SOME POINTS ON ELECTRICITY—IX.

A Study of Telegraphic Apparatus.

BY WILLIS H. JONES.

OFFICE LOOPS.

No doubt nearly every operator understands that an office loop is merely an extra set of sounders suitably located, and connected temporarily with some multiplex circuit which has no desk room to work on, yet there is often considerable ignorance of its construction and possibilities on the part of those who take the liberty of altering the position of the switch levers when anything goes wrong. It is to the latter that the subject matter of this article is directed.

The accompanying diagram, taken from the "Pocket Edition of Diagrams," shows the complete connections of an office loop outfit, as arranged by the Western Union Telegraph Company. It will be seen that the two sounders, one for the sending side and the other for the receiving side, are each looped to a springjack at the loopswitch which connects with a multiple set local apparatus, viz.: the polechanger and the contact points of the relay, with the latter of which they are connected respectively in series.

The sounders used are invariably the four-ohm pattern. The low winding is required in order that their addition to or removal from the uniform 100-ohm local circuits adopted for all multiplex loops will not appreciably alter the normal current of 250 milliamperes each local circuit is expected to carry. If a fifty-ohm sounder should be substituted the total resistance of the circuit would be abnormally increased and the volume of current correspondingly decreased, with the result that the four-ohm polechanger would not work properly.

Attention is called to this fact particularly, because now and then operators becoming dissatisfied with a sounder sometimes exchange sounders between adjoining desks and frequently pick out a fifty-ohm instrument. As they all look alike there is probably no thought that the exchange may prove harmful. The harm done is this: the fifty-ohm sounder may throw the branch office sounders out of adjustment by depriving them of sufficient current, while the low resistance of the four-ohm sounder, if substituted for the high wound sounder, may cause so much current to flow through the fuse as to melt it and open all the other sounders which take current through the same fuse. It is obvious, therefore, that operators should not make such exchanges without proper authority.

Another unfortunate habit many operators have acquired is that of cutting off branch offices the moment a loop opens and failing to restore the switch levers to their original position, after a short wait in order to ascertain if the opening was permanent or merely temporary. In some cases no attempt is made to investigate, and sometimes the change is not even reported. Such indifference may cause serious delay to branch offices before the situation is finally discovered. Operators should understand that many of these temporary openings are legitimate, yet unavoidable. Every time a newspaper loop is connected or removed temporary opening of the circuit will occur, and if the operator finds it necessary to turn the switches in order to break,

Digitized by Google

he should invariably restore the connections at very short intervals to see whether the branch office loop has been closed or not. If within a reasonable time he finds the loop still open he should report the fact to his chief.

Again, in the event of a resistance lamp being broken, and a new one substituted, it should be understood that the latter must be one of a certain standard resistance. The resistance of these lamps is supposed to be approximately the same as that of the resistance of the loop it replaces, when the latter is removed temporarily. If the lamp substituted possesses a lower or a higher resistance than the loop, the operator will notice a difference in the strength of current flowing through his sounder when a loop is cut in and cut out. When a loop is cut in the lamp is not in circuit and when it is cut out the local circuit ends at the ground wire connected to the lamp. The "return wire" leading back to the loopswitch

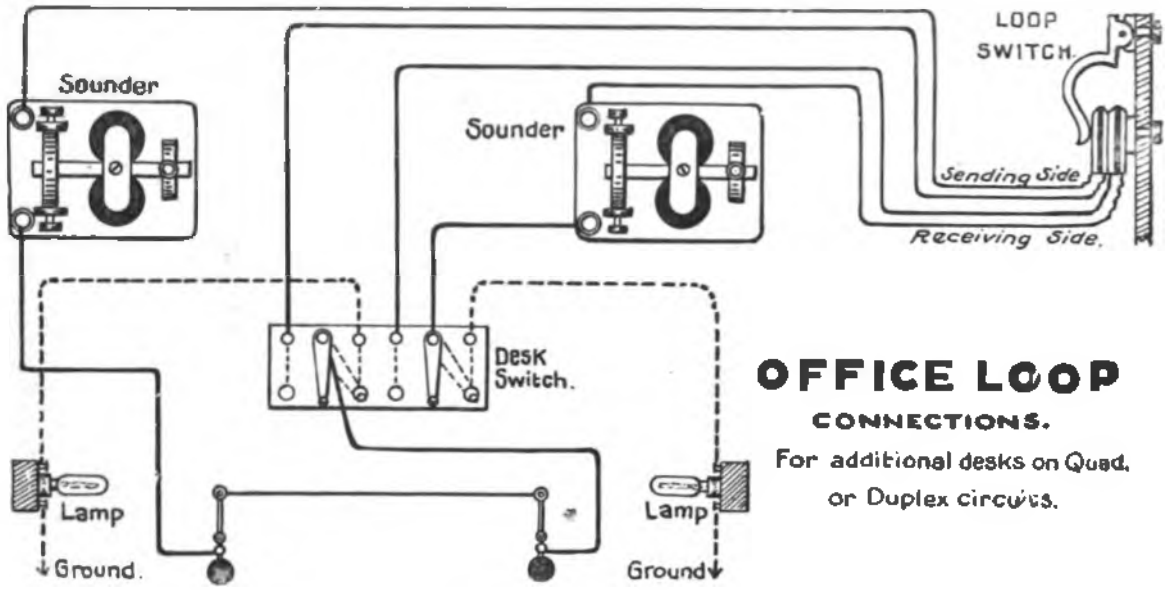

DIAGRAM OF OFFICE LOOP.

under these conditions is out of commission, being left open at the disk on the desk switch.

When this return wire becomes defective it is impossible to connect a branch office loop in series with the office loop, yet it is sometimes hard to convince laymen that the fault is in the office set and not in the branch loop, when requested to substitute another. They argue that the office loop is intact because it works all right when the branch loop is cut off. They apparently forget, or possibly do not know, that only half of the office loop conductors leading to and from the loopswitch, where the branch loop is connected, is in service when they cut the loop off. The loop chief is the only one who can detect this fault, which is usually due to a loose connection on the under lip of the springjack at the loopswitch or at the binding post of the local three-point switch on the operator's desk.

(To be continued.)

The Inventors' Guild.

The Inventors' Guild has been incorporated in New York.

The object of the guild, as stated in the constitution is "to advance the application of the useful arts and sciences, to further the interests and secure full acknowledgment and protection for the rights of inventors, to foster social relations among those who have made notable advances in the application of the useful arts and sciences."

Some of the handicaps to which the inventor is subject, other than the proverbial one of never having any money, are the delays in the Patent Office and the ineffectiveness of its work, due to overcrowding and lack of proper facilities in that office; the expense and tardiness of litigation, and the possibility that a rich and powerful corporation, by delaying and prolonging a suit, may increase the expenses to a point which makes such suits prohibitive for a poor inventor; the disadvantage to which the American inventor is subject in foreign patent offices, as compared with the liberality of the American Patent Office toward the foreign inventor, and many other conditions militating against the American inventor which should be remedied.

The officers of the Inventors' Guild are as follows: Mr. Ralph D. Mershon, president; Mr. Chas. W. Hunt, first vice-president; Mr. Chas. S. Bradley, second vice-president; Mr. Thomas Robins, secretary, and Mr. Henry L. Doherty, treasurer.

The professional committee is: Messrs. F. L. O. Wadsworth, chairman; Thomas A. Edison, Chas. S. Bradley, Peter Cooper Hewitt, Michael I. Pupin and Bion J. Arnold.

At the present time the Guild has twenty-nine members, including: Messrs. Bion J. Arnold, Thomas A. Edison, Stephen D. Field, Peter Cooper Hewitt, Dr. John F. Kelly, Ralph D. Mershon, Prof. Edwin F. Northrup and Prof. Michael I. Pupin.

Branch Office Wiring.

BY JOHN F. SKIRROW, ASSOCIATE ELECTRICAL ENGINEER, POSTAL TELEGRAPH-CABLE CO., NEW YORK.

The accompanying diagram shows in a very clear manner the Postal Telegraph-Cable Company's standard method for wiring branch offices. The wires from the cable head shown at the top of the illustration are brought directly to fuse blocks containing half-ampere fuses with lightning arresters, thence to spring-jacks mounted upon porcelain bases. The instruments are thus protected against damage in the event of accidental crosses with high potential or electric railway wires, as well as against damage by lightning. A small knife switch mounted on a porcelain block, shown between the fuses, is used for grounding. This switch is so arranged that when it is closed a loop is grounded between

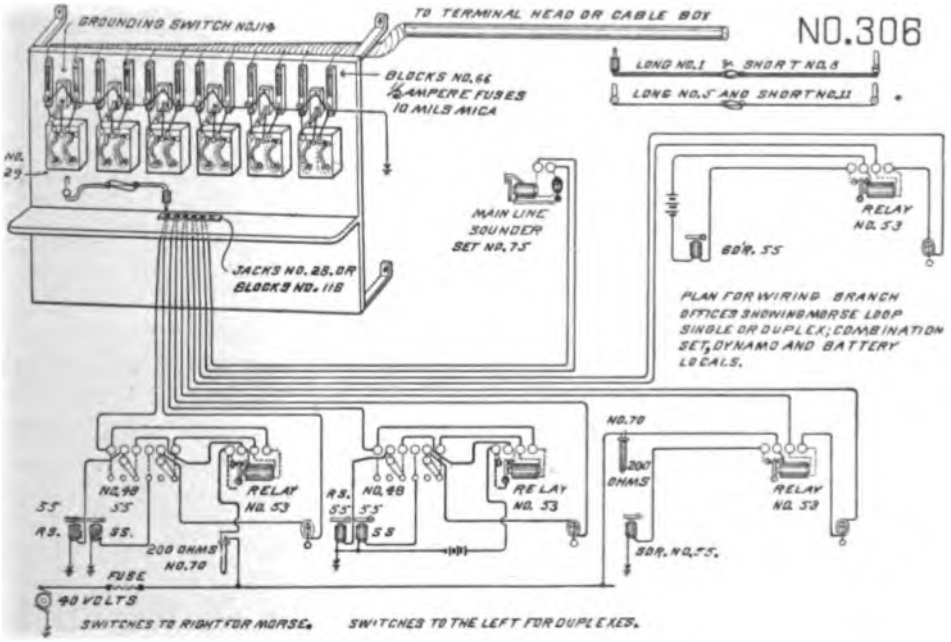

DIAGRAM OF BRANCH OFFICE WIRING.

two spring-jacks, thus permitting the use of each side of the loop to a ground through a separate spring-jack.

Round or "pin" jacks mounted on a porcelain bar are connected on a shelf or in the face of the board upon which the spring-jacks, fuse blocks, etc., are mounted. The office sets are permanently wired to these jacks. Connections between the pin jacks and line jacks are made by cords of suitable length having a wedge on one end and a plug on the other.

The wiring shown in the illustration comprises an ordinary Morse set with battery local, a similar set with dynamo local and combination sets which can be converted from Morse to grounded duplex legs with battery and with dynamo locals.

The dynamo arrangement shown is the one used where 40-volt current is fed to the branch office from the main office. Where 110-volt electric light current is used, 2,000-ohm coils and 150-ohm local instruments are required in place of the 200-ohm coils and ten-ohm instruments used with forty-volt pressure. The fuses shown are the standard one-half-ampere enclosed cartridge fuse.

Recent Telegraph and Telephone Patents.

No. 977,477. Cut-out Telephone System. To E. Gould, Spring Valley, Minn.

No. 977,452. Telegraph Sending Machine. To J. R. Jones, Port Arthur, Ont., Can. The machine is mounted on a pivoted frame and can be substituted for the ordinary key. Within the case or frame is a pendulum which sends the dots and dashes by a movement of the casing.

No. 977,536. Automatic Switch for Telephone Systems. To G. H. North, Cleveland, Ohio.

Nos. 977,616, 977,617, 977,618, 977,619, 977,620, 977,622, 977,623. Telephone Transmitter. To F. Gottschalk, New York.

No. 977,621. Sound Reproducing Device. To F. Gottschalk, New York.

No. 977,642. Means for Effecting Telephone Communication Without Connecting Wires. To H. G. Matthews, Gloucester, Eng.

No. 977,657. Telephone Transmission System. To O. T. Lademan, Milwaukee, Wis.

No. 977,658. Telephone Desk Stand. To W. Leaver, Chicago, Ill.

No. 977,721. Electric Battery. To C. J. Everett, New York.

No. 977,879. Electric Telegraphy. To J. Kajiura, Tokyo, Japan. This is a semi-bridge duplex system for cables and telephonic circuits with means for reducing the capacity of artificial cables by means of an artificial line corresponding to the line cable, and a balancing rheostat with self-inductances and capacities branching from the center of the rheostat.

No. 978,075. Telephone Mouthpiece. To G. R. Taylor, San Francisco, Cal.

No. 978,079. Keyboard Telegraph Transmitter. To D. S. Troth, Oakland, Cal.

No. 978,083. Telephone Repeater System. To N. G. Warth, Columbus, Ohio.

No. 978,128. Telautograph. To R. W. Armstrong, New York.

No. 978,269. Automatic Burglar Alarm. To H. B. Collier, Prairie Grove, Ark.

No. 978,370. Telephone Receiver Support. To J. G. Harris and A. Mancuso, Philadelphia, Pa.

No. 978,435. Telegraph Transmitter Apparatus. To H. G. Davis, Williamsport, Pa.

No. 978,603. Testing System for Party Lines. To D. A. Lawyer and C. C. Bradbury, Chicago, Ill.

No. 978,709. Combined Telephone and Alarm or Kindred Service System. To W. W. Dean, Chicago, Ill.

No. 978,733. For Answer Back Signals has been granted to E. R. Gill, Yonkers, N. Y.

The following patents have expired:

No. 509,367. Switchboard Circuit and Signaling Apparatus. Issued to F. W. Dunbar and E. S. C. May, Newark, N. J.

No. 509,430. Printing Telegraph. Issued to Robert A. Fowden, Philadelphia, Pa.

No. 509,447. Train Signaling Apparatus. Issued to Joseph S. H. Pellot, Paris, France.

No. 509,477. Trunk Line Signal. Issued to E. S. C. May, Chicago, Ill.

No. 509,484. Signal Apparatus for Telephone Systems. Issued to J. J. O'Connell, Chicago, Ill.

No. 509,524. Police and Fire Alarm System. Issued to J. B. Gill, San Francisco, Cal.

No. 509,530. Telephonic Apparatus. Issued to W. S. Harrington, Hong Kong, China.

No. 509,873. Signaling Telegraph. Issued to M. J. Burns, Lowell, Mass.

No. 509,932. Testing Apparatus for Multiple Switchboards. Issued to Frank R. McBerty, Downers Grove, Ill.

No. 509,956. Annunciator for Telephone Switchboards. Issued to Charles E. Scribner, Chicago, Ill.

No. 509,964. Telegraph Key. Issued to Josef Steiner, Brooklyn, N. Y.

No. 509,965. Telephonic Transmission. Issued to John S. Stone, Boston, Mass.

Nos. 510,002, 510,003, 510,004, 510,005, 510,006 and 510,007. Telegraphy. Issued to Patrick B. Delany, South Orange, N. J.

No. 510,115. Electric Fire Alarm. Issued to Milton C. Cantrell, Springfield, Ohio.

No. 510,156. Circuit-Breaking Apparatus. Issued to John Burry, New York, N. Y.

No. 510,195. Automatic Telephone Exchange System. Issued to John Serdinko, New Braunfels, Tex.

Personal.

Prof. Alexander Graham Bell has been elected an honorary member of the Royal Institute of Great Britain.

Mr. J. Townsley, superintendent of construction at Montreal for the Canadian Pacific Railway Company's telegraph, retired on January 1.

Mr. H. F. Thurber, vice-president and general manager of the New York Telephone Company, gave an address on the subject, "Our Business Associates," before the meeting of the Telephone Society of New York, on December 19.

Mr. H. E. Dunham, formerly associate editor of Telegraph and Telephone Age, now an assistant examiner of patents in the Patent Office, Washington, D. C., was a recent New York visitor, enroute to his home in Syracuse, where he spent the holidays.

Mr. Hugh P. Trainor, district engineer of the government telegraphs, Pretoria, South Africa, will begin a six months' leave of absence on January 1 and will visit England, the United States and Australia, where he will examine the telegraph systems and kindred interests in these countries.

We have received from Mr. F. W. Jones, former electrical engineer of the Postal Telegraph-Cable Company, who, with Mrs. Jones, is spending the winter at Palm Beach, Fla., a neat Christmas card bearing greetings from that country of balm and sunshine.

Superintendent of Insular Telegraphs at Porto Rico.

Mr. A. W. Metzger, of the Cumberland Telephone and Telegraph Company, Louisville, Ky., has resigned to accept the government position of Superintendent of Insular Telegraphs at Porto Rico. Mr. Metzger is a native of Louisville, having been born December 20, 1871. During his entire business career, he has been in the service of the Cumberland Telephone and Telegraph Company in Louisville. He was chief electrician for the company in the Louisville district at the time of his resignation. Mr. Metzger sailed from New York December 17 for his new post. While in this city he called on many of his friends.

Mr. Metzger was the guest of honor at a banquet given by the employes of the Cumberland Telephone and Telegraph Company in the Louisville district, on the eve of his departure.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. C. P. Bruch, vice-president of this company, was in Buffalo, Rochester, Syracuse and Albany recently on business connected with the service.

Mr. H. F. Hawkins has been appointed chief clerk in the office of Traffic Superintendent F. F. Norton vice Mr. G. W. Fleming resigned.

The money transfer bureau of this company has

Digitized by Google

been separated from the cashier's department. Mr. E. S. Butterfield is general agent of the money transfer bureau while Mr. J. A. Manning has been appointed cashier and Mr. C. H. Walter becomes assistant cashier.

Mr. George Marshall Purdy, manager of the Postal Telegraph-Cable Company at Cleveland, Ohio, whose appointment was recorded in a previous issue, was born on a farm near West Unity, Ohio, February 22, 1874, and in June, 1890, entered the telegraph service as messenger for the Western Union Telegraph Company at Mansfield, Ohio, afterward serving as operator at Canton, Ohio, for the same company. Between January, 1896, and September, 1909, he was manager of the Postal Telegraph-Cable Company, at Mansfield, and from September 1, 1909, until December 15, 1910, was manager of the Dayton, Ohio, office of the same company. On the latter date he received the appointment of manager of the Cleveland office.

Mr. Eugene Yates Onderkirk, who was recently appointed manager of this company, at Wheeling, W. Va., was born at Saratoga Springs, N. Y., May 31, 1868, and in the summer of 1882 he entered the telegraph service at that place. He was manager of the Commercial Union Telegraph Company at Saratoga, N. Y., and afterwards was manager for the Postal Company at Titusville, and Johnstown, Pa. He has worked as operator at Albany, Buffalo and New York. He took charge of the Wheeling office November 1 last. Mr. Onderkirk is a member of the Old Time Telegraphers and Historical Association.

Mr. J. H. Dorsey has been appointed manager of this company at Los Angeles, Cal., vice V. V. Stevenson transferred to San Francisco as division electrical engineer.

Mr. John D. Prosser, night traffic chief of the Philadelphia office has resigned to engage in farming at Boulogne, Nassau County, Florida. On his last night at the office (November 30), he was presented by his associates with a double-barreled gun, a hunting coat and other hunting paraphernalia. On the night of December 1, Mrs. Prosser entertained the force at her home in West Philadelphia. About fifty guests entered the room with hoes, rakes, shovels, pitchforks and other farming implements, all of which were presented to Mr. Prosser.

Mr. Charles Henry Johnson, formerly chief operator of the Memphis, Tenn., office, has been appointed manager to succeed Mr. J. F. Wilson, appointed district commercial manager. Mr. Johnson was born at Holly Springs, Miss., May 3, 1871, and entered the telegraph service in that place in 1887. He worked in various railroad and Western Union offices and entered the service of the Postal Telegraph-Cable Company in 1909.

Mr. W. E. Pope, wire chief of the Memphis, Tenn., office, has been appointed chief operator, vice Mr. C. H. Johnson, advanced to the managership of that office.

President Clarence H. Mackay recently entertained the heads of departments of the company in Chicago at a performance of grand opera. On subsequent nights he entertained all other employes, including the messengers.

Mr. J. S. Ellis has been appointed assistant to the general superintendent of plant with headquarters in New York.

The wife of Mr. W. L. Hallett, of the supply department, New York, died on December 19.

Mr. Clarence H. Mackay, president of the Postal Telegraph-Cable Company and the Commercial Cable Company, has sent a woolen sweater as a personal Christmas gift from him to every one of the 5,000 messenger boys employed by his companies in America.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. E. J. Hall, chairman of the executive committee, has returned from his trip to Europe.

Messrs. Belvidere Brooks, general manager; W. N. Fashbaugh, traffic engineer of this company; W. H. Baker, vice-president of the American District Telegraph Company of New Jersey, and W. C. Merly, secretary to the general manager, were recently in Chicago, Detroit, Toledo, Cleveland and Buffalo on business connected with the service. Conferences were held with the company's officials and representatives at those places.

Mr. W. B. Powell, district traffic chief, Atlanta, Ga., is now located in Louisville, Ky., his headquarters having been changed to the latter city.

Mr. F. E. Horton has been appointed district plant superintendent, second district, Mountain Division, with headquarters at Salt Lake City, Utah, vice Mr. R. P. Cowardin.

Mr. A. L. Wellington has been appointed chief clerk in the office of Mr. E. Boening, district commercial superintendent at Seattle, Wash. Mr. Wellington was assistant manager of the Seattle office at the time of his recent appointment.

Mr. D. C. Dawson, district traffic superintendent of the sixth district, with headquarters at St. John, N. B., has been appointed general agent of the Company in the Maritime Provinces, including Newfoundland. These new duties are additional to those of the position of district traffic superintendent.

Mr. W. S. Barker has been appointed district plant superintendent at Boston, Mass.

A quarterly dividend of three-fourths of one per cent was declared by the directors on December 14, payable on and after January 16. The report for the quarter ending December 31 shows estimated net earnings of $1,226,937.50, after deducting the interest on bonded debt. The surplus, after deducting the dividends, is $8,973,067.59.

Mr. J. F. Wilson, manager of the Postal Telegraph-Cable Company, Memphis, Tenn., has accepted the position of district commercial manager for this company, with headquarters in that city. Mr. Wilson was born in Rankin County, Miss., September 12, 1881, and began his telegraphic career in August, 1896, as messenger for the Western Union Telegraph Company in Memphis. He remained with that company until 1901, when he entered the service of the Postal Telegraph-Cable Company at Memphis. He has held the positions of operator, traffic chief, wire chief, night chief operator, chief operator, and finally became manager of the office.

Mr. A. C. Kaufman has been appointed commercial agent of the Eastern Division, with headquarters in New York.

A. R. McGrath, assistant manager of the Postal Telegraph-Cable Company, Chicago, has resigned to accept a position as special agent for this company, with headquarters at that place.

Mr. George Laidlaw, recently appointed manager of the Halifax, N. S., office, is a native of that city, being born January 31, 1879. In 1895 he entered the telegraph service at Halifax as messenger and has filled the positions of clerk, operator, chief operator and has finally become manager of the office.

Mr. H. C. Worthen, general superintendent Southern Division, Atlanta, Ga., was the guest of honor at a banquet given in that city, December 10, by the members of the traffic and plant departments. Mr. D. M. Therrell, division traffic superintendent, made the speech of welcome. Those present, in addition to those mentioned, were E. E. Williams, district commercial superintendent; G. W. Lloyd, district traffic superintendent; W. A. Neill, district plant superintendent; L. B. Thompson, J. E. Scofield and L. J. Amsden, Atlanta; W. G. Peebles, district traffic superintendent, and W. K. McClarin, district plant superintendent, Nashville, Tenn.; F. O. Nourse, district traffic superintendent, and J. B. Faulkner, district plant superintendent, Richmond, Va.; W. F. Williams, superintendent of telegraph of the Seaboard Air Line, Portsmouth, Va., and J. C. Duane, district plant superintendent, Jacksonville, Fla.

Mr. W. B. Tyer, chief clerk and assistant manager of this company's office at Houston, Tex., has been appointed manager of the Fort Worth, Tex., office.

Mr. George Laidlaw has been appointed manager of the Halifax, N. S., office of this company to succeed Mr. C. W. McKee, promoted to be district commercial superintendent at St. John, N. B. Mr. John Eckersley and Mr. John Fitzpatrick of the Halifax office, have been appointed day and night chiefs respectively.

Mr. George R. Allen has been appointed district traffic superintendent, first district, of the Mountain Division, Denver, Col.

Mr. Allen is a native of Colorado, and entered the service of the Western Union Telegraph Company as a messenger in 1887, and was employed in various capacities by that company until 1896, when he entered the service of the Associated Press at Denver. In 1903 he was appointed chief operator of the same association in New York. In 1907 he returned to the Denver bureau as chief operator, which position he held at the time of his recent appointment.

Mr. Henry J. Kinnucan, recently appointed division general agent at Detroit, Mich., was born in Detroit, and after graduating from the public schools of that city, went with the Western Union Telegraph Company as messenger in 1875. In the sixteen years he remained with the company, he advanced through various positions until he became chief clerk to the superintendent. In 1891 Mr. Kinnucan became manager of the Postal Telegraph-Cable Company's Detroit office, then recently

H. J. KINNUCAN,
Division General Agent, Detroit.

opened. A year later he was appointed assistant superintendent of the first district, and was placed in charge of the Michigan lines and offices, including Toledo, Ohio. When the territory was divided a year or so later he was advanced to the superintendency. Mr. Kinnucan held this latter position at the time of his recent appointment to the Western Union service.

Municipal Electricians.

Mrs. Ehore Adelia Foster, mother of Mr. Frank P. Foster, of Corning, N. Y., former secretary of the International Association of Municipal Electricians, died at her home in Caton, N. Y., at the age of 71 years.

Patent No. 978,626 has been issued to J. G. Nolan, of Chicago, for an Automatic Electric Signaling System. This is a fire alarm system which distinguishes between the trouble signal and the alarm signal.

The Telephone.

Ear-rings are no longer in vogue except among telephone girls.—*Philadelphia Ledger.*

Mr. C. F. Mason, commercial engineer of the Pacific Telephone and Telegraph Company, has been promoted to the position of district commercial superintendent of the same company, with headquarters at Los Angeles, Cal.

Mr. John A. Howard, of Wheeling, W. Va., one of the organizers of the Continental Telephone and Telegraph Company, has filed a voluntary petition in bankruptcy. It is stated that his assets exceed his liabilities. He was endorser of notes of independent telephone companies comprising the Continental Company, to the extent of about $1,000,000.

The Southwestern Telegraph and Telephone Company is planning to erect a new exchange building in Houston, Tex.

Charged with Wrecking a Telephone Company.—Former State Senator Henry H. Evans, of Illinois, and his co-officers in the Interstate Telephone and Telegraph Company, E. R. Conklin and S. H. Case, are charged by the receivers of the company, Fred A. Dolph and William C. Niblack, with having "milked" the company of $1,231,000. Suit has been filed against them in the United States Circuit court at Chicago to collect this amount. It is stated that Evans paid himself nearly $40,000 out of the funds of the company, four days before the interest on the bonds came due. As a consequence, the depleted treasury did not contain the money to pay the interest.

The New York Telephone Company has petitioned the Public Service Commission, Second District, for approval of the transfer to it of the franchises of The Empire State Telephone and Telegraph Company. The latter company is now operating a public telephone system in the counties of Wayne, Ontario, Oswego, Yates, Cayuga, Seneca and Cortland, and on April 1, 1909, it conveyed all of its property, rights, privileges and franchises to the Central New York Telephone and Telegraph Company, which latter company has been merged into the New York Telephone Company. The capital stock of the Empire Company is $200,000, which the New York Telephone Company now owns.

New Telephone Exchange for London.—The Post Office authorities in London, England, are converting a large block of buildings in St. James's Square, E. C., into a new telephone exchange.

Telephone Conference.—The monthly conference of exchange managers and contract agents of the New England Telephone and Telegraph Company was held in Springfield, Mass., recently. Among those present were Messrs. G. G. S. Perkins, superintendent of the Directory Department, and R. P. Jones of the Auditing Department, Boston, and Messrs. G. W. Learned, contract agent, and H. R. Leathers, manager, Holyoke, Mass.

Telephone Equipment for San Francisco Western Union Offices.

The plant department at San Francisco has just completed and placed in service at the Western Union Telegraph Company's main office in that city, a special telephone equipment and storage battery plant. This equipment consists of a ten-position multiple switchboard, specially designed to take care of local switching; also to properly handle the large number of telegrams that are now being sent and received over the telephone. This switchboard is stated to be the first of its type to be installed on the Pacific Coast.

American Telegraph Typewriter Company.

The American Telegraph Typewriter Company, 72 William street, New York, which is handling the Cardwell telegraphic typewriter, is now in a position to meet the demand for these instruments. This machine is used interchangeably as a transmitter or receiver, and has received a practical test, extending over a year, on the lines of the Long Island Railroad Company between Long Island City and the Brooklyn terminals. Mr. L. S. Wells, superintendent of telegraph of that company, makes a favorable report upon the results attained. These typewriters are connected on a telephone circuit and the operation is carried on simultaneously with telephonic conversation, without in any way interfering with the latter. The system, which is economical, flexible and rapid, having no complicated mechanism, will prove a most valuable substitute for present methods.

This typewriter is in daily operation between Philadelphia and New York and orders have already been received for instruments from the Government and from several railroad companies. The construction of the instrument is so simple that only the ordinary office help is required to operate it. It is stated to be the only printing telegraph of one unit that can be placed on any circuit with intermediate stations to be operated selectively, or a message can be sent to any number of machines simultaneously. It is suitable for long or short haul and terminal service.

The machines have been tested in the New York city police headquarters, and the demonstration, it is stated, was very successful. The City News Association, which supplies practically all the daily newspapers of New York city with routine news reports, gave an order to place one of them in the offices of each of the daily papers. These machines are now being installed. One of the principal functions of the machine is that it may be used to supplement and increase the use of telephone and telegraph wires.

The system has also been tested on board the United States battleship Nebraska, with a view to determining its utility in communicating range and target observations and fire control orders in time of battle to all parts of the ship.

Death of S. S. Dickenson, Vice-President and General Superintendent of Commercial Cable Company.

Samuel S. Dickenson, vice-president and general superintendent of the Commercial Cable Company, died at his residence, 430 West 116th Street, New York, December 23, of an obscure ailment causing impoverishment of the blood. He was born at Plymouth, England, May 8, 1852. He began his career as a telegrapher in England in 1867 and has been identified with submarine cable interests for many years. He went to Nova Scotia, where, in 1874, he helped to establish the Torbay station of the Direct United States Cable Company. He particularly distinguished himself as an expert in the then little understood art of applying the duplex apparatus to submarine telegraph cables.

In 1884 he joined the Commercial Cable Company, just then organizing. He established its cable station at Hazelhill, Canso, N. S. He was the superintendent of this station for twenty years and he made it a model of efficiency. Meantime he undertook important work for the same interests in other parts of the world.

THE LATE SAMUEL S. DICKINSON.

In 1900 he established the Commercial Cable station at Fayal, Azores, and opened the first cable communication between Portugal, the Azores Island and North America. For his services in this connection he was decorated by King Carlos of Portugal.

In 1901 he was sent to Honolulu, Midway, Guam and Manila to select landing places and sites for the Commercial Pacific cables and stations. How well he succeeded is attested by the fact that the cables have remained undisturbed and uninjured in the places he selected.

On January 1, 1904, he was appointed general superintendent of the Commercial Cable Company and shortly thereafter he became a member of the Board of Directors and was elected a vice-president. He was also a director in the Commercial Pacific Cable Company.

No telegraph man was better known or more esteemed throughout the entire cable and telegraph service than was Mr. Dickenson. He was a man of noble character, great ability and much tact; an expert electrician and had few equals as an allround telegrapher. As a manager of men Mr. Dickenson had no superior, thoroughly straightforward in all his dealings, he possessed a most kindly disposition and was much respected by his subordinates. All who knew him deplore his death.

Mr. Dickenson was a member of the British Institution of Electrical Engineers and of the American Institute of Electrical Engineers.

As a mark of respect to his memory, all the circuits of the Commercial Cable and Commercial Pacific Cable companies were silenced for a few minutes during the funeral services which were held at the church of St. Ignatius Loyola, Park Avenue and 84th Street, at 10 a. m., December 26. The pall bearers were: Mr. Clarence H. Mackay, Mr. Geo. G. Ward, Mr. Geo. Clapperton, Mr. W. W. Cook, Mr. E. J. Nally, and Dr. G. D. Stewart. The service was attended by many cable and telegraph officials and other employes and friends. The body was taken to Antigonish, N. S., for interment. Mr. Dickenson leaves a widow, three sons and a daughter.

The Cable.

The Eastern and Eastern Extension telegraph companies, acting in conjunction with Reuters Telegram Company, have agreed to supply to the newspapers of India, South Africa and Australia a largely increased amount of British imperial news, it being an essential part of the arrangements that Reuters makes no extra charge to newspapers in India and the colonies.

The Commercial Cable Company is distributing a leaflet describing some fast telegraphic work. On November 16 Messrs. S. Marshall Bulley & Son, of Houston, Tex., filed at 9:58 a. m. with the Postal Telegraph-Cable Company an order to be delivered to their correspondents in Liverpool, England, before 10 a. m., that time corresponding with the time of the closing of the Liverpool cotton market—4 p. m. This cablegram was relayed at New Orleans and New York, thence transferred to the Commercial Cable Company at New York and sent to Waterville, Ireland, then to Liverpool, being handled by twelve or fourteen persons. The message reached its destination within the time limit—two minutes.

Mr R. L. Dean of Chicago, the inventor of the Dean Rapid Printing Telegraph System, in renewing his subscription for another year takes occasion to say: "I consider Telegraph and Telephone Age the most progressive and valuable publication of its kind in America. Kindly accept my best wishes for the success it deserves."

Standard Definitions of Electrical Terms.

The careless and indiscriminate use of electrical terms and symbols often leads to doubt and confusion in the minds of electrical students. Our old friend $C = \frac{E}{R}$, for instance, under the modern nomenclature has become changed to $I = \frac{E}{R}$. The meaning of this formula has not been changed, however—only one of the symbols. Again, the familiar "dynamo" is no longer known as a dynamo. It is a "generator," which is a broader and more definite term. The machine itself has undergone no change, only its name. We might call a rose a cabbage, but it would still be the fragrant flower we know it to be.

It is always advisable to call things by their right names. In the early days of electrical development many monstrosities crept into the language of electricity, and because electrical knowledge was not then reduced to a scientific basis, these hybrids found general acceptance, there being no one qualified to challenge them. In later times it was found necessary to revise electrical terminology to make the terms and definitions agree with the facts. It is slow work dislodging the undesirable and ambiguous terms, but all up-to-date telegraph engineers and electrical engineers are overcoming the bad habits of earlier days of calling things electrical by improper names, and are now calling them by their right names. That is, they are right names as far as human wisdom and experience can make them right. Some day in the future, when we know more than we do now, we may find it necessary to revise our present system; but we need not worry about that now, as long as we are doing the best we can in our present state of knowledge.

"Be sure you are right, then go ahead" is a safe rule to follow always. In order to point out to electrical students the right way to go, so that they can "go ahead" without fear, we give the standard and authorized definitions of electrical terms for electrical quantities, machines, etc., as promulgated by the American Institute of Electrical Engineers and foreign electrical societies. In some instances these definitions have been amplified in order to make them clearer to those who are not advanced in their knowledge of electricity.

SYMBOLS.

The following notation is recommended by the Institute and has been generally adopted. The full list of symbols is not given, but only those that are in ordinary use.

E, *e*, for voltage, electromotive force, (emf) potential difference, pressure and tension. All of these terms are synonymous.

I, *i*, for current—not *C* or *c*.

R, *r*, for resistance. This is not changed. The expression of Ohm's law under the new system of notation is $I = \frac{E}{R}$, not $C = \frac{E}{R}$, as formerly. The *C* has been adapted to another use. It now represents capacity, as noted further.

P, for power.

Φ. (Greek letter phi), for magnetic flux.

$\mathfrak{B}$. *b*, for magnetic density. The letter $\mathfrak{B}$ is German script.

C. *c*, for capacity (the capacity of a condenser, or of a line or a cable, for instance).

G, *g*, for conductance.

DEFINITION OF CURRENTS.*

1. *"A Direct Current* is a unidirectional current," that is, acting in one direction. Such a current may be varied in strength but its direction does not change.
2. *"A Continuous Current* is a steady or non-pulsating, direct current." A current from a battery or a generator in a circuit with a fixed resistance is an example of a continuous current.
3. *"A Pulsating Current* is a current equivalent to the superposition of an alternating current upon a continuous current."
4. *"An Alternating Current* is a current which, when plotted, consists of half-waves of equal area in successively opposite directions from the zero line." In other words, it is a current that flows first in one direction then in the opposite direction alternately.
5. *"An Oscillating Current* is a current alternating in direction, and of decreasing amplitude." The discharge from a Leyden jar or a condenser gives a current of this kind, the energy growing less and less until it is entirely dissipated. The discharges from the spark gap of wireless telegraph induction coils are also of this kind.

ROTATING MACHINES.

6. *"A Generator* transforms mechanical power into electrical power." The so-called "dynamo" is a generator, because under the above definition, it is driven by mechanical power and delivers electrical power. The mechanical power is transformed into electrical power. The mechanical power may be supplied by a steam engine, a gas engine, a steam turbine, a water wheel, etc.
7. *"A Direct-Current Generator* produces a direct current that may or may not be continuous." The machines used for generating telegraph currents are direct-current machines.
8. *"An Alternator or Alternating Current Generator* produces alternating current, either single-phase or polyphase." Such a machine generates current of the character described in definition 4.

*In these definitions the portions within the quotation marks are the standard definitions. The rest is explanatory.

Digitized by Google

9. "*A Double-Current Generator* produces both direct and alternating currents." It has a commutator at one end of the armature where direct current is obtained, and at the other end of the armature it has collector rings, at which point alternating currents are delivered.

10. "*A Motor* transforms electrical power into mechanical power." It will be noticed that this definition is just the reverse of that of a generator. A motor is driven by electrical power and delivers mechanical power, while, as already explained, a generator is driven by mechanical power and delivers electrical power.

11. "*A Booster* is a machine inserted in series in a circuit to change its voltage." The booster may be driven by an electric motor or otherwise. It is usually used on electric railway and other lines where the drop of voltage is heavy.

12. "*A Motor-Generator* is a transforming device consisting of a motor mechanically connected to one or more generators." In telegraph offices motor-generators are used to generate energy of suitable voltage for the operation of the main lines and of local circuits. They are usually driven by energy obtained from the electric light circuit within the building.

13. "*A Dynamotor* is a transforming device combining both motor and generator action in one magnetic field with two armatures; or with an armature having two separate windings and independent commutators."

14. "*A Converter* is a machine employing mechanical rotation in changing electrical energy from one form into another." A converter may belong to either of several types, as follows:

a. "*A Direct-Current Converter* converts from a direct current to a direct current.

b. "*A Synchronous Converter* (commonly called a rotary converter) converts from an alternating to a direct current, or vice versa.

c. "*A Motor-Converter* is a combination of an induction motor with a synchronous converter, the secondary of the former feeding the armature of the latter with current at some frequency other than the impressed frequency, i. e., it is a synchronous converter concatenated with an induction motor.

d. "*A Frequency-Converter* converts from an alternating-current system of one frequency to an alternating current system of another frequency, with or without a change in the number of phases or in voltages.

e. "*A Rotary Phase Converter* converts from an alternating-current system of one or more phases to an alternating-current system of a different number of phases, but of the same frequency."

STATIONARY INDUCTION APPARATUS.

15. "*Stationary Induction Apparatus* changes electric energy to electric energy through the medium of magnetic energy. They comprise several forms, distinguished as follows:

a. "In *Transformers* the primary and secondary windings are insulated from each other.

b. "In *Auto-Transformers*, also called compensators, a part of the primary winding is used as a secondary winding, or conversely.

c. "In *Potential Regulators* a coil is in shunt and a coil is in series with the circuit, so arranged that the ratio of transformation between them is variable at will. They are of the following three classes:

a. "*Compensator Potential Regulators* in which a number of turns of one of the coils are adjustable.

b. "*Induction Potential Regulators* in which the relative positions of the primary and secondary coils are adjustable.

c. "*Magneto Potential Regulators* in which the direction of the magnetic flux with respect to the coils is adjustable.

d. "*Reactors, or Reactance Coils*, formerly called choking coils, are a form of stationary induction apparatus used to produce reactance or phase displacement."

NOTE. There is an important difference between the apparatus called a "Converter" and a "Transformer." These two terms are often used indiscriminately. As noted in definition 14, a Converter is a machine with a revolving member, while a Transformer, as explained in definition 15, has no moving parts, the primary and secondary coils being in fixed relations to each other.

16. *A Rotor* is the rotating member of a machine. This member is usually the armature but in some machines it may be the field magnet structure, with the armature stationary.

17. *A Stator* is the stationary member of a machine. It is evident from the definitions that a rotating machine has a revolving member and a stationary member, and that the revolving part may be the armature or the field magnets.

Arrest of Wire Thieves.—Four young men were arrested in North Bergen, N. J., recently, charged with stealing wire from the Western Union Telegraph Company and the Erie Railroad Company. Much annoyance and loss have been sustained by these and other companies lately from thefts of wire and until now the culprits have eluded detection.

Wireless Telegraphy and Wireless Telephony.*

The subject of wireless telegraphy will undoubtedly still remain a subject more or less surrounded by mystery to the lay mind for many years to come, predicts London *Engineering*, a circumstance which it deems the more anomalous from the fact that no scientific theme has been more exploited (with the exception of radium, perhaps). The scientist knows, however, that wonderful as the subject undoubtedly is, there is not nearly so much mystery investing the transmission of intelligible signals from a ship at sea over even a thousand miles as there is in one of the commonest facts in life—the transmission of light from the stars to the earth over a distance so great that the human mind cannot make an attempt to grasp its significance.

Nevertheless, many engineers daily conversant with phenomena quite as remarkable as that involved in wireless telegraphy seem to have very hazy notions of the principles employed, remarks our expert authority, while the allied subject of the future —wireless telephony—scarcely seems to be even grasped by many engineers. As the investigations of the illustrious Professor J. J. Thomson into electricity and magnetism are now so well known, this ignorance is inexcusable. Unquestionably the term wireless itself is responsible for a great deal of the misunderstanding. "Ethereal waves," or better, radio-telegraphy, would much better express the facts, although such a change in nomenclature is unlikely to be made at this day.

"If it were taught as an elementary fact in our schools that, besides the atmosphere, the whole of space, so far as we know, is permeated with an invisible ether, and that just as we can produce a disturbance in a pool of water by dropping a stone into one part, so can we produce a traveling disturbance in the ether by analogous methods, we should have a much clearer conception of wireless telegraphy existing in the lay mind. Recent developments in this subject have been more in the perfecting of complex details rather than in any remarkable change in principles. Practical advancement has gone ahead at such a rate as to leave theory somewhat behind, and, as a consequence, many of the most skilful minds in science have been elaborating and perfecting the theory. The probable result will be that the future will see a steady advancement just as soon as some of the more difficult points have been cleared up.

"It is true that the number of systems in employment are still extraordinarily numerous. This would point to the fact that the best form has not yet been reached, as in that case it would inevitably leave others in the background. Since October 17, 1907, the transatlantic service inaugurated by Marconi between Clifden Station in Ireland and Glace Bay Station in Cape Breton has been in working order, with but few breakdowns. These stations were designed for a wave length of 12,000 feet, and a consequent periodicity of 82,000 vibrations per second, using a spark length of 0.5 in. to 0.8 in. The detectors now chiefly employed in the Marconi system are the Marconi magnetic form, using a revolving iron band and a modified form of the 'Fleming valve,' also devised by Marconi. The form of 'jigger' which seems to be meeting with considerable success is that form in which a heavy current is passed between two balls, between which a plate is revolved at high speed. Instead of an ordinary arc being set up, a high-frequency oscillatory current is generated between one ball and a brush pressed against one side of the revolving disc. By means of the now usual form of syntonic system, this oscillating current is employed to set up waves from the antennae.

"One of the latest improvements in the Telefunken system has been the employment of the so-called 'singing arc.' This employs a multiple spark-gap, consisting of a number of flat discs separated by a thin ring of mica. An induction coil, giving a secondary current at from 2,000 to 3,000 volts and 250 periods is employed, together with a capacity shunt. It is expected that with this apparatus it will be possible to transmit over 1,500 miles over level land or sea, with an expenditure of energy amounting to only eight kilowatts. It is also expected that it will be feasible to receive two or more different messages with one detector at the same time, owing to the tone feature of this system."

In spite of many efforts, we still seem to be far from devising any satisfactory mode of preventing the leakage of signals into the hands of those who are not intended to receive them. By means of the syntonic tuned systems now employed, it is generally possible to prevent a station from receiving messages which it does not want, but how to prevent unauthorized persons from getting messages which they deliberately set themselves out to receive has been by no means solved.

Very different in detail is the situation presented by wireless telephony, which is more and more confused in the general mind with the methods of wireless telegraphy. Although for several reasons wireless telephony is not likely soon to exceed in practical importance the practice of wireless telegraphy, some really simple and successful system of wireless telephony would possess so many obvious advantages that the advent of such a system is well worth striving for. Not the least of the advantages is that wireless telephony does not require a specially trained operator.

"A ship installation could be used by the ordinary officers as a ready means of communicating from one ship to another. Recent improvements have suggested the possibility that it is only a question of time before it will be possible to speak across the Atlantic, although whether such a possibility would be of real practical advantage is perhaps doubtful. Taken as a whole, we might say that wireless tele-

*Current Literature.

phony has reached a stage corresponding to that reached by wireless telegraphy ten years ago, so that it readily be seen that the next year or two may see advances of a revolutionary character. Many of the problems of telegraphy and telephony are so similar that much improvement in the latter can be obtained by experience in the former.

"As the subject of wireless telephony has not been written about to nearly the same extent that the telegraphy branch has been, we may, perhaps, be pardoned for dealing with it in a rather more elementary fashion. At the present time the methods employed in wireless telephony may be divided into two distinct classes—those which depend on the remarkable effects of light on selenium, and those in which the principle employed is almost identical with those used in wireless telegraphy. The property of selenium to which we allude is that the electrical resistance of the crystalline form of this subject varies greatly according to the amount of light incident upon it. This selenium (which is a slate-gray kind of substance) has rather a high resistance in any case, and in order to use it for telephony work it is necessary to arrange it in so-called 'cells.' These consist in principle of a large number of thin slices or rings arranged 'in parallel.' Such a cell may have a resistance of, say, 1,200 ohms when in darkness, while in bright daylight the resistance would fall off to perhaps 600 ohms."

The second phenomenon necessary for a wireless telephony set is associated with the fact that an electric arc is remarkably sensitive to minute changes of current:

"So much so that if we connect an arc light in the secondary circuit of a transformer, and then by connecting up a telephone transmitter to the primary side of the transformer and speaking into the transmitter cause electrical variations in the arc circuit, these variations will be faithfully copied by variations in the light given by the arc. The rays of light from the arc are projected by a suitable mirror arrangement on to a second parabolic mirror, at the focus of which is placed the selenium cell already described. Connected in circuit with the latter is an electric battery and a telephone receiver. The cycle of operation is then obvious enough."

RADIO-TELEGRAPHY.

Wireless Telegraphy on Transports.—The British transports Soudan, Rohilla, Dongola, Rewa and Plassy have been fitted with Marconi's wireless telegraph apparatus.

Wireless in Turkey.—The Imperial Post and Telegraph Department is contemplating the erection of a wireless telegraph station at Alaschati or Karaburun, near Smyrna.

Wireless Telephony on French Battleships.—Experiments carried out by French battleships have resulted in successful conversation by wireless telephony at a distance of 72 miles.

Wireless in the Court Room.—In the suit of the Marconi Wireless Telegraph Company against the British Radiotelegraph and Telephone Company, for patent infringement, now before a London court, wireless apparatus is operated in the court room as evidence, an antenna having been erected on the flagpole of the building.

The Rev. Joseph A. Myer, pastor of the Catholic Church at Tompkinsville, Md., is erecting a wireless station near his home and church in order to keep in touch with the outside world. The nearest telegraph office is twenty-five miles away, and he is twenty miles away from the nearest railroad.

Joseph H. Reall, who represented himself as being behind a scheme to combine the Continental Wireless Telegraph Company with other similar companies, and who was charged by the postal authorities with using the mails in a scheme to defraud surrendered himself to the Federal authorities in Boston a few days ago.

Wireless in Australia.—The proposed Australian wireless station at Sydney, N. S. W., will be located on Pennant Hill. There are two private wireless stations in Sydney which have held communication with steamers 1,500 miles away. These stations, however, are not permitted to transact business of a public character.

The steamer Olympia, of the Alaska Steamship Company, was wrecked December 10 off Bligh Island, Alaska, and wireless operator Hayes sent out the distress signal "S. O. S." calling for aid. In answer to the call two government steamers and a launch were despatched from Valdez, Alaska, to the relief of the Olympia. All of the Olympia's passengers were saved by the prompt arrival of the government boats.

British Imperial Wireless Line.—Regarding the proposed British imperial wireless line, Consul-General James T. Du Bois at Singapore says that only twenty stations in all are necessary to connect the British possessions. They would cost $5,000,000 to build and about $1,000,000 annually to operate. Stations would be required at Montreal, Glace Bay, and Vancouver, Canada; Hongkong; Singapore; Perth, Adelaide, and Sydney, Australia; Wellington, New Zealand; Gibraltar; Malta; Alexandria, Egypt; Aden; Bombay; Colombo; Mombasa, Durban, Cape Town, Bathhurst, Sierra Leone, and St. Helena, Africa. The connections required would be: (1) Montreal, Canada, to Sydney, Australia, as follows: Montreal to Glace Bay, thence to Vancouver, Hongkong, Singapore, Perth, Adelaide, and Sydney. (2) England to Wellington, as follows; England to Gibraltar, thence to Malta, Alexandria, Aden, Bombay, Colombo, Singapore, Perth, Adelaide, Sydney, and Wellington. (3) England to China, by route 2 to Singapore, thence to Hongkong. (4) England to Africa, as follows: England to Gibraltar, thence to Aden, Mombasa, Durban, and Cape Town; or, England to Bathurst, thence to Sierra Leone, St. Helena, and Cape Town.

The Military Telegrapher in the Civil War.

PART LI.

Mr. George C. Pierce, vice-president of the Old National Bank, Grand Rapids, Mich., is one of the many military telegraphers of the Civil War who have reached positions of prominence in their respective communities. Their stories of their experiences during that trying period of this country's political existence are always interesting and should be read and cherished by all telegraphers, especially those of the later generation, who cannot and do not realize what civil war means.

Mr. Pierce contributed an account of his experiences for Colonel William R. Plum's book entitled "The Military Telegraphers During the Civil War in the United States." The story reveals the dangers to which telegraph employes were exposed in the execution of their duties, and we are often surprised that they escaped with their lives under the circumstances narrated. Mr. Pierce says in part:

"September 1, 1863, found the army in the Tennessee Valley extending along the line of the Memphis and Charleston Railroad from Decatur to Shellmound, the latter being a station about nine miles this side of Running Water bridge, so called. Reynold's corps being at Shellmound, I had, under the direction of Captain Van Duzer, opened the line from Bridgeport to that point. It was reported there that General Bragg had evacuated Chattanooga. This information came from Wilder's cavalry which was operating on the bank of the Tennessee river directly opposite to our position and our scouting parties also reporting that there was no signs of the enemy on our front.

"On September 5, General Reynolds was ordered to move his forces to Running Water and establish communication with his rear by telegraph. In order to carry out this order I was directed to take four men with me and the necessary supplies and proceed along the railroad, repair the lines, etc. Starting from Shellmound about two o'clock in the afternoon of that day on a hand car with the men we found little to do. The line was in good order, and there were no obstacles to overcome. The army was marching along the highway below us and parallel with the railroad, but it was somewhat obscured from view by the intervening trees. As we found nothing to do, our progress along the railroad was much faster than that of the troops as it subsequently appeared. Meeting citizens passing along the track the information obtained from them seemed to confirm the previous reports of the non-existence of any Confederate forces, this side of Chattanooga at least, and in fancied security we moved along and in due time reached a point within one hundred and fifty feet of the bridge. Leaving the men to unload the material from the hand car, I proceeded along the track and stood upon one of the piers of the bridge, surveying the situation—the superstructure having been burned by the Confederates. I had hardly looked around me when I was startled by hearing a voice near by exclaim: 'What you all doing up there.' Turning to my right I saw, not thirty feet away from me, a Confederate cavalryman with his carbine held in a warlike position, which made me feel exceedingly uncomfortable. A glance showed that the "jig" was up with me, and I replied: 'I was just looking around.' 'Come down from there,' was a command I heard next from him and I complied promptly without any parley. By this time four more cavalrymen put in an appearance. Without much ceremony I was placed upon one of their horses and told to hang on to its rider for life, which you can be assured I did, and we started for the Confederate pickets. The squad had been out on a scouting expedition and had arrived at the bridge at the same time I did. During the ride I exchanged clothing with them, and surrendered about everything of value that I had, except $12.00 in currency, and by the time I reached the picket line I was to all appearances as much of a Confederate as any of them. We went direct to Chattanooga which was not evacuated as had been reported. There I was taken before General Bragg and he questioned me for more than an hour trying to ascertain the strength of our forces and the location of our supplies, but I managed to profess such profound ignorance upon those subjects that I was sent to the guard house. This was about midnight. The sensation of being in the hands of the enemy was strange enough, yet I cannot say that I felt bad about it. There was something novel in the situation and I supposed that I would go directly through the Confederacy to Richmond and two or three weeks would bring me around again. It is hardly necessary to say that I was much mistaken in this regard. From Chattanooga I was sent to Atlanta, and from there direct to Richmond where I remained confined on Belle Isle until the following March 7, when I was exchanged and came home. I afterwards returned to the service at Chattanooga and worked there while you and your associates marched through the country to the sea with Sherman. I left Chattanooga in 1865, and came north, remaining in Chicago until 1866, when I left the telegraph profession to engage in other business."

Copper wire has a great attraction for thieves. The American Telephone and Telegraph Company reports the stealing of some of its wire recently from a shed along the Maryland and Pennsylvania Railroad near Baltimore. All telegraph and telephone companies are reporting losses of copper wire by theft.

The Magnetic Club of St. Louis, Mo., composed of employes of the Western Union and Postal Telegraph-Cable Companies, gave a ball on November 23, which was largely attended.

When the Postal Entered San Francisco.

BY N. F. HARRISON, OF ASHLAND, OREGON.

From the year 1877 until the early spring of 1887, the Western Union Telegraph Company had no competitor in the telegraph field on the Pacific coast. When the Atlantic and Pacific Telegraph Company was absorbed by the Western Union during the summer of 1877 very few persons thought that the telegraph business would increase to a volume that would support two transcontinental telegraph systems.

In those days the newspapers of the Pacific coast handled comparatively little news service. Now, each large daily receives many thousand words, apart from the Associated Press service. Then, the Los Angeles business was all handled on one or two Morse wires, the way business also being transacted on the same wires. Now there are several quadruplexed and duplexed circuits and they are worked to their fullest capacity.

The construction of the Pacific Postal Telegraph Company's system was begun in 1886 and during the spring of 1887 it opened its San Francisco office, the lines entering the city from the north.

The personnel of the San Francisco office at the time of opening, if my memory serves me right, was as follows: Mr. M. C. Laven, superintendent; Mr. L. W. Storror, auditor; Mr. John Leach, manager; Mr. B. C. Shearer, cashier, and Miss Anna Koster in charge of the delivery and receiving departments. The operating force consisted of Mr. T. H. Berry, night chief; Mr. Walter E. Huey; Mr. F. G. Dickinson; Mr. W. C. Swain; Mr. George W. Parsons; Mr. George Denison; Mr. W. A. Galvin; Mr. James L. Lillis and Mr. N. F. Harrison. Of this list the following have since died: M. C. Laven, John Leach, F. G. Dickinson, J. L. Lillis and Miss Koster. There are only three of the original force now working in the San Francisco office, viz.: Messrs. Wm. C. Swain, T. H. Berry and George W. Parsons. Our former general superintendent, Mr. Leonard W. Storror, is now with the Pacific States Telephone Company, and the writer of this article, who was also a member of the original force, is now manager of the Postal Telegraph-Cable Company's repeater station at Ashland, Oregon. Mr. George Denison is still with the company and is assistant chief operator at Salt Lake City, and Mr. W. E. Huey was seen in Los Angeles three or four years ago. I have lost track of Messrs. Dickinson and Galvin. Mr. B. C. Shearer is a county official at Reno, Nev.

A quarter of a century brings many changes and as we grow older it is difficult to recall either the time or the character of the changes. In those comparatively old days in our service we were accustomed to see much of our beloved president, Mr. John W. Mackay. I was all-night chief operator in the San Francisco office at the time his son, John W. Mackay, Jr., and brother of Mr. Clarence H. Mackay, now president of the company, was accidentally killed in France. I remained all that night in the office with Mr. Mackay and I recall that I accompanied him on several trips from the office to the Palace Hotel where he was stopping. On one of these Mr. Mackay stopped in front of the Grand Hotel and pointed out to me the room in which his dead son was born.

With the closing of the year 1910 the Postal Telegraph-Cable Company will have completed two new wires between San Francisco and Seattle, making a total of five wires between these points. In addition to its southern route, the company has recently completed a line of three wires on the central route between Salt Lake City and San Francisco.

Such has been the change from one wire, via New Westminster, B. C., and the Canadian Pacific Railway, in 1887, as an outlet for the eastern business, to a dozen or more wires via the southern and central routes at the close of 1910.

Mark Twain and the Telephone.

At a recent meeting of the New England Telephone Society, according to *New England Telephone Topics*, Mr. Thomas D. Lockwood, the well-known old-time telegrapher, and now general patent attorney for the American Telephone and Telegraph Company, Boston, told a funny story about an experience he had with the late Mark Twain regarding the latter's telephone. "When I had been in the telephone business about two years," said Mr. Lockwood, "Mark Twain wrote me a letter which I still have, and it read something like this:

"'I see that you have written a book, and I bought the book, and I enjoyed it and was much entertained; but after reading it through from A to izzard, I find that I know very little more about the telephone than I did at first. I have read it, in fact, with the same sort of inscrutable enjoyment with which I should read a book written in Sanscrit, knowing that there was something good there if I could only get at it. But it gave me no light upon my own special telephone problem, which is this: I want to know why the inspector of the ——— Telephone Company feels it a necessity to examine my telephone every day of the 365 in the year without fail.

"'I have formed a sort of nebular hypothesis upon it and it is this: When my telephone was first installed, the same inspector, aided by two or three linemen, came in and set it up, and I felt it my duty to set up the cake and wine, and having begun that way I felt it my duty to keep on. I have had a telephone for exactly nineteen months, and the number of bottles of sherry that I have had to use on that inspector, and the number of cakes my cook has had to bake—well, it reaches well up into infinitude.'

"I explained to him that that was not really one of the necessaries of telephone service, but he wrote me back that he didn't see his way clear to stopping it, having begun and having carried it along such a long time."

ADDRESS ALL COMMUNICATIONS TO

J. R. TALTAVALL, - Editor and Publisher,
253 BROADWAY, NEW YORK.
T. R. TALTAVALL, Associate Editor.

CABLE ADDRESS: "Telegage," New York.
Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

January 1, 1911.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

The Old Year and the New.

Telegraph and Telephone Age extends the compliments of the season to its readers and friends, and wishes them a happy and prosperous New Year. In conformity with the universal custom we have turned over a new leaf for 1911 and written upon it the resolve to make Telegraph and Telephone Age more interesting and valuable to its readers than ever before, and it would please us if they would let us know from time to time how we are succeeding in our efforts.

The past year has been without doubt the most notable in the history of the telegraph in this country.

By far the most important event of the year in telegraphic circles was the merging of the Western Union Telegraph Company and the American Telephone and Telegraph Company. The telegraph administration has been reorganized to conform with the organization plan of the telephone company, and the official staff has been very largely increased. It seems to be the purpose of the new management to popularize the telegraph; as it has done the telephone, and enlarge its usefulness. The last act in the change of administration was the appointment of Mr. Theo. N. Vail as president of the Western Union Telegraph Company and the retirement of Col. R. C. Clowry from that position after a continuous service in the telegraph field of over half a century.

Mr. Vail is not a stranger to the telegraph. He was an operator in his early career and afterwards became interested in the telephone to which interests he has devoted most of his time in late years. He is an organizer and manager of the highest type, and the telegraph interests now under his direction will feel the quickening influence of his progressive mind. The retirement of Col. Clowry was attended with universal regret among telegraphers but on reflection they agreed that he was entitled to the rest which he sought.

The telegraph and telephone which have so many interests in common are now being conducted co-operatively to the great benefit of the public. The plans of the management have hardly begun to be unfolded and what they fully provide for time will reveal.

The institution of the system of message exchange between telegraph and telephone offices has passed through the experimental stage, and it seems to have met with popular approval. There is no doubt that when its advantages become more generally known it will prove of great benefit to public and company alike. The underlying principle, as practiced in all public utilities, is to encourage the people to use these facilities in the freest manner possible. Looking at the situation from a broad standpoint this system of message exchange renders it possible for a telephone subscriber, whether he be a farmer or a banker, to send a message to any part of the world without the necessity of leaving his home or desk. Thus it may be asserted that there are over five million telegraph and telephone offices in this country.

The night letter service instituted during the year has made it possible for the telegraph companies to operate their plants to well-nigh their maximum capacity. Where there is a large investment in plant it is of the highest importance to keep the plant busy during the hours when general business is closed. The night message service is bringing about this result. It gives business men additional facilities for the transaction of business and enables them to accomplish more in a given time than was possible before.

The same idea, in a somewhat modified form has been developed for application to Atlantic cable business. The American interests are agreed to the proposition; it only remains now to obtain the sanction of the European governments concerned and of the International Telegraph Bureau which must give its approval to matters affecting international

Digitized by Google

telegraph relations before they can become effective. The proposition is to create a class of business which may be transmitted at night or at other times when the cables are not overtaxed. To secure such a class of deferred business it is proposed to accept cablegrams written in plain language at one half the present tolls, each letter to be counted and five letters to be regarded as equivalent to one word. How the proposed plan will work out in practice is perhaps a little problematical. There seems to be good reason, however, to believe that all the parties interested will agree to the main proposition.

The close alliance between the Western Union and telephone interests does not seem to have alarmed the opposition telegraph company in any way. It has on more than one occasion during the year stoutly denied that it was interested in any manner in the consolidation of the opposite interests, and has vigorously asserted that it was its intention to maintain its position of strict independence.

In this connection it is interesting to point out that the reorganization of the telegraph interests has resulted in the promotion to higher and important positions of many worthy employes of the company. That there was plenty of good material in the profession is evident from the fact that most of the promotions have been from the rank and file. There is yet much latent ability there and it will be encouraging to those who come within that class to know that the prospects of the recognition of their worth are better now than ever before.

The outlook for the new year is certainly one full of promise and prosperity for the telegraph and telephone companies and incidentally for the telegraph employes, and it is the wish of Telegraph and Telephone Age that all hopes will be realized.

Reciprocal Fidelity.

One of the greatest contributing causes of success of a business organization is the fidelity and loyalty of the individuals composing it. Antagonism has never produced harmony and never will, while loyalty, or in other words, an honest desire to work for the interest of the employer, will sooner or later be rewarded. One common mistake is to slight the duties imposed upon us and allowing indifference and dissatisfaction to creep in if the reward does not come as soon as we think it should. We forget that we must first earn the reward by diligence and fidelity to duty. Spurts of duteous action are not worth much, but the continuous "pull all together" accomplishes everything.

In order to secure the best results in an organization the individual should subordinate himself to the general cause. He should work first for his company, and give his company credit for all that pertains to the business and not take all the credit upon himself. What he has accomplished individually will be properly credited to him by others. The employe should feel that the success of the telegraph business depends upon his honesty and loyalty and upon that of others, and that if this spirit were more generally applied better conditions would prevail. On the other hand the employing companies have a serious relation toward their employes. They should encourage in every way possible honesty, fidelity and enthusiasm on the part of their employes, and reward them for good and faithful service. Many worthy employes feel that they have not received the recognition that is due them. However this may be, it should be the solemn duty of the companies to be as loyal and fair to their employes as they expect the employes to be toward them. The duty is on both sides.

Government Crusade Against Bucket Shops.

In discussing his crusade against "bucket shops," United States Attorney-General Wickersham, at Washington, advocated publicity for legitimate corporations as an assurance of prosperity and expressed favor for a properly framed federal incorporation law. "By publicity," he said, "I mean that business corporations should not conceal the records of their transactions, but should make them public and should at all times deal fairly and frankly with their stockholders and the public in general. This, in my estimation, is the best means of encouraging confidence among those who have money to invest and among those who are already stockholders. But, above all, this publicity and fair dealing would almost entirely do away with the many 'wildcat' financial schemes which have thrived in the past and which the government is endeavoring to suppress by depriving them of the use of the mails and in other ways.

"Within the last few years the American public has lost many millions of dollars through swindling operations in imaginary enterprises, bucket shops and get-rich-quick schemes generally, prompted by alluring advertisements and circulars. If the investors had had opportunity to know the real financial condition of these companies and their business methods their savings would not have been lost. Instead, their money would have been put into legitimate business corporations.

"The main difficulty has been that the investing public has been unable to distinguish, because of the secretive policy maintained by so many genuine, bona fide institutions, between the legitimate and the illegitimate ones. The former can afford to deal openly with the public, but the get-rich-quick concerns cannot.

"There is nothing which would do more to divert the investments of the country into honest enterprises than the publicity of their financial conditions and business methods. The result would necessarily mean prosperity for all concerned. A federal incorporation law properly framed would assist in bringing this about."

Electrical Exhibition in Cape Town.—It is proposed to hold an electrical exhibition in Cape Town, South Africa, in March, 1911.

MR. THEO. N. VAIL

President of the American Telephone and Telegraph Company and President of the Western Union Telegraph Company, New York.

Digitized by Google

Mr. Theo. N. Vail, President of the Western Union Telegraph Company.

The election of Mr. Theo. N. Vail to the presidency of the Western Union Telegraph Company brings back into the telegraph field a family name that stands second only to that of Prof. Morse in the development of the great invention for electrical transmission of intelligence. Mr. Alfred Vail, uncle of Mr. Theo. N. Vail, was the friend, partner and loyal supporter of Prof. S. F. B. Morse all through the early struggle to make the telegraph possible and practicable. Alfred Vail was the practical mechanic, designer, engineer and operator who seized upon the conception of Morse, made the instruments, and invented numerous accessories so that the system would work. He was the first operator. Prof. Morse was at one end of the wire and Vail at the other when the first telegraph message was sent in 1844—the historic phrase "What hath God wrought."

Mr. Theo. N. Vail was born in Carroll County, Ohio, July 16, 1845, where his father and mother were residing temporarily, but later they returned to Morristown, N. J., and there around the famous and now historical Speedwell Iron Works, he passed his boyhood days. It was natural that he should become interested in the telegraph. He learned early to become a proficient operator, and although it was the parental plan that he should become a physician, he soon threw aside the study of medicine for electricity and worked in the local telegraph office at Morristown, and later was manager of a Western Union branch office in New York City.

In 1866, when Mr. Vail was 21 years old, his family moved to Iowa. The Union Pacific Railroad was then in process of construction and the young man obtained a position as telegraph operator and station agent, and did duty at several small points west of Omaha. Through the friendly offices of General G. M. Dodge, chief engineer of the railroad, Mr. Vail obtained an appointment in the United States railway mail service in 1869. In seven years he was in Washington as general superintendent of the entire railway mail service, which he reorganized and improved to a high state of efficiency.

In 1878 Mr. A. G. Bell and his associates were looking for a practical man to organize and build up the telephone system, and they asked Mr. Vail to take the place. Mr. Vail took hold of the work with enthusiasm and developed the invention of Bell, as his uncle had done forty years earlier for the invention of Morse. He resigned from the government service and began work on the structure that stands to-day as the American Telephone and Telegraph Company with its associated companies. In 1889 Mr. Vail resigned from active management of the telephone company to devote his attention to personal enterprises.

In the spring of 1907 Mr. Frederick P. Fish, then president of the American Telephone and Telegraph Company, retired. The business had grown by leaps and bounds in the last decade, and the trouble was to find a man broad enough to fully grasp the magnitude of the position and solve the vastly important problems connected with its direction. The only man who measured up to the standard which the directors set was Mr. Theo. N. Vail, and he was accordingly asked to accept the trust. At first he refused. The directors were insistent however, and as he was one of their number, having always retained his position on the board, he finally yielded, and went back into the harness.

Among the many plans in Mr. Vail's mind over twenty years ago for the development of the telephone service were: Metallic circuits, underground cables, subways, long distance service, and multiple switch boards. The absorption of the various local operating companies into one organization, etc., was the ultimate combination and cooperation of the telephone and the telegraph.

When he again took up the active management of the telephone affairs Mr. Vail naturally sought to materialize and secure as soon as possible, the advantages which he knew would accrue to both companies and the public by a union of telegraph and telephone facilities and interests. This he set out to do and his efforts, as usual, met with success.

This great system of telephone and telegraph now under the direction of Mr. Vail represents a combined capital nearing the billion dollar mark, every dollar of which is represented in actual value. In fact, the physical valuation of the properties at the present time is conservatively estimated at over $85.000,000 in excess of all capital obligation.

As head of the railway mail service, as head of the great telephone system and now as head of the greatest telegraph system in the world, all of Mr. Vail's work, it will be seen, has been along one line, that of the transmission of intelligence.

The recent rapid expansion of the telegraph and the plans laid down for its development are due to Mr. Vail's initiative. All of the possibilities of a physical combination of the telegraph and telephone are being rapidly developed and the telegraph company is receiving the benefit of the highly developed organization of the telephone company, with the result that the telegraph facilities enjoyed by the public are now better than ever before. The night letter service received immediate popular approval and with the execution of other plans there is no doubt the company will enjoy a prosperity unheard of in the history of the telegraph.

Mr. Vail is without doubt the foremost telephone and telegraph man in the world to-day and it would be difficult to over-estimate the value of his vigorous and progressive policy to the great public serving institutions, the telephone and the telegraph.

U. S. Wagon Stations increased to 3.
Brazilian Land Stations increased to 7.
Brazilian Ship Stations increased to 8.

UNITED WIRELESS TELEGRAPH COMPANY.

Executive Offices, 42 Broadway, New York; organized under the laws of the State of Maine; charter obtained February 15, 1907; capital $20,000,000, divided into ten millions preferred and ten millions common stock.

The company maintains 28 land stations along the Atlantic and Gulf Coasts from Eastport, Me., to Galveston, Tex.; 14 land stations on the Pacific Coast from Alaska to Southern California, and 17 land stations on the Great Lakes, extending from Buffalo, N. Y., on the east to Chicago, Ill., and Duluth, Minn., on the west.

In the North and South Atlantic and West Indian waters 180 trading vessels are equipped and operated; on the Pacific Ocean 100 vessels, and on the Great Lakes 69 vessels.

Officers—C. C. Wilson, president; C. C. Galbraith and Fredk. I. J. Hanson, vice-presidents; Cloyd Marshall, secretary and purchasing agent; W. A. Diboll, treasurer; E. P. Davis, assistant secretary and assistant purchasing agent; L. C. Wallace, assistant treasurer.

Directors—C. C. Wilson, C. C. Galbraith, Cloyd Marshall, E. P. Davis and L. C. Wallace, New York; F. I. J. Hanson, Philadelphia, Pa.; W. A. Diboll, Denver, Col.; G. Ross Eshleman, Lancaster, Pa.; Geo. H. Parker, Seattle, Wash.; Rev. D. J. Starr, Columbus, Ohio; and Wm. H. Sargeant, Portland, Me.

Executive Committee—C. C. Galbraith, C. C. Wilson, W. A. Diboll, Cloyd Marshall, secretary.

Operating Dept.—C. C. Galbraith, general manager, New York. Atlantic and Gulf Division: H. J. Hughes, superintendent, New York. Great Lakes and Northern Division: F. C. Newton, superintendent, Schofield Building, Cleveland, Ohio. Pacific Coast and Western Division: R. H. Armstrong, manager, Grand Trunk Wharf, Seattle, Wash.

Foreign Offices—London, England, Lennox House, Norfolk street, Strand, W. C.; Shanghai, China; Keegan and Rosencrantz, Asiatic agents.

Engineering and Manufacturing Departments—Harry Shoemaker, chief engineer; C. D. Babcock, general superintendent of factories.

AMERICAN TELEPHONE AND TELEGRAPH COMPANY AND ASSOCIATED COMPANIES.

LIST OF OFFICERS.

American Telephone and Telegraph Company.

Theo. N. Vail, president; Union N. Bethell, William R. Driver, Edward J. Hall, Bernard E. Sunny, Harry B. Thayer, Charles P. Ware, vice-presidents; William R. Driver, treasurer; Charles E. Hubbard, secretary; Charles G. DuBois, comptroller; John J. Carty, chief engineer.

American Bell Telephone Company, Boston, Mass.

Theo. N. Vail, president; William R. Driver, treasurer; Charles E. Hubbard, clerk; Robert W. Devonshire, general manager.

Bell Telephone Company of Missouri, St. Louis, Mo.

Charles S. Gleed, president; Edwards Whitaker, vice-president; Fritz Nisbet, secretary and treasurer; Francis L. Gilman, general manager; James K. Wass, auditor; J. F. Bratney, chief engineer.

Bell Telephone Company of Pennsylvania, Philadelphia, Pa.

Union N. Bethell, president; Frank H. Bethell, vice-president; Winfield S. Peirsol, secretary and treasurer; Philip L. Spalding, general manager; Martin H. Buehler, auditor; Nathan Hayward, chief engineer.

Central District and Printing Telegraph Company, Pittsburg, Pa.

Union N. Bethell, president; Frank H. Bethell, vice-president; Winfield S. Peirsol, secretary and treasurer; Philip L. Spalding, general manager; Martin H. Buehler, auditor, Nathan Hayward, chief engineer.

Central Union Telephone Company, Indianapolis, Ind.

Louis G. Richardson, president; Horace F. Hill, first vice-president; John Uprichard, second vice-president; William S. Chapman, secretary and treasurer; Horace F. Hill, general manager; Edward H. Bangs, chief engineer.

Chesapeake and Potomac Telephone Company, Washington, D. C.

Union N. Bethell, president; Frank H. Bethell, vice-president; Winfield S. Peirsol, secretary and treasurer; Philip L. Spalding, general manager; Martin H. Buehler, auditor; Nathan Hayward, chief engineer.

Chicago Telephone Company, Chicago, Ills.

Bernard E. Sunny, president; Byron L. Smith, first vice-president; Angus S. Hibbard, second vice-president and general manager; Charles E. Mosley, secretary and treasurer; Benjamin S. Garvey, auditor; J. G. Wray, chief engineer.

Cincinnati and Suburban Bell Telephone Company, Cincinnati, Ohio.

John Kilgour, president; Bayard L. Kilgour, vice-president and general manager; W. A. Blanchard, treasurer; Volney Elstun, secretary and auditor.

Cleveland Telephone Company, Cleveland, Ohio.

Louis G. Richardson, president; John Balch, vice-president; Alexander H. Kirkwood, treasurer;

Digitized by Google

Charles A. Grant, secretary; Peter Yensen, general manager; John Uprichard, auditor; Edward H. Bangs, chief engineer.

Colorado Telephone Company, Denver, Col.

Edward B. Field, president; Edward B. Field, Jr., vice-president and treasurer; J. E. Macdonald, secretary; E. M. Burgess, general manager; Roderick Reid, auditor; G. E. McCarn, chief engineer.

Cumberland Telephone and Telegraph Company, Nashville, Tenn.

James E. Caldwell, president; W. W. Berry, William Litterer, Alonzo G. Sharp, vice-presidents; T. D. Webb, treasurer; John W. Hunter, Jr., secretary; Leland Hume, general manager; H. Blair Smith, auditor.

Iowa Telephone Company, Des Moines, Iowa.

Casper E. Yost, president; George E. McFarland, vice-president and general manager; James B. Mason, secretary and treasurer; Emil Palm, auditor.

Michigan State Telephone Company, Detroit, Mich.

N. C. Kingsbury, president; Dudley E. Waters, vice president; Bernard W. Trafford, vice-president and general manager; W. L. Burrows, treasurer; Walter I. Mizner, secretary; H. J. Booth, auditor; C. L. Boyce, engineer.

Missouri and Kansas Telephone Company, Kansas City, Mo.

Charles S. Gleed, president; Sherman R. Hall, vice-president; Herman F. Lang, secretary and treasurer; Francis L. Gilman, general manager; Edward F. Webster, auditor; Walter O. Pennell, engineer.

Nebraska Telephone Company, Omaha, Neb.

Casper E. Yost, president; C. W. Lyman, vice-president; E. M. Morsman, secretary and treasurer; George E. McFarland, general manager; W. A. Pixley, auditor; A. S. Rogers, engineer.

New England Telephone and Telegraph Company, Boston, Mass.

Jasper N. Keller, president; Henry S. Hyde, vice-president; Francis A. Houston, vice-president and general manager; William R. Driver, treasurer; Edmund W. Longley, secretary and auditor; George K. Manson, engineer.

New York Telephone Company, New York City.

Union N. Bethell, president; John H. Cahill, vice-president; Howard F. Thurber, vice-president and general manager; Ford Huntington, treasurer; Waldron Hoppins, secretary; Walter Brown, auditor; R. M. Ferris, chief engineer.

Northwestern Telephone Exchange Company, Minneapolis, Minn.

Casper E. Yost, president; Charles P. Wainman, John Balch, vice-presidents; J. W. Christie, treasurer; Charles A. Grant, secretary; George E. McFarland, general manager; William R. Overmire, auditor; Benjamin Waller, engineer.

Pacific Telephone and Telegraph Company, San Francisco, Cal.

Henry T. Scott, president; Edgar C. Bradley, vice-president and general manager; Emile J. Zimmer and Louis Glass, vice-presidents; Frederick W. Eaton, secretary and treasurer; Frank C. Phelps, auditor; Charles W. Burkett, chief engineer.

Pioneer Telephone and Telegraph Company, Oklahoma City, Okla.

Eugene D. Nims, president; John M. Noble, vice-president and general manager; Emery E. Westervelt, secretary and treasurer; Arthur Whorton, auditor; James F. Noble, engineer.

Providence Telephone Company, Providence, R. I.

Dexter B. Potter, president; Fenner H. Peckham, vice-president; Charles T. Howard, secretary and treasurer; Joseph F. Beck, general manager; John T. Frankenburg, engineer.

Rocky Mountain Bell Telephone Company, Salt Lake City, Utah.

H. Vance Lane, president; William S. McCormick, vice-president and treasurer; Robert B. Harkness, secretary; P. R. Ferguson, auditor; A. S. Peters, chief engineer.

Southern Bell Telephone and Telegraph Company, Atlanta, Ga.

William T. Gentry, president; J. Epps Brown, vice-president and general manager; John H. B. Hoxsey, vice-president; Addison Maupin, secretary and treasurer; C. J. Holditch, auditor; George J. Yundt, chief engineer.

Southern New England Telephone Company, New Haven, Conn.

John W. Alling, president; James T. Moran, vice-president; Andrew H. Embler, secretary and treasurer; Henry H. Sykes, general manager; Edward H. Everit, engineer.

Southwestern Telegraph and Telephone Company, Dallas, Tex.

Heman J. Pettengill, president; Joseph E. Farnsworth, vice-president and general manager; John Balch, vice-president and treasurer; Charles A. Grant, secretary; Frederick E. Bedlow, auditor; Frederick W. Yensen, chief engineer.

Wisconsin Telephone Company, Milwaukee, Wis.

Alonzo Burt, president; John Balch, vice-president and treasurer; Charles A. Grant, secretary; Henry O. Seymour, general manager; O. B. Koepke, auditor; W. R. McGovern, chief engineer.

Western Telephone and Telegraph Company.

Theo. N. Vail, president; Edward J. Hall and Charles P. Ware, vice-presidents; William R. Driver, treasurer; Charles G. DuBois, auditor.

Bell Telephone Company of Canada, Ltd., Montreal, Canada.

Charles F. Sise, president; Robert Mackay, vice-president; William G. Slack, treasurer; W. H. Black, secretary; L. B. McFarlane, general manager; James A. Baylis, engineer.

Philadelphia Electrical Exhibition.—An electrical exhibition will be held in Philadelphia, February 19-25. Special attention will be given to the decorations of the hall. The telegraph and the telephone will be adequately represented.

THE CANADIAN PACIFIC RAILWAY COMPANY'S TELEGRAPH.

Executive offices, Hospital and St. Francois Xavier streets, Montreal, Que.; incorporated in 1881. The property of this department consists in 12,250 miles of poles and cables, and 76,100 miles of wire.

OFFICERS.

James Kent, Montreal, manager of telegraphs; W. J. Camp, Montreal, electrical engineer; F. J. Mahon, St. John, N. B., superintendent; J. F. Richardson, Montreal, Que., superintendent; W. Marshall, Toronto, Ont., superintendent; F. T. Jennings, North Bay, Ont., superintendent; B. S. Jenkins, Winnipeg, Man., general superintendent, western lines; John Tait, Winnipeg, Man., superintendent; R. N. Young, Moosejaw, Sask., superintendent; J. McMillan, Calgary, Alta., superintendent; John Fletcher, Vancouver, B. C., superintendent.

CONSTRUCTION AND INSPECTION STAFF.

D. Mersereau, St. John, N. B., superintendent of construction; A. J. Grant, Montreal, superintendent of construction; J. Mitchell, Montreal, inspector; S. Elliott, Montreal, inspector; E. A. Spear, superintendent of construction, Toronto; F. C. Robertson, Toronto, inspector; A. Allen, Sudbury, Ont., superintendent of construction; D. C. Coons, Winnipeg, inspector; E. M. Payne, Winnipeg, inspector; A. C. Fraser, Moosejaw, Sask. inspector; C. H. Powell, Calgary, inspector; H. McIntyre, Vancouver, B. C., inspector; F. E. J. Camp, inspector, Revelstoke, B. C.

MANAGERS AND PRINCIPAL OFFICES.

Sydney, N. S.—A. P. Anderson.
Hazel Hill, N. S. (Cable Station).—D. Blehr.
Halifax, N. S.—W. M. Godsoe.
St. John, N. B.—J. M. Barnes.

THE GREAT NORTH WESTERN TELEGRAPH COMPANY.

Executive offices, Toronto, Ont.; organized in 1881; capital $500,000.

The property of this company consists of 13,410 miles of poles, 406 miles of wire in cables, 49,686 miles of wire. The company maintains a total of 1,360 offices, of which 1,183 are located in Canada and 177 in the United States. Of the 1,360 offices 894 are reached exclusively by the lines of this company. The following is a list of a portion of the more important circuits operated between large cities:

Montreal to Quebec, Que.; St. John, N. B.; Halifax, N. S.; North Sydney, N. S.; New York, N. Y.; Albany, N. Y.; Ottawa, Ont.; Toronto, Ont.; Chicago, Ill.; Boston, Mass.; Ogdensburg, N. Y.

Toronto to New York, N. Y.; Buffalo, N. Y.; Montreal, Que.; Ottawa, Ont.; North Bay, Ont.; Hamilton, Ont.; London, Ont.; Detroit, Mich.; Chicago, Ill.; Winnipeg, Man.

OFFICERS.

H. P. Dwight, president; I. McMichael, vice-president and general manager; George D. Perry, secretary-treasurer and superintendent of supplies; A. C. McConnell, auditor; S. B. McMichael, assistant general manager; W. J. Duckworth, superintendent of construction; D. E. Henry, chief clerk, general manager's office; A. R. Porte, superintendent, Ogdensburg, N. Y.; inspectors—C. W. Dawzy and W. G. Parker, Toronto, Ont.; J. Beauchamp, Quebec.

MANAGERS OF PRINCIPAL OFFICES.

Belleville, Ont.—P. F. Canniff.
Brandon, Man.—Miss E. Quigg.
Brantford, Ont.—E. Cameron.
Hamilton, Ont.—J. Jamieson.
Kingston, Ont.—T. A. Hanley.
London, Ont.—David Adams.
Montreal, Que.—L. S. Humes.
Niagara Falls, Ont.—George Phemister.
North Bay, Ont.—M. B. Douglas.
Ogdensburg, N. Y.—A. R. Porte.
Ottawa, Ont.—C. E. Davies.
Plattsburg, N. Y.—W. C. Crooks.
Quebec, Que.—C. E. Lillie.
St. Catharines, Ont.—T. E. Dudley.
St. Thomas, Ont.—George Rowley.
Sault Ste. Marie, Ont.—Miss A. Sutherland.
Toronto, Ont.—G. Hogarth.
Watertown, N. Y.—C. E. Comstock.
Windsor, Ont.—H. H. Hodgkinson.
Winnipeg, Man.—J. Padington.

THE AMERICAN DISTRICT TELEGRAPH COMPANY (NEW YORK).

Executive offices, 195 Broadway, New York; capital, $4,000,000.

Officers.—Theo. N. Vail, president; Wm. H. Baker and Newcomb Carlton, vice presidents; A. R. Brewer, treasurer; I. B. Ferguson, secretary and auditor; D. Skelton, general manager, and W. A. May, chief clerk.

Executive Committee.—Messrs. Theo. N. Vail, Union N. Bethell, Wm. H. Baker and Newcomb Carlton.

Directors.—Messrs. Theo. N. Vail, Wm. H. Baker, Union N. Bethell, Newcomb Carlton, W. C. Humstone, C. F. Patterson, P. V. R. Van Wyck.

THE AMERICAN DISTRICT TELEGRAPH COMPANY (NEW JERSEY).

Executive offices, 15 Exchange place, Jersey City, N. J.; incorporated November 1, 1901; capital, $10,000,000.

OFFICERS.

Theo. N. Vail, president; Wm. H. Baker and Newcomb Carlton, vice-presidents; C. F. Patterson, general manager; I. B. Ferguson, secretary and auditor; A. R. Brewer, treasurer; Lewis Dresdner, assistant treasurer; Thos. E. Fleming, commercial superintendent.

SUPERINTENDENTS.

J. McRobie, general superintendent; C. C. Johnson, superintendent, Eastern Division; W. H. Harris, assistant superintendent, New Haven; G. L. Ross, assistant superintendent, Pittsburg; J. R. Kearns, assistant superintendent, Boston; J. Maxwell, assistant superintendent, New York City; W. H. Butler, assistant superintendent, Philadelphia; W. J. Bagby, assistant superintendent, Buffalo.

P. G. Kern, superintendent, Southern Division; W. F. Huber, assistant superintendent, Louisville.

R. C. Baker, superintendent, and George McGann, superintendent, Western Division; H. S. Fearons, assistant superintendent, Dallas; Frank Sloane, assistant superintendent, Indianapolis; J. H. Gates, assistant superintendent, Columbus.

J. M. Maddox, superintendent, Pacific Division, San Francisco, Cal.

E. W. Fuller, manager, San Francisco, Cal.
M. P. Reeves, manager, Atlanta, Ga.
C. J. Protzen, manager, New Orleans, La.
J. M. Diegel, manager, Minneapolis, Minn.
C. H. Dickson, manager, Kansas City, Mo.
H. M. Riner, Buffalo, N. Y.
G. Soderstrom, manager, Memphis, Tenn.
J. G. Harris, manager, Newark, N. J.
George Stewart, manager, St. Louis, Mo.

(Directory continued on page 57)

Rubber in Dutch East Indies.

In view of the fact that india rubber is used so extensively for electrical insulating purposes, and its limited supply gives much concern to all interested, the following figures regarding the cultivation of rubber in the Dutch East Indies, as of December 31, 1909, will be of general interest.

Ficus—planted 16,754 acres, being planted 4,493 acres; Hevea—planted 57,167 acres, being planted 70,590 acres; Ficus and Hevea (not specified)—planted 16,038 acres; being planted 26,369 acres; miscellaneous—planted 19,686 acres; being planted 24,661 acres; total planted and being planted, 235,758 acres.

COLONEL ROBERT C. CLOWRY, NEW YORK.

Digitized by Google

The Retirement of Col. Robert C. Clowry as President of the Western Union Telegraph Company.

Colonel Robert C. Clowry who retired from the presidency of the Western Union Telegraph Company on November 23, as announced in the December 1 issue, was one of the most commanding figures in the telegraph world. While his successor, Mr. Theodore N. Vail, was an operator in his earlier career he has not been intimately associated with the telegraph through so long a period as has Colonel Clowry. Colonel Clowry was essentially a telegraph man and has lived under telegraphic influence all through his long active business life, and as manager of the great telegraph corporation, has established a reputation that is world-wide.

Colonel Clowry was born in Will County, Ill., September 8, 1838, and after receiving a common school education he entered the telegraph service as messenger at Joliet, Ill., in 1852, for the Illinois and Mississippi Telegraph Company. In order to secure the privilege of learning telegraphy, he was required to serve as a messenger for six months without pay. At the end of his first year of service, he was made manager of the company's office at Lockport, Ill. He was later transferred to Springfield, Ill., and while there became well acquainted with Abraham Lincoln, then a young lawyer. A year later Mr. Clowry went to St. Louis and at the age of twenty-one was appointed superintendent of the St. Louis and Missouri River Telegraph Company.

At the beginning of the civil war he enlisted and was commissioned in 1863 by President Lincoln as captain and assistant quartermaster, and assigned to duty by the quartermaster-general in charge of the United States military telegraph in the Southwest, with headquarters at Little Rock, Ark. For his valuable service during the war he was brevetted by President Johnson, in 1865, as Major and Lieutenant-Colonel.

Colonel Clowry was honorably mustered out of the service May 31, 1866, at his own request, and was appointed district superintendent of the Western Union Telegraph Company's lines in the Southwest. In December, 1879, he was made assistant general superintendent of the Western Union Telegraph Company with headquarters at Chicago, and in May, 1880, succeeded General Anson Stager as general superintendent of the territory from Pennsylvania to the Pacific Coast, from the British boundaries to the Gulf of Mexico, west of the Mississippi and north of the Ohio Rivers. He was elected a director of the company in October, 1885, also a vice-president and a member of the executive committee, still retaining his position as general superintendent, with headquarters at Chicago. His election to the office of president and general manager took place April 1, 1902, and he moved to New York to take up the duties of his new position.

Since Colonel Clowry's assumption of the office of president and general manager, the affairs of the company have been conducted in a masterly manner. He has introduced many reforms and improved the service in various ways, and altogether, he has placed the great business of which he was the head on a foundation more secure and satisfactory than ever before.

It was quite natural that he should think that he was entitled to a rest after a continuous service in the telegraph work for over fifty years. Few men could stand such a strain but Colonel Clowry's splendid physique and temperate manner of living have well carried him through the vicissitudes of a business career of half a century, and now on his retirement from active duties he is still in possession of a clear and active mind and a well preserved body.

Colonel Clowry was relieved of a part of his onerous work last March, on the appointment of Mr. Belvidere Brooks as general manager of the company, and has since given his entire time to the duties of president.

His gentleness of manner and kindness of heart, have endeared him to all who knew him. The thousands of employes who have so long been under his direction, have felt his influence for good, and those who enjoyed a personal acquaintance with him will feel deep regret at his retirement, yet all will extend to him their sincerest wishes for his future happiness and comfort.

Underwriters' National Electrical Association.

The National Board of Fire Underwriters has transferred to the National Fire Protection Association the work of the Underwriters' National Electrical Association and the committee of consulting engineers of the national board, the former body being now known as the electrical committee of the National Fire Protection Association. The national board considers that the National Fire Protection Association is the logical organization for the assumption of all important codification work, its work in recent years in fire prevention, as well as protection, having entitled it to a high place among the engineering bodies of the country. The membership of the newly formed electrical committee of the association is as follows: Messrs. F. E. Cabot, Ralph Sweetland, J. E. Cole, C. M. Goddard and H. O. Lacount of Boston; George E. Bruen, J. C. Forsyth and Charles Lum, of New York; William S. Boyd, Dana Pierce and B. H. Tousley, of Chicago; Washington Devereaux and C. H. Hill, of Philadelphia; A. M. Paddon, of Syracuse; A. M. Schoen, of Atlanta, and R. P. Strong, of New Orleans. The committee will also include a representative of the American Institute of Electrical Engineers, the American Street and Interurban Railway Association, the National Electrical Contractors' Association and the National Electric Light Association.

DETERMINATION OF SELECTOR RESISTANCES.

[COPYRIGHT 1910 BY W. E. HARKNESS.]

Several letters of inquiry have reached the Telegraph and Telephone Age with reference to the article, "What Is a Selector," in the issue of June 16. These correspondents have asked particularly for information as to the method of determining the resistance to be connected in series with bridged selectors on telephone train despatching or message circuits. Appreciating the interest manifested in the technical details of the system described, the question referred to may be answered by the following statement of the method used in calculations for installations made by the United States Electric Company, makers of the Gill selector.

The factors entering into this problem relate to the quantity (amperage) and pressure (voltage) of the selector operating current, the distribution of the current, with respect to the number and location of stations and the fall of potential due to line resistance.

With the Gill selector .01 ampere is used for estimating the amount of current required for the safe operation of each selector. This is double the minimum operating current, and in addition to giving a wide operating margin, it allows for line leakage, etc. This permits of the maximum economy in the use of the cells forming the main signaling battery before the operation of the selectors will be affected by weak batteries.

The voltage required to give the selectors the proper amount of current depends upon the resistance of the selector. The voltage is determined by the well-known formula:

(1) $E = R \times I.$

in which E = voltage, R = resistance of selector, and I = current required by the selector.

The resistance of the Gill selector is 4,500 ohms, and the current, as given above, is .01 ampere. Substituting these values for R and I in the foregoing formula we have:

(2) $E = 4{,}500 \times .01,$

or voltage required = 45.

As two 40-ohm retardation or choke coils are connected in series with the Gill selectors to protect the selector winding from damage by lightning, the fall in potential through these coils should be considered. This is figured in the same manner as that given for the selector. The current through these retardation coils, owing to their being in series with the selector, is necessarily the same as that passing through the selector, i. e., .01 ampere. Substituting the resistance of the two coils (80 ohms) and the current (.01 ampere) for R and I in the formula previously given, we have:

(3) $E = 80 \times .01 = 0.8$ volts.

This, added to the voltage required at the selector terminals gives the following:

(4) Voltage at terminal of selector ....45. volts
Voltage at retardation coils ..... 0.8 "
Total voltage at terminals of selector and coils .....45.8 volts

DISTRIBUTION OF CURRENT.

The amount of current passing over the line wires to the selectors varies on the different sections, the section nearest the source of current supply carrying the maximum current. The current on the next section is decreased by the amount required by the first selector, that of the third section being decreased by the amount of current required by the second selector, and so on, until the last section is reached. This section carries only the current for the last selector. This will be readily understood by an examination of the accompanying diagram (Fig. 1), which shows four stations, each requiring .01 ampere.

FALL OF POTENTIAL FROM LINE RESISTANCE.

The resistance of the line enters into the problem, as it causes a fall in the potential or voltage in proportion to its resistance and the amount of current carried. This is figured by the same formula given under (1), i. e.:

Volts Drop = Resistance × Current.

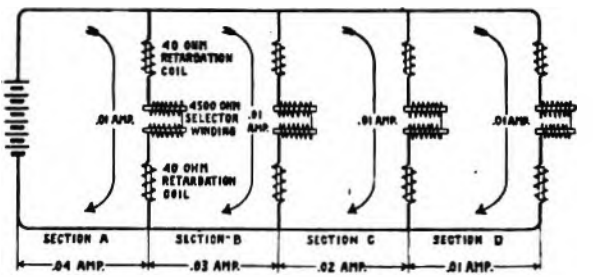

FIG. 1.—CURRENT DISTRIBUTION ON TELEPHONE TRAIN DISPATCHING CIRCUIT.

As the current on each section of the circuit varies with the number and location of the selectors, and as wires of various sizes and materials are employed, each section must be figured separately, after determining the following:

(5) a—Resistance per mile of wire.
b.—Resistance of the two wires or metallic circuit forming each section.
c—Total current flowing over each section.

The various values of "a" will be found in the accompanying table:

RESISTANCE PER MILE OF COPPER WIRE.

Size B. and S.	Diameter Mils.	Pounds per Mile.	Ohms per Mile.
0	324.860	1683.6	.51937
1	289.300	1335.2	.65490
2	257.630	1058.8	.82582
3	**229.420**	**839.68**	**1.0414**
4	204.310	665.91	1.3131
5	181.940	528.05	1.6558
6	162.020	418.81	2.0881
7	144.280	332.11	2.6331
8	128.490	263.37	3.3201
9	114.430	208.88	4.1860
10	101.890	165.63	5.2800
11	90.742	131.37	6.6568
12	80.808	104.18	8.3940

The values of "b" are obtained by multiplying the resistance per mile of wire by twice the length, in miles, of the section being considered. The values of "c" are determined by multiplying the current required by one selector by the number of selectors beyond the end of the section nearest the source of current supply.

WIRE DATA.

The wire usually used for train dispatching and message circuits in the United States is as follows:

(6) Material—hard drawn copper.
Gauge—No. 9 Brown and Sharpe.
Diameter—.11443 inch.
Weight per mile—208.88 pounds.
Resistance per single wire mile—4.186 ohms.
Resistance per metallic circuit mile—8.372 ohms.

For other sizes, see the foregoing table of wire resistances.

As an example of the presentation of this calculation, the train dispatching circuit between Easton and Pen Haven Junction, Pa., is shown. The total length of line is 53.8 miles, and the circuit consists of No. 9 B. and S. hard drawn copper, weighing 208.88 pounds per mile. Gill selectors are used. The dispatcher is located at Easton and the main battery is located at the dispatcher's office. For clear presentation the stations should be arranged in order in a vertical column, beginning with the dispatcher's office, and space should be allowed for the five columns of figures as shown:

(7) RESISTANCE TABLE OF A TRAIN-DISPATCHING CIRCUIT.

	Miles between stations.	Current on each section in amperes.	Volts drop in each section.	Potential at each station to overcome drop.	Resistance at each station.
Easton	...	...	...	31.65	3165
Glenden	2.0	.140	2.3	29.35	2935
Bethlehem	9.6	.130	10.3	19.05	1905
East Pen Junction	3.9	.120	3.8	15.25	1525
Allentown	.8	.110	.75	14.5	1450
Gap Junction	1.9	.100	1.65	12.85	1285
Catasauqua	1.9	.090	1.4	11.45	1145
Coplay	1.9	.080	1.25	10.2	1020
Laurys	3.7	.070	2.2	8.0	800
Slatington	6.8	.060	3.3	4.7	470

Mahoning	2.5	.040	.8	1.6	160
Packerton	3.1	.030	.7	.9	90
Mauch Chunk	2.0	.020	.3	.6	60
Pen Haven Junction	8.1	.010	.6	.0	0
Length of line	53.8				
Total line drop, volts			31.65		

The first column shows the distance, in miles, between stations. In the second column is placed the current, in amperes, carried by each section of the line. With the Gill selector this will be the total number of stations × .01 amp. for the section between the dispatcher's office and the first station, and this product, less .01 amp., for the next section, the current on each succeeding section decreasing by a similar amount, as shown.

The drop in voltage on each section of the line is set down in the third column. These figures are obtained as previously explained in (5), or from the curves shown in Fig. 2. If the curves are used, proceed as follows: First locate the horizontal line corresponding to the distance under consideration. Follow this line to its intersection with the slanting line corresponding to the current carried by the section considered. The drop in voltage will be indicated at the foot of the vertical line nearest the intersection of the horizontal and sloping lines. For distances under two miles the enlarged portion of the curve at the lower right-hand corner of the figure may be used to advantage. The sum of the drops, in volts, in each section will give the total line drop, in volts.

In the fourth column are placed the figures obtained by starting with the drop of the last section and adding the drop of each preceding section to the sums thus obtained. Referring to the table in the third column and opposite the next to the last station (in this example Mauch Chunk) is found a .6 volt drop. This, plus the .3 volt drop shown in the section between Packerton and Mauch Chunk, makes .9 volt, for the potential required at Packerton to overcome the drop. Similarly the drop in the section Mahoning to Packerton .7 volt is added, giving 1.6 volt for the potential required at Mahoning to overcome the drop beyond that point. This is similarly continued until the top of the column is reached, the sums thus obtained being placed opposite the stations as shown.

The resistance to be placed in series with the selectors at each station is then obtained by moving the decimal point of these figures two places to the right and entering the figures thus obtained in the fifth and last column as shown.

The total voltage required is obtained in the following manner: Take the total drop in voltage due to the line resistance and add to it the voltage required at the last selector and the drop in voltage in the coils at the dispatcher's office. With the preceding case as an example, the following is obtained:

(8) Total line drop ..... 31.65 volts
Voltage required by selector at end of line ..... 45.80 "
Drop in coils at dispatcher's office (150 ohms × .14 amp.) ..... 21.00 "
Total voltage required ..... 98.45 "

If curves are not available for the wire used, the drop of voltage in each section must be figured, as previously explained, and placed in the third column of the table. The figures in the fourth column are obtained in the same manner, and if the current required by each selector is still .01 amp., the decimal point is moved, as before.

If, however, the current and voltage required by the selector differ from those required by the Gill selector, the resistances in each station must be obtained by dividing the figures placed in the fourth column by the required current. For example, assuming that the figures given in column four of the table are correct for the new current values of, say,

Digitized by Google

.008 amp. per selector, the resistance for the first station would be obtained by dividing 29.35 volts by .008 amp. = 3668× ohms. The resistance at the other stations will be obtained by the same process.

With selectors operating at high speeds and depending upon slow and quick-acting electromagnets, the foregoing method of calculation may not apply. In all probability a non-inductive resistance, or one of a smaller value, would have to be substituted to permit of the successful operation of such systems. A constant which may be used with the resistances obtained in the manner described may be determined, applicable to various types of high-speed selector. The constant may vary according to the design of the magnetic circuit employed.

CIRCUITS WITH BRANCHES.

The preceding description has considered only a line without branches. When branch lines connect with the main line the method of figuring the resistance differs in some respects. The diagram (Fig. 3) shows a typical arrangement. In this the dispatcher and main battery are located at A, the wire is of copper, 208 pounds to the mile, and there are twelve stations, seven to the east and five to the west of the dispatcher.

The dispatcher being located at an intermediate station, the current for the selector is sent out in two directions. If the battery were located at the center of the line and the number of selectors on each half of the line were the same, the fall of potential on each half of the line would be the same. This seldom occurs, however, so that an unbalanced line condition may be assumed. As in the previous example, the stations should be arranged in a vertical column, with the distances between stations, and the current on each section in adjacent columns. There is this difference, however: the stations from A to H should be arranged in one group, and the stations from A to M in another group, as shown in (9) and (10).

(9)

RESISTANCES IN UNBALANCED CIRCUIT.

	Miles between stations.	Current on each section in amperes.	Volts drop in each section.	Potential at each station to overcome drop.	Resistance at each station.	
					1150	A
A to B	4.3	.070	2.4	11.5	910	B
B to C	5.6	.060	2.7	9.1	610	C
C to D	4.1	.050	1.6	6.4	480	D
D to E	4.9	.040	1.6	4.8	320	E
E to F	3.7	.030	.9	3.2	230	F
F to G	10.2	.020	1.7	2.3	60	G
G to H	7.5	.010	.6	.6	0	H
Total drop volts			11.5			

(10)

				11.5		A
A to I	5.2	.050	2.1	9.4	940	I
I to J	3.1	.040	1.	8.4	840	J
J to K	2.9	.030	.7	6.7	670	K
K to L	4.6	.020	.7	6.	600	L
L to M	7.3	.010	.6	5.4	540	M
Total drop, volts			5.1			

The figures in the fourth column (10) are obtained by consecutively deducting those in the preceding column, from the required voltage or potential at station A as obtained from the table (9), as this potential is required to overcome the drop in the other or longer sections of the line, which will necessarily be greater than in the portion being considered. It

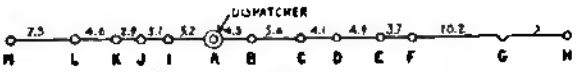

FIG. 3.—UNBALANCED TRAIN DISPATCHING CIRCUIT.

will be noted that it is necessary to have some resistance in the selector at station M, owing to this increased potential.

To the figure opposite station A must be added the 45.8 volts required at the terminal of the line and the drop in the coils at the dispatcher's office, which in this case would be

45.8 volts + (No. of stations on whole line × .01 amp. × 150) ohms = 63.8 volts.

or a total of 75.3 volts at the battery.

Where a circuit has numerous branches, such as are shown in diagram (Fig. 3), the problem is somewhat more complicated than those previously considered, but is solved by the application of the same principles. In this circuit the dispatcher is located at A, where the main battery is also located. There are two stations at junction H. There are twenty-

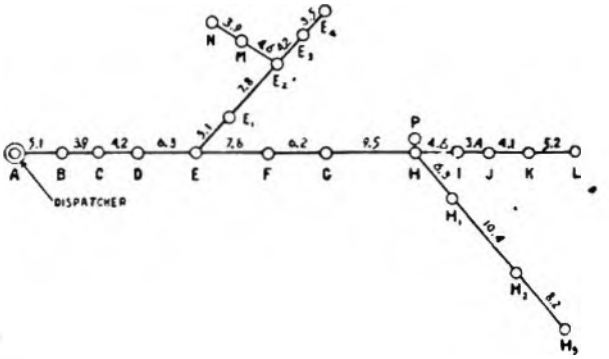

FIG. 4.—TRAIN DISPATCHING CIRCUIT WITH BRANCHES.

one stations in circuit, Gill selectors are used, and the copper line wire, weighs 208.88 pounds to the mile.

In a case of this kind it is well to consider some part of the circuit as the main portion, and in this case the part A to L is so considered. The drop in the various sections should be figured and the potential required at each junction be obtained as heretofore explained. With these figures as a basis, figure back on the branches as shown in table (10) and obtain the drop and resistance at the stations on the branches. Where there are branches on a branch from the main line, as from E2 to N, the same method of figuring back on the branch from the junction is followed. As this has been so thoroughly explained in this article, the detailed figuring for the circuits shown in diagram (Fig. 4) is not given. When two selectors are located at one station, they each take the same resistance and the cur-

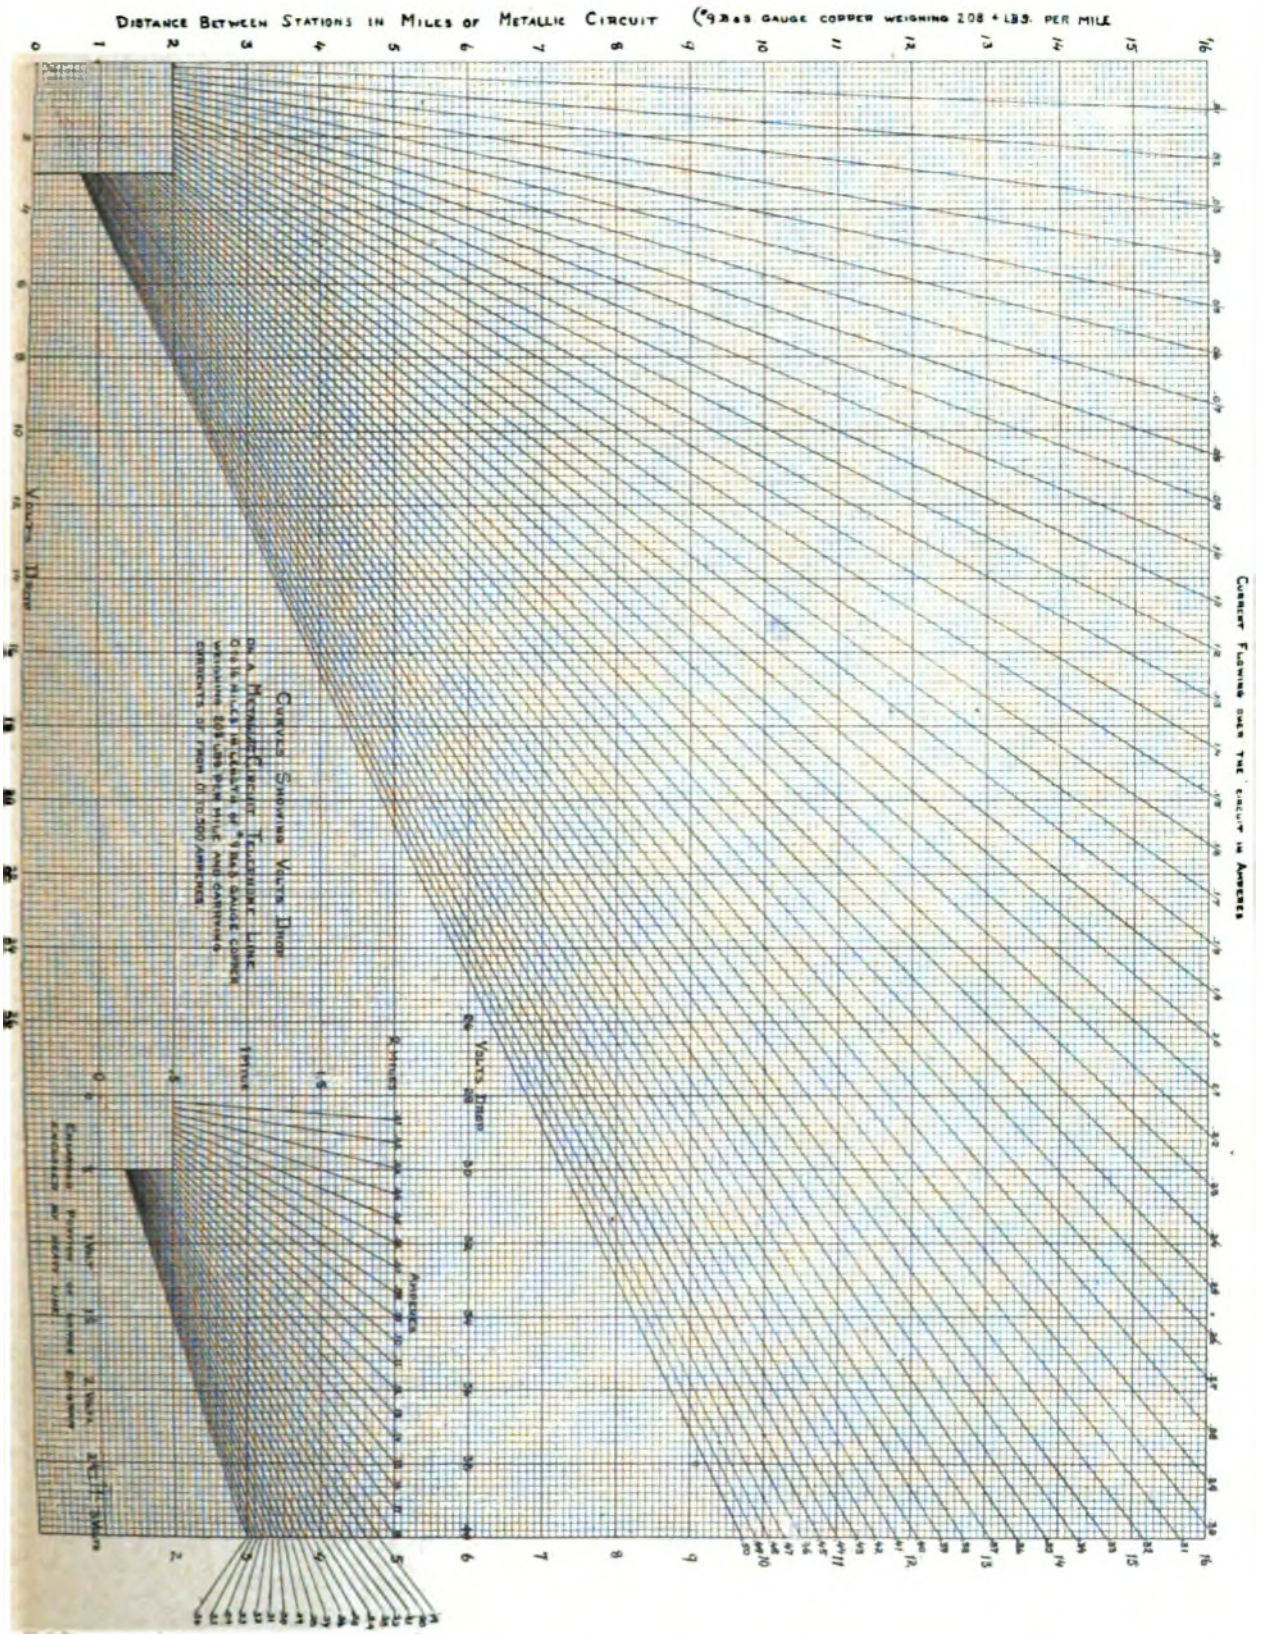

FIG. 5.—CURVES SHOWING RESISTANCE OF A METALLIC CIRCUIT TELEPHONE LINE.

Digitized by Google

rent on the section beyond will be reduced by 2 × .01 amp.

In figuring the resistances on a circuit such as shown in diagram (Fig. 4), the current on the various sections of the main line must include that required by the branches beyond the section being considered.

Interrupter for Railroad Telephone Work.

A new interrupter, designed especially for railway telephone service, has been placed on the market by the Western Electric Company. This interrupter is especially adapted for use in block towers, where the operators are so busy that they do not have the time to call other stations by means of a hand generator. It is also especially well adapted for use on yard lines where several telephones are connected to the same pair of wires. It is not limited, however, to this class of work, but is very useful in all code ringing work, as the signals can be made very clear and distinct.

Fig. 1 shows an open view of the interrupter, which is intended to be mounted upon the wall in a vertical position in the same manner as a telephone set. The set is enclosed in a neat, well constructed oak cabinet, provided with a hinged cover. The mechanism is mounted upon the base of the cabinet and is readily accessible for adjustment, test and inspection.

The interrupter is operated by means of a key, or push button, which closes a battery circuit containing four to eight dry cells. It is recommended

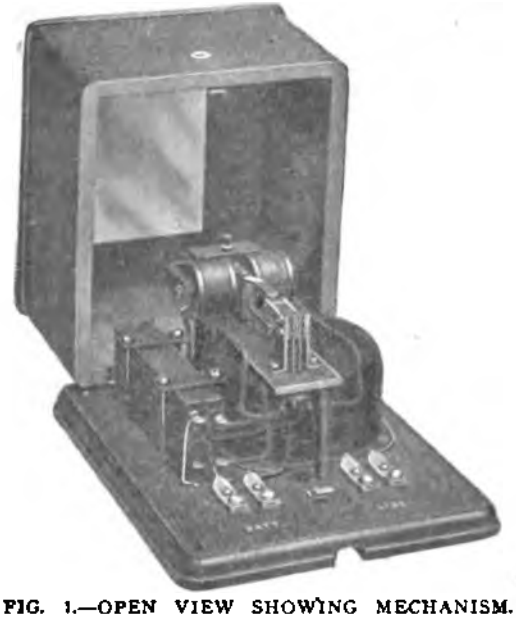

FIG. 1.—OPEN VIEW SHOWING MECHANISM.

that five dry cells be used, which will effectively ring fourteen 1,000-ohm ringers, or sixteen 2,500-ohm ringers on a line of 500 ohms resistance, an equivalent of about a thirty-mile metallic circuit of No. 12 B. and S. copper wire.

The interrupter is so adjusted that it responds at once when the key is pressed, closing the battery circuit. This insures a very economical current consumption, as the interrupter is in action only when the battery circuit is closed. The mechanism is practically noiseless and sparkless, and all circuit

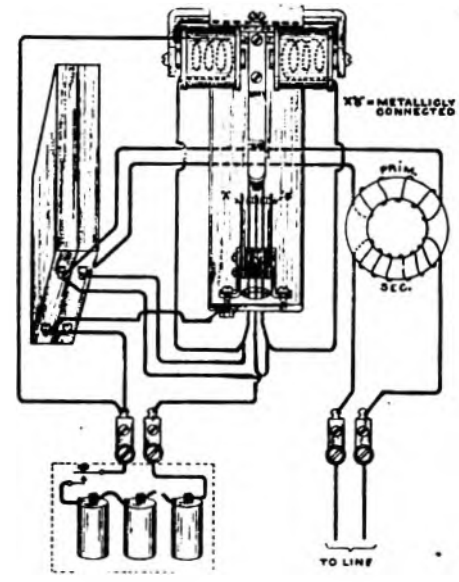

FIG. 2.—CIRCUIT DIAGRAM.

contacts are of platinum. While the mechanism is very sensitive, it is built in a substantial manner which insures long service and low maintenance.

The circuit diagram shown in Fig. 2 shows the simplicity of the circuit and the ease with which it can be connected.

Who Left the Bell Cut Off?

BY EDGAR C. DODGE, CHICAGO.

A great deal of annoyance is frequently caused in large offices where bell circuits are maintained between repeating stations, by quadruplex men neglecting to throw the switch to its proper position after using the bell. The result is that the man at the repeating station must send a wire message, when he could have been able to get prompt attention had somebody not forgotten to cut in the bell.

We all make mistakes and the more mistake-proof we can make things the better we shall get along; yet we should not tax our minds with anything that we can be relieved of.

A simple way to avoid the bell trouble is to equip the bell local with a back contact push button so arranged that the bell is out only so long as the button is kept pressed down. This may be easily handled with the left hand while the right is manipulating the key. Then when the circuit is left the bell is always set for further use. A small label on the switch reading:

"USE THE BUTTON."

should be enough to warn everybody concerned, and they would soon learn to keep their hands off the switch except in cases of the bell wire being out of service.

Railway Telephone Maintenance.*

BY WOOD WILSON.

With the commercial telephone companies the greatest factor in maintenance is cost; with us, efficiency should be the first consideration.

Starting with a magneto telephone the important item is the battery. Within the last ten years the dry cell has been improved in quality and reduced in cost, until it has entirely supplanted the Fuller cell, which was almost universally used previous to that time. The essential features of a dry cell for telephone use are slow deterioration when not in service, the ability to recuperate rapidly during periods of use, and long life in service.

An ammeter, for measuring dry cells, should have a resistance about equal to that of the primary circuit of a telephone. Those commonly used have a very low resistance, practically short circuiting the cell under test, which greatly injures it in a few seconds. In measuring the current of a cell a firm contact should be made on the brass terminal, as the carbon offers a high resistance, making a material difference in the reading.

While good results are obtained by connecting batteries in parallel for use with low resistance transmitters the best results are obtained by using a high resistance transmitter and connecting the batteries in series, three cells being commonly used. The cells should have a moisture proof covering over the zinc, and should be placed in or as near the telephone as possible and not less than a No. 19 gauge wire should lead to the transmitter and induction coil. Batteries placed in cellars or other damp places are not only short lived, but as they are connected through the switch hook and secondary to the line, they cause leakage and an unbalanced line. On the other hand they should be kept away from radiators or registers, as they are worthless when dried out.

No more dry cells should be carried in stock than are actually needed, as they should be used within one month of the date of manufacture. In coupling cells together the wire should be thoroughly scraped and looped around the binding post to the right, and the nut tightened with pliers, care being taken not to cut the wire by tightening the nut too much. Very good connectors may be made by saving the tips of desk cords and soldering a short piece of wire to them, as they give a large surface contact and are not injured by tightening. Care should be taken that no zinc binding posts shall touch that of another cell when placed in the telephone.

The hinges of a telephone should not be used as part of primary circuit, as the springs deteriorate very rapidly, around a railroad, causing opens or high resistance. Where the transmitter is mounted on a door, flexible cords should lead around the hinges. Tinsel telephone cords are very fragile, and their life is greatly lengthened by using telephones and receivers with internal binding posts which prevent their breaking at the tip. They should always be kept dry, as when moist they are noisy and also give a "permanent" signal at common battery exchanges. In renewing cords, care should be used to see that they are not reversed. It is surprising to find that some of our most careful men make so many errors in connecting the cords of desk telephones. One way to eliminate this trouble would be to have three styles of cord tips on a triple cord and have terminals that hold only the proper cord tip.

Where it is necessary for a desk extension cord to have a cord weight attached there should be a hard rubber bushing in the hole in the desk to prevent wear. The use of cord weights, however, on this class of cord is not advisable, as the short bending soon causes noise from broken tinsel. The various types of folding and swinging desk sets reduce the cost of cord maintenance very considerably.

The switch hook of a modern telephone requires very little attention, unless it is bent out of shape or in very dusty places. Dust sometimes settles on the top of hard rubber between springs and when strong ringing currents are used, causes an arc which carbonizes the rubber, causing a short circuit. Dust between the platinum contacts can be removed by depressing the switch hook and placing card board on paper between contacts, then raising the hook and withdrawing the paper.

The adjustment of polarized bells is a source of much trouble to some repairmen. No adjustment has been found that will meet all conditions, as a bell at the distant end of a party line necessarily receives less current than a near one, and must have the armature set closer to the core than others. The armature should be so adjusted that the clapper rod will not touch the sides of the hole through which it passes. The gongs should then be moved until they come as close to the clapper as possible without touching it when the armature is resting against the core. This adjustment will allow undamped vibrations of the gongs and the recoil of the clapper will tend to pull the armature away from the coil and strengthen the next stroke. Iron filings should be removed by passing a piece of card board or blotting paper between armature and coils, as they cause the armature to stick by forming a magnetic bridge around the brass pin, which is placed in the armature to prevent sticking. The armature should have as little end shake as possible without binding. The permanent magnets often become demagnetized by abnormal currents and should be replaced or remagnetized by holding them against the field of a motor or dynamo.

A good hand generator requires very little attention, except a drop or two of oil on the bearings when they become dry. An excess of oil is liable to cause a short circuit by creeping in to the armature winding or by softening the hard rubber of the commutator. The magnets rarely lose their strength and it hardly pays to remagnetize them, unless one has a special helix and suitable current.

*Address to Pennsylvania Railroad Employes.

Digitized by Google

The receiver magnet should be tested for strength by touching edge of the diaphragm across the poles, as it frequently becomes weakened by strong ringing current passing through it. All dust and especially iron and steel filings should be removed from it at each inspection. When a telephone is to be used both on magneto and common battery lines the receiver cord should be reversed if the common battery exchange cannot be heard distinctly, and if used on more than one common battery line, the lines should all be poled alike.

The office wiring, if properly installed, gives very little trouble. Where floor outlets are used they should be watertight, and should be under the desk where a mop will not touch them. Where wires pass down walls through the floor, hard rubber tubing should extend from the top of the mop board through the floor. Where joints are necessary they should be soldered. No joints should be pulled in floor conduit where they cannot be inspected. It is better to pull in a new piece and use the short pieces for other work.

The average protector on the market has entirely too many joints. The ideal protector should have but four joints in the talking circuit. These should be formed by four strong screws which will bring the wire and fuse ends under the same screw. Very few repairmen carry suitable wrenches for the nuts on protectors, and in using pliers the lock nut is often tightened and the wire may be loose.

Nothing smaller than No. 14 B and S. twist should be used for subscribers' loops. In splicing twisted pair, a Western Union joint should be made and well soldered. It should be wrapped with rubber tape then slightly warmed and covered with friction tape. The splices in both sides of a pair should not fall together, as any leakage across joints in wet weather not only causes noise, but soon eats wires off on common battery lines. In dead-ending twisted pair on insulators, do not make turns short around the wire but let them extend out in a spiral form, covering several inches from the insulator, as wire may be taken down and used again if no short kinks have been made in it. Twisted pairs should not be used for overhead railroad crossings, where open copper will do, as the vibrations from the exhaust cause intermittent opens which are very hard to locate.

Terminal boxes should be waterproof and as nearly airtight as possible, as the sulphur from engines soon destroys the arresters. It is well in case of large terminals to have two sets of doors and pack the bottom of the box with loose asbestos, where cables and wires pass through. A wire screen should cover the bottom of the box outside to keep sparrows from nesting in them, or from carrying away the asbestos packing. Sparrows' nests are often ignited by lightning, thus destroying the terminal. These birds have also been known to strip the wires of all insulation. All lines entering a cable terminal should pass through a pair of fuses and have carbon or copper block cut-outs on the cable end of the fuse. Frequent tests of these should be made to see that they are well grounded.

To be able to locate and clear cable troubles promptly, complete records should be kept, showing distances between all manholes; also span measurements of all aerial cables and distances between terminals. A chart should be kept, showing each conductor, its gauge and terminals and switchboard number, if in use.

The most frequent cause of trouble in cables is moisture, which is indicated by "permanent" signals at common battery exchanges or cross-talk at magneto exchanges. Prompt action will usually allow one to locate trouble by means of a Wheatstone bridge before all the conductors become wet, as otherwise it is necessary to string an outside wire for use in the Murray or Varley loop methods. Several types of trouble detectors are in use, for which good results are claimed. They consist of an apparatus for sending tone to the fault and a detector with a head receiver to be carried along in close proximity to the cable; the tone being heard until the fault is reached. Several other methods may be used when proper facilities are not at hand, such as removing all grounds from the sheath of a cable and grounded conductors, then advance along the cable toward the supposed fault, holding a needle in each hand connected to a head receiver or milli-ammeter. Place the needles on the sheath as far apart as you can reach and a slight click will be heard in the receiver, or a deflection noted on the milli-ammeter until the fault is reached.

When water in a cable becomes frozen and conductors show clear, a torch carried along the sheath will thaw it out and cause the line lamps to burn when the fault is reached. Having located the moisture, if in underground, a piece of cable must be pulled in a vacant duct and the old cable cut over to the new cable at manholes on each side of the fault. If an aerial cable, the sheath should be cut off from a little shorter length than the sleeve to be used, and the core boiled out with paraffine until all traces of moisture are removed. If the moisture has run back too far to be drawn out in this way it may be necessary to cut a new piece of dry core in. If the cable has been wet for any length of time a new piece is best, as the insulating qualities of the paper are spoiled by the decomposed copper deposited on it by electrolytic action.

Frequent readings should be taken on underground cables for current which would cause electrolysis. If the current flows from the surrounding earth to the cable at all points, no damage will occur, but if in the opposite direction the cable should be bonded to the negative side of the street railway or other circuit from which the leakage comes. Insulating sleeves placed in the sheath of cable leaving steel structures will often prevent the flow of the current, or for short lengths of underground cable, a good plan is to place it in iron conduit which should be properly drained; then electrolytic action will take place on the conduit instead of the cable.

Digitized by Google

As the electrolytic currents vary with the load carried on the disturbing circuit a good precaution is to have a pair of insulated wires leading from each manhole to the terminal room, having one side connected to earth and the other to the sheath of the manhole and placing a recording voltmeter on a circuit for a week at a time, thus making a chart of the current for all days of the week.

If heat coils are used they should not have inductive windings, as the impedance causes serious transmission losses, in addition to loss from the resistance of the coil. Much noise is caused on trunk lines by poor contacts between ends of heat coils and plate springs, which become oxidized in a short time.

Main and intermediate frames should be located in a dry place, as in damp basements the jumpers are soon eaten off by electrolytic action, and much cross talk also results. Dust should be removed daily from all terminal strips, especially horizontal ones, by use of a moulders' bellows or vacuum cleaner. Nothing but rubber covered, flameproof, braided, tinned, copper wire should be used for jumpers.

Not one man in ten makes a good soldered joint. In soldering copper wire nothing but resin should be used as a flux. All other soldering preparations for copper wire are for lazy men; for if the copper is cleaned and is covered by a film of rosin, the solder will always flow. Most soldering preparations clean the copper by chemical action when heat is applied. This chemical action continues to some extent until the terminal or wire is destroyed. After the terminal and wire are cleaned and in place, hold a piece of resin core solder on the joint and touch the point of the soldering copper to it. This will allow the resin to flow into the joint before the solder, thus preventing oxidizing of the copper.

The handle of a soldering copper should be held high enough to allow solder to flow to the point. When solder flows remove the soldering copper quickly. Never use sal-ammoniac to tin a soldering copper, as it will soon eat pits into it and make frequent dressing necessary. If it should need dressing use a file to shape it up, then heat and rub on a piece of sandpaper, at the same time applying resin core solder.

All trunk lines should pass from the main frame to a patch or test panel which should contain four jacks for each line. These jacks should have platinum contacts and be spaced to receive a double plug for patching or testing. The line side jacks should be placed one above the other, and the switchboard jacks to the right of them. These jacks are strapped together in such a way that a double plug placed on the line side will connect with the line and leave the switchboard side open, and vice versa. Patch cords should be provided, which will allow any line to be cross connected to any other line on the panel.

Composite sets and simplex coils should terminate on jacks in the same manner. Several "Morse" wires should lead from the telegraph office to the panel, so that any kind of circuit can be plugged on any line, or in case of storms a telephone line can be split up into Morse lines.

In locating patch panels at various points on long lines care should be used to place them at points where local lines will be available for patching around breaks in the through lines. Heavy gauge wire should be used to lead into panels from through trunks, to keep the resistance as low as possible. Where one man looks after the patch panel and test table, it is well to have them combined.

The test table should be equippel with a 100,000 ohm voltmeter, having a fifty-volt scale. A set of dry cells, sufficient to give fifty volts, should be grounded at one terminal and the other terminal carried through a series of switches, grouped in such a way that the battery will pass through the voltmeter and out on a cord terminating in a double plug which will fit the jacks on the patch panel. One switch should be arranged to reverse the line, another to ground the opposite side of line for continuity tests, another to cut off battery when measuring foreign current, another to reverse the voltmeter when foreign current is of the opposite polarity, another to throw a low resistance shunt around voltmeter when measuring foreign currents which may be of a higher voltage than the voltmeter. Keys should also be provided to connect a telephone to the cord and to throw battery out on the line, for testing common battery telephones.

Ringing keys should be wired in circuit, one each for metallic ringing, tip to ground, ring to ground and pulsating positive and negative where selective systems are used. A key should be mounted which will cut in an artificial twenty-mile cable for transmission testing. This artificial cable should consist of resistances and capacities equivalent to twenty miles of low capacity, No. 19 B. and S. gauge cable.

Two test lines should lead from jacks on the test-table to test cords on telephone switchboards. Battery should be supplied to the sleeve of these cords through lamps on the test table. This battery will serve to operate the cut-off relay and will burn the lamp as an indication that a line is under test.

Much better transmission can be secured if the storage batteries have an ample capacity, as the voltage will hold up better on the peak of the load. Manufacturers' instruction for care of storage battery must be strictly adhered to if the best results are to be obtained. The battery terminals should be well soldered in addition to bolting and very large conductors should lead to bus bars by the shortest route possible, and all switches should be of a capacity several times greater than the current to be carried, as a fraction of an ohm in the battery circuit will cause cross-talk.

The commutators of motor-generator sets should be kept thoroughly cleaned and polished, as noisy lines will result, especially on loaded trunks, if they are rough. If carbon brushes become rough, the machine should be stopped and a strip of sandpaper drawn under brushes with the smooth side

Digitized by Google

against the commutator, thus grinding the carbon to conform to the commutator. Vaseline or paraffine can be used under brushes, but the results are not as good as obtained from some of the compounds on the market. Brushes should always be set diametrically opposite one another, and the yoke shifted until the maximum current output is reached and no sparking results.

As switchboard maintenance would form a subject for an additional paper, only a few of the most important items are here mentioned. Daily tests of all switchboard cords should be made by plugging in a noisy line and moving the cord just back of the plug, when any cut-off can be detected by the interruption of the noise. In a small exchange cords can be cut off and plug reset without removing them, but in a large office they should be removed for repairs. Cord weights should never be allowed to touch the floor, as the noise is very annoying to operators. In looping up slack in a long cord the loops should be made as close to the end as possible in order that the cord will reach the farthest multiples. Series jacks are very objectionable in a large board for railroad use, as much dust gets in the contacts, causing open or unbalanced lines. When switchboard plugs have been out of service they should be buffed with jeweler's rouge to remove oxidizing, as it forms a very high insulation.

No. 14 twist should lead from arresters in cable terminals through enameled iron bridle rings on bottoms of cross-arms to aerial copper lines; the latter should be dead-ended with a half sleeve and enough end left, to give space to solder the jumper, which should have only one or two turns to the inch of line wire, as closely wrapped wire does not make a good contacts, and is ruptured by short bends. If construction men do not carry a soldering outfit they should use test joints, which should be removed when soldering is done. Too little attention is paid to joints in trunk lines, as we spend thousands of dollars for heavy gauge copper to give a low resistance line when a better line might be built at half the cost by having perfect joints. Frequent resistance measurements should be made on all trunk lines and records kept, together with temperatures, so that any unusual resistance can be noted and removed. These records will also be useful in locating trouble by the Varley loop method.

Poles Purchased in 1909.

The total number of poles reported to the Bureau of the Census, at Washington, as purchased during the calendar year of 1909 by the telegraph and telephone companies, steam and electric railroads, and electric light and power companies of the United States was 3,739,000, as against 3,249,000 in 1908 and 3,283,000 in 1907. There were purchased in 1909 by the same class of users 3,509,000 cross-arms, 6,168,000 brackets and 18,463,000 insulator pins. Cross-arms, brackets, and insulator pins were not included in the annual census of lumber and timber products prior to 1909.

This information appears in a preliminary comparative report, covering 1909, 1908, and 1907, which was transmitted to Census Director Durand by Chief Statistician William M. Steuart, under whose supervision it was prepared by J. E. Whelchel, expert special agent of the Division of Manufactures. In co-operation with the Forest Service of the Department of Agriculture, the Bureau of the Census annually collects and publishes statistics pertaining to the group of lumber and timber industries.

Telephone and telegraph companies reported purchases during 1909 of 2,916,000 poles, or 78 per cent of the total. This was an increase over 1908 in the number reported as bought by this class of users of 354,000 poles, or 14 per cent, and over 1907 of 604,000 poles, or 26 per cent. Steam railroads reported the purchase of 26 per cent more poles in 1909 than in 1908, though 34 per cent less than in 1907, while the reported purchases by electric railroads and electric light and power companies were 18 per cent greater than in 1908 and 7 per cent less than in 1907.

There was little change in the average cost per pole of all lengths and from all species of wood in 1909, as compared with 1908, it being $1.89 in the later and $1.82 in the earlier year. The average cost per pole, $2.46, in 1907, was substantially larger than in either of the later years, mainly for the reason that a class of pole consumers in the United States which uses chiefly short poles was not included in the census for 1907.

Cedar continues to be the principal pole timber, contributing 65 per cent of the total purchases in 1909, 68 per cent in 1908, and 64 per cent in 1907. Chestnut, after cedar, was used in greatest quantity in all three years, forming 16 per cent of the total in 1909, 16 per cent in 1908, and 19 per cent in 1907. Among the remaining species, the increase in the number of oak poles reported as purchased during the last three years is noteworthy; more than three times as many poles from the species having been reported as purchased during 1909 as was the case in 1907.

Substantial progress in the practice of treating poles with chemicals to preserve them from decay is disclosed by the returns for 1909, nearly one-sixth of the total purchases during that year having been given some preservative treatment, as against about one-tenth in 1908 and one-eighth in 1907.

Of the total outlay during 1909, $1,621,000, for crossarms, brackets, and insulator pins, the telegraph and telephone companies contributed 63 per cent, electric railroads and electric light and power companies 3 per cent, and steam railroads 4 per cent.

Mr. W. H. Stansell, manager of the Postal Telegraph-Cable Company at Wilmington, N. C., in renewing his subscription for the ensuing year writes: "I have been a subscriber to your paper for several years and I always grow as impatient for its arrival as children for Christmas."

The Manager.

BY H. SCRIVENS.

Superintendent Postal Telegraph-Cable Company, Pittsburg, Pa.

A Postal telegraph office always represents the investment of a certain amount of money, in most instances a very considerable sum, as the building and maintenance of a telegraph line and the equipment and maintenance of an office is expensive work. When a manager is appointed to take charge of an office it practically means making him the custodian of the money represented by the office and line. It should be his aim to obtain the very largest return on the investment.

An office is bound to do more or less business —that is to say, as the company is well established a certain amount of business will naturally flow to it. But what counts is the business a manager secures over and above what comes without effort, and there is just where the manager's ability and worth are shown to advantage. Ability to hold the position of manager does not signify success, but ability to do the largest possible volume of business does indicate the successful manager. There are so many ways of securing business and the conditions in different cities vary so widely that no hard and fast rules can be set down for managers to follow, except everlastingly strict attention to business and constant planning and effort to constantly secure more and more of it

Upon the manager rests the responsibility for the discipline of the office, the courteous treatment of patrons, the attention they receive over the telephone, and the actions of the messenger boys. I fully realize that the latter is quite a problem, but by far the majority of our boys are good honest workers, and may be developed by proper treatment and proper handling. It often happens that a boy with good intentions is spoiled, at least temporarily, by petty impositions or inconsiderate treatment by a clerk or others, and this is something which the manager should guard against by an understanding that he is ever willing to listen to and adjust any differences which may arise with the boys. The work performed by the messenger is just as important as that of the clerk or operator, since the service on a telegram is not complete until it is delivered to the addressee and an improper delivery may undo the hard work of a manager in some distant city.

Giving credit where it is due is an excellent plan. Responsibility for faulty work should be placed where it belongs. There is frequently a disposition to shift responsibility for errors and omissions. But that is unmanly and weak, and the manager can do the individual and the company a vast amount of good by insisting that those at fault shall assume the responsibility, and that the same error should never be made twice.

A branch manager in one of the large cities a short time ago tried the experiment of personally instructing all new boys as to their duties. He warned them that they would certainly be detected in any wrongdoing. He then noted their work, and later, for a short period, let the new boys start in without instructions, and the While the boys were instructed and warned, things moved smoothly and properly, but when difference between the two plans was startling. instruction and warning were stopped trouble began. This experiment may be of value to other managers.

Another responsibility devolving upon a manager is the training of those under him so that there will be hearty co-operation in everything pertaining to the getting and handling of traffic. A good corps of workers from the messenger up is a wonderful help. It rests with the manager to encourage and develop those who show a disposition to be of assistance, and weed out those who are satisfied to drift with the tide. We look to the operators for our future managers, and managers should train such operators as show a disposition to advance. I frequently find very promising managerial material in operators, but they have not been immediately available because the manager has not instructed them in handling accounts and reports. Managers should feel that this is a duty they owe not alone to the company, but to each of their fellow employes as they consider trustworthy.

A manager is also depended upon to properly represent the company in the appearance of his office. This can be done only by scrupulous cleanliness and orderliness, which is the standard set by the company.

Our managers are on a par with other business men in that they represent a thoroughly reliable, well organized and splendidly equipped company, giving the best telegraph service that has ever been given. They have every reason to feel proud of their positions.

Considerable good advice has been given on the subject of fast callbox service, prompt handling of correspondence, practice of economy, quick adjustments of complaints, and other important matters, so that it is not necessary for me to touch on them; the object of this article being to point out the responsible position which the manager holds and the urgent need for him to live up to the responsibility in its many phases.—*Postal Telegraph.*

New Telephone Plant in the Canal Zone.—A new telephone exchange has been established at Miraflores, Canal Zone, Isthmus of Panama. Pedro Miguel, Corozal, Ancon quarry and Balboa are connected with the new exchange, from which about fifty stations are served. Service is furnished during working hours only and but one operator is employed. It is expected to extend the service to about 100 stations, using the party-line system.

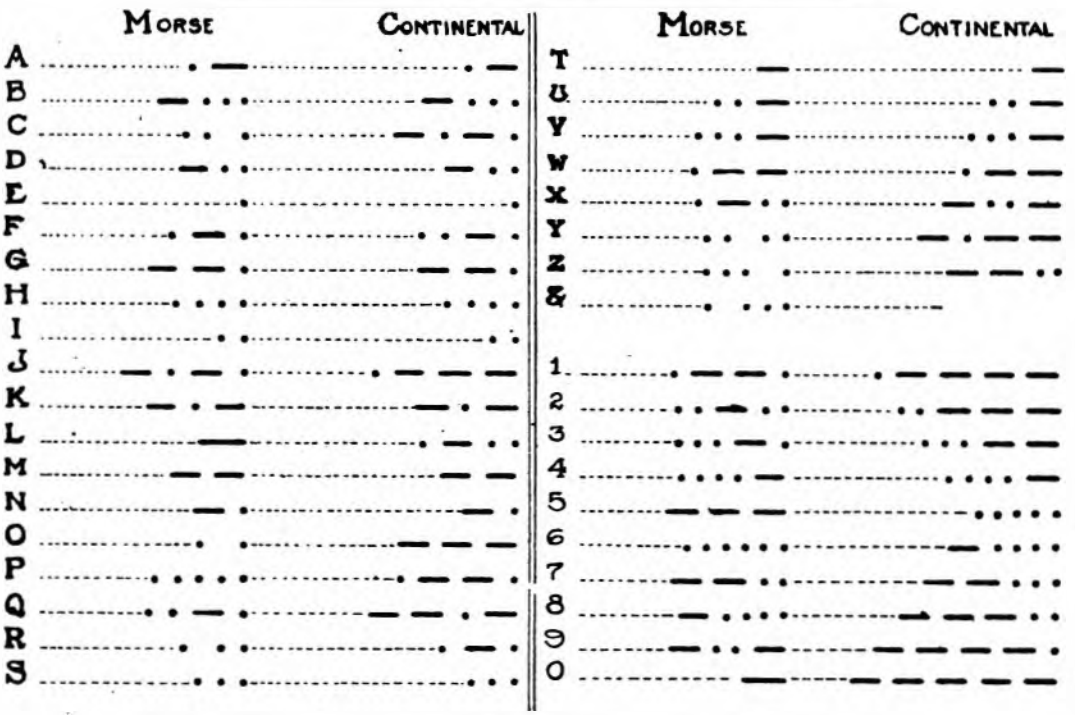
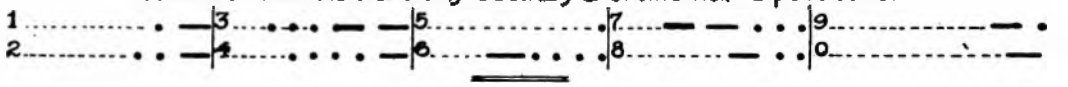
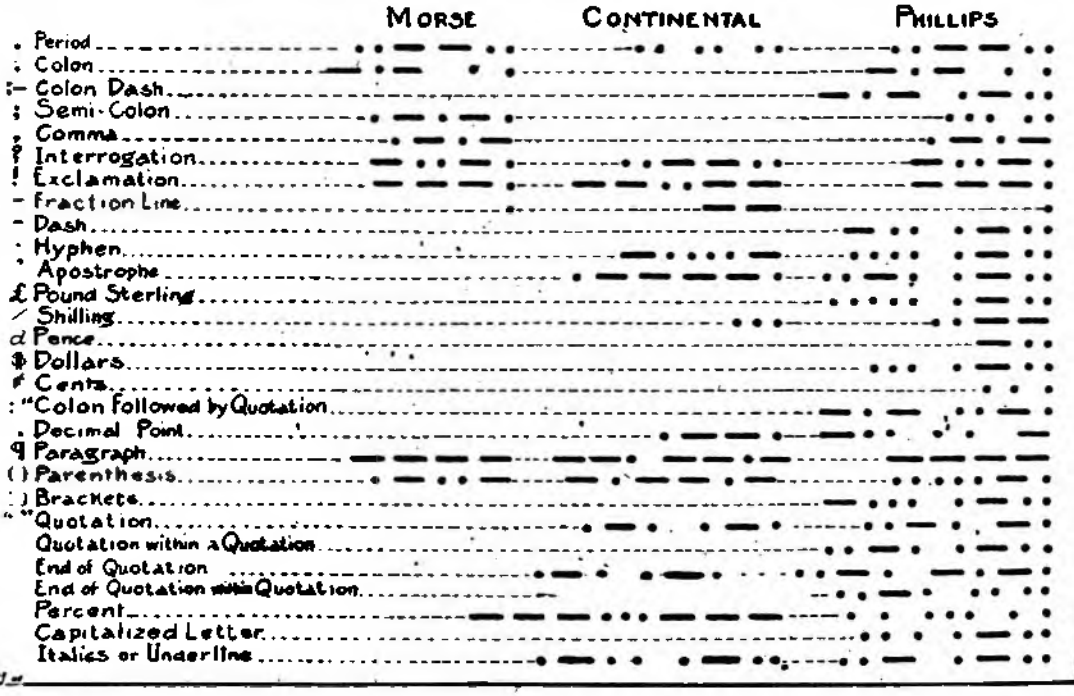
TELEGRAPH CHARACTERS



Short Numerals Generally Used By Continental Operators.





In the Phillips' Code, punctuation signals for fractions used generally in the United States are sent by inserting the letter e between the numerator and the denominator, thus: Three-sixteenths—3 e 16.

Owing to the fact that three ciphers when quickly transmitted bear striking resemblance to the figure 5, it will always be better to use tnd for thousand an myn for million when thousands or millions are expressed after the first, second or third figures by ciphers exclusively, thus: 10,000—10tnd; 248,000,000—248myns.

Hnd may also be used to advantage sometimes to express hundreds, thus: 400—4hnd; 500,000—5 hnd tnd; 300,000,000—3 hnd myn.

Decimals should be sent by inserting the word "dot," thus: 0.34—o dot 34; 89.92—89 dot 92.

When an omission occurs in the copy, and the fact is shown by the presence of asterisks, the letter x several times repeated will indicate that asterisks are to be inserted in the copy to be sent out, thus: And this has been one of the results x x x x x Who shall account for such corruption—And this has been one of the results * * * * * Who shall, etc.

In sending poetry or one or more lines of verse, a paragraph mark (— — — —) should be used at the end of each line.

The United Wireless operators use the Morse code, while the Marconi wireless telegraphers use the Continental code.

Application of Interstate Commerce Act to Telegraph and Telephone Companies.

With a view to reaching a satisfactory determination of the application of the present Interstate Commerce act to telegraph and telephone companies, the Interstate Commerce Commission on December 7 gave a hearing to officers of telegraph and telephone companies, which, by the terms of the law, are made common carriers. Some of the questions presented to the conference were:

"What telegraph and telephone companies are subject to the act?

"May such companies issue franks entitling to free interstate service, or may they grant free interstate service?

"Are telegraph and telephone companies required to file with the commission their tariffs of charges?"

"Does the law forbidding rebates and undue preference apply to telegraph and telephone companies?"

It was not the purpose of the commission to determine the status of any particular company, but rather to induce a discussion of the meaning and application of the law to the new common carriers generally.

Attorneys for the telegraph and telephone companies said that the transmission of messages was an entirely different thing from the transportation of persons or property, and it was their opinion that the difference between the words transmission and transportation was sufficient to relieve them of the necessity of filing their tariffs.

The hearing lasted but two hours and, with this one exception, the representatives of the "transmission" companies agreed that they were subject to the law in every other particular.

Mr. Rush Taggart, attorney of the Western Union Telegraph Company, said that all the lines which he represented were interstate and that there was no separate or strictly interstate business. He was undecided whether telegraph franks could be exchanged for passes on railroads, as he had not looked into that subject.

Mr. Taggart said that the words transmission and transportation were entirely distinct, and since section six said transportation, it did not mean that the rates for telegraph should be filed with the Commission. Commissioner Clark referred to the section which used the word "facilities," and asked if that was not sufficiently elastic to include telegraph companies. Mr. Taggart said that the word "facilities" was used in the old act before the telegraph and telephone companies were put into the Interstate Commerce act.

Referring to the fourth question set for the hearing Mr. Taggart said that the telegraph companies could be fined for giving rebates or practicing other discriminations. Commissioner Clark wanted to know how the Commission would know when the company was guilty of discriminations if its tariffs were not on file, as this would permit the company to change a rate within five minutes and change it back the next five minutes. Furthermore the Commissioner wanted to know how the Commission was to suspend proposed advances to telegraph rates unless those rates were on file. Mr. Taggart said he had no answer for either of these questions.

Mr. Hunt Chipley, representing the American Telephone and Telegraph Company, held to the same views as Mr. Taggart. Commissioner Prouty asked Mr. Chipley to file a memorandum with the Commission showing just where the word transmission appears and in what sections it does not appear. Mr. Chipley said that it would be furthermore a physical impossibility for the telephone company to file its rates and place a copy with every station. Each telephone is a station, and he said that the company had about 5,000,000 of such stations and something like 1,420,000 rates. Adding to these the sectional rates for the further divisions, the number of rates would run up to over 13,000,000.

Mr. N. Koenigsberg, representing the International News Service and the National News Association, said that the law does provide for the filing of tariffs and that these tariffs are now in printed form. He desired further that contract rates made with large users of the telegraph and telephone be placed on file and subjected to the law prohibiting discriminations.

Mr. J. D. Cable, representing the Ohio Telephone Association, said that the local lines in his State had a contract by which outside business was taken care of. He believed that the local companies do not come under the provisions of the law.

Mr. F. H. Woods, representing the National Association of Independent Telephone Companies, said that the State connecting lines do come under the law when they do outside business. He said he wanted all rates filed so that competitive methods could not be used to kill and buy up a small company.

The United Wireless Telegraph Company was represented by Mr. W. D. McLain; the Marconi Wireless Telegraph Company of America, by Mr. John Bottomley and the Telepost Company by Mr. H. Lee Sellers.

Bound Volumes of Telegraph Age Covering a Memorable Year in the Telegraph.

The year 1902 was especially significant in the annals of the telegraph, inasmuch as that date marked the accession to office of the recent official heads of the Western Union Telegraph Company. The story as told in Telegraph Age distributed over the months of that year, chronicling the numerous changes that eventful period witnessed, is of interest, one viewed with importance by many as being of high referential value, furnishing data and dates nowhere else so readily available. A portrait of Colonel Robert C. Clowry, the incoming president and general manager of the company, and of General Thomas T. Eckert, whom he succeeded, as well as others prominent in the Western Union service, were included in the issues of the paper during that year.

How Shall I Begin to Study Electricity?

BY JOHN F. SKIRROW.

Associate Electrical Engineer, Postal Telegraph-Cable Company, New York.

Not long ago I received the following letter:

"I wish to make quite a study of electricity in its relations to the telegraph business, taking it from the beginning where generated and following it through switchboards, various kinds of instruments, etc., learning the terms as applied to various currents and all such other information as would be of interest to any one making it a study. If you can do so, I should greatly appreciate it if you would give me the name of a book or set of books which in your judgment would best serve my purpose in this direction. I would also like permission to write you occasionally on matters which may not look clear to me."

This letter is a sample of many similar ones, and the reply to it may therefore be of interest to others who feel like asking the same questions. The reply was as follows:

"As regards the best books to study; this is a difficult question to answer, as I do not know what electrical knowledge you now have.

"If, to start with, you have some knowledge of the rudiments of electrical science, you will find 'The Quadruplex,' $1.50, by Maver and Davis, a very good book on the subject of duplexes, quadruplexes, repeaters, etc. 'American Telegraphy,' $5.00, by Wm. Maver, Jr., is an excellent book, covering all systems, including printing telegraph and ticker systems. 'Official Diagrams of the Postal Telegraph Company,' 50 cents, published by the Telegraph and Telephone Age, will give you our standard wiring methods, and the new book, 'Telephonology,' by Van Deventer, $4.00, will give you the latest and best about telephones and composite telegraphy and telephony.

"You may write me whenever you feel like it, and I will take pleasure in helping you to get an understanding of anything you may find difficult. Any of the above-named books can be obtained from Telegraph and Telephone Age, 253 Broadway, N. Y."

When the writer was asking the same questions twenty-five years ago, some one told him, "The first thing you want to do is to understand 'Ohm's law.'" That sounds formidable, but it isn't. "Ohm" was the man who discovered similarity in the behavior of electricity flowing in a wire, to water flowing in a pipe, and he established the rule which enables us to tell how much electricity will flow in the wire under various conditions.

We all know that water will flow through a pipe if the level of the water is higher at one end of the pipe than it is at the other. The reason for this is that the difference in the level of the water creates pressure, and it is the pressure that causes the water to flow. We can create pressure to make the water flow by raising the level of the water, or by mechanical means, such as a pump. The main point is that if we have a difference of pressure between one end of the pipe and the other the water will flow from the point of higher pressure to the point of lower pressure. When the pressure becomes the same at both ends of the pipe, the flow will stop.

We get similar results with electricity, using a wire instead of a pipe, electricity instead of water, and a battery to make pressure. As with water we make pressure by raising the level of the water or by the use of a pump, so with electricity we make pressure by chemical means (battery) or by mechanical means (generators). To get back to the water simile; the question "How much water will flow through a pipe?" would bring the answer, "That depends on the size of the pipe and the pressure of the water." Similarly, if you should ask "How much electricity will flow through a wire?" the answer would be, "That depends upon the size of the wire and the pressure of the electricity."

This brings three factors into the problem, "pressure," "quantity," and "resistance." The latter term means the objection put up by the pipe or wire to the passage of the water or electricity. Obviously the smaller the pipe or wire the greater the "resistance" to the passage of the "current," the "current" meaning the water or electricity that is flowing.

Now we have the three factors as pressure, current and resistance, and here is where Mr. Ohm comes in with his law. He says if you have any two of these factors you can always tell the third. In other words, if you know the pressure and resistance, you tell how much current you will have. If you know the pressure and the amount of current you can tell what the resistance is. If you know the resistance and the amount of current you can tell what the pressure is.

These things are vital ones to know in the operation of electrical apparatus, as all electrical apparatus is operated by current. So long as the electricity stands still, there is "nothing doing." To know how and what to apply electrically to operate apparatus we must ascertain the current required for operation. We must then determine the resistance offered by the apparatus, and knowing these factors we can, thanks to Mr. Ohm, tell just what pressure we will have to apply to secure the desired results.

Practically every electrical problem brings in these factors, and if the student will familiarize himself with this fundamental law governing them he will be building the best kind of a foundation for future study and development.

The generally accepted symbols for the factors referred to are as follows: "*I*" for current, "*R*" for resistance and "*E*" for pressure (another name for electrical pressure is "electromotive force," hence the abbreviation "E.M.F." or simply "*E*"). Now the law is that the amount of current flow-

Digitized by Google

ing will be equal to the pressure divided by the resistance or to put it down in the accepted form (don't get scared, this isn't algebra) $I = \frac{E}{R}$. Now let's give I, E, and R numerical values. Suppose we say instead of the above, $6 = \frac{12}{2}$. Now, that looks a lot simpler, but it's just the same in a way,

Now, it's plain to see that, if $6 = \frac{12}{2}$, then $2 = \frac{12}{6}$ and $12 = 6 \times 2$, or, to get back again to the letters, $I = \frac{E}{R}$, $R = \frac{E}{I}$ and $E = I \times R$.

Now, where do the figures come in and how are we going to apply them? Because Mr. Ohm discovered this law his name has been perpetuated by using it as a measure of resistance. So we measure resistance by ohms, just as we would measure water by the quart. Similarly, because Mr. Volta discovered the principles involved in making chemical batteries, which create electrical pressure, we measure electrical pressure by volts, just as we would measure mechanical pressure by pounds. Because Mr. Ampere discovered much that we know about electrical current, we use his name as the unit of measurement of current.

Now we can re-state the problem this way: amperes $= \frac{\text{volts}}{\text{ohms}}$; ohms $= \frac{\text{volts}}{\text{amperes}}$; volts = amperes $\times$ ohms. A practical application of this law may show its value. An ordinary sixteen-candle-power incandescent lamp has a resistance of 220 ohms. It is known that half an ampere of current will have to flow through it to make it incandescent. What voltage will be required to produce this result? Go back to your rule, which shows that the voltage = current $\times$ resistance. Therefore, 110 volts pressure will be required.

If the student will try out a few of these examples for himself he will find them interesting, and they will show him the "reason why" for the resistances and pressures used, or where he knows the resistance and pressure, he can tell the amount of current.—*Postal Telegraph.*

Reunion of Former Indianapolis Messengers.

A reunion of former telegraph messenger boys in Indianapolis, Ind., now prominent business men, was held December 12, at the Denison Hotel, in that city. The "boys" were in the service in the late seventies and early eighties and they met in response to a suggestion of Mr. Thomas F. Chilton, of Petoskey, Mich., to talk over old times. The affair was so successful in all respects that it was decided to form a permanent organization to be known as the Indianapolis Messenger Boys' Association, to which all messenger boys shall be eligible. A committee of organization was appointed.

The association will meet once a year or oftener and will look after the interests of the present day messengers.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works of telegraphy and treat them in the same manner.]

CHAPTER XXIX.

How is the energy from the generators* conducted to the operating room at the top of a high building?

At the operating room how are the main leads from the generator room disposed of?

What size of wire should be used for the net work in the operating room?

Would it be advisable to use a wire of larger gauge for the operating room distribution than for the leads from the generator room?

Explain why.

What is the reason for using as large conductors as possible?

Describe the method of laying the wires in the operating room floor.

How are the operating tables connected with the loop switch?

How are the cables drawn through the floor trenches?

How are the wires and cables in trenches marked for identification?

CHAPTER XXX.

What is a fuse?

What is the purpose of using fuses in connection with telegraph apparatus?

Draw a diagram showing the multiple arrangement of instruments.

What is the fuse holder?

How many circuits should be fed from one fuse?

Why is it advisable to limit the number of connections to the fuse holder?

What is the advantage of connecting instruments to the fuse holder?

In selecting a fuse what is the basis upon which to determine the proper size?

If there is a demand for two amperes should a fuse melt with that current or should its fusing point be higher?

Give the reason.

What size fuse is generally used on circuits carrying two amperes?

What is the resistance of sounders generally used on loops?

*The term "generator" is the more modern name for "dynamo" and is used by electrical engineers.

Digitized by Google

What disadvantage is there in using instruments of higher resistance?

Describe the plan of house wiring for a series system and point out the difference between it and that employed for the multiple system.

Refer to Fig. 70 and trace out the circuits and connections.

Why is a lamp or other form of resistance included in the grounded conductor connected with the right hand disk of the switch?

How can loops be made equal in resistance for the purpose of grouping?

Balancing Quadruplexes and Duplexes.

BY HENRY S. GILBERT, PUEBLO, COL.

I have read with much interest the articles of Mr. E. C. Dodge in your issue of November 1, and that of Mr. M. M. Davis in the December 1 issue, relative to balancing quadruplex and duplex apparatus. Possibly the description of a still different method might be of interest to your readers.

That there is unnecessary delay on nearly all multiplex circuits, due to waiting for the repeater chief at the distant end or the next repeater station to come in, there is no question. On some circuits bells are provided to call the repeater chief in, but on a majority of circuits they are not used. While it is possible to get a pretty good balance in the manner Mr. Dodge suggests, it is far from being a perfect balance. It is more or less guess work and extremely difficult for some persons who are inclined to be nervous to take a satisfactory balance in that way. While I do not use the ground switch for balancing, I firmly believe every quadruplex and duplex set should be provided with the customary ground switch, for the attendant can often locate the nature of instrument or line trouble by the use of the switch. It is true that the switch may be corroded and cause a higher resistance than that of the compensating coil, but I believe that as most quadruplex sets are wired so that the split wire from the neutral relay, polar relay and retardation coil goes to the transmitter points before reaching the ground switch, that the higher resistance is caused largely by the corroded points on the transmitter, both when open and closed. The fewer defective points the current has to traverse the quicker the trouble can be located. I believe that on all quadruplex and duplex sets the split wire should go direct to the ground-switch lever, then the distant office would not have to balance to any added resistance resulting from defective points on the transmitter. The practice of biasing one's relay to compensate for the imperfect balance at another station is inadvisable, for when the other office does take a balance, your magnetic balance is defective, and you are again called in, thus adding another delay. The use of galvanometers on quadruplex and duplex circuits is a great help, as it is only necessary to stop business for ten seconds to determine whether your electrical balance is correct or not, provided that it is merely a balancing of the circuit that is desired.

A method I have adopted for balancing quadruplex and duplex circuits without calling in the distant office or the next repeater station, and without the use of the ground switch, is by the use of the mil-ammeter, together with the open post on the latest type rheostats in the artificial line and the lightning arrester or main line fuse block of the set. It is a matter of a few seconds' time to throw the arm of the rheostat upon the open post, draw the fuse or remove the main line wire from the lightning arrester and center your polar relay armature. Then upon closing the main and artificial lines, place your mil-ammeter wedge between the second and third posts of the polar relay, operate your pole-changer, and at the same time readjust the resistance in the artificial line until no movement of the needle is noticeable. Your static balance can also be taken by the same method after a little practice. On a duplex set place the mil-ammeter wedge upon the first and fourth posts of the polar relay.

A balance by this method can be obtained after a little practice in less than one minute, and eliminates the delay from fifteen to twenty-five minutes in waiting for repeater stations to come in. A comparison of this method of balancing with that of the grounding balance will show the two to be identical.

If the distant station attendant is at his set the instant you are in, one might center the armature quicker by the ground switch method, but on long overland circuits where the repeater stations are called in, I believe the latter method quicker and better.

Among the appointments sent to the Senate by President Taft on December 12 were the following: Mr. B. H. Meyer, of Wisconsin, and Mr. C. C. McChord, of Kentucky, to be members of the Interstate Commerce Commission. Mr. Martin A. Knapp, chairman of the Interstate Commerce Commission, to be judge of the new Court of Commerce.

A telegraph operator of Denver is the inventor of a device which he claims will automatically overcome most of the difficulties which have in so many cases proved disastrous to aviators. By use of this invention he expects to make an aeroplane self balancing under any adverse conditions of wind. In case anything goes wrong with the aeroplane this device is expected to allow the machine to settle easily to the ground without any damage.

For the first time the leased wire of The Associated Press from Laredo, Tex., to Monterey and Mexico City, Mex., was seized by the Mexican Government on November 21, on the plea of military necessity. The Federal telegraph circuit manager in Nuevo Laredo was ordered to cut off the Laredo office of The Associated Press, in order to prevent the gleaning of information regarding the revolution in Mexico from messages moving over the wire.

1910

KERITE INSULATED **WIRE AND CABLE CO.**

Incorporated by W. R. Brixey

Hudson Terminal, 30 **Church Street, New York**

Western **Representative:**
WATSON INSULATED WIRE CO., **Railway Exchange, Chicago, Ill.**

Digitized by Google

New York, November 18, 1868.

To AUSTIN G. DAY, Esq.

Dear Sir:

I have been much gratified in hearing your explanation of KERITE. . . . Its quality or rather property of resisting the deteriorating causes which tend to destroy sooner or later the insulation by gutta percha, or caoutchouc, makes it an invaluable discovery in the aid of telegraphic extension. The test to which it has been submitted and by which it has been proved to resist the deteriorating effects of the ozone of the atmosphere appear perfectly satisfactory, and I therefore most cheerfully and cordially join with those who have tested its efficiency in congratulating you on your success in introducing so valuable an aid to the telegraphic enterprise of the world. . .

With hearty wishes for your success,

Your obedient servant,

(Sgd.) SAMUEL F. B. MORSE.

Digitized by Google

¶ Fifty years of efficient service in installations on whose reliability both the safety and convenience of the public have depended have proved Kerite Insulation to be the safest, because it is the most reliable; and the most economical, because it is the most durable.

¶ Kerite has been demonstrating for years the fact that it gives more service per dollar of expenditure than any other insulation known.

¶ Ask the people who have used it.

THE ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.

The object of this association is the improvement of the telegraph service, and the promotion and advancement in general of the interests of the telegraph department of railroads.

Place of next meeting, Boston, Mass., June 19, 20, 21, 22 and 23, 1911.

OFFICERS FOR 1910-11.

President, I. T. Dyer, Los Angeles, Cal.; first-vice-president, J. B. Sheldon, Omaha, Neb.; second vice-president, Wm. Bennett, Chicago, Ill.; secretary and treasurer, P. W. Drew, Chicago, Ill.

COMMITTEES.

Executive—I. T. Dyer, Chairman; J. B. Sheldon, Wm. Bennett, P. W. Drew, C. Selden, E. A. Chenery.

Topics—Mr. W. C. Walstrum, Mr. W. L. Connelly, Mr. U. J. Fry.

SPECIAL COMMITTEES.

Committee on High Tension Wire Crossings—G. A. Cellar, G. H. Groce, W. W. Ashald, W. P. Cline, C. Selden, C. A. Parker, J. M. Walker, Wm. Bennett, S. A. D. Forristall, J. G. Jennings.

Committee on Miscellaneous Matters—W. F. Williams, S. L. Van Aiken, F. T. Wilbur, W. W. Ryder, George Boyce, B. F. Frobes.

Committee on Resolutions—W. W. Ryder, E. P. Griffith, E. J. Little.

Committee on Form for Delivery of Messages to Trains, etc.—E. P. Griffith, C. M. Lewis, W. J. Camp, Wm. Bennett, J. C. Johnson.

Entertainment Committee—S. A. D. Forristall, N. E. Smith, W. Marshall, M. Magiff, B. A. Kaiser, P. W. Miller, A. P. Eckert.

Ladies' Reception Committee—Mrs. C. F. Ames, Mrs. L. J. Shay, Mrs. Geo. W. Conway, Mrs. N. E. Smith, Mrs. M. Magiff, Mrs. S. A. D. Forristall.

LIST OF ACTIVE MEMBERS.

W. W. Ashald, Supt. Tel., G. T., Montreal, Que.
Geo. J. Bayliss, Gen. Foreman, So. Pac., San Francisco, Cal.
Wm. Bennett, Supt. Tel., C. & N. W., Chicago, Ill.
F. E. Bentley, Supt. Tel., T. R. R. Assn., St. Louis, Mo.
J. H. Brennan, Asst. Supt. Tel., St. L. & S. F., St. Louis, Mo.
H. L. Bennett, Supt. Tel., H. & T. C., Houston, Tex.
George Boyce, Supt. Tel., C. St. P. M. & O., St. Paul, Minn.
F. G. Boyer, Supt. Tel., N. T. Co., Oil City, Pa.
J. C. Browne, Gen. Foreman, Mo. Pac., St. Louis, Mo.
W. J. Camp, Elec. Engr., Can. Pac., Montreal, Que.
J. F. Caskey, Supt. Tel., L. V. R. R., South Bethlehem, Pa.
G. A. Cellar, Supt. Tel., Pa. Lines W. of P., Pittsburgh, Pa.
E. A. Chenery, Supt. Tel., Mo. Pac., St. Louis, Mo.
J. P. Church, Chief Clerk, Wabash, Decatur, Ill.
W. P. Cline, Supt. Tel., A. C. Line, Wilmington, Del.
W. L. Connelly, Supt. Tel., C. I. & S., Chicago, Ill.
C. T. Day, Asst. Supt. Tel., Senora Ry. & S. P., Empalme, Son., Mex.
E. W. Day, Asst. Supt. Tel., B. & O., Baltimore, Md.
E. E. Dildine, Asst. Supt. Tel., N. Pac., St. Paul, Minn.
J. H. Ditch, Ch. Tel. Insp., Pa. R. R., Altoona, Pa.
G. A. Dornberg, G. Foreman, Pa. Lines W of P., Pittsburgh, Pa.
P. W. Drew, Supt. Tel., M. St. P. & S. S. M., Chicago, Ill.
I. T. Dyer, Supt. Tel., S. P. L. A. & S. L., Los Angeles, Cal.
L. B. Foley, Supt. Tel., D. L. & W., New York, N. Y.
A. S. Foote, Gen. Foreman, Sunset Lines, Houston, Tex.
S. A. D. Forristall, Supt. Tel., B. & M., Boston, Mass.
W. S. Fender, Asst. Supt. Tel., S. Pac., San Francisco, Cal.
B. F. Frobes, Supt. Tel., O. S. L., Salt Lake City, Utah.
U. J. Fry, Supt. Tel., C. M. & St. P., Milwaukee, Wis.
J. W. Fry, Asst. Supt. Tel., C. M. & St. P., Seattle, Wash.
T. R. Gooch, C. T. Despr., R. F. & P., Richmond, Va.
O. C. Greene, Supt. Tel., N. Pac., St. Paul, Minn.
E. P. Griffith, Supt. Tel., Erie, Jersey City, N. J.
W. H. Hall, Supt. Tel., M. K. & T., Denison, Tex.
T. M. Haston, Supt. Tel., T. St. L. & W., Bloomington, Ill.
A. Hatton, Inspr. of Trans., C. P., Winnipeg, Man.
J. L. Henritzy, Supt. Tel., C. & S., Denver, Colo.
Percy Hewett, Supt. Tel., Sunset Lines, Houston, Texas.
G. O. Perkins, Supt. Tel., C. G. W., Chicago, Ill.
Otto Holstein, Casilla 652, Lima, Peru, So. America.
E. D. Hubbard, Gen. Foreman, G. T., Battle Creek, Mich.
H. L. Husted, Div. Opr., W. J. & S. R. R., Camden, N. J.
J. G. Jennings, Supt. Tel., C. R. I. & P., Chicago, Ill.
F. T. Jennings, Supt. Tel., C. P., North Bay, Ont.
J. C. Johnson, Supt. Tel., Pa. R. R., Philadelphia, Pa.
W. B. Jones, Supt. Trans., C. I. & L., Lafayette, Ind.
L. M. Jones, Supt. Tel., A. T. & S. F., Topeka, Kans.
E. C. Keenan, Supt. Tel., L. S. & M. S., Toledo, O.
G. C. Kinsman, Supt. Tel., Wabash, Decatur, Ill.
V. T. Kissinger, Supt. Tel., C. B. & Q., Chicago, Ill.

FINANCE COMMITTEE.

Chairman, H. G. Kennedy, of Rochester, N. Y.; P. H. McManus, of Wilkesbarre, Pa.; W. H. Flandreau, of Mt. Vernon, N. Y.

Herbert W. Angier, superintendent of fire telegraph, Marlboro, Mass.

W. Arbuckle, superintendent of fire telegraph, Bayonne, N. J.

George R. Babcock, superintendent of fire and police telegraph, Oakland, Cal.

J. Bagby, assistant superintendent of National District Telegraph Company, Buffalo, N. Y.

Alexis J. Balizet, superintendent of fire telegraph, Meadville, Pa.

Arthur J. Bell, superintendent of fire telegraph, New Rochelle, N. Y.

C. E. Beach, Binghamton, N. Y.

John Berry, superintendent of fire and police telegraph, Indianapolis, Ind.

P. J. Beisel, city electrician, Allentown, Pa.

Fred W. Bladon, superintendent of fire telegraph, Roanoke, Va.

B. A. Blakey, city electrician, Montgomery, Ala.

Harry A. Bowen, superintendent of fire telegraph, Cleveland, Ohio.

Samuel R. Boone, superintendent of police telegraph, Baltimore, Md.

Adam Bosch, superintendent of fire telegraph, Newark, N. J.

L. S. Bosley, superintendent of fire telegraph, Springfield, Ohio.

C. E. Bradshaw, city electrician Charlotte, N. C.

Wm. Brophy, 17 Egleston street, Jamaica Plain, Mass.

H. C. Bundy, superintendent of fire telegraph, Watertown, N. Y.

F. A. Cambridge, city electrician, Winnipeg, Manitoba.

E. C. Chamberlain, 451 East 176th street, New York.

John S. Craig, superintendent of fire telegraph, Toronto, Can.

William Crane, city electrician, Erie, Pa.

V. L. Crawford, St. Louis, Mo.

Eugene N. Davis, superintendent of lights and wires, Brookline, Mass.

Wm. S. Devlin, American Union Telegraph Company, New Castle, Pa.

C. E. Diehl, superintendent of fire and police telegraph, Harrisburg, Pa.

M. J. Donohue, city electrician, Niagara Falls, N. Y.

C. S. Downs, city electrician, Altoona, Pa.

Will Y. Ellett, superintendent of fire telegraph, Elmira, N. Y.

Warren E. Fastnacht, superintendent of fire telegraph, York, Pa.

W. H. Flandreau, city electrician, Mount Vernon, N. Y.

Frank P. Foster, 136 Cedar street, Corning, N. Y.

C. F. Gall, chief operator fire department, Louisville, Ky.

Louis Gascoigne, superintendent fire telegraph, Detroit, Mich.

Clarence R. George, city electrician, Houston, Texas.

James Grant, superintendent fire telegraph, New Haven, Conn.

A. S. Hatch, Burnside, Ky.

J. S. Henry, chief operator fire department, Winnipeg, Manitoba.

C. C. Johnson, 44 East 23rd street, New York.

P. G. Kern, superintendent American District Telegraph Company, Louisville, Ky.

W. L. Kent, city electrician, Lynchburg, Va.

H. G. Kennedy, superintendent of fire telegraph, Rochester, N. Y.

John W. Kelly, Jr., chief electric bureau, Camden, N. J.

L. L. Kingsbury, chief inspector, Baltimore, Md.

A. L. W. Kittredge, superintendent of police telegraph, New Haven, Conn.

John G. Kraetz, chief operator fire department, Buffalo, N. Y.

John Leininger, city electrician, Canton, Ohio.

Elmer G. Loomis, city electrician, Allegheny, Pa.

F. F. Loomis, city electrician, Akron, Ohio.

Frank C. Mason, Washington Mills, N. Y.

G. F. Macdonald, city electrician, Ottawa, Can.

W. C. Matthias, superintendent of fire and police telegraph, Reading, Pa.

George T. Manson, 253 Broadway, New York.

S. W. Manning, superintendent of fire telegraph, St. Paul, Minn.

Charles Marizot, superintendent of fire telegraph, Shrevenport, La.

R. L. McCulloch, city electrician, Vancouver, B. C.

James McLaughlin, chief electric bureau, Philadelphia, Pa.

John W. McCarthy, superintendent of fire telegraph, Corning, N. Y.

C. S. McCosker, city electrician, Mobile, Ala.

P. H. McManus, superintendent of fire and police telegraph, Wilkes-Barre. Pa.

John McRobie, 147 Fifth avenue, Chicago, Ill.

G. E. Morley, Binghamton, N. Y.

P. W. Miller, 30 Church street, New York.

Jerry Murphy, superintendent of police telegraph, Cleveland, Ohio.

M. Jervis Myers, superintendent of police telegraph, Syracuse, N. Y.

W. J. Neave, superintendent of fire and police telegraph, Scranton, Pa.

Chas. R. Newman, superintendent of fire telegraph, Passaic, N. J.

T. C. O'Hearn, city electrician, Cambridge, Mass

John O'Brien, city electrician, Fond du Lac, Wis.

Price I. Patton, electric bureau, Philadelphia, Pa.

Walter M. Petty, borough electrician, Rutherford, N. J.

A. L. Pierce, superintendent Borough Electric Works, Wallington, Conn.

F. E. Pierson, city electrician, Morristown, N. J.

Incorporated 1907; capital $300,000.

M. W. Rayens, president.

Dr. Edward Weston Honored.

At a dinner given at the Lotos Club, New York, on the night of December 16, Dr. Edward Weston, of Newark, N. J., was presented with the Elliot-Cresson gold medal recently awarded to him by the Franklin Institute, Philadelphia. The presentation was made by Dr. Robert B. Owens, secretary of the Institute. Among those present were Dr. Louis Duncan, Dr. F. B. Crocker, Professor C. F. Chandler, Dr. C. F. Brackett, Professor D. C. Jackson, Dr. Alexander C. Humphries, Dr. Charles P. Steinmetz, Dr. S. W. Stratton, Colonel Samuel Reber, and Messrs. Gano S. Dunn, L. A. Osburn, William Stanley, J. J. Carty, Charles W. Price, W. D. Weaver, Samuel Insull, W. C. L. Eglin and Ralph W. Pope.

Dr. Weston is one of the pioneers in the electrical arts and has done much valuable work in the development of the electric lamp, electric generator, in electro-metallurgy, etc., and is the founder and active head of a great industry which manufactures electrical measuring instruments. For his valuable scientific and practical achievements, he has been honored with degrees from Stevens Institute of Technology, McGill University and Princeton University.

MEXICO.

Camilo A. Gonzales is director-general of telegraphs of Mexico, with offices in the City of Mexico.

The telegraph system of Mexico embraces 36,133 kilometers of aerial lines, and 74,254 kilometers of wire, and about 7 kilometers of underground cable. It also comprises 745.5 kilometers of submarine cable and 17.5 kilometers of subfluvial cable.

Digitized by Google

The Railroad.

The value of the telephone method of dispatching trains has been demonstrated by the behavior of this system on the Pere Marquette Railroad during recent sleet storms. The telegraph was put out of commission, but the telephone circuit worked continuously. Telephones have been installed at thirty way-stations and four sidings. The Michigan Central Railroad has recently installed train dispatching telephone circuits between Jackson, Mich., and Niles, Mich., 105 miles, with thirty-four telephone stations; between Jackson and Bay City, Mich., 115 miles, with twenty-three stations, and Jackson and Grand Rapids, Mich., 94 miles, with twenty-one stations. Equipment has been ordered for a telephone line between Windsor and St. Thomas, Ontario, 111 miles, with twenty stations.

Mr. E. L. Myers, for eight years general foreman of telegraph for the Mexican Central Railway, has been appointed chief electrician in charge of telegraph construction and maintenance, electric lighting and car lighting for the same company, at Mexico City.

Mr. G. O. Perkins, superintendent of telegraph of the National Railways of Mexico, at Mexico City, has been appointed superintendent of telegraph of the Chicago Great Western Railroad, with headquarters at Chicago, succeeding Mr. A. T. Hollenbeck, who has been assigned to other duties. Mr. Perkins was born in Beloit, Wis., September 29, 1866, and began his telegraphic career in Quincy, Ill., in 1882. He was at one time superintendent of news service for the United Press of Chicago, and later superintendent of telegraph of the Mexican Central Railway, Mexico. He afterwards occupied the position of superintendent of telegraph of the National Railways of Mexico, which he now relinquishes to return to the United States.

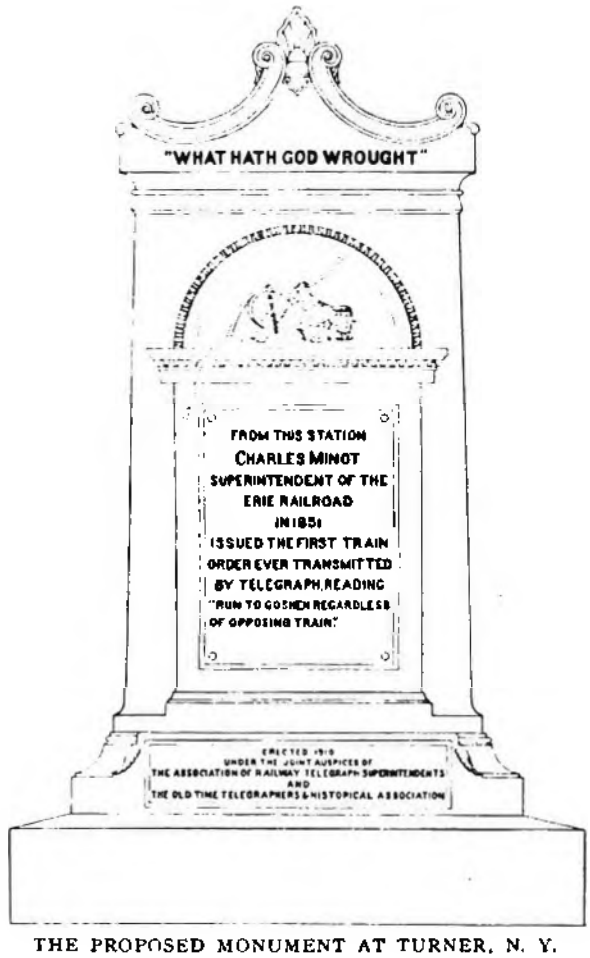
Mr. Antonio Jimenez has been appointed superintendent of telegraph of the National Railways of Mexico, to succeed Mr. G. O. Perkins, resigned.

Mr. Frank N. Dowler, city freight agent for the Lackawanna Railroad, New York, is a former telegrapher. He entered the telegraph service at Perrysburg, Ohio, and was afterwards operator in various Toledo, Ohio, offices in the middle seventies and early eighties. He was afterwards manager of the Atlantic and Pacific Telegraph Company's office in the same city. From 1890 to 1900 Mr. Dowler was general agent for the "Clover Leaf" Railroad. Mr. Dowler is a member of various telegraph associations and is well known to telegraphers throughout the country.

"Jack" Binn's Name.—Protection against the use of his name for advertising purposes was granted by the appellate division of the Massachusetts supreme court to "Jack" Binns, the wireless operator, whose "C. Q. D." message called help to the sinking steamship *Republic* in January 1909. An order was issued restraining a moving picture firm from using Binns' name on films portraying the wreck of the vessel.

The Turner Monument Fund.

The Turner Monument Fund is growing very satisfactorily and there is every reason to believe that after the holidays contributions will be made with greater liberality and freedom. As has been already explained the purpose of this fund is to erect a bronze and granite monument at Turner, N. Y., from which point, the first telegraph train order was sent by Charles Minot, general superintendent of the Erie Railroad, in the autumn of 1851. The monument will cost about $3,000 and to defray the expenses, subscriptions are invited from all



THE PROPOSED MONUMENT AT TURNER, N. Y.

railroad and telegraph men. The Association of Railway Telegraph Superintendents and the Old Time Telegraphers' and Historical Association have given the proposition their official endorsement and are heartily co-operating in the work of raising the necessary funds. All contributions are acknowledged in the columns of Telegraph and Telephone Age. The following named gentlemen constitute the committee in charge of the Monument Fund: E. P. Griffith, superintendent telegraph, Erie Railroad, Jersey City, N. J., chairman; Charles Selden, superintendent telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, Telegraph and Telephone Age, New York; E. A. Chen-

ery, superintendent telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railway, Montreal, Canada; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who has been elected treasurer of the fund. Many who have already contributed towards the fund express their willingness to make further contributions, if necessary.

An illustration of the proposed monument is given together with a description.

DESCRIPTION OF THE MONUMENT.

Material—Granite, and two tablets of bronze. Above the tablet on the front face is a fac-simile of the original Morse register. The tape bears the characters of the first train order, "Run to Goshen Regardless of Opposing Train."

Dimensions:

	Width Ft. In.	Thickness Ft. In.	Height Ft. In.
Base	7.0	4.6	1.4
Die-block	4.6	2.0	6.4
Sub-base	5.6	3.0	1.0
Cap	4.5	1.11	2.6
Total Height			11.2

The lettering is raised and has polished faces.

The contributions received up to date are as follows: Previously acknowledged $609.50.

Henry Adams, New York, $5.00; J. Merrihew, New York, $5.00; D. Roth, New York, $1.00; M. Nolan, Port Jervis, N. Y., $1.00; E. F. Meredith, Jersey City, N. J., $1.00; Miss A. Heuser, Passaic, N. J., $1.00; A. G. Saylor, New York, $5.00; H. B. Pigman, Connellsville, Pa., $1.00; W. R. Clasper, Connellsville, Pa., $1.00; Shenandoah Division Operators, B. & O., J. C. Smith, dispatcher, Winchester, $1.00; W. R. Smith, dispatcher, Winchester, $1.00; M. B. Murnam, dispatcher, Winchester, $1.00; J. R. Darlington, operator, Strasburg Junction, $1.00; O. L. Marks, operator, Lexington, $1.00; E. C. Houser, operator, Lexington, $1.00; A. W. Hawne, operator, Lexington, $1.00; P. S. Rogers, operator, East Lexington, $.25; W. C. Yates, operator, East Lexington, $.25; E. E. Rogers, operator, Middletown, $.25; D. L. Host, T. M. & C. T. D., Columbus, O., H. S. Conley, dispatcher, Columbus, O., J. F. Sutherland, dispatcher, Columbus, O., F. W. Fisher, dispatcher, Columbus, O., O. G. Geil, dispatcher, Columbus, O., $3.00; C. Christie, Watertown, N. Y., $2.00; John Egan, San Francisco, Cal., $1.00; Mrs. M. C. Gates, New York, $1.00; F. N. Shultz, Garrett, Ind., $.50; W. O. Keefe, Garrett, Ind., $.50; H. S. Carroll, Garrett, Ind., $.50; W. H. Cavers, North Bay, Ont., Can., and W. C. Newman, North Bay, Ont., Can., $.50; A. W. Mombert, New York, $2.00; U. J. Fry, Milwaukee, Wis., $2.00; W. A. Pfeil, New Castle, Pa., $1.00; W. P. Cahill, New Castle, Pa., $1.00; E. C. Bock, New Castle, Pa., $1.00; W. J. Lloyd, Chicago, Ill., $5.00; F. W. Brindle, Paterson, N. J., $1.00; J. Fitzgibbons, Middletown, N. Y., $1.00; J. E. Cleary, Middletown, N. Y., $.50; Geo. D. Reynolds, Middletown, N. Y., $.50; John McNearney, Middletown, N. Y., $.50; J. M. Hurky, Arlington, N. J., $1.00; J. W. English, New York, $1.00. Total $664.75.

Postal Christmas Frolic.

On Friday afternoon, December 23, the officers and employes of the Postal Telegraph-Cable Company enjoyed their annual Christmas entertainment and frolic in the reception room of the executive offices, 253 Broadway, New York.

The room was very attractively decorated for the occasion, Christmas greens, bells, etc., being plentifully used. A good time was had by all present, and every one was remembered in the way of favors.

Mr. C. H. Mackay was presented with a miniature lantern, tagged, "Let your light so shine before men that they may dodge your motor car."

Mr. E. J. Nally, received a wheelbarrow, marked, "Lo, he that expecteth nothing but junk shall not be disappointed, but he that yearneth for an aeroplane shall peradventure receive a wheelbarrow."

Mr. C. C. Adams, got a paper cigar of generous size. This was tagged, "A cigar in the mouth is worth two in the shop."

Mr. C. P. Bruch received a toy dog, to which was attached two anchors. "It is well to moor your bark with two anchors," was the inscription.

Mr. W. I. Capen got a miniature telegraph line, also a hank of clothesline marked, "The family line that is the most useful but never bragged about is the one where the wash is hung, but the real thing in lines is the Postal Telegraph sample attached."

Mr. C. F. Leonard received two small dolls, inscribed, "He that kids others must stand some kids back."

Mr. E. Reynolds was presented with a large Bermuda onion which was tagged, "If you have tears to shed, prepare to shed them now."

Mr. E. B. Pillsbury got a doll's hair brush. "A hair on the head is worth two in the brush."

Mr. M. M. Davis received a doll's house, "Ohm, sweet ohm."

Mr. J. F. Skirrow received an automobile marked, "He that speeds and runs away may live to be nabbed some other day."

Mr. F. F. Norton received a miniature watch, inscribed, "The S. R. S. Service is all right but you need a watch to catch the ferry."

No one was overlooked, not even the editor of Telegraph and Telephone Age, who received a hatch of clippings, a pair of scissors, a blue pencil and bottle of ink emblematic of his functions, tagged:

"There once was an editor, and what do you think?
"He lived on nothing but clippings and ink.
"Clippings and ink were the chief of his diet,
"And yet this same editor scarce ever was quiet."

Digitized by Google

Miss T. N. Brown, of the general manager's office, ably assisted by others connected with this department, is entitled to the credit for this unique entertainment which was thoroughly enjoyed by all present.

The Robert W. Martin Fund.

In contributing toward the fund for the relief of Mr. Robert W. Martin, who has been in bed for several years past, suffering from a paralytic stroke, Mr. E. B. Pillsbury, general superintendent of the Postal Telegraph-Cable Company, New York, says: "I have just read your reference to Bob Martin in Telegraph and Telephone Age, and although his name and fame are but traditions to me, as I never knew him, I am glad to enclose $5.00 to add to the fund for his relief." Other amounts received toward the fund are as follows: Charles P. Bruch, third vice-president Postal Telegraph-Cable Company, $500; W. J. Lloyd, division traffic superintendent Western Union Telegraph Company, Chicago, $5.00; T. Lynch, Pittston, Pa., $2.00, all of which has been turned over to Mrs. Martin.

Mr. D. A. Mahoney, 203 Broadway, New York, makes a specialty of handling factory rebuilt typewriters for operators. Being an operator himself he knows all the requirements. He is well known in the telegraph trade for his fair dealing, and for the past twenty years has been placing "mills" with telegraphers. Mr. Mahoney would be pleased to hear from any one who wishes a rebuilt machine or desires to have his old one put in first-class order.

