuse' which soon or late is bound to become short-circuited and so weld these great bodies into a homogeneous unit. Human laws may hinder and delay, but they can not prevent this consummation."

Mr. Williams discussed public opinion in so far as it concerns public service corporations.

For the telephone company, Mr. T. D. Lockwood of Boston gave an interesting account of some of the trials and tribulations of the telephone people in the early days of that industry. The rules for using the early type of instruments were often misread and misinterpreted and much confusion resulted in the attempts of subscribers to use their telephones. In addition to this there

were no text books and no guides of past experience to go by.

Mr. B. E. Sunny, of Chicago, vice-president of the American Telephone and Telegraph Company and president of the Chicago Telephone Company also spoke of the new relations existing between the two interests.

Mr. Angus S. Hibbard, general manager of the Chicago Telephone Company had composed, upon popular songs of the day, some parodies relating to the telephone and telegraph, which were very amusing.

The officials of the Western Union Telegraph Company who were present were: E. J. Hall, chairman of the executive committee; R. C. Clowry, president; T. F. Clark, J. B. Van Every, and G. W. E. Atkins, vice-presidents; B. Brooks, general manager; J. C. Willever, secretary; A. R. Brewer, treasurer; Rush Taggart and H. D. Estabrook, solicitors; W. E. Athearn, engineer of equipment; R. E. Chetwood, engineer of construction; A. G. Saylor, general superintendent of the eastern division; E. Y. Gallaher, auditor, and S. M. Williams, special agent.

The telephone officials present were: Theodore N. Vail, H. B. Thayer, U. N. Bethell, B. E. Sunny, G. V. Leverett, C. G. Du Bois, F. A. Pickernell, J. D. Ellsworth, C. R. Bangs, A. S. Hibbard, E. T. Holmes, J. J. Carty, B. Gherardi, K. W. Waterson, E. F. Bloom, C. H. Wilson, H. S. Brooks, F. A. Stevenson, J. L. R. Van Meter, J. S. Wiley, E. W. Moister, W. S. Gifford, F. G. Nelson, C. D. M. Cole, T. D. Lockwood, H. F. Thurber, Ford Huntington, W. D. Sargent, J. A. Stewart, E. A. Gurnee, Waldron Hoppins, E. F. Sherwood, R. M. Ferris, J. S. McCulloh, Walter Brown, Alex. Cameron, C. T. Russell, M. Eggleston, A. E. Holcomb, and Colonel Hunt Chipley.

The Western Electric Company was represented by: H. A. Halligan, C. E. Scribner, F. H. Wilkins, Gerard Swope, A. L. Salt, R. H. Gregory, and J. W. Johnston.

The R. W. Martin Fund.

Contributions to the Robert W. Martin fund having ceased some time ago, the entire amount collected has now been exhausted. In a recent letter to us acknowledging the receipt of a check Mrs. Martin said:

"I wish to thank you and all of our friends very much. Mr. Martin is failing all the time, mentally, of course, and he grows more like a child each week. He especially enjoys my reading to him from Telegraph and Telephone Age words of good cheer from friends of long ago."

The total amount collected as recorded in our March 1 issue was \$618.25. Since that time no contributions have been received. In our February 1 issue we made note of the payment of \$466 to Mrs. Martin. Since then we have sent her the following amounts: February 28, \$60; March 28, \$60; April 28, \$32.25, making a total of \$618.25 thus closing the account.

The Military Telegrapher in the Civil War.

PART XXXVIII.

Captain Thomas B. A. David, who is now living in retirement at Pittsburg, and is a highly respected citizen of that place, was during a greater part of the Civil War a prominent member of the United States Military Telegraph Corps, being in charge of construction and operating forces in that branch of the army. In a letter written to Colonel William R. Plum, historian of that organization, in 1878, Captain David gave the following account of the part which he played in the great conflict.

"My army experience was characterized by so few of the severe trials endured by others in the United States Military Telegraph service that I reluctantly attempt to reduce to writing what remains in my memory of that eventful period in our history, nor could I persuade myself to do so, were it not that my part, although devoid of many of the hardships and heroic events which others have to record, is nevertheless a link in the history of that important branch of the service.

The breaking out of the war found me at Wheeling, Va., where I had resided some six years, and knew therefore some of the vicissitudes incident to men holding anti-slavery views in a slave-holding state. Being one of the few who voted for Abraham Lincoln, and holding the position of manager of the telegraph office, I became, immediately after the election of Mr. Lincoln, an object of disfavor on the one hand and on the other hand a source of some comfort to the few Republicans throughout the western part of the state.

"My entry into the service may really be said to have been in April, 1861. Early in that month I received a letter from Anson Stager stating that Mr. William H. Seward, secretary of state, was exceedingly anxious that any information touching the movements of the Confederates encamped at Harper's Ferry should be communicated to him, and asking me to keep a sharp watch of messages passing over the wires on the line of the Baltimore and Ohio Railroad. Subsequently I was directed to visit Cumberland and arrange cipher communication with the operator there, Mr. George M. Deetz.

"The firing upon Fort Sumpter developed the real honest sentiments of the people of Western Virginia and showed that the Unionists were in the majority. Steps were presently taken to secure money and arms in order to form and equip military companies, there being no state organization except that at Richmond, which was under Confederate control. Colonel B. F. Kelly was placed in command of the First Regiment, and on Sunday, May 26, 1861, he took possession of the telegraph office at Wheeling. Some very amusing and very greatly exaggerated reports were circulated about this seizure.

"I was then ordered by Colonel Stager to take charge of the telegraph on the line of the Baltimore

and Ohio Railroad proper from Wheeling to Grafton and Cumberland, Mr. W. G. Fuller, of Marietta, having been given charge of the lines on the north-western branch between Grafton and Parkersburg.

"The troops moved eastward from Wheeling on Monday, May 27, to a point on the line of the railroad, near Mannington, where a small Confederate force under William Thompson, of Wheeling, had been encamped a few days before and who on leaving had burned the bridge. I followed on the night train and, arriving at headquarters at 4 a. m., was ordered by Colonel Kelly to proceed at once to Fairmont and open communication by wire. I started with a squad of recruits filled with a sense of great danger to be apprehended. I soon discovered that the greatest danger laid in the awkward squad that accompanied me for one moment I was liable to be run through with a bayonet, and at another to be pierced with a ball from the premature discharge of one of their guns.

"We reached Fairmont about 9 a. m. on the twenty-eighth. The instruments had been carried off, but I had an extra set with me and we were soon in communication with division headquarters. Before leaving Wheeling I had procured a form of oath to be administered to operators, requiring in addition to loyalty a promise not to divulge the contents of any messages. Delivering a copy to a justice of the peace, I had him swear into the service two or three operators who happened to be at Fairmont. It was the custom at that time to bring into town, or to headquarters, anyone suspected of disloyalty and require them to 'take the oath.' I learned some time afterward that this judicial functionary had been requiring all brought before him to subscribe to the telegraphers' oath.

"A temporary bridge having been constructed, Colonel Kelly moved forward to Grafton on the thirtieth of May and found that the Confederates had vacated the town the day before, taking the telegraph instruments with them. I proceeded the same day by special car, as far as Rowlesburg, and cut the connection east by Colonel Kelly's order and returned to Grafton that night.

"Here we rested awaiting the division moving from Parkersburg. There was no telegraphic communication and great anxiety was felt concerning its safety. General T. A. Morris having arrived he assumed command, and by his order I was directed to open up communication with the troops coming from Parkersburg. I started immediately on an engine. The telegraph line was soon put in operation and a junction formed with the troops.

"We were joined shortly after by Colonel Anson Stager, who became an inspiration to the service. The remainder of June was spent in the preparation for a movement away from the line of railroad. July to the advance moved from Clarksburg, W. Va., and then began, I believe, the first effort to follow an army with a telegraph line. W. G. Fuller commenced the construction of the line and when about

eight miles from Clarksburg I took charge of the work by Colonel Stager's order and Mr. Fuller returned to Clarksburg to supervise matters there. I continued with the construction gang until the line was completed to Beverly and Huttonville. It was subsequently continued a few miles further to the top of Cheat Mountain under the personal supervision of one of my aides, Mr. E. B. Bryant, who remained with the troops at that point until the following spring, and then only gave up when crippled by rheumatism. The line was a crude affair. The work was done by inexperienced men detailed from the troops. We were frequently delayed waiting for material and reached Buckhannon on the fifth of July. At this point the telegraph was highly complimented by General McClellan's staff, notably by Captain Saxton, quartermaster-in-chief to the army. They openly stated that but for the telegraph line the army would have been detained many days at Buckhannon. In the light of later experience this does not seem at all remarkable, but the proposition to follow the army with the telegraph met with opposition from some of the old army officers, and the acknowledgment of their error was then regarded as an important matter.

"We left Buckhannon, July 8, keeping close up with the army. The battle of Rich Mountain, the first real battle of the war, was fought July 12. We were delayed at this camp two days waiting for material, and suffered much for want of food. Here the Confederates seemed to realize that the Government was in earnest. I had just reached the fortifications the Confederates had occupied the day before, and pitching my tent, 'opened an office.' As some Confederate prisoners were being marched by, catching a glimpse of the wire, one of them exclaimed, 'My God, Jim, there's a telegraph wire,' in a tone that indicated that he at least realized that the Government meant business. Another said, 'And here is an office,' as he espied my tent.

"We reached Beverly, July 15, and opened an office at General McClellan's headquarters with E. B. Bryant as operator. On July 19, General Cox having failed in his movement against Wise in the Kanawha Valley, General McClellan decided to make a movement in that direction and gave me orders to construct the line to Huttonville, and then return to Buckhannon, construct a line to Weston and establish a depot of supplies at the latter place.

"On July 28, having given instructions as to how to proceed with the line beyond Huttonville, and having opened an office at Beverly, I started alone for Buckhannon, by Colonel Stager's order. Arriving at that place I found orders from Colonel Stager awaiting me to report at Clarksburg and I went there on horseback the next day. While in camp at Beverly, our line became grounded one night, cutting us off from our base of supplies. With a detail of four cavalymen and a lantern I started in search of the trouble. At a point about ten miles from camp, the wire suddenly turned through the woods and up the mountain side. Leaving my horse in

charge of the guard, I started through the woods and soon found the trouble.

"By Colonel Stager's orders Mr. Fuller was made supervisor of construction and I was appointed superintendent of operators and lines, with headquarters at Clarksburg. This arrangement continued until December, 1861. During this time lines were built from Clarksburg to Gauley Bridge, thence down the Kanawha River to Gallipolis, Ohio. In December I was ordered by Colonel Stager to come to Cleveland, and was then given the choice of going to Kentucky or remaining in full charge in Western Virginia, I chose the latter and returned to that department.

"I had entered the service with a sincere purpose to aid in making the telegraph of the greatest benefit to the Government, and at the least possible expense, and I may justly claim credit for adhering religiously to that purpose. I never coveted position in the public service and never could believe that a Government office entitled one to do otherwise than they would in the conduct of private business.

"The time arrived for the troops to go into winter quarters, the army headquarters were moved to Wheeling, and our work was limited to the actual operation of the lines then erected from Clarksburg to Cheat Mountain, and from Clarksburg to Gauley Bridge, thence down the Kanawha River to Gallipolis and across the country to Hamden Station on the Marietta and Cincinnati Railroad. During this time our men were subject to many trials and hardships, especially the repairmen, who were often in great danger. On the occasion of the line breaking between two places it was never certain that our repairmen would be heard from again, and their report of 'safe' gave a sense of relief that could not well be expressed. We had but one man captured, and that was Alfred Winder, of Indiana. He was stationed at a picket post on the top of Rich Mountain. He and his guard disappeared one night and some weeks after a Richmond paper heralded his arrival at Libby Prison. After a sojourn of some months at that place, he was exchanged.

"The following spring, 1862, departmental changes were made and the mountain department was created and General Fremont was assigned to the command. He at once formed a plan for moving two columns, one up the Kanawha Valley and by way of Lewisburg under General Cox, the other up the New Creek Valley, under his personal command. I was ordered to follow both columns with the telegraph. This was undertaken in face of the warning of my chief from Washington that I must not hope to come up to General Fremont's expectations or requirements, but must be satisfied in doing the best I could. We followed General Cox until he reached Big Sewell Mountain, where he encamped, W. H. Nash, of Gallipolis, one of my aides, being in charge of the lines. We followed General Fremont until Stonewall Jackson attacked him near McDowell, driving him back on Romney. General Cox subsequently fell back to a point near Gauley Bridge and the line was taken down.

"Shortly after this, in July, 1862, I received notice of my appointment as Captain and Assistant Quartermaster and was ordered to report at Washington. I was then informed of the purpose of commissioning superintendents of military telegraph. July 29, 1862, I received the following order to go to St. Louis: 'You will proceed to reorganize the whole department of the Mississippi to meet the new order of things. Reduce the number of employes where practicable and remove all inefficient men whenever found. You will, no doubt, find much work to do, but I rely on your experience and perseverance to bring order out of chaos in the quickest time possible.' Leaving the Department of West Virginia temporarily in charge of Charles O. Rowe, I went to St. Louis at once. The plans proposed proved a great task, but with the efficient aid of Robert C. Clowry, whom I placed in charge of the lines in Missouri, and J. C. Van Duzer, to whom I gave charge of the lines in Tennessee and Alabama, I was enabled to get matters systematized by the last of August, when George H. Smith assumed control. I then returned to West Virginia to find the army driven out of the Kanawha Valley and our lines all destroyed. The greater part of the fall was occupied in reconstructing these lines and getting our wires in proper shape.

"Nothing of special importance transpired during the winter. The simple duty of attention to the lines was all that appeared on the surface, but a deep anxiety was constantly felt lest at the important moment our lines should fail, a desire inspired by patriotic motives and professional pride, that the telegraph should be equal to all emergencies was always present. With this in mind, it was my aim to anticipate the demands of the service and the orders of commanding generals, and I do not now recall a single instance where they were required to wait. In all this I was greatly aided by those who were in my department. If less of anxiety rested upon them more of the severe trials were their lot. I cannot speak particularly of any. All strived to do their duty.

"The year 1863 brought only the trouble and annoyance which was the natural fruitage of raids and guerilla warfare. In the early part of 1864 I resigned my commission and accepted a position as district superintendent of the Western Union Telegraph Company."

What Our Friends Say About This Publication.

Mr. F. E. Howell, manager of the Western Union Telegraph Company at Utica, N. Y., in renewing his subscription for another year recently said: "I get more genuine pleasure and information from *Telegraph and Telephone Age* than from any other publication that I subscribe for, and I know of nothing within its sphere but what is treated in a splendid manner."

Mr. J. P. Parmentier, manager for the Western Union Telegraph Company at Green Bay, Wis., in renewing his subscription recently, said, "*Telegraph and Telephone Age* is certainly a fine paper and it is improving all the time."

Mr. L. S. Wild, manager of the Western

Union Telegraph Company, at Butte, Mont., in renewing his subscription to our paper, which he has received for over twenty years, says: "*Telegraph and Telephone Age*, the new name, is up-to-date and carries the right ring, and as for the contents, we old timers find the *Age* indispensable."

Mr. E. A. Patterson, manager for the Western Union Telegraph Company at Saginaw, Mich., in renewing his subscription recently, said: "I would regret to miss a single copy of the *Age* as it is full of interesting and good reading matter which cannot help but be beneficial to the reader."

Mr. A. J. Ostheimer, secretary of the Telefunken Wireless Telegraph Company at Philadelphia, in renewing the company's subscription for another year writes: "We are always pleased to say a good word for your paper so as to procure additional subscriptions if possible. We always read *Telegraph and Telephone Age* with interest."

Mr. J. J. Dunne, manager of the Postal Telegraph-Cable Company, Seattle, Wash., in renewing his subscription recently said: "A great many things are happening in the telegraph business in these days, and the only way to keep properly informed concerning these matters is to read your valuable paper. You can always count upon me as a subscriber."

Mr. Samuel S. Bogart vice-president of the United Wireless Telegraph Company of New York, in renewing his subscription for another year, and, by the way, Mr. Bogart has been a subscriber since the paper was established, in 1883, writes: "*Telegraph and Telephone Age* is necessary for my mental development. It is an educator and a habit with me."

Mr. A. W. Orton, of Rome, N. Y., an old time and military telegrapher, but for many years past identified with other interests, in renewing his subscription recently said: "You do not know how much of personal interest I find in your paper and it is a pleasure for me to keep in touch with the advancement and reminiscences of the profession of my past life."

Mr. Robert Morrell, general superintendent of the West India and Panama Telegraph Company, Limited, with headquarters at St. Thomas, D. W. I., in renewing his subscription for another year says, "*Telegraph and Telephone Age* is a most readable and useful journal and frequently I find mention of many old cable employes of this company and their whereabouts, which otherwise I could not possibly hear about."

Mr. Francis W. Jones, formerly and for many years electrical engineer of the Postal Telegraph-Cable Company of New York, in renewing his subscription for another year writes:

"The continuance of an intelligent and unbiased publication, of up-to-date articles that are useful alike to telegraph and telephone owners and employes, besides the liberal allotment of space devoted to the personal and professional interests of those who are or have been active in the service, will surely maintain your subscription list on a satisfactory footing and prove very gratifying to your many friends."

Mr. J. A. Scrymser on the South American Cables.

Mr. James A. Scrymser, of New York, president of the Mexican and of the Central and South American Telegraph Companies, who is on a pleasure trip to various points in South America was, while at Buenos Ayres, interviewed by a representative of the leading daily paper of that city in regard to the cable situation in South America. When questioned concerning the importance and future of the direct cable between Argentine and Europe and also his ideas in respect to the strategic merits of the existing cables and projects, Mr. Scrymser stated that in regard to the Argentine European cable via Ascension he was of the opinion that the increase in facilities of communication always led to increase of traffic and judging the future by the past, one could believe that based on the future of the Argentine Republic, new telegraph facilities would be necessary to meet the requirements of commerce.

As to the strategic importance of submarine cables he said that he believed that a large portion of the cables which have been laid in the ocean have been almost entirely laid for strategic purposes, for example, owing to the acquisition of the Marshall Islands in the Pacific, Germany laid the cables which connected those islands with Yap, Guam and the city of Shanghai in order to put Berlin in direct communication, via St. Petersburg, with its naval stations in the Pacific, cutting out England which controls the Cape of Good Hope, India and the Mediterranean cables. In like manner France and Germany have laid cables to their possessions in Africa and have projected additional lines to some important points in South America.

In speaking of the history of the South American cables, Mr. Scrymser related that in 1866 he promoted the cable between the United States and the Island of Cuba which was afterward extended to the West Indies and the Isthmus of Panama.

In 1870, he proposed laying another telegraph cable from the Isthmus of Panama to Valparaiso, Chile, but it was impossible to raise the entire capital because capitalists at that time were of the opinion that the inhabitants of the South American republics were likely to be molested by Spain and they would not use a cable which passed through Cuba. Ten years later this spirit of hostility against Spain having disappeared and Mexico having revealed its commercial importance, he was induced to promote the telegraph lines from Galveston to South America and later the direct cable between New York and Colon.

Since then it has also been necessary to duplicate the cables from the Gulf of Mexico to Valparaiso and the land lines from Valparaiso to Buenos Ayres, all of which has been done without the aid or co-operation of any government.

Mr. Scrymser said that it was only his unlimited faith in Argentine to the south and Mexico to the north, added to a promising future for the inter-

mediate countries, which induced him and his associates to undertake these enterprises. These represent an expense of \$15,000,000 and the laying of about 14,000 miles of telegraph cable. During twenty-eight years this work has been a subject of continuous vigilance resulting in the systems working with great regularity. On his present trip he will be able to visit the different telegraph stations of importance on his company's lines and judge personally of the results of his own work.

In 1880 the tariff for telegrams between Buenos Ayres and London was \$7.00 per word, and Buenos Ayres and New York counted as two words each. The increase of facilities and competition has improved the service and reduced rates at the present time to \$1.00 per word.

The Central and South American Telegraph Company has facilities for handling a large increase of traffic and Mr. Scrymser in conclusion said that it would be their policy to reduce the present tariffs as soon as the increase of traffic justifies a reduction.

Canadian Telegraph Companies Adopt Night Letter Telegraph Service.

It was announced April 12 by both the Canadian Pacific Railway's Telegraph and the Great North Western Telegraph Company that, beginning April 13, they would inaugurate what is known as the "night lettergram service."

The announcement of the Canadian Pacific, says:

"The charge for a night lettergram of fifty words or less will be the regular day rate for ten words, and one-fifth of this rate will be charged for each additional ten words or less. Messages must be written in plain English, code or cipher is prohibited. Lettergrams may be accepted either prepaid or collect under usual regulations, and will be taken at counter or over telephone, or collected on call any time up to midnight, but, as in the case of other night telegrams, will not be put on the wires until night, and when wires are clear of full-paid day business.

"Night lettergrams will be delivered free the next morning, within one-half mile of the company's office in towns of 5,000 population or less, and within one mile of such offices in other cities or towns. Beyond these limits, the company will, without liability, at sender's request, and at his expense, endeavor to contract for him for such delivery at a reasonable price."

The Great North Western Telegraph Company has put into effect the same reduction as the Canadian Pacific. The rate applies to messages to the two companies' connections in the United States.

The testimony of progressive operators is that Telegraph and Telephone Age is so thoroughly comprehensive in character as to make it absolutely indispensable to those who would keep informed. Its technical articles are of high practical value. Write for a free sample copy.

TALKING AND TELEGRAPHING SIMULTANEOUSLY OVER THE SAME LINE.*

The Composite Ringer.

BY N. C. KISSELL.

Special apparatus and circuits are necessary for signaling between telephone stations on a composite line without interfering with the "Morse" instruments. The device for accomplishing this, which is ordinarily used, comprises several instruments wired together to form what is collectively designated by the name "composite ringer." This provides for sending out on the line signaling current of too high a frequency to operate telegraph relays, and for the operation of a signal by this current when the apparatus is at the "incoming" end of a toll line. Composite circuits are not wired permanently into a toll line, but are arranged so that

for outgoing and incoming signals. When the operator rings from the switchboard end of the circuit, the low frequency ringing current passes over wire 1, through contacts on relay B, wire 2, through condenser 3, relay D, wire 4, contacts on relay B and back to generator.

The relay D is designed to operate on low frequency alternating currents.

The armature is a piece of soft iron sufficiently massive to possess considerable mechanical inertia. A light flexible spring is attached to the armature and makes contact with a stud when the armature is drawn up. As this spring extends above the armature, and is very flexible, it will make contact with the stud before the armature is fully drawn up; also it will not break contact until the armature has dropped a considerable distance. This construction will allow the armature to flutter in a given range without breaking contact between the spring

Figure 1.—Circuit of composite ringer, which makes it possible to signal between telephone exchanges without affecting telegraph instruments on a composited toll line. All apparatus required for telephone and telegraph work at one end of a line is shown in this circuit.

they can be placed in any line, so that in case the line upon which they are being operated becomes in trouble they can be shifted to a line in good working condition. It is therefore necessary to so wire them, that the operator at the telephone switchboard may ring on all the lines in the same manner, whether they are composited or not. As the generator ordinarily used to ring on telephone lines gives out current at a comparatively low frequency, the action of the composite ringer will be to replace this low frequency ringing current with one of high frequency which will not interfere with the telegraph instruments. The action of the composite circuit shown in Figure 1 is worth studying step by step

and the stud. When an alternating current is passed through the coil the armature is drawn up, making contact with the stud before its movement stops. The ringing current being of low frequency, the armature is fully drawn up, however, before the current ceases and starts to flow in the opposite direction. The instant current ceases the armature starts to drop down, but is so massive that a fraction of time elapses before it starts to drop. It only drops a little before current is back in the coil again, remagnetizing the core in the opposite direction and causing it to again exert a pull on the armature. This will cause the armature to flutter in a certain range, but the contacts do not make and break owing to the flexibility of the spring contact.

*Article reprinted from the American Telephone Journal.

When the armature is at rest its weight closes the two contacts and when it is drawn up these open by means of the resiliency of the spring. When the operator rings through relay *D* the latter therefore opens one circuit and closes another at the same time. It opens the circuit through relay *F*, and closes one starting from 24 volt battery, relay *E*, wire 5, relay *C*, wire 6, relay contact on *D*, to ground, through which it flows back to battery. This energizes relays *E* and *C*, causing them to draw up their armatures. When the contacts on relay *E* are closed alternating current from the generator at a given instant passes over wire 7, relay contacts, through a non-inductive resistance *G* then through the coils of the interrupter, primary of a small transformer *H* back to generator over wire 8. This causes the armature of the interrupter to make and break contact, thereby inducing in the secondary of the transformer *H* a high frequency current which passes to the composite circuit through contacts on relay *C*. This current, being of very high frequency, will pass through condensers *I* and *J*, and out over the line, being prevented from short circuiting itself by the high impedance of coil *K*, and also from passing back through the "Morse" instruments and ground by the coils *M* and *N*. If any of this current should pass through the coils *M* and *N* into the "Morse" relays, it would be so small and alternate so rapidly that it would not affect their armatures on account of their mechanical inertia and the inertia of the spring attached to them. To summarize this whole action, when the operator rings on the circuit the low frequency current from the exchange generator is replaced by one of high frequency which passes over the line.

Coming in over the line wires, the high frequency signaling current encounters the high impedance of coils *M*, *K* and *N*, and so keeps the direct path, passing through condensers *I* and *J* into the composite ringer. At the incoming end this current comes in over line wire 9, through condenser *I*, wire 10, and through contacts on relay *C* to point 11. Here it has two paths offered to it, one of which leads to the toll board through the drop and back to point 12. Whatever current passes through the drop will be so small, however, and will alternate so rapidly, that it will not affect the drop. From point 11 the current passes through condenser 3 to point 13, where two paths are again offered. One is through relay *D* and the other through relay *F*. The small amount of current which passes through *D* will not affect its armature, on account of the inertia of the heavy piece of iron. From point 13, then, the high frequency current which must be considered will pass through condenser 14, resistance *O*, through the high frequency relay *F*, wire 15, contacts on relay *D*, wire 16, contacts on relay *C*, wire 17, condenser *J* to the other line wire 24 and back to the distant station. This current, passing through relay *F*, will set the latter in rapid vibration. This relay consists of an L shaped piece of steel which is permanently magnetized, having both north and south poles. To the long end of this is screwed

a soft iron core wound with insulated wire. To the other end is rigidly fastened one end of a rather heavy reed of steel, the opposite end of which is in front of the soft iron core. In conjunction with this heavy reed is another lighter reed, fastened rigidly at one end, and insulated from the first reed. One end of this rests against the heavy reed near its top, and makes electrical connection with it. When an alternating current of high frequency is passed through the coil the heavier reed will be set into vibration, and in turn will cause the lighter reed to vibrate violently, thereby making and breaking the contact between the two reeds. Referring to Figure 1, a circuit is normally made, starting from 24 volt battery and passing through wire 18, the reed contacts on relay *F*, wire 19, through relay *A* to ground and back to battery. This current causes the armature on relay *A* to be held up all the time normally; but when the reeds on relay *F* are set into vibration, the making and breaking of the circuit causes the relay *A* to release its armature, thereby completing a circuit starting from 24 volt battery, wire 20, relay *B*, wire 21, relay contacts on *A* to ground back to battery. This causes the armatures on relay *B* to draw up, making a circuit from exchange generator through wire 22, contacts on relay *B*, wire 23, into the toll board, returning over wire contacts on relay *B* and wire 25 back to the generator. This rings down the drop. To summarize, then, the action of a pair of composite ringers is to substitute for the low frequency current from the board a high frequency current which passes over the line, and at the incoming end, cause a low frequency current to pass to the toll board. This circuit is used commercially every day and is very successful, giving so little trouble that it may be properly said to work perfectly.

The Man Who Never Wins.

1. The hind-sighted man—
Never sees opportunity till it passes.
2. The back-boneless man—
Always has to ask somebody's advice.
3. The "only" honest man—
Must have the control.
4. The spendthrift—
Never has anything to invest.
Always afraid somebody will rob him.
5. The unsuccessful man—
Knows other people's business better than his own.
6. The conceited man—
Knows where all the best things are without being told.
7. The modern Shylock—
Believes in nothing but the "pound of flesh."
8. The narrow-gauged man—
Refuses to listen to anything "out of his line."
9. The unfortunate man—
Has a friend who invested and lost.
Do you know any of them?—Express Gazette.

Telephone Train Despatching.*

BY J. B. SHELDON, OMAHA.

Superintendent of Telegraph of the Union Pacific Railroad.

(Concluded from page 287, April 16 issue.)

The magnet operates the selector mechanism, which is merely a special modification of the ordinary ratchet and pawl principle. The essential features of the selector are a step-up selector wheel and a time wheel which normally is held at the top of an inclined track. The operation of the selector magnet allows the wheel to roll down the track. If the magnet is operated rapidly, the wheel does not get clear down before being pushed back again. A small pin on the side of the pawl engaging the selector wheel normally opposes the selector wheel teeth near their outer points. When the time wheel rolls to the bottom of the track however, the pawl is allowed to drop to the bottom of the tooth. Some of the teeth on the selector wheels are formed so that they will effectually engage with the pawl only when the latter is in normal position while others will engage only while the pawl is at the bottom position; thus innumerable combinations can be made which will respond to certain combinations of rapid impulses with intervals between. The correct combination of impulses and intervals, steps the selector wheel clear around so that a contact is made. All other wheels fail to reach the contact position, because, at some point or points in their revolution, the pawls slip out and allow the selector wheels to return home.

The despatcher, by giving a selector key a quarter turn, sets a train of gears in motion as the key returns, which delivers to the line a succession of impulses and intervals corresponding to the particular arrangement of teeth in the particular way-station selector wheel it is desired to operate. For instance, the despatcher may throw key 1421. That starts a mechanism similar to a messenger call box, which impresses at regular intervals on the telephone line direct current impulses in the following order 1-4-2-1. There is on the line one selector corresponding to this combination, and it alone will step its wheel clear around so that contact is made and the bell rung. On all of the others, the pawl will have slipped out at some point of revolution so as to cause the wheels to return home.

A special winding, consisting of a few turns of wire, placed on the selector magnet, is included in the local bell circuit to produce the "answer-back" feature previously mentioned. The operation of the bell through these turns, induces an alternating current in the selector winding, which flows out on the line and is heard as a distinctive noise by the despatcher. Thus, the despatcher is always certain whether or not the

way-station bell has rung, as he can get this noise in no other way than by the operation of the bell.

Each selector requires approximately one hundredth of an ampere at forty-six volts to operate it. The ordinary voltage from this battery is necessarily very high at points near the despatchers office, where the battery is located, compared with the voltage at the other end of the line. To equalize this disparity in current flow at the different offices, variable resistances are inserted in series with the selector magnets at way-stations, so that each selector on the line gets approximately the same current. The values of these resistances are high for stations near the despatchers office, and taper off gradually to zero at the other end of the line. Two cells of dry battery are required in the local circuit to operate the selector bell at each way station.

TEST PANELS AND SWITCHES.

Test panels are installed at testing offices, usually located about twenty miles apart, for use in testing for trouble in the telephone circuit and the patching in of part of the auxiliary circuit when necessary to do so on account of trouble in the regular circuit. In this way, either wire forming the circuit, or both, can be readily opened or grounded, the office cut out or local telephone and selector equipment transferred from and to the regular or auxiliary circuits, by the manipulation of plugs and cords that form part of the equipment. The numbers of the wires are indicated on designation strips on each side of the panels and the jacks, with which line and instrument connections are made by use of the cords and plugs, are all numbered. Thus it is a simple matter for the despatcher, or wire chief, who does the testing, to indicate to testing offices just what manipulations are required to secure the desired results.

At other stations, where test panels are not located, double-pole double-throw switches are installed for switching the telephone and selector apparatus from and to the regular or auxiliary circuit, according to which may be in use. When the switch is thrown down the apparatus is on the regular circuit, and when thrown up, it is on the auxiliary circuit. The switch is turned straight out, instead of either clear down or up, in cutting out the local telephone and selector apparatus.

Framed copies of instructions for manipulation of test panels and switches are placed in the offices.

PORTABLE SETS.

Portable telephone sets are supplied for the private cars of officials and for wrecking cars, which can be readily connected with the line by means of a light jointed rod, along which wires are attached that lead to the instrument. For emergency service, these sets are very valuable.

LISTENING SETS.

Some of the officials have also been provided

*Paper read before Omaha Railway Club March 9.

with pocket listening sets, which consist of a small hand receiver with associated condenser, that are used for listening in on the despatchers circuit at stations, without making use of the regular station set and thus bothering the operator in his work.

PROTECTORS.

A protector is installed at each office to guard the telephone and selector apparatus from damage, and the users thereof from injury, on account of lightning or other high electrical discharges that may come in on the line. The protector consists of carbon blocks, three in all, the middle one being grounded, and the other two, with which the line wires are connected, being separated from it by a short gap, across which high potential discharges. These protectors, on account of the air gap, are self-clearing, so that they do not ordinarily require attention after electrical discharges pass through them. In time, however, carbon dust is likely to form in the gap and cause the line to become noisy or grounded. The protectors should be examined and cleaned occasionally by passing a piece of paper between the carbons.

OPERATIONS.

In transmitting or repeating an order by telephone, the names of stations will be pronounced and then spelled out; the time will be spelled out and the numerals pronounced; train and engine numbers will be pronounced plainly and figures duplicated, naming each figure separately as per examples. The word "Oh" should be used for ciphers.

Example 1:

No. 1 (o-n-e) Eng. 17 (1-7) meet No. 56 (5-6) Eng. 1600 (1-6-9-0) at Paxton (P-a-x-t-o-n).

Example 2:

No. 2 (t-w-o) Eng. 18 (1-8) has right over No. 9 (n-i-n-e) Eng. 110 (1-1-0) Julesburg (J-u-l-e-s-b-u-r-g) to Paxton (P-a-x-t-o-n).

Example 3:

No. 53 (5-3) Eng. 1901 (1-9-0-1) run t-w-e-n-t-y 20 mins late Paxton (P-a-x-t-o-n) to Roscoe (R-o-s-c-o-e) and wait at Ogallala (O-g-a-l-l-a-l-a) until t-e-n t-e-n 10:10 a. m., for extra 1688 (1-6-8-8).

The figures and names in brackets in the examples are for purpose of showing the manner of duplication and are to be omitted in writing regular orders.

The rules and regulations of the Transportation Department governing the movement of trains must be complied with. In addition thereto, the following instructions must also be observed:

When desiring to communicate with despatcher, take down receiver and listen. If line is not busy, press key and name your station. If despatcher is ready, he will say "despatcher." It will happen frequently that two or more stations will come in on circuit at same time, each giving the name of their station before de-

spatcher has had time to answer. In such cases, when despatcher is ready, he will speak the name of the station he wants first, following it with the word "despatcher." This to save time and annoyance.

Speak slowly and distinctly into the transmitter, with lips close to mouthpiece, without raising the voice.

In answering call, press transmitter key and speak the name of your station.

In reporting trains, first speak name of your station, and when through, get despatcher's O. K.

Despatchers will write the train orders in long-hand while transmitting them, to properly regulate the speed.

The transmitter key, which is mounted on table at the left hand, is for the purpose of keeping out noise and unnecessary use of battery, and must not be pressed except while talking.

No objection to wearing head receiver at any time to keep posted.

When placing receiver on hook, see that the face is turned down, to avoid dust settling in it.

All concerned must familiarize themselves with the diagrams and instructions showing the different positions of switches and the changes necessary to be made, when called upon by despatcher, for wire testing, patching and transferring of equipment from one circuit to another in cases of wire interruption.

The telephone apparatus is fully protected from lightning.

The despatching of trains by telephone is, all told, at least one-third more rapid than the use of the telegraph for that purpose. While orders are not transmitted any faster by telephone, as their speed is limited to the ability of the despatcher and operators to write them, their repetition back to the despatcher is expedited very much, and reports from operators to the despatcher of the passing of trains are handled very rapidly in this way. In the matter of calling, great time is saved, as the operators pay much closer attention to the loud ringing of a bell than to the ticking of a telegraph sounder that is feeble in comparison.

This increase in the speed of the work makes it possible in some cases for one set of despatchers to handle a district, where, with the use of the telegraph, extra despatchers, or a full extra set, would be required.

Also, the ability of conductors to talk with the despatcher direct, instead of through an operator, as occasion requires, and to receive orders at places where operators are not on duty continuously, or at all, is a great help to the despatchers and of large benefit to the road.

Direct talk between the despatcher and operators, in connection with the work, has a very good effect on service and discipline, as the personal element involved in the use of the telephone is greater than is possible in the telegraph service, and, as a consequence, better results all round are secured.

The telephone also contributes greatly to ease the work of the despatcher. The quickening of the work gives him more time for figuring out the problems of train movements, which greatly reduces the stress, and the ease of talking, compared with telegraphing, affords much relief.

Experience has shown that, expensive as it is to install, the operation of a telephone train despatching circuit can usually be carried on with such economy, altogether, as to make up the cost of it within practically the first year of its use.

CONCLUSION.

Attention has herein been called to railway composite service, or simultaneous telegraphy and telephony on a single grounded wire, but nothing has yet been said about such double service on a pair of wires to form a metallic circuit for telephone purposes.

We have a number of such circuits, some by the use of two existing parallel iron wires, that are transposed for the telephone circuit, but the most valuable are had from our four through copper duplex telegraph circuits between Omaha and Ogden that, by transposing, give us two splendid telephone circuits all the way, that are capable of satisfactory use for long distances. Conversations on these circuits are frequent between Omaha and Cheyenne, 516 miles and talks have been had as far as Rawlins, 690 miles.

The principal use for these telephone circuits, however, is for conversation by officials and the handling of regular messages by telephone operators between district or division terminals.

These circuits are connected with our private branch telephone exchange switchboard at Omaha, through which connections can be made with any of the telephones in our exchange, or through the city, for conversational purposes.

For the message business, roomy, ventilated and nearly noise-proof booths are provided for the operators. These operators handle messages by telephone that would otherwise be put upon the telegraph. They take them directly on typewriter as transmitted and the speed of the service is approximately three times that of the telegraph. Both day and night service in this way is maintained at most of the ten division and district terminal points between Omaha and Ogden.

Although the duplex telegraph circuits on these four wires, making eight telegraph circuits in all, are worked for long distances, one as far as from Omaha to San Francisco and another the distance between Omaha and Salt Lake City, with repeaters approximately every 500 miles, we divide up the telephone service generally into five separate circuits on each pair of wires, thus giving us in all on these four through wires a total of eight telegraph and ten telephone circuits.

These circuits are kept practically in constant operation for telegraph service, and during the day, especially, are quite busy with telephone communications; they care for a volume of approximately 120,000 telegraph messages and con-

versations and telephone messages equal to a telephone message service of about 80,000 messages per month, or a total of in the neighborhood of 200,000 messages by both classes of service on these four wires per month.

This further shows the availability of the telephone service for railroad work and the more extensive place it is rapidly taking in the world of electrical communication.

Telephone Despatching on the Great Northern.

The Great Northern Railway, which at the present time is using the telephone to despatch its trains on divisions covering approximately 2,100 miles of its line, is now planning a further extension of this system.

Orders have recently been placed for telephone train despatching apparatus to be installed on six more divisions, viz: Fergus Falls, Breckenridge, Northern, Dakota, Saint Cloud and Cascade divisions, covering a total of approximately 1,900 miles. As these divisions are among the most important and busiest of the whole railway, thirteen despatchers being required to handle the large amount of traffic, it can easily be seen that this method of train despatching has taken a firm hold upon the Great Northern Railway officials.

Two hundred and ninety stations will be equipped for the new class of service. Telephones will be placed at sidings and at stations which are not open during the whole twenty-four hours, three hundred and fifty telephones being required for this purpose. While the train crews in this way can reach the despatcher at any time, the important fact is that the despatcher can get in touch with the train crews waiting at any siding, thus enabling him to give orders, prevent congestion, and keep the traffic moving.

When the proposed equipment has been installed, the telephone train despatching system of the Great Northern Railway will extend over the entire main line from Minneapolis and Superior to Seattle and Vancouver, and, it is believed, will cover the longest continuous stretch of track of any railroad in this country.

The Cerebotani Typewriter Transmitter.

Tests have been made recently by the French telegraph department of a telegraph typewriter, the invention of Professor Cerebotani. The apparatus prints the message at both the receiving and the transmitting ends, and is operated by an ordinary typewriter keyboard. It is claimed that it can be worked on an ordinary telephone line without interfering with the telephonic transmission. It is said that the device may be operated at twice the speed of Morse hand operation.

The combined length of the telephone and telegraph lines of Switzerland is 14,717 miles. There are 2,255 telegraph offices, which, in 1908, handled 4,942,000 telegrams. There are 60,494 telephone subscribers in Switzerland, and in the combined telegraph and telephone service there are 4,544 employees.

The Possibilities of Machine Telegraphy.

BY MR. LOUIS DE GOLL, BALTIMORE.

President, Rowland Telegraphic Company.

The two salient causes for the advent of the night letter telegraph are the need of it by the public and the economical advantage of the use of the plant at night.

There has been a traditional skepticism as to what the public would do in the way of telegraphing at night. The recent experiments have dissipated the doubt and point to sweeping economies. The maintenance of the plant has been a charge solely upon the day traffic. If the interest, depreciation and maintenance are shared by a night traffic the day rates may be materially reduced.

The intense use of the plant in this way must be closely related to its operation by an unskilled class, that is to machine telegraphy. Machines pay in handling a large traffic. A skilled class must be raised up to manage them, so that that unskilled class may operate them. The plant operated at a reduced cost, tariffs may be reduced to invite the desired traffic.

Machine telegraphy is, at this stage, most readily applicable to the trunk lines, and it is these that carry every telegram (on the average) once in its passage.

Perhaps the chief reason for the backwardness of machine telegraphy has been the absence of a committal of the administration to its commercial development. And yet the cost of perfecting a machine system cannot but be insignificant as compared with the operating profits to be expected from it. We must not at first look for the perfect machine but for the valuable idea in the machine. The staff must understand that it is to be made a "go," as the machine can be evolved to perfection only in commercial practice.

Any comprehensive improvement of the telegraph must take place first in the United States and by a private company bringing to that special development technical methods abreast of the problems involved; European telegraphs are involved with the political administration and deprived of the initiative for such a work.

Our people have been educated to avoid the telegraph, the rates being the chief deterrent. The telegraph will be developed like the telephone and become similarly indispensable in daily routine.

Machine telegraphy has already been sufficiently used commercially to prove the efficiency of the operators, the increased capacity of the wires and the reduced cost of handling. Its commercial development now seems imminent as the service it can render becomes daily more evident.

