A McGraw-Hill Publication/0360-5280

MOST BANG FOR THE FEWEST BUCKS

You get equally extreme values on our line of feature- and power-packed VESA local bus 486 systems with their large-capacity hard drives and outstanding video performance, now standard in our new, smaller but more expandable case. The Baby AT case measures 16.9-inches wide, 6.6-inches high and 16.8-inches deep, with four external and three internal expansion bays. Two VESA slots give you upgradeability to tomorrow's totally cool graphics and disk controller technology, and five ISA slots are compatible with 16-bit technologies. All DX2 VESA systems come with a CD-ROM drive, giving you access to new applications, databases and entertainment programs.

AT THE COOLEST PRICES

BIGGEST VALUE ON OUR SMALLEST DESKTOPS

We've elevated value to enormous levels on our new mini desktop systems, but we're still giving you pint-sized prices. Our new integrated local bus video provides up to twice the video performance found in our previous mini desktop systems. With up to 1MB video DRAM, you get 1024 x 768 resolution and an array of colors. All this on our 14-inch CrystalScan non-interlaced, .28mm dot pitch color monitor. You won't have any growing pains with Gateway's new integrated mini desktop cases, either. They're small, but more flexible and

expandable than ever. They come with two 3.5-inch drive bays, and two 5.25-inch drive bays so you can add a tape backup, CD-ROM drive or another floppy drive. Of course, all Gateway mini desktop PCs are upgradeable to Pentium technology.

STRONGEST SERVICE FOR YOUR WEAKEST MOMENTS

We're committed to bending over backward to please our customers. Gateway employees understand that there may be a time when your computer makes you feel a little weak in the knees. Never fear — our Midwestern people know the importance of a friendly voice and a helpful attitude on the other end of the phone. And they know you want the best in service. That's what you'll get with our support departments.

HOTTEST SOFTWARE, COOLEST PERIPHERALS

Multimedia Upgrade Kit

Everything you need to add multimedia to your PC is included in our specially priced multimedia upgrade kit. You get:

Sound Blaster™ 16 Sound Card with Advanced Signal Processing — Simply the best sound card available! This 16-bit PC audio card offers CD-quality sound. Yamaha® FM music synthesizer, MPU-401 MIDI interface, joystick connector, built-in CD-ROM interface, and more. You also get two Labtec® speakers that attach to your PC monitor.

Double-Speed CD-ROM Drive — Kit comes with a high-performance double-speed CD-ROM drive. You also get our free system CD with Microsoft Multimedia Pack™ and more!

Kit Price: \$395 (with system purchase)

Altec Lansing Speakers ACS-300 with Subwoofer — Get superior stereo sound with these top-rated speakers. **\$219** (with system purchase)

Check out the extensive list of application software included with many of our systems. If the system you want comes with MS Works for Windows, you can upgrade to a choice of application software for only **\$100**.

Call and ask about our full line of peripherals — *and* our new Gateway DuoLine MasterCard® Card. For an application, call 800-846-1781.

GET A GATEWAY AND ... GET EXTREME!

At Gateway, we strive to be extremists when it comes to bringing you the *highest*-performance PCs, with the *most* features, at the *lowest* prices, with the *strongest* after-the-sale support, for the *greatest* value in the PC industry. Get a Gateway and ... *get extreme!* Call your Gateway 2000 sales representative today!

ING MODEL-
TALK TO PCS,
VS, I'M SUP-
RE PCS NOW,
AS A BETTER
DOES... **TOCK**

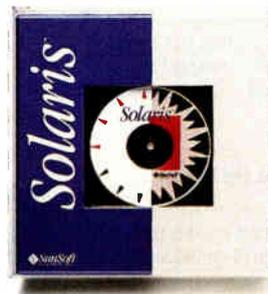

THERE ARE TIMES WHEN YOU'RE SURE THE WHOLE ENTERPRISE WILL NEVER GET RIGHTSIZED. HELP IS HERE.

IT'S SOLARIS.

IT'S FROM SUNSOFT AND NOW AVAILABLE FOR x86 AS WELL AS SPARC® — THE MOST POPULAR CISC AND RISC ARCHITECTURES. WITH THE SOLARIS® SOFTWARE OPERATING ENVIRONMENT YOU'LL CONNECT YOUR ENTIRE ENTERPRISE — HARDWARE AND SOFTWARE — AND RUN IT LIKE ONE WELL-OILED MACHINE.

SOLARIS IS THE RIGHT 32-BIT SOLUTION FOR A WORLD WHERE MANAGEMENT EXPECTS YOU TO DO MORE WITH LESS, TO MAXIMIZE THE RESOURCES AT YOUR DISPOSAL, TO PROTECT YOUR EXISTING HARDWARE AND SOFTWARE INVESTMENTS, AND PROVIDE EVEN MORE POWER, PRODUCTIVITY AND FASTER TIME TO MARKET. SOLARIS GIVES YOU VIRTUALLY UNLIMITED ACCESS TO ALL SYSTEMS ON YOUR LANs AND WAN*. WHAT'S MORE, IT'S SCALABLE FROM PCs TO MAINFRAMES.

SOLARIS HARNESSES AND CIVILIZES THE POWER OF UNIX®, THE PROVEN STABLE ENVIRONMENT AND LEADING 32-BIT DISTRIBUTED COMPUTING SOLUTION. UNIX IS RENOWNED FOR HIGH PERFORMANCE MULTITASKING, MULTITHREADING, AND MULTIUSER CAPABILITIES. AND SOLARIS RUNS MORE 32-BIT APPLICATIONS THAN ANY OTHER OPERATING ENVIRONMENT — OVER 7,500 INCLUDING LEADERS LIKE COMPUTER ASSOCIATES, ORACLE AND LOTUS. SOLARIS RUNS WINDOWS AND DOS, TOO. YOU'LL ALSO DISCOVER AN EXCELLENT SOFTWARE DEVELOPER ENVIRONMENT AND A SEAMLESS TRANSITION TO DISTRIBUTED OBJECT COMPUTING.

IF ALL THIS SOUNDS LIKE THE SOLUTION YOU'RE LOOKING FOR, DON'T WASTE ANOTHER SECOND.

THE **NEW** PINNACLE SIERRA 1.3GB™ OPTICAL HARD DRIVE

**It's The Ultimate
In Storage!**

4500 RPM

19 msec effective access time

2.0 MBytes per sec. data throughput

THE LAST HARD DRIVE YOU'LL EVER NEED

Introducing the Sierra™ 1.3 Gigabyte optical hard drive with speeds faster than most magnetic hard drives and removable media for infinite capacity. With each additional standard optical disk you'll have another 1.3 Gigabytes of capacity to store spreadsheets, databases, CAD/CAM, graphics, multimedia or any data intensive application demanding mountains of storage.

The Sierra™ 1.3 GB is a lightning fast mass storage system with performance that rockets past most magnetic hard disk drives. (see chart)

OPTICAL PERFORMANCE ADVANTAGE		
	XCOPY 20MB TO OPTICAL DRIVE/HARD DRIVE	XCOPY 50MB TO OPTICAL DRIVE/HARD DRIVE
PINNACLE SIERRA™ 1.3GB	135.3 seconds	379.5 seconds
SEAGATE ST4766N (630MB)	210.6 seconds	496.8 seconds
FUJITSU M2266SA (1.2GB)	165.5 seconds	375.1 seconds
MAXTOR XT-8760SH (676MB)	178.9 seconds	428.7 seconds

Optical technology has many advantages such as removability, reliability, expandability, and is less expensive than magnetic storage solutions.

OPTICAL PRICE ADVANTAGE			
RETAIL COST @	1.3GB	2.6GB	5.2GB
PINNACLE SIERRA™ 1.3GB	\$3245	\$3495	\$3995
HARD DISK DRIVE	\$3250	\$6500	\$13,000

"It has a 19 millisecond access time and outperformed every other device we tested here." Stanley Wszola, Byte

With Pinnacle's ASCENT program you can upgrade your Sierra™ 1.3GB to a Pinnacle optical library system that ranges in capacity from 20 Gigabytes to 186 Gigabytes for Novell.

The Sierra™ ... only by Pinnacle. The optical storage leader. For more info call:

Circle 119 on Inquiry Card (RESELLERS: 120).

THIS SHOULD GIVE YOU OF WHY WE CREATED AN

The image you see over there started out attached to the image you see over here. But as it made its way to the printer, the computer it was created on recognized a problem: 11 x 17 pages can't fit on

8 1/2 x 11 paper.

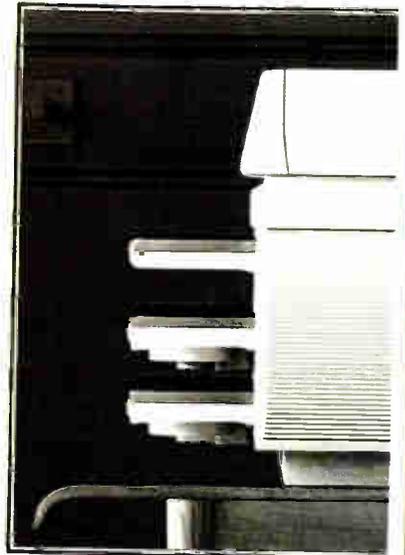

And so, out came the electronic scissors.

Now, if you're like a lot of people, you know all about this routine.

And you know how it feels to walk into a meeting with a presentation that contains hours of blood, sweat and tears, and a big fat strip of tape going right down the middle of it. Enough said.

COMPAQ PAGEMARQ Network

Laser printers were built to help put an end to all of that. They can print 11 x 17 pages in a single pass. They come with up to three paper

trays, which lets you switch between paper sizes without leaving your desk, so you don't have to pull one paper tray out and replace it with another, only to have your neighbor

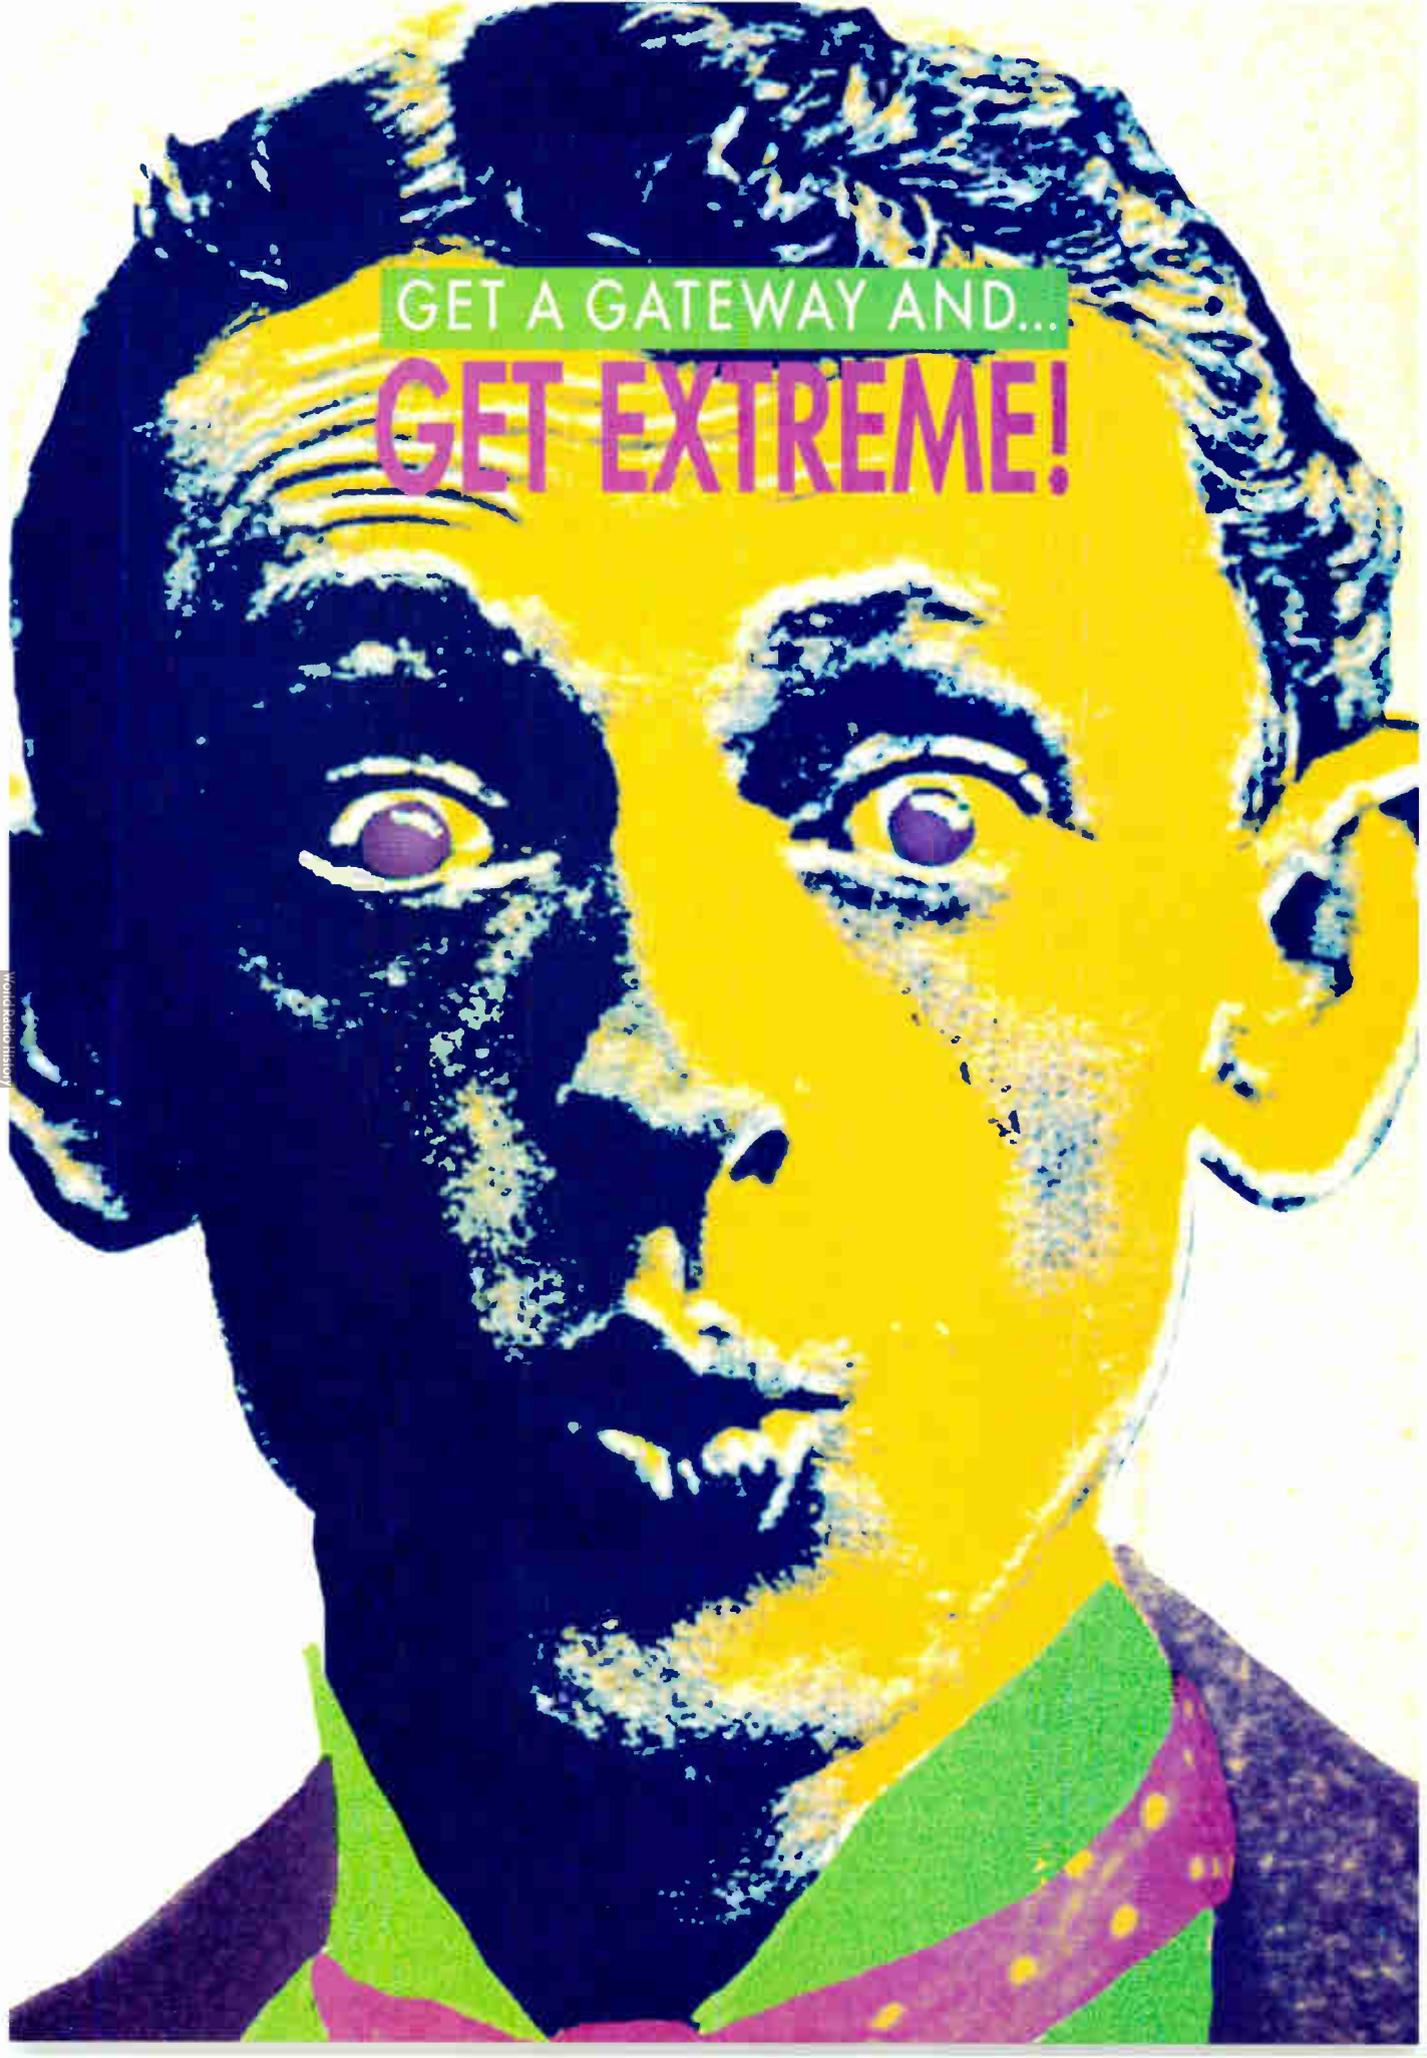

**CONNECTIVITY

GET A GATEWAY AND...

GET EXTREME!

World Media History

GET THE HOTTEST COMPUTERS

GATEWAY 2000 GOES TO EXTREMES!

You never get middle-of-the-road performance or value from Gateway! We've always had a reputation for going to extremes to be the *best* at giving you the *highest* performance and the *latest*-technology PCs, at the *biggest* value. We try to think of everything we do in superlatives. Just see what this means for you.

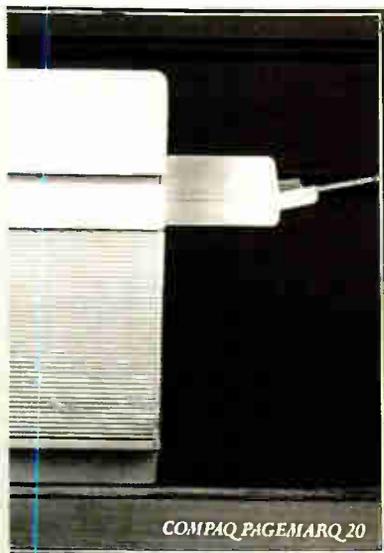

HIGHEST PERFORMANCE, LOWEST PRICES

Now you can get the ultimate, pinnacle-of-performance Pentium system from Gateway! Our new P5-60 is based on Intel's® Pentium™ processor, the absolute maximum PC performer available today, at a typical Gateway how-low-can-they-go price of under \$4,000! And we haven't faltered on features to give you this incredible price. The P5-60 is loaded, including the new ATI™ Ultra XLR 2MB video card on a screaming PCI bus, 528MB hard drive, 16MB RAM, 2X CD-ROM drive (300KB/second DTR), 17-inch color monitor, new tower case, added expandability, and all the extras that come with every Gateway PC.

Budget-conscious buyers can get the exceptional performance of the Gateway P5-60 at a great savings with our Best Buy system — a remarkable value at \$2,995! This fully configured PC combines Pentium-based power and performance for your future at an affordable price. Check it out!

IT'S A PRETTY GOOD IDEA IN AN 11 x 17 LASER PRINTER.

repeat the process two minutes later. They hold up to 1,500 sheets of paper. And for people whose design ambitions extend beyond Helvetica

Bold, Pagemarq Printers offer two ways to expand your type library, eliminating the need to continually download from your computer. You can add 1- and 2-MB Programmable

Font Modules, or you can add an internal 60-MB Hard Drive.

All of which print with razor-sharp clarity thanks to the 800 x 400 dpi-high-resolution mode.

Of course, both the COMPAQ Pagemarq Laser Printers are fully backed by CompaqCare, our extensive service and support program.

Which includes a one-year, on-site* limited warranty as well as unlimited toll-free telephone support. All at no additional charge whatsoever.

If you're interested in learning more, just call us at 1-800-345-1518 in either the U.S. or Canada.

We'll show you how to keep big ideas in one piece. At least until your client sees them. **COMPAQ**

B

A typographer's dream, these printers can store 1,500 fonts. Of course, not all of us dream about type. In which case, the 35 fonts that came standard are more than adequate.

Send Fax

Add an Internal FAX Modem and you can turn your PC into a personal fax machine. One that will send and receive true Adobe PostScript quality faxes in any size up to 11 x 17.

In fact, they'll do just about anything you tell them to.

"Computer, call Michelle Dunn."

With Apple GeoPort, you can turn your AV computer (in this case, the Macintosh Centris 660AV) into a telephone and an answering machine. The hands-free phone lets you do work on-screen while you talk. And both computers have ES-F2F software, so all you need is a video camera to hold a video-conference across a local area network.

"Computer, fax letter to Steve Wingate."

Forget the fax machine. The optional Apple GeoPort™ Telecom Adaptor includes fax and modem software—everything you need to send and receive faxes from your desk or use on-line services. And both computers let you try out ExperFax, an application that converts your faxes into text.

"Computer, read me today's mail."

These computers will actually speak to you, reading aloud your e-mail, documents or spreadsheets numbers. Our new Apple AudioVision™ Display, with its sensitive microphone and built-in speakers, is the perfect all-in-one monitor for speech capabilities, multimedia presentations and more.

"Computer, open my word processor."

Now work the most intuitive way. With Apple PlainTalk™, AV computers (here, the Macintosh Quadra 840AV) can recognize spoken commands—you just speak naturally. We've also included QuickKeys OSA Component software, so you can create your own verbal commands, like "Computer, open my word processor."

"Computer, start video."

Just plug a video camera, VCR or laserdisc player into the back of either AV computer. The FusionRecorder software included lets you easily capture video and single-frame snapshots, or record 16-bit stereo sound. You can paste your videos directly into presentations, documents or any software that supports QuickTime™.

"Computer, display Macintosh on TV."

You can play video right on your AV computer monitor for easy presentations to coworkers, clients or a class. You can also plug either machine into a TV, if you need a larger display. Or plug into a VCR, and record your work on videotape for distribution.

"Computer, play CD."

Add the AppleCD™ 300i disc drive to either machine, and you can access huge libraries of clip art, sound effects, video clips and more. Or just play your own music CDs while you work.

The Macintosh Centris 660AV and Macintosh Quadra 840AV

You've probably read that telephones, computers, television and other technologies will converge soon.

This is where they meet. Introducing the Macintosh Centris™ 660AV and Macintosh Quadra™ 840AV personal computers. These two computers offer a suite of communication capabilities called Apple® AV Technologies: a telecommunications center, easy video input/output connections, voice recognition and text-to-speech abilities.

For the first time, use a Macintosh® to pick up phone messages with a point and click, record video by plugging in a video source, and open a file by saying, "Computer, open."

Apple AV Technologies.
Telecommunications, video, speech — all the ways you communicate.

Many of these new functions are sped along by a digital signal processor (this chip flies through data at the rate of 55 MHz in the Macintosh Centris and an even faster 66 MHz in the Macintosh Quadra).

With a 25 MHz 68040 processor and up to 68MB of RAM, the Macintosh Centris has the horsepower required to breeze through huge spreadsheets and documents. And there's room to add a 500MB internal hard disk, a CD-ROM or SyQuest drive and a NuBus expansion card.

The new Macintosh Quadra will make publishing, graphic design and other communications professionals salivate. Its 40 MHz 68040 processor and up to 128MB of RAM make it the most powerful Macintosh ever. And it has room for a gigabyte of hard disk storage, four internal storage devices and three NuBus expansion cards.

Best of all, you can get a Macintosh with Apple AV Technologies starting at \$2,489.* Once again, Apple puts the most amazing kind of power within your reach. The power to be your best. 

Announcing the first personal computers that will send faxes, read you your mail, take phone messages and work with your video camera, VCR and TV.

Windows, NT, or OS/2

To pick the right operating system, you need to examine technologies and strategic directions

Both Windows NT and OS/2 run applications written for Windows 3.1, but which is best? You might expect that either 32-bit advanced operating system—NT or OS/2—would naturally be better than Windows 3.1 running on top of DOS. However, Jon Udell, one of BYTE's operating-system experts, made an interesting discovery that might surprise you (see "Is There a Better Windows 3.1 Than Windows 3.1?" on page 85).

Udell's article does more, though. It sums up the current debate about operating systems for Intel-based computers. Is upgrading to either NT or OS/2 2.1 worthwhile? That's not an easy question to answer, and it's complicated by the fact that the number of 32-bit applications that can exploit either NT or OS/2 is small compared to those made for Windows 3.1.

That's why much of the debate should also focus on what NT and OS/2 promise; therefore, you ought to examine the technologies and strategic directions of the two systems. To that end, BYTE editors have compiled articles in this issue on what we believe to be the hottest debate going.

Take, for example, distributed processing. Recently, IBM announced its Distributed Computing Environment SDK (Software Development Kit) (see "IBM Ships DCE SDK for OS/2 and Windows" on page 131). Long thought to be too complicated for microcomputers, true distributed computing will become possible on OS/2 and Windows. Meanwhile, other major players are readying their responses for distributed computing.

On a related subject, you should also examine IBM's Distributed System Object Model (see "IBM's Assault on Distributed Objects" on page 125). Now applications can reach across a network to use remote objects, which is essential for distributed processing.

Speaking of networks, Barry Nance provides some insight into the six Windows or OS/2 native-networking options (see "OS/2 and Windows Networks" on page 117). Sorting through the advantages of Windows for Workgroups, NT, Windows NT Advanced Server, LAN Server, LAN Manager, or Novell NetWare for OS/2 is not a trivial task. If you've had trouble getting a handle on the

important differences, Nance's article will surely help. That's not the only kind of networking happening, either. How about networking PCs to the telephone? That's what Microsoft has in mind with its Windows Telephony API (see "Partners Seek to Unite Phone and PC" on page 107). The idea is relatively simple: Establish the standards necessary for enabling PC-driven telephone applications software and for connecting PCs to existing phone systems and PBXs.

Concurrently, IBM is doing its level best to push more than voice lines through PC networks. In fact, IBM wants to serve up video on OS/2 (see "IBM Has High Hopes for Multimedia on OS/2" on page 110). To accomplish that, IBM has designed a set of multimedia tools that share the name Ultimedia that may give OS/2 an advantage over Windows in the multimedia arena.

And, if all that's not enough, there's more. From user's perspectives to symmetrical multiprocessing, you'll find it in our special report. We've also included a roundup of interesting products to help you find what you need.

Finally, to take advantage of either NT or OS/2 running on a high-performance processor, software compilers have had to advance. Check out Oliver Sharp's excellent article on compiler technology (see "Compilers: Essential Partners" on page 135). If you develop software, you cannot afford to miss Sharp's technical discussion.

What more can I say? Already I feel a little bit like a Ginzu knife salesman (but wait, there's more...). It's just hard to hide my enthusiasm for this issue. The Windows and OS/2 debate is raging, and I think the BYTE editors and writers have done the best job of anyone to bring light to the subject.

And no, we haven't forgotten Unix, PowerOpen, NetWare, the Mac, and other important operating systems. But, for this issue, we wanted to focus on the players currently hogging the spotlight—Windows and OS/2.

It doesn't end here, though. In upcoming issues, we promise to keep you posted on developments as they happen. We also promise to bring you an in-depth analysis of several key technologies and how they are implemented across all the advanced operating systems. And that's something you won't find anywhere else but in the pages of BYTE. Stay tuned—we're just getting started.

DENNIS ALLEN, EDITOR IN CHIEF

New Paradox makes your desk a ramp on the data superhighway

New
Version 4.5

There's lots and lots of data out there. The trouble is, it has to go to the right place in order to be productive. That's the reason why we developed the new Paradox® Workgroup Edition. The only database with superior SQL connectivity and workgroup information sharing.

Share data easily with any workgroup

First we built in support for SQL servers* so you can work with information from corporate databases as if it were on your desktop. Then we added the Workgroup Desktop to distribute the data where it's needed. Now anyone with a Workgroup Edition of Paradox® can exchange data over local and wide area networks, or via electronic mail.† You can establish and modify workgroups instantaneously to meet the needs of a given project. *Everything you need is built right in!*

Best Windows database for all skill levels

Of course, no new version of Paradox would be complete without enhancements to the powerful and easy-to-use features that have made it the #1-rated Windows database. Built-in productivity Experts™ guide you at every step, from linking tables to building forms and reports. Object Inspector™ menus provide instant access to capabilities without searching through layers of menus. Paradox's ease of use stays with you as you move up the power curve. Corporate developers find that ObjectPAL™, the fully integrated programming language, lets you create custom Windows applications that are powerful, graphical, and deliverable *fast*. Plus, 100% compatibility with Paradox DOS means your existing Paradox data will migrate automatically to your new Windows application.

When it comes to workgroup database productivity, nothing gets you where you want to go faster or easier than the new Paradox Workgroup Edition from Borland.

Welcome to life in the fast lane.

Limited-time offer!

\$495

Suggested retail price for new users.

\$149⁹⁵

Upgrade price for Paradox, FoxPro, Access, Superbase, and Approach users. \$20 rebate for Paradox Windows 1.0 owners.

90-day, money-back guarantee

ware up to 70% more ka-boom.

Plus, the OverDrive processor is easy to install. Depending on your system, you can either plug it into the OverDrive socket or swap it with your original microprocessor. No problem.

To get a better idea of how the OverDrive processor boosts perfor-

mance of your software, call 1-800-354-3112, Ext. 5719,* for a free demo disk. It could be the greatest show on earth.

intel®

Circle 96 on Inquiry Card.

Fax Plus OCR

What impressed me about Stan Wszola's "Fax Plus OCR: More Than Meets the Eye" (August) was its Rube Goldberg quality. One computer is to convert a word processing file into a voluminous bit map, which is then transmitted over a narrow channel. On arrival at a second computer, this bit map is laboriously converted back to text.

OCR should be done at the originating fax machine, to achieve compression far in excess of anything obtainable by treating characters as bit maps. The time is ripe for someone to create such an extension, without waiting for the standards committee. Keep it simple.

Andrew D. Todd
Philadelphia, PA

Elegant Windows Dialog Boxes

In the August *Some Assembly Required*, Gen Kiyooka suggests the auto-reconfiguring dialog box in Word for Windows 2.0 is the result of the Microsoft Applications Group's "constant stream of new interface ideas." Oh, please—Mac users have been treated to this interface object in the Control Panel since System 4, back in 1987. Let's give credit where credit's due.

Fred Martin
Cambridge, MA

I think it's fair to say the Applications Group at Microsoft has contributed to, informed, and proselytized fine GUI design, both on the Mac and under Windows. The article's context was Windows development, and the Word options dialog box was an early implementation under Windows, although certainly not the first I'd seen. Originally, my article concluded with a certain wistful glance toward the exemplary toolbar design in Windows Excel, perhaps suggesting yet another idea from the stream of our UI cultural consciousness, which can be attributed, in reductionist thinking, to any of a number of sources.—Gen Kiyooka

Pournelle and Windows Word Processors

Hooray for Pournelle's gripes about Windows word processors. They clutter the

screen with icons and can't handle file naming or filing. Worse, I suspect that not a single Windows word processor programmer is a touch typist.

Commands should be easy to type and remember. Give us a collaborative article between programmers and writers about the architecture of a useful word processor. Forget the tiresome comparison of features. I'm interested in fast typing, a hot-shot command structure, minimal use of the mouse, a huge file capacity with multiple files at my fingertips, sophisticated searching, indexing, and a spelling checker with just enough grammatical smarts to tell the difference between the words *to* and *too*.

Donald Kingsbury
Montreal, Quebec, Canada

They Just Don't Get It

Walter Mossberg's "They Just Don't Get It" (August) hit the nail on the head. I purchased a hand scanner six months ago, and it's still not hooked up. It requires a mouse, and there is a conflict with the ports. I had to upgrade from DOS 3.2, so I bought DOS 5.0. I could not upgrade because I needed a 5¼-inch drive, and I only had a 3½-inch drive. So I bought a 5¼-inch drive. I had a conflict that erased the CMOS. It took a week to get the original settings back.

My modem and Hercules card work on my 8088 but not on my 386. I have 64 MB installed and recognized when booting, but I can access only 32 MB. I'm sick and tired of "Well, we're still in the Model A era." Personally, I am in the boycott era. When "they" finally get it, then I'll buy it.

Lowell Allen
Adolphus, KY

I couldn't agree with Mossberg less when he states, "Personal computers are just too hard to use, and it's not the fault of the people who use them." Oh, but it is. You cannot get about in an information age if you are unwilling to learn its most basic tool. We effectively deeducate the masses while trying to make them happy. The easier we make a thing, the more people will buy it and be satisfied with it, but it re-

mains a magical and mystical thing, not born by them but borne by them.

SPREADSHEETS

Excel 5.0 Gets Smart

Packing lots of new bells and whistles, Excel 5.0 for Windows certainly looks good. But new integration capabilities with other Microsoft Windows applications may prove a stronger incentive to upgrade.

BY NICHOLAS JOHN DELONAS

Excel has long been Microsoft's flagship application. Its users have come to expect excellence, and that's generally what Microsoft has delivered. Excel 5.0 continues that noble tradition and represents an evolutionary, rather than revolutionary, step forward. That's good news, because Excel 4.0 was already a good product. However, in embracing technologies like 3-D worksheets and advanced data modeling in version 5.0, Microsoft is only now catching up to competitors like Lotus and Borland.

Excel 5.0 introduces many novel user-friendliness features, which Microsoft is touting as a new kind of spreadsheet "intelligence," called IntelliSense. IntelliSense, which Microsoft is adding to applications such as Word 6.0 for Windows and PowerPoint 4.0, senses what you want to do,

to help make routine and complex tasks easier to automate and complete.

If you type a formula with an open parenthesis and don't add the closing parenthesis, Excel adds it for you. Excel's developers have obviously put a lot of work in adding intelligence to this version. These new properties should make Excel 5.0 easier to learn and use than its predecessor, and that will be an important consideration for any organization looking to standardize on a spreadsheet program.

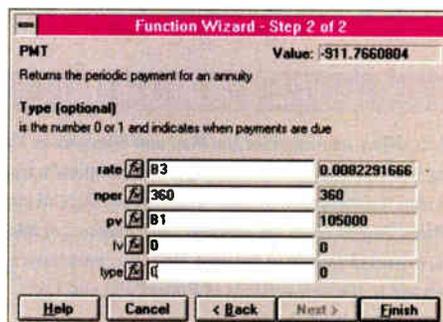

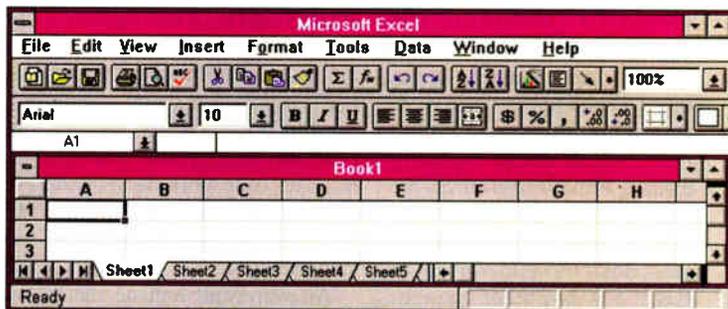

But in today's graphical-interface world, users want more than just new features: They also want consistency and integration among their various applications. More than half of all sales of Excel for Windows are now achieved through sales of Microsoft Office, so it's no wonder that the company beefed up Excel 5.0's ability to share data with other Windows applications, especially other Microsoft applications.

Excel 5.0 has itself become much more standardized. Microsoft changed the menus and dialog boxes to closely match those in Word 6.0, as well as a future version of PowerPoint that should ship in January. People using these products will see a consistent interface, and the standardization of features doesn't stop there. A standard macro language (see below), OLE 2.0, and other features are starting to blur the boundaries between Microsoft products.

New Ease-of-Use Features

Users will see a more intuitive multisheet interface in Excel 5.0. Following the lead of Quattro Pro for Windows, Excel displays a tabbed index to its workbook, which happens to be the new default-document type. Not only can you name these page tabs, but you also can move them by dragging and dropping. That's an advantage over Lotus 1-2-3 for Windows' fixed-page structure.

continued

Microsoft improved Excel 5.0 workbooks with Quattro Pro-like page tabs.

Excel's Function Wizard dialog box elevates function help to a new high.

NEW EXCEL FEATURES

- True 3-D worksheets.
- In-cell editing.
- Rich text in cells: lets you use more than one type of format on text in a single cell.
- Tool tips: tiny explanatory boxes that appear below each toolbar button when you pause the mouse pointer over that button.
- Full support for OLE 2.0.
- Tighter integration with other Microsoft Office applications.
- Custom AutoFill: lets you create your own series, such as business divisions, for AutoFill operations.
- Accounting-underline text styles: conform to accounting standards.
- Trend charts: automatically chart various types of trends.

The new workbooks don't just look good. Excel 5.0 represents the first time the product fully embraces the 3-D spreadsheet concept. Microsoft has improved the functionality of the 3-D workbook over version 4.0's workaround that used cross-tabulations. The 3-D syntax is now simpler, selecting 3-D ranges is improved, and, most important, adding many sheets doesn't quickly exhaust Windows resources the way it did in version 4.0.

Worksheet tabs represent the most obvious improvement in Excel 5.0, but other changes aren't merely cosmetic. For example, Excel 5.0 adds many

more wizards for task automation. Another improvement is Tip Wizards, which offer advice on how to better accomplish spreadsheet chores. For example, if you choose Edit-Copy from the menu, a Tip Wizard displays a message saying, "You can use the 'Copy' button on the Standard Toolbar." If you Edit-Copy again, the Tip Wizard offers yet another way to copy data. It keeps track of your work habits and won't bother you with the same advice more than once in the same session.

An even better enhancement is the Function Wizard. Click on its icon in the toolbar, and it

gives the ultimate in function-building help. Excel breaks out the function's arguments into text boxes, and the dialog box shows you the value of the function given the arguments before you commit the function to the worksheet. This is definitely neat stuff for novices and gurus alike.

Data Access and Analysis

External data access is one area where Excel has lagged behind the competition. This new version improves matters somewhat by replacing Q+E with the Microsoft Query technology borrowed from Microsoft Access. While this gives you

query-by-example friendliness and more data-access options, I still prefer the better-integrated Datalens technology that you get with Lotus 1-2-3.

Excel 5.0 does include a powerful new data-analysis tool, though, called the PivotTable. This is a multidimensional table that lets you manipulate and rearrange views of summary data in a manner that is similar to Lotus's Improv for Windows. While PivotTables are quite potent, they are probably likely to appeal only to power users, because I did not find them particularly intuitive.

Programmability

Of course, there's nothing wrong with appealing to power users, and Microsoft certainly hasn't forgotten them in its drive toward more user-friendliness. The new Excel has some dramatic changes on the high end. The most stunning is the introduction of Visual Basic for Applications as the new macro language. While Excel 5.0 will fully support the old macro language (which many users found arcane), it is, for all practical purposes, now obsolete.

While some macro mavens may lament this fundamental change, most should welcome it. The move to a standard macro language is a great one. Soon, all members of Microsoft Office will share Visual Basic as a common language. Throw in OLE 2.0 automation, and complex cross-application development is suddenly much less troublesome.

Excel 5.0 is an exciting product full of improvements, some of which are immediately apparent, and others that are more subtle. Managers who are making buying decisions for whole departments would do well to give Excel 5.0 a good look.

IT'S A FAMILY AFFAIR

When Microsoft introduced its Office packages for the Mac and Windows in 1989 and 1990, respectively, the packages were mainly marketing bundles designed to highlight the company's word processing, spreadsheet, and presentation graphics programs. But the company has been working ever since at improving the integration and consistency among Word, Excel, PowerPoint, and its other applications. New versions of these three applications will be integrated with Office 4.2 for Windows, expected to ship in January. However, purchasers of Office 4.0, which will have the new Word 6.0, will be able to upgrade to the new versions of PowerPoint and Excel, when they become available later this year, for free. Office 4.0 is slated to ship this fall.

To bolster the consistency of its applications from one package to the next, Microsoft designed the menu bars of Excel, Word, and PowerPoint so that they will now provide the same choices (e.g., File, Edit, and View), except for the third option from the right. Microsoft has coined

a new term, OfficeLinks, to describe the integrating features that mesh these applications. The new Word for Windows supports OLE 2.0. But in one example of a feature Microsoft added that goes beyond the standard object embedding of OLE 2.0, Word 6.0 for Windows now has an Excel toolbar icon that you can use to insert and graphically size an in-place Excel 5.0 spreadsheet object (provided Excel is present on your system).

Other integrating features are simply hard-coded into the applications and don't ride on top of OLE 2.0 at all. PowerPoint 4.0 for Windows, expected to ship this winter, will have a Report It feature that takes a PowerPoint presentation and converts it into a Word for Windows outline.

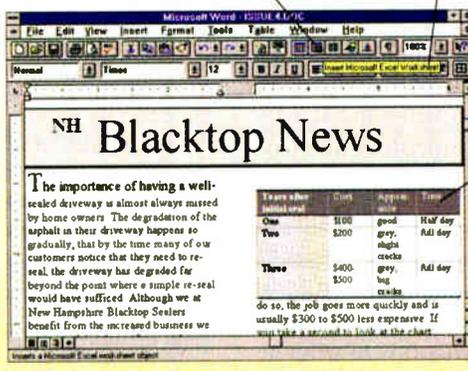

Although the integration in Office has come a long way in the past three years, it still has a ways to go. Currently, only Excel 5.0 can both control and be controlled by other applications through Visual Basic Applications edition (VBA). Word 6.0 cannot control another application through VBA—it can only expose its own WordBasic objects so that Excel can drive it. PowerPoint 4.0 will not be able to control or be controlled by other applications through VBA. However, Microsoft is committed to continually improving the situation in both the Windows and Mac versions of Office. The company has established an Interoperability Design Group that will help ensure this happens.

—Dave Andrews

Office 4.0 for Windows (standard version): Excel, PowerPoint, Word, and Access, \$750. Professional version: (substitute FoxPro for Access), \$949.

The Excel toolbar icon in Word 6.0 for Windows allows you to place an Excel 5.0 spreadsheet object directly in a document.

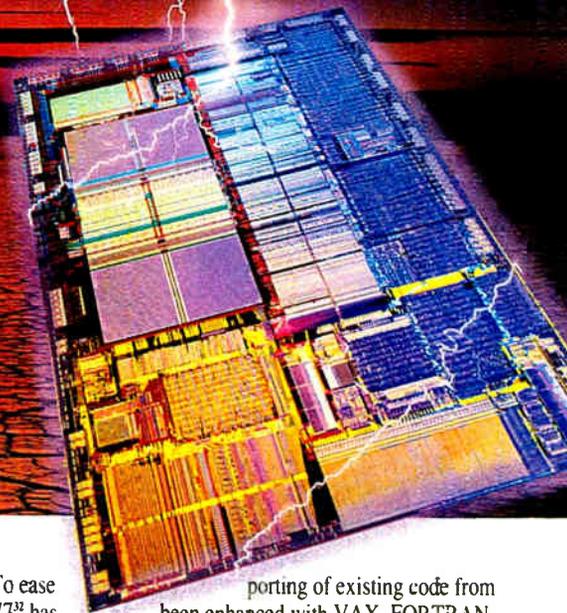

The new ToolTips feature lets you quickly learn what a toolbar button does.

Word 6.0 now automatically formats and sizes tables just like Excel. You can pick from preset formats and then apply special formats to certain rows and columns.

Unleash 32-bit Power on your FORTRAN Applications

- ▶ **Widest Range of 32-bit Intel x86 Platforms**
- ▶ **The Industry's Leading Code Optimizer**
- ▶ **Comprehensive Language Support**

Power. Unleash the 32-bit power of Intel's 386, 486 and Pentium processors on your most demanding FORTRAN applications with WATCOM's 32-bit FORTRAN. F77³² delivers 32-bit performance. The 32-bit flat memory model simplifies memory management and lets applications efficiently address large amounts of memory. Powerful 32-bit instruction processing delivers a significant speed advantage; typically a minimum 2x processing speedup. Together, the power of F77³² and these 32-bit processors provide a desktop platform that is capable of handling mainframe FORTRAN applications.

Performance. The hot, new F77³² code generator advances the performance envelope. New superscalar optimization strategy uses "riscification" and instruction scheduling to deliver improved performance on 486 and Pentium processors. The compiler can create a single, high-performance executable which runs on 386, 486 and Pentium processors.

Platforms. In a single package, F77³² supports a wide range of 32-bit Intel x86 host and target platforms. F77³² applications can fully exploit the graphical user interfaces of Windows 3.x and OS/2 2.x.

- ▶ **32-bit DOS host and target support;** includes the DOS/4GW 32-bit DOS extender by Rational Systems with royalty-free run-time and virtual memory support up to 32Mb.
- ▶ **OS/2 2.x host and target support;** enables development of OS/2 2.x applications and DLLs. 32-bit Windows 3.x applications can exploit WIN-OS/2 using WATCOM's 32-bit Windows Supervisor technology.
- ▶ **NetWare NLM 3.11 and 4.0 target support;** includes licensed components of the NetWare 4.0 SDK.
- ▶ **Windows NT host and target support;** includes a Windows NT-hosted debugger for 16-bit Windows 3.x, Win32s and Windows NT debugging; also includes Win32s target support.
- ▶ **32-bit Windows 3.x target support;** includes WATCOM's 32-bit Windows Supervisor, and enables development and debugging of true 32-bit Windows 3.x applications and DLL's.

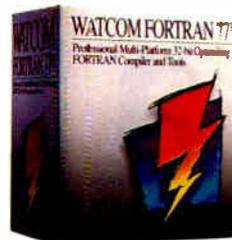

Porting. To ease porting of existing code from other platforms, F77³² has been enhanced with VAX, FORTRAN 90, Microsoft and IBM VS language extensions. F77³² supports the full FORTRAN 77 ANSI standard and is compatible with IBM's SAA FORTRAN language definition.

C and C++ Compatibility. Run-time compatibility with WATCOM C/C++³² allows you to combine C, C++ and FORTRAN modules in a single application. Seamless debugging eases development of mixed-language applications.

Professional. The comprehensive professional toolset includes a full-screen source level debugger, profiler, linker, librarian, object code disassembler, make utility, 32-bit royalty-free DOS extender, licensed components of the IBM OS/2 2.1 Toolkit, Microsoft Windows 3.1 SDK and NetWare 4.0 SDK and much more.

Price. WATCOM FORTRAN 77³² v9.5 has a suggested retail price of \$599*. Dealers may sell for less. For additional information or to order direct call 1-800-265-4555. You can also call our FAX Back system 519-747-2693 from your fax machine for immediate product information.

Promise. You can try F77³² risk-free. If for any reason you are not completely satisfied with the product, simply return it within 60 days to the place of purchase for a refund.**

Even a *free* memory manager may not be a bargain—especially if it can't give you all the memory you need.

Introducing QEMM 7 The Memory Manager Worth Paying For

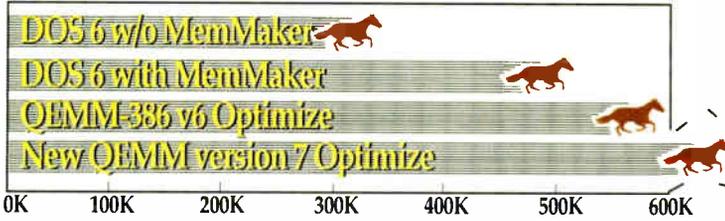

The newest version of the Quarterdeck Expanded Memory Manager (QEMM), version 7, once again is extremely innovative in using the critical area between 640K and 1024K. It finds space for more TSRs and drivers in this area than anyone thought possible. It optimizes this area, taking into account the many drivers that need more memory at start-up than when running; instantly calculating millions of possible memory configurations to find still more memory for your programs to use. And it treats the rest of memory as a giant pool to instantly fulfill the needs of all of your programs—whether they use extended or expanded memory. Whether your PC has 1 megabyte or 16, you can benefit from new QEMM 7.

Instant Riches

What does more memory mean in a practical sense? It means that your DOS and MS Windows programs run faster, smoother and more reliably. It means you can continue to add valuable utilities, drivers, TSRs and new capabilities to your PC. Whether it's workhorse drivers like LAN utilities and fax drivers; productivity-enhancers like disk caches and disk compressors; or fun and exciting capabilities like sound boards, CD ROM drivers, graphics tablets, etc. The better your memory is managed, the more versatility and flexibility your PC has. QEMM 7 lets you have it all without fear of 'out of memory' messages or crashes.

How to Look a Gift Horse in the Mouth

We tested DOS 6 with and without MemMaker and with QEMM 6 and our new QEMM 7 runs away from all of them. See details of test conditions listed below.

DOS 6 Giveth; DOS 6 Taketh Away

The best feature of new DOS 6 is the stable of utilities it includes. Trouble is, they all eat up memory. DoubleSpace file compression needs 43K, Vsafe anti-virus needs 745K, Smartdrv disk cache needs 28K and even Undelete takes 10-14K as a resident program. Using Microsoft's free memory utility, MemMaker, you could easily end up with a net loss of available 'conventional' memory in DOS 6.

New QEMM 7 takes the best of the new DOS 6 features into account, finding ways to give you more free memory for your program while taking full advantage of DOS 6. One new QEMM 7 feature, DOS-Up, moves the DOS 6 kernel, its data and resources to memory above 640K (this feature also works with DOS 3-5), freeing 770K. Another new QEMM 7 feature, Stealth DoubleSpace, frees 40K of the memory addresses used by DoubleSpace and makes them available for other drivers and TSRs. Both features ensure that the all-important memory below 640K is free for your programs. And QEMM 7's seemingly small feature of supporting multiple configurations gives you the flexibility and ease of setup that you expect. (MemMaker doesn't work well with this important DOS 6 feature.) That's why it makes more sense than ever to put your money on the best memory manager.

Page Frame: the Key to Your Future

There's been a lot of talk about our patent-pending Stealth technology. Jealous talk, mostly. Because nobody else can touch its performance. Our Stealth ROM feature, pioneered in QEMM 6, frees 48-115K of ROM addresses for use by TSRs and drivers. Our Stealth DoubleSpace feature, described above, frees another 40K. And as you might imagine, there's more to come.

The key to Stealth is its use of a 64K reserved area above 640K called the page frame. Besides being used by Stealth, the page frame is used by Lotus 1-2-3 r2.x for larger spreadsheets and WordPerfect 5x for larger documents, DESQview for multitasking, Novell Netware, IBM LAN Server and DECnet for reducing the network driver memory footprint, plus games like Wing Commander, Car and Driver, Ultima Underworld II, Wolfenstein and others for fast action.

You sacrifice all this when you turn off the page frame (which

other memory managers do to maximize available memory above 640K). It's this use of the page frame by Stealth that lets you set up your PC with a mouse, CD ROM, sound board, a network such as Novell NetWare, reserve 8-24K of extra memory for optimal MS Windows performance, use all of DOS 6's memory-hungry utilities and still have more than 630K available for your programs. (Compared to DOS 6's 527K available in the same configuration, after using MemMaker).

Easier to use for Novices, More Power for Experts; More Memory for All

Our seventh-generation thoroughbred QEMM has improved ease-of-use, with Express Install and Help features. And for power users, Advanced Install and editable parameters and troubleshooting hints.

And QEMM 7 comes with Manifest, the award-winning memory analyzer—enhanced for more flexibility with Pentium testing, laptop battery reporting, network analysis and editable configuration files.

The new and ever more exciting capabilities coming to your PC will all compete for memory with your favorite applications, TSRs and drivers. And that makes QEMM 7 the front runner in your efforts to get the best performance out of your PC today—and tomorrow.

There's lots more to QEMM 7:

- Tuned for MS Windows
- New ability to use Vidram inside MS Windows
- DPMI Host
- Pentium Support
- Laptop suspend / resume support
- PS/2 micro channel adapters
- Compaq support
- Fine tuning tools for power users
- 32-bit architecture for speed
- Enhanced compatibility in response to hardware needs of our millions of users:
 - Detects adapter RAM and ROM and bus-mastering hard drive controllers
 - Monitors DMA access into memory
 - Supports Shadow RAM

Prior versions of QEMM won just about every competition in sight, as well as remaining the #1 best-selling memory manager 5 years straight.

COMMUNICATIONS

E-Mail Unplugged by Wireless WANs

Wireless WANs (wide-area networks) have been slowly chugging toward mainstream business use. But the wireless-data movement is picking up steam, and the engine that's driving the demand for wireless WANs is convenient access to the E-mail systems that people depend on through the wired-phone network.

"E-mail is the logical first application for wide-area wireless networks," notes Eric Arnum, editor of *Electronic Mail and Micro Systems*, a newsletter published by BRP Publications (Washington, DC). "E-mail works, it's easy, and it's become an all-purpose data transfer system."

People wanting wireless E-mail have a few choices and will soon have more. Intel recently introduced three packages that put all the pieces—hardware, software, and network—into a reasonably priced bundle. The products are designed to work with RAM Mobile Data's radio-packet network, which charges \$75 a

month. The Intel packages cost \$795 apiece.

"We think E-mail is the most-wanted application in the wireless field, and that people would prefer to use what they already know to get it," says Tom Jackson, wireless marketing manager at Intel.

Intel is not the first company to offer a coordinated solution for wireless E-mail. Ericsson GE is selling a \$995 bundle called Mobidem Kit, which works with RadioMail's wireless service. Motorola, which currently operates a one-way, pager-based E-mail service called Embarc, says it plans to introduce two-way E-mail products in 1994, perhaps using the Ardis wireless network it runs with IBM. Many other companies are working on wireless products for delivery late this year and in 1994.

The next step in the evolution of wireless E-mail will be reducing the size of the hardware from a bulky external modem to a thin card that slides into the PCMCIA slot now

found in many notebooks and hand-held PCs, including Apple's MessagePad. Motorola and Megahertz have announced their intentions to produce wireless modems on PCMCIA cards in 1994. "Until the PCMCIA two-way transceivers for RAM and Ardis come out, there will be limited acceptance," says Mark Eppley, chairman and CEO of Traveling Software (Bothell, WA), which is working on wireless products.

There are other obstacles, including the fairly short battery

life of most portable modems and computers. But many believe it's only a matter of time before people begin embracing wireless E-mail as eagerly as they have cellular phones.

—Christopher O'Malley

PACKAGES FOR WIRELESS E-MAIL

INTEL'S WIRELESS MODEM:

- wireless modem—a Hayes-compatible radio modem (also sold by Ericsson GE as the Mobidem)
- wireless version of Lotus's cc:Mail or Microsoft's Mail

Both packages require a \$795 server version.

WIRELESS MODEM (EASYLINK):

- wireless modem
- AT&T's Access Plus software (for use with its public EasyLink network)

ERICSSON GE'S MOBIDEM KIT:

- Mobidem wireless modem
- Hewlett-Packard's HP 95LX palmtop
- wireless E-mail software and gateway service from RadioMail

RadioMail is also available for other DOS systems and was recently introduced for Apple's PowerBook portables.

CDPD NETWORK EMULATOR FOR DEVELOPERS

Wireless communications may get a boost from a new Windows-based development tool that emulates a complete CDPD (cellular digital packet data) network. The software emulator, called CDPD Workbench, lets developers test their applications while simulating various levels of network traffic, radio interference, vehicle speeds, and other variables that are difficult to create under actual conditions.

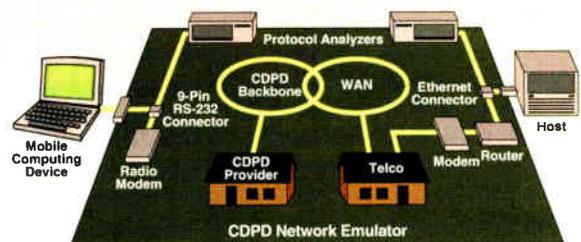

Workbench was introduced in September by Cellular Data (Palo Alto, CA, (415) 856-9800). Workbench emulates the entire CDPD network between the mobile-computing device (known as the MAS, or Mobile Application Subsystem) and the host device (the F-ES, or Fixed-End System).

"Given the alternative, which is to put an engineer in a car and drive around a lot, the price [\$3995] is exceptionally attractive," says Jacques A. Robinson, president and CEO of Cellular Data. Without rigorous testing, says Robinson, developers can't be sure how their wireless applications will fare in the hostile environment of mobile communications.

Just before the official launch of CDPD Workbench, as this article was going to press, Cellular Data was informed that its key source of funding would no longer be available. A spokesperson said the company is seeking alternative sources.

—Tom R. Halfhill

The Network Emulator Replaces...

CELLULAR DIGITAL

Cirrus Subsidiary Leads CDPD Push

Pacific Communications Sciences, Inc., a subsidiary of Cirrus Logic located in San Diego, is playing a central role in the development of CDPD (cellular digital packet data), the technology that wedges bursts of bits into minuscule pauses in the analog cellular-phone system.

PCSI was a key developer of CDPD technology and specifications, supplying prototype equipment to the nine-member CDPD consortium and helping conduct field tests in 1992. This past August, only days after AT&T revealed its plans to acquire McCaw Cellular, PCSI announced that it had been selected by AT&T to supply equipment for adding CDPD capability to cell sites. PCSI's electronics will be bundled with other AT&T products and services and sold to cellular carriers upgrading to CDPD.

DEVELOPERS:

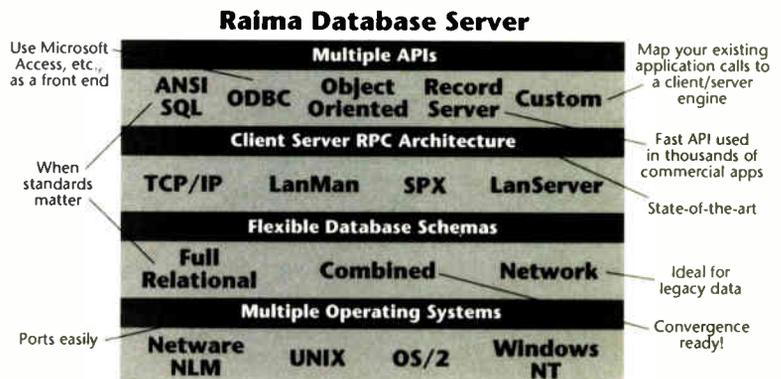

Have you been asked to produce a fast, open, **client/server** application that is inexpensive to deploy and differentiates your company?

Then we have a suggestion...

use our engine.

The new Raima Database Server is a product designed for developers who value flexibility along with speed and support for standards. Your application design is not constrained by the database interface. Why? With RDS, we begin with a multithreaded client/server architecture coupled to a high performance SQL processor/optimizer. Then we add support for C++ objects, a fast record-oriented API, and custom extension modules featuring remote procedure calls from your client application to your server-hosted user defined functions. Further, your database schema can be fully relational, network, or a combination of the two. It's all there for you.

Supports stored procedures, triggers, and referential integrity!

Join the thousands of developers, from small vertical market ISVs to industry giants like Hewlett Packard, who use our technology to set their applications and products apart.

Call 1-800-DB-RAIMA for more information.

Two w make a

If patience is a virtue, it would be tough to find anyone more virtuous than a 386 user.

Of course, you're not waiting to be canonized. You just want to get your spreadsheet crunched, printed and e-mailed before your boss's boss calls you looking for it.

Now if you had a 486, you wouldn't have this problem. But all that wishful thinking goes out the window when you consider the double-knots on your company's purse strings.

Performance Benchmarks		
(figures indicate relative performance)	Intel i386	Cyrix 486 Upgrade
MS Excel 3.0	1.0x	2.1x
MS Word 2.0	1.0x	2.8x
Micrografix Designer 3.1	1.0x	2.6x

*Benchmark tests run on IBM PS/2 Model 70/20MHz.
The new Cyrix 386-to-486 Upgrade Microprocessor delivers application performance that's twice as fast. And that's twice as smart.*

Fortunately, there's a smarter alternative to the downward migration path pictured above. It's called the 386-to-486 Upgrade Microprocessor.[™] And it's only available from Cyrix,[®] the smarter microprocessor company.

It's smarter because it's the only single-chip upgrade solution of its kind. And as such, the most cost-conscious way to replace the pedestrian 386 computer you have, with the searing 486 power you want.

Our upgrade chip acts just like a 486, and with good reason. It has Clock Doubling, a 1K on-chip cache

ays to 386 fly.

and enhanced Cx486 technology. Which means it delivers *twice* the application performance, and 100

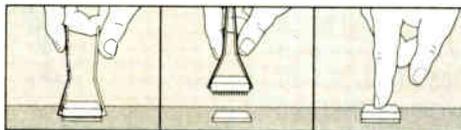

percent compatibility with all your software.

Like DOS,

Windows and OS/2. Even Windows NT. It's also certified software compatible in Novell, Banyan and Lan Manager nodes.

What's more, it's easy to install (it takes all of 15 minutes), and costs under \$400. So it's also easy to justify to

Talk about immediate gratification. Just use the chip removal tool provided to pull out your 386DX chip (16, 20, and 25 MHz versions only at the moment), and plug our Cyrix Upgrade Microprocessor into the empty socket. Then get ready for screaming 486 power.

even the stingiest bean counters.

Every Cyrix upgrade chip comes with the reassurance of a limited lifetime warranty, toll-free telephone support, and a money-back guarantee.

So do the smart thing.

Call us directly at 1-800-46-CYRIX. Quick. Before your old 386 computer inadvertently takes flight.

Cyrix® instead™

Circle 83 on Inquiry Card.

Cirrus Subsidiary Leads CDPD Push

In addition to its work on the infrastructure side of CDPD, PCSI is providing products for the subscriber side. The company was awarded a contract in November 1992 to supply IBM with CDPD modules for mobile computers; IBM was expected to announce this fall a model of the ThinkPad with PCSI's CDPD modem built in. The company is also working closely with Apple to develop wireless-communications features for next-generation MessagePad systems.

Brandon Nixon, product line manager for wireless communications at PCSI, says that trials of real CDPD systems will begin this month, with many areas rolling out in the first half of 1994. National coverage and roaming agreements between carriers likely won't be in place until 1995. Nixon believes that there will be a strong link between CDPD and the use of hand-held computers like the MessagePad. "CDPD will really come on strong with PDAs [personal digital assistants]," he says.

On the other hand, he notes, the technical problems of implementing a cellular radio, especially in a PCMCIA form factor, are quite challenging, because electromagnetism from the screen interferes with the signal. PCSI's product for IBM will be embedded in the system, not on a PCMCIA card, but the company expects to deliver card-size products later, as does Motorola.

CDPD offers an attractive business opportunity for carriers, because they will be able to realize greater profits from their existing cell sites. A study by IBM and McCaw Cellular found that even at peak usage, roughly 30 percent to 40 percent of the total bandwidth at a site is idle; these holes can be filled with data packets billed at 5 to 7 cents each.

—Andy Reinhardt

DATA STORAGE

Sony's MiniDisc for Data: Future Floppy?

Sony's recent decision to adapt its 2.5-inch audio MiniDisc for computer data storage poses a new alternative to conventional floppy disks, which are falling far behind the curve of today's mass-storage requirements.

MD DATA, as Sony's new MO (magneto-optical) format is called, offers a promising combination of storage density, economical mass duplication, and cross-platform compatibility. MD DATA disks come in three variations: writable, read-only, and a hybrid that's partly writable, partly read-only. They all store 140 MB of data per disk, and all disks are readable on the same drive. The disks are protected against physical damage by a shuttered cartridge and are more resistant to stray magnetic fields than conventional floppy disks, according to Sony. Because MD DATA has its own file system, disks are interchangeable between PCs, Macs, and other supported platforms.

Writable MD DATA disks can be erased and rewritten any number of times. Blanks are expected to cost about \$20. That's nearly as much storage as a hundred 1.44-MB floppy disks at a much lower cost per megabyte. For software publishing, read-only versions of the disks (called MD-ROMs) can be mass-produced using the same premastering process as CD-ROMs. In quantities of thousands, they could cost only \$1 or \$2 each.

Hybrid MD DATA disks are intended for interactive applications in which some information is read-only and the rest of the disk is writable. Like conventional MO formats, MD DATA uses a laser to heat selective locations on the disk to their Curie point—a temperature at which the magnetic material can be easily altered by the drive's read/write head. But MD DATA differs from conventional MO technology in two important ways. First, the drive can erase and rewrite data in a single pass; regular drives require two passes. Second, this direct-overwrite technology allowed Sony to greatly simplify the optical head, thus reducing cost, size, and power consumption.

Sony hasn't announced prices for MD DATA drives, but MiniDisc audio recorders now sell for about \$700. MD DATA isn't a

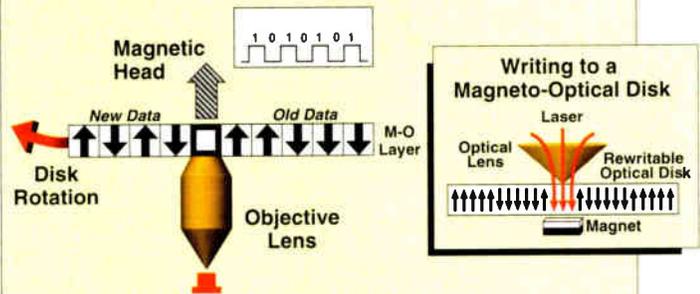

replacement for CD-ROM because it offers only about one-fourth the storage capacity. It also won't replace hard drives because the data transfer rate is only 150 Kbps, the same as most CD-ROMs. But MD DATA could fill the need for a writable, removable storage medium that matches the growing demands of today's PCs.

The shortcomings of floppy drives are becoming more apparent as PCs accumulate megabytes of memory, hundreds of megabytes of hard disk space, and applications software that ships on a dozen or more disks. Years ago, floppy disks could store two or three times as much data as the computer's RAM, but today that ratio is reversed. Many files—such as those produced by page-layout programs—are too large to fit on a single floppy disk, even when compressed. Hence the popularity of removable hard drives for sending files to service bureaus and the widespread use of tape cartridges to back up hard drives.

MD DATA could provide a universal solution that's small enough for mobile computers. The nearest likely competitor is floptical technology, which stores 21 MB on a 3½-inch magnetic disk and offers backward compatibility with existing 3½-inch floppy disks.

—Tom R. Halfhill

Overwriting Technique Used for 2.5-inch MiniDisc

Sony gets single-pass writing by using three new techniques. First, the laser and the magnetic read/write head are positioned on opposite sides of the disk, and the laser remains constantly on during reading and writing. Other MO drives repeatedly turn the laser on and off while erasing and writing the magnetic signal (see the figure inset). By leaving the laser constantly on, Sony was able to simplify the design of the optical head. Normally, this would require a powerful magnetic field, but Sony also invented a new magnetic layer (i.e., terbium ferrite cobalt), whose polarity can be changed by using only one-third as much magnetic coercivity as conventional MO drives. This allows a weaker magnetic field, which in turn reduces the size, complexity, and power consumption of the head. Sony claims the new head is more efficient than regular heads and requires only about 100 nanoseconds to reverse the polarity of a spot on the disk.

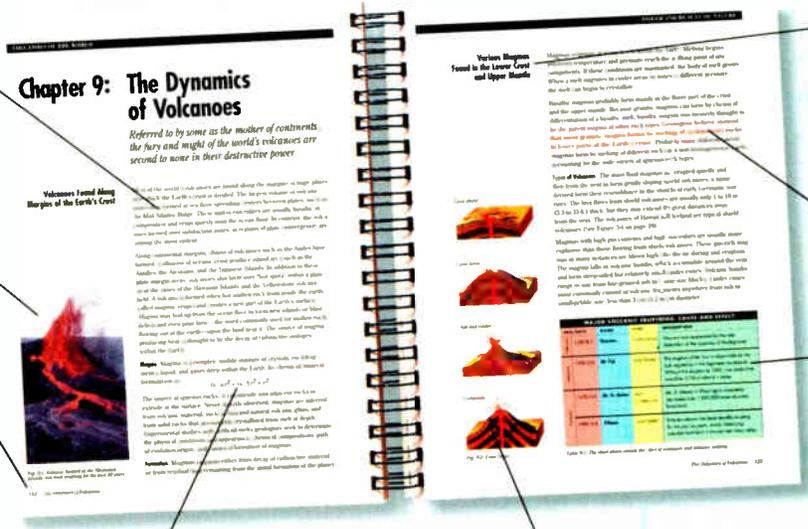

INTRODUCING FRAMEMAKER 4

We wrote & published,
 edited & organized & designed,
 formatted & indexed,
 cross-referenced & distributed
 the book on writing and publishing.

Writing is a breeze with our high-speed WYSIWYG word processor, which includes a spell checker and thesaurus.

Create custom colors with CMYK, RGB, HLS, and PANTONE® color palettes, and produce 4-color process or spot color separations.

Build complex documents easily using automatic hypertext markers, multichapter cross-referencing, running headers and footers, plus multiple indices and tables of contents.

Page layout tools enable rotated text and graphics, dashed and dotted lines, multiple columns, auto side heads, even portrait and landscape pages in the same document.

Conditional text lets you store or display multiple versions of a document in a single file.

Our advanced table editor lets you build multipage tables with unlimited paragraphs, straddled cells, rotated text, even graphics.

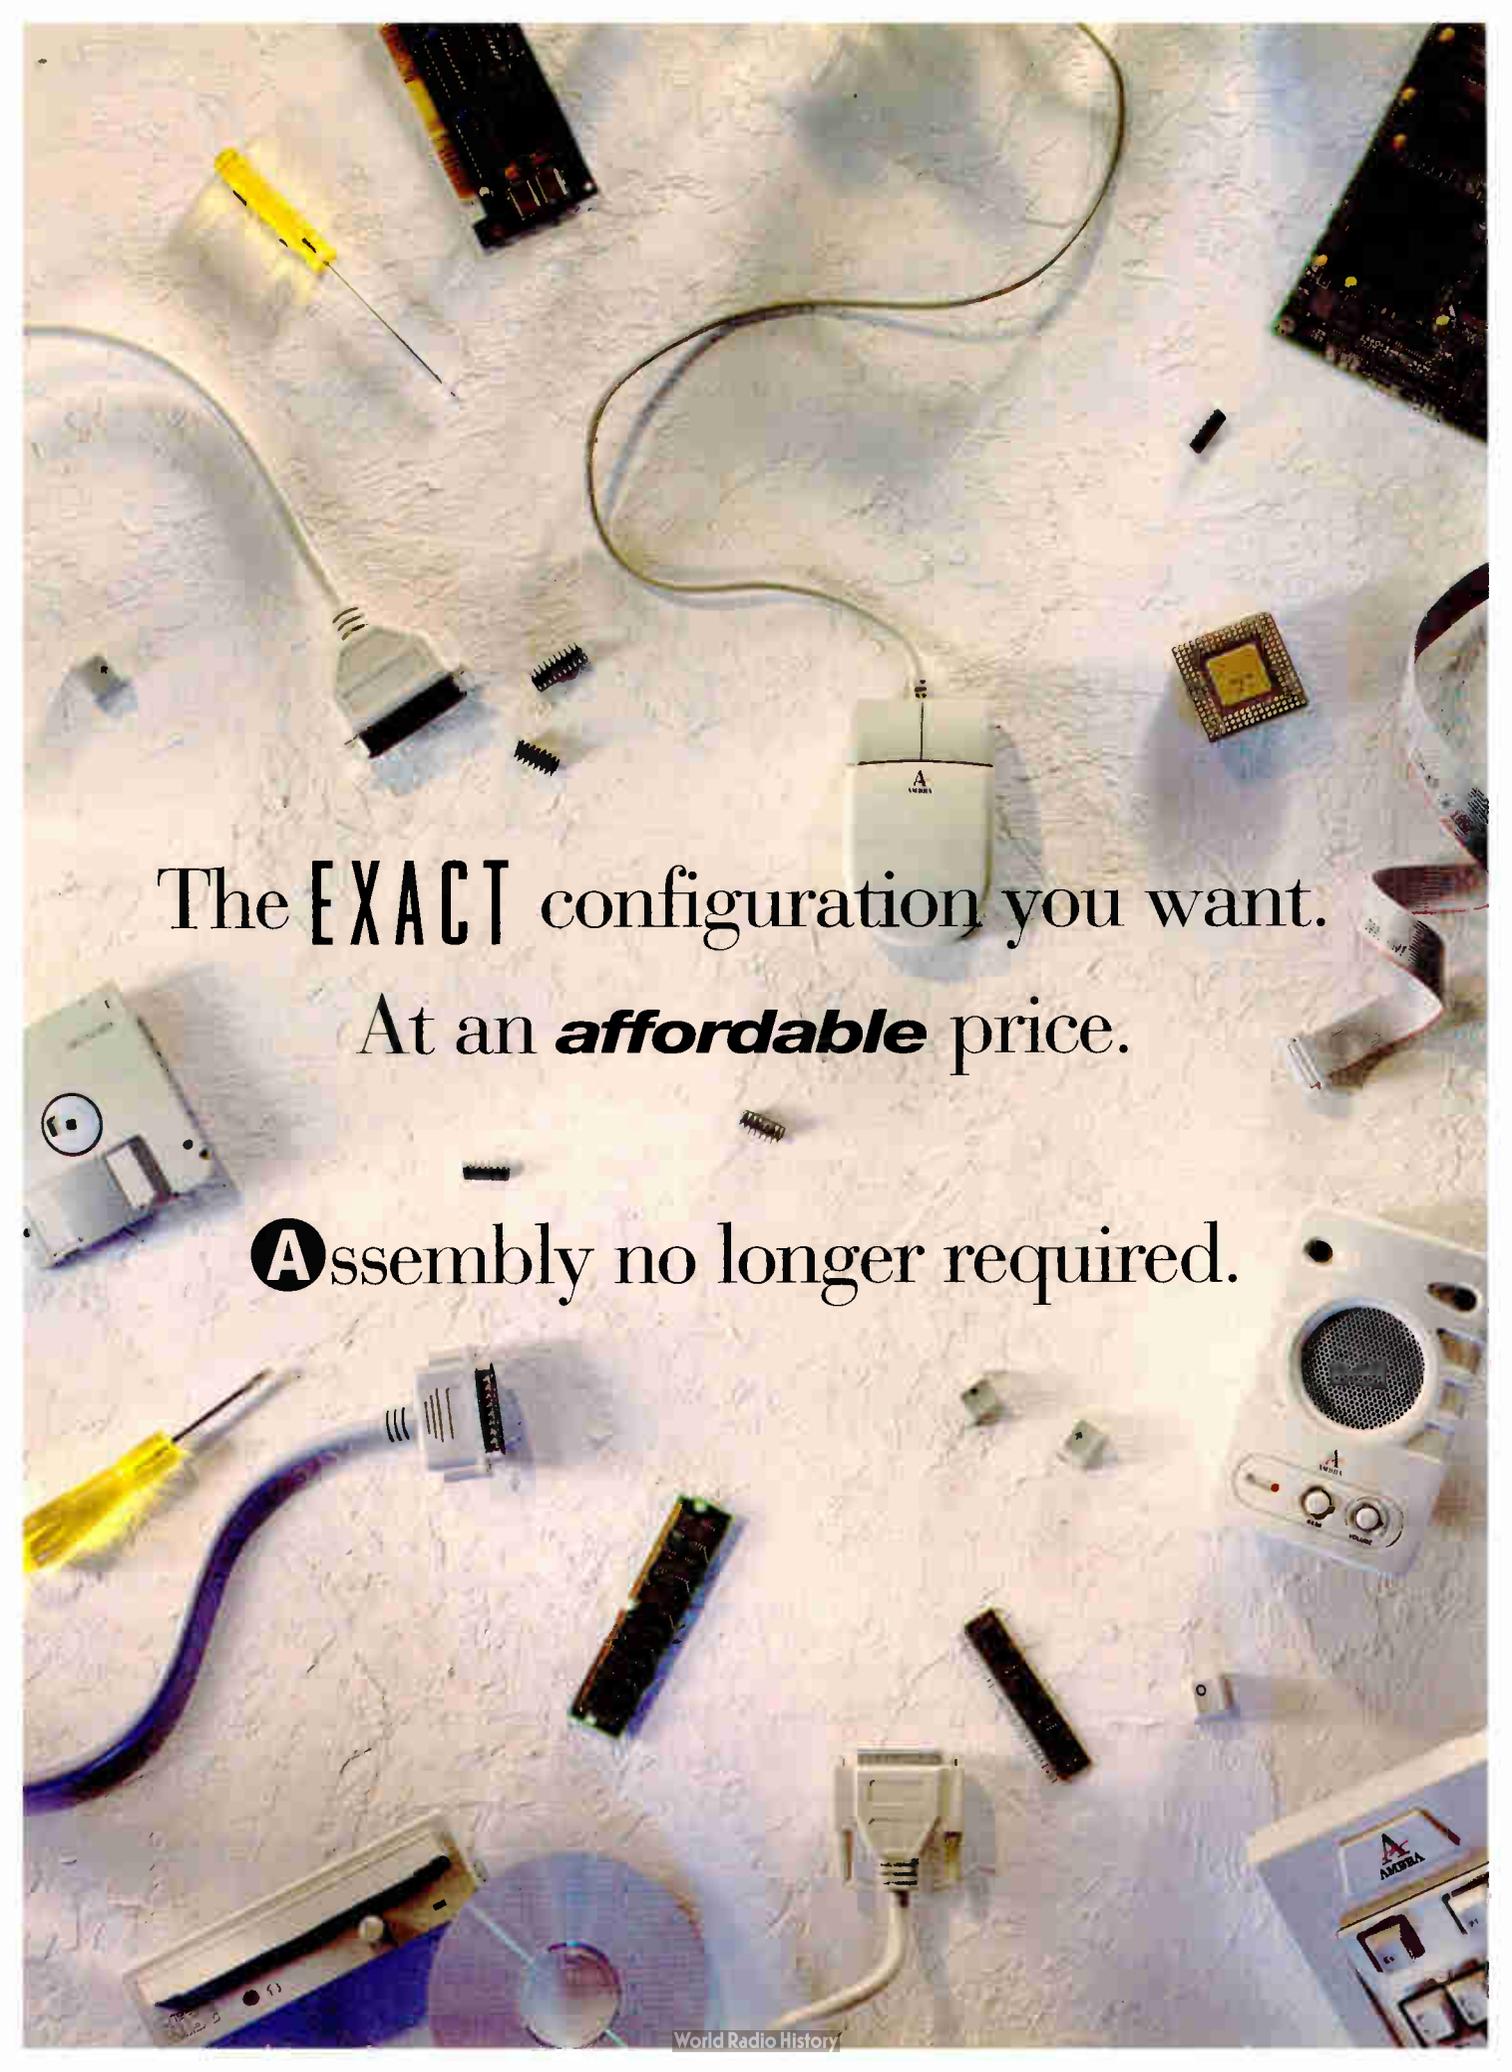

A sophisticated math editor lets you create and edit everything from simple arithmetic to calculus equations.

Create your own graphics with a full set of drawing tools, or import 24-bit color images.

Frame Technology presents the best way to write and publish demanding business and technical documents: Introducing new FrameMaker® 4. FrameMaker 4 dramatically increases your productivity because it automates much of the publishing process. Which makes it faster and easier to produce everything from simple business reports to complex multichapter manuals. Only one program handles it all, FrameMaker 4. Which means you don't have to switch back and forth between word processing, graphics, and page layout programs, and you won't lose any of your data or formatting. FrameMaker 4 is loaded with over 100 new features including context-sensitive help, automatic side heads, document compare, even ad hoc formatting. Best of all, you can share your FrameMaker 4 documents with your colleagues across the most popular hardware platforms. Including Windows, Macintosh, and X/Motif. So when you need to write, publish, design, edit — the works — make sure you use the one program that does it all: FrameMaker 4. For a free guide to writing and publishing, or information on our special upgrade offer, call 1-800-U4-FRAME, Ext. 926.

The **EXACT** configuration you want.
At an **affordable** price.

Assembly no longer required.

AMBRA. WE CUSTOM-BUILD. SO YOU DON'T HAVE TO.

Complete customization — at no extra cost.

Sorry to disappoint all you hands-on, do-it-yourself types. Likewise, you people who insist on paying for every service that comes your way. When it comes to customizing AMBRA™ computers, you can leave your tools in the box and your money in the bank. Just send us your specs. We'll build you a ready-to-run computing solution including everything from your choice of processor to your choice of word processor. Plus your choice of options, preinstalled. And you won't pay an extra penny for the service, or wait an extra day.

High-powered technology — without high prices.

A word to the power-hungry: You can put away that huge purchase order. AMBRA offers the latest and leading industry-standard technology — like blazing-fast IBM® Blue Lightning™ processors, Intel® Pentium™ complexes, advanced video subsystems, high-speed local bus architecture, and lots more — for lots less.

Here's how: Sourcing worldwide from the best suppliers, we buy smart and bargain aggressively. And because we keep our overhead low, when you buy direct from us, we pass our savings directly along to you.

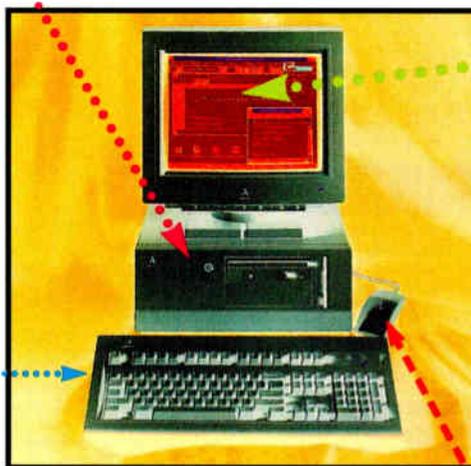

Prompt service and support — no empty promises.

Now, for you savvy buyers: We know you're looking for more than a mere computing "bargain." Quite rightly, you want to be sure of receiving rapid service and ready support. That's why we've contracted with IBM to back

AMBRA systems with rock-solid one-year warranties. You can count on expert technicians nationwide to deliver onsite service within two days of your call, Monday through Saturday.¹ You can also rely on a toll-free support line for answers any time you need them — technical representatives are standing by to assist you 24 hours a day, every day.

Money-back guarantees — not gimmicks.

Finally, to all our new and soon-to-be-new friends: We absolutely want you to be satisfied with your customized AMBRA system. If, for any reason you're not, you can simply return it within 30 days for a full refund.^{1,2} We're committed to delivering exactly the computer you want, exactly the way you want it, at a price that's only surprising in terms of its thriftiness. We build it your way. To meet your needs. And, if you're not happy, we'll give your money back.

WILL RUN ON MAC, WINDOWS, AND UNIX

First PowerPC Systems Hit the Street

It looks as though the first system to use the PowerPC 601 processor will come from—drumroll, please—IBM. The company's Advanced Workstations and Systems division plans to ship four PowerPC-based systems by the end of the year, including a server that will cost about \$9000. Any future single-chip RS/6000 models that AWS will introduce will be based on the PowerPC. The company claims that the Model 250, one of the four new RS/6000s, will run two to three times faster than its older sibling, the Model 230. The Model 250 will run the

same AIX 3.2.5 applications as the current single-processor RS/6000s (Models 220 and 230), which use IBM's RISC processor. IBM says that its version of the PowerOpen environment, expected to ship this year, will also let you run Mac and Windows programs on the Model 250. Other operating systems being ported to the PowerPC platform include Apple's System 7, Microsoft's Windows NT, SunSoft's Solaris, IBM's OS/2 (perhaps in the form of Workplace OS), and Taligent's Pink. "We've been criticized a lot for not being first to market

with technology that we invented," said AWS's workstation marketing director John B. Holz, "so here's a case where we've been working real hard. We invented it, we want to be first, and, unless something strange happens, we will be first."

For people who need multiprocessor RISC systems, IBM offers POWER2, a replacement technology for the POWER chips now implemented across the SMP (symmetric multiprocessing) part of the RS/6000 line. While the PowerPC 601 is capable of multiprocessing, Holz says that the multichip POWER2 processor module is far superior to any multiprocessor array of PowerPC chips that could now be built.

At the Unix Expo show in New York, AWS also previewed the PowerPC-based notebook computer that Tadpole developed for IBM. The 5.5-pound notebook, boasting a 9.3-inch color TFT (thin-film transistor) display, is finished, said Holz, but IBM will not announce it until early next year.

The real trick for IBM will not be selling RS/6000 customers on the PowerPC. It will be persuading customers who use Intel-based systems that a PowerPC-based computer will run their DOS, Windows, and OS/2 applications. Another division of IBM's Personal Systems line of business, Power Personal Systems, came into being solely to develop PowerPC-based computers. The first of these will be client-level machines.

—Ed Perratore

IBM'S POWER2 SYSTEMS

For many customers of IBM's Advanced Workstations and Systems (AWS) division, the PowerPC just doesn't cut it—at least not in its present incarnation. For these high-end AIX users, whose needs rise to the level of massively parallel systems, there's the new POWER2 architecture and two systems to employ it.

POWER2 uses an eight-chip processor module that includes several processors and support circuitry (e.g., I/O and cache controllers). Because of the integration of these chips, IBM claims, a module will execute six instructions in one machine cycle. It looks like a uniprocessor to the operating system and any applications.

By contrast, an operating system dispatching instructions to an eight-processor PowerPC configuration would do so knowing there are eight processors. POWER2 modules can be implemented in the hundreds, while the PowerPC's efficiency quickly falls short beyond eight to 12 chips. Hence AWS's plans, at least for now, to limit PowerPC to single-chip implementations.

Along with the debut of POWER2, IBM has announced two system families that will use this architecture. The 990 replaces the RS/6000 970B and 980B. It may be rated the fastest RISC system in the industry, until new high-end systems appear. The new 58H and 590, running at 55 and 66 MHz, respectively, are replacements for the RS/6000 580. Existing systems are field-expandable to POWER2; no prices were yet available.

IBM is expected to announce massively parallel systems using POWER2 by the end of the year.

—E. P.

Sharing the PowerPC Three separate arms of IBM are currently developing PowerPC-related products. An additional suspect—IBM PC Co.—is sticking instead with the Intel 80x86 platform, which includes IBM variations on Intel processors, like the 486-based Blue Lightning from IBM Microelectronics. Following is a rundown of the players.

IBM PC Co.

Somers, New York
Robert Corrigan, president and CEO

At least for now, this division will develop systems based solely on the Intel 80x86 platform, despite earlier public statements to the contrary.

IBM Advanced Workstations and Systems

Austin, Texas
Bill Filip, president

This division will have introduced the first PowerPC-based RS/6000 system, the Model 250, by the time you read this. Early next year, it will bring out a 5.5-pound Tadpole-developed notebook based on the PowerPC. It will eventually replace the entire single-chip RS/6000 product line with PowerPC-based systems running AIX and PowerOpen. Multiprocessor systems will be based on POWER2 processor modules.

—E. P.

IBM Power Personal Systems

Somers, New York
Nobuo Mii, president

Formed with the mission of developing and marketing PC-like systems based exclusively on the PowerPC, this division expects to introduce its first products by mid-1994, which will compete with Intel-based systems.

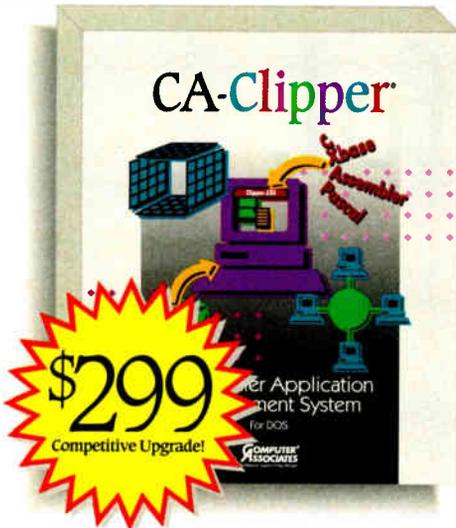

IBM Microelectronics

Fishkill, New York
Michael J. Attardo, general manager

Formerly called IBM Technology Products, this division is the sole supplier of PowerPC 601 chips. It manufactures and sells the 6XX series to system makers and next year will introduce the PowerPC Embedded Controller 4XX series. It also makes IBM processors under a technology-sharing agreement with Intel.

Extraordinary Exo-Upgrade.

Upgrade To CA-Clipper® 5.2 For \$299 And Get A Copy Of
New CA-Clipper®/ExoSpace™ And Your Choice Of
Another Product Absolutely FREE!

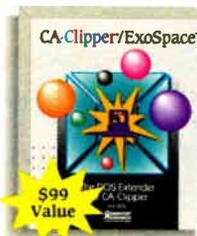

Break Through
The 640k Barrier With
New CA-Clipper/ExoSpace!

CA-Clipper®/ExoSpace™ increases directly addressable memory by up to 2,500% — from 640k to 16 megabytes.

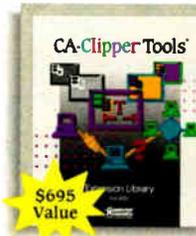

Eliminate virtual memory swapping, greatly improve performance and run your Clipper applications in protected mode. Existing 5.2 users can get CA-Clipper/ExoSpace for only \$99!

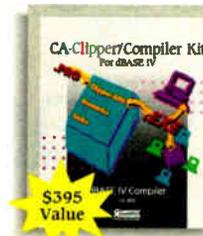

DBA readers rated CA-Clipper 5.01 Best Development Language, Best Xbase Compiler and Best Development Product.

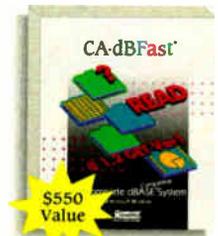

Break through the 640k barrier with the ultimate extended memory manager! Increase directly addressable memory from 640k to 16 megs.

Over 550 time-saving, problem-solving functions in one high-performance package. Raise your productivity with this valuable library.

Compile almost any dBASE IV application in three easy steps — and produce executable (.EXE) files with the efficiency of CA-Clipper.

dBASE apps come alive with new CA-dBFast 2.0 — the first dBASE-compatible database and language for Windows.

CA-Clipper 5.2: The Complete, Professional Programming Environment.

CA-Clipper® 5.2 is a robust language, an efficient linker, a flexible preprocessor and a high-performance compiler. It includes: an editor, debugger and make utility for creating PC- and LAN-based applications.

PC Magazine Editor's Choice for Xbase Development

And you were told Pentium was powerful.

If you've heard the Pentium™ microprocessor was powerful, it's time you see the PowerPC™ Microprocessors from Motorola. To be perfectly candid, Pentium is fairly powerful, but it's not nearly as powerful as the PowerPC family of microprocessors.

The first of Motorola's PowerPC Microprocessors, the PowerPC 601™ Microprocessor will bring workstation-like performance to low-cost PCs. Its integer performance (how fast it handles basic computer functions) is equal to Pentium's. In floating point performance (the speed you need to crunch numbers, run graphics, video, voice and the like), the 601 is a full 40 percent faster than Pentium, with no loss in integer performance.

While the 601 outruns Pentium, it actually runs cooler. The 601 draws only 8.5 watts of power to 16 watts for Pentium which, incidentally, leads to lower overall system costs.

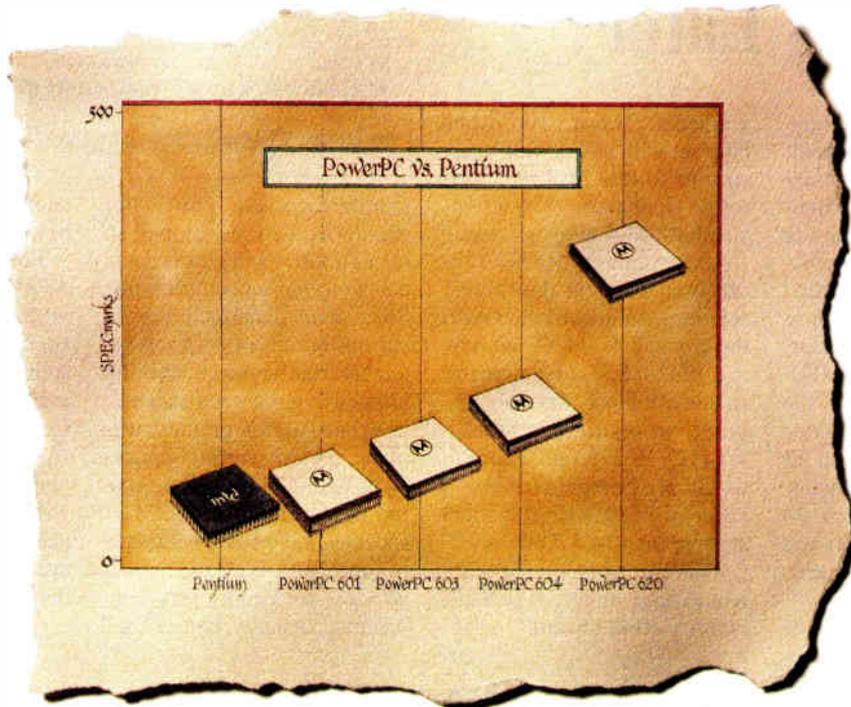

The 601, of course, is only the beginning. Over the next eighteen months, we'll ship ever

World Radio History

more powerful versions of the PowerPC microprocessor. The low wattage PowerPC 603™ Microprocessor will bring unprecedented performance to battery-powered computers. The PowerPC 604™ Microprocessor will push high end PC and server performance to new highs. The PowerPC 620™ Microprocessor will run at 200 to 400 SPECmarks in high end workstation, server and supercomputer applications.