LETTERS FROM OUR AGENTS.

PHILADELPHIA, WESTERN UNION.

Thomas C. Egan, a well-known and expert telegrapher, died at his home in Detroit, Mich., November 26, after an illness of three months.

Mr. Wm. Keefer Bennett, one of the oldest and best-known telegraphers in Texas, died suddenly at his desk in the Houston, Tex., Western Union office on November 14. He was 42 years of age, and was a brother of Mr. H. L. Bennett, superintendent of telegraph of the Houston and Texas Central Railroad.

BALTIMORE, WESTERN UNION.

The following appointments and promotions in this office became effective December 1: Mr. C. E. Clagett to be plant chief; Mr. R. L. Dryden, to be wire chief; Mr. R. G. Simmons, to be assistant wire chief vice R. L. Dryden, promoted; Mr. H. E. Hess, assistant night wire chief; Mr. J. W. Waller, all night chief vice R. G. Simmons, promoted; Mr. Alex. Moore, night traffic chief, vice J. W. Waller, promoted, and Mr. Wm. Mallonee, assistant day traffic chief.

PHILADELPHIA, POSTAL NOTES.

Chief Operator Earl W. Miller was married to Miss Jessie M. Vivian on December 16. After their honeymoon the couple will reside in West Philadelphia. A handsome book case was presented by the officials and employes of the office.

Mr. H. W. Hetzel, chief clerk to Superintendent Bagley, has resigned to accept a position as traveling auditor for the company. His friends presented him with a traveling bag.

Mr. W. P. Bowers, formerly manager of the Record office, has succeeded Mr. J. D. Prosser as night traffic chief.

Among recent visitors at this office were Mr. James P. O'Donohue, division electrical engineer, and Mr. D. H. Gage, Jr., of the electrical engineer's department, New York.

Mr. J. Jerome O'Neill has been appointed chief clerk to Superintendent C. E. Bagley.

PITTSBURG, WESTERN UNION.

The Electrical Society held a special session for the purpose of arranging a course of study for the ensuing year. Mr. George H. Kendrick, electrician of the Company, was appointed instructor of the Society to lecture upon the practical and technical points of the telegraph. The first regular session of the course is scheduled for the first week in January. Great interest and enthusiasm was manifested by all the members present. Mr. F. E. Schiller, vice-president of the Society, occupied the chair.

Mr. J. A. Larimore, chief operator of the Western Union office, Pittsburg, Pa., whose appointment was briefly announced in the December 16 issue, has been in the service of the company for many years, occupying positions as traffic chief, night chief operator, and wire chief, serving in the latter capacity at the time he was appointed chief operator. Mr. Larimore is thoroughly familiar and devoted to the interests of the company and upon entering his new duties, carries with him the good will and best wishes of all his associates.

MAHONEY! A name synonymous with honesty and fairness respecting typewriters and typewriter rebuilding. Your name in GOLD on Phillips' Code $1.15. D. A. Mahoney, Room 705, 203 Broadway, New York.

NEW YORK, POSTAL.

Percy W. DeBaum, traffic chief in this office, died December 18, of typhoid fever. Deceased was only twenty-three years of age and was held in high esteem by the officials of the company and his associates.

Miss Annie Niemann, a telegraph operator in the Postal Telegraph-Cable Company's office at Germantown, Philadelphia, distinguished herself a few days ago by refusing to leave her key until she had finished sending a message, while the building was on fire. She was nearly suffocated, but has since recovered.

Obituary.

Augustus Schnell, aged 74, died at Des Moines, Ia., November 30, and A. C. Schnell, a brother of Augustus, died at Guthrie, Okla., December 8. The latter was an old-time telegrapher and a member of the United States Military Corps during the Civil War. There were five of the Schnell brothers, and all of them enlisted for service during the Civil War, three of them in the military telegraph service and two of them were soldiers. The surviving members are Thad M., Joseph and James Schnell. Thad M. Schnell is still actively engaged in the telegraph service at Des Moines, Ia.

Assessments Nos. 517 and 518 have been levied by the Telegraphers' Mutual Benefit Association, to meet the claims arising from the deaths of W. J. Bodman, at Buffalo, N. Y.; A. B. Churchill, at Boston, Mass.; H. A. Sheldon, at New York; J. Weber, at Liberty, N. Y.; M. D. Jones, at Goshen, Ind.; J. Watson, at Northville, Minn.; C. M. Coven, at Atlanta, Ga.; J. D. Voltz, at South Elgin, Ills.; L. M. Johnston, at Montgomery, Ala., and T. Nelson, at Tomah, Wis.

Magneto Telephone Sets and Accessories is the title of a forty-page pamphlet issued by the Western Electric Company. It is profusely illustrated and is a comprehensive exposition of the subject.

Wireless Operators' Head Receiver.

The most important points to be considered in the selection of wireless telephone receivers are sensitiveness, comfort and permanence of adjustment and construction. The head receivers manufactured by the Holtzer-Cabot Electric Company, Boston, Mass., have been designed with these points in view. The windings are of silk covered copper wire and the magnets are made from a special quality of steel and are of the proper strength to give best results with the diaphragms used. The spools and magnets are mounted in a metal cup which supports the diaphragm and the cores are ground to a proper height so that the adjustment is permanent. The metal cup is enclosed in a hard rubber shell. The two receivers are mounted on an adjustable leather covered head band.

Large pneumatic rubber cushions are provided with each set, which not only shut out extraneous noises but also make the set more comfortable to wear. These cushions are readily detachable.

These sets may be wound to resistances up to 4,000 ohms.

DISAPPEARED

Information wanted as to the present whereabouts of William H. Bogar, a telegrapher. Last heard of at Hopkins, Michigan; formerly of Armington, Illinois. Important to him or his family. Write

JOHN D. SAGE, Box 892, Cincinnati, O.

The Telegraphers' Mutual Benefit Association, 195 Broadway, New York, combines fraternalism with sound business principles; it offers to the telegraph and telephone employe an absolutely safe form of protection, at a cost within the reach of all and lower than can be found elsewhere. Membership only open to employes in commercial or railroad telegraph or telephone service, and it is manifestly to the interest of those who are eligible and wish to secure life insurance within their means, to secure without delay a certificate for $1,000 or $500, or both, at rates based on present age.

The Serial Building Loan and Savings Institution, 195 Broadway, New York, is conducted for the benefit of employes of the telegraph and telephone services; primarily, to enable them to purchase a home on easy terms and, secondarily, to encourage the habit of thrift. What is paid now for rent goes toward the payment for a house. The great advantage is you own your house and yet it costs no more than paying rent to a landlord for the use of his property. Particulars of the Institution's plan will be cheerfully given by addressing the Secretary, 195 Broadway, New York.

MARTIN'S LATEST VIBROPLEX, $9.00. Address James B. Havice, General Agent, 253 Broadway, New York.

Absolutely the best values in factory-rebuilt typewriters, all makes. Rebuilding and repairing by first class workmen only.

Postal employes may purchase typewriters or have their machines rebuilt by negotiating with the Mutual Investment Association upon payment of 75 cents weekly. We invite correspondence. Central Typewriter Exchange, D. A. Mahoney, Representative, 203 Broadway, New York.

WANTED: An agent in each Western Union and Postal office to represent us. Please address, Central Typewriter Exchange, 203 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEYBOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

SOME POINTS ON ELECTRICITY—X.

A Study of Telegraph Apparatus.

BY WILLIS H. JONES.

NEWSPAPER LOOP COMBINATION SETS.

As the loops connected with the various newspaper offices are as liable to be called for on duplex as on single-line circuits it is necessary to arrange the apparatus in such a manner that the operator will be able to utilize the same set of instruments for each class of work. This he accomplishes by merely shifting the levers of his three-point switch to the right or left as the occasion requires. Figs. 1 and 2 show the connections and positions of the outfit required for gravity and storage local battery respectively.

The sounders employed are usually of the four-ohm pattern for the reason that when connected for duplex work they should correspond with the type used in the main-office multiplex apparatus which latter, for Western Union Telegraph service, is invariably four-ohm winding.

Another reason for the low wound instrument is that it requires a less number of gravity cells of battery to operate it when the local circuit is switched through the relay contact points for single line work than higher wound sounders would require. However, higher wound sounders may be, and in fact are, used by the Postal Telegraph-Cable Company for this service where a higher voltage for local circuits is provided. In either case the local battery in the newspaper office must be arranged to furnish approximately the same amount of current to the sounder when the latter is operated by the relay that the main office supplies it with when in series with the duplex or quadruplex local apparatus. Otherwise the operator in switching from one class of service to the other might find it necessary to readjust his sounder on each occasion.

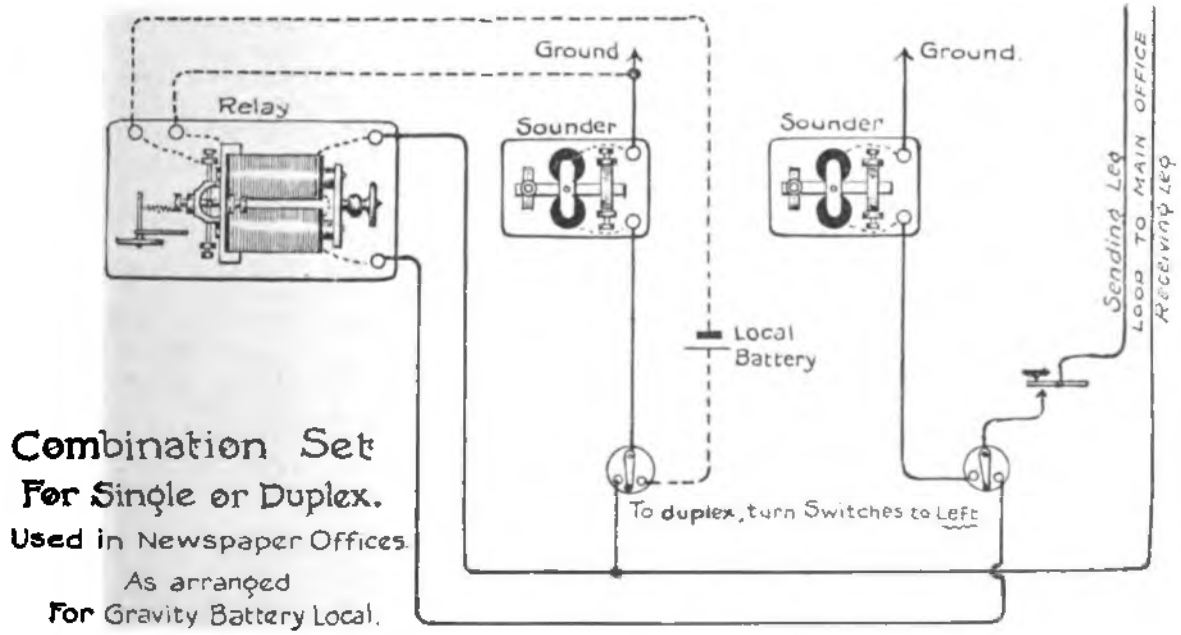

FIG. 1. CONNECTIONS OF COMBINATION SET FOR GRAVITY BATTERY.

Digitized by Google

It will be seen by a glance at Fig. 1 that instead of the gravity local battery being placed in a metallic circuit, as it usually is for relay operation, one pole of the cell or cells is grounded. This method is used in order that when the relay is not in service and the sounder has been connected with the duplex apparatus, the loop conductor will remain closed through the sounder. Otherwise that particular sounder would receive no current from the main office battery, as the circuit would then be open at the relay contact points.

It will also be seen that when the newspaper operator "duplexes" his loop, it is no longer a loop proper, but two single circuits terminating in a ground wire at that point, one half of the loop being used for the sending side and the other half for the receiving side. When, however, he "singles," he removes the "ground" and shifts the circuit through the coils of the single line relay; both conductors then become part of the main line circuit in which the loop is connected, and one of the sounders responds to the actions of the relay contact points in the usual way.

Fig. 2 shows the local connections where storage battery is employed. The other connections are, of course, the same as those in Fig. 1.

Combination sets of this kind can only be used at terminal offices, as intermediate offices can not "single" or "duplex" the loop, even if provided with switches, without cutting off the stations beyond, hence they are used very little except in newspaper offices.

The conductors for newspaper loops are built up by means of artificial resistance, usually resistance lamps, to a uniform value, say 100 ohms, that is to say 100 ohms in each half of the loop in order that the sending and the receiving side when "duplexed" will take the same amount of current.

As some newspapers are at a greater distance from the main office than others, and as the loops obviously possess a greater resistance than the shorter conductors, different size lamps are required for the purpose of evening them up. These lamps are inserted in sockets behind the loop-switch board as explained in a previous installment of this series of articles.

The operator in the newspaper offices gets his instructions to "single" or "duplex," as the occasion requires, over a "call wire" in which all the other newspaper offices are connected.

Newspaper combination sets give very little trouble where the operators are careful about shifting the switch levers and avoid reversing the wedge cords. (To be continued.)

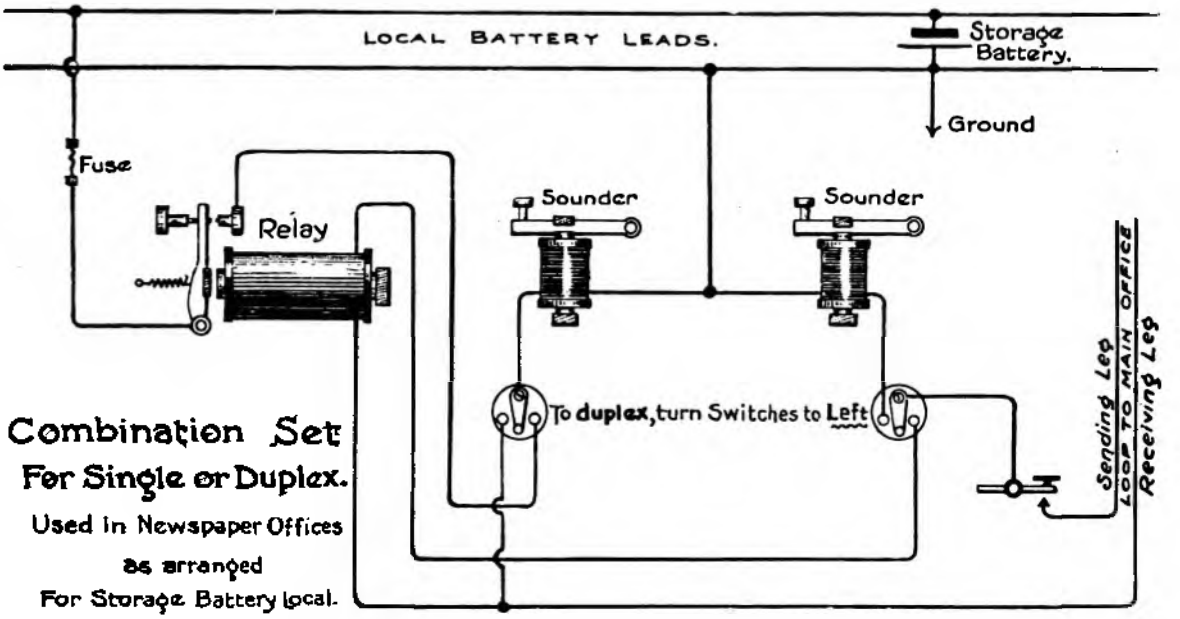

FIG. 2. CONNECTIONS OF COMBINATION SET FOR STORAGE BATTERY.

Multiplex Telephony and Telegraphy.

On January 3 four patents were issued to Major George O. Squier, United States Army, on a system of multiplex telephony and telegraphy, and his invention has been dedicated to the public.

The objects of the invention are to permit of simultaneous transmission of a plurality of telephonic and telegraphic messages over a single telephonic circuit; to eliminate cross-talk or other harmful effects; to impress electric waves or oscillations of such different frequencies upon the circuit as to make possible the selection and complete independence of the various messages; to superimpose upon a standard battery telephone circuit, as now commercially used, one or more additional telephonic and telegraphic circuits without any interference of the various messages, and to make use of grounded connections in combination with the usual metallic circuit.

Personal.

Mr. W. T. Gentry, president of the Southern Bell Telephone Company, Atlanta, Ga., was a recent New York visitor, coming here on business connected with the telephone and telegraph service.

Mr. Bion J. Arnold, the well-known electrical engineer, of Chicago, and a former telegrapher, has been elected a director of the Chicago Association of Commerce. Mr. Arnold is a past-president of the American Institute of Electrical Engineers.

Mr. E. F. Slack, manager of the new Canadian Press, Limited, Montreal, Que., was a recent New York visitor, coming here on business connected with the press service of Canada.

Mr. P. V. De Graw, fourth assistant postmaster-general and a well-known old time telegrapher, recently submitted to the postmaster-general his report for the year ended June 30, 1910. It is a comprehensive document and strongly recommends pensioning superannuated employes in the postal service.

Mr. J. M. Scott, formerly an operator on the Cincinnati, Hamilton and Dayton Railroad, and latterly trainmaster of the Kansas City Southern Railway at Heavener, Okla., has been appointed chief inspector for the Railroad Commission of Indiana.

Mr. J. Schanher, formerly manager of the Western Union Telegraph Company at Mount Clemens, Mich., accompanied by Mrs. Schanher and his son, Frank S., were recent New York visitors, on their way to Bermuda, where they will spend a vacation of three weeks.

Canadian Notes.

Telegraph Tolls in Canada. — The Canadian Board of Railway Commissioners has extended the time within which the Canadian Pacific Railway Company, the Great North Western Telegraph Company, and the Canadian Northern Telegraph Company may be allowed to charge tolls as authorized by law, and has extended the time to the same date for approval of the Grand Trunk Pacific Telegraph Company's tolls.

Mr. H. P. Dwight, president of the Great North Western Telegraph Company, Toronto, Ont., celebrated his eighty-second birthday on December 23. He is well-preserved and his many friends wish him many returns of the day. Mr. Dwight's career has been a busy and useful one, and his interest in human progress remains undiminished.

The Brown Magnetic Bridge.

Referring to the article in the issue of December 16 on the Brown Magnetic Bridge, Mr. Donald Murray, of London, writes: "There was a slight omission on my part which it may perhaps be well to rectify. In the diagram of the bridge I should have made it clear that there is only one inductance with two coils on it. I sketched it in the old bridge way, and it is right enough as long as it is understood that the iron in the two arms of the bridge is really one piece forming one magnetic circuit. If there were two separate masses of iron the currents in the two windings would not neutralize each other's magnetic effect, and there would be heavy inductive opposition to the outgoing current, which would of course be very injurious."

Christmas Night-Letter Rush.—The Western Union and Postal Telegraph-Cable offices all over the country were almost swamped with night-letter Christmas greetings. Telegrams from California to the East spoke of "picking roses on the lawn," while those from the East to the West told of the cold and snow.

Recent Promotions in the Postal Telegraph-Cable Company's Service.

Mr. John F. Looney who was recently appointed superintendent of the Eighth District of this company, with headquarters at Chicago, is a native of the Hoosier State, having been born in Indianapolis, Ind., April 25, 1875. In 1887 he started his business career as messenger for the Western Union Telegraph Company in Indianapolis, and in October, 1890, he entered the Postal Company's service as branch office manager, and later was made cashier and bookkeeper, afterwards filling the positions of operator, night chief operator and day chief operator. On January 1, 1904, he went to Chicago to assume the position of assistant electrician and was afterwards promoted to be division electrical engineer. The district of which Mr. Looney will have charge is a newly created one and comprises the lines and offices in Wisconsin, Northern Michigan, Iowa, South Dakota and Minnesota, and that gentleman's wide experience will serve him well in his new position.

Mr. Charles H. Ashburn, whose promotion to the superintendency of the first district, Southern Division was announced in the December 1 issue, was born in Windsor, Va., February 8, 1866, and began his telegraphic career at Norfolk, Va., in November, 1883. He was operator for the Southern Telegraph Company in Norfolk from 1883 to August, 1886, and auditor for the Virginia Beach Railway Company from November, 1886, to August, 1887. He returned to the service of the Southern Telegraph Company in October, 1887, and in 1888 he entered the employ of the Western Union Telegraph Company at Norfolk, remaining with that company until August, 1889, when he became manager of the Postal Telegraph-Cable Company's office in that city. This latter position he held at the time of his recent promotion. Mr. Ashburn's headquarters will be in Richmond temporarily, but will later be removed to Atlanta, Ga.

Mr. Ed. R. Bennett, superintendent of construction and equipment of the Postal Telegraph-Cable Company of Texas, with headquarters at Dallas, Tex., was born at Del Rio, Tex., January 22, 1877. He first entered the telegraph service in November, 1891, at Fort Worth, Tex., serving as a messenger for a couple of years. He was afterwards engaged in other business, and on his removal to Dallas he entered the service of the Standard Light and Power Company. Later he went to El Paso for the electric light company in that place, and afterwards to Rincon, New Mexico. He assisted in the work of building the line of the Atchison, Topeka and Santa Fe Railroad and the Western Union Telegraph Company to Santa Rita mines. He returned to Dallas and went to work for the Postal Telegraph-Cable Company in December, 1900, holding a position as lineman and electrician until his present appointment.

Mr. William C. Daviet, whose appointment as superintendent of the fourth district, Southern Division, was announced in the December 1 issue, was born in Phillipsburg, N. J., December 24, 1875. He entered the telegraph service as a clerk in the bookkeeping department of the Western Union Telegraph Company in New York about 1895. On November 15, 1899, he accepted a position with the Postal Telegraph-Cable Company, in the message department and chief clerk in the New York City Bookkeeping Department, and since 1902 has filled the position of chief clerk to the superintendent of the second district, Eastern Division, New York, and to General Superintendent G. H. Usher, of the Southern Division, at Atlanta, Ga. He occupied the latter position at the time of his recent appointment.

Mr. Howard Almon Lanier recently promoted to the managership of the Norfolk, Va., office of this company was born at Petersburg, Va., August 27, 1876, and entered the telegraph service as messenger for the Postal Telegraph-Cable Company in Norfolk, March 23, 1890. He has never severed his allegiance to that company and has been in its service for over twenty years. From messenger he advanced through the various positions in the office until he finally became chief operator. During the past year he has filled the position of supervisor of traffic, and in the performance of his duties as such he covered many states in the north, west, and Northwest. His appointment as manager of the Norfolk office is a well-merited promotion.

Mr. Albert L. Lafferty, who has been promoted to be superintendent of the fourth district, Western Division, to succeed Mr. H. J. Kinnucan, with headquarters at Chicago, is a native of Detroit, Mich., and has worked his way up from the bottom. He entered the service of the Western Union Telegraph Company, February 1, 1881, when he was a boy. His service with the Postal Telegraph-Cable Company dates from May 1, 1887, and for twelve years he was manager of the Chamber of Commerce office of this company in Detroit. Nine years ago he was made manager of the Toledo office, which position he held at the time of his recent appointment as superintendent.

Mr. Jackson H. Dorsey, manager of the Postal Telegraph-Cable Company, Los Angeles, Cal., was born in Litchfield, Mich., November 22, 1870. He entered the telegraph service in Albion, Mich., June 28, 1887, and worked as operator for the Michigan Central Railroad from that time until 1891, when he went with the Western Union Telegraph Company, being manager at different points in Michigan and Indiana until 1897. From 1898 to 1901 he was operator in Chicago for the Western Union and Postal Telegraph-Cable Companies. He has been employed in the Los Angeles Postal office since 1901, where he filled the positions of operator, assistant chief operator, chief

Digitized by Google

operator, and night chief operator, becoming manager early in December, 1910.

Mr. Edward F. Fahrendorf, who has been appointed assistant to the manager of the Cleveland, Ohio, office, was born in Covington, Ky., October 12, 1882. He entered the telegraph service as messenger in Cincinnati, Ohio, in 1896, and advanced through various positions, finally becoming cashier, which position he held at the time of his appointment to the Cleveland office. Between 1899 and 1903 he was engaged in other business.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. S. H. Mudge, superintendent of the third district, St. Louis, Mo., has been advanced to the position of division superintendent with headquarters at Chicago, vice F. W. Conger assigned to special duties.

Mr. John F. Looney succeeds Mr. Mudge as superintendent of the third district with headquarters at Chicago.

Mr. C. A. Comstock, manager of the Milwaukee office, has been promoted to be superintendent of the eighth district with headquarters at Chicago.

Mr. H. C. Shaw, division electrical engineer, Chicago, and Mr. Jesse Hargrave, division superintendent at Atlanta, were recent New York visitors coming here for a conference in the interest of the service.

Mr. F. H. Dernell, manager of the Rutland, Vt., office, has been promoted to the management of the Burlington office, vice F. F. Bradish, resigned, to enter other business.

Mr. E. D. Stone has been appointed manager of the complaint department. Mr. Stone has had considerable experience in this branch of the service and is well qualified to discharge the duties of his new office.

Mr. G. C. Clapp, of Boston, Mass., succeds Mr. Dernell at Rutland, Vt.

Mr. W. C. Lloyd, manager of the New Orleans, La., office, on Christmas day submitted to a surgical operation for the purpose of removing some of the skin from his body to graft upon the side of his young son who had received serious burns. Eighteen square inches of skin were removed from Mr. Lloyd's thigh. At last accounts the boy had good chances of recovery.

Mr. Philip L. Lee has been appointed manager of the Milwaukee, Wis., office of this company to succeed Mr. C. A. Comstock promoted to be superintendent. Mr. Lee is a native of Milwaukee, and entered the telegraph service ten years ago.

Mr. D. McNicol, of the electrical engineer's office, New York, has just returned from Chicago where he has been for the past two weeks on company business.

Mr. Augustus J. Eaves, of the Postal Telegraph-Cable Company's Pittsburg office, has been appointed to a position in the office of the electrical engineer at New York. Mr. Eaves was born in Bamberg, S. C., July 27, 1881, and began his telegraphic career on the Southern Railway in 1900. He entered the Postal Company's service in Pittsburg where he has filled the positions of repeater chief, wire chief and night chief operator. He occupied the latter position when he was called to New York to take up more important duties in the engineer's department.

Annual Meeting of North American Telegraph Company.—At the annual meeting of the North American Telegraph Company held in Minneapolis, Minn., January 3, the present officers were reelected, as follows: President, H. A. Tuttle, Vice-President, A. S. Harris; Secretary, D. G. McIntosh; Treasurer, E. C. Cooke.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Belvidere Brooks, general manager of the company, is making an inspection trip of the southern States east of the Mississippi river and will be absent until January 20. He will visit Cincinnati, Louisville, Nashville, Memphis, Birmingham, Atlanta, Montgomery, New Orleans and other commercial centers. He is accompanied by his secretary, Mr. W. C. Merley, and Mr. S. B. Haig, of the office of traffic engineer.

Mr. Wm. J. Lloyd, division traffic superintendent, of the Western Union, Chicago, was a recent New York visitor, coming here on business connected with the service.

Mr. H. J. Kinnucan, formerly superintendent of the Postal Telegraph-Cable Company, at Detroit, Mich., and who recently accepted the position of division general agent of this company with headquarters in the same city, has been appointed district commercial superintendent succeeding Mr. John Fitzpatrick, of Cleveland, Ohio. The district headquarters will be removed from Cleveland to Detroit. A picture and sketch of Mr. Kinnucan appeared in the January 1 issue.

Mr. John Fitzpatrick, district commercial superintendent of this company at Cleveland, Ohio, has been transferred to Chicago where he becomes superintendent of what will be known as the Chicago District, Western Division, which will comprise the main and branch offices in Chicago and such others in the immediate vicinity as may be added later.

Mr. J. P. Edwards, of the office of engineer of equipment, New York, has been appointed special agent of the southern division with headquarters at Atlanta, Ga.

Mr. F. J. Scherrer, accompanied by his wife and daughter, spent the holidays at their former home in Chicago.

Mr. A. E. Campbell has been appointed manager of the Detroit, Mich., office, vice Mr. C. H. Cadwallader, resigned. Mr. Campbell was chief clerk to Mr. H. J. Kinnucan when the latter was superintendent of the Postal Telegraph-Cable Company.

Digitized by Google

Mr. S. V. King, manager of the Charleston, W. Va., office of this company, has been appointed district commercial manager of the territory embracing West Virginia and a part of western Maryland.

Mr. V. L. Brooks, chief operator of the Charleston, W. Va., office, has been appointed manager to succeed Mr. S. V. King, promoted.

The managers of the larger offices in the third district of the Eastern Division were present at a conference in the office of Mr. N. E. Church, district commercial superintendent, Pittsburg, Pa., on December 31. The managers present were S. V. King, Charleston, W. Va.; Harry Young, Wheeling, W. Va.; U. W. Boggess, Clarkesburg, W. Va.; W. T. McWhorter, Fairmont, W. Va.; H. F. Smith, Martinsburg, W. Va.; M. N. Haller, Elkins, W Va.; I. N. Sharpnack, Parkersburg, W. Va.; C. O. Pennypacker, Huntington, W. Va.; C. H. Reed, Bluefield, W. Va.; J. L. Snyder, Cumberland, Md.; J. C. McGraw, Jamestown, N. Y.; A. A. Jeunet, Franklin, Pa.; J. F Calahan, New Castle, Pa.; G. F. Stadtmiller, Erie, Pa.; E. E. Buel, Bradford, Pa.; S. W. Kirk, Johnstown, Pa.; E. Ross Collins, Pittsburg, Pa., and George S. Walters, district commercial manager.

Mr. Fay E. Horton, district plant superintendent, Salt Lake City, Utah, was born in Northville, Mich., October 11, 1872, and entered the telegraph service in Omaha, Neb., in 1885. Mr. Horton's activities have been in telegraph line construction and was general foreman at the time of his recent promotion. He is a son of the late Charles B. Horton, who was superintendent of the Western Union Telegraph Company at Omaha, and a brother of Mr. C. B. Horton, district commercial superintendent at that point.

During the holidays this company used a special telegraph form. It was printed on white paper and had a colored holly border, with the words "Holiday Greetings" printed in Old English. The novelty met with public favor and approval.

Mr. Thomas F. Breslin, of the Associated Press, Fall River, Mass., has been appointed manager of these interests at the same place, vice Mr. Joseph A. Elms, promoted.

W. H. Jackson, a well-known telegrapher, manager of the leased wire department of this company, New York, died January 5 of acute gastritis, after a brief illness. Mr. Jackson was born at Wellington, Ontario, January 3, 1854, and was a prominent figure in telegraphic circles in New York, and had many times been honored by being elected president and director of the various fraternal associations. He was highly esteemed by a large circle of friends and acquaintances. The funeral services were held Sunday evening, January 8, at the late residence of the deceased in Brooklyn. Ex-Senator Walter C. Burton conducted the ritualistic service of the Royal Arcanum and paid a glowing tribute to the character and memory of the deceased.

Mr. C. C. Delany has been appointed chief operator of the Jacksonville, Fla., office, vice R. L. Branton, resigned.

Mr. E. M. Edwards, assistant manager of the Western Union, Kansas City, Mo., office, has been appointed general agent for the second district of the Western Division, with headquarters at St. Louis.

Mr. W. F. Orr, manager of the Postal Telegraph-Cable Company, North Adams, Mass., has been appointed district commercial manager for Vermont and western Massachusetts for this company.

Morse Electric Club.—The annual meeting of the Morse Electric Club was held at 195 Broadway, New York, January 11, and the following officers were elected for the ensuing year: President, J. B. Van Every; vice-presidents, Belvidere Brooks and W. J. Dealy; secretary, Frank J. Scherrer; treasurer, R. J. Murphy. Directors for three years, Gardiner Irving and Marion H. Kerner. The club dinner will be held at the Savoy Hotel, February 23.

Plan to Get Rid of Loan Sharks.

The Western Union Telegraph Company has inaugurated a plan to make financial loans without interest to its employes who may be in need of extra money, to be paid back in small monthly installments. The object of this is to get rid of the loan sharks who abound in all large centres, and whose importunities in many instances seriously impair the efficiency of employes. The effect of this policy will be beneficial in two ways. It will have a deterrent effect upon those who tend to borrow money on slight pretexts, and it will save the company legal annoyances, besides avoiding interference with business.

The company has thus set a precedent that should be followed by other great corporations, for there is nothing so detrimental to the welfare of employes than the operations of unprincipled loan sharks. By permitting workers to borrow reasonable sums without interest the company instantly will ease the sufferings and hardships of scores of persons who are kept in actual want by the loan sharks. In numerous instances employes who were hard pressed for money have been compelled to pay back to the shylocks as much as three and five times more than the original loan obtained. Such usury is not only demoralizing but it is dangerous. Many instances of the outrageous treatment of borrowers might be given. It has been found that every time a person is backward in making payments the hunt begins, and the loan shark never ceases hounding him until the employer, thoroughly annoyed, discharges the borrower. The new plan will undoubtedly have a wholesome effect, and is to be commended.

A. C. Kaufman, Commercial Agent, Western Union Telegraph Company, New York.

Mr. Albert C. Kaufman, commercial agent of the Eastern Division, Western Union Telegraph Company, with headquarters in New York, was born in Clinton, Iowa. He took up the study of telegraphy while attending school in Canada and entered the telegraph service as manager of the Corn Exchange branch office of the Dominion Telegraph Company in Montreal. He was afterward in the employ of the Mutual Union Telegraph Company and later of the Canadian Pacific Railway Company. Later he went to Pittsfield, Mass., for the Commercial Union Telegraph Company, and when that company's

A. C. KAUFMAN
Commercial Agent Eastern Division, Western Union Telegraph Company, New York.

lines were leased to the Postal Telegraph-Cable Company in 1892, Mr. Kaufman remained as manager of the Pittsfield office. In May, 1899, he was appointed superintendent of the sixth district, Eastern Division, of the Postal Company with headquarters at Albany, N. Y. He retired from the Postal Company's service July 1, 1908, and engaged in telephone work in Canada. On May 15, 1910, he entered the service of the Western Union Telegraph Company as special agent to General Superintendent A. G. Saylor, and was, on December 1 advanced to his present position. Mr. Kaufman has a host of friends among telegraphers and business men, all of whom will wish him continued success.

Mr. John William Ware, district traffic chief, first district, Southern Division, with headquarters at Wilmington, N. C., was born in Locust Grove, Ga., November 16, 1882. In June, 1899, he entered the telegraph service at Adams Park, Ga., and has filled various positions, as follows: Manager at Bainbridge, Ga.; chief operator at Meridian, Miss.; traffic chief at Charlotte, N. C.; traffic chief at Jacksonville, Fla., and district commercial agent, third district, Southern Division, which latter position he held at the time of his recent promotion.

Mr. J. M. Green, manager of the Western Union Telegraph Company, at Sacramento, Cal., was born at Salem, Ohio, May 10, 1872, and entered the telegraph service at Nortonville, Kan., in September, 1891. He was agent for the Atchison, Topeka and Santa Fe Railway until February, 1905, and was traveling auditor for the same company during the year following. After that he was agent at Emporia, Kan., until September, 1910, when he entered the Western Union service.

Mr. Thomas E. Russell, recently appointed district traffic superintendent at New Haven, Conn., was born at Meriden, Conn., April 21, 1871, and entered the telegraph service in his native town as a messenger, in October, 1885. He became clerk, and afterwards passed through the positions of operator, manager, inspector, chief clerk to the superintendent, finally becoming assistant superintendent, which position he held at the time of his recent advancement.

The Telephone.

Mr. N. C. Kingsbury, Chicago, of the firm of N. W. Harris & Company, has been appointed a vice-president of the American Telephone and Telegraph Company with headquarters in New York.

Telephone Pioneers to Organize.

Signatures are being obtained with a view to the formation of an organization to embrace all persons of good standing employed in the Bell telephone service twenty-five years prior to January 1, 1911, and for five years continuously at any time thereafter. The suggested title for this organization is "The Telephone Pioneers of America." All the signers thus far entered the service prior to 1882. Applications for membership are solicited and may be forwarded to either Mr. Henry W. Pope or Mr. Chas. R. Truex, 15 Dey Street, New York.

Mr. P. L. Spalding has been appointed second vice-president of the Bell Telephone Company of Pennsylvania, the Chesapeake and Potomac Telephone Company, the Delaware and Atlantic Telegraph and Telephone Company and the Diamond State Telephone Company.

Telephone Reorganization in Cleveland.—The Cleveland Telephone Company, which is part of the system of the American Telephone and Telegraph Company, on January 1 changed the organization of its operating department to the "Three Column" basis, and the following appointments have been made in accordance therewith: Department commercial superintendent, Mr. T. P. Cagwin; department traffic superintendent, Mr. A. S. R. Smith, and department plant superintendent, Mr. E. E. Ranney.

The Cable.

Cables Broken by Earthquake.—Four of the Eastern Telegraph Company's cables between Zanzibar and Durban, Africa, were broken on December 13 as a result of an earthquake.

Semi-Bridge Duplex for Cables.—Mr. Juzo Kajiura, a Japanese, was granted a United States patent on December 6, 1910, on a system of Electric Telegraphy, which he calls a "semi-bridge duplex." It relates to a duplex system to be used upon submarine cable and other telegraphic circuits containing or not containing overhead wires, one abject being to effect economy by reducing the number or capacity of the artificial cables required, as compared with ordinary "duplex" systems, while another object is to enable exact "duplex" balancing to be more easily and rapidly attained, and thereby to increase the working capacity of cable circuits.

Cable Receiver.—A London electrical journal of recent date prints a paper by Dr. A. C. Crehore and Major G. O. Squier describing a cable recorder in which variations of current are recorded by means of interference bands or fringes The coil in the recorder carries two small, thin plates of optical glass for producing interference bands. When the current is passed through the coil a torque is produced and transmitted through silk fibers to the upper glass plate, thus changing the pressure between the plates and altering the thickness of the thin film of air confined between them, and thus moving the system of interference bands. A commercial mercury-vapor lamp may be used. A current of .000002-ampere is a good working value for this recorder.

Quicker Telegraph Service with Spain.—In order to improve telegraph service with Spain, the telegraph officials at Barcelona have established a direct and well-equipped line to Bilbao, the Spanish terminus of the Direct-Spanish Company's Cable from England. Messages sent to the United States will be first telegraphed to Bilbao, thence to England by the Direct-Spanish Company cable, and then by transatlantic cables to America. Under this new arrangement messages will reach England a very few minutes after being dispatched in Barcelona and will avoid the necessity of transmitting messages across France to reach the Atlantic cables.

St. Vincent - Ascension Cable. — The cable steamer *Colonia*, of the Telegraph Construction and Maintenance Company, has laid the St. Vincent-Ascension cable for the Western Telegraph Company. The length of the cable is about 1,900 nautical miles.

New German Cable.—The new German cable from the West Coast of Africa to Pernambuco, Brazil, will be laid early this year.

New Atlantic Cable.—There is an evident revival of the old movement in England to lay a state-owned cable across the Atlantic between England and Montreal, where connection would be made with the Canadian Pacific Railway's telegraph system and the Pacific Cable Company's leased wires. The proposed route of the cable is from the north of Scotland by way of the Faroe Islands, Iceland, Greenland and Labrador.

The death of Mr. George Stevenson, in England recently, removes one of the few remaining links between the present and the early days of submarine telegraphy. Born in 1839, he joined the firm of Glass, Elliott & Company (afterwards the Telegraph Construction & Maintenance Company) in 1861, and on the laying of the first Malta-Alexandria cable was made clerk in charge of the Alexandria station in 1868. He remained as superintendent at Alexandria until 1885. After the Arabi rebellion and the hardships endured by the Eastern Company's staff at Alexandria, his health declined, and he was transferred to head office in that year. Here he worked for ten years under the late Mr. W. T. Ansell. In 1895 he retired on pension. His death in his seventy-second year will be regretted by a large circle of cable men all over the world, who will retain a warm feeling for their kind-hearted superintendent.

The Marconi Company's Business Campaign.—The Marconi Wireless Telegraph Company of America is engaged in an active campaign for business in New York. The service between Glace Bay, N. S., and Clifden, Ireland, is stated to be absolutely reliable and business is being flashed through the air between these points day and night without interruption. In America the land lines of the different wire companies are utilized to carry the business to the Glace Bay station, and on the other side the messages are transferred to the government land lines and thus distributed to their destinations. The company has recently established permanent stations at Philadelphia, Cape May, N. J., Virginia Beach, Va., The Breakers and Royal Poniciana at Palm Beach, Fla., for handling messages to and from steamships in the southern trade. Two new stations are being installed along the southern Atlantic coast, one at Cape Fear and the other at Fernandina, Fla. A station is also being established at Nassau, New Providence.

New French Telegraph and Telephone Journal.

"Annals of Posts, Telegraphs and Telephones," is the title of a new publication in Paris, France, under the authority of the Minister of Public Works, Posts and Telegraphs.

Among the articles in the first number is the address, in French, of Mr. J. J. Carty, chief engineer of the American Telephone and Telegraph Company, New York, delivered last September before the Paris meeting of the International Conference of Telegraph and Telephone Engineers, and others of interest to telephone people. The work is to be issued every three months.

Status of Legislation for Relief of Military Telegraph Operators.

Bill No. 24211 in the House of Representatives, at Washington, which provides for extending the Pension Laws of the United States to the military telegraph operators who served in the civil war, is now being considered by a sub-committee of the House, with Captain John A. T. Hull, of Iowa, as chairman. Captain Hull has continually expressed sympathy for the beneficiaries to be and it is hoped that his sympathy will now take a practical turn and a favorable report be made. Congressman E. L. Taylor, Jr., of Ohio, fathers the bill and will use every effort to secure its passage. In addition to the "Appeal to Congress," the following petition has been filed with President Taft:

Holmesburg, Pa., December 12, 1910.

Hon. William H. Taft,
President of the United States.

Mr. President:—Having read with care your recent message to the Congress, we, in common with all Americans who love their country and its institutions, are deeply impressed with its fullness and clearness as well as its patriotic progressiveness and the wisdom of its recommendations.

There is in it, however, one minor suggestion that, through a misunderstanding of its scope, might promote the continuance of a national injustice to a small and fast disappearing body of men who served in the United States Army throughout the civil war. We thoroughly agree with you that the Congress should not "distribute the bounty of the government to classes of persons who may, at this late day, from a mere mercenary motive, seek to obtain some legal relation with an old veteran now tottering on the brink of the grave," but we do feel that it would be a great injustice to embrace in those classes, as doubtless will be done, the members of the United States Military Telegraph Corps of the United States Army who served 1861-1865. The Act of Congress, approved January 26, 1897, clearly recognized them as soldier-integers of the army, and as the armies of the world are now constituted, the militarv telegraphers are soldier-integers. It can hardly be claimed that a class of men who are soldiers in time of peace were any less soldiers in time of war.

The Military Telegraph Corps was a body of young Americans who brought to perfection that mystic arm of military service subsequently adopted by the nations, but who as yet have not had their services in doing so recognized by their own government. For thirty years their appeals have been before the Congress for justice and for the reparation of the wrongs they have suffered by not having their soldier status with all its rights and privileges proclaimed. It will thus be seen that they cannot in truth be classed with the tottering veterans as latter-day mercenary seekers for a legal relation.

The leading generals of the Civil War bore testimony that the military telegraphers were soldiers de facto, and all they ask or have asked is to have that status made de jure.

General U. S. Grant, in a letter written in 1884, said: "I will endeavor to show how indispensable the telegraph was to our success, and how uniformly well the service was performed by the operators in the field. The telegraph and the signal service, its co-ordinate, were as necessary to our success as the railroad is to commerce."

General William T. Sherman, in a letter written in 1882 said:

"They were as much a part of the army as though armed with muskets in the ranks," and he classified them with "staff soldiers and officers."

General W. S. Rosecrans in a telegram from the field in 1863 said in relation to them:

"Those at my headquarters do more work and have more responsibility than any captain in the service."

The veterans at the national encampment of the Grand Army of the Republic at their Milwaukee meeting passed resolutions recognizing the corps as constituting "in fact a part of the Union Army partaking of its hardships and dangers while rendering invaluable aid," and petitioned Congress to recognize the status and services of the corps by appropriate legislation.

Such testimony as the foregoing can be multiplied indefinitely, but we refrain from further quotation and append hereto several documents containing fuller testimony to the soldier-status of the members of our corps. There are but about two hundred survivors out of a possible fifteen hundred, their average age approximately, is seventy years, and in their fast declining years they appeal in all confidence to the high sense of justice possessed by the President of the United States for the influence that will obtain for them the rights of which they have been so long deprived.

Most respectfully,

WILLIAM BENDER WILSON,
PRESIDENT, HOLMESBURG, PA.

DAVID HOMER BATES,
SECRETARY, 658 BROADWAY, NEW YORK.

Wireless Telephony From Moving Trains.

The Railophone, an invention of Mr. Hans von Kramer, designed to telephone to and from moving trains, is thus described: The principle applied is that of induction, emanating from large wire frames of special construction, which are suspended from the bottom of a railway coach near the track. From the frames the terminals of which are connected to telephone instruments placed in a sound-proof box on the train, electrical impulses are induced in a stationary wire fixed between the track-rails on which the train travels, one wire being laid on the 'up,' and a similar wire being laid on the 'down' track. The ends of these two stationary wires are connected either to the telephone apparatus at the railway terminus or to an intermediate station between the termini. The messages received from the train are telephoned or telegraphed by the railway company to their destination, or, vice versa, communicated to the passengers on the train.

To Manufacture Cables in Australia.—From Melbourne, Australia, comes the information that a company intends starting the manufacture in Australia of cables, wire, and other material used by the Telegraph Department.

Wireless in South Africa.—The Union Government has decided to erect a wireless telegraph station at Slangkop, near Kommetje. A contract has been entered into with the Marconi Company, and it is expected that the station will be in working order in a few months. It will be a 5-KW. station and will have a day range of 400 miles, while at night the range will be from 600 to 1,600 miles.

Wireless in Siberia.—A system of wireless telegraphy has been established between Nikolaiefsk and Petropavlovsk in Kamschatka.

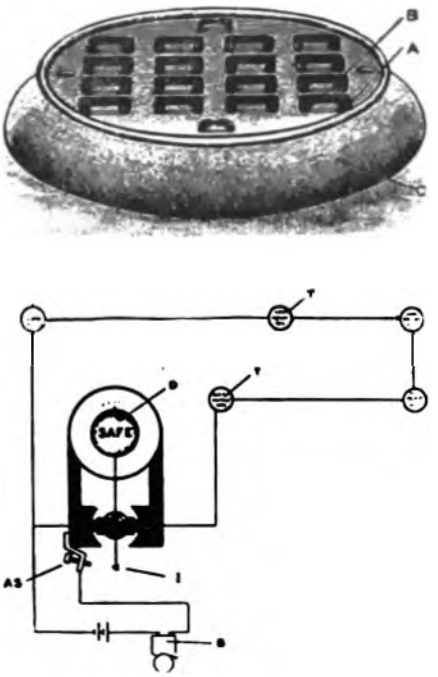
New Automatic Fire-Alarm System.

A new automatic fire alarm system has been invented by Mr. L. T. Reichel, former chief electrician to the New Zealand Government Public Works Department.

The following description of the system and the illustrations are taken from the London Electrical Review:

One of the novelties in the system lies in the fact that it is entirely unaffected by dust and vibration, for there are no line contacts involved, neither are there any batteries having what may be termed primary functions in the system. Upon the care spent upon the maintenance of batteries entirely depends the success of many fire-alarm schemes—a detail involving a personal element often found wanting when an emergency does arise.



FIGS. 1 AND 2. AUTOMATIC FIRE ALARM SYSTEM.

The Reichel system depends upon the use of thermopiles made up of couples of bismuth and an antimony alloy. Such couples—any number of which may be chosen according to the degree of sensitivity required—are mounted in a porcelain block *C* in such a way that one series of junctions *A B* only is exposed to the air (Fig. 1). The blocks, with their couples protected from accidental mechanical injury by a suitable grid, are mounted on the ceilings of the apartments which it is desired to protect. A detector of this type possesses a useful feature in that a room may be gradually heated to any degree of temperature that comfort or utility demands without affecting the alarm device, due to the fact that the length of each couple is so short that the temperature lag of the unexposed junction follows closely behind the exposed junction, so that, at an ordinary rate of temperature increase, little or no thermo-e.m.f. is generated; whereas, if a sudden rise of temperature occurs in a room where the pile is installed, such as would arise from even a small conflagration, a thermo-e.m.f. will instantly be generated to operate the alarm. This feature might have somewhat of the nature of a drawback where it is desired to protect apartments from the effects of a smouldering fire, but this difficulty is surmounted in the Reichel system by an auxiliary device which causes the warning to be given should the temperature at any time reach a predetermined figure.

Groups of from one to ten such thermopiles are connected by insulated wires in one series circuit, and each of the circuits is connected to an indicator mounted in a suitable case with others for different circuits.

The indicator (Fig. 2), consists of a sensitive moving-coil relay whose tongue carries a light iron disk upon which the platinum contact point is mounted. In juxtaposition thereto is an adjustable iron screw *A S* which carries the fixed contact, and which is magnetized. These contacts form part of a local circuit, including a suitable battery and such warning bells *B* as are necessary. A deflection of the coil from its normal position moves the iron disk into the range of magnetic pull of the screw, when the former is pulled over and the contacts held firmly together until the coil is restored by hand. The adjustable screw forms a ready means of fine adjustment of the range of operation of the warning, already approximately determined by the selection of the number of couples in the detectors *T*. The moving coil also carries an arm to which is attached a disk *D*, which, according to its position, displays the words "safe" or "fire" through a window in the indicator case.

The indicators, &c., are mounted upon a central board, from which the various thermostat and warning bell circuits radiate in the usual way, and the board is fitted with various control switches, means for testing the condition of the local battery, and an ingenious method for testing the continuity of the alarm circuits by the insertion of the test detector, which, when breathed upon, causes the appropriate indicator to deflect should its circuit be continuous.

The efficacy of the system was demonstrated by the fact that, in a room whose temperature may vary as widely as from 150° F. in the day-time to somewhere about 40° F. at night without causing false alarms of fire, it was sufficient merely to place one's hand upon one of the thermostats for a very brief period for the alarm to be set going.

New Maine Corporation.—The Public Service Company has been organized in Portland, Me., with a capital of $800,000, for the purpose of constructing, owning and operating railway, telephone and telegraph lines, etc. The officers are: President, George F. Duncan of Portland; treasurer, Edward Woodman of Portland.

Canada 2.50
Other Foreign Countries 3.00

ADDRESS ALL COMMUNICATIONS TO
J. B. TALTAVALL, - Editor and Publisher,
253 BROADWAY, NEW YORK.
T. R. TALTAVALL, Associate Editor.

CABLE ADDRESS: "Telegage," New York.
Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

January 16, 1911.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Importance of Efficiency.

A plant superintendent of the Western Union Telegraph Company in a communication to the editor of this journal in answer to a request for a biographical sketch of himself for publication writes: "I have never known the time when efficiency meant so much to the corporation and to the individual employes as it does now. It is a word that looms up large in the want department of every company, therefore, I am sure that you will not consider me lacking in appreciation, or presumptuous in suggesting that your space can be used much more profitably along educational lines rather than employing it for a personal reference to the writer.

"The rank and file of this company is not as efficient as it should be, and what is more important both from the standpoint of the company and that of the employes, it is not as efficient as it would like to be, and I am sure that your co-operation is not only desired, but, judging from the past, is assured for the future."

Our correspondent may rest assured that Telegraph and Telephone Age stands for progress in telegraphic affairs. The telegraph business in the United States is now undergoing a change, the like of which has never been known, and in order to carry out the plans of the companies the efficiency of plant and management must necessarily be increased. The word efficiency means to get the most out of a given expenditure or consumption of material. The material may be brains, coal or any other substance from which energy is obtained.

It is a well known fact that there is ordinarily much waste of effort and material in producing results, and we get much less in return for our work or investment than we should receive. The question is "How can efficiency be increased," or, in other words how can waste be prevented? If we accomplish more for the same expenditure of effort or energy, we are increasing efficiency.

It has been the aim of this journal in the past to point out to its readers how to improve themselves, *i. e.*, increase their individual efficiency. The way to do this is essentially an educational task. The more a man knows the greater is his capability and if his knowledge is rightly applied good results will surely follow not only to himself but to others. Concentration of thought and effort, or in other words undivided attention to the subject in hand, is the secret of efficiency. Careful reading and study of wholesome literature and of the technical articles which appear in the columns of this and other standard journals is essential to mental improvement, and having the right mental equipment to work with there should be no fear for the results.

The telegraph companies are eager for men with technical and business knowledge and every man in the service should set about qualifying himself for a better position. Education is the only solution of the problems referred to by our correspondent. It does not necessarily follow that a man should have a college education. True education is obtained rather from the appropriation of every little useful fact, however or wherever obtained, and placing it in our mental storehouse for future use. This means also that we should learn something each day that we did not know before, and to that end it is the purpose of this paper to aid and encourage those of its readers who really desire to qualify for better positions.

Lifting Up the Messenger.

In the general awakening in telegraphic circles the messenger is not forgotten. Many have come to realize that he is an important factor in the business and is deserving of better treatment than being made the subject of so-called newspaper jokes; in fact, he is a human being and as such is entitled to consideration by other human beings.

Digitized by Google

In a recent article on the subject of messengers, Mr. Charles P. Bruch, third vice-president of the Postal Telegraph-Cable Company, New York, writes: "Let those of us to whom these boys are now subordinate take care that we set them good examples in uprightness and square dealing, diligence in business and faithfulness to duty in all the relations of life, so that when they, too, are men they may be good men."

The Western Union Telegraph Company is giving attention to the interests of its messengers as it is doing for its higher grade employes, and no one will question the wisdom of such a course. Generally speaking, the messengers of today are the operators of tomorrow, and many of them the officials of the future, and for this reason alone the telegraph companies might, with propriety, exercise, in an organized manner, educational and parental influence over the youthful mind as far as it can consistently do so, and thus raise the standard of efficiency of its future employes.

At a recent meeting in Denver of officials of the Western Union Telegraph Company the messenger boy problem was considered. District Commercial Superintendent U. G. Life, of Salt Lake City, held that the messenger boy is the beginning and end of the telegraph service—he carries the message to the office for transmission and carries the transmitted message to the addressee at the other end. "To really improve and increase the company's efficiency," said Mr. Life, "the reliability and responsibility of the messenger boy must be considered of paramount importance." He advocated the establishment of reading-rooms well supplied with wholesome current literature for the benefit of the boys, and the employment of a capable instructor to teach them how to telegraph and to give instruction in other lines of the telegraph business, with the object of awakening a desire and an ambition to rise to positions of importance. He would also forbid smoking, especially of cigarettes, and drinking, and place moral safeguards around the lives of the boys.

This is a very commendable suggestion and should receive the hearty encouragement and support of the company. Mr. Life proposes to carry out these policies at his headquarters in Salt Lake City, and the results will certainly be watched with wide-spread interest. His solicitude for his boys was manifested by giving them a Christmas dinner, followed by a plain common sense talk on how they could best serve themselves and the company.

This instance of entertaining messenger boys, however, was not the only one in the country at that time. At other places they received consideration and attention, and in each case a deep impression was created upon their minds. In Baltimore, seventy-five boys were entertained by Dr. and Mrs. H. B. Jacobs with a Christmas dinner, followed by a minstrel show, and in other places public-spirited citizens gave the youngsters a Christmas treat.

The telegraph companies can well afford to be mindful of their boys' welfare when they have public sentiment with them, as they certainly have.

New York Public Service Commissions.

A bill has been introduced in the New York Senate having for its purpose the abolition of the two existing Public Service commissions and the substitution of two corporation commissions. One of the proposed commissions is for New York City. It is to be composed of five members, one for each borough, to be elected by the people. The other commission, for the territory outside of New York City, is to be composed of members appointed by the Governor. The salary of each commissioner is placed at $10,000 instead of $15,000, the annual salary of the present Public Service commissioners. Jurisdiction over telephone and telegraph companies is divided between the two commissions.

The Death of B. F. Dillon.

In the recent sudden death of Mr. B. F. Dillon, general superintendent of the Western Union Telegraph Company, at Atlanta, Ga., which was noted in the issue of December 1, the company has lost one of its most capable and popular officials. His death has given rise to widespread expressions of regret, emphasizing the fact that he was held in the highest esteem by all who knew him. As further evidence of this, we have received letters from various sources testifying to the lovable character of the deceased and paying affectionate tribute to his memory. These expressions were of the sincerest kind, and some of the writers declare that they feel the loss as much as they would of their father or brother.

His warm and sympathetic heart and kindly disposition, as well as his dignified bearing, endeared him to many, and while he is gone in the flesh, he will live long in mind. The world would be a much happier and brighter place of existence were there more such spirits in it as was his.

Holiday Greetings.

We have received Holiday cards and greetings from Mr. Harry A. Tuttle, general manager of the North American Telegraph Company, at Minneapolis, Minn.; Mr. W. F. Williams, superintendent of telegraph, Seaboard Air Line, Portsmouth, Va.; Mr. William Murphy of Manzanillo, Cuba; Mr. W. H. Potter, superintendent of telegraph of the Southern Railway System, Washington, D. C.; Mr. Frederick W. Cushing, the well-known old-time telegrapher and now proprietor of "The Moraine," at Highland Park, Ill.; Mr. J. Hartman Oswald of Memphis, Tenn.; The Commercial Cable Company, New York; Mr. Clarence R. George, secretary International Association of Municipal Electricians, Houston, Tex.; Mr. E. J. Nally, vice-president and general manager, Postal Telegraph-Cable Company, New York; Mr. W. H. Baker, vice-president American District Telegraph Company of New Jersey, New York; Sanosuke Inada, engineers' section, Department of Communication, Tokyo, Japan; Mr. T. Waldemar Goulding, European General Manager Western Union Telegraph Company, London, and others.

Trying to Get Something for Nothing.

Compensation is a natural law, and exacts an equivalent in one form or another for everything we give or receive. But this is a hard lesson for many people to learn. The idea of getting something for nothing has possession of many minds, and after more or less unsuccessful experience they finally come to the conclusion that they can not acquire anything of value without rendering an equivalent. Take for instance the mania for investing in "wild-cat" financial schemes of all sorts. Very few of such enterprises so-called yield any returns to the original investor not on the inside. Indeed, he usually loses all he puts in; the odds are largely against him. The greatest difficulty in the situation is that would-be investors are influenced by the glittering language of prospectuses and circulars sent out by the questionable concerns, frequently in the face of common sense advice given by friends who understand the character of these schemes. Some investors know better, but they will take chances in spite of their better judgment.

Those who invest in these questionable enterprises are those who usually can least afford to lose their money. The promoters of these schemes understand human nature well. They take advantage of the cupidity and gullibility of the average man and they depend upon those human weaknesses for their success. It can be safely accepted as a truth that any legitimate enterprise can get all the money it needs for promotion through legitimate channels, instead of seeking its capital form the "dear public" in small amounts. To those who have some spare money they desire to invest our advice is do not put it in any questionable scheme, however, promising the promoters make it out to be. Better deposit the money in a reliable savings bank where three or four per cent interest is paid, and the capital can be had any time in case of necessity.

Along this line there is another class of persons who seem willing to part with their earnings on the slightest pretext. We refer to those who are addicted to the horse-race betting evil. This habit soon makes a slave of a man and it is difficult to shake off the incubus. Many men have this disease, if it may be so called, and they are surely drifting to ruin if they do not wake up to a realization of their peril. "Ill-luck" constantly pursues them; at least, they call it ill-luck. In fact, it is not ill-luck at all; it is their own ignorance or their unwillingness to follow the dictates of their better judgment, and for this the penalty is what they call ill-luck. It is the natural result of trying to get something for nothing.

So extensive and morally damaging has the business of promoting and conduct of dishonest projects become that the United States government has taken cognizance of the seriousness of the situation and is endeavoring to protect innocent investors by depriving the promoters the use of the mails in carrying on their illicit business. But the individual should protect himself and not depend upon the government to improve his morals for him. A bad man cannot be made a good man by law; but he can be made good by education.

Many men in subordinate positions stand in their own light, yet they do not realize it. They usually think that the fellow that gets ahead does so by means of a pull or other subtle influence, whereas, if the truth were known, the advancement is in most cases found to be due to merit attention to duty and faithfulness. The man who plays the races, and shows too much interest in prize fights and sporting matters in general, to the exclusion of other more serious affairs of life, cannot make any progress, because his mental activities lack breadth as a result of his devoting too much time to frivolities. He has become a mere machine and is not capable mentally to undertake any duty which requires serious thought. There are, unfortunately, too many of this class and it is sincerely to be hoped that with the New Year they will shake off their shackles and free themselves from all degrading influences. Every business needs good, faithful and reliable men.

Bound Volumes of Telegraph and Telephone Age.

For those of our readers who desire to have the past year's issue of Telegraph and Telephone Age in a form in which they can readily preserve all of the copies for future reference we would recommend a bound volume. We are now able to supply these containing the twenty-four issues of 1910 for the nominal price of $3.50. There are several features in one of these volumes which comprise nearly 900 pages of reading matter, which are alone worth much more than the amount asked. The series of articles by Willis H. Jones entitled "Some Points on Electricity" are in themselves worth the price of the book to any student. We have also published articles by the best informed authors upon the developments in wireless telegraphy, and, in fact, there will be found recorded in this book all of the important improvements in the wireless art during the past year. The use of the telephone for train despatching has largely increased since January, 1910, and we have kept pace with its development by presenting to our readers many articles upon this subject, written by some of the best posted men in the railway and telephone world. These are but a few of the many features presented in Telegraph and Telephone Age, during 1910, and those interested in any branch of the telegraphic industry will find much valuable information in one of these bound volumes. A copy of this work will be sent to any address upon receipt of price, $3.50, by J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Mr. Charles G. Burke, of 132 Nassau Street, New York, in renewing his subscription recently, takes occasion to say: "To anyone who is interested in telegraphy and kindred subjects, whether from a technical or commercial standpoint, Telegraph and Telephone Age is an indispensable necessity."

ANSWERS TO QUESTIONS.

[In this department questions on matters of a practical character, and of general interest, will be answered. Questions intended for this department must be signed by the writer's full name—not for publication, but for identity. No attention will be paid to anonymous communications.]

(1) Q.—I have seen the word "Mho" used in electrical literature. Will you please explain its meaning?—R. A. B.

A.—The term "Mho" (which is the word "Ohm" spelled backward) is the proposed unit of conductance. It expresses the relative facility with which a given wire will conduct an electric current. It expresses the opposite of resistance, the unit for which is the ohm. The conductance of a wire is the reciprocal of the resistance of the wire. Thus if a wire has a resistance of 125 ohms, its conductance is the reciprocal of 125, which is 1/125.

(2) Q.—Is there any device of a practical character that gives an electromotive force of one volt exactly?—J. A.

A.—A cell of Daniell battery gives an E.M.F. of 1.07 volt, which is near enough to the standard volt for all practical purposes.

(3) Q.—How can I ascertain the amount of heat developed in a circuit by an electric current?—M.

A.—First ascertain the value of the current, then multiply the square of this value by the resistance of the circuit, and the product will represent the amount of heat developed, expressed in watts. Example: Assume that 2 amperes of current is flowing in a circuit of 80 ohms resistance, then, according to the rule given, $2^2 \times 80 = 320$.

(4) Q.—I understand that the current in a circuit has the same value at all points in the circuit. Is this true of the electromotive force as well? F. A. M.

A.—No. The electromotive force has a different value at different points in the circuit. The resistance of the wire reduces the E.M.F. Hence at one end it is higher than at the other. It is by reason of the fact that there is a difference of potential between the two ends that there is an electromotive force at all.

(5) Q.—What is meant by the polarization of a cell of battery, and what is the cause of it?—J. H.

A.—Polarization is an action within the cell which reduces the output of electricity. It is caused mainly by the accumulation of a film of hydrogen on the copper element (in the case of a copper-zinc cell). The gas, which is deposited in the form of bubbles, is a bad conductor, therefore it introduces a resistance to the passage of the current from the electrolyte to the copper. The effect of this foreign resistance is to reduce the current.

(6) Q.—Has thermo-electricity ever been developed to a point where it could be considered of commercial value. It is a simple method of producing electricity, but I have never heard of its being put to any practical use?—A. R.

A.—The greatest disadvantage of the thermo-electric couple is that it is of very low efficiency, only five per cent. of the energy of the fuel being actually utilized in producing the current. This fact alone is sufficient to condemn the thermo-electric battery for practical use.

American Telegraph Company in 1865.

The telegraph blanks of the American Telegraph Company of 1865 gave a list of branch offices in New York, on their reverse side, which in these times recalls some old landmarks. The locations of these offices were as follows:

Hudson River Railroad depot on Warren street; International Hotel, Broadway and Franklin; Earle's Hotel, Canal and Centre; St. Nicholas Hotel, Broadway and Spring; Westchester House, Broome and Bowery; Harlem Railroad depot, Twenty-sixth street and Fourth avenue; St. James Hotel, Broadway and Twenty-sixth street; New Haven Railroad depot, Fourth avenue and Twenty-seventh street; Allerton's, West, Eleventh avenue and Forty-first street. The blank suggested that messages be repeated to insure accuracy "on account of some of the errors arising from atmospheric and other causes appertaining to telegraphy." The main office was at 145 Broadway.

The officers of the company included E. S. Sanford, president; Cambridge Livingston, secretary, and Marshal Lefferts, engineer.

Gold Excitement and the Telegraph in Australia.—The telegraph facilities at Southern Cross, Western Australia, are severely taxed in consequence of the business resulting from the discovery of a rich gold reef near that place. Extra instruments and men are employed night and day to cope with the large volume of business.

New York Electrical Society.—At the meeting of the New York Electrical Society on December 14, an amendment to the constitution was passed creating a life membership in the Society. Twenty-five life members were elected, among them being Messrs. Frank J. Sprague, H. Ward Leonard, T. C. Martin, Kingsley G. Martin, C. A. Coffin, John J. Carty, Charles Blizard, Thomas A. Edison.

Telegraphy in Australia.—The Postal Commission which has been inquiring into the working of the Australian post and telegraph system has issued its report. Many defects in the service are pointed out and improvements are suggested, including the expenditure of $10,000,000 for this purpose.

Wire Thefts in Russia.—The telephone companies in Russia experience much trouble through the theft of the copper wire of the lines. It is stated that the line between St. Petersburg and Moscow is rendered idle for hours several times a week from this cause.

Patent Protection Is Costly.

The Chicago *Tribune* recently printed the following interesting article relating to the great expense involved in the protection of patents by electrical manufacturers:

"About ten years ago Mr. George Westinghouse caused a statement to be prepared showing the legal expenses of the protection of his patents from the time he began inventing and marketing electrical apparatus. He was amazed when he saw the total. He passed the paper containing the figures to the author, Mr. Holland, saying:

"'You will see how large an item of expense litigation for the protection of patents is for a manufacturing company like the electrical company of which I am president.'

"Mr. Westinghouse was asked if he thought the other great electrical corporation, of which Mr. Coffin is president, had been compelled to pay bills of equal, or approximately equal, amounts.

"'His bills must have been large,' Mr. Westinghouse responded.

"It was the contemplation of a sum which of itself would have been regarded as a large capitalization for a corporation, the total expenses of litigation to protect patents, which undoubtedly brought about an understanding between the larger of the electric companies of the United States.

"That agreement provided that each company might use the patents of the other, subject, of course, to a fair royalty. The agreement may be regarded as in restraint of trade, as tending to prevent competition. But that was not the purpose of it. It was entered into simply to put an end to heavy legal expenses.

"Mr. Thomas A. Edison had a similar experience. To protect his patents has cost him millions, and although in almost all cases he has received final judgments in his favor, yet many of these judgments were handed down only a few months before the expiration of the patents. In not one instance has Edison ever received a penny representing damages awarded by the courts for the infringement of his patents. This experience has led him to be strongly in favor of the license system, and he has sometimes wondered whether he would not have been better off pecuniarily had he relied upon the trade secret principle for the protection of his inventions.

"Word has come from Washington that the Department of Justice is about to begin proceedings in the federal courts, having for their purpose the dissolution of the so-called electric trust. It will be something of a surprise if the evidence obtained by the government makes it clear that the great electrical companies of the United States are practically operated upon the combination or trust principle. Certainly the competition, at least until within a short time, between them, has been remarkably keen.

"There is still vivid recollection in commercial and railway circles of the fierce competition carried on by the two great electric companies for the contract of electrifying one of the greater railways of southern New Jersey.

"In this city, after the legislature commanded the railroad companies to abandon steam and electrify their terminals, a competition which was scientific as well as theoretic, and in addition practical and financial, was in progress.

"From the scientific point of view this competition involved demonstration of the economy, safety, and expediency of the direct current, which apparatus is controlled by President Coffin's company, and the alternating current, which utilizes inventions of Mr. Westinghouse and his associates. The New York Central Railroad accepted the propositions made by President Coffin. The New Haven railroad preferred the alternating current and the apparatus for using it. The struggle was a desperate one. In it is not to be found any evidence of such a combination as the attorney general might reasonably regard as having been forced in violation of the anti-trust law.

"So far as the public knows, the only combination entered into between the greater electric companies is one involving a common use of patents upon payment of royalties. Apparently the Department of Justice deems it worth while to test in the courts whether or not a monopoly secured by patent may be so used to justify the allegation that this is done in violation of the anti-trust law.

"Should the courts so find, then a new and unexpected issue will have been created. It might be so extended as to include some of the companies operated under the Edison patents. It would almost appear to invalidate the license system, certainly if the system gave exclusive right to one corporation within a certain district, to operate under patents controlled by another corporation. So far as now can be seen, the question involving proceedings against the so-called electric trust is simply this: Must a corporation that controls a patent be compelled to make exclusive use of that patent in its own manufactory? For it is thought to be apparent that the Department of Justice does not purpose attacking the monopoly itself, which is the vital quality of a patent."

Telephony in China.—Consul General Knabenshue at Tien-Tsin, China, reports that the use of the telephone in that country is increasing rapidly, and urges American manufacturers to enter the field for the future telephone trade of the empire. The telephone system is controlled by the Board of Communications. Members of that board express the belief that within a few years systems will be in operation in nearly every city in the country.

Any book on electrical subjects can be obtained through Telegraph and Telephone Age, 253 Broadway, New York.

New Telephone Board in Nashville Western Union Office.

A new telephone switchboard has recently been installed in the office of the Western Union Telegraph Company, at Nashville, Tenn., for the purpose of exchanging business over the two services. It is a departure from the standard private branch exchange board generally installed and was designed to make its operation as simple as possible.

Instead of the usual signal lamps in front of each operator, there are ten eight-candle power lamps, located on top of the board, one for each trunk. An incoming signal causes a lamp to glow at full brilliancy. When the trunk is taken up, the lamp glows dimly. By locating the lamps above the desk in full view of the general office, the manager at his desk or any clerk in the office can see when calls are not being answered promptly and can go to the assistance of the operators at the board.

The board has six positions, three on each side of the desk. While both sides of the desk are built alike, it was intended that one side should be used for the "receiving" side and the other three positions for the "sending" side. In the key cabinet above the writing desk are twenty-six pigeon holes extending entirely through the cabinet so that the pigeon holes can be reached from either side of the desk. These pigeon holes are lettered alphabetically. When a telegram is delivered by any one of the operators, it is filed alphabetically, and in case of any operator later receiving an inquiry in regard to a delivered message, the operator can instantly locate the message, giving whatever information is desired. A feature of the trunk circuit is a switch controlled by a floor push depressed by the foot of the operator. This cuts out all of the apparatus in the circuit excepting the receiver which is then bridged across the line, at the same time cutting out side tones in the transmitter.

All of the operating positions are equipped with head receivers and breast transmitters excepting one position where the ordinary desk stand is used, this being intended for the use of employes of the several departments of the manager's office.

The manager's desk is also equipped with a set of keys corresponding with each trunk, and by depressing the corresponding key, he can listen on any trunk and observe the character of service given the subscriber.

During the night and on Sundays there is a buzzer associated with the calling lamps, giving an audible signal to any clerk on duty, it not being necessary during these periods to keep an operator at the board. The board was designed by E. M. Fisher, superintendent of traffic of the Cumberland Telephone and Telegraph Company. Mr. Fisher being a former telegrapher, realized the necessity and requirements of both services.

The Turin International Telegraph Tournament.

In our issue of July 1, 1910, we published some preliminary facts relating to the proposed international telegraph tournament in Turin, Italy, in 1911, in connection with the International Exposition of Labor and Manufactures.

This competition, which has for its aim the awakening of a new interest among all telegraph employes and to encourage them to perfect themselves in the use of the apparatus, is open to telegraphers in the service of the government administrations and the companies belonging to the International Telegraphic Union, as well as to the other administrations and private companies. The competition will consist of a trial of sending and receiving by Morse apparatus, Hughes or Baudot, either individually or between representatives of the Administrations or private companies who take part.

The trials will be judged according to special rules by a jury in which the visiting administrations will be equitably represented.

The jury will have at its disposal as a reward for the winners prizes of money, medals and objects of art. Letters of invitation to take part in this tournament have been sent to all of the administrations and private companies. This competition is being planned with the object of strengthening the feeling of friendship which already exists between telegraphers of different nations. M. Ferdinand Geronimi, Minister of Posts, Rome, Italy, is in charge of the plans for the affair.

The final announcement of arrangements will not be made until the decision as to the time for holding the tournament, and the Italian government will issue the programme just before the time set for the contest to begin.

Much interest is being manifested in the event by the Spanish and other foreign papers, and in a bulletin issued by the Italian Minister of Posts and Telegraphs, that official urges Italian operators to make a good showing. It is hoped that the United States will be ably represented at this tournament, and it is about time to take preliminary action in the matter.

In these days of rapid promotion in the telegraph and telephone service every aspiring operator should prepare himself for any opportunity in the way of promotion that may present itself by acquiring a technical knowledge of his profession, and a thorough understanding of telegraph apparatus. There is no better way to do this than to study Maver's "American Telegraphy and Encyclopedia of the Telegraph," as hundreds of men now prominent in telegraph affairs will attest from personal experience. It is the most up-to-date publication on the subject and is regarded as authority on all points covered by it. To facilitate the purchase of this work by operators and others, the publishers have announced a new departure in the sale of the book, the particulars of which will be found in our advertising columns in this issue.

Porcelain and Glass Insulators.*

BY ARTHUR BESSEY SMITH.

When people began to experiment with electricity they very soon discovered the value of insulating bodies to keep the mysterious fluid where they wanted it and make it perform the desired tricks. But when this force began to be applied to commercial uses involving its transmission over outdoor lines, the problem of insulation became really a live issue. In dry weather almost any kind of a support would do, but in wet or foggy times the best available insulation was found to be none too good.

Some of the early experimenters with telephones used glass bottle necks, each supported by a nail through the hole. But it was found that in wet weather the leakage was still very great. The cup-shaped insulator then came into use. It had the form of an inverted cup to secure between the wire and the support a space which is dry even during a rain. It was thus recognized that the leakage is chiefly across the surface, and not through the body of the insulating material. Just what this material shall be is determined largely by the cost and the results to be obtained.

In America, glass has predominated for telephone and telegraph lines, while in Europe, especially in England, porcelain and stone ware have been favored. Accordingly a short and, of necessity, incomplete study has been made of the conditions existing in these countries with a view to ascertaining the relative values of glass and porcelain for telephone use. Because the climate of England is exceedingly adverse to outdoor insulation, the conditions there have received chief attention.

MATERIALS FOR INSULATORS.

In England glass telephone and telegraph insulators are almost unknown. Ninety-five per cent. of the insulators now in use are porcelain, while the rest are of stone ware. The best porcelain insulators cost from ten to twelve cents each in lots of 10,000, while a glass insulator costs less than 3 cents.

Cast glass was formerly used very largely, but very few are left, as they showed too low insulation and broke in great numbers. Perhaps lack of careful annealing was the cause of breakage, but it is next to impossible to tell from inspection if glass has been properly annealed. Glass was found to break rapidly in deep railway cuts where the sun did not strike the insulators till it was quite high, and consequently hot. They were thus suddenly warmed on one side, and the stresses finally caused breakage.

Glass insulators have failed to serve in the moist island climate of England chiefly on account of the hygroscopic, or moisture gathering quality of a glass surface. Most of the leakage is across the surface, hence if moisture be collected the insulation drops to a seriously low value. This is worst in cast glass, because the surface is more or less rough, due to the effect of the walls of the mould. Plate glass is not as hygroscopic, because by grinding and polishing a new surface has been produced, which is very smooth.

The least hygroscopic glass surface is claimed to be that produced by blowing the article. The glass is taken by the glass worker while very hot and plastic, almost fluid. Being blown into shape while in this semi-fluid condition in contact with air alone, the glass particles arrange themselves freely in an exceeding smooth surface according to the law of surface tension. Hardening in this condition the surface is less likely to form dew than is the cast surface.

Acting on this principle, Mr. Brooks, an American, introduced into England a blown glass insulator with a very deep cup, which is much better than the old cast insulators. However, it has not come into extended use.

Brown stoneware insulators are excellent, strong, cheap and durable, but do not have the good insulating qualities of porcelain, hence are used only on unimportant lines. Stoneware does not have the smooth, hard surface of porcelain, but the glaze which it does have will not crack, while that of porcelain sometimes does.

The surface of porcelain is so smooth that it resists the formation of a film of moisture, retains little or no dust, and is easily washed by rain. Grease is a great aid in repelling water and new insulators were formerly dipped while dry and hot into melted paraffine. This had to be discontinued, as the paraffine retained dust very badly and offset any good effect.

MANUFACTURE.

There are two ways of making porcelain insulators, moulding and hand turning. The latter is much preferred since it produces the best quality of porcelain, both in insulating power and mechanical strength.

The quality of the porcelain itself must be of the highest for in the climate of England it will not do to rely on the glaze. The latter is used to make the surface easy to clean so that a rain will wash off the dust, and so reduce surface leakage. But British engineers place chief reliance on the porcelain body for insulation. To cause vitrification ground flint is mixed with the clay. The flint must be of the purest, and the mixture completely vitrified as well as non-absorbent.

If a piece of the porcelain be broken, the fracture must show a glassy appearance. If a drop of ink be placed on the broken surface, where no glaze is present, it must not be absorbed. This test applied to poor quality porcelain or stone ware forms a spot which runs out in all directions as the ink follows the minute porous openings.

TYPES OF INSULATORS.

The standard insulators of the British Post Office, which operates the trunk, or toll, line telephone system of England, differ from American types chiefly by having straight, parallel sides and a differently shaped top. A double petticoat insulator is used for long distance line work. The single petticoat insulator is used only for short and unimportant lines.

*Telephony.

Digitized by Google

The standard porcelain insulator is white and consequently forms an attractive target for mischievous persons. A brown colored porcelain has been produced which is less noticeable, and is used in localities where stone throwing is prevalent. It is also provided for regions where people demand an insulator which shall not be noticeable on account of marring the landscape.

ELECTRICAL TEST.

Each porcelain insulator to be tested is soaked in water at 60° Fahrenheit for twenty-four to forty-eight hours. After this it is placed upside down in salt water to within a quarter of an inch of the edge, the inner space being also filled with water to the same level. Usually a whole trough is filled with insulators and each is tested in succession. At the moment of testing a particular cup, a red-hot bar of heavy iron is held close to the edges projecting above the water to drive off the moisture. At the same time testing forks connected to battery and galvanometer are inserted so as to test the inner and outer walls of the insulator.

Tests made under the above conditions give about 50,000 megohms for each insulator, although under favorable conditions as high as 500,000 megohms have been obtained. It is very likely that most of the leakage is across the surface and not through the porcelain. If given a breakdown test with high voltage in dry air, these insulators rarely break down under 50,000 volts.

INSULATION OF LINES.

The actual insulation which is obtained from even these high-grade porcelain insulators is exceedingly variable, depending on the weather. In bad weather the minimum insulation allowed is 200,000 ohms per mile, but on long lines a higher value is expected. If it falls below 100,000 ohms per mile it is time to hunt for faults.

On account of the nature of the climate the spans are somewhat longer than is customary in the United States. Sixty yards (180 feet or 30 poles per mile) is common, but side lines and rural extensions often run as high as 70 yards (210 feet or 25 poles per mile), or 80 yards (240 feet or 22 poles per mile).

Taking the standard of 30 poles to the mile, the above minimum insulation of 200,000 ohms per mile in bad weather means six megohms per insulator. In dry weather the insulation is expected to be from 10 to 20 megohms per mile, or 300 to 600 megohms per insulator.

The worst conditions are encountered in foggy "muggy" weather, especially if it has been dry and dusty just before so that the insulators are covered with dust. In this case the moisture from the fog depositing on the surface of the porcelain, forms a muddy or gummy surface which causes very bad leakage. A brisk rain will improve matters very much by washing off the dust. If, now, the sun comes out and drives off the moisture, a very good insulation is obtained, which increases as the inside of the petticoats dries out, which necessarily takes somewhat longer.

The form of petticoat has a great deal to do with the performance of the line under varying weather conditions and must be taken into account in comparing glass and porcelain. A very deep skirt will give greater insulation in damp weather, because of the longer path which it interposes between the line wire and the supporting pin or bolt. But this type dries out much more slowly, because of the deep cavity in the cup. The blown glass insulator of Brooks manufacture has a petticoat of this character, and although a very good insulator, acts as above described.

Along a certain stretch of railway in England are two particular lines, each two miles long, side by side, one insulated on Brooks glass and the other on double petticoat porcelain of the standard type. On a certain very foggy night the line on Brooks glass measured up 290,000 ohms insulation and the one on porcelain 150,000 ohms. But on the following morning just after the sun had broken out, the line on porcelain measured 2,000,000 ohms, while the line on Brooks glass was only 390,000 ohms. The value of the more shallow type of cup for quick drying out is thus clearly shown, but gives no basis for comparison of glass and porcelain.

In England the spiders give considerable trouble by spinning their webs under the skirts of the cups, and this accumulates dust and moisture to such an extent as to lower the insulation to a marked degree. It has been noticed that spiders do not work on creosoted poles as long as the smell remains. Several means have been devised for preventing this trouble, but the only effectual plan is to clean the insulators at intervals. The work is done in the fall after the spiders have ceased to spin. A brush of proper size is used to reach up into the spaces under the petticoats. Glass is not subject to this trouble, as the inside of the cup is light.

The most serious condition which English lines have to encounter is in smoky factory districts and along the sea coast. In the former case a greasy black deposit accumulates on the insulators which the rain will not remove. Hence, when the leakage gets too bad, the insulators are taken down and cleaned. The process is as follows:

Put three and one-half pounds of soda into a bucketful of hot water and steep the insulators in this for some time. The cups are then taken down and rubbed inside and out with dilute hydrochloric acid (one part of acid to four of water) applied with a woolen or worsted mop. They are then rinsed in clear cold water and all remaining dirt rubbed off with waste. This seems a costly and needless process, but is necessary under the conditions found in the regions mentioned.

Along the sea coast the salt is deposited on the insulators with such bad results that coast line is avoided wherever possible. No kind of protection has proven satisfactory.

METHODS OF MOUNTING.

It is interesting in connection with the subject of insulators to note the methods employed in mounting them on cross arms and the attachment of line

Digitized by Google

wires. Wooden pins are not used by the British Post Office, steel pins or bolts being employed exclusively. These pins do not differ materially from those in use in the United States.

To obviate the twisting effect on the cross-arm caused by terminating a line on an ordinary pin, a J-shaped pin or "cup-holder" is used. This provides a straight pull directly from the center of the cross-arm. In dead-ending the wire the end is doubled and then dead ended.

AMERICAN CONDITIONS.

Generally speaking, the porcelain telephone insulator is such a rarity in the United States as to attract special attention when used. Undoubtedly the dry continental climate and the cheapness of glass accounts for the absence of the more costly porcelain. Some manufacturers of both glass and porcelain insulators claim that the advantage of the latter is chiefly mechanical strength and that its insulation is practically no better than glass. But under certain conditions porcelain has proven necessary. On a 30,000-volt transmission line, a telephone line for the operating company's use was carried on the same poles. The circuit was insulated with glass insulators and properly transposed. In spite of this, the telephone line was so noisy that difficulty was experienced in using it. Finally all the glass insulators were exchanged for porcelain, which cleared the trouble and made the line satisfactory.

CONCLUSIONS.

In dry weather and ordinary conditions as in the United States there seems to be little advantage whatever in using porcelain. For the average lines both glass and porcelain give about equal results. For loaded No. 8 circuits, recently installed by the American Telephone and Telegraph Company, the extraordinary high insulation requirements caused the adoption of porcelain, of the moulded, vitrified, glazed type.

In damp weather porcelain maintains its insulation much better than glass, but exact figures giving relative values have not been obtainable. The extreme difference between English and American conditions makes direct comparisons impossible.

In connection with the foregoing article, it will be of interest to refer to a discussion which took place on the subject of insulators at the recent meeting in New York, November 16 and 17, of the Eastern Division of the Association of Railway Telegraph Superintendents.

Mr. L. B. Foley, Superintendent of Telegraph of the Lackawanna Railroad, New York, understood that porcelain insulators benefited transmission and thought that it might be advantageous to use such insulators for train despatching circuits.

Mr. W. J. Camp, electrical engineer of the Canadian Pacific Railway's Telegraphs, Montreal, stated that his company had used only porcelain insulators for the past two or three years, but during the present year he had found some of the insulators defective. He obtained his supply from three sources, one in the United States, one in Canada and the third in Germany. The insulators from the first two sources were not of good insulating qualities and are otherwise defective. On some of the company's long telegraph circuits the leakage is quite appreciable. He spoke very favorably of the German insulators and had no fault to find with them. He uses only single petticoat insulators as the climate through which his company's lines pass is very dry.

As to glass insulators, he has found that they were improperly annealed. The breakage averaged fifteen to twenty per cent. in transit. One great trouble was that a month or two after the insulators were put up, they would fall to pieces without injury from any mechanical force. With porcelain insulators they had no trouble of that sort. There is hardly any breakage when received and no breakage afterwards. Tests at McGill University showed that porcelain insulators, even on the petticoat, would stand at least three times the blow that glass would, and on the crown eight or ten times the blow.

Glass insulators manufactured in Montreal cost $29.00 per thousand, approximately three cents each. German porcelain insulators made from the company's specifications cost $44.00 per thousand, approximately 4½ cents each. Those manufactured in Pittsburg and Canada cost 4¼ cents each, but the difference between glass and porcelain is offset by breakage and maintenance.

Public Utilities in Kansas.—A bill is to be introduced in the Kansas legislature to regulate public utilities in that state. The commission will be composed of five or seven members, one of which will give most of his time and attention to the affairs of telegraph and telephone companies and interurban electric railways. All members of the body are to be experts in the special line of investigation covered by the bill.

Present of a Gram of Radium.—A gram of radium has been presented to the British Radium Institute by Sir Ernest Cassel. The radium was purchased from the Austrian Joachunstahl Radium Mining Company and cost $72,000. The institute will use the radium in experiments on the cure of cancer.

An Officious Alderman.—Mr. E. G. Boyer, alderman at Algona, Ind., recently undertook to move the Western Union Company's wires and poles himself because the company did not move them rapidly enough to suit him. In so doing, he chopped down some poles belonging to the Chicago and Northwestern Railroad Company, and crippled the train service. He is now in trouble in consequence of his blunder.

Impregnated Telegraph Poles.

In the *Zeitschrift für Forst- und Jagdwesen* Mr. K. Havelik, an engineer, of Brünn, Austria, publishes some interesting observations upon the frequent occurrence of the so-called house fungus (Merulius lacrimans) on telegraph poles impregnated with sulphate of copper in the Province of Moravia.

The poles, which by reason of their having been attacked by this parasite had to be removed and replaced with others, were characterized by a sort of dado or wainscoting on the surface of the underground portion, such as one sees on all wood which has been injured by this fungus. On digging up the poles there was noticed an unpleasant fungus odor. This fungus was found wherever the poles were subjected to alternations of dryness and dampness, no matter what the character of the soil in which the poles stood. The seed-bearing or germ-bearing parts were almost always on the southeast side of the poles wherever that was shielded from the sunlight. In other cases they were found on that side which was most protected from the direct rays of the sun. The form of these germ-bearing portions is various, depending on the neighborhood and the degree of dampness. If the neighborhood of the pole is sufficiently damp the fertile portions are quite high up and have a bracket-like form. If, however, the earth surrounding the pole is dry, they commence lower down and there is manifested an endeavor to reach the surface of the soil.

The life of poles attacked by the Merulius lacrimans is from two to fourteen years; where there is sudden alternation of dampness and dryness the pole rots away sooner. The formation of the Hyphen can also be observed. The thread-like germs of this fungus always lie in the lengthwise cracks of the wood and are often quite deep. The more quickly the earth about the pole dries the larger are the threads, but the Hyphen itself is seldom to be found here. Where the earth dries more slowly, there are formed either weaker threads or none at all. The Hyphen usually branch out all around the pole.

In order to counteract the influence of the house fungus the Austrian Telegraph Department has introduced impregnation with tar, which is regarded as a sure preventive of the Merulius.

The Imperial German Postal Department has recently published statistics concerning the life of telegraph poles, as well as their durability.

The average life of the poles was as follows for different impregnating materials: Zinc chloride, twelve years; copper sulphate (blue vitriol), fourteen years; corrosive sublimate, seventeen years; tar oil, twenty-two years.

The annual cost per cubic meter treated and delivered was as follows for the several impregnating materials: Zinc chloride, 4 marks; copper sulphate, 3.50 marks; corrosive sublimate, 3.10 marks; tar oil, 2.80 marks.

These figures show that impregnation with tar oil paid the best, that with corrosive sublimate the next best, and that with zinc chloride the least.—*Electrical World.*

Submarine Cables for Long-Distance Telephone Circuits.

Major W. A. J. O'Meara, engineer-in-chief of the British post-office, presented an interesting paper on "Submarine Cables for Long-Distance Circuits," at the meeting of the Institution of Electrical Engineers, in London, December 15, 1910. An abstract of the paper, taken from the Electrical Review and Western Electrician, is given below:

After recounting many historical incidents in the laying of telephone cables since 1891, Major O'Meara dwelt on the great value of the theoretical work of Oliver Heaviside in pointing out the importance and beneficial effects of self-induction and stating the relation which must exist between the constants of a circuit in order that electrical waves of all frequencies may be transmitted without distortion. In 1891 Prof. S. P. Thompson had secured a patent on the use of inductances to improve telephonic and similar circuits. The chief reason why this had not been done earlier was the difficulty in manufacturing the requisite cables. In fact, for a long time it seemed impossible to use this idea and it was felt that improvement must come by the reduction of the electrostatic capacity of the cables. An opportunity to verify this opinion came in the laying of a cable to the Isle of Wight, for which there was selected an air-space type of cable about two knots long that was laid in 1897. As it seemingly proved entirely satisfactory, a similar cable was laid between Ireland and Wales. The much greater length of the latter cable quickly showed its inherent defects, for both pairs of conductors could not be used simultaneously without troublesome overheating due to serious inductive disturbances. Extended experiments showed that this type of cable could not be manufactured so as positively to eliminate inductive troubles between the two circuits and therefore it was unsuitable for long distance telephony, although excellent for telegraphy.

In 1908 it was decided to lay an additional telephone cable between England and France, and the question of the type of cable most suitable for increasing the possible range of telephonic communication naturally came up again. Three methods of doing this presented themselves. (1) By the use of heavier copper wires and increased space between them. (2) By providing one or more closely arranged layers of iron wire over the entire length of the conductors, that is, by the "continuous" loading system. (3) by the introduction at regular intervals of suitable inductance or loading coils, that is, by the "coil" loading system. The first did not seem practicable after some deliberation and was therefore given up. The "continuous" loading was first regarded as

Digitized by Google

the more desirable on account of its evident mechanical simplicity as compared with the "coil" loading. The increased efficiency expected to result was, however, found to require an incommensurable increase of cost. Moreover, it was found that it is almost impossible to predetermine the results to be expected with reasonable accuracy, owing to difficulty in attaching correct values to the electrical constants involved in the calculations. Exhaustive investigations have not revealed any certain way of determining what some of these constants, such as the permeability of the iron after winding, are likely to be. Therefore it was practically decided to use the "coil" system of loading. An artificial test cable was constructed on this plan with gratifying results. The final specifications for the Anglo-French cable provided for dimensions of the copper and gutta percha identical with those of the existing Channel cables, so that in case of failure of the loading coils these could be cut out and a cable of as good qualities as those cables would result. It was specified that either the "continuous" or "coil" loading should be used, but that the attenuation constant should not exceed a certain definite value. No bids were received for a "continuously" loaded cable, but three were received for a "coil" loaded cable.

These loading of Pupin coils in the finished cable possess the following features: Two double coils, required for the four conductors of the cable, are inserted at intervals of one knot (1.153 miles), except the coils nearest the ends are inserted at only one-half knot from each terminal apparatus to diminish reflection losses. Each coil has a resistance of close to six ohms and an inductance of 0.1 henry at a frequency of 750 cycles per second. Each double coil consists of two windings on the same iron core and one winding is connected in series with each conductor. The total length of each joint is 30.75 inches. The mechanical problem of building and inserting the coils was more serious than the electrical problem.

During manufacture the cable was continually inspected and frequently tested. The manufacturers were Siemens Brother & Company, who also undertook the laying of the cable on May 5, 1910. Great care was taken in this work to prevent damage to the loading coils, but everything was carried out without any damage being done to the cable.

A most complete success was achieved in the entire undertaking and extended tests on the cable have shown its excellent qualities. A total length of 1,700 miles of unloaded overhead lines may be added to the ends of the cable before a commercial grade of conversation over the composite circuit will fail.

Balancing Quadruplexes and Duplexes.

BY FRANK M. CRITTENTON, HARVEY, ILL.

The discussion now going on in the columns of Telegraph and Telephone Age for and against the method of balancing to the distant battery is very interesting, and as the writer has devoted many years to this line of work, his experience and conclusions may be of further interest in this connection. The method of balancing to the distant battery was used by me at Omaha, Neb., in handling the old "Overland" circuits in the early eighties.

In managing circuits the prime consideration is, first, to keep the business moving, and anything that will help to do this should be utilized. My method of balancing a polar duplex is to obtain an open or closed key at the farther end of the circuit, bias the polar relay tongue until the magnetic pull of the distant battery is met evenly by the bias, adjust the line balance and the static also,—the former by adjustment and touch, and the latter by changing the capacity in the condensers until there is no disturbance from my own signals,— then move the tongue of the relay as required in order to even the percussion on the points and the balance is complete and on a working basis. In the case of a wire where the normal balance is over 6,000 ohms, and in changeable weather, it is well to balance to both poles of the distant battery. It sometimes happens that there is a difference in the shape of some slight escape to either positive or negative, due to the condition of the wire, which can be offset by taking the mean balance or the difference between the balance to positive and negative batteries. On a short wire there is little need of stopping the work to balance, as adjustment of the resistance coils can be made to meet any humidity changes by the simple act of observing cause and effect. We know that increasing humidity requires decreasing the artificial resistance in order to balance the incoming signals and smooth them down, and a decrease in the humidity needs contrary action. The only difference in balancing a quadruplex is that you call on the distant office also to leave his long end off and you balance to his smaller potential the same as on the duplex.

For the balancing of static I probably differ in method from most quadruplex handlers in the fact that I like to bias the polar relay backward in order to meet the current pull from the other end. Then, if my signals come reversed on the polar relay I insert pegs until the fault disappears, and when my relay follows the key, I take the opposite course.

Balancing to the distant battery undoubtedly saves time in the handling of multiple circuits. Many times I have had distant offices stop work for ground balances and insisted upon the performance being gone through with, when no change was apparent by balancing either way.

How to Balance a Quadruplex.

BY D. B. GRANDY, ST. LOUIS, MO.

Although the subject, "How to Balance a Quadruplex," has been threshed out several times in the columns of Telegraph and Telephone Age and other publications in years past, it seems to be of perennial interest. Some five or six years ago, the late E. L. Bugbee, of Washington, described, in your columns, the method of balancing to the distant battery by feeling the armature of the polar relay, and

Digitized by Google

showed the great advantage of this method as a time-saver.

A discussion of this subject took place about twelve years ago and was participated in by Messrs. A. C. Terry, O. K. Newton, Charles Thom and other recognized experts. In a contribution to that discussion, I described the method I had used from the time of the introduction of the quadruplex, as follows:

"The best method, for the amateur, is to follow the beaten track. Get a ground at the distant end, center your polar relay, and proceed as laid down in the books. But, if the amateur is quick to learn, experience will soon teach him that the polar relay will work well, even when considerably out of balance, while the neutral relay requires a very delicate balance and adjustment. Therefore, a perfect balance of the neutral relay is the best possible balance for the whole apparatus, and such a balance can be quickly obtained by turning the neutral relay down and balancing to the 'short end' at the distant station as well as, and under some conditions, better than to a ground, and will often save time."

I may add that this method was suggested to me and doubtless to others by the fact that during the experimental stage of the differential duplex on the old Franklin line, we used to balance to the open key at the distant end, and the consensus of opinion in the discussion referred to favored this method as applied to the quadruplex.

In the case of the polar duplex, with the old style polar relay, it was easy to adjust the tongue to any position and thus get a balance to distant battery, but with the modern form of relay this cannot be done without changing the contact screws on each side, and the balance can be more readily obtained by "feeling" the armature, as described by Mr. Bugbee.

New Books.

Elementary Telegraphy. By H. W. Pendry. New York: Whittaker and Company. 216 pp., 200 illus. Price, $1.50.

This is a manual for students and was written especially to meet the requirements of the ordinary grade of the subject as published in the syllabus of the City and Guilds of London Institute. While the work is written from an English standpoint, as far as the practice of telegraphy is concerned, it contains much matter of general interest. The underlying principles of course are the same in any country, but in this instance they are set forth in a very clear manner. The American student of telegraphy will no doubt find this part of the book of special interest, as it explains many things that are not always stated very clearly in other books of like character.

The section devoted to telegraph instruments and practice will be of interest to those who care to look beyond the American shores in matters pertaining to telegraphy. It is well to know how things are done in other countries besides our own, and a study of this section will aid in broadening the mind.

There are six chapters and an appendix, each chapter being supplemented by a list of questions, or exercises, on subjects covered by the related chapter.

This or any other book on electrical and kindred subjects can be supplied by Telegraph and Telephone Age, 253 Broadway, New York.

Electricians Operating and Testing Manual. By Henry C. Horstmann and Victor H. Tousley. Chicago: Frederick J. Drake and Company. 360 pp., illus. Price, $1.50.

The design of this work is to instruct the practical electrician in the management, operation and testing of the more important electrical devices now in use. The method adopted has been that of familiarizing the student with the underlying principles governing the design of motors, dynamos, arc lamps, etc. Telegraphy and telephony are not considered at all. As far as it goes, however the work will be found very useful along the lines indicated, and students in telegraphy and telephony would find it to their advantage to broaden their minds by studying the general applications of electricity, and not confine their attention to telegraphy or telephony alone.

There are no mathematics employed in this book, and it is very well illustrated, the diagrams of connections being especially commendable.

Brookes' Automobile Handbook. By L. Elliott Brookes, and Automobile Mechanician's Catechism, by Calvin F. Swingle, have been issued by Frederick J. Drake and Company, Chicago.

The former work gives practical information for the use of owners, operators, automobile mechanics and technical schools, and is a strictly up-to-date treatise on the subject of automobiles. The price is $2.00.

The latter work consists of over 400 examination questions and answers prepared expressly for the use of owners, chauffeurs, garage men and automobile machinists. The price is $1.25.

Old Time Telegraphers and Historical Association.—The official report of the proceedings of the twenty-ninth annual reunion of the Old Time Telegraphers and Historical Association, held at Chicago, September 8, 9 and 10, 1910, has been issued. It is a very handsome and artistically gotten up book of 132 pages and is liberally illustrated with portraits of prominent members of the association and its committees, and with views of points of interest in and around Chicago. The book is printed on fine coated paper and will form a valuable and important addition to the literature of the Association. The cover is embossed and is an artistic piece of work. Great credit is due Mr. Franklin J. Scherrer, secretary of the association, 30 Church Street, New York, under whose direction this excellent work was produced.

Telephones on the Southern Railway.

The Southern Railway has recently placed in service 125 miles of telephone circuits, not only for dispatching, but for message work and "blocking" as well. The telegraph has been relegated to through business exclusively between Greensboro, N. C., and Monroe, Va.

The line consists of two complete No. 9 B. and S. gauge copper circuits, the wire weighing 420 pounds per circuit-mile. One of these circuits is used for train order work. The other is employed for message business. Transpositions are cut in every quarter of a mile in alternate circuits, and in addition provision has been made for a future phantoming of the two telephone circuits. In addition, a grounded block wire made up of an old No. 8 BWG telegraph wire is used from station to station.

All the selectors and telephone apparatus are mounted on backboards in each office. Fig. 1 shows

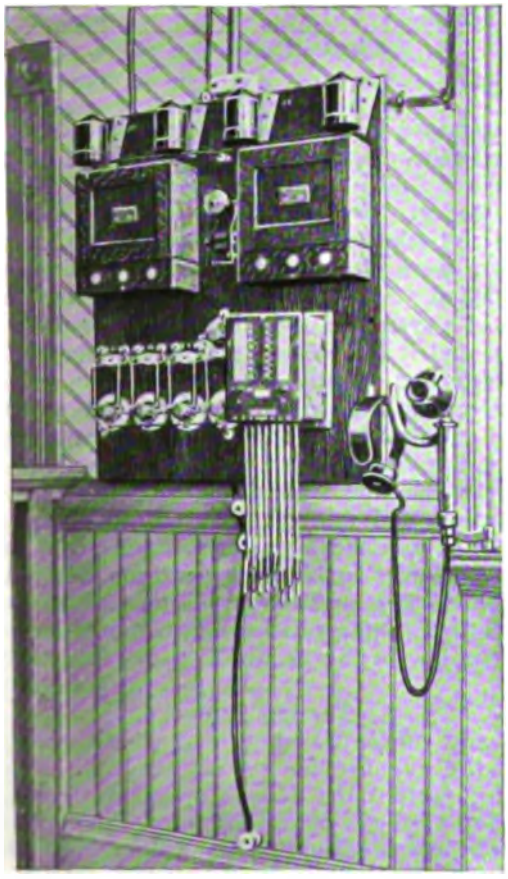

FIG. 1. APPARATUS IN A WAY STATION.

one of these backboards at a way-station. The outside wires are brought into each office through circular loom cable which runs directly to the protectors shown at the top of the mounting board. These are carbon block arresters, manufactured, as is all of the rest of the telephone apparatus, by the Western Electric Company. From these arresters the lines are cabled to the test panel, which is shown in the lower right hand corner of the board.

This test panel consists of two rows of telephone jacks with designation strips beside them. By means of these jacks, it is possible to make various simple tests on the circuits, and to patch around breaks in case of trouble on the line. A grounding jack is also provided in this panel, together with two keys for throwing the operator's telephone set on either set of cords. In the middle of the board are mounted the selector sets, one on the train wire and one on the message wire. Between these sets is placed a bell which is connected to the signals on what is known as a blocking set. Below the selectors and to the left of the test panel appears the secondary system of protection, which consists of fuses and carbon arresters. These fuses protect the line in case of crosses with power or lighting circuits, and the arresters operate at a lower voltage than the primary arresters at the top of the board. From these protectors the circuits go to the various pieces of telephone apparatus. All way-stations are equipped with flexiphones and head telephone sets, which form a most flexible and convenient arrangement for the operators.

The blocking set makes it possible to use one telephone instrument in connection with either a block wire north, a block wire south, the train wire, the message wire, or a private line, and it permits con-

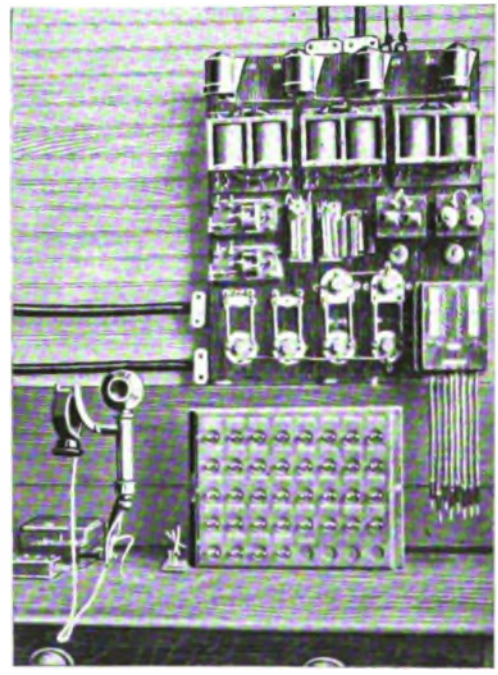

FIG. 2. MESSAGE OPERATOR'S APPARATUS.

nections to be made between adjacent block and between metallic and grounded circuits such as the train wire and the block wire. This set, being in almost constant use by the way-station operators, is located in the most convenient spot.

The terminal apparatus at the message operator's desk in Greensboro is shown in Fig. 2. It is thoroughly protected, and it also has the test panel for making patches and simple tests on the line. Switch-

Digitized by Google

ing arrangements are provided here, as well as at the dispatcher's desk, so that either the dispatcher or the message operator can put his telephone set on either circuit. The telegraph relays, condensers, retardation coils, and other auxiliary apparatus are placed on the terminal board. An extension bell is provided for both the train and message circuits. This is in order that the way-station may ring up the operator at Greensboro, if for any reason he is not connected in on the circuit.

Subscribe for Telegraph and Telephone Age.

The January 1 issue, which is an important directory number, is a paper that every member of the profession should possess. It contains ninety-two pages of valuable information. Mr. Willis H. Jones describes some important telegraphic apparatus in his usually lucid style, while Mr. John F. Skirrow has an article on Postal Branch-Office Wiring which is also an important contribution to practical telegraphic literature. Considerable space is given over to Postal and Western Union executive offices notes, changes in administration, etc., all of which is intensely interesting at this time. Several pages are devoted to miscellaneous items of an absorbing nature while an extensive obituary of S. S. Dickenson, a vice-president and general superintendent of the Commercial Cable Company, is printed.

Of the many interesting features are a full page engraving of the new president of the Western Union Telegraph Company, Mr. Theo. N. Vail, and a similar one of Col. R. C. Clowry, the retiring president of that company, printed on the finest coated paper and suitable for framing. Lengthy biographical sketches of these officials also appear. More than twenty pages are given over to a directory of the telegraph and telephone companies and their officials, railway telegraph superintendents, fire and police telegraph superintendents, the cable and other interests together with the names of seven or eight hundred managers of Western Union and Postal offices throughout the country. A vast amount of other valuable and interesting information which every telegrapher should be familiar with also appears, all of which go to make one of the best productions of a telegraphic nature that has ever been placed before the fraternity. The directory feature of this issue makes it of so much value that it will be at the elbow of everyone concerned ready to refer to at a moment's notice during the entire year of 1911.

Another feature of practical importance in this issue is the article giving the standard electrical notation and the definitions of electrical terms now in general use.

The Morse and Continental Alphabets used by the telegraph, cable and wireless companies throughout the world are also shown.

In addition to all of this valuable and interesting matter is an index of the contents of the twenty-four issues of Telegraph and Telephone Age for 1910.

The price of this issue is twenty-five cents, and if you have not already obtained a copy, we would advise you to order one at once before our supply of extra copies is exhausted.

If, however, you have a copy and you realize the value of the same, kindly pass this information to someone you think will be interested. Those desiring to begin their subscription with this number can do so without any extra charge. The terms of subscription are $2.00 per year, or $1.00 for six months; Canadian subscriptions, $2.50; foreign subscriptions, $3.00.

Interstate Commerce Commission Report.

The twenty-fourth annual report of the Interstate Commerce Commission was submitted to Congress December 21. By the act of June 18, 1910, telegraph and telephone companies doing an interstate business were placed under the jurisdiction of the commission. Steps have been taken for the formulation of a system of operating tariffs for these companies, and it is expected that this system will become effective on July 1, 1911.

Concerning the application of the law as to telegraph and telephone companies, the report says: "There are from 25,000 to 30,000 telephone companies which make provision for interstate communication, and the commission is in doubt as to whether it was the intent of Congress to place all these companies under its supervision and control. No opinion is expressed at this time as to the administration's interpretation which should be placed upon the law in this regard."

Testing Bridge.

In any office or laboratory where testing is done, the expense for testing, and the delay in locating faults must depend upon the time necessary for a single determination. The reliability of the results depends on the accuracy of the apparatus and the simplicity of the calculations. Calculated results are always less certain than results reached by inherent process which can be read direct from the setting of the rheostat dials. The Friendly testing bridge, made by Messrs. W. and L. E. Gurley, Troy, N. Y., is designed with an appreciation of these conditions. It is a high grade and reliable instrument, it is quick in obtaining measurements, the results are read direct from the rheostat dials, and the only calculation consists in pointing off decimal places or in adding ciphers.

Digitized by Google

The bridge is available for the measurement of resistances as a Wheatstone Bridge, faults may be located by the Varley or Murray loop methods, or by a new method known as the Friendly Loop.

The bridge is compact and the resistances are of manganin wound on metal spools and adjusted to an accuracy of 1-10 of one per cent. A new and ingenious arrangement of the ratio coils has been adopted, permitting unusual ratios, and a new construction for the decade dials maintains low resistance contacts and smoothness of motion with very small wear. This construction permits a continuous motion of rotation in either direction. There are ten units in each decade, and the galvanometer is of the moving coil type and is of high sensibility. Any other galvanometer may be connected, if desired. The cover may be removed entirely and it is provided with dust tight openings, so that the box can be closed and locked without disconnecting the wires leading in.

Municipal Electricians.

The Chicago Stock Yards Fire.—Fire Marshal James Horan, of the Chicago fire department, who was killed, with twenty-two of his men in the disastrous fire in the Union Stock Yards, December 22, was a telegraph and telephone lineman before he entered the fire department. He had many friends among electrical men. Mr. B. E. Sunny, president of the Chicago Telephone Company, called the first meeting to raise funds for the relief of the families of the dead firemen.

Recent Fire Alarm Patents.—Among the patents issued January 3, was one (No. 979,769) for an Electric Signaling Box, to A. Kempston, San Francisco, Cal. It comprises a fire alarm for preventing interference of signals by holding a box in a position so that it will start its signal to the main office after another box has completed its round of signaling and thus hold the other boxes till it gets through with its signal. Patent No. 979,977 was issued to E. Mahon, Fairfield, Iowa, on an Electric Fire Alarm. The alarm and a circuit closer are operated by a float in a liquid.

Automatic Fire Alarm is the subject of patent No. 979,376 issued to L. Cain, Caledonia, Mich., on December 19, 1910.

Patent No. 975,175 has been granted to W. J. St. Onge, Elyria, Ohio, for an Alarm System.

International Association of Municipal Electricians.—The proceedings of the fifteenth annual convention of the International Association of Municipal Electricians, which was held at Rochester, N. Y., September 6, 7, 8 and 9, 1910, have been issued in book form. The volume is neatly bound in cloth and has 168 pages, including portraits of the officers and some of the members of the executive committee. Fine paper is used and altogether the results reflect great credit upon the editorial ability of ex-Secretary Mr. Frank P. Foster, of Corning, N. Y., under whose direction the work was issued and who is succeeded as secretary by Mr. Clarence R. George, city electrician, of Houston, Tex.

Directory of Municipal Electricians.—In the list of municipal electricians printed in the Directory of telegraph, telephone, cable and wireless companies and associations, in our issue of January 1, the following four names were inadvertently omitted: James Warren, superintendent of fire telegraph, New Brunswick, N. J.; W. E. Walgamott, city electrician, Peoria, Ill.; J. W. Waggoner, superintendent of fire telegraph, Roanoke, Va., and J. B. Yeakle, superintendent of fire telegraph, Baltimore, Md.

Fire Alarm Boxes in Rochester, N. Y.

The 300 fire-alarm boxes in Rochester, N. Y., are lighted at night by an incandescent lamp enclosed in an outer red globe. In describing the system *The Electrical World* says no change was made in the fire-alarm posts, a special fitting at the top being equipped with a shade holder and a 40-watt, clear-bulb, tungsten lamp over which is a red globe with the words "Fire Alarm" etched in it. The lighting circuit to the post is run underground either from the underground system or from a pole line, the leads in the latter case passing down the pole in conduit to the fire-alarm box. Where the lighting circuits are on the opposite side of the street the circuit is placed underground in an iron pipe, a single conductor being used for one lead and the pipe itself for the other lead. The small transformers used in connection with the system are in most cases set in the manholes adjacent to the fire-alarm posts.

Every fire-alarm box in Rochester is now easily discernible at night for a great distance. When looking down a main thoroughfare the red lights thrust themselves into view like so many danger signs along a brightly lighted roadway, and the plan has given complete satisfaction ever since its installation a few months ago.

Telephones in Philadelphia Terminal of Pennsylvania Railroad.

The Pennsylvania Railroad is installing a telephone system of controlling train movements at its Philadelphia terminal. This is believed to be the first installation of a complete telephone dispatching system within the limits of a terminal. This system is unique, being in some measure a telephone train wire having intercommunicating features only between certain points. Dispatchers' offices are located at the tower at Thirty-second street, which is a telegraph office, and at the tower at Seventeenth street. At the latter point three calling equipments are provided, which enables any one of the three operators to call any station, while at the former tower only one calling equipment is provided. The various way stations, of which there are fifteen, can call either tower automatically, but there is no provision for calling the other way stations. Accordingly both dispatchers' offices are equipped with selectors, as are the regular way stations.

Line Testing by Indicating Instruments.

The following article, prepared in the office of Mr. W. E. Athearn, engineer of equipment of the Western Union Telegraph Company, New York, is reproduced, in slightly abridged form, from the current number of *The Journal of the Telegraph*:

All wire chiefs have felt the need, at various times, of a better instrument than the Morse relay for testing the line wires under their care. This need has been partially met by furnishing portable voltmeters and mil-ammeters for use at many important switchboards, but the difficulties attending the handling of such instruments on a busy, crowded board have made them somewhat unsatisfactory. In order that the full benefits of voltmeter and mil-ammeter tests may be secured by the Plant Department in their work of maintaining the company's circuits at the highest possible efficiency, the engineer of equipment has designed a combination volt-mil-ammeter set arranged for convenient operation at the switchboard.

SUMMARY.

Indicating instruments, such as the voltmeter and mil-ammeter, are better than the usual Morse set for all line testing purposes. The switchboard volt-mil-ammeter, Fig. 1, has therefore been designed for this work. Its scale reads 200-0-200 volts or milliamperes, and its resistance is 20,000 ohms when used as a voltmeter, or less than one ohm when used as a mil-ammeter.

This meter is to be installed as shown in Fig. 5, at stations where wire chiefs are responsible for line conditions.

Theory shows the adaptability of the voltmeter for measuring high resistances, such as insulation resistances of telegraph lines in good weather, and the adaptability of the mil-ammeter for measuring telegraph currents, also for measuring and comparing insulation resistances of telegraph lines in bad weather.

In general tests, meter readings are not usually recorded, but are valuable for comparison with tables or with similar readings obtained on other wires.

In insulation tests, voltmeter readings are recorded and calculations made to determine whether or not the standard insulation resistance of 100 megohms per mile is being maintained. When used for making voltmeter tests, the regular switchboard battery is automatically cut off.

GENERAL.

The tests of wires made at a telegraph switchboard are for the purpose of detecting faults, which may be divided into the following classes:

(1). Grounds, including escapes from wire to ground, and wires swinging to ground.

(2). Crosses, including escapes from wire to wire, and wires swinging together.

(3). Opens, including "partial opens" due to high resistance connections in the circuit.

On account of its convenience and the rapidity with which it may be applied, the Morse relay is largely used for making these tests, and in experienced hands gives fair results. It is never, however, as satisfactory as an instrument which accurately indicates the condition of the wire under test, and for this reason there has been a decided tendency in recent years to use a voltmeter or mil-ammeter for these tests. The combination volt-mil-ammeter has therefore been designed with a view to its general use in wire testing, and the arrangement of the meter and its connections is such that it can be applied with nearly the same speed as a Morse set, while capable of much greater accuracy in the tests made. The instrument may be used either as a voltmeter or mil-ammeter, and has a scale reading 200-0-200, i. e., the needle or pointer is normally in the center and moves to the left or right, depending upon the direction of the current passing through the coils, the maximum reading on each end of the scale being 200 volts when used as a voltmeter, or 200 milli-amperes when used as a mil-ammeter. The connections of the instrument for the various tests are made by the insertion of a plug in one of four jacks mounted in a box just below the meter, and the connection with the line to be tested is effected by a cord carrying a switchboard wedge which fits the usual line spring jacks.

It is intended that one of these instruments shall be provided for every two sections of fifty-wire switchboard at stations where wire chiefs are responsible for the condition of lines.

INSTALLATION.

The volt-mil-ammeter is furnished with a voltmeter mounting which consists of a swinging arm bracket equipped with a jack box on the stationary base of the bracket, while the swinging arm is arranged for carrying the meter. The jack box contains four Western Electric Company's No. 91 jacks, and attached to the box by a short cord or chain is a connecting plug which may be inserted in any one of the four jacks as required for the various tests.

OPERATION.

The voltmeter is a special form of galvanometer, that is, an instrument for measuring current, but it is arranged to have such a high resistance (20,000 ohms in the case of the volt-mil-ammeter here considered), that the amount of current which can be passed through it is extremely small, and the scale of the instrument is so marked that the needle or pointer indicates the voltage being applied to its terminals. For example, if we connect a 200-volt battery or dynamo to a 20,000 ohm voltmeter as per Fig. 2, the current flowing will be ten milliamperes; since by Ohm's law the current equals the voltage divided by the resistance, 200 volts divided by 20,000 ohms gives 10/1000 of an ampere, and a milliampere is 1/1000 of an ampere. But the voltmeter needle will point to 200 when such a current is present indicating that the voltage applied has that value. If the current were five milliamperes the needle would point to 100, as that would be the volt-

Digitized by Google

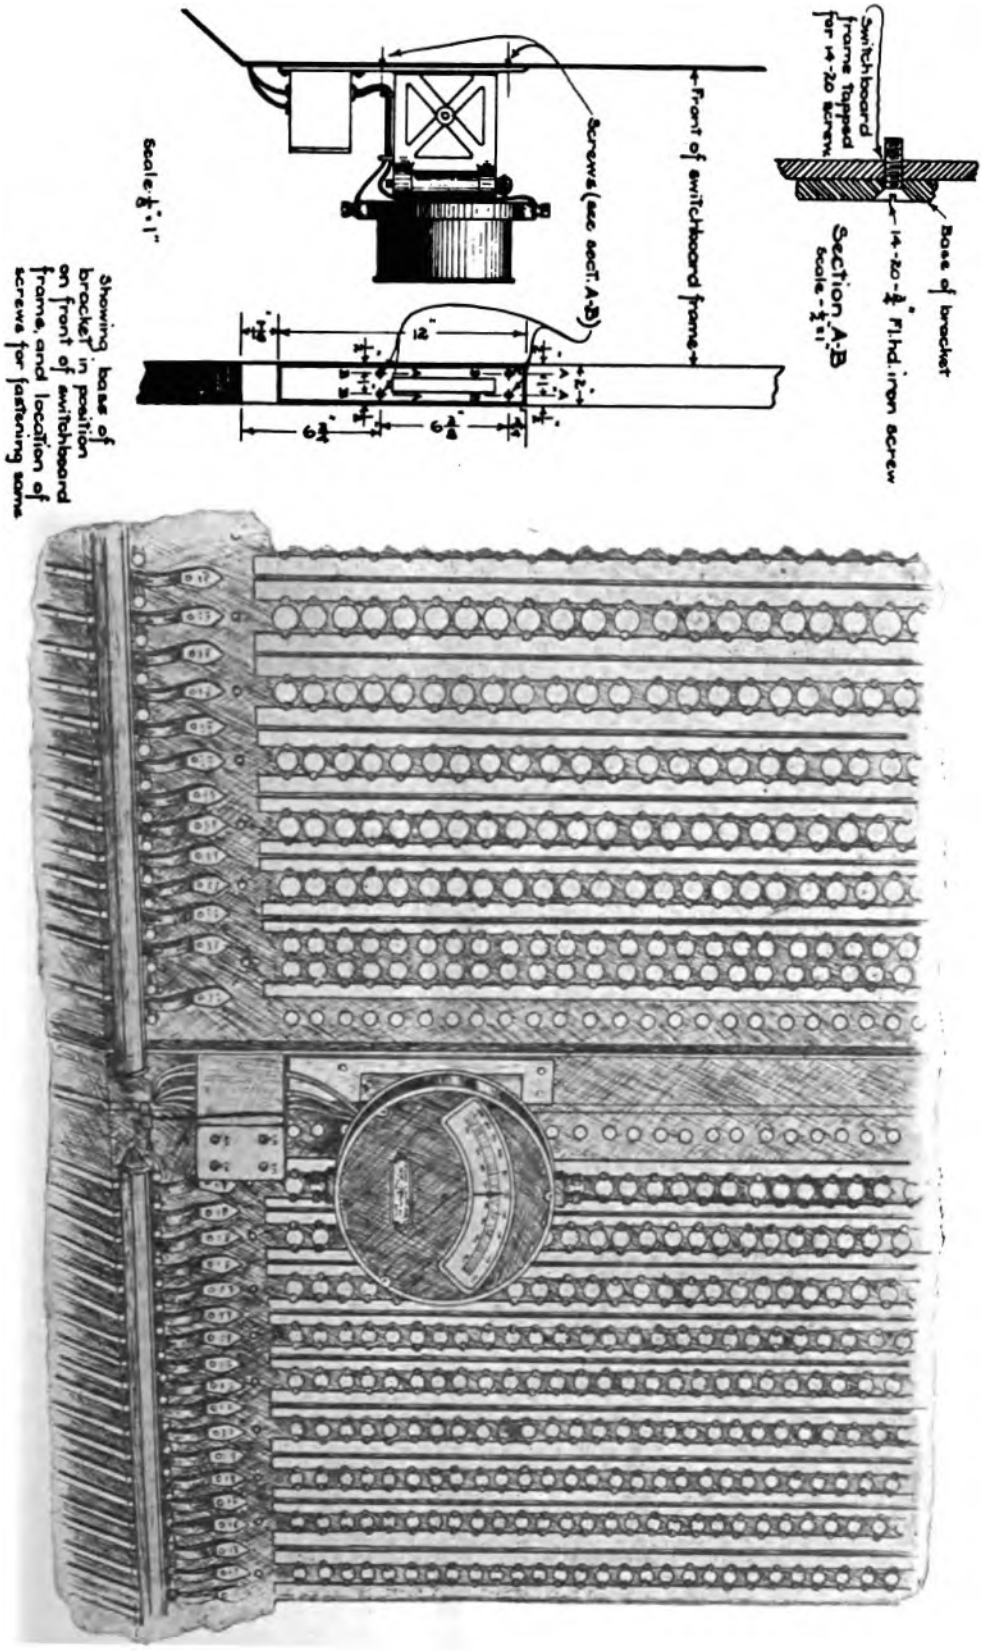

FIG. 1. SECTIONAL AND GENERAL VIEWS OF VOLT-MILAMMETER.

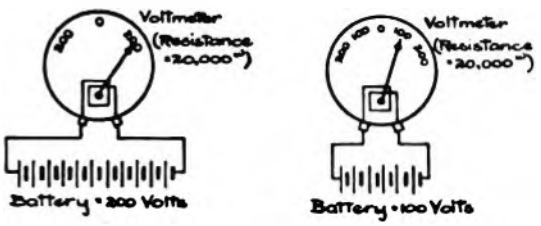
Digitized by Google

age applied to the volt-meter terminals when such a current was flowing, since $\frac{100 \text{ volts}}{20{,}000 \text{ ohms}} = \frac{5}{1{,}000}$ ampere. This condition is shown in Fig. 3. But instead of reducing the voltage of the battery from 200 to 100, we might have reduced the current from ten milliamperes to five milliamperes by increasing



FIGS. 2 AND 3. CURRENT READINGS.

the resistance of the entire circuit from 20,000 ohms to 40,000 ohms as shown in Fig. 4, that is, by inserting a resistance of 20,000 ohms in series with the 20,000-ohm voltmeter.

If we had added 60,000 ohms to the 20,000 ohm meter making a total resistance of 80,000 ohms, the 200 volt battery would have caused a current of two and one-half milliamperes to flow, or one-fourth as much current as we had in Fig. 2, and the needle would have indicated fifty volts which is one-fourth of the 200-volt reading obtained in Fig. 2; the 20,000 ohms resistance in the voltmeter is also one-fourth the total resistance (80,000 ohms) in the circuit. In other words, the voltmeter reading always bears the same proportion to the total voltage, as the voltmeter resistance does to the total resistance in circuit. For example, in Fig. 4, the voltmeter

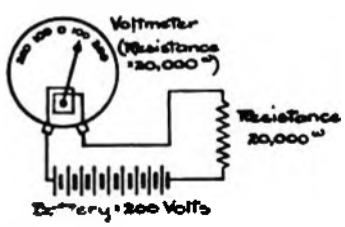


FIG. 4. READING WITH ADDED RESISTANCE.

reading 100 is to the total voltage 200 as the voltmeter resistance, 20,000 ohms is to the total resistance 40,000 ohms. We may look at this in another way: The voltmeter reading being proportional to the voltmeter resistance, the difference between this reading and the total voltage is proportional to the resistance in the circuit outside of the voltmeter, or, if

e=voltmeter reading,
Rv=voltmeter resistance,
E=total voltage,
K=resistance of circuit outside of voltmeter; then e : Rv : : E — e : K.

Applying the "rule of three," we get the formula:—

$$K = \frac{E - e}{e} \times Rv.$$

From this it will be seen that the voltmeter may be used to measure resistances; in fact, within certain limits it is well adapted for such use and the above formula is the one on which calculations are generally based. Now in all tests of wires the resistance is one of the most important matters to be determined; if a wire is "clear" we want to know how clear it is, i. e., what the resistance is between it and other conductors such as the ground or neighboring wires, this being known as its "insulation resistance;" or if a wire is grounded, leaky, or crossed, it is important to have some idea of the resistance of such a fault. When using a Morse relay for making these tests, the wire chief makes a rough estimate of these resistances by feeling the "pull" of the magnets on the armature, noting that the wire is "very clear," "slightly leaky," "very leaky" or "grounded." It is plain that these decisions may vary widely with different wire chiefs, and that at best the results obtained cannot be expressed in such a way as to be comparable with similar results obtained on other wires or at other stations. When the voltmeter or mil-ammeter is used, however, the wire chief can say in figures how well insulated the wire under test is, or how high or low the resistance of a fault is; the latter feature being of value in making location tests by the Wheatstone bridge and in directing linemen.

The mil-ammeter, like the voltmeter, is a special form of galvanometer; unlike the voltmeter, however, it is arranged to have a very low resistance, usually a fraction of one ohm. It can therefore be connected in series with a circuit in which current is flowing and will make no appreciable difference in the value of this current. The scale of the instrument is marked in milliamperes and the needle or pointer indicates the current flowing in these units. If the voltage applied to a circuit is known, and the mil-ammeter is inserted in that circuit, a simple application of Ohm's law will enable us to determine the resistance of the circuit. For example, a circuit fed by a 200 volt battery gives a mil-ammeter reading of 100; the resistance equals 200 volts divided by $\frac{100}{1{,}000}$ ampere, or 2,000 ohms. It the reading had been 200 milliamperes, the resistance would have been 200 volts divided by $\frac{200}{1{,}000}$ ampere, or 1,000 ohms. These figures give us a good idea of the relative values of a voltmeter and mil-ammeter when used for measuring resistance. It has been determined that the best point at which to change from the voltmeter to the mil-ammeter in measuring resistances is when the deflection of the voltmeter needle exceeds 75% of the testing battery voltage, e. g., in making resistance tests with a 200 volt battery we would discard the voltmeter whenever the deflection exceeded 150 and resort to the mil-ammeter instead.

The Military Telegrapher in the Civil War.

PART LII.

In time of war among the most important things to learn at the front are the strength, plans of the enemy, etc., and every device and subterfuge is resorted to to achieve the purpose. Anything and everything is fair in war. Usually it is extremely difficult, if not impossible to obtain such information, as men are at such times suspicious and on their guard and are likely to deceive inquirers and throw them off the scent. Occasionally, however, it happens that the enemy comes into possession of important information by good luck, or chance, or whatever it may be called, and the story given below emphasizes this fact in an interesting manner.

Mr. E. T. Chapman, an operator in the civil war, in a report to Captain W. L. Gross, assistant quartermaster and assistant superintendent of Military Telegraph, dated Lexington, Ky., January 2, 1865, relates his experiences in the Confederates' country in connection with General Stoneman's raid into Western Virginia. He says in part:

"I have the honor to submit the following report of Major-General Stoneman's raid into Western Virginia so far as it relates to the Confederate telegraph lines. We entered Bristol on the morning of December 14, at two o'clock, capturing without resistance the property of the Virginia and Tennessee railroad, all government property and the telegraph office on a line of which Mr. S. Morris, of Richmond, was president. Our arrival was so unexpected that the telegraph operator, Mr. Fred Montgomery, formerly of Lynchburg, and the bookkeeper, were taken prisoners while engaged in playing cards in their office. By order of the general commanding, I took charge of all books, papers and other property belonging to the telegraph company. A main battery of the Grove type was located here and was in good order, earthen jars being used in place of glass. Brevet Major-General Burbridge had previous to our arrival at Bristol instructed me to make any Confederate operator whom we might capture do all the telegraphic manipulating and in case he said anything over the line not dictated by me to shoot him instantly. At 8 a. m., the hour for opening the offices for business, Abingdon called Bristol and asked if any 'Yanks' were or had been there, suspecting that there had been from the fact that a party of Confederate soldiers had escaped capture and gone to Abingdon. Under the circumstances, I deemed it best to send the following dispatch: 'A small Yankee scouting party appeared in town this morning about two o'clock; remained but a few moments and retreated in great haste toward Kingsport, Tenn.' A similar inquiry was made by Lynchburg to whom the same answer was given. When the business of the day began, Abingdon and Lynchburg sent a great number of messages to Confederate government officials (supposed to be at Bristol) and to private citizens. Among the dispatches on file at the office when I entered were some from General Duke to General Breckenridge, Breckenridge to Duke, and Vaugher and Duke to Breckenridge, which, together with the information obtained over the line during our occupation of the office gave us full and accurate information of the enemy's strength, position and intended movements. I may here state that while working the line I received an Associated Press report from Richmond and also General Breckenridge's orders from the Confederate War Department.

"From what I saw of the telegraph line it was well constructed and, according to Mr. Montgomery, the Confederate operator, the best working line in the Confederacy. The wire was about No. 10 gauge and installed with glass 'egg' insulators. The main battery consisted of about thirty jars.

"At 3 p. m. all government, railroad and telegraph property was set on fire, and we then proceeded toward Abingdon, arriving there about midnight. I went at once to the telegraph office, but the operator had left. We, however, captured the instrument and one very important dispatch from General Duke to Breckenridge. As nothing could now be done in the way of telegraphy, the Confederates being apprised of our approach, we proceeded to destroy the line. Owing to the limited facilities for transportation we were obliged to destroy all the telegraph instruments, as we could not take them with us. After leaving Abingdon a portion of the command proceeded to Wythville where they captured and destroyed an instrument and battery. After our fight with Breckenridge near Marion we proceeded to Saltville, at which place there was no telegraph office.

"From Mr. Montgomery I learned that commercial operators in the Confederacy were receiving $200 (Confederate money) per month, and army operators, $90 and rations. In conclusion, I have the satisfaction of saying that the General Commanding acknowledged to me that the success of the expedition was attributable in a great degree to the information derived from the Confederate telegraph line."

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works of telegraphy and treat them in the same manner.]

CHAPTER XXXI.

What is a loop switch?

What are the principal uses to which the spring jacks are put?

What is a "flip"?

In wiring a loop switch how should the spring jacks be arranged?

How are the lamp sockets arranged?

Digitized by Google

How is the lamp for a leg of a given loop located?

How does the wiring and arrangement of spring jacks in the loop switch, as practiced by the Western Union Telegraph Company, differ from the method of the Postal Telegraph-Cable Company?

Describe the main features of construction of a main-wire switchboard.

What are single and double "flips" used for?

Describe a "double flip."

Describe the main wire sub-switchboard.

How are the conductors in a cable connected with the springjacks at the back of the switchboard?

What is the chief feature of the Gardanier universal switchboard.

CHAPTER XXXII.

Trace the connections of a polar duplex.

What pieces of apparatus are placed underneath the table?

How much resistance should the ground coil for duplex apparatus have?

Trace the desk main and local connections of the quadruplex.

How much resistance is allowed for the ground coil of quadruplex apparatus?

CHAPTER XXXIII.

What is a repeater?

What is the simplest form of a repeater?

What is an automatic repeater?

Why are the contact points of the relay not used as the repeating points?

What is the objection to the Wood button repeater?

How are the contact points of repeating instruments kept closed?

How is the transmitter in the Milliken repeater held closed?

How is the relay in the Toye repeater prevented from being demagnetized?

Why does the Toye repeater require no extra magnets?

What is the chief advantage possessed by the Neilson repeater?

What is the object in using high resistance magnets on the repeating sounder of the Neilson repeater?

In what respect does the Weiny-Phillips repeater differ from other repeaters?

Describe the construction of the extra magnet of the Weiny-Phillips repeater.

What is the principal feature of the Atkinson repeater?

Describe the Horton repeater.

What is the distinguishing feature in the construction of the Horton repeater and how does this repeater differ from the Hicks-Milliken repeater?

What are the special features of the Ghegan repeater?

How does this repeater perform its repeating functions?

What is a half-repeater and what are the names given these instruments?

What is a defective loop or side line repeater used for?

What are double loop repeaters?

Describe such a device.

How is the repeating sounder connected?

What means are employed to equalize the lengths of the shunt and loop conductors?

On what class of circuits should double loop repeaters be used?

How are such repeaters set up?

Describe the Wood double-loop repeater as to the instruments used and its operation.

What is the object of inserting extra resistance in the battery tap?

(To be continued.)

Depreciation of Telegraph and Telephone Plant.

In an address delivered recently by Mr. Alonzo Burt before the Wisconsin State Telephone Association, at Madison, Wis., on the subject "What Constitutes a Reasonable Rate of Return," the author gave a very clear explanation of the meaning of "depreciation" as applied to bookkeeping. Although his address related to telephone property, his remarks on depreciation are applicable, as well, to the telegraph, and are given, as follows:

"Pioneers in the development of the telephone had very little to guide them in the way of precedent in building or managing telephone property. They put up poles, strung wires, put in the instruments and gave service. They collected the revenues, made expenditures for such repairs as were necessary to keep the plant operating and figured the balance as profits upon the capital invested.

"This ran along for a time until the plants began to require a very much greater sum for the annual upkeep. New money was raised to repair the properties, but the earning capacity was not materially increased. Dividends were substantially decreased and in some cases were suspended entirely. This situation led the managers to investigate, and investigation resulted in the discovery that some financial provision must be made against the rapid and constant depreciation of telephone properties generally.

"Depreciation is probably the most important item in any system of telephone bookkeeping, and the telephone manager who fails to realize that depreciation and dividends are everywhere very closely related is liable to find himself in serious trouble.

"There is considerable confusion in the minds of managers of telephone properties as to the real meaning of depreciation and in the handling of this account. In too many cases the manager confuses depreciation with current upkeep. The terms "current repair" or "current maintenance" used in telephone accounting have the same meaning and cover the expense of keeping the plant in good working condition other than such replacements as become necessary because of inadequacy, obsolescence, decay or gradual deterioration from natural and usual causes.

Digitized by Google

"Depreciation, on the other hand, represents the loss of the value of the plant which, in spite of repairs, is constantly accruing by reason of decay, inadequacy, obsolescence or gradual depreciation from natural and usual causes. To this may be added loss through extraordinary damage resulting from sleet storms, cyclones and fire.

"From the experience of the Bell companies and from investigations by special commissions and engineers not connected with the Bell system it is found that the average life of a well constructed telephone property is approximately twelve years. Some portions of the property last much longer than others, but the average annual rate of depreciation has been dealt with by the Railroad Commission of Wisconsin as being around 8 per cent. The rate of depreciation, however, is controlled largely by the character of the original construction, and the depreciation ratio may, therefore, in instances be greater or less than the average.

"A suit of clothes has often been used to illustrate depreciation and maintenance of telephone property. The suit while new is, of course, serviceable, but after a time it gets out of shape and possibly becomes soiled. It is then sent out to be cleaned and pressed, which is maintenance or upkeep. Later the lining becomes worn and some of the buttons are missing. The suit is again sent out for repairs and for more pressing, which is more maintenance. This process goes on and although everything possible is done to extend the life of the suit there is a constant depreciation or wear taking place that cannot be prevented or replaced by any amount of repairing and in the course of time another suit must be purchased. A suit may also depreciate through changes in styles and with an up-to-date dresser may be discarded before it is worn out.

"Breaks in wire and cable may be repaired promptly and thoroughly and repairs made on switchboard and subscribers' station apparatus. This effort corresponds to cleaning and pressing the suit of clothes, but throughout the telephone plant as with the suit depreciation is taking place that cannot be prevented.

"In addition to this depreciation, changes and improvements in the art of telephony are being made which often necessitate discarding apparatus for obsolescence before it is unserviceable through wear.

"It is impossible to replace the annual depreciation on much of a telephone plant each year. Poles begin to depreciate from the time they are placed in the ground, yet the wear cannot be restored annually, and we must wait until they have become useless or unserviceable, when they must be wholly replaced.

"To provide against depreciation it is essential that a specific appropriation be made for depreciation and that the money representing such appropriation be actually set aside for replacement work. To this depreciation account should be charged the cost of replacing a line of poles worn out through decay. A switchboard that has become worn from long service or obsolete through changes in the art or both, would also be charged to the depreciation account, it being understood that if the new switchboard should be of greater capacity the cost of the added capacity would be charged to the plant account and paid for out of new money and not from the depreciation fund."

Radio-Telegraphy.

Mexican Wireless Station.—The Government of Mexico will establish a wireless telegraph station at Bacochibampo, near Guaymas, to replace the Cabo Haro station, which was destroyed by fire.

Apprehension of Bank Robbers by Wireless.—Two alleged bank robbers escaped from Texas recently on the steamer *Brazos*, bound for New York. The captain of the steamer was informed of the fact by wireless, and on arrival at Key West the men were arrested.

Wireless Telephony.—By the use of a new microphone invented by two Swedes, Carl Egner and J. Kanner, it is possible to hold wireless telephone conversation for a distance of 175 miles.

Seizing a Wireless Station.—A story from Brant Rock, Mass., January 4, was to the effect that a number of men surrounded the wireless telegraph station of Professor Reginald A. Fessenden, preparatory to seizing his books, records and plans. In the absence of Professor Fessenden, Mrs. Fessenden called up her husband's attorney in Boston by wireless telephone for aid. The sheriff at Plymouth was communicated with and went to the scene of disturbance to protect the Fessenden property.

Congressional Wireless Inquiry.—It is stated that demands will be made upon Congress for an investigation of the wireless telegraph situation throughout the United States. Letters are being sent to members asking that the matter be taken up. These letters charge that a conspiracy was set on foot to destroy the United Wireless Telegraph Company because its present officers would not surrender $5,000,000 worth of stock. Formal request will be made for the appointment of a committee in each branch with authority to summon witnesses and inspect the books of all wireless companies.

Mr. John R. Irwin, the wireless operator on the Wellman airship, who for the past two months has been filling a theatrical engagement, has agreed to accompany another Wellman expedition in an attempt to dash across the ocean next July. The airship will be a great improvement over the previous one and very much larger, and the experience obtained through the first attempt to cross the ocean will be very valuable and contribute much toward the success of the next effort. In his theatrical work Mr. Irwin gives practical demonstrations of wireless telegraphy, using the instruments that were employed on the Wellman airship. He also illustrates his topic by means of many lantern slides, showing the airship in detail and other things in connection with the now famous but unsuccessful attempt to cross the Atlantic by the air line route.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIXEY

Sole Manufacturer

The Railroad.

The Union Pacific Railroad Company has experienced so many cases where its wires have been shot in two by hunters, that it has instructed its train men to keep on the look-out and warn shooters of the danger to the wires. It is thought that the damage is not intentional but results from the hunters shooting at birds perched upon the wires.

Mr. L. W. Landman, the new general passenger agent of the New York Central Lines, was, like the chief official of his company, President W. C. Brown, formerly a telegraph operator. He entered the railroad telegraph service in 1888 as operator on the Bloomington and Western Railway, and has filled important positions on other railroads.

Discharged Operator's Suicide.—Nicholas Honness, an operator discharged from the service of the New York Central Lines, on January 4, at Corning, N. Y., fired four shots at Mr. D. W. Dinan, division superintendent of the railroad company and, thinking that he had killed Mr. Dinan, fired a shot into his own brain from the effects of which he died later. Mr. Dinan will recover.

Mr. E. L. Myers, chief electrician of the National Railways of Mexico, whose appointment to that position was recently mentioned in this column, was born in Toulon, Ill., July 16, 1864. He began his telegraphic career in Los Angeles, Cal., in 1887, and had an extensive experience in line construction for the Western Union Telegraph Company before going to Mexico. Prior to his recent appointment he was gang foreman on the National Railways of Mexico.

Block Signal System.—A patent (No. 979,556) has been issued to G. S. Pflasterer, Nashville, Tenn., on a block signal system. This is a three-position signal with an actuating device for moving the signal from danger to an intermediate position and then to a third position with a manual latch preventing movement of the actuating device to set the signal to the third position and an electric lock for the latch.

Mr. Antonio Jimenez, superintendent of telegraph for the National Railways of Mexico, whose appointment was announced in these columns January 1, is a native of Mexico, having been born in Cuantitlan on March 23, 1875. He entered the telegraph service on that road as operator in July, 1888, and has filled positions as operator, manager, train dispatcher, chief clerk to the superintendent of telegraph and chief dispatcher on the National, Central and Interoceanic Railways.

Determination of Selector Resistances.—The article of Mr. W. E. Harkness on the "Determination of Selector Resistances," in the January 1 issue, has met a very appreciative reception. Several railway telegraph superintendents have written us commenting upon it very favorably, and suggest that everyone identified with railroad operation should read it carefully. The article was a very clear and comprehensive exposition of the subject, and all railway superintendents and others concerned should familiarize themselves with the matter as it is one of vital concern in railway telegraph operation at the present time.

Meetings of Railway Telegraph Superintendents.—The Hotel Brunswick has been selected as the headquarters for the convention of the Association of Railway Telegraph Superintendents to be held in Boston, Mass., June 19 to 23. The rates at this hotel are: $2.00 to $3.00 per day for single room without bath; $2.50 to $4.00 for single room with bath. The meetings will be held in the banquet hall of the hotel and plenty of room will be available for the display of exhibits.

The next meeting of the Western Division of the Association of Railway Telegraph Superintendents will be held at the Southern Hotel, St. Louis, Mo., January 26. At this meeting some suggested changes in the constitution and by-laws of the association will be discussed. Mr. E. A. Chenery, superintendent of telegraph of the Missouri Pacific Railway Company, St. Louis, is chairman of the Western Division.

Telephone Train Dispatching on the Lehigh Valley.—A telephone line has just been cut into service between Packerton and Bernice, Pa., on the Lehigh Valley Railroad, the dispatcher being located at Wilkes-Barre. The telegraph will soon be supplanted also between Wilkes-Barre and Sayre, adding about 90 miles more. The new circuit connects with about twenty-five way stations, and is approximately 140 miles long. This train wire is divided into three sections, each radiating from Wilkes-Barre. The signaling equipment is so arranged that when a dispatcher calls any station signaling impulses are sent out over that particular section only. One section, which is known as the Mountain cut-off, has a special arrangement whereby in the event of any trouble on the train wire it is possible to connect it into the main line, thus completing the circuit on either side of the trouble and enabling the dispatcher still to get every station. It is stated that the Lehigh Valley plans eventually to use the telephone exclusively for the work of dispatching trains.

Dispatching on the Baltimore & Ohio.—The Baltimore & Ohio Railroad has just installed a telephone train dispatching equipment, made by the United States Electric Company, of New York, between Grafton and Salem, W. Va. The circuit is 35.8 miles long and there are twelve stations on the line, the dispatcher being located at Grafton. The Gill selector is installed at each of these stations and the signal bell is rung by the main line current, the source of power being at the dispatcher's office. This circuit covers a busy section of single track road and telephone dispatching is expected to expedite train movement over the division.

The Turner Monument Fund.

Subscriptions toward the Turner Monument Fund are coming in steadily and the total is now approaching the one thousand dollar mark. As the project becomes more widely known greater interest is manifested in it, and it is hoped that the plans will soon be brought to a successful conclusion.

It should be understood that the monument shown in the illustration in the last issue has not been accepted by the committee. Suggestions and plans are invited from anyone who has ideas on the subject.

The following named gentlemen constitute the committee in charge of the Monument Fund: E. P. Griffith, superintendent telegraph, Erie Railroad, Jersey City, N. J., chairman; Charles Selden, superintendent telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, Telegraph and Telephone Age, New York; E. A. Chenery, superintendent telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railway, Montreal, Canada; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who has been elected treasurer of the fund. All contributions are acknowledged in the columns of Telegraph and Telephone Age, and the funds are deposited with the Washington Trust Company, New York, as soon as received.

Since the last acknowledgment of contributions the John A. Roebling's Sons Company has subscribed $50 toward the fund.

For the information of those who may not yet be familiar with the object of this undertaking we may state that it is to commemorate the sending of the first telegraphic train order. This historical event took place at Turner, N. Y., in the autumn of 1851, and the order was sent by Charles Minot, general superintendent of the Erie Railroad. The proposed monument will cost about $3,000, and to meet this expense subscriptions are invited from all railroad and telegraph men. The Association of Railway Telegraph Superintendents and the Old Time Telegraphers' and Historical Association have given the proposition their official endorsement and are heartily co-operating in the work of raising the necessary funds.

The contributions received up to date are as follows: Previously acknowledged, $664.75; Maxwell Green, New York, $1.00; C. Adams-Randall, New York, $1.00; W. B. Holmes, Ravena, N. Y., $1.00; W. A. Sawyer, Philadelphia, Pa., $5.00; Thos. F. Clark, New York, $5.00; E. M. Rine, Scranton, Pa., $1.00; L. B. Foley, New York, $2.50; G. A. Poore, Syracuse, N. Y., $1.00; Geo. E. Hollrook, Wagner, Mont., $1.00; J. Moxam, Detroit, Mich., $1.00; Dr. Alfred Lowther, Detroit, Mich., $1.00; John A. Roebling's Sons Company, New York, $50.00; S. L. Van ,Akin, Jr., Syracuse, N. Y., $2.00; B. K. Van Nortwick, Paterson, N. J., $2.00; S. B. Van Nortwick, Paterson, N. J., $2.00; W. G. Brownson, Toledo, Ohio, $5.00; J. B. Stewart, New York, $5.00; G. H. Corse, Shanghai, China, $5.00; I. T. Dyer, Los Angeles, Cal., $1.00. Total, $757.25.

Reminiscences of Charles Minot.

Mr. W. G. Brownson, of Toledo, Ohio, a well-known old-time telegrapher, a forty-niner of the telegraph, and an ex-railroad official, was associated with Mr. Charles Minot for several years during the time the latter gentleman was general superintendent of the Erie Railroad, beginning in 1851.

For five years Mr. Brownson was agent and operator at Turner, N. Y. Mr. Minot used to call the division superintendents to Turner once a month and hold conferences for the benefit of the service, making the telegraph office their headquarters. The superintendents talked about everything, from track to locomotives, and Mr. Brownson found these conferences an excellent schooling. Great credit is due to Mr. Minot for his foresight in perceiving the advantages of holding conferences, and was probably the first one in the railroad business to undertake such meetings.

Six division superintendents attended these monthly gatherings, and all of them developed into good railroad men. They included Mr. Hugh Riddle, who afterward became president and general manager of the Chicago, Rock Island and Pacific Railway, and Mr. Horatio Brooks, who was the founder of the Brooks locomotive works.

Mr. D. C. McCallum was placed in charge of the railroad, and Mr. M. D. Woodford, afterwards president of the Cincinnati, Hamilton and Dayton Railroad, was the operator at Jersey City. On one occasion Mr. Brownson called on Mr. Woodford and learned that there was a washout on the road between Jersey City and Turner, and as he was passing out of the office he met Mr. Minot, who was going over the road with Mr. McCallum. Mr. Minot invited Mr. Brownson to go along. When they reached Passaic Bridge, they got out and walked to the center of the brige to see if it was safe—the water being high and running swiftly. Mr. McCallum was afraid that it was weak, but Mr. Minot motioned to the engineer to come on and the train crossed the bridge all right. On reaching Ramapo they found the track washed out. There was an engine on the other side of the break, over which the rails and ties were hanging. Mr. McCallum again was in doubt, but Mr. Minot was undaunted.

Mr. Brownson mentions a strike of the engineers on the Erie which, he thinks, was the first strike among that class of employes. The engineers really struck, Mr. Brownson says, because Mr. Minot had left the road. They disliked Mr. McCallum.

Mr. Minot was a bachelor and very fond of young men, and about six months before he left the

Digitized by Google

Erie Railroad he invited Mr. Brownson to go to his place in Somerville, near Boston, and become his boy. Mr. Brownson declined because he intended to get married the next year. He, however, suggested that Charles Vail be employed, which Mr. Minot did. When Mr. Minot died he left Mr. Vail the use of $14,000 as long as he lived.

Mr. Minot stayed at Somerville for a short time and then went to the Michigan Southern and Northern Indiana Railway, now part of the Lake Shore system. At the end of a year, however, he returned to the Erie Railroad and remained with it until his death. He was made consulting director, and he died in his chair in the company's offices.

Mr. Brownson expresses his wish for success in the Turner monument project and contributes $5.00 toward the fund.

Obituary.

Frank M. Greene, age 69 years, for many years manager of the Western Union Telegraph Company at Toledo, Ohio, died December 27 of heart disease. Mr. Greene entered the service of the company at Toledo as a clerk in the early seventies, later becoming cashier and finally manager of the office. He retired from active duties five years ago.

Edgar F. Phillips, assistant to Mr. Alexander Dow, vice-president and general manager of the Detroit Edison Company, Detroit, Mich., and a former telegrapher, died in that city December 25, aged sixty-one years. Mr. Phillips was night chief operator in the Detroit Western Union office for several years, and was afterward general manager of the Michigan State Telephone Company.

Caleb L. Pope, aged 69, a veteran telegrapher, died recently at Hull, Mass. He was born in that place July 16, 1841, and was an operator at various points in Massachusetts, including Boston. He retired from active service six years ago, after having been engaged in telegraphy for forty-five years.

Roy H. Miller, an operator for the National Packing Company, in New York, died December 23 after a two-weeks' illness. He was born in Ohio November 1, 1855, and was employed at different times at various places throughout the country by the Western Union Telegraph Company, the Postal Telegraph-Cable Company and the Associated Press. He was for seventeen years with the Postal Company at Savannah, Ga. On January 1, 1904, he came to New York to accept a position with the National Packing Company in its telegraph department which he occupied until he became ill. His remains were buried at Millheim, Pa. Mr. Miller is one of three brothers who have devoted their business careers to the telegraph service.

Sidney Brooks Curtis, for forty years cashier of the Hartford office of the Western Union Telegraph Company, died in that city, December 11, of pleuro-pneumonia. He was in his seventy-first year, and had been in the company's service for fifty years. A few days prior to his death Mr. Curtis was in New York and called upon many of his old firiends.

Henry Guy Carleton, of New York, the playwriter, an old-time telegrapher, author, also soldier and inventor, died at Hot Springs, Ark., on December 10, aged 65.

The Robert W. Martin Fund.

A high official of one of the large telegraph companies in contributing toward the fund for the relief of Mr. Robert W. Martin, writes as follows: "I take pleasure in enclosing herewith a check for $10 for the relief of Robert W. Martin." Mr. Martin, who is a well-known old time telegrapher, is suffering from a stroke of paralysis and has been confined to his bed for several years as a consequence. In his helpless condition he has been unable to do any work, and his friends have very generously helped him and his family along in their need. Contributions are acknowledged in these columns and turned over to Mrs. Martin as they are received.

Attention is called to the advertisement of the Central Typewriter Exchange of New York which appears on another page of this issue.

The "Exchange" was established in 1896 and is therefore one of the oldest in the city.

Their specialty is the sale of factory-rebuilt typewriters. Mr. D. A. Mahoney, who for the past 20 years has had extensive dealings in placing "mills" with telegraphers has been placed in charge, and we can assure our readers that they may be confident of being accorded fair treatment and are requested to write Mr. Mahoney direct if they desire a rebuilt machine or wish their old one put in first-class order.

Duplex Transmitter. — The "Dunduplex," handled by Thomas J. Dunn & Co., 1 Broadway, New York, enables an operator to transmit clean-cut dots at any rate of speed, and greatly relieves the nerve strain. The vibrating frame is operated by a plunger, which successfully checks the wig-wagging of the vibrating arm and prevents the splitting of dots and other mutilation of characters. It produces a firm solid contact at the points, irrespective of the force used in the operation of the lever. It's mechanical construction is solid and it is designed on correct principles.

LETTERS FROM OUR AGENTS.

Los Angeles, Postal.

The promotion of Mr. V. V. Stevenson, manager of this office, to be electrical engineer on the Pacific Coast at San Francisco, to succeed Mr. H. C. Shaw, transferred to Chicago, as noted in a previous issue, has occasioned other changes as follows: Mr. J. H. Dorsey becomes manager of the Los Angeles office; A. B. Fountain, all night chief; Walter Ogden, night chief; C. E. Page, assistant day chief.

Digitized by Google

PITTSBURG, WESTERN UNION:

The following service changes in this office became effective January 4: Mr. F. E. Schiller, plant chief; Mr. D. F. Driscol, wire chief; Messrs. S. B. Harte, Jr., J. R. Palmer, D. D. Calvert and William Fox, assistant wire chiefs; Mr. D. Kelly, repeater chief; Messrs. Wm. H. Maize, B. I. Gable, W. J. Gilson, J. E. Palmer, W. W. Creahn, I. H. Weaver, E. Fisher, W. L. Lentz, and D. V. Lawell, assistant repeater chiefs.

NEW YORK, WESTERN UNION.

Andrew A. Offutt, aged fifty-six, an operator in the general operating department of this company for over thirty years, died on January 5 after an illness of two weeks. The funeral services were held January 9 and were attended by a large number of friends and a delegation from the New York Telegraphers' Aid Society, who served as honorary pallbearers. Mr. Offutt had been an active member of this society since 1881, just one year after its organization. The remains were buried in St. Michael's Cemetery, Jersey City, N. J. Mr. Offutt's death came as a great shock to a large circle of friends, who held him in high esteem.

Peter Westervelt, for many years connected with the Gold and Stock Telegraph Company, New York, died in Brooklyn January 5. He was seventy years old.

New York Telegraphers' Aid Society.—The financial statement of the New York Telegraphers' Aid Society for the quarter ended December 6 shows the following results: Balance on hand September 6, $24,487.01; receipts, $1,770.50; disbursements, $1,220.50; leaving a balance of $25,037.01. The relief fund was increased $427.57 during the same period.

Impregnating Apparatus Wanted.—Proposals will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until 10 o'clock a. m., January 24, to furnish at the navy yard, Norfolk, Va., a vacuum drying and impregnating apparatus. Applications for proposals should designate the schedule number 3248. Blank proposals will be furnished upon application to the navy pay office, Norfolk, Va., or to the Bureau. T. J. Cowie, Paymaster-General, U. S. N.

NEW YORK, POSTAL.

Mr. W. J. Parrall, service clerk in the main operating room, died December 18.

It is a pleasure for me to sell a CENTRAL rebuilt. Write me personally. D. A. Mahoney, 203 Broadway, New York.

Central Typewriter Exchange, 203 Broadway, New York. The best factory-rebuilts to be found anywhere. Postal employes may own their mills; seventy-five cents weekly. Correspondence invited. D. A. Mahoney, Representative.

Life Insurance is based upon the certainty of death at some time and its possibility at any time. The splendid financial position of the Telegraphers' Mutual Benefit Association, 195 Broadway, New York, is shown in the Reserve Fund, of $317,000, which, apart from current assets, amounts to nearly 6 1-3% of the total contingent mortuary liabilities, and yields an annual revenue of more than $15,000; operating on sound and correct principles, with ample security, it offers to the telegraph and telephone employe the best and most economical form of protection for the family and dependents yet devised. Write for particulars.

Serial Building Loan and Savings Institution.—The report of the Serial Building Loan and Savings Institution, 195 Broadway, New York, shows that the year 1910 was the most successful in the history of the institution. This is the best of evidence that it is doing good work. It has assisted over a thousand telegraphers to save money and buy homes. This is what it is in existence for. Each member is also a shareholder and participates in the profits of the business. Those who are not familiar with the plan of operations would do well to look into the matter and become interested. The secretary will be glad to give all the particulars desired.

American Telegraphy and Encyclopedia of the Telegraph

By WILLIAM MAVER, JR.

668 Pages, 490 Diagrams, $5.00.

To facilitate the purchase of this valuable work on telegraph engineering and electricity and magnetism, the publishers will forward the book to responsible telegraphists and telephonists on receipt of order for same as follows:

"Please send me one copy of 'American Telegraphy and Encyclopedia of the Telegraph,' for which I agree to pay $5.00; namely $1.00 (plus 25c. postage) herewith and $1.00 monthly for four months.

"Reference Signature and Address."

Special discounts to agents. Write for terms.

Address

Maver Publishing Co., 136 Liberty St., New York

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEYBOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

SOME POINTS ON ELECTRICITY—XI.

A Study of Electrical Apparatus.

BY WILLIS H. JONES.

GENERATOR EFFICIENCY.

Students frequently confound the words efficiency and capacity when referring to the output of some electrical machine on account of the too common misunderstanding of those terms.

If we were to speak of a man's ability to accomplish some particular piece of work we might say that he possessed the capacity to do it, but if we referred to the electrical output of, say, a generator there is quite a distinction between the meaning of the two words.

In electrical parlance the term efficiency refers properly to the percentage of useful electrical energy a generator delivers as compared with the mechanical energy expended in running the machine. Thus if a generator requires ten mechanical horsepower to run it and could only deliver five electrical horsepower its efficiency would be rated at fifty per cent, while a seven and one-half horsepower output would indicate a seventy-five per cent efficiency.

The capacity of a generator refers to the maximum current it is capable of delivering with safety without undue heating.

In constructing a generator for any given output there are many things to consider. The first point to realize is that the larger the machine is the greater will be its efficiency, other things being equal. The explanation is that large diameter copper conductors on large armatures have less resistance than have smaller sizes and therefore can add no appreciable resistance to the external circuit with which they may be connected when supplying current.

In like manner large masses of iron in the armature and in the magnet cores and polepieces decrease the reluctance of the magnetic circuit, thus facilitating the generation of a stronger magnetic field than could be obtained from the same expenditure of energy in smaller masses.

For example, if the armature core is small the wire used in winding it must likewise be small in diameter in order that the various slots when filled to the prescribed limit will possess a sufficient number of turns to generate the necessary voltage.

If the E. M. F. (voltage), is high in a small machine you may safely conclude that its current output is correspondingly small, for the reason that small conductors possess considerable resistance and cannot carry a very great volume of current without becoming overheated.

It also follows that owing to the high internal resistance of such machines they consume quite a large percentage of their own energy, hence in overcoming this resistance their efficiency is low.

In order to obtain a greater output therefore it is obvious that the method to follow is to use larger conductors in the windings. The output will then be greater because of diminished internal losses, although the E. M. F. across the brushes of a small and of a large machine may be the same.

Nor are the dimensions of a machine all that determine its efficiency. Much depends upon the material, design and workmanship. Yet even with perfection in these particulars there will still remain certain small unavoidable losses in the form of useless electrical currents developed in the coils and iron which consume a portion of the energy generated by the machine.

For instance, when a mass of iron is magnetized and demagnetized rapidly, a rearrangement of its molecules takes place at each alternation. The resulting friction between them generates heat in the mass, which is a useless waste of energy. This action is known as hysteresis.

In well constructed direct current machines losses due to this cause are comparatively small, but in alternating current generators it becomes quite large owing to the fact that the relative positions of the molecules are changed with each alternation of the magnetizing current. In high frequency alternators, therefore, the molecular friction may be great, resulting in the development of much heat in the magnetic circuits.

Again, when the magnetism in a mass of iron is denser at one point than at another a difference of

Digitized by Google

potential will arise and a current of electricity will flow through a wire laying between the points. Sharp corners and edges in the iron parts are detrimental because they contribute to this effect. Currents of this kind are called eddy currents. Eddy currents may be minimized by using laminated cores for the armature and magnets, as such cores offer a high ohmic resistance to these currents.

The student should now understand and appreciate the fact that the efficiency of generators increases generally in inverse proportion to the reduction of the losses referred to.

Messenger Call System.

BY JOHN F. SKIRROW, ASSOCIATE ELECTRICAL ENGINEER, POSTAL TELEGRAPH-CABLE COMPANY, NEW YORK.

The accompanying diagram shows the Postal Telegraph-Cable Company's standard method of connecting up a messenger call system at small stations where gravity battery is used to supply current to the circuit. Normally the lever of the three-point switch shown at the right of the lower relay stands in the centre and under the conditions thus shown the circuit is metallic throughout. If a ground should appear on the circuit it may be detected by the action of the relay when the switch lever is thrown to the right or left, as placing the lever on these contacts tends to cut the relay out of circuit when there is a ground on the line.

In the event of a break where the circuit is opened on one side and grounded on the other, the switch lever is thrown so that the battery will supply current from the office ground through the relay to the ground on the circuit. If the connections are traced it will be seen that with the switch in one position, current is supplied by the battery with one side of the circuit open and the other grounded, and with the switch in the other position the conditions are reversed; i. e., with the other sides of the line open and grounded respectively.

Several fuse blocks are arranged at convenient places in the circuit for temporarily grounding the line in case it should open in both directions. Dry battery cells are used to operate the call bell and register.

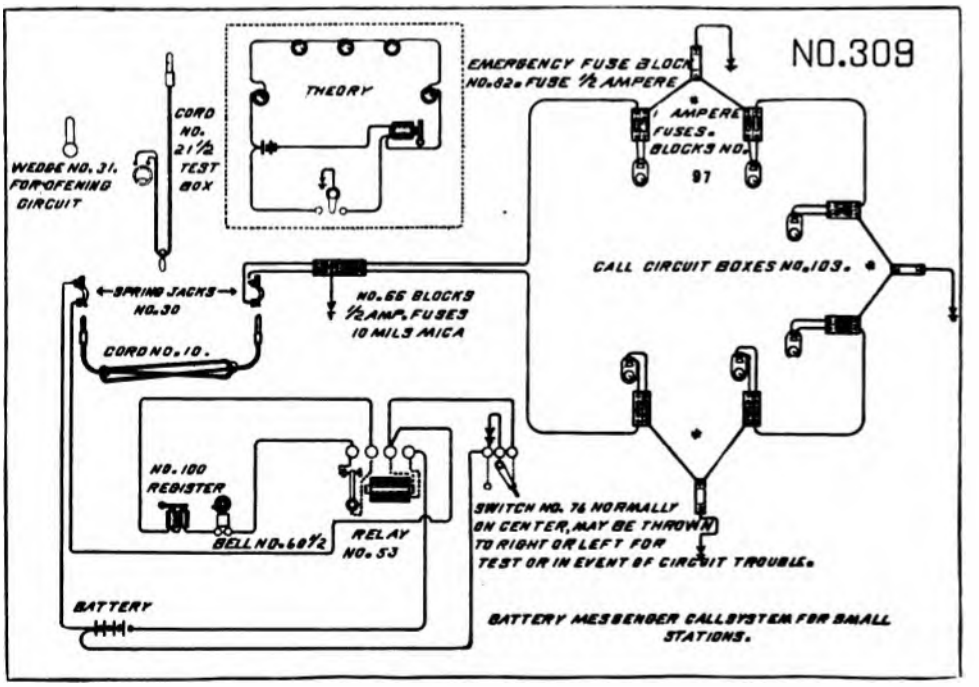

DIAGRAM OF MESSENGER CALL SYSTEM.

No. 510,863. Telephone Exchange System. Issued to Wm. W. Jacques, Newton, Mass.

Personal.

Mr. Angus S. Hibbard, vice-president and general manager of the Chicago Telephone Company, has been elected president of the Wisconsin Society of Chicago.

Mr. Agustin Sal has been appointed general manager of government telegraphs of Argentina with headquarters at Buenos Aires. Mr. Sal has had a wide experience in the telegraph service of the Argentine Republic.

Mr. H. D. Twombly, vice-president and treasurer of the Wm. E. Reynolds Company, Omaha, Neb., was a recent New York visitor on business. This company manufactures the Reynolds relay telegraph sounder attachment.

Mr. Charles C. Walker, assistant general manager of the Chesapeake and Ohio Railroad, was formerly a telegraph operator and has occupied many important positions since then on that road. He is a native of Virginia, being born June 21, 1858.

Mr. Thomas A. Edison has been elected an honorary member of the Engineer's Club of New York. The club has now four honorary members, including Mr. Andrew Carnegie, Rear-Admiral George W. Melville of the United States Navy and Mr. John Fritz, the pioneer of the steel and iron industry in America, besides Mr. Edison. The official letter of the club to Mr. Edison refers to his achievements as an inventor and his great contributions to engineering and industry.

Mr. W. H. Hurst, president of the Stock Quotation Telegraph Company, New York, accompanied by Mrs. Hurst, will sail for Europe in April on business connected with the service.

Mr. James R. Mayer has been appointed superintendent of telegraph and telephone of the Texas Company with headquarters at Houston, Texas. This oil company's wire system embraces the states of Kansas, Oklahoma, Texas and Louisiana. Mr. Mayer is a native of East Liverpool, Ohio, and has had a long and successful experience in telegraphy, and is well fitted for the duties of his new position.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. E. J. Nally, vice president and general manager, accompanied by Mr. W. I. Capen, general superintendent of plant, and Mr. Lewis MacConnach, secretary to Mr. Nally, left on January 22 on an extended business trip through the Western and Pacific Coast states.

Mr. E. B. Pillsbury, general superintendent of the Eastern Division, was a delegate in the interest of the Merchants' Association of New York at the National Tariff Convention recently held in Washington. Mr. Pillsbury, with his associates, attended a special reception given to them by President Taft, and was also present at the banquet, given in honor of the delegates.

Mr. F. H. Hollenbeck has been appointed chief clerk in the office of Vice-President Charles C. Adams, to succeed Mr. W. H. Matthews, resigned.

The main office of this company, at Rochester, N. Y., has been enlarged and rearranged to meet the demands of the increased business.

Mr. H. G. McGill, superintendent of the first district, Western Division, Chicago, was presented with a handsome scarf pin and monogram cuff-buttons by the managers of the first district upon his assuming charge of the district comprising the main and branch offices in Chicago. This token of their esteem was all the more sincere because the managers seemed to act as of one accord in their desire to express their appreciation of Mr. McGill's worth as a man and a superior official.

Mr. Philip L. Lee, whose appointment as manager of the Milwaukee, Wis., office of this company, was noted in these columns January 16, was born in Milwaukee in 1877 and entered the telegraph service in that city July 1, 1901, as delivery clerk. He afterwards became chief clerk, and, later, cashier, from which latter position he was promoted to be manager of the office.

Mr. Wm. O'Connell, of Pittsfield, Mass., has been appointed manager of the North Adams, Mass., office, vice W. F. Orr, resigned.

Postal Company's New Tariff Book.—The new tariff book of the Postal Telegraph-Cable Company, just issued, contains 834 pages, which is an increase of 60 pages over the previous book. On the four

Digitized by Google

margins of the front cover is a list of cities and towns throughout the world, together with the standard time at each compared with New York time. On the outside back cover is a table of tolls for night lettergrams containing fifty words (or less) to 250 words. Following the tariff section of the book is a group of green pages giving general instructions as to the money transfer service. These are followed by pink sheets, containing rules, rates and instructions regarding cablegrams, and the last section, on yellow pages, consists of Book of Rules for Postal Service. The book represents a vast amount of labor, and reflects great credit upon Mr. Isaac Smith, superintendent of tariffs, New York, under whose immediate direction it was produced.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Belvidere Brooks, general manager of this company, who has been on a tour of inspection through the Southern states east of the Mississippi, has returned to his office. He was accompanied on his trip by Mr. Thomas W. Carroll, assistant to the general manager, Mr. S. B. Haig, of the office of the traffic engineer, New York, and his secretary, Mr. W. C. Merly. The party visited the principal Southern cities where they conferred with the local, district and division officials on matters pertaining to the further expansion of the service.

Mr. Rush Taggart has been appointed general counsel of this company, vice Judge J. F. Dillon, who has been appointed consulting counsel.

Mr. P. G. Kern, superintendent of the Southern Division of the American District Telegraph Company of New Jersey, with headquarters at Louisville, Ky., was a recent New York visitor on company business.

Mr. W. H. Mathews, of the executive offices of the Postal Telegraph-Cable Company, New York, has accepted a position in the complaint service department, Eastern Division of this company, with headquarters in New York.

An arrangement has been made whereby telephone subscribers in small places where the telegraph office is open only part time, may file their telegrams by telephone at the nearest open Western Union office at the same cost as though the telegram was dispatched direct from the home town. No charge will be made against the subscriber for the use of the long dtasince telephone service in such cases. This service goes into effect February 1.

Certain telephone pay stations throughout the country have been designated to receive telegrams from the public as though they were actual telegraph stations. The attendant at such stations will represent the telegraph company, and transact the telegraph business with the public in the usual way. Hereafter the American Telephone and Telegraph Company will collect the charges for telegrams sent by subscribers to telegraph offices over the telephone.

Telephoning Telegrams.—A few days ago it was stated in the newspapers that the telegraph companies had decided to either abolish or modify the practice of telephoning telegrams to their destination because of alleged trouble that had arisen on account of some messages having thus fallen into improper hands. This report on investigation appears to have no foundation in fact. Commenting on the matter editorially, a New York daily paper states: "This proposal is foolish, reactionary and unworthy of a sensible man. * * * Let it be understood that those who thus send telegrams over the telephone wire do so at their own risk, and are willing to abide by that risk. The combination of telegraph and telephone is a great public service. * * * But this combination is in line with the great work of organization, of concentration, and of simplifying, and it must go on."

Mr. H. D. Austin, district traffic chief of the American Telephone and Telegraph Company at Reading, Pa., has resigned to become district traffic supervisor, fourth district, with headquarters at Philadelphia.

Mr. C. E. Davidson, manager of the Tampa, Fla., office has been promoted to the management of the Jacksonville, Fla., office.

Mrs. H. O. Bannister, wife of Mr. H. O. Bannister, manager of the Western Union Telegraph office at Raleigh, N. C., and their seventeen months old son, were asphyxiated by escaping gas at their home in that place on January 6. A gas heater in the bath room had become deranged, and it is thought that Mrs. Bannister became faint from the smell of the escaping gas and fell with her child. In their helpless condition they were both suffocated by the gas. Mrs. Bannister was formerly a telegraph operator and was twenty-two years of age. The remains were taken to Richmond for burial. Mr. Bannister has the sympathy of a large circle of friends in his great bereavement.

Reciprocity Agreement with Canada.—The reciprocity agreement between the United States and Canada, which is now before Congress, provides for the placing of telegraph and telephone poles upon the free list. Other articles used in the electrical industries and included in the free list are, mica (unmanufactured), carbon electrodes, and galvanized iron or steel wire.

Overcoming Gravitation.—Mr. Emile Bachelet, of Mount Vernon, N. Y., claims to have discovered a means of overcoming gravitation by electricity. According to a local paper the electric machine acts upon metals in such a manner as to keep them suspended in air. From the description the effects seem to be similar to those obtained by Prof. Elihu Thomson some years ago in his experiments with the repulsive action of alternating currents.

Telegraph and Telephone Age is the leading publication in its field. Subscription price, $2.00 per year.

B. P. Hancock Becomes Western Union Traffic Superintendent at Jacksonville, Fla.

Mr. B. P. Hancock, formerly district supervisor of the Western Union Telegraph Company, with headquarters at Atlanta, Ga., has been appointed district traffic superintendent at Jacksonville, Fla., vice J. E. Peacock, resigned. Mr. Hancock was born at Centreville, Ala., April 20, 1868, and began his telegraphic career in 1881 at Corpus Christi, Texas. In 1883 he obtained a position as operator on the Mexican National Railroad, but returned to the "States" two years later, entering the Commercial service at Galves-

B. P. HANCOCK,
Superintendent of Traffic, Western Union Telegraph Company, Jacksonville, Fla.

ton, Tex. In 1891 he was appointed manager of the Postal Telegraph-Cable Company's office at Chattanooga, Tenn., and three months later was transferred to the Nashville office. He was out of the service for four years after this on account of ill health, but re-entered the Postal Company's employ as chief operator at Memphis, Tenn., in May, 1897, since which time he has filled a similar position in St. Louis, and that of traffic chief operator at Chicago. Later he was promoted to be city superintendent for that company in Chicago. He was afterwards engaged in the electrical business in New York, and four years ago returned to the Postal's service at Birmingham, Ala., where he remained until he entered the Western Union office at Atlanta last November.

Mr. William F. Orr, of North Adams, Mass., Becomes District Commercial Manager.

Mr. William F. Orr, district commercial manager of the Western Union Telegraph Company, with headquarters at North Adams, Mass., has been placed in charge of the state of Vermont and western Massachusetts. Mr. Orr was born in North Adams, and entered the telegraph service at the age of fourteen years with the Western Union Company. He was appointed manager of the Western Union office at North Adams in 1880, and in 1886 resigned to go into the brokerage business. Upon the organization of the Commercial Union Telegraph Company, Mr. Orr was appointed superintendent of the Central District, acting in that capacity until January, 1892, when the lines of that company were leased by the Postal Telegraph-Cable Company. He remained

W. F. ORR,
District Commercial Manager, North Adams, Mass.

as manager of the North Adams office until his acceptance of his present position. Mr. Orr started the first telephone exchange there, which was afterwards sold to the New England Telephone and Telegraph Company. Mr. Orr's experience in telegraph matters admirably equips him for the duties he is now taking up.

vice as messenger in the Western Union Telegraph office at Cleveland, Ohio, in 1890, and later in the year went with the Postal Telegraph-Cable Company and worked his way up to the position of chief clerk. On January 1, 1904, he was transferred to Chicago to occupy a like position and on June 1, 1908, was appointed office manager. A year later he was promoted to the assistant managership which position he held at the time of his recent appointment.

Mr. Charles E. Davidson, manager of the Western Union Telegraph office at Jacksonville, Fla., was born at Waresboro, Ga., October 7, 1877, and entered the telegraph service at Brunswick, Ga., in June, 1894, as operator. He filled this position for five years and for six years afterward was manager of the office. He then went to Jacksonville, first as traffic chief and afterward as operator, and later accepted the managership of the Tampa, Fla., office. He remained in Tampa for two and a half years, and on November 10, 1910, was transferred to Jacksonville as manager.

Canadian Notes.

Mr. J. Townsley, former superintendent of construction at Montreal for the Canadian Pacific Railway Company, was presented with a fur-lined coat by the linemen of the Eastern Division of that railroad on the occasion of his retirement on January 1. Mr. Townsley was also presented with a gold headed ebony cane by the superintendents, inspectors and other officials of the construction department, from Vancouver to St. John. He has been in the service of the company since 1882, and, having completed his allotted period of service, has retired. He is 69 years of age.

Message Forms in Canada.—The Board of Railway Commissioners for Canada has approved, for four months, the forms of contract used in transmitting and receiving messages by the Canadian Pacific Railway Company's Telegraph, the Great North Western Telegraph Company of Canada, the Canadian Northern Telegraph Company, the North American Telegraph Company, the Western Union Telegraph Company, the Anglo-American Telegraph Company, the White Pass and Yukon Route, the Marconi Wireless Telegraph Company, and the Grand Trunk Pacific Telegraph Company.

Annual Meeting of Montreal Telegraph Company.—The Montreal Telegraph Company held its annual meeting in Montreal, January 12. The balance sheet shows assets of $2,293,387. Dividends of $160,000 were paid during the year. A bonus of $5,000 was paid in October. There were no changes in the board of directors. Mr. Hugh A. Allan was re-elected president and Mr. D. Ross Ross, secretary and treasurer.

The Cable.

Lower Cable Rates for Canada.—In response to a question by a member of the Canadian House of Commons, the government stated that "negotiations have been going on for some time and are still going on with a view to reducing the tolls on cablegrams. A conference of the Atlantic cable companies with the British postmaster-general has just taken place with that object in view. It is expected that an announcement will be made shortly in England on the results of that conference."

German Cable to Brazil.—The cable steamer *Stephan* is engaged in laying the last stretch of the new submarine cable of the German-South American Cable Company, which will connect Germany and Brazil. The portion of the cable now being laid is between Monrovia, Liberia, and Pernambuco, Brazil. It is expected that the line will be ready for public business at the end of March.

Diploma for Central and South American Telegraph Company.—A diploma of honor has been awarded to the Central and South American Telegraph Company by the Buenos Aires International Exposition of Railways and Land Transport.

Municipal Electricians.

Fire Alarm.—A patent (No. 981,020) has been granted to F. D. Smenner, Fort Wayne, Ind., for a fire alarm.

Mercury-Arc Rectifier for Charging Fire Alarm Storage Batteries.

A mercury-arc rectifier has been installed for charging the storage batteries which operate the fire-alarm system of Sandusky, Ohio. The battery consists of four sets of fifteen cells each, chloride accumulator, and, with the present system, fifty fire-alarm boxes can be pulled at once.

Previous to the installation of the rectifier a gravity battery consisting of 108 cells operated the fire-alarm system. The new installation, it is stated, effects a saving of $300 per year, as cell renewals when gravity batteries were used were a large item of expense. The first cost of the new equipment, including rectifier, battery and distributing board installed complete, was $589, while the cost of energy for its operation is about $1.40 per month at a ten-cent-per kw-hour rate. It is stated that this equipment is operating very satisfactorily and during the six months it has been in operation no trouble of any kind has been experienced with it.

Keep posted on the latest developments in Telegraphy and Telephony by subscribing for Telegraph and Telephone Age.

Gano Dunn, a Former Telegrapher, Chief Engineer of a Large Electric Manufacturing Company.

Mr. Gano Dunn, chief engineer, vice-president and a director of the Crocker-Wheeler Company, Ampere, N. J., was formerly a telegrapher, and has the distinction of being the first student to receive the degree of Electrical Engineer from Columbia University. Mr. Dunn was born in New York City, October 18, 1870. He learned telegraphy in the signal offices of the New York Central tunnel in New York, and in 1885 obtained his first position as operator at a summer hotel in Catskill, N. Y. He filled this position six summers. During the intervening winters from 1885 to 1891 he worked in various Western Union branch offices at night, in the day time attending the City College, from which he was graduated in 1889. He graduated from Columbia University in 1891.

Mr. Dunn designed and installed the generators in the Western Union New Haven, Conn., office to

GANO DUNN,
Former Telegrapher, now a prominent Electrical Engineer.

take the place of batteries, and assisted Mr. Francis W. Jones, formerly electrical engineer of the Postal Telegraph-Cable Company, in designing and installing the plant in the Postal building at 253 Broadway, New York. He has designed a number of telegraph generating stations and special kinds of motor-generators for use as intermediate batteries, quadruplex batteries, etc.

Mr. Dunn still has a love for telegraphy. His name has been proposed as a candidate for the presidency of the American Institute of Electrical Engineers for the coming year. He takes an active interest in the Institute's affairs, and is one of its foremost members. He was honored by being elected president of the New York Electrical Society for two successive terms, and has occupied prominent positions in committee work of many scientific bodies. Mr. Dunn has traveled extensively and has a wide grasp of electrical matters in European countries as well as in the United States.

Military Telegrapher in the Civil War.

PART LIII.

Among the telegraphers who, during the civil war, took an important part in connection with the telegraph service on both the United States Military and commercial lines was Mr. James A. Swift, who was connected with the signal service for some years, being a lieutenant in the Signal Corps, United States Army, at the time of his death many years ago. Mr. Swift learned telegraphy in 1860, at Magnolia, Md., and at the age of thirteen was placed in charge of that office. Writing of his war experiences, Mr. Swift says in part:

"In those days telegraphy was what you might call in its infancy, but when hostilities began between the North and South, my station became an important one on account of the numerous troop trains passing over the road, nearly all of which made that station the stopping point for the receipt of telegraphic orders. Extra trains loaded with troops hurrying off to the seat of war became so frequent that it necessitated the operator remaining almost constantly at his post.

"Notwithstanding the hard work everything went smoothly until April 21, 1861, when at about ten o'clock at night, the circuit south failed, thus cutting off all communication with Baltimore. I stood by my instrument, adjusting every few minutes in hope of detecting some signs of working, but alas! the familiar "click" did not come. Everything was as silent as the grave, and thus remained until the arrival of the south-bound mail train at three o'clock in the morning. The conductor, Tom Slater having received orders from the superintendent to stop at all telegraph stations and wake up the operators and ascertain the cause of the wire trouble, came rushing into the office and inquired: 'Where is the operator?' 'Here,' was my answer. 'Is your key open?' 'No.' 'Is your ground wire on?' 'No.' 'Then what in the d——l is the matter with the line?' 'Dead open south and has been since ten o'clock,' I said. Turning to the engineer, he said, 'Go ahead to the next telegraph station,' and the train moved on.

"I remained at my instrument, watching faithfully until the dawn of day, yet no signs of 'circuit.' At eight a. m. a train was seen approaching from around the Gunpowder curve, evidently from Baltimore. The engine was running backward and pulling the train after it. It was soon noticed that this engine was the same one that went down with the night mail at three a. m. The train pulled up and stopped at the station and out jumped a number of the Baltimore City police force, also a military company in command of Major I. R. Trimble. I was at my instrument reporting matters to the superintendent, when I was suddenly informed that I was a prisoner. I was placed aboard the train, carried to Bush River and held until the bridge at that point was destroyed. On getting aboard the train, I found my old friend and companion, W. J. Dealy, also a prisoner, having been captured at Back River, at

Digitized by Google

which place he had been stationed. From him it was learned that the wire had been cut in many places and all the railroad bridges destroyed. The train which had passed to the South, at three a. m. had been boarded at the city limits in Baltimore by the policemen and the military company, and the engineer with cocked revolvers at his head was compelled to run his train back as far as Bush River in order that all bridges between there and Baltimore might be destroyed. After burning the bridges and destroying the telegraph line in various places, Mr. Dealy and I were liberated.

"Perryville, a station about forty miles from Baltimore, then became the terminus of the Philadelphia, Wilmington and Baltimore Railroad, owing to the destruction of the bridges and was held by a large body of Federal troops. There was no way of reaching the place, however, other than by foot. This course was determined on and we started on our journey and after a weary tramp we reached our destination. Mr. Dealy was placed on duty at the headquarters of Colonel Charles P. Dare, commanding, and I was sent on to Philadelphia. The stay at Perryville lasted about one month, when I received orders to return to my old station. Owing to the fact that the bridges had not yet been rebuilt, no trains were running, and the return trip had to be made on foot, the distance being seventeen miles. The journey was begun at nine a. m. and at four p. m. the station was reached, and telegraphic communication reopened to Baltimore.

"In May, 1862, I accepted a position at the Baltimore and Ohio Railroad depot in Washington City, being in the employ of both the railroad company and the United States Military Telegraph department under superintendent Westbrook of the railroad company and Major Thomas T. Eckert of the military telegraph department. The business consisted of government, commercial and railroad messages, and was very heavy, especially that of the railroad company, which resulted from the running of numerous extra trains hurrying troops from point to point during the raids of General Stonewall Jackson and the battles of South Mountain and Antietam. I served a year there.

"On July 10, 1864, communication with Washington City being entirely cut off by the Confederates, who were in sight of the city, operators were needed by Major Eckert of the United States Military Telegraph Corps to open communication between the War Department and the fortifications, at the most important points around Washington. I was among those who offered their services and was directed to report to the commanding officer, General A. McD. McCook. Being provided with a horse, all haste was made to reach the fort. Just as I was about reporting to the general, an orderly, who was a little ahead, was heard to remark: 'General, they are advancing on our right, and we are out of ammunition,' and a few minutes later a soldier was seen to suddenly throw up his hands and fall, being shot by one of the enemy's sharpshooters. Stray bullets could now occasionally be heard buzzing overhead.

"After reporting to General McCook I was directed to open telegraphic communication with the military headquarters in Washington immediately. This was rather difficult to accomplish, there being no wire yet erected. However, no time was lost. A suitable location for an office was found, and the wire wagon was seen approaching within about two miles of the fort, accompanied by operators J. H. Dwight and T. N. Loucke of the Military Telegraph Service. The work of running out the wire was soon finished and the fort put in telegraphic communication with the War Department. Things remained quiet, with the exception of the killing, or wounding, now and then of some of the pickets, until the evening of July 12, when a portion of the Sixth Army Corps arrived from the Army of the Potomac, and attacked the enemy. A severe fight ensued, lasting from four o'clock in the afternoon until late at night, resulting in the retreat of the Confederates.

"The Confederates having retreated, the office at Fort Stevens was abandoned a day or two after and the operators withdrawn. I returned to the American Telegraph Company in Washington, going with the Western Union Telegraph Company when these two companies were consolidated."

Reference Files.

The importance of keeping a record of articles published pertaining to the line of business one is engaged in cannot be too strongly emphasized, if it is desired to keep informed as to what progress is being made. There is no general rule for doing this, excepting that the classification principle be observed. The details are largely a matter of individual preference, but whichever way the work is done it requires a little labor and time. These, however, are well expended when we consider the results.

One of our subscribers, an official of one of the telegraph companies, informs us that for the past ten years he has kept a clipping file of articles taken from this journal. He uses a loose-leaf scrap book and files the articles under such heads as Quadruplex, Duplex, Repeaters, Selectors, Poles, etc., the classification being carried out to meet his individual ideas and needs. He now has a complete record of everything that has been published on telegraphic subjects from the time he began up to the present.

This method of keeping track of published articles and items has met with favor in other lines and is probably one of the simplest and most satisfactory, for it enables one to look up the record on any particular subject in the shortest time possible. The ideal filing system would be the memory, but very few of us indeed are endowed with brains so highly developed as to enable us to locate a particular item from memory without resorting to artificial means.

New Canadian Press Association.

Another leased wire circuit was added to the Associated Press on January 1, serving the papers in Eastern Canada. In the past these papers have been served by a report taken from the New York state wire at Buffalo, the franchise being controlled by the Canadian Pacific Railway Company's telegraph department. The increasing prosperity of the Canadian papers and the desire for a change that would bring them into a closer working arrangement with the Associated Press, led to the formation in the fall of the past year, of the Canadian Press, Limited. The new organization follows very closely the same plan of organization as the Associated Press, and, like it, is a purely mutual and non-profit making concern. A contract has been signed with the Associated Press, covering all Canada. The nature of the territory to be covered and the conditions prevalent, rendered a sectional plan of organization advisable, and while the Associated Press franchise is controlled by the Canadian Press, Limited, the news distribution service is divided into four districts, each of which is independent of the others. These four districts are: British Columbia, which takes the Associated Press report at Seattle, over a leased wire; the Western Associated Press, which covers the provinces of Manitoba, Alberta and Saskatchewan, and which has a leased wire between Winnipeg and St. Paul; the Ontario and Quebec division, covering the provinces of Ontario and Quebec, and the Maritime provinces. These two latter districts obtain their Associated Press service from the head office of the Associated Press over a leased wire of the Postal Telegraph-Cable Company and the Canadian Pacific Railway telegraphs running from New York to London, Ont., via Montreal, Ottawa and Toronto, and with a leg to Quebec. The Maritime Provinces papers are served from Montreal over the Canadian Pacific Railway wires on a word basis, the rate depending upon the number of papers served. Local conditions rendered a further division of the Ontario and Quebec section advisable, the morning papers assuming responsibility for the morning service and the evening papers for that for day papers. While entirely separate in regard to financial and administrative matters, the two sections work together in the preparation and covering of news matter. The morning papers opened their service on January 1. Mr. Edward F. Slack, of the Montreal Gazette, is manager of the morning paper service, while the chief operator is Mr. A. F. Haralson, who has had experience on press circuits in the United States, and who has succeeded in getting together a first-class staff of operators. When the service opened a heavy sleet storm caused severe wire trouble, and the same conditions prevailed the following night. For the remainder of the week the wire was in first-class condition, working from 5 p. m. to 3 a. m., handling an average of over 14,000 words per night. Considering that in addition to the Associated Press service from New York, which averaged about 8,500 words per night, an average of 5,500 words per night was handled from six Canadian points at which copy is filed. No small share of the credit for this is due to Mr. E. V. Wedin, Jr., who is the operator in the New York office of the Associated Press. The editor of the service in New York is Mr. P. T. Ahern, who resigned from the New York Tribune staff to accept the position.