A Mercury Arc Relay.

The patent No. 953,361 for a mercury arc relay granted recently to Mr. J. B. Taylor of Schenectady, which was recorded in our previous

issue, describes a form of relay entirely different from anything heretofore used. It is designed to be employed in connection with any circuit where it is desired to reproduce or repeat in a second circuit an electrical impulse or oscillation impressed upon the first. Its field of usefulness hence, would include telephone, telegraph and signaling systems. The invention consists essentially of a device comprising two anodes and a cathode in an evacuated receptacle containing a body of mercury, a source of current and means for causing the division of the current between the two anodes to vary in accordance with the indications desired, whereby a translating device in circuit with these anodes will be caused to respond. The current deflecting means used is an

Mercury Arc Relay Applied to Telegraph Use.

electromagnet whose poles are arranged to produce a flux across the mercury arc set up between the anodes and the cathode. By varying the current energizing said electromagnet the flux will be varied, and the result is a corresponding variation in the circuit of the receiving instrument. If the electromagnet is in circuit with a telephone transmitter, and the receiving instrument is a telephone receiver, the relay will transmit spoken or other sounds.

The illustration given herewith shows the way in which this relay may be used with telegraph systems. The coils of the electromagnets 10 are in series with the line 21 and with the keys 22 and batteries 23. The sounders 24 are in circuit with the anodes, each sounder having preferably two coils 25 and 26 located respectively in the two anode leads 27, 28, and differentially wound so that the balanced currents in said leads will not affect the armature 29. But any unbalancing of the potentials of the two anodes by the closing of either of the keys, will cause one or the other of said coils to attract the armature.

A Relay with Double Adjustment.

The main line relay recently patented by Mr. H. E. Powell, of Oakland, Cal., as mentioned briefly in our April 16 issue, is designed to utilize the power of weak currents arriving over long sluggishly working lines. It is provided with two adjustments, one to accommodate the nearby offices while the other adjustment permits the recording of signals from the distant offices. The form of relay provided by Mr. Powell also serves as a sounder.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIKEY

Sole Manufacturer

**Hudson Terminal, 30 Church St.
NEW YORK**

Western Representative

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

Mr. E. A. Chenery, superintendent of telegraph of the Missouri Pacific Railroad, St. Louis, has been elected president of the St. Louis Railway Club.

Mr. W. S. Fender has been appointed an assistant superintendent of telegraph of the Southern Pacific, with headquarters at San Francisco. He will have charge of the telephone equipment and such portions of the telegraph service as may be assigned to him.

Mr. Frank M. Ewing, assistant manager in the telegraph office of the Pennsylvania Railroad at Williamsport, Pa., was a recent New York visitor. Mr. Ewing has been making quite extensive experiments with wireless telegraphy and the distant control of lights and other electrical devices by wireless and has secured some very satisfactory results. Mr. Ewing has delivered many lectures upon this subject in Williamsport and vicinity.

The Virginian Railway will soon place in service telephone despatching equipment on its division from Roanoke to Deepwater and has ordered similar apparatus for the other two divisions of its road from Norfolk to Roanoke. The length of these two divisions is approximately 250 miles and the despatcher will be located at Victoria near the center of the line. Thirty-one stations will be equipped for selective calling and twenty-seven other stations will be provided with telephones but no selectors.

The Norfolk and Southern Railway is making preparations to install a telephone train despatching system on its main line from Norfolk to Washington, N. C. It is expected that the new apparatus will be placed in service early in the summer. The length of this circuit is 136 miles with twenty stations and eight siding telephone sets will be installed at various places along the line. Portable sets will also be provided for the use of the train crews. The system will be so arranged that the despatcher can call all stations either individually or collectively.

The plans for the annual convention of the Association of Railway Telegraph Superintendents which will be held at Los Angeles, June 20 to 25, at the Hotel Alexandria, are now nearing completion. The western members of the Association have decided to go by way of the Santa Fe system, taking their train No. 1, leaving Chicago at 10 p. m. Tuesday, June 14, and Kansas City at 11:30 a. m. the next day. The western committee have arranged with the Santa Fe to handle the party in a body on that train and to give them a day at the Grand Canyon reaching Los Angeles, Monday morning, June 20, at 8:30. This much of the itinerary has been decided upon. It has been proposed that the eastern members connect with this train at Chicago or any other point en route. It has also been suggested that the party return by way of the Southern Pacific, stopping off at San Francisco, Salt Lake City and Denver on the return trip.

Mr. J. J. Ross, superintendent of telegraph of the Michigan Central Railroad, Detroit, was a recent New York visitor coming here in the interest of the service.

At a recent meeting of the Frisco Railroad Club, held at St. Louis, Mr. H. D. Teed, superintendent of telegraph of that system gave an address upon "The Telephone versus the Telegraph."

The Train Despatchers' Association of America will hold its annual convention at Spokane, Wash., June 21. Mr. John F. Mackie, 7042 Stewart Avenue, Chicago, is secretary and treasurer of the Association.

Mr. A. T. Hollenbeck Superintendent of Telegraph of the Chicago Great Western

Mr. Avenel Thalberg Hollenbeck, whose appointment as superintendent of telegraph of the Chicago Great Western Railroad was announced in our April 16 issue was born at Fairmount, Ill., October 12, 1867. He entered the telegraph

A. T. HOLLENBECK, CHICAGO.

Superintendent of Telegraph, Chicago Great Western Railroad.

service in May 1888 as operator for the North American Telegraph Company at Fond Du Lac, Minnesota. After a year and a half in commercial work he entered the railway field as operator for the Chicago Great Western then called the Chicago, St. Paul and Kansas City. During the next three years he occupied the positions of cashier, wire chief and manager in the telegraph service of that railroad. In 1893 he was made chief clerk in the telegraph department which position he held until his recent advancement.

Probably the only telegraph messenger boy in the country who delivers messages with an automobile is Albert Hartman, who is employed by the Postal Telegraph-Cable Company at Allentown, Pa. Some time ago a clothing store in Allentown conducted a contest for boys giving an automobile as a reward. This messenger won the machine and now makes good use of his prize in his daily work.

Portable Wireless Sets for Automobiles.

As a result of extensive tests which have been conducted for them recently, by Dr. Lee DeForest, the Chalmers Motor Company has decided to equip several of its cars with portable wireless sets for the Glidden Tour which will be conducted next August. Dr. DeForest has made tests both with the wireless telegraph and the wireless telephone but the results so far obtained with the latter have not been sufficiently satisfactory to justify its use during the coming

Figure 1.

tour. With the telegraph, however, the results of the tests have proven that it may be of great service to the tourists.

In the early part of March, successful tests were made between a car in Central Park, New York, and the Terminal Building at Park Avenue and 42nd Street where Dr. DeForest maintains his experimental laboratory. The distance involved varied from one and one-half to three miles in the trial from a moving car, while the experiments with the portable field stations showed that this type of apparatus would be able to carry on certain communication up to fifty miles.

Figure 1 shows the receiving and sending stations used on moving automobiles, the receiving apparatus consisting of a seven foot aerial in connection through a loose coupling with a variable and a fixed condenser, the audion, telephone receivers and a high and low voltage battery. The sending set comprises two storage cells, a novel mechanical interrupter capable of 12,000 variations a second, a ten inch spark coil, two leyden jars and a three and one-half inch radiotone discharger. This apparatus which

worked successfully up to three miles, the farthest distance tried, would probably operate for several miles further. The ground was secured by drawing between the rear wheels a bicycle tubing frame supported on four small wheels mounted on roller bearings, the middle space being occupied by three eight-inch steel wheels with slide bearings arranged so as to allow the weight of the wheels to keep them in contact all of the time, by gravity, with the road. On the macadamized roads of the park this system of grounding worked fairly well although on the sandy roads of New Jersey, where the subsequent tests were made, a great deal of difficulty was experienced in properly maintaining the ground. The spraying of water over the contact wheels by means of a small rubber tube leading up into the car partially overcame this trouble and no doubt subsequent experiments will provide a suitable way of securing a satisfactory ground contact although it is true that probably for some time to come the speed of moving cars must be considerably limited for successful wireless work, the cars in the tests not exceeding twelve miles an hour.

Field stations which can be put up in five minutes can be operated more successfully, and

Figure 2.

the same apparatus used in the automobile by stopping the machine and securing a proper ground has a range of about ten miles.

Two crystal detectors were used in the tests, namely, the perikon and radion, but neither of them worked as reliably as the audion.

The field sending station uses a 100-foot aerial secured at one end to a spreader attached to a forty-eight foot bamboo telescope mast and

leading down diagonally to the top of a twelve foot mast about ninety feet away and thence back to the wireless apparatus about midway between the two poles.

Figure 2 shows the field apparatus used in the earlier tests. The last set used embraces additional condensers, storage cells and audion receiving accessories. The box upon which the operator is sitting contains the interrupter, spark coil and discharger.

In the coming tour it is proposed to send two scout cars ahead of the regular contestants, each one of which will carry the complete field set of greater range than those which every car can carry. Points where the telegraphic facilities are poor or are lacking will be picked out, and the two cars will arrange to be at these points just ahead of the pilot car, one station being set up at the next point ahead while the other is taking care of the telegraphic business of the tour. In this way one of the two field stations will be in operation all of the time. The moving stations will send messages constantly to these two stations and will be able to receive their replies.

The Metropolitan Clock.

One of the most remarkable clocks in the world is the one recently installed by the Self Winding Clock Company in the tower of the Metropolitan Building in New York, the highest building in the world and which rises seven hundred feet above the street level. The clock is placed three hundred and forty-six feet above the sidewalk and the dials, of which there are four, are twenty-six feet, three inches in diameter. This makes it the highest clock in the world and only three others have larger dials. It is operated entirely by electricity, its action being strictly automatic. The numerals which mark the hours are four feet high. They are made of white wire glass which shows black in the day time but at night they are illuminated by strong lights placed behind them while the dials are dark. The hands are also illuminated by lights placed within them. By this arrangement it is possible to decipher the time at a greater distance at night than during the day. The minute hands are seventeen feet long and weigh over one thousand pounds each while the hour hands are thirteen feet four inches long and weigh seven hundred pounds each. One would naturally expect that a heavy and cumbersome mechanism would be required to operate such a large clock, but the machinery for operating each dial is contained in a steel chamber behind it which is only $14\frac{1}{2}$ x 25 x 34 inches in size.

The striking apparatus of the clock includes a chime of four bells which are located at the top of the tower two hundred and sixty-nine feet above the dial faces. The notes are G, F, E flat and B flat and the bells weigh 1,500, 2,000, 3,000 and 7,000 pounds respectively. It is said

that the note of the large bell, upon which the hours are struck, has been heard at a distance of fifteen miles. At night the announcing of the hours is done by a series of electric flashes from a great gilded lantern which crowns the summit of the tower. As soon as darkness comes the bells are silenced automatically. A white light is seen in the lantern throughout the night. Ten seconds before the quarter hour this disappears and a red flash is seen, one flash for the first quarter, two for the half hour and three for the three quarters. The full number of the hour is told by an equal number of red flashes.

The mechanism which accomplishes all of this is controlled by a master clock in a case of carved mahogany which is located in the director's room of the insurance company on the second floor of the building. This operates and regulates not only the tower clock but a complete system of time keeping throughout the building which includes one hundred office clocks. The correctness of the time of this system is insured by the fact that the master clock is connected with a time service wire of the Western Union Telegraph Company, which keeps it absolutely accurate. It is said, however, that the operating mechanism is so finely constructed and adjusted that it would not vary over five seconds per month.

Trade Notes.

The business of the Western Electric Company continues to show a decided improvement over last year, the sales for March being about forty per cent. larger than those for March, 1909.

The Electric Storage Battery Company of Philadelphia, has recently issued two illustrated bulletins describing an installation of their chloride accumulators in the mills of the Indiana Steel Company at Gary, Ind. and the application of their chloride accumulators and oxide batteries for lighting and other purposes on board yachts and motor boats.

The Western Electric Company has recently issued bulletin No. 1,005, which is the third of a series of nine bulletins on telephone exchange apparatus which is to be issued. This bulletin is entitled "Branch Exchange Switchboards of Lamp Signal and Magnetic Signal Types." It describes the types of branch exchange equipments which have been designed for use in business establishments, factories, schools and places where a modern private telephone system is required.

New Edition of Cable Directory Issued.

The thirteenth annual edition of the International Cable Directory of the World, which is issued by the International Cable Directory Company of New York in conjunction with the Western Union Telegraphic Code, is just off the press. As usual, the publishers bring matters relating to the government of telegrams and cables right up-to-date and present a large mass of material which is of interest to all who use the wires.

QUESTIONS TO BE ANSWERED.

[In studying any book it is difficult for most students to pick out the facts contained in the text and arrange them in his mind so that they have a particular meaning to him. To aid the student who is desirous of securing a thorough knowledge of the technical side of the telegraph we have decided to publish in each issue a list of questions, the answers to which may be found in that popular telegraphic text-book, Jones' Diagrams. It will be most profitable to the student after carefully studying the subject matter to which each list of questions applies to try to see if he can answer them without referring to the book. If he masters the text so that he can answer any of these without consulting his book he will then be able to take up more intelligently the subjects which follow.]

CHAPTER I.

What conception has the average mind of the nature of electricity?

What is the scientists idea of the related phenomena of heat, light, and electricity?

How is the sun's energy transmitted to us through the ether?

How do scientists account for the various ways in which the energy of ether waves is made manifest?

How does the author define electricity?

Why is there said to be a "current" in the conductor when electrical energy is being transmitted from one point to another?

What causes earth currents?

What are some of the influences which disturb the normal electrical equilibrium of the earth's surface?

What is the essential condition necessary for the manifestation of the phenomenon known as electricity?

Why is not natural electricity available for practical purposes?

What property of an electric current enables us at all times to detect its presence in a conductor?

How may the magnetizing effect of a feeble current be increased?

What happens when a circuit is broken?

How is the magnetizing power of an electric current made use of in telegraphy?

Why is soft, annealed iron the only metal suitable for an electromagnet which is to be used for telegraphic purposes?

What determines the amount of heat developed in a conductor in which a current of electricity is flowing?

How is the heating effect of an electric current in a conductor made use of for electric lighting?

What is the distinction between a conductor and an insulator?

What medium offers the least resistance to the flow of the magnetic lines of force set up by an electric current?

Why is part of a telegraph relay or sounder made of iron and part of brass?

Annual Report of Telegraphers' Aid Society.

The annual report of the New York Telegraphers' Aid Society, for the year ending March 6, 1910, is as follows:

Annual Convention of Associated Press.

The eleventh annual convention of the Associated Press was held in New York April 26, 27. The past year has been a most prosperous one for this organization and twenty-five in new members have been added to its list. Now that Mr. Melville E. Stone, general manager, who has been on a trip around the world which has occupied the past six months has returned to his office in New York, Mr. Charles S. Diehl, assistant general manager, who has directed the organization during Mr. Stone's absence, will return to his headquarters at Chicago. The following officers were elected: President, Frank B. Noyes; first vice-president, R. M. Johnston; second vice-president, Frank P. MacLennan; secretary, Melville E. Stone; assistant secretary, Charles S. Diehl; treasurer, J. R. Youatt.

There is a lively interest manifested by members of the profession in the various large cities in the eastern division of the Western Union Telegraph Company in the matter of increased electrical knowledge. As an evidence of this it is only necessary to state that nearly 500 copies of Swoope's "Lessons in Practical Electricity" have been purchased during the past month and are being daily studied by members of the various electrical societies. In addition to these it should be mentioned that the sales of Jones' "Diagrams," Thom and Jones' "Telegraphic Connections," Maver and Davis' "Quadruplex" and other works have also been unusually heavy since the formation of the schools in the different cities.

Obituary.

George Griffiths Steel, publicity manager of the Bell Telephone Company of Pennsylvania and controlled companies, and managing editor of the Telephone News, died April 11, at Pittsburg.

Benjamin F. Wright, for the past twenty-five years an operator in the employ of the Western Union Telegraph Company at St. Paul, died in that city April 6.

George J. Frankel, who occupied the position of superintendent of the Western Union Telegraph Company at St. Louis until April 1, died at San Antonio, Tex., April 19, aged fifty-three years. Mr. Frankel entered the telegraph service in his native town San Antonio as messenger at the age of fifteen. Subsequently he was employed as clerk and operator at Dallas and Houston and as manager at Jefferson, Marshall and El Paso, Tex. After a year spent as train despatcher on the Texas and Pacific Railway he returned to Western Union employ and soon after became chief clerk to Superintendent T. P. Cook at St. Louis. May 1, 1897 he was made assistant superintendent and in 1902 when Mr. Cook became general superintendent at Chicago Mr. Frankel succeeded to the superintendency. Although he had been in poor health for some time past, having been attacked by tuberculosis, he stuck to his post until he was relieved April 1, as previously mentioned.

Emory Cobb, a forty-niner of the telegraph, died at Kankakee, Ill., April 15, as the result of injuries received by being kicked by a horse. Mr. Cobb was born at Dryden, N. Y. August 20, 1831. He went to Ithaca to learn telegraphy and in 1848 became an operator on the line of the Erie and Michigan Telegraph Company at Fredonia, N. Y. Later he went to Chicago and took a prominent part in the formation of the Western Union Telegraph Company becoming its first superintendent at that point. He occupied this post during the war but in 1865 his health failing he was compelled to retire for a year's rest. He then went into business at Kankakee and has been one of the leading citizens of that place since that time. Among his other business activities he was largely interested in building the lines of the Northwestern Telegraph Company in Wisconsin and Minnesota, now a part of the Western Union system. While he was superintendent at Chicago, Mr. Cobb conceived the idea of sending money by telegraph. The officials of the company did not at that time, see the value of the scheme, but Mr. Cobb organized a money transfer system on his own account, which he afterward turned over to the company. Mr. Cobb was an intimate friend of President Lincoln and had charge of all of the telegraphic arrangements at the Wigwam in Chicago when he was first nominated for the presidency. He also accompanied Mr. Lincoln as far as Cincinnati on his trip from Springfield, Ill. to Washington to be inaugurated. As an evidence of the esteem in which he was held in Kankakee, all of the business places of that city were closed at three

o'clock for fifteen minutes while Mr. Cobb's funeral was being held.

Robert Redman, an old time telegrapher, died at Pittsburg April 10 aged fifty-eight years. Mr. Redman was at one time assistant superintendent of construction for the Western Union Telegraph Company and was afterward connected with the construction department of the Pittsburg and Allegheny Telephone Company.

William Arnoux, a forty-niner of the telegraph, died at Passaic, N. J., April 23, aged eighty-five years. In 1848, Mr. Arnoux issued in his own handwriting one of the first tariff books ever used in connection with the telegraph. For the past fifty years he was attached to the offices of the secretary and general attorney of the company.

Charles J. Osborn, an old time telegrapher and for fifty-five years connected with the Associated Press, died at St. Louis April 18 aged eighty-four years. Mr. Osborn was born at Utica, N. Y. and learned telegraphy in Pittsburg in 1847. He afterward went into newspaper work and in 1855 became correspondent for the Associated Press at St. Louis. This position he held until 1902, when he retired from active work though he has since been connected with the St. Louis office in an advisory capacity.

LETTERS FROM OUR AGENTS.**PHILADELPHIA, WESTERN UNION.**

Spring house cleaning under the direction of chief operator F. R. Webb, is now in progress here. The office has been thoroughly cleaned, all the desks scoured, all ink stains removed and a coat of varnish is being put on, which makes everything in the office look bright and cheerful. The switchboard, under the manipulations of Messrs. Chas. M. Pennypacker and H. Schwartz has also assumed the appearance of being new. Recent changes are: D. A. Gifford and C. R. Hulse, have resigned; James Lindskey has been transferred to the Hotel Walton; arrivals are, David Bryan, Albert B. Kurtz, E. H. Fritz, Alfred B. Cain, Fred Heisman, Louis Neigut, Morris Kunin, Walter I. Smith, Wm. Kalmey, Harvey G. Wolf, Robt. M. Keller, Chas. S. Weed, Wm. E. Lowe; Chas. F. Darr, from New York; S. E. Standifere, from Atlanta, and Michael A. McLaughlin, from Pittsburg.

The tenth annual entertainment, banquet and dance of the Philadelphia Electrical Aid Society was held at Mercantile Hall, on April 20. Over 750 were present and the occasion was thoroughly enjoyed by all.

WASHINGTON, WESTERN UNION.

Mr. F. D. Giles, of the office of General Superintendent A. G. Saylor, New York, was a recent visitor here, coming in the interest of the service.

The wife of Mr. Dennis F. Brown, wire chief in this office, died April 15. Mrs. Brown had been in poor health for some time. Her death, however, was caused by congestion of the lungs. She was a niece of former Postmaster Van Cott of New York.

CHICAGO, POSTAL.

Mr. F. N. Roberts, formerly chief operator of this office who has been transferred to a position with headquarters at New York, was, before leaving this city, presented with a handsome diamond stud as evidence of the esteem of his co-workers.

Mr. T. N. Powers, who has been appointed Mr. Roberts' successor as chief operator, was born December 6, 1872, and entered the telegraph service in 1886 for the Western Union, casting his lot with the Postal in 1892. He is well qualified to fill the responsible position he has now assumed.

Mr. Powers was agreeably surprised on reaching his office April 7, the day on which he took up his new duties, by beautiful floral desk decorations that were provided by his friends and associates in this office.

Mr. B. D. Seymour, eastern division quad chief, has been appointed wire chief of the eastern division to succeed Mr. Powers. Mr. Seymour was born at Homer, Mich., October 8, 1870. He entered the service as messenger boy at Marshall, Mich., in 1886, and has worked his way up through the various grades to his present position.

Mr. H. H. Dengler, quad chief in the overland division, has been transferred to the eastern division to succeed Mr. Seymour. Mr. Dengler was born at Ann Arbor, Mich., July 8, 1865, and entered the telegraph service in 1882 as messenger at that point. He has since served at various places as operator and manager for both the Western Union and Postal companies and in this office as wire chief and quad chief. He is assisted in his new position by Mr. A. C. Johnson.

Mr. G. A. Redman has been transferred from assistant quad chief, nights, to assist in the overland division, days.

OTHER NEW YORK NEWS.

Twenty-five years ago, in August, 1885, Mr. Charles P. Bruch, then secretary of the Telegraphers' Mutual Benefit Association, attended, as the representative of his association, a convention of the mutual benefit societies held in Boston. Thirty one societies were represented at that convention but only two of them, the Telegraphers' Mutual Benefit Association and the Ancient Order of United Workmen, Grand Lodge of New York, reported to the New York State Insurance Department in 1909. All of the other associations appear to have gone out of existence, except the Fidelity Mutual, which turned into an "old line" company and is still doing business. There can be no better evidence than this that the Telegraphers' Mutual Benefit Association has been well and conservatively managed on sound business principles."

Assessment No. 507 has been levied by the Telegraphers' Mutual Benefit Association to meet claims arising from the deaths of Jennie Wetmore, at Houlton, Me.; Ellis W. Rhivers,

at San Francisco, Cal.; Charles H. Schermerhorn, at Plainfield, N. J.; Millard F. Parkhurst, at Plattsburg, N. Y., and William S. Wood, at Chicago, Ill.

New Page Printing Ticker Company Organized.

The Interurban Telegraph News Company of Atlantic City has been organized with a capital of \$1,000,000 for the purpose of operating telegraphic news tickers in Philadelphia, Pittsburg, Scranton, Harrisburg, Trenton, Wilkes Barre and other cities. The incorporators are Richard H. Robertson, Russell L. Browne, and Coleman H. Watkins, all of Atlantic City. The system to be used is the invention of Dr. G. A. Cardwell the well-known inventor of New York. Wires of independent telephone companies will be utilized for transmitting the news, the system to be employed not interfering in any way with the use of the wires for telephonic purposes at the same time.

Every telegrapher can own a home. The Serial Building Loan and Savings Institution of 195 Broadway, New York, was organized for the purpose of assisting telegraphers to buy homes and encourage them to save systematically. During the twenty-five years of its existence it has aided over eleven hundred persons to secure homes and is now assisting many others. Write for particulars.

Wanted—Address of telegraph operator who wants railroad work in country, \$55. Address "Relief," care Telegraph and Telephone Age.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. This renders the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Leg Pattern \$2.50

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Elementary Lessons in Electrical Measurements. Joint Resistance.

PART II.

The fact that the joint resistance of any two or more wires connected in parallel is always less than the actual resistance of any one of them singly seems to perplex a great many students. They cannot understand why the resistance should be less when obviously more resisting material is added.

The trouble is they do not quite grasp the true meaning of the words "joint resistance" as applied to electric circuits.

If the student will substitute the word "facilities" for "resistances" in connection with a conductor or number of them he will get the correct meaning.

For instance, a dynamo cannot furnish any current until we provide some facility for its conveyance. A wire attached to such a machine will furnish such facility notwithstanding it offers a certain amount of resistance.

Let us assume that it offers 100 ohms resistance, and absorbs one ampere of current. Now connect a second wire possessing the same amount of resistance to the same dynamo also. There will then actually be 200 ohms of resisting material connected with the machine, but as

the latter now finds two facilities for creating current, instead of one, the dynamo finds itself able to furnish just twice as much current as it did when but one wire was connected.

In other words the two conductors, although actually possessing a total resistance to the amount of 200 ohms, create a combination circuit which draws from the dynamo exactly the same volume of current that one single wire would which possessed but 50 ohms. Hence the joint resistance of a number of wires joined to one source of current, really refers to the facilities they offer for absorbing current, and the measure of such combined facilities is represented by the resistance of one single wire which with the same source of current will absorb exactly the same total volume of current as the group. The resistance of the single conductor which will do this is called the joint resistance of the two or more wires so combined. For example, if one wire alone possessing 100 ohms resistance draws one ampere of current, two similar wires will absorb two amperes. A 50 ohm wire alone will also take just two amperes, hence the joint resistance of 100 and 100 is 50 ohms. Three similar wires will absorb three amperes. So will one wire of 33 1-3 ohms, hence 33 1-3 is the joint resistance of 100, 100, and 100. The joint resistance of four such wires would be twenty-five ohms, because a wire of that length would carry exactly four amperes of current. Hence the rule for determining the joint resistance of several wires each of which possesses the same amount of resistance is, divide the resistance of one wire by the total number of such wires. Thus four wires of 100 ohms each would give a joint resistance of 25 ohms because $\frac{1}{4} = 25$.

When the joint resistance of two or more wires possessing different values of resistance is desired and the figure or figures representing the same are so small that the operation will not require too much figuring, it may be determined by what is called the "reciprocal method," in which the first object is to ascertain the conductance of the circuits. The word conductance in this case really means the "facilities offered" for absorbing current, in contra-distinction to the actual material resistance of the conductors themselves.

For instance, if we have say three wires in parallel possessing resistance of two, four and six ohms, respectively, the conductance will be equal to the reciprocals of those figures. Thus $\frac{1}{2}$, $\frac{1}{4}$ and $\frac{1}{6}$ are the reciprocals of 2, 4 and 6. The total conductance of the circuit will equal the sum of the separate conductances.

To work out an example by this method observe the following rough rule:

Multiply the denominators of the reciprocals together in order to obtain a common denomina-

tor for the group. Then add together the numerals of the reduced fractions and place the sum over the figures representing the common denominator for the latter's numerator. The final fraction thus obtained will represent the total conductance of the circuits in parallel.

Example: Three wires possess 2, 4 and 6 ohms resistance respectively. If placed in parallel what will be their joint resistance?

Now the reciprocals are $\frac{1}{2}$, $\frac{1}{4}$ and $\frac{1}{6}$. Thus $2 \times 4 \times 6 = 48$, the common denominator. $\frac{1}{2} = \frac{24}{48}$, $\frac{1}{4} = \frac{12}{48}$, $\frac{1}{6} = \frac{8}{48}$.

Adding these numerals together and placing the sum over the common denominator we find we have in fractional form $\frac{44}{48}$ or $\frac{11}{12}$, which represents the total conductance of the circuit.

This really means that we have the equivalent of 11 wires in parallel, each of which possesses exactly 12 ohms. Hence the joint resistance of the group must be equal to the resistance of one wire divided by the number of such wires in the circuit. Thus $\frac{11}{12} = 1.09+$ ohms, the joint resistance of 2, 4 and 6.

To ascertain the total volume of current divide the electromotive force of the source of current in volts, by the joint resistance of the circuit, or 1.09 ohms.

If it is then desired to ascertain the volume of current which flows through each of the three wires it would merely be necessary to divide the total volume drawn from the machine by the sum of the three numerators of the enlarged fractions representing the three respective wires or by 44 and multiply this quotient by each numerator separately.

Then 24 times the quotient obtained will show how much current the two ohm wire will take; 12 times the quotient will be what the four ohm wire absorbs, while the six ohm wire will take the remainder or 8 times this quotient.

(To be Continued).

Recent Telegraph and Telephone Patents.

A patent, No. 955,134, for a selective locking-key, has been granted to John F. Cadell, of Baltimore, Md.

A patent, No. 955,302, for a telephone signal-bell, has been issued to Herman L. Wuerffel, of Maywood, Ill.

A patent, No. 955,335, for a bridging-telephone system, has been secured by Henry F. Joeckel, of Clayton, Ill.

A patent, No. 955,472, for a combined telephone and protective alarm system, has been awarded to James G. Nolen, of Chicago, Ill.

A patent, No. 955,633, for a telephone system, has been taken out by Merritt S. Conner, of Oakdene, Hale, England.

A patent, No. 955,676, for a telegraph sounder, has been granted to G. F. Oehmen, of New York. A vertical solenoid, a straight vertical core movably mounted and means carried by the core for producing signals.

A patent, No. 955,685, for a telephone transmitter, has been issued to G. N. Quinby, Jr., of North Providence, R. I.

A patent, No. 955,716, for a telephone transmitter, has been secured by Pietro Stragiotti, of Hurley, Wis.

A patent No. 955,921, for a telephone receiver, has been awarded to H. R. Stuart and E. O. Kizer, of Wheeling, W. Va.

A patent, No. 955,923, for a telephone, has been taken out by W. H. Thompson, of Wheeling, W. Va.

A patent, No. 956,171, for telephonic apparatus, has been granted to T. C. Rafferty, of Philadelphia, Pa.

A patent, No. 956,228, for long-distance telephonic apparatus, has been issued to V. Tardieu, of Arles, France.

A patent, No. 956,251, for telephone apparatus, has been secured by D. H. Wilson, of Chicago, Ill.

A patent, No. 956,484, for a telephone exchange system, has been awarded to E. E. Clement, of Washington, D. C.

The following patents have expired:

A patent, No. 495,030, for a means for telegraphing, held by William H. Fahrney, of Chicago, Ill.

A patent, No. 495,087, for central-office apparatus and circuit for telephone-exchanges, held by Edward J. Hall, of Morristown, N. J.

A patent, No. 495,090, for granulated material for transmitting telephones, held by William W. Jacques, of Newton, Mass.

Patents, Nos. 495,179, for a system for protecting telephone apparatus from lightning and, 495,180, for a telephone-gage, held by John J. Carty, of New York.

Patent No. 496,513, for vibratory telegraphy, issued to Stephen D. Field, of Stockbridge, Mass.

Patent No. 496,549, for a printing-telegraph instrument, issued to Alexander H. Wirsching, of Brooklyn, N. Y.

Patent No. 496,602, for electric signaling apparatus, issued to Stephen D. Field, of Stockbridge, Mass.

Personal.

Mr. Stephen D. Field, the well known electrical engineer and inventor of Stockbridge, Mass., was a recent New York visitor.

Mr. T. Commerford Martin, who was well known for so many years as editor of *Electrical World*, is securing excellent results in his efforts for the up-building of the National Electric Light Association of which he became secretary last September. The twenty-fifth annual convention of that association, which meets in St. Louis, May 23-28, and for which Mr. Martin is actively engaged in making arrangements, promises to be one of the greatest gatherings of electrical men ever held.

Mr. Charles A. Tinker, formerly general superintendent of the eastern division of the Western Union Telegraph Company, New York, who has been spending the winter months in Mexico, has returned to his home in Brooklyn.

Mr. A. W. Orton, a well known old-time and military telegrapher, has been elected president of the Rome Box and Lumber Company of Rome, N. Y. Mr. Orton has lately secured a large interest in this company and is now devoting his time to re-organizing and extending the business.

Mr. T. Thorne Baker, the English inventor who has developed a system of transmitting photographs by wire, is spending some time in this country. Mr. Baker is here for the purpose of demonstrating the operation of his system for sending pictures either by wire or wireless.

Mr. Ernst Halling, assistant manager of the government telegraph office at Stockholm, Sweden, is spending some time in this country, making a study of our telegraph systems as regards their organization, management, bookkeeping, etc. Mr. Halling will return to Sweden about June 15.

Mr. A. B. Banker, formerly of the Postal Telegraph-Cable Company in New York, but for several years past connected with Paul Smith's in the Adirondacks, was in New York recently, coming here on business connected with the hotel interests with which he is identified. While in the city Mr. Banker took occasion to call on many of his old friends.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. W. I. Capen of New York, general superintendent of plant and Mr. C. M. Baker, superintendent of construction of the western division, Chicago, are supervising the construction of the new line which is being built from Salt Lake City to Reno, Nev.

Mr. W. P. S. Hawk has now assumed the superintendency of the sixth district, western division at Chicago, his transfer to that position having been announced in our April 16 issue. Superintendents J. A. Forehand of Seattle and W. C. Black of Denver, have taken charge of the lines of the eighth district over which Mr. Hawk formerly presided.

Mr. Edward J. Nally, vice-president and general manager of the company has announced that on June 1 his company will increase the wages of its telegraph operators in all important offices, the offices to be classified according to their comparative importance. The increases will be selective and will run from five—and in some cases as high as twenty-five per cent.

Careful examination and full inquiry will be made as to the merits of each individual operator, ability to be the first requisite; years, experience and other special fitness will count in each man's favor and all will be graded accordingly. Efficient and deserving operators will receive pay commensurate with the value of the

work that they are able to perform and less experienced and new operators will have greater opportunity to demonstrate their fitness for advancement in pay or promotion in other ways.

It is the company's intention, by continued fair dealing with employees, to retain and attract to its service the most skillful and reliable operators.

The "Postal Telegraph" for May, bears on its front cover a splendid likeness of Professor Morse. On the first inside page is a picture of the original Morse telegraph set while on the opposite page a picture of modern apparatus shows the striking contrast between the crude instruments employed originally and those in general use to-day. The leading article in the book is an excellent biographical sketch of Thomas A. Edison, written by Elbert Hubbard, editor of "The Fra" and "The Phillistine." A noticeable feature of the section devoted to tariff changes is the addition of over 300 points in New York State to which messages will be delivered, the telephone being made use of to reach a majority of these places.

RESIGNATIONS AND APPOINTMENTS.

Mr. G. A. Probert, manager at Pueblo, Col., has been appointed manager at Colorado Springs vice Mr. A. G. Barks, resigned to engage in other business. Mr. Leslie Van Arsdale of Pueblo, has been appointed to the position vacated by Mr. Probert.

Mr. C. H. Jett has been appointed chief operator of the Denver office vice Mr. E. Cox transferred to a similar position at San Francisco.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. B. Brooks, general manager, and Mr. W. N. Fashbaugh, in charge of the traffic, left New York, May 9, in the company's car, Morse, for an extended tour of inspection, which will take them as far as the Pacific Coast. The itinerary includes El Paso, Texas; Los Angeles, San Francisco, Portland, Seattle, Salt Lake City and Denver. Mr. Brooks expects to return to New York about June 5.

Recent executive office visitors included Theodore P. Cook, general superintendent of the western division, Chicago, accompanied by his secretary, M. T. Cook; B. F. Dillon, general superintendent of the southern division, Atlanta, Ga., and wife; J. C. Nelson, superintendent at Omaha, Nebr.; J. S. Calvert, superintendent at Richmond, Va.

Mr. J. McRobie, general superintendent of the American District Telegraph Company, Chicago, Ill., was a recent New York visitor, coming here on company business.

Mr. C. H. Bristol, general superintendent of construction, has returned from a trip to Salt Lake City and other western points, where he was supervising the construction of new copper wires to the Pacific coast.

Mr. S. R. Crowder, electrician of the southern division at Atlanta, Ga., has been transferred to the office of W. E. Athearn, engineer of equipment. Mr. Crowder's duties consist in preparing plans for new offices, and any extensive changes in existing offices.

Mr. J. E. Jenkins, formerly inspector at New Haven, has been transferred to the New York main office of the company, as assistant to Mr. R. H. Morris, electrician.

A rearrangement of the executive offices is now being made. Several of the departments will be located on the fourth floor, which was previously occupied by Mr. George J. Gould. The Gould offices have been moved from this building to 165 Broadway.

The rooms in the main building, known as 195 Broadway, will be renumbered, each floor beginning with an even hundred.

E. J. Hall, chairman of the executive committee, will occupy room 400; S. M. Williams, special agent, room, 401; Colonel Robert C. Clowry, president, and F. J. Scherrer, assistant secretary of the company, room 402; Belvidere Brooks, general manager, rooms 403 and 404; John C. Willever, secretary, rooms 405, 406, 407 and 408. Room 409 is reserved for out-of-town officials of the company visiting in New York. The legal department remains in its old quarters on the fourth floor.

The fifth floor will be occupied as follows: G. W. E. Atkins, vice-president, rooms 500 and 501; Thomas F. Clark, vice-president, room 502; W. N. Fashbaugh, who has charge of the traffic, will occupy rooms 503 and 504; W. E. Athearn, engineer of equipment, rooms 505 and 506; R. E. Chetwood, engineer of construction, 507 and 508; C. H. Bristol, general superintendent of construction, and G. F. Sworthfiger, assistant general superintendent of construction, will occupy room 509. A. G. Saylor, general superintendent of the eastern division, and staff will remain in rooms 510, 511, 512, 513, 514 and 515. The agent of the building, Mr. A. O. Wallis, will occupy room 518.

The entire sixth floor, with the exception of the meeting room of the board of directors and executive committee, and room 602, which will be occupied by Vice-President J. B. Van Every, has been assigned to Mr. E. Y. Gallaher, auditor.

On the second floor rooms 202 and 203 will be occupied by the tax attorney's department. Mr. W. J. Dealy, superintendent of the commercial news department, will occupy room 204.

Arrangements are being made for the construction of one new copper wire between Chicago and Salt Lake, two new wires between Salt Lake and San Francisco, and one between Salt Lake and Portland, Ore.

RESIGNATIONS AND APPOINTMENTS.

Mr. P. E. Jones, of Portsmouth, Ohio, has been appointed manager at Springfield, Ohio, vice Mr. George R. Carter, who has resigned to become secretary of the Elk's home in that city.

Mr. A. H. Kohlhaas, manager of the office at Calumet, Mich., has been appointed manager at Miles City, Mont. Mr. John Gerhne has been appointed to succeed Mr. Kohlhaas at Calumet.

Mr. O. T. Welch, manager of the office at Council Bluffs, Ia., has been appointed manager at Lincoln, Neb., vice C. B. Horton, appointed assistant superintendent at Omaha. Mr. George Nicoll, formerly manager at Council Bluffs, but for the past two years chief clerk in the office of Superintendent Nelson, at Omaha, has been appointed to succeed Mr. Welch.

J. M. Stephens, Western Union Superintendent at Atlanta.

Mr. J. M. Stephens, who has been re-appointed to the position of superintendent of the Western Union Telegraph Company at Atlanta, Ga., is one of the best-known telegraph executives in the South, having been born in Canton, Ga., November 11, 1848, and having been employed in that section of the country during his entire telegraphic career. He entered the service at Kingston, Ga., in 1863, as

J. M. STEPHENS,
Superintendent, Western Union Telegraph Company, Atlanta, Ga.

messenger. Between then and 1867 he held various positions as an agent, operator and train despatcher on the Western and Atlantic Railroad. In the latter year he joined the forces of the Western Union, at Atlanta, as operator, and has resided in that city since that time. He displayed such ability that he was made manager of the Atlanta office, and in 1892, when there was a vacancy in the superintendency at that point, he was advanced to that post. This position he held until 1905, when he retired. Since then he has devoted all of his time to his extensive business interests in Atlanta. The reappointment of Mr. Stephens brings back to the service one of the most capable officials ever connected with the telegraph and the Western Union Telegraph Company is to be congratulated upon securing his acceptance of the position.

A. A. Patterson, Manager Western Union Telegraph Company, Bay City, Mich.

Mr. A. A. Patterson recently appointed manager of the Bay City, Mich., office of the Western Union Telegraph Company, was born in that city in 1882. He entered the telegraph service in his native town in 1897 as messenger. While thus employed he made such good use of his opportunities to learn telegraphy that the next year he became an operator. He was employed in Washington, D. C., for a short time in 1902, but soon returned to Bay City to accept

A. A. PATTERSON,
Manager Western Union Telegraph Company, Bay City, Mich.

a position as press operator. While serving in that capacity he copied the report for one year without a break. He was thus employed until 1907 when he became repeater chief in the Western Union office at Toledo. In March 1908 he went to Bay City to relieve Manager Cooper while the latter was enjoying a vacation abroad. Returning to Toledo in June of the same year he became wire chief in the Toledo office, which position he held until his present advancement. Mr. Patterson has throughout his entire career been a close student of the technical side of the telegraph operation as well as of the business features and consequently is well qualified to discharge the duties of the responsible position which he has now assumed.

W. W. Murphy, Western Union Manager at Chattanooga.

Mr. W. W. Murphy, who has been appointed manager of the Chattanooga office of the Western Union Telegraph Company as announced in our May 1 issue, is one of the youngest telegraph managers in the country to hold such an important position. It goes without saying that this is because Mr. Murphy has made the most of his opportunities to acquire a thorough knowledge of the telegraph business since he first entered the service at the age of

fourteen only twelve years ago. During the past two years, while holding the position of traffic chief at Atlanta, Mr. Murphy has made

W. W. MURPHY,
Manager Western Union Telegraph Company, Chattanooga, Tenn.

a host of friends in that city who are sorry to have him leave but all of whom unite in congratulating him upon his promotion to the more responsible position.

The Cable.

Mr. George Gray Ward, vice-president and general manager of the Commercial Cable Company, accompanied by Mrs. Ward, sailed for England, May 14, on the steamer Baltic.

Mr. W. Fenn, manager of the Direct United States Cable Company, London, has been spending a few days in New York after visiting the other stations of his company on this side of the Atlantic. Mr. Fenn, accompanied by his family, sailed for Liverpool, May 14, on the steamer Baltic.