To take a closer look at the future of computing, call Motorola today at 1-800-845-MOTO. We'll be happy to provide you with more information, including our free PowerPC Information Pack.

PowerPC Microprocessors from Motorola. They have the power to take you further into the future than the competition.

PowerPC Microprocessors. *Changing the course of computing. For the better.*

HIGH-SPEED MODEMS

At Your Own Risk: Faster Modems Now, Standards Later

Users accustomed to buying new high-speed modems within a year of their last upgrade will have to cool their jets for nearly another year—or risk gross incompatibility problems. Two years after the first V.32bis (14.4-Kbps) modems came to market, manufacturers are still waiting for the ITU-TSS (formerly known as the CCITT) standards committee to release the specification for the next set of improvements, known collectively as V.34 (formerly called V.fast) and promising data-pump speeds of up to 28.8 Kbps.

But the manufacturers of the chip sets that control the modems are forging ahead with products that close the gap between 14.4 and 28.8 Kbps. The problem is, these chip sets do not conform to any universally recognized standard. Users shelling out money for more speed are likely to find that the new modems will not connect, even with other superfast modems, at speeds greater than 14.4 Kbps.

AT&T and Rockwell, two central players in both the modem market and the ITU-TSS committee, are among the renegade chip-set vendors. As of this summer, the ITU-TSS, at a major impasse, had not expected to release the V.34 specification until 1995. Chip-set vendors jockeying for both market share and political power on the committee announced their plans to release superfast modems over the next year: AT&T developed a V.terbo modem with 19.2-Kbps speed, while market leader Rockwell

readied a “V.fast” 19.2-Kbps chip set with a 28.8-Kbps version to follow by 1994. Motorola Codex also sells a non-standard, 24.4-Kbps modem.

Unfortunately, these chip sets used different algorithmic schemes, in accordance with the companies’ views on how the ITU-TSS specification should eventually develop. The practical result was that an AT&T 19.2-Kbps modem would not communicate with a Rockwell 19.2-Kbps modem at more than 14.4 Kbps.

This sort of incompatibility would have undercut years of industry effort toward “V-dot”

SPEEDS: THE LONG AND WINDING ROAD BACK TO COMPATIBILITY

Just as modem vendors have supported the ITU’s specifications for modem speed through the V.32bis specification, both AT&T and Rockwell have committed to supporting the V.34 specification when it is released. But until then, both companies are introducing nonstandard specifications.

	ITU-TSS	AT&T	ROCKWELL
14.4 Kbps	V.32bis	V.32bis (ITU)	V.32bis (ITU)
19.2 Kbps	—	V.terbo (AT&T, shipping)	V.fast (R, late this year)
24 Kbps	—	—	TBA (R, early 1994)
28.8 Kbps	V.34	V.34 (ITU, after 6/94)	V.34 (ITU, after 6/94)

standardization. The V-dot standards were developed so manufacturers and buyers could count on chip-set compatibility. Since many manufacturers use various brands of chip sets interchangeably, incompatibility loomed as a market disaster.

In late August, progress was made toward averting this debacle. The ITU-TSS said that the final version of the V.34 specification would be released in June 1994. With the market window for proprietary chip sets much smaller, both AT&T

and Rockwell will support the new specification.

For the moment, however, AT&T is still releasing V.terbo. USRobotics is burning the specification onto Texas Instruments chip sets and offering it in the latest additions to its Courier line. And Rockwell is still developing V.fast. It’s expected that both alternatives will appeal mainly to buyers able to control which modems are used on both ends of the data connection.

—Noa Schoenfeld

DOCUMENT INTERCHANGE

Send Your Font Worries ElseWare ...

When sending an electronic document from your machine to another, it used to be sufficient to send it as plain ASCII text, or to make sure the recipient had the same word processor you did. Now you also have to pay attention to the fonts you use in your document.

ElseWare’s Font Works software, expected to ship in December, promises to make the transition from ASCII less painful. Font Works (\$129) installs into your Windows environment and uses ElseWare’s Infinifont technology to synthesize hundreds of fonts on-the-fly. When you open a document that uses a TrueType, Adobe Type 1, or Agfa Intellifont font, Font Works will step in and generate the font for you from a description in its extensive database. According to ElseWare, the database and Font Works software take only 2 MB of hard disk space for the 220 fonts included in the package.

Font Works uses ElseWare’s PANOSE typeface-matching system to find the best match for any font you don’t have installed. PANOSE cat-

egorizes fonts by style and shape. Given the PANOSE description of a font, the Infinifont generator can create any of the fonts included in the Font Works package. PANOSE is currently supported in packages from Lotus, Aldus, Adobe, Bitstream, Microsoft, and others.

Font Works incorporates an extensive help system that assists you in picking the right typeface for a job. Font Chooser lets you build groups of related fonts that you can switch in and out of your Windows installation at will. You might have one group of fonts that you like for Ami Pro, while you want a second set for PageMaker work. Font Chooser lets you manage these font groups without hand-editing files or restarting Windows. Type Tutor lets you select a document style and then gives you suggestions for appropriate, complementary typefaces.

HOW TO BUY A DOUBLE-SPEED CD-ROM... WITHOUT GETTING TAKEN FOR A DRIVE.

Introducing Creative OmniCD.

If you've been thinking about adding the power and excitement of an internal CD-ROM to your PC, here's some great news: thanks to our exclusive Creative Double-Speed Technology,[™] *double-speed CD-ROM performance is now available at about the same price you'd expect to pay for a single-speed drive.*

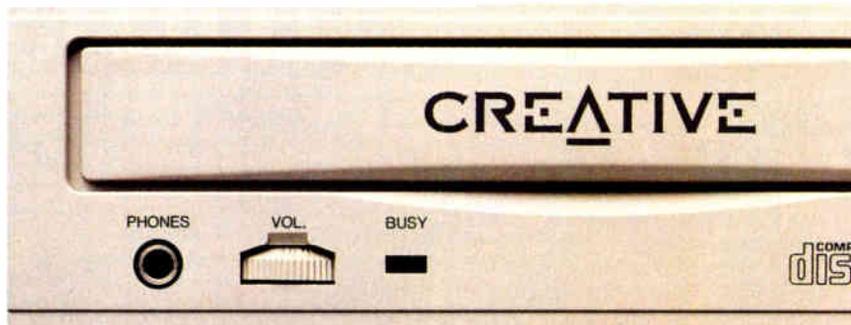

And we're not talking about just any CD-ROM here. This is a full-featured, MPC 2 compliant, XA-ready, 300KB/second, multi-session photo CD drive with a blistering fast 320ms access time:

The all-new Creative OmniCD.[™]

WORKS WITH ANY SOUND CARD.

Of course Creative OmniCD works with your Sound Blaster[™]—after all, it is the industry standard for PC audio. But what if you've already got another sound card?

No problem. Because *Creative OmniCD works perfectly with just about every major brand of audio card...or even without a sound card for applications that don't use audio.*

Best of all, Creative OmniCD opens up a whole new world of CD-ROM applications. Like photo CD—we've even included Aldus[®] Photostyler[™] SE image enhancing software right in the box. And also games, multimedia and business applications, education, and more.

THE BOTTOM LINE: A LOT MORE DRIVE, A LOT LESS MONEY.

Sure, there's plenty of other manufacturers offering double-speed CD-ROM drives. But as part of a complete package *with an SRP of less than four hundred dollars.** Now that's Creative.

For more information and the name of your nearest Creative Labs dealer, call 1-800-998-5227.

PENTIUM TECHNOLOGY.

NOW.

\$3,999.

How? AMBRA. WHAT MORE CAN WE SAY BESIDES "CALL SOON"?

Computers powered by Intel® Pentium™ processors are here!

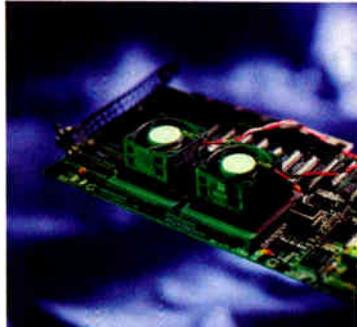

And a fast-moving company puts them directly within your reach, right now! We're AMBRA,™ a new IBM® subsidiary committed to bringing you the very latest — like full-fledged 64-bit Pentium technology — for less. We think you'll agree our specs and prices speak for themselves. Loud and clear.

Model DP60E/VL

- Intel Pentium processor, 60 MHz
- 64-bit processor complex
- 8MB RAM, max: 64MB
- 256KB processor cache
- 3.5" 1.44MB diskette drive
- 540MB SCSI hard disk
- Onboard dual-channel fast SCSI
- 8 32-bit EISA slots
- 2 local bus VESA slots
- ATI® Ultra Pro Mach 32, 2MB VRAM
- 15" Flat Square LR color monitor, NI
- Desktop casing (8 x 6; convertible to minitower)
- 200-watt autoswitching power supply
- MS-DOS® 6.0, Windows™ 3.1, mouse

\$3,999

Power times two — today and tomorrow.

AMBRA's dual-processor complex delivers double Pentium processor power in one computer — taking advantage of multi-processor support in such operating systems as UNIX® and Windows NT®.

Model TP60E/VL¹

- Intel Pentium processor, 60 MHz; upgradeable to dual processors
- Dual 64-bit processor complex
- 16MB RAM, max: 128MB
- 512KB processor cache
- 3.5" 1.44MB diskette drive
- 540MB SCSI hard disk
- Onboard dual-channel fast SCSI
- 8 32-bit EISA slots
- 2 local bus VESA slots
- L25 S3 805 video accelerator, 1MB DRAM
- 15" Flat Square LR color monitor, NI
- Tower casing (8 x 12)
- 350-watt autoswitching power supply
- MS-DOS 6.0, Windows 3.1, mouse

\$4,639

Complete customization.

The Pentium processor-based systems presented here are just the beginning of your choices with AMBRA. We custom-configure to your exact specs — preinstalling and/or preloading your pick of memory sizes, hard disks, option cards, and more — with no extra service charge and no delay.

Complete confidence.

AMBRA covers every computer with a 30-day money-back guarantee, and we've contracted with IBM to provide one-year onsite warranties.^{2,3} You can count on expert technicians nationwide to deliver service within two days of your call, Monday through Saturday. And you can rely on toll-free technical support 24 hours a day, 7 days a week.

Complete convenience.

To get more information or place an order, just call. AMBRA's lines are open every weekday 8 am to 9 pm, and Saturday 10 am to 6 pm (ET). We accept American Express®, Visa® and MasterCard® — as well as purchase orders from qualifying businesses. So pick up the phone, and get a direct line to Pentium processing power today.

MULTIMEDIA

Intel's VDI Speeds Up Video, Miffs Microsoft

Intel and Microsoft are at odds over a new way to dramatically accelerate Video for Windows. Although it's likely the two giants will resolve their differences before they cause problems for users, some of the smaller companies are scrambling to avoid getting trampled in the fray.

At issue is Intel's new Video Device Interface, a software extension to video drivers that roughly doubles the speed of software-only playback in VfW. A PC that plays VfW movies at a jerky 15 frames per second could attain true full-motion video at 30 fps at the same resolution without any additional hardware. Intel says VDI also improves overall picture quality and, once installed, is completely transparent to applications and users.

What's wrong with that? Plenty, says Microsoft. To achieve its magic, VDI bypasses the Windows GDI (Graphical Device Interface) and writes directly to the video controller's frame buffer. Although Microsoft acknowledges that direct access to the frame buffer is a legitimate way to accelerate software-only video playback, it argues that Intel's implementation is premature and overcomplicated. Microsoft says VDI conflicts with a similar mechanism it plans to introduce this year.

"The technique is not rocket science," says Carl Stork, Microsoft's director of Windows platform definition. "We could demonstrate our technology now, but we're not ready. We don't understand why Intel decided to announce the VDI specification [in late August]. They should have

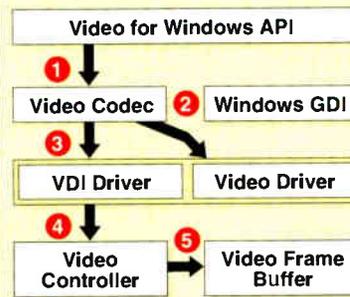

waited until we had the spec finalized and then made an announcement together."

According to Stork, codecs can't use VDI without understanding the frame buffer's internal structure, such as whether the buffer is arranged in banks and how large those banks are. Too complicated, he says: Codecs shouldn't have to know anything about the frame buffer but its starting address.

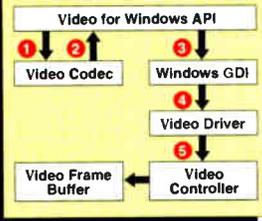

Likewise, the new VDI driver (which can be integrated with the video driver or installed as a separate DLL) can perform such functions as clipping and scaling. Redundant, says Stork: Those tasks are already handled by the GDI.

Intel contends that VDI is intended to complement the GDI, not replace it. The GDI is fine for regular graphics, says Intel, but it adds too much overhead to video playback and doesn't let codecs directly ac-

How Intel's Video Device Interface Works

How Video for Windows Works Now

How Intel's Video Device Interface Works

1. Video for Windows sends the encoded data stream of compressed video to the video codec.
2. The codec queries the video driver to see if it supports VDI or checks to see if VDI is implemented as a separate driver. If there's no support for VDI, video is handled normally through VfW and the GDI. Otherwise, the codec queries the driver to see which VDI functions are supported (e.g., color-space conversion, color-keying, clipping, and scaling).
3. After determining which VDI functions are supported, the codec decompresses a video frame, opens a channel to the VDI/video driver, and hands off the appropriate tasks.
4. and 5. The VDI/video driver BitBits the video frame onto the screen by directly addressing the video controller's frame buffer, bypassing the Windows GDI.

How Video for Windows Works Now

1. Video for Windows sends the encoded data stream of compressed video to the video codec.
2. The codec decompresses a video frame, converts YUV color to RGB, and sends it back to VfW.
3. VfW calls Windows GDI routines to handle such tasks as window management, clipping, and scaling.
4. The GDI sends the video frame to the video board's driver.
5. The video driver transfers the BitBits to the video controller's frame buffer to display the frame on-screen.

cess the frame buffer in video's native format, YUV (luminance-chrominance).

Although Intel's announcement was joined by ATI Technologies, Brooktree, Matrox, Tseng Labs, Western Digital, and S3, a few vendors quietly avoided the press conference.

A spokesman for one company that declined to participate told BYTE: "We don't want to be forced to choose sides between Intel and Microsoft. We're just a small company, and we can't afford to get stepped on by a pair of 800-pound gorillas."

—Tom R. Halfhill

BEAM MY FILES UP, SCOTTY

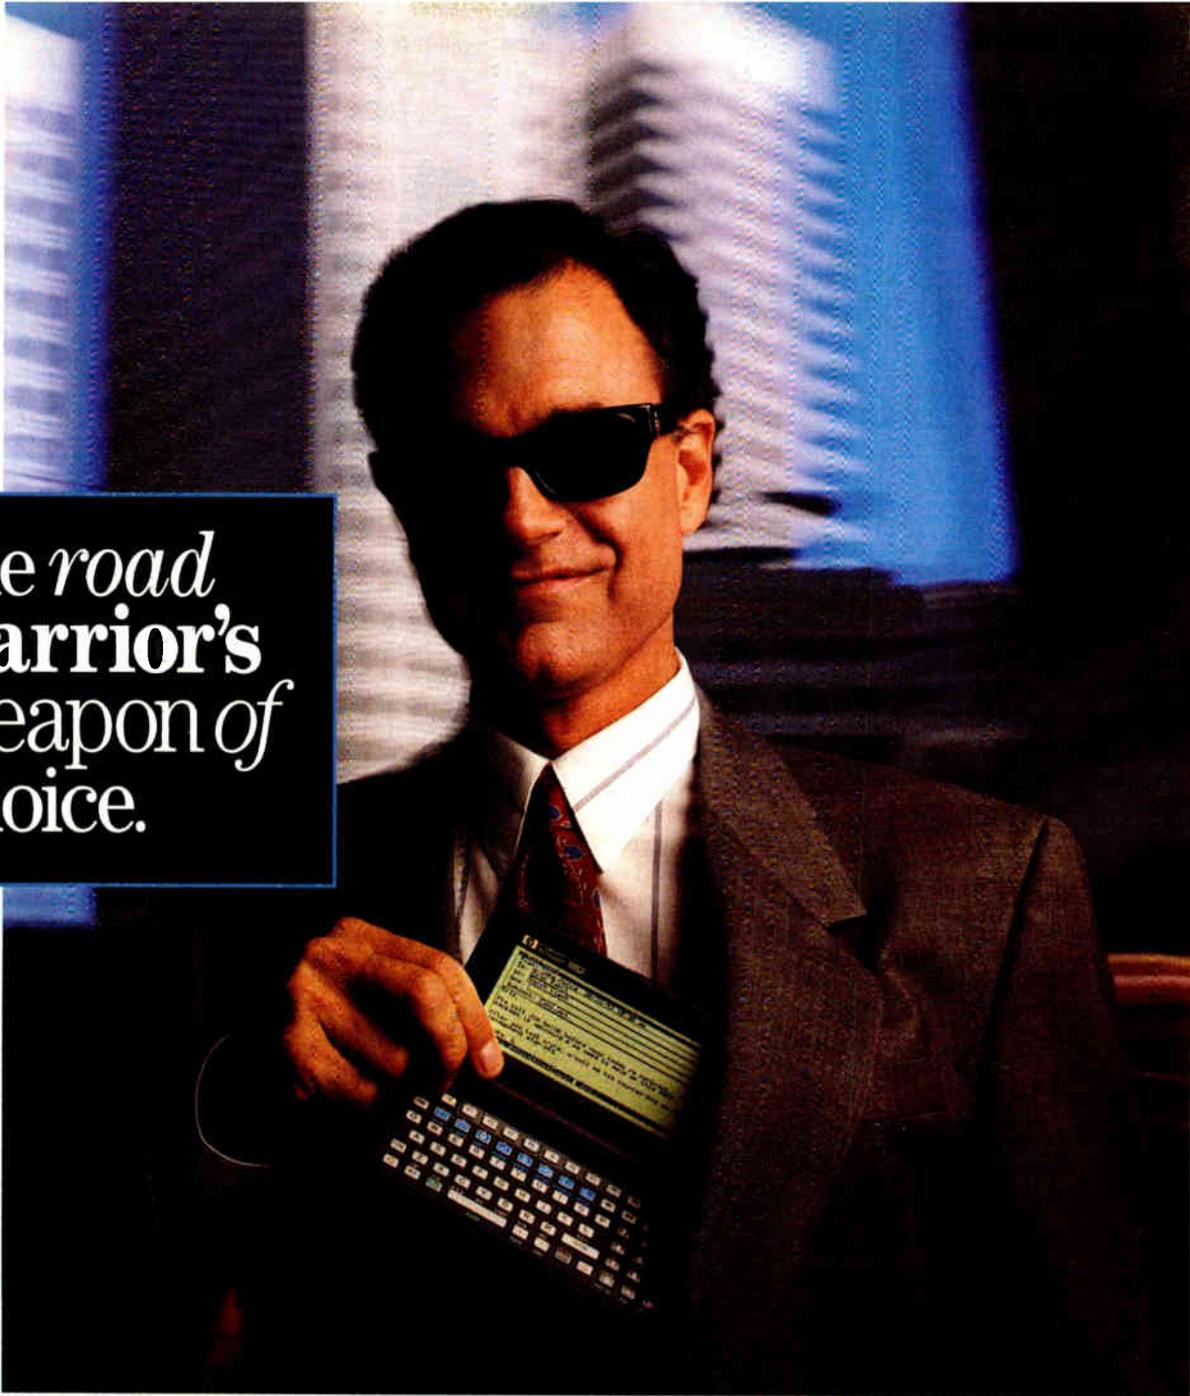

Infrared technology is poised to do for the office what it's done for the living room's entertainment center. Instead of being used to change TV channels, infrared light beams will make it much easier to exchange data between desktops, PDAs (personal digital assistants), and other devices. For swapping data to become as easy as changing channels, however, an infrared standard must be built into products from many companies. A nonprofit group called the InfraRed Data Association (IRDA) says it has a way to ensure that happens.

IRDA has agreed on a short-range, point-to-point standard for two-way infrared links. The group hopes these links will soon replace cumbersome cables for simple tasks such as moving a spreadsheet from your desktop to your laptop. IRDA's high-profile members include Intel, Microsoft, Apple, and Compaq.

Using infrared beams in place of cables is not new, of course. Infrared-leashed mice have been available for several years now, as have a handful of infrared-based LANs. Infrared has crept into newer products as well. But because they operate at different speeds and use varying protocols and data formats, they won't communicate with devices outside their immediate families. The new standard is expected to change all that. Based on the same technology already used in HP's products, the IRDA standard is a baseband system that zips along at 115 Kbps. HP's approach was chosen over competing systems from Sharp and General Magic due to its superior speed, circuit simplicity, low power requirements, and minimal cost, according to Steven Harris, an engineering manager at Crystal Semiconductor and chairman of IRDA's technical committee.

Whether or not there will be any provision for compatibility with previous infrared systems remains to be seen. Harris notes that it's possible to support the IRDA standard and a proprietary infrared system on a single chip. New products using the IRDA standard could begin appearing by the end of this year, with many more arriving in 1994.

—Christopher O'Malley

The road warrior's weapon of choice.

The HP 100LX palmtop PC keeps you in touch wherever you go.

It packs cutting-edge computing and communications features. All wrapped up in a sleek 11-ounce package. Including one-key access to:

cc: Mail® Mobile, the market-leading e-mail software.

Today's new card modems fit neatly into our PCMCIA 2.0 slot, connecting you to your corporate or office e-mail systems. Talk about portable communications! This e-mail solution fits right in your pocket.

Take most of your office with you. Built-in MS-DOS® 5.0 means you can run optional PC soft-

ware, such as Quicken, Microsoft® Project Manager and ACT! No other palmtop comes close.

With equal ease, you can create custom databases. And sort through a list of customer billing profiles or your favorite restaurants.

Even when you're on top of the world, our appointment book keeps you on top of your schedule. With week- and month-at-a-glance. You don't miss a thing.

Keep running numbers on the run. One touch brings up Lotus® 1-2-3,® Rel. 2.4. You're in spreadsheet heaven!

The features keep coming. Like note-

taker to capture ideas. Powerful analysis on the HP financial calculator. Flexible phone book. And much, much more.

For more information and the name of your nearest HP 100LX dealer, call us at 1-800-443-1254, Dept. 785. Or in Canada, 1-800-387-3867. Then hit the road armed with all the right answers.

ARTIFICIAL INTELLIGENCE

AI Saves Money and Time

In a market dominated by drastically reduced profit margins, hardware and software companies are eager to use technology that will help them reduce costs while maintaining their standards for quality and customer service. One technology they are turning to is AI. The recent Innovative Applications of Artificial Intelligence conference featured 16 award-winning applications built at companies like IBM and AT&T. They saved between \$1 million and \$20 million annually. The programs spanned a range of areas: intelligent CASE tools, customer support, product quality man-

agement, troubleshooting, and configuration.

Compaq's Windows-based QuickSource typifies new products that offer knowledge publishing. Through a help-desk-on-a-disk program that Compaq ships with all its networked printers, Compaq has shrink-wrapped its staff's troubleshooting expertise and put it in the hands of its customers. The result, according to Compaq, is a savings of \$10 million to \$20 million annually in customer service operations. The company believes that 20 percent of all problems are now handled directly by customers themselves with QuickSource.

Compaq used CBR (case-based reasoning) techniques, a branch of AI, which enables programming by example. Knowledge is stored in the form of experiences, or cases, that are written in conversational-language style. When a new case is described to the CBR system, it retrieves similar past cases. This technique is proving valuable for help-desk applications, enabling users to store the expertise of its best specialists. QuickSource captures about 500 cases with three levels of detail: for internal Compaq use, for

service providers/dealers, and for end users (printer customers). The system also includes rule-based reasoning, the hallmark of expert systems, to help focus the case searches.

Other companies with award-winning applications that use AI to save money include Nynex and IBM. Nynex, the Baby Bell serving the northeast U.S., has developed the Outside Plant Engineering and Resource Administration application, which assists more than 350 engineers in planning and installing sophisticated electronic equipment. Nynex reports a significant productivity gain and \$5 million annual savings.

IBM's Diagnostic Yield Characterization Expert provides automated data interpretation and process diagnostics for semiconductor manufacturing. It looks at product quality and yield loss. The company says the program reduces diagnosis time from several hours to minutes. IBM estimates DYCE saves hundreds of hours per month of engineers' and technicians' time. In addition, early detection has saved additional products from being manufactured with a defective process. This has meant a savings of several million dollars.

Interest in AI declined after an initial flurry of interest in the middle 1980s. However, in today's highly competitive atmosphere, companies are looking for solutions that give them an edge over their competition. AI is proving to be one such solution.

—Sara Hedberg

ERGONOMICS

Software Eyes Health Concerns

LONDON—When it comes to ergonomics and health issues regarding the use of desktop computers, Europe is often several steps ahead of the U.S. The Scandinavian countries' long-standing insistence on low-radiation monitors and the emergence of the EC's VDU directive that is now law in all member states exemplify a heightened awareness of how computers affect us.

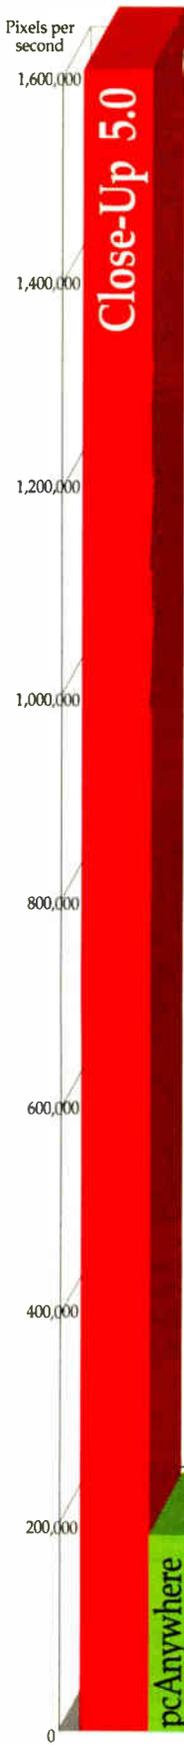

The regulations and guidelines regarding the use of monitors in the workplace have created an opportunity for European software firms that develop products that help companies comply with the law. Two products focusing on eye testing on a user's machine and the wider implications of the EC's VDU law show that companies are taking advantage of the opportunity.

City Visual Systems (+44 71 837 3388) has released a product called Vision Screener. It makes use of a clause in the EC directive allowing optometric software to perform eye tests, with employee consent, on a user's machine. The software runs under Windows 3.1 and contains a series of tests aimed at spotting any eye problems experienced by the user.

Vision Screener does not replace the need for employers to arrange physical eye exams by a trained optometrist for employees. But it can help cut down on unnecessary testing. The package is also useful in charting a person's recovery from a VDU-related complaint after treatment.

The other Windows package is ErgAware from UserData (+44 71 243 2925). Through a question-and-answer process, the program assesses how well your company complies with European VDU health and safety provisions.

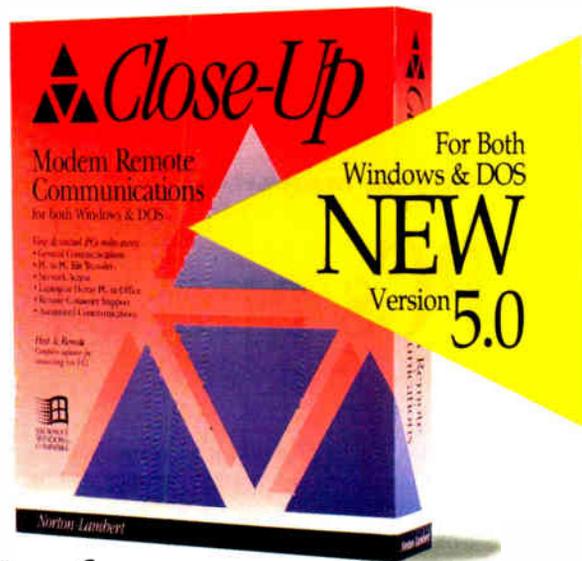

"There is a perception in Europe that everything must be more advanced in the U.S., but this is not really the case in ergonomics," says Chris Hunt, managing director of City Visual Systems. "The country [the U.S.] is so vast and has so many variations between state government and employer attitudes that things are fragmented, with no common guidelines." However, this state of affairs could change in the U.S. if regulations regarding the use of monitors in the workplace are attached to the U.S. Health and Safety Reform Act now wending its way through Congress.

WinBench™ 3.11 by Ziff-Davis Labs Tests Remote Windows™ Speed

This graph shows the speed of the three leading remote control programs when transferring Windows screens. As you can see, Close-Up handles more pixels, faster, meaning you spend less time waiting for Windows screens.

The industry standard test, WinBench 3.11, is perfect for testing the speed of remotes. It is an accurate measure of video throughput. Video throughput is the limiting factor in remote operations, because remote programs must transmit Windows video functions from one PC to the other.

New Remote Software Sets Windows Speed Record

Communicate Faster & Easier

Close-Up* lets you communicate faster & easier with five exciting technology firsts.

Close-Up is the only remote communications software that won both PC Magazine's coveted "Editors Choice" and PC World's "Best Buy" awards. Now Close-Up has a new faster & easier version that allows you to view and control another PC by modem as if you were there!

Why Is Close-Up So Fast?

Close-Up learns as it works. It uses AI (Artificial Intelligence) to compress all Windows video function calls. That's why Close-Up does so well in Windows

Technology Firsts

1. AI Video Compression
2. Photographic Memory
3. Non-Intrusive Technology
4. Expert System
5. Video Translation

Benchmark tests (see WinBench 3.11 chart). Close-Up uses its revolutionary Photographic Memory™ so that once Close-Up has seen all or part of a Windows screen, it's memorized. Then as screens change, Close-Up only transmits new unmemorized data. Incredibly, with this technology Close-Up gets faster & faster the longer you use it.

What Remote Companies Haven't Told You

Other remote programs permanently slow Windows and usually reduce your video resolution and depth of color, even when they are not in memory. That's because they permanently change your system.ini file. Close-Up's breakthrough Non-Intrusive Technology does not modify any of your sensitive Windows files including the system.ini. Close-Up is the only remote that when not in use, allows Windows and your PC to run at normal optimal levels.

Expert System Makes Communications Easy

You don't have to be a communications expert to get the results of one. Close-Up has an Expert System that automatically analyzes system components and configures your system for optimal speed.

Video Translation

With Close-Up, dissimilar PCs can easily connect, because Close-Up senses the video capabilities of both PCs and automatically displays Windows in a video mode compatible with both sides.

Risk-Free Offer!

Try Close-Up. If you're not absolutely convinced that Close-Up 5.0 is the fastest remote program, we'll give you your money back!* Order Close-Up Host & Remote, a complete system, for only \$199.⁹⁵

Upgrade your current or competitive remote program to new Close-Up 5.0. Get both sides, Host & Remote, for only \$69.⁹⁵

TREVOR MARSHALL

PCs and Printing Plates

In the world of desktop computing, every day brings a new technology that makes current technology obsolete. Compared to the fast-paced world of desktop computing, the prepress industry changes at an almost glacial-like pace. But based on observations at the International Printing Exposition, or IPEX, it is clear that this industry has begun to fully embrace the computer.

"This industry has seen little change for decades," says Andrew Low of Genix Imaging, the London-based distributors for Cactus plotting systems. "But this show is totally different from the last IPEX. There were very few PC-based prepress computers at the last show, just a lot of mechanical printing presses. In the last five years, this industry has been thrust into the computing age, and many of the artisans and craftsmen are finding it difficult to cope with the new concepts."

Some major industry players are managing better than others to understand the dynamics of this new marketplace. Mitsubishi announced the formation of MC-Imaging, a company that will market Mitsubishi's prepress products worldwide, as well as those of other manufacturers; thus, it can provide customers with solutions tailored to their own requirements.

MC-Imaging has also decided to sell directly to the end user, bypassing the distribution channels that Mitsubishi has previously used. Company officials say the reason for the direct-sales effort is that its customers increasingly de-

mand better value for their money and the expert advice that only a specialized prepress company can provide.

Brussels-based Dainippon Screen is also restructuring its operations. Roger Mattalon, Dainippon's European general manager, says the company now sells open systems. "If a customer wants to use Photoshop on a Mac or PC, we will not try to sell him our own proprietary solution but only those parts of it that he needs," Mattalon says.

The most interesting new technology at IPEX is called direct-to-plate printing. Currently, when a page has been prepared on a PC, it is transferred as a PostScript image to an imagesetter, which plots the page to high-resolution film. That film is then put into a photographic platemaker, and the aluminum plates that the printing press uses are exposed and etched.

Direct-to-plate systems let the actual plate material be created in the imagesetter, bypassing the inaccuracies inherent in the old process. Agfa Compugraphic demonstrated its Lithostar process, which creates aluminum plates that have a service life of 100,000 copies. Mitsubishi Paper Mills has Silver Digiplate, a lower-cost alternative in which the plates are made with paper or polyester substrates.

Although MPM's plates are good for only 20,000 copies, the media can be used in standard imagesetters and costs only about \$1 per square foot. This system could considerably lower the current cost of short-run color printing.

Perhaps the most interesting direct-to-plate technology was shown at the NewGen booth. There, Plazer Ltd. (Tel Aviv, Israel) was generating printing plates using standard laser printers. In Plazer's new process, special polyester material is fed into a laser printer. A person then etches the resulting image using nothing more technical than cotton swabs of etch solution. The sheets were then put into a small Heidelberg T-Offset press, which can generate prints at an alarming rate of 10,000 copies per hour. Plazer says that the life of a typical plate is 15,000 copies. The product can be bought in the U.S. from Anitec. The cost of this polyester "plate" material is about \$1 per square foot.

Plazer's new technology might give new meaning to desktop publishing, as you can run what would normally be a plain black-and-white image several times through the press to produce prints with color spots. The plazer film is also transparent, so it can generate screens for silk-screen printing.

Autotype International showed a laser platemaker system called NovaDom that is similar to Plazer's, but Autotype processes its plates in a toner-fusing machine prior to putting them in the press. The fuser costs \$450. Autotype is more conservative, claiming that each plate will last for 5000 or so copies, as com-

MANUEL KING © 1993

Direct-to-plate technology, a highlight of the International Printing Exposition, will bring printers into the digital age.

pared to Plazer's claimed 15,000-copy life. Both systems are capable of resolutions in excess of 1200 dots per inch.

At the last IPEX, which was held in 1988, heavy machinery represented 90 percent of the exhibit space. This year the electronic prepress exhibits have expanded to occupy nearly half the total floor space. What a difference five years make. ■

Beauty And dBASE.

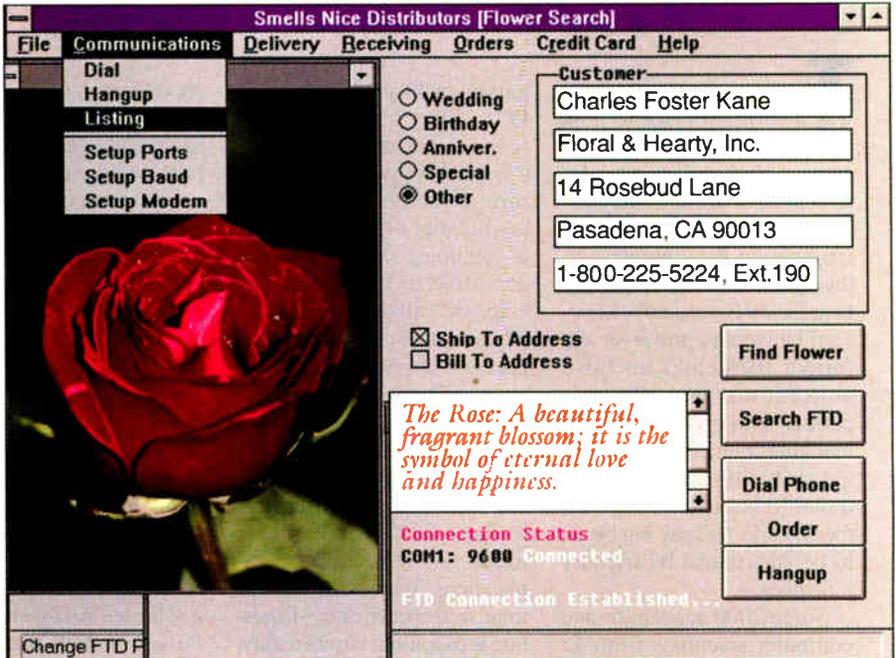

For millions of dBASE developers, this is a fairy tale come

true: new CA-dBFast 2.0, the first and only dBASE-compatible database and language for Windows.

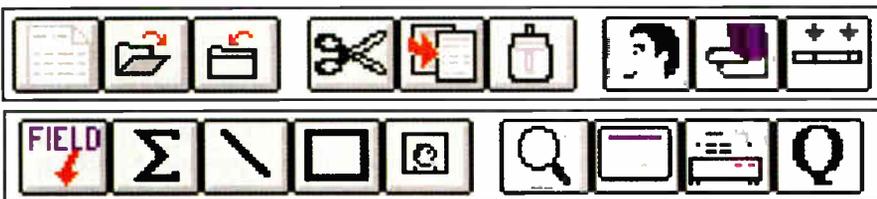

CA-dBFast meets two giant needs: moving existing dBASE applications to Windows and developing dazzling new applications in record time. It's the one solution that lets you take advantage of Windows while protecting the huge investment you've made in Xbase technology.

With CA-dBFast 2.0, you get a proven, stable environment that's more visual and more intuitive than anything you've ever used. And there's no need for Microsoft's confusing, intimidating SDK, so creating applications with CA-dBFast is - true to its name - fast.

CA-dBFast includes Windows interface objects for pull-down menus, push buttons, radio buttons, check boxes, scrolling list boxes, bit-mapped graphics and more.

debugger that's so advanced it lets you watch your source code execute at run time - even Single Step through execution.

CA-dBFast's report writer, CA-RET, lets you mix text, graphics and data to produce great-looking reports in minutes.

The Visual Application Designer (VAD) makes creating pull-down menus, push buttons, radio buttons, check boxes, scrolling list boxes and other Windows objects as easy as "point and click" or "drag and drop".

The VAD generates the required source code, saving you hours of complex programming. You also get a

CA-dBFast 2.0 also includes CA-RET - an outstanding Windows-based report writer that lets you mix text, graphics and data on the same report in a full WYSIWYG environment.

Creating great-looking tabular reports, form letters and labels is as easy as using a word processor.

FOR A FREE DEMO DISK, CALL 1-800 CALL CAI, Ext. 190.

With CA-dBFast applications, there are no license fees, royalties or key diskettes to bother with. And recipients of runtime programs don't need CA-dBFast to run the application - just Windows. CA-dBFast is also compatible with CA-CLIPPER, dBASE III Plus, dBASE IV, and FoxBASE.

So whether you want to wake up old applications or build brilliant new ones, there's only one way to marry Windows beauty and Xbase power.

Check out CA-dBFast today.

The VAD generates the required source code, saving you hours of complex programming. You also get a

New CA-dBFast Release 2.0.

RICH FRIEDMAN

Walt Disney Knew a Good Interface

The home of Disney World was a befitting place to hold the 5th International Conference on Human-Computer Interaction, or HCI. Disney engineers believed in multimedia long before the computer industry. As conference participant Lewis Branscomb, a Harvard University professor and former IBM chief scientist, noted, it was Walt Disney's people who created human-machine interfaces that have induced millions of people to travel long distances to visit theme parks and pay big bucks to be entertained by friendly machines.

Some 2000 academics and computer scientists from 43 countries came to the city Disney built to exchange ideas and research notes on how to make computers easier to use during the next 10 years. Several presenters showed or referred to that deceptively simple Knowledge Navigator video that Apple produced in 1987 to demonstrate what kind of computers we might be using in the future.

In the Knowledge Navigator video—set half jokingly in the “era of the 40-minute work week”—a young professor tells his computer, which looks like a small flat notebook, to rearrange his schedule, converse with a colleague, search disparate databases for “a certain paper that was written about two years ago on the effect of logging on the Amazon rain forest,” and perform other perfectly

natural tasks you'd love your PC to do.

So how close are we to such a vision? Not very, but by the turn of the century, experts predict that desktop PCs will be humming along at between 256 MIPS to 1 GIPS. The average PC will hold about 4 GB of data, and networked data access will be counted in terabytes. This means that if the hardware engineers continue to extract their miracles, there will be enough bandwidth and speed to take graphical interfaces far beyond today's menu- and mouse-driven applications. Welcome to much-improved speech and 3-D gesture recognition, virtual reality, agents, and eye tracking.

Jakob Nielsen, a research scientist at Bellcore in Morristown, New Jersey, who gave a day-long seminar on next-generation user interfaces, believes that future computers will play a much more active role in terms of what they present on their screens to users. For example, a PC might automatically change the size of a screen font to accommodate a user who sits further away from the screen. Object-oriented software will let the document, rather than the applications that created it, become the primary focus of the user's attention. In fact, plug-and-play software modules will replace applications altogether, thus eliminating, for example, the need to store—and use—six different spelling checkers that come with

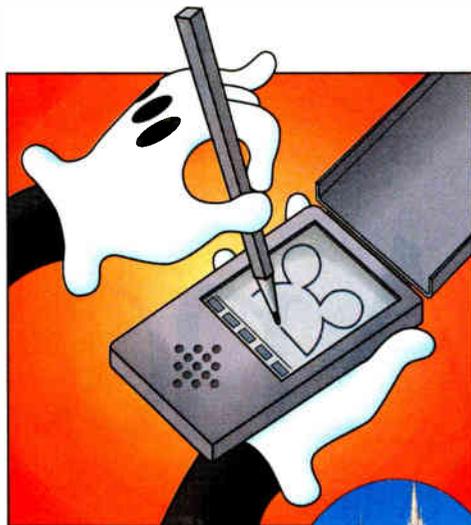

six different applications.

According to Nielsen, as multiple spelling checkers fade away, so, too, will our current notion of files. In the age of gigabyte hard drives, information retrieval will not be based on simple files but rather on interlinked information objects that let you manipulate associations between your data.

Although much work is yet to be done, agents will increasingly anticipate a user's needs and take over many tasks of operating a computer. If an agent senses that a user is having trouble, it can suggest a solution. An agent can learn fairly complex patterns, forward data to various locations depending on where a user is, and even, in some circumstances, DWIM (do what I mean) instead of DWIS (do what I say).

With its increased ability to recognize patterns and work habits, the computer will take on more programming tasks. By observing a user, the computer will be able to write programs that automate such behavior in the future. This will be more far-reaching and universal than the arcane scripting and macro languages contained in present applications.

Everyone's question, of course, is, When will the next-generation interfaces happen? Some are already in use, such as pen and voice recognition, but they are handicapped by today's hard-

Experts in human-computer interaction predict computers will play a much more active role, taking the GUI far beyond today's point-and-click method of interaction.

ware limitations. Researcher Nielsen does not believe we will have a very practical next-generation interface before the year 2000. He says that the hardest hurdle to overcome will be standards for advanced data interchange and system integration.

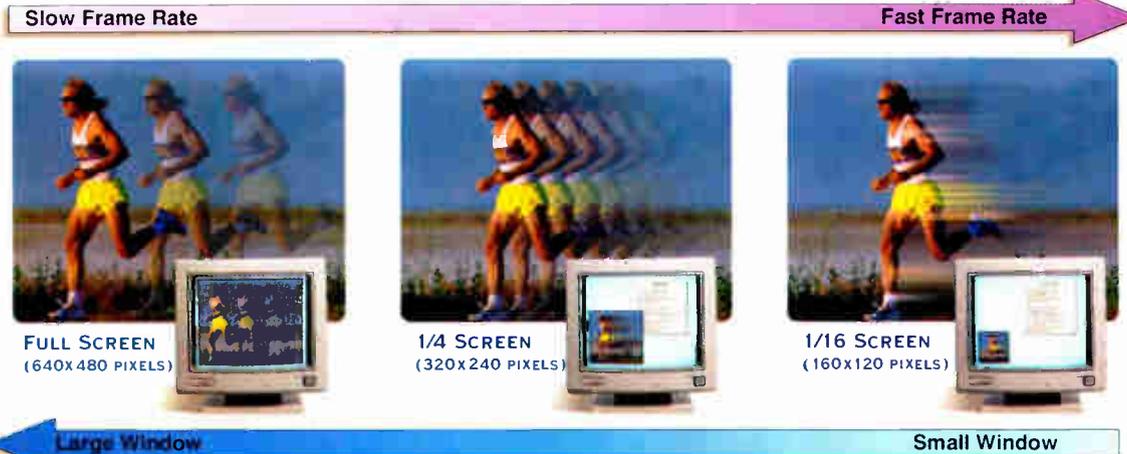

In 1986, a group of Danish computer professionals was asked how computer interfaces would change by the year 2000. A third mentioned speech I/O; 16 percent cited the increased use of graphics, mice, and icons; 12 percent thought the “system would adapt to the user's level,” and 7 percent thought we would progress to the point of self-explanatory systems and eliminate the need for manuals. Yet an equal number believed “the past will survive.”

COBOL lives. ■

Rich Friedman is BYTE's executive editor. You can reach him on BIX as "rfriedman."

FACTORS THAT AFFECT VIDEO QUALITY

WINDOW SIZE VS. FRAME RATE

MICROPROCESSOR PERFORMANCE

Processor**	Full Screen	1/4 Screen	1/16 Screen
i486 SX-25	~1 fps*	15 fps	30 fps
i486 DX2-66	10 fps	30 fps	30 fps
Pentium Processor	20 fps	30 fps	30 fps

*Frames Per Second. **Frame rate based on playing an Indeo video file captured at 30 fps. These are typical numbers only. The frame rate may vary based on system configuration and the video clip being used.

FACTORS THAT AFFECT VIDEO PLAYBACK.

THERE ARE ESSENTIALLY THREE FACTORS THAT AFFECT VIDEO PERFORMANCE:

- MICROPROCESSOR SPEED
- PLAYBACK WINDOW SIZE
- FRAME RATE

SMALLER PLAYBACK WINDOWS RESULT IN SMOOTHER, MORE NATURAL VIDEO IMAGES. A FASTER MICROPROCESSOR SUPPORTS BIGGER PLAYBACK WINDOWS AND HIGHER FRAME RATES.

INTEL VIDEO ADVANCEMENTS.

There are three ways in which Intel is continuing to improve desktop video. First, faster video starts with faster computers, so we're developing faster CPU technology. Second, we're working with leading graphics card vendors to optimize their software drivers for Indeo video. And finally, we're developing more efficient compression

and decompression (codec) techniques to give video higher quality. All of which will help you understand why Intel and Indeo Technology mean higher-quality video.

HOW DO I GET INDEO VIDEO?

Indeo video is included in most operating systems, so you get it free. Additionally, most leading software developers are using Indeo Technology

to add video capabilities to their applications, because of its high quality and interoperability between different platforms. So you can interchange video

files between operating systems—even between PCs and Macs. Look for the Indeo video logo whenever you buy multimedia hardware and software.

FOR MORE INFORMATION ON INDEO VIDEO, CALL 1-800-955-5599.

We've prepared a complete package of information including an Indeo Video Technical Overview. Simply ask for literature packet #71. The materials are free. So is the call.

REAL-TIME VIDEO COMPRESSION

Big Blue Tales

ANDY REINHARDT

No matter how closely you've followed the inexorable decline of IBM over the last few years, or how voraciously you've devoured every revelation in the public and bitter "divorce" between IBM and its erstwhile ally Microsoft, you're bound to find new and fascinating details in *Big Blues: The Unmaking of IBM* by *Wall Street Journal* reporter Paul Carroll. Densely researched and richly detailed, it chronicles the fall of IBM, from the heady highs of the early 1980s—

when the company posted a \$6.6 billion profit in a single year, the most ever earned by any corporation—to the nightmare of 1993, when IBM ousted its chairman, broke its policy of no layoffs to jettison thousands of workers, and posted the largest corporate loss ever recorded.

Carroll covered IBM for seven years for the *Journal* and was especially admired for the quality of his sources. He minces no words in analyzing the factors that led to IBM's fall: thick layers of bureaucracy, excruciatingly slow development cycles, a mainframe mentality and lack of vision about the PC market, an inability to deliver good software, and, most of all, rampant complacency that obscured how bad things had really gotten.

The fast-paced narrative is full of juicy anecdotes; some have appeared elsewhere, but many more are published here for the first time. Carroll's access and knowledge are evident throughout. He covers a huge range of subjects, from the underlying trends that have shaped and altered the computer business over the last two decades, to the personalities of key executives inside and outside IBM, to fly-on-the-wall descriptions of key battles in the long-simmering feud between IBM and Microsoft.

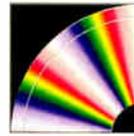

Indeed, the strongest aspect of *Big Blues* is its anecdotes. Carroll reveals, for example, that IBM tried and failed to create a custom version of the 286 that would fix the chip's inability to switch from protected mode back into real mode. He also discloses that Lotus founder Mitch Kapor tried and failed to interest IBM in an exclusive marketing deal for 1-2-3. The latter is one of dozens of examples Carroll cites of opportunities squandered by IBM.

I found especially interesting the discussion of the "bus wars" of 1989, in which Carroll concludes that with the PS/2's Micro Channel architecture, "IBM had staked the future of its PC business on an irrelevancy." Another fascinating section is his description of the events leading up to the fateful 1989 Fall Comdex press conference in which IBM and Microsoft tried to clarify the relationship between OS/2 and Windows and succeeded only in confusing the market.

The book's main weakness is that its assessment of IBM may prove to be too unremittingly harsh. Carroll subjects the company and many of its executives to breathtaking criticism: those especially mauled are former chairman John Opel and former PC division head Bill Lowe, whom Carroll describes repeatedly as wooden and upon whom he heaps the most blame for IBM's PC market-share loss. Carroll accords most favorable treatment to Don Estridge, the head of the IBM PC skunk works, who was killed in an airplane crash in 1985. Microsoft chairman Bill Gates comes off surprisingly well, a notable change from the pasting he has taken in a wave of recent biographies.

The book's organization varies between chronological and thematic, which introduces redundancy and sometimes confuses the order of events. Readers who are not well versed in computer technology will appreciate how clearly Carroll explains basic concepts, but sometimes his lack of technical detail obscures the meaning of events, such as the battle between IBM and Microsoft in mid-1986 over whose GUI architecture should be used on top of OS/2.

Carroll's writing suffers from a problem common among newspaper-reporters-

INFORMATION GALORE

**MICROSOFT DEVELOPER NETWORK
CD QUARTERLY, \$195**

This powerful research tool, built around a customized version of Microsoft's Multimedia Viewer, is an information gold mine for the professional software developer. One section presents technical articles that address a wide range of questions: How do I use the DLL version of the Microsoft Foundation Classes? How does the SQL Server query optimizer work? How can my program exploit the Windows palette manager? Microsoft programmers answer these questions with surprisingly literate prose, diagrams, and sample code.

Another section presents nothing but code samples. You can view and in many cases run these programs directly off the CD. When you want to tinker with them, you can just click on a transfer button to move the complete sources onto your hard disk.

A third section presents the full text of a number of key specifications, including those for NDIS, DPMI, MAPI, ODBC, Windows Sockets, and Windows Telephony. A fourth section contains technical notes and bug reports for nearly 40 products, including Visual C++, FoxPro, MS-DOS, and various SDKs and DDKs. Almost all entries include illustrative code fragments. Bugs still outstanding are so noted, and workarounds (if available) are described.

A fifth section offers books and periodicals, notably classics on DOS and Windows programming by Charles Petzold and Ray Duncan and the *Microsoft Systems Journal*. A sixth section contains documentation for products such as the MSCDEX DDK, the Excel SDK, and the Windows 3.1 DDK and SDK, along with the Windows 3.1, Windows for Workgroups, and Windows NT resource kits. If your livelihood depends on Microsoft's growing family of operating systems, programming tools, and applications, you probably can't afford not to subscribe.

—Jon Udell

PROTECT YOUR SOFTWARE

FREE!
Authorization Button.
Call 800-258-5061

**NO BUTTON,
NO ACCESS.**

Dallas Semiconductor is re-shaping the world of software protection and distribution control with a new family of microchips called Buttons. We put the lid on software piracy by packaging microchips in button-shaped, stainless steel cans. The chips contain missing but critical information to make the software run.

We offer a variety of Authorization Buttons and features so you can select the level of protection and price point that are right for you.

Security Continuum

Button Type	Unique Serial #	Read/Write Memory	Password Protection	Expiration Timer	Decoy Responses
DS1420 ID Button	X				
DS1427 Time Button	X	4K bits		X	
DS1425 Multi Button	X	2K bits	X		X

Snap In, Snap Out

Authorization Buttons interface to the installed base of 100+ million PC's via the DS1410 Button Holder. They simply snap in and out. The DS1410 accepts two Buttons concurrently.

Toward a Dongleless World

New computers that accept Buttons directly, including palm and notebooks, are being designed at OEM's today. Our Dongle Trade-In Program will help in your transition to this world. With an approved application, we'll pay you \$7.00 for each dongle that you trade in for an Authorization Button and Holder. This offer is good until December 31, 1993. The one-piece price for the DS1420 is \$4.35; volume discounts apply.

We're Serious About Security

At Dallas Semiconductor, we design and manufacture our own microchips. And we're the only ones in the software protection business who do. Sixty intricate process steps and a 64-bit unique registration number lasered into each chip prevent duplication.

To learn how to button down your software, give us a call.

**DALLAS

Books & CD-ROMs

turned-authors: a tendency to rely too much on stories strung together with generalizations and foreboding phrases. Thus, describing IBM's decision to pull the PC group back into the corporate structure, he says, "The move would not only doom IBM's PC business but would eventually put Don Estridge on a plane that would cost him his life." (The millions of IBM PCs and PS/2s sold since then suggest that the business was far from doomed.) The glibness reaches a peak in Carroll's frequent assertions that mainframes are dinosaurs and OS/2 is a failure, before the final verdicts have been rendered.

Although he doesn't offer a unique or especially profound analysis of the recent history of IBM, Carroll's story-telling skills justify reading *Big Blues*. If you're hungry for a peek inside the walls of IBM, you'll soak up every page.

Andy Reinhardt is BYTE's West Coast bureau chief. You can reach him on BIX as "areinhardt."

CLONING TRENDS

TECHNOTRENDS by Daniel Burrus and Roger Gittines

HarperCollins, ISBN 0-88730-627-6, \$25

In 1982, John Naisbitt's *Megatrends* launched a new subgenre of business books with a formula that was simplicity itself: Identify a handful of major trends, sketch out each in a highly structured chapter, and pitch the result to baby-boomer corporate business managers looking for a road map to the future. *Megatrends* wasn't so much a book to read as it was a database to access. Naisbitt's 30-something audience could pick up the buzzwords from the subtitles, dig a little deeper by scanning chapter introductions and boldface keynote paragraphs, and check out his statistics and other evidence at leisure. Not surprisingly, clones of *Megatrends* soon started rolling off the presses. Naisbitt even copied his own success in *Megatrends 2000* (which included a prediction that there would be no recession in the 1990s).

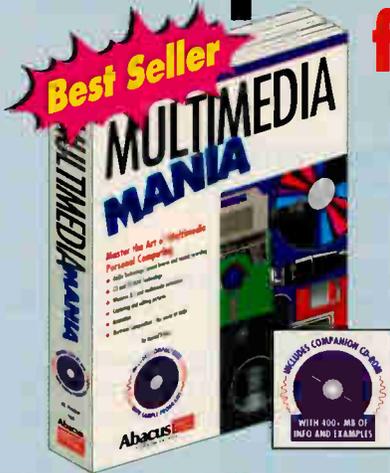

At first glance, Daniel Burrus's *Technotrends* seems to come from the same genetic heritage, albeit with a high-tech spin. The cover blurb promises "24 technologies that will revolutionize our lives." Pen-based and multimedia computers top the list, but that's just the start. Burrus identifies 20 core technologies, nine revolutions new products will create, 30 rules for leveraging new technology ("If it works, it's obsolete"), and nearly 100 paradigm shifts. If the genetic code for a *Megatrends* clone calls for a short list of memorable trends identified by buzzwords, *Technotrends* resembles a recombinant DNA experiment run amok.

Burrus is clearly no management pundit distilling the future into a simple road map. He's not a technologist, either; most BYTE readers won't learn anything new from the discussions of object-oriented programming and distributed computing. Burrus's goal is to get readers thinking about how all these products, technologies, revolutions, and trends fit together—and how ordinary people can create business advantages from technological change.

Unfortunately, the book's dialogue is sophomoric. And while Burrus's thoughts are wide-ranging, they never go very deep.

—Frank Hayes

Computing Know How Books for advancing your business skills

Multimedia Mania

Learn the basics from adding CD-ROMs and sound boards to making an MPC system. Includes CD-ROM with over 400 megabytes of sounds, graphics, animations, samples and techniques. Experiment with several commercial multimedia demos. Valuable coupons from major software publishers worth over \$600 inside.

\$49.95 with companion CD-ROM.

EXCEL for Science & Technology

focuses on the power of Excel beyond the spreadsheet. Learn about Excel Solver, Scenario Manager, Mathematics Functions, Physics, Chemistry, Technology Conversion and many other topics.

This book and its companion disk allow you to immediately apply what you learn by using the macros and worksheets on the disk. Excel for Science and Technology is more than a book; it's an indispensable professional work tool.

\$34.95 with companion disk.

HP DeskJet Companion

Hands-on knowledge necessary for running ink jet printers efficiently. Provides solid support including how to select and download new fonts, how to choose the correct Windows printer driver, tips on using the color options and practical advice on how to troubleshoot the most frequently encountered problems. The ideal reference for HP DeskJet users, whether they're looking for information about connecting the printer, paper handling or programming the HP DeskJet printer.

\$26.95 with companion disk.

PKZIP, LHARC & Co.

Learn the basics of data compression and then the specifics of using the major shareware and freeware programs. Covers features and commands for using PKZIP, LHARC and others.

\$19.95.

DataCruncher Software-

Fail Safe way to save disk space

A Windows shell for using any of the above software.
\$17.95.

AutoCAD 12 Programming

See how to integrate custom functions and commands into AutoCAD. Learn batch file programming, for user defined startup; script files, for specific drawing sequences; and custom commands with AutoLISP or ADS. Diskette contains menus and programming examples to help you learn fast.

\$44.95 with companion disk.

The 486 Book

See why the 486 is the processor of choice; how it works and how you can set up your system for maximum performance — even with DOS 6.

Info on new Overdrives, DX2s and even the pentium. Includes *System Sleuth Professional* and *PCINFO* software on companion diskette.

\$34.95 with companion disk.

Upgrading & Maintaining Your PC

Turn your PC into a high performance screamer! Whether you're adding memory or a hard drive, a CD-ROM or a sound board or upgrading an XT to a 386 or 486, this book shows you how. Includes companion diskette of utilities and *System Sleuth*™ diagnostic software that helps you analyze your systems performance.

\$34.95 with companion disk.

OS/2 BIBLE

Tells you everything you want to know about IBM's latest and greatest Personal Computer operating system. Learn all about the OS/2 Workplace Shell and the fantastic programs IBM has included with OS/2. See why OS/2 runs Windows applications faster and better than Windows does. The appendix contains a complete printed reference of all the OS/2 commands, so you can find the info you need fast.

\$44.95 with companion disk.

The SoundBlaster Book

This bestselling book is the complete guide to Sound Blaster™, from installation to custom programming. Discusses different Sound Blaster™ cards, commercial, public domain and shareware software products available.

\$34.95 with companion disk.

RUN ROBOT RUN

MOBILE ROBOTS: INSPIRATION TO IMPLEMENTATION

by Anita Flynn and Joseph Jones

A. K. Peters, ISBN 1-56881-011-3, \$39.95

Imagine a robot in your future. It will clean the house, walk the dog, wash your car, and take out the trash. Well, dream on, but don't expect reality to catch up with fiction anytime soon.

There are, however, extremely interesting projects currently under way in the robotics field: interplanetary explorers, deep-sea divers, and automated toxic-waste cleanup crews. In my opinion, one of the most interesting trends in robotics is the move away from the design of giant, all-powerful robots toward developing groups of small, special-purpose machines. It's the approach of trying to build ants rather than anything even as complex as a chimpanzee.

Another trend is the separation of intelligence from intelligent behavior. As long as a robot does what you want it to do, why bother wondering whether or not it's really intelligent? Leave that for the theorists and scientists. Engineers simply make things that work.

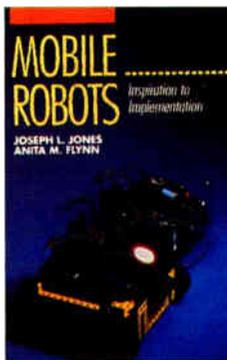

Mobile Robots: Inspiration to Implementation is a handbook for constructing your own experimental robots. These machines may be constructed of Legos and other equally inexpensive components, but they are more than simply toys. They are fully functioning robots with minds of their own.

The simplest machine, TuteBot, doesn't even require a microprocessor. Its programmable, exploratory behavior is controlled by a few transistors and potentiometers. Yet, even being brainless, it can explore entire rooms, wandering into remote corners and extricating itself for further exploration. Believe me, a roomful of these little critters is pure entertainment.

Rug Warrior is the more complex machine, complete with an on-board 68HC11 processor and software based on subsumption architecture. The subsumption approach to robotics is the simple yet elegant concept that behavior should be composed of increasingly complex levels of control. For example, a low-level behavior may simply know how to move a leg. A middle-level behavior could know about gaits. A high-level behavior could say, "Let's go through that door."

Flynn and Jones provide more than just step-by-step plans for constructing these robots. They include the basic mechanical, electrical, and software background for making it all work, and for designing your own machines. You'll find chapters on real-time control, types of sensors and how to control them, motor dynamics, battery recharging, and the design of stable systems. Appendixes provide complete plans for a 68HC11 control computer, a parts source book, and a list of current robot-related publications (it even references my own newsletter).

Whether you are a serious explorer intent on creating a future world populated with robot devices, or simply a backyard hobbyist building machines to frighten the neighborhood cats, you'll find *Mobile Robots* an indispensable handbook. ■

Ever seen a grown pirate cry? Just plug this in ... and watch

MEMOPLUG™

The amazing Software protection system based on a hardware plug. Contains read-write programmable memory. This system is practical and easy to use for both programmer and end-user. Supports various programming languages, operating systems and types of computers.

U-PLUG™

The premiere protection plug for UNIX systems that connects the standard serial port of computers and workstations.

LANPLUG™

Comprehensive network protection starts with a single plug. The LANPlug lets you operate protected software from any workstation on the network, while supervising a number of authorized simultaneous operation applications.

CLOCKPLUG™

This unique Time-limited software protection system is based on a plug containing a real-time clock. It allows users limited execution times for leasing and demonstration applications.

A password system allows you to rewind the clock by telephone.

High performance 486™DX2.
Blazing 66MHz, backed by our exclusive turbo cache, for unparalleled workstation performance.

Two Full-length ISA Slots.
Connections are everything. And this machine allows for plenty—Ethernet, video, you name it.

Optional Built-in 5.25" CD ROM. The medium with capacity for video clips, graphics, photo CDs, or an entire set of manuals.

PCMCIA Expandability. The T6600C offers a huge wealth of communication and expansion options, including a 16mm PCMCIA 2.01 compliant slot large enough for a hard drive!

Built-in Stereo Speakers. Quality audio adds another dimension to any program. With Microsoft® Microphone™ included, your work can speak for itself.

A technological tour de force that actually tours.

Take your entire show on the road. The new Toshiba T6600C Series represents the most advanced technology and muscle we've ever put into a portable. With its 486™DX2 processor, dual ISA full-slot expansion, and huge storage options, the T6600C Series delivers the power and capacity for the most demanding portable applications. From network analysis to software development to full-blown multimedia, if you need to tour with a great deal of force, this is your system.

Feel the force. **For your nearest dealer, call 1-800 457-7777.**

PC MAGAZINE REVEALS:

The Computer That Gives You The Most Bang For The Buck.

MOST BANG FOR THE BUCK

BANG FOR THE BUCK

ZEOS 486DX2-66... THE TOP GUN \$2995

- Genuine Intel 486DX2-66 microprocessor, upgradable to Pentium™ OverDrive™
- 8MB RAM expandable to 64MB
- 256K SRAM system cache
- 528MB local bus IDE hard drive
- Diamond Viper/VLB local bus video card with 1MB VRAM
- 1.2MB and 1.44MB floppy drives
- 15" ZEOS color SVGA non-interlaced monitor, .28mm dot pitch
- MS-DOS 6 with Enhanced Tools, Windows, and new Microsoft Mouse, plus choice of Lotus Windows applications
- 14,400 bps V32 bis send/receive fax modem
- SAME DAY SHIPPING

Others pale in comparison. There's no way to dispute it! The results are in, and the ZEOS Upgradable 486DX2-66 is "the overall performance winner."

PC buyers expect low prices, top-quality, impeccable performance and prompt support. Basically, they want the most bang for their buck. *PC Magazine* recognized this and compared value-line PCs with more traditional systems to see if they were "truly good values or stripped-down machines

trying to pass for good buys." The results are overwhelmingly in ZEOS' favor. In fact, *PC Magazine* said: "ZEOS doesn't sell a separate value line, but the flexibility of its main system may be the least confusing solution of all."

Stacked against Gateway, Dell, Compaq, IBM and others, ZEOS stood alone. Using the Benchmark Tests

as a guide, *PC Magazine* made these conclusions: "As DOSmark scores are heavily weighted for processor and hard disk performance, the ZEOS garnered the first-place position in that category as well."

"The clear winner is... the ZEOS Upgradable, which turned in an incredible score of 55.01 megapixels per second."

"The real highlight among tested hard disks was the Seagate ST3600A, which has 12-ms access time and 256K of built-in cache. The ZEOS 486DX2-66 Upgradable's hard disk performance was almost 31 percent above the average in this roundup."

Of the "systems that demonstrated the best agility under strenuous exercise of all their components... ZEOS (scored) 26 percent above average."

The ZEOS local bus upgradable systems are the perfect solution—the brand-new motherboard is faster, more integrated, versatile and reliable than ever. Plus, ZEOS is always thinking ahead to your

Get Your Kicks with Switched 56

DANIEL M. JOFFE

Data communications can never be too fast or too cheap. This is especially true for demanding tasks such as internetwork communications, where vast amounts of data are exchanged on a constant basis. Using even the fastest available modems for this task can be slower and more expensive than you might like.

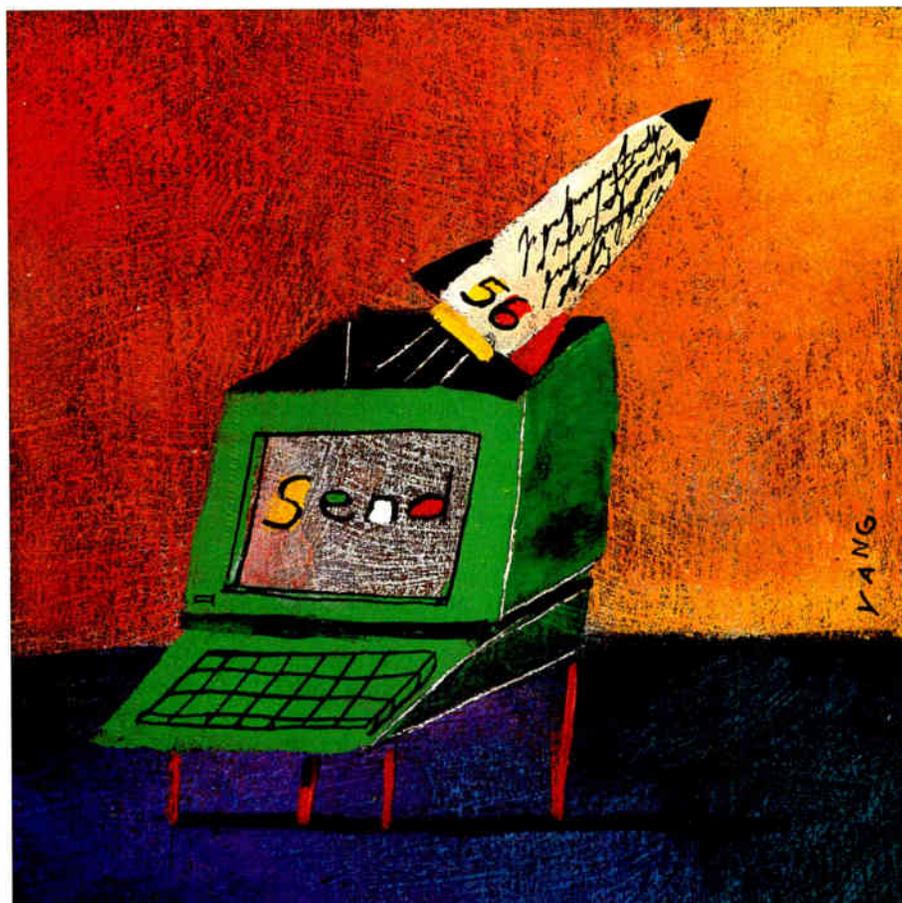

PC users battling the spiral of file sizes and LAN traffic are becoming aware of a digital telephone data-transport service called Switched 56. Every local and long-distance telephone carrier in the U.S. offers Switched 56 digital service. It is a digital, dial-up data channel with speeds of 56 Kbps synchronous or 57.6 Kbps asynchronous.

Although installation costs are higher than for analog service, Switched 56 usage charges are basically the same as for POTS (plain old telephone service). This means that you can save time and money with Switched 56 by shipping more data in much less time. At 9.6 Kbps, a modem takes 90 minutes to send a 5-MB file. The same file at 57.6 Kbps takes 15 minutes; assuming a long-distance call costs 25 cents per minute, you save \$18.75 each time you transfer a 5-MB file at the faster rate. Even modems running at 24 Kbps and higher do not provide the speed and value of Switched 56.

Needy Applications

Switched 56 got a boost with the advent of low-bandwidth videoconferencing. The digital service made it possible to send acceptable sound and pictures using only 112 Kbps, or two Switched 56 lines. As a result, every major videoconferencing manufacturer today has embedded Switched 56 in its equipment.

In publishing, Switched 56 is used to transport high-resolution image files to and from editorial offices. And in medicine,

JAMES YANG © 1993

Switched 56 offers a happy middle ground in price and performance for high-speed data communications

Switched 56 has been tested as a way to send dental x-rays to health insurers for preapproval of procedures or to consulting specialists for examination.

People who work at home with remote connections to LANs—an increasing population—find that 9.6 Kbps can be painfully slow. As a result, some companies use Switched 56 to connect home machines to office LANs.

Switched 56 is growing as a tool for LAN inter-networking. Until recently, LAN routers were linked by dedicated digital lines running at speeds of 56 Kbps to full T1, if traffic warranted, or by dial-up 9.6-Kbps modems. But full-time leased lines are expensive, while the performance penalties of 9.6 Kbps drove organizations to dedicated digital lines even with light traffic.

With Switched 56, LAN routers automatically dial remote locations in response to requests for data from remote servers. To accomplish this, router and Switched 56 CSU/DSU (channel service unit/data service unit) vendors have standardized on V.25bis

TELECOMMUNICATIONS SERVICES COST COMPARISON

Although it can cost significantly more in installation and monthly fees for a Switched 56 line than for a POTS line, per-minute connect charges are almost the same. This could save money considering the speed of Switched 56. The business daytime line rates shown here are quoted from Ameritech, Nynex, and Pacific Bell. Per-minute rates are based on AT&T interexchange rates.

	NEW YORK	NY TO SF	SAN FRANCISCO	NY TO CHICAGO	CHICAGO
POTS					
Installation	\$270		\$155.75		\$165.50
Monthly	\$23.11		\$11.85		\$13.35
Per minute		\$0.25		\$0.23	
Switched 56					
Installation	\$532		—*		\$750
Monthly	\$82.35		\$39.65		\$83
Per minute		\$0.264		\$0.245	
Dedicated 56 Kbps					
Installation		\$1851.08		\$1976.61	
Digital 56 Kbps					
Monthly		\$1645.93		\$903.85	

* Fee waived for 24-month commitment.

as the synchronous dialing-command language. V.25bis is to the synchronous world what Hayes AT commands are to asynchronous users. With V.25bis capabilities, a router can dial anywhere using the same path over which synchronous data is transferred. In the asynchronous world, PC users can turn to 57.6 Kbps asynchronous with AT-compatible dialing to speed their data transfers. And since many Switched 56 CSU/DSUs provide a subset of the Hayes Standard AT command set, PC users do not need to change existing software.

Speed on Demand

Switched 56 is bandwidth when you need it. You only pay for the connection time. Analog modems offer the same capability but not the speed of 56 Kbps, nor the 99 percent error-free transmission accuracy guaranteed by the telephone company. The switched or usage-sensitive nature of the channel delivers powerful bandwidth-on-demand capability that opens up a new range of applications that dedicated channels made cost prohibitive and analog alternatives made too slow.

Just as a modem provides the data interface to a standard analog phone line, a CSU/DSU provides the data interface to a Switched 56 digital phone line. Switched 56 calls are dialed and handled in much the same way as regular telephone calls. Each Switched 56 line is assigned a telephone number that you can dial like any POTS line. The CSU/DSU automatically handles all telephone company maintenance requests and changes the digital line format to a format compatible with DTE

(data terminal equipment). A CSU/DSU has a street price of about \$1000—less than some V.Fast modems. You do, however, need a CSU/DSU at each end of the connection.

Switched 56 replaces the local analog access line with a local digital access line and extends digital capability to a home or business. The combination of Switched 56 access lines and CSU/DSUs keeps the signal from your DTE in digital format from start to finish as it travels through the telephone company's digital network. In contrast, to transmit data using an analog modem, the modem converts your computer's digital signal to analog format, and then A/D converters residing in the central office reconvert the signal to digital. The corresponding series of conversions and related signal degradations occur again at the central office and modems on the receiving end.

Moreover, Switched 56 lines maintain independent transmit and receive paths, making the transmission faster and cleaner. In analog transmission, transmit and receive directions are combined onto the one pair of wires running between your

home and the central office. The analog modem has to separate these directions, causing additional delays and potential for errors.

Switched 56 offers true 57.6-Kbps asynchronous speed for PC-to-PC file transfers. "True 57.6 Kbps" means 1-MB file transfers in just under 3 minutes (assuming 8 bits, no parity, 1 stop bit, and an efficient file transfer protocol). You can send even compressed files that fast.

How do you transmit 57.6 Kbps over a 56-Kbps line? Each asynchronous 57.6-Kbps character is burdened by 1 start bit and 1 stop bit. The meat of the character is the remaining 8 data bits. The Switched 56 CSU/DSU transmits only these 8 data bits using a more efficient way to mark the beginning and end of groups of characters—flag patterns similar to HDLC (high-level data-link control).

BBSes and services like CompuServe typically store large files in compressed format. Compression algorithms such as V.42bis, the CCITT data compression standard used on analog modems, do nothing to speed transfer of already-compressed files. So a V.32 modem with a DTE interface set to 57.6 Kbps can provide a maximum throughput of only 960 characters per second. In contrast, real 57.6 Kbps provided by Switched 56 allows a maximum throughput of 5760 cps, regardless of whether the file was compressed.

PC-Compatible

Some PCs cannot keep up with true 57.6-Kbps speed; it depends on the IC that's being used for the asynchronous serial-port UART (universal asynchronous receiver/transmitter) chip. PCs originally came with 8250 UARTs and later changed to 16450 UARTs. Both chip families share the shortcoming of 1-byte transmit and receive buffers.

With a single-byte buffer at 57,600 bps, the CPU must collect the next byte every 174 microseconds or risk having it overwritten. The "missing" byte would be detected by the communications program's file transfer protocol, and this would result in multiple block retransmissions,

COST-JUSTIFYING SWITCHED 56

Based on installation, monthly, and per-minute fees, Switched 56 becomes more cost effective than using a modem on a POTS line or a dedicated high-speed line. This table shows at which point, measured in megabytes of data transferred per month, Switched 56 starts to save money

	MEGABYTES PER MONTH FOR		
	9.6-KBPS MODEM	14.4-KBPS MODEM	DEDICATED 56 KBPS
New York to Chicago	37.85	63.6	1064
New York to San Francisco	23.47	39.42	1924

SINCE OUR UPS COSTS LESS, LET'S FORGET ABOUT PRICE FOR A MINUTE...MAN

**BECAUSE WHEN THE
POWER DIPS, ITS
NOT WHAT YOU PAID
FOR YOUR UPS
THAT'S IMPORTANT,
ITS WHAT IT DOES**

**SO LET'S TALK ABOUT
FEATURES...**

The MINUTEMAN ALLIANCE A750 keeps your network safe from brownouts, the most common power problem. Our line-interactive technology continuously monitors and provides an automatic boost whenever power dips. This important feature prevents frequent battery usage, saving the battery for more severe power problems.

Other important features that make the MINUTEMAN A750 stand out are a 750 VA

rating, extensive status indicators and a Test button so that you can confirm that the UPS is doing its job. A Site Wiring Fault Indicator is included to let you know if there is a problem with grounding or other on-site electrical wiring problems that could be catastrophic.

The Alliance A750 is compatible with MINUTEMAN's LanMaster unattended shutdown software for all operating systems to further protect your network, even when you're not there.

If all UPSs were priced the same, the choice would be easy based only on features. But when you compare prices, the choice becomes even more obvious.

We don't believe you'll pay 38% more for a product that gives you less. Call our POWER HOTLINE now and find out how to get more UPS for less.

Switched 56 connections can serve most applications that demand high-speed communications: videoconferencing, network interconnectivity, or mainframe links. Each end of the connection must have a CSU/DSU and perhaps a bridge or router.

dramatically reducing throughput.

The 16550 UART with its 16-byte receive and transmit buffers solves this problem. With a 16-byte buffer, the CPU now has 16 times as long, or 2.77 milliseconds, between reads of the receive buffer. This affords sufficient time for the CPU to respond and service longer interrupts from drives or lumbering code. Even so, Windows—particularly disk caching under Windows—generates interrupts so long that even the 16-byte buffer of the 16550 may not be enough. To handle this, some companies have built communications boards with larger buffers.

There are a few ways to find out if your PC has buffered (16550-based) or non-buffered (8250- or 16450-based) asynchronous serial ports. The most direct way may be to just look under the hood. Alternatively, you can download one of the UART identification programs available on most BBSes. These programs tell you the quantity and type of serial ports in your PC. If your computer has a buffered asynchronous serial port, then you need only make sure that your software knows how to take advantage of the buffer.

Once you believe you're ready, you can run a final verification test by transferring a few large files between PCs using a null-modem cable. Most communications pro-

grams give file transfer statistics showing retransmissions and average throughput. This data will tell you whether you're making the most of your 5760-cps potential.

In some extreme cases, you may find that even with a buffered UART and appropriate software, there are still some block retransmissions, caused by an overwritten input buffer while the PC services a long interrupt. Possible remedies for this include using a serial port with an even longer buffer (make sure the software can take advantage of it—there is no de facto standard for such a card) or pacing the transmitter slightly (i.e., increasing the intercharacter timing).

A more expensive alternative (\$600 versus \$60) to standard 57.6-Kbps asynchronous serial ports comes in the form of synchronous 56-Kbps serial communications boards with large built-in buffers and separate processors. These cards off-load the communications task from your main CPU and typically provide an error-corrected HDLC data link. However, they are not that commonly used today, they have proprietary interfaces, and they usually must be interfaced to custom software. You would probably use this arrangement only if you were connecting to a mainframe in a corporate synchronous network.

Large corporations often have T1 (mul-

tiplexed digital) lines. This offers the possibility of further Switched 56 savings through bypassing the local telephone company. A heavy calling volume can be a factor in justifying this kind of arrangement. To determine whether your calling volume is high enough, calculate the cross-over point in number of minutes by dividing the allocated monthly cost of the dedicated access channel by 5 cents, which is the per-minute rate the telephone company charges for providing access to long-distance carriers.

Hooking Up

There are two ways to make a local digital connection to a central office. The more common is known as *4-wire*. This uses independent pairs of wires for data transmission and reception. A slightly less common arrangement is known as *2-wire*, or *Datapath*. This uses one pair of wires and time-compression multiplexing to provide both directions of transmission on a single pair of wires. In time-compression multiplexing, the use of the single pair of wires is reversed every millisecond. For the first millisecond data is outgoing, and for the second millisecond the data is incoming. Which arrangement you use depends on which type your local telephone company offers.

Each telephone company calls its Switched 56 service by a different name, and a local telephone business office may not be familiar with digital services. This is why you should request a guide to services in your area. You can download such a listing of services, tariffs, and customer contacts from various BBSes and from BIX. [Editor's note: For details on connecting to BIX, see page 5.]

Installation costs vary widely: In California, Pacific Bell waives the installation charge if you keep a line for two years; in New England, the cost averages around \$300. Usage charges are basically the same as for regular telephone lines. Monthly recurring charges are comparable to POTS business-line charges, ranging from \$10 to \$90 per month.

ISDN-Compatible

ISDN is essentially two 56-Kbps (sometimes 64-Kbps) data channels carried over a 2-wire technology called 2B1Q, which is incompatible with the 2-wire Datapath technology mentioned earlier. On top of this is a separate 16-Kbps channel for call control or X.25 packet data.

Switched 56 is compatible with ISDN BRI (Basic Rate Interface). This compatibility is important for companies with global networks, since Switched 56 is not

The New Generation 21" Monitor. Incredible Performance. Incredible Price.

COMDEX
Booth L2858

ViewSonic continues its advancement into the future with the powerful and full-featured ViewSonic 21. This flat square 21" monitor offers a picture-perfect image with unsurpassed clarity and brightness.

Designed for the discriminating user, the ViewSonic 21 offers some incredible features including an ultra-fine 0.25mm dot pitch, resolution up to 1,600 x 1,280 non-interlaced and a maximum refresh rate of 152Hz. It also has a double dynamic focus gun which provides a crisp focus even in the corners.

ViewSonic has added the ARAG™ coating to reduce annoying screen glare and ViewMatch™, a color control system that tunes colors to closely match printer output. Its two page display makes this monitor the perfect choice for all windows, 3-D graphics and CAD/CAM applications.

All of this for a suggested list of only **\$2,399!** Unbelievable, but true. ViewSonic has indeed come up with another incredible monitor. In fact, VAR Business ranked ViewSonic as the "fast place" monitor company (Products and Business Features) in a survey of high resolution monitor companies.

The ViewSonic 21 meets MPR-II certifications for low radiation and is backed by a three year limited warranty*. Call **800-888-8583** or visit your dealer today for information on the full line of ViewSonic monitors.

Welcome to the New Generation.

Feature

available in Europe and elsewhere but ISDN probably is. Where the ISDN service is not available, Switched 56 can step up to build large regional or national networks.

Among the problems that have delayed ISDN's deployment has been the cost of converting central office and interoffice facilities. Upgrading even existing digital switches to ISDN can cost from \$500,000 to \$1 million per switch. With this cost structure, some telephone companies have been reluctant to convert a central office without a guarantee of hundreds of subscribers on the day the conversion is complete. As a result, until recently, most telephone companies offered only a Centrex ISDN tariff. (Centrex is a multiline service where a portion of a central office

Upgrading digital switches to ISDN can cost \$500,000 to \$1 million per switch.

Power Packed Upgrades.

POWER SUPPLIES

"The premier power-supply maker"

John Dvorak, *PC Magazine*, March 30, 1993

"The only company to go to for a power supply"

Jerry Pournelle, *Byte*, April 1993

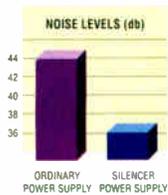

STANDARD UNITS

These UL/CSA approved, fully tested power supplies are the best basic units available.

STANDARD 205 SLIM \$89

STANDARD 220 DESK/TOWER \$89

ULTRA-QUIET UNITS

Unrattle your nerves with a **Silencer** power supply, recognized since 1986 as the industry's quietest. They're cooled by custom, high-efficiency fans that are virtually inaudible!

A must for home office or *multimedia* applications.

SILENCER 205 SLIM \$119

SILENCER 220 DESK/TOWER \$129

SILENCER 270 DESK/TOWER \$179

HIGH-PERFORMANCE UNITS

Upgrade your computer with one of our premium **Turbo-Cool** power supplies—the choice of PC professionals. You'll get 50% - 100% more power, built-in line conditioning, super-tight regulation, ultra-clean output, a high-capacity **ThermaSense** variable-speed fan (300W models), UL/CSA/TUV approvals, and a no-hassle 2-year warranty! Ideal for high-end workstations and network file servers.

TURBO-COOL 300 SLIM/BABY \$169

TURBO-COOL 300 DESK/TOWER ... \$189

TURBO-COOL 450 DESK/TOWER ... \$349

SOLID-STEEL CASES

Give your computer a professional, high-tech look with one of our premium-quality, **American-made** all-steel cases. They're rigid—unlike light-weight imports—so motherboards, cards, and drives are always properly aligned and grounded. And, with up to 18 drive bays, they offer real expandability! Ideal for commercial and industrial applications.

CPU COOLER

It's a fact. 486 chips run hot, often exceeding 185°F! Now, you can cool your 486 to a safe 85°-95°F with our popular **CPU-Cool**. It prevents random system errors and other heat-related problems. Consists of a mini-fan embedded in a sculptured heat sink that easily mounts on the CPU. Powered by a spare drive connector. Effective, inexpensive insurance!

■ cools CPU 70° - 100°F

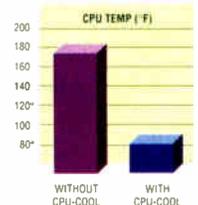

■ prevents system errors

■ adds years to CPU life

■ thinner, quieter, and better-built than cheap imported imitations.

■ safe, simple installation

CPU-COOL \$29

REDUNDANT POWER

Eliminate the risk of network downtime or data loss due to power supply failure with the **TwinPower 900** redundant power system. It delivers high-capacity, fault-tolerant power to your entire network server. Consists of two **Turbo-Cool 450** power supplies in parallel, utilizing a special power-management interface module. A must for mission critical LANs.

■ 900 watts peak power

■ 100X more reliable

than a single-unit

■ load-sharing design

■ hot-swap capability

■ allows dual UPSs

■ monster-case compatible

World Radio History

BUSINESSES ARE USING MICROSOFT ACCESS TO TRACK WORMS, MOVE PEOPLE, AND MAKE WISHES COME TRUE.

HOW WILL YOU USE IT?

"Our information was in a variety of locations: filing cabinets, notebooks, people's heads," recalls Bob Wolf, 3M Product Development Engineer. "The business problem we had was not being able to access our information effectively." They chose Microsoft Access to build their database of ideas, maintain mailing lists, generate surveys, and more. "It saves time in training, in building the databases, and it saves time in accessing the information." Which leaves more time to concentrate on turning wishes into the products people want.

Managing data and reporting are easier.

Scott Emmons, Professor of Molecular Genetics at Albert Einstein College of Medicine, spends a lot of time with worms. Thousands of them. As a basic research tool, nematode worms are a valuable part of learning how DNA forms the blueprint for life. For Scott, managing the variety of data associated with each different mutant worm strain—and being able to generate reports on his research quickly—is critical to keeping his lab running smoothly. He turned to Microsoft Access.

"A major part of the way I'm using Microsoft Access is the reports that I generate," says Scott. "I can sort the data a number of ways, and the ease of use means I can quickly scan these reports to locate a particular strain." And that means a lot less strain on Scott.

The uses are endless.

Intercity Transit in Olympia, Washington, recently moved from Paradox® because of the superior reporting capabilities in Microsoft Access, and its interoperability with other Microsoft applications. "To go with our suite of Microsoft® Office products, we felt it was the best choice for us," explains Richard Madrid, Intercity Transit MIS Specialist.

Today, Intercity Transit relies on Microsoft Access to keep them running—literally. By using it to maintain

and generate timetables for bus riders and drivers, they've all but eliminated scheduling errors, and saved countless hours of proofing and information-transfer time. Plus, they can track ridership by customer segment and keep tabs on the productivity of every route. Now they plan to use Microsoft Access to help grow their rideshare program.

"Microsoft Access has given us a lot of capabilities, not just report writing, but access to the data, and configuring it the way we need it for reporting and tracking," notes Richard. "Plus it's easy, so people are happy." And that's bound to keep Intercity Transit headed in the right direction.

Now everyone in your organization can work smarter—if they work with Microsoft Access. If you use another database or any Microsoft Office program, you can take advantage of our special \$149** offer today, which includes a 90-day money-back guarantee. Then you can create your own success story. When you do, we'd love to hear it—simply write to: Microsoft Access Product Manager, One Microsoft Way, Redmond, WA 98052.

For the name of your local reseller, or to order by phone, call (800) 894-6636, Dept. KS7.

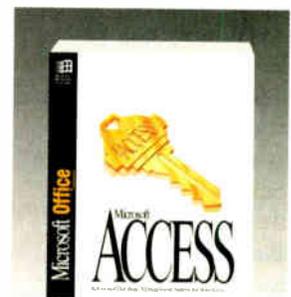

\$149*
90-DAY
GUARANTEE

You may have heard that the introduction of the Microsoft Access® database management system was incredibly successful. In fact,

we've now shipped over a million copies. What you may not know is that this relational database for the Windows™ operating system is being used worldwide in a number of imaginative ways. Once you hear these success stories, you'll want to create one of your own.

Now everyone can get access to data.

The Commercial Office Supply Division at 3M® is always on the lookout for new product ideas. After all, the next Post-it™ note could be right around the corner. But until recently, they were missing a way to organize all of the "product wishes" floating around their department into a format everyone in the group could easily share and use.

Microsoft®

*Special offer for users of competitive database products and Microsoft Office.

**Plus freight and applicable sales tax when ordering direct from Microsoft. Reseller prices may vary. For information only: In Canada, call (800) 563-9048; outside the 50 United States and Canada, call your local subsidiary or (206) 936-8661. Microsoft and Microsoft Access are registered trademarks and Windows and the Windows logo are trademarks of Microsoft Corporation.

Why do they call it a dongle?

He wasn't famous. He didn't drive a fancy car, but dressed in his favorite Comdex T-shirt and faded blue jeans, he set out to change the course of the computer software industry. Quite a task for a lonely software developer.

Sitting in front of his computer, drinking pots of coffee and smoking cartons of cigarettes, he'd write pages of code.

It took time. Years in fact. But he did it. He wrote the most powerful computer program in the world. Now came the hard part. Selling it.

The Most Powerful Program in the World

Determined to make those long years pay off, he called on every distributor, VAR and dealer in the world. He drove from Beantown to San Diego. Flew from Dublin to Borneo. Everyone loved the program.

So he sold a few. Only a few.

Back in Boston he waited. After a long year

with only 13 orders he set out to see what happened. As he drove across the

country and flew around the world he discovered everyone knew about his program. Everyone had it too.

The Global Marketplace

From Paris to Prague, his program was everywhere in Europe. When he got off the plane in Hong Kong he found his program stacked to the ceiling in every computer store. Amazed in disbelief, he bought a hundred cartons of cigarettes and a hundred pounds of Indonesian coffee and flew back to Boston.

Beaten, battered and bruised he went back to the drawing board. This time he would really change the face of the software industry. He would develop a device that would prevent unauthorized distribution of software programs.

Call It What You Like

He developed a hardware key. His peers applauded his efforts. Finally, a solid solution for revenue protection.

But he didn't know what to call it. He thought of naming it after an exotic place he visited in his travels. Madagascar was a bit too long, though.

"Name it after you, Don!", urged his peers. So he did. Soon everyone was calling the key a dongle, after Don Gall — the lonely software developer who did what he had to do.

You've Come A Long Way, Baby

Today, dongles are different. Fact is, they've come a long way. Leading the industry with security solutions, Rainbow Technologies has changed the face of hardware keys. They work with multiple applications, are programmable and network versions control concurrent usage. And they're always transparent to the end-user.

Sentinel Family from Rainbow

Truth is, more and more developers are using keys. And the Sentinel Family is the most widely used in the world. In fact, over 6,000

developers use Sentinel from Rainbow. Why? They are simply the most effective, reliable and easy to implement keys on the market.

Learn more about securing

your software and how keys provide developers with extra value. Call for a free copy of "The Sentinel Guide to Securing Software." And see just how easy it is to

install a hardware key into your application in just minutes. Try it with our low cost Sentinel Evaluation Kit. Order one for your DOS, OS/2, Windows, Macintosh or UNIX based application.

And remember, when you need a dongle, you need Sentinel — the only dongle Don Gall would use.

In Good Electronic Form

**BEN SMITH AND
HOWARD EGLOWSTEIN**

Truth be told, there is no such thing as the paperless office. Today's offices wouldn't function without forms—contracts, supply requisitions, purchase orders. And it's not enough to fill out the forms; somebody has to process them. Even small companies often have employees whose only job is to handle insurance and tax forms.