The day paper service, which is managed by Mr. Charles O. Knowles, until recently news editor of the Toronto Telegram, covers the same field as the morning paper service, with the addition of Hamilton, in which city there is no morning paper at the present time. This service went into operation on January 16.

The president of the Canadian Press, Limited, is Mr. J. F. MacKay, of the Toronto Globe, and the secretary-treasurer is Mr. J. E. Atkinson, of the Toronto Star. The board of directors represent the leading Canadian papers from the Atlantic to the Pacific.

Preservative Treatment of Poles in Hungary.

The Hungarian method of impregnating pine poles with coal tar oil, as described by Mr. Bela Gati, manager of the Royal Hungarian telegraph and telephone experiment station, at Budapest, Hungary, in a paper read before the telegraph and telephone conference held in Paris last September, consists of making incisions through the tracheid cells in the lower part of the pole by mechanical means to facilitate the penetration of the liquid, while the upper part of the pole is treated superficially, the wood absorbing what oil it will naturally. Experiments were made to determine the form, size and depth of these tiny openings. It was found that under ordinary circumstances the action of the atmosphere penetrates the soil for a depth of one meter, and that below that distance the ground is sterile and does not act detrimentally upon the wood. Therefore, it was determined that the perforations should cover a length of two meters, thus allowing ample margin for protection.

At the Püspokladany impregnating plant it has been found that effective distribution of the oil is obtained by making incisions twenty millimeters in depth, and by subjecting the pole to a pressure of fifteen atmospheres for one hour it was possible to secure a penetration of twenty millimeters deep in the butt and an average depth of five millimeters in the upper part. The quantity of oil required per cubic meter was found to be about ninety kilogrammes. Incisions to a depth of twenty-five millimeters absorb about 110 kilogrammes and at 30 millimeters from 130 to 140 kilogrammes. The experiments proved conclusively that this method of treatment produced absolutely reliable results.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works of telegraphy and treat them in the same manner.]

CHAPTER XXXIV.

What is a three-wire repeater?

What does it consist of?

What is the ordinary method of working three wires together?

Describe the operation of the three-wire repeater.

CHAPTER XXXV.

What is an office loop?

What apparatus does an office loop consist of?

What is the object of an office loop?

How are duplex and quadruplex sets usually arranged in large offices?

If it is desired to cut off the broker loop and use the office loop alone what must be done and what happens when the switch is turned?

CHAPTER XXXVI.

What is the combination set for duplex or single line circuits used for generally?

Trace the circuits for battery and generator connections and note the difference between the two.

Under what circumstances are the branch office sounders operated by the regular duplex-set local battery in the main office?

What is the effect of turning the switch lever to the left, and what is the effect when it is turned to the right?

Why is a local battery in the branch office required for the sounder shown at the left in Fig. 109.

CHAPTER XXXVII.

What is the rule to ascertain the number of cells of battery to employ in order to obtain a given current in a circuit having a known external resistance?

Work out an example on the basis of this rule, substituting numbers for the letters in the formula and performing the operations indicated.

CHAPTER XXXVIII.

What is the rule for ascertaining the number of cells required to operate four-ohm sounder circuits, also for 150-ohm relay circuits?

Do these rules meet every condition of circuits? State reasons.

What is the standard resistance of sounders used on local circuits?

How much current do they require?

How much current does a single 150-ohm relay require to work satisfactorily?

Why does a relay of 150 ohms resistance consume less current than does a sounder of four ohms?

How many cells of battery are required to operate a sounder circuit having an external resistance of fifty ohms?

Find out the number of cells required for a relay circuit with an external resistance of 4,000 ohms.

CHAPTER XXXIX.

How does the telephone work?

What action takes place upon a telephone wire?

Are the sound waves (from the voice) conveyed over the wire mechanically, or electrically?

How is the strength of the magnetic field in a telephone transmitter varied?

Describe the effect of such variations upon the receiver.

Was a battery required for the operation of the original Bell telephone?

Who were among the first to produce a more powerful transmitter than the one above referred to?

Did they use a local battery?

What kind of electric current is it that carries the electrical impulses over telephone wires?

What are the means of producing telephonic transmission currents?

Explain how induced currents are produced.

How did Edison produce a variable resistance in the local telephone circuit?

What is the principle upon which the Blake transmitter was constructed?

Compare the Edison transmitter and the Blake transmitter.

(To be Continued)

Novel Telegraph Receiver. — A curious telegraph receiver is described in a recent issue of the *Elektrotechnische Zeitschrift*, of Berlin, Germany. It contains an electromagnet of special form around the poles of which is a gas chamber divided into two compartments by a membrane. On the membrane an armature is affixed, between the two poles. Small gas tubes are fixed to the chambers, and gas admitted. When the gas is lighted at the tube openings the vibration of the diaphragm, which is caused by the movements of the armature, varies the pressure of the gas in the chambers and causes a corresponding variation in the brilliancy of the gas flames. The signals are read from the fluctuating gas flames.

Girl Messengers in Indiana.—Representative John J. Keegan proposes to introduce a bill in the Indiana legislature to prohibit the employment of girls as telegraph messengers in that state.

ADDRESS ALL COMMUNICATIONS TO
J. B. TALTAVALL, - Editor and Publisher,
253 BROADWAY, NEW YORK.
T. R. TALTAVALL, Associate Editor.

CABLE ADDRESS: "Telegage," New York.
Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

February 1, 1911.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Long Distance Underground Telegraph Lines.

The subject of long-distance underground telegraph circuits is one that is pressing upon the attention of the telegraph and telephone companies. There are several reasons for this. In the first place the growing scarcity and increasing cost of poles is rendering new construction work and renewals very expensive, and in the second place public sentiment is growing more insistent in its demand to have the wires placed underground, even in rural communities. Existing pole lines are in many instances overloaded with wires, and the loss of even one pole from any cause means the disablement of a large number of circuits, usually important ones. Pole lines develop weakness in heavy storms and the damage done to telegraph and telephone lines by a winter's gale is always a very serious matter to the companies, both financially and materially. The damage is usually wrought in exposed situations, such as along railroads and country roads, and the problem is how to avoid these losses of property and consequent loss of business. Obviously one way to do this would be to place the wires underground, even along the country highways, where they will not be exposed to the ravages of storms.

The American Telephone and Telegraph Company has taken up the matter in real earnest and is laying wires underground over the entire distance between Boston and Washington, by way of New York, and the British post office has laid underground wires between the principal business centres, including London, Liverpool and other large cities.

As far as placing wires underground is concerned the problem is not only one of cost but of continuity of service. The installation and maintenance cost of a long distance underground system is very great and it will require careful calculation to determine how far such operations can be carried. Underground lines are subject to many adverse conditions that are not met with in aerial line construction. Electrolysis is an ever-present foe, and requires bonding of the cables to minimize its destructive effects. In city streets underground construction is relatively substantial and reliable, but along country roads there is greater liability to interruption. An important matter to consider is that of repairs to the cables. Cables are expensive, and an injury to one wire often means incidental injury to all. Then in order to maintain the service a new section of cable must be substituted, to remedy a fault perhaps trifling in itself but large in consequences.

Granting the desirability of long-distance underground plant it is evident that the problem as viewed from the companies' standpoint is one of such magnitude as to stagger them in its contemplation. It may be possible to meet the situation by a compromise that will be at least fairly satisfactory to the public and the companies. The companies no doubt would be very glad to adopt any reasonable measures to preserve their property from destruction, and they can be depended upon to do that when they are fairly certain that the end will justify the means.

Public Service Commission in Washington.

In his annual message to the State Legislature Governor Hay of Washington recommends the abolition of the Railroad Commission, the Tax Commission and the office of Insurance Commissioner, and the creation of a Public Service Commission. The Public Service Commission would undertake the duties now carried on by the Railroad Commission in reference to transportation, telegraph and telephone companies, with the added powers of supervision and regulative control over light, power, gas, water and irrigation companies or corporations doing business in the State.

Success and Hard Work.

There are in the world many people who delude themselves with the belief that men attain success and prominence in business more frequently through some outside influence, such as favoritism, etc., rather than by inherent merit. It may be safely stated that no greater error of belief was ever committed. The men who have achieved success have worked hard for it and they are entitled to much credit for their perseverance because they have helped to make their fellowmen happier in one way or another. Certainly this cannot be said of the faultfinder.

Another mistaken notion is that those occupying prominent places in business live on "Easy" street and all they have to do is to draw their salaries and have a good time generally. This, too, is far from the truth. These men do not belong to unions and work eight hours a day. They are on deck and on watch all the time, planning for the betterment of the interests entrusted to them.

A notable example of success through hard work is that of Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company and the Western Union Telegraph Company. Mr. Vail occupies these important positions because he has demonstrated his ability to fill them. He is a tireless worker and wherever he goes and at all times he is never without a pad and pencil to jot down ideas. Great things are developed from ideas and Mr. Vail has lived this principle all through his business career. Everything he has undertaken has been successful.

Along this line of thought the following article from a prominent authority is worth wide circulation and careful reading. It is full of promise for the ambitious young man:

No, young man, there isn't any chance for you at all. The corporations have swallowed up every opportunity, and all that is left for you is to be a hewer of wood and drawer of water—

Unless you are a young man of good character.

Unless you are a young man of intelligence.

Unless you are a young man of energy.

Unless you are a young man willing to put in your best licks all the time, and not spend most of it complaining because you work too hard and get too little pay.

Unless you make up your mind that in every honorable way you are going to succeed.

Otherwise you have a dark future, for which you need not pay a dollar to a fortune teller to inform you.

But if you are all of these things, you have a better chance to get ahead than any young man ever before had in this country.

Take the case of Charles H. Markham, who was recently elected president of the Illinois Central Railway Company, at a salary of $50,000 a year. Less than thirty years ago he was a day laborer on a western railroad and got $1.25 a day. Did he spend his spare hours grumbling over his hard lot? Did he make up his mind that corporations were grinding out the life of the people and try his best to down them? He did not. He did with his might all his hands found to do and with such intelligence that he has never been idle or unemployed an hour when he wanted to work.

Practically every man in great executive positions in this country has had the same experience. Practically every such position in future will be filled by men who have worked up from the bottom. It is not the sons nor favorites of rich men who are going to get the big positions in this country, but those who are able to fill them after a career which has demonstrated fitness. Everybody knows Napoleon's saying that there was a marshal's baton in the knapsack of every private soldier, and the spirit of it is true of civil or industrial life. There is success for every young man in this country who deserves it.

Messengers' Clubs.

The idea of establishing clubs for messenger boys seems to be a long step forward and is meeting with wide approval. It certainly would be to the advantage of the telegraph companies to employ boys of good character to start with and use every endeavor to keep them permanently in the service, employing every legitimate means to help them along morally and physically.

An interesting article from a former messenger, and now prominent in business, appears on another page of this issue. The writer strongly advocates the boy club idea and points out the advantages to all parties concerned that would result from its practical application. The boys' club on the East Side of New York City, referred to by our correspondent, was started thirty-four years ago by the late E. H. Harriman. It was established to give the miscellaneous denizens of that section of the city an opportunity to help themselves. It is not a charitable institution, a small fee being charged for membership privileges. It has accomplished a great deal of good mentally, morally and physically among those whom it was intended to benefit, and it does its work unostentatiously. The membership is divided into three grades, i. e., juniors, intermediates and seniors, and last year nearly 5,000 juniors registered. There are no restrictions that any self-respecting boy cannot comply with. This institution might serve as a model for others of its kind, and messenger boys could easily be induced to avail of the advantages offered. The companies could with great benefit to themselves co-operate in a movement of this sort and see that the welfare of their messengers is looked after. The object is a worthy one and is certainly of sufficient importance to deserve the most careful consideration.

Copies of electrical books covering the electrical industry may be purchased at the office of Telegraph and Telephone Age, 253 Broadway, N. Y.

Line Testing by Indicating Instruments.

In our issue of January 16 was printed the first part of an article prepared in the office of Mr. W. E. Athearn, engineer of equipment of the Western Union Telegraph Company on the subject of testing telegraph lines by a volt-mil-ammeter, designed by the engineer of equipment for convenient operation at the switchboard.

The installation and operation of the instrument were there considered and now general tests of wires will be taken up.

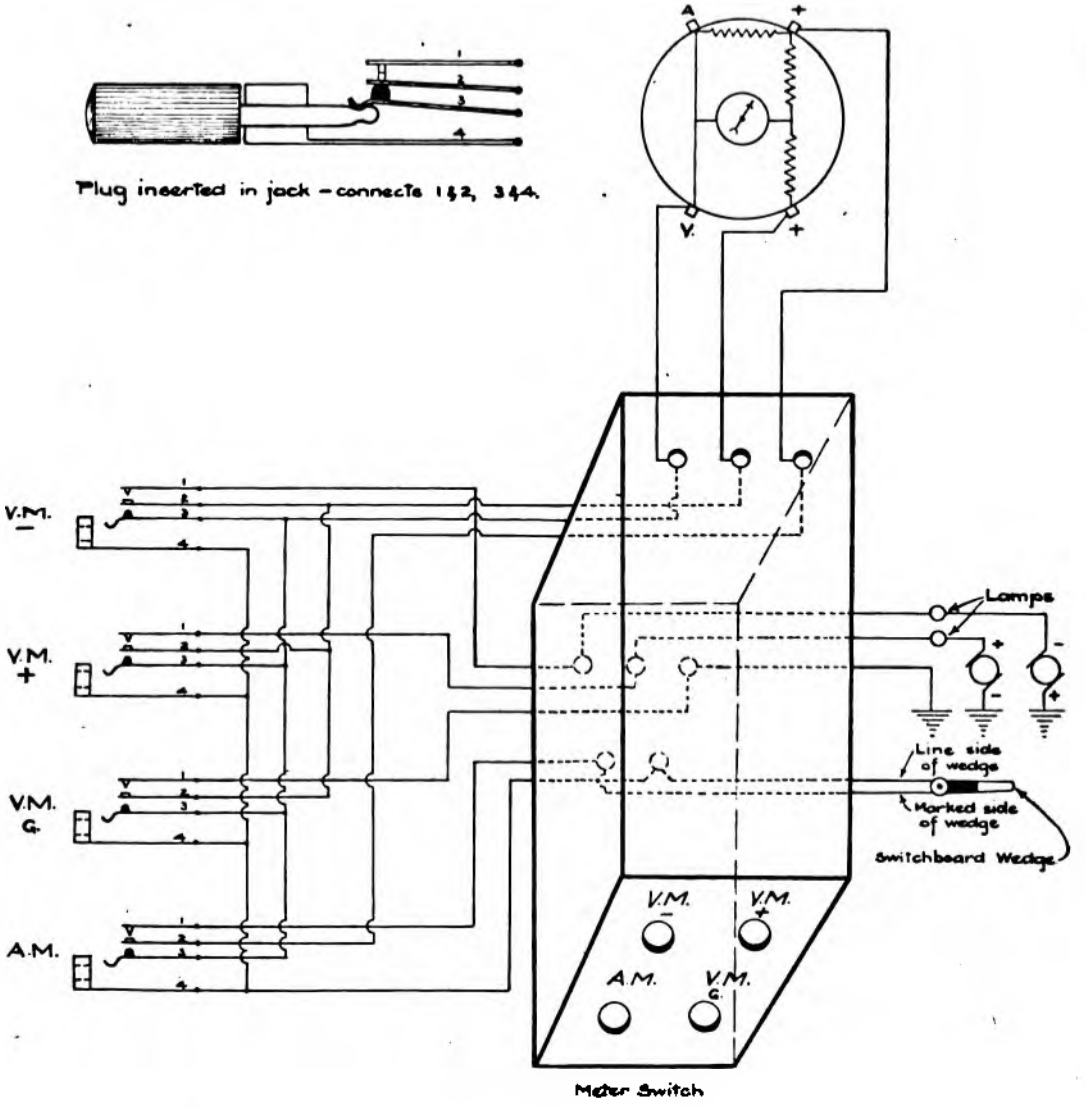

FIG. 5.—DIAGRAM OF JACK BOX AND CONNECTIONS.

GENERAL TESTS OF WIRES.

The following instructions cover the general tests made whenever it is desired to determine the condition of a wire; for example, when it is suspected that a wire is in trouble or at the daily tests of all wires made before the hours of heavy traffic. The readings of the voltmeter or mil-ammeter are not often recorded at such times, but are observed for comparison with similar readings on other wires or with tables of resistance values corresponding to the meter deflections.

To test a wire.—The first test to be made is to determine whether or not the wire is clear, that is, well insulated from the earth and other conductors. For this purpose the wire is opened at the distant end of the section to be tested. At the testing station the volt-mil-ammeter is applied by inserting the wedge connected with it, in the switchboard spring-jack of the wire, with the marked side of the wedge outward; that is, the marked side of the wedge connects with the working battery of the wire plugged on at the proper disc, while the unmarked side connects with the line to be tested. Care should be taken that any other wires which might be crossed with the wire to be tested are connected to either battery or ground. If they are working wires, this is of course provided for by the regular working battery and it is unnecessary to disturb them, but if

Digitized by Google

such wires are out of service they should be grounded while the tests are being made.

The connecting plug is then inserted in the jacks of the jack box as follows (see Fig. 5), and the reading of the meter observed each time:

No. 1. Plug in jack marked "VMG,"
No. 2. " " " " "VM+,"
No. 3. " " " " "VM—."

The results obtained in these three operations may be analyzed as follows.

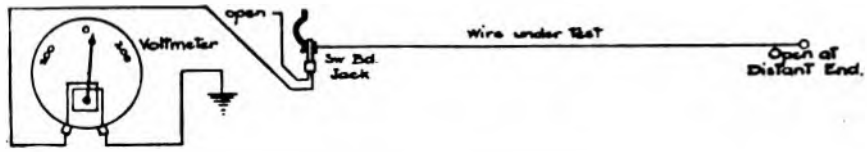

FIG. 6.—VOLTMETER CONNECTIONS.

1. The insertion of the connecting plug in the "VMG" jack, as may be seen by tracing out the connections shown in Fig. 5 connects the voltmeter portion of the instrument as shown in Fig. 6, leaving open the circuit of the regular switchboard working battery. It is evident that the only way in which the voltmeter needle can be deflected in this case is by contact between the wire under test and some other conductor having a voltage, positive or negative, to the ground. If this voltage is positive the voltmeter needle will be deflected to the left; if negative it will swing to the right. There are several ways in which such a voltage may be met with: The distant station may have failed to open the wire and left his working battery on; or the wire may be crossed with a working circuit; or it may be leaky or grounded at a point having considerable ground potential. The first condition is usually easy to detect by the high and steady reading of the voltmeter. If the wire is crossed with a working circuit the fact is often apparent by the rapid movement of the needle in response to the Morse signals and it is generally a simple matter to pick out the working circuit by watching the needle while the working battery is removed in turn from each of the wires likely to become "mixed up" with the one under test as the needle will come to rest (though probably not at zero) as soon as the working circuit referred to is interrupted. It is possible, however, if the working circuit were not in use at the time, that the voltmeter needle might show a steady deflection or even remain at zero, in which event the "cross" would not be discovered until the operations numbered two or three were performed. The third condition—a deflection due to ground potentials, is most commonly noticed on wet days and generally shows a reading of only a few volts varying rather slowly.

2. With the wire still open at the distant end, and the connecting plug at the jack box transferred from the "VMG" jack to the "VM+" jack, the connections are as shown in Fig. 7, the regular switchboard working battery still remaining disconnected, as before, as special taps of the "second potential" are used entirely with this voltmeter. A deflection is almost certain to be obtained in this case, unless the insulation of the wire is perfect, for it is evident that if there are any leaks at all, such as those shown by dotted lines in Fig. 7 a current will flow from the generator or battery through the voltmeter, out over the line and return through the leaks and the ground or other conductors. This current will deflect the voltmeter needle to the right, the amount of the deflection depending on the amount of leakage or the resistance of any fault that may be present. If the leakage is slight, as in the case of a good wire in clear weather, the deflection will be only a few volts. If there is a high resistance fault on the wire or if it is leaky, the voltmeter reading will be considerably higher, and if the fault is a "solid" cross or ground the reading will be almost equal to the voltage of the testing battery. The distinction between a cross and a ground is usually made without difficulty. A cross with a working wire would generally be indicated by the first operation, when the connecting plug was in the "VMG" jack as previously explained; if not, it will show up in either this operation or in operation No. 3, by giving a high volt-

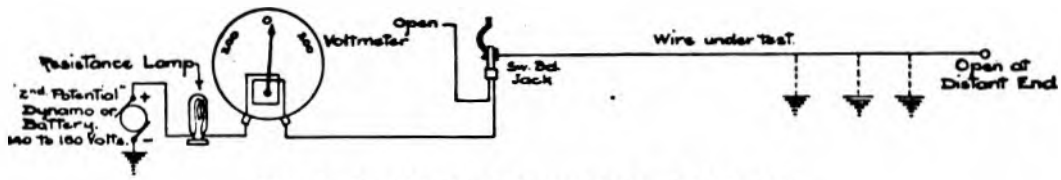

FIG. 7.—TESTING FOR INSULATION, LEAKS, ETC.

meter reading, probably much in excess of the testing voltage. A cross with a grounded wire will give the same results as a ground, but as the wire chief knows which wires he has grounded for the test, he will open such wires one by one, watching the voltmeter needle to see whether any change occurs; the needle will drop to a much lower deflection as soon as the ground is removed from the crossed wire, but if the fault on the wire under test is a ground no change in the deflection will result.

3. After noting the deflection obtained in operation No. 2, with the wire still open at the distant end, the connecting plug is transferred from the

Digitized by Google

"VM+" to the "VM—" jack, making the connections as per Fig. 8, which is identical with Fig. 7, except that a special negative tap of the "second potential" is now used as the testing battery instead of the special positive tap previously used; the regular working battery at the switchboard is still cut off by the jack box connections. The voltmeter deflections will of course be reversed by the above change, the needle now swinging to the left. Usually the deflections obtained with the negative battery will not differ greatly from those obtained when the "VM+" jack was used. It is necessary to take the two readings, however, because the leakage in other conductors, and the only remaining test is to determine whether or not it is intact. This is done by having the distant end ground the wire. The voltmeter or mil-ammeter is left in circuit at the testing station and as soon as the distant ground is applied the needle will indicate the fact by an increased deflection, provided the wire is continuous. If the voltmeter is being used the reading will be very nearly as high as the voltage of the testing battery; if the mil-ammeter is being used the deflection will depend on the resistance of the wire but should be considerably higher than the deflection obtained previously with the distant end open. Should the

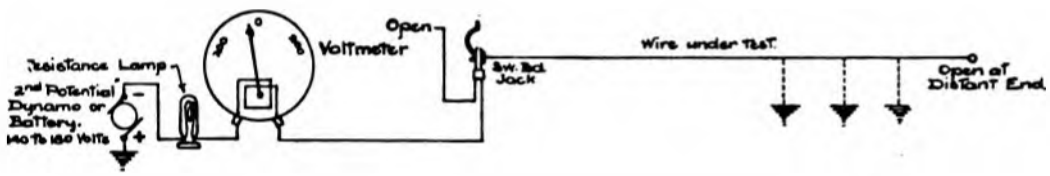

FIG. 8.—TESTING FOR INSULATION, LEAKS, ETC.

the first case may be at a point where considerable earth potential exists, or there may be a cross with another wire having some potential; and either of these potentials might be such as to oppose the current from the testing battery thus giving a much lower deflection of the voltmeter needle than would be the case if these opposing potentials were absent. By reversing the testing battery in this way, such effects are at once brought out since they then increase the deflection as much as they previously decreased it.

The amount of the deflections obtained with the connecting plug in the "VM+" and "VM—" jacks will vary widely with the weather conditions. To make the mil-ammeter test, the connecting plug is inserted in the "AM" jack, which makes the circuit as per Fig. 9. It will be noticed that the special testing taps are no longer used, but instead the regular switchboard working battery is connected by a plug at the proper disc. This plug should usually be so placed as to apply the "second potential" for this test. While it is easy to calculate the resistance in circuit for any deflection of the mil-ammeter needle by the application of Ohm's law, as already explained, such figures are not often required in this test. Instead, the principal value of mil-ammeter readings under these conditions is in the comparisons they enable us to make between one wire and another.

The tests so far outlined will show whether or not the wire is clear, i. e., insulated from the earth and wire be broken or open at any point, the application of the distant ground will not affect either the voltmeter or the ammeter at the testing station.

To MEASURE CURRENT.—For satisfactory operation of telegraph circuits the strength of current must be kept within certain definite limits. In the case of a simple Morse circuit equipped with 150-ohm relays, these limits are forty and sixty milliamperes with thirty-five-ohm relays on such a circuit, the limits are fifty and seventy milliamperes. For a quadruplex circuit, with the grounding switch thrown at the testing station, the "long end" of the distant battery should give between sixty and seventy-five milliamperes and the "short end" between twenty and twenty-five milliamperes, the mil-ammeter being cut in between the set and the line wire

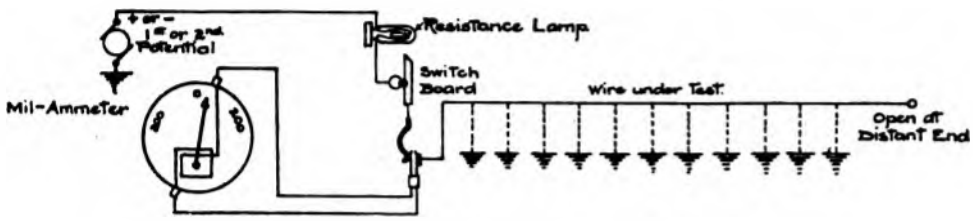

FIG. 9.—MIL-AMMETER TEST.

at the testing station. For a polar duplex a similar measurement should show twenty-five to forty milliamperes. To make these tests with the volt-mil-ammeter, the connecting plug is first inserted in the "AM" jack at the jack box, which connects the instrument as an ammeter to the switchboard wedge. That wedge is then inserted with the marked side outward in the spring-jack of the wire under observation on the line side of any other wedge or wedges that may be already occupying that jack. The meter will then indicate in milliamperes the strength of the corresponding to a positive voltage at the distant end current flowing in the wire, a deflection to the left and vice-versa.

It may be noted that this use of the mil-ammeter

Digitized by Google

is of great value in bad weather for indicating the amount of working margin to be expected of a wire.

To test distant battery.—This test is identical with operation No. 1 under the heading "To Test a Wire," except that the wire is not opened at the distant end. The volt-mil-ammeter wedge is inserted, marked side outward, in the spring-jack of the wire over which the reading is to be taken. The connecting plug is inserted in the "VMG" jack at the jack box, and the meter indicates the voltage of the distant battery; if the latter is positive, the needle will swing to the left, and if negative to the right. These readings will be somewhat lower than the actual voltage of the distant battery, on account of the resistance of the line wire. This error only amounts to ten per cent. when the line wire resistance is 2,000 ohms, and is below that for lower resistance wires; it is therefore unnecessary to calculate this error in most cases.

(To be continued.)

Meeting of Serial Building Loan and Savings Institution.—At the annual election of the Serial Building Loan and Savings Institution, held at 195 Broadway, New York, January 17, officers and directors were elected as follows:

President, A. G. Saylor; vice-president, James R. Beard; treasurer, E. S. Butterfield; secretary, Edwin F. Howell. Directors: Thomas W. Carroll, E. M. Mulford, Thomas M. Brennan, William J. Quinn, M. J. O'Leary, Thomas E. Fleming, John A. Hill, C. A. Kilfoyle, G. W. Blanchard, Edward Reynolds, M. S. Cohen, E. E. Brannin, M. W. Ravens, H. A. Konninger, J. T. Laidlaw.

The fifty-second semi-annual statement for the six months ended December 31, 1910, shows the following assets and liabilities:

ASSETS.

Cash in bank	$ 7,475.65
Mortgages	461,261.41
Stock loans	6,705.00
Land contracts	10,866.43
Real estate	12,679.43
Advances	3,502.88
Furniture	500.00
	$502,990.80

LIABILITIES.

Shareholders cumulative	$331,578.64
Shareholders prepaid	56,400.00
Shareholders matured	35,000.00
Shareholders juvenile	806.21
Borrowed money	26,964.72
Due on loans	16,300.00
Surplus and undivided earnings	35,941.23
	$502,990.80

Transmitting Pictures by Electricity.

The Belin system of transmitting pictures has been improved with a view to the softening of the shades in the received reproductions. The inventor has substituted for the rheostat in the earlier apparatus, a microphone of special construction, which not only excludes any abrupt variation and corresponding harshness of shades, but, on account of its sensitiveness, is actuated even by the minute differences in relief present in any ordinary photographic print, so that there is no necessity of preparing any special photograph.

In the Belin system a photographic print in bichromated gelatine, presenting a series of elevations and depressions, is wound around a cylinder rotating in front of a tracing point carried by the short arm of a lever. The long arm of the lever carries a little wheel rolling upon a series of silver plates alternating with minute sheets of mica. By sliding on the elevations and depressions of the picture the double arm lever, with the wheel affixed to its end, thus inserts into the circuit a variable resistance depending upon the depth, and accordingly the shades of the various portions of the picture. The fluctuations in current intensity thus introduced into the circuit are transmitted over the telegraph or telephone line, in order to be reconverted at the receiving station into fluctuations of luminous intensity.

An article on the subject of transmitting photographs by wire was published in these columns June 1, 1910.

Beginning of Telephoning in New York City.

The October and November issues of the *Telephone Review*, of New York, contain an interesting article by Mr. Herbert N. Casson on "The Beginning of Telephoning in New York City." Among the well-known persons mentioned in connection with the pioneer work are, Mr. Willard L. Candee, now president of the Okonite Company, New York, Mr. Walter C. Humstone, formerly superintendent of the Western Union Telegraph Company, New York, Mr. Henry W. Pope, special agent of the American Telephone and Telegraph Company, New York, the late L. G. Tillotson, Mr. Charles E. Chinnock, Mr. W. H. Eckert, Mr. J. A. Seely, and others.

An interesting feature of the article is the facsimile reproduction of a letter from Mr. Theo. N. Vail, then general manager of the National Bell Telephone Company, Boston, to Mr. H. W. Pope, who was then general superintendent of the company in New York. In this letter Mr. Vail said: "What we want to do in every case is to adopt the best system."

In the article, Mr. Casson states that the first regular telephone exchange in New York city was opened at 82 Nassau Street, in March, 1879. This statement, however, is challenged by Mr. George B. Scott, superintendent and electrician of the Gold and Stock Telegraph Company, New York, who states that the first telephone exchange was started on August 1, 1878, by the Gold and Stock Telegraph Company, at 198 Broadway, using Scott's centennial private-line printer and Edison telephones and call bells, with one wire to each customer. He gives the names of fifteen customers who were connected with the company's central office on August 6, 1878. Each customer could be put in communication with the others, using a telegraph printer or an Edison telephone as preferred.

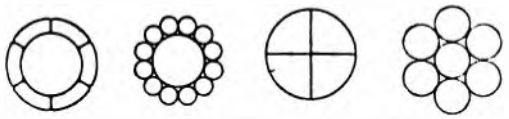
Submarine Cable-Laying and Repairing.

Mr. Charles Bright, F. R. S. E., recently delivered two lectures before the Royal Naval War College, in England, on the subject of submarine cable-laying and repairing.

After introducing his subject the lecturer proceeded to describe the interesting work of stowing cable in the tanks of a cable ship and at cable stores at stations. Proceeding, he said: This brings us to the subject of types of cables. As you are no doubt aware, the conducting wire is always composed of the purest possible copper, that having a higher electrical conductivity than any material other than silver, which is too expensive—besides being practically no better in this respect, and less satisfactory in other ways. There are different forms of electrical conductors. Electrically speaking, the solid wire is the obvious form for a conductor of given dimensions. A single solid wire is, indeed, the most suitable where only small gauges are concerned— for a short telegraph line, for instance. When, however, a larger conductor is necessary, its rigidity is soon found to give trouble in buckling through the insulating envelope. The plan of laying up several smaller wires into the form of a strand (Fig. 1) was, therefore, resorted to for the con-



FIGS. 1, 2, 3 AND 4.—FORMS OF CONDUCTORS.

ductor of long telegraph cables, the gauge and number of wires varying with the total length of the line. This is, undoubtedly, the best adapted form mechanically. Electrically, however, it is clearly at some disadvantage, owing to the interstices between the separate wires; and, in order to meet this objection, while retaining, in some measure, the mechanical features of a strand, a segmental type (Fig. 2) was adopted by Messrs. Bright and Clark on the first cable to India. But considerable difficulty was experienced in the manufacture of such a conductor; and a little later the late Sir William Siemens' form, shown in Fig. 3, —that of a large wire surrounded by a number of smaller wires—was resorted to, for combining the electrical advantages of a single solid wire with the mechanical advantages of a strand. This is the type now usually adopted for very long cable conductors, while the strand form is in universal use for lengths under about 1,000 miles—where the required speed of electrical work does not necessitate the other type. Again, for ocean cables of extreme length, the form shown in Fig. 4, due to Mr. Willoughby S. Smith, has recently been turned to account. The insulating envelope of a cable is almost invariably composed of gutta-percha, the electrical, physical and mechanical qualities of which improve so much from submergence under the depths of the ocean—both by pressure and low temperature.

Vulcanized india rubber is the only other material which is ever adopted for insulating submarine conducting wires. This is used in the case of cables laid in certain tropical waters invaded by a tiny boring insect called the teredo, and by similar insects possessing a penchant for gutta-percha. The comparative toughness of india rubber is more than these creatures of the deep can readily negotiate. For submarine purposes, gutta-percha has, however, many advantages over india rubber under ordinary conditions. In some teredo-ridden waters, gutta-percha is adhered to for the insulation, the core being covered with a thin brass taping (embedded in cotton tape, or threads) and this is found to be fairly satisfactory.

The thickness of insulating covering is dependent upon the size of the conductor, in accordance with the electrical requirements of the line. It is, in any case, essential to have a sufficient depth of insulation, strength and lightness being the main objects. A wire of comparatively small gauge, of mild steel or homogeneous hard-drawn iron, is therefore adopted, such a wire having a breaking strength up to 100 tons per square inch. For shallow water cables, however, the considerations are entirely different. Hence, in the type used for shore approaches, large metallic surfaces to withstand abrasion by rocks, etc., together with great weight to withstand lateral (shifting) strains due to strong currents or heavy seas, are of first importance. The increased quantity of metal thus entailed being more than sufficient to withstand all longitudinal stresses likely to be experienced under such conditions, an ordinary class of iron wire ("best-best" quality) of comparatively low tensile strength, say 30 tons per square inch is employed. The reduced rigidity here obtained is essential on account of the increased bulk. It will be obvious that the iron sheathing would be likely to damage the insulated conductor if applied direct. The gutta-percha, or india rubber, core is, therefore, served with a bedding of jute yarns previous to the laying up of the sheathing wires.

In any cable, as now made, there are at least three types of construction, namely, the "shore-end," the "intermediate" and the "deep-sea" (or main) cable, the last-mentioned usually constituting by far the greater portion of the entire length. The "shore-end" is employed, say, for the first two miles from each beach, in depths up to about twenty fathoms, the "intermediate," say, to a depth of 200 fathoms, and the "main" type for the remaining portion. Sometimes, however, as many as six different types are necessary for coping with the varying conditions along the route, and it is often found convenient to apply a distinguishing number, or letter, to each. The "shore-end" type is, as a rule, furnished with two sheathings, the outer composed of wires of large diameter, with an intervening layer of jute. The weight of such a cable is sometimes as much as thirty tons to the mile. Generally speaking, more or less the same quality of iron is employed for the ordinary "intermediate" type, in a single sheathing of

Digitized by Google

wires of medium, though rather large diameter. With a view to preserving the iron from oxidation, the sheathing wires are galvanized. In the case of deep-sea types it is also very usual to apply cotton tape steeped in a bituminous mixture, galvanizing not being a very lasting preservative against rust where salt water is concerned. This preservative mixture is commonly known as Bright and Clark's compound, and is composed of varying proportions of mineral pitch, tar and silica—the latter being incorporated as an extra precaution against the inroads of the teredo. By way of a firm binding and a further preservative, the sheathed cable is, as a rule, finally enveloped in two outer servings of hemp cords, yarns or canvas tape, and then again coated with the aforesaid bituminous compound. In the case of the special shore end these outer wires appear elliptical. In reality, however, they are the ordinary circular wires, but being applied with a very short lay, this appearance is produced in true

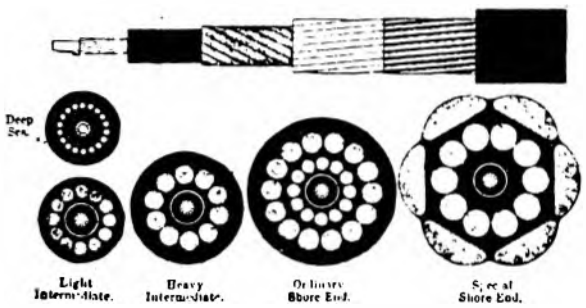


FIG. 5.—MODERN OCEAN CABLE TYPES.

section. Shore end cables of this description are now largely used where local conditions demand something specially heavy and offering a large surface to withstand the abrasion of rocks.

Deep sea (main type) cable of the description depicted in the sectional elevation is intended for up to maximum depths of three or four miles, and will bear a strain of seven tons, with an elongation of at least three per cent. Its weight being only about one ton per mile in water, it is capable of supporting a considerable length of itself. Thus, a cable can be recovered and repaired in great depths. The form of telegraph cable now in vogue is fundamentally the same as that which was first devised, but other patterns have been tried occasionally, though not with much success. At one time an attempt was made to reduce the weight of deep-sea types by introducing more hemp and less iron. Thus, in the second Atlantic cable each iron wire was enveloped in hemp, but the hemp was soon destroyed by the rusted iron wires which then remained in a loose bundle. A return was thereupon made to the close sheathed type, which has been adhered to ever since. Steady advance has, however, been effected in the quality of the materials used, and the available strength of the cable shown in Fig. 5 is 30 per cent. greater than that of the Atlantic cable of 1865.

(To be continued.)

Wireless Telegraphy and Telephony in 1910.

In reviewing the progress made in 1910 in wireless telegraphy and wireless telephony the *Electrical World* says that progress in wireless signaling during 1910 has been "of an unusual nature, since it has consisted both of advances and setbacks. The federal government has shown unexpected activity in the prosecution of a number of firms which, the authorities allege, have been engaged in the development of wireless mainly as an auxiliary to their respective stock-selling agencies. Whether or not the government will be able to prove its cases is still an open matter; but if the charges which have been brought reflect the conditions which have existed it is high time that an art so necessary to the world's welfare should be relieved of connection with unsound financial methods. The unprogressive attitude which certain of the European governments have held with regard to wireless communication has greatly restrained its usefulness to the general public as a competitor of cable signaling. During the past year, however, there has been a change, and concessions have been granted for working over some important stretches of sea. South American countries, however, are likely to benefit before we do, on account of the great difficulties which have been encountered in satisfactorily arranging for transatlantic wireless transmission. The wireless patent situation in the United States has steadily been growing more complicated. Legal activity is beginning, and it is greatly to be hoped that when decisions are handed down on the dozen or so wireless patents which are now in suit much of the confusion which has been due to the patent situation will be cleared away.

"In spite of the handicaps which are preventing ether communication from reaching its full degree of utility, it has, in the past year, given a good indication of what this may be. Half a dozen vessels, on which were 300 or more people, have been rescued by the use of wireless from positions in which the fates of the crew and passengers were at least very uncertain. However, other recent examples, such as that of the steamer *Cincinnati*, have shown how crudely the wireless is applied. The *Cincinnati* had a rough passage, and on both continents friends of the ninety-six cabin passengers were much worried, since no word could be had from the ship. On her arrival, two days overdue, it was explained that she 'was too far away to send wireless message.' This shows regrettable limitations in installing, since it is not difficult to obtain apparatus by the use of which a ship may keep in touch with land during an entire passage. One of the most significant accomplishments of the year was the long-distance test carried on by the navy in the early summer, namely, 3000 miles daylight signaling from a 600-ft. tower. When the requirements of this test were stated some time ago, wireless engineers in general considered the feat too great to be thought of in the 'present state of the art.' Nevertheless, the test was made to indicate the feasibility of the proposition, and the re-

Digitized by Google

sult was so satisfactory that work on the high-power government station, to be located near Washington and to have a daylight range of 3000 miles, has been begun. The record figures for long-distance communication have been pushed upward. Under exceptional conditions (at night in the fall or winter) a distance of 6500 miles has been attained, and 3000 miles by daylight is scarcely more than normal working for well-equipped stations. Notwithstanding this, 'records' of much shorter distances continue to be announced from time to time. The group frequency of 1000 per second which had been quite thoroughly tried out by the end of 1909, has had a year of fairly general use, and is showing up well. The prediction that the 1000-spark per second frequency would be much more easily followed by the ear through the irregular rumblings of 'atmospheric' than are the lower rates of discharge has been well verified by experience. The navy is now installing some sixty outfits in which this higher spark frequency is used.

"The methods of theoretical engineering necessary in the design of wireless instruments are daily reaching more firm foundations. In the study of the quantities involved in electro-magnetic wave signaling it has been necessary to invent both methods of making measurements and apparatus for carrying them out. Conceptions of new physical entities and their relations with the ordinarily used quantities have had to be worked out, and the connection between standard alternating-current practice and high-frequency alternating-current practice has been established by necessity. Thus the tools for intelligent work in wireless are being rapidly developed, and the cut-and-try methods gradually done away with. The more progressive workers in the field have left the 'accepted standards,' and by evolving new methods and apparatus therefor have reached new degrees of usefulness. It is stated that by the utilization of several novel principles the harmful effects of even the worst 'static' or atmospheric interference may be completely done away with; and those who have witnessed demonstrations of the late methods and who understand their technology are indorsing this statement without qualification. The application of the method to commercial practice is expected within the next few months.

"Wireless telephony in America has suffered from over-exploitation and under-accomplishment. Promises ranging from opera music at 200 miles to telephony between New York and Paris have been very lacking in fulfilment. The majority of workers in this branch of wireless signaling have either feared or been unable to break away from the arc-and-microphone types of sender, and the general lack of progress is probably the result of this. Even the patents on space telephony have been exceedingly few, and the entire development of the science is quiet. Occasionally a wireless telegraph operator is startled by picking up a "Hello! Hello!" from the ether about him, but practically no activities are announced. It may be that development is going on without the fireworks which usually accompany work in this line, and that announcement of unusual progress may be made most unexpectedly. If this is not the case, it is to be regretted that the work has been put aside, for wireless telephony should be able to offer the solution of transmission over distances which are impossible with wires or cables."

New Typewriting Telegraph System.

The Telegraphic Mail Company, 220 Broadway, New York, is exhibiting what it claims to be a new system of telegraphic transmission. The apparatus consists of a typewriter transmittter and a like machine as a receiver; each machine performs both functions. The transmitting machine looks like an ordinary typewriter set on a base which contains all the electrical mechanism. The message is printed on a sheet of paper on the receiving instrument, as on the ordinary typewriter, the receiver being operated by the electrical impulses sent out by the transmittter. The sending operator makes a typewritten copy of his message by the same operation that performs the transmission.

Mr. Tullio Venier Giara is the inventor of the apparatus. For the purpose of demonstration, sending and receiving instruments are set up in the office of the company. Mr. Giara states that for short lines, such as between office and factory or departments, each character is provided with a conductor; thus there are as many conductors (cabled) as there are characters on the keyboard. For long lines, however, such as between cities, he states that one wire is used and that the characters are selected at the receiving end by a new method, which he would not disclose.

The system is recommended particularly for business purposes in such places as banks, factories, theatres, offices, etc. It is stated that the Teletype, as the instrument is called, will form a valuable adjunct to the telephone.

Report of New York Public Service Commission.—The New York Public Service Commission, second district, according to the fourth annual report, has jurisdiction over ten telegraph and 135 telephone corporations. The commission calls attention to the provision of the law as to special low rate contracts by telephone corporations. The statute does not say that such special contracts are unlawful, or that in fact they shall be discontinued. The burden of requiring the cessation of discriminations from that course is placed upon the commission. Until it acts such discriminations which have heretofore existed may continue, and when it does act whatever increase of rates is entailed to any individual will at once be charged to the commission and not to the corporation which has initiated and continued the discrimination.

Loaded Submarine and Underground Telephone Cables.

A patent was issued December 6, 1910, to Dr. J. H. Kuntz, of Hoboken, N. J., covering a method of construction of cables whereby the effect of capacity is counteracted in whole or in part. The effect of the distributed capacity is counteracted by means of an inductance, and it is stated that by the construction described a cable can be produced with an inductance as large as may be required for the given conditions, and, what is more important, the amount can be predetermined and the dimensions of the elements of the cable so fixed as to secure the proper adjustment in a way mechanically simple and commercially practicable. The conductor is disposed helically about a core, which may or may not be of iron, depending upon the amount of inductance desirable. In the case of a submarine cable with capacity and resistance such as are encountered in actual practice the amount of inductance necessary to neutralize the capacity is calculated and then the dimensions and arrangement of the core and conductor are determined from these data. The specifications give an example of such a calculation. In the case of an iron core the strands are of fine soft-iron wire, which may be insulated from each other by a coating of oxide, or they may have a thin coating of insulating compound.—*Electrical World.*

Demagnetization of Receivers on Telephone Train Dispatching Circuits.

At the meeting of the Eastern Division of the Association of Railway Telegraph Superintendents, held in New York, November 16 and 17, 1910, a discussion took place on the demagnetization of receivers on telephone train despatching circuits.

Mr. W. J. Camp, electrical engineer of the Canadian Pacific Railway Company's Telegraph, Montreal, brought the matter to the attention of the meeting. He stated that sometimes, almost before a circuit was in operation the receivers on the station telephones would become demagnetized, then others would become demagnetized in the course of a month or two. Some of the members reported that they had experienced similar trouble on their circuits, while others had not observed anything of the kind.

It had been suggested that the mass of iron in the arm tended to demagnetize the receivers, but this theory does not seem to have been supported by the facts.

Mr. Camp stated that he had found it difficult to get any explanation from the telephone people.

Mr. A. B. Taylor, superintendent of telegraph of the New York Central Lines, New York, stated that his experience in connection with receivers made by a leading company was that the first lot were built up with three separate parts, and he lost quite a number of receivers of that type of construction, but since then the manufacturer has made them in one piece, and that has practically eliminated all of that trouble.

ANSWERS TO QUESTIONS.

[In this department questions on matters of a practical character, and of general interest, will be answered. Questions intended for this department must be signed by the writer's full name—not for publication, but for identity. No attention will be paid to anonymous communications.]

(7) Q.—How can the plates of a storage battery be distinguished by their color? O. C.

A.—When the plates are fully charged and in good condition, the positive plates have a dark reddish brown or chocolate color; the negative plates have a gray or slate color. The plates may also be distinguished by the relative hardness of the active material. The lead peroxide on the positive plates is hard, like soapstone, while the material on the negative plate is soft and can be easily cut into with the finger nail.

(8) Q.—What is the speed in air of electromagnetic waves used in wireless telegraphy? B.

A.—The speed of electromagnetic waves through air is approximately 186,400 miles per second, which is equal in distance to seven and one-half times around the world. This is the same speed as light.

(9) Q.—What is the length of wave commonly employed in wireless telegraphy? L. T.

A.—The wave length may vary from 100 yards to six and a half miles, corresponding to frequencies between 3,000,000 and 30,000 cycles per second. An ordinary wave length would be say 328 yards long with a frequency of 1,000,000 cycles per second.

(10) Q.—How can I place a Wheatstone transmitter in circuit on Wheatstone automatic repeaters so that the repeating station may, when traffic between the terminal stations is clear, put on a transmitter and utilize the repeaters for transmitting his business at high speed? J. W. B.

A.—In Maver's "Telegraphy," 1897 edition, there is a diagram of such an arrangement. If the transmitter is connected in circuit as shown, and special wires are taken from the binding posts to the necessary battery connections on the repeater board, the arrangement will work all right.

(11) Q.—How is selective ringing accomplished on party telephone lines? E. B. F.

A.—There are two principal methods of selective ringing on party lines. In one the ringer is so arranged that it will respond to currents in one direction only. Such a ringer is called a biased bell. Selection between four stations on a line may be had by connecting two biased bells, one of each polarity, between each limb of the line and ground. By sending positive or negative pulsations of current from the central station over one limb of the line, any one of the four bells may thus be made to respond to the exclusion of all the others.

(12) Q.—What is the purpose of amalgamating battery zincs, and how is amalgamating done? T. P.

A.—Zincs are amalgamated to prevent loss of energy due to "local action" within the cell. Local action always takes place when commercial zinc is placed in acid solution. Commercial zinc contains

Digitized by Google

foreign substances, such as bits of iron, carbon or other conducting bodies. When these foreign bodies are acted upon by the acid they form closed local circuits, and the zinc is eaten away in patches, or pits. Zincs are amalgamated by first cleaning them by dipping in diluted sulphuric acid and then rubbing mercury over the surface. The action of the mercury seems to bring pure zinc to the surface, while the foreign substances are left behind and fall to the bottom of the cell.

(13) Q.—What is the method of charging a storage battery cell by the current from a loop? B. T. C.

A.—As the answer to this question would take up so much space, we refer our correspondent to Mr. Jones' book of descriptions and diagrams of telegraph apparatus. On page 130 of that work a full description is given for charging a storage cell in this manner.

(14) Q.—What is the difference between a Daniell cell and a gravity cell of battery? M. A.

A.—There is no difference in principle, only in form. The gravity cell is a modification of the Daniell cell and was designed to avoid the use of the porous cup of the Daniell cell. The solutions of zinc and copper sulphate are kept separated in the gravity cell by reason of the difference in their densities, whereas in the Daniell cell they are kept separated by the porous cup.

Among Our Advertisers.

Under this heading we propose to keep our readers informed as to what the telegraphic and telephonic business interests are doing in the production of new apparatus. It will be a department worth reading, and will be of a newsy character. Advertisements of these concerns will be found on other pages.

A visit to the establishment of J. H. Bunnell & Company, 20 Park Place, New York, the old-established manufacturers of telegraph apparatus and dealers in general electrical supplies, made it evident that the old-time activity of this house is still maintained. They keep up to date in all their processes and products, and indeed manage to keep in advance of the demand for new things and new ideas. The company was organized in 1878 and established at the start a reputation for furnishing first-class goods, and this reputation has always been jealously guarded. There is nothing in the way of telegraph, telephone and general electrical supplies that this house cannot furnish. Their wireless outfits are of the best make and are reliable in operation.

Finding fault is not a very enviable trait of character, but there are times when fault finding is certainly justifiable and even desirable. Finding faults on telegraph and telephone lines, for instance, belongs to the latter class, and a good and certain way to succeed in this is by using the Friendly testing bridge made by W. & L. E. Gurley, Troy, N. Y. The name Friendly is suggestive, and might be taken to mean the relation of the instrument to the work. Whatever it means, the instrument does the work to perfection, and it does it quickly. Any one desiring to know more about this instrument can secure the information by addressing W. & L. E. Gurley, Troy, N. Y., who are the licensees.

It is not very pleasant to those who are compelled to use head telephones to carry the burden of the ordinary instrument upon the head and submit to the continuous pressure of the hard rubber receivers upon the ear. Wireless operators should be thankful to the Holtzer-Cabot Electric Co., Brookline, Mass., for producing a head receiver that is at once light in weight and easy in pressure upon the ears. Lightness is secured by using aluminum and easy pressure by the use of pneumatic cushions. The thing has been studied out carefully, and the long-standing reputation of this well-known house is back of this particular device, as it is in the case of all the other products of this firm.

We are in daily receipt of letters from telegraphers in all parts of the country asking where they can learn the principles and practice of wireless telegraphy. Dodge's Institute of Telegraphy, Valparaiso, Ind., gives instruction in wireless telegraphy and has a complete commercial station in operation for instruction purposes. This branch of instruction is in charge of a competent wireless telegraph expert, and the instruction is thorough. Those who desire to learn the art of wireless telegraphy would do well to communicate with the institute.

Mr. C. H. Murphy, manager of the Western Union Time Service, New York, has recently returned from a trip through West Virginia, where he succeeded in interesting a large number of the Western Union managers in the time service with the result that considerably over one hundred additional clocks have been contracted for. There seems to be a general awakening of interest on the part of the Western Union managers in the clock service, and evidently Mr. Murphy is encouraging the managers to do their utmost to increase this branch of the company's business. There is every indication that the year 1911 will prove highly satisfactory from a time-service standpoint, both to the Western Union Telegraph and Self-Winding Clock Companies, the latter concern being the manufacturer of these clocks.

The typewriter is frequently referred to as "The Barometer of Trade," and an increased demand for typewriters is an indication that general business is active. The Remington typewriter has been extensively used by operators simply because it is a first-class machine and can always be relied upon. The Remington Typewriter Company is enlarging its plant at Ilion, N. Y., to produce machines in greater quantities in order to meet the demand for them. This concern has a very large and completely fitted out plant, and has reduced the manufacture of typewriters to a science.

Lifting Up the Messenger.

An ex-messenger, a successful business man in New York, reflecting upon the article in the January 16 issue under the heading "Lifting Up the Messenger," has written us commenting favorably upon the efforts being made in many places throughout the country to uplift the telegraph messenger boy. Our correspondent says:

"It is very gratifying to thousands of your readers who are ex-messengers to see, for perhaps the first time, the amount of space in your valued paper devoted to the telegraph messenger. It would seem from your issue of January 16 that the telegraph officials are becoming deeply interested in the welfare of the messenger, and that his work is beginning to be appreciated; in fact, he has become recognized as an apprentice and not as a temporary porter or runner. The action of the telegraph officials, organizations and individuals, who have with kindness and generosity provided entertainments and dinners for the messengers during the recent holiday season is highly commendable, and it seems to me that no more gracious-patriotic if not philanthropic proposition could be evolved than the founding of messenger boy clubs, especially in the larger cities of the United States. The building up of the American youth in all that goes for manhood and decent citizenship should be the greatest of all endeavors, and there are doubtless many ex-messengers blessed with much of this world's goods who need only the presentation of a proper plan to come to the front and assist in forwarding a movement of this kind. I am informed that the late Mr. E. H. Harriman organized and endowed the boys' club in New York city, which has done a world of good in developing both physically and mentally the youth of the East Side.

"The youth needs play; play is necessary for development. It is a mistake to imagine that a boy of fourteen or fifteen years of age can go direct from school to business with enthusiasm, if his opportunity for recreation be cut off. This is the time in his life for the strengthening of character and physical development. A well-regulated gymnasium, a well-equipped library, and a lecture hall suitable for entertainments of a clean character would be productive of the greatest value to the youth of America, and the founders of such an institution would leave a lasting memorial. I am aware that the Young Men's Christian Association has these features, but the fee required is much too large for the average messenger boy to pay and, in addition, there are many telegraph messengers that would feel out of place in the 'gym' or the lecture hall of the Young Men's Christian Association and kindred institutions. Just think of the value to good citizenship the mingling of races would produce! How soon the traditions and environment of narrow home life would be broadened by the association of boys of Irish, German, Jewish and Italian extraction. I realize that there are details in the development of the plan as outlined, but the general idea of providing a permanent telegraph messenger club or institute I think a good one, and sincerely trust that the suggestion may take root in the minds of those who are able financially to give of their store for the moral and physical training of the young American boy."

Organizer of Great Corporations.

Mr. William W. Mulford is the author of an article on "The Organization of Great Corporations" in the November issue of *The Engineering Magazine*.

"Like all wholesome American business methods," the author states, "it [organization] is a matter of evolution. The better forms have been adopted after careful studies of those already used in doing similar work. These are changed, modified, or revised to meet the conditions and requirements of the particular work; then improved and simplified in order to obtain greater efficiency and to yield larger results. Certain customs are common to many of the successful big corporations. This has gradually brought about a standardization of their forms of organization. Certain fundamental principles are so clearly recognized that they can well be considered as established. These are summed up and expressed in what is known as the 'three-column form.'

"Broadly speaking, there are three distinct branches in the work of all large corporation organizations, Financial, Operating, Commercial; all other positions or departments are either subordinate to these, or are practically consulting authorities. This holds true whether in industrials or railroads, whether in the single corporation or in the series of corporations, and whether the departmental, the bureaucratic, the divisional, or the functional form of organization is used.

"The reason why the three-column form of organization holds true in so many apparently distinctly different kinds of organizations seems to rest upon the underlying principle of an old saying—"Even in a democracy there must be a leader." This is equally true in carrying on a business. There is always a fixed policy to be carried out, although that policy may be of the *laissez faire* variety. There must be a leader; and furthermore each department, or bureau, must have a head, and these are the lieutenants of the commander in chief. But organization is the antithesis of administration. Under the three-column form of organization the distinction between administration and organization is so clear that it is instinctively understood by every employe.

"The reason why the financial, operating, and commercial divisions rather than any others are the chief is that the form of organization is not determined by the size of the department, the number of employes, or the volume of work, but by the relative importance of the work and its relationship to the policy of the company. The salient questions of finance, operation, and commerce affect directly

Digitized by Google

the policy of the corporation and are wholly dependent upon one another. First, the money must be provided; second, the work must be done; third, the product must be sold. The best salesman cannot sell unless he has the goods to sell. He knows what the market requires, and what prices he can obtain. He knows how to create selling methods. With that given, the skilled operating man knows how to manufacture what is demanded, or to perform the service that is required. With these two given, the financial man must not only provide for the money but must ascertain beforehand whether the monetary market warrants furnishing or withholding the supply, for financial emergencies must be prepared for well in advance. These are the vital features of any business policy. In the three-column form, the vice-president in charge of finance, the vice-president in charge of operating, the vice-president in charge of commerce, are on an equality; they are peers, and have an associated authority and responsibility. . . .

"The three-column form of organization makes it possible to separate the work of direction and deliberation from the details of execution, and also makes the executives of the great vital departments parties to these deliberations in their positions of staff officials. In this rests its greatest strength.

"The employe must not only know his duties and what is expected of him, but also rather than have obstacles placed in the way he should be able to obtain in a convenient manner, in so far as they affect his work, all the information, statistics, data, and even an understanding of the policy of the company, if he desires to seek them. Unless this is done, it is impossible to avoid duplication of work; or what may be more discouraging, the employe may suddenly find out that half of the work he has done has already been done by others and probably, because they had more time for it, in a more thorough way. Here is where system becomes manifest. Here is where true *esprit du corps* is nurtured or destroyed. Here is where man's originality is crushed, or he gains the joy of achievement. . .

"In the telephone organization only two of the three great divisions of the three-column form of organization are predominant factors, finance and operating. And because there are only two, the power swings like a pendulum from one to the other, for a few years the one dictates and then the other. The commercial division has not been given an equal standing with the other two. It is said that this is because business has always come to them as fast as it could be conveniently taken care of and that they have not had to seek a market except occasionally for a by-product. However that may be, it is true that if a balance in power is to be maintained between finance and operating, it can only be accomplished through the recognition of the commercial division as their peer."

"Stickers" on Messages.—The Massachusetts Supreme Court in sustaining a verdict of $50 obtained against the Western Union Telegraph Company, holds that a telegraph company is obliged to accept a "sticker" on a message intended to fix additional liability on the telegraph company in the event of delay in transmission or non-delivery of a message. The Western Union Company, under its rule, refused to receive such a message from the plaintiff and in defense relied upon the Interstate Commerce act.

Portable Railway Telephone.

The portable telephone illustrated herewith is stated to be the lightest set used in railway telephone dispatching. It weighs only 6 lb. 5 oz., and its dimensions are 6 3-16 in. high, 6¼ in. wide and 6 in. deep. The arrangement of the transmitter, receiver,

FIG. 1. PORTABLE TELEPHONE, CASE OPEN.

batteries and induction coil is very compact as will be noted by a glance at the illustrations.

This telephone is designed for use by officials, trainmen, signal men, and line men in talking to the

FIG. 2. PORTABLE TELEPHONE, CASE CLOSED.

dispatcher's headquarters, and is arranged to connect at any point on the circuit, its compactness rendering it easy to carry and handle. It is made by the Kellogg Switchboard and Supply Company, Chicago, Ill.

Multiplex Telephony and Telegraphy.

In the issue of January 16 announcement was made of the granting to Major George O. Squier of the United States Army, of four patents on a system of multiplex telephony and telegraphy. The objects of the invention are to permit the simultaneous transmission of a plurality of telephonic and telegraphic messages over a telephone wire, and to eliminate cross talk.

The method of accomplishing these results is described in the first patent of the series (No. 980,356) as follows:

"In the whole range of electromagnetic waves, which may be looked upon as a spectrum extending from the ultra-violet rays on the one hand to the exceedingly slow oscillations, such as are used on long submarine cables, on the other hand, use has been made of all parts for various purposes with the exception of two well defined intervals, one extending from a frequency of about 3×10^{12} of the extreme infra-red, to 5×10^{6}, which are the shortest electromagnetic waves yet produced by electrical apparatus—and another interval extending from about 100,000 cycles per second to about 15,000 to 20,000 cycles per second. This latter range of frequencies represents a practically unexplored field which I have found by experiment to be very useful in solving the problems of multiple telephony and telegraphy upon wire circuits. * * *

"By employing ultra-sound electromagnetic wave frequencies as the vehicle for transmitting telephonic and telegraphic messages, it is evident that all harmful effects to any element of the battery telephone apparatus are immediately removed, since not only are any such effects very minute, in character, by virtue of the high period of the oscillations, but also, even if there were any effects in the telephone receiver, or transmitter, or any other part of the apparatus, it could not be detected by a human being, since the natural limitations of the ear afford a most effective and sure separation between all frequencies above 15,000 to 20,000 per second on the one hand, and all frequencies below 15,000 to 20,000 and down to about sixteen per second, which is the lower limit of audibility. Therefore, a fundamental principle of this system may be said to be, from one viewpoint, the utilization of this unalterable characteristic of the human ear.

"With such frequencies as are used in ordinary battery telephony the so-called phenomenon of "skin effect" is comparatively small, and the current is fairly well distributed throughout the cross-section of the conductor. As the frequency increases the skin effect becomes more pronounced and the energy appears to be more and more transmitted or stored in the ether surrounding the conductor. For this reason the battery telephone current is largely a conduction current through metal, and the ohmic resistance of the wire is one of the principal elements which limits long distance telephony at present, whereas in commercial wireless telegraphy, in which frequencies from 100,000 up to several millions are used, the impressed energy is chiefly radiated into the ether.

"In the intermediate range from say 20,000 to 100,000 and above the energy is largely carried by the ether, but is still sufficiently linked to the conductor to prevent excessive radiation into the ether. The conductor while carrying only a small part of the energy at its surface nevertheless acts as an efficient guide for the high frequency electromagnetic waves. In accordance with these principles, use is made of these efficiently guided electromagnetic ether waves as a vehicle to carry the telephonic or telegraphic message.

"The present invention makes use of the types of apparatus, engineering methods, etc., now practiced in the wireless art and applies them to the transmission of electromagnetic waves along wires, with the result of an enormous increase in efficiency of such transmission over the ordinary method employing antennæ at transmitting and receiving stations. The circuits employed in this invention are ordinary telephonic circuits, such as now used in wire telephony and telegraphy, and are very poor radiators of electromagnetic energy; in fact, the regular twisted-pair paper-insulated lead-covered telephonic cable affords a circuit for such electromagnetic waves which produce a very closely bounded system and the energy is principally conveyed in such a circuit in the minute layer of ether separating the two metallic conductors. In this manner, and by these means, a most efficient system of directive high frequency telegraphy and telephony is attained, and also any interferences between neighboring circuits operated by this system is eliminated, so that a plurality of such circuits may be brought to the same switchboard with no harmful interfering effects.

"It is old in the art to use high frequency oscillations and modify these in accordance with speech vibrations by effecting some electromagnetic constant or constants of the circuit in which the oscillations take place. It is possible to change the capacity, the inductance or the resistance of such a circuit or combination of these, and while I do not wish to limit myself to any one of these, I have found that it is very convenient and effective to change the resistance by a suitable telephone transmitter such as a microphone transmitter of the usual type employed in ordinary telephonic work. Having modified these oscillations suitably they are transmitted over the line to a receiving station where they are then received in a suitable selective circuit containing a detector for high frequency oscillations, any detector, such as used in wireless telegraphy and telephony, being satisfactory so long as it is a quantitative or integrating detector. By means of suitable trans-

Digitized by Google

lating means the oscillations are then transferred into telephonic currents.

"Since a plurality of high frequency waves of different frequencies may be impressed on the same line, and since these may be selectively separated from each other by suitably tuned circuits, it is obvious that multiplex telephony may be accomplished. Also, for the reasons stated, it has been found that these high frequency waves may exist on the same line with ordinary battery telephone currents without in any way affecting them, and thus this system of multiplex telephony may be applied to the usual telephonic circuits without the presence of harmful effects, such as "cross-talk" or other disturbances.

"It has been found necessary, in order to obtain efficient results, to make use of such detectors as are commonly found in the wireless telegraphic art. These detectors are not used because of any greater sensitiveness to electrical energy than resides in the telephone receiver itself, but because the energy, being in the form of rapid oscillations, cannot affect the telephone or other indicating device. These rapid oscillations cannot sensibly affect the telephone because the diaphragm in its motion must reverse with the reversal of the current and the deflecting impulse if applied directly to the telephone receiver will be first in one direction and then in the other with a frequency so high that the diaphragm cannot follow or respond. Furthermore, if the diaphragm should respond with this frequency the effect would not be audible. Also, in the case of the ordinary telephone, on account of the large self-inductance of the instrument, the high frequency E. M. F. generated by the waves would produce in a telephone receiver only extremely weak currents. I have found it necessary, therefore, and consider it an important part of my invention to make use of some form of integrating detector to transform these rapid oscillations into effects which can be manifested by the indicating instrument."

Great Industrial Corporations.

Mr. George W. Perkins, the well-known financier and organizer of industrial corporations, in an article on the subject of the future relations between capital and labor has this to say in regard to great industrial corporations:

"Whether we like it or not, whatever theories we may formulate on the subject, the great corporation is here to stay. It is as idle to cavil at its presence in the present day industrial system as it would be to find fault with the existence of electricity, the use of steam, or the employment of the telephone, the telegraph, or wireless communication. Were it not for these agencies, which have rendered possible the vast strides which have been made in the last half century in the development of material civilization, the handmaid of social progress, the great corporation, would never have come into being. The problems which confront us to-day in connection with the giant corporations are the natural outcome of the conditions which have given birth to this new form of commercial and industrial endeavor.

"The faults in corporation management have grown out of the sources from which the giant corporation has sprung. They were perhaps inherent in the conditions which surrounded the organization of these great consolidations of human effort, but the faults are such as can be eradicated by enlightened effort, and the benefits derivable from the employment of corporate cooperation are far too great ever to be abandoned. The evolution of the modern corporation has kept close pace with the progress in transportation, in manufacture, and in all forms of material development. With the advent of steam came corporations made up of a moderate number of stockholders and with the general application of electricity to the service of man and the invention of the telephone, the telegraph, and the wireless transmission of messages, came the giant corporation.

"With the opportunity which the improvement in the methods of transportation and transmission offered for extension of business undertakings it became essential to find an agency which would fill the requirements of the new opportunities. It was a natural step from the firm made up of a few men to the small corporation and from the small corporation to the great railroad or industrial combination equipped to do business not in one city nor in one State, nor even in one country, but all over the world. We cannot do away with the giant corporation except by doing away with the use of electricity and of steam and go back to the methods which our forefathers employed not because they were better than those we know to-day, but because they were the only ones then available. Only by destroying the things which make the giant corporation a possibility can the corporations themselves be done away with.

"It has become an essential part of present day business organization and it behooves us all as sensible men to make the most of the good that the corporation offers and to bend all our energy to see that such abuses as have crept into corporate management be eradicated and that the corporation itself be advanced to its state of greatest efficiency."

Electrical Testing Laboratories.—Among the many activities of the Electrical Testing Laboratories, New York, is the checking of electrical instruments, insulation tests, tests of magnets, certification of electrical standards, and many others, the latest addition being the testing of papers for any purpose, including electrical insulation.

Telegraph Facilities vs. Political Morals.—Attention is called by a western newspaper to the political corruption in Adams County, Ohio, and attributes the cause to the absence of railways and telegraph facilities at the county seat.

Digitized by Google

The Telephone.

Mr. Chester J. McKee, of the American Telephone and Telegraph Company's office, Philadelphia, was, on January 10, married to Miss Lonthair, of Rochester, N. Y.

Mr. D. B. Grandy, of the American Telephone and Telegraph Company, St. Louis, has the sincere sympathy of his numerous friends in the death of his daughter, Alice Frances, on January 6. Miss Grandy was a teacher in the St. Louis public schools and was twenty-one years of age.

Mr. Wm. A. Blanchard, special agent of the American Telephone and Telegraph Company, was a former telegrapher. He entered the telegraph service in 1879 and afterwards became identified with the Bell Telephone service, and has occupied positions as wire chief, chief operator, district operator, district manager, and is now special agent, with headquarters in New York.

The Southwestern Telegraph and Telephone Company is erecting a new exchange building in San Jacinto, Tex. It will be eight or ten stories high.

Telephony in Russia.—Telephonic communication has been established between Moscow and Nijni Novgorod and the important cotton spinning centres of Vladimir, Shuy and Ivanovo-Vosnesensk.

Telephone Bonds.—All of the $10,000,000 American Telephone & Telegraph Company 4 per cent. collateral trust bonds sold to an N. W. Harris syndicate in Boston have been disposed of. A very large percentage of the bonds went abroad.

Telephone Extensions Along Pacific Coast.—The Pacific Telephone and Telegraph Company has floated in New York and Boston a $5,000,000 short-term note issue. The proceeds will be expended in the betterment of plant in California, Oregon and Washington.

Telephony in Switzerland.—The government has authorized the erection of long-distance telephones on the Egner and Holmström system. This system is said to allow of conversation over distances of between 3,000 and 4,000 kilometers—1,863 and 2,484 miles respectively.

Receiver for Continental Telephone and Telegraph Co.—On the application of Mr. John E. Stevenson, Judge Willson, at Philadelphia, has appointed Mr. Charles E. Wilson receiver of the Continental Telephone and Telegraph Company under a bond of $100,000.

Telephone Mergers.—It is stated that plans are now under consideration for a merger of several leading independent telephone companies in the West with the American Telephone and Telegraph Company. Negotiations to such an end are said to have been undertaken by J. P. Morgan & Co., New York.

Telephones in Winnipeg.—During 1910 the number of telephones in the city of Winnipeg, Man., increased by 3,437, making the total number of telephones there 16,161. This is said to mean a larger number per capita than in any other city in Canada. The telephone system is owned and operated by the government.

Cable Steamer for British Columbia Telephone Company.—The British Columbia Telephone Company, with headquarters at Vancouver, B. C., has decided to build a cable steamer at a cost of $35,000. The first work to be done by this steamer will be laying the new paper Pupin cable between Vancouver Island and the mainland.

Telephone Wires on High Tension Towers.—A telephone line is strung on the steel towers of the transmission line of the Mexican Light and Power Company, in Mexico, and it is stated that no serious disturbances have yet been attributed to the proximity of the power lines. The power line is operated at 80,000 volts.

Interest on Interstate Telephone Bonds to be Paid.—The six months' interest due last October on the $2,390,000 outstanding bonds of the Interstate Independent Telephone & Telegraph Company, which is now in the hands of receivers, has been deposited with the Continental and Commercial Trust and Savings Bank, Chicago, by Receivers Dolph and Niblack. Mr. Dolph says that the receivership can soon be terminated.

Telephone Rates in Texas.—The Texas Supreme Court on December 21 granted a writ of error in the case of the Southwestern Telegraph and Telephone Co. vs. the City of Dallas and the case was sent back for hearing on January 4. This is the telephone rate case involving the question as to rates and the right of the City of Dallas under its charter to regulate them through a referendum vote of the people. Three inferior courts have upheld the case.

Pacific Telephone and Telegraph Company.—The gross earnings of the Pacific Telephone and Telegraph Company for the ten months ended October 31, 1910, showed an increase of approximately $1,500,000 compared with earnings for the same period in 1909. The net earnings for this period, however, showed only $2,523,106, as compared with $2,937,407 in 1909, a decline of $414,301.

The Spare Pair Society.—The Spare Pair Society, which is composed of employes of the American Telephone and Telegraph Company in Philadelphia, held its monthly meeting in that city on Tuesday evening, December 15, Mr. R. H. Clegg, presiding. Mr. S. B. Williams, of the engineering department of the Bell Telephone Company of Pennsylvania, gave an interesting talk on cable multipling. The discussion which followed the address was participated in by a large number of those present.

Digitized by Google

The Southern Bell Telephone and Telegraph Company.

According to official estimates the Southern Bell Telephone and Telegraph Company will earn a total of approximately $6,000,000 gross for the twelve months to end December 31. This will compare with about $5,200,000 in the year previous and some $4,600,000 in 1908. It is also calculated that the net surplus available for dividends will be around $1,200,000.

Special Telephone Rates in Louisiana.

The Railroad Commission of Louisiana has authorized the Cumberland Telephone and Telegraph Company to establish special rates as per schedule submitted.

Telephone Rates in Oklahoma.—The Supreme Court of the State of Oklahoma in a case involving the reasonableness of rates charged by the Pioneer Telephone and Telegraph Company holds that in valuing the property of a public service corporation such valuation should not be limited to the value of the physical tangible properties, but must include the value of the property as a "going concern."

Earnings of American Telephone and Telegraph Company.—The gross earnings of the American Telephone & Telegraph Company and associated holding and operating companies in the United States, not including connected independent or sublicense companies, for the eleven months ended November 30, 1910, were $150,244,013 an increase of $15,092,843; operating expenses $49,148,357, an increase of $4,580,106. The net earnings were $45,996,234, an increase of $2,074,248.

Alleged Illegal Sale of Bonds.—The report of Messrs. W. C. Handlan and James W. Ewing, receivers for the National Telephone Company at Wheeling, W. Va., shows that $670,000 of bonds of the corporation were sold by the Metropolitan Trust Company of New York, to satisfy a claim of $235,000. It is claimed that the bonds were sold at five per cent. of their face value for the benefit of the Continental Telephone and Telegraph Company, and that the holder of the bonds was not a bona fide purchaser thereof.

Spare Pair Society.—The regular monthly meeting of the Spare Pair Society, of Philadelphia, was held January 20, President H. C. Porter presiding. Mr. H. Mauraudian, of the engineering department of the Bell Telephone Company of Pennsylvania, delivered an able address on "Toll and Long Distance Telephone Transmission." Messrs. Williams and Wright, of the engineering department; Mr. Clegg, district engineer, and Messrs. Eldridge, Stoever, Jones, Stewart and Wuerst of the plant department participated in the discussion which followed.

Women Telephone Traffic Inspectors.—Miss A. J. Connelly, of Jamestown, N. Y., and Miss Lillian A. Vavasour, of Albany, N. Y., have been appointed telephone traffic inspectors by the Public Service Commission, Second District, New York. Both of these young women have had extended experience in telephone work and it will be their duty to enter the operating rooms of all telephone companies within the jurisdiction of the Commission, determine the faults that may exist, offering suggestions or corrections on the ground, and making a report of the same to the Commission.

Prof. D. C. Jackson to Appraise English Telephone Property.—Professor Dugald C. Jackson, of the Massachusetts Institute of Technology, Boston, Mass., and president of the American Institute of Electrical Engineers, has been retained by the British government to valuate the property of the telephone companies in that country which the government is to take over this year. Professor Jackson sailed for England January 18, for a preliminary consultation with the British post-office officials. A London dispatch states that English appraisers are criticising the government because it has ignored home interests in retaining Prof. Jackson.

Trial Telephone Service Illegal.—The New York Public Service Commission, Second District, has notified all telephone corporations within its jurisdiction that the practice of offering trial service installations is regarded by the Commission as unlawful, and that the company engaging in the same is subject to the forfeiture and penalties prescribed by the Public Service Commissions Law. It has been brought to the attention of the commission that certain telephone corporations have heretofore been in the habit of making what is called trial service installations and now it is desired that such installations be discontinued. Also that some corporations have been since September 1 and are now making such trial service installations, thus giving the new subscriber free service from a telephone corporation during a certain period of time, in many cases as long as six months.

High-Salaried Male Switchboard Operators.—Several large firms down town in New York have dispensed with women operators at their telephone switchboards and are employing high-salaried men to do the work. Among such houses it has come to be recognized that the task of dealing discreetly with the calls that come in so promiscuously over the wire is not a mere switchboard operator's duty. Rather, it demands a confidential person with such experience, such clear judgment, and so much ready diplomacy as is rarely possessed by young women.

It is stated that there are firms in the financial district who pay their operators $2,000 and $3,000 a year, and find that it pays the firms handsomely. Some particularly eminent concerns whose operations are of peculiar significance and delicacy pay even more. Such operators are virtually confidential private secretaries.

Radio-Telegraphy.

Patents.—The following patents have been issued: No. 979,144. Transmission and Receipt of Electrical Energy, to R. A. Fessenden, Brant Rock, Mass.; No. 979,276. Space Telegraphy, to L. De Forest, New York, N. Y.

Powerful Wireless Waves.—It is stated that Professor Jacoviello of the University of Parma, Italy, has invented a method of transforming electric currents into Hertzian waves with little loss. This gives electromagnetic (wireless) waves of great power and increases the operating radius.

Wireless in Chile.—The Chilean government proposes to establish a powerful wireless telegraph station at Talcahuano, where the Chilean navy yards are located. The government has under contemplation the construction of several wireless stations along the coast, from Arica to

Ordered a Meal by Wireless.—A passenger on board of an Atlantic steamer sent an order from sea by wireless to a New York restaurant to have a meal ready for him on his arrival. The order was carried out faithfully and the man got his meal just as he had planned it.

Wireless Telegraph Association of Rhode Island.—At the annual meeting of the Wireless Telegraph Association of Rhode Island, held in Providence, January 11, Percy Williamson was elected president; Leo Murray, vice-president; I. Creaser, Jr., secretary, Leonard Thornton, treasurer.

Stopping Trains by Wireless.—It is stated that Mr. Frank W. Prentice, of Toronto, Ont., has invented a wireless brake-operating device for railway trains. The device has been practically tested at Ottawa, Ont., on the Canadian Pacific Railway and is reported to have worked satisfactorily.

Australian Wireless Stations for Sale.—The Marconi Wireless Telegraph Company has offered to sell to the State the wireless telegraph stations erected five years ago at Queenscliff (Victoria) and Devonport (Tasmania). The stations have been little used. It is the intention of the Marconi company to modernize the equipment and to erect a station on King Island.

New Form of Masts and Poles.—A German inventor has devised a new method of constructing collapsible masts and poles, suitable for wireless telegraph antennae, signal masts, etc. They are constructed of steel bands running lengthwise of the mast and transverse connecting members for holding the steel bands together to form a tubular structure. It is claimed that this form of construction gives a very strong and light structure. These masts may be made in the stationary or portable types.

Wireless in Russia.—The Russian Posts and Telegraphs Department is elaborating a project to establish wireless stations on the Tchukott peninsula to connect with Petropavlovsk and Nicolaieffsk; in Archangel for Solovietz and islands; in Reval for communication with ships sailing the Baltic; and, finally, at Taganrog for communication with vessels in that region. The wireless system is being extensively adopted in many other parts of Russia.

Continental Wireless.—Mr. C. L. Spear, reputed to have been the chief promoter of the Continental Wireless Telephone and Telegraph Company, New York, which was raided by the Post Office authorities, pleaded not guilty to an indictment charging him with using the mails in connection with a scheme to defraud investors in the company's stock. He was held in $7,500 bail.

More Wireless Stations in Alaska.—The Navy Department proposes to establish two new wireless stations on the southern coast of Alaska, one at Unalaska and the other at Kodiak. The collier Saturn will leave the Mare Island navy yard, San Francisco, on May 1, with the apparatus. The Navy Department also contemplates the erection of a wireless station on the Hawaiian Island of Oahu. An effort will then be made to establish wireless communication between Unalaska and the Hawaiian Islands.

Wireless for Canadian Steamers.—A law recently enacted at Ottawa provides that every seagoing and coasting passenger ship of over 400 tons gross tonnage registered in Canada, and every seagoing and coasting freight ship having a gross tonnage of over 1,200 tons, shall be equipped with apparatus for wireless telegraphy. Failure to comply with the law subjects the offending owner to a fine ranging from $100 to $1,000, or to a term of imprisonment not exceeding twelve months, or both.

Wireless Inventions on Exhibition.—Prof. Cerebotani, an Italian scientist, gave a private exhibition, in Paris, December 30, of his wireless inventions. Among the apparatus shown were a pocket wireless machine, a wireless telegraph printer by means of which messages are sent as readily as writing on a typewriter, and a wireless telautograph which enables persons to sign their signature as far as wireless waves reach. Another invention shown was a syntonizing device for wireless telegraphy.

Wire and Wireless Telegraphy and Telephony.—Dr. A. E. Kennelly of Harvard University, on January 13, delivered a lecture on Wire and Wireless Telegraphy and Telephony, before the Sigma Xi Honorary Society of the University of Pennsylvania, Philadelphia. The lecture was illustrated by lantern slides. Dr. Kennelly is a former telegraph man, and is one of the highest authorities in telegraph and cable matters. He is the author of several books on electrical subjects and is an interesting and entertaining writer on any subject.

Digitized by Google

Mr. A. H. Ginman, operator of the Marconi wireless telegraph station at Siasconset, Mass., has been promoted to the construction department of the company. He will erect two new stations along the south Atlantic coast and one at Nassau, Bahamas. Mr. Ginman is succeeded at Siasconset by Mr. John Cowden.

Wireless Telegraphy Between Army Posts.—Powerful wireless telegraph stations have been installed at Fort Omaha, Neb., and Forts Leavenworth and Riley, Kan. The War Department has ordered the use of wireless telegraphy in place of line telegraphy hereafter between these posts. It is the purpose of the Department to extend wireless communication to other Western posts, so that they shall not be dependent upon wire service. Stations are being equipped at Cheyenne and Denver.

Wireless Communication from Aeroplane.

Lieutenant Paul W. Beck, of the United States Signal Service, on January 22, demonstrated the practicability of sending wireless messages from a scouting aeroplane. The biplane was equipped with a wireless sending instrument, and with a wire 100 feet long trailing from the car Lieut. Beck transmitted several messages to the wireless station on the aviation grounds, at San Francisco, from a height of 500 feet. They were received successfully. The airship was at times about two and a half miles from the field.

Wireless Telegraphy in Fiji Islands.—The Colonial Sugar Company, an English concern, is about to establish a system of wireless telegraphy at its mills in the Fiji Islands. The mills are situated on different islands, and some of them are hundreds of miles apart. The company's steamer *Fiona* is also to be fitted with wireless apparatus. When the installations are completed, communication will be maintained between all the company's properties, and will enable the *Fiona* to be advised by wireless at which island she is required to call.

Wireless Across the Pacific.

Navigators in the northern Pacific ocean where the route to Yokohama skirts the Aleutian Islands wish the United States Government would erect wireless stations on some of the outer islands by which messages could be relayed to Dutch Harbor on Unalaska and thence to the mainland. The range of wireless on the north Pacific, for some reason—perhaps its nearness to the magnetic circle—is much less than on the Atlantic or in the tropical part of the Southern Sea. As it is, ships are long out of hearing and seldom pick up the Japanese station at Otsuiski beyond 500 miles, while sometimes 300 is the limit at which the instruments will work.

Wireless Telegraphy in Italy.

In the presence of representatives of the Italian Ministry of War and the Ministry of Posts and Telegraphs direct wireless communication was recently established between Coltano, Italy, and stations in Ireland and Canada, and messages exchanged with the station at Massowa, in the East African Italian colony of Eritrea. A similar station to that of Coltano is to be constructed at or near Buenos Aires and direct communication thus established between Italy and Argentina. From Massowa wireless communication will be maintained with Magadisho, in Italian Somaliland.

Life Saved by a Wireless Prescription.—Captain A. N. McGray of the tramp steamer Henry Frasch was taken ill recently on his voyage from Sabine Pass, in the Gulf of Mexico, to Portland, Me. There being no surgeon on board he telegraphed by wireless to the physicians of the United States Naval Station at Dry Tortugas for a prescription. The message was caught by the steamer Merida, then a much greater distance away, and the doctor on board the Merida sent a prescription by wireless to the sick captain. Captain McGray thinks his life was saved by this wireless prescription. He was ill from ptomaine poisoning.

Wireless Stations in South America.—It is expected that the fifteen new wireless telegraph stations of the United States Wireless Company along the Amazon and Paraquay Rivers, Brazil, will be completed within twelve months. Experiments made on November 16 with the Rio de Janeiro station, on Copocabana beach, resulted in satisfactory communication with a vessel in the harbor of Buenos Aires, 1,000 miles south, with Amaraline, in Bahia, 750 miles north, and with two ocean steamers nearly 500 miles at sea. It is reported that the Government will authorize the Lloyd Brazileiro to enter into a traffic agreement with the government telegraph system whereby these stations will be allowed to take commercial messages. The station at Rio de Janeiro replaces a government station which was built by a German Company.

International Telegraph Union Memorial.—The Swiss Federal Council has issued a revised programme for a competition for the erection of a monument at Berne to commemorate the foundation of the International Telegraph Union. None of the designs submitted for the competition, which took place last year, met with the approval of the international jury appointed to consider them. The new competition is open to all artists in the world. The artists chosen for the purpose will be entrusted with the execution of the monument, at a cost not exceeding 170,000 francs. The jury will have at their disposal the sum of 20,000 francs, to reward deserving competitors. Models must be deposited at the Federal Palace, Berne, before August 15, 1911.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

The Railroad.

Telephone Dispatching on the Evansville & Terre Haute Railway.

The Evansville & Terre Haute Railway has recently equipped its main line from Evansville to Terre Haute, Ind., with a telephone train dispatching circuit, consisting of twenty-seven regular way stations, twenty-five siding telephones and twenty-five block telephone stations. The siding telephones have been placed on the block wire. It is possible by means of a system of repeating coils and switches to connect a branch telephone direct to the train wire in case it is found necessary for a train crew to talk to the dispatcher. An interesting feature of this installation is that the block telephone wires are simplexed for telegraph work, thus providing a local telegraph station for message work at each block office.

Lake Shore Railway's Telephone System.

From Buffalo straight through to Chicago the Lake Shore and Michigan Southern Railway is making use of the telephone method of controlling train movements. Its circuits now equipped consist in detail of the following: Buffalo to Erie, eighty-eight miles, twenty-one telephone stations; Erie to Cleveland, ninety-five miles, twenty-five stations; Buffalo to Erie (message circuit), eight-eight miles, twenty-one stations; Cleveland to Toledo, Sandusky Division, 110 miles, thirty-seven stations; Cleveland to Toledo, Norwalk Division, 116 miles, thirty-five stations; Toledo to Elkhart, Ind., Air Line Division, 133 miles, forty-four stations; Toledo to Elkhart, Old Line Division, 143 miles, thirty-five stations; Elkhart to Chicago, 101 miles, thirty-three stations. Ultimately there will be a branch for telephone dispatching from Elkhart to Grand Rapids, Mich. This will be operated in conjunction with both the Air Line and the Old Line dispatching circuits, using one in the daytime and the other at night.

The apparatus used by this road consists of Western Electric telephones and selectors, and a few details of the equipment are of the special design of Mr. W. W. Ryder, general superintendent of telegraph of the New York Central lines.

Railway Telephone System on Chesapeake and Ohio.

The Chesapeake and Ohio Railroad will soon be using the telephone method of controlling train movements from Fortress Monroe to Cincinnati, Ohio, a distance of nearly 1,000 miles. Since last March the telegraph has been supplanted for train dispatching over four of the most important divisions of this road. Two new divisions were recently equipped with telephones and have rendered service since December 24. The telephone system is now complete from Richmond to Cincinnati by the James River route. The system now in use comprises 545 miles with 154 way stations. When present plans are completed nine divisions will be equipped, with 992 miles and 248 telephone way stations. The new equipment will be installed on the main line between Clifton Forge and Charlottesville, between Charlottesville and Richmond and between Richmond and Fortress Monroe.

Telegraph Engineering Course of Study.

The International Correspondence Schools of Scranton, Pa., said to be the largest institution in the world conducting a system of education taught by mail, brings its course of instruction in the field of telegraphy to the attention of operators through the medium of an announcement printed on advertising page iv in this issue. It is not designed to teach telegraph operating, but to furnish operators, whether in the commercial or railway service, with the practical instruction necessary to fit them for advancement in their profession. The object of this course is to give students a thorough education in all branches of telegraphy, in order that they may be qualified to fill the highest positions in the profession, and to be competent to understand and apply improvements that are constantly being made.

The course is especially thorough in all details and the textbooks are remarkable for their excellence, comprehensiveness and clearness of statement, and fully cover the subject taught. No telegrapher who desires to fully master the technicalities of his profession, should hesitate to enroll himself as a student in the International Correspondence Schools.

The principles underlying all telegraph systems are so thoroughly explained and freely illustrated that an operator taking this course should be able to read new circuits, and with a little study, to readily understand their operation. The preliminary subjects give the progressive telegrapher a firm foundation upon which to base the more advanced work.

Many telegraphers are dissatisfied with the positions they hold, yet they do nothing to better them. They are simply dissatisfied and complain—that is all. What they should do is to study—educate themselves so as to be fit to hold superior positions. Promotion and recognition may not come as soon as one might expect it, but the one who is prepared by study and observation to perform the duties of a higher position, will eventually get it, and will be appreciated. There is much valuable time wasted, when it might be utilized by studying a properly arranged Course, such as the Telegraph Engineering Course of the International Correspondence Schools.

Any book on electrical subjects can be obtained at the office of Telegraph and Telephone Age, 253 Broadway, New York.

The Turner Monument Fund.

Mr. Andrew Carnegie has signified his intention and deems it a privilege, of contributing $50 toward the Turner Monument Fund, which is growing steadily. There is much to be done, however, and it is suggested that a renewal of effort be made generally to attain the purpose of the movement as early as practicable.

Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company, and of the Western Union Telegraph Company, has shown his interest in this movement by contributing $50 toward the fund.

The last acknowledgment included a contribution of $5 from Mr. George H. Corse, of Shanghai, China. Mr. Corse was identified with the telegraph and railroads in this country for a number of years and is now representing in Shanghai the Chicago, Milwaukee and Puget Sound Railway.

For the information of those who may not yet be familiar with the object of this movement we may state that it is to commemorate the sending of the first telegraphic train order. This historical event took place at Turner, N. Y., in the autumn of 1851, and the order was sent by Charles Minot, general superintendent of the Erie Railroad. The proposed monument will cost about $3,000, and to meet this expense subscriptions are invited from all railroad and telegraph men. The Association of Railway Telegraph Superintendents and the Old Time Telegraphers' and Historical Association have given the proposition their official indorsement and are heartily co-operating in the work of raising the necessary funds.

The following named gentlemen constitute the committee in charge of the Monument Fund: E. P. Griffith, superintendent telegraph, Erie Railroad, Jersey City, N. J., chairman; Charles Selden, superintendent telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, Telegraph and Telephone Age, New York; E. A. Chenery, superintendent telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railway, Montreal, Canada; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who has been elected treasurer of the fund. All contributions are acknowledged in the columns of Telegraph and Telephone Age, and the funds are deposited with the Washington Trust Company, New York, as soon as received.

The contributions received up to date are as follows: Previously acknowledged, $757.25; W. S. Fender, San Francisco, Cal., $10.00; E. C. Drawbaugh, Cumberland, Md., $1.00; J. H. Weaverling, Pittsburg, Pa., $1.00; M. H. Cahill, Pittsburg, Pa., $1.00; G. W. C. Day, Pittsburg, Pa. $.50; M. W. Ross, Butler, Pa., $.50; P. P. McGorlick, Butler, Pa., $.50; C. F. Wilson, Butler, Pa., $.50; J. C. Hagerty, Cincinnati, Ohio, $.50; B. G. Knowlton, Seymour, Ind., $.50; J. M. Haffinton, Seymour, Ind., $.50; R. J. Sanders, Seymour, Ind., $.50; V. L. Childs, Seymour, Ind., $.50; G. V. Copeland, Seymour, Ind., $.50; S. W. Baker, Seymour, Ind., $.50; B. W. Parker, Seymour, Ind., $.50; T. C. Clifford, Jersey City, N. J., $5.00; Charles A. Harris, Jersey City, N. J., $1.00; John Casey, Middletown, N. Y., $.50; William A. Van Tassell, Middletown, N. Y., $.50; M. O'Brien, Middletown, N. Y., $1.00; H. R. Laughlin, Grafton, W. Va., $1.00; J. T. Dorsey, Grafton, W. Va.; $1.00; J. T. Staples, Grafton, W. Va., $1.00; A. P. Lavelle, Grafton, W. Va., $1.00; E. D. Griffin, Grafton, W. Va., $1.00; W. G. Robey, Grafton, W. Va., $1.00; J. F. Fordyce, Grafton, W. Va., $1.00; J. P. Dorsey, Grafton, W. Va., $1.00; P. Judge, Grafton, W. Va., $1.00; M. F. Greene, Grafton, W. Va., $1.00; A. Dwight Smith, Montreal, Can., $5.00; U. N. Bethell, New York, $10.00; J. F. Maquire, South Bethlehem, Pa., $5.00; G. J. Gildroy, Hazleton, Pa., $2.00; C. T. O'Neal, Buffalo, N. Y., $1.00; C. J. Shea, Wilkes-Barre, Pa., $1.00; J. N. Haines, and Sayre Dispatcher's office, Sayre, Pa., $2.00; J. F. Caskey, South Bethlehem, Pa., $3.00; T. H. Pindell, Bethlehem, Pa., $1.00; F. E. Schall, South Bethlehem, Pa., $1.00; J. F. Andrews, Newark, N. J., $1.00; F. A. Breisch, Hazleton, Pa., $1.00; Bert Hayden, Sayre, Pa., $1.00; G. R. Lewis, Auburn, N. Y., $.50; F. J. McCauley, Auburn, N. Y., $.50; A. C. Kerrick, Cortland, N. Y., $.50; M. C. Meservey, Cortland, N. Y., $.50; T. B. Smith, Auburn, N. Y., $.50; L. M. McGraw, Auburn, N. Y., $.50; H. D. Bartholomew, Newark, Ohio, $.50; E. E. Baird, Newark, Ohio, $.50; G. R. Keniball, Newark, Ohio, $.50; H. S. Leslie, Newark, Ohio, $.50; J. T. Mendenhall, Newark, Ohio, $.50; E. H. Conner, Newark, Ohio, $.50; L. L. Kerr, Newark, Ohio, $50; Theo. N. Vail, New York, $50.00; Charles Selden, Baltimore, Md., $2.00. Total, $888.25.

The treasurer of the fund holds a certificate signed by the assistant secretary of the Washington Trust Company, New York, Mr. George W. Toerge, to the effect that on January 24 the trust company had on deposit on account of the fund, $736.94.

Next Meeting of Old Time Telegraphers.—The next meeting of the Old Time Telegraphers and Historical Association and the Society of the United States Military Telegraph Corps will be held at Atlantic City, N. J., September 7, 8 and 9. The hotel headquarters have not yet been selected.

Telegraph Tolls to Alaska.—The Seattle Chamber of Commerce has requested United States Senator Samuel H. Piles to urge upon the government immediate consideration of a substantial reduction in telegraph tolls between Seattle and Alaska, on the grounds that the present tariff between Seattle and Alaskan points is exorbitantly high and works a hardship upon the commercial interests of this territory and in the North.

Annual Meeting of Gold and Stock Life Insurance Association.

The thirty-third annual meeting of the Gold and Stock Life Insurance Association was held in New York, January 16. Mr. George W. E. Atkins, president, in his report, stated that the little band, who first proposed a monthly payment of life insurance to temporarily take the place of the income of the deceased breadwinner, and thus enable, in many instances, the widow and orphan to adjust themselves to the changed conditions of life, "Builded better than they knew." Their good work, which has grown with the years, has indeed yielded abundant fruit, and the $139,000, paid in $50 monthly installments into over 240 homes, has surely been as a bond of sympathy and of hope, appealing to all who are eligible to seek the protection which the Gold and Stock Life Insurance Association offers. He therefore again urged the members to exert themselves in making known the merits and advantages of membership in the association, and to solicit applications to the end that the association may be enabled to permanently continue its useful and beneficent mission.

The old board of officers was re-elected as follows: George W. E. Atkins, president; Gardiner Irving, vice-president; W. J. Dealy, secretary; Lewis Dresdner, treasurer; executive committee, G. W. E. Atkins, Gardiner Irving, Herbert Smith, Lewis Dresdner, W. J. Dealy, Michael Breslin, Charles Shirley, T. A. McCammon and Albert J. Driver. Auditing committee, M. J. O'Leary, F. J. Nurnberg and J. J. Frederick.

Telegraphers' Mutual Benefit Association Annual Report.—The proceedings of the forty-fourth annual meeting of the Telegraphers' Mutual Benefit Association, held November 16, 1910, have been issued in pamphlet form, and copies are being distributed among the members. The report gives a very complete analysis of the work of the association, and it should be carefully studied by every member. President Brooks' suggestion that steps be taken to extend the operations of the association into the telephone ranks should be taken up vigorously by each member. The report covers thirty-two pages, and is gotten up in a very neat manner.

Advisory Board of Telegraphers' Mutual Benefit Association.

The following named gentlemen have been elected as an Advisory Board to act in conjunction with the Executive Committee of the Telegraphers' Mutual Benefit Association: B. E. Sunny, president Chicago Telephone Company, Chicago; H. J. Pettengill, president Southwestern Telephone and Telegraph Company, Dallas, Tex.; J. N. Keller, president New England Telephone and Telegraph Company, Boston, Mass.; W. T. Gentry, president Southern Bell Telephone and Telegraph Company, Atlanta, Ga., A. L. Salt, general purchasing agent Western Electric Company, New York; G. E. Paine, general superintendent Postal Telegraph-Cable Company, Chicago; H. C. Worthen, general superintendent Western Union Telegraph Company, Atlanta, Ga.; G. H. Usher, general superintendent Postal Telegraph-Cable Company, Atlanta, Ga.; C. H. Gaunt, general superintendent Western Union Telegraph Company, San Francisco, Cal.; J. G. Blake, general superintendent Postal Telegraph-Cable Company, San Francisco, Cal., and J. C. Nelson, general superintendent Western Union Telegraph Company, Denver, Col.

Combination of German Wireless Interests.

The German Operating Company for Wireless Telegraphy has been organized, with headquarters at Berlin, Germany. It is an amalgamation of all the German wireless interests and the Belgian Wireless Company of Brussels. The new company will have control of the Telefunken and Braun patents through the participation of the Allgemeine and Siemens & Halske electrical companies.

An arrangement has been effected with the Marconi Wireless Telegraph Company, whereby 110 stations on board the North German Lloyd, Hamburg-American and other German steamships, which heretofore have been operated jointly by the Marconi and the Telefunken companies, will be wholly in the hands of the new company. The company expects soon to have 150 German vessels supplied with its stations. As the Belgian company owns Marconi rights, the new organization acquires the right to use that system generally, thus ending a long standing rivalry between the Marconi and German interests.

Mr. C. E. Jones, manager of the Western Union Telegraph Company, Zanesville, Ohio, has been in the service of the company for twenty-four years. At the age of sixteen, he began his telegraph career at Waverly, Ohio, in 1886, and worked successively at Ashland, Ky., Cattlettsburg, Ky., and Portsmouth, Ohio, going to Zanesville in 1903, as manager. Mr. Jones is held in high esteem in Zanesville, and a few days ago, on the occasion of his entering his twenty-fifth year of service, a local paper printed an interesting account of his career.

Mr. T. F. Clohesey, a well-known old time telegrapher now located in Buffalo in other business, in renewing his subscription, writes: "I subscribe for quite a number of periodicals, etc., but I look forward with more interest to the arrival of Telegraph and Telephone Age than to all the others together, because I know there is something in every issue to call up pleasant memories of the past."

The Nantucket Shoals lightship which has been overhauled, has been equipped with a new wireless telegraph outfit, and returned to her anchorage off the Massachusetts coast. Two wireless operators are included in the crew.

Obituary.

Duane D. Stilwell, a telegrapher, aged 73 years, died at La Grange, Ind., December 23.

Dwight M. Bowers, died at Syracuse, N. Y., on December 27, at the age of 65.

Orrin B. Ocker, an operator in the Kansas City, Mo., Western Union Telegraph office, died on December 29, from the effects of injuries received in a railroad accident two days prior. He was 37 years of age.

William F. Butler, a telegrapher at Rochester, N. Y., died in that city December 19, aged 54 years.

Albert C. Adair, for thirty-six years manager of the Western Union Telegraph office at Paris, Ky., died December 8, aged 53 years. He was city clerk of Paris for many years and held that position at the time of his death.

Frank Books, of Louisville, Ky., a telegrapher, died in that city December 12, aged 42 years. Mr. Books was formerly night manager of the Postal Telegraph-Cable Company's Louisville office, and had been in the company's service for many years.

William H. Stevens, formerly and for many years night chief operator of the Western Union Telegraph Company, Buffalo, N. Y., died on January 14, at the age of 66 years. He was at one time in the newspaper business and later became ticket agent in Buffalo for the Grand Trunk Railroad, but for the past thirty-five years in the service of the Western Union Telegraph Company, holding many important local positions. On New Year's day he was presented with a loving cup by the Western Union employes. He is survived by his wife, a son and a daughter.

Charles C. Boyd, aged 40 years, night chief of the Western Union Telegraph Company at Columbia, S. C., died on January 10. Mr. Boyd was well liked by all who knew him, especially by the newspaper fraternity, to whom he rendered much valuable service. He is survived by his wife and five children.

Charles T. Beery, aged 35 years, an operator for the Western Union Telegraph Company at Kansas City, Mo., died recently.

The Late E. B. Havis.—Mr. Frank P. Foster, Corning, N. Y., former secretary of the International Association of Municipal Electricians, writes feelingly regarding the death of E. B. Havis at Birmingham, Ala., which was noted in these columns December 16 last. Mr. Foster states that his first telegraph work was the carrying of messages for the Western Union Telegraph Company at Birmingham, under Mr. Havis, who was identified with the company at that time. He naturally associated Mr. Havis with his progress and experiences in telegraphy, and was greatly shocked on learning of that gentleman's death.

Operator Frozen to Death in British Columbia.—Eugene W. Snodgrass, an operator at Hazelton, British Columbia, died alone in a Canadian forest during a blizzard last December. The hardships endured by men who spend their lives in the desolate places of earth for the benefit of their fellow men can hardly be realized by those who enjoy the advantages and comforts of civilization. Young Snodgrass started out to repair the telegraph line on December 11 and, although he failed to report, it was thought that he had reached the test camp ten miles away. When his faithful dog reached the camp without his master a search for him was immediately started. The tracks in the snow, which was four feet deep, showed that Mr. Snodgrass had wandered fourteen miles in the storm. The frozen body was found under a tree. The searchers were guided by the dog's tracks in the snow, which led directly to where the body lay. Travel in that region is difficult at this time of the year, and as the body can not be sent to the former home of the deceased before April it was buried in Hazleton by the Order of Eagles, the Canadian government paying the expenses. Mr. Snodgrass was twenty-two years of age, being born at Council Bluffs, Iowa, where his mother still resides. He was married three years ago and his wife survives him.

About seventy-five messengers of the American District Telegraph Company attended the Child Welfare Exhibit at the Seventy-first Regiment Armory, New York, on the evening of January 25. They were the guests of the company on this occasion.

Magnetic Club Election.

At the annual meeting of the Magnetic Club, held January 12, the following officers were elected for the ensuing year: President, Charles P. Bruch; first vice-president, Marston R. Cockey; second vice-president, Bertram M. Downs; third vice-president, Theodore L. Cuyler, Jr.; fourth vice-president, Edward B. Pillsbury; secretary, William B. Dunn; treasurer, Joseph J. Cardona. Governors until January 10, 1913, Messrs. Frank E. McKiernan, Charles Shirley, Leona Lemon, Daniel F. Mallen.

The following gentlemen were elected members of the Board of Governors at a previous annual meeting for the term expiring January 11, 1912; Messrs. John J. Whalen, Eugene P. Tully, Isaac Smith, Christopher F. Leonard.

The officers and members of the Magnetic Club were entertained by the officers and members of the First Company, Signal Corps, National Guard, New York, Wednesday evening, January 11, on the occasion of a review of the company by Colonel Frederick T. Leigh, chief signal officer, State of New York, and his staff, in the armory at Thirty-fourth Street and Fourth Avenue, New York. After the close of the review, and the inspection of the armory, a reception was held and supper was served. At the annual meeting of the Magnetic Club, held the day following, a resolution was adopted expressing appreciation of the high compliment paid the club by the Signal Corps and thanking the corps for its courtesy.

Philadelphia Electrical Aid Society.—The twenty-third annual meeting of the Electrical Aid Society of Philadelphia was held January 10. The following officers were elected for 1911: President, William R. Harmstad; vice-president, A. G. Strickland; recording secretary, W. E. Vanarsdall; financial secretary, R. C. Murray; treasurer, James H. Wilson. Executive Committee—The officers and Frank E. Maize, Andrew S. Weir, Mary McFadden, Nellie F. Hayes, George J. Wells, C. H. Beckworth. Trustees—George J. Wells, R. H. Conway, M. N. Redding. One hundred and sixty-six members were admitted during the year. The membership December 31, 1910, was 937. Receipts for the year were $5,282.42. Disbursements: Sick benefits, $3,029; death benefits, $600; expenses, $880.15; total, $4,509.15. Amount in bank and saving funds, $7,116.04. After the meeting sixty-five members were admitted, making the total 1,002. After adjournment there was a banquet, followed by a dance.

LETTERS FROM OUR AGENTS.

PHILADELPHIA, POSTAL.

Recent visitors to this office were President Clarence H. Mackay, General Superintendent E. B. Pillsbury and Division Superintendent L. Lemon.

Miss Catherine M. Graham has resigned to become a trained nurse. Miss Graham was very popular in the office, and gave a farewell party to friends at her home in Bryn Mawr on January 26. The office was well represented and the occasion was one that will not be soon forgotten.

CLEVELAND, WESTERN UNION.

Mr. M. D. Combs, traffic chief, has been promoted to be chief operator, and Mr. T. H. Baker has become assistant chief operator. Mr. J. E. Wertman has been appointed district wire chief with headquarters at Cleveland; Mr. A. G. Spiller has been advanced to be plant chief and Mr. W. E. Gales wire chief.

CLEVELAND, POSTAL.

Mr. Fenton T. Bott has resumed his former position as manager of the Dayton office, succeeding Mr. George M. Purdy, who has been transferred to the managership of the Cleveland office, as previously announced in these columns. When Mr. Purdy assumed his new position, he found a broken organization. Manager B. J. Ross, his assistant Mr. J. A. Paskert and chief delivery clerk Mr. M. A. McGrath, had packed up their baggage and moved to the Western Union headquarters. Affairs are righting themselves, however, under Mr. Purdy's guidance and the Postal company's interests are starting out on a new era of prosperity. Mr. E. F. Fahrendorf, formerly branch manager at Cincinnati, and later cashier and assistant manager at that point, succeeded J. A. Paskert as assistant manager. Mr. J. J. Hayes, formerly assistant cashier, has been appointed cashier and Mr. Nathan Gerson has succeeded Mr. M. A. McGrath as chief delivery clerk at Cleveland. Mr. Howard Simon, formerly messenger at Findlay, Ohio, has succeeded Mr. P. M. Grebe as manager. Mr. A. E. Jenkins, formerly manager at Wapakoneta, Ohio, has succeeded Mr. E. C. Snell as manager at Ashtabula Harbor, Ohio, and Mr. Ralph Cowles, formerly messenger at Lima, Ohio, has succeeded Mr. Jenkins as manager at Wapakoneta, Ohio. Miss D. M. Beckstead, manager of the Newark, Ohio, office, having won a trip abroad through her popularity vote, started on her tour January 1. Her position is being filled, until her return, by Miss M. Winifred Evans, manager of the Warren, Ohio, office, and Mr. Frank Schweinfurth, operator in the Cleveland office, is filling Miss Evans' place at Warren, until her return from Newark.

LOS ANGELES, WESTERN UNION.

A. L. Fish has been transferred from San Francisco printer department to this city, having charge here of the printer department, vice Mr. C. J. Covher transferred to the all-night traffic chief operatorship. W. B. Patterson has been appointed assistant wire chief days, and Mr. T. J. McDonald night wire chief.

NEW YORK, WESTERN UNION

Onnolee Lodge, order of Iroquois, New York, which is composed mainly of telegraphers, held its annual meeting January 12, and elected the following officers: president, P. Varian; past president, M. H. Crane; vice-president, John J. O'Brien; secretary, Maxwell Green; treasurer, A. M. Lewis; collector, E. C. Rafford; trustees, Gardiner Irving, William Rath, J. Heidemark.

Mr. James Tompkins, employed in this department many years ago, and a telegrapher of exceptional ability, died at Ogdensburg, N. Y. on January 16.

A direct circuit to Seattle, Wash., was inaugurated January 19. This is the longest telegraph circuit worked out of New York.

Mr. Charles Thom of the quadruplex department, who has been giving lectures for the Electrical School class, has been obliged to relinquish this work on account of ill-health. Mr. Thom's lectures have been very helpful and greatly appreciated, and general regret is expressed at his having to give up the work.

NO APOLOGY NEEDED after a "Central Rebuilt" typewriter is delivered. Remington, Smith-Premier, Underwood, L. C. Smith, Royal and all makes—high in quality, low in price. Postal employes may purchase at 75 cents weekly. Central Typewriter Exchange, 203 Broadway, New York. D. A. Mahoney, Representative.

Telegraphers' Mutual Benefit Association.

Assessment No. 519 has been levied by the Telegraphers' Mutual Benefit Association, to meet the claims arising from the deaths of Benj. F. Dillon at Atlanta, Ga. John F. Noonan at Paterson, N. J., Morris J. Kern, at San Francisco, Cal., Will-

Digitized by Google

iam Brennan at Philadelphia, Pa., Martin Adams at Chicago, Ill., William K. Bennett at Houston, Tex.

Morse Electric Club Dinner.—Active preparations are being made for the Morse Electric Club dinner which is to be held at the Savoy Hotel, New York, February 23, and there is every indication that there will be a large attendance. An excellent programme of entertainment is being prepared. Mr. Frank J. Scherrer, 30 Church Street, New York, is the secretary of the club.

A Brave Lot of Operators.—During the recent fire in the Chamber of Commerce building in Cincinnati, Ohio, the operators in the Western Union Telegraph office, which adjoined the burning building, stuck to their posts although the room was filled with smoke and sparks. Night manager Conley and assistant manager Herman made preparations for a hasty exit for the force in case of necessity, and told the men that they were at liberty to leave if they felt themselves in danger, but not a man deserted his key. Business was not interrupted by the fire.

Mr. C. F. Annett, Jr., son of Mr. C. F. Annett, an old-time telegrapher, now of Jerome, Idaho, distinguished himself recently in bringing relief to a disabled passenger train on the Pacific, Idaho and Northern Railway, when other means had failed. Each train carries an emergency composite telephone set, but in this instance it failed to work. Mr. C. F. Annett, Jr., plant foreman of the Weiser, Idaho, telephone exchange, was a passenger on the train, and having with him a test set and repair tools, he climbed a pole and sent a message to Midvale calling for a relief engine to take the place of the one which had broken down. Annett the younger is one of the youngest veterans of the Spanish-American war, and was with the Sampson fleet during its operations in Cuba, on the battleship *Oregon*.

Booster Railway Telephone Circuit.—The Kellogg Switchboard and Supply Company's special "booster" railway telephone circuit is now in operation on a great many lines handling train movements, and is used on railway telephone message circuits. No additional batteries are required, yet twenty-five stations can be spoken to at any time without detriment to transmission. With the Kellogg transmitter the voice is clear and strong, regardless of the number of stations that may be in with operators listening. It is stated that the Kellogg circuit arrangement increases the transmission efficiency from twenty-five to 100 per cent.

Non-Multiple Toll Switchboards.—The Western Electric Company has just issued bulletin No. 1006, describing non-multiple toll switchboards. The apparatus is recommended for use as toll boards in either magneto or central battery exchanges, and for use also as magneto exchange switchboards where a desk type board is desired or a switchboard with a lower key-shelf than is ordinarily provided on local boards.

Telegraph and Telephone Age is in a position to furnish its readers with any information that they may desire pertaining to electrical matters, also any book that is published on telegraph, telephone or any other electrical subject. Prompt attention is given to all inquiries, orders, etc.

Mr. C. A. Johnson of the Postal Telegraph-Cable Company at Meadville, Pa., in renewing his subscription for another year, writes: "Glad you did it, the Telegraph and Telephone Age is the only thing I like to write a check for."

WANTED.—Live agents in all large Western Union and Postal offices to represent us. Central Typewriter Exchange, New York.

It is a valuable privilege to be eligible for membership in a sound and reliable Life Insurance Association which cannot afterwards cancel or alter the terms of the certificate issued. The payment of the sum called for in a benefit certificate blesses alike the recipient and the provider. The Telegraphers' Mutual Benefit Association, 195 Broadway, New York, now the oldest co-operative life insurance association having been in successful operation for the past 43 years, offers this privilege to all eligible employes of telegraph and telephone service. Write at once for application form and full particulars.

There is much for telegraph operators to learn respecting their calling which can be readily obtained by reading Telegraph and Telephone Age—$2 a year.

MARTIN'S LATEST VIBROPLEX, $9.00. Address James B. Havice, General Agent, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEYBOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

SOME POINTS ON ELECTRICITY — XII.

A Study of Telegraph Apparatus.

BY WILLIS H. JONES.

THE RHEOSTAT.

The word rheostat refers to all devices which contain adjustable resistance material intended to be inserted in an electric circuit for the purpose of regulating the voltage therein. The material may consist of water, gas, metal, or any other substance that can be utilized in a practical manner. In telegraph service, however, rheostats almost universally consist of a number of coils of fine insulated German silver wire any of which may be cut in or out of circuit by means of metal plugs.

If we should stop with this conventional definition of a rheostat the reader would probably say, "Well, I don't learn anything new from that. Every operator certainly knows that much about it." But right here is where the study begins. If an operator without further enlightenment attempted to construct a rheostat for a multiple circuit, for example, he would probably learn too late that it would not answer the purpose in every respect.

The mistake that possibly nine out of every ten operators would make would be in the manner they wound the coils and the selection of material for the core. Each coil would probably be wound in series around an iron spindle or core after the manner of a relay, with the result that when used as an "artificial line" on a multiplex circuit, the artificial line would have a static discharge as great or greater than the main line itself It is obvious, therefore, that this method cannot be followed.

Now the first thing to consider in the construction of a rheostat is the elimination of everything that tends to create a magnetic field. Iron of course is the worst material to use, hence it is never used and the coils are wound around wooden spindles, or some other non-magnetic material.

Again, a magnetic field will be created and a counter-electromotive force developed in the coils if the current is allowed to flow in parallel chan-

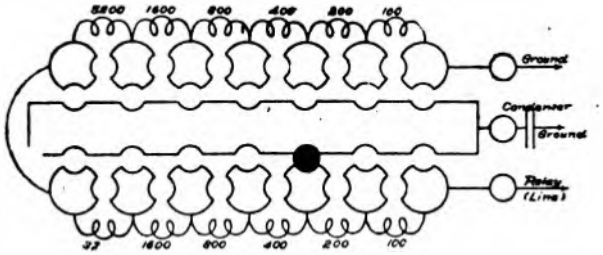

FIG. 1.—DIAGRAM OF CONNECTIONS OF RHEOSTAT COILS.

nels, such as is the case between the various convolutions of the ordinary series-wound coils. If, however, the convolutions are so arranged that the current flows in opposite directions through any two adjacent wires, the current in one wire neutralizes the magnetic effect of the other and no magnetic field is developed. Hence with these two precautions taken the multiplex rheostat is non-inductive. The detached portion of the accompanying diagram shows how the wire should be wound.

After the necessary length of wire required for a given number of ohms is ascertained, place the two ends together and make a double strand of it, but do not cut the wire in the middle where it doubles back. It will then become a long loop. Then, beginning with the loop or closed end, wind the two wires thus doubled as though they were a single strand. When it is all wound the two terminals of the coil will be ready for connection with the two separate brass disks just over the coil as shown in the diagram. By means of this method of winding it will be readily seen that the current in each strand and each double turn of wire must necessarily flow in opposite directions, which is the object of the winding.

The two terminals of the wire are attached to separate disks in order that when a metal peg is inserted in one of the holes shown in the illustra-

Digitized by Google

tion, a coil may be cut out and the amount of resistance that particular coil measures eliminated.

The brass bar placed between the two rows of coil disks (Fig. 1) forms the terminal connection for one plate of the condenser as shown. It has no connection whatever with the artificial or the main line multiplex circuit in the way of being a branch circuit, except to absorb a charge of electricity from the current flowing through the artificial line. The condenser being open, the current cannot flow through it, hence, although the artificial line is actually tapped and connected to the condenser at about the third hole in the rheostat it does not create a leak as a grounded branch circuit would. This tap often perplexes inexperienced students and the explanation should be noted. The amount of retarding resistance the condenser must discharge through depends upon the position of the peg connecting it with the artificial line. As a rule this connection is made at the third hole, which inserts four hundred to six hundred ohms resistance.

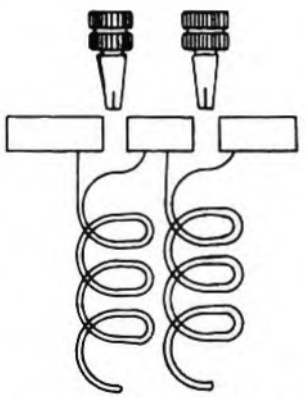

FIG. 2.—DETAILS OF COILS AND PLUGS.

(To be continued.)

983,240. Telegraph System. To I. Kitsee, Philadelphia.

Personal.

Colonel Robert C. Clowry, former president of the Western Union Telegraph Company, accompanied by his secretary, Mr. F. J. Scherrer, left on February 6 for a few weeks' trip to the South, where they will visit Tampa, Fla., Palm Beach, Fla., Nassau, Bahamas, and other points.

Mr. Thomas A. Edison has gone to Fort Wayne, Fla., to spend his usual winter vacation.

Hon. David P. de Villiers Graaff, Minister of Public Works, Posts and Telegraphs of the Union of South Africa has been made a baronet by King George of England.

Major General A. W. Greely, U. S. A., retired, in a recent address before the District Society of the Sons of the Revolution, Washington, D. C., described the work of the army in connection with the laying of the cable and the operation of the wireless telegraph system in Alaska.

Mr. Andrew P. Sell, the well known telegrapher of Philadelphia, is the author of an interesting contribution which appeared in the Philadelphia *North American* of December 25, 1910, under the heading "Joys and Jars of the Christmas Messenger."

Mr. F. E. Camp, inspector of the Canadian Pacific Railway Company's Telegraphs, Revelstoke, B. C., son of Mr. and Mrs. W. J. Camp, of Montreal, spent a vacation with his parents recently in the latter city.

Mr. H. B. Perham, president of the Order of Railway Telegraphers, was a recent New York visitor. The next convention of the order will be held in Toronto, Ont., in May.

Mr. Walter C. Burton, the well known former telegrapher of New York, and at one time a state senator from Brooklyn, was honored on February 7 by an appointment as a Civil Service Commissioner by Governor Dix. Mr. Burton's nomination was confirmed at once by the Senate for the reason that he was a former member of that body and needed no further investigation.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. Charles C. Adams, second vice-president of the company, accompanied by Mr. F. F. Norton, superintendent of traffic, New York, was in Chicago, on company business this week.

Mr. E. B. Pillsbury, general superintendent; Mr. C. P. Bruch, third vice-president; Mr. M. M. Davis, electrical engineer, and Mr. J. P. O'Donohue, division electrical engineer, were in Buffalo recently on company business.

Mr. Thomas F. Burke, of the Jersey City office of this company, has been appointed manager of

Digitized by Google

the Poughkeepsie, N. Y., office, vice F. W. Towne, who is to enter the brokerage business.

Mr. E. L. Kearney has been appointed assistant manager of the Pittsburg office. Mr. Kearney was born in that city, February 26, 1873, and began his telegraphic career as messenger for the Mutual Union Telegraph Company in 1886. He entered the service of the Postal Telegraph-Cable Company as messenger in 1888, and afterward filled various positions until 1904, when he resigned to engage in other business. He returned to this company in 1907 and had charge of the branch office in the financial district until his recent promotion.

Mr. J. F. Horn, formerly manager at Zanesville, O., has succeeded Mr. M. G. Mullins as manager at Canton, O.

Mr. D. Pemberton, formerly operator at Lima, O., succeeds Mr. K. P. Huff as manager at Middletown, O.

Mr. Glenn L. Pierce, manager of the Evansville, Ind., office of the Postal Telegraph-Cable Company, was born at Alexander, N. Y., January 10, 1887. He began his telegraphic career in May, 1904, as manager of the Harvey, Ill., office of the same company. He has filled positions as operator at St. Louis, Mo., and Quincy, Ill., and as manager at Hannibal, Mo. He was appointed to his present position, January 1, 1909.

A newly opened office has been established at Hazleton, Pa. Mr. James C. McGeehan has been appointed manager.

This company has secured the right of way for its line along the Santa Fe system throughout Texas and is extending its lines in that state. Mr. C. M. Baker, division superintendent of plant of the Western division at Chicago, has the work in hand.

New Postal Office in Buffalo.

The growth of the Postal Telegraph-Cable Company's business in Buffalo, N. Y., has made it necessary for that company to enlarge and improve its equipment and facilities in that city. A lease has just been signed for a long term of years with the Prudential Building Company, in Buffalo, under which the Postal Company will occupy the room vacated by the Columbia Bank, at the corner of Pearl and Church Streets, as a receiving office, and will have ample space on the second story for its operating and accounting departments. Arrangements are now being made for re-fitting the quarters, and the work of installing fixtures and equipment will be started at once. When finished the receiving room will probably be the handsomest and most attractive of its kind in the United States.

The operating department will be fitted out with new and up-to-date apparatus and will be arranged with a view to facilitating the handling of business and to assure the comfort of employes to the utmost extent.

The moving of a telegraph office of the size of that in Buffalo is a vast undertaking. In this instance it will involve months of time and an expenditure of $30,000 or $40,000. It will probably be a year before the new office is ready for occupancy, although the work will, in the meantime, be pushed as rapidly as conditions will permit.

Buffalo is one of the most important points in this company's service and will become still more so as the business continues to expand. It is what is known as a repeating and distributing point. A large number of the most important circuits between the East and West are operated through this office, and the local business is large.

Postal Office in Pennsylvania Terminal, New York.

The Postal Telegraph-Cable Company's new office in the Pennsylvania Terminal, New York, is striking for its simplicity and elegance.

The office is located in a prominent position on the main waiting room floor, opposite the railroad company's ticket office. It is a room about ten or twelve feet square, and it is fitted out in the simplest manner possible. Not a scrap of unnecessary paper is visible anywhere, and absolute order and cleanliness are strictly enforced by the railroad company's rules.

Around two sides of the room is a counter of solid mahogany, highly polished and 1½ inches thick. On this are set four sounder resonators, two relays and four keys, also the outlet of a pneumatic tube which connects with the Pullman ticket office across the waiting room. These are the only things visible on the counter. Under the counter are several steel closets for supplies, etc., the switchboard being contained in one of these.

The switchboard consists of ten jacks and four wedges, ten wires running into the office. Not a wire is visible to any one inside of the office or outside. The resonators used are of the company's latest improved form, and are constructed of material to harmonize with the general surroundings. They are screwed to the desk, the long arm supporting the resonator being movable in a socket.

The office is lighted by four Nernst lamps suspended from the ceiling, which give a soft well-diffused light.

Each member of the force wears a regulation Pennsylvania Railroad uniform with the word "Postal" on the collar, this being one of the railroad company's requirements.

The office is always open, there being three shifts of operators, only one being on duty at a time, however. In a recess near the office door is a long counter of heavy plate glass provided for patrons on which to write their telegrams. The counter is lighted at night by electric lights placed in long shades and all of the fittings are of solid brass.

To look into the office one would never suspect that it was a busy place, everything is so

Digitized by Google

scrupulously clean and orderly. Mr. J. Sheffery is manager of the office.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Belvidere Brooks, general manager of this company is on a trip of inspection throughout the west and southwest. He will visit Buffalo, Cleveland, Detroit, Chicago, St. Louis and Kansas City and will return to New York February 20. He is accompanied by his secretary, Mr. W. C. Merly.

Mr. E. Y. Gallaher, auditor of the company, was married on February 2, to Miss Isabelle Moore, of New York. The couple will be absent on their honeymoon until March.

Mr. Frederick W. Lienau has been appointed assistant secretary of this company. Mr. Lienau is a native of New Jersey and studied law at Columbia College and the New York Law School, graduating from the latter. He entered the legal department of the company in 1903 and in 1906 was attached to the general manager's office.

Mr. C. H. Gaunt, general superintendent of the company at San Francisco, who has been confined to his home for some time past with typhoid fever, is reported convalescent.

Mr. J. G. Hilbert, has been appointed division superintendent of construction of the Gulf Division of this company with headquarters at Dallas, Tex.

Mr. C. A. Rhoades, of New York, has been appointed division auditor of the Mountain Division with headquarters at Denver, Col.

Mr. J. J. Hoefman has been appointed division auditor of the Southern Division with headquarters at Atlanta, Ga.

It has been arranged to bring under one responsible control in the person of Mr. S. M. Williams, who will be in charge with the title of manager, the various services at present rendered under the designation Commercial News Department and Gold and Stock. The department will continue to be known as the Commercial News Department. Superintendent Mr. W. J. Dealy of the Commercial News Department will continue in his present position with the title of general superintendent. Mr. George B. Scott will continue as superintendent of the Gold and Stock branch of the service in New York City, reporting to Mr. Williams.

Mr. Jacob Levin, formerly general superintendent of the Southern Division of the Western Union Telegraph Company at Atlanta, Ga., was a recent New York visitor.

Mr. E. B. Saylor, formerly superintendent of this company at Pittsburg, Pa., has been appointed to a position in the office of the general manager, New York.

Mr. W. H. Mathews has been transferred from the complaint bureau to the general manager's office. He has been succeeded in the complaint bureau by Mr. G. W. Blanchard.

Mr. Albert J. Lister has accepted a position with this company as cable solicitor with headquarters at the Central Cable office, New York. Mr. Lister was formerly in the service of the Commercial Cable Company and has a wide experience in the cable service.

Mr. L. F. Taylor has been appointed to a position in the office of Mr. H. J. Kinnucan, district commercial superintendent, Detroit, Mich.

Mr. W. T. O'Neal, of Washington, D. C., has been appointed manager of the Alexandria, Va., office, vice Mr. R. L. Stultz, resigned.

Mr. G. T. White has been appointed manager of the Wilmington, N. C. office, vice Mr. E. T. Moore, transferred to the Richmond, Va. office.

Mr. G. P. Sterk, manager at Escanaba, Mich., has accepted a position in the superintendent's office at Minneapolis, and Mr. H. E. Grimes succeeds him as manager of the Escanaba office.

The new office of this company at Atlanta, Ga., was opened for business on January 28. It is fitted out in a very substantial manner and has 133 desk sittings.

Mr. B. A. Harris, formerly chief operator of the Western Union Telegraph Company, at Memphis, Tenn., and later occupying a position in the New Orleans office, has decided to rest for a year at Helena, Ark., owing to a break down in his nervous system.

Mr. John J. McCloskey, formerly an operator in the Sedalia, Mo., Western Union office, has been appointed city collector for the same company at Kansas City, Mo. He succeeds Mr. E. M. Edwards, recently promoted to the position of special commercial agent at Kansas City.

Mr. Louis Casper, for many years identified with the Western Union Telegraph service in Chicago and at other points, but for the past three years a member of the faculty of the Port Arthur Business College, at Port Arthur, Tex., has re-entered the telegraph service at New Orleans, La., where he has accepted the position of superintendent of equipment of this company. Mr. Casper is well qualified to fill the duties of his new position. Before leaving Port Arthur he installed a regular Marconi station at the Port Arthur Business College, using a steel tower for the aerial, surmounted by a forty-five foot wooden mast, making the total height, 180 feet. A 2-kw sending transformer and regular standard Marconi apparatus are used.

Mr. Hayden D. Austin, district traffic supervisor of the Western Union Telegraph Company with headquarters at Philadelphia, was born at Camden, N. J., in March, 1875. In July, 1895, he entered the telegraph service at Winslow Junction, N. J., on the Pennsylvania Railroad, and was employed at various points on that line, the Central Railroad of New Jersey and the Philadelphia and Reading Railroad until 1899 when he accepted a position with the American Telephone and Telegraph Company at Philadelphia, as connecting board operator. He

Digitized by Google

was later advanced to the position of assistant chief operator at that point. In 1900 he was transferred to the Reading, Pa., office of the same company as chief operator, becoming manager some years later. He was made district traffic chief in April, 1908, and on January 1 of this year he was appointed to his present position.

Opening of New Operating Room at Seattle.

The new operating department of this company's office at Seattle, Wash., was formally opened on January 20. The new quarters are located on the sixth floor of the Bailey Building, and the patrons of the company were invited to inspect the new office and witness the actual operation of handling telegraph business.

Rush Taggart, General Counsel Western Union Telegraph Company.

Mr. Rush Taggart, whose appointment as general counsel for the Western Union Telegraph Company was announced February 1, comes from the Buckeye State, having been born at Smithville, Wayne County, Ohio, September 4, 1849. Shortly after his graduation from the law department of the University of Michigan in 1875, he accepted a position in the service of the Pennsylvania Company at Salem, Ohio, as assistant in the office of Solicitor J. T. Brooks. In the fall of 1877, upon the promotion of Solicitor Brooks to the position of general

MR. RUSH TAGGART,
General Counsel Western Union Telegraph Company, New York.

counsel, Mr. Taggart was made solicitor, and for the succeeding ten years had charge of all the legal business on the lines of the Pittsburg, Fort Wayne and Chicago Railway and branches in the state of Ohio.

Coming to New York in 1887, he entered the law office of Dillon and Swayne, the senior member of which was Judge John F. Dillon, now consulting counsel of the Western Union Telegraph Company, the junior member being the late General Wager Swayne, himself an Ohioan and a friend of the young attorney. On May 11, 1887, Mr. Taggart became identified with the law department of the Western Union Telegraph Company, in which department he has since been able to render conspicuous service. Mr. Taggart is well versed in the law, possesses a keen analytical mind and is a speaker of more than ordinary ability.

C. A. Comstock Advanced to a Superintendency.

Mr. Curtis A. Comstock, manager of the Milwaukee, Wis., office of the Postal Telegraph-Cable Company, has been appointed superintendent of offices in Wisconsin, Northern Michigan, Iowa, South Dakota and Minnesota with headquarters in Chicago, as previously announced in these columns. Mr. Comstock was born in Adrian, Mich., August

MR. C. A. COMSTOCK,
Superintendent Postal Telegraph-Cable Company, Chicago.

3, 1872, and began his telegraphic career in Appleton, Wis., in 1890. In 1891 he went to Milwaukee as manager of the wholesale district branch office, and afterwards became cashier, then chief operator in the main office. In 1902 and 1903 he was employed at El Paso, Tex., and Omaha, Neb., and in 1904 returned to Milwaukee as assistant manager. In the following year he became manager of the office and held this position at the time of his promotion to the superintendency. Mr. Comstock has been a Postal man throughout his entire business career and is a capable and industrious gentleman.

Municipal Electricians.

Fire Alarm.—A patent (No. 981,998) has been granted to A. Goldstein, New York, on an Electrical Thermostatic Fire Alarm System.

Fire Alarm System.—A patent (983,191) has been issued to F. B. Wood of New York, on an electric signal system for fire alarms.

New Fire Alarm System for Syracuse.—It is likely that the fire-alarm telegraph system of Syracuse, N. Y., will be modernized. Chief Quigley has been largely instrumental in bringing about this result.

New Building for Western Union Telegraph Company and New York Telephone Company.

The accompanying illustrations show two views of the new building of the New York Telephone Company, which is to be erected on a plot of ground running from Walker Street to Lispenard Street, New York. About a year ago the company purchased, at a cost of approximately $500,000, property at Nos. 18-24 Lispenard Street, and Nos. 18-26 Walker Street, having a total area of about 21,000 square feet. This property has a frontage of approximately ninety feet on Lispenard Street and 125 feet on Walker Street, and a total depth from street to street of approximately 200 feet.

It is the intention to erect on this property an initial building of about seventeen stories; the foundation and framing, however, will be planned for an ultimate height of twenty-four stories. The floor plan of the building will be in the shape of the letter "L," with a floor area of approximately 14,000 square feet. It is estimated that the initial

FIG. 1.—LISPENARD STREET END OF BUILDING.

building will cost in the neighborhood of $1,250,000. It is the intention to start constructing the foundations about March 15, and to begin the structural steel work and masonry walls about June 15, with the expectation of having the building ready for occupancy about March 1, 1912.

When finished the building will be occupied about as follows: The first floor will be rented for stores; the second floor will be used for office space by the New York Telephone Company; the third, fourth, fifth, and about half of the sixth floors will be used by the American Telephone and Telegraph Company for terminal and operating rooms, quarters and offices; the seventh eighth, ninth, tenth and certain portions of some of the other floors will be used by the New York Telephone Company for office space for the various division superintendents and their forces.

The Western Union Telegraph Company will occupy a portion of the building. It will have the main operating room and terminal rooms there and also some business offices.

The American Telephone and Telegraph Company will install in this building as soon as it is completed the largest long-distance switchboard in this country having approximately 200 positions for operators. While no local switchboard will be installed in the initial building, it is the intention later, when additional stories have been added, to install two and possibly three local switchboards

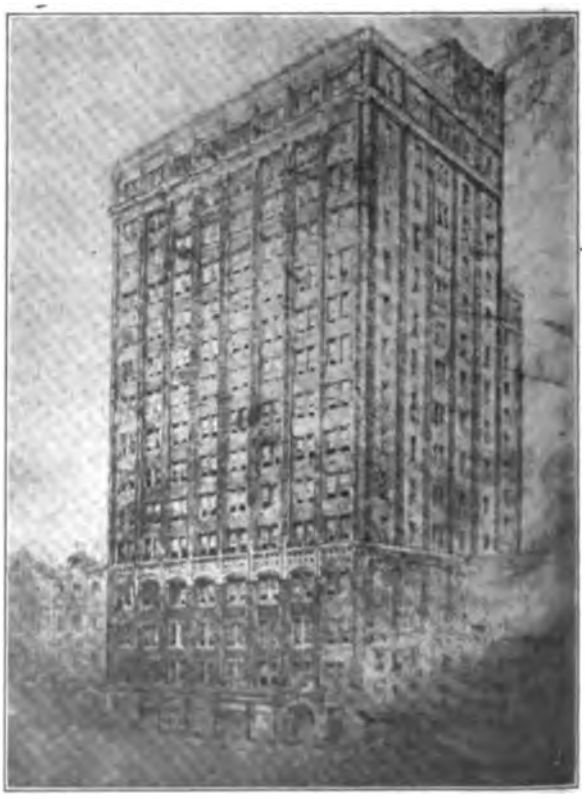

FIG. 2.—WALKER STREET END OF BUILDING.

which will be capable of furnishing service to approximately 60,000 stations.

The proposed quarters for the central office employes are being carefully considered with a view to giving them adequate locker and dining-room facilities and large cheerful retiring rooms. The company is considering finishing up the roof of the building in order that it may be used in the nature of a roof garden. In addition to these provisions for the welfare of the central office operators, three large ventilating plants will be installed in order to furnish adequate ventilation at all times for the large number of operators who will be on duty. Similar provisions will be made for the telegraph quarters in the building.

Military Telegrapher in the Civil War.

PART LIV.

Among those who took an active and prominent part in the exciting times attending the civil war, and who was one of the most trusted of military telegraphers, was Mr. E. C. Boyle. Mr. Boyle's story of events in Louisville during the campaign and his relations with the great generals representing the Union cause is a most interesting one. He traces his war experiences back to that memorable event, the fall of Fort Sumter, and carries us through the exciting days in Louisville and the adjacent country. Mr. Boyle's narrative, in part, follows:

In giving a history of my connection with the United States Military Telegraph it will not be out of place to give a brief description of the state of affairs for some months after the fall of Fort Sumter and before there were any regular military operators in the department of the Cumberland. My brother, T. R. Boyle, deceased, had charge and was manager of the telegraph office at Louisville, I being assistant manager, and we both had charge of the government ciphers and attended to that duty for several months until regular cipher operators were appointed. I remember my first military duty was to deliver in person a very important telegram to General L. H. Rousseau, who was at that time quartered at Camp Joe Holt, Jeffersonville, Ind. This was my first experience in a military camp. I was ordered to halt by the sentry, and I called out to General Rousseau to order the sentry to pass me as I was the bearer of important dispatches. The general did so and at once invited me to his headquarters, treated me very politely and was always after that a warm friend of mine.

The Army of the Cumberland was organized and General Robert Anderson was the first commanding officer of the department. On September 27, 1862, at 11 o'clock p. m., No. 1 and 2 southern wires were cut between Louisville and Bowling Green. All in the office felt almost certain that the lines were destroyed by the Confederate forces under General Buckner, so as to cut off our further communication south. General Buckner had planned a surprise. Had he first directed squads of troopers, each accompanied by an operator, to capture and control some of the northern telegraph offices, and moved more cautiously by rail, instead of cutting the wires between Bowling Green and Louisville as he did, and having his forward engine dumped in the ditch as it was, by reason of a rail being displaced by loyal young Crutcher, there can be no doubt but that he could have taken the city.

The news of the wires being down spread very rapidly, and it was supposed that Buckner was advancing on Louisville. In the meantime the employees of the Louisville and Nashville Railroad Company commenced tearing down the poles and wires in the vicinity of the depot under the impression that they were helping the Union cause by doing so. About 6 o'clock p. m., Captain Green and Major Murray, both of General Anderson's staff, came to the office and informed me that their object in coming was to take charge of the southern wires to see that no communications were sent over them, etc. I told the gentlemen that the wires south were down and that it was impossible for any one to transmit or receive news over them. Captain Green also informed me that they had orders not to allow any of the wires in the office to be worked. He then requested me to go with him to General Anderson and talk to him in regard to the matter. After being introduced, the General asked me if I was a Union man, and he required me to give my word of honor that no treasonable messages would be sent south. On my giving assurance that his orders would be carried out the two officers named were relieved from further duty at the office. I mentioned to General Anderson about the railroad men destroying the wires and explained to him how essential it was to have the wires in working order so that he could be in almost constant communication with the troops that were to leave that night. I promised also to send operator John Lenhart with the troops and this seemed to please him very much, and he issued an order at once for no one to interfere with the telegraph wires. A few weeks after the troops left Louisville, General W. T. Sherman was placed in command of the department with headquarters at Louisville.

General Wm. Nelson was in command of the district of Louisville. There was much excitement, as the Confederates under General Bragg were supposed to be marching on the city. A pontoon bridge was placed across the Ohio and several thousand people crossed to Indiana, fearing that Bragg would take the city. General Nelson told me that there were nine chances against us to one in our favor. He had a number of heavy guns and ordnance supplies removed from the city. There was intense excitement and much apprehension of an attack until General Buell and his army reached the city. About the same day that General Buell arrived General Nelson grossly insulted a brother officer and was shot for the offence. The shooting occurred at the Galt House. I was there a few minutes after it happened.

A few days after the arrival of General Buell's army, General Thomas received a telegram from the Secretary of War ordering him to relieve General Buell and assume command of the Army of the Cumberland. General Buell at the same time was ordered to report at Indianapolis for orders. General Thomas answered the telegram at once and requested that General Buell be reinstated in command as we were on the eve of a battle and he believed it was for the good of the service. General Thomas told me that General Buell knew the geography of the country, and had just reorganized the army to meet Bragg. Soon after October 8, after the battle of Perryville, Ky., Buell was relieved and General Thomas took command of the Army of the Cumberland.

Early in 1866 I was appointed manager of the Nashville, Tenn., office, among my operators being

Digitized by Google

D. O. Dyer, George Everett, B. B. Glass, Ellis Wilson, John Thode, E. M. Shape, G. H. Shape and others, who worked early and late. Nashville was the headquarters for the Army of the Tennessee and the Army of the Cumberland. There were usually a large number of troops quartered about the city, consequently the telegraph business was very heavy. It required efficient operators and much care to keep the files clear, and the amount of newspaper matter at times was very large. We managed to give full satisfaction and I heard very few complaints considering the amount of business handled.

On November 30 I received an important telegram from General Schofield giving the particulars of the battle of Franklin, Tenn. I delivered the message in person at the St. Cloud Hotel. The late ex-president, Andrew Johnson, who was military governor, and medical director Cooper, were present. As soon as General Thomas read the message and made known the contents Governor Johnson got up and shook hands with me and said the news was glorious.

I will conclude my narrative by stating that my business relations with such of the officers of the Army of the Tennessee and the Army of the Cumberland that I met were always pleasant and agreeable. After the battle of Nashville I sent a communication to General Thomas asking permission to keep the office open on Sundays one hour in the morning and then closed until 6 p. m., so as to give the men a chance to attend church. The General approved of it at once. Before this the office was usually open all day for military business. When the United States Military lines were turned over to the commercial company, I received an autograph letter of recommendation from General George H. Thomas, which I value highly for the reason that he was such a noble and conscientious man. He gave me credit for efficiency in carrying out all his orders, etc.

Combined Quadruplex and Telephone Circuits.

BY L. C. MCINTOSH, LOS ANGELES, CAL.

Where two quadruplex circuits parallel each other along the railroad right of way and a Morse circuit is not available, or by reason of too many relays, is not adaptable to telegraphone circuits, it frequently becomes necessary to bridge the quadruplex circuits for a telephone line by using condensers on each side of the telephone and tapping the quadruplex circuits at the different stations along the line, the trainmen being provided with a forked pole for cutting in at any point between stations.

This makes an ideal telephone circuit with all the necessary retardation in the quadruplex apparatus at each terminal to back it up, but, unless some provision is made to balance the two telegraph circuits with each other there will surely be trouble on the circuit which has a short end battery to line while the other has a long end battery to line. In other words it will be impossible to make both circuits work four cornered simultaneously, due to the kick through the condensers bridged across the lines.

The writer has found that by introducing a similar arrangement, minus the telephone instrument, across the artificial lines of the two circuits the interference can be entirely eliminated. To do this it is only necessary to tap the artificial lines at the terminal stations at their entrance to the rheostats and connect an adjustable condenser between the two with an adjustable resistance on each side of the condenser as shown in the illustration.

If a pre-determined number of telephones are installed on the circuits and not more than one is connected or disconnected at a time, as would be the case when trainmen cut in and out, the condenser and resistances can remain at a fixed value, and after the capacity required is once definitely established by the use of adjustable apparatus, permanent resistance and blind condensers can be substituted. There will then be no necessity for a change, as the addition of one telephone set will hardly be perceptible after a certain capacity has been introduced.

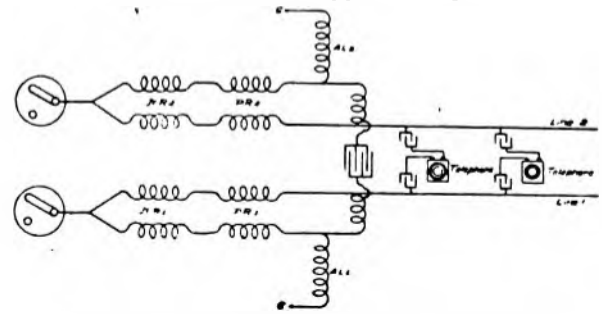

DIAGRAM OF COMBINED QUADRUPLEX AND TELEPHONE CIRCUITS.

We are operating a circuit over the Southern Pacific lines between Los Angeles and Bakersfield, Cal., with telephones bridged across the two quadruplex circuits with much success. Before the condensers were introduced across the artificial lines, it was impossible for us to work four corners on both circuits simultaneously. I believe that it is possible to extend this telephone circuit to San Francisco, the distant terminal of the quadruplex circuits. It might be necessary to transpose south of Bakersfield on such a long line, but the wires separate and take different routes north of that station.

Messenger on Skiis.—A messenger of the Postal Telegraph-Cable Company in Reno, Nev., attracted much attention recently by delivering messages on skiis. He made rapid progress by means of his new method of locomotion.

Telephone and Telegraph in Switzerland.

Practically every post office in Switzerland is provided with a public telephone and telegraph, and every community, no matter how remote, is supplied with both services. Rates are low, and every inducement is offered to the public to use the telephone and telegraph as means of communication.

The total number of telegrams sent and received during 1909 was 5,202,969.

Wire Patching and Testing.

BY WILLIS H. JONES.

The many requests received from all quarters for the names of good books covering wire and switch work indicates that the subject is an interesting one for both layman and expert. In the absence of particulars, however, this is rather a difficult question to answer. There are a number of standard works which, collectively, contain about all the information required by a wire chief, such, for example, as Maver's American Telegraphy, Jones' Pocket Edition of Diagrams, Schneider's Electrical Instruments and Testing, etc., yet no one makes a feature of that particular subject. In other words, there is no single book published, so far as the writer can learn, which deals with the subject exclusively, or any which attempts to cover the subject fully.

For the purpose of directing those seeking information of this character, the following suggestions are offered:

A novice should first procure a good text book and acquire a knowledge of Ohm's law, relative to electromotive force, the resistance of wires and currents. Without such knowledge he need not expect to ever be able to make wire patches or test intelligently.

Again, it would be unwise for him to attempt handling voltmeters, ammeters, or galvanometers,

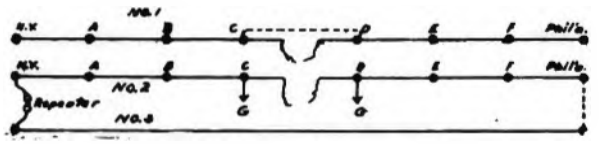

DIAGRAM OF WIRE PATCHING.

without first learning their construction and principle of operation. Hence he should study each instrument separately. Swope's Lessons in Practical Electricity, or any one of the first named books, contains information on this subject. In these books will also be found the latest and most approved formulas and methods used in making all the various tests a wire chief will probably ever be required to make. Such formulas, for example, as Varley's and Murray's Loop tests, the three-wire method, etc. These should be studied carefully and the principles involved mastered.

Finally, there are things to be learned in handling wires at a switchboard which can only be learned through actual experience. Each wire possesses an individuality of its own if studied closely. Some wires differ widely from others, while a few may show many points of resemblance.

It is the knowledge of the individual merits, faults, and other peculiarities of the wires that is necessary in order to test and patch, not only quickly, but to the best advantage. As previously stated, this knowledge cannot be obtained from any book, but in an article it is possible to point out some of the features which the layman will recognize after a few weeks' experience at a main wire switch board.

For the purpose of illustration we will follow the operation of an experienced wire chief testing and patching a broken way wire between, say, New York and Philadelphia. He has been notified that the wire is open, but of course has no idea of where the break is. An inexperienced chief would simply have to guess at the location and possibly test with half of the stations along the line before finally locating the fault. Not so, however, with the experienced chief. He is familiar with the normal "feel" of the circuit when it is "O. K.," and other conditions pertaining to it. For instance, he knows that a way wire with several relays in circuit if open at the distant end will give a pronounced static kick on his test relay every time he taps his key, and that each station this side will give a diminishing return discharge. Hence when he inserts his instrument in a broken wire, if the kick is nearly normal he knows that the fault is probably a long distance away. If it is feeble it is near by. He, therefore, for a test, calls up on another circuit a station through which the faulty wire runs, and as a rule his guess is not far out of the way. Usually one or two trials will locate the break.

In case the wire had been reported grounded instead of open he would estimate the probable distance to the fault by noting the strength of current flowing through his test relay, as indicated by the magnetic pull on the armature. If the pull should be unusually strong he would know by that fact that the ground was near by, and vice versa, more distant if the pull was nearly normal. Having located the break between, say, stations C and D, as shown in the illustration (wire No. 1), by ascertaining that the ground at the switch board at station C would close the circuit and that station D's ground would not, the next operation is to find some available idle wire to connect the broken ends of the circuit together between the switch board at C and the board at D. If there is a short wire available between those points, the chief would use that as the first choice, for economical reasons. If not, he may be compelled to use a full length wire between New York and Philadelphia as shown in the lower portion of the diagram. In this case he would tell Philadelphia to connect the two wires, No. 1 and No. 3 together at his board. New York would then have a circuit to all stations between D and Philadelphia by thus picking up the other end of wire No. 1. The other portion of the wire No. 1 between New York and C would, of course, be O. K. as long as C kept his ground on as shown on wire No. 2. The chief would then only have to keep battery on wires No. 1 and No. 3 and connect the two together in one circuit by means of a repeater as shown in the diagram. With this arrangement all stations will be able to work with one another just the same as if wire No. 1 had not been open or grounded in the first place.

This, of course, is a very elementary illustration

Digitized by Google

of wire testing and patching. Experience alone will give the necessary knowledge concerning the various wires and conditions of circuits that will enable one to choose wisely.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works of telegraphy and treat them in the same manner.]

CHAPTER XL.

What led to the discovery that telegraphy and telephony could be carried on over one circuit at the same time?

By whom was this possibility discovered?

In what manner was it demonstrated that the inductive effect of a telegraph circuit upon a telephone circuit could be minimized?

How many conductors are necessary to form a combination telegraph-telephone circuit?

How is the telephone apparatus connected to the circuit with reference to the telegraph apparatus?

What is the effect of the condenser in the bridged telephone circuit?

What is the principal advantage of the Van Rysselberghe system of simultaneous telegraphy and telephony?

Why is it necessary to bridge all Morse telegraph keys with condensers?

In a combined telegraph-telephone circuit is there ever an actual break in the line current?

Why is it necessary to preserve continuity of current?

What is the chief feature of the Pfund method of simultaneous telegraphy and telephony?

How are telephones on regular telephone circuits connected?

Is duplex telephony used to any extent?

Describe the Jacobs' duplex telephone as shown in Fig. 125.

CHAPTER XLI.

What is the phonoplex?

What is the effect of phonoplex operation on wires on the same poles?

How are the impulses used in phonoplex operation generated?

Describe the operation of the phonoplex.

CHAPTER XLII.

In wireless telegraphy what is the medium of propagation of electric waves?

What is the ether?

In wireless telegraphy do the electrical waves travel in any one direction?

How are the electrical waves produced?

What happens when a disruptive discharge takes place across the air gap between the two terminals of the primary coil in an induction coil?

How are the effects of such a discharge demonstrated?

In wireless telegraphy what code is used, the Morse or Continental?

How are the electric waves intercepted at the receiving station?

What is a coherer?

How is a coherer constructed?

What is the purpose of the coherer and how does it act in the presence of electric waves?

Telephone and Telegraph System.

Mr. Harry O. Rugh, of Sandwich, Ill., has been granted a patent upon a system of simultaneous telegraphy and telephony over one circuit. In this system Mr. Rugh employs two line wires, and means at one station for the selective calling of any other station over the first wire. Claim 5, which covers the system, reads as follows:

"A telegraph and telephone system, comprising two line wires and a plurality of stations, means at one station for selectively calling over the first line wire any of the other stations, selective signal-receiving means at each station associated with the first aforesaid line wire, telephone instruments for communicating over the second line wire between the calling station and any station selectively called, telegraphic instruments for communicating over the first aforesaid line wire, telegraph instruments adapted for operation over said first aforesaid line wire, and means associated with said first aforesaid line wire to prevent interference between simultaneously operating telephone and telegraph instruments."

Change of Date of Old Timers' Atlantic City Meeting.—The date of the meeting of the Old Time Telegraphers and Historical Association, and the Society of the United States Military Telegraph Corps, which is to be held at Atlantic City, N. J., next September, has been changed to September 5, 6 and 7. The headquarters will be at the Marlborough-Blenheim. Col. W. B. Wilson, Holmesburg, Pa., is president of both associations, and Mr. F. J. Scherrer, 30 Church Street, New York, is secretary of the Old Time Telegraphers and Historical Association. Mr. David Homer Bates, 658 Broadway, is secretary of the Society of the United States Military Telegraph Corps.

Mental Anguish at Bargain Counter Rates.—The suit brought against one of the telegraph companies under the Mental Anguish Law in a southern state names the amount of Mental Anguish damages as $999.99. The suit is brought by a woman who evidently is particular as to the exact value of her feelings, which were badly lacerated by the delay in the delivery of a message.

ADDRESS ALL COMMUNICATIONS TO
J. B. TALTAVALL, - Editor and Publisher,
253 BROADWAY, NEW YORK.
T. R. TALTAVALL, Associate Editor.

CABLE ADDRESS: "Telegage," New York.
Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

February 16, 1911.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Mr. Vail on the Future of the Combination of the Telegraph and Telephone.

Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company and president of the Western Union Telegraph Company, predicts that a large part of the business correspondence of the country will be done by telephone and telegraph. He also states that the combination of the telephone and telegraph services will effect a great improvement in the service of telephone and telegraph and enable new services to be given to the public at rates which will permit the public to utilize the wires more than at present. Mr. Vail states that efforts are being made to find a means of recording a spoken message so as to obviate the chance of error in transmission over the telephone. "We are experimenting with every device that promises results," he said, "and I believe some such means of record is possible and before long will be in general use. It is probable that the distance over which personal conversation can be carried on will be from ocean to ocean in the not distant future."

Destruction of Poles by Woodpeckers and Insects.

In connection with the growing scarcity of timber suitable for telegraph and telephone poles, the ravages of birds and insects have come in for a good deal of attention in late years. The woodpecker is responsible for much of the damage, and ants and other woodboring insects do their share of the work of destruction. The effect of the woodpeckers' injurious activity is outwardly visible and this fact offers an opportunity to check the damage before it has gone too far, providing a reliable method of discouraging the bird in its work is known and applied. How this can best be done, however, is a problem that is not easy of solution. Various expedients have been tried with indifferent success. It was thought that poles treated with chemical preservatives would be proof against these attacks, but in some parts of the country birds seem to thrive upon the chemicals. Traps, shot guns, and other methods of discouragement and execution have been tried. They are effective as far as concerns birds caught in the act, but what is needed is something that will distract the birds at any and all times.

We print elsewhere in this issue extracts from letters on this subject received from various sources throughout the country. They indicate that the difficulty is a real one in many sections, and that the remedy is still to be found. In the case of woodpeckers, their natural habit is to look for insects, larvae, etc., on which they feed, in the crevices in the bark of trees. But telegraph poles are denuded of bark, and the question arises what is there about a bare pole that attracts the birds? One explanation suggested is that the humming noise due to the vibrations of the wires may lead the birds to the belief that it comes from insects within the wood.

Ants, according to one correspondent, constitute an enemy to be reckoned with. Their damage to a pole is mainly on the inside and not always visible from the outside, and this is a more dangerous form of injury.

In some countries wild animals seem to regard the telegraph pole as having been erected for the purpose of enabling them to scratch their backs, and where elephants indulge in such pleasantries the poles suffer. In our own country years ago the buffalo got the same idea into his head with consequent disaster to the poles.

But the necessity for a cure of these evils will bring about a cure in time, and he who discovers an effective remedy will deserve a monument to his memory, as one correspondent suggests.

Honesty.

A young man employed by one of the telegraph companies in New York was arrested the other day in a suburban town charged with forging telegraph money orders. He was only twenty-two years of

Digitized by Google

age and by this misstep he has ruined his career. In some crimes the force of extenuating circumstances are admitted, but in cases of deliberate dishonesty and infidelity, it is a question if such circumstances should be recognized. Any one who occupies a position of trust and betrays his employer's interests, does not as a rule, commit his crime under a momentary evil impulse. Generally the act is designed.

Without discussing the subject in its moral aspect, it is sad indeed to see a young man blight his career for life by a false step which could easily have been avoided. The question of temptation usually figures largely in cases of this kind, but the truth is, the cause is not to be found in the temptation but in the yielding to it. Temptation will exist so long as the individual is willing to yield to it. The only proof aganst temptation is an honest character, and no one can question the wisdom of impressing this important fact upon the minds of all young people.

Telegraphy in Signal Corps Work.

BY CAPTAIN WILLIAM L. HALLAHAN, NATIONAL GUARD, N. Y.

The purpose of this article is to demonstrate how a telegraph operator in the city of New York may learn those features of the telegraph business that will make him most valuable to his employers, increase his earning capacity and enlarge his social status, as well as to greatly advance his usefulness as a member of the community; and all this outside of his office hours and at no expense when compared with the results obtained.

There are in the city of New York two companies of the signal corps; the First Company in Manhattan and the Second Company in Brooklyn. In most respects these companies are similar. I will take the Manhattan company for example.

This company has a large armory with every facility for laboratory practice, so far as the telegraph business is concerned. It has all the known scientific methods for constructing, operating and testing telegraph and telephone lines, as well as a complete wireless equipment.

It is the Signal Corps of the army that has made the most striking advances in wireless achievement. In the National Guard Signal Corps, the city operator may learn both the practical and theoretical side of the wireless. One enlistment in this arm of the service means the making of a practical electrician out of a man with any sort of brains. It prepares a man for all emergencies, with a knowledge of all sorts of short cuts and makeshifts to keep a line working at high pressure, at all times and under all conditions. The telegraph companies need this kind of men, and the man who, if the occasion arose, could test his line for breaks and leaks, find them and repair them, is one man in a thousand, and is the man who is going ahead. This is the kind of man turned out by the signal corps.

A large number of men at the head of affairs in the telegraph business today saw service in the signal corps during the Civil War, and the man with the same training today or the tomorrow that may come, will be the leader of the future.

In the event of war, which we all hope will never occur, a large number of patriotic operators would enlist in the service of Uncle Sam. The advantages that men with previous experience in the National Guard, trained in military discipline, would have then in the line of promotion, over those who volunteered at the last moment, are obvious. The various grades of office are much larger in the signal corps than in any other branch, and in war time the signal corps would be suddenly enlarged, so that the sergeant of today may be the commissioned officer of tomorrow.

There is no monotony in the signal corps work. There is the field buzzer, the telephone, the telegraph, the heliograph and the old-fashioned, but ever useful, wig-wag, and for night signaling, the acetylene lantern, searchlight, the Ardois system of electric lights, rockets and bombs. A signalman must be a lineman, too, able to climb poles, tie and splice wire, and run lines under all conditions of weather and territory. He is, also, taught to ride a horse. Starting with a walk, he is coached through all the gaits, until he learns to stick, mount and dismount, ride standing on two or more horses, vault over horses at a canter and gallop, and, in fact, every sort of exercise that will make a real horseman out of him, able to manage his mount under all conditions. A first-class gymnasium is at his disposal to aid in putting his muscles in shape for these "stunts."

If his military ardor runs to the very proper desire to appear as a dashing trooper, this organization has a distinctive full dress uniform, admitted to be one of the most striking in the country.

The signal corps is a small organization. The men know each other, the officers are in touch with them and know their capabilities. The man joining becomes acquainted with a crowd of clean young fellows, in all sorts of different professions. He broadens the number of his acquaintances and makes friendships that are no less strong and lasting than those of college days; and, above all, in the case of a telegraph operator, he is improving his spare time for future advancement in his profession, with which the signal service is so closely associated.

Wood Preservers' Association.—The seventh annual convention of the Wood Preservers' Association was held at the Auditorium Hotel, Chicago, on January 17, 18 and 19. Papers relating chiefly to the preservative treatment of timbers for railroad ties were read and discussed.

Submarine Cable-Laying and Repairing.

BY CHARLES BRIGHT, F.R.S.E.

(Continued from page 121.)

JOINTING AND SPLICING.—Having dealt with the various types of cable in vogue, the author proceeded to deal with the jointing and splicing operations in uniting two lengths whether of the same type or of different types. Obviously (said the lecturer), these are operations which would form an important feature in any cable work the Navy might have to undertake. Let us first take the joint in the conductor and insulating material. As a preliminary, we must cut away the gutta-percha insulation of the two ends sufficiently to bare the conductor for about an inch and a half from either end. The several wires of the copper strand are now unlaid, and each is pulled out straight at their various angles, care being taken to give them no twist. Each is then separately cleaned either with fine emery paper or the back of a knife blade, more particularly in order to get rid of all the compound used for satisfactorily uniting the insulating gum with the wire. With the aid of a pair of flat-nosed pliers the bared wires are now twisted together again into a true strand for about a third of their length. The entire length of the exposed ends is then, each in turn, dipped into a lump of molten solder on the soldering iron in order to re-unite thoroughly the separate wires of the strand, as so to render them practically one wire. Each end of the wire is then filed down to a long tapered wedge or scarf. The conductor ends are then placed in a vise, the respective scarfs being fitted together and pressed against one another. The two wedge surfaces are next soldered together. Over the joint and one either side for a distance equal to its length are wound two laps of fine tinned copper wire, so as to make the joint firm and permanent and to maintain continuity in the case of separation in the scarfed surfaces by failure of the metallic union. The completed joint is then finally soldered over. This work is fairly simple, but the corresponding junction in the dielectric is one which demands considerable care and experience. We will content ourselves here with the more usual case of gutta-percha.

To begin with, the ends of the core should be pared off to avoid joining to the material those portions which have received heat from the soldering iron, and which would not, therefore, join properly to the new gutta-percha about to be applied. The metallic joint and the gutta-percha ends are next cleaned by wiping over with a clean rag soaked in wood naptha. The metal conductor is now gently warmed by waving the flame of a spirit lamp underneath. Whilst this is being done the assistant jointer—over another spirit lamp—has softened the end of a stick of what is known as Chatterton's compound, composed of gutta-percha, resin and Stockholm tar. The jointer now lightly dabs the heated compound along the bare conductor, afterwards spreading the adhering compound evenly around the strand with a warm tooling iron. The joint is now ready for the first covering. This is effected by drawing a portion of the gutta-percha from each end over the joint. The ends of the gutta-percha to be joined are warmed by the lamp—in the same way as with the compounded conductor—thereby softening it for nearly 2 in. on each side, the two ends of the gum being gradually drawn down towards one another till about ½ in. apart, until the joint is enveloped in a covering materially thinner than, but nearly as uniform as, the rest of the conductor. The joint is allowed to cool and set for a while. We next warm and tool over the surface preparatory to applying a fresh piece of gutta-percha. A strip of gutta-percha sheet, especially kept for jointing, is then carefully softened over the lamp and a piece cut off. The jointer takes the strip into his fingers and applies it from underneath lengthways. The edges are then raised, and gradually, by a uniform pressure, brought together at the top, so as completely to surround the core. The jointer trims off the excess strip with a pair of bent scissors, and proceeds to apply the iron, heated to the required temperature, to smooth off any inequalities, and complete this second covering by rubbing into shape with the moistened palm of the hand. The third covering is applied to the joint in precisely the same way. In this third covering the strip is longer by an inch or more at each end than the previous one, so as to insure complete overlapping. When finished, a well-made joint is usually from 6 in. to 8 in. in length. It is now cooled and hardened with water, the whole process from start to finish usually occupying nearly an hour. The work of jointing is of the greatest practical importance in connection with the repair of submarine telegraph cables, hence the length at which I have dealt with this part of my subject. A first-rate jointer is an important factor in the success of the work. I might have gone into still further details in view of how much depends upon the good behavior of a joint.

We now come to the splice in the armor. On the completion of the joint as described, the first operation previous to starting on the splice between the two lengths of cable is that of cutting off a sufficient length of the existing inner serving, to avoid a double thickness. There are two sorts of splices, applicable for two different occasions. There is the butt or "laid in" splice for joining two cables of similar type, and there is the overlapping splice, for uniting two cables where one is of a materially larger diameter than the other. Turning to the first, let us say that two similar iron-sheathed cables, A and B, are to be spliced together. The outer serving of this cable is stripped off, and the wires unlaid for a certain distance, this depending on the length of splice about to be effected. A given length of the core is then cut out—preparatory to making the joint in the dielectric, the splice naturally involving a diminishment in proportion to its length. An iron wire seizing is applied to B, the distance from the end being regulated by the length of splice to be made. If intended for quite shallow water the distance is sometimes only about 10 ft., if for deep

Digitized by Google

water it may be as much as sixteen fathoms long. A good rule for the length of splice in a deep sea cable is one fathom per wire—*i.e.*, so many fathoms according to the number of wires, the object being to avoid the butts between wires coming too close to one another. Unlaying the wires is often accomplished with a splicing tool consisting of an iron collar, pierced with holes and fitted with two handles diametrically opposite to one another. The collar is in two halves hinged at one side, and secured by a pin at the other. Each sheathing wire is passed through a hole in the collar, the core being in the hollow centre. A man works the tool along the cable, turning it round the cable the opposite way to the lay of the wires as he advances, while the served core passing through the centre of the collar, remains stationary. A second "hand" follows with a similar tool at a short distance, in order to retain the wires in their proper relative position. After the joint in the dielectric has been made it is carefully protected by jute serving built up to the proper diameter, so as to form a suitable bed for the wires. Each iron wire is taken in succession, cut to the required length and laid in as the corresponding wire on the other end is taken out to the necessary distance. All the wires are similarly dealt with in turn, the individual butts being kept about a fathom apart. The splice in the sheathing being completed, one end is held between tongs, the inside diameter of which exactly corresponds to the size of the cable. A man then drives the tongs towards the other end of the splice by means of a hammer, so forcing the wires into their places and giving the cable practically as regular a formation here as elsewhere. The splice finally receives a covering of spun yarn tightly wound round with a serving mallet. This serving should extend at least 3 ft. beyond the extreme limits of the splice.

Now, as to the overlapping splice for uniting dissimilar types of cable, or different lays. Let us call A the smaller of two cables, B the larger. The method of procedure will be precisely the same as in the preceding butt splice, until the wires of B have been relaid from B to A. All the wires of B—sometimes two or three taken together—are now twisted spirally round A as before, but without disturbing the sheathing of A. The ends of the B wires are then secured with fine wire seizings at about every fathom, and the whole splice served over with spun yarn as in the preceding operation. This form of splice is often resorted to in emergencies, in cases where it would not perhaps be so suitable as a laid-in splice, chiefly because of the saving in time. As in the case of the joint, technical knowledge has little to do with excellence in cable splicing. The degree of success achieved is mainly dependent on the "hands" who carry out the work.

Effect of Sending Machines Upon Quadruplexes.

BY J. P. O'DONOHUE, DIVISION ELECTRICAL ENGINEER, POSTAL TELEGRAPH-CABLE COMPANY, NEW YORK.

During a series of quadruplex experiments recently made in our laboratory, the detrimental effects of high speeds of polar reversals upon the common side margin were clearly brought out. The results of these tests will no doubt be of interest to all chiefs and operators at this time, owing to the now general use of sending machines.

Upon an artificial line representing 600 miles of No. 9 copper overhead construction, using standard sets and voltages, it was found that when the polar side was operated at a rate of fifteen words a minute, the common side was capable of a speed of forty words a minute. Increasing the polar speed to thirty words a minute greatly reduced the common side margin and lowered the working speed to twenty words. Operating the polar at forty-five words cut the common to fifteen words and running up the polar to sixty words rendered the common side practically useless at any speed. Automatic sending devices were employed during these tests, so as to obtain uniform signals under all speed conditions.

Now here is where the sending machine comes in! These sending machines are very often so adjusted that the dots are made at the rate of fifty words a minute, while the actual speed made by the operator is only thirty words a minute. When the machines are used on polar sides of quadruplexes the common sides suffer a serious reduction in working margin due to the high speed dot reversals on the polar side and, consequently, the total carrying capacity of the quadruplex is lowered, without any gain whatever. Not only are the high speed dots wasteful of margin, but the lack of proportion and rhythm in the signals is very trying to the receivers. There is no gain in speed and much is lost in comfort when the dots are disproportionately rapid. The quadruplexes and duplexes have been improved and more improvements are coming; but it is bad practice to send out signals known to be much less perfect than they could easily be made. Everyone at repeater stations notices that the signals from sending machines have a tendency to be thin and chippy.

Sending operators always know when the dots are needlessly fast and they can add to the comfort of receivers and help to make good signals by giving careful attention to the adjustment of their sending machines. The dot speed should be kept in strict relation to the speed of the dashes.—*Postal Telegraph.*

Morse Electric Club Dinner.—Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company, and president of the Western Union Telegraph Company, will be the principal guest of honor at the annual dinner of the Morse Electric Club, which will be held at the Hotel Savoy, New York, February 23. The entertainment committee is making arrangements for a suitable programme for the evening and a large number of telegraph people from outside of the city will be present. Tickets for the dinner are $3.00 each, and can be procured of Mr. R. J. Murphy, treasurer, 195 Broadway, New York.

Protection of Circuits and Apparatus from Lightning and Foreign Currents.

BY W. E. HARKNESS.

The protection of electrical apparatus connected to aerial telephone, telegraph and signal wires has been one of the principal subjects of investigation by those interested in the design, installation and maintenance of electrical equipment. The most important factors entering into this problem are common to every system of distribution, whether telephone, telegraph or signal.

SOURCE OF TROUBLE AND THE REMEDY.

The source of trouble may be divided into two distinct classes.

1.—Electrical disturbances in the atmosphere.

2.—Foreign circuits of high potential.

The first of these may be subdivided into:

(a) Direct lightning strokes.

(b) Induced static charges.

The second main classification may also be further divided into:

(c) Leakage from or contact with other circuits.

(d) Induction from adjacent circuits.

Most aerial circuits are subject to trouble from both of the primary sources mentioned, although there are some which are subject to only the first named of the two mentioned, i. e., atmospheric disturbances.

To safeguard properly circuits and apparatus, a protector must be provided which will:

First.—Reduce the potential on the circuits to a point where it cannot injure the apparatus or interfere with its operation.

Second.—Prevent an excess flow of current through the line which would destroy the apparatus or wire.

Third.—Reduce the chance of injury to the users of the apparatus.

THE EASIER WAY PROVIDED.

The usual method of guarding against high potentials is to provide some sort of a protector offering, for currents of high potential, a path to earth which has a lower break-down point than is offered by the insulation of the circuit or apparatus. In general, such protectors consist of two conducting bodies, one connected to the circuit and the other to earth, the opposing or discharge faces of the blocks being separated by a poor, or non-conductor. This arrangement produces an open air space between the blocks which serve as the path to earth for the high potential currents. In the majority of cases these protectors are exposed to the atmosphere; in some cases, however, they have been placed in tubes from which the air has been exhausted to create a partial vacuum.

The sensitiveness of these protectors, aside from questions of mechanical construction, is governed by the separation of the discharge surfaces, the nature of the insulating separators and whether they are exposed to the atmosphere or are in a partial vacuum. The rules governing these three factors are well known and need not be discussed here.

The materials used in the construction of what may be called the Open Space type protectors have been varied, carbon and both similar and dissimilar metals being used for the discharge surfaces and mica, paper, silk, linen and celluloid being among the insulating separators employed.

Carbon blocks, separated by accurately gauged mica separators have been generally used in the protection of telephone apparatus. Carbon such as is used in the vacuum tube arresters has the advantage of being able to withstand repeated discharges without being destroyed or having the reliability of the protector affected. The trouble experienced with carbon generally employed for this purpose is due to the poor quality used which permits particles to break off and collect between the two discharge surfaces, which in the usual telephone protectors are within .005 inch of each other, and thus cause a leak to earth. Attempts have been made to overcome this trouble by increasing the separation of the carbon blocks and by shaping the opposing faces, but none of these has been successful as the increased separation decreases the sensitiveness of the protector, permitting the rise of an objectionable potential on the line before the protector acts. The separation of .005 inch is necessary, in the type of protector mentioned, to obtain protection against crosses with circuits carrying potentials of 500 volts. High-grade carbon does not disintegrate and is used in the vacuum type previously mentioned, thus overcoming the trouble experienced with lower grades.

Metal in place of carbon has been used with varying success, depending upon the protection desired. It has not been as satisfactory as carbon, owing to the fact that the metal blocks tend to fuse together by discharges, or that the distance between the discharge surfaces is altered by the spitting or vaporizing of the metals, thus changing the breakdown point of the protector, with the result of reducing its effectiveness and reliability. Metal blocks are also subject to corrosion. The so-called non-arcing metals have been tried, but have not proven superior to others.

Various dielectrics, such as mica, hard rubber, silk, linen and celluloid have been used to obtain the proper spacing of the discharge surfaces. Of these mica seems to be the best, as it is practically fire-proof, non-hygroscopic and can be split to give separators of accurate thickness.

ACCURATE SPACING AND INSULATION IMPERATIVE.

In any type of open space protector it is essential that the base and supports be so designed as to establish good contact with the protector blocks and retain them in their proper relative position to insure the normal and uniform operation of the protectors. An objection common to the majority of protectors is that the mountings are not designed to secure the highest insulation between the line and ground when the protectors are exposed to dust, smoke and moisture.

Digitized by Google

A further objection to many of the various types of protectors now on the market is the fact that the separation of the discharge surfaces is not accurately gauged, nor does it remain constant after repeated discharges. As a result the break-down point is usually far in excess of that of the apparatus which it is supposed to protect.

PROTECTION AGAINST ABNORMAL CURRENTS.

So far, protection against high potentials only has been considered. There still remains the need of protection against abnormal currents or those of excessive strength. There seems to be but one recognized method of providing this protection, i. e., by means of properly proportioned fuses which will operate when currents above a predetermined strength flow over the circuit. There are in use two general types of fuses; the open or link fuse and the enclosed or tubular type fuse.

There seems to be no question as to the superiority of the enclosed or tubular type fuse over the open link fuse. The enclosed type not only affords a mechanical protection to the fuse wire, but insures better contacts and more accurate and reliable operation.

In many cases the function of the fuse has been confounded with that of the open space protector and the service has been interrupted and maintenance expense increased without securing proper protection by the use of fuses of too small a carrying capacity. In other words the fuse was supposed to act as a protection against lightning or high potential discharges instead of against abnormal currents. In fact, in some cases the mistake has been made of using it to the exclusion of the lightning arrester.

When determining the capacity of a fuse to be used in the protection of a specific piece of apparatus the following points should be considered:

1. The amount of current which the fuse must carry continuously under normal conditions.
2. The amount of current which the wiring or apparatus can carry for a given time without undue heating or injury.
3. The possible sources of trouble from other circuits of high potential.

Having determined these points a fuse of suitable carrying capacity can be used which will afford the desired protection without causing excessive maintenance costs or frequent interruptions to the service.

In view of the fact that most aerial circuits are exposed to both lightning strokes and crosses with foreign circuits carrying large currents or high voltages, it is customary and, in fact is necessary, to provide both the lightning arrester and the fuse.

In the protection of telephone lines and apparatus it has been customary, where the lines are entirely removed from possible contact with foreign circuits, to use the lightning arrester only. Owing, however, to the rapid extension of the electric light, electric railways and the building of high-tension transmission lines it is now considered advisable to install both the lightning arrester and the fuse in order to provide adequate protection for any conditions which may arise in the future.

The standard method of protecting apparatus is to bring the line wires through the fuses to the lightning arrester and from there to the apparatus to be protected. With this arrangement, using properly proportioned fuses and lightning arresters, high potentials are removed from the line by the open space protector without blowing the fuses, unless the current flowing over the circuit is in excess of the predetermined safe amount, in which case the fuses blow and disconnect the apparatus from the line carrying the dangerous current, thus preventing damage.

THE LOCATION OF PROTECTORS.

The proper location of protectors in the circuit has been regarded as open to discussion. Opinions differ as to whether they should be placed on the poles or cross arms adjacent to the line wire or in the offices, or the relay or signal cases. It is believed by many that the lightning arresters should be located as close as possible to the line wire, because from this position the ground wires can be run to earth by the shortest route and with the minimum number of bends, and, also because it places the protector nearer the source of trouble. There is in favor of the inside location facility of inspection and promptness of repair, tending to reduce maintenance expense and interruption of service. Objection may be raised to the pole location where long pans of wire are used to connect line wires to the apparatus. Under such conditions it is possible, although improbable, that these wires may become crossed with other circuits, or struck by lightning.

LIGHTNING ARRESTER GROUNDS.

The methods employed in obtaining a satisfactory ground, vary in different parts of the country and numerous devices have been put on the market for this purpose. The use of a galvanized iron ground rod is common among the telephone companies. Such rods should be driven to reach earth permanently damp. Another practice is to bury a coil of wire or a copper plate at such depth as to make contact with damp earth. It has been thought that the use of charcoal or coke around the ground plate would be advantageous on account of their quality of retaining moisture. Some railways have used cinders from the front end of locomotives for this purpose. It is believed, however, that the use of cinders is not as satisfactory as charcoal, because cinders, and coke as well, contain certain acids which may affect injuriously the ground plate or the connecting wire. Another important consideration is that the connection between the wire and the plate should preferably be brazed or riveted, as the use of dissimilar metals may cause electrolytic action at the point of contact which may eventually cause a disconnection between the ground wire and the plate.

The wire used in making connections between protectors and the earth should be of size sufficient to stand any mechanical strain that may be placed

Digitized by Google

upon it, and should be run as directly to the earth as is possible, with the minimum number of bends. Where the direction of the wire must be changed, it is preferable to gain that result by a long curve rather than by a sharp bend, as lightning discharges are often deflected by sharp turns from the ground wire to adjacent objects. Where the ground wire is run through iron pipe standards, the pipe must be electrically connected to the ground wire at the point of entrance.

The Economy of Line-Time.

BY D. MCNICOL, ELECTRICAL ENGINEER, NEW YORK.

"Line-time," says the author in the *Postal Telegraph*, refers to the amount of time in hours and minutes that a circuit actually is used in handling a given number of telegrams, or given amount of telegraph matter.

It is the object in this article to point out some of the ways in which operators assigned to the operation of circuits may very effectively aid in conserving line-time.

In order more clearly to understand the importance of maintaining constant and uninterrupted operation of circuits, let us consider the analogy of a railroad train operated on a time schedule. On an important run, a competent and experienced engineman has either a regular or a special schedule to observe, and his standing as the "man for the job" is invariably dependent upon how closely his performance accords with the requirements of the schedule. Assuming that the other departments of the organization have done well their work and that the engineman has been provided with a good engine and has been given a safe and clear track; bringing the train to its destination on time means that the engineman has been on the alert during the entire trip and in the various operations of oiling, taking water, coaling, station stops, etc., has not taken a minute more time than was necessary to perform these functions.

As these remarks concern principally the economical operation of circuits where generally there is a sufficient amount of traffic available to keep them supplied, it might be said that each such circuit has a schedule.

The regular equipment used in duplex operation and on the polar sides of quadruplexes is capable of handling sixty words per minute in each direction or one hundred and twenty thirty-word telegrams per hour, or 960 telegrams in eight hours. Of course, there is a wide margin between what the equipment is capable of handling and what it is possible to transmit by the Morse manual method, but it is the fact that this margin exists which prompts the suggestion that the systematic conservation of line-time, might in numerous instances curtail the discrepancy.

We might with considerable profit consider the methods employed by our confrères in charge of the operation of the deep sea cables in maintaining constant operation of their lines. In cable operation there is no time lost in "balancing," or in changing shifts of operators. Transmission is continuous and the organization of staff is accommodated to meet this condition.

It has been suggested by a traffic expert that the fastest and heaviest circuits be supplied with two sets of equipment at each end of these circuits, so that when shift changes take place the relieving force might be in place to take immediate hold at the moment the relieved let go and thus avoid stopping the operation of the circuit.

It would seem, however, that there are some preliminary steps which might be taken which would tend to school us up to a proper appreciation of the importance of introducing every possible refinement which would effect savings in line-time.

The best economy in circuit operation obtains when the line is not permitted to be idle a moment as long as it is operative and while there is business on the hook.

Operators should make sure that their typewriters are in good working order before sitting in on a circuit. Circuits should not be stopped while operators insert new ribbons in their typewriters. Frequent exchange of remarks with the operator at the distant station as well as conversations carried on with neighboring operators and clerks at the home station seriously interferes with an operator's performance and results in the aggregate in great loss of line-time.

"Plain copy" tends to conserve line-time by making it unnecessary for an operator to stop to decipher or "send back."

A workable circuit is worth so much per minute as a traffic carrier as long as there are messages on the hook, and every minute such circuit is not being used to clear the hook represents inexcusable waste.

Proper supervision of repeaters promotes the efficiency of circuits and prevents lost line-time.

On a long circuit sudden weather changes on some part of it occasionally occur and so alter the electrical conditions of the line that changes in the adjustments of repeaters are necessary. Repeater attendants should "keep out" of circuits as much as possible and by taking preventive measures make it unnecessary for them to "come in." The signals passing in each direction should be listened to long enough to make sure that they are reliable. Repeater trouble should not be permitted to stop the operation of a circuit if there is another set available. Intermittent "swings" should not be allowed to slow up the operation of a circuit if there is another wire available to substitute.

Every operator, wire chief and manager can figure out ways to conserve "line-time" and we should do all we can to this end, so that those who come after us will have a hard task in devising methods of improving on our performances.

Line Testing by Indicating Instruments.

(Concluded from page 117, February 1.)

INSULATION TESTS.

Operations No. 2 and No. 3, described under the heading "To Test a Wire," are really insulation tests, but this term is usually restricted to special tests of the same character made at specified intervals, the results of these tests being carefully recorded for immediate and future guidance in line maintenance work.

The testing station first measures the voltage of his testing battery; this may be readily done by tapping the unmarked side of the meter wedge on a grounded disc at the switchboard, while the connecting plug at the jack-box is placed in the "VM+" and "VM—" jacks in turn. The reading of the voltmeter for each of these conditions is recorded in the + or — space opposite "Testing Voltages" on the form supplied for that purpose.

The wire to be tested is opened at the distant end; ordinarily, this will be at an authorized testing point near the boundary line of the territories of adjacent testing stations. All other wires on the pole line should be connected to battery (as will be the case with working circuits) or to ground, if possible, while these tests are being made. At the testing station the meter wedge is inserted, with its marked side outward in the switchboard spring-jack of the wire to be tested. The connecting plug is placed in the "VM+" jack of the jack box which makes the connections as per Fig. 3. The voltmeter needle will be deflected to the right. The deflection to be recorded is the highest scale reading reached by the needle; that is, if the needle begins to climb upward as soon as the connection is made the reading shall not be taken until it comes to rest, but in a case where the needle swings to a high deflection at first and then gradually settles down to a lower point the first reading would be the correct one. These remarks do not apply to the "static kick" sometimes noticed when testing a very well insulated line, which is a sharp sudden throw of the needle occupying but a small fraction of a second at the instant the connection is made; this should be disregarded. The reading having been taken as above, it is recorded on the form, in the "Voltmeter Deflections +" column.

The connecting plug is then transferred to the "VM—" jack, which will cause a new deflection of the voltmeter to the left. This is read in the same way as for the + test described above, and then recorded in the "Voltmeter Deflections —" column of the form.

The above operations are performed in turn upon each of the wires to be tested, and the readings recorded, as stated, in the "+" and "—" columns. This completes the actual tests. The only remaining work is to fill out the other columns of the form for any wires on which the deflections indicate an insulation resistance lower than 100 megohms per mile. In making insulation tests, the conditions are as shown in Fig. 10, that is, the current from the testing battery passes through the voltmeter and out over the wire under test; but the latter being open at the distant end, the current is compelled to return through the leakage paths as shown by the dotted lines. These paths will be formed by anything in contact with the wire; each insulator and support allows a slight leakage to occur over it, and although each path of this kind measures many millions of ohms in clear weather, the fact that there are thousands of such paths in parallel usually brings the insulation resistance down sufficiently to permit a noticeable deflection of the voltmeter needle. If some of the insulators on a line are broken, or if the wire is in contact with trees, poles, buildings or other partially conducting materials, the leakage will be much increased; i. e., the insulation resistance will be lower, and a greater deflection of the voltmeter needle will occur. By comparison of the two figures, it will be seen that the joint or combined resistance of all the leakage paths on the wire in Fig. 10 has the same position as the resistance being measured in Fig. 4. We can determine the value of this combined or joint resistance of the leakage by the formula $K = \frac{E-e}{e} \times Rv$, where

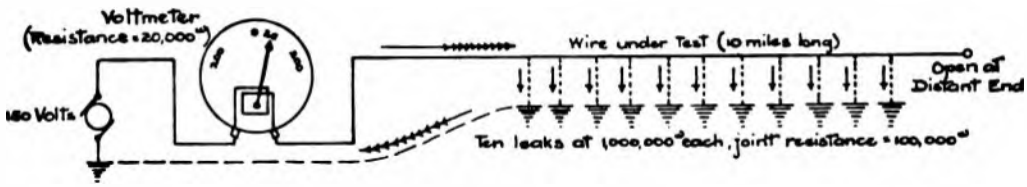

FIG. 10. INSULATION TEST.

K = Insulation resistance (or joint resistance of all leakage paths).

e = Voltmeter deflection,

E = Voltage of testing battery,

Rv = Voltmeter resistance.

In other words, we can obtain the insulation resistance of the wire as follows:

Subtract the voltmeter reading from the voltage of the testing battery; divide the remainder by the voltmeter reading; multiply this quotient by the resistance of the voltmeter.

It is sometimes necessary to determine the insulation resistance of a section of wire at a distance from the testing station, as shown in Fig. 11, where B C represents the distant section, and A B the wire connecting it with the testing station A. To do this, two insulation tests are made as described above, one with the wire open at B and the other with the

Digitized by Google

wire cut through at B but open at C. Having calculated the two insulation resistances, we multiply these two figures together and divide the product by the difference between the two figures; the result will be the insulation resistance of the distant section, which may be reduced to "megohms per mile" by multiplying it by the length of that section in miles and dividing by 1,000,000. This is expressed by the following formulas applicable to Fig. 11.

FIG. 11. TESTING INSULATION OF A DISTANT SECTION OF WIRE.

Let K = Insulation resistance of section BC
Let K^1 = Insulation resistance of section AB
Let K^2 = Insulation resistance of entire wire ABC

$$\text{Then } K = \frac{K^1 \times K^2}{K^1 - K^2}$$

Insulation resistance in megohms per mile of section BC

$$X = \frac{K \times M}{1{,}000{,}000}$$

where M = Length of section BC in miles.

CONDUCTIVITY TESTS.

Accurate measurements of the conductivity resistance of a wire are best made by means of a Wheatstone Bridge. Where only a fair degree of accuracy is required, however, such measurements may be made with greater speed by the voltmeter-ammeter method as follows:

The wire to be tested is grounded at the distant end; and at the testing station a first or second potential battery tap is applied by plugging in the proper disc at the switchboard. The mil-ammeter is then connected in the circuit by inserting meter wedge, marked side outward, in the line spring-jack, while the connecting plug is placed in the "AM" jack at the jack-box. The connection will then be as per the full lines in Fig. 12, and the meter reading will show the strength of the current flowing in milli-amperes. This reading is noted and the meter wedge withdrawn from the line spring-jack; as the resistance of the mil-ammeter is less than one ohm, this does not appreciably alter the current flowing. The connecting plug is transferred to the "VMG" jack at the jack-box, and the unmarked side of the meter wedge is tapped on the line side of the switchboard spring-jack of the wire under test, without opening or otherwise disturbing the connections. This will make the conditions as per the dotted lines in Fig. 12, and the deflection of the needle will indicate the voltage used in causing the current previously noted to flow in the line; this voltage being somewhat lower than the potential of the battery applied, owing to part of the latter being used in forcing the current through the lamp resistance, etc. From the above current and voltage readings, the resistance of the wire is calculated by Ohm's law, i. e., the voltage is divided by the current to get the resistance. As the current reading is in milliamperes, it must be converted into amperes before making the calculation, or else the result must be multiplied by 1,000. In other words,

$$\text{Ohms} = \frac{\text{Volts}}{\text{Amperes}} \text{ or Ohms} = \frac{\text{Volts}}{\text{Milli-amperes}} \times 1{,}000.$$

It should be noted that the current and voltage readings must be taken as nearly simultaneously as possible to avoid errors.