The prohibition against the use of telegraphic codes in Turkey has been removed. Messages in cipher, however, will not be transmitted over the government lines.

The Brazilian Government has purchased a cable tug for use in repairing submarine cables in Rio Janeiro Bay. The new boat, which is ninety feet in length, and of 150 tons burden, will be equipped to repair cables up to a depth of 150 feet.

What is known as the Raymond-Barker system of inductive signaling was tried recently on the steamer Buccaneer while making a splice on an Atlantic cable off the coast of Ireland. Very satisfactory results were obtained, messages being exchanged between the ship and shore while the operation was in progress, and after it was completed until the cable was released. The distance between the ship and shore was sixty-six miles and the device would easily have operated a distance of one hundred miles.

It is expected that the new cable which is being laid by the Western Telegraph Company, between Ascension Island and Buenos Ayres, will be opened for business about May 25. The completion of this work involves the construction of about fifty miles of land line.

The new three-core cable which the Canadian Pacific Railway's Telegraph will lay between Vancouver, B. C., and Nanaimo is now on its way from England to Victoria, B. C., and will be laid sometime in June by the cable steamer *Restorer* of the Commercial Cable Company. The new cable is forty-five miles long.

The facilities of the trans-Atlantic cable companies were taxed to their utmost capacity for several days following the death of King Edward. Because of the general popularity of the late monarch the newspapers in this country made use of all the information concerning him that they could secure and as a result the cable traffic was enormous. Some of the papers received several thousand words in a single message.

Municipal Electricians.

Mr. Thomas Monaghan has been appointed superintendent of fire alarm telegraphs at Holyoke, Mass., vice Mr. John Castle resigned.

Plans have been completed for the new \$30,000 fireproof building which will be erected at Oakland, Cal., as headquarters for the fire alarm and police telegraph systems.

Mr. R. A. Smith, city electrician of Norfolk, Va., has just completed the installation of twelve new fire alarm boxes in that city.

Of 709 fire alarms answered in Houston, Texas, during the past year, 506 came by telephone and 203 came through the fire alarm system.

Bids have been received for placing underground fire alarm telegraph wires in certain sections of Brooklyn. Deputy Fire Commissioner A. J. O'Keefe of Brooklyn has asked for an appropriation of \$275,000 for this purpose and for the installation of about 200 new fire alarm boxes.

Mr. Frank P. Foster, of Corning, N. Y., secretary of the International Association of Municipal Electricians is busily engaged in preparing the plans for the fifteenth annual convention of that body, which meets at Convention Hall, Rochester, N. Y., September 6, 7, 8 and 9. An interesting and instructive program is being arranged for and it is hoped that there may be a large attendance.

An electrical typewriting telegraph system has been installed in Berlin for the use of the police department. From the central station at police headquarters messages may be transmitted simultaneously to all of 200 receiving stations distributed throughout the city and its suburbs. It is said that on an average 150 telegrams of thirty words each are sent each day from the central station, though on some days this number is doubled.

Willis H. Moore Upon Telegraph Weather Bulletin Service.

Mr. Willis H. Moore, chief of the United States Weather Bureau, took occasion recently to comment most favorably upon the telegraph service of this country for transmitting weather reports as compared with that of foreign countries. Mr. Moore stated that he had visited the meteorological bureaus of other countries, but had never found that they receive anywhere near as efficient telegraph service as given in the United States.

"When foreign meteorologists come here," said Mr. Moore, "they are amazed to find that through the efficiency of our service and the mutually helpful co-operation that exists between the operators and our observers we are able to gather the reports from our stations and deliver them at one hundred different important points in from forty to sixty minutes from the time that the messages are filed at the different stations. In Europe I have seen the reports straying in ten hours after the observations were taken, in fact, not reaching any central point in time to have the map constructed before the weather had arrived. From this it can be seen what it means to the Weather Bureau and the great commercial industries whose interests are so intimately related to the weather to have the character of service that we are now receiving and always have received."

Annual Reunion of Old Time and Military Telegraphers.

President William J. Lloyd, of the Old Time Telegraphers' and Historical Association, is busily engaged in preparing the plans for the twenty-ninth annual gathering of that body and the Society of the United States Military Telegraph Corps, which convenes in Chicago, September 8, 9 and 10. The headquarters of this reunion will be at the Auditorium Hotel and not at the Hotel La Salle as previously announced. President Lloyd is to be congratulated upon the selection of this fine centrally located hotel facing the lake. He and Colonel William Bender Wilson, president of the Society of the United States Military Telegraph Corps, will soon announce the various committees who will assist in arranging for the coming gathering. Mr. F. J. Scherrer, assistant secretary of the Western Union Telegraph Company, New York, is secretary of the Old Timer's Association, and David Homer Bates, 658 Broadway, New York, is secretary of the Military Telegrapher's Society.

The R. W. Martin Fund.

Since the report given in our May 1 issue, we have received \$5.00 from Mr. J. McRobie, general superintendent of the American District Telegraph Company, Chicago, to be applied to the fund for the assistance of the old time and military telegrapher, Robert W. Martin. This makes a total of \$623.25, which has been collected and turned over to Mrs. Martin.

The Telephone.

Mr. H. H. Brown, of Beaumont, Tex., has been appointed manager of the Southwestern Telegraph and Telephone Company, at Houston, vice Mr. E. G. Evans, resigned.

Mr. Morris Ruberg of the repeater department of the American Telephone and Telegraph Company, Philadelphia, was a recent New York visitor.

The stockholders of the Missouri and Kansas Telephone Company have voted to increase the capital stock of that company from \$5,000,000 to \$20,000,000.

Mr. F. W. Morris, superintendent of construction of the Bell Telephone Company of Missouri, has been appointed acting superintendent of plant to succeed to the duties of Mr. F. R. Mott, general superintendent, who has resigned.

The Elson Telephone Merger Bill allowing the consolidation of telephone companies in Ohio, which was passed recently in the House of Representatives of that state was defeated in the Senate.

The Iowa Telephone Company has voted to increase its capital stock from \$4,000,000 to \$10,000,000. At the end of 1909 this company had a total of 350,451 stations, an increase of 67,366 during the past year.

According to the annual report of the New England Telephone and Telegraph Company the number of stations belonging to that company December 31, 1909, was 263,583, an increase of 21,985 during the year. Including other companies whose lines connect with them the system of the New England company embraces 337,021 stations. The net revenue of the company for the year showed an increase of \$623,537 over 1908.

In addition to the new London-Paris telephone cable which is being laid between Dover and Cape Grisnez, preparations are being made for laying another telephone cable across the Channel to Belgium. The continental telephone cables have been so successful that the demand for their use has far exceeded anything that was anticipated. The new cable will contain four wires, giving two complete circuits, and will be laid between St. Margaret's Bay, Dover, and La Panne, near Ostend.

At a meeting of the stockholders of the New England Telephone and Telegraph Company, held in Boston, May 2, General Thomas Sherwin, who has been president of that company for the past twenty-five years, retired and was elected chairman of the board of directors. Mr. Jasper N. Keller, vice-president, was elected to succeed Mr. Sherwin, and Francis A. Houston, general manager, was made a vice-president. Mr. Keller and Mr. F. D. Fletcher were also elected directors of the company to succeed Mr. B. Jones and W. S. Hutchinson. It was voted to increase the number of directors from twelve to fifteen. The three new directors will be elected later.

It is now possible to communicate by telephone between Liverpool, England and Paris, Lyons, Brussels and other points in France and Belgium. When the loaded submarine telephone cable which will soon be laid across the English Channel is completed, this service will be greatly improved.

That the use of the telephone along the Pacific coast is increasing rapidly is indicated by a statement of the Pacific Telephone and Telegraph Company which shows between January and March an increase of over two per cent. in the total number of stations in service. The increase in San Francisco during that period was over three per cent. and 2,384 new contracts were taken in that city during March.

Mr. Frank B. Knight, the well known old-time and military telegrapher, now connected with the Southwestern Telegraph and Telephone Company, at Dallas, Texas, recently delivered an after dinner speech by telephone to a gathering of advertising men at Fort Worth. Each of the eighty-five guests at the dinner were provided with a desk telephone and at the appointed time, Mr. Knight, seated in his office thirty-five miles away, rang a small bell upon each instrument. The diners then placed the receivers to their ears and listened to Mr. Knight's address.

The American Telephone and Telegraph Company has applied to the State Good Roads Commission of Maryland for permission to lay underground conduits along the road between Baltimore and Wilmington, Del. This action is part of a plan to eventually establish an underground connection between Boston and Washington. The chief object of this is to prevent the recurrence of such a condition as existed on March 4, 1909, the day of President Taft's inauguration, when Washington was almost entirely cut off from communication with other parts of the country owing to a severe sleet storm breaking down the overhead wires.

Mr. H. P. Buehler, formerly general manager of the Central District and Printing Telegraph Company, Pittsburg, who was recently appointed auditor of the Bell Telephone Company of Pennsylvania at Philadelphia was before leaving for his new post, the guest of honor at a luncheon given by his former associates. Mr. A. C. Terry, district manager of the American Telephone and Telegraph Company at Pittsburg acted as toastmaster. Among others present were D. Leet Wilson, D. F. Henry, M. C. Rorty, J. H. Boeggeman, Springer H. Moore, F. T. Ewing, D. L. Thomas, J. A. Connell and D. J. Murphy.

An important amendment has been added to the Administration railroad bill, which has been passed in the House of Representatives and is now under consideration in the United States Senate. By this amendment the bill declares that the telegraph and telephone companies are common carriers thus placing them on the same footing as railroad and steamship companies and subject to the control of the Interstate Commerce Commission.

Radio-Telegraphy.

The Japanese Government has been making experiments in wireless telegraphy with a view of establishing a wireless service between Japan and Hawaii.

A mast 200 feet high for the aerial of a wireless station has been erected at New London, Conn., and the other equipment will soon be installed.

At a meeting of the Wireless Institute of New York, held May 4, Mr. Stanley M. Hills presented a paper on "High Insulators" in which he made a comparison of high insulators as to electrical resistance, resistance to heat, chemicals, etc.

The bill of Senator Frye of Maine, requiring ocean-going vessels carrying fifty persons or more to be equipped with wireless apparatus having a range of at least 100 miles, has passed the Senate.

A patent, No. 956,165, for electrical space communication, has been secured by G. W. Pickard, of Amesbury, Mass. Makes use of a plurality of conductor stations separated from the local stations with loaded line conductors connecting the conductor stations with the local stations.

Mr. C. C. Galbraith, vice-president of the United Wireless Telegraph Company has returned from a trip to England where he has made arrangements with the British postal authorities to have messages of his company from liners at sea transmitted to their destination through the government land stations.

Wireless stations will be on the lookout for atmospheric disturbances on May 18 when the tail of Halley's comet reaches its nearest point to the earth. Professor O. C. Wendell of the Harvard Observatory, however, believes that there is little probability of any interruption to the wireless service.

Because of the large number of amateur wireless installations the Chicago Board of Underwriters has issued a special circular relating to the wiring of wireless telegraph apparatus. All interior wiring must conform to the rules of the National Board of Fire Underwriters and certain additional requirements must be complied with concerning the grounding of the aerial and the provision of a lightning arrester for the same.

In a recent number of a French publication, there is described a new form of electrolytic detector which it is claimed possesses a high degree of sensibility. This detector consists of a small glass vessel containing in the bottom mercury in which pure tin has been dissolved. Above this amalgam there is a solution of sulphuric acid in water and the upper electrode is the same as that ordinarily used in this class of detectors.

There are two vacancies for the position of wireless engineer in the Government service in the Philippines at a salary of \$2,000 per year. A civil service examination will be held June 1 to secure candidates for these positions. At the same time an examination will be held to fill three vacancies in the position of wireless telegraph operator in the Philippines at a salary of \$1,200.

Contracts have been awarded to the Australian Wireless Telegraph Company for the construction of two high power wireless stations at Sydney, New South Wales and Fremantle, Western Australia. These are to be part of the chain of stations which will be established to connect the various British possessions in the Pacific and will have a guaranteed range of 1,000 miles.

The Continental Wireless Telephone and Telegraph Company has been incorporated with an authorized capital of \$5,000,000 for the purpose of operating a wireless service on the Great Lakes. It is said that the new concern has been formed by a consolidation of the Clark Wireless Telegraph and Telephone Company, the Pacific Wireless Telegraph Company, the Massie Wireless Telegraph Company and the Collins Wireless Telegraph Company.

At a recent meeting of the International Society of Electricians at Paris M. Tosi, who is one of the inventors of the Bellini-Tosi system of directive wireless telegraphy described some experiments made with that system at a station which has been established at Boulogne, France. It has been contended by some that the carrying distance of directive aerials is less than that of ordinary antennae for the same amount of power. M. Tosi, however, showed by his experiments that such was not the case but that the directive aerial has a greater carrying distance than the usual vertical antennae.

The Senate Committee on Commerce gave a hearing recently on the Depew bill regulating the use of wireless installations at which the amateurs were represented by W. E. D. Stokes Jr., president of the Junior Wireless Association and George Eltz. The United Wireless Company, the National Electric Signaling Company and the Marconi Wireless Company were also represented as well as the Government. As a result of the hearing the requirement for a license fee was eliminated from the bill and registration substituted. In the bill as reported to the Senate certain wave lengths are reserved for government use to protect important messages or distress calls. The Secretary of Commerce and Labor is authorized to make the necessary regulations to govern the use of wireless instruments. It is said that the private companies object to the bill because they believe that it confers too much authority on the Secretary of Commerce and Labor.

Storage Battery Practice.*

BY R. C. HULL.

When two plates consisting of peroxide of lead and pure lead respectively are immersed in a solution of sulphuric acid and connected externally by an electrical conductor, a current will flow from one plate to the other, and at the same time the composition of all the materials will change. When a current is passed through this combination in the opposite direction, it will tend to restore it to the original compositions. This combination is known as a storage battery. There are other combinations which fill these conditions, but on account of independent chemical reactions which occur, none have so far proved commercially successful.

The original lead storage battery was formed by passing an electric current through a lead couple immersed in dilute sulphuric acid. This current formed an oxide of lead on one of the plates, the other plates being unaffected. When these plates were connected by an electrical conductor the current would flow from one to the other. By frequent applications of current in alternate directions it was found that the oxide film was increased and a greater capacity could be obtained. With this as a basis numerous methods were adopted to increase the surface of the plates, and thereby their capacity; some of these methods consisting in cutting ribs, grooves, etc., the object being to obtain the greatest surface for the smallest weight of material. The storage battery evolved on these principles was known as the Planté type, named after the discoverer of the principle, Gaston Planté. Some time later Faure conceived the idea of making up a battery by pasting the active material on frames or grids. The active material of the positive plate was peroxide of lead, and of the negative plate was of some chemical composition, generally an oxide of lead, which was later treated to remove the oxygen, leaving a pure, spongy lead. This type of battery has a large capacity for its weight, and is extensively used to-day in automobile and other service where small weight is the great desideratum.

The chemical changes involved between discharge and charge are rather complicated, but the final states are as follows:

When lead is fully charged the active material on the positive plate is peroxide of lead (PbO_2), the negative plate is pure lead (Pb), and the solution is sulphuric acid (H_2SO_4), and water (H_2O). If the battery were completely discharged the active material on both plates would be of the same character (PbSO_4), the sulphur-oxide radical coming from the acid and reducing the density of the electrolyte.

The development of the storage battery in commercial use was attended by many difficulties,

and the evolution of the positive and negative plates now most extensively used was an interesting one.

It was found that the Planté type of positive plate could be surfaced to have an extremely high capacity at first, but when made of pure lead its life was comparatively short. Lead is a ductile material, practically inelastic, and any distortion of the plate due to changes in volume between the various stages of charge and discharge were non-corrective, the consequence being the well-known phenomenon of buckling. On the other hand, the Brush plate, non-homogeneous, would disintegrate, especially upon high charges and discharges. It was finally realized that in any positive plate a certain amount of the metal was necessary for mechanical support, and as a conductor of current, and it was decided to make this portion of the plate of a more rigid character. On this principle the Manchester plate was developed. This plate consists of a stiff lead-antimony alloy non-corrodible grid pierced by a number of circular holes slightly tapering to the centre, and in these holes are forced by hydraulic pressure spirals of pure lead tape corrugated to obtain surface. When the plate is formed—that is to say, when the surface of the pure lead is changed to lead oxide, the spiral button naturally expands and makes a tight connection to the grid. Any pressure in the plate is in a lateral direction, and the plate is so proportioned that this pressure only results in better contact, the amount of material not being great enough to affect the grid.

Another feature of the plate is that the electrolyte has free passage from one side to the other, thus doing away with the disastrous buckling and distortion due to unequal work on opposite sides of the plate, as is inherent to plates built up from solid sheets and retaining what is known as a central web, which is used in this latter form of plate for support and conductivity.

This unequal work can be best understood if we imagine a battery made up of a positive plate with a negative plate on either side. If this positive plate be of pure lead the change in its chemical condition is apt to distort it slightly. If we send an electrical current through the circuit composed of the two negatives and the positive, it is evident that the electricity will have two paths to travel. Now if through distortion or other reasons there is slight difference in distance between the positive and the two negatives, there will naturally be a flow of current greater to one side of the plate than to the other. If the plate has a central web, this unequal flow of current cannot be equalized, but results in one side of the plate being more highly formed than the other, causing further tendency to distortion. If, however, there is free passage from one side of the plate to the other, it is evident that the only effect of this unequal current would be formation deeper into the plate

*Extracts from a paper read before the Engineers Club of Central Pennsylvania.

from the direction of the greater proportion of current.

In order to avoid the disastrous results that accrue from the use of a plate with a central web, still another type of positive plate has been devised. This consists of a cast or rolled plate of pure lead having free conduction of the electrolyte from one side to the other. A certain portion of the plate is left solid, forming a grid for mechanical support and conductivity. A successful plate of this type is the Tudor plate, which is used by the Tudor Company, of Germany. The manufacture of this type of plate requires the greatest amount of care and experience to avoid buckling or distortion, due to growth or expansion in charging, which effects have been shown to be non-corrective on account of inelasticity of pure lead.

The pure lead negative is not subject to the buckling or distortion effects of the positive on account of the small difference in volume of the active material from full charge to full discharge. It was found, however, that no matter how great a surface was given to the plate, in a very short time this surface was largely decreased on account of the fact that the active material tends to crystallize in a solid mass. For this reason efforts were made to find a spongy material that would hold to its original composition. One of the most successful types of negative plates evolved on this line was the chloride negative, which consisted of a lead grid filled with sections of chloride of lead, this chloride being reduced into a spongy lead. This plate was in service for many years, and there are plants in service at the present time with the chloride negative that were installed nearly ten years ago. The chloride buttons were mechanically self-supporting, and it was realized that if there could be obtained a method of supporting a still more porous and spongy material that the capacity of the negative could be largely increased. On this basis was developed what is known as the box negative, which consists of a grid enclosing a number of sections of litharge or spongy lead oxide. On the outside of the grid are cast perforated lead sheets forming boxes holding the active material in position. The active material consists of the spongy, porous composition most necessary to the chemical requirements of the negative plate. It will be noted that the Manchester positive, the plate most in use to-day is an evolution of the Planté type, and that the box negative is an evolution of the Faure type, and inasmuch as the strength of a chain is only that of its weakest link, both of these plates are practically of equal importance in the storage battery.

In the design of a storage battery the greatest consideration must be given to its rigidity and ability to stand neglect and bad treatment. It is often placed in an out-of-the-way position, and necessarily cannot receive the constant attention and the intelligent supervision that can be given to it in a laboratory. From its nature, it is often-

times used as a reserve, and when it is needed it is needed badly, and is discharged oftentimes far beyond its rated capacity. It is the aim, therefore, of every manufacturer to make his product of a sufficiently rigid nature, capable of standing the strain and abuses incident to practical service.

In the application of the storage battery many problems are encountered, the great majority of them being those of current or voltage regulation. The basis upon which the engineer has to work is that with electrolyte of a density of 1.200 degrees, specific gravity 1.2, the difference in potential between the positive, or oxidized plate, and the negative or pure lead plate, is about 2.08 volts. When the cell is discharged this voltage will drop on account of polarization and internal resistance, and for the same reason the voltage will rise on charge. The amount of voltage change depends on the current put through the cell, and its percentage of discharge or charge. In regulating work this voltage change amounts to about 10 per cent. on either side. On peak discharge work the difference may be considerably greater, often amounting to as much as 20 per cent.

Where the current variations are slow, as in peak work, the discharge voltage of the battery may be kept practically constant by the introduction of extra cells as the voltage drops. In regulating work, however, the change from charge to discharge of the battery is so rapid that means have to be adopted to steady the voltage automatically. This has resulted in a number of ingenious systems of regulation.

A committee has been appointed by the Postmaster General of England to inquire into the prevalence and causes of telegraphers' cramp, which is so common in that country and to report upon means for its prevention.

A general demand among the people of Ireland for improvements in their telegraph service to England has been brought about in an unexpected way. In the opening debate in Parliament recently, on the Home Rule for Ireland bill, John Redmond, the noted Irish leader spoke for about forty-five minutes. Almost as soon as he had finished despatches giving his speech in full were filed in London by the correspondents of all the Dublin papers, and in the ordinary course of events they ought to have reached Dublin in about an hour. Only a few words got through that night at all, and the end of the speech did not reach Dublin until after five o'clock the next evening. A messenger leaving Westminster after the speech had been finished could have delivered it by hand in Dublin eleven hours earlier than it was delivered by telegraph. As a result of this delay there has been a demand made throughout Ireland for an investigation to see if the telegraph system can not be improved so that such long interruptions can not occur.

Telegraph and Telephone Age

Entered as second-class matter, December 27, 1909, at the Post Office at New York, N. Y., under the act of March 3, 1879.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

May 16, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

The Regulation of the Telegraph and Telephone.

According to present indications the Administration railway bill which is now being considered in Congress will, when finally passed, carry a clause giving the Interstate Commerce Commission jurisdiction over the telegraph and telephone companies. Just what the effect of this will be to the interests concerned is not easy to predict. However, as we have previously contended in these columns, it is not likely that the national body will attempt any regulation which will seriously hamper the efforts of the managements of the various telegraph and telephone companies to improve their services and keep the business on a sound financial footing.

On the other hand there is a strong possibility that the new arrangement may be of great value in promoting a feeling of good will between the public and the companies. The Interstate Commerce Commission has many times proven of service in settling differences of opinion between railroads and those who make use of their facilities. Hundreds of cases are submitted to them

every year which otherwise would have to be carried to the courts or in which the complainant would have no redress whatever. This body is composed of able and unprejudiced men and their decisions are almost invariably accepted as fair and just. As a result the feeling of the public toward these public service corporations is much more friendly than it would be if this means of arbitrating disputes did not exist. There is no reason why the same condition should not prevail if the jurisdiction of this commission is extended to cover the wire operating interests as well. The majority of the higher officials of these companies will not only be willing to have the management of their systems investigated by a national commission whenever such inspection is required but will be glad to assist the investigators by every means in their power.

When a man feels that he has a grievance against a public service corporation and goes to the officials of that company for redress, if they are unable to comply with his desires, it is almost impossible for them to satisfy the complainant that he is receiving justice. If, however, a third party who is known to be entirely unprejudiced can be called in to settle the difference the aggrieved party will generally be satisfied whether the decision is entirely favorable to him or not.

We believe and have frequently asserted that the telegraph is as economically administered as it possibly could be under existing conditions. The rates are as low as they can be and leave a reasonable profit in the handling of messages. There should be little difficulty in proving this fact to a disinterested body of men, hence there is little fear that the Interstate Commerce Commission will require any reduction in rates which conditions do not justify and which the companies would not make themselves as soon as they were able. The fact that the existing rate has the stamp of approval of an unprejudiced commission will go a long way toward convincing the public that it is just and that they are getting full value for their money in service rendered when they send a message.

From another standpoint also this widening of the powers of the Interstate Commerce Commission is most desirable. There is now a bill pending before the Legislature of New York State and which will probably be passed by that body placing the telegraph and telephone companies operating in that State under the control of the Public Service Commission. Similar action has recently been taken in Maryland and attempts are being made in many other states to control these two utilities. There being no uniformity, however, in the action taken in the different states such efforts naturally lead to much confusion and little good can be accomplished in this way. The Public Service Commission of New York as well as similar bodies in other states have without doing the corporate interests

any injustice been of great service to the public in dealing with local problems connected with street railways and other concerns operating only within the state limits. For a business like that of the telegraph and the telephone, however, which is essentially interstate and national in its character the outside control, if any is needed, should logically be in the hands of a national commission.

The Damage Suit Industry.

Attention has been called recently by a publication in one of our Southern cities to the great number of damage suits which are continually being brought against public service corporations, few of which have any just claim as a basis. In commenting upon the condition of affairs the journal in question says:

"Four mental anguish cases were docketed for trial in the Court of Common Pleas during one week recently. These were suits for damages against a telegraph company for failure to deliver telegrams promptly or something of the kind.

Each case was non-suited. That is, each case was thrown out because there was not sufficient evidence for it to go to the jury.

"The telegraph company was put to a large amount of unnecessary expense. They had to prepare for trial in each case, and bring to court a number of witnesses from various parts of the country, some of them their higher salaried employees. The telegraph company had to expend several hundred dollars in each case, and yet each one was so lacking in merit, in the opinion of the presiding judge, that it could not go before a jury.

"It does seem that some way should be devised by which the telegraph companies, and other corporations or individuals, could be protected against impositions of this kind. Some limit or restriction should be set against the filing of useless damage suits.

"The thing ought to be checked because, if for no other reason, the practice of bringing suits upon flimsy excuses tends to work against the plaintiffs in bona fide damage suits. Public sentiment can become so disgusted with the damage suit industry that a legitimate damage suit would be injured by an outraged public feeling."

There is much truth in what this writer says. The telegraph companies, as well as every other public service corporation, have to employ a large amount of legal talent to defend themselves from actions which are brought against them for the most trivial causes. Indeed it would probably surprise most people if they knew how large a part of the companies' earnings have to be expended for this purpose.

The majority of claims having any substantial basis are settled without going to court, which procedure is usually greatly to the advantage of all parties concerned. There are plenty of lawyers, however, who are willing to take up any possible cause for action on the very remote chance of their client

being allowed damages, in which case the attorney will receive a substantial portion of the amount awarded. If they lose, their client pays the expenses and the attorney's only loss is his time.

This is a state of affairs which has grown to a great extent during the past few years, and the number of such actions seems to still be on the increase. The remedy does not seem easy to find. Any legislation dealing with this matter would have to be most carefully prepared in order to strike at the root of the evil and not work an injustice to anyone. There must be a fault, however, somewhere in our system of jurisprudence which allows such a tendency to continue unchecked, and the sooner our lawmakers take cognizance of this and remedy the situation the better it will be for the country at large.

Increase in Night Letter Telegrams.

The public has supported the night letter telegram system so substantially ever since its first introduction that it is now conceded by all interested that this is a feature of the business that has come to stay. As we predicted when it was first put into effect, many uses have been found for the night letter telegram which were not even thought of by the originators. One Chicago concern sent out in one night 1,000 fifty-word telegrams, advertising their products. The results were so satisfactory that it is said they will send out 10,000 more similar telegraph letters in the near future. Many brokers who are accustomed to send out daily market reports to customers throughout the country, are using the night letter telegrams for this purpose. On one night recently two New York business houses sent 4,200 and 4,400 night messages respectively. An Indiana manufacturer discovered one night that a mistake had been made in about fifty invoices which had been mailed that day and he immediately sent out night letters to head off the invoices and correct the mistake. In a telegraph office in a small southern city where one operator would ordinarily handle all of the night business without any difficulty, 500 letter telegrams were filed recently in one night. These are only a few of the instances in which business men are taking advantage of this system for various purposes and there is every indication that the traffic will not only continue to be as large as it is at present, but will steadily increase.

A fine incentive to messenger boys to work for promotion is found in the Houston office of the Postal Telegraph-Cable Company of Texas, of which Mr. J. D. McLelland is manager. The portraits of Mr. E. J. Nally, vice-president and general manager of the Postal Telegraph-Cable Company, and of Mr. S. M. English, president and general manager of the Postal Telegraph-Cable Company of Texas, hang side by side. Under Mr. Nally's picture is inscribed the following: "Started as a messenger in St. Louis in 1875." Under Mr. English's: "Started as a messenger in Mobile, Ala., in 1874." Under both is written: "There is no office in this work too high for a messenger boy to attain."

The Military Telegrapher in the Civil War.

PART XXXIX

Mr. L. W. Wortsman who now resides at Savannah, Ga., served in the Military Telegraph Corps in South Carolina during the latter part of the Civil War. As most of the sketches which we have published of the experiences of military telegraphers have been written by those who served in other sections of the country the following account which Mr. Wortsman has written at our request of his military career will be of especial interest showing as it does to some extent the part played by the telegraph in South Carolina:

"I learned telegraphy in 1861 on the line of the Cuba and West India Telegraph Company using a Bain instrument. I entered the service of the United States Military Telegraph Corps in March 1864, being first employed under Cap-

L. M. WORTSMAN, SAVANNAH, GA.
Member of United States Military Telegraph Corps.

tain L. F. Sheldon at Hilton Head, S. C. Later I was transferred to Beaufort, S. C. I was next ordered to General Schimmelfenig's headquarters on Morris Island and was there made chief operator of the northern district of the department of the south under Captain James R. Gilmore who was superintendent of the military telegraph in that department and who is now living in retirement at Chambersburg, Pa.

"I was at Fort Wagner, S. C., during the bombardment of Charleston. We were under continuous fire and had to do our telegraphing in bomb proofs inside the fort while the 'Swamp Angel' was sending shells into Charleston and the batteries on Johnson Island, Fort Moultrie and Fort Sumpter were returning the fire.

"I was on duty at Fort Wagner when Charleston was evacuated and Captain Bennett and myself were the first to enter that city. We found the city on fire in several places and vessels in the harbor were being blown up. We took possession of the telegraph office and cared for the

operators of whom we found about fifteen. I opened an office temporarily in the citadel until I was transferred to General Hatch's headquarters. An office was then opened on Meeting Street near the Battery and this was the headquarters of the Military Telegraph Corps until all of the lines, etc., were turned over to the telegraph company.

"Soon after I was ordered to superintend the reconstruction of the telegraph lines in the state of South Carolina. I had for this work about one hundred enlisted soldiers besides civilians and a few telegraph linemen. The repair of the lines was no easy task as there was but little railroad left for us to travel on and most of the material had to be transported by wagons. Far the most trying duty, however, was the rebuilding of the line from Charleston toward Savannah, Ga. This ran through low lands and marshes and of a force of forty-five men that were engaged in that work, only about ten escaped an attack of fever. In many cases this proved fatal. I myself was sick for nearly a month. I remained in charge of the lines in the northern district of the department of the south until they were turned over to Mr. J. A. Brenner, superintendent of the American Telegraph Company and later of the Western Union Telegraph Company. Mr. Brenner died about a year ago.

"After my discharge I went to Europe and saw some of the Franco-Prussian War. Returning to the United States in 1871 I joined the forces of the Southern and Atlantic Telegraph Company, superintending the construction of their lines. I was manager of their offices at Savannah, Charleston, Macon and other places. After the consolidation of this company with the Western Union in 1875 I went to New York and worked in the telegraph department of the Pennsylvania Railroad and for the New York Transfer Company. In 1878 I left the telegraph service and moved to Savannah, where I have since resided."

Mr. William H. Wilson, who was one of the younger operators in the military telegraph service in writing in 1878 to Colonel William R. Plum, historian of the United States Military Telegraph Corps gave the following sketch of his military experiences:

"I was born at Marietta, Washington County, Ohio, February 15, 1847, and entered the military telegraph service April 22, 1863, at the age of sixteen. I learned the business while a messenger boy under Henry C. Vincent at first and afterwards under J. Wesley Ellsworth.

"When I first entered the military service I was in Captain T. B. A. David's department and was operator at Camp Piatt, W. Va., nearly all of that summer, only leaving there twice until I returned home that fall.

"During the summer I relieved Mr. G. H. Curtiss, at Gauley Bridge, for a few days and was at Charleston, Brigadier General E. P.

Scammon's headquarters for about a week, during Mr. C. J. Thomas' absence at the front. Returning home I was in a short time ordered by Captain Samuel Bruch at Louisville, Ky., to report to the chief operator at Lexington, Ky., and I did so at once and was ordered by him to report at General Burnside's headquarters.

"I overtook General Burnside at Crab Orchard, Ky., and as there was to be an office established there, I was appointed manager, and held that position until the latter part of December, 1863, when I was relieved by Mr. J. W. Sampson. I again returned home and remained there until May, 1864, when I enlisted as private in an Ohio regiment. Our regiment went direct from Marietta, Ohio, my home, to Harper's Ferry, W. Va., where we did guard duty for a few days and were then sent to the Army of the James. A day or two after arriving at Bermuda Hundred, Va., I was detailed and again entered the military telegraph remaining a day or two at Bermuda Hundred and then going to Major-General B. F. Butler's headquarters.

"I worked there for some weeks and was then sent to the Bermuda 'Front' office relieving Mr. Maynard Huyck. I remained there but a short time when I was ordered to the 'Jones Neck' office relieving Mr. W. S. Logue. Not long after taking charge there the office was moved across the James River to Deep Bottom, General R. S. Foster's headquarters. During the summer I accompanied General W. S. Hancock on a reconnoissance crossing James River at Deep Bottom and advancing several miles in the direction of Richmond but the enemy were too strong for us and after a few days of hard fighting we were obliged to recross the river. I remember the night we fell back very distinctly. I was instructed by General Hancock to take my instrument and go to the river and open an office at the pontoon bridge. I cut out, jumped onto my horse and made for the river. By the time I reached there it was after dark, perhaps eight o'clock, and raining hard. I had no tent but after a search I found an empty hard tack box, then cutting the wire and running it down through the branches of a small sapling and laying the box on its edge and putting my instrument inside to keep it and my paper dry, I soon had an office open. I dug a hole for a ground wire with my pocket knife. It was telegraphing under difficulties as I had to spread a blanket on the ground and lie flat and reach inside the box to copy. However, the office did good service for two or three hours, being in communication with General Grant at City Point and receiving instructions and reporting movements.

"During the summer the colored troops of the 10th and 18th corps were put into a corps by themselves and the command given to Major General G. Weitzel and I was appointed manager at his headquarters where I remained until the 28th of March, 1865. At first I was assisted

by Mr. Edward Mason of Maryland, who died in Augusta, Ga., in 1867, afterwards by Mr. Frank Davis, of Williamsport, Pa., who was detailed from the ranks of a Pennsylvania regiment. The operator at our extreme right in the Army of the James was Mr. John A. Torrance, since known as the 'lightning' operator, at this writing a lawyer and operator in Wheeling, W. Va. Upon the 28th or evening of the 27th of March I heard Mr. Richard O'Brien, our chief operator send him a message to report for duty at the headquarters of the sixth army corps, Army of the Potomac. I persuaded him to let me go in his stead and the next day he came to the twenty-fifth corps and I went to the Army of the Potomac. By this trade, Torrance got into Richmond first and I witnessed the surrender of Lee's army at Appomattox Court House.

"Our force at the sixth corps headquarters consisted of Mr. W. N. Embree, chief operator, John Smith and myself assistants and John Ingle at the signal tower. We accompanied the corps on the march after Lee's retreating army and were eye witnesses of the last battle fought by the Army of the Potomac at Sailors' Run, April 6. After the surrender the corps returned and went into camp near Burkeville Junction, Va., where upon the morning of April 15 I heard of the assassination of President Lincoln. I had been over to the cook tent before breakfast and as the meal was not quite ready, I returned to the office, a tent near General Wright's headquarters. While sitting there I heard a message from General Grant to General Meade announcing the assassination. I copied it, my pen trembling so I could scarcely hold it and then went back to the cook tent and called Embree aside and showed it to him. He thought I was joking but my nervousness and looks convinced him it was anything but a joke. We said nothing of it to any others until it was officially announced in a telegram from General Meade soon afterwards. After remaining at Burkeville the corps was ordered to Danville, Va., and the telegraphers proceeded along the line of the railroad taking charge of the offices, instruments and operators. We had a pleasant time on that march, the country being clear of Confederates we could ride off the line of march as far as we pleased without fear of Libby or Andersonville prisons before us.

"I remained in Danville until about the middle of June when I was ordered to Petersburg where I remained until the military telegraph became a thing of the past.

"I cannot close this without referring briefly to one of my assistants while I was at Deep Bottom, viz: John A. Sheridan of Brooklyn, N. Y., as noble hearted a boy as ever fingered a key, a good operator and genial companion. He was stationed at Burkeville Junction after the surrender and along in July, I think it was, we received a message at Petersburg that he was

very ill. It appears that he had a congestive chill early in the morning and never received one particle of medical attention although the surgeon was sent for several times during the day. Mr. Lester Painter who was with him is my authority for this statement. Towards evening he became unconscious and died at 7 p. m. We had his body brought to Petersburg and embalmed and placed in a metallic case and accompanied by Mr. Painter the remains were forwarded to his widowed mother. John D. Tinney, manager at Petersburg, and myself assisted the surgeon in embalming the remains."

More Facts Regarding the Death of D. B. Lathrop.

Editor Telegraph and Telephone Age:

Since my return from an extended absence in the West, I have read with interest the statements in the "Age" of April 1, regarding D. Brainerd Lathrop and his untimely death at Yorktown. I enclose copy of a letter written by myself at that time which may be of further interest, although you appear to have secured all the facts, and perhaps consider the incident closed and may not care to use it.

In further reference to the subscription for a monument; In reading the statement of Mr. Andrew Schnell in which he says, "He turned the money which he collected, together with the list, over to someone in General Eckert's office at Washington," it recalled to my mind that I had received them from someone while I was in the War Department, but when, or from whom, I cannot remember. Sometime after, however, I wrote to Mr. J. D. Reid, editor of "The Telegrapher," stating the facts and requesting advice as to what disposition should be made of them. I believe he published the letter, but as far as I can now remember, I received no response to the communication, either from himself or anyone interested. I kept the money, and subscription list in the envelope handed me, in my strong box with other valuable papers of my own, when I left Washington in 1872 for Vermont, and thence to Chicago in 1875, thence to Baltimore in 1879, thence to New York in 1882 and thence to Brooklyn in 1883, where I have since resided. I am confident they were still in that box when in May, 1891, I broke up housekeeping and stored all of my household effects, not required for domicile in a suite of rooms at the hotel where I subsequently resided. In packing for removal, I also placed in the box the sets of silver which had been presented to me by my fellow employees in the Washington office, and the Baltimore and Ohio Railroad Telegraph service. In February, 1892, the storehouse, supposed to be fireproof, was burned and everything in store was destroyed. I have searched my records without avail and I do not remember ever having

seen or having had further knowledge of the Lathrop papers after I left Washington, until reading the statement of Mr. Schnell, and I can only account for it by the pressure of duties and other matters involved in the numerous changes in positions and locations herein noted, which wholly engrossed my mind without incident to revive my recollection of them.

Recognizing my personal responsibility for the money involved in accepting its custodianship, I shall gladly contribute an equal amount, which, as near as I can remember was \$50.00, and add to it a further contribution toward the object for which Mr. Schnell states he started the subscription, should surviving members of the United States Military Telegraph Corps desire to renew the effort.

Very truly yours,

Chas. A. Tinker.

Brooklyn, April 30, 1910.

The letter enclosed by Mr. Tinker which was written May 4, 1862, after relating the thrilling scenes incident to the evacuation of Yorktown by the Confederates gives the following account of the death of Operator Lathrop:

"In all the line along our front I have heard of but one casualty in the occupation of the enemy's works, and I am sorry to be obliged to say it befell a member of our corps. Brainerd Lathrop, one of the eight operators who came down on the Steamer 'Commodore,' went out early this morning from General Porter's headquarters, where he has been operating, and strolled into Yorktown with another operator, Smith, who has been with me here until yesterday. As they were passing along a road leading into the town, Lathrop stepped on to one of the torpedoes, which the Confederates laid for murdering our troops, and it exploded, tearing off his left leg near the hip. He lingered till 4 p. m. when he died, unconscious from the moment he was injured. Smith was three feet in advance of him, and was knocked down by the concussion but not injured. Lathrop's body is to be embalmed and sent home to his friends in Springfield, Ohio. His was a sad end. Our troops have been very cautious in taking possession of the town for fear of something 'infernal' there. A man was taken prisoner to-night who acknowledges he helped bury all of the torpedoes. To-morrow he has to go under guard and dig up every one of them and I don't know but he may be made to tread on the last one."

"The Practical Management of Dynamos and Motors," by F. B. Crocker and S. S. Wheeler, as indicated by its title, affords a clear understanding of the use, care and operation of these important adjuncts of the well equipped modern telegraph office. There is a constant demand for this book, for telegraphers find it an invaluable addition to their working library. There are 206 pages, and 90 illustrations; price, \$1. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

For Neutralizing Induction in Telegraph Circuits.

Mr. Minor M. Davis, electrical engineer of the Postal Telegraph-Cable Company, New York, has recently been granted two patents for means for preventing the harmful effects of induction from high tension alternating current transmission systems, upon parallel conductors used for signaling purposes such as telegraphing. The first one of these No. 955,141 consists in placing an idle conductor in close proximity to but insulated from a conductor connected in a signaling circuit so that both of these conductors are subject to the induction from the disturbing source, and are affected to the same extent, but the idle conductor will re-act on the circuit conductor and this re-action is adjusted so as to compensate or neutralize the action of the disturbing source on the circuit conductor. Stated specifically a positive impulse in the disturbing conductor induces a negative impulse in the circuit conductor and the idle conductor, the negative impulse in the idle conductor re-acts tending to generate a positive impulse in the circuit conductor. By varying the constants of the idle conductor that is, the resistance or capacity or both, the impulses from the idle conductor may be made to counteract the disturbing impulses in the circuit conductor.

This scheme is especially applicable to wires in cables which parallel high tension systems. The conductors in the cable consist of two groups arranged parallel and insulated from each other. The wires of one of these groups are used for signaling purposes and the other group of wires which are known as idle conductors and which are substantially like the active conductors are all connected together at each end. At one end they are connected to ground through a variable resistance and at the other end through a variable capacity.

With this arrangement a positive impulse in the high tension line induces a negative impulse in all of the conductors of the cable. If the resistance and capacity of the idle conductors is properly adjusted this negative impulse will be so proportioned in its effect upon the active conductors as to neutralize in that wire the inductive impulse of the disturbing conductor. The idle conductor does not need to be as long as the active wire but by establishing the constants of the idle conductors, that is the resistance, or capacity, of said conductors at a determinable point an effect is produced that is efficient to compensate for the effect of the disturbing cause on the active conductors.