For Cigna Insurance, the move from paper to electronic forms not only sped up the processing but also saved millions of dollars in printing costs, storage, shipping and postage, and waste removal. And it paved the way for even greater productive use of Cigna's huge network. For a relatively small company like Trace Technologies (a San Jose, CA, maker of magnetic-media duplicating equipment), the motivation was compliance with ISO9000 (a specification for business organizations), but again the immediate returns have been increased productivity.

Moving Mountains

Cigna Insurance is an international company whose services have depended solely on moving information, but a major operating expense has been the mountains of paper that hold that information. By reducing the amount of paper without reducing the information flow, the company stands to save a considerable amount.

Cigna's corporate headquarters employs over 5000 workers in a Philadelphia skyscraper. But the company has over 500 offices spread over several continents, with a total of more than 45,000 employees.

That's the scale of the company; the scale of the paperwork is even greater. Internally, Cigna uses more than 300 different forms. Externally, with its agents and corporate clients, it distributes over 35,000 different forms. This represents tens of millions of sheets of paper a year: warehouses of blank forms and of

MEL LINDSTROM © 1993

A large insurance company and a small manufacturing firm save time and money with electronic forms

forms that have been filled out and filed.

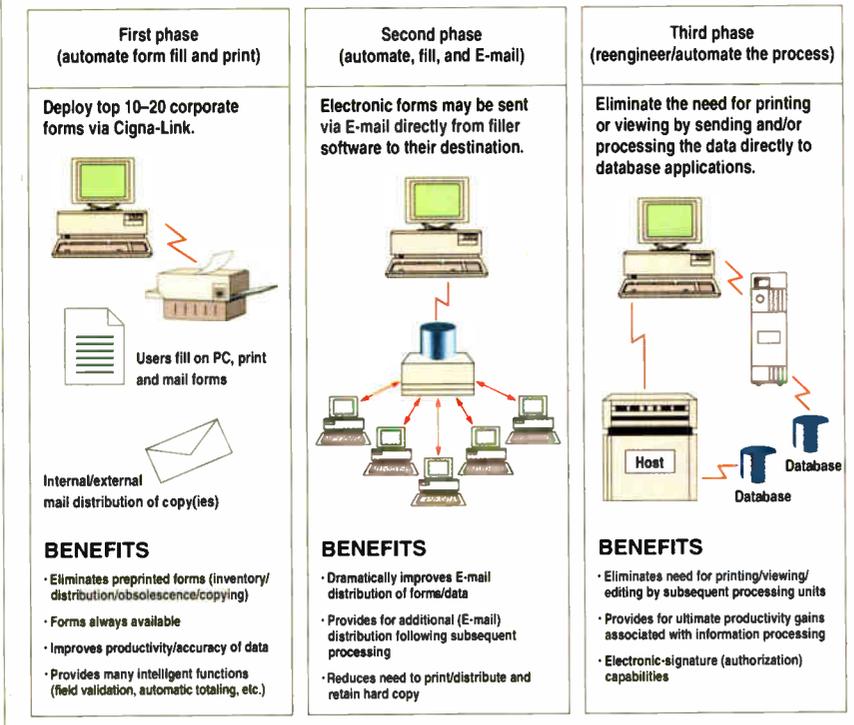

When any of these forms become obsolete, all the unused copies are discarded and new forms are printed and distributed. This may be good business for the paper industry and printing companies, but it costs Cigna millions of dollars a year. Just moving the paper forms to an electronic format would prevent tremendous waste and reduce the expenses of warehousing and distributing the paper forms.

But blank forms are only part of the expense. If Cigna could also reduce the filled-out forms to electronic format, it would realize tremendous savings from not having to file and archive the paper. As a bonus, the company would retain the information in the format needed to process it as computer data; normally, a data-processing center rekeys the data from stacks of paper forms.

Big Changes in Three Stages

The project to automate forms at Cigna is an important case to study, not only because of the scale of the company's paperwork

A Three-Phase Approach to Electronic Forms

The three phases of Cigna's electronic-forms adoption. The first phase moves 10 to 20 forms onto PCs, where users fill them out, print them, and mail them via traditional mail. The second phase incorporates forms routing via E-mail. The final phase ties in a data-processing component with electronic signatures and direct transfer of data to database applications.

and processing, but also because the company decided to take the project all the way, eliminating almost all paper handling. Cigna planned the changes in three stages:

1. Automate the filling out and printing of forms.
2. Automate the transfer of the forms by using E-mail.
3. Tie the forms processing directly into data processing.

Cigna had to implement each stage carefully so that the new process would not interrupt the operations that were already in place. First, the company selected a subset of 10 corporate (in-house) forms to be "electronified." Of that set, one form, the internal purchase-request form, was chosen as the test of the technology.

This form had all the complexities inherent in the other hundreds of forms. In particular, its approval path required both electronic-signature verification and electronic-forms routing. This one pilot project takes the original request from the Cigna employee all the way through the approval process, even to the point of issuing the order to the vendor.

Two groups brought these plans to fruition: the forms management group, head-

ed by Paul Ferrand, and the networking/systems product-delivery group, represented by Mark Orthner. The entire project was inspired by Ray Caron, the chief information officer, who started the search for the technology eight years ago.

The Essential Link

Before Cigna implemented electronic-forms routing, it had to establish a solid infrastructure on which to build. Mark Orthner and others of Cigna's systems division (now more than 4000 strong) developed Cigna-Link, a huge enterprise network and E-mail system.

Cigna-Link consists of more than 500 separate IBM Token Ring networks loaded with 386 (or better) PCs. Each office maintains a Token Ring network. For instance, the Philadelphia office ties its 5000 PCs together, along with 76 file servers, on a 16-Mbps Token Ring network. The Token Ring networks talk to IBM mainframes connected with an IBM SNA (Systems Network Architecture) network over T1- and T3-grade leased phone lines. The mainframes had been the data-processing core of Cigna's operations back when IBM 3270 terminals sat on everyone's desk.

Cigna-Link gives everyone in the organization a smooth, seamless link to the

system's E-mail and file storage. Cigna-Link workstations are also highly standardized. We saw a variety of hardware vendors represented in the Philadelphia office, but the software is essentially the same on all 25,000 machines: Microsoft Mail 3, WordPerfect 5.x, assorted compatible versions of Lotus 1-2-3, and IBM LAN Server client software. Some machines run Microsoft Windows; some are still running DOS.

Orthner is quick to point out that Cigna-Link's most significant attribute is not its topology, but the fact that there is only one LAN network operating system (LAN Server 3 from IBM) and one E-mail system (Microsoft Mail 3) throughout the entire enterprise. Cigna's current electronic-forms distribution system would be impossible without this standardized, mature infrastructure. The painful process of bringing an entire corporation under a single set of standards was somewhat alleviated because the standards were in place before a PC-LAN anarchy developed. One of Orthner's suggestions (see "Tips from the Experts" on page 76) is that you put the network in place, get your E-mail running reliably, and make sure everything is working before you attempt an electronic-forms solution.

Eight Years of Electronic Forms

Eight years ago, Cigna adopted a mainframe-based forms design product. With it, sales agents could customize the necessary forms to conform to their clients' requirements. The forms design program applied a set of preprogrammed rules to the profile of the company (i.e., its size, the kind of business, and so on) and created a contract form with all the right clauses and paragraphs for the customer. In addition, it automatically generated additional forms or contracts that might be applicable.

Cigna's next step was to adopt form-filling/data-entry software so that sales agents could fill in forms at a computer. To help make electronic forms more acceptable, the electronic form looked, on-screen, just like the paper version. However, the data-entry fields incorporated some error checking. The completed form could be printed out or even sent directly to Cigna's database system. Cigna started working with form-filling products in 1987, but these early versions of forms software did not have all the capabilities Cigna needed.

In 1991, Cigna began an internal pilot program with 120 forms. This system produces health-care paperwork for large corporate customers. With this project, the electronic forms and design team learned that the electronic form does not need to

Introducing
The Developer
Connection for OS/2

Developments

They're all here. All the tools, tips and techniques you need to send your OS/2® development rocketing up the charts. Brought to you by the original artists: IBM's own OS/2 development team.

Join The Developer Connection for OS/2,™ and you'll receive the most timely and extensive information available to the OS/2 community. Four times a year, you'll get a CD packed with the latest productivity tools, utilities and sample programs from IBM and others. A powerful browser and easy, graphical user interface let you locate any topic instantly in our comprehensive technical library.

Each CD includes the latest releases of smashes like "The Developer's Toolkit for OS/2," "Multimedia Presentation Manager/2 Toolkit," and "Pen for OS/2 Toolkit." Plus, you also get pre-release versions of many IBM products, operating systems, internal development tools, product demos, bit maps—you name it.

But wait, there's more. You also receive

greatest

The Developer Connection News, our newsletter filled with information about the latest OS/2 developments, new products, a Q&A column and much more. Plus, you get access to the Developer Connection forum on CompuServe,™* where you can talk directly to the experts.

And here's music to your ears: Buy a year's subscription to The Developer Connection for OS/2 before November 30, 1993 and pay only \$149—a savings of \$50 off the regular rate. Call 1 800 6DEVCON today, and start producing some hits of your own.

Feature

look identical to the paper form. It's nice to have the screen presentation look like the paper form it replaces, but it's not always necessary, and sometimes it's not desirable. Instead of letting the forms software dictate the form's appearance or simply mimicking the paper form onto the screen, the forms automation group goes through a *process engineering* step: When the group puts a form together, it determines how a department plans to use the form and analyzes the current paper form's layout.

One example of a reengineered form is a purchase requisition. On a paper form, you might have a section where you could enter a long list of items. At the top of the list are the headings that describe the different columns. But you can't fit as many lines of text on a 24-line computer screen as you can on paper, so repeating the column headings periodically throughout the section makes it easier for end users to remember where the data goes. For a special comment section, where the paper form might have room for several lines of text, the electronic version could start out with one line and expand as needed. Cigna considers the user interface critical and puts a great deal of effort into its design.

Questions about Routing

The next obvious step was to implement electronic-forms routing—a form and its data moving through the network via E-mail. A basic premise of electronic-forms routing is that paperwork doesn't necessarily flow in a straight line; depending on conditions, it may be rerouted or even returned to a previous status for further processing. The form must somehow maintain routing and status information. Either the form can carry this information with it, or the information can be maintained in an external database.

Other concerns center around security: Who can see the form? Who can modify the form's contents? How do you ensure that only the authorized signer has signed the document?

There must, of course, already be an E-mail or other network service in place that spans the entire network and is supported by the forms-routing application. Fortunately, the Cigna-Link network with its Microsoft Mail already provided the infrastructure for the forms routing. The more sophisticated database-structured forms-routing packages were still in development. So Cigna looked at the E-mail-

based systems. As it turned out, only JetForm provided what Cigna needed: forms design, forms filling, forms routing via Microsoft Mail, and a secure electronic-signatures database.

Cigna's Solution—JetForm

JetForm's solution consists of three basic parts: JetForm-Design, a Windows product that lets you design the appearance and function of your electronic form; JetForm-Filler (DOS and Windows), for entering data into the predesigned forms; and JetForm for E-Mail (DOS and Windows), to both enter data and transfer it through E-mail to another networked location. A fourth piece, JetForm-Server, runs under DOS or OS/2 to provide client-server forms handling.

Cigna's forms solution is conceptually simple:

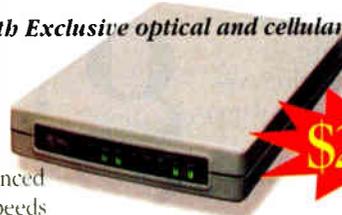

- Use JetForm-Design to create both screen and paper versions of the form. Include the transfer information so that the form knows how to move from one place to the next.
- E-mail the finished form to each site so that it automatically installs itself onto

No Noise, No Hassle. Just **SCREAMER** Prices!

DataPort™ 14.4/Fax Modem with Exclusive optical and cellular technology!

You get *no noise* from AT&T's Optical Line Interface* (OLI™), just the fastest speeds possible on good or bad phone lines. You get *no hassle* either, with AT&T's Enhanced Throughput Cellular (ETC™) protocol,* just the fastest speeds when connected to a cellular call.

Catch

This just in. Applications Manager, best known as *AM*,™ has just added OS/2® 2.1 support. We repeat, the flagship client/server application development software from Intelligent Environments is now available for OS/2 2.1 environments.

For the latest-breaking developments, we take you to corporate America, where *AM* and OS/2 offer

a tried and tested mechanism for building 32-bit, multitasking, line-of-business client/server applications. *AM*'s visual programming environment streamlines the development and maintenance of mission-critical client/server applications by teams of programmers. And Static SQL support makes *AM* a real headliner.

This recent news is becoming quite a feature story. By interfacing with MMPM/2, included with OS/2 2.1, *AM* lets programmers employ innovative team development capabilities

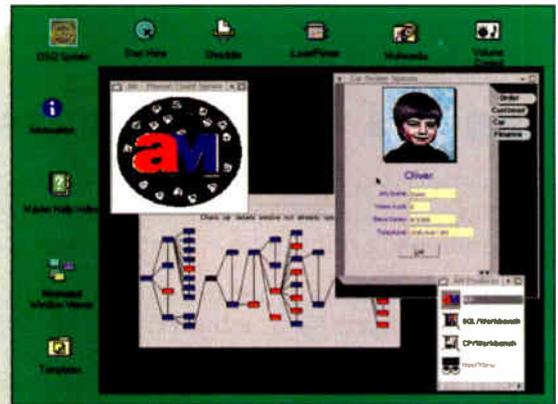

AM

like dynamically linked programming—simplifying reuse and maintenance of program code. DDE support allows programmers to paste information, including *AM* code, comments and *AM*-generated documentation, into Windows™ 3.1 applications easily. And there's also quicker screen interaction and improved productivity through support for OS/2's new high-performance 32-bit graphics engine.

With *AM* and OS/2, you'll never again have to return to your regularly scheduled programming.

the latest

Use *AM* to develop your own highly rated network programs.

news.

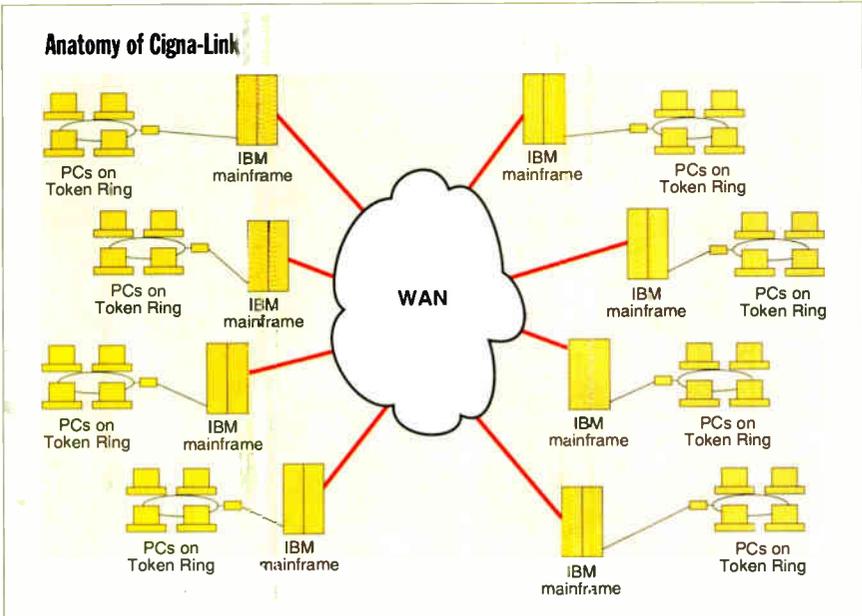

To order or to find out more about OS/2 2.1 or *AM*, call 1 800 3-IBM-OS2. In Canada, call 1 800 465-7999.

Circle 373 on Inquiry Card.

A simplistic view of Cigna-Link, Cigna's WAN (wide-area network) infrastructure. Each office runs PCs over a Token Ring network. The Token Rings talk to an IBM mainframe. The mainframes are connected with an IBM SNA network over T1- and T3-grade leased phone lines.

each of the 25,000 machines.

- When a user fills out a form, make the data available for printing on a local print-

er or for sending off electronically. Jet-Form for E-Mail takes care of dispatching the data through the mail system.

- Obtain an approval/signature, if one is required.
- Route the form on to the next site.

Two of these steps present challenges worth mentioning. First, distributing the form to each of the workstations on a huge network requires a tight integration between your forms package and your mail system. You also have to make sure that you've tested out everything thoroughly: You wouldn't want to distribute 25,000 copies of a defective form. Second, approvals/signatures, simple on a small network, can be a significant problem on a large network.

The typical way of handling electronic signatures on a LAN-based forms system is to use public-key encryption (see "Digital Signatures" on page 309). When a form requires your signature, you move the cursor to the signature field. The forms software presents a list of authorized people, and you select your name from the list. After you enter your password correctly, the data on the form is secured and encrypted. From then on, anyone reading the form can decrypt it, but not change it. Further approvals work the same way.

continued

DATA COMPRESSION LIBRARIES™

PKWARE's® Data Compression Libraries™ allow software developers to add data compression technology to software applications. The application program controls all the input and output of data allowing data to be compressed or extracted to or from any device or area of memory.

- All Purpose Data Compression Algorithm Compresses Ascii or Binary Data Quickly with similar compression achieved by the popular PKZIP software, however the format used by the compression routine is completely generic and not specific to the PKZIP file format.
- Application Controlled I/O and memory allocation for extreme flexibility.
- Adjustable Dictionary Size allows software to be fine tuned for Maximum Size or Speed.
- Approximately 35K memory needed for Compression, 12K memory needed for Extraction.
- Compatible with most popular Languages: C, C+, Pascal, Assembly, Basic, Clipper, Etc.
- Works with any 80x86 family CPU in real or protected mode. \$295.00
- No runtime royalties.

RUNNING OUT OF EXPENSIVE DISK SPACE?

PKzip can help! **PKzip** compresses your files to free up disk space and reduce modem transfer time. You can compress a single file or entire directory structures with a single command. Compressed files can be quickly returned to their normal size with **PKUNZIP**.

Software developers can reduce the number of diskettes needed to distribute their product by using **PKzip**. Call for Distribution License information.

The included **PKzip** utility lets you store compressed files as a single self-extracting .EXE files that automatically uncompresses when run. Only \$47.00

A Streamlined Approach

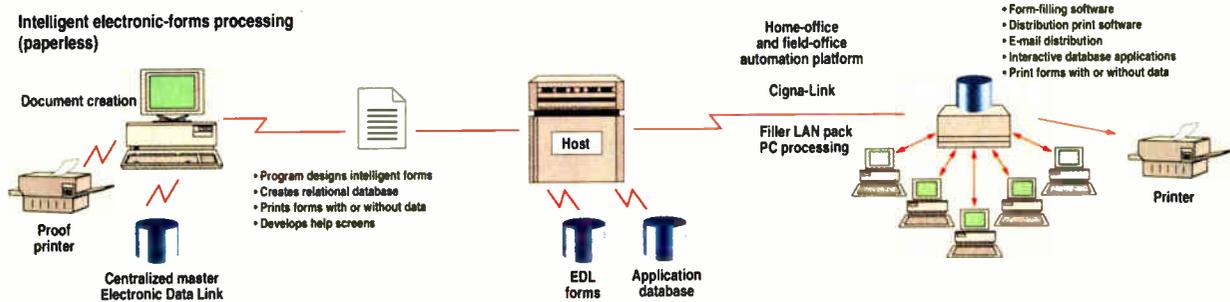

Traditional process (paper process)

Processing

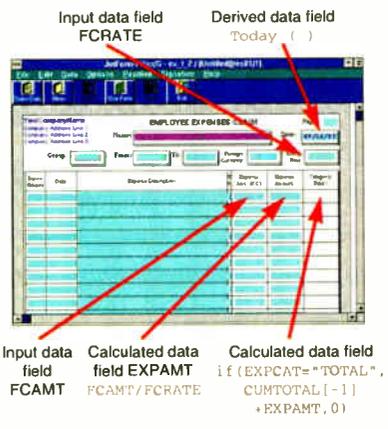

Intelligent electronic-forms processing (paperless)

Electronic forms can alleviate many of the resource-intensive steps of forms processing. Traditional typesetting and printing steps are unnecessary. Distribution and storage requirements are streamlined when handled electronically. And processing centers do not need to rekey data from paper-based forms, since the data remains in electronic format throughout the process.

Elements of an Electronic Form

An electronic form can prevent errors by validating entries, and it can save time by filling in parts of the form automatically. Along with these embedded rules, the form can carry routing and tracking information.

The only disappointment with JetForm was that the signature database didn't scale up to Cigna's requirements—a distributed database with 25,000 records. What JetForm evolved for Cigna was an ability to use the Microsoft Mail signature system in place of JetForm's. You have to log onto the server and your mail system anyway, and the server has to have your password handy. When you need to sign a form, JetForm asks you for your network ID and password; if you enter them correctly, the form is secured. This is not as safe as the public-key method, but it doesn't require anything special from the network.

In 1½ years of work with JetForm, Cigna has moved 1800 forms over to electronic format. Of that set, 30 forms have progressed all the way to electronic routing. Cigna is just beginning the process of interfacing the routed forms directly to its databases. Currently, the company is only

partially through stage two of the three-stage program.

Pains and Gains

Despite the tremendous work that Cigna has done and the accomplishments the company has achieved, Paul Ferrand says the project is still in the "show me" stage. Cigna is committed to totally automating all the appropriate forms, but offices within Cigna still need to be convinced that this is all worthwhile.

The forms automation group has invested a tremendous amount of time in "dog-and-pony acts" to demonstrate the usefulness of electronic-forms routing. This investment in time has really helped smooth the way for change.

Cigna estimates that it can save 80 percent of the cost of handling internal forms with the system that is in place. That's a pretty significant piece of change. While Cigna wouldn't put an exact dollar figure

C Set++

Get set for incredible 32-bit power. Get set for mission critical reliability. Get set for a range of advanced features. Get C Set++™ from IBM Programming Systems. C Set++ is the most complete object-oriented application development package you can buy for OS/2®.

C Set++ lets you create the most advanced, high-performance applications imaginable. Its 32-bit C/C++ compiler lets you unleash all the power of OS/2, giving you industrial-strength code for your mission critical applications. It has an extraordinary code optimizer with a full set of options—even a switch to optimize for the new Pentium™ processor. Plus there's a full set of class libraries, including application

Feature

Tips from the Experts

If you're considering an electronic-forms solution, Cigna and JetForm have several suggestions:

- Make sure your network and E-mail systems are fully implemented and stable before you begin looking at forms software.
- Don't be swayed by a large bundle of prepackaged forms. It's not likely that you'll want to use any of them directly; you'll want to design your own.
- Instead of simply transferring your paper forms to the screen, rethink the form. Is it really necessary? Do you need all that data? Don't ask your users to do any more work than necessary.
- If your forms package lets you use the same data in both screen and printed form, the screen form doesn't have to look exactly like the printed version. The screen may need a different format to use space efficiently.
- Once you select a product, switching to another will be difficult. There are no standard electronic-forms formats.
- Don't buy vaporware. If a vendor doesn't have a component you need for your forms system, ask yourself if you can live without it, or look elsewhere.

on the savings, any reasonable estimate would easily be in the millions of dollars. Of even greater value to Cigna is Cigna-Link users' change of attitude about using the network and E-mail system to automate other tasks. As Ferrand puts it: "We are just touching the surface of the capabilities of these systems."

On a Smaller Scale

It isn't just the huge paper-based operations like Cigna that have benefited from electronic-forms routing. Trace Technologies has started moving its operations over to electronic forms.

Trace is a leading manufacturer of digital-media copy equipment for the computer industry. Its worldwide operation employs only 275 people (tiny compared to Cigna). Its network consists of two HP 3000 database servers and many MS-DOS/Windows PCs mixed with just a few Macintoshes. It is a multiprotocol 10Base-T Ethernet network, but with a single E-mail system. Because of the scale of opera-

tions at Trace, only one person, Felix Camerino, has the responsibility for working out the move to electronic forms.

Trace is working on gaining ISO9000 certification. ISO9000 is an international standard for total quality management. One of its elements is office automation with electronic-forms routing (called *automate with validation*). Therefore, implementing electronic forms has a dollar value independent of the operation's expense savings. And the expense savings are considerable: Time-card automation will bring savings of \$30,000 per year, and all five forms of the pilot project should save about \$250,000 per year.

Camerino considered other LAN/E-mail-based forms-automation paths, but he, too, found that JetForm fit the needs better than any other existing package. One major consideration was that it worked well with cc:Mail.

Camerino created and evaluated a prototype system for payroll time sheets. The evaluation period lasted six months and required one JetForm-Designer license and 10 JetForm-Filler licenses—an initial investment of \$15,000 for licenses. The original time-sheet electronic-form design took him roughly 80 hours, even though the form had nearly 600 data fields, each with an associate attribute or formula.

After the pilot program started, Trace completely changed its processing and policies for time cards, so Camerino has made a second version of the electronic form. The second version will be distributed to users along with the JetForm-Filler licenses.

Now and the Future

In the next few years, we will see sophisticated forms-routing products that will reach beyond even what JetForm offers now. These emerging products will manage and track all aspects of a company's work flow. Forms routing will be only an element of this broader ambition.

But for now, the electronic-forms software is sufficient for sophisticated operations. An electronic routing system can reduce expenses and increase productivity for companies with only a few hundred employees on up to organizations tens of thousands strong. ■

INTRODUCING SYMANTEC C++ PROFESSIONAL. DESIGNED BY MICROSOFT AND BORLAND C++ USERS.

We asked questions. We listened. And we took what we learned from Microsoft and Borland C++ users and created a better way for you to develop applications.

The best compiler. And the best linker.

Microsoft users hate slow compilers. Borland users hate slow, fat code. So we made Symantec C++ Professional 6.0 faster and more efficient.

But our one-pass compiler isn't just faster — it produces faster applications. Thanks to powerful global and local optimizations. And some unique C++ optimizations you won't find anywhere else. We've also included OPTLINK, absolutely the fastest linker you can buy

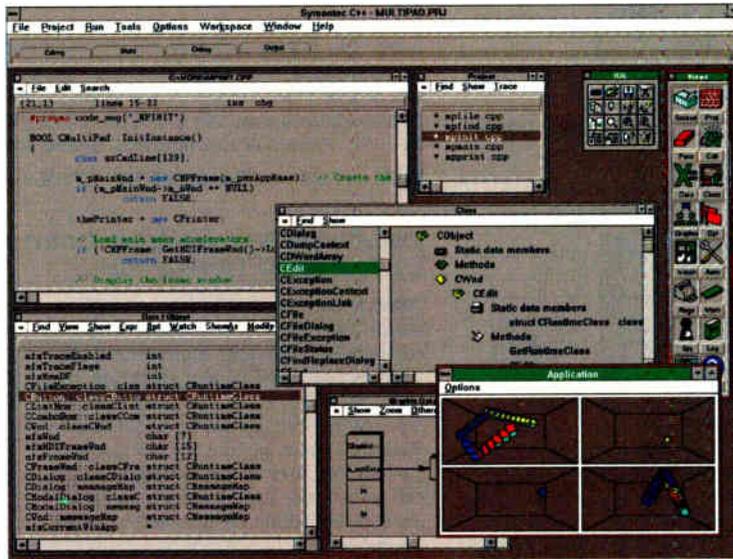

The best environment.

Symantec C++ is the first development system to fully integrate editing, compiling, debugging and version control in a completely new and graphical Integrated Development and Debugging Environment (IDDE). This breakthrough new IDDE is packed with graphical tools, a great new resource editor and drag-and-drop capabilities.

The best visual tools.

Using technology developed for Symantec by Blue Sky

Symantec C++ is available in both Professional and Standard versions.

complete Microsoft Foundation Classes 2.0 as well as support for Microsoft Visual Basic controls.

Order today.

Symantec C++ Professional 6.0 is now priced at just \$499.* But if you are already a Microsoft or Borland user, we have a special upgrade offer of just \$199.95.** A 60% savings.

See your dealer. Or

call 1-800-453-1077 ext. AP80 and order now. Symantec C++ Professional 6.0 is everything a Microsoft or Borland C++ user could want.

Software, Symantec C++ gives you the world's most sophisticated visual tools. This is what Microsoft Visual C++ should have been.

Win32s from the leader in 32-bit compilers.

Win32s is free in every box. Create true 32-bit applications that run unchanged under both Windows 3.1 and Windows NT. Develop and debug apps on your existing Windows system.

It's easy to switch.

Symantec C++ is highly compatible with Microsoft and Borland C++. So there's no reason to wait. We've also included the

Get today's best C++. And two tickets to Hawaii.

Two awesome environments in every box. Along with our incredibly powerful IDDE, you'll also find a coupon redeemable for two airline tickets to Hawaii in every copy of Symantec C++ Professional or competitive upgrade.

This coupon is redeemable for a travel certificate that entitles you to receive from Travel Reservations, roundtrip airline tickets for two to Honolulu, Hawaii upon the purchase of seven nights hotel accommodations with an estimated total cost of \$526 to \$1,806. Prices may be subject to reasonable changes (i.e., inflation) prior to confirmation. Prices may vary depending on times and dates of departure. Some restrictions do apply. For complete FAX details, dial 1-800-554-4403, select option #1, document #443.

*Suggested retail price. Actual price may vary. **Upgrade offer plus shipping, handling and applicable tax. Offer price in U.S. dollars. Valid in U.S. and Canada only. COVER STORY

Is There a Better Windows 3.1 Than Windows 3.1?

Windows, OS/2, and NT offer distinct benefits and disadvantages. One of them excels at running standard Windows applications. But the best choice depends on your requirements.

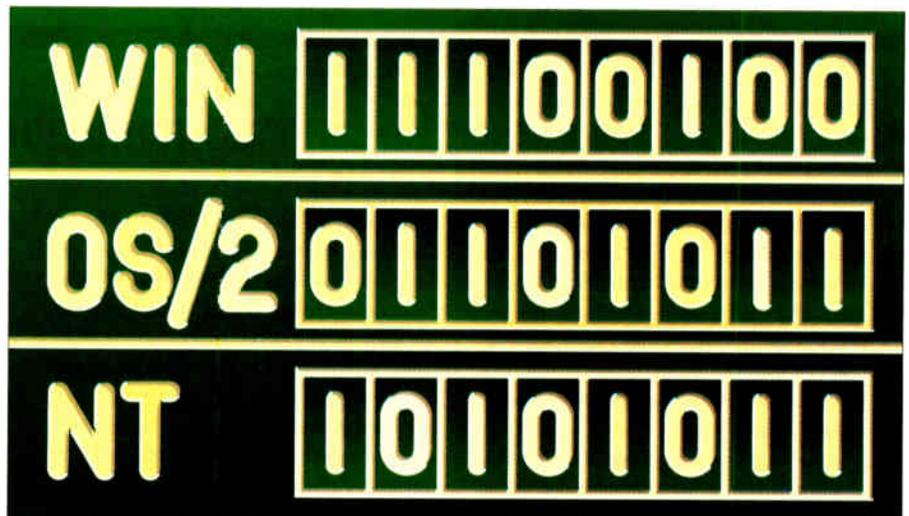

JON UDELL

Let's get right to the point: The answer is no. I ran the BYTE Windows application benchmarks and the BYTE Windows low-level benchmarks on five fast Intel systems under Windows 3.1, OS/2 2.1, and Windows NT 3.1 (and on two RISC systems under NT alone). For applications, the hands-down winner was Windows 3.1.

That's a result that should surprise no one. Running 16-bit Windows software is not the primary mission of either OS/2 or NT. These are robust operating systems built to run 32-bit Presentation Manager and Win32 applications, respectively. Of course, if you adopt one of these systems to run mission-critical line-of-business applications, you won't want to forgo standard productivity applications like the ones in our application suite—Excel, Ami Pro, and Superbase. And since PM and Win32 versions of these aren't yet available (Ami Pro for OS/2 was imminent but missed our deadline), that means you'll be leaning on the Win16 support built into OS/2 and NT.

The good news is that your Win16 applications will run on the Win16 subsystems of both OS/2 and NT. The bad news is that they will run more slowly there than under straight Windows 3.1.

There are, of course, a number of ways to qualify that statement. For starters, note that Windows 3.1 posts the best marks when running in standard mode, not 386 enhanced mode. Windows 3.1 narrowed, but clearly did not eliminate, the performance gap that made many Windows 3.0 users prefer standard mode. Despite that gap, however, 3.1 users need enhanced mode to multitask DOS, to run virtual device drivers such as the 32-bit FastDisk driver and the Windows for Workgroups network components, and to run 32-bit Windows-extended applications.

DANIEL PELAVIN © 1993

If you don't rely on any of these features, you might as well run Windows 3.1 in standard mode. On three of the four systems for which the comparison was possible, the overall applications index for standard mode was 12 percent to 15 percent better than for enhanced mode. If you're like most Windows users, however, you do rely on enhanced-mode features. Note that while both OS/2 and NT lag behind Windows 3.1 in Win16 application performance, they lag enhanced mode by less than they lag standard mode.

Tales of the Triple Boot

Despite horror stories you may have heard, Windows, OS/2, and NT can coexist peacefully on the same hard disk. Once you install all three, switching among them is straightforward. However, there is no master boot utility that can control the whole show. OS/2 provides two mechanisms: a simple dual-boot utility and the Boot Manager, which can switch between an operating system that boots from drive C and an arbitrary set of operating systems that can boot from other partitions. NT offers only the equivalent of OS/2's dual-boot utility.

Ideally, you would let Boot Manager (or an equivalent)

handle everything. Launching from its active 1-MB partition, it would present three choices: DOS/Windows on primary partition C, OS/2 on a logical partition, and NT on another logical partition. Unfortunately, NT, like DOS, wants to boot from partition C. That dictates a two-tiered boot strategy. You first make a C partition on each system—reserving space for a D partition and Boot Manager—and install DOS 5.0 and Windows 3.1 on C. You can then install OS/2 and NT in any order.

If OS/2 goes on first, say on drive D, add drive C to the Boot Manager menu as usual. Then, while booted to DOS from C, install NT. The only complication is that NT will make C the active partition. To recover Boot Manager and gain triple-boot capability, use FDISK or NT's Disk

Manager to set NT's partition active again. (NT informs you that you need to reactivate Boot Manager if you want to use it.)

Alternatively, you can install NT on top of DOS/Windows and then add Boot Manager and OS/2 into the reserved space on the disk. Either way, use Boot Manager to control a primary choice between DOS and NT on drive C and OS/2 on drive D. When you choose C, you'll land in NT's dual boot, which controls your secondary choice between DOS and NT.

On one system, an IBM PS/2 Model 90 XP 486, I forgot to leave room for separate OS/2 and Boot Manager partitions. Stuck with OS/2's dual boot, I used the `boot` command to switch to DOS. Next, I installed NT with its dual booter. The system was then switchable between DOS and NT.

If OS/2's dual booter switched to OS/2 and then back to DOS, would it restore NT's dual booter faithfully? Half expecting to find that I had sawed off the limb I was sitting on, I tried the experiment... and it worked just fine.

The moral is that, while triple-booting DOS, OS/2, and NT may not be an exercise for the casual user, you shouldn't run into any trouble if you're inclined to test these operating systems head to head—assuming, of course, that your disk can hold them all. Don't forget that NT's hefty swap file (28 MB on a 16-MB Intel system) makes it a voracious disk hog.

Into the Starting Gate

While OS/2 won points with me for its wonderfully flexible Boot Manager, NT's

Win-OS/2 Subtleties: Enhanced-Compatibility Mode and DDE

Windows 3.1 uses one kernel for standard mode (KRNL286.EXE) and another for enhanced mode (KRNL386.EXE). Win-OS/2, however, uses only an IBM derivative of the enhanced-mode kernel. Win-OS/2 KRNL386.EXE can, confusingly, operate in two modes that IBM calls standard (the default) and enhanced compatibility.

In standard mode, Win-OS/2 KRNL386.EXE always runs with the standard-mode flag set. In enhanced-compatibility mode, it loads with the enhanced-mode flag set, switches temporarily to standard mode to suppress the loading of virtual device drivers (since OS/2 doesn't support virtual device drivers), and then switches back to enhanced mode.

Why bother with this rigmarole? Applications like Mathematica, FoxPro, and Interleaf Publisher use Windows extenders to gain access to linear extended memory, and the extenders depend on enhanced mode. Why, then, isn't enhanced-compatibility mode the default? "I lost that battle," says Win-OS/2 architect Ayo Anise.

Probably IBM should have listened to Anise, because users of 32-bit Windows 3.1 software under Win-OS/2 can run into some strange problems, the causes of which are not immediately apparent. Ordinarily, when you run multiple Windows 3.1 applications under Win-OS/2, they share a single VDM (virtual DOS machine) that supports either a full-screen or

seamless display in Win-OS/2 standard mode. To run an extended program like FoxPro, however, you have to set its `WIN_RUN_MODE` to 386 enhanced compatibility. It's not obvious to the user, but that means FoxPro will run alone in one VDM while other applications using the default settings will share another VDM.

You might argue, as IBM loudly does to anyone and everyone who will listen, that this isolation of Windows 3.1 applications into separate VDMs means greater robustness: A Windows spasm in one VDM won't affect Windows programs running in another. That's true, but the multi-VDM scenario causes problems for DDE. In the single-VDM case, applications share common address space; to perform a DDE data transfer, they need only exchange a handle. In the multi-VDM case (or in the case of Windows-to-Presentation Manager DDE), DDE messages and transaction data must move from one address space to another. IBM solved this problem by building a mechanism to relay DDE traffic across process boundaries. Unfortunately, it doesn't work as well or as reliably as it should.

To test DDE under Win-OS/2, I modified the DDEML (DDE management library) samples provided in the Windows SDK (Software Development Kit) to time a 1-MB data transfer between a DDE server and a DDE client. Under Windows 3.1 and single-VDM Win-OS/2, the transfer works reliably and (since there's no

memory-to-memory copying) in a negligible amount of time. Under multi-VDM Win-OS/2, though, I ran into the same set of problems on several test systems. First, I had to tweak the transaction time-outs to make the transfer work. Second, transactions took an order of magnitude longer than they did under Windows 3.1 and single-VDM OS/2. Third and most troubling, the connection invariably broke after one successful transfer, and no further DDE transactions were possible without restarting both client and server.

IBM has gone to great lengths to portray multi-VDM Win-OS/2 as a robust alternative to the DOS multitasking of Windows 3.1. In general, it is. But—despite IBM's insistence to the contrary—you pay a price for that "crash protection." DDE across VDMs (or between Win-OS/2 and PM) is wobbly. OLE, which rides the DDE transport, also suffers.

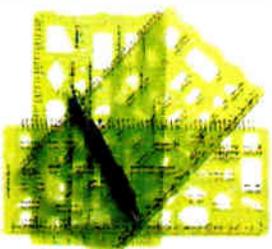

If you use 32-bit Windows software under Win-OS/2 and also rely on DDE, you should probably use enhanced-compatibility mode for all your 16- and 32-bit Windows applications. That way they'll share a common VDM, and you'll avoid DDE hassles.

What about NT? The Win32 subsystem handles DDE calls from both Win16 and Win32 applications evenhandedly. 16-bit DDE and OLE clients interoperate smoothly with both 16- and 32-bit DDE and OLE servers, and vice versa.

Visio 2.0 is the easiest way to make great business drawings.

Now, it's also the easiest way to make a great business decision.

You're looking at some great drawings and diagrams made by a bunch of people who can't draw.

All were created with Visio,™ Shapeware's® award-winning drawing program for Windows™ 3.1 users.

Visio provides job-specific, on-screen stencils for easy access. So instead of drawing, you simply select SmartShapes™ from one of 20 stencils, and drag and drop them into place.

Unlike clip art, Visio's 600-plus SmartShapes have built-in intelligence. So they resize without distorting, connecting lines stay glued and integrated text makes labeling and editing a snap. You can even create and customize shapes of your own.

Visio's drag and drop SmartShapes take the "drawing" out of business drawing.

And since Visio supports OLE 2.0, you can easily integrate drawings with other Windows applications. Creating great business drawings has never been simpler.

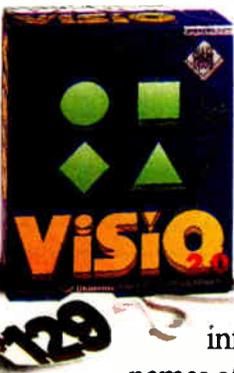

For a limited time, buy Visio 2.0 for just \$129.

Here's an easy business decision: Purchase Visio 2.0 by December 31, 1993, and save \$170. Visio also comes with a 60-day, money-back guarantee. To order, for more

information, or for the names of authorized Visio resellers near you, call toll-free:

No standard mode; video driver requires enhanced mode.

Windows 3.1 applications did not execute. Excel results are for an experimental Mips version of Excel.

extensive device support scored a knockout. In the first week of its commercial release, I installed NT on four Intel systems: a Unisys 60-MHz Pentium-based 5606e, a Gateway 2000 4DX2-66E, an Everex Step 486DX2/50, and the 33-MHz PS/2 Model 90 XP 486. (A fifth machine, the ALR Flyer 32LCT 4DX2/66, lacked the RAM to run NT; with only 8 MB, it ran DOS/Windows and OS/2.) NT detected and automatically configured for every drive controller, video adapter, network card, and CD-ROM it encountered, with one exception—the Unisys-brand CD-ROM in the Unisys machine.

With OS/2, 18 months after the release of its first 32-bit version, the situation was quite different. On the Gateway machine, for example, OS/2 appeared to install happily but then turned in suspiciously poor benchmark results. There were two problems.

First, OS/2 does not, by default, detect and configure for SuperVGA controllers like the Diamond Speedstar 24x (Western Digital 90C31A accelerator) that came with the Gateway machine. You have to run a separate utility, `dspinst1`, to configure advanced video support.

Second and more troubling, OS/2 silently used its generic INT 13-based SCSI support to substitute for the Ultrastor 24F driver that didn't come in the box. That worked, but slowly, and precluded access to the Toshiba 3401 CD-ROM drive in the machine. The correct `.ADD` driver is available from Ultrastor; I downloaded and installed it, and then everything was fine. But the burden was on me, the user, to notice a problem with disk performance and take steps to correct it.

Why was the Ultrastor driver, if available, not bundled with OS/2? An Ultrastor spokesperson expressed frustration with IBM on this point, but also said that IBM's procedures are changing and that future versions of OS/2 should come with more complete bundled device support.

I also had to use `dspinst1` to activate OS/2 support for the embedded ATI Mach 32 controller in the Unisys Pentium machine and for the STB Horizon adapter (Cirrus Logic CL-GD 5426 accelerator) in the Everex system. Further, I had to acquire the `.ADD` driver for the Adaptec 7770 in the Unisys machine (which, in fairness, wasn't available in March when OS/2 2.1 shipped), and I learned that Ultrastor no longer offers specific OS/2 support for the 15C caching IDE controller in the ALR machine.

Finally, OS/2 did not, of course, even

attempt to make use of the Ethernet adapters that were available in all the test machines. With OS/2, as with Windows 3.1, installation is all too often just the beginning of what can be a long and complicated journey. Although NT does not initially target the mass audience of desktop users that Windows and OS/2 do, it puts both those systems to shame when it comes to easy and comprehensive installation. Ironically, the system administrator who installs NT to run server applications for a department will probably have an easier job than the administrator or user who installs Windows 3.1 or OS/2 to connect to that server.

A Closer Look at OS/2

I began by running the OS/2 tests four times on each machine to account for all combinations of modes. There are a number of possibilities to consider. You can run a Windows 3.1 program seamlessly—that is, side by side with PM programs on the OS/2 desktop—or full-screen in a dedicated Windows screen session. Each Windows program can also run in standard mode or in what IBM calls 386 enhanced-compatibility mode. Finally, Windows programs can share a common VDM (virtual DOS machine) or run in their own separate VDMs.

Since our application suite doesn't require that multiple Windows programs be concurrently active, I ran all the tests in a single shared VDM. However, I separately uncovered problems with DDE across OS/2 VDMs; for a description of these problems, see the text box "Win-

OS/2 Subtleties: Enhanced-Compatibility Mode and DDE" on page 86.

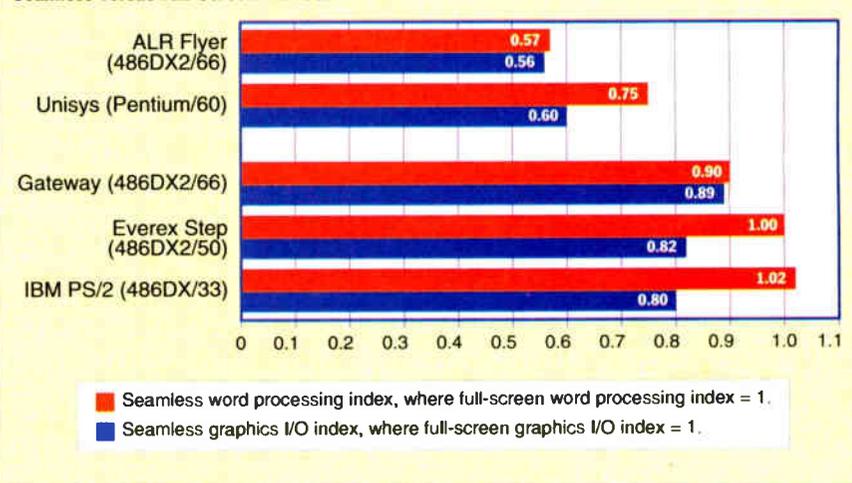

Although I initially tested both standard and 386 enhanced-compatibility modes for both the seamless and full-screen cases, the standard/enhanced differences turned out to be insignificant. After IBM explained that the two modes are effectively the same, I settled on just one test for seamless display and one for full-screen display.

Seamless display does mean extra work for OS/2, so you'd expect that full-screen display would be best for graphics-intensive tasks. Interestingly, the five Intel systems cluster into two groups when you compare ratios of the low-level graphics index under seamless Win-OS/2 to the same index under full-screen Win-OS/2 (see the figure "Seamless versus Full-Screen Win-OS/2"). For the Unisys with its ATI Mach 32 controller and the ALR with its standard VGA controller, seamless display had no better than 60 percent of the performance of full-screen display. For the remaining three systems, seamless performance was 80 percent to 90 percent that of full-screen.

The word processing indexes, which register these variations in video performance, suggest that for systems with less capable Win-OS/2 drivers (like those in the first group), the seamless penalty when running an application like Ami Pro can be significant. By contrast, for systems with better Win-OS/2 drivers (like those in the second group), the penalty can be relatively insignificant.

Looking at the Windows application

Seamless versus Full-Screen Win-OS/2

Ratios of seamless to full-screen Win-OS/2 performance for five systems cluster into two groups. Systems with relatively weak seamless Win-OS/2 display drivers pay a significant penalty for seamless operation. Systems with stronger seamless Win-OS/2 drivers pay little or no penalty.

BREAKTHROUGH!

Client/Server SQL Database for Windows Applications

WATCOM™ SQL for Windows is a high-performance SQL database engine for Windows applications. The package includes everything required to begin using WATCOM SQL immediately from many popular Windows applications, supporting interfaces ranging from ODBC and DDE to the Windows clipboard. Everything necessary for application development in C/C++ (using compilers from WATCOM, Microsoft or Borland) is also included.

Installation in Under 10 Minutes The easy installation and setup reduce the time and expense traditionally required by client/server technology. Further, WATCOM SQL lets you achieve high performance results right out of the package without the need for performance setup and tuning by expert personnel.

Performance and Reliability WATCOM SQL's cost-based query optimizer and efficient data representation combine to deliver high performance. Transaction processing and declarative referential integrity protect the consistency of your data. The client/server architecture reduces network traffic, resulting in increased performance for your multi-user applications.

Scalable SQL for Now and the Future WATCOM SQL applications can be designed to run without change in environments ranging from standalone PCs to large multi-user networks. The 32-bit WATCOM SQL Network Server Edition unleashes the power of 386/486 PC's to deliver high performance for large networks with many clients.

The Best Value in SQL Database Engines WATCOM™ SQL for Windows has a suggested retail price of \$795* but for a limited time you can get it at the introductory price of only \$395*. Even better, as a registered user of WATCOM SQL you'll be able to get a copy of the 6-user Network Server Edition for only \$99* (Suggested retail price: \$795*).

Royalty-Free Runtime for only \$99* As a registered user you can get royalty-free runtime support for just \$99*, enabling you to distribute our standalone single-user runtime SQL database engine with your applications royalty-free.

Highlights

- ▶ ODBC Level 2 support
- ▶ Built-in declarative referential and entity integrity
- ▶ Visual Basic Interface
- ▶ Bi-directional, scrollable, updatable cursors
- ▶ Row-level locking
- ▶ ANSI SQL and IBM SAA compatible
- ▶ Full transaction processing support with checkpoint log and forward transaction log
- ▶ Multiple simultaneous application connections
- ▶ Symmetric multi-threading of concurrent requests
- ▶ Import data from popular file formats including DBF
- ▶ Automatic use of expanded and extended memory to improve performance
- ▶ Static and dynamic embedded SQL interface for use with WATCOM's 16 and 32-bit C/C++ compilers, and other popular C/C++ compilers

World Radio History

Windows versus OS/2 versus NT: Summary Results

On the application benchmarks, OS/2 trails Windows by a wide margin, while NT in turn trails OS/2, although by a lesser margin. NT's prodigious disk performance dominates the low-level results, although the graphics numbers are disappointing.

benchmarks across systems, OS/2 was a middle-of-the-road performer, generally a bit better than NT and a lot worse than Windows (see the figure "Windows versus OS/2 versus NT: Summary Results"). At best, on the PS/2, OS/2's overall applications index (using full-screen display) was 85 percent that of enhanced-mode Windows. At worst, on the Everex, it was 64 percent of Windows.

The Windows low-level benchmarks reveal some interesting details. For example, OS/2's enhanced FAT (file-allocation table) file system and robust disk cache

often get credit for improving the performance of DOS (and therefore Windows) applications relative to what you can achieve under DOS equipped with SmartDrive or another DOS-based disk cache. On four of five systems, however, Win-OS/2's file I/O index lagged or, at best, didn't quite equal that of enhanced-mode Windows. The lone exception was the PS/2 system, on which Win-OS/2's file I/O bested that of DOS/Windows by 10 percent. Evidently, OS/2 on the PS/2 machine makes good use of that system's IBM SCSI-2 controller. Note, though, that

NT—a shockingly good disk performer—more than doubled OS/2's score on the same PS/2 hardware.

The low-level graphics results show that OS/2's SuperVGA drivers exploit some accelerated chip sets spottily. OS/2's full-screen pixel- and line-drawing performance on the Unisys system's embedded ATI Mach 32 accelerator actually outdid Windows running ATI's Mach 32 driver, and OS/2's BitBlt performance lagged behind that of Windows by only about 10 percent. On the Gateway's WD 90C31A, however, OS/2's pixel- and line-drawing

"Abracadabra! We put VDTs into your PCs"

Falco is taking center stage, making magic right before your eyes with Pipeline - VDT emulation software for Windows.

With over 1 million terminals installed, Falco pulls Pipeline out of its bag of tricks. Falco terminals, known for high performance and extensive list of features, have been deftly transformed into software.

Pipeline will create more than an illusion of a terminal sitting on your desk. With its 20 full features terminal emulations, including VT 420 and Wyse 60, Pipeline doesn't rely on smoke and mirrors.

Pipeline's interactive host features aren't for a limited audience. They can be controlled from the keyboard, or application software, including; configurations, emulations, port switching, baud rates and color mapping. And Pipeline can do it over serial lines, modems and high speed networks.

Just point and presto. With Pipeline's graphical keyboard display you can map keyboard functions where you want them and program over 176 soft keys - like magic.

Pick a color, any color; in fact there are over 16 million to choose from.

Like any great assistant, Pipeline will set the stage by saving all your favorite configurations both single window and window groups.

Don't get sawed in half by the competition, choose the most complete VDT software for your next performance. Call Falco today.

Portable CPU/FPU Benchmarks

BYTE's portable benchmarks display raw CPU/FPU horsepower for five Intel systems and two RISC machines.

numbers dropped noticeably, and the BitBlt function was nearly an order of magnitude slower than under Windows with the Speedstar 24x driver from Diamond. The same was true for the Everex's Cirrus Logic 5426; here, OS/2's BitBlt score wasn't even a twentieth that of Windows. On these same systems, however, NT fared even more poorly than OS/2.

The moral? There's more to accelerated SuperVGA support than just handling popular display resolutions and color depths. Both OS/2 and NT recognize and support a variety of SuperVGA chip sets, but their drivers don't always support the acceleration functions of those chip sets as comprehensively as the drivers that are available (though usually not bundled) with Windows.

NT's Maiden Voyage

Two striking findings emerge from the NT numbers. On the application benchmarks, NT trailed in nearly every case. (The gap between NT and OS/2 was much narrower, however, than that between OS/2 and Windows.) As always, there are various filters through which to view that result.

On the one hand, Microsoft hasn't vociferously made IBM's "better Windows than Windows" claim on behalf of NT. It can also say with some justification that Win32 applications (which can be very close cousins of Win16 applications) will soon alleviate pressure on NT's Win16 subsystem.

On the other hand, Microsoft admits that NT must run Win16 binaries well and has said that the API pass-through architecture that gives those programs access to NT's native Win32 subsystem would give Windows 3.1 performance under NT a major shot in the arm. It's likely that the pass-through has increased performance, and that performance would be even worse if NT had to rely for its Win16 support entirely on its

VDM (as is the case with OS/2).

When you consider NT's overhead—the costs of protected subsystems, C2 security, portability, and Unicode—the surprising result may not be that OS/2 leads NT, but rather that NT doesn't lag by a wider margin. The fact remains that pure Win16 application performance is not a reason to prefer OS/2 over NT. Note, also, that NT will barely run on an 8-MB system like the ALR, a machine on which OS/2 performs admirably.

The second startling result is NT's tremendous performance on the low-level file I/O test. NT's unified cache manager aggressively exploits memory mapping and can use all available RAM not needed by applications. Evidently, the strategy pays off: NT's file I/O numbers range from one-and-a-half to nearly three times those of Windows. Indeed, the I/O index is so disproportionately large that it overcomes weak graphics results and causes NT to emerge as the overall winner on three of four sys-

tems on the low-level benchmarks.

For evidence of this effect at the application level, look at the disk-intensive remove substest of the Superbase test (see the table on page 88). Here, NT consistently equaled or bettered both enhanced-mode Windows and OS/2. Clearly, these results bode well for NT not only on file and database servers but also on high-end workstations that must deliver industrial-strength I/O.

The RISC Dimension

Our RISC systems were a Silicon Graphics/Mips Magnum 75SC (75- to 150-MHz R4400, 32-MB RAM, SGI G364 frame buffer, and NCR 53C9X SCSI controller) and a DECpc AXP 150 (150-MHz Alpha, 64-MB RAM, Q-Vision video adapter, and Adaptec 1742 SCSI controller). The BYTE portable benchmarks indicate how these machines stack up against the Intel crowd in terms of raw CPU and FPU horsepower (see the figure "Portable CPU/FPU Benchmarks").

Note that NT was shipping for the Mips but not for the DECpc at the time of this review. Because the version of NT on the DECpc was an unoptimized debug build of the operating system rather than an optimized retail build, I have chosen not to report the application and low-level benchmark results for the DECpc. However, BYTE's portable benchmarks, which don't rely heavily on NT system services, do hint at the awesome potential of this machine.

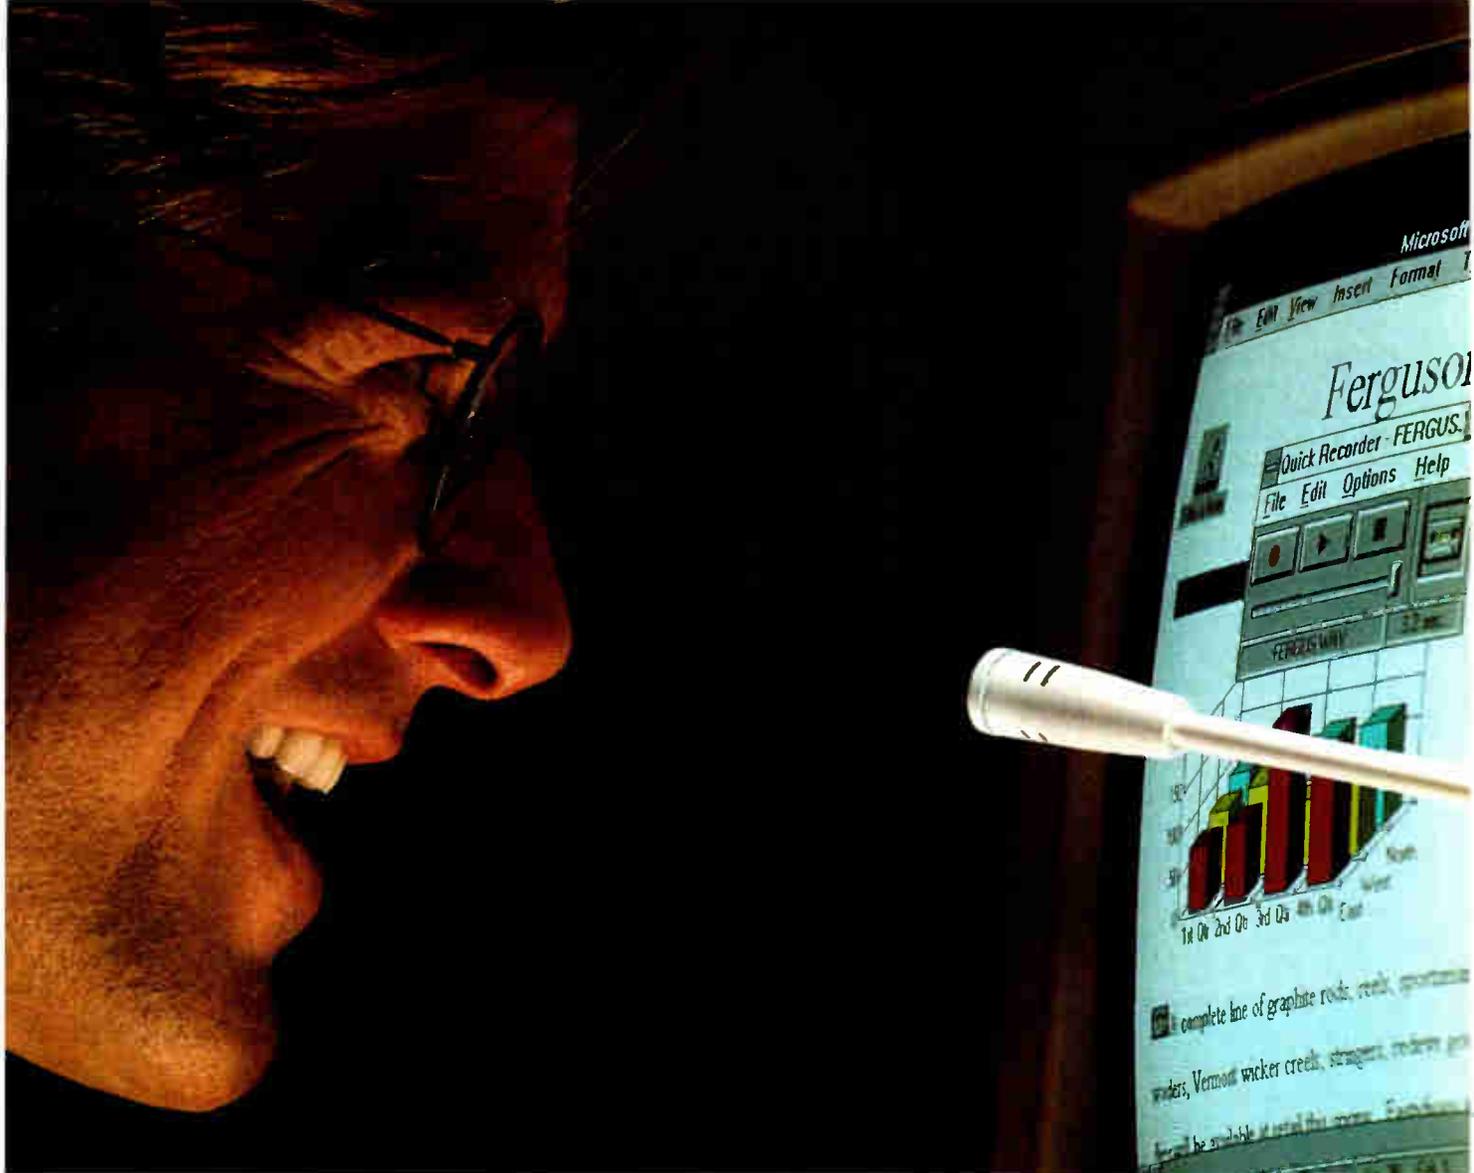

The Mips Magnum's cumulative low-level Windows benchmark results place it ahead of all the Intel boxes except the Unisys—an impressive performance indeed. Application benchmarks, however, were a severe disappointment. While Ami Pro, Excel, and Superbase did load and operate interactively, all three applications fell flat on their faces when subjected to our test scripts.

Why did the low-level Windows benchmark succeed where the applications failed? Our staff-written benchmark is a vanilla Windows program that plays by the rules. Commercial applications almost always bend some of the rules, and the Mips version of NT's Insignia-derived

emulator clearly won't tolerate such behavior. (Interestingly, two of the three scripts did complete, albeit slowly, on the DECpc.) Clearly, NT's Win16 compatibility on the

When you want to run Windows 3.1 software

- Standard-mode Windows does it fastest.
- Enhanced mode runs a close second.
- OS/2 runs a not-so-close third.
- NT brings up the rear.

FIRST WE MADE WINDOWS. NOW IT'S TIME TO TALK.

With the new Microsoft® Windows™ Sound System, just tell your computer what you want it to do. You can customize your system to respond to your personal spoken commands. Even our new directional microphone knows exactly who you are.

This full set of audio software has lots of options, too. Spice up presentations with music or quotes.

Or proofread numbers as the computer reads them back.

All for the price of a game.

You can also get this software with the sound board included. So go visit your nearest reseller to see what's creating all the conversation.

Microsoft
Making it easier

Mips machine will have to improve. At the same time, however, the availability of RISC NT—an attractive, high-powered option—should induce Windows developers to rely less on dirty tricks. (Editor's note: *At press time, Microsoft informed us that our Excel, Ami Pro, and Superbase test scripts did run successfully on several Mips machines at Microsoft. We worked with a Microsoft technician to resolve the problem, but, despite several reinstalls of Windows NT, we could not pinpoint whether NT's configuration or the Mips Magnum itself was at fault.*)

Ultimately, your bread-and-butter applications want to run as native Win32 programs on RISC NT platforms. The Excel results hint at the kind of performance you can expect. These numbers are *not* for Excel 3.0a under Windows 3.1—which, like the other Win16 tests, did not complete—but rather for an experimental Mips-native version of Excel 4.0. Using those results, the spreadsheet index for the Mips Magnum more than doubles the next-best result (posted by the Unisys Pentium machine).

Both IBM and Microsoft deserve credit for their operating systems' Windows support.

The Final Analysis

Both IBM and Microsoft deserve great credit for the Windows support they have engineered into their 32-bit operating systems. But neither OS/2's nor NT's Windows support would entice me to use these systems purely as Windows platforms. If you can tolerate Windows on DOS, you probably should—it's faster even on machines well equipped to run the bigger and better operating systems. Use OS/2 or NT to deploy mission-critical 32-bit programs, and tap the 16-bit Windows software base

for personal productivity. Their Win16 subsystems are plenty good enough for this.

What about OS/2 versus NT? Comparing the two is really inappropriate. The apples-to-apples comparison would be Chicago versus OS/2, and the oranges-to-oranges matchup would be NT versus Workplace OS. But neither Chicago, which will be Microsoft's Intel-specific offering, nor Workplace OS, which will be IBM's portable offering, is shipping. That leaves the unfortunate but inevitable apples-to-oranges comparison of OS/2 to NT.

With respect to Win16 support, OS/2 has a performance edge and does well in 8 MB. NT handles DDE and OLE more reliably and needs double the RAM. Ultimately, of course, the choice will hinge not on Win16 support but on availability and quality of 32-bit line-of-business applications. Developers in both camps are hard at work, and we'll be following their efforts closely. ■

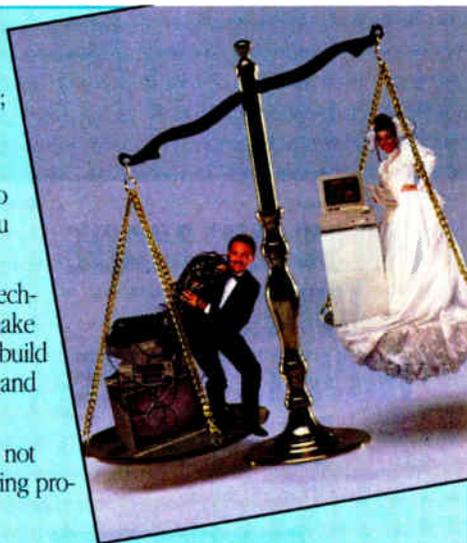

Jon Udell is a BYTE technical editor at large. You can reach him on BIX as "judell" or on the Internet at judell@bytepb.byte.com.

You love videography. It's your life. So why get involved with a video editing system that seems attractive now, but can't accommodate your needs in the future; an editing system that shows signs of age as soon as your entry-level video devices have to be upgraded?

The beauty of AmiLink CIP for Windows editing system is that it's totally devoted to your career. AmiLink CIP for Windows has been specifically designed to stay with you all the way no matter where it all leads.

The day you're ready to improve your abilities in character generation, animation techniques or special effects, AmiLink CIP for Windows will be at your side. When you make the crucial decision to build your business on larger, more sophisticated projects and build a reputation of quality at the same time, AmiLink CIP for Windows will support each and every one of your efforts.

Not too surprising when you consider that AmiLink CIP's parents are video people not computer people. AmiLink CIP for Windows is from RGB, the same company delivering pro-quality editing to pro-editors and Video Toaster™ users all across the country.

Are you about to marry an editing system that can't keep up with your career?

So shuttle over to your AmiLink dealer today. Or call RGB for more information about AmiLink CIP for Windows, the video editing system that will never let you down.

For more information call 1-800-535-7876.

OS/2 2.1: A User's Perspective

STAN MIASTKOWSKI

For a few minutes, let's forget the politics, the personalities, and the seemingly interminable corporate bickering associated with The Great Windows versus OS/2 Controversy. The subject at hand is OS/2 2.1... from a decidedly user-oriented perspective. While it's tempting to throw down the OS/2 versus NT gauntlet, the more apt comparison for most PC users right now is OS/2 2.1 versus Windows 3.1.

If you're a Windows user attempting to make a decision on whether to make the move to OS/2, the obvious question is whether OS/2 2.1 really delivers a "better Windows than Windows" (as IBM is so fond of saying). The answer: a resounding "It depends." The more you do with Windows, the more advantages you can get from 2.1. If you place yourself in the power-user category, run numerous Windows applications simultaneously, are comfortable tweaking INI files, and still depend on multiple DOS applications, OS/2 2.1 offers many advantages. On the other hand, if you don't push Windows to its limits, you're just as well off staying with it.

Strong Foundations

Windows 3.1 and the Windows that runs in OS/2 2.1—dubbed Win-OS/2—are virtually identical. Windows compatibility also existed in OS/2 2.0. The problem was that it included Windows 3.0 at the same time that Microsoft was shipping 3.1. With OS/2 2.1, things are on a more even keel.

One of the biggest advantages that OS/2 2.1 offers is that Win-DOS runs on top of a true 32-bit operating system, using a 386 or 486 processor to nearly its full potential. OS/2 is a full-fledged preemptive multitasking operating system. Windows, DOS, and OS/2 applications all run in their own protected-mode sessions, guarded from the slings and arrows of overlapping application problems. If one crashes, the others are usually unaffected. (In certain circumstances, it is possible to lock up the whole system, but it happens considerably less frequently than in a DOS/Windows-based environment.)

A Long Installation

Both installing and using OS/2 2.1 requires time and commitment (at least initially). Getting up and running isn't sim-

ply a matter of copying a few disks. You should figure on at least half a day, and make a backup before you begin. There are many decisions to make along the way, too. The size of the installation task becomes apparent as soon as you rip open the shrink wrap. Buried under a couple of manuals is a pile of 25 3½-inch disks. (A 5¼-inch version is available, too, with even more disks.)

If you have a CD-ROM drive, IBM also offers a CD-ROM version. But in order to install OS/2 2.1 directly from the CD-ROM (and be able to access the CD-ROM drive later), you'll need to have a true SCSI CD-ROM drive connected to a specific SCSI controller from Adaptec, Distributed Processing Technology, Future Domain, or IBM. There are a lot of nonstandard CD-ROM drives around with their own proprietary interfaces. IBM lets you use a nonstandard CD-ROM drive by first manually creating all 25 installation floppy disks (under DOS) from the files on the CD-ROM.

IBM says you'll need at least a 386SX and 4 MB of RAM. You'll definitely want more RAM and power, though, especially if you'll be taking advantage of OS/2's true multitasking capabilities. I found that a 486 (even an SX) and 8 MB of RAM is about the minimum to obtain acceptable performance. I finally settled on running OS/2 on a generic clone based on a 66-MHz 486DX2 along with 16 MB of RAM. You'll need a hefty hard disk as well. A full OS/2 2.1 installation requires about 29 MB of disk space.

continued

DANIEL PELAVIN © 1993

Are you feeling cramped by DOS/Windows? Give OS/2 a try.

Take Your Choice

You can have the installation format your hard disk and start from scratch, choosing between the standard DOS FAT-based (file allocation table) file system or the HPFS (High Performance File System) that's unique to OS/2. HPFS offers some unique advantages, especially if you're using data-intensive applications such as databases. It is generally faster, although your mileage may vary, and it offers some neat extras, such as long (up to 255-character) file names. However, HPFS and FAT files aren't compatible. For most users who are easing into the brave new world of OS/2, FAT will be sufficient.

If you decide to stay with FAT, you can use all the programs and data that are already on your hard disk. You can then also opt for the dual-boot feature that lets you boot either OS/2 2.1 or DOS at start-up. Being able to boot into your old familiar DOS environment is a comfort, but setting up your system for the dual boot is needlessly complex. To IBM's credit, the process is for the first time explained in plain English in the installation manual. But it requires a number of steps, such as adding lines to your existing CONFIG.SYS and AUTOEXEC.BAT files and then copying all files from your root directory into your DOS directory. Why

couldn't it include a batch file to automate the process?

The Old Disk Shuffle

Installing OS/2 isn't a linear process. You have to reinsert various disks at various times. It's also during the installation that some of OS/2 2.1's limitations begin to show up. To get seamless Windows (i.e., the ability to run windowed OS/2, Windows, and DOS applications side by side) in something beyond 16-color standard VGA, you need to have a graphics card based on chips by ATI, Cirrus Logic, Headland Logic, IBM, Trident, Tseng Labs, or Western Digital. Or, you need to

Tips for Tweaking OS/2

For those used to twiddling with a few well-known commands in a DOS CONFIG.SYS or AUTOEXEC.BAT file, taking a look at the OS/2 versions can be daunting. They may have the same names as the DOS versions, but they're different beasts entirely. A "typical" OS/2 CONFIG.SYS file consists of 60 or so lines with a raft of unfamiliar commands such as THREADS, MAXWAIT, and TIMESLICE.

What to do? Luckily, the OS/2 installation does a great job of setting all these esoteric commands to what's best for your system. But if you must tweak, help is right at your fingertips. Just typing, for example, HELP THREADS at an OS/2 prompt brings up detailed graphical help that includes everything you need to know and even specific (and always helpful) examples.

A Couple of Cautions

Caching—OS/2's built-in caching utility uses very little RAM for disk caching: 256 KB for an 8-MB system, and 512 KB for a 16-MB system. Although you might be tempted to increase that, it's best to leave it alone. OS/2 uses caching in a different and vastly more efficient way than does DOS. Your best bet is to leave the rest of the RAM for programs.

Swapping—OS/2's swap file is different from that of Windows. It's dynamic, expanding and contracting as needed, and usually

stays comparatively small because it works very quickly and swaps data to and from the hard disk (when needed) in small segments. Unlike Windows' permanent swap file, you can't set it to a specific size, but you can specify the minimum amount of free space that it should leave in a disk partition. For the best performance, set the swap-file path for its own partition, although that requires some planning ahead.

Cleaning Windows

Win-OS/2, OS/2's version of Windows 3.1, is virtually identical to Microsoft's version. It should be; it's virtually the same source code. Win-OS/2 has its own WIN.INI and SYSTEM.INI files, and you're welcome to tweak away, just as you might under 3.1.

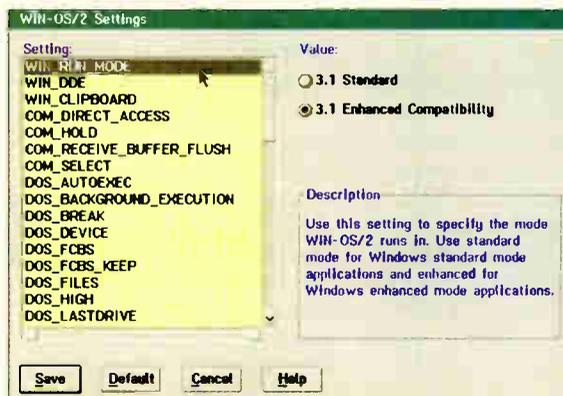

The key to maximizing Win-OS/2 performance is OS/2's unique settings screen, a menu of over 50 settings that

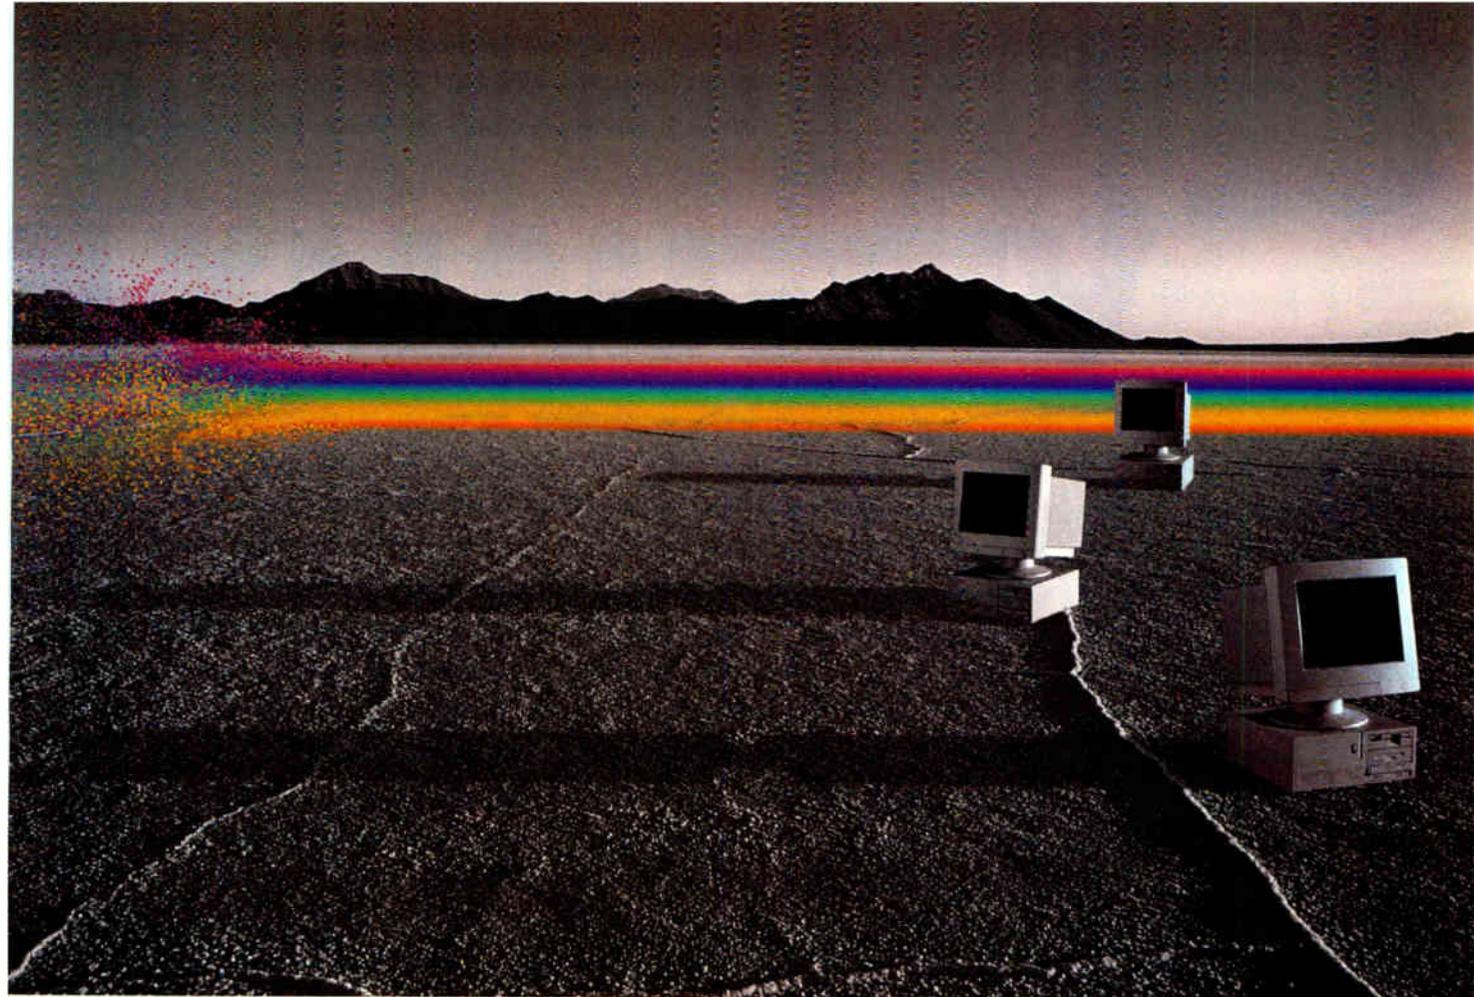

can adjust just about any settings of Win-OS/2 that you can imagine (and many that you've never imagined). Best of all, you can set up different settings for different applications and different Win-OS/2 sessions. Each setting has its own detailed help available.

General Tips

Because OS/2 is so capable at doing lots of things at the same time, and because minimized program icons don't appear on the desktop, it's easy to lose track and end up with lots of concurrent programs dragging down system performance. What follows are some other helpful hints:

- If you're running a system with minimal RAM, say 4 MB, you should disable the default animation that's used to draw boxes in the Workplace Shell. Also, don't run multiple Windows sessions if you can help it. They absorb system resources like a soft-ware sponge.
- If you are running short on hard disk space, there are all sorts of OS/2 files you can live without. (For example, OS/2 comes with two different text editors.) The OS/2 manual does a great job of explaining every single file that's loaded during installation, and it tells you what isn't essential for what you're doing. It's a great way for you to save megabytes.

GRAPHICS SO FAST, WE HAD TO GO TO A SPECIAL PLACE TO TEST IT.

Don't let the next generation of high-performance graphics cards pass you by.

Introducing Pro Graphics™ 1024. Driving a stunning 16.7 million colors at 1024 x 768 resolution, it delivers the best performance in the field. Now, that's True Color. And it's from

Media Vision, the leader in innovative PC graphics. With a refresh rate of 76 Hz for a crisp flicker-free display, Pro Graphics 1024 delivers the speed you're looking for.

At a price that won't blow you away.

Why not test drive a Pro Graphics 1024

at your local computer retailer? And see what

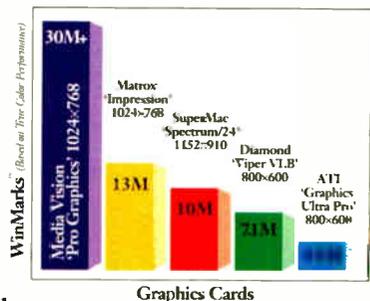

16.7 million colors at 1024 x 768 looks like at this

speed. For more information on the whole Media Vision family of

Pro Graphics accelerators call 1-800-845-5870 dept. 630.

16.7 million colors at 1024 x 768 resolution puts a new twist on performance.

Circle 344 on Inquiry Card.

GET A VIRTUAL VIRTUALLY E

Virtual screen technology is like having two monitors in one. Create the mother of all spreadsheets. Run PageMaker and Excel side-by-side. Use your monitor as a viewfinder and pan across to the place you want to be. All it takes to upgrade to a 2048 x 1024 virtual screen is just 2MB of optional RAM (1MB VRAM, 1MB DRAM)†.

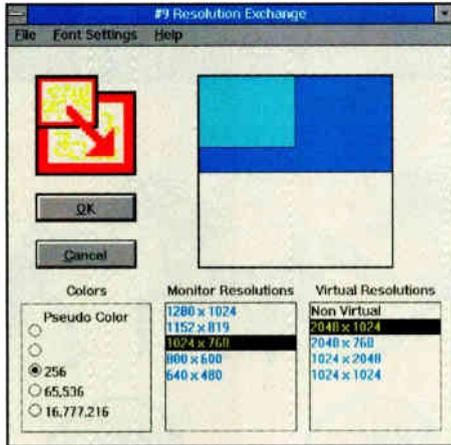

Our chameleon cursor can change size and color so it never gets lost. So you never have to play that frustrating game of hide-and-seek.

†Performance measured by running WinBench 3.11 at 1024 x 768, 256 colors, using #9GXE Display Driver 9. Dell system configured with 66MHz #86DX2 processor, 16MB RAM and 256KB cache. VL-Bus is a trademark names of others. ©1993 Dell Computer Corporation. All rights reserved.

SCREEN WITH EVERYTHING.

Our Resolution Exchange Panel gives you complete control over your desktop environment. And since the VL-Bus links video directly to your powerful 486DX2, your commands are executed instantly.*

If you open up your Dell Dimension™ XPS PC, inside you'll find a #9GXE video card. This fast and versatile video card uses the VL-Bus™ and ultra high-speed video RAM to give you the video ride of your life.

A Dell Dimension XPS PC configured with our #9GXE video card (with 1MB Video RAM) delivers 26 million WINMARKS! Or with our optional 2MB RAM upgrade (1MB VRAM, 1MB DRAM), it delivers a face-warping 33 million WINMARKS! Either way, we're talking incredibly fast.

But raw speed is just part of the Dell Dimension XPS story.

The Dell Dimension XPS's #9GXE video engine can be accessed on-screen via a control panel that allows you to configure a host of powerful utilities to give you total control of your desktop video environment.

Add our optional 2MB RAM upgrade and you have the power to switch your #9GXE to a virtual screen with a resolution of up to 2048 x 1024 pixels. Very cool.

This versatile add-in effectively gives you the desktop equivalent of two monitors. So you can have two full-size applications, like Excel and PageMaker, displayed side-by-side.

The virtual screen allows you to seamlessly pan across your monitor from application to application.

When you need a closer view of your work, press a "hot key" and you can zoom in and out with four levels of magnification.*

Working against color backgrounds? Our chameleon cursor can change size and color so it never gets lost.

You can also create a whole library of time-saving "hot keys" for all of your applications.

When it comes to video and video-related utilities, Dell Dimension XPS PCs are your ticket to ride.

Our Hawkeye Zoom Feature gives you up to four levels of magnification.* So you can really see the details of what you're working on.

*Resolution Exchange Panel and Hawkeye Zoom examples given for #9GXE configured with 3MB RAM (2MB VRAM, 1MB DRAM), and 1280 x 1024 monitor.

If you want to plug in a mouse, Dell gives you a dedicated mouse port.

of Video Electronics Standards Association. Dell disclaims proprietary interest in the marks and

FAST VS HALF-

With faster access and nearly double the data transfer rate our double-spin CD ROM makes others seem positively sluggish.

Thanks to our multi-session CD technology, you can have the disk printed on up to four different times, storing up to 100 color photographs in all.

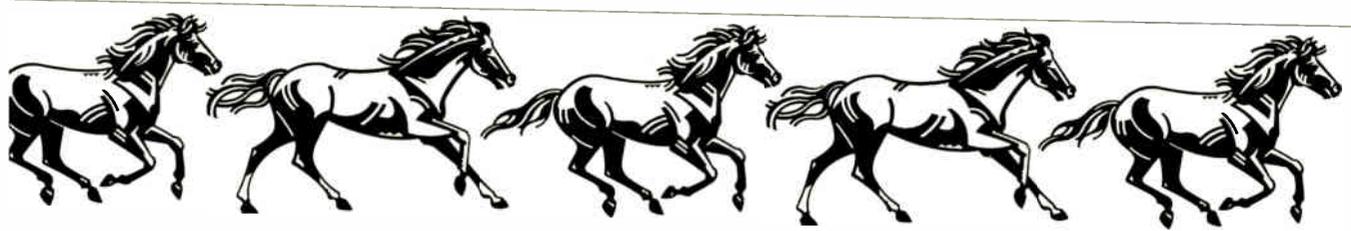

Many of our competitors use a spring mechanism to eject your disks. At Dell, we give you a motorized loading tray like you'd expect from a high-end CD player. The choice is yours. But if your CDs could talk, we know which one they would choose.

Whistle while you work. Or tap your foot. Or sing along. Our audio center CD ROM software lets you play disc jockey while you carry on with the important work of the day.

CDs FAST CDs.

153.6KB

300KB

When you buy a Dell Dimension™ XPS 450V or 466V equipped with a CD ROM, you get a CD ROM drive that runs circles around our competition.*

Thanks to advanced dual-spin technology, our CD ROM gives you an access time of just 350ms and a data transfer rate of 300KB per second. That's nearly twice the performance of many of our competitors.

And that's just the start.

Our drive has the automatic, push-button motorized tray you'd expect to find on a high-end CD player.

Compare that to the manual spring-load reject, uh, eject button from many of our competitors. It's still push-button, but your CDs don't glide effortlessly. In fact, they don't glide at all.

Ours is obviously a lot easier and more pleasant to use. And our CD ROM drive is built to last.

Our CD ROM is Kodak Photo-CD compatible. Which means you can take advantage of the latest in CD technology and view photographs on your PC screen.

What's more, our CD drive is multi-session. Which

means you can have the disk printed on up to four different times. Storing up to 100 pictures in all. Keeping them in perfect condition with no fading.

Our CD ROM also comes with software that lets you play your favorite audio CDs while you work.

So you can listen to Mozart as you crunch numbers or hop along to the Beatles as you cruise your local BBS.

Sound like a better drive for your money? It is.

So if you want the best CD ROM technology for your money, make a fast decision and call Dell today.

After all, there's absolutely no reason why you should settle for a CD ROM that's behind the times.

Seamless Windows. OS/2 2.1 can run Windows, OS/2, and DOS applications concurrently. True preemptive multitasking means they're all running and not in a state of suspended animation.

have OS/2-specific drivers from the graphics-card maker. These are becoming more common. For this review, I used a Radius XGA-2 board designed specifically for OS/2. I also tested beta drivers with a high-speed Matrox board and beta drivers for the Diamond Viper board. A fast graphics board and OS/2-tuned drivers can result in some impressive video performance.

The final step in the installation is "migrating" both Windows and DOS applications to OS/2. The applications themselves aren't changed; essentially, folders and icons are created for the OS/2 desktop. Some common non-OS/2 applications require fine-tuning to run to best advantage in the OS/2 2.1 environment. OS/2 2.1 comes with a Migration Database that contains settings for many applications, taking advantage of the fact that each VDM (virtual DOS machine) in which a Windows or DOS application runs can have its own settings. (You can also migrate non-OS/2 applications later, or just install them directly from the OS/2 environment.) An IBM spokesperson says the company plans to update the migration database regularly. It will be available on major BBSes and on CompuServe.

Exploring the Workplace

When you finish installing OS/2 2.1, the moment of truth finally arrives: rebooting into the environment. What you see on the screen is vastly different from Windows' irritating-yet-familiar Program Manager. Initially, you can think of the Workplace Shell as a cross between the Macintosh desktop and Norton Desktop for Windows. But it's much more than that. The WPS is almost infinitely customizable and can be clean or cluttered, depending on your work

habits. You can have icons for applications and folders. And the WPS is hierarchical, too; you can have folders within folders ad infinitum. Unique to the WPS is its ability to *shadow* icons—to create multiple icons for the same application that can reside in multiple locations on the desktop (e.g., in multiple folders).

The WPS is also object-oriented with a vengeance. You've heard that before, but this is the real thing. Icons, folders, and even the blank space on the WPS are all true objects. You can drag and drop to your heart's content. And you'll need to exercise that long-neglected right mouse button. When you point to any object on the screen and click the right-hand button, up pops a list of common tasks associated with that object. It makes a great deal of sense, but it also takes getting used to.

Virtual DOS Reality

If you are a creature of confirmed Windows habits, you can click on the Windows Full Screen icon and work away in 3.1 Program Manager while completely ignoring OS/2. That's fine, but the real edge of OS/2 2.1 is in its true multitasking capabilities. From within the WPS, you can click on any application icon—Win-

dows, DOS, or OS/2—and OS/2 starts it up. It's possible to have multiple Windows, DOS, and OS/2 sessions all running concurrently. In fact, that's the major advantage of OS/2.

The ability to have multiple Win-OS/2 sessions running concurrently isn't hard to see. You can, for example, have Procomm Plus doing a high-speed file transfer in one Windows session while Excel is doing some heavy calculations in another. They don't get in each other's way. And while all this is going on, you can also be formatting a floppy disk under OS/2 and perhaps running a dBase sort under DOS. Admittedly, the system I used for this review is powerful, but I didn't begin to see any degradation of performance until I had six major applications running concurrently.

For those of us who occasionally still run old favorite DOS applications, OS/2 is particularly powerful. You can run gobs of separate VDM sessions. And each can have separate CONFIG.SYS and AUTOEXEC.BAT files, as well as numerous other customized settings. The same holds true of Win-OS/2 sessions. (See the text box "Tips for Tweaking OS/2.")

VDMs aren't perfect. They don't, for example, let you run block device drivers such as those used by my Bernoulli PC-Powered MultiDisk 150, which uses a proprietary SCSI interface that isn't supported under OS/2. In addition, I couldn't run the drivers for the LANtastic 5.0 network operating system. There is, however, a

ADVANTAGES

- **Multitasking:** True preemptive multitasking walls off applications from each other.
- **Workplace Shell:** This truly object-oriented graphical interface is like a cross between the Mac and Norton Desktop for Windows.
- **Windows anywhere (or DOS or OS/2):** Start any application from anywhere in Windows, DOS, or OS/2.
- **Capable Interapplication Communication:** Clipboard and DDE work between all Windows and OS/2 applications.
- **On-line help:** Just about everything you need to know is a couple of mouse-clicks away.
- **Advanced multimedia:** True multitasking makes multimedia easy and powerful, supporting IBM's Ultimmedia. OS/2 2.1 supports Sound Blaster and Media Vision sound cards and plays digital video at up to 30 frames per second in up to 320- by 420-pixel resolution. The CD-ROM version of 2.1 includes a considerable collection of sound and video files.

DISADVANTAGES

- **No 32-bit Windows support:** OS/2 is a 32-bit operating system, but it won't run 32-bit Windows applications and Windows VxDs (virtual device drivers). IBM says a solution is on the way.
- **Missing drivers:** Version 2.1 has more built-in drivers (e.g., CD-ROM, SCSI, and graphics) than ever before. But you still can't be sure that your peripherals will work to best advantage with OS/2. And some peripheral makers have no plans to make drivers available.
- **Workplace Shell:** Even though this also appears under Advantages, it can be needlessly complicated to figure out how to use the GUI. Common operations are sometimes buried deep in confusing layers of object orientation. Plus it's too easy to lose track of what's where and what's running.
- **Wimpy applications:** The Productivity Applications included with 2.1 are a misnomer. Wipe them off the disk and get real applications.
- **Dual-boot setup:** It works well, letting you switch back to your original DOS-based system. But setting it up is a needlessly complicated manual process.

PERFORMANCE MACHINES THAT BLOW THE GATES OFF GATEWAY.

**DELL DIMENSION XPS.
PCs DESIGNED FOR THE HIGH
PERFORMANCE USER.**

Now that you have been a witness to the impressive technological advancements of the Dell Dimension XPS PCs, there are only two small decisions you have left to make. And they're both easy ones:

Which Dell Dimension XPS PC is the right computer for you?

And what kind of software would you like to go with it?

That's right. You can order your software at the same time you order your Dell Dimension PC. That way, you'll be up and running the minute you open the box and unpack your system.

Purchase any combination from 100 of the most popular and competitively priced MS-DOS and Windows applications and have them pre-loaded onto your machine for one flat \$15

installation fee per system. Now that's a really good deal.

And should you ever feel the need to add

a peripheral, upgrade a software package or order a new application, we're ready and able to help you there too. With our DellWare™ program. A great selection of more than 2,400 software and peripheral items that you can order direct from us at discount prices. And if you want your DellWare selections in a real hurry, we'll ship your order to you overnight for only \$5 extra. For no charge at all, we'll send you a free DellWare catalog.

Now if there's anything else we can do for you, just pick up the phone and call.

A GUIDE TO THE WORKPLACE SHELL

The Workplace Shell is aggressively object oriented. Point anywhere, even on a blank area (as shown), and click on the right-hand mouse button; up pops a menu of associated choices. Shaded icons mean an application (or application in the group) is running in the background.

MINIMIZED WINDOW VIEWER
To keep the Workplace Shell look and feel clean, minimized applications aren't arranged across the bottom of the screen as in Windows. Instead, the icons are tucked into their own folder. (If you'd really prefer the Windows method, you can change it.)

SHREDDER
The name is a misnomer. It's just like the Mac Trashcan. It erases files, but you can also recover them.