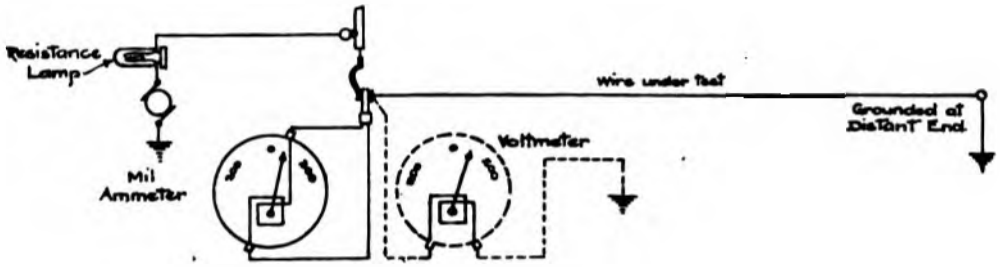

FIG. 12. DIAGRAM OF CONNECTIONS OF CONDUCTIVITY TEST.

Overhead Line Construction.—The overhead line construction committee of the National Electric Light Association, acting in co-operation with committees of the Maintenance of Way Association, the American Street and Interurban Railway Association and the American Institute of Electrical Engineers and a representative of the American Telephone and Telegraph Company, has prepared for general acceptance a set of specifications for overhead work. The specifications apply to overhead electric light and trolley line crossings (except trolley contact) over railroad rights-of-way, and the tracks and lines of wires situated thereon, and also to overhead electric lighting and transmission wires of over 5,000 volts constant potential crossing or constructed over telephone, telegraph or other similar lines. The committee, of which Mr. Farley Osgood, of the Public Service Corporation, Newark, N. J., is chairman, has requested that all persons interested in such specifications communicate to the chairman any suggestions that they may care to make.

Enemies of the Telegraph Pole.

BY GEORGE DENISON, SALT LAKE CITY, UTAH.

In Telegraph and Telephone Age of December 16, 1910, Mr. C. T. Day, assistant superintendent of telegraph of the Sonora, Mexico, railway, gives an account of his troubles with the Mexican woodpeckers.

The Mexican railway company has probably thought of, but likely has not tried the cement pole. This would be a certain, but expensive remedy, since a few taps on a reinforced concrete pole would jar the finer sensibilities of even one of these voracious Mexican hammerers. However between the stone pole on the one hand and the shot-gun as the further limit, there are several devices available.

The most economical plan is to cover the wooden poles with a wire netting of half-inch square mesh. The birds will not dig far into a pole thus covered. I tried this on the old Fort Laramie-Fort McKinney line in Wyoming, where the yellowhammer and red-headed woodpecker had destroyed miles of poles. We found one disadvantage, however, to the use of wire netting. Our wires were frequently grounded by the netting when they had broken away from the insulators and swung against the pole. We also found a number of young woodpeckers that had hanged themselves by forcing their heads through the mesh, while reaching after real or imaginary grubs. A twenty-foot pole can be covered with netting for 6 cents, not including the expense of labor.

We also tried another device for stopping this ruinous waste of poles. We hung a bird-trap to every pole from the lower cross-arm—a cheap bird-cage, with doors that swing inward only—and for a decoy, we placed in the cage a stuffed redhead or yellowhammer swinging in the center ring like a canary. These we obtained for $2.50 each from a taxidermist at Laramie, Wyo., who mounted them with very life-like fiery red glass eyes. This method is, perhaps, too expensive, although it comes within the shot-gun limit laid down by Mr. Day, since, in addition a lineman must be maintained every eight miles. That is about the length of line one man can properly take care of, as he has to climb poles, and remove and kill the ensnared birds.

Another cheap and effective method is to maintain at each end of the line a James phantoplex motor, run at its highest voltage. The rapid alternations seriously affect all bird-life, and on the Santa Fe line between Los Angeles, Cal., and Albuquerque, N. Mex., not a single pole has been lost to the wood-peckers in the last twenty-five years.

Several attempts have been made to utilize the rapid and musical tap of the wood-pecker as a transmitter of telegraphic dots and dashes; but with varying success, since it is almost impossible to train either species to make either a long or short dash, and while the letters E I S and H are made with little difficulty, a letter P or figure six seems to be a signal for an interminable string of dots the bird frequently making as high as twenty-five or even thirty taps, and it is safe to say it will not for some time displace or antagonize the Mecograph or Vibroplex:

"The Hills were brown; the Heavens were blue;
A Woodpecker pounded a pine-top-shell,
While a partridge whistled the whole day through
For a rabbit to dance in the chapparelle;
And a Grey Grouse drummed; All's well, All's well."

Burnettized Creosoted Butt Poles.

A lumber company in Texas is treating poles by a new process which, it is claimed, adds to the life and strength of the poles and makes them superior to cedar in all respects.

At the company's works are steel cylinders 126 feet long by six feet in diameter, into which the poles are placed. By the use of steam pressure and vacuum the liquid sap is completely extracted from the wood. The entire pole, from end to end throughout its innermost cells and cell walls, is then, under high pressure, impregnated with a strong solution of chloride of zinc, which is a powerful antiseptic. The pole is then dried out thoroughly, after which process, that section from the butt end to a point from ten to eighteen inches above the ground line is impregnated by pneumatic pressure with creosote, the most powerful wood preserver known to science. This treatment it is believed will give an average service of not less than twenty to twenty-five years, or many years in excess of the average life of cedar poles. Poles treated in this manner carry the natural color of the wood above the creosoted butt section and weigh slightly in excess of cedar poles of equal size. The objections to the fully creosoted pole have been practically avoided, and those who have tested the Burnettized creosoted butt pole it is stated recommend it as superior to any pole on the market.

Damage to Chestnut Poles by Wood-boring Beetles.—The United States Department of Agriculture has issued a bulletin giving an account of the damage done to the bases of standing chestnut telephone and telegraph poles by the grub or larva of a wood-boring beetle, and the practical methods of preventing such damage. Much of the damage reported was in Maryland and in some of the Southern states. Poles treated by a creosote "open tank" method of impregnation and by brush treatments with creosote and carbolineum resist the attacks of these insects.

Multiple Telegraphy.—Experiments have been made at Florence, Italy, with an apparatus invented by an Italian engineer named Andreini, in which vibrators of different frequencies are employed to transmit ten to fifteen messages simultaneously on one wire, the messages being sorted out at the receiving end by means of suitably-tuned receivers.

A Question of Wages.

A Chicago newspaper has asked the question, "Is $1,000 a year a sufficient wage for the average clerk?" and is printing the replies received from many of its readers. Mr. E. C. Dodge of the Western Union Telegraph office in that city contributes a sensible statement of his view of the subject. He says: "I agree with my colaborer of years ago, Mr. A. R. Urion, former president of the Board of Education, that it is purely a matter of the individual, and my experience as an average clerk under the almost constant observation of the late Philip D. Armour, whom I consider was one of the greatest executive men who ever lived, thoroughly convinced me that every man, sooner or later, strikes his level and his success depends wholly upon his ability to recognize an opportunity when one comes his way. Luck is a word which has no place in a man's life—a man who expects to succeed. Whenever he sees the word he should promptly prefix the letter 'P' and go ahead fighting his way up to the front.

"The average clerk goes about the task assigned to him about as the common laborer goes about the task of sawing a cord of wood. He looks at the wood and then at the clock and these are the only things he thinks about. If his task is doubled he wastes more time in growling about it than it would take him to do the work. The successful clerk and the one who slides quickly out of the average class is the one who meets any extra demand made upon him cheerfully and sets about finding a quicker and better way of doing things. If he is employed by a man who is broad enough to allow suggestions from employes and who appreciates honest efforts to increase in efficiency he will find that a little study of methods on how to improve and the courage to take the initiative when he gets an idea will soon put him beyond the average clerk and he will never have to ask for a salary increase."

Wireless in the Navy.

The annual report of the chief of the Bureau of Equipment, Navy Department, states that improvement in the equipment and efficiency of wireless telegraph installations has been steady and satisfactory. Modern high-frequency apparatus is being purchased for a number of vessels and shore stations. The results of tests indicate that ten and twenty-five-kilowatt sets are better suited for shore stations, where suitable higher antennæ of greater capacity can be used. Several sets of portable wireless telegraph apparatus have been manufactured for test on the cruisers *North Carolina*, *Montana*, and *Chester*. These are intended to be used during battle, the maximum range to be in the neighborhood of twenty miles.

It is proposed to use steel towers along the coast wherever possible, especially in the tropics. The number of messages handled has increased steadily. Storm warnings, weather reports, and time signals are sent out broadcast as often as obtained, also notices of obstructions to navigation, changes of lights, etc. A modern high-powered station has been installed at Colon, Canal Zone. This station has given very satisfactory results and is able to communicate with Key West every night in the year except in the summer months when static conditions make communication in the tropics irregular. Other stations of similar power are to be erected at Key West and on the island of Porto Rico. It is expected that these stations will afford constant communication between the United States and the stations at San Juan, Guantanamo, and the Canal Zone.

Combined Fire Alarm and Telephone.—A patent has been issued to Mr. W. W. Dean of Elyria, Ohio, for a combined common battery telephone system and alarm system. In applying the alarm system, two relays are introduced at the central office, one on each side of each subscriber's line. If these act in unison they counteract each other. If, however, one fails while the other acts the alarm-recording device is used to operate. At the subscriber's station the code wheel of the alarm box causes simultaneous grounding of both line limbs. When the telephone calls the signals are over a metallic circuit and both alarm control relays operate in unison. When the alarm code wheel is tripped only that control relay operates which is upon the battery side of the line. The other fails as it is connected between two earth connections.

Convention of Cedarmen's Association.

The fifteenth annual meeting of the Northwestern Cedarmen's Association was held in Minneapolis, Minn., January 10 and 11. Twenty cedar producers were represented at the convention and the stock report of present poles on hand showed a decrease of nearly forty per cent., or 800,000 pieces, compared with the stock of a year ago. All sizes are thus cut down to a point where, with reasonable trade for the next few months, the old stocks will be well cleaned up before the new stock is in shipping condition.

The estimated production for the present season indicates a total of about 600,000 pieces from the twenty-foot lengths up. If this estimate is correct the available supply will still show a shrinkage of 200,000 poles. In any event a sharp decrease in stocks on hand during the coming season is predicted by the pole men.

Race Prejudice in the Far East.—Mr. Melville E. Stone, general manager of the Associated Press, New York, is the author of an interesting article in the National Geographic Magazine, for December, 1910, entitled "Race Prejudice in the Far East." Mr. Stone says: "It is not the Asian who needs educating; it is the European. I am not worrying half so much about the heathen in his blindness as I am about the Christian in his blindness."

Kansas Public Utilities Commission.—A bill has been introduced in the Kansas House of Representatives to change the name of the State Board of Railroad Commissioners to "Public Utilities Commission of Kansas," and to give the commission full power and authority to supervise and control all public utilities and all common carriers doing business in Kansas.

Another bill has been introduced in the House providing for a license or excise tax of two per cent. on the gross receipts of telegraph and telephone companies. Other bills affecting these interests are also before the legislature. The first named bill, although an administration measure, will probably be greatly amended, as there is a strong opposition to its important provisions. An effort will be made by the opposition to eliminate the appointive power of the governor in the selection of commissioners by providing that they be elected by the people.

Public Service Commission for State of Washington.—A bill has been introduced in the Washington legislature to create a commission to regulate public service utilities in that state, including telegraph and telephone companies.

A Jokér in Jail.—A telegraph operator in a western city was recently arrested as the result of a joke he tried to play upon the public. He inserted an advertisement in the newspapers, offering to send art lovers an excellent likeness of George Washington for the sum of ten cents. Then he sent his patrons a two-cent stamp, bearing the likeness of the father of our country. Some of them did not appreciate the joke and had him arrested. The joke is now on the joker.

Mr. B. P. Hancock, district traffic superintendent, Jacksonville, Fla., in a recent letter to our Jacksonville agent, says:

"It does seem to me that with the splendid opportunities now afforded by the telegraph service that our younger men especially should strive to qualify themselves in a technical way for advancement."

If this fact were forcibly brought to the attention of the younger members of the profession who are seeking knowledge and, naturally, promotion, it might have some influence in determining them to subscribe for Telegraph and Telephone Age. We publish a paper that is strictly educational in character and furnishes the proper material that will enable a telegraph man to fit himself for better positions.

Mr. W. J. Camp, electrical engineer of the Canadian Pacific Railway Company's Telegraph, Montreal, in remitting for another year's subscription for Telegraph and Telephone Age, writes: "I find that I must continue this subscription in order to keep posted properly on the progress in the telegraph field."

ANSWERS TO QUESTIONS.

[In this department questions on matters of a practical character, and of general interest, will be answered. Questions intended for this department must be signed by the writer's full name—not for publication, but for identity. No attention will be paid to anonymous communications.]

(15) Q. Is the potential of the earth the same at all points on the earth's surface? A.

A. Normally, it is within narrow limits. It has been found, however, that at widely separated points there is a difference between the earth's potential at those points. This difference of potential is the cause of so-called earth currents on telegraph lines.

(16) Q. What is the effect of heat upon the conductivity of wires? T. E. O.

A. The conducting power of metals is decreased by the action of heat, the decrease being approximately proportional to the increase of temperature. An exception to the law is carbon, which is a better conductor when it is heated to a red or white heat than when it is cold. The resistance of some alloys is little affected by moderate changes of temperature. This is the reason for using alloys for the construction of resistance coils.

(17) Q. What is the meaning of the word potential, and what is zero potential? W. H.

A. The most general meaning of potential is a condition with power to do work. If there is no power to do work, there is no potential. The electrical potential of the earth is assumed to be neutrality or zero, therefore, zero potential means that of the earth. A body charged positively is said to be at a higher potential than the earth, while a negatively charged body is considered as having a potential lower than that of the earth.

Selector Bulletins.—The United States Electric Company, New York, has issued two bulletins, No. 401 being devoted to the Gill selector in message service and No. 501 to Gill selectors for telephone train dispatching. Both are liberally illustrated with general views of the apparatus and diagrams of circuits, and replete with information on the subjects considered. The bulletins are models of the printers' and engravers' arts, and copies can be obtained by those interested on application.

Twenty-Thousand Night Lettergrams in One Night.—In furtherance of their plans to secure the Panama-Pacific International Exposition in 1915, the citizens of San Francisco and other places in California and the Far West on January 23 sent about 20,000 night lettergrams to President Taft, urging him to favor their claims for the honor. Both the Western Union and Postal Telegraph-Cable Companies were swamped, and their facilities were taxed to the utmost. They managed to handle the business with little friction, however, and made a record that will not be easy to beat. It is stated that a total of 40,000 telegrams were received by President Taft in this campaign.

Destruction of Poles by Woodpeckers.

In recent issues of this paper have appeared articles on the subject of damage done to telegraph poles by woodpeckers. These birds are evidently in search of food when they attack poles, but it is also evident that the supply of larvae, on which they feed, must be very limited on poles. It has been suggested that the humming of the wires may sound to the birds like the noise of insects within the wood, and in their efforts to reach the supposed insects they injure and frequently destroy the poles.

The damage is serious in many parts of the country, and in other sections there seems to be no trouble of the kind. In a general way it may be stated that the greatest damage is done in warm climates.

In our issue of December 16, 1910, Mr. C. T. Day, assistant superintendent of telegraph of the Ferrocarril sud-Pacifico de Mexico, Empalme, Mexico, described the damage done to poles by woodpeckers in that country. He stated that the birds do not avoid creosoted poles as would be supposed, but, in fact, grow fat on the creosote regimen.

With a view to ascertaining the extent of damage done to telegraph poles throughout the country from this and other causes we asked the superintendents of telegraph of many of the railroads and others, to state their experiences in this regard. The substance of the replies so far received are given herewith.

Mr. Charles Selden, superintendent of telegraph of the Baltimore & Ohio Railroad, Baltimore: "Some years ago we were annoyed by the work of woodpeckers on our poles located in Ohio, Indiana and Illinois, where we had rebuilt with cedar, and a number of the birds were shot. Since that time we have had very few cases where the birds have attacked the poles and we never have suffered from them where our poles were chestnut, so that with us it is not at all a serious question. Once in a great while there may be a pole in the states named that is attacked and we have to assume in that case tht it was wormy and the birds were seeking food. It would appear also that some of our cedars were wind-falls and though appearing all right were breeding places for worms or larvae."

Mr. W. F. Williams, superintendent of telegraph, Seaboard Air Line, Portsmouth, Va.: "We have not been materially troubled by woodpeckers, but we have found that poles are being attacked at the ground line by an insect or worm, which attacks the chestnut poles especially. So marked is this becoming, that at our request, Professor Thomas E. Snyder of the Department of Agriculture, investigated and examined quite a number of these poles and has written a pamphlet on the subject. Professor Snyder not only examined quite a number of poles on the Seaboard Air Line, but a number on the Norfolk & Western Railroad in the vicinity of Petersburg, Va. He recommends a compound of creosote, etc., to be applied to poles perhaps two feet above the ground and as far under the ground, as a probable remedy."

Mr. W. J. Camp, electrical engineer, Canadian Pacific Railway Company's Telegraph, Montreal, Que.: "I would say that on the line through the Crow's Nest Pass and the Rocky Mountains, the original pole line (cedar) was affected to a considerable extent by woodpeckers, there being hardly a pole for miles which did not have at least one hole bored into the heart. Outside of this line we have had practically no trouble from woodpeckers, only an odd pole being attacked now and then. I am inclined to think that they only bore into poles which are worm eaten. We have had considerable trouble on some parts of the line from black ants, which attacked the poles just below the surface of the ground and bored upwards, even into good sound wood. I am of the opinion that these ants will not attack a sound pole, but only commence their burrowing where the pole has decayed and work up into the sound portion. We are not now using preparations of any kind on our poles as preservatives. We experimented a few years ago with different compositions, but from the experience we obtained, came to the conclusion that we did not receive any practical benefit from the money expended in this direction."

Mr. W. C. Walstrum, superintendent of telegraph, Norfolk & Western Railway, Roanoke, Va.: "I have to say that we have not had any trouble to speak of from woodpeckers damaging the telegraph poles in this section."

Mr. C. B. Phelps, superintendent of transportation, Louisville & Nashville Railroad Company, Louisville, Ky.: "Wish to advise that all poles on our line are owned and maintained by the Western Union Telegraph Company, therefore we have no data on this subject."

Mr. F. S. Rawlins, superintendent of telegraph, Southern Pacific Company, San Francisco: "While we are bothered to some extent in this way in Arizona and New Mexico, our Mexican lines suffer more than any other. Mr. C. T. Day, superintendent telegraph, Southern Pacific Lines in Mexico, Empalme, Sonora, Mexico, has had a great deal of experience along this line and could no doubt give you an account that would be interesting and valuable."

[Note.—An article on this subject from Mr. Day was published in our issue of December 16, 1910, as previously stated.]

Mr. J. G. Jennings, superintendent of telegraph, Rock Island Lines, Chicago: "Woodpeckers in Oklahoma and Texas especially are second only to sleet storms in the way of damage to our poles. Jokingly, the "shot-gun" policy seems to me to be the only method to bring about relief. This, however, would prove to be so expensive, as well as not altogether successful, that it cannot be considered; for despite the vigilance of the "sharpshooters" the woodpecker would dodge the shot and get in his destructive work to a more or less extent. If there can be found a man in this big world of ours who could devise some method of annihilation of the woodpecker he would surely be entitled to the erection of a monument, even before his demise; and I feel sure that the Rock Island Lines would aid largely

Digitized by Google

in the raising of funds for the same. We have recently erected one mile of concrete poles for experimental purposes in Oklahoma, and we are very solicitous as to how they will withstand the attack of the little bird with the penetrating bill."

Mr. H. A. Tuttle, president and general manager The North American Telegraph Company, Minneapolis, Minn.: "We are not troubled in this way or, at least, to a noticeable degree. We use no preservative, from the fact that we have not found anything in this country that would be effective, at a reasonable cost. I notice that the telephone companies are using a paint or creosote stain on the butt of the poles. Unless this can be done in the yard, at odd times, I do not think it pays. The outfit to do the work, carried along with the gang, is unsatisfactory and expensive, that is considering the cost of new poles in our country."

Mr. J. M. Walker, superintendent of telegraph, Denver & Rio Grande Railroad Company, Denver, Col.: "We are not troubled much with the feathery tribe of woodpeckers, probably due to high altitude. The human 'woodpeckers,' however, give us considerable trouble by shooting at our lines and destroying them."

Mr. E. J. Little, superintendent telegraph, Great Northern Railway Company, St. Paul, Minn.: "We are not experiencing any trouble to speak of from either woodpeckers or insects and we have not found it necessary therefore, to adopt any preventive measures."

Mr. W. W. Ashald, superintendent of telegraph, Grand Trunk Railway System, Montreal: "I have no knowledge of any damage in this part of the country caused by woodpeckers or any other bird. We use cedar exclusively for our telegraph poles, and their life varies according to the nature of the soil. We have poles on our right-of-way in very fair condition which were planted thirty-five years ago. We experience more trouble from grass fires than from any other cause. We do not use any wood preservatives."

Mr. J. B. Murphy, superintendent of telegraph, Mobile & Ohio Railroad Company, Jackson, Tenn.: "We have never had any poles destroyed by woodpeckers that I am aware of. There are but few of these birds down in this country. Presume this is accounted for by our having but few cherries, and so many peaches."

Mr. E. A. Klippel, superintendent of telegraph, Oregon-Washington Railroad & Navigation Company, Portland, Ore.: "On the lines over which I have jurisdiction we have had but very little trouble caused by woodpeckers damaging telegraph and telephone poles. There have been a few isolated cases of this kind but not sufficient to justify us to adopt any particular methods to combat this source of trouble."

Mr. W. H. Hall, superintendent of telegraph, Missouri, Kansas & Texas Railway System, Denison, Tex.: "We have had a great deal of trouble with these birds, especially on our San Antonio division between San Antonio and Smithville, Tex. During the past summer we put on about five hundred new cross arms and set quite a number of poles on account of the destructive work of the birds. I had all of the new cross arms thoroughly impregnated with creosote at our creosoting plant and have hoped that this would overcome the trouble. I note you state one superintendent of telegraph has reported that the birds get fat on creosote and this is rather disappointing. My linemen have tried almost everything to stop the destructive work of these birds. One man had trouble caused by the birds eating holes in cable boxes. He covered the holes with tin and the birds came back and pecked new holes by the side of the tin. Another lineman reports that he has killed off a number of the birds by soaking corn meal in poison and putting it in the holes, and another, who appeared to be sober when he was relating the story, but might have been telling it on the 'morning after,' stated that he had been 'hanging the varmints.' He said he took a small piece of twine, made a loop in it and hung it over the hole. When the woodpecker stuck his head in the hole his feathers became entangled in the loop, with the result that he hung himself and that the horrible example of the hung woodpecker frightened the other birds away."

Mr. J. C. Brown, general foreman, Missouri Pacific Railway, St. Louis, Mo.: "In my experience the life of poles is determined principally by grass fires, and not by woodpeckers. The various chemical conditions of the soil in which they are set is also an important factor to be taken into consideration. I have known sound white cedar poles to dry rot at the ground line within a period of eighteen months after being set, to such an extent that a slight strain would break them off. In most of the Southern states, where grass and undergrowth are abundant, right-of-way fires are most destructive to poles for the reason that poles and cross arms are usually totally consumed, and the service interrupted before knowledge of the cause is obtained. With the loss of poles and cross arms in such instances, it is often a difficult and expensive undertaking to provide and get new material on the ground to restore the physical condition of the line. White cedar poles, which are used almost exclusively in the limits of my experience, are easily ignited, and once on fire they are invariably consumed. There are territories west of the Mississippi River comprising less than seven thousand miles of poles where the destruction of and damage to poles from this cause has amounted to forty miles per annum. Spading the grass away from the base of the poles and using wooden braces for a distance of four or five feet would prevent this loss. This should be done during the months of July and August. While the woodpeckers are a source of great detriment to the strength and life of poles, we are warned by inspections from time to time just what to expect from the depredations of these birds. I recall that a few years ago, after

Digitized by Google

a heavy lead had been prostrated by a sleet storm, and the wires were lying on the ground for a distance of sixty or seventy miles, that in many places a number of the shattered and broken poles were mere shells, having been bored and hollowed out by the woodpeckers. I also recall that several years ago, on a certain division, these birds were very numerous. As many as three or four could often be seen pecking away on one pole. The division lineman in charge of this territory was a conscientious Irishman, fertile in expedients, and when his attention was called to the apparent unnecessary destruction of poles from this cause, he seemed deeply grieved, but made no reply. Some two months later he called my attention to the matter, stating that he did not have a "peckerwood" on his division, that he had been riding on the local freight trains from one to three days per week, locating himself in the cupola of the caboose with a shot gun and had shot them by the dozen. I think this remedy about as effective as any."

(To be continued.)

The Turner Monument Fund.

One way to popularize the Turner monument project is to secure a large number of small subscriptions from the employes of railroads, connected as they are by a common bond of interest. This enables all employes, down to the lowest grade, to be represented in the movement. Mr. Charles Selden, superintendent of telegraph of the Baltimore and Ohio Railroad, has set the pace, and it would be well if officials of other roads would canvas their lines in the same manner. If this were generally done the balance required for the monument would not long remain a negative quantity.

The Turner Monument project was established for the purpose of raising a fund of $3,000 for a monument to be erected at Turner, N. Y., on the Erie Railroad, to commemorate the sending of the first telegraphic train order. This historical event took place at Turner in the autumn of 1851, the train order being sent by Charles Minot, general superintendent of the road. It has been considered an event of sufficient importance to justify its commemoration in bronze and granite and the Association of Railway Telegraph Superintendents and the Old Time Telegraphers and Historical Association have officially endorsed the movement.

Many large subscriptions to the fund have been received and duly recorded in these columns. Among these contributors may be mentioned: Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company and of the Western Union Telegraph Company, $50; Col. Robert C. Clowry, New York, $25; John A. Roebling's Sons Company, $50; Mr. F. D. Underwood, president of the Erie Railroad, $25; Mr. Thomas A. Edison, $50; Mr. George T. Williams, formerly superintendent of telegraph Nickel Plate Railroad, Cleveland, Ohio, $25.

The following named gentlemen constitute the committee in charge of the Monument Fund: E. P. Griffith, superintendent telegraph, Erie Railroad, Jersey City, N. J., chairman; Charles Selden, superintendent telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, Telegraph and Telephone Age, New York; E. A. Chenery, superintendent telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railway, Montreal, Canada; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who has been elected treasurer of the fund. All contributions are acknowledged in the columns of Telegraph and Telephone Age, and the funds deposited with the Washington Trust Company, New York, as soon as received.

The contributions received up to date are as follows: Previously acknowledged, $888.25. Through Charles Selden, superintendent of telegraph of the Baltimore and Ohio Railroad: B. F. Kelly, St. George, S. I., N. Y., $1.25; M. E. Weist, St. George, S. I., N. Y., $1.00; L. E. Hoagland, St. George, S. I., N. Y., $1.00; D. A. McLaughlin, St. George, S. I., N. Y., $1.00; T. M. Bridges, St. George, S. I., N. Y., $1.00; F. C. Schelhorn, St. George, S. I., N. Y., $1.00; F. W. Freeman, St. George, S. I., N. Y., $1.00; J. T. Lee, St. George, S. I., N. Y., $1.00; Miss K. Crosson, St. George, S. I., N. Y., $.50; E. L. Haskins, St. George, S. I., N. Y., $.50; J. L. Foggarty, St. George, S. I., N. Y., $.50; W. L. Connor, St. George, S. I., N. Y., $.50; J. M. Troutman, St. George, S. I., N. Y., $.50; J. C. Muhlbach, St. George, S. I., N. Y., $.50; F. D. Jennings, St. George, S. I., N. Y., $.50; S. G. Eilenberger, St. George, S. I., N. Y., $.50; J. A. Larkin, St. George, S. I., N. Y., $.50; J. H. Groves, St. George, S. I., N. Y., $.50; J. L. McDonald, St. George, S. I., N. Y., $.50; A. B. Schlowsky, St. George, S. I., N. Y., $.50; T. J. Oldham, St. George, S. I., N. Y., $.50; F. A. Stoffel, St. George, S. I., N. Y., $.25; L. F. Kunz, St. George, S. I., N. Y., $.25; E. R. Burke, St. George, S. I., N. Y., $.25; W. J. Madden, St. George, S. I., N. Y., $.25; H. C. Spencer, St. George, S. I., N. Y., $.25; B. F. Fithian, St. George, S. I., N. Y., $.25; J. M. Hughes, St. George, S. I., N. Y., $.25; J. P. Klinger, St. George, S. I., N. Y., $.25; J. P. Tully, St. George, S. I., N. Y., $.25; W. E. Connell, St. George, S. I., N. Y., $.25; R. J. Cromie, St. George, S. I., N. Y., $.25; C. R. Klinger, St. George, S. I., N. Y., $.25; L. A. Francis, St. George, S. I., N. Y., $.25; J. B. Every, New York, $5.00; Manhattan Electrical Supply Company, New York, $25.00; G. C. Kinsman, Decatur, Ills., $5.00. Total, $941.25.

The Telephone.

The Telephone in Ecuador.—The Guayaquil Telephone Company is about to convert its system to common-battery working at a cost of $125,000.

Interchange of Telephone Connections in Indiana.—A bill has been introduced in the Indiana legislature to compel telephone companies to provide interconnection between their systems on demand of a subscriber.

Shooting at Overhead Cables.—The Pacific Telephone and Telegraph Company has suffered much damage to its overhead cables in the vicinity of Portland, Ore., and in other sections by sportsmen shooting at them or at birds. Inspectors are patrolling the lines and offenders, if caught, will be prosecuted.

Telephone Amalgamation in Glasgow.—Preparatory to the amalgamation on January 1, 1912, of the post office and National Telephone Company's systems in Glasgow, Scotland, 1,600 National subscribers have been transferred from the company's exchange to the post office central exchange. The two systems have been interconnected, a small fee being charged for this service. Small users find this arrangement cheaper than paying for two separate services.

Telephony in Denmark.—The Danish Telegraph and Telephone Act provides, in principle, for the exclusive right of the State to work the telephone system, but it gives the Government the right to grant concessions for the working of telephone systems to private companies. The Government supervises the companies and fixes the maximum rates. The peculiar geographical conditions of the country has made the arrangement quite natural of forming a company for each individual part of the country, while the connection between the different parts mutually, as well as with foreign countries, is worked by the State.

The Interstate Telephone and Telegraph Company.—Mr. Adam S. Clow, secretary of the Interstate Telephone and Telegraph Company, Chicago, states that it is probable that the system of his company and that of the Illinois Tunnel Company will be connected and that an effort will be made by the receivers of both companies to have the United States judge in whose court the bankruptcy proceedings are pending grant the companies the right to effect such an arrangement.

A. C. Sands, district manager in western Washington for the Pacific States Telephone and Telegraph Company, died in North Seattle, Wash., December 22. He was 60 years of age. He was a practical telephone man and superintended the building of telephone lines in Alaska in 1898.

Telephone Rates in Chicago.

The order of the City Council of Chicago directing its expert to draw up a lower schedule of rates is declared by President B. E. Sunny, of the Chicago Telephone Company, to be unfair and a statement has been made by him that the lower rates would not be accepted.

This decision of the council as to rates is the outcome of the report made by Mr. W. J. Hagenah, chief telephone expert of the city. The committee adopted the recommendations of its investigators fixing the value of the company's plant at about $22,000,000, reducing the payments to the American Telephone & Telegraph Company $147,000, establishing a depreciation fund of five and one-half per cent. and a dividend of eight per cent. and distributing a surplus of $216,168 by a reduction of rates.

The Telephone in Japan.—The twentieth anniversary of the establishment of the telephone in Japan was celebrated on December 16, 1910. In 1890, the year of commencement, there were only sixteen stations and two exchanges throughout the whole country. Ten years later these numbers had grown to seventy-four and twenty-five respectively, and there had been added four automatic telephone exchanges. The figures for 1910 are 1,568 stations, 708 exchanges and 484 automatic telephone exchanges. In 1890 there were only 343 subscribers; in 1900, 11,668, and in 1910, 126,720. So far a sum of $11,500,000 has been expended by the Japanese Government on its telephone system, but in view of the fact that there are at present over 42,000 people waiting to have the telephone installed in their premises, it is proposed to increase the 1911 appropriation from $2,250,000 to $3,250,000.

Energy Required for Telephonic Conversations. Mr. John J. Carty, chief engineer of the American Telephone and Telegraph Company, states that the energy consumed per 1,000 telephone conversations, under the usual operating conditions of the American Telephone and Telegraph Company, is about 950 watt-hours, which is equal to the consumption of eight and one-half pounds of coal. Assuming that there are 9,000,000,000 conversations held in the United States per annum, which is a fair estimate, the amount of energy required would involve the consumption of about 30,000 tons of coal. It should be explained that this energy is required for the telephone power plant which furnishes the current for telephone signaling circuits, the telephone ringing machines, etc., in other words, the energy required for the operation of the telephone switchboard.

Buying and Merging Telephone Companies in New York State.—Petitions have been received by the New York State Public Service Commission, Second District, from the New York Telephone Company asking that it be permitted to buy the Amsterdam Automatic Telephone Company for $150,000, to merge the Trumansburg Telephone Company, the Jefferson County Telephone Company, and to transfer the rights, property and franchises formerly belonging to the Central New York Telephone and Telegraph Company, now owned by the New York Telephone Company, to the Otsego and Delaware Telephone Company for the sum of $98,000. The New York Telephone Company also asks to be

Digitized by Google

permitted to sell its property in Allegany County, including the rights and privileges granted to the New York and Pennsylvania Telephone and Telegraph Company by the villages of Wellsville and Andover, to the Allegany Telephone Company of Wellsville. The price to be paid is $35,000.

Telephone Rates in Massachusetts.—Representatives of various business and improvement organizations in Boston have started a movement in opposition to the new telephone rates recommended by the Massachusetts Highway Commission. It is stated that Governor Foss will probably be asked to appoint a special investigating committee to examine the telephone system and conditions.

To Wind Up a Telephone Company's Affairs.—The affairs of the Telephone, Telegraph and Cable Company of America are to be wound up February 16. An order was signed by Vice Chancellor Emery of New Jersey directing all parties in interest to show cause why the report of Charles M. Myers and Edward M. Colie, receivers, should not be approved and an offer of $75,000 by Henry S. Kearny of New York for all assets in the hands of the receivers, barring cash assets, should not be accepted.

New York Telephone Company Bids for Continuance of Privileges.—The New York Telephone Company has applied to the Board of Estimate for a continuance of its privileges in carrying on its business in Greater New York. The company agrees to pay the city $122,000 per annum for the next five years, $134,000 a year for a second term of five years, $152,000 per annum for a third term of five years, $176,000 yearly for a fourth term of five years and thereafter $200,000 a year. The matter has been referred to the city chief engineer.

Convention of National Independent Telephone Association.—The National Independent Telephone Association began its convention in Chicago, February 8. It is stated that the delegates from the smaller companies charge that many telephone promoters counted in the past among the strongest bulwarks of the independent movement are showing themselves not averse to consolidation and friendly to the Bell camp or the J. P. Morgan interests. The American Telephone and Telegraph Company, it is reported, was represented at the Hotel LaSalle, where the meetings were held. Representatives of the Morgan interests were also present.

Long Distance Telephone Rates.—Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company and of the Western Union Telegraph Company, states that while the telephone company is constantly giving consideration to the problem of reducing rates for long distance telephone service, no change in tolls is in contemplation or under consideration at present, it being entirely a matter of the future to show whether economies can be effected, through the use of wires for combined telephonic and telegraphic service, sufficiently to permit a reduction in the cost of transmitting long distance telephone messages.

Telegraph and Telephone System of Texas Company.—The Texas Company, an oil-producing concern, with headquarters at Houston, Tex., has an extensive telegraph and telephone system, extending from Laredo, Tex., to New Orleans and Shreveport, La., and from Kansas to Port Arthur, Tex., on the Gulf of Mexico. It has about 100 operators in all in the main offices and at the pumping stations. Mr. James R. Mayer is superintendent of the system.

Cumberland Telephone and Telegraph Company.—The annual report of the Cumberland Telephone & Telegraph Company shows the result of operations and the financial condition of the company on December 31, 1910, as follows:

Total earnings	$6,897,080	Inc..	$281,712
Operating expenses	3,894,409	Inc..	14,970
Net earnings	$3,002,671	Inc..	$266,742
Total charges	$595,403	Inc..	$16,321
Balance	$2,407,268	Inc..	$250,421
Dividends	1,574,412		
Surplus	$832,856	Inc..	$250,421

Ball of Boston Telegraphers' Aid Association.—The Telegraphers' Mutual Aid Association of Boston, Mass., held its annual dance February 3. There was a large attendance and everyone present had a thoroughly enjoyable time. Mr. Robert E. Tobin is president of the association and to his hard work the success of the affair was largely due. Mr. John B. Gatins acted as floor manager. This association has done excellent work for many years in aiding its members in time of sickness and providing burial expenses. Among the guests present were C. A. Richardson, manager, and J. D. McDonald, chief operator of the Postal Telegraph-Cable Company; superintendent C. F. Ames; J. B. Rex, general traffic chief; L. D. Wilbourn, district traffic superintendent and W. S. Barker, district plant superintendent, of the Western Union Telegraph Company and J. J. Flaherty of the American District Telegraph Company.

Proposal for Wire for Signal Service.—The Chief Signal officer, War Department, Washington, D. C., will receive bids until 11.30 a. m., February 27, for 300 miles of 11-strand field wire, to be furnished on spools in lengths of 2,640 feet, the spools to be furnished by the Signal Corps. Address Captain A. S. Cowan, disbursing officer, Signal Corps, U. S. A., Washington, D. C.

Special Ocean Mail Service Ports.—The following ports have been designated as forwarding stations for the Western Union Special Ocean Mail Service: New York, New Orleans, San Francisco, Seattle, Vancouver, St. John, N. B., and Halifax, N. S.

Calculating Joint Resistance by the Aid of Charts.

BY THOMAS R. TALTAVALL.

The mathematical calculation of joint resistance is not often an easy task, and we are not always sure that the answer is correct unless each step of the operation is carefully checked.

A method of calculating joint resistance by the aid of a chart or diagram is given herewith. It will be found extremely useful by those having calculations of this nature to perform, and is preferable to mathematical calculations because it gives a visible record of the various steps in the solution of the problem. Too much dependence, however, should not be placed upon any mechanical means of doing brain work, because the brain needs exercise to maintain its reasoning power. The brain and the chart should work together and help each other, and one should not be used to the detriment of the other.

By the use of a chart we can accurately and quickly determine:

1. The joint resistance of two or more conductors, and

2. The component resistances of a given joint resistance.

TO DETERMINE JOINT RESISTANCE.

Assume that two wires are supplied with current by one battery. The resistance of one wire is say, 75 ohms and of the other, 50 ohms. What is their joint resistance?

To draw a diagram that will give the answer to this and other like problems, proceed as follows. First, provide a scale, the finer the divisions and the more accurate it is the better. The divisions should not be greater than one-tenth of an inch. Next, on a sheet of paper draw a horizontal line, C, for the base line. Upon this line erect two perpendiculars, A and B, at right angles to the base line, their distance apart being immaterial, so long as they are not too close to each other or too widely separated.

Upon the vertical line A, point off 50 divisions of the scale to represent the 50 ohms resistance of one wire and on the other vertical line, B, mark 75 divisions for the 75 ohms of the other conductor.

Then draw a diagonal line, D, from the 50 point on A to the base of B, and another diagonal in the opposite direction from the 75 point on B to the base of A, as shown in the diagram. The height from the base line of the point where the two diagonals cross represents the joint resistance of the two wires. This distance must be measured by the same scale used in laying off the 50 and 75 ohms. The joint resistance, as thus measured, is found to be 30 ohms.

Assume now that we wish to determine the joint resistance of three wires, with resistances of 75, 50 and 60 ohms respectively. In solving this problem the same diagram can be used.

We already have the joint resistance of the 75 and 50-ohm wires, which is 30 ohms. We use this joint resistance, G, as the foundation for further calculation.

Point off on the vertical line, B, 60 ohms in the same manner as before, then draw a diagonal from this point to the base of G, cutting diagonal D at J. The distance of the intersecting point of these diagonals measured from the base line gives the value of the joint resistance of the three wires.

The joint resistance of any number of wires can be determined in this manner.

TO DETERMINE THE COMPONENT RESISTANCES OF A JOINT RESISTANCE.

Suppose we have a conductor of 75 ohms resistance and wish to combine it with another conductor so as to obtain a joint resistance of 30 ohms, what must be the resistance of the second conductor?

Construct a diagram as before. Draw a diagonal from 50 ohms on the vertical line A to the base of the vertical line B. Then find the point on this diagonal which is exactly 30 scale-units above the base line. This point then represents the joint resistance

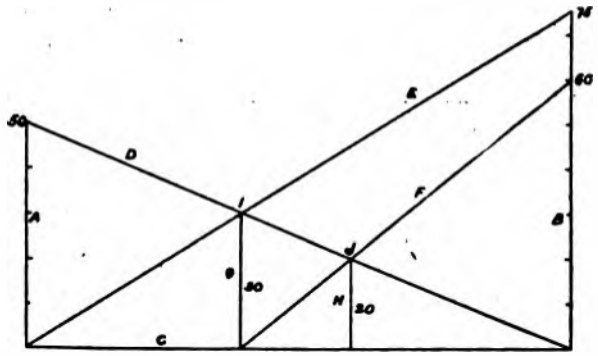

CHART FOR CALCULATING JOINT RESISTANCE.

of the wire of 50 ohms and the wire whose resistance is to be determined. Next draw a diagonal from the base of the vertical line A through the 30-ohm point on the diagonal D and project it to the vertical line B. This point of intersection with B will represent the resistance of the second conductor, which was to be determined. The value of this resistance is found to be 75 ohms.

If we desire to determine the resistance of a third conductor in order to obtain a joint resistance of, say, 20 ohms, find the point on the diagonal D, which is 20 units above the base, then draw a new diagonal from the base of G through the 20 point on the diagonal D to the vertical B. The new diagonal and the vertical B will intersect at 60, which is the resistance of the third conductor.

In solving problems of this kind it is generally more satisfactory to use cross section paper. This paper, which can be obtained of any dealer in drawing materials, is accurately ruled with horizontal and vertical lines. Cross section paper is a scale in itself, and no other scale is needed to make measurements. The separate scale and blank paper method is satisfactory if one has an accurate scale and does not mislay it. The advantage of the cross section paper is that we have scale and paper in one, where-

Digitized by Google

as in the other method the scale and paper are separate and require extra handlings.

It will be noticed that along the verticals A and B in the drawing are little marks. They represent divisions of 10 units of the scale. Each division should be divided into 10 units, in order to obtain accurate measurements. Whether cross section paper or a separate scale is used, divisions of twentieths of an inch give very satisfactory results. Finer divisions would of course, give more accurate readings.

In the foregoing examples whole numbers were used for the sake of clearness, but the same rule applies, of course, to numbers composed wholly of fractional parts or of whole numbers and fractions. The fractions, however, should be expressed in decimals.

The divisions of the scale or of the cross section paper may be given any value. In the diagram the figures used were given a low value in order to make the principle clear, but whatever is the value of the figures in an actual case, the principle is the same. Obviously, very large quantities cannot be represented within the limits of a sheet of paper if we use the same unit for measurement that we do for quantities of low value. The way to meet this seeming difficulty, however, is very simple. If we are dealing with large quantities they can be brought within the limits of the sheet by reduction, that is, by dividing the quantities by any figure that will reduce them to workable dimensions. The resulting value of the joint resistance will, of course, represent the true value similarly reduced, and must be multiplied by the reducing factor in order to give the result the actual value.

For example, suppose the resistances 50 ohms and 75 ohms, used in the original example, had been 300 ohms and 450 ohms instead; we could reduce the values of the latter quantities by dividing them by say 6, which would give us 50 and 75 as quotients. Now we can work with 50 and 75 with advantage, as we did in the first place.

It must be borne in mind, however, that the value of the joint resistance is affected by the same number used in reducing the separate resistances. In the example given the 300 and 450 were reduced by dividing by 6. The resulting joint resistance will also represent the actual value divided by 6. Therefore, to obtain the correct value of the joint resistance we must multiply the result by 6; this will give us, in this instance, 180, which is the joint resistance of two wires of 300 and 450 ohms respectively.

It is evident from the foregoing that very small quantities can be given workable dimensions by multiplication. In a case of this kind the resulting joint resistance will be larger than the actual resistance, and must therefore be divided by the figure used in multiplying the separate resistances, to give it its true value.

Subscribe for Telegraph and Telephone Age. It is the leading paper of its class in America.

Radio-Telegraphy.

Wireless in Turkey.—The Turkish Government has established wireless telegraphy on eleven war ships and a land station.

Wireless for Submarines.—It is stated that the British Admiralty has developed a wireless system for use in submarine boats.

Wireless in Australasia.—Direct wireless communication between New Zealand and Australia has been established by the Dominion Postal authorities.

Wireless in Korea.—Wireless telegraph stations are to be established at Mokpo, Hangmunto and Sochongto, Korea, and on the customs cruiser, *Kwangche.*

Wireless News in the Amazon Country.—Porto Velho, a town on the Amazon river, in the Brazilian rubber country, has a weekly newspaper which receives its news exclusively by wireless telegraphy.

Wireless Station on Cocos Islands.—The British Government is arranging to install wireless telegraphy at the Keeling Cocos station in order that telegrams may be exchanged between passing ships and that remote region.

Wireless Institute Election.—At the meeting of the Wireless Institute held in New York, January 4, Mr. Kolster of the Radio Telephone Company read a paper on "Singing Spark Sets." The election of officers resulted as follows: President, Mr. R. H. Marriott, of New York; vice-presidents, Messrs. Greenleaf W. Pickard, of Amesbury, Mass., and Fritz Loenwenstein, of New York; secretary-treasurer, Mr. Alfred N. Goldsmith, New York, and directors, Messrs. Frank H. Fay and Sidney L. Williams, both of New York.

The Newport Wireless Station.—One of the most important wireless stations of the Navy Department is that at Newport, R. I. Another new mast will be erected in a few months and a complete new wireless equipment installed. The mast will be 186 feet high. This station has an excellent record in rendering valuable aid to vessels in distress, the most notable of these being the case of the steamships *Republic* and *Larchmont.* It was this station that had a twenty-minute conversation with Colon, Panama, recently, a distance of 1981 miles. Official messages are sent from this station to the navy department direct through the air, and can quickly flash messages to the Boston, New York, Portsmouth and other navy yards at greater distances. The one trouble this station experiences is the constant interference by amateurs and other operators, but with the new instruments this trouble will be largely obviated and the wireless business will be controlled at the torpedo station. Since Commander Mark L. Bristol, assumed charge of the station he has greatly increased the efficiency of the plant.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

The Railroad.

Omaha Land Show.—Dr. Frederick Millener, of the Union Pacific Railway, recently gave a demonstration of wireless telephony and wireless telegraphy in the Colorado exhibit at the Omaha Land Show. The receiving apparatus of the wireless telephone system is concealed in the hat.

Train Dispatching by Telephone on Chicago and Western Indiana Railroad.—The Chicago and Western Indiana Railroad has just ordered a complete equipment of railway telephone material. The new dispatching system will cover the entire line of this road and of the Belt Railway of Chicago, a subsidiary road. There will be three circuits. One is the train dispatching wire of the Chicago and Western Indiana lines, another the train dispatching wire of the Belt Railway and the third a message circuit paralleling the train wire circuit of both roads. A total of fifty-five way-station telephone outfits and 104 station selector outfits will be provided.

Mr. W. P. Cline, superintendent of telegraph of the Atlantic Coast Line, Wilmington, N. C., was a recent New York visitor; also Mr. G. A. Cellar, superintendent of telegraph, Pennsylvania Lines West of Pittsburg, Pittsburg, Pa.; Mr. Wm. Bennett, superintendent of telegraph, Chicago and Northwestern Railway, Chicago, and Mr. S. A. D. Forristall, superintendent of telegraph, Boston and Maine Railroad, Boston. They came to attend the meeting of the High Tension Crossing Committee of the Association of Railway Telegraph Superintendents of which committee they are members.

Mr. Charles T. Day, has been appointed superintendent of telegraph of the Southern Pacific lines in Mexico, with headquarters at Empalme, Sonora, Mexico. Mr. Day was assistant superintendent prior to his promotion.

Mr. G. H. Groce, of the General Railway Signal Company, Rochester, N. Y., and formerly superintendent of telegraph of the Illinois Central Railroad, at Chicago, was a recent New York business visitor. He called on many of his old friends while in the city.

Telephone Dispatching on the Canadian Pacific.—The management of the Canadian Pacific Railway Company has authorized the equipment of the following telephone dispatching circuits: Calgary-Field, 136 miles; Field-Revelstoke, 131 miles; Revelstoke-Kamloops, 129 miles; St. John-Vanceboro, 94 miles; Vanceboro-Megantic, 217 miles; Montreal-Quebec, 175 miles; Brockville, Ottawa, Chalk River, 175 miles; Smiths Falls-Havelock, 110 miles; Havelock-Toronto, 107 miles; Toronto-Muskoka, 141 miles; London-Windsor, 113 miles. Total, 1,528 miles. This added to the 2,254 miles of circuit now in operation makes a total of 3,782 miles of telephone train dispatching circuits on the Canadian Pacific Railway, covering the main line from St. John, N. B., to Vancouver, B. C., with the exception of two sections worked double track and two other short sections, also various branches of single track throughout Ontario and Quebec.

Meeting of Western Division of Association of Railway Telegraph Superintendents.

The regular quarterly meeting of the Western Division of the Association of Railway Telegraph Superintendents was held at the Southern Hotel, St. Louis, Mo., January 26; chairman E. A. Chenery, superintendent of telegraph of the Missouri Pacific Railway, presiding. There were forty-three members of the division present at the meeting, and matters pertaining to the operation and maintenance of railway telegraph and telephone systems occupied the larger part of the time in their discussion.

A committee was appointed to make the necessary arrangements for the attendance of the Western Division members at the annual meeting of the parent body in Boston, June 19 to 23. Mr. W. C. Walstrum, superintendent of telegraph of the Norfolk and Western Railroad, Roanoke, Va., was appointed chairman of this committee.

It was announced that Mr. Thomas A. Edison had promised to develop a "loud sounding telephone" for use in the railway service. The receiver is to be of such construction that a voice speaking at the other end of the wire can be heard all over the room.

According to a statement made by Mr. Chenery, 35,000 miles of railroad have been equipped with telephones in place of the telegraph for train dispatching. There still remain 240,000 miles of road to be equipped with the telephone system.

Mr. C. S. Rhoads, superintendent of telegraph, Cleveland, Cincinnati, Chicago and St. Louis Railway explained the application of the telephone in manual block circuits on his line. Where such stations are from four to five miles apart, they have secured excellent results on a grounded circuit by the use of an adjustable coil bridged around the receiver, making the circuit comparatively quiet, notwithstanding the fact that such circuits were paralleled by high tension trolley and power circuits.

Some proposed amendments to the constitution were presented and will be acted upon at the annual convention. These amendments relate to proper handling of applications for membership in the event a full attendance of the Executive Committee is not had.

The members and guests were entertained at luncheon by the supply man present, and in the evening were the guests of Mr. M. T. Cook, division commercial superintendent of the Western Union Telegraph Company at a banquet at the Jefferson Hotel.

A letter from chairman E. P. Griffith, of the Turner Monument fund committee was read and every member present urged to lend his assistance towards swelling the funds sufficient to carry out the purpose of the committee.

Some discussion was had with reference to legislation in which the telephone was a conspicuous factor. In some states bills have been introduced restricting the use of the telephone for the giving of train orders; in others, providing that train or-

Digitized by Google

ders shall not be issued to train men, the purpose being to prevent train men from securing orders at blind stations, etc. Legislation in other states provides that telephone service must be installed in all depots where the railway company employs an agent. The effect of these various proposed laws was discussed.

Meeting of High-Tension Committee of Railway Telegraph Superintendents.

A meeting of the High-Tension Wire Crossings Committee of the Association of Railway Telegraph Superintendents was held at the Waldorf-Astoria, New York, February 7, to consider the general situation. The members of the committee are: Mr. G. A. Cellar, superintendent of telegraph, Pennsylvania lines west of Pittsburg, Pittsburg, Pa., chairman; Mr. G. H. Groce, General Railway Signal Company, Chicago; Mr. W. W. Ashald, superintendent of telegraph, Grand Trunk Railway, Montreal; Mr. W. P. Cline, superintendent of telegraph, Atlantic Coast Line, Wilmington, N. C.; Mr. Chas. Selden, superintendent of telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; Mr. C. A. Parker, superintendent of telegraph, Denver, North Western and Pacific Railway, Denver, Col.; Mr. J. M. Walker, superintendent of telegraph, Denver and Rio Grande Railway, Denver, Col.; Mr. Wm. Bennett, superintendent of telegraph, Chicago and Northwestern Railway, Chicago; Mr. S. A. D. Forristall, superintendent of telegraph, Boston and Maine Railroad, Boston, Mass.; and Mr. J. G. Jennings, superintendent of telegraph, Chicago, Rock Island and Pacific Railway, Chicago, Ill. The members present were Messrs G. A. Cellar, Wm. Bennett, S. A. Forristall and W. P. Cline.

A joint committee of the National Electric Light Association, the American Railway Engineering and Maintenance of Way Association and the American Electric Railway Association is preparing an overhead crossing specification applicable to practically all aerial crossings of electric power wires over telephone or railway systems, and suggestions and criticisms are invited from all persons interested before the final adoption of the specification. The telegraph superintendents met the National Electric Light Committee and they discussed the subject together. Satisfactory progress was made.

Boston Meeting of the Association of Railway Telegraph Superintendents.

Active preparations are going forward for the next annual meeting of the Association of Railway Telegraph Superintendents which is to be held in Boston, June 19 to June 23. The committee of arrangements, of which Mr. S. A. D. Forristall is chairman, is arranging an excellent programme of entertainment, and as there is much to be seen in and around Boston, the attendance will probably be large. The papers to be presented will be of a most practical character, and it is hoped that the members will come prepared to discuss the subjects brought to their attention. It is desired to make this meeting the most profitable and interesting ever held by the association. The headquarters will be at the Hotel Brunswick. Additional information can be obtained from the secretary, Mr. P. W. Drew, Minneapolis, St. Paul and Sault Ste. Marie Railway, 204 Clark Street, Chicago.

Annual Dinner of Commercial Cable Company's Staff.

The tenth annual dinner of the staff of the Commercial Cable Company was held at the Hotel Grenoble, New York, January 28, superintendent S. F. Austin presiding. Among those present besides Mr. Austin, were Mr. Clarence H. Mackay, president; Mr. George G. Ward, vice-president and general manager; Mr. Albert Beck, secretary; Mr. C. E. Merritt, assistant treasurer; Mr. F. H. Dennis, superintendent of Clearing House; Mr. Charles Priest, electrician and Morgan Williams, Thomas Drew, E. L. Cohn, W. J. Gaffney, W. Beynon, J. F. Power, L. S. Fisher and others, about 100 in all.

In his opening address, Mr. Austin's sympathetic reference to the late general superintendent S. S. Dickenson found the sentiment of his audience. Mr. Mackay gave an interesting talk in which he referred in complimentary terms to the personnel of the staff. Unfortunately Mr. Ward was suffering from a cold and complete loss of voice, therefore his response to Mr. Morgan Williams' toast to the "Executive" was read by Mr. Austin. Mr. Cohn amused the company with his native wit. Mr. Drew in an address on "Co-operation" made an excellent impression. The musical numbers contributed by Messrs. Gaffney, Beynon and Power, with Mr. Fisher at the piano, were received with much favor.

Telegraph Taxation in Maine.—An act providing for the taxation of telegraph companies at the rate of 2½ per cent. of the value of their lines and other equipment has been presented to the legislature. This tax, the bill stipulates, shall take place of all state and municipal taxes.

Serial Building Loan and Savings Institution.

A dinner of the officers and directors of the Serial Building Loan and Savings Institution, New York, was held at the Astor House on the night of January 27, all of the directors being present. Plans and provisions were discussed, looking to the expansion of the institution's business during the coming year. Among those present were: Mr. E. S. Butterfield, treasurer; Mr. Edwin F. Howell, secretary; and Messrs. Thomas M. Brennan, William J. Quinn, M. J. O'Leary, Thomas E. Fleming, C. A. Kilfoyle, G. W. Blanchard, Edward Reynolds, M. S. Cohen, E. E. Brannin, M. W. Rayens, H. A. Konninger, J. T. Laidlaw and W. B. Dunn, directors. President A. G. Saylor was unable to be present on account of illness.

An optimistic spirit prevailed in the Board, which was encouraged by reason of the fact that the year 1910 shows the largest net increase of shares since the year of organization, 1885. The association's affairs are in excellent condition.

Digitized by Google

Hard Drawn Copper Wire.

In the Western Union Telegraph Company's plant there are at present approximately 530,600 miles of hard drawn copper wire. The amount is increasing rapidly as new circuits are being constructed and old iron ones replaced. The history of the development of hard drawn copper wire, whereby it was made applicable to telegraph and telephone use, is the subject of an interesting article in the *New England Telephone Topics*, for December, by Mr. Thomas B. Doolittle, who was a pioneer in the field.

EARLY EXPERIMENTS WITH COPPER.

Previous to 1877, much thought and large sums of money had been expended to get the benefit of the superior conductivity of copper for electric line circuits. Prof. Morse had used copper wire in the construction of his experimental line between Baltimore and Washington and the Western Union Telegraph Company had tried it out in New Jersey. These attempts had failed for the reason that the wire used was ordinary market wire, which was not strong enough to sustain its own weight. Other experiments made at about that time consisted in doubling the wire and twisting it; also in using a steel wire with a copper ribbon wound spirally about it. In another case, the copper ribbon was folded longitudinally about the steel wire; in another, copper was electroplated on the steel wire. As these and many other attempts along the same line proved equally futile, it remained for Mr. Doolittle to avail himself of the fact that the process of drawing wire hardens its surface, and to obtain hard drawn copper wire as an adaptation of this property.

The wire for connecting the several mills, offices, and residences of the officials of a brass company was drawn in its own mills under the direct supervision of Mr. Doolittle. The problem was to draw a rod of a given size down to a wire of a given size and it was only after many repeated trials, in which different sized rods were used and in which the finished product was either too brittle or too soft, that the desired result was accomplished.

This was in 1877, but it was several years before any other commercial use was made of the wire. The fact that it was in successful use seemed to be no argument for it and the objections to hard drawn copper wire, without any investigation whatsoever, were many. It was too costly; it would stretch and sag and would not stand exposure to the elements; the structure of the metal was impaired by the drawing process and the conductivity was reduced to a point where it would be little, if any, better than iron; it was even argued that the wire would expand from the heat of the sun and not contract to normal when cool.

FIRST LONG COPPER CIRCUIT.

It was not until 1883, six years after hard drawn copper wire had been in constant and successful service, that Mr. Theo. N. Vail, then general manager of the American Bell Telephone Company, commissioned Mr. Doolittle to build a metallic circuit of No. 8 B. W. G. hard drawn copper wire between Boston and New York. The cost of the experiment was estimated at about $70,000, which, in those days of the telephone development, was considered a very large sum of money. At that time all the wires were overhead; consequently the copper circuit had to be strung through the network of every intervening city on poles and over housetops. After the lines were at last completed and after many delays due to interruptions from stringing wires in intervening cities, from blasting of rock near the line and even from the hauling out of cable in the Harlem river by a tug boat, the tests were made and the circuit approved by the directors of the company.

During the tests and experiments, Messrs. Preece, of England; Wahner, of Germany, and Berton, of France, each at the head of the telegraph and telephone departments of their respective countries, visited the experimenter in his little laboratory, and each returned home to institute the manufacture and use of hard drawn copper wire.

On August 15, 1885, the American Telephone & Telegraph Company was organized with Mr. Theo. N. Vail as President, and from that time, the general adoption of hard drawn copper wire for toll lines, and very largely for exchange lines, was rapid.

IMPROVEMENTS IN MANUFACTURE.

Great improvements in the process of manufacture have been made in recent years. In the old process, billets of copper were rolled into sheets and then slitted into square rods. These rods were tapered by means of a hammer, so that they might be inserted far enough through the drawing die to be grappled on the opposite side, after which they were ready to be drawn into wire. The method of starting with a square rod had disadvantages for the reason that the corners were likely to lap and fold over in the process of drawing, thereby producing flaws or bad places in the wire. In the new process, the copper is received from the smelting works in round bars, about 54 inches long and three-fourths of an inch in diameter. These bars are heated and run through a series of grooved rolls until reduced to a diameter of five-sixteenths inches. After treatment with sulphuric acid to remove whatever oxide has been formed during the rolling operation, the rods are immersed in a lubricant of tallow and soap, and are then ready for the drawing process.

The cost of production has been enormously reduced by the new process. Whereas, under the old process, a very skilled workman was required for each single drawing, an attendant is now able to care for several continuous drawing machines that are run at a speed unapproachable by the old method.

Early History of the American District Messenger Service.

BY HENRY W. POPE.

The early days of the district telegraph were not unlike those of the telephone. Why one needed a call box in his house, and why one should pay thirty dollars per annum were just as difficult to set forth enticingly to the public as was the so-called "toy," the magneto telephone, which has grown into a corporation with interests second only to those of the United States Steel Corporation but with ramifications far beyond it.

In the early seventies, Mr. E. A. Calahan had been interested in the inventing and promoting of the three-wire stock printer and had also perfected and put in operation a private line printer which was utilized between banks and the Clearing House, switching through a central exchange. This, as the writer recalls it, preceded the Law dial and telephone system, the dial telegraph operating similarly through a central office, both schemes being followed later, in a measure, by the telephone.

Mr. Calahan conceived the idea that there was a domestic field for electricity and devised an instrument consisting of a Seth Thomas clock movement supported upon a circular iron base and covered with a glass shade. The base projected downwards at one side which provided a means for fastening the instrument to the wall. Two break wheels were attached to the clockwork, either of which could be brought in circuit by means of a switch. One wheel was notched for the even number and the other for the odd; the former indicating "messenger" and the latter "fire."

The apparatus had to be wound up by hand and the release of the clock movement, by pulling a hook downward, caused the break wheels to revolve and transmit the signal to the central office. Later this was developed into an automatic and non-interfering call box.

The first district office was established in Brooklyn and was managed by Mr. L. H. Smith, an experienced printing-telegraph operator. Two more districts were afterwards opened in South Brooklyn, and one in the vicinity of Clinton Ave., it being believed at that time that the greatest possible development would be along residential lines. The Brooklyn territory was later sold to the Brooklyn District Telegraph Company and Mr. F. P. Sherwood became superintendent, Mr. Smith having resigned to embark in the retail drug business. Mr. W. H. Sawyer, a well known telegraph operator, became identified with the enterprise as consulting engineer.

Following the Brooklyn development a company was formed in New York and Mr. E. W. Anderson was made president. This was followed later by the appointment of Mr. W. H. Sawyer as general superintendent; Mr. Geo. F. Durant, superintendent and Mr. Henry W. Pope, assistant superintendent in charge of construction. Ample capital was secured and the plant rapidly extended, covering Manhattan Island. Mr. Sawyer proved to be the right man in the right place, a competent electrical engineer, strict disciplinarian, methodical in the extreme and a man who would, as Josh Billings used to say, "chase cockroaches up and down stairs till they wore their legs off to their stomach." One could never tell when Mr. Sawyer would drop in and go through one's desk and criticise vigorously the condition of its contents; yet to this day the writer appreciates what at that time seemed an unnecessary procedure. The systematic development of the plant, the central office system and all the details were unquestionably the product of Mr. Sawyer's brain and became the model for all outlying district companies afterward formed.

The first districts opened in New York almost at the same time were one at Broadway (about No. 907) between Twenty-second and Twenty-third Streets, the other at Broad Street, corner of Exchange Place. The office at 907 Broadway was the first to open for business and as the whole scheme was a good deal of a speculation, intense interest was manifested in the operating development. Frequently a day would pass without having had more than one or two calls and the registers were watched for them by officials as a cat watches a rat hole. However, the calls increased with encouraging rapidity and new uses developed and provision was made for them. This success justified the opening of other districts in rapid succession and applications were made for house protection, for police-patrol, fire service, circular delivery, etc. These services were given consideration and became established features.

In July, 1874, Mr. Sawyer resigned and took up the establishment of district companies in other cities, Mr. Durant succeeding him, and the writer was moved up to the superintendency.

During these early years of the business the official duties were extremely arduous, necessitating constant vigilance, night and day, because of the police, fire and burglar alarm and messenger features requiring much prowling around at all times of night to keep the large force of messengers and patrolmen up to proper standards of duty. The company had its own printing department and many of the original general orders were set in type by Mr. Geo. F. Durant, who later became the head of the Bell Telephone Company of Missouri, at St. Louis.

Upon the writer's assuming the management, the messenger and police departments were organized on a military basis which involved an annual parade, generally in connection with the National Guard, and the presentation of gold and silver medals awarded for meritorious or heroic conduct. These parades, in some instances, exceeded seven full companies, twenty-two files, front, from curb to curb, and the marching was not excelled by any of the regiments of the National Guard. The messengers were officered by the company officials, from the general superintendent down. A school of instruction was also instituted for messengers in which they were taught cleanliness, politeness, and the de-

Digitized by Google

tails of the business. As many as 100 boys were kept in this school for thirty days at a reduced wage and were available as an auxiliary force for emergency purposes. The messenger force was increased and decreased in harmony with the demands of the business and the gross earnings of the messengers.

To those familiar with the "ins and outs" of this business, it has always seemed that a high class service might be made just as efficient today as formerly, regardless of telephone development, which is considered to have worked detrimentally to the interests of the district business. In its day the service was efficient and reliable and had the good will of the public. The company's messengers in 1875 delivered two-thirds of all the stock handled in Wall Street. As many as eighty boys in this district were sent out in one hour, or one to every three-quarters of a minute. The messenger business was always a profitable one and it is believed that it could be made just as profitable today. It also paid dividends on a capitalization of $2,000,000, besides providing a comfortable surplus.

The average earnings of $1.50 per day per messenger imbued the writer with the idea that by doing away with the box rentals, amounting to some $100,000 annually, the number of boxes could be largely increased, likewise the uses for messengers. The American District Telegraph Company never could bring itself to this idea and hence left the field open for the organization of the Mutual District Company, which carried out the policy of free call boxes, established a great system and practically dominated the field until finally purchased at a goodly profit to all those interested. The district service was of great usefulness in developing boys to become important factors in the business world. It furnished a large portion of the first ticket agents of the elevated railroad, through the good offices of the late Col. F. K. Hain, general manager, who learned to realize the advantages of good discipline and the reliability of the young men sent to him by the district company officials. Many former messengers became leading members of the Stock Exchange, and of Stock Exchange houses; many are officially connected with the telephone company; one of the author's office boys is an auditor of a leading express company, and others hold official positions in the telephone companies. A few graduates from the ranks of the American District service in other capacities during my administration are well known, and some of them internationally, and the writer points with pride to what little credit is due him for starting these people on their successful careers: Mr. Thomas D. Lockwood, general patent counsel of the American Telephone and Telegraph Company, Boston; Mr. John H. Cahill, vice-president New York Telephone Company; Mr. John McAllister, wire chief and Mr. W. E. Huntington of the New York Telephone Company, and others.

Mr. Geo. F. Durant, who was, at the time of his death recently, vice-president and general manager of the Bell Telephone Company of Missouri and was as previously mentioned, an enthusiastic district telegraph man and organized and operated the district service at St. Louis, which afterwards took up the telephone interests in that city.

Of those referred to in this article Mr. E. A. Calahan, the well known inventor of telegraph instruments, is now living in Brooklyn. Mr. W. H. Sawyer made a fortune in the electrical wire business in Providence, R. I., and has retired from active work. He lives in Pasadena, Cal., during the winter season and in Providence in the summer.

It is well to record the prominent part the early district organizations played in the development of what has now become the greatest industry, excepting possibly the Steel Corporation, but with interests more widespread and appealing almost individually to every self-supporting person in the United States.

The district companies quite generally throughout the country took up and developed the telephone and their officials afterward became important factors in the telephone field, notably Mr. W. D. Sargent, at Philadelphia; Mr. T. B. A. David, at Pittsburg; Mr. John I. Sabin at San Francisco; Mr. C. H. Wilson at Chicago and Mr. Chas. H. Sewall at Albany. Mr. Sewall, it should be noted, promoted one of the first telephone exchanges, early in 1878, and was the first to introduce message rate charges.

DO NOT THROW AWAY GOOD MONEY on a second-hand typewriter. Secure a "Central" factory-rebuilt, the best investment in the long run. Old "mills" taken in exchange. Postal employes may **purchase** at 75 cents weekly. Write me personally. **CENTRAL TYPEWRITER EXCHANGE**, New York. D. A. Mahoney, Representative.

Obituary.

Harry C. Webber, aged 23, an operator for the Postal Telegraph-Cable Company at Champaign, Ill., died at his home in Urbana, Ill., on January 27.

Charles E. Wise, formerly operator at Newark, Ohio, died at Chicago, January 28, aged 57 years.

C. F. Wilhelm for many years an operator on the Lake Shore and Michigan Southern Railway at Erie, Pa., and well known in commercial offices, died in that place January 21.

Alva McCall, aged 33 years, employed in the Pittsburg Western Union office for a number of years, died February 3. His remains were taken to his old home at Coshocton, Ohio, for burial.

John Benjamin Page, formerly manager of the Western Union office at the Metropolitan Hotel, New York, and of other city offices, died at Montreal, January 23, of paralysis. He was 71 years of age. Mr. Page was well known to the old time telegraphers in New York.

NEW YORK, POSTAL.

A class for instruction in telegraph engineering has been inaugurated by the employes of this Company. The first meeting was held February 2 with forty members present. Mr. Donald McNicol, of

Digitized by Google

the electrical engineer's office is the instructor. A course of instruction has been prepared to cover the following subjects: Sources of Electricity Used in Telegraph Work; Points in Telegraph Circuits Where Currents are Applied; Instruments Used in Telegraphy; Repeaters; Switchboards; Testing; Effects of Capacity and Inductance; The Phantoplex; The Telephone; Printing Telegraphs. The meetings will be held weekly in the electrical engineer's office where the equipment of that department will be available for the benefit of the class. Mr. F. E. McKieman is president of the class, and Mr. Henry L. Stern is secretary.

NEW YORK, WESTERN UNION.

Mr. Anthony J. Neyer of the Philadelphia force was a recent New York visitor, calling on many of his friends while in the city.

Meeting of Mutual Investment Association.

The second annual meeting of the Mutual Investment Association, consisting of the employes of the Postal Telegraph-Cable Company, was held at 253 Broadway, New York, on the evening of February 1. The treasurer, Mr. E. Reynolds, was pleasantly surprised by the presentation to him of a handsome gold watch from the members of the association in recognition of his services. The presentation was made by city superintendent C. F. Leonard in a few well chosen remarks. In accepting the gift, Mr. Reynolds expresed his appreciation for the good-will thus shown and was greatly encouraged by this evidence of interest in his work.

The financial statement for the year showed excellent returns on the money invested, but the feature of the association's work most gratifying to its members is the assistance it has rendered to all employes in the service in time of financial need. In addition to advancing money to employes in times of sickness and distress at the legal rate of interest, 6% per annum, and permitting them to pay the sums borrowed in small weekly payments, it has made arrangements with a number of stores so that the needs of the family can be met without recourse to installment houses at installment prices and large bonuses.

The following officers were elected for the year 1911: Finance Committee: E. S. Butterfield, E. B. Pillsbury, C. Shirley, F. E. McKiernan; Treasurer, Edward Reynolds; Secretary, H. F. Hawkins.

Postal Company's Complaint Against Western Union.—The Public Service Commission at Albany, N. Y., on February 6 heard a complaint filed by the Postal Telegraph-Cable Company against the Western Union Telegraph Company, involving the transferring of messages from one company to the other for a destination not covered by the lines of the company offering the messages for transfer. The Postal Company states that for messages thus transferred it is obliged to pay the Western Union full rates and a further charge is exacted for additional words which indicate the transfer point and the date. By this arrangement the Postal Company loses about ten cents on each message transferred. The Postal's complaint declares that this arrangement is unreasonably and discriminatory, and the commission has been asked to direct its discontinuance. The commission reserved decision. The Postal Company was represented by Mr. W. W. Cook, general counsel; Mr. C. C. Adams, second vice-president and Isaac Smith, superintendent of tariffs. The Western Union Company was represented by Mr. Rush Taggart, general counsel, Mr. William Holmes, superintendent of tariffs, and Edward M. Mulford, division commercial superintendent, New York.

Announcing Order of Dancing on Fire Alarm Box.—At the recent ball of the Quincy, Mass., Police Relief Association the dances were announced on a fire-alarm box installed on the stage for the purpose.

WANTED.—Live agents in all large Western Union and Postal offices. Central Typewriter Exchange, New York.

A certificate of membership in the Telegraphers' Mutual Benefit Association, 195 Broadway, New York, affording protection for the family and dependents in the amount of $500 or $1,000, which is at once available and cannot be diverted from its mission, should be held by every eligible person between the ages of 18 and 45 engaged in telegraph and telephone service, either commercial or railroad. If those not now members could realize and fully understand the stern necessity for beneficial help too often experienced by bereft families, would they not make earnest effort to secure such provision? Write for particulars.

MARTIN'S LATEST VIBROPLEX, $9.00. Address James B. Havice, General Agent, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEYBOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

SOME POINTS ON ELECTRICITY.—XIII.

A Study of Telegraph Apparatus.

BY WILLIS H. JONES.

HOUSE WIRING.

To those uninformed, the laying of house wires under the floors and in other parts of the building occupied by a large telegraph office is considered merely a matter of stringing the conductors from point to point as desired without regard to any particular rule.

Such, however, is not the case. Everything depends upon the purpose for which the conductors are to be used, as well as upon the method employed in supplying the instruments with current.

Furthermore, one class of floor conductors may be of comparatively small gauge, while others must consist of either one very large wire, or a number of small bare conductors twisted together in rope fashion so as to form the conductivity equivalent of a large gauge solid conductor. Finally, some of these floor conductors must have one of their terminals left "open" permanently. Another set must have both terminals open, while a third class is normally closed at all times. It should thus be apparent that the student may learn many interesting facts in connection with this part of electrical engineering if he will study closely the accompanying diagrams, Figs. 1 and 2, which illustrate the several principles involved in this class of work.

The most important point to realize and appreciate is that the conductors nearest the generator, that is to say, the "leads" must carry the entire current that is to be distributed to the various instruments, while those more distant carry only such a volume as is required for those instruments which are in circuit beyond. For this reason the mains or generator leads must be large in diameter, not only in order to provide sufficient capacity for carrying large volumes of current, but to prevent a drop in the electrical pressure in them. The principle is the same as that involved in distributing water

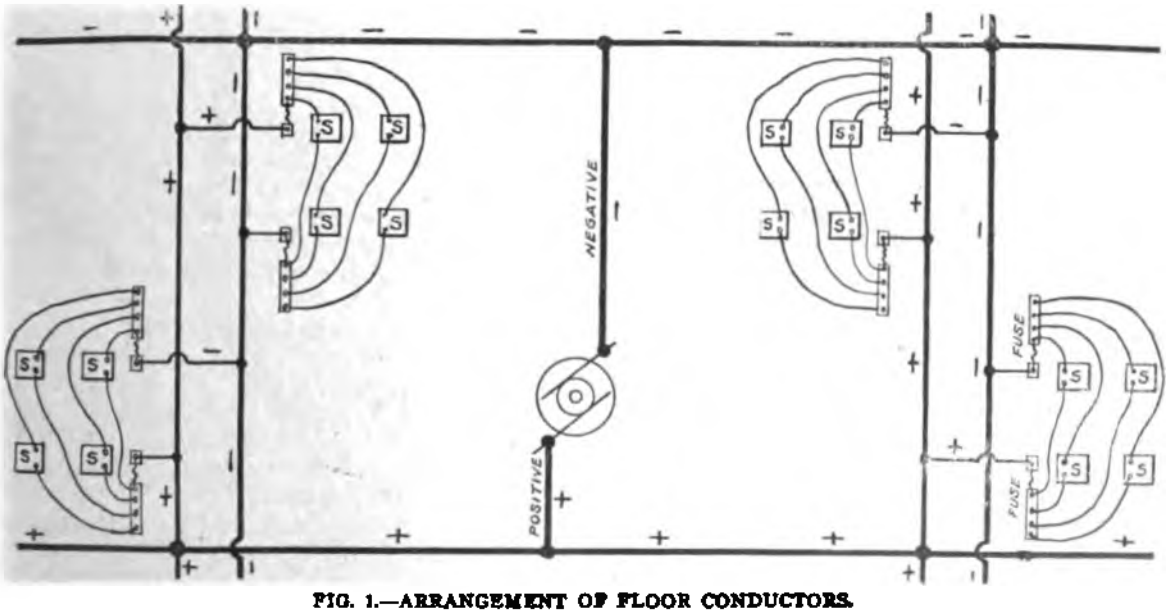

FIG. 1.—ARRANGEMENT OF FLOOR CONDUCTORS.

Digitized by Google

throughout city mains. The main pipes near the reservoir must be large enough to carry all the water flowing therefrom, those between the street and the private house have a smaller diameter; yet even these must be larger than the pipes leading to the faucets, as they must be able to carry all the water the faucets might demand in case they should all be turned on at the same time.

The proper gauge required for leads in house-wiring is determined in the same manner as the diameter of a water main would be ascertained, viz.: find the total demand and then add to this volume a value sufficient to take care of future growth. In the water system the answer would be in terms of gallons. In electrical work the total present and future amperage is the point to determine. The rest is easy. Most electrical text books contain tables showing the safe current-carrying capacity of the different gauges of wires. From this table the proper size of conductor for any circuit may be readily determined.

Fig. 1 shows the manner in which the wires for a multiple system would be arranged. As a rule, the generator is located in the cellar where the earth foundation minimizes the vibrations due to the operation of the machines, while the operating department is usually several stories above. In order to prevent an excessive drop in the e.m.f. of the generator by the time the current reaches the upper floors and the different points in the operating department where the taps or connections are made with the desk instruments the resistance of the leads must be practically negligible. Hence the two wires shown, leading from the two brushes of the machine are large, usually consisting of several smaller wires made into a rope. The two wires to which they are connected (see diagram) are merely extensions of the generator leads and must also be large enough to offer no appreciable resistance. These extensions are then laid in trenches along the aisles in parallel, one being positive and the other negative. The main leads are then tapped with the instruments connected between them like rungs in a ladder as shown. As a rule only four or five instruments are grouped together in one such branch. Hence these tap extensions may consist of much smaller wires, because they are not called upon to carry a very great volume of current.

Theoretically, these parallel taps are not absolutely necessary as the instruments could be connected directly between the two large parallel mains. Practically, however, this method would not be satisfactory, for the reason that in case of a "short circuit" of low resistance between the mains,

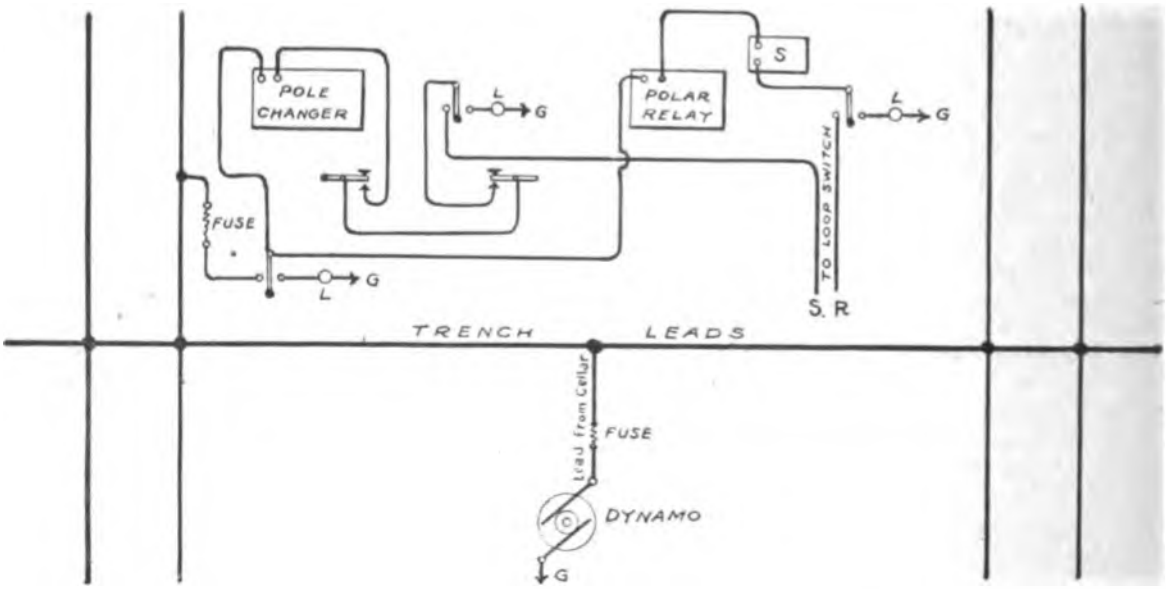

FIG. 2.—FLOOR WIRING FOR GROUNDED LOCAL CIRCUITS.

the fuse would blow out and it would be like hunting for a needle in a haystack to find the fault, as every circuit in the system would be open. By grouping the apparatus in bunches of five, a blow-out due to a short circuit in one instrument would simply open the five circuits of that particular group and the fault could thus be readily located.

Fig. 2 illustrates the manner in which the floor is wired for grounded local circuits. The same rule as to the size of wires for leads and taps holds good with this as with the system just described. In the grounded circuit system, however, only one end of the lead is left open, but it may be tapped and extended to all parts of the room in the manner shown in the diagram. This latter system is the one used for duplex local circuits, and pony wires. In fact, it is the method employed for main wires and all grounded circuits of every description.

Recent Telegraph and Telephone Patents.

ISSUED FEBRUARY 7.

983,491. Sanitary Appliance for Telephones. To G. T. Hadley, San Francisco, Cal.

983,570. Holder for Telephone Receivers and the Like. To S. K. Rothschild, Detroit, Mich.

ISSUED FEBRUARY 14.

983,905. Telegraph Sounder. To H. T. Johnson, New York.

983,966. Telephone Testing System. To C. S. Winston, Chicago.

984,108. Apparatus for Determining the Direction of Space-Telegraph Signals. To O. C. Roos, Cambridge, Mass.

984,202 and 984,203. Selective Signaling System. To J. Erickson, Chicago.

984,204. Lockout for Party Line Telephone Subscribers' Stations. To J. Erickson, Chicago.

984,235. Telephone System. To A. Nemeth, New York.

The following patents have expired:

510,929. System of Telegraphy. Issued to Josiah A. Parker, St. Louis, Mo., and Leland L. Summers, Chicago, Ill.

511,005. Telegraphic Relay. Issued to Edward Weston, Newark, N. J.

511,081. Telautograph. Issued to Rudolph M. Hunter, Philadelphia, Pa.

511,118. Magneto Telephone. Issued to James A. Brown, Moline, Ill.

511,172. Telegraphic Transmitter. Issued to Mary E. Stinde, Red Bud, Ill.

511,244. Telegraphic Relay. Issued to Frank P. Medina, San Francisco, Cal.

511,276. Two-station Telephone Circuit. Issued to Frank Pickernell, Newark, N. J.

511,358. Telephone. Issued to Barton Pickering, Dayton, Ohio.

511,464. Multiple Switchboard System for Telephone Exchange. Issued to Charles E. Scribner, Chicago, Ill.

511,589. Telephone System. Issued to Frank R. Colvin, New York, N. Y.

511,739. Telephone System. Issued to John J. McNally, California, Mo.

511,787. Self-Closing Telegraph Key. Issued to Henry E. Moss, Kansas City, Mo.

511,882. Telephone Transmitter. Issued to Stephen C. Drew, Boston, Mass.

512,214. Composite Telephonic and Multiple Telegraphic Transmission. Issued to Frank A. Pickernell, Newark, N. J.

512,398 and 512,399. Apparatus for Telephone Switchboards. Issued to Charles E. Scribner, Chicago, Ill.

512,422. Printing Telegraph. Issued to Emil A. Wirsching, New York, N. Y.

512,872. Sextuplex Telegraph. Issued to Thomas A. Edison, Menlo Park, N. J.

Personal.

Mr. William P. Sidley, vice-president and general counsel of the Western Electric Company, Chicago, has been elected to the presidency of the Young Men's Christian Association of that city.

Mr. Bion J. Arnold, the well known electrical engineer, Chicago, and an old-time telegrapher, has been honored by the University of Nebraska, which has conferred upon him the degree of Doctor of Engineering.

Mr. J. Frank Howell, a former telegrapher, and now a stock and bond broker, New York, has issued a 64-page pamphlet giving statistics and diagrams of the active stocks dealt in at New York covering the year ending December 31, 1910.

Mr. Maurice E. Fox, formerly of the engineering department of the New York Telephone Company has accepted a position as engineer in the Edison laboratories, Orange, N. J., in connection with the work on the new Edison storage battery.

Sir W. H. Preece, the well-known English electrician, and for many years at the head of the English telegraph service, London, has gone to South Africa, primarily for his health. He will be absent about three months. Sir William was born in 1834 and has been in active service for nearly sixty years.

U. S. Senator George S. Nixon of Nevada is the subject of an interesting and chatty story in a recent issue of a Washington, D. C., paper. Senator Nixon started his business career as a telegrapher. He afterward became interested in banking, mining, etc., and is now a "multi-millionaire." He distinguished himself a few years ago, while a passenger on a wrecked train, by climbing a pole and, after cutting in an emergency telegraph set found on the train, summoned relief.

Mr. E. F. Varona, manager of the Western Union Telegraph and International Ocean Cable Companies, at Havana, Cuba, is the subject of a complimentary article published in the February 1 issue of *The Lucha*, a newspaper of that city. The article commends Mr. Varona's active work in behalf of the public and the press in connection with the recent Key West-Havana aviation flight. Mr. Varona has for many years enjoyed the confidence of the people of Havana, officials and civilians alike. He is always on the alert in behalf of their interests, and leaves nothing undone to give them the best of service. In the Spanish régime Mr. Varona was as highly esteemed as he is now, under different political conditions.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. E. J. Nally, vice-president and general manager of the company, who has been absent on a trip of inspection in the western and Pacific Coast states is now in the southern section of the country en route to New York. He will be at his office again about March 10.

Mr. Charles P. Bruch, third vice-president and Mr. E. B. Pillsbury, general superintendent of the eastern division, New York, attended the banquet of the Sons of the Revolution on the evening of February 22 in honor of George Washington's birthday.

Digitized by Google

Mr. C. C. Adams, second vice-president, is authority for the statement that this company does not approve of the day-letter plan, just instituted by the Western Union Telegraph Company, and will not adopt a like service.

Mr. N. I. Taylor has been appointed cashier of the Washington, D. C., office vice Mr. J. P. Malloy.

Mr. T. P. Wheeler, night chief operator at St. Louis, has resigned on account of failing health. Mr. Wheeler has been with the Postal Company since May 1, 1884.

Mr. Louis J. Mackey, manager of the Franklin, Pa., office of this company, has been appointed chief clerk to Mr. H. Scrivens, district superintendent at Pittsburg, Pa. Mr. Mackey entered the telegraph service as messenger in September, 1886, and was made manager of the Franklin office in 1890.

Mr. E. W. Miller, chief operator of the Philadelphia office was a recent New York visitor. He attended the Postal employes' electrical class on the night of February 16, and was deeply impressed with the educational work.

Mr. Jos. Coffer, manager of the Postal office at Galveston, has been transferred as manager to Oklahoma City, Okla. Mr. Fred A. Rollfing succeeds Mr. Coffer as manager at Galveston. Mr. R. E. Reese, manager at McAlester, Okla., has resigned to enter the coal business and is succeeded by Miss Myrtle Abbott. Mr. J. F. O'Donnell, manager at Joplin, Mo., has resigned. He is succeeded by Mr. J. E. Sandford, who was promoted from Guthrie. Mr. L. E. Waugh has been made manager of the Guthrie office.

Postal Telegraph Club of Atlanta.

The second annual meeting of the Postal Telegraph Club of Atlanta, Ga., was held February 17. Plans were considered for extending the usefulness of the organization. The report of President Daviet was very interesting and showed the club to be in an excellent condition financially. One of the features of the evening was the music on the piano and violin by Mr. C. H. Ashburn, Jr. and Mr. F. J. Poundstone. Both are members of the Club, and accomplished musicians. The annual banquet will be held in April, the date to be announced later.

The following officers were elected: president, Mr. W. C. Daviet; vice-president, Mr. A. D. Holcomb; secretary, Mr. L. A. Minor; assistant secretary; Mr. F. F. Pursley; treasurer, Mr. G. W. Oliver; Governing Committee, the officers and Messrs. D. C. DeLaney and C. G. Knapp.

Postponement of Morse Electric Club Dinner. On account of the unavoidable absence of Mr. Theo. N. Vail, president of the American Telephone & Telegraph Company and of the Western Union Telegraph Company, who was to have been the guest of honor at the annual dinner of the Morse Electric Club which was to have taken place at the Hotel Savoy, New York, February 23, the meeting has been postponed. The dinner will probably take place about the middle of March.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Belvidere Brooks, general manager of the company, who has been on an extended trip of inspection and is now in Texas, will return to his office by the end of the first week in March.

Mr. W. A. Sawyer, district commercial superintendent at Philadelphia, has been transferred to a similar position at New York. Mr. James F. Nathan, district commercial superintendent at New York, becomes superintendent of the Metropolitan District. The superintendency at New Haven, Conn., has been abolished and the offices comprising that district have been annexed to the Boston district, presided over by Mr. C. F. Ames, with the exception of the offices in Connecticut, which have been attached to the first district, presided over by Mr. Sawyer. Mr. J. W. Reed, district commercial superintendent at New Haven, has been transferred to a similar position at Philadelphia, vice Mr. W. A. Sawyer.

Mr. B. S. Jones, manager of the Spokane, Wash. office, has been promoted to be district commercial manager, second district, Pacific Division, with headquarters at Seattle, Wash.

Mr. H. K. Griffin, of the general operating department, New York, has been advanced to the position of chief operator of the Atlanta, Ga., office.

Mr. J. E. Rowe, until recently identified with the Postal Telegraph interests at Birmingham, Ala., and who a short time ago accepted a position with this company at Atlanta, Ga., has been appointed chief operator of the Jacksonville, Fla. office, vice Mr. C. C. Delany, resigned.

The battery plant of the Western Union Telegraph office at Dickinson, N. D., comprising 4,600 cells, has been displaced by eight electric generators which have just been installed. Mr. C. F. Norton is the manager of this office, which has recently been made an important repeater and relay station.

Mr. P. G. White, who was recently appointed manager of the Wilmington, N. C., office of this company, started his telegraphic career in that office as messenger and has held every position except lineman. He left the company in 1901 to go with a leased wire concern, and has worked since then at Asheville, N. C., Cincinnati, Ohio, Augusta, Ga., and Birmingham, Ala., going direct from Birmingham to Wilmington to accept his present position.

Mr. L. F. Saylor has been appointed to a position in the office of Mr. H. J. Kinnucan, district commercial superintendent, Detroit, Mich.

Mr. Louis Casper, superintendent of equipment, Dallas, Tex., was born in Manchester, England, in 1871. He was educated in St. Enoch's School, Glasgow, Scotland, and the Normal College and Cooper Institute, New York, and is a graduate in chemistry and natural philosophy. He began his business ca-

Digitized by Google

reer in this country in 1885, entering the repair shop of the Western Union Company, in New York, and afterwards became an operator. He filled positions as Wheatstone chief, repeater chief, wire chief, instrument inspector, and cable inspector. Later, he was contracting engineer for the Sandwich Electric Company, Sandwich, Ill., and afterwards principal in telegraph engineering and wireless telegraphy in the John W. Gates College, at Port Arthur, Tex. Mr. Casper is an inventor of considerable note, having taken out over fifteen patents, mostly electrical, and was awarded a gold medal for an electrical signal.

Mr. George Sinclair Tulloch, district plant superintendent at San Francisco, Cal., was born in San Francisco, April 18, 1873. In 1886 he entered the service of the American District Telegraph Company, of San Francisco, as messenger, and in 1887 he accepted the position as messenger of the Pacific Bell Telephone Company. In the year following he became an operator. Since that time he has advanced through the positions of lineman, patrolman, foreman, clerk to general superintendent, and has held various other positions with the Bell telephone interests on the Pacific Coast. When he severed his long connection with the telephone company, he held the position of district superintendent of plant, Coast District, with headquarters in San Francisco. On November 15, 1910, he accepted the position of district plant superintendent with the Western Union Telegraph Company.

Opening of New Office of Western Union Company at Seattle.

The new operating department of the Western Union Telegraph Company at Seattle was formally opened to the public on January 17 with a reception. The reception committee included Mr. E. Boening, district commercial superintendent, Mr. W. J. Smith, district commercial agent, Mr. G. D. Hood, district traffic superintendent, Mr. E. L. Ritter, district plant superintendent, Mr. J. F. Rawie, manager, and Mr. J. L. McDonnell, chief operator. Prominent citizens attended the function, and during the afternoon the company officials received a body of students from the electrical engineering class of the University of Washington.

The telephone department in connection with the delivery and receipt of telegrams has been considerably enlarged, and seven experienced telephone operators are employed. The new operating department occupies approximately 5,000 square feet, and the quarters used by the general offices comprise about 7,500 square feet. Comfortable rest rooms for male and female employes, have also been fitted up. It is estimated that fully 2,000 people attended the reception.

Pensions for Western Union Telegraph Employes.

Mr. Thos. F. Clark, vice-president of the Western Union Telegraph Company has sent a circular letter to general superintendents, dated January 23, regarding a proposed plan of pensioning employes of the company. The letter reads as follows:

"To General Superintendents:

"The Western Union Telegraph Company is considering the matter of devising a plan for the pensioning of its employes for length of service or disability.

"Information is therefore desired concerning the nature and length of service, the age and the amount of monthly pay of all persons who are regularly employed on the lines and in the independent offices of the company, in accordance with the enclosed card.

"A card is to be filled in by each employe who has been in the service of the company continuously for not less than ten years; and the cards are to be forwarded through your office to the undersigned.

"I suggest that you send a copy of this letter to each superintendent for distribution to his office managers, with such additional instructions as may be necessary to insure the speedy return of the cards."

(Signed) THOS. F. CLARK,
Vice-President.

Western Union New Day-Letter Service.

On March 1 the Western Union Telegraph Company instituted a new day-letter service. The rate is one and a half times the night letter rate for a message of fifty words or less, written in plain language, to be sent at the company's convenience. In other words, where a ten-word day message now costs fifty cents, a message of fifty words or less can be sent for seventy-five cents.

The Anglo-American-Western Union Agreement.—A despatch from London states that at the annual meeting of the Anglo-American Telegraph Company on February 3, Mr. F. A. Bevan, who presided, admitted that there were difficulties in the way of concluding a provisional agreement with the Western Union Telegraph Company. He said that the directors, however, hoped to soon surmount these obstacles. As to the companies remaining distinct, he was not so sure that this would be the case, but he gave assurance that no agreement would be carried out without the consent of the shareholders of the Anglo-Amercian.

Change in Value of International Volt.

On January 1 the Bureau of Standards at Washington adopted a new value for the electromotive force of the Weston normal cell, namely:

$E = 1.01830$ international volts at 20° C.

This is equivalent to an increase of about 0.08 of one per cent in the value of the international volt. The change will affect to a slight extent all measurements of electric current, electromotive force and power, and will in some cases require slight changes in electrical measuring instruments.

The Telephone.

Central District Printing and Telegraph Company.—The annual meeting of the Central District Printing and Telegraph Company was held in Pittsburg, February 9, and the retiring directors were re-elected.

"Phonegram."—A correspondent suggests that the word "Phonegram" might be used to designate a telephone message. There is nothing fantastic about this word and it seems to fit the requirement very well.

Telephone Service in Charleston.—The Southern Bell Telephone Company has completed the work of cabling its open wire system in Charleston, S. C. The company has also just completed an extension to its building in Charleston. Mr. W. H. Rousseau is district commercial manager of the company.

Telephone Wire Through St. Gothard Tunnel.—The Swiss Government has authorized the establishment of a telephone wire through the St. Gothard tunnel, enabling Berlin and Frankfort to communicate with Milan and Rome. But, though it passes through Switzerland, it must not be used by the Swiss. The St. Gothard tunnel is 9¼ miles long.

Telephone Peak Loads in a Small Town.—Every death and every birth in a small town causes approximately 300 extra telephone calls, according to figures issued by a telephone company in Columbia, Mo. The calls resulting from the births are more trouble, says the report, because these are limited to women and the conversation occupies more time than in telling of a death.

Pacific Telephone & Telegraph Company Statement.—The Pacific Telephone & Telegraph Company reports gross revenues for the year ended December 31, 1910, of $14,667,111, an increase of $1,782,094, and a surplus, after deducting dividends, of $119,205, a decrease of $44,323. The total number of stations operated by the company, including private lines, on December 31 last, was 446,622.

Joint Meeting by Telephone.—Through the courtesy of the American Telephone and Telegraph Company the Ad clubs of Buffalo and Rochester, N. Y., on February 25 held a joint meeting by telephone, the actual meetings being held simultaneously in their respective cities. Each member of the two clubs was provided with a telephone so he could hear all that was said at the meeting at the other end of the line.

New York Telephone Company to Absorb an Up-State Company.—The New York Public Service Commission, Second District, has received a joint petition from the New York Telephone Company and the Clifton Park Telephone Company for approval of the transfer of the plant of the Clifton Park Company to the New York Telephone Company. The Clifton Park Company operates in Jonesville, Saratoga County, and the territory immediately adjacent thereto.

Telephony in San Domingo.—The Dominican Republic has no general telephone system. The Government operates long distance lines between the cities and towns, but the messages have to go through the operators, as conversations are not permitted except through State officials. Concessions have just been granted to build and operate telephone systems in Puerto Plata, Santiago de los Caballeros and San Francisco de Macoris. The maximum charge for service is to be $3 a month.

Telephone Expansion in Milwaukee. — Mr. Alonzo Burt, president of the Wisconsin Telephone Company, Milwaukee, Wis., in an address before the Merchants' and Manufacturers' Association of Milwaukee, February 16, predicted that that city would have a population of 600,000 inhabitants in 1930. His prediction was based upon investigations made by his company to ascertain how greatly its plant must be increased in order to provide for the service in twenty years. The company, he stated, expects to invest several million dollars as a result of this investigation.

Telephone Merger Contract Canceled.

In the case of the Sunset and Pacific Telephone and Telegraph companies against the City of Tacoma, Wash., federal Judge Donworth has entered a decree in which he directs that the contract transferring the franchises of the Sunset Company to the Pacific Company, drawn at the time of the so-called Bell merger, but without consent of the city, shall be canceled. He also enjoins the city or any employe of the city from attempting to forfeit the Sunset Company's franchises until their expiration in 1915.

Telephone and Telegraph Taxation in Michigan.—Judge Denison, of the United States District Court at Grand Rapids, Mich., has rendered a decision upholding the constitutionality of a new law which provides for the taxation of telephone and telegraph companies on an ad valorem basis and a temporary restraining order preventing the auditor-general from collecting taxes under this law has been dissolved. Hereafter these companies will pay taxes on the same basis that railroad companies do and the amounts, it is said, will be much larger than they have been.

Peking Telephone System.—The Imperial Chinese Telephone Administration expects to have a new system installed and operating by May, 1911.

Two telephone exchange buildings have been erected. Three thousand telephones are being installed, but the plant will admit of an increase up to 12,000, as the switchboards, at each of the two exchanges, have been designed each with a capacity of 6,000 telephones.

The telephone wires have been laid under ground. The cables are of lead tubing 3½ inches in diameter, and contain 400 wires. The cables are laid in earthenware pipes.

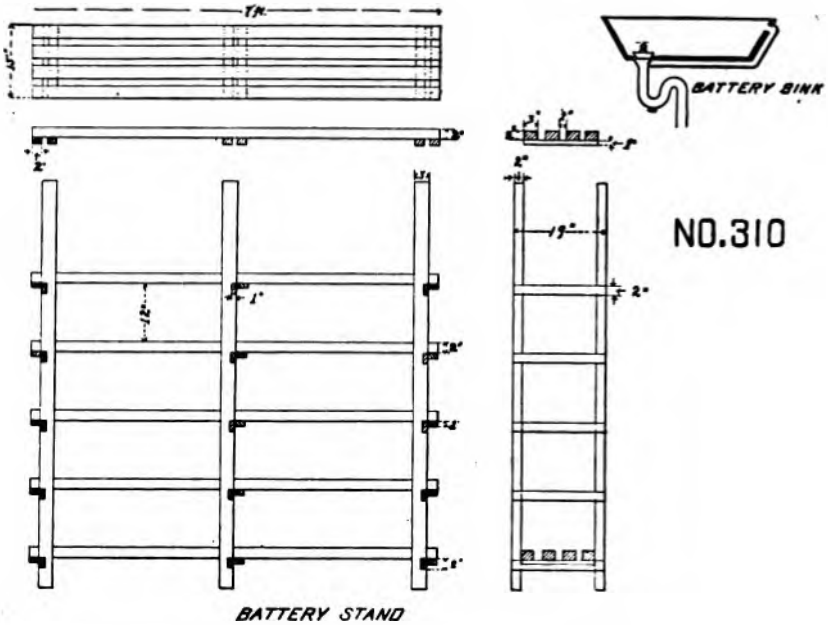
Standard Battery Rack of Postal Telegraph-Cable Company.

BY JOHN F. SKIRROW, ASSOCIATE ELECTRICAL ENGINEER, POSTAL TELEGRAPH-CABLE COMPANY, NEW YORK.

In the standardizing of its equipment the Postal Telegraph-Cable Company has paid as close attention to small things as it has to the large ones.

The standard battery racks of the company are built up in the following manner: The uprights are two inches by three inches and the shelves are constructed of four two-inch by three-inch strips with a space of one inch between them. The end supports for the shelves are of one inch by two inch material, and the cross braces one inch by two inches. The space between the shelves is twelve inches in the clear, and that between the lower shelf and the floor is not less than six inches in the clear.



DIAGRAMS SHOWING CONSTRUCTION OF BATTERY RACK.

The wood used in the construction of these racks is North Carolina pine, dressed smooth, and oiled or well painted to prevent spilled solution from adhering to the wood. The uprights are usually carried to the ceiling so that the rack may be rigidly braced, and the cross braces and end supports are secured to the uprights by finishing nails, the heads of which are driven in and puttied over. From this form of construction it will be understood that these racks are very strong.

Battery sinks have an overflow outlet at the side and a plug at the waste outlet. This permits the dumping of cells to be cleaned without clogging the drain pipe with the refuse from the jars.

Fire-Killed Pine and Spruce for Poles.

A considerable market for the native fire-killed spruce and pine of Colorado may be opened as the result of timber-testing experiments conducted at Boulder, Col., by the local branch of the United States Forestry Service. The results indicate that for timber of the same size at the top, lodgepole pine and Engelmann spruce are practically equal in strength to the Western red cedar.

The investigations were made in the timber-testing laboratory of the University of Colorado, on poles nominally seven inches in top diameter and twenty-five feet long. Twenty poles of each species were used. The experiments showed that when the three kinds of poles were of the same diameter at the base, the cedar was considerably stronger, the pine being only 80 per cent. and the spruce 64 per cent. as resistant as the cedar. In elasticity the pine was 98 per cent. and the spruce 79 per cent. as strong as the cedar. When poles which had the same top diameter were used, the spruce and pine showed considerably more strength because of the greater degree of tapering which characterizes this kind of timber.

Although the tests showed that cedar is superior to either pine or spruce as a pole or a pole material, the native timber is by no means outclassed and should be found very satisfactory, the forestry officials say. If the lodgepole pine be treated with a preservative, it will outlast the untreated cedar in actual wear by at least five years. The life of a fire-killed lodgepole pine is twenty-five years. Untreated the pole would last only five years on an average.

Alleged Unreasonable Telegraph Rates in New York State.—The New York Public Service Commission, Second District, has received complaints from the Boards of Trade of the villages of Lake Placid, Saranac Lake, and Tupper Lake directed against the Western Union Telegraph Company, the Great Northwestern Telegraph Company of Canada, the Postal Telegraph-Cable Company, and the Champlain Telegraph Company, as to alleged unreasonable rates charged from these places.

Cables and Their Care.

In an article by Mr. O. B. Bohny, in the "Southwestern Telephone News," the author gives much practical information on the care of cables, referring particularly to telephone cables. Inasmuch as telephone and telegraph cables are practically alike in construction, however, what applies to one is equally applicable to the other. Some extracts from Mr. Bohny's article, therefore, will be of interest to telegraph as well as telephone engineers, foremen and others.

Cables, although presenting a great many advantages to the telephone man in economy of operation and maintenance when properly cared for, are capable of a great deal of expense and annoyance to both the telephone company and to the subscriber when neglected or installed in a poor manner.

The first or most serious damage that can come to a cable is the presence of a high potential current in a cable, which burns open and welds the conductors together for sometimes as far as 200 to 300 feet from the points of entrance, and oftentimes further depending upon the strength of the current and the kind of cable used. It is obvious then, that a case of trouble of this character is a difficult one to repair promptly and one that is often costly whenever it becomes necessary to replace cable and terminals. A cable after receiving one or two such burns, will nearly always be a source of trouble by reason of the insulation having been burnt off or charred in minute spots on the conductors in various places and any little disturbance such as a sudden movement of the cable will tend to develop a case of trouble. This accounts to a certain degree for the pairs that go bad during clear weather.

A high potential current may be introduced in diverse ways, but it is nearly always due to the following reasons: The careless handling of a pair of bare line wires over high tension circuits by a lineman; the placing of drops and lines in close proximity to high tension circuits where they are liable to damage in case of storm or accident; and by the connecting of long lines of open wire into an unprotected terminal of a cable, which invariably invites any discharge of lightning along these long lines into the cables. This is perhaps one of the most common troubles we have to contend with.

The latter phases of trouble can be overcome by the placing of boxes equipped with fuses and lightning arresters at the unprotected points. It seems to be the opinion of some wire chiefs and managers that once such a box is in position nothing more is necessary to the successful diverting to ground of any stray currents that may happen. But it is human to err and many are the boxes the writer has investigated that were placed with a view of intercepting stray currents and which had failed in their purpose by reason of being destitute of carbon or copper blocks or on which the ground wire had been broken off or had never been placed. There can be no doubt but that, if all who have to do with plant maintenance would care for this part of the cable by systematic inspections and instructions to those who perhaps do not fully realize the necessity of perfect protection at these points, we would soon notice a marked decrease in the number of pairs bad in a cable, of the kind that are termed "chronic" or "scattered trouble."

The next cause of interruptions to service and one that is frequently expensive and more frequent than that described, is the presence of moisture or water in a cable. To enumerate the various causes of such trouble would take up considerable space, but some of the most common belonging to aerial cable are given: the shooting of bullets into a cable; the crystallizing and breaking of the cable sheath which surrounds the core, or the small, round holes in the cable sheath generally found under marlin hangers; improperly wiped joints; improperly filled potheads; trouble caused by spur holes and a miscellaneous assortment of other causes which can either be traced to carelessness or design.

As is doubtless known, expansion and contraction of cable sheath has become a serious question in some parts of the country, and has been studied by many with a view of overcoming this particular failing in cables. As we are concerned only with the neglect of cables, it may be stated that these crystallized places and breaks will usually occur where a number of hangers are off or at poles where slack has been left and the cables form a dip or loop. Consequently it will be advisable to be on the lookout for defective hangers and large loops or dips which, where they become too pronounced and cannot be taken care of along a cable lead, should be cut out and a split sleeve put on.

American District Telegraph Company of New York.—The annual report of the American District Telegraph Company of New York for the calendar year of 1910, shows revenue from all sources of $580,008, compared with $549,225 in 1909. The net revenue was $88,504 compared with $84,563 in 1909. The net revenue for 1910 equals 2.3 per cent. earned on the $3,844,700 capital stock, as compared with 2.2 per cent. in 1909. Total assets, according to the balance sheet, are $4,466,954, of which $4,145,968 represents plant, franchises and stocks of merged companies. There were 342,821 more telegrams delivered than in 1909, and 214,817 more were collected and in the distribution department 6,540,882 pieces were handled, an increase of 2,626,144 over the previous year.

Mr. F. W. Sprong, manager of the Postal Telegraph-Cable Company, Cincinnati, Ohio, in renewing his subscription for another year, says: "Your paper is up-to-date and I can assure you I receive much pleasure in reading its contents."

Capt. L. T. Lindsey.

BY E. H. HOGSHEAD, MERIDIAN, MISS.

The first meeting of the writer with Capt. L. T. Lindsey, father of Judge Ben. B. Lindsey, was during the second year of the Civil War. What his initials stood for I never knew: he was known as "Tunny" Lindsey, and that is all that was generally known of his name. He was an operator at Jackson, Miss., during the siege of Vicksburg, and after the capitulation of that city and the evacuation, a little later, of Jackson by the Confederates, Lindsey joined the cavalry as an operator. He was soon after appointed adjutant with the rank of captain, on the staff of Brigadier-General Jas. R. Chalmers, whose command served under General Forrest. He continued in this position until the end of the war. He took part in many strenuous campaigns, as any one who followed General Forrest necessarily had to do, but he seems to have passed through the protracted struggle unscathed.

I am indebted to Colonel George M. Dugan, former superintendent of telegraph of the Illinois Central Railroad and now living in retirement at Tip Top, Ky., for some interesting incidents in Captain Lindsey's career. Colonel Dugan, who was at that time assistant superintendent of the Southwestern Telegraph Company, had equipped him with an old Clarke relay, encased in a box, which Captain Lindsey wrapped in his blanket and tied to his saddle behind him.

On one occasion General Chalmers, having been driven out of Oxford, Miss., by the enemy, retired to Water Valley, some twenty miles south, leaving Lindsey with a few scouts as a rear guard and corps of observation. Colonel Dugan, who was in the office at Water Valley, waited for tidings from Lindsey, as per agreement. Soon Lindsey's office "astraddle of a log," six miles south of Oxford, reported that a scout just in from the front informed him that the town of Oxford was on fire, which proved to be true. (This was the time when the residence of Hon. Jacob Thompson, Secretary of the Interior under President Buchanan, was burned, his wife not being permitted to save anything.) Soon another horseman, uniformed in blue, riding like Jehu, was espied in the distance and his approach was watched with suspicious interest. The rider proved to be a negro, a slave of Colonel Walton, a prominent citizen of Oxford. He unfolded a tale to the effect that a "Yankee" major had accosted him and asked him to hold his horse for a few minutes, while he dismounted and entered a house. The major being a little slow in reappearing, it occurred to the darkey that he might capture the horse for his own account. So he mounted and put spurs to the animal, which was a fine one and handsomely equipped, and left town, and running the gantlet of numerous pickets, and reached the "rebel" camp safely with his prize, which he soon disposed of to good advantage. After the enemy left he returned to his home in Oxford with the proceeds of his spoil in his pocket. This story, with elaborate details, was given by Lindsey, while astride the log, to Colonel Dugan at Water Valley.

On another occasion Colonel Dugan joined Lindsey and General Chalmers' command in a sally from Holly Springs, Miss., in search of the enemy. They soon found him in such force that they were unable to cope with him and they sounded the retreat, which necessitated much activity on the part of Colonel Dugan in making good his escape, his strenuous endeavors to reach a place of safety being handicapped by the loss of his horse, which had been shot from under him. But he escaped with as much grace as any man of the physical proportions of the Anakim could be expected to exhibit under such trying circumstances. (But I was strictly prohibited from making public this little episode. So I whisper it on the sly.)

Captain Lindsey was a man of medium height, slight build, weighing about 135 pounds, the complexion of a light brunette, piercing black eyes, raven-black hair; in bearing gentle and unobtrusive; in manners refined and engaging. As a telegrapher his ability was of high class. I have heard it said that he could copy fifteen to twenty words behind the sender with ease; while his penmanship left nothing to be desired. Where he learned the telegraphic art, or what particular locality is entitled to the credit of being his birthplace, is not now ascertainable. But it is known that he was a native of central Mississippi.

When peace returned, Lindsey entered the service of the Mobile & Ohio Railroad as an operator, at Jackson, Tenn., where at the same time he was manager for the Western Union Telegraph Company. He was married at Jackson, and remained there a number of years. While there he spent much time and labor in trying to perfect a printing telegraph. On one occasion he showed the writer a part of his apparatus, as far as completed and workable; but he finally failed to perfect it. As the late Mr. John Van Horne, vice-president of the Western Union Telegraph Company, remarked, anent his failures: "Tunny made the mistake of not fully informing himself as to how far others had gone before him in the same direction."

After a residence of several years in Jackson, Tenn., Captain Lindsey removed to Denver, Col., where he secured employment in some kind of railroad work; but I know nothing of his career there. However, I learn that he died there, in middle life, some ten or twelve years ago, leaving a wife, one daughter, and three sons, of whom Judge Ben. B. Lindsey is the eldest.

At this point I may say that a brother of Captain Lindsey was slain in New Orleans in front of the Custom House, in the ranks of the citizen soldiery, in the battle on September 14, 1874, between the metropolitan police, a political organization led by General Badger, in support of the

Digitized by Google

pretensions of William Pitt Kellogg, to the Governorship of Louisiana, on one hand, and the forces of the legal governor, Penn, on the other, wherein Kellogg was overthrown, and the people vindicated their right to self-government.

But perhaps the greatest of Captain Lindsey's claims to distinction is the fact that he was the father of Judge Ben. B. Lindsey, of Denver, Col., the originator of the famous Juvenile Court, whose reputation as such, and as a political reformer and writer, is nation-wide.

The Military Telegrapher in the Civil War.

PART LV.

One of the most famous operators in the sixties and early seventies was Mr. W. E. Kettles, and his reputation as a telegrapher of the highest order was country-wide. He entered the United States Military Telegraph service in 1863 and while he did some military field work, his principal duties were in the War Department office at Washington. It was he who received the announcement of the fall of Richmond, and so great was the joy and excitement over the event that Secretary E. M. Stanton held young Kettles out of the window that the people might see the one who received the great tidings.

Modest men do not always appreciate their own achievements however momentous they may be. "Billy" Kettles was one of this class. In writing of his war experiences, this characteristic is shown, but his narrative discloses many interesting facts, which we give in part as follows:

"As to reminiscences," he says, "there were undoubtedly many, but in my case, few. Excitement was so general that we did not pretend to commit anything to memory unless it was very unusual. I worked the Harper's Ferry and Winchester wires while there was an engagement in progress with President Lincoln, Secretary of War E. M. Stanton and many others at my desk giving suggestions or orders, and the scene was wearing on any one. Imagination ran high under such circumstances.

"I was working the Fort Monroe wire on that good old morning in 1865 when Richmond fell, when Mr. William J. Dealy at Fort Monroe, called me excitedly and said, 'Sharpen for Richmond.' I sharpened, when the following message came:

'Richmond, Va.....1865.

'Hon. E. M. Stanton,
Secretary of War.

'We entered Richmond at eight o'clock this morning.'

(Sig.) G. Weitzel,
B. M. G. Commanding.

"Probably no other message, from that day to this, has contained news of such importance and interest. I took the message, the Lord only knows how, and distinctly remember upsetting the inkstand and instrument, I hurried to General T. T. Eckert's room, and started to give the message to the General himself, but it was hard to tell who actually did receive it from me, as President Lincoln sat close by and snatched it from his or my hand and ran into Mr. Stanton's room adjoining. To say the least, I was very much flustered; but I could stand it; everybody was in the same state of mind. Mr. Charles A. Tinker came in and looked out of the window. I shall never forget the scene which followed. There were the broad grounds of the government departments in front and there was but one person to be seen. He was walking slowly up the path, and happening to be an acquaintance of Mr. Tinker's, he naturally asked the news. It was too good to keep; and he got it. In less time than it takes to tell it there were crowds before us; and such a crowd! I am not able to describe the scene. You can break; you may shatter the wall, if you will but you could not count the people.

Secretary Stanton came in and General Eckert introduced him; Mr. Stanton snatched me in his arms, and held me out of the window at arms' length and told the crowd of the news I had received, how wonderful I was, etc. They wanted a speech; how they howled for that speech. In the next morning's *Washington Chronicle* the editor gave it to them after an interview with me."

Mr. Kettles is still living and resides in Boston, which city he has made his home for many years. Mr. Charles A. Tinker, former general superintendent of the Eastern Division of the Western Union Telegraph Company, New York, is living in retirement in Brooklyn, and Mr. William J. Dealy is still actively engaged in business, being general superintendent of the Commercial News Department of the Western Union Telegraph Company, New York.

Bridge Testing Set.

Specifications for the installation and operation of the bridge testing set used by the Western Union Telegraph Company has been issued by the office of the engineer of equipment.

Directions are given to make the Varley loop test and the metallic Varley test. The three-wire and the two-wire methods of measuring wire resistance are described in detail, and the method of locating a ground is gone into thoroughly. Three ways of locating crosses are described and under the head of "Location Tests under Unusual Conditions," are given directions for testing for high resistance faults and broken wires.

The subject-matter is illustrated by sixteen diagrams showing the form of test circuits, and these in connection with the text, present the subject in a very clear manner.

Telegraphy in Brazil.—The Brazilian Government has authorized the building of a telegraph line between Goyaz and Boa Vista de Tocantins. The equipment will be of English make.

ADDRESS ALL COMMUNICATIONS TO
J. B. TALTAVALL, - Editor and Publisher
253 BROADWAY, NEW YORK.
T. R. TALTAVALL, Associate Editor.

CABLE ADDRESS: "Telegage," New York.
Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

March 1, 1911.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Western Union Company Adopts a Day-Letter Service and Is Considering a Pension Plan.

Events of a radical nature are occurring with startling rapidity these days in the Western Union Telegraph Company's affairs. The night-letter service and the telephone-telegraph service, though in operation but a few months, have fitted in as part of the telegraph and telephone conveniences of the country, and the business community is utilizing these benefits to the greatest extent. Now come two other important announcements, viz.: A day-letter service and a pension plan for the benefit of employes.

The day-letter service, which went into effect March 1, is perhaps the most radical of all the recent innovations. The company will accept a message of fifty words or less, to be sent at its convenience, at a rate of one-half more than the existing night-letter rate. To state the matter in another way, a fifty-word day message will cost half as much again as a ten-word day message. The day letters must be written in plain language.

The effect of this new rate will be far-reaching and the question naturally comes to mind "How will the company be able to handle the enormous increase of business that will follow?" Along the same line of thought, machine or automatic telegraphy forces itself upon the attention, and it would not be surprising to hear, at any time, of the adoption of some high speed automatic system.

The other important action, that of establishing a pension system for employes, is one that will meet the approbation of employe and public alike, and is in harmony with the spirit of the times. There is no question as to the justice of a step of this sort. A man who has devoted his entire business life to the company's interests is entitled to some consideration when he becomes incapacitated for further service through old age or disability. While the pension plan is still in a formative stage there is no doubt that a practical system will be evolved and the Western Union Telegraph Company will take its place in the line of progressive concerns.

Messenger Boys' Clubs.

The welfare of the telegraph messenger boy is a live question at the present time, public spirited citizens and philanthropists vying with the telegraph companies in their efforts to elevate and protect the boys and put them in the way to become worthy employes and honorable members of the community.

It is alleged by many that the messenger boy has until recently been regarded with little consideration by the companies or the public. The companies, however, have long realized that the boy of today is the man of to-morrow, or in other words, the messenger of today will be the higher employe of to-morrow. Therefore, it is to their own advantage to train the boys for the business they have entered, and this they are now doing quite extensively. Better and improved quarters are provided for the youngsters, where they can read and learn the rudiments of telegraphy during their spare moments. It has been suggested that the companies might, with great advantage to themselves and to the boys, employ, more generally, capable teachers to instruct the latter in telegraphy and kindred duties. Such a course of action would arouse interest on the part of the boys and tend to make them more satisfied with their employment, especially when they realize that there is a future open for them.

In one city where the idea has been carried into effect, the manager invited the parents of the boys to visit the office and see how their sons were taken care of, and examine the facilities afforded them to learn telegraphy. The result was highly satisfactory as was evidenced by the increased number of applications for positions from parents of boys of high respectability.

Digitized by Google

Another manager provided wholesome quarters and every facility for betterment with the result that the chief operator and all the operators, as well as every branch office manager in the city, began their careers as messengers, and the manager has never once found it necessary to employ any other than home people. He had, at the time he wrote, messengers in his employ who were capable of relieving the regular operators for meals and were waiting for the opportunity to be advanced to the position of junior operators.

Mr. C. P. Bruch, second vice-president of the Postal Telegraph-Cable Company, New York, says: "I am disposed to think that clubs for messengers would be very helpful to the boys, if properly organized and wisely managed, so as to provide interesting and healthful occupation for spare time, and an opportunity for education and training."

Naturally, those dealing directly with messenger boys are qualified to speak with authority on the subject. Mr. M. W. Rayens, general manager of the United District Messenger Company, New York, says: "I do not think that the club idea would be practicable here, as boys inclined that way have their own little clubs and associations, in close proximity to their homes, which they naturally seek in preference to what they might reasonably term a semi-charitable institution, and which would lead to nowhere. The boy is father to the man, on whom depends naturally the future of the race. But I think you will find on close observation that the so-called apparent movement in all directions for the training of messenger boys is largely in the interest of the companies rather than the welfare of the boy or the future of the race. Then why not go further, and instead of a club, organize great training schools and employment agencies, which would be supported by all employers, encouraged by parents and guardians, through which the boy might commence his career and be placed under some sort of voluntary beneficial supervision from the time he begins to earn a livelihood until he has reached man's estate; to such a place the employer might go with confidence and find the material required."

The objection to this suggestion, it seems to us, is that it is too general. An organization of this sort might prove unwieldy in practice, as it contemplates trying to accomplish a great deal. The companies would do better by concentrating their efforts upon their own interests, and then they would have control of all the forces that go toward building up their organization. The question is a large one and cannot be decided offhand. The main thing is to make it possible to secure boys of good character to start with and then afford every opportunity possible for improvement mentally, morally and physically. With such provisions it should not be difficult to secure boys of respectability, and thus the telegraph companies would be strengthening their own cause in a way that could not be accomplished in any other manner.

Capacity and Induction on Telegraph Circuits.

In the development of the practical utilization of alternating currents, some very interesting phenomena have been brought to light, which theretofore were barely suspected. Among them are capacity and inductive reactance and the effects of these are very marked indeed on alternating current circuits. On direct current lines, however, their effects are much less pronounced, and prior to the advent of multiplex telegraphy, these phenomena were practically ignored. With the coming of the duplex and quadruplex, however, the effects of capacity and inductance revealed themselves with pernicious activity and had to be dealt with as a real live problem. They have been generally regarded as necessary evils in the operation of multiplex circuits and consequently the remedy has been sought in their elimination.

Certain effects in the operation of multiplex apparatus have been ascribed to certain causes and in practice these assumptions appeared to be correct, but according to Mr. S. R. Beatty's investigations, as set forth in an article published elsewhere in this issue, telegraph engineers seem to have been wrong in their deductions and have confused causes and their effects. Mr. Beatty attempts to prove that the effects usually charged to induction are really due to capacity, and if further investigation proves this assumption to be correct, telegraph engineers will be compelled to revise their theory and practice of multiplex telegraphy.

A Model Organization.

Every one who has had any relations with the principal telephone company has not failed to notice on every hand the effects of scientific organization. System in its most highly developed form is the basis of this vast business, and its affairs seem to move with the greatest ease and freedom from friction. Indeed, without a scientific organization the affairs could not be conducted without confusion and disorder in such a complex business would occasion incalculable loss to the company.

Cohesion is one of the most noticeable characteristics among the company's vast army of employes. Each and every individual is loyal to the company and takes real interest in his duty. The company on the other hand takes interest in the welfare of its employes, and does what it properly can to make them satisfied.

It is evident that the interests that are now in control of the Western Union Telegraph Company have in mind a similar organization for the telegraph service and there is no doubt that if an *esprit de corps* equal to that prevailing in the telephone service can be established in the telegraph division its effect upon the telegraph business would be inestimable. The controlling interests should be as desirous for the good will of the employes as it is for that of the public. With both of these forces on its side the telegraph will be developed to its utmost possibilities.

The Usefulness of Thinking.

BY MR. CHAS. P. BRUCH, SECOND VICE-PRESIDENT, POSTAL TELEGRAPH-CABLE COMPANY, NEW YORK.

In Northern New England, farming operations are practically suspended in the winter time. Somebody once asked an old lady (a farmer's wife) in that section, what she and her neighbors did to pass the time between fall and spring. She said: "Oh, we set and think—and sometimes we jest set!"

There are a good many other people, not living in cold climates, who just "set."

If I were to presume to offer advice to the younger men present here to-night, I should advise them to think.

I have had more or less to do with the management of a business in which there are several thousand employes, and much of the work in the executive offices is made necessary because some employes do not think for themselves. In fact, it is my observation that a large majority of people do not think, in the true sense of the word "They have eyes and they see not—they have ears and they hear not." Mentally they are like parrots. Their opinions are merely reflected from newspapers, magazines and books which they read. They do not reason out things for themselves. Even in their daily work they are little better than machines, and do things because they have always been done that way, or because someone told them to do that way. They make no effort to understand the reasons for the methods they are pursuing, or to comprehend the purpose of their work.

People like that never succeed; they don't even think far enough to understand why they don't succeed.

Men who succeed in any vocation are always men who think—men who study their work and try to find better ways of doing it; they search for the reasons.

If you wish to excel in whatever you undertake, you must observe, listen, study; use your brains and form your own independent conclusions. Your conclusions need not necessarily be different from the conclusions of other men; on the contrary, they will frequently be the same, because the other fellow has also "thought it out." But, don't accept conclusions merely because some other fellow thinks so. Try to find out why he thinks so. Get a clear understanding of the reasoning that has led him to his conclusions. And keep at it until you can either agree with him and adopt his conclusions as yours, or until you can give logical reasons for reaching a different decision.

But, thinking alone is not sufficient. Thought, without action, is worthless. "Be sure you are right, then go ahead!" Think things out and then act. And don't talk too much. I have noticed that the men who think the most, talk the least—but when they do talk, they are worth listening to.

Some people can talk a great deal without saying much. I have read that upon one occasion, Lincoln, who was engaged in a joint debate with an eloquent opponent, got up after the other man had finished and said something like this:

"My opponent has been very eloquent. He is a great orator—but he has not said anything. You have listened to him attentively; now I challenge any man in the audience to get up and tell us a single thing that he has said."

Although there were many in the audience who were of the same political party as the orator, not one man responded to Lincoln's challenge!

A great many people have the habit of talking without thinking, or of talking before they have thought enough.

I was once connected with a building association; the president was what some poet has described as a "Silent man who does things." The secretary was a good secretary; he wrote a beautiful hand, kept the accounts correctly and made copious minutes of the proceedings—and he also did most of the talking at the meetings. On one such occasion, the usually patient president remarked: "There is an old saying, that a man 'should think twice and speak once,' but I guess the secretary got it wrong end to!"

Think out your ideas, then carry them out, if you can. Talk about them only that other people may understand them and help carry them out. That seems to be the way to accomplishment.

In Bishop Fowler's lecture on Lincoln he tells another story that illustrates the difficulty of thinking and talking at the same time—and the futility of too much talking.

Lincoln said of a man who had great facility of speech, that he reminded him of a little steamboat that used to go snorting and cavorting up and down the Sangamon River, where Lincoln used to live; it had a six-foot boiler and an eight-foot whistle, and every time it blew its whistle it stopped!

Save the steam in your mental boiler and utilize it for progress. Don't waste it in making a noise!

I realize that what I am saying is not new, but I believe it to be true.

Think out for yourselves and decide for yourselves whether I am right.—*Abstract of address before a Men's Club.*

Night Work Among Telephone Girls.—In a recent address in New York, Mrs. Florence Kelley spoke on the subject of night work among telephone girls. She drew a parallel between the bill making it illegal for any male under twenty-one years of age to carry messages between the hours of 10 p. m. to 5 a. m. and the present law fixing the age required for girls employed in night work at sixteen years. She thought that girls should be as well protected as boys. Resolutions were passed asking that the National Child Labor Committee and the State Child Committee co-operate to investigate conditions of telephone night work and that the department of labor investigate conditions of night work for girls in general. This address was given before the New York State Consumers' League, January 30.

Creosote Treatment for Poles.

In a paper read at the convention of the Colorado Electric Light, Power and Railway Association, Mr. George R. Ogier gave some interesting facts concerning the "open tank" process of treating poles with creosote. In the plant considered, the apparatus consists of three storage tanks, supported upon a platform high enough to allow the creosote to run by gravity into two treating tanks, one 10 ft. in diameter and 9 ft. high, and a rectangular tank, 12 ft. long, 4 ft. wide and 8 ft. deep. By the use of a derrick the treating tanks are loaded, oil is allowed to enter to a height in the tank sufficient to creosote the pole to the height stated in the specifications, which is about 6 ft. from the butt on a 25-ft. pole, treating all the buried end of the pole and to about 1 ft. above ground. The creosote around the pole is then heated to a temperature sufficient to open the pores in the wood and expel most of the air by expansion, thus forming a partial vacuum. This condition is then relieved by turning off the steam, and thereby stopping the hot bath. The hot oil is replaced by cool oil, which penetrates the pole while cooling is taking place. The duration of this cool bath is made sufficient to give the desired penetration for about a twenty-year service.

The theory of this process may be given in a few words: The heat of the preservative expands and expels a portion of the air and water contained in the cellular and inter-cellular spaces of the wood tissue, and when the cool creosote replaces the hot there is a contraction and condensation of the air and water which remains. To destroy the partial vacuum thus formed the liquid is forced by atmospheric pressure into the cellular and inter-cellular spaces, a process aided, of course, by capillary attraction.

The ease and effectiveness with which timber can be treated by this process depend upon the kind of wood, and whether it is seasoned or unseasoned.

The following is a table of data compiled by the United States Government showing the comparative life of untreated and treated poles:

	Average number of years untreated.	Average number of years treated
Cedar	12 to 15	25
Chestnut	8 to 10	20
Lodgepole pine ...	5	20
Western Yellow pine	6	25
Cypress	12	25
Juniper	10 to 13	25
Redwood	12 to 15	30
White oak	8	20
Douglas fir	8	20

Some of the above data is estimated from test lines put in by the United States Government in cooperation with the American Telephone and Telegraph Company in November, 1906.

The best available figures on the life of creosoted poles are from the German Postal and Telegraph Department, which, after 52 years of observation gives a life of 21 years for creosoted Baltic pine. The use of creosote for preserving timber has been shown by the experience of the English and French lines, to be beyond question a method which absolutely protects those parts injected with it. Creosote prevents that effect shown by intermittent wet and dry, and makes the timber waterproof.

One of the greatest advantages of creosote treatment for timber is that not only does it lengthen the life of timbers, but it makes the life of all kinds of timber practically the same, so far as decay is concerned.

In many cases the consumers require in their specifications, poles of larger diameter than the actual service requires, in order that a certain amount of deterioration by decay shall be allowable before replacement is necessary. For example, it is computed that a circumference of not less than 28 in. of sound wood in the pole at the ground line is required to support the strain to which the line is liable to be subjected, and the poles used have a circumference of 36 in. at the ground line; then 8 in. of deterioration, or the equivalent of a depth of decay of approximately 1¼ in., is allowable before replacement is required.

In some species otherwise durable, the sapwood decays very quickly. Untreated white cedar poles in Georgia, inspected after being set in line four years, showed 45 to 50 per cent. of the number with sapwood completely decayed at the ground line, which amounted to an average deterioration of 4 in. in the circumference, equivalent to an average depth of decay of fully ⅝ in. Cypress poles in Florida, inspected after being in the ground seven years, showed an average depth of decay of 0.8 in. at the ground line. The heartwood of these poles is sound, and in nearly all cases is of sufficient dimensions to meet the requirements of the line in which they are used, although graded by the butt circumference they fall decidedly lower than their original class. If poles, originally of the same grade represented by these poles after the sapwood has decayed, had been used, and the butts well treated with creosote so that their full size and strength would be maintained, not only would the poles be equally as strong as the ones now in use, but their ultimate life would be greater. The difference in cost between the two grades of poles in some cases would largely offset the cost of the treatment. It appears that pole users are paying money to secure large diameter sizes of poles in order to secure longer life, that might more profitably be spent for preservative treatment. The possibility of using lighter poles and giving them preservative treatment so as to maintain their full size and strength, is one that merits the attention of all pole users.

Mr. T. W. Goulding, European general manager of the Western Union Telegraph Company, London, England, in renewing his subscription for another year, writes: "I shall always be glad if you will have my subscription renewed should I overlook it, because I cannot get along without your paper."

"Postal" Portable Quadruplex.*

BY LEONA LEMON.

When widespread calamities occur, the result of storm, flood or fire, the telegraph perhaps is relied upon to a greater extent than any other agency to spread the news and bring help. Such events are never scheduled and may occur in the large city, where telegraph facilities are abundant, or at some remote spot where they are very limited; but, whether in the city or village, a portion at least of the users of the telegraph, expect ample wire facilities almost immediately, and they are seldom, if ever, disappointed. Until a comparatively recent date, the opening of a temporary office of any consequence (and I believe the plan is still followed by some companies), meant the shipment of large quantities of battery material and instruments, all of which had to be tested and set up—a slow and expensive method. It is also necessary at times to greatly increase the telegraph facilities temporarily, because of conventions, athletic contests, etc. Realizing that a quicker and more simple method of providing temporary facilities was necessary, Mr. J. F. Skirrow, associate electrical engineer of the Postal Company, set to work, and the result is our present-day portable quadruplexes, which enable us to establish an office, wire or cable on the mountain top, on the deck of a boat, or at any other point where wire connection can be secured.

These quadruplex units are a combination packing box and table. The sides of the box drop downward and form the operating table, collapsible frames being used to support the boxes at the right height. The interior of the case is wired up with a standard quadruplex set and also with a pin jack equipment mounted on porcelain, so arranged that every connection that can be called for can be quickly made. A single Morse set is also included, arranged with a switch, so that a wire can be "singled" instantly. The sets are also fitted with miniature electric lamps, so that they may be set up in any convenient place and be ready for operation day or night.

The outfit comprises four quadruplex sets such as described; a 110-volt generator of 1.5 kw. capacity; three motor-generators transforming from 110 volts to 375 volts; a switchboard with ammeter, voltmeter, rotary voltmeter switch, etc., and an outfit of special stranded wire for making the connections. This stranded wire is cut up in convenient lengths fitted with plugs at each end. The connections from the switchboard to the sets and between the sets are made with plugs and jacks. This makes it possible to make all the connections between these sets that are possible at the switchboards in a terminal office.

The local instruments of the sets are wound to 150 ohms, and the 110-volt current direct from the generator is used to operate the locals and to light the quadruplexes. Two of the 375-volt motor-generators are used for the line quadruplex currents, the third being a spare.

The generator and motor-generators are mounted upon small trucks. The regulating rheostats are mounted on top of the machines. The machines are covered with oak cases that are bolted to the trucks. The generator switchboard is wired up complete and slides bodily into an oak case. Blue prints of all connections are pasted to the quadruplex switchboard cases.

The complete outfit can be set up and put in operation in fifteen minutes from the time it arrives at its destination, and can be packed up ready for shipment after operation has ceased in much less time.

A small kerosene engine is also used in connection with this outfit when it is impracticable to obtain power to operate the generator or motor-generators.

A combination set of repeaters which can be used either as a full repeater or two half repeaters, is also wired up in the same manner and is a part of the outfit. This is used when it is necessary to take care of single circuits by repeatering them into the quadruplexes.

The first occasion for the use of the portable quad sets was at Canton, Ohio, during President McKinley's obsequies. Since then they have been used at many places, but probably at no place where they were more valuable than at Baltimore at the time of the great fire in 1904.

Late Sunday evening, when it was apparent that the main office was doomed, an order was issued that four portable quadruplex sets be shipped from New York to Baltimore. Notwithstanding the congestion on the railroad, and the difficulties of obtaining trucks to haul the sets from the station to the temporary office, they were ready for use and put into operation on Monday afternoon. While these sets were in use at Baltimore, one of them was needed for exhibition at a dinner given by the American Institute of Electrical Engineers to Mr. Thomas A. Edison, at the Waldorf-Astoria Hotel, New York. It was taken out of service at Baltimore late Tuesday evening, set up and operated in the banquet hall on Wednesday evening, and put back into service at Baltimore in the forenoon of the following day.

These portable quadruplexes were also used to advantage during the International Yacht Races off Sandy Hook; at the Peace Conference at Portsmouth, on the occasion of Prince Henry's visit to this country when he christened the yacht "Meteor" at Shooter's Island, N. Y.; at the annual boat races on the Hudson River, near Poughkeepsie, N. Y., and on many other occasions of less general note, but of equal importance to the telegraph service.

*Postal Telegraph.

Jamaica's Telegraph Service yielded a profit of $32,940 during the last fiscal year. The telegraph is operated by the government in conjunction with the postal service, and the latter also showed a profit.

Among Our Advertisers.

Under this heading we propose to keep our readers informed as to what the telegraphic and telephonic business interests are doing in the production of new apparatus. It will be a department worth reading, and will be of a newsy character. Advertisements of these concerns will be found on other pages.

Uncle Sam is a good customer of manufacturers of wireless telegraph apparatus, and Messrs. Foote, Pierson and Company, New York, are enjoying a share of his patronage. This firm has the best of facilities for manufacturing wireless apparatus of any power and the fact that the United States government gives them contracts for such equipment is sufficient evidence that they do first class work, for Uncle Sam will have nothing but the best. The Argus lightning arrester holds its own against all competitors and is a standard device. The demand for these instruments will soon be on the increase, as the lightning season advances, and the firm is all ready to meet it. This company manufactures an extensive line of electrical apparatus, and its laboratory instruments, X-ray outfits, photometers, etc., are among the best made. Mr. H. G. Pierson is the son of one of the original manufacturers of telegraph apparatus. His father had a large shop in Cleveland, Ohio, in the same building where the late J. H. Wade, one of the first early presidents of the Western Union Telegraph Company, had his office.

The Edison primary battery, manufactured by the Edison Manufacturing Company, Orange, N. J., has long occupied a position among standard electrical devices, and the field for it is constantly enlarging. The position of the elements in the cell is such that the internal resistance is practically eliminated. As regards internal resistance this battery compares with the electric generator. The battery gives a powerful output on demand, and the cost of maintenance is stated to be less than that of any other battery. These are all good points.

Many things are made by machine these days, even to the dots and dashes of the Morse characters on telegraph lines. The little machine known as the Mecograph is a semi-automatic sending device. It must be controlled by the operator but it does the work. The Mecograph has brought back to many operators afflicted with telegraphers' cramp the ability to earn a living. It not only helps the unfortunate ones, but it enables sturdy operators to do better by increasing their working speed.

The Mecograph Company, 321 Frankfort Ave., Cleveland, Ohio, will be glad to tell any one interested all about this machine.

There is a great demand for telegraph engineers, men who know the whys and wherefores of the telegraph. Every ambitious operator cannot know too much about the business that brings him his living. An excellent opportunity to learn all about telegraphy is offered by the International Correspondence Schools of Scranton, Pa. The course does not teach operating telegraphy, however. Its object is to fit operators for higher positions by teaching them the things about the technical features of the business that they must know to enable them to rise higher in their profession. This knowledge can be obtained without loss of time during business hours.

To paraphrase a common expression, what Mr. William Marshall don't know about electrical condensers is not worth knowing. Mr. Marshall has been making condensers for many years and his customers are those who must have first class instruments. His condensers are never found on bargain counters and cannot be bought in job lots. He makes wireless telegraph condensers that will stand any voltage used in this line of work. His condensers are found in telegraph offices all over the land and are used in submarine cable work. Marshall condensers are also found in laboratories where exacting requirements are demanded.

Secret Telegraphy.

Mr. Patrick B. Delany, of Nantucket, Mass., the well known old-time telegrapher and inventor, was granted a patent on January 17 on a system of secret telegraphic transmission which possesses some novel features. The transmission involves the use of two wires or circuits and the system is not intended to be used for ordinary commercial business, but rather for private circuits and on occasions when secrecy without the trouble and delay of conversion of messages into code and the loss of time in deciphering is desirable, and where the absolute protection gained would more than warrant the use of an extra wire. The result is accomplished by sending the dots and the dashes of the Morse code over separate wires and if necessary over different routes to the point to be reached. Thus a message for Chicago might have the dots go via Albany and Buffalo, while the dashes were sent via Philadelphia and Pittsburg, both to reach the receiver at Chicago in their regular order to form Morse characters or letters precisely as though they had come over a single wire in the ordinary way, or instead of sending the dots over one circuit and the dashes over another, the impulses, whether dots or dashes comprising a letter, may be alternated over the two circuits. The arriving signals are recorded in their proper sequence by a common receiver exactly as if they had been sent over a single circuit in the ordinary way.

This system may be applied to quadruplex, duplex, multiplex or any circuits however organized. In the case of a quadruplex it is only necessary to make both receiving relays operate the same sounder, or the receivers of two duplex circuits may be combined to work a single sounder in the same way.

Physical Tests of Wire and Insulation.

Mr. Hugh T. Wreaks, secretary of the Wire Inspection Bureau, New York, read a paper on "Wire Inspection" at the recent convention in Chicago of the National Independent Telephone Association.

In regard to braided wire, Mr. Wreaks pointed out that the function of the braid is to add strength to the wire and to serve as a protector to and prevent the action of air on the compound or conductors underneath. Rubber insulation, both low and high grade, has been in the past, and is even now to a greater or less extent, a bone of contention between purchasing agents and wire manufacturers. The characteristics of a good compound are high insulating qualities, long life, both physical and electrical, and sufficient strength to withstand without damage such handling as it will receive when being installed. The quality of strength is not so important, especially when the insulation is covered by a braid. There are, however, many engineers who claim that a relation exists between electrical, physical and aging qualities of a rubber insulation, but the Wire Inspection Bureau has made a number of experiments along these lines without discovering any such relation.

The physical tests on ordinary-grade insulation were classified under three heads: hardness, flexibility and softness. The test for hardness requires no apparatus except a sharp knife and a little practice, and consists in carefully removing the braid and then wrapping the insulation on itself and seeing that no cracks develop in less than twenty-four hours' time. The test for flexibility consists in wrapping the insulated and braided wire under tension around a small mandrel immersed in water and measuring by electric tests the damage, if any, that has been done. Tests for softness are made directly on the insulation and, by means of an electric current and a scale, tell how many pounds' pressure it takes for a given tool edge to cut through the insulation. Physical tests on high-grade insulation are usually of the nature of a stretch-and-return test, say, from 2 in. to 6 in. and return in one minute to 2¼ in., then a stretch without breaking to 9 in. The tests also call for a breaking strain of about 800 lb. per square inch.

Tests for both soft-drawn and hard-drawn copper wire are in the main alike in kind, but different in degree, elongation tests and breaking-strength tests being required for both, and a twisting test being called for for soft copper. Hard copper, again, must be carefully observed for splinters since these are very dangerous to the linemen in handling the wire. Physical tests on soft-drawn wire, except in large sizes, need only simple apparatus. Conductivity tests are also specified for both soft-drawn and hard-drawn wire, although for the former they are of less importance as practically all copper when soft has a conductivity above specifications.

Tinning on wire is put on not only to preserve the copper presumably against any action from free sulphur or oxidizing agent in the rubber compound, but also to protect the copper from the air in case the braid or compound on the wire is damaged in spots. A chemical test for tinning is made by alternate immersions in a solution of hydrochloric acid and a solution of sodium sulphate of stated strength and for stated periods of time. Another test specified is to band the wire around a given mandrel, depending upon the size of the wire, and then immerse the wire in the sodium solution for stated intervals.

The Brown Telephone Relay in Wireless Telegraphy.

In our issue of September 16, 1910, was printed an illustrated description of a telephone relay invented by Mr. S. G. Brown, London, England, which instrument has attracted much attention in technical circles. In a letter to a London electrical paper, Mr. G. W. O. Howe describes some experiments made with one of these relays in connection with the wireless telegraph installation at the Central Technical College, at South Kensington, near London. One of the aerials at the College consists of a single wire suspended between a chimney stack on the college and the tower of the Imperial Institute. The length of the span is about 530 ft., and the height of the upper end about 260 ft. When it was erected it was thought that it might be possible to pick up the signals sent out from the transatlantic station at Glace Bay, Nova Scotia. The distance is about 2,400 miles. No success attended these efforts, however, even with special apparatus designed for the purpose, until a Brown telephone relay was introduced between the detector and the telephone receiver. With this arrangement the Glace Bay signals can be heard quite distinctly at night, but, on account of atmospheric disturbances, they are not always readable. When the other transatlantic station at Clifden, Galway, is working, one can put the telephone receiver on the table and walk to the far corner of the room, 30 or 40 ft. away and still read the signals with ease, even when the primary and secondary coils of the receiving transformer are 4 ft. apart. Under similar conditions without the telephone relay, the receiver has to be held near the head. The fundamental wave length of the aerial is about 900 metres, while the wave length employed by Clifden and Glace Bay seems to be about 6,100 metres. These results show that a telephone relay is an important addition to a wireless station receiving very weak and hardly readable signals.

Public Service in Alabama.—In his annual message Governor O'Neal, of Alabama, suggested that the powers of the present Railroad Commission be so enlarged as to embrace telephone and telegraph companies, with full power after hearing to adjust and regulate rates.

Legislative Attacks Upon Telegraph and Telephone Corporations.

An idea of how widespread is the mania of attacking corporate telegraph and telephone property through legislative enactment may be gleaned from the following, which represent only a few of the cases brought to our attention.

A bill has been introduced in the Pennsylvania Senate, giving third-class cities and boroughs the right to compel telephone and telegraph companies to place their wires in conduits and empowering municipalities to condemn and purchase such conduits when desired.

In the Massachusetts legislature, Mr. James H. Knight on behalf of the United Improvement Association, Boston, has petitioned for a number of bills relative to the proposed new telephone rates and to the supervision of telephone and telegraph companies.

In Washington City telephone and telegraph companies, including wireless concerns, engaged in interstate commerce are contesting the right of the Interstate Commerce Commission to require them to publish schedules of their tolls. A hearing has already been held, and the commission expects to take the matter up for definite settlement at an early date.

In Oregon the constitutionality of the state law enacted by the initiative and referendum is attacked by the Pacific States Telephone and Telegraph Company. The case is now before the United States Supreme Court for final adjudication. In the legislature of the same state, Representative Amme has introduced a bill to nullify the contracts printed on the backs of telegraph blanks and holding the companies responsible for actual damages caused by the delay in transmission of messages, or errors.

In Texas a bill has been introduced in the legislature making all telegraph companies liable for damages for mental anguish or suffering, even in the absence of bodily injury or pecuniary loss, for neglect in receiving, transmitting or delivering messages.

In the matter of the Cumberland Telephone and Telegraph Company on the readjustment of exchange rates the Louisiana Railroad Commission has amended its order of last year providing that certain monthly rates are subject to a monthly discount of fifty cents if paid quarterly in advance.

The latest freak from Kansas is the demand from a farm paper in that state that square instead of round poles be used by telegraph and telephone companies. At a great expense of gray matter the writer of the article has come to the conclusion that the square pole would avoid the necessity of walking around the pole to read sale-bills tacked thereon. He also tells the world something that it did not know before, that "there is no more wood in a square pole than in a round one, and a square pole can be made just as tall as a round one." He clinches his argument with the assertion that it is just as easy to dig a hole for a square pole as for a round one.

The borough of Washington, Pa., is seeking to collect a pole tax from the Western Union Telegraph Company and the Central District and Printing Telegraph Company, due under an ordinance. The companies contend that the tax is unreasonable and excessive.

In California a bill has been introduced in the legislature proposing radical changes in the stringing of power, telephone and telegraph wires in that State. The bill requires a distance of 13 in. between the pole and a wire, making a space of 26 in. in which the lineman will be free to work. Cable lines are to be strung on crossbars, instead of along the poles on brackets, and laterals from underground conduits to the crossbars of poles must be incased in wooden casing of 1½ in. thickness.

What the Telegraph Says.

Telegraph "bulls" are always a source of amusement and frequently a source of annoyance to the parties concerned.

Recently one of the women operators at a relay office was handling a night letter telegram in which a western firm was apparently ordering twenty-five dozen men's "ball-bearing" underwear, to be shipped at once. She, however, guessed that the gentlemen were not at present wearing that kind of a garment, and sent the message back for correction. The firm's order was for balbriggan underwear.

It is not recorded what happened to the wheat market when an order was received by a commission house to "buy 8 Drew Heat," but when the tangle was straightened out the order read, "buy 8 Dec. wheat."

The sporting editor of one of the press associations found in a report of a horse race the name of a horse he had never heard of, namely "Side Fence." On investigation it was shown that the horse's name was "Defence," the "si" being the character for a semicolon preceding the name.

There are various kinds of drunks, but a "cylindrical" drunk is in a class by itself. The chief of police at New York telegraphed to the chief of police at Albany to apprehend a man on a certain train with a cylindrical trunk, but when the Albany chief received the telegram the fugitive had a "cylindrical drunk."

Our old friends, "Jags is not 100," for "James is not well;" "Real & Tate" for "Real Estate," etc., bear repetition occasionally to chase away the blues.

Conscience Stricken.—A telegraph operator who had worked for commercial and railroad companies and who recently became a missionary in China has returned a small sum of money to a railroad company to be added to its "Conscience Fund." He states that he owed the company that much money and he felt that he could not continue to do missionary work until this debt had been paid.

Multiplex Telegraphy.

BY S. R. BEATTY, OF NEW YORK.

Articles on multiplex telegraphy have appeared from time to time in the columns of Telegraph and Telephone Age, but there are several phases of the subject which I have never seen alluded to. One of these is how to determine the value of current on a duplex or quadruplex circuit while in operation. The general opinion is, that, owing to the self-induction of relays, the value of the current cannot be ascertained except during periods of inaction, and then by Ohm's law. Besides the solution of problems of the current, there are a number of conditions, both electrical and magnetic, which are equally puzzling.

It seems to be the prevailing idea that multiplex telegraphy has reached the zenith of its efficiency, in fact, that it is on the wane, and so firmly has this belief become established that an article on "The Passing of the Quadruplex," appeared in Telegraph and Telephone Age a couple of years ago. There is no doubt whatever that conditions have arisen within the past ten years which have proven very detrimental to telegraph circuits. All of these, however, are not extraneous by any means. Multiplex circuits possess certain inherent qualities which can be utilized in overcoming conditions inimical to their operation, which have developed in recent years. The efficiency of multiplex circuits has been decreasing gradually until now it has reached a low figure, and the situation is becoming serious. There is no disguising this fact.

So far as the self-induction of the relays on multiplex circuits is concerned, it is not the bugaboo that it is generally supposed to be. Its effects are known and can be calculated in ohms.

Multiplex circuits are installed and operated according to Ohm's law, as if there were no other conditions to be considered other than the ohmic resistance of the circuit. Except for long circuits the ohmic resistance is of secondary importance. Multiplex circuits contain three factors, viz.: resistance, self-induction and capacity, the latter being of the greatest importance. In such circuits Ohm's law does not obtain, neither does Helmholtz's law, expressed as

$$It = \frac{E}{R}\left(1 - e^{-\frac{R}{L}t}\right)$$

which gives the current value time t, seconds after closing the circuit. This law applies to inductive circuits only. Neither does the formula

$$It = \frac{E}{R} e^{-\frac{t}{RC}}$$

which applies only to circuits containing capacity. Moreover, owing to the small currents used on telegraph lines, the negative power in each formula will give a negative characteristic of the logarithm of such a small quantity as to render the calculation impracticable.

The current on multiplex circuits being alternating in character, although furnished by direct current generators, is therefore pulsatory. This characteristic of the current in addition to the manner of its impression on the circuit will not give a true sinusoidal wave similar to that given by an ordinary alternating current; there is, however, a growth and decay of the current which will very nearly approximate a sine wave. Therefore, we are justified in applying to multiplex circuits the laws which govern alternating currents, and are thus enabled to determine the current and also understand certain other conditions of these circuits while they are in operation.

The self-induction of a relay depends on the flux density, which in turn depends on the magnetizing current, the length, cross-sectional area, permeability and reluctance of the various parts of the compound magnetic circuit, including the permanent magnet, air-gaps and joints (the latter being reckoned as air-gaps) and the total number of turns.

The electrostatic capacity of the line is distributed along its entire length, and very unevenly at that. It depends on a number of conditions among which are circular-mil area of the conductor, the area of surface exposed to other conductors, whether adjacent conductors are grounded, the number of inators per mile and their insulation resistance, the specific inductive capacity of the insulating material (if the conductor is insulated), and the distance from other conductors and the earth. The reactance due to capacity, like that due to self-induction, can also be calculated in ohms. These reactances have opposite effects: that due to capacity gives a leading current while the reactance due to self-induction gives a lagging current. In any alternating current circuit where self-induction and capacity are present they tend to neutralize each other and if that is accomplished, Ohm's law obtains; that condition, however, is very rarely attained.

One or two illustrations of the application of the laws governing alternating current circuits to multiplex circuits in operation will make the foregoing more clear, besides explaining some of the phenomena attending the operating of such circuits. It should, however, be stated at this point, that it is impossible to make absolutely accurate tests of multiplex circuits in operation (especially those which are operated manually), that is to say, the values given will not be dead-beat values, owing to the irregular frequency and also to the manner in which the current is applied. But for a given frequency, other conditions remaining unchanged, the values given will be correct, and for automatic circuits the values will be even more accurate.

In determining the self-induction of the relay it was necessary to assume a flux density in order to obtain a working hypothesis so as to be able to ascertain what flux density a given magnetization would maintain in the compound magnetic circuit,

Digitized by Google

and, as already mentioned, each part had to be calculated separately, making use of magnetization curves. The process was difficult and required great care. Assume a duplex circuit 345 miles in length, ohmic resistance 4,500 ohms, e.m.f. 200 volts, current 44 milliamperes (Ohm's law) and capacity 4.08 microfarads. A speed of thirty words per minute will give a frequency of 7.5 cycles per second. The magnetizing current of 44 milliamperes will give approximately 4,000 magnetic lines of force, that is, the flux density would be that value all the time if the current remained 44 milliamperes during the operation of the circuit, but such is not the case. This magnetomotive force of 4,000 lines will give the self-induction of the relay as 2.53 henrys. We now have all the requisite values.

The impedance of a circuit containing resistance, self-induction and capacity is equal to the square root of the sum of the squares of the resistance and the difference between the reactance due to self-induction and the reactance due to capacity and is that quantity which, multiplied by the current, gives the e.m.f., therefore

$$I = \frac{E}{\sqrt{R^2 + \left(2 \times 3.1416 \times n L - \frac{1}{2 \times 3.1416 \times n C}\right)^2}}$$

Where n=Frequency.
L=Coefficient of self-induction.
C=Capacity in microfarads.
therefore,

$$I = \frac{200}{\sqrt{4{,}500^2 + \left(2 \times 3.1416 \times 7.5 \times 2.53 - \frac{1}{2 \times 3.1416 \times 7.5 \times 4.08}\right)^2}} =$$

$$\frac{200}{\sqrt{20{,}250{,}000 + (119.22 - 5{,}201)^2}} =$$

$$\frac{200}{\sqrt{20{,}250{,}000 + 25{,}826{,}724}}$$

Hence,

$$I = \frac{200}{6{,}787} = 29 \text{ milliamperes.}$$

The reactance due to self-induction equals 119 ohms, while the reactance due to capacity equals 5,201 ohms, 701 ohms greater than the ohmic resistance of the circuit and 43.7 times greater than the self-induction. The decrease in the current to 29 milliamperes will reduce the magnetomotive force to about one half, which would make the self-induction 1.92 henrys. This would increase the impedance of the circuit about 29 ohms, thus making no appreciable difference in the current value. This decrease in the flux density however, has a marked effect on the efficiency of the circuit which will be referred to later.

The reactance due to capacity being in excess of that due to self-induction, indicates that the current is a leading one, or ahead of the e.m.f. by a given angle, which can be calculated in degrees as follows:

The e.m.f. necessary to overcome resistance = 4,500 × .029 = 130.5 volts.

The e.m.f. necessary to overcome self-induction = 119 × .029 = 3.45 volts.

The e.m.f. necessary to overcome capacity = 5,201 × .029 = 150.8 volts.

The resultant component at right angles to the current = 3.45 — 150.8 = — 147.35

Hence tan $\phi = \frac{147.35}{130.5} = 1.12911 = 48° 18'$ or 48 degrees ahead of the current.

Again assume another duplex circuit of 90 miles in length, ohmic resistance 2,500 ohms, e.m.f. 140 volts, current 56 milliamperes, capacity 1.24 microfarads, frequency 7.5 per second. This current value will give a magnetomotive force of approximately 5,000 lines (if the current were steady) and a self-induction in the relay of 2.32 henrys, therefore

$$I = \frac{E}{\sqrt{R^2 + \left(2 \times 3.1416 \times n L - \frac{1}{2 \times 3.1416 \times n C}\right)^2}} =$$

$$\frac{140}{\sqrt{2{,}500 + \left(2 \times 3.1416 \times 7.5 \times 2.32 - \frac{1}{2 \times 3.1416 \times 7.5 \times 1.24}\right)^2}} =$$

$$\frac{140}{\sqrt{6{,}250.000 + (109 - 17{,}114)^2}}$$

hence,

$$I = \frac{140}{17{,}187} = 8 \text{ milliamperes.}$$

In this case may be noticed the exceedingly high value of the reactance due to capacity.

The reactance due to capacity = 17,114 ohms.

The reactance due to self-induction = 109 ohms.

The angle by which the current leads the e.m.f. is obtained in the same manner as in the first case.

The e.m.f. necessary to overcome resistance = 2,500 × .008 = 20 volts.

The e.m.f. necessary to overcome self-induction = 109 × .008 = .872 volt.

The e.m.f. necessary to overcome capacity = 17,114 × .008 = 136.9 volts.

The resultant component at right angles to the current = .872 — 136.9 = — 136.028. Hence the angle of lead =

Digitized by Google

$$\tan \phi = \frac{136.028}{20} = 6.80140 = 81^\circ\ 38'.$$

The angle of lead in either illustration could have been obtained by using the following formula:

$$\tan \phi = \frac{2 \times 3.1416 \times n\ L - \frac{1}{2 \times 3.1416\ n\ C}}{R} =$$

$$\frac{17{,}005}{2{,}500} = 6.802$$

which would give the same value, viz.: 81° 38′.

In an alternating current circuit containing resistance, self-induction and capacity, the angle of lead or lag may vary 90° either way.

In circuits similar to the one mentioned in the second example, where the capacity is very low, the condenser action of the circuit is correspondingly low; the breaking of the circuit at each alternation causes the impedance to become infinitely large and the current drops to a very small value, in some cases almost to zero.

In quadruplex circuits the same conditions exist and the same principle obtains. The self-induction of the neutral relay, however, is very much greater than that in the polar relay, being approximately 5.07 henrys with a magnetizing current of 60 milliamperes. This value of 5.07 henrys for the neutral relay was obtained by a series of tests on quadruplex circuits taking the values obtained thereby and calculating backwards. This was necessary because of the fact that it was impossible to obtain any measurements whatever of the magnetic circuit in this relay. The value given is approximate. But verifying the calculation from an assumed measurement as close as it was possible to judge it, by careful observation, the value of 5.07 henrys will be found substantially correct.

The time constant of a circuit is the ratio $\frac{L}{R}$, but it will be found that this will not apply to multiplex circuits because of capacity which has a much greater effect than self-induction. It does, however, apply to the relay, apart from the circuit.

Sparking at pole-changer points has been said to be due to a variety of causes, including self-induction, also to a series of rebounds at the instant of contact and then again to the discharge of the main and artificial lines. There is no sparking due to self-induction and a careful study of the circuit will show that sparking from this source is impossible. There are sparks at both points of the pole-changer and both are from the same cause. When the pole changer is opened and closed rapidly the spark made by the contact when the current is reversed is confusing to a good many people and is generally taken to be at the "break" of the circuit. It is made at the "make" of the circuit at the reversal of the current, and both sparks are due to capacity reactance. The method usually adopted for the elimination of this spark is by means of a grounded condenser, which is only a makeshift, as it has no effect whatever on the capacity of the line, which is the thing to consider.

In the operation of the circuits there is a great lack of uniformity; in fact, there is a medley of ideas, conforming to particular opinions of each office.

Suppose a circuit will not give good results with a given voltage; the voltage is increased until satisfactory results are obtained when the circuit will then probably be carrying a current value of over two hundred to three hundred per cent. in excess of the carrying-capacity of No. 36 wire. In fact, it requires a higher voltage to operate a short circuit in proportion to that necessary to work a long circuit. Ocasionally we read of the destructive effect of sparking, the heating of relays and the high voltages necessary nowadays. In the case of a quadruplex circuit sometimes the neutral side has to be closed in order to get a good duplex out of the polar side, notwithstanding the fact that there is current enough on the circuit according to Ohm's law to make it work four cornered, there being no unfavorable conditions so far as wire or weather conditions are concerned. (It would be very interesting to know the number of abandoned common sides due to this cause alone.) Sometimes a change of sets will obviate this condition; if so, the matter rests there; and it is considered lucky to have overcome one of those "necessary evils" of quadruplex working, by so easy a method, but the real cause of the trouble is still unknown.

It should be remembered that the permanent magnet of a polar relay plays a very important part in the operating efficiency of the circuit and that the pull on the armature is proportional to the square of the flux. Suppose the flux in the permanent magnet is 500 lines and the flux in the cores of the relay 500 lines (about 8 milliamperes) then we have $(500 + 500)^2 = 1{,}000{,}000$ lines. If the flux in the cores be increased to 2,000 lines (about 30 milliamperes) this will give us $(500 + 2{,}000)^2 = 6{,}250{,}000$ lines. If the flux in the permanent magnet is 2,000 lines and the flux in the cores 500 we will then have $(2{,}000 + 500)^2 = 6{,}250{,}000$ lines, thus getting the same pull with one fourth less current. We can now see how the circuit has been greatly impaired in the effort to get rid of a condition which was apparently very little understood.

It is also advocated that the cores of relays should be laminated in order to overcome the effects of hysteresis and eddy currents, which produce heat in the cores. This is another condition which is not understood apparently. The cores of relays are worked greatly below the saturation point and the heating is due to the abnormal currents, especially when the circuit is inactive. Hysteresis and eddy currents have nothing to do with it. Steinmetz gives the following formula to determine the power in watts lost by hysteresis:

Digitized by Google

$$P = \frac{K\ V\ B^{1.6}\ n}{10^7}$$

Where P = Watts lost due to hysteresis.
K = a constant depending on the magnetic qualities of the iron.
V = Volume of iron in cm.
B = Maximum magnetic density per square cm.
N = Number of cycles per second.

Thus for a circuit with a potential of 140 volts and 56 milliamperes the loss would be

$$P = \frac{.003 \times 5{,}000^{1.6} \times 4.6 \times 7.5}{10^7} = .173 \text{ watt}$$

or the .022 of the power in the circuit (taking .003 as the constant for soft iron), which proves how unnecessary it is to laminate the cores.

Polar relays should be handled with great care and not subjected to rough usage, such as is frequently accorded them. When being handled, each jar or blow has a demagnetizing effect on the permanent magnet which indirectly affects the efficiency of the circuit.

In adjusting the neutral relay the theory is advanced that it is necessary to remove the left hand or repelling coil further from the armature than the right hand or attracting coil, because the repelling pole has more effect at a greater distance. This theory is not in accord with the laws of the magnetic circuit. Gauss, Maxwell and other scientists have verified the law of inverse squares as set forth by Coulomb, that "magnetic attractions and repulsions are inversely as the square of the distance." It is impossible to obtain a magnet having unequal poles either by means of magnetization or by any other method, consequently in a uniform field the intensity of each pole is exactly the same and is inversely as the square of the distance. The fields set up by the poles of the neutral relay are uniform. In the neutral relay the signs of the poles in the right hand coil and those of the armature coil are always opposite while the signs of the poles in the left hand coil are similar to that of the armature, further the signs of the poles in the two coils are always opposite, hence there are two magnetic circuits and if the two coils are equi-distant from the armature, there is a leakage between the two coils, and the effect on the armature is obvious.

It is problematical if there is not a leakage even under the most favorable conditions, that is, when the left hand coil is removed a distance from the armature, as lines of force are vector quantities. Kohlrausch has shown that the distance of the poles from the ends of a bar magnet is about one twelfth the length of the bar, as far as its action at a distance is concerned.

The subject of multiplex telegraphy is so far-reaching, inasmuch as it necessarily involves everything pertaining to the circuit, that it is impossible to do more than touch upon the matter in a cursory manner in the space of a short article. This much can be said, however, that if properly handled, the excessive voltages and abnormal currents can be reduced besides increasing the efficiency of the circuit and even going so far as to reduce the weight of copper in the conductors, an item in itself of no small moment, besides the elimination of other very detrimental conditions.

Radio-Telegraphy.

Noiseless Vacuum Spark Gap for Wireless Telegraphy.

A patent (No. 981,503) was issued January 10, to Dr. Harry F. Waite, New York, for a vacuum discharge spark-gap in wireless telegraphy. This simple device, as constructed, eliminates all noise and the familiar loud cracking sizzle heretofore so annoying in the operation of wireless transmitting apparatus. This gap consists of two vacuum chambers, each having an upper electrode of iron and a lower electrode of mercury. There is also an automatic vacuum regulator on each chamber which keeps the internal resistance constant when connected. In the closed circuit of an ordinary sixty-cycle wireless transmitter it exhibited all the properties of the ordinary gap. It transferred energy from the closed to the open circuit or antenna, the same as in the ordinary gap. Although with a given transmitter and antenna, the radiation value of the current at the base of the antenna was somewhat less than that of the ordinary spark gap, yet the effective range of the transmitter was identically the same on an aerial test.

Another interesting and highly desirable effect in wireless was noted, namely: that the radiated wave train was very slightly damped; in fact, the logarithmic decrement of damping was approximately .06, whereas with the ordinary spark gap the radiated wave train had a decrement of .12. Only one wave length was emitted on the antenna even when using the direct connected helix.

This vacuum gap has also been tried on sets using various primary frequencies from 60 to 500 cycles and it appears that the best results will be obtained on the higher frequencies. Varying secondary voltages have been used from 10,000 to 35,000 and the gap was effective over this wide range. Tests have also been made using several sets in multiple. The gap is kept cool by immersion in either oil or distilled water. It is absolutely noiseless in operation, and will doubtless have a useful field.

Three Thousand Lives Saved by Wireless.—A rough calculation has been made recently as to the success and value of the assistance rendered by wireless telegraphy to ships at sea in the saving of life, and it is computed that 3,000 persons owe their continued existence at the present time to the help rendered by wireless.

Digitized by Google

Wireless Telegraphy in Uruguay.—The Republic of Uruguay has placed a contract with the Berlin Telefunken Gesellschaft for the supply and erection of seventeen wireless stations within its territory.

Wireless for the Protection of Seal Fisheries.—The United States government is considering plans to establish wireless telegraph service to connect the Pribyloff Islands, off the coast of Alaska, with the main land, for the protection of the seal fisheries.

Wireless in China.—The only notable addition to the Imperial Chinese telegraph line in 1909 was the installation of a public wireless telegraph station at Shanghai. Communication can be had with ships at a distance of 150 miles.

Wireless in Sweden and Norway.—The largest wireless station in Sweden—erected by the Telefunken Company, near Gothenburg—with a radius of action of 1,250 miles, has been opened. It belongs to the State, and will serve mainly military purposes. A station of 620 miles radius is to be erected at Bergen.

Wireless in India.—The Indian Government has placed a contract for the erection of wireless stations at Calcutta, Delhi, Allahabad and Simla. The stations will be employed mainly for military and official purposes, and will have a range of 600 miles each, except that at Simla, which will have a range of 300 miles. The cost will amount to $250,000. The Marconi Wireless Telegraph Company, Limited, will erect the stations.

Wireless Communication with Flying Machines.—Experiments are being carried out near Versailles by M. Maurice Farman in connection with the establishment of wireless telegraphic communication between a flying aeroplane and the earth. The aviator has already succeeded in transmitting messages from his machine to a point ten miles away, and is conducting experiments in an endeavor to receive on, as well as transmit messages from, his machine.

Storm Warnings by Wireless.—The German wireless telegraph station at Norddeich has been ordered to send storm warnings by wireless and short weather reports twice daily over the North Sea and the western part of the Baltic Sea. As, however, the smaller fishing craft, for whose benefit these warnings are specially intended, are not provided with wireless apparatus, ships receiving these warnings and reports by means of their wireless equipment are required to communicate them to neighboring ships by optical signals.

The Eiffel Tower as a Center of Wireless Communication.—The results of recent experiments go to prove that if the Eiffel tower were somewhat more centrally situated on the earth's surface it might prove to be the centre for a world-wide system of communication. The range of communication from the tower is gradually being extended, and embraces a wider radius at each new effort. The tower is the object of much attention just now, and its wireless equipment promises to become by far the most important and extensive in the whole world.

Wireless in Marine Wrecking Work.—The value of wireless telegraphy in marine wrecking operations was demonstrated recently in the salvage of the French steamer *Louisiane* which was driven ashore near Key West in a hurricane. The wrecking tug *Relief* was employed more than three months in the work of saving the stranded ship and was during that time in constant communication with shore.

Wireless Telephony on Moving Trains.—Dr. F. H. Millener described his method of installing wireless telephones on the trains of the Union Pacific Railroad at a meeting of the New York Railroad Club, February 17. About 300 railroad and traction officials were present. Communications between moving trains and signal towers have been held over distances varying between 500 feet and thirty-five miles. "The ether waves," the speaker stated, "seem to tend naturally to take the direction of the track. Instead of wire antennae a steel-ribbed umbrella had sometimes been used." The Union Pacific Railroad Company is still carrying on the experiments, but has not yet equipped any of its cars with the system.

Wireless Telegraphy in China.—Wireless telegraphic communication will soon be established between Hong Kong and Hanoi, China. Wireless service is projected in Indo-China between Saigon and Hanoi a distance of about 1,000 miles; also from Hanoi to Quang-chung-wan; from Hanoi to Lang Biang; from Lang Biang to Saigon; from Lang to Vientaine; and others from Saigon to Pnompenh and Battambang. The Chinese Government is also constructing systems in Yunnan toward Tibet and in Tibet proper, which it is expected will be within reach of the lower coast French and English systems. There is a movement on foot to establish wireless communication between Hong Kong, China and Singapore, Java.

Underwriters' National Electric Association.

Mr. C. M. Goddard, secretary of the Electrical Committee of the Underwriters' National Electric Association, Boston, Mass., has issued a bulletin containing the committee reports and suggestions for changes in the National Electrical Code, which will be considered at the meeting of the Electrical Committee in New York, March 22 and 23. The report of the committee on wireless telegraph apparatus will also come up for consideration at the meeting.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIXEY

Sole Manufacturer

Hudson Terminal, 30 Church St.

The Railroad.

Mr. John L. Davis, president of the Association of Railway Telegraph Superintendents, 1909-1910, and formerly superintendent of telegraph of the Chicago and Eastern Illinois Railroad, Chicago, is now superintendent of transportation of the New Orleans Great Northern Railroad Company, with headquarters at Bogalusa, La. Mr. Davis also occupies the position of superintendent of transportation of the Great Southern Lumber Company, and is president of the Bogalusa Telephone and Telegraph Company.

Mr. R. L. Logan, superintendent of telegraph of the Kansas City Southern Railway, Kansas City, Mo., has had his authority extended over the Arkansas Western Railway.

Miss Nellie Belle Hope, daughter of the late H. C. Hope, superintendent of telegraph of the Chicago, St. Paul, Minneapolis & Omaha Railway, at Minneapolis, Minn., and well known to railway and telegraph officials throughout the country, will be married to Mr. Parker D. Dix, of Baltimore, on March 18.

Train Dispatching by Telephone.

At the meeting in St. Louis, January 26, of the Western Division of the Association of Railway Telegraph Superintendents, considerable discussion took place on the use of the telephone for dispatching and message service. Mr. W. W. Ryder, general superintendent of telegraph New York Central Lines, west of Buffalo, Chicago, reported the progress of this class of service on the lines represented by him, explaining that of the road mileage, 89 per cent. of the Lake Shore is now dispatched by telephone, 46 per cent. of the Michigan Central, 50 per cent. of the Big Four, 65 per cent. of the Lake Erie and Western, and on the Chicago, Indiana and Southern and some other small lines, where message circuits are also in use, 100 per cent. covers train dispatching and practically that amount for message service. Mr. H. D. Teed, superintendent of telegraph St. Louis and San Francisco Railway, St. Louis, reported that 750 miles of his road was equipped with two physical circuits, one for dispatching and the other for message work, while a phantom circuit is secured from these. Mr. W. C. Walstrum, superintendent of telegraph Norfolk and Western Railway, reported that on 850 miles of his line trains are handled by telephone. One circuit, composed of a No. 8 B. W. G. wire is 707 miles long, and is used for through message purposes.

High Tension Line Crossings.

Mr. Geo. A. Cellar, superintendent of telegraph Pennsylvania Lines west of Pittsburg, has been appointed to represent the Association of Railway Telegraph Superintendents on the joint committee of the National Electric Light Association, the American Railway Engineering and Maintenance of Way Association and the American Electric Railway Association, in the preparation of an overhead crossing specification applicable to aerial crossings of electric power wires over telephone or railway systems. As announced in the February 16 issue of this paper a meeting of the High Tension Committee of the Association of Railway Telegraph Superintendents was held in New York February 7, and on February 8 it met the joint committee referred to and considered the general subject. Considerable progress was made.

Boston Meeting of Railway Telegraph Superintendents.—The entertainment committee of the Association of Railway Telegraph Superintendents is hard at work in preparing for the reception and entertainment of the delegates and friends at the next annual convention of the association which is to be held in Boston, June 19-23. It is proposed to give the meeting a distinctive Turner Monument Fund character by adopting a badge with a representation of the monument on one side and a likeness of Mr. Charles Minot, general superintendent of the Erie Railroad, who sent the first telegraph train order, upon the other side. Mr. S. A. D. Forristall, superintendent of telegraph of the Boston & Maine Railroad, Boston, is the chairman of the committee of arrangements. The convention headquarters will be at the Hotel Brunswick. Additional information can be obtained from the secretary, Mr. P. W. Drew, Minneapolis, St. Paul and Sault Ste. Marie Railway, 204 Clark Street, Chicago.

Trade Notes.

Appointment.—Mr. M. S. Allen, who has been in charge of the telephone sales department of the Western Electric Company's Atlanta, Ga., house for three years, has been appointed manager of the Omaha house of the same company.

Central Battery Telephone Sets and Accessories.—Bulletin No. 1117, describing central battery wall and desk sets, together with their accessories, for meeting standard requirements, has been issued by the Western Electric Company, New York.

Selector Resistances.—The United States Electric Company, New York, has issued in pamphlet form the article printed in these columns January 1, on the "Determination of Selector Resistances," by Mr. W. E. Harkness. The pamphlet is gotten up in an excellent manner, coated paper being used, and the press work is well executed. It is, on the whole, exceedingly neat, and well worth preserving for the valuable information it contains on the subject of selector operation. The full-page chart used with the article has been printed on a long folding sheet which, when opened out, is constantly before the reader for reference. This is a very convenient arrangement. The price of this pamphlet is 25 cents.

New Western Union Atlantic Cable.

The new Atlantic cable of the Western Union Telegraph Company from New York (Coney Island) to England, was opened for business February 17. It is divided into two sections, viz.: From New York to Bay Roberts, N. F., and from Bay Roberts to Sennen Cove, Penzance, England. The section as laid from Coney Island to Bay Roberts is 1409.75 nautical miles in length, from cable house to cable house. The core is made up of 350 lbs. of copper and 250 lbs. of gutta percha per mile. The conductivity resistance is 3.47 ohms per nautical mile at 75° F. and the inductive capacity is .382 microfarads per nautical mile at 75° F.

The section between Bay Roberts and Sennen Cove, as laid, measures 2036.4 nautical miles, from cable house to cable house. The core consists of 700 lbs. of copper and 360 lbs. of gutta percha per nautical mile. The conductivity resistance is 1.743 ohms per nautical mile at 75° F. and the inductive capacity is .445 microfarads per nautical mile at the same temperature. Total length of cable 3446.15 nautical miles.

Bay Roberts, which is on the eastern coast of New Foundland, was selected as the safest landing place for the cable on the New Foundland shore.

The new cable is the most modern of Atlantic cables as regards construction. The central copper conductor of the section between Bay Roberts and England is the heaviest ever put into an Atlantic cable. It is surrounded by six copper strips laid spirally, as is also the conductor of the New York-Bay Roberts section. The cable was made by the Telegraph Construction and Maintenance Company, of London.

The Turner Monument Fund.

The Turner Monument Fund is rapidly approaching the thousand dollar mark, and when that sum has been collected, one-third of the required amount to complete the work will have been secured. The next meeting of the Association of Railway Telegraph Superintendents, which will be held in Boston June 19-23, will probably take special action on the Turner Monument matter. It is proposed to design a badge for the members which will show on one side a picture of the monument and on the other a portrait of Mr. Charles Minot, general superintendent of the Erie Railroad, who sent the first telegraph train order. This historical event took place at Turner in the autumn of 1851. It has been considered a circumstance of sufficient importance to justify its commemoration in bronze and granite and the Association of Railway Telegraph Superintendents and the Old Time Telegraphers and Historical Association have officially endorsed the movement.

The following named gentlemen constitute the committee in charge of the Monument Fund: E. P. Griffith, superintendent telegraph, Erie Railroad, Jersey City, N. J., chairman; Charles Selden, superintendent telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, Telegraph and Telephone Age, New York; E. A. Chenery, superintendent telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railway, Montreal,, Canada; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who has been elected treasurer of the fund. All contributions are acknowledged in the columns of Telegraph and Telephone Age, and the funds deposited with the Washington Trust Company, New York, as soon as received.

The contributions received up to date are as follows: Previously acknowledged, $941.25.

James Arrigan, Paterson, N. J., $1.00; J. F. O'Connell, Newark, N. J., $.50; P. J. O'Connell, Newark, N. J., $1.00; R. Palmer, Port Jervis, N. Y., $.50; Warren Holt, Paterson, N. J., $.25; C. F. H. Johnson, Passaic, N. J., $2.00; M. Regan, Paterson, N. J., $1.00; J. D. Rahaley, Paterson, N. J., $1.00; G. M. Curren, Paterson, N. J., $1.00; A. Wollenhaupt, Arlington, N. J., $.25; H. G. Reich, Chicago, Ills., $1.00. Through N. E. Smith, New Haven, Conn., supt. of telegraph, N. Y., N. H. & H. R. R.; N. E. Smith, New Haven, Conn., $5.00; H. A. Shepard, New Haven, Conn., $1.00; J. A. Droege, Providence, R. I., $1.00; J. Coburn, Providence, R. I., $1.00; H. P. Haley, Providence, R. I., $1.00; J. A. Carroll, Providence, R. I., $1.00; M. D. Miller, Providence, R. I., $1.00; H. E. Webber, Providence, R. I., $1.00; V. Parvin, Waterbury, Conn., $2.00; G. A. Heller, Waterbury, Conn., $1.00; J. B. Considine, Hartford, Conn., $1.00; G. P. Snow, Taunton, Conn., $2.00; T. P. Wheeler, Walnut, Kansas, $1.00. Mr. O. C. Green, superintendent of telegraph, Northern Pacific R. R., St. Paul, Minn., sends the following: Through Mr. J. E. Cramer, Dilworth, Minn., $3.00, contributed by different parties around General Office Building, Fargo Division; H. H. Maher, Staples, Minn., $1.00; F. L. Birdsall, Staples, Minn., $1.00. Total, $974.25.

Telegraph Dot Transmitter. — Mr. Harry H. Smith of Brooklyn, N. Y., has been granted a patent on a "Telegraphic Dot-Transmitter." The vibrator is actuated by a supplemental lever by means of which the circuit is consecutively opened and closed so that a predetermined number of dots can be automatically transmitted on the line. The dashes are made with the ordinary key to which the invention is attached. The supplemental lever is supported on the pivots of the main lever with the main portion of its length over the said main lever, and the vibrator extends up from the said supplemental lever. In general appearance the device resembles an ordinary key with two levers and two knobs.

Annual Meeting of the Mackay Companies.

The annual meeting of the Mackay Companies was held in Boston, February 15.

Referring to the combination of the American Telephone and Telegraph Company and the Western Union Telegraph Company, President Mackay states that the combination "has not injured the business of the Postal Telegraph-Cable Company—quite the reverse."

Mr. Mackay states that the advantage to the telegraph companies of the night-letter service "is doubtful, to say the least. It necessitates the transmission of fifty words instead of ten, and transmission is expensive."

The employes of the Commercial Cable and Postal Telegraph systems continue to invest their savings very largely in shares of The Mackay Companies, their holdings being over two million dollars par value.

The gross earnings of the land line system have increased substantially during the past year, but increased wages have absorbed a great part of increased earnings.

The profit and loss account for the year February 1, 1910, to February 1, 1911, shows:

Receipts:

	1911.	1910.
Income from investments in other companies	$4,125,907	$3,808,779
Disbursements:		
Dividends paid on The Mackay Companies—		
Preferred shares	2,000,000	2,000,000
Common stock	2,069,020	1,758,667
Operating expenses, etc.	37,194	32,284
Balance carried forward	19,093	17,774

The balance sheet shows:

ASSETS.

	Feb. 1, '11.	Feb. 1, '10.
Investments in other companies	$91,919,338	$92,083,966
Cash	384,521	200,201
Total	$92,303,859	$92,284,166

LIABILITIES.

Preferred shares issued	$50,000,000	$50,000,000
Common shares issued	41,380,400	41,380,400
Surplus	923,459	903,766
Total	$92,303,859	$92,284,166

The trustees were re-elected as follows: Mr. Clarence H. Mackay, Mr. William W. Cook, Mr. George G. Ward, Mr. Edward C. Platt, Mr. Robert A. Smith, Mr. H. Vincent Meredith, Mr. Milton W. Blackmar.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works of telegraphy and treat them in the same manner.]

CHAPTER XLIII.

What apparatus is used in the Wheatstone automatic duplex?

How are the received signals on the Wheatstone apparatus recorded?

What are the principal points of difference between the Wheatstone system and the Morse system?

By what means are messages transmitted by the Wheatstone system?

Describe the operation of the perforator.

How is the tape perforated to distinguish between dots and dashes?

What class of current is used in the operation of the Wheatstone system?

Describe the operation of transmission of a message perforated on the tape.

How is the Wheatstone duplex balanced?

What instrument is used to indicate a balance?

CHAPTER XLIV.

What is the function of a lightning arrester?

What is the effect of a lightning discharge upon a wire?

Why is it more difficult to provide protection on alternating current lines than upon direct current lines?

What is the effect of a coil in an alternating current circuit?

What is an impedance coil?

How is a path to ground usually provided in lightning arresters containing impedance coils?

How is the coil of the Argus lightning arrester wound?

Describe the construction of the Argus lightning arrester?

Where should the arrester be placed with reference to the line to be protected in order to afford the most reliable protection?

CHAPTER XLV.

What are the chief features of the Skirrow switchboard as used by the Postal Telegraph-Cable Company?

Describe the construction of the switchboard and show the points of difference between it and the old style of board.

What is the terminal frame and what advantages does it possess?

What apparatus are the pin jacks connected with?

How are the main line jacks and the pin jacks connected with each other?

What is the annunciator board and how is the annunciator operated?

How are the various lines and connections indicated and identified on the board?

Enumerate the advantages of this switchboard system as a whole.

Destruction of Poles by Woodpeckers.

In our issue of February 16 we printed extracts from letters written by many railway telegraph superintendents and others interested in the subject of telegraph pole lines and their maintenance but for the lack of space we could not print all that had been received. The remainder, therefore, are given herewith:

Mr. J. L. Henritzy, superintendent of telegraph, Colorado & Southern Railway, Denver, Col.: "Woodpeckers burrow into our poles extensively throughout Texas, and on the 400 miles of line we lose an average of five poles per year. Many pecked poles are of course standing, and we do not replace them unless they are broken by winds. This insectivorous bird is an indefatigable worker, and we have not taken any pains to discourage him, considering it futile."

Mr. M. H. Clapp, division plant superintendent, Western Union Telegraph Company, Chicago: "It has been my experience that the damage done to poles by woodpeckers does not amount to as much as is generally supposed. In the first place, woodpecker holes do not weaken the poles as much as was considered at one time. I know this to be true from actual breaking tests of poles on which there were what was regarded as very bad woodpecker holes. There are, without doubt, instances where woodpecker holes have weakened poles considerably, but this I believe is only true in a small percentage of the cases. Regarding the principal causes of destruction of poles on our system, I would say briefly that ordinary decay or rot at the ground line affects the greater number of the poles that it is necessary to replace. We also lose a considerable number of poles from burning off at the ground line, and from other causes, such as being shattered by lightning, etc. However, ordinary decay and depreciation of poles is the principal cause that we are continually thinking about and planning to prevent in any way possible."

Mr. J. W. Lee, Jr., of the Pennsylvania Railroad Company, Philadelphia: "I beg to advise that we have found that the damage done by woodpeckers is usually confined to cedar poles, though we doubt very much if the birds are responsible for the direct destruction of many poles. Creosote is a substance in which neither animal nor vegetable life can exist. It is possible, however, that a woodpecker might drill a hole through an inch or two of creosoted wood on the outside of a pole to provide a nesting place in the untreated heart."

Mr. J. J. Lynch, superintendent of construction, Postal Telegraph-Cable Company, San Francisco: "During my experience while located at Kansas City, I found that poles were damaged a great deal by woodpeckers and that this damage was in most cases to poles that had insects of some kind in them. This company's line was damaged to such an extent between St. Joseph and Leavenworth, a distance of forty miles, that it was necessary to rebuild it long before its time. The line in eastern Kansas, and all of Missouri, and a portion of Illinois, along the Mississippi river appeared to be bothered by woodpeckers more than any other part. This company's line between Kansas City and St. Louis was damaged considerably, but not as much as the line mentioned. The only preventive I ever used was wire netting, which proved satisfactory as long as it lasted, but in a great many instances it rusted out very soon. In one case where the holes in a pole filled with young woodpeckers had been covered up with wire netting the mother cut the netting and thus reached her young while the men were at lunch. I have not noticed any great amount of damage to our poles on the coast from woodpeckers. There is some, but it is trifling. The principal cause of the destruction of poles is the rot at the ground, which varies with the soil. I have never used any of the chemical processes for preserving poles, and do not know that it pays to do so, unless put in under pressure, judging from what treated poles I have seen."