The second patent, No. 955,142 consists in neutralizing induction in parallel conductors by employing as a conductor the metal sheath of the cable inclosing the signaling conductor or conductors and a parallel compensating conductor, subjecting all of these conductors to the same inductive influence, and causing the induced im-

pulses in said compensating conductor to re-act upon the signaling conductor to substantially an equal and opposite extent as compared with the disturbing cause.

Where there are one or more insulated conductors in parallel relation, connected in circuit with signaling apparatus in the ordinary manner, substantially parallel with these conductors, as in the same cable, are one or more compensating conductors; these are connected in a circuit susceptible of conveying induced impulses, and for this purpose there may be used a ground return circuit, or the circuit may include a condenser in series, or otherwise. One coil of a transformer is connected in this circuit and the other coil of the transformer is connected in circuit with a conductor arranged parallel with the disturbing source, at any suitable distance therefrom; for this purpose there may be used a separate conductor or the metal sheath or armor of the cable included in a compensating circuit may be used, and the transformer is so adjusted that the compensating conductors will develop a source of alternating current having an electromotive force efficient to compensate for the inductive effect of the disturbing source. If the disturbing source extends parallel to the circuit conductors for a comparatively long distance there may be one or more compensating conductors arranged substantially parallel with the signal circuit conductors for a much shorter extent but the electromotive force, intensity or current strength is increased, graduated or adjusted so as to compensate and neutralize the effect of the disturbing cause in the circuit conductors.

Cable Repair Steamer, Robert C. Clowry, Placed in Commission.

The new cable repair steamer, "Robert C. Clowry," which was built during the past year for the Western Union Telegraph Company, has recently been completed and placed in commission. The new vessel is one hundred and fifty feet long and has a thirty-two foot beam. She is painted parlor car green with black trimmings and presents an attractive appearance. Her tonnage is 532 and her equipment is such as to enable her to repair ocean cables in any depth found between New York and Nova Scotia.

Captain Olmstead, who commanded the old cable tug "Western Union" for many years, is sailing master of the new vessel, and the electrical equipment is under the supervision of Alexander Kline, who will have charge of the operation of the boat. The cable laying and picking up apparatus and electrical equipment installed is of the latest design. The boat will carry a wireless telegraph outfit and will thus be enabled to keep in touch with the shore at all times while on repairing expeditions.

The builders trial trip took place on March 16 and was satisfactory to all concerned, and the boat is now the property of the Western Union Telegraph Company.

Disturbances to Telegraph Lines Due to Single-Phase Electric Traction.

In a recent number of the *Journal Télégraphique*, published by the International Bureau of the Telegraphic Union at Berne, Switzerland, M. Muller, chief inspecting engineer of the Swiss government railway telegraphs, gives some interesting observations on the effect upon the telegraph lines of introducing single-phase electric traction upon a section of one of the railroads of that country. The voltage used on the high-tension system was 15,000. The wires of the power system and the telegraph lines paralleled each other for a distance of about twenty kilometres and the distance between the two varied from 2.25 to 7.5 metres, averaging about 4.8 metres. When electric traction was first introduced there were nine stations working in series on the line between the two terminal points and the operating current was about ten milliamperes.

The disturbance to the telegraph line began as soon as the high voltage was thrown on to a part of the power system. This consisted of a vibratory movement of the armatures of the relays and these vibrations destroyed the clearness of the signals, they being cut off abruptly. By a close adjustment of the apparatus they were able to obtain on a recording tape a succession of points the frequency of which corresponded to the periodicity of the high-tension system. The amplitude of these vibrations increased as the power line was extended.

The first electric locomotive used was provided with converters which changed the fifty-cycle alternating current to direct current for operating the motors. This system was soon replaced by one which used for its motors fifteen-cycle alternating current. This change which was injurious to the telephone lines because of higher harmonics produced on the line by the induction motors did not produce any appreciable effect in the telegraph circuit. Because of the inertia of the armature the amplitude of the vibrations would naturally be greater when a fifteen-cycle current was flowing in the magnet coils than when one of fifty cycles was flowing therein. However, as the disturbance was caused by an electrostatic effect on a conductor connected to earth, in which case the charging current varies inversely as the frequency the strength of that current was not more than thirty per cent as great, with the fifteen-cycle transmission, as it was with the fifty-cycle system. For that reason the disturbance was not increased when the fifteen-cycle system was put into service.

It was proven by the following facts that the disturbance to the telegraphic service was not caused by magnetic induction or by stray currents, but rather by electrostatic induction:

The disturbance commenced when the voltage was first thrown onto the high tension line and when no current was flowing therein.

It was independent of the position of a train along the line and of the load of the train.

It was most pronounced when one end of the line was not connected to earth; that is, when the telegraph circuit was open.

Foreséeing the impossibility of insuring service when the telegraph wire would be exposed to the electrostatic influence throughout its whole length a second line was built. The instruments connected in series were equally distributed on the two conductors, which were transposed once between each station.

When the high-tension line was thrown into service throughout its entire length the disturbance commenced again stronger than ever. It was at first thought to be due to faulty insulation, but that not being the case it was found necessary to look elsewhere for the trouble. The difficulty was soon discovered to be due to the capacity of a cable in the line about four and a half kilometres in length. When this was cut out and a loop formed around it the trouble immediately ceased. The static charge on the line was 580 volts without the cable and 280 volts with the cable. An ammeter placed in the line before it passed through the cable indicated a current of ten milliamperes. The instruments located near this cable were influenced the most. Under these conditions the only apparent remedy was the connection of the instruments in parallel. To do this it was necessary to change the windings of the magnet coils; to give them instead of 15,000 turns and a resistance of 500 ohms 30,000 turns and a resistance of 10,000 ohms. This high resistance was necessary in order to reduce to reasonable limits the drop of voltage in the line and thus secure an approximate uniformity in the strength of current in the different instruments without changing the strength of the batteries. The currents resulting ranged between three and a half and five milliamperes. When this arrangement had been made the disturbance disappeared entirely. This connection made it possible to discharge the line easily either by condensers or by grounding the neutral point of the relays. The first means was used in the beginning, but was afterward abandoned in favor of the second on account of the condensers being frequently punctured by atmospheric discharges.

The Difference between Success and Failure.

"I have watched the careers of young men by the thousand in this busy city of New York for over thirty years," said the late Dr. Theodore L. Cuyler, "and I find that the chief difference between the successful and the failures lies in the single element of staying power. Permanent success is oftener won by holding on than by sudden dash, however brilliant. The easily discouraged, who are pushed back by a straw, are all the time dropping to the rear, to perish or to be carried along on the stretcher of charity. They who understand and practice Abraham Lincoln's homely maxim of 'pegging away,' have achieved the solidest success."

The Wright Printing Telegraph.

Mr. John E. Wright of New York has been granted a patent, No. 954,489 for a printing telegraph system which includes several improvements over former patents which he held.

The instrument as a whole comprises several mechanisms which may be regarded in a sense as independent instrumentalities co-operating to the one general purpose of the machine. The most important of these are the type-wheel and its immediate accessories; the means for rotating the type wheel; the means for raising and lowering the same; the means for shifting the type-wheel from the position to which it has thus been brought so as to bring the next adjacent character into the printing position; means for printing any character when brought into position; and the means for effecting the various feed movements required in the operation of the machine. The type wheel is in the form of an elongated cylinder having five horizontal rows of characters with ten characters in each row. This is mounted on a vertical triangular, knife edge spindle bearing at its lower end a pinion which meshes with a bevel gear mounted on a horizontal, triangular knife edge driving shaft. The type-wheel carriage is movable laterally but the bevel gear which drives the type-wheel spindle moves on its shaft, along with the carriage and by this means a movement of rotation may be imparted to the type-wheel, no matter what the position of the carriage. The shaft on which the bevel gear is mounted is driven by impulses communicated through a suitable mechanism, from the movement of the armature of a polarized magnet. Each impulse communicated to the driving shaft turns the type-wheel through an angle which includes two adjacent characters. The type-wheel therefore has five positions around its vertical axis, one of which it occupies normally and to any other of which it may be rotated by not more than four impulses of current through the polarized magnet. Thus by each back and forth movement of the armature of the magnet one of a pair of characters will be brought to the printing position. Special means is provided for shifting the type-wheel independently of the driving mechanism for presenting the other character of any given pair at the printing position when it, and not the one normally presented, is to be printed.

The type wheel carriage which is supported on suitable transverse guides engages with and works on a worm or screw so that the rotation of the latter causes the carriage to advance. At the bottom of the type wheel there is a small wheel with star teeth arranged so that each space corresponds to a vertical column of characters. In the plane of this wheel there is a plunger provided with a pointed head that exactly fits into the spaces between its teeth. After the type wheel has been moved to the printing position this plunger is advanced so that its head enters

the adjacent space between the teeth of the small wheel. If the type wheel has not been turned to quite the correct position required for printing the head of the plunger will turn the wheel until the head and notch fit exactly whereupon the desired character will be in the exact printing position and will be firmly held there during the operation of printing.

The type-wheel is supported by a plate or bar which in turn is mounted on a vertical rack bar which meshes with a pinion mounted on the carriage but surrounding and sliding on a triangular knife edge shaft which imparts motion to it. Thus no matter what the position of the carriage a rotation of the shaft on which this pinion is mounted will raise or lower the type-wheel. By a mechanism, similar to that which causes the type-wheel to revolve, the shaft just mentioned is made to revolve and raise the type-wheel one step for each impulse of current which passes through the coils of a magnet. The two mechanisms are so arranged that the operations of turning the type-wheel and raising it may be performed at the same time. The type-wheel is, after each impression, automatically restored to its normal or lowest position.

After each impression made on the paper the carriage is automatically advanced to the next printing position. The operator has the means at his disposal to return the carriage to its starting position to begin a new line at any time he desires. At the same time the paper is automatically carried forward the space necessary for one line.

The main shaft of the instrument is driven preferably by an electric motor which is geared to it with provision for frictional or slipping engagement between the two. The application of the power to the instrumentalities comprising the machine is controlled by the action of electromagnets. The mechanism for causing an impression to be made on the paper is brought into operation by the rotation of the main shaft. A cam upon this together with a series of suitable links causes the printing platen to be thrown forward, with each revolution, carrying the paper with a quick blow against the type-wheel and causing it to receive an impression. This happens every time that the carriage is shifted so in order to leave a blank space between words one of the type spaces on the wheel is left blank. Each complete cycle of operation of the instrument involves a single rotation of the main driving shaft. This is normally locked but at the proper time is released so that by frictional engagement with the source of power it may turn to perform one or more of the functions necessary for the operation of the machine as a whole.

The transmitter is constructed to send out over the line impulses of either positive or negative current of greater or less duration in a certain predetermined order of succession. At the receiving end three magnets are in series with

the main line. Two of these are polarized, one which is affected only by positive impulses brings about the desired adjustment horizontally of the type wheel, the second which is affected only by negative impulses accomplishes the necessary vertical adjustment of the type-wheel. The third magnet which is not polarized is for the purpose of closing a local circuit, a magnet in which releases the locking mechanism of the main line shaft and thus effects the printing and other automatic operations. The magnet in the local circuit is sluggish in its action and as this circuit is alternately opened and closed as impulses are sent over the line the short positive and negative impulses which perform the other operations are not of sufficient duration to keep this circuit closed long enough to operate its magnet. As soon as the impulses cease, however, the local circuit is automatically held closed long enough to operate its magnet and the operation of printing is performed. The same action takes place if the last impulse is prolonged. By the means so far described only one-half of the characters in any row can be brought to the printing position. In order to print any character of a pair adjacent to that which has been brought to the printing position special means is provided for shifting the type-wheel backward a distance equal to the space occupied by one character. The mechanism which operates this is controlled by the tongue of the armature of the third relay in the main line circuit. When in its central position this tongue prevents the wheel from being moved forward the space desired. If, however, the last impulse sent to adjust the type wheel is of longer duration than the usual impulses the armature tongue of the relay is held over to one of its extreme positions long enough to allow the type-wheel shifting mechanism to operate. The order in which all of the operations described will be performed is predetermined by the configuration of the various operating cams. In general, however, the bringing of the type-wheel into position for printing precedes all other operations. This is followed by the release of the main driving shaft the first effect of which, if the last impulse is prolonged, is to shift the type-wheel. The next operation is to lock the type-wheel into the proper position for printing. The next is to throw forward the printing bar or platen. Following this the various parts of the instrument are restored to the positions they normally occupy when not in operation. Last of all the type-wheel carriage is fed forward the space of one letter.

As the type-wheel is restored to its normal or vertical position after each operation or cycle of operations of the machine no special synchronizing device or similar apparatus often employed in printing telegraph systems is necessary.

Telegraph and Telephone Age is headquarters for electrical, telephone and telegraph books. Write for catalogue.

The Tudor Repeater.

The diagram which we present herewith illustrates the operation of a main line repeater which has been devised by Mr. R. H. Tudor, manager for the Western Union Telegraph Company, at Corinth, Miss.

This repeater is made of two ordinary relays mounted on one base. Enclosed in this base are two adjustable rheostats 2 and 3. The novel feature is the holding of one of these relays in a closed position while the other is in operation. This is done by shifting the main battery current into the artificial lines.

Its operation may be more clearly understood by referring to the diagram and assuming that the western circuit 16 has been opened at some distant station, which opens the relay 4 on the

CONNECTIONS OF TUDOR REPEATER.

right. When the armature of this relay falls back it first comes in electrical contact with the upright spring, and at the same time breaks the eastern circuit at the set-screw 10. The relay 5, however, is still energized and remains in its closed position, its current having been shifted to the ground through the rheostat 3 via the armature and upright spring of relay 4. The upright spring is of course fastened to the armature but insulated from it, and so arranged that it will make electrical contact therewith when the armature falls back. The rheostats should be adjusted to have about the same resistance as the main line wires, so that when the current is being shifted first into the line wire then to the artificial wire the relay through which the current passes will not feel the change but will hold its closed position. A glance at the diagram will show that an operator on the opposite wire can readily break through the repeaters. Owing to the fact that the armature levers have so little friction the repeater can be adjusted to do excellent work on the weakest wire. In fact it will work on any wire that an ordinary relay will work on.

The switch 21 is added for the purpose of cutting the repeaters into single sets.

"Pocket Edition of Diagrams," etc., the latest revised edition, 334 pages and 160 illustrations, published by Telegraph & Telephone Age, contains just the information every telegrapher requires.

The Kitsee Cable Relay.

A test was made recently between New York and Canso, N. S., of a system of cable telegraphy invented by Dr. Isidor Kitsee, of Philadelphia. The essential feature of this system is a relay which operates a local sounder for receiving the messages. Hence it may also be used as an automatic repeater.

At the transmitting station two sets of batteries are used, one of about twice the electromotive force of the other. They are connected in opposition to each other and in series with the cable. The set having the higher electromotive force is provided with a shunt, this shunt being opened or closed by a telegraph key. The key is manipulated in the same way as for telegraphing on land lines. By this arrangement impulses of opposite direction are sent over the line. When the key is closed the higher powered battery is shunted and an impulse from the other set of batteries is sent to the line. When the key is open the high potential battery overcomes the other and sends an impulse to the line of opposite polarity to that sent when the key was closed.

At the receiving station a shunted condenser is inserted in the cable and the cable is then grounded through an impedance. The relay is not connected in series with the cable, but in a shunt around this impedance. Each stop of the line relay is connected to a source of current, one source being in opposition to the other. These sources are joined together and their junction point is connected through a condenser to one terminal of a polarized relay, the second terminal of which is connected to the tongue of the line relay. The polarized relay is made use of to close a local circuit with a sounder.

The line relay consists of a circular yoke of iron to which six cores extending radially inward are secured. Windings upon these cores are connected in series in such a way that opposite poles alternate. The terminals of these windings are brought to suitable binding posts for connection to some source of exciting current.

The coils of the relay of which there are three, are suspended on fine jeweled bearings between the separately excited poles. The tongue of the relay is normally held in a central position between its two stops by the two fine spiral springs. When the key at the opposite end is closed an impulse is sent over the line and the movable coils being given a certain polarity are hence either attracted or repelled by the poles of the separately excited stationary coils, thus throwing the tongue of the relay over to one of its stops and causing it to actuate the local polarized relay, and close the circuit. When the key is opened an impulse of opposite sign to the first is sent over the line, the polarity of the movable coils is reversed, the relay tongue is thrown to its other stop and the polarized relay opens the local circuit. The cable upon which this device was tested is eight hundred miles in length and a speed of from thirty to thirty-five words per minute was attained by the new method of working.

The Passing of the Oldest Railway Station. Editor Telegraph and Telephone Age:

I have been much interested in the article on page 290 of your issue of April 16, under the caption "The Passing of the Oldest Railway Station."

As a youth of sixteen years just starting on my life's work, I was in 1852 or 1853, located at "Turner's" as a telegraph operator in the employ of the New York and Erie Railroad Company for a brief period. I took my meals in the railway dining room inaugurated by Peter Turner, and boylike hugely enjoyed the excitement and turmoil occasioned by the frequent inrush of hungry passengers from the passing trains who were accorded from ten to twenty minutes to refresh the inner man. My home having been in the south where the table servants were exclusively of the African persuasion, I was charmed and interested by the bright eyed and buxom Irish girls that constituted the dining room force at Turner's and being at an impressionable age I speedily lost my heart to several of them.

I became acquainted with Mr. Charles Minot, the general superintendent of the road, in New York City under circumstances that reflected great credit on him and that won for him my everlasting gratitude. He seemed to take quite a fancy to me and encouraged me in my ambition to become a telegrapher, and gave me my first employment as an operator at Piermont, then the eastern terminus of the New York and Erie.

I never before heard of the incident related of Mr. Minot having inaugurated the telegraphic train order system, or if I ever did it has faded entirely from my memory, but it is quite probable that the story is true. Mr. Minot I remember as an enterprising gentleman, and an able railway magnate, and I know he was in favor of the telegraphic train order system long before its formal adoption, but was withheld from carrying out the idea by the prolonged and persistent opposition of the trainmen; an opposition that I was mainly instrumental in overcoming later.

I spent several years on the New York and Erie during the pining infancy of the telegraph, and grew up with the sturdy progeny of Professor Morse's brain until we both reached mature manhood. The middle and latter part of my telegraphic career, however, was spent in the sunny south during and after the little unpleasantness between the states.

C. E. McCluer, Norfolk, Va.

April 22, 1910.

Mr. C. B. Turpin, manager of the Postal Telegraph-Cable Company, Kokomo, Ind. in renewing his subscription writes: "I find the 'Age' better than ever. The electrical articles especially are very interesting and instructive."

How Telegraph Messages Came to be Read by Sound.

Mr. E. J. Edwards, writing recently, tells the following story of how one of the early telegraph operators discovered that he could read messages by sound:

"Ezra Cornell is known in history as the father of Cornell University, as one of the men who helped to build the first telegraph line, and as an ardent organizer of telegraph systems in the early days, being instrumental in the formation of the Western Union Telegraph Company. His son, Alonzo B. Cornell, became ultimately vice-president of the Western Union Telegraph Company and Governor of New York State—high commercial and political honors. Yet he once confessed to me that he felt he should be credited with the additional honor of having been one of those to make the discovery that telegraph messages could be read by ear; and he seemed to take more pride in his part in bringing this about than he did in any of his other achievements.

"I was trained as a telegraph operator," said Mr. Cornell, in telling the story. "I suppose I took to telegraphy naturally because of my father's deep and large interests in the then new mode of communication. Anyway, I learned the Morse key easily, and I was, in fact, very fond of telegraphing from both the practical and the scientific standpoints. I can say without boasting that in my day I was regarded as one of the best operators in all New York State. That was when all messages were received in dots and dashes on tape, and from this tape we transcribed the messages into English. Because of the tape, it was impossible to send messages with anything like the speed of the present day.

"One afternoon, some time in the early fifties, when I was stationed at Albany, N. Y., there was an unusual inrush of newspaper dispatches—I was in charge of the press key—and in the midst of the task of receiving them I found to my consternation that I was out of tape. Before taking my seat before the key I had neglected to replenish the tape reel. There was a bountiful supply of tape in the cellar of the building, but it was a long trip there—there were no elevators in those days—and I knew that to go there I would waste precious time. And there were those anxious newspaper men hanging over my shoulder.

"Suddenly, as I fished about mentally for the quickest way out of my dilemma, this thought popped into my head: 'You don't need any tape. Half the time you don't look at it when the dispatches are coming in before you write them out. You trust to your ears to tell what the instrument says. Why not do so now?' Instantly, I determined to see whether or not I could take the dispatches by sound alone.

"I put my fingers on the key and broke in on New York, whence the dispatches were coming. 'Send rather slowly and very distinctly,' I asked the man at the other end of the wire. He at once began to do so—not without some curiosity as to my rea-

son, I found out later. But I didn't think of that at the time, for I was glowing all over with the knowledge that I could write out the dispatches and write them correctly—for they made sense—by simply listening to the sounds that the key made.

"Thus I continued taking the dispatches to the very end. Then the New York operator called me. 'What are you doing up there?' he asked. 'Why did you want me to send slowly and distinctly?'

"I answered that I had said good-bye to the telegraph tape forever, and told him of the discovery I had made. He was immediately interested. 'Send me slowly and very distinctly fifteen or twenty words, and I'll see whether or not I can do the same thing,' he requested.

"I did so, full of confidence, and a little later there came to me this message: 'I've done it, too. Some of the other boys also say they can. I predict that within a month there won't be an inch of tape used in the New York office.'

"Years later," added Mr. Cornell, "I was told that about the time that I discovered for myself a new and revolutionary method of receiving telegraph messages, the same method was discovered by an operator in the main office in Pittsburg, Pa. I have no doubt that this is true. Sooner or later, the discovery was bound to be made not only in one but several offices. But I have always felt that I was among the first to make the discovery and should be credited with it in telegraphic history."

Peculiarities of Telegraphers.

A journal in one of our western cities in speaking of some of the peculiarities of telegraph operators remarks that Professor S. F. B. Morse is said to have been the first man to whom the appellation "crank" was applied, and though he made the word mean genius, it still clings to the profession. All telegraph operators are not cranks, and they are not all numbered among the geni of the key; but no other profession has been so successful in bringing out the eccentric characteristics of those inclined to be cranky, and few vocations have developed more true genius. Many of the men who made history first made dots and dashes, and today it is difficult to find a group of men engaged in an important undertaking that does not include one or more who started their career at the telegraph key.

Telegraphers are usually high strung, nervous men, and some develop eccentricities that cause them to be considered cranky. There used to be an operator employed by a Washington newspaper who earned the appellation of crank because whistling in the office so affected him that he could not work. His case, however, was not an isolated one; for it is well known that music of any kind has a peculiar effect upon telegraphers. It is said that a small boy whistling a popular air will stop practically every instrument in a telegraph office. Dots and dashes become a meaningless jumble of sounds, and the

operators lose all idea of their meaning. All operators are affected more or less by music; but those who have a natural ear for melody have the hardest time when a band passes the office.

It is not the noise that smothers the sound of the instrument. The din on the field of a sham battle, the hoarse cheering of political conventions and the busy babble of voices in the Stock Exchange have no effect upon him so long as he can hear the tick of the instrument. He will even carry on a conversation while receiving a message, or watch thrilling plays in an exciting baseball game without breaking; but let the plaintive strains of a hand organ float up from the street below and he is all at sea. The reason for this may be found in the fact that there is a kind of musical rhythm in the ticking of Morse characters which is accentuated in a musical ear. The tempo of the air played by the organ or band or whistled by the small boy upsets the rhythm of the ticking instrument, and in his effort to keep the dots and dashes from falling into the swing of the rival music the operator loses their meaning.

Not all operators are affected by music, however, probably because there are some men who have no ear at all for music, and are, therefore, able to keep the dots and dashes in line and prevent them joining in with the band.

The man who beat Joseph P. Gallagher for the message championship of the world in 1904 was one of this class. Gallagher was one of the star operators who held the receiving championship. He won in the contest at Philadelphia in 1903; but lost it the next year because the band at Madison Square played "Dixie" during the contest. His opponent was a Southerner with no ear for music: so, instead of confusing him, the strains of the patriotic air inspired him to greater effort, while Gallagher was floundering around, hopelessly lost.

Old operators are cranky about working Saturday nights; at least the uninitiated say they have a cranky idea about the telegraph wires becoming tired. Youngsters say the trouble is in the waning strength of the aged arms that plays out towards the end of the week and not the wire; but the older men shake their heads and talk about the saturation of the wires by the constant flow of current over them. Electromagnets are said to be rendered useless by too much current, which saturates them, and the same theory is applied to telegraph wires by these cranky old operators. Practically every telegraph operator has some "queer" notion regarding his profession or some part of the implements with which he works; but they are discovered only by close association.

The choicest bit of slang of the age lay concealed in the ticks of their instruments for years before George Cohan rescued it and put it to work in one of his musical comedies. Telegraph operators have been saying "23" to each other over

the wire for a number of years; but no one knew anything about it. A great many people are still unaware of the fact that this bit of slang originated with telegraph operators; for only a short while ago a writer ventured the opinion that the term "23" was of biblical origin, and cited the twenty-third verse of the sixteenth chapter of Matthew as the probable place.

Western Electric Pension System.

The Western Electric Company was one of the first of the large industrial corporations to adopt a system of pensions for superannuated or disabled employees. In March, 1906, the company set aside \$400,000 out of profits as a permanent fund for this purpose and later \$150,000 was added with the further provision that \$150,000 might be added to the fund in subsequent years. The fund, with accrued interest, now totals \$597,500.

This pension fund is managed by a board consisting of five officers, who are employees of the company, appointed annually by the board of directors or executive committee. All employees who have reached the age of sixty and have been in the company's services twenty consecutive years, are eligible to the pension privileges, whether able to work or not, and are not debarred from going into other business if they accept the pension privileges. Employees who have been thirty years in service or who have reached the age of fifty-five and been twenty-five years in service may on recommendation of the president be granted a pension allowance. Any employee who has been ten years in service and through injury or sickness has been incapacitated from work, may receive aid from the fund at the discretion of the pension board.

The annual allowance for each employee retired with a pension, on account of age or length of service, is as follows:

For each year of active service one per cent. of the average annual pay during the ten years next preceding retirement, with the provision that the board may base the pension upon the average annual pay of the ten consecutive years of service during which the retired employee was paid the highest rate of wages. The pension allowance is paid monthly from the date of retirement until death and, at the discretion of the board, the allowance may be continued to widows or orphans for a period not exceeding one year. The expenses of the pension system are borne entirely by the company, the employees contributing nothing to its financial support.

Savings and Loan Association Notes.

The New York State League of Co-operative Savings and Loan Associations will hold its annual convention in Schenectady on May 19-20. The association of that city has appointed committees to arrange details, and the plans proposed indicate there will be an unusually interesting session. Among those who have been invited to address the convention are Governor Hughes and O. D. Cheney, state superintendent of banks.

How Cedar Poles Are Marketed.

Between three and a half and four million poles, most of them of cedar, are purchased and used by the telegraph and telephone companies of the United States each year. The average life of these poles is from twelve to fourteen years.

Three sources of supply are open, the white cedar from the northern lake region, Idaho cedar from the Rocky Mountain country and red cedar from the Pacific northwest. Cedar is used because of its straight growth, although in some regions redwood, chestnut, fir and cypress are employed.

The cedar is the most durable and it is the preferred timber. The red cedar grows to a greater height than the other varieties, and almost all the extremely tall poles are from the States of Washington and Oregon. Twenty feet is the minimum height for telephone poles.

The pole getting industry is distinct from general lumbering. It has its own special crews and its own special nomenclature. The sawlog man is a lumber jack, the pole cutter a cedar savage. The cutting is done in the fall and winter months, and the hauling season is from the early freezing period till the spring thaws.

Cruisers pick out and mark the timber that is to be cut, and a compass man runs the lines. After him come the foreman and the crew that lay out the camp and put up the necessary buildings to house the men and horses and store the supplies. Then comes the roadmaking.

Roads are laid out as nearly direct as possible from the standing timber to the landing place next the railroad, allowing for grades and elevations. Trees are cut down close to the ground and a smooth bottom is prepared for the road, which is invariably of ice. If snow precedes the coming of the road gang ploughs are utilized to get it out of the way and give the frost a chance at the ground, often swampy in character.

A number of tank sleds that sprinkle water on the roadway are kept running in alternation with a machine called a rutter, which cuts deep ruts in the ice road as it slowly forms. When finished the road is composed entirely of ice a foot or so in thickness, with six or eight-inch ruts on each side. These ruts are made for the purpose of furnishing a place for the runners of the pole laden sleds to glide through and thus make hauling an easier task.

Pole cutting is done usually by piece work, but in order to prevent the cedar savage from hunting out the bunches of timber most to his liking the foreman causes the strip for each pair of men to work in to be marked off by a line of blazes along the trees. He must confine his operations to merchantable timber, avoiding the crooked trees.

As he goes he must make a path through which the trees may be rolled or slid down to the road or so that the horse and chain that snake them thither may be able to work with ease. This is insisted upon by his boss. He must exercise skill in making

the cut trees fall in such a way that they can be easily handled with branches and tops removed.

Hauling begins as soon as the road is completed and the cutters get a sufficient supply stacked up ahead. The peeling is usually left until after the winter rush is over and the men are brought from the woods to the yards. The bark is removed either with a heavy draw-knife or a four by eight-inch chisel with a four or five-foot handle called a spud.

The pole cutters are usually supplied with a list showing the sizes desirable. Long experience enables them accurately to judge the size of a tree at a glance. The smallest cuts are seven feet long and are sold for fence posts. Longer sticks are used for shed timber. All over twenty feet go into the pole class. This practically insures the cutting of all the standing timber.

As each pole is cut it is marked with the cutter's number and checked up by a man whose task it is to keep tab on the work. For defectives he gets no credit.

Sometimes at the railroad landing place, but usually in the assembling yards, the poles are sorted according to size and decked, which means piled up. The greatest activity follows the Christmas season, when each crew is working at top speed to keep ahead of the next crew that handles the poles.

This top speed is again reached when breaking up time comes, when thaws arrive. The melting ice turns its streams into the ruts during the day and the tank wagons are kept going all night to furnish ice in place of that which the sun has melted. When the weather gets too warm the road soon disappears and this puts an end to the hauling and likewise to the cutting. When this happens earlier than usual the first indications of a break up cause a general hustle and a race ensues to get out the timber before the roads become useless.

Notwithstanding the good pay it is difficult to keep the men at work all winter. From the cedar savage down to the road monkey, the man whose duty it is to keep the ruts free from all rubbish, there are among the loggers many who drink heavily, chew snuff and smoke strong pipes and unconcernedly throw up one job, knowing they can get another just as good at the next camp. These roamers are known as camp inspectors from their making the rounds during the winter.

As the renewals are estimated to require nearly 3,000,000 poles a year, not counting the new poles put up, the end of the cedar supply is in sight. The forest department figures that it will not last longer than fifteen years and the more optimistic supply men don't think there is more than a twenty years supply ahead.

Mr. J. C. Browne of St. Louis, Mo. general foreman of telegraph of the Missouri Pacific Railway System writes: "I have not missed an issue of the Age for years, subscribing for your paper each year is one of the most profitable habits I have formed. Success to you always."

The Hudson Word Register.

The Hudson Word Register for counting the number of words written on a typewriter which is the only reliable device for this purpose now on the market may be obtained with attachments for applying it to the standard makes of machines. When properly attached, the greatest confidence may be placed in this invention. It can be rendered inaccurate only

by the playful and careless operator who forces the space-key far below the spacing point and allows the fingers to slip from the key releasing it with a snap, causing the register lever to fly upward with uncalled for violence. This motion which is unnecessary and unnatural, might cause the register to jump. The space-key may be struck with any force desired, but should be released in the usual manner with a smooth, even motion. This insures accurate results.

There being no limit to the continuous forward movement of this register, any number of words may be counted without re-setting by simply taking note of the first 1,500 words and adding thereto the number registered when the work is complete.

To ascertain the number of words written, add the amount registered on the dial to the number appearing through the face.

This useful device is easily set by, first, turning the lower button in the direction of the arrow until it locks, and the pointer rests at 50 on the dial. Next, turn the upper button in like manner until it reaches the stop and the number 1500 appears through the face.

For message work the writer disregards the upper numbers, using the dial and pointer only, which is set by simply turning the button forward until it locks, requiring but one movement, and as little attention as is given in returning the typewriter carriage to commence a new line.

The additional tension on the space key is very light, and in no way interferes with the working of the machine. The register being thoroughly made, nickel plated and of neat appearance, is an ornament to any typewriter and is practically indestructible. Every operator who uses a typewriter will find this invention of great assistance, and it has been the general testimony of those who have used these registers that they would not do without one.

Special directions accompany each counter telling how to attach it to the particular type of machine for which it is wanted.

The price of this useful adjunct to a telegrapher's equipment has been reduced from \$5.00 to \$3.00 and orders may be addressed to J. B. Taltavall, Telegraph and Telephone Age, 253

Broadway, N. Y. In ordering, be sure to specify the make of the typewriter for which the counter is intended, so that the proper attachments and directions may be sent with it.

Bound Volumes of Telegraph Age Covering a Memorable Year in the Telegraph.

The year 1902 was especially significant in the annals of the telegraph, inasmuch as that date marked the accession to office of the present official heads of the Western Union Telegraph Company. The story as told in *Telegraph Age* distributed over the months of that year, chronicling the numerous changes that eventful period witnessed, is of interest, one viewed with importance by many as being of high referential value, furnishing data and dates nowhere else so readily available. A portrait of Colonel Robert C. Clowry, the incoming president and general manager of the company, and of General Thomas T. Eckert, whom he succeeded, as well as others prominent in the Western Union service, were included in the issues of the paper during that year.

In that year, also, occurred the death of John W. Mackay, the head of the Postal telegraph and Commercial Cable companies. His passing necessarily wrought changes in the great telegraph interests under his control, their direction descending as a possession to his son, Clarence H. Mackay, their present head. Full-page engravings of both the Messrs. Mackay also appeared.

It was in 1902, also, that *Telegraph Age* printed a comprehensive, instructive and illustrated article descriptive of the famous Buckingham Long Distance Page-Printing Telegraph, a chapter covering nine pages and of profound interest. Again, it was in this same year that the notable telegraph tournament, known as the American Telegraphers' Tournament, was held at Atlanta, Ga., when some well remembered records for fast sending were established, an event altogether of achievement of which telegraphers are proud and delight to refer.

Enough has been indicated to show that the year 1902 was an eventful one in the telegraph. The bound volumes of *Telegraph Age* for that year possess a special value. A few are on hand and are offered for sale at \$2.50 apiece. These will be delivered to any address in this country, carrying charges prepaid, on receipt of price. Address all orders to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Mr. C. E. Davidson, manager, Western Union Telegraph Company, Tampa, Fla., in renewing his own subscription and that of E. M. Doyle, chief operator, recently, says: "You can always count on our renewing our subscriptions whenever they expire. We cannot get along without your paper."

The testimony of progressive operators is that *Telegraph and Telephone Age* is so thoroughly comprehensive in character as to make it absolutely indispensable to those who would keep informed. Its technical articles are of high practical value. Write for a free sample copy.

New Marconi Station at Glace Bay.

The trans-Atlantic service of the Marconi Wireless Telegraph Company has again been restored after having been discontinued since last August when the station at Glace Bay, N. S., was destroyed by fire. The station at that point has been erected on a headland about three miles from the town of Glace Bay, in Cape Breton, and is separated from the Nova Scotia peninsula by the Strait of Canso. The station stands about eighty feet above sea level and is a conspicuous landmark to fishermen for miles around.

The operating building is an unpretentious wooden structure with nothing to show that it is different from the ordinary wooden cottage, except the wires which lead down from lofty masts to special insulators inserted in its walls and the double line of telegraph poles leading to it which carry the wires of the Western Union and Canadian Pacific Telegraph Companies by means of which land messages reach and leave the station.

The transmission of a wireless message across the Atlantic is no different from that of the ordinary cable, except that the operator with every motion of his hand is controlling several hundred horse power at a point half a mile away, where the signaling switches are situated.

These switches connect the condenser and spark discharger and its associate circuits with the source of power, and there results from the condenser discharge a powerful electrical oscillation, which radiates into space and affects the receivers at Clifden.

The aerial system of the station is supported by four tall wooden towers, each 212 feet high. They form a square, the sides of which are 220 feet in length. In this space were contained the original station buildings which were destroyed in the fire. Supporting the aerial wires, in conjunction with the towers, are a number of masts, each 180 feet tall, which are so arranged that the wires spread out in the shape of a gigantic fan, the "handle" of which points toward Clifden, on the west coast of Ireland, where the corresponding station is situated.

The machinery for the generation of electrical energy and the transmission and reception of messages is contained in three buildings which are almost in a straight line. To the west of this line is the new power house containing the new machinery which has recently been installed.

The station at Clifden, Ireland, has also been overhauled and new apparatus installed. The transmitting aerial of this station contains 60,000 feet of wire and the receiving aerial 18,000 feet. The former is supported about 200 feet above the ground on twelve poles placed in three rows in the shape of an attenuated fan nearly one-tenth of a square mile in area, this arrangement being adopted with the object of radiating the electric waves most strongly in the direction of Glace Bay. The condenser, producing the necessary waves, is discharged by an apparatus consisting of a disk which rotates at a speed of more than 2,000 revolutions a minute.

Book Review.

A new and revised edition of "Wireless Telegraphy and Wireless Telephony," by Professor A. E. Kennelly, has been issued recently. This latest edition contains 271 pages and has 84 illustrations. This work which has heretofore been received with much favor by wireless students has now been revised and brought up to date. Because of the rapid advances made in the art of wireless telephony the author has added over sixty pages dealing with this subject. This is a book which can be appreciated by the practical man. It gives a general outline of the various principles underlying wireless apparatus and operation, avoiding complicated theory and tiresome details. The author also refrains from devoting any space in the book to historical matter attempting rather to include only those things which are of value to the art to-day. A copy of this work will be sent, carrying charges prepaid, to any address upon receipt of price \$1.00, by J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

What Our Friends Say About This Publication.

Mr. John F. Skirrow, associate electrical engineer of the Postal Telegraph-Cable Company, New York, says: "Telegraph and Telephone Age is as necessary to the telegrapher who would be up-to-date as gasoline is to the automaniac."

Mr. H. G. Haddon, general manager of the Martha's Vineyard Telegraph Company, Woods Hole, Mass., in a recent letter states. "Telegraph and Telephone Age shows improvement with every issue."

Mr. W. G. Peebles, assistant superintendent of the Western Union Telegraph Company, Jacksonville, Fla., in a recent letter has this to say: "Your renewal of my subscription was eminently correct. I cannot get along without the paper, so don't fail to let it come along promptly every time it is issued."

Mr. J. B. Dillon, of Dallas, Tex., in ordering us to re-enter his subscription for another year writes:

"How will anyone get in the hall of fame, if he is in the telegraph or telephone business. And the 'Age' subscription list has not his name?"

Mr. J. Hervey Nichols, of Denver, an old time and military telegrapher who was with General Grant as operator when Lee surrendered at Appamattox, in renewing his subscription for another year says: "I have been a reader of your valuable journal since its first issue, and by this means have kept in touch not only with my old friends, but also with the new and wonderful electrical inventions, devices, and improvements as I could in no other way. How any ambitious employe of any telegraph or telephone company can afford to be without your paper is a problem that I am unable to solve."

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIXEY

Sole Manufacturer

Hudson Terminal, 30 Church St.

NEW YORK

Western Representative

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

Mr. John Ditch, chief telephone inspector of the Pennsylvania Railroad Company, Altoona, Pa., was in New York a few days ago on company business.

The jurisdiction of Mr. W. W. Ryder, general superintendent of telegraph of New York Central Lines west of Buffalo, has been extended to cover the Toledo and Ohio Central Railway and the Zanesville and Western Railway following the taking over of the operation of those lines by the New York Central management.

A bill has been introduced in the House of Representatives by Congressman Murphy of Missouri, which if passed would make eight consecutive hours a days work for all railroad telegraphers and other connected with the movement of trains. The stated object of the measure is "To promote the safety of employes and travelers upon railroads by limiting the hours of service of employes thereon."

Mr. S. A. D. Forristall, superintendent of telegraph of the Boston and Maine Railroad, Boston, Mass, was a recent New York visitor, coming to the metropolis on official business. Mr. Forristall is preparing to extend the use of the telephone for train despatching upon the system with which he is connected by installing telephone circuits with selective apparatus upon several divisions of the road in addition to those which are already thus equipped. He speaks in most commendatory terms of the service rendered by the telephone circuits which are now in daily use on his system.

Mr. W. F. Williams, superintendent of telegraph of the Seaboard Air Line, Portsmouth, Va., was a recent New York visitor. Mr. Williams has in operation on the railway system with which he is connected, what is probably the longest telephone train despatching circuit in use to-day. This circuit which extends from Richmond to Norlina and Raleigh, N. C. and from Norlina to Portsmouth and Norfolk, Va., is 276 miles in length and has fifty-one selector stations and sixty-five telephones. It has been in operation since February 1 and is giving very satisfactory results.

The transportation committee of the Association of Railway Telegraph Superintendents is endeavoring to secure reduced rates for the associate members and friends of the Association who wish to attend the annual convention, which meets at Los Angeles June 20 to 25. The rate from New York to Los Angeles and return via New York Central or Pennsylvania and any direct route from Chicago will be \$110.30. By any other line to Chicago the rate will be \$105.80. The round trip rate from Chicago will be \$72.50 and from Kansas City \$60.00. Tickets bought at these rates will be good returning until October 31. The committee has been trying to secure a reduction from these prices by getting tickets which will only be good a much shorter period.

Copper thieves have been at work recently on the Putnam Division of the New York Central Railroad, stealing telegraph and signal wires. Upon one occasion about 1,200 feet of wire was stolen.

Mr. W. E. Peirce of the Western Union Telegraph Company, New Orleans, La., has for some time past been engaged in installing telegraphones on the New Orleans and North Eastern Railroad. This system, as far as finished, gives entire satisfaction.

G. B. Reeve, formerly vice-president and general manager of the Grand Trunk Railroad, died at La Mirada, Cal., May 1, aged sixty-nine years. Mr. Reeve entered the telegraph service of the Grand Trunk railroad in 1862 as an operator and afterward served that road in various capacities, in 1900 becoming vice-president and general manager.