TEMPLATES FOLDER
Templates are predefined objects for the Workplace Shell for programs, data, printers, and so forth. Each type has a stack of templates you peel off (like a sheet off a pad) and drag and drop to a location in the Workplace Shell or in a folder. Then you click on the right-hand mouse button and customize the settings. Templates save gobs of time when you're setting up new applications.

PRINTER ICON
Want to print a file? Just drag the file icon and drop it on the printer icon. It also gives you the print-queue status.

DUAL BOOT
Clicking on it closes all running applications and boots your original version of DOS (if set up that way during installation).

START HERE ICON
This icon tells you just about everything you need to know the first time OS/2 appears on your screen.

DISK A
It accesses the floppy drive.

FOLDERS
This is a hierarchical approach, just like the Mac Desktop. Organize applications and data in as many layers of folders as you wish. It's the graphical equivalent of subdirectories.

PROGRAM ICONS
Any Windows, DOS, or OS/2 applications. OS/2 starts them directly. (No need to enter Win-OS/2 to run Windows applications.)

way to get around the problem, at least partially. You can boot a "true" DOS image and use drivers that aren't supported under OS/2's VDMs. The process is comparatively complex. You first create a bootable DOS disk on another computer, then copy FSFILTER (a DOS device driver that provides access to OS/2 partitions) to it, use VMDISK to create an image of a disk on your OS/2 hard drive, and finally create a new object for the DOS session. It works, but you get access only to the devices from within the DOS session under OS/2.

The 32-bit Question

The future of true 32-bit applications for the OS/2 environment is a mixed one. Although OS/2 applications are becoming more prevalent, few yet take advantage of the OS/2 internal power and multithread-

ing capabilities. Some (e.g., WordPerfect for OS/2) are 16-bit ports of Windows applications. But true 32-bit applications (e.g., Lotus Ami Pro for OS/2) are now appearing. Their performance is impressive when compared with Windows.

More thorny is the question of the future of 32-bit applications under Win-OS/2. When I wrote this, Win-OS/2 didn't support Windows 32-bit applications and VxDs (virtual device drivers). At the present time, most applications are compatible under OS/2 2.1. And because Windows for Workgroups uses VxDs, you can't use it with OS/2. Help should be on the way: IBM expects that an OS/2 2.1 upgrade will appear "by the end of the year" to handle this. In the meantime, however, you're definitely out of luck. And, as mentioned, the question of longer-term OS/2 compatibility with future versions

of Windows remains up in the air.

Let's get real. OS/2 2.1 isn't going to push aside Windows. Windows has too large an installed base. But neither will Windows destroy OS/2 2.1. OS/2 has some tantalizing advantages that make it ideal for true PC power users, especially in the corporate environments that IBM knows and loves. After years of development and testing and six versions, IBM should finally take a few well-deserved bows for OS/2 2.1. For PC users who need true pre-emptive multitasking, OS/2 makes a solid choice. ■

Stan Miastkowski is a BYTE consulting editor. He was cofounder and publisher of the OS/2 Report newsletter and has been an OS/2 user since version 1.0. You can reach him on BIX as "stamm," on the Internet at stamm@bix.com, or via MCI Mail at 530-9979.

WINDOWS

INTRODUCING WORDPER IT'S WINDOWS THE W

Of all the things people do with personal computers, word processing may be the most personal.

Nobody writes the way you do. Nobody gets the same assignments or tackles them the same way. And nobody understands that better than WordPerfect®, the worldwide word processing leader.

That's why we're excited to introduce WordPerfect 6.0 for Windows. We didn't design it to be the perfect writing tool for the *average* user. We designed it to be the perfect writing tool for *you*.

MAKE IT YOUR OWN.

Which features of your word processor do you use most often? Are they organized so that you can get at them quickly?

WordPerfect 6.0 gives you direct, one-click access to *any* command, process or macro in the program. Just drag your favorites to a context-sensitive Button

Bar™ and arrange them any way you like.

You can even drag in other Windows applications and files and launch them from within WordPerfect. (How's that for easy integration?)

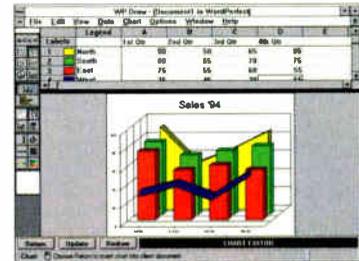

You can quickly create customized interfaces to streamline the writing of reports, memos or letters. Or you can simply use any of 70 professionally designed ExpressDocs™ templates included in the package.

And it's not just commands you're in command of. Virtually every element of the interface — including how it looks and feels—is yours to do with as you will.

It's the most easily customized word processor ever to come out of a box.

How it looks is up to you. Because every aspect of the WP interface can be easily customized.

Now, you can create 3-D charts from table and spreadsheet data without ever leaving WordPerfect.

* LIMITED TIME OFFER. WORDPERFECT IS A REGISTERED TRADEMARK OF WORDPERFECT CORPORATION WITHIN THE UNITED STATES AND OTHER COUNTRIES. ALL OTHER BRAND AND PRODUCT NAMES ARE TRADE MARKS OR REGISTERED TRADEMARKS OF THEIR RESPECTIVE COMPANIES. © WORDPERFECT CORPORATION 1993

WORDPERFECT® 6.0 FOR WINDOWS. ANY WAY YOU WANT IT TO BE.

GETTING HERE WILL BE EASY.

With more than 100 built-in spreadsheet functions and advanced charting and drawing capabilities, this is the most powerful program WordPerfect has ever developed. But how difficult will it be putting all this power and flexibility to work?

If you've used WordPerfect on another operating system, you and your existing documents and macros will feel right at home here. This is the WordPerfect you know, in a friendlier, more accommodating environment.

There's an on-line tutorial for first-timers, of course. But there are also interactive Coaches smart enough to lead you step-by-step through sophisticated operations, not on *sample* documents, but on *your* documents. And if you have any questions, WordPerfect's support people (widely acknowledged to be the best in the business) are standing by to help.

THE BEST REASON FOR MOVING TO WINDOWS.

This is everything WordPerfect has learned about word processing over the years, combined with all the advanced ease-of-use capabilities of the Windows environment.

It connects your documents directly to other powerful Windows applications, and to the rest of the business world. And the power of WordPerfect 6.0 is all yours.

Partners Seek to Unite Phone and PC

The Windows Telephony API promises a new generation of phone-enabled applications for the desktop

ANDY REINHARDT

Despite their obvious affinity, the two most essential pieces of equipment in today's offices, the computer and the telephone, have yet to be fully integrated. The gap has not gone unnoticed by vendors, but old habits and technology have kept the worlds apart.

Now, as part of its ongoing WOSA (Windows Open Services Architecture) initiative, Microsoft is trying to bridge this gulf. Following the front-end/back-end model the company has used in other WOSA components, Microsoft and its partners have designed a set of software interfaces that will facilitate connecting Windows systems to phone equipment.

The goal of the Windows Telephony API, or TAPI, is to enable a new generation of telephone-enabled software applications, while at the same time making it easier to connect desktops, laptops, and LANs into phone systems and PBXes. TAPI defines a client-side API that supports telephony features and a back-end SPI (service provider interface) that defines how phone equipment talks to a Windows DLL. When implemented, TAPI will let you access sophisticated central phone functions from your PC and let developers create phone-based programs without having to worry about the intricacies of the device on the other side of the interface.

Helping Hands

Microsoft's partners include phone-equipment vendors

Northern Telecom, Alcatel, and Rolm; call-processing system makers Dialogic, Natural Microsystems, and Octel; software vendors Lotus, Delrina, and Contact Software; chip makers Intel, National Semiconductor, and Analog Devices; and RBOCs (Regional Bell Operating Companies) Ameritech and US West. Together, these companies are redefining the physical and logical connection between phone and PC. Soon you may have both devices on your desk, attached to a PBX and operating under the control of desktop software. In the future, telephone hardware could become integrated into the PC, and a handset could become a standard PC accessory.

In either scenario, the PC display will be the user interface to the phone system. To place a call, you could select a recipient from a pull-down list, and the phone number would be routed out through the PBX or switch. If you have a separate desktop phone, the PBX would ring it when the connection is made. Similarly, taking advantage of the Caller I.D. capability that identifies the phone number of an incoming caller, the PBX could feed the number to a database that would look up the caller's record and send it to your screen while the phone rings.

Much of the motivation for TAPI is the growing complexity of today's phone systems. Many users don't take advantage of sophisticated features such as Call Forwarding be-

cause they can't figure out how to use them. Providing access to these capabilities through the Windows interface could make them easier to use. For example, you could set up a conference call by dragging and dropping the names of all the participants into a box on the screen, leaving the PBX to place the calls.

An attractive potential application of TAPI would be a unified "in box," where E-mail, fax, and voice-mail messages are presented. This would eliminate an annoying aspect of voice mail: the need to listen to all the messages in a linear fashion. With Caller I.D. and a database of known numbers, incoming messages could be listed by the name of the caller, letting you retrieve them in any order. Using the same kinds of filtering software now available for E-mail (e.g., Beyond-Mail), you could prioritize voice messages or specify that calls from certain people be forwarded to another location.

Adding the LAN

For the time being, TAPI assumes that each client system is linked directly into the PBX or phone switch. It also requires that the software to implement phone capabilities be installed on every client, which could cause big companies with tens of thousands of users to think twice about the cost of buying it.

To better address the installed base, Novell and AT&T have established a nonexclusive partnership to connect Net-

Applications

Ware servers and AT&T Definity switches. This server-based approach would allow the same kinds of features described above—dialing out directly from the client (routed through the server to the PBX) or looking up incoming Caller I.D.s in a server database—but would distribute the cost of telephony software across all network nodes. One major advantage of a LAN-based solution is that the PBX and LAN user directories may be integrated and centrally managed. It could also eliminate the need for separate network and telephone wires to each workstation.

The Novell/AT&T and Microsoft solutions are not necessarily incompatible: You could apply client-side TAPI applications in a NetWare environment through AT&T switches. Sue Rubinstein, a senior research analyst for the

- 5 Year/15 month warranty provides long term peace of mind

We could talk for days about how great our new EVOLUTION V family is. We could fill up pages detailing why these 64-bit Pentium processor powerhouses are the most revolutionary systems to hit the microcomputer industry in years. But frankly, it's easier for us to just quote the industry experts. After all, these folks live, breathe and dream computers, so if something

impresses them, you know it has to be good.

Yet these systems are more than just award winners. The EVOLUTION V family continues ALR's eight year history of delivering state-of-the-art technology at unbeatable prices — a tradition shared by our entire family. Backed by our industry leading 5/15 warranty, the entire ALR product line delivers an unbeatable combination of performance, service, and value.

The ALR EVOLUTION VQ/60 & EVOLUTION V

Technology designed from the inside out

While most of today's Pentium processor systems are merely upgraded versions of existing 32-bit 486-based PCs, the ALR EVOLUTION V and the EVOLUTION VQ were engineered from the ground up to take full advantage of this advanced, 64-bit CPU. With support for the Pentium processor's wider data path and high performance write-back mode, these powerful systems easily outperform their less sophisticated competitors.

The ALR EVOLUTION VQ System Board Technology

- 60 or 66 MHz Pentium Processor
 - Quad-Bus 128 Architecture (ALR Custom ASICs) with Dual 64-bit Path cache to Memory; supports Pentium Write-Back Mode
 - Dual 256-KB (512-KB total) 64-bit integrated Write-back Cache
 - 6-MB RAM (Expandable to 1-GB); True 64-bit Data/Memory Path
 - Ten 32-bit EISA Expansion Slots
 - 3 VESA VL Local Bus Slots
- Also Includes:
 13 Drive Bays
 415 Watt Power Supply

- 60-MHz Pentium Processor Supports Pentium Write-Back Mode
 - 8-MB RAM (Expandable to 128-MB); True 64-bit Data/Cache/Memory Path
 - Integrated 256-KB Write-back Cache
 - Integrated MULTUS (Multi-seeking) IDE Controller
 - 5x ISA Expansion Slots
 - 2 32-bit VESA VL Local Bus Slots
- Also Includes:
 Six Drive Bays
 400 Watt Power Supply

Circle 280 on Inquiry Card (RESELLERS: 281).

IBM Has High Hopes for Multimedia on OS/2

Multimedia Extensions for Presentation Manager gives capabilities to OS/2 that outstrip Windows 3.1

NICHOLAS BARAN

IBM faces an uphill battle in its effort to make OS/2 a major player in the PC operating-system arena. But the company has a clear advantage with the multimedia capabilities of OS/2, which are packaged as the Multimedia Extensions for Presentation Manager (or MMPM/2 for short).

This advantage comes in part from OS/2 features such as 32-bit bandwidth and preemptive multitasking. These features enable the operating system to handle simultaneous multiple video and audio sources as well as the demands of video and audio synchronization and high-speed video frame rates that are required for digital movies.

Windows 3.1, on the other hand, does not offer the performance or the robustness to handle sophisticated multimedia applications. (For a detailed comparison of multimedia on Windows 3.1 and OS/2, see "Multimedia Infrastructures," August BYTE.) In spite of the software's limitations, however, Microsoft has focused its multimedia program on Windows 3.1 and has not done much to promote multimedia for its

new high-performance Windows NT operating system. Observers speculate that Microsoft will promote multimedia heavily in its 32-bit successor to Windows 3.1 (called, depending on whom you talk to, either Chicago or Windows 4), which is due out sometime next year.

Window of Opportunity

In the meantime, IBM is aggressively pushing OS/2 for multimedia. In the past few months, IBM has announced a series of multimedia development tools, under the moniker *Ultimedia*, that work with MMPM/2.

Ultimedia Builder allows you to build multimedia presentations. Ultimedia Perfect Image is an image-processing tool for editing and enhancing captured images. And Ultimedia

Workplace provides links for multimedia applications and databases so that you can incorporate data from your database into multimedia presentations. In addition, IBM is about to release a tool called Ultimedia Video IN for capturing video footage and converting it into a sequence synchronized with audio.

All of these tools support IBM's Ultimedia data-compression algorithm; in addition, they also support other major data-compression algorithms, such as SuperMac's Cinepak and Intel's Indeo. It is also interesting to note that IBM is porting its Ultimedia algorithm to Windows.

But while few would dispute that IBM's multimedia offerings are superior to what is currently available from Microsoft, there's considerable concern about OS/2's installed base. Says Joe Scirica, vice president of product development at Maxis (makers of the popular SimCity game for the Mac and Windows), "The OS/2 market is still too small. The installed base isn't large enough for us to support OS/2. Where's the OS/2 section in the software store?"

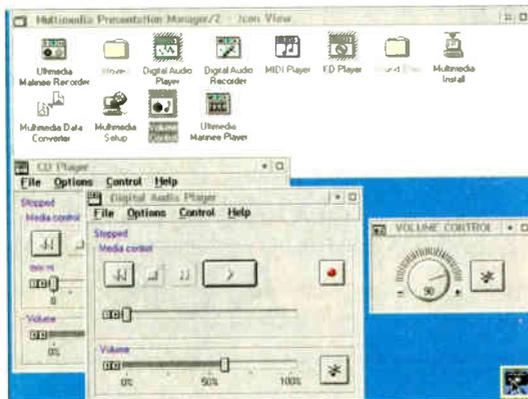

Applications

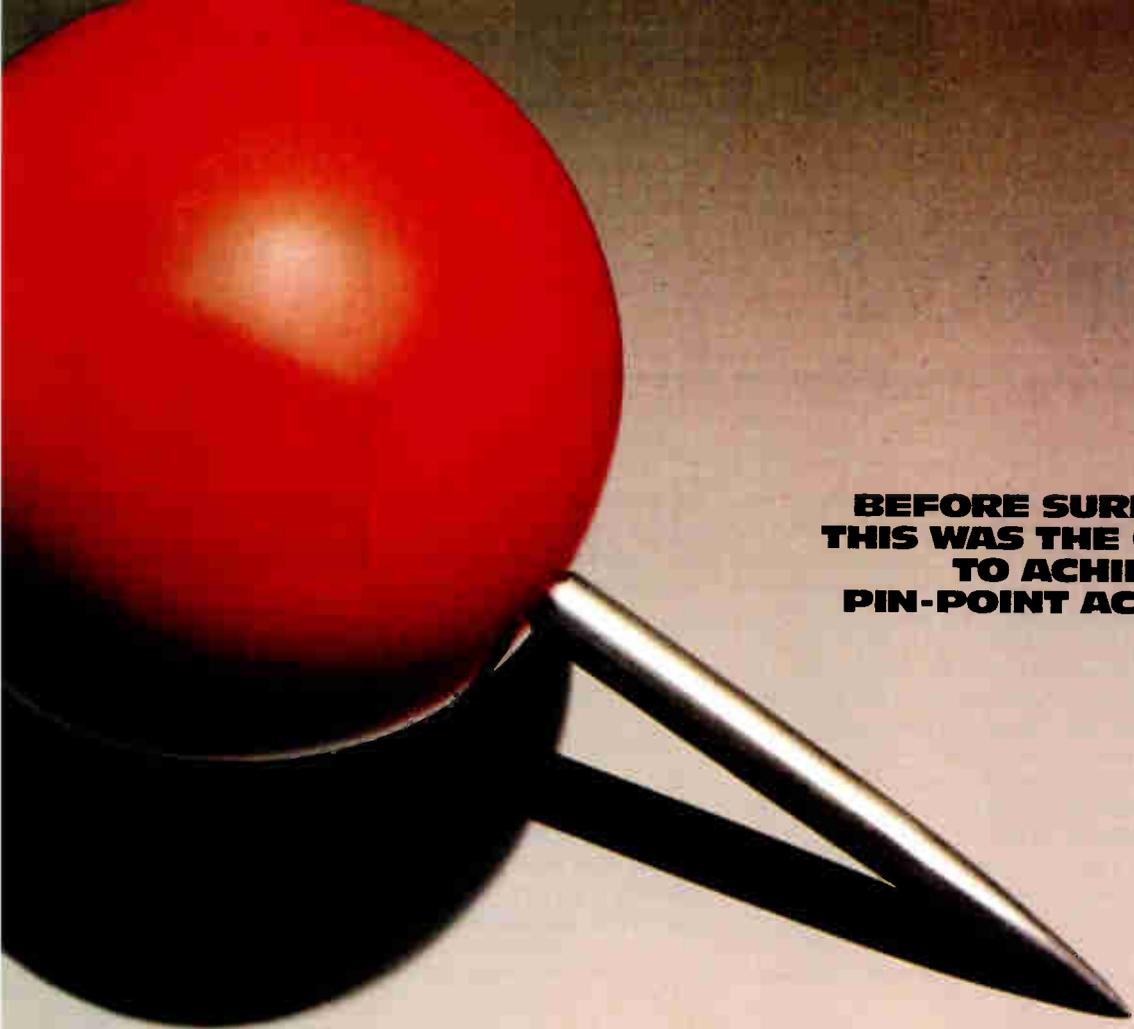

While OS/2's small installed base might scare off the game makers, IBM says that it is making headway with corporations that want to use multimedia for computer-based training and video E-mail and conferencing. For example, Holiday Inn is designing a multimedia training system for its desk clerks using OS/2 multimedia.

IBM's brand manager for multimedia, Karl LaWall, observes that "people who are beginning to use multimedia are discovering they need a robust platform—we're seeing increased acceptance of OS/2 across all areas of [the multimedia] marketplace." ■

Nicholas Baran is a BYTE consulting editor living in Sandpoint, Idaho. He is the author of Windows from the Keyboard (John Wiley & Sons, 1993). He can be reached on BIX as "nick-baran."

Multimedia Extensions for Presentation Manager.

**BEFORE SURE!MAPS,
THIS WAS THE ONLY WAY
TO ACHIEVE
PIN-POINT ACCURACY.**

Expand Sure!MAPS with detailed information on major metropolitan areas.

Street maps let you pin-point locations by address or latitude/longitude.

Now there's a better way: Sure!MAPS™ CD-ROM based desktop mapping software from Horizons Technology. No more colored stick pins. No more holes in your office wall. Sure!MAPS brings detailed mapping capabilities directly to your DOS or Windows PC. Import your database into Sure!MAPS to reveal geographic trends that will help you make faster and better business decisions. Whether it's real estate listings, office locations, customer sites or virtually any kind of point-specific data, Sure!MAPS can open your eyes to a world of valuable insights.

The Sure!MAPS base product includes a continental U.S. map and two world maps. You can expand your map coverage by ordering full-color raster USGS Map Sets of major metropolitan areas, complete with terrain contours and details like airports, parks, rivers, buildings and bridges. Street-level maps and satellite imagery are available, too. All you have to do is pick the Map Set that contains your city or region and Sure!MAPS does the rest. It even imports spreadsheet and database files, calculates distance and area, and scrolls from map to map in one seamless presentation.

Pin-point mapping will never be the same after Sure!MAPS. So throw away those little pins and call **1-800-828-3808**. Or plot a course to your local distributor, reseller or computer store to get your copy today.

Pen for OS/2

IBM sees multitasking as key to moving OS/2 into the pen market

ED PERRATORE

IBM first had to make OS/2 the robust operating system users expect. Then came pen capability, supported by hardware makers such as Dauphin Technology, Telepad, and AST Research. Now for the Personal Systems Products group's next challenge: selling Pen for OS/2 horizontally in an essentially vertical market.

IBM's chief target market is the company's long-established base of existing users. "Customers want either to take those custom-built applications and

add pen function to them or to continue running their DOS, Windows, and OS/2 applications and write a brand-new pen application," says Gordon Arbeitman, PSP's technical planner for pen software. This approach saves money and programming time, especially considering the "very minor transition" for a competent OS/2 programmer to master Pen for OS/2's controls and APIs.

The problem? Despite notebook PCs with bigger hard drives and more RAM, the per-

ception lingers that OS/2 is a desktop operating system. And there is the better-grounded perception that handwriting recognition has a long way to go.

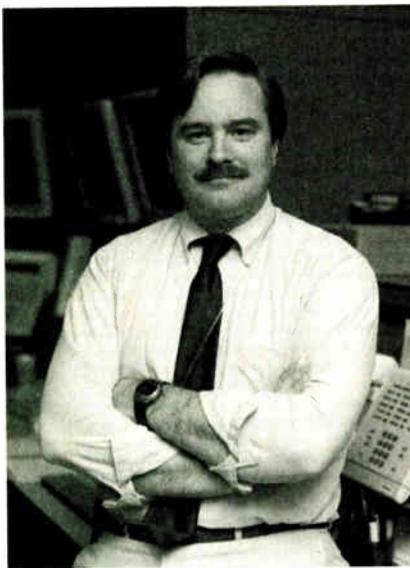

But for mobile workers using standard forms and needing to multitask, Pen for OS/2 may serve well. For example, says Debra Davis, PSP pen brand manager, if you're a meter reader filling out a pen-driven form, "you could be sending the data back, accessing customer files, preparing bills, and getting them out faster."

Applications

Says Gerry Purdy, Dataquest's chief mobile computing analyst: "It may end up, for a mission-critical application, to be the kind of operating system that is absolutely right on. You can't get that [yet] from Microsoft." ■

"DynaComm® is Microsoft's® choice for terminal emulation." It should be yours.

Evaluating terminal emulation software? Consider the one Microsoft chose for communicating across their world-wide network. FutureSoft's DynaComm for Windows™ offers a single solution for PCs communicating across multi-platform networks to host computers.

DynaComm features:

- 16 Terminal emulation types for UNIX, DEC, Hewlett-Packard, IBM, and Data General systems

- 19 Network interfaces including TCP/IP and IPX
- Powerful development tools for creating GUI front ends to host applications

No doubt you've experienced the limitations of Windows.

Central Point and PC Tools are trademarks of Central Point Software. Names of other products are used for identification purposes only and may be trademarks of their respective companies.

Too slow.

Too cluttered. And a little klutzy. Clearly,

Windows has its imperfections.

Fortunately, they're easy to fix. All you need is PC Tools™ for Windows software. It makes Windows faster, simpler, more fun—while it protects your data. Infoworld concluded, "with the release of PC Tools for Windows, Central Point has in a single stroke grabbed the top spot as best Windows shell from Norton Desktop." We couldn't have said it better. And at \$99 (from participating dealers) the advantages of PC Tools for Windows are really hard to ignore. To see if you qualify for the \$49.95 upgrade to PC Tools for Windows, just call 1-800-695-0679.

IBM Makes MP Promises for OS/2

By adding symmetrical multiprocessing to OS/2, IBM has brought scalability to its premier desktop operating system

ED PERRATORE

Multiprocessor-capable hardware is a waste if your software is unable to use more than one CPU at a time. One major criticism of OS/2 has been its lack of support for multiprocessing. IBM plans to rectify this situation with OS/2 SMP, an operating-system enhancement due to go into beta by year's end.

IBM expects OS/2 SMP to turn in performance numbers superior to SMP performance on kernel-based operating systems. According to OS/2 developer Dave Medina, OS/2 SMP lacks much of the baggage of message passing and other overhead required to enable SMP on kernel-based architectures. This could mean a performance advantage for OS/2 over Windows NT and IBM's forthcoming Workplace OS when compute-intensive applications are run on a mul-

tiprocessing system.

OS/2 SMP makes no distinction between operating-system threads, such as the Workplace Shell or the Windows Manager, and those of the applications, says OS/2 SMP development manager Ayodele I. Anise. And DOS and Windows applications as well as those for OS/2 will be supported. Multithreaded applications will benefit the most, of course, because the various threads can be dispersed among available processors.

Ensuring Compatibility

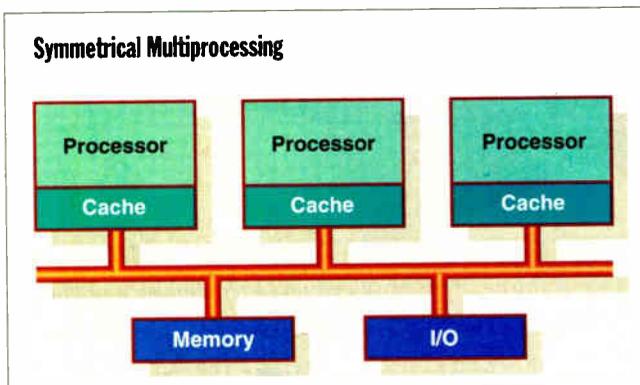

By the time the code goes into beta, IBM hopes to have overcome difficulties created by certain OS/2 ISVs (independent software vendors) who, in the words of John Navas, a consultant working with alpha OS/2 SMP code under contract with Everex, "have written

code that makes a lot of assumptions that are tied to a uniprocessor." Such software can very easily get into race conditions, where two pieces of code in the same application deadlock over simultaneous attempts to access the same resource. For example, the application may boost its priority because it assumes nothing else will be running. "In a multiprocessing environment, that doesn't work," says Navas. The answer, he suggests, may be to offer a compatibility mode in which a particular ill-behaved application can run in a uniprocessor-emulation mode.

Navas's team, running AutoCAD, Windows applications, Ultimedia for OS/2, and other applications, has encountered no problems that he does not expect to see resolved by the time the code goes into beta. "Our only concern right now is how fast IBM is going to move forward," he says. "I've got people who are saying that they'd take it *yesterday*."

When we went to press, the decision on how to package OS/2 SMP had yet to be finalized. Weaving it into OS/2 2.2 is a possibility, as is offering it as a quiet upgrade—the way the Personal Systems Products division included the 32-bit graphics engine in its Service Pak late last year. IBM says it tentatively expects to sell it through the OEM channel on OS/2-equipped multiprocessing systems from IBM and other vendors.

However it hits the market,

In a **symmetrical** multiprocessing system, the processors have equal access to system resources, and any processor can run any operating-system or application thread. In an **asymmetrical** system, one processor usually runs the operating system and controls access to resources, creating imbalances in the distribution of work across the processors in the system.

OS/2 SMP is sure to better IBM's attraction in the face of formidable opposition from Microsoft and from PSP itself. "One of the big objections I've seen many times, from clients who are looking at OS/2, is its lack of scalability," says Navas. "They're saying, 'It's limited to one Intel processor—what if I need more power than that?' This is the answer. It's limited to however many chips you want to buy, assuming the hardware guys come through and deliver reasonably priced systems." ■

SOFTWARE DEVELOPERS

The Key to Solving Your Piracy Problem & Increasing Sales.

Protect Your Software and Profits

Let's face it. Piracy costs software developers billions of dollars in lost sales each year. The only way to protect yourself from these losses is to protect your products. That's why more developers protect with Sentinel from Rainbow Technologies, the world's largest manufacturer of software protection devices for software developers.

Most Widely Used Keys in the World

Over 10,000 software developers worldwide use the Sentinel Family of software protection keys from

SENTINEL
Securing the future of software

Rainbow Technologies. They are simply the most reliable, compatible and effective keys

available. And with more keys to choose from, the Sentinel Family offers keys for more platforms and languages than anyone else. For DOS, OS/2, Windows, Macintosh, LAN, UNIX, open systems and more.

Service and Support Worldwide

Rainbow Technologies is the world leader in software protection. With offices throughout Europe and the United States, and distributors located worldwide, Rainbow Technologies offers just-in-time delivery and the largest engineering and technical support staff in the software protection industry. Find out how Sentinel keys can help solve your piracy problem and increase sales. Contact Rainbow Technologies at 800/852-8569 for a free copy of "The Sentinel Guide to Securing Software" and ask how you can get a Sentinel Evaluation kit.

OS/2 and Windows Networks

BARRY NANCE

When you visit a foreign country, you use the local currency, and you try to follow the local customs. On many levels, you soon discover that people are not all that different. If you're familiar with Novell's NetWare, using a LAN based on OS/2 or Windows gives you the same feeling of being in a foreign country. You learn to think of the LAN in different terms, but you quickly find the net result—shared disk space, shared files, and shared printers—not all that different from what you're accustomed to. LANs based on OS/2 and Windows use different means to achieve file and print I/O redirection, and they offer some capabilities difficult to implement in a NetWare environment.

Two server-based NOSes (network operating systems), IBM's LAN Server 3.0 and Microsoft's LAN Manager 2.1, run on various flavors of OS/2 and share a common code base—programmers from IBM and Microsoft worked closely together to create the original versions of these products. Microsoft's newest operating system, Windows NT Advanced Server, runs on NT; Microsoft will continue to offer and support LAN Manager running on OS/2, as well as the NT Advanced Server.

Future products will use IBM's SMB protocols on NetBIOS to exchange file data. Lee Reiswig, president of IBM's Personal Systems Products Division, says his division plans to ship a peer-to-peer LAN product later this year or in early 1994. The as-yet-unnamed product has an object-oriented interface and a clipboard that lets different workstations share information. IBM licensed the core software from Symbolics. IBM will position its peer LAN relative to OS/2 the same way Microsoft does with Windows for Workgroups and Windows 3.1.

Other NOSes that work with Windows but aren't part of the base Windows environment include LANtastic for Windows, Invisible LAN, and WEB for Windows. Sun Microsystems says that later this year, it will release a version of NFS (Network File System) that will run on NT. IBM offers TCP/IP for OS/2. These latter two products help OS/2 and NT work with Unix-based servers.

LAN Server and LAN Manager

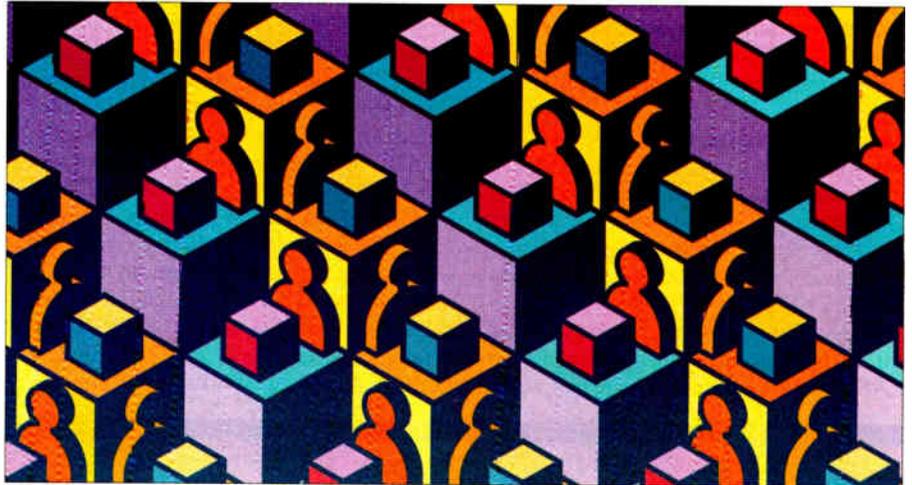

LAN Server 3.0 is a 32-bit NOS that the BYTE NSTL team has clocked as being faster than NetWare 3.11. LAN Man-

ager uses many of the same commands as LAN Server and, like it, works internally. LAN Server runs on OS/2 2.x, which you buy separately, while LAN Manager comes bundled with OS/2 1.3.

LAN Server and LAN Manager are excellent environments for client/server computing. It's relatively easy to program an OS/2 computer, even one that is already running as a file server. If you have a staff of programmers or if the applications software you buy already supports LAN Server and LAN Manager, client/server architecture becomes a possibility. SQL Server, Oracle, and DB/2 are examples of RDBMSes (relational database management systems) that work well on OS/2-based LANs.

In LAN Server and LAN Manager parlance, a *requester* is the software that lets a workstation log on to a domain—a group of file servers and workstations with similar security needs—and use network resources. Users have access to the network through the OS/2 LAN Requester program from OS/2 workstations and through the DOS LAN Requester program from DOS workstations. A server can share its files, printers, and even serial devices (e.g., modems) across the LAN. DOS requesters can't access a shared modem, but OS/2 requesters can.

During installation, the network administrator specifies a server to be a domain controller or an additional server. There is only one domain controller in a domain. You can set up several domains on a large LAN Manager or LAN Server network. On a small LAN, a file server can also act as a domain controller. Domains provide a simple way

DANIEL PELAVIN © 1993

IBM's LAN Server and Microsoft's LAN Manager have more similarities than differences

to control access to the network and the network's resources. A network user can have accounts in multiple domains, but he or she can log on in only one domain at a time. Additional servers cannot be started, nor can users log on, if the domain controller is not running. Several domains can exist on the same LAN, each managed separately, but each file server belongs to only one domain. Domains are managed by network administrators who set up, maintain, and control the network, manage its resources, and support its users.

Same-Domain Concept

LAN Manager and LAN Server both use the domain concept but in slightly different ways. If you want to use LAN Manager and LAN Server on the same physical network, you should set up separate domains for each NOS.

In one domain, all file servers should run LAN Manager, or they should all run LAN Server. You should ensure that work-

stations in a LAN Server domain log on to a LAN Server domain before trying to access LAN Manager file servers. Workstations in a LAN Manager domain, however, can log on to any domain. Once logged on, you can access files on servers in other domains if the network administrator has given you access rights on the other servers and defined the other servers as external resources. In practice, most people just log off one domain and log on to the next when they want to cross domains. The new NT Advanced Server eliminates this annoyance with a feature called *Trusted Domains* (which I'll explain later); however, you must add at least one NT Advanced Server to each LAN Manager or LAN Server domain.

To give access to an external resource, you assign a nickname, or *alias*, to it. On a server named ACCTING, an administrator might create an alias named OCTRCPTS to refer to the server's C:\RECEIPTS\OCTOBER directory. Workstations equate

the OCTRCPTS alias to a drive letter, perhaps drive G, to gain access to the files in that directory. The alias specifies the server where the directory is located and the path to the directory, so people at workstations don't have to remember server names and directory structures. An alias remains defined after the domain controller is stopped and restarted, but a network name does not.

LAN Server can use aliases for shared resources, but LAN Manager cannot. LAN Manager workstations must refer to the shared resources by their full name, not by the alias. Suppose you have a LAN Server machine named PRODUCTION that shares a printer with an alias of REPORTS. The full name of the shared printer is \\PRODUCTION\PRINTER1. LAN Server workstations can share REPORTS, but LAN Manager workstations must use the full name \\PRODUCTION\PRINTER1 to access that printer.

LAN Manager offers a feature called

NetBIOS and SMBs

The NOSes (network operating systems) discussed in the main text use NetBIOS to send and receive messages. The NetBIOS messages contain Server Message Blocks, or SMBs, to carry file I/O requests and responses between servers and workstations. NetBIOS accepts communications requests from the file redirection portion of the NOS or from an application program, such as an E-mail product. NetBIOS operations fall into four categories:

Name support—Each workstation on the network is identified by one or more names. These names are maintained by NetBIOS in a table; the first item in the table is automatically the unique, permanently assigned name of the network adapter. Optional user names (e.g., Barry) can be added to the table for the sake of convenient identification of each workstation. The user-assigned names can be unique or, in special cases, can refer to a group of users.

Session support—A point-to-point connection between two names (workstations) on the network can be opened, managed, and closed under NetBIOS control. One workstation begins by listening for a call; the other workstation calls the first. The computers are peers. Both can send and receive message data concurrently during the session. At the end, both workstations hang up on each other. LAN

Server, LAN Manager, Windows for Workgroups, and NT Advanced Server establish sessions between workstations and servers.

Datagram support—Message data can be sent to a name, a group of names, or all names on the network. A point-to-point connection is not established, and there is no guarantee that the message data will be received.

Adapter/session status—Information about the local-network adapter card, other network adapter cards, and any currently active sessions is available to applications software that uses NetBIOS.

At the workstation, the requester software intercepts an application's file I/O operations and sends them across the network to the file server, using IBM's SMB protocol to accomplish the redirection. SMBs can be used for session control, file access, print service, and sending messages.

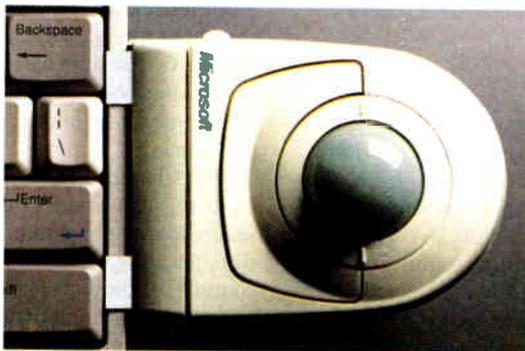

Session control—Once a NetBIOS session is established between a workstation and the server, the workstation sends a Verify Dialect SMB to the server. This message contains data indicating the capabilities of the version of the PC LAN Program running at the workstation. The server examines this message and responds to the workstation with information about itself and the capabilities the server

supports. This exchange is then followed by one or more Start Connection SMBs, which are used to create logical connections between the workstation and network resources at the file server. These logical connections are later terminated by the workstation when it sends End Connection SMBs to the server (or when the NetBIOS session is aborted by the occurrence of an error).

File access—A workstation uses the SMBs in this category to gain access to the files on the server's hard drive. The functions included in this category let the workstation treat the server drive almost like a local hard drive—the workstation can create and remove directories; create, open, and close files; read, write to, rename, delete, and search for files; get or set file attributes; and, of course, lock records. The requester detects file operations intended for network files and converts the operation into one or more SMBs. The local operating system (e.g., DOS or OS/2) never sees file requests for network files. The server performs the file operation when it receives the SMB message and returns a response to the workstation's requester.

Print service—The SMBs in this category let a workstation queue files for printing by a server and to obtain print-queue status information. The workstation can create a spool file, write data to the spool file, close the spool file, and ask that the server return a print-queue status SMB.

**YOU CAN'T CONTROL
YOUR BOSS,
YOUR WORKLOAD,
YOUR WEIGHT,
YOUR BACKHAND,
YOUR WEEDS,
YOUR DOG, YOUR LIFE.
AT LEAST NOW
YOU CAN CONTROL
YOUR CURSOR.**

At Microsoft, we feel there are enough things in the world that follow their own unpredictable path.

So we redesigned just about every aspect of the new Microsoft BallPoint mouse to let you regain control of your portable computer.

We started by changing the weight of the ball. We improved the smoothness of the tracking mechanism. We reshaped our mouse to fit your hand better. We even added software features that make it easier to find and control your cursor.

All of which means, in simple terms, that the cursor will now do what you want it to do.

And which is why, in independent tests, people worked 35% faster with the BallPoint mouse than with other leading portable and built-in pointing devices.

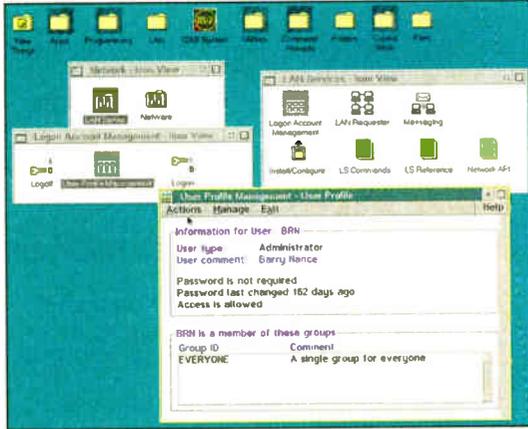

Of course, you should try it yourself. So pick up a BallPoint mouse at a computer store today.

And have one aspect of your life firmly, and comfortably, in the palm of your hand.

Microsoft
Making it easier

IBM's OS/2 LAN Server.

persistent net connections that helps you avoid retyping resource names at log-on time. By default, each time you log on, you get the same network connections you had in your last session. You can enable or disable persistent connections with the `/PERSISTENT=` option on the NET USE command. You can also put entries in a user's LANMAN.INI file to turn persistent net connections on or off or to freeze a certain set of network resources as shared by that user.

An administrator assigns a network name to a resource (e.g., disk directory, printer, or serial device) to define the resource temporarily. Like an alias, a network name identifies a shared resource on a server. But to use a resource through its network name, you specify the server name as well as the network name. Unlike an alias, a network name does not remain defined if the domain controller is stopped.

A UNC (Universal Naming Convention) name consists of a server name and a network name, which together identify a resource in the domain. A UNC name has the following format:

```
\\servername\netname\path
```

Note the use of the double backslash characters preceding the server's name.

If you assign LPT1 to a shared print queue, you override your local printer port, and your print jobs go to the network printer. On the other hand, you can't override local drive letter assignments. If you have drive C on your computer, you must use other drive letters besides C to refer to file-server disk resources.

Security

User-level security on a LAN Manager or LAN Server network consists of log-on security and permissions. Each user account

has a password; you specify your user ID and password to gain access to the network through a domain. A network administrator can limit a particular user's access to certain times of the day or the workstation(s) from which a user logs on. Permissions limit the extent to which you can use shared resources. The network administrator, for example, can create a COMMON directory that everyone can use, and the administrator can create an UPDATE directory, with files only certain people can modify but everyone can read. With share-level security, a feature of LAN

Manager, the administrator can set up a single password to limit access to a particular shared resource or device. LAN Server does not support share-level security.

The network administrator creates an access-control profile to grant, restrict, or deny access to a shared resource. Each shared resource (usually a disk directory) can have just one access-control profile. An administrator can put individual log-on accounts in an access-control profile, or the administrator can set up named groups of accounts and insert group names in the access control profile. Group names are more convenient, and they help keep the profile to a manageable size. Each individual or group name has a list of permissions and security restrictions the administrator can use. The access permissions allow or disallow the following operations:

- run programs
- read and write data files
- create and delete subdirectories and files
- change file attributes
- create, change, and delete access control profiles

Fine Tuning

You tune LAN Server by using a text editor to modify the computer's CONFIG.SYS and IBMLAN.INI files. LAN Manager features auto-tuning, whereby the file-server software monitors its own activity and changes its initialization files automatically. To take advantage of auto-tuning, you merely have to stop and restart a LAN Manager file server periodically.

LAN Manager and LAN Server interoperate well on a Token Ring LAN but not on an Ethernet LAN. On Ethernet networks, you may need to modify both NOSes' configurations. LAN Server sup-

ports the DIX (Digital/Intel/Xerox) 2.0 protocol and the IEEE 802.3 protocol; LAN Manager does not support DIX. On Ethernet networks, you need to switch LAN Manager and LAN Server to use IEEE 802.3 so that workstations can use both file servers.

You should also note that the networking products from Microsoft and IBM can't do packet routing inside a file server, as NetWare can. You need to buy router hardware if you want to segment your LAN. Mike Nash, product manager at Microsoft, says that Microsoft and IBM share the philosophy that file servers aren't the place to do packet routing. On the other hand, if you decide to link two or more LANs, you have a wide variety of options to choose from. For example, you might connect LAN Server or LAN Manager through a leased line, T1 link, or X.25 connection.

Both LAN Server and LAN Manager support the use of RFS-compliant (Remote File System) NetBIOS over TCP/IP. Through appropriate routers or bridges, you can issue standard NET USE commands to gain access to remote shared resources.

Windows NT Advanced Server

In early August, Microsoft surprised the industry by releasing NT Advanced Server at the same time as NT itself. Microsoft had said that NT Advanced Server would lag behind NT by about 30 days. NT Advanced Server extends the features and advantages of LAN Manager in a number of ways.

Like LAN Server, NT Advanced Server is a 32-bit NOS; however, unlike with LAN Server, you can run NT Advanced Server on Intel, Mips R4000, or DEC Alpha platforms. While CPU speed is rarely a bottleneck on file servers, you might choose to run NT Advanced Server on a symmetric multiple CPU. The extra CPU processing power might let you use the file server for additional client/server applications.

NT Advanced Server offers C2-level security, which means that the NOS has a secure log-on procedure, memory protection, auditing, and discretionary access control (i.e., the owner of a shared resource can monitor who is using the shared resource). Some corporate and military LANs require C-2 or higher security. In the area of reliability, NT Advanced Server uses a transaction-based file system that can back out file updates if a series of related updates don't finish successfully. NT

XFTWARE™

New Desktop Edition Only \$195!

X WINDOWS FOR DOS, MS WINDOWS & WINDOWS NT

At \$195, New X Windows is Priced for Every PC!

Mainstream PC users running MS Windows have wanted to access network-based Unix applications for quite awhile, but for most the price has simply been too high to justify the hook-up. Until now.

Announcing *XoftWare™ for Windows, Desktop Edition (DT)*, the first easy-to-use, value-priced PC X server software. Now anyone with a 386/486 PC can afford an integrated system that combines the best of MS Windows and Unix simply by clicking on icons.

Finally, Unix for the rest of us. *XoftWare for Windows DT* was created specifically for the non-technical PC user. Which is to say, those of us who occasionally want to access Unix applica-

WITH A SIMPLE CLICK, *XoftWare for Windows, Desktop Edition* makes it easy to cut-and-paste between MS Windows and X.

tions, but don't need the higher throughput or extra features of a true 32-bit X server.

Truth is, *XoftWare for Windows DT* has been streamlined to give all PC users

just what they need in features and functionality, and at a very affordable price.

Are you tired of poring over User Guides? We thought so. That's why we made *XoftWare for Windows DT* exceptionally easy to install, simple to start up, and a snap to operate. With our *XoftStart™* feature, PC users don't even have to know how to start Unix, much less run it. Just click and start from

a Windows-based icon. You'll also appreciate our *CascadeX™* feature, which positions windows in a Microsoft-like cascading window format.

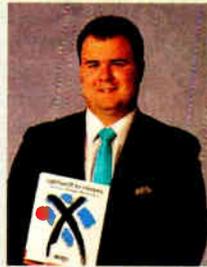

XoftWare for Windows DT supports all leading network software, including the MS Windows Sockets API. You can even order it bundled with Novell's TCP/IP networking software.

Act now for free fonts. Already an exceptional value, if you act while supplies last we'll send you our *XoftFonts™* font package, a \$50 value, absolutely free. *XoftWare for Windows DT*—the perfect add-on to your networked PC. Call us at (619) 455-8600. Fax: (619) 597-6030. email: sales@age.com

MicroAge Applauds 32-bit X Server for its Vim, Vigor and Very Good Value

Staten Island, NY—Michael Conroy, Systems Engineer for MicroAge, likes AGE's new *Desktop Edition*, but he loves its big brother — *XoftWare™/32 for Windows*. "We tell our customers it's the turbo-charged version — with the throughput and process power to handle a broad

MicroAge's Michael Conroy: If fast is good, faster's better!

range of robust Unix applications and databases. It gives MS Windows PCs workstation-like functionality." Conroy says he was surprised at its ease of use. "You figure when you get the power, you

sometimes lose friendliness, but that's not the case with AGE's products. I particularly like MPSS™ — the Multi-Process Start-up System, which lets users start multiple applications simultaneously, saving valuable time." Conroy says he likes the 32-bit offering's price

point, \$395 (or \$495 with Novell's TCP/IP bundled). He's also looking forward to the upcoming 32-bit X server for MS Windows NT, which will be priced at \$495. Circle 348 on Inquiry Card.

Advanced Server supports RAID level 5 (disk striping with parity), recognizes signals from a UPS (uninterruptible power supply), and comes with tape-backup software.

Trusted Domains

NT Advanced Server adds Trusted Domains to the way domains work in LAN Server and LAN Manager. Suppose, for instance, that your LAN has separate domains for engineering and marketing. People in the engineering department have developed a new product and want to let product managers in the marketing department see the specifications for the new product. The engineering department can authorize access to its files by making the marketing domain

trusted and giving read-only permissions to the product manager's group. The product manager doesn't have to separately log in to the engineering domain to view the files. When the file server holding the documents senses a request from a marketing-domain product manager, the file server verifies access permission, with the trusted marketing-domain controller, through the engineering domain controller.

A Performance Monitor utility helps administrators manage NT Advanced Server, and the NOS is also SNMP- and NetView-aware. Desktop and LAN management products such as OpenView, LANLord, LANDesk, and Frye's Utilities should soon support NT Advanced Server. Microsoft says NT Advanced Server will comply with the DMTF (Desktop Management Task Force) specification for the management of LAN-connected desktop computers as soon as the DMTF finalizes its specification. Other utilities you get with Advanced Server include User Manager, Disk Administrator, Event Viewer, and an enhanced Control Panel.

If you prefer not to establish permanent drive-letter mappings for each workstation but rather to let each workstation browse lists of shared resources to create new connections to shared directories and printers, you'll like NT Advanced Server's BrowseMaster feature. Each PC with resources to share periodically reports a list of those resources to the BrowseMaster server. When a person at a workstation clicks on the Browse push button (e.g., in Windows for Workgroups

File Manager or Print Manager), the workstation gets the list of available resources from the central BrowseMaster computer. This technique keeps LAN traffic down, because servers and workstations don't have to continually broadcast resource lists to each other.

NT Advanced Server uses SMBs, on NetBIOS, to send and receive file I/O redirection requests over the LAN cable. This means that NT Advanced Server should interoperate with LAN Server, LAN Manager, Windows for Workgroups, and even the older PCPLP (PC LAN Program). In addition, NT Advanced Server supports TCP/IP and Novell's IPX/SPX transport-layer protocols.

You get a wealth of other connectivity options with Microsoft's latest NOS: Windows Sockets, Named Pipes, NetDDE, IBM's DLC (data-link control) for host sessions, and RPCs (remote procedure calls). This last interface is compatible with the OSF/DCE (Open Software Foundation/Distributed Computing Environment) specification. Microsoft says it will offer connectivity modules for SQL Server and SNA Server. The version of Remote Access Server for NT Advanced Server handles up to 64 concurrent connections over dial-up, leased, X.25, and ISDN lines. And NT Advanced Server has Macintosh support built in.

Windows for Workgroups

Windows for Workgroups is a marriage of Windows 3.1 and NOS that includes an E-mail application (i.e., Microsoft Mail) and an appointment book application (i.e., Schedule+). The two software products install themselves into the main program group.

If you're a part of a small team of people who are accustomed to using applications in a Windows 386 enhanced-mode environment, Windows for Workgroups can help you share information. Shared files can exist on every PC running Windows for Workgroups in 386 enhanced mode, or they might be located on a separate, unattended PC that you use just for file storage. A PC must be running Windows for Workgroups in 386 enhanced mode to share files, however.

Users who use Windows for Workgroups can share printers as well as disk files. Using File Manager and Print Man-

ager, you can designate the PCs that should share disk directories and those that should share printers. When you share a disk directory or printer from a PC, you give the shared resource a name by which other users can refer to that resource.

Other users establish connections to shared resources by also using File Manager and Print Manager. Establishing the connection assigns a new drive letter (perhaps D) to a shared directory and, for a shared printer, redirects the parallel printer port (LPT1) across the LAN to the shared printer. You can tell Windows for Workgroups to remember the connections you've established. Windows for Workgroups will automatically re-create each connection when you start Windows. You have access to shared directories and printers both from within Windows and from within the DOS applications you run in a Windows DOS session (either via the DOS Prompt icon or a program information file, or PIF).

You can use Windows for Workgroups to add convenient peer-to-peer networking functions on a LAN that is running LAN Manager, LAN Server, or NT Advanced Server. Security on a Windows for Workgroups LAN isn't great, but for small groups who already use Windows, this entry-level peer-LAN environment can be effective. Windows for Workgroups is the easiest LAN to set up and use.

Building a LAN based on Windows or OS/2 can be a good investment. You'll find these environments fertile ground for client/server applications. For example, you can save hardware and software dollars by running a database manager directly on the file server. You'll be able to easily create peer-LAN relationships on a Windows or OS/2 LAN. Or you might use one of these NOSes as an application server on a LAN that's already running Novell NetWare.

Novell has about 70 percent of the NOS marketplace, and that percentage isn't likely to plummet significantly any time soon. However, you may find it advantageous to add LAN Server, NT Advanced Server, or perhaps Windows for Workgroups to your Token Ring or Ethernet LAN. At first, the new NOS may make you think you're in a foreign country. But you'll find the extra drive letters and other shared resources not all that different from NetWare's. And you may find you spend less money on network software. ■

KINGSTON PROCESSOR UPGRADES. SAVE YOUR SYSTEM AND A BUNDLE.

Significant Savings, Equivalent Performance.
Kingston's IBM designed SLC/Now! plus SX/Now!, 486/Now! and MCMaster processor upgrades make existing systems perform like new 386SX, 486SX or 486DX models. They provide the power needed for today's software, perform comparably to new systems and cost at least 70% less.

Upgrade	Before	After	New System	System Supported
SX/Now!	IBM-AT	With SX/Now! 25	PS/2 Model 57SX-D45	SX/Now!
Landmark Speed 2.0:	8 MHz	35 MHz	22 MHz	286-based systems from AST, Compaq, Epson, Everex, Hewlett-Packard, IBM, NEC, Toshiba and Zenith
Recount:	5:44 Min.	1:51 Min.	1:54 Min.	
Retail Price:		\$215	\$1,545	
SLC/Now!	PS/2 Model 50	With SLC/Now! 50	PS/2 Model 90-0H9	SLC/Now!
Landmark Speed 2.0:	13 MHz	114 MHz	84 MHz	IBM PS/2 Models 50, 50Z, and 60
Recount:	3:34 Min.	:29 Sec.	:38 Sec.	
Retail Price:		\$425	\$3,280	
486/Now!	PS/2 Model 70-25MHz	With 486/Now! SX 25	PS/2 Model 90-0H9	486/Now!
Landmark Speed 2.0:	39 MHz	84 MHz	84 MHz	IBM PS/2 Models 70 and 80, Compaq Deskpro Models 386-16, 386-20, 386/20c, 386-25, 386-25c, 386-33
Recount:	:55 Sec.	:39 Sec.	:38 Sec.	
Retail Price:		\$495	\$3,280

Recount:	2:47 Min.	:36 Sec.	:38 Sec.	
Retail Price:		\$795	\$3,280	

All systems tested with 16MB installed except MCMaster, tested with 64MB on board and 64MB on mother board. All system prices are MSRP at standard config state as of 1/91. Processor upgrade prices are MSRP as of 4/91. Recounts conducted on: VSB Excel for Windows spreadsheet generated by Kingston Technology.

Quality is Assured.

Bench testing of each and every product with the original system diagnostics and certification by the National Software Testing Laboratory provides the maximum assurance of individual product quality and compatibility.

Full Compatibility.

Kingston's processor upgrades are tested to be fully compatible with today's most popular operating environments including MS DOS, Microsoft Windows, IBM's OS/2 and Novell Netware.

More Information.

Contact your nearby Kingston dealer or give us a call at (800) 835-6575 to find out which processor upgrade is best for you.

[800]

Kingston Reliability.

Like our memory products, every processor upgrade is individually tested prior to shipping, supported by free comprehensive technical assistance and backed by a five-year warranty.

IBM's Assault on Distributed Objects

With its Distributed System Object Model, IBM is in the forefront of bringing the benefits of object technology to distributed applications

JON UDELL

When IBM shipped OS/2 2.0 in the spring of 1992, the company touted the new object-oriented Workplace Shell as a major achievement. While the WPS itself garnered mixed reviews, the foundation on which it rests—the System Object Model—emerged as an object technology to be reckoned with. Its successor, the Distributed System Object Model, extends objects across networks and forms the cornerstone of IBM's distributed-object strategy.

SOM 1.0, which shipped with OS/2 2.0 and 2.1, is an operating-system extension that provides OOP (object-oriented programming) mechanisms such as inheritance and method dispatching. OOP-language products such as Smalltalk and C++, which have traditionally provided these mechanisms, can't adequately package objects for binary reuse across

languages or even across implementations of the same language. The SOM 2.0 engines (there are two) retain backward compatibility with the 1.0 version while adding multiple inheritance, C++ bindings, and an interface-definition language that can now work in combination with the latest Object Management Group standard. Both engines—the Workstation Runtime and the Workgroup Runtime—are available as part of the SOMobjects Developer Toolkit.

Objects Local and Remote

The Workstation Runtime engine enables objects to communicate across process boundaries on a single OS/2 or AIX system. The Workgroup Runtime engine enables those same objects to communicate across system boundaries over NetBIOS, TCP/IP, or IPX transports. This engine swaps byte

order as needed to keep data streams intelligible in mixed networks of OS/2 (Intel) and AIX (RISC) machines. There's no protocol bridge yet, however, so stations on LAN Server networks will have to run NetBIOS and TCP/IP concurrently to talk to stations on AIX networks.

The Workstation Runtime will help correct a flaw in the WPS. Currently, user-written shell objects share address space with the WPS itself and can therefore crash it. With SOM 2.0, such objects can optionally run in a separate address space. The WPS in OS/2 2.1 can't take advantage of this feature yet, but a future version will be able to. More important, the Workstation Runtime will enable developers to build on a single machine the distributed-object systems they plan to deploy on networks. To switch from single- to multiple-machine mode, you just replace the Workstation Runtime (\$75) with the Workgroup Runtime (\$235).

Object Framework

In addition to the run-time systems, the SOMobjects Developer Toolkit (\$365 for OS/2; \$585 for AIX) includes the SOM compiler, documentation, a class that supports collections (notable because it's

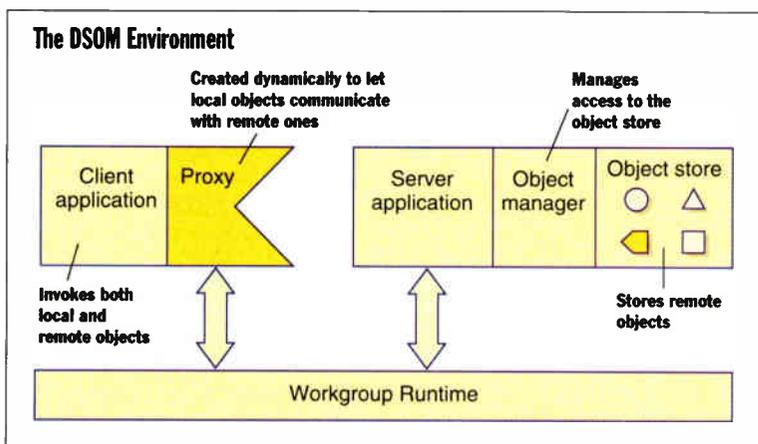

Networking

the first IBM product derived from the Taligent effort), and three sets of C++ classes that IBM calls *frameworks*.

The emitter framework provides IDL (interface definition language) parsing support for those interested in binding SOM to a programming language other than C or C++. MicroFocus used this framework to bind SOM to its COBOL implementation. The persistence framework writes objects out to disk and reads them back. The replication framework has a number of intriguing uses: Objects that inherit from it can share common data safely. A collaborative text editor, for example, might use the replication framework to enable live editing of a document by multiple concurrent users.

"DSOM gives you the opportunity to solve the most difficult aspect of distributed

The DSOM Environment lets applications take advantage of remote objects by creating a local proxy that regulates access to remote methods.

“DSOM gives you the opportunity to solve the most difficult aspect of distributed computing, which is latency.”

computing, which is latency,” says SOM architect Mike Connors. That’s because SOM adds another layer of indirection to the standard RPC (remote procedure call) model. With RPC, you make direct calls to the local proxies that invoke remote

procedures. With DSOM, even calls to local proxies are dispatched through method tables. If you write an intelligent proxy, Connors says, you can cache some object-state information locally. That way, you won’t automatically incur network delay every time you inquire about a remote object’s attributes.

You won’t go out and buy DSOM directly. Instead, you’ll acquire it from developers of DSOM-based applications and utilities. One early proponent is ChipChat-Cawthon Software, a longtime developer of OS/2 communications software. The company’s ChipChat SOM objects support file transfer and terminal emulation over serial, parallel, and telnet ports. “If we didn’t already give you telnet support,” says ChipChat-Cawthon’s president Marty Cawthon, “you could add it yourself in the language of

your choice and automatically inherit our ability to perform XMODEM, YMODEM, Kermit, and ASCII file transfers. Our ChipChat object encapsulates communications ports at a high level, just as a UART encapsulates them at a lower level.”

The Wide World

IBM’s DSOM strategy doesn’t end with OS/2 and AIX. Windows support is due by year’s end, according to IBM’s object czar Cliff Reeves. Moreover, a technology exchange with Hewlett-Packard will synchronize DSOM with HP’s Distributed Object Management Facility. For HP, the deal means access to DSOM, a finer-grained object technology than HP’s own. For IBM, it means a strategic link between DSOM and DCE (Distributed Computing Environment). While DSOM offers its own

native directory service, IBM is investing heavily in DCE for large-scale distributed systems. The ability to run DSOM over DCE will be crucial. DSOM will also provide the packaging and method-dispatching services used by Apple’s forthcoming distributed compound-document technology, OpenDoc.

Distributed computing will have truly arrived when software developers can build distributed objects the same way they write stand-alone ones. If IBM delivers the SOMObjects Developer Toolkit for Windows by year’s end as promised, DSOM, rather than a future version of OLE, could be the first to realize that dream. ■

Introducing the \$139 investment no computer user can afford to be without...

“Don’t take chances...Get the ultimate protection...Back-UPS from APC.”

**PC World
Top 20
Upgrade**

Blackouts, brownouts, sags... if you use computers, your bottom line is directly linked to your power line. The fact is, your data and hardware are vulnerable to problems that surge suppressors and power directors just aren’t equipped to handle.

Now there’s an Uninterruptible Power Supply (UPS) to suit any budget. Back-UPS® are perfect protection for LAN servers, personal computers, phone/fax systems, POS equipment, or any other device that can go down when the power does. If lightning is a concern, Back-UPS are even backed by a \$25,000 insurance policy against surge damage to your equipment (see details).

So don’t wait for the inevitable power problem to rob your business. Protect your productivity with Back-UPS, available where quality computer products are sold.

APC Back-UPS provide instantaneous battery power during power disturbances, so your data and hardware are safe!

Mathematica

New...
Mathematica Notebooks
 For The X Window System

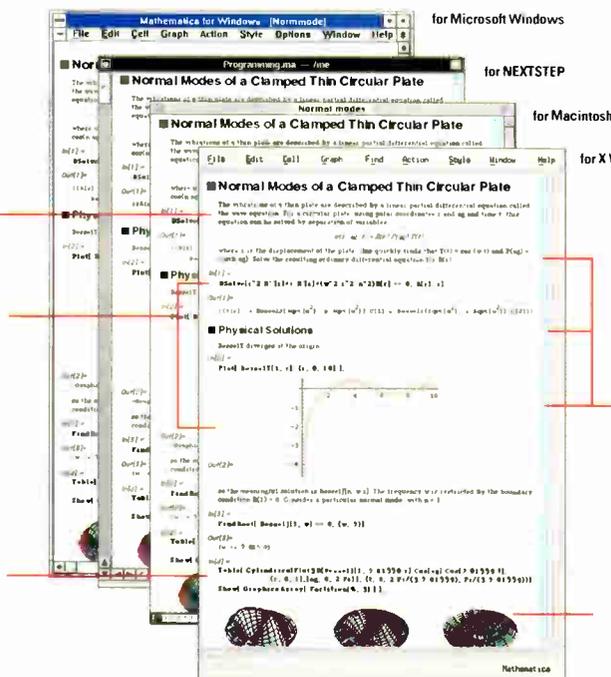

POWERFUL CALCULATION. EFFECTIVE COMMUNICATION.

The Mathematica Notebook

Add introductions, explanations, and conclusions to your computations just as you would with a word processor.

Cut, paste, or edit your calculations or formulas at any time and your answers, plots, and graphics will be re-calculated or re-graphed right in the notebook.

Solve problems with custom solutions that you create using Mathematica's high-level programming language.

You can exchange your notebooks with co-workers even if they use another type of computer, because Mathematica notebooks are compatible across multiple platforms.

Use notebook cells to organize your document into sections. You can collapse and re-open cells to control what sections you want to see on the screen as you work.

Create full-color 3D graphics and animation from functions and lists of data. You can easily import graphics into your notebook or export Mathematica graphics in PostScript and other standard graphics formats.

You've done the work, now it's time to let everyone know. Colleagues, your manager, the department head, your own students—they all need to understand what you've put together.

Mathematica already brings today's most powerful technical computing system to your desktop. But beyond that, the Mathematica notebook enables you to communicate quickly and clearly, either electronically or on paper. As you work in Mathematica you automatically create your own notebook—an electronic Mathematica document.

Live computations, plots, animated graphics, and text that you assemble in this notebook are then easily organized in an outline format for an impressive technical report, a personal record of your work, class courseware,

or even book publishing. When your work is done, simply print it out, send it over the network, or present your notebook directly from your computer.

Print your report directly from your electronic notebook, controlling font styles, font sizes, and line spacing as you wish.

Use Mathematica to get work done faster and Mathematica notebooks to make a professional impression with your results. Nothing could communicate your ideas more convincingly.

The truth about

Before you decide what client/server platform is right for you, make sure you know what's true, and what's Not True.

Fact: the OS/2® client/server solution preserves your current hardware and software investment,

 accessing your mainframes, minis and PCs when necessary and bringing their power and capacity to the desktop level. **Fact:** the Windows NT™ solution is based on PC servers and desktops and *doesn't* embrace all your existing resources. That could mean porting applications and data. The only plus that offers is the cost of porting *plus* the cost of additional PC servers.

Fact: OS/2 2.1 runs DOS, Windows™ and more than 1,200 native OS/2 applications. With LAN Server 3.0 or Novell® NetWare,® OS/2 supports DOS, Windows, OS/2 and Mac clients. **Fact:** it's not likely NT will support all your existing applications. It won't run existing 32-bit applications like WordPerfect® 5.2 for OS/2 and Lotus® 1-2-3® for OS/2. It *will* require additional software to support DOS, OS/2 and even Windows clients. Worse yet, *Infoworld* sources

▲ All this monkeying around with NT raises lots of questions. OS/2 has the answers. report that Windows 3.x applications run 20% slower under NT than they do under OS/2 2.1!

Fact: OS/2 delivers powerful, reliable, client/server applications for data storage and retrieval (DB2/2,™ Oracle 7,™ InfoPump™), communications (Communications Manager/2, REMOTE OS,™ TalkThru®), transaction processing (CICS, IMS Client Server/2 V2), comprehensive network management (LAN NetView,® CA-UNICENTER,®

The OS/2 ▶ client/server solution exploits your existing hardware and software investment. There's No Telling how much the NT solution could cost you.

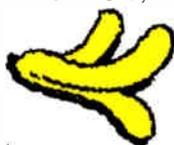

client NT

Domain/DACS™, AlertView™, Foundation Manager™), and more. **Fact:** The NT strategy is still Not There, and neither are native client/server applications.

Fact: OS/2 is committed to the industry-accepted Distributed Computing Environment (DCE) standards of the Open Software Foundation.

Fact: NT is Not.

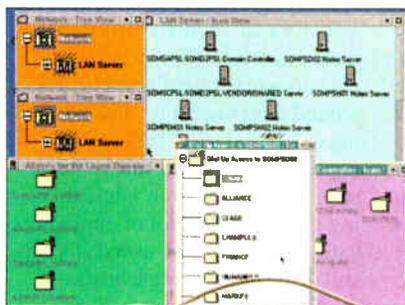

Fact: NT still Needs Time to

▲ *Who needs first-generation slipups? OS/2 is second-generation solid.*

prove itself in the real world. **Fact:** OS/2 is used by millions world-

◀ *With OS/2, it's full speed ahead for your DOS, Windows and OS/2 applications—there's no need to buy DOS and Windows.*

wide. It's the leading, second generation, 32-bit Intel®-based operating system—a more stable, more developed version of the award-winning March, 1992 release.

If you're looking for a cost-effective, secure, high function client/server solution today—Not Tomorrow—then OS/2 is for you. To order or to find out more about OS/2 2.1, call 1 800 3-IBM-OS2. In Canada, call 1 800 465-7999. OS/2 2.1 is also available at your local software dealer. And that's a fact.

Operate at a higher level.™

Developers Cautiously Optimistic About Multiplatform OpenDoc

Are users ready to have documents—as opposed to applications—become the focus of desktop computing?

DAVE ANDREWS

One of the benefits of Microsoft's OLE 2.0 technology is that it lets you focus on the document you're creating instead of the Windows applications that created it. OLE 2.0's integrating features, such as its support for in-place editing and drag-and-drop of data, show promise for interapplication collaboration on a single CPU. But OLE 2.0 does not address remote execution of applications and sharing of data among Mac, Windows, Unix, and OS/2 applications running over a network.

Currently, only programmers developing Windows applications can take advantage of OLE 2.0. Microsoft says it will release implementations for Mac and Windows NT developers by year's end, but this still leaves OS/2 and Unix out of the picture. Several companies, uncomfortable with OLE

2.0's lack of support for other operating systems and its control by a single company, have announced an architecture called OpenDoc that promises an object-based framework for developing applications that interoperate across platforms and distributed networks.

What's Inside

OpenDoc will use technology from several companies, including IBM's System Object Manager for its object-calling mechanism, Apple's Bento standard as its storage mechanism, and the industry-standard CORBA (Common Object Request Broker Architecture) for sharing objects across a network, according to Cliff Reeves, program director of object-oriented technology products for IBM's Personal Systems Products division. WordPerfect is working on an implementation of OpenDoc for Windows (WordPerfect's OpenDoc effort was code-named *Amber*) that will interoperate with OLE 2.0. Reeves said. He added that an OpenDoc consortium, which will set the architecture's direction and certify applications for compliance, will be modeled after the X Consortium.

Reaction from third-party software developers to OpenDoc is mixed, partly because programmers are not expected to receive the first code drops for developing OpenDoc applications until late 1993. Hil-

mi Ozguc, senior product manager for Lotus 1-2-3, said the ideas espoused in OpenDoc fit well with Lotus's cross-platform orientation. "We like the direction... but it's too early to come out and make a commitment." Also, because different parts of OpenDoc will come from different companies, developers questioned whether the three major companies providing OpenDoc technology—IBM, WordPerfect, and Apple—could successfully coordinate their efforts.

The Redmond Tack

Microsoft is working on its own distributed OLE solution, naturally. David Seres, Microsoft's OLE 2.0 product manager, said a distributed OLE implementation will be included with Cairo, Microsoft's unreleased, object-oriented version of Windows. But that isn't expected to ship until sometime in 1995.

Perhaps the biggest hurdle OpenDoc and Microsoft's distributed OLE will face at the end-user level is the network bandwidth issue. Network administrators may see a significant network performance degradation as applications access data or remotely execute other applications over the network. Others question if users and developers will truly accept the notion of small object programs, or *componentware*, exchanging data with other programs.

Networking

Craig Yappert, product marketing manager at Frame Technology, said one of the reasons users like working with a single application is that it gives them a feeling of security through their expertise. "Software applications really aren't designed around this concept of 'I'm going to be kind to all these other applications around me,'" he said. "OpenDoc is an interesting goal, but for a lot of applications and a lot of users, it's still unclear how people are going to use it." ■

Dave Andrews is a BYTE news editor. You can reach him on the Internet at dave.news@bix.com.

Planned OpenDoc Features

- Open scripting architecture
- Bento storage format defines how complex data is stored on disk in such a way that the producer of one document can exchange that concept with another producer rather than rely on private data forms
- Technology road map set by multivendor consortium
- Support for Unix, Windows, Mac, and OS/2
- Support for irregular document frames, version control, in-place editing

COMPAQ WOULD LIKE TO
MAKE AN ANNOUNCEMENT OF
STAGGERING PROPORTIONS.

TRAPPED IN THE BODY OF THIS TINY SI

This is a story about a small computer engineered to be so dependable, you won't think twice about trusting it with your mission-critical applications. And to be this without filling a closet, much less a room. If you haven't thought of Compaq as an enterprise-critical platform before, we invite you to grab your bifocals and begin. (We'll be cramming a lot of information into this ad, which, given how much we managed to fit into our new servers, only makes sense.)

If there's one thing we've learned working with our customers, it's that you're running more and more mission-critical applications on your network. And if your network goes down, your business goes down. All of which makes the introduction of the new Compaq ProLiant Server even more timely.

The ProLiant is a new family of affordable, high-performance, easy-to-manage servers engineered specifically to provide the high availability you need for mission-critical networks. We've designed ProLiant in three different models, ranging from a single-processor configuration to a four-Pentium processor model.

Now, how can you be sure our server is truly a miracle and not a mirage? To begin with, there's Full Spectrum Fault Management, provided by Compaq Insight Manager technology and software that continually monitors over 800 aspects of the server's operating status. (For example, Drive Parameter Tracking checks 15 hard-drive parameters.) All of this information is constantly gathered, analyzed and then used to prevent, tolerate or recover from system problems.

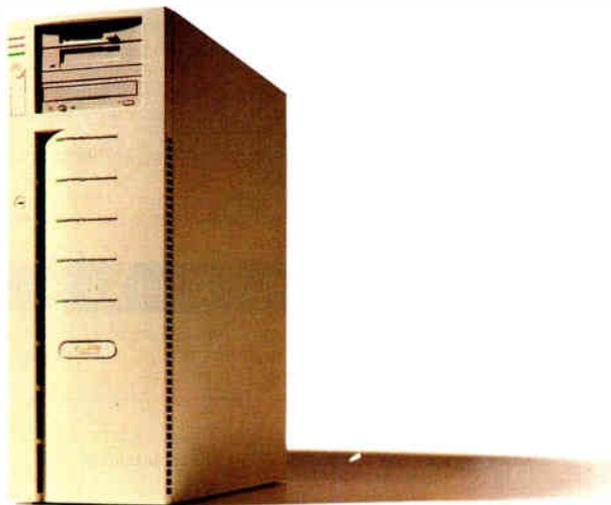

If the performance of a monitored component drops below a specified level, our unique Pre-Failure Warranty kicks in. We'll actually replace a Compaq warranted drive or memory system free. Before it stops working. No downtime. Ringing cash registers. Happy boss.*

Still, no network's perfect. In the unlikely event problems occur, our server exhibits remarkable tolerance. Every ProLiant includes Compaq-designed hot-pluggable drives. ProLiant Models 2000 and 4000 come standard with advanced error-correcting memory and off-line backup processor features (whereby the server reboots

automatically to a second processor). And, most notably, the Compaq Smart SCSI Array Controller together with the ProLiant Storage System ensures mission-critical data integrity. Should a network problem bring the server down, the Rapid Recovery Systems of the ProLiant are designed to bring it back u

SERVER IS A MAINFRAME WITH AN ATTITUDE.

For example, Automatic Server Recovery 2 uses a historical record of server status and performance to perform an astonishing array of tasks. Like intelligently restarting the server, automatically correcting a variety of problems, and accessing a telephone pager to contact network administrators.

By now you'd expect us to have rethought server setup, configuration and OS installation, but you might be surprised by the results. Introducing SmartStart, a CD-ROM system that takes the headache out of getting your server up and running. ProLiant includes a CD-ROM drive and bundled CDs of optimized

Netware and other major operating systems. To get hooked up to your network operating system, simply call your dealer for an access code, enter it, answer a few questions, and leave. Minutes later—say, after you've enjoyed a cup of coffee and a jelly donut—you'll return to find an integrated OS fully installed and optimized for increased performance and improved management. And we'll keep you updated via CD when new operating system versions appear.

And finally, to accompany our new line of mission-critical servers, we're introducing mission-critical support. With ProLiant, we now offer extensive analysis, installation and service through our CompaqCare System Partners, a select group of highly trained systems experts backed by Compaq engineers. You can now choose 4-hour on-site warranty response upgrade** direct from Compaq. Again, there's our unique Pre-Failure Warranty. And, of course, all Compaq servers come with a 3-year on-site[†] warranty, and 7-day-a-week, 24-hour-a-day technical support.

All in a surprisingly small box for not a whole lot of money. In fact, a DX2/66 Compaq ProLiant 1000 starts at about \$6000[†].

Which may help to explain the look your boss gives you when he hears how much money you've saved: stunned admiration. But you'll get used to that. It goes with the territory. For more information on the new Compaq ProLiant servers, or for the location of an authorized Compaq reseller near you, just call us at 1-800-345-1518. If you'd like to receive model, feature and specification information immediately via fax, select the PaqFax option. Or, if you'd like that information even sooner, just turn the page.

<i>Standard Disk Controller</i>	Integrated Fast SCSI-2 and Smart SCSI Array Controller (selected models)		
<i>Storage Capacity</i>	550MB-112GB Internal/external	1050MB-140GB Internal/external	1050MB-140GB Internal/external
<i>Typical Usage</i>	Departmental network services—primarily NetWare	Departmental network application services—NetWare, NT and Unix	Application services for preemptive downsizing—NT and Unix
<i>Transaction Rating</i>	50-150 TPS	200-300 TPS	300-400 TPS
<i>Estimated Starting Street Price[‡]</i>	\$6,000	\$8,900	\$13,900
SERVER DEPENDABILITY AND AVAILABILITY			
<i>Management</i>	Second-generation Compaq Insight Manager (standard) combines with innovative hardware design to constantly monitor, assess and report server health and performance		
<i>Fault Prevention</i>	Insight Manager alerts you to server status changes in over 800 component parameters, allowing proactive server management backed by 3-Year Pre-Failure Warranty		
<i>Fault Tolerance</i>	Standard support for RAID levels 1,4,5; hot-pluggable drives; on-line spare drive; off-line backup processor [§] ; advanced ECC RAM [§]		
<i>Fault Recovery</i>	Standard rapid recovery services automatically return server to full operational status even in the event of a critical subsystem failure		
SIMPLICITY, EASE OF OWNERSHIP AND SUPPORT			
<i>SmartStart</i>	Standard CD-based intelligent hardware configuration and system software installation, providing simplified server configuration for NetWare, NT or Unix. (CD-ROM drive standard)		
<i>System Warranty</i>	Free Three-Year, On-Site Limited Warranty		
<i>Pre-Failure Warranty</i>	Three-Year, On-Site Warranty replacement of designated components that fall below preestablished thresholds		
<i>4-Hour Warranty Response Upgrade</i>	Optional Three-Year On-Site Warranty upgrade to 4-hour response		
<i>Technical Support</i>	Toll-free, 7 x 24 technical phone support from Compaq engineers		
<i>CompaqCare System Partners</i>	Highly trained, dedicated, third-party professionals who provide systems maintenance and comprehensive technical support		
<i>QuickFind/PaqFax</i>	Proactive notification and delivery of new technical information/7 x 24 fax response for updated specification, configuration and settings data

IBM Ships DCE SDK for OS/2 and Windows

Big Blue makes DCE the cornerstone of its future distributed-computing platforms. Will DCE carry the load or sink under its own weight?

ANDY REINHARDT

Given a reputation for lagging the market in software, IBM's recent announcement of the first Distributed Computing Environment SDK (Software Development Kit) for OS/2 and Windows is especially noteworthy. As one of the founding members of the OSF (Open Software Foundation), which distributes DCE, IBM has long played a major role in that organization. However, IBM's true commitment to open systems continued to be questioned by some observers.

Now, IBM has shipped a set of tools that facilitates the creation of distributed applications across not just IBM platforms (i.e., OS/2 and AIX), but also non-IBM Unix servers from competitors such as DEC and Hewlett-Packard. By embracing DCE as a strategic direction, IBM has confirmed that SAA (Systems Application Architecture) is no longer its only play. And with client support for Microsoft Windows, IBM shows that it is increasingly more practical than parochial.

Inside DCE

DCE is an architecture for multiplatform distributed computing defined by the OSF. It's based on contributions from member companies and MIT. DCE encompasses a mechanism for RPCs (remote proce-

dures calls), security and authentication based on MIT's Kerberos, a timing service that synchronizes clocks throughout a network, a "cell" naming and directory service, and a threads service, which adds multiple program threads to Unix. The SDK will let developers write applications for OS/2 and Windows clients that will meet the DCE specification and can call services on DCE-compliant remote servers. OS/2 server support is slated for later delivery.

IBM also has committed to supporting DCE throughout its product line. Client and server compliance already is available for AIX and is planned for OS/400 and MVS. When implemented, this scheme should allow complete interoperability among IBM systems and systems from its competitors. "DCE is fundamental to IBM's whole approach to client/server and distributed computing," says John Rymer, editor of *Distributed Computing Monitor*, "to the point where they're almost too obsessed with it for their own good."

The reason for Rymer's observation is that DCE isn't the only game in town, and its acceptance has been slow, to say the least. After dribbling out of OSF in 1991, the technology has spent the last two years being evaluated by corporate and

commercial users in feasibility and pilot programs, but it has not exactly taken the market by storm. In part, this was due to its heavy association with Unix, but this is changing now that implementations of DCE for non-Unix platforms are starting to appear.

Beyond Unix

One such program, and the source of IBM's Windows DCE offering, comes from Gradient Technologies (Marlborough, MA), whose PC/DCE is an implementation of DCE client-side support for DOS/Windows 3.1. Gradient did not implement DCE server-side support because it requires a robust, preemptive multitasking foundation, which DOS couldn't provide. However, the company will likely create DLLs for Windows NT that implement both the client and server modes of DCE. This third-party solution will let NT systems interoperate with Unix servers and IBM minicomputers and mainframes.

That Gradient couldn't practically implement DCE server capabilities on DOS/Windows points to DCE's main impediment to widespread adoption: It was designed presuming an all-Unix world of desktops and servers. Notes Rymer, "A lot of people I talk to see DCE as almost irrelevant; it's too big,

Networking

too complex. The dominant desktop now is Windows, but DCE's design point was a much more powerful client."

IBM's response to this problem, naturally, is to emphasize OS/2 as a client, because it is a fully 32-bit, preemptively multitasking, multithreaded operating system. Another alternative is to forgo DCE entirely and use NetWare to implement client/server applications.

"Look at what NetWare has become: a distributed-computing environment," says Rymer. Most client/server applications now under development are small in scale and designed for local workgroups, not worldwide enterprises, he argues. The high-end features of DCE are overkill for these users, while NetWare, he says, "has distributed directories, security, network management, but is optimized for the low end, for workgroups and LANs of PCs."

Another potential weakness of DCE is its security model, which is based on Kerberos, derived from the DES. Rymer

notes that many IBM competitors, notably Novell and Microsoft, have openly scorned DES in favor of RSA public-key encryption. "There's also concern that Kerberos won't work on a large scale, which is ironic given the high-end design center of DCE," says Rymer. Novell, he says, rejected Kerberos because it was too slow.

Nevertheless, IBM has committed strategically to DCE as the basis for its open client/server offerings. Given how widely supported DCE will likely be, IBM's decision to aim for today's high end—which will be tomorrow's mainstream—may not turn out to have been a mistake. The riskiest part of the strategy is the problem that haunts all open-system providers: If the products are truly interchangeable, how do you keep your

customers from bolting to the competition? Here, IBM aims to win based on better service and support, market-leading implementations of standards-based technology (e.g., AIX), and superior network and enterprise management tools (e.g., NetView).

Scoping the Competition

The ultimate wild cards will be Novell and Microsoft. Both companies want to move into IBM's enterprise computing space by extending their current offerings upward, but neither one—to the chagrin of the OSF—has licensed DCE. Both companies support SNA (Systems Network Architecture) connectivity from their network servers, but this is mere plumbing compared to the high-level distributed-computing model encompassed in DCE.

Novell is moving surpris-

ingly slowly on DCE, given its acquisition of USL, which had committed to DCE, and the fact that it controls Unix. Novell has a lot of interest in preserving its own naming conventions, RPC methods, and security provisions, so the approach it probably will take will be to support DCE as a backbone mechanism for connecting NetWare LANs to each other or to DCE-compliant minicomputers and mainframes.

Microsoft's approach is, typically, even more proprietary and homegrown: The company has coded its own versions of some parts of DCE, such as a compliant RPC mechanism in LAN Manager and Cairo. But Microsoft isn't using the DCE cell directory (derived from Banyan technology), nor the X.500-based global directory services. And, of course, both companies have opted to

use RSA encryption.

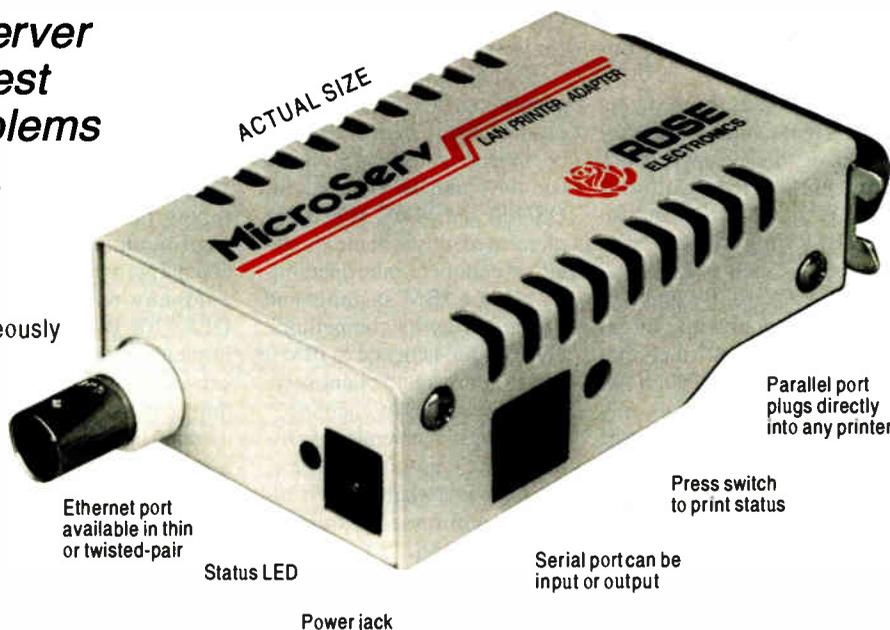

IBM's DCE SDK is shipping now (the Windows client still is in beta testing) and costs \$1095, including five OS/2 and five Windows run-time licenses. Additional OS/2 client run-time licenses are available for \$55. Although DCE is protocol-independent, this first implementation for OS/2 assumes TCP/IP, says Trudy Henke, IBM brand manager for OS/2 DCE. The OS/2 SDK implements all major DCE functions, but because OS/2 supports threads, the native mechanism is used. IBM's AIX client and server are one generation more advanced, and now they support distributed file systems and global directory services based on the X.500 model. ■

Andy Reinhardt is BYTE's West Coast bureau chief. You can reach him on BIX as "areinhardt."

GREAT THINGS COME IN SMALL PACKAGES

This powerful print server can tackle your biggest network printing problems

- Connects any parallel printer directly to your Ethernet LAN
- Fully Novell Netware 286 and 386 compatible
- Can attach to 8 file servers simultaneously
- Fast and easy to install
- Combines high-speed printing and exceptional printer control
- Supports encrypted passwords, forms, notify, cancel, and others
- Full one-year warranty and unlimited free technical support
- Made in the U.S.A.

Discover the basic principle of connectivity...

Look to SmarTerm® for visionary emulation and multi-platform connectivity.

It's a basic principle worthy of Galileo:

SmarTerm's stellar PC-to-host connectivity puts you at the center of your system. New SmarTerm emulation software for Windows will expand your vision with a galaxy of UNIX, VMS, and DG host applications. SmarTerm 420 for Windows and SmarTerm 340 for Windows have both been upgraded. We also offer SmarTerm 470 for Windows, the first full-featured Data General 470 emulation product for Windows. And coming soon—SmarTerm for Windows NT!

New Windows Sockets TCP/IP and more!

Assure your system a window on the future with great new features like SmarTerm TCP/IP as a Windows Sockets DLL, drag-and-drop FTP, a dialing directory, a script recorder, and *SmartMouse™* enhanced mouse support!

Test a proven theory for reducing support costs.

It's a fact. You'll save money and time with SmarTerm's pioneering corporate support tools and utilities.

These corporate support tools include simplified keyboard remapping, pop-up keyboard, toolbox, customizable help system, and enhanced button palettes with icons or text.

Discover SmarTerm.

It's the only emulation software that includes LAT and SmarTerm TCP/IP as a Windows Sockets DLL (a \$199 value) FREE in every package. Discover the basic principle of connectivity today.

OS/2 Gets Device Support

IBM finally makes it easy for hardware vendors to support OS/2

STEVE MASTRIANNI

Perhaps the most notable improvement in OS/2 2.1 over version 2.0 is the newer version's dramatically increased support for third-party expansion hardware. For example, for the first time ever, I'm able to run my ATI Graphics Ultra Plus in 1280- by 1024-pixel-resolution mode, with 256 colors. Users of S3-based video boards are reporting similar success. Admittedly, these drivers are in beta, but they will soon be generally available.

By the time you read this, OS/2 will likely support most of the state-of-the-art video accelerator chip sets from companies such as S3, ATI, and Weitek. It will also claim support for non-SCSI CD-ROM drives, 24-bit color printers, scanners, touchscreens, and a host of other input and output devices.

This situation is unusual for OS/2, to say the least. For most of its existence, the operating system has lacked meaningful support for third-party hardware. The major reason for this situation has been the lack of a DDK (device-driver toolkit) from IBM. OS/2 device drivers are difficult to write under the best of circumstances. Without samples, they are nearly impossible.

Driver History

When OS/2 2.0 was released, the only existing OS/2 device-driver toolkit was the Microsoft DDK, which Microsoft had already pulled from the market. Moreover, many things had changed in OS/2 2.0 that pre-

cluded the use of the Microsoft DDK with this new version. The kernel debugger, which was version-specific, was not able to work with OS/2 2.0. In addition, IBM replaced the Microsoft LADDR (Layered Device Driver) architecture with the ADD (Adapter Device Driver) architecture, and the Microsoft Strategy 2 disk driver interface was replaced by IBM's EDDI (Extended Disk Driver Interface).

Changes in DOS compatibility also affected device drivers. OS/2 1.x supported only one DOS session, in which the processor actually operated in real mode. OS/2 2.0, however, introduced multiple VDMs (virtual DOS machines), which allowed each DOS program to run in its own 1-MB memory space, completely unaware of any other running applications. These programs needed to have shared access to I/O devices even though they assumed that they had exclusive access to them.

IBM's solution is the VDD, or virtual device driver, which arbitrates ownership of the device. The VDD has also virtualized the common system devices, such as the clock, the serial ports, and the DMA controller.

VDDs are 32-bit DLLs, which brought up yet another problem—namely, that there were no existing 32-bit compilers for OS/2 when version 2.0 shipped. IBM had used a Microsoft 32-bit compiler, but it could not distribute the compiler externally. As a result, developers were forced to write

VDDs in assembly language or not at all.

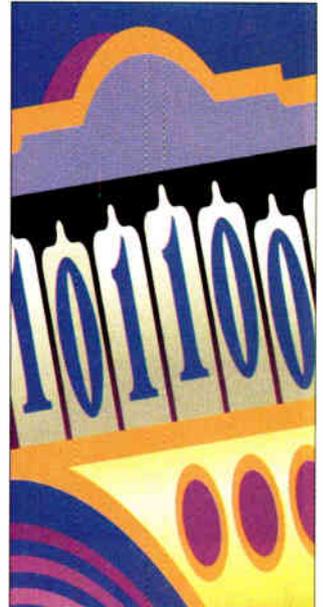

The Turnaround

As a result of all these problems, device-driver support for OS/2 2.0 was nonexistent. Late in 1992, IBM finally realized that the lack of device support was hindering OS/2 2.0's success and would also hurt the expected success of OS/2 2.1.

Under the direction of Lois Dimpfel, director of IBM's Personal Operating Systems division, a group was formed in Boca Raton to make enhanced device support a reality. The group consisted of device-driver experts from all parts of IBM. Dubbed the Worldwide Industry Hardware Support department, it was given a simple mission: do whatever was necessary to make enhanced OS/2 device support a reality.

The culmination of the IBM group's effort was the release of the first beta DDK in early 1993. To ensure that it received feedback from a large number of developers, IBM released the beta DDK for a nominal charge of \$15. The DDK was available only on CD-ROM because of its size and complexity, and it included the previously unreleased 32-bit C compiler to make it possible to write VDDs in C.

The first commercial DDK was released a few months later. Dubbed the IBM Device Driver Sourcekit 1.0, the DDK contained more than 70 device-driver sources, as well as a large set of on-line documentation. Included were sources to the mouse, disk, CD-ROM,

Technology

serial, printer, and floppy disk drivers, as well as a modest collection of device-driver test tools.