Mr. C. T. Day, superintendent of telegraph, Ferrocarril sud-Pacifico de Mexico, Empalme, Sonora, Mexico: "Our burnettized poles, although fine and well preserved, are going the same way that the creosoted ones are. They were set last May but birds have begun to peck at them. Am now trying cement where we find the birds have started. The new holes will be plastered up with it. This treatment will have a tendency to preserve the pole."

Mr. J. B. Sheldon, superintendent of telegraph, Union Pacific Railroad Company, Omaha, Neb.: "We do not seem to be having any serious trouble on account of woodpeckers at the present time, although we have at times had damage done to cable boxes, and I recollect one instance where a telegraph pole was very badly damaged. Our troubles all together in this way have been so few and far between, however, that it hardly seems necessary for us to take any special action to guard against such damage."

Mr. L. M. Jones, superintendent of telegraph, Atchison, Topeka and Santa Fe Railway, Topeka, Kan.: "Mr. George Denison's reference in your issue of February 16 to loss of poles between Los Angeles and Albuquerque, due to damage by woodpeckers is correct. There are very few woodpeckers along our line in that section, in fact, very few birds of any kind are found in this part of the country. The phantoplex referred to in the same article is operated by the Postal Telegraph-Cable Company, whose line parallels ours from Albuquerque to Los Angeles."

Mr. I. T. Dyer, superintendent of telegraph, San Pedro, Los Angeles and Salt Lake Railroad Company, Los Angeles, Cal.: "We do not seem to be afflicted with the woodpecker pest which is so prevalent in other parts of the country. As a matter of fact we find very little or no damage to telegraph poles by insects or vermin of any kind."

Digitized by Google

The woodpecker has a friend in Mr. Charles H. Lane, superintendent of construction of the Postal Telegraph-Cable Company, who writes: "I am a great lover of birds, woodpeckers included, and wouldn't think of doing anything to deprive even a woodpecker of the necessaries of life, and you know how the cost of living has advanced. We simply let the poor woodpecker peck."

Death of Isaac McMichael.

Isaac McMichael, vice-president and general manager of the Great North-Western Telegraph Company, Toronto, Ont., died at the Johns Hopkins Hospital in Baltimore, on February 22. Mr. McMichael entered the hospital on February 6 suffering from an acute form of dilation of the heart and was operated upon shortly after. At first the operation, which was a delicate one, seemed to relieve the tension around the organ, but later the old trouble returned, and a second operation was deemed necessary. Every effort was made to restore the patient to a condition to withstand the operation, but he was unable to respond to treatment and died.

Mr. McMichael was born in Brantford, Ont., January 7, 1840. He began his telegraphic career in 1856 in Canada and came to the United States in 1860, locating at Piqua, Ohio. He entered the United States military telegraph service at the outbreak of the civil war and saw considerable field duty. At the close of the war he entered the service of the Western Union Company at Kansas City. He was appointed chief operator at St. Louis in 1869, and in 1870 became chief clerk to Col. Robert C. Clowry, who at that time was superintendent of the Western Union Telegraph Company at that point. In 1874 Mr. McMichael was appointed assistant superintendent, which position he held for seven years. On July 1, 1881, he was advanced to the superintendency of the newly created district of the Western Union Company, with headquarters in Minneapolis, Minn. He held this position for twenty-two years, and upon the retirement of Mr. H. P. Dwight from the general management of the Great North Western Telegraph Company, Toronto, Ont., he was, in October, 1903, elected vice-president and general manager. Mr. McMichael was an intelligent, progressive and able manager, and had a host of friends who will mourn his loss.

He is survived by his wife, a daughter and a son, Mr. S. B. McMichael, who is assistant general manager of the Great North-Western Telegraph Company at Toronto.

Obituary.

James Elverson, editor and proprietor of the Philadelphia Inquirer, and an old-time operator, died in that city February 10. Mr. Elverson was born in England in 1838 and came to this country with his parents in 1847. At the age of fourteen he entered the office of the Magnetic Telegraph Company in Newark, N. J., as messenger, and became an operator two years afterward. Later he became manager of the consolidated offices, being at the same time agent for the Associated Press. Subsequently he assisted in line construction throughout New Jersey. During the Civil War he held a position in Washington with the American Telegraph Company, but retired from telegraphy in 1865 to take up newspaper work to which he devoted the rest of his life.

Municipal Electricians.

Recent Patents.—Among the patents issued February 7 on fire alarm and kindred apparatus are the following: No. 983,306, Automatic Fire Alarm, to E. F. Oliver, Monroe, Ind.; No. 983,345, Thermostat, to J. Bockel, Philadelphia, Pa.; No. 983,443, Electrical Alarm Thermometer, to R. Heddle, Nelson, B. C., Canada; No. 983,713, Fire Alarm, to S. J. Heinrich, Bellevue, Pa.

Patent No. 511,462 for a fire alarm telegraph issued to Charles H. Rudd, Chicago, has expired.

Stockton's Fire Alarm System Criticised.—An unreliable fire alarm system is one of the weak points of the fire fighting facilities of Stockton, Cal., according to the engineers of the National Board of Fire Underwriters. It is an automatic system maintained by an electrical contractor under the direction of the fire chief, and has no registering devices. The wires are on poles with high-tension circuits at many points; tests are irregular and no records are kept.

The Sonorophone.—Mr. John F. Kelly, Jr., chief of the Electric Bureau of Camden, N. J., is the inventor of an electrical musical instrument, which was exhibited in practical operation, at the Philadelphia Electrical Show last month. Mr. Kelly has discovered a means by which the music of a talking machine may be transmitted to a distant point either by wire or by wireless. The machine is fitted with a telephone transmitter in place of the usual horn and the music is thus transmitted to a distant room, the received electrical notes being amplified by means of a horn. The instrument was the centre of attraction at the show.

Municipal Electricians' Convention. — Active preparations are going forward for the next convention of the International Association of Municipal Electricians which is to be held in St. Paul, Minn., in September. The place and time of the meeting are wise selections and as fire matters in the Twin Cities are, in keeping with the spirit of those communities, held up to the top notch of efficiency, the visiting electricians will find much of interest. The meetings of the municipal electricians result indirectly in greater security from fire to the people of the country at large on account of the advanced knowledge obtained by the members of the latest ideas and appliances. The dates of the meeting have not yet been fixed, but the announcement will soon be made by the executive committee. Mr. Clarence R. George, city electrician, Houston, Tex., is secretary of the association.

ANSWERS TO QUESTIONS.

[In this department questions on matters of a practical character, and of general interest, will be answered. Questions intended for this department must be signed by the writer's full name—not for publication, but for identity. No attention will be paid to anonymous communications.]

(18) Q. I desire to find the value of current in a circuit with a resistance of 500 ohms and an e.m.f. of 250 volts. I have applied Ohm's law to this problem and get .5 milliamperes, but I know that this answer is wrong. Will you please point out my error? W.

A. Your error is due to the confusion of terms. You call the result .5 milliamperes when it really is .5 ampere. According to Ohm's law 250 ÷ 500 = .5 ampere, not .5 milliampere. A milliampere is equal to one one-thousandth of an ampere, therefore, .5 ampere expressed in milliamperes is .005. The answer is five milliamperes, not five-tenths of a milliampere.

(19) Q. What is the meaning of the word hysteresis, used in connection with the magnetization of masses of iron? T. M. O.

A. Magnetization of the core of a field magnet for instance, involves the rearrangement of the position of the molecules of the iron. If it then be magnetized in the reverse direction another rearrangement of the molecules takes place. With a rapidly alternating magnetizing force the molecules of the iron are in a state of continual motion. One effect of this action is that the motion of the particles of iron lags behind the magnetizing force. To this lagging effect the name hysteresis has been given.

(20) Q. Please explain the meaning of the word "frequency" which I often notice used in connection with alternators, and give the rule to ascertain the frequency. F. R.

A. Each conductor in the armature cuts across the lines of force from each pole as many times in a revolution as there are poles. The time in seconds required for any point on the circumference of the armature to pass two poles is called its "period" and the number of these periods per second is called the "frequency." The rule to find the frequency of an alternator is: Multiply the number of revolutions per second by half the number of the poles of the machine.

(21) Q. I have a large permanent magnet which seems to be losing its magnetism. Can you give the reason for this? A. P. M.

A. Permanent magnets lose their magnetism if they are roughly handled or knocked about. A sharp tap with a hammer will frequently destroy the magnetism. Magnetism is also lost by heating the magnet to a bright red. A slight vibration will destroy residual magnetism in annealed soft iron. All permanent magnets lose their magnetism gradually but shocks hasten the decay.

(22) Q. Does the size of the positive and negative plates in a cell of primary battery have anything to do with the electromotive force of the cell? F. O. T.

A. No, it does not. The size of the plates can be increased or decreased, or the plates may be placed closer together or wider apart, but that will not affect the electromotive force. The e.m.f. of a call depends entirely upon the nature of the materials used for the electrodes.

(23) Q. What is the meaning of the word "conductance" as applied to electric wires? R. E. S.

A. The word conductance means the relative conductivity of a wire and is expressed as being the reciprocal of the resistance of the wire. Thus, suppose we have a wire with a resistance of 750 ohms, its conductivity (conductance) would be written 1/750.

(24) Q. What is the meaning of the term permeability? D. E.

A. If a bar of iron be placed inside a helix through which a current of electricity is flowing, the number of lines of force produced is greatly increased. This power of iron to concentrate the lines of force is called its permeability. Permeability, however, is affected by the presence of impurities in the iron, such as phosphorus, carbon, etc.

Improved System of Telegraphy.—Mr. Robert L. Dean, of Chicago, has obtained a patent on a system of telegraphy. Positive and negative impulses transmitted from batteries of opposite polarity are employed in the transmission of messages, the impulses being controlled through the aid of embossed message-sheets and contact devices which latter are drawn to and fro over the successive rows of embossments upon the message-sheets.

Claim 15 reads: In a system of telegraphy, character-bearing levers arranged to travel to and fro, electrically-controlled means for actuating said levers, a relay in circuit with said means to control the same, contact-levers in circuit with said relay to control the same and arranged to travel to and fro, a sheet containing embossments for actuating said contact-levers one at a time to temporarily close the circuit in which they are arranged, and means for simultaneously starting the character-bearing levers and the contact-levers on their to and fro movements.

The Turin Exposition and Telegraph Tournament.

The Turin International Exposition of Industry and Labor will be opened on April 29 by the King and Queen of Italy. The exposition is to celebrate the fiftieth anniversary of the declaration by the First National Assembly, in Turin in 1861, that Victor Emanuel II was the first King of Italy. During the exposition an international telegraphic tournament will be held, in which event much interest is manifested by European governments. Details of the tournament were published in these columns, July 1, 1910, and January 16, of this year.

Commercial Association of the Western Union Telegraph Company.

The Greater New York Commercial Association of the Western Union Telegraph Company was organized a few evenings ago after an informal dinner at the Hotel Gonfarone. The following officers were elected to serve one year: President, Mr. P. J. Casey; Vice-President, Mr. M. E. Pierce; Secretary, Mr. John Simmonds; Treasurer, Mr. Thomas F. Hull. Board of Governors: Chairman, Mr. John Veitch; Mr. M. J. Hayden; Mr. Albert Lister; Mr. Frank Spree; Mr. James J. Riley. Honorary Members: Mr. James F. Nathan and Mr. Maynard W. Hamblin.

Mr. James F. Nathan, district commercial superintendent, addressed the assemblage and in a very forcible manner outlined the purpose of the new organization, viz.: to promote the welfare of the employes, introduce modern supervision in every branch of the telegraph organization, provide comfortable offices for employes, whether he be messenger or official, popularize the service by raising the standard of efficiency, and to recognize the merit of each individual and measure his work by merit earned.

Mr. John Simmonds spoke of the requisites essential to qualify the representatives of the company to meet the general public, and the support and co-operation of the telegraph organization necessary to redeem the assurance of the "field men;" that every detail of the service must be carefully supervised to obtain satisfactory results, placing the company's service above criticism.

Mr. P. J. Casey, the dean of the service in the executive branches in New York City, delivered a very witty and characteristic address embracing the telegraph service from its infancy and the vast increased facilities established in the upper section of the city to meet the requirements of the public.

Mr. Albert Lister, Mr. Thomas P. Hull, Mr. C. B. McCann, Mr. P. J. McMahon, Mr. J. J. Riley, Mr. F. W. White, Mr. M. J. Hayden, Mr. John T. Carberry, Mr. Frank Spree and many others identified with the service spoke briefly of the benefits that the telegraph fraternity in Greater New York will derive as a result of the new organization, which will meet on the first Monday of each month at the Hotel Gonfarone.

New Atlanta Western Union Office.

The Western Union Telegraph Company moved into its new quarters in Atlanta, Ga., on January 28. The office is in the new building of the Atlanta Journal on North Forsyth Street, the operating room being located on the fifth floor of the structure.

The office is equipped with new machinery and apparatus, very little of the old material from the former office being utilized. All of the desks are new, and ample lockers have been provided for the operators and other employes; also two shower baths with hot and cold water. A new five-section fifty-wire switchboard was installed, and the electric generators are placed on a concrete foundation to avoid vibration.

The office has a high ceiling and is well ventilated. It receives daylight from three sides, and at night is lighted by electric lights placed sufficiently high to throw ample light over the entire room. Altogether it is well arranged for the handling of business and for the convenience of the operators.

The old office was occupied by the company for twenty-two years. Gravity batteries were used at first; these were afterward displaced by storage batteries and they, in turn, gave way to generators more than ten years ago.

The operating force at Atlanta consists of 140 operators. The officials of the company are located on the second floor of the building and their offices are handsomely furnished. Mr. H. C. Worthen is general superintendent, Mr. J. M. Stephens, division commercial superintendent; Mr. D. M. Therrell, division traffic superintendent and Mr. L. H. Beck, division plant superintendent. The district superintendents are: Commercial, Mr. E. E. Williams; Traffic, Mr. G. W. Lloyd; Plant, Mr. W. A. Neill. Mr. S. L. Burts is manager and H. K. Griffin, chief operator.

Atlantic City Meeting of Old Timers.—The Atlantic City meeting of the Old Time Telegraphers and Historical Association, and the Society of the United States Military Telegraph Corps, on September 5, 6 and 7, promises to be one of the most enjoyable and largely attended meetings ever held by the twin organizations. It would be very difficult indeed to find a more delightful spot than Atlantic City at that season of the year. Plans for the meeting are being developed and announcement will be made to the members of anything of interest. The headquarters will be at the Marlborough-Blenheim. Col. W. B. Wilson, Holmesburg, Pa., is president of both associations, and Mr. F. J. Scherrer, 30 Church Street, New York, is secretary of the Old Time Telegraphers and Historical Association. Mr. David Homer Bates, 658 Broadway, is secretary of the Society of the United States Military Telegraph Corps. Mr. G. W. Deetz, manager of the Western Union Telegraph Company, Atlantic City, N. J., is a member of the executive committee and has charge of many of the arrangements.

An American Consul in Amazonia.—Major J. Orton Kerbey, an old time telegrapher, formerly United States Consul to Brazil, and author of "The Boy Spy" and other books, makes an advance announcement of a new work entitled "An American Consul in Amazonia." It is a narrative of the author's experience in Brazil several years ago. It touches on the rubber industry, railways, climate, and the life of the people in the Amazon country. The book is now in the hands of the publishers and will be sold by subscription at $2.50 per copy.

Effect of Sending Machines Upon Quadruplexes.

Under this title we printed an article in these columns February 16 by Mr. J. P. O'Donohue, division electrical engineer of the Postal Telegraph-Cable Company, describing the effects upon the second side of a quadruplex of the mechanical transmission of dots at various speeds.

Mr. Stephen D. Field, the well-known electrical inventor and old-time telegrapher, of Stockbridge, Mass., suggests that the situation can be met by prohibiting a greater speed than five dots per second, which is equivalent to forty words per minute, and that any machine making dots at a higher rate of speed should not be allowed on a circuit. All transmitting machines, he states, could be made so as to not exceed this limit, thus standardizing the instrument. Any one could tell by means of a watch whether these instruments were standardized and meeting the requirements.

YOU RUN NO RISK in purchasing a **CENTRAL** factory-rebuilt "mill." **QUALITY** is our first consideration. We also make a specialty of rebuilding. Prices moderate. Postal employes may purchase typewriters, 75 cents weekly. Write me personally. D. A. Mahoney, Representative, Central Typewriter Exchange, New York.

LETTERS FROM OUR AGENTS.

NEW YORK, WESTERN UNION.

Joseph Knittle, a well-known old-timer, formerly of this office, who worked on the old printer system, died February 10 at his home in Brooklyn. Mr. Knittle was born in Rochester, N. Y., September 10, 1839. He entered the telegraph service in 1852 as a messenger in New York and remained in that city all through his business career except between 1864 and 1866, when he was an operator in the United States Military Telegraph Corps, and located in the south. On his return to New York in 1866 he entered the printer service of the Western Union Company. Mr. Knittle possessed a gentle character and was highly esteemed by a large circle of friends.

Mr. Michael H. Crane, for several years president of Onnolee Lodge, Order of Iroquois, was presented with a handsome diamond badge, February 8, by the members of that body in recognition of his faithful services during his incumbency.

Mr. Daniel T. Sheridan has returned to his desk fully restored to health after an illness of several months.

NEW YORK, POSTAL.

Mr. E. A. Coney has been appointed night manager to succeed Mr. C. J. McCarthy, who, at his own request has resumed his former duties as assistant night manager. Mr. J. T. Ewing has been transferred from the Western to the Eastern switchboard and Mr. A. Ward from the Eastern to the Western board. Mr. T. P. Smith, assistant all-night chief, has been transferred to the automatic department.

PHILADELPHIA, POSTAL.

General superintendent of plant Mr. W. I. Capen was a recent visitor at this office.

Mr. W. P. Bower, night traffic chief, has been confined to his home for the past month with a severe attack of grippe.

Wire chief Mr. M. A. Baker has been seriously ill with pleuro-pneumonia for the past three weeks, but is now convalescent.

Mr. F. S. Barrett was also among the absentees on account of illness, but has returned to duty.

ST. LOUIS, AMERICAN TELEPHONE AND TELEGRAPH.

Mr. Arthur Koch, late chief clerk to the district plant chief, has been appointed chief test board man at Little Rock, Ark.

Mr. John C. Fallinger has been appointed operator in the office of the district supervisor of leased wire service, Star Building.

Mr. C. W. Erickson, lately with the Missouri Pacific Railway, has accepted a position in the test room.

WANTED.—Live agents in all large Western Union and Postal offices. Central Typewriter Exchange, New York.

The Telegraphers' Mutual Benefit Association, 195 Broadway, New York, enables telegraph and telephone employes to provide for their families life insurance in reasonable amounts, at a cost so low as to be within the reach of all. It has already paid beneficiaries of deceased members $1,500,000, at an average annual cost per $1,000 of about four cents a day, and has also accumulated $327,000 Reserve Fund securely invested, to provide against excessive cost in the future. Membership is easily acquired and cannot be invalidated during life for any cause except failure to pay the necessary mortuary calls.

MARTIN'S LATEST VIBROPLEX, $9.00. Address James B. Havice, General Agent, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEYBOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

SOME POINTS ON ELECTRICITY—XIV.

BY WILLIS H. JONES.

QUESTION AND ANSWER.

Question.—Is there any difference between the current-creating power of a positive and a negative electromotive force of equal pressures? If not, why do we sometimes get different indications when one polarity is substituted for the other, especially when using a galvanometer?

Answer.—No, there is no difference in their pressure under normal conditions of the conductor being measured, that is to say, where there are no foreign electrical influences affecting the circuit.

This can be readily proved by causing a current to flow through the coils of a rheostat alternately from a positive and a negative battery of the same e. m. f. The current will be exactly the same value in either case.

If, however, there is a foreign electric influence in the conductor, there will obviously be a greater pressure in the line with one polarity than the other, because the foreign pressure has a polarity of its own. If the polarity is positive it adds its e. m. f. to our negative pole, and, *vice versa*, it opposes our positive battery.

The difference in the volume of current that an ammeter shows when we shift from say 100 volts positive to 100 volts negative under these conditions is not due to any inequality in our battery but to alternately helpful and opposing conditions existing in the external conductor.

Nevertheless, while there is really no difference in the current creating abilities of the two polarities under normal conditions, a positive battery can actually create a different condition in a slightly defective conductor, if given time, which condition is the opposite in character to that which a negative battery would cause. This phenomenon, no doubt, has misled some to doubt the initial equality of the two polarities.

The explanation of their different behavior in defective circuits is this: Where a slight defect in a conductor exists, such, for example, as a partial break or rusty thin strand in a poorly insulated cable, a positive current if given time will precipitate a thin metallic film of sulphate of zinc over the joint. This tends to bridge the fault as well as reduce the resistance of the circuit.

On the contrary, a negative current if substituted for positive will soon remove such film and leave the joint bare and bright. This fact may be readily proved with an ordinary 150-ohm relay. Connect a positive battery to the faulty cable and pull up on the spring until the relay points just stand open. In a few minutes the relay will close. Then pull up again. The relay will again soon close as before. This operation may be repeated, in some cases, many times. Each closing of the relay indicates that the volume of current is gradually increasing and this proves that the joint is healing.

Now if you substitute a negative current, the opposite effect will be caused.

Turn down the retractile spring till the relay points just close and wait. In a few minutes the relay will open. Turn down again and wait. It will continue to open soon after each readjustment until the joint is bare and bright, after which the volume of current will remain practically unchanged.

Nor does the fact that a positive current will create marks on a blue litmus stained tape while negative will not, indicate any actual difference in the strength of positive and negative currents. This phenomenon is due to the difference in direction in the flow of current, the marks being the result of the separation of the molecules comprising the solution through the action of the current which flows through it. That portion of the solution which forms the coloring matter simply happens to seek the positive electrode and consequently appears on the top or surface of the tape. It rarely shows through on the under side unless the tape is very thin and strongly saturated. When it does the mark is usually very dim and probably due to the transparency of the paper ribbon.

Digitized by Google

When it comes to the question of creating magnetic lines of force in an iron magnet there is, again, no difference in the number developed by equal electromotive forces of different polarity. It has been claimed, by an authority, that a negative force begins to act a little sooner than the positive, but even if this is true the advance is so slight that the effect is inappreciable in the practical operation of any apparatus used in the telegraph or telephone service. So the question may be disregarded, as being a matter of no importance to us. Possibly there is nothing behind the statement to warrant the claim.

A careless experimenter might be easily deceived if he overlooked the fact that even the best of soft iron often retains a little residual magnetism after having been charged by an electric current.

It is obvious that if such a magnet be recharged with the same polarity of current as it received on the previous charge it will begin to act slightly quicker than it would if the second charge was of opposite polarity, for the reason that in the latter case the first part of the charge would have to clean out the opposing residual magnetism in the iron before beginning to build up the new lines of force.

Had the residual magnetism been of a polarity like that of the recharging current it is evident that the process of rebuilding would begin at once and be completed in shorter time.

Recent Telegraph and Telephone Patents.

ISSUED FEBRUARY 21.

984,547. Central Energy Telephone System. To F. W. Dunbar, Chicago, Ill.

984,558. Mouthpiece for Sound Transmitters. To J. Graham, Philadelphia, Pa.

984,679. Automatic Adjustable Holder for Telephone Receivers. To S. O. Lancaster, London, Ont., Can.

984,686. Intercommunicating Telephone System. To R. H. Manson, Elyria, Ohio.

984,738. Anti-Induction Apparatus for Telephone Systems. To A. Barrett and W. Condon, Kansas City, Mo.

984,945. Telephone System. To O. M. Leich, Genoa, Ill.

984,958. Telephone Exchange System. To J. G. Mitchell, Cleveland, Ohio.

984,154. Electrical Signaling and Alarm Apparatus. To C. H. Pool. New York.

984,210. Sprinkler Alarm System. To A. Goldstein and H. F. Blackwell, New York.

984,211. Electrical Alarm System. To A. Goldstein, New York.

The following patents have expired:

514,695. Telephone. Issued to C. T. Bloomer, New York.

514,823. Telephone Signaling System. Issued to Webster Gillette, New York.

514,913. Cushion for Telephone Receivers. Issued to V. A. Cook, Averill Park, N. Y.

514,916. Telephone. Issued to D. Drawbaugh, Eberly's Mill, Pa.

514,920. Telephone Transmitter. Issued to P. Fitzsimons, Birmingham, Ala.

515,531. Switch and Circuit for Telephone Exchanges. Issued to J. J. O'Connell, Chicago, Ill.

515,709. Telegraphic Instructor. Issued to T. J. Houck and H. M. Browning, Baltimore, Md.

Personal.

Col. R. C. Clowry and Mr. F. J. Scherrer, his secretary, have returned to New York from Palm Beach, Fla., where they spent several weeks.

Mr. John Darr, assistant superintendent of telegraph for the Standard Oil Company, Oil City, Pa., was a recent New York visitor.

Mr. W. W. Splane, former superintendent of telegraph for the Standard Oil Company, and now in the oil producing business, with headquarters at Oil City, Pa., was also in New York recently.

Dr. Karl George Frank, of New York, representative of the Siemens & Halske Company, of Berlin, Germany, will sail for Europe about April 1, on business. He will be absent about four months.

Mr. W. J. Mercer of London, England, director of the Commercial Telegram Bureau, is making a business visit to New York and took occasion to call upon many old friends in the telegraph and cable service.

Mr. and Mrs. Thomas A. Edison celebrated the silver anniversary of their wedding February 24 with a quiet family dinner at their home. Mr. Edison, however, managed to get in a good day of hard work in his laboratory.

Mr. J. A. Hulit, formerly of Topeka, Kan., a well known telegrapher and electrical expert and the inventor of the Hulit transmitter, is now in the service of the Western Electric Company at New York having recently been transferred to this city from its Chicago office.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. E. J. Nally, vice-president and general manager, Mr. W. I. Capen, general superintendent of plant, and Mr. Lewis MacConnach, secretary, are again at their desks after an absence of several weeks in the far west and south in the interest of the service.

Mr. V. V. Stevenson, division electrical engineer, of San Francisco, is in New York on company business.

Mr. M. N. Redding, traffic chief at Philadelphia, was a recent New York visitor.

Superintendent A. L. Edgecomb, of Boston, has gone to Southern Pines, N. C., for the benefit of his health and expects to resume full duty at Boston within a few weeks. Mr. Edgecomb has been suffering from nervous prostration since last July, but his friends will be glad to learn that he has now fully recovered.

Signs of new design are being painted on the principal windows on the main floor of this company's building at 253 Broadway, New York. One shows a facsimile of a message on one of the new message blanks and the others represent the company's trade-mark.

Mr. Louis J. Mackey, former manager of the Franklin, Pa., office and who was recently appointed chief clerk to Mr. H. Scrivens, district superintendent at Pittsburg, Pa., was tendered a dinner on February 18 by twenty-two of Franklin's representative citizens on his departure from that city. He was presented with a handsome gold watch as a testimonial of the regard and esteem with which he was held by the citizens of Franklin.

A branch office has been opened by this company in the Marlborough-Blenheim Hotel at Atlantic City, N. J.

The receiving department of the main office at Boston, Mass., will be refitted and enlarged. The plan contemplates making it one of the handsomest offices in the country.

Mr. C. R. Snyder, operator in the Altoona, Pa., office has been transferred to Franklin, Pa., as manager to succeed Mr. L. J. Mackey, whose appointment as chief clerk to Mr. H. Scrivens, district superintendent at Pittsburg, Pa., as noted in these columns March 1.

Mr. T. P. Wheeler, whose resignation as night chief operator at St. Louis, Mo., was announced March 1, was born in Huron County, Ohio, December 25, 1847, and entered the telegraph service at Norwalk, Ohio, in 1863. He has held positions in various places throughout the country and was night chief operator at St. Louis from May 1, 1884, until March 1 of the present year, when he resigned on account of ill health. Mr. Wheeler is now living in retirement at Walnut, Kan.

Telegraph Men at the Opera.—Mr. Clarence H. Mackay, president of the Postal Telegraph-Cable Company, New York, entertained several members of the staff of that company and of the Commercial Cable Company, at the first performance of the new American opera, "Natoma," at the Metropolitan Opera House, New York, February 28. Among the guests of Mr. Mackay were Mr. C. C. Adams, second vice-president, Postal Telegraph-Cable Company, and wife; Mr. C. P. Bruch, third vice-president, and wife; Mr. E. C. Platt, treasurer, and wife; Mrs. Nally, wife of Mr. E. J. Nally, vice-president and general manager, and Miss Leslie Foster; Mr. E. B. Pillsbury, general superintendent and Mr. M. M. Davis, electrical engineer.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Belvidere Brooks, general manager of the company, has returned to his office after an extended western and southern business trip. The returning party was made up of W. N. Fashbaugh, traffic engineer, S. B. Haig, assistant traffic engineer, and W. C. Merly, secretary, in addition to the general manager.

Mr. Thos. F. Clark, vice-president of the company, accompanied by his wife, sailed for England on February 4 on business connected with the service.

Mr. S. B. Haig, of the traffic department, New York, has returned to his office after visiting southern division offices.

Mr. Thomas W. Carroll, assistant to the general manager, is making an extensive trip of inspection. He recently visited Canada in the interest of the service.

Mr. Henry D. Estabrook, formerly solicitor of this company, on March 1 became a member of the law firm of Noble, Jackson and Hubbard, 52 William Street, New York. The firm name will henceforth be Noble, Jackson, Estabrook and Hubbard. Mr. Estabrook is, however, retained by the Western Union Telegraph Company for special service.

The Western Union stock transfers are now made by the treasurer of the company instead of by the secretary as formerly.

Mr. H. C. Worthen, general superintendent of the Southern Division, Atlanta, Ga., entertained Mr. S. B. Haig, of the traffic engineer's office, New York, and Mrs. Haig, at the Mechanical and Manufacturers' Club, Atlanta, Ga., on February 10.

Mr. Astley C. Terry, of the American Telephone and Telegraph Company, Philadelphia, for many years identified with the same service at Pittsburg, Pa., has been appointed district commercial superintendent of the Third District, with headquarters at Pittsburg, Pa., vice Mr. N. E. Church appointed commercial superintendent at Pittsburg. Mr. Terry is a well-known old-time telegrapher and was for many years in the Western Union service at Buffalo, N. Y. His advancement in late years has been progressive, his honors having been achieved on merit alone.

Mr. W. A. McAllister, of the operating department, main office, New York, has been appointed traffic superintendent of the Central Cable Office, 16 Broad Street, New York.

The Salt Lake City office will be moved into larger quarters in the Tribune building. The furniture will be in Flemish oak and the decorations will be artistically carried out. Free instruction in telegraphy will be given the messenger boys.

The postponed dinner of the Morse Electric Club of New York will take place Thursday, April 6, at the Hotel Savoy.

Mr. Henry K. Griffin, chief operator of the Western Union Telegraph Company at Atlanta, Ga., was born in Bedford, N. Y., December 22, 1864, and entered the telegraph service in that place in June, 1881. He has held positions as operator and manager for the Western Union Company at Ridgefield, Conn., and manager of

Digitized by Google

the Postal Telegraph-Cable Company's office at Bridgeport, Conn. Coming to New York for the Western Union, first as operator, he advanced through the positions of assistant quadruplex chief, traffic chief and chief in charge of the quadruplex department, nights. He has filled his present position since December 31 last.

Mr. Harry J. Carpenter has been appointed district traffic superintendent for the Western Union Telegraph Company, with headquarters at Nashville, Tenn. Mr. Carpenter was born at Cohoes, N. Y., November 8, 1867, and entered the telegraph service as messenger in his native town in 1880. He has held positions at Albany, N. Y., Haverhill, Mass., Charleston, S. C., and Charlotte, N. C. On October 8, 1910, he was appointed district traffic chief for western North Carolina, but, on the discontinuance of the traffic force, on February 1 of this year, he was appointed chief operator at Charlotte, N. C., which position he held at the time of his recent appointment.

American District Telegraph Co. of New Jersey.—At the annual meeting of the American District Telegraph Company of New Jersey held in Jersey City, February 14, Messrs. Theo. N. Vail, Newcomb Carlton, William H. Baker and H. B. Thayer were chosen directors.

B. S. Jones, District Commercial Manager Western Union Telegraph Company, Seattle, Wash.

Mr. Branch S. Jones, recently appointed district commercial manager for the second district, Pacific Division, of the Western Union Telegraph Company, with headquarters at Seattle, Wash., was born in Henderson County, Ill., November 14, 1872. He entered the service of the

BRANCH S. JONES.
District Commercial Manager, Seattle, Wash.

Western Union Telegraph Company as messenger in 1888 at Marshalltown, Iowa, and was employed at that point in various capacities until 1904, when he went to the Pacific Coast. He was manager successively at Tucson, Ariz., Sacramento, Cal., Goldfield, Nev., and Spokane, Wash., from which latter position he was advanced to his present post.

G. W. Deetz, Manager Western Union Telegraph Company, Atlantic City, N. J.

Mr. George W. Deetz, manager of the Western Union Telegraph Company at Atlantic City, N. J., it is expected will render valuable assistance in the preparations for the convention of the Old-Time Telegraphers and Historical Association and the Society of the United States Military Telegraph Corps, which is to be held at

GEORGE W. DEETZ.
Manager Western Union Telegraph Company, Atlantic City, N. J.

that famous resort on September 5, 6 and 7. Mr. Deetz is a member of the executive committee of the Old-Time Telegraphers and Historical Association. He is a native of Philadelphia, where he was born on November 29, 1867. He began his telegraphic career in Philadelphia in 1882 as messenger, and advanced through various positions until 1887, when he became manager of the office at the Broad Street station. In 1892, at the age of twenty-five, he was appointed manager of the Camden, N. J., office, which position he held for eleven years, when he was transferred to the Atlantic City office as manager. Mr. Deetz will not leave anything undone that will contribute in the slightest degree to the enjoyment of the members of the two organizations and their families who will attend the convention.

Keep posted on the latest developments in Telegraphy and Telephony by subscribing for Telegraph and Telephone Age.

Mr. F. E. Howell, manager of the Western Union Telegraph Company at Utica, N. Y., writes: "I believe the Telegraph and Telephone Age to be the best paper in its line that I have ever known. It affords me many hours of solid pleasure."

Mrs. D. M. Tillotson Retired on Pension.

Mrs. D. M. Tillotson, of the Chicago office of the Western Union Telegraph Company, has, after a long and faithful service, been retired on a pension. Mrs. Tillotson is a native of New York State and was the first female operator employed

MRS. D. M. TILLOTSON OF CHICAGO.

in the Chicago office. She never used the typewriter, but could handle sixty messages an hour, this having been proved on test eight years ago.

Mrs. Tillotson's retirement took effect February 15 after a service of fifty years. She has a large circle of friends in and out of the profession who will agree that she has earned a well-deserved rest from her long labors.

The Cable.

Atlantic Cable Recovered.—The Commercial Cable Company's repair ship "Mackay-Bennett," during the year 1910, picked up from the bottom of the Atlantic Ocean 422 miles of transatlantic cable, which the company discontinued using in 1909, when new cables were laid. The picked up cable will be used to advantage elsewhere.

Life at a Cable Station.—It is not generally realized that a cable station at an important point is a village in itself. At the Waterville, Ireland, station of the Commercial Cable Company there are thirty-nine family houses; three buildings containing single men's apartments; operating department and office building; club house; recreation hall with a stage for amateur performances; school for employes' children; two water towers, an electric lighting system, a fire engine and a fire brigade organized from the staff.

Landing Submarine Cables.—In laying the new telegraph cable between Newbiggin, England, and Arendal, Norway, a novel process was adopted in landing the shore end. The usual method of the British postoffice service is to raft the cable ashore, but in the case of this new cable a hauling rope was brought ashore on a raft and passed through a sheave or pulley secured to a wooden frame buried in the sand. It was then carried through a second sheave, placed about 150 yards from the first, and thence back to the ship. In this way the coming and going portions of the rope were kept apart, and as one end was drawn into the ship by the engines, the other end, to which the cable was attached, was pulled ashore. As the cable passed from the ship to the water it was lashed to empty barrels placed at suitable intervals, and was thus kept afloat.

South American Cable Interruptions.—United States Consul Isaac A. Manning, at La Guaira, Venezuela, in a communication states that at various times during the past year the cable of the French Cable Company giving communication between Venezuelan ports and the United States has been seriously interrupted, frequently for several days at a time. This, he says, has been a source of serious inconvenience to merchants and others interested in trade between the two countries, as the only communication possible has been, under these circumstances, via Guadeloupe and the West India Cable Company, with an extra charge of $1.24 per word to or from the United States and of $1.10 to or from Europe. The interruptions have occurred from storms among the land lines crossing Santo Domingo or by the cable being fouled by vessels in the shoal water of the Dominican coasts. He advocates the laying of an American cable connecting the United States with the ports of Colombia and Venezuela. This would unquestionably have to be done by the French Cable Company which has the cable concession from Venezuela. The concession still has several years to run. [As a matter of fact the business between the United States and Venezuela is not sufficient to support one cable. Therefore, a second cable is out of the question.—Ed.]

British Postmaster-General on Cable Rates.

The British Postmaster-General delivered an address on cable rates at the annual dinner of the British International Association of Journalists on January 28. He said in part:

"The present cable rates, so far as they are used by business men, are not unduly high, owing to the rapid growth of the use of code telegraphy. But the case is different in regard to cablegrams in plain language, whether they are social telegrams or press telegrams. The assent of nearly all of the great cable companies throughout the world has been obtained to a reduction of fifty per cent. in the charges for plain-language telegrams which are subject to be deferred for a time not exceeding twenty-four hours in any case. The assent of one or two foreign administrations is still to be obtained to that reform. It is not possible at the same time to press the cable companies for a reduction of press rates. That is a reform for the future. When the reduction in the charges for uncoded deferred telegrams has been carried through, it is intended to give immediate attention to certain questions as to unduly high rates for press cablegrams."

Digitized by Google

William Hutchinson, manager of the Commercial Cable Company's office in the New York *Herald* building, died March 1, at his home in Brooklyn, N. Y. He was born at Chorley, Lancashire, England, February 9, 1870, and became an operator in the British Post Office Telegraphs. He came to New York in 1890, and has been identified with the Commercial Cable Company since that year.

Canadian Notes.

Mr. Geo. Matthews, who left the Quebec office of the Great North Western Telegraph Company seven years ago to work in the main office of that company at Toronto as operator, later becoming assistant traffic and wire chief, has returned to the Quebec office to become chief operator. Mr. Matthews is a native of Quebec, and learned the telegraph business in the office of which he now comes to take charge.

Canadian Old-Timers.—"Old-time telegraphers" of Edmonton, Alberta, Canada, met in reunion recently and talked over the early days of the telegraph in that region. The "early days" in that new country were in 1879, when the first telegraph line was strung into Edmonton. Mr. Alexander Taylor received and sent the first message. Among those present at the meeting, besides Mr. Taylor, were Messrs. George Fraser, M. C. Wright, George A. Reid and J. S. Macdonald, superintendent of Dominion Telegraphs at Edmonton.

No Case Against Canadian Managers.—The conviction registered against certain Canadian telegraph managers for violation of the Miller Act by transmitting betting information has been quashed on the ground that there is nothing to connect them with the alleged offence.

The Late Mr. McMichael.

Mr. S. B. McMichael, assistant general manager of the Great North Western Telegraph Company of Canada, Toronto, Ont., requests us to publish the following note: "On behalf of Mrs. I. McMichael, Miss Edna McMichael and myself, I wish to express our appreciation of the many kind words of sympathy conveyed to us by the officials of the telegraph company and the close personal friends of I. McMichael at the time of our recent bereavement."

Municipal Electricians.

The Gamewell Fire Alarm Telegraph Company, will on May 1 move its offices to the Underwood Building, now being erected on the corner of Church and Vesey Streets, New York.

Telephone Fire Alarm System.—The Denio General Electric Co., of Rochester, N. Y., has arranged to install its telephone fire alarm system in connection with the system of the Utica Home Telephone Co., Utica, N. Y. This converts every telephone connected with the Home plant into an automatic fire alarm station.

New York's Fire Alarm Telegraphs.—Commissioner Rhinelander Waldo, of the New York Fire Department, in his annual report for 1910 states that the fire-alarm telegraph system in the Borough of Manhattan should be replaced as quickly as possible, and that an electrical engineer has been appointed to superintend the replacing of the present antiquated system.

Electrical Exhibits at Convention of Chiefs of Police.—Police telegraph and signal systems will be shown at the exhibition to be held in connection with the eighteenth annual convention of the International Association of Chiefs of Police in Rochester, N. Y., June 13 to 17, inclusive. Mr. J. M. Quigley, chief of police, Rochester, N. Y., is chairman of the committee of arrangements to whom all communications regarding exhibits should be addressed.

Fire Alarm System in Kansas City.—A system of turning in fire alarms from street corners is to be installed under the direction of Mr. Bert Haldeman, electrician of the fire department at Kansas City, Mo. The new plan contemplates connections with the Gamewell system of the police department and will notify both fire and police headquarters. Separate apparatus will be installed for fire alarms. Indicators in both police and fire headquarters will designate the locality from which the alarm is sent in.

The New Standard Volt in France.—Announcement has been made by the Laboratoire Central d'Electricité, Paris, of the change in the value assigned to the standard Weston cell, in accordance with the recommendations of the International Committee. The new value is now in effect in France, Germany and the United States. It was adopted by the Bureau of Standards at Washington, January 1, as announced in these columns March 1.

Electrical Engineering Exhibition in England.

The third triennial exhibition of Electrical Engineering and Machinery will be held at the Olympia, London, from September 23 to October 21, both dates inclusive. It is to be international in character. Information regarding the exhibition may be obtained of the Bureau of Manufactures, Washington, D. C.

Mr. M. W. Jones, chief train despatcher of the Guayaquil and Quito Railroad, Guayaquil, Ecuador, formerly identified with the Western Union Telegraph Company's service at New York, in renewing his subscription for another year, writes: "I certainly could not get along without the Age. It keeps me in touch with the doings of my many friends 'Along the Great White Way' and other ways so that although I am a good many miles from New York I will not be entirely 'green' if I should return."

High Power Telephone Transmitter and Automatic Telephone Repeater.

Mr. C. Adams-Randall, of New York, has invented a telephone transmitter of high power and an automatic telephone repeater, both of which were exhibited in practical operation at the recent convention in Chicago of the National Independent Telephone Association. The tests, it is stated, proved highly satisfactory and much enthusiasm was manifested in the devices by the delegates present.

The transmitter differs in several essential features from its predecessors. The fundamental difference consists in combining a variable resistance, preferably carbon granules, under pressure, with a vibratable non-conducting diaphragm, in contradistinction with the present instrument in which the carbon granules are held in a loose free state, the speaking contact being obtained by the weight of the loose granules.

Under Mr. Randall's method of construction, a low normal resistance is obtained that permits the use of a low-power current-energy and also affords a greater conducting capacity for any increased energy, generally in proportion to the cross section of the subdivided mass of granulated carbon, or variable resistance, when confined under pressure.

With instruments of this class a current energy may be employed equal to that now generally used with granular transmitters, and, when required, a current energy many times greater than is now possible may be utilized without any change in construction or adjustment, and with proportionate increased efficiency.

The maximum current energy that may be used is yet undetermined, but with the instruments at present in use the power may be increased three, four or more times that of the standard transmitters. This increased power means increased distances of operation, which has been proved on actual telephone lines. It also means, it is claimed, that the present costly low-resistance circuits may be duplicated at greatly reduced cost by the use of smaller copper or iron wire. Assuming, from a profitable commercial basis taking into consideration the various details of practical telephony, such as current consumption, cost of circuit construction, electrical troubles arising from induction, leakage, etc., that the distance of direct transmission must be limited to 1000, 2000 or 3000 miles, it naturally follows that to increase this maximum distance two, three or more times, the messages must be re-transmitted or repeated manually or automatically. As manual re-transmission is impracticable, an automatic telephone repeater becomes an actual necessity if the telephone is to have as wide a scope as the telegraph.

The Randall automatic telephone repeater differs radically in principle of operation, construction and in application from all previously patented repeaters. It is operative on longer circuits and is more efficient on present circuits. It bears the same relation to telephony that the telegraph repeater does to telegraphy.

This invention has for its object the re-transmission or automatic repetition of telephone messages from the terminal of one circuit into or over a second circuit, and from a second circuit to another or other circuits, much in the same manner as telegraph messages are automatically re-transmitted. The essential elements are: electromagnetically-operated telephone transmitters of special construction, and electromagnetic controlling devices, the operative parts being in duplicate, one-half being in one circuit, and the other half in a second main line circuit or a local circuit when used as a relay.

The electromagnetic transmitters are actuated by the voice-caused currents passing from the distant transmitting station over the circuit of which it is a part, and serves to automatically re-transmit the spoken messages into or over one or more separate and distinct circuits.

The repeater transmitting apparatus comprises an electromagnetically-operated transmitter, a suitable transformer, and a local battery, normally open, connected in circuit through the action of the electromagnetic controller. The controller of the apparatus is of the telegraph relay form, and automatically makes or breaks the main line and local circuits connected to the circuit-closing devices of the controller.

The controller is actuated by a current energy much greater than that of the voice-caused current in general use, such as is obtained from a main line battery, or preferably by means of a local battery in circuit with the electromagnet of the controller. In this arrangement the action of the local battery and the controller is determined by the action of a suitable relay included in the main line metallic telephone circuit, at or near the repeater, or on one side of the metallic circuit grounded. The latter arrangement overcomes all trouble resulting from bridges on the metallic circuit. With bridged metallic circuits it is only necessary to install a suitable condenser in the bridges.

The main line battery for actuating the controller when it is in the main line, or for actuating the main line relay, is included in the circuit at any convenient point or it may be divided, with one portion at the repeater, and another portion at the distant terminal station or elsewhere. The battery is normally open and may be closed manually at either of the terminal stations, when required, with a circuit-closing key attached to the telephone receiver. It may also be automatically controlled at either of the transmitting stations by the act of speaking into the transmitter through the medium of intermediate devices.

The object of the controller is to select, determine and control the main line and local circuits and the local batteries. The controller of one of the main lines when energized, closes the local battery and circuit for the repeater transmitter of that line and also that of the other main line cir-

Digitized by Google

cuit, for either sending or receiving. Under this combination of circuits and devices, the two transmitters of the repeater cannot operate simultaneously and therefore humming or singing is effectively prevented, and the necessity of balanced circuits and frequent re-adjustment of the apparatus is entirely overcome.

The electromagnetic transmitters are operated with the current obtained from any good granular transmitter and when thus operated will re-transmit into a second separate circuit of equal or greater distance. With transmitters of greater power the length of circuit from the terminal station to the repeater can be proportionately increased. The automatic repeater therefore serves to double the distance of the primary circuit by repeating into a second circuit and with a repeater at the distant terminal of the second circuit, the message can be automatically re-transmitted into a third circuit with an auxiliary power equal to or greater than that of the manually operated transmitter at the first terminal. On long toll circuits composed of cable and aerial lines with an intermediate automatic repeater present operative distances can be increased two or more times.

With the repeater used as a relay at the terminal of a circuit the volume of tone at the receiving instrument is greatly augmented, and speech that is barely heard by direct transmission becomes as distinct and as reliable as on telephone circuits of moderate length.

For subscribers and toll lines on which the transmission is unsatisfactory this invention is especially applicable and with its use intercommunication is made more reliable; distances increased, and "phantom" circuits more efficiently operated.

In regard to the tests, Mr. C. H. Smith, secretary and general manager, and Mr. P. C. Cockerill, superintendent of the New State Telephone Company, Sioux City, Iowa, report that they repeatedly talked over circuits with the repeater in that could not be talked over without it. The instrument was also tested on the lines of various other independent telephone companies with, it is stated, the most satisfactory results. All those witnessing the tests agree that the Randall repeater will make it possible to talk commercially over distances that have never been talked over before. Speech over long circuits, it is claimed, is as loud, clear and distinct as over local lines.

Radio-Telegraphy.

Mr. John Bottomley, vice-president of the Marconi Wireless Telegraph Company of America, New York, in commenting on the decision in the suit brought by Mr. Marconi against the British Radio-Telegraph and Telephone Company, referred to in another column, stated that if the decision is upheld by the court of last resort in England and followed in other countries it would give Mr. Marconi complete control of the wireless situation.

Wireless Monopoly in South America.—It is announced in Berlin, Germany, that Brazil, Argentina, Peru, Chile, and Uruguay have decided to establish State monopolies in wireless telegraph. The equipment, it is stated, has been ordered from Germany.

Wireless and Aeroplanes.—Wireless telegraphy from and to aeroplanes is attracting much attention among inventors at the present time, and the problem is pressing with increasing demand for its solution. The Goff Aeroplane Company, Chicago, makes model aeroplanes which might be utilized for experimental work of this character. The company makes an interesting proposition in its advertisement in regard to its models.

Jack Binns' Suit.—Mr. Jack Binns, the wireless hero of the Florida-Republic steamship disaster, has brought a second suit for $50,000 against the Vitagraph Company of America for selling moving picture films which purport to represent him in a moving picture drama, "Saved by Wireless." Mr. Binns declared in his complaint that he declined a good offer to go on the stage, and he objects to having the Vitagraph Company making capital out of what he declined to make capital out of himself, on the ground that it belittles him. Since the foregoing was written a verdict for $12,500 was rendered in favor of Mr. Binns.

Detectors and Antennæ.—Mr. John Beattie, of Leete Island, Conn., says, in reference to antennæ for wireless telegraphy: "Two years ago during a windstorm my antennæ were disarranged. While engaged in straightening up the poles my wires, about 1,000 feet of No. 14 naked copper, were laid irregularly as they fell upon the wet grass. I went into the house while my men were straightening the poles and as an experiment I threw my switches over to receive, when to my great astonishment I heard signals from a station fifty miles away.

"I saw a recent article on 'Wireless for Railroads.' I thought I would make some tests and did so, with the following interesting results: I received signals from O H X and T W T without 'earth' connections. These New York stations are ninety miles from this place. I received signals from two steamers on Long Island Sound which were ten or more miles from my station. The antennæ were disconnected and the ground was disconnected. I used a single slide tuning coil, .006 microfarad condenser and a 'Perikon' detector, which is standard in the navy.

"It is possible to receive signals through or from limited distances without the use of extensive highly elevated wires and without the use of a ground connection."

Telegraph and Telephone Age is headquarters for all electrical books.

The "Singing Spark" System of Wireless Telegraphy*.

In December, 1906, Prof. Max Wien in Germany published the first account of a phenomenon on which the new method of wireless telegraphy has been based. In order better to illustrate this phenomenon, let us consider the general behavior of two circuits, one of which (viz., the exciter circuit) comprises a spark-gap, whereas the other circuit is tuned electrically and closely coupled to the former. From its initial maximum amplitude, the oscillation in the exciter circuit rapidly decreases in intensity, so that, after a few oscillations, its energy is communicated to the second circuit and the primary energy becomes exhausted. There will then take place a reflux of energy from the secondary to the primary, until the latter once more contains the whole of the remaining energy, and this cycle is repeated several times. It might be supposed that the spark would be quenched at the very moment the energy had, for the first time, left circuit 1. However, the course of events is, in reality, quite different, the spark being maintained throughout the fluctuations of energy until the oscillation of circuit 2 has vanished almost entirely. The resistance of a spark-gap is known to rise as the current intensity decreases, and as the current amplitude of the exciter at the end of the first stage falls at a certain moment to zero, the resistance of the spark-gap should then be very high. But this is not found to be the case, and owing, it seems, to the accumulation of heat, the increase in resistance lags behind the reduction in current intensity, so that at the critical moment its maximum value is not yet attained. The secondary circuit then exerts an inductive effect on the primary, and the potential difference produced at the terminals of the spark-gap, owing to the still moderate resistance, results in the production of further sparks. The spark discharges, owing to this reflux of energy, are thus never discontinued, and the resonance curve of such a coupled system always yields, in the place of the fundamental vibration of the tuned system, two new frequencies different from the former, viz., what are called two coupled waves. Prof. Wien's experiment was as follows:

While examining, by means of a resonance circuit, two such vibratory circuits closely coupled together, of which the primary one contained a very short spark-gap, the Profressor found, instead of the usual two coupling waves, a system of three waves. This phenomenon was due to the resistance of the very short spark-gap increasing very rapidly, so that, the vibrations in circuit 1 disappearing rapidly, only those of circut 2 were left. The latter then could go on vibrating, as an uncoupled individual system with its own frequency of vibration and damping.

Count Arco, of the German Wireless Telegraph Co., took up this experiment with a view to obtaining by its means nearly undamped vibrations, and in conjunction with Mr. Rendahl succeeded in working out the system of wireless telegraphy, termed the "singing-spark" method, of which a short description follows.

The sender consists of an exciter circuit, containing the "quenched spark-gap," as Prof. Wien's arrangement is called. To the exciter circuit is coupled, inductively or otherwise, the tuned antenna system, the coupling between the two circuits being on the one hand so close as to cause the exciter energy to pass as quickly as possible; and, on the other hand, so loose as to damp any waves outside of the secondary main vibration. Coupling efficiencies of 15 per cent. to 20 per cent. are obtained in most cases, the damping of the wave emission being, in the case of slowly-radiating umbrella or T-antennas, about .08 to .1 if the antenna vibrates with its fundamental wave, and only .05 to .03 if the wave be extended to three or four times the fundamental vibration. The condition of the spark-gap does not exert any influence on the frequency of the second circuit, and accordingly it does not need to be regulated. The period is, on the contrary, absolutely constant, so that resonance can be fully utilized.

In order to control the wave length, either the capacity of condensers or the inductance of inductive coils—or both factors—can be altered, the most convenient method being the variation of inductive coils, as used in wireless telegraphy in the shape of "variometers." While the latter had previously only been designed for low pressures and current intensities, so as to be suitable only for the receiver, the German Wireless Telegraph Company succeeded in designing them for receiving very considerable amounts of energy, so that they could be employed in connection with the sender. The sending variometer consists of a fixed disk and a rotary disk, both of which are wound with wire, the windings being arranged either in series or in parallel. When the disks are adjusted so that the fields of the four coils are added, the self-induction will reach a maximum, whereas, in the event of the fields being in opposition, the self-induction is a minimum. The intermediary positions then yield any value comprised between these extremes. Variations in the ratio of 1 : 16 can thus be obtained by a complete rotation and a single change from parallel to series with the variometer.

In the case of a constant primary capacity, the variometer thus allows the wave to be altered from 1 to 4—e. g., from 500 to 2,000 metres; and more complicated constructions even allow of a continuous variation between 1 and 5. In order further to increase the range of waves, either the variometers are changed or the capacity is altered by steps.

As regards the feeding current of the exciter, a maximum number of impulses being desirable, alternating currents of about 500 to 2,000 cycles per second were adopted, giving a succession of 500 to 2,000 spark impulses per second. The reg-

*London *Electrical Review.*

Digitized by Google

ularity of this spark generation can be made so great as to convert the noise of the spark into a real musical sound. The purity of the latter plays an essential part in connection with the utilization of energy and freedom from disturbance in the receiving apparatus.

The alternator current is transformed with a view to charging the exciter capacity to from 4,000 to 70,000 volts, according to the dimensions of the station. This transformation is effected in large stations by means of an induction coil, and in smaller stations by a transformer.

The high-frequency apparatus of the exciter circuit will now be described. The main point in this connection was the design of the quenched spark-gap itself, in which connection many difficulties had to be overcome. In order to make the succession of sparks quite regular, the electrodes were given the shape of rings, the active surfaces being planed. In order to keep the electrodes at very short distances apart, mica was inserted at the circumference. By distributing the total energy over several spark-gaps, the experimenters were able to convert any amount of energy into electric vibrations. Copper and silver metals of great heat conductivity were chosen as electrode materials. The large number of individual spark-gaps, so far from complicating operations, allows a very simple regulation of the transmitted energy.

In contrast to the trouble caused by the spark-gap, the design of the capacity did not offer any difficulty. As, owing to the rapid quenching of the primary circuit, any excessive care in regard to slight losses was quite superfluous, the experimenters were able to substitute for the Leyden jar the far less efficient paper condenser, of which a sufficient number were connected up in series.

In connection with both the capacity and the third element of the exciter circuit, the inductive coil, maximum safety and minimum volume were the most important points to be considered. The rapid quenching of the exciter circuit ensured an economy previously unknown in the production of high-frequency oscillations, the efficiency coming very near 100 per cent.

Far more difficult was the design of the secondary circuit, as the energy in the latter is kept up for a very long time, while its damping determines the damping of the electric wave given out. The Braun arrangement, in conjunction with slowly radiating slightly damped antenna, was provisionally adopted, in spite of many drawbacks. Very fine subdivided copper wire of 0.07 mm. diameter was used in winding the secondary circuit. Owing to the very high current intensities in the antenna, very low resistances had to be designed. In the case of the smallest type, the 2-kw. station, the antenna coils were made up of 480 individual conductors connected up in parallel whereas the 8-kw. station comprises upwards of 3,000 wires, each of which has exactly the same resistance and self-induction.

In order to allow the wave length of the antenna to be readily varied, one section of these coils has been designed with continuously variable self-induction, while the remainder is variable by steps. Whereas the old exciter method at most allowed of an extension of about 1.5 times the fundamental vibration of both parts, of a very extended wave variation.

At the receiving station the detector consists of a contact between a thin graphite point and a plate of lead sulphide or iron peroxide (mostly the latter), which contact has a resistance of several thousand ohms. Such detectors work as current rectifiers, and, without any auxiliary battery, transform alternating currents into waning trains of pulsating continuous current. One thousand such wave trains per second, given out from the musical sender, are received as 1,000 direct-current trains, and, provided the impulses be of sufficient regularity, cause a membrane to give out a musical sound. In order to produce a given sound intensity, a smaller current amplitude in the telephone suffices than in the case of the ordinary irregular impulses perceived as noises.

The musical sound of the sparks imparts to each sender, in addition to its own wave-length and damping, another characteristic. Musically pure sounds are known to be perceptible, even if very feeble, and accordingly allow telegraph operation to be carried on even during the most violent atmospheric disturbances. The operator thus can ascertain by the pitch of the sound which station a given wave train comes from. Owing to the large scale of sounds embraced by the ear and the telephone, a very wide interval of variation (from about 200 to 2,000) is thus obtained by very simple means. By means of a resonance relay, the selectivity, as well as the sensitiveness of the arrangement, is increased considerably. The apparatus can also be designed for Morse signals, which are used whenever the subjective method fails.

The Morse receiver is actuated by a resonance relay and ensures a mechanical accumulation of undamped sender impulses. It may be said to be the first graphical receiver free from disturbance which has so far been produced in wireless telegraphy, as well as the first graphical receiver which can be used over about the same range of distances as the acoustic receiver.

The smallest type of apparatus, which requires a primary power of 1.5 kw., in the case of 20 metres (66 feet) antenna height ensures wireless communication to 200 km. (124 miles), and with an antenna of 35 metres (115 feet), to 600 km. distance (373 miles). The 8-kw. apparatus, with an antenna 60 metres high, has a guaranteed range of 2,500—3,000 km. (1550—1865 miles), and that of 20 kw., with 85 metres (279 feet) antenna height, a range of 3,500—4,500 km. (2175—3000 miles) over a level country, or the sea. The 2-kw. station can be mounted as a portable land station in a military vehicle.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

March 16, 1911.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Western Union Pension Scheme.

We have heard many expressions of satisfaction from all quarters regarding the proposed adoption of a pension system by the Western Union Telegraph Company. The plan when carried out will, of course, cost the company a large sum of money, but, on the other hand, it will receive in return service from satisfied employes that it could not obtain in any other way. The good will and loyalty of the employes is of far greater value to a large corporation than dollars and cents.

In an extensive business there are two important factors to be considered—the employer and the employe. One cannot get along without the other and it is to the interest of both parties that the relations between the two be harmonious. This principle is being more and more recognized by large employing organizations, and in its practical application great benefits result to employer and employe alike. Apart from the radicals and chronic "kickers" in the ranks, which happily are relatively few in the telegraph service, the greatest good to the greatest number will result from the practical operation of the pension plan. It will be a great satisfaction to the employes to know that long, faithful service will be recognized and rewarded by the employing company.

After a man has devoted the best years of his life to the service of the company common justice entitles him to some reward in his declining years, when he is physically unable to perform his duties as in the past.

The effect upon the minds and habits of operators in line with the pension list will be wholesome. It will have a steadying tendency upon those who have an itinerant disposition, and bring them to a realization that it will be to their own interest to hold their present positions as long as possible; prepare themselves for higher positions, and be faithful to their employer. If they move about and are unmindful of their obligations towards the company it is their own loss.

In whatever light the proposed system may be viewed there can be no question as to the advantage to both parties concerned. The employes will work with a mind free from fear as to what will become of them when they grow old. This feeling will be uplifting and result in the individual rendering better service. The company's benefits appear at this point. In the long run the company will gain much more in better and continuous service than it pays out in pensions. The company is certainly to be commended for its interest in the welfare of its deserving employes.

A Lesson in Loyalty.

The following little essay from the pen of Mr. Elbert Hubbard is of general application and will be read with interest.

A business is a steamship bound for a port called Success. It takes a large force of men to operate this boat. Eternal vigilance is not only the price of liberty, but it is the price of every other good thing, including steamboating.

To keep this steamship moving, the captain requires the assistance of hundreds of people who have a singleness of aim—one purpose—a desire to do the right thing and the best thing in order that the ship shall move steadily, surely and safely on her course.

Curiously enough, there are men constantly falling overboard. These folks who fall overboard are always cautioned to keep away from dangerous places, still there are those who delight in taking risks. These individuals who fall off, and cling to floating spars, or are picked up by passing craft, usually declare that they were "discharged"—they say the captain or the mate or their comrades had it in for them.

I am inclined to think that no man was ever "discharged" from a successful concern—he discharges himself.

When a man quits his work—say, oiling the engine or scrubbing the deck—and leans over the

Digitized by Google

side calling to outsiders, explaining what a bum boat he is aboard of, how bad the food is and what a fool there is for a captain, he gradually loosens his hold until he falls into the yeasty deep. Now, there is no one to blame but himself, yet probably you will have hard work to make him understand this little point.

When a man is told to do a certain thing, and there leaps to his lips or even to his heart the formula, "I wasn't hired to do that," he is standing upon a greased plank that inclines toward the sea. When the plank is tilted to a proper angle, he goes to Davy Jones' locker, and nobody tilts the fatal plank but the man himself. And the way the plank is tilted is this: The man takes more interest in the passing craft and what is going on on land, than in doing his work on board ship.

So I repeat: No man employed by a successful concern was ever discharged. Those who fall overboard, get on the greased plank and then give it a tilt to the starboard.

If you are on a greased plank, you'd better get off from it, and quickly, too.

Loyalty is the thing!

Now Is the Opportunity.

Mr. W. S. Barker, district plant superintendent, Western Union Telegraph Company, Boston, writes:

"Some one has well said that the past is secure. No matter what it has had or what it has been, this company has at its head today big men, men who are leaders, organizers and who have been and are now successful; one of their best assets is their knowledge of the details of the business which they are handling. They will make this company bigger and better than it ever was before and herein lies the opportunity of every telegrapher. I have never known a time when the future of the ambitious, honest hardworking telegrapher looked as bright as it does today."

Multiplex Telegraphy.

BY JOHN B. TAYLOR, SCHENECTADY, N. Y.

In your issue of March 1 you print and refer editorially to an article headed "Multiplex Telegraphy," by Mr. S. R. Beatty. As many enterprising men in the telegraph field who are not perhaps well versed in the calculation of alternating current circuits may devote some time to the study of this article and feel that some of their practical ideas are upset, it seems desirable to point out the serious mistake made by Mr. Beatty on which his calculations and conclusions are based. This mistake rests on his assumption that in the typical telegraph line, resistance, reactance and capacity are all connected in series, whereas the actual circuit may be pictured as a large number of combinations of sections, each composed of resistance and reactance in series, with capacity in multiple from line to ground. This results in current being transmitted in the form of a wave with maximum values of current and potential occurring at different times in different parts of the circuit, and different values of current at sending and receiving ends. The fallacy of calculating a value of current on this serial assumption is shown by comparison of the two examples given, in which cases the current is figured as being very much less for a 90 mile line than for one 345 miles in length. If another example is worked out on the same assumptions, and the length of line reduced to, say one mile, the answer would indicate that almost no current could be sent over such a short line, which any practical telegrapher, whether versed in alternating current or not, will immediately see is ridiculous.

The exact calculation of values of alternating current and voltage at different points in a long line is far from a simple matter. Where no great accuracy is desired, certain approximations can be made, such as assuming that the capacity of the line instead of being uniformly distributed, is concentrated and connected between line and ground at the halfway point.

Exact calculations for telephone and telegraph lines are carried out by formulas involving hyperbolic trignonometry as written up in various papers by Dr. A. E. Kennelly and others. Those of your readers who do not immediately see the fallacy in Mr. Beatty's treatment of the question will probably not be ready at once for taking up the hyperbolic functions.

Regarding the suggestions on adjustment of relays, my practical acquaintance with operation of quadruplex circuit is not sufficient to warrant any comments, except to point out that the law of inverse squares applies only to magnets of very special form and cannot be taken as applying to commercial forms of relay magnets.

Incidentally, in the formula given for current in a serial circuit of resistance, reactance and capacity on page 196, the symbol C should be capacity in farads, and not in microfarads. The value in farads has apparently been taken for making the calculation, although the arithmetic does not show it.

Multiplex Telegraphy.—In the article published in our issue of March 1, under the title "Multiplex Telegraphy," by Mr. S. R. Beatty, an error in the equation on page 198 passed unnoticed. It was due to reading the figures on a wrong line in the table of logarithms used in solving the problem. The result of the calculation was given as .173 watt, when it should have been .008576 watt.

Production of Platinum in the United States.—The Geological Survey, Washington, in its report for 1909 shows that 672 Troy ounces of platinum were produced in the United States during that year. The value was placed at $12,803, about $19 an ounce. Platinum is produced in this country only as a by-product of placer gold mining. The principal supplies of platinum come from Russia, the mines being in the Ural mountains.

Marconi English Patent Upheld by English Court.

The English patent granted to Mr. G. Marconi relating to the principle of tuning in wireless telegraphy has been upheld by an English court in a decision rendered February 21. The defendant in the suit was the British Radio-Telegraph and Telephone Company. The charge was infringement and in its defense the Radio Company claimed that the principle of the patent in suit was anticipated in an English patent issued to Braun in 1889.

The defense claimed that Marconi was absolutely anticipated by Braun in "loose-coupling" tuning. The counsel for the plaintiff claimed that Mr. Marconi had conceived the desideratum of having a closed reservoir which should gently give out energy, and the idea of a reservoir circuit which should have a constant oscillation backward and forward of such character that the oscillations would only gradually be given out to the other circuit, so that it should persistently oscillate. There was not, he said, a trace of these principles in any document before the date of the Marconi patent; there was no hint about it in Lodge, and there was no "building up" in Lodge. The result of the resonance that one got by tuning everybody knew, but the one thing that people did not know was that connecting a closed reservoir with an open aerial and attuning these, apart from trying to tune the aerial in one to the aerial in the receiver, was in fact an application of a well-known method of tuning in a new way and for a new purpose.

The Marconi interests claim that the patent upheld covers the entire principle of wireless tuning. As described in the patent specifications, the invention consists in including in a wireless-telegraph system, at the transmission station, the combination, with an oscillation transformer of a kind suitable for the transmission of very rapidly alternating currents, of a persistent oscillator and a good radiator; one coil of the said transformer being connected between the aerial wire and earth and the other coil connected in circuit with a condenser, a producer of Hertzian oscillations in the form of a spark producer, and an induction coil (constituting the persistent oscillator) controlled by a signaling instrument. The complete system also includes at the receiving station an oscillation transformer, one coil whereof is included between the aerial receiving wire and earth, constituting a good absorber of electrical oscillations, while a device responsive to electric waves, such as an imperfect contact or a device for operating the same, is included in the circuit with the other coil of said transformer. The system also requires at both stations the inclusion in the lines from the aerial conductor to the earth of variable inductances and the use at both stations of means for varying or adjusting the inductances of the two circuits at each station to accord with each other. The specification states that by this arrangement a perfect tuning of the apparatus is secured at a transmitting station and one or more of a number of receiving stations.

Maintenance of Storage Batteries.

Mr. W. P. Cook, of the plant department of the Pacific States Telephone and Telegraph Company, Seattle, Wash., gives, in the *Pacific Telephone Journal*, some notes concerning the care of storage batteries in general, that may be of interest to those engaged in this class of work. Since the vital question concerning storage-battery maintenance is in determining when and how long to charge them, it is therefore very desirable to be able to properly regulate these periods in order to prevent unnecessary overcharging or dangerous undercharging. Frequently the voltage readings exclusively are relied upon to determine these periods, while again the specific gravity readings alone are used. The specific gravity method is to be preferred, owing to the gravity changes being almost directly proportional to the charge or discharge, that is, if when a battery of the "Chloride" type fully charged tests 1.210 specific gravity, it will be found 1/3 discharged when it tests 1.205 S. G., 2/3 discharged when it tests 1.200, and discharged the allowable 15 points when it tests 1.195. These figures pertain to a cell that is filled with plates. Where the cells are only partly filled with plates the range in specific gravity reduces as the number of plates is reduced. In practice where a battery is charged daily it is advisable to raise the specific gravity by charging until it is within five points of the highest reading ever taken for this particular battery. Then, on the overcharge day, usually weekly, the charge should be carried until the fifteen point raise is reached, or until there is no further rise at the end of an hour. It is not uncommon to find the plates covered with lead sulphate, which is white in color, and in cases of this character the charging current should be left on at about one-half normal rate until the white is entirely dissolved, leaving the positive plates clear brown all over. It has been known to require several days of continuous charging to remove the sulphate, and since the sulphate was virtually formed by absorbing a portion of acid from the electrolyte, it would naturally follow that the specific gravity of the electrolyte would raise considerably by the time all of the sulphate was regenerated back into acid.

The cause for the accumulation of the sulphate is insufficient charging, and if the plates are permitted to remain in this condition long enough they will warp out of shape and need replacing. On the other hand, if the batteries are charged too much, the positive grids become soft and weak, letting the buttons fall out and eventually falling to pieces themselves.

The system of raising the gravity a certain number of points each charge and allowing it to drop a fixed number of points each discharge will greatly lengthen the life of the battery. If these observations are then transferred to a record sheet, a graphic picture of the battery will be had, which will illustrate any irregularities. The figures will also exhibit to what extent the batteries are being either under or overcharged.

The Military Telegrapher in the Civil War.

PART LVI.

Among the few military telegraphers of the Civil War still alive, and who took a prominent and active part in the first year of that memorable struggle, was Mr. L. A. Rose, now of Davenport, Iowa. Mr. Rose's story of his experiences shows what hardships the military telegrapher had to endure. There was no sympathy or sentimentality; every one who enlisted did so to engage in the harshest kind of activity, and the individual was not considered at all. There were no office hours—everyone was on duty all the time. He had to eat and sleep as best he could, and it was not always possible to get the opportunity to do either.

Mr. Rose endured the hardships that fall to the lot of a soldier in time of war, and the excitement of such a life is well portrayed in the story of his experience, a part of which is given herewith. Mr. Rose says:

"On May 8, 1861, while at Erie, Pa., I heard a message passing over the wire addressed to Anson Stager, superintendent of telegraph, Cleveland, Ohio, asking for a supply of operators to enter the United States military telegraph service. I at once applied by wire for a position, getting an answer within an hour and orders to report to David Brooks at Philadelphia for further instructions. I left Erie the same night and arrived at Philadelphia on the morning of May 10. During the day, operators Solomon Palmer, T. A. Davin, W. C. Hall and William MacIntosh of Boston arrived. We all left on the evening train for Havre de Grace to take the boat for Annapolis. Sol. Palmer was acting as captain, having letters to Thomas A. Scott, who was in charge of the government railroads and telegraphs. We arrived at Annapolis about 9 o'clock the next morning and Mr. Palmer presented his letters to Mr. Scott, who, however, did not read them but remarked that he wanted the operators to go to work that night as his own men were worn out.

"Mr. Palmer did not like the way he was treated and said we could go to work for Mr. Scott or go to Washington with him and he would see that we were taken care of. Hats went up, and all said "Palmer and Washington." We boarded a train heavily loaded with troops and arrived at Washington at 9 p. m., tired, hungry, and sleepy, not having had a meal or any sleep since leaving Philadelphia. Mr. Palmer took us to the National Hotel, where he gave us a good meal and told us to be happy until further orders. Mat. Buell of Buffalo and others joined us there in a day or two and all were put to work in the main office. Manager Snyder asked me to go to Beltsville for David Strouse, superintendent of military telegraphs, who wished to have a man there. After consulting Mr. Palmer I went to Beltsville, where I stayed about two weeks. I found Mr. Strouse to be a gentleman, and he did all he could for us. All who knew him regretted his untimely death.

"On June 8, 1861, I began work at the east end of Long Bridge with W. C. Hall and remained there until Alexandria was captured. I was ordered to Camp Trenton, June 24, with General Runyon of New Jersey in command. General Runyon was a gentleman and treated his operators as he did his staff.

"From here I went to guard camp at Springfield station. An operator named Cummings was with me. During the night pickets began firing and Cummings very unceremoniously left me asleep and went down the track to the relief camp. I may say here that General O. O. Howard was in command and sent me my rations in an old grain bag—very good but rather mixed—and if the Ellsworth Zouaves had not been near by I might have been obliged to eat the rations as they came. The Zouaves, however, thought that a telegrapher was deserving of better treatment and soon served me with chicken, bread, milk, etc.

"On the night of July 21 I started from Fairfax for Alexandria for a mess kit and supplies. The train was overhauled by an engine—an operator was wanted by the Secretary of War at Burke's about four miles from Fairfax. I started back and, when the engine ran off the track, I walked to Burke's, where I found the Secretary of War. I laid down for a little rest with an old relay for a pillow and was called by an officer about 4 o'clock in the morning. I opened the office and the battle soon afterwards began. The Secretary of War left and I went back to Fairfax on the first train, where I found Mr. Hall much excited and Col. Johnson of the Third New Jersey Volunteers as cool as a cucumber. General McCunn of New York claimed to be in command as he held a brigadier's commission from New York State. He was afterwards dismissed. Soon after the first battle of Bull Run the operators at Fairfax Court House were excited and took to their horses. Some important orders passed between General Winfield Scott and General McCunn ordering the latter to stop the retreat, but not having a sufficient number of men, he started down the track with his force about 11 p. m. The operators were requested to stay until the last moment and an engine would come after us. We remained until the relief guard ordered us to close and an engine from Alexandria met us about one mile west of Burke's and took us to Alexandria in time to catch the last boat for Washington, orders having been issued to stop all boats. Everybody was excited and there was general disorder. I then took a furlough of two weeks and went home.

"On August 5 I returned to Washington and was assigned to duty at the arsenal office. On August 13 I was sent to Tennallytown, where the Philadelphia reserves were in camp, with General McCall in command. The troops were reviewed by General McClellan August 23.

Digitized by Google

While here I had typhoid fever and was laid up for two months. I returned to Washington in March, 1862, and was sent to Wilmington, Del., on the twenty-second of that month, where I was transferred to the American Telegraph Company. I attended the repeater on the Fort Monroe and Washington wire. On November 22 I was sent to 145 Broadway, New York, and remained there until December 28, when I resigned and returned home."

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works of telegraphy and treat them in the same manner.]

CHAPTER XLVII.

What is the distinctive feature of the direct repeating relay described in this chapter?

Describe the effect of turning the switch levers to the left.

What is the reason for using an extra set of contact points on the relay?

Describe the "Testo" cut out switchboard.

What advantage is gained by the use of this board?

How is patching done and other connections made on the "Testo" board?

How are the coils of the combination quadruplex rheostat wound?

Referring to the diagram, what does the upper circle represent?

How is the total resistance calculated after taking a balance?

What is the extra resistance coil of 200 ohms inserted in the line for?

Describe the construction of the box relay shown in Fig. 137.

Why are steel contact points used in place of platinum?

Describe the improvements embodied in this instrument as compared with the ordinary box relay.

CHAPTER XLVIII.

What is an ammeter?

What is the difference between an ammeter and an ampere-meter?

What is a voltmeter?

What is an ammeter used for?

What is a voltmeter used for?

Describe the principle of the Weston voltmeter and ammeter.

What is the effect on the rectangular flat coil of wire when a current is passed through it?

How is the coil attached in an actual instrument?

How is the current conveyed to the coil?

What metal is the spiral springs made of, and why are they so made?

When an ammeter is connected in circuit why does it not change the value of the current to be measured?

Besides measuring currents, for what other purpose may an ammeter be used?

In what respect does a voltmeter differ in construction from an ammeter?

Why is the coil of high resistance placed in series with the movable coil to which the pointer is attached?

What is the principle upon which the construction of the voltmeter is based?

What is the resistance of a coil used in a 150-volt instrument?

What is the resistance of a 300-volt instrument?

Why is the resistance of a voltmeter made as high as it is?

In order to secure accuracy what rule should be particularly observed in the manufacture of a voltmeter?

President Taft Signals to Honolulu.—President Taft pressed a telegraph key in the White House, at Washington, at 12.30 a. m., February 22, thus transmitting an impulse over the Postal Telegraph-Cable Company's line to San Francisco, a distance of about 3,700 miles, thence through the Commercial Pacific Cable Company's submarine cable to Honolulu, a distance of about 2,500 miles, where the telegraph circuit was connected with a clock in the hall in which the Elks were about to open their carnival. The transmitted signal automatically lighted up the clock, which was the sign for the opening of the carnival at 7.30 p. m., February 21, Honolulu time.

To Reduce Telegraph Tolls in New York State.—The Western Union and Postal Telegraph-Cable companies have notified the up-State Public Service Commission that they will meet the complaints of the boards of trade of Lake Placid, Tupper Lake and Saranac Lake and reduce telegraph rates from these and other points in the Adirondacks commencing June 1, when the heavy business from Adirondack points commences. The new rates will be 35 cents, instead of the present 50-cent rate, to New York, Syracuse, Buffalo and other points. The entire Adirondack region, in addition to the complaining points, will have the benefit of the reduced rates.

Denver Tax on Public Service Corporations.—An ordinance has been introduced in the Denver City council to impose a tax of five per cent. upon the gross earnings of all public service corporations which use the city streets. It includes telegraph and telephone companies.

Mr. Martin Draws the Line at Translations.

T. Commerford Martin, joint author of the two volume "Edison: His Life and Inventions," was recently approached with a proposition for its translation. He threw up his hands and remarked: "The recompense is very small, but even that is somewhat better than my first experience, when, having brought out the first American book on the Electric Motor, an enterprising German translated it into his native language, put his own name to it, and then issued it as a serial, without sending me a single mark—even of esteem." There have been offers for the translation of "Edison: His Life and Inventions" into Spanish, German and French, as well as for a Spanish edition to be used as a textbook in the schools of Cuba.

Night Lettergram Rates.

The table given herewith is reproduced from the Postal Telegraph-Cable Company's tariff book for 1911, and will no doubt be found useful by those who utilize this class of service.

NIGHT LETTERGRAMS

TABLE OF COMPUTED TOLLS FOR NIGHT LETTERGRAMS CONTAINING 50 (OR LESS) TO 250 WORDS

WHERE RATE FOR A DAY MESSAGE OF 10 WORDS IS

NO. OF WORDS	$ .20	$ .25	$ .30	$ .35	$ .40	$ .50	$ .60	$ .65	$ .75	$ .85	$ .90	$1.00	$1.10	$1.15	$1.20	$1.25

Western Union Award Upheld.

On February 20, Judge Colt, in the United States Circuit Court at Boston, confirmed the report of Mr. Everett W. Burdett as Master in the suit of the Western Union Telegraph Company against the American Bell Telephone Company for an accounting on stocks received by the Bell Company as rentals and royalties for telephone licenses.

Under a contract dated November 10, 1879, the Western Union Company claims 20 per cent. of this stock, together with the dividends and interest thereon, amounting to $5,873,292 and 38,188 shares of stock. The Bell Company contended that the Western Union was not entitled to any of this stock, as it was not received as a rental or royalty.

The Master awarded the Western Union 20,087 shares of stock and $2,579,914 as dividends and interest thereon, exempting from the accounting stock received by the American Bell from the American Telephone and Telegraph Company, the New England Telegraph and Telephone Company, the Bell Telephone Company of Philadelphia, and Chicago Telephone Company.

Use of Dead Chestnut Poles for Telephone Lines.

In a recent communication Mr. B. Gherardi, engineer of plant, American Telephone and Telegraph Company, New York, says:

"We have recently been considering the advisability of using for poles chestnut trees killed by the bark disease. This disease is believed to have originated on Long Island and has now spread over considerable areas in New Jersey, New York State and Connecticut. Authenticated centers of infection have been discovered as far to the north and east as the northern part of Rhode Island, and as far south as the southern part of Virginia. A number of centers of infection are located in Pennsylvania, Maryland and Delaware, and in

Digitized by Google

the other states previously mentioned at points distant from the completely infected region which is centered about New York City.

"The chestnut bark disease is due to a fungus, the spores of which generally enter the tree through wounds on the branches or trunk. From the point of infection the fungus grows in all directions through the cambium and the inner bark until the growth meets on the opposite side of the trunk or limb which is thereby girdled. It has sometimes been found that a few of the outer annual rings of the wood are attacked, but generally the wood is not affected. The injurious work of the fungus is usually completed during the first summer after it obtains a location on the tree, but injury is frequently not apparent until the next spring, when the new leaves put out are stunted and soon wither. The injury to the trunk or the branch to which the fungus has become attached is very much the same in character as if the tree had been girdled—that is, the rise of the sap to the upper parts of the trunk or branch is affected and the death of the trunk or limb results. As the fungus does not work in the wood to any appreciable extent and ceases its activity when the tree is dead, the wood is not damaged as a result of the disease. Provided the timber is used within a reasonable time—say within two or three years after the tree has been killed by the disease—there is no reason why its serviceability for poles is in any way impaired. It should, of course, be understood that dead standing trees are undergoing a certain amount of seasoning, and that generally it is not desirable to allow poles to season for more than two or three years. There is, of course, one feature to which careful attention must be given in case trees killed by the bark disease are used for poles. While the bark disease does not injure the timber, the dead tree is more susceptible to injury from insects and from the usual decay-producing fungi than the live tree. On this account poles cut from trees killed by the bark disease should always be inspected to make sure that no impairment has come from decay or from the work of insects while they have been standing in the forest after being killed by the bark disease fungus."

How to Rise from the Ranks.

In an address before the School of Business of the College of Economics of Marquette University, on "Some Phases of the Telephone Business," President Alonzo Burt, of the Wisconsin Telephone Company, Milwaukee, in discussing organization, made reference to men in executive positions with the Wisconsin Telephone Company who had started in the employ of the company as office boys.

How do you suppose an office boy becomes the head of a department in a big public service company, or in any other?

Simply by attending to business and being ambitious to hold a better position than the one you are holding.

These men as office boys did what they were told to do, and did it well. They kept their eyes and ears open and readily "learned the business" in their particular departments. They saw other fellows getting ahead, watched how they did it, and concluded that what others could do they could do, and they won.

Here is some good advice: Study yourself seriously.

If you are honest with yourself, you know better than any one else what are your weak points. Go still farther and do your best to eradicate the weak points.

No one can improve you as you can improve yourself.

Earn a promotion, and when you have it, earn another.

Remember that the big employer plays no favorites.

He judges entirely by the class of service you furnish and your capability for service of higher order.

Postal's Messenger Force at Dallas, Tex.

The accompanying illustration shows the messenger force of the Postal Telegraph-Cable Company of Texas, at Dallas, Tex. As will be noted all the boys use bicycles, which is evidence that

POSTAL COMPANY'S MESSENGER FORCE, DALLAS, TEX.

speed in the delivery of telegrams is sought to be attained. The boys appear to be wide awake, and the people of that enterprising city are to be congratulated on having such up-to-date messenger service.

Messenger Boy Law in New Jersey.—The New Jersey Senate has passed the Osborne bill, which makes it a misdemeanor for telegraph companies or other employers to permit boys under eighteen years of age to deliver messages between 10 o'clock at night and 5 o'clock in the morning.

Any book on electrical subjects can be obtained at the office of Telegraph and Telephone Age, 253 Broadway, New York.

Quadruplex Installation and Operation.

The following instructions pertaining to quadruplex installation and operation have been issued from the office of Mr. W. E. Athearn, engineer of equipment, Western Union Telegraph Company, New York, and are printed in the *Journal of the Telegraph* for February 20:

In the rearrangement of the quadruplex apparatus, for long and difficult circuits, a combination of the "differential," and "bridge" principles is employed.

THE NEUTRAL RELAY:—The neutral relay coils are wound differentially, and connected to the main and artificial lines in the usual way. This relay is provided with an auxiliary or holding coil H, which is placed in series with a condenser HC, and connected across the main and artificial lines in the manner indicated in the accompanying diagram Fig. 1. The function of the auxiliary coil is to hold the relay armature closed during the periods of "no magnetism" in the relay, caused by the operations of the distant polechanger.

NEUTRAL RELAY ADJUSTMENTS:—The armature of this relay should not be brought too close to the main line magnet cores, a sufficient amount of air space being necessary to prevent the armature from "sticking," or exhibiting that sluggishness of movement which frequently results from the effects of residual magnetism in the relay cores. It is far more preferable to minimize any such tendencies by increasing the air gaps, and then suitably reducing the retractile spring tension, than by the converse methods of adjustment which appear to obtain to some considerable extent. The tension of the spring, however, should always be sufficient to pull the armature smartly against its back stop whenever the magnetism, excited by the "long end" of the battery is cut down to the value induced by the "short end."

The wider separation between the cores and armature will also lessen the amount of disturbance produced by the outgoing currents upon the home relays as a result of imperfect balances, as well as tend to counteract the effect of earth currents, voltage inequalities, or other irregularities which make an incoming current of one polarity greater or less than that of the opposite polarity.

HOLDING COIL ADJUSTMENT:—The holding coil H should first be adjusted by bringing it as close as possible to the relay armature without actually touching it. Then instruct the distant station to close his No. 2 key and dot with his No. 1 key. While this is being done, plug up the holding condenser, HC until just enough capacity has been inserted to keep the neutral relay armature steady on its front contact under the distant reversals. Between one and two m.fs. usually suffices for that purpose.

THE REPEATING SOUNDER:—Experiments indicate the possibility of being able to dispense entirely with the repeating sounder and of operating the local sounder direct from the front contact of the neutral relay. As the feasibility of doing so has not as yet been fully demonstrated, all neutral relays are now being furnished with front and back interchangeable contacts with a view to further trials in that direction.

REPEATING SOUNDER ADJUSTMENTS:—As in the case of the neutral relay, the armature of the repeating sounder ought to be far enough removed from the magnet core to deprive the latter of its "residual" tendency, without unduly diminishing the attractive force exerted upon the armature, the retractile force of whose spring should be regulated to suit these conditions.

In this way the rapidity of action, so highly essential in this instrument, can be best attained; it being also understood that the local or repeating points of the sounder require to be closely adjusted.

THE POLAR RELAY:—The new form of relay shown is placed in the cross wire of the "bridge," the arms of which are represented by the two windings of the impedance or retardation coil marked "5-U" in the various diagrams. The relay coils may be connected either in "series" or in "multiple," according to line conditions. The "series" arrangement has generally given the best results on long or leaky circuits, while the "multiple" arrangement seems better adapted for short and well insulated lines.

CENTERING THE POLAR RELAY:—Whenever this is necessary, cut off the sending battery, and open the main line by throwing the lever of the "Line Resistance Box" over to the "dead" stop at the extreme right of that box. (See Fig. 2.)

THE MILLIAMMETER:—This instrument (which is connected in series with the polar relay in the bridge) has been specially designed to facilitate the operations of line balancing. It will also indicate the precise value of such portions of the incoming currents as pass through the polar relay, as well as afford—by the character of its deflections—an index of the general condition of the circuit.

The milliammeter may also serve a useful purpose in detecting the presence of underground faults—such as escapes—which generally manifest themselves in a peculiarly distinctive way upon the meter. This arises from the fact that currents of opposite polarity in passing through the fault, produce different electrolytic effects upon the conductor at that point; a positive current tending to oxidize and seal up the fault, while a negative current deoxidizes and further develops the fault. Hence, the balancing of a circuit in which such a fault has appeared, will be rendered more difficult by the changeable character of the resistance of the fault under the current reversals; a balance obtained with one polarity of current to line being immediately destroyed by the current of opposite polarity.

At each disturbance of the balance, the meter needle will first be suddenly deflected to one side or other of its previously assumed position (according to the current polarity) and then gradually move in that same direction until it reaches some other point where the needle will remain in a more or less stationary position. Symptoms of such like character will indicate the particular nature of the

Digitized by Google

trouble, to which the attention of the wire chief should immediately be directed.

THE TRANSMITTING APPLIANCES:—The "walking beam" type of polechanger has been discarded in favor of the more efficient apparatus shown in Fig. 3, which is equally well adapted for transmission purposes on the common side, and can therefore be utilized either as a polechanger, or as a No. 2 transmitter.

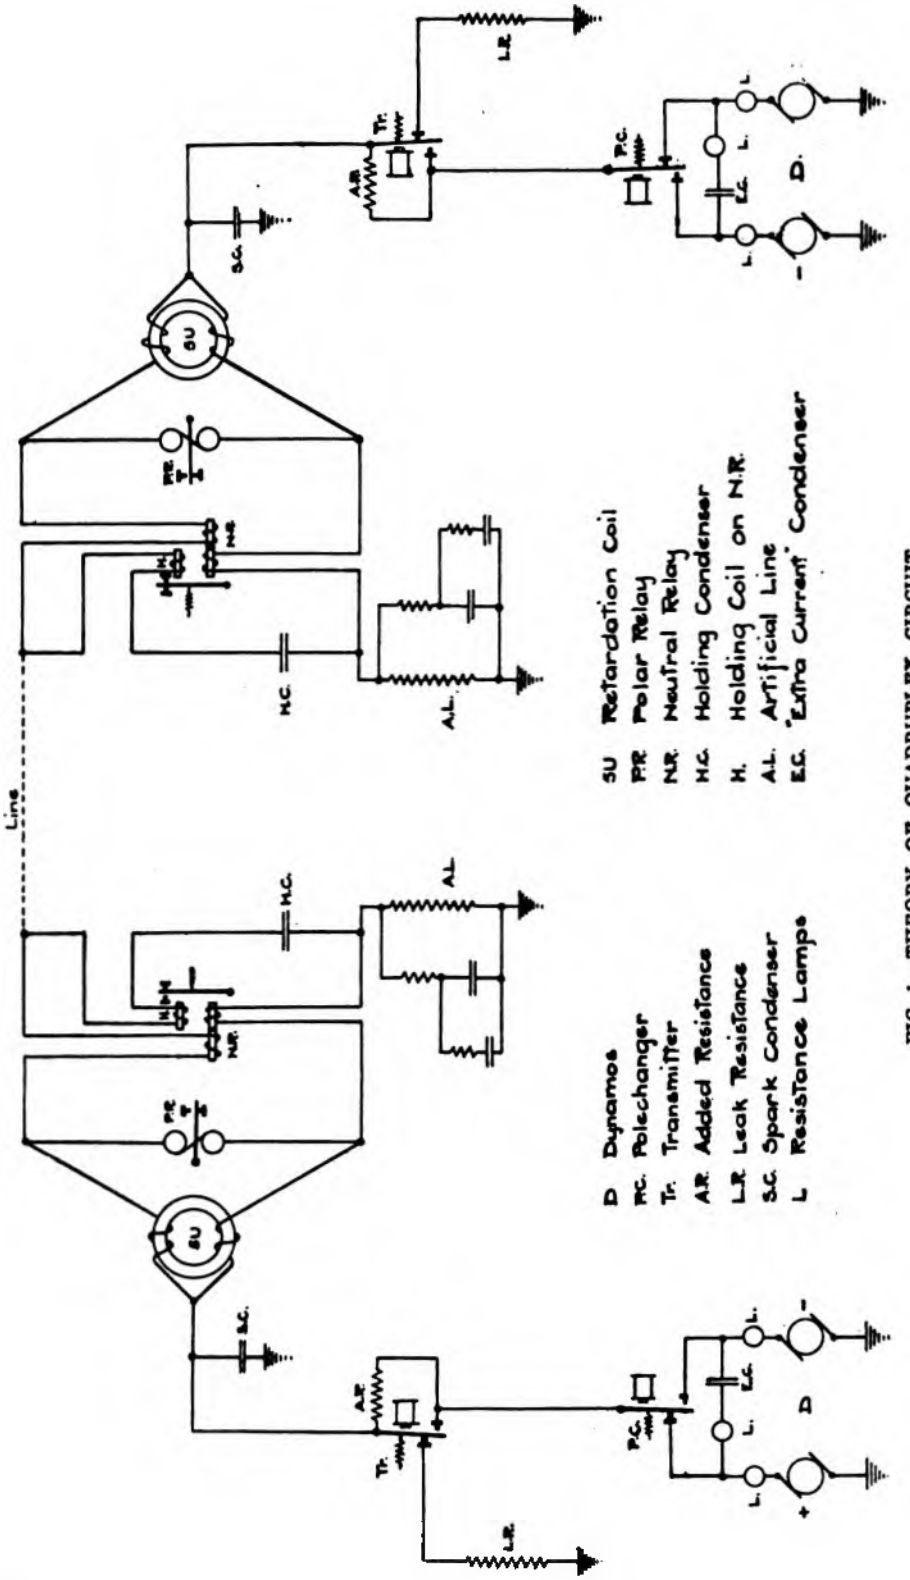

FIG 1.—THEORY OF QUADRUPLEX CIRCUIT.

TRANSMITTING APPARATUS ADJUSTMENTS:—The coil adjustments of both polechanger and transmitter should normally be such as to leave an air space of

Digitized by Google

about 1-64 inch (or not less than 4 thicknesses of an ordinary receiving blank) between the armature and cores of each instrument in its closed position.

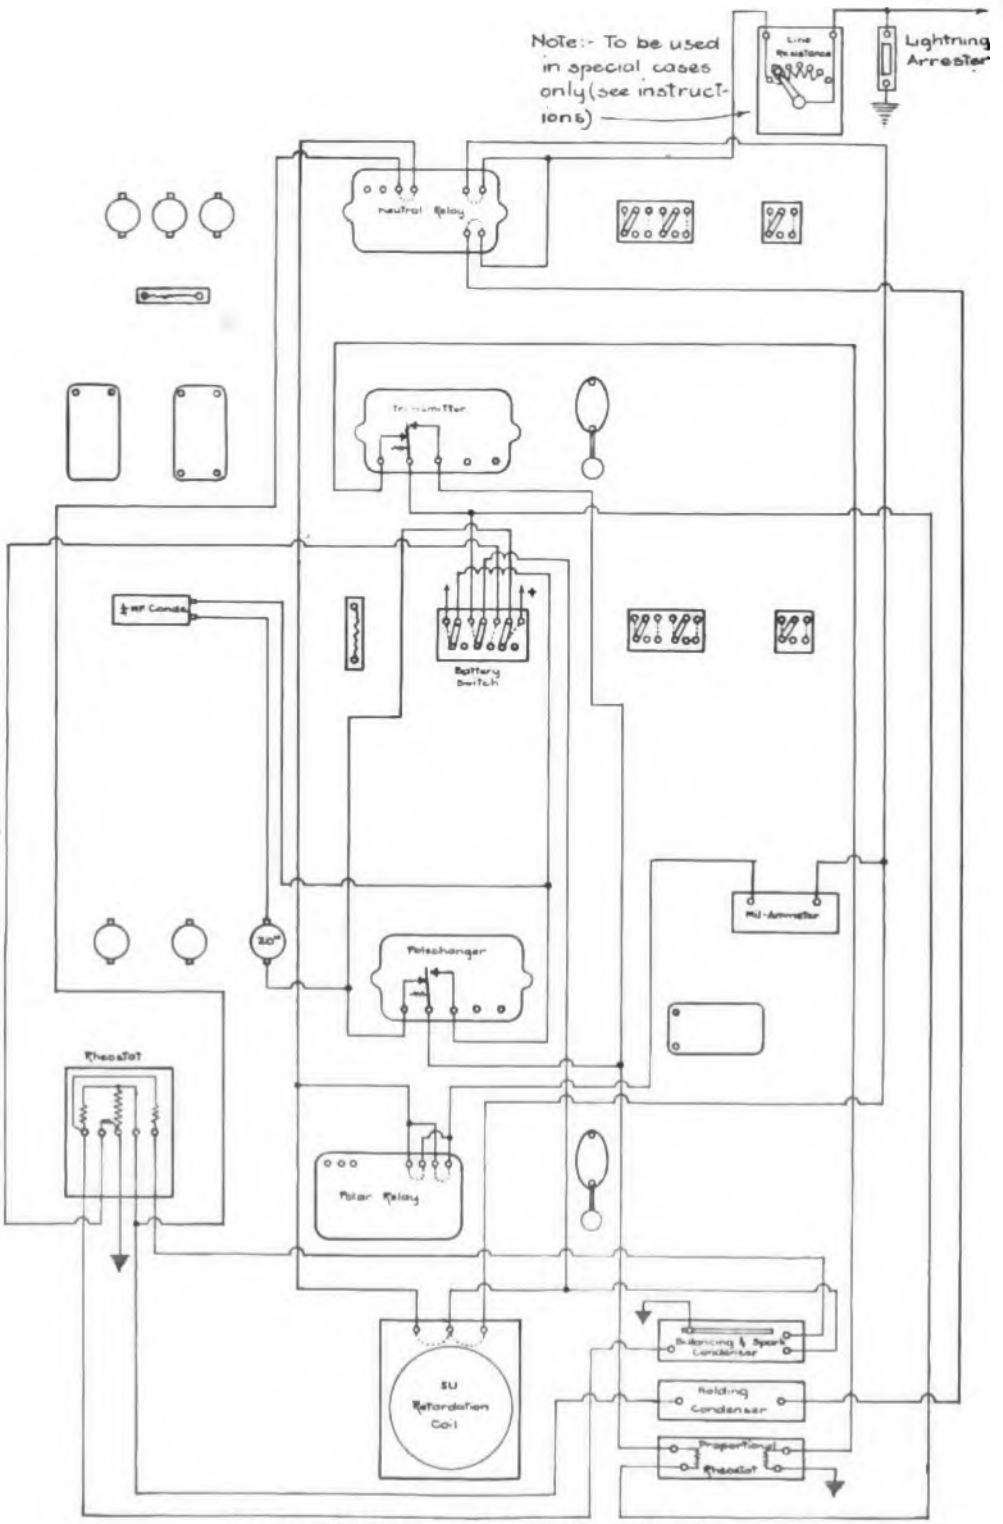

FIG. 2.—WIRING OF MAIN LINE CIRCUITS.

When used as a polechanger, the play of the armature lever between its battery posts should be as small as is possible without creating a tendency to "arc," which is liable to occur at the breaking of battery contact. To minimize such tendency, a small ¼ m.f. condenser EC in series with a 20-ohm resistance lamp is now placed across the battery leads as illustrated in diagrams (Figs. 1 and 4.)

The sparking that apears at the making of bat-

Digitized by Google

tery contact represents the static discharge from the main and artificial lines. The particular object of the spark condenser SC is to open up an inductive path to ground for this discharge, the effects of which are thereby diminished at the contact points of the polechanger.

THE 5-U RETARDATION COIL:—This is a differentially wound magnetic or impedance coil, consisting of a circular core of soft iron wires, upon which are placed the two windings that constitute the arms of the bridge. Being of the "closed magnetic circuit" variety, this type of coil possesses consid-

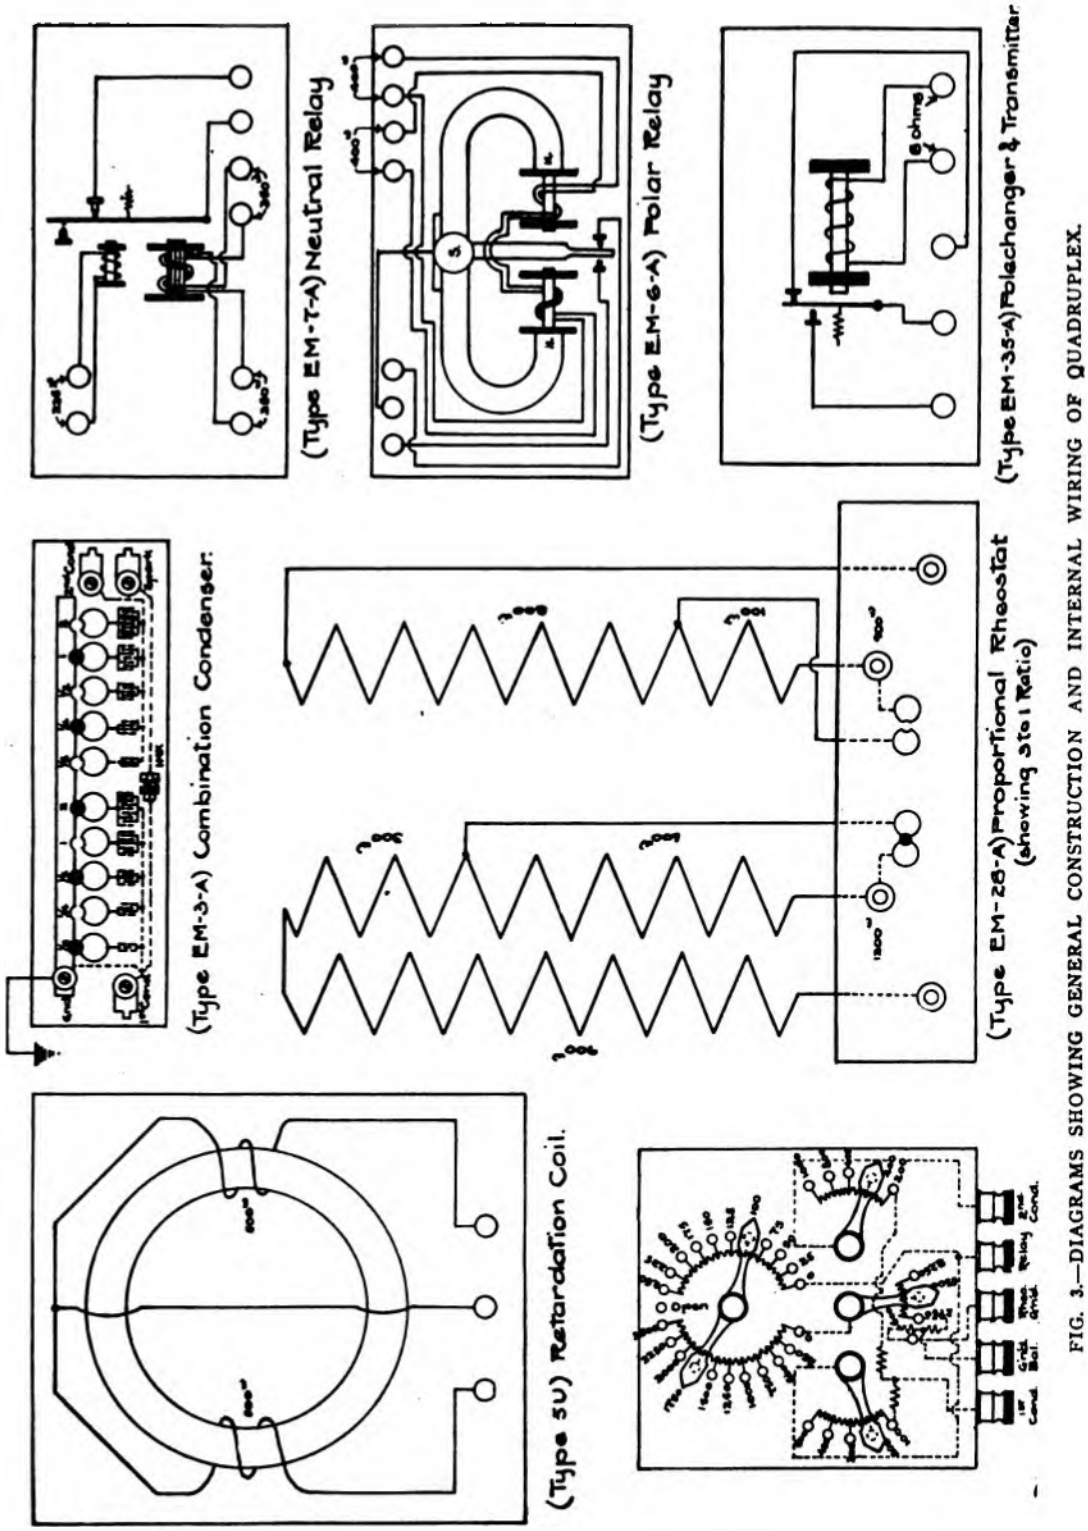

FIG. 3.—DIAGRAMS SHOWING GENERAL CONSTRUCTION AND INTERNAL WIRING OF QUADRUPLEX.

Digitized by Google

erable inductance, a property that tends to retard the passage of the current and to change the form or character of the wave passing through the circuit.

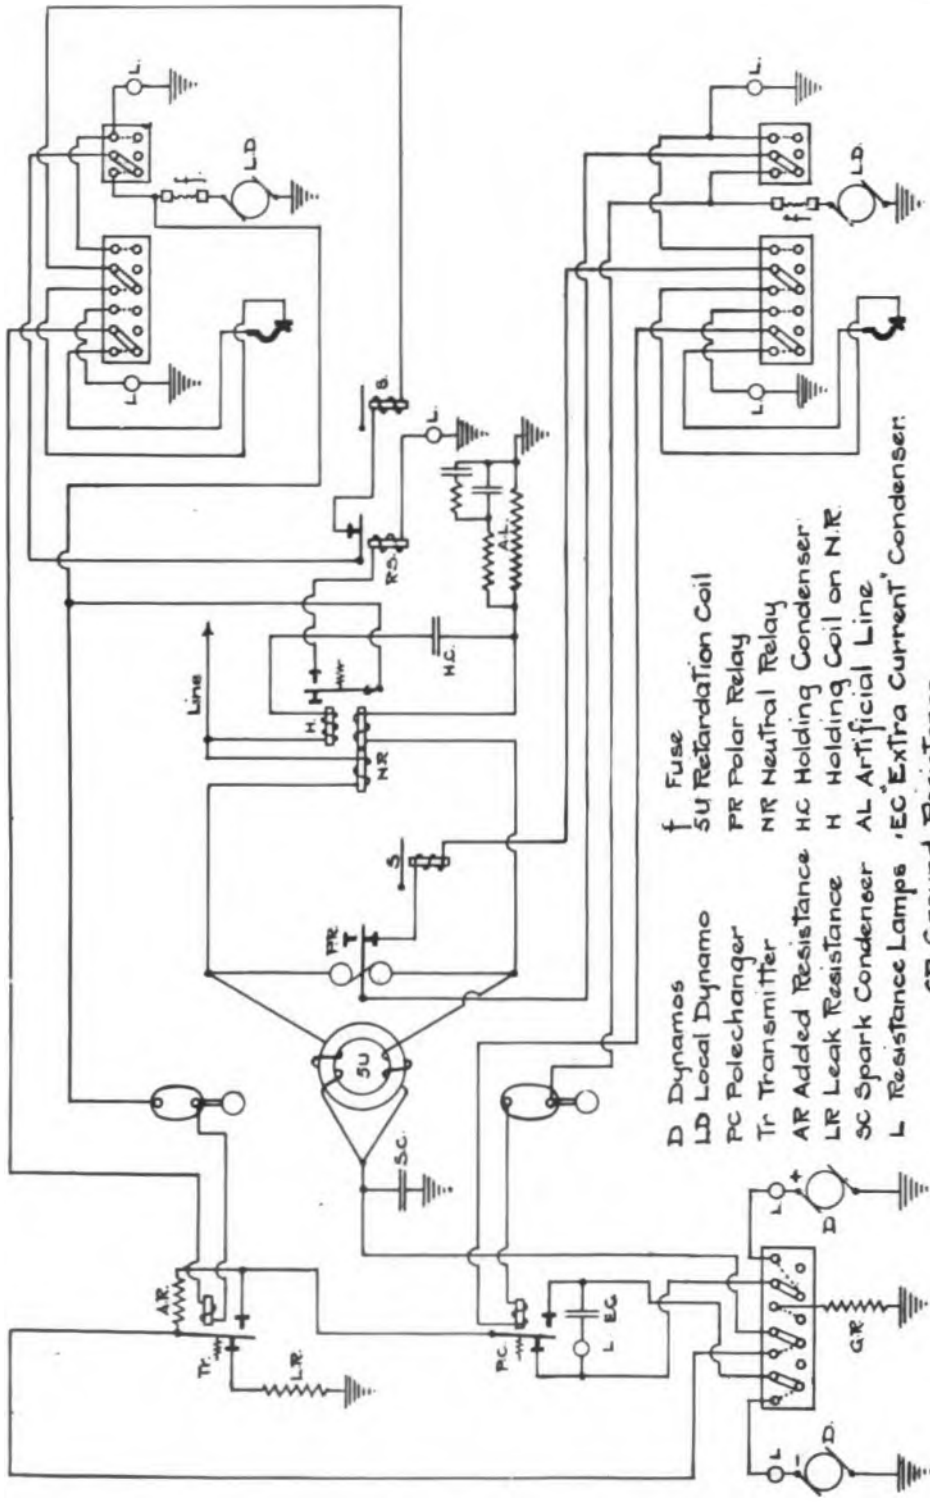

FIG. 4.—MAIN AND LOCAL CONNECTIONS OF QUADRUPLEX.

The absence of inductance in any circuit causes the current that flows therein to attain its maximum and zero values very abruptly at the making and breaking of battery contact, producing what is known as the "square top" form of wave, which gives rise to inductive effects more or less prejudicial to the operation of neighboring lines. On the other hand, the inductance present in a circuit tends to round off or graduate the rise and fall of the cur-

Digitized by Google

rent, which is the kind least calculated to create inductive interference, and for the particular development of which, the 5-U coil is employed to considerable advantage.

It is, however, in connection with the operation of the auxiliary or holding coil (which it will be remembered holds the neutral relay closed during the interval of "no magnetism" therein) that the 5-U coil is particularly beneficial in quadruplex working, inasmuch as its magnetic discharge is not only utilized to energize the holding coil, but owing to the gradual manner in which the closed core parts with its magnetism, the discharge current is lengthened out or prolonged, and is thus enabled to act upon the neutral relay armature for a period of time more nearly corresponding with that represented by the "interval of no current" at the distant pole-changer.

It may be further remarked that the 5-U coil plays an important part in connection with the operation of the polar relay, whose armature movements are accelerated by the impetus derived from the induced currents set up in the impedance coil, the said currents taking such directions through the relay windings as to correspond with those of the signaling impulses.

(To be continued.)

ANSWERS TO QUESTIONS.

[In this department questions on matters of a practical character, and of general interest, will be answered. Questions intended for this department must be signed by the writer's full name—not for publication, but for identity. No attention will be paid to anonymous communications.]

(25) Q. By what means is the "hardness" imparted to hard-drawn copper wire? C. W.

A. Simply by the mechanical process of drawing the copper through the dies to obtain wire of the proper gauge. From this it is evident that the hardness is largely on the surface.

(26) Q. Will you please tell a novice what is the difference between a direct current and an alternating current? O. T. S.

A. The character of different currents was treated on page 9 of our issue of January 1, under the head of "Standard Definitions of Electrical Terms." Much other information on electrical terms, etc., will be found in that article.

(27) Q. What is the difference between electrostatic induction and electromagnetic induction? W. D. H.

A. 1.—Electrostatic induction is the effect of bringing an electrified body near to an insulated conductor. The electricity on the charged body acts across the dielectric (air) and attracts the opposite electricity to the side of the conductor near the electrified body, and repels the same kind of electricity to the side remote from it. 2.—Electromagnetic induction is produced by the action of electric current in a coil of wire, or by the action of a permanent magnet or an electromagnet upon an adjacent closed circuit. Electrostatic induction does not involve wires at all, while electromagnetic induction does. The one involves electricity at rest (static); the other, electricity in motion (dynamic).

Correction.—In the answer given to question 18 in the March 1 issue, a decimal point at the wrong end of a group of figures gave a value the reverse of what it should have been. The part of the answer affected by the error should have read: "A milliampere is equal to one one-thousandth of an ampere, therefore .5 ampere expressed in milliamperes is 500. The answer is five hundred milliamperes, not five-tenths of a milliampere." Stated another way, one ampere equals 1,000 milliamperes, therefore half of an ampere (.5) must equal half of one thousand, which is five hundred.

The Turner Monument Fund.

Mr. E. P. Griffith, superintendent of telegraph of the Erie Railroad, New York, chairman of the Turner Monument Fund, is making every effort to interest all railway men in the movement. It is the ambition of the committee to close the matter at the earliest possible date, and show the people of the country how earnestly and readily railroad and telegraph men can carry to completion an undertaking of this character and magnitude. It is the intention to present to each subscriber to the fund a souvenir of the dedication which will be well worth preserving. Mr. Griffith's efforts should be encouraged and supported by all railroad men.

In the autumn of 1851, Charles Minot, general superintendent of the Erie Railroad, sent from Turner, N. Y., the first telegraph train order, and it is the purpose to commemorate this interesting and historical event by erecting a monument at that place. The following named gentlemen constitute the committee in charge of the monument fund: E. P. Griffith, superintendent telegraph, Erie Railroad, Jersey City, N. J., chairman; Charles Selden, superintendent telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, Telegraph and Telephone Age, New York; E. A. Chenery, superintendent telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railway, Montreal, Canada; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who has been elected treasurer of the fund. All contributions are acknowledged in the columns of Telegraph and Telephone Age, and the funds deposited with the Washington Trust Company, New York, as soon as received.

The contributions received up to date amount to $974.25.

The individual subscriptions received since the acknowledgment printed in the March 1 issue will be recorded in the issue of April 1.

A Pathetic Use of the Morse Alphabet.

BY J. W. HAYES, OF PORTLAND, ORE.

It was about the year 1870 that a handsome, young Canadian applied for a position to Mr. Charles R. Hosmer, then manager of the Dominion Telegraph Company at Buffalo, N. Y. The name of this youth was George Edwin Millar. Like most of our Canadian brothers, Millar was an expert operator and quite a polished young fellow. He could sing well, write very fair verses, and was an entertainer in a small way. He worked in Syracuse, New York city, Philadelphia, Washington, Chicago and St. Louis.

It was at the last named place, in 1876, that I first met him. He was then working for the Atlantic & Pacific Telegraph Company as day operator, with Mr. W. H. Spencer as operator at the Merchants' Exchange, Mr. C. W. Hammond as manager, and myself, night operator, this being the full staff of the "opposition" in 1876 in St. Louis. Millar had developed into a man of ample proportions, fine business capacity, and one of the biggest hearted men in the State.

In the course of time I came West and Millar soon followed, being appointed manager for the Atlantic & Pacific Company at Pioche, Nev., then a wonderfully prosperous mining town. Later, Millar accepted the position of manager for the Western Union at Austin, Nev., where he was afterward elected to the Nevada Legislature. Some time after, he came to California, where he obtained a position with a large importing house for whom he traveled for twenty years, being regarded as the most popular commercial traveler on the Coast. On a trip to Arizona about 1900 he suffered a sunstroke from the physical effects of which he recovered, but the shock weakened his intellect quite materially and he was forced to resign his position. With nothing that he could do to earn a livelihood his mind appeared to turn to me and he came to Portland, where he lived till a year ago. He could telegraph as well as ever, but he lacked application and continuity of thought, and he would sooner do a messenger boy's labor than anything else and it was this calling that he followed for seven or eight years. Getting mixed up in a crowded street one day he was knocked down by a passing car and received severe injuries. These injuries deprived him of his hearing and partially of his sight, and here it is that the Morse code played a pathetic part.

I called to see my old friend at the hospital and found him cheerful, but unable to see or hear very much. Communication between individuals bereft as he was of these senses is not an easy matter. A thought struck me and seizing his hand I tapped with my finger in the Morse alphabet:

"How do you get me, George?"

"Oh, that's good stuff; tell me the news."

I tapped off what interesting items I had at my command and he was all attention, asking me later to read to him out of the *Oregonian*.

As I, too, am not able to see, my escort was called upon to do the reading. As he read to me, I ticked the news to Millar on his hand, using Phillip's code, with which he was familiar. He would "bk, bk" occasionally, and get off some witticism for which he was noted in former years.

I enjoyed these visits and we were certainly a puzzle to the doctors and nurses, who required demonstrative proofs of this transmission of intelligence before they could believe it.

Millar lingered for several months, but one day I was hurriedly summoned to his bedside. Taking my hand in his he feebly telegraphed me as follows:

"I'm gg home, Jef. Pls remember me to all t old boys wn u cn. Gd by."

His hand dropped from mine. The spirit of George Edwin Millar had gone to meet his Creator.

New Book on the Telephone.

Telephonology, by H. R. Van Deventer, is one of the latest and best books published on the telephone and on account of its practical character will appeal to all engaged in telephone work. The book is divided into sixteen chapters upon the following subjects; first principles, talking equipment; signaling equipment; commercial talking equipment: magneto instruments and circuits, magneto switchboards; selective and lock-out systems; batteries; testing telephone parts; testing equipment and fault location; measuring instruments and their uses; common battery equipment; harmonic party line systems; line and cable construction; the automatic system; composite systems and wireless telephony.

The author very wisely refrains from attempting to give any history of the development of the telephone, but after a brief discussion of the general subject of telephony, devotes the remainder of his book to describing apparatus, systems and methods in common use at the present time.

The chapter upon composite systems is probably the best and most concise exposition of this question of such importance at the present time to both telegraph and telephone people, that has ever been produced, being, in fact, the first general discussion of this subject which has ever appeared in any work on telephony. This chapter is well illustrated with circuit diagrams, showing the various combinations of apparatus which can be used to secure composite and phantom circuits. These are but a few of the many points contained therein which make the work a valuable one to the engineer or student. Copies of Telephonology may be obtained by addressing Telegraph and Telephone Age, 253 Broadway, N. Y. Price $4.00.

Mr. L. H. Jordon, manager of the Western Union Telegraph Company, Pittsfield, Mass., in renewing his subscription writes: "I felt as if I had lost a member of the family while I was without your paper."

Among Our Advertisers.

"Okonite" is an electrical household word. It came into being with the electric light and the telephone and has been as steadfast and enduring. Okonite wire is now standard and is used for all electrical purposes and the well-known trade mark of the Okonite Company is seen wherever two or three electrical men are gathered together for business purposes. Captain Willard L. Candee is still at the head of the company. He has been at the helm ever since the company was organized and will probably be found there for a long time to come. He has built up a business and a reputation for this company that are rarely excelled these days. Mr. Candee is prominent in social life in Brooklyn, where he resides, and in business circles is widely known. He is a member of various prominent clubs and takes much interest in their affairs.

The catalogue of a large electrical supply house is an interesting book to look through, and if it is generously illustrated it gives one an idea at a glance of the almost infinite variety of instruments, supplies, etc., that a modern supply house must be prepared to deliver. The new catalogue of the old and well-known electrical supply house of J. H. Bunnell & Company, 20 Park Place, New York, is a book of this kind. It contains 210 pages, and almost every page excepting the index pages, has at least one illustration. Every instrument and device handled by the firm is concisely described, so that an intending purchaser can know the characteristic features of the instruments he wants. The catalogue is strongly bound and is intended for wear and service. The firm keeps abreast of the times in all things.

The American Telegraph Typewriter Company, 27 William Street, New York, has completed a large factory in Brooklyn, and is now manufacturing its instruments in lots of a thousand. The company expects to be in a position to make deliveries in a week or two. This instrument will fill an important place in telegraphy of the future, and will find a very wide field of utility on railroads and among press associations, industrial concerns, etc. Many railroads have already ordered equipment and the United States government will use the machines in various services. The instrument is remarkably compact in construction and the speed of transmission is limited only to the ability of the operator to manipulate the keyboard. Dr. G. A. Cardwell of New York is the inventor of this instrument and is president of the company.

The Friendly testing bridge made by Messrs. W. & L. E. Gurley, Troy, N. Y., is sustaining the claims made for it by the manufacturers. In a recent communication an official of one of the companies writes as follows regarding this testing set: "I have had the instrument at my office and made some tests and have arranged to make other tests. Only one case of actual trouble has been measured and the fault was located within one-half mile. The instrument is exceedingly well made and possesses some excellent features that I have never seen in a Wheatstone bridge. The manufacturers, Messrs. W. & L. E. Gurley, are an old and thoroughly reliable firm, and if the present instrument is not all that it should be, I am sure that they stand ready to make it so."

Harmonic Selective Telephone Systems.—Bulletin No. 1016, entitled "Harmonic Selective Systems for Party Lines," has just been issued by the Western Electric Company. It contains a description in detail of the principle of operation of harmonic systems and a number of diagrams are shown to illustrate the application of harmonic apparatus and the advantages of this system.

Moisture-Proof Telephone Cords for Railway Telephones.—A new line of telephone cords designed especially to meet the severe conditions common to railroad work has been developed by the Western Electric Company. The construction of these new cords is different from that of the standard cords now in use, the most radical change being that the insulation of each conductor is treated with a moisture-proof compound and that each conductor in those cords, which are subjected to the greatest wear, is reinforced with copper wires. This construction insures a flexible, moisture-proof cord, with long life and increased strength throughout. These cords are made in standard lengths, consisting of one, two, three and four conductors for use as receiver, transmitter and extension cords in connection with the various types of desk stands, transmitter arms and flexiphones.

Black Enameled Magnet Wire.

Black enameled wire is now offered to the market by the Western Electric Company and has been tested under the severest conditions. It is claimed for this wire that while the black enameled insulation is only .0002 inches to .0004 inches in thickness, it is so elastic that when the wire is stretched to the breaking point, the enameled insulation does not break until the wire itself gives way. It is stated that it will withstand indefinitely the ordinary atmospheric corrosives and the severe atmospheric conditions of shops, factories, tropical climates and the sea coast. It is not injured by exposure to temperatures of 250° F., a temperature which will destroy the tensile strength of cotton or silk in a few hours. It cannot be removed from the wire by the ordinary solvents, and the wire can be handled as easily and successfully as a silk insulated wire.

One of the great advantages possessed by black enameled wire is its small diameter as compared with that of single silk or cotton insulated wire. The winding space (for a specified number of turns) saved by black enameled wire over single silk No. 34 B. & S. wire is 25 per cent.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

The Railroad.

Mr. W. F. Williams, superintendent of telegraph of the Seaboard Air Line, Portsmouth, Va., was also a recent New York visitor.

Mr. Wm. J. Camp, electrical engineer of the Canadian Pacific Railway Company's Telegraphs, Montreal, Que., was a recent New York business visitor.

Mr. R. L. Stultz for six years manager of the Alexandria, Va., office of the Western Union Telegraph Company, has resigned to accept a position in the telegraph department of the Southern Railway at Washington, D. C.

Mr. S. H. Anderson, Los Angeles, Cal., is electrical engineer of the Pacific Electric Railway Company, which operates 1,000 miles of road out of Los Angeles. Mr. C. M. Warnecke is assistant electrical engineer of the same road.

Mr. H. H. Morris, superintendent of the Huntington Division of the Chesapeake and Ohio Railroad, at Huntington, W. Va., was formerly a telegraph operator on that road and afterwards occupied higher positions. He was born in April, 1873.

Mr. A. E. Roome, formerly superintendent of telegraph of the Southern Pacific Company, has been appointed superintendent of telegraph, telephones and signals of the Pacific Electric Railway, with headquarters at Los Angeles, Cal. The railway lines of this company comprise 1,000 miles of standard gauge track.

Meeting of Railway Signal Association.—The stated meeting of the Railway Signal Association will be held at the Congress Hotel, Chicago, March 20.

Telephone Train Despatching in the Copper Region.—Telephone train despatching has been substituted for the telegraph on the Copper Range Railroad in Michigan. Mr. W. A. Rankin, Houghton, Mich., is chief electrical engineer of the Copper Range Consolidated Company.

Meeting of Eastern Division of Railway Telegraph Superintendents.—The regular meeting of the Eastern Division of the Association of Railway Telegraph Superintendents will be held in the committee room of the Washington Terminal Railway, Washington, D. C., at 11 a. m., Wednesday, March 22. The minutes of the meeting of the Western Division and other matters of importance will be discussed. Mr. Charles Selden, superintendent of telegraph, Baltimore & Ohio Railroad, Baltimore, Md., is chairman of the Eastern Division.

Boston Meeting of the Railway Telegraph Superintendents.

As the time approaches for the next annual meeting of the Association of Railway Telegraph Superintendents, which is to be held in Boston, June 19 to 23, arrangements are assuming definite shape. The entertainment features of the meeting will be of unusual interest. Mr. S. A. D. Forristall, superintendent of telegraph of the Boston and Maine Railroad, Boston, writes us as follows: "The Boston and Maine Railroad has kindly tendered the telegraph superintendents a special train to some point of interest on its lines, possibly Old Orchard Beach or Lake Winnipesaukee, on some day that will be agreeable to the Association. The New England Telephone & Telegraph Company has also tendered the ladies and such of the members as desire, an automobile ride through Boston's beautiful suburbs and nearby points of interest. I expect to arrange for an evening at the 'Pop' concerts. These concerts are given by members of the Boston Symphony Orchestra, one of the leading musical organizations of the world. This will give the people attending the convention an opportunity to listen to a very high order of entertainment. I am also trying to arrange for a harbor trip and a shore dinner at some point."

Breakage of Glass Insulators.

At the meeting in New York last November of the members of the Eastern Division of the Association of Railway Telegraph Superintendents Mr. W. J. Camp, electrical engineer of the Canadian Pacific Railway Telegraphs, brought up the subject of breakage of glass insulators, stating that many of them used on his lines broke into pieces without any apparent cause. There seem to be differences of opinion as to the reason for this. The general belief is, however, that it may be found in the incomplete annealing of the glass.

Mr. D. C. Hemingray, secretary of the Hemingray Glass Co., Covington, Ky., thinks that the abnormal breakage may be due to imperfect annealing. In regard to Hemingray insulators he says: "Our insulators after coming from the ovens are placed in the open air, where they are subject to all changes of climate for many days before they are packed ready for shipment. If by chance any of the insulators are not properly annealed, they will go to pieces in the yard."

Mr. W. E. Athearn, engineer of equipment, Western Union Telegraph Company, states that he has not experienced any unusual breakage of glass insulators. When they are placed on steel pins the pins are first fitted with a wooden cap and the insulators are screwed on the wood.

Mr. J. J. Ghegan, president of J. H. Bunnell & Co., New York, stated that though he had had no personal experience in the matter his attention had been called to many instances where glass insulators went to pieces from no apparent cause. He stated that it was well known among steam engineers that when steam gauge glasses were brought into contact with iron or steel they frequently flew into pieces and he had not been able to find a reason for it. He thought that possibly glass insulators on steel pins were affected in a similar manner.

The Telephone.

Mrs. Sarah F. Glass, wife of Mr. Louis Glass, vice-president of the Pacific Telephone and Telegraph Company, San Francisco, died on February 3.

Mr. Charles Kinyon, formerly manager of the Davenport, Iowa, office, and recently with the telegraph interests at Kansas City, has accepted a position with the American Telephone and Telegraph Company at Oklahoma City, Okla.

Mr. L. C. Steele, circuit chief of the Michigan State Telephone Company at Detroit, has resigned to enter other business. He is succeeded by Mr. D. G. Williams, of the American Telephone and Telegraph Company, Indianapolis, Ind.

Mr. S. A. Jackson, chief test board man of the American Telephone and Telegraph Company at Detroit, Mich., has been transferred to a like position at Beaver Dam, Ohio. Mr. L. M. Shoppart, from Maumee, Ohio, succeeds Mr. Jackson at Detroit.

Mr. E. W. Moister, assistant controller of the American Telephone and Telegraph Company, New York, has been attached to the office of the controller, Mr. Charles G. DuBois. Mr. F. L. Devereux has been appointed auditor to succeed Mr. Moister.

Mr. Thomas D. Lockwood, general patent attorney of the American Telephone and Telegraph Company, Boston, and an old-time telegrapher, has returned from Bermuda much improved in health. He will rest during the month of March, before resuming his duties in Boston.

Telephone Penalty Suits Dismissed.—The Mississippi Supreme Court has dismissed penalty suits aggregating $1,100,000 filed against the Cumberland Telephone and Telegraph Company, in the Chancery Court of Prentice County, alleging violation of the anti-trust law. The company's victory is based upon the question of jurisdiction, the Supreme Court holding that the anti-trust statutes do not apply to complaints of this character.

New York Telephone Earnings.—The report of the New York Telephone Company for the year ended December 31 shows revenue of $36,353,899, and expenses, including depreciation and taxes, amounting to $25,734,733, which left net earnings of $10,619,165. Dividends and interest earnings amounted to $3,840,604, and miscellaneous earnings to $36,944. These brought the total net earnings up to $14,496,714. Interest charges of $2,150,714 and dividends of $8,712,488 were paid, leaving a surplus of $3,633,512.

Telephone Rates in New York.—Mr. Union N. Bethell, president of the New York Telephone Company, appeared before the New York Public Service Commission, second district, on February 24, and gave his reasons against reducing telephone rates between Manhattan and Brooklyn boroughs. He stated that the New York Telephone Company in seeking to avoid competition was trying to render competition unnecessary by giving the most adequate and most efficient service that money and men can create.

General Grant in Error on Telephone Matters.—The recent complaint of Major-General F. D. Grant, U. S. A., to the Public Service Commission, against the New York Telephone Company asking that the New York Telephone Company be required to furnish trunk line service to army posts' telephone switchboards on military reservations in this State, has been dropped. General Grant has written the Commission that he now finds that it is a question which concerns the War Department and the Department of Justice and it is improper for him to take action in relation to the matter.

Organization of Telephone Pioneers of America. Sixty-seven signatures have been obtained for the formation of the proposed organization of the Telephone Pioneers of America. The tentative requirements are "employment in the telephone service twenty-five years prior to date of application and continuously at any time thereafter for five years." The rosters are still in circulation and many names have been registered that do not appear on the list referred to. Letters of application may be forwarded to Mr. Henry W. Pope, American Telephone and Telegraph Company, 15 Dey Street, New York.

Telephone Communication with Moving Trains.—A system of telephony between moving trains and signal boxes, has been invented by Mr. H. V. Kramer in England. The apparatus consists mainly of a coil of wire wound round a railway coach, connected with the telephone instruments, and a wire laid alongside the track, connected with instruments at stations and signal boxes. Communication is effected by induction between the coil and the wire along the track. A buzzer can also be installed on each train, which automatically warns the engineer of the presence of another train on the same line within a radius of five or ten miles. The system is to be tested on one of the English roads.

Dinner of Telephone Men.

The employes of the New York Telephone Company in the Westchester division held their first annual dinner in New Rochelle, N. Y., February 9, at which were present telephone men from Rockland County, New York City and New Jersey. Covers were laid for 175 persons.

Mr. G. L. Yates, of Mount Vernon, division superintendent of traffic, acted as toastmaster. The speakers were Mr. Herbert N. Casson; Mr. H. F. Thurber, vice-president and general manager New York Telephone Company; Mr. George C. Allen, general plant superintendent; Mr. D. C. Cox, division manager, Long Island; Mr. W. F. Judson, special agent legal department, New York; Mr. H. G. Kerr, division commercial man-

Digitized by Google

ager, Westchester, and Mr. W. J. Clark, vice-president Westchester Lighting Company.

A very enjoyable time was had by all present. Mr. Thurber's remarks were reminiscent in character and created a general good feeling.

Buoy Telephone.—The use of the buoy telephone with which submarine vessels are equipped for communicating with the surface in case of accidental sinking was well demonstrated recently, when a German submarine torpedo boat sank in Kiel harbor. The buoy float was automatically released and rose to the surface, where the life-saving crew made connection with it and learned from the captain of the submarine that his stock of oxygen would support the twenty-five men of the crew for forty-eight hours. Careful preparations were then made for raising the submarine, and in three hours the submerged vessel was brought to the surface. Mr. Jesse Sims, Maynard, Mass., claims to be the inventor of this buoy telephone. He submitted prints of his invention to the various European governments and the device was being tested by the German government when the practical utility of the instrument was unexpectedly demonstrated in the manner stated.

Telephone Extensions in Southwest.—The directors of the Colorado Telephone Company have authorized the sale of $1,500,000 of its capital stock, the proceeds to be used in refunding loans and to meet the cost of extensions in Colorado, New Mexico, Texas and Arizona.

Public Service Commission Approves Telephone Mergers.

The New York Public Service Commission, Second District, has authorized the transfer by merger to the New York Telephone Company of all the property and rights of the Jefferson County Telephone Company, also all the property and rights of the Trumansburg Citizens' Telephone Company.

The Commission has also approved of the transfer by the New York Telephone Company to the Allegany County Telephone Company of franchises or rights granted to the New York and Pennsylvania Telephone and Telegraph Company by the board of trustees of the villages of Wellsville and Andover. The Commission holds in this case that the consent of the Commission is not required for the transfer of the physical properties.

The Commission has dismissed the joint petition of the Amsterdam Automatic Telephone Company and the New York Telephone Company for the approval of the transfer of the real estate, physical plant and property of the Amsterdam Automatic Telephone Company to the New York Telephone Company. The Commission holds that it has no power or jurisdiction to consent to or forbid the transfer of the physical property of one telephone company to another, its power being limited to controlling the transfer of franchises from one such company to another.

The transfer by the New York Telephone Company to the Otsego and Delaware Telephone Company of certain franchises or rights of the Central New York Telephone and Telegraph Company assigned to the New York Telephone Company in the city of Oneonta, villages of Unadilla, Laurens, Cooperstown and Richfield Springs and village of Walton, has been approved by the Commission. The sum of $98,000 was paid for that property and rights conveyed. The Commission holds that its approval of the transfer of the physical properties was not required by the Public Service Commissions Law, and has dismissed the joint petition of these companies so far as it relates to the approval of the transfer of the physical properties.

No Destruction of Poles by Woodpeckers on Pacific Coast.

Mr. R. W. Gray, division plant superintendent, Western Union Telegraph Company, San Francisco, Cal.: "I do not know of there having been very much trouble on the Pacific Coast from woodpeckers destroying poles; the only cases being in California, and in certain very limited areas, and the damage has been to redwood poles only. The redwood poles are very soft and very easy 'pecking.' The places where the damage by woodpeckers has occurred have been in parts of the country where there were considerable groves of live oak trees. There is a large woodpecker known as the "Flicker," which lives in the oak trees and whose chief vocation in life is digging grubs and insects out of the bark of the oak trees. It seems that occasionally he alights on one of the redwood poles and does a few stunts to it, merely in a spirit of frivolity, rather than with any definite purpose in view. The remedy adopted in these cases was to substitute western cedar poles in place of the redwood. We have never known of any damage being done to cedar poles by woodpeckers. We can readily understand how the woodpeckers in Mexico, who are used to a diet of mesquite, palo verde, cholla and ocotilla, would esteem a nicely seasoned, creosoted cedar pole a great delicacy. However, the California woodpeckers are much better brought up, and will not have anything to do with a cedar pole. We have experienced a small amount of trouble in the Yuma Desert, due to the drifting sand wearing away poles. This was limited in extent, however, and not particularly serious. Poles in California, Arizona and Nevada never deteriorate above the ground; they rot at and below the ground line. In Oregon and Washington, in the western part of the states, where the rainfall is very great, poles rot at and below the ground line, and the entire pole deteriorates from decay, the life of the pole above the ground being six or eight years longer than that of the part below the ground."

Every one connected with the telegraph and telephone services should read Telegraph and Telephone Age. Its columns contain the latest news in these fields.

The United States Military Telegraph Corps.

The bill introduced in the recent Congress purposing to place the military telegraphers on an equal footing, as to pensions and homestead rights, with those who served in other arms of the service during the Civil War, failed of consideration in common with 30,000 other bills, some of which were of great national importance. Representative Taylor of Ohio will reintroduce the bill in the House of Representatives at the extra session of the Sixty-second Congress, which will convene on April 4.

In our issue of January 16 was published the text of a letter to President Taft from Col. W. B. Wilson, president of the Society of the United States Military Telegraph Corps, urging the President to use his influence in behalf of the bill.

Bronze Tablet in Soldiers Memorial Building at Pittsburg.

The design for this tablet in memory of the telegraphers from Allegheny County, Pa., who served in the United States Military Telegraph Corps during the Civil War is now completed and the tablet will, it is hoped, be finished in time to be unveiled on April 22, the fiftieth anniversary of the founding of the Corps. It is expected that Mr. Andrew Carnegie will be present at the unveiling. The committee having the matter in charge is composed of Mr. Andrew Carnegie, Mr. Joseph W. Boyd and Mr. David Homer Bates, secretary of the Society of the United States Military Telegraph Corps.

New Book.

Storage Batteries: Their Theory, Construction and Use. By A. E. Watson. Second edition. Price, $1.50.

This excellent work has been completely revised and enlarged and brought up to date. The author is assistant professor of physics in Brown University, Providence, R. I., and the manner in which he has treated his subject shows that he is thoroughly familiar with it. The contents are descriptive and general, and there are no mathematics whatever to confuse anyone not familiar with algebra.

The book contains chapters on the construction of plates, the action of the lead storage battery, how to make a storage battery, diseases and remedies of the storage battery, boosters, etc., and gives much information valuable to anyone interested.

This book or any other on electrical and kindred subjects may be obtained of Telegraph and Telephone Age, 253 Broadway, New York.

Bids Wanted for Government Supplies.

Proposals will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until 10 a. m., March 21, to furnish at the navy yard, Boston, Mass., a quantity of electrical cable as per schedule 3379. Blank proposals will be furnished upon application to the navy pay office, New York, or to the Bureau. T. J. Cowie, Paymaster-General, U. S. N.

Bids are also invited until 11:30 a. m., March 27 for supplies for the Signal Corps, U. S. A., Washington, D. C., as follows: bolts for cross arms, porcelain cleats, 1-ampere fuses, copper splicing sleeves, wire staples, condulets, wire grips, pliers, linemen's tool bags, insulators, telegraph keys, sounders, knife switches, torches, cross-arm braces, files, pikes, outlet boxes, coppers for gravity cells, crowfoot zincs, etc. Apply to A. S. Cowan, Captain Signal Corps, U. S. A., Washington, D. C.

Telephone Supplies Wanted for Signal Corps.—Proposals will be received at the office of the Chief Signal Officer, War Department, Washington, D. C., until 11 a. m., March 23, for a large quantity of electrical supplies, including lightning arresters, carbons for same, telephone induction coils, telephone cords, loud ringing extension bells, generators for artillery telephones, binding posts, magnetos, receivers, plugs, etc., etc. For further particulars address A. S. Cowan, Captain Signal Corps, U. S. A., disbursing officer, Washington, D. C.

Electric Clocks in Kansas Legislature.—Electrical self-winding clocks, controlled by Washington time, have been installed in both chambers of the Kansas legislature. It is pointed out that they will prevent the lengthening of the legislative day prior to adjournment. The legislators, however, know the art of wire pulling, now they ought to add the art of wire cutting. By cutting the wires just before noon the legislative day can be extended indefinitely.

Increasing Telegraph Facilities in Texas on Account of Mobilization of Troops.

The mobilization of United States troops in Texas along the Mexican border which is now being actively carried out will result in a heavy increase of telegraph business from that section. San Antonio and Galveston will be the principal centres of telegraphic activity and the Western Union Telegraph Company and the Postal Telegraph-Cable Company of Texas have made ample provision to increase the operating forces at these and other points where the sudden increase of business will require greater facilities for handling it. Government and newspaper correspondence promises to be of very large volume.

Time Signals in New York Harbor.—The subject of an official time signal for the benefit of the shipping interests in New York harbor is being discussed by shipping men, and the Hydrographic office. The Western Union time-ball served this purpose for many years, and is still doing duty, but it is not now visible from the harbor on account of the surrounding skyscrapers. It is proposed to place the new signal on top of the Whitehall Building, at Battery Park, which is the highest and most conspicuous structure in the lower part of the city.

Death of David R. Downer.

David R. Downer, a prominent New York telegrapher many years ago, died at his home in East Orange, N. J., March 2, after an illness lasting two years. Mr. Downer was for some years assistant manager of the Western Union Telegraph Company at 145 Broadway and at 195 Broadway, after the removal from the old quarters at 145, his brother, the late A. S. Downer being manager. He resigned his position in April, 1884, to enter the gold and silver refining business in Newark, N. J. Mr. Downer was born in New York, November 15, 1839.

Obituary.

John Fitzpatrick, aged 78, a pioneer in telegraph circles in Springfield, Mass., died in that city recently. He built the first long distance telephone line between Springfield and Boston.

Alfred G. Trulan, aged 53, an operator in the service of the Western Union Telegraph Company at Montpelier, Vt., died on February 13.

Frank R. Wells, aged 49 years, an operator for the Western Union Telegraph Company, New York, died suddenly on a train while on his way to business on March 9.

Joseph Wetzler, well known several years ago in connection with electrical journalism in this country, died in London February 22. Mr. Wetzler was born in Hoboken, N. J., December 6, 1863. He was co-editor, with Mr. T. Commerford Martin, of the *Electrical Engineer* of New York, up to the time of its consolidation with the *Electrical World*, in 1899. He was a graduate of Stevens Institute and was a patron of the fine arts. Since his retirement from the journalistic field he devoted his entire time to the management of a correspondence school in electricity in England.

Samuel C. Suydam, aged 80 years, at one time a prominent Syracuse, N. Y., operator, died in that city on February 22.

Col. Josiah C. Reiff, aged 73 years, an old railroad financier, and known to the electrical fraternity on account of the financial aid extended by him to Mr. Thomas A. Edison during the latter's early career as an inventor, died in New York, February 28. Col. Reiff supplied Mr. Edison with funds to carry on his experiments and investigations which resulted in the automatic telegraph and the quadruplex. Col. Reiff was well-known to many old time telegraphers.

Charles W. Hennessy, aged 24, an operator in the Postal Telegraph-Cable Company's office at Oswego, N. Y., died in that place February 18.

Henry C. Rowell, aged 86 years, one of the oldest telegraphers in the Eastern States, died at his home in East Hanover, N. H., February 22.

Joseph Keenan, who, for about fifty years had charge of the construction department of the Western Union Telegraph Company at Toledo, Ohio, and who died some time ago, was well known in that branch of the service. He was one of the most expert line builders in the country, and carried on his work in a scientific manner. He was 70 years of age and practically his entire business career was spent in Toledo. He was a man of unusual ability, and highly respected. Under Mr. Keenan several well-known line constructors and repairers received their training and practical experience. Mr. Keenan was the father of Mr. Edwin C. Keenan, superintendent of telegraph of the Lake Shore and Michigan Southern Railroad Company.

LETTERS FROM OUR AGENTS.

NEW YORK, WESTERN UNION.

In the death of Joseph Knittle, which was recorded in the March 1 issue, the quartette of operators who worked the Phelps printers in this office for so many years has suffered its first loss by death. The three living members are Mr. Thomas P. Scully, Mr. John K. Calvert, and Mr. Joseph L. Edwards. All four were retired by the company in 1903 on the discontinuance of the printer system, after a service of almost fifty years. They were all held in high esteem by their Morse colleagues and were gentlemen of the old school. Mr. Scully's telegraph service goes back to the early fifties. He is therefore a veritable old-timer. He was president of the North Western Telegraph Company for many years. Mr. Calvert's service has been mainly as a printer operator. He began his career as a messenger for the Bain Chemical Telegraph Company at 29 Wall Street, New York, in 1851, and went with the House Printing Telegraph Company at 145 Broadway, in 1862. Mr. Edwards' experience also was mainly with printing telegraph companies. He was chief operator of the printing service at 145 Broadway and assistant editor of the *Telegrapher* in 1865. He was associated with the late G. M. Phelps in the invention of printing telegraph instruments.

George H. Schnitgen, aged 42 years, formerly of this office and a well known telegrapher, died on March 4, at his home at Clinton Corners, N. Y., to which place he had retired some time ago to engage in farming.

E. C. Rafford, a member of the Commercial News Department force, died of apoplexy on March 7. Mr. Rafford was a well known member of the profession and his sudden death is mourned by a host of friends.

THERE ARE NO REBUILT TYPEWRITERS equal to the "Central." Call and see them or write me personally. "Mills" rebuilt by high class workmen. Prices moderate. D. A. Mahoney, Representative, **CENTRAL TYPEWRITER EXCHANGE,** New York City.

PHILADELPHIA, POSTAL.

Night Traffic Chief W. P. Bowers has returned to duty.

Mr. Edward Fitzgerald has been appointed to the post of "rider" on the leased wires.

Digitized by Google

The Postal Electric Club, under the guidance of Chief Operator E. W. Miller, is growing in favor. The three lectures given so far have been a success.

The Wright printing machine recently installed between New York and Philadelphia is doing excellent work under the supervision of Mr. Nelson.

ATLANTA, WESTERN UNION.

Mr. H. K. Griffin, whose appointment as chief operator of this office was announced in these columns March 1, succeeded Mr. E. Waldron. Mr. Griffin came from New York. Mr. Waldron was transferred to the position of night chief operator. Mr. J. F. Morey is all night chief operator and Mr. W. C. Hair day traffic chief. Mr. J. T. Goodrum has been recently transferred from day supervisor to night traffic chief, vice Mr. R. F. Williamson, who has left the service. Mr. O. T. Hughes is the all-night traffic chief. Mr. R. E. Satterwhite was recently appointed supervisor in the "way room," vice Mr. H. B. Smith. Mr. A. H. Condra, formerly night traffic chief, has been transferred to the plant department as general wire chief, days.

An electrical class has just been organized, with a membership of fifty-five. The class is made up of thirty-six men from the operating department, the remainder coming from the various division and district superintendents' offices. The first meeting was held in the office of Mr. D. M. Thorell, division traffic superintendent, on February 20. Mr. H. C. Worthen, general superintendent, gave the class a very interesting talk on the benefits of an electrical and general telegraphic education. Another meeting was held the following evening, at which Mr. Worthen gave a talk along the same lines but covering a wider range. The address was listened to with marked interest and created a feeling of enthusiasm for and appreciation of the importance of the work to be taken up by the class. The third meeting, at which the class began serious study was held in the evening of March 1. It was in charge of Professor Wood, of the Georgia School of Technology.

Owing to the heavy volume of business at Jacksonville, Fla., caused by the "tourists," the following named operators were recently sent there from this office: Messrs. J. W. Jones, E. P. Cox, L. T. Lester, L. Swartzburg, J. E. R. Stinson, D. J. Siegel, F. C. Connor, T. A. Smith, F. L. Maxler, J. A. Spencer, P. L. Nash, and Mr. LaChevrotiere.

Mr. E. Waldron, night chief operator, and Mr. J. F. Morey, all-night chief operator, of this office, have been transferred to the plant department. Mr. J. T. Goodrum, night general traffic chief, and Mr. O. T. Hughes, all-night general traffic chief, will be in charge of the traffic on their respective tricks.

PITTSBURG, WESTERN UNION.

Miss Hattie Richards, timekeeper and stenographer, employed in this office, died on February 14.

Commercial Association of Western Union Telegraph Company.—In our issue of March 1 we gave an account of the organization of the Greater New York Commercial Association of the Western Union Telegraph Company. Mr. J. W. McMahon, district commercial manager at 270 West 23rd Street, New York, was one of the speakers, but in the original account a clerical error gave Mr. McMahon the initials "P. J." that he never possessed.

Martin's Double Lever **VIBROPLEX**, $8.00 f. o. b. D. C. DeLany, 15 S. Broad St., Atlanta, Ga.

WANTED.—Live agents in all large Western Union and Postal offices. Central Typewriter Exchange, New York.

The Telegraphers' Mutual Benefit Association, 195 Broadway, New York, combines fraternalism with sound business principles; it offers to the telegraph and telephone employe an absolutely safe form of protection, at a cost within the reach of all and lower than can be found elsewhere. Membership only open to employes in commercial or railroad telegraph or telephone service, and it is manifestly to the interest of those who are eligible and wish to secure life insurance within their means, to secure without delay a certificate for $1,000 or $500, or both, at rates based on present age.

MARTIN'S LATEST VIBROPLEX, $9.00. Address James B. Havice, General Agent, 253 Broadway, New York.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEYBOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York.

SOME POINTS ON ELECTRICITY—XV.

BY WILLIS H. JONES.

The New Western Union Polechanger.

In discussing the admitted superiority of the new polechanger used in connection with the new Western Union quadruplex which will soon supersede the old standard, it is apparent that many laymen are somewhat perplexed as to its operation, and fail to fully understand just why the actions of two opposing magnets situated on opposite sides of a common lever armature do not interfere more or less with each other.

Others ask why the retractile spring of the relay should require aid in pulling the lever back. This is one of the strong points in the device after the contact points have once been broken. The lever armature is placed between the pole pieces of two opposing magnets, one of which is short and stumpy and acts quickly; the other is longer and larger, and is so constructed and connected as to make it act sluggishly. When the lever touches the front contact point one polarity of current goes to the line while the opposite polarity follows when the position of the lever is reversed.

Now the reason that there is no appreciable magnetic interference with the common control of the armature lever is that the two magnets act successively instead of simultaneously, and, furthermore, because their respective duties are performed and finished within a shorter period of time than the lever, unassisted, would otherwise occupy in its transit across the air gap between the two contact points. This is because magnetic action is much quicker than mechanical action.

In other words, with this arrangement we get, alternately, two separate magnetic actions on the armature while the retractile spring is occupied in performing its duty of opposing or assisting the lever across the air gap.

This brings up the question, "Why is it necessary to assist the retractile spring in withdrawing the lever?" The answer is, this: in order to accelerate the movement of the lever, it is advisable to use any method that will reduce the time thus occupied which time measures the duration of the period the battery is disconnected from the line during the reversals. The shorter this period is the nearer we come to obtaining the efficiency derived from the old style continuity-contact-preserving polechanger.

The reader will now probably perceive that the aim of this polechanger is to give the same efficiency of service as the continuity-contact-preserving pattern, not by actually bridging the gap but through its ability to annihilate time during the process of reversing polarities, while at the same time actually retaining the gap necessary to prevent excessive sparking. Its operation is as follows:

When the key in the local circuit is closed, both magnets, of course, become energized. But the stumpy magnet, which is a little closer to the armature than is the larger one, is so much quicker in action than the latter that it draws the lever over before the large magnet has "built up." By that time it is too late to interfere, but it is now "loaded," so to speak, and is ready to add its pull to that of the retractile spring the moment the lever starts back for the reversal. Of course, when the local circuit is opened both magnets become demagnetized. In this case, the delay of the large magnet in losing its energy is just long enough to enable it to pull the armature back quickly, as the tension of the spring is relaxing, before becoming entirely demagnetized. In thus shortening the period of transit, we practically diminish the width of the gap without actually altering its dimensions in the least. This fact was satisfactorily proved by comparing the dimensions of the spaces or breaks shown between marks recorded on a running tape when reversals of polarity were made rapidly, first by retractile spring energy alone and then by the combined method just described. It was found that no matter how rapidly the reversals were made by means of retractile spring energy alone the gap or space marks were invariably quite conspicuous between the black marks due to such reversals. But when the records made by the reversals of the new

Digitized by Google

polechanger were examined, although the speed was not diminished, the gap was almost imperceptible to the eye.

With this positive evidence before us and the knowledge that the superiority of this polechanger over the old patterns is probably due solely to the diminished "time period" when the battery is disconnected from the circuit, the writer cannot miss this opportunity to again urge laymen to realize the importance of keeping the contact points of the old-pattern polechangers as close together as it is possible to work them without sparking. Every fraction of a second that can be gained by this means not only helps the operation of the apparatus at the other end but raises the general efficiency of the circuit. In all forms of energy, time is one of the factors with which we must reckon. This is especially true in connection with electrical energy.

Try the following experiment:

First: Connect, say, 300 volts to one brush of a solid metal ring which is being rapidly rotated and ground the other brush, as shown in the upper part of the accompanying illustration. You will then get 300 volts at X where the line is connected, because there is no break and no time is lost.

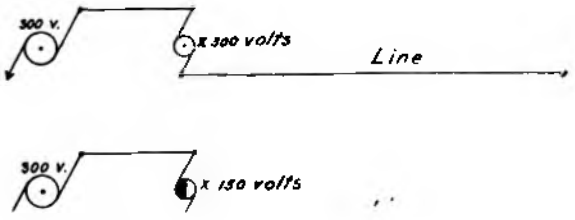

DIAGRAM SHOWING EFFECT OF SOLID AND HALF-SOLID RING IN CIRCUIT.

Second: Replace the solid disk with one of half metal and half rubber or glass, as shown in the lower part of the illustration. In this case a voltmeter will indicate only 150 volts at X because the energy is sustained only half of the time occupied by the disk in making one revolution. If the metallic and insulated parts of the disk are divided in any other proportion the value of the e.m.f. at X will be changed to correspond with the ratio of one to the other, in other words, it will rise or fall in accordance with the time the energy is sustained during one cycle.

This, illustration, of course, shows very marked variations in the alternations, but the fact that a break, due to an unnecessarily wide open pole changer, is comparatively small, should not mislead one to imagine that it is harmless. No matter how small the gap is it will diminish the electric energy and in multiplex operation there is little or no margin to work on. So keep the polechanger contact points closely adjusted.

Telegraph and Telephone Age is the oldest and most ably-conducted telegraph journal in America and should be read by every one engaged in telegraphy. Subscription price, $2 per year.

Recent Telegraph and Telephone Patents.

ISSUED FEBRUARY 21.

985,021. Antiseptic Telephone Mouthpiece. To W. M. English, Sausalito; L. E. Boukofsky and S. M. Lichtenstein, San Francisco, Cal.

985,186. Telephone System. To O. M. Leich, Genoa, Ill.

985,233. Printing Telegraph. To J. J. Vermeer, Oakland, Cal.

985,638. Telephone Mouthpiece. To L. Steinberger, New York.

985,680 and 985,760. Telegraphic Receiving Organism. To I. Kitsee, Philadelphia.

985,820. Party-Line Ringing Key To R. H. Manson, Elyria, Ohio.

985,899. Automatic Telephone Selector or Ringing Device. To R. R. Hobbs, Louisville, Ky.

986,260. Selective Lockout Telephone System. To F. W. Adsit, St. Paul, Minn.

986,267. Telephone Signal. To C. L. Chisholm, Marysville, N. B., Can.

The following patents have expired:

515,797. Telephone Receiver. Issued to Charles Selden, Baltimore, Md.

515,845. Telegraph Repeater. Issued to W. E. Sloan, Chicago, Ill.

515,939. Telephone Exchange System. Issued to E. Pope, Quebec, Can.

515,940. Telephone System. Issued to E. Pope, Quebec, Can.

516,506. Interior Telephone System. Issued to Thomas McCoubray, New York.

516,552. Telegraph Apparatus. Issued to Josiah A. Parker, St. Louis, Mo.

Personals.

Mr. N. J. Cornell, of the Western Union Telegraph Company, Portland, Ore., is now at Goshen, Ind., on sick leave.

Mr. C. A. Tinker, former general superintendent, Western Union Telegraph Company, New York, is visiting his daughter, Mrs. W. Tracy Smith, at Empalme, Sonora, Mexico.

Mr. F. N. Bassett, a well-known old-time telegrapher and for some years assistant general manager of the United Press, is now managing the Highland House at Pinebluff, N. C. The hotel is located in the midst of the pines, and is conducted in a home-like manner.

Mr. Robert O. Bailey, the new assistant secretary of the United States Treasury, began his business life as a messenger for the Western Union Telegraph Company in Chicago. He later entered the printing business and became a reporter. He was afterwards connected with the Associated Press.

Digitized by Google

Mrs. Theo. N. Vail, wife of president Mr. Theo. N. aVil of the American Telephone and Telegraph Company and the Western Union Telegraph Company, returned from Europe on the steamer *Oceanic* on March 22.

Fishing in Florida.—Mr. George M. Myers, of Kansas City, Mo., a well-known old-time telegrapher, president of the Priests of Pallas and president of the Kansas City Aero Club, has been spending some time in Florida fishing. Florida is the Mecca of fishermen and many telegraph men go there to indulge in their favorite sport. Mr. Myers and his party are having excellent catches.

Mr. Gano Dunn, formerly a telegrapher and now chief engineer of the Crocker-Wheeler Company, Ampere, N. J., stands at the head of the list of nominees for president of the American Institute of Electrical Engineers. In a canvass of the membership he received 993 votes, the next highest being 590. Mr. Dunn's election to this high position is therefore practically assured.

Mr. D. G. Ramsay, an old-time telegrapher and a member of the Old-Time Telegraphers and Historical Association, is a candidate for judge of the Circuit Court of Cook County, Chicago. Mr. Ramsay has served a term in the Illinois legislature. He began his business career as a telegrapher and was for three years president of the Order of Railway Telegraphers. Later he became assistant cashier of the East St. Louis (Ill.) National Bank. During the three years that he occupied this position he studied law and was admitted to the bar. He began the practice of law in Chicago in 1888. Mr. Ramsay is an eloquent and forcible speaker.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. Clarence H. Mackay, president, and Mr. C. C. Adams, second vice-president, have returned to their offices after a short inspection trip in the South.

Mr. H. A. Tuttle, president of the North American Telegraph Company, Minneapolis, Minn., was a recent New York visitor on company business. He was accompanied by Mrs. Tuttle.

Mr. George H. Usher, general superintendent, Mr. Jesse Hargrave, division superintendent, and Mr. C. B. Arrington, district superintendent, Atlanta, Ga., were in New Orleans recently on a tour of inspection. The New Orleans office is to be enlarged.

Mr. John Doran, superintendent of the complaint and claim department, has been ill with an affection of the eyes, but is now back at his office.

Mr. Lewis MacConnach, a clerk in the office of the vice-president and general manager, was married March 22 to Miss Dorothy Elizabeth Pettit, of Brooklyn, N. Y.

Mr. D. H. Gage, Jr., of the electrical engineer's office, has gone to Oklahoma City, Okla., to assist in planning and equipping new offices in Mr. F. W. Conger's division.

Mr. C. F. Printz, of the Cincinnati office, has been appointed to a position in the division electrical engineer's office of this company at Chicago.

Mr. C. F. Leonard, district superintendent, New York, announces the following appointments and changes:

The office at 157 East 125th Street, will on May 1 be removed to 163 East 125th Street. Manager S. Cohen of the office at 1947 Broadway has been transferred to the 228 Pearl Street office as manager and has been succeeded at 1947 Broadway by Mr. E. T. Flannagan. The district at 1397 Broadway, covered by manager C. A. Francis, has been divided, the lower section being assigned to the management of Mr. Francis and the upper part to that of Mr. T. J. McQuillan, with headquarters at 1566 Broadway. Mr. Francis' district will now cover the section from thirty-fifth Street and Broadway to Forty-second Street and that of Mr. McQuillan from Forty-second Street to Fifty-third Street.

Mr. E. Kimmey, district superintendent, New York, has returned to his office after an inspection of offices in the States of New York and Vermont.

Mr. S. G. Fitch, manager of the Scranton, Pa., office, and Mr. J. W. Weed, manager of the Syracuse, N. Y., office, were recent New York visitors.

Annual Dinner.—The Postal Telegraph Club of Atlanta, Ga., will hold its annual dinner on April 22.

Mr. G. F. Fuller has been appointed manager of the Indianapolis, Ind., office, vice Mr. F. W. Samuels, retired.

Mr. E. A. Siferd, manager of the Postal Telegraph-Cable Company at Lima, Ohio, has resigned to engage in other business. He is succeeded by Mr. H. A. Thompson of the Zanesville, Ohio, office.

The Company has made the following awards of prizes for valuable suggestions in accordance with the offer of the company made in January, 1910; first prize $50, to Mr. M. W. Gotheld, manager, Greenville, Miss.; second, $45, to Mr. J. H. Dorsey, manager, Los Angeles, Cal.; third, $40 to Mr. C. M. Gaffney, manager, Greenville, S. C.; fourth, $35, to Mr. R. H. Hawkins, chief clerk to superintendent Black, Denver, Col.; fifth, $30 to Mr. G. H. Mills, manager, Providence, R. I.; sixth, $25 to Mr. C. C. Ramsay, manager, Portland, Me.; seventh, $25, to Mr. C. F. Thompson, chief operator, Washington, D. C.; eighth, $10 to Mr. A. G. Drake, assistant chief operator, Chicago, Ills.; ninth, $10 to Mr. R. H. Armstrong, manager, Richmond, Ind.: tenth, eleventh, twelfth, thirteenth, fourteenth and fifteenth,

Digitized by Google

$5 each to Messrs. A. J. Mackler, operator, St. Louis, Mo.; Lewis McConnach, clerk, general manager's office, New York; R. A. Barton, manager, Lancaster, Pa.; O. F. Schultze, solicitor, Seattle, Wash.; J. H. Hennessy, manager Messenger Department, New York; A. J. Kavanaugh, chief service clerk, New York. Prizes will be awarded for valuable suggestions during the year 1911.

Telegraph Right of Way on Southern Pacific Railway.—The Court of Appeals in California has rendered a decision sustaining the right of the Postal Telegraph-Cable Company to condemn a right of way on the Southern Pacific Railroad, and has denied the application of the Western Union Telegraph Company for a writ of prohibition against such condemnation.

Magnetic Club Spring Dinner.

The Magnetic Club will hold its spring dinner at the St. Denis Hotel, New York, April 26. The editors of electrical papers published in New York have been invited to attend the dinner as guests of the club. An exceptionally fine entertainment programme is being prepared and a large attendance is expected.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company and of the Western Union Telegraph Company, has been spending a few days at Asheville, N. C. He was accompanied by his sister, Miss Vail, and his private secretary. He returned to New York on March 25.

Mr. G. D. Perry, general manager of the Great North Western Telegraph Company, Toronto, Ont., was a recent business visitor at the executive offices.

Mr. John C. Willever, secretary of the company, has returned to his office after a few days absence in Ocean City, N. J., whither he went to get rid of a cold. He was much benefited by his rest.

Mr. H. C. Worthen, general superintendent of the Southern Division at Atlanta, Ga., was in Key West, Fla., recently on company business.

Mr. C. H. Gaunt, general superintendent of this company at San Francisco, accompanied by Mrs. Gaunt, was a recent guest of Mr. Hugh McPhee, district commercial superintendent at Los Angeles, Cal. Mr. Gaunt is convalescing after an illness of typhoid fever.

Mr. W. A. Houghtaling, of New York, has been transferred from the traffic department to the department of the engineer of equipment.

Mr. Allan Woodle, manager at Boston, has been promoted to the position of district commercial manager of the first district, with headquarters at New Haven, Conn.

Mr. O. A. Conner, district commercial manager at Buffalo, has been appointed acting manager at Boston, Mass., vice Mr. Woodle.

Mr. S. M. Custer, district commercial manager for Connecticut at New Haven, goes to Philadelphia as district commercial manager.

Mr. H. A. Carrell, manager of the Macon, Ga., office has been appointed manager of the Savannah, Ga., office, vice W. B. Stuart.

Mr. F. M. Houser, of Jacksonville, Fla., has been appointed chief operator at Savannah, vice Joseph Marshall, transferred to Charleston, as chief operator.

Mr. J. T. Gray has been appointed manager at Columbia, S. C.

Mr. John W. Brown, manager of the Augusta, Ga., Western Union Telegraph office since October, 1902, has been retired on a pension. Mr. L. R. Daniel, of the Columbia, S. C., office will succeed Mr. Brown. Mr. Brown was born on April 29, 1847, and entered the telegraph service on December 1, 1859. He is one of the best known figures in telegraph circles in the South.

Mr. Harman D. Jones, chief clerk in the office of the general superintendent at San Francisco, Cal., has been appointed special agent for the first district of the Pacific Division with headquarters at San Francisco, Cal.

Mr. G. H. Boothby chief solicitor at Philadelphia has been transferred to Boston as chief solicitor.

Mr. Edward Schrader Ridgway, chief operator of the Memphis, Tenn., Western Union office, was born in Union City, Tenn., March 7, 1885, and entered the telegraph service in Nashville, Tenn., January 7, 1900, where he remained without interruption until November 16, 1910, when he was appointed to his present position. He was repeater chief in Nashville in 1908, and chief and night chief operator in 1909.

Mr. O. L. Michaels, manager of the Colorado Springs, Col., office of this company has been appointed traveling auditor for the Mountain Division, with headquarters at Denver.

Mr. J. W. Dudley of the El Paso, Texas, office has accepted a position in the Salt Lake City, Utah, office of the company.

Mr. James F. O'Donnell, fourteen years manager of the Postal Telegraph-Cable Company of Texas, at Joplin, Mo., has been appointed manager of the Western Union Telegraph Company at the same point. Mr. O'Donnell was born at Nevada, Iowa, March 3, 1866, and has filled many railroad positions as operator, clerk to the superintendent, train dispatcher, etc., and is consequently a man of wide experience in the railroad as well as in the commercial service.

This company is installing in its Spokane, Wash., office a five-position telephone switchboard and a 30-circuit fire alarm, burglar alarm, night watch and sprinkler supervisory switchboard. The burglar alarm and sprinkler switchboard are new additions to the equipment and are being installed by Mr. C. M. Marron, general foreman of the American District Telegraph Company.

Digitized by Google

Mr. A. C. Terry, district commercial superintendent, Pittsburg, Pa., was a recent New York visitor.

Mr. H. A. Whitsett, of Hattiesburg, Mississippi, has been appointed manager of the Jackson, Miss., office, vice Mr. A. M. Stanley, resigned to enter other business.

Mr. Frank Easton, recently deputy state engineer of Colorado, has accepted a position in the plant department of the Western Union Telegraph Company at Denver, Col., under Mr. R. W. Whitehead, district plant superintendent.

Western Union Managers Meeting in Syracuse.—A meeting of Western Union managers in the Western section of New York state was held at Syracuse, N. Y., March 23. A telegram was read from general superintendent A. G. Saylor, New York, expressing his appreciation of the meeting and commending its work. Mr. Saylor said: The object of your meeting is fully appreciated, and carried to a conclusion, means success to the company and to each of you individually. I am satisfied that you are taking the same interest in the company's affairs as though they were the affairs of your own, and with a dominating spirit of this character you are bound to succeed."

Mr. C. E. Senseman has been appointed manager of the Spartansburg, S. C., office, vice Mr. F. B. Washington who has been transferred to Macon, Ga., as manager. Mr. Washington succeeds Mr. H. A. Carrell who is now manager of the Savannah, Ga., office.

Morse Electric Club Dinner.

The annual dinner of the Morse Electric Club, New York, which was postponed from February 23, will be held at the Hotel Savoy, Fifth Avenue and 59th Street, April 6. The guest of honor will be Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company and of the Western Union Telegraph Company.

Many prominent telegraph and telephone men will be present, and among the speakers will be Mr. Union N. Bethell, president of the New York Telephone Company. Mr. Bethell is one of the ablest orators in the profession.

An excellent entertainment programme is being arranged and there is every prospect of the meeting being a memorable one.

The tickets issued previous to the postponement and the seating reservations will hold good unless canceled by April 3, in which case the treasurer will promptly refund.

Marcus D. Crain, aged 70 years, night chief operator in the St. Louis office, died on March 26. During the Civil War he joined the Military Telegraph Corps and saw much active service under General Halleck. In 1863 he was appointed chief operator of the Military office in St. Louis by Colonel R. C. Clowry as a reward for meritorious conduct in the field. After the war he became superintendent of telegraph of the Missouri Pacific Railway, and was afterwards appointed chief operator in the St. Louis Western Union office. He went to Kansas City as chief operator and returned to St. Louis in 1877 as assistant chief operator. In March, 1892, he was appointed night chief operator, which position he held at the time of his death. Deceased was one of the best known telegraphers in the country and had a host of friends.

George D. Perry Appointed General Manager Great North Western Telegraph Company.

Mr. George D. Perry, secretary-treasurer and superintendent of supplies, Great North Western Telegraph Company, Toronto, Ont., has been appointed general manager of that company, to succeed the late Isaac McMichael.

Mr. Perry was born at Whitby, Ont., on April 19, 1858, and was educated at Trinity College School, Port Hope, Ont. He began his business career in November, 1877, when he entered the service of the Standard Bank of Canada in Colborne, Ont. In February, 1880, he was appointed cashier of the Credit Valley Railway Company, which was later absorbed by the Canadian Pacific Railway Company. In February, 1881, he accepted the position of bookkeeper with the Dominion Telegraph Company, Toronto, Ont., and in September of the same year, on the consolidation of the Canadian telegraph lines, he was appointed private secretary to the secretary and auditor of the Great North Western Telegraph Company. He was afterwards advanced successively to the positions of chief clerk, assistant auditor, secretary and auditor, and finally, in 1902, secretary-treasurer and superintendent of supplies.

G. D. PERRY,
General Manager Great North Western Telegraph Company.

James Haviland, who helped Ezra Cornell build the first telegraph line in this country, and who constructed the first telegraph lines in the Middle West, died March 19 in Brookline, Mass. He was born in Elmira in 1825.

John Lapey—April, 1861-1911.

Many telegraphers throughout the country have good reason to remember John Lapey of Buffalo, who has just rounded out fifty years in the Western Union Telegraph Company's service at that point. He was an operator of the highest rank and was classed with such stars as Harvey D. Reynolds, the late A. S. Ayres, Geo. M. Eitemiller, and others of equal note. Some years ago he filled a position in the Buffalo dock office which was a very important telegraph center over thirty years ago, and the wire upon which he worked was generally shunned, because it meant real hard and fast work for the one who was compelled to receive from him at the Chicago end. Any one who could handle Mr. Lapey's speedy and finished Morse became a member of the "four hundred" of the profession. It was a sufficient recommendation for an applicant for a position to be able to say that he could receive from John Lapey.

It is related that on one occasion an operator applied to chief operator Maynard of the Chicago office for a position. He was recommended as a first-class operator. "Well, we'll see," said Mr. Maynard. "Sit down to the Buffalo dock wire there and show what you can do. John Lapey will send to you." Anyone who could not measure up to John Lapey's standard had no right to be classed as a first-class operator, according to Mr. Maynard's idea.

In reply to an invitation to give an account of his fifty years' experience, Mr. Lapey's thoughts of the past took on a poetic turn and in the following verses he tells a story that would require a page of type to express in prose. It is not our custom to print verse, but we feel that we can make an exception in Mr. Lapey's case on account of his old-time fame and the fact that he has attained the exceptional distinction of being in the service of one company and in one office fifty years.

RETROSPECT.

APRIL 1, 1861-1911.

On April first, in '61,
Just fifty years ago;
To join the Western Union force,
I came to Buffalo.

The wondrous changes that have come
This half a hundred years,
In personnel and business ways,
All like a dream appears.

Remembrance of the past recalls
To mind with pleasing thought,
The old-time "stars" with pen and key;
How skillfully they wrought!

But stars will rise and stars will set,
'Tis life's unchanging tune.
We all, some day, must "30" say,
For no one is immune!

J. L.

Buffalo, N. Y., March 31, 1911.

Mr. Lapey is still in harness and is in charge of the Commercial News Department at Buffalo, and his numerous friends throughout the country will no doubt join us in wishing him many more years of activity and happiness.

The Cable.

Mr. George G. Ward, vice-president and general manager of the Commercial Cable Company, New York, who has been ill and absent from his office for several weeks, sailed from New York March 25 on a West Indian cruise. Mr. Ward was advised to make this trip in order to escape the rigors of the northern climate. He expects to return to New York on April 12.

Mr. Frank B. Gerrard, superintendent of the Commercial Cable Company's station at Hazel Hill, Canso, N. S., who has been on special duty in Newfoundland for the last two years, is in New York.

New Atlantic Cable to South America.—The German cable ship *Stephan* is now occupied in laying a cable across the narrowest part of the Atlantic ocean, from Monrovia, Liberia, to Pernambuco, Brazil. The cable is owned by a German company. This is part of the new system of cables between Germany, Africa and South America. The sections already laid are from Emden, Germany, to the Island of Teneriffe and from Teneriffe to Monrovia, and the *Stephan* is laying the section from Monrovia to Pernambuco. The next step in the work will probably be the laying of a cable from Monrovia to connect with the German possessions on the West Coast of Africa.

James Graves, former superintendent of the Anglo-American Telegraph Company, at Valentia Island, Ireland, died on January 14 last. He joined the Electric Telegraph Company of England in 1852. He was appointed superintendent at Valentia in 1865 when the Anglo-American Telegraph Company was formed, and remained in that company's service until June, 1909. He assisted Mr. J. B. Stearns in the development of the duplex.

Louis A. Lurienne, aged 52 years, representative of the French Cable Company in the United States, for the past fourteen years, with headquarters at New York, died at Paris on March 25 of heart failure. Mr. Lurienne had been a sufferer from heart trouble for the past six months, and had gone to France in the hope that a rest in his native country would restore his health. Mr. Lurienne, before coming to the United States was identified with the government telegraph department in France. Mr. E. C. Sweeney, superintendent at New York, has been looking after the interests of the French Cable Company since Mr. Lurienne went to France six months ago.

Battery Quadruplex of the Postal Telegraph-Cable Company.

BY J. F. SKIRROW, ASSOCIATE ELECTRICAL ENGINEER, POSTAL TELEGRAPH-CABLE COMPANY, NEW YORK.

The accompanying illustration shows the main line connections of the battery-operated quadruplex of the Postal Telegraph-Cable Company.

In reading the diagram it will be particularly noticed that the functions of the polechanger are performed by two transmitters, whose local magnets are connected in series with the transmitting key. This permits the use of standard apparatus for both dynamo and battery-operated quadruplexes. The same arrangement is used as a polechanger on a battery duplex. It has been found in practice that this arrangement can be more readily adjusted and taken care of than can the continuity-type of polechanger, and the results are equally as good.

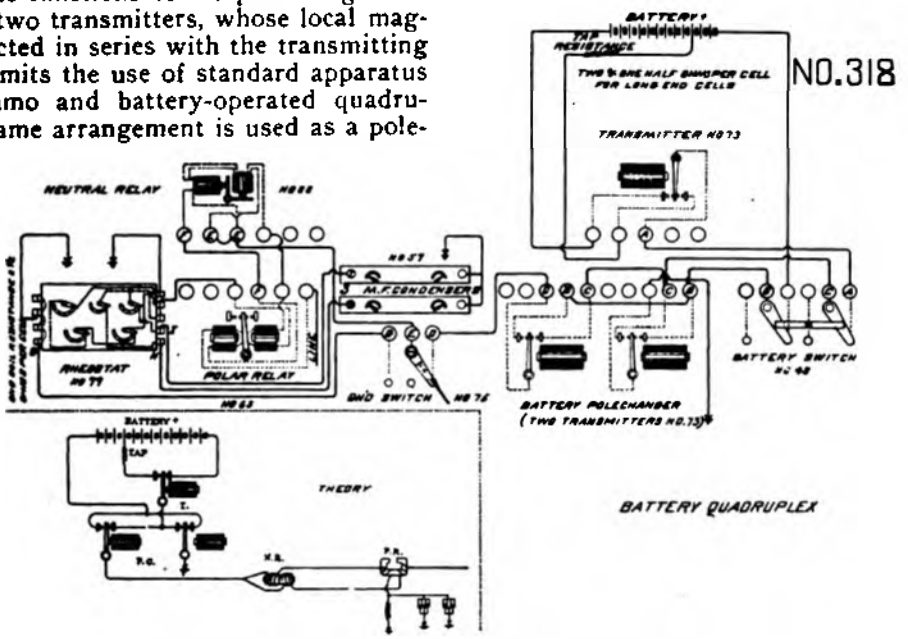

DIAGRAM OF CONNECTIONS OF BATTERY-OPERATED QUADRUPLEX.

Serial Building Loan and Savings Institution.

In the address of President A. G. Saylor, at the recent annual meeting of the Serial Building Loan and Savings Institution, New York, some interesting facts were presented on the subject of Savings and Loan Associations in New York State. He referred to the action of the legislature of 1910 in passing amendments to the banking laws with a view to securing greater uniformity in the management of such associations. This action, President Saylor states, is the result of the untiring work of Mr. E. F. Howell, secretary of the Association, who has been for five years chairman of the legislative committee of the State League.

In order to fully reap the benefits of this new legislation new by-laws regulating the affairs of the Institution will be submitted to the members for approval.

During the year 298 new members were added to the Institution's list, the highest of any one of the past ten years.

"The business of the Institution," he said, "is in a sound and healthy condition, which has been reported upon with favor, following its recent annual examination under the direction of the New York State Superintendent of Banks."

Continuing his address to the members President Saylor said:

"The continued success of this Institution depends more upon the good will and effort of its members than upon the carefulness of its management. We may and do give you an association worthy of your confidence and enthusiastic support, but it is for you to extend its influence and widen its field of operation. It is your duty, it is the duty of every individual member, to add to our roll at least one new member."

Meeting of Commercial News Department Officials.

Representatives of the Commercial News Department, Eastern Division of the Western Union Telegraph Company, met in New York on March 22, in conference to discuss matters pertaining to that branch of the service. Those present were: Messrs. E. R. Tilghman, Pittsburg, Pa., M. J. Cook, Boston, Mass., W. J. Taylor, Baltimore, Md., E. Ryder, Hartford, Conn., J. Lapey, Buffalo, N. Y., G. D. Butler, Rochester, N. Y., and W. P. Wheatland, Philadelphia, Pa., and Messrs. S. M. Williams, Geo. B. Scott, W. J. Dealy, Gardner Irving and H. M. Heffner of New York.

Messrs. Dealy, Cook, Lapey, Ryder and Irving are veterans, having been in the Commercial News Department service for more than a quarter of a century.

Convention of Railway Telegraphers. — The Order of Railway Telegraphers will hold its biennial convention in Toronto, Ont., on May 8.

Quadruplex Installation and Operation.

(Concluded from page 231, March 16.)

[NOTE.—All illustrations referred to in this section were used in connection with the first part.]

THE COMBINATION CONDENSER:—This consists of a wooden box containing three groups of condensers, two of which are adjustable, and the other non-adjustable, as represented theoretically in Fig. 3.

The adjustable condensers, each of which has a total capacity of 3⅜ m.f.'s graded in the manner shown, are to be used in the artificial line for the purpose of securing the "static" balance.

The non-adjustable condenser has a fixed capacity of 1 m.f. and is intended for use as a "spark" condenser, to be placed between the "ground" and the dividing point of the "5-U" coil, as illustrated in Figs. 1 and 4.

THE DYNAMO OR BATTERY VOLTAGE:—This should be of the value necessary to develop in the main line, a working current of about 60 milliamperes with the "long end," and 20 milliamperes with the "short end," under favorable weather conditions.

THE PROPORTIONAL RHEOSTAT:—The resistance values should be adjusted to give a current ratio of 3 to 1, as illustrated in Fig. 3.

LINE RESISTANCE BOX:—This box (shown in the upper right hand corner of Fig. 2) contains a series of resistance coils aggregating 1250 ohms, the whole or certain portions of which may be included in the main line. The primary object of this resistance is to afford a means for increasing the electrical length of short quadruplex or duplex circuits, in order that the latter may be successfully operated on potentials ordinarily used in connection with comparatively long circuits.

It may also be employed to advantage in reducing the strength of earth currents on lines between whose terminal ground plates, potential differences exist that would be detrimental to the working, particularly of short quadruplex circuits.

The use of this resistance may occasionally be desirable on the longer circuits under such changeable weather conditions as might seriously affect the working by disturbing the line balances. The insertion of the line resistance under these circumstances, would have the effect of removing the main line wire from the immediate vicinity of the home apparatus, which would then be less susceptible to the alterations in magnetism brought about by leakage variations.

In all such cases, a compensating resistance equal to that inserted in the main line, should be added to the artificial line, together with condenser retarding resistances of approximately similar value; the distant office being notified of the change thus made in order that any rearrangement of the balance rendered necessary thereby, may be suitably effected at that office.

BALANCING THE QUADRUPLEX:—The usual practice of balancing to the distant "ground" on quadruplex circuits, is now regarded as unnecessary, owing to the presence in the circuit of the milliammeter, which admits of the balances being taken against the distant battery with less loss of time, and under conditions that eliminate all differences that may happen to exist between the ground coil and battery resistance.

RESISTANCE BALANCE:—In taking a resistance balance, proceed as follows:

(1) Ask the distant station to close both keys, which will cause the milliammeter at the home station to deflect to the left, or in what may be called a marking direction.

(2) Note the number of degrees obtained on the needle, first with your No. 1 key open, and then with it closed, the deflection in each case being taken after the needle has come to rest.

(3) While the key is in the closed position, adjust the balancing resistance until the needle reaches a point midway between the two readings above-noted, which point will represent the deflection required to secure the ohmic or resistance balance. If, for instance, the needle stands at 28° on the open key, and at 24° on the closed key, then the adjustment should be such as to bring the needle to a position that will correspond as nearly as possible with the mean of the above two readings, viz. 26°.

It will be found that when the resistance in the artificial line is greater than that in the main line, the needle will swing somewhat deliberately in an upward or spacing direction upon closing the key. And, per contra, the swing of the needle will be in the downward or marking direction should the resistance in the artificial line be less than that in the main line.

STATIC BALANCE:—It will next be in order to take a "static" balance, any disturbance of which will make itself evident by a sudden throw of the milliammeter needle, which will quickly jerk or "kick" in one direction just as the key is being depressed, and in the opposite direction at the moment the key is released, the needle instantly returning to its normal or steady position after each movement of the reversing key.

In order to avoid confusion during these balancing operations, it will be well to disregard the effects produced upon the needle at the opening of the key, and take note only of those observed at the closing thereof.

(1) If, then, upon closing the key, the needle swings, or kicks in a spacing or upward direction, and then rapidly returns to its former fixed position, it will be an indication that the capacity of the condensers in the artificial or compensating circuit is not enough, and should accordingly be increased.

(2) If, on the other hand, the throw of the needle is in the downward or marking direction at the instant of depressing the key, the condenser capacity should be diminished.

The amplitude of the swing or kick in each case, will show the extent or amount of the static unbalance, the latter depending upon the difference between the strength of that portion of the current which suddenly rushes into, and charges any main line possessing electro-static capacity, and that of the current rushing into the artificial line to satisfy the "capacity" requirements of the condensers forming part of the compensation circuit.

Digitized by Google

RETARDATION BALANCE:—If the retarding resistances in the paths of the balancing condensers are not accurately adjusted the time occupied in charging and discharging the condensers will differ from that required to charge and discharge the main line. Should this difference be very pronounced, the milliammeter will give a peculiar "double kick" each time the key is opened and closed, this kick being readily distinguishable from that due to the ordinary static unbalance, in having a decidedly more jerky and lively appearance during its exceedingly brief period of existence. It may, however, be somewhat difficult to differentiate between the two, on account of the constant vibration, to which the milliammeter needle is ordinarily subjected by induction from neighboring wires, the effects of such interference rendering accurate readings and close observations a matter of considerable difficulty. Under such circumstances, it may be well to make the final compensating adjustments by rapidly dotting on the No. 1 key, whilst making such alterations of the capacity—and particularly of the timing or retardation resistances—as will cause the needle to show the least amount of disturbance as a result of the changes thus made.

APPROXIMATE BALANCES:—An absolutely perfect balance cannot be secured until the needle ceases to be influenced by the operations of the reversing key, the steady condition of the needle denoting that an equality of potentials (upon which the bridge principle depends) has then been duly established or in other words, that the pressures exerted by the outgoing currents at opposite ends of the "bridge"—in which the milliammeter and polar relay are placed—are equal in magnitude and oppositely directed, thus producing a null effect upon both of those instruments.

An absolutely perfect balance being somewhat difficult of attainment—especially when the time involved is an important consideration—it is only necessary as a rule to obtain a good working balance, that is, one in which the clearness and legibility of the incoming signals are practically unaffected by the outgoing currents.

It should not be necessary in most cases to call in the aid, and await the appearance of any traffic or repeater chief at a distant station for the purpose of restoring a balance, which can usually be effected by suitable "snap-shot" adjustments calculated to meet the practical working requirements, without involving a stoppage of the circuit, or the delay incident to securing the attendance of the particular chief concerned at either the repeater or terminal office.

THE SIGNALING CIRCUIT:—The local signaling device (for calling in quad and duplex attendants) which forms part of the multiplex table equipment for quad and duplex circuits, includes a low resistance signal relay and 2 c.p. lamp, the functions and operation of which are more specifically set forth in the specifications describing this signaling system.

THE QUADRUPLEX REPEATER:—The repeating apparatus is in every way identical with that at the terminal stations.

What Our Friends Have to Say Regarding This Publication.

Mr. C. W. Lemont, of the New England Telephone and Telegraph Company, Springfield, Mass., in renewing his subscription to our publication writes: "Telegraph and Telephone Age improves with age."

Mr. L. D. Wilbourn, district traffic superintendent, Western Union Telegraph Company, Boston, Mass., writes: "You did perfectly right in renewing my subscription. I cannot afford to be without your excellent journal, and I never fail to recommend it to the craft."

Mr. J. McMillan, superintendent of the Canadian Pacific Railway Company's Telegraph, Calgary, Alta., Can., in renewing his subscription for another year, says: "I have recommended to our chief operators their subscribing for Telegraph and Telephone Age and I am quite free to admit that your paper is the best publication of its kind that I know of. Each number contains valuable electrical information enough to keep any man busy until he receives the next number."

Mr. James Hervey Nichols, of Denver, Col., an old-time and military telegrapher, and for many years past one of Denver's successful business men, in renewing his subscription to our paper, writes: "It affords me great satisfaction to see your paper grow. Telegraph and Telephone Age is a necessity." It will be remembered that Mr. Nichols was one of the most interesting telegraph figures during the Civil War. He was at General Grant's headquarters at Appomattox at the time of the surrender of General Lee. When the government turned over the lines to the Western Union Telegraph Company Mr. Nichols was retained as manager of the Petersburg, Va., office. In 1867 he went to Denver.

Gold and Stock Life Insurance Association.—The proceedings of the thirty-third annual meeting of the Gold and Stock Life Insurance Association, which was held in New York, January 16, has been issued in pamphlet form. It is a very complete record of the association's work and includes a list of living and dead members. In a note accompanying the report Secretary W. J. Dealy urges all members to take an active interest in the affairs of the Association by securing new members. Mr. Dealy's efforts should be encouraged and supported by every one interested.

Day-Letter Service on Texas Postal Lines.

The Postal Telegraph-Cable Company of Texas has adopted the 50-word day-letter service on its lines in Texas, Arkansas, Oklahoma, Louisiana, including Joplin, Mo., and Arkansas City and Mulvane, Kan. The rate is one-half more than the regular day rate for ten words. Mr. S. M. English, president and general manager of the company, states that his company stands ready to render superior service of every kind and has authorized this day-letter service on its own lines.

Improvements in Telegraphy and in Combined Telegraphy and Telephony.

Mr. George E. Hines, a well-known telegrapher of New York, has been granted two patents on telegraph systems and one on a combined telephone and telegraph system.

The first of the former, which is dated April 13, 1909, has for its principal objects economy in maintenance and operation; duplex and quadruplex operation and the doing away, in quadruplex operation, with a battery continuously in circuit. In this system Mr. Hines combines the use of induced currents of definite polarity with battery currents and employs a polarized relay for both sides of the circuit. He also uses polarized relays in connection with devices for sending induced currents over the line when the first side alone is operated, and battery currents over the line when the second side alone is operated, and substitutes battery currents for induced currents, or parts thereof, when both sides are actuated.

His invention, it is claimed, results in greater definiteness in transmission and receiving signals under all conditions and particularly in wet weather when transmission is difficult, since the receiving apparatus on the first side is sensitive to currents of any strength so long as their polarity is reversed, and the receiving apparatus of the second side is responsive to currents from a constant potential source, provided the constant potential is at least as great as the induced potential impressed upon the line at the sending station. Moreover, the relay of the second side does away with disturbance in the main line circuit produced by frequent demagnetization and movement, the demagnetization being eliminated and the movement greatly reduced, and furthermore, does not open the local relay circuit controlled by the relay on the second side in such a manner as to interfere with its action.