Dr. Frederick H. Milliner, of Omaha, experimental engineer of the Union Pacific Railroad, has received orders to proceed at once with the installation of a wireless telegraph system along that road. A station has already been established at Omaha. The first new stations to be equipped will be at Sydney, Neb., and Cheyenne, Wyo.

A patent, No. 956,109, for a transmission system, has been granted to O. T. Lademan, of Milwaukee, Wis. A telephone system for railroads in which each substation has a primary and secondary winding and a switch in the transmitter circuit for shunting the secondary and then opening the circuit so that telephone currents may pass through the receiver.

A patent, No. 956,373, for a composite telephone and telegraph system, has also been secured by Mr. Lademan. For calling telephones on telegraph lines with a make and break receiving contact signal, a battery, a relay and a closed circuit battery with signal controlling relay having a vibratory contact.

The thirtieth annual convention of the Telegraphers Beneficial Association was held recently in the Pennsylvania Railroad building at Trenton, N. J. The election of officers resulted as follows: President, William Ettenger, Elizabeth; vice-president, William Wilmot, Trenton; secretary-treasurer, W. H. Clarke, Elizabeth; trustee, John B. Fisher, superintendent of the New York division of the Pennsylvania Railroad; executive committee, H. T. Vauls, Elizabeth; W. T. Swem, Trenton; George C. Kadel, Camden; Edward P. Bruere, Trenton; W. C. Rogers, Camden; auditing committee, I. A. VanDusen, Elizabeth; W. H. Buckalew, New Brunswick; E. S. Mullen, Frankford, Pa. After the meeting a banquet was held at which about seventy-five were present. This association, which is composed of employes of the telegraph department of the Pennsylvania Railroad, has a membership of over 300.

The Work of a Lineman.

The average telegraph or telephone lineman, says an exchange, is recruited from the farm, as there are few city bred youths who are able or willing to undertake the hardships that befall the beginner or "groundhog," as he is commonly called by the rest of the gang. The groundhogs are set to work at first digging holes, and while this may not seem laborious it must be considered that to get this hole to a sufficient depth, which is from four to six feet, it is necessary to use a thirty-pound steel bar two inches in diameter and nine feet long, sharpened at both ends, to loosen the earth, as it is impossible to use a pick after breaking the ground at the top.

Then rock formation is often met with, which is never blasted unless it is impossible to break it out. To the beginner this is tedious work, and if he is not careful he will invariably chip it out until he has the hole running to a point at the bottom and find it impossible to continue. It is astonishing what an old timer can do with a bar and interesting to hear them tell of their feats and the number of holes they can dig in a day. Many are the wagers they make on their ability in this line.

After a few months of apprenticeship at digging holes the groundhog, if he is found to be a willing worker, is allowed to help the lineman, that is, he is detailed to wait on him while at work on a pole, tying such articles as may be needed from time to time to a line so the lineman may pull them up as he requires them. This is where he receives his first schooling in the art of climbing. The next pay day is likely to see him in the possession of a pair of spurs or climbers, if he is ambitious. Then it is up to him to see how long it will be before he is able to get up and down a pole lively enough to become a full-fledged lineman and command the respect of the gang.

There is a class of linemen who are called floaters. These men never work more than a few days at a time in one place, and are continually traveling. While this is the case with many, there are, of course, exceptions, and you will find some who manage to save enough money to purchase a small farm, where they settle down and live contently for the rest of their days.

The lineman has to work ten hours each day that it is possible to be out in the open, and seldom is the weather so bad that the foreman will allow his men to stay under cover. They live in the cheapest of hotels or boarding houses and fare badly, as it is difficult to find a suitable place to accommodate a large gang of men at the rate which they are able to pay.

Several years ago an enterprising young superintendent of construction while trying to economize and at the same time benefit the many men under him, conceived the idea of building portable camps, tents having been tried and proved unsuccessful. He designed and built one set, which consisted of two cars, one for sleeping accommodations and the other for eating and cooking in. These cars were built with the idea that they could be moved from

time to time as the work progressed and thereby overcome the necessity of the long drives it was necessary to take each morning to reach the work and return at night, and at the same time provide the men with good clean sleeping quarters and good wholesome food.

They were built just the size of a flat car and made so they could either be fitted with wheels or else be loaded on flat cars and hauled on the railroad as circumstances might require. The sleeping car was fitted with two rows of bunks on each side and would accommodate twenty men, having a small room at each end for the foreman and his assistant, while the dining car had one large table and at one end a large cook stove and the sleeping quarters for the cook and his assistant, usually a man and his wife.

They were so successful that several more sets were built, and the only drawback was the fact that the quarters were too small in the evenings when the entire gang was present. Yet the men were better satisfied and the company pleased with the knowledge that it could provide its employes with good and sufficient food at three-quarters the cost of boarding, and always have them on hand for a moment's call.

Of course, these cars could not be used in all branches of the service. When engaged in putting up or stringing wires the linemen cover several miles a day. They string anywhere from two to fifteen miles a day according to the number they are stringing and the nature of the country they are covering.

In one case a gang was at work raising a large pole and one young fellow who was angry because the foreman would not give additional help deliberately broke three of the pike poles by pushing so hard with his shoulder that they were splintered. To do this required a great amount of strength, as the pikes are made of hickory and are at least three inches in diameter and from ten to twenty feet in length.

To this lineman, breaking them seemed child's play, and he laughingly remarked: "If you don't get more men under this pole I'll break all the pikes we've got and then we won't be able to raise it at all." Evidently the foreman in charge must have believed him, for he quickly granted the request.

There are always chances for good and reliable linemen to secure steady employment as trouble hunters. These men are stationed at different points all over the country, each having a territory to cover in case of trouble on the line. While this work is steady and much easier, the salary attached to it is not very large and the lineman has to be ready to go out at a moment's notice, never being able to enjoy a holiday unless he fills his place.

He is ordered out in all kinds of weather and has a territory of from fifty to a hundred and fifty miles to cover. The line must be kept in the best of order and he is seldom allowed more than one man to help him, and then only for a few days at a time.

His great difficulty is to keep the wires clear, as

the farmers feel they should receive some compensation for granting permission to trim limbs of their trees, and while the companies have in most cases an absolute right of way for their lines this does not prevent the farmer from meting out his vengeance on the lineman when he comes to trim the trees on his land by either setting dogs on him or ordering him off the property and enforcing his order with a shotgun.

In one case a farmer kept a large and vicious bull in his field, which would chase a man on sight, and upon the case being taken to court the judge sustained the farmer, saying that he had a perfect right to keep the animal on his own property as long as it was not interfering with anyone on the public highway. This left the lineman in a quandry as to how he could clear the wires, for each month when the chief operator of that district sent in his report of the insulation of the wires under his jurisdiction it always showed "poor" at this point, and the trouble man would receive orders to clear them at once.

This continued for some time, but try as he might the lineman would always find the bull waiting for him. At last one day, meeting the trouble man from the next district, he arranged to go with him at night and trim the tree, for they were positive that in the dark they would be able to sneak up, climb the tree, cut the limb and get safely away.

Just as they were about to start their courage began to fail and they resorted to some stimulant to brace them up, after which they started for the scene of the trouble. On arriving one agreed to climb the tree and cut off the limb. After events seem to show that the Dutch courage imbiber must have gone to the wrong place and affected the eyesight instead of the head of the climber. He succeeded in sawing off a limb and after hauling it away they drove back home believing the trouble was a thing of the past. Two days later as the trouble man was driving by he looked up in amazement, saw the limb still there and a large branch on the opposite side of the tree missing. It is still a standing question how he could make such a mistake. It was costly for the company he was employed by, as it was compelled to buy the tree at the farmer's own price, cut it down and haul it away.

The trouble man meets with many surprises and never knows what he will find when he is sent out to repair a break. Several years ago a temporary line was built for a telegraph company by one of the leading railroads. Some of the poles were so short that the wires could be reached from the ground. One morning the trouble man received orders to cover his line north and look for a "swinging cross," meaning that several of the wires were touching each other in some way every few minutes and causing trouble all over the line.

After going several miles and not seeing anything he came to a large railroad construction camp, where several hundred Italians lived in the little huts furnished by the contractor who was grading a new cut for the railroad. It must have been wash day for these Italians, as he discovered their wet clothes

hanging on the wires and the wind blowing them against the other wires, causing the trouble.

Another man while covering his line looking for two "open" wires, found after an all-day drive that they must have been broken by a wild goose that he found dead on the ground at the point of the break. On making inquiries a farmer living close by informed him that the previous night he had heard wild geese honking and evidently flying very low and that one of them must have been low enough to hit and break the wires. He was well repaid in this instance for his long journey, as he secured a good fat goose in addition to finding his trouble.

There is a young man who has a station in the northern part of the country and has over one hundred and fifty miles of line to cover. While this is comparatively easy in the summer months, as he has only a few wires on the line, in the winter it is often almost impossible to cover it; but no matter what the weather may be when he receives an order he is expected to go out and fulfil it at once.

This line for mile after mile runs through a dense forest, and in some places he has to make fifty miles in a day to find a place to sleep. This can be done in summer on horseback, but in the winter the only mode of travel is on snowshoes. A fifty-mile jaunt on snowshoes with a bag of tools such as are necessary for him to carry is not a trip to joke about.

He often finds the poles completely covered with snow where it had drifted so he cannot find them, and last winter he was snowbound in a small cabin for three days without food except a few sandwiches he had with him for lunch. When the storm abated so he could start again he was so weak that he could hardly drag himself to the next village, where he was compelled to remain, his feet being so badly frozen that it was a question whether they would have to be amputated or not. With the courage of his class, inside of a week he started on his long journey back again, thinking nothing of the fact that he had come near losing his life.

Another man in the employ of the same company is stationed on the desert in the west. While the little hut he lives in, which is also a test station, enables him to hear all the news that is flashing over the wires, he rarely has a chance to hear a human voice, for although his abode is near the railroad it is seldom a train stops except to bring him supplies or water. In some ways he is better off than his fellow workman in the north, yet his is a position that few men would care to accept.

While there is hardly one of this class of men who has not had narrow escapes from death, yet they glory in their vocation. They love to boast of their many hairbreadth escapes among themselves, but to the stranger they merely shrug their shoulders and make some indifferent reply when questioned about them. As a general rule they are fatalists, believing that if they must have an accident it will come when ordained and not until then.

QUESTIONS TO BE ANSWERED.

[The list of questions which we published under this heading in our previous issue, the answers to which may be found in Chapter I of Jones' Diagrams, was much appreciated. Students in telegraphy have found them of great assistance in helping master the contents of this standard text book of telegraph engineering. We will continue to print similar lists of questions, taking up each chapter in turn. If students will carefully study the subject matter to which each set of questions applies until he is able to answer all of them without referring to the book, he will, by the time he has gone through the book in this way have gained a thorough knowledge of all of the principles underlying telegraphic operation].

CHAPTER II.

How is the action of magnetism usually described?

What is the difference between a natural and an artificial magnet?

What remarkable distinction is there between magnetic lines of force and an electric current with regard to the path which each will follow?

What effect does a magnet have upon another piece of iron which is brought in contact with it?

What property of a magnet led to the development of the polar duplex telegraph system?

What condition always prevails in a wire which is carrying a current of electricity?

Give a summary of the general facts made use of in the operation of a telegraph circuit.

Why do the majority of the lines of force of a relay pass through the armature and attract it instead of passing directly from one core to the other?

Why is steel or hard iron unsuited for use in telegraph neutral and single relays?

Where are the local circuit binding posts on a relay usually located?

Why are some batteries more efficient than others?

How was voltaic electricity first discovered?

What is the nature of the action in a battery which produces electricity?

What quality must two metals possess in order to be suitable for the two elements of a battery?

What effect does the generation of an electric current have upon the water in a battery?

How may this action weaken the battery?

Why are dry cells usually unsuited to telegraph operation?

What is the chief requirement of a battery for telegraphic purposes?

Why is the ordinary blue stone cell so often used in telegraphy, not suitable for use where a large volume of current is required?

In a copper zinc battery how do you explain the fact that we speak of the copper electrode as being positive while the zinc is known as the positive plate?

What is electro-motive force?

How is it measured?

What is the normal voltage of a single blue stone cell?

What determines the electro-motive force of any battery?

How do you explain the fact that a small battery may be nearly as efficient as a large one for a short time when connected on a long circuit but would not be nearly as efficient on a very short circuit?

General Mention.

At a meeting of the directors of the Associated Press, held in New York, May 2, Mr. Melville E. Stone, of New York, was reappointed general manager and Mr. Charles S. Diehl, of Chicago, assistant general manager.

Mr. Jerry O'Connell, of the operating force of the Western Union Telegraph Company at Milwaukee, on May 1 celebrated the fiftieth anniversary of his entrance to the telegraph service, all of which time he has spent at Milwaukee.

The Court of Appeals of New York State has declared constitutional a law passed by the State Legislature two years ago, limiting the hours of labor of telegraphers and others connected with the movement of trains to eight hours in any twenty-four hour period.

Instruction in telegraphy is now given at the Carlisle Indian School. The Indian students have been found to be well adapted for this work and it is believed that they will prove valuable as railway operators at stations in the desert regions of the west where it is difficult to get employes who will stay for any length of time.

Miss Jennie F. Beckwith, cashier of the Postal Telegraph-Cable Company at Chicago, formerly cashier of the Western Union Telegraph Company at Minneapolis, has been granted a four months' leave of absence and will sail from New York on May 28 on the Steamer Barbarossa for a European trip.

Mr. W. J. Holten, of Chicago, a former railway telegraph superintendent, for the past three years identified with the West Englewood Bank of that city, writes: "I cannot keep house without the Age. It puts me in touch somewhat with my old life and the associates of my telegraph days."

Telegraph service in Arkansas was interrupted recently in an unusual manner. A tornado picked up a negro woman and deposited her in a network of telegraph wires tangling them up and thus crossing the circuits and causing trouble. Some linemen with ropes soon came to her rescue, lowered her to the ground uninjured and thus cleared the lines.

Mr. Paul R. Wiggs, for many years identified with the telegraph service at Jacksonville, Fla., but for the past seven years engaged in commercial pursuits writes us that he finds sufficient matter of interest in our publication to warrant him in remaining a permanent subscriber to the same. He adds: "I like to keep up with my old friends in the business and enjoy reading the Age."

Obituary.

Charles H. Irwin, formerly in the employ of the Postal Telegraph-Cable Company, died recently at Front Royal, Va., aged fifty-one years. Mr. Irwin was at one time manager of the Birmingham, Ala., office of that company, and was later chief clerk in the office of the superintendent at Nashville. Mr. Irwin suffered a stroke of paralysis about two years ago.

George F. Porter, secretary and general manager of the Atlantic Insulated Wire and Cable Company, New York, died at Montclair, N. J., April 29, aged fifty-five years. Mr. Porter was at one time a telegraph operator. He was a member of the Magnetic Club and well known in telegraph and electrical circles throughout the United States and Canada. From 1892 to 1902 he was secretary of the National Electric Light Association.

Prosecution of Bucket Shop Cases by Government.

Following the raid made by Federal officials upon alleged bucket shops operating in various parts of the country and the arrest of about thirty persons against whom evidence had been secured, a special grand jury in Washington has been making a thorough investigation of these concerns. Many telegraph officials have been called to Washington to testify as to their knowledge of the way in which the bucket shops have obtained the stock quotations whereby they were enabled to do business. The investigators believe that they have obtained evidence proving conclusively that these quotations have been supplied for the past twenty-five years or more by one New York concern, but how this firm obtained them has not been discovered. Since the investigation has been in progress the Philadelphia Electrical Bureau has cut down a large number of wires in that city which had been strung without any permit and some of which it was alleged were used for transmitting the quotations to the bucket shops.

Answers to Correspondents.

[We will under this heading answer from time to time questions from any of our readers in regard to technical, historical or other features of the telegraph, telephone and allied industries. We receive many such inquiries from subscribers and always answer them by mail. As some of these, however, are of general interest we will hereafter print both questions and answers in this column so that all our readers may receive the benefit of our answers.]

A Boston correspondent asks the following:

"In an argument between myself and another, the question arose as to the origin of the prefix 'HR' in starting a commercial message, as used by both the Western Union and the Postal companies. I contend that it means technically 'Have ready,' while he says it means 'Here,' 'HR' being code for 'Here' according to Phillips. Will you please send me the origin of the prefix, and which is right, or if we are both wrong."

In answer to this we would say that "HR" is an abbreviation for "another." Some opera-

tors use "ANR," others use "AHR" and others again simply use "HR." These abbreviations were in common use long before Phillips' code was thought of.

Stories of Inventors.

Mr. Charles A. Brown, a patent attorney of Chicago, gave an address before the Chicago Electric Club on April 27 in which he related some interesting reminiscences in connection with various inventors and inventions. Mr. Brown spoke of Thomas A. Edison's invention of the duplex telegraph system and related the story of the inventor's negotiations with Mr. William Orton, then president of the Western Union Telegraph Company. Mr. Orton tried to impress on Edison that his invention was not very different from the Stearns duplex. Edison's laconic rejoinder was, "But mine works."

Another story related to the "expert relay" of Stephen D. Field. In explaining to the patent examiner this unusual title for an invention, Mr. Field said: "I call my relay an 'expert relay' because it has a tongue adapted to lie on either side with equal facility, according to the influences brought to bear upon it."

Night Messages and Word Counters.

When an operator has to receive a night message containing from fifty to possibly several hundred words the attachment of a word counter upon his typewriter is a great time saver. Many do not appreciate this, but, instead, when through receiving will take the time to count each word in checking up with the sender. This is wasted effort, as, in most cases, if he had a word counter on his machine he could check as soon as the sender had finished. In view of this fact, it seems strange that more operators are not provided with these useful devices. The Hudson word register is simple in operation, can be provided with attachment for any standard typewriter and is absolutely accurate. There is no limit to the continuous forward movement of this device. It registers up to 1,500 and then automatically begins counting again from 1 upwards. The additional tension placed on the space key to operate the counter is so slight as to be scarcely noticeable. The price of this useful adjunct to a telegrapher's equipment has been reduced from \$5.00 to \$3.00, and orders may be addressed to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York. All orders should state the make of typewriter for which the counter is desired, as attachments differ.

The United States Senate has passed a bill requiring telegraph companies to pay a tax on their gross earnings in the District of Columbia. As this bill had previously been passed by the House of Representatives it now goes to the President for approval.

Such is the scarcity of telegraph operators in Vermont that when one disappeared suddenly a short time ago bloodhounds were placed on his trail in order to find him and bring him back to his duties.

LETTERS FROM OUR AGENTS.

DETROIT, POSTAL.

William J. Macksey has been appointed all-night chief operator, vice W. C. Griffin, who resigned recently to accept a position with the American Telephone and Telegraph Company. B. C. Van Valkenburg has been appointed assistant night chief operator.

PHILADELPHIA, POSTAL.

Superintendent C. E. Bagley, General Foreman Lane and Foreman Gorsuch have returned from a tour of inspection of the telegraph lines along the New York, Philadelphia and Norfolk Railway and report very favorably on their condition for the coming volume of business to be handled during the produce season.

Mr. E. B. Pillsbury of New York, general superintendent of the eastern division was a recent visitor.

Chief Operator Earl W. Miller has returned after an illness of ten days and is superintending the rearrangement of the office.

NEW YORK, WESTERN UNION.

Dr. T. H. Fisher, formerly of this department, died in Brooklyn on May 8, aged fifty-five years. Dr. Fisher studied medicine while employed as a telegrapher in this office. Since completing his course about twenty years ago he has been practicing his profession in Brooklyn.

W. H. Mayer of this department is confined to his home, at Passaic, on account of a broken leg.

Bound Volumes of Telegraph Age.

For those of our readers who desire to have the past year's issue of Telegraph Age in a form in which they can readily preserve all of the copies for future reference we would recommend a bound volume. We are now able to supply these containing the twenty-four issues of 1909 for the nominal price of \$3.50. There are several features in one of these volumes which comprise nearly 900 pages of reading matter, which are alone worth much more than the amount asked. The series of articles by Willis H. Jones entitled "Some Points on Electricity" are in themselves worth the price of the book to any student. We have also published articles by the best informed authors upon the developments in wireless telegraphy, and, in fact, there will be found recorded in this book all of the important improvements in the wireless art during the past year. The use of the telephone for train despatching has largely increased since January, 1909, and we have kept pace with its development by presenting to our readers many articles upon this subject, written by some of the best posted men in the railway and telephone world. These are but a few of the many features presented in Telegraph Age, during 1909, and those interested in any branch of the telegraphic industry will find much valuable information in one of these bound volumes. A copy of this work will be sent to any address upon receipt of price, \$3.50, by J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Weber's Handy Electrical Dictionary is a practical handbook of reference, containing definitions of every term or phrase used in the electrical industry. This vest pocket size indexed handbook contains over two hundred pages and over three thousand definitions. Notwithstanding the limitations of space, the work is so clear and lucid in its definitions, and so comprehensive in its scope, that it is not only an indispensable guide to the electrician in the intelligent performance and understanding of the duties of his profession, but is a work of the highest order of educational merit as well. Price, 50 cents. Address orders to J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, N. Y.

The Serial Building Loan and Savings Institution, of 195 Broadway, New York, has a record of over twenty-five years of successful operation. It is the oldest association of its kind in Manhattan and its business is conducted in the safest possible manner. It is managed by and for telegraphers and no securer place for the deposit of savings can be found. Write for particulars.

Telegraph Operator who wants a railroad job at \$55. Address "Relief," care of Telegraph and Telephone Age.

Will buy or sell, in one to ten-share lots, Western Union Telegraph Company and Mackay Companies stocks. Remittances by New York draft or express money order are requested. Address "Stock Investment," care Telegraph and Telephone Age, 253 Broadway, New York.

Rubber Telegraph Key Knobs.

No operator who has to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. This renders the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Leg Pattern \$3.50
Legless Pattern 4.00
P.O.B. Columbia, Pa.

THE LEFLEY KEY

The Best Key on the Market for Business and Profit. Because it does not stick; is durable; speedy; insures fine clear-cut Morse; an easy sender.

Send draft, express or P. O. Money Order.

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Elementary Lessons in Electrical Measurement. Joint Resistance.

PART III.

Where the values of resistance in conductors are represented in large numbers; that is to say consist of a group of figures containing three or more numerals each, the "reciprocal" method of ascertaining joint resistance as described in the previous installment of this article is not usually followed for the reason that the calculations require too much figuring.

Under these conditions the rule of determining the joint resistance of two wires is to divide the product of the two resistances by their sums. From this rule we get the following formula: $JR = \frac{R \times R'}{R + R'}$

In which JR stands for joint resistance. R stands for the resistance of one wire. R' stands for the resistance of the second wire.

Example: Find the joint resistance of two wires possessing 1,800 and 900 ohms, respectively.

If we substitute these figures for the letters in the formula each represent we get

$$\frac{1800 \times 900}{1800 + 900} = \frac{1,620,000}{2,700} = 600$$

600 ohms, therefore, represents the joint resistance of the two wires.

Now if the example had called for the joint resistance of three wires, say of 1,800, 900 and 1,200 ohms, respectively, instead of two, the solution of the problem would have required a second calculation identical with that of the first. We can only ascertain the joint resistance of a group of wires by this method by dealing with them in pairs separately. In other words we can determine the joint resistance of but two conductors at a time, but after having done so the joint resistance of any such pair may be considered the same as though it represented the actual resistance of one single conductor. Hence we can couple the latter with the resistance of the third wire and repeat the operation. The answer obtained in the second calculation will give the joint resistance of the three wires.

Thus, treating the joint resistance of the first two wires, 600 ohms, as though it represented one wire and pairing it with 1,200, the resistance of the third wire we find that the joint resistance of all three conductors is

$$\begin{aligned} 600 \times 1200 &= 720,000 \\ 600 + 1200 &= 1,800 \\ \frac{720,000}{1,800} &= 400 \text{ ohms.} \end{aligned}$$

If there were more wires in the group the operation would be continued in the same manner, simply coupling the last joint resistance with the next wire and then proceeding as before.

Sometimes the joint resistance of two wires and the actual resistance of but one of the pair are known. In order to determine the resistance of the second wire in a case of this kind the formula is made to read: $\frac{R \times R'}{R - R'} = \text{Resistance of the second wire.}$

The only alteration being in the divisor, where instead of adding the resistances together, the lesser resistance is subtracted from the greater.

Using the same example for the purpose of demonstration, we know that the resistance of one of the wires is 1,800 ohms and that the joint resistance of it and its companion is 600 ohms. What is the resistance of this second wire?

Substituting the known values in the last formula we get $\frac{1800 \times 600}{1800 - 600} = 900$.

Hence 900 is the resistance of the second wire and this we know to be correct.

JOINT RESISTANCE OF DIVIDED CIRCUITS.

In a combination circuit containing taps or leaks the manner of ascertaining the total amount of resistance therein is somewhat different from either of the processes described.

Let us suppose we have a circuit made up in the manner shown in the accompanying diagram.

In order to find the total resistance of this circuit we must first find the joint resistance of the branch lines. In this case where we have two branches, each of which possesses 50 ohms, the joint resistance of the pair is 25 ohms. This means that

the entire resistance of the circuit is $75+25=100$ ohms. If there had been three or four branches from X, the calculation would be made in the same manner, viz: ascertain the joint resistance of all the branches and add the same to 75 for the total amount.

This diagram offers an opportunity for interesting study in several other ways. For instance, we may ask: How much current does the circuit draw from the dynamo? How much will flow in each of the three wires and why? Also: What is the value of the electromotive force at the point X?

Having ascertained that the total resistance in the circuit is 100 ohms, it follows from Ohms law $\frac{E}{R} = C$ that $\frac{100}{100} = 1$ ampere of current, the total volume drawn from the dynamo. It is also evident that all of it must flow through the wire leading to X, hence the lead takes 1 ampere. As the current divides equally between two branches when the resistance of the latter is the same, we find that each leg takes one-half of an ampere of current.

To find the value of the electromotive force at X, it is merely necessary to ascertain what percentage of the total resistance in the circuit the current has passed through when it has reached X, for the reason that the electromotive force in the line falls from maximum value to zero in direct proportion to the resistance at the point taken.

Thus we find 75 per cent. of the resistance has been overcome, hence the drop is 75 per cent. of 100 volts, leaving but 25 volts at X to furnish current in the branches. But as there is but 50 ohms resistance in each leg beyond X $\frac{25}{50} = \frac{1}{2}$ ampere. This answers the question as to why it divides equally at X.

If the branches were unequal, then each such branch would take current in volume according to Ohms law $\frac{E}{R} = C$, E being the value of the E. M. F. at X.

(To be Continued.)

Recent Telegraph and Telephone Patents.

A patent, No. 956,782, for a signal system, has been granted to H. O. Rugh, of Sandwich, Ill. Selective signaling device for party-line telephones, the substation having a signal controlling element controlling two signals with switching devices at central to operate either signal, and to place the controlling element in operative position.

A patent, No. 956,808, for a telegraphic relay, has been issued to Isidor Kitsée, of Philadelphia, Pa.

A patent, No. 957,050, for a telautograph instrument, has been secured by A. L. Golden, of Oakland, Cal. A plurality of magnets with moveable cores, a universal joint connected with all of them, a lever pivoted in the joint and a writing instrument pivotally secured to the lever.

A patent, No. 957,312, for a telegraphic keyboard transmitting apparatus, has been taken out by Patrick B. Delany, of South Orange, N. J. Transmitting keys, one for each character or letter, are provided.

A patent, No. 957,403, for a telephone receiver, has been awarded to Nathaniel Baldwin, of Heber, Utah.

Patents Nos. 957,489 and 957,490 for telephone apparatus and 957,491 for a telephone system have been granted to Charles F. Bradburn, of Delmer, Ontario, Can.

The following patents have expired:

Patents Nos. 496,904, for multiple-switchboard apparatus; 496,905, for a multiple-switchboard system; 496,906, for multiple-switchboard testing apparatus, and 496,907, for testing apparatus for multiple-switchboard systems, held by Charles E. Scribner, of Chicago, Ill.

Personal.

Dr. Alexander Graham Bell sailed from New York May 20 on a trip around the world.

Mr. J. A. Rosen, secretary of the Hult Transmitter Company, Topeka, Kansas, spent a few days in New York recently, coming here on business.

Mr. W. B. Van Sise, electrical and patent expert and an old-time telegrapher with offices at 253 Broadway, has associated himself with the Western Electric Company as patent expert; his address is now 463 West Street, New York.

Mr. W. H. Sawyer the old-time telegrapher who is well known in electrical circles, having been for many years identified with the American Electrical Works at Providence, R. I., has returned to his home in that city after spending the winter in Pasadena, Cal., as is his usual custom.

Mr. Gerrit Smith, the well-known electrical engineer and inventor, who for many years was identified with the electrical engineer's office of the Western Union Telegraph Company, after three years' illness has almost entirely recovered his health.

Mr. T. Thorne Baker, the inventor of the system for transmitting pictures by telegraph which is described elsewhere in this issue, sailed for England May 21. He expects to return to the United States in the fall and give a demonstration of his system between New York and Chicago.

Mr. Harry A. Tuttle, president and general manager of the North American Telegraph Company and president of the Commercial Club of Minneapolis, was in Denver recently, having been sent there by the latter organization to inspect the large Denver Auditorium and report upon it to the united commercial bodies of Minneapolis with a view of building a similar structure in that city.

Mr. Melville E. Stone, general manager of the Associated Press, New York, tendered Prince Iyesato Tokugawa of Japan, who was a recent visitor in this country, a dinner just previous to his sailing from New York for Europe. Mr. Stone did this as an appreciation of the hearty reception given him while in Japan during his recent trip around the world.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. J. G. Blake, general superintendent of the company at San Francisco is in New York on company business.

Mr. W. I. Capen, general superintendent of plant, New York, has returned to the city after a prolonged absence in the west on business connected with the construction of new lines.

Mr. Thomas A. Edison was a recent executive office visitor taking occasion to call upon many of his old friends in the service. After dining with the officers of the company he visited the various departments shaking hands with all whom he met. He enjoyed a visit of several hours inspecting the modern telegraph installation found in the main office.

A son was born to Superintendent and Mrs. John A. Forehand of Seattle, on April 11.

Mr. H. H. Hall, manager of the Ashtabula, O., office who has been identified with the telegraph service for sixty years and is one of the best known old timers in that state, was a recent New York visitor. Mr. Hall took occasion while in the city to call on many of his old time friends.

The office of the company at Fort Wayne, Ind., has been moved to new quarters.

The Postal club of Atlanta held a German luncheon Saturday evening May 28 in the Merchants' and Manufacturers' Club rooms in that city. Originally designed post card invitations sent out by Mr. A. M. Beatty, whom one of the Atlanta papers characterizes as the chief booster of the club, assured a large attendance.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. S. M. Williams, special agent and Mr. F. A. Pickernell, assistant to the president of the American Telephone and Telegraph Company have gone to Salt Lake City, Utah to join the party of Mr. Belvidere Brooks, general manager, accompanying them back to New York on their trip of inspection.

Mr. Theodore P. Cook, of Chicago, general superintendent of the western division also joined the party at Salt Lake and is accompanying them through his territory.

Mr. A. R. Brewer, treasurer, and Mr. A. S. Dresdner, assistant treasurer of the company have had added to their department an extra office which will be occupied by these two officials. This additional room gives the treasurers' department the extra space long needed.

The Jacksonville, Fla., Board of Trade, has passed resolutions of regret at losing from their membership Mr. B. F. Dillon, who was recently promoted from the superintendency in that city to be general superintendent of the southern division with headquarters at Atlanta. Similar action was taken by the Citizens' Loan Association of Jacksonville. Mr. Dillon had held the office of president of the latter organization since its formation in 1895 and as expressed in the resolution, "his ability and sound judgment have contributed largely to the success of the Association."

Mr. R. A. Black of Philadelphia and Mr. A. C. Kaufman of Albany, who was for many years until June, 1908, superintendent of the Postal Telegraph-Cable Company at Albany N. Y., have been attached to the office of General Superintendent A. G. Saylor.

Albert F. Kelley, aged thirty-five years chief clerk in the office of Superintendent E. M. Mulford, New York, died on May 27.

Mr. S. M. Cullison of the General Superintendent's office has been transferred to the auditor's department.

Mr. Marion H. Kerner, on Memorial Day, had the statue of Professor Samuel F. B. Morse in Central Park appropriately decorated. For sixteen years now Mr. Kerner assisted by a few other loyal admirers of Professor Morse has paid this tribute to the memory of the inventor of the telegraph.

An entirely new office in more commodious quarters has been moved into at Sioux City, Iowa.

At the annual meeting of the American Telegraph and Cable Company, held May 25, Edward J. Hall, Union N. Bethell, and Belvidere Brooks were elected directors, to succeed J. T. Terry, George J. Gould, and Edwin Gould. Other directors were re-elected.

At a recent meeting held at Kenosha, Wis., of the stockholders of the Northwestern Telegraph Company, owner of many lines operated by the Western Union Telegraph Company in Wisconsin and Minnesota, control of the company formally passed into the hands of residents of Hartford, Conn. A majority of the stock, amounting to nearly \$4,000,000, was voted by Francis R. Cooley of Hartford, and the old Directors gave up their places to Francis R. Cooley, Charles P. Cooley, Jonathan B. Bruce, Lyman B. Brainard, Arthur L. Shipman, Arthur R. Bradley, and Henry M. Sperry, all of Hartford.

C. B. Horton, Assistant Superintendent, Western Union Telegraph Company, Omaha.

Mr. Charles Bela Horton, who has recently been appointed assistant superintendent of the third district, western division of the Western Union Telegraph Company, with headquarters at Omaha, is one of the younger men in the service. He has evidently inherited the true telegraphic instinct, however, from his father, the late Charles B. Horton, having himself served for many years

C. B. HORTON.

Assistant Superintendent, Western Union Telegraph Company, Omaha.

as assistant superintendent and superintendent at Omaha. Mr. Horton was born at Northville, Mich., May 16, 1876, and entered the telegraph service in October, 1891, as messenger in the Omaha office of the Western Union. In June, 1893, he became an operator in that office, later serving in the same capacity at Denver, Aspen and Colorado Springs, Col. In 1898 he was made manager at Deadwood, S. D., and filled that position until 1903, when he joined the telegraphic staff of the Globe-Democrat of St. Louis. In June, 1904, he returned to the Western Union service as manager at Lincoln, Neb., where he was located until his recent promotion.

The Cable.

Mr. James A. Scrymser, president of the Central and South American and Mexican Telegraph Companies returned to New York, May 20, from a three months trip to South American points, during which he took occasion to visit the stations of the Central and South American Telegraph Company along the Pacific coast and at the Isthmus of Panama. Mr. Scrymser was accompanied on his trip by his wife, Mr. J. Montgomery Hare and Mr. Loyall Farrugut.

The Central and South American Telegraph Company announces that on and after June 1 the rates between the United States and Canada, and Peru, Bolivia, Chili, Argentina, Uruguay and Paraguay will be reduced fifteen cents per word,

making the rate from New York east of the Rocky Mountains and Canada eighty-five cents and west of the Rocky Mountains eighty-six cents per word.

According to the annual report of the Indo-European Telegraph Company for the past year one of that company's North Sea cables was out of commission 79 days during the year on account of the depredations of trawlers and their second cable was interrupted for 66 days from the same cause.

Mr. Clarence H. Mackay has made the following statement in regard to the report in English and American papers that The Commercial Cable Company had formed an alliance with the Anglo-American Telegraph Company:

"The Commercial Cable Company never has had, and has not now, and does not intend to have any connection, whatsoever, with its competitor, the Anglo-American Telegraph Company, either in the way of controlling its stock, or making any traffic agreement, or in any other way. The Commercial Cable Company will continue to be independent and competitive just as the Postal Telegraph-Cable Company will continue to be independent and competitive. All reports to the contrary are false."

Mr. George G. Ward, vice-president and general manager of the Commercial Cable Company, New York, at the hearing recently held by the Canadian Senate in regard to the bill which was introduced in that body with a view of placing cable companies under the jurisdiction of the Railway Commission and requiring them to lower their rates made the following statement.

"None of the Atlantic cable companies are earning more than a fair return. Some are not even earning that, because of the loss of income from disabled cables and the enormously increased charges for maintenance. To reduce rates would be to reduce income still further.

"There is no reason to expect that the trans-Atlantic cables will be free from damage or breakage in the future, any more than they have been in the past. On the contrary, the agencies which inflict the injury are multiplying and extending the field of their operations, and the cable companies must take into account the probabilities that their repair bills and loss of traffic will increase and will not diminish. One of our cables was damaged last year about sixty-five miles from our cable landing at Dover Bay, Nova Scotia, and we were in consequence deprived of its use for three months. When making the repair our repairing ship found that for a distance of two and a half miles the cable had been caught about every ten fathoms by steam trawlers, and had been flattened, twisted and subjected to great strain. A large number of steam trawlers are now fitting out in readiness for this season's fishing, and we dread the damage which they may do us, and which we see no way to avert. The strongest, newest and

best cables are not immune from the depredations and devastations of these trawlers.

"The Commercial Cable Company has had three cable ships at sea at one time repairing or replacing disrupted cables. For over six months continuously during the past year we at no time had our entire facilities working, there being some break somewhere during all that period. The expense connected with all this has been enormous, to say nothing of the loss of business on account of not having complete facilities. In fact, the menace to the business is so great that we have decided to lay still another cable in the Atlantic Ocean, although such additional cable is entirely unnecessary to our present business if we could be sure of having our present facilities uninterrupted. Then there is our competitor, the Western Union Telegraph Company. We are told that for nearly nine months both of its cables have been entirely disrupted and out of use. The Direct United States Cable Company which has one cable in the Atlantic Ocean, has also been in trouble during the past winter. All the cable companies without exception have had these troubles, and the aggregate expenditure for interruption and repairs has been enormous.

"This demand on the part of Canada for reduced rates is not justified. Canada already enjoys a much lower rate than would be possible if the rate were to be fixed for a cable service dependent on Canadian traffic alone. It is the large volume of United States traffic that renders possible the low trans-Atlantic rate for the smaller volume of Canadian traffic. The cable rates across the Atlantic are the lowest cable rates in the world. The companies, and especially this company, have shown their friendly disposition towards Canada already by making a special rate as a matter of special gratification to Canada for the traffic in which Canada herself is specially interested—namely, the traffic between Australia, Canada and Great Britain."

S. Fenn, Manager of Direct U. S. Cable Company.

Mr. Samuel Fenn who was recently appointed manager of the Direct United States Cable Company with headquarters at London, England, is one of the old timers in cable circles having entered the service when submarine cable communication was in its infancy and grown up along with it, so to speak. Mr. Fenn was born at Brentford, England, May 28, 1855 and entered the employ of the Electric and Intercolonial Telegraph Company in 1868 as operator. In 1875 when the cable of the Direct United States Cable Company was laid he joined the forces of that company being employed at Halifax. He was connected with the company's station at that point from that time until his recent promotion, serving successively as operator, assistant superintendent and superintendent.

SAMUEL FENN.

Manager, Direct United States Cable Company, London.

J. F. Fraser, Superintendent Direct United States Cable Company, Halifax.

John F. Fraser, who was recently appointed to the superintendency of the Direct United States Cable Company, at Halifax, as briefly mentioned in our March 16 issue, was born at Fochabers, Morayshire, Scotland, October 5, 1854. He prepared for Aberdeen University, but did not enter, passing instead into the Govern-

JOHN F. FRASER.

Superintendent, Direct United States Cable Company, London.

ment Postal Telegraph service at his native place soon after the transfer to the state of the inland telegraphs in 1870.

At the formation of the Direct United States Cable Company Mr. Fraser joined the electrical staff of the company under Mr. George Von Chauvin at the works of Messrs. Siemens Brothers on October 6, 1873, and was engaged in testing duties during the manufacture and

submersion of the cables. When the cable was landed at Rye Beach, N. H., he remained there as the company's first representative and later joined the operating staff under Mr. George G. Ward, filling the positions of operator, clerk in charge and assistant superintendent. In 1888 he took charge of the Rye Beach station, when Superintendent W. J. Fraser assumed dual control of the Boston and Rye Beach offices.

Mr. Fraser has had a wide experience in translation and testing work at Rye Beach, where the first union of the English double current and American closed circuit system was accomplished.

Municipal Electricians.

Mr. H. T. Snyder has been appointed superintendent of the fire alarm bureau at Los Angeles, Cal.

The installation of a fire alarm telegraph system has been recommended at Kansas City, Mo. At present the telephone is depended upon entirely for reporting fires in that city.

The fifteenth annual convention of the International Association of Municipal Electricians will be held in Convention Hall, Rochester, N. Y., September 6, 7, 8 and 9. The previous convention chose wisely in selecting the place for their next gathering and there is no reason why the coming meeting should not be the most successful and enjoyable one ever held by the association. Any one desiring particulars may secure the same by addressing the secretary Mr. Frank P. Foster, Corning, N. Y.

Telegraph and Telephone Companies Under Control of New York Public Service Commission.

The bill placing telegraph and telephone companies operating in New York State under the jurisdiction of the Public Service Commission of the Second District of the State which has its headquarters at Albany, has been passed by the Legislature.

This measure was prepared by the Special Legislative Committee which made a careful investigation of the conduct of these companies during the past winter. Power is given to the commission, upon complaint or upon its own motion, to issue orders in relation to rates and service. This authority, the bill stipulates, shall not be construed as giving the commission power to make an order requiring a telegraph or telephone company to perform any act which is unjust or unreasonable or in violation of the requirements of its franchise or of any State or Federal law.

The Commission receives the power of investigation and limited control over the forms of accounts and records of the companies, which are required to file annual reports with the Commission. The Commission is given the veto power over the exercise by the companies of

rights and privileges under the franchises, which they have not exercised up to this time.

The measure contains provisions against discrimination in rates. It prohibits any corporation or association other than a telephone or telegraph company, to acquire more than ten per cent. of the stock of any telephone or telegraph company.

The bill prohibits the granting of reduced rates or free passes or franks for transmission of any messages except by officers or employees of the companies.

The bill requires that the permission and approval of the Commission shall be given for issues of stocks and bonds, except that companies may issue notes payable otherwise than on demand for proper corporate purposes without the approval of the Commission, and notes to be payable at specified periods of not more than twelve months.

Retirement of R. F. Easson.