In July of this year, IBM held the first-ever IBM OS/2 Device Driver Conference. This conference was attended by more than 300 OS/2 device-driver developers. Today, drivers for all types of devices are at last beginning to appear, spurred on not only by the efforts of the Boca Raton team, but by the success of OS/2 2.1 as well. IBM has put OS/2 device support back on the right track. ■

Steve Mastrianni is president of Personal Systems Software in Canton, Connecticut. He specializes in device drivers, operating systems, and real-time applications for OS/2 and Windows NT. "You asked for a powerful and affordable tool to develop client/server applications. That's why I developed System Architect 3.0."

JAN POPKIN, CHIEF SCIENTIST
POPKIN SOFTWARE & SYSTEMS, INC.

Developers and project teams looking for a CASE-based tool for client/server application development will find the answer in System Architect™ 3.0. This latest version of the CASE price/performance leader includes all the features of expensive tools for a fraction of the cost.

To quote CASE Trends Magazine: "Popkin Software and Systems have delivered on their promises, by offering inexpensive, easy-to-use products that deliver results."

System Architect 3.0.

SA 3.0 simplifies the development of client/server applications by supporting multiple methodologies including Information Engineering, Gane & Sarson, Yourdon, IDEF, OOA&D, SSADM IV, Shlaer/Mellor, and Ward & Mellor. It also features an integrated data repository you can customize. And it runs under MS Windows® or IBM's OS/2 PM®.

Flexibility And Functionality.

The ideal combination of flexibility and functionality has made SA the undisputed price/performance leader. As the needs of developers have changed, so has the scope of SA's features and options:

SA Screen Painter: Allows repository-based development of GUI screens and menus or character-based screens.

SA Object-Oriented Version: Supports Booch '91 and Coad/Yourdon.

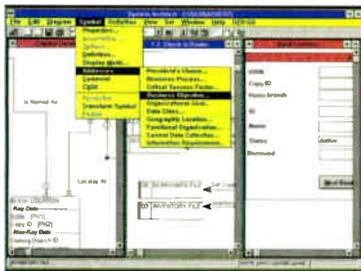

SA Reverse Data Engineer: Reverse engineers SQL databases, including SQL Server, SYBASE, DB2, Informix, and Oracle.

SA Schema Generator: Generates DDL and SQL triggers from entity models for Oracle, Informix, Ingres, PROGRESS, Paradox, dBASE III, DB2, SQL Server, SYBASE, and other SQL and 4GL databases.

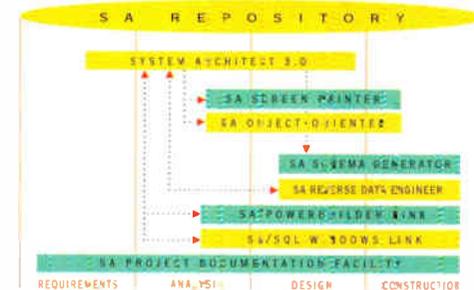

SA Project Documentation Facility: Enables the automatic generation of deliverables with desktop publishing quality from SA Encyclopedia.

Choose Your Development Environment.

System Architect 3.0 allows you to seamlessly interface with your choice of client/server application development environments:

▲ Paint GUI screens from data in repository.

System Architect 3.0 covers your development lifecycle with a complete range of features and options.

Put Your Project Team In A Class Of Its Own.

System Architect 3.0 makes your project team more productive because it lets your users really work together. It does this with a range of capabilities including:

Network Version – Allows multiple team members to work concurrently on a project while sharing the SA Repository by locking diagram and data dictionary records.

Network Security – Allows Project Managers to uniquely identify and classify personnel with appropriate levels of authorization.

Access Control – Allows team members to check-out, check-in, or freeze encyclopedia objects with defined authorization.

Version Control – Allows project encyclopedias, and their related files, to be saved and stored with appropriate version-identifying data. (Available in version 3.1)

Learn More About System Architect 3.0.

Superior In E

Every Nanao monitor undergoes intense scrutiny and testing to ensure maximum performance and product reliability. Our quality control processes and technical standards are among the most rigorous in the industry.

Our new line of Ecological Design™ Monitors incorporates advanced energy-saving features including PowerManager, which cuts power as much as 93% when the monitor is not in use. (After Dark screen saver software free with each monitor.)

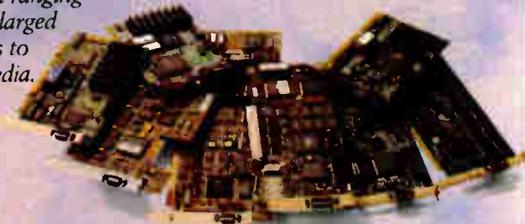

Nanao was the first monitor company to join in partnership with the EPA Energy Star Program. Our commitment to bring technical innovation to today's environment ranges from eliminating CFCs in our manufacturing process to using recyclable packaging and paper products.

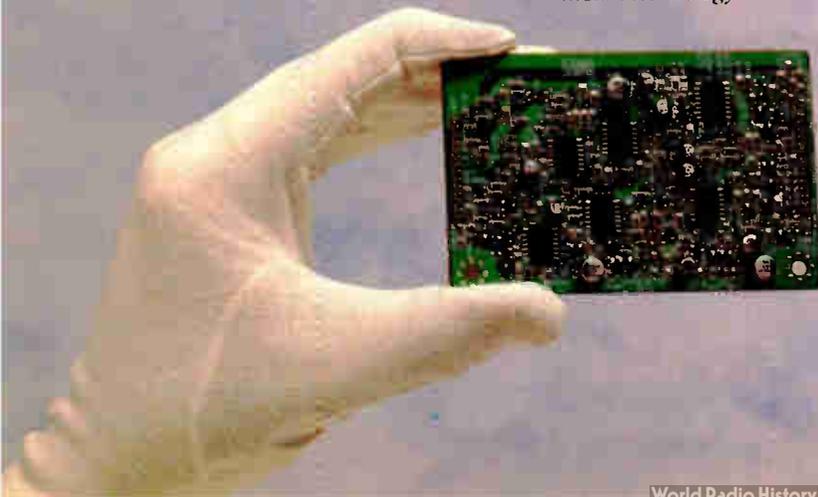

Nanao's FLEXSCAN family of monitors meets safety specifications for radiation emissions established by the Swedish MPR-II guidelines as well as those of TCO, the Swedish Confederation of Professional Employees. Nanao was the first monitor manufacturer to achieve FCC Class B approval for our 80kHz frequency monitors.

Nanao FLEXSCAN technology is compatible with all of today's popular graphics cards, offering a viewing environment ranging from enlarged graphics to multimedia.

High quality PCB boards are assembled, adjusted and inspected at Nanao's special chip-mounting factory. All PCB boards are built using sophisticated surface-mount technology.

Model	Size	Dot Pitch	Scan Frequency	Recommended Resolution
T660i	20"	0.30mm	H:30-82kHz V:55-90Hz	1280x1024
T560i	17"	0.25mm	H:30-82kHz V:55-90Hz	1280x1024
F760i-W	21"	0.31mm	H:30-78kHz V:55-90Hz	1280x1024
F560i-W	17"	0.26mm	H:30-82kHz V:55-90Hz	1280x1024
F550i-W	17"	0.28mm	H:27-65kHz V:55-90Hz	1024x768
F340i-W	15"	0.28mm	H:27-61.5kHz V:55-90Hz	1024x768

Nanao T-Series and F-Series monitors have captured every major award.

very Detail.

Our high resolution CRTs deliver a complete range of color displays with photographic quality and brilliant color images to sophisticated applications like CAD, DTP and multimedia. TRINITRON® CRT models offer greater precision and intricate

detail, while Nanao's Invar Shadow Mask Flat Screen CRT models provide a wide display area and lower distortion image.

Both CRTs feature our unique built-in Dynamic Beam Spot Control System that ensures maximum brightness and sharp focus.

A heritage of precision craftsmanship and attention to detail has been designed into Nanao's family of display monitors.

To reduce glare, eliminate static electricity, and improve the focus level on the display area, Nanao has developed two anti-reflective innovations: ErgoCoat™, a protective coating for all F-series monitors, and ErgoPanel™, a sturdy panel that covers the surface of our T-series monitors.

Our user-friendly front control panel incorporates ergonomic design and ease-of-use as well as a variety of powerful options for customizing images.

At Nanao, details make all the difference in creating our family of professional display monitors. From the product design and manufacturing that takes place in our factory to the end user's working environment, Nanao pays attention to every detail. In engineering. Assembly. Product testing. Quality control. Shipping. Customer support. From the very first days of the company, we set out to be an innovator in monitor technology. And, in a few short years, we have achieved that goal. Today, Nanao has the lowest repair rate in the monitor industry, the highest product reliability, and a fast-growing number of enthusiastic customers. So if you're looking for a superior monitor, start with the details. We do.

Top Software for Windows & OS/2

A compendium of top programs and tools for Windows and OS/2 users—word processors, databases, spreadsheets, programming tools, graphics packages, communications software, and utilities

COMPILED BY ANNE LENT

The number of programs for Windows users has grown to the point that you could lay them all end to end and probably span several time zones. Well, that's a bit of a stretch, but the fact is, the number of Windows applications is in the thousands. The number of OS/2 applications is nothing to laugh at, either—a directory published by IBM lists more than 1400 software packages that run under OS/2. Some of them are vertically inclined—programs for computing fluid dynamics, for example, or managing a fleet of trucks. The bottom line is this: There's a Windows or OS/2 program for doing just about anything you'd want to do with a computer. (That's not the case with Windows NT—yet. Applications for that 32-bit operating system are mostly still in the announcement stage.) This guide will point you to some of the best applications for Windows and OS/2. Whether you're looking for a word processor, database, spreadsheet, programming tool, graphics package, presentation program, or utility, you'll find the best choices covered here.

WORD PROCESSING

Ami Pro 3.0 for Windows and OS/2

Ami Pro 3.0 features Fast Format for automated text formatting, drag and drop editing, and SmartClick for access to settings and controls. Also included are document and style-sheet viewers and a Clean Screen feature that lets you maximize your workspace by removing elements such as the title bar, menus, scroll bars, and SmartIcons.

The word processor includes a macro language, a spelling checker, a thesaurus, footnote and endnote support, automatic indexing, a four-level undo command, and a tables facility. You can create tables of contents that are up to nine levels deep. Ami Pro 3.0 supports OLE and all major Windows-supported networks, according to Lotus.

\$495

Lotus Development Corp., Atlanta, GA; (404) 391-0011; fax: (404) 698-7653

Circle 1320 on Inquiry Card.

CA-Textor for Windows and OS/2

Computer Associates calls CA-Textor a professional word processing tool. The interface uses pull-down menus, pop-up dialog boxes, and a user-configurable tool-

bar. Word processing features include user-defined dictionaries, a spelling checker, a thesaurus, WYSIWYG text editing, standard and draft mode, a multiple document interface, embedded graphics, a table editor, and a calculator. CA-Textor also offers a full document history that lists a file's author, last version date, time, and version number.

According to Computer Associates, the program can import CGM, TIFF, WFF, WPG, and BMP files and can import and export WordPerfect, Word, RTF, and ASCII files. CA-Textor supports DDE and PostScript printing.

DeScribe 4.0 for OS/2

DeScribe, the first word processor written for OS/2, is a native 32-bit application. With the ability to multitask and multi-

thread, DeScribe can perform several tasks simultaneously so that you can continue working in an application while another operation is under way. To run DeScribe 4.0 you need OS/2 2.0 or 2.1.

Q&A Write

Symantec's Q&A Write 3.0 for Windows lets you create documents and mail merge them with database formats such as Paradox and dBase. The program uses 1.7 MB of hard disk space, making it useful for portables, Symantec says. Q&A Write also provides automatic, transparent file conversion from Word and WordPerfect.

The package has a sort-and-retrieve function for creating targeted mailings. It lets you select entries from a merge database based on various criteria. Q&A Write offers fax and mail support for products such as cc:Mail and Microsoft Mail. The program supports file sharing over networks and OLE and DDE links.

Word for Windows 6.0

Microsoft says that when developing the new Word 6.0 for Windows, the company focused on "core" word processing tasks such as entering text, manipulating text, and formatting text. Word 6.0 for Windows offers new, automatic features that perform some of the common word processing tasks for you, Microsoft reports. Also added are features such as Wizards (on-line assistants) and on-the-fly spelling and grammar checking. As in its predecessor, version 6.0 features a customizable toolbar, drag-and-drop ability, a file finder, a table maker, and a multilingual spelling checker.

Price not available at press time.

WordPerfect 5.2 for Windows and OS/2

Both these versions of WordPerfect 5.2 provide tools that are designed to speed up word processing tasks: the Button Bar, a group of buttons that access major functions and macros, and QuickMenu, which lets you switch among and make changes to buttons. The Ruler lets you change tables, fonts, and zoom percentages, along with margins and column borders; it also lets you create columns and tables by dragging the mouse.

WordPerfect 5.2 for Windows and for

XyWrite for Windows

XyWrite for DOS, favored by writers and editors, is now available in a Windows version. The Technology Group is calling it the only Windows word processor with a command line. It offers customization options, an intuitive interface, and straightforward word processing, according to The Technology Group.

Features include Named Log and Resume, which lets you create multiple notebooks to hold different work projects; Auto Replace, which lets you create a glossary of shorthand notation and expand personal abbreviations as you type them; a Styles capability that helps you maintain uniform formatting over long projects; and a library of buttons that you can use to initiate common commands.

Approach 2.0 for Windows

Approach, recently acquired by Lotus, is a relational database that lets you link up to 10 databases at a time. You can also mix data from multiple file formats on a single report, form, form letter, or mailing label.

Approach uses PowerKey technology, which gives you access to any dBase, Paradox, FoxPro, Oracle SQL, SQL Server, or DB2 file. You update, analyze, and report on the data in its native format, with no filters or importing involved. Approach offers OLE and TrueType support, drag-and-drop capability, "sounds like" searches, record and field locking ability, event processing, conditional branching,

DATABASES

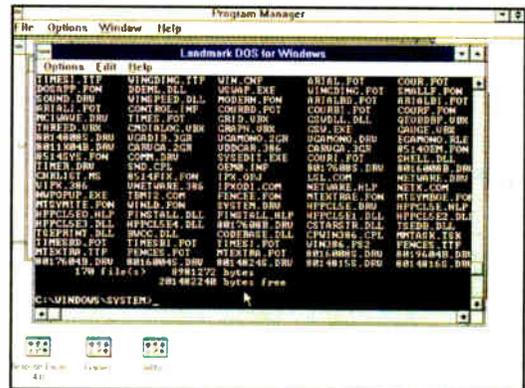

Access 1.1

Microsoft's Access is a relational database designed to offer transparent access to data as well as provide a full development environment, according to the company.

At last, new software provides Windows™ users all the advantages of DOS...

"How to get the flexibility, speed, and power of DOS while using Windows."

If you like DOS commands, but work in Windows anyway, then you need new **Landmark DOS for Windows**. Landmark DOS for Windows is a fully functioning, scalable window that operates virtually all the DOS commands right from within Windows.

No more switching from Windows to the DOS shell!

With **Landmark DOS for Windows** you can instantly access virtually all DOS commands right IN Windows. No more switching to the DOS shell prompt. DOS command access is quick as a mouse click (or alt-tab). You'll really appreciate the time saving, speed, and ease of use.

Run DOS internal commands from Windows!

Now you can run DOS internal commands like DIR, pipes, and redirects. **Landmark DOS for Windows** makes writing power BATCH files a breeze. And, **Landmark DOS for Windows** includes 23 new commands like GETINI and SETINI for command line .INI file editing.

Eliminate memory overload.

The DOS shell requires 256K of RAM and doesn't even know Windows is running! **Landmark DOS for Windows** is a true Windows program whose memory size and location is entirely controlled by Windows. You'll get all the benefits of DOS (and more) without suffering the 'out of memory' message.

Run DOS and Windows apps from the command line.

With **Landmark DOS for Windows** you get the best of both worlds - DOS power and flexibility and Windows graphics and features. You can run either DOS or Windows applications right from the command line. You can even use your mouse to click on the application name or associated file to launch the program. And, for real power BATCH files, you can launch both DOS and Windows applications in any sequence right from within Windows.

Copyright © 1993 Landmark Research International Corp. All Rights Reserved. Windows is a trademark of Microsoft Corp. Other names are trademarks of their associated owners.

Perform superior multitasking safely.

Since **Landmark DOS for Windows** is a true Windows application, it doesn't depend on the risky time-slice multitasking of DOS in Windows 386 enhanced mode. The result is much smoother and safer multitasking.

Increase operating speed and save time.

With the flexibility of DOS commands available right in Windows you'll dramatically increase your operating speed and slash wasted time waiting and switching between the DOS shell and Windows. Time is money, **Landmark DOS for Windows** makes you much more productive!

Dozens of new DOS commands!

- **DATECOPY:** Perform quick and easy daily backups by today's date.
- **FF:** Find File quickly locates any file or group of files by name.
- **TS:** Search files for specific text when you forget the file name.
- **CDD:** Change the drive and directory in one command.
- **TOUCH:** Resets the DOS date/time on all files described to the current date and time (works great before DATECOPY for flexible backups).
- **MOVE:** Move subdirectory and contents to another directory.
- **DELDIR:** Delete an entire subdirectory and its contents in one command.
- **NUKE:** Delete and overwrite any file for security (cannot be un-deleted).
- **GETINI:** Reports any .INI files that match input variable.
- **SETINI:** FAST command line editing of your .INI.
- **And much, much more.**

askSam for Windows

According to askSam Systems, askSam for Windows is a free-form database that is easy to use. Using the Windows Clipboard, you can copy information from other applications into askSam. Import formats include ASCII, WordPerfect, dBase, and RTF. Search capability includes Boolean, date, numeric, hypertext, proximity, and full text. The program also supports OLE and TrueType.

The following predefined templates come with askSam: address, calendar, clippings, E-mail, notes, questionnaire, phone directory, to-do list, and more.

The database supports an unlimited number of fields per record. It also supports sequential number generation and variable-length fields. It does not support database servers or networks. To run askSam you need at least Windows 3.1 and 4 MB of RAM.

askSam Systems, Perry, FL; (904) 584-6590
Circle 1329 on Inquiry Card.

FileMaker Pro 2.1

FileMaker Pro 2.1 for Windows lets PC and Mac users share multiuser database applications with a single menu selection across LANs. FileMaker Pro 2.1 supports NetBIOS API and Novell's MacIPX. It also is compatible with NetWare, Banyan Vines, LANtastic, and other NetBIOS networks. It supports QuickTime for Windows, so you can add full-motion video, animation, and digital sound to your databases. It also supports DDE, Windows for Workgroups, and MAPI.

Features included in FileMaker Pro 2.1 are pre-designed business templates for use in invoicing, inventory management, lead tracking, contact management, project

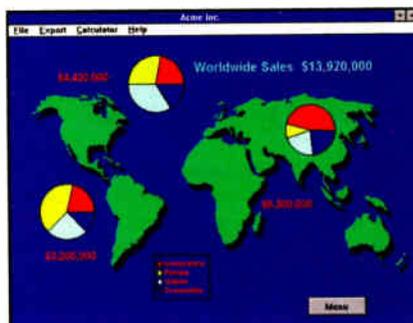

tracking, mailing lists, and more. ScriptMaker lets you streamline repetitive tasks with mouse-driven scripts. Intelligent Field Formatting lets you use radio buttons, check boxes, and pop-up lists. The Auto Indexing feature lets you select and retrieve information based on any defined criteria without specifying key fields. You can have an unlimited number of fields per record and records per table. Graphics tools let you create and place boxes, lines, and other graphics anywhere in a report.

Forest & Trees

Trinzie, formerly Channel Computing, calls Forest & Trees a client/server data-analysis and reporting tool. It lets you collect, combine, monitor, and analyze information from a variety of sources such as spreadsheets, databases, mainframes, and Lotus Notes. Forest & Trees uses an ANSI-SQL-compatible query engine. It

can import data from Lotus 1-2-3, Excel, dBase, Notes, and several database servers, including Oracle, NetWare SQL, Sybase, and Gupta SQLbase.

Forest & Trees lets you monitor data sources automatically through scheduled queries, preset alarm conditions, and alarm triggers. Alarm triggers can execute query

calculation, report or graph printouts, E-mail, and formula calculations based on changes in your data.

According to Trinzie, a WYSIWYG report writer lets you create reports with an object-oriented layout tool. The program can collect up to 100,000 data points per view, with date and time of calculation and values. Forest & Trees can communicate with other Windows programs as a DDE server. To run Forest & Trees, you need Windows 3.0 or higher and at least 2 MB of RAM.

FoxPro 2.5 for Windows

With FoxPro 2.5, Microsoft extended the query optimization of its Rushmore technology, making it, according to Microsoft, up to three times faster than FoxPro 2.0. By combining Rushmore's query optimizer with relational query by example, you can retrieve data from multiple databases without coding.

FoxPro 2.5 supports Oracle, Sybase, SQL Server database servers, and NetWare, LAN Manager, Vines, 3+Open, IBM LAN Server, and NetBIOS network operating systems. Programming features include a procedural language, access to DLLs, data-entry forms, user-defined functions, record and field locking, and event processing. DDE, OLE client, and TrueType are supported. FoxPro 2.5 imports ASCII, dBase, Lotus 1-2-3, Paradox, and Excel files. The maximum number of fields per record is 256, with up to 2 billion per table. The program also supports the ability to query by example, generate sequential numbers, and perform relational links between tables.

R:Base 4.5 for DOS, Windows, and OS/2

R:Base is a relational database for DOS, Windows, and OS/2 with an interactive debugger. It has ANSI Level-2 SQL built in, along with a menu-driven interface. Microrim reports that improvements in version 4.5 include better speed and per-

formance as a result of a new data indexing system, a smarter query optimizer, and other enhancements.

With R:Base 4.5 you can do full-text data indexes, multicolumn indexes, index-only retrieval, and like-predicate indexes. Security features are also increased with version 4.5 because now you can specify your own data integrity constraints in the SQL create table command.

The R:Base LAN Pack supports up to five additional users on any NetBIOS-compatible network. An R:Base SQL En-

gine for Windows and DOS is also included, along with numerous utilities.

Superbase 2.0

Superbase 2.0 relational database for Windows has new visual development tools, including an icon-driven query-by-example interface, a report generator, and a report designer. An Icon Bar lets you switch between open files, indexes, and views, including an editable spreadsheet-style table view. The SuperBasic Language is similar to Microsoft's Visual Basic, according to Software Publishing, and it comes with a debugger.

Version 2.0 supports OLE (client), DDE, and DLL. The database supports several database servers—Oracle, Sybase, XDB, SQL Server, and more. It also supports NetWare, Microsoft LAN Manager, Vines, and 3+Open network operating systems. File formats imported include ASCII, dBase, Lotus 1-2-3, Paradox, and Excel. The number of files per record is limited only by memory, and you can have up to 1 billion records per table. Superbase 2.0 offers data-integrity checking.

SPREADSHEETS

CA-Compete 5.0 for Windows and OS/2

CA-Compete 5.0 is a multidimensional modeling, data-analysis, and reporting tool for Windows and OS/2. New features in version 5.0 include integrated charting; a configurable toolbar and model bar; multiple open models, views, and sheets; user-defined styles; advanced linking; and print preview with zoom.

The spreadsheets created with CA-Compete can be linked using sheet/model, model/sheet, model/model, and sheet/sheet interdocument linking. Analysis tools include forecast, allocate, curve building, audit trail, goal seek, and data table. You can construct, manipulate, and present multidimensional models along with linked two-dimensional spreadsheets and integrated charts. You can explore the relationships among up to 12 dimensions of your data and the impact that change in one can have in the others. You can also drag and drop a column label to transpose the rows and columns.

You can access over 150 database, date/time, financial, informational, logical, lookup, mathematical, statistical, string, and trigonometric functions. The program also lets you define your models using natural language. CA-Compete supports DDE and DLL. It also will work with other data formats, including CA-SuperCalc, Lotus 1-2-3, Excel, Xbase, and ASCII.

Circle 1339 on Inquiry Card.

Excel

Microsoft says that by using the auto-format and drag-and-drop capabilities in the newest versions of Excel, you can create a basic worksheet in 60 seconds. In addition to analytical tools, chart and reporting

tools, and technology that lets you run macros from Lotus 1-2-3 unmodified, Excel 4.0 has Wizards, which are on-line assistants that walk you through complex tasks. Shortcut menus pop up with context-sensitive and most-used commands. Task-oriented toolbars offer one-click access to the most frequently used commands.

A Scenario Manager lets you create and save multiple what-if scenarios in a single file and then create a separate summary report of them. Workbooks let you manipulate and store groups of files. And the Analysis ToolPak adds 140 functions, including complex number support and

curities calculations and 20 new procedures.

With the brand-new Excel 5.0, Microsoft has added Improv-like data modeling, 3-D worksheets, OLE 2.0 capabilities (client and server), and Visual Basic Applications.

Improv for Windows 2.1

Lotus says Improv 2.1 simplifies complex analytical tasks by letting users change the perspective views of their data. With the ability to examine data in a variety of ways and use English-language formulas, Improv is suited for users who need to arrange data into different layouts, reuse and maintain spreadsheets, and extend an analysis to incorporate new data or factors.

The latest version of Improv offers network-ready installation, external data access capabilities, and compatibility with the WK4 file format for the new 1-2-3 release 4. The new Improv also works with Lotus Notes.

Familiar spreadsheet components such as cells and formulas, what-if analysis, and business graphics are all elements of Improv. Dynamic views give you control over the arrangement of categories of data

along the rows, columns, and pages. You can use the mouse to drag and drop categories, and you can display, analyze, and manipulate up to 12 categories of data within a worksheet all at one time, according to Lotus.

Improv for Windows offers English-language explanations of the spreadsheet logic. Chart types include 3-D bar, stack, line, bar pie, scatter, and bar graphs. Data and graphs are dynamically linked, so any changes you make in a worksheet are reflected in the associated graph. InfoBox is a feature that lets you change the look of a spreadsheet. It's a flowing, modeless panel that lets you set the style of any object or chart.

Lotus 1-2-3 Release 4 for Windows and 1-2-3 for OS/2 Release 2.0

Lotus says this new version of Lotus 1-2-3 offers a simplified, context-sensitive interface. Menus are shown according to the task at hand. The program has a version manager that tracks changes in spreadsheets shared among workgroups. It also includes a data-query tool. Other features include "One-Step Charting," customizable fill-by-example, worksheet tabs, and in-cell editing.

The new cell engine results in improved recalculation performance, according to Lotus. Release 4 for Windows includes more than 250 macro commands. You can create on-sheet buttons to run macro programs and to build custom applications with prebuilt dialog boxes. For access to databases, release 4 ships with the most common database drivers, including dBase, Paradox, SQL Server, and OS/2 Data Manager. Release 4 supports OLE, DDE, ODBC (Open Database Connectivity),

Introducing DesignCAD for Windows

CAD Power With Windows Simplicity

IT'S NEW!

Meet DesignCAD for Windows, the powerful-but-affordable Computer-Aided Design package from the makers of the award-winning CAD software, DesignCAD.

DESIGNCAD EXCLUSIVES!

Finally, a CAD package that has a customizable toolbox, instant change editing boxes and a price that won't drain your budget. Now anyone can create their own professional quality CAD drawing thanks to the simplicity of DesignCAD's Graphical User Interface. Anything from backyard storage buildings to a NASA engineer's plans for a new space station, it's all within your grasp.

DESIGNCAD SAVES YOU TIME!

DesignCAD for Windows contains features such as full clipboard support for cutting and pasting graphic elements, multi-tasking for editing multiple DesignCAD drawings on the same screen and TrueType font support.

IT'S EASY!

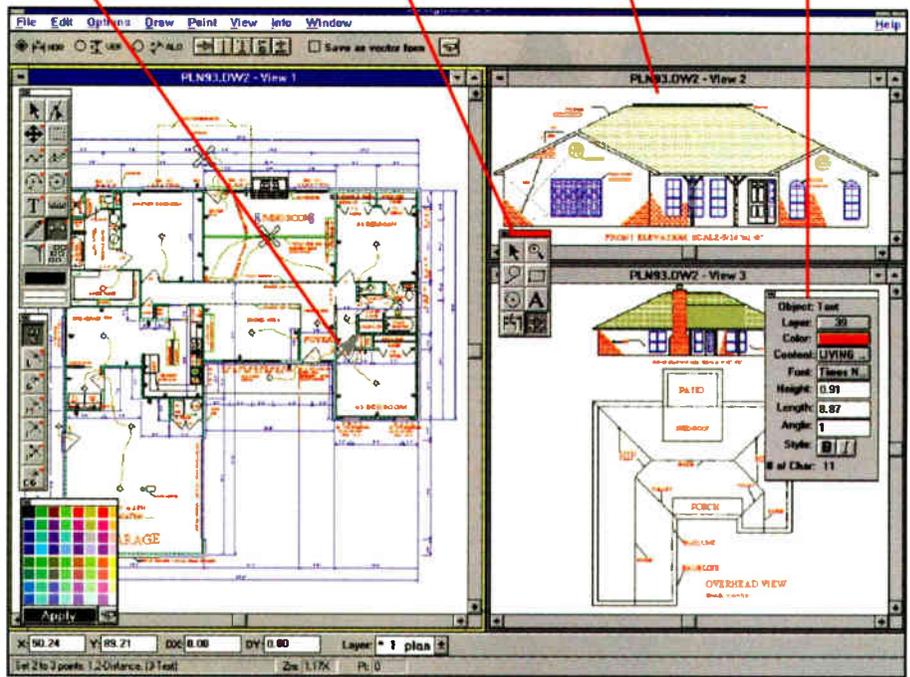

With DesignCAD's short learning curve you can start designing immediately. Perfect for home, office or leisure. Your only limit is your imagination!

DesignCAD's Intelligent cursor changes to inform you of your editing options as you move across the screen.

"Hot Toolbox" allows you to create your own toolbox with your choice of tools for increased speed.

Regional zoom windows allow you to edit detailed areas of a drawing without having to zoom the whole drawing.

Instant-change edit box allows you to edit any attribute of an object with point-and-click simplicity.

"Proving that a CAD package can let you draw a bank building without emptying your bank account."

Meet Our Biggest

V.I.P.

V.I.P., in this case, stands for *Value In Performance*. And our new Pentium-based P5-60 system is definitely our biggest V.I.P.

When you put this system in your office, you'll know you've arrived. Feel the exquisite luxury of 64-bit processing power as you work on the P5-60. With its superscalar architecture, the Pentium moves instructions and data twice as fast as a 486.

Our V.I.P. P5-60 also incorporates the ultimate in leading edge technology, including the new, faster PCI local bus and the sophisticated ATI Ultra XLR video system for first-class video

performance. Another perk comes from true 24-bit color support. To top it off, this machine is loaded with deluxe features, including a double-speed CD-ROM drive. All of this performance for under \$4,000. *Now that's a big V.I.P.!*

In its standard configuration, even the most demanding PC users will be impressed with the P5-60. For added economy, try our P5-60 Best Buy configuration.

Give us a call today and ask for the big V.I.P., the system that gives you Pentium performance at a 486 price. When it comes to value in performance, Gateway 2000 is positively top drawer!

VIM, and MAPI.

Lotus 1-2-3 for OS/2 Release 2.0 offers customizable, context-sensitive Smart Icons, menus, and dialog boxes to build spreadsheet applications that use scroll bars, radio buttons, and check boxes. It performs adjust-to-page printing to resize worksheets and offers you the ability to select "collections" of noncontiguous cell ranges. There's also a C-language interface. Version 2.0 adds Solver and Back-Solver technology to perform optimization analysis, presentation-quality output, database management, and Datalens data access technology.

Circle 1342 on Inquiry Card.

Quattro Pro for Windows

Borland's Quattro Pro for Windows has two technologies that Borland describes as unique: Spreadsheet Notebooks and Object Inspector menus. Spreadsheet Notebooks are based on the tabbed paper notebook and let you organize spreadsheet data and improve the way you build and manage spreadsheets. Object Inspector menus let you right-click on an object to display a list of options that can be changed for that object.

Other features include a SpeedBar, which provides point-and-click access to

certain features, presentation graphics, access to external databases, and visual application-building tools. SpeedFill determines what information should be placed into a range of cells, based on information you provide.

Quattro Pro for Windows uses Borland's Object Component Architecture, or BOCA, to connect users to dBase and Paradox files. The program also offers query-by-example tools. Other files supported include Quattro Pro for DOS, Excel

3.0 and 4.0, and Lotus 1-2-3. Graphics files supported include BMP, EPS, CGM, PCX, GIF, and TIF.

COMMUNICATIONS

BeyondMail 2.0

Release 2.0 of BeyondMail includes NetWare Global MHS support, shrink-wrapped tools for developing work-flow applications, and cross-platform capabilities.

With NetWare Global MHS support, NetWare users can now use BeyondMail 2.0, and it can be synchronized with NetWare 4.0 NDS. It also provides full-name support for users on MHS 1.5. Beyond

will release Macintosh and Unix versions of BeyondMail later this year, the company reports, and release 2.0 will deliver rules, forms, and work-flow compatibility across all those platforms. Also included with BeyondMail 2.0 is Watermark Software's Explorer Edition, an OLE-based document-imaging program that enables you to embed image thumbnails into messages that recipients can view and annotate.

BeyondMail 2.0 supports OLE and DDE. Database formats supported include dBase, Paradox, FoxPro, Oracle, and Sybase.

\$995 for a 10-user license

Beyond, Inc., Cambridge, MA; (617) 621-0095; fax: (617) 621-0096
Circle 1033 on Inquiry Card.

Carbon Copy for Windows 2.0

Remote support and access are the primary uses of Carbon Copy for Windows. Ver-

sion 2.0 supports networks, letting users connected to a NetWare LAN access data and applications on a remote PC or another PC on the network.

Other features of Carbon Copy for Windows 2.0 include drag-and-drop capability, an event log, a file detail option that lets users display filenames only or a combination of names, dates, times, and file attributes. Roving Callback is another new feature, and it lets users specify the number they're calling from. Security is preset on the host PC, preventing unauthorized access and enabling Carbon Copy to call back users at the number they are dialing from. According to Microcom, the Virtual Desktop feature adds ease of use. It enhances the Remote Control utility when two PCs with different screen resolutions communicate. Virtual Desktop displays a scaled-down version of the host screen in a foreground frame, and the guest user can click on a portion of the frame to view the desired area of the host screen. DOS applications can run full screen or in a window. To use the program, you need an IBM AT-compatible modem.

\$199 for a two-user license

cc:Mail 2.0 for Windows and OS/2 Workplace Shell

Version 2.0 of cc:Mail for Windows features a redesigned user interface and new rules and search capabilities. Message handling is automated with the rules in cc:Mail, and as a result, you can instruct the mail system to perform tasks if certain events occur. The rules are dialog driven with pick

lists. The new search capability gives you additional mail management functions.

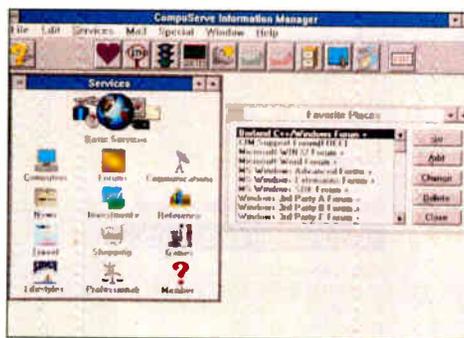

Other new features include viewers for many spreadsheet applications, the ability to find and replace text, a spelling check-

CompuServe does Windows.

Introducing a whole new way to look at CompuServe: CompuServe Information Manager for Windows (WinCIM™). It's a fully integrated Windows application, and lets you take advantage of Windows when you're on CompuServe. It'll make your session faster, more efficient, easier, and a lot more fun.

With the help of icons and pull-down menus, you'll find your CompuServe time is almost effortless. Cruise the forums, browse through your messages, download files — it's all about as simple as clicking a mouse button.

And with WinCIM you can do more offline, too. That means everything from writing letters to reading the answers to your hardware and software questions can be done much more economically.

So take a look for yourself. If you're already a CompuServe member, just type GO WINCIM. If you aren't, call us for more information at 1 800 848-8199. Either way, you'll soon see why

the best view is the one from CompuServe Information Manager for Windows.

 **CompuServe®**
The information service you won't outgrow.™

er, folders for storing messages, and the ability to compress attached files with a user-selectable compression algorithm. In addition, cc:Mail supports DDE and OLE as well as VIM.

Lotus cc:Mail for OS/2 Workplace Shell allows for message processing in the background through OS/2's multithreading and preemptive multitasking capabilities, let-

ting you send and receive mail from other applications. Features such as inboxes, message folders, BBSes, and directories are presented as individual desktop objects. Users can gather E-mail messages together with other items associated with a project by "shadowing" objects in the cc:Mail folder any number of times.

Other features of cc:Mail for OS/2

Workplace Shell include the ability to view faxes and attach graphics and audio files to a message, a draft folder for storing messages in progress, a trash folder for retrieving deleted messages, and the ability to do Boolean searches for filtering messages.

PUT A NEW FACE ON YOUR HOST DATA...

KEAterm VT EMULATION GIVES YOUR HOST DATA A FACELIFT—THE WINDOWS WAY!

Before KEAterm, host data was dull, colorless, and limited by aging host applications. KEAterm transforms your host data—making it better looking, and more useable.

Apply the power and ease of Windows tools, like Excel, 1-2-3, WordPerfect, Visual Basic... to your host data using KEAterm's DDE, hot links, file transfer, and user-defined menus and dialog boxes. And you'll get more done faster with multiple KEAterm sessions.

Advanced features include a powerful macro language and definable on-screen button pads, to make your work even easier. KEAterm speeds your work with high throughput over your serial port or installed TCP/IP or LAT network. ■

KEAterm 420—a powerful link to your VAX and UNIX text applications

KEAterm 340—for applications requiring ReGIS, Tektronix, or sixel graphics

KEAterm—for Windows NT available soon!

Co/Session 6.01 for Windows

With Co/Session you can operate a remote PC over phone lines, letting you run programs, access data, print reports, and transfer files from one system to the other. Co/Session allows two PC users to work together on the same program because of its dual-screen, dual-keyboard capability. Co/Session's "Intelligent Graphics" technology is responsible for moving the Windows screen information across the phone lines.

According to Triton, Co/Session allows background file transfers, command-line file transfers, and point-and-shoot file transfers. Security features include multiple passwords, dial back, and data encryption. The program supports all IPX and NetBIOS PC Networks, including Novell, Banyan, 3Com, LANtastic, AT&T StarLAN, and IBM Token Ring. To run Co/Session you need to have 5 KB to 75 KB of RAM on the host and 123 KB of RAM on the guest.

Other features include keyboard chat, a billing log, session recording, on-line configuration changes, and the ability to toggle between voice and data connections while still connected.

Crosstalk for Windows

The Windows version of this veteran communications program offers terminal emulations and file transfer protocols, including ZMODEM. It also supports DDE and features a macro ability that lets you assign multistep activities to special on-screen objects on the QuickPad. You can perform regularly executed tasks via icons in the QuickBar, and you can mark text on-screen for copying to other applica-

“When Microsoft chose Backup Exec for Windows NT, I knew it had to be good. I’m not taking any chances when it comes to my data.”

MICROSOFT
WINDOWS NT.
COMPATIBLE

Microsoft demanded an innovative backup utility for Windows NT. That’s why they turned to Conner Software. Now you can protect your data with a full-featured version of that same software: Backup Exec for Windows NT. It’s easy to use because it matches the NT interface exactly. Its simple installation program will have you up and running in no time. You can set it to automatically backup, even when nobody’s around. Our disk grooming feature will allow you to move inactive files to tape, freeing up valuable disk space. And if you know how to use File Manager, you’ll know how to use Backup Exec. Plus, it uses the Microsoft Tape Format (MTF), which enables you to exchange tapes with any NT user or system. If you don’t want to take chances with your data, it’s important to protect it with Backup Exec.

To order Backup Exec for Windows NT, or any of Conner’s other software products, call 1-800-4NT-BKUP.

Remotely Possible/LAN 1.0 and Dial 2.1b for Windows and Windows NT

Remotely Possible/LAN for Windows lets you control another PC on your Novell, IPX, NetBIOS, or Windows for Workgroups networks. It offers you remote con-

trol, file transfer, and chat capabilities. Remotely Possible/Dial 2.1b also lets you operate a remote Windows PC. It offers remote control, file transfer, and chat. A version of both products was recently announced for Windows NT.

The Remotely Possible products pro-

vide full video translation and support for Super VGA displays with 24-bit true-color operation, according to Avalan. Version 2.1b of Dial has a video-panning feature as well. This lets you see the entire host screen even if it's running at a higher resolution than the viewer. By moving the cursor, you can see information outside the viewing area.

Security features include optional logins with multilevel password and user IDs, modem dialback, multiple access levels, and a Windows icon that shows the name of a remote user when connected.

Why 2,000,000 people trust us with their savings.

Your data and your time.

What could be more valuable?

And what could be more useful than a software package that saves both?

With more than 2,000,000 copies sold so far, Fastback Plus is used by more people than any other backup software.

And not one copy has ever been returned for failure to restore data.

Fact is, you — or the people who work with you — can destroy up to 50% of the information on a tape and still restore every last byte, error-free. Whether you're using Fastback Plus for DOS, for Windows, for OS/2 or for Macintosh.

And if it weren't for our UNIX version, the smallest corrupted sector could bring your backups, your restores and perhaps your career to a screeching halt.

Of course, even the most reliable backup software can't be relied upon at all if it isn't being used.

Which explains why all five Fastbacks let you schedule automated, unattended backups.

And why all five are so easy to use, so accessible and so intuitive, complete with multiple user levels.

Our Windows and OS/2 versions let you customize the interface.

While the interface for our new DOS version is customized already.

Based on input from 2,000 people and developed with the hands-on assistance of 40 users brought to our offices during a month of exhaustive usability testing, it packs a wish list of the brand new and the tried-and-true. From one-screen file selection to peer-to-peer backup.

Whichever Fastback — or Fastbacks — you specify, you'll be assured of the most efficient backups possible.

That's because all five versions deliver the ideal combination of speed *and* compression. Our latest Windows version, for example, achieves compression rates of up to 85% while backing up to QIC tape at over 10MBs per minute.

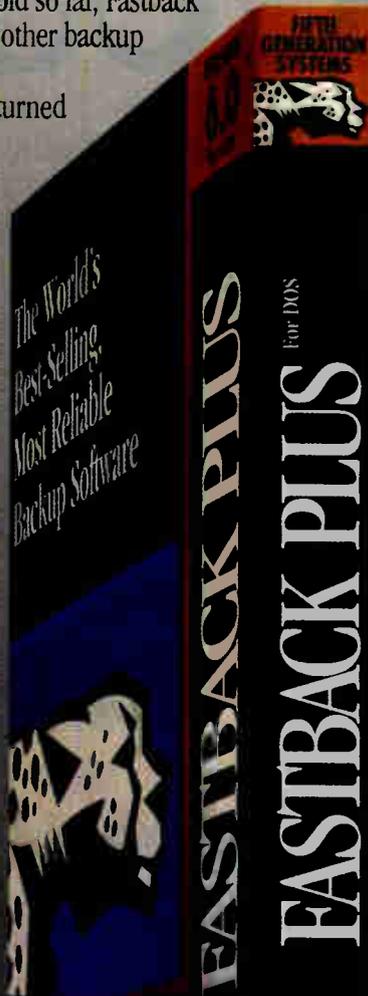

Clearly we didn't call it Fastback for nothing.

Speaking of calling, if you'd like a copy — or a thousand copies — in your hands tomorrow, pick up the phone today.

Dial 800-926-4289 Ext. 77.

And thanks a million.

Illustrator 4.0

Adobe Illustrator for Windows is a professional illustration program. Release 4.0 includes Adobe Type Manager, 40 Adobe Type 1 scalable fonts, the Adobe Type-Align type-manipulation program, color-separation software, and a selection of patterns, textures, symbols, and borders. Adobe says that users of Illustrator for Windows can exchange files with users of Illustrator for the Mac and Next with full compatibility.

Using Illustrator, you can sketch free-hand, trace over scans, or enter object dimensions for automatic creation. You can also add and select points on curves, lines, and objects.

Text-handling features enable you to place text on a line or curve, even within an object. You can position text in a defined block of any shape, according to Adobe, and link it to other text blocks or wrap it around any object. Illustrator supports 16- and 24-bit color and lets you select from more than 16.7 million colors on-screen.

New features in Adobe Illustrator for Windows 4.0 include editing in preview mode, on-screen text entry and manipulation, better control over artwork with marquee zoom, a new graphing tool, enhanced

color features, and context-sensitive help.

Registered Adobe Illustrator for Windows customers can upgrade to version 4.0 for \$99 and receive a free copy of Adobe Streamline 3.0 for Windows.

Picture Publisher 4.0

Micrografx calls Picture Publisher the desktop darkroom for Windows. The program is geared toward sophisticated computer users who aren't necessarily graphics professionals. The new version of the image editor includes Object Layers, which allows you to edit and move objects that you've pasted in. FastBits is another new feature, and it lets you quickly open just the section of the picture you want to work

on rather than loading the whole image into memory.

The ImageBrowser feature provides thumbnails of images that users can open and save. Further enhancements include searches based on keywords and filenames.

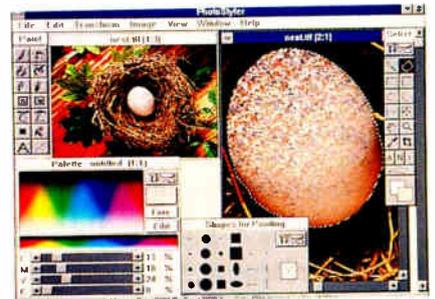

Other features of Picture Publisher include masking ability, editing and retouching tools, special effects and filters, and a range of output capabilities. Version 4.0 also has some Painter-like tools, such as crayons, oil paints, and markers. Picture Publisher is OLE 1.0-aware and supports the TWAIN scanner standard and Kodak Photo CD. It lets you import and export all the major file formats.

PhotoStyler 1.1

PhotoStyler is a full-color image-processing program for Windows. It lets you scan, enhance, compose, retouch, and print 24-bit color, gray-scale, and black-and-white images. It supports raw-image data for-

mats and the JPEG standard for image compression and expansion. This version also offers numerous interface and performance improvements, including optimized memory management and faster image handling, as well as TIFF LZW (Lempel-Ziv-Welch) compression and decompression, according to Aldus. Other file formats supported include EPS, GIF, PCX, TIFF, TGA, and BMP. The open architecture of PhotoStyler lets you plug in import and export capabilities as you need them, Aldus says. To run PhotoStyler 1.1, you need a high-resolution graphics card.

WHY Is Brutus*, the King of Monitors, So Impressed by the **15"** SCEPTRE?

Among the finest 15-inch High Resolution Color Monitors you can get, the Microprocessor based Low Radiation (MPR II compliant) **SCEPTRE CC-615L** offers:

1024 x 768 VESA 72Hz Flicker-free
Multi-scan 30-60 KHz
INVAR Shadow Mask Tube, FS II Flat Screen
31 Memory Settings
(5 Factory Preset, 26 User Adjustable)

Anti-static Screen
Universal Power 90-260 VAC 50/60Hz Auto-sensing
Advanced Dynamic Focusing
Manual and Auto-Degaussing
Front Access Push-button User Controls

PLUS: Energy Saving Option (**CC-615G**), SCEPTRE's Two Year Limited Warranty, and many more.

In addition, SCEPTRE's impressive full line of Micro-processor based monitors includes **CE-6N**, **CC-6N** (14-inch) and **CL-617/617L** (17-inch). For more information, contact SCEPTRE or its distributors today.

CA-Cricket Graph for Windows

CA-Cricket Graph is a charting application package geared toward scientists, engineers, and business people who need to create graphs and charts for reports, presentations, technical documents, or data analysis. You can import and graph data from files in ASCII, SYLK, DIF, WKS, WK1, WK2, or Windows Clipboard for-

formats. You can manage up to 40 columns by 2700 rows of data directly in the program, rearrange data, or generate new data by using mathematical operators or trigonometric transforms.

Cricket Graph for Windows will let you generate a variety of chart types, including scatter, line, stacked bar, pie, column, area, double Y axes, and polar.

Visio 2.0

Visio is a drawing program for people who aren't graphics specialists. In fact, the package was developed specifically for computer users who can't draw or don't have the time to learn one of the sophisti-

cated illustration programs. The package takes a drag-and-drop approach to drawing, using ready-made stencils of more than 300 different shapes. These stencils include flow diagrams, business models, engineering schematics, organization charts, facility plans, and network layouts. To draw with them, you click on the shapes, drag them to the drawing area, and then drop them into place. You can then manipulate or create any kind of drawing or diagram, according to Shapeware.

There are tools for drawing all the basic elements you'd need to create a diagram or simple illustration: lines, arcs, rectangles, and ellipses. With its "gesture-recognition" technology, the pencil tool knows from the way you move the mouse whether you want a straight line or a curve.

Other features in Visio include text tools, the ability to automatically connect shapes, conversion from 2-D to 1-D, floating-point precision, global editing, and rotation of objects.

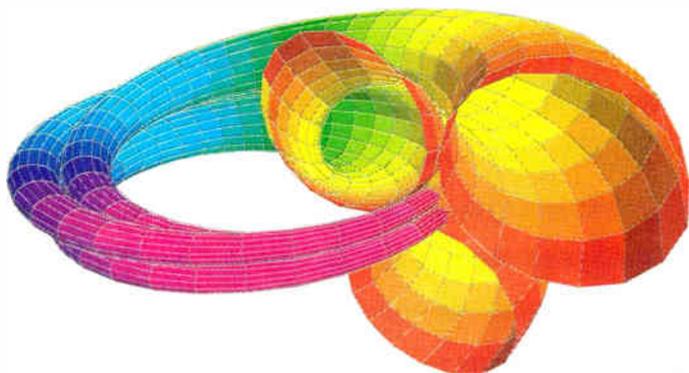

Version 2.0 includes OLE 2.0 object and container support, drag-and-drop capability across applications, and OLE automation. Also added in 2.0 are control handles, an alternative toolbar, multiple stencil views, and pop-up menus.

CAN THE MOST POWERFUL AND RELIABLE MATH SOFTWARE REALLY BE THE EASIEST TO USE?

Engineers and scientists who use Macsyma consistently describe it as more powerful and more reliable than any other mathematics software. Reviewers agree that Macsyma's on-line help system is the best in the field. IEEE Spectrum calls Macsyma "a national treasure" and says:

"Users with heavy mathematics needs should insist on Macsyma."

And, the most recent PC Macsyma runs fully three times as fast as earlier ones on PC Magazine's 1992 benchmark tests.

PRESENTATION
GRAPHICS

CA-Cricket Presents for Windows

With CA-Cricket Presents, you can create a presentation with display-quality graphics, speaker's notes, and audience handouts. The Abstract Outline Processor is a planning tool that helps you turn your ideas into a presentation structure. The templates let you use preselected fonts, colors, and background elements. Auto Presents takes information from an outline and creates a presentation for you. Video Presents is a utility that lets you use your monitor like a slide projector so that you can display your presentation.

Text capabilities include a ruler-based editor that lets you manipulate justification, tabs, kerning and leading, and style. A 100,000-word spelling checker is included. Graph types include scatter, line, area, pie, column, bar, stacked column, and stacked bar charts. You can import TIFF, PCX, Windows metafile, CGM, GIFF, GMF, and EPSF formats.

\$199

Computer Associates International, Inc., Islandia, NY; (516) 342-5224
Circle 1163 on Inquiry Card.

Charisma 2.1

Charisma, from Micrografx, is a business graphics program that combines charting, drawing, and presentation capabilities. The package comes with 44 predefined chart types, including technical types, such as linear and exponential. Charisma will let you create additional charts and save them as templates. All the major graphics and data file formats are supported for import and export.

Drawing tools include square, rectangle, circle, a variety of lines, Bézier curve editing, arrowheads, and more, as well as a collection of 2200 clip-art symbols. For presentations, more than 32 templates are included, along with color style sheets. Charisma runs on all Windows-supported networks.

Micrografx, Inc., Richardson, TX; (214) 234-1769; fax: (214) 234-2410
Circle 1164 on Inquiry Card.

Compel 1.0

Compel combines text and graphics capabilities with audio, video, and animation. With Compel, you can create on-screen presentations, slides, overheads, or printouts. You can also create interactive on-screen presentations. And the program's MAPI support lets you send interactive multimedia presentations through Microsoft Mail.

Hyperlinking allows for audience interaction and the ability to navigate through a presentation in customized ways. Users can click on a "hot word" or bullet to instantly provide supporting information in response to questions or comments, or they can skip ahead if they like.

The TwinClick control panel pops up

when both mouse buttons are pressed; buttons on the panel let presenters move to any place in the presentation. An Autobuild feature simplifies the creation of a series of slides, according to Asymetrix, and automatically creates links between slides.

Compel supports MCI-compatible multimedia devices under Windows. Built-in sound recorder and animation capabilities are also included. More than 100 MB of multimedia clips come with the Compel package.

Freelance Graphics for Windows
Release 2.1

Lotus's Freelance Graphics for Windows helps you build business presentations with QuickStart, an animated on-line tutorial that guides you step by step through the creation process. SmartMaster presentation pages and page layouts let you fill in the blanks to complete a presentation. Release 2.1 comes with 12 new SmartMaster designs, bringing the total to 65.

Release 2.1 supports the new WK4 file format created by Lotus 1-2-3 for Windows release 4 in the data import viewer. The program integrates with Lotus Notes in order to create and use the presentation libraries in a Notes environment. Another addition in the latest release is the OLE Screen Show, which lets you specify that presentations embedded as OLE objects automatically play as screen shows when launched. Also included with Freelance Graphics are a PowerPoint 2.0 file import filter, an encapsulated PostScript export filter, and support for the OS/2 metafile for importing and exporting.

Harvard Graphics for Windows 2.0

Harvard Graphics for Windows offers three views for creating a presentation: the Slide Sorter, the Outliner, and the Slide Editor. The presentation is stored in one file to simplify presentation editing and organization, according to Software Publishing. Changes in one working view are automatically reflected in the other views of the presentation. You can move between views by clicking on an icon or by selecting the new view from the pull-down menu.

With the Slide Sorter, the presentation is displayed in a collection of slide miniatures, so you can make global modifica-

RAIDION

FAULT - TOLERANT DISK ARRAYS

RAIDION LT and LS Series disk array subsystems are designed for use with either Novell NetWare 3.11/4.0 or IBM OS/2.

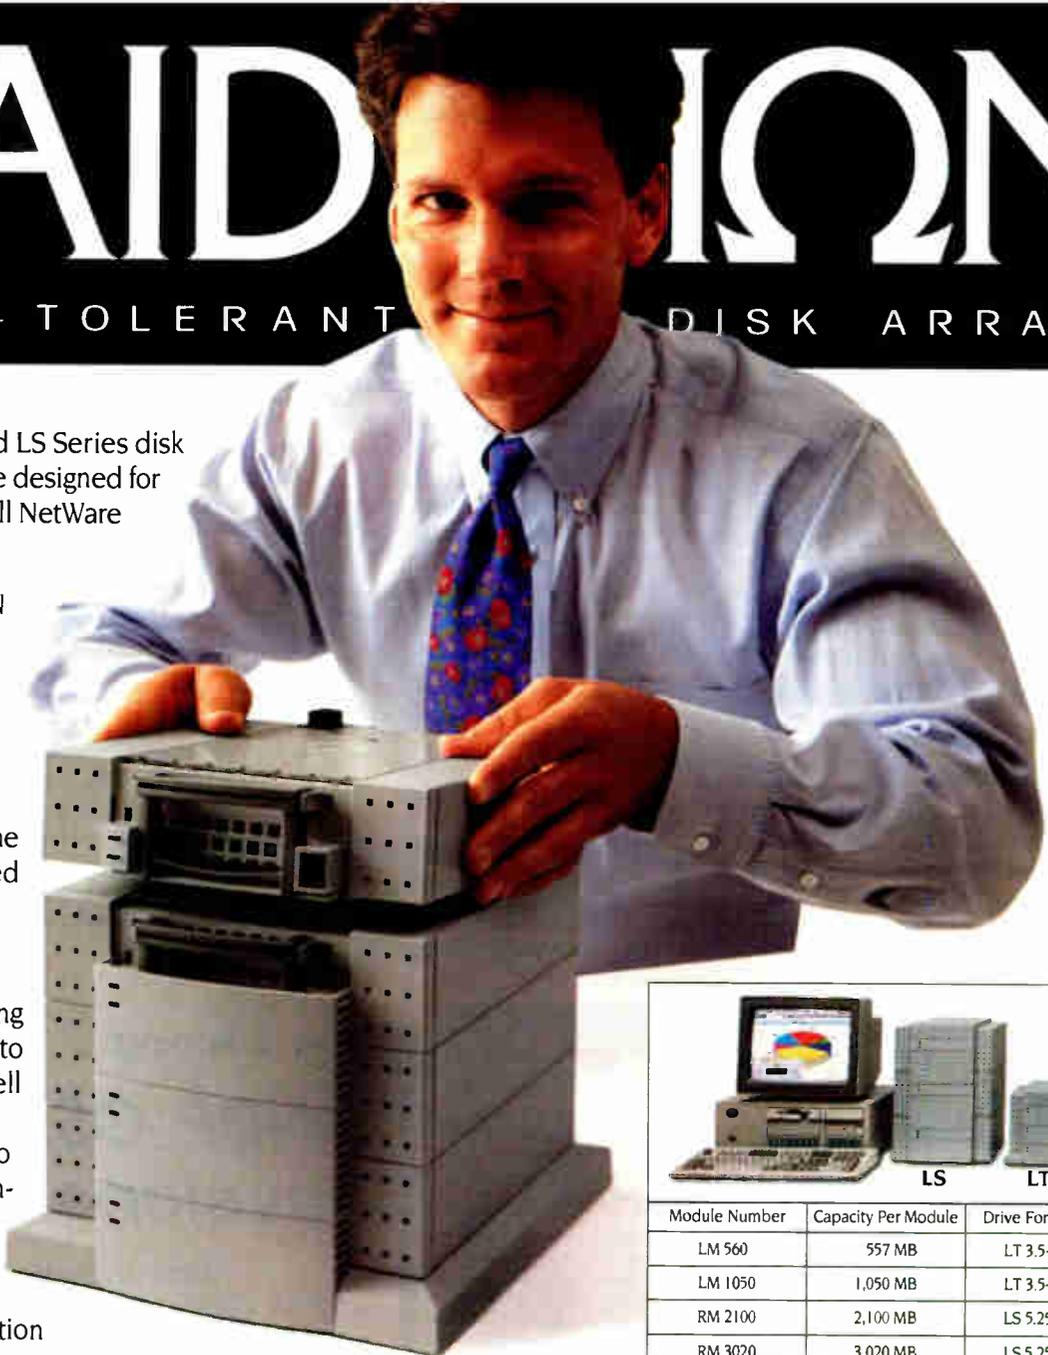

MIRROR. RAIDION can be configured with 2 modules to provide mirrored fault tolerance up to 3GB.

RAID 5. Adding one module to a mirrored array and installing RAIDWARE™ doubles the user capacity by converting the mirrored array to RAID 5. Under Novell NetWare, RAIDION can be expanded to 32 modules per single array with a capacity of 93GB. Under OS/2, the maximum configuration is 28 modules.

RELIABLE. RAIDION can be configured with an on-line spare option that activates automatically upon a drive failure, ensuring continued fault-tolerant operation without human intervention. Hot-Swap and Hot Replacement features allow RAIDION to be serviced while your network remains in operation.

ECONOMICAL. An LT Series three module 2 GB array is just \$7,545. An LS Series Raid 5 array with a capacity of 6 GB lists for just \$16,980. That's less than \$3.00 per MB. It's no wonder Byte Magazine said: "RAIDION's low price alone makes it worth considering." August, 1992.

AWARD WINNING. In a benchmark comparison of disk arrays, Corporate Computing said: "Raidion was our overall winner with an impressive combination of high performance, low cost, and unparalleled expandability." May, 1993.

Module Number	Capacity Per Module	Drive Form Factor
LM 560	557 MB	LT 3.5-inch
LM 1050	1,050 MB	LT 3.5-inch
RM 2100	2,100 MB	LS 5.25-inch
RM 3020	3,020 MB	LS 5.25-inch

Other add-on Module capacities available.

PowerPoint 3.0

Microsoft's PowerPoint provides word processing, graphing, outlining, and drawing tools that enable you to produce 35mm slides, overheads, speaker's notes, audience handouts, or electronic slide shows. The Slide Master lets you control the look

and format of your presentation. A shape tool helps you create diagrams. A free-form tool lets you draw figures that combine polygon and freehand drawing. The slide sorter lets you view miniatures of your slides and also lets you copy and paste between presentations.

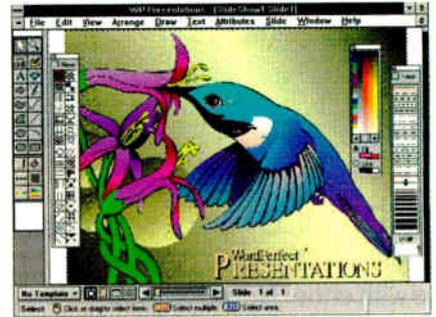

You can create 2-D and 3-D graphs, including area, bar, line, column, pie, scatter, and combination charts. You can choose from 84 graphing styles. Data can be imported from Excel, Lotus 1-2-3, and ASCII files. Also included is MCI support for sound and AVI video. PowerPoint supports OLE.

WordPerfect Presentations 2.0 for Windows

WordPerfect Presentations provides drawing tools and multimedia capabilities that

let you build presentations under Windows. It comes with templates, clip art, and other functions for creating bullet, organization, text, and chart slides. Features include a data-entry tool, an outliner for bulleted lists and text, a spreadsheet tool for charts, and a spelling checker. Charting ability includes line, surface, organizational, area, high-low, pie, and bar charts. 3-D effects are also possible. You can import Lotus 1-2-3, Excel, Quattro Pro, or ASCII files. You can create speaker notes and handouts and use the slide sorter to get a thumbnail view of your presentations.

Introducing SST

A New Standard in Multimedia Software

that will make your presentations soar!

Now you can develop any sales presentation, school report, or even a family scrapbook using the power of multimedia. With SST, you can produce dynamic presentations complete with scrolling text, sound, narration, graphs, pictures, video—even interactive capabilities. SST works like a slide carousel and a VCR player with point & click and drag & drop controls. Plus it utilizes two revolutionary operating techniques that no longer require you to learn complicated script languages or deal with time-based editing systems. In fact, it's so easy to use, you'll create a multimedia presentation in less than 60 minutes. **GUARANTEED.**

The best sound is not in the cards.

PORT·ABLE *Sound* PLUS™

Perk up your presentations. Make training more effective. And, put some guts into your gaming pastimes. Anytime. Anywhere. In fact, if you

are not a card carrying member of the computer set, you have to hear PORT·ABLE Sound Plus from DSP Solutions. You know, those real smart people who make simple sound solutions.

PORT·ABLE Sound Plus is the first portable external sound peripheral to deliver 16 Bit CD quality music with stereo audio capabilities. And, since you just plug into your IBM PC or compatible, desktop or laptop parallel port, you do not need an engineering degree or even a screwdriver.

When you compare PORT·ABLE Sound Plus to any other external sound peripherals, you will see why anything else is just noise. PORT·ABLE Sound Plus is based on advanced Digital Signal Processing technology, so you will enjoy the greatest

compression capability with the highest quality sounds. Here is something else that will be music to your ears. PORT·ABLE Sound Plus comes complete with everything you need including a high fidelity speaker and built-in microphone. There is an "Audio-in" for a CD or tape player and a "Line-out" for external powered stereo speakers. Even a built-in smart parallel port pass through so you can keep printing.

Whether you take your work across the hall or across the country, with PORT·ABLE Sound Plus, you have all the cards you need to play right in your hip pocket. The hinged design lets you flip up the unit if you are short on desk space or lap space. And, the power will always be with you whether you use rechargeable or non-rechargeable AA batteries. PORT·ABLE Sound Plus also comes equipped with an AC/DC power converter.

As a bonus, you will get all the software you need to communicate. Like Lotus Sound™ an OLE server for Windows 3.1. WinReader for Windows 3.1, a handy text-to-speech utility, DSP Solution's DOSTalk and DOSReader text-to-speech applications. Show & Tell For Kids™ for

Windows — an easy to use MultiMedia Authoring program. It is also Sound Blaster and AdLib compatible.

Why compromise on quality, portability, compatibility or affordability? When all the cards are on the table, PORT·ABLE Sound Plus from DSP Solutions is your ace in the hole. Suggested retail is only \$198.95.

To order or obtain more information about PORT·ABLE Sound Plus, write or call DSP Solutions, or, contact your local dealer.

Sales Office: 550 Main Street, Suite J, Placerville, California 95667. Telephone: (916) 621-1787. Fax (916) 621-2093.

DEVELOPMENT TOOLS

CA-dbFast 2.0

CA-dbFast is a stand-alone dBase-compatible application development system for Windows. The Visual Designer allows you to take advantage of object-oriented design and other Windows features. You can run dBase III Plus applications concurrently with your new CA-dbFast applications, according to Computer Associates.

CA-dbFast includes extensions to dBase that allow applications to use Windows resources, fonts, pull-down menus, bit maps, sizable Windows, and more. CA-dbFast also has multiuser capabilities, so you can share data on your network.

An interactive debugger supports source-level single-stepping and breakpoints. Extensible code templates let you standardize your programming efforts. And an object relationship manager maintains the relationships between project components.

Circle 1169 on Inquiry Card.

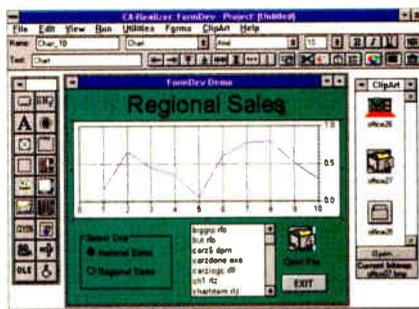

CA-Realizer 2.0 for Windows and OS/2

CA-Realizer 2.0 lets you create multiplatform applications for Windows and OS/2, and you can port applications to Windows NT. The BASIC language in this package lets you create families within families with dynamic record-like collections of variables that can be expanded at run time with new elements at any level, Computer Associates says. You can create and manipulate multidimensional arrays with up to 30 dimensions and expand them dynamically in any dimension. CA-Realizer's debugger lets you place breakpoints at procedures, functions, and program lines. You

can also display the contents of an array in the variable list box.

The new release of CA-Realizer for Windows and OS/2 lets you launch FormDev directly from the CA-Realizer Run menu. You can also create complete projects and edit multiple forms at the same time and cut and paste one or more objects between forms. You can align objects to adjustable grids with auto snapping and alignment, and you can resize and move objects as they appear. You can also generate CA-Realizer BASIC code from FormDev, edit it, and then reimport the file with its changes intact. And you can generate database query and entry forms automatically from any Xbase file. Computer Associates reports.

The package provides a range of chart types. The program's forms capability in-

cludes support for PCX and metafiles along with Windows bit maps. OLE objects are also supported. You can import and export Xbase database files.

FORTRAN PowerStation 1.0

Microsoft's FORTRAN PowerStation 1.0 is an implementation of FORTRAN that lets developers create 32-bit protected-mode DOS applications. The product comes with Visual Workbench, a Windows integrated development environment that lets developers move seamlessly between the compiler, editor, and debugger.

In addition to creating 32-bit protected-mode executable files and libraries, FORTRAN PowerStation provides support for 32-bit graphics in VGA, Super VGA, and VESA formats. The compiler is a 32-bit

executable file, so it handles programs up to 4 GB. FORTRAN PowerStation comes with a set of global optimizations, including optimizations for expressions, sorts, peepholes, and dead-loop removal.

FORTRAN PowerStation is compatible with ANSI FORTRAN 77 and includes VAX and IBM extensions. The package also comes with a 387 emulator. Microsoft recently announced a version of the FORTRAN compiler for NT that will let developers create 32-bit applications for NT and DOS.

fractal

Adding images to your Windows applications? Avoid storage problems with fractal image compression, the technology that inspired PC Magazine to declare "The advantages of fractal compression are unmatched."

This technology is now available to Windows 3.x developers in **POEM ColorBox III**, which provides DLLs for:

- Ultra-high compression;
- Resolution independent images;
- Background compression; and
- FTC-III coprocessor support

For database, multimedia, archiving or other applications, **ColorBox III** is comprehensive, easy-to-use and at \$995, surprisingly affordable.

Call today for more information. Learn why **ColorBox III** can solve your image storage problems.

If It Were A Baseball Player, It Would Hit Home Runs, Toss No-Hitters, Steal Bases, And Sign For Under \$200.

Okay, it hasn't happened in baseball. But in the computer world, there's a major league player in the communications game that can pretty much do it all. Introducing CommWorks™ for Windows™ by

Traveling Software. The first complete communications package that gives you more flexibility than ever to do business away from the office. For starters, there's **LapLink® V**, the number one selling file transfer program. You can make unattended, regularly scheduled file transfers at anytime, from any place. And for local file transfers, use the included serial cable. CommWorks also

allows you to send and receive a

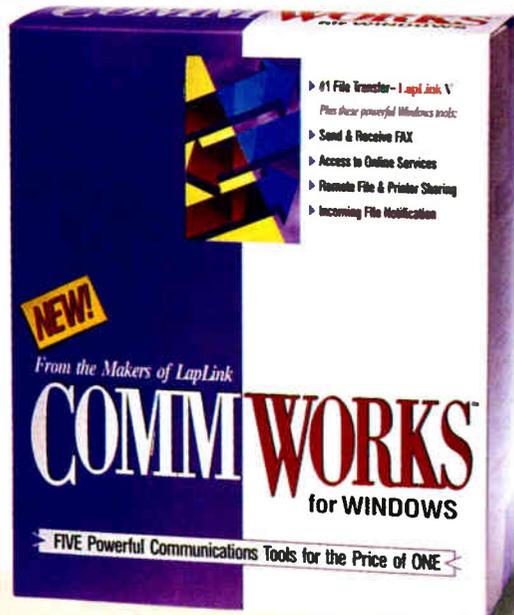

Fax

from your PC quickly, easily and privately. CommWorks also features **Remote Access**, which brings remote files and printers directly to your PC wherever you are. And with

the online program, you can tap into MCI Mail®, CompuServe®, or other **Online Services**

at the click of a button. What's more, the CommWorks Control Center puts all these communications tools at your fingertips. See your local dealer or call Traveling Software direct for \$50 off the introductory SRP of \$199.95. And get the

one who can do it all. Without the overblown salary.

**Introductory Offer
Call for \$50 off

Mirrors

Micrografx Mirrors, a toolkit for porting Windows applications to OS/2, is a 32-bit DLL that emulates Windows under OS/2. When an application running under OS/2 calls a Windows function, Mirrors intercepts the call and implements it using functions within the OS/2 system DLL. Mirrors transforms the data that is returned by OS/2 and passes it back in a form Windows applications understand.

Some of the key functions of Mirrors are support for 16-bit applications; automated conversion of bit maps, icons, and help files; debug and nondebug versions of the Mirrors DLL; DOS3CALL interrupt support; and DOS and OS/2 host-independent file I/O libraries.

Toolbook Multimedia Resource Kit

Asymetrix says its Toolbook Multimedia Resource Kit simplifies the creation of multimedia applications. If you are building an application with motion video, you

can paste the prebuilt VCR-like control panel into your application to provide play, pause, stop, fast forward, and rewind functions—without doing any programming. The Resource Kit supports DLLs and lets you link to and control any multimedia hardware and software that has a Windows DLL library.

An OpenScript function supports all the Microsoft high-level application programming interfaces and timer services. There's also a library of more than 85 pre-scripted multimedia objects, called widgets. And there's a facility that lets you play MacroMind Director or Autodesk Animator animation and palettized images in child and pop-up Windows. The kit includes graphics filters for importing DRW, EPS, TIFF, BMP, and DIB files. It also

supports 256-color bit maps.

To run the Resource Kit you need Tool-Book for Windows, Microsoft Multimedia Windows, and 2 MB of RAM.

Visual Basic 3.0

The Microsoft Access 1.1 database engine is integrated into Visual Basic 3.0, providing venues to Access, FoxPro, dBase, Paradox, and other client/server databases available through ODBC (Open Database Connectivity). The engine also has a query capability that parses SQL, the ability to perform distributed joins, updatable queries, query optimization, and international collating orders.

The Programmatic Layer of Visual Basic 3.0 is a suite of objects that drives the database engine and lets you define a query, field, index, or table and gives you access to data stored in a table, as well as the ability to execute a query, manipulate the results, and update the database. The Visual Layer of Visual Basic 3.0 offers data-aware controls that you can link to a query.

For designing reports, Visual Basic 3.0 Professional Edition includes Crystal Reports 2.0, which uses a custom control to simplify embedding reports in applications.

Visual Basic 3.0 has tools that help you create and manipulate data as well as distribute applications. New controls help you create hierarchical list boxes, to issue queries and navigate through the results, and more.

Unlike the Professional Edition, the Standard Edition lacks full ODBC support, a few drivers, the programmatic access layer, Crystal Reports, some data-aware controls, and the on-line Windows 3.1 API reference and the Custom Control Development Kit.

E-mail That Works...!

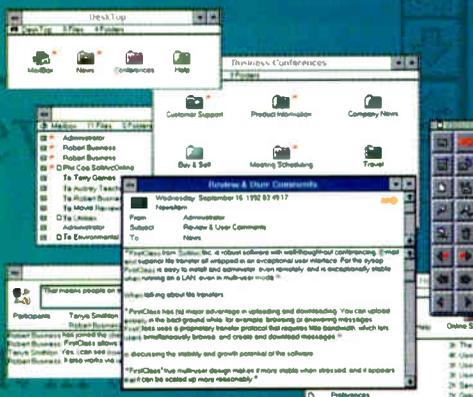

More than just a leading multi-platform e-mail system, FirstClass features **electronic conferencing** and **remote access**—all in the same package.

E-mail

Conferencing

Remote Access

Use FirstClass for internal mail, workgroup communication, and even as a public access tech support solution. All simultaneously from **the same non-dedicated server!**

FirstClass™

- Built-in support for both Macintosh® and Windows machines on the same network (or via modem) without costly file servers
- Handles up to 250 users simultaneously per server, 20 of which may be via modem
- Simple network or modem connectivity to other FirstClass servers or other mail systems
- Remote or local administration with the same client all others use
- Messages with multiple fonts, styles, colors & unlimited file attachments
- Simultaneous multiple file transfers
- Background searching
- Gateways to other mail systems or the Internet with full Usenet newsgroup sending & receiving
- Fax gateway for individual or broadcast faxing and more!

Windows & OS/2

C++ developers will be the first PC-based development system with all software and documentation distributed on CD-ROM, according to Microsoft. The on-line documentation contains more than 8000 pages of information, including references to the Win32 SDK, C, and C++.

Visual C++ 32-bit Edition comes with Foundation Class Library 2.0. According to Microsoft, this library offers the building blocks that encapsulate thousands of lines of reusable, robust, and optimized C++ code for Windows-based applications.

AppWizard lets you create a skeleton application that supports these building blocks, and ClassWizard lets you connect user-interface elements and application code.

AppStudio lets you create, edit, and browse application resources. And Visual Workbench gives you an integrated editor, debugger, browser, and profiler. Also included is Spy++, an analysis tool that gives you information on threads, processes, and windows in Win32-based applications.

To run Visual C++ 32-bit Edition you need at least 16 MB of RAM, 80 MB of hard disk space for a full installation, a VGA or higher display, and a CD-ROM drive supported by NT.

Watcom C/C++³²

This is a professional, multiplatform, 32-bit optimizing C and C++ development system for extended DOS, Novell NLM, OS/2 2.0, Windows NT, and Win32s. The development package implements instruction scheduling to deliver better performance on 486 and Pentium processors, according to Watcom.

The compiler can create a single, high-performance executable file that runs on 386, 486, and Pentium processors. It supports a range of 32-bit Intel 80x86 host and target platforms. The package comes with a debugger, C and C++ compilers, a profiler, a royalty-free DOS extender with 32 MB of VMM support, licensed components of the Microsoft Windows 3.1 SDK, OS/2 2.1 Toolkit, and NetWare 4.0 SDK, and more.

To run C/C++³² you need DOS 3.3 or

higher, OS/2 2.0, or Windows NT and 3 MB of available RAM.

DESKTOP PUBLISHING

FrameMaker 4

FrameMaker is aimed primarily at professionals who need to produce long, complex documents—books, manuals, business plans, and financial reports with numbered sections, sophisticated page layouts, tables, cross-references, footnotes, indexes, and lengthy tables of contents. As you might guess from the name, the program takes a frame-centric approach to laying out pages. The latest version for Windows includes more than 100 new features that make it more accessible and easier to use for creating demanding documents, according to Frame Technology. Leading the list of enhancements is a new

user interface and features such as the ability to compare documents, better graphics handling, a thesaurus, functions for preparing color separations, and complete rotation of text and graphics. System administrators can customize the menus.

As in earlier editions, Version 4 lets you create conditional text and create formats for complex mathematical equations. Also included is a utility that lets you distribute documents across a network or on CD-ROM.

FrameMaker 4 is also available for Sun and Hewlett-Packard Unix workstations and for the Macintosh. FrameMaker 4 shares files transparently across these platforms with no file conversion.

PageMaker 5.0

The latest version of PageMaker features advances in precision and control of text, integration with other software, and a wider range of printed communications that it can produce. With version 5.0, functions are identical under the Windows and Macintosh operating systems.

PageMaker 5.0 is able to rotate and skew text and graphics in 0.01-degree increments, along with horizontal and vertical reflection of objects. You can also edit the rotated text and crop rotated graphics directly in page layout view. Version 5.0 produces process-color separations of complete pages including text and graphics, as well as imported CMYK TIFF, DCS, and EPS images. Pantone color is also supported.

PageMaker now comes with Aldus Additions technology, which lets you tailor your desktop publishing operations to specific needs. More than 20 Aldus Additions come with 5.0, including Expert Kerning.

QuarkXPress 3.2 for Windows

The newest version of QuarkXPress for Windows comes with color-related features, such as the EfiColor XTension from Electronics for Imaging. The EfiColor XTension lets you separate imported continuous-tone color images from within QuarkXPress and ensures consistent color matching across an array of display and output devices, including offset presses, EFI says. The XTension includes information about the capabilities and limitations of each device and will alert you if a color cannot be displayed or printed by a device.

Quark claims that version 3.2 runs substantially faster than 3.1. There are more than 20 new features, including Collect for Output, which allows you to save a document and related graphics in one file for shipping to a service bureau. (The files that are needed to print the document are

Develop Cross-Platform GUI Applications in a Single Stroke.

Master the art of multi-platform GUIs.

XVT Software is the leading choice of world-class developers for one reason. It is the simplest, quickest path to building quality applications that port to every GUI without compromises in look-and-feel or performance. Plus, it's easier to learn and use than native toolkits, so your time and effort goes into your application, not your GUIs.

XVT gives you simultaneous original GUIs.

Because XVT uses native GUI objects, your application is indistinguishable from one written directly to the native toolkit. Through our layered architecture, you achieve equivalent cross-platform functionality appropriate to each GUI, without the overhead and inflexibility of proprietary emulation-based systems.

XVT puts complete C/C++ solutions at your fingertips.

The XVT Solutions for C and C++ each include an Interactive Design Tool and the XVT Portability Toolkit. Our Design tools let you use your mouse to design and lay out your GUI, using native and custom controls, then test it on all your target platforms before generating and compiling your code.

When combined with in-depth consulting, training and support, plus a wide range of Partners products, XVT

forms the most comprehensive and advanced solution for developing completely portable GUI applications.

Developers judge XVT to be a masterpiece.

XVT is the base document for the IEEE's GUI standardization effort. Our thousands of customers include internal and commercial developers like: Alcoa, Amoco, AT&T, Avis, Ford, General Motors, Grammatik/Reference Software, Kodak, Lockheed, NCR, NEC, NIST, Novell, Rockwell, Siemens, Sony, Southwestern Bell, Tandem, Uniplex, Unisys, US Army and US West.

Call now for a free XVT Technical Overview and Demo.

Ascend 4.0

Franklin Quest, producer of this product, is a time-management training company that put its concepts on disk so you can manage your time directly on computer or print out day-planner pages. Ascend is both a

personal information manager and a contact manager for Windows. It lets you print tasks, appointments, calendars, values and goals, phone and address lists, and contact information. The package can dial phone numbers for you.

Ascend is compatible with Novell, LAN Manager, and other networks. You can share calendars and other data with other Ascend users on a network. You can also use a groupware feature to find available time slots for group appointments and schedule them with or without confirmation. Ascend features password protection for security.

Version 4.0 supports OLE and DDE. It also has a monthly view and weekly view, a summary report, and an enhanced values and goals module. In addition, Ascend 4.0 supports pen computing with features such as gesture recognition, freehand drawing, and push buttons.

Commence 2.0

Commence 2.0 includes calendar, contact management, and task management fea-

tures in addition to the ability to share databases, views, categories, and connections over networks. Commence 2.0 has a database synchronization feature for PCs not connected to a network.

Commence uses agent technology that gives you a way of defining triggers and actions to automate routine tasks. A trigger defines the event that will cause the agent to operate, and the actions determine what task Commence will perform. There are time, data, and manually activated triggers.

The new version employs a distributed database architecture, letting you disconnect from the network and retain a local copy of the database to use at home or on the road. When you connect to the network, changes made while you were disconnected are automatically updated and synchronized. Sync Link, the technology that performs the synchronization, provides a compressed file export utility that handles incremental changes.

Commence 2.0 comes with two predefined databases. Each allows you to save data in up to 300 categories, each capable of storing up to 16,000 items. The categories consist of named fields that you can add, edit, or delete. Security features include four levels of password protection for the LAN-based version, and scrambling and password protection for the stand-alone version.

OnTime 1.5

The new version of OnTime for Windows includes import and export support for several palmtops, as well as support for WinBee wireless communication software that transmits messages to alphanumeric pagers. A feature called RSVP lets users who originate meeting requests require recipients to respond with a "yes," "no," or "pending." A reminder icon stays at the bottom of the recipient's calendar screens until he or she responds. Originators of the meeting can get a list of attendees and a grid that indicates each person's response.

Also added to version 1.5 is MHS support, giving users the option of having meeting requests sent via E-mail (using

Phar Lap

The Future of 32-Bit DOS!

FREE!
TNT Lite
In Visual C++
32-Bit Edition!

IT'S HERE!

NT power under 32-bit DOS!

Microsoft Visual C++ and Phar Lap TNT bring the never-before-available power of Windows NT to 32-bit DOS! Phar Lap's new TNT DOS-Extender lets you break the 640K DOS barrier, build multi-megabyte DOS applications and take advantage of powerful NT features. Implement threads, DLLs and multitasking with your familiar Microsoft development tools — under DOS! It's never been so easy to create the most powerful, full-featured DOS programs ever.

TNT DOS-Extender is the new standard in 32-bit DOS. The DOS power you've been waiting for is finally here!

Try it out... FREE!

If you have the Microsoft Visual C++ 32-Bit Edition tools, you've already got a free trial-size version of TNT DOS-Extender. TNT DOS-Extender

Lite is automatically installed with your Visual C++ 32-Bit Edition software. You can use TNT DOS-Extender Lite to build versatile 32-bit programs that can access up to two megabytes of memory and run under DOS, Windows 3.1, or Windows NT. It's the easiest introduction you'll find to the power of TNT.

The next-generation DOS extender.

TNT DOS-Extender is the only DOS extender to support the Win32 API, allowing your native Windows NT character-based programs to run under DOS with no changes. Programs can access all available memory — up to four gigabytes — and run with 32-bit speed and power.

But that's not all. TNT DOS-Extender also supports powerful NT features such as dynamic link libraries (DLLs) and threads, enabling developers to build modular, responsive multi-megabyte applications. And all this power is delivered with the high standards of technical excellence you've come to expect from Phar Lap, the industry leader in DOS extender technology.

Already a standard.

TNT DOS-Extender is the tool chosen by Microsoft to develop their own 32-bit tools. TNT DOS-Extender was used to build both the 16-bit and 32-bit versions of Microsoft Visual C++, Microsoft MASM 6.1 and Microsoft FORTRAN PowerStation.

32-bit CodeView, too!

TNT DOS-Extender includes a 32-bit version of the familiar Microsoft CodeView debugger. So you can use industry standard Microsoft tools, including CodeView, to develop software for the operating system of the future — that your DOS customers can use today!

TNT DOS-Extender SDK is the latest release of Phar Lap's award-winning 386DOS-Extender SDK. You can also use TNT DOS-Extender with a wide variety of 32-bit compilers (including Visual C++ 32-Bit Edition) to build Extended-DOS programs with no NT system required. In addition, TNT DOS-Extender is compatible with all 32-bit tools supported by 386DOS-Extender. An add-on run-time kit is available for developers who want to distribute TNT DOS-Extender applications to customers.

So if you've been wondering what the future holds for DOS developers, don't wait... bring cutting-edge technology to your DOS applications today with TNT DOS-Extender!

NT Power Under DOS Lets You:

- Utilize NT features such as multitasking, DLLs and threads
- Build multi-megabyte 32-bit DOS programs
- Break the 640K DOS barrier — with your familiar Microsoft tools
- Build one application that runs under both Windows NT and DOS
- Save RAM! Run a 4 MB DOS system, not a 20 MB NT system
- Use industry-leading, high-quality Phar Lap and Microsoft tools

ACCOUNTING

ACCPAC Simply Accounting for Windows and OS/2

ACCPAC Simply Accounting for Windows and OS/2 is an entry-level accounting program that is part of the ACCPAC family of accounting software from Computer Associates. The package provides general ledger, accounts receivable/payable, payroll, inventory, and project costing modules. The package can handle up to 5000 ledger accounts and 32,000 customers, vendors, employees, inventory items, jobs, and projects.

Version 2.0 includes the ability to enter cash purchases or cash sales as singular transactions rather than through multiple journals. It also includes flexible transaction handling and enhanced forms handling, with multiple form sizes for invoices, checks, and statements.

The program comes with a primer that walks you through basic accounting principles and a tutorial with sample data. It also features automatic transaction posting and pop-up customer, vendor, employee, job, account, and inventory lists. The package supports both accrual and cash-basis accounting and provides month- and year-end closings. You can link ACCPAC Simply Accounting data with your word processor and spreadsheet documents that support DDE.

Money 2.0

Microsoft Money 2.0 is based on a checkbook-style design and includes tax, budget, and loan analysis capabilities. The charting feature allows you to view trends in your income and expense categories, compare budget versus actual spending, see pie charts of asset allocations, and more. Transaction Coaches are like having a personal trainer for your finances, according to Microsoft. A calculator lets you convert foreign and local currencies. A loan calculator is also included, along with an automatic budgeting feature.

MoneyCounts for Windows

MoneyCounts for Windows, from Parsons Technology, uses a checkbook analogy for its screens to manage cash, checking, credit cards, and savings. Designed for home or small business use, the program handles an unlimited number of transac-

tions and accounts for organizing daily finances and tax documents.

Some features are the ability to create multiple sets of books, the ability to choose single- or double-entry accounting, support for nonprofit and for-profit organizations, and more. An on-line facsimile of the 1040 tax form is included, as well as an address book that enables you to build a

HEADS, IT'S REAL. TAILS, IT'S FAKE.

It's your choice. A little more than 50 percent of all business software in use today is pirated.

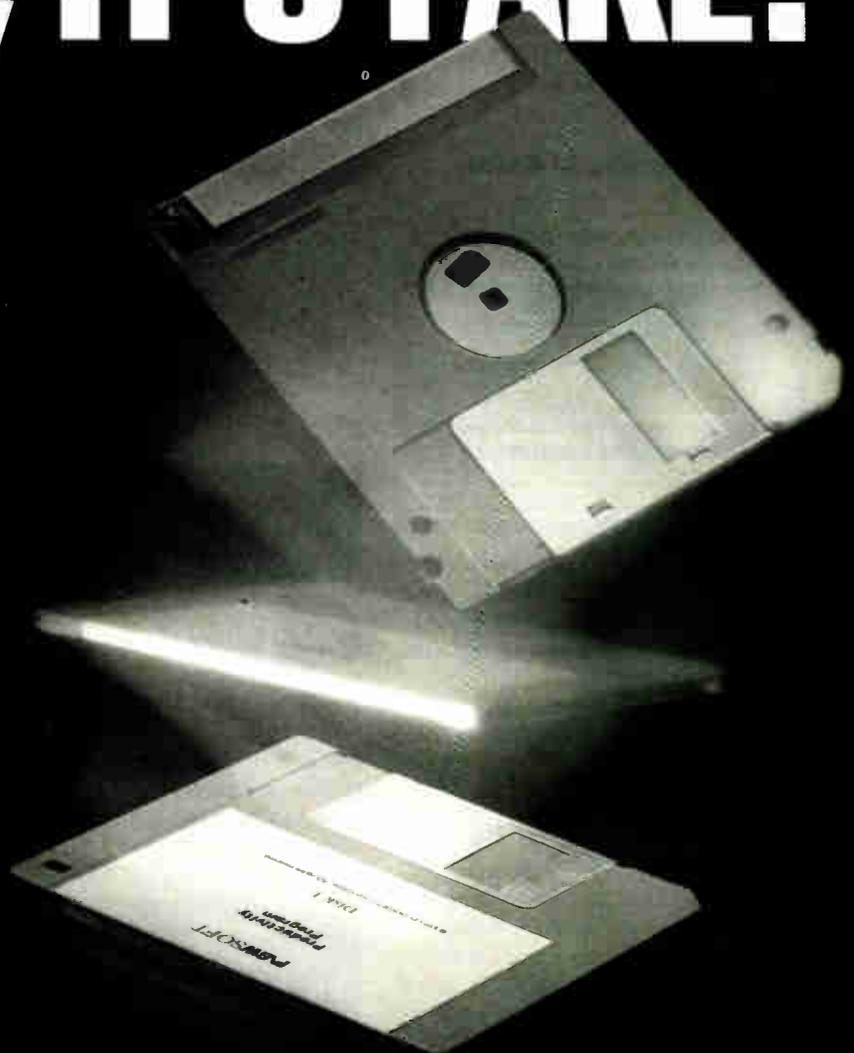

You might save a few bucks on it—but when phony software doesn't work, forget calling for product support. When it infects *your* computer with a deadly virus, it'll be your work that gets lost. The documentation is nonexistent or inadequate, so that won't help. And, of course, there will never be any product upgrades.

Selling or copying software without authorization is against the law, with severe criminal and civil penalties including imprisonment of up to five years, fines of up to \$250,000, or both. If you suspect the sale or use of pirated software, call the BSA Anti-Piracy hotline:

Peachtree Accounting for Windows Release 2

Peachtree Software calls this package "accounting for the beginner" and simplifies

it with graphics guides, a setup checklist, and on-line tutorials. A "Friendly Accountant" walks you through setup and installation, and there are Smart Guides that explain data fields.

Peachtree Accounting provides general ledger, accounts receivable, accounts payable, payroll, inventory, job/project tracking, financial report writer, forms design, bank reconciliation, and import/export modules.

According to Peachtree, the Manager's Series assists small businesses in making decisions. The software offers interpretations and graphical overviews of your cash flow, collections, and payment status. Peachtree Accounting supports OLE and DDE, and the new version uses MDI, giving you the ability to display multiple reports at once.

SCIENTIFIC & ENGINEERING

AutoCAD Release 12

Autodesk says it developed the Windows version of AutoCAD to make it easier for people to use CAD tools for the first time. Features of the Windows AutoCAD include a new graphical interface, accelerator keys, enhanced Clipboard support, support for multiple sessions, OLE support, and drag-and-drop functions.

You can start drawing and editing by clicking on an icon button. The new feature set includes the ability to do 2-D and 3-D design, links to several databases, and the Advanced Modeling Extension, which is an optional module for solid modeling, integrated color rendering, network licensing, and printing and plotting.

To run AutoCAD release 12 for Win-

dows you need Windows 3.1 or higher, 8 MB of RAM, and a math coprocessor.

Foresight Resources Corp., Kansas City, MO; (816) 891-1040

Circle 1206 on Inquiry Card.

Mathcad 4.0

The latest version of this engineer's tool features SmartMath, a rules-based processor that MathSoft says makes numeric and symbolic calculations faster and more ac-

curate. SmartMath provides an intelligent interface between the user's problem and Mathcad's numerical and symbolic capabilities. SmartMath reviews your input and executes a strategy for solving the problem by writing a new set of equations in a pop-up window. It also delivers the results to the Mathcad document. SmartMath comes with Symbolic/Numerical Optimization and Live Symbolics modules. Other SmartMath add-ons will be available in the future, according to MathSoft.

Mathcad 4.0 runs under Windows 3.1 as a 32-bit application. According to MathSoft, it runs twice as fast as the previous version and lets you manipulate a virtually unlimited amount of data arrays simultaneously.

Version 4.0 supports OLE as both client and server so you can transfer data and graphics between Mathcad and other OLE-aware applications.

Mathematica 2.2 for Windows

Mathematica handles numeric, symbolic, and graphical computations and has a built-in programming language. You can use it as a numeric and symbolic calculator, a visualization system, a programming language, a modeling and data analysis environment, a knowledge representation system, or a control language.

Mathematica 2.2 for Windows contains new front-end features that enhance interactive document capabilities, according to Wolfram Research. The new version can recognize sparse linear systems. Equation solving has also been improved, Wolfram says, and interval arithmetic capabilities have been added. The program's symbolic capabilities include more sophisticated treatment of singularities in definite integrals, according to Wolfram Research. It can also generate symbolic solutions to systems of nonlinear ordinary differential equations, additional Riccati equations, and first-order partial differential equations.

WaveTest VIP

WaveTest VIP is a test program software tool that lets you add GPIB, VXIbus, MX-Ibus, or RS-232 instrument control and data acquisition to any Windows-based test development program. It also provides interactive instrument simulation.