Claim 3 reads as follows: In a telegraph system, the combination of a main line, two sources of current, one for sending induced impulses and the other for sending continuous current impulses, a key for controlling said induced impulses and commutating said continuous current impulses and a second key for interrupting said induced and continuous current impulses one kind at a time, and two polarized relays, one responsive to induced and commutated currents only and the other responsive to commutated and uncommutated continuous currents only, the former relay engaging a single contact, the latter engaging forward and backward contacts.

The second patent, issued November 29, 1910, has for its object the transmission over a line to distant stations of dynamic currents of definite direction induced by a local or primary current. Mr. Hines by this invention impresses electromotive forces on a line by means of induction coils having primary and secondary windings. Such currents approach the sine wave form and are more easily transmitted and cause less interference with neighboring lines than where an electromotive force from a constant potential source is impressed directly upon the line, as in present practice. To accomplish this result Mr. Hines employs a transformer having a closed magnetic circuit, and so wound that the primary circuit has the necessary large time constant. A secondary electromotive force is induced in the secondary winding during the whole period of rise of the magnetism of the core, resulting in a secondary current flowing along the line and during this period. Mr. Hines introduces an adjustable self-induction coil in series with the secondary winding, so as to more or less neutralize the capacity of the line.

The transmitting key is preferably such that the electromotive forces impressed upon the primary are all in the same direction, since a reversal of the electromotive force upon a single operation of the key is liable to send two impulses in the same direction and of substantially equal strength, instead of one impulse in a given direction of double strength.

The invention is summarized in claim 2, which reads as follows:

The combination of a main line conductor grounded at each end, closed magnetic circuit transformers having secondary windings in series with said conductor and a key-controlled primary circuit in series with a source of constant current, relays having movable polarized armatures also in series with said conductor, jockeys restraining said armatures against movement due to the action of stray currents, and an adjustable self-induction device also in series with said conductor.

The third patent, issued April 12, 1910, relates to improvements in combined telegraph and telephone systems and has for its specific purpose the combination of a telephone circuit with a single or duplex telegraph circuit. Mr. Hines eliminates the interference between two such systems by the elimination of the static discharge from the line, and accomplishes this result by impressing upon the telephone conductors telegraphic impulses which are of rounded wave form, there being one such wave for each impulse. On account of this wave form the impulses upon the telephone lines are in effect shaded at both the beginning and at the ending, and are in effect single waves of an alternating current and are of such low frequency as compared with telephonic currents as to produce no effect upon the diaphragms of the telephones.

The final claim reads: In a combined telephone and telegraph system the combination of a main conductor, telephonic apparatus connected therewith, said conductor being grounded at each end, a coil in series with said conductor, a second coil in inductive relation to said first coil, a closed magnetic circuit common to said coils, a telegraph key and battery in series with said second coil, an impedance coil located in the ground connection between said first coil and the point to which the telegraphic apparatus is connected receiving relays and jockeys for the armatures of said relays.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

April 1, 1911.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

The Telegraphers' Mutual Benefit Association.

It is a happy sign of the times and source of great gratification to note that the telegraph companies are recognizing long and faithful service, as indicated by a form of pension plan which we understand is now being considered, based on faithful performance of duty and at a fixed age of retirement.

The companies have for many years shown interest in the employe's family and dependents by urging their caretaking through the medium of the Telegraphers' Mutual Benefit Association, and it is to this worthy association that we now wish to direct special attention.

Every married man at least should give the matter of life insurance very serious consideration. If he has a family to provide for he should, as far as he is able, insure against the contingency of his being taken away at any time, and if he has the ordinary human instincts he will see to it that his family is not left unprovided for.

The Telegraphers' Mutual Benefit Association is one of the strongest fraternal insurance organizations in this country and it is the moral duty of everyone engaged in telegraphy, telephony and related interests, especially if he or she has a dependent family, to lay the foundation for their support in the event of sudden taking away. The history of this organization is one of marked success, but its continued success depends upon the numerical strength and activity of its membership, and the payment of their dues of course, and everyone engaged in the interests referred to should take an active part in promoting its welfare. In so doing he not only helps his own family in time of need, but many others besides.

Everyone engaged in telegraphy and telephony in any department—administrative, operative or manufacturing—is eligible to membership in this association, and if even one-half of the members should make an endeavor to secure a new one the activity and strength of the organization would be greatly augmented.

Mr. H. J. Pettengill, president of the Southwestern Telephone and Telegraph Company, Dallas, Tex., through the columns of *The Southwestern Telephone News*, brings forcibly to the attention of telephone employes the advantages of membership in this association. He gives a brief history of the organization and points out its financial strength, having a reserve fund of over $325,000. Mr. Pettengill has been a member of the association for thirty-three years and has recently been appointed one of the newly created Advisory Board. "The Association," he states in the communication referred to, "has the entire confidence of its members, who unhesitatingly recommend it to you as an institution that has done and is doing much substantial good for the fraternity and humanity in general." He closes with the statement that representatives of his company will be appointed agents for the association in the principal cities in Texas and Arkansas.

This action on the part of one so prominent in the telephone field augurs well for the future of the association, and no doubt similar action will be taken by other telephone officials throughout the country. This activity should prove to be a stimulus in the telegraph field. There are hundreds—probably thousands—of eligible persons in the telegraphic ranks who should be urged to join the association, and every member should make some effort to get these persons interested. We advise all who are not members of this worthy association to give the matter their careful consideration.

Federal Corporations Tax Law Declared Constitutional.

The United States Supreme Court on March 13, handed down a unanimous decision affirming the constitutionality of the corporation tax law imposing a tax of one per cent. on all earnings of corporations showing a net profit of over $5,000 per year.

Extinction of the Loan Shark in Telegraph Offices.

In our issue for January 16 we referred to the plan instituted by the Western Union Telegraph Company to make financial loans to those of its employes who need extra money to meet exceptional emergencies, and thus get rid of the annoyances resulting from the importunities of loan sharks into whose traps the unfortunate borrower had been caught.

It is gratifying to note the good that has already resulted from this step. Borrowers of company funds can now stand up like men and look other men squarely in the face, with a feeling of relief over the fact that they have been saved from the machinations of the wily Shylock.

An aggravated case in New York taken up by the company was that of an employe whose entire salary was pledged to satisfy the greed of the money lenders. He began by borrowing of them a small sum to tide himself over an emergency, and before he realized it his indebtedness grew to alarming proportions. The interest, so-called, accumulated so rapidly his salary was garnisheed on an average two or three times a month. His case seemed hopeless until the company came to his rescue. It loaned him sufficient funds to free him from his indebtedness to the loan sharks and he is returning the money to the company without interest, in small weekly sums.

It is needless to say that this man is now one of the happiest individuals in New York, now that he is free from the human parasites, who live on the weaknesses and misfortunes of their fellow men.

Interstate Commerce Commission Decides That Telegraph and Telephone Companies Are Subject to Law of Common Carriers.

The Interstate Commerce Commission on March 20 issued the following rules and regulations for telegraph and telephone companies:

"1. Each and every telegraph and telephone company which transmits messages over its line or lines from a point in one state, territory or district of the United States to any other state, territory or district of the United States, or to any foreign country, is subject to the provisions of the act.

"2. If a telegraph or telephone company at the time of which is wholly within a single state, territory or district of the United States, receives a message within such state, territory or district of the United States, for transmission to a point within the state, territory or district, which it transmits over its line to another point in the same state and there delivers it to an inter-state line for transmission to destination, the first-named company, by virtue of its participation in this transaction, is not made subject to the provisions of the act, unless there be an arrangement between that company and its connection for through continuous transmission of such messages, in which latter case all of the participating companies in such through continuous transmission are subject to the provisions of the act.

"3. If two or more lines are connected so that a person within one state, territory or district of the United States talks with a person at a point without such state, territory or district of the United States, or so that a message is transmitted directly from a point within a state, territory or district of the United States, to a point without the same, the transmission of messages in this manner constitutes inter-state commerce and brings all of the participating lines within the purview of the act.

"4. It follows that telegraph and telephone companies subject to the act, as above indicated, must conform to the provisions of Section 1 thereof, requiring that all of their rates and charges for the transmission of inter-state messages shall be reasonable and just, and that such companies may lawfully issue franks covering free inter-state service or may grant free inter-state service to the same extent, and subject to the same limitations, as other common carriers under the provisions of said section.

"5. Such telegraph and telephone companies subject to the act are also governed by the provisions of Section 3, forbidding any undue or unreasonable preference or advantage by rebates or otherwise, or any undue or unreasonable prejudice or disadvantage in any respect whatsoever, and are subject to the lawful orders of the commission made pursuant to the provisions of Section 15 of the act, and also of Section 20 thereof respecting the keeping of accounts and memoranda and the making of reports to the commission.

"The commission at this time withholds expression of its views regarding other questions which have arisen with respect to the amenability of these carriers to the provisions of other sections of the act."

Edison's Secret of Hard Work.

Mr. Thomas A. Edison, who recently celebrated his sixty-fourth birthday by spending three-fourths of the day at hard work, surprises even his intimate friends by his endurance of mental labor. In a conversation in 1909 he remarked, as if it were nothing out of the way, that up to seven years previously his average of daily working hours was nineteen and one-half, but that since then he figured it at eighteen. It was suggested that the secret of it might be that he did not live in the past, but was always looking forward to a greater future. He replied: "Yes, that's it. I don't live with the past: I am living for to-day and to-morrow. I am interested in every department of science, arts, and manufacture. I read all the time on astronomy, chemistry, biology, physics, music, metaphysics, mechanics, and other branches—political economy, electricity, and in fact all things that are making for progress in the world."

Kansas Public Utilities Commission.—The bill passed by the Kansas legislature creating a Public Utilities Commission for that state, will become a law on May 1. It provides for the regulation and control of public utilities and common carriers, including telegraph and telephone companies.

Damage to Chestnut Telephone and Telegraph Poles by Wood-Boring Insects.

BY THOMAS E. SNYDER.

The United States Department of Agriculture has recently issued a pamphlet on the subject of damage to chestnut telephone and telegraph poles by woodboring insects. The investigations were made by Mr. Thomas E. Snyder, agent and expert, and his report, slightly abbreviated, follows:

It has recently been determined through special investigations conducted principally by the writer that serious damage is being done to the bases of standing chestnut telephone and telegraph poles in certain localities by the grub or larva of a wood-boring beetle, here called the chestnut telephone-pole borer. The character and extent of the damage under different conditions of site in several localities have been determined, and poles treated with various preservative substances have been inspected to compare the efficiency of both chemicals and methods of treatment. These investigations have resulted in the determination of practical methods of preventing injury to poles by wood-boring insects.

The first information of serious damage to standing chestnut poles by wood-boring insects was conveyed in a letter, dated December 15, 1906, from E. O. Leighley, a correspondent of this Bureau, reporting damage to telephone poles in Baltimore, Md., by borers. The borers were identified as cerambycid larvæ, and later were determined to be the chestnut telephone-pole borer.

On December 16, 1906, Mr. H. E. Hopkins, division superintendent of a telephone company, stated that the poles in West Virginia were badly injured by borers and that these borers were abundant.

The writer on October 3, 1909, inspected some chestnut telegraph poles which had been standing for about twelve years on New York avenue, in Washington, D. C. The poles had been taken down under orders from the city authorities, which necessitated the placing of wires in conduits under ground, and they had been lying in piles for about a month before they were inspected. The chestnut telephone-pole borer had been working in the base of the poles, and white ants, or termites, were associated with them. Twelve out of the 103 poles examined had been damaged, some more seriously than others.

On October 15, 1909, Mr. H. E. Hopkins stated that in one line built twelve years ago (40 miles long, 36 chestnut poles to the mile, poles 20 to 40 feet long and 5 to 12 inches in diameter at the top) approximately 600 poles had been rotted off at the top of the ground, and inspection showed that 95 per cent. of the damage was directly or indirectly due to insects. Other lines in this division were reported to be in about the same condition. It was later determined that most of the insect damage was the work of the chestnut telephone-pole borer.

Dr. A. D. Hopkins states in a recent comprehensive bulletin that "construction timbers in bridges and like structures, railroad ties, telephone and telegraph poles, mine props, fence posts, etc., are sometimes seriously injured by wood-boring larvæ, termites, black ants, carpenter bees, and powder-post beetles, and sometimes reduced in efficiency from 10 to 100 per cent." Thus, while it has been known that almost all classes of forest products that are set in the ground are seriously injured by wood-boring insects, the problem of insect damage to standing poles, posts, and other timbers has never been made the subject of a special investigation.

In May, 1910, this study was assigned to the writer, and, in addition to a study of the insects involved, investigations in co-operation with telephone and telegraph companies have been conducted in the District of Columbia, Maryland, Virginia, Pennsylvania, New Jersey, and New York. Through the courtesy of the Western Union Telegraph Company several telegraph lines were inspected in July and August, 1910, in Virginia, where the poles were being reset or replaced. Here the butts of over 200 poles set under different conditions of site were thoroughly examined for insect damage, and sometimes the entire pole was split open. In one line 10 to 12 years old (approximately 30 chestnut poles per mile, 25 feet long, about 6 inches diameter at the top, 10 inches at the base, and apparently of second quality), between Petersburg and Crewe, Va.—the poles had already been reset once, east of Wilson, Va.—serious damage by the chestnut telephone-pole borer rendered from 15 to 20 per cent. of the poles unserviceable. After the present second resetting it was estimated that the poles can not last more than four or five years longer. West of Wilson the poles were naturally in much worse condition, and many were broken off and only held up by the wires on the sounder poles. In another line examined, between Portsmouth and Boykins, Va. (poles 30 feet long and apparently of second quality), serious damage by this borer averaged about 10 or 15 per cent., and between Boykins, Va., and Weldon, N. C., according to a lineman, 50 per cent. of the poles are badly decayed near the surface of the ground. Much of this damage, however, is due to fungus heart rot. According to a statement by the foreman of a resetting crew, between Asheville, N. C., and Spartanburg, S. C., hundreds of chestnut poles were badly decayed in the 67 miles of line reset, and were only held up by the wires. The line was 15 years old. There was serious damage by "wood lice" (termites) and also by "white wood worms."

The chestnut pole borer is very widely distributed, ranging from Ontario, Canada, to Texas, eastward to the Atlantic coast, and westward to Arizona and southern California. It is common throughout the natural range of the chestnut—and in this connection it should be observed that most of the chestnut poles are purchased from local timber-land owners.

The injury to the poles consists in large mines in the wood near the line of contact of the pole with the ground, necessitating the frequent resetting or even the replacement of the damaged poles. These irregular galleries of the grub run both horizontally

Digitized by Google

and longitudinally throughout the heartwood, and are sometimes seven inches long, but vary with the individuals, which show great differences in size. The borers usually work in the outer layers of the wood at the base of the pole for a distance of from two to three feet below, and sometimes from one to two feet above the line of contact of the pole with the surface of the ground. The greatest damage is to that area just below and just above the surface of the ground; here the conditions of air and moisture are most favorable. Often the entire butt up to a distance of from 4 to 6 feet and higher, according to the depth of setting, is mined. The numerous galleries, often very close together, completely honeycomb the wood in a zone three to four inches in from the exterior of the poles; this so weakens the poles that they break off close to the surface of the ground. The basal two feet is usually sound. Even if the damage is not serious enough to cause the poles to break off under strain, they are likely to go down during any storm, and thus put the wire service out of commission; such damaged poles are a serious menace along the right of way of railroads. The beetle will attack poles that are perfectly sound, but evidently prefers to work where the wood shows signs of incipient decay; it will not work in wood that is "sobby" (wet rot), or in very "doty" (punky) wood. It has not yet been determined just how soon the borers usually enter the poles after they have been set in the ground. However, poles that had been standing only four or five years contained larvæ and adults of this borer in the heartwood, and poles that had been set in the ground for only two years contained young larvæ in the outer layers of the wood.

Poles that appear sound on the exterior may have the entire basal interior riddled, and the work of the borers is not noticed until the poles break off. If merely isolated poles are injured, the poles that are broken off are held up by the wires and can be detected by the fact that they lean over, but if several adjacent poles are affected, especially where there is any unusual strain, that portion of the line is very likely to go down. The presence of the borers in injurious numbers can be determined only by removing the earth from about the base of the pole; the exit holes of the borer are found near the line of contact with the soil. Often large, coarse borings of wood fiber project from the exit holes. Sometimes old dead parent adults are found on the exterior of the poles underground. During August the young adults may be found in shallow depressions on the exterior of poles below the ground surface.

The subject of the relation of insects to the rapid decay of chestnut poles has not been thoroughly investigated in the past, but now that the supply is becoming scarcer it is especially important to know what are the various primary causes of the deterioration of these poles, hitherto described under the vague term "decay." Although the chestnut telephone-pole borer has not hitherto been considered an insect of any economic importance, and has been described in entomological literature as only living under bark, principally of pine, or in the decomposing wood of various species of deciduous and coniferous trees, the evidence is abundant that breeding in the bases of chestnut poles is not a newly acquired habit. It has also been determined that this beetle damages many species of living forest, fruit, and shade trees that have been previously injured by fire or other causes, and often leads to the destruction of trees that would otherwise recover from such wounds, and while not normally a primary enemy to trees, may thus become of more than secondary importance.

The damage by the chestnut telephone-pole borer is especially serious in consideration of the fact that in many parts of its range the chestnut is threatened with extinction as a tree species on account of the very severe ravages of the combined attack of an insect and a fungus disease. Further unnecessary drain upon the supply of chestnut timber should be avoided by protecting that already in use and thus prolonging its length of service.

As more than one-fourth of the 3,500,000 round poles exceeding 20 feet in length used annually by telephone, telegraph, and other electric companies are chestnut, and as this borer has seriously damaged as high as 10 to 40 per cent., varying with conditions of site, of the chestnut poles which have been set in the ground for from ten to twelve years in lines in North Carolina, Virginia, West Virginia, Maryland, and the District of Columbia, it is evident that this insect is an important factor in decreasing the normal length of service of the poles.* In lines from twelve to fifteen years old the damage is much greater, and at the end of this number of years of service any line in which poles of this species are set has to be practically renewed. According to a statement in Forest Service Bulletin 78 (Sherfesee, 1909), "approximately four per cent., or 5,908 feet board measure of the 147,720 feet board measure of standing poles annually requiring replacement in the United States, is destroyed by insects." If only chestnut poles can be considered, at least ten per cent. of the poles reset or replaced are injured by insects.

The damage is apparently greatest and the borers are most abundant where the poles are set in high or level dry ground under good conditions of drainage. Such sites are the crests of railroad cuts through low hills, slopes of "fills," and in cultivated or other fields. Where the poles are in wet sites there is usually little injury by wood-boring insects except to that portion near the surface of the ground. Conditions of drainage are more important than different soil combinations, and the condition of the soil is more important than its composition; *i. e.*, where the soil is hard packed there is apparently less damage than where it is loose. The quality and condition of the poles before setting

*The average life of a chestnut pole is eight to ten years (Sherfesee and Weiss, 1909).

Digitized by Google

is a very important factor to consider before arriving at any conclusions as to the relative longevity of poles under various conditions of site. Green (unseasoned) or imperfectly seasoned poles are less durable than those thoroughly seasoned. Poles that are defective before setting, as they very often are (i. e., showing evidence of incipient decay), and poles that have the heartwood mined by the chestnut timber worm, the work of which is very abundant, will, of course, decay much more rapidly than poles that are in a sound condition. The galleries of the chestnut timber worm afford an entrance to the spores of wood-destroying fungi, and thus greatly accelerate decay. White mycelium compactly filled these galleries throughout many standing poles, thus clearly proving that these mines aid greatly in enabling the fungus heart rot more rapidly and completely to penetrate the entire heartwood of the poles. If the injury of both wood-boring beetles and wood-destroying fungi (between which there is a varying interrelation) be considered, then in several lines from ten to twelve years old in North Carolina, Virginia, and West Virginia at least 50 per cent. of the poles are either rendered unserviceable or their length of service is much shortened.

It is not to be concluded that this wood-boring beetle is the only insect that injures standing chestnut poles. Indeed, the most common injury is by the "wood lice" or white ants. In lines from ten to twelve years old these insects have seriously damaged as high as 15 per cent. of the poles, and their work is often present, at least superficially, in as high as 75 per cent. of the poles under all conditions of site. However, the damage is usually to the outer layers of the wood, where it is moist or there is incipient decay, and is more superficial and localized than that of the chestnut telephone-pole borer. Nevertheless, white ants often completely honeycomb the sound heartwood of poles, especially at the base. They work both in sound wood, "doty" (dry rot) wood, and "sobby" (wet rot) wood. Sometimes a large channel runs up through the core of the heart and the sides are plastered with clay, forming a hollow tube with several longitudinal galleries. Their work often extends from two to four feet above the surface of the ground. They leave the outer shell of the wood intact and work up through the longitudinal weathering checks, covering the exterior of the pole with earth to exclude the light. White ants will damage poles that have been set in the ground only two years. Evidently they enter the pole from below the surface of the ground.

A giant round-headed borer is sometimes found in the poles, usually in association with the chestnut telephone-pole borer. In poles where the wood is sound this borer apparently works as a rule only in the outer layers of the wood, the galleries running longitudinally through the heart below the surface of the ground. In poles where there is decay it will completely honeycomb the heartwood near the surface of the ground.

In several poles where the wood was "doty" a large Scarabæid which has before been found in decayed oak railroad ties was present and caused the poles to break off sooner than they otherwise would. The irregular galleries of the grub completely honeycomb the decayed heartwood near or just below the surface.

A flat-headed borer and wireworms were found in galleries locally in the more or less decayed heartwood of several poles. A large black carpenter ant does some damage to sound poles set in dry ground through woodland. This ant often widens the longitudinal weathering checks and thus accelerates decay. A small black ant was very numerous in many poles, but its work is usually confined to the outer layers of the wood. The work is often throughout "doty" poles. Injury by this ant is not primary, but it also widens weathering checks, enlarges other defects, and induces more rapid decay.

Regarding prevention of the injury, Doctor Hopkins makes the following statement in a recent bulletin: "Insect damage to poles, posts, and similar products can be prevented to a greater or less extent by the preservative treatments which have been tested and recommended by the Forest Service for the prevention of decay. These should be applied before the material is utilized for the purposes intended, or, if it be attacked after it has been utilized, further damage can be checked to a certain extent by the use of the same substances.

"It is often of prime importance to prevent injury from wood-boring insects, for the reason that such injuries contribute to more rapid decay. Therefore, anything that will prevent insect injury, either before or after the utilization of such products, will contribute to the prevention of premature deterioration and decay."

Through the courtesy of the American Telephone and Telegraph Company and the Forest Service, about 40 chestnut poles set in a test line near Dover, N. J., were inspected by the writer on July 15, 1910, in company with engineers of the telephone company and Mr. H. F. Weiss, assistant director, Forest Products Laboratory, Forest Service, to determine the relative merits of various methods of preventing damage by wood-boring insects to the bases of poles. In this line, which is eight years old, variously treated poles alternated with untreated poles in order that each chemical preservative and method of treatment might be given an absolutely fair test under the same conditions of site. The poles were 30 feet long, 7 inches in diameter at the top, and 33 inches in circumference 6 feet from the base. In this inspection the earth was removed (to a depth of about 1 foot) from the base of the pole, and then the pole was chopped into to determine the rate of decay. This method of inspection for insect damage is not very satisfactory. The various methods experimented with in this test line were brush treatments with a patented carbolineum preservative and spirittine, charring the butt, setting the pole in sand, and setting it in small broken stone. It was found that, although these methods may temporarily check the inroads of wood-boring insects, they will not keep the insects

Digitized by Google

out of the poles. The most serious damage to the poles in this line was by white ants. Other insect damage was by a large black carpenter ant and the larvæ of a round-headed borer.

An inspection was made, between September 6 and 14, 1910, of the bases of over 400 chestnut poles set in a similar test line near Warren, Pa., and Falconer, N. Y. These poles were treated by the creosote "open-tank" method of impregnation, and brush treatments of creosote, wood creosote, creolin, two different carbolineum preservatives, and tar; they had been set in the ground for a period of five years. All these treatments, except the brush treatments with creolin and tar, were efficient in preventing the attacks of wood-boring insects, at least for a five-year period, in this northern climate. There was little damage by insects to the poles in this test line. The most common injury to the untreated poles was by the large black carpenter ants, which widen the longitudinal weathering checks, and hence induce more rapid decay. The work of the chestnut telephone-pole borer was found in several poles, and this beetle was evidently just beginning to attack these poles. There was some damage by a round-headed borer. No white ants or termites were present and this is evidently too far north for these destructive borers. A report by inspectors of the American Telephone and Telegraph Company and the Forest Service on the remainder of the poles in this test line (between Jamestown and Buffalo, N. Y.) not personally inspected by the writer, showed that these conclusions can be applied to all the poles in the line with the exception that there was superficial injury by small black ants to two poles treated by brush treatments of carbolineum avenarius and to two treated with wood creosote; also, as the inspection progressed, injury by the chestnut telephone-pole borer became more abundant and serious, and the borers seemed to be established in the poles. The poles treated by the creosote "open-tank" method of impregnation and by brush treatments with creosote and with "S. P. F." carbolineum remained uninjured.

Methods of treating poles superficially by brushing with various preservatives have proved to be temporarily efficient in keeping wood-boring insects out, if the work is thoroughly done and not only the butt, but also the base, is treated. If the pole is not thoroughly brushed, insects enter through the untreated or imperfectly treated portions, especially through weathering checks and knots. Where the base is left untreated, insects, especially white ants or termites, enter the pole from below ground and, avoiding the treated portions, come right up through the pole.

The few poles of southern yellow pine in a line near Bartley, N. J., inspected on July 15, 1910, which had been impregnated with cresote by the Bethell cylinder-pressure process, 12 pounds of oil to the cubic foot, and had been set in the ground since February, 1903, were apparently free from signs of decay or damage by wood-boring insects. In another line, running between Norfolk, Va., and Washington, D. C., the few poles (12 years old, of squared—with the sapwood cut away—southern yellow pine) inspected on August 10, 1910, near Portsmouth, Va., which had been impregnated with creosote by the Bethell cylinder-pressure process, were also apparently sound.

Thus, it is evident that impregnating the poles with creosote by some standard process (either the open-tank or the cylinder-pressure processes) will keep wood-boring insects out and preserve the poles for a much longer period than they would last untreated. In the open-tank method only the area most subject to the attacks of wood-boring insects and deterioration in general (i. e., the basal eight feet) is treated, while by the cylinder-pressure processes the entire pole is impregnated. Alternating less susceptible juniper (red cedar) poles or pine poles thoroughly impregnated by some standard process in the line with the chestnut poles would be a safeguard in holding up an old line where the damage is found to be serious on resetting.

New Book.

The Wireless Operator's Pocketbook of Information and Diagrams, is the title of a 174-page book just issued by the Bubier Publishing Company, Lynn, Mass. The author is Leon W. Bishop, a well-known authority on wireless matters, and he has given to the student and general reader a book that is well worth careful reading and study. It is a practical pocketbook for the wireless operator, showing all up-to-date apparatus, in theory and practice. Its purpose is to satisfy the desires of the wireless operator and of those experimenters who have already some knowledge of wireless phenomena, for a practical book more suited to their needs than the many elementary ones which deal mostly with the construction of simple apparatus, or the elaborate technical and mathematical treatises which presuppose a technical education to understand them.

Briefly, it thoroughly describes all of the latest transmitting and receiving instruments; aerials, giving the types and relative sizes for the best work in transmitting and receiving; the latest methods of tuning both transmitting and receiving apparatus; and it has a full chapter of diagrams, showing the most approved circuits for all sizes of sets, both in transmitting and receiving.

Among other features it gives a table showing how to compute roughly the sending and receiving distances for all types of instruments with all types of aerials and ends with the latest Call-Book containing the calls of the principal land and water-stations in America both government and commercial. The book is very liberally illustrated and the price is $1.00, $1.25 or $1.50, according to the style of binding which is in cloth, leatherette and leather, respectively. Postage is 8 cents additional.

This and other books on electrical subjects can be supplied by Telegraph and Telephone Age, 253 Broadway, New York.

The British Telegraph Service as a Government Institution.

The following article reprinted from the London *Spectator* is a rather severe arraignment of the British telegraph service as a government enterprise. Of course it is only one side of the story, yet the facts are impressive.

"At the end of the present year the Postmaster General will take over the whole of the vast business now in the hands of the National Telephone Company," says the *Spectator*, "and will then become possessed of an absolute monopoly of telephonic communication.

"In order to realize what this means," it continues, "or may mean, it is necessary to trace, as Mr. Herbert Laws Webb has done in a very useful little book (The Development of the Telephone in Europe), the history of the purchase of the telegraphs by the postoffice.

"When that project was first mooted, Mr. Scudamore, one of the officials of the postoffice, was called upon to make an estimate of the probable cost. His first estimate, made in 1866, was that the whole of the plant of the two telegraph companies could be bought up for £2,500,000, and he calculated that the net revenue would amount to 8.8 per cent. on the capital. He subsequently made other estimates, rising rapidly till his fourth estimate, made in 1869, put the capital expenditure at £6,750,000, but he was careful, at the same time, to put up his estimates of revenue so as still to show a profit.

"Finally, parliament voted £7,000,000 for the purchase, and, having done so, speedily discovered that that sum was insufficient.

"Among other incidents of the transaction, which would have been humorous if it had not been so serious for the nation, was the discovery, after the bargain had been completed with the telegraph companies, that they only had a leasehold interest in their wires running along the railway lines and that the railway companies must be compensated for their freehold interest. When the capital account was finally closed it reached nearly £11,000,000.

"In spite of the obvious superficiality of these estimates, Mr. Scudamore and the other enthusiasts for the state purchase of the telegraphs succeeded in converting the ministry of the day to their view of the financial success that the purchase would prove, and rosy pictures were painted in the house of commons of a large and increasing net revenue from the telegraphs which would be sufficient in fifteen or twenty years to wipe off the whole of the capital cost, and leave the taxpayer a magnificent source of income to be used in relief of taxation.

"It is safe to say that unless the house of commons had been deluded into the belief that the purchase would prove commercially profitable it would never have sanctioned such an adventure with the money of the state.

"Barely twelve months had elapsed before the disillusionment came. There was, it is true, a small net profit made on the first year's working, and a very much smaller profit the second year.

"After that the net revenue rapidly fell below the amount necessary to pay interest on capital, and, as a matter of fact, except for the first and second years, interest on capital never has been paid out of the profits of the concern. It has been met out of the exchequer, or, in other words, has been a charge upon the taxpayer.

"This, however, is only the beginning of the story. As years went on, the cost of working the telegraphs under state control rapidly increased out of all proportion to the revenue earned. Simultaneously pressure was put upon the department by the house of commons to reduce the charges, and it was constantly urged that lower charges would mean higher profits.

"Possibly this might have been the case if the undertaking had been worked by an enterprising commercial company, for before the purchase of the telegraphs by the state the companies principally concerned had progressively reduced their charges and improved their service for the sake of obtaining a more profitable business. But under state control lower charges meant, as a matter of fact, less profit, with the result that the gross revenue speedily fell far below the gross expenditure.

"This point is extremely important, because the apologists of state purchase have for years spread the inaccurate statement that the telegraphs have only failed to show a profit because of the high price paid for them. This is entirely untrue, for except for the first two or three years the postoffice has not been charged with interest on capital, and during the greater part of the administration of the telegraphs by the state the revenue has failed to meet working expenses.

"Nor is this all; for year by year parliament has granted large sums to the postoffice to be used as capital for telegraph development, but has charged no interest upon any of these advances. When all these facts are taken into account—namely, the original capital which has never been repaid, the advances from parliament upon which no interest is charged, and the annual deficiencies on working expenses—it will be found that the aggregate commercial loss to the country by the state purchase of the telegraphs is not less than £35,000,000.

"Nor can we console ourselves with the reflection that for this £35,000,000 the state has a valuable asset, for that asset, such as it is, involves every year on its working an additional loss of over £1,000,000.

"From a commercial point of view the purchase has been an unmitigated failure. To reply, as the advocates of state action invariably do, that the public has received compensation in the shape of a more efficient and a cheaper service is plausible but unconvincing. For even if we make the large assumption that the service is better and cheaper than it would have been if it had remained in private hands, we are entitled to ask by what right the taxpayer is deprived of his money in order to subsidize persons who send telegraphic messages.

"The latter are a minority of the population; they are mostly well-to-do, and they are principally repre-

Digitized by Google

sented by two classes—purely commercial men, who look upon telegraphing as a business expenditure; and the racing fraternity, who certainly have no special claim to the charity of the taxpayer.

"Curiously enough, the one gleam of real enterprise displayed by the postoffice is in connection with race meetings, where the telegraphic arrangements are, we understand, generally excellent. But we dispute altogether the right of the advocates of state action to assume that the state control of the telegraphs has given the country a better and cheaper service than the companies would have done.

"During company control the rates were constantly being lowered and the service extended, and after the telegraphs passed into the hands of the government, inventions were made (notably duplex and multiplex telegraphy) which ought to have immensely reduced the cost of working.

"Yet such is the fatal incapacity of governments to conduct a commercial undertaking that, as Mr. Webb has conclusively shown, the working cost per thousand telegrams is actually more to-day than it was thirty years ago.

"What is even more serious is the effect of the state monopoly of the telegraphs upon the development of the telephone. If the telegraphs had remained in private hands the telephone would have entered the field as a separate concern, and its competition would have forced the telegraph companies to give better terms to the public. Probably, after a more or less prolonged struggle, the telephone would have established itself as a universal means of communication for short distances. But as the postmaster general was held by the law courts to have a complete monopoly of all electrical intercommunication, he was able for many years to block the development of the telephone.

"Finally, when compelled by public opinion to modify his attitude, he insisted that the telephone companies should pay him no less than 10 per cent. on their gross receipts. It will amuse our readers to learn that up till a couple of years ago, this heavy royalty on the receipts of the National Telephone Company, which, in effect, is nothing more or less than blackmail, was actually credited by the postmaster general to the earnings of the telegraph department.

"Yet, in spite of paying this royalty, now amounting to nearly £300,000 a year, the National Telephone Company is able to pay its shareholders a dividend of 6 per cent. while the postoffice telephone system shows hardly any profit at all, even on the most favorable construction of the official figures.

"In view of these facts the financial prospect of the acquisition of the business of the National Telephone Company by the postoffice is appalling, and we therefore heartily welcome Mr. Webb's practical suggestion that the government, instead of taking over the National Telephone Company's telephones, should create a new authority, somewhat on the lines of the Port of London authority, which would take over both the postoffice system and the company's system.

"It should pay the government a reasonable percentage on its taking, and arrangements should be made for reduction in its charges to the public going hand in hand with any increase in dividends. Subject to these conditions, it should be allowed—nay, encouraged—to work for a profit like any other commercial venture.

"Working for a profit is the best incentive to efficient, and so to beneficial training.

"This authority would of course have to be absolutely independent both of the treasury and of the house of commons, and free to borrow money upon its own credit. For if the telephone system of this country is to be developed to anything like the extent to which it has been developed in the United States under private enterprise, large sums of capital—probably £5,000,000 or £6,000,000 at least—must be expended every year for many years to come; while, if the system is to be worked so as to produce a profit, instead of a loss, the controllers of it must not be subject to political influences, which have made the telegraph service so complete a failure from the commercial point of view.

"We therefore commend this proposal very strongly to the present government, in spite of their predilection for state enterprise. For in the long run the hard facts of finance are unanswerable. The country is already committed to vast schemes of expenditure, and there is a growing feeling of irritation at the burden of taxation.

"If the postoffice takes over the telephones itself the ghastly failure of the telegraphs will certainly be repeated; if a separate telephone authority is created, there is a reasonable prospect of a satisfactory profit for the state."

New System of Multiplex Telegraphy.

A new system of multiplex telegraphy has been invented by Mr. C. Andraini, an Italian engineer. The Morse code is used and, according to a foreign publication, it is possible to transmit more than ten messages over one line at the same time. Each closure of a key causes a blade to vibrate, which is tuned to a certain sound, and this transmits to the line alternating currents of high power and of known and invariable periods. The currents transmitted by the blades "disconnect themselves at the receiving station, and by means of special mechanism associate themselves with different Morse instruments." The adoption of the new apparatus, it is stated, necessitates very slight alterations in existing instruments.

Mr. S. S. Bogart, executive engineer of the New York Continental Jewell Filtration Company, New York, in renewing his subscription for another year writes: "Enclosed find my check for one year's renewal of my subscription. I began many years ago, when the Age was in swaddling clothes. Are there many older subscribers? I have the best of reasons for continuing. The Age is progressive, instructive and interesting."

ANSWERS TO QUESTIONS.

[In this department questions on matters of a practical character, and of general interest, will be answered. Questions intended for this department must be signed by the writer's full name—not for publication, but for identity. No attention will be paid to anonymous communications.]

(28) Q. When lines of force are expressed in square inches, how can I reduce them to equivalent square centimeters, also, please give me the rule to change them from square centimeters to square inches. C. E. G.

A. (1) To reduce from lines of force per square inch to lines of force per square centimeter, divide by 6.45. (2) To reduce from lines of force per square centimeter to lines of force per square inch multiply by 6.45.

(29) Q. Will you please state the rule for finding the efficiency of a battery? W. Y. P.

A. Divide the resistance of the external circuit by the resistance of external circuit plus the internal resistance of the battery and multiply by 100. The result will be the efficiency.

(30) Q. Please tell me when the first submarine cable was laid between England and America, also give a brief history of it. Also please tell how many cables there are now across the Atlantic between England and America. E. A. A.

A. The first cable was laid in August, 1858, but it failed entirely within two months afterward. During that time 732 messages were transmitted through it. A message of twenty-six words occupied twenty-five minutes in transmission; now a message of that length can be transmitted in one minute. There are thirteen cables in operation across the Atlantic between England and America at the present time, the latest being laid in the past few months. A description of this cable was published in our issue of March 1, on page 202.

(31) Q. (1) If there are two telephone lines each one mile long, one composed of two No. 12 wires and the other one No. 12 wire and the ground what will be the difference in the resistance; in other words what is the resistance per mile of the ground?

(2) Our country lines, being ground return, are bothered considerably by cross talk. Would it lessen the induction any if we were to coat the wires with some kind of paint by saturating rags and dragging them over the wires? B. E. F.

A. (1) The resistance of No. 12 B. W. G. iron wire per mile is 29.1 ohms. On the assumption that your lines are of iron the resistance of the metallic circuit would be 29.1 x 2 = 58.2 ohms, and that of the grounded line 29.1 ohms, the difference of the two resistances being 29.1 ohms. The resistance of the ground is regarded as zero so does not enter into the calculation. (2) Coating your wires with paint will not prevent induction. Inducton could be diminished by properly transposing the wires on the poles, that is by changing the relative positions of the wires on the poles or cross arms.

(32) Q. Kindly tell me what Mr. Marconi's Christian name is. I notice that he is sometimes called W. Marconi and again G.? T. M. W.

A. His name, in Italian, is Guglielmo, which, in English, is William, the "G" and "W" being the initials of the different forms of the same name.

Some Curious Tests of Cable Core.*

BY HAROLD OHLSON.

A strange phenomenon was noticed by the writer a few months ago while testing submarine cable core, and some notes on it may prove of interest. Tests for 10 minutes with a battery of 1,500 Leclanché cells were being taken on lengths of core served with yarn and coiled in small iron tanks, each able to contain two lengths of two nautical miles. The tanks were close together, but not in contact, and rested on the floor of the factory, an iron pipe for waste water, connecting them at the bottom and grounded. It was noticed that the first set of zinc-to-line readings was often, but not always, too high by nearly a constant number of scale divisions; the readings with carbon-to-line were always correct. An actual test was as follows, the first three readings only being given:—

	Zn to line.	*C to line.*	*Zn to line.*
First minute	251	206	206
Second "	166	120	120
Third "	137	91	91

It will be noticed that zinc readings taken after carbon to line had been used were not disturbed. From a number of observations and experiments the following facts were established:

(*a*) The disturbance was never present except in these small tanks, and was never observed even in them when carbon to line was being used: (*b*) it was usually only the first set of zinc readings that was disturbed, although occasionally subsequent tests were affected; (*c*) the rise in deflection would sometimes suddenly appear after the zinc had been applied for several minutes, a constant deflection being added to the normal; (*d*) a length disturbed on one day might be tested on the next under apparently exactly similar conditions, and a good test obtained; (*e*) these false readings were never noticed with lower battery powers; (*f*) they were invariably much larger when testing the top length in the tank.

From these observations it was deduced that the disturbance only occurred when the tank was raised to the high potential relatively to the core conductor, pointing to an electrostatic effect. From (*f*) it would appear that the disturbance was probably nil on the bottom flake and a maximum on the top, and it was noted that the only connection between the tanks was at the bottom. The remedy was then obvious: the tanks were all joined from rim to rim by copper wire where they approached each other most closely, and the disturbance disappeared. Although some of the phenomena noted are difficult of explanation, the remedy has seemed complete, and the writer offers it in the hope that it may be of service to others whose tests may be dis-

Digitized by Google

turbed in a similar manner. Briefly, it was found that when testing core with a high-potential battery in tanks not completely sunk in the earth, it is necessary to have metallic connection, top and bottom, between all the tanks when they are grouped in a small space.

The Vitality of a Telegram.

BY ARTHUR T. ABERNATHY, MANAGER WESTERN UNION TELEGRAPH COMPANY, JESUP, GA.

Few of the thousands of persons who send and receive telegrams realize the attention given to their messages from the moment they are written and filed for transmission. A pen or pencil and telegraph blank might lie idly alongside of each other for months—yes, even for years—without causing any comment, but the moment a telegram is created by the simple combination of these two utilities with the human interest of the sender added, that telegram becomes something more than a written note; it becomes alive, and is the centre of an intense interest and effort until it finally reaches the hands of the addressee.

From the moment the sender hands it across the counter to the clerk, it is literally pounced upon by a force of alert telegraph employes. The clerk quickly checks it and it is hurried to the operating room where a traffic chief assigns it to its proper wire for prompt transmission. The wire to which that particular message is assigned for transmission may at the moment be busy, but the message is not permitted to repose on the hook undisturbed. The operator seizes the key of the telegraph instrument and immediately another campaign of effort takes place to get it away on its route with the utmost dispatch. No matter how many messages that particular operator may have handled during the day, his utmost energies are again set in motion to get the message out of his jurisdiction, as we may call it, so that the Argus-eyed traffic chief, whose business it is to keep a constant watch on the time marked on messages in transit, does not make his life one unending burden if he permits that particular message to lie on the hook. The struggle often is marked with acrimony, for operators at other points along the line are equally insistent on the immediate dispatch of messages they have, and neither friendship nor favor counts in such cases. It is hammer, hammer, hammer, until the message is moved — and thus it is eagerly watched after by operator, traffic chief, and other employes, while the wire chief sits alert at the board to see that no wire trouble impedes its progress until it finally reaches its destination.

Nor does the message rest there. The delivery clerk seizes it; a copy is made for the records of the receiving office and away goes the message either by telephone, when the telephone is available, or by messenger—sometimes by both—until it resposes snugly in the hands of the person to whom it is addressed, when that message, to all intents and purposes, so far as the operator and dispatching force are concerned, is a thing of the past. But in case of non-delivery, incorrect address, or if for any other cause it has not been properly destined, it undergoes a reverse experience. The same treatment is accorded a "service" message regarding it, and so on until the message is permitted to rest, only after it has finally been disposed of to the satisfaction of the sender and receiver.

Perhaps there is nothing in the commercial world that is the subject of so much unrelenting activity as a telegram during its progress from sender to receiver. It is under the ceaseless guardianship of many persons, but its contents are always sacredly inviolate.

Commercial and Railway Telegraphy.

"The Modern Service of Commercial and Railway Telegraphy," is the title of a widely-known book originally written by Mr. J. P. Abernethy and brought up to date by experts. The information is imparted in the form of questions and answers, which is one of the most effective methods of teaching.

In this case the practical sides of commercial and railway telegraphy are thoroughly and comprehensively discussed, and a copy of the book should be very useful and valuable to one who is preparing himself for positions higher up.

It has been well said that one cannot know too much of his own business. Variety of experience of course is a great help in acquiring knowledge, but this kind of experience cannot be obtained by sitting in an office. It can, in such cases, however, be acquired by study, and in order to gain knowledge in this way care should be taken in the selection of books. This book is one of the few that should comprise the student's library. It covers the Morse system of telegraphy; the telegraph; commercial business; railway telegraphy; railway station service, etc., and goes a little into electric phenomena.

The price is $2.00 and copies can be mailed the same day the order is received. Address Telegraph and Telephone Age, 253 Broadway, New York, which is headquarters for all electrical books, and prompt attention is given to orders.

A 10,000-Volt Storage Battery.—At a recent meeting of the Röntgen Society in London, Mr. A. Campbell Swinton performed some experiments with a current from storage battery of 4,800 cells, giving a pressure of 10,000 volts. The cells were made of test tubes ¾ inches in diameter and four inches long, celluloid separators being used. Thirty years ago Warren De la Rue made a chloride of silver battery of 10,000 volts, and ten years ago Professor Trowbridge built a battery of 20,000 cells.

Telegraphers and telephonists should make a study of their professions. They can do this without loss of time by studying books on telegraphy and telephony. Telegraph and Telephone Age, 253 Broadway, New York, is headquarters for all electrical books published.

The Funny Side of the Telegraph.

In our issue of March 1, under the heading, "What the Telegraph Says," we gave a few examples of telegraphic bulls. The manager of an office in a Western city has taken the matter so seriously that he has contributed his mite toward the general storehouse of fun and thinks others should do the same and thus lengthen the lives of their brethren who read the paper.

"Ship immediately one thousand light seeds at 75c. each," is the way it was received, but it was sent, "Ship immediately one thousand sight feeds at 75c. each."

"John Jones & Q," for "John Jones, Esq.," and "Buy one bug," for "Buy 10 sug." are other recent examples of telegraphic idiosyncrasies.

A commission house received the order: "Ship us immediately one barrel of strings and one-half barrel of pens." On repetition the message came back: "Ship us immediately one barrel of springs and one-half barrel of hens," which was more intelligible to the poultry dealer.

Day-Letter Tolls.

The following table shows the tolls for day-letters at different rates, which service was instituted by the Western Union Telegraph Company, March 1:

No. of Words	Rate of 20—1	Rate of 25—2	Rate of 30—2	Rate of 35—2	Rate of 40—3	Rate of 50—3	Rate of 60—4	Rate of 75—5	Rate of 100—7
1 to 50	.30	.38	.45	.53	.60	75	.90	1.13	1.50
51 " 60	.36	.45	.54	.63	.72	.90	1.08	1.35	1.80
61 " 70	.42	.53	.63	.74	.84	1.05	1.26	1.58	2.10
71 " 80	.48	.60	.72	.84	.96	1.20	1.44	1.80	2.40
81 " 90	.54	.68	.81	.95	1.08	1.35	1.62	2.03	2.70
91 " 100	.60	.75	.90	1.05	1.20	1.50	1.80	2.25	3.00
101 " 110	.66	.83	.99	1.16	1.32	1.65	1.98	2.48	3.30
111 " 120	.72	.90	1.08	1.26	1.44	1.80	2.16	2.70	3.60

New York, March 1, 1911 B. BROOKS, General Manager

Telepost Company Closing Offices.

The Telepost Company recently closed some of its way offices between Boston, Mass., and Portland, Me., because it did not pay to keep them open. This action aroused so much newspaper talk and criticism, that we asked President H. Lee Sellers for an official statement regarding the situation. His reply is given herewith:

"We recently saw fit to close some of the way statons on the Boston-Portland line, because they were not only utterly unproductive, but could not possibly be made to pay until the completion of our line from New York to Boston will enable us to take their through business, at which time Telepost service will be renewed. We did this in the interest of our stockholders, as we did not feel it right to carry these offices at an expense to them after we saw that the extension from Boston would be somewhat delayed.

"The way some newspapers have rushed to the front in the attempt to make a sensational exploitation of this very judicious and proper business move on our part, is quite an interesting commentary on what we are 'up against.' Zealous to do what they can to injure the Telepost, those papers are serenely quiet concerning all the progressive work of the company.

"When we opened for business in Chicago, St. Louis, Kansas City, Omaha, Indianapolis, Louisville, and other cities in that vicinity, scarcely a line of notice was given to this very important achievement. When we gave out information of the fact that in the last few months we had secured over a thousand additional firms and corporations as customers in three cities alone, not a word appeared in recognition of this appreciation by business men of Telepost service and economy. Though for two years the Telepost has been sending 50-word day or night letters for 25 cents, the press said nothing about this remarkable service until the old companies were forced, by Telepost competition in the Middle West, to adopt the 'letter' but at higher rates. But when we shut up a few way offices so close to Boston that there is practically no telegraph business at all, 'enterprising' papers take the matter up and parade it with scare headlines. This is what the Telepost Company has been taught to expect. We have learned a good deal about 'opposition' tactics in the past two years, the mildest of which are insinuation and guarded misrepresentation."

Mr. Richard O'Brien, of Scranton, Pa., writes: "To me the Age is like the telephone, a delight and a necessity."

Multiplex Telegraphy.

BY S. R. BEATTY, NEW YORK.

In my article on Multiplex Telegraphy, published in the issue of March 1, and referred to by Mr. John B. Taylor, in the issue of March 16, the calculations were made on the serial assumption, and a number of tests seemed to bear it out. Theoretically, the capacity is in multiple with the resistance and reactance. However, if we make calculations on this basis (which involves the use of trigonometric functions) we shall obtain values which are not at all in accord with this theory and are entirely different from the values which are present during operation. If we divide the circuit into sections and calculate from that standpoint, we will find that the capacity is not, strictly speaking, a multiple arrangement. The problem is exceedingly complex, no matter from what direction it may be approached.

In actual practice it may be observed that a circuit with a given capacity will stand a higher speed and record firmer signals than one half the length with a very small capacity and worked at the same speed. If the speed of the two circuits be increased it will be noticed the one having the smaller capacity will be the first to give very light signals and finally begin to "drop." This condition is always present in what is known as a "thin wire." If a circuit of this kind is worked at a high speed it is a well-known fact that the current may fall to such a small value that it will not actuate the armature of the relay.

In circuits having a small capacity (which does not necessarily imply a small mileage any more than a large capacity indicates a great mileage), it is possible for the capacity to be of so small a figure that the breaking of the circuit at each alternation causes the impedance to become so large that the current may fall even to zero. To work such circuits the frequency must be so low as to permit the circuit to be charged.

These are conditions which are actually encountered in practice and which would indicate that the serial assumption is nearer to the actual conditions existing on such circuits, than that of the capacity being in multiple. However, as already stated, the problem is very difficult and must be worked out for each circuit separately. It would also indicate that to get at the true conditions existing on multiplex circuits in operation, they must be studied from the basis of what they are, instead of what they are not, if the detrimental conditions existing therein are to be successfully combated and overcome.

Regarding the law of the inverse square, this subject has been gone into very exhaustively by the most eminent authorities who have proved that law, also that of the inverse cube. It is also voiced, although in a different manner, by Newton's Third Law.

In the formula given for calculating current it is of course understood that the capacity must be expressed in farads owing to the farad being chosen with respect to the volt and ampere, and while it is not shown, it is indicated.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works of telegraphy and treat them in the same manner.]

CHAPTER XLIX.

Why is the current on a line weakened in wet and foggy weather?

Does a battery or generator, supply the same amount of current under such conditions as in dry weather?

When a wire cannot be worked quadruplexed on account of leakage, how is it tested.

If, in testing a wire, the home end being grounded and the distant end open, the existence of a current is indicated on the ammeter, where does the current come from?

If the escape is near the home station and of ten milliamperes in value what does it indicate?

Is the measure of "escape" any criterion as to the workable value of the wire?

When two wires become crossed what is usually done in order to clear one of them?

In case this is a quadruplexed circuit what is the effect of this "opened" crossed wire upon the operation of the quadruplex?

In order to reduce the static capacity of the working wire what should be done with the crossed wire?

CHAPTER L.

What is counter-electromotive force as developed in the coils of a relay?

What is the effect of counter-electromotive force upon the current that produces it?

How is the counter-electromotive force in relay coils calculated?

What is the best means of reducing the counter-electromotive force?

How does a relay act when the counter electromotive force is reduced by special means, as compared with its ordinary action?

Why is it necessary to keep the ampere turns up to a certain point?

How should the relay coils be wound in order to reduce self-induction, or counter electromotive force?

Enumerate some of the advantages of winding relay coils in multiple.

Can multipled relays be worked satisfactorily on circuits containing relays wound in the usual way, that is, in series?

What's in a Name.—Adam Hamm is the name of an operator in an eastern city. This name may have two meanings.

Organization of Telephone Pioneers.

The proposed organization of the telephone pioneers of America is meeting with enthusiastic support and the "pioneers" who are scattered all over the country are sending in their names for enrollment.

Suggestions have been submitted with regard to time and place for the first meeting, Boston being named on account of its being the birthplace of the telephone, and Niagara Falls, because the first telephone convention was held there. The meeting will be held during the summer or early fall, as this time of the year is considered the most preferable.

The tentative qualifications for membership in the association are: "Employment in the telephone service twenty-five years prior to date of application and continuously at any time thereafter for five years."

Following are the names of the telephone pioneers who have been so far heard from, together with the dates of their entry into the telephone service:

Adee, D. M., June, 1878; Adkins, W. H., 1878; Allen, A. M., Feb. 1, 1880; Allen H. E., May, 1885.

Bailey, Thos. B., Feb. 28, 1878; Baker, Ellis B., Jan. 31, 1878; Barton, Enos M., 1876; Barrett, John A., 1881; Barrett, A., May 1, 1883; Bawsell, E. E., Feb. 6, 1878; Berthold, V. M., Sept. 20, 1883; Bloodgood, F. S., April 14, 1880; Blake, J. T., March, 1882; Boutilette, H., 1879; Bradshaw, Thos. N., 1884; Brown, Joseph M., May 1, 1879; Buttrick, F. A., August, 1879; Butler, John K., 1878.

Yensen, P., Jan., 1884.

All communications relative to the proposed organization may be addressed to Mr. Henry W. Pope, or Mr. C. R. Truex, 15 Dey Street, New York.

The name of Mr. Enos M. Barton stands at the head of the list in point of date of entry, having entered the telephone service in 1876. No other name appears under that year.

Among those who entered in 1877, 1878 and 1879 are found several well known names, as follows:

1877—Willard L. Candee, R. W. Devenshire, T. B. Doolittle, C. A. Nicholson, Richard O'Brien, Henry W. Pope, W. D. Sargent, C. P. Wainman, Chas. H. Wilson, D. L. Wilson and F. G. Wood.

1878—J. N. Culberson, J. J. Ghegan, E. J. Hall, C. F. Kelleher, J. W. Ladd, R. T. McComas, C. E.

Digitized by Google

Scribner, Theo. N. Vail and W. T. Westbrook, Wiley, G. L.

1879—H. Boutilette, F. A. Buttrick, J. J. Carty, F. W. Conn, W. T. Gentry, W. D. Hanchett, Jasper N. Keller, T. D. Lockwood, C. W. Mackenzie, C. W. McDaniel, L. B. McFarlane, G. D. Milne, W. D. Paynter, C. M. Root, E. F. Sherwood, H. L. Stork, C. R. Truex, F. E. Warner.

The Telephone.

Telephone Dividend.—The American Telephone and Telegraph Company has declared the regular quarterly dividend of 2 per cent., payable April 15.

Increase of Capital.—The capital stock of the Consolidated Telephone, Telegraph and Electric Company, Tucson, Ariz., has been increased to $8,000,000 to provide for future expansion.

Long Distance Telephony in Europe.—It is stated that a trial is to be made of telephonic communication between London and Amsterdam, Cologne, Frankfurt, Basle and Zurich, by way of Paris and some other continental city.

New Telephone Building for Portland, Me.—The New England Telephone and Telegraph Company is erecting a new building in Portland, Me. It will be four stories high and will be the headquarters for the new district.

Mr. George A. Campbell, research engineer of the American Telephone and Telegraph Company, will read a paper on "Cisoidal Oscillations" at the Congress of Technology, to be held in Boston, April 10 and 11.

The Telephone Society of Washington.—At the meeting of the Telephone Society of Washington, D. C., March 2, Major George Owen Squier, Signal Corps, U. S. A., talked to the society on the subject of "Multiplex Telephony and Telegraphy."

Underground Trunk Telephone Lines in Australia.—Underground trunk telephone lines between Adelaide and Port Adelaide, Australia, are now in operation. The length of the cable is eight miles 3,485 feet; the length of wires is 2,700 miles 3,960 feet.

New Orleans Telephone Employes Meet.—The New Orleans Employes' Association of the Cumberland Telephone and Telegraph Company held its regular meeting on February 15. It was decided to give a boat ride for the benefit of the sick and relief fund. After the meeting a musical programme was rendered.

New England Telephone Employes' Association.—Prof. W. L. Hooper, of Tufts College, gave a talk on the fundamentals in electricity before the Boston Plant Chapter of the Telephone Employes' Association of New England on March 24. At the meeting of the Chapter on April 28, Mr. G. K. Heyer will deliver an address on "Telephone Train Dispatching."

Tent for Linemen at Work.—During a recent cold snap in Knoxville, Tenn., the telephone companies used a portable canvas tent, which fitted over the cable boxes and wires on telephone poles, effectually protecting the linemen while at work. The tent could be let down over the top of the pole and could be run from one pole to another by means of a pulley.

A Successful Woman Organizer.—Mrs. Anne McElroy Brett is a prominent manager and organizer of electrical properties in western Texas. She is president of the Southern Independent Telephone and Telegraph Company, and is president and general manager of the Brett Construction Company. She is known as the "telephone queen of the Southwest," and the companies she has organized represent a capital of over $500,000.

Pacific Telephone and Telegraph Company Election.—At the annual meeting of the Pacific Telephone and Telegraph Company and the Sunset Telephone and Telegraph Company, held in Martinez, Cal., March 1, the following officers were elected: President, Mr. Henry T. Scott; first vice president, Mr. E. C. Bradley; second vice president, Mr. E. J. Zimmer; third vice president, Mr. Louis Glass; secretary-treasurer, Mr. F. W. Eaton. These gentlemen will constitute the board of directors for the two companies for the next year.

Telephone Consolidation in New York State.—It is reported that negotiations have been started by the Friendship Telephone Company of Syracuse, N. Y., representing the Bell interests, for the purchase of the Rochester Telephone Company, with independent and affiliated lines. The Syracuse company has made an offer to purchase the outstanding stock and bonds of the Rochester Telephone (Home) Company, the Rochester, Syracuse and Utica Telephone Company, and the Utica Home Telephone Company, comprising the system of independent telephone lines operating in Rochester, Syracuse, Utica and adjacent places.

Wanted, a Name for a Telephone Message.

The New York Telephone Company desires to adopt a word to signify a telephone message. The *Telephone Review* publishes a long list of words suggested; some of them are good but many of them are quite the contrary. Among the names given in the list are: Audigram, Bell-gram, Bluebell, Communigram, Grahambell, Parlegram, Phonogram, Telcall, Televerb, Verbaphone, Wireword, Wordophone. It has been suggested that the public vote on the question.

Public Service Legislation.

A bill has been introduced in the Minnesota House of Representatives to limit the charges by telegraph companies for messages within the State to twenty-five cents for ten words, and two cents for each additional word over ten.

The bill introduced in the Oregon legislature fixing the liability of telegraph and telephone companies for delayed or incorrect messages has been stifled in committee.

International Congress of the Applications of Electricity at Turin in September.

An International Congress of the Applications of Electricity will be held at Turin, Italy, from September 9 to 20, on the initiative and under the auspices of the Italian Electrotechnical Association and of the Italian Electrotechnical Committee, during the period of the International Exhibition of Industry and Labor. The first meeting of the International Electrotechnical Committee will be convened at Turin from September 11 to 16, and the official delegates of the Electrotechnical Committees of several nations will be assembled there.

The president of the Organizing Committee is Mr. L. Lombardi, and the secretaries are Messrs. G. Semenza and C. A. Curti, 10 Via San Paolo, Milan. At a meeting of this committee on December 28 last a programme was decided upon. The subscription for membership has been fixed at five dollars (25 lire) which is to be paid in advance. Membership carries with it the right to attend all meetings of the Congress and of the various sections, to vote and to receive a copy of the printed transactions.

In addition to the papers offered by the official reporters the Committee of Organization will consider papers or proposals presented by members or by any electrical association. Papers may be written in French, English, German or Italian accompanied by a translation or a summary in French. All papers will appear in the transactions of the Congress in their original language. Those in English, German and Italian will be accompanied by a French translation or summary.

Among the subjects to be presented for discussion at the Congress will be the following:

Converters, rectifiers and motor-generators; Application of electricity to submarine boats; Long-distance wire telephony; Wireless telephony; Automatic telephone exchanges as a means of economy and improvement in telephonic communication in large cities; Research on secrecy in wireless telegraph; Comparative study of the direct and indirect methods of taxing electricity in different countries; The various systems of multiplex telegraphy.

It is proposed to hold an international telegraph tournament some time during the exposition, with expert telegraphers from various countries as participants. Definite plans have not yet been announced, but they may be expected soon. This tournament was referred to at some length in our issue for July 1, 1910, also in the issues for January 16 and March 1 of this year.

The Messenger Situation.

BY HARMAN D. JONES, SAN FRANCISCO, CAL.

The messenger situation has not advanced in proportion to the great strides in recent telegraphic development, and the study of the boy problem has been largely overlooked and by many managers almost completely ignored. No one who takes into account the forces that make for the best, whether in character or conduct, can be insensible to the importance of the proper training of the future telegraphers, beginning with the boy when he first enters the service.

A boy's mind is something impressionable; his earliest impressions are likely to be his deepest and most enduring. Then is the time to inculcate right ideas and honest ambitions. Nothing is more important than to have the conditions and surroundings by which these first impressions are created, sources of the highest inspirations. It must be acknowledged that the average telegraph office and present-day office manager are not adequately recognizing the responsibilities or improving the opportunities before them to properly educate and advance the messenger. The commanding position to which the present day telegraph service has soared has necessarily lifted the messenger boy into one of large importance, and it is gratifying to know that thoughtful people in the telegraph service are now seeking to lift the messenger to a higher plane. The time has come when the almost general dissatisfaction with past methods demands earnest effort to correct them. There are doubtless many difficulties in the way of accomplishing desired results and the work will demand expert and trained intelligence, but our wise leaders will no doubt prove themselves masters of the situation.

The messenger boy comes to us fresh from school and thus takes his first and most serious step in his business life. It is a period when he begins to realize the moral problems that confront him; when he finds himself drifting from the earlier influences of his home. He tries to adjust himself to the world as he sees it, and no doubt he feels more keenly than we realize the big break between his former ideals and his first rough impressions of actual experience. Here is where our great responsibility begins, not only in laying a good foundation for future leaders in great enterprises, but in seeing to it, by our example and interest in the personal welfare of the youth, who has chosen the telegraph office as the stepping stone to a business career, that he is guided in the right direction in order that he may ultimately attain to some desirable goal. As the opportunity in the telegraph field is greater today than ever before there is no longer any reason why the young men should seek other fields of labor, and it is hoped that the discussion of this vital topic will result in the adoption of some uniform plan whereby the standard and efficiency of the messenger force will be elevated and liberal inducements afforded such as will make it worth while for messengers to remain in the service with the hope of reaching positions of prominence and trust.

Bowling Match by Telegraph.—An inter-city bowling match will be held by telegraph on April 22 under the auspices of the New York Athletic Club. A number of athletic clubs throughout this country and Canada have entered. The bowling will commence at different hours in different cities, so that all the results will be received at the New York Athletic Club at about the same time.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

The Railroad.

Train Despatchers' Convention.—The next convention of the Train Despatchers' Association of America will be held in Baltimore, June 20.

Train-Controlled Highway Signal.—Mr. R. D. Peters, of Knox, Ind., has been granted a patent (No. 985,628 issued February 28) on a train-controlled highway signal.

Overhead Wire Crossings in Indiana.—The bill passed by the Indiana legislature regulating the construction of telephone and telegraph wires across railroad and interurban electric railway tracks has been signed by the Governor.

Mr. W. H. Johnson, assistant superintendent of the Winston-Salem district of the Atlantic Coast Line, at Florence, S. C., began his business career as a telegrapher on the Shenandoah Valley Railroad in 1889. He was born at Charlestown, W. Va., October 26, 1871.

Mr. F. V. Worden has been transferred from Shopton, Iowa, to La Junta, Col., as manager and wire chief for the Atchison, Topeka & Santa Fe Railway. Mr. O. O. Ouderkirk, of Newton, Kan., has succeeded Mr. Worden at Shopton as wire chief and manager for the same company.

Mr. W. J. Holton, formerly superintendent of telegraph of the Chicago and Western Indiana Railroad Company, Chicago, Ill., and in 1902-3, vice-president of the Association of Railway Telegraph Superintendents, but for the past four years identified with one of the national banks at Englewood, Ill., died recently. Mr. Holton was born in 1859 and was well known in railway telegraph circles.

Test of Typewriter Telegraph.—The Morkrum printing telegraph system is being tested on the Chicago, Burlington & Quincy Railroad between Chicago and Galesburg, Ill. Messages are transmitted by the manipulation of a typewriter keyboard and they are received automatically on a like machine. This is the same system that is now being used on the Postal Telegraph-Cable Company's lines between New York and Boston.

More Telephone Dispatching on Canadian Pacific.—Authority has been given for the installation of another telephone dispatching circuit between Medicine Hat and Calgary, on the Canadian Pacific Railway, a distance of 180 miles. When this is installed there will be a total of 3,955 miles of telephone train-dispatching circuits on the Canadian Pacific Railway, the whole of the main line being covered except from Kamloops to Vancouver, 251 miles, single track; Winnipeg to Fort William, 419 miles, double track, and Montreal to Smiths Falls, 128 miles, double track, besides a number of branches. Mr. W. J. Camp, Montreal, Can., is electrical engineer of the Canadian Pacific Railway's Telegraphs.

The Boston Meeting of Railway Telegraph Superintendents.—The next meeting of the Association of Railway Telegraph Superintendents, which will be held at Boston, June 19-23, promises to be the most interesting and important ever held by that association. Many new things are coming to the front in the operation of railways which call for attention and action on the part of the operating officials. The use of the telephone in the dispatching of trains has been brought about by this association and there seems to be no end to its possibilities. The Boston meeting will probably give an impetus to the Turner Monument project that will carry it forward to a successful issue. Mr. S. A. D. Forristall, superintendent of telegraph of the Boston and Maine Railroad, Boston, is chairman of the committee of arrangements, and he is preparing an excellent programme for the meeting. The entertainment features will also be of extraordinary interest. Mr. P. W. Drew, Room 306, 135 Adams Street, Chicago, is the secretary of the Association, and will be glad to give further information regarding the meeting.

Protective Devices for Railway Circuits.

The special High Tension Wire Crossings committee of the Association of Railway Telegraph Superintendents, the chairman of which is Mr. G. A. Cellar, superintendent of telegraph of the Pennsylvania lines west of Pittsburg, is prosecuting its investigations into the matter of protective devices for railway telegraph and telephone circuits.

Thus far, the committee has been unable to find any single device that may be depended upon absolutely, particularly from the effects of a lightning stroke. However, the employment of a vacuum lightning-arrester at each of the several stations is found to safeguard the railroad telephone against trouble much better than the ordinary telephone line is guarded, for the reason that the apparatus in question strung out, as it were, along the line, acts like a drawn-out picket fence of grounds which tend to prevent the concentration of the lightning discharge at any one point and so dissipate its energy.

Another type of arrester has also attracted favorable attention of the committee, differing from the vacuum form in that no open space is permitted between the line and the ground, a solid block of special material being brought into contact with the line and ground terminals by means of carbon plates secured to the two surfaces thereof.

The committee is still at work on the problem, and the thoroughness with which its investigations are being conducted gives promise of satisfactory results.

Washington Meeting of Eastern Division of Railway Telegraph Superintendents.

The quarterly meeting of the Eastern Division of the Association of Railway Telegraph Superintendents was held in the committee room of the Washington Terminal Railway, Washington, D. C., Mar. 22, with a large attendance.

At the morning session the following subjects were discussed:

Digitized by Google

Standard form for reporting troubles and repairs made on telephone train-dispatching circuits and apparatus.

Destruction of telegram records of steam roads on account of the order of the Interstate Commerce Commission.

Circular of vice-president G. W. E. Atkins of the Western Union Telegraph Company in regard to the illegal use of wires for messages other than railroad business under business franks.

New standard railway operating agreement.

A committee, consisting of Mr. W. F. Williams, of the Seaboard Air Line, chairman, Mr. L. B. Foley of the Delaware, Lackawanna & Western Railroad and Mr. E. P. Griffith, of the Erie Railroad, was appointed to consider the subject of destruction of telegram records.

The entire afternoon was taken up by the executive session.

Mr. E. P. Griffith, superintendent of telegraph, Erie Railroad, New York, and chairman of the Turner Monument Fund, did some effective missionary work and aroused much interest in behalf of the project.

The following named superintendents of telegraph were present: Mr. Charles Selden, Baltimore and Ohio Railroad, Baltimore, Md.; Mr. W. F. Williams, Seaboard Air Line, Portsmouth, Va.; Mr. W. H. Potter, Southern Railway, Washington, D. C.; Mr. E. P. Griffith, Erie Railroad, New York; Mr. B. F. Thompson (telephone inspector) Baltimore and Ohio Railroad, Baltimore, Md.; Mr. E. W. Day, (assistant superintendent of telegraph) Baltimore and Ohio Railroad, Baltimore, Md.; Mr. L. B. Foley, Delaware, Lackawanna and Western Railroad, New York; Mr. W. P. Cline, Atlantic Coast Line, Wilmington, N. C.; Mr. G. A. Cellar, Pennsylvania Lines West of Pittsburg, Pittsburg, Pa.; Mr. C. L. Lathrop, Pittsburg, Shawmut and Northern, Angelica, N. Y.; Mr. W. C. Walstrum, Norfolk and Western, Roanoke, Va.; Mr. J. T. Nolan, (chief operator), Washington Terminal, Washington, D. C.; Mr. W. F. Taylor, Pennsylvania Railroad, Altoona, Pa.; Mr. C. M. Lewis, Philadelphia and Reading, Reading, Pa.; and Mr. C. W. Bradley, acting superintendent of telegraph, Chesapeake and Ohio, Richmond, Va.

Other gentlemen present were Messrs. Hy. Homer, and G. W. Peck, of the American Telephone and Telegraph Company; Mr. W. F. Crowell, New York Telephone Company; Messrs. H. E. Merrill and W. E. Harkness, United States Electric Company, New York, and Mr. G. K. Heyer, Western Electric Company, New York.

Hours-of-Service Law.—The United States Supreme Court has decided that railroads employing telegraph operators for six hours, then after an interval, three hours more, do not violate the Federal "hours of service law," of 1907. The government claimed that the nine hours of service must be continuous.

Pennsylvania State Railroad Commission.—A bill has been introduced in the Pennsylvania legislature to create a public service commission to be known as the Pennsylvania State Railroad Commission. The definition of the term "common carrier" includes telegraph and telephone companies, besides electric railways, steam railways, etc.

Municipal Electricians.

Mr. A. C. Farrand, city electrician of Atlantic City, N. J., who has acceptedly filled that office for many years finds himself out of a position owing to a change in politics in that city.

Police Telegraphs in Kansas City.—Mr. B. C. Halderman, special engineer for the Kansas City, Mo., police department, has recommended the expenditure of an additional $10,000 to put the police telegraph system in a proper condition, asserting that it will then save the city that amount every year.

Meeting of Executive Committee of Municipal Electricians.—The executive committee of the International Association of Municipal Electricians, will convene in St. Paul, Minn., on April 5 to select the dates for the next annual convention which is to take place in that city in September, and to transact much important accumulated business. The committee consists of S. W. Manning, chairman, St. Paul, Minn.; C. S. McCosker, Mobile, Ala.; Jos. B. Smith, Rochester, N. Y.; R. A. Smith, Norfolk, Va.; W. H. Thompson, Richmond, Va., W. R. Arbuckle, Bayonne, N. J.; A. L. Pierce, Wallingford, Conn.; Robt. Quain, St. Louis, Mo.; Louis Gascoigne, Detroit, Mich.; with H. C. Bundy, of Watertown, N. Y., president, and C. R. George of Houston, Tex., secretary, ex-officio members. The officers and a majority of the executive committee will be present at St. Paul on this occasion.

Improvement in Typewriter Manifolding.

Mr. William England, for many years manager of the Central and South American Telegraph Company and the Mexican Telegraph Company in Mexico, Colombia and Peru, has invented a new process for making duplicate copies of typewritten messages, etc. He employs a special carbon paper on a vertical double spool arrangement attached to the typewriter over the cylinder. This enables a front and back copy to be obtained at every stroke of the typebar, the duplicate being recorded on the back of the second blank or sheet of paper. Two blanks are printed on one sheet and fed folded into the typewriter, the ribbon making the record on the front blank in the regular way and the special carbon at the back making the duplicate copy. By this method there are no loose sheets of carbon paper to handle and a great saving of time is effected in handling messages. Mr. England is now in New York introducing his new manifolding process.

Telegraph and Telephone Age is headquarters for all electrical books.

The Turner Monument Fund.

New interest is being awakened in connection with the Turner Monument project and there is good reason to believe that subscriptions will come in more rapidly henceforth.

The sending of the first telegraphic train order opened a field of operations in railroading in this country that cannot be measured in importance, and the event was fraught with such far-reaching results that it is to be commemorated in stone and bronze at the spot where it occurred. This was at Turner, N. Y., in the autumn of 1851, and the message was sent by Charles Minot, general superintendent of the Erie Railroad.

Contributions to the fund are invited from all railway and telegraph men throughout the country. The movement has the official endorsement of the Association of Railway Telegraph Superintendents and the Old-Time Telegraphers and Historical Association. The cost of the proposed monument will be about $3,000, and one-third of this amount has been subscribed. The following named gentlemen constitute the committee in charge of the monument fund: E. P. Griffith, superintendent telegraph, Erie Railroad, Jersey City, N. J., chairman; Charles Selden,, superintendent telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, Telegraph and Telephone Age, New York; E. A. Chenery, superintendent telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railway, Montreal, Canada; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who has been elected treasurer of the fund. All contributions are acknowledged in the columns of Telegraph and Telephone Age, and the funds deposited with the Washington Trust Company, New York, as soon as received.

Mr. J. N. Abbott, former general ticket and passenger agent of the Erie Railroad, who was a personal friend of Charles Minot, sends the following interesting communication about that gentleman:

"I have read with lively interest the article in the March issue of the 'Erie Railroad Employes' Magazine,' regarding the proposed Telegraph Monument to be erected at Harriman, N. Y., on the site of the old Turner's 'Un' station, and beg to participate therein (herewith enclosed) to the extent that individual subscription is limited.

"I entered the service of the 'Old Erie' in April, 1861, as a clerk in the office of Charles Minot, general superintendent, and in the following year was acting chief clerk. Mr. Minot and L. G. Tillotson, superintendent of telegraph, became my personal friends.

"In the 'Ya' headquarters telegraph office, Erie Building, New York, at that time, A. N. Aplin was chief operator. He was succeeded by W. J. Holmes, who became the successor of Mr. Tillotson as superintendent of telegraph. Scott M. Kress was operator at Turner's and graduated thence to the Atlantic and Great Western Railroad as superintendent of telegraph under general superintendent H. F. Sweetser.

"A word about Mr. Minot's personal method of using the wires in sending instructions to his subordinates on the road may be interesting. His every message was written by himself—in ink—and in his bold round hand. After transmitting the message the operator noted thereon the time and returned it to Mr. Minot's desk; the message was then copied in the impression book and the original mailed, so that if there had been any error by wire it would thus be rectified; in any event the instructions would thus be reinforced. He used to make sure about his most important messages by adding the cabalistic instructions: 9. 27. 31. 35.

"The writer continued with the 'Old Erie' until December, 1886, then resigning his office as general ticket and passenger agent to become chairman of the Western States Passenger Association, Chicago."

Mr. John C. Haring, of Piermont, N. Y., is an old railroad man and a contemporary of Mr. Minot. "Many times," Mr. Haring states, "Mr. Minot rode with me on special trains, regular passenger trains and on freight trains. One time, on a special car, he had with him assistant general superintendent Joe Guppy, L. G. Tillotson, then superintendent of telegraph, and a number of division superintendents including J. J. Lawrence, Mr. Reddington, Horatio Brooks, of the Brooks Locomotive Works, W. J. Holmes, who later became superintendent of telegraph, and others. While they were eating lunch Mr. Minot called me aside and said, 'The moment I get up from the table you have the train ready to start, as I want to play a joke on these fellows.' The moment he stepped on the car the train was pulled out and only a portion of the party caught it. The others had to run about half a mile, and Mr. Minot was very much amused.

"Mr. Minot was always ready for a good meal with 'Jim' Turner and his party," Mr. Haring says in conclusion.

In the March number of the Erie Railroad Employes' Magazine is printed some interesting matter regarding the monument. An old document was discovered recently which throws considerable light upon conditions in the early days of railroad telegraphy. It was a report of Mr. L. G. Tillotson, then (August 1, 1857), superintendent of telegraph to Charles Moran, president of the Erie Railroad. It shows that, in the six years following 1851, telegraphic train despatching had come to be an established fact over the entire Erie system of that day, for the original wire was divided into sections to correspond with each division of the road. It was the growth of the seed planted at Turner by Mr. Minot, when he issued his famous order, that caused the cutting up of the original Jersey City-Dunkirk wire, into the four division wires, and this made a second wire a necessity."

The contributions toward the fund received up to date are as follows:

Homer, Philadelphia, Pa., $5.00; W. F. Williams, Portsmouth, Va., $2.50; W. P. Cline, Wilmington, N. C., $2.50; C. W. Bradley, Richmond, Va., $1.00; Craig Graves, New York, $1.00; A. J. Stone, New York, $1.00. Total, $1,123.25.

Radio-Telegraphy.

Wireless Telegraphy from Eiffel Tower.—The military wireless station at the Eiffel Tower in Paris has succeeded in transmitting prearranged, but weak and intermittent, signals to the Marconi station at Glace Bay, Canada.

United Wireless Meeting Postponed.—The annual meeting of the stockholders of the United Wireless Telegraph Company, which was to have been held in Portland, Me., March 14, has been postponed until June 13 because of an injunction obtained by minority stockholders.

Wireless Telephone Company Bankrupt.—Mr. Jesse Watson has been appointed receiver of the Radio-Telephone Company in bankruptcy proceedings filed by creditors. The company is a New Jersey corporation with a stock issue of $2,000,000 and was organized to exploit a wireless telephone invented by Mr. Lee de Forest.

Mr. Neil McAlester McIntyre, aged 30 years, manager of the Marconi Wireless Telegraph station at Virginia Beach, Va., died on March 13 of typhoid fever. He was a native of Scotland, and had a wide experience in the wireless field, being one of the pioneers. He was well known in the wireless profession throughout the world having traveled extensively in the Marconi service.

Wireless Service to Ships at Sea.—Arrangements have been made whereby wireless telegrams may be received at any postal telegraph office in England for transmission to ships at sea, when such vessels have passed beyond, or have not yet entered into, the radius of operation of the Postmaster-General's coastal station. The Marconi station at Poldhu has a range of about 1,500 miles, and should the ship to which the message is addressed have passed beyond this range, the telegram will be forwarded by telegraph to the Marconi Company's long-distance station at Cape Cod, Mass., and thence transmitted to the ship.

New System of Wireless Telegraphy.

A new system of wireless telegraphy and telephony has been invented by Dr. R. Goldschmidt, of the Darmstadt (Germany) Technical High School, which makes use of a specially constructed generator which produces the necessary electrical oscillations directly, and without sparks or arcs. This high-frequency machine delivers alternating currents whose direction is declared to change over 100,000 times per second, and as soon as the telegraph key is closed the waves pass direct into the transmitting network. It is claimed that the system places no limit upon the distance over which messages can be sent, and that its working is independent of the daylight and the conditions of the weather. The machine gives in the form of electric waves an output corresponding to about 17 h.p., and requires for this a generator of about 21 h.p., showing an efficiency of 80 per cent. According to the inventor, there is no difficulty in the way of constructing machines of 80 h.p., 100 h.p., or even greater power.

Bronze Tablet to Commemorate the United States Military Telegraph Corps from Allegheny County, Pa.

Brief reference was made to this subject in our March 16 issue and we had hoped to be able in our present number to give further particulars as to the date fixed for the unveiling of the bronze tablet now almost completed and which is to be permanently installed some time in April in the Soldiers' and Sailors' Memorial Hall in Pittsburg. The committee in charge of the matter, however, has been prevented so far from selecting a day because of the fact that the anniversary of Founders' Day of the Carnegie Institute at Pittsburg occurs on Thursday, April 27, at which time Mr. Carnegie will be present. In our next issue, however, we will announce the final plans of the committee. As this function will mark the fiftieth anniversary of the founding of the Military Telegraph Corps, it is expected that the celebration will excite very great general interest on the part of the two hundred survivors of the corps, particularly of the sixteen survivors out of forty-one from Allegheny County. These survivors are Messrs. Joseph W. Boyd, David H. Bates, Andrew Carnegie, Albert B. Chandler, Capt. Thomas B. A. David, Charles W. Jaques, Major Jos. O. Kerbey, George A. Low, Theodore E. Moreland, Edward W. McKenna, James H. Nichols, George W. Perkins, J. William Pope, Jesse H. Robinson, J. A. Torrence and Robert F. Weitbrec.

LETTERS FROM OUR AGENTS.

PHILADELPHIA, WESTERN UNION.

Mr. George Youtz, formerly of the Lebanon, Pa., office is now employed by the Reading Railroad in this city. Mr. Youtz was a student at Lebanon and after graduating was given an appointment as operator at the Reading Terminal for the Philadelphia, Reading and Pottsville Telegraph Company, which is operated in connection with the Reading Railroad. This telegraph company is a feeder for the Western Union and has table room and operators in the Western Union office to facilitate the handling of business.

The telephone department is being installed in a separate room, adjoining the bookkeeping department. The operators will thus be removed from the noise and confusion of the bookkeeping department.

PHILADELPHIA, POSTAL.

Mr. Wm. Sullivan has been transferred to Atlantic City, N. J., for the Easter and Summer rush.

Mr. C. E. Nelson of the Wright Printing System, has returned to New York. Mr. Harry Gage is in charge of the machine now.

NEW YORK, POSTAL.

All the pneumatic tubes have been removed from the gallery to the operating room floor, thereby doing away with the relaying of carriers on the gallery. By cutting out this extra handling the service throughout the room and to the outside tube offices has been considerably quickened.

The Lamson carrier system is now in operation between the two terminal route desks at each end of the operating room. This improvement also quickens the service, and at a reduced cost.

The Postal Electric Club, New York, now has 49 members, and much interest is taken in the work. It meets every Thursday night, and Mr. Donald McNicol, of the electrical engineers' office, is the instructor.

NEW YORK, WESTERN UNION.

Mr. Walter J. Williamson, for the past 27 years a transmitting operator in the Commercial News Department, has been retired on a pension. He has been absent from duty since February 15 on account of illness.

"Send Me a Night Letter, Dearie," is the title of a piece of music composed by Mr. Barrington L. Brannan, a well-known telegrapher at 195 Broadway, New York, and dedicated to Mr. Theo. N. Vail, president of the Western Union Telegraph Company, "originator of the night letter." On the front cover there is a fac-simile of a night letter, on a standard blank. The message is cleverly designed and is in harmony with the idea. For instance, it was sent by "Me" and received by "U." It is dated February 14, St. Valentine's day, and originated at Loveland, Iowa, via Honey Creek. It is addressed to "Dearie, Friendship, N. Y.," and the message, being the words of the chorus, contains fifty words.

Besides the reproduction of the message the front cover contains the head of a handsome girl printed in colors. The idea and its execution are certainly very unique. The price of this music by mail is 17 cents per copy. Mr. Brannan has an advertisement elsewhere in this issue.

Obituary.

Nathaniel Thayer, a well-known capitalist of Boston, died in that city March 21. Deceased was a director of the American Telephone and Telegraph Company and of other large corporations.

Edward D. L. Sweet, aged 86 years, a prominent telegraph official forty years ago, died in Oak Park, Ill., March 18. In his early youth he became a telegraph operator and was subsequently division superintendent of the Illinois and Mississippi Telegraph Company, vice president of the Atlantic and Pacific Telegraph Company and superintendent of the Western Union Telegraph Company, at Chicago, He retired from business in 1887. He was born at Virgil, N. Y., and went to Illinois with his parents in 1829, where he always resided. In the middle seventies Mr. Sweet was the general manager of what was known as the Sweet lines, a system of telegraph wires connecting various Boards of Trade, over which probably the fastest telegraph service ever conducted in this country was carried on between Chicago, Milwaukee, St. Louis, Toledo, Cincinnati, Buffalo, New York, Baltimore, and other cities. The transmission of over 100 messages an hour was considered ordinary work, and none but the cream of the profession were permitted to man the Sweet wires.

David H. Moffat of Denver, Col., one of the best-known railroad men and financiers in the country, died suddenly in New York on March 18. He was born at Washingtonville, N. Y., in 1839, and went to Colorado in 1860. He was the manager of the first telegraph office in Denver, yet he was not an operator. The way he came to occupy this position was an unusual one. When the overland telegraph lines were built in the early sixties, Julesburg was the only point in Colorado that was touched by the telegraph. Mr. Moffat who had large interests in the vicinity of Denver, which place was then practically unknown, desired to have telegraph connection with that place. He arranged with the telegraph officials to open a branch office in Denver, in his book store. When a person wished to send a telegram, they left it and the cash for tolls, with Mr. Moffat, who would send it to Julesburg, 200 miles away, by the first stage. From Julesburg it would be telegraphed to its destination. Messages were received at Mr. Moffat's Denver office in like manner. In 1862 Mr. Moffat and a few other wealthy business men subscribed $35,000 and had the telegraph line extended from Julesburg to Denver, and on Oct. 10, 1863, the first message was sent direct from that city.

Any book on electrical subjects can be obtained at the office of Telegraph and Telephone Age, 253 Broadway, New York.

New York Telegraphers' Aid Society Election.

The annual election of the New York Telegraphers' Aid Society took place March 27, with the following results: President, R. J. Marrin; vice-president, A. M. Lewis; treasurer, T. M. Brennan; financial secretary, C. A. Kilfoyle; recording secretary, Miss M. E. Saunders; executive committee, to serve one year, Edw. J. Oakley, John F. King, J. F. E. Hopkins, J. F. Zeiss, H. T. Tepe, W. H. Brahe, D. H. DeBaun; to serve two years, F. J. Sheridan, C. J. Lemaire, W. W. Price, Miss S. Dougherty; to serve three years, Edw. Mesler, E. E. Brannin, Edw. F. Howell, H. M. Heffner. Auditors, F. J. Nurnberg, J. F. E. Hopkins, H. M. Heffner.

At the annual meeting of the Society on March 29 various amendments to the constitution were adopted.

R. W. Martin Fund.—"A. T." has sent us $1 to be turned over to Mrs. Robert W. Martin, whose husband, the well-known old-time telegrapher, is helpless from the effects of a paralytic stroke received several years ago. Mrs. Martin, in acknowledging the receipt of this contribution, says: "I had just paid out my last dollar to the gas company, as they were going to close the meter, so you see this remittance couldn't have been more appreciated than at this time." Mr. Martin is gradually losing the power of speech, and his reason, and is very deaf.

T. M. B. A. Assessments.—Assessments Nos. 521 and 522 have been levied by the Telegraphers' Mutual Benefit Association, to meet the claims arising from the deaths of George M. Reed, at Valentine, Tex.; Edgar F. Phillips, at Detroit, Mich.; Caleb G. L. Pope, at Jamaica Plain, Mass.; Dwight M. Bowers, at Sydney, N. Y.; Duane D. Stilwell, at La Grange, Ind.; Orrin B. Ocker, at Kansas City, Mo.; William H. Jackson, at Brooklyn, N. Y.; Charles T. Beery, at Kansas City, Mo.; Charles C. Boyd, at Roanoke, Va.; Patrick Beggin, at Yonkers, N. Y., and Charles J. Mitchell, at San Francisco, Cal.

Legislation in Texas.—Bills have been introduced in the Texas legislature placing telegraph and telephone companies under the control of the railroad commission, also requiring telegraph and telephone and other public service corporations to operate under State charters and providing that those now in operation can make no further extensions or improvements until they take out State charters.

The great telegraphic song hit,
"SEND ME A NIGHT LETTER, DEARIE."
Good, catchy music; beautiful title design magnificently printed in colors. Title contains night letter. Sung all over New York. 17c. by mail. All popular music sent by mail.
B. L. BRANNAN,
195 B'way, N. Y.

Telegraph and Telephone Handbook for France.—Mr. Ch. Laine, of Paris, France, has issued in English, a neat little volume giving information about telegraph, telephone and postal regulations in France. It was gotten up for English and American travelers to avoid the detentions and annoyances due to the differences in language and unfamiliarity with the French regulations in these matters. It contains telegraph rates, and specific information on arrival and departure of mails, remittances, etc. It also gives very full information and instructions regarding long distance telephone conversations. The price of this book is 75 cents and copies can be obtained of Telegraph and Telephone Age, 253 Broadway, New York.

Martin's Double Lever **VIBROPLEX**, $8.00 f. o. b. D. C. DeLany, 15 S. Broad St., Atlanta, Ga.

WANTED.—Live agents in all large Western Union and Postal offices. Central Typewriter Exchange, New York.

Life Insurance is based upon the certainty of death at some time and its possibility at any time. The splendid financial position of the Telegraphers' Mutual Benefit Association, 195 Broadway, New York, is shown in the Reserve Fund, of $317,000, which, apart from current assets, amounts to nearly 6 1-3 % of the total contingent mortuary liabilities, and yields an annual revenue of more than $15,000; operating on sound and correct principles, with ample security, it offers to the telegraph and telephone employe the best and most economical form of protection for the family and dependents yet devised. Write for particulars.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEYBOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS, Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York.

Every one engaged in telegraphy and telephony should be a constant reader of TELEGRAPH AND TELEPHONE AGE. It gives the latest news in both these fields. Subscribe now. Subscription price, $2.00 per year.

SOME POINTS ON ELECTRICITY—XVI.

BY WILLIS H. JONES.

Little Things That Count.

If a black sheep is allowed occasional access to a field containing a large flock of pure white animals it may possibly mingle with them a long time before its objectionable presence becomes generally known. It is only after a great number of black sheep appear on the field that the depreciatory influence of each one is noticed. This statement illustrates a condition which exists in every industrial undertaking and discloses what is probably the greatest factor that contributes to inefficiency, viz.: little defects. Big defects are readily detected and quickly remedied. It is the little things which we overlook that count most in the aggregate, and their importance is often belittled.

In the telegraph service the facilities for developing small defects are unusually great, yet a large percentage of them could undoubtedly be avoided if operators could be educated to recognize a sense of personal responsibility to their employers for defects resulting solely from carelessness, indifference, or ignorance on their part. While this may sound harsh the words do not imply a moral or mental inferiority to those following other vocations, but afford the writer an opportunity to call attention to a new but much-needed point of attack in the "uplift" movement now going on in the various official schools inaugurated by the company for the instruction of the operators and employes generally.

In other words the writer suggests that the means of preventing these little defects should be explained and demonstrated so frequently that nothing but willful negligence on the part of an operator could cause trouble.

Let us begin the first lesson with, say, preventable faults caused by operators who use vibratory transmitting devices. This apparatus, if properly handled, would undoubtedly add great capacity to every wire on which it might be used. A few simple suggestions, therefore, offered from time to time would not fail to bring about beneficial results. As the matter now stands the company is rather inclined to discourage further use of this device, and comparatively few operators have any definite idea as to what really contributes towards its present inefficiency.

First, let us suppose that a really good machine sender, with his transmitting apparatus correctly adjusted, relieves a Morse hand sender on a long duplex circuit which has been working smoothly right up to that moment. Now see what happens. In the majority of such cases the moment the machine man begins to send the receiving operator will break and interrupt both sides of the duplex while he explains that the signals are too light. In case the sender cannot remedy the trouble the receiver jumps to the conclusion that the repeater chief at the midstation may be able to "let them down," and after sending for him, more time is lost in waiting. The repeater chief failing to remedy matters, the sender then requests the home quad. chief to pass his signals. This the latter attempts to do by getting the contact points of the polechanger closer together, thus reducing the mechanical inertia of the lever. Still the receiver is possibly not satisfied, and in the meantime enough time has been lost both ways to have permitted the exchange of many messages by hand transmission, and probably ten per cent. more by the machine had the receiver and the sender each known what to do at the start.

Now the light signals complained of were due, in this case, solely to too great a mechanical inertia of one or more parts of the multiplex apparatus, and not to the machine itself. Had each operator been properly posted the receiver would first have lessened the play of the sounder lever. If the home and the repeater station apparatus were properly adjusted, that one operation alone would probably have prevented further delay.

If, on the other hand, the readjustment of the sounder, while helpful, still failed to remedy the

Digitized by Google

trouble, the sender should then seek the aid of the home quad attendant and request a readjustment of the polechanger. The repeating station should be called in as a last resort as the fault is least likely to be found at that point.

The lesson to be learned and strongly impressed upon both the operator and the multiplex attendant is that the efficiency of any given circuit will be enhanced and time saved in direct proportion to the degree in which the mechanical inertia of the transmitting and receiving apparatus of the multiplex is diminished.

Hence any failure to maintain this high standard is obviously due, as previously stated, to ignorance on the part of those uninstructed, or to indifference on the part of those who are supposed to understand the conditions, both of which faults are remediable.

Nor does the above information cover all that the machine sender should be told. He should be cautioned about injuring the circuit closer of the Morse key when he inserts his cord wedge. In many cases the thick wedge raises the thin platinum upper contact so high that when the Morse key-lever is reinserted in order to close the key the latter is left open and the fault is not discovered promptly. Hence another source of delay due to carelessness.

The cord also wears out in time and frequently causes temporary openings or high resistance in the circuit owing to broken strands in the conductor, long before the fact is discovered by the unobserving operator. Operators should therefore test all the connections daily, especially when the circuit opens from any cause whatever.

There are also many points in connection with the proper adjustment of the spring contact points that might be explained, such as the relation of spring tension to the duration of the period of contact in the formation of Morse characters.

If the above facts can be brought home to machine users it is obvious that not only will the general efficiency of telegraph service be greatly enhanced but the operators themselves will derive personal satisfaction in the performance of their daily work.

(To be continued.)

Recent Telegraph and Telephone Patents.

ISSUED MARCH 7.

986,306. Cable Telegraph Apparatus. To I. Kitsee, Philadelphia, Pa.

986,405. Transmitting Apparatus for Wireless Telegraphy. To P. O. Pedersen, Copenhagen, Denmark.

ISSUED MARCH 14.

986,606. Telephone Body Support. To V. Tardieu, Arles, France.

986,651. Space Telegraphy. To J. S. Stone, Boston, Mass.

986,787. Telephone System. To A. H. Weiss, Chicago, Ill.

986,806. Reflector for Wireless Telegraphy. To R. d'Antonio, Aquila, Italy.

986,889. Secret Service Telephone Circuits and Switching Mechanism. To A. K. Andriano, San Francisco, Cal.

986,952. Locking Device for Telephones. To W. A. Soles, New York.

ISSUED MARCH 21.

987,107. Telegraph Key. To C. Bolick, Rocky Mount, N. C.

987,128. Telephone Exchange System. To W. A. Fricke, Chicago, Ill.

987,129. Telephony. To W. A. Fricke, Chicago, Ill.

987,304. Telephone. To W. J. C. Kenyon, Chicago, Ill.

987,563. Telephone Attachment. To C. L. Fields, Rochester, Ind.

987,582. Telegraph and Telephone System. To O. D. Lademann, Milwaukee, Wis.

987,630. Quadruplex Telegraphy. To I. Kitsee, Philadelphia, Pa.

987,631. Quadruplex Printing Telegraphy. To I. Kitsee, Philadelphia, Pa.

ISSUED MARCH 28.

987,720. Telegraphy. To B. P. Hayes, Topeka, Kan.

987,864. Operators' Selective Ringing Key or Switch. To W. W. Dean, Chicago, Ill.

987,956. Telegraphic Transmitter. To G. A. Cardwell, New York.

988,044. Telephone Receiver. To H. R. Stuart, Wheeling, W. Va.

The following patents have expired:

516,642 and 516,643. Magneto Telephone. Issued to H. A. Chase, Boston, Mass.

516,777. Telephone Switch. Issued to A. Stromberg and A. Carlson, Chicago, Ill.

516,982. Telephone. Issued to A. C. White, Boston, Mass.

517,243. Single-Line Telephone System. Issued to J. I. Sabin and W. Hampton, San Francisco, Cal.

517,263. Telephone Switch. Issued to F. R. Colvin, New York.

English King and Queen Visit London Telegraph Office.—King George and Queen Mary of England, accompanied by Princess Mary, paid a visit to the new general post office and the Central Telegraph office in London in the evening of March 24 last. Major Walter A. J. O'Meara, engineer-in-chief of the British Postoffice Telegraph, and Mrs. O'Meara received the royal party at the telegraph office. Loyal greetings were received by telegraph from various sections of the kingdom, and from foreign capitals, during the visit.

Mr. M. W. Gothelf, manager of the Postal Telegraph-Cable Company's office at Baton Rouge, La., and winner of the first prize awarded by his employing company for valuable suggestions, writes: "Your excellent journal should be in the hands of everyone engaged in the telegraph business."

Digitized by Google

Personal.

Mr. Frank N. Dowler, a well-known old-time telegrapher, has been appointed general eastern agent of the Colorado Midland Railway Company, with headquarters at New York. Mr. Dowler was latterly city freight agent for the Lackawanna Railroad at New York.

Mr. H. P. Trainor, electrical engineer of government telegraphs, Pretoria, South Africa, has arrived at New York from Melbourne, Australia. He will spend a few days in New York and then proceed to London. Mr. Trainor left South Africa January 1 last, on a six months' leave of absence, and is visiting various countries to obtain knowledge regarding the management and operation of the telegraphs and telephones. While in New York his headquarters will be at the office of Telegraph and Telephone Age.

Mr. Frederick F. Fitzpatrick, president of the Railway Steel Spring Company, New York, was a former telegrapher, having first entered the service in 1881 at Kansas City, Mo., for the Western Union Telegraph Company. He afterwards took up railroad telegraph work and was employed successively on the lines of the Atchison, Topeka and Santa Fe Railroad, the Pennsylvania Lines, the Wabash Railroad and the Missouri Pacific Railroad. In 1886 he entered the executive department of the Missouri Pacific Railroad and advanced through various positions. On November 1, 1910, he was elected president of the Railway Steel Spring Company. Mr. Fitzpatrick was born near Peterboro, Ont., June 9, 1866.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. John F. Skirrow, associate electrical engineer of this company, New York, was married on April 8 to Miss Grace Fredericka Kelsey of East Orange, N. J.

Messrs. Harvey D. Reynolds, superintendent, Buffalo, N. Y.; A. L. Edgecomb, superintendent, and C. A. Richardson, acting superintendent, Boston; C. E. Bagley, superintendent, Philadelphia, and H. Scrivens, superintendent, Pittsburg, Pa., were in attendance at a recent New York conference.

Mr. G. H. Usher, general superintendent, Atlanta, Ga., and Mr. Guy E. Paine, general superintendent, and Mr. H. G. McGill, superintendent, Chicago, were recent New York visitors in attendance at a conference.

Mr. D. McNicol, instructor of the Postal Electrical Society, New York, states that the attendance at the meetings is holding up well and the members of the class are making excellent progress in their studies.

Mrs. Irene L. Scofield has been promoted to the managership of the Council Bluffs, Iowa, office, vice Mr. C. M. Sizer, resigned.

Dennis Fletcher, aged fifty years, manager of the Spokane, Wash., office of this company, died on February 14. Mr. Fletcher was born in Brockville, Ont., and entered the telegraph service as operator in his native town in 1873. He held positions in Canada and at various points in the United States, going to Spokane as manager when this company opened its office there in 1889.

Mr. George F. Fuller, manager of the Indianapolis office, whose appointment was noted in the April 1 issue, is a native of that city, being born December 17, 1873. He entered the telegraph service at that place March 17, 1885, as messenger and was advanced successively through the positions of bookkeeper, operator and chief operator, finally becoming manager. Mr. Fuller's entire career has been spent in the city of his birth, and naturally he is thoroughly familiar with its telegraphic needs.

The new offices at Williamsport, Pa., and Syracuse, N. Y., are rapidly approaching completion.

The new Worcester, Mass., office was opened Sunday, April 9.

Magnetic Club Dinner.—The spring dinner of the Magnetic Club, New York, will be held at the St. Denis Hotel, New York, April 26. It is characterized as a "family" dinner, and the editors of electrical papers in New York have been invited to attend as guests of the club.

The major part of the evening will be devoted to social intercourse and entertainment.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Theo. N. Vail, president of the company, sailed for Europe on the steamer *Celtic* on April 1.

Mr. John C. Willever, secretary of the company, New York, was married on April 1 to Miss Lillian V. Voorhees, at Millburn, N. J.

The desk of Mr. W. H. Baker, vice-president of the American District Telegraph Company of New Jersey, New York, was on April 13 decorated with a beautiful bouquet of roses presented to him by his associates in honor of his birthday.

Mr. William Holmes, superintendent of tariff, New York, has returned to his office after enjoying a brief vacation in Bermuda.

Mr. B. P. Hancock of Jacksonville, Fla., has been transferred to the general superintendent's office at Atlanta, Ga., as traffic inspector to make a study of traffic conditions in the southern division.

Mr. John McRobie has been appointed general manager of the American District Telegraph Company of New Jersey with headquarters at New York, vice Mr. C. F. Patterson, resigned. Mr. McRobie was general superintendent of the company at New York prior to his recent advancement and is highly esteemed by telegraphers in general. His many telegraph friends will be pleased to learn of his promotion, and wish him success in his new duties. He has occupied important telegraph positions in various sections of the country for the past forty years.

Mr. Gardner Irving has been appointed superintendent of the Commercial News Department, New York, and will have supervision of traffic and commercial affairs in New York City, including the operation of the Gold and Stock Telegraph Company.

Digitized by Google

Mr. Geo. B. Scott, superintendent of the Gold and Stock Telegraph Company, New York, was retired on pension on April 1, after a service of forty years. Mr. Scott was born in Scotland seventy-one years ago and was reared in Canada. He began his business career as a railroad telegraph operator at Hamilton, Ont. Mr. Scott was one of the foremost in the development of the ticker service and made numerous inventions in that line. He will retire to his farm near Lakewood, N. J.

Mr. J. C. Nelson, general superintendent, Denver, Col., accompanied by division and district officials, recently made a tour of inspection of the Mountain Division.

Miss Genevieve Moore has been appointed manager at High Point, N. C., vice Mr. Clifton Suggs, resigned.

Mr. E. T. Moore has been appointed district commercial agent at Richmond, Va., vice Mr. T. A. Worthington, transferred to the position of manager at Newport News, Va. Mr. Worthington relieves Mr. H. B. Cliborne, who has been transferred to the Richmond operating department.

Mr. Gay Phillips has been appointed manager at Clinton, N. C., vice Mr. H. S. Matthews.

Mr. C. J. Heath, chief clerk for the past six months to Mr. L. K. Whitcomb, division traffic superintendent at Dallas, Tex., has been appointed manager of the Corpus Christi, Tex., office of the company, vice Mr. R. D. Ridgill, resigned.

Mr. S. L. Burts, manager of the Atlanta office, has been appointed commercial superintendent at Jacksonville, Fla., vice Mr. B. P. Hancock, promoted.

Mr. W. J. Francis, manager of the Montgomery, Ala., office has been promoted to the management of the Atlanta office vice Mr. S. L. Burts, promoted.

Mr. D. M. Therrell, division traffic superintendent at Atlanta, Ga., has resigned to return to the Southern Bell Telephone service.

Mr. W. G. Peebles has been appointed chief clerk to district commercial superintendent E. E. Williams at Atlanta, Ga.

Mr. B. F. Ragsdale, general wire chief of the Buffalo, N. Y., office has been appointed chief operator of the Augusta, Ga., office. Mr. C. W. Aldridge succeeds Mr. Ragsdale as general wire chief at Buffalo.

At a recent conference at New York of superintendents of the American District Telegraph Company of New Jersey, the following named out-of-town superintendents were present: Messrs. R. C. Baker, George McGann, M. E. Barrett and F. V. Sackett, Chicago, Ill., and P. G. Kern, Louisville, Ky.

Mr. A. W. Springer, district manager, with headquarters at Wilmington, Del., was recently married to Miss E. L. Cox of that city.

Mr. W. L. Glasheen of the San Francisco office has accepted a position with this company at Los Angeles.

Mr. Harman D. Jones, special agent for the first district of the Pacific Division, Western Union Telegraph Company, San Francisco, Cal., was born in Dansville, N. Y., June 9, 1862. He entered the telegraph service as a messenger for the Western Union Company at Erie, Pa., in 1876, and was in the railroad service from 1877 to 1881. He was employed in the office of the district superintendent of the Western Union Telegraph Company at Cleveland, Ohio, between 1882 and 1906, and then went to San Francisco and entered the office of the district superintendent there. He advanced through the positions of chief clerk, inspector and auditor, finally becoming special agent.

Mr. T. P. McKinney, chief operator at Spokane, Wash., has started a class of understudies in that office and expects that it will meet with favor by those interested. Mr. McKinney will probably adopt Jones' book of diagrams as his text book.

A meeting of superintendents of the Southern Division was held at Atlanta, Ga., March 29, at which the following named district commercial superintendents were present: Mr. J. S. Calvert, Richmond, Va.; Mr. L. J. Maxwell, Jacksonville, Fla.; Mr. E. E. Williams, Atlanta, Ga.; and Mr. J. R. Terhune, Nashville, Tenn. The following named railway telegraph superintendents were also present: Mr. W. F. Williams, Seaboard Air Line, Portsmouth, Va.; Mr. W. P. Cline, Atlantic Coast Line, Wilmington, N. C.; Mr. W. H. Potter, Southern Railway, Washington, D. C.; Mr. J. B. Murphy, Mobile and Ohio, Jackson, Tenn.; Mr. C. W. Bradley (acting) Chesapeake and Ohio, Richmond, Va.; Mr. W. S. Melton, Queen and Crescent, Danville, Ky.; and Mr. W. L. Oakley, Gulf and Ship Island, Hattiesburg, Miss. After the meeting Mr. H. C. Worthen, general superintendent, entertained the visiting officials at a luncheon at the Capital City Club.

Mr. G. W. Hammell has been appointed chief operator of the Nashville, Tenn., office vice Mr. J. F. Fleming, appointed night chief operator.

Mr. W. A. Sawyer, district commercial superintendent, New York, was the guest of honor at a dinner given by managers and other employes of the first district at Troy, N. Y., March 23.

Canadian Notes.

The Great North Western Telegraph Company has increased the pay of a number of its employes, ranging from $5 to $10 per month.

Mr. A. C. McConnell has been appointed secretary and auditor of the Great North Western Telegraph Company, Toronto, Ont. Mr. D. E. Henry has been appointed treasurer and Mr. George Watt superintendent of supplies. All of

Digitized by Google

these positions were filled by Mr. George D. Perry at the time of his appointment as general manager of the company.

Investigation of Canadian Telegraphs.

The Canadian Board of Railway Commissioners will commence their general investigation into the operation of telegraph companies at Toronto on April 24, with the object of determining as to whether telegraph tolls charged in Canada are fair and reasonable. The investigation will begin with the Great North Western Telegraph Company as a purely telegraph organization, and this will form a basis for the investigation into the operations of the Canadian Pacific Railway's Telegraph, the Canadian Northern and the Grand Trunk Pacific Railway's Telegraphs where the accounts are almost inextricably interlaced with the operation of the railways themselves, and the Western Union Telegraph Company which only operates directly in New Brunswick, Nova Scotia and British Columbia. The Great North Western Telegraph Company will probably be represented by Mr. George D. Perry, general manager, and some legal light; the Canadian Pacific Railway by its general solicitor, Mr. E. W. Beatty, and an assistant, Mr. James Kent, manager telegraphs, and Mr. W. J. Camp, electrical engineer, the Canadian Northern by Mr. W. C. Muir, superintendent of telegraphs and express, and perhaps Mr. Phippen, legal representative; the Grand Trunk Pacific by Mr. A. B. Sith, general manager, Grand Trunk Pacific Telegraphs. The public will be represented by Messrs. Isaac Pitblado, K. C., of Winnipeg, Man., and W. C. Buell, Barrister, Brockville, Ont., as counsel, and various representatives of Boards of Trade, etc., throughout the Dominion. Messrs. G. D. Perry and W. J. Camp will probably be the principal witnesses for the companies.

The Cable.

Mr. Edward C. Sweeney, superintendent of the French Telegraph Cable Company, New York, has been appointed traffic manager for the company and general manager of the United States and Hayti Telegraph and Cable Company, with headquarters in New York, to succeed the late Louis A. Lurienne.

German-Brazil Cable Opened for Business.—The new German cable from Emden, Germany, to Pernambuco, Brazil, by way of Monrovia, Liberia, which has been frequently referred to in these columns, was formally opened for business April 1.

Jubilee of the Military Telegraph Corps.

To commemorate the fiftieth anniversary of the founding of the Military Telegraph Corps of the United States Army, and particularly the services of forty-one members of the corps who volunteered from or who were residents of Allegheny County, Pa., before the civil war, a superb bronze tablet (size 9 ft. x 4ft. 6 in.) will be unveiled in the Soldiers' and Sailors' Memorial Hall, Pittsburg, Pa., on Friday, April 28, at 4 o'clock p. m.

The names of the forty-one volunteers are inscribed on the tablet, and the faces of twenty-eight are shown in bas-relief around the margin, the centre figure in the upper row being that of the founder of the corps, Mr. Andrew Carnegie, who has promised to be present at the ceremony of unveiling.

The names of the sixteen survivors and the positions they held in the service are as follows: David Homer Bates, cipher operator and manager War Department telegraph office; Joseph W. Boyd, operator; Andrew Carnegie, assistant general manager; Albert Brown Chandler, cipher operator and cashier; Captain Thomas B. A. David, superintendent; Charles William Jaques, operator; Major Joseph Orton Kerbey, operator; Theodore E. Moreland, operator; George Albree Low, operator; Edward W. McKenna, operator; James Hervey Nichols, operator; George W. Perkins, line builder; J. William Pope, line builder; Jesse H. Robinson, operator; John Abernethy Torrence, operator; Robert F. Weitbrec, operator, captured by the enemy and exchanged after being confined in a Confederate prison.

The names of the twenty-five deceased volunteers and the positions they held are as follows: Thomas Armor, operator; Bennett R. Bates, operator; *Nicholas H. Brady, line builder; *Warren Brockett, line builder; Samuel M. Brown, operator; Jesse H. Bunnell, operator; A. Harper Caldwell, cipher operator; *David R. Ecker, line builder; Benjamin W. Flack, operator; *George Holmes, line builder, died in Confederate prison; John Spencer Kerbey, operator; *Henry King, line builder, died in Confederate prison; *Henry Knowland, line builder; *David Morse, line builder, died in Confederate prison; J. Andrew Munson, operator; Martin Murray, line builder; John A. L. McKenna, operator; James P. McIlvaine, operator; John L. O'Neill, operator; *S. Theodore Paisley, operator; *Thomas S. Perkins, line builder, died in Confederate prison; *Augustus Steinmyer, line builder; Thomas Dale Williams, operator; *Ben. F. Woodward, operator; *L. D. McCandless, line builder.

The faces of those indicated by a star do not appear in bas-relief on the tablet, no photographs or pictures of them being available. The faces of all of the others and of the survivors are shown.

It is expected that all of the survivors will be present, and all other members of the corps are cordially invited to attend this unique and historical event.

Relatives of the deceased volunteers, who have not already communicated their names and addresses to the committee in charge of the affair, should do so at once to Mr. David Homer Bates, 6=8 Broadway, New York City, or Mr. Joseph W. Boyd, Soldiers' and Sailors' Memorial Hall, Pittsburg, Pa.

The committee hopes that when the unveiling takes place one or more of the sons, grandsons, or other relatives and near friends of the entire forty-one military telegraphers whose names are indelibly carved upon this enduring memorial, will be present on this historic occasion.

The Telephone.

Mr. M. J. Carney, assistant to President A. W. Burt of the Wisconsin Telephone Company, Milwaukee, Wis., was a recent New York visitor.

Mr. E. E. Bawsel, division commercial superintendent of the American Telephone and Telegraph Company at Atlanta, Ga., has accepted a position with the Southern Bell Telephone Company at the same point.

Mr. G. Calhoun, division commercial superintendent of the American Telephone and Telegraph Company, New York, has transferred his services to the legal department of the company. The division headquarters have been abolished.

Telephone Assets Sold.—The assets of the Telephone, Telegraph and Cable Company of America, now in bankruptcy, were sold on March 9 for $75,000.

Conducting Business by Telephone.—A Somerville, Mass., man stricken with paralysis, conducted his business by telephone for four months prior to his death while lying in bed.

To Prevent Unauthorized Use of Telephone.—Mr. Charles V. Richey, of Washington, D. C., has invented a telephone attachment which prevents unauthorized outgoing telephone calls during the subscriber's absence. It does not prevent incoming calls from being received, however.

Independent Telephone Companies to Enter Telegraph Field.—The West Virginia Independent Telephone Association at its recent convention, held in Clarksburg, W. Va., passed a resolution empowering the executive committee to take steps toward the formation of a pool of toll lines for the purpose of engaging in the commercial telegraph business.

Darning Stockings by Telephone.—The Pacific Telephone and Telegraph Company of San Francisco received complaints from farmers on a certain telephone line near Madero, Cal., that every Friday and Saturday their line would open and remain in that condition all of these two days. An investigation revealed the fact that a woman was in the habit of taking the telephone receiver off the hook every Friday and kept it off all that day and Saturday to use it as a darning ball in mending the socks of the farm hands.

Meeting of Texas Telephone Managers.—The managers of the Northeast Texas division of the Southwestern Telephone and Telegraph Company met in conference in Dallas, Tex., recently. Many papers pertaining to telephone operation and management were read and discussed. A banquet was held at the conclusion of the meetings, about eighty representatives of the company being present. General commercial superintendent P. K. Baker acted as toastmaster. Among the speakers were Mr. H. J. Pettengill, president, and Mr. J. E. Farnsworth, vice-president and general manager.

Wire Thieves Fire Upon Pursuers.—In an attempt to capture wire thieves near Kearny, N. J., recently, three policemen in the pursuing automobile, and the chauffeur, were shot by the thieves during the chase. The New York Telephone Company has suffered the loss of so much wire in that section lately that it decided to take extraordinary means to capture the thieves. It placed an automobile at the disposal of the authorities for this purpose, and on receiving information that wires were being cut the officers started out after the thieves with the result as noted. The thieves escaped with their booty in a truck.

Organization of Telephone Pioneers.

In our issue of April 1 was printed a list of telephone pioneers who are eligible to membership in the proposed organization of the early telephone men. Since that issue other names have been added to the list as follows: Berliner, Emil, September, 1878; Boeggeman, J. H., May, 1878; Chambers, J. A., June, 1881; Daboll, F. G., March 21, 1879; Gates, C. A., February 7, 1875; Fitzpatrick, Thos. P., 1879; Mellen, A. J., January, 1883; Marshall, H. P., July 27, 1885; MacCrellish, J. A., February 1, 1881; O'Rourke, John, January, 1881; Powell, T. L., February 4, 1884; Raup, K., October, 1880; Thomas, M. F., February, 1879.

Long Distance Telephone in Spain.—Malaga, Spain, is now in long-distance telephone connection with seven cities in that kingdom, including Madrid. The service is to be extended to cover fifty-three important cities within a few months. The rates for conversations of three minutes or fraction thereof, are 9 cents for 30 miles, 22 cents for 125 miles, 40 cents for 250 miles, and 75 cents for 500 miles. In connection with this service a new system has also been inaugurated for the transmission of telegraph messages. A 15-word message destined to any point outside the province of Malaga may be sent for 19 cents; to any point within the province 9 cents. These messages are received on blanks similar to those now in use for the telegraph service.

Test of New Duplex.—On April 4, Mr. George E. Hines of New York gave a practical demonstration of the operation of his new duplex at the School of Ethical Culture in New York. The demonstration was made with apparatus installed in the physics laboratory, the two sets of instruments representing the terminals of a line, being placed on separate benches. The laboratory test was all that could be desired as regards operation. Several representatives of the telegraph and telephone companies witnessed the test.

Mr. F. O. Nourse, commercial superintendent of the Western Union Telegraph Company at Richmond, Va., writes: "It is certainly a great pleasure to me to receive the Age, and I will be glad to continue talking its value."

Annual Meeting of American Telephone and Telegraph Company.

At the annual meeting of the American Telephone and Telegraph Company, held in New York March 28, the retiring board of directors was re-elected, including Mr. N. W. Harris and Mr. Lewis Cass Ledyard, who succeed Messrs. G. L. Greene and G. W. Perse. The present officers of the company were also reelected.

At the conclusion of the meeting president Theo. N. Vail stated that he considered the outlook for 1911 to be an excellent one and that he expects the business of the company to show about the same percentage increase for 1911 over 1910 as was shown in 1910 over the previous year.

Following is the list of directors and officers:

Directors: Charles W. Amory, Thomas B. Bailey, George F. Baker, Francis Blake, Harry H. Brigham, Alexander Cochrane, T. Jefferson Coolidge, Jr., W. Murray Crane, Henry P. Davison, Rudulph Ellis, Norman W. Harris, Henry L. Higginson, Henry S. Howe, Charles Eustis Hubbard, Lewis Cass Ledyard, John J. Mitchell, William Lowell Putnam, Thomas Sanders, Sylvanus L. Schoonmaker, Eugene V. R. Thayer, Theo. N. Vail, Frank E. Warner, John I. Waterbury, Moses Williams and Robert Winsor.

The officers are: President, Theo. N. Vail; vice-presidents, Edward J. Hall, U. N. Bethell, William R. Driver, N. C. Kingsbury, B. E. Sunny, H. B. Thayer, Charles P. Ware; treasurer, William R. Driver; secretary, C. E. Hubbard; comptroller, Charles G. DuBois; general counsel, George V. Leverett; chief engineer, John J. Carty.

Annual Report of American Telephone and Telegraph Company.

The annual report of the American Telephone and Telegraph Company for the year ending December 31, 1910, has been issued. It forms a pamphlet of 68 pages, and is of unusual interest on account of reference to the complementary operation of the telephone and telegraph services.

The report shows that the gross revenue collected from the public in 1910 for telephone service by the Bell system—not including the connected independent companies—was $165,600,000; an increase of nearly $16,000,000 over last year. Of this operation consumed $54,000,000; taxes $8,000,000; current maintenance $25,700,000; and provision for depreciation $26,200,000. The surplus available for charges, etc., was $51,000,000, of which $11,550,000 was paid in interest, and $25,000,000 was paid in dividends to the public.

The report of the American Telephone and Telegraph Company alone shows net revenue for the year $31,933,214.49, out of which interest amounting to $5,077,321.33, and dividends amounting to $20,776,822.12, were paid. The balance, $6,079,071.04, was an increase over last year notwithstanding the increase in charges due to conversion of bonds into shares. At the end of the year there were about $39,000,000 bonds outstanding which have since been reduced to about $30,000,000.

The interest of the American Telephone and Telegraph Company in its associated operating companies is over 80%, in addition to which it has its own earnings. The American Telephone and Telegraph Company's share of the surplus earnings of the Bell system is approximately 90%, so that the showing of real interest to the security holders of American Telephone and Telegraph Company lies in the figures of the Bell system as a whole.

During the year a great deal of attention has been given to some scheme for pensions and saving which would be of the greatest possible benefit and assistance to the employees, and, if possible, a substantial improvement on any scheme now in force.

The section of the report referring to the relations between the telephone and telegraph systems reveals the plans of the company in the complementary operation of the two services.

The relations between the telephone system and the telegraph system are complementary.

Telephone service annihilates distance in that it brings parties at distant points into speaking distance with each other.

Telegraph service annihilates time in that it instantaneously transmits written messages between different points.

The telephone provides something to be used by the public themselves.

The telegraph performs a distinct service for the public.

A telephone "circuit" consists of two copper wires of superior construction arranged, in a particular relation to each other, forming a metallic circuit equipped with auxiliary apparatus, loading coils, etc., connected with a switchboard—all very complicated and elaborate.

A telegraph "circuit" consists of one wire at most —a grounded circuit. This wire can be divided into several distinct "circuits."

A telephone "circuit" cannot be used for telephone purposes by any but the two parties in communication, during the time of such communication, but the same telephone "circuit" can, at the same time it is being used for telephone service, be divided into two, four or even eight telegraph "circuits," each of which can be used for the transmission of telegraph messages.

The possible use of a telephone circuit is limited by the necessity of the personal presence on the circuit of the parties communicating; by the time necessary to get both parties on the circuit; by the time taken by the communication; and by the intervals lost while waiting for parties.

This limited capacity, together with the costly character of the telephone circuit, makes distance the important controlling element in the cost of telephone toll line or long distance service.

The ratio of the possible number of telegraph messages over the same wires compared to the possible number of telephone communications is very large.

Digitized by Google

The use of the telephone for telegraphing messages is limited economically to short distances and the possibility of either being used indiscriminately or interchangeably to very short distances, or to other particular situations.

Any attempt on the part of a telephone company to do a regular "telegraph business" would necessitate a "telegraph" operating organization in addition to its "telephone" operating organization.

Before a telegraph company could do a "telephone business" it would be necessary to reconstruct and rearrange its entire wire plant; to construct and equip central offices, distributing subways and lines, subscribers' connections and stations, at a cost of several times its existing telegraph wire plant, and also to create a distinct "telephone" operating organization.

The large economies are in the joint occupancy and the joint use of the trunk "wire plant." There are in the distributing and branch lines of both services large plant and operating facilities; where to maintain any office there must be utilized the office and employes of some business which has first claim on the service and attention of such employes. Under these conditions satisfactory service is impossible. This waste incident to separate service could be almost entirely eliminated by joint use or occupancy, and by bringing the business entirely under one common control or influence the efficiency and the reputation of the service could be greatly improved.

Cheap service comes from full loads. In the wire service this can only be had by employing the plant to its full capacity, all the time.

In some lines of business like the transportation of passengers, where the unit of service is the car mile, and the overload capacity of the car is large, the average load can be greatly increased by making use of the "overload" during the few hours of maximum business. In no other way could the prevailing cheap fares be afforded for such long hauls.

In the electrical transmission of intelligence there can be no overload. Cheaper service can only be given by the development of new or additional uses which can be distributed over the time now unused.

Up to the present time the telegraph and cable business has been developed wholly on lines of expedition. Theoretically at least there should be no possibility of any further expedition, of any rush or special service, beyond what should now be given.

In the great possibilities of electrical transmission of intelligence some uses will be found or developed to absorb and utilize this enormous waste, by furnishing a service which would be satisfactory to such of the existing business as has heretofore had no alternative, but would prefer the new service.

The Night Letter—the first attempt—met with popular reception and is filling a definite place in the business and social world. The day letter, so recently introduced that its possibilities cannot yet be determined, will doubtless find its place.

It is also intended to extend some of these new classes of service to the transatlantic cables as soon as it is made possible by the completion of negotiations and arrangements now pending.

Until the economies, which may result from the joint occupancy or joint use are determined, there will be no changes made in the present conduct of expedited or regular service. Whether all or only part of the economic waste will be absorbed in the other classes of service is a question yet to be answered; until answered anything that might result adversely either to the quality of the service, the extension and introduction of new services, or to the reasonable profits to which the companies are entitled, would be foolish and uncalled for.

Wireless as a Fire Hazard.

The use of high-voltage transformers for wireless purposes on the ordinary lighting circuits without the proper protective device, says Mr. Elmer J. Lamb in the *Electrical World*, constitutes a fire hazard which has been generally overlooked by wiring inspectors.

The supply mains oscillating in harmony with the antenna of the transmitter carry a static charge, which, although harmless in itself, very often may result in serious consequences. As the supply mains and the oscillating antenna approach the same length they come nearer to a state of perfect harmony—that is, they are electrically in tune—and the trouble becomes proportionally more aggravated.

The charge carried by the "live" side tends to ground itself by jumping to the grounded neutral wire, sometimes carrying the low-voltage current with it and establishing a destructive arc.

In case the fixture is a combination electrolier for the use of both electricity and gas the static current is liable to jump to the gas-pipe ground to relieve the difference in potential, carrying the line current with it and setting fire to the insulation. The fire in turn may be communicated to the insulating joint, which is made of an inflammable compound.

This supposition became a reality in several cases brought under the observation of the writer, the insulating joint taking fire from the resultant arc. Had the fire remained unnoticed for a time sufficient to allow the joint to burn through and let the gas escape what would have eventually happened can be easily imagined.

The trouble is not confined merely to the building in which the transformer may be used, but is strongly in evidence in all places which may be supplied from the same lighting transformer. In many cases, as a result, the voltage coils of the consumers' meters are burned out in identically the same manner as when the lines are affected by lighting disturbances.

This trouble is most conveniently corrected by the use of a small high-tension condenser constructed of glass and tinfoil, arranged in two sections of proper capacity, which must be determined by experiment and is dependent upon local conditions. The condenser should be bridged across the supply mains with a ground connection between the two sections. This arrangement will alleviate any abnormal difference in voltage between the two lines, or between one side and the ground.

ANSWERS TO QUESTIONS.

[In this department questions on matters of a practical character, and of general interest, will be answered. Questions intended for this department must be signed by the writer's full name—not for publication, but for identity. No attention will be paid to anonymous communications.]

(33) Q. I have often seen the letters B. T. U. in technical articles. Will you please tell one "who does not know" what they mean? D. N. K.

A. The letters B. T. U. stand for British Thermal Unit. One British Thermal Unit is the quantity of heat required to raise the temperature of one pound of pure water one degree Fahrenheit at or near its maximum density, 39° F.

(34) Q. What is meant (1) by the dielectric strength of an insulating substance, and (2) how is it determined? W. I. M.

A. (1) The dielectric strength of an insulating substance is the maximum potential it will stand without being punctured. (2) It is determined by placing a thin layer of the substance between two metal electrodes and increasing the difference of potential between the electrodes by small steps until a spark passes through the dielectric. The difference of potential in volts preceding that which punctures the insulation is the maximum strength of the dielectric.

(35) Q. Will you please tell me what are the standard elongation and ductility tests for iron telegraph wire? J. F. I.

A. The Western Union standard specifications provide that the wire must be capable of elongating 15 per cent. without breaking, after being galvanized. Tests for ductility are made by placing a piece of wire in two vises, six inches apart, and twisted not less than fifteen times. The number of twists must be distinctly visible on the wire.

(36) Q. Please give me the rule to ascertain the weight of a copper wire when the sectional area in circular mils is given. P. G. M.

A. Multiply the area by the length of the wire and the product by .000003027. This number is the weight of a copper wire one circular mil in diameter and one foot long.

Some Appreciated Postal Testimonials Regarding This Paper.

Mr. E. J. Nally, vice-president and general manager of the Postal Telegraph-Cable Company, New York, writes as follows:

"Thirty-five years ago I began my telegraph career as a messenger boy in St. Louis, and for a very large portion of this period I have been an attentive reader of Telegraph and Telephone Age.

"In sending you the enclosed check, renewing my subscription for another year, I feel prompted to speak in grateful testimony of the value of your publication and of the very high grade and high-toned way in which you have conducted it. You are doing a world of good in educating young men, and even old men, in the profession, and especially are you stimulating them to take interest and pride in their work. I have always found the Age fair and dignified in its treatment of all subjects and all questions and I wish you the full success to which your splendid efforts entitle you."

Mr. Charles C. Adams, vice-president of the Postal Telegraph-Cable Company, New York, under date of March 22, writes as follows:

"Although your publication was most interesting and instructive before it was changed to the Telegraph and Telephone Age, the new issues are editorially broader and more instructive and typographically handsomer. The Age is indispensable to me. Therefore, do not solicit the renewal of my annual subscriptions, but let the renewals be automatic, notifying me when my subscriptions are due."

Mr. E. B. Pillsbury, general superintendent, Postal Telegraph-Cable Company, New York, writes, under date of March 20, as follows: "It is always a real pleasure to receive your paper, which I have read assiduously since the first number. Its appearance always gives me the feeling of meeting an old and valued friend. You have improved its makeup from time to time, until it is now an ideal electrical journal. I regard it as a most helpful and valuable aid to those in our profession who aspire to self-improvement and advancement to the higher grades; and you have my sincere wishes for future success in an enlarged sphere of usefulness."

Mr. Guy E. Paine, general superintendent, Postal Telegraph-Cable Company, Chicago, under date of March 20, writes: "I have for many years looked upon Telegraph and Telephone Age as a valuable Gospel of Self-Help for those who would. I have tried to do missionary work for the paper during all these years, believing that in such effort I was helping my friends in the telegraph business. If any word from me will result in inducing others in our service to become subscribers, I know the Age will retain them as permanent friends."

Bucket Shop Law Declared Unconstitutional.—Justice Wright of the Supreme Court of the District of Columbia, Washington, on March 30, in a decision declared the anti-bucket-shop law unconstitutional. An appeal will be taken. The statute is of local application only and does not necessarily affect the actions which the Department of Justice has begun at many other points against alleged bucket-shop operators, for the prosecution in these cases has been under the postal laws.

Mr. F. S. Lewis, manager of the Western Union Telegraph Company at Jersey City, N. J., in renewing his subscription for another year, writes: "Telegraph and Telephone Age is becoming more and more interesting to me and I would not know how to get along without it."

The Late L. A. Lurienne.

The death of Louis A. Lurienne, manager in America of the French Telegraph Cable Company, which occurred in Paris on March 25, and which was recorded in our April 1 issue, has taken from the cable world one of its most distinguished and respected personalities. Louis A. Lurienne was born in Normandy, France, in 1859, and studied at the Naval College at Brest, passing his graduation examination among the highest in his class. A weakness of his eyes, however, prevented him from carrying out his intention of following the navy as a profession, and he entered the French government service as a telegraph engineer, constructing several lines in France for it. He was later sent on a similar mission to Siam, at the time France acquired a large tract of land from the Siamese government, and acquitted himself with great credit. He subsequently accompanied his brother-in-law, M. La-Place, on a voyage of scientific research to Terra del Fuego and Patagonia. On his return from this voyage, Mr. Lurienne entered the service of the French Telegraph Cable Company, which company he has represented as manager in America for the past fourteen years in New York City. In this capacity he was devoted to his official duties and was as punctual and constant at his desk as any member of his staff. He achieved great success, and on many important occasions gave proof of executive ability of the highest order.

During the Spanish-American war he was summoned to Washington and informed by the United States Government that he must suspend the completion of the second French cable, which was then about to be landed in the United States, and that the cable must not be landed. He met this situation with a firmness that could not be shaken, informing the government that he would carry out to the letter the instructions of his company, and that the government could cut the cable after it was landed if such a course seemed proper to it. The cable was promptly landed and it is evident that he suffered no disadvantage on account of the independence of his attitude as President McKinley was the first to make use of this new cable by sending a message from the White House to the President of France, congratulating him on the inauguration of this new means of communication between France and the United States. Mr. Lurienne's tenacity of purpose got for his company a considerable indemnity in compensation for the losses it suffered, during the hostilities of the Spanish-American War, in the Antilles Sea, where the company's cables were cut for strategic reasons.

Recognizing his loyal services the French government in July, 1900, granted him the Cross of the Legion of Honor, which recognition was welcomed by his many friends in this country, who, having seen him at work, were able to appreciate his worth as well as his modesty. In the meantime he had succeeded the late Eugene de Bocando as vice-president of the French Chamber of Commerce where he has left the memory of a most courteous colleague endowed with sure and correct judgment.

Mr. Lurienne's health began to fail two years ago, but a vacation in Europe at that time seemed to have benefited him greatly, and he returned to his post in New York with renewed energy. From that time, however, uninterrupted labors and preoccupations of a purely professional nature gradually undermined his strength and the summer of 1910 found him very much in need of a rest and change of scene. Being, however, a man who thought of duty before all else he resisted the urgings of his friends and the advice of his physician and stuck to his duties, feeling that his presence in New York was indispensable. Late in the Fall he was stricken with an illness which drove him to the Catskill Mountains in search of health and later to Europe, but he had delayed too long and this time failed to recuperate, his death occurring in Paris from embolism of the heart.

Mr. Lurienne was a man with many admirable characteristics. He had an extremely dignified presence, which compelled the respect of all who met him. His official acts were always governed by a fine sense of justice and equity and his courtesy and politeness were unfailing. Consecrating all his efforts to the accomplishment of his duty, he avoided the fashionable world and its opportunities for parade, but was at all times accessible by the poor and needy, many of whom benefited by his providence. An enemy of all ostentation his charities were hidden under the veil of anonymity; no one ever made an appeal to his good-heartedness in vain. This beneficence which he always showed to the unfortunate, was one of the predominant traits of his character.

In short, he was a true and generous gentleman whose untimely death has caused genuine sorrow, and whose loss is felt keenly by his many friends, particularly by every member of the staff of the French Cable Company who had worked under his management.

As evidence of the great esteem in which Mr. Lurienne was held by the members of the French Cable Company, a resolution to his memory was passed at a special meeting of the staff members, which was called immediately on the receipt of the news of his unfortunate demise, a copy of which follows:

"*Resolved*, That the New York staff of the French Telegraph Cable Company, wishing to render homage to the memory of Mr. Louis A. Lurienne, their much lamented late manager, forward to the managing director and the adminstration at the company's head office, this expression of their profound sorrow caused by the great loss which has come so suddenly upon them. During the fifteen years that he was with us in New York, Mr. Lurienne had won the respect and affection of every one of us. He was at all times a most courteous gentleman whose every act was guided by a fine sense of justice and equity, and whose personal dignity compelled the respect of all who came in contact with him."

The resolution bore the signatures of the members of the staff.

ADDRESS ALL COMMUNICATIONS TO
J. B. TALTAVALL, - Editor and Publisher
253 BROADWAY, NEW YORK.
T. R. TALTAVALL, Associate Editor.

CABLE ADDRESS: "Telegage," New York.
Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

April 16, 1911.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

A Few Observations.

We are frequently asked by operators as to the advisability of giving up railroad telegraph service for commercial service, and vice versa. Questions of this character call for answers that cannot be given without a knowledge of all the attending circumstances, and an answer that might be applicable in one case probably would not fit another. The old saying: "It all depends upon circumstances" is as true and applicable today as it ever was. In general it may be said that if an operator's training and experience have been along commercial lines and he has established a good record for character and service it would be inadvisable, merely to gratify a yearning for a change, to give up a certainty for an uncertainty. Such a man if he desired to enter the railroad service would have to begin at the bottom of the ladder, or near it at least, and when he looked up the ladder he would find many ahead of him. If he were to live long enough he might get to the top or somewhere near it. This same reasoning of course is applicable the other way. A railroad man by reason of his training is not altogether fitted for commercial work and he too, would have to begin in a lower grade position to gain commercial experience. Now, as to the relative advantages of railroad and commercial positions. Perhaps, if one were to choose between the two, all things being equal, the railroad service might be more attractive as offering greater promise for future advancement. The railroads are not hampered to so great an extent by legal enactments as are the commercial telegraph companies and consequently there is greater latitude for energy and enterprise.

From the public's point of view there is vast difference between the telegraph companies and the railroad companies, as far as their relations with the public are concerned, yet as a matter of fact, there is no real difference. They are both common carriers, one of telegrams and the other of passengers and goods. The unreasoning man thinks that when he buys a railroad ticket and gets the transportation it entitles him to he is getting full value for his money; whereas, if he spends twenty-five cents, fifty cents or a dollar for a telegram he does so grudgingly, as if the telegraph company were taking his money without giving a fair equivalent in return. He compares what he calls the "exorbitant tolls of the grasping monopoly" with the post office service which will carry the same communication, and much more intelligence, for two cents, and asks why the telegraph companies cannot do the same. He forgets—he may not know—that in sending a telegram he is really paying for time and speed, and for the use of private property which enables him to save time.

When he pays for his telegram his taxes cease as far as that particular transaction is concerned; whereas for government service his taxes go on without ceasing. He should know the underlying facts and then he would not be so prone to condemn where there is no occasion for condemnation.

The Beginning of the Telegraph.

The late H. M. Dellinger, who fitted up Prof. Morse's first telegraph office in Washington, in 1844, and whose death occurred in that city February 22, recently gave some interesting reminiscences of the early days of the telegraph.

"It was sixty-seven years ago, in 1844," he said, "when the first telegraph office in the world was installed in a couple of rooms in an old government building on Seventh street, Washington. The general post office stood on the site of the old building. The first official dispatches that came over telegraph wire, however, were received in one of the rooms of the Capitol some time before this."

Mr. Dellinger recounted the astonishment with which these dispatches were received at the time. The first was the announcement of the death of an American commodore at Cadiz, in Spain, and the second was the announcement of the nomination of Polk for President. These dispatches were received with incredulity by the scoffers of Morse, and they would not accept them as authoritative until verified

Digitized by Google

by mail. Even then there were suspicions of a trick somewhere.

"People had the impression," said Mr. Dellinger, "that it was the paper on which the dispatch was written that was sent over the wire. You have no idea how the people laughed at the old man (Morse) in those days.

"You know Congress voted him $30,000 the year before to build the line between Baltimore and Washington. Well, when that bill was up before Congress he and his telegraph were unmercifully ridiculed. One day he went into the House when the bill was up for discussion and he was very much discouraged and downhearted.

"Nathan Sargent, who was then sergeant-at-arms of the House, came up to him, and tapping him on the shoulder, said:

"'What's the matter, Mr. Morse?'

"'If this bill don't go through I am a ruined man. I can't even pay my board. If it goes through, I am a made man.'

"'Cheer up!' said Sargent. 'It's going through all right,' and it did.

"When Morse took his first messages at the Capitol I don't believe he had an instrument. He held the wires in his hand in some way and brought them against something. That's my impression. They had an instrument in the office, however, which Mr. Alfred Vail operated.

"I remember when Morse brought his lead pipes in coils to Washington the first time. You know, his first idea was to lay wires underground. But that didn't work. He couldn't insulate the wires in the pipes."

Down With the Loan Sharks.

An approximate estimate shows that telegraphers throughout the country are paying $70,000 to $100,000 every year in the form of usury to money lenders. This is a large amount of money to pay to human leeches. It is of course scattered very widely and it is impossible to estimate the individual average. But whatever is the average, it is, in most cases, a grievous burden to the individual.

Debt to loan sharks is an evil that is hard to get rid of when once it has obtained a grip upon its victim, and the man whose income is limited should beware of the traps of these wily individuals, for once he falls into the evil he is on the road to degradation and despair.

If the Western Union Telegraph Company succeeds in stamping out this unnecessary evil—and there is no reason to fear that it cannot—it, together with the Postal Telegraph-Cable Company, which has already banished the loan sharks from its offices and released its employes from this degrading form of slavery, will have benefited its employes to an extent that cannot be measured by the money involved.

Something for Nothing at Last.—A man in New York has invented a machine that fairly imbibes power from the air and runs itself. He claims that he can get from one to 1,000 horsepower from the machine. It requires no fuel or water, only oil. A child, he says, can stop it at will. All you have to do is to start it, then it goes on robbing the air of its power, and when you have had enough power you simply stop the machine. All this is so clear that it is really a wonder that no one has ever stumbled over the idea before. For those who are yet skeptical we will quote the inventor's own technical description. "It is an electric air-power, it takes a dynamo and motor and fan and driving wheel. * * * The flywheel runs the dynamo and the motor runs the fan and the fan runs the driving wheel and the more power you want the less power it takes to run the driving wheel."

Old-Time Telegraphers at Atlantic City.—The Old-Time Telegraphers and Historical Association and the Society of the United States Military Telegraph Corps will hold their annual reunion at Atlantic City, N. J., September 5, 6 and 7, with headquarters at the Marlborough-Blenheim. There will probably be an unusually large attendance of members and their families. Mr. G. W. Deetz, manager of the Western Union Telegraph office at Atlantic City is a member of the executive committee and has charge of many of the arrangements for the reunion. Col. W. B. Wilson, Holmesburg, Pa., is president of both Associations and Mr. F. J. Scherrer, 30 Church Street, New York, is secretary of the Old-Time Telegraphers and Historical Association. Mr. David Homer Bates, 658 Broadway, New York, is secretary of the Society of the United States Military Telegraph Corps. Any of the gentlemen named will be glad to supply additional information regarding the the coming reunion.

Mr. Thomas A. Edison thought he had discovered an actual case of perpetual motion, in his suit against the Atlantic and Pacific Telegraph Company, Jay Gould, et. al., involving a settlement for his quadruplex patents. The case was before the courts 35 years and was recently thrown out by the Court of Appeals. All of the original litigants are dead, except Mr. Edison, and he for many years was not even interested in the matter.

Delayed Telegram Case.—The Georgia Court of Appeals holds a telegraph company responsible for the loss of a woman's eye through a delayed telegram. It was claimed that if the telegram had not been delayed the physician could have given the case more prompt attention and saved the eye.

Prompt Transmission of Telegrams.—The United States Supreme Court has upheld as constitutional the statute of the State of Virginia prescribing a penalty upon telegraph companies for failure to transmit promptly messages filed with them.

How the Public Benefits by Joint Telegraph and Telephone Service.

Some time ago it was announced that the Western Union Telegraph Company and the American Telephone and Telegraph Company had entered into an operating agreement, says the *Wisconsin Telephone News*, which would result in the co-operation of the two companies for the joint use of facilities, such as pole lines, exchange of wires in cases of emergency, closer relations in having to do with the sending and delivering of telegrams by telephone and, generally, to bring the two great wire using companies closer together for their mutual benefit and for the benefit of the public.

It has been the commonly accepted notion that the telephone and telegraph were competitors. While this is in a sense true, it is a fact, nevertheless, that they perform separate functions, and that their service, in the strictest sense, is not competitive, as it is not possible to do the same things by telephone that it is by telegraph, and vice versa.

For instance, a telegram does not involve both people being at the end of the wire and is a recorded message. A telephone requires that both parties be on the line and no record of the message is made. Therefore, the telephone can be used under conditions where the telegram is absolutely impracticable and, likewise, the telegram can be used when it is out of the question to use the telephone lines. A telegram is delivered, but there is no such service performed in connection with the telephone. It is evident, therefore, that the services are not similar, but they may be used together to the great advantage of the public if both organizations are co-operating for that purpose. For instance, the telephone is the natural messenger at either end of the line; with proper co-operation in the matter of operating methods, assistance each to the other, etc., the message carrying company and the message company completes the arrangement to the maximum advantage of the public so far as the transmission and delivery of the message is concerned.

Because of the size of these two great companies this operating agreement was looked upon with suspicion, perhaps, by the general public, who, feeling that they were naturally competitive, the competition being wiped out might result in advantage to the companies themselves but without advantage to the public.

The companies themselves, however, made this arrangement with only one end in view, and that was the ultimate advantage of the public, and that not a small advantage, but a great one. To be sure, some advantage no doubt was assumed to accrue to the companies themselves, but if there is any such advantage, surely it cannot be begrudged them if great advantages come to the public.

Let us consider the results of this telephone-telegraph arrangement.

Both companies use poles which are serviceable alike to each; both companies use wires which, generally, are serviceable alike to each. The wires of both companies are attached to the poles in practically the same manner. Much territory is reached, or will be reached, by both companies.

Now let us assume that instead of two pole lines serving the purposes of both companies in the territory reached by both, one pole line will largely serve the purposes of both companies, reducing the investment in the pole lines to the extent that duplication is done away with, the investment in pole lines being reduced for both companies, the result, finally will be reduced rates, if rates prove to be too high, considering the saving investment, or in the maintenance of present rates or lower rates than would be possible with the higher investment.

It may occur that the telegraph wires are out of service because of storms, fires, etc., and instead of remaining out of service and delaying the business of the public, the co-operation of the companies bring into use for the telegraph company the wires of the telephone company, or vice versa. Then the public receives, as nearly as possible, a continuous telephone and telegraph service.

All this was intended by both companies when the arrangement was made, and today is effective, and the telegraph wires are coming into play for telephone purposes when telephone wires are out of service, and telephone wires are constantly being turned over for the use of the telegraph company when telegraph wires are in trouble.

All over the country the telephone company, with its many extensions to small points, and with its connections with companies operating in rural neighborhoods, reaches a very large territory not reached by telegraph lines, and that by co-operation between the telephone and telegraph company, telephone users at these points have easier access to telegraph lines and that they can send their message and pay their bills at telephone points without the same being questioned by telegraph offices miles away. This results in bringing the telegraph facilities to thousands of communities which otherwise could not avail themselves of telegraph facilities.

This arrangement actually is effective between the telephone and telegraph company, and the public now is receiving the benefits thereof.

Let us assume that a telephone subscriber desires to send a telegram and does not wish to personally deliver it to the sending telegraph office and has not sufficient time to call a messenger. In the past, if he telephoned his message to the telegraph office, the telegraph company, probably, would not care to extend him credit, first, because it does not know him, and secondly, because of the expense in making the collection for the messages, which, in a majority of instances, would nearly equal the charge for the telegram. It was necessary, therefore, for him to deliver the message personally to the telegraph office or call a messenger.

The present arrangement between the telephone and telegraph company contemplates that any telephone subscriber shall have credit with the telegraph company until he has proven that he is unworthy thereof. He may, therefore, step to his telephone, and because of the co-operation between the two

Digitized by Google

companies, simply say, "Telegram" to the telephone operator, and be connected with the telegraph office, which takes his message, transmits it prepaid to any part of the world and charges the cost of the message against him as a telephone subscriber, the charge being collected by the telephone company without inconvenience to the subscriber. This, certainly, is a great benefit to the public, and makes every subscriber's telephone a telegraph station as well.

A traveler may determine that he wishes to send a telegram, perhaps while he is walking on the street. In the past it has been necessary for him to seek a telegraph office to place his telegram. With the co-operation of the telephone and telegraph company he may now step into any public telephone pay station, and if the same has an automatic coin collector, can call the telegraph company, place his telegram, and collection for the same will be made by the telephone operator in the same manner as she would collect for a telephone message.

A traveler may determine that he will place a telephone call for some distant point. He does so with the attendant at some public telephone station. He learns that his party is out, and then determines that he will use the telegraph. In the past it was necessary that he seek a telegraph office, which might have been many blocks away. Under the new arrangement between the telephone and telegraph company he may now place his telegraph message with the telephone operator, who will either permit him to write it on a blank and leave it with her to be taken care of by herself, as a joint employe of the telephone and telegraph company, or he may telephone the message to the telegraph office himself and pay the telegraph charge therefor to the telephone operator.

There are hundreds of points throughout the country that are reached by telephone and telegraph lines, and while the nature of the business makes it necessary that the telephone office remain open twenty-four hours in the day, the telegraph service at night is so light that the telegraph company cannot afford to keep its office open. This leaves all of such communities without telegraph service at night, either for incoming or outgoing telegrams. Telegraph charges to long-haul points are ordinarily lower than telephone charges. The night message is one ordinarily of great importance, and circumstances are oftentimes such that it is impossible to telephone as the two parties cannot be gotten together on the line. The telegraph service, therefore, is especially valuable to these communities at night.

In the past it was possible for people in these communities to have placed their calls for the telegraph office to the nearest open telegraph office in some other city, if they knew where that office was and were certain that the telegraph company at that point would accept their message and bill them for it, a thing rather unusual and impracticable except in the case of the very occasional party who might be well known by the telegraph company; but if such calling party were successful in placing their telegram, they would have been obliged to pay the telephone charge from their city to the city in which the open telegraph office was located and the telegraph charge from that point on. This meant an increase in the telegraph charge by the amount of the telephone message, and this charge, together with the difficulties in working out the arrangement, made telegraphing from all such points impracticable, if not impossible.

The present arrangement between the telephone company and the telegraph company means that all such points where there are both telegraph and telephone offices one may, at any time, day or night, when the telegraph office is closed say only "Telegram" to the telephone operator and be connected immediately with the nearest telegraph office wherever that may be, place his telegram, have the same charged to his telephone station, and the rate paid by him is only the regular telegraph rate from the point at which he telephones—no charge being made him for the telephone message, that charge being paid to the telephone company out of the telegraph rate. This means, at all such points, an actual reduction in cost to parties sending telegrams at hours when the telegraph office is closed.

For instance, at New London, Wis., the telegraph office is closed at night. The regular night telegraph office for that district is Oshkosh. The telephone rate from New London to Oshkosh is twenty cents, and the telegraph rate from Oshkosh to New York is sixty cents. In the past if a party desired to telegraph during the time that the telegraph office was closed at New London he would have been obliged to call Oshkosh and pay twenty cents for his telephone message to that point, and his message would have been sent from Oshkosh to New York at a charge of sixty cents, paying a total of eighty cents to get the telegram transmitted.

Under the new arrangement, he pays only the regular telegraph rate from New London to New York, which is sixty cents. His cost, therefore, is reduced twenty cents.

The public, under the new arrangement, may feel that at all times, day or night, it is in touch with a telegraph office and need not worry where it may be. A patron has only to say "Telegram" to the telephone operator and she does the rest. The patron need not consider the cost of the telephone message in connection with the transaction, as the patron pays only the regular telegraph rate; the same rate he would be obliged to pay if he went to the telegraph office in his own city and filed the message there.

In this day and time, when innovations and inventions are developed and commercialized before one knows what is being done, it is easy for us to accept as the ordinary the most wonderful and extraordinary advantages. It may be, therefore, that this great service now provided by the co-operation of the American Telephone and Telegraph Company and the Western Union Telegraph Company will be accepted as such, but when one considers that by the means of these two great services they are given the fullest measure of advantage of

Digitized by Google

both by using either one, and this with a reduction rather than an added cost, it would seem that the man at the head of these two great enterprises. Mr. Theo. N. Vail, should be counted as one of the few great men of the times, and a master in the development and operation of a public utility business, and that the whole transaction should serve as a lesson that, contrary to the commonly accepted belief, combinations of this sort can be made to the great advantage of the public, and that the same should be encouraged and, especially, that this arrangement should receive the applause and commendation of all individuals and bodies politic.

If there is the slightest suspicion that any advantage to be gained might be made to satisfy only the selfish aims of the two concerns, this should be put at rest by the results already attained; but if still there should be those who fear the future results, they certainly cannot question the possibility for advantage to the public, and with the great national regulating body, in the shape of the Interstate Commerce Commission, now watching over the public interests, they may be certain of their rights being protected. With that knowledge the public should applaud the enterprise of these two great concerns which, without force or compulsion, and of their own free will, did away with the barrier separating the two and have not only given the public the benefits thereof, but by reason of the combination have practically forced these benefits upon the people.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works of telegraphy and treat them in the same manner.]

CHAPTER LI.

What is the effect of wet weather on telegraph lines?

What is the cause of these effects?

Why do relays distant from the source of current supply receive less than normal current?

What is the first principle to be observed in adjusting the relay?

How should the adjusting be done?

Why should the relay spring not be stretched to excess?

How should the strong magnetic pull of the magnets be taken care of by the armature and spring?

In wet weather why is it difficult and sometimes impossible to break the operator at or near the battery station?

How can the operator at the home station or a nearby station avoid this difficulty?

What should be done to make a sounder produce a louder noise?

Is it advisable to give the sounder lever wider play in order to get more sound out of the instrument?

What is the effect on the signals of giving the lever wider play? Describe the action of the lever under such circumstances.

What rule should be observed in adjusting the lever for different speeds of operation?

What is the method for adjusting for maximum strength?

When signals "drop out" what is the usual cause of the defect?

If a loose connection is the suspected cause, what is the proper procedure to locate the trouble?

How is the local circuit tested for trouble of this character?

Name other causes of trouble of this kind.

When a sounder stands "open" by what means can it be ascertained if the trouble is in any of the relay connections?

Under what conditions should the "knife blade" test not be made?

Why is it not possible to send at high speed on a line containing many offices, especially if they are close together?

Where speed is required how should the sounder lever be adjusted?

Why is it important to exercise great care in the adjustment of multiplex apparatus?

If sending is heavy or light at a repeater is it possible for the receiving operator to compensate the defect?

Finding a Man by Telephone.

A remarkable story of the use of the telephone to locate a man whose whereabouts were unknown was related by Mr. George K. Gann, of Lincoln, Neb., at a recent telephone convention in Chicago. A woman called up the Lincoln exchange one day in great excitement, and after some difficulty it was found that she was the wife of a traveling man who had left home a day or two before on one of his trips. The wife had just discovered that a bottle of laudanum was missing from the medicine closet, and as her husband was taking cough medicine from a bottle of similar shape, which had been left behind, she was greatly alarmed realizing that her husband had taken the poison with him by mistake. She rushed to the telephone at once to call up her husband in some way and tell him of his mistake, but she was unable to tell the operator where her husband might be located; she did not even know what state he might be in. The telephone company called up the employer and obtained a list of about twenty towns in one of which it might be possible to locate the man wanted. These places were called up in succession, and after three or four attempts the traveling man was located. In a few minutes a happy though excited woman was talking to a surprised husband. After the latter had succeeded in convincing the anxious wife that he was really alive he told her that he had noticed his mistake shortly after he left home.

A New Primary Battery.

Messrs. T. Pichinot and L. Fischer, of Reinbek, near Hamburg, Germany, have recently placed on the market a new primary cell which seems to possess some distinct advantages over most of the older types, says *Zeitschrift für Elektrotechnik und Maschinenbau.* The negative plate is of zinc, and the positive is composed of some lignitic material, which is apparently pressed when in a plastic state into rectangularly formed plates. Each cell contains several separate lignite plates and two large zinc plates. The electrolyte is not specified.

It is claimed that the internal resistance of the cell is very small, and, moreover, that the resistance does not appreciably increase even after long periods of work. The salts which are formed by the action of the electrolyte are not deposited on the plates, but are dissolved by the electrolyte itself. The e. m. f. of the cell is about 1.4 volts, and this voltage is maintained until the cell is completely exhausted. The zinc consumption is said to be extremely small. Another good point is that there are no soldered connections, so that one fruitful source of trouble is thus avoided. The cells are made up in batteries suitable for lighting small rooms. These batteries give a pressure of 10 volts, and have a capacity of 160 ampere-hours. The cell is called the Niewarda-Element.

Life of Primary Batteries.

In a paper read by Mr J. G. Lucas at a meeting of the Institution of Postoffice Engineers, London, the author gave the results of some investigations carried out in connection with the ordinary types of signaling batteries used by the British Post Office and other telephone administrations. Referring first to the porous-pot Leclanché type of cell, text-books were, the author stated, very much out of date on this question and pointed out that modern telephone requirements could be met much more economically by modifying the sub-division of the manganese dioxide and carbon in the porous pots. In the case of even such small current discharge rates as forty milliamperes the result of the modifications was to decrease the total working costs considerably, while at discharge rates higher than forty milliamperes the decrease in costs was much greater. The agglomerate form of Leclanché battery was an expensive type, and the possible advantages which might be derived from its use were not, he considered, commensurate with this expense.

Investigations with dry cells as at present designed went to show that the chief difficulties and expense lay in the fact that for discharges which must necessarily be spread over several months full use could not be made of the chemical energy contained in the materials used in these cells owing to the sudden rise, after a time, in the internal resistance. The behavior of experimental cells indicated that the difficulties were not insuperable.

The free ammonia gas evolved from Leclanché cells has been found to seriously affect the metal work of telephones and to act deleteriously upon secondary cells. To overcome this objection experiments had been conducted with an electrolyte of manganese chloride instead of the usual ammonium-chloride solution with satisfactory results. The author pointed out the practicability of sealing up the battery compartments in connection with cells charged with manganese-chloride solutions and the consequent reduction in loss by evaporation as compared with ammonium chloride.

Telegraph, Telephone and Cable Directory.

If you wish a complete and accurate directory of the telegraphs, the Bell telephones, the wireless telegraphs, the names and addresses of all the superintendents of telegraph of all the railroads in this country, the names of the superintendents of fire alarm and police telegraphs, send us twenty-five cents and receive a copy of our January 1 directory number of Telegraph and Telephone Age. This is a ninety-two page paper containing interesting information including the names and addresses of the managers of several hundred Western Union and Postal Telegraph-Cable Company offices in the principal cities in the United States and all of the officials and managers of the Great North Western Telegraph Company and the Canadian Pacific Railway Company's Telegraphs in Canada. This issue also contains full page engravings of the new president and the retiring president of the Western Union Telegraph Company, Mr. Theo. N. Vail and Colonel Robert C. Clowry, respectively.

Another feature of practical importance in this issue is the article giving the standard electrical notation and the definitions of electrical terms now in general use.

The Morse and continental alphabets used by the telegraph, cable and wireless companies throughout the world are also shown. Full statistics and names of officers and offices of the Signal Corps of the United States Army in Alaska and elsewhere are also given.

In addition to all of this valuable and interesting matter is an index of the contents of the twenty-four issues of Telegraph and Telephone Age for 1910.

The price of this issue, twenty-five cents, does not begin to represent the true value of this paper. Many firms who obtained one copy have purchased several additional copies for the use of the heads of various departments and their traveling salesman. Send 25 cents in one or two-cent stamps to J. B. Taltavall, publisher, 253 Broadway, New York.

Mr. A. C. Cronkhite, district commercial superintendent of the Western Union Telegraph Company, Indianapolis, Ind., writes: "I wish to thank you for the renewal in advance of my subscription, as I would dislike very much to miss a single issue of your valuable paper."

How Wireless Messages Are Sent from Vessels in Distress at Sea.

The question, "What is the character of wireless messages sent out from vessels in distress at sea, and how are they handled?" is one that naturally comes to mind in connection with events of this nature.

A contemporary publishes the wireless-distress call sent out from the steamer *Queen*, which was discovered to be on fire while on her way from San Francisco to Seattle, Wash., last January, and the resulting correspondence with other vessels. Mr. Arch Macdonald, the wireless operator recorded the calls and messages as follows:

"SOS. SOS. SOS. On fire ten miles north of Point Reyes." Signed "Queen" (GX)."

The government station at Mare Island (NPH) answered and asked her position again.

"SOS. SOS. SOS. Send us some help. We are afire in forward hold. GX."

Six stations answered this call. GX answered, "Don't all answer at once. I won't be able to read anybody. GX."

Hillcrest, the 15 k. w. station at San Francisco (PH), answered "Have 'phoned your message to Malorin (chief operator of United Wireless Company)."

"Is any ship near us? GX."

PH called the steamer President (GW), and said, "Queen afire. Go to her help! PH."

"Get orders and we'll proceed. GW."

GX then gave GW her position and said, "Hurry for all you are worth. Fire gaining. GX."

At 6.25 p. m. GW asked, "Is it blowing much?"

"A small-size gale is blowing. GX."

"Are the passengers in danger? PH."

"No. We have them all out in library and social hall. GX."

At this time the operator on the steamer Norwood (SG) came on duty and asked "What is the trouble?"

"Do you know we are afire? GX."

"Tell your captain quickly, we are afire ten miles north of Point Reyes. GX."

GW now called the steamer City of Pueblo (GQ), and said, "Keep sharp lookout for the Queen. She's afire above Point Reyes. GW."

"Will come to your aid right away. SG."

"How badly are you off? SG."

"Don't know. But bad enough. GX."

"Will we have to take passengers off? SG."

"No. The President will be here at eight o'clock, but you can help us, I guess. GX."

"Am leaving to assist," said the revenue cutter "McCullough" (RCH).

"Wire full particulars as to what is being done. Is fire under control? PH."

"The fire started in the forward hold among the oil cans. We are getting it under control. GX."

All this time GW had been fighting the gale up the coast, and was near the point given out by GX.

"We are nearly there. Can you see us? GW."

"Wait a minute. I will go outside on deck and look. GX." He then went outside his cabin and looked for the President.

"No, cannot see you yet. GX."

"O. K. Have you got it out yet? Are you under way? GW."

"No. GX."

"GW. Have you sighted GX yet? NPH."

"Not the last time I was on deck. GW."

Ten minutes later. "We are right close onto you now. Am here when you want anything. GW."

"O. K., GW. Wait a moment. GX."

Ten minutes later. "What's the matter? PH."

"Nothing new, about the same. GX."

RCH now called GX. "We are off Point Bonita bound for you, full speed. Please give us your latitude and longitude. Will be up to you in an hour. RCH."

"On my suggestion, could you go to San Francisco? I will follow slowly if conditions are such that we can do so. Have information by wireless that southeast gale is approaching," said Captain Thomas of the President.

At 10:30 p. m. GX said, "Tell Captain Thomas we have fire under control and are going to turn around for San Francisco. GX."

The operator on the *Queen* assured himself that all would be safe. "Will you follow us closely? GX."

"Yes, we will. GW."

"We are trying to make San Francisco now. GX."

"Can we be of any more help? SG."

"Have fire under control now. Many thanks. GX."

In about five minutes came the message, "We are now under way with fire under control. Good-by. GX."

Destruction of Poles by Woodpeckers.

Mr. W. H. Meyer, manager of the Sault Ste. Marie, Mich., office of the Western Union Telegraph Company, writes as follows:

"I have read with considerable interest the articles published recently in your journal in regard to woodpeckers destroying telegraph poles. Several years ago I experienced considerable annoyance from the feathery tribe in picking cherries from cherry trees. I tried the following remedy with success, and I believe it may also be used to frighten away the woodpecker. Into a good size cork were imbedded pieces of a broken mirror and this was hung in the trees, a few feathers being added to give the cork air resistance. The feathers kept the cork in motion and the sun flashes cast back by the pieces of mirror evidently had a disheartening effect on the birds. The device was a decided success as far as its application to cherry trees was concerned, and it certainly had the advantage of being inexpensive."

inches high. This ancient message is interesting in the light of present-day practice, and exhibits some details in form that have been eliminated in modern blanks. The message was loaned to us by Mr. Kite through Mr. R. C. Bliss, manager of the Western Union Telegraph Company at Cincinnati.

The Working Boss.

BY E. C. DODGE, CHICAGO, ILL.

It is possible, with the addition of the proper resistance, to ring a door bell as satisfactorily with a current of five thousand volts as with two volt current, but the installation of a five-thousand volt plant for that purpose would seem the height of folly, yet there are five thousand dollar men doing two dollar work every day.

It is amazing to note the number of high-salaried men who lose sight of the fact that they are cheating their employer by doing a lot of detail work which properly belongs to a fifteen-dollar-a-week clerk. The five-thousand-dollar man who earns his salary is the man who can put his hands in his pocket and, by walking around among his men, with his eyes open and with a clear head, pick up an idea here and there which will save or earn his employer twice his salary every month in the year. It is keeping close to the actual work and observing the methods and talking to the men who are doing the actual work, which makes the money. Even the janitor can often give a pointer which is of value. Many a workman is pegging away in some corner following along an old rut and all the time nursing an idea which would save dollars if he could only get in touch with the powers that be; but his suggestion to the next one above him in authority is generally as far as it gets and he soon settles down with the conclusion, "What's the use?"

The "big fellow" who has his department properly organized has always time to listen and ask questions. It is not necessary for him to interfere in any way with workmen or issue any orders outside of the regular channel, but by divesting himself of all detail work which can be thrown upon the shoulders of his assistants, he is in a better position to observe and plan schemes and methods which will make him of more value to his employer. These are the kind of men big corporations and progressive business firms are looking for and they are ready and willing to pay the price, but they are scarce and hard to find.

Cyclopedia of Telephony and Telegraphy.

The American School of Correspondence, Chicago, has issued a cyclopedia of telephony and telegraphy which covers these branches of the electrical arts in a very complete manner. There are four volumes in the set, and the subjects are treated and presented in such a simple manner that no one can fail to readily absorb the information.

The telephone section of the work covers the installation, maintenance and operation of all types of telephone systems, discusses without prejudice the respective merits of manual and automatic exchanges, and gives special attention to the various "troubles" that are met in actual practice.

The sections relating to telegraphy cover both commercial service and train dispatching; and they include a full treatment of the practical methods of wireless telegraphy. There are chapters on testing and testing instruments, management of storage batteries, telegraph apparatus, repeaters, multiplex telegraphy, wireless telegraphy and wireless telephony.

The use of the telephone in railway service is also thoroughly covered; in fact the work is right up to date in telegraphy and telephony, and covers the latest practice.

The March bulletin of this school gives much information regarding this institution and its work. It includes outlines of the various courses, also synopses of text books used in connection with the studies. The school has a long list of text book writers and instructors, all of them experts in their several lines.

Two Wires on One Lamp.

BY J. B. DILLON, OF DALLAS, TEX.

There has been so much criticism relative to connecting two wires to one lamp at the main switchboard that the writer made some tests with long circuits to determine the soundness of the practice. It is good practice to place two wires on one lamp when they are practically alike as to resistance, etc., and it has been checked by watching the results as indicated on a mil-ammeter.

Fig. 1 shows the usual method of connecting two circuits to one lamp at the switchboard. Line 1 is, say, 200 miles long, of iron wire, with a resistance of 2,800 ohms. It includes 30 relays each with 150 ohms resistance, making the total resistance of the circuit 7,300 ohms. This line with a pressure of 180 volts at each end is represented in Fig. 2. To the main line add the resistance of the two lamps (720 ohms) and we

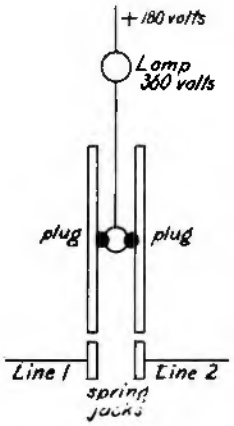

FIG. 1.—METHOD OF CONNECTING TWO LINES TO ONE LAMP AT THE SWITCHBOARD.

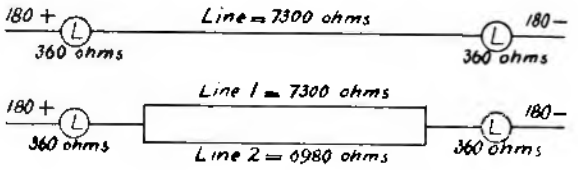
have a grand total of 8,020 ohms. With an e. m. f. of 360 volts the current in the circuit is 44.8 milliamperes.

Line 2 is also of iron, 220 miles long, the total resistance of line, relays and lamps being 7,700 ohms. With the same e. m. f. as before, 360 volts, the current is 46.7 milliamperes.

Fig. 3 shows these two circuits connected to the same lamp. In this case the joint resistance of the two lines must be taken into consideration. This is found to be 3,568 ohms, which, with the resistance of the two lamps added, makes a total of 4,288 ohms. With an e. m. f. of 360 volts as before circuit 1 in Fig. 3 gets a current of 41 milli-amperes as against 44.8 milli-amperes in Fig. 2, while circuit 2 gets 43 milli-amperes as against 46.7 milli-amperes with only one circuit per lamp.

It is evident therefore that by using proper potentials two wires on one lamp is not so inadvisable as many believe it to be. As an example of the ill-effect of not exercising care in the assignment of proper potentials, let us assume a case where circuit X has a resistance of 4,800 ohms and circuit Y 2,400 ohms. Using an e. m. f. of 180 volts at each end, and lamp resistances of 360 ohms, as before, X alone will receive 65 milliamperes and Y alone 115. With both circuits worked jointly with one lamp, X will receive 51 milli-amperes and Y 102, omitting decimals. This circuit, it is needless to say, would not work satisfactorily. The conditions were assumed simply to demonstrate the importance of combining circuits of practically the same resistance, and exercising discretion in placing potentials, it being



FIGS. 2 AND 3.—SINGLE AND TWO LINES CONNECTED TO ONE LANMP.

evident that 90 volts would have been more practical in the present instance in case a smaller potential was not available. The writer believes that the switchboard should be wired so that there will be two lamps for each potential, thereby avoiding the snares and pitfalls for the improper placing of two dissimilar wires on one lamp.

Conference on Electrical Rules Disbanded.—The National Conference on Standard Electrical Rules was formally disbanded at a meeting held in New York on March 24. This body comprised delegates from various national organizations, including the American Institute of Electrical Engineers, International Association of Municipal Electricians, National Electric Light Association, National Electrical Inspectors' Association, and Underwriters' National Electric Association. The last named organization having been consolidated into the National Fire Protection Association so as to bring the work of fire-preventing engineering under one head, and an electrical committee having been established as a part of a working association of national standing which can provide machinery for carrying out its work, the need for the national conference no longer exists. The holding of general meetings of the electrical committee every two years, to which meetings all will be invited to participate in suggestions and discussions, is to be continued as in the past by the National Fire Protection Association.

Mr. B. S. Jenkins, general superintendent Canadian Pacific Railway Company's Telegraph, Winnipeg, Man., in sending in four new subscriptions, writes: "The Age is keeping well abreast of the times in giving prompt information as to developments in the telegraph and telephone fields, and every telegrapher who desires to be up in his profession should be a subscriber."

Reminiscences of an Old-Timer.

Major J. Orton Kerbey, of Washington, D. C., the well known old-time and military telegrapher, and ex-consul to Para, Brazil, in a letter referring to the unveiling of a bronze tablet this month in the Soldiers and Sailors Memorial Building, at Pittsburg, Pa., to commemorate the fiftieth anniversary of the founding of the Military Telegraph Corps, states that he reads Telegraph and Telephone Age with much interest, especially the articles from the military telegraph boys. "I confess," he says, "to being an old-timer who retains pleasant impressions of early days and perhaps entertains a prejudice against the modern doings on the wires." Continuing, Mr. Kerbey says: "I got out of the work about the time that the duplex and quadruplex were being adopted and entertained the opinion then that they would certainly be failures, as I was positive that it was utterly impossible for two currents to pass on the same wire, and in all these years I have never been fully convinced that they really do. I fail to become absorbed in the study of the diagrams printed in the Age, which I think are apt to drive a man a bit daft. Neither do I comprehend the puzzles in geometry and algebra wherein is placed a big O with a -- or an X, etc.

"I adhere to the good old magnet with its abundant coil of fine copper wire covered with green thread which magically vibrated the armature and which we 'adjusted' for escape or grounds by a rubber spring. Those were the good old days when we tried the duplex on a single wire by fighting the fellow at the other end for circuit. Perhaps it was that species of contest that developed the duplex. I know of fine operators who could pound the key with their fists for an indefinite length of time.

"Those were halcyon days in Mr. Carnegie's office when the boys, David Homer Bates, Sam Brown, Bennie Flack and Dode Moreland, had to take turns cleaning the battery which was of the old Grove pattern of zinc and porous cup and potash. There was not only danger from the burning acid but as the cups were not well insulated, one working near the battery was liable to get severe shocks that would cause him to spill the acid and get stains on his clothing and body. All the boys had stains on their fingers of a yellowish tint, which was an advantage in one respect.

"In those days to be an 'operator' was a coveted distinction. The boy with stained fingers and spotted clothes was looked upon as something to be envied. He had free admission to the theatres and circus and other places where the ordinary boy did not have access to. It was only necessary to show his stained hands to identify him as a 'telegraft operator.'

Another means of proving an operator's identity was the copper wire shoe strings. I ought to know about these things as I was one of the earlier cubs at the famous '2' office when Andrew Carnegie was division operator and secretary to Col. Thomas A. Scott, superintendent of the Pittsburg Division of the Pennsylvania Railroad, and had to do my stunt cleaning zincs with a brush. When Col. Scott was advanced to be general superintendent and moved to Altoona, I was made division operator to succeed Mr. Carnegie, when only 17 years of age. I was tempted to join the Western Union force of three men in the Pittsburg office by an offer of an advance in salary, which I declined.

"The year preceding the war was spent in the South, principally in Texas, but I was obliged to leave on acount of some boyish talk in favor of the North. On my return I went to Washington and from this date the story of my experiences as an operator in the war is told in the book, 'The Boy Spy.'

"The fiftieth anniversary of the founding of the Military Telegraph Corps to be marked by the unveiling of a bronze tablet in the Soldiers and Sailors Memorial Hall at Pittsburg, will be an interesting event for all concerned. Though I had planned to sail for Brazil and the Amazon in April I have postponed the date of sailing until May, in order that I may attend the unveiling.

"You know of my consistent telegraph record in subsequent years as an operator at Pittsburg and in the oil regions, becoming manager and superintendent of the Atlantic and Pacific Telegraph Company in my home town, Pittsburg. I performed some work for the press service during the riots that resulted in my transfer to Washington where I worked a special code wire at night to Chicago. During the day I was Associated Press operator in the Senate gallery. I was then appointed U. S. Consul to Para by Secretary James G. Blaine, because I was a telegrapher whom he thought would be able to investigate the rubber industry, rubber being necessary for insulation in this electric age. Secretary Blaine was a far-seeing statesman, but not even he could foresee the wonderful development of the rubber interests for bicycle and automobile tires.

"I have been 'rubbering' ever since, having succeeded in publishing two books, 'Land of To-morrow' and 'An American Consul in Amazonia,' dealing with cable and wireless in the Andes and detailing social life in the land of eternal sunshine and occasional hurricanes. The latter book is now on the press."

New Telegraph Company Incorporated.—The Metropolitan Telegraph Company has been incorporated at Wilmington, Del., with a capital stock of $100.000. The incorporators are Messrs. W. J. Maloney, M. C. Taylor and W. N. Akers.

Mr. George M. Myers, one of the foremost citizens of Kansas City, Mo., an old time telegrapher and president of the Mutual Pacific Telegraph Company, which sold out to the Postal Telegraph-Cable Company many years ago, in renewing his subscription has this to say: "It is always a great pleasure for me to forward my annual subscription to you. I read the Age with more interest than I do any other journal I receive."

Multiplex Telegraphy.

BY S. R. BEATTY, NEW YORK.

If we picture a multiplex telegraph circuit as a condenser into which a current flows until it is charged, the flow of current being maximum at the instant the e. m. f. is applied, the condenser acts as though it had acquired a counter e. m. f. which is the equal to and the opposite of the impressed e. m. f., this counter e. m. f. being at maximum when the impressed e. m. f. is at zero, or when the pole-changer is midway between the two power terminals. The discharge of the condenser (or the main and artificial lines) occurs at this instant through the spark condenser, thereby partially eliminating the spark The condenser has no effect whatever upon the electstatic capacity of the line, as it still requires the same value of electricity to raise its potential to unity. To go more into detail would make this article very lengthy. The foregoing, however, should make the action of the spark condenser quite clear.

A few words upon the electrostatic capacity of the line might not be amiss. The ideal telegraph circuit is one which charges and discharges very rapidly, this action depending upon the condenser action of the circuit, or the electrostatic capacity of the line which is measured by the quantity of electricity with which it must be charged in order to raise its electric potential from zero to unity. This condition of the circuit is of the first importance, yet there seems to be very little known concerning it so far as its effects can be determined and calculated; and the same appears to be true regarding self-induction. In fact, so far as the circuit as a whole is concerned, the ohmic resistance is the only factor which is known. Occasionally we read about the K R of the circuit, but what does that teach us about the reactances due to capacity and self-induction? Absolutely nothing. This, it would seem, is due largely to the fact of working from a theoretical basis formulated 40 years ago, when alternating currents were unknown as such. These theories are apparently considered the *ne plus ultra*, so far as multiplex circuits are concerned. A multiplex telegraph circuit is nothing more nor less than an alternating current power transmission circuit and should be studied from that viewpoint. When this is done, the problems which have confronted telegraph companies for several years and of which expert advice does not appear to have reached a solution, will be solved and not before.

As an illustration of how little is known concerning the reactances of a multiplex circuit, a recent article in Telegraph and Telephone Age in describing the effect on the neutral side of a quadruplex, when the polar side was being operated at speeds varying from fifteen to sixty words per minute, pointed out that as the speed increased the efficiency of the neutral side decreased until at sixty words per minute it had dropped to zero. The entire blame was placed upon the sending machine without any explanation as to why the high speed affected the neutral side in such a manner, except that it was due to "the high speed of dot reversals." What about the increased impedance of the circuit, this impedance increasing as the speed increased, and the value of the current dropped in consequence until it was not sufficient to properly energize the neutral relay. The value of current flowing in the line (when it does flow) is the same at all points. There is no such condition as different values at different portions of the line at the same time. This theory suggests induced currents, and is not only untenable, but does not occur in actual practice. If it should occur the effect on the signals is well known. While there is more or less inductive action between parallel circuits, the resistance is so high and the current so small, that the number of lines of force are relatively small, so much so that their effect is negligible in practice. (I am now referring to the inductive action between parallel telegraph conductors.) In connection with speed of circuits considerable is being said about the inertia of the relay armature, which is more often the effect of an unsuspected cause.

Poles, Cross Arms and Pins Purchased in 1909.

In a bulletin issued by the United States Department of Agriculture, Forest Service, dated March 10, it is shown that 2,916,005 poles were purchased by telephone and telegraph companies during the year 1909, at a cost of $4,081,251 at the point of purchase. The average cost of these poles was $1.40 per pole. Twelve and a half per cent. of the poles purchased were treated with preservatives.

Telephone and telegraph companies purchased 2,064,451 cross arms during the same period at a cost of $790,284, an average cost of 38 cents each. These companies also purchased 13,900,077 insulator pins at a cost of $161,760, an average of twelve-thousandths of a cent per pin.

In this connection it is interesting to point out that the pole problem is not by any means a new one. In a report to the president of the Erie Railroad, dated August 1, 1857, Mr. L. G. Tillotson, then superintendent of telegraph of that railroad, referring to that company's telegraph line, says: "In the original construction of the line but little attention, apparently, was given to the selection of the poles, in consequence of which large numbers are rotting, and we have been and shall be obliged to replace them, although the line was built hardly seven years since. The poles which we now purchase are of chestnut, with the bark peeled off and will last for fifteen years."

Bids Invited for Cable.—Proposals will be received until 11:30 a. m., April 18, by Captain A. S. Cowan, disbursing officer, Signal Corps, U. S. A., Washington, D. C., for 175 miles of single conductor intermediate cable, to be made in two lengths of 57 miles each, and one length of 55 miles This cable is to be consigned to the Philippine Islands.

Telegraph and Telephone Age is the oldest and most ably-conducted telegraph journal in America and should be read by every one engaged in telegraphy. Subscription price, $2 per year.

Postal Company's Dynamo Quadruplex.

BY JOHN F. SKIRROW, ASSOCIATE ELECTRICAL ENGINEER, POSTAL TELEGRAPH-CABLE COMPANY, NEW YORK.

The accompanying illustration shows the main line circuits of the Postal Telegraph-Cable Company's dynamo quadruplex with the Field key system.

It will be noted that the transmitter and pole-changer are of the relay type, these instruments being in effect regular relays with back and front contacts. The sounders and keys are operated in series with these relay transmitters, the sounders being placed in resonators so located that the transmitting operator can comfortably listen to his own transmission. The Postal engineering department disociated the transmitting and sounding functions of these instruments many years ago. This separation permits the independent adjustment of the transmitting points and the sounder, so that the operator may have an adjustment of the sounder to suit without in any way interfering with the proper adjustment of the transmitting points, an arrangement impossible with the walking-beam and similar types of transmitters. The improvement in the quality of the signals following this change was marked. Placing a resonator so that the transmitting operator can comfortably follow his own sending also results in improved transmission.

On the receiving sides the sounder is brought close to the operator's ear by an extension-arm resonator, enabling him to hear the signals distinctly regardless of extraneous noise. These features have been Postal standard practice for the past ten years and have been widely copied.

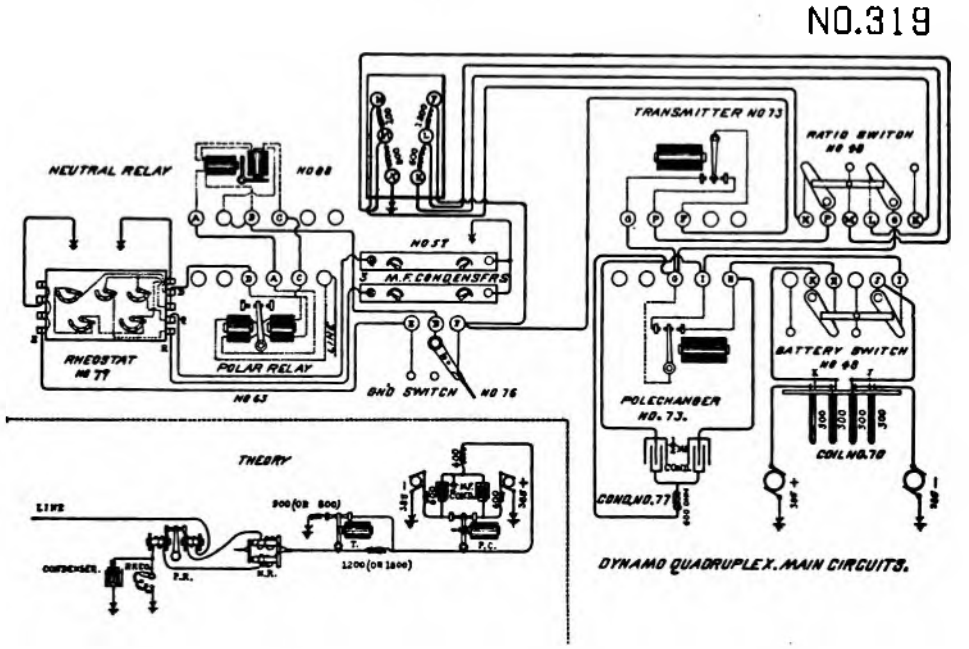

DIAGRAM OF CONNECTIONS OF POSTAL COMPANY'S DYNAMO QUADRUPLEX

Mercadier Multiplex Telegraph.—The multiplex telegraph system of Mercadier depends upon the transmission of signals by currents of differing frequencies upon a single circuit, the respective signals being sorted out at the receiving end by suitably resonant apparatus. Successful experiments were made in 1907 and 1908 with heavy metallic circuits, the Hughes apparatus being operated thus between Paris and Havre and Marseilles. Later the inventors, Messrs. Mercadier and Maguna, succeeded in working between Paris and Lyons on a single ordinary telegraph wire with earth return, three alternating current and one direct current Hughes apparatus being thus operated; and the direct current Hughes was ultimately replaced by a Baudot quadruple with complete success. Taking the capacity of the Baudot as 1,550 words per hour, and that of the Hughes as 1,800 words, the total capacity of the line was thus 17,000 words per hour. The Academy of Sciences, in recognition of the economy of line thus effected, has awarded to Mr. Maguna the Kastner-Boursault prize and the Berthelot medal.—*Journal Télégraphique.*

Hypnotism by Telegraph.—An operator by the name of Fernando Loutzenheiser recently put three young men at Canton, Ohio, to sleep by hypnotic influence transmitted by telegraph from Pittsburg, Pa. After keeping them under his influence for twenty-four hours, he awakened them by the same means. The affair was conducted with dramatic accompaniments, the three subjects taking their 24-hour nap in a show window in Canton in full view of crowds of people.

Dinner of the Morse Electric Club.

The annual dinner of the Morse Electric Club of New York was held at the Hotel Savoy, on the evening of April 6, and it was without question the most enjoyable and successful affair ever held by that organization. Many of the most prominent officials of the American Telephone and Telegraph Company and of the Western Union Telegraph Company were present as members or guests of the club. Unfortunately the chief guest of the evening, Mr. Theo. N. Vail, president of the two companies named, was absent, having sailed for Europe a few days previously on urgent business. Everyone present deeply regretted his absence, feeling that if Mr. Vail could have witnessed the splendid gathering in his honor it would have established the utmost cordial relations between the head of the two great corporations and their employes as represented on this occasion. Mr. Vail was undoubtedly unknown personally to many of those present and all would have been happy to have met him, and no doubt Mr. Vail himself would have been delighted to have seen and met under these social circumstances the kind of men that do the actual work for the companies of which he is the head.

Everything passed off most delightfully. The elegant banquet room was brilliantly lighted, and enjoyment and good fellowship prevailed in abundance. The dais on which the guests of the club were seated was tastefully decorated, a large bed of roses at the centre forming a conspicuous feature.

Mr. J. B. Van Every, president of the club, made an excellent toastmaster, and conducted the exercises with great tact and skill. Seated with him on the dais, as guests of the club, were Col. R. C. Clowry, former president of the Western Union Telegraph Company, at his right, and Mr. Newcomb Carlton, vice-president of the Western Union Telegraph Company, at his left; Mr. Union N. Bethell, vice-president of the American Telephone and Telegraph Company, and president of the New York Telephone Company; Mr. N. C. Kingsbury, vice-president of the American Telephone and Telegraph Company; Mr. J. J. Carty, chief engineer of the American Telephone and Telegraph Company; Mr. W. H. Baker, vice-president of the American District Telegraph Company of New Jersey; Mr. G. W. E. Atkins, vice-president of the Western Union Telegraph Company; Mr. W. J. Dealy, general superintendent Commercial News Department, Western Union Telegraph Company; Mr. E. T. Jeffery, president Denver and Rio Grande Railroad Company; Mr. C. H. Wilson, general superintendent American Telephone and Telegraph Company; Mr. Henry A. Bishop, director and member of the Executive Committee of the Western Union Telegraph Company, and Mr. Job E. Hedges.

The hotel's chef provided a delicious menu which was greatly enjoyed. During the dinner an orchestra and vocalist rendered an excellent programme of music and song which aided very materially in the enjoyment of the affair.

At the conclusion of the dinner, and before the speaking began, an intermission of ten minutes was arranged, giving an opportunity to the members to indulge in social intercourse and renewal of old acquaintance.

Mr. Van Every prior to calling upon the speakers read a letter of regret from Mr. Theo. N. Vail, as follows:

"Dear Mr. Van Every: I cannot express to you my regret at my inability to be present at your dinner in consequence of an enforced absence that could not be postponed.

"I had looked forward with much anticipation to meeting again so many of the old Morse men that I knew, and meeting with many known to me in every way except personally.

"It is the younger of these men that the great development and the widening of the wire service begun by Morse will be dependent upon. In point of development measured by possibilities, or even probabilities, it is younger than the youngest of them.

"But while all these serious things must not be lost sight of I trust that the evening of the dinner will be given to that other side where wholesome frivolity and enjoyment will drive out everything except a large sense of enjoyment and that all of you will be able to look back on this evening as one of the best they have ever enjoyed.

"With my hearty good wishes and sincere regards to your other guests, I am,

"Most cordially yours,

(Signed) THEO. N. VAIL.

"P. S.—I shall be with you in thought and give you all a good toast even though absent."

The first speaker called upon was Mr. W. J. Dealy, who spoke most eloquently of the great inventor after whom the club was named. He described most graphically and interestingly the public testimonial tendered to Professor Morse at the Academy of Music, New York, in 1871.

At the conclusion of Mr. Dealy's remarks the chairman asked if any were present who attended the Morse farewell reception in 1871, if so to rise, and the following named gentlemen stood up in answer to the request: Mr. J. B. Van Every, Mr. A. R. Brewer, Mr. W. J. Dealy, Mr. E. P. Griffith, Mr. P. J. Casey, Mr. M. H. Kerner and Mr. T. M. Brennan.

Col. Robert C. Clowry was the next speaker called upon. He said that it gave him very great pleasure to be present to meet so many old friends and comrades with whom he had been so closely and intimately associated for so many years. Having occupied every position in the telegraph service from the lowest to the highest he had formed a large acquaintance with telegraph people, and the more he saw of them the better he liked them. The telegraph office, he said, was an excellent school for the training of business men. It is estimated, he stated, that 70 per cent. of the leading railroad presidents and general managers of this country graduated from telegraph offices, and a large number of other business men handled the telegraph key in their youth. He knew

Digitized by Google

of no other large corporations that could point with more pride to the intelligence and efficiency of their employes than the telegraph companies. He expected to have the pleasure of assisting in welcoming the guest of honor, Mr. Theo. N. Vail, who unfortunately was called away suddenly to meet a business engagement on the other side of the Atlantic. With Mr. Vail, he said, it is always "business before pleasure." In conclusion he asked all to rise and join him in drinking the health of Mr. Vail.