Mr. R. F. Easson, superintendent of the press and commercial news department of the Great North Western Telegraph Company at Toronto, Ont., has, after sixty-one years in the service, retired, his resignation becoming effective June 1. Mr. Easson joined the force of the Montreal Telegraph Company in Toronto in 1844, at the age of eleven, being the second messenger employed in that city. With the exception of two years from 1853 to 1855, when he was employed in Chicago, his entire telegraphic career has been spent in Toronto. In 1864 he became chief operator and in 1882, when the Montreal Telegraph Company was taken over by the Great North Western, Mr. Easson became superintendent of the press and commercial news department, which position he has held until the present time. The system which he has organized for gathering the news of the Dominion and distributing it to the various newspapers is known as the Easson service and is regarded as especially complete in all its details. The many friends of Mr. Easson throughout the country wish him a long and pleasant holiday.

The Associated Press.

The telegraph bureau of this association located on the third floor of the Western Union Telegraph building at 195 Broadway, New York, is, since its complete overhauling, declared to be the best equipped press office in the country. New and up to date telegraph apparatus has been installed throughout the office and ample space has been provided for each operator so that the work of the department is now carried on with the greatest possible facility and convenience.

Among the members of the force is Mr. W. L. Waugh, who has been in active service since 1878 and has probably transmitted more press matter during his thirty-two years of employment with this association than any other operator.

The Telephone.

The report of the Cumberland Telephone and Telegraph Company for March shows an increase in the gross income of \$39,595 over March, 1909.

Mr. E. L. Cline, manager of the Toledo Home Telephone Company at Toledo, Ohio, has been appointed general manager of the New Long Distance Telephone Company, at Indianapolis.

The New York Telephone Company has filed with the Secretary of State at Albany a certificate increasing its capital stock from \$100,000,000 to \$125,000,000. There has been issued up to the present time stock of a par value of \$85,672,800.

Mr. H. B. Thayer, vice-president of the American Telephone and Telegraph Company, and president of the Western Electric Company spent a few days in San Francisco recently, going there on business connected with the service.

Mr. V. B. Hicklin has been promoted to the managership of the telegraph department of the American Telephone and Telegraph Company at Des Moines, Ia., where quite a large number of repeaters are located.

Mr. James K. Wass, who has been auditor of the Bell Telephone Company of Missouri, at St. Louis for the past seven years, was the guest of honor recently at a dinner given to celebrate the twenty-fourth anniversary of his continuous service with the company.

William R. McGovern, chief engineer of the Wisconsin Telephone Company, lectured before the engineering classes of Marquette University at Milwaukee, Wisconsin, May 21, on the "Engineering and Construction of a Telephone System."

The report of the American Telephone and Telegraph Company and associated companies for the three months ending March 31, shows gross earnings of \$39,533,281 and a net income of \$12,197,112. After paying \$2,598,141 interest and dividends amounting to \$6,400,674, this leaves a surplus of \$3,198,297, an increase of \$722,774 over the corresponding period in 1909.

The stockholders of the Continental Telephone and Telegraph Company, at a meeting recently in New York, elected the following board of directors: J. N. Vance, Senator William Flinn, Herman C. Stifel, George E. House, John A. Howard, A. S. List, Samuel W. Harper, Max Koehler, Robert C. Hall, Walter S. Dickey, George E. Sifel, W. C. Handlan, John W. Garland and William M. Clark.

John G. Stoakes, who for over thirty years was secretary and treasurer of the Central District and Printing Telegraph Company of Pittsburg, died in that city May 15, aged fifty-six years, after an illness extending over three years. Mr. Stoakes was born at Wilkville, O., and after leaving high school became a telegrapher for the Pennsylvania Railroad in his native town. He afterward went to Pittsburg, entered the telephone service and soon became secretary and treasurer of the company, which position he held until the recent reorganization when the executive offices were moved to Philadelphia.

Mr. E. H. Greenleaf, district plant superintendent of the New York Telephone Company, Newburgh, N. Y., was a recent New York visitor coming here on company business.

The annual report of the Cuyahoga Telephone Company of Cleveland, Ohio, for 1909, shows gross earnings for the year of \$842,387 and net earnings of \$392,525. This is one of the most important of the so-called Morgan properties and has over 26,000 stations.

It is reported that an option has been secured by J. P. Morgan and Company on \$2,000,000 worth of bonds of the Interstate Telephone and Telegraph Company of Illinois out of a total issue of \$2,300,000. This company is an independent company having connections throughout Illinois and their lines would furnish connection between the Ohio and Indiana properties controlled by Morgan and Company and the new independent telephone system which is to be installed in Chicago.

An order has been issued at Trenton, N. J., by United States Judge Rellstab, requiring the Continental Telephone and Telegraph Company to show cause why a receiver should not be appointed upon the grounds of insolvency. The complainants are Bernard M. Wolf of Boston and Max Koehler of St. Louis, stockholders. Mismanagement of the company's affairs and misuse of assets by some of the officers are alleged as the cause of the troubles of the company. Pending decision on the application, the officers of the company are restrained from disposing of any of the assets.

A New Telephone Relay.

Mr. S. G. Brown, the inventor of the submarine cable relay, has recently developed a telephone relay or repeater which is said to possess some remarkable properties. The principle of this relay depends upon the researches of Professor J. J. Thomson and others with regard to the flow of electrons across a microscopic air-gap between two conducting surfaces at different potentials. If the metallic circuit of a dry cell be interrupted by a minute space of the order of 5×10^{-7} centimeters, the metal at the point of interruption being platinum, the current will continue to flow round the circuit and across the opening, and any slight alteration in the length of the space will vary its resistance and greatly affect the value of the current that flows round the circuit. This conduction space is therefore exactly what is wanted for the current-varying device of a telephone relay, where microscopic mechanical movements are to be transformed into large current changes. The relay constructed on this principle will magnify the feeblest telephone currents, speech or signals too faint to be heard in the ordinary telephone receivers being heard clearly by means of the relay. In wireless telegraph work it has detected messages, the very existence of which was not even suspected.

Radio-Telegraphy.

The Belgian Marconi Wireless Telegraph Company reports a net profit for the past year of about \$9,500, as compared with about \$5,000 for the previous year.

It is stated that the French government will install a chain of wireless stations to connect their various African possessions and that wireless communication will be established across the desert of Sahara.

A patent, No. 956,489, for signaling for electromagnetic waves, has been granted to R. A. Fessenden, of Washington, D. C. A medium of high specific inductive capacity with an antenna and reflector immersed in the medium.

A patent, No. 956,936, for apparatus for teaching wireless telegraphy, has been granted to F. E. Butler, of Detroit, Mich. A sending key, an adjustable core resistance coil, a buzzer and generator in series receiving circuits and telephone receiver.

The Hawaiian Islands are now completely linked together by wireless telegraphy. The principal station has a day range of 400 miles and a night range of 1,250 miles. This station is reported to be in frequent communication with Sitka, Alaska, 2,000 miles distant.

Now that Marconi has successfully re-established the trans-Atlantic wireless service of his company, it is said that he will next turn his attention to overland wireless transmission with a view of extending his system from the Atlantic to the Pacific coast of Canada.

A recent report of the British Post Office shows that at the end of 1909, 116 sea-going vessels were licensed by the English Government to carry wireless telegraph apparatus. There were also 260 licensed land stations in the United Kingdom of which 241 were for experimental purposes.

The French liner *La Provence* has been equipped with the Bellini-Tosi "wireless compass" system and on a recent voyage from Havre to New York gave this device a thorough test. It was found that by this means the relative positions of the ship and any other vessels with which they could get into wireless communication could be accurately determined. By making observations of the direction of land stations of known location the course of the ship could also be ascertained.

The United Wireless Telegraph Company has received orders for equipping twenty-one vessels of a Brazilian steamship company, the *Lloyd Brasileiro*, with wireless apparatus. They will also establish eight shore stations in Brazil. One of these stations is to be at Rio Grande de Sul, one at Santos, three in and near Rio de Janeiro, one at Bahia, one at Pernambuco, and one at Para. The system will afford communication between Rio de Janeiro and all of the *Lloyd* fleet at all times, except when those in the New York service are out of range.

Beginning May 23 the French Government inaugurated a wireless time service from the Eiffel Tower for the benefit of ships at sea. Time signals are sent out at midnight and at two minutes and four minutes after midnight.

A patent, No. 957,001, for wireless telegraphy, has been awarded to Frederick G. Sargent, of Graniteville, Mass. Receiving apparatus of a wireless telegraph system is provided with a circuit-breaker for the local circuit, connected with the relay circuit and operating to break the direct connection between relay and coherer to compel all the Hertz waves to pass through the coherer, and establish an indirect connection therebetween.

A patent, No. 957,852, for a transmitting system for space telephony, has been issued to Victor H. Laughter, of Detroit, Mich. Space telephony apparatus comprising a transmitting set including in the circuit oscillation-inducing means adapted to be adjusted to a state of inactivity close to the critical point, and means adapted when influenced by sound waves to bring the oscillation-inducing means to a critical operative point, a receiving set, and means in circuit with the transmitting set adapted to throw the receiving set into operative relation with the aerial limb of the transmitting set when the oscillation-inducing means is inactive and to cut out the receiving set when the inductor is rendered active.

The officers of the newly formed Continental Wireless Telephone and Telegraph Company are: President, F. T. Davis, of Philadelphia; vice-president, Walter W. Massie, of Providence, R. I.; general manager, Thomas E. Clark, of Detroit, Mich.; technical director, A. Frederick Collins, of Newark, N. J. The headquarters will be in New York. The new company contemplates the institution of a transcontinental commercial service, as well as the continuance of marine reports and shipping messages. As announced in our previous issue, the companies which form the consolidation are the Massie Wireless Telegraph Company, Clark Wireless Telephone and Telegraph Company, Pacific Wireless Telegraph Company and the Collins Wireless Telegraph Company.

According to a German publication, the Zeppelin Air Ship Company have recently carried out some wireless telegraph experiments, using the new Telefunken singing spark system, and have obtained some very satisfactory results. The experiments up to the present have shown that with a comparatively simple laboratory form of apparatus installed on the Zeppelin air-ship signals can be readily given and received at distances up to at least fifty kilometers from the Telefunken Station at Nauen. It has also been found that the large mass of metal employed in the construction of this form of air ship enables considerably less sending energy to be employed for a given distance than is the case with the ordinary land stations or stations carried on other non-metallic types of air ship.

New Methods of Transmission Employed in Wireless Telegraphy.*

BY G. FERRIE.

Among the numerous defects which were charged against wireless telegraphy on its first appearance the chief was that little security was offered as regards the messages entrusted to it; the reception of radio-telegrams could be spoiled, not only by the signals simultaneously sent from other stations, but also by the electric phenomena of the atmosphere. Although the numerous investigations which have been made with a view to remedying this state of affairs do not yet permit of absolute security for Hertzian messages, important improvements have been realized, and the situation is distinctly ameliorated.

The maximum of security would be obtained were it possible to realize, on the one hand, an emission of very regular unifrequent waves, having as small damping as possible, and, on the other hand, receiving and detector circuits of small damping, and which could only be set into vibration under the influence of an oscillatory movement of single, well-determined frequency. At the sender the desired result will be realizable when it becomes possible to generate sustained oscillations of sufficient power.

Since 1903, following Poulsen, numerous attempts have been made to utilize the singing arc supplied at low tension, with a view to producing such waves, but the results are not good enough for modern practice. The production of very high frequency alternators for use in supplying the antenna directly without the intermediary of arc or spark is occupying attention in France at the present time, and the results obtained in this direction will shortly be published.

In the methods in actual use which employ the discharge of a condenser for generating the Hertz waves, either inductive or direct excitation is used. Wien has shown that the disposable energy is split up between the two vibratory motions whose wave-lengths differ the more the closer the coupling employed. It is, therefore, important to try to reduce the difference—that is, the coupling—at the same time keeping the value of the latter sufficiently high for the energy transference from the one circuit to the other to take place. It has been found that for values of the coefficient of coupling lying between .06 and .12 the energy is practically confined to a single one of those two oscillations, the slower or the faster, according to the relative values of the elements of the circuits. For the measurement of the coupling and the damping recourse is usually had to wave-meters and to the equations of Bjerknes.

Although there are many kinds of wave-meter, a new type has recently been devised by the author, which enables measurements to be made without any adjustments from a simple reading. The principle is as follows: Between two points, a certain effective E.M.F. is maintained by means

of a single loop which encloses a part of the flux to be measured. Between these two points two circuits are connected, each containing one wire of a hot-wire ammeter and an impedance. Each of the wires controls a pointer; these pointers are both capable of movement across the same scale. For each value of the frequency the pointers cross at some point on a curve which can be empirically marked on the scale. The apparatus having been previously graduated, the measurement of the wave-length or frequency of an oscillating circuit is made by simply taking a reading of the point of intersection while the loop is held near to the circuit.

The calculation of the damping of antennæ is not a simple matter, owing to the apparent resistance due to radiation and to the difficulty of measuring the low resistances of earth connections. It is, further, important in practice to keep down the ohmic resistance of the circuits. In the installations erected by the military telegraphs, direct excitation is employed, and the resistance of the connections from the exciting circuit is reduced as much as possible, these being made of wide strips of thin sheet copper. Bethenod's formula for the high-frequency resistance of conductors shows particularly that it is important to diminish the thickness of the sheet. Finally, the mass of the sparking electrodes has been made considerable, with a view to avoiding over-heating during prolonged working.

This construction of the circuits has rendered it possible to make the capacity greater, other things being equal, and, as a result, increased the power brought into play, with loose coupling and reduced damping. Poincaré has shown that the radiation decrement of an antenna composed of several wires increases with the number of wires and with decrease of the mutual induction between the wires, hence with increase of the distance apart of the wires; but since the volume which can be given up to an aerial in space is limited in practice, it is advisable to employ a sufficiently large number of wires, within limits.

The method of charging up the condensers is also of importance, not merely as regards the quality of the spark, but also as regards ease of reception of the transmitted signals. Telephonic reception having been almost exclusively employed of late years, the number of sparks and the kind of sound they produce are both of some importance. The majority of installations at present employ low-frequency current which is stepped up for charging the condensers by means of resonance transformers. With such transformers liberally designed, both as regards the iron and the copper circuits, it is easy to obtain pressure rises of six and even of ten. The number of sparks is not equal to the number of alternations, and it is possible, by suitable means, to vary the number of sparks between ten and twenty on alternating current of forty or fifty cycles per second. The sparks being so few in number, each represents a considerable power. Arcing is, however, not so persistent, since the sparks are due to pressure

*Abstract of an article from the bulletin of the International Society of Electricians.

risers; but still, in order to avoid formation of an arc, the electrodes of the spark-gap have been made in the form of large parallel cylinders; for very large powers these cylinders should be kept rotating. A more musical note is obtained by using a metal wheel provided with teeth and rotating between the electrodes of the spark-gap. This suffices for one to two kilowatts, but if a larger amount of power is employed the heating is too great and arrangements must be made to ensure that the spark always jumps from the moving tooth to a new spot on the fixed electrode. For powers of six kilowatts to ten kilowatts, the author, with Fracque and Brenot, has obtained good results using a discharger arranged in the following manner: On a copper cylinder twenty-five centimetres in length copper rods are fixed radially, each passing perpendicularly through the axis of the cylinder, and being equally spaced angularly; fifteen or twenty such rods are used. The cylinder is driven by an electric motor, the minimum tangential velocity of the ends of the rods being fifty metres per second. The sparks occur along the length of the fixed electrodes as each rod on the cylinder arrives in turn at the position where the air-gap is smallest.

A well-sustained musical note is obtained with this device, although some irregularity is caused by the blank spaces which occur in the series of sparks, and which are unavoidable when low-frequency alternating current is used. The use of such dischargers is not limited to the case of alternating currents, for Marconi has for several years past been using a rotating disc discharger with direct current at 10,000 volts.

Instead of employing low-frequency alternating currents, it is advantageous to use alternating current of higher frequency—300 to 1,000 cycles per second—so as to be able directly to obtain sparks of the required frequency for a musical note. Such arrangements have, in fact, been employed by von Lepel and by the Telefunken Company. Investigations along this line also have been made by the author with Fracque and Brenot. These have shown that it is impossible to obtain a musical note with the ordinary discharger, since the blank spaces occur just as with low-frequency alternating current. If, however, the discharger is made in the form of a point opposed to a disc, a good musical note is obtainable; the better the longer the spark, which has been used up to fifteen millimetres. These experiments were made using special alternators furnishing current of 1,000 and of 400 cycles per second. With the latter the note of g' (about 400 vibrations) can be obtained, and by diminishing the excitation c' , and even g . These experiments have as yet, however, only been made with reduced power.

As regards the reception, the use of slightly damped waves has rendered it necessary to find new detectors. These are now available in the shape of detectors operating in virtue of their unilateral properties or as solid electrolytic cells.

For still further safeguarding the receiver against disturbances caused by signals which are

not intended for it, directive antennæ have been tried, with which a maximum intensity is obtained in a definite direction. One ingenious solution of this problem is that due to Bellini and Tosi, and this is being put into practical operation at Boulogne.

Trolley Induction Litigation.

The Indiana Appellate Court, in the case of the Postal Telegraph Company of Indiana vs. the Chicago, South Shore and South Bend Railway Company, which was appealed from the La Porte County Superior Court of that state, has granted the appellee's request for oral arguments and has fixed the same for June 9.

In the case of the Lake Shore and Michigan Southern Railway Company, which also was appealed from the La Porte County Superior Court, the Indiana Appellate Court overruled a motion to postpone the hearing for advancement, advanced the cause and fixed the oral argument thereof for June 9. The same ruling was made in the case of the Western Union Telegraph Company vs. the South Shore Company.

These cases were instituted by the two telegraph companies and the Lake Shore Railroad in December, 1908, in an endeavor to prevent the use of high tension single phase alternating current by the South Shore Interurban Railroad. Judge Tuthill in the La Porte County Superior Court in June, 1909, ruled that the air was free and that the interurban company had as much right to it as the other companies. A motion to consolidate the three cases has also been filed in the Appellate Court.

Need of a Telephone Engineers' Handbook.

Editor Telegraph and Telephone Age:

Do you publish or do you know of any one who publishes a book on central energy telephone work issued in the same size and style as Jones' "Pocket Edition of Diagrams." I would like a book of this nature so that I could carry it in my pocket. All of the books on the telephone which I have are too large to carry in this way.

May 12, 1910.

Linn Roush.

West Bridgewater, Pa.

This is a sample of many inquiries which we receive for a telephone engineers' hand book. It would seem that the demand for such a work would be great enough to amply repay some one who has an extensive practical experience in telephone work for the labor required in its preparation. The telegraph, electrical, mechanical, civil and other engineering fields all have their so-called pocket books, each containing a vast amount of information relating to the particular branch of industry to which it applies and with the large number of progressive men now employed in telephone work there is no reason why that field should not also have its hand book of ready information.

Telegraph and Telephone Age

Entered as second-class matter, December 27, 1909, at the Post Office at New York, N. Y., under the act of March 3, 1879.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

June 1, 1910.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientele. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

The Study of the Telegraph.

The plan which we have recently adopted of publishing in each issue a list of questions, the answers to which can be found in Jones' Diagrams, seems to fill a long felt need on the part of many of those connected with the telegraph who desire to obtain a thorough knowledge of the principles underlying the operation of the apparatus which they see before them every day. It is difficult for most people, unassisted, to study a book and secure therefrom the most important information. The boy in school only learns his lesson so that he remembers it by studying it and then answering the questions of his teacher. If he was left to follow his own course and merely made to devote a certain amount of time to reading the lesson it is safe to say that nine out of ten would fail when examination time came. It is the same with those of more mature mind who endeavor to increase their knowledge by self-education. Upon first reading a chapter in the book which they are studying the principles there evolved, may seem so plain that it appears to be

wasted effort to give that chapter any more attention. This is where the mistake is usually made. With nothing to direct the mind along a course which will enable it to retain the important things which come before it the best things are lost, entirely forgotten when the time comes when they might be of use.

We believe that the plan which we have adopted will enable many of those desirous of increasing their store of electrical knowledge to check themselves before they commit the common error of believing that because a thing is easily understood it is easily remembered. It will be surprising to most people to find how few of those questions they are able to answer after reading over once the text to which they apply. After a second reading they will be able to answer more, but in most cases it will require several careful readings before all of the questions can be answered without referring to the book. As these will appear at intervals of two weeks it will be an excellent idea to study that part of the book to which they apply as soon as the list is received. A half hour or an hour each day spent in this manner for a week would in most cases be sufficient for the student to gain a thorough understanding of that particular part of the book. If this is done he will then be able to take up more intelligently the next succeeding chapters, when the questions bearing upon them appear in our columns.

The words of commendation which we have heard already are sufficiently numerous to make us feel that the plan is a good one and well worth continuing because of the benefit which our readers will derive. We will continue the publication of these questions until we have covered all of Jones' Diagrams and will then take up other standard works on telegraphy and follow the same course.

Cost of Telephone Operation in Chicago.

One of the most complete analyses of the cost of furnishing telephone service in a large city has been made recently by D. C. and W. B. Jackson, expert telephone engineers in the form of a report on the business of the Chicago Telephone Company during the year ending March 31, 1910. This report was prepared in conjunction with certified public accountants and gives these detailed statements: First, a comparative statement by classes of service showing for each the gross revenue, gross expenses, net revenue or losses and the totals covering the portions as a whole; second, a statement showing the details of the investment in property apportioned to each class of service and third, a statement for each class of service showing the details of the expense figures submitted in the first statement.

The company's books show that \$622,296 was expended during the year on reconstruction and replacements. Instead of this amount, however,

the engineers and accountants have added to the expense of operating the property and spread against the various classes of service in the statements of the report the sum of \$1,578,922, which was considered a fair amount to be set aside for depreciation. This figure was arrived at by considering the fact that a large part of the plant has been recently installed and hence has not as yet cost the company anything on account of depreciation, and up to the present time there has been no cost on account of reconstruction occasioned by the construction of street-railway subways; but it is contended that these costs are just as real as the costs for operators or maintenance of plant, and it is said to be just as important for the life of the company and the continued quality of its service that these costs are provided for, although the effect is not so immediately apparent.

Taking this amount into consideration the report shows that the gross revenue for the year was \$7,864,770 and the total expense \$6,973,785, leaving available for dividends and interest on bonds \$890,985. After paying five per cent. interest on the bonds and eight per cent. dividend on the stock this left a deficit of \$908,533.

The tables accompanying the report show that after deducting the proper amount for depreciation only eight classes of service out of the twenty-six included in the classification were conducted at a profit. The greatest profit per station was derived from the public prepaid nickel single party telephone service installed in approved locations only. The net revenue per station on this class of service amounted to about \$67. The greatest loss per station or line was shown in one class of private branch exchange service on which a flat rate is given. The loss in this case amounted to about \$156 per line.

About half of the total deficit is traced to the prepaid nickel four party line residence service, the loss per station on which equals \$5.87. The number of telephones in this class was 72,932.

This report was made for the city in accordance with a provision in an ordinance passed in 1907 extending the franchise of the company. It was made for the purpose of readjusting rates and this question will now be taken up by the city council of Chicago.

Legal.

The ignorance of a clerk as to whether Seida is a man or a woman's name lost for the defendant a suit brought recently against one of the telegraph companies in a municipal court at Detroit. Seida Abda, a Syrian woman, landed at Ellis Island, New York, October 21, 1909, and fell into the hands of crooks. They found that she had a relative in Detroit named John Marab.

They sent a telegram to him asking him to send \$100, and signed the name of Seida Abda. The money was telegraphed and one of the

crooks received it from the telegraph company.

Suit was brought by Marab, and his attorney argued that the company made a mistake in not paying the money to the woman, and that they should have known Seida is a woman's name, and therefore should not have handed the money over to a man.

One of the telegraph companies recently won an important victory in the United States Circuit Court of Appeals when Judge Buffington of that court handed down a decision reversing that of a lower court in an action which was brought against the company in Pennsylvania. During a heavy storm in 1903 fourteen miles of wire were broken down and the company then, to strengthen its line, erected an extra pole between every two in position before the storm. The residents along the road contested the right of the company to erect the poles.

The lower court sustained this contention and refused to grant the company an injunction restraining the residents from chopping down the poles. The Court of Appeals, however, holds that the company has a right to make these improvements and orders that the decree of the lower court be reversed, the case reinstated and an injunction issued restraining the respondents from tearing down, or in any way interfering with the erection of the poles, so long as the complainant stays within the bounds of the law.

The Supreme Court of Massachusetts decided recently that a telegraph company had no right to refuse to accept and transmit a proper message for which pay had been offered. In the case in question suit for damages was brought against the company for its alleged refusal to transmit a message to which was attached a sticker which said:

"Notice is hereby given that this is a business message and that failure to deliver it promptly and correctly is likely to cause sender financial loss."

The court's opinion said that such a notice would furnish no justification for a refusal to send a message whether it might or might not be sufficient reason for charging something more than the lowest rate established for the transmission of messages. It was intended to show that the damage for a failure properly to send and deliver the message would probably be substantial, and, under the statute and the rules and regulations of the company, create a liability that might reach the sum of \$100.

Such a liability might exist without a special notice if the language of the message sufficiently indicated the importance of a prompt delivery of it, and the loss that would result from a failure to deliver it promptly.

Whatever negotiations or proposals or limitations on the part of the defendant might have been warranted by the giving of the notice, the absolute refusal to receive and send the message was unreasonable and justified a finding for the plaintiff.

The Baudot Printing Telegraph.

The Baudot printing telegraph system which is described in considerable detail in "The Hughes and Baudot Telegraphs," by Arthur Crotch, is somewhat similar to the Hughes system described in our May 1 issue, in that the printing is done on a tape from a type wheel. It possesses a great advantage over that system, however, in that it allows of the use of the wire at one time for the transmission of four separate messages and on comparatively short circuits this number may be increased to six. Unlike the usual multiplex systems in which half of the messages are transmitted in one direction and half in the opposite direction all of the messages may, if desired, be sent in one direction by this method.

It is a well-known fact that in ordinary Morse working, the duration of the impulse used to send a dot is much greater than the time required for the current to rise to its working strength and then to fall to zero. If then the duration of the signals can be shortened, the speed of working may be greatly increased. This is what is accomplished in the Baudot system. The principle by which this is effected is as follows: The line is not permanently connected to any one set of apparatus, but is caused to make regularly recurring contact with each set. Thus each sending operator has the use of the line for approximately one fourth, one fifth, or one sixth of the time, as the case may be, in which to transmit his signaling impulses over the wire. The requirement for Morse multiplex working in this way is that the line be brought at each end to a revolving arm carrying a metallic brush which sweeps over a circle divided into as many insulated segments as there are separate sets of apparatus to be worked on the line. If the two arms are made to revolve in synchronism then during a fraction of each revolution an insulated segment at one end of the line will be connected to a corresponding segment at the other end.

Supposing that the duration of the contact between the line and a segment is about equivalent to the length of a dot. Then if a dot be sent by a key connected to a segment at one end while the brush is passing over that segment it may be received intact on a relay attached to the corresponding segment at the other end. If the key contact is not closed until the brush is about to pass off the segment the signal will be clipped short. A dash would be inevitably cut short. If, however, the revolving arms were run at a high rate of speed, say several hundred revolutions per second, the depression of the key for a dot would be of sufficient duration to send a rapid succession of impulses to the line. The sending of a dash would simply mean a greater number of such impulses. Suitable apparatus being provided to convert these rapid successions of impulses into continuous signals, it will be seen that although each set of apparatus is worked

precisely as if it had sole possession of the line it is actually disconnected from it the greater part of the time. It will also be noted that the current sent out by any set may travel in either direction without interfering in any way with the operation of the other sets.

In applying this principle to Baudot operation, each segment of the ring described is divided into five equal segments, all insulated from each other and the rest of the ring. At the sending end each one of these segments is connected to a key and at the receiving end the segments are connected to a series of five electromagnets. From the previous explanation it will be clear that if one, two or all of the keys be held down a current or currents will pass to the line and will be received on the corresponding electromagnets at the opposite end. The keys are connected, however, for double current working, that is, when in their normal position the segments are all connected to the negative pole of a battery, and where any one is depressed it connects its segment to the positive pole of the battery. Thus if none of the keys are depressed a succession of negative impulses will be sent to the line with each revolution of the trailer arm. If the first one only is depressed a positive impulse followed by four negative impulses will go to the line, and so on. As the receiving magnets are not polarized they would be affected either by positive or negative impulses. To avoid this a relay is inserted in the line at the receiving end, the tongue of which is connected to battery and one contact of which is connected to the trailer arm. When a positive or marking impulse is received over the line this relay makes the proper contact and transmits an impulse to the proper segment and thence to the corresponding electromagnet. When a negative or spacing impulse is received the relay breaks contact and the corresponding electromagnet is not affected.

The five keys and magnets thus described represent the means for sending and receiving one message only.

The five keys are arranged so that one, two or all of them in any order may be depressed by the fingers of one or both hands. It will be seen that no matter how many of the keys are depressed the passage of the trailer over the segments will result in sending to the line five impulses of current. Each such set of five constitutes a character, the different characters being obtained by varying the order and direction of the currents. Thus all of the letters and figures are of equal length, that is, they each require the transmission of five current impulses. At the receiving end, however, only the positive or marking impulses actuate the magnets.

In order to form the signals correctly the operator must hold his keys in the proper formation while the brush is passing over the segments to which they are connected. As soon as it has passed he must get the next combination ready. To permit him to do this he is provided with a telephone receiver, known as a cadence telephone. This is so connected that just before the brush is to pass over the segments on which he is working, a momentary current is sent through the telephone and thus he is informed

that the trailer is about to pass. While he is getting ready for the next signal the printing mechanism at the other end of the line having been actuated by the receiving magnets, is performing the operation of printing the character sent. When sending, instead of allowing the current to pass through the line relay at the home station, and thus actuate the printing mechanism so that the operator may have a check on himself, a leakage path is provided so that a small part of the current passes through what is known as a leak relay, and this operates the printing apparatus, thus allowing the sender to see that the correct signals are being transmitted.

The receiving electromagnets each have a single coil. The armature is pivoted to the piece of soft iron forming one end of the coil, and when the magnet is actuated this armature comes in contact with a similar piece of soft iron, which forms the other end of the coil, thus completing the magnetic circuit. A flat spring normally keeps the armature from making this contact.

Mounted inside the case of the instrument, on the principal axle of the machine, is what is known as the combiner. This consists first of all of a toothed wheel by which the axle is turned. On the same shaft, close to this wheel, are mounted side by side two steel discs, having cut on their peripheries a series of notches. Separating them from each other, and from the toothed wheel, are two thin discs of somewhat larger diameter. The one of these, which is between the two thicker discs, is not quite continuous, but is cut away for a short distance. Mounted above these discs is a series of five levers, the lower ends of which will normally rest on the periphery of one of these discs in the groove formed by the disc itself and the two thin discs. This groove is called the spacing groove, while the groove formed on the periphery of the second disc, is called the marking groove. The levers mentioned are free to move laterally in the direction of the shaft, and when the part cut out of the disc, separating the two grooves, in the course of its revolution comes opposite these levers, they are free to pass from the spacing groove to the marking groove. The magnets actuated by the series of impulses sent over the line will cause their corresponding levers to be moved from one groove to the other, while the levers corresponding to the magnets, which are not operated, will remain in the spacing groove during the course of that revolution. At the end of the revolution unless held in the marking groove by the next succeeding impulse the levers will be automatically returned to the spacing groove.

As mentioned previously, the discs which form the bottom of the two grooves have notches cut in their peripheries, these notches extend over thirty-five fortieths of the circumference, the remaining five fortieths opposite the space cut out of the separating disc being left plain. Where a notch is cut in one disc the other disc is left plain. The formation of the various characters is dependent upon the arrangement of these notches. When a character has been sent over the line, or rather the impulses corre-

sponding to a character, and the magnets thus actuated have moved their levers over into the marking groove, there is a certain point in the course of the revolution of the combiner when there will be a notch beneath the foot of every one of the five levers. When this point is reached a spring which acts collectively upon the heads of all of the five levers forces their feet into these notches. The combiner is all of the time traveling at a fair rate of speed and the feet of the levers are no sooner in the notches than the traveling of the wheel throws them out. This ejection is in the nature of a sharp blow which is transmitted to their heads and from the heads to the mechanism which causes the paper to be brought into contact with the type wheel.

The type wheel is mounted on the same shaft as the combiner, and thus revolves with that part of the mechanism. Nine-fortieths of its circumference is left plain, and on the remaining portion the letters of the alphabet are raised. Alternating with the letters are the figures, punctuation marks, etc. When in its normal position with reference to the shaft, letters only will be printed. It is not rigidly fastened to the shaft, however, but is so arranged that when a certain combination of signals, known as the figure space, is sent over the line it will be shifted forward in relation to the shaft a distance equal to half of the distance between two letters. Then when the required combinations are sent over the wire, figures or punctuation marks will be printed. The same set of combinations of signals used for transmitting letters are used for transmitting punctuations. When it is desired to begin printing letters again another combination, known as the letter space, is sent over the wire, and the type wheel is automatically shifted back to its normal position.

As the work done in the receiver is not constant, it is necessary to have a governor or moderator to keep the speed uniform. Part of this consists of a brass disc fastened to the frame of the machine and hollowed out on one side, so as to present an inclined plane to the second part of the device which is mounted on the main driving shaft, which passes through the center of the disc. The moving part consists of a weight loosely mounted and held in position by two spiral springs. Opposite the hollowed out part of the disc this weight carries a small brush of tow. Normally this brush does not come in contact with the disc. When the speed of the shaft increases beyond the normal, however, the weight brings an extra tension on the springs and flies outward. As it does so the brush moves outward and comes in contact with the inclined surface of the disc, the friction resulting acting as a brake. The higher the speed the greater the pressure between the two, and the greater the braking effect. As the axle on which the moderator is mounted is running at a much higher speed than the one on which the combiner and type wheel are mounted, any variation in the speed of the latter will be greatly multiplied on the former. The springs which restrain the weight may be so adjusted that the speed variation of the apparatus is very slight.

In order to be operated by the extremely short impulses of current used it is necessary that the relay employed should be very sensitive. The form of relay used with this apparatus consists of a pair of permanent horseshoe magnets clamped together with a piece of soft iron between each pair of poles. In each of these pole pieces a short vertical pin is inserted, ending in a sharp point, and these points serve as pivots for the armature. The armature consists of three pieces. Two pieces of circular section of unequal length are joined together with a piece of brass intervening. Across the inner end of the longer piece a rectangular crosspiece is fastened. This crosspiece is above the poles of the electromagnets and both of its ends are of the same polarity. A change in the polarity of the magnet cores will consequently cause the armature to respond very quickly. A vertical tongue attached to the armature plays between the two contact points.

Three of these relays are used at each end of the line. The first one known as the line relay repeats impulses of the same kind as those received into the coils of the combiner relay. This relay in turn repeats positive impulses only to the electromagnets of the receiver. The third relay is the leak relay which is brought into action as previously mentioned when the station is sending.

The distributor which distributes all of the impulses received to their proper destination consists of two ebonite plates one of which carries six circles of brass made up of segments arranged in the proper order and the other one of which carries four similar circles. These plates are stationary while by means of arms carrying brushes which revolve over them the actual work of distribution is performed. One of these rings is solid and is permanently connected to the line. Adjoining this is a ring made up of twenty-four segments, five for each of the four arms of the apparatus and four for correcting currents. These segments are connected directly to the levers of the sending keys. The second set of rings consist of one made up likewise of twenty-four segments and one made up of five segments four of which are each equal to five of the smaller ones and the fifth of which is equal to four of the smaller ones. The smaller segments of the one ring are connected to the receivers while the four larger segments are connected through a switch of each sender to the tongue of the leak relay. A third pair of the rings is made up of one which has twenty short segments all electrically connected together and one short movable segment likewise connected to the others. These segments are all connected to the tongue of the line relay. The second ring of this pair has one long segment which is opposite the twenty short ones of the other ring and one shorter one which occupies the remaining space of the circle and is thus opposite any space in which the movable segment may be placed. The long segment of this ring is connected to the

coils of the combiner relay. The movable segment is for the receipt of correcting current and the segment opposite it is connected to the correcting magnet. A fourth set of rings is like the second set described, the longer segments being connected to the tongue of the combiner relay through the receiving switch on each arm and the shorter segments being connected directly to the receivers. The fifth set of rings is made up in the same way as the first. The solid ring is connected to a battery which sends currents through the cadence telephones and correcting currents to its own receivers by means of the connections made with the short segments.

The distributor is provided with a regulator similar to that used on the receiver. The brush, however, and disc on which the brush rubs are omitted. The extra energy required to drive the revolving weight as the speed increases and the circle which the weight describes increases is sufficient to compensate for any slight irregularities which may occur. The work of the distributor being simply to turn the bushes, the load on that instrument is practically constant so very little speed regulation is necessary.

When the signals arrive they are not sharply divided into their constituent impulses but come as a series of waves more or less running into each other. The shortened segments of the ring in the third pair described serve to separate these waves and to utilize only the stronger portions or the crests. The combiner relay being fitted with a low resistance shunt which renders its movements sluggish the signals are repeated into the receivers at their proper length.

For the successful operation of this system it is of course necessary that the two distributors and the eight receivers shall run in perfect synchronism. The arrangements for accomplishing this are of two kinds main and local. For the former the distributor at one station is made standard and caused to send correcting currents regularly to the line. The other distributor is fitted with apparatus to be actuated by the receipt of these currents. There is thus no interchange of correcting currents the latter being sent in one direction only. The standard distributor is set at a certain speed and the one fitted with correcting apparatus is set to run slightly faster so that the correction will always act as a retarding influence. Local correcting currents are sent from each distributor to its own receivers. Two twenty-fourths of the time required for each revolution of the distributor is consumed in sending correcting currents to the line. Connections are made by the brushes between the movable segment of the ring in the third pair mentioned and the distributor correcting magnet. The segment mentioned is made adjustable to provide for varying retardation in the line. When properly adjusted and when the distributor is running at the proper speed no impulse will be received in the cor-

rector magnet. If, however, the speed is too high current will flow to the correcting magnet and the armature of that magnet will operate a brake thus cutting the speed down to the desired limit. The same principle is made use of in making local corrections between each distributor and its receivers.

From the description so far given it might be inferred that the transmission of an impulse was instantaneous. Such, however, is not the case and the length of time which it takes for the current to flow from the sender to the receiver is appreciable when compared with the total duration of an impulse. This time factor depends of course upon the electrical constants and length of the line. On this account if the two distributors were running exactly together, that is, if segment 1 of the sender was connected to the line at the same time as segment 1 of the receiver at the distant station the impulse sent out from segment 1 instead of being received on segment 1 would be received on some other segment as 2, 3 or 4 depending upon the amount of retardation. To provide for this the distributor at the receiving end is run far enough behind the sending distributor to make up for this difference. This would avoid all further difficulty if we only wished to send one way. Suppose the distance which the distant distributor lagged behind the home distributor was equal to one segment. Then if we were sending on the first two arms of the home station impulses sent from segments 1 to 10 inclusive would be received on segments 1 to 10. If then we desired to send from the distant station on the two remaining arms impulses sent from segments 11 to 20 inclusive would be received on segments 13 to 22 inclusive. In this case if all of the rings were running in phase with each other the impulses in question would not reach their proper receiving magnets. To avoid this one of the distributor plates which bear the rings may be turned with reference to the other until the impulse sent from the distant station will be received on the proper magnet at the home station. To accomplish this the distributor plate at the home station only has to be moved.

Duplex working is possible with this system but has never been attempted in France, where it is chiefly used, as the capacity obtained by simplex working is sufficient to meet all ordinary demands. Repeaters are used with the Bandot to a considerable extent. Where the traffic is sufficient, between two points far enough apart to require repeaters, it is customary to allot two wires to the traffic, one to be worked one way and the other in the opposite direction. In this case a simple form of repeater can be used. When a wire is worked both ways, however, a more elaborate arrangement is required and a distributor becomes necessary at the repeating station.

Wheatstone Working in England.

In view of the return to the use of the Wheatstone system in this country the following description of the way traffic is handled in England by this method will be of interest. This outline was very kindly given us by Major Walter A. J. O'Meara, engineer in chief of the British Post Office in a recent letter which reads as follows:

"The transmission of news traffic in this country is dealt with almost entirely by the Wheatstone system.

"London is the distributing centre for news work, and about twenty special 'news' wires radiate from the central telegraph office to all parts of the country. A number of offices are in circuit on each wire so that about 80 towns are in special direct communication with the central telegraph office for the reception of news messages.

"During parliamentary sessions and other periods of pressure, the number of special news circuits is considerably increased.

The average working speed on these lines is 250 words per minute.

"Wheatstone slips up to eight in number, can be perforated simultaneously by means of pneumatic perforators, thereby avoiding delay to those news items which have to be transmitted to a large number of stations.

"At the receiving offices the Morse slips are written up by hand. If re-transmission be necessary, the written messages are dealt with, being either sent by key, or re-punched and forwarded by Wheatstone transmitter.

"For some years past, Creed receivers have been in use in the Manchester office which re-transmit much of the news matter received from London to the smaller towns in Lancashire and Yorkshire. These instruments have been found very useful for this class of work, the only drawback being that they limit the working speed of the circuit to about 100 words per minute. With recent improvements, however, it is probable that the speed of perforating the received tape may be raised to 150 words per minute.

"Where Creed receivers (perforators) are in use for the reception of messages to be delivered locally, the perforated slip is passed through a printing instrument which translates the Wheatstone signals and prints the messages in Roman characters on slip, at a speed of about 100 words per minute. The Creed system, however, has not yet been extensively adopted in this country, and further comments on its merits would be premature."

"The Practical Management of Dynamos and Motors," by F. B. Crocker and S. S. Wheeler, as indicated by its title, affords a clear understanding of the use, care and operation of these important adjuncts of the well equipped modern telegraph office. There is a constant demand for this book, for telegraphers find it an invaluable addition to their working library. There are 206 pages, and 99 illustrations; price, \$1. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

The Military Telegrapher in the Civil War.

PART XL.

Mr. H. D. Sloat, who is at present living at Elgin, Ill., served as a member of the United States Military Telegraph Corps in Arkansas during the Civil War. In writing to Colonel William R. Plum, the historian of that organization, in 1879, he gave the following account of his military experience which shows that although he was not exposed to all of the dangers that some of his comrades were, who were located where more important military operations were in progress, still life in that section of the country was not entirely without excitement.

"I commenced my career as an operator in 1860, at which period I was placed in charge of the old Pacific Telegraph Company's office at Ft. Kearney, Nebr. This was long previous to the building of the Union Pacific Railroad, or, in fact, long before that gigantic project was conceived. I spent nearly two years at this frontier post, during which time I devoted myself energetically to the acquiring of the art of reading signals by sound. The tedium of picking up the art was relieved semi-occasionally by orders from headquarters at Omaha to start out on repairs and, by the way, in order to give something of an idea of the difficulties and hardships of early Pacific operators in obtaining a knowledge of the art, I will say that I had seventy miles of wire to keep in repair, besides conducting the office and keeping up a small battery.