WaveTest VIP can be used in C, C++, Turbo Pascal, or Visual Basic programming environments or with application environments such as Excel, SuperBase IV, and Lotus 1-2-3. Under these environments, when you need to add instrument control and data acquisition, you select the instrument from WaveTest VIP and choose its function from the graphics instrument control panel.

WaveTest VIP comes with a library of over 250 drivers for instruments from more than 30 vendors and includes a utility that helps you create new instrument drivers for any GPIB, VXIbus, or RS-232 instrument. Drivers handle set-up, read delays, data-string parsing, and SRQ interrupts. A panel editor lets you develop user interfaces, data display panels, and reports. Also provided is an active bus traced for program editing and debugging.

Uninstaller

MicroHelp's UnInstaller cleans up Windows by removing an application and the bits and pieces left behind (e.g., references in WIN.INI, changes to SYSTEM.INI, application INI files, and data files with extensions listed in WIN.INI.) UnInstaller uses what MicroHelp calls Smart Decoy Technology, which lets you remove applications from a network's server and workstations. When a system administrator uninstalls a program, UnInstaller leaves a decoy copy of itself on the server, so

when users try to run the application, it offers to clean up their application, too.

Real Stats. Real Easy.

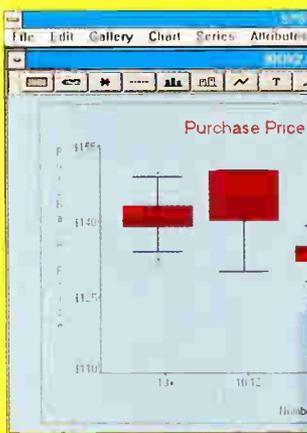

NEW VERSION!
Features for: Mainframe, Correlator,
Business Statistics, Business Communications

SPSS 6.0 for Windows gives you stats, graphs and reports your spreadsheet or database can't.

Learn fast, work fast

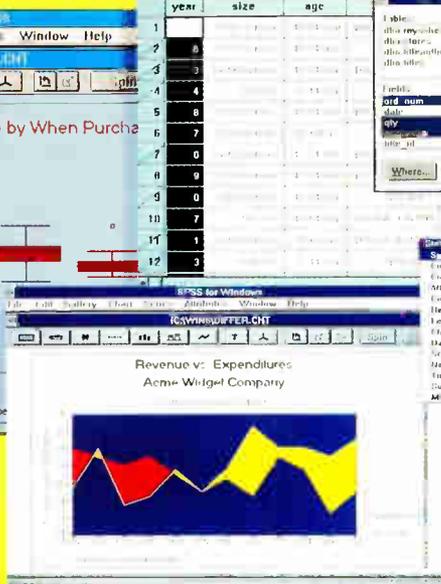

"Stumbling blocks to statistical analysis are eliminated with SPSS for Windows. You don't have to be a programmer to use it and you don't have to be a statistician to understand it." — Richard O'Reilly, Los Angeles Times The 100% Windows interface makes doing analysis simple.

Context-sensitive help and an online glossary of statistical terms are just a click away.

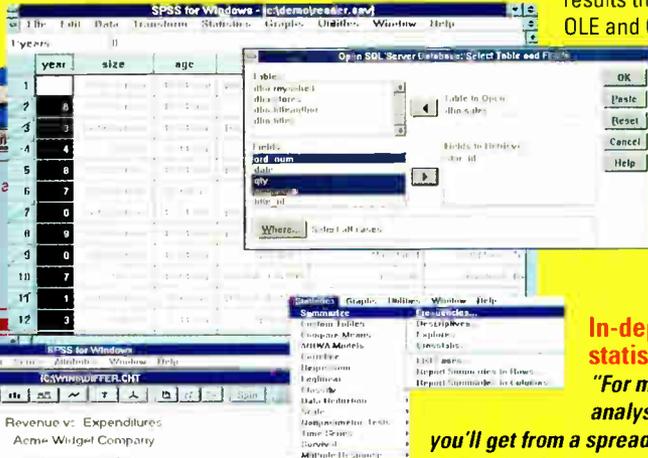

Automatic statistical graphics

"A complete set of graphics and charting capabilities." — Marc Ferranti, PC Week. Create statistical, business, time-series and SQC charts automatically as part of your analysis or directly from your data. Over 60 chart types in all.

Complete data management and editing

"A breakthrough in data capacity and ease of use... impressive." — Alan Fridlund, InfoWorld. There's no limit to the number of variables you can analyze. Access enterprise data with dialog-box interfaces to Oracle® and SQL Server.™ Read data directly from Excel®, Lotus®, .dbf and SAS® transport files. Share data and results through DDE, OLE and ODBC.

In-depth statistics

"For more statistical analysis tools than you'll get from a spreadsheet such as Excel, without the steep learning curve, SPSS for Windows is a great buy." — Michael Burgard, PC/Computing Widely used analytical tools such as crosstabs, correlations, curve-fitting and regression are in the Base module. Optional modules with unrivaled advanced statistics are available. You won't outgrow of this package.

To answer your really tough questions, you have to go beyond spreadsheets and databases. You need a package designed for real statistical analysis, reporting and charting. One that's powerful, easy-to-use and gives you built-in access to enterprise data. You need the latest version of SPSS for Windows, winner of PC Magazine's Editors' Choice Award — the "Real Stats. Real Easy." combination that delivers real value.

Break out of the spreadsheet cell with SPSS for Windows. Do more than simple percentages and sums — find relationships, see patterns and trends, determine significance and use the past to predict the future. Complete data management frees you to subset, sample, slice and dice your data however you want. Whether you need to analyze surveys, dig into databases, improve quality, conduct research studies, forecast sales or prepare reports, SPSS for Windows makes it easy.

Learn fast, work fast. Prepare for your analysis quickly with SPSS' full-featured Data Editor. Get data from a variety of sources through new ODBC support. Choose from a broad range of statistical routines that produce full-color business,

statistical, time-series and quality charts automatically — some 60 charts in all! Put together standard reports quickly and create great presentations with a powerful, flexible report writer. Share data and results with other applications using DDE and OLE. For the most complete analytical solution, you can choose from nine specialized, optional modules. And you can use new features and programming tools to link other products directly into SPSS for Windows.

SPSS for Windows — when you need more statistics than a spreadsheet or database can offer.

Order now and get a great value for only \$695. American Express, Discover, MasterCard and Visa accepted. Try SPSS 6.0 for Windows with our unconditional 60-day money-back guarantee.

THE ONLY THING MISSING FROM OUR CHILI RECIPE IS YOU.

ANNOUNCING MICROGRAFX FIFTH ANNUAL CHILI FOR CHILDREN COOK-OFF

It's not often you can combine, music, fun and quite possibly the most outlandish chili recipes anywhere to accomplish something so worthwhile. Your company has the opportunity to become an official sponsor for the Micrografx Fifth Annual Chili For Children Cook-Off, benefitting the National Center For Missing & Exploited Children.

Chili For Children is one of the most popular and highly visible events at Comdex. The evening features outstanding musical entertainment and visual demonstrations by today's leading-edge technological innovators. Past corporate participants have included IBM, Intel, Microsoft, Lotus, Hewlett Packard and many more, all coming together to raise donations for an outstanding cause. The National Center For

Missing & Exploited Children handles tens of thousands of cases each year and has helped reunite many missing children with their families.

Corporate sponsorships range from \$30,000 to as little as \$500, and sponsorship entitles you to a variety of premiums ranging from tickets, to chili cooking booths, to T-shirts. It all takes place November 16, 1993 from 6 to 11 p.m. at the Thomas & Mack Center (UNLV), Las Vegas, Nevada during Comdex Fall 1993. To find out how your company can get involved or if you want individual tickets, call TicketMasters at 1-800-848-4615. It's sure to give everyone involved a very warm feeling inside

THE POWER OF GRAPHICS

The growing sophistication of computer graphics for GUIs, videoconferencing, and 3-D is made possible by some very advanced technologies

JOHN BRYAN AND BOB RYAN

Worldwide History

In the history of computer graphics, time is divided into two eras—pre-Mac and post-Mac. Before the introduction of the Apple Macintosh in January, 1984, graphics were an expensive luxury for most desktop computer users; something you bought only if your application demanded it.

The Macintosh changed all that. It showed how you could use computer graphics to create an abstract environment that was accessible—indeed easy—for mere mortals to manipulate. In the case of the Macintosh, of course, the environment abstracted is your personal computer. The windows, menus, and icons that populate Macintosh, Windows, NextStep, Motif, and other GUI-based desktop computers are readily understood abstractions of programs and files that exist as bits on your computer's hard drive and in your computer's memory.

Today, computer graphics are bringing the power of abstraction to bear on many problems beyond the operation of your personal computer. Research scientists use sophisticated graphics to visualize both the small and the large. The former is best represented by the use of computer graphics in molecular modeling. (The days when a Watson and Crick would have to rely on hand-built metal models to test their theories are gone forever.) The latter recently made headlines when scientists used computer graphics to discover that the Andromeda Galaxy (M31) has a double nucleus, a finding that theoretical astrophysicists may take a while explaining.

Computer graphics are having an enormous impact beyond GUIs and the rarefied worlds of molecular biology and theoretical physics. They are used to simulate environments as diverse as the core of a nuclear reactor, the cockpit of a high-performance fighter, the interior of your next house, or the inhabitants of a Jurassic-era grassland. Increasingly, they are also being

used as a substitute for air and ground transportation by bringing people together via videoconferencing rather than in person. The technologies behind graphics advances—from faster GUIs to the creation of realistic 3-D simulations—range from new data pathways on desktop machines to multigigaFLOP dedicated processors on Unix workstations. Fortunately, they all have one goal: to make ever-more powerful computer-generated abstractions that make our jobs and lives a little easier.

Taking the Fast Path

For desktop computer users, the most important advance in computer graphics has been local-bus video. Local bus describes a fast pathway between a processor and a peripheral such as a video card, especially when coupled with the new breed of video adapters that accelerate GUI operations in hardware (see "Inside Windows Accelerators" on page 229).

The first local-bus implementations were developed to service graphics data. They were also proprietary; your system came with whatever local-bus graphics capabilities that manufacturers (e.g., Dell) put on the motherboard. By 1991, however, the industry came to realize the importance of adopting a standard for local buses that would let you both upgrade your graphics and let other peripherals such as drive controllers take advantage of the speed of the local-bus interconnect. Of course, instead of adopting a single standard, the industry has adopted two.

The VESA standard local bus, published by the Video Electronics Standards Association, is an adaptation of the 486's own bus structure. It is the most popular local-bus choice of PC-compatible computer makers. Intel's PCI (Peripheral Component Interconnect) local bus also supports high-speed graphics applications, along with other types of direct CPU-to-periph-

eral operations.

Both the original VESA and PCI specifications described 32-bit buses (see "Fast Transit," October 1992 BYTE), but both have raised the ante to coincide with the introduction of the next generation of processors with 64-bit processors, which include the Intel Pentium, the DEC Alpha, and the Mips R4000. As these processors are destined to run today's graphics-intensive operating systems, superior graphics performance is going to be essential.

At a resolution of 640 by 480 pixels and 24-bit color, a single screen goes through over 7 million bits per iteration. This is obviously well beyond the capabilities of either the ISA or EISA bus, and, indeed, it starts to strain the 32-bit bus implementations. But both the 64-bit VESA and PCI 2.0 offer theoretical performance of up to 250 MBps, sufficient bandwidth for just about anything in the foreseeable future.

The VESA-64 specification is the second generation of local bus to come from the 170 voting members of VESA. With the 64-bit implementation, VL-Bus now stands ready for the next generation of Intel processors. Perhaps the only limiting factor on VL-Bus is that it is really ready only for Pentium, as opposed to other processor options that are encroaching on the previously "Intel-only" PC market.

Because the original VL-Bus design closely followed the 486's own bus design, it was a relatively easy design specification to integrate into the PC. VL-Bus is a true local bus, directly connected to the processor. This offers both advantages and disadvantages.

The two most significant advantages are that first, because VL-Bus is directly connected, transfers are not subject to a great deal of address-decoding and bus-timing overhead. Applications that generally use several small transfers, rather than extended bursts, tend to perform better on

The Power of Graphics

Advanced graphics add new dimensions for desktop systems **206**

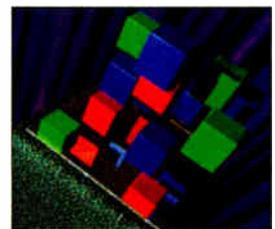

Three Ways to 3-D

The technology of 3-D is out of this world **215**

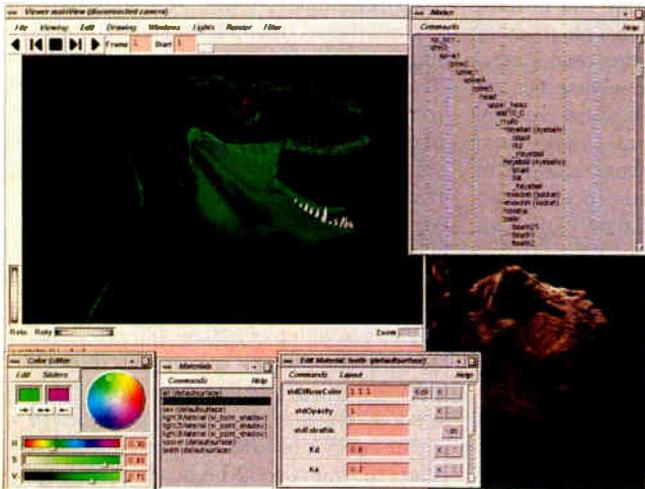

Inside Windows Accelerators

Getting your GUI to dance is a complex matter **229**

State of the Art The Power of Graphics

Computer graphics let you see what usually can't be seen. Sophisticated modeling programs and interactive 3-D graphics give us the best view we will ever have of Tyrannosaurus rex and other out-of-reach phenomena such as subatomic particles and quasars. (Courtesy of Silicon Graphics, Inc.)

VL-Bus than on PCI.

Second, the mechanical specification of VL-Bus calls for an in-line bus connector. This means that cards can be produced that take advantage of both the local bus and the slower system I/O bus. This results in lower overall system costs, because more functions can be integrated onto a single expansion card.

The obvious disadvantage is that to run VL-Bus in non-Intel-compatible systems, it must be bridged, which negates the advantages. Nonetheless, you can use VL-Bus with an R4000 or an Alpha, but no one seems to be jumping at the possibility. Another disadvantage is that the 486 local bus was never designed to drive a lot of devices, so the number of slots available to VL-Bus will always be small, without a bridge in place.

Unlike VL-Bus, PCI was designed to be relatively independent of processor type and, in fact, will be integrated into the second generation of DEC Alpha chips, due sometime in the fourth quarter of this year. (Considering the availability of the first generation of Alpha processors, expect the second generation later rather than sooner.) PCI is a mezzanine bus, rather than a true local bus, and it has to be bridged to any processor, including Intel's own.

Because of translation issues, the bridge takes its toll in performance, but in burst transfers, PCI can deliver approximately the same throughput as VL-Bus. The dividend a bridged bus provides is independence for (and from) the CPU. With PCI, the CPU (or multiple CPUs) can be work-

ing in the background as PCI bus masters use the PCI bus for their own purposes.

Both VESA-64 and PCI 2.0 use multiplexed address and data lines to transmit 64 data bits. VESA-64 is still an in-line connector with respect to the I/O bus, while PCI's connector is positioned parallel to the I/O connectors. The result is that PCI boards will not be able to take advantage of standard I/O functions concurrently with local-bus activities,

which means higher overall system costs.

One primary advantage of PCI is its automatic configuration feature. With VL-Bus, add-in cards are transparent to the operating system and software, unless the software is looking for a specific function, which can result in incompatibilities. With PCI, in a similar fashion to EISA, the system looks at the bus and identifies the cards installed, transparently with respect to the user. This allows for optimization by the system and increased performance in certain functions.

These features come at a cost, however. Implementing PCI in the first place is more expensive than VL-Bus, and expansion cards will also probably cost somewhat more. Between the cost, design, complexity, and adaptability issues, it looks as though the low-to-medium range of system vendors will adopt VL-Bus, while PCI will probably dominate the medium-to-high range of platforms.

Real-World Images

Technologies such as local-bus video are useful for much more than GUI accelera-

tion. In conjunction with new classes of video hardware, they are bringing real-world graphics, in the form of still images and motion video, to the desktop.

One of the linchpin technologies that is making digital manipulation of real-world images viable for desktop machines is digital signal processing. In many cases, a DSP (digital signal processor) is better suited than general-purpose processors to the types of operations that graphics images demand. Specifically, DSPs are designed to accelerate the multiply/add operations that are the heart of many image-processing operations.

Major firms such as Intel, Microsoft, Texas Instruments, IBM, Compaq, and Dell are in the process of migrating DSP technology to desktop computers. Apple is already shipping its new Mac AV series with their built-in DSPs. Applications running on a Mac AV can use the DSP to process video and other types of real-world information.

One company active in bringing DSPs to the desktop is Analog Devices. As part of its Signal Computing initiative, Analog Devices has developed SCOPE, the Signal Computing Operating Environment. In essence, SCOPE provides an API and a hardware abstraction layer, or HAL, that allows applications developers to get at the power of a DSP without having to deal with its internal complexity. The API offers a standard interface that programmers

can use to call the services of hardware, without regard for the actual hardware type. HAL provides access to the actual signal-processing hardware, which powers the application.

Because the DSP is a secondary processor, SCOPE includes HALs

for both the CPU and the DSP to enable program developers to take advantage of both processors. The focus of SCOPE is the adoption of an open standard of development for applications. SCOPE supports both the Microsoft and OSI (Open Systems Interconnection) communications models so that standard Windows appli-

DSP vs. CPU

DSPs are specialized processors, while CPUs are more general. You wouldn't want to run Word for Windows on DSPs, but for image manipulation, they are ideal.

DSP

- accumulator-based architecture
- programmer-accessible caches
- dual data buses
- optimized for multiply
- accumulate operations

CPU

- register-based architecture
- transparent caches
- single data bus
- general-purpose instruction set

State of the Art The Power of Graphics

cations can take advantage of the power of programmable DSPs.

Giga Operations uses SCOPE for its low-cost, parallel DSP board for desktop computer systems. Giga Operations' G-200 and G-800 boards use Analog Devices' 2105 DSPs, together with 1 MB of DRAM and a Xilinx PGA (Programmable Gate Array) in a single surface-mount module called Scalable Intelligent Image Module, or SIIMOD. Giga Operations is targeting the image-processing market. With the programmable SIIMODs, the G-200 can deliver a performance of up to 200 MIPS for video-effects applications—10 to 30 times the performance available from other conventional accelerators in dedicated systems—and at significantly lower costs. As a bonus, because of the programmable nature of DSPs, in general, and of SIIMODs, in particular, the G-200 and G-800 are adaptable to a wide variety of applications other than image processing.

The Codec Question

Perhaps the fastest-moving area of computer graphics today is full-motion video. From interactive CD-ROMs to videoconferencing, full-motion video promises to be one of the most important data types of the 1990s.

At TV resolutions and frame rates, full-motion video requires an enormous amount of storage and transmission bandwidth—far beyond the capabilities of present or near-future storage and communications technologies. Because of the demands it places on a system, video data must be compressed before you can use it as a data type on a computer system or a network.

The job of compression falls to the video codec. Video codecs use several different technologies to remove redundancy from video signals to make the individual frames more digestible and then to reconstruct the frames for playback. Thus, they are pivotal in bringing full-motion video to the desktop. The problem isn't that good codecs don't exist, but that too many do.

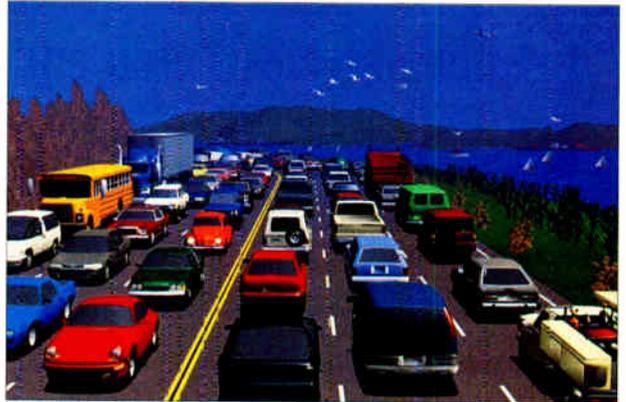

Take, for example, Microsoft's Video for Windows, which incorporates

three different codecs that can either be implemented in hardware or software. Video for Windows is also extensible so that you can add still other codecs to your system.

The reason several codecs exist is that different video applications have various resolution and frame-rate requirements. Some applications just need SIF (Source Input Format) resolutions (360 by 240 pixels) while others require broadcast-quality CCIR 601, the 720- by 480-pixel digital studio standard. Often, the codec used depends on the capabilities of the hardware system.

For example, interactive CD-ROM applications are limited by the 1.5-Mbps data transfer rate of CD-ROM players. To provide full-motion video from such devices, you must sacrifice frame rate or resolution, or both. Companies like Philips and 3DO adopted the codec standard MPEG 1 for CD-ROM playback. MPEG 1 provides SIF resolution at CD-ROM playback rates.

MPEG 2 is designed to handle applications (e.g., video on CD) that need higher-quality playback. MPEG 2 supports CCIR

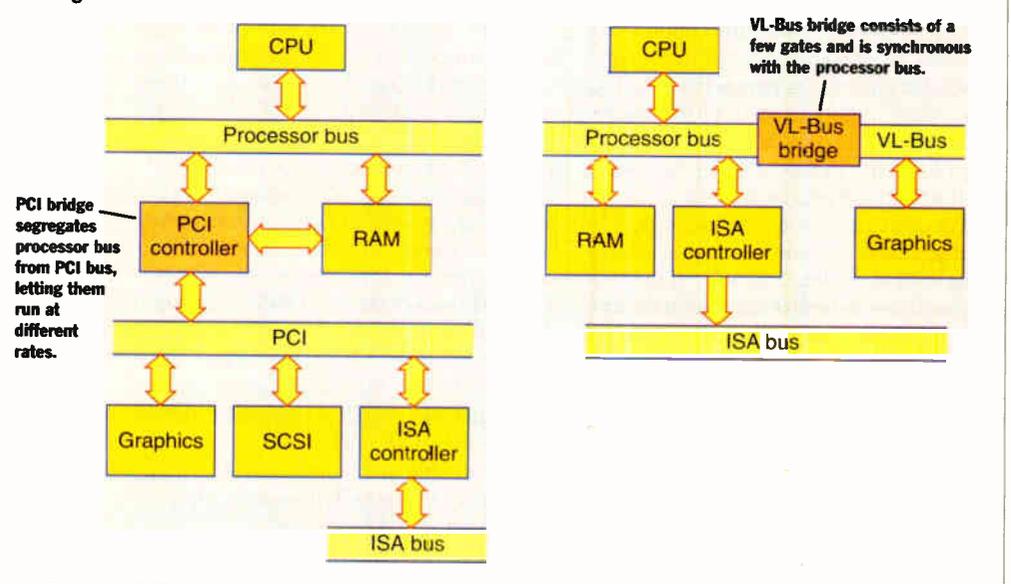

Perhaps the most important role for computer graphics is in modeling the mundane. Real-time 3-D animations are being used to investigate subjects as diverse as traffic congestion and architectural visualization. (Courtesy of Sun Microsystems Computer Corp.)

601 resolutions, but it requires transmission rates above 4 Mbps, as opposed to the 1 to 3 Mbps that MPEG 1 requires. It also requires a lot more processing time to encode the source video signal.

Some codecs can adapt to different environments. For example, Intel's Indeo runs on 386 and compatible platforms. Indeo is adaptive in the sense that the software recognizes the basic capabilities of the underlying hardware, which may be a simple 386 or Intel's 750 video coprocessor, and adjusts the playback to the size, definition, and frame rate to which the hardware is best suited.

continued

Clocking the Buses

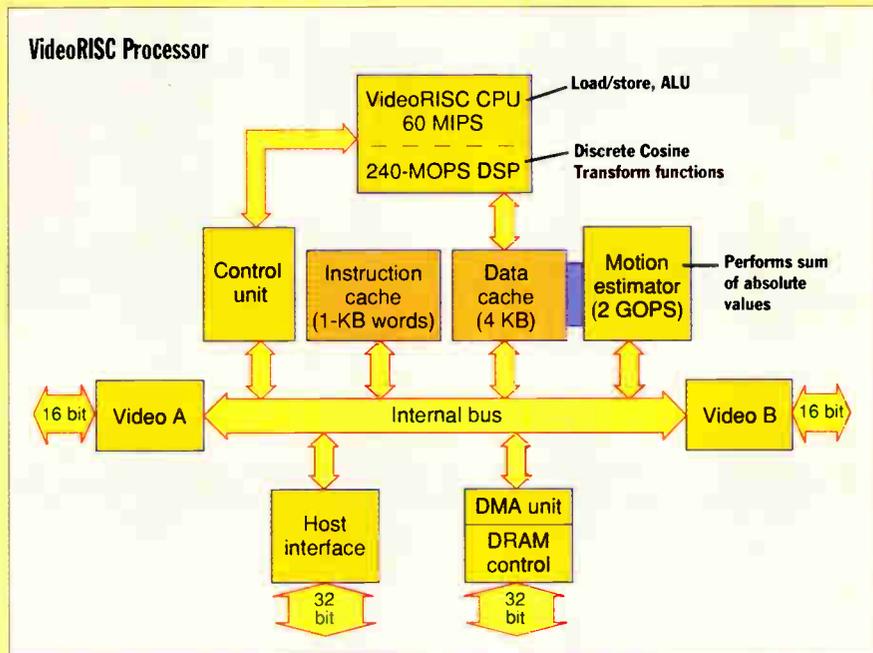

VL-Bus requires a simple bridge to the processor bus, allowing it to run synchronously with the processor. PCI has a complicated bridge and runs asynchronously.

C-Cube Marries Video and RISC

C-Cube Microsystems plans to bring silicon to bear to all types of full-motion video applications through its VCA (VideoRISC Compression Architecture). The core of VCA is the VideoRISC compression processor, which can handle many different compression algorithms.

The VideoRISC processor contains 1.2 million transistors on a 225-square-millimeter die. It consists of a number of functional units including a five-stage processing pipeline optimized for real-time video applications, a DSP unit for performing functions such as DCT (Discrete Cosine Transform), and a motion estimator that can perform up to 2 billion operations per second. These operations help determine differences in one frame from the previous or following frames.

In addition to being programmable, which allows the VideoRISC processor to handle different codec standards, such as JPEG, MPEG 1 and 2, and H.261, it is also scalable. For example, you can use eight processors in parallel to encode NTSC video signals in real time, using the MPEG 2 codec. Two processors will suffice to encode using MPEG 1 in real time. In the future, C-Cube plans to produce both high-quality and low-cost versions for videoconferencing markets using H.261.

The functional units of the VideoRISC processor are designed to perform the types of computations required by compression and decompression algorithms.

Videoconferencing

A bigger challenge than full-motion video from a CD-ROM is videoconferencing. The added complexity comes from the fact that video signals used in videoconferencing must be encoded in real time; you don't have the luxury of encoding them off-line for later playback.

Also, because videoconferencing is a communications technology, standards become critical. Videoconferencing requires protocols for establishing and maintaining a connection, as well as agreement on the codec to be used at each end of the connection.

The most widespread videoconferencing standards are promulgated by the CCITT. The codec standard is designated H.261 (also known as Px64). The H.261 codec supports two resolutions, the 352- by 288-pixel CIF (Common Intermediate Format) resolution and 176- by 144-pixel QCIF (Quarter CIF). Other CCITT standards define the protocols for setting up and main-

taining a videoconference connection.

Many companies are also promoting their own codecs for videoconferencing (e.g., Captain Crunch from Media Vision and Cinpac from SuperMac Technology). Other companies are developing general-purpose hardware capable of handling different codecs. Some of these hardware solutions are based on DSPs, while others are more tightly focused on compression and decompression (see the text box "C-Cube Marries Video and RISC"). AT&T Microelectronics, for example, is bringing to market the AVP-1000 Video Codec chip set, which will handle many important digital video codecs, including MPEG and H.261. The AVP-1000 is not fully programmable, but it does provide a higher degree of flexibility than a single-purpose, hard-wired processor.

Tomorrow's Graphics

At their most sophisticated, computer graphics can pull entire worlds out of the

ether or at least out of a database of polygon descriptions. In the past, sophisticated, real-time 3-D graphics was the province of supercomputers. Today, you find it in high-end workstations from companies such as Silicon Graphics (see "Three Ways to 3-D" on page 215). The trend here is clear.

In the future, real-time 3-D and videoconferencing capabilities will be available at a reasonable price to anyone who needs them. Your desktop computer will become your primary means of communication, as well as an invaluable tool for exploring a class of what-if possibilities beyond the ken of today's spreadsheets. Computer graphics technology will provide you with unparalleled access to complex data, objects, and entire systems. ■

John Bryan is a freelance writer and consultant. You can reach him on BIX c/o "editors" or on the Internet at editors@bix.com. Bob Ryan is a BYTE technical editor. You can reach him on BIX as "bryan" or on the Internet at b.ryan@bix.com.

POOR OLD MOUSE.

Come and see us at COMDEX,
Las Vegas (Nov 15-19, 93)
— South Annex Pavilion, Booth A 1930 —
and bring your old mouse too!

Most of the time all mice are nice and fine for pointing around. But when it comes to inputting graphics or logos into any application or any CAD package, they are hopeless. They just can't — and so you can't. No way.

Problem? Yes and no. It depends — you may shrug your shoulders and say "Well, I'll never do CAD and I just never want to input any sketches, logos, or photos into my computer anyway." Or — you feel that isn't good enough after all the money you have invested and all the nice things you know you could do today with your own graphics once they were in the computer.

PROBLEM SOLVED.

Here comes the mouse that lets you input all your graphics as well. How?: That's what they all want to know, but we're not telling. It's a new invention. It's a universal combination of a true mouse and an independent manual drawing board that becomes a precision full-featured digitizer tablet once you just place the mouse onto the board. It's all in one or all separate as required. Simply unplug your poor old mouse, plug in our mouse and have the real all purpose input device to your PC always at hand. At a price poor mice can afford too.

MULTIMEDIA ACCELERATION

Software Safety Net

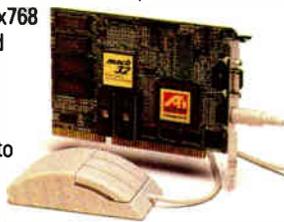

Software driver support shouldn't have to be a giant leap of faith... but without it, an accelerator is just an expensive VGA card. ATI gives you the best driver selection with the full security of 8514/A-compatible acceleration, plus up-to-the-minute ATI drivers for all major applications, including 32-bit environments, like OS/2 2.1 and Windows NT.¹

Don't Fall Behind

ATI helps you stay on the leading edge, without going over the brink financially. Our new upgrade plan² lets you move up to the latest hardware... at a fraction of the regular price.

GRAPHICS ULTRA+

- ▶ True color at 800x600 and 65,000 colors at 1024x768
- ▶ Non-interlaced 1280x1024 in 256 colors
- ▶ Flicker-free Windows, up to 76Hz refresh rate
- ▶ 2.0MB memory
- ▶ Fast DOS and graphics performance
- ▶ Enhances and accelerates Video for Windows
- ▶ **\$299.00³**

GRAPHICS ULTRA PRO adds

- ▶ VRAM for better performance at higher refresh and greater colors
- ▶ Non-interlaced 1280x1024 graphics at 74Hz refresh
- ▶ ISA⁴, or VL-BUS
- ▶ **\$499.00³**
- ▶ EISA or Micro Channel **\$549.00³**

THREE WAYS TO 3-D

All types of computer simulations from data analysis to virtual reality require 3-D graphics-rendering hardware that can create complex images in real time

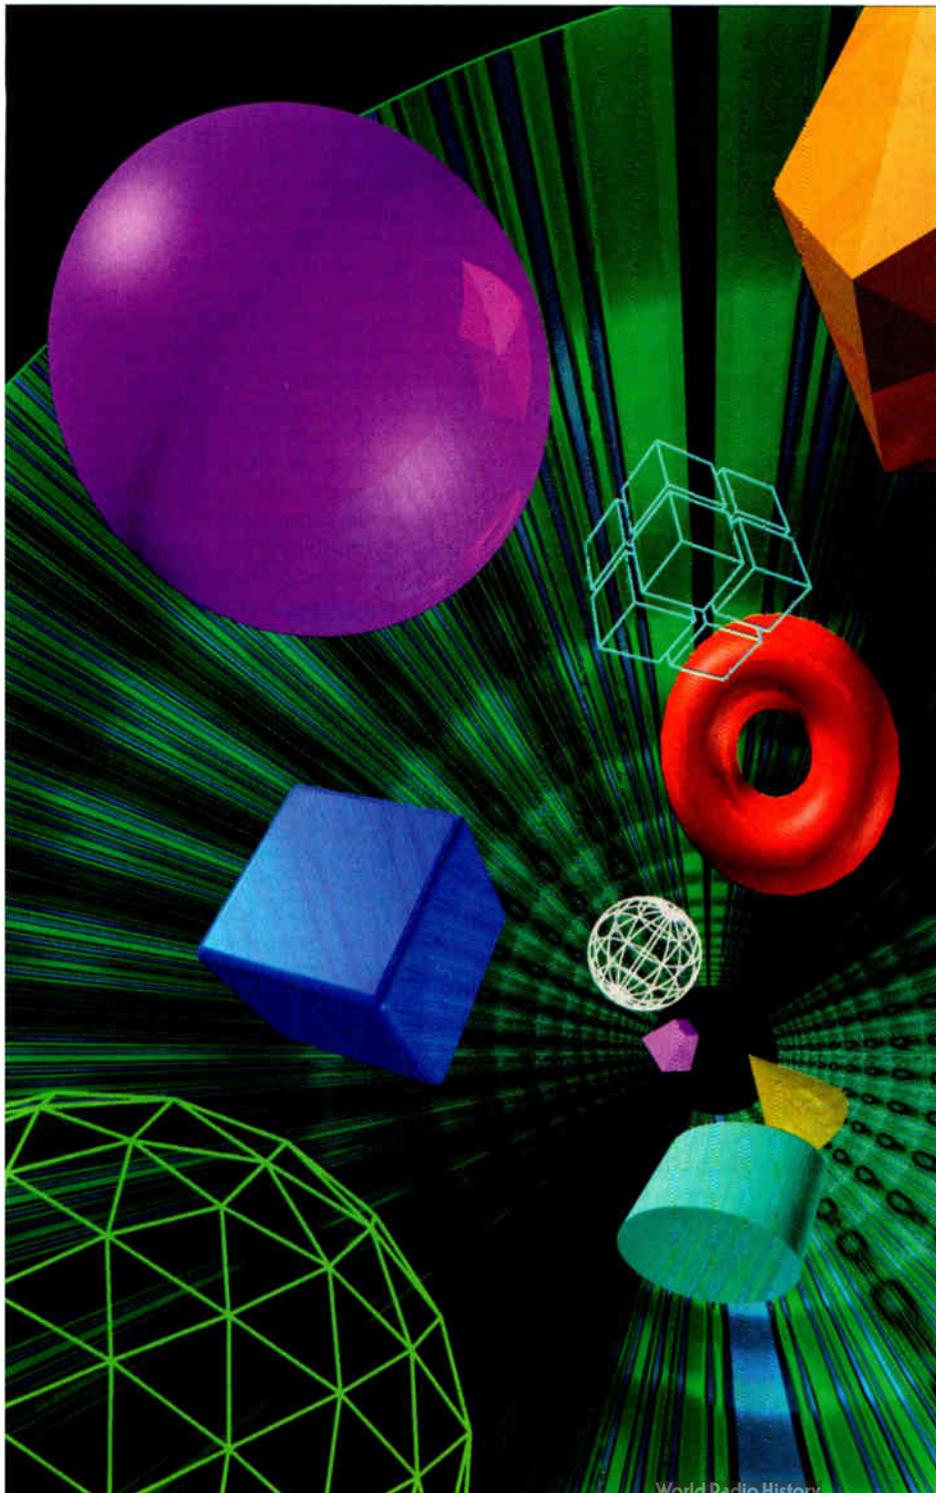

Like most computer-related technologies that capture the imagination of the general public, virtual reality has been hyped to the point of overkill. Nevertheless, the usefulness and economy of a technology that lets you explore the dynamics of an object or system built from polygon descriptions rather than from plastic and steel are beyond question. Once you understand the complexity of the many pieces that make up a virtual-reality system, you can better separate the hype from the reality of this interesting technology.

A flight simulator is the best-known example of such a system, where what you see on your screen changes in response to how you manipulate the controls of your virtual aircraft. The more the visual image created by the simulation resembles what you would see from the cockpit of a real aircraft, the better the simulation will succeed in conveying the experience of flying an airplane—without the risk of you crashing a multimillion-dollar machine, which would have nasty consequences for both you and the aircraft.

Behind the Scenes

The representation of virtual worlds—whether they reflect the fantastic or the mundane—presents great challenges to the designers of virtual-reality systems. By far the most common method used to represent such a world is as a collection of objects. These objects are programmed to react in a realistic way to the inputs you supply the system. To complete the feedback needed for a successful simulation, however, the system must also be able to visually represent the state of these objects in real time.

Thus, the heart of any virtual-reality system, or any computer-based simulation, is the graphics hardware that creates the images you view when you use the system. A successful system can create images so compelling that you will be hard

DIGITAL ART © 1993

pressed to distinguish the real from the virtual.

Consider the work that a graphics subsystem has to do to animate 3-D objects. Working from a database that describes the objects, their position in a coordinate space, and their color and texture properties, the graphics subsystem has to create a bit-map representation of the objects, based on the position and orientation of the observer in the scene and the position, color, and intensity of any sources of illumination. For most general-purpose desktop machines, you measure the time it takes to render one frame of such an animation in hours. This is why real-time 3-D animation remains the realm of specialized hardware graphics engines.

Working with 3-D

The following articles describe 3-D graphics engines from Hewlett-Packard, Sun Microsystems, and Silicon Graphics, Inc. These subsystems represent three ways of tackling the problem of generating a visual representation of an object database. They vary because users require different capabilities and have different price sensitivities. In addition, they represent three different philosophies of creating 3-D images.

HP's 3-D graphics concentrates dedicated hardware on the most processing-intensive part of the pipeline used to create the images. By leaving front-end calculations to the system CPU, the HP graphics subsystem scales in performance as you move to better-performing CPUs.

On the other hand, the Sun and SGI systems use dedicated hardware for all aspects of the pipeline. Despite this, the Sun ZX graphics subsystems and the SGI RealityEngine² differ markedly in design and cost, as well as in the markets they address. Sun ZX graphics subsystems are far less expensive than the RealityEngine², thus giving more people access to 3-D graphics.

The SGI RealityEngine² is a masterpiece of hardware engineering. Like all masterpieces, it is expensive. It is designed for those people who need the best available 3-D graphics performance, regardless of cost.

Like all aspects of computing, graphics rendering is getting better, faster, and less expensive all the time. However, from the descriptions that follow, you'll find that it still takes a lot of technology to create the images of virtual worlds. ■

—Bob Ryan

HP TAKES A DUAL APPROACH

HP's graphics technology takes advantage of the ever-increasing power of the PA-RISC architecture. Here's how it works.

NORTON EWART AND LARRY THAYER

The job of a 3-D graphics subsystem is to convert a database describing a physical object into a representation of that object on the screen. This is a compute-intensive task that is rich in floating-point math and features large data sets. A designer's challenge is to implement a subsystem that performs at interactive speeds, all the while staying within a typical user's budget for 3-D graphics hardware.

The special-purpose processor the designer uses to deliver this performance is called a *graphics pipeline*. Among different graphics subsystems, the principal differences lie in the designer's implementation of this pipeline.

The Pipeline Process

Your application both creates the database representing the physical object and provides an interface for interacting with the data. When you call for a 3-D view of the data, with lighted and shaded surfaces, the pipeline goes into action. It uses polygonal primitives (e.g., triangles and quadrilaterals) to represent the geometric form of the data in the application database. In general, processing demand increases as you move from left to right along the pipeline. This fact is important when assessing the trade-offs involved in the various implementations.

We refer to the first stage of a graphics pipeline as the *geometry and color calculation stage*. Often called the *front*

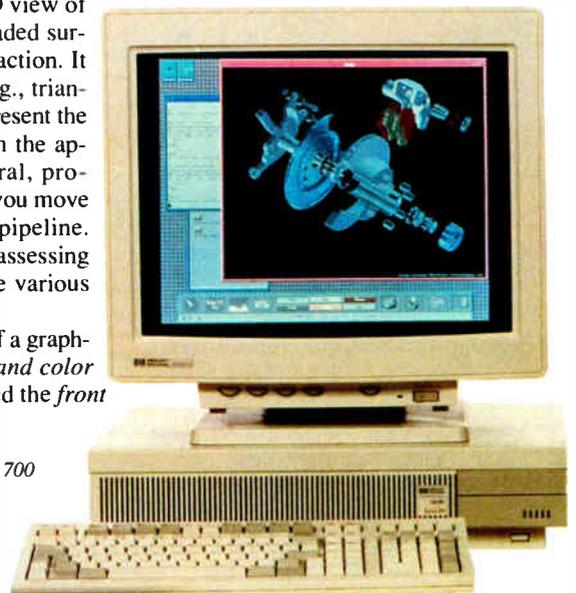

end of the graphics pipeline, this stage is where the primitives representing the physical model are calculated. The types of operations that occur here include rotation and scaling. Once the physical structure has been calculated, the colors are applied, using calculations for diffuse lighting and specular highlighting.

Following the geometry and color calculation stage comes the *rasterization* stage. During rasterization, the polygons are mapped to the pixels on the screen. Rasterization is often called the *back end* of the graphics pipeline. This compute-intensive process consists of three major steps.

Stepping Out

The first step in rasterization is polygon decomposition and edge setup. Here, a polygon's vertices, which are determined during the geometry calculation, are used

The HP graphics philosophy is embodied in this HP/Apollo Series 700 Model 735 workstation. The PA-RISC CPU handles geometry calculations, while the graphics subsystem performs rasterization.

State of the Art Three Ways to 3-D

to calculate the slopes of the polygon's edges. Following this comes edge intersection and span setup. Here, the system determines the intersection of the polygon's edges with physical pixel rows from the vertex and edge slope data. Also calculated in this step is the length of the horizontal pixel rows that span (or fill) the polygon.

The final stage is *pixel generation*. Here, the graphics subsystem uses the Z-buffer data to determine the colors of the individual pixels that make up the display. Using shading calculations, it also determines how color will vary across the horizontal spans of the polygon.

The amount of data that must be manipulated increases dramatically at each step in the graphics pipeline. For example, because several spans per pair of polygon edges typically need to be calculated,

the number of calculations involved in edge intersection and span setup is greater than that for the total process up to that point, including geometry calculation and edge setup. Similarly, there are typically several pixels per span, so the computational requirements of pixel generation are even greater. Because of this, the most cost-effective way to apply dedicated compute-power in a graphics-subsystem design is in the back end, where the complex rasterization process occurs.

Depending on your cost and perfor-

You get the highest graphics performance when you implement the entire pipeline in hardware.

mance goals, a range of possible pipeline implementations exists, from doing it all in software to doing it all in hardware. The lowest-cost and lowest-performing option is the software-only pipeline.

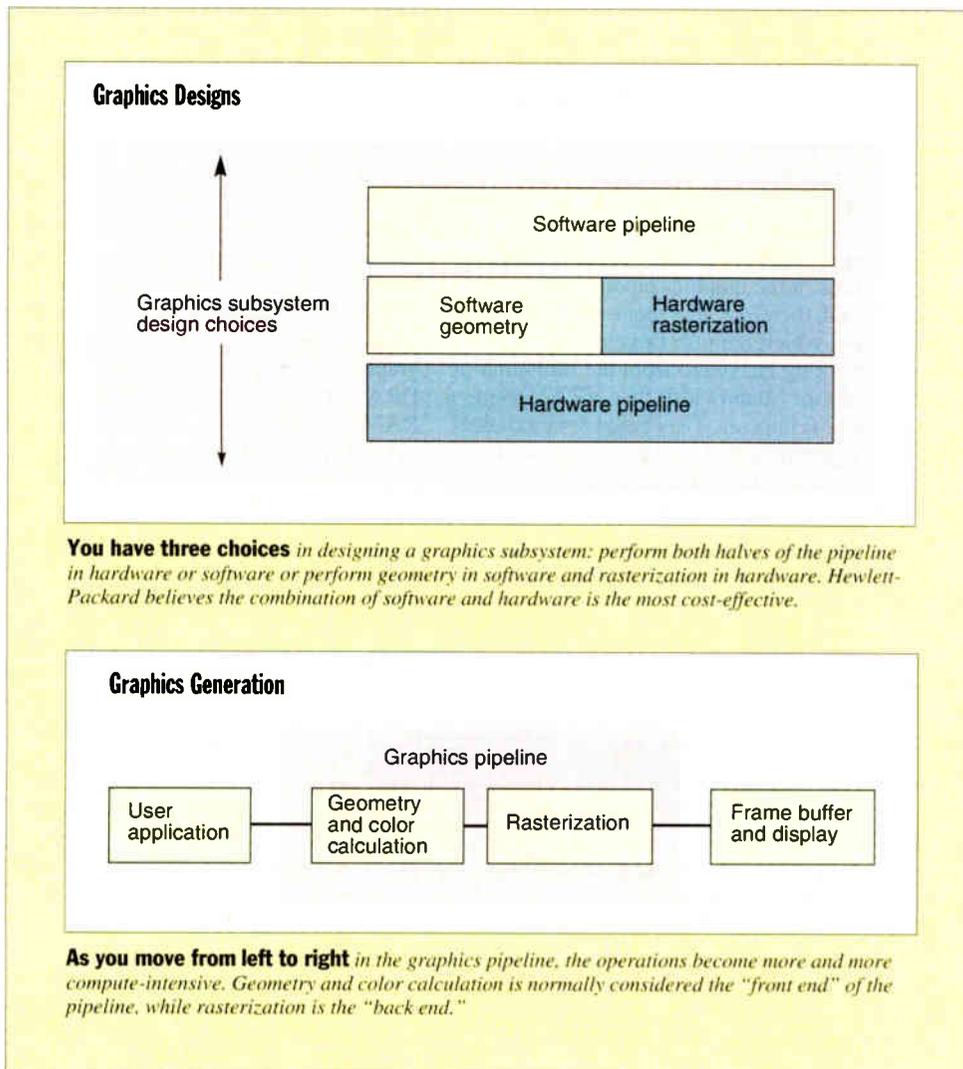

If the pipeline is implemented in software, then the CPU performs the graphics calculations along with the normal cal-

culations involved in running your application. In addition to requiring many compute cycles, the amount of data that needs to be sent between the CPU and the graphics subsystem is very large. This implementation is typically acceptable only on fast CPUs with high I/O bandwidths or with small data sets.

Oftentimes, the architecture of the CPU can make a software-only pipeline an acceptable alternative. For example, Hewlett-Packard includes instructions in the PA-RISC architecture to facilitate the rapid movement of blocks of data from main memory to the frame buffer, resulting in acceptable 3-D modeling performance for many users even on nonaccelerated products such as the HP/Apollo Series 700 Models 715 or 735 with 8-bit plane color graphics all-hardware pipeline.

You get the highest graphics performance when you implement the entire pipeline, from geometry calculation to rasterization, in hardware. All-hardware implementations completely off-load the CPU and use custom, dedicated, high-performance processors to perform all computations in the graphics pipeline. Most graphics subsystems on the market today use this technique, including the DEC PGXT Turbo, the IBM G4x, the Silicon Graphics Elan and Extreme systems, and the Sun Microsystems GT.

Although it provides the best performance, this implementation has several drawbacks: It is

the most expensive option—typically out of the price range of average users. In fact, it is not uncommon for a graphics subsystem using this approach to cost more than the CPU it connects to. Moreover, performance is forever stuck at the level that the dedicated hardware pipeline provides, and it doesn't scale up with advancing CPU performance.

Solomon's Choice

Between the all-software and all-hardware solutions lies the combination of software and hardware. As was mentioned earlier, the computational demands of 3-D graphics increases toward the back end of the pipeline, where rasterization occurs. A graphics subsystem that includes hardware acceleration for the rasterization process significantly reduces the demand on the CPU, as well as the amount of data that must be sent from the CPU to the graphics board. HP uses a hardware/software implementation in its CRX-24Z and CRX-48Z graphics subsystems, available on the HP/Apollo Series 700 Models 715 and 735. The CRX-24Z uses a single-path rasterization engine based on custom VLSI running at 40 MHz. The CRX-48Z provides a dual-path approach running at a faster 62.5-MHz rate, delivering up to eight times the graphics performance of the CRX-24Z in some benchmarks.

Because rasterization is a well-defined and repetitive calculation, it can be implemented with reasonably low-cost hardware. Manufacturers can deliver high-performance graphics subsystems at a low cost by matching the amount of rasterization acceleration to the geometry-handling capabilities of the CPU.

A secondary benefit results from having the CPU process the geometry calculations: Graphics performance scales with increasing CPU performance. This is a valuable side effect in the current environment of exponentially increasing CPU performance.

In summary, the high performance of RISC CPUs has enabled HP designers to combine them with a rasterization engine to get high performance at a reasonable price. And HP's implementation of the pipeline assures that graphics performance will continue to grow as CPU performance grows. ■

Norton Ewart is a product manager for graphics workstations at Hewlett-Packard, and Larry Thayer is an engineer/scientist there. You can reach them on BIX clo "editors."

SUN BREAKS THE BOTTLENECKS

Sun Microsystems uses an all-hardware graphics engine that combines performance with economy

BILL FLEMING

The new Sun Microsystems SparcStation ZX 3-D graphics subsystem is designed to provide advanced graphics rendering for 3-D applications while reducing component and manufacturing costs. These days, few secrets are left when it comes to high-end graphics performance: Bringing affordable 3-D computing to a volume market lies in overcoming bottlenecks in graphics processing and leveraging component technologies via the highest possible level of integration.

The key to building the Sun ZX graphics subsystem lay in pinpointing which portions of the graphics pipeline are scalable (and, therefore, less prone to bottlenecks), and which are not. Developers began by working backward from the limitation of memory bandwidth that VRAM (video RAM) imposes. They based design choices on the idea that by breaking down com-

plex geometry at the beginning state of graphics rendering, you could more effectively define and control the processing burden imposed on the individual FPUs. They got greater performance by providing scalable processing to rendering operations such as edge walking and span interpolation. Finally, they used the timing constraints associated with the cross-connection of multiple drawing processors accessing common VRAM to define the optimum number of drawing processors.

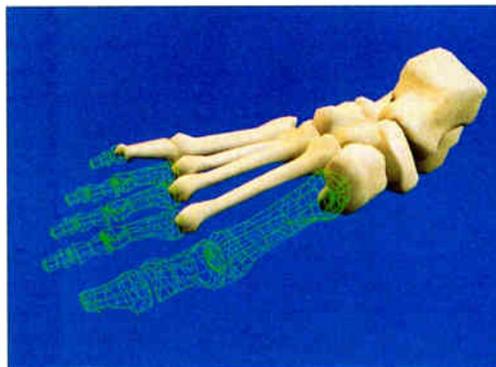

The Sun ZX uses a double-wide SBUS form factor consisting of two boards, stacked vertically to double the available area. In the space allocated for two SBUS cards (approximately 5 by 9 inches), the graphics processor offers 96-bit planes of DRAM/VRAM, associated SRAM (static RAM), a RAMDAC, and four types of custom ASICs (application-specific ICs).

The ASICs substantially reduce the requirement for discrete chips and eliminate glue logic. Higher integration also provides additional size and power reduction.

The Sun ZX is optimized to accelerate the geometry-oriented XGL foundation graphics library, which includes 2-D and 3-D graphics primitive functions to support a wide variety of graphics-based applications. XGL is the foundation interface on which most industry-standard and third-party graphics APIs are built, including OpenGL, PHIGS, HOOPS, PEXLIB, and others.

Inside the ZX

The main elements of the Sun ZX are the command ASIC, four floating-point processors, five drawing processors, and the frame buffer that

An important feature of the Sun SparcStation ZX graphics architecture used to render the photo is its ability to perform dynamic tessellation of NURBS (nonuniform rational B-splines) curves and surfaces. NURBS are concise, yet powerful, representations of simple and complex geometries. From a high-level mathematical description, the graphics system tessellates curved geometry into lines (in the case of curves) or triangles (in the case of surfaces).

When protecting your software against piracy and unauthorized use, make sure that your protection system has all the following qualities:

A GOOD HARDWARE KEY

Hardware-based software protection systems are now the standard worldwide. However, not all keys are the same. A good key should have all the following features:

- ✓ Compatibility and transparency. The key should work without any problem on your customers' computers. The user should be able to forget the key after connecting it.
- ✓ Unbreakable electronics. A customized ASIC (Application Specific Integrated Circuit) component should be integrated in the key. This prevents reverse engineering and makes cracking virtually impossible.
- ✓ A unique and inaccessible software developer's

code burnt into the ASIC. (This code should not be held in the key's memory, where it can be read and altered.)

- ✓ A Read/Write Memory inside the key should be available on demand. The memory should be writable in the field, on any PC, without any special programming equipment.
- ✓ Very low power consumption, enabling the key to work even under the worst power conditions, on PCs and laptops, with or without a printer.

POWERFUL SOFTWARE

- ✓ A Linkable Protection Module with which calls can be made to the key from any point in the protected program.
- ✓ An "Envelope" installation program. Such programs enhance security while making it possible to protect a software even without its source code.
- ✓ Sophisticated antidebugging and encryption mechanisms.

HASP® - The Professional Software Protection System

HASP® OFFERS YOU ALL THESE FEATURES AND MORE:

HASP was designed by a team of computer experts, professional cryptologists, and electrical engineers. As a result, HASP keys are supported by what is probably the best software in the market, and the HASP system has worked on every computer it has been tried on. In addition to all the features mentioned above, HASP provides:

- ✓ A Full Authorization System for protecting dozens of programs using only one key.
- ✓ A Pattern Code Security System (PCS) enabling parallel processing of multiple calls by the Linkable Protection Module.
- ✓ A Virus Detection option that can be incorporated in the protected program to check whether it has been infected by a virus.
- ✓ Several HASP keys can be connected one behind the other. Small physical size ensures maximum convenience for your customers.

NETHASP- THE ULTIMATE SOFTWARE PROTECTION FOR NETWORKS

✓ Only one NetHASP key is needed to run a protected program from many stations in a network. NetHASP provides full support for protecting DOS and WINDOWS software under network environments, including Novell dedicated & non-dedicated servers, Lan Manager, Lantastic, Banyan, DLink, and NET-BIOS based LANs.

WHAT OTHERS ARE SAYING ABOUT US:

In all the products we tested, except the HASP, we could see through the encrypting and questioning procedures... and crack them.

CT Magazine (Germany)

MemoHASP: ...of all the protection devices tested is without any doubt, the one which combines the best features.

PCompatible (Spain)

Trying to crack a program... that was protected utilizing all of HASP's features - is like searching for the Holy Grail.

Micro Systems (France)

PC dongles... come with varying claims as to their transparency. The majority suffer from problems when a printer is connected... the DESkey and HASP-3 are not affected...

Program Now (Britain)

Of all keys tested, HASP is the most ambitious one... the quality of HASP manufacturing seems excellent.

PC Compatible (France)

OPERATING ENVIRONMENTS

PC: DOS, WINDOWS, WINDOWS -NT, OS/2, SCO UNIX, SCO XENIX, INTERACTIVE UNIX, AIX, AUTOCAD, DOS EXTENDERS, LANS
MAC (ADB port): System 6.0.5 and up
NEC (Serial Port): DOS, WINDOWS

AND THE BOTTOM LINE:

We offer some of the most competitive prices in the market. There are no hidden costs! Since 1984, HASP has enabled thousands of software producers in more than 40 countries, including several Fortune 500 companies, to protect their software.

Please call us for our HASP evaluation package.

KEEP PACE WITH THE NEWEST INFORMATION TECHNOLOGIES, YOU NEED PROFESSIONAL HELP

PRESENTING THE FULL LINE OF DATAPRO INFORMATION SERVICES

Downsizing. Wireless. Client-server computing. Multimedia. ATM. Strategic planning and sound business decisions depend upon keeping up with the latest information technologies.

But you probably need a supercomputer to sort through all the publications that end up on your desk. Sure, consultants can help, as long as you're willing to pay as you go.

Isn't it time you turned to Datapro information services?

For over two decades Datapro's unmatched information services have helped users, buyers, and managers of information technology plan effectively. And Datapro has been there every step of the way—from mainframes and dumb terminals, through the PC revolution, to the rise of internetworks.

Today, with its staff of over 400 specialists and more than 100 expert analysts, Datapro has the resources to address virtually every critical issue in computing and communications.

An essential resource for anyone who must evaluate, implement, or manage technology.

Whether you want a quick overview or are looking to build a complete library of research materials, Datapro's comprehensive information technology services can help you make decisions quickly. Charts, tables, and graphs make it a snap to compare product features, functions, and prices. And once your system is up and running, Datapro is there to help you manage and maintain it.

That's why IT professionals use Datapro to stay up to date. Sales and marketing professionals count on us to help them track trends. And vendors turn to Datapro to size up the competition.

Datapro's line of comprehensive information services can meet all your needs.

With Datapro's complete line of information services, you're always in the know no matter what your concerns.

Product and Technology Services

• **First Looks.** Keep tabs on major developments in information technology

• Available on CD-ROM.

Circle 386 on Inquiry Card.

until a complete report is available.

• **User Ratings.** Get beyond the hype and find out which vendors can really deliver on their promises.

• **Technology Concepts.** Stay ahead of the game when it comes to vendor strategies and other vital issues.

• **Market Overviews.** Discover the market's promising vendors and products.

• **Comparison Columns.** The effortless way to make side-by-side appraisals.

• **Competitive Outlooks.** Put products and underlying technology in perspective.

• **Product Reports.** An in-depth look at specs, features and functions, pricing, interoperability, and other issues.

• **Management Reports.** Practical advice from professionals that takes the mystery out of managing information technology.

Business Services

• **Datapro Online.** Tap into three online databases from the office, at home, or even on the road.

• **Reprints.** A cost-efficient way to deliver your product message and verify product features and benefits.

• **Feature Reports.** Cull just what you need from Datapro's database of information services and put a sharp focus on strategic business decisions.

• **Custom Publishing.** Package the latest product information in a convenient, single source tailored to keep sales personnel one step ahead of the competition.

Consulting Services

• **Help Desk.** A telephone inquiry service to help you make the best use of your Datapro information service.

• **Assist On Demand.** Pay only for the

information you need about a specific product, vendor, or technology.

• **Surveys.** Determine the strengths and limitations of your products—and your competitors'—from actual users.

• **On-Call Consulting.** Fast answers to most inquiries within minutes—via phone, fax, or electronic mail.

Educational Services

• **On-Site Seminars.** Custom-tailor a curriculum in any aspect of information technology right where you do business.

• **Computer-Based Training.** Get a grounding in the fundamentals or master advanced topics right on your own PC.

• **Teleconsulting.** Let a conference call between students and instructors address implementation issues that come up in later stages of a project.

International Services

• **Datapro International.** Get up-to-the-minute industry analyses and in-depth evaluations into the hands of professionals whose responsibilities extend beyond the U.S.

Market Research Services

• **Northern Business Information.** A Datapro subsidiary, Northern Business Information is the world's foremost strategic telecom research company.

State of the Art Three Ways to 3-D

holds the image bit map. Together, these form the graphics pipeline of the Sun ZX.

First in the chain is the ZXCommand ASIC, which converts application-generated chained vertex data into a number of isolated drawing primitives. The incoming vertex data, which exists in a variety of numeric formats, contains position data, vertex and facet, normal and color information, edge highlight flags, and chaining information. Normal and color information are represented as 32-bit floating-point numbers. The command processor converts this data into isolated triangle and line commands—all with floating-point

chip then arranges for the result to be sent from the ZXFloat chip to the render section of the pipeline.

The ZXFloat chip converts individual dot, vector, and triangle data from 3-D model coordinates to 3-D world coordinates and then to 3-D device coordinates represented by frame-buffer pixel locations and Z-buffer values. It performs lighting calculations that result in three floating-point values (i.e., RGB) for each vertex. These values are a function of the color and surface properties of the triangle, the color of the lights, and the angle that the light hits the surface. In addition,

through the transformation pipeline.

For 3-D accelerated operations, ZXDraw converts the dot, vector, or triangle parameters calculated by the ZXFloats into pixel operations for the frame buffer. For the vertices, ZXDraw receives various values, such as the slopes of the sides of a triangle, and the corresponding increments for the RGB values. ZXDraw fills in all the intermediate pixels that the vertices outline. ZXDraw is also responsible for raster operations, vector antialiasing, alpha transparency, and Z-buffer algorithms.

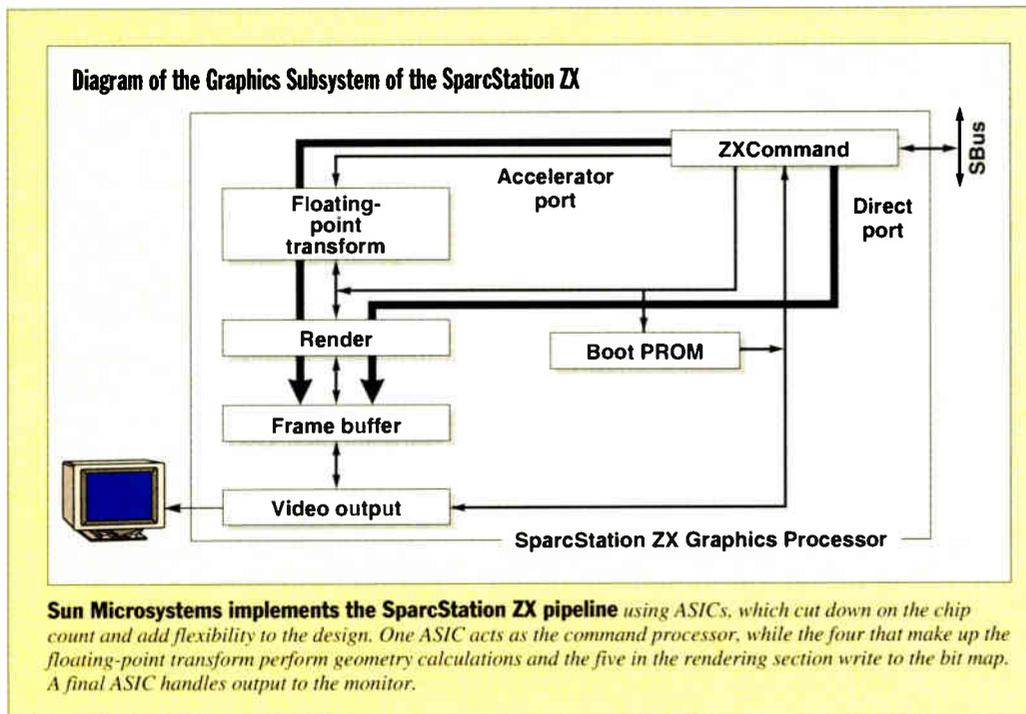

The ZXDraw processors operate on the bit map held in the the Sun ZX frame buffer, which consists of 1280 by 1024 pixels by 96-bit planes. The memory planes are organized as 48-bit image planes, a 24-bit plane Z-buffer, eight overlay planes, 10 window ID planes, and six fast-clear planes.

The 48-bit image planes hold a color value for each pixel to be displayed. The system uses one of two color models: 24-bit RGB true color or 8-bit indexed color. The color model is selected on a per-pixel basis by the window ID planes. In the 24-bit true-color model, two separate 24-bit planes are dedicated to displaying the 16.7-million-color gamut. Each 24-bit plane is divided evenly into 8-bit planes each for the three primary colors: red, green, and blue. The

two frame buffers are referred to as buffer A and buffer B. As the system displays the image in buffer A, the next stage in the image's transition is being drawn in buffer B. When the contents of buffer B are complete, the display is switched from buffer A to buffer B.

The 24-bit Z-buffer stores the depth value for the last pixel written at a given location into the image buffer. Z-buffering enables the system to make visible the portions of an object that are nearer to the viewer and hide the portions that other portions of the object should conceal. This process is called *hidden surface removal*, and a ZXDraw ASIC performs it. The process tests to determine which faces are in front and removes those surfaces that should be hidden.

continued

Sun Microsystems implements the SparcStation ZX pipeline using ASICs, which cut down on the chip count and add flexibility to the design. One ASIC acts as the command processor, while the four that make up the floating-point transform perform geometry calculations and the five in the rendering section write to the bit map. A final ASIC handles output to the monitor.

arguments—before sending it to the floating-point ASICs.

The next section of the pipeline is the floating-point transform. It consists of four custom ZXFloat ASICs, each with its own SRAM. Each ZXFloat is a specialized floating-point processor that is optimized for low-level graphics operations that scale linearly in performance. The SRAM contains microcode used by the ZXFloat chip to perform its specialized operations.

The ZXCommand ASIC accesses each ZXFloat chip to determine if the chip is busy or available. If a ZXFloat is available, the ZXCommand chip sends it a graphics primitive via its accelerator port. The ZXFloat processes the primitive and signals the ZXCommand chip when it has completed processing. The ZXCommand

ZXFloat performs window clipping on the rendered image.

Rendering an Image

The render section of the Sun ZX graphics pipeline consists of five ZXDraw ASICs. Each controls one-fifth of the frame-buffer memory, which is organized into a five-by-one interleave factor. Each ZXDraw processor operates independently; together they can render up to the maximum VRAM bandwidth.

The ZXDraw ASIC has two internal data paths for rendering: accelerated and direct. The accelerated geometry path contains drawing hardware for 3-D images, while the direct path allows access to the frame buffer for windowing systems and applications that do not need to pass

We probably won't live to tell about it. But hey, our data will.

Circle 140 on Inquiry Card (RESELLERS: 141).

The eight overlay planes on the Sun ZX serve as an additional 8-bit indexed color frame buffer. The overlay data can be transparent or solid. Overlay planes provide nondestructive annotation of underlying 8- or 24-bit images. They enable an image (e.g., a mail tool) to be temporarily superimposed over another image without affecting the image underneath; it need not be redrawn when the overlay image is removed.

The six fast-clear planes implement the fast-clear function for three selected double-buffered image windows or for six single-buffered windows. Each fast-clear plane pair can be assigned to clear one double-buffered window at optimized hardware speed. Before the beginning of a new frame, the appropriate fast-clear plane is cleared to all zeros, using a special high-speed clear mode, indicating that the values stored in the image and Z-buffer planes are invalid for a specified window.

Video Output

The last stage of the graphics pipeline is the video-output section, which consists of the ZXCross ASIC and a RAMDAC. The ZXCross ASIC contains the window ID lookup tables and the color lookup tables, along with the programmable video-timing generation and hardware-cursor generation logic. The window ID lookup tables define the window's display properties, such as the color mode, double-buffering, and so on. The color lookup tables are, in essence, color maps, which contain a selection of colors for a particular application. Color lookup tables are used primarily in 8-bit indexed mode.

The ZXCross ASIC performs output pixel multiplexing (buffer and channel selection, pseudocolor lookup, and gamma correction, as required). The system supports many monitor resolutions, ranging from NTSC at 640 by 480 pixels to 1280 by 1024 pixels noninterlaced. The ZX system can also output stereo images that require the use of stereo glasses.

Sun Microsystems believes that the SparcStation ZX graphics subsystem will usher in an era of affordable high-performance 3-D graphics. Perhaps then, high-end graphics systems can finally achieve high volumes, helping users solve many computing problems. ■

DAMN THE TORPEDOES!

Silicon Graphics takes an immediate approach to imaging with its full-speed-ahead RealityEngine²

DOUGLAS VOORHIES

Silicon Graphics, Inc. is focused on graphics technology. All its workstations, from \$5000 personal machines to million-dollar multiprocessing supercomputers, can display dynamic 3-D color images. While the emphasis at the low end is on price and performance, the emphasis at the high end is on raw performance and superior image quality.

Achieving smooth motion (30 to 60 frames per second) while using sophisticated rendering techniques is far more demanding than the more modest rates common in the marketplace. It requires powerful hardware acceleration; in some high-end configurations, the graphics hardware exceeds the cost and complexity of the rest of the system. And it requires that the system and interface be designed from the start to accommodate such accelerators.

Graphics for a Dynamic World

SGI emphasizes its *immediate-mode* approach to the graphics hardware/software interface. To minimize system bandwidth, most systems send a description of the surfaces to be rendered to the graphics subsystem, which redraws them frame by frame as the viewpoint changes. This technique is called *retained-mode* graphics. On the other hand, with immediate mode, the surface description is sent repeatedly, every frame, without retaining the previous surface description in the graphics subsystem. This has the obvious cost of repeatedly sending data that may change infrequently; however, it has two profound and subtle advantages.

First, immediate mode allows applications that display changing information to run as efficiently as those with mostly static information. Immediate mode in-

vites rather than punishes dynamic applications. Second, retained information in a graphics subsystem is essentially a "second database" that duplicates data structures inside the application. When that data changes, the retained data must be edited synchronously. It's a bit like keeping a document in a laser printer and sending editing commands to the printer rather than simply sending the final version in its entirety. Because immediate mode doesn't need to synchronize an application's data structures with data stored in the graphics subsystem, it is far easier to program. Of course, for those of you with static scenes, SGI's OpenGL—a programming interface and library for 3-D graphics applications—supports retained graphics as well.

SGI also goes far beyond displaying static scenes by enriching its workstations with digital media. Adding 3-D graphics to a multimedia presentation can create a crisp and dazzling impression, and video I/O lets you use live images to decorate 3-D surfaces or use them as backgrounds to 3-D scenes. In addition, you can harness the power of the rendering hardware to perform real-time image manipulation on a video stream.

Silicon Reality

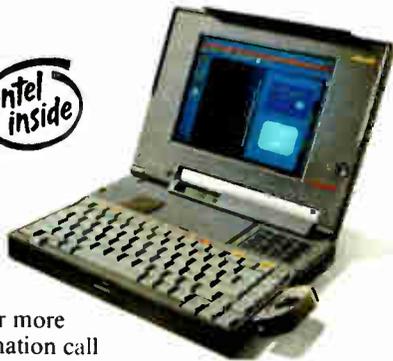

The system that best exemplifies immediate-mode graphics is the RealityEngine². It differs fundamentally from other graphics devices because its primary rendering method combines antialiasing and texture mapping. The result is on-screen images that look uncannily real, with rich surfaces and without jagged edges.

Antialiasing is the process of eliminating the interference between high-frequency edges in the image and the grid of pixels

1-800-387-9660, Ext.220

Today, keeping up with the market means grabbing every opportunity on the run. That's why, whatever you do, wherever you do it, the ideal portable PC for your job is in the Olivetti Philos Portables.

They talk like you: MPC business audio means it's easy to add vocal notes to documents, or send voice mail messages. And you can communicate with the other side of the world by fax, modem or network using the PCMCIA type III slot.

They think like you: up to 32 Mb RAM and up to 240 Mb HDU that is removable for your security, all propelled by the powerful 486SL or 386SL microchip. What's more, it can think in vivid color.

They're smart like you: the PopUp-trackball™ provides a simple and

immediate interface with ready to run Windows 3.1. The pre-installed Lotus Organizer is always on time, and the User Manual is always on line.

They move like you: less than 6.5 lbs. and 8½" x 11" of stylish design you can take everywhere, for up to nine hours of hard work. Plus, it fits neatly into your briefcase together with its unique Slotin™ AC mains adapter. Back in the office, just hook into the optional Quick Desk™ and in seconds you're in touch with your office peripherals.

Even the most complex corporate organizations are rediscovering the power of individuals. With the Philos Portables, you can give your company the best of individual productivity, from the economical Philos 11 to the super-productive Philos 44. Anywhere you want it.

olivetti

State of the Art Three Ways to 3-D

that compose the screen. Just as CDs sample sound at a high 44-kHz rate, anti-aliased rendering samples the colors and shades at several places inside each pixel to ensure that the fine details and abrupt edges are represented as faithfully as the pixel grid allows. The effects of anti-aliasing are most evident in the elimina-

tion of jagged edges.

Texture mapping adds a level of in-direction to 3-D graphics, analogous to pointers and subscripts in conventional programming. Instead of varying colors smoothly across a surface, which produces a chalky appearance, the graphics system paints an image stored in an alternative

memory array on the surface. This image can give the surface the appearance of brick, gravel, or fabric, as well as the reflection of gloss or metal. The surface seems real because the texture is often created photographically. Texture mapping warps the texture photograph onto the surface, squeezing it if the surface is viewed obliquely or shrinking it if the surface is far away. The result is a major improvement in visual realism, although the math required, which is based on projective geometry, is arduous and compute-intensive.

Many other workstations, including earlier models from SGI, can do texture mapping or anti-aliasing, but always with a dramatic speed penalty. The RealityEngine² invests enough hardware and microcode to do both at full speed.

The Design of Reality

Architecturally, the RealityEngine² is fashioned as a short pipeline, with most of the stages being richly parallel. Over a succession of generations, the pipelines in SGI 3-D renderers have gotten shorter and shorter, with the important stages getting wider and wider. Pipelines run at the speed of their slowest stage, whereas independent parallel processors are not so limited.

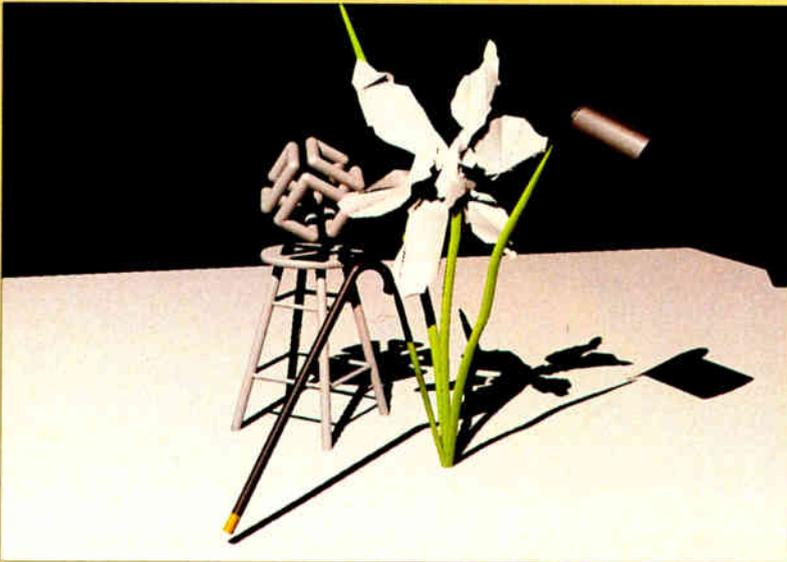

The first stage of the RealityEngine²'s pipeline starts with the command processor, a complex-state machine that parses the incoming drawing primitives, rearranging them as necessary, and divides them up into 12 parallel streams for the next stage. Small commands may be assembled into larger commands, and extremely large commands (e.g., draw a long strip of triangles) may be broken up.

In addition, the command processor manages the drawing state for the second stage in the pipeline, the 12 geometry engines. Infrequent state changes, such as a new transformation matrix, are broadcast to the 12 geometry engines. More common changes, such as a new vertex color, are bundled only with the commands they affect. The result is a reduction in the data flowing to each geometry engine, with each engine being given reasonable units of work.

The 12 geometry engines work independently and in parallel on the data generated by the command processor, performing floating-point math to prepare each primitive polygon for rasterization. Each engine consists of an Intel 860XP RISC processor, a formatting and control

Effects of Texture Mapping

Without

With

Surfaces without texture (top) appear dull and chalky. Although the illumination and occlusion of hidden parts gives a clear 3-D effect, the surfaces appear artificial. Mapping a photographic texture onto the surfaces makes the scene come to life (bottom). The floor looks like wood, and the flowers seem real. Shadows tie each object to its position above the floor.

PC-Xware

NEWT

Accessing a Unix application from your PC no longer means you have to leave the world of Microsoft Windows. That's because NCD has brought its leading X server technology to your PC.

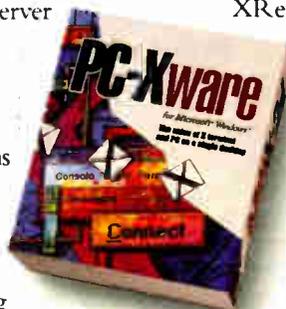

It's called PC-Xware, and it's a Windows application. So it allows you to access both graphical X and character-based Unix applications in the same way you currently access, say, Excel. Or Word. And since the complexity of Unix is masked behind Windows icons, displaying a Unix application on your PC requires nothing more than a point and a click.

What's more, only PC-Xware integrates fast X access with the tools needed to get Windows and Unix not just working together, but complementing one another.

For beyond its powerful PC X server and VT320 emulation, it has a 100% Windows-based TCP/IP stack, plus NCD's XRemote serial protocol.

Which means your PC can access all your hosts and all your applications without the need for extra software. And if you're also after Unix files, PC-Xware even has integrated file transfer and NFS options.

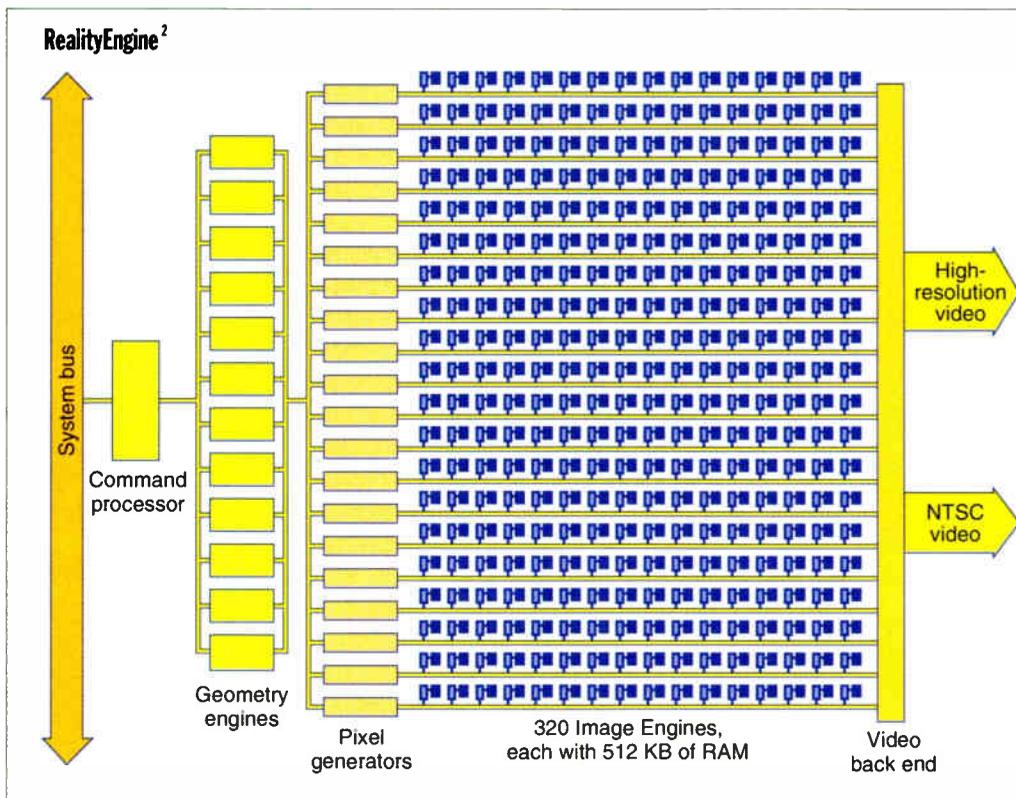

If all this sounds like something you could get friendly with, call NCD today at 1-800-793-7638 and ask for PC-Xware.

Network Computing Devices, Inc. **NCD**

All registered and unregistered trademarks mentioned above are the sole property of their respective owners

State of the Art Three Ways to 3-D

With the processing bandwidth of a supercomputer, the RealityEngine² uses parallelism to achieve real-time texture mapping and antialiasing of 3-D images.

chip, and 2 MB of memory. Together they provide 1.2 GFLOPS of processing bandwidth, the raw calculation power of a supercomputer.

This power is necessary to handle the projective-geometry calculations to transform each graphics primitive (e.g., a triangle or a quadrilateral) onto its screen position and to determine what color each vertex should be, based on the primitive's material, position, and orientation relative to light sources. The geometry engines also set up the iterative calculations performed by the final stage in the pipeline. The engines work in parallel, taking tasks from the command processor in round-robin order. Because bit-map pixels can be looped back through the command processor, the power of the geometry engines can also be used for image processing. For example, a five-by-five convolution of a 1024- by 1024-pixel image takes less than 66 milliseconds.

Creating the Bit Map

The final stage in the pipeline consists of 20 pixel generators, which compute the color and other parameters for each pixel. Each pixel generator has a copy of the 16-MB texture memory (320 MB total).

This 20-way replication allows the RealityEngine² to generate 1 pixel every 2.5 nanoseconds.

The pixel generators step from pixel to pixel, interpolating the color, screen X/Y/Z, distance to the surface, 2-D or 3-D texture address, and other parameters. They also read the texture memory and compute a fog density based on the surface distance. For pixels that the drawn primitive only partly covers, the pixel generators create a mask describing that coverage and adjust the color to reflect the centroid of the overlap.

Texture access is a key role for the pixel generators. Because warping the texture onto a surface involves zooming it up or down by noninteger amounts, the texture pixels must be sampled carefully to avoid texture aliasing.

When viewing a surface in perspective, the texture-index computation involves an onerous division at every screen pixel. Four texture pixels are averaged for *bilinear* sampling, eight are used for *trilinear* sampling, and 16 are needed for *bicubic* sampling. This image warping and resampling power can be harnessed for 2-D image processing, allowing full-screen image zooms and rotates and

warps at 60 Hz. Achieving texture access at the 2.5-ns-per-pixel rate was probably the single greatest technical challenge in the RealityEngine².

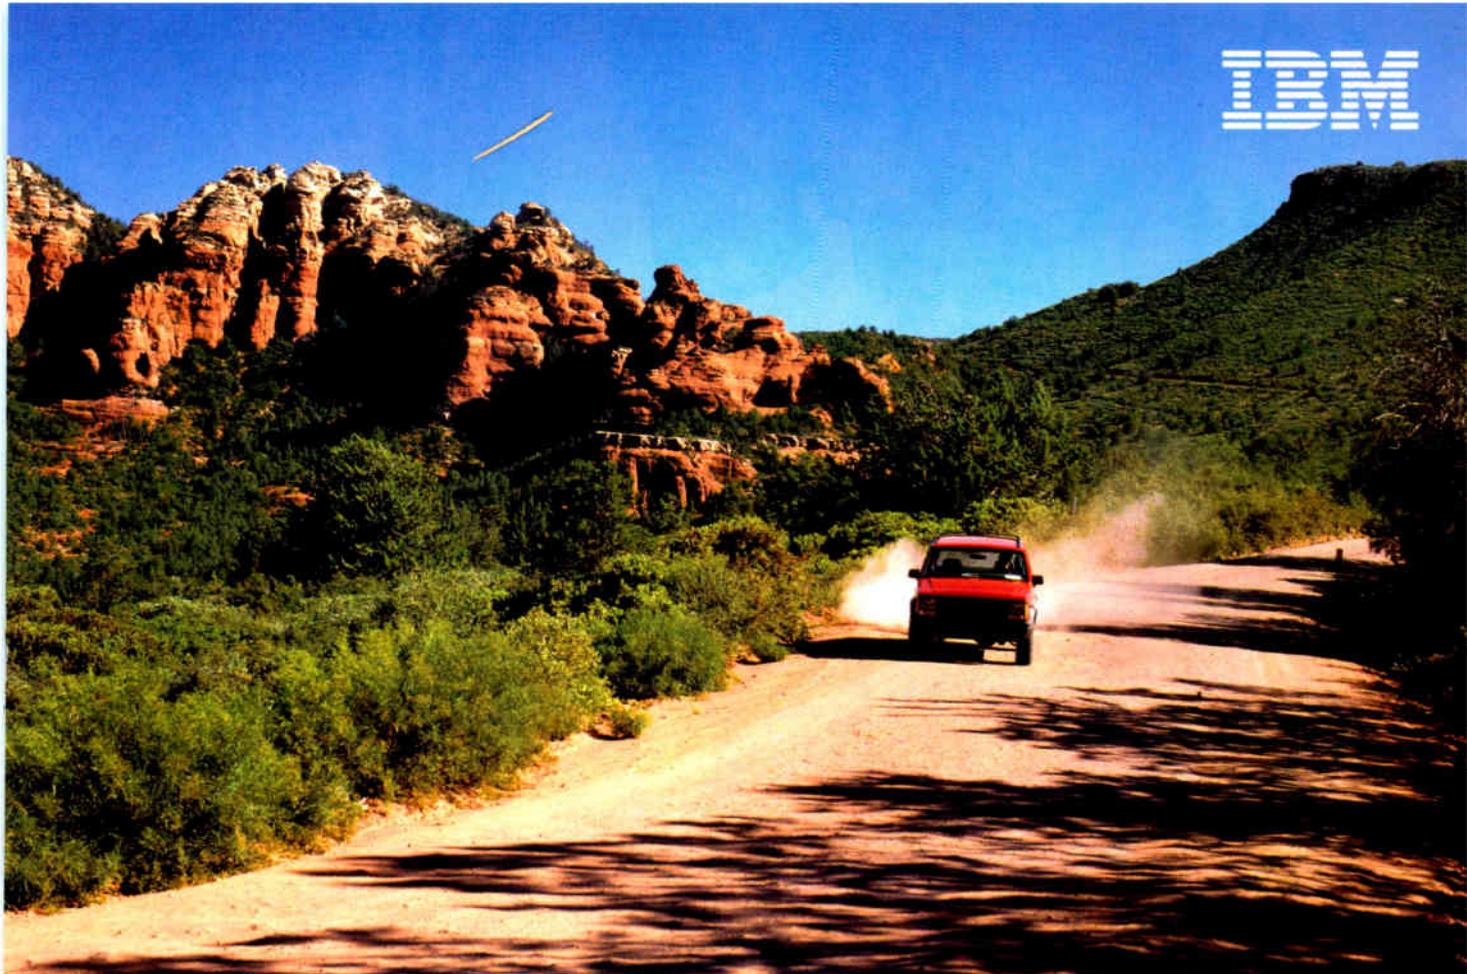

Once the pixels are generated, the Image Engines write them into the bit map. For each relevant subsample of each pixel, the Image Engines determine which surface is in front of the others. The Image Engines then combine the subsamples to produce the pixel color. Storing all the image information—including multiple buffers with 12 bits each of RGB and alpha (i.e., transparency) values, as well as the screen Z coordinates for every subsample—requires up to 1024 bits per pixel. To achieve the 2.5-ns-per-pixel bandwidth, the Image Engines are a parallel array of 320 image processors, each controlling 512 KB of bit-map memory.

The Image Engines also read the pixels in blocks and send them to the video circuitry. After a table lookup, the pixels form the video signal sent to the monitor. At 160 MB, the bit map is large enough and has sufficient access bandwidth to support multiple independent monitors or even HDTV. An extra roving NTSC channel makes it easy to videotape an application running in a window.

The focus on graphics that gives rise to such extreme architectures accounts for SGI's success in applications where graphics performance and visual image quality are paramount. As the performance of computers skyrockets, interacting with them in new ways becomes not only possible but essential. From CAD to molecular modeling to visual simulation and movie production, 3-D graphics is getting less and less arcane and more and more mainstream.

The visceral experience of immersing yourself in a rich visual application is something new. Once you experience it, you never want to go back. ■

Douglas Voorhies works in corporate R&D at Silicon Graphics, Inc. You can reach him on BIX c/o "editors" or on the Internet at voorhies@sgi.com.

There was a time you couldn't expect onsite service if your site was as remote as this.

Jay Pancost
IBM Customer Engineer

To IBM Customer Engineer Jay Pancost, going the extra mile often means exactly that. His service calls take him to homes and offices from the Grand Canyon to the Hopi and Navajo reservations. "When you buy a PC," he says, "the company that made it should be there for you when you need them. I like the idea of a job where people are always glad to

see me, even if they're sometimes surprised I would go so far off the beaten path." Wherever you may be, there are more than 10,000 IBM service representatives like Jay Pancost, in over 1,600 locations nationwide, at your service. Right where you want them.

If you've ever bought computers "direct," we want you to know one important thing.

IBM PC Direct

We're putting the personal in personal computing.

This time, it can be different.

Angela Hardy
PC Consultant
IBM PC Direct

It's as simple as calling Angela Hardy, or any one of our other PC consultants. ValuePoint PCs, ThinkPad® notebooks, peripherals, printers, monitors, add-ons, the most popular software and more (IBM and non-IBM) are all yours — at prices you'll find personally pleasing — when you call 1 800 IBM-2YOU. You'll speak to a PC consultant who'll either answer any question you have, or get you in touch fast with an expert who can. If you don't see it here, it's in our free catalog. And if it's not in the catalog, we can probably get it for you anyway. Either way...call!

This time you can have it all.

Save space inside your multimedia PC!

The Mwave™ Windsurfer™ Communications Adapter is the complete small business/home office solution! It's a data/fax modem, a telephone answering machine, a CD-quality sound system and MIDI synthesizer...all in one! Included are a V.32 Data Modem, 9600bps Fax/Modem, IBM PhoneFX™ for Windows, Mwave MIDI synthesizer with MIDI port, Trio DataFAX LITE for Windows...and more.

Mwave Windsurfer Communications Adapter (92F4057) \$349

Improve your communications and connectivity!

Whether you need to communicate with outside customers, satellite offices or the person next door, we offer a range of options for keeping you connected.

Boca Research™ 144/144 Data/Fax Modem, including FaxWorks™ (MM28202) \$175
 10Base-T ISA Ethernet® Adapter (60G0605) . . . \$125
 10Base-2 ISA Ethernet Adapter (60G0615) . . . \$139
 IBM Token-Ring 16/4 AT Bus Adapter (25F7367) \$490

Super prices on popular software!

IBM PC Direct has the popular software you want, at prices you'll love. Remember, if you don't see it here, or in our catalogs, call us. Chances are we can get it for you fast!

WinFax™ Pro (MM3632) \$79
 STACKER® (MM29205) \$95
 Quicken™ for Windows 2.0 (MM45870) \$45
 WordPerfect® for Windows 5.2 3.5" (MM77919) \$305
 5.25" (MM80915) \$305

Boost your processing performance.

Here's a super way to boost system performance without buying a new system. Our 256KB L2 Write Back Cache Memory Kit, Video Memory Upgrade Kits and Intel OverDrive Processor make it easy to upgrade your ValuePoint system. And we now offer L2 Cache Memory Kits for the ValuePoint Si, too!

256KB L2 Write Back Cache Memory Kit (60G1626) \$249
 256KB L2 Write Thru Cache Memory Kit (60G1625) \$229
 128KB L2 Write Thru Cache Memory Kit (60G1624) \$119
 1MB Video Memory Upgrade Kit (60G1623) \$89
 New! 256KB L2 Cache Memory Kit (73G3129) . . . \$60
 New! 128KB L2 Cache Memory Kit (73G3128) . . . \$90
 New! 512KB Video Memory Upgrade Kit (73G3127) \$42
 New! 1MB Video Memory Upgrade Kit (73G3134) \$119
 Intel OverDrive Processor 486DX25 (MM99983) \$469

Give your PC gigantic storage capacity!

There are more options than ever for upgrading your current system. Replace your hard drive to keep up with tomorrow's demands, or add an additional diskette drive for increased flexibility...the choice is yours!

IBM 5.25" Internal, 1.2MB diskette drive (32G3947) \$99
 340MB AT IDE Hard Drive (32G4195) \$719
 527MB AT IDE Hard Drive (32G4196) \$1079

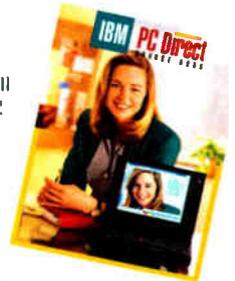

The easy, affordable way to go to a speedy CD-ROM.

The ISA Internal CD-ROM has a fast 300KB/SEC maximum data transfer rate — double the speed of most CD-ROM drives! You can load your operating system and applications software from a typical 600MB CD-ROM disk. You save precious hard drive space and load onto your ISA system faster. It's priced to move fast too!

IBM ISA Internal CD-ROM Drive (32G2961) . . . \$315

FREE!

The IBM PC Direct™ Source Book, ValuePoint, ThinkPad, peripherals, add-ons, popular software...it's all here and it's all yours for the asking. Call 1 800 IBM-2YOU today!

INSIDE WINDOWS ACCELERATORS

GUI accelerators increase system performance by relieving the CPU of some basic graphics manipulation tasks. Here's how they do it.

PETER WAYNER

When PCs ran DOS only, they provided adequate video performance using video cards tuned for either graphics or text output. Today, Microsoft Windows is placing great strains on PC hardware because it forces a machine to employ graphics for all output—text as well as icons and windows. This load can bog down even the fastest 486.

Fortunately, a class of video adapters has emerged that can directly handle many of the screen manipulation chores that the CPU formerly performed. These GUI accelerators are essential if you want a fast graphical interface.

The additional demands of a graphical interface like Microsoft Windows are daunting. Every time you open a window, the system must draw its contents on the screen. The same thing happens when you pull down a menu. Whenever you open a window with a resolution of 200 by 200 pixels, your system must manipulate over 40,000 pixels. If you move the window, your system must change up to 80,000 pixels to reflect the new position.