Mr. Newcomb Carlton followed Col. Clowry. As he was comparatively a newcomer in the telegraph field he said he felt that he could not yet say much about it. He had, however, never met a more loyal, earnest and faithful lot of men than he has found in the telegraph service. Mr. Carlton is the active vice-president of the Western Union Telegraph Company and his remarks were received with much favor. He made a deep impression upon those present by the candor, force and directness of his statements, and his hearers evidently felt that they already knew the man, and heartily welcomed him to the telegraph field.

Mr. E. T. Jeffery spoke at length upon the great benefits the world at large has derived from the inventions of James Watt, George Stephenson, S. F. B. Morse and Alexander Graham Bell. Without these inventions, he said, the world would come to a standstill. He spoke of the great benefits resulting from social fellowship among officials and employes at gatherings of this kind, and suggested that it would be better if such meetings could be held more frequently and in various sections of the country.

The next speaker, Mr. Union N. Bethell, spoke in his usual forceful and happy style and was listened to most attentively. He referred to the great benefits of loyalty and organization. Organization thoroughly applied, he said, will qualify a man to fill the duties of any office to which he may be assigned.

Mr. Job E. Hedges followed Mr. Bethell with humorous remarks on the telegraph and telephone, punctuated with personal references regarding many of those present. Mr. Hedges is a prominent New York lawyer and an after-dinner speaker of national reputation.

Mr. Walter C. Burton, a former telegrapher and now a Civil Service Commissioner of the State of New York, was the next and last speaker. He dwelt upon the importance of the telegraph and his love for those engaged in the work, and paid a glowing tribute to the progressive management which has given to the public the night-letter, the day-letter and many other conveniences for facilitating transmission of intelligence.

NOTES.

The menu contained a portrait of Mr. Vail seated at his desk in his characteristic working attitude.

The menus of the club's guests were specially decorated with figures in water colors intended to represent some characteristic of the individuals. The card intended for Mr. Vail represented a man at a desk with his right hand on a telegraph key, from which a line of wires radiated, and at his left stood a telephone with a wire leading therefrom to a bell—the telephone company's well known trade mark. At the top of the card were the words, "The Hand that Holds these wires moves the World." Mr. Carlton's card contained a picture of a man in the act of pushing money along the wires, to represent telegraph money orders. The picture on Mr. Van Every's card showed a young man at a desk with papers strewn all over the floor around his chair. That on Mr. Baker's card showed a uniformed messenger boy with a telegram in his outstretched hand. On the card of Mr. Bishop was a yachting scene. Mr. Bishop is an enthusiastic yachtsman.

A lady at a telephone was the decoration on Mr. Bethell's card; and Mr. Dealy's was embellished with a stock ticker.

A locomotive decorated Mr. Jeffery's menu, and a wire with a telephone at one end and a telegraph key at the other was the representation on Col. Clowry's. Under it were the words "Good evening, Col. Clowry," in Morse characters.

Spring-time was suggested on Mr. Atkins' card, which had a picture of a youthful telegraph messenger and a young lady telephone operator seated together upon a line of wires, making love.

A man reaching out after a lot of telephones arranged in a semicircle was depicted on Mr. Kingsbury's card, and an orator at work, with a volume of steam issuing from his mouth was represented on Mr. Hedges'.

Following is a list of those present:

Albany, N. Y., Van Zant, W. H.
Atlanta., Ga., Gentry, W. T.
Baltimore, Md.—Day, E. W.; Selden, Charles.
Boston.—Barker, W. S.; Forristall, S. A. D.; Harrington, P. F.; Meigs, R. J.; Rex, J. B.; Shay, L. J.; Wilbourn, L. D.

Trade Notes.

Western Electric Report.—The report of the Western Electric Company for the thirteen months ending December 31, 1910, shows gross income, $68,861,455; cost of product, $63,442,286; interest, $884,893; carried to reserves, $1,150,000; dividends, $1,700,000; surplus, $1,684,276.

Western Electric Exhibit at Railway Appliances Convention.—At the recent convention of the Railway Appliances Association in the Coliseum, Chicago, the Western Electric Company exhibited a comprehensive line of telephone apparatus and other railway material. The telephone apparatus consisted of appliances that are used in model dispatching work.

AMONG OUR ADVERTISERS.

Enlarged Quarters.—The Central Electric Company, of Chicago, has just completed changes in its quarters which will nearly double its present facilities. The offices are now on the top floor of its six-story building, and the floor space available for stock purposes has been increased by about 25,000 square feet. This will enable the company to increase both the quantity and variety of its stock, and effect other improvements in the conduct of its business. The Central Electric Company is one of the pioneer electrical houses in the West.

A New Switch.—The old electrical supply house of J. H. Bunnell & Co., 20 Park place, New York, is constantly bringing out new things. The firm first makes certain that the new goods placed upon the market meet the requirements, and this knowledge is arrived at by actual test. The latest device brought out is the Ramsay table instrument switch, which enables an operator to connect a set of instruments to any line connected with the switch. The switch is made in two sizes, one for five lines and the other for ten lines. In design it is a radical departure from the old, the switch lever being locked in position when it is set in place so that it cannot be displaced accidentally. It is said to be a time-saver, a motion saver, a temper saver, and what is generally most important, a money saver.

Light Wireless Receiver.—Mr. C. Brandes, 111 Broadway, New York, is calling attention to his wireless telegraph receiver, which is said to be an excellent instrument for long-distance service. A head receiver, unless it is very light, is likely to become extremely burdensome and irritating if carried on the head any length of time, but this one is remarkably light and meets these objections, weighing only three ounces.

Indiana Child-Labor Law.—A law has been passed by the Indiana legislature regarding child labor. It prohibits the employment of any child under fourteen years of age and those under sixteen years shall not be employed before seven a. m., and after six p. m., and not more than eight hours per day.

Mr. E. J. Comstock, manager of the Western Union Telegraph Company at Watertown, N. Y., writes: "You did right in renewing my subscription to the Age for another year."

Telegraph and Telephone Age is headquarters for all electrical books.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

The Railroad.

Mr. William Bennett, superintendent of telegraph of the Chicago and Northwestern Railway, Chicago, accompanied by his wife, and Mr. C. M. Lewis, superintendent of telegraph of the Philadelphia and Reading Railroad, Reading Pa., were recent New York visitors.

Mr. John Gaul, well known in telegraph circles in the eastern states and chief operator of the Western Union office at Pittsburg, Pa., until about four years ago, when he went to California for the benefit of his health, is now manager of the telegraph department of the Santa Fe Railroad system at San Francisco.

Mr. S. A. D. Forristall, superintendent of telegraph of the Boston and Maine Railroad Company, Boston, Mass., was a recent New York business visitor. He reports that satisfactory progress is being made by the committee, of which he is chairman, having charge of the work of preparing the entertainment and business programme for the next meeting of the Association of Railway Telegraph Superintendents in Boston, June 19-23.

Extending Telephone Dispatching on Seaboard Air Line.—The Seaboard Air Line is extending its telephone train dispatching system from Wilmington, N. C., to Hamlet, N. C., a distance of 111 miles: from Hamlet to Columbia, 106 miles, and from Hamlet to Rutherfordton, 157 miles. Also from Jacksonville to Tampa, Fla., with branches to Orlando and Venice, 265 miles. Mr. W. F. Williams is superintendent of telegraph of the Seaboard Air Line, with headquarters at Portsmouth, Va.

Telephone Dispatching on Michigan Central.

Telephone train dispatching is now used on the Michigan Central Railroad between St. Thomas and Windsor, Ont., and it is expected that the lines between St. Thomas and Buffalo and between Bay City and Mackinaw will be similarly equipped during the year. Dispatchers' telephone circuits are now operated on the main line and divisions as follows: St. Thomas and Windsor, Detroit and Jackson, Jackson and Niles, Jackson and Grand Rapids, Bay City and Jackson, Detroit and Toledo and Detroit and Bay City. Eventually the entire system from Buffalo to Chicago will be furnished with telephone-dispatching equipment. Mr. J. J. Ross is superintendent of telegraph with headquarters at Detroit.

Automatic Telephone Selector or Ringing Device.

Mr. R. R. Hobbs, chief operator Louisville & Nashville Railroad Company, Louisville, Ky., has been granted a patent on an automatic telephone-selector or ringing device. The instrument consists of a polarized relay, wound to the proper resistance, operating on positive and negative electrical impulses, and a ratchet-wheel mounted on a suitable frame above the relay so arranged with arms, dog and pawl that the operation of one side of the relay armature will cause the ratchet-wheel to move one tooth in a specified direction and automatically lock the same at the point where impulses cease on that side. When the opposite side of the relay armature is worked through or by reason of electric impulse the ratchet-wheel is released automatically and a contact point is caused to touch a pin placed at the desired position on the face of the ratchet-wheel, thereby closing a local bell circuit. The ratchet-wheel is returned to normal position instantly by means of a spring, or weight, as desired, when all current ceases through both sides of the polarized relay.

This invention is designed to provide for a system of telephone ringing or signaling apparatus whereby any particular telephone station may be called without causing any of the other telephone stations on that particular line to be called, or signaled.

The primary object of the invention, Mr. Hobbs states, is to cheapen and simplify selectors. "Selectors now on the market," he states, "are good but they are expensive and complicated and are not interchangeable, in other words they are set to a certain combination and it is often impracticable to remove them promptly and substitute another of the same combination, especially on isolated divisions. Hence we believe that a selector that is not much greater in cost than a Morse relay and as adaptable to any station, will simplify the problem especially when coupled with reliability of operation, all of which it is believed the selector described will meet."

Hearing Approaching Rain Storms by Wireless.—A report has been filed with the branch hydrographic office in New York by Jules Maguy, wireless operator of the French Line steamer Niagara, in which he says he can hear rain storms at a great distance in the receivers of his instrument. "The sound," he says, "is like the pattering of rain on a zinc-covered deck, and the increasing or decreasing intensity indicates whether the squall is approaching or receding. I am so sure of this that when I hear the pattering I go quickly to the top of my wireless station to grease the insulators."

Commenting on this means of foretelling storms at sea the hydrographic office bulletin says: "The night being clear and dry, we have a cumulo-nimbus cloud loaded with electricity, positive, for example, and the sea underneath it loaded with negative electricity. At a certain instant, when the distance between the raindrop and the sea is small enough, a minute spark originates, giving a very small Hertzian wave." Every falling drop of rain is charged with positive electricity. It is declared that it is these Hertzian waves following one upon the other, or intermingled like the roar of musketry in battle, that gives the pattering effect in the wireless receiver.

TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York, is headquarters for electrical books. Every telegrapher should make a study of the technical side of telegraphy. We can supply all the books needed for such study; also for the study of electrical engineering in general.

The Turner Monument Fund.

Mr. S. A. D. Forristall, superintendent of telegraph, Boston and Maine Railroad, Boston, Mass., has sent us a portrait, reproduced herewith, of the late Charles Minot, general superintendent of the Erie Railroad, who, in the autumn of 1851, sent the first telegraph train order. This event is to be commemorated by the erection of a monument at Turner, N. Y., from whence this now historical message was sent, and a fund of $3,000 to defray the cost of the monument is now being raised. Every railroad and every telegraph man is invited to contribute toward this worthy object. Railroad men particularly should take pride in the movement as it marks an event which is of great significance to railroad interests.

The project is officially endorsed by the Association of Railway Telegraph Superintendents and the Old Time Telegraphers and Historical Association, and many prominent men actively and formerly engaged in railway and telegraph service have contributed liberally, as well as many prominent manufacturing interests.

THE LATE CHARLES MINOT.

The following named gentlemen constitute the committee in charge of the monument fund: E. P. Griffith, superintendent telegraph, Erie Railroad, Jersey City, N. J., chairman; Charles Selden, superintendent telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, Telegraph and Telephone Age, New York; E. A. Chenery, superintendent telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railway, Montreal, Canada; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who has been elected treasurer of the fund. All contributions are acknowledged in the columns of Telegraph and Telephone Age, and the funds deposited with the Washington Trust Company, New York, as soon as received.

Many commendatory letters have been received regarding the project, all the writers speaking of it in warm praise and attesting their interest by sending liberal contributions. Mr. G. L. Potter, Baltimore, Md., writes, "I think it appropriate that the memory of this important event in railroad history should be perpetuated, and am very glad of the opportunity to be among those who will help, by the erection of a monument, to commemorate the event."

Mr. John F. Mackie, secretary-treasurer of the Train Dispatchers' Association of America, Chicago, writes: "As an old telegraph operator and train dispatcher on the Erie at the time Charles Minot was general superintendent, I need not say that I am greatly interested in the matter."

Mr. Ralph W. Pope, an old time telegrapher and now secretary of the American Institute of Electrical Engineers, New York, says: "A very worthy movement for which I enclose a small contribution, which I am willing to increase if necessary at a later date."

An interesting reference to Mr. Minot's work in adapting the telegraph to the operation of trains is found in the book of the late James D. Reid, entitled "The Telegraph in America." Mr. Reid says: "Charles Minot, of the Erie Railroad, so determined on acquiring its use for running its trains as to induce him to build, in advance of any patent right, a line of his own, is a noted example. And yet it is certainly true that even to the alert western mind, it was a work of some difficulty to prove the value of the telegraph in moving and directing trains."

The contributions toward the fund received up to date are as follows:

Previously acknowledged, $1,123.25. G. W. E. Atkins, New York, $10; Col. A. B. Chandler, New York, $5.00; J. Donnelly, Baltimore, Md., $5.00; W. T. Charles, Tyrone, Pa., $.50; J. J. Loughery, Tyrone, Pa., $.50; J. N. McDonald, Tyrone, Pa., $.50; P. A. Downes, Tyrone, Pa., $.50; A. J. McLaughlin, Tyrone, Pa., $.50; H. F. Stewart, Tyrone, Pa., $.50; A. A. Witter, Tyrone, Pa., $.50; H. W. Hill, Wilmington, Del., $1.00; J. R. Donovan, Wilmington, Del., $1.00; J. L. Tucker, Pittsburg, Pa., $1.00; A. J. Schauer, Pittsburg, Pa., $1.00; C. F. Kissinger, Pittsburg, Pa., $1.00; C. J. Isler, Pittsburg, Pa., $1.00; J. A. Cook, Pittsburg, Pa., $1.00; F. Sargent, Pittsburg, Pa., $.50; T. P. Irwin, Pittsburg, Pa., $.50; R. A. McCarty, California, Pa., $1.00; S. E. Frank, Media, Pa., $1.00; F. H. Hadley, Media, Pa., $1.00; H. Calvert, Media, Pa., $1.00; G. B. Reynolds, Media, Pa., $1.00; J. H. McDonald, Philadelphia, Pa., $1.00; J. C. Johnson, Philadelphia, Pa., $5.00; Clarence H. Mackay, New York, $50.00; J. F. Howell, New York, $5.00; V. S. J. Vaughan, Franconia, Va., $.25; I. L. Tyler, Franconia, Va., $.25; I. S. Stout, Franconia, Va., $.25; S. B. Gifford, Syracuse, N. Y., $5.00; T. Welch, Port Jervis, N. Y., $1.00; M. J. Conway, Suffern, N. Y., $.50; M. Hamers, Port Jervis, N. Y., $.50; Charles T. Knight, Monroe, N. Y., $1.00; A friend of Turner's, $.50; E. B. Thomas, New York, $1.00; J. A. Middleton, New York, $1.00; F. L. Blendinger, New York, $1.00; G. A. Thompson, New

York, $1.00; L. D. Smith, New York, $1.00; F. H. Silvernail, New York, $1.00; E. A. Albright, New York, $1.00; J. J. Teal, New York, $1.00; C. A. Austin, Jersey City, N. J., $1.00; M. A. Hullyan, Jersey City, N. J., $1.00; M. C. Roach, Jersey City, N. J., $1.00; J. M. Cherry, Jersey City, N. J., $1.00; C. W. Kinney, South Bethlehem, Pa., $1.00; F. N. Hibbils, South Bethlehem, Pa., $1.00; G. B. Minshull, South Bethlehem, Pa., $1.00; G. L. Moore, South Bethlehem, Pa., $1.00; F. N. Borker, South Bethlehem, Pa., $1.00; W. N. Estabrook, Elmira, N. Y., $5.00; C. H. Bull, Chicago, Ill., 5.00; S. S. Bogart, New York, $5.00; J. H. Gordon, Matamoras, Pa., $.25; Timothy Burns, Middletown, N. Y., $.50; F. G. Gunsands, Matamoras, Pa., $.25; Belvidere Brooks, New York, $10.00; R. S. Clark, $.50; E. C. Shannon, $.25; F. Harlson, $.25; H. E. Gilpen, $1.00; H. M. Merrihew, $1.00; J. S. Keamerer, $1.00; J. J. McNamara, $.25; S. O. Livingood, $.25; S. B. Grine, $.50; Sol. Zieve, $.25; J. D. Anthony, $.50; W. V. Bishop, $.50; W. J. Shaw, $.25; J. E. Jackson, $.25; W. R. Sibley, $.50; L. H. Geller, $1.00; M. J. Gallaher, $.50; J. T. Mullaney, $.50; P. R. Long, $.25; J. D. Brown, $1.00; Geo. L. Ross, $.25; H. D. Hileman, $.50; W. S. Cozad, $.50; W. A. Cotton, $.50; E. B. Collister, $1.00; C. G. Smith, $1.00; P. J. Dailey, $.50; C. N. Van Wormer, $1.00; W. F. Fallon, $.50; J. C. Hamilton, $.50; F. R. Thrall, $.25; A. F. King, $1.00; H. H. O. Empuy, $.50; T. H. O'Brien, $.25; Phil. Cassidy, $.25; Charles Hoffman, $.25; George Graff, $.50; A. G. Schuman, $.25; A. L. Conkey, $.25; J. G. Hausler, $.25; William M. Reakes, $.25; C. G. Heckling, $.25; J. B. Aylward, $.50; Frank Laughlin, $1.00; E. T. Gray, $.25; E. E. Ellsworth, $.50; A. H. Mansfield, $1.00, all of Cleveland, Ohio; G. H. Cannout, Lakewood, O., $1.00; K. P. Kingsley, Lakewood, O., $.50; C. E. Norway, Randall, O., $.25; Pratt & Letchworth Company, Buffalo, N. Y., $15.00; W. S. Martin, Denver, Col., $1.00; J. M. Walker, Denver, Col., $1.00. Total, $1,316.00. 316.00.

Municipal Electricians.

Patents. — Mr. J. W. Griffith, of Greenfield, Tenn., and Mr. J. H. Bruhn, Jr., of Spirit Lake, Iowa, have each been granted a patent on an automatic fire alarm.

Fireproof Building for Switchboard.—It is proposed to install the new fire alarm switchboard and appurtenances at Allentown, Pa., in a separate fireproof building instead of placing it in the central fire and police station building.

Convention of Fire Engineers.—The next convention of the International Association of Fire Engineers will be held at Milwaukee, Wis., September 19, 20, 21 and 22. Mr. Oscar D. Kleinsteuber is superintendent of fire-alarm telegraphs in that city.

Convention of Municipal Electricians. — The next convention of the International Association of Municipal Electricians will be held in St. Paul, Minn., in September, on dates to be fixed later. The influence of this association is growing from year to year, and the cities represented by its membership are deriving much benefit in the way of improved protective appliances. Mr. Clarence R. George, city electrician, Houston, Tex., is secretary of the association.

Fire Alarm Telegraphs in New York.—The proposed new charter for New York City provides that the Fire Commissioner shall have control of the construction, maintenance and use of all fire alarm telegraph, signal and alarm systems in the city. The commissioner may authorize any privately owned fire alarm system to connect or continue to be connected with the fire alarm or signal system of the department upon such terms and conditions as may be authorized by the Board of Estimate and Apportionment. The fire alarm telegraph staff is to be composed of chief telegraph operators, telegraph operators, assistant telegraph operators and wiremen.

Fire Alarm and Police Telegraph Superintendents.

The tenure of office of superintendents of fire alarm and police telegraphs is a subject that could be properly taken up and considered by the International Association of Municipal Electricians. These officials should not be liable to removal through changes of administration, because the safety and welfare of the communities concerned depend largely upon the technical experience gained by them in managing the departments under their care. The position should be subject to civil service rules and not affected by political changes.

Mr. Frank P. Foster, former secretary of the Association states that it was his constant aim to bring the Association to a point of such influence that it could make more secure the positions of these officials irrespective of the political complexion of the party in power. He desired to show the municipalities that it was to their best interests to have this important office held by men who were competent and could feel sure of their position while doing their duty. They could and would work for the best interests of the tax payers and protect them much better than would be possible if they labored under the knowledge that they would be liable to be displaced at the next change of administration.

Foreign Corporations in New Jersey.—A bill has been introduced in the New Jersey Senate to prevent telephone or telegraph companies not incorporated in that state from maintaining local lines within the state, as distinguished from through lines.

Mr. C. L. Lathrop, superintendent of telegraph and signals of the Pittsburg, Shawmut and Northern Railroad, Angelica, N. Y., in renewing his subscription for another year, says: "I thank you for renewing my subscription and will be pleased to have you do so any time that I neglect it for I wish to keep my file complete and would very much dislike to miss a copy of your valuable journal."

Radio-Telegraphy.

Mr. Morris F. Wescoe, a wireless operator, has been appointed editor of the wireless news of the *New York Herald.*

Wireless Station at Colon, Panama.—The Congress of Panama has authorized the construction of a wireless telegraph station at Colon.

Wireless in California.—Recent storms in California prostrated the telegraph wires and it is stated that business houses in San Francisco utilized the wireless systems to reach their clients in the southern part of the State.

Music, Etc., by Wireless Telephone.—The Harvard Wireless Club at Harvard University is experimenting with wireless telephony. Conversation, songs and instrumental music on the graphophone it is stated are transmitted from the college station to the rooms of the different members with excellent results.

High Wireless Towers for Navy Department.—The Navy Department at Washington has decided to erect three or four 450-foot wireless steel towers at Fort Myer, Va., near that city. The towers will be arranged in a triangle or a parallelogram, according to the number, and with the high power contemplated will have, it is said, a radius of at least 1,500 miles.

High Wireless Mast.—The Marconi Wireless Telegraph Company has erected a steel pole and wooden mast, with a total height of 210 feet, close to its works at Chelmsford, England. The mast is to be used for experimental work in connection with high power currents.

High-School Girls' Wireless Club.—The high-school girls at Kansas City, Kan., have organized a wireless telegraph club for the study of wireless telegraphy. The building is equipped with wireless apparatus.

Mr. F. B. Barton, of Toronto, Ont., passed through New York April 5 on his way to that city after a vacation spent in Europe. Mr. Barton will fill the position of wireless operator for the large department store of the T. Eaton Company. Mr. Eaton, the head of this establishment, spends much time on his yacht in cruising about the lakes, and keeps in constant touch with business by means of wireless telegraph. His yacht is equipped with an outfit of sufficient power to keep in communication with the Toronto headquarters wherever the vessel may be.

Kites in Wireless Telegraphy.—A party conducting experiments in the use of kites in wireless telegraphy at San Francisco, Cal., claims to have heard distinctly calls from San Juan, Porto Rico; Washington, D. C.; Key West, Fla.; Brooklyn Navy Yard; Colon; Guantanamo, Cuba, and the station at Otichishi, Japan, which is 4,900 miles distant. They also claim to have detected indistinct signals which they believed were sent from Cornwall, England, a distance of 6,500 miles. The receiving aerials were strung between two pairs of 16-foot kites, which rose to a height estimated at 1,500 feet.

Subterranean Wireless Telegraphy.—Drs. Leimbach and Loewy have, according to reports from Berlin, succeeded in sending wireless telegraph messages underground between the potash mines in the North Harz Mountains over a distance of about one and one-half miles at a level of 1,600 feet below the surface.

Wireless Investigations at Pennsylvania State College.

The Engineering Experiment Station of the Pennsylvania State College, State College, Pa., is conducting some investigations in connection with wireless telegraphy. Professor Chas. L. Kinsloe who is in charge of the experiments, writes us as follows:

"Primarily, the object of these investigations is to make a more comprehensive study than has yet been made, so far as we are aware, of the wireless transmission of messages overland, especially in mountainous countries; and second, the object of our station is to furnish opportunity for experimental work in this field to the students in electrical engineering at this college.

"At present the sending equipment is of 2 kw capacity and this and the receiving equipment were manufactured by the Clapp-Eastham Company. The sending transformer is of the closed magnetic-circuit type and operates at 60 cycles. At present there is being constructed for use a 5 kw transformer of the open magnetic-circuit type which will be operated at 150 cycles. For the early experiments a temporary antenna has been erected on top of the electrical building which is at present about 90 feet above the ground and is about 100 feet between spreaders. It consists of four No. 10 wires.

"The Pennsylvania State College is located in the borough of State College in a broad valley 1200 feet above sea level and it is surrounded on all sides by numerous mountain ranges which rise to about 1000 feet above the location of the college. It is planned to erect a portable antenna at various points on these mountains and at varying distance from our sending station and since the topography varies considerably in this district, it is believed that much valuable information can be obtained. Thus far these experiments have been carried to only a limited number of points within six or seven miles of the college, but these distances will be gradually increased. It has been possible so far to receive from a number of outside stations, the most remote being a station at Cape Cod, Mass. It is proposed to erect, at a later day, a permanent antenna of such dimensions, as may be found to be best suited to the purposes and until this is done and the sending capacity is increased, it is hardly expected that much can be accomplished in sending to other stations."

A New Telegraph System.

BY GEORGE E. HINES, NEW YORK.

A great deal has been said during the past twenty years upon the scientific properties of the telegraph, but nothing practical has been evolved which increases the operative efficiency of the polar duplex. While there have been a number of ingenious devices built upon the basic functions of this method of telegraph signaling, most all of them have failed to prove to be of greater commercial value than the original apparatus. To acknowledge the truth of these statements is not flattering to those who have spent so much time, thought, and money on new devices that have been tried and found wanting.

The telegraph differs from other electrically applied arts in that a reciprocating movement of an armature at the distant end of a circuit is desired instead of a rotary one. With this fact as a basis upon which to build it may be added that a very small amount of magneto motive force through a circuit is required to move a relay armature, provided we can reverse the direction of electromotive force through the circuit, which is not done at the present time.

Facts of condition must be adhered to, and the true relative electrical condition of earth, forming one part of our telegraph circuit, and air, the medium through which the other part is established, have become widely diffused during the past few years of commercial activity. So much so that interruptions of the telegraph are as frequent as the electromagnetic condition changes in any part of the circuit due to various natural causes. The cause of these interruptions are understood and can be prevented if proper means are provided to bring the electromagnetic functions of the two parts of the circuit to act in accord instead of in opposition to each other. When weather conditions are favorable the duplex works all right, but when the line is made heavy by rain or fog, or the condition of the earth side of the circuit is interrupted, our present method fails.

Now, the electrical reactory terms, capacity, inductance, and resistance, have about as much to do with the operation of the telegraph as the differential calculus has to do with gravity. They are good things for study but do not help the telegraph or gravity do their work. Indeed, before we can proceed to transmit the first signal through a telegraph circuit, we are compelled to neutralize the reactory effect of these quantities by dividing the line side of the circuit into three parts and maintaining a state of resonance in each and between the parts, nearly perfect, else we do not get satisfactory results.

Remembering that our purpose is wholly to create a magnetomotive force through a circuit of known resistance strong enough to move a delicately mounted relay armature seemed to the writer to be a simple proposition but requiring a simpler arrangement of both circuit and applied electromotive force than that now used. These conditions, the writer believes he has met in his newly devised system of duplex and quadruplex telegraphy which was described in Telegraph and Telephone Age of April 1.

Mr. Jerry Foley, of the Postal Telegraph-Cable Company's office at Indianapolis, Ind., is a candidate for the position of official telegrapher for the House of Representatives at Washington.

Obituary.

Joseph J. Lawlor, aged 35 years, formerly chief operator for the Hearst news service in New York, and afterward manager of the Atlantic Telegraph Company at Portland, Me., died in the latter city, April 10. Mr. Lawlor went to Chicago for the Western Union Telegraph Company, but returned to Portland a year ago on account of ill-health.

William A. Dunn, an operator at Baltimore, Md., died in that city March 28, at the age of sixty-eight years.

The R. W. Martin Fund.—We have received from Mr. H. C. Richardson of Metuchen, N. J., an old-time operator, a check for $2.00 for Mr. R. W. Martin, who has been confined to his bed for several years suffering from a stroke of paralysis, and is helpless in consequence.

LETTERS FROM OUR AGENTS.

NEW YORK, WESTERN UNION.

The new song, "Send Me a Night Letter, Dearie," composed by Mr. B. L. Branman of this office, was sung with excellent effect at the dinner of the Morse Electric Club on April 6.

PHILADELPHIA, WESTERN UNION.

Mr. Anthony J. Neyer of this office has gone to Baltimore, where he has entered the service of this company at that point.

Mr. Harry V. Emanuel and Mrs. George W. Uber, both of the operating force in this office were married on March 25.

Many new faces are appearing in the operating room, which is evidence that business is on the increase. It promises to be good during the spring and summer.

PHILADELPHIA, AMERICAN TELEPHONE AND TELEGRAPH.

Mr. Chester J. McKee, test-board man, has resigned and is now engaged in the telephone business at Rush, N. Y. While in this office Mr. McKee made many friends.

Mr. Bernard Stohner, early night test-board man, has been transferred to the district office. Mr. Morris Ruberg, repeater man, succeeds Mr. Stohner, and Mr. Daniel Hoffman, of the clerical department, has been transferred to the repeater department to succeed Mr. Ruberg.

ATLANTA, WESTERN UNION.

Mr. A. H. Condra has been transferred from the plant department to be night chief operator, vice Mr. E. Waldron, transferred to the plant department.

Mr. E. G. Clinkscales, assistant day repeater-chief, has been transferred to be night repeater-chief, vice W. A. Reynolds. Mr. Reynolds is now assistant wire chief, days.

Digitized by Google

Mr. W. O. Ballard, assistant wire chief, days, has been appointed day wire chief, vice A. H. Condra.

Mr. E. E. Cunningham has been appointed assistant repeater chief, and Mr. T. E. Argo has been appointed chief in charge of repeaters.

On Monday, March 27, this office handled the largest volume of business in its history.

New York Telegraphers' Aid Society.

At the annual meeting of the New York Telegraphers' Aid Society on March 29 the amendment to the constitution relating to the limitation of benefits that may be paid out during a period of forty-eight months was defeated. The matter will probably be again brought to the consideration of the society in a modified form next year.

Mr. R. J. Marrin, president of the society, feels highly honored over his election for the third consecutive term, this time without opposition. He has been faithful to the interests of the society and has made a capable head. The society has prospered under his leadership and no doubt the year 1911 will show still better results. The members have, in the re-election of Mr. Marrin, expressed in a very emphatic and complimentary manner their confidence in his ability to conduct the affairs of the society, and Mr. Marrin is to be congratulated on so great a distinction being shown him.

Messenger Boys Robbed.—Three young men, armed with revolvers, entered the Western Union Telegraph office at 91 Wall Street, New York, on March 27, and robbed twelve messenger boys of their money and valuables. It was pay day and the boys were preparing to go home after their day's work when the "hold up" took place.

The Associated Press.

Philip H. Kerby, aged 50 years, private secretary to Mr. Melville E. Stone, general manager, New York, died suddenly while teaching his Sunday-school class, April 2.

Col. Charles S. Diehl, assistant general manager at Chicago for the past eighteen years, and Mr. Harry B. Beach, superintendent of the Central Division, Chicago, have resigned to take up the management of the San Antonio *Light*, San Antonio, Tex., which they have purchased. Col. Diehl's service with the Associated Press covers a period of twenty-eight years, while that of Mr. Beach covers twenty years.

The great telegraphic song hit,
"SEND ME A NIGHT LETTER, DEARIE."
Good, catchy music; beautiful title design magnificently printed in colors. Title contains night letter. Sung all over New York. 17c. by mail. All popular music sent by mail.
B. L. BRANNAN,
195 B'way, N. Y.

Mr. F. M. McClintic, the well-known telegrapher, and manager of a stock brokerage office in New York, has decided to give up his brokerage position and embark in the moving-picture show business. For over a year Mr. McClintic has been managing the Park Row Theatre in New York, and is now part owner in the enterprise. This theatre has gained an enviable reputation for the high-class pictures exhibited there and Mr. McClintic is very proud of its success and standing, which are largely due to his own efforts and good judgment in the selection of pictures and arrangement of the programmes. He has a large circle of telegraph friends who will wish him much success in his new line of work.

Martin's Double Lever **VIBROPLEX**, $8.00 f. o. b. D. C. DeLany, 15 S. Broad St., Atlanta, Ga.

WANTED.—Live agents in all large Western Union and Postal offices. Central Typewriter Exchange, New York.

It is a valuable privilege to be eligible for membership in a sound and reliable Life Insurance Association which cannot afterwards cancel or alter the terms of the certificate issued. The payment of the sum called for in a benefit certificate blesses alike the recipient and the provider. The Telegraphers' Mutual Benefit Association, 195 Broadway, New York, now the oldest co-operative life insurance association, having been in successful operation for the past 43 years, offers this privilege to all eligible employes of telegraph and telephone service. Write at once for application form and full particulars.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEYBOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York.

Every one engaged in telegraphy and telephony should be a constant reader of TELEGRAPH AND TELEPHONE AGE. It gives the latest news in both these fields. Subscribe now. Subscription price, $2.00 per year.

SOME POINTS ON ELECTRICITY—XVII.

BY WILLIS H. JONES.

Little Things That Count.

(Continued from April 16 issue.)

In the preceding instalment of this article the vibratory transmitting machine was made the subject-matter, to illustrate how a systematic order of instructions given to operators concerning its operation would not only raise the efficiency of the telegraph service by increasing the capacity of each wire on which such a machine is used, but add greatly to the comfort of the operators themselves.

Now, the suggestions made to remedy the evil were little ones, and the transmitter trouble itself was shown to be a very small defect, taken by itself, yet owing to the frequency with which the fault occurs and the number of machines in simultaneous use the accumulative harm done is great. Hence each little unit of a harm-creating tendency might be taken up separately in the official schools of the company and made a subject for special instruction, with beneficial results to all concerned.

For the second lesson the writer suggests the importance of impressing all operators with a sense of personal obligation and responsibility to the company for certain little (yet cumulatively great) sources of delay which they could minimize if they really had their employer's interest at heart and took the trouble to do so.

For instance, there is probably no operator so dense that he does not know that a loose wire connection in a binding post will cause trouble, and only few who are not aware of the fact that ink or dirt on a switch disk either opens the circuit or weakens the current, yet it is seldom that any of them discover such faults because they imagine the remedy is "up to the chief."

Furthermore, if such an operator were accused of being not "first class" he would probably be much offended, yet it is evident by his conduct that he is not. Many operators now rated second class may possibly be more valuable to the company and therefore more desirable.

One of the easiest ways that an operator might make himself valuable is to cultivate the habit of examining the various binding-post connections whenever he sits down to a desk. Should the circuit open later this examination should be made first thing. It requires only a moment to do this, while the general adoption of this practice would undoubtedly prevent a great many of the unnecessary delays now experienced in moving traffic which are due to the lack of observation.

Moreover, operators should realize the fact that as there are a multiplicity of binding-post connections to be looked after, a little help on their part in the way suggested is really necessary in order to maintain a maximum equipment-efficiency.

A retractile spring on a telegraph relay is a very insignificant looking part of the outfit, yet its abuse creates a source of delay to traffic every wet day that is hardly appreciated fully. Springs that have lost their original elasticity by having the close fitting "curls" stretched are almost as useless as a string would be if substituted therefor.

In large main offices where apparatus are inspected frequently springs are not often allowed to reach that condition before being renewed, but in way stations the contrary condition often prevails.

A case in point: Not long ago the writer while visiting an operator at a way station heard a station beyond call up his friend and request him to "pull up" and answer Philadelphia. After a very careful readjustment of his relay he finally succeeded but the signals came very indistinctly and the slightest alteration of the spring tension caused them to disappear. After he finished with

Digitized by Google

Philadelphia he explained that he guessed he had a pretty "bum" relay as none of the other stations along the line seemed to experience any trouble of that nature.

Happening to glance at the retractile spring on the relay the writer noticed that it was stretched out so that it looked like a straight piece of wire. There was not a "curl" in it. Luckily the writer happened to have a relay spring in his pocket and quickly substituted it for the old one. From that moment the operator had no further trouble hearing and reading the signals from any point along the line.

Asked how long he had been bothered that way he replied, "Ever since I came here, and I have been here six months."

Just think of it! six months of delays and more or less bother and trouble for every other operator on the circuit who happened to have business for him, and all due to a little thing like a retractile spring.

Now all operators should realize the fact that no retractile spring not possessing closely fitting curls is capable of following, or keeping in step, with the minute fluctuations in the magnetic strength of the relay which take place in very wet weather at way stations situated remotely from the battery. Naturally the volume of current that reaches such points is very small compared to that received in dry weather; hence the spring should possess great elasticity. For best results the tension of the spring should be very slight, just sufficient to keep it taut, and it should be kept that way regardless of the weather or volume of current flowing through the relay coils. All readjustments should be done by moving the magnet itself toward or from the armature, as the occasion demands. The spring tension itself should never be altered except to give the final touch.

Recent Telegraph and Telephone Patents.

ISSUED APRIL 4.

988,706. Telephone Receiver Shell. To J. Halldow, Elyria, Ohio.

988,711. Central Telephone System. To J. D. Holmes, Pasadena, Cal.

988,811. Telegraphy. To L. M. Potts, Baltimore Md.

988,819. Telephone Transmitter. To C. R. Rogers, Waverly, N. Y.

988,876. Telephony. To I. Kitsee, Philadelphia, Pa.

988,878. Cable Telegraph System. To I. Kitsee, Philadelphia, Pa.

988,879. Telegraphy. To I. Kitsee, Philadelphia, Pa.

ISSUED APRIL 11.

989,191. Multiple Telephone Receiver. To W. B. Relth, Chicago.

989,205. Telephone System. To D. L. Temple, Chicago, Ill., and C. L. Goodrum, Altantic City, N. J.

989,529. Conversation Meter for Telephone Systems. To G. W. Lorimer, Piqua, Ohio.

The following patents have expired:

517,445. Coin-Controlled and Coin-Return Lock for Telephones. Issued to J. M. Dashiell, Jr., Washington, D. C.

517,762. Telephone. Issued to S. D. McKelvey, Canton, Ohio.

517,763 and 517,764. Magneto Telephone. Issued to S. D. McKelvey, Canton, Ohio.

518,142. Telephone Transmitter. Issued to J. Goodman and H. M. Goodman, Louisville, Ky.

Personal.

Mr. J. Levin, of Atlanta, Ga., formerly general superintendent of the southern division of the Western Union Telegraph Co., was a recent New York visitor.

Dr. Karl G. Frank, New York, representative of the Siemens and Halske Company, Berlin, Germany, sailed for Europe April 27. He will be absent about four months.

Mr. Harry E. Dunham, former associate editor of Telegraph and Telephone Age, was a recent New York visitor. Mr. Dunham is now an examiner in the Patent Office at Washington and finds work and life in the capital very congenial.

Mr. Joseph W. Stover, an old-time telegrapher and formerly president of the Gamewell Fire Alarm Telegraph Company, New York, has the sympathy of his many friends in and out of the telegraph profession in the death of his wife at their home in East Orange, N. J., on April 7. Mrs. Stover had been ill for a long time.

Mr. Charles R. Williams, who, twenty or more years ago was assistant general manager of the Associated Press, New York, afterwards becoming editor-in-chief of the Indianapolis *News*, has decided to give up newspaper work and devote his time to the compilation of a history of the life of the late president Rutherford B. Hayes. Mr. Williams was formerly professor of Greek at Lake Forest (Ill.) University, and tutor in Latin at Princeton University.

Mr. William McClellan, a well-known electrical engineer and a man of wide technical experience, has been appointed consulting electrical engineer for the Public Service Commission, Second District, New York, to succeed Mr. Howard H. Crowell, resigned. Mr. McClellan is a graduate of the University of Pennsylvania, and has been connected with the work of electrification of several large railroads. He is a member of all of the technical engineering societies.

Mr. B. M. Downs, vice-president of the Brookfield Glass Company, New York, was recently tendered a complimentary dinner by his associates, Messrs. H. M. and F. Brookfield, to mark the completion of his twenty-five years' service with that company. Twenty-one gentlemen were

Digitized by Google

present at the dinner and an enjoyable time was had. Mr. Downs, who is now on a business trip to the Pacific Coast, was heartily congratulated by all present. Many telegraph people were present.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mrs. John W. Mackay, wife of the late president of the Postal Telegraph-Cable Company, and her daughter, the Princess Colonna di Stigliano, of Rome, Italy, recently arrived from Europe on a visit to New York.

The general superintendents of the Eastern, Western and Southern divisions were in New York recently in conference with the general manager, Mr. E. J. Nally.

Miss T. N. Brown, chief clerk to vice-president and general manager E. J. Nally, who has been absent on account of illness, has returned to her office.

Mr. E. B. Pillsbury, general superintendent, has returned to New York after a brief absence on company business.

The Mackay Telegraph and Cable Company is actively engaged in building new lines in Texas. The line between Galveston and Houston is being built along the right of way of the Atchison, Topeka and Santa Fe Railway. It is expected that the new lines will reach Dallas by June 1. Beautiful offices will be established in that city and location for offices have been secured at Fort Worth, Galveston, San Antonio and at other places.

The fourth annual outing of the Association of Postal branch-office managers in the first district, New York, will be held at Witzel's Point View, College Point, L. I., Saturday, June 24. Mr. C. F. Leonard, district superintendent, New York, will be the guest of honor. There will be games in the afternoon at which valuable prizes will be awarded, and in the evening there will be a dinner followed by a vaudeville entertainment, composed entirely of Postal talent. These meetings are held primarily for the purpose of getting together for the exchange of views on business affairs.

Mr. J. A. Vogt has been promoted to be manager of the Baltimore, Md., office, vice Mr. V. J. Albert, resigned.

Among recent executive-office visitors were: Superintendents H. Scrivens, Pittsburg, Pa.; C. A. Richardson, Boston, Mass.; C. E. Bagley, Philadelphia. Managers C. A. Johnson, Meadville, Pa.; S. H. Flint, Bridgeport, Conn.; C. E. Diehl, Harrisburg, Pa.; J. A. McNichol, Philadelphia, Pa.; F. B. Travis, Washington, D. C.; N. C. Pangburn, Albany, N. Y.; J. A. Coughlan and Geo. Downey, Boston, Mass.

Mr. George H. Mills, manager of the Providence office of this company, was a recent New York visitor.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company and of the Western Union Telegraph Company, has been elected a director of the New York, New Haven and Hartford Railroad to succeed Nathaniel Thayer, deceased.

Mr. G. D. Perry, vice-president and general manager of the Great North Western Telegraph Company, Toronto, Ont., was a recent New York visitor.

Mr. T. W. Carroll, assistant to the general manager, New York, has returned from an inspection trip in the West.

Mr. W. E. Athearn, engineer of equipment, has returned from a short business trip through the southern division.

A meeting of the Commercial Managers Association of New York was held a few days ago and plans were perfected for semi-monthly meetings, for the benefit of the service. Mr. James F. Nathan, superintendent of city offices, presided in the absence of Mr. P. J. Casey who was on a trip to Florida.

Mr. T. A. Thorp has been appointed equipment man at Boston.

Mr. C. B. Kelley, manager of the Burlington, Vt., office, has been promoted to be manager at Springfield, Mass.

Mr. Rollo D. Welch, of Chicago, has been appointed chief operator of the Kansas City, Mo., office, vice Mr. S. W. Atkinson retired to engage in other business.

Mr. R. C. Mason, of the Bell Telephone Company of Pennsylvania, Philadelphia, has been appointed special agent to assist district commercial superintendent J. W. Reed, of that city.

Mr. C. W. Garver, manager at Ashland, Ohio, has been transferred to the managership of the Youngstown, Ohio, office, succeeding Mr. H. L. Herbert, resigned, to go with the Postal Company at the same point. Mrs. C. W. Garver is acting manager at Ashland.

Mr. A. Simon, manager of the 65 Gold Street office, New York, has been advanced to the position of solicitor and attached to the 16 Broad Street office. Mr. Louis Westrope, of the superintendent's office, has been appointed manager of the 65 Gold Street office.

Mr. Allan Woodle was tendered a farewell dinner on his retirement as manager of the Boston office by the heads of the various departments and many of the employes. Mr. O. A. Connor, who succeeded Mr. Woodle as manager, was also a guest at the dinner. Several congratulatory addresses were made. Superintendent C. F. Ames acted as toastmaster.

Digitized by Google

Mr. Joseph Marshall, chief operator of the Western Union Telegraph Company at Charleston, S. C., is giving instructions on the construction and operation of telegraph apparatus, office connections, etc., to a number of the operators in that office who have taken an interest in the technical side of telegraphy. Meetings are held regularly and good progress is reported.

Mr. V. J. Albert, manager of the Postal Telegraph-Cable Company at Baltimore, Md., has accept the position of commercial manager of Maryland for this company, with headquarters in that city.

Thomas P. Scully, aged 74 years, one of New York's veteran telegraphers, died April 25. Mr. Scully had been identified with the telegraph service in this city for the Western Union Telegraph Company as a printing operator since 1851. He was a man of commanding presence. He had traveled extensively both in North and South America and all over the continent of Europe. He was president for a number of years of the North Western Telegraph Company and he held other positions of responsibility during his long and active career. He retired from active duty ten years ago since which time he lived in Brooklyn.

Mr. William John Francis, whose promotion to the managership of the Atlanta, Ga., office was announced in our issue of April 16, was born at Old Point Comfort, Va., August 23, 1865, and began his telegraphic career at that place in 1878. His entire business experience has been in the South. He was manager for a brokerage house in Atlanta, Ga., and afterwards became manager of the Western Union offices at Macon, Ga., and Montgomery, Ala., holding the latter position at the time he was transferred to Atlanta.

Mr. Charles Elmer Thatcher, chief of the transportation rate section in the Treasury Department, Washington, D. C., has been appointed manager of the Western Union Telegragh Company, San Francisco, Cal. Mr. Thatcher was born at Mount Sterling, Iowa, December 11, 1869, and entered the telegraph service in Washington, D. C., in August, 1889. He has filled positions as operator, manager, chief clerk, and train dispatcher in Western Union offices and on railroads and entered the government service in Washington in 1898. There he studied accounting and economics of transportation at the George Washington University, and aided in the organization of the transportation office of the United States Treasury Department. Mr. Thatcher was transportation agent for the government at the Jamestown and Seattle expositions.

Telegraph and Telephone Age is the oldest and most ably-conducted telegraph journal in America and should be read by every one engaged in telegraphy. Subscription price, $2 per year.

Gardner Irving Appointed Superintendent Commercial News Department, New York.

Mr. Gardner Irving, who has just been advanced to the superintendency of the Commercial News Department of the Western Union Telegraph Company, New York, and whose official appointment was recorded in our April 16 issue, was born in Greenport, N. Y., in May, 1855. He began his telegraphic career as a messenger for the Atlantic and Pacific Telegraph Company at Hudson, N. Y., in 1868, and afterwards became engaged in other lines of business but returned to the telegraph service March 21, 1871, at Hudson, N. Y. On the opening of the Grand Central Depot in New York, November 1, 1871, he was promoted to the superintendent's office. He soon afterward entered the service of the Western Union Telegraph Company at 145 Broadway and after some years' experience in the cable department he was, in 1882, appointed traffic chief of the Southwestern Division. In 1885 he was appointed chief operator of the Commercial News Department and in 1905 was made manager of that department. Mr. Irving has had a wide experience with quadruplex, Wheatstone, ticker and transmitter systems and has been largely instrumental in the development of the quotation service. He is an unassuming gentleman and is very popular among his associates and business connections. He is a charter member of the New York Telegraphers' Aid Society and has all through its career been an active member of this worthy organization, of which he was president for six years. He is also one of the original members of the Magnetic Club and is a director of the Morse Club and chairman of its reception committee. Mr. Irving has been vice-president of the Gold and Stock Life Insurance Association for five years.

GARDNER IRVING.
Superintendent Commercial News Department, Western Union Telegraph Company, New York.

Radio-Telegraphy.

Mr. T. C. Harlan, wireless operator for the United Wireless Telegraph Company on the Great Lakes during the last year, and manager of the Western Union Telegraph office at Trenton, Mo., during the winter, is now taking an extended vacation at Newville, Pa., for the benefit of his health.

Wireless Telegraphy in Spain.—A company has been formed in Spain to establish public wireless telegraph service in that country and on vessels in Spanish waters. Stations with large range will be established at Cadiz, Las Palmas, Teneriffe, Madrid, Barcelona, the Balearic Islands, and other points.

Marconi and French Wireless to Exchange Messages.—A dispatch from Paris states that the French Minister of Public Works has signed an agreement with the Marconi Company for an exchange of wireless communications both on sea and ashore between the Marconi stations and others fitted with the French wireless system.

Secret Wireless Telegraphy.—Johann Sacek, of Prague, Bohemia, has devised a system of wireless telegraphy which, it is stated, prevents the interception of wireless messages by outside parties. The system has been tested at the Darmstadt Technical High School and is said to represent real progress in wireless telegraphy.

Society of Wireless Telegraph Engineers.—The following named officers of the Society of Wireless Telegraph Engineers were elected at the recent convention held in Boston: President, Mr. Fritz Lowrenstein; vice-president, Mr. Louis Cohen; secretary, Mr. E. B. Moore, 39 Trinity Place, Boston; treasurer, Mr. V. F. Greaves; directors, Messrs. Samuel Cabot, F. H. Knowlton and George Hill.

Wireless on a Stranded Steamer.—The wireless telegraph played a very important part in keeping in close touch with the German steamer *Prinzess Irene* which ran ashore recently off Fire Island, on the Long Island coast. Progress in the work of rescuing the passengers was reported frequently by wireless, and events and happenings on the vessel were known to the outside world as quickly as if the ship had been lying quietly at her dock. The busiest place on the ship was the telegraph office and the receipts ran into thousands of dollars.

Wireless Along the Mexican Border.—Five hundred miles of territory along the borders of the Rio Grande in Texas are covered by the wireless system, in connection with the Army now stationed along the Mexican border. The work of installing the system was performed by the Signal Corps. In connection with the Eagle Pass wireless station, which is a permanent one, three field stations were established, 100 miles apart. Two signal-corps men are posted at each of the three sub-stations and at the Eagle Pass station. The system was mapped out by Major George O. Squier, in command of the Signal Corps at the division camp.

Range of Wireless Telegraphy.

In a recent address Captain H. R. Sankey of the British Army gave the following figures representing the range in nautical miles attainable in wireless telegraphy over sea and over land by apparatus of different powers:

Power in K.W.	Wave Length Meters.	Over-sea.	Over Land		
			Flat.	Hilly.	Mountainous.
0.3.....	300	100	77	30	13
0.3.....	1200	100	95	73	52
1.5.....	300	220	170	67	28
1.5.....	1200	220	210	160	115
3	300	280	220	84	36
3	1200	280	270	200	145
5	300	340	260	100	43
5	1200	340	325	240	175
10	300	470	360	138	59
10	1200	470	450	330	240

Hertzian Waves.

In an address before the Southern Commercial Congress at Atlanta, Ga., on March 10, Mr. George Westinghouse made some interesting references to the possibility of wireless transmission of electrical energy. He stated that the frequency of the electrical waves sent out by some forms of wireless transmitters approaches a million per second and that either by the increase in the amplitude of these vibrations or by a more sensitive receiver the distance which these waves may record can be greatly increased. Dr. Peter Cooper Hewitt had, he stated, made an experiment with powerful wireless transmission apparatus which produced incipient fires within the room where the apparatus was erected, thus demonstrating the power of this incomprehensible force and suggesting great possibilities in the transmission of electrical energy without wires.

Referring to radium phenomena, Mr. Westinghouse stated that during a conversation with the late Lord Kelvin he ventured to give a conception of the cause of the production of heat by radium, his idea being that radium acts as a transformer of one of the forces of ether into some other form of force and that in such transformation heat is produced. Lord Kelvin stated that he had already arrived at the same conclusion on the general hypothesis that neither heat nor light can be produced without energy.

Magnetic Club Spring Dinner.

The spring dinner of the Magnetic Club was held at the St. Denis Hotel, New York, April 26, and was largely attended, and a very enjoyable time was had by all.

The entertainment features were especially good and of a high order, and the debut of the Magnetic Glee Club under the guidance of Mr. Lewis MacConnach was an instant success, and added much to the enjoyment of the occasion.

The club had as its guests the editors of the various electrical papers in New York, including Mr. C. W. Price, of the Electrical Review and Western Electrician, Messrs. J. B. Taltavall and T. R. Taltavall, of Telegraph and Telephone Age, and Mr. D. D. Moore, managing editor of the Times-Democrat, New Orleans, La.

In introducing the speakers President C. P. Bruch made some felicitous remarks.

"In the course of a moderately long and somewhat varied career," he said, "I have found it necessary to undertake several kinds of occupation, but it was not until recently that I was called upon to exercise editorial functions. As a result of my experience in that connection I have acquired a very broad and deep sympathy, not to say pity, for that unfortunate class of individuals —editors.

"I now realize," Mr. Bruch continued, "that the editor is continually between the 'devil and the deep sea,' the 'devil' being the compositor and the 'deep sea' the reader."

He hoped that the guests had enjoyed their brief respite from their normal condition of unappeased hunger and lack of shelter, and proposed to add to their happiness by asking them to make brief addresses.

Short addresses were then made by Messrs. J. B. Taltavall, C. W. Price, D. D. Moore, M. J. Pike and Mr. E. J. Nally, vice-president and general manager of the Postal Telegraph-Cable Company.

Following the addresses a short intermission was taken to prepare for the vaudeville entertainment and the opportunity was taken advantage of to indulge in social intercourse and make and renew acquaintances.

The entire affair was well arranged and executed and everyone present spent an enjoyable evening. There was no restraint whatever, and there was a real "home" feeling all round. The dinner was an excellent one, and the entertainment was all that could be desired and a fitting termination of a happy evening.

Those present were:

Albany, N. Y.—N. C. Pangburn.

Boston, Mass.—J. A. Coughlan, Geo. Downey, C. A. Richardson.

Bridgeport, Conn.—S. H. Flint.

Harrisburg, Pa.—C. E. Diehl.

New Orleans, La.—D. D. Moore.

New York.—J. J. Alcock, W. P. Bowman, C. P. Bruch, J. Bigger, M. R. Cockey, W. I. Capen, T. L. Cuyler, Jr., S. Cohen, J. Costello, J. J. Cardona, F. W. Daly, T. J. Donovan, M. L. Dunn, W. B. Dunn, A. J. Eaves, A. P. Eckert, E. J. Edwards, J. H. Flood, W. Finley, W. J. Fives, R. Gould, J. F. Gaynor, J. J. Ghegan, W. R. Holligan, Thos. J. Howlett, J. Hennessy, T. E. Heffren, P. A. Hickey, L. L. Howell, Dr. L. R. Hallock, J. C. Johnson, E. Kimmey, F. J. Kernan, S. C. Kniffin, L. Lemon, C. F. Leonard, A. J. Lafaye, D. F. Mallen, F. E. McKiernan, Wm. Marshall, R. H. Miller, W. H. Mishner, J. J. McCormick, J. J. McDermott, T. J. McQuillan, E. F. Maher, J. A. Manning, J. McNeill, J. McCauley, J. Moran, L. MacConnach, F. Morris, E. J. Nally, E. B. Pillsbury, Fred. Pearce, C. F. Pearce, C. W. Price, M. J. Pike, W. F. Pelton, D. F. Regan, J. J. Reilly, H. J. Reinhardt, R. R. Rosa, E. J. Rhates, Thos. F. Rochford, J. F. Shugrue, J. Shandley, Wm. Scarborough, H. Scrivens, C. Shirley, W. F. Stanz, T. J. Sullivan, E. P. Tully, T. R. Taltavall, J. B. Taltavall, V. H. Wiese, H. Wiese, A. G. Williams, P. J. Walsh, H. Zweifel.

Philadelphia, Pa.—J. A. McNichol, C. E. Bagley, A. E. Zintl.

Washington, D. C.—F. B. Travis.

Mr. Union N. Bethell, vice-president of the American Telephone and Telegraph Company, and president of the New York Telephone Company, gave a dinner party recently at his home in Upper Montclair, N. J., during which he entertained his guests by telephone conversation with Denver, Col., and other points. Speeches were made from Boston, Washington, Chicago, Detroit and Denver. There were also songs, and Ben Greet gave readings. Each guest was provided with a head receiver so he could listen to the entertainment.

The Cable.

Mr. George G. Ward, vice-president and general manager of the Commercial Cable Company, New York, has returned from his excursion to the West Indies, greatly benefited by the trip. He has fully recovered from his recent illness and is again hard at work.

British South American Cable.—The Birmingham, England, Chamber of Commerce is collecting the opinions of other English Chambers of Commerce regarding a proposition that a British submarine cable all around South America is a necessity in order to counteract the efforts now being made by the United States to promote American trade.

Mr. J. C. Browne, general foreman of the Missouri Pacific Railway System at St. Louis, Mo., writes: "Sometimes we do things from habit and sometimes because it is necessary. I herewith renew my subscription to Telegraph and Telephone Age because it is necessary."

Handling of Dry Cells.

Dry cells are commonly regarded as mechanically indestructible and are consequently subjected to rough handling, says *The Pacific Telephone Magazine*. Contrary to their name, dry cells are not dry, but are so sealed as to expose no damp surface to view. A dry cell consists of the two elements, carbon and zinc, also a metallic salt solution which serves as an electrolyte and a depolarizing agent immediately surrounding the carbon. The active solution is prepared in the form of a paste and saturates a porous paper used as a filler between the elements. The deterioration of cells is due to chemical action and evaporation of the electrolyte. The effectiveness of a cell is dependent on a low internal resistance and a high electromotive force, both of which are adversely affected by abnormal chemical action and evaporation directly traceable to improper handling.

The following precautions should be of assistance in preventing premature deterioration. Barrels containing cells should be wheeled on a truck, not rolled. Cells should be kept in an upright position, whether in barrels, on shelves, etc. Do not throw cells into a wagon or allow them to bounce around during transportation. Cracks found in the sealing compound should be seared with a hot iron to prevent excessive evaporation. Do not test a cell by short circuiting it to get a spark, as you will shorten its life. Tests and maintenance of dry cells should conform to a standard practice. Keep stock cells in a cool place to reduce evaporation.

Dry cells are perishable and considerable care must be taken in maintaining stock so that cells will be placed in service within three months, and preferably two months, of the date of manufacture stamped on the paper case.

The "Marconigraph." — Marconi's Wireless Telegraph Company, Ltd., London, England, has just begun the publication of a magazine entitled the "Marconigraph," the aim of which is to set forth in detail all the interesting happenings incident to the development of the system and to illustrate the growth of the Marconi service in the various parts of the world. The latest developments in connection with the technical side of the system will also be covered. The subscription price is fixed at three shillings per annum.

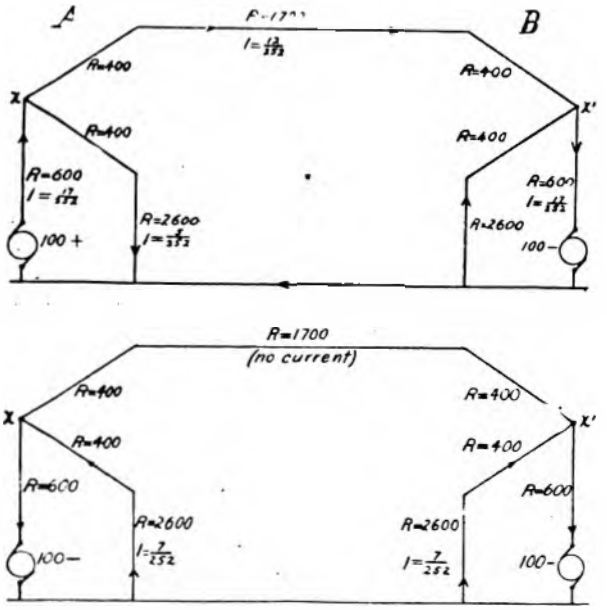
Current Flow in Quadruplex Circuits.

BY W. J. DOHERTY, OF MILES CITY, MONT.

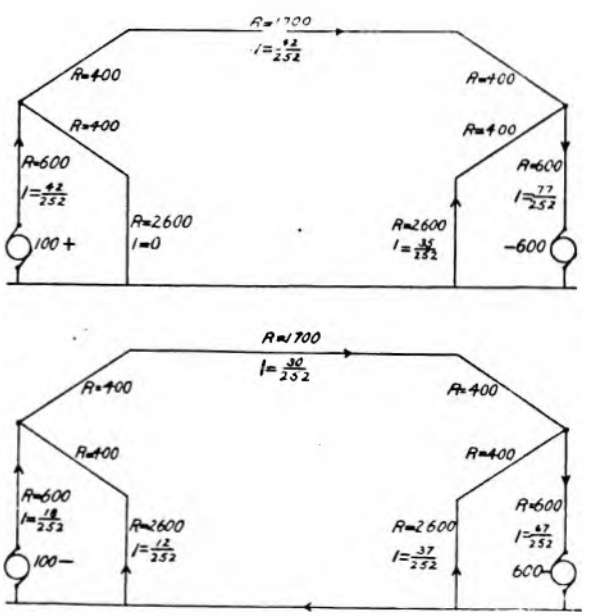
With reference to the operation of duplex and quadruplex circuits there is an interesting feature that I have never seen referred to, and is perhaps understood by very few, besides those familiar with the laws governing current distribution in divided circuits.

Do the currents from the home and distant batteries divide equally between the main and artificial lines, in a perfectly balanced quadruplex or duplex set? The general belief is that they do, but it can be proved mathematically that such is not the case.

It might be well to first explain just what constitutes a perfect resistance-balanced quadruplex



FIGS. 1 AND 2.—DIAGRAMS OF CURRENT FLOW.



FIGS. 3 AND 4.—DIAGRAMS OF CURRENT FLOW.

or duplex set. In Fig. 1 it will be noted that the e. m. f. at Station A dropping to whatever potential it may, at the point of diversion to the main and equating circuits, finds those paths of equal resistance, with 3000 ohms in the equating circuit, and a similar amount in the external circuit; that is to say, 2500 ohms in the line and relays, plus the joint resistance of the distant lamp and rheostat, 500 ohms. This amount will also equal the correct ground-coil value. We may now proceed with a balance to this ground-coil at station A, and we get a difference of potential between the split and the coil of 71 3/7 volts, with a consequent equal division of current between these paths, of 6/252 of an ampere. This condition should exist to effect a perfect balance, yet, strange at it may seem, it does not exist at all when the distant station comes in with battery.

The recorded current values shows (in Fig. 1) only 5/252 of an ampere flowing in the equating circuit, and 6/252 of an ampere delivered to the main line by the home battery. The other 6/252 is, of course, produced by the distant battery.

Whether such a circut is or is not in balance can be proven only by a magnetic test, by reversing at station A. If there is no alteration in the volume of effective current we may safely assume that the balance is preserved. The effective current now is the difference between that flowing in the main line path and that flowing in the equating circuit, or 7/252 of an ampere. These currents passing through their respective coils would on the same core have a neutralizing tendency, 5/252-ampere flowing in the artificial path neutralizing 5/252-ampere of the main line's current, leaving an effective current of 7/252 of an ampere. Now upon reversal (see Fig. 2) there is no difference of potential between X and X' and consequently no current. The equating circuit coil alone, therefore, must maintain the magnetic effect of the 7/252 of an ampere existing before the reversal; hence the reversals exert no disturbing effect. We may now open and close our home pole-changer without producing any effect on the pre-existing magnetic conditions. This is the one very strong argument in favor of these so-called common-side balances, where we meet the actual conditions with rheostat paths; on the other hand the ground coil balance, to say, a standard 600-ohm coil, cannot result in anything else but an approximate discrepancy of 100 ohms in each case.

To those who do not understand how to obtain the required rheostat resistance to balance a duplex attention is called to a formula covering this matter which appeared in Telegraph Age, June 16, 1908.

The conditions represented in Fig. 3 show that

Digitized by Google

no difference of potential exists between the terminals of the equating branch at the home station and consequently there can be no current, and that the working margin must be that found alone in the main line coil, viz.: 42/252 of an ampere. In Fig. 4 it is shown that the working margin on reversal consists of this value plus 12/252 in the artificial line plus 30/252 in the main line, the current flowing through the main line coil in the same direction as before thus proving the balanced condition.

In Fig. 2 it was shown that with an e. m. f. of 100 volts at the distant station the margin was 7/252 of an ampere, whereas, in Fig. 4 it is six times as great, thus proving that the working margin is directly proportional to the voltage of the distant battery. In this case it is particularly noticeable that the increase of the distant e. m. f. to 600 volts has not increased the margin at the distant station, which still remains at 7/252 of an ampere, as shown in Fig. 2.

The working margin at the distant station being the difference between the two opposing currents in the rheostat and main line is, in the case of Fig. 2, 7/252 of an ampere. In the case represented in Fig. 3 it is the same, i. e., 42/252 — 35/252 = 7/252, and on reversal, as shown in Fig. 4, the margin remains unchanged, i. e., 37/252 — 30/252 = 7/252, thus indicating that increasing the distant e. m. f. does not increase the margin at that station. Neither does an increase in the home battery increase the home margin.

Interference of Telegraph Lines Supplied by Current from One Generator.

BY JOHN A. ESSLINGER, WASHINGTON, D. C.

One of the leased wires running into the Washington office of The Associated Press has for years been the cause of much annoyance to the operators on account of induction, soc-called. When the circuit stood closed a current of about twenty-five milliamperes was indicated, enough to operate the line under normal conditions. It was necessary, however, to get a close relay adjustment. If the armature was pulled back a trifle too far the relay would chatter at the opening of the most distant key; if not pulled back far enough, it would act so erratically as to make receiving difficult. Intermediate points came "light" in direct proportion to their distance; yet frequently the Washington office would lose letters that reached other points, the wire being free from interruptions.

By inserting a telephone receiver a veritable storm of counter currents was heard. Many of the signals could be read without difficulty and others required close attention; some were on the back stroke and some on the forward stroke; and there were impulses that could not be read at all. But through it all the rhythmical hum of the generator could be distinctly heard.

When the loop was divided and the receiver connected in series with the line thence to ground, a practically clear wire was indicated, while with the battery end of the loop connected through a condenser in series with the receiver to the ground, the same tumult of signals existed. It was discovered that by connecting a relay in circuit with the line and receiver that the disturbances were considerably reduced when the relay was next to the battery, but increased when the relay was connected to the line side; while a choke coil almost entirely eliminated the "induction," in the first position and aggravated it in the second.

The conclusion reached is that with the opening and closing of the various circuits fed from the one generator the circuits discharged their static charges into the multiple lines at the point of connection with the generator in inverse proportion to the resistance of the circuits, consequently, the Associated Press circuit would receive a static discharge either increasing or diminishing the current flowing at any particular moment. Tests on other circuits indicated that this was the real cause of the disturbance, thus leading to the conclusion that induction is not always the cause of these troubles but that they are due rather to too many wires being connected in multiple to the generator, and that the static discharges from the various lines distribute themselves among the wires closed at the moment. The choke coil has the effect of reducing the disturbances very materially.

The Morse Farewell Reception.

At the dinner of the Morse Electric Club which was held at the Savoy Hotel, New York, April 6, President J. B. Van Every asked if any gentlemen were present who attended the Morse farewell reception at the Academy of Music in 1871 to stand up. Only eight answered to the summons. They were: Mr. J. B. Van Every, Mr. A. R. Brewer, Mr. William Holmes, Mr. W. J. Dealy, Mr. E. P. Griffith, Mr. P. J. Casey, Mr. M. H. Kerner and Mr. T. M. Brennan. When it is remembered how large a throng met at the Academy of Music on that occasion to honor the inventor of the telegraph, the few who responded to the invitation to stand up, a mere handful in comparison, reflected the relentless work of time in "decimating the ranks." The thought was impressive to most of those present at the dinner.

Reorganizing the Western Union.—The *Boston Evening Transcript* of April 15 prints a full-page article by H. A. Bullock under the heading "Reorganizing the Western Union." It is a well-written history of the coalition of the Western Union Telegraph Company and the American Telephone and Telegraph Company and traces the progress step by step of the combination from the conception of the idea in the brain of Mr. Theo. N. Vail up to the present time. It is an excellent exposition of the whole subject.

ADDRESS ALL COMMUNICATIONS TO
J. B. TALTAVALL, - Editor and Publisher
253 BROADWAY, NEW YORK.
T. R. TALTAVALL, Associate Editor.

CABLE ADDRESS: "Telegage," New York.
Telephone: 6657 Barclay

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

May 1, 1911.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Promotion.

It has been suggested to us that the telegraph companies might adopt some method for the promotion of faithful and competent employes so that the latter could look forward to advancement if they possessed the necessary qualifications. The point is made that one company has shown a liberal spirit in dealing with its employes, with highly satisfactory results, and the question is asked why other companies do not adopt the same policy.

There is no question that it pays any company to look after the interests of its employes and make them satisfied as far as possible. This principle is becoming more and more recognized and, happily, put into practice. There is a decided tendency among the telegraph and telephone companies to better the conditions of their employes. By this it does not necessarily mean that a mere increase in salary alone is the cure-all. The tendency is rather to bring about the results through education and self-help and this is by far the most satisfactory method. It is no more than right and just that an employe should be paid all he is worth to the employing company, but on the other hand the employe is under the obligation to make himself as valuable to his company as possible. Through study and observation he is really bettering his condition; financial results may not be shown at once, but when the opportunity does come to step into a higher position he is fitted to occupy it.

If all the capable men were stationed at one point where they could be drawn from as needed to fill positions each individual would in time probably receive proper recognition, but one difficulty is that they are not so arranged. Many are found in out-of-way places and it is difficult for their light to so shine as to be seen at headquarters, and their talents tend to become unproductive in consequence. These men in many cases so unfortunately situated are largely victims of circumstances but the companies could with advantage keep an eye on them so that they could be called upon to fill more important duties as necessities arise. It is said that the French government keeps an accurate record of every horse in France so that in case of war it knows exactly where it can get its supply of horses. In the army and navy of this country and other countries the government knows the location of every man in the service so that he can be called upon at a moment's notice in case of emergency. The same principle could be applied to the operation of large telegraph, telephone and other companies where the employes are scattered over a large territory. In this way each employe would stand upon the records at headquarters at his true value, and his reward would come sooner or later.

These are days of competition and the man who does not keep up with the spirit of the times must fall behind. If he has not the ambition, then no one is to blame but himself for his failure to move forward. The worthy man can not always be overlooked; if he has the right kind of material in his make-up he is sure to be found out. A man must prove himself to be what he claims to be in order to gain acceptance; if he does not measure up to the standard he is rejected. Many who fail ascribe their failure to favoritism in one form or another, whereas the probabilities are that it is due to their own deficiencies. Failures are due largely to influences within ourselves and not to external influences. It has been given to man to have dominion over all things, but in order to obtain this dominion man must work.

The Busy Man's Creed.

The following creed, promulgated by Mr. Elbert Hubbard, is good enough for the man who is not busy, as well as for the busy man, and should be made the rule of life of every man.

"I believe in the stuff I am handing out, in the firm I am working for, and in my ability to get

Digitized by Google

results. I believe that honest stuff can be passed out to honest men by honest methods. I believe in working, not weeping; in boosting, not knocking; and in the pleasure of my job. I believe that a man gets what he goes after, that one deed done today is worth two deeds tomorrow, and that no man is down and out until he has lost faith in himself. I believe in today and the work I am doing, in tomorrow and the work I hope to do, and in the sure reward which the future holds. I believe in courtesy, in kindness, in generosity, in good cheer, in friendship and in honest competition. I believe there is something doing, somewhere, for every man ready to do it. I believe I'm ready—right now!"

Public Control of Public Utilities.*

Public control or regulation of public service corporations by permanent commissions, has come and come to stay. Control or regulation exercised through such a body has many advantages over that exercised through regular legislative bodies or committees. The permanent commission will be a quasi-judicial body. It should be made up of members whose duty it will be, and who will have the desire, the time and the opportunity, to familiarize themselves with the questions coming before them. It should act only after thorough investigation and be governed by the equities of each case. It would in time establish a course of practice and precedent for the guidance of all concerned.

Experience also has demonstrated that this "supervision" should stop at "control" and "regulation" and not "manage," "operate" nor dictate what the management or operation should be beyond the requirements of the greatest efficiency and economy.

Management or operation requires intimate knowledge and experience which can only be gained by continuous, active and practical participation in actual working, while control or regulation can be intelligently exercised, after judicial hearing, by those who have not the knowledge or experience to operate.

Such "control" and "regulation" can and should stop all abuses of capitalization, of extortion or of overcharges, of unreasonable division of profits.

If there is to be state control and regulation, there should also be state protection—protection to a corporation striving to serve the whole community (some part of whose service must necessarily be unprofitable), from aggressive competition which covers only that part which is profitable.

Governmental control should protect the investor as well as the public. It should ensure to the public good service and fair rates. It should also ensure fair returns to the investor.

A public utility giving good service at fair rates should not be subject to competition at unfair rates.

Through a wise and judicious state control and regulation all the advantages without any of the disadvantages of state ownership can be secured, and state ownership doomed.

State control or regulation, to be effective should, when exercised, be accepted and acquiesced in by the public. If all the decisions not in exact accord with the desire or contention of the public are condemned, if it is expected and required that all decisions be against the utilities controlled, if politics and political effect are to govern decisions, if decisions go for nothing with, and are not respected by the public, failure and disappointment are bound to follow, self-respecting men will refuse to act, the standard of appointments will fall and state control and regulation will become a disgrace, and the evils which it was intended to correct will multiply.

If any company gives good service, meets all the reasonable demands of the public, does not earn more than sufficient to provide for the maintenance of its plant up to the latest standard and for reconstruction of plant when worn out or obsolete, pays only fair dividends to its shareholders —if a company is only doing this its rates and charges to the public cannot be unreasonable.

*From the annual report of President Theo. N. Vail of the American Telephone and Telegraph Company.

New Books.

"Telegraphy," by T. E. Herbert, has been revised and brought up to date. This volume gives a detailed exposition of the telegraph system of the British Post Office, and while the apparatus shown is of English design, there is much other matter of value to the American telegraph engineer. The subject of telegraphy is very completely covered in the twenty-two chapters of the book, and the descriptive matter is so clearly written that the student should have no difficulty in grasping and absorbing the ideas and information given.

An idea of the scope of the book may be gained from some of the chapter headings, viz.: Fundamental principles; primary cells; calculations in connection with circuits and conductors; galvanometers, resistance coils and shunts; battery testing; single current systems and relays; duplex; quadruplex; repeaters; different systems of telegraphy; construction of aerial lines; construction of underground lines, etc. The appendix includes a complete description of the Murray automatic system. The book has 912 pages and a very complete index to its contents. Price $3.00. Address J. B. Taltavall, publisher, 253 Broadway, New York.

Rate Regulation in Florida.—A bill has been introduced in the Florida legislature relative to the service and charges of telegraph and telephone companies in that state and conferring jurisdiction over such companies upon the railroad commission.

The Military Telegrapher in the Civil War.

PART LVII.

On April 28 was unveiled the memorial bronze tablet placed in the Soldiers and Sailors Memorial Hall at Pittsburg, Pa., to commemorate the fiftieth anniversary of the founding of the Military Telegraph Corps of the United States Army. Only sixteen out of the original forty-one volunteers from that county are still alive, among them being Mr. Charles William Jaques, of Ashtabula, Ohio. Mr. Jaques was one of the first to volunteer his services at the outbreak of the war and was stationed at Alexandria, Va. He was operator at Fairfax Court House during the battle of Bull Run, and was associated with the late Jesse H. Bunnell in the constant changing about of the scenes of military operations. Mr. Jaques was cipher operator for General Burnside during the latter's march upon Knoxville and was stationed in that city during the siege. In April, 1864, Captain J. C. Van Duzer added a third wire to the line between Chattanooga and Nashville and Mr. Jaques became a member of the operating staff. Continuing his narrative from that point in his experience, Mr. Jaques says:

"I reported to Captain Van Duzer at Nashville about the time General Sherman with his personal staff left for Chattanooga. I was set to work as cipher operator at the headquarters of the Adjutant General's department in Nashville. After a few weeks' work in Nashville I applied to Captain Van Duzer for a place in the field and reported to him at Chattanooga. As soon as our troops had advanced beyond Dalton, Ga., I was sent with Mr. L. B. Spellman to open an office there. While I was there a terrible railroad accident occurred. The water tank, where the engines took their supply of water, was about a mile north of Dalton and up a heavy grade. It was the custom to cut the engines loose from the trains and go to the tank for water returning to Dalton. A train of several cars loaded with wounded soldiers arrived at Dalton. The engineer cut his engine loose and started for the water tank, although he knew that an engine of another train then at Dalton had also gone up the hill for water. When near the tank he met the other engine coming back and, being afraid of a collision he reversed his engine and both he and the fireman jumped off. The two engines came together but did no damage to themselves. The shock, however, started one of the engines down hill and it ran the distance of about a mile constantly gaining in speed until, when it reached Dalton, it plunged into the train loaded with the wounded soldiers. The tank of the engine went nearly half way through the first car and the platforms of the cars were all crushed and the cars themselves so jammed together that the soldiers could not get out through the doors. Many of them jumped out of the windows. I shall never forget the horror of the situation as I saw the engine plunge into this train of helpless persons.

"After spending a few days in Dalton I was sent to the headquarters of General McPherson, commanding the Army of the Tennessee, to relieve Mr. William B. Somerville who was in poor health. I found this to be one of the pleasantest headquarters I had been in during my entire service in the war. General McPherson seemed to realize that an operator was of some consequence and entitled to some consideration. I was furnished with a good horse and sleeping tent and taken into the mess of Adjutant-General Clark and made to feel much at home from the very beginning.

"The Army of the Tennessee was used so much for flanking purposes, changing from right to left and back again that during the Atlanta campaign we seldom remained long enough in any one place to open a telegraph office. The first and only office we had between Chattanooga and Atlanta was at Kenesaw Mountain where we remained for some time. Over this line was arranged the plan of flanking the enemy. This plan was completed one evening while General McPherson spent several hours in the office. Little did either of us think that before we should open another office General McPherson would be numbered with the dead. We all wished that he had been spared a few months longer to see the end of the war for which he had done so much to make successful, and share with his wife who was waiting so patiently for the end of the war to come, the happiness each had looked forward to for so long. As one of his humble friends, I pay a tribute of respect to his memory. He was one of the bravest and ablest and one of the most unassuming of all the officers in the service.

"After this nothing of any particular moment occurred until after the capture of Atlanta. I was taken sick there just as our troops were starting for Savannah and returned to Nashville. I served there for a short time as cipher operator and then left the service for good."

The Turin Telegraph Tournament.—The international telegraph contest which is to be held on the occasion of the International Exhibition of Work and Industry at Turin, Italy, during the coming summer will begin August 22. The competition will comprise trials with Morse, Hughes and Baudot apparatus and is open to employes of the telegraph service of states adhering to the International Telegraph Convention and also to the staff of submarine cable companies and large private telegraph systems. Those desiring to take part in the competition should apply to the Minister of Posts and Telegraphs at Rome, not later than June 15. Prizes will be awarded to individuals competing in each system. There will also be a single championship prize and a single team prize. There will be ten Morse prizes, eight Hughes and eight Baudot.

ANSWERS TO QUESTIONS.

[In this department questions on matters of a practical character, and of general interest, will be answered. Questions intended for this department must be signed by the writer's full name—not for publication, but for identity. No attention will be paid to anonymous communications.]

(37) Q. Will you please tell me what are the relative conductivities of copper and aluminum wires, also their relative weights? B.

A. Taking the conductivity of a given copper wire as unity the conductivity of an aluminum wire of the same gauge will be from .54 to .63, according to the purity of the metal. If the weight of a copper wire of a certain length is one pound, the weight of an aluminum wire of the same length and gauge will be .33 pound.

(38) Q. Is there a simple rule for converting temperature measurements from Fahrenheit to Centigrade and vice versa? If there is, will you kindly state it? J. A. T.

A. The freezing point of the Fahrenheit scale (32°) is equivalent to zero on the Centigrade thermometer, and the ratio between the two scales is 1 to 1.8—that is to say, for every degree of change on the Centigrade scale there is a corresponding variation of 1.8 degrees on the Fahrenheit scale. From these facts we deduce the following rule: To convert Centigrade to Fahrenheit multiply the number of degrees Centigrade by 1.8 and add the product to 32. The sum will be the equivalent temperature on the Fahrenheit scale. Conversely, to change from Fahrenheit to Centigrade, deduct 32 from the given temperature and divide the remainder by 1.8, the quotient will be the equivalent temperature Centigrade. An example will perhaps make the matter clearer. Change 20° C. to the Fahrenheit scale:

$$(20 \times 1.8) + 32 = 68° \text{ F.}$$

Change 68° F. to Centigrade:

$$\frac{68 - 32}{1.8} = 20° \text{ C.}$$

It is only necessary to remember that one degree on the Centigrade scale is equivalent to 1.8 degrees on the Fahrenheit scale. Starting from this relation as a basis a conversion table can easily be constructed.

(39) Q. Does it make any difference, as far as the heating effects of a current are concerned, whether a wire is laid horizontally or vertically? B. L.

A. Yes; with a given current the heating of the conductor will be less when the wire is laid horizontally than when it is suspended vertically.

(40) Q. Our head battery-man, who keeps his battery in first class condition, is constantly complaining of the neglect of the battery-man at another point on the line to keep up his battery to the standard. Our man claims that his battery is being weakened unduly by having to do a portion of the work that the other battery should do, and the two men are at loggerheads over the matter. Will you please give some information on the subject? D. J. W.

A. Your battery man has just cause for complaint. His battery must certainly do the greater part of the work on the line, and consequently is exhausted quicker than it would be if the other battery was doing its proportionate share. It is an easy matter to keep a battery up to the standard of output. A cheap and well-made milammeter can now be obtained for about $5. With this the battery can be tested for output by connecting the milammeter to the two terminals of the battery. If the reading does not come up to the standard, the individual cells can similarly be tested until the defective cell is found. This is an excellent way to keep tab on the battery's performance.

"Looking Backward at Portland," is the title of an interesting book of 100 pages written by Mr. J. W. Hayes, a well-known old-time telegrapher of Portland, Ore. It consists of humorous and interesting stories of the old timers of Portland, of the early eighties, and includes some historical data. In the sketch entitled "A Traveling Auditor" incidental reference is made to several well known old-time telegraph and telephone men. The stories are written in a sprightly and entertaining manner, and make good reading to while away spare moments. The book is well illustrated, the frontispiece showing a picture of the author seated at a typewriter, with his little daughter standing by his side watching the operation of the machine. Mr. Hayes has been totally blind for many years but evidently conducts his business as well as if he were in possession of sight. Copies of the volume which is bound in a substantial paper cover can be obtained at the office of Telegraph and Telephone Age, New York, at $1 per copy.

American District Telegraph of New Jersey.—The report of the American District Telegraph Company of New Jersey for the year ending December 31, 1910, shows the following results as compared with the previous year.

	1910	1909
Earnings	$3,894,578	$3,638,928
Expenses	3,090,832	2,756,779
Profits	803,746	882,149
Dividends	398,549	398,496
Surplus	405,197	483,653
Previous surplus	2,116,390	1,632,737
Profit and loss, adjust. debit	40,160	.....
Profit and loss, surplus	2,481,427	2,116,390

Mr. E. C. Dodge, instructor of the Western Union Electric Club, at Chicago, is wide awake and is making strong efforts to keep his students interested and enthusiastic in their work. In a recent circular distributed among the members of the class he makes some very forcible and convincing suggestions calculated to encourage his students and sustain them in their studies.

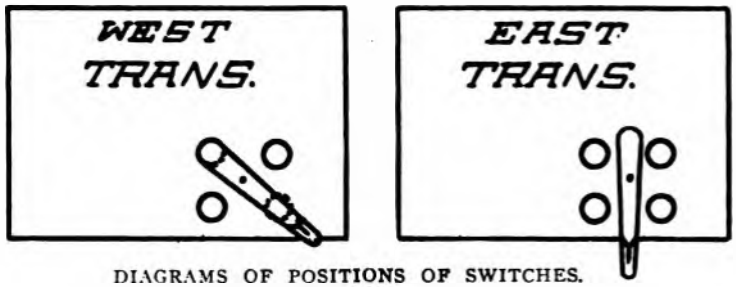
Testing Repeater Points.

A quick method of testing the main line points on a Weiny repeater without disturbing the operation of the repeater has been devised by Mr. J. B. Slocum, night chief operator of the Postal Telegraph-Cable Company, Buffalo, N. Y.

The method is described and illustrated in *The Postal Telegraph* as follows:



DIAGRAMS OF POSITIONS OF SWITCHES.

When the East is sending and it is desired to know how the signals are passing through, the switches are thrown as indicated in the diagrams.

When the switches are placed as indicated the East signals repeater through to the West line and also operate the West relay, which in turn actuates its transmitter as a sounder. The East sender is not interfered with because the East line points in the West transmitter are short circuited by the switch.

QUESTIONS TO BE ANSWERED.

[We are daily receiving letters of commendation upon our plan of publishing lists of questions covering chapters in Jones' Diagrams. Students of telegraphy throughout the country are finding these questions of great assistance in their attempts to master the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. We will continue to print similar lists of questions until we have covered all of Jones' Diagrams in this way. We will then take up Maver and Davis' "Quadruplex" and other standard works of telegraphy and treat them in the same manner.]

CHAPTER LII.

What is the "Decade" Wheatstone bridge?

What were the conditions which gave rise to the development of the "Decade" testing set?

Name the component parts of the "Decade" testing set.

Describe the construction of the D'Arsonval galvanometer.

Why is the pointer of this instrument "dead beat?"

What causes the pointer to oscillate?

What form of shunt is used in connection with the galvanometer?

In what respect does the shunt differ from the old-style shunt?

What is the principal advantage derived by the use of the universal shunt?

What are the connections for insulation tests?

What is the galvanometer constant?

How is the constant obtained?

To what class of tests is the "Decade" outfit particularly adapted?

What particular kind of test is used for underground cables?

How is a test made to locate a ground in a conductor in an underground cable?

Describe the "R" test.

What is the purpose of the "R" test as described?

What is the principal object sought in making tests for faults in conductors?

What is the rule for ascertaining the distance in feet of a fault?

In making tests, where leads are used, why is it necessary to know the resistance of the leads?

Describe the connections of the direct polar-relay repeater of the Postal Telegraph-Cable Company.

Describe the construction of the Western Union Telegraph Company's standard lightning arrester, fuse and holder.

Describe the new type of switchboard referred to at the end of Chapter LII.

In designing this board what was the object sought?

What are the advantages of this board?

[This concludes the chapters in Jones' Diagrams. In our next issue we will take up Maver and Davis' "Quadruplex" and treat it in the same manner.]

Emergency Resistance in Testing.

When measuring currents with an ammeter, in the field, it not infrequently happens, says Mr. F. H. Kingsley, in *The Signal Engineer*, that the highest scale reading is not sufficiently large to permit the measuring of the current in question. If the needle is thrown over beyond the end of the ammeter scale, under these conditions, it is still possible to obtain an intelligible reading as follows: Shunt the ammeter terminals, while in the circuit, with a resistance, varying this resistance until a scale reading is obtained. Any number of readings may then be taken with the resistance remaining as thus determined. After completing the test, care should be taken not to disturb the emergency shunt. At the home station, the readings of the ammeter used for the field test, still equipped with its emergency shunt, may be compared with a standard instrument of proper range. Then, by means of direct proportion, the correct values of the field readings may be accurately calculated.

Interesting Subjects Treated in Back Numbers.

Telegraph and Telephone Age publishes the best articles which can be obtained anywhere upon telegraphic subjects. We enumerate herewith a few of the many important subjects treated in our columns during the past few years, together with the dates of the papers containing the same. We have a limited supply of the back numbers containing these articles which we will send to any address upon receipt of price, 25 cents each. Any of these issues less than six months old are not regarded as back numbers, but will be sent upon receipt of the regular price, 10 cents. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Directory of Annual Meetings.

Association of Railway Telegraph Superintendents meets at Boston, Mass, June 19-23, 1911.

Commercial Cable Company meets the first Monday in March, at New York.

Great North Western Telegraph Company meets the last Wednesday in September, at Toronto, Ont.

International Association of Municipal Electricians meets at St. Paul, Minn., September 12, 13, 14 and 15, 1911.

Old Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps, will meet at Atlantic City, N. J., September 5, 6 and 7, 1911.

Postal Telegraph-Cable Company meets the fourth Tuesday in February, at New York.

Telegraphers' Mutual Benefit Association meets the third Wednesday in November, at New York.

Train Despatchers Association meets in Baltimore, Md. June 20, 1911.

The stockholders of the Western Union Telegraph Company meet the second Wednesday in October, at New York; election of officers occurs on the third Wednesday in October.

Telegraphers and telephonists should make a study of their professions. They can do this without loss of time by studying books on telegraphy and telephony. Telegraph and Telephone Age, 253 Broadway, New York, is headquarters for all electrical books published.

Damage to Poles by Woodpeckers.

BY C. T. DAY, SUPERINTENDENT OF TELEGRAPH SOUTHERN PACIFIC RAILWAY IN MEXICO, EMPALME, MEXICO.

In our issue of December 16, 1910, we printed an article from Mr. C. T. Day, superintendent of telegraph of the Southern Pacific Railway in Mexico, Empalme, Mexico, in which he gave a brief account of the damage to poles on the lines of his company by woodpeckers. Mr. Day has sent us several photographs of poles damaged in this way, which show that the birds are very thorough in their work and leave nothing to be desired in the number and size of holes.

The two views shown herewith are typical. That of the pole reveals the effects of the woodpeckers' work. The pole is certainly well ventilated.

With the photographs Mr. Day sends us some additional facts regarding the pole situation in that country, which we print herewith. He says:

"I have just finished reading your interesting articles on the pole situation. It seems to me that our lines here in Mexico have been hit harder by adverse conditions than are lines in the States. To give you some idea of the damage done by woodpeckers to our poles on the Sonora Railway, between Magdalena and Torres, a distance of 229 kilometers (142 miles), I may state that we have

FIG. 1.—PIECE OF A POLE DAMAGED BY WOODPECKERS.

just completed the work of changing 500 poles. Of this number 450 were removed on account of being so weak from holes made by the birds that they were no longer fit for service. Of these poles a number were creosoted, some of them having been set in 1908. Others were redwood, cedar and pine.

"One of the pictures shows a piece of a pole damaged by woodpeckers. One creosoted pole taken down had six holes, starting a foot below the crossarm. The first hole was two and one-half inches wide by eight inches long, the cavity extending five inches into the pole horizontally, and having a vertical depth of one foot. The pole at this point, therefore, was a mere shell. The

FIG. 2.—POLE SHOWING EFFECTS OF WOODPECKER'S WORK.

other holes were slightly smaller and of the same general shape.

"Last spring we began reconstructing with a small gang of men, using a burnettized pole with creosoted butt. It was claimed that these poles would stand any attack the birds might make, but I find that they are attacked as readily as cedar or creosoted pine. The only remedy seems to be to use a concrete pole, which we are figuring on now."

Mr. Frank B. Knight, the well known old-time and military telegrapher and for the past 20 odd years special agent and head of the publicity department of the Southwestern Telegraph and Telephone Company at Dallas, Tex., has always been a reader of this publication. He writes: "Telegraph and Telephone Age is simply fine these days, and I see it everywhere. It evidently enjoys a great circulation and is disseminating a lot of information on all sorts of subjects, which is not only interesting but valuable."

The Military Telegraph Corps Tablet at Pittsburg.

The accompanying illustration was made from a portrait of the bronze tablet which was unveiled at Soldiers' and Sailors' Memorial Hall, Pittsburg, Pa., April 28. This tablet was erected to commemorate the fiftieth anniversary of the founding of the United States Military Telegraph Corps and in memory of the forty-one volunteers from Allegheny County, Pa., who served in the corps during the civil war. The names of the forty-one men who enlisted, including those who have died and of the survivors, were printed in our issue of April 16.

MILITARY TELEGRAPH CORPS TABLET UNVEILED AT PITTSBURG, PA., APRIL 28, 1911.

The tablet measures nine feet long by four and a half feet high and was designed and modeled by Mr. Charles Keck of New York. Mr. Keck was the pupil and assistant of the late St. Gaudens, the famous sculptor.

The faces set in relief along the border of the tablet will be easily recognized and the artist has performed his task well in reproducing the features of the twenty-eight men thus represented. The names of the remaining thirteen, pictures of whom could not be obtained, are inscribed above and below the inscription.

Following is the inscription on the tablet: "To Commemorate the United States Military Telegraph Corps from Allegheny County, Pennsylvania.

"Washington, D. C., April 22, 1861.

"D. McCargo—Send four of your best operators to Washington at once prepared to enter government service for the war.

"Andrew Carnegie.

"No orders ever had to be given to establish the telegraph. "Grant's Memoirs."

The unveiling exercises took place at 4 p. m., the presentation address being made by Mr. David H. Bates, secretary of the Society of the United States Military Telegraph Corps. Mr. William J. Patterson, president of the Memorial Hall Committee, made the address of acceptance, and this was followed by an address by Mr. Andrew Carnegie, founder of the Corps. Other addresses were made by Mr. Richard O'Brien, of Scranton, Pa., one of the first four operators, and Mr. William R. Plum, of Lombard, Ill., historian of the Corps.

Associated Press Telephone Service.

About thirty papers are now receiving the Associated Press service by telephone, varying from 1,000 to 5,000 words and transmitted at regular intervals during the day or night. The changes from telegraph to telephone occurred mainly in the Central West and followed the recent action of the Interstate Commerce Commission in assuming control of the telegraph companies, which brought about some increase in rates.

Special instruments are installed in the central office, from which the report is telephoned, and at the receiving end of the wire. Several receiving points are connected, and all get the same service at one sending. The report is copied directly on the typewriter. After a little practice, senders and receivers harmonize their methods and work with a minimum amount of friction and delay.

Value of Property Used in a Telephone Conversation.—Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company and of the Western Union Telegraph Company, recently gave some interesting figures showing the value of the property placed at the disposal of telephone patrons during conversations over long-distance lines. "You hear a good deal of complaint," he said, "about high charges for long-distance calls. But as conditions have existed in the past we had to charge high. Let the complainer do a little calculating and he will understand. There are about 240 pounds of copper in a mile of wire. At 15 cents a pound this means $72 per mile. Add to this the cost of poles, installation and all that, and we have $122 per mile. When a man in New York calls up Chicago, he has at his disposal about $125,000 of our property. Allowing 6 per cent. interest on that sum, and another 6 per cent. on depreciation, we have an annual cost of about $15,000, or $50 a day. That is a fixed charge, and the tolls must be high enough to leave an appreciable profit. Through contracts which have been made by the American Telephone and Telegraph Company and the Western Union it is now possible for us to use these long-distance telephone wires for telegraph service. One wire will provide four telegraph circuits. In this way it will be possible to increase greatly the earning capacity of the wires and open the way for a reduction in the tolls on long-distance calls."

The Early Days of the Telegraph.

The difficulties that Professor S. F. B. Morse had to overcome in the development of his telegraph were enough to discourage the average man, and many of the objections urged against the adoption of the new invention were amusing in the extreme.

The Baltimore & Ohio Railroad rendered what aid it could to Professor Morse in the development of the telegraph, but a rival road later advanced the idea that the telegraph would interfere with traffic, for if people could speak with each other so quickly they would not care to meet, hence they would not travel. The resolution drawn up by the Baltimore & Ohio Railroad Company agreeing to allow Professor Morse to use its right of way for his telegraph poles contained the amusing proviso that the sending of electric messages shall be allowed if they do not in any way "prove injurious."

The diagrams appearing in "Official Diagrams of the Postal Telegraph-Cable Company's Apparatus and Rules Governing the Construction and Repair of Lines" were made from the company's blueprints and are absolutely correct. This volume, which is published by Telegraph and Telephone Age, under official sanction and supervision, is of especial value to operators and linemen. It will be sent to anyone, postpaid, on receipt of fifty cents. Address J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York.

Signaling System for Quadruplex and Duplex Circuits.

The Western Union Telegraph Company, through the office of Mr. W. E. Athearn, engineer of equipment, New York, has issued specifications for the installation and operation of a signal system to secure prompt attention on quadruplex and duplex circuits. The following extracts and illustrations are taken from the *Journal of the Telegraph*:

In the operation of multiplex telegraph circuits, the best practice is to locate the quadruplex and duplex sets for each city in a selected portion of the main office, where they may be most efficiently cared for by attendants who are specialists in this work. From these sets, local loops or legs extend to the operating tables, which are equipped with simple Morse apparatus consisting of keys and sounders; such operating tables may be located in the operating room of the main office, or at a branch office or subscribers' station in the same city.

When trouble of any kind develops on the circuit, it is necessary that the attention of the quadruplex or duplex attendant be promptly called to it, in order that he may remedy matters by readjustments of the apparatus, or by substituting a good wire for a faulty one. To supersede the present indirect methods of securing attention at such times, a signaling system has been devised which permits an operator who notices trouble on his circuit to immediately call in, by pressing a push button, the attendant at the multiplex set. This lights the signal lamp at the quadruplex or duplex set, whether the key at the operating table is open or closed. If the circuit is still workable, the operators may continue to use it, as the signal lamp will not be extinguished until the attendant answers at the multiplex set. In so answering, the first opening at the attendant's Morse key automatically extinguishes the signal lamp; when the attendant closes his Morse key, the lamp is ready to respond to another call-signal whenever the push-button may be depressed again.

This signaling system depends for its operation upon a small relay, which has an ironclad magnet of about one ohm resistance. For ordinary cases, where loops or legs are connected directly to duplex or half-quadruplex sets, one of these relays is connected in the sending side at the set. This relay is unaffected by the regular working current of about 250 milliamperes, but operates when the current is increased to 350 milliamperes or more. Such an increase of current occurs whenever the signaling push button is depressed at the operating table. This is accomplished, in the case of an office loop, by having the push button make contact between the loop and an auxiliary path to ground of lower resistance than the regular working circuit; at a branch office or subscriber's station a 3-point push button is used instead, and cuts in an additional battery of such voltage and polarity as to similarly increase the current. In responding to the increase of current, the signal relay armature closes the circuit of the signal lamp, and thus locks itself in the closed position, as the current of about 300 milliamperes taken by the

Digitized by Google

lamp is obtained through the relay winding and continues to energize the magnet regardless of whether the circuit at the operating table is open or closed. It will therefore be seen that a single depression of the push button at the operating table will cause the signal lamp at the quadruplex or duplex set to become and remain lighted, even though the circuit may continue to be operated and the sending leg thus be opened and closed by the manipulation of the Morse key at the operating table. It is also immaterial whether or not the Morse key at the operating table is closed at the time the push button is depressed. To extinguish the signal lamp, the attendant at the quadruplex or duplex set simply answers by Morse in the usual way; the first opening of his key for this purpose cuts off all current

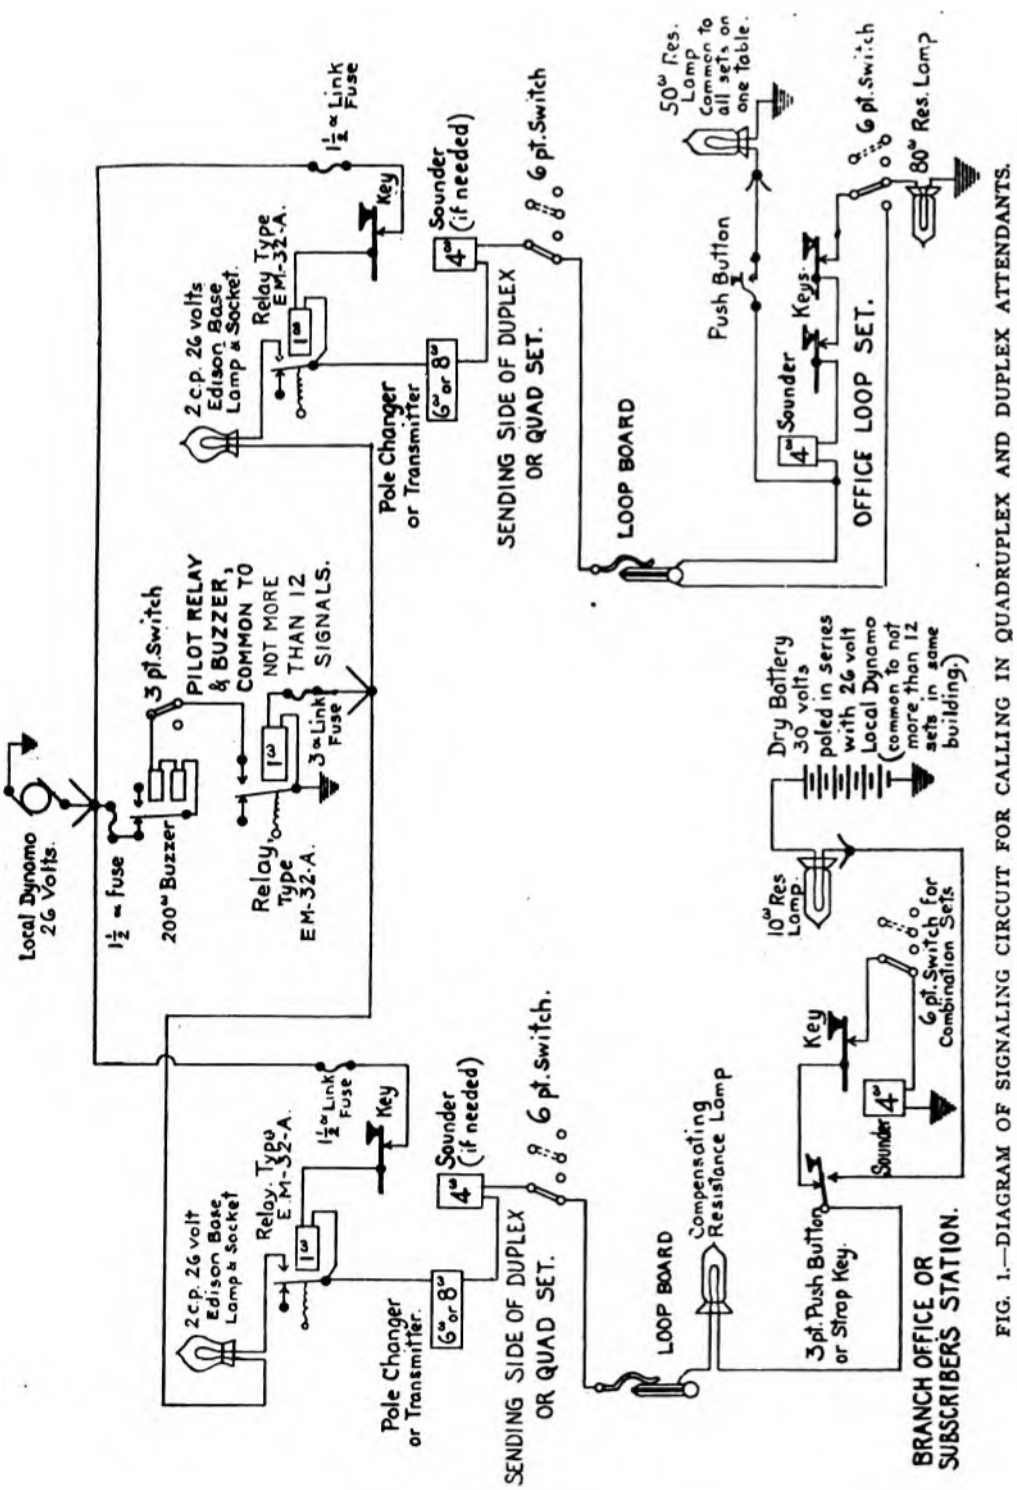

FIG. 1.—DIAGRAM OF SIGNALING CIRCUIT FOR CALLING IN QUADRUPLEX AND DUPLEX ATTENDANTS.

Digitized by Google

from the sending side circuit, including the signal relay and lamp, thus causing the relay magnet to release its armature which in turn opens the lamp circuit. In order that the need of attention at a multiplex set may be promptly met, even if the attendants fail to notice the lighting of a signal lamp, a pilot relay is inserted in the ground connection of each group of lamps. This relay is of the same type as the signal relay. When one or more lamps are lighted in the group connected with it, the pilot relay closes a circuit containing a bell or buzzer, thus giving the necessary audible signal. A two or three point switch is provided for opening the buzzer circuit during periods when the number of attendants is such that a lighted signal lamp is certain to attract attention.

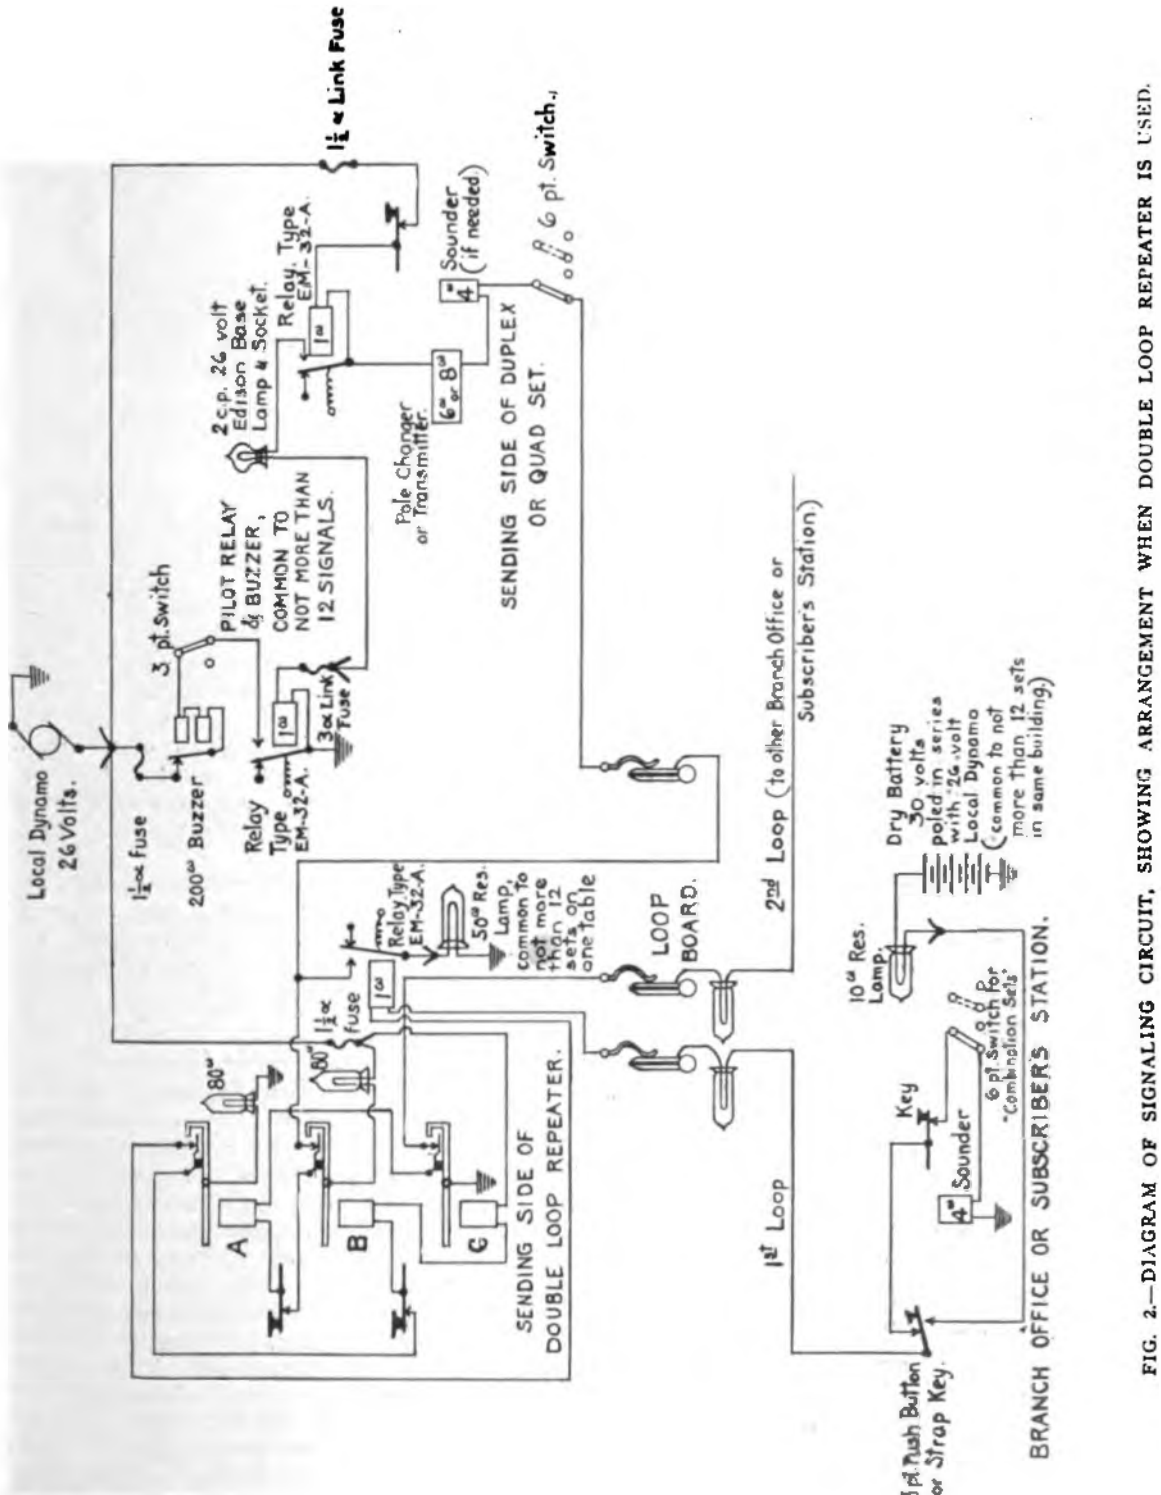

FIG. 2.—DIAGRAM OF SIGNALING CIRCUIT, SHOWING ARRANGEMENT WHEN DOUBLE LOOP REPEATER IS USED.

Digitized by Google

For those cases in which the sending and receiving legs are connected to the quadruplex or duplex sets by means of a double loop repeater, a relay is provided at the double loop repeater. The function of this relay is merely to repeat into the sending circuit of the multiplex set, the signals made by the depression of the push button in the sending leg with which connection is made through the double loop repeater. The relay is therefore adjusted so as to follow the operation of the push button, the magnet attracting its armature while the increased current is flowing, and releasing it when the current is reduced to its normal value by the releasing of the push button. The closing of the relay armature reduces the resistance of the sending circuit of the multiplex set in the same way as the operation of the push button at an office loop set, thus setting the signal at the multiplex table. The duplex or quadruplex attendant restores the signal as previously explained, by answering there with his Morse key and is not required to go to the double loop repeater set, since the signal-repeating relay at that set has already restored itself on the release of the push button.

Train Portable Telephone Sets.

With the spread of telephone train dispatching among the railroads the portable telephone set has come into extensive use on such lines. This set is

FIG. 1.—SET EQUIPPED WITH 5-BAR GENERATOR.

being used by officials in their private cars, inspectors, train crews and construction, bridge and wrecking gangs.

FIG. 2.—SET WITH LEATHER CASE, CLOSED.

By the use of these sets communication can be established immediately between a distant point and headquarters connection being made with the telephone train wires by means of a line pole.

The Western Electric Company manufactures

FIG. 3.—SMALL AND LIGHT TALKING SET, IN LEATHER CASE.

three types of portable railway sets. The set shown in Fig 1 is equipped with a powerful 5-bar generator and finished with a special weatherproofed varnish. The construction is of the strongest throughout, and the corners are reinforced with steel. The hand set is attached to a 6-foot cord so that the user may stand upright when the set is on the ground, and a push-button is provided so that the transmitter circuit is closed only when desired. The set shown in Fig. 2 is of similar design, but equipped with a 3-bar generator, and that illustrated in Fig. 3 is for use on train wires where the dispatcher is at all times connected with the circuit; it has no generator.

Many of the roads are equipping every train on their lines with these sets, and their use on wreckers is very general. In some cases, the portable telephone set is made part of the standard equipment of the engine.

Other Trade Notes.

Selective Train Order Signaling.—The United States Electric Company has issued Bulletin No. 701, entitled "Some Preventable Accidents," in which three of the collisions reported in the latest train accident bulletin of the Interstate Commerce Commission are studied and shown to be preventable with apparatus now available to the railways. This company's system provides, in brief, for the absolute control, by the dispatcher, of any semaphore or train-order board which he may throw to the stop position, independent of the presence of local attendance. The signal, when so thrown, reports itself audibly to the dispatcher and cannot be set back in the safety or proceed position until electrical permission so to do has been given by the dispatcher, although the dispatcher may clear the signal without the intervention of the train crew or agent.

Electric Storage Battery Company.—The Electric Storage Battery Company, Philadelphia, Pa.,

Digitized by Google

will erect a new reinforced concrete building in that city, approximately 300 feet long, 115 feet wide and six stories high, besides a one-story extension 80 by 120 feet. It will be the largest building of that type in the city. The demand for this company's storage batteries has increased to such an extent that it has been necessary to provide additional manufacturing facilities.

Dinner of English Electrical Engineers.

In an address before the eighth annual dinner of the Post Office engineering department, London, the Hon. Herbert Samuel, postmaster general, referred to the new telephone cable between England and France.

"Certainly," he said, "the new cable has enabled telephonic communication to be made between Paris and Glasgow and conversations have been successfully held, I presume, in a mixed French and Scotch accent between these two places. For myself, I am, of course, a layman in these matters and make no pretensions to any but a layman's knowledge in that respect. I am not quite so ignorant, however, of electrical matters," he continued, "as the man who recently was mentioned to me by Sir John Gavey. He was pursuaded that the way in which faults were discovered in submarine cables was to pump air into them and watch with a telescope to see where the bubbles came up. But any of us who have the ordinary organs of hearing are able to judge—as I myself have been able to judge—by actual test the extraordinary efficiency of the new telephonic cable compared with the old one which maintained communication between our country and France."

Mr. Alexander Siemens, president of the Institution of Civil Engineers, said he was in charge of the work of building telegraph lines in Persia in 1868. The line had to cross a mountain peak and it was laid out in a straight line for 80 miles. Someone afterwards asked "who was the idiot that laid out that line." Mr. Siemens acknowledged that he was the person concerned. The man said "whoever built the line set it up in the middle of the road." This appeared to be true, the explanation being that the caravans followed the telegraph line, some going to one side and some the other, and that was how the poles got in the middle of the road.

Mr. S. Z. de Ferranti, president of the Institution of Electrical Engineers, made some interesting remarks regarding his early work in the utilization of high-voltage currents and made some humorous references to the controversy he had with the post office department in regard to the use of the earth for grounding purposes. The matter was finally adjusted amicably, but on one occasion one of the high tension cables failed between London and Deptford station so that he was compelled to ground both ends of the cable in order to establish a lighting circuit. The result was that telegraph service with the continent was demoralized for the entire night, and in referring to the matter the newspapers next day stated that the trouble was due to an electrical storm.

Among those present at the dinner were Major W. A. J. O'Meara, engineer-in-chief, presiding; Mr. William Marconi; Sir John Gavey, ex-engineer-in-chief; Mr. Alex. Siemens, Mr. S. Z. de Ferranti, Mr. W. Duddell, Dr. Walmsley, Prof. Ewing, Col. Bain and Mr. J. Newlands.

More the Haste Less the Speed.

The story of the five wise and five foolish virgins is brought to mind by the experience of an eminent electrician of the Western Union Telegraph Company who was arrested while riding his bicycle at night without a light. He explained to the policeman that the light had just gone out, but the policeman, being a wise man, and knowing the habit bicycle lights had of extinguishing themselves when a policeman heaves in sight, gathered in the victim in spite of his protestations. He was, to the large crowd which speedily gathered, a hero, but when they learned that it was a case of light out they dispersed in disgust.

Mr. Carnegie who is reputed to be one of the richest men in the world occasionally encounters streaks of ill-luck, despite the general belief that he and others of his ilk have nothing else to do but enjoy themselves. Mr. Carnegie was caught red-handed a few days ago with the goods. The law knows no persons, and dispenses justice and injustice upon all alike, rich and poor. As if Mr. Carnegie had not sufficient notoriety, he succeeded in having himself and his chauffeur arrested recently for violating the automobile speed law. To this humiliation he was compelled to add another in confessing to the court that he did not have such a fabulous sum as $50 about his clothes with which to satisfy the demands of the law for his reckless driving. Mr. Carnegie, after pledging his Fifth Avenue mansion to pay the fine, was permitted to depart and keep an engagement to play a game of golf with some friends.

Following close upon the heels of the Carnegie episode came the announcement that Mr. and Mrs. Clarence H. Mackay had, individually and separately, without malice aforethought, brought themselves into the limelight of public notoriety by speeding their automobiles into the arms of a couple of obscure country guardians of the law yearning for fame. Mrs. Mackay had hardly been released from durance vile when word came of the arrest of her estimable husband for the same offence. Rich men do not speed their automobiles in the race after wealth alone; even they have different motives. Mr. Carnegie's goal was golf and Mr. Mackay's was dinner. Mr. Mackay's automobilistic haste can be explained on the ground that he is a living exponent of haste and speed. He advocates speed in the telegraph business and he is constantly preaching the speed gospel to his subordinates, so it is not surprising that speed has become second nature with him. It is not reported how much money Mr. Mackay had with him, but he got his dinner.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

The Railroad.

Mr. J. F. Keegan, recently appointed superintendent of the Baltimore & Ohio Railroad at Wheeling, W. Va., was formerly a telegraph operator. His entire business career has been spent in railroad service.

J. C. Dailey, aged 47 years, a leading railroad official in the West, and a former telegrapher, died in Salt Lake City, Utah, April 3. At the time of his death he was general superintendent of the Utah lines of the Denver and Rio Grande Railroad.

Mr. Wm. M. Hayes has been appointed superintendent of telegraph of the Pere Marquette Railroad, with headquarters at Detroit, Mich., to succeed Mr. Theodore Ensel who has been promoted to division superintendent at Grand Rapids. Mr. Hayes was formerly chief clerk to the division superintendent at the latter place. Mr. W. K. Tasker, formerly superintendent of telegraph of this system, is now division superintendent at Detroit.

Telephone Train Dispatching.—Mr. G. K. Heyer of New York, gave a talk on "Telephone Train Dispatching," before the Boston Plant Chapter of the Telephone Employe's Association of New England, on April 28. The lecture was illustrated by lantern slides.

The Boston Convention of Railway Telegraph Superintendents.

The Association of Railway Telegraph Superintendents will meet in annual convention at the Hotel Brunswick, Boston, Mass., June 19-23. The meeting will probably be one of the most important ever held by the association, as the rapid developments in railway telephony, dispatching, etc., are constantly bringing up new problems that require careful consideration at the hands of the association. It will be a busy convention, and several valuable papers are promised and Mr. W. C. Walstrum, of Roanoke, Va., chairman of the committee on topics, is very busy arranging for the papers to be read. The entertainment features have not been overlooked, and elaborate provisions have been made in this respect. Automobile rides, musical entertainments, etc., will be provided. Mr. S. A. D. Forristall, superintendent of telegraph of the Boston & Maine Railroad, Boston, Mass., is chairman of the committee having the business and entertainment programme in charge. One of the important matters to come before the meeting will be the Turner Monument project, and the plans for the monument will be officially passed upon.

Mr. P. W. Drew, Room 306, 135 Adams street, Chicago, is the secretary of the association and will be glad to furnish further information regarding the meeting.

Telephone Train Dispatching.

The Queen & Crescent Railway has completed the construction of a telephone train-dispatching circuit paralleled by a local message telephone circuit on the second district of the Cincinnati, New Orleans & Texas Pacific Railway, which extends from Danville, Ky., to Oakdale, Tenn., 134 miles. There are more than twenty tunnels on the division.

Telephone Train-Dispatching Statistics.—According to the bulletin of the Interstate Commerce Commission, just issued, 41,717 miles of railway in the United States used the telephone train-dispatching system on January 1, and the telegraph was used on 175,211 miles. The telephone figures represent an increase of 15,372 miles for the preceding year.

Atlantic City Meeting of Old Timers.—The Atlantic City meeting of the Old Time Telegraphers and Historical Association and the Society of the United States Military Telegraph Corps, on September 5, 6 and 7, promises to be one of the most enjoyable and largely attended meetings ever held by the twin organizations. Plans for the meeting are being developed and announcement will be made to the members of anything of interest. The headquarters will be at the Marlborough-Blenheim. Col. W. B. Wilson, Holmesburg, Pa., is president of both associations, and Mr. F. J. Scherrer, 30 Church Street, New York, is secretary of the Old Time Telegraphers and Historical Association. Mr. David Homer Bates, 658 Broadway, is secretary of the Society of the United States Military Telegraph Corps. Mr. G. W. Deetz, manager of the Western Union Telegraph Company, Atlantic City, N. J., is a member of the executive committee and has charge of many of the local arrangements.

Electrical Condensers.—Mr. William Marshall, the well known manufacturer of electrical condensers and artificial cables, New York, has just issued a pamphlet describing and illustrating the various kinds of condensers manufactured by him. Apart from the trade description and specifications of these instruments, the pamphlet gives considerable information regarding the theory and construction of condensers in general, also directions for their use. A copy of this pamphlet can be obtained by any one interested by addressing Mr. Marshall at 709 Lexington Ave., New York.

Dr. A. E. Kennelly, professor of Electrical Engineering at Harvard University, and an old-time telegrapher, has accepted an invitation from the University of London to deliver a series of lectures during the latter part of May, on "The Application of Hyperbolic Functions to Electrical Engineering Problems.

Pollak-Virag System of Telegraphy in France.—It is stated that the Pollak-Virag system of telegraphy will be used in France for the purpose of transmitting press matter.

The Turner Monument Fund.

An opportunity is offered to those who have any ideas on the subject of commemorative monuments to submit sketches for the monument to be erected at Turner, N. Y., to commemorate the sending of the first telegraphic train order which took place in the fall of 1851 and was issued by Charles Minot, general superintendent of the Erie Railroad.

In our issue of January 1 we gave a sketch for the monument which has been submitted to the committee for approval, but so far this is the only design that has been sent in. It is the committee's desire to have other designs to pass upon, and it invites general competition in the work. It should be distinctly understood that the plan already submitted has not been accepted, therefore the way is open for others who may wish to express their ideas of what a monument of this character should be. The competition is not confined to professional monument designers; all are invited to participate in the contest. Frequently better ideas are obtained from laymen than from professionals.

The committee having the matter in charge expects to hold a meeting in the near future to pass upon plans and suggestions which may be submitted to it. A rough sketch embodying the individual ideas will answer in the absence of a more finished drawing. It is hoped that as many as possible will enter the competition with a drawing of some sort, but preferably telegraphic in character.

The fund is steadily growing and now amounts to nearly one-half of the total needed, viz.: $3,000.

The following named gentlemen constitute the committee in charge of the monument fund: E. P. Griffith, superintendent telegraph, Erie Railroad, Jersey City, N. J., chairman; Charles Selden, superintendent telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, Telegraph and Telephone Age, New York; E. A. Chenery, superintendent telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railway, Montreal, Canada; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia. F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who has been elected treasurer of the fund. All contributions are acknowledged in the columns of Telegraph and Telephone Age, and the funds deposited with the Washington Trust Company, New York, as soon as received.

The contributions toward the fund received up to date are as follows:

Previously acknowledged, $1,316. M. J. Carpenter, $1.00; M. W. Wells, $0.50; E. H. Pfafflin, $0.50; H. Knowles, $0.50; F. H. Van Etten, $1.00; J. T. Averitt, $0.25; D. M. Cameron, $0.25; C. T. Young, $0.25, all of Chicago, Ills.; H. P. Radley, $0.50; F. A. Leith, $0.25; E. E. Heller, $0.25; F. W. Cherry, $0.25; W. E. Allen, $0.25; E. C. Sappenfield, $0.25; N. D. Fisher, $0.25; H. E. Fitch, $0.25; C. S. Roof, $0.25; W. H. Powley, $0.25; A. P. Turner, $0.25, all of Terre Haute, Ind.; W. O. Duntley, President Chicago Pneumatic Tool Company, Chicago, Ills., $15.00; G. A. Cellar, Pittsburg, Pa., $5.00; R. H. Wallace, $1.00; J. F. Shinn, $1.00; H. W. Hawley, $1.00; W. O. Rock, $1.00, all of New York; A. C. Hilton, $1.00; J. F. Condon, $1.00, Buffalo, N. Y.; F. S. Howard, Elmira, N. Y., $1.00; R. O. Humphrey, $1.00; W. L. Ferris, $0.50, Passaic, N. J.; H. R. Cole, Arlington, N. J., $1.00; American Brake Shoe & Foundry Company, Mahwah, N. J., $25.00.

Total, $1,377.75.

Death of Fred Catlin.

Fred Catlin, one of the best-known telegraphers ever produced in America, died at his home in East Orange, N. J., on April 14, at the age of 63 years. He was a born expert operator, and was expert not only as a sender, or as a receiver, but both, besides being an expert in penmanship. In addition to these qualifications which brought him wide renown, Mr. Catlin was a man of high character and of pleasing presence. He was always domestic in his habits and for this reason he did not wander around the country, as many other famous operators did. But this did not detract from his fame, which grew to be world wide.

Mr. Catlin was really a phenomenon in the telegraphic world. As a sender his style was adjudged to be most perfect and finished besides being speedy, and as a receiver he was equally skilled, and his penmanship was graceful and beautiful. His style of sending was of such grace and ease that it practically became the American standard, and the Catlin "grip" of the key was the model for operators for a generation.

By reason of his peculiar fitness to give things a finish Mr. Catlin was always selected to carry out special telegraph work, where good judgment and taste were involved. He taught telegraphy to Mr. George J. Gould, and his distinguished pupil speedily became a good operator under his instruction.

Much of Mr. Catlin's fame came from his active management of various tournaments held in New York and vicinity during the past forty years. He managed these events with masterly skill and they always received the enthusiastic support of the profession and met with great success. While his musical Morse sending is forever silenced his extraordinary skill as an operator is reflected in his son Frank L., whose fame as a high-class telegrapher is country wide.

Mr. Catlin was born in Great Bend, Pa., March 26, 1848, and learned telegraphy on the Erie Railroad. He was in the service of the Western Union Telegraph Company in New York for forty-five years.

The funeral took place on April 16 and was attended by many of his former telegraph friends. He is survived by his wife, three daughters and two sons.

Digitized by Google

The Telephone.

Mr. D. H. Drewery, commercial manager of the Pacific Telephone & Telegraph Company, Seattle, Wash., has resigned to become general manager of the Kootenai Telephone Lines, Limited, of Cranbrook, B. C.

Mr. Angus S. Hibbard, second vice-president and general manager of the Chicago Telephone Company, has been elected a director of the Chicago Savings Bank and Trust Company. Mr. Hibbard will remove to New York early in May to take a position on the staff of Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company, and of the Western Union Telegraph Company.

Telephones in New York Cathedral.—The new Cathedral of St. John the Divine in New York, which was dedicated April 19, is equipped with an extensive telephone system.

Telephones for Rangers.—Rangers in the National forests are to be supplied with portable telephone sets with a special flexible wire which can be easily and quickly run along the ground to isolated places in the forests. The telephones will be of use in summoning help to prevent conflagrations.

The Telephone in Emergency Service.—The Delaware, Lackawanna & Western Railroad, besides being fully equipped for telephone train dispatching has also in service portable test sets for the use of its linemen, with the extension pole, whereby telephonic communication may be secured at any point on the line.

Telephones in Churches.—The telephones in several churches in New York City are being used to good advantage. When pew holders find they cannot attend Sunday services they notify their church by telephone and in this way their pews, which would otherwise be vacant, are rendered available for visitors.

Meeting of Telephone Traffic Men in Texas.—Traffic representatives of the Southwestern Telegraph and Telephone Company, the Pioneer Telephone Company of Oklahoma and the American Telephone and Telegraph Company recently met in Dallas, Tex., to fix upon a standard method for the handling of long distance telephone calls in the Southwest.

Name for Telephone Messages.—Mr. Frederick O. Vaille, of Denver, Col., suggests the words "Telephogram" or "Telphogram" as names to signify telephone messages. These words he thinks are especially appropriate in their root derivation and otherwise for this particular use. He says: "Of the words you mention 'Phonogram' would be good, except that it would more appropriately be the name of a phonograph record and some day may be wanted for that purpose."

Telephone Bill Vetoed in Nebraska.—Governor Aldrich of Nebraska on April 12 vetoed the bill passed by the legislature providing for placing all telephone companies in the State under the control of the State Railway Commission. The Governor withheld his name from the bill for the reason that the measure would, he said, eventually result in a telephone monopoly and ultimately increase rates.

State-Owned Telephones in France.—The Association of Telephone Subscribers in Paris was non-suited in its action for damages against the State for interruption of the telephone service after the fire at the central telephone exchange three years ago. The court threw the case out on the ground that the State could not be held responsible for any damages caused by the interrupted service. It declared that if subscribers could claim compensation whenever the service was interrupted it would be impossible to carry it on. This was a test case on the part of telephone subscribers who have many complaints against the telephone service, which is a State monopoly.

Bell Telephone Changes in Middle West.

Five of the associated companies in the middle west of the American Telephone and Telegraph Company have been placed under one executive head, in conformity with the policy of the parent company to unify the work and effort of the constituent companies.

The companies concerned are the Michigan State Telephone Company, the Cleveland Telephone Company, the Central Union Telephone Company, the Chicago Telephone Company and the Wisconsin Telephone Company. Heretofore each of these companies has had a different president and a separate corps of general officers. The new plan contemplates one president and one corps of officers for the five companies, with specialists in the several branches of the whole work. There will be no change in the corporate existence of any of the companies nor will there be any consolidation or merger of the physical properties. The new operating unit is being established to enable the management to keep pace with the growth of the business and to insure uniform efficiency of the service everywhere.

Mr. Bernard E. Sunny, president of the Chicago Telephone Company and a vice-president of the American Telephone and Telegraph Company, has who has relinquished the duties of that office. been elected president of the Michigan State Telephone Company, vice Mr. N. C. Kingsbury Mr. Sunny thus becomes president of the five companies involved in this executive reorganization. Mr. Alonzo Burt, president of the Wisconsin Telephone Company, Milwaukee, Wis., has been elected vice-president and treasurer of the Michigan State Telephone Company, and Mr. B. W. Trafford, vice-president. Mr. H. F. Hill,

Digitized by Google

formerly general manager of the Central Union Telephone Company, Indianapolis, Ind., is to be general manager of the five companies. Mr. B. S. Garvey has been appointed auditor, Mr. J. G. Wray, engineer, and Mr. L. G. Richardson, president of the Central Union Telephone Company, Indianapolis, Ind., general counsel.

Telephone Service in Italy.

Some years ago the Italian government bought from private companies the telephone systems of the country and undertook their operation. The service rendered has, according to a pamphlet issued by the American Telephone & Telegraph Company, New York, been very unsatisfactory under government management and is being severely criticized by Italian newspapers. At a meeting of the Naples Chamber of Commerce in November last the president, referring to the royal commission appointed to investigate complaints made of the telegraph, postal and telephone services, stated that he had brought to their attention the great delay in delivering telegrams and the execrable telephone service, and that he was obliged to say that since the government has taken over the telephone company the service has been far worse in every respect.

The annual cost of a telephone in Naples is $40 within a radius of 3,000 meters from the central office (about 1.8 miles); for every additional mile there is to be added about $10 extra annual tax. The cost of long distance telephoning is about forty cents between the principal cities, between 6 a. m. and 9 p. m., and one-half rate between 9 p. m. and 6 a. m., besides a fixed tax of ten cents for notice for a night call.

The estimate for expenditure on new telephones for the year 1910-11 is fixed at 5,260,000 lire (one lira is equal to 19 cents). From official statistics it appears that in 1910 there were 46,293 subscribers to the state system and 20,170 subscribers to private telephone companies. Since the installation of telephones in Italy the sum of 60,792,186 lire has been voted for the telephone service, all of which, except 9,200,215 lire, has been spent.

The Philadelphia-Washington Underground Telephone Cable Line.

We have in previous issues referred to the work now being carried on by the American Telephone and Telegraph Company in laying an underground cable between Boston and Washington. The section between Philadelphia and Washington will be completed during the fall of this year.

The conduit between the two cities is approximately 135 miles in length, which, added to the existing underground line between Philadelphia and New York, makes a total of about 235 miles. The wires used in these cables are larger than those employed on overhead lines and are so arranged that from each two pairs it is possible to obtain simultaneously three complete telephone and eight complete telegraph circuits. In addition there are contained within the cable sheath a number of pairs of smaller gauge wires for use between intermediate cities along the route. These pairs of the small-gauge wire may also be used for telegraph purposes. Altogether the cables contain 148 wires, which are arranged in 74 pairs and capable of giving 99 telephone and 296 telegraph communications simultaneously. As the cables, when completed between New York and Washington, will handle telegraph and telephone business to a number of cities along the route, it is evident that when working full capacity the actual number of simultaneous telegraph and telephone messages may be many times these figures.

At intervals along the cable the wires are connected to Pupin "loading coils." Nearly 10,000 of these coils are to be used between Philadelphia and Washington and their aggregate weight will be about 200 tons.

On the section between Wilmington and Washington the trench in which the cable is being laid is about 100 miles in length and in the distance between the two cities there are 75 bridges over which the cables are to be carried. The manholes are three feet wide by four feet six inches long, and are placed at an average distance apart of about 500 feet. One thousand of these manholes will be constructed along the line between Philadelphia and Washington.

On one section of this line a trenching machine is used to excavate the trench. This machine is capable of digging daily a trench 1,000 feet long, 18 inches wide and three feet deep. In the other sections a trench plow is used.

The Telephone in Berlin.

The telephone in Berlin is the subject of an article in the *Telephone Review*, by Mr. James H. Collins. As compared with American practice telephone service in the German capital is woefully inefficient, and, from Mr. Collins' account, is no better than any other State-controlled telephone service. He points out one of the principal handicaps to first-class service as follows: "The Germans," he says, "like all continental telephone authorities, are very keen in experimenting with automatic switchboards. In Berlin a small automatic with a couple of hundred subscribers is kept in a room by itself. The reason for this interest, according to an engineer thoroughly posted on foreign practice, is this: European telephone systems, being run by government, must be worked by employes who are taken on under civil service rules. The examinations tend to favor those who can pass a good scholastic test rather than the candidates showing special aptitude for telephone work. Political 'pull' saddles undesirables on the system. Employes agitate for privileges that hamper service. It seems to be next to impossible to improve the service along the lines of skill and personnel that are followed in America, and so the officials look to mechanical improvements to bring about better service."

Digitized by Google

Telephone Improvements in Texas.

The Southwestern Telegraph and Telephone Company has just completed a six story building at San Antonio, Tex., which is now occupied by the business offices. The exchange will soon be removed to the new quarters. The switchboards will have a capacity of 9600 lines. At Houston preliminary work has begun on a seven-story steel structure which is to be used for exchange headquarters, and a new branch exchange building three stories high has just been completed at Fort Worth, Tex. This makes three exchanges in that city. In Dallas the fourth exchange is near completion. The buildings erected by the company are of the most substantial character and fire proof and everything connected with the service is most modern.

LETTERS FROM OUR AGENTS.

RICHMOND, WESTERN UNION.

Following is a list of the chiefs in this office: Chief operator, F. R. Veale; night chief operator, E. N. Dennis; all night chief, E. Wilkinson; traffic supervisor, J. W. Ware; assistant supervisor, R. E. Hotze; wire chief, T. B. Maher; day chief, J. L. Wingler; night chief, F. H. Muire. Repeater chiefs: H. H. Cramer, C. W. White, T. Farley, L. C. Surles, J. E. Stevens; ticker and equipment chief, R. L. Reveley.

Including extra men there are sixty-five operators and the total number of employes in the operating room is ninety. Mr. W. G. Sale, formerly of Wilmington, N. C., is manager.

Mr. W. N. Reveley, formerly of this office, is now attached to the office of district plant superintendent J. B. Faulkner in the capacity of district plant chief.

Mr. M. S. Cline, formerly of this office, is now wire chief at Lynchburg, Va.

During the past year, a number of improvements have been made in this office, including the installation of tungsten lamps, which give much better illumination. The operating room has been generally overhauled and various changes in the arrangement of desks and circuits have been made in order to facilitate the handling of the growing volume of traffic.

The new building on Main street between Eleventh and Twelfth streets, in which our main office is to be located, is nearly completed and it is expected that the new quarters will be occupied in July. The building is a thirteen-story fireproof structure of red brick, the floors being built of reinforced concrete. The receiving and delivering departments will occupy half of the first floor, and half of the cellar will be occupied by the line department. The superintendents' offices and the locker and retiring rooms will take up the entire twelfth floor and the entire thirteenth floor will be utilized as the operating room.

NEW YORK, POSTAL.

Mr. George D. Wilkinson, formerly of Boston, is printer expert now for this company at New York.

H. E. Ryder, an operator in this office, died at Elmira, N. Y., April 22.

An office has been opened by this company in the Martinique Hotel, corner Thirty-second street and Broadway.

The first examination questions were given out to the members of the Postal Electrical Class April 20, by the instructor, Mr. Donald McNicol.

The new office of this company at Syracuse, N. Y., was opened April 23.

NEW YORK, WESTERN UNION.

The baseball team of "Clark's" department at 195 Broadway, is open to meet any team of the Cable, Postal or Western Union companies. Mr. Robert Jablin is captain and Mr. Sam. Silverman manager.

Albert E. Sink, aged 62 years, formerly manager of the operating department of the Western Union Telegraph Company at 195 Broadway, New York, died April 21. He was born in Utica, N. Y., and his entire telegraphic career was spent in his native State. He became manager of the operating department at 195 Broadway, New York, in June, 1893, but retired from the service several years ago. Mr. Sink was a man of high principles and very conscientious in all his relations with his subordinates and others.

Municipal Electricians.

Convention of Municipal Electricians. — The next convention of the International Association of Municipal Electricians will be held at the Ryan Hotel, St. Paul, Minn., September 12, 13, 14 and 15. Any further information may be obtained of the secretary, Mr. Clarence R. George, Houston, Tex.

Los Angeles Fire Alarms.—The special committee of electrical experts appointed to investigate the local fire and police signal system at Los Angeles, Cal., has reported that an adequate system can be provided at an approximate cost of $102,500. The estimates provide for 150 additional fire-alarm boxes, underground cables, overhead extensions and central office equipment.

Fire Alarm Patents.—The following patents have been issued for fire-alarm and kindred apparatus: 989,107 to J. E. Barrett, Pollock, La., on a fire alarm; 989,335 to L. D. Chandler, North Abington, Mass., on a signal for fire sprinkler system and the like; 989,347 to Albert Goldstein, New York, on an electric thermostat; 989,420 to L. T. Reichel, Wellington, New Zealand, on a fire alarm system; 989,516 to N. H. Suren, Needham, Mass., on fire-alarm telegraph apparatus.

New York Telegraphers' Aid Society.

Following is the statement of the New York Telegraphers' Aid Society for the year ending March 6:

Balance on hand March 6, 1910		$24,901.02
Receipts:		
From Dues	$5,524.50	
" Initiation Fees	50.00	
" Interest	1,204.16	
		6,778.66
Total		$31,679.68
Disbursements:		
Sick Benefits	$4,282.27	
Death "	1,600.00	
Expenses	720.25	
		$6,602.52
Balance on hand March 6th, 1911		25,077.16
Total		$31,679.68

Summary:		
Receipts	$6,778.66	
Disbursements	6,602.52	
Gain for year	$ 176.14	

RELIEF FUND

Balance on hand March 6th, 1910	$4,958.67
Receipts	946.92
Total	$5,905.59
Disbursements	$500.95
Balance on hand March 6th, 1911	5,404.64
Total	$5,905.59

BALANCES

Aid Society	$25,077.16
Relief Fund	5,404.64
Total	$30,481.80
Bonds and Mortgages	$20,416.24
On Deposit	10,065.56
Total	$30,481.80

F. J. Nurnberg, J. F. E. Hopkins, H. M. Heffner, auditors.

Lineman.—Wanted first-class lineman with sufficient knowledge of operating to receive orders and report. For station vicinity Chicago. Telepost, 135 E. 16th St., New York City.

The great telegraphic song hit,
"SEND ME A NIGHT LETTER, DEARIE."
Good, catchy music; beautiful title design magnificently printed in colors. Title contains night letter. Sung all over New York. 17c. by mail. All popular music sent by mail.
B. L. BRANNAN,
195 B'way, N. Y.

Mr. Robert B. Welch, an old-time telegrapher of St. John, N. B., died at that place on April 5. He held certificate No. 31 in the Telegraphers' Mutual Benefit Association. He became a member of the association when it was organized in the latter part of 1867.

T. M. B. A. Assessment.—Assessment No. 523 has been levied by the Telegraphers' Mutual Benefit Association to meet the claims arising from the deaths of Mrs. Alice A. Stuart at Wahpeton, N. D., Peter B. Westervelt at Brooklyn, N. Y., Arthur G. Tufts, at Dover, N. H.; Philip K. Dumaresq, at Boston, Mass.; John B. Page, at Montreal, Que., and Charles E. Wise, at Chicago, Ill.

Martin's Double Lever **VIBROPLEX, $8.00** f. o. b. D. C. DeLany, 15 S. Broad St., Atlanta, Ga.

WANTED.—Live agents in all large Western Union and Postal offices. Central Typewriter Exchange, New York.

A certificate of membership in the Telegrapher's Mutual Benefit Association, 195 Broadway, New York, affording protection for the family and dependents in the amounts of $500 or $1,000, which is at once available and cannot be diverted from its mission, should be held by every eligible person between the ages of 18 and 45 engaged in telegraph and telephone service, either commercial or railroad. If those not now members could realize and fully understand the stern necessity for beneficial help too often experienced by bereft families, would they not make earnest effort to secure such provision? Write for particulars.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEYBOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

J. B. Taltavall, TELEGRAPH AND TELEPHONE AGE, 253 Broadway, New York.

Every one engaged in telegraphy and telephony should be a constant reader of TELEGRAPH AND TELEPHONE AGE. It gives the latest news in both these fields. Subscribe now. Subscription price, $2.00 per year.

SOME POINTS ON ELECTRICITY.

BY WILLIS H. JONES.

Phenomena of Electricity.

To the average student the study of electricity has always been one of great fascination, but it is the close observer only who really understands and appreciates the wonderful properties and possibilities of that most mysterious force. To the latter class only are we indebted for the great electrical inventions and industrial electrical appliances of the present day. Each electrical industry has resulted from the observations of some investigator who looked below the surface and detected some peculiar action of the current which although not required in one industry might be utilized in another.

The trouble with most of us is we usually look upon an electrical appliance as a finished product, and, as a rule, are contented when we have mastered the general principles involved in its operation. Thus the invention of the electric telegraph by Prof. S. F. B. Morse was at one time looked upon as the ultimate limit of electrical possibilities, yet even then the current was constantly performing additional services before unappreciative eyes and disclosing the principles upon which nearly all the electric appliances of the present day are based.

All progress that has been made in electrical industries is due to such men as Edison, Marconi and other close observers who detected, one by one, the various side performances of an electric current. Hence the lesson to be learned is that new achievements should be sought in the by-ways, and not in the well beaten roads.

Let us analyze this first Morse circuit and see what else the current was doing besides performing its legitimate duty of creating a magnet of the iron core of the relay. Probably the most prominent performance was that of coating one of the battery plates with copper due to the chemical decomposition of the liquid solution in the jar through which the current passed. These copper deposits are, of course, not required in the creation of magnets and are unavoidable, but they disclose a side action of the current which enables us to use it for the purpose of electroplating.

An excess of current in a thin wire or coil disclosed the accumulation of heat, hence the suggestion of electric lights and heating apparatus constructed on the principle of high resistance and low heat capacity.

Then there was the disruptive spark every time the key was opened. How little did Prof. Morse then dream that he was sending wireless impulses throughout space in all directions every time he touched the key. The significance of this action of the spark in creating waves in the surrounding ether was, of course, unknown to the professor and others because such action remained undetected until later. But the spark was lighting the way even then and snapping out information which was finally heard by the acute ears of Marconi and utilized in a practical manner.

Two batteries of equal potential opposing each other at opposite terminals of a line created no current in the conductor, hence no magnetic effect, and it was some years later before the fact was observed that a magnet could be demagnetized while current was actually traversing its coils, by winding the core differentially. Hence the development of the duplex method of telegraphy.

In like manner we can trace each separate electrical appliance to the discovery of some particular property of electricity and no doubt the future will disclose as many more possibilities, manifestations of which, like the escaping steam in the famous tea kettle, are daily observed by as yet unappreciative eyes.

Aside from the practical view of the subject there are many interesting things in connection with an electric current, among which is the phenomenon of discharge.

An electrified conductor may be discharged in several different ways, which give rise to the terms "conductive," "disruptive," "convective," etc.

Digitized by Google

A conductive discharge refers to the ordinary flow of a current through a closed conductor, such as a telegraph wire, or through the coils of a sounder.

When a conductor or metal ball holds a charge of bound electricity the induction which takes place in its immediate vicinity creates a mechanical stress upon the intervening medium. When the stress becomes too great the charge breaks through and manifests its passage by a bright spark. In this case it is called a disruptive discharge. The distance, or length of the air gap the discharge will leap across depends upon the potential of the charged terminals. With some of our powerful induction coils the stress may be made so great that glass plates two inches thick may readily be pierced or shattered. If a card board is thus pierced by placing it exactly between the two points of the conductor the perforation will show a burr on each side of the card, as though the force worked outward from the middle. If the two terminals are not exactly opposite each other the perforation will appear nearer the negative than the positive terminal, unless the experiment be made in a vacuum in which case the hole will be exactly midway between the two points.

We also have what are called convective discharges. These refer to electricity which flies off by repulsion under the influence of high potential and discharges itself at sharp points by reason of the great density at these points which electrifies the particles of air in the immediate vicinity.

POSITIVE AND NEGATIVE ELECTRICITY.

The different behavior of negatively and positively charged bodies which has been noticed in many experiments has given rise to the belief on the part of some investigators that the two actions are possibly the result of different kinds of electricity. The action of electric discharges in perforating card board, as previously referred to, is pointed out in support of this belief; also the different arrangement of dust or iron filings on a card under the influence of positive and negative electricity; the difference in the striking or the attractive force of electricities, etc., etc.

The correct answer probably is that positive and negative electricity are one and the same, the different behavior of the two being due to the fact that there is an excess of one over the other. This is the view taken by modern scientists, among them Prof. Sylvanus P. Thompson, who bases his opinion on the fact that all his experiments show that "the rate of dissipation of charge is always greater for negative electrifications than for positive, and the law of loss is the exact counterpart of the law of loss of heat."

Recent Telegraph and Telephone Patents.

ISSUED APRIL 18.

989,576 and 989,577. Telegraphy. To P. B. Delany, South Orange, N. J.

989,761. Telephone Lock and Call Register. To E. L. Buxbaum, Chicago, Ill.

989,762. System for Registering Calls and Locking Telephones. To E. L. Buxbaum, Chicago, Ill.

989,763. System for Registering Telephone Calls. To E. L. Buxbaum, Chicago, Ill.

989,768. Telephone System. To A. H. Dyson, Chicago, Ill.

989,792. Telegraph Relay. To Z. McD. Miller, Pittsburgh, Pa.

989,795. Sanitary Telephone Mouthpiece. To J. B. O'Hara, Philadelphia, Pa.

989,814. Auxiliary Telephone Receiver. To W. Schwarzhaupt, Cologne, Germany.

989,856. Telephone. To W. C. Lockwood, San Juan, Porto Rico.

990,275. Telephone Transmitter. To S. A. Koltonski, Boston, Mass.

990,365. Telephone Repeater Circuit. To C. A. Kruckow, Halle-on-the-Saale, Germany.

990,468. Telegraph System. To F. G. Agrell, Stockholm, Sweden.

990,484. Case for Telegraph Transmitters. To B. P. Hayes, Topeka, Kan.

990,485. Telegraph Transmitter. To B. P. Hayes, Topeka, Kan.

990,527. Telegraph Muffler. To F. W. Cook, Denver, Col.

990,638. Telephone Meter System. To G. Deakin, Oakland, Cal.

990,685. Telephone Signaling System. To E. M. Tormin, Newtown Center, Mass.

PATENTS EXPIRED.

518,742. Telephony. Issued to W. C. Lockwood, New York.

518,916. Telephone Transmitter. Issued to H. Cottrell, Newark, N. J.

Personal.

Mr. Stephen Dudley Field, the well known electrical engineer and inventor, of Stockbridge, Mass., was a recent New York visitor.

Professor Alexander Graham Bell, inventor of the telephone, will be honored at his birthplace, Brantford, Ont., by the erection of a memorial on Dominion day, July 1, 1912.

Mr. Chauncey A. Doty, a prominent and wealthy business man of Seattle, Wash., was formerly a telegraph operator at Marshalltown, Iowa. Among his many business connections Mr. Doty is vice-president of the Mercantile Bank of Seattle.

Mr. H. A. Sinclair, who for the past twenty-five years has served as treasurer of the New York Electrical Society and who recently resigned that position, has been presented with a testimonial in recognition of his faithful service during that period.

Mr. George V. Hobart, the well-known dramatist, was a telegrapher and several years ago worked for the Western Union Company in New York, and for the different press associations. Mr. Hobart is a natural born humorist and has been very successful in his theatrical work. He became a reporter

Digitized by Google

and made his first success as a writer with his Dinkelspiel stories.

Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company and of the Western Union Telegraph Company, has been urged to permit the use of his name as candidate for Governor of Vermont, but he replied that he is not seeking nor would he accept any such preferment. Mr. Vail owns a farm of 5,000 acres at Lyndonville, Vt., and is one of the largest land owners in that State.

Mr. Theodore T. Moore has been appointed to the position of chief of the telegraph division of the Weather Bureau at Washington, D. C., to succeed Jesse H. Robinson, deceased. Mr. Moore was Mr. Robinson's assistant for a long time.

Canadian Notes.

The Canadian Telegraph Toll Investigation.—The hearing of the telegraph toll case came before the Canadian Board of Railway Commissioners at Toronto on April 27. Mr. George D. Perry, general manager of the Great North Western Telegraph Company, Toronto, gave evidence regarding the status and financial results of the operations of the Great North Western Telegraph Company, and on April 28 Mr. F. Roper, secretary of the Dominion Telegraph Company, testified as to the relations of his company with the Great North Western, the Western Union and other companies. The Board then adjourned the hearing until some future date after statements of various kinds are prepared by the Canadian Pacific Railway and other companies. The investigation is based on a complaint made by the Winnipeg board of trade, but the issues involved are of general interest throughout the Dominion. It will probably be two months before the case comes up again.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. Charles C. Adams, second vice-president of the company, is at Mt. Clemens, Mich., taking the baths for the benefit of his health.

Mr. Chrales P. Bruch, third vice-president, has returned from a trip to Newport, R. I.

Mr. S. M. English, general manager of the Postal Telegraph-Cable Company of Texas, was a recent New York visitor. He was accompanied by General A. P. Wozencraft, general counsel of the company.

Mr. D. T. Gage, Jr., of the electrical engineer's office, New York, who has been in Oklahoma City, Okla., for some time, assisting in the planning and equipping of new offices in that section, is now located at Dallas, Tex.

A 60-conductor cable laid from the Chicago main office to Hammond, Ind., a distance of 20 miles, is now in service.

A seventy-five pair cable (150 wires) has been laid by this company through the Pennsylvania Railroad's tunnel under the North River, New York. It has a total length of 17,000 feet and has an over-all diameter of 2⅛ inches. The conductors are of 14-gauge copper wire. The paper insulation is very compact.

Mr. F. A. Bivens of the Jackson, Miss., office, has been advanced to the managership of the Montgomery, Ala., office, vice W. A. Sheppard, resigned.

Mr. C. D. Ross, manager of the Huntsville, Ala., office, has been promoted to the management of the Jackson, Miss., office. Mr. M. S. Levy of Birmingham succeeds Mr. Ross as manager of the Huntsville office.

Mr. John A. Vogt, whose appointment as manager at Baltimore, Md., was announced in our issue of May 1, was born in that city Sept. 29, 1869. He entered the telegraph service as a messenger in Baltimore in 1883, and his entire business career has been spent in that city. He advanced from messenger to a clerkship, then became an operator, and afterwards manager of the dry goods district. Subsequently he was promoted to the managership of the produce district, and filled this position for seventeen years. From this position he was advanced to the managership of the main office.

Mr. Robert Harrington, a lineman for the Postal Telegraph-Cable Company, was killed in Douglas, Ariz., recently by a stray shot during a battle between insurrectos and Mexican troops along the Mexican border near that place.

Frank M. Hoops, a lineman of this company, stationed at Laconia, Wash., on the summit of the Snoqualmie Pass of the Cascade Mountains in that state, was frozen to death recently while working on a line during a recent cold wave. Mr. Hoopes had finished some repair work and it is believed that he intended to return to Wolf's ranch, two miles away, but, instead, while probably suffering from the extreme cold, went in the opposite direction. From marks in the snow it was evident that he became exhausted by the extreme physical exertions during his wanderings and finally succumbed to the strain. The body was found in the snow by searchers the next day.

The Postal Situation in Texas.—A temporary restraining order has been granted by Judge Clark of the district court of Oklahoma in the case of the Postal Telegraph-Cable Company of Texas, against the Postal Telegraph-Cable Company, a recently organized Oklahoma corporation. In the order the latter concern is enjoined against using the word "Postal" in connection with the word telegraph, at any place where the Postal Telegraph-Cable Company of Texas is engaged in business in that State. The name of the Postal Company organized in Oklahoma will therefore be changed to the Mackay Telegraph & Cable Company, and temporarily will do business under this name in the States of Texas, Oklahoma and a portion of Arkansas.

Digitized by Google

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company and of the Western Union Telegraph Company, has returned from London, after an absence of five weeks.

Mr. Newcomb Carlton, vice-president, Mr. Belvidere Brooks, general manager, and Mr. W. C. Merly, secretary to the general manager, recently made a trip to the principal cities in the western division. They also visited Toronto, Ont.

Mr. Thomas W. Carroll, assistant to the general manager, left New York on May 9 for a western trip of inspection that will take him as far as the Pacific coast.

The following notice regarding typewriters has been issued on the authority of General Manager B. Brooks: "As the company has under consideration the question of supplying typewriters as a part of the regular equipment of offices for such employes as are required to use typewriters, I think it would be well to advise employes of the fact, in order that they may not be led to incur an expense for replacing machines which can possibly be continued in use for the present. The matter will be decided as soon as certain tests of various standard typewriting machines now being made are concluded, which, it is anticipated, will be in about six months, and in the meantime we should avoid as far as possible the purchase of machines for use in the departments at current prices." It is understood that the competition will be confined to "visible" typewriters and that the trial will be open to any standard first class machine.

The following general notice has been issued by General Manager Belvidere Brooks: "It being the desire of the management to correct conditions affording just cause for complaint on the part of the employes of this company, employes are hereby informed that they may address to the general manager at New York any complaint growing out of what they consider arbitrariness, discrimination, prejudice and the like. Before such complaints can be considered by the general manager, the employe must first have made the complaint in writing to his or her immediate superior. If the employe is dissatisfied with the decision, or if the complaint does not receive attention, then a copy of the complaint may be forwarded to the general manager with such statement as the complainant may deem necessary or desirable. All communications upon this subject from employes will be regarded by the general manager as confidential, in so far as he is able to preserve their confidence without impairing the efficiency of his inquiry. It must be distinctly understood that complaints of a trivial character or involving personal abuse will not be considered. All complaints and communications must be signed by the writer's full name and address." In forwarding this notice to his district officials, General Superintendent A. G. Saylor, of New York, says: "It is important that in the promulgation of the above regulation it should be fully comprehended by managers and subordinate officials generally that the notice means exactly what it says and that employes everywhere are to receive fair treatment and will be protected against favoritism or discrimination resulting from personal prejudice, etc. It should also be understood that no employe is to be at any disadvantage by reason of any appeal of his or her case after failure to secure local redress in accordance with the regulations as now established."

Mr. C. H. Murphy, manager of the time service of this company, has been advanced to the position of general superintendent of the same service, with headquarters in New York.

Three hundred of the new standard quadruplex sets have already been installed. The New York-Syracuse quadruplex has been in continuous operation for a year and has worked all four corners through all kinds of weather without any difficulty.

One thousand of the new standard resonators have been placed in service. This device was developed by the engineering department of the company. The resonator is mounted at the end of a double-jointed iron arm which is supported by a vertical iron pedestal fixed to the desk top. This construction permits of placing the sounder in any position on the plane swept over by the arm. The resonator is of new design, the form having been adopted after many experiments to determine the best shape for reflecting the sound.

The appointment of Mr. A. C. Terry as district commercial superintendent of this company at Pittsburg, Pa., has been received with much satisfaction by the business men of that city. The Chamber of Commerce of Pittsburg, through its president and secretary, has congratulated Mr. Terry and expresses its assurance that when he says he will "give the people the service they want" he will "deliver the goods." Mr. Terry has a well-defined business platform and he promises to give the company's patrons courteous treatment at all times and the best possible service.

Mr. Allan Woodle, formerly manager at Boston, Mass., has been appointed district commercial manager with headquarters at Syracuse, N. Y.

Mr. W. W. Murphy has been appointed manager at Savannah, Ga., vice Mr. H. A. Carroll, resigned.

Mr. B. F. Ragsdale, the recently appointed chief operator of the Western Union Telegraph Company at Augusta, Ga., comes from the Hoosier state, having been born in Washington, Ind., December 12, 1869. He entered the telegraph service in that place in August, 1892, and has since filled positions as operator at New York, Washington and St. Louis, and at Buffalo, N. Y., he filled the positions of repeater chief, wire chief, assistant chief operator and general

Digitized by Google

wire chief, holding the last named position at the time of his appointment as chief operator at Augusta. On his leaving Buffalo he was presented with a diamond stick pin by his associates in the plant department, as a token of their esteem and friendship.

Mr. J. R. Parker, formerly chief clerk to division commercial superintendent J. M. Stevens, of Atlanta, Ga., has been made chief clerk to district superintendent J. S. Calvert, of Richmond, Va.

Miss Julia Jennings, for a number of years in charge of the complaint department at Richmond, Va., has been transferred to the same department in Atlanta, Ga.

Mr. Ernest L. Sollers, operator at Baltimore, Md., has been appointed district traffic supervisor, with headquarters at Boston, Mass.

H. O. Bannister, manager of the Western Union Telegraph office at Raleigh, N. C., died suddenly at Richmond, Va., May 2. His death was particularly sad. Mr. Bannister's wife and infant son were accidentally suffocated by gas at their home in Raleigh on January 6 last, and the shock to Mr. Bannister was so great that he has never acted like himself since.

Mr. W. B. Stuart, former manager at Savannah, Ga., has been appointed manager at Greenville, S. C., vice Mr. D. F. Cason, resigned.

Mr. J. T. Warner has been appointed chief clerk to superintendent E. E. Williams at Atlanta, Ga., vice Mr. W. G. Peebles, resigned.

Mr. C. B. Wade has been appointed manager of the Raleigh, N. C., office, vice H. O. Bannister, deceased.

Mr. J. W. Stephenson, of the Raleigh, N. C., office, has been appointed manager at Rockingham, N. C., vice C. G. Traywick, resigned.

Mr. J. S. C. Murphy has been appointed district manager for the State of Virginia with headquarters at Richmond, and Mr. E. T. Moore has been appointed district manager for the State of North Carolina with headquarters at Raleigh, N. C. The positions of district commercial agent held by both of these gentlemen have been abolished.

Mr. W. A. Sheppard, manager of the Postal Telegraph-Cable Company at Montgomery, Ala., has been appointed manager for the Western Union Telegraph Company at the same place. Mr. Sheppard's first commercial work was for the Western Union Company in New Orleans, in 1879, and in 1883 he was transferred to the Atlanta, Ga., office. He afterwards went with the Southern Telegraph Company at Savannah, and later with the Associated Press at Anniston, Ala. He left the Associated Press service in 1889 to accept the managership of the newly opened office of the Postal Telegraph-Cable Company at Anniston, and in 1893 he was transferred to the Montgomery office of the same company. He held this position at the time of his recent appointment to the Western Union managership.

Mr. Stephen Latimer Burts, whose appointment as commercial superintendent of the third district, Southern Division, at Jacksonville, Fla., was announced in our issue of April 16, was born in Abbeville County, S. C., forty years ago. In October, 1899, he entered the telegraph service at Chester, S. C., on the Richmond and Danville Railway, now the Southern Railway. He held the positions of operator, bookkeeper and chief operator at Columbia, S. C., for the Western Union Telegraph Company between December, 1892, and September, 1896, and was manager of the Charlotte, N. C., office from the latter date until December 31, 1904. He became manager of the Atlanta office on January 1, 1905, and in August, 1906, was appointed general inspector of the Southern Division, which position he held until February, 1909, when he resumed the managership of the Atlanta office. From this position he was promoted to the present one of commercial superintendent. Mr. Burts has been in the service of the Western Union Telegraph Company continuously since 1892.

Atlantic & Pacific Telegraph Company.—At the annual meeting of the Atlantic & Pacific Telegraph Company held in New York recently the following directors were elected: Theo. N. Vail, Newcomb Carlton, G. W. E. Atkins, A. R. Brewer, B. Brooks, Thomas F. Clark, George H. Fearons, E. J. Hall and J. B. Van Every. At a subsequent directors' meeting the following officers were elected: President, Mr. Theo. N. Vail.; vice-president, Mr. Thomas F. Clark; treasurer, Mr. A. R. Brewer; acting secretary, Mr. F. W. Lienau.

A New Telegraph System.—Experiments are being made by Messrs. Siemens & Halske, Berlin, Germany, with a new telegraph system which, it is said, is similar in principle to that of Pollak and Virag. It includes a typewriter key board which perforates the character on a wide band of paper. It is stated that the system can be operated at a speed of 300 words per minute.

One Way to Stop Gambling in Futures.—Congressman Burleson of Texas has introduced a bill in Congress "to stop gambling in cotton futures," by denying the use of telegraph and telephone wires for transmission of messages relating to contracts for future delivery when there is no intention on the part of the seller to deliver the cotton or the buyer to take it.

The Bangor Fire.—On April 30 a conflagration destroyed a large part of the business and residential sections of Bangor, Me. The Western Union telegraph office was destroyed, but the Postal Company's office escaped. The telephone exchange was also destroyed, as well as the electric light station and street railway power house.

Quadruplex Printing Telegraph.

Mr. Isidor Kitsee, of Philadelphia, has recently obtained a patent on a quadruplex printing telegraph system. While the device is applicable to different systems of printing telegraphy its greatest value is most apparent in a system in which the groupings of the different characters of the Morse alphabet are made use of for the purpose of selecting locally the required type. Mr. Kitsee makes special reference to the Barclay printer in this connection. He uses standard apparatus, with the addition thereto of instruments which can be secured at a very small cost.

At the transmitting end a device similar to the Wheatstone transmitter is employed as contact maker. The perforated tape as it passes through the machine closes the circuit through the coils of a differentially-wound polarized relay. The armature lever opens and closes a circuit which includes a portion of the main line battery which is cut in or out according to the position of the armature lever of the neutral relay transmitter, also included in the circuit. When the neutral relay is closed the entire battery is shunted, but when it is open the battery is connected to the line. This battery is divided into two parts, which are connected in opposition, one of the parts being subdivided in the proportion of about 1 to 2. The entire battery with exception of the small portion referred to is controlled by the neutral transmitting relay.

A second polar-relay transmitter, which is also operated by perforated tape, controls the smaller portion of the battery, the circuit including the battery, the armature lever of the second polar relay and the front contact point of the neutral transmitting relay just referred to. The general operation of the transmitting apparatus, it will thus be understood, is similar to that of the standard quadruplex.

At the receiving end the apparatus is also standard as far as connections are concerned, impulses operating the polar relay and the increase or decrease of current strength controlling the neutral relay in the usual manner. The contact point of both these relays control through secondary polarized relays the circuits which operate the sunflowers of the printing telegraph apparatus.

The last two claims of Mr. Kitsee's patent read as follows: "In a telegraph quadruplex printing system, four receiving stations, two stations for each terminal of the line of transmission, a neutral relay inserted in the line for one station of each terminal and means for said relay to make the same inoperative to home impulses, a localized circuit, a polar relay and source of current in said circuit, said circuit adapted to be operated by said neutral relay, a second local circuit, a step-by-step movement in said second circuit, said second circuit adapted to be operated by the localized polar relay, said step-by-step movement adapted to operate different printing organisms; a polar relay for the second station of each terminal, means for said polar relay to make the said inoperative to home impulses; a localized curcuit, said circuit adapted to be operated by the polar line relay; a second local circuit, a step-by-step movement in said circuit, said second circuit adapted to be operated by the localized polar relay, said step-by-step movement adapted to operate printing organisms.

"In quadruplex printing telegraphy, the method of transmitting and receiving character symbols which consists in locally developing at a transmitting station a short positive and a short negative impulse producing thereby an impulse of predetermined polarity and of a length to accord with the length of the character symbol to be transmitted, transmitting such impulse to a receiving station, producing from such transmitted impulse two impulses, and translating such impulse into a separate symbol, one impulse indicating the beginning and one the ending of such symbol."

Municipal Electricians.

The Convention of Municipal Electricians.—Active preparations are going forward for the convention of the International Association of Municipal Electricians at St. Paul, Minn., September 12, 13, 14 and 15. An interesting programme is being arranged and many valuable papers will be presented on topics of special interest to the members. This promises to be one of the best meetings ever held by the association and a large and enthusiastic attendance is looked for. Mr. Clarence R. George, Houston, Tex., is secretary of the association.

Improved Fire Alarm System in Baltimore.—An index system of fire alarms has been put into service in each of the fire department houses in Baltimore, Md., as well as at headquarters. By this system a box can be picked out as it rings off on the gong, so that at the instant of the completion of the alarm a card is exposed to view which gives full information needed by the department. The system covers the city boxes on street corners, boxes in large establishments and in private houses, automatic stations and American District Telegraph stations.

Test of Mail Catching Device.—Mr. J. L. Adam, formerly cashier of the Western Union Telegraph Company at New Orleans, La., has invented a device for picking up mail bags at stations where trains do not stop. A practical test was recently made of the apparatus and the results are said to have been satisfactory.

Mr. Edward Reynolds, auditor of the Postal Telegraph-Cable Company, New York, in renewing his subscription writes: With my subscription for another year, I wish to express my appreciation for the valuable information received through your publication. Without it, I should miss much interesting data."

E. C. Sweeney, American Traffic Manager, French Telegraph Cable Company.

Mr. Edward Charles Sweeney, whose appointment as traffic manager of the French Telegraph Cable Company and manager of the United States and Haiti Telegraph and Cable Company, with headquarters in New York, was announced in our April 16 issue, was born in Liverpool, England, April 13, 1857. He began his telegraphic career in his native country in 1869, entering the service of the Electric and International Telegraph Company. He afterwards served the London and Northwestern Railway Company, the British Post Office and the

E. C. SWEENEY,
American Traffic Manager, French Telegraph Cable Co., New York.

Direct United States Cable Company, being with the latter both in England and at Torbay, Nova Scotia.

When the French Cable Company commenced business in 1879, Mr. Sweeney was the first operator appointed by the company and has remained with it ever since. For twenty years he was stationed at St. Pierre, Miquelon, as clerk in charge and filled the same position in New York for three years, being then promoted to the position of superintendent of the company with headquarters in New York, which position Mr. Sweeney held at the time of his recent promotion.

Mr. Sweeney is well known in telegraph and cable circles and is one of the few remaining experts in the reflecting galvanometer system of operating ocean cables. He is a fine scholar and speaks French fluently. His appointment creates great satisfaction in telegraphic as well as business circles.

Sea Water as a Pole Preservative.—It is stated that soaking telegraph poles in sea water lengthens their lives. Some poles immersed several years ago were found to be quite sound. The treatment is said to be quite satisfactory.

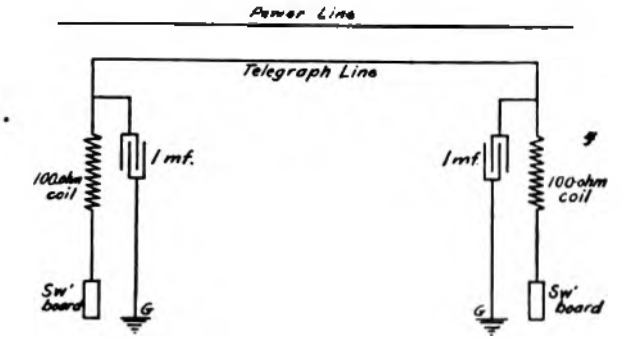
Mr. Wilbur Frewerd, manager Western Union Telegraph Company at Ishpeming, Mich., in renewing his subscription writes: "Telegraph and Telephone Age is certainly a great publication."

Inductive Disturbances Between Telegraph and Power Transmission Lines.

BY E. D. HUBBARD, GENERAL FOREMAN OF TELEGRAPH, GRAND TRUNK RAILWAY SYSTEM, BATTLE CREEK, MICH.

During the past winter a high tension power line was constructed adjoining our right of way for a distance of fourteen miles. As this line was of steel tower construction with suspension insulators designed to carry 100,000 volts, and was only to carry a 40,000-volt, 60-cycle, three-phase current, no trouble was expected, since similar lines at other points had caused no interference.

When the line was finally completed, and the current turned on all of our single Morse wires were badly affected. All relays were set to chat-



ELIMINATING INDUCTIVE DISTURBANCES ON TELEGRAPH LINES.

tering and could not be adjusted so as to overcome the disturbance and still respond to the telegraphic impulses. The power company claimed that its lines were perfectly balanced, free from grounds, and that it could not cut in transpositions in its lines without constructing extra towers.

It being necessary to clear the trouble from the telegraph wires as quickly as possible retardation coils were placed in the telegraph circuits at the first stations each side of the exposed section and condensers were bridged from lines to ground between the coils, as shown in the accompanying illustration. This removed the trouble entirely and the telegraph circuits apparently worked as well as ever. One hundred-ohm retardation coils and one-microfarad condensers were used.

Report of Bacteriological Tests by Telegraph.—Dr. Frederick C. Novy, head of the bacteriological department of the University of Michigan, Ann Arbor, Mich., while making tests of a new filterable virus which were to form the basis of a paper to be read at a medical conference in Chicago, was compelled to leave the determination of the results to his assistants at the college, so as to enable him to leave for that city. The results of the tests were telegraphed to him in detail, thus he was enabled to formulate his conclusions at long distance.

Postal Company's Standard Duplex and Quadruplex Local Wiring.

BY J. F. SKIRROW, ASSOCIATE ELECTRICAL ENGINEER POSTAL TELEGRAPH-CABLE COMPANY, NEW YORK.

The accompanying cut illustrates the Postal Telegraph-Cable Company's standard method for wiring duplex and quadruplex local circuits. From the fuse block on the table leads are run to three-point switches—one for each local circuit. The circuits run thence through the local windings or contact points of the instruments, thence to another three-point switch, and from that switch to spring jacks, resistance coils and the ground at the legboard.

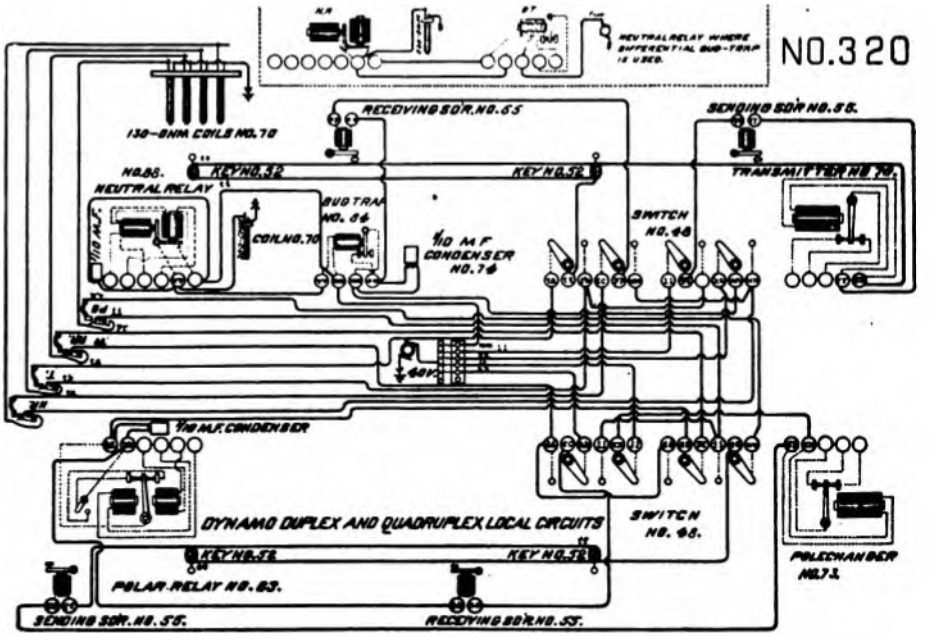

DIAGRAM OF DUPLEX AND QUADRUPLEX LOCAL CONNECTIONS.

Throwing the first switch to the left substitutes the ground for the battery feed. Throwing the second switch to the left cuts off the spring jack and any connections made through it for repeating or to branch offices. This gives the attendant at the set complete control of the local circuit without going to the switchboard to make changes.

By throwing the switches at one set to the left and at another to the right and connecting their jacks together at the legboard by cords, any two sets can be made to repeat into each other.

By throwing the switches on a set one to the right and the other to the left, the local instruments of any set can be picked up as loops at the spring jacks, and thereby used as "flip-downs" upon other sets. In normal service all switches are turned to the right. On an idle set all switches are turned to the left.

The connections permit the substitution of grounded legs to branch offices for the office resistance coil and ground so that sets may be repeatered through with a branch office connected upon grounded legs.

The binding posts upon all keys, switches and other apparatus are located on top so that loose connections under the tables are avoided. All switches have safety spring clips, thus avoiding open circuits due to poor contact.

Making Work Hard.

"Work is easy enough. It's watching the clock that makes it hard."

This gem is from Cooke, the poet-philosopher, and is reasonably good proof that he knows what he is talking about. The man who is having the hardest time with his work, says *Railroad Men*, is the man who is running it through the eight-hour measure. It is not his work that is killing him; it is keeping track of the clock. No wonder there is no ray of joy in his task and no sense of achievement in the doing of it.

The man who finds pleasure in his work is he who takes a little pride in it; who, forgetting the time of day and the day of the week, puts some of his best self into the daily work. The "dead ones" are the men who are careful not to do too much; who never check six sheets while they can hold their job by checking four. And they are the men who blast the futures of young fellows by such talk as: "Don't kill yourself for these people. You'll never get any thanks for it. I've been here sixteen years and I'm getting just what I got when I came here. Take it easy or they'll think you are a fool."

When you hear talk of that sort you may be sure you are listening to the sophistry of a failure. Instead of heeding him, shun him, and go on giving good measured. Do not flock with the clock-watchers if you care anything about your future.

The Train Dispatcher and the Telephone.*

BY VAN A. WIRT.

Train dispatching has been revised and revolutionized time and again in the effort to keep pace with advances in other departments of railway operation, but with modern equipment, ballasted roadbeds, improved grades, automatic block systems and the standard code of rules, train dispatching still follows in the wake of advanced methods, struggling to overcome the obstacles incident to heavy and rapid traffic. Despite the fact that invention has made wonderful strides in providing labor-saving devices and safety appliances, the train dispatcher has not been lifted very far from his old position of heavy nervous strain and responsibility. Today, as always he stands directly in charge of the movement of trains. His success depends upon his ability to quickly foresee and forestall. He is, in one respect, the most independent, and in another, the most dependent, employe of a railroad. No one can stand over him and successfully direct his work, while, on the other hand, without the co-operation of officials, train and enginemen and operators, he is a failure.

The telegraph, in recent years, has been the ever present "sticking brake" to the train dispatcher. It prevents quick and effective communication of orders to the men who are to execute them. The dispatcher's work has been so far behind his thought that the effect of a well-laid plan is often lost before it is possible to transmit the required orders to all concerned. Telegraph operators at way stations are too frequently amateurs and are often sadly incompetent. The suspense and mental strain upon the dispatcher while calling offices for orders or to procure information incident to the movement of trains, has made physical and nervous wrecks of many otherwise successful men.

The use of the telephone for operating trains is one of the greatest steps ever taken by the railroads to put the train dispatcher on his feet. The bell in place of the telegraph call solves the problem for prompt service on the part of the operators. Good English in place of the Morse alphabet eliminates the poor telegrapher from the dispatcher's category of troubles, and reduces misunderstandings to a minimum.

The telephone permits an element of personality to enter into the work, which is far reaching in its good effect and which is impossible with the telegraph. Direct communication with conductors, engineers, yardmasters and officials, in cases of congestion, engine failures, accidents or severe weather, permits of a more thorough understanding of conditions and quicker action in making arrangements to overcome irregularities than is possible through a number of telegraphic messages.

Prejudice against the telephone on account of its liability to get out of order and the interference of outside persons, is ungrounded when the system is properly installed and where proper discipline is maintained among employes having access to the instruments. The telephone will work satisfactorily through weather conditions which often render the telegraph useless. All other things being equal, it is fair to say that a dispatcher can handle one-third more business on a single track with the telephone than with key and sounder, and do it with less effort and with less delay in traffic.

*Railway and Engineering Review.

An Early Canadian Telegram.

In our issue for April 16 we gave a reproduction of an old telegram, received at Cincinnati from Philadelphia on November 28, 1848. These were the days when the electric telegraph was truly "in its infancy." Our Canadian neighbors were not slow, however, to appreciate the importance of the new means of communication of intelligence, for they too contemporaneously applied the telegraph to their needs.

St. Catharines Dec 23rd 1848

REPRODUCTION OF EARLY CANADIAN TELEGRAM.

The accompanying cut is a reproduction of an early Canadian telegram, dated December 23, 1848, about a month later than the one previously mentioned. It was loaned to us by Mr. James Kent, manager of telegraphs, Canadian Pacific Railway, Montreal, Que. The paper on which it is written is well preserved although the ink has faded somewhat indicating its age.

Mr. J. Schanher, a prominent druggist at Mount Clemens, Mich., formerly and for many years manager of the Western Union Telegraph Company at that place, in renewing his subscription for another year says: "It gives me great pleasure to renew my subscription for Telegraph and Telephone Age."

Simplified Wireless Telephony.

In an article in the *Electrical World* Mr. M. Freimark briefly describes some experiments he made in wireless telephony and brings out some facts which he thinks should be followed up.

In the spring of 1910, he says, while making experiments to devise a method for locating open circuits in insulated and concealed wiring, it was found that the human body acts as an excellent antenna and detector and responds remarkably to the slightest excitation from electromagnetic waves or static induction. Having perfected this method for localizing breaks in telephone wiring, a close resemblance was observed between the apparatus and a miniature wireless-telegraph sending station.

The sending outfit being identical — from a purely theoretical point of view—in the two cases, one could not help thinking why the receiving station should not be the same, and why, in particular, it should not be used for wireless telephony. To this end it was necessary merely to change the sending station to a talking circuit. An operator's telephone set answered the purpose. A few dry cells were put in series with the transmitter and the primary side of the induction coil. One terminal of the secondary was grounded, the other one serving as the sending antenna. The receiving station consisted of a telephone receiver with one terminal connected to the body (ear or finger) and the other one to a wire which trailed on the ground or was directly connected to ground for the purpose of better receiving. The results were as anticipated. The sounds were audible a few feet from the antenna.

Further experiments with a phonograph, in connection with a small step-up coil, such as is used in wire-telephone practice, brought out the fact that the phonograph could be heard through the receiver anywhere in a good-sized living-room when the wire was concealed under the rugs. Metal, such as a brass bedstead or a tin roof, readily takes up the waves, acts like a sounding board and gives them off with seemingly increased strength.

It is doubtful, Mr. Freimark states, whether a transmitter of the present type will ever be developed to withstand currents strong enough to serve directly for wireless transmission. However, there is no doubt that combinations of this transmitter with generators, transformers, arc lamps or coils can be made which will be able to transmit sound within the limits of any city, and for overland or oversea transmission very high frequency waves can be used as the carrier.

Like wireless telegraphy the method described has the disadvantage of publicity, and even more so since anybody equipped with a receiver can pick up the message; for the same reason it also has the good side — though it is only one-way transmission—that it is accessible to everybody, rich or poor.

A city equipped with such a station could, Mr. Freimark thinks, send out orders to the whole police force in an instant, publish election or ball-game returns, give free concerts to the whole population and accomplish a good many other things which would tend to better the social life of its citizens.

Telephone Rates in Louisville.—Judge Evans, in the Federal Court for the Western District of Kentucky, has granted a permanent injunction in favor of the Cumberland Telegraph and Telephone Company restraining the City of Louisville from enforcing telephone rates fixed in an ordinance recently enacted.

Connecticut Telegraph Company Purchased By Southern New England Telephone Company.

The board of directors of the Connecticut Telegraph Company, New Haven, Conn., has decided to wind up its corporate existence, the plant of the company having been purchased by the Southern New England Telephone Company. The stockholders of the Connecticut Telegraph Company held a meeting in New Haven on May 10 and ratified the action of the board of directors.

New England Telephone and Telegraph Annual Meeting.—At the annual meeting of the New England Telephone & Telegraph Company May 1, Mr. William J. Denver was elected a director to take the place of Mr. H. S. Hutchinson, deceased. The other directors were all re-elected. The following executive committee was selected: Messrs. Thomas Sherwin, Jasper N. Keller, Theo. N. Vail, Moses G. Parker, and Union N. Bethell. At the subsequent directors' meeting the retiring officers were re-elected, with Mr. Jasper N. Keller as president.

Half-Automatic Telephone System in Amsterdam.

A half-automatic telephone system is being practically tested by the telephone authorities in Amsterdam, Holland. The system is thus described: Instead of a table showing the number of the subscribers, as in the old way, a device is provided with five rows of buttons, each row comprising ten buttons, representing the figures from one to ten. The first row represents ten thousands, the second thousands, the third hundreds, etc. The glowing of a small incandescent lamp indicates when a subscriber desires connection. The girl asks the number, in the usual way, and then effects the connection by pressing different buttons. For instance, if 13,785 be requested, she presses button one of the ten thousands, three of the thousands, and so on. Instruments in the office then rise and turn, making the connection. The telephone girl seems to do what the subscriber does in the full-automatic system. If the connection is made, the subscriber hears a ringing sound. If the desired line is engaged, he hears a blowing noise.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

May 16, 1911.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Two Important Western Union Orders.

Two noteworthy steps in the direction of improving the conditions surrounding the employes have recently been taken by the Western Union Telegraph Company; one in providing typewriters for the operators at the company's expense, the other having for its purpose fair treatment of employes.

The decision of the company to supply its operators with typewriters is a step in the right direction and yet, we can readily understand, it is one that is fraught with difficulties in its practical application. It has often been asserted that the companies should provide its operators with typewriters just as it does keys, sounders, etc.; one is as much a part of the operating equipment as the other. The typewriter was introduced by the operators themselves on their own volition, but with the permission of the companies to use it, and it has for this reason not had what might be called an official standing. It is easy, however, to find an explanation for the apparently anomalous conditions. When keys, relays, batteries, etc., were adopted they were actual necessities in the transaction of business, but the typewriter came rather as a luxury. We often hear the statement that the luxury of to-day becomes a necessity to-morrow, and so it has proven in the case of the typewriter. It has become part of the equipment of all first-class offices, and its adoption has met with the favor of the public and the companies alike.

Now, the time having become ripe, it has been officially recognized, and there can be little question as to the wisdom and justice of this important step.

As to the other order. It is unfortunate that conditions existed that should give rise to its necessity. Its object is to secure fair treatment of employes at the hands of their official superiors. It seems that complaints have been made of favoritism, prejudice, etc., against some employes. An appeal to the minor officials does not always bring relief, so now the general management has constituted itself a court of arbitration to investigate and settle such questions. The company is desirous of protecting the interests of its employes and securing justice in all its dealings with them, and the step it has taken in this direction will certainly receive the approbation of all concerned.

Telephone and Telegraph Companies Subject to the Rate Act.

The Interstate Commerce Commission at Washington has issued conference rulings in which it it held that every telegraph and telephone company which does interstate business is subject to the provision of the amended rate law. If such a company, the line of which is wholly within a single state, receives a message within the state for transmission to a place outside and delivers it to an interstate line for transmission to its destination, the first-named company is not subject to the act unless there is an agreement for through continuous transmission of business, in which case all participating companies are subject to the act. They are also forbidden to give rebates or other special advantages and are subject to the orders of the commission respecting the keeping of accounts and memoranda and the making of reports. The transmission of telephone messages from one state to another in a like manner constitutes interstate commerce and brings all of the participating lines within the purview of the act.

Object to Removal of a Telegraph Office.—The citizens of Wapakoneta, Ohio, are advocating the confiscation of the property of the Western Union Telegraph Company and the Cincinnati, Hamilton and Dayton Railroad because the telegraph office at the station has been moved to a point six blocks away.

Digitized by Google

Opening of the New York-Denver Telephone Line.

On the evening of May 8 the American Telephone and Telegraph Company gave an exhibition of the working of its new telephone circuit between New York and Denver, a distance of 2,011 miles. This new circuit marks a very important advance in the development of long-distance telephony. For a number of years telephone service between New York and Chicago and St. Louis, over distances of about 1,000 miles, have marked the practical limit of commercial long-distance talking. By the recent advances which have been made in the development of long-distance lines, this range has been extended to over 2,000 miles, as shown by the tests on the evening of May 8.

A number of newspaper men in New York and Denver were assembled at the telephone company's offices in these cities and talked to each other over the new line, thus receiving an actual demonstration of its capabilities. At the New York end the tests were carried on from the company's offices at 15 Dey Street. Among those present on the American Telephone and Telegraph Company's staff were: Mr. N. C. Kingsbury, vice-president; Mr. J. J. Carty, chief engineer, under whose direction the work the results of which were shown has been carried on; Mr. Charles H. Wilson, general superintendent; Mr. H. S. Brooks, general commercial superintendent; Mr. B. Gherardi, engineer of plant; Mr. Frank B. Jewett, transmission and protection engineer, who, under Mr. Carty's direction, has carried on the work resulting in the New York-Denver service; Mr. H. V. Briesen, Mr. C. A. Robinson, engineer, and Mr. G. C. Pratt.

Mr. Carty explained to those present that the success of the line was due to developments which have been made during the last two years, without which the line would have been an economic impossibility One of the important developments embodied in the new line was the application of the so-called Pupin loading coils to the large gauge (No. 8 B. W. G.) copper circuits used for very long haul telephone conversations. While for about ten years the American Telephone and Telegraph Company and its associated companies have been making very successful applications of loading coils to underground cable circuits and to the aerial cable circuits of No. 12 gauge wire which are used for moderate distances, it has been, up to very recently, impracticable to apply loading coils to No. 8 B. W. G. circuits on account of certain losses which occurred all along these lines when such loading coils were used. These losses arose from the fact that when a very large gauge wire is loaded it is necessary that there should be a high degree of perfection in the insulation all along the line. The No. 8 circuits, when loaded, are so efficient that minute leaks and losses here and there along the line, which would be insignificant with smaller and less efficient wires, become of controlling importance and must be guarded against to obtain successful results. Consequently it was necessary to climb every one of the 87,000 telephone poles carrying the wires between New York and Denver and to substitute new and better insulators for the 285,000 insulators used on the wires concerned in the circuits between New York and Denver. In addition, at a number of special points where it was known that leakage was especially likely to occur, further and special steps were taken to eliminate this possibility. The very best experts and engineers worked on this problem for a considerable length of time and the results obtained in the tests are proof of the success of their efforts. Another important improvement which contributed substantially to the results obtained was the working out of arrangements by which these high-grade loaded circuits could also be phantomed and the phantom circuit thus produced loaded. This required much special work and invention in connection with the adaptation of loading coils to this special class of service. By these developments it is possible to get out of four wires three telephone circuits of efficiency heretofore unattainable and at the same time that these wires are being used for telephone conversations to carry on over them eight telegraph communications. These results between New York and Denver have been attained, as described, by the use of existing circuits, at a total expenditure of about $100,000. Had the company undertaken to obtain these same results without the developments referred to and by the stringing of additional copper circuits sufficiently heavy to permit of talking between New York and Denver without loading or phantoming, the expenditure required would have been about $1,600,000.