"But orders to go on the line were not so unpleasant after all, and bringing a government mule into requisition I would get over my fifty miles on the western division pretty lively, though at seasons, when the buffaloes made use of our poles as scratching apparatus, thereby breaking poles and dragging the wires about utterly regardless of the law they were violating. I was obliged sometimes to work an entire week in repairing one break of this nature. When I joined the military telegraph corps I was assigned to take charge of the Pine Bluff, Ark., office, in Colonel Cloglin's department, and after a few months' very pleasant experience, socially and otherwise, during which period I was initiated into the mysteries of military cipher telegrams, I received orders from R. C. Clowry, then captain and assistant quartermaster in charge of military lines at Little Rock, to report at that point for duty. At this juncture I want to pay a brief but heartfelt tribute to Colonel Clowry. He was a whole-souled, genial, unassuming gentleman, whose position never interfered with his friendly intercourse and gentlemanly deportment towards his subordinates. He was one of the few men whom promotion does not spoil.

"I wish also to express my good opinion of Messrs. Smith and Holt, with whom I was associated in the Little Rock office. I remember them as genial fellows, first-class telegraphers and a credit to the profession generally.

"My only experience in actual military service was on the occasion of my accompanying a cavalry expedition of 200 men up the Arkansas River. Two steamers had been despatched for Fort Smith with supplies, but owing to the low stage of the water, they had become stuck in the sand bars about fifteen miles above Little Rock. I was selected as operator to accompany the expedition and report progress with the aid of a set of pocket instruments. We reached the boats without any difficulty except marching under a torrid sun and I was detailed with about a dozen men to go to the telegraph line, which ran parallel with the river, about three miles distant. I shall never forget that tramp over the roughest section of the country conceivable, with the sun's ray pouring down upon us with fearful intensity. We did not succeed in finding the line but really lost our bearings, and before we knew it had described a circle and struck the river again, just as our steamers were passing back on their return to Little Rock. I came very near suffering sun stroke and when we reached the river I was violently ill.

"I am not likely to forget a little incident which occurred on the previous night, before we reached the boats and while in camp. I took a few men as guards over to the line, which at that point ran close to the river, for the purpose of reporting progress to headquarters. We were obliged to cross a bridge spanning a little stream from which a plank had been torn up as a precaution against surprise from the guerillas who were (in our imagination at least) concealed all about the place. Tying our horses on the camp side, I stationed my men and proceeded to bring the two sections of the telegraph wire into the window of an old deserted and dilapidated hotel in order to establish communication with Little Rock. Unfortunately, however, I could get no response to my repeated signals. You can easily imagine that the situation was somewhat 'ticklish' to me, out there in the darkness with the dense forest all around me and the thought of a guerilla picking me off with a rifle. Just at that moment I heard the sharp report of a gun, either from a sentry or a guerilla. This was followed by a call to arms in the camp and my boys came rushing in, declaring the guerillas were on us. We scrambled over that break-neck bridge and mounted our horses and started for camp, I bringing up the rear. We were obliged to ride along the base of a precipitous brush-covered bluff, the boys were ahead and I was spurring my horse frantically to catch up with them, when I heard something breaking through the brush, above me. At that, every hair stood up on my head like bristles—yes, like the bristles of that infernal hog coming through the brush which I had taken for a guerilla. I don't remember telling this to the boys.

"The alarm proved to be false, however, and soon the camp became quiet. The next morning we moved on again in search of the steamers. I sometimes recall this incident of my military experience and enjoy a hearty laugh over my encounter with that swine guerilla. I afterward came north on account of an attack of chills and fever, and fearing

I should experience a return of the malady should I go back, I concluded to remain in the north."

Mr. James Jones served as an operator in the United States Military Telegraph Corps in Kentucky and Tennessee during a greater part of the Civil War. In writing to Colonel Plum, in 1878, he gave in part the following account of his military experiences:

"I was the first operator at Stanford, Ky., on the line to Somerset. When this line was extended to Cumberland I was sent to Mount Vernon. Returning to duty at Mount Vernon, after a leave of absence, the day after the battle at Richmond, Ky., I was captured by a portion of General Kirby Smith's command near Terryville, Ky. I marched five days with the Confederates, a distance of about 100 miles. I was then released on parole at Frankfort, Ky. I was exchanged after two months and sent to Munfordsville, Ky., where I remained about six months, and from there was sent to Glasgow, Ky., the headquarters of the third division of the twenty-fourth army corps, General Judah commanding. After the movement of the Army of the Ohio into east Tennessee I was sent to Burnside Point.

"One morning while I was stationed at Mount Vernon, General Morgan's command of Confederate cavalry reached Crab Orchard. The operators at Landon and Cumberland Gap, as well as myself, had been notified to be on the lookout for him. About ten o'clock someone on the wire called 'MC,' my office call, and said: 'Where is Morgan?' The question and the style of sending satisfied me that it was Morgan's operator, Ellsworth, so without indicating any suspicion, I replied: 'Morgan was south of Richmond this morning. Wolford's cavalry and the seventh Pennsylvania regiment are in close pursuit. Our troops here are preparing to cut them off in the direction of Somerset. I think we will bag the rascals.' The troops of Mount Vernon consisted of one sick soldier, forty or fifty home guards and myself. The home guards were called out and a small party sent in the direction of Crab Orchard. Seeing no signs of the enemy they continued until they reached the town where they learned that the Confederates had left in a great hurry, having learned by tapping the wire that a large force from Mount Vernon was moving to cut off their retreat. The home guards returned to Mount Vernon and reported the situation to me, whereupon I was able to explain the reason for the enemy's sudden retreat. Upon his return to Dixie, Ellsworth published an account of his exploits with the telegraph, but somehow forgot to mention the one at Crab Orchard.

"At Mount Vernon the telegraph was a new thing, as before the extension of the military line to that point many of the people in the mountains had never heard of it. As a consequence the operators were regarded as superior to ordinary mortals and were asked many strange questions. One man in particular, however, would not be fooled. After listening to the story of the speed with which the telegraph

would carry intelligence, this old man said: 'Stranger, that's a lie. A humming bird is the fastest thing on earth, and it can't begin to make the time you say this thing makes.'

"While I was stationed at Munfordsville, General Morgan made a raid along the Louisville and Nashville Railway, destroying to the best of his ability the railroad and telegraph lines. Following this, I started out with a party of men to make repairs. The Confederates had cut down some of the poles, burned others, broken the wires, and twisted them in all imaginable shapes, in some places carrying them away into the forest and winding them around the trees. Consequently I had a hard task to restore communication between Munfordsville and Nashville. I think I made more splices without tools than any other man living. Arriving at Elizabethtown I learned that another party from Louisville had reached Muldranglis Hill and would soon meet me. The railroad buildings at this point having been burned, I was given permission by a lady residing in the town to run the wire into her house. The other party came along in a short time, connection was made and the first message sent over the line was the official announcement from General Rosecrans to General Halleck of the victory of Murfreesboro. I was complimented by Captain Samuel Bruch, superintendent of military telegraph, for my promptness in opening up communication, but no notice was ever taken of it by the government or military authorities.

"In February, 1864, I was sent from Burnside Point to Clitwoods to open a new office there. A line repairer went with me to reconstruct the line as we went along. When we arrived at that point, I found that the line was open. My repairer went back, found a break, repaired it, and returned and still there was no circuit.

"We remained there three weeks and the line was never put into working condition. At the end of that time I received orders to return to Kentucky, as the route had been abandoned.

"I was next stationed at Jacksboro. While I was there, General Joseph Wheeler, with his cavalry, crossed the river at Strawberry Plains and moved in the direction of Clinch River. I had with me at the time as line repairer James Palmer. The line between Jacksboro and Knoxville having ceased working, I sent Palmer out to look for the break. When he approached Clinton, he learned that the Confederates had appeared on the south side of the Clinch River. He also met a woman who had talked with some of the Confederate soldiers who had told her they would cross the mountains at Jacksboro or Wheeler's Gap two miles below that point.

"This news caused great excitement in Jacksboro. A few troops there at once began to look for a place of safety in the woods and all of the male citizens sought the same shelter. That the Confederates would cross at one of the points named appeared plausible enough but to me it appeared to be too plausible. I could not see why

known, so while the others sought places of safety, I concluded to wait and see what would happen. Making the best preparations possible for safety in case of a hasty flight, I took my station at the key while Palmer laid down and went to sleep. I waited until daylight when Palmer took the watch and I slept for a while. In the meantime, I had received the following message from Captain W. L. Gross: superintendent of military telegraphs:

If you should have to leave Jacksboro, do not go farther than to secure your safety and return as soon as possible. Try and report where the Confederates cross the mountains.

"As the Confederates did not come to Jacksboro it was necessary to look them up. This duty was assigned to Palmer and he performed it most satisfactorily. My message to Captain Gross gave the hour when the Confederates crossed at Winters Gap, their number, and the number of guns which they had with them. It also predicted that they would strike the railroad at or near Murfreesboro three days after the time of crossing. This prediction proved accurate as the Confederates reached the railroad at the exact place and time given in my message. As a result they were driven back and the military branch of the army claimed great credit for their success in defeating the movements of the Confederates. Needless to say, however, not one word of credit was ever given to the telegraph operator who secured the information which gave the army its victory. The theory of the commanders of the army in regard to this raid was that its objective point was the Louisville and Nashville Railroad and preparations were made accordingly. My report, however, gave them accurate information as to the real objective point and enabled them to drive the Confederates back."

What is Electricity?

First we must ask what is positive electricity? and the answer is still we do not know. For myself I do not even guess—beyond supposing it to be a mode of manifestation, or a differentiated portion of the continuous and all-pervading ether. It seems to exist in lumps the size of the atoms of matter; and no portion of it less in bulk than an atom has ever been isolated, nor appears likely to be isolated. But although it may have bulk, it appears as if it had no appreciable mass; the massiveness or inertia of the atom is probably due to something else, in fact to the possession of negative charges in equal amount. This part of the doctrine is not yet certain. More investigation is urgently needed into the meaning and properties of positive electricity. Meanwhile we shall only be following the lead of Professor J. J. Thompson if we assume that a unit of positive electricity has a massiveness (or what is often inaccurately called "weight") either zero or very small, most

probably very small; perhaps about one per cent. of the mass of some atoms of matter may be due to the positive electricity which they contain.

But concerning negative electricity we know a great deal more. This exists in excessively minute particles, sometimes called electrons and sometimes called corpuscles; these are thrown off the negatively charged terminal in a vacuum tube, and they fly with tremendous speed till they strike something. When they strike they can propel as well as heat the target, and they can likewise make it emit a phosphorescent glow; especially if it be made of glass or precious stones. If the target is a very massive metal like platinum, the sudden stoppage of the flying electrons which encounter it causes the production of the ethereal pulses known as X-rays. Electrons are not very easy to stop, however; and a fair proportion of them can penetrate not only wood and paper, but sheets of such metals as aluminum, and other moderately thin obstacles. That is because they are extremely small much smaller than the atoms of matter.—Sir Oliver Lodge, in Harpers.

The Quadruplex.

"The Quadruplex," by Maver and Davis, is doubtless the most thoroughly practical low-priced work treating on this subject ever published.

It is clear and lucid in its style, a text-book free of all technicalities and easily comprehended. It contains 128 large pages, is copiously illustrated, bound in cloth and well printed on heavy paper.

It embraces just the ideas that should find a place in every telegraph office, and no telegrapher who desires to acquire a complete knowledge of multiplex telegraphy, the perfect understanding of which is so essential in these days, should fail to promptly obtain a copy of this important book.

Its chapters include: Development of the Quadruplex; Introduction and Explanation; The Transmitter, Rheostat and Condenser; Stearns Duplex; Instruments of the Polar Duplex; The Polar Duplex; The Quadruplex; The Dynamo-Electric Machine in Relation to the Quadruplex; The Practical Working of the Quadruplex; Telegraph Repeaters; The Wheatstone Automatic Telegraph.

It will be seen at a glance that such chapters as these fully cover the modern apparatus found in the telegraph offices of to-day. Copies of this book can be obtained from us at \$1.50 each, express charges prepaid. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

As there are only a few copies of this important work on hand and as a new edition of the book is not contemplated, it will be well to secure a copy before the supply is exhausted.

Telegraphy of Photographs, Wireless and by Wire.

Mr. T. Thorne Baker, of London, England, who has been spending some time in this country, on May 14 gave a very successful demonstration of the operation of his apparatus for transmitting photographs by wire on a circuit between New York and Boston. One of the lines of the American Telephone and Telegraph Company was used for this purpose and the operation of the device was witnessed at both terminal points by many men prominent in the commercial and scientific world. By retouching, the photographs transmitted in this way may be made as good as the originals. Mr. Baker hopes to be able to make a test of his apparatus between New York and London in the near future over one of the transatlantic cables. The time required to transmit an ordinary photograph is about four minutes. Previous to this test on the evening of May 11, Mr. Baker, in an address before the New York Electrical Society, described the operation of his apparatus and exhibited some of the results which he has accomplished.

Just before coming to America Mr. Baker delivered a lecture before the Royal Institution at London, in which he said in part that it frequently happens that when two alternate processes are available for certain work, and one of them is considerably less practical than the other, that the less practical one is possessed of much higher scientific interest. This may certainly be said of the telegraphy of pictures and photographs. The whole of the methods of transmission can be classed as either purely mechanical, or dependent on the physical properties of some substance, which, like selenium, is sensitive to light. The latter methods are of no little scientific interest, and, although very delicate and for the moment obsolete, there is every likelihood of their coming into more extended use later-on.

The telegraphing system has been employed by the London "Daily Mirror" for the transmission of photographs since July, 1909, and has been worked very regularly between Paris and London, and Manchester and London. The method of telegraphing photographs that has been employed on a large scale by the "Daily Mirror" may be called a practical modification of several early attempts. The effect of an electric current to discolor certain suitable electrolytes or to set free an element or ion that can be used to form, with a second substance a colored product was employed in many early forms of instruments for telegraphing writing, etc. If we break up a photographic image into lines which interrupt the current for periods depending on their width, these interrupted currents can be used at the receiving station to form colored marks which join up en masse to form a new image. Mr. Baker's telegraphic process is thus briefly as follows:

At the sending station is a metal drum revolving under an iridium stylus, to the drum being attached a half-tone photograph printed on

lead foil. Current flows through the photographic image to the line and thence to the receiver. The receiver consists of a similar revolving metal drum over which a platinum stylus traces. Every time the transmitter stylus comes in contact with a clear part of the metal foil current flows to the receiver, and a black or colored dot or mark appears on the chemical paper. But it will be readily understood that if the reproduction—built up of these little marks, which have to be made at the rate of some 200 per second—is to be accurate, each mark must be only exactly as long, in proportion, as the clear metal space traversed by the stylus.

In this system a metal drum is revolved by a motor, making one revolution every two seconds; over this a metal stylus or needle traces a spiral path in the same way as a phonograph. On the drum is fixed a half-tone photograph broken up into lines, and printed in fish glue upon a sheet of lead foil (in these line photographs the light and shade of the picture is made up of masses of thinner or thicker lines, with clear spaces in between). As the stylus traces over such a photograph its contact with the metal base is interrupted every time one of these fish-glue lines comes beneath it, and for such a time as depends, of course, on the width of the line. The transmitting instrument thus sends into the telegraph lines a series of electric currents, whose periods of duration are determined by the width of the lines composing the photograph. A similar stylus traces an exactly similar path over a revolving drum in the receiving instrument, but round this drum is wrapped a piece of absorbent paper impregnated with a colorless solution, which turns black or brown when decomposed by an electric current. What happens then is that every brief current which passes through the paper causes a mark to appear on it. The width of the mark depends on the duration of the current—or should do—so that these marks gradually combine to re-compose the photographic image.

This method is all very well in the laboratory, but when we come to try it over a long distance the capacity of the line at once causes serious interference. If the circuit be closed by means of a Morse key, the time of contact at the key being one-sixth of a second—a common time duration of a short tap—the discharge of current from the cable would be considerably longer than one-sixth of a second. When, therefore, we are sending signals through the line at the rate of 175 per second, it is not difficult to see that every signal will run into the next dozen or so at the receiving apparatus, and the result will be a hopelessly confused mass of overlapping marks. The use at the receiver of what is termed a line balancer, a modified form of shunt apparatus embodying the principles of wiping out residuary currents from the cable in the way frequently made use of in duplex telegraphy, has rendered commercial the old ideas of telegraphing by the electrolytic method, and as many as 300 sharply defined chemical marks can be recorded in one second by its use.

If a picture revolving beneath a tracer has to redraw itself, as it were, on a piece of paper perhaps hundreds of miles away, it is obvious that each mark redrawn must occupy a precisely similar spot on the new paper as it does in the original picture. As cylinders or drums are used in picture telegraphy, this means that they must revolve in perfect unison. The method of synchronizing used by Professor Korn has proved very satisfactory, and has been adopted in practically all systems of phototelegraphy. The motors which drive each drum are run at about 3,000 revolutions per minute, and geared down very considerably, so that the drums themselves revolve, perhaps, at thirty revolutions per minute; the motors are run from secondary batteries and should be run for a sufficient time before beginning a transmission to allow of their warming up. The speed of each motor is controlled by a regulating resistance in series with the field magnets, and the speed is ascertained by means of a frequency meter.

The receiving drum is revolved a little quicker than the transmitting drum. It consequently completes its revolution before the transmitter. It is then stopped by a steel check, and is obliged to wait until the other drum has caught up. When the transmitting drum has completed its turn, a fleeting contact comes into play, a reverse current is sent to the receiving station, this is led into a polarized relay which actuates an electromagnet, and this magnet removes the check. Thus both drums must always start off in unison for each new revolution. It was found that where each operator endeavors to keep his motor running uniformly by regulating the resistance according to the fluctuations recorded by a frequency meter, the personal element makes itself visible in the results; straight lines appear wavy, and the synchronism is not at all good.

The great advantage of this process is that the whole operation is in full view, whereas with systems in which the received picture is obtained on a photographic film one has to develop such film before it is possible to discover whether anything is wrong. With the receiver described, the operator keeps his hand on a sliding contact of the resistance in the line balancer and merely adjusts their position during the first two or three seconds according to the condition of the electrolytic marks—i.e., whether crisp and concise or not. The transmitting cylinder can be used as the receiving cylinder, and the apparatus is thus reduced to the limits of simplicity.

Portable instruments have been built embodying these principles, and these machines have worked successfully. They are suitable for wire or wireless work.

The "Daily Mirror" inaugurated the Paris-London photographic service in November, 1907, with Professor Korn's selenium instruments. In this system use is made of the fact that the electrical resistance of the metal selenium varies according to the strength of illumination to which it is subjected, a beam of light passed through the light

and dark parts of a photograph in succession being used to vary the strength of an electric current sent to the receiving apparatus. The transmitter light is concentrated from a Nernst lamp to pass through a revolving glass cylinder, round which a transparent photograph (printed on celluloid) is fixed, the beam traversing the film at its brightest part, where the rays come to a focus. The light which passes through the picture is reflected by a prism inside the cylinder on to the selenium cell, through which the current passes.

The inertia of selenium once overcome, the metal immediately becomes of great use for many purposes. Professor Korn's method of compensation is to let the light fall at the same time on two cells of opposite characteristics; one has great inertia and small sensitiveness, the other low inertia and great sensitiveness. By this combination the cells may be used for the purposes of photo-telegraphy, where at least half a dozen changes per second are required to be recorded abruptly, even in transmitting the simple portraits to which the selenium process is limited.

Late in 1908 Professor Korn introduced his telautograph, in which a Caselli transmitter, such as already described for the telegraph is used, and a line sketch or half-tone photograph is attached to the drum. The receiver is similar to that used in the selenium machines, a spot of light cast on a revolving sensitive film being shut off every time current flows through the wire of the galvanometer and displaces it; when displaced the shadow of the wire falls over a fine slit placed in front of the film, and so prevents the light from passing through to it. The method of synchronizing the sending and receiving cylinders is the same as that used in the telegraph, in which Professor Korn's arrangements have been copied. Similar methods have been adopted for many years, however, in certain systems of ordinary telegraphy.

For wireless transmission of photographs a line picture is attached to the drum of the transmitter, and the intermittent current which is ordinarily passed into the telephone line goes into an electromagnet, which then attracts a soft iron diaphragm attached to brass springs, which are fixed to two rigid supports. Every time current flows through the magnet coils this diaphragm is attracted to it, and platinum contacts are brought together; when the current flows, and this contact is made the primary circuit of a transformer is closed, and the secondary having a spark gap and being inductively coupled to the aerial and earth, a signal is transmitted into space. Thus, in the wireless transmitter the only difference from ordinary telegraphy lies in the fact that the length of the signals and their distance apart is regulated by the lines composing the sketch or photograph.

When working with high voltages in the primary, such as 110, arcing is liable to take place, and hence the distance between the contacts when not attracted must be considerable. This means that the distance between the diaphragm clamps

must be short, and the German-silver spring of which the diaphragm is made must be thick, these two conditions making the natural period of vibration very short. It has been found, however, that by interposing a mercury motor-interrupter in the primary circuit, aging is almost entirely avoided.

The receiving apparatus is very simple, and depends, for short-distance work, upon a coherer cymoscope, the decohering apparatus being of a particular character. Every time an oscillation passes to the antenna, the coherer becomes conductive in the ordinary way, and a relay is actuated; this relay is usually made to start a hammer vibrating, the hammer hitting the coherer, and thus causing it to lose its conductive power. But a vibrating hammer is useless for the photo-telegraphic receiver, and it is essential to have one strike only on the coherer for each signal detected.

Small portable machines have been constructed for wireless transmission, and they possess the advantage that "tapping" of the communications would be quite impossible. For this reason it would seem that the method should be of value for military and naval purposes; even supposing that anyone wishing to intercept a plan or written message were to have an exactly similar instrument, with the same dimensions, by merely altering the rate of running by five or ten per cent., according to prearranged signals, the picture as received by the intercepting party would be quite unintelligible and confused.

When dealing with wireless work the question of synchronism becomes more serious. Two methods have been employed, each of which appears to answer satisfactorily. The first method secures accurate synchronism independently of any wireless communication. It has already been explained how, in the ordinary telegraphic work, the receiving cylinder is driven rather faster than the sending one, and when it finishes up a complete turn too soon it is arrested until the sending cylinder has caught up with it when the latter sends a reverse current which is responsible for its release. In the wireless apparatus both sending and receiving cylinders are driven too fast, so to speak—that is, they are made to revolve in four and three-quarters seconds, instead of a nominal five. A check comes into play at the end of the revolution, and the cylinder is stopped until the five seconds are completed, the motor working against a friction clutch in the ordinary way during the stop. At the end of one-fifth of a second each cylinder is automatically released by chronometric means. A special form of clock is used, with a centre seconds hand which projects beyond the face by about one inch, and to the end of it is attached a brush of exceedingly fine silver wires. At every one-twelfth part of the circumference of the clock dial is fixed a platinum pin, and consequently every five seconds the little brush wipes against the convex surface of one of them. Each of these pins is connected with one terminal of a battery, the other side of the battery leading to the relay, as does also the centre sec-

onds hand. Therefore, each time the brush wipes against a pin the circuit is closed, and the relay throws into action a local circuit connected up with its terminals. This circuit excites an electromagnet, which attracts an armature and pulls away the check which is holding back the cylinder. At the end of each five seconds the cylinders consequently recommence turning. Well calibrated clocks of the pattern used will keep good time for the period taken to transmit a picture, one gaining on the other quite an inappreciable amount, depending on the friction of the brush against the pins.

The other method of synchronizing is controlled by electromagnetic oscillations. Let us suppose that a coherer is being used as a cymoscope, the transmitting cylinder is kept running without any interruption, but by means of a reflecting contact it sends out a wave at the conclusion of its turn, a bare space in the picture being necessary about one-half second beforehand, so that no waves are sent out for the one-half second previous. The receiving cylinder is driven too quickly and checked at the end of the revolution. It then, by means of a cam pressing down a spring lever, throws out of circuit the marking current and brings into circuit the relay which actuates the electromagnetic release. Consequently, when the synchronizing wave is received, the coherer causes the relay to work, the release is effected, and the receiving cylinder starts a new revolution in unison with the transmitter. This means of synchronizing is only possible in cases where a cymoscope is employed that is capable of actuating a relay. It will therefore be seen that it is out of the question except for short distances.

Book Review.

A new edition of the "A B C of Wireless Telegraphy," by Edward Trevert, has just been issued. Since this book was first published in 1902, it has been one of the most popular works on the market for the use of those who desired to obtain an elementary knowledge of the principles underlying the art of wireless telegraphy and who had neither time nor inclination to master a large amount of complicated theory or to trouble with many tiresome details. Two editions have been issued since the first and additional matter added so that the present edition has been brought up-to-date. The author aims to give some information regarding the theory, apparatus employed and methods of operation used in wireless telegraphy and telephony. Directions are also given for making some of the simpler pieces of apparatus. A copy of this work will be sent, carrying charges prepaid to any address upon receipt of price \$1.00, by J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Telegraph and Telephone Age is headquarters for all electrical books. Write for catalogue.

Telephones in England.

The Financial Times, of London, England, in a recent article reviews the telephone situation in that country, where, after 1911, the telephone system will be entirely under Government supervision. Since the arrangements were first made whereby the Government assumes the management of all of the telephones the National Telephone Company, the private organization which operates there has naturally refrained from making any greater expenditures in extending the service than were absolutely necessary. During the same time the Post Office authorities have not increased their expenditures in this direction. As a result the service has not been developed in the past three or four years as fast as it should have been. In commenting upon the condition of affairs which will exist when all of the telephones are transferred to state control the article in question says in part:

"There are two great difficulties to be met—the difficulty of obtaining sufficient capital year by year and the difficulty of keeping the service at the highest pitch of efficiency in the face of constant demands for lower rates to subscribers and higher wages to the staff. It is much to be regretted that chambers of commerce should confine their agitation in telephone matters almost exclusively to the question of rates. If they were to make a close study of the telephone situation here and in countries where the service is more highly developed, they would see that the difference does not lie at the door of lower rates, but it due to a liberal expenditure of capital (attracted by good dividends) and to unceasing attention to efficiency in every detail of organization. Contrary to the general view, the telephone service is not simply a matter of providing so many instruments and so many exchanges and arranging a cheap schedule of rates. It is a very highly specialized business, demanding keen intelligence and intimate knowledge, constant supervision of minute but vitally important details of traffic, and the highest incentives of carefulness and devotion on the part of every member of the staff. All kinds of business demand these qualifications, but none in a greater degree than the telephone service.

"The high stage of telephone development reached in the United States—where, for instance, trunk lines are used with an ease and freedom which are a revolution to anyone accustomed to the dilatory and inefficient system in Great Britain—is due to the fact that under private enterprise, unharassed by state interference, the telephone companies have been able to develop their organizations to the highest pitch. There is grave doubt whether a similar pitch is possible under British Post Office rule, with officials who tend inevitably to become hide-bound, with capital restricted by treasury and political requirements, with a system of promotion by seniority instead of by merit, and with the same sort of labor agitation as is growing year by year in the telegraph and postal services. One has also to reckon with the fact that

the growth of the telephone has been affecting the revenue from telegrams, and that, consequently, the Post Office authorities will not be inclined to force the telephone service forward at the rate it deserves. That there will be a definite change in the state of affairs is clearly recognized within the National Telephone Company's own staff.

"The National Telephone Journal recently remarked: 'In America, on the one hand, the telephone service is rapidly being developed to its utmost limits; in Europe, on the other hand, state-controlled, the telephone system is either, at best, moderately developed, or else absolutely starved. There is no doubt that in a well-organized company the freer stimulus given to individual merit and capacity, and the reaction of the latter both on the quality and earning power of a service, benefit a far wider circle than the shareholders—namely, the public at large. Compared with the simple question of rates, the possibility of a falling-away from the high standard of efficiency now reached by the National Telephone Company is a profoundly serious matter.' After all, it does not matter very much to a business man whether the telephone service costs him \$50 or \$75 a year if the facilities afforded are in every way adequate. The effect of an increasing agitation for lower rates, and only for lower rates, must tend to discourage the outlay of capital, to delay the replacing of out-of-date equipment, and to provide an excuse for starving the special technical departments on whose work the value of the service to the public depends to a far larger extent than those people are aware. The entire energies of chambers of commerce and other bodies representing business men ought to be concentrated on securing the highest rate of progress and the highest limit of administrative efficiency under Post-Office rule. All their energies will be needed for that work; but if these energies are to be limited merely to adjusting the schedule of rates, it will be found by experience that the cheapness of a telephone service is no guarantee that it will be worth even the reduced amounts asked for it. We feel sure that if these bodies were to arrange for a detailed study of telephone conditions at home and abroad by capable men they would realize their influence is really needed to secure the adequacy and efficiency, much more than the superficial cheapness, of the telephone service under Post-Office management."

Use of Telephones in National Forests.

The telephone in the national forest is not only of the greatest assistance in the management of the forest but its value is inestimable when used to report or summon help for a fire. In a single case of forest fire it may be worth the entire cost of its construction. No other work of improving the forests has been more acceptable to the residents in their vicinity.

In the summer of 1905 Secretary Wilson and United States Forester Gifford Pinchot, after going over large areas of little developed and

almost unexplored national forest land, decided that systems of telephones, with proper connections, would be invaluable in the forests of the west.

It was not until sometime later, however, when Congress made a specific appropriation for the improvement of the national forests, that funds were available for this purpose. Last year 3,200 miles of telephone lines were constructed in the 148 national forests in the west, and wire to build about 400 miles of additional line was shipped to the various forests, but with the funds on hand the work of construction could not be completed.

A town in southern Utah, with about 1,000 inhabitants, was isolated four days' ride from the nearest railroad station until a telephone line was built by the forest service across the mountainous country for forty miles, thus connecting the town, the headquarters of the forest, and several ranger cabins with the telegraph station.

From two to five ranger stations are now connected with the supervisor's office on many of the national forests, and by the use of telephones in the homes of settlers centrally located, other points are reached. The marked saving in time otherwise required for a trip of from twenty to forty miles is evident.

In some forests lookout stations have been established to which a wire is run and a man stationed in the vicinity, so that he can climb the point of vantage several times each day and with his glass sweep over the landscape in every direction, quickly scanning an area of two or three hundred thousand acres. It is by such plans that fire patrol and fire control have been established in the national forests with an exceedingly small protective force, and damage from fire has been reduced to a minimum.

An Improved Cable Relay.

Dr. Isidor Kitsee, of Philadelphia, has recently secured a patent, No. 956,808, for an improvement in a telegraphic relay. Its object is to produce means to lessen the sparking or sticking between the stationary and movable contacts of a relaying device.

In experimenting with sensitive relays, Dr. Kitsee has found that the sticking or sparking is greatly prevented when the source of current itself, without any electro-magnetic devices or other resistance, is short circuited; but in short circuiting the source of current, such for instance as batteries, not every type is suitable therefor and the type now usually employed—secondary batteries—has to be entirely discarded on account of their low resistance. The so-called "gravity" or "blue-stone" cells, however, are well adapted for the purpose in question.

In applying this improvement a relay is used consisting of a suspended movable coil placed in a magnetic field similar to the siphon recorder commonly used in ocean cables. This coil carries a movable

contact which normally touches a fixed contact and thus short circuits the battery. The battery is also connected to the coils of a local relay or sounder, but when the line relay is in its normal position no current will flow through these coils, as the battery is short circuited. When, however, an impulse is received over the line, and the connection between the movable part of the line relay and stationary part is broken, the short circuit is removed and the local relay or sounder is operated.

Dr. Kitsee's first claim on this device is: In cable telegraphy, a receiving organism comprising a movable coil in the region of a stationary magnetic field, two relaying contacts therefor, one relaying contact movable and suspended on a conducting thread, the second relaying contact stationary, a localized source of current, one pole connected to the stationary contact and the second pole connected to the conducting thread; a second circuit for said source of current and a translating device in said second circuit.

New Cable to Isle of Shoals.

The Shoals Cable Company has been incorporated with a capital stock of \$50,000 for the purpose of laying and operating a cable between the Isle of Shoals and Rye Beach, N. H., with land connections to Portsmouth, N. H. A company was formed for a similar purpose and a cable about five and one-half miles in length was laid in 1892. The cable, however, was defective and poorly laid and because of the constant expense of keeping it in repair, was afterward abandoned.

In 1908 the Shoals Telephone and Telegraph Company was organized by Robert Morton, of Boston, manager of the eastern division of the Telepost Company for the purpose of purchasing the franchise of this company and repairing the old cable. The franchise was purchased but it was soon learned after a considerable expenditure of money that it would not pay to attempt to put the old cable in service. On this account the present company with larger capital was formed as a holding company with Robert Morton as president, Charles W. Crane, treasurer and William O. Forbes, secretary. These, in addition to C. L. Egin, of Somerville and E. C. Kimball, of Lowell, form the board of trustees. The new cable will have seven conductors and will be suitable for either telephonic or telegraphic purposes. It is expected that the new connection will be completed during the present season. This will prove a great convenience to the many people who visit the Isle of Shoals during the summer. Mr. Morton still retains his connection with the Telepost Company. The new company, is in no way identified with that corporation except that it will have a working arrangement with it.

"Pocket Edition of Diagrams," etc., the latest revised edition, 334 pages and 160 illustrations, published by Telegraph & Telephone Age, contains just the information every telegrapher requires.

How.

BY E. E. BRANNIN.

Nearly a quarter of a century ago, an employe, not over zealous in his work, though particularly active in his efforts to obtain an increase of salary, asked the writer how he could get more than he was then earning and was thus answered: A reply to your question can be made in twenty words, but for the purpose of illustration we elaborate it slightly in order that you may more easily understand the answer.

If a grocer pays six dollars for a barrel of flour delivered at his store, keeps the flour in stock for a month or so and then sells it for six dollars, how much does he make or lose on the transaction? To this the employe replied: He just evens up, neither makes or loses.

Now then, suppose that every article in his store was sold on the same basis as the barrel of flour, how long could he maintain his store, paying rental, clerk hire, keep of horse and wagon, light, heat, etc? Of course he must make a profit otherwise he sustains a loss, was the answer. Now then, suppose that every man in this office rendered no more service than you do in comparison with the compensation you receive, do you think that the company would revel in an immense profit? Now let us talk plainly, and on a basis of fact. It is my honest opinion that the net profit to this company as a result of your labor here is a fraction less than that the grocer would realize on his barrel of flour.

If you want more remuneration for your work than you are now receiving, demonstrate the fact that you are earning it, make yourself a partner with your employer, make his interests your own. Emulate the example of some of those working near you, doing more than you for a smaller compensation, don't wait for work to come to you, look for it. Don't work mechanically, or be afraid to do something outside the work you are supposed to do; do not pretend to be at work, when you are only trying to avoid it. Don't forget that Abraham Lincoln was dealing out facts when he wrote: "You can't fool all the people all the time." Don't talk unless you have something to say, utilize your brain, don't think with your feet. In other words, the best way to get more than you are now earning, is to earn more than you are now getting.

To-day, if asked how one could get more than he is now earning the writer would tender the same prescription given the employe twenty-five years ago, and supplement it with advice calculated to meet the present day conditions of strenuous activity and exactness, advising him to thoroughly master every detail in his line of employment; to steer clear of pessimism and jealousy; to be at all times loyal even if he cannot love, if the latter quality is lacking on either side ascertain why. The consideration and courtesy that the public demand and have a right to expect from an employe, should also obtain

between the employer and the employe. Neither should lose sight of the fact that things we are desirous of catching are not attracted by worm-wood or vinegar. The employe should aspire to lead or at least keep step with or close on the heels of the leader. He should also understand the "how" or theoretical as well as the practical side of his work. He may understand that by making deductions, additions, or divisions a certain result is obtained, but he should be in a position to elucidate the why and wherefore. To sum up: He should be prompt and careful, quick and accurate, practical and theoretical, not forgetting to inject into the whole a 'goodly portion of "horse-sense." Be kind, considerate and just to all with whom he comes in contact. Annihilate discouragement, build up perseverance. If he is a member of the new electrical class stick to it. The promoters of that class doubtless feel gratified at the success of their efforts. The result will certainly tend to the betterment of the service and redound to the credit of the members of the class. They may not all develop into electrical wizards like Edison, but they will attain knowledge that will materially benefit them in their present employment, and better fit them for other pursuits if they elect to retire from their present vocation. Veritably "knowledge is power."

A Messenger's Prank.

A restaurant proprietor in Wilmington, Del., was surprised one day recently to find that every order sent to the kitchen was returned doubled, that is two orders were forthcoming instead of one. After this had continued for about an hour he finally visited the kitchen and demanded what the cook meant by doubling up every thing that was ordered. The cook was astonished.

"Deed, boss," he stuttered, "I only obeyed what you said."

This only served to make matters worse.

"Well, boss," said the cook, "every time you give an order you said 'make it two.' What else could I do?"

The proprietor denied all responsibility for the "make it two" amendment and was trying to solve the mystery when the housekeeper suddenly espied a telegraph messenger boy perched on a ladder near a window. She thought this a queer proceeding. When the next order was shouted from the dining room by a waiter, however, she heard the lad exclaim, "Make it two!" This was the cause of all the trouble. During the time that he was not engaged delivering messages the lad in question had amused himself by making trouble in the nearby restaurant.

Mr. C. A. Fonville, manager of the Western Union Telegraph Company at Montgomery, Ala., in a recent letter writes: "The Age is received regularly and it is like getting a letter from home. I will do all that I can to increase your list of subscribers in this city."

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIXEY

Sole Manufacturer

**Hudson Terminal, 30 Church St.
NEW YORK**

Western Representative

WATSON INSULATED WIRE CO.

Railway Exchange, CHICAGO, ILL.

The Railroad.

Mr. C. McCormack has been appointed superintendent of telegraph of the Chicago and Eastern Illinois Railroad with headquarters at Danville, Ill., vice Mr. J. L. Davis who has resigned to accept a position with another railroad system with headquarters in New York.

The first telephone despatching circuit on the New York, New Haven and Hartford Railroad, extending from New Haven to Northampton, Mass., a distance of about one hundred miles, has been placed in operation and is giving very satisfactory service.

Telephone despatching service has been inaugurated on the St. Louis and San Francisco Railroad between Springfield and Monett, Mo. Additional equipment between Springfield and Kansas City has been installed and will soon be placed in service. This will make 238 miles of such circuits in operation.

Mr. N. C. Griswold, who for many years has been a railroad official in the coming session of the Northern Pacific Railway at Tacoma, Wash., having acquired a half interest in the Eagle Mill Company of Centralia, Wash., has resigned and will in the future devote his energies to the lumber business.

Considerable interest is being taken by American railroad officials in the coming session of the International Railway Congress to be held at Berne, Switzerland, July 3 to 16, and according to present indications this country will be well represented. The United States Government has appointed eight delegates, and the American Railway Association will send its president, Mr. F. A. Delano, and six other delegates.

The committee from the eastern division of the Association of Railway Telegraph Superintendents which was appointed at the meeting held in Washington, March 25, to formulate a system for delivering messages to passengers on trains, whereby a receipt can be obtained and returned to the telegraph company, met in New York, May 24, and conferred with officials of the telegraph companies. A plan for accomplishing this purpose was prepared and will be presented to the Association for approval at the Los Angeles Convention. The superintendents present at the meeting were: Mr. E. P. Griffith, of the Erie Railroad, New York; Mr. J. C. Johnson, of the Pennsylvania Railroad, Philadelphia; Mr. C. M. Lewis, of the Philadelphia and Reading Railroad, Reading, Pa.; Mr. A. B. Taylor, of the New York Central Railroad, New York and Mr. N. E. Smith, of the New York, New Haven and Hartford Railroad, New Haven. The Western Union Telegraph Company was represented by Mr. A. G. Saylor, general superintendent of the eastern division and Mr. E. M. Mulford superintendent, New York, and the Postal Telegraph-Cable Company was represented by Mr. Minor M. Davis, electrical engineer, New York.

The final meeting of the committee appointed by the eastern division of the Association of Railway Telegraph Superintendents to consider the proposed standard railway telephone agreement was held in the office of Mr. F. G. Sherman superintendent of telegraph of the Central Railroad of New Jersey in New York, May 24. There were present the entire committee, consisting of Mr. E. P. Griffith, chairman Mr. L. B. Foley and Mr. A. B. Taylor of New York; Mr. J. C. Johnson of Philadelphia; Mr. N. E. Smith of New Haven and Mr. Sherman. A report was adopted which will be presented to the Los Angeles Convention.

Some time ago an application was made by the Seymour Power Company to cross the Canadian Pacific Railway at a certain point in Ontario. They proposed using a single pole on each side of the tracks to carry their transmission line of 45,000 volts. The railroad company objected to this construction and an appeal was made to the Board of Railway Commissioners. The case was heard in Port Hope, Ont., early in May. The Canadian Pacific asked that a structure on each side of the railway be made up of four cedar poles in the form of two A's and connected together with arms, the butts of the poles to be protected by concrete or otherwise from fire for a distance of six feet from the ground. The Board of Railway Commissioners has rendered its decision ordering the construction according to the requirements of the railway.

The twenty-ninth annual convention of the Association of Railway Telegraph Superintendents which meets in Los Angeles June 20 to 25 bids fair to be one of the most successful of any ever held by that body. The list of papers which appeared in our April 16 issue indicates that the committee has arranged an educational program second to none. The various subjects which will be considered will be handled by experts in the line of work which each represents and the discussion which will follow their presentation will be participated in by those who can speak from practical experience. There are so many points of interest around Los Angeles that the entertainment committee has had a difficult task to select the very few places which it will be possible for the superintendents and their friends to visit during their brief stay in that city. Taken altogether it is hard to see where the plans for the coming convention could be improved upon. On account of the resignation of Mr. John L. Davis, president of the Association, Mr. I. T. Dyer, first vice-president will preside over the business sessions of the convention. Mr. Dyer is chairman of the committee of entertainment which has arranged the plans for the gathering and it is largely through his personal efforts that such an excellent program has been provided.

Telegraph and Telephone Age is headquarters for electrical, telephone and telegraph books. Write for catalogue.

The Boston Force in 1863.

Mr. Charles C. Bedlow, assistant superintendent of telegraph of the Boston and Maine Railroad, Boston, Mass., and the son of J. S. Bedlow, formerly superintendent of the American Telegraph Company at Boston, has in his possession an album which was presented to his father in 1863 and which contains pictures of all the operators in the Boston office at that time.