The old text-style displays (CGA), on the other hand, consisted of a 25-row by 80-column matrix. The video hardware converted ASCII characters directly into pixels. Drawing an A was as simple as writing a 65 (the ASCII code for A) into the right memory location. Changing an entire screen or drawing a window required no more than 2000 operations where the CPU wrote a value to memory.

Using the older-style display technology, your Windows machine would have to be at least 40 times faster than your text-based DOS machine to generate the same apparent level of performance. This estimate is conservative, too, because I am only comparing the act of moving a 200-by-200-pixel window in a Windows environment to completely redrawing the screen from an old CGA card. This means, of course, that you can't use the older-style

State of the Art Inside Windows Accelerators

display technology if you want decent Windows performance.

To compensate, Windows accelerator boards are designed to make communication between the CPU and the video hardware and between the video hardware and the monitor as fast as possible. A graphics accelerator chip set provides additional intelligence to bundle a long sequence of similar operations into one powerful screen-drawing command.

Most of the design excitement is in the laboratories of the chip manufacturers. The board and computer manufacturers often have little flexibility in the architecture after they decide which chip set to purchase. The die has already been cast, literally.

Board-Level Basics

The basic architecture of video boards is simple. The information flows from the CPU into a special section of memory that holds the description of the screen image. Then, about 70 times a second, the board must convert the screen image into the analog signal that drives the screen.

The first part of the path, the conduit between the main CPU and the video hardware, must be as fast as possible. Unfortunately, the original design specified that the main system expansion bus for the PC run at only 8 MHz, even if the processor ran at 50 MHz or higher. For this reason, most serious designs bypass the expansion bus and include a high-speed local bus that runs at the same rate as the processor.

Speeding up the information flow from the processor to the video hardware and local RAM-based image of the screen is a simple solution. If the data moves faster, then screen changes will be that much faster. But switching from the 8-MHz standard bus to a 50-MHz VL-Bus works six times faster. This is nice, but it is only the beginning of the acceleration story.

Adding Intelligence

The most common solution to speeding up GUI functions is to pack additional intelligence into the video hardware. Standard graphics adapters simply maintain the image of the screen in RAM (i.e., the frame buffer) and depend on the CPU to update each pixel. This is not very efficient because a number of Windows commands consist of telling the video hardware to perform

GUI ACCELERATOR FUNCTIONS

FRAME BUFFER

BITBLT

HARDWARE CURSOR

LINE DRAWING

CIRCLE DRAWING

POLYGON FILL

a repetitive operation on large areas of the screen. It is common, for instance, to paint a background pattern over a large portion of the screen at start-up. The CPU could do this pixel by pixel, or it could simply ship over a small clip of the pattern and ask the video hardware to repeat it everywhere. The latest chips now have the intelligence to generate complicated patterns on the screen with only a few commands from the CPU.

Many of these embedded intelligence features are standard on almost all chip sets designed to do Windows acceleration. The most common is a hardware-based block move solution known as BitBlt (pronounced "Bit Blit") that moves large blocks of pixels around. The BitBlt takes a source rectangle and a destination rectangle and then copies all the bits from one to the other.

This approach speeds up graphics performance for two reasons. First, the connection between the video controller chip doing the copying and the RAM holding the screen is much faster than even the local bus. The Tseng Lab W32i chip, for example, can maintain this connection at 162 Mbps. Second, the width of the path between this RAM and the controller can be many bits wide, allowing all this data to transfer at once. The Western Digital WD-35, for instance, has a 64-bit-wide path.

The BitBlt operation is used in two important ways. First, when you move a window, the system copies the old image from one location to another. You do not have to redraw the window contents object by object. This approach is even more useful when you pull down a menu or open a small dialog box on top of other images. Then a covered image is copied into unused video-board memory. When the menu or dialog box selection is completed, the system restores the old image by

VRAM

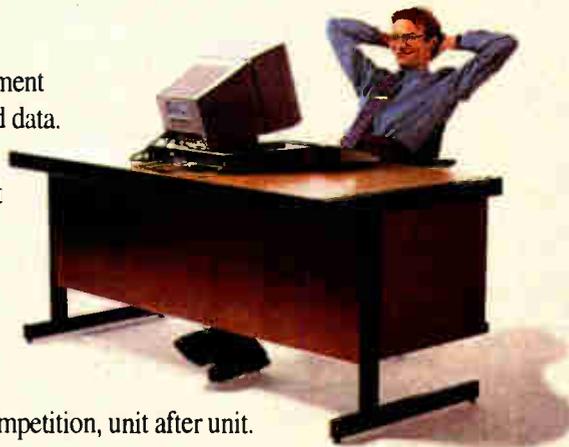

- more expensive
- two read/write ports
- no conflicts between drawing and refresh

DRAM

- less expensive
- one read/write port
- possible conflicts between drawing and refresh

Relax! When you demand guaranteed no-break network protection, delivers!

You've made a considerable investment in your network...in dollars, effort and data. You want the peace of mind that comes with knowing your investment is being protected by the BEST in the UPS industry. Rest easy...it's not just our name that's BEST.

The BEST Product Quality

Our quality performance and reliability consistently outpace the competition, unit after unit.

The BEST Technology

Our engineers are on the leading edge of power protection innovation. Our successes have been acclaimed for superior design and performance.

The BEST Customer Service

Only BEST offers 24 hour, 365 day a year free phone support and a lifetime surge suppression warranty that covers both our circuitry and the protected equipment. You can rest assured, because we guarantee: **No Dissatisfied Customers.**

BEST On The All-Important Ratio Of Price to Performance

We continue to be the best-cost manufacturer.

- *Genuine "no-break" power systems.*
- *Five comprehensive levels of protection available.*
- *Intelligent and interactive systems.*
- *Suitable for any network application.*
- *24-hour service and support for life.*
- *FREE system warranty up to two years.*
- *On-site servicing available.*
- *Leasing options available.*

State of the Art Inside Windows Accelerators

VRAM-Based GUI Accelerator Board

The second port on the VRAM allows the data to flow to the display device at the same time that new drawing information arrives from the GUI acceleration hardware.

copying back this rectangle.

BitBlt operations can also draw text on the screen. Many video boards have built-in font caching, and they store images of the individual characters in unused memory on the video board. When it comes time to draw an *e*, there is no need for the processor to send an image of the *e* to the video board. It simply tells it to copy a rectangle containing this image onto the screen in the right place.

Another important solution is a hardware-implemented cursor or mouse pointer. The pointer image is almost always visible and often in motion on the screen. Obviously, you could use BitBlt to implement the movement of the mouse pointer, but this is not very efficient. Most video chip sets maintain the pointer image as a small bit mask (32 by 32 bits or 64 by 64 bits) that is kept in unused memory. They also keep track of the *x,y* coordinates of the pointer. When the system constructs the screen image, it automatically draws the pointer in the place designated by the coordinates. This is much faster, because the system can move the mouse by simply changing the coordinates. There is no need to copy the cursor on and off.

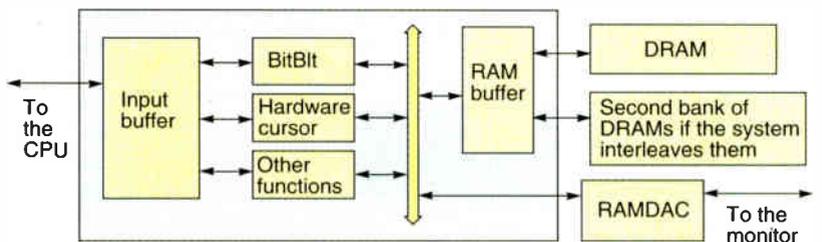

Many extra features make performance better but are not as generally useful or used as BitBlt and hardware-pointer support. These extra features have commands that let the graphics subsystem fill a polygon with a color or pattern and perform hardware-assisted line and circle drawing.

Memory Matters

Building a fast, intelligent video controller speeds up the system by reducing the traffic over the bus. This approach has been so successful that the bus is rarely the bottleneck for most applications. Today, the most important bottleneck in a PC graphics system is the bandwidth in and out of the memory on the video card.

The demands on video memory are high. If you are running Windows at a resolution of 1280 by 1024 pixels with 8 bits of color per pixel, then your machine must send 1.3 MB of data from the video memory to the screen 72 times each second. This 92 MBps of bandwidth is necessary simply to keep the screen running: Any additional drawing operations require extra bandwidth. This is why companies try to maximize the bandwidth between the video controller and the memory.

DRAM-Based GUI Accelerator Board

The screen image must flow back through the accelerator hardware before it is sent to memory, causing conflicts with screen-drawing information.

Juggling Standards?

Why Not Keep Them All In One Place?

Getting PCs to co-exist with diverse computing standards means keeping a lot of balls in the air.

As the pioneer in developing X Servers for Microsoft Windows™, VisionWare™ understands how to unite Windows, X™, NT™, networks, UNIX™ and VMS™ to bring all your computing standards together at the PC desktop.

XVision 5 sets a whole new standard for PC X Servers as a smart, environment-aware server. XVision 5 automatically detects underlying network transports, automatically optimizes graphics speed to any PC hardware configuration, automatically aliases fonts and automatically eases the installation process.

Not stopping there, XVision also features transport-independent file transfer, local terminal emulation and an object-oriented, drag & drop desktop integrating DOS/X/Windows.

XVision 5 ties it all together. Instead of another ball to keep in the air, XVision provides a real solution that finally frees you from the whole juggling act.

Circle 377 on Inquiry Card: Call me, I'm interested

Circle 378 on Inquiry Card: Send Literature

One of the big architectural decisions that chip-set manufacturers make is whether to keep the local version of the screen image in expensive special VRAM (video RAM) or in standard, off-the-shelf DRAM. Regular DRAMs have one port that a processor can use to read and write data, which is fine for regular system uses. RAM on video boards, however, must both accept new screen information from the processor and, at

the same time, send out the current image to the hardware driving the monitor. That is why companies started producing RAM chips with two ports that can be written to or read at the same time.

This second port on VRAM makes life much simpler for video-board architects, because it effectively doubles the bandwidth of the video memory subsystem. The boards run faster because the commands from the CPU to change the image do not have to wait while screen refresh is taking place.

One major problem is that VRAM chips are more expensive—often 1.7 to 2 times more—than comparable DRAMs. For that reason, cost-conscious designers have found that by changing the way the system accesses the chips, they get almost the same performance out of DRAMs that they get out of VRAMs.

One solution that Tseng Labs took with its W32i was to divide the DRAMs into two different blocks (i.e., interleaving), putting the odd addresses in one half and the even in the other. Now the video-control chip could ask for two blocks of information at once, as long as one request was for an odd address and one was for an even address. This is almost always the case when large blocks of image are being copied. Tseng Labs claims to have measured bandwidth in excess of 160 MBps.

How is this better than a VRAM solution? The hottest VRAM solutions often have almost 90 MBps of bandwidth available through each of the ports. The problem is that the bandwidth is not flexible. A 90-Mbps bandwidth must go toward updating the screen, and 90 MBps is available for new drawing and BitBlt commands. The 160 MBps of the Tseng Labs chip can be split as needed. If you're running Windows in a lower resolution (e.g., 1024 by

GUI ACCELERATOR CHIP COMPARISON

CHIP SET	MEMORY TYPE	MEMORY (BUS SIZE)
Chips & Technologies Wingine DGX	DRAM ¹	32-bit
Cirrus Logic Alpine CLGD543x	DRAM	64-bit
NCR 77C32BLT	DRAM	32-bit
Oak Technology Spitfire	DRAM	64-bit
S3 928	VRAM	32-bit
Trident CXI	DRAM	32-bit
Tseng Labs W32p	VRAM	32-bit ²
Weitek Power 9100	VRAM	32-bit ²
Western Digital WD-35	VRAM or DRAM	32- or 64-bit

Note: Although the use of VRAM provides better performance to GUI accelerator chip sets, DRAM is less expensive and sometimes more flexible in how it can be configured.

¹ With cache for recently used lines.

² Can interleave two banks.

768 pixels by 8 colors), then only a small amount of bandwidth (e.g., 57 MBps) is necessary. That leaves over 105 MBps of bandwidth available for redrawing operations.

The flexibility of these DRAM designs also allows high-resolution operations to be implemented by trading responsiveness for resolution. You could use the 130-Mbps rate to drive a 24-bit color screen, leaving only 32 MBps of bandwidth available to respond to redrawing operations. This would be a sluggish but rich display. The VRAM solution could not achieve this, because only 90 MBps can be devoted to screen refresh.

Video architects have also explored other solutions to double the width of the data path between the main controller chip and the memory. Western Digital and Cirrus Logic both use 64-bit-wide buses for their latest chips (the WD-35 and the Cirrus Alpine). This is easier in one sense than interleaving, because there is no need for complex timing algorithms to govern accessing the two different sections of memory. It is more expensive, though, because the chip package and the internal buses must be twice as big. These wide buses offer about 180 MBps of bandwidth.

Fattening the bus by doubling the size or interleaving is much easier to do with DRAM than with VRAM because of the practical limitations on the number of pins that a chip can have and the number of traces that can be drawn on a circuit board. VRAMs already have twice as many pins as DRAMs because they have two ports. More pins mean more circuit board traces and more complex manufacturing standards that raise the price. Weitek still chose to use interleaved VRAMs in its Power 9100 line and found it was able to maintain a phenomenal 200 MBps.

Interior Questions

The internal architecture of the video-driving chips can vary widely. The standard chip sets, which make up almost all of the price-competitive market for PCs, are almost all very basic architectures with dedicated functional units for each of the different processes. It is often possible to pick out the BitBlt, the fill unit, and the cursor unit in a magnified picture of the unpackaged silicon.

These basic chip sets have to handle three tasks: communicating with the CPU, communicating with memory, and sending an image to the screen. The first problem of talking with the CPU is complicated by a large number of different bus standards that exist out in the market. Some video boards speak with the processor via the old ISA standard, while others use the VL-Bus. S3, for instance, builds two different versions of the same chip to handle the different bus designs (86C801 handles ISA, 86C805 handles VL-Bus).

After the bus-interface logic decodes the information, it places it in a FIFO (first-in/first-out) buffer. This serves two purposes. First, it buffers the input so that the chip can accept further instructions from the main processor while it is working. If the video processor is in the middle of a BitBlt operation, the main processor can continue to off-load drawing instructions without waiting. The second effect is to allow larger instruction-word sizes. The Cirrus Logic CLGD5434, for instance, joins every pair of 32-bit blocks that arrives into one 64-bit instruction. Other processors do the same thing when they buffer the 16-bit input from the VL-Bus.

All chips also buffer the data between the video controller and the memory. The Chips & Technologies Wingine DGX offers a buffer that acts like a cache. When the screen is being refreshed, it can read the information from this buffer and not spend the additional time required to access the video memory.

The construction of the image for refreshing the screen is handled by both the main processor chip and the RAMDAC that converts the digital bits into an analog RGB signal accepted by monitors. When a screen is working in 8-bit mode, the screen can have only 256 total colors

A built-in spreadsheet that's compatible with Lotus® 1-2-3®, includes sophisticated financial and statistical functions, 3-D graphs and print preview.

The familiar windows-type graphical interface makes the Series 3a incredibly easy to use.

The RS232 Serial Interface and PSION link software let you seamlessly exchange data and files with your Mac® or PC – and support modems, plus a full range of printers including PostScript®.

Password protection and data encryption for total security wherever you go.

New! VOICE RECORDING with a Digital Audio System – built-in microphone and speaker let you record information for replay later, or record your own wake-up calls and reminders!

More power! Up to 512K built-in RAM and 1Meg ROM. Unlimited memory expansion with two Solid State Disk memory card – drives. Cards are available in Flash or RAM formats from 128K to 2Meg.

Built-in word processor, compatible with Microsoft® Word, includes full Print Page Preview to view the layout of your entire document.

Fast, flexible database for any data storage need with DTMF auto-dialing.

World times and a calculator that remembers your previous calculations. Plus a built-in programming language for the enthusiast.

Large screen with CGA-level resolution and full letter-size page width, plus 12 font/size combinations and zoom function in all applications.

The most advanced Agenda and Time Management System that compare with the biggest and best desktop software.

Remarkably, the PSION Series 3a runs for months of normal use on two standard AA batteries.

Additional plug-in software applications available, including financial, banking, spell checker, dictionaries, games and more.

THE NEW PSION SERIES 3a

WITH DIGITAL VOICE TECHNOLOGY.

AN IDEA SO FRESH IT TALKS BACK TO YOU.

Now, PSION adds voice recording and playback to its already advanced computer functionality in the new PSION Series 3a. So you can pocket the power of a 16-bit, multi-tasking operating system, a full palette of built-in, integrated applications and digital audio, too. And you can take it all with you at a price worth talking about – units start as low as \$399. Call 1-800-54-PSION for the dealer location nearest you.

State of the Art Inside Windows Accelerators

available, because only 8 bits of information are stored for each pixel. The RAM-DAC keeps a color lookup table that matches each of these 256 values to a 24-bit full RGB color definition. When an 8-bit image is being displayed, it will automatically replace the 8-bit values with the correct 24-bit RGB values.

Most companies implement the RAM-DAC on a separate chip because there is not enough space on the main chip for all the functions. The Cirrus Logic and Sierra architecture teams, on the other hand, chose to squeeze it on the main chip to save costs. Although this decision may have hampered some functionality, it let them produce a good, low-cost solution. Extra chips add to total board costs, because they take up more board space, require extra circuit traces, and make assembly more difficult.

This trend will no doubt continue as price consciousness drives the market. A designer could use the extra silicon real estate for more functionality or more integration. The hardware cursor, hardware BitBlt, and some simple line-drawing routines make up most of the load on a Windows machine. Why keep adding other seldom-used functions when the software doesn't use them?

In the future, you may see general-purpose processors used more as graphics engines as the software begins to make increased demands on the graphics architecture. Some members of the Silicon Graphics Indigo line, for instance, use a Mips R4000 for its main processor and

another R4000 for the graphics processor, because the chip offers very good floating-point arithmetic performance that is useful in rendering good 3-D effects. Many graphics accelerators will take this processor approach as the demand for good graphics increases.

The Multimedia Future

Video accelerators for multimedia are beginning to appear. The challenges of placing full-motion video on the screen are different from those of Windows. In many cases, the Windows operations involve moving blocks of bits from one part of the screen to another. Much of the drawing is accomplished with well-known shapes that can either be done with primitives (line or rectangle fill) or cached bit maps (fonts).

On the other hand, video is a never-ending flow of bits, and it is rarely the same from frame to frame. For this reason, chip architects are looking at new extensions of the local bus that run directly to the hard drive, CD-ROM drive, or wherever the data is kept. The Oak Technology 107, for example, has a separate 8-bit video port that accepts a signal, performs all the necessary conversions, and sends it directly to the main display memory. Now the video signal is part of the image.

The next generation of video chips will maintain several features that will take this stream of data and perform basic manipulations on it. The Western Digital WD-35, for instance, will offer a *stretch blit* oper-

ation that will stretch a small image to fit any rectangle on the screen. It will also clip the image on the fly to fit into a smaller rectangle. This makes it possible for the software creator to place moving images anywhere on the screen. These features are certain to become common in this generation of chips.

You will continue to see an expanding low end where manufacturers compete to offer the most features at a rock-bottom price. These chips will be popular because most people buy their PCs based solely on price. This part of the market should continue to be the most exciting, because analysis of Windows software shows that extra graphics features do not substantially affect performance that most users need.

The middle-range chip sets will expand by providing multimedia capabilities. It may be at least two or three years before the market grows through this period and reaches a point where most new PCs come with high-quality, high-speed multimedia interfaces. When that happens, the market should turn toward the high-quality, 3-D graphics offered by high-end workstation companies such as Silicon Graphics. When we reach that point, the well-rendered, high-end graphics—like those used to make the movie *Jurassic Park*—will finally arrive on the desktop. ■

ROMDISK™ SOLID STATE Disk Emulators and PCMCIA Products

Board Level Disk Emulators

- Capacities from 180K to 14MB
- Flash, EPROM and battery-backed SRAM technologies
- Dual Drive and Hard Drive emulation support
- High performance and low cost models available
- 8 and 16 Bit ISA Bus support

PCMCIA Carddrives and Host Adapters

- 100% PCMCIA 2.0 compliant
- Software support for all types of memory and I/O Cards
- Can be used in desktop and embedded PC environments
- Internal and external floppy drive adapters and boards
- Memory cards & Controller ICs

3 1/2" and 5 1/4" Disk Drive Models

- Flash IDE Drives with capacities from 2.5 to 40MB
- DRAM Based high performance SCSI drives with capacities from 16MB to 256MB

Features and Applications

- Autoboot capability, all drives. Support for all popular operating systems
- Applications: Embedded Systems, Diskless PCs, High Performance PCs, LANs, Medical, CAD/CAM, POS, Industrial Control, etc.

The only statistics package you'll ever need.

NEW
SYSTAT® 6.0 for DOS
 More Statistics, Extended Memory

"The best general-purpose statistics program" just got better

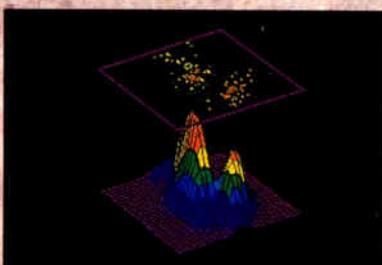

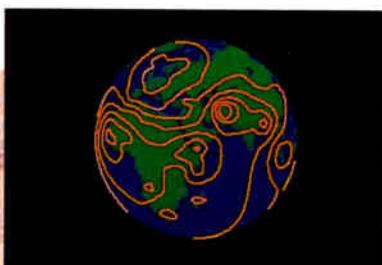

For 10 years, SYSTAT, Inc. has been producing accurate, comprehensive statistics and graphics software. SYSTAT 6.0 for DOS, the latest version of the highly-rated SYSTAT package, brings you new dimensions of power and functionality. More than 20 statistics modules have been added to the basic package, without using more disk space than the previous version. And SYSTAT for DOS now supports extended memory, allowing you to analyze larger and more complex problems than ever before. Depending on your computer's available memory, you can analyze thousands of variables and unlimited cases.

From basic to advanced statistics

SYSTAT provides a full range of statistical analyses: ■ frequencies ■ *t* tests ■ multiway cross-tabs ■ non-parametric statistics ■ correlations ■ linear, multiple, and stepwise regressions ■ ANOVA ■ ANCOVA ■ repeated measures ■ factor analysis ■ cluster analysis ■ multi-dimensional scaling ■ Box-Jenkins ARIMA models ■ Fourier analysis ■ principal components analysis ■ means models ■ post-hoc tests ■ time series ■ nonlinear modeling.

SYSTAT 6.0 for DOS offers even more statistical tools: ■ quality control ■ design of experiments ■ survival analysis ■ sampling ■ logistic regression ■ probit analysis ■ matrix algebra ■ two stage least squares ■ canonical and set correlation ■ reliability analysis ■ linear programming ■ signal detection ■ expected mean squares, and more. For market researchers, new SYSTAT for DOS provides: ■ complex stub-and-banner tables with multi-response data ■ conjoint and correspondence analyses ■ tree classification ■ perceptual mapping.

You can't beat SYSTAT's graphs

PC Magazine says: "SYSTAT has the most complete set of graph types of any PC-based program." And no other package can do them as easily. SYSTAT's graphs include: ■ bar charts ■ box plots ■ density plots ■ function plots ■ pie charts ■ Chernoff faces ■ probability plots ■ quantile plots ■ stem-and-leaf plots ■ 2-D and 3-D scatterplots ■ maps with geographic projections ■ contour plots. SYSTAT 6.0 for DOS also provides Shewhart, Pareto, and CUSUM charts for quality control.

SYSTAT for Windows & Macintosh

SYSTAT (version 5) is also available for Windows™ and Macintosh®. And SYSTAT's data and command files are compatible across platforms.

"SYSTAT (for Windows) - with its superb graphics, high-quality statistical algorithms, and reasonable price - is an excellent choice." PC Magazine

Also available - FASTAT

If you need powerful statistics software but don't need the broad range of features offered in SYSTAT, choose FASTAT, available for DOS and Macintosh.

Building SQL Front Ends

New versions of tools from Borland, Gupta, KnowledgeWare, and PowerSoft for building Windows database clients

RICK GREHAN

Shared databases are the lifeblood of modern corporations. Windows is the platform of choice among PC users. So Windows clients sharing an information repository maintained by a SQL database manager is an appealing model, and one that seems like a natural next step for companies seeking to automate their businesses. But I'll bet if you took a survey among programmers, asking them to name the applications that are the nastiest to build, you'd find Windows programs and SQL database client applications right at the top. Combine the two into a request for a Windows client for a SQL database server (or worse, a group of SQL database servers), and you are asking for trouble—at least if that programmer is armed only with a C compiler and Windows SDK (Software Development Kit).

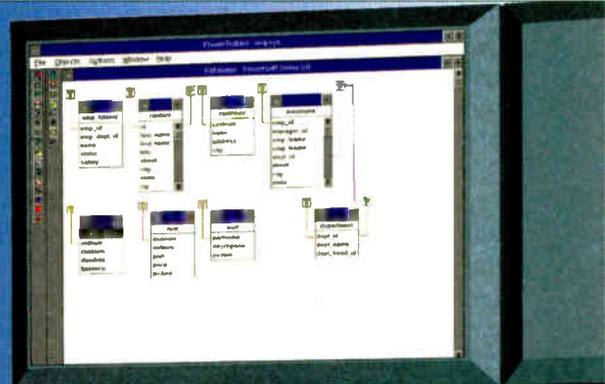

As usual, the right set of tools can make all the difference. The packages that I cover in this review—KnowledgeWare's ObjectView 2.1, Borland's ObjectVision Pro 2.0, PowerSoft's PowerBuilder 3.0, and Gupta's SQLWindows 4.0—all exist to reduce the trauma of building a Windows-based database application. Each provides a set of common interface elements (e.g., data-entry fields and check boxes) and a way of binding these elements to code that can communicate with a variety of database managers through SQL.

Common Tools

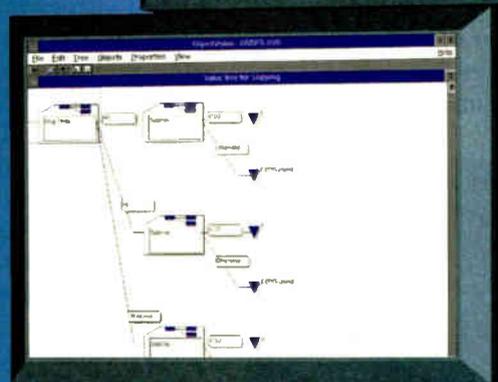

These four packages allow developers to build applications using more mouse than keyboard. In a sense, they are like specialized, souped-up resource toolkits. When you want to design a form, the front-end package opens a blank window and presents you with a smorgasbord of objects—entry fields, push buttons, check boxes, combo boxes, and so on—that you can place anywhere within the window. Click on a menu entry to select a push button; click over the form to deposit the push button; click on the push button to alter its properties.

Since your finished application must ultimately adjoin a database, front-end ap-

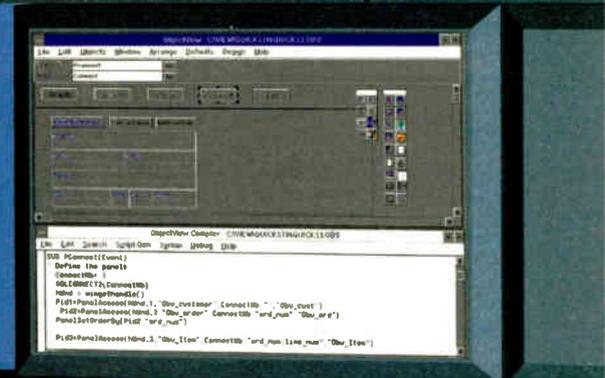

► PowerBuilder's database painter provides a graphical view of database tables. Key fields are identified by an attached key icon. Foreign-key connections (such as between the department and employee tables) are shown by a connecting line.

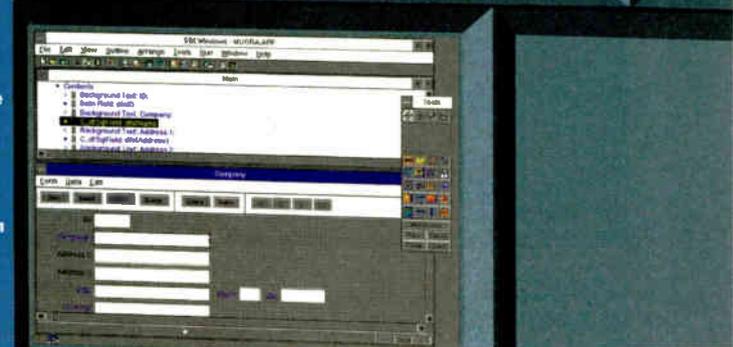

► A program in ObjectVision is actually a flowchart (known as a tree). Here, a value tree attached to the shipping field determines the shipping charge based on the state.

► ObjectView's editor and compiler work in concert. The form under design appears in the upper window. The source code for handling events received by the connect button appears in the lower window. Note the floating tool palettes in the upper window; the smaller is a custom control.

► SQLWindows' outliner (upper window) and design window (lower window) track one another through the development process. Selecting an object in the form window synchronizes the outliner to the object's definition (highlighted in the upper window). SQLWindows also includes a floating tool palette (to the right of the design window).

lications builders also include specialized objects for such work. One example is a data-entry field that must be connected to the back-end database and can carry along format and validation rules. Each of these packages also provides (in one form or another) a table object that allows manipulation of rows from a database table. The table is usually arranged in grid fashion, with column names across the top. In most cases, you can equip the tables with scroll bars. Most systems allow the user to manipulate the table's contents directly; the changes are automatically reflected in the back-end database.

Ultimately, some code has to get written somewhere—every menu you build graphically still needs a collection of methods to handle its events. But a good toolkit will make you write only as much code as is absolutely necessary. This is most true for generating SQL statements. PowerBuilder, especially, does a good job of building SQL SELECT statements automatically, loading them up with field names selected from database-table pick lists.

Although the front end works hard to shield user and developer alike from the actual database engine, that engine is an important consideration. Even now, the list of potential back ends is long, and providing support for a variety of database engines is not easy. The trend seems to be turning with the growing acceptance of Microsoft's ODBC (Open Database Connectivity) as a common access layer for database back ends. However, among these packages, only ObjectView and PowerBuilder support ODBC; the others (primarily for performance considerations, according to their developers) write directly to each back-end database they support.

ObjectView 2.1

- Development language uses an easy-to-master BASIC-like syntax.
- Graphics engine provides a variety of business graphics styles.
- Supports numerous back-end databases.
- Includes no support for version control.
- Includes only a rudimentary object-repository system.

ObjectView is indeed an object-oriented system. The topmost object in the ObjectView hierarchy is the *form*, which is more or less synonymous with *application*. A form consists of one or more panels (where a panel is a view of a result set from a database) and includes data-entry and display fields.

When you build an application in ObjectView, you wind your way through three separate programs: ObjectView's editor, the data modeler, and the compiler. Typically, you open a blank form in the editor and then move directly to the data modeler to select which tables will contribute data to or receive data from the form.

Once you've selected the database fields that will appear in the form, the data modeler automatically loads entry fields into the form (thus creating a panel) and returns you to the editor. The entry fields are loaded vertically in the form from top to bottom; you design the application's final layout by simply picking up each field and putting it where it belongs.

At any time in the editor, you can also add push buttons, check boxes, text, and even bit maps. Clicking the right mouse button while an object is selected will summon a pop-up menu that lets you alter that object's attributes, such as color and typeface. If the selected object can be manipulated by the user, this pop-up menu also leads you to a dialog box, where you indicate not only the events that the object responds to but also the method that manages that object's behavior. Some methods are built into ObjectView; for example, an EXIT push button might simply issue the CLOSE event, which will terminate the application.

For less trivial objects, you would enter SCRIPT for the method name. You must then slip out of the editor and slide into the compiler to compose the method code in ObjectScript, ObjectView's BASIC-like programming language. Programming in ObjectView is close to pure point-and-click, thanks to the hand-holding provided by the ObjectView compiler's editing menus and dialog boxes.

You build the subroutine body by more clicks in more pop-up dialog boxes. In most cases, ObjectView provides you with pick lists of appropriate ObjectScript functions. If you select a function from the pick list, a comment window appears that not only tells you what the function does, but also displays the command syntax in a special editing box. This syntax box actually acts as a template: You can overwrite the dummy arguments that appear in the function description and then cut and paste the result into your program.

ObjectView's ability to handle master-detail forms (such as might appear in an order-entry application) is particularly good. The data modeler uses a drag-and-drop paradigm to manage table joins. Within

the data modeler, you select the tables that will participate in the application from a combo box. Child windows open for each table. To indicate the join, you grab the field from the first table's window, drag it to the window of the second table, and drop it over the join field. ObjectView signals the link by drawing a line between the appropriate tables. You can modify the details of the link to define a one-to-one, one-to-many, or many-to-one link.

ObjectView's table object manipulates multiple database rows. In an application, a table appears as a grid of rows and columns, its contents typically filled with the results of rows drawn from a database table. However, ObjectView also offers a special superset of the table object: the spreadsheet object. This object provides a remarkable amount of spreadsheet functionality. Users can edit cells and add formulas much as with any other spreadsheet.

ObjectView's graphics server object can produce up to 14 different graphs and charts. Along with the standard graphs (e.g., pie, 3-D pie, and bar), the graphics server can produce more esoteric graphs: polar graphs and Gantt charts, for example.

Back-End Support

ObjectView supports a stunning array of back-end database packages. Most of this connectivity is available thanks to the Q+E Libraries (available from Q+E Software) and Microsoft's ODBC. This results in a hodgepodge of access and concurrency mechanisms. Earlier versions of ObjectView provided more manifest connectivity to dBase files, so ObjectScript still retains functions explicitly to manipulate such databases; for example, you can lock individual records or entire files. Besides dBase, ObjectView also provides Btrieve-specific functions. You can lock or unlock individual Btrieve records, and Btrieve supports transaction control, accessible through ObjectScript calls.

ObjectView still has plenty of SQL connectivity, however. In fact, while manipulating dBase or Btrieve files, an ObjectView application can be carrying on operations with up to eight simultaneous SQL connections. ObjectView even provides a number of Oracle-specific commands, including the binding mechanism for associating ObjectScript variables with placeholder variables that you can insert directly into SQL statements. Most important, the SQL functions provide direct access to commit/rollback functions.

Like SQLWindows and PowerBuilder, ObjectView lets you construct classes and

COMPARING SQL CLIENT DEVELOPMENT SYSTEMS

A blow-by-blow comparison of features for front-end builders can boil down to a comparison of concurrency mechanisms, back-end support, and price. But keep in mind that the quality of the development environment, where SQLWindows and PowerBuilder excel, can't be easily captured in a tabular comparison. (● = yes; ○ = no.)

instantiate objects based on those classes (e.g., a data-entry field). But SQLWindows and PowerBuilder also let you create *object repositories*—databases that can hold bits and pieces of an application such as push buttons, entry fields, panels, and entire forms. The closest ObjectView comes to any kind of repository is the mini-album and object manager applications.

The mini-album holds clip-art-type graphics (Windows-compatible bit maps or vector images). The object manager is a similar kind of clipboard-style holding tank. You can, for example, copy button and field objects out of your application and place them in the object manager for later use. The object manager will remember not only the image of the object (e.g., color and font) but also other attributes (e.g., methods).

New in version 2.1 is an improved interface to C and C++ (the documentation gives examples for interfacing to Microsoft C/C++ 7.0, Quick C, Visual C++ for Windows, and Borland C/C++ 3.1). All in all, ObjectView is a capable package. The only thing really missing is a good object repository with version control capabilities. Engineers at KnowledgeWare informed me that this was on the way; I'll be watching.

ObjectVision Pro 2.0

- Bundled with Turbo C++ and ObjectWindows.
- Programming is graphical.
- Has limited concurrency controls.
- SQL connectivity is not well integrated; SQL access is through a DLL.
- Least expensive package; targeted at less experienced developers.

ObjectVision is a graphical tool for constructing applications, which are collections of forms. In ObjectVision, *form* is really just another word for *data-entry screen*. You can populate forms with the usual array of user-interface objects: entry fields, push buttons, tables, and bit maps.

If there's an overriding principle behind ObjectVision, it's the notion of *goal-directed* or *guided* completion. Simply put, this means that an applications designer does not have to explicitly specify the execution path through a form. All forms in an application reside on the *form stack*, a kind of internal data structure that isn't much more than a list of form names. The topmost form in the form stack is referred to as the *goal* form. It is ObjectVision's ultimate aim to fill all unfilled fields in that form.

¹ Requires an additional router package.
² Similar to BASIC but includes nonstandard features.
³ Single time/date data type.
⁴ Time data handled as strings.
⁵ Through ODBC only; subject to ODBC driver.
⁶ Isolation levels.

⁷ ObjectVision does support SQL connectivity through a DLL.
⁸ Rudimentary object-storage tools but no version control.
⁹ Development system only; distributing run times requires additional licenses.

As an ObjectVision application executes, guiding the user from one entry field to the next and encountering fields that depend on values from other forms, ObjectVision calls up the forms on which each field depends. This nesting goes arbitrarily deep into the form stack, and ObjectVision keeps track of the nesting path. The application is considered complete when all entry fields on the goal form are filled.

Of course, you can override ObjectView's guided completion by attaching code to a form's data-entry fields and other user-input objects. Here's where ObjectView diverges from the pack; programming in ObjectView is more an act of drawing than of writing.

Rather than type in lines of source code, you construct *trees*, a specialized form of flowchart. There are two kinds of trees in ObjectVision: event trees and value trees. Event trees specify how an object responds to a particular event (e.g., what happens when you click on a button); value trees define what actions are taken when a value is placed in a field. As an example, a value tree attached to a subtotal field could examine the subtotal amount and determine whether to apply a discount to the entire total.

Connections between fields in ObjectVision programs and data in databases occur via links. A link defines how data flows into or out of an ObjectView application. Thus, a link might also connect an ObjectView application to another application via DDE. Currently, ObjectView supports links to five external sources: dBase, Paradox, Btrieve, ASCII, and DDE. The SQL connection takes place through a DLL.

The act of building links sends you through a series of dialog boxes. When you're done, you've assigned connections between fields in the database and fields in the form. In the process, you identify which fields are read from the database and which fields are written. You can also have ObjectVision build database navigation buttons for you automatically—creating all the necessary support code—and deposit those buttons into your form.

Although links are easy to define, their static nature makes for some limitations. Specifically, when you build a link, you have to define the path to the database files. This path definition stays in the final application, which means that the target system must have an identical directory structure to the development system. The only workaround is to define logical drives using the DOS ASSIGN command.

Split Access

ObjectVision's commands for accessing SQL databases are separate from those commands that access Paradox, Btrieve, dBase, and ASCII files. ObjectVision's SQL awareness comes via a DLL that your application must load and register (i.e., build structures that "teach" ObjectVision how to call entry points in the DLL).

On the one hand, this means that Paradox databases, for example, are accessed directly as Paradox databases, not through an additional layer that makes Paradox files look like a SQL database. The absence of the additional layer certainly results in higher throughput. However, it makes it difficult to create back-end-independent packages in ObjectView, since database functions being called are either SQL-type functions or non-SQL-type functions. Furthermore, you can't create links between SQL tables and ObjectVision fields using the dialog boxes provided in ObjectVision (as described above). Instead, you have to hand-code the links using the @SQLOPEN() function.

ObjectVision's concurrency mechanisms are rudimentary. The only concurrency ObjectVision understands is the *dirty read*. It works like this: Whenever your application requests a record from the database, the ObjectVision engine takes a snapshot of the record before handing it to the application. After the user has made modifications and the application issues a write request, ObjectVision checks its snapshot with the copy of the record in the file. If ObjectVision finds any differences—indicating that another user has modified the record behind your back—it asks whether the write request should be aborted. ObjectVision supports no record locking (even though those capabilities are within Paradox, dBase, and Btrieve) and, even worse, provides no commit/rollback capabilities. (If you use SQL within ObjectView, you can issue any commit and rollback commands that are provided by the SQL engine you are attached to.)

There's plenty of room for improvement in ObjectVision. The version I tested incorporated a version of the Paradox engine that was not up to date. Borland rightly points out that ObjectVision is targeted toward entry-level developers who may not have the skills for managing large or complex databases. Users requiring a more industrial-strength database applications builder from Borland will likely opt for Paradox for Windows, which should include SQL connectivity by the time you read this.

PowerBuilder 3.0

- Development language is like BASIC.
- Development environment provides good isolation from SQL.
- Object repository system is not as well developed as SQLWindows'.
- Watcom SQL is bundled with the package.
- PowerBuilder applications can also include dynamically generated business graphics and charts.

As I write this article, PowerSoft's PowerBuilder has just undergone a major face-lift, moving up from version 2.0 to 3.0. I worked with both releases but concentrated on 3.0 (unfortunately, 3.0 documentation was still at the presses).

Because of an effort to drive home the graphical nature of the PowerBuilder environment, every program in the suite is a painter: There's the application painter, the window painter, the menu painter, and even a database painter. Each is a separate object-building application within the PowerBuilder suite. For example, you open the structure painter to build frequently used data structures for later entry into modules that you create in PowerScript (PowerBuilder's BASIC-like application language). These data structures have a format similar to C's `struct` or Pascal's record data structures.

Like ObjectView, PowerBuilder is compatible with a surprising number of database back ends. In addition, PowerBuilder arrives bundled with the capable Watcom SQL engine (to which it talks via ODBC). Included are Watcom's database tools, which can handle rudimentary SQL database creation and maintenance activities, as well as provide an interactive SQL screen for ad hoc queries.

PowerBuilder's standard control is the PowerBar, a row of icon-bedecked push buttons that provide instant access to PowerBuilder's various painters. The PowerBar is customizable: You can add new icons (PowerBuilder provides 80) and attach applications to each. A single click can transfer you to your favorite editor. If you don't like the PowerBar approach, you can revert to the PowerPanel, which displays as a child window populated with regular Windows icons.

Constructing a PowerBuilder application typically begins at the database painter, where you create and manipulate database tables. The database painter represents foreign key connections graphically, much in the way ObjectView displays joins in

its data modeler. A line connects the corresponding fields. From the database painter, you can also store validation rules and display styles in the database.

Next is the application painter, which builds the root entity from which all other objects in the application spring. Although the application object has no visible counterpart in the final executable file, it holds guiding scripts that determine how the windows in the application interconnect.

As you might expect, the window painter is PowerBuilder's editor for building windows and populating them with interface objects such as push buttons, check boxes, and (among others) PowerBuilder's most powerful interface object, the datawindow. The datawindow is PowerBuilder's answer to ObjectView's panel and SQLWindows' QuestWindow; it is the means by which data moves between the application and the database.

A datawindow has a great deal of flexibility, thanks largely to its eight presentation styles. Tabular presentation style displays rows in columns in the familiar grid fashion; free-form style lets you position database fields haphazardly (if you choose) within the window. Other styles include grid (tabular style with lines), labels (for printing labels), and even group (which lets you arrange fields for subtotals). Finally, the graph presentation style connects the datawindow to PowerBuilder's graphing capabilities and allows the application to display data in one of over a dozen graph styles (both 2-D and 3-D).

As usual, there's code behind the window. As with many of the other packages, whenever you click the right mouse button over a datawindow object, a floating menu appears. Topmost in that window is the selection script. Click on that, and you're taken to a window from which you can select all the source code for the methods associated with that datawindow. Each event that a datawindow might accept (e.g., a click within the window or an item changed) can trigger a different script. Select the event, and the window displays the code that will be triggered in response to that event. Of course, you can attach a script to any kind of object that might respond to an external action.

PowerBuilder's debugger is full-fledged. You can deposit breakpoints in selected scripts. Then, when you execute the application, the debugger halts the application at the appropriate point and opens a debugger window. From there, you can open a watch window to keep an eye on global or local variables.

Library Painter

PowerBuilder has an object repository, called the *library painter*, that can hold various application objects: datawindows, menus, functions, even whole applications. The library database, which can reside either locally or on a network, maintains a checkout/check-in facility. If you check out an entry for modification, no one else can check out (and therefore modify) that entry until you check it back in again.

Upon first opening the library painter, you'd swear you were in the Windows file manager. You see a tree diagram of sub-directories represented as folders; double-clicking on a folder expands that branch of the tree. The library manager takes this metaphor all the way into libraries: If you double-click on a library icon, it opens to reveal that library's contents. Each object has its own icon. Furthermore, you can see modification dates and times, as well as one-line comments that can be attached to each object. All this fits seamlessly within the graphical display structure you've become used to in the program manager.

Within the library painter, you can search a library (or a portion thereof) for a specific string. The results of the search will be displayed in an annotated pick list. Click on an entry of the pick list (which, again, could be any kind of object), and PowerBuilder sends you directly to the proper painter for the object.

PowerBuilder works hard at doing your programming for you. It's rapidly acquiring as much back-end capability as ObjectView (3.0 adds ODBC). PowerBuilder is in hot competition with SQLWindows, and it will be interesting to watch the rivalry as version 3.0 moves to completion.

SQLWindows 4.0

- Provides extensive team-programming and project-control tools.
- SQLBase back end is tightly coupled with the front end.
- Object-oriented programming constructs allow reuse and inheritance.
- SQLWindows Application Language is difficult to master.
- Quest development tool allows rapid creation of database objects within a form.

Gupta SQLWindows is the most robust development package. It's available in two editions: the standard edition (\$1995) and the corporate edition (\$3495). The corporate edition has a host of tools, most notable among them being SQLWindows, TeamWindows, Quest, Re-

portWindows, SQLTalk, and (of course) the SQLBase server. The standard edition includes all the above except for TeamWindows and Quest. I reviewed the corporate edition.

When you launch the SQLWindows development system, you actually open two windows into the application. One, the form-design window, allows you to graphically populate the form with user-interface objects in much the same way as the other packages do. A typical procedure is choosing the push-button icon from the floating tool palette and clicking on the form, where a push button then appears.

The other window into the form is the outliner, where the text for the SAL (SQLWindows Application Language) code associated with the window resides. The two windows are tightly coupled: Place a new object in the form window, and the proper SAL code automatically appears in the outliner. Activate a menu in the form window (you're still designing, mind you), and the line corresponding to the SAL code that defines that menu entry is highlighted in the outliner.

Quest, Gupta's graphical query, editing, and reporting tool, is also closely tied to the SQLWindows development environment. This linkage takes place through the QuestWindow object. It lets you build database access panels for either querying or editing a data file. While you build your query/edit child window, Quest generates SAL code for you automatically. Once you've built the QuestWindow, you can customize its behavior by programming SQLWindows directly. You can, of course, operate Quest as a separate product, for graphically generating everything from queries to reports.

TeamWindows is SQLWindows' project management system. A project is a conglomerate of application code modules, some non-SQLWindows objects (e.g., bit maps), an application database, project standards (which can be anything from coding standard to default object names), and a project manager and staff.

In TeamWindows' administrator component, you create and maintain users and projects. This amounts to working with a specialized database. One piece of this database is the data dictionary, which carries information about the structure of databases within applications. This information is extensive and falls into three categories: SQL attributes (e.g., data type and field length), SQL Windows attributes (e.g., font and color), and user-defined attributes (e.g., free-form comments) that

Save Time, Save Money, Save Code... Save Your Environment

REVISION CONTROL SYSTEM

A quality configuration management system can save your development environment from all kinds of disasters. Avoid costly collisions, keep a complete audit trail, and automatically rebuild your project – saving time, saving money and even saving you from potential “environmental disaster.” When you’re looking for a quality configuration management system, you want the best in the business.

MKS RCS (Revision Control System) is that system. Fully featured,

reliable, easy to use, and a reputation for excellence make MKS RCS the best in the business.

- our Windows GUI saves valuable time – get up and running quickly
- MKS Make performs precise, uniform, repeatable builds of your project
- designed for use by teams on networks; specialized support for Novell
- unlimited branching and merging, locking, binary file support, access lists
- we believe in giving our clients the best prod-

uct at the best price. Save thousands of dollars by choosing MKS!

■ Platforms Supported

- DOS ▪ WINDOWS
- UNIX ▪ WINDOWS NT
- OS/2 ▪ & MORE

MKS has a reputation for excellence – quality software, prompt support, real value. At MKS the customer always comes first. Join IBM, Lotus, Intel, DEC, Hewlett Packard... and choose MKS as your partner in innovation.

Complete satisfaction or money-back guarantee.

*“MKS gave us the solution we needed across platforms”
Lotus Development Corporation*

*“MKS RCS has easily paid for itself with the time it has saved our engineers”

A MESSAGE TO OUR SUBSCRIBERS

FROM TIME TO TIME WE MAKE THE BYTE SUBSCRIBER LIST available to other companies who wish to send our subscribers material about their products. We take great care to screen these companies, choosing only those who are reputable, and whose products, services or information we feel would be of interest to you. Direct mail is an efficient medium for presenting the latest personal computer goods and services to our subscribers.

Many BYTE subscribers appreciate this controlled use of our mailing list, and look forward to finding information of interest to them in the mail. Used are our subscribers' names and addresses only (no other information we may have is ever given).

While we believe the distribution of this information is of benefit to our subscribers, we firmly respect the wishes of any subscriber who does not want to receive such promotional literature. Should you wish to restrict the use of your name, simply send your request to the following address.

BYTE Magazine

Attn: Subscriber Service
P.O. Box 555, Hightstown, NJ 08520

can be attached for later referral.

TeamWindows' checkout/check-in facility provides version control for large projects involving multiple developers. To work with an application's modules, you must extract them from whatever project's library the application is a member of. This moves them into your personal workspace and tags them as being logged out; no other developer on the project can alter those modules until you check them back into the library. Users within TeamWindows are assigned access levels and promotion levels. The access-levels attribute (there are four levels) defines what a user can do within the TeamWindows environment—that is, what parts of the TeamWindows database the user is able to alter. For example, only a project administrator is allowed to create new projects.

The promotion level indicates the privileges that the user has within the TeamWindows promotion facility, which is the mechanism by which TeamWindows manages the status of project components as they pass through design phases. TeamWindows recognizes three levels in the life cycle of a program module: the development level, the testing level, and the production level. In a nutshell, a program module begins in development. From there, it moves into a testing phase. After verification, the module may be promoted into the production phase.

There are actually parallel paths in the testing phase. TeamWindows recognizes that some modules may be tested in stand-alone fashion, as part of a single application, while other modules may be tested in multiple applications. Hence, TeamWindows provides a shared testing phase.

SQL and SAL

SQLWindows expects only a SQL backend, so it doesn't have any of the dBase- or Btrieve-like explicit record-locking commands that you will find in ObjectView. However, SQLBase does provide a kind of implicit row locking via *isolation levels*, which can be set using the SAL function `SqlSetIsolationLevel()`. Although there are four isolation levels, the basic function of the level is to determine whether an automatic lock is placed on rows that your application accesses during a transaction. This permits you to manage the level of concurrency an application can handle. There is, of course, also the standard SQL commit/rollback mechanism for managing transactions.

As good as SQLWindows and Quest are at rapidly building forms, sooner or

Reviews SQL Development Tools

later you have to deal with code. SAL is a departure from typical programming languages, not only in syntax, but also in the method by which you create SAL code. Programming in SAL involves working with a *folding editor*, which is like an outline processor. The SAL code that manages an application is often referred to as the *outline*, and the window in which the outline is displayed as the *outliner*.

Recall that the outline window and the form-design window in SQLWindows run in parallel. Changes that you make in the form-design window are instantly reflected in the outliner. Similarly, if you add a new object to the outliner, it appears in the form window. Object attributes that are not specified in the outline are available via a pop-up menu that you conjure with a mouse-click over an icon that appears next to the object name in the outline.

For example, at one level of the outline you'll find an entry named *menus*. Double-click on that entry and the level below opens, revealing entries for all the menus in the application. Select one, click on it, and the next level opens, exposing information about the selected menu, including its title, its description, and a list of menu items. Of course, the menu items themselves have more information hidden at lower levels; you can access that information by clicking on the items.

This approach has a number of advantages. Most visibly, it takes top-down programming design to the extreme. You can zoom in to focus on only the portion of the program under construction, or zoom out to examine the overall flow of the program. Since the entire format is nonprocedural by nature, it fits in well with the event-driven structure of Windows programming. Finally, when you add an object to a form under construction, not only does SQLWindows automatically load the proper source into SAL, but it also attaches the necessary subheadings for that object.

SQLWindows is undeniably one of the most capable front-end development packages. Furthermore, since

Gupta provides a strong back-end SQL engine (SQLBase), the pairing is more solid (i.e., if a function is more there, rather than available only if the engine sitting on the other side of ODBC supports it), and the documentation for the database administration is thus more complete.

Straining Under Complexity

SQL front-end development packages sit at the collision point of two very complex activities: building a Windows application and building a SQL database application. Consequently, their raison d'être is an attempt to simplify both activities. Sometimes, this attempt results in bizarre overachievements—the GUI philosophy carried to near unusability, you might say.

Programming in ObjectVision (high-level programming of form mechanics; that is, not using Turbo C++ to build a DLL) amounts to building a flowchart.

Personally, I don't see that this process is any easier than simply writing code. Is all the mouse-clicking really faster than typing in an IF... THEN statement?

Perhaps I suffer from my nongraphics programming roots, and perhaps ObjectVision's paradigm is something that a nonprogrammer would cotton to quickly. But in my experience, programming in ObjectVision is ultimately no faster or easier than programming in other packages.

Two more examples of the GUI straining under complexity come from ObjectVision and PowerBuilder. If you are building an ObjectVision application and you need to select an entire table, you have to click on an entry twice... slowly. A standard double-click will not work—that does something else. The slower double-click forces you to hit your mental brakes and un-

fortunately expands the universe of user interactions that you have to master in order to deal with the application. Meanwhile, PowerBuilder's primary user interface, the PowerBar, can sometimes stretch from near the top of the screen to the bottom. The visual effect is a long column of minuscule icons.

SQLWindows is undeniably one of the most capable front-end development packages.

Making Ends Meet

Probably, neophyte applications developers will gravitate toward ObjectVision. Of course, as the demands you place on your application grow, ObjectVision's limitations will make themselves apparent. In particular, if your database either sees significant multiuser activity or is not already in one of the data file formats that ObjectVision supports directly, you should look elsewhere.

ObjectView stakes out a solid position on middle ground. It talks to just about any database you can think of, supports plenty of visual interface objects, and uses a programming language that's easy to pick up even if your only programming training has been in BASIC.

My guess is that SQLWindows and PowerBuilder will continue elbowing one another for position as the premier development platform for serious Windows SQL applications builders. Although it's difficult to make a comparison with PowerBuilder in the midst of a revision, SQLWindows enjoys a more complete and better-integrated object-repository and project-control system.

Furthermore, SQLWindows has the advantage that the front-end application builder comes from a company with a very popular database back end. On the one hand, this means it's less likely that SQLWindows will have the widespread back-end support that PowerBuilder has (via ODBC). On the other hand, it gives the developer working against Gupta's back-end database greater control over the entire system. And simply put, it's always best when your front end knows precisely what your back end is doing. ■

Windows Under 4 Pounds

New 486-class subnotebooks from Epson and IBM offer alternatives to Intel CPUs and include the kind of features found in heavier models

DAVE ROWELL

The guiding idea behind subnotebooks has been compromise on features to shed pounds. The result is systems under 4 pounds but with external floppy drives and less processing power, smaller screens, cramped keyboards, shorter battery life, and higher prices than standard notebooks.

If Windows is your yardstick, the lack of processing power is perhaps the most significant compromise. However, several recent subnotebooks, including two from Epson America and IBM, employ 486 or 486-like processors that are fast enough for good Windows performance.

Along with the claim of 486 power, Epson's ActionNote 4000 and IBM's ThinkPad 500 both provide features more often found in heavier notebooks—4 MB of RAM, an 85-MB hard drive, and a backlit VGA screen—for just under \$2000. I reviewed production units with these standard hardware configurations (except that the ThinkPad I evaluated came with an optional 170-MB Western Digital Caviar Lite hard drive).

Both Epson and IBM make acceptable subnotebooks. However, the ThinkPad comes out ahead based on both performance and usability, although it costs slightly more and has fewer bundled extras than the ActionNote.

What's in a 486?

If "486" means "Intel" to you, then the Epson and IBM subnotebooks are 486 PCs in name only. The ActionNote uses a 33-MHz Cyrix 486SLC, while the ThinkPad runs IBM's speed-doubled 25-/50-MHz 486SLC2. At comparable clock speeds, neither gives you the all-around performance of an Intel chip, and neither provides a built-in FPU. (The ActionNote can take an optional Cyrix 387SL math chip.) For comparison, I used CompUSA's 4SL/486SL (see "The Littlest Notebooks," September BYTE).

Consider Cyrix's 486SLC chip as sort of a 386-and-a-half. It benefits from pipelined execution, a built-in 1-KB cache, and a hardware multiplier that greatly speeds up

integer math operations, such as spreadsheet recalculations. With its 386SX pin-constricted 16-bit path to DRAM, Intel's 486 chips use an 8-KB cache and a full 32-bit external data path. Even at 33 MHz, the ActionNote's raw CPU performance, as measured by BYTE's low-level DOS Subnote with its 25-MHz Intel 486SL,

is less than two-thirds that of the Subnote with its 25-MHz Intel 486SL. Not related to the Cyrix 486SLC family, IBM's 486SLC provides performance closer to that of an Intel 486 of comparable clock speed. The ThinkPad makes up the difference and a little more by using a speed-doubled version, the 486SLC2, which runs internal operations (including an 8-KB cache) at 50 MHz.

The video and hard drive subsystems also play a big part in performance. In spite of its slower CPU, the ActionNote provides decent Windows graphics performance and did better in the Windows applications tests than the Subnote—but not as well as the ThinkPad, which gave superior performance in all hardware categories. The ThinkPad pulled way ahead

in all application tests except the DOS spreadsheet section, where its lack of built-in floating-point capability put it at quarter speed compared to the Intel 486SL-powered Subnote.

If chips ending in SLC aren't as fast as their Intel namesakes, they are smaller, use less power, and run cooler. Running at 50 MHz, IBM's 486SLC2 needs no heat sink or fan even though it's lodged in close quarters. The chip is a power miser to begin with and keeps even cooler by running at 3.3 V, as do most of the ThinkPad's other internal components. With power management enabled, the ThinkPad lasted just over 4½ hours in BYTE's battery test.

Cyrix's 486SLC has a similar reputation for low power consumption, but the ActionNote runs it at 5 V, and the CPU's position close beneath the machine's outer skin creates a surprisingly warm spot on the bottom of the case. Battery life was under 3 hours.

Epson ActionNote 4000

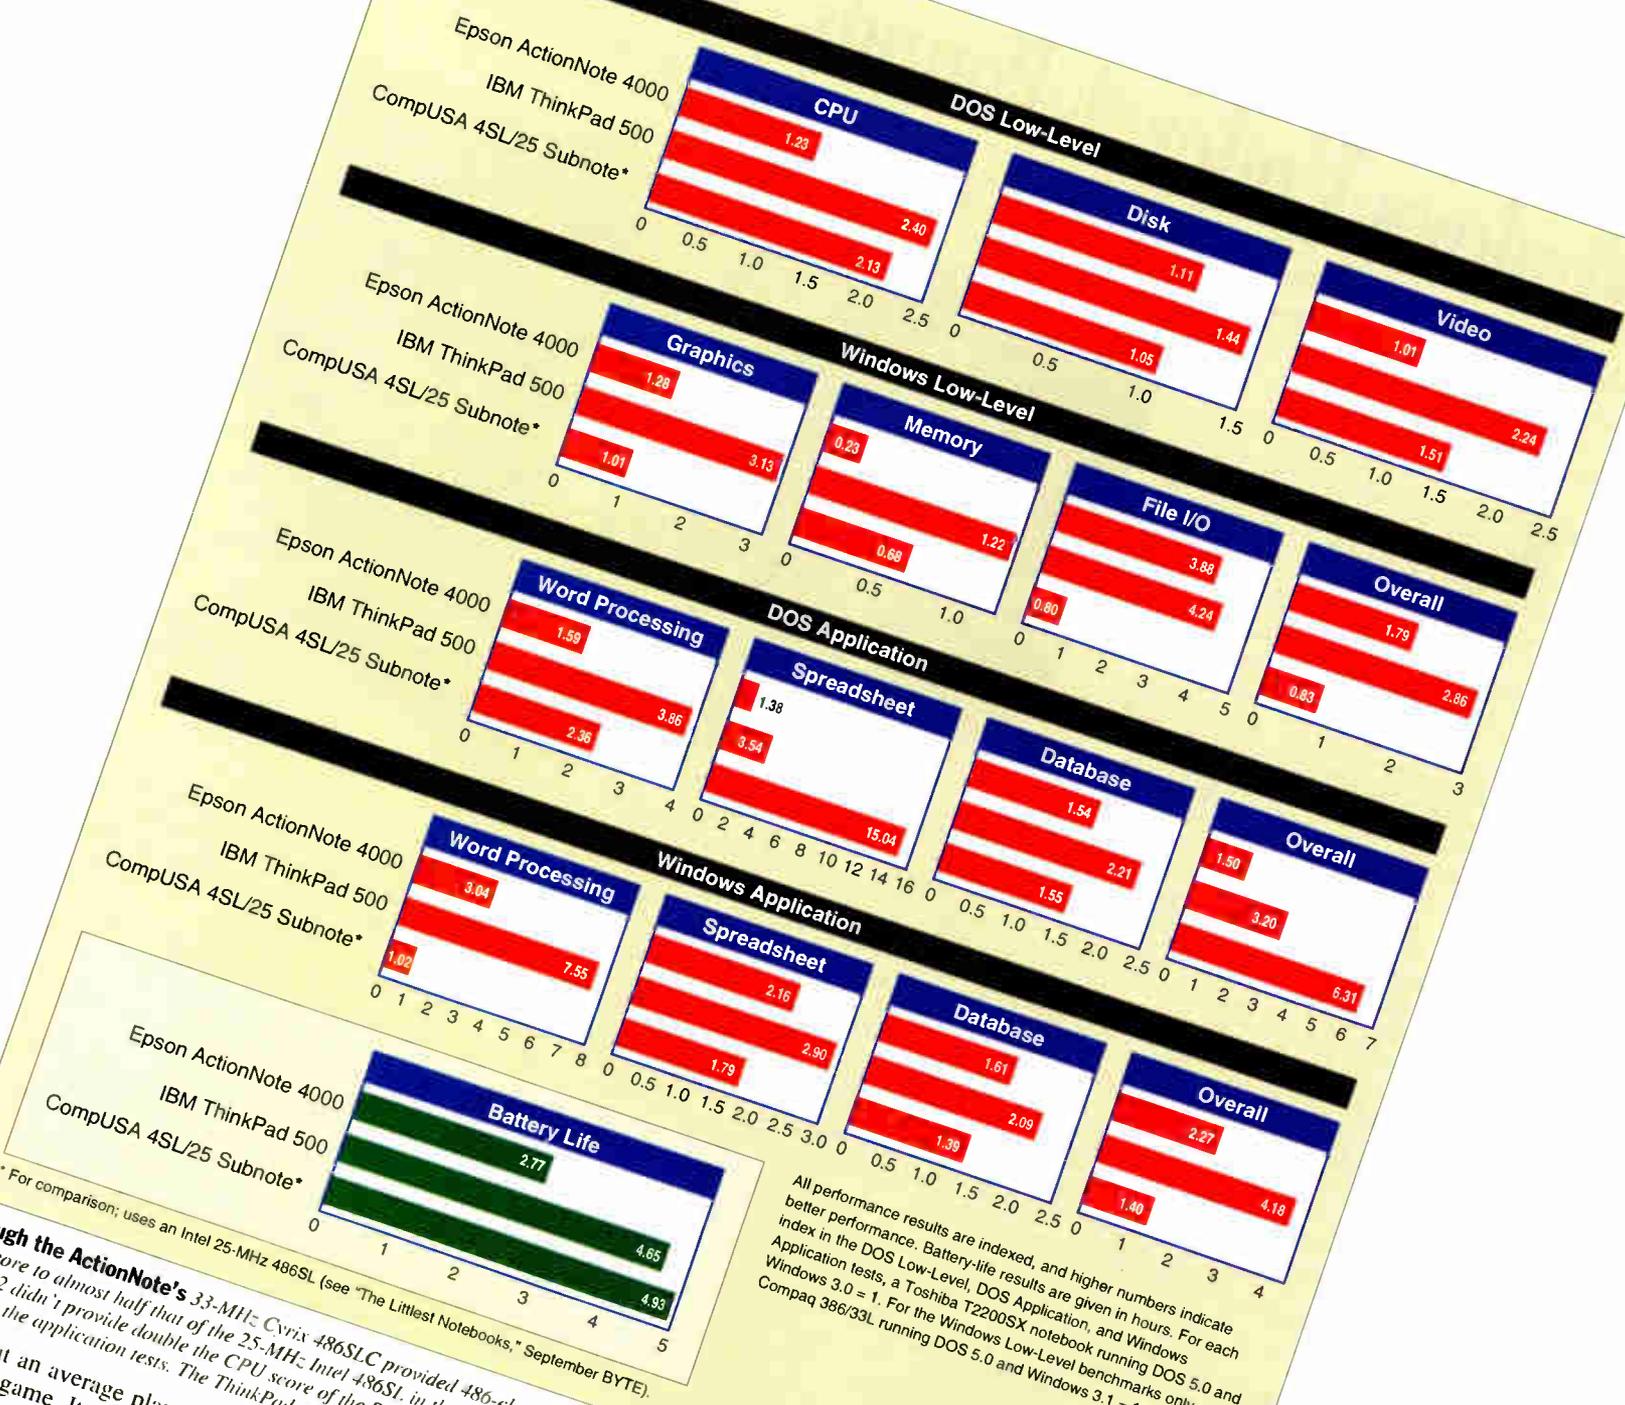

Epson's ActionNote 4000 provides a mixture of strong and weak features and s

New subnotebooks from IBM (left) and Epson America. Both run Windows easily, but IBM's ThinkPad 500 sets new usability and performance standards for this class.

Reviews Windows Under 4 Pounds

Subnotebook Performance Benchmarks

* For comparison, uses an Intel 25-MHz 486SL (see "The Littlest Notebooks," September BYTE).
 Although the ActionNote's 33-MHz Cyrix 486SLC provided 486-class integer performance, its 16-bit external memory bus lowered its DOS Low-Level CPU score to almost half that of the 25-MHz Intel 486SL in the CompUSA Subnote (provided for comparison). Similarly, the ThinkPad's 50-MHz IBM 486SLC2 didn't provide double the CPU score of the Subnote's 25-MHz 32-bit Intel chip. Disk and graphics performance was more important than CPU speed for the application tests. The ThinkPad excelled everywhere except in floating-point math, and the ActionNote beat the Subnote in Windows testing.

All performance results are indexed, and higher numbers indicate better performance. Battery-life results are given in hours. For each index in the DOS Low-Level, DOS Application, and Windows Application tests, a Toshiba T2200SX notebook running DOS 5.0 and Windows 3.0 = 1. For the Windows Low-Level benchmarks only, a Compaq 386/33L running DOS 5.0 and Windows 3.1 = 1.

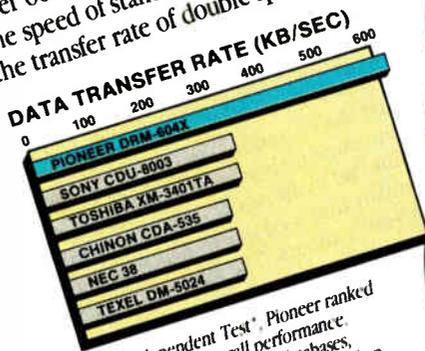

comes out an average player in the sub-notebook game. Its strong points are its sharp, paper-white LCD, smooth typing action, and a hard drive that can be removed as a cartridge. The ActionNote also comes with a carrying case, which is a \$79 option with the ThinkPad. The machine's weak points are its keyboard's nonstandard layout, a hard-to-use tiny trackball (like most found in subnotebooks) located to the right above the keyboard, short battery life, and an underdeveloped set of power management features.

The ActionNote's LCD screen appears to be the same 7.4-inch panel used in the ThinkPad. Although small (I measured the actual display area as 7 1/4 inches diagonally), the display is bright, sharp, and easy to

The World's EASTEST CD-ROM.

Yes it is the world's fastest... and no one else comes close!

Pioneer's DRM-604X, featuring its exclusive Quadraspin technology, has jumped past double speed drives to a new transfer rate of over 600 KB/sec. That's four times the speed of standard drives and twice the transfer rate of double speed drives.

In an independent Test*, Pioneer ranked number one in overall performance. The DRM-604X searched databases, retrieved files and read CD's faster than any other drive.

Highest Capacity

Not only is this drive fast, it's also the industry's only 6 disc mini-changer.

*MacWorld, July 1993

The DRM-604X holds 6 CD's and can change CD's in an amazing 5 seconds. If you need more than 6 CD's you can manually change 7 mini-changers to automatically access up to 42 discs and more than 5 million pages of data.

Best Flexibility

The DRM-604X is compatible with most operating systems and hardware platforms and has the latest features including multisession technology. Multisession makes it 100% Kodak Photo CD compatible and ready for new applications in the future.

DOS Application

Windows Application

All performance results are indexed, and higher numbers indicate better performance. Battery-life results are given in hours. For each Index in the DOS Low-Level, DOS Application, and Windows Application tests, a Toshiba T2200SX notebook running DOS 5.0 and Windows 3.0 = 1. For the Windows Low-Level benchmarks only, a Compaq 386/33L running DOS 5.0 and Windows 3.1 = 1.

* For comparison; uses an Intel 25-MHz 486SL (see "The Littlest Notebooks," September BYTE).

Although the ActionNote's 33-MHz Cyrix 486SLC provided 486-class integer performance, its 16-bit external memory bus lowered its DOS Low-Level CPU score to almost half that of the 25-MHz Intel 486SL in the CompUSA Subnote (provided for comparison). Similarly, the ThinkPad's 50-MHz IBM 486SLC2 didn't provide double the CPU score of the Subnote's 25-MHz 32-bit Intel chip. Disk and graphics performance was more important than CPU speed for the application tests. The ThinkPad excelled everywhere except in floating-point math, and the ActionNote beat the Subnote in Windows testing.

comes out an average player in the subnotebook game. Its strong points are its sharp, paper-white LCD, smooth typing action, and a hard drive that can be removed as a cartridge. The ActionNote also comes with a carrying case, which is a \$79

option with the ThinkPad. The machine's weak points are its keyboard's nonstandard layout, a hard-to-use tiny trackball (like most found in subnotebooks) located to the right above the keyboard, short battery life, and an underdeveloped set of

power management features.

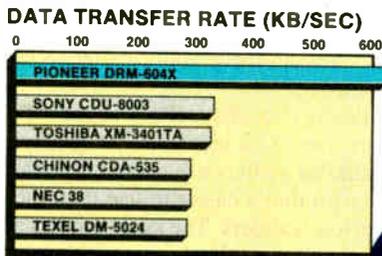

The ActionNote's LCD screen appears to be the same 7.4-inch panel used in the ThinkPad. Although small (I measured the actual display area as 7 1/4 inches diagonally), the display is bright, sharp, and easy to

The World's FASTEST CD-ROM.

Yes it is the world's fastest... and no one else comes close!

Pioneer's DRM-604X, featuring its exclusive *Quadraspin* technology, has jumped past double speed drives to a new transfer rate of over 600 KB/sec. That's four times the speed of standard drives and twice the transfer rate of double speed drives.

In an independent Test, Pioneer ranked number one in overall performance. The DRM-604X searched databases, retrieved files and read CD's faster than any other drive.*

Highest Capacity

Not only is this drive fast, it's also the industry's only 6 disc mini-changer.

The DRM-604X holds 6 CD's and can change CD's in an amazing 5 seconds. If you need more than 6 CD's you can manually change magazines or daisy chain up to 7 mini-changers to automatically access up to 42 discs and more than 5 million pages of data.

Best Flexibility

The DRM-604X is compatible with most operating systems and hardware platforms and has the latest features including multisession technology. Multisession makes it 100% Kodak Photo CD compatible and ready for new applications in the future.

For a fast response, call Pioneer at 1-800-LASER ON.

Pioneer New Media Technologies, Inc.
 **PIONEER**[®]
 The Art of Entertainment

read under most lighting conditions, thanks to adequate backlighting and an 18-to-1 contrast ratio. You can display 800- by 600-pixel resolution on an external monitor, or display standard VGA simultaneously on LCD and monitor.

The sliders to adjust contrast and brightness don't move smoothly, but they work. (This condition characterizes other components of the ActionNote's case design, such as the battery and the hard drive latches. The machine doesn't have the overall fit and finish of, for example, a Toshiba notebook.) The doors to the back ports and to the Type II PCMCIA slot are hinged and therefore susceptible to breaking off.

The ActionNote's keyboard has a smooth, pleasant typing action. Although the keys are spaced closely together in typical subnotebook fashion, most people will be able to touch-type easily. What I don't like is the placement of the reduced right Shift key—one space further to the right and close over the cursor keys—so that I was just as likely to hit the up arrow as the Shift key.

The removable hard drive makes it feasible for the ActionNote to be shared among several people, each with his or her own drive cartridge, as well as lockup data security. Currently, the review unit's 85-MB hard drive (made by Toshiba) and a larger 120-MB drive (\$220 more) are the only drive options available from Epson, and there is as yet no third-party support.

Besides a math chip, you can add memory to a maximum of 8 MB. Other expansion options are limited to what you can attach to a standard-size parallel, mouse, or serial port, or insert in the single Type II PCMCIA slot. The ActionNote comes with drivers that provide PCMCIA 2.01 Card and Socket Services. Newer cards with drivers that also meet this software standard should work; all will, eventually. Older cards that don't meet this standard may not work, because the ActionNote uses a Databook PCMCIA controller chip rather than the Intel chip that most cards with older drivers support directly. Epson sells several types of PC cards that do work in the ActionNote.

SUBNOTEBOOK FEATURES

Epson's ActionNote 4000 and IBM's ThinkPad 500 have several similarities besides small size and light weight. In addition to identical RAM, hard drive, and display configurations, both provide a small 3½-inch external floppy drive and a Type II slot that meets the latest PCMCIA 2.01 standard. The ThinkPad has the faster CPU, while the ActionNote provides for a math-chip upgrade. (Neither CPU provides built-in floating-point capability.) The lower-priced ActionNote comes with Windows 3.1 installed and a carrying case.

	EPSON ACTIONNOTE 4000	IBM THINKPAD 500
CPU	33-MHz 486SLC	25-/50-MHz 486SLC2
RAM	4 MB (up to 8 MB)	4 MB (up to 12 MB)
Storage	85-MB internal IDE (removable)	85-MB internal IDE (170-MB unit reviewed)

Price	With 85-MB drive: \$1949 With 120-MB drive: \$2169	With 85-MB drive: \$1999 With 170-MB drive: \$2499

The ThinkPad's hard drive and video systems provide exceptional performance.

The 3½-inch floppy drive cable attaches to both the keyboard and parallel ports, an unusual arrangement providing a pass-through connector for the keyboard/mouse port only. In contrast to the ThinkPad's floppy drive, the ActionNote's drive has a fold-down stand that makes it easier to insert and remove floppy disks.

Compared to the ThinkPad's, the ActionNote's power management options are limited. You can set a hard drive and a total system time-out. In addition, you can press a function-key combination to enter suspend mode, though not from within Windows. And closing the lid puts you in standby mode under all conditions. Setting power options is inconvenient because you can enter setup only during the boot-up sequence. The ActionNote's nickel-

cadmium battery lasted only 2¾ hours under power management.

The ActionNote provides preloaded Windows and the padded carrying case; both are optional with the ThinkPad. The carrying case has just enough space to hold the ActionNote, the external floppy drive, manuals, and an AC adapter with cables. A last plus is Epson's Extra Care Road Service, which provides overnight replacement of the unit with all shipping costs paid by Epson. You can keep your data by removing the old hard drive and installing it in the new system (if the problem isn't with the drive itself).

IBM ThinkPad 500

There's more to like and less to dislike about IBM's

ThinkPad 500 than there is about Epson's ActionNote. Performance is at the top of the list. In addition to the fast speed-doubled CPU, the ThinkPad's hard drive and video systems provide exceptional performance for a system without graphics acceleration. The ThinkPad zipped ahead of the ActionNote in all the BYTE benchmarks—low-level and applications, DOS and Windows.

While the two subnotebooks appear to share the same nice monochrome display, the ThinkPad's offers a digital adjustment mechanism that's easier to use than the ActionNote's sliders. The keyboard has a great layout for a subnotebook; it closely resembles that of larger notebooks. I liked the ActionNote's typing action better, but I'd rather use the stiff-typing IBM keyboard because of its layout. The compromise that allows this relatively luxurious key layout is foreshortening of the function keys (F1 through F12) and cursor keys. Although reduced in size, the cursor keys are all there (not doubled up, as with the ActionNote), and the arrow keys have the inverted-T arrangement that most people prefer. Both Epson's and IBM's arrangements are necessarily compromised, but I find that the IBM arrangement slows me down less.

I also preferred the TrackPoint II, the ThinkPad's pink-rubber pointing device, over most trackballs, although a mouse is better still. The pink stick connects to a

A chain is as strong as its weakest link.

Picture your Hardlock™ key as a bike lock, and the accompanying software routines used to implement the copy protection as the chain. You can own the best lock that money can buy, but that lock is useless if the chain is weak.

Introducing **HL-Crypt**, a major breakthrough in copy protection. HL-Crypt is not just a shell or simple conditional response checker. Using our proprietary Patcher Technology, HL-Crypt encrypts and binds the application to your Hardlock™ device. HL-Crypt features many protection modules that secure the application against piracy, reverse engineering, and debugging, to name a few.

Picture HL-Crypt as an ironclad chain. The only ironclad chain in the industry today. For more information, call

Olivetti's Quaderno Now Does Windows

When BYTE last looked at the Olivetti Quaderno (see "Ultraportable PCs: Worth the Trade-Offs?," April BYTE), we found that it filled a niche somewhere between a bulky palmtop and an underpowered subnotebook. With an 8086-compatible V30 chip running at 16 MHz, 1 MB of RAM, a 20-MB hard drive, and a reflective LCD screen, the Quaderno could run DOS, but you couldn't touch-type on the diminutive keyboard.

Quaderno's attraction was its built-in voice-recording capability: a microphone, a speaker, and digital recording software. In addition to using the Quaderno as an

electronic notebook with the supplied suite of business software, you could also use it as a dictation machine, pressing "tape recorder" buttons on the outside of the case (or function keys if the top is up).

Olivetti's updated Quaderno 33 has the same appealing voice-recording functions as the original, but it has moved into the Windows environment, thanks to a hardware boost that has bulked it up a pound in weight and almost half an inch in thickness. In addition to Windows 3.1, bundled software now includes Microsoft Works and Lotus Organizer.

With a 20-MHz AMD 386SXLV CPU, 4 MB of RAM (expandable to 12 MB), and an 80-MB hard drive, the Quaderno 33 is now just fast enough to run Windows. The screen has also gained backlighting. Besides adding weight, these hardware changes have decreased battery life. In a worst-case situation with power management disabled, the Quaderno 33 lasted only an hour and a half on battery power.

The price has gone up along with the weight. While the original Quaderno now sells for \$699 (down from \$1195), the Quaderno 33's price is up to \$1750. The Quaderno has definitely moved into subnotebook territory, but you still can't touch-type on it.

pressure transducer that senses the amount and direction of pressure you apply. The device is no more accurate than a trackball for moving the cursor long distances across the screen, but you don't have to lift your finger from it (as you sometimes do for a trackball when you need to put in an extra roll), so it's less annoying when you have to make secondary adjustments. And for small movements in a local area, the TrackPoint gives finer control than even a mouse. It also lets you keep your fingers on the home row. The "mouse buttons" are within thumb reach on the front of the case.

The ThinkPad provides a plethora of power management options, all of which are readily available at any time with a well-marked function-key combination. Enabling doze mode allows the CPU to slow down when it's not busy (e.g., between keystrokes). Suspend shuts down most subsystems in the ThinkPad but leaves the contents of memory intact so that programs pick up where you left off.

Hibernation is a state where memory contents are saved to disk and the computer shuts off totally.

You can also set timers for shutting down the hard drive, the display, or the whole system, and specify whether parallel and serial ports are power managed. The ThinkPad can be aroused from suspend mode by modem, or you can set a particular wake-up time.

The lead-acid battery has no memory effect, so you can top it off as much as you like without worrying about shortening battery life. The self-charging battery

can be plugged directly into the wall for charging, eliminating the need for the included AC adapter if you can charge the battery when you're not using the system. With power management pushing battery life to over 4½ hours, that's a real possibility for some users.

The ThinkPad has a standard printer port, but the video port and the floppy drive/serial port have miniature nonstandard connectors. However, IBM provides two adapter cables that create the necessary standard connectors, as well as the floppy drive connection. The parallel port supports EPP (enhanced parallel port). The sliding door that covers the external ports on the right rear of the machine won't break off or fall out, but it sometimes gets off track when closing—a minor annoyance at most.

You can expand the ThinkPad's RAM to a maximum of 12 MB. Although there is no internal modem slot, the single Type II PCMCIA slot will do. The ThinkPad is PCMCIA 2.01 compliant; this new designation covers the latest PCMCIA hardware and Card and Socket Services standards. The ThinkPad also uses an Intel PCMCIA controller chip that most older card drivers support. The system comes without a case or Windows; on the other hand, it comes equipped with Prodigy software and IBM DOS 6.10.

The Performance Choice

The Epson and IBM notebooks are comparable in size, weight, and many other features. Epson's ActionNote 4000 costs at least \$50 less for a comparable configuration and comes with a case and Windows.

Nevertheless, the IBM ThinkPad 500 clearly comes out ahead. It offers better performance, longer battery life, easily accessible and superior power management, and a workable keyboard layout. ■

Dave Rowell, a technical editor for the BYTE Lab, has reviewed notebooks and other systems for 10 years. You can contact him on BIX as "drowell."

Harness the Power of 64-Bit Graphics

The *Proven* 64-bit graphics standard from Matrox.

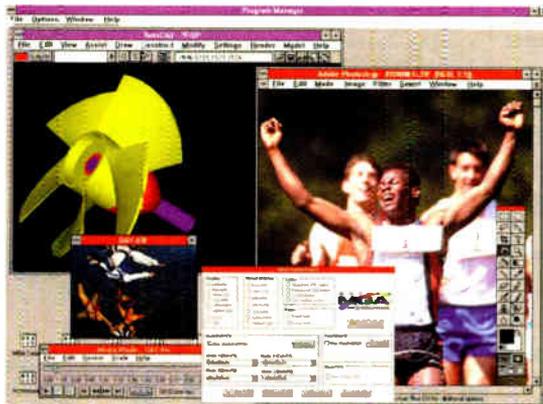

You asked for workstation-level performance from your PC. We gave you a 64-bit graphics engine. You asked for blazing speed. We gave you 60 to 70 million WinMarks* for 8-bit color and 25 million WinMarks for true 24-bit color acceleration. You asked for flexible computer and software support. We gave you support for AT, VL, MCA, PCI and Windows 3.1, NT, OS/2, AutoCAD, Microstation and X-Windows for Unix.

"...the accelerator beat our previous standard of excellence hands down."
Peter Coffee

Point-and-Click Presentations

Harvard Graphics proves its mettle as the presentations market leader against an upstart challenge from WordPerfect Presentations

MARK CLARKSON

It's always exciting to witness a fray between an established veteran and a newcomer. Software Publishing Corp.'s Harvard Graphics is the granddaddy of the presentation graphics world. In fact, SPC takes unabashed credit for having created the whole field way back in 1986. SPC's latest entry is Harvard Graphics for Windows 2.0 (\$395).

WordPerfect—best known for its popular word processor—is a newcomer to the presentations arena with its contender WordPerfect Presentations for Windows 2.0 (\$495). (Don't let the version number fool you; there was no version 1.0).

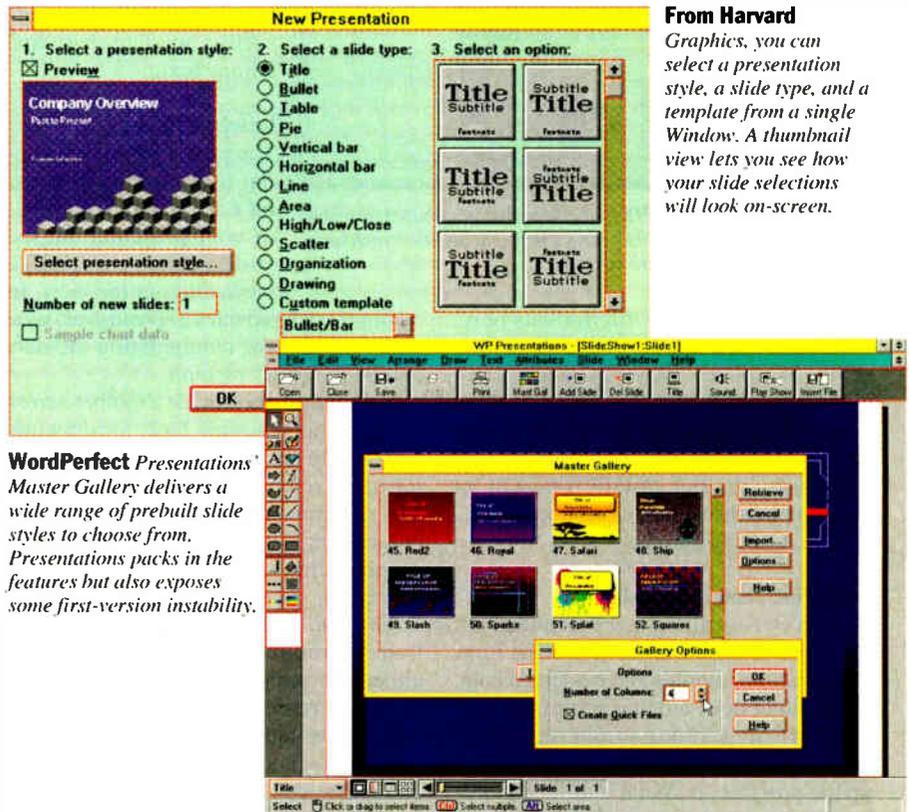

I pit the two packages head-to-head to see how WordPerfect's entrant stands up against the standard set by Harvard Graphics. In many ways, WordPerfect Presentations holds its own, but some serious flaws hamper its appeal.

Baroque Backgrounds

Multimedia is *the* buzzword for the 1990s, and these programs simply bristle with multimedia tools: sound, music, video, special effects, bit-map and vector graphics, charts, sophisticated drawing tools, and so on. And by the way, they can display text, too.

Frankly, if you're just doing bulleted word charts to slap onto an overhead projector, you don't need either of these programs, although they would make your task easier. In fact, most of the newer, snazzier features are geared specifically toward presentations given on a PC; if you're sending the output to slides or overhead transparencies, the multimedia features don't do you any good at all.

WordPerfect Presentations tries hard to be your one-stop graphics shop. To emphasize its support of the TWAIN scanner interface, WordPerfect is bundling Logitech's ScanMan 32, a hand-held grayscale scanner, until October 31. Presentations plays sound and music (WAV, MIDI, and CD) and supports video through OLE (it's an OLE server and client). The package comes with an impressive collection of goodies, including a handful of WAV files, 100 MIDI music files, 30 ATM fonts, 1000

From Harvard Graphics, you can select a presentation style, a slide type, and a template from a single Window. A thumbnail view lets you see how your slide selections will look on-screen.

WordPerfect Presentations' Master Gallery delivers a wide range of prebuilt slide styles to choose from. Presentations packs in the features but also exposes some first-version instability.

pieces of clip art, and 60 backgrounds ranging from vanilla to Byzantine.

WordPerfect includes a bit-map image editor, but it's not much of an improvement over the paintbrush program that comes with Windows. It has no good variable-zoom feature: You are zoomed either all the way out or all the way in. And if you're all the way in, most of the tools don't work. I found it impossible to crop images that were too big to fit on the screen all at once.

Harvard Graphics lacks TWAIN support and comes with a smaller but adequate collection of over 500 pieces of clip art. This package also integrates support for sound (MIDI, WAV, and CD) and video and supports OLE, both as a client and as a server.

Special Effects

Harvard Graphics comes with an applet (a mini-application), called F/X, for producing fancy drawings. F/X supports so-

phisticated path-based drawing and provides some special effects for bit maps, text, and objects. All of this is nice, but some simple capabilities (e.g., cropping or rescaling a bit map) are missing. I need to crop bit maps much more often than I need to render them as seen through frosted glass.

F/X feels like a bit of a kludge, something bolted onto the side of the product as an afterthought. I wanted to apply some of those cool text effects to my slides, but it's not that easy. In fact, you can't run the F/X program directly from Harvard Graphics; you must run it as a separate program from the program manager, or you can embed an F/X object in your presentation via OLE. On the other hand, since F/X is a stand-alone program, you can use OLE to embed F/X pictures in any OLE client—your word processor, for example. I expect to see F/X more fully integrated into the product in future versions.

Both of these programs read and write

In Business. Everywhere.

Quaderno 33 is the smallest Windows PC yet designed. With 386 SXLV speed and a backlit screen, it is ideal for your work, whatever you do and wherever you do it.

It speaks your language: MPC business audio means it's easy to add vocal notes to documents, or send voice mail messages.

It's dynamic: up to 12 Mb RAM and 60 Mb HDU, rechargeable batteries plus the speed of the 386 SXLV microchip.

It's street smart: the efficiency of a built-in trackball that provides a simple and immediate interface with ready to use Windows 3.1. The pre-installed MS-Win Works and Lotus Organizer

are always on time, and the User Manual is always on line. Its total compatibility lets you work with all your favorite software packages.

It's always with you: 2.9 lb. and 8 1/4" x 5 3/4" of stylish design you can take everywhere. It fits in your coat pocket and puts in up to six hours of work. And Quaderno 33's complete connectivity can take you anywhere in the world by modem and fax (with its PCMCIA type II slot), or by network. Even the most complex corporate organizations are rediscovering the power of individuals.

With Quaderno 33, wherever you go, you can give your company the best of individual productivity.

Windows 3.1 is a registered trademark of Microsoft Corp. Lotus Organizer is a registered trademark of the Lotus Development Corp.

Reviews Point-and-Click Presentations

WordPerfect Presentations comes bundled with a bit-map editor, but it's not much of an improvement over Windows Paintbrush.

change slide types (e.g., from a title slide to an organization chart).

To edit any object on the screen, just double-click and you are taken to the chart editor program. Type in your changes and click on return. This makes sense if you're editing a large block of numeric data, but it's a *slow* way to edit simple text. A title change takes almost twice as long under WordPerfect as it does in Harvard Graphics, where you edit text directly on the slide.

The chart editor allows you to do some powerful editing. You can easily skew the chart around in three dimensions, looking at your data from above or below, right or left.

But WordPerfect Presentations has some serious problems. Often when I closed down a series of menus, I found little bits of flotsam lurking on the screen—fragments of menus and dialog boxes that were incompletely erased or, occasionally, too completely erased, leaving blank holes on the page. These artifacts weren't part of the slide—any operation that forced WordPerfect to redraw the screen took care of them—but they were pretty annoying.

The bit-map editor would also blow up when called on to edit relatively large bit maps (e.g., 640 by 480 pixels). And worst of all, WordPerfect had a habit of "eating" pieces of my slides. Three times during the review, elements disappeared from slides in my presentations. I had

saved the work, but the elements were missing from the saved files as well. The files seemed fine, and not all slides were affected.

WordPerfect's technical support was unable to tell me what was causing the problem, unable to duplicate it, and, as far as I know, unable to find anything wrong with the files in which it had occurred. One customer-support representative admitted that it had happened to him once, although no one had ever been able to figure out exactly why it happened.

Needless to say, if you've spent the entire morning laboriously constructing a complicated slide for a presentation to your boss, you do not want to find that most or all of the elements in one of your slides have simply gone away. This is a serious problem.

And the Winner Is...

As a long-time user of WordPerfect, I wanted to like WordPerfect Presentations. WordPerfect packs in lots of features and more clip art, more music, more frills, and more gewgaws. It's got a bit-map editor and its own supply of fancy new fonts.

But the program just isn't solid. WordPerfect Presentations is full of little oversights, and it crashed on both of my machines many times, providing a variety of errors from general protection faults to a mysterious divide-by-zero error. Harvard Graphics, on the other hand, was solid as a rock. Even the beta version never crashed, never hung, and never, *never*, lost my data.

If WordPerfect can clean up this program, the company will have a legitimate challenge to SPC, Lotus, Microsoft, and the other leaders in the presentation graphics field. For now, however, WordPerfect Presentations does not live up to its promise. Harvard Graphics is still the champ. ■

The Good Books.

The HandBook®

Size

The difference between a 3-pound portable and a 4-pound portable doesn't sound like very much until you lug one around for hours. Then every ounce counts! HandBook users sing the praises of the

HandBook's size. It's big enough to be fully functional, but small enough to take anywhere effortlessly.

Battery

A 2.2Ah NiMH rechargeable battery comes with your HandBook. The battery lasts up to four hours with power management, about two hours without power management.

You receive an AC adapter/charger that charges the battery pack separately or in the HandBook.

The HandBook also has a

convenient alkaline battery pack option which enables you to use over-the-counter double-A batteries, too.

Drive

The HandBook 486 includes an 80MB or 130MB hard drive for today's larger Windows programs and files. With the Interlink software utility and serial download cable provided, you can easily transfer data between the HandBook and other PCs.

Display

Looking at the HandBook's VGA display is easy on your eyes. It's the largest backlit display of any subnotebook in this world or the next, and you can use it comfortably in all lighting situations.

Suspend/Resume

Suspend/resume is one of the features HandBook users rejoice about! It allows you to stop work any time, leave all your Windows applications open, then resume instantly at exactly the same chapter and verse without losing anything or restarting the system. It's great for taking notes in meetings!