The opening of telephone communication between New York and Denver marks an important step in the project of giving telephone service between the Atlantic and Pacific coasts of the United States, a distance of about 3,000 miles. Until the completion of the developments which made the New York-Denver line possible, the practical range of commercial telephone communication was about 1,000 miles. It has now been extended to about 2,000 miles. One more step like this and the spanning of the continent with telephone wires will be complete and it will be possible for anyone in New York city to talk to anyone in San Francisco.

The demonstration was not only interesting in connection with the possibilities of talking between New York and Denver, but also brought out clearly the advantages of very close relations between those giving telephone and telegraph service. Those present were able to see right before them telephone and telegraph communications being carried on over the same wires at the same time. It is, of course, important that the economic advantages which would result from the general use of wires for both telephone and telegraph circuits should be attained.

The Wireless Ship Act.

In a recent communication issued by Mr. Charles Nagel, secretary Department of Commerce and Labor, Washington, D. C., to the collectors of Customs instructions are given for the enforcement of the Wireless Ship Act which will take effect July 1.

The letter reads as follow:

"To prepare for and facilitate the enforcement of the Wireless Ship Act which will take effect on July 1, 1911, this Department has made an arrangement with the Navy Department by which naval wireless shore stations of the United States will receive during the months of May and June between the hours of 8 a. m. and 6 p. m. (time of shore station) wireless messages from merchant vessels subject to the Act, to show that such vessels are 'equipped with an efficient apparatus for radio-communication in good working order in charge of a person skilled in the use of such apparatus.' The Navy operators at shore stations will mail such messages to the Navy Department for transmission to this Department and the proper collectors of customs will then be advised. Such messages should, of course, be sent by a vessel at sea to a naval shore station at least one hundred nautical miles distant from the ship and preferably from a point which will show the average maximum radius of the ship's apparatus.

"The message should be prefaced by the words 'For Commerce Labor, Washington,' and should contain the following information: 1. Name of vessel; 2. Nationality of vessel; 3. Latitude and longitude at time of sending message; 4. Full name of operator sending message; 5. Master's signature.

"You will communicate this arrangement to the owners or agents at your port of ocean steamers subject to the Act.

"The sending of these messages is not, of course, obligatory but it is for the convenience of shipowners as well as of the Department."

Section 1 of the Wireless Ship Act of June 24, 1910, reads as follows:

> "Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That from and after the first day of July, nineteen hundred and eleven, it shall be unlawful for any ocean-going steamer of the United States, or of any foreign country, carrying passengers and carrying fifty or more persons, including passengers and crew, to leave or attempt to leave any port of the United States unless such steamer shall be equipped with an efficient apparatus for radio-communication, in good working order, in charge of a person skilled in the use of such apparatus, which apparatus shall be capable of transmitting and receiving messages over a distance of at least one hundred miles, night or day; Provided, That the provisions of this Act shall not apply to steamers plying only between ports less than two hundred miles apart."

WIRELESS OPERATORS.

1. Paragraphs 3 and 4 of Article VI of the Service Regulations, annexed to the Berlin International Radio-telegraphic Convention, provide:

> "3. The service of the ship station must be carried on by a telegraphist holding a certificate issued by the Government to whose authority the ship is subject. This certificate testifies to the technical proficiency of the telegraphist as regards: (a) The adjustment of apparatus; (b) Transmission and sound-reading at a speed which must not fall short of 20 words a minute. "An operator 'skilled' within the meaning of the act should be able:

(a) To send on an ordinary Morse key for five consecutive minutes at not less than twenty words per minute, five letters being counted as one word. The accuracy of signaling, the correct formation of the letters, and the correctness of spacing will be taken into account;

(b) To receive and write legibly at the prescribed speed from a double headgear telephone receiver as ordinarily used for radio-telegraphic reception;

(c) To understand simple diagrams of the electrical connections of the apparatus;

(d) To be able to connect up the apparatus;

(e) To name the principal parts of the apparatus and indicate their use;

(f) To mention the most common faults, and the means usually taken to remedy them;

(g) To explain the steps taken to change from one wave-length to another, in sending and receiving.

The Berlin Convention has been ratified by the following nations and provinces: The United Kingdom and British South Africa, Germany and all German protectorates, France, Norway, Japan, the the Netherlands and Dutch Indies, Russia, Sweden, Austria-Hungary, Spain, Denmark, Belgium, Brazil, Turkey, Portugal, Roumania, Mexico, Bulgaria, Persia, and Tunis. It is to be noted that the United States is not as yet a signatory power to this convention.

Wireless operators, holding valid certificates, issued by the governments named will be recognized as persons "skilled in the use of such apparatus" within the meaning of the Act cited unless in the case of a specific individual there may be good reason to doubt the operator's skill and reliability. Such certificates should be ready at hand for the inspection of customs or other officers before the ship departs from the United States.

Mr. H. M. Heffner, chief operator of the Commercial News Department, 195 Broadway, New York, in renewing his subscription for Telegraph and Telephone Age for another year says: "It is always a pleasure to point out the necessary, entertaining and instructive features of the Age to such as are not yet initiated into the graces of a regular enrollment. I shall certainly recommend your paper at all times."

QUESTIONS TO BE ANSWERED.

[The success which has attended our plan of publishing in each issue a list of questions covering the subjects considered in Jones' Diagrams, has encouraged us to maintain the work through other books. Students of telegraphy throughout the country are finding these questions of great assistance in their studies of the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. Having completely covered Mr. Jones' book we will now take up "The Quadruplex," by Maver and Davis, and bring out, in a like manner, all the facts that every telegrapher should know about duplex and quadruplex telegraphy as found in this book.]

CHAPTER I.

In what year did Mr. Edison perfect the quadruplex?

Between what cities was the first quadruplex circuit established?

Upon what system was the quadruplex worked at that time?

Describe the general arrangement of the receiving instruments?

How were the instruments operated?

How were the instruments wound?

What were the principal features of the No. 2 relay?

Did it differ essentially from the present No. 2 relay?

Was the first quadruplex a complete practical success?

What was the principal difficulty of operation and what was the cause of it?

What were the first steps taken to obviate the troubles?

What was the purpose and action of the condenser?

What change in the foregoing arrangement was made in 1875?

Did the armature of the No. 2 relay respond to changes of polarity or to current strength alone?

What was the next change in the development of the quadruplex?

What is a diplex system?

Does the present quadruplex involve the diplex system?

What was the next improvement made and how were the No. 1 and No. 2 relays placed?

In this arrangement of the instruments did the No. 2 relay respond to either polarity ?

In the operation of the apparatus when does the No. 2 relay break the local circuit?

What was the next step in the placing of the two relays?

At this time a change in the position of the condenser was made; where and how was it connected?

Who devised this arrangement?

What was the function of the combination relay illustrated in Fig. 6?

Did this device work successfully and why was it found advisable to use two separate relays?

What was the character of the No. 2 relay in 1878 and how was it operated?

What was the effect of the introduction of the short-core No. 2 relay?

Has any material change been made in the continuity-preserving transmitter?

Has any change been made in the form of the pole changer?

Researches on Multiplex Telephony.*

BY ERNEST RUHMER.

Directly after my first researches on wireless telephony in the summer of 1906 I conceived the plan of combining wireless with wire telephony and in this way solving the problem of multiplex telephony. After several preliminary researches in this field I succeeded in the spring of 1908 in transmitting at the same time over the line between my laboratory and my house five separate conversations without any disturbance. These researches and those which followed were carried out with the apparatus described as follows:

In the same way as in wireless telegraphy high-frequency alternating current is generated at each transmitting station. The frequencies at the various stations are, however, different. All these high-frequency currents are propagated along the same wire and are then separated again at the receiving station, where they operate a resonance circuit connected with a telephone. The coupling between the telephone wire and the respective receiving stations must be as loose as possible in order to separate the various speeches and thus to prevent

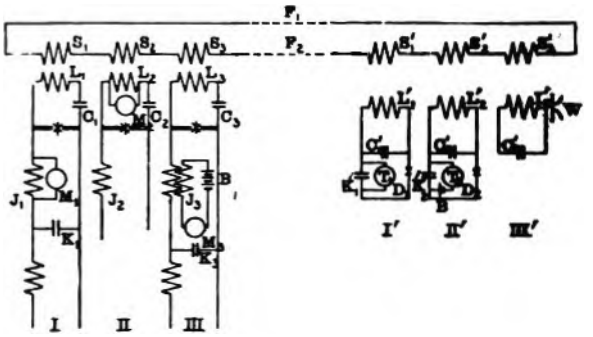

DIAGRAM OF CONNECTIONS OF RUHMER MULTIPLEX TELEPHONE STATIONS.

the troubles which arise when there is a great deal of speaking; otherwise some of the listeners cannot hear very well.

The accompanying illustration shows diagrammatically three transmitting and receiving stations arranged on this system. An arc burning in an atmosphere of hydrogen is used for generating the high-frequency current. The arc is connected in parallel with an oscillatory circuit which is fitted with a capacity (C_1, C_2, C_3) and a self-induction (L_1, L_2, L_3) so that the periods of oscillation are different.

The strength of the high-frequency current flowing in these circuits is dependent on the microphone M. Further, the main current can be regulated as in I and III, or the high-frequency current in the oscillatory circuit as in II. Any of these arrangements are permissible as long as the microphone at

*From a London Exchange.

Digitized by Google

a given transmitting station does not influence the alternating current from the other transmitting stations.

Detectors D can either be connected with the oscillatory circuits in an analogous manner to that used in wireless telephony, or the alternations in the alternating current may be changed into sound-waves direct either by using a condenser or an eddy current telephone as at W in III'. The transfer of the different speaking currents through the common wire F_1, F_2 is effected by means of a coil, S, which is coupled fairly closely with the transmitter oscillatory circuit and loosely with the receiving circuit.

As the wire carries oscillations of all frequencies certain free oscillations occur in the circuits at the respective receiving stations, so that each receiving station only hears the conversation from the corresponding transmitting station.

The Telegraph and Telephone in Salvador.

The telegraph and telephone lines of the Republic of Salvador, Central America, are government property. The first telegraph line was built between San Salvador and the port of La Libertad in 1870 by Mr. Charles H. Willings, a telegrapher from the United States.

The submarine cable of the Central and South American Telegraph Company was laid in 1882 under the direction of Mr. Stanley MacNider, then of New York but now of Guatemala. It connects La Libertad with Salina Cruz to the north and with Panama to the south.

The telegraph was instituted in 1888 by native telegraphers under the direction of Don Teodoro Gomez. There are 2,551 miles of telegraph wire in the country, 2,074 miles of telephone wire, and 200 offices. In the year 1910, 1,540,040 telegrams were transmitted. The receipts from the telegraph service were $448,385.75; from the telephone service, $257,269.87; from the cable service, $113,512.60, making the total receipts $819,167.68.

The following named gentlemen constitute the board of directors: Director-general, Don Ricardo Posada; sub-director, Don Manuel Olmedo; inspector-general, Don Teodoro Gomez; inspectors of telephones, Don Ramón A. Cáceres and Don Manuel C. Mariona; inspectors of telegraphs, Don Francisco Corea and Don Luis Aceituno; secretary, Don M. A. Girón; cashier, Don O. Lindo; shopkeeper, Don Felipe Guzman.

The present central office not being large enough to satisfactorily accommodate the several services, the Board of Directors has arranged to buy a piece of land near by, and the engineer, Mr. José E. Alcaine, is preparing the plans for a new building.

The central office at Santa Ana was constructed in 1905 especially for the various services. In this installation were used for the first time in that country underground cables, laid in lengths of 100 meters from the office, each cable having 50 wires, paper insulated. During the first year of service these cables were troubled by atmospheric discharges. In the following years, however, lightning arresters were installed, and since then no trouble has been experienced.

A switchboard of fifty-six lines capacity, manufactured by J. H. Bunnell & Co., New York, was installed September 25, 1910, by the inspector, Don Ignacio R. Zamora, in the central office of San Salvador.

The central office of telephones of San Salvador contains four switchboards of 100 grounded lines each. There is also a multiple combination switchboard for 500 subscribers.

The Van Rysselbergh system of simultaneous telegraphy and telephony is used with good success to several points in the country that are not reached by special wires for telephone service.

Two sets of wireless telegraph apparatus have been purchased and will be installed as soon as the buildings are completed.

In order to obtain direct communication with the capitals of Guatemala and Honduras four sets of Ghegan telegraph repeaters have been ordered. The use of these repeaters will make it possible to communicate from San Salvador to Tegucigalpa, the capital of Honduras, a distance of 360 miles. Two sets of Hughes printers were recently installed on busy lines and are working satisfactorily. The director-general is forming a corps to operate these machines.

A Central American telegraph conference is soon to be held in Venezuela for the purpose of arriving at a better understanding among the five Central American republics in regard to telegraphic matters. The conference will consider, among other things, intercommunication between the various republics on a more equitable basis.

The matter upon which the foregoing article is based was supplied by Mr. Fidel Villacorta, of Sonsonate, San Salvador, who also sent us several photographs showing interior and exterior views of the telegraph and telephone headquarters in San Salvador. The telegraph operating room as shown in the photographs strikes an American as being very peculiar in its arrangement and equipment. The instrument desks resemble old-fashioned office desks, with drawers down one side and inclined tops, enclosed by a railing. The desks are placed in rows, with ample space between them. The switchboard is of the modern American type, and the room is lighted by electric arc and incandescent lamps.

The telephone switchboard is of the drop-type, male operators being employed in their handling. The view of the exterior of the headquarters show the main building to be of a substantial character and one story high. The wires are carried into the building through an elaborate frame work placed upon the roof.

China's Telegraphs.—The Chinese government has raised a loan for the development of the Chinese inland telegraphs, which are said to be the worst in the world.

Interferences and Perturbations in Wireless Telegraphy.

Mr. J. E. Taylor recently read a paper before the Institution of Electrical Engineers, London, on the subject of "Wireless Telegraph Working in Relation to Interferences and Perturbations," from which the following extracts are taken:

The working efficiency of a radio-telegraph installation is very greatly influenced by its freedom or otherwise from interferences and perturbations of all kinds.

Interference by local inductive disturbance is avoidable. It is necessary to ensure that there is no electrical disturbance of the radio-telegraph receiver by the operation of the land circuits. Such disturbance may, in the case of Morse apparatus on the land circuit, arise from sparking at relay and key contacts, electrostatic or electromagnetic induction from circuit leads, or from battery leakage direct or via the earthing elements, and direct induction from the external line to the aerial wires of the radio-telegraph plant. To obviate these troubles, telegraph or telephone circuits are led into the station by a short length of underground cable, so that the exposed landline is at least 30 or 40 yards distant from any part of the aerial wire system of the radio-telegraph plant. The landline apparatus and wiring are located in the operating room as remote from the radio-telegraph apparatus as possible, consistent with convenience in having both sets of apparatus manipulated by one officer. The land-circuit ground connection should be made separately to a ground-plate distinct, and separated by at least a few yards, from the main high-frequency grounding system of the wireless telegraph plant.

In addition to inductive disturbance of the wireless telegraph receiver by the landline there is also the reverse action to consider, viz., the powerful electrostatic induction of the wireless transmitting plant on the landline and Morse apparatus. In the case of wireless telegraph transmitters with coupled or closed-circuit excitation, troubles of this kind are not very apt to occur; but if "plain aerial" transmission, or any form of transmission involving precharging of the aerial system prior to disruptive discharge across the spark-gap be used, strong inductive disturbances are liable to be created on neighboring circuits.

Complete isolation of running machinery from the operating-room, preferably by locating it in a separate structure, is desirable to eliminate vibration effects, and battery-charging circuits should be excluded completely from the operating-room.

The consideration of mutual disturbance produced by radio-telegraph stations on one another opens up a peculiarly involved problem. In certain tracts of sea around the British Islands where congested radio-telegraph conditions arise, it is, unfortunately, sometimes necessary, under present working arrangements, to rely largely on "shouting down" interfering stations. Although, under the International Radio-telegraph Convention, the range of wave-lengths allotted for ship to shore working is strictly limited and defined, no radical improvement in working conditions can at present be expected from any system of allotting distinctive wave-lengths for individual coast stations.

Stations in sufficiently close contiguity are liable to powerful electrostatic induction across from aerial to aerial, tending to produce forced oscillations, the effect of which on the receiver it is extremely difficult to annul. This effect decreases very rapidly with increase of distance of separation. It is more pronounced in transmitters of the open-circuit type, in which the aerial system is charged up to a high potential prior to discharge across the spark-gap. The pre-charged aerial method produces an extensive and obtrusive electrostatic field, whilst the electrostatic field produced by the coupled transmitter is negligible in comparison, and can be made wholly unobtrusive in its interference-producing qualities.

Emphasis must be placed on the disability of the station experiencing such interference at close quarters to "tune out" to the necessary extent by dissonance, assuming coupling methods and receiving appliances of the kind required for the efficient operation of a spark system.

Interference by pre-charged aerials on distant stations is also of a very pronounced character; this effect cannot, of course, be due to electrostatic induction, but is doubtless determined by the impure character of the waves emitted.

Heavily coupled transmitters give rise to interference both in respect of impurity of wave-train, due to forcing at the transmitter, and in respect of the well-known double wave emission. Lightly coupled spark transmitters have most certainly proved themselves to occupy a premier position as regards elimination of objectionable interference. For ship-and-shore communication, a very light coupling is impracticable, both by reason of the diminution of range and because, if sharp tuning is necessary, there will be a difficulty in getting into touch; calls would be lost, and the communication would lose its utility. Under present conditions of operating coast station services, there are periods during which the "jamming" of the signals of one station by others is so pronounced that confusion begets confusion, and "shouting down" becomes the order of the day.

Regulation of interference at the receiver is a very important proposition. It is unfortunate that complete elimination of disturbance by regulation of the receiving appliances is not feasible, as in that case the difficulties experienced in successfully legislating for the regulation of transmitters would not arise.

In contrast with coupling methods of reducing interference, various plans of divided circuits have been proposed or used in which the impulses conveyed by one branch are annulled by those conveyed by the other, except to the extent necessary for the interpretation of the signals required. In these methods the required signals are "turned in"

Digitized by Google

as against tuning out undesirable impulses. Fessenden's "differential" method and S. G. Brown's "bridge" method are examples of this class.

If the two branches of the divided circuit in the bridge are absolutely symmetrical, all received impulses will divide equally and no effect will be produced on the detector (which occupies a position corresponding to the galvanometer in a Wheatstone Bridge). A very slight disturbance of the balance by shifting the point of the earth-wire connection to right or left will determine signals on the detector from the branch best tuned to the received impulses. If these impulses consist of a sufficiently long train of waves, discrimination is effected between these and any other impulses (even if of the same periodicity) if such other impulses are of a more rapidly damped character. A "valve receiver" interference preventer based on a similar principle has been patented by Marconi.

Transmitters of high sparking rates or intermittency, producing a constant musical note in the receiver, lend themselves to acoustical methods of reducing interference both by reason of the possibility of resonating acoustically to the spark frequency and by the comparative ease with which signals of high and constant periodicity can be magnified at the receiving station. This method appears to have been fully worked out by the Telefunken Company.

The phenomena known in operating parlance as "X's," otherwise parasitic impulses or "atmospherics," present a wide variety of characteristics depending upon the latitude in which they are observed, the season of the year and the time of day. They manifest themselves in the auditive wireless receiver as a series of scraping, scratching or explosive noises of various intensities. They present distinct periodic characteristics in all latitudes, being stronger, more persistent and prevalent during the summer than the winter months, whilst they also present distinct periodic variation connected with the times of rising and setting of the sun, though varying greatly in intensity and prevalence from day to day at all times of the year.

During thundery weather, atmospheric impulses are always very pronounced, and occasionally cripple the working of the coast stations in this country for several hours together or even, in exceptional cases, for a whole day. In the winter months, in this country, these disturbances are rarely strong enough to interfere seriously with traffic, whilst they are sometimes totally absent for days together.

With regard to means of reducing interference due to "atmospherics," no special devices are at present in use at the British coast stations, and it is problematical whether any entirely effective arrangement is possible, for the reason that a rough, comprehensive kind of tuning adjustment is essential at these stations for their normal receiving arrangement or "stand-by" adjustment, in order that calls on a variety of wave-lengths from ships may not be missed. For actual reception of messages, however, the sharply tuned adjustment with variable coupling can be resorted to, and the intensity of disturbance thereby much diminished. Tuning alone does not appear to be by any means a complete solution of the problem, doubtless for the reason that most, if not all, of the disturbing impulses have no specific wave-length or frequency of their own. They appear to be due to sudden changes in the electrical state of the atmosphere (probably in the higher regions), which determine sudden changes in the electrical charges normally induced on the aerial wires. The sudden release or accumulation of a charge will set the aerial system into electrical oscillation at the latter's own periodicity. Hence the futility of tuning them out. That they are reduced by tuning and weak coupling to a greater extent than signaled impulses is doubtless due to the damping factor of the aerial system, which determines a rapid rate of decay and few oscillations for the individual disturbance, whilst the signaled impulses may consist of much longer trains of oscillations.

Wireless "freak" communications are wrapped up in the phenomenon of variations in the transmitting efficiency of the atmosphere. Perturbances in this respect exhibit almost the same characteristes of irregularity as atmospheric impulses. Freak ranges of communication or variations in range of communication occasionally occur by day, but the variations noticed during the night hours are much more pronounced. The sudden veiling or obscuring of distant signals together with the equally sudden "opening out" of signals observed whilst listening on the receiver at a wireless station during the prevalence of this phenomenon is very impressive. These variations of range are not found to synchronize definitely with the periods of atmospheric disturbances, though it may well be that more disturbances are observed when the range extends. The author has, however, observed these remarkable variations in range on nights when "atmospherics" have been conspicuously absent.

A Man's Expressive Opinion of Mr. Carnegie.

A story is told of how Mr. Andrew Carnegie befriended a Texas man who had broken a leg. The man was taken to a hospital and when he was asked if he had any friends replied that he had only one genuine friend, and that was a man named Andrew Carnegie; but that he did not know where he might be reached.

Mr. Carnegie was in Scotland at the time but the facts in the case were cabled to him. He replied directing that the moneyless man be carefully nursed and doctored, and that a certain sum be placed at his disposal after leaving the hospital. When this was told to the man in the hospital, he raised himself on his arm and said:

"That's damned white of Andy." And Mr. Carnegie says that he wants nothing better on his tomb than the words, "That's damned white of Andy."

How Faults on Telegraph Lines Are Located.*

Failures of telegraph wires may be divided into two classes—avoidable and unavoidable. It is the constant aim of an efficient maintenance force to entirely eliminate the avoidable troubles, and to reduce to a minimum the effect of the unavoidable ones by clearing them in the shortest possible time after their appearance. To assist the Plant Department's efforts in the latter direction, the engineer of equipment of the Western Union Telegraph Company, Mr. W. E. Athearn, has issued specifications which describe the installation and operation of the bridge testing set. In designing this apparatus, the principal aim has been to secure simplicity and ease of operation. With it, a wire chief can quickly determine the location of wire trouble which may develop in his territory, and thus avoid any loss of time on the part of the lineman assigned to clear it.

The apparatus required for one bridge testing set of the type covered by these specifications is as follows: One Varley bridge, consisting of 2-100 ohm balancing arms and a rheostat adjustable from 0 to 9,999 ohms, with keys, etc.; 1 jack-box, containing

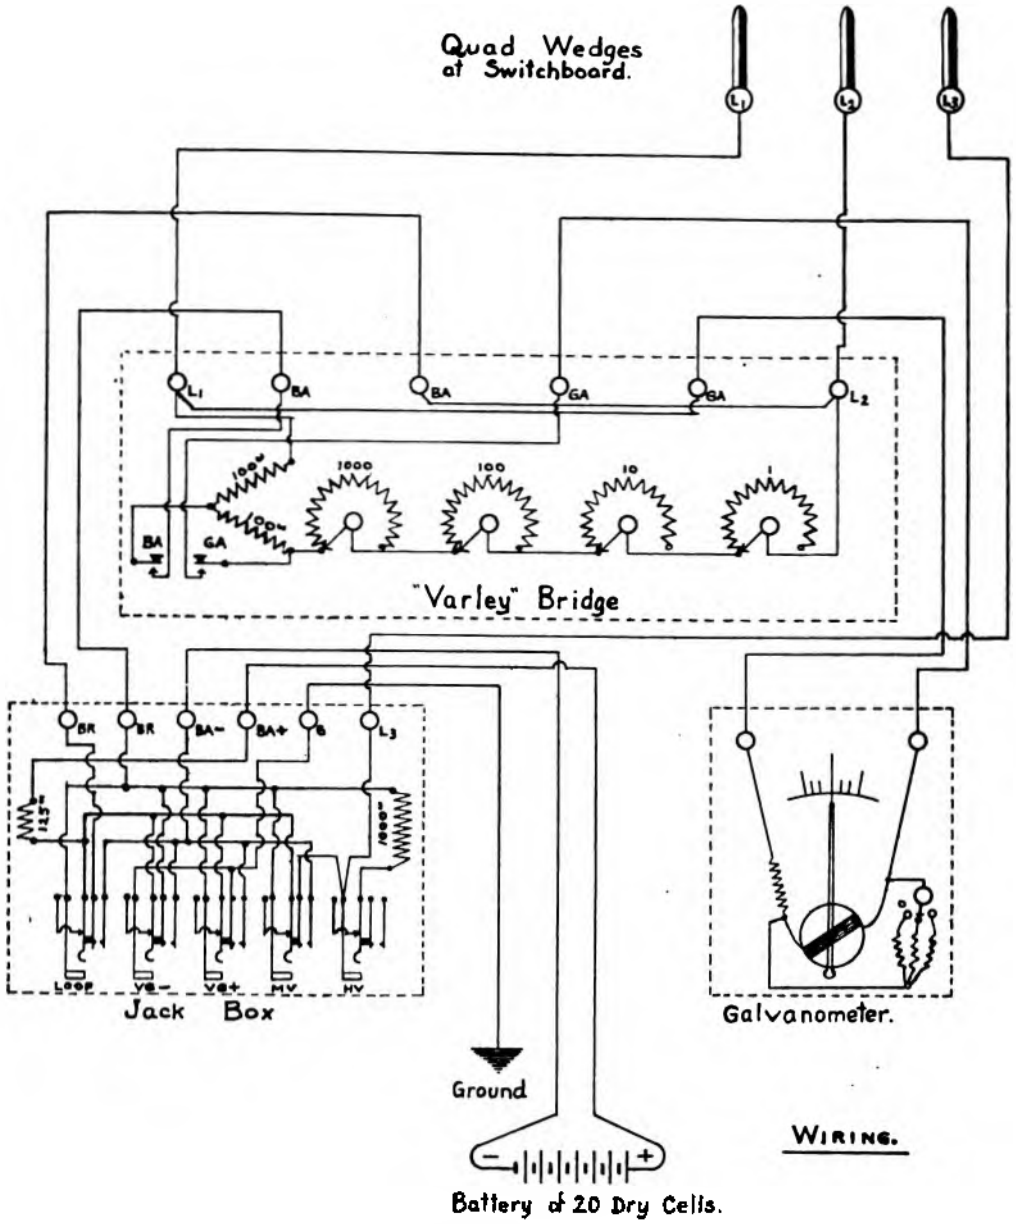

FIG. 1.—DIAGRAM OF CIRCUITS OF WIRE CHIEF'S TESTING SET.

5 W.E.-No. 120 jacks and 1-125 ohm and 1-1,000 ohm resistance units; 1 Weston galvanometer, model 14 with shunts; 3 single-conductor, 6 ft. switchboard cords with wedges marked *L*-1, *L*-2, and *L*-3 respectively; 20 cells of dry battery.

The testing set is principally intended for use by switchboard attendants, in connection with tests of overhead lines. It is a special form of Wheatstone

*Abstracted from *Journal of the Telegraph.*

Digitized by Google

bridge, consisting essentially of two 100-ohm resistance coils, a rheostat adjustable from 0 to 9,999 ohms, and a galvanometer. The actual wiring and arrangement of apparatus is shown in Fig. 1. A simplified diagram of the connections is given in Fig. 2. In this diagram the rheostat is shown as being adjusted to 100 ohms, and the path of the currents is indicated by arrows. Starting from the battery *Ba* it will be noticed that the current divides

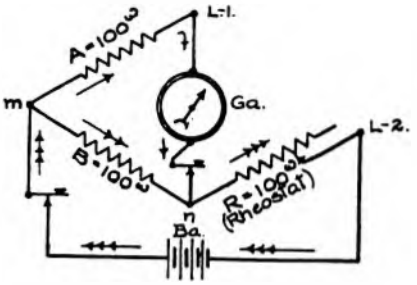

FIG. 2.—DIAGRAM OF CONNECTIONS.

at the point *m*, part of it going through the branch *A* (100 ohms) to the point *L*-1 and then through the galvanometer *Ga* to the point *n*, while the remainder goes through the branch *B* (100 ohms) to the point *n*. At *n* the two currents reunite and pass through the rheostat *R* (100 ohms in this case) to the point *L*-2 and thence back to the battery *Ba*. As the galvanometer *Ga* is simply an instrument for indicating the presence of any current passing through it by the deflection of a needle or pointer, it is evident that such a deflection will occur in this case; in fact, the deflection will be great, if the galvanometer is at all sensitive.

If we now connect a loop having a resistance of exactly 100 ohms to the points *L*-1 and *L*-2, as shown in Fig. 3, the galvanometer needle will drop to zero, indicating that no current is passing through the galvanometer. If the resistance of the loop had been 101 ohms instead of 100 ohms, the tendency of the current to flow down through the galvanometer from *L*-1 would have been slightly greater than the tendency to flow up through the galvanometer from *n* and a small deflection of the galvanometer needle would have resulted; if the loop had a resistance of 99 ohms, the tendency would have been reversed and a slight current would have passed up through the galvanometer from *n*, deflecting the needle in the opposite direction. In either of these cases, however, the galvanometer needle could have been quickly brought back to zero by readjusting the rheostat *R* to 101 or 99 ohms respectively. From this it may be seen that if the resistance of the loop referred to had been unknown, it could have been readily determined by connecting up as shown in Fig. 3 and adjusting the rheostat

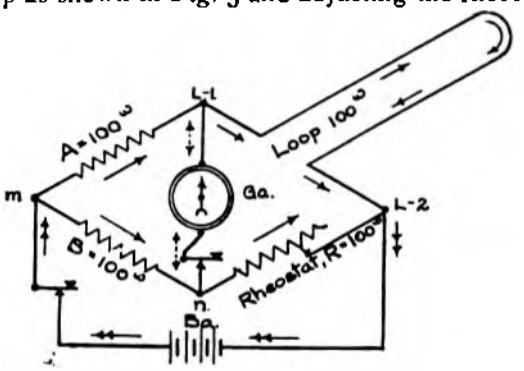

FIG. 3.—CONNECTIONS FOR LOOP TEST.

R until the galvanometer indicated a balance, i. e., until the galvanometer needle showed no deflection; the reading of the rheostat *R* would then show the resistance of the loop connected to *L*-1 and *L*-2. Of course, the unknown resistance connected to *L*-1 and *L*-2 may be anything we desire to measure—a loop, a pair of wires looped together at some distant office, or the coils of a relay or sounder, etc.

It should be noted that a variation of resistance in the battery branch of the bridge, that is, the branch between *L*-2 and *m* via *Ba*, does not affect the measurement, for while it varies the total amount of current available for the bridge, it cannot change the proportions in the branches *A*, *B*, *Ga*, *R*, etc., upon which the balancing depends. The voltage of the battery *Ba* should therefore only be high enough to give good deflections of the galvanometer and any ordinary resistance which may develop in the battery or any resistance which may be inserted in the battery branch to keep the current at a safe value, may be disregarded.

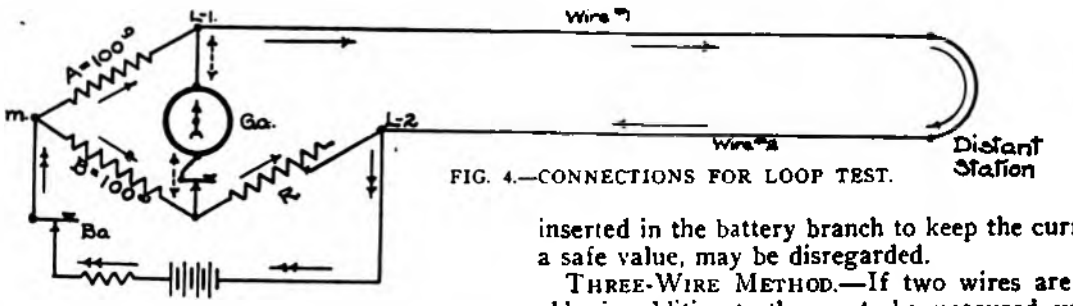

FIG. 4.—CONNECTIONS FOR LOOP TEST.

THREE-WIRE METHOD.—If two wires are available, in addition to the one to be measured, very accurate results can be obtained as follows:

Calling the wire to be measured No. 1, and the other two wires Nos. 2 and 3, have the distant station loop back wires No. 1 and No. 2. Connect these wires to the testing set at the home station by inserting the wedges *L*-1 and *L*-2 in the line springjacks at the switchboard. At the testing set, insert the connecting plug in the jack marked "Loop." The connections will now be as shown in Fig. 4.

Digitized by Google

Adjust the rheostat *R* until the galvanometer indicates a balance, and record the rheostat reading which will be the total resistance of wires No. 1 and No. 2 in series.

Have the distant station loop back wires No. 2 and No. 3, change switchboard wedges *L*-1 and *L*-2 to these wires, and re-balance the bridge; record the new rheostat reading as the resistance of wires No. 2 and No. 3.

Now have the distant station loop back wires No. 1 and No. 3, change wedges *L*-1 and *L*-2 to these wires, and re-balance the bridge; record this rheostat reading as the resistance of wires No. 1 and No. 3.

Add the three sets of figures which have been recorded. The sum will be twice the total resistance of the three wires, since we have measured each wire twice—No. 1 in the first measurement and in the third measurement, No. 2 in the first and second, No. 3 in the second and third. We therefore divide the sum of the three sets of figures by 2, thus getting the total resistance of the three wires. From this subtract the resistance of wires No. 2 and No. 3, as obtained on the second measurement, and the result will be the resistance of wire No. 1. If it were desired to get the resistance of wire No. 2, we would subtract from the total resistance of the three wires the resistance of No. 1 and No. 3 as obtained in the third measurement; or for the resistance of wire No. 3, subtract from the total resistance of the three wires the resistance of wires No. 1 and No. 2 as obtained in the first measurement.

TWO-WIRE METHOD.—If only one wire is available, in addition to the one to be measured, the following method may be used; accurate results will be obtained with it when the insulation of the wires is good:

Have the distant station ground the two wires, which we may call No. 1 and No. 2. Connect these wires to the testing set at the home station by inserting the wedges *L*-1 and *L*-2 in the line spring jacks at the switchboard; *L*-2 should go to the wire

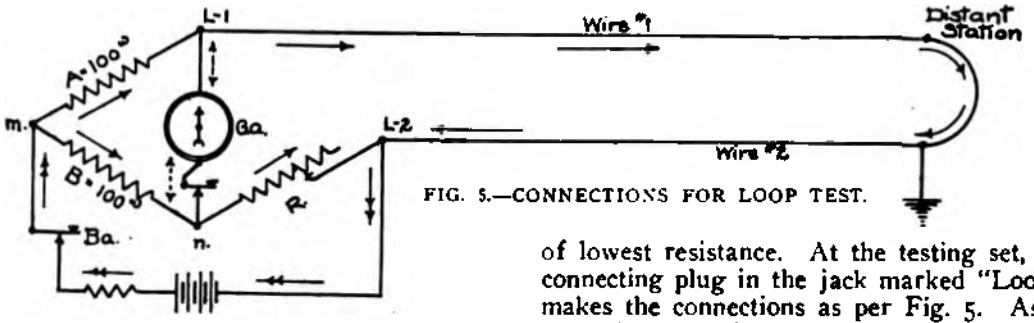

FIG. 5.—CONNECTIONS FOR LOOP TEST.

of lowest resistance. At the testing set, insert the connecting plug in the jack marked "Loop," which makes the connections as per Fig. 5. As the only ground on the circuit is the one at the distant station, it will have no effect on the balancing of the bridge; the current will pass out over one wire and return over the other, exactly as in the "Loop" measurements previously made, and a balance will be obtained when the rheostat *R* is equal to the total resistance of the two wires under test. Record this figure as the "Loop" resistance. Now transfer the plug from the "Loop" jack to the "VG+" or "VG—" jack; use the "VG+" jack if the distant ground has negative potential, and vice-versa. The connections will now be as per Fig. 6; the testing battery being grounded, the current will pass outward over both wires from the testing set and return through the ground from the distant office as shown by the arrows. A study of this drawing will show that the conditions for a balance of the bridge are now totally different from those which were shown in Fig. 5. Instead of the rheostat *R* having to equal the total resistance of wires No. 1 and No. 2 in series as it had to in Fig. 5, we are now using wire No. 2 in series with the rheostat *R* to form one arm of the bridge and thus they match against wire No. 1 which forms the opposite arm. Now if wire No. 1 has exactly the same resistance as wire No. 2, it is evident that the rheostat *R* may be set at zero and the bridge will be balanced, that is, no resistance need be added to the arm containing wire No. 2 to make it equal to the arm containing wire No. 1, as they are already equal to each other. On the other hand, if wire No. 2 has less resistance than wire No. 1, it is plain that the rheo-

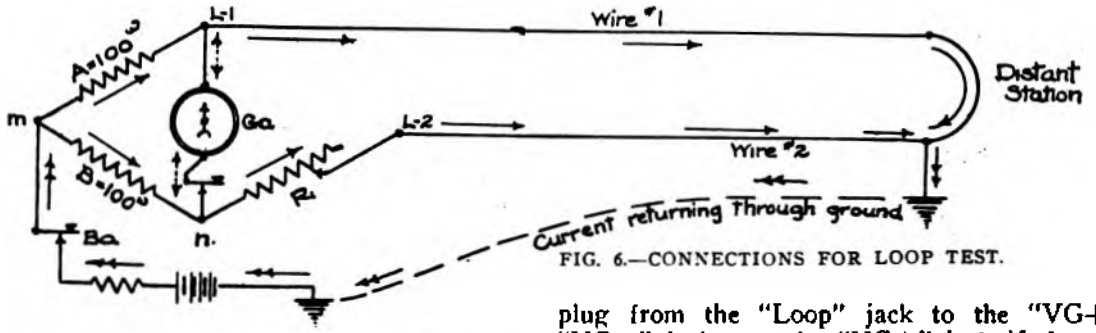

FIG. 6.—CONNECTIONS FOR LOOP TEST.

Digitized by Google

stat R must be set at a figure which is equal to the difference between the resistances of wires No. 1 and No. 2. This is made clearer by the example shown in Fig. 7. This figure is electrically the same as Fig. 6, but is drawn with greater similarity to the usual bridge diagrams and assumed resistances for the two wires have been added. If wire No. 1 has a resistance of 150 ohms and wire No. 2 has a resistance of 100 ohms, rheostat R must be set at 50 ohms to effect a balance, as that will make the opposite arms equal at 150 ohms each. This idea of adding, by means of the rheostat R, such resistance to a wire which forms one arm of the bridge as will make it equal the resistance of the wire which forms the oposite arm of the bridge, is the basis of all "Varley" measurements. It is the principle on which practically all our locations of faults will be made.

If, in making the "Varley" test, it is found that the galvanometer indicates that a still lower resistance is required in the rheostat to effect a balance,

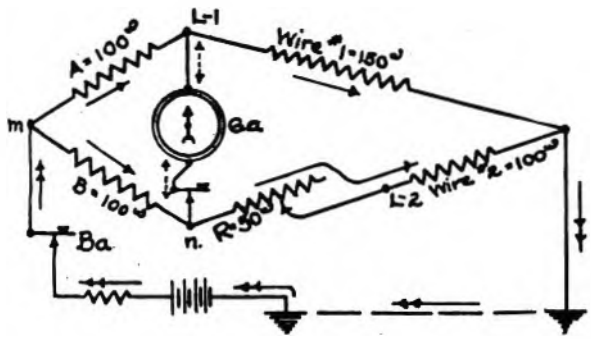

FIG. 7.—DIAGRAM SHOWING WIRES OF DIFFERENT RESISTANCES.

even when the rheostat is set at zero, this proves that the line wire of lowest resistance is connected to L-1 instead of L-2, and the wedges L-1 and L-2 must be transposed at the switchboard.

It should be remembered, in connection with the above and other "Varley" tests, that the resistance in the two ground connections (one at the testing station and the other at some distant point) has no effect on the accuracy of the measurements, for a variation in the battery branch of the circuit (of which the two ground connections form a part in this case) cannot in any way change the proportions of the balancing arms or branches, upon which the elimination of current through the galvanometer depends. For the same reason, variations of potential between the two grounds do not affect the balance.

It is scarcely necessary to say that in measuring the resistance of a wire, or in locating trouble, all relays and other apparatus should be cut out if possible. In the few cases where this cannot be done, careful allowance should be made for the extra resistance due to such instruments, and even then unsatisfactory results are quite likely to be obtained.

(To be continued.)

Banquet of Postal Telegraph Club of Atlanta.

The Postal Telegraph Club of Atlanta, Ga., held its second annual banquet at the Mechanical and Manufacturers' Club April 22, the affair proving a most enjoyable one. The banquet hall was beautifully decorated and the dinner itself was served in the style which has made the M. & M. Club famous.

District Superintendent W. C. Daviet, who was "at the board," cut in on local circuits. The Hon. John M. Slaton, president of the State Senate, made some interesting remarks. He was followed by Col. Felder, who spoke on the Law and the Telegraph, and his "pleadings" contained many anecdotes which upset the decorum of his "jury."

Dr. Turck confined his remarks to a history of the wireless telegraph, proving to his hearers' satisfaction that it must have existed in ancient Jerusalem, because recent excavations at that place had failed to show any buried poles.

Following on the bonus circuits were General Superintendent G. H. Usher, Division Superintendent J. Hargrave and Superintendents C. B. Arrington and C. H. Ashburn. Mr. Usher's talk was an excellent one. He dwelt upon the importance of loyalty to the company and to the head of the division on the part of all employes.

During the evening the proceedings were interrupted by the appearance of an excited individual (Mr. J. F. Livingston), who wished to see the Manager, and upon being introduced made a formal demand for $1,000 damages which he had lost because of the bulling of the code words "alkali" and "peninsular" in a message sent by him, the errors causing the message to read "Cannot use alcohol at price named. Can probably use it at penitentiary." After considerable argument, in which it was pointed out to the complainant how much his business was appreciated, and how gladly the company would pay the amount of the claim were it not for the fact that by so doing both complainant and manager would be likely to receive jail sentences through the medium of the Interstate Commerce Commission, by reason of the fact that that learned body would construe the settlement as a case of giving and accepting of rebates. He was finally induced to drop the matter upon his payment of the notary fees for witnessing the release signed by him, in which he not only saved the company from harm, but agreed to work for its interest and to distribute its advertising matter.

During the evening the "multiplex apparatus" was manipulated by Mr. F. J. Poundstone (violin) and Mr. C. H. Ashburn, Jr. (piano), and their performances contributed in no small degree to the evening's enjoyment.

The Postal Club of Atlanta, while only one year old, has taken its place among the prominent clubs of that city, and several letters were read from prominent citizens regretting their inability to be present. The Club has just organized a savings and investment department along the lines of the Mutual Investment Associations of New York, Chicago and Washington.

Unveiling of the Memorial Tablet of the U. S. Military Telegraph Corps at Pittsburg.

The fiftieth anniversary of the Society of the United States Military Telegraph Corps was celebrated at Pittsburg, Pa., April 28, by the unveiling of a bronze tablet at the Soldiers and Sailors Memorial Hall in that city in memory of forty-three volunteers from Allegheny County, Pa., who served in that Corps during the Civil War. Judge Charles F. McKenna, chairman of the Memorial Hall Tablet Committee, who presided, delivered a brief but very interesting address, which was followed by the invocation by Rev. Dr. Thomas N. Boyle, vice-president of the Memorial Hall Committee.

After the singing of "America" by the audience Comrade Joseph W. Boyd gave an account of the inception of the tablet. The idea first came to him during the early part of 1907 while corresponding with Mr. David Homer Bates, secretary and treasurer of the United States Military Telegraph Corps, relative to Mr. Bates' book, "Lincoln in the Telegraph Office." While in Washington in the spring of 1908 the idea occurred to Mr. Boyd of commemorating the enlistment of all the volunteers from Allegheny County by preparing a bronze tablet in honor of Mr. Andrew Carnegie, founder of the United States Military Telegraph Corps.

He referred to the valuable assistance rendered to the project by Mr. Bates. "To the comrades who have been spared to witness the unveiling of this Military Telegraphers' Tablet," he said in conclusion, "it is a source of congratulation. To the speaker and all members of the Corps who have contributed their labor of love in bringing about this happy consummation it will ever be cherished as a delightful memory."

Mr. David Homer Bates, secretary of the society, then made the presentation address. He briefly sketched Mr. Andrew Carnegie's career as an operator and his entrance into the military service during the Civil War, afterwards being appointed, at the age of 26, assistant general manager of military railroads and telegraphs under Colonel Thomas A. Scott. The four operators who responded to Mr. Carnegie's call for volunteers for war service were Samuel M. Brown and David Homer Bates from Pittsburg, David Strouse from Mifflin, Pa., and Richard O'Brien from Greensburg, Pa. All four arrived in Washington about April 28, 1861. Brown and Strouse are dead.

So far as known there were forty-three telegraphers in all from Allegheny County, Pa., who entered the government telegraph service, twenty-five of whom are dead. Ten of the survivors are present to witness the unveiling of this tablet to commemorate the United States Military Telegraph Corps from Allegheny County. Mr. Carnegie generously offered to pay the entire cost of the tablet. The first as well as the last members of the Corps in actual service were from Allegheny County, Pa., namely, Mr. Andrew Carnegie and Bennett R. Bates, who resigned in June, 1869.

In the Civil War the Morse telegraph was for the first time employed to direct widely separated armies and move them in unison, and the history of that war was largely recorded by the telegraph.

Mr. Bates then quoted from Secretary Stanton's annual report of 1863, in which he compliments the telegraph corps for diligence and devotion to duty; also from General Grant's memoirs referring to the telegraph service in a like appreciative manner. The tablet will be, he believes, the first public memorial in honor of the Corps and in recognition of its service. This Corps, he stated, is one of the few branches of the service that has ever at any time been specially mentioned by name in acts of Congress and yet, strange to say, Congress has denied the few survivors pension rights.

Reference was then made to Mr. Carnegie's generous grant of a private soldiers' pension to needy telegraph comrades. Later Mr. Carnegie extended his bounty to the widows of comrades who died subsequently to December 16, 1907. The executive committee of the United States Military Telegraph Corps has up to the present time approved in all 121 applications for these pensions, including 21 widows.

Five of the military telegraphers from Allegheny County were captured and incarcerated in Confederate prisons, four of them dying in imprisonment.

Mr. Bates gave a brief history of the United States Military Telegraph Corps, and closed with these words: "This emblem in its superb setting will serve as a reminder to this generation and to posterity of the youthful zeal and faithful service of a special corps of 1,800 telegraphers who responded to their country's call in its hour of need, and ninety per cent. of whom have already answered their last roll call."

The beautiful tablet was then unveiled by Miss Virginia Moreland, daughter of Mr. Theodore E. Moreland, one of the Pittsburg survivors.

On behalf of the Memorial Hall Committee the tablet was accepted by Mr. William J. Patterson, of Pittsburg, president of that committee, who stated in his address that the mural tablets to be placed on the walls of the Memorial building will contain about 30,000 names of Allegheny County soldiers who went forth to the war. "The Military Telegraph Corps," he said, "held an important place in the movements of our armies. One of our own honored citizens was the first to recognize the need of such service. Andrew Carnegie was the originator and the organizer of this corps. He was appointed fifty years ago as assistant general manager of Military Railroads and Telegraph Lines. When the commander of an army wanted skilled mechanics or experts in

Digitized by Google

any branch of the service he sent down along the line to discover and have them detailed. In this way many private soldiers who were familiar with the Morse key found themselves assigned to the Military Telegraph Corps.

"From Sumter to Appomatox," he continued, "while the Union armies were battling for the right, the electrical wires of this Corps played an important part. When the glad tidings of peace flashed over the land and the veterans of the war with happy hearts were homeward bound no body of men marched with a prouder conscience of having done their full duty to the government than the still youthful members of the United States Military Telegraph Corps."

Mr. William R. Plum, historian of the Corps, then delivered an eloquent address. "We are happily gathered," he said, "to commemorate in hallowing memory some of those whom we revere; comrades whose names are here perpetuated, in the hope of inspiring future generations to patriotic endeavor.

"This tablet is not an ephemeral memento," he continued, "for though our immortal Webster said that 'the record of illustrious actions is most safely deposited in the universal remembrance of mankind,' yet in all ages men have sought bronze reminders, that such remembrance might not die.'

He compared the names on the tablet to a constellation in the heavens. "Let us," he continued, "contemplate the constellation grouped on this tablet. First in order, by reason of his limited service, perhaps not of the first magnitude, we rejoice to name Andrew Carnegie, whose genius for organization and almost unerring judgment of men impelled Colonel Thomas A. Scott to name him to initiate the service, that in its marvelous development compelled a like department in all of the armies of the world. Ours," he said, "might be called the Military Corps of Intelligence."

Mr. Plum then referred to the first four telegraphers who answered Mr. Carnegie's call for volunteers, and spoke of them in complimentary terms. He then directed his attention to the others whose names appear on the tablet and reviewed their lives and their achievements in the service of their country. Speaking of T. B. A. David, Mr. Plum said: "To him and Captain W. G. Fuller is given the credit of constructing the first telegraph line as an army advanced to battle."

"Fifty years," said the speaker in closing, "is a long time in one's span of life. Long enough to hallow memories of that epochal period when this constellation, now as a whole near its nadir, was in its zenith of splendid usefulness buoyant with brightest hope, risking all and at times giving all."

An address by Mr. Richard O'Brien, of Scranton, Pa., one of the first four operators, was read by Mr. Charles W. Jaques, of Ashtabula, Ohio, one of the Pittsburg survivors. Mr. O'Brien referred to his early war experiences, and paid a high compliment to the other members of the corps from Allegheny County. "I was with them at the front," Mr. O'Brien said in conclusion, "and on the battlefields of Virginia and North Carolina from the first to the close of the war and I can truthfully say I do not believe the world has ever produced a braver, more faithful or more efficient body of men than the boys of the United States Military Telegraph Corps, of which Mr Andrew Carnegie was the founder."

Mr. Carnegie was then introduced by the chairman, Judge McKenna. He told how he journeyed to the capital in April, 1861, a few days after Fort Sumter was surrendered to the enemy. "The Baltimore sympathizers," he said, "had destroyed the railroad bridges over the Bush, Gunpowder and Patuxent rivers, and I was compelled to go by boat to Annapolis and thence by railroad to Washington, riding on the locomotive. While near Annapolis Junction I saw that the telegraph wire was broken and jumped down to fix it. The wire had been pulled back and tied to the pole and in releasing it the tension caused it to swing up and strike me across the face, causing it to bleed profusely so that when I reached Washington depot my face was still bloody. I have always contended that after the two soldiers who were killed in the Baltimore riots one week before I was the third man to shed his blood in the civil war."

Mr. Carnegie then told of his dispatch to Superintendent McCargo of the Pennsylvania Railroad, directing him to send operators to Washington, which brought Strouse, Brown, Bates and O'Brien within a few days, followed by Wilson, Crouse, Snyder and others, and that from this small beginning grew the United States Military Telegraph Corps, which rendered such important and valuable service to the country. "I do not think there is a member of this corps alive today," he added, "who is not a proud and happy man to know that he served his country so well in its need."

A letter was read from Mr. Robert T. Lincoln, of Chicago, expressing regret at his inability to be present at the unveiling ceremonies.

After the singing of "Hail, Columbia," and the benediction by Rev. Thomas N. Boyle, D.D., vice-president of the Memorial Hall Committee, the exercises were brought to a close.

An illustration of the tablet appeared in our issue of May 1.

Mr. R. C. Bliss, manager of the Western Union Telegraph Company, Cincinnati, Ohio, writes: "I have been a reader of your paper for a number of years and it is always a welcome guest. I wish it the success it deserves."

The Telephone.

Henry M. Watson, until recently president of the Bell Telephone Company of Buffalo, N. Y., died at Watkins, N. Y., April 21. He became associated in the telephone business with Mr. Edward J. Hall in November, 1878. Mr. Watson was born May 13, 1839.

Mr. Frank B. Knight, an old time telegrapher and now special agent and head of the publicity department of the Southwestern Telephone and Telegraph Company, at Dallas, Tex., is the author of an interesting paper read at a recent meeting of the Telephone Society in that city. The paper was entitled "Early Reminiscences of the Telephone."

Mr. F. R. Mott, formerly general superintendent of the Bell Telephone Company of Missouri, St. Louis, Mo., and lately associated with the Duplex Metals Company, New York, has been appointed general manager of the Bell Telephone Company of Missouri, with headquarters at St. Louis, taking the place of Mr. Francis L. Gilman, who was general manager of both the Missouri and Kansas Telephone Company and the Bell Telephone Company of Missouri.

Steel Rails for Telephone Poles.—Old steel rails have been used as poles in the construction of the telephone line along the Panama Railroad. The rails are embedded in concrete, and it is stated that this form of construction gives excellent results in that climate.

American Telephone and Telegraph Stocks in Paris.—It is stated that an influential banking syndicate headed by the Banques de Paris et des Pays-Bas is backing the movement for the listing of shares of the Amercian Telephone and Telegraph Company on the Paris Bourse.

Independent Telephony in Chicago. — Judge Kohlsaat in the United States Circuit Court at Chicago has authorized the receivers of the Interstate Independent Telephone and Telegraph Company to enter into a traffic agreement with the Illinois Tunnel Company. The agreement will give the independent company an entrance into Chicago.

Telephones in Paris.—There are in the city of Paris 500,000 telephone subscribers and seven or more large central exchanges, besides numerous branch exchanges. Each exchange has two sets of storage batteries which operate the lines at 24 volts, the batteries being used alternately. Nearly all of the cables in the Paris system are run through the sewers of the city. Compressed air is used in searching for leaks and faults in the insulation of the paper insulated cables, all of the exchanges being connected to the pipes of a private company which furnishes them with compressed air. The trouble man examines the cables for the hissing noise caused by a leak in the insulation as the air escapes from the cable. A scheme is now being developed to use compressed air in giving notice automatically of leaks in any part of the cables.

New Automatic Telephone Equipment.—Mr. Charles S. Winston read a paper at the Pacific Coast meeting of the American Institute of Electrical Engineers, at Los Angeles, Cal., April 25-28, in which he described some new automatic telephone equipment. The company he represents has been developing automatic apparatus which, it is said, will meet all of the requirements of automatic, automatic-distributing and semi-automatic systems. The five switches described do the same work as is done by the Strowger switch, but in a radically different manner.

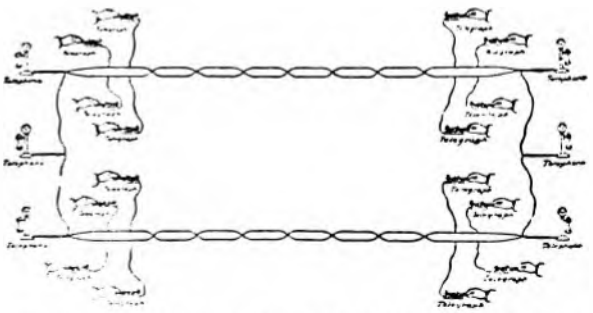
Physical Telephone Connections.

A measure legalizing the merger or lease of telephone corporations and providing for compulsory physical connection, has become law in Michigan. The bill provides that physical connection shall only ensue after an application has been made to the State Railroad Commission by the people of a given locality for such connection.

The bill which was introduced in the lower house of the Tennessee legislature providing for physical connection for long distance telephone service has been defeated.

Simultaneous Telephony and Telegraphy.

The accompanying diagram, which is reproduced from the annual report of Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company, New York, is extremely interesting in



SIMULTANEOUS TELEPHONY AND TELEGRAPHY.

that it shows, in principle, how two telephone circuits are employed daily between New York and Chicago in carrying three telephone conversations and eight telegraph messages simultaneously without interference with one another.

It will be seen that the basis of the system consists of two metallic circuits. These two pairs are bridged by telephone connections at each city in such a manner as to give a third telephone circuit, each of the original circuits constituting one side of

Digitized by Google

the third, or phantom circuit. Each of the original circuits is quadrupled for telegraph operation, as shown. The transposition of the wires is a very important feature of such a system, and this is well emphasized in the illustration.

The Telephone Pioneers' Organization.

It has been decided to extend the service time limit of applicants to membership in the proposed Telephone Pioneers' Association to and including 1890. The original limit placed upon applications was 1885.

Among the new names added to the list of pioneers are Mr. F. E. Kinsman, of New York, 1876; Mr. George C. Maynard, Washington, D. C., 1876; Mr. Thomas A. Watson, Braintree, Mass., 1875, and Mr. W. H. Baker, New York, July, 1886.

Those who entered the service prior to and including 1890 will be classed as "pioneers" in the new organization, and those who came afterwards will probably be known as "associates."

Henry M. Watson, one of the pioneers, died at Watkins, N. Y., April 21.

Radio-Telegraphy.

Wireless Station at Saigon.—A wireless station is being established at Saigon in French Indo-China which will enable this French Colony to communicate with Singapore, Batavia and Manila. The plant, it is stated, will cost about $75,000. It will have a radius of about 2,500 miles.

An Early Wireless Telegraph.

An old-time telegrapher, now residing in Central America, sends us the following interesting story of an incident that occurred at Aspinwall, now Colon, on the morning of April 15, 1857. He reached Aspinwall on the U. S. Mail Steamship *Illinois* and when the vessel was yet about 100 yards from the pier, on which many persons were waiting for the steamer to tie up, he sent what he claims was probably the first wireless message.

"My brother, who was then operator at Aspinwall," he says, "was among the crowd on the pier and as soon as I was sure that he could detect the movements of my arms as I stood by the ship's rail, I applied my right hand to the rail and in good Morse told him all about the trip of the steamer, that we had left New York two days behind schedule time in consequence of bad weather and had not called at Kingston, Jamaica, but had stopped at Port Royal where the health officer told us to proceed on our journey because we had not a clean bill of health to present. The truth was we had 200 United States soldiers on board bound for San Francisco and that was enough to produce forty unclean bills of health in Kingston.

"How well I remember," he continues, "the excitement my message created on the pier when my brother repeated it. I doubt if Mr. Marconi did more."

ANSWERS TO QUESTIONS.

[In this department questions on matters of a practical character, and of general interest, will be answered. Questions intended for this department must be signed by the writer's full name—not for publication, but for identity. No attention will be paid to anonymous communications.]

(41) Q. Is there any relation between the dimensions of a wireless telegraph antenna and its radiating capacity? R. C.

A. Yes, and a very definite one. The electrostatic capacity of an aerial is measured by the charge required to raise its potential one unit. An increase in the capacity enables more energy to be accumulated in the antenna and consequently greater radiation results. The capacity of an aerial may be increased by adding wires, but there is a limit to which the increase may be carried.

(42) Q. When a gravity cell is exhausted is it possible to restore its chemical activity by sending a current through it in a reverse direction? J.

A. Yes, it is possible, but not practicable. If a current be sent backward through the cell the zinc in the sulphate solution will be deposited in metallic form upon the zinc electrode; copper will be dissolved to form the blue solution, and apparently the cell is restored to its original operative condition. A cell cannot be restored in this way economically.

(43). Q. The electromotive force of a storage cell is two volts or more. How is it that two plates of lead in the same solution can produce a difference of potential? I have always understood that in order to produce a difference of potential it was necessary to use electrodes of different materials, but in the storage cell only one material—lead—is used for the electrodes. Please explain. T. C.

A. In the case of a storage battery the difference of potential is not produced by the lead plates, but between the lead peroxide on one plate and spongy lead on the other. These conditions of the plates are the result of passing a current of electricity from an outside source through the cell. No current at all would result from immersing two plates of lead in the acid solution, but by altering their physical condition, as we do by passing a current through them we create the necessary conditions to produce a difference of potential.

(44) Q. Please give me the rule to find the resistance of copper wire such as is now used in line building, its cross section being known. P. G. M.

A. Divide the length of the wire by its cross section in circular mils and multiply by 10.79. Expressed in formula this rule is

$$R = \frac{L}{C.M.} \times 10.79$$

where L = Length of wire
C.M. = Diameter in circular mils
R = Resistance.

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIXEY

The Railroad.

Mr. W. H. Potter superintendent of telegraph of the Southern Railway, Washington, D. C., was a recent New York visitor.

Mr. Benj. F. Thompson, telephone inspector Baltimore & Ohio Railroad Company, Baltimore, Md., was a recent New York visitor.

Mr. B. A. Kaiser has been placed in entire charge of the railway service of the commercial department of the American Telephone and Telegraph Company, with headquarters in New York.

Extension of Telephone Dispatching on C. B. & Q.—The Chicago, Burlington & Quincy Railroad is equipping a circuit for telephone train dispatching between Kansas City and Napier, Mo., a distance of 96 miles. When this installation is completed this road will have telephone dispatching equipment on 2,700 miles of track.

Telephone-Dispatching on the Central Vermont.—Telephones have supplanted the telegraph for train dispatching on the Central Vermont Railway between St. Albans and Windsor, Vt., a distance of 150 miles. Thirty-eight way stations on this division have been equipped with selectors and telephone sets. Two portable sets have also been provided for the wreckers on this road.

Investigating Selectors.—Mr. J. C. Johnson, superintendent of telegraph of the Pennsylvania Railroad Company, Philadelphia, Pa., recently appointed a committee to investigate the operation of the different selector systems used in train despatching service. The committee's investigations were conducted from an educational standpoint only and not for the purpose of passing upon the merits of the different systems.

Telephone Train Dispatching on the "Katy" Line.

Within a short time, the Missouri, Kansas and Texas Railroad will be using the telephone to dispatch trains on both its Fort Worth and its Dallas divisions. The Dallas division runs from Dennison to Hillsboro via Dallas, a distance of 172 miles, and has a branch line of 22 miles from Dallas to Lewisville. On this division, selector equipment for twenty-nine stations will be used. The dispatcher will be located at Dennison. The Fort Worth division extends from Dennison to Hillsboro, a distance of 152 miles, with a branch nine miles long extending from Egan to Cleborne. It will be equipped with selectors and telephone apparatus for twenty stations. The dispatcher for this division will also be located at Dennison.

Telephone Despatching on the Lehigh Valley Railroad.—In view of the rapid extension of train despatching telephone lines on the Lehigh Valley Railroad, that company is installing portable telephones and line poles on all cabooses and baggage cars, the same to be used in case of emergency or accident, enabling the train crew to get into immediate touch with the train despatcher.

This installation will require about 550 telephones and line poles. The apparatus consists of a telephone enclosed in a portable box, the transmitter and receiver being in one piece. A generator also is furnished so that in case the train line should be out of order the apparatus can be used on any of the other telephone circuits on the poles.

A blue print showing the exact location of the telephone lines on the poles accompanies each portable telephone with specific instructions as to how to use the apparatus.

W. M. Hayes, Superintendent of Telegraph, Pere Marquette Railroad, Detroit, Mich.

Mr. William M. Hayes, recently appointed to the position of superintendent of telegraph of the Pere Marquette Railroad Company, at Detroit, Mich., which was announced in our issue of May 1, was born at Saginaw, Mich., March 31, 1877, and began his business career November 1, 1892, on the road of which he is now superintendent of telegraph. His service has been continuous on this system. He began as operator and agent and became successively stenographer to the general manager, secretary to the general superintendent and finally chief clerk in the superintendent's office in the Grand Rapids district, occupying the latter position at the time of his recent appointment.

Postponement of Convention of Railway Telegraph Superintendents.

The next annual convention of the Association of Railway Telegraph Superintendents which was scheduled to take place in Boston, June 19-23, has been postponed for one week, the new dates set being June 26-30. The postponement was brought about primarily because some of the prominent active members of the Association could not be present at the time originally set, including Chairman G. A. Cellar of the High Tension Crossing Committee, who will present an elaborate report on the committee's investigations during the year. Many of the associate members also found that it would be impossible to attend. The executive committee therefore recommended a postponement for one week and submitted the question to the members by letter ballot. The result of the vote was in favor of the change.

Following is a partial list of the papers to be read at the convention: "Development of Telephones for Train Dispatching and Other Railway Purposes," by Mr. G. K. Heyer, of New York; "Co-operation Between Railroad People and the Commercial Companies," by Mr. W. P. Cline, superintendent of telegraph of the Atlantic Coast Line, Wilmington, N. C.; "Economy of the Telephone in Railway Service," by Mr. M. E. Launbranch, Chicago, Ill.; "Here Are Some Hints," by Mr. W. J. Camp, electrical engineer, Canadian Pacific Railway Company's telegraph, Montreal. The committee on High Tension Crossings, of which Mr. G. A. Cellar, superintendent of telegraph Pennsylvania Lines west of Pittsburg, is

Digitized by Google

chairman, will make its report and submit revised specifications. The headquarters will be at the Hotel Brunswick, where ample space will be provided for exhibits. Mr. P. W. Drew, Room 306, 112 West Adams Street, Chicago, Ill., is secretary of the Association, and will be glad to give any further details regarding the convention.

The Railway Telegraph Department.*

BY JOHN A. KICK.

The means of communication in connection with railway operation is organized under the name of telegraph department, although this department has charge of both telephone and telegraph service. For train dispatching, the telephone is fast supplanting the telegraph and for other service is slowly but surely coming into favor.

A number of the trunk lines now have telephone service between their operating headquarters and the more important terminals, with prospects of extending the service over the entire system.

The progressive railway management has come to view the telegraph department as one which must be of very high efficiency, although this view has not always prevailed on account of the department being classed as non-revenue paying. It can be demonstrated that first-class service on the telephone and telegraph circuits of a railway system is a source of revenue by saving to the company freight and passenger traffic which must be secured in competition where prompt quoting of rates and routings as well as ticket and sleeping car arrangements and reservations must be made by telegraph or telephone.

A prominent business man recently called at a trunk line ticket office and made inquiry concerning tickets and reservations to a point which would mean transfer from one depot to another at an intermediate point. He remarked that he had always taken a competitive line for this trip, as he could get off at the intermediate station, arrange for his reservations for the outgoing train from the same depot, and then feel safe to go about the town until train time. The ticket agent asked details of the intended trip, turned to his telephone, called the intermediate station, arranged sleeping car reservation direct with the line beyond, and gave the patron his car and berth number, all in less time than it requires to tell the story. The gain to the railway company was the price of a ticket and the good will of a pleased patron who freely expressed his surprise and satisfaction with the marvelous service. The ticket arrangement was made with a point about four hundred miles distant and its success was dependent on first-class service, and should be entered as a credit on the telegraph department ledger.

There is an agreement between railways whereby each road agrees to pay so much per car per day for all foreign cars on its lines; also agreeing as to the proper point of delivery for cars en route to home line. When a foreign car is unloaded a telegram or telephone message is sent to the contracting department, asking for "home route" directions, and upon the prompt handling of these requests and answers depends the termination of the per diem charges. Delays in handling this class of business mean loss of money, which could be placed to the credit side of an efficient telegraph department; and so it runs through all departments which are receiving telephone and telegraph service.

There are no known means to put the railway telegraph department actually on an income basis, as its greatest value is in giving free service to all other departments in such full measure as to be effective to the extent desired by the writer of the telegram or the user of the telephone.

The good condition of the telegraph department of a railway is of the utmost importance, as it is the means whereby the commanding general reaches his field generals in planning and directing the movements of his army of men. The telephone is one of the most important utilities of the progressive railway organization, as by its use the directing members of the organization may confer at any time as well as reach any part of the system personally to direct their subordinate officers. The telephone is superior to the telegraph for general railway service, as it is instantaneous; does not require education or practice to handle; answers are received directly, allowing further questions and answers, or a number of questions and answers are exchanged on one telephone call which might require a series of telegrams extending over several days; and this service extends to the bedside of almost every railway official in the country.

Railway operation is being brought within more scientific lines; each year special men are being employed, departments in some cases entirely reorganized, antiquated methods discarded for the modern, and in general the "good old days" are fast becoming memories only. Engineering skill has been gradually drawn into railway work and with all other departments specialized and in a high state of efficiency, the telegraph and telephone service must be of the highest order, and it is for this reason that the telephone has become so popular in that service.

The telephone system of the larger terminals is of incalculable service and I doubt the possibility of satisfactorily handling some of our present day freight terminals without the service which results from having telephones placed at every advantageous point—including fifty to a hundred telephone stations in a single yard. A number of the railways have adopted the grounded telephone line as a means of station to station manual block, and others have gone still further and extended a telephone connection to all outlying siding switches; others have placed means

*From *Telephone Engineer.*

Digitized by Google

of telephone connection with the dispatching circuit at intervals not exceeding two miles.

The telephone and telegraph department under capable management and with the financial aid and encouragement of the general executives must and will develop with the other departments, providing a saving sufficient to represent an acceptable return on the investment.

The Turner Monument Fund.

The Turner Monument Fund has passed the $1,500 mark, which amount is half of the total required to defray the cost of the proposed monument. The first half having been secured, the second half should be comparatively easy to get. There are hundreds and probably thousands who have not yet been approached on the subject and no doubt they will be glad to contribute toward the object of this movement. Everyone connected with the railway and telegraph service should be represented financially in this work. It certainly will be an honor to be thus identified with it. The committee has done much hard work and will do more yet to advertise the project and collect the funds, and theirs is a labor of love.

It is desired that other plans for the monument be submitted; any one is free to enter the contest. The committee having the matter in charge will soon hold a meeting to pass upon plans, etc., and it is hoped that those with ideas will present them.

The monument is to commemorate the sending of the first train order by telegraph, which took place at Turner, N. Y., in the fall of 1851. The author of this historical train order was Charles Minot, general superintendent of the Erie Railroad, and his name has passed into history as one of the progressive spirits of his time.

The following named gentlemen constitute the committee in charge of the monument fund: E. P. Griffith, superintendent telegraph, Erie Railroad, Jersey City, N. J., chairman; Charles Selden, superintendent telegraph, Baltimore & Ohio Railroad, Baltimore, Md.; J. B. Taltavall, Telegraph and Telephone Age, New York; E. A. Chenery, superintendent telegraph, Missouri Pacific Railroad, St. Louis, Mo.; W. J. Camp, electrical engineer, Canadian Pacific Railway, Montreal, Canada; Col. W. B. Wilson, president Old Time Telegraphers' and Historical Association, Holmesburg, Philadelphia; F. J. Scherrer, secretary Old Time Telegraphers' and Historical Association, New York. All remittances should be made to Mr. J. B. Taltavall, Telegraph and Telephone Age, 253 Broadway, New York, who has been elected treasurer of the fund. All contributions are acknowledged in the columns of Telegraph and Telephone Age, and the funds deposited with the Washington Trust Company, New York, as soon as received.

The contributions toward the fund received up to date are as follows: Previously acknowledged, $1,377.75. F. S. Gannon, $5.00; Martin Quick, $1.00; H. M. Clawson, $1.00; F. G. Braunlich, $1.00; A. N. Pryor, $1.00; F. W. Hachner, 50 cents; A. N. Dugan, $1.00, New York; C. E. McCluer, Norfolk, Va., $1.00; C. T. Ford, superintendent of the Harriman estate, Central Valley, N. Y., contributions from 145 employes of the Harriman estate, Harriman, N. Y., $155. Total, $1,544.25.

Trade Notes.

Match Folders. — Salesmen of the Kellogg Switchboard and Supply Company, Chicago, are distributing match folders which are proving an attraction to smokers. Each match is labeled with the name of an apparatus type. The folders come in small colored leather cases and can be obtained only from salesmen as the government postal regulations prohibits their being mailed.

Kerite Company Acquires a Western Wire Concern.—Mr. R. D. Brixey, president of the Kerite Insulated Wire and Cable Company, 30 Church St., New York, announces that his company has acquired the interests of the Watson Insulated Wire Company and established a western office in the Peoples Gas Building, Chicago. Mr. B. L. Winchell, Jr., formerly vice-president of the Watson Insulated Wire Company, has been appointed western sales manager of the Kerite interests.

Electrical Supplies Wanted for Navy. — Proposals will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until May 19 for a quantity of magnet wire and watertight vibrating bells (schedule 3515), to be furnished at the Navy Yard, Brooklyn, N. Y. Bids will also be received until May 23 at the same place for portable testing sets and watertight bells (schedule 3524) to be delivered at the Navy Yard, Mare Island, Cal. Address T. J. Cowie, Paymaster General, U. S. N., Washington, D. C.

Non-Paying Offices in Baltimore Hotel.—The Maryland Public Service Commission has been asked to compel the Western Union and Postal Telegraph Companies to reopen their offices in a Baltimore hotel, which were discontinued because they were non-paying.

Lecture on Telegraphy.—Mr. R. C. Bliss, manager of the Western Union Telegraph office at Cincinnati, Ohio, gave an address on "Telegraphy, its Invention and Development" at a recent meeting of the Men's League and Woman's Auxiliary of the Walnut Hills Baptist Church, Cincinnati.

Wire Tappers Arrested.—A prominent society man and a contractor of Philadelphia caused the arrest in New York on May 6 of thirteen men, some of whom are said by the police to be the most notorious wire tappers and confidence men in the United States. In order to bring about the arrest of these men, Mr. McDonald came to New York and associated constantly with crooks, who expected to get a lump sum of from $20,000 to $30,000 from him.

Dinner of Commercial Managers' Association of Greater New York.

The regular monthly dinner of the Commercial Managers' Association of Greater New York, of the Western Union Telegraph Company, was held at the "Carlos," New York, May 3, and was the most enjoyable and successful dinner ever held by the association. It was unique in the fact that for the first time the branch office lady managers were invited to participate.

Mr. P. J. Casey, president, made an excellent toastmaster, and his introductions of the speakers were happy and in a manner entirely original. Seated with him at the guest table were Mr. A. G. Saylor, general superintendent, Eastern Division; intendent; Mr. A. C. Kaufman, commercial agent; Mr. John A. Hill, division traffic superintendent; Mr. B. H. Reynolds, superintendent of the Central and South American Cable Company; Mr. J. F. Nathan, commercial superintendent; and Mr. John Simmonds, district commercial manager.

During the dinner an orchestra rendered excellent music. Mr. Joseph N. Matier, of the Central Cable Office, enlivened the evening by a number of comic songs.

At the conclusion of the dinner, and before the speaking began, an intermission of fifteen minutes was arranged so that all present could have an opportunity to visit and renew old acquaintance. During this period, Mr. Saylor and Mr. Mulford held an impromptu reception and every person in the room greeted them.

President Casey introduced Mr. J. F. Nathan, who, in responding, said it would sound too conventional and formal were he to address those present as other than friends. He complimented them on their fidelity, zeal and loyalty, and dwelt on the good derived from social intercourse, harmony and co-operation. He pointed out managers employed within a short distance of each other who had for the first time met that evening. Mr. Nathan closed his remarks by inviting all when in trouble or doubt to call on him at his office.

The next speaker, Mr. A. C. Kaufman, commercial agent of the Eastern Division, spoke on "Commercialism," and urged that all working together could and would accomplish the goal set for Greater New York, that they were near it and that all that was necessary was a determination to win or die. He complimented those present and considered it a privilege to have the opportunity of addressing them.

Mr. B. H. Reynolds followed Mr. Kaufman, and in an able and forcible address expressed his ideas of the duties of the telegraph employe, taking as a basis for his remarks his twenty years' experience with the Western Union.

President Casey, in introducing the guest of honor, Mr. A. G. Saylor, referred to him as the friend of the manager, the operator and the messenger, whose geniality and fairness well fitted him for the position he occupies.

Mr. Saylor, by his kindly manner, won the esteem of everyone present from the start. He said he was going to take all into his confidence. When accepting the invitation to be present, he supposed it was to be a meeting of the district commercial managers. The large number present somewhat abashed him, but he was going to stick to his guns.

After some reminiscences as to his experience as a branch office manager, Mr. Saylor took up the subject of organization, comparing the territorial with the functional features, pointing out the advantages of the latter. His discourse was entertaining and instructive. Mr. Saylor and Mr. Mulford were unanimously elected members of the association.

Among those present, in addition to those mentioned at the guests' table, were:

From Brooklyn: M. J. Hayden, J. E. Shields, J. J. McCaffrey, Joseph Goldstein, H. Lupka, P. I. McGowan, C. A. Harvey, A. D. Shaw, J. McNeil, W. F. Alcock, Miss F. Rosenblume, Miss A. E. Gardiner, Miss A. R. Ward, Miss E. Egan, Miss A. B. Lyons, Miss E. Koch, Miss F. Samsony, Miss H. A. Samsony.

From the Bronx: John T. Carberry, J. P. McGovern, J. Lauerman, Miss A. G. Burns.

From Manhattan: J. W. McMahon, J. J. McGrath, M. Russnow, M. E. Pierce, L. E. Westrope, R. Raphael, L. Silberstein, F. R. Anson, P. E. Grogan, Miss Hills, Mrs. Curtiss, Miss McEvily, Miss O'Donnell, Miss Reed, Miss Wall, Miss Brennon, F. Spree, F. J. Nielan, A. J. Burton, L. Ribler, W. H. Megie, W. Badgley, Miss M. Kircher, Miss M. Browman, P. Kinmon, N. W. Jacobs, N. Goldman, J. Cummings, R. J. Nimmons, N. Feder, Miss N. C. Loughlin, Miss K. T. Donohue, Miss M. L. Hayes, Miss M. E. Saunders, Miss Loughran, George F. Smith, Miss Benson, F. J. Lantry, Charles F. Seelman, P. J. Sullivan, M. M. Greene, William Levy, Miss Hoff, Miss Pollak, W. Hermann, Fred. Bollman, Miss Sadie Greenwald, James A. Berry, Martin J. Brooks, James Felsenheld, J. J. Riley, Albert Lister, B. F. Benson, A. Disney, E. G. Hohenstein, V. M. Sozzi, J. Cashman, J. Veitch, J. Cahill, J. Fleming, W. A. Schudt, J. Lee, J. Matier, H. F. White, A. Simon, T. F. Hull, J. S. Bradbury, A. Guthrie, Miss Sultan, Miss Scully, Miss Van Vliet, Miss Morrissey, Miss Donohue, C. B. McCann, A. K. Ainlay, J. J. Shelley, O. L. Whiteneck, D. Drew, M. P. Vrabel, B. Liebowitz, E. S. Clark, William J. Ackerley, Thomas T. Parr, D. Fuchs.

Omaha Telephone Exchange.—The Omaha *Bee* of April 30 published an interesting full-page description of the development of the telephone, with particular reference to the Omaha exchange. It contains illustrations of Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company, and the now historical picture showing the opening of the New York-Chicago line with Prof. Alexander Graham Bell at the instrument, besides news of the Omaha exchange operating room.

Obituary.

George W. Canfield, aged 84 years, died at Hornell, N. Y., April 23.

Frank Kisselburgh, aged 55 years, an operator at Rensselaer, N. Y., died April 28. Mr. Kisselburgh was the operator who sent the message announcing the death of General U. S. Grant at Mount MacGregor.

Richard D. Holmes, aged 73 years, who was connected with the Western Union Telegraph Company in a clerical capacity at Pittsburg, Pa., for the past 40 years, died at his home in that city April 9. Mr. Holmes was a Civil War veteran.

A. D. Holcomb, aged 30 years, for many years in the service of the Postal Telegraph-Cable Company at Atlanta, Ga., died in that city May 5. Mr. Holcomb was a telegraph engineer of considerable ability and was an associate member of the American Institute of Electrical Engineers.

Jesse H. Robinson, a well-known old timer and a military telegrapher, died in Washington, D. C., May 1, at the age of 67 years. Mr. Robinson had been in charge of the telegraph division of the Weather Bureau at Washington for thirty-four years. He worked in Pittsburg before going to Washington and was a co-worker with Mr. Andrew Carnegie at that point. Mr. Robinson enlisted in the United States Military Telegraph Corps in 1863, and at the close of the war constructed portions of the overland telegraph line which was intended to connect this country with Europe by the way of Alaska and Siberia. He was located in Siberia for two years in connection with this work. He entered the signal corps of the army in 1872 and was assigned to the weather bureau service. This is the fourteenth death among military telegraphers since the Chicago reunion last September.

Annual Meeting of The Associated Press.

The annual meeting of the Associated Press was held at the Waldorf-Astoria, New York, April 25 and 26, with a large attendance from all parts of the country.

Messrs. Frank B. Noyes, of the Washington Star; Adolph S. Ochs, New York Times; W. L. McLean, Philadelphia Bulletin; W. R. Nelson, Kansas City Star, and A. C. Weiss, Duluth Herald, were re-elected directors, and Mr. W. H. Coles, of the Spokane Spokesman-Review was elected to succeed the late Harvey W. Scott.

The Board of Directors re-elected the present officers, as follows:

President, Frank B. Noyes, Washington Star; first vice-president, R. M. Johnston, Houston Post; second vice-president, Frank P. MacLennan, Topeka (Kan.) State Journal; secretary and general manager, Melville E. Stone, New York; treasurer, J. R. Youatt, New York.

General Manager Melville E. Stone in his report refers to the new Canadian press service which was inaugurated January 1 last, and which was referred to in detail in this publication at the time. The experiment of sending news by telephone in sections of the West, he states, is successful.

New Book on the Telephone.

Telephonology, by H. R. Van Deventer, is one of the latest and best books published on the telephone and on account of its practical character will appeal to all engaged in telephone work. The book is divided into sixteen chapters upon the following subjects; first principles; talking equipment; signaling equipment; commercial talking equipment; magneto instruments and circuits; magneto switchboards; selective and lock-out systems; batteries; testing telephone parts; testing equipment and fault location; measuring instruments and their uses; common battery equipment; harmonic party line systems; line and cable construction; the automatic system; composite systems and wireless telephony.

The author very wisely refrains from attempting to give any history of the development of the telephone, but after a brief discussion of the general subject of telephony, devotes the remainder of his book to describing apparatus, systems and methods in common use at the present time.

The chapter upon composite systems is probably the best and most concise exposition of this question of such importance at the present time to both telegraph and telephone people that has ever been produced, being, in fact, the first general discussion of this subject which has ever appeared in any work on telephony. This chapter is well illustrated with circuit diagrams, showing the various combinations of apparatus which can be used to secure composite and phantom circuits. These are but a few of the many points contained therein which make the work a valuable one to the engineer or student. Copies of Telephonology may be obtained by addressing Telegraph and Telephone Age, 253 Broadway, New York. Price $4.00.

An Interesting Message in Morse's Handwriting.—Among a lot of old telegrams in the possession of Mr. F. J. Scherrer, New York, is one written by Prof. S. F. B. Morse for transmission. It is addressed to a firm in New York and reads "I will call for frame when next in the city." The peculiar feature of the message is a drawing of a human skull in the lower left hand corner of the sheet to indicate that the message is "deadhead." This message was sent on October 28, 1857, from Poughkeepsie, N. Y., by Mr. Henry A. Reed who was manager of that office at that time and is now president of the Bishop Gutta Percha Company, New York.

LETTERS FROM OUR AGENTS.

NEW YORK, WESTERN UNION.

The funeral services of A. E. Sink, formerly and for many years manager of the operating department, which occurred on April 24, were attended by over one hundred members of the staff of this office.

Digitized by Google

Mrs. E. M. Curtis has been appointed manager of the newly opened office in the Hotel Martinique.

Mr. J. E. Shields, formerly of the office of the superintendent of the Long Island Railroad, has been appointed manager of the Brooklyn office, vice William Porr, resigned.

Mr. M. J. Hayden, formerly manager of the Brooklyn office, has been appointed district commercial manager in Brooklyn.

Mrs. S. J. Kirschbaum, recently of the Norwich, Conn., office, has been appointed manager of the Grand Union Hotel office, New York.

Mr. Charles E. Shelly, formerly of Albany, N. Y., has been appointed solicitor at 195 Broadway, New York.

Mr. L. F. Badgley, of the general operating department, has been appointed solicitor at 854 Broadway, New York.

PHILADELPHIA, WESTERN UNION.

Mr. A. H. Poody, a full-blooded Indian graduate of the Carlisle Indian School, who learned telegraphy at Carlisle, has been given a place on the night force in this office.

PHILADELPHIA, POSTAL.

Traffic chief M. N. Redding has resumed his duties after a long absence occasioned by the deaths of his mother, aunt and his wife's mother, all of which occurred within five weeks.

Mr. E. B. Pillsbury, general superintendent, New York, was a recent visitor.

The loss of our supply of current due to the fire at the Philadelphia Electric Company's station early on the morning of May 6 caused considerable anxiety for a time, but Chief Operator E. W. Miller, assisted by Mr. William Fitzgerald, straightened things out by arranging to get a supply from a neighboring building until the electric company restored its service late in the evening.

Philadelphia Electrical Aid Society Entertainment.

The Electrical Aid Society of the City of Philadelphia held its eleventh annual entertainment, banquet and dance on April 26. The affair was very successful and enjoyable and was largely attended. Mr. Andrew Weir, past president of the Society, was presented with a loving cup by the members in token of his faithful service during his incumbency as president from 1906 to 1910. The presentation speech was made by Mr. William C. Ash, principal of the Philadelphia Trades School, No. 1. The membership of the Society is composed of about 1,100 employes of the electrical bureau, the Western Union and Postal Telegraph companies, the Bell and Keystone Telephone companies and the Automatic Signal service of the Pennsylvania Railroad and the Reading Railroad. Col. Green, a forty-niner of the telegraph and now retired, was the guest of honor. He was accompanied by his daughter. The officers of the Society are: President, William R. Harmstad; vice-president, A. G. Strickland; recording secretary, William E. Vanarsdall; financial secretary, R. C. Murray; treasurer, J. H. Wilson. Mr. Charles A. Huyer was chairman and Mr. Richard H. Conway secretary of the entertainment committee.

The great telegraphic song hit,
"SEND ME A NIGHT LETTER, DEARIE."
Good, catchy music; beautiful title design magnificently printed in colors. Title contains night letter. Sung all over New York, 17c. by mail. All popular music sent by mail.
B. L. BRANNAN,
195 B'way, N. Y.

Martin's Double Lever **VIBROPLEX**, $8.00 f. o. b. D. C. DeLany, 15 S. Broad St., Atlanta, Ga.

WANTED.—Live agents in all large Western Union and Postal offices. Central Typewriter Exchange, New York.

Among sound and reliable insurance organizations the Telegraphers' Mutual Benefit Association of 195 Broadway, New York, occupies a foremost place. Organized in 1867, it has paid to beneficiaries of deceased members $1,500,000. Reserve Fund, $327,000, the largest Reserve in proportion to liabilities that is held by any similar Association. All persons engaged in Telegraph or Telephone service between the ages of 18 and 45 are eligible for membership, no restrictions after admission as to change of occupation or residence. The lowest possible cost consistent with security offered. Write for blanks and further information.

TRANSMITTING MACHINES

I am placing on the market improved YETMAN TRANSMITTING TYPEWRITERS, and KEY BOARD TRANSMITTERS without typewriting features. Am prepared to exchange, repair or rebuild all old machines. Write for catalogues and particulars to

James Uncles, NORTH ADAMS Massachusetts

Rubber Telegraph Key Knobs.

No operator who has had to use a hard key knob continuously should fail to possess one of these flexible rubber key caps, which fits snugly over the hard rubber key knob, forming an air cushion. They render the touch smooth and the manipulation of the key much easier. Price, fifteen cents.

SOME POINTS ON ELECTRICITY.

"Grief," or the Stress of Discipline; Its Source and Remedy.

BY WILLIS H. JONES.

Some time ago a former chief operator gave "grief" as his excuse for leaving the telegraph service, meaning the mental anguish caused by what might be called the stress of discipline. To a certain extent the excuse given seems justifiable. The "grief" is certainly great where negligence, indifference or incapacity exists, but on the other hand the fact should be more generally appreciated that where duty is faithfully, intelligently and honestly performed, though the task utterly fails to produce successful results, the "stress" is seldom applied. Unfortunately, however, the majority of good men of this type do not always stop to consider this fact and thus become unnerved through fear of unlikely consequences.

Now a certain number of rules and regulations are obviously necessary in any business undertaking in order that the manager's desired method of operation may be intelligently carried out by his subordinates. Unfortunately, however, these, what may be termed first instructions, while usually sufficient in scope and direction to insure satisfactory results when faithfully carried out, have to be eventually so amended and amplified in order to infuse ambition, if not actual fear, in the hearts of the ever present weaker and indifferent element, that even the faithful cannot entirely escape the resulting general "stress" thus unavoidably and perhaps reluctantly imposed upon all alike for the company's own protection.

The original source of "grief," then, should not be very difficult to trace, for the preponderance of evidence shows plainly that severe strictures are, in nearly every case, the direct result of mistakes, incapacity, or some other weakness on the part of one or more employes themselves.

When we begin to analyze the factors which contribute to this end we immediately encounter a phase of the question not generally taken into consideration, but which probably leads as directly to the eventual issuing of stringent rules as anything else. At the same time it discloses a very fertile field for educational development along a new line and which suggests the real subject matter of this article. We refer to the somewhat reprehensible spirit often displayed by the unwise in their mutual business dealings with one another. In other words, to a lack of frankness and deference to the intelligence of the man at "the other end of the wire," or with whom one may be temporarily conversing or colaboring.

This unfortunate attitude is not taken solely by those engaged in the telegraph service, but is common, to a greater or lesser degree, in all classes of workers engaged in service which subjects them to a continuous mental strain.

Now while the "mental strain" explains, in many cases, the source, or rather the tendency to be unfair, it should not be accepted as an excuse or a license to act in such a manner.

In the correction or mastery of this trouble-breeding tendency lies the true method of avoiding the penalties of our own making. A few illustrations will show how we unwittingly bring about conditions that leave the company no alternative other than to inaugurate a set of rules so explicit in detail that we experience "grief" in their very number.

Probably one of the most frequently occurring tactics pursued by employes too generally is that of disclaiming responsibility for unlocated "trouble" by attempting to place the fault at the other end of the circuit. This tendency is particularly true where the trouble mysteriously disappears while each attendant is trying to find the source of it. Naturally in a case of this kind each at first imagines the other found it but would not

Digitized by Google

admit the fact. After several recurring experiences of this kind lack of confidence in each other's sincerity is born, and discourtesy often results from unwise and usually unwarranted accusations. Distance tends to make one brave in speech, hence when two excitable persons allow themselves to digress from legitimate duty to personal abuse, each becomes a bar, instead of an aid, to the other, and the service suffers thereby. In time knowledge of the habit and its consequences reaches the manager's ears and a drastic order is issued which holds both parties responsible for the location of the fault. Then, the belligerents for their own protection get together and aid one another in eliminating the disturbing element, while rebelliously doing what might just as well be done cheerfully at first.

Distance and the absence of convicting witnesses often tempt some not overscrupulous persons in branch offices and way stations to deny having a ground wire on when caught napping after having used the same temporarily without authority and then forgotten to remove it. When such a ground connection has been made at a nearby station and suddenly lifts when a request is made for the operator at that point to try the circuit it is useless for him to deny an accusation, for the reason that both the simultaneous restoration of stations beyond him and the greatly diminished volume of current resulting from the thereby lengthened conductor is almost positive evidence of guilt.

The average way-station operator is not usually aware of this conclusive evidence, hence his conscience rests easy until a complaint comes up and the wire chief at the main office states the facts. The latter's version is usually accepted. Wire chiefs are thus often misled in their tests by prevarications of this kind, especially when the unauthorized "ground" is so distant as not to give conclusive evidence as to its location.

Another source of lack of effective co-operation between employes in large offices sometimes is discourtesy in speech and treatment, and the strangest part of it is that the persons apparently the most discourteous during business transactions, are often the most courteous at other times and our best friends. This spirit is particularly displayed by wire chiefs. In most cases it is not only unintentional, but the offender is at the time really unconscious of his demeanor. When such a person is straining every nerve to untangle a mess of crossed and broken circuits and a traffic chief comes along with a report of further interruption, perhaps while the wire man is in the midst of a half-completed order to a lineman, he really feels at the moment that he is being imposed upon and snaps out an answer that he would never acknowledge in his tranquil frame of mind. The result of this apparent discourtesy tends to cause traffic chiefs to delay reporting interruptions which require immediate attention, and he takes a chance that the trouble will disappear later. In this way the company is again the sufferer and cause is again given for tightening the reins.

Another thing that gives results directly opposite to that intended is the withholding of necessary information on the part of a senior chief concerning the details of one's particular branch of work, under the erroneous impression that by so doing he will enhance the position and render his personal services indispensable. No greater mistake can be made than to pursue such a policy. On the contrary the man who willingly and voluntarily endeavors to uplift his weaker brother by freely imparting information which acts to his employer's advantage comes the nearest of all to rendering his own services indispensable, as the manager readily recognizes the fact that in addition to getting first class legitimate service out of such a man the company is also deriving the benefit of free instructions for its employes without the requirement of additional compensation.

It would seem then that the rules which bring us "grief" are after all of our own making and principally due to the acts of our weaker co-laborers whom we should endeavor to uplift instead of decrying as is too often the case.

Recent Telegraph and Telephone Patents

ISSUED MAY 2.

990,972. Telephone Call Distinguisher. To K. W. Gale, Los Angeles, Cal.

991,234. Telegraphy. To I. Kitsee, Philadelphia, Pa.

991,260. Automatic Telephone System. To V. Alexeeff, Ensell, Persia.

991,325. Telegraphic Relay. To I. Kitsee, Philadelphia, Pa.

ISSUED MAY 9.

991,583. Bell Desk Instrument. To C. L. Williams, Parkersburg, W. Va.

991,654. Telephone Exchange System. To N. C. Schellenger, Chicago, Ill.

991,672. Printing Telegraph. To G. S. Tiffany, Summit, N. J.

991,829. Electrical Relay. To E. E. Clement, Washington, D. C.

991,837. Wireless Signaling System. To S. Eisenstein, Berlin, Germany.

991,928. Telephonic Relay System. To C. G. Ashley, Chicago, Ill.

992,042. Wireless Telegraphic Apparatus. To M. A. Parisano, New York.

The following patents have expired:

518,959. Telephone. Issued to E. V. Kolbassieff, Cronstadt, Russia.

519,346. Apparatus for Telegraphic or Telephone Transmission. Issued to M. I. Pupin, New York.

519,347. Transformer for Telegraphic, Telephonic or other Electrical Systems. Issued to M. I. Pupin, New York.

519,876. Telephone Circuit. Issued to C. E. Scribner, Chicago, Ill.

Digitized by Google

Personal.

Prof. Alexander Graham Bell has returned from a trip around the world.

Major Joseph Orton Kerbey, of Washington, D. C., an old-time and military telegrapher and ex-consul to Brazil, sailed from New York for Brazil on May 27.

Mr. Andrew Carnegie and Mr. Frank Munsey, proprietor of *Munsey's Magazine*, both old-time telegraphers, recently sailed from New York for Europe.

Mr. G. K. Heyer, of New York, delivered an address before the Central Railway Club, Buffalo, N. Y., on May 12, on "Train-Dispatching by Telephone."

Mr. B. M. Downs, vice-president of the Brookfield Glass Company, New York, has returned from a business trip which took him to the Pacific Coast.

Mr. G. L. Lang, formerly superintendent of telegraph of the Queen & Crescent and now living in retirement at Chattanooga, Tenn., was a recent New York visitor, and made it the occasion to call on many of his old friends.

Mr. M. Musgrave, superintendent of telegraph, United Fruit Company, whose headquarters have been at New Orleans, La., for some time past, is located at New York, which point he may possibly make his permanent headquarters.

Grace J. Johnston, widow of the late W. J. Johnston, for many years proprietor of the *Electrical World* and an old-time New York telegrapher, was married in New York on May 16 to Mr. William McCarroll, public service commissioner of Brooklyn.

Mr. F. W. Jones, former electrical engineer of the Postal Telegraph-Cable Company, New York, and Mrs. Jones, have returned from West Palm Beach, Fla., where they have been spending the winter. They are now residing at Spring Valley, N. Y.

Mr. George M. Myers, an old-time telegrapher and now a prominent citizen of Kansas City, Mo., is president of the Kansas City Aero Club. He, with two other men, made a balloon trip recently from Kansas City, landing at a place twenty miles away. Mr. Myers enjoyed the trip very much and is very enthusiastic over his experience.

Mr. George H. Thomas, the Democratic nominee for mayor of Portland, Ore., was formerly a telegraph operator. At one time he occupied the positions of chief operator and manager of the Western Union Portland office. He is a brother of Mr. Percy Thomas, of the Hearst newspapers, and president of the New York local Commercial Telegraphers Union of America.

Mr. David Homer Bates, secretary of the United States Military Telegraph Corps, New York, is lecturing under the management of the J. B. Pond Lyceum Bureau, New York, on "Personal Reminiscences of Lincoln in the Telegraph Office During the Civil War." It is an intensely interesting narrative of the exciting times of that period and Mr. Bates makes it all the more attractive by the use of illustrations.

Mr. Gano Dunn, a former telegrapher and now vice-president and chief engineer of the Crocker-Wheeler Company of Ampere, N. J., has been elected president of the American Institute of Electrical Engineers. Mr. Dunn is an electrical engineer of high standing and prominence and has an international professional reputation. A biographical sketch of him was published in our issue of February 1.

Canadian Notes.

Common Carriers in Canada.—A bill has been introduced in the Canadian House of Commons to amend the railway act in order to include telephone, telegraph and express companies and require them to make statements of business and operation to the railway board.

Connection Between Competing Telephone Companies in Canada.—Compulsory physical connection of competing telephone lines is to be tested in the province of Ontario. The Dominion Railway Board has ruled that nine independent telephone companies are to be permitted to connect with the long distance lines of the Bell Telephone Company of Canada during a period of one year. If, at the expiration of that time, the plan has been found to be unsuccessful, it will be abandoned. If, on the contrary, it has been found to work to the advantage of the companies and the public, it will undoubtedly be extended in its scope.

Postal Telegraph-Cable Company.

EXECUTIVE OFFICES.

Mr. C. C. Adams, vice-president, and Mr. F. F. Norton, superintendent of traffic, have returned from a brief western trip of inspection, which included Cleveland, Buffalo, etc.

Mr. S. M. English, general manager of the Postal Telegraph-Cable Company of Texas, was a recent New York visitor.

Mr. M. M. Davis, electrical engineer of the company, has returned from a business trip which took him to Buffalo, Chicago, St. Louis and Pittsburg in the interest of the service.

Mr. T. J. Donovan, formerly manager at 239 Greenwich Street, has been transferred to 30 Church Street as manager, vice Mr. J. J. McDermott, who takes the place of Mr. Donovan at 239 Greenwich Street.

Mr. C. H. Jett, chief operator of the Denver, Col., office, has organized an electrical class among the studiously-inclined members of his force. The class meets at his residence and much progress in electrical matters is being made.

The Postal Company has opened new and up-to-date offices at North Adams, Mass., and Geneva, N. Y.

Digitized by Google

Mr. Fred Arrington Bivins, whose appointment as manager at Montgomery, Ala., was noted in our columns May 16, was born at Alligator, Miss., January 2, 1887, and entered the telegraph service on the Yazoo and Mississippi Valley Railroad in July, 1902. He afterwards went with the Postal Company and worked as operator at Greenville, Miss., and Memphis, Tenn. In March, 1908, he was appointed manager at Greenville and was in October, 1909, transferred to the managership at Jackson, Miss., which position he held at the time of his recent appointment to be head of the Montgomery office.

Story of Postal Telegraph and Commercial Cable Companies.—The *New York Herald* of Sunday, May 21, printed a two-page illustrated article entitled "The Mackay System's Romance of Success." It is the story of the rise and magnitude of the Postal Telegraph-Cable Company and the Commercial Cable Company, and is written in an interesting style. Among the illustrations are portraits of Mr. Clarence H. Mackay, president, and Mr. George G. Ward, vice-president and general manager of the Commercial Cable Company.

Western Union Telegraph Company.

EXECUTIVE OFFICES.

Mr. W. E. Athearn, engineer of equipment, has returned after an inspection trip throughout the West. He went as far as Omaha and was accompanied by Mr. F. E. D'Hume of his staff.

Mr. W. L. Vatter, of the engineering department of the American Telephone and Telegraph Company, has been appointed division supervisor of equipment for this company, with headquarters at New York.

Mr. C. H. Carroll, district commercial agent of the fourth district, Southern Division, has been appointed district commercial manager, with headquarters at Louisville, Ky.

Mr. Frank L. Titus, manager of the Reno, Nev., office, has been advanced to a position in the district commercial department at Los Angeles, Cal. Mr. L. L. Nolton, manager of the Goldfield, Nev., office, succeeds Mr. Titus as manager at Reno.

Mr. W. R. Edmondson, district commercial agent of the fourth district, Southern Division, has been appointed district commercial manager with headquarters at Jackson, Miss. Mr. Edmondson will be in charge of all independent offices in the state of Mississippi, reporting direct to Superintendent J. R. Terhune at Nashville, Tenn.

Mr. F. C. Dowd, an old-time telegrapher and a member of the bar, at Boston, Mass., has recently been attached to the commercial department at New York.

Mr. E. R. Shinn has been appointed to a position in the office of Mr. H. E. Roberts, purchasing agent, New York. Mr. Shinn is a practical printer and will have charge of the printing, stationery, etc.

Mr. J. W. Atkins, manager of the Key West, Fla., office, was a recent New York visitor. Mr. Atkins is a brother of Mr. G. W. E. Atkins, vice-president of the company.

Mr. J. M. Ball, has been appointed manager at Middlesboro, Ky., vice Mr. J. B. Campbell, resigned.

Mr. J. W. Miles has been appointed manager at Johnson City, Tenn., vice Mr. J. H. Clark, resigned.

Mr. L. C. Flora has been appointed manager at Corinth, Miss., vice Mr. F. G. Goodman, resigned.

The Commercial Managers' Association of Greater New York will hold its next dinner at the St. Denis Hotel, New York, on the evening of June 7. Mr. Belvidere Brooks, general manager of the company, will be the guest of honor. This dinner will be the last one of the spring season; the meetings will be resumed in the fall.

A meeting of Western Union managers of Southern New York and Northeastern Pennsylvania was held at the Hotel Radington, Wilkesbarre, Pa., May 10. Those present were: E. M. Mulford, division commercial superintendent, A. C. Kaufman, division commercial agent, and W. A. Sawyer, district commercial superintendent, New York; Richard O'Brien, district traffic manager, G. R. Daniels, district commercial manager, and W. H. Collins, district plant chief, Scranton, Pa.; A. Woodle, district commercial manager, Syracuse, N. Y., and the following named managers: W. H. Peterson, Scranton, Pa.; E. F. Cowell, Wilkesbarre, Pa.; H. L. Hilton, Allentown, Pa.; S. G. Smith, Williamsport, Pa.; C. B. Slawter, Easton, Pa.; C. E. Coleman, Bethlehem, Pa.; Fred Rau, South Bethlehem, Pa.; A. E. Shuman, Hazleton, Pa.; H. W. Deitterick, Bloomsburg, Pa.; A. L. Davenport, Plymouth, Pa.; J. B. Scureman, Nanticoke, Pa.; A. H. Krum, Ithaca, N. Y.; J. J. Brickweddie, Elmira, N. Y.; H. F. Horton, Binghamton, N. Y.; R. T. Harris, chief operator, Scranton, Pa.; E. M. Holland, chief operator, Wilkesbarre, Pa.; David Edwards, chief operator, Plymouth, Pa.; A. E. Deleven, cashier, Syracuse, N. Y.

This company has opened a new and up-to-date office in Miami, Fla. Mr. W. H. McDonald is manager. The new equipment is much appreciated by the patrons of the company.

The Cable.

Mr. F. G. Burstall, assistant superintendent at the Hazel Hill, Canso, N. S., station of the Commercial Cable Company, is in charge at that point during the prolonged absence of Superintendent F. B. Gerrard, assigned to duties in the executive offices at New York.

Reduction of Cable Tolls.—Postmaster General Hon. H. Samuel announced in the British House of Commons on May 18 that he had arranged with the cable companies for a reduction of 50 per cent. on all non-code cable messages liable to be deferred not longer than twenty-four hours. The Government has decided to secure the control of cable rates through the licenses necessary

Digitized by Google

to the landing of the cables on British shores. The licenses come up for renewal periodically and henceforth on such occasions the Government will oppose such rates as it may think excessive. If the company disagrees the question will then be arbitrated.

Cable Telegraphy.—At a meeting of the Royal Colonial Institute in London, on April 25, Mr. Charles Bright read a paper on "Imperial Telegraphs." Mr. Bright's lecture was largely occupied with the question of a cable system for the empire, exclusively under British control.

German Transoceanic Cables.

In the past seventeen years six submarine telegraph cables with a total length of 21,748 miles have been laid by German capital. The Deutsche-Atlantische Telegraphengesellschaft, of Cologne, is the most important cable company in Germany and owns the lines between Emden and Vigo, 1,284 miles, and the two cables between Emden, Horta and New York, 4,770 and 4,916 miles respectively. The latest German cable laid is the German-Brazilian line which belongs to the Deutsch-Suedamerikanische Telegraphengesellschaft. The last section of this cable, between Monrovia and Pernambuco, was laid a few months ago and reference made to it in these columns recently. The cable starts at Emden and stations are located at Santa Cruz de Teneriffe and at Monrovia. To further improve the service it is proposed to erect a wireless station at Monrovia.

Municipal Electricians.

Fire Alarm.—A patent, 991,903, on a fire alarm has been granted to Mr. Frank Simonyi of New York.

Fire Alarm System in Trinidad, Col.—Eighteen Gamewell street fire-alarm boxes are to be installed in Trinidad, Col.

Electric Fire Alarm.—Mr. A. C. Farley, of Shinglehouse, Pa., has been granted a patent on an electric fire alarm. It depends for its operation upon the expansion of metals by heat.

Telephones for Fresno Fire Department.—A private telephone system for the exclusive use of the Fresno fire department, Fresno, Cal., is to be installed by the Pacific Telephone and Telegraph Company and a branch exchange will be located at fire headquarters.

Municipal Electricians.—We have received from Mr. C. R. George, secretary of the International Association of Municipal Electricians, Houston, Tex., a copy of the membership list of that association. According to the list there are 117 members. The next annual convention of the association will be held at St. Paul, Minn., September 12, 13, 14 and 15 at the Ryan Hotel, and a large and enthusiastic gathering is expected. Several matters and papers of importance to municipal electricians will come up for consideration, and from the outlook the meeting will be one of the largest and most successful ever held by that organization. Secretary George will be glad to give any further information regarding the meeting.

Charles H. Murphy, General Superintendent of Time Service, Western Union Telegraph Company, New York.

Mr. C. H. Murphy, who has been appointed general superintendent of time service of the Western Union Telegraph Company, New York, was born at South Lebanon, Ohio, May 6, 1872. Mr. Murphy entered the company's service in September, 1889, and served about three years in the construction department. In December, 1892, he took up the time service work at Chicago and two weeks later was assigned a territory in Iowa,

C. H. MURPHY,
General Superintendent Time Service, New York.

with headquarters at Cedar Rapids. On January 1, 1896, he was transferred to Denver, Col., as time service inspector for the western part of the Third District, and on September 1, 1898, became manager of the time service at Omaha, Neb., for the entire Third District of the Western Division.

In May, 1902, Mr. Murphy was called to New York to assume the managership of the Time Service Department for the Eastern Division, which position he has successfully filled until his recent appointment.

Mr. Murphy has a thorough and comprehensive knowledge of time service matters and is eminently well qualified to discharge the duties of his new position.

The Telephone.

Mr. F. H. Bethell has been elected a director of the New York Telephone Company to succeed Henry M. Watson, deceased.

Mr. W. A. Blanchard, special agent of the American Telephone and Telegraph Company, New York, has returned to New York after completion of service studies in the larger cities of the east.

Mr. E. J. Hall, vice-president of the American Telephone and Telegraph Company, who has been spending a few weeks in Watkins, N. Y., for rest and recuperation, has returned to his desk much improved in health.

Mr. Henry W. Pope, special agent of the American Telephone and Telegraph Company, New York, is absent on a tour taking in Colorado and New Mexico and is expected to return in the course of a month or six weeks.

Mr. S. G. McMeen, the well-known telephone engineer of Chicago, addressed the students of the Throop Polytechnic Institute, Pasadena, Cal., recently on "The Work of the Telephone Engineer." Mr. McMeen has recently completed the installation of an automatic telephone system in San Francisco.

Mr. Angus S. Hibbard, former second vice-president and general manager of the Chicago Telephone Company, who is to occupy a position on the staff of Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company in New York, was the guest of honor at several going-away parties prior to his leaving Chicago. The Wisconsin Society of Chicago presented him with a meat dish, explaining that a loving cup might lead him into temptation, and from the executive committee of the Chicago Association of Commerce Mr. Hibbard received a gold mounted baton in recognition of his musical ability.

Telephones in New York City.—On May 24 there were 417,361 telephones in service in New York City, an increase of 15,837 since January 1.

Removal of Telephone Headquarters.—The division headquarters of the American Telephone and Telegraph Company now at St. Louis, Mo., are to be transferred to Kansas City, Mo.

Paris-Vienna Telephone.—The telephone line between Paris and Vienna was recently opened for public business. The tariff is $1.60 for an ordinary communication and $5 for urgent communications.

The Telephone in Constantinople.—A telephone contract has been signed in Constantinople and steps are now being taken in London to organize a company and the necessary engineering staff to carry the plans into effect.

Multiplex Telephony and Telegraphy.—Major George O. Squier will present a paper on "Multiplex Telephony and Telegraphy by Means of Electric Waves Guided by Wires" at the annual convention of the American Institute of Electrical Engineers to be held at Chicago, June 26-30.

Regulation of Telephone Rates in Denison.—The Denison, Tex., city commission is endeavoring to acquire the right to tax the franchise of the Southwestern Telephone and Telegraph Company and to compel it to place its wires underground in that city. It also desires permission to refuse telephone rates if they are not considered satisfactory.

Federal Telephone Company to Issue New Bonds.—The New York Public Service Commission, Second District, has authorized the Federal Telephone and Telegraph Company, of Buffalo, to issue $578,000 in bonds to pay for the purchase of the Niagara Home Telephone Company, the Dunkirk Home Telephone Company and the Independent Union Telephone Company.

Telephones for Damp Places.—Special telephones are now used by the German post office for use in damp places. They are similar to those used in tropical climates to stand the rainy season. All the iron parts are coppered and varnished, the wooden parts are coated with a waterproof varnish and the remaining parts are covered with impregnated silk.

Pennsylvania and New York Telephone Company to Sell Its Franchise.—A special meeting of the Bell Telephone Company of Pennsylvania will be held July 18 to vote on the purchase of the Pennsylvania and New York Telephone and Telegraph Company, and on the same day the stockholders of the latter company will hold a special meeting to vote on the sale of their property to the Bell interests.

Emergency Telephone Equipment for Bangor.—Some remarkably quick work was done in shipping an emergency telephone equipment to Bangor, Me., after the great fire there on April 30. The equipment, which consisted of seven sections of central battery lamp signal board with a capacity of 3,000 subscribers' lines, and filled two cars, was started on its way Monday morning, May 1, and reached Bangor early Wednesday morning. A large force began installing it at once in a hall that had been spared by the flames, and service was soon resumed.

Large Hotel Telephone Equipment.—The new McAlpin Hotel, on Broadway and Thirty-fourth street, New York, will be the best telephoned building in the world when it is finished. The contract covers 100 trunk lines, 1,800 stations and 500,000 local messages at an annual value of $25,334 for services. Sixteen telautograph instruments will also be installed at various points in the hotel. The telephone switchboard will have sixteen regular operating positions, and there will be three sub-switchboards, also a two-position switchboard for pay-station purposes in connection with nineteen booths to be located in the main corridor and at other points in the hotel.

Practical Aspects of Printing Telegraphy.*

BY DONALD MURRAY.

No doubt in time wireless printing telegraphy will receive more or less attention, but it will not be of much importance, in this generation at any rate, because there cannot be any saving of line or line maintenance when there is no line. Any saving of labor that might be effected by wireless printing telegraphy is of trifling importance, because the wireless operator has to be in attendance in any case, and the speed of signaling is low.

For railway work printing telegraphs have hardly been employed at all up to the present, and as the telephone is gradually displacing the telegraph for most railway work in America, and therefore no doubt in time in other countries also, printing telegraphy does not appear to have any extensive possibilities in conjunction with railways. In time, printing telegraphy will probably play a considerable part in connection with ocean cables, but up to the present hardly anything has been done in this direction, because the conditions to be fulfilled are extremely complicated. There cannot at present be any line saving, because ocean cables are already utilized up to their full capacity. It will be possible to effect a slight saving of time and some saving of labor, but the apparatus will necessarily be of a very delicate and intricate character. The expenditure will necessarily be heavy, and the saving will not be more than about £300 ($1,500) or £400 ($2,000) a year on each cable at each end.

So far as the present position of printing telegraphs is concerned, the Hughes tape printer carries the bulk of the telegraphic traffic on the continent of Europe, and it has done so for nearly half a century, about 3,000 Hughes instruments being now in use. Most of the telegraph traffic between Great Britain and the continent is also carried by the Hughes, but this machine is only employed outside of Europe to a very slight extent. During the past thirty years the Baudot system, which may be described as a multiplied Hughes tape printer, has been developed and extended in France until all the telegraph lines of any importance are equipped with it. During recent years it has also made considerable progress in Italy, Brazil, India and Russia. In Russia it is quite extensively used, most of the leading towns in European Russia being connected by it. It has likewise secured some foothold in most other European countries, Paris being linked up by it to nearly all the capitals of Europe. Great Britain has proceeded in very leisurely fashion, and, so far, has only coquetted with printing telegraphy, more or less prolonged flirtations having been carried on by the British Post Office with the Hughes and Baudot, the Buckingham, the Murray automatic, the Siemens & Halske and several other systems. The latest arrival, the Murray multiplex, may be described as the child of the British Post Office, it having been developed with the assistance of that institution. The Murray automatic system has made most progress up to the present in Germany. It has also secured a foothold in Russia, Sweden and Norway. It is in regular commercial use between Hamburg and Berlin, Berlin and Frankfort, Hamburg and Frankfort, Berlin and St. Petersburg, St. Petersburg and Omsk in Siberia (about 2,400 miles, with three repeating stations), Stockholm and Gothenburg, Kristiania and Bergen. A new installation with all the latest improvements is being established between London and Dublin. For various reasons, however, the use of the Murray automatic system is limited to long lines and underground cables, and there is, consequently, not a very wide field for it, especially in comparatively small countries like Great Britain. The Murray multiplex, on the other hand, is very well adapted for moderate distances, but it has not yet had time to come into extensive use. In the United States the Buckingham system was developed under the auspices of the Western Union Telegraph Company, and some sixty circuits are now equipped with the Buckingham system as improved by Barclay.

Printing telegraph inventors are still busy increasing the height of the printing telegraph scrap pile, but the substantial results over the whole wide world are summarized in the foregoing paragraphs. These results are neither extensive nor brilliant, and it is an actual fact that less than £1,000,000 sterling ($5,000,000) would cover the value of all the printing telegraph machinery on the face of the earth to-day. This is the outcome of fifty years of constant labor by scores of inventors. We have only to compare this with the gigantic extension of telephone apparatus all over the world in only a few years to realize that there must be some hampering circumstances, some peculiar difficulties and obstacles in the way of printing telegraphy.

Before considering these difficulties the author discusses the four economies of fundamental importance in the transmission of intelligence—namely, to save time, to save labor, to save line, to save office equipment—and he emphasizes the heavy labor cost and loss of time in the transmission of telegraphic communications. The vital importance of printing telegraphs lies in the fact that they can greatly reduce the present waste of line and labor in telegraphy, and that they render it possible to foster the growing co-operation between the telegraph and the telephone. The telegraph and telephone are each strong where the other is weak. We can set out the points in tabular form as shown on the next page.

If we utilize the telephone as the short-line feeder and distributor for the long-line telegraph we get the ideal co-operation shown in the last

*Abstract of a Paper read before the Institution of Electrical Engineers, London.

Digitized by Google

column of the table. The cost of office equipment will be increased, but this will be outweighed ten or twenty-fold by the economies of line, labor and time.

If telegraph messages were charged for like telephone messages—by time instead of by the number of words—a lot of the labor cost would

——	Telegraph.	Telephone.	Telegraph-telephone.
Time.....	Wasteful.....	Extremely economical	Fairly economical
Labor.....	Wasteful.....	Extremely economical	Fairly economical
Line.....	Very economical	Very wasteful...	Very economical
Office equipment.....	Cheap.....	Expensive.....	Expensive

fall away. A merchant would then ring up the nearest telegraph office. He would be switched on to the required circuit, and he would dictate his message direct to a telegraph operator, who would type it on a rapid keyboard tape perforator. The perforated message would run through an automatic transmitter, and would be printed automatically direct from the line signals at the distant station, from which point it would be telephoned at once to the addressee. This telephone-telegram idea is already slowly emerging into everyday use. The British and other administrations now accept and deliver telegrams by telephone, and the British Post Office has actually coined the special name of "phonograms" for such telephone-telegrams. To handle "phonograms" under ideal conditions there should be a system giving either high automatic speed of transmission or at least four simultaneous transmissions in each direction on busy lines, and the speed of each transmission should be a steady average of at least forty words a minute. Not only would quick handling and transmission of messages be necessary, but also quick reception and printing of the messages at the other end of the line ready for transmission by telephone. Printing telegraphs are a necessity for such methods of handling telegrams.

The chief stumbling-block at present is the practice of charging for telegrams according to the number of words, which involves an incredible amount of waste time and labor in counting the number of words.

In addition to the telephone as a local collector and distributor of telegrams, there appears to be a field for the small step-by-step printing telegraphs generally known as stock-tickers. The Siemens & Halske teletyper is a good example of this class of machine. These little machines, however, are more expensive and complicated and slower than telephones, and in the nature of things can only come into very limited competition with the telephone. The same remarks apply to the telewriter.

Meanwhile we have to see what steps we can take to reduce labor cost of telegrams under present conditions. The subject is very complicated and there are many obstacles, but threepenny telegrams and quick service would lead to a wonderful growth of telegraph traffic. These depend on rational co-operation between the telegraph and telephone, upon the extension of the telephone to practically every office and home, and last, but not least, upon efficient printing telegraphs. It is practically certain that in the course of the next ten or fifteen years the British Post Office alone will have to spend not less than a quarter of a million sterling on printing and other telegraph machinery in telegraph offices.

The printing telegraph inventor has to conform to most intricate and unexpected conditions, and although the telegraph administrations do all they can to assist in the development of printing telegraphy, they are still bound to look at the matter from the financial point of view, and to insist on a printing telegraph showing either (1) a saving of labor, or (2) a saving of line, or (3) a saving of time in transmission, or if possible all three. In fact, we may say that the difficulties in the way of introducing printing telegraphs are essentially commercial.

In Europe, excluding Russia, labor saving is most important, especially as the telephone has cut into telegraph traffic to such an extent that during the past few years the growth of telegraph traffic in most European countries has been small or nil. In giant new countries with magnificent distances, including the United States of America, Russia, Canada, South Africa, the Argentine, Brazil and Australia, the saving of wire is of the greatest importance, and some waste of labor may be tolerated if there is compensating line saving. In each case the relative advantages of line and labor saving have to be balanced to get the maximum benefit.

The difficulties in the way of labor saving in telegraphy may be roughly classed under two heads: those in connection with commercial messages and those in connection with press messages. Commercial messages are short and average about twenty words; continual stoppages of the mechanism are therefore necessary. With a page-printing telegraph the loss of time in cutting up tape and pasting it on message forms is saved, but provision has to be made and time allowed for line-feed, column-feed and page-feed. These delays take place every twenty words or oftener, thereby considerably reducing the saving possible in theory. The position is entirely different in the case of the stock-ticker and ticker news service, and practically the whole of the troubles are questions of mechanical maintenance.

Press Messages.—The conditions at the first glance are much more favorable for printing telegraphy, but actual experience shows that the obstacles are much worse than in the case of commercial messages.

The British system of news distribution is divided into the Post Office "News Division" worked

Digitized by Google

by the Wheatstone system, and the leased and private wires rented from the Post Office by the leading British newspapers. London is the great originating and distributing centre for news, and it flows out from London all over the United Kingdom. Taking first the government service, in the British "News Division," news distribution is carried on by an elaborate arrangement of Wheatstone circuits, each message being perforated simultaneously on from one to eight tapes by pneumatic perforators, the tapes being then used to transmit press messages over as many as thirty different Wheatstone news wires, many of which have four or more towns strung on them *in series*. In this way news is distributed all over *the United* Kingdom at a very rapid rate, and with remarkable economy of labor, as one man can prepare a message for transmission to a hundred or more towns. There are very great difficulties in the way of any printing telegraph coming in and doing this work. In the first place, the news is distributed at a very high speed of from 200 to 300 words per minute. No printing telegraph can work steadily at such a speed on one wire. Also the Murray automatic system, and, indeed, any other printing telegraph using a special alphabet (not Morse), would require a piece of news to be punched in the Murray alphabet as well as in the Morse, unless the whole news service of Great Britain was handled entirely by the Murray automatic system. Apart from the speed difficulty and the cost of the apparatus, it would take years for a printing telegraph to be installed all over the country. Using it for a few circuits for news would mean double labor in perforating the messages, and although other advantages might be great enough to compensate for this extra labor, the speed of the line would have to be dropped to about 150 words per minute.

In other countries where there is no highly complicated arrangement for news distribution there is no obstacle to the use of such printing telegraphs as the Murray automatic; but in countries where there is no complicated news-distributing organization there is very little news traffic, and it can be handled easily by the Hughes and other low-speed and therefore cheap instruments.

Another difficulty about news work is that in London and other large centres of population at least twelve copies are required of press messages to various newspapers. It puts a serious strain on any typewriter to make twelve copies continuously for long periods of time at a high speed. Rotary mimeographs and hectographs get over the difficulty in New York, and there is no reason why they should not do equally well in London.

Newspaper Private Wires.—In the case of these wires the conditions that exist are even worse from a printing telegraph point of view. High-speed printing telegraphs are of necessity complicated, and require good mechanical skill to keep them in order. This means that a skilled mechanic with an assistant and a small workshop would have to be installed. The question of speed also is just as serious with newspapers as with the post-office. Take, for instance, a great provincial daily paper like the "Glasgow Herald." Every night it sends from 30,000 to 40,000 words from its London office to its Glasgow office 400 miles away. The great bulk of this news is sent over the "Glasgow Herald" private wire between 5 p. m. and midnight, and the conditions are such that it is absolutely imperative to have a speed of transmission over the line of not less than 250 words a minute (1,500 letters) and preferably 300. At present the work is done by the Wheatstone system, and there is a staff of six to eight operators in London, who punch the news in the form of perforated tape, and it runs through the Wheatstone transmitter at 200 to 300 words a minute, coming out in the Glasgow office of the "Herald" as dots and dashes on a tape, which is then copied out by a staff of eight to ten men. It is not apparent how any printing telegraph can meet such requirements. The writer tried it with the Murray automatic system, but the utmost that he could achieve was 184 words a minute, and even this was with very fine adjustment, much too fine for practical work; 150 words a minute was practical, but it was too slow. Less serious troubles are to be found in the fact that mistakes show up badly in the typewritten pages produced by printing telegraphs, and make the sub-editors uneasy about the accuracy of the messages. In the case of the Wheatstone the transcribers correct the errors as they proceed, and they write out clean "copy."

In spite of the great difficulties in the way of using printing telegraphs for news work, it would be taking too pessimistic a view to say that printing telegraphs cannot be used for press despatches. They can be and they are so used. In Germany and France, for instance, where the newspaper telegraph traffic is small, all the press messages are sent over the Hughes and Baudot printing telegraphs, and even in Great Britain printing telegraphs will in time make their way for news work; but it will be a very slow progress and very costly. The apparatus will have to be faultlessly made, and well-trained men employed to run it. There will probably be a saving of time, but the saving of labor will not be great.

The difficulties in the way of making a copy for record of telegrams delivered were explained, and the author pointed out that wet-press copying is the only practical method when printing telegraphs are used. The necessity for keeping copies of telegrams at all is not obvious.

When page-printing telegraphs are used a change is necessary in the telegraph forms used by various administrations. There are two kinds of telegraph messages, those sent from city A to be delivered in city B, and those sent from city A to be retransmitted in city B to city C. In city B nearly all telegraph administrations use two different kinds of telegraph forms to distinguish these two kinds of messages. For a page-printing telegraph only one form for both kinds of messages is possible.

Digitized by Google

Numbering messages involves a waste of about two and a half per cent. in line time and labor; and the tendency is to omit all unnecessary signals. Whether consecutive numbers on telegrams are necessary appears to be an open question. Certainly numbering is a safeguard against messages being lost—an accident that happens occasionally in all telegraph offices. Hence when the Murray automatic system was introduced into the British telegraph service it was considered desirable by the officials to resume the numbering of messages on the Murray circuit. This is a small matter, but it involved a certain amount of change of routine, and in a big department a change of routine is a matter of difficulty. The experience of the writer is that the real conservatives are not the official heads but the operators, who often show extraordinary reluctance to accept change of routine. In fact, that is one of the minor obstacles to the introduction of printing telegraphs.

Counting the number of words in telegrams is a serious matter, causing much waste of time and labor. Charging by the number of words is a very defective system, but it is difficult to say what better arrangement could be adopted. As long as word counting remains in force it will be one of the hindrances to any considerable saving of labor by printing telegraphy. The number of words in the message is sent in the preamble, and it is the duty of the receiving operator to count the number of words in the received message to see that it agrees with the number in the preamble. In case of discrepancy this involves a talking back and forward, which, with printing telegraphs, is not so quick as with the Morse key. There are also so many Siamese twin words that are neither one nor two that counting is difficult, and the labor cost is increased. Thus, "motorbus" is one word, but "motordriver" is two. If it were possible to charge for telegrams in some way by time as in the case of the telephone, a lot of delay and labor would be saved.

Apart from these difficulties, the most serious trouble a printing telegraph system has to face is errors in telegrams. These, due to disturbances on the telegraph line, stray currents, inductive interference, men repairing the line, wind and weather, or to the human operator, involve repetition of messages and impose very serious limitations on the time and labor saving possible with printing telegraphs.

A special difficulty for printing telegraphs is also to be found in the variety and irregularity of telegraph traffic, which varies greatly in volume and in character according to the circuit and the seasons. There are also great variations in the volume and kind of traffic according to the hours of the day. Moreover, the present system of multiple address messages is impossible with a printing telegraph.

Traffic arrangements and hours of duty of operators are necessarily of a very complicated character in the case of large telegraph administrations, and the introduction of printing telegraphs leads to considerable variation of these arrangements. It is most difficult to introduce changes in the daily routine of large numbers of human beings. Of course, in the case of France, Germany and other countries on the continent of Europe, where the Hughes has been largely employed for more than a quarter of a century, such difficulties have long since adjusted themselves. It is in the Morse key and sounder countries that the introduction of printing telegraphs necessitates some changes of routine.

International telegraph traffic presents special difficulties because of the division of authority and difference in habits and ideas and customs, and differences in language. Alphabetical troubles are not the least that printing telegraph inventors have to encounter. Each country requires some variation in the telegraphic alphabet, and it appears to be a physical impossibility to devise a printing telegraph that will suit all languages. A curious illustration of this alphabetical difficulty is the confusion that exists in Great Britain through the use of the oblique stroke both for money and fractions. 3/8 may be read as 3s. 8d. or as ⅜. This confusion has led to monetary loss. Code and cipher messages also are the despair of telegraph administrations, but on the whole a good printing telegraph can handle such messages with less risk of error than the Morse key and sounder, and at least as expeditiously if proper methods are used. The essential condition is careful training of operators in working on typewriter keyboards without looking at the keys.

The use of envelopes and the addressing of telegrams present difficulties in the case of page-printing telegraphs. On the continent of Europe envelopes are not used, and the telegrams have to be folded up in special ways, varying with each administration. The printing of the messages must suit these methods of folding. This requirement is hard to fulfill in the case of a page-printing telegraph.

Finally, there are mechanical difficulties of construction. Printing telegraph machines belong to a theoretically bad group of mechanisms, in which the majority of the actions are striking instead of sliding or rolling, and it is only by close attention to details that success has been achieved.

New Form of Battery.

A new cell has recently been invented and patented by F. Di Palma, in Italy, which consists of electrodes of amalgamated zinc and lead peroxide respectively, immersed in sulphuric acid solution, and has a potential difference of two volts. The electrodes are placed horizontally in a closed vessel, the zinc one near the bottom, and the lead peroxide one in the center; the space between them is filled with sulphuric-acid solution and that above the lead peroxide is filled with compressed oxygen pumped in through a tap at the top of the vessel, thus reoxidizing the lead peroxide as fast as it is reduced. The apparatus may be used as a storage battery by charging with an electric current when the oxygen is exhausted, and is stated to be much lighter and to cost less.

CHANGES OF ADDRESS.—In ordering a change of address the old as well as the new address must be given.
REMITTANCES to Telegraph and Telephone Age should be made invariably by draft on New York, postal or express money-order, and never by cash loosely enclosed in an envelope. By the latter method money is liable to be lost, and if so remitted is at the risk of the sender.

June 1, 1911.

The Book Department of Telegraph and Telephone Age has always been a prominent and carefully conducted feature of this journal. The desire has been and is to furnish our readers and buyers everywhere the readiest means possible of securing such technical books as they may require. Aiding buyers in their selection with advance information, which at all times is cheerfully furnished; promptness in sending books, filling all orders on the same day of their receipt, has brought to this department a generous clientage. Catalogues fully covering the range of books treating on the telegraph, wireless telegraphy, the telephone, as well as those on the general subject of electricity, together with the principal cable codes, will be sent to any one asking for the same.

Telegraph Service.

In any line of industry first-class results cannot be obtained with poor and inappropriate tools. A stone cutter's implements, for instance, could not be used for constructing a watch; neither could the watchmaker's tools be employed in building a locomotive, yet both kinds of tools must of necessity be of the best to produce the best results.

The output of a telegraph company is public service, and, although public service is an intangible thing, it is subject to the same laws that govern the production of tangible things, such as locomotives and watches. It requires tools of the proper kind in order to render efficient service to the public, and the quality of the service is measured by the quality of the tools employed.

A telegraph company's tools are its management, its plant and its operating force, and, in passing, it may be noted that it is on these general bases that the telephone company and the telegraph companies are organized and operating. No one of these three grand divisions could manifest any results without the co-operation of the other two. The management furnishes the ideas which, when put into practice, will produce results; the plant (wires, batteries, instruments, etc.) furnish the means of producing results and the operating forces control these means. Ideas themselves, as ideas, are of no use to mankind, neither is inanimate plant; the plant can do nothing of itself; it requires human electromotive force to put both into action. This is the sphere of the operating force; and, as already stated, the quality of service rendered depends upon the quality of the means used to render it. Poor management cannot in any possible manner keep the plant in proper condition and maintain discipline and efficiency in the operating department; poor wires, batteries and instruments cannot give satisfactory results because they are poor tools, and a poor operating force cannot perform first-class work—all three must be efficient and harmonious in action. If one is deficient the others are correspondingly affected.

The most important desideratum in the conduct of a telegraph business is a high standard of efficiency and its maintenance. The patrons of the company know a good deal more about this quality than most people think they do. They judge of the efficiency of the company by the service it renders. If messages are garbled, badly written or full of errors the recipients very naturally are led to think that the company is weak in the performance of its duties, and they lose confidence in it. On the other hand, if messages are delivered neatly written, on the typewriter preferably, and without errors, confidence in the service is promoted and the public is satisfied.

We recognize the fact that some of the errors in the transmission of business are properly chargeable to the writers of telegrams themselves, but with that we need not concern ourselves here. The company's duty is to do its share of the work properly and as well as it can be done in the face of such obstacles.

One of the principal aims of the telegraph and telephone companies is to interest the public in their services and foster a more liberal use of them. They well know the value of efficient service in the attainment of this result, and it is to their credit that they are doing everything possible to gain the confidence of the people. They are increasing their facilities, not only in establishing new lines, but in improving present plant and adopting new devices designed to aid in the accomplishment of that one great purpose. In addition to this they have not overlooked the fact that while the plant must be improved the means of operating it must also be improved. The operating force is being raised to higher standards of efficiency and the future outlook for the operators, clerks, etc., is more encouraging now than ever before. A spirit of enthusiasm and zeal pervades the ranks to a degree never before attained and the companies are putting forth every endeavor and offering every encouragement to their men to better fit themselves for their present positions and for future advancement. The rapid expansion of the telegraph service and its exacting de-

Digitized by Google

mands require a high grade of intelligence on the part of the employes, and it is gratifying to note the great changes that are taking place in this direction through the encouragement of the companies. There are no doubt some individuals who may not look at the situation enthusiastically, but fortunately they are in the minority. They stand in their own light and are a bar to progress of any kind. Action is the motive-power of all progress; lethargy clogs the wheels.

An Early Reference to the Telegraph.

BY D. MCNICOL, NEW YORK.

Modern newspapers occasionally manifest their activity and enterprise as newsgatherers by securing scoops covering the details of some event of great moment. Any periodical publication being the first to announce to the world the details of a great calamity, the exposure of a disastrous fraud, the announcement of a horrible crime or of any event of unusual importance, is credited with having made a scoop.

Almost any newspaper publisher or magazine editor would be glad to have scoops as laurels, and the fame of many a publication has been established by the success of its managers in publishing news items of local or national importance before other contemporary publications noted the happening.

As an evidence that even magazines may have "greatness thrust upon them," there is the case of *The Scot's Magazine*, which in its issue of February, 1753, published a contribution from a man who signed himself "C. M.," to which article the editor gave the title, "An expeditious method of conveying intelligence."

This communication contained the earliest known reference to an electric telegraph, and as the telegraph was the forerunner of all electrical activities, historians of electrical development in every civilized country in the world have in hundreds of instances made reference to the article which appeared in the issue of *The Scot's Magazine* referred to. Thus this magazine, which apparently had little other claim to greatness, secured a scoop in February, 1753, with which for all time to come it will be credited.

The article in part states: "It is well known to all who are conversant in electrical experiments that the electric power may be propagated along a small wire, from one place to another, without being sensibly abated by the length of its progress; let, then, a set of wires equal in number to the letters of the alphabet be extended horizontally between two given places parallel to each other and each of them about an inch distant from that next to it. At every twenty yards' end let them be fixed in glass or jeweler's cement to some firm body, both to prevent them from touching the earth or any other non-electric and from breaking from their own gravity."

The writer then goes on to explain his proposed method of operating the telegraph whereby bits of paper bearing the letters of the alphabet are placed an eighth of an inch below suspended metallic balls at the receiving end and are attracted thereto as each wire is electrically charged from the distant station. Thus by observing the letters affected the receiving operator may form the words of the message transmitted.

After the publication of the "C. M." article nearly a quarter of a century elapsed before the first method of electric telegraphy was tried out, namely, that of Georges Louis-Le Sage, of Geneva, who in the year 1774 constructed a telegraph machine practically along the lines suggested in the article referred to.

Supreme Court Decision Against Standard Oil Company.—The United States Supreme Court, on May 15, approved the decree of the Circuit Court for the Eighth Circuit directing the dissolution of the Standard Oil Company. The court determines against the Standard Oil Company on the ground that it is a combination in unreasonable restraint of interstate commerce. The period for the execution of the decree is extended to six months.

General War on Loan Sharks in New York.—Prominent merchants and representatives of large corporate concerns in New York, employing thousands of people, held a conference on May 18 on the question of loan sharks and declared a systematic warfare against them. Among the interests represented were the Postal Telegraph-Cable Company, the New York Telephone Company, the New York Edison Company, the General Electric Company, the Erie Railroad and the Brooklyn Rapid Transit Company. The employers pledged themselves to work for the enactment of more rational loan legislation, and to install, wherever practicable, co-operative savings and loan associations, whose funds will be at the call of all employes on a company's payroll in case of trouble, sickness, or other legitimate need for money. By this means the merchants expect to cut down the zone of the loan shark's operations.

Mr. Vail's Views on Regulation.—The views expressed by Mr. Theo. N. Vail, president of the American Telephone and Telegraph Company, in his recent annual report to the stockholders on the subject of "Public Service Regulation," have received much commendation from the press. They are regarded as being based on broad gauge principles and the governors of Colorado, Oregon, Wyoming, Michigan, North Dakota, Illinois, and other states, have gone on record as approving Mr. Vail's attitude on this question.

Combined Telephone and Telegraph Building for Buffalo.—The proposed new building in Buffalo, N. Y., for the New York Telephone Company will provide quarters for the Western Union Telegraph Company. It will be erected at Church and Franklin Sts., and will be a modern fire-proof structure.

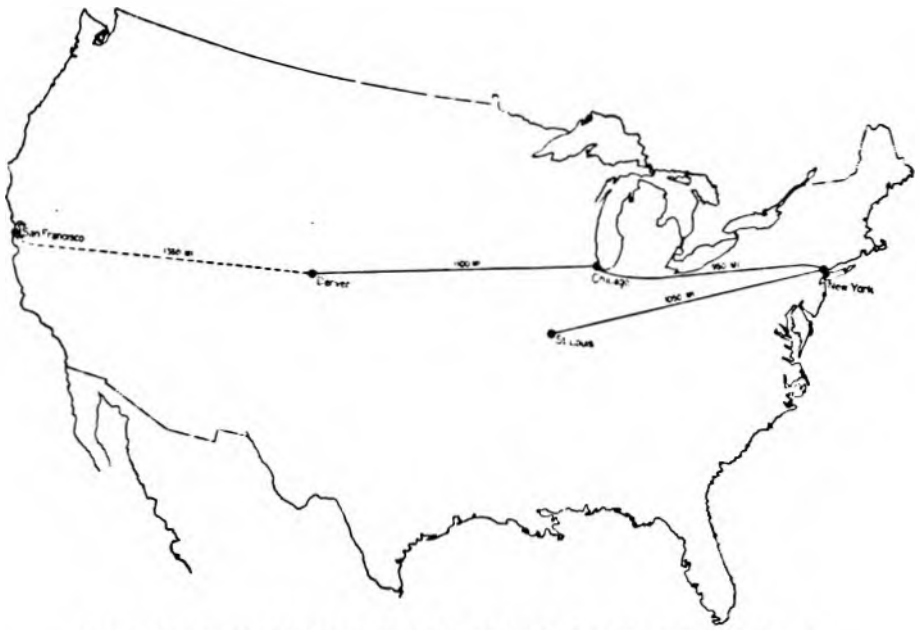
Some Recent Advances in Transmission Efficiency of Long Distance Telephone Circuits.*

BY B. GHERARDI, ENGINEER OF PLANT, AMERICAN TELEPHONE AND TELEGRAPH COMPANY, NEW YORK.

In June, 1900, Professor M. I. Pupin, who is one of our guests of honor this evening, took out his patents for loading. Since that time practical applications of loading on a very extensive scale have been made in the plants of the American Telephone and Telegraph Co. and the associate companies, and most gratifying results in improved transmission and economy in first cost of construction have resulted from the applications of Professor Pupin's invention. At first the work done dealt with the loading of ordinary open wire lines and standard cables and with the perfection of the apparatus required to accomplish these results. Later attention was directed to the more complex problem of loading phantom circuits, the loading of our high-grade No. 8 circuits and the design of special cables so constructed that phantom circuit working was possible in connection with loaded cable conductors. As a result of the work which has been done along these lines during the last two years some very remarkable improvements in the transmission efficiency of long lines and cables have been made. The New York-Denver circuit, which is now in operation, and the Boston-Washington cable, which is in process of manufacture, have been made economic possibilities by these advances. While it cannot be said that these results could not have been obtained with our knowledge of the art as it was two years ago, it may safely be stated without fear of contradiction that the cost of such work, as it would have had to be done with our knowledge of two years ago, would have been so great as to have been commercially prohibitive.

Mr. Gherardi then described the New York-Denver circuit and dealt with the engineering problems involved.* "One of the aims of our president, Mr. Theo. N. Vail," he said, "is to give universal service. The first step in the direction of giving such service is obviously to be able to give transcontinental service—that is, a talk from New York to San Francisco. The illustration shows how much of a step in this direction has been made since Mr. Vail's wish on this matter was stated about two years ago. This diagram shows what we could do two years ago, what we can do now, and how much remains to be done to get to San Francisco. It was a long step from Chicago to Denver. One more step a little longer will take us to San Francisco.



MAP OF NEW YORK-DENVER-SAN FRANCISCO TELEPHONE LINE.

The problem of loading No. 8 circuits, Mr. Gherardi continued, was primarily a problem in connection with the insulation of the line wires. A No. 8 circuit can be loaded with the same coils used on No. 12 circuits and these coils would be spaced in the same manner, that is, at 8-mile intervals. It has been a fact known to us ever since we started to do commercial loading that low insulation on a loaded circuit has a much greater effect in impairing the efficiency of such a circuit than the same insulation has on an unloaded circuit. It has also been known that the effect of low insulation on the No. 8 circuits was much more serious than on the No. 12 circuits.

When we first began to load our open wire circuits about ten years ago it was found that the No.

* Abstracts from a paper read before the New York Telephone Society, April 18.

* A full authorized description of the New York-Denver telephone line was published in Telegraph and Telephone Age, May 1.

Digitized by Google

12 gauge circuits which had been loaded gave satisfactory results in dry weather. In wet weather the results were not so good, due to the lower insulation at such times, but these results were good enough. In the case of No. 8 circuits, however, it was found that when they were loaded the effect of low insulation was so serious in wet weather that at such times the circuit was no better than if it was unloaded—sometimes even worse. A system of loaded No. 8 circuits could not, therefore, be considered satisfactory, as it would be a system which part of the time would be better than if not loaded and part of the time worse.

It having been established that a substantial improvement would have to be made in the insulation of No. 8 circuits in order that they might be successfully loaded, and reasonably uniform results obtained from the loading, a study of line insulation conditions was made to determine what steps would be necessary in order to improve the line insulation. Aside from the general insulator leakage two particularly weak points were found in the insulation of open wire circuits. One of these was at transposition points. Actual measurements showed that the leakage on lines equipped with standard single pin type transposition insulators was 20% greater during wet weather than on lines where the two wires were never allowed to be on the same pin. Of course the old standard transposition which employed two insulators, both of the transposition type, and in which the wires were tied to both of them, was just twice as bad as the single pin transposition already discussed. The method of overcoming this difficulty was to transpose the wires without bringing them onto the same insulator. The same problem, of course, arises when phantoms are involved and having used the phantom bracket for the transposition of physical circuits, something else is required when phantoms are involved. By the means described the transposition as a factor in producing low insulation is eliminated and the transposition points are made just as good as any other point in the line.

Another point at which it was found that there was considerable leakage was where, for the purpose of inserting loading coils, connecting with a test station, or for any other reason, the wires were bridled. These places were particularly bad during wet weather, especially after the bridle wire had been in service for a short time and had weathered. The braid on the bridle wire soon becomes weathered and when wet is a fair conductor. Leakage takes place easily over the wet surface at the end of the rubber insulation and thence to the wet braid. This difficulty was overcome by a very neat device known as a bridle wire insulator. The adoption of this arrangement has completely eliminated low insulation at bridling points.

In addition to the changes at transposition points and at bridling points it was thought desirable on the first of these loaded No. 8 circuits to use a line insulator that would be more efficient than our standard glass insulator. After a careful study of insulator design and insulator materials, it was decided to try on these circuits a double petticoated porcelain insulator. Tests on these insulators extending over a period of several years have shown that the new insulator is several times as good in wet weather as the standard insulator. Part of this improvement is due to the design of the insulator. Some is attributed to the use of porcelain. An objection to these insulators is that they are not so easy to manufacture uniformly, and that each insulator must be inspected, whereas with glass insulators they may be inspected by sample. These porcelain insulators also cost considerably more than glass insulators.

As a result of applying the improvements described to our No. 8 circuits, it has been found by measurements and tests extending over a long period that the line insulation was at all times sufficiently good to warrant the loading of No. 8 circuits.

The problem of the phantoming of No. 8 circuits is one in phantom repeating coil design. To meet the special conditions existing in connection with the phantoming of loaded No. 8 circuits as used in our plant, it was desirable that apparatus should be developed of the highest possible transmission efficiency. In order to do this the ringing efficiency of the phantom coil was sacrificed and special means for ringing through these coils had to be adopted. In this way and by specially designing a coil to meet the circumstances of these circuits, coils that were suitable were developed.

Up to very recently, while we knew how to phantom ordinary circuits, it was impracticable to phantom loaded circuits because the loading coils so unbalanced the phantom and so increased its effective resistance that a phantom circuit created out of loaded circuits could neither be made quiet nor made efficient from a transmission standpoint. This problem is one of loading-coil design. In order to overcome this difficulty, it was necessary to devise special arrangements of the windings on the loading coil so that while the coil would still be effective in respect to the current flowing in the physical circuit, the effect of the current flowing in the phantom circuit would be such as not to magnetize the loading coil core. These windings had not only to be balanced magnetically, but also to be so arranged that the electrostatic capacities between the various windings of the coil would not unbalance it. Such coils were devised and are now in successful use on the New York-Denver circuit.

The phantom produced in this manner is, however, not loaded. It is, of course, desirable to load the phantom in order to obtain the benefits of improved transmission on this circuit also. To do this another coil was devised, the windings of which were so arranged that they would introduce inductance in the phantom circuit without affecting the side circuits.

Mr. Gherardi then dealt with the Boston-Washington underground telephone cable and gave many interesting facts in connection with the work. This part of his address will form the subject of an article in a later issue.

The Commercial Side of the Telephone and Telegraph Business.

Mr. S. M. Williams, manager of the Commercial News Department of the Western Union Telegraph Company, New York, was the principal speaker at the meeting of the Telephone Society of New England, which was held in Boston April 13. It was a "Western Union Evening" and marked the joint relations now existing between the American Telephone and Telegraph Company and the Western Union Telegraph Company.

Mr. Williams spoke on "The Commercial Side of the Telephone and Telegraph Business."

"Some months ago," he said, "the Western Union Telegraph Company made an analysis of the use of the telegraph in various cities on a basis of per capita expenditure. The results disclosed that New England cities, with the exception of Boston, were at the very bottom of the list, and itself made only a mediocre showing. The poorest town in the United States in telegraph business, on a per capita basis, is Somerville, Mass., and in close company with it are Fall River, Lowell, Lawrence, Pawtucket and New Bedford.

"On the other hand the best telegraph city, on the same basis of figuring, is Kansas City, followed by San Francisco, Dallas, Texas, Salt Lake City, Oklahoma City, and Houston, Tex.

"It would be interesting to know how these same cities stand in a telephonic list. I venture to say that some of the positions would be almost reversed, although I am aware that in installation development western cities stand very high. I think I have been told that Dallas is very near the top.

"Between New England and old England there is rather striking contrast in the use of the telegraph. According to compiled statistics old England makes the largest per capita use of the telegraph of any of the nations, although its financial balance sheet is not to be taken as a good example. The latest report of number of messages sent shows England leading with 1.84 per capita and France coming next with 1.52. But these figures cannot be taken accurately for purposes of comparison, because different systems of counting prevail.

"We have not in the United States any reliable figures on the use of the telegraph. The Western Union makes full reports upon the volume of its business, but other companies do not. Still, I think it would be a reasonable estimate to make that last year there were 100,000,000 telegrams sent in this country. But this figure does not represent all the telegrams, because there is no record of the large number of messages sent over leased wires, and the leased wire system of the United States is much greater in extent than in England or in France. There is a large amount of railway telegraph business, also, that does not enter into the count.

"But taking such figures as are available, there is the nominal showing that England sent 1.84 messages per capita, while the United States sent about 1.10. This discrepancy is accounted for in two ways: first, by the fact that the telegram is a customary method of social communication in England, while in this country it has been used socially only in cases of emergency; and, secondly, the slow development of the telephone in England compelled the continued use of the telegraph even for short distances.

"Merely because I mentioned the English telegraph system, and not as having particular reference to government ownership, there is one rather interesting fact to be added concerning it. The net loss on the British telegraphs is half a million dollars per month, or approximately six million dollars per year. My authority for this is the London Times, which recently analyzed the post-office accounts. That sum would pay an additional six per cent. dividend on Western Union stock.

"The other European nations render no telegraph financial reports that give us any adequate opportunity of making up a balance sheet. They lump their telegraph expenses in with post-office accounts, and then beg parliaments for annual appropriations, which come out of public taxation. The masses contribute so that the relative few who use the telegraph may have the advantage of cheap rates. The burden, as you in Boston know from your recent rate inquiry, does not fall on those who derive the benefit and should be made to pay for the service.

"We are endeavoring in the Western Union to carry out Mr. Vail's magnificent principles of making a full utilization of facilities. The telegraph had a plant of vast extent that lay almost dormant during most of the night. The Night Letter was put on the wires, and the result was gratifying. It pleased the public and it awakened a sleeping plant non-productive during those hours. The Night Letter was announced one year ago on March 7, and within the twelvemonth it became an established institution, an integral part of American life, both for business and social use.

"Now we have the Day Letter. Some of you may be a bit hazy about the details of its transmission, and ask when do we send it and how much delay there is. The answer is simple. The Day Letter is a filler to keep the traffic load line on a high even level. If you look at the chart in Mr. Vail's recent report you will see that the peak of the telegraph load is near to 11 a. m. and it holds a high level until about 3 p. m., when it drops sharply. We must have the facilities and the force to meet the maximum demand, and these must be employed all day even though there is sharp fluctuation of the load. Every minute there is a drop in the traffic and a peak is about to become a valley, the Day Letter is put on the wires and sent along. Large

Digitized by Google

numbers of them are ready for the first opening. Some may have to wait an hour, some that may come in at the moment of opportunity are placed immediately on the wire. But we find that the average delay is much smaller than anticipated.

"The new development of the telegraph lies along three main lines. The first is the increase of the number of persons who use the wire. The second is the introduction of new forms of service and improved methods of transmission. The third is the welding together of the telegraph and telephone facilities so as to produce the most advantageous results both to the public and to the companies.

"The great mass of American people have not been taught or induced in the past to get the telegraph habit. Certain classes have it to a point of saturation, but for ninety per cent. of the population, the telegraph has been only an emergency service to be used only in times of direst need. Now we are preaching the gospel that the telegraph is a money-making service for every business man and a means of pleasurable communication in social life.

"For lack of statistics, I can only guess at how many people in the United States send a telegram in the course of a year, but I feel confident that not to exceed 10 per cent. of them did in 1910. Thus, broadly speaking, we have 10,000,000 telegrams, or an average of 10 per person, while some 80,000,000 people did not use the wire at all. But among the 10,000,000 users, there were many who sent only a single message, on the occasion of some family crisis or business emergency. The great bulk of the entire telegraph business of the country is done by fewer than 5,000,000 people.

"This refers only to the land lines. On the cables the conditions are even more extreme. A very small group of financial and business houses with a few newspapers added do 95 per cent. of the cabling. The general public enjoys the facilities of the cables practically not at all. The future of the telegraph does not lie in the furnishing of extraordinary facilities for the benefit of the few large patrons. Its development must come through the patronage of the great public and to induce that the service must be popularized and adapted to meet the needs and the convenience of the millions now outside the fold.

"Dealing with the second line of development, namely, new forms of service and improved methods of transmission, I have referred to the Night Letter and the Day Letter, which we believe to be only the forerunner of other uses to which our million and a quarter miles of wire and our 25,000 offices may be adapted. For a century past the mails have been the almost exclusive channel of communication. Mr. Vail performed wonderful service for the postoffice perfecting this method of transmission during the years he was connected with the railway mails. Then he took hold of the telephone and began to cut great inroads on the local use of the post, and now he is blazing the way for the telegraph to take on an increased burden of the long haul. This is not competition with the mails. It is simply providing the facilities for swifter means of communication to meet the demands of our rapid American life in all its phases.

"But there is a very clear vision of the practical and material benefits to come from the co-operation of telegraph and telephone services. We hear much these days about educating the public up to appreciation of certain things and conditions, but that indefinite entity called the public has some very definite ideas of its own and often gets ahead of its self-constituted instructors. Mr. U. N. Bethell, president of the New York Telephone Company, tells this story illustrative of the point. A telegram was received at the Western Union office in Havre de Grace, Md., dated from some point in West Virginia, and addressed to the manager of the Telephone Company. It read something like this: 'Telephone 467 party J Chesapeake City to tie up baby's cow's calf. Will be home to-morrow.'

"The telephone manager was puzzled by this new public demand for co-operative service, so he called up his superior in Baltimore, who likewise was puzzled but finally rendered this Solomon verdict: 'Do what the telegram says.'

"So the message was delivered and accepted as entirely satisfactory. Then the manager inquired of 467 party J what it meant, and was told by a husky farm hand that it was perfectly simple. The owner of a farm down on the eastern shore of Maryland was arriving home the following day and unless the farm hand tied up the calf, the family baby would not have a supply of fresh milk. The farmer had called upon the telegraph and the telephone as public servitors to perform a certain service for baby, and he knew better than the managers how to go about it."

Carrying Messages for Exercise.—Mr. John D. Donahue, a wealthy citizen of Brooklyn, N. Y., has joined the messenger force of the American District Telegraph Company in that city for exercise. Mr. Donahue is 53 years of age and looks upon his new work as interesting and regards the duties as light. He loves to be out of doors. It is stated that Mr. Donahue has a fortune of $500,000. He does not expect to increase his fortune materially, however, by carrying messages. All he wants is exercise, and he will probably get it in his new line of duty.

Electricity at the Society Islands.—Mr. C. A. F. Ducerron has entire control of electrical enterprises in Papeete on the island of Tahiti, Society Islands. He has in operation on the island seventy-four telephones and a wireless telegraph station which has a transmitting and receiving radius of 180 miles. He also operates the electric light plant. The natives stand and gaze at the electric light by the hour and many of them make long voyages from neighboring islands to see them.

Tent Telegraph Office at Military Camp.

The accompanying illustration is a view of the Western Union Telegraph Company's tent office at the manoeuvre camp at San Antonio, Tex. When the troops were concentrated there the single wire between government headquarters and the main office was duplexed, and an additional operator was placed at headquarters, the government supplying one. A loop was then run from the main office to the manoeuvre camp, which is one and a half to two miles beyond government headquarters. This loop was also cut into government headquarters. It is about two

TELEGRAPH OFFICE AT ARMY MANOEUVRE CAMP, SAN ANTONIO, TEX.

and a half miles from the main office to government headquarters and about four miles to the camp.

The wires are run open, overhead from headquarters to the camp, and from the main office to government headquarters in cable. Only one operator is employed at the camp office, which is treated as a branch of the San Antonio office. This unique office, it will be noticed, is provided with modern equipment, including a typewriter and a messenger with bicycle.

Mr. J. L. Newton is the manager of the San Antonio office, and Mr. J. F. Marshall chief operator.

Mr. P. L. Lee, manager of the Postal Telegraph-Cable Company, Milwaukee, Wis., in renewing his subscription for another year writes: "It is needless to say that I am extremely well pleased with the paper. In future always renew my subscription."

Electricity in War.

The uses of the telegraph and telephone in the United States army are interestingly described in the *Electrical Record*. The army is up to date in its signaling equipment, which must necessarily include the telegraph and the telephone, and the article deals with these two branches of the service in detail.

In the field service of the United States army the ordinary telegraph apparatus is modified to suit the conditions. A new signal corps instrument of value is called the "field induction telegraph kit." The outfit weighs about eighteen pounds and tests show that the apparatus works successfully for from 250 to 300 miles over No. 9 galvanized iron wire.

There is an ordinary service telephone set as well as a lighter instrument known as the field telephone. Complete with battery, this instrument weighs only twenty pounds and may be carried anywhere in the field. In the work of the outposts of an army this equipment is generally of far greater value than visual signaling, its secrecy being a cardinal advantage.

The Russell cut-in telephone set, weighing only ten pounds thirteen ounces, with battery, is another valuable instrument designed for operation over short distances on telegraph lines. The so-called field artillery telephone is an instrument designed for use by the field artillery in communicating over base lines. It consists of a transmitter with a battery key, induction coil and battery and a head telephone with flexible bands. No facilities for calling are provided.

An important equipment is the field switchboard,

Digitized by Google

which is especially adapted to camp service. It consists of a strong oak box with leather carrying case, ground-rod and tripod, the inside of the box being equipped with ten line drops with the necessary ringing, listening and connecting cams to enable four sets of connections to be established simultaneously. A breast set and single head receiver are provided for the operator. The entire outfit weighs about seventy-five pounds and can be set up in a few moments.

The field buzzer is one of the most important devices used in a modern army, as it is practically the only instrument capable of operating successfully over hastily constructed lines in the field, whose insulation cannot be of the best on account of the contact with the ground, water, dampness and metallic obstructions which often are encountered.

The buzzer is a combined telephone and telegraph instrument working on the principle of self-induction. A very rapid interruption is provided, giving a high pitched note in the telephone receiver, which is used as a sounder when the apparatus is employed as a telegraph instrument. The American army in China and the Philippines used it extensively and habitually as a means of telegraphing over hastily constructed lines of too poor insulation for ordinary Morse instrumental service.

The buzzers used in the United States army are either of the field type or the cavalry type. With the field buzzer, which weighs complete about eleven pounds five ounces, a waterproof telephone transmitter with a push button key is provided in addition to the buzzer proper. When the telephone set ceases to be effective the buzzer is usually still capable of performing the most exacting service. The cavalry buzzer is of the same general type but its weight has been cut down to five pounds twelve ounces.

Wireless telegraphy and telephony are important factors in military campaigns, but neither has passed far enough beyond the experimental stage to warrant the placing of the greatest confidence in these methods of communication. In the important field of coast defence, however, wireless telegraphy is as available as on the ocean itself. For land service it must at present be regarded largely as a resource rather than as a main dependence.

One of the most important applications of wireless telegraphy thus far made in the United States army is that at Norton Sound, Alaska, as a part of the Valdez-Nome system of the service. Five thousand words have been transmitted over this section in a single afternoon. The Seward Peninsula of Alaska is cut off from the world for about eight months of each year, except for an occasional mail carried by dog sled, and over 1,000,000 words were sent over this route in the first year of its service.

In the Philippines wireless telegraphy is growing constantly more valuable, particularly in replacing cables difficult to maintain among coral reefs. Wireless stations exist for artillery work at many coast fortifications on the shores of New England and the middle Atlantic States. One of the most effective equipments used in the United States army is designed to be carried by pack mules and is divided into three 150-pound loads. The transmitting and receiving apparatus is contained in a leatheroid trunk, 30x17x14 inches inside measurement. Current is supplied by storage batteries or by land generator.

Extensive applications of electricity are made in the important service of coast defence, notably in the operation of searchlights, manipulation of coast defence guns and mortars, operation of ammunition hoists, range and position finders, field and fortress telephone and telegraph service, the lighting of casemates, garrisons, gun sights and magazines, the firing of guns, submarine and subterranean mines, the control of dirigible torpedoes and the timing of projectiles by chronographic methods in ballistic experiments.

Fire control requirements demand that the battle commander's station shall be so equipped as to communicate electrically with district, fire and mining commanders and with the searchlights attached to the station; that the fire commander's station shall be so equipped as to communicate with the battle commander and with each primary and secondary battery of his command; that the mining commander's station shall be equipped to communicate with the battle commander, the secondary station mining casements, loading room and with the rapid fire batteries and lights assigned to the mining command, etc.

To establish such communication the signal corps provides telephones of special type, the telautograph and telegraph, electrical appliances for indicating time intervals, for the collection of meteorological and tide data and range zones. The telautograph is coming into widespread service in fortification duty as a supplement to the telephone and buzzer, both of which might easily be useless in the terrific din of a bombardment.

The whole tendency of electrical applications in war, says the article in conclusion, is to reduce fighting to a push button basis. Courage of the highest type is required to face the hidden terrors made possible by electricity, and if the conduct of campaigns loses in dramatic interest in comparison with the spectacular hand to hand combats of former ages, war gains in destructive power through the utilization of scientific progress. And destruction is the chief business of modern military conflicts.

Self-Adjusting Relay.

A self-adjusting relay is being patented by Mr. C. H. Lacey, of Fulton, Ind., for which the inventor claims many advantages. While the cost of manufacture will probably not much exceed that of the ordinary relay, the advantages gained will more than offset the additional expense. Mr. Lacey states that the relay is sensitive and will close the local circuit on a current of five milli-amperes. One of the claims made for the relay is that it prevents the armature of the sounder used in connection with it from sticking when an abnormally heavy current

Digitized by Google

passes over the line wires and it adjusts itself to wide variations of current on the main line.

Unlike the armature of the ordinary relay, the armature of this instrument is not limited to a very slight movement but is free to move against the tension of the retractile spring until the pull of the magnetism is balanced by the tension of the spring. Any variation in the strength of the current will cause the armature to move until the magnetic pull and the tension of the spring are again balanced. To effect an opening and closing of the local circuit the switch lever contact and its back stop are carried forward with the armature contact until it has almost reached the balancing point. The lock armature, carrying with it the front contact and its back stop, is then locked in position by its magnetic contact with the pole pieces of a second electromagnet, the windings of which, together with those of the main electromagnet, are connected in series with the main line. The make and break devices are included in a shunt across the leads of the main lines and excluding the windings of the second electromagnet, but including the core thereof and the lock armature.

When a light current is traversing the coils, the armature will move only a short distance, and may not unlock or move the lock armature on the poles of the second electromagnet, remaining magnetically locked across the poles of that magnet, but should a heavy current traverse the coils tending to move the armature a greater distance, the greater pressure between the contact points and the contact arm will move the switch lever so as to shunt the coils of the second electromagnet. This action results in carrying the lock armature to a point where the magnetic pull is balanced against the resisting spring.

Cat and Parrot Tales.

It was the late Charles A. Dana, editor of the New York *Sun* who drew the attention of the world to the wisdom of cats. The *Sun's* editorial cat had the rare gift of being able to discern good from bad manuscript and lived on those of the latter quality, including poetry. Whenever an aspiring author did not see his contribution in print, nor get it back, its disappearance was charged to the office cat.

Cats are wise animals and although they cannot communicate their thoughts to the brains of human beings they can manifest them by their actions. We will not try to give any explanation why two of the most wonderful cats and an equally wonderful parrot belong to telegraph men, simply because we cannot. We record the facts as they were told to us by three veracious gentlemen at the recent dinner of the Magnetic Club in New York.

Mr. J. J. Ghegan, president of J. H. Bunnell & Company, New York, who lives in Roseville, N. J., has a cat that has been so well trained that it can tell a policeman from an ordinary citizen. When a guardian of the peace passes the house the cat runs out and shakes hands (or paws) with him. Now, some evil-minded persons might draw the conclusion from this that the cat sees some connection between policemen and his owner, but this explanation cannot be considered because there is a no more law-abiding citizen than Mr. Ghegan, and it is doubtful if he knows a suburban policeman when he sees one.

Mr. J. B. Taltavall, publisher of this paper, also has a cat in his family. It is a beautiful and intelligent animal and is an excellent operator. There is a wireless outfit in Mr. Taltavall's home, in East Orange, N. J., and the ether, surcharged as it is with electromagnetic waves, has had a remarkable effect upon pussy. In fact the cat is tuned to the wireless and it will lie on its back with its ear alongside of the receiver and kick the Morse characters with its hind paws as they are received on the telephone.

The third story was told on Mr. E. J. Nally the genial vice-president and general manager of the Postal Telegraph-Cable Company. Mr. Nally has a parrot. Its owner being a telegraph man, the parrot naturally lives in a telegraphic atmosphere. It was trained to telegraph and it did so until the Interstate Commerce Commission issued its order prohibiting the further issue of telegraph franks. Since the day the order went into effect the parrot has never touched a key.

New Book.

"Wireless Telegraph Construction for Amateurs." By A. P. Morgan. The intense general interest in wireless telegraphy is evidenced by the number of books being published on the subject, and as a rule they are excellent expositions of the art. This new book is all that could be desired for the beginner especially, and, indeed, for the technical and practical wireless telegrapher as well.

The subject is very thoroughly covered, and the language is so clear that the reading and study of the work is a course of instruction in itself. An idea of the scope of the book may be obtained from the chapter headings as follows: Introductory, Apparatus, Aerials and Earth Connections, Induction Coils, Interrupters, Transformers, Oscillation Condensers and Leyden Jars, Spark Gaps or Oscillators, Transmitting Helixes, Keys, Aerial Switches and Anchor Gaps, Hot Wire Ammeter, Oscillation Detectors, Tuning Coils and Transformers, Receiving Condensers, Telephone Receivers and Headbands, Operation.

The book is well illustrated with views of aerials and circuits of all kinds and of the instruments used in wireless telegraphy. The author's purpose is to give practical information for those who may wish to build for private or experimental use a set of wireless instruments which are more than toys but yet not so expensive as the commercial apparatus, and he has used the English language to good advantage in the attainment of his purpose. The book is well gotten up and shows pains and experience in its execution. The price is $1.50 per copy, and copies can be had from Telegraph and Telephone Age, 253 Broadway, New York.

Personal Recollections of the Late Charles Minot.

BY C. E. M'CLUER, NORFOLK, VA.

The biographical sketch and portrait of Charles Minot published in your issue of April 16 interested me greatly. I was carried back in memory to the year 1851 or 1852 when I, as a boyish clerk in the pioneer electrical establishment of J. W. Norton, at 177 Broadway, New York, became quite intimately acquainted with Mr. Minot. He was then the general superintendent of the New York and Erie Railway, and was intensely interested in the construction and equipment of the pioneer railway telegraph line then in course of construction along the iron link between the New World metropolis and the Great Lakes. Much of the material for this line was purchased from Mr. Norton, and if my memory is not at fault all of the equipments were the product of the Norton electrical shops.

As Mr. Norton's chief factotum and only clerk or salesman, it fell to my lot to take Mr. Minot's orders for materials and apparatus. I thus became quite well acquainted with him and was fortunate enough to win his regard which was exhibited in his becoming my sponsor and guardian when my parents decided to return to their Virginia home, and after much persuasion accorded their permission for me to remain in New York. Not until my mother had seen and conversed with Mr. Minot did I secure her consent to the separation, and not until Mr. Minot had promised to give me employment on the New York and Erie telegraph line as an operator, and assume the role of guardian and mentor of the callow youth of sixteen, would either of my parents consent for me to remain.

The morning after my parents took the train for Virginia I reported to Mr. Minot, who gave me a pass and orders to report for duty to Superintendent Charles Loring Chapin at Piermont, N. Y., then the eastern terminus of the Erie road, as his assistant in that office.

For the next two or three years Mr. Minot took a real fatherly interest in my welfare. At stated intervals I would be handed a communication from him enclosing a pass and instructions for me to turn my office over to the bearer, and report to him in New York forthwith. At first with sad misgivings as to the reasons for the order, I would return to the great city to receive from Mr. Minot a warm and kindly welcome, and the gratifying information that he thought I deserved a little recreation and wanted me to spend a week or ten days there with him. During each of these visits Mr. Minot would make me board and lodge with him, and every few nights I would be treated to a concert or theatrical performance, and usually return to my duties with a new suit of clothes forced on me by his generous bounty.

Frequently, however, we would spend the evenings at his rooms somewhere on Broadway, near the Irving House, I engaged in poring over his files of the London publication "Punch," while he was engaged in writing. He would, however, often kindly stop his work to answer some boyish question about the admirable skits or caricatures published in the columns of Punch in ridicule of some of the prevailing English fads and fashions, and would explain the conditions that gave them birth, thus displaying his native kindliness of heart and disposition, and arousing in my mind a thirst for information and in my heart a love that has never abated. He was certainly kind and good to the lonesome and homesick boy who was for the first time in his life released from his mother's apron strings, and who sadly needed the sustaining influences of a kindly heart and hand to encourage him in his fight for a correct and independent manhood.

While unable to do all I would like in furtherance of the praiseworthy enterprise of erecting to Mr. Minot at Turner's, a monument in commemoration of his historical telegraphic train order, I will enclose herewith my mite—$1—in aid of the enterprise, only regretting that I am not able to defray the entire expense of the project. In my gratitude to a whole-souled benefactor I would do it if I could.

While the story about Mr. Minot transmitting the first telegraphic train order from Turner's is historically correct, the first use made of the telegraph for the preconcerted movement of a train of an inferior class in the teeth and time of a delayed train of a superior class, was not undertaken for several years after. That occurred on the Susquehanna Division of the New York & Erie road and the orders were transmitted from the office of Division Superintendent D. C. McCallum, at Owego, to the train crew at Hornellsville, where the time-table then in force provided a meeting place for the east-bound stock express, second class, and the Cincinnati express, first class, but which meeting was arranged by telegraph to take place, and did take place several hours later at Owego.

But I have told of that circumstance and many others of that early railroad and telegraphic period in my "Reminiscences."

I had lost all recollection of Mr. Minot's personal appearance, but his portrait in your journal brings it all back to me, in spite of the lapse of almost sixty years since I saw him. My last interview with him must have been in 1857 or 1858, just before I returned to my Virginia home to remain, and that was just in time to witness and participate in the stirring scenes enacted on the soil of the Old Dominion from 1861 to 1864. Through all these years the names of Charles Minot and D. C. McCallum have been kept fresh and green in my memory. They were both good and helpful friends to the helpless and otherwise friendless boy.

According to the records on file in our office Mr. Charles Edward McCluer, the author of the foregoing article, was born in Indianapolis, Ind.,

Digitized by Google

March 28, 1836. In the spring of 1852 he entered the telegraph service for the New York and Erie Railway (now the Erie Railroad) at Piermont, N. Y., which was then the eastern terminus of the line. During the next three years he was operator and depot agent at various places along the Erie road, and between 1855 and 1857 he served as operator on the Virginia and Tennessee Railway at Central Depot, Montgomery County, Va. He afterwards became auditor of transportation accounts and superintendent of telegraph for the Virginia Central Railway, now the Chesapeake and Ohio Railroad, with headquarters at Richmond, Va. When Virginia passed the ordinance of secession Mr. McCluer volunteered with his command, the First Company of the Richmond Howitzers, and went into camp with them, but was a few days afterwards detailed by Governor Letcher (Honest John), for special duty with the Virginia Central Railway Company and was never permitted to bear arms in the field. During the civil war Mr. McCluer was superintendent of supplies for the Confederate Telegraph Company, with headquarters at Richmond. After the war he filled the positions of operator at Richmond and Knoxville, and in 1867 was appointed manager of the Western Union Telegraph office at Lynchburg, Va. In 1880 he became superintendent of the first district of the Southern Bell Telephone and Telegraph Company and manager of the Richmond, Va., exchange. He left the service of this company in 1900 to become manager of the Independent Telephone Exchange in Richmond, and on the absorption of this company by the Bell interests, in 1902, Mr. McCluer found himself out of employment. In 1903 he moved to Norfolk, Va., where he and his son started a business as electrical engineers and contractors. At the end of a year the business was closed up. Since that time Mr. McCluer has been engaged in various employments outside of the telegraph.

QUESTIONS TO BE ANSWERED.

[The success which has attended our plan of publishing in each issue a list of questions covering the subjects considered in Jones' Diagrams, has encouraged us to maintain the work through other books. Students of telegraphy throughout the country are finding these questions of great assistance in their studies of the general principles underlying the operation of the apparatus with which they come in daily contact. Many consider this the best plan which has yet been devised for a systematic study of the technical side of the telegraph. Having completely covered Mr. Jones' book we will now take up "The Quadruplex," by Maver and Davis, and bring out, in a like manner, all the facts that every telegrapher should know about duplex and quadruplex telegraphy as found in this book.]

CHAPTER II.

Of what two duplexes is the quadruplex a combination?

What are the four main instruments used in a quadruplex?

What is the function of the single-current transmitter?

What is the function of the pole-changer?

What is the function of the neutral relay, and of the polar relay?

How are both relays wound?

How can a bar of soft iron be made a magnet?

How is the polarity of a magnet determined?

What happens when the current ceases?

If two equal currents are caused to pass around the iron bar in opposite directions, what is the effect?

Describe the principles employed in the Stearns differential system?

What is the office of the transmitter in the Stearns duplex?

What other name is frequently given this instrument?

Does the transmitter substitute the battery for ground and vice versa without an actual break in the circuit?

Does the home battery have any effect upon the coils of the home relays?

What is the effect of placing a battery in circuit at the other end of the line?

What is the object of the duplex and quadruplex?

What is an artificial line?

What is the artificial line used for in duplexing and quadruplexing a wire?

What is the name of the instrument used in providing artificial lines?

What is the instrument used for?

How are coils of a rheostat connected to the brass discs?

What is the effect of inserting a plug between two discs?

How are the resistance coils wound, and why?

How is a wire with a given resistance balanced by the rheostat?

When the weather is wet what is the effect on the line resistance, and how is this change compensated on the rheostat?

Why is it necessary to change the artificial resistance to make it correspond with the line resistance?

What would be the effect if a balance between the artificial and line resistances was not preserved?

What do the figures on the brass discs of a rheostat indicate?

If an insulated conductor is electrified what is the effect upon surrounding objects?

What is induced electricity?

What substance permits of the least inductive effect to take place through it?

What substance permits the greatest effect?

What is the effect of bringing the plates, or surfaces of a condenser, closer together?

How are condensers generally constructed?

What insulating substance is used to separate the sheets of tinfoil in a condenser?

What is meant by the "capacity" of a condenser?

How is the capacity of a condenser varied?

Track Circuit Installation and the Care of Batteries.

Mr. C. G. Stecher is the author of an article in *The Signal Engineer* on the subject named in the heading. We reproduce the portion relating to the care of gravity batteries:

When setting up gravity batteries for new track sections it is usually not necessary that they should be of full strength at once and the cells can be connected to the track and allowed to work up gradually. However, if they are to be put in operation and used to energize the track relays within 48 hours they must be short-circuited before being connected to the track. When setting up or renewing battery the glass jars should be handled carefully, and should not be set or pushed around on gravel or rock ballast. If this is done jars are frequently scratched, and cracks may be the result within a short time. The proper care of track batteries is of the utmost importance. Neglect of this work in any manner or form means signal failures. They must be cleaned every two to three weeks, the interval being dependent on the ballast conditions, and on the density of traffic or train movements. If ballast conditions are poor or the track is short-circuited by trains at short intervals, zinc sulphate solution forms very rapidly and the cell quickly becomes dirty, consequently will require attention at shorter intervals than if the external resistance were high. Only one cell at a time must be disconnected, so that the circuit is not interrupted. The zinc must be cleaned and some of the zinc sulphate solution removed, and the zinc is then replaced and connected, and the jar refilled with fresh water. The density of the solution of track cells should be from 18 to 25 deg. on a gravity battery hydrometer, and it should never be allowed to reach above 30 deg. This is especially important during wet weather on other than clean rock ballast. It has been found in actual practice that on relays which failed during wet weather, the solution of the batteries tested from 30 to 38; the batteries were then adjusted to below 30 with the result that the relays then picked up. If the density is allowed to go to 30 or over and wet weather sets in, it increases to 35 and above very quickly on account of the low external resistance. The voltage of the cell is then very low and the internal resistance comparatively high.

As the zinc is consumed it should be lowered by its hangers so as to maintain the same distance between it and the copper as there is between a new zinc and the copper. By this means the internal resistance is maintained as low as is practicable.

When renewing cells the jars should be well washed, and scoured, if necessary. The loose copper should be separated from the copper element, which is then placed in the bottom of the jar. On a new copper of the usual pan-bottom type the four corners should be turned under completely so that the copper plate will lie flat against the bottom of the jar and, also, so that it can be removed easily from the jar. If a space is left between the bottom of the jar and the copper plate there is a tendency to cause crystallization. Clean blue vitriol should be placed on top of the copper and fresh water then poured into the jar to within about 1½ inches of the top of the jar, the zinc put in place, and the jar then filled up with clear zinc sulphate solution taken from the top of the old cell—this in order to start strong chemical action and have the cell available for service at once.

The blue vitriol which is left in the cells when they are taken out of service should be thoroughly washed, freed from all metallic copper and then used again. This should be placed on top of some new clean blue vitriol. The loose copper should be gathered up for shipment, as it is of considerable value.

The zinc sulphate solution must not be poured on the blue vitriol, but the fresh water must be poured in first, otherwise crystallization may set in. This condition may also be induced, if old, dirty, unwashed, blue vitriol is placed in the bottom of the new cell, or if blue vitriol is added while the cell is in service and is nearly exhausted—a practice which should not be permitted. It should be remembered that the voltage of a gravity cell is highest when there is a preponderance of copper sulphate, i. e., blue vitriol solution; as the amount of copper sulphate solution decreases and the zinc sulphate solution increases, the voltage decreases. The current output is dependent on the size of the zinc, the distance between the zinc and the copper, and the resistance of the solution. Zinc sulphate solution offers less resistance to the flow of current than copper sulphate solution. If the distance between the zinc and the copper is decreased the internal resistance is decreased, and the current output thereby increased. However, a distance of at least 2½ in. to 3 in. should be maintained between the two elements, otherwise short circuits may be the result, due to the formation of stringers of dirt and copper between the two elements.

Annual Convention of the A. I. E. E. at Chicago.

The annual convention of the American Institute of Electrical Engineers will be held at Chicago, Ill., June 26-30. The headquarters will be at the new Hotel Sherman. The Meetings and Papers Committee has arranged an attractive programme of technical papers on a wide variety of subjects.

President D. C. Jackson has appointed the following convention committee which will have charge of the local arrangements: Messrs. Louis A. Ferguson, chairman; W. L. Abbot, B. J. Arnold, H. M. Byllesby, W. L. Campbell, T. P. Gaylord, W. B. Jackson, J. W. Johnson, John D. Nies, W. P. Sidley, B. E. Sunny, Fay Woodmansee, P. B. Woodworth and J. G. Wray.

Radio-Telegraphy.

Wireless in Labrador.—The Newfoundland government has instructed the Marconi Wireless Telegraph Company of Canada to proceed with the erection of two small power stations at Makovick and Cape Harrison, Labrador.

Wireless Equipment for the Khedive's Yacht.—The yacht "Mahroussa" belonging to the Khedive of Egypt will be equipped with a wireless telegraph outfit of 5 k. w. capacity, which will have a working range under normal conditions of about 250 miles over sea.

Wireless in Turkey.—The Turkish government has closed a contract for the equipment of eleven ship stations and one shore station at Constantinople of 20 h. p. capacity. The latter will have a range of 620 miles which will transmit five wave lengths ranging from 600 to 2,000 meters.

Wireless on Whaling Vessels.—Several vessels of the American whaling fleet operating in Alaskan waters have been equipped with wireless outfits so that they can communicate with wireless stations along the coast. There are now 121 vessels plying along the Pacific coast that are equipped with wireless apparatus.

Wireless Signals from Eiffel Tower.—It is stated that wireless signals from the Eiffel tower, Paris, by the use of singing sparks have been clearly heard by the Glace Bay station in Canada, a distance of over 3,000 miles, with an expenditure of energy at the Eiffel tower of only 13 horse-power. The French Radio Electric Company of Paris operates the system.

Marconi's Wireless Telegraph Company.—At the recent annual meeting of the Marconi's Wireless Telegraph Company of America, Mr. Godfrey C. Isaacs, managing director of the Marconi Company in London was added to the board of directors and Mr. Chas. A. Terry of New York and Major S. Flood Page, of London, were re-elected directors to serve for five years.

Wireless Train Telegraphy in Prussia.—The administration of the Prussian railroads has been experimenting with a system of wireless train telegraphy between Berlin and Beelitz. It appears from the account at hand that the train is not equipped with transmitting apparatus but only for the reception of signals. The transmitting station is located between Berlin and Sangerhausen. A special wire is suspended upon the telegraph poles alongside the road and the train receives the signals from it through the air.

Wireless Telegraphy in the Arctic Regions.—The Norwegian government will establish wireless telegraph stations at Christiania, Mandal, Bergen, Hammerfest and Spitzbergen, which will give wireless communication over a large area of the Arctic circle. By means of these stations Norway will be kept in touch on the South with the coasts of Denmark, Germany and Holland; on the West with England and Scotland; and on the East with Russia. Communication will be established with polar waters through the Hammerfest and Spitzbergen stations.

Secret Wireless Telegraphy.—Captain Hovland, of the Norwegian navy, recently read a paper in Berlin describing his system of cipher language combined with the rapidity of ordinary transmission. The transmitting apparatus resembles a typewriter. A definite number of contacts are closed for each letter by the pressure of the key, and a number of current impulses proceeds from the contacts. The characteristic of the Hovland system consists, however, in the circumstance that the apparatus can be disarranged by means of a special cryptographic contrivance. The disarrangement of the apparatus leads to the dispatch, not of the current impulses which actually correspond with the individual letters, but of other definite impulses according to the combination which may be chosen. It is, of course, necessary for the receiving station to set its cryptographic contrivance according to the same combination, and the current impulses received are then transformed automatically again into those which correspond with the original letters. The letters in the case of the latest apparatus are at once printed in type on paper strip. The system is to be introduced in the Norwegian navy, and the German Telefunken Company is reported to have acquired the patents.

Sir W. H. Preece on Wireless Telegraphy.

Sir William H. Preece, the well-known English telegraph engineer, made an address recently before the South African Institute of Electrical Engineers at Johannesburg on "Some Aspects of Theory." Referring to wireless telegraphy he said: "The ocean acts as a directive agent and simplifies very much the working of wireless telegraphy on board ship. The waves hug the surface of the water. Thus also the curvature of the earth is harmless. But the electric waves diverge in space in every direction. They spread out and diminish in voltage and amplitude rapidly, so that the effect of distance has to be overcome by increasing the energy expended in making the waves. It requires, as a rule, one kilowatt per 100 miles lineal to cross the surface of the ocean.

"Mr. Marconi has discovered a great difference of range of signaling between night and day. The ratio is sometimes 3 to 1. While he has signaled 1,500 miles at night, he has had difficulty in signaling more than 500 miles by day. This is supposed to be due to the electric waves flowing in the upper regions of the atmosphere encountering free electrons and dissociated ions, due to the passage of the ultra-violet rays of the sun. It is quite an acceptable explanation, but it is also a proof of the character of electricity as a form of energy."

KERITE

Insulated Wires and Cables

KERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.

Efficiency and safety in electrical installations depend chiefly on insulation. For fifty years KERITE insulation has been the standard of excellence.

Results count. KERITE wires and cables installed half a century ago are in service to-day. The wonderful durability of KERITE insures the highest safety and economy.

Initial tests determine the properties of an insulation only at the time they are made. They do not determine how well it will do its work years afterward.

The indestructibility of KERITE and its power to resist deteriorating influences should be carefully considered in specifying an insulated wire or cable.

Experience of others should be useful to you. Insure your service by using KERITE.

KERITE INSULATED WIRE AND CABLE COMPANY

INCORPORATED BY W. R. BRIXEY

Sole Manufacturer

Hudson Terminal, 30 Church St.

NEW YORK

The Railroad.

Mr. E. A. Chenery, superintendent of telegraph, Missouri Pacific Railway, St. Louis, Mo., was a recent New York visitor.

Mr. A. C. Kellar, a former telegrapher, has been appointed superintendent of the Sierra Railway of California, with headquarters at Jamestown, Cal.

Mr. John W. Daly, a former telegrapher, has been appointed traffic manager of the New York Central Lines west of Buffalo, with headquarters at Chicago.

Mr. E. J. Little, superintendent of telegraph, Great Northern Railroad, St. Paul, Minn., and W. F. Williams, superintendent of telegraph, Seaboard Air Line, Portsmouth, Va., were recent New York visitors.

Telephone Train Dispatching on Lehigh Valley.—The Lehigh Valley Railroad is equipping the east end of its Buffalo division for telephone train dispatching, under the supervision of Mr. J. F. Caskey, superintendent of telegraph.

Train Dispatching on Santa Fe.—The mileage of the Atchison, Topeka & Santa Fe system on which trains are directed and dispatched by telephone is 6,374 miles. Mr. L. M. Jones, Topeka, Kan., is the superintendent of telegraph of this system.

Train Dispatching on Chicago, Milwaukee & Puget Sound Railroad.—The Chicago, Milwaukee & Puget Sound Railroad is installing a telephone dispatching system on 755 miles of its line, between Mobridge, S. D., and Leer Lodge, Mont. Mr. U. J. Fry, Milwaukee, Wis., is superintendent of telegraph of this system.

The Railophone.—The "Railophone," which is attracting much attention in England just now, is a wireless system of communicating with moving trains, and has been briefly referred to in these columns. A few more details of the system have come to hand. It comprises essentially a large rectangular coil of wire, wound round the frame of a railway coach, and a single insulated wire carried alongside the railway track, at any distance up to thirty feet from the latter, and either aerial or underground. The necessary transmitting and receiving instruments are fixed respectively in the coach and in a signal box or at a station. Communication is effected by electromagnetic induction between the coil and the stationary wire, the circuit of the latter being completed via earth. In practice two coils are carried on the coach, one for receiving and the other for transmitting messages. Communication is easily effected, whether the train is at rest or in motion, and it is stated that conversation can be carried on between two moving trains on the same railway. A novel feature of recent introduction is a sensitive relay, which can be actuated by induction from the stationary wire, and thus would enable the engineer on one train to put the brakes on another running on the same line of rails, thus averting a possible collision. The system is being exploited by International Railophones, Ltd., Birmingham.

The Boston Meeting of the Railway Telegraph Superintendents.

Secretary P. W. Drew of the Association of Railway Telegraph Superintendents is sending out to the members a circular letter giving information regarding the next annual convention of the Association at Boston, June 26 to 30. The first session will be called to order at 1.30 p. m. Monday, June 26, thus giving the members an opportunity for social intercourse during the morning of that day.

The headquarters will be at the Hotel Brunswick, and the hotel rates will be: Single room without bath, $2.00 to $3.00 per day, and with bath, $2.50 to $4.00 per day. When the same room and bed are occupied by two people an extra charge of $1.00 per day will be made. Reservations should be made from Mr. Herbert H. Barnes, The Brunswick, Copley Square, Boston, Mass. All those who intend to make an exhibit of appliances are requested to correspond with the hotel direct.

If any of the members wish to use the Rome and Ogdensburg Navigation route between Toronto and Montreal at reduced rates, they are requested to correspond direct with Mr. Wm. Marshall, superintendent of telegraph, Canadian Pacific Railway, Toronto, Ont.

The Boston meeting will probably be the largest one in the history of the Association and many very interesting papers will be presented and discussed. Mr. S. A. D. Forristall, superintendent of the Boston and Maine Railroad, Boston, is chairman of the entertainment committee. This committee will provide some special features of enjoyment for the ladies and guests of the members and for the members themselves between sessions.

Three amendments to the constitution will be submitted for action at this meeting. A new article to the constitution will also be proposed regarding the submission of various questions pertaining to the railway operations as recommendations to the American Railway Association.