The album bears on its front cover in gold letters the inscription "J. S. Bedlow, Superintendent, American Telegraph Company, 1863" and on the back cover is engraved "From the Employees of the Boston Office." Photographs of the following are found in the book:

W. F. Richards, G. F. Milliken, J. Harlow, J. F. Lotts, A. W. Todd, T. A. Davin, Gerrit Smith, J. W. Duxbury, Thomas McKey, H. W. Wheeler, C. W. Henderson, J. A. McGee, J. Labonte, W. H. Allen, J. H. Milliken, J. W. Robman, W. C. Havens, B. G. Winter, J. C. Barrett, Thomas Allen, D. C. Roberts, H. S. Martin, C. L. Godwin, E. W. Gibbons, J. J. Powers, E. S. Hardy, D. D. Devereaux, Wm. Martin, Jaius Harlow, M. J. Crook, C. A. Richardson, C. Sughrue, A. B. Rogers, I. N. Keith, J. H. Twichell, Frank J. Milliken, Miss A. M. Leavett, Miss S. B. Allen, E. J. Byrne, F. B. Lynch, N. Rice, J. B. Davidson, S. N. Holloway, C. H. Pike, C. J. O'Leary, E. McEleny, J. S. Whitacre, J. Hinchman, C. H. Sawyer and J. W. Robinon

The album was made up and presented to Mr. Bedlow and a duplicate was also presented to the superintendent of the division in which Boston was located, Mr. Charles F. Wood. Mr. Bedlow was superintendent from Boston to Calais, Me., and Mr. Wood from Boston to New York. Mr. Bedlow resigned in 1863 to take the superintendency for New England of the United States Telegraph Company and continued in that capacity until the formation in the east of the present Western Union Telegraph Company July 1, 1866. He then became superintendent of the third district, eastern division of that company, Boston to Calais, Me., including a part of New Hampshire, retaining this position until his death by accidental drowning at Old Orchard, Me., July 2, 1878.

There are a number in the album who were prominent in the service but most of them have long since died. Only two are at the present time employed in the Boston office, viz.: C. W. Henderson, formerly and for many years manager of the operating department, and Jas. A. McGee, the latter now a member of the operating force.

Gerrit Smith has been an honored member of the electrical staff of the Western Union at New York for the past thirty years. He is the inventor of many useful telegraphic devices.

Geo. F. Milliken, for many years manager, succeeding W. F. Richards, at the death of the latter, is still a hale, hearty personage on the streets of Boston. He has been identified with the Gamewell Fire Alarm Telegraph Company for many years. When in the telegraph service he was

prominent electrically and was the originator of the well-known "Milliken" repeater.

A. W. Todd, E. S. Hardy and D. C. Roberts were well known outside of the Boston circle, having at various times been in the New York office and elsewhere.

John W. Duxbury entered the telephone service and was connected in an official capacity with the New England Telephone and Telegraph Company at the time of his death.

Thomas A. Davin was well known to the older men in the service. His death occurred March 27 of this year. For the previous twenty years he had been operator for a banking house in Boston.

W. H. ("Billy") Allen left the business to become private secretary to the collector of the port of Boston some twenty-five or more years ago, but returned to the service later and was in the Postal Company's employ as manager at Washington. For several years past he has been private secretary to Mr. P. V. DeGraw, fourth assistant postmaster-general.

H. S. Martin, whose home is in Keene, N. H., has been in the banking business for many years and is now with J. C. Stratton and Company of New York.

Daniel D. Devereaux was manager of the Duxbury cable office for the twenty-seven years prior to his death, which occurred May 13, 1909.

John Whitacre became one of the high grade operators in the office, but left the service about thirty years ago to enter commercial pursuits. He is now in the real estate business in St. Paul.

Wm. Martin, of the receiving department, was well known by nearly everybody in the city. He was very prominent in Masonic circles. His supply of witty stories was inexhaustible.

Henry Wheeler entered the service of the Maine Central Railroad Company at Brunswick, Me., as ticket agent in the early seventies and held that position until his death about ten years ago.

John Milliken was in the employ of a banker as private operator many years ago, and is still employed in that capacity.

Benjamin Winter, who died about 1880, will be remembered as the manager of a very important branch office for the Western Union in the basement of the old State House. As this was prior to the invention of the telephone and introduction of leased wires, he handled a tremendous brokerage business.

James Barrett will be remembered as one of the operators of the Phelps printer, which system was long since shelved.

Jaius Harlow, filled the position of cashier for many years prior to his death.

Miss Allen (known to operators of the present generation as Mrs. Howard) is one of the most expert women operators who has ever worked a key. For many years she was chief operator for Charles Head and Company, one of the largest banking institutions in Boston, and was recently retired on a pension without having in any degree lost her nimbleness of finger or alertness of mind.

Charles Sawyer became chief operator for the Atlantic and Pacific in Boston, and when that company was merged with the Western Union, he became chief operator for Lee, Higginson and Company, the well known bankers of Boston, which position he held until his death some ten years ago. He was one of the most expert and intelligent telegraphers America has produced, and was the District Director of the National Telegraphic Union in 1864.

Canadian Notes.

The case between the Western Associated Press and other papers of Canada which was mentioned in our February 1 issue and which was not completed at the hearing in Ottawa held in February, was continued in Winnipeg May 13, but no decision was reached and a further hearing will take place in Ottawa during the first week in June.

The application of the Board of Trade and Grain Exchange of Winnipeg for a reduction in telegraph rates and a general investigation into the telegraph throughout Canada came up before the Board of Railway Commissioners in Winnipeg on May 12. The Board decided they would not enter into a general investigation, but later on would look into the rates in and out of Winnipeg. This will probably be done in September.

At the hearing of these two cases in Winnipeg there were present, representing the Canadian Pacific Railway, Mr. Jas. Kent, manager of telegraphs; W. J. Camp, electrical engineer, and E. W. Beatty, general solicitor of the company. The Canadian Northern Railway Company was represented by W. C. Muir, superintendent of telegraph, and the Great North Western Telegraph Company by Mr. I. McMichael, vice-president and general manager and Mr. J. Paddington, manager at Winnipeg. The Grand Trunk Pacific was represented by Mr. A. B. Smith, general manager of telegraphs.

Annual Reunion of Old Time and Military Telegraphers.

When the twenty-ninth annual reunion of the Old Time Telegraphers' and Historical Association and of the Society of the United States Military Telegraph Corps meets at the Auditorium Hotel in Chicago, September 8, 9 and 10 there will probably be gathered together the largest number of old timers who have ever attended one of these meetings. The fact that Chicago is near the centre of population of the United States and also the home of so many of those who were in the service twenty-five years ago or more ought alone to be reason enough to justify this prediction. When, however, we add to this the fact that there are among the Chicago members of these two bodies some of the most energetic and wide-awake men who ever served at the key and who are now interesting themselves in the success of the coming event there is no reason to doubt that the 1910 reunion of the old time and military telegraphers will be one of the most successful ever held.

International Telegraph and Telephone Conference.

The second International conference of telegraph and telephone engineers will be held in Paris September 4 to 11, inclusive. Among the list of subjects which will be discussed which appeared in our March 1 issue is the question of manual versus automatic telephony. To aid the consideration of this question the French Government has proposed the holding in Paris from September 4 to 18 of a public exhibition of automatic telephone systems. The French Administration will, if the suggestion is carried through, provide free space and lighting and will be responsible for the safety of the exhibits, which should include apparatus for at least 100 subscribers and should, as far as possible, represent inter-communication stations.

General Mention.

The bill prohibiting the employment as messengers, between the hours of 10 p. m. and 5 a. m., in the larger cities of New York state, of boys under twenty-one years of age, has passed the Legislature and been signed by the Governor.

The English underground telegraph system will be extended during the present year from Leeds to Hull. It is expected that Leeds and Stockton will also be joined. The latter connection will complete the underground system from London to Newcastle.

Professor J. A. Fleming, the well-known electrical engineer and author of London, has, during the past winter, conducted a lecture course in that city on the "Propagation of Electric Currents in Telegraph and Telephone Cables." This course was attended by over seventy telegraph, cable and telephone engineers, and at its completion an examination was given on the work covered.

Mr. W. E. Athearn, engineer of equipment, of the Western Union Telegraph Company, New York, and Minor M. Davis, electrical engineer of the Postal Telegraph-Cable Company, New York, report absolutely no disturbances, whatever, observable on the lines of their respective companies during the recent passage of the earth through the tail of Halley's comet. The wireless companies also state that their service was not interfered with in the least.

The first annual number of Poor's Manual of Industrials has just been issued. This covers in the industrial field information, similar to that which has appeared concerning the railroads for over forty years in Poor's Manual of Railroads. In the new volume the telegraph and telephone companies of the United States are grouped together. The total capitalization of all of these companies reported is \$1,140,734,324. Their gross earnings during 1909 amounted to \$198,095,052 and their net earnings to \$72,612,736. After paying dividends of \$29,015,348 and making other deductions there was a surplus of \$18,871,278.

QUESTIONS TO BE ANSWERED.

[The lists of questions which we published under this heading in our previous issue, the answers to which may be found in Chapters I and II of Jones' Diagrams, was much appreciated. Students in telegraphy have found them of great assistance in helping master the contents of this standard text book of telegraph engineering. We will continue to print similar lists of questions, taking up each chapter in turn. If students will carefully study the subject matter to which each set of questions applies until he is able to answer all of them without referring to the book, he will, by the time he has gone through the book in this way have gained a thorough knowledge of all of the principles underlying telegraphic operation].

CHAPTER III.

What principal factors determine the capacity and electromotive force of a dynamo?

What factors directly determine the electromotive force of the dynamo?

What principle is involved in the generation of an electric current by means of a dynamo?

How was this principle discovered?

At what point in its revolution is the greatest electromotive force generated in a conductor on the armature of a dynamo?

At what point is there no electromotive force generated?

What is the essential difference between a direct current dynamo and an alternating current generator?

CHAPTER IV.

What three factors have to be considered in making electrical measurements?

What effect does the resistance of a conductor have on the value of the current flowing therein?

Who discovered this fact and what is the statement of this fact commonly called?

Upon what is the standard unit of resistance in general use to-day based?

What formula represents the relation which always exists between electromotive force, current and resistance?

What information is necessary in connection with a given circuit to determine the value of any one of these three factors?

How can you find the strength of current in a circuit having given the voltage and resistance?

How can you find the resistance having given the current and voltage?

How can you find the voltage having given the current and resistance?

What is the unit of quantity called and what is its value?

What is the unit of work and how is its value determined?

How would this unit be made use of in determining the required capacity of a dynamo for an electric lighting installation?

What is the electrical equivalent of a mechanical horsepower?

Rates for inland telegrams in Jamaica have been reduced from one shilling for twelve words inclusive of the address, to six pence and one-half pence for each additional word.

Obituary.

Charles E. Chandler, a member of the United States Military Telegraph Corps, died at Los Angeles, Cal., April 7.

William H. von Hartman, also a military telegrapher, died at Westville, Oklahoma, April 25. This is the ninth death of members of the Corps since the annual meeting at Pittsburg last August.

John J. Gallagher, aged twenty-six years, an operator employed by the Postal Telegraph-Cable Company at Boston, was accidentally drowned May 22.

Charles A. Tommaney, an operator employed by the Western Union Telegraph Company at Albany, N. Y., died of pleurisy May 3, aged twenty-four years.

James Howard Crawford, an old time telegrapher, died at his home in Pittsburg May 15, aged fifty-two years, after a long illness. Mr. Crawford was born in Pittsburg and served as train despatcher and later had charge of the telegraph system of the Pittsburg and Lake Erie Railroad.

Answers to Correspondents.

[We will under this heading answer from time to time questions from any of our readers in regard to technical, historical or other features of the telegraph, telephone and allied industries. We receive many such inquiries from subscribers and always answer them by mail. As some of these, however, are of general interest we will hereafter print both questions and answers in this column so that all our readers may receive the benefit of our answers.]

One of our Brooklyn readers asks the following:

Regarding speed and practical efficiency, what system of telegraphy stands foremost in the field to-day?

This is a difficult question to answer as there are many systems in use to some extent designed for higher speed than Morse operation and each of which has its exponents who claim that it is the fastest and most efficient. From results being attained at present in this country, however, it would seem that the Wheatstone system is probably the fastest and most efficient system now used to any extent in our telegraph service. A speed of from 100 to 300 words per minute can be attained by this method, according to the length of the line.

There are of course, certain chemical and other highly sensitive systems capable of much more rapid signaling over the line than the Wheatstone, but none begin to compare with it as a really practical working system, peculiarly well adapted to take care of a large volume of business with the minimum delay and greatest accuracy.

Following the action of the Western Union and Postal Telegraph-Cable Companies in increasing the wages of their employes the 125 operators in the United Press service have been granted an increase of fifteen per cent. in their wages.

Trade Notes.

The Western Electric Company has recently placed on the market a selector for telephone train despatching which has been developed by their engineers.

The new selector is a very simple device, being a straight step-by-step mechanism with but three moving parts, bridged directly across the line. There is only one contact made and as all relays and other complicated parts are eliminated it is claimed that the selector is as near perfect as it is possible to make it. Central battery ringing is provided for, thus doing away with the necessity of installing dry batteries at the way stations. The selector is also arranged for local battery ringing if desired.

The Electric Storage Battery Company of Philadelphia has opened two new sales offices, one at Detroit, Mich., and the other at Denver, Col. These offices have been opened in order to better serve the customers of the company in the adjacent territory. A stock of battery material will be carried in Denver from which orders can be promptly filled.

Electrical Club at St. Louis.

At a meeting of employes of the Western Union Telegraph Company and the American Telephone and Telegraph Company held at St. Louis on May 12, an electrical club was organized, to be known as the "Western Union Electrical Club of St. Louis."

The following officers were elected: W. E. Bellman, chief operator Western Union, president; Charles McNeill, manager of branch offices, vice-president; Peter A. Peterson, traffic chief, secretary, and Miss Loretta M. Hood, treasurer; R. H. Bohle, J. G. Alger, C. W. Frey, W. J. Armstrong and G. A. Littell constitute the executive committee.

The object of the club is education along electrical lines. Meetings will be held on the second and fourth Thursday of each month. A regular course of lectures will be given by professors from technical schools, followed by practical demonstration of matters pertaining to the telegraph and telephone business.

The following have been enrolled as members of the new club:

G. R. Alger, W. J. Armstrong, W. E. Bellman, J. Benedict, Miss Rose Berg, R. H. Bohle, Jno. F. Canavan, C. W. Carroll, O. R. Carson, M. J. Cassidy, W. R. Chapman, C. W. Crary, L. P. Custer, C. E. Drake, C. E. Dubbs, J. E. Dunlop, T. F. Dunn, R. C. Dyer, Miss Nellie Frazier, C. W. Frey, H. G. Gosting, H. S. Graber, C. W. Groos, Erle Harlan, R. L. Holden, Miss L. Hood, W. H. Johnson, C. W. L. Jost, E. A. Kintz, C. A. Lackey, J. M. Leeper, G. A. Littell, R. G. Matthews, J. F. McCarron, J. A. McIntyre, C. McNeill, A. Mitchell, E. H. Moore, H. F. Musgrove, R. E. Norman, M. M. O'Neill, P. A. Peterson, N. T. Petty, Ed. Powers, G. A.

Putnam, C. L. Rayborn, W. L. Rhodes, P. W. Robertson, Miss Nellie Ruhlman, C. S. Slaughter, H. S. Smith, Miss Alma Snyder, L. R. Spehr, Geo. F. Stewart, S. D. Terrell, A. Turner, O. L. Turner, A. E. Van Tyne, W. A. Wilkerson.

LETTERS FROM OUR AGENTS.**CHICAGO, WESTERN UNION.**

Mr. C. H. Addison has been appointed night traffic chief.

Mr. W. E. Clabeau has been made division chief nights in the St. Louis division and Mr. Louis Finan has been assigned as his assistant.

C. H. Shell, Jr., has been appointed chief of the St. Louis division, vice A. C. Garrison resigned.

E. P. Hass has been appointed assistant chief of the St. Louis division.

A gold watch, chain and charm was presented recently by the employes in this office to Mr. A. B. Cowan former chief operator who was, on April 1, promoted to the assistant superintendency in this city. The presentation was made by Mr. C. H. Finley, chief operator, following which Mr. C. H. Shell, general wire chief, gave Mr. Cowan a bouquet of American beauty roses.

NEW YORK, WESTERN UNION.

Mr. Martin Durivan has taken charge of the West End, Long Branch, N. J., operating department for the summer as has been his custom for over twenty years. Mr. P. J. Casey, assistant superintendent, New York will soon assume the management of the West End office. Mr. Casey has acted as manager at this summer resort for some twenty-five years.

Mr. George E. Cromwell, a former old timer in this office but for some years past living in retirement at Damascus, Pa., was in the city recently. Mr. Cromwell who was a military telegrapher during the Civil War came here for medical attendance. He has recently undergone a severe but successful operation and his friends hope for his early restoration to complete health.

Edward Gordon, formerly an operator in this office and one of the prominent figures in the service during the seventies died at Hudson, N. Y., May 2 aged seventy-one years.

Recent appointments in this office are:

F. B. Chase, to be assistant traffic chief of the southwestern division; Mr. A. Patridge, to the loop board, vice Mr. Chase; O. L. Butler, as Erie division traffic chief, vice N. B. Hall, assigned to learn the eastern switchboard; F. W. Streeter, and J. W. Burnett, to the southern switchboard, vice C. C. Lever, transferred to the office of general manager B. Brooks, and J. R. Heidemark, transferred to the position of all night wire chief; J. Gschwind, night newspaper chief has been transferred to day work as assistant general wire chief; J. D. Price, has been appointed night newspaper chief, vice Mr. Gschwind; W. F. Packard has been appointed southern traffic chief, vice Mr. Price.

D. W. McAneeny, assistant eastern wire chief is absent from duty on account of sickness.

A. A. Lopez, repeater chief has just returned to duty after his wedding trip.

Miss M. F. Lynch, city wire chief and Miss E. Vatelet sailed May 21 for an extended trip in Europe.

The Electrical Society has engaged Mr. J. Harold Morecroft, professor of electrical engineering at Columbia University, to give a series of lectures on electrical currents, electromagnetism, etc. Professor Morecroft will alternate with Mr. Charles Thom, chief of the quadruplex department, who gives lectures on the practical working of the Western Union instruments.

Mr. Louis C. Williams, professor of physics at the Erasmus Hall High School, will teach the theory of electricity. Professor Williams will lecture and quiz the class every Friday evening.

The membership of the society is now 125. In addition to this class, there are six classes of night men, averaging ten men to a class, who are studying under professors during the day.

OTHER NEW YORK NEWS.

The Telegraphers' Aid Society now has its headquarters in room 518, at 195 Broadway.

The Serial Building Loan and Savings Institution, Mr. E. F. Howell, secretary; is now located in its new office room 517, at 195 Broadway. This room has been fitted up as a miniature banking office, including a large fire proof safe capable of holding all the securities and books of the Institution with a burglar proof money chest, filing cabinets, accommodations for the handling of business and the convenience of its members. The employees of both the Western Union and Postal Telegraph-Cable Companies are to be congratulated upon the great prosperity of this telegrapher's association.

Assessments Nos. 508 and 509 have been levied by the Telegraphers' Mutual Benefit Association to meet the claims arising from the deaths of Smith Robertson, at Minneapolis, Minn.; Thomas D. Whipple, at Newark, N. J.; Frank C. Ball, at Woodbridge, N. J.; Thomas C. Wilkenson, at Mallerytown, Ont.; Matthew R. Wolff, at Wheeling, W. Va.; Joseph W. Woods, at New York; Augustine Justice, at Camden, N. J.; Thomas A. Davin, at Dorchester, Mass.; Levi C. Weir, at New York, and Thomas H. Maholland, at Philadelphia, Pa.

An Electrical Book for Practical Men.

"Lessons in Practical Electricity," by C. Walton Swoope, which has been selected as an official text book by the electrical schools organized among the employees of the eastern division of the Western Union Telegraph Company, is, as its name signifies, an elementary text book for the practical worker. It contains nearly five hundred pages and has over four hundred illustrations. It is divided into thirty-

one chapters dealing with magnetism, batteries, electrolysis, current measurement, resistance, Ohm's law, circuits, galvanometers, electromagnets, measuring instruments, electro-dynamics, induction coils, dynamos, motors, electric lighting and alternating currents. At the end of each chapter, there are given several questions for the student to answer and practical problems for him to solve. Numerous interesting experiments are also described, which can be performed by the aid of simple apparatus. The book was written especially for the use of evening classes in practical electricity and is admirably adapted to that purpose. This work, together with Jones' "Diagrams," Maver and Davis' "Quadruplex" and Thom and Jones' "Telegraphic Connections" seems to meet all of the requirements of the student who desires to acquire a thorough knowledge of the principles underlying the operation of the telegraph system. The prices of these books are: Swoope's "Lessons in Practical Electricity," \$2.00; Jones' "Diagrams," \$1.50; Maver and Davis' "Quadruplex," \$1.50; Thom and Jones' "Telegraphic Connections," \$1.50. Any of these books will be sent, carrying charges prepaid, upon receipt of price by J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, N. Y.

Why not start a savings account with the Serial Building Loan and Savings Institution, 195 Broadway, New York, and have something laid aside for a rainy day, or to assist you in buying a home? They pay a higher rate of interest than any other depository for savings and the fact that they are under the supervision of the New York State Banking Department assures you that they offer a perfectly secure place for the deposit of your money.

WANTED—A man accustomed to the making of telephone parts, and the assembling, adjusting, and installing of telephone transmitters and the like; an experienced all around workman and electrician. Address, Manufacturer, care of Telegraph and Telephone Age, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved **YETMAN TRANSMITTING TYPEWRITERS, and KEY-BOARD TRANSMITTERS** without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Elementary Lessons in Electrical Measurement.

PART IV.

In the preceding instalment of this article it was shown that the value of the electromotive force at the point where a circuit divides into two branches would change if either of the branches should be opened.

For instance, in Figure 1, with the voltage and resistances given the electromotive force at x would be one-half of a volt with both branches closed, because that point represents just half of the total resistance of the circuit, consequently the voltage in its drop from maximum pressure to zero has also reached the middle mark in its descent.

If one branch should be opened the electromotive force at x would then be greater because there would be a greater resistance in the line beyond x. With both closed the joint resistance in the branches is but 2 ohms. With one open we get 4 ohms straight, making the total resistance of the circuit $2 + 4 = 6$ ohms. Hence as x now represents but one-third of the total resistance the voltage would only fall to two-thirds of a volt instead of the one-half volt as in the first case. It is evident therefore that any instruments inserted in the branch circuits would receive more current at

one time than another and thus act in that choppy manner often noticed in sounder circuits where proper precautions have not been made to prevent it.

The remedy for preventing choppy circuits and the one invariably followed is to eliminate the resistance between the battery and the junction point x, as shown in Figure 2.

The object of this illustration is to emphasize the importance of constructing all mains, or feeders of telegraph circuits in such a manner that they shall contain no appreciable resistance

between the brushes of the dynamo and the point where a branch or line wire is connected for the purpose of taking current.

In Figure 1 that portion of the wire between the machine and the junction point x acts in the capacity of a main or feeder for the two branch circuits, hence it is inefficient for the purpose of a feeder for the reason stated.

In actual practice the objectionable resistance in mains or feeders is eliminated by merely leaving their terminals open and then tapping the various lines to them in the manner shown in Figure 2. Each line wire thus connected constitutes an individual circuit of its own and is in no wise affected by the opening or closing of any of its companions.

The value of the electromotive force does not alter in the mains because their ohmic resistance is so insignificant up to the point where such connections are made as to be negligible.

Each grounded circuit connected with the main may then have a resistance lamp inserted be-

twice the tap and the first instrument in circuit for the protection of the dynamo, usually two ohms per volt of the battery used. Figure 2 gives a good illustration of the manner in which current is supplied to the various wires at the main wire switchboards. The feeders or mains are represented by the rows of battery disks, the protecting resistance by the lamps above the board, while the fuses may be found behind the board where the line wires are connected.

For sounder circuits arranged in multiple two mains are required which must also have their terminals left open in order to prevent a difference of potential at different connecting points.

Theoretically all of the sounders might be connected between the two mains and the branch circuits shown in Figure 3 eliminated. In actual practice, however, that method is never followed for the reason that should the coils of one of the sounders accidentally become shunted out the dynamo would be short circuited and the resulting great volume of current that would flow into the mains would instantly blow out the fuse and open all circuits. In such a case it would be like hunting a needle in a haystack to locate the sounder at fault, even if otherwise such an arrangement was feasible.

To prevent such an occurrence as this the mains are tapped in the manner shown in Figure 3 and but four or five sounders combined in one group. By this method a similar short circuit would only affect the apparatus in one group while the mains and other circuits would not be affected. A fault of this kind would be located at once and remedied without material delay.

Returning to the subject of joint resistance it will be seen that as the joint resistance of the sounder or external circuits is equal to the resistance of one such circuit divided by their total number it is obviously very low. Consequently not only the resistance of the mains but the internal resistance of the dynamo itself must be exceptionally small. This requirement is easily met through the construction of the dynamo but with gravity battery the multiple method of arranging circuits is impractical for the reason that the two ohms per cell of internal resistance the jars contain foots up to more than the joint resistance of the external circuit amounts to. Hence with a gravity battery system the entire row of jars in series constitutes a part of the feeder or main, and for that reason is in exactly the same position as that of the conductor between the dynamo and x shown in Figure 1 and therefore useless.

(To be continued.)

Recent Telegraph and Telephone Patents.

A patent, No. 957,869, for an intercommunicating telephone system, has been awarded to E. R. Corwin, of Chicago, Ill.

A patent, No. 957,909, for an autophone system, has been granted to A. E. Stevens, of Fall River, Mass.

A patent, No. 957,973, for a signaling system, has been secured by O. T. Lademan, of Milwaukee, Wis. Metallic line telephone circuit, including a plurality of relays which are non-inductive with respect to the metallic circuit and which can be operated over the two metallic conductors in parallel as a telegraph system.

A patent, No. 957,977, for a protective system, for telephone lines has been issued to R. H. Manson, of Elyria, O.

A patent, No. 958,067, for a telephone system and apparatus, has been taken out by A. K. Andriano, of San Francisco, Cal. Interconnecting telephone system doing away with the operator at the central station.

A patent, No. 958,145, for a telephone meter system and apparatus, has been secured by R. H. Manson, of Elyria, O.

A patent, No. 958,224 for an electric signaling apparatus, has been awarded to L. W. Carroll, of Anamosa, Ia. A selective telephone signaling system, including tuned reed and an electric variable resistance device operated from the reed.

A patent, No. 958,248, for a telephone system, has been granted to L. E. Hicks, of Stinson, W. Va.

A patent, No. 958,315, for a telephone system, has been awarded to E. C. Rodman, of West Point, Ia.

Patents No. 958,560, for a telephone repeater, and No. 958,561, for a telephone transmitter, have been granted to P. Stragiotti, of Hurley, Wis.

A patent, No. 958,627, for a telephone system, has been issued to C. L. Goodman, of Atlantic City, N. J.

A patent, No. 958,847, for a party-line telephone call mechanism, has been taken out by William E. Zabst, of Portage, Wis.

A patent, No. 958,856, for a telephone system, has been secured by W. W. Dean, of Elyria, O.

A patent, No. 958,863, for a party line call register for automatic telephone systems, has been awarded to A. H. Dyson, of Chicago, Ill.

A patent, No. 958,868, for a telephone system, has been granted to W. F. Grandolph, of St. Louis, Mo., and W. C. Halne, of Chicago, Ill.

A patent, No. 958,894, for party line telephone system has been issued to H. J. Roberts, of Evanston, Ill.

A patent, No. 958,925, for a telephone set, has been taken out by W. Kaisling, of Chicago, Ill.

A patent, No. 958,979, for a telephone switch hook, has been secured by B. W. Sweet, of Cleveland, O.

A patent, No. 959,243, for a desk telephone standard, has been issued to C. T. Mason, of Sumter, S. C.

The following patents have expired:

Patent No. 498,236, for a telephone system, issued to Emery A. Clark, of Sioux City, Ia.

Patent No. 498,243, for a telephone switch, issued to Augustus G. Davis, of Baltimore, Md.

Patent No. 498,291, for an automatic telephone exchange system, issued to Alfred S. McCaskey, of Chicago, Ill.

Patent No. 498,309, for a telephone transmitter, issued to Charles F. Scattergood, of Albany, N. Y.

Patent No. 498,674, for a printing telegraph, held by Donald Murray, of London, England.

Personal.

Mr. H. W. Pope, the well known old time telegrapher, but who, for many years past, has been associated with the American Telephone and Telegraph Company, is traveling through the west with a party of newspaper men.

Mr. G. W. Peck, of New York, and Albert Douglass, of Chicago, special agents of the American Telephone and Telegraph Company, have gone to Los Angeles to attend the convention of the railway telegraph superintendents.

Mr. Charles J. Glidden, the well known old time telegrapher, at a recent dinner of the Press Club of Boston, related some of his experiences as a telegrapher and newspaper correspondent in Manchester, N. H., in early days. He also told how he once sent a telegram from the Fiji Islands to Boston that arrived seventeen hours ahead of the time it was filed.

English papers announce the marriage in London on May 11 of Miss Evelyn Butler, daughter of Lord and Lady Arthur Butler and granddaughter of the late General Anson Stager, to the Hon. Rupert Drummond. Lady Arthur Butler, nee Miss Nellie Stager, was well known in social circles in Cleveland and Chicago, having resided in those cities while her father, General Stager, occupied the positions of general superintendent and vice-president and general superintendent of the Western Union Telegraph Company.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Colonel R. C. Clowry, president of the company, has moved into his new home at Tarrytown, N. Y.

Mr. Belvidere Brooks, general manager of the company, has returned to his office, after an extended trip of inspection through the south-west and west, which took him as far as the Pacific coast. Mr. Brooks was accompanied throughout the trip by his wife, W. N. Fashbaugh, who is in charge of the traffic and W. C. Merly, secretary to the general manager. His party was later joined by R. E. Chetwood, engineer of construction; F. A. Pickernell, assistant to the President of the American Telephone and Telegraph Company, and S. M. Williams, special agent, all of New York. Arrangements were

made at the various points visited for the extension of the reciprocal operating relations existing between the company and the different Bell Telephone Companies, thus opening up for improved service many remote points in the west. As a result of the inspection a large amount of new construction and reconstruction work has been authorized. From San Francisco to Salt Lake City the New York party was accompanied by Mr. Frank Jaynes, general superintendent of the Pacific division; Mr. J. L. Ord, superintendent of construction and Mr. F. S. Rawlins, superintendent of telegraph of the Southern Pacific Railway, all of San Francisco. At Salt Lake they were met by Mr. Theodore P. Cook, general superintendent, and Mr. M. T. Cook, general agent, of Chicago; Mr. J. B. Sheldon, superintendent of telegraph of the Union Pacific Railroad, Omaha, and Mr. S. E. Leonard, superintendent at Denver. An informal dinner was given at Salt Lake City May 25, in honor of the visiting party and Mr. Jaynes, who, on that day, celebrated the fiftieth anniversary of his entry into the telegraph service. He gave some interesting reminiscences of his telegraph career, stating that when he first joined the telegraph in 1860 on the line of the Pacific Telegraph Company, between San Francisco and San Jose, there were just three men in the service of that company, the president, general manager and a boy, he being the boy. He was in Salt Lake City in 1861, when the transcontinental lines were joined there.

Mr. T. P. Cook also entertained the party with some of his early experiences when he was an operator at the military stations between Cheyenne and Salt Lake in 1864. He said that he was operator, lineman and a little of everything in that neck of the woods when the Indians had on their war paint. He said that whenever he went out to repair wires between stations he was escorted by fifty or more soldiers.

At Denver a dinner was given to Mr. Brooks in the Denver Club by a number of the leading men of that city. At this point the party was joined by Mr. C. H. Gaunt, superintendent of telegraph and assistant general manager of the Santa Fe system, Topeka, and Mr. C. S. Gleed, president of the Missouri and Kansas Telephone Company, Kansas City, accompanied by their wives.

Mr. W. E. Athearn, engineer of equipment, has returned to his office from a western trip on business connected with the service, which included visits to Omaha, Kansas City, St. Louis, Chicago and other offices.

Messrs. D. Lynch, cable engineer, of New York, D. C. Dawson, superintendent at St. John, N. B., and C. B. Dunham, manager of the cable station at Canso, N. S., have been in Newfoundland recently on business connected with the cable service of the company.

Mr. E. A. Baird, manager of the Binghamton, N. Y., office has been appointed chief clerk and inspector in the office of E. M. Mulford, superintendent of the first district, eastern division, New York. Mr. Baird is well qualified for the new position, having been in the service since 1890, when, at the age of sixteen, he was employed as operator on the Erie Railroad and the following year became manager at Warsaw, N. Y. He later occupied a similar position at Elmira and in July 1904, was transferred to Binghamton as manager, where he has since been located.

Engineer of Equipment W. E. Athearn has changed the apparatus on the New York-Albany and on the New York-Syracuse quadruplex circuits. Those circuits are now doing first-class quadruplex work.

A conference of managers in the district of Superintendent W. J. Lloyd, of Chicago, was held in his office recently to consider the condition and betterment of the service throughout the district. About forty managers were in attendance. Many improvements will be made in all of the offices of the district.

A new telegraph line is being constructed to the top of Pike's Peak, to replace a cable which was extended to that point several years ago, the service given by the cable not having been entirely satisfactory, because of much trouble from lightning.

Three new wires have been completed and placed in service along the line of the new Western Pacific Railroad between Salt Lake City and the Pacific Coast.

At the regular quarterly meeting of the Board of Directors, held June 8, a dividend of three-quarters of one per cent. was declared, payable July 15 to stockholders of record June 20. The following statement shows the condition of the company at the close of the quarter ended March 31, 1910.

Surplus December 31, 1909.....	\$18,584,497.13
Net revenues, quarter ended Mar. 31, 1910.....	1,794,998.55
	<u>\$20,379,495.68</u>
Dividend of $\frac{3}{4}$ per cent. paid	
Apr. 15, 1910.....	\$747,711.00
Interest on bonded debt.....	433,062.50
	<u>1,180,773.50</u>
Surplus Mar 31, 1910.....	\$19,198,722.18

The following statement shows the estimated condition of the Company at the close of the quarter ending June 30, 1910:

Surplus Mar. 31, 1910.....	\$19,198,722.18
The net revenues of the quarter ending June 30, based upon nearly completed returns for April, partial returns for May, and estimating the business for June, will be about.....	\$1,950,000.00
Less interest on bonded debt..	433,062.50
Leaves estimated net earnings for the quarter, less interest on bonded debt.....	<u>1,516,937.50</u>
	<u>\$20,715,659.68</u>

A great increase is noted in the number of telegrams collected and distributed by telephone. In Chicago the report for May, 1910, shows that six times as many messages were handled in this way as during the corresponding month last year. The telephone business in the Chicago office now requires the employment of eighteen telephone operators.

RESIGNATIONS AND APPOINTMENTS.

Mr. C. B. Foster, of Chicago, has been appointed manager at Moline, Ill., vice G. E. Peterson, transferred to the main office at Chicago.

W. J. Riordan has been appointed manager at Orange, N. J., vice C. R. Crowell, transferred to New York.

Mr. H. F. Horton, of Superintendent Mulford's office, New York, has been appointed manager of the Binghamton, N. Y., office, vice E. A. Baird, transferred to New York.

Mr. G. C. Wardell, manager at Elizabeth, N. J., has been transferred to the superintendent's office in New York, as inspector in charge of the development of the telephone-telegraph service in Northern New Jersey and Staten Island. He is succeeded by W. E. Demarest.

Mr. A. M. Stanley, wire chief at Jackson, Miss., has been appointed manager at Corinth, Miss., vice R. H. Tudor, transferred to the office of J. R. Terhune, superintendent, at Nashville, Tenn., where he will hold the position of estimate clerk, relieving Aris Brown, who has been transferred to a similar position in the office of J. C. Smith, superintendent, at Dallas, Texas.

The regular quarterly dividend of one per cent. on the preferred stock of the Mackay companies and one and one-fourth per cent. on the common stock has been declared.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. Minor M. Davis, electrical engineer of the company, is on an extended trip of inspection to San Francisco, Seattle and other Pacific coast points, which will take him away from New York for about a month. He will also attend the convention of the Association of Railway Telegraph Superintendents at Los Angeles.

Mr. W. J. Camp, electrical engineer of the Canadian Pacific Railway Company's telegraph, Montreal, was a recent executive office visitor, coming here on business connected with the service.

Mr. J. P. O'Donohue, of the electrical engineer's office, New York, is in Chicago, on company business.

The Morkrum printing telegraph is soon to be given a trial between New York and Boston. This system is designed for duplex working. All of its functions are electrically performed and not mechanically.

The company now has a composite telephone and telegraph line in successful operation between San Francisco and Sacramento. This will eventually be extended to Reno, Nev., and Salt Lake City when the new line between the two latter points is completed.

The lines of the Independent Long Distance Telephone Company of Tennessee and Alabama have been acquired by this company and will be operated as strictly telegraph lines. These wires extend to many smaller points in Southern Tennessee and Northern Alabama not hitherto reached by direct wire.

RESIGNATIONS AND APPOINTMENTS.

Mr. C. M. Blivins, of the Chicago office, has been appointed manager at Council Bluffs, Ia., vice Mr. C. I. Scofield, transferred to the Omaha office as traffic chief.

Mr. Harry Morlan, formerly manager of the Kansas City, Mo., office, but for the past two years in other business at Dallas, Tex., has returned to the service and accepted the managership of the El Paso, Tex., office.

C. H. Jett, Postal Chief Operator, Denver.

Mr. Charles Henry Jett whose promotion to the position of chief operator of the Postal Telegraph-Cable Company at Denver, Col., was briefly mentioned in our May 16 issue, was born at Munfordville, Ky., May 1, 1865. He entered the telegraph service at Calvert City, Ky., in 1879 becoming an operator on the Louisville and Nash-

C. H. JETT.

Chief Operator, Postal Telegraph-Cable Company, Denver.

ville Railroad. He was afterward employed by different commercial companies and several of the leading railroads, being with the Santa Fé at Topeka for several years in the office of Superintendent of Telegraph R. B. Gemmell. The most exciting time in Mr. Jett's career was in 1893 when he was employed as a telegrapher by the United States Government at Haucks Tank, Ariz., during the last uprising of the Navajo Indians. He was sent with a body guard of eight or ten men to the scene of the uprising and while he was cutting the wire to get in communication

with Fort Wingate where the troops were located his guard started for a safer place half a mile away leaving him at the water tank station surrounded by the Indians. He finally succeeded in cutting the wire and crawling under the water tank got into communication with the fort. Just about daylight when the Indians would have been sure to discover him the troops arrived and rescued him from his perilous position. In 1896 Mr. Jett left the service to engage in other business but ten years later he returned to the key and was employed by the Santa Fé and Rock Island Railroad systems until he re-entered the commercial field by taking a position with the Postal Telegraph-Cable Company, at Denver.

The Cable.

At the annual meeting of the Central and South American and Mexican Telegraph Companies, held June 7, all of the directors were re-elected.

The cable ships Telconia and Colonia, belonging to the Telegraph Construction and Maintenance Company, have sailed from London with the new cable on board which they are to lay for the Commercial Cable Company between England and Ireland.

The Western Telegraph Company reports that on the occasion of King Edward's death over 100,000 words concerning that subject were transmitted over their cables. The new cable of this company from Europe to Buenos Ayres, Argentina, via Ascension Island, has been completed and the last section was placed in public service June 3. A reduction in rates followed the completion of this cable.

The Commercial Cable Company has announced that beginning June 1, their rates for cable messages from New York to Argentina, Bolivia, Chili, Paraguay and Uruguay, via the Azores, have been reduced to eight-five cents per word. The rate to Iquitos, Masisea, Orellana and Requena, Peru, is \$1.35 per word; to all other Peruvian offices, eighty-five cents per word.

Mr. Thomas Gothorpe has been appointed superintendent of the new station of the Direct United States Cable Company at Harbor Grace, Newfoundland. Mr. Gothorpe, who has been connected with the Rye Beach, N. H., station of the company for the past thirty-five years, was, before leaving for his new station, given a farewell reception by his friends at Rye Beach and presented with a chest of silver by the employees of the Rye Beach and Boston offices.

The diagrams appearing in "Official Diagrams of the Postal Telegraph-Cable Company's Apparatus and Rules Governing the Construction and Repair of Lines" were made from the company's blueprints and are absolutely correct. This volume, which is published by Telegraph and Telephone Age, under official sanction and supervision, is of especial value to operators and linemen. It will be sent to anyone, postpaid, on receipt of fifty cents. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Municipal Electricians.

The Utica Fire Alarm Telegraph Company is engaged in installing the new fire alarm telegraph system in Ilion, N. Y., recently contracted for.

A new fire alarm system is being installed at San Jose, Cal., by the Gamewell Fire Alarm Telegraph Company.

The city electrician of New Orleans has recently completed the installation of fifty new alarm boxes, located mainly in residential sections of the city.

Mr. William Allen has been appointed superintendent of police telegraphs in Brooklyn. Mr. Allen has been connected with the police department of Brooklyn for twenty-one years, during most of which time he has been attached to the telegraph bureau.

A patent, No. 958,719, for a signal-box for fire-alarm systems, has been granted to F. S. Bronson, of Rochester, N. Y. Fire-alarm and automatic telephone in which the signaling apparatus actuates the central telephone to automatically select the fire-alarm headquarters and then ring the number of the box.

Members of the International Association of Municipal Electricians should, if possible, arrange to attend the fifteenth annual convention of that body, which meets at Rochester, N. Y., September 6, 7, 8 and 9. The annual meetings of this organization are always productive of great benefit to those who attend and the coming gathering will be an exceptional one in this respect. Mr. J. B. Yeakle, of Baltimore, Md., is president and Mr. Frank P. Foster, of Corning, N. Y., secretary of the association.

A patent, No. 957,968, for a call-box signaling system and apparatus therefor, has been awarded to Clarence C. Johnson, superintendent of the American District Telegraph Company, New York. This covers signal-transmitting apparatus which comprises main-signal transmitting means, including means for transmitting through one circuit either of two different classes of signals at will, and comprising also other transmitting means for transmitting a signal through another circuit concurrently with the transmission of one of the two classes of signals transmitted by the first mentioned transmitting means.