The ColorBook

Dual-Scan STN Display

Dual-scan STN color is the latest technology in portable color displays. The incredible quality of the LCD coupled with local bus video gives you truly out-of-this-world graphics. You can display up to 256 colors with the ColorBook running in VGA mode.

Battery

You can have faith that your rechargeable battery will last up to four hours with power management, over two hours without power management. You also get an AC adapter/charger capable of fast-charging the battery separately or during operation in the ColorBook.

Suspend/Resume

Gateway 2000 HandBook users like suspend/resume so much we designed it into the ColorBook as well!

Drive

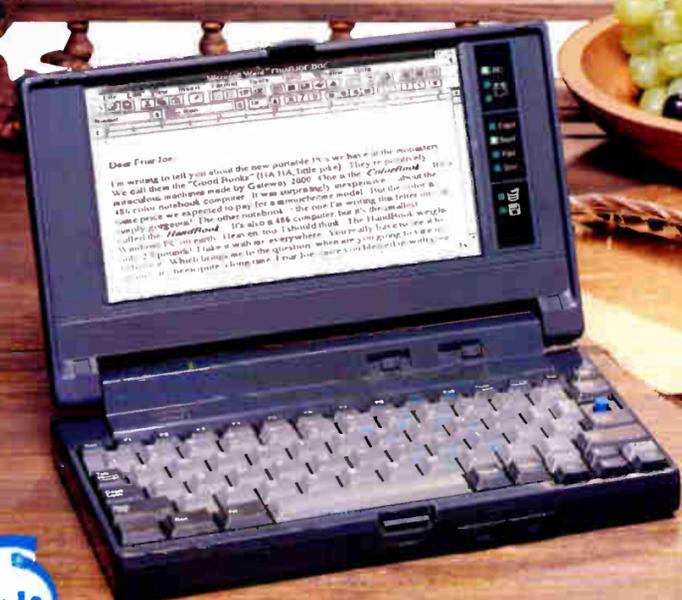

The ColorBook includes a floppy drive and a high-capacity hard drive. The hard drive is removable — a handy feature for companies where notebooks are checked out to multiple users. Upgrading to a larger drive in the future is also much easier with the ColorBook's removable hard drive.

External Ports

The ColorBook has parallel, serial, PS/2 and VGA ports. You can use it with an external mouse, keyboard and monitor. The ColorBook supports simultaneous video and allows you to display your ColorBook screen on an external monitor in up to 1024 x 768 resolution.

Your Calling

Surely one of these "good books" is a match made in heaven for your needs. Give us a call. We'll be eternally grateful!

8 0 0 - 8 4 6 - 2 0 1 0

The Gateway 2000 HandBook® And ColorBook Are Simply Divine!

If you're looking for the perfect portable PC for your next pilgrimage, look no further than the HandBook and ColorBook from Gateway 2000.

One of these notebooks is the answer to your prayers.

4 The HandBook 486 is the next generation of the original HandBook, the product that was the genesis of an entirely new portable PC category dubbed "subnotebook" computers. The new product is blessed with many improvements while retaining all the things people love about the first model. With the HandBook 486, you get the smallest Windows™ PC in this world — and when using a 486DX2 processor, the HandBook is by far the most powerful PC of its size. New HandBook 486 models include SL Enhanced Intel486™ CPUs and come with 4MB RAM (expandable to 20MB), 80 or 130MB hard drive, backlit VGA display, built-in pointing device, and one PCMCIA slot. All this and the HandBook 486 still weighs under three pounds, is smaller than the day planners many people carry, and starts at \$1,495. Once you get your hands on a HandBook 486, you'll be a HandBook convert.

 The ColorBook is the 486 color notebook that's priced the same as other companies' black-and-white models. With the ColorBook, you get bright, crisp color graphics from the dual-scan STN display. You get a small, easy-to-carry notebook. The ColorBook weighs less than 5.7 pounds and measures 11.7" x 8.5" x 1.77". It's one of the thinnest color products on the market. And, you get 486 performance. ColorBook models are based on SL Enhanced Intel486™ processors, and include the virtues of a 1.44MB floppy drive, 4MB of RAM (upgradeable to 20MB), a large, fast hard drive, integrated track ball and two PCMCIA Type II card slots. All this starting at under \$2,000. Heavenly!

Behold.

The Business-Card Shuffle

The Microtek Scan-in-Dex scans business cards and puts them where you can find them—in a searchable Windows database

HOWARD EGLOWSTEIN

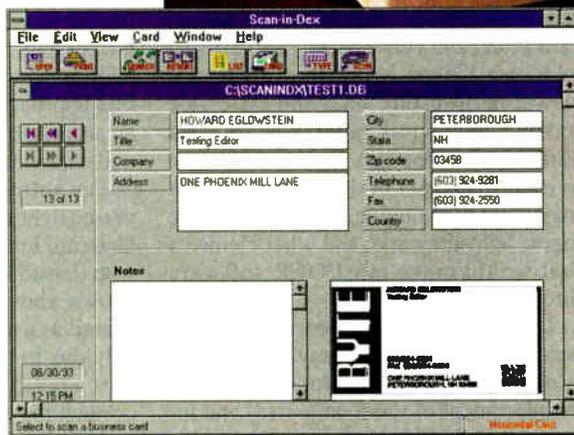

If you collect a lot of business cards and need to keep track of the contacts, you know the problem: Either you can sift through the cards every time you need a phone number, or you can manually key the information into a database every time you get a card. Microtek's Scan-in-Dex promises to deal you a fresh hand by scanning your cards, recognizing the names and addresses, and storing the information in a searchable database. It's an idea that's been floating around the industry for a long time, but no one has been able to implement it until now.

The \$399 Scan-in-Dex package is a combination of hardware and software for your 386 or better PC running Windows 3.1. The scanner is a svelte unit, weighing in at just over 1 1/2 pounds and taking up just 6 1/2 by 6 inches on your desk. An 8-foot cable attaches the scanner to the 8-bit interface card that slides into a free slot in your PC. The scanner gets its power from the interface card. The software installs easily and provides a simple but minimalist user interface to a lightweight database application.

A Tough Hand

Scanning business cards and applying OCR technology isn't a new idea. Several packages have let you place your business cards on a flatbed scanner, extract the information, and store it in a database. But most of these packages haven't worked well, due to the limitations of standard scanner and OCR products. A 300-dpi scanner teamed with OCR software is usually straining to get reasonable accuracy with 6-point text.

Most mainstream OCR software is designed to read business documents (typically printed at 10 or 12 points), printed in standard "business-like" fonts. Business cards often feature text in many colors, include some tiny text items (perhaps as small as 4-point), and use unusual fonts

Scan-in-Dex scans business-card data into a searchable Windows database. Intelligent algorithms automatically drop the information into the appropriate fields. In this case, the software could not handle the company name because of its vertical orientation on the business card.

optimized for pulling a variety of business-card stocks through its mechanism. There's no power switch, and no buttons of any kind. To scan a business card, you simply place the card in the input tray.

A Diamond in the Rough

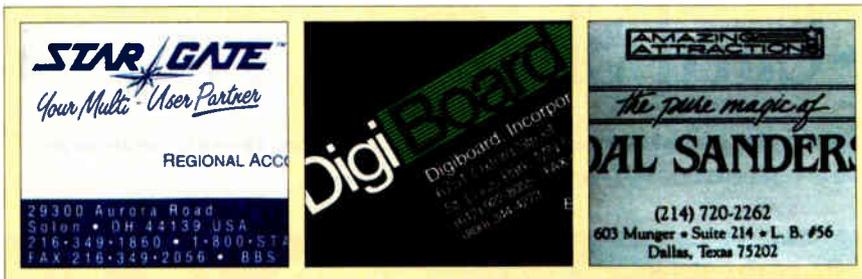

Getting my evaluation unit working took some doing. First, I tried installing the scanner interface into a typical machine for the times: a 66-MHz 486DX2 with 16 MB of memory, a CD-ROM, and a sound card. Microtek provides jumper settings for four different I/O selections, but the scanner just didn't want to run in this machine.

I then moved the card to a different PC: a 33-MHz 486 with a similar configuration but with components from different vendors. After I made sure I moved the interface card's I/O address to step around the sound card, the interface card installed fine. It could be that the sound card in the

in creative ways to make a statement. Elements like these present a significant challenge to OCR vendors and require specially adapted OCR algorithms. Microtek's OCR software (licensed from Ocron) was designed to handle the various characters typically used on business cards, and automatic gray-scale thresholding helps differentiate colored text on colored backgrounds.

If you've tried arranging a handful of business cards neatly on a copier's glass, you've experienced the other big problem: getting the information into the computer so that the OCR software can get a look at it. Microtek's solution is elegant: The scanner is built specifically to scan business cards. It's a single-feed 400-dpi scanner,

Reviews The Business-Card Shuffle

Scan-in-Dex cannot decipher many business cards with creative layouts. It could not handle the logo at the top of the Stargate card (left) or the reverse text at the bottom of the card. The DigiBoard card (center) was doubly tough because the text was both slanted and reversed. And Scan-in-Dex was foiled by the contrast between the text and the silver background of the business card at right.

486DX2 was stepping outside its designated address range. If Microtek had provided a wider range of I/O address selections, I could have moved the card way out of reach of the sound hardware, making the issue moot.

The OCR and Windows database software comes on a single disk. The software installed without trouble, and within moments of popping in the disk, I was scanning business cards.

The Scan-in-Dex software is impressive in its simplicity. To enter the information from a card into your database, you simply drop the card face-down in the scanner and click the Scan button on the toolbar. The scanner pulls the image in and displays it in a small window on the screen. As the OCR software executes, you see the status in the business-card window. Within seconds, the name, address, phone numbers, and other information from the card appear in the proper fields on the database entry screen.

To figure out what information goes into which field, Scan-in-Dex uses clues from the data format. It keeps a small database of titles and positions. When it finds keywords such as *president* or *manager* in a line, it knows that it has found a title. Phone numbers are usually in the format (xxx) xxx-xxxx or something similar, and fax numbers are often preceded by *fax:* or *telex:*. Any information that the OCR software recognizes but can't place goes into a general Notes field. You can then drag and drop data from place to place on the database form.

If the card won't fit into the scanner's 3.6- by 2.4-inch maximum limit, you simply enter the card data manually. However the data gets there, you can sort it by name or company, and display it on-screen or print it on any Windows-compatible printer. Fi-

nally, you can export the information to an ASCII file to move it to another application. You choose between comma- or tab-delimited formats. Again, simple but effective: I can't think of a database, spreadsheet, or word processor application that can't import an ASCII file. Specific formats support Act and Lotus Organizer.

Sample Scans

I tested the installation by scanning hundreds of cards I've collected over the years or borrowed from other editors. A typical card scans and converts in 15 to 20 seconds on a 486 machine; expect somewhat slower performance on a 386 (Microtek recommends a minimum of a 20-MHz 386DX). Scan-in-Dex successfully read in over 50 percent of these cards without major errors, including some very strange logos, light-gray text, and other elements that would make most OCR software throw in its cards.

The most common error was confusing personal names and company names (there is no accurate heuristic for determining the placement of these on a card) and incorrectly adapting to an unusual color scheme. The scanner's automatic contrast adjustment could usually pick up light-gray text on a white background. However, if there was a nearby logo or element in black, the scanner got confused and failed to find the gray text. Still, I don't think I've ever seen any standard office OCR software that could do any better.

Microtek's intended audience is the busy professional who wants a quick and easy solution for entering information from business cards. The trade-off for simplicity and ease of use is leaving out some features.

The most glaring omission

is the unconfigurable database-field layout. You get fields for name, address, company, title, country, one phone number, and one fax number. Some people have multiple phone numbers or E-mail addresses; this information just gets lumped into the Notes field.

The OCR Challenge

Many of the test cards I ran through the scanner contained colored text, strange fonts, and graphical elements. The Ocron OCR software did a remarkable job of picking letters out of many of the logos, and it seldom failed to decipher the tiny 4-point text that a lot of these cards had.

To handle horizontal and vertical formats, you have to tell the software which way the card is oriented before scanning it. This proved to be annoying as I shoved cards through the scanner for the better part of an hour, but I suspect that I'd find it less of a problem if I only had one or two cards at a time.

I would have liked to see the software handle this situation using a technique common throughout the OCR industry: If you scan a card and the entire thing looks like gibberish, go through the data again at a right angle and try recognizing it then. With images as small as a business card, this approach can't be hard, and having an automatic card-orientation mode would make the product easier to use.

The software also will not handle reverse (light on dark) text or slanted text. One card I tried was dark green and black, with slanted white text (the DigiBoard card shown above). The scanned image appeared as a mangled checkerboard (probably due to the scanner's automatic contrast adjustment), and the OCR software crashed the application with an unrecoverable error. That problem would not have bothered me—after all, the manual specifically states that the software won't do reverse or slanted text—but I hadn't saved the results of over a half-hour of scanning cards. The whole database was lost.

Scan-in-Dex isn't perfect, and it's not going to scan every business card. Microtek has a few loose ends to deal with: The box won't connect to your laptop computer yet, and having to tell the software the card format should be unnecessary. But in spite of its faults, Microtek's Scan-in-Dex is an elegant solution to a difficult problem. ■

Howard Eglowstein is a testing editor for the *BYTE Lab*. You can contact him on BIX as "heglowstein."

Poetic License \$99.*

The True, Cross-Platform C++ Object Database.

Empower yourself to create the C++ applications you've always envisioned.

For a limited time, you can get a single-user POET Personal Edition for Windows for just \$99. The Personal Edition is 100% compatible with the client/server Professional Edition and supports either a Borland or Microsoft Compiler.**

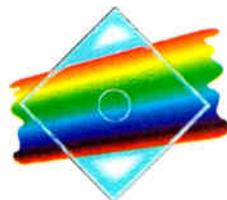

POET is truly object-oriented. It saves you time because complex objects do not need to be broken up into tables. POET requires only one command to store, read, or delete them.

POET gives database functionality to C++. Your Personal Edition features include: object querying, sorting, indexing, transactions, class versioning, container classes, variable length string and BLOB types.

True heterogenous capabilities. Both the Personal Edition and the Professional Edition offer built-in portability. You can leverage your C++ programming investment across DOS, Windows, Windows NT, Novell (NLM), NeXT 486, Macintosh, OS/2 and various UNIX platforms.

The Personal Edition for Windows is only \$99 now, but starting in '94 prices go up to \$139. So, take some liberties with POET — order today at this one-time-only, low price.

How Do You Know You've Got The Right Software Protection?

Your software protection strategy shouldn't be a hit or miss proposition. But with so many conflicting claims about one vendor's product being better than another, we can understand why you might want to leave it to chance.

The fact is, what really makes one protection scheme better than another is the level of security it provides. For more than a decade, we have been pioneering seamless, reliable security systems for your applications and data. Software Security's many patents

are evidence of our continuing ingenuity in developing ways of protecting your intellectual property. Our latest advances in software distribution, network license control, and "metering" are worth looking at.

But that's only part of the story. We offer a wide range of developer tools including our very highly secure AEGIS System™ which requires only a few minutes to implement. In addition, we understand the importance of our relationship with our customers

and are fully committed to the best developer support program in the business.

If you are serious about protecting your software, contact Software Security and ask for an evaluation kit. It contains everything you need to explore all of our outstanding protection methods. So call today and see why there's a big difference between the bull's-eye and the bull.

NLMerlin and AlertView

A pair of watchdogs for PC-based LANs monitor network problems and take action

MIKE HURWICZ AND DAN CARROLL

Network management usually boils down to fire fighting and handling routine tasks. Unlike most PC management utilities, Knozall's NLMerlin and Shany's AlertView are management tools that can help automate both ends of the job.

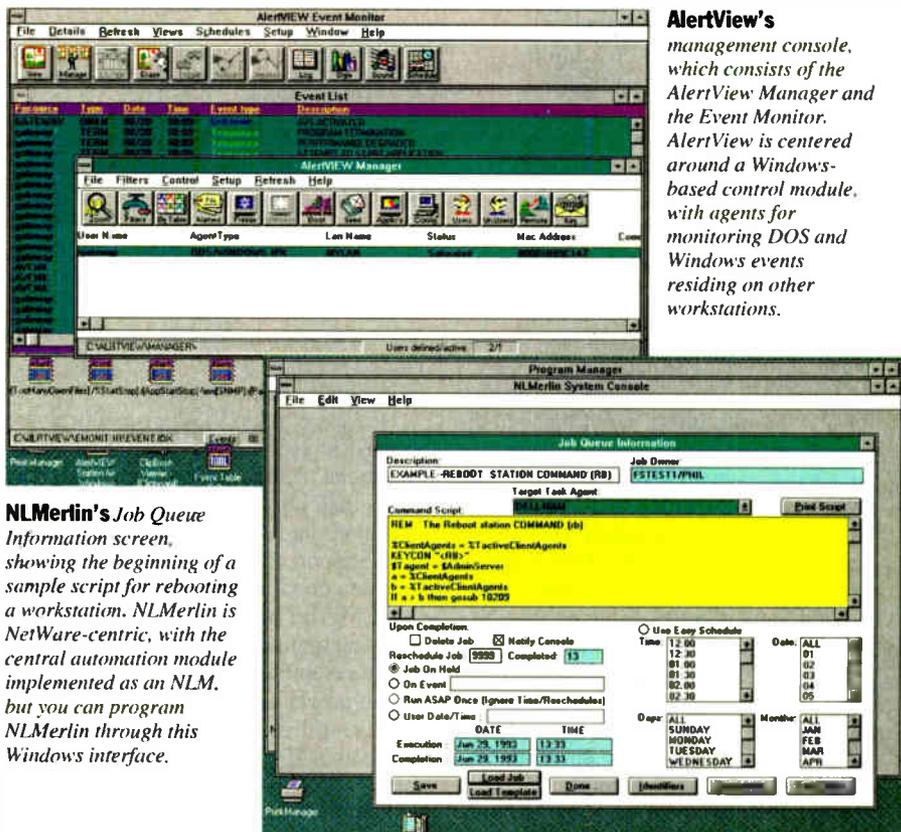

Although these products address similar gaps in the network management market, they are more complementary than competitive. AlertView's strength is monitoring and responding to problems in Windows and DOS applications. This package also detects network-related problems encountered in these applications. NLMerlin focuses on NetWare file servers and is better suited to day-to-day task automation than to handling problems. NLMerlin also offers some task automation and problem handling for DOS and Windows workstations.

What They Do

NLMerlin consists of four types of modules: administrative server agents implemented as NLMs (NetWare loadable modules), NLM-based server task agents, workstation task agents implemented as TSR programs, and a Windows-based administrative utility or *system console*. Only one server has to have an administrative server agent. When present, the administrative server agent is combined with a server task agent in a single NLM.

The system console, communicating with the administrative server agent by way of a direct file interface, is used for managing security and scheduling jobs. Once a job is in the queue, the administrative server agent keeps track of it and distributes it to one or more task agents. Task agents on either servers or workstations receive and carry out jobs. The administrative server agent communicates with task agents via IPX, using MCPs (Merlin control packets).

AlertView is also an agent-and-manager combination. The two functions are performed by a Windows-based administrative utility (the management console) and workstation agents implemented as TSRs. The management console is used to mon-

AlertView's management console, which consists of the AlertView Manager and the Event Monitor. AlertView is centered around a Windows-based control module, with agents for monitoring DOS and Windows events residing on other workstations.

NLMerlin's Job Queue Information screen, showing the beginning of a sample script for rebooting a workstation. NLMerlin is NetWare-centric, with the central automation module implemented as an NLM, but you can program NLMerlin through this Windows interface.

itor events, schedule and initiate procedures, and gain control of workstations through the workstation agents. The agents monitor system events and report them to the management console. All modules communicate via IPX, DLC (data-link control), NetBIOS, or TCP/IP and proprietary packets.

A more detailed look at the information gathered by the two programs highlights their differences. AlertView detects and records application activities, including starting and stopping applications, file operations (e.g., open, close, access denied, and file not found), interactions with peripherals (e.g., drive not ready and serial port time-out), Windows errors (low Windows system resources), and network client errors (e.g., network device driver error, sharing violation, locking violation, send/receive error, network busy, and IPX/SPX time-out). NLMerlin can't detect a single one of these application events.

On the other hand, NLMerlin can de-

termine the number of server volumes, current server utilization, average server utilization over the last 10 minutes, number of connections on the server, total disk space, and percentage of disk space in use on a server, as well as information specific to the NetWare bindery (e.g., the number of user, group, and server objects in the bindery). On its own, AlertView will only display the name of the primary server. (Through integration with the NMS [NetWare Management System], AlertView can get and respond to SNMP alerts, including alerts from Novell's server-based agents. But when it comes to managing servers, NMS can do as well without AlertView.)

Running Each

Installation is straightforward for both products, though a little faster for NLMerlin (with only one disk to install) than for AlertView (which has six). We had some problems learning to use AlertView. For

instance, we had trouble starting applications on remote Windows workstations. We could start Windows accessories like Notepad or Clock, but not other applications. In addition, we were unable to stop the Windows accessories. Eventually, we learned that we had to enter the full path of the executable file to start the application. To stop it, we simply had to reselect this program from a list. The documentation for these functions was not very clear, and even Shany's technical support required three calls to determine the problem. We were told that these functions are new in version 2.1.

We also had trouble using AlertView's remote function, which allows the management console machine to take over an agent workstation, much like NetWare's RCONSOLE. The remote function worked for DOS workstations, but it blanked the screen and locked the keyboard every time we tried to control a Windows machine. Eventually, we learned that agent machines are limited to standard VGA video. After changing to a standard VGA driver, we were able to use this function.

AlertView is better designed than NLMerlin for detecting and handling errors. First of all, AlertView is designed to monitor all application operations and errors. By selecting from a pick list, you can tell it which ones not to report on. With NLMerlin, you have to explicitly query, in the script file, for each piece of information. AlertView displays the probable cause (in addition to a description of the event, the user name, and the workstation address) and suggests a solution.

The network manager can configure AlertView to respond automatically with predefined corrective procedures for a set of problems. With NLMerlin, in contrast, the manager has to determine appropriate corrective procedures and write them into a script. NLMerlin offers no suggestions. In addition, NLMerlin lacks built-in support for editing files such as CONFIG.SYS or AUTOEXEC.BAT; this would be useful when correcting errors.

In a typical corrective procedure, AlertView might modify the AUTOEXEC.BAT file, notify the user that his or her workstation will be down, reboot the machine so that modifications will take effect, restart the application that the user was in, and, finally, notify the user that the problem has been corrected. Various common procedures are included; they may be used as is, modified, or used as examples. Proce-

ALERTVIEW 2.1

- Works on any network supporting Windows workstations
- Doesn't monitor server information
- Starts and stops DOS and Windows applications remotely
- Has Windows-based command module
- Offers optional OS/2 agents
- DOS agents implemented as TSRs
- Control program through graphical Windows program

NLMERLIN

- Works with NetWare only
- Provides detailed NetWare server monitoring
- Can't gather specific Windows information from workstation agents
- Loads and unloads NLMs automatically
- Has NLM command module
- DOS agents implemented as TSRs
- Provides control automation through BASIC-like scripts

dures can also be scheduled to occur at specified times on specific dates or periodically, such as a nightly backup. AlertView can also kick off a batch file (although not an NCF [NetWare control file]) in response to a problem.

However, AlertView procedures are expressed as simple lists of commands, which can include keystroke macros. This limits their ability to take varying system conditions into account. For example, there is no support for IF... THEN logic, FOR loops, or conditional subroutines.

NLMerlin is better designed for automating routine procedures. Its script language resembles BASIC, offering some of the power and flexibility (and complexity) of that language, including such elements as IF... THEN logic, FOR... TO loops, and conditional GOSUB and GOTO statements. Such capabilities are indispensable for handling the vagaries of real environments when complex tasks execute automatically. Lists of commands and keystroke macros don't offer much leeway for variation.

The Long Run

Both programs—but especially NLMerlin—leave us with some concerns about long-term and enterprise-wide strategy. Software and hardware vendors interested in NLMerlin's automation will have to explicitly support NLMerlin. Knozall doesn't appear to have the market clout to attract third-party developers. Furthermore, APIs and interfaces to distributed task management functions may eventually be standardized, perhaps under the auspices of the DMTF (Desktop Management Task Force), a group now boasting more than 200 vendor members, including Hewlett-Packard, IBM, Intel, Microsoft, Novell, and SunConnect. If no committee standard emerges, de facto standards are likely.

Contrast NLMerlin with Hermes, Mi-

crosoft's proposed centralized desktop management system. Hermes will run under Windows NT and will offer functions such as hardware and software inventory, software distribution and installation, remote diagnostics, and remote control. Hermes's software distribution function will actually distribute jobs, with or without accompanying data. While the initial intent is to do such things as copying a new printer driver to drive C or running the setup program for a new piece of software, there is no inherent limit to the jobs that could be shipped

around the network.

How Hermes will define jobs is not yet clear. However, given Microsoft's dominance of the desktop software environment, that definition could become a de facto standard. Hermes will also support committee standards. To gather information about network nodes, for instance, Hermes will use MIFFs (management information format files), which are ASCII files in a format defined by the DMTF. The API for registering managed objects and interfacing to MIFFs will be the DMTF's DMI (Desktop Management Interface).

NLMerlin can perform many of the functions promised from Hermes. However, since NLMerlin is not based on any management standards, it will be harder to get third-party support.

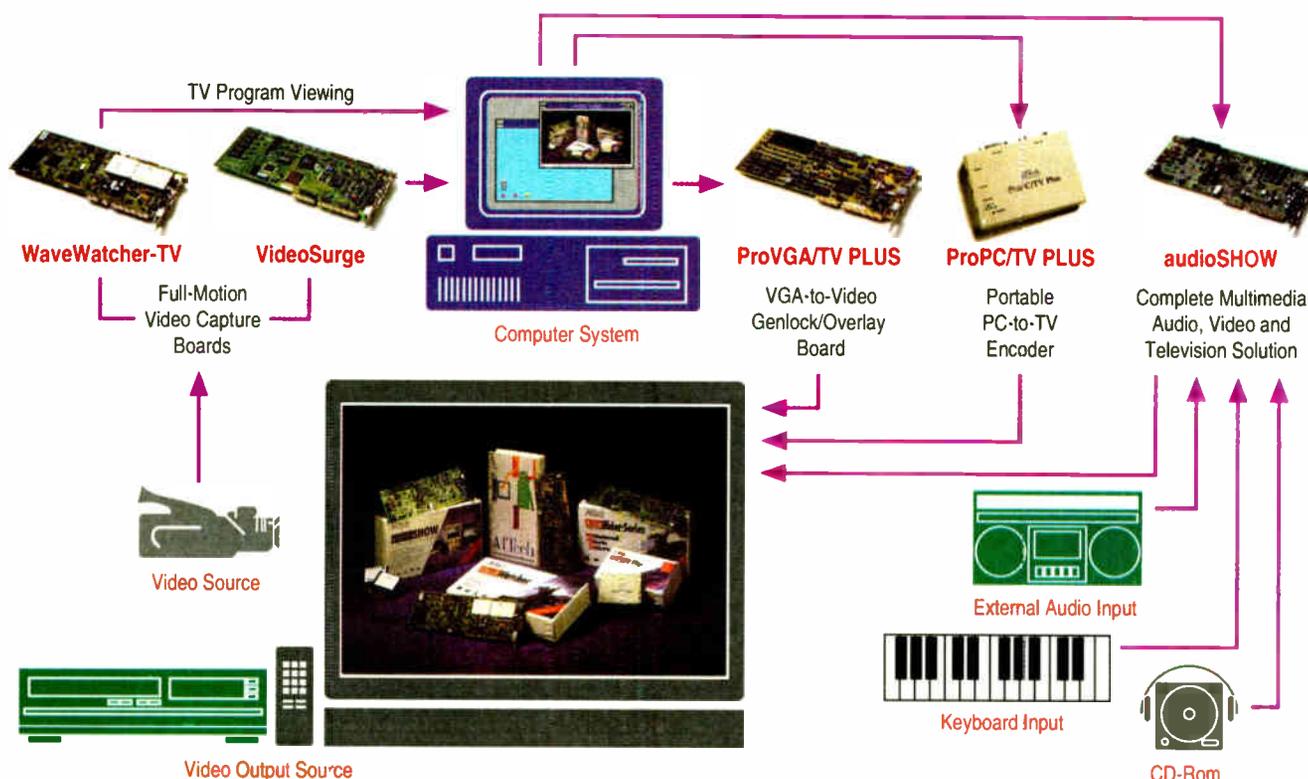

It may still be possible for Knozall to support DMTF or other standards. Knozall says it will respond to the needs of the market by interfacing to standards as they develop, and that it anticipates no major problems in accommodating whatever standards emerge. Meanwhile, NLMerlin is here now. The same can't be said of products like Hermes. NLMerlin's scripting language closely resembles BASIC, thus making use of a well-established standard. In making a decision about NLMerlin, you should weigh immediate needs for task distribution against potential advantages of waiting for standards in this arena.

We also would have liked to see the ability to generate and receive SNMP alerts in NLMerlin. This would have made it easier to integrate NLMerlin's functions into corporate networks and ensured some level of integration with existing management applications.

Shany provides SNMP integration for AlertView through integration with the NMS. This integration enables NMS to

Meet Our MultiTalented Family

Performing All Your Multimedia Needs

AI Tech's family of five is ready to act for you. We can help you create high-impact presentations. Or take these presentations on the road with utmost convenience. You can develop a teleconferencing or interactive training system, or create picture records. Or just entertain yourself. Whatever you may need, we have a multimedia product that can fulfill your requirements. For either full-motion video capture or VGA output to TV or video.

With WaveWatcher-TV, you can view TV or video on your VGA monitor. Images or full-motion video can be captured from any TV program and used in your desktop documents or presentations.

If you require higher performance, VideoSurge should be considered for full-motion video capture. VideoSurge displays

a real-time, 24-bit true color. Plus, three sets of stereo source inputs. Volume, bass, treble and balance control can be individually selected and controlled.

The AI Tech audioSHOW combines the ability to display your computer's output on a TV or VCR with full-featured 16-bit stereo sound capabilities. Imagine recording your VGA screen to videotape and adding a music soundtrack consisting of CD music. MIDI synthesizer orchestrations, sampled sound effects and narration. This is the power of audioSHOW!

The ProVGA/TV Plus enables you to convert VGA display graphics into NTSC or S-VHS video for display on TV monitors or

projection systems. The converted video can be genlocked to external input for mixed video presentations. You can mix, overlay, or chroma key the VGA signal.

Taking your computer presentation on the road? Or just want to play computer games on your TV? The ProPC/TV Plus is an external pocket-size VGA-to-TV encoder that meets these needs. You get portability and easy installation, plus TV/VGA concurrent display.

Let us show how our talents can perform for you. For more information on the AI Tech multimedia product family, contact your local dealer or call us at 1-800-882-8184 or fax 1-510-226-8996.

Reviews NLMerlin and AlertView

discover AlertView agents and put them on an NMS map with an icon that accesses AlertView's tools. AlertView and NMS can also receive, display, and respond to each other's alarms. Thus, NMS can receive SNMP traps and forward them to AlertView, or receive AlertView's alarms and forward them as SNMP traps.

In addition to providing this support for SNMP, AlertView is based on well-defined, stable Windows application APIs. Thus, AlertView already works with all Windows applications. It would still help if AlertView took advantage of DMTF standards where possible; if it doesn't, it may not be able to obtain some critical information.

Interestingly, Windows NT includes an event monitor that provides error-re-

lated information and suggestions similar to those provided by AlertView. We like the idea of monitoring applications through

an operating-system utility as opposed to a third-party package. If Microsoft ever decides to offer a Windows event monitor and then hooks it into a central console such as Hermes, Shany could have some serious competition.

The difference between NLMerlin and AlertView in terms of a strategic direction boils down to this: Task distribution is in its infancy; anybody who invests now may have to backtrack when standards and standardized products emerge. In contrast, standards for monitoring applications are already firm. Because it focuses on application monitoring more than on task distribution, AlertView is

less vulnerable to outflanking by a new standard.

Overall, we see value in both of these products. AlertView is more accessible and is easier and more fun to use. It adds significantly to your ability to manage Windows and DOS applications but not NetWare servers. NLMerlin is good at managing servers, is currently less capable in the workstation arena, and lacks the ability to monitor applications.

Both products seem to have lots of room for expansion and may serve as a basis for future capabilities. Still, NLMerlin will remain a tool for the type of user who would write DOS batch files and program in BASIC using just a text editor—in other words, a tech-weenie—while AlertView will appeal to the average network administrator who wants to know what is happening in users' applications. ■

Mike Hurwicz and Dan Carroll are writers and consultants specializing in networking and imaging. They are based in Eastsound, Washington. You can contact them through AT&T Mail as "mhurwicz" or on BIX c/o "editors."

July 1993
CheckIt PRO: SysInfo

"TouchStone Software's \$100 CheckIt PRO: SysInfo is the closest thing this category has to perfection."

We Couldn't Have Said It Better Ourselves...

"It made no errors reporting on either of our test systems, and it provided more detailed information on many hardware items in our test bed PCs than did the competition."

"Beyond the basics, CheckIt PRO reports on detailed drive mapping with suitable disk controllers and on the kind of UART your serial ports are using. Adding to CheckIt PRO's appeal is a set of benchmark comparisons that allows you to make sense out of the numbers that the benchmarks produce. If you get the SysInfo package and have any interest in diagnostics, you should consider the bundle of SysInfo & Tests and Tools."

"Quality of information is the key to a good reporting tool. As such, the program of choice for DOS users is TouchStone's CheckIt PRO."

HANDS-ON TESTING

176 PRINTERS FACE OFF

From high-end dye-sublimation to low-cost dot-matrix models, we select the best printers for eight important business applications

HELEN HOLZBAUR, JIM HURD, AND STEPHEN PLATT

New printers continue to hit the market at breakneck speed: Of the 176 printers tested here, 70 of them either didn't exist when we prepared our last printer report in May or have been significantly upgraded since then. What's more, five of the eight printers that received BYTE Best awards in this report only began shipping since this spring.

For printer buyers, a dynamic market is good news. Prices in the last six months have dropped dramatically: The 105 printers that remain on the market since our May report now cost an average of \$500 less. The bottom line for those who need a new printer is that cutting-edge performance and print quality have never been less expensive.

Through hands-on tests of laser, dot-matrix, ink-jet, high-end color, and portable printers, this report documents the advances of the printer market. We invited vendors to submit printers for every category. Besides our memory specifications, which were necessary to make our test results comparable, our only restric-

How to use this guide

In each application category, we name a best overall printer that offers the best mix of performance and quality plus any required features relevant to the particular application. We

also name the best low-cost printers for each application, as well as highest quality and best for use with Macintosh environments.

Each score represents pages-per-minute speed; higher numbers indicate faster performance.

Vendor's rating for engine or print-head speed; does not include printer processor time.

BEST OVERALL Lexmark IBM 4039Laser 12R

Competitively priced with slower printers, this 12 ppm laser really screams when you install Lexmark's software rasterizing Windows drivers. Overall, its 600-dpi quality is among the best in its class. Unfortunately, its PostScript performance is lackluster. For heavy PostScript usage, pick the TI MicroLaser Pro 600 Turbo with the PowerStep accelerator board instead.

A composite score of text and graphics output; based on a scale of 10, with higher numbers indicating better output quality.

	PC	BYTE PERFORMANCE SCORES (PPM)		QUALITY INDEX	CLASS	PRICE	RESOLUTION (DPI)	MEMORY (MB) STAN. MAX.	
		POSTSCRIPT	OVERALL						
BEST	Lexmark IBM 4039Laser 12R	▲ 8.63	3.57	5.04	8.74	12	\$1999	600	4,16
BORDER-SP	Lexmark IBM 4039Laser 10R	▲ 7.04*	3.12	4.32	9.00	10	\$1599	600	2,16
BORDER-SP	TI MicroLaser Pro 600 (wPowerStep)	▲ 3.98	5.37	5.23	8.72	8	\$1948	600	6,22
BORDER-SP	Xante Accel-a-Writer 8000	▲ 5.18	2.67	2.78	8.44	8	\$2295	600	8,16
BORDER-SP	HP LaserJet 4M	▲ 4.85	3.21	3.95	8.78	8	\$2399	600	6,32

Retail price; may include optional memory to conform to our testing specifications (see "How We Tested").

What to Look For in a Laser Printer

PAPER-INPUT TRAY

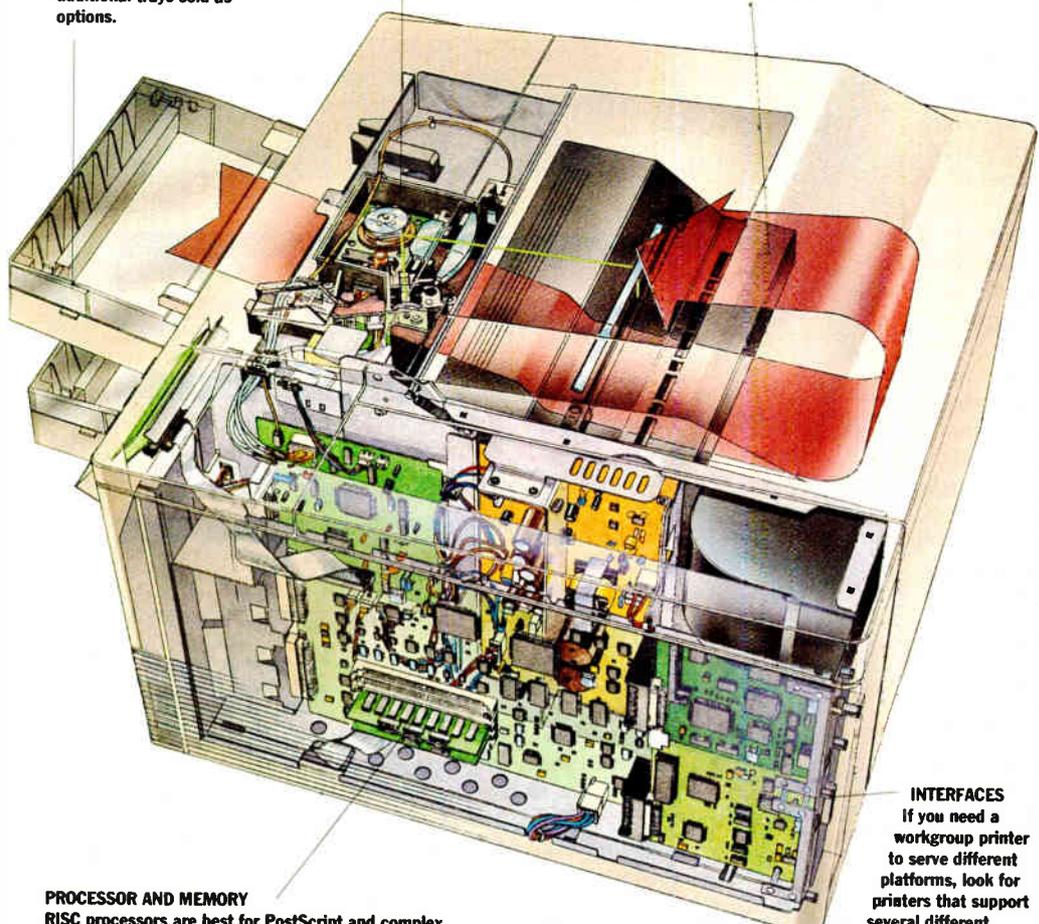

Network printers typically hold 500 to 1000 sheets. For workgroup and word processing applications with high volumes, consider printers with larger trays or additional trays sold as options.

ENGINE

Choose a 600-dpi engine for high output quality; for lower printer cost and faster performance, a 300-dpi engine is a better alternative.

PAPER PATH

The shorter the path, the more efficient the printing process and the less chance for jammed paper. For envelope and heavy-stock printing, choose printers that provide a straight-through path.

PROCESSOR AND MEMORY

RISC processors are best for PostScript and complex graphics. One MB of memory is minimum for full-page graphics; 4 MB is minimum for PostScript.

INTERFACES

If you need a workgroup printer to serve different platforms, look for printers that support several different interfaces and can automatically sense which interface is receiving a print job.

tions were price related: We didn't test any network or color printers costing over \$15,000, and all other models carried list prices of \$10,000 or less.

Lasers continue to make inroads into the low-cost market. A dozen in this report carry list prices of approximately \$1000. In response to this competition, ink-jet printers now sell for \$200 to \$300 after discounting. At this price point, ink-jets have entered the price domain of dot-matrix printers. What's more, new high-speed ink-jets, like the C-Tech Speedjet 300 and Texas Instruments MicroMarc, now run as fast as dot-matrix printers, which are increasingly becoming niche products for multipart forms and invoices.

Color printers are at the cutting edge of development. Eighteen of the new printers we tested were color printers, and many had impressively low prices. From the \$319 LA 95-DECWriter to the Tektronix Phaser IISDX, a \$10,000 dye-sublimation printer, color output has never been better or offered at so many price points.

In this report, we've divided the printers into eight categories to make it easier for you to match a printer to your needs. For PC and Mac users, we selected printers for general business, draft text, high-quality color, general-purpose color, workgroups, tabloid, CAD and desktop publishing, and travel.

GENERAL BUSINESS

Lexmark IBM 4039Laser 12R

Posted the fastest times for PC text and graphics, along with respectable PostScript and Mac scores. **PAGE 279**

HIGH-QUALITY COLOR

General Parametrics Spectra Star GT

This \$5000 thermal-wax-transfer printer uses standard paper and produces brilliant color images. **PAGE 285**

GENERAL-PURPOSE COLOR

THE BEST PRINTERS FOR

GENERAL BUSINESS

High-quality output makes laser printers the standard for business documents, which may range from correspondence, to proposals and reports, to standard-format desktop publishing (see the CAD and desktop publishing section for large-format laser printers). The printers we rank in this section are suitable for use by up to five people. Because of quality considerations, we considered only laser printers for this category. The lasers ranked here are rated at 12 pages per minute or less; to be considered for best in the low-cost category, a laser had to be rated at 6 ppm or less.

Although 300-dot-per-inch laser printers are appropriate for most business applications, low-priced 600-dpi laser printers such as the Lexmark IBM 4039Laser 10R (\$1599) led us to recommend the high-resolution models unless you're on an especially tight budget. If so, low-cost 300-dpi printers such as the NEC Silentwriter Superscript 610 (\$700) and the Hewlett-Packard LaserJet 4ML (\$1279) are excellent choices.

However, if you're printing newsletters with graphics or doing any type of desktop publishing, a 600-dpi laser printer is the only way to go. Among the higher-resolution lasers, we call it a draw for overall quality among HP's LaserJet 4M, the Lexmark IBM 4039Laser series, the TI MicroLaser Pro 600, and the Apple LaserWriter Pro 630.

Brother's HL 10H also produced top-quality 600-dpi output; unfortunately, its gray-scale dithering fell short of that of the other leaders. HP's LaserJet 4 and 4P also fell down a bit on gray-scale reproduction.

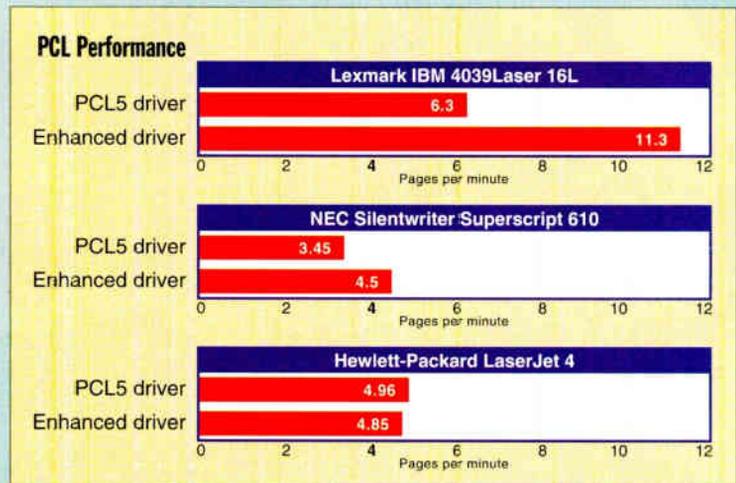

The Xante Accel-a-Writer 8000 and 4000 and Samsung Finale Hi-Res all use resolution enhancement to coax higher resolution from print engines designed for 300-dpi output. In general, the quality of the Xante printers is on a par with that of the 600-dpi printers, although its text does not have the same clarity at small point sizes. Resolution enhancement is less successful with the Finale, however. Samsung claims the printer can simulate 1200 dpi, but its output quality in our tests did not even approach that of a true 1200-dpi printer. (The printer is also designed to be upgraded to a true 600-

dpi resolution, but we didn't test this feature.)

The fastest printers for Windows were the ones designed to accept rasterized pages from the host computer. The Lexmark IBM 4039Laser 12R and 10R printers and the NEC Silentwriter Superscript 610 use this technique to outperform conventional PCL (Printer Control Language) and PostScript drivers shipped with Windows. Because this technique is heavily dependent on the host, the faster your computer, the faster these printers will print. (We obtained our speed scores using a 33-MHz 486DX with 8 MB of memory.)

All the 4039-series printers offer a wide range of features,

ENHANCED DRIVERS

Printer performance, in pages per minute.

Within the past year, both IBM and NEC have introduced "enhanced" PCL5 languages on their printers. These languages, supersets of HP's PCL5 printer language, provide additional features for improved graphics and font-rendering performance. The languages are true supersets—the printer will still operate using a normal PCL5 driver, but using the accompanying drivers will improve their performance.

We tested the Lexmark IBM 4039Laser 16L and the NEC Silentwriter Superscript 610 using both PCL5 and enhanced drivers and compared them to a Hewlett-Packard LaserJet 4 running the driver that ships with the printer and a standard PCL5 driver. While using IBM's 4039-16L print accelerator, the 4039Laser 16L was 44 percent faster in our benchmark tests. Using straight PCL5, it averaged 6.3 ppm on our test suite, but when driven by the IBM 4039-16L print accelerator it averaged 11.3 ppm. Likewise, the NEC Superscript 610, using NEC's Superscript 610 GDI (Graphical Device Interface) language, improved from 3.45 ppm to 4.5 ppm, a 24 percent decrease in print time. The LaserJet 4's driver speeds up font and bit-map processing, but overall it lags behind the PCL5 version because of slower text and graphics performance.

including power management, optional duplexing, an easy-to-read five-line LCD showing configurations, and flash ROM to store fonts and logos.

For graphical illustrations and desktop publishing, or for use with a Macintosh, choose the TI MicroLaser Pro 600 equipped with the optional PowerStep accelerator board (\$349). This 8-ppm unit blasts through PostScript jobs faster than many 16- and 17-ppm printers. The printer's quality is comparable to that of 600-dpi printers. Unlike the PhoenixPage PostScript interpreter in the Lexmark printers, the Adobe interpreter in the MicroLaser supports Level II. However, the MicroLaser's PCL performance is below average for an 8-ppm printer, so don't purchase this printer if you primarily print PCL jobs.

For low-cost PostScript, we recommend the HP LaserJet 4ML. At \$1279, it is not the cheapest printer you can buy, but its high quality and good performance make it worth the incremental cost. Its RISC processor puts it among the fastest of the 4-ppm printers; it even outperforms many 8-ppm printers. Of all the laser printers, the LaserJet 4L and 4ML are among the biggest power savers: They consume just 5 W when idle. With its "L" series, Hewlett-Packard has introduced draft mode to the laser world: The print quality is reduced, but so is toner consumption.

If you want the best combination of low cost and high performance for non-PostScript jobs, pick the NEC Silentwriter Superscript 610. The quality was only average for a 300-dpi printer, however. Thanks to resolution enhancement, both the Epson ActionLaser 1500 and the LaserJet 4L offer higher-quality text and graphics than the Silentwriter Superscript 610, but they can't match its speed.

BYTE BEST

GENERAL BUSINESS

Need the best balance of speed and quality?

BEST OVERALL

Lexmark IBM 4039Laser 12R

Competitively priced with slower printers, this 12-ppm laser really screams when you install Lexmark's software-rasterizing Windows drivers. Overall, its 600-dpi quality is among the best in its class. Unfortunately, its PostScript performance is lackluster. For heavy PostScript usage, pick the TI MicroLaser Pro 600 with the PowerStep accelerator board instead.

How We Tested

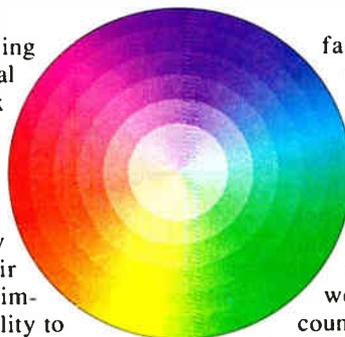

We subjected each printer to as many as 50 different performance and output-quality tests using DOS, Windows, and Mac applications. As appropriate, we tested each printer in letter-quality and draft modes; with PostScript and PCL page-description languages; and using LocalTalk, parallel, and Ethernet connections.

Not every printer is right for every application, so we segmented printers into eight business applications. See the individual application write-ups for details about filters we chose for group- and workgroup printers, we considered only those laser printers that were rated at 15 ppm or higher.

We identified the best printers for Mac users by considering only printers that provided a LocalTalk or EtherTalk connection. You can use other printers with a Mac by using products such as Apple's DOS Companion. In fact, the Apple Portable StyleWriter is identical to the Canon BJ-10ex except that the Apple model comes bundled with a serial-to-parallel converter and Mac drivers. Overall, we think most Mac users will do better by selecting printers designed to support the Mac environment.

Our performance scores are measured in pages per minute. We generated a performance index for each printer by

weighing and combining scores of the individual tests (see the text box "Our Speed Tests") as appropriate for each particular application category. For example, we judged high-quality color printers by their ability to print color images, not for their ability to print text.

Color Wheel

failed to run two of our tests. Workgroup printers that do not support automatic switching between PCL and PostScript did not receive "best" honors.

When choosing printers for highest quality, we made quality scores count for 80 percent of the overall evaluation, with the remaining 20 percent consisting of

the printer's high-quality-mode speed. We noted that PostScript produced noticeably better output overall than PCL, so we used PostScript performance as a tiebreaker among printers that had very similar output quality.

For best low cost, we used price and technology filters to identify those printers that are likely to sell in the lower end of the price spectrum. For example, 4- to 6-ppm, 300-dpi printers dominate the low-cost laser market, and we considered only this class for our low-cost choices in the business category.

The winner of the low-cost category may not be the lowest-priced printer on a particular day through some particular channel; we cannot reliably predict how street prices might change from minute to minute. What our low-cost pick identifies is a printer that stands out from its peers by offering excellent value at a reasonable price. If a runner-up becomes available to you at a substantially lower cost, you can use the performance and quality measurements to make your own decisions.

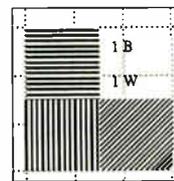

CATEGORIES

In deciding our best-overall recommendations, we valued performance and quality equally. To determine performance scores, we averaged each printer's speed, measured in pages per minute, in draft and high-quality modes. When a printer offered a choice of either PostScript or PCL for high-quality modes, we used the scores from the mode that produced the fastest results.

We also evaluated each printer for the features it offered and for how easy it was to set up and use the unit. The scores served as filters: We did not recommend products that were difficult to use or lacked essential features, regardless of their speed and quality. For example, the NewGen ImagerPlus 12 has excellent performance and quality, but it

PRINT QUALITY

The quality tests measured each printer's ability to draw a variety of lines, reproduce a photographic image, and print attractive, legible text in a wide range of point sizes. We also had the color printers output a page that tested the printer's ability to print different hues; it also faded the printer's primary ink colors to white and black. We looked for a color printer's ability to lay down primary colors adjacent to each other without smear-

Line Test

OUR SPEED TESTS

We measured each printer's performance using a variety of tests designed to mirror real-world applications. To run our tests, we used Windows and Mac drivers supplied by the printer vendor. Our performance scores revealed how fast each printer could produce the following:

Standard Text

This test consisted of a word processing document in one font. We sent the test to the printer using the Windows or Mac drivers. If a printer had a device font available, we used it.

Raw Text

The same word processing document as above, but we sent it directly to the printer, not through the Windows driver.

Graphics

This consisted of a line-intensive world map with filled areas taken from CorelDraw clip art.

Color Graphics

This test consisted of balloon clip art from CorelDraw.

Bit Map

A test page of rasterized text, essentially the same as fax output. This generated scores applicable to graphics applications. It also showed the speed of the communications link between printer and computer.

Fonts

This document was rich in fonts in a variety of type sizes. The test uses serif and sans-serif typefaces in regular and boldface at 30 different point sizes.

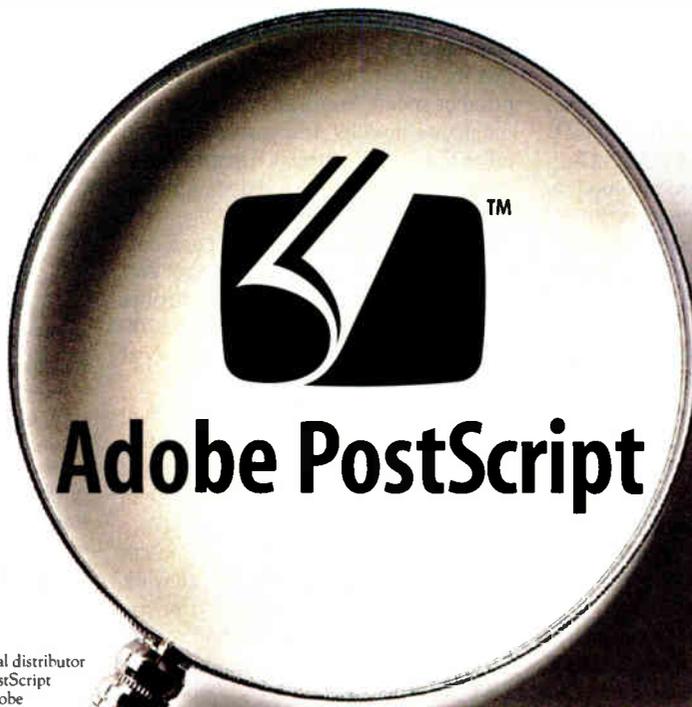

Forms

This document consisted of a simulation of preprinted forms.

There's just one choice: Insist upon a printer with genuine Adobe™ PostScript™ software inside. It's the industry standard—the only way to guarantee that your printer will work with virtually every software application and hardware environment today and tomorrow. With Adobe PostScript, you're assured the highest quality output whether you're printing from DOS, Windows™, OS/2®, Macintosh® or UNIX®, from a PC or a mainframe. And since almost every major printer manufacturer offers

THE MOST IMPORTANT CHOICE YOU'LL MAKE WHEN CHOOSING A PRINTER, ISN'T JUST THE PRINTER.

Adobe PostScript printers, it's easy to choose the brand of printer that's right for your company. Remember, the best choice is the clear choice. Make sure your next printer has genuine Adobe PostScript. Accept no substitutes. For a free guide on how to choose a printer, call 1-800-962-3623, Dept. L, Ext. 0106.

Outside the U.S.A. and Canada call your local distributor or 408-986-6555. Adobe, the Adobe logo, PostScript and the PostScript logo are trademarks of Adobe Systems Incorporated which may be registered in certain jurisdictions. Windows is a trademark of Microsoft Corporation. OS/2 is a registered trademark of International Business Machines Corporation. Macintosh is a registered trademark of Apple Computer, Inc. UNIX is a registered trademark of UNIX System Laboratories. ©1993 Adobe Systems Incorporated. All rights reserved.

IT'S NOT JUST PRINTING,
IT'S **ADOBE POSTSCRIPT** PRINTING.

Circle 64 on Inquiry Card.

ing. We also assessed the effectiveness of the printer's screening and dithering, and we looked for a minimum of random specks of ink and alignment errors, which detract from the output's appearance.

The quality tests were written in PostScript. To generate quality test pages for non-PostScript printers, we used the Freedom of Press PostScript interpreter from ColorAge. To measure print quality, we examined the output from all the printers and selected the one that best met our quality standards. Output from all the other printers was ranked in relation to the best sample.

FEATURES AND EASE OF USE

Features and usability go hand in hand. We noted each printer's features, as well as any important capabilities a printer may have lacked. We also noted how easy it was to use each printer.

CONFIGURATIONS

We performed PC tests using Compaq Deskpro 433i systems with 200-MB hard drives and 8 MB of RAM. DOS 5.0 and Windows 3.1 were installed on each system. We performed Macintosh tests using Quadra 700 computers equipped with 8 MB of RAM and 400-MB hard drives. We used System 7.1 for all Mac testing.

All print servers, spoolers, and buffers were disabled. When soliciting printers, we requested each manufacturer's standard memory configuration for dot-matrix and ink-jet printers. Workgroup laser printers required at least 8 MB of RAM and PostScript, if available. All other lasers needed 4 MB of memory and PostScript if available.

BREAKDOWN OF TEST CATEGORIES

We sorted printers for appropriate applications by using the following definitions.

General business. Appropriate for use by one to five people who need a print-

Our testing team. Front, from left: Siva Kumar, André Whittle, Alan Joch. Back, from left: Jim Hurd, Vidya Maharaj, Helen Holzbaur, Stephen Platt, and Morgan Nec.

er for business correspondence, proposals, reports, and limited desktop publishing. Requirements for high-quality output limited our rankings to laser printers. A printer's output quality weighed equally with its performance. Printers that were rated at 6 ppm or slower and priced at less than \$900 were considered for low-cost honors.

High-quality color. When quality matters more than price or speed. For drafts of brochures, magazine layouts, transparencies, and other four-color material. Thermal-wax-transfer, solid ink-jet, and dye-sublimation printers were ranked.

General-purpose color. Ink-jet and dot-matrix printers for color drafts, spot color, transparencies, and monochrome text. Printers that were priced at \$1700 or less were considered for low-cost honors.

Workgroups. Laser printers rated at 15 to 20 ppm. Speed, quality, and connectivity were key considerations. Low-cost competitors carried prices of less than \$4000.

Draft quality. Ink-jet and dot-matrix printers to serve single users whose work consists of producing draft reports, forms, and labels. Printers had to sell for \$600 or less to be considered for best-low-cost status.

Large format. Dot-matrix and ink-jet printers able to use 11- by 17-inch paper. For draft-quality CAD, spreadsheets, and ledgers where low cost and speed are more important than output quality. Low-cost competitors sell for \$1000 or less.

CAD and DTP. Lasers for high-quality output and 11- by 17-inch printing. Printers selling for \$4000 or less were considered for low-cost honors.

Portable. Thermal, ink-jet, and dot-matrix printers that can run on batteries and are also light enough for easy travel. To be ranked for low-cost status, printers had to sell for less than \$500.

Font Test

OUR TEST TEAM

Jim Hurd, Vice President of Research and Development/NSTL, wrote the printer performance tests. He has tested scores of printers during the last 10 years at NSTL.

Helen Holzbaur, Project Manager/NSTL, was a network manager and systems administrator at Temple University for 10 years before joining NSTL.

Alan Joch, Senior Editor/BYTE, coordinates the combined testing between the BYTE Lab and NSTL.

Siva Kumar, Technical Analyst/NSTL, specializes in hardware and network-operating-systems testing.

Vidya Maharaj, Consultant/NSTL, helped evaluate 120 printers for the Canadian government earlier this year. She is completing a B.S. degree in computer science from the University of Toronto.

Morgan Nec, Consultant/NSTL, has tested printers and systems for NSTL since 1988.

Stephen Platt, Manager of Unix Development/NSTL, has a doctorate in computer science/computer graphics and wrote the quality tests for this report.

André Whittle, Consultant/NSTL, has evaluated computer hardware for the Canadian government, including a large-scale printer test conducted last spring.

The Lab Report is an ongoing collaborative project between BYTE Magazine and National Software Testing Laboratories (NSTL). BYTE Magazine and NSTL are both operating units of McGraw-Hill, Inc.

Us.

Them.

We'd like to compare our color prints to theirs, but we don't have all day.

When you can get photo-like output like this from a dye-sublimation printer, who wants to wait? Especially when you can use that vivid, continuous-tone color for everything from overhead transparencies to proofing your layouts before going to film.

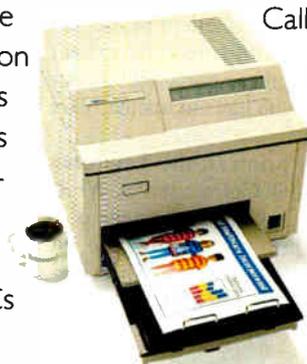

That's why we made the new Phaser™ II SDX the fastest Adobe™ PostScript™ Level 2 dye-sublimation printer around. Its powerful RISC CPU processes large scanned images at about the same speed as a dedicated raster printer, but with all the convenience and shareability you've come to expect from a network PostScript printer.

The Phaser II SDX can be shared with Macs, PCs

(Windows/DOS or OS/2), and workstations—simultaneously. It switches automatically from user to user using its parallel, serial, AppleTalk®, or optional EtherTalk™ and TCP/IP Ethernet™ ports. And it's as simple to operate and maintain as a standard office laser printer.

Call us today for a free sample print. Our number is 800/835-6100, Department 29-J.

For faxed information, call 503/682-7450 and ask for document 1231.

Tektronix

Tektronix, TekColor and Phaser are trademarks or registered trademarks of Tektronix, Inc. PostScript is a trademark of Adobe Systems, Inc. All other marks are trademarks or registered trademarks of their respective companies.

World Radio History

THE BEST PRINTERS FOR

HIGH-QUALITY COLOR

We tested 13 printers that excel in applications where proofs for color publications and top-quality transparencies demand the best color, no matter what the cost. These thermal-wax-transfer and dye-sublimation models are among the most precise printers for placing color pigment on a printed page. In most cases, the output from this class of high-priced printers was of near-photographic quality.

On our 10-point scale, where higher numbers indicate better quality, thermal-transfer printers received scores ranging from the Star Micronics SJ 144's 5.75 to the Tektronix Phaser III PXi's 8.29. The dye-sublimation Tektronix Phaser IISDX scored a near-perfect 9.29.

Although prices for high-end color printers have dropped in relative terms over the last year, none of these printers is cheap. The "low-cost" Phaser 200e lists for \$3695. To get the top-quality output of the Phaser IISDX, however, expect to pay a list price of \$9995, the highest price of any printer we evaluated for this report.

In addition, none of these printers is particularly speedy, and therefore should not be considered for doing double duty in other types of printing applications. For example, the Spectra Star GT, from General Parametrics, was the fastest, with a speed of about 1 ppm in our tests. Most of the rest were in the 0.3- to 0.5-ppm range, with the slowest being the Eastman Kodak Colorease PS at 0.16 ppm (or 6 minutes per page).

Our choice for best overall in this category was a thermal-wax-transfer model, the Spectra Star GT. It was the fastest printer in the category, and it scored well on most of our quality tests. Its scores on the monochrome quality tests were average, as were those of all the thermal-transfer printers we reviewed. The technology just isn't designed for placing text on a page. However, the Spectra's color-quality score of 7.71 points out of a possible score of 10, coupled with its relatively fast print speed, helped make this the best all-around printer.

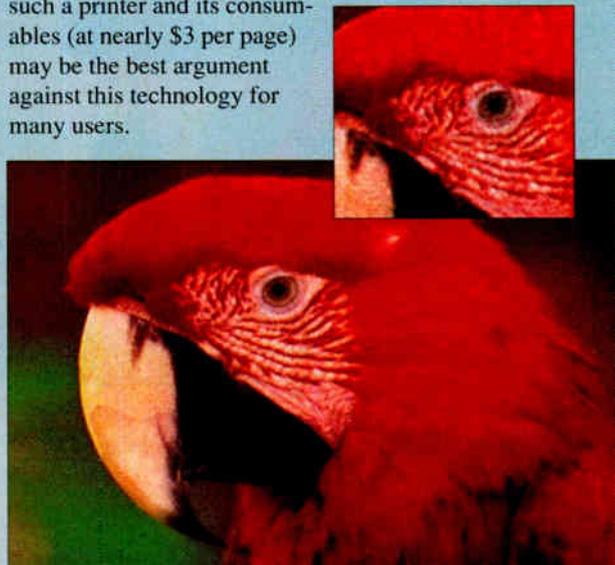

The Spectra Star GT comes equipped with serial, parallel, and LocalTalk ports, which makes it an excellent printer for PC, Mac, or mixed environments. Unfortunately, the printer does not automatically switch among these ports—an inconvenience in a mixed setting, because you have to manually set the printer for the proper platform.

We tested two dye-sublimation printers, the Tektronix Phaser IISDX and the Eastman Kodak Colorease PS. While thermal-transfer printers melt waxy inks onto the page on a dot-by-dot basis, dye-sublimation printers vaporize the ink (going from solid to vapor, hence the sublimation) onto specially coated paper. This allows better ink blending, finer control of ink deposits, and smoother colors (see the samples in the text box above).

The results are nothing short of spectacular. The color wheel and shade stripes of our color test were almost per-

Dye Sublimation: Color for Tomorrow?

Dye-sublimation printers produce crisp, clear output by using varying degrees of temperature to transfer color from the ribbon to special paper. The pictures below are the best argument for dye-sublimation printers, although the cost of such a printer and its consumables (at nearly \$3 per page) may be the best argument against this technology for many users.

The image on the bottom was produced by the Tektronix Phaser IISDX, the dye-sublimation model with the highest quality score of any color printer we tested. On the top is output from the Tektronix Phaser 200e, a high-quality thermal-wax-transfer printer. Note: Both images were magnified 150 percent to illustrate the dot structure of thermal-wax-transfer printers versus the continuous tones of dye-sublimation technology.

fectly smooth on the output from both of these printers. In fact, we needed to examine the paper through a $\times 30$ loupe to see the ink deposits. Typical thermal-transfer and ink-jet output has uneven dot placement, while output from both of the dye-sublimation printers showed fairly smooth, filled-in areas. Instead of visibly dithered dots, the inks blended together seamlessly in the dye-sublimation samples.

For color reproduction, we found the Phaser IISDX to be slightly better than the Colorease on two of our quality tests. The Phaser IISDX's pigments were slightly stronger and purer, while the Colorease's yellow is more orange, the magenta slightly more bluish, and the cyan slightly paler. Our color-wheel tests indicate that the Phaser IISDX's gamut of colors is larger than the Colorease's, showing that it can print a wider color range.

We also noticed a slight registration problem on the Colorease. When printing fine lines of one color against a background of a differing color, the line was offset slightly. This results in two visible edges, one white (i.e., no pigment deposited) and the other a blend of the two inks.

One warning if you need a color printer for prepublication

For the best in all-around performance...

BEST OVERALL

General Parametrics Spectra Star GT

A good mix of speed and quality push the Spectra Star GT to the top for color printers. It printed our benchmarks at an average of 59 seconds per page, significantly quicker than the next-fastest color printer, the Tektronix Phaser 200i, which averaged 80 seconds per page. Although the Tektronix Phaser IISDX received higher scores for quality, it ran almost three times slower than the Spectra Star GT. Its price is among the lowest for this class of printers, and its ability to handle plain paper helps reduce consumables costs. The 300-dpi Spectra Star GT comes standard with PostScript Level II support.

proofs. Many of the printers we tested have a fairly large "grab" area: The top inch or more of the page isn't printable, because the print engine uses this space to hold the paper. The General Parametrics Spectra Star GT, for example, loses slightly more than an inch, while the QMS ColorScript 210 loses almost three-quarters of an inch. Some manufacturers, such as Tektronix, design some of their printers for over-size 14-inch paper, which allows space to hold the paper while preserving an 8 1/2- by 11-inch print area.

Among the thermal-wax-transfer printers, Calcomp's ColorMaster Plus 6613XF posted the highest output-quality scores. Although it doesn't match the quality levels of dye-sublimation printers, its quality is high enough to place it less than a tenth of a point below the Eastman Kodak Colorease PS.

However, the ColorMaster Plus 6613XF is priced to match its quality status: It sells for \$1000 more than the Colorease PS. Nevertheless, the Calcomp (as well as other thermal-transfer printers) can accommodate plain paper, which makes it more economical to run than its dye-sublimation competitors.

Two of the solid-ink printers that we tested, Tektronix's Phaser III PXi and DataProducts' Jolt PSe, bring ink-jet printers into the same output-quality league as dye-sublimation and thermal printers. Specially coated paper is not a requirement for solid-ink printers. Although the Phaser III PXi and the Jolt PSe fell short in dye-sublimation quality, they both scored higher in our quality tests than five of the thermal-wax-transfer printers: General Parametrics' Spectra Star GT and Spectra Star Q10E, Tektronix's Phaser 200i and 200e, and the QMS ColorScript 230.

		BYTE COLOR PERFORMANCE SCORES (PPM)						RESOLUTION (DPI)	SPECIAL PAPER REQUIRED?

The choice for premium Mac color

MACINTOSH

General Parametrics Spectra Star GT

Mac users also benefit from the Spectra Star GT's speed and quality. Only the Tektronix Phaser 200i was faster in our Macintosh tests, but its output quality was significantly lower (7.71 versus 6.36). Although the Calcomp ColorMaster Plus 6613XF beat the Spectra Star GT for quality and almost matched it for speed, the Calcomp sells for almost twice as much. An advantage shared by these top three Macintosh color printers is their ability to use standard paper, unlike the remaining two runners up.

Need the best four-color output?

HIGH QUALITY

Tektronix Phaser IISDX

We could distinguish the output of the Tektronix Phaser IISDX from a photograph, but of all the printers we reviewed, the Phaser IISDX produces the most photograph-like output. Its dye-sublimation print engine blends inks together to produce areas of true color. No dither patterns were visible, raising the Phaser IISDX above any other non-dye-sublimation printer. It placed fine lines nearly perfectly, without gaps and with blending that was visible only with the aid of a microscope.

**The secret
HP, Compaq and
Lexmark were
hoping we
wouldn't tell.**

Take a close look at their page printers and you'll see: you spend your really big money on disposable printer cartridges.

One HP® LaserJet® 4Si, for example, in a high-volume* network printing environment could easily run up \$4,183 in cartridge bills in its first year alone — more than the price of the printer itself. Five Compaq® Pagemarq™ 15s could cost you \$22,193 in cartridges. And a year's worth of cartridges for ten Lexmark™ IBM® 4039 16L printers would probably set you back by about \$41,611.

If you had no choice, these numbers would simply represent the cost of doing business. But the fact is, you do have a choice.

Cartridge-Free printing

Kyocera® is in the printer business, not the cartridge business. That's why we were free to develop Ecosys® Cartridge-Free printing. And why you can print up to 7,000 pages with an Ecosys printer with a single \$49

no-mess Ecotone® toner refill.

In our high-volume network printing example, choosing an 18-ppm Ecosys FS-3500A over an HP LaserJet 4Si would save you \$2,797 a year. Five FS-3500As would

save you \$15,263 compared with the Compaq solution, while ten FS-3500As would save \$27,751 over Lexmark in just one year.

Best of all, you wouldn't give anything up. You'd get consistently high output quality, fast throughput, reliability and full network compatibility.

Cartridge-Free for consistent quality

The traditional laser printer uses disposable cartridges because the traditional drum built into them wears out fast. The Ecosys drum doesn't. Its durable amorphous silicon (a-Si) surface will last

a fully-warranted three years/300,000 pages and beyond. Plus, Ecotone toner has ceramic particles to polish and recondition the drum with every page you print. The result for you is consistently clean output over the lifetime of the printer.

So what's the secret?

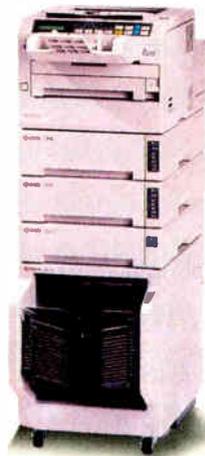

It's this: to evaluate a printing solution, you've got to consider cost of printing. And for networks with one to 1,000 printers, Ecosys Cartridge-Free printing is inherently more economical — by a wide margin.

How wide? The free Ecosys savings-at-a-glance calculator wheel will help you find out. For yours, or additional information on the Ecosys printer family, call **1-800-2-ECOSYS.**

Now that you know the secret, the only question is, how much can you save?

From the 10-ppm FS-1500A to the 18-ppm FS-3500A (shown alone and with full complement of paper handling options), Ecosys Cartridge-Free printers deliver world-class quality, performance and support with unprecedented economy.

TECHNOLOGY WITH A CONSCIENCE.

*All comparisons based on InfoCorp values 5% average page coverage, "high-volume" = 16,500 pages/month. Retail prices (8/93)/InfoCorp yields used for calculations: HP 4Si cartridge—\$169/8,000 pages; Compaq 15 cartridge—\$269/12,000 pages; Lexmark 16L cartridge—\$269/12,800 pages. To calculate: Cartridge price ÷ yield at 5% = cost-per-page. cost-per-page x total annual volume = annual cartridge expense.

GENERAL-PURPOSE COLOR

The best for color and monochrome output

A color printer to be used for reports and presentations doesn't have the same quality requirements as thermal-wax-transfer or dye-sublimation printers for prepress and other high-end color uses. For one thing, printers in the general-purpose category must be able to produce crisp monochrome text. Nevertheless, the color-output quality of these printers should still make you look good. Compared to their high-end color cousins, general-purpose color printers must run faster and offer more economical (under \$1 per page) consumables costs.

We found six color ink-jet printers and 20 dot-matrix printers that performed admirably in this regard. The rated printers also produced top-quality transparencies. Colors remained saturated and solid and did not smear or peel on either medium. On the other hand, we found that color dot-matrix printers, such as the DEC LA 95-DECWriter (which otherwise produces reasonable-quality output), do not print well on transparency film because of ink smearing.

Performance from color ink-jet printers is slow compared to that of monochrome printers. Don't buy a color printer as your primary printer unless you do is prepare charts and overhead transparencies.

The fastest of the printers rated in this category achieved a score of only three-quarters of a page per minute, while the fastest monochrome ink-jets ran at 2 ppm. Ink-jet color cartridges cost approximately \$25 to \$35 and should last for about 400 to 700 pages.

BEST OVERALL

Hewlett-Packard DeskJet 1200C/PS

This printer produced the best balance of high-quality color and monochrome output of any printer we tested. With a speed rating of 72 ppm, it was also the fastest color ink-jet printer we tested. It comes with color-matching software that helps ensure the color you specify is the color you'll get on the printed page.

THE BEST PRINTERS FOR

WORKGROUPS

If you have ever sat in a print queue while a coworker produced a large mailing, you know that speed matters for a shared printer. The laser printers we evaluated for network use were rated at 15 ppm or faster and can handle print jobs from approximately five to 50 people. Most of these printers can be attached directly to your Ethernet, Token Ring, or LocalTalk network. However, while direct network attachment can provide a noticeable speedup on documents with large scanned images, this capability is generally more of a convenience than a speed boost.

The printers ranked in this section have duty cycles of 25,000 pages per month or more; anything less couldn't sustain the print load of a large workgroup. Not included in this category are the tabloid (11- by 17-inch) printers (see the CAD and desktop publishing section for a comparison of tabloid-capable lasers).

Only four of the workgroup printers we tested offered 600-dpi resolution: the HP LaserJet 4SiMx, the Lexmark IBM 4039Laser 12L and 16L, and the QMS 1725 Print System. Not surprisingly, these four provide the best quality and make up our short list for workgroup printer recommendations.

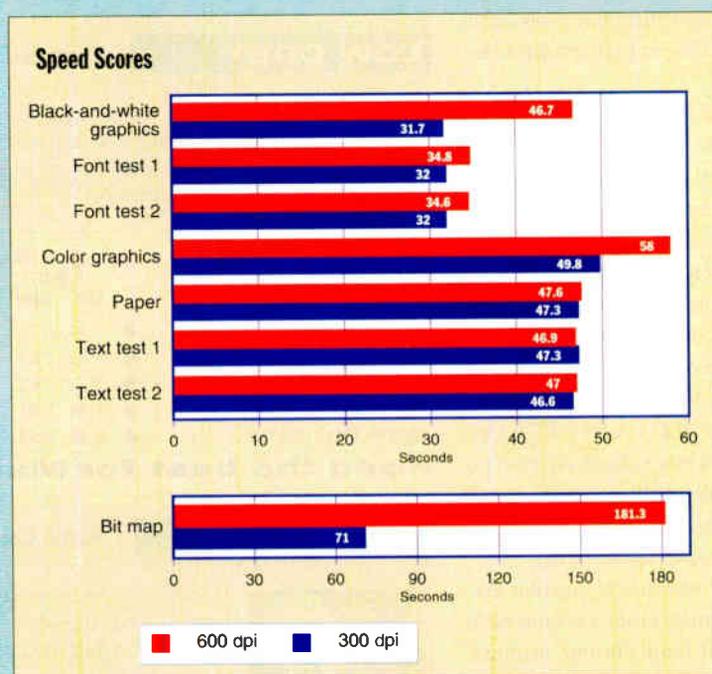

As standard equipment or options, almost every feature imaginable comes with workgroup printers: PostScript, hard drives, fax modems, and Ethernet interfaces are de rigeur. In addition, we consider automatic emulation switching a must, as well as support for NetWare and AppleTalk.

The LaserJet 4SiMx took top honors in this category. It supports Adobe PostScript Level II, the state of the art for graphical illustrations and desktop publishing. The quality of its text output is particularly good. It provides the best overall performance of any printer we tested. It was by far the fastest for printing from the Macintosh, and second only to the Compaq PageMarq 20 (see the CAD and desktop publishing section) for PostScript printing from the Macintosh. It supports the broadest range of network protocols and paper-handling options. Its 1000-sheet input capacity is double that of competitors such as the Lexmark IBM 4039Laser 16L, which offers a 500-sheet capacity.

Nevertheless, the 4039Laser 16L was the 4SiMx's main competition, thanks in part to a list price that's over \$2000 lower. Like all the Lexmark laser printers, the 4039Laser 16L provides blistering speed when used with Lexmark's

600 VS. 300: TRADING SPEED FOR QUALITY

If you want the best-looking output, you'll have to pay a price. As this figure of averaged 600- and 300-dpi printers shows, printing at 600 dpi greatly adds to the time it takes to print graphical images, such as bit maps and scanned photos, compared to 300-dpi printers.

Windows drivers, power management, a duplexing option, an excellent five-line LCD for configuration, and flash ROM to store fonts and logos. The 4039Laser 16L also provides credible PostScript performance.

The faster software raster-image processor does not produce graphics with the same quality as the PhoenixPage PostScript Level I-compatible interpreter, which does not yet incorporate all the features of Level II. In addition, the interpreter renders graphics differently (though not necessarily worse) than the Adobe product. The 4039Laser 16L does not support as wide a range of networking protocols as the 4SiMx; for example, Macs cannot yet access the 4039Laser 16L over Ethernet (LocalTalk is an option).

The 4039Laser 12L is a lower-cost, lower-performance version of the 4039Laser 16L. The two are identical except for performance and can use the same network cards and paper-handling options. With both printers, two trays with a maximum capacity of 500 sheets come standard. Like the

16L, the 12L does not yet support EtherTalk.

The Kyocera Ecosys FS-3500A touts an "environmentally sound" hardened drum that you do not replace with the toner. The performance of the FS-3500A is excellent; its PostScript speed was one of the fastest we saw, as was its PCL performance. Quality was average for a 300-dpi printer, and it was inferior to that of the 600-dpi 4SiMx and the 4039Laser 16L. Kyocera's EtherTalk support was in beta at the time of our tests.

The QMS 1725 Print System uses the same print engine as the 4SiMx, but when rendering a page rich in fonts, the 1725 takes up to 36 percent longer than the 4SiMx and as much as 240 percent longer than the 4039Laser 12L. Although the 1725 renders pages at 600 dpi, its enhanced 300-dpi engine cannot produce the same high-quality output as the best 600-dpi engines.

If you are specifically looking for low cost for high-volume DOS applications such as billing and database listings, the TI MicroLaser XL is a good choice. It was the least expensive printer in this class (\$2399), and for printing raw ASCII text streams it was faster than every other printer except the Compaq PageMarq 20. The Sharp engine in the MicroLaser XL also has a very low cost per page.

The MicroLaser XL Turbo is a souped-up version of the XL for faster PostScript printing. The Turbo adapter produced better than a 300 percent speed improvement under PostScript. But even with the Turbo upgrade, PostScript output was slower overall than on TI's 8-ppm MicroLaser Pro 600. We judged its output quality to be poorest in this class of printers because of fuzzy text that was illegible at small point sizes.

The Genicom 7170 and the

DRAFT QUALITY

Small and low-cost printers still fill a niche in many offices for quick printing of draft reports, forms, and labels. In this section, we evaluate narrow-carriage dot-matrix and ink-jet printers designed to be used by one person. Most businesses need at least one dot-matrix printer for multipart forms or large label-printing jobs that require adjustable tractors and straight-through paper paths.

Unlike the water-soluble inks used in ink-jets, dot-matrix output won't smear when wet. As a rule, the simplicity of dot-matrix printers makes them more rugged than models that use other, more complex printing technologies.

By comparison, ink-jet printers are quieter, and their output quality is usually better. Dot-matrix printers tend to be faster than ink-jets in draft mode but slower in letter-quality mode, because dot-matrix printers need two passes (versus one pass by ink-jets) to produce high-resolution text and graphics.

The best dot-matrix printer we tested was the Okidata Microline 590. Okidata has long been known for building tough printers, and the 590 is not only built like a tank, but it's also fast and easy to use. Its monochrome output quality is well above average. Another plus: The 590 produced some of the finest color output we saw from a dot-matrix printer.

The Brother HJ 400 is a good choice for double duty between a Mac and a PC. It is one of the only personal printers that comes standard with both Mac and Windows drivers.

Need speed versus quality?

BEST OVERALL C-Tech Electronics Speedjet 300

This ink-jet (and its twin, the TI MicroMarc) distinguished itself by its speed: It was the fastest ink-jet printer and outperformed five laser printers. The Speedjet has excellent paper-handling capabilities: We never saw it double-feed pages. Its output quality was also excellent.

Low cost for the Mac?

MACINTOSH Apple StyleWriter II

The fastest Mac printer in its class, the StyleWriter II also produced the best quality of the Mac printers. The one major drawback is its limited paper capacity: We could not achieve the stated 100-sheet capacity without causing paper jamming.

		BYTE PERFORMANCE SCORES (PPM)					RESOLUTION (DPI)	MEMORY (KB) STAN., MAX.	WARRANTY (YEARS)

When quality still matters...

HIGH QUALITY Epson Stylus 800

Although the Stylus 800 and the Brother HJ 400 achieved the same overall score, a page-to-page showdown shows that the Stylus 800 remains the next-best thing to a laser printer. The near-absence of the stray ink particles that are typical of most ink-jets is truly amazing, and curves are rendered flawlessly.

You want the features of a laser printer.

You require the output size of a large format plotter.

What you need is the new ProTracer II.

It's small enough to sit on your desktop. At 360 dpi, it prints crisp text, precise lines and the smoothest of curves. Its speed is undeniable. And its price — unheard of in the world of CAD.

Called ProTracer™ II, it's a large format inkjet plotter that brings something new to CAD. Versatility. Because not only does ProTracer II produce impressive drawings up to 17"x 22" in size, but it also delivers sharp, high quality text documents.

ProTracer II has an abundance of new features and capabilities all aimed at making you more productive. Like its speed enhancements. And its expanded plotting capabilities including a larger printable area, auto-centering, best fit, replot, and long axis plotting functions.

If you're an AutoCAD® user you'll want the ProTracer II base unit, priced at \$1599. It comes with ADI® drivers for AutoCAD as well as an AutoCAD 12 for Windows driver. Also included is a C-size Windows 3.1 driver and IBM ProPrinter and Epson emulations.

Our new ProTracer II-GL model combines the base unit with resident HP-GL® and HP-GL/2 emulations, and 2 MB memory. It provides support for all major CAD applications and is priced at only \$2149.

ProTracer II is backed by a full one year warranty and optional extended warranties. You'll also receive unlimited access to our expert technical support.

To receive your FREE sample output packet, locate a dealer near you, or to order direct, call Pacific Data Products at (619) 625-3643, Fax (619) 552-0889.

Reports, invoices, forms, and labels on large-size paper, where quality is not nearly as important as speed, is where 24-pin dot-matrix printers shine. The wide-carriage ink-jets we tested had superior quality to, but significantly slower performance than, their dot-matrix competition. However, these ink-jets make good alternatives to expensive tabloid laser printers for CAD drawings.

Several dot-matrix printers in this category were fast enough to outperform the slowest general-purpose lasers. The Mannesmann Tally MT 360 is the fastest printer in this group—and the most expensive, with a list price of \$2695. Although it can handle a wide variety of paper types, loading the paper is awkward. On the plus side, the MT 360 has an LED panel that is easy to read and understand, and it's easy to set DIP switches for fonts, pitch, and paper widths.

Our favorite dot-matrix printer costing under \$1000 was the Epson LQ-1170. It is a durable wide-carriage printer that combines decent speed, average quality, and above-average usability. The control panel on the front of the printer has LEDs indicating the selected font, pitch, and paper. Paper paths are at the front, bottom, and rear of the printer. The printer is noisy, like many other 24-pin dot-matrix printers, especially in 360-dpi mode. Unfortunately, no quiet mode is available. But at just \$859, this printer is a bargain in the high-end dot-matrix group.

The Lexmark IBM ExecJet

Need speed and 11- by 17-inch capabilities?

BEST OVERALL Mannesmann Tally MT 360

At more than 4 ppm, this is the fastest dot-matrix printer in this class. Speed, combined with below-average quality, make this unit a good choice for high-volume printing of multipart forms and continuous-feed stock. Paper loading is easy, and the printer has an MTBF rating of 10,000 hours.

Need sharp text and graphics?

HIGH QUALITY Canon BJ-230

This economical ink-jet was the clear winner for quality in this category. It doesn't support PostScript, but its ability to draw lines rivals its competitors'. Also, its text is sharp and clear, even using type as small as 4 points. Curves were smoothly drawn, and the printer produced solid black-filled areas. The only way of differentiating its output from a laser's was in the banding caused by its print head, a problem common to ink-jets.

		PERFORMANCE PC DRAFT (PPM)	QUALITY INDEX	CLASS	PRICE	RESOLUTION (DPI)	MEMORY (KB) BASE, MAX.	WARRANTY (YEARS)	RESIDENT FONTS
BEST	Canon BJ-230	■ 2.71	4.56	173 cps	\$549	360	42, 42	2	5
RUNNER-UP	Lexmark IBM ExecJet 4072	■ 0.43	4.39	300 cps	\$799	360	30, 128	1	64
RUNNER-UP	Epson LQ-1170	● 3.27	4.33	415 cps	\$859	360	24, 40	2	12
RUNNER-UP	Okidata Microline 395	● 2.53	3.89	607 cps	\$1499	360	64, 64	—	4
RUNNER-UP	Mannesmann Tally MT 360	● 5.53	3.67	600 cps	\$2695	360	128, 128	1	9

4072 was one of only two printers in this category that could be used with a Mac, the other being the undependable GCC Wide Writer 360. The ExecJet is a fast printer with average quality, and it has a control panel that controls font, pitch, and paper selection. Unfortunately for Mac

users, the documentation leaves much to be desired.

A final note: We also tested Advanced Matrix Technology's Tracjet Model III, which is a unique laser printer that uses pin-feed rather than sheet-feed paper. Its quality is comparable to that of the best dot-matrix printers,

and it is 60 percent faster at printing text on forms than the fastest dot-matrix model. On the other hand, it can't print on wide paper and, of course, it is unable to print multiple-part forms. At \$6995 retail, you could print faster and less expensively with two high-speed dot-matrix printers.

wait seconds

If you have to wait much longer to print, you need

You see, the NEC Silentwriter SuperScript 610 is the only laser printer that begins printing the second you press "Print." So there is absolutely no waiting.

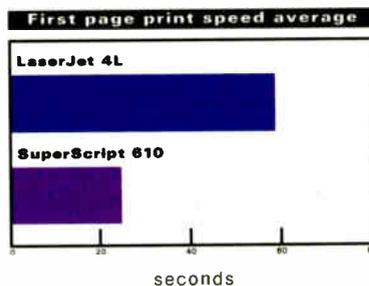

And the only laser printer with a first page print speed that's three times faster than the HP® LaserJet® 4L.

The first Windows™ printer.

In fact, the SuperScript 610 is a whole new way of printing. That's

because it's the only personal laser printer that directly interfaces with Windows. So it's as upgradable as your PC. That means as your PC gets better, so does your

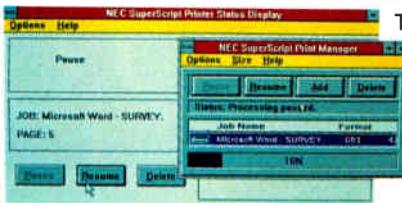

printer. In fact, this printer will print exactly what you see on your screen. Fonts, DOS applications, everything. And at less than \$700 it's an even better value than you thought.

It's a DmD.

a Silentwriter® SuperScript™ 610.

See what's happening, while it's happening.

tells you exactly what's going on. So screaming, cursing and kicking your printer are no longer necessary.

And it comes with a 2-year replacement warranty. So, if by some remote chance your SuperScript 610

The SuperScript 610 even sends an on-screen status display to your PC that

runs into bigger problems than an empty paper tray, have no fear.

We'll get you a new one overnight. If you can wait that long.

For more information on this exciting new technology, call 1-800-NEC-INFO. Or via fax, call NEC FastFacts™ at 1-800-366-0476. Request document #SW610.

Need laser quality in a large format?

BEST OVERALL

Compaq PageMarq 20

The Compaq PageMarq 20 is fast, with a speed rating of 7.7 ppm. Able to handle large-format paper and print PCL, PostScript, scalable fonts, and HPGL (Hewlett-Packard Graphics Language), there is little that this printer can't do. Its generous 1500-sheet-capacity paper tray means you don't have to spend a lot of time swapping trays.

We tested 10 laser printers designed to handle 11- by 17-inch paper and produce high-quality output for CAD, desktop publishing, and presentation materials. Four of the printers supported resolutions of 1200 dpi, and this clearly showed in the quality of the output: The two LaserMaster Unity printers received almost perfect scores in the quality tests.

The Compaq PageMarq 20 was the performance leader among the tabloid printers. Not only was it the leader in overall and low cost, it and its slower cousin, the PageMarq 15, were the top printers we chose for Macintosh applications. Although the PageMarq 20's quality was within the top 10 percent of all the printers we tested, its 800- by 400-dpi resolution doesn't match the standards set by the LaserMaster Unity printers, or even that of 600-dpi printers such as the HP LaserJet 4SiMx.

Overall, the printers in this group are workhorses, although some of them work harder than others. The LaserMaster Unity 1200 XLT and XLO, priced at \$6995 and \$8995, respectively, not only come with the highest resolutions we tested but also have an easy-to-use menu system and can produce full-bleed, camera-ready output.

The QMS 860 Print System has output that is slightly less spectacular. But at under \$4600, this printer is a good choice if you need outstanding quality and have a tight budget.

The GCC Select Press 600 is a 600-dpi printer whose output quality was second only to that of the 1200-dpi printers, but with

		BYTE PERFORMANCE SCORES (PPM)			QUALITY INDEX	CLASS (PPM)	PRICE	RESOLUTION (DPI)	MEMORY (MB) STAN., MAX.

For the best output...

HIGH QUALITY

LaserMaster Unity 1200 XLT

The Unity 1200 XLT produced the best output of all the 176 models we tested. However, at 1200 dpi, the printer scored a slow 3.88 ppm in our tests. It's clearly meant for typesetting: It comes with a 20-MB hard drive, 135 resident fonts, and 21 MB of memory.

		BYTE PERFORMANCE SCORES (PPM)			QUALITY INDEX	CLASS (PPM)	PRICE	RESOLUTION (DPI)	MEMORY (MB) STAN., MAX.
		PC		MAC					
		PCL	POSTSCRIPT	OVERALL					
BEST	LaserMaster Unity 1200 XLT	▲ 3.12	3.88	2.71	9.89	8 ppm	\$6995	1200	21, 48
RUNNER-UP	LaserMaster Unity 1200 XLO	▲ 3.37	2.17	2.17	9.89	8 ppm	\$8995	1200	32, 48
RUNNER-UP	GCC Select Press 600	▲ —	3.29	3.59	9.33	8 ppm	\$4499	600	16, 16
RUNNER-UP	QMS 860 Print System	▲ —	3.48	3.54	9.11	8 ppm	\$4595	600	12, 32
RUNNER-UP	Xante Accel-a-Writer 8100	▲ 3.69	1.66	1.53	9.17	8 ppm	\$3995	1200	12, 64

a \$4499 price tag. It was the only 600-dpi printer to print full-bleed to the edge of the page. However, one major drawback with this printer is its slow speed, which was barely more than 3 ppm.

The \$3725 Genicom 7170 looks like a Compaq PageMarq 20, but it pales in comparison in

both performance and quality. The Genicom 7150 fares slightly better in quality comparisons with the Compaq PageMarq 15. The 7150 has an easy-to-use control panel that lets you quickly navigate through the menu structure.

We experienced numerous

problems trying to run our Mac and PC tests on NewGen's Turbo PS/660 B. The NewGen Imager-Plus 1200 had even more problems. At the time this article was written, we still could not get the printer to generate the monochrome graphical image or get the bit-map components to run.

The nine portable printers we tested represented three different printing technologies. The dot-matrix models provided reasonably fast output and low price, but they almost always scored low on our quality tests. The thermal printers were fast and had much better quality than dot-matrix and ink-jet models, but their prices were almost double those of their competitors. Ink-jet printers tended to be slow, but they offered good quality and lower prices. If noise is a concern for you, the thermals and ink-jets were pleasantly quiet compared to the dot-matrix printers.

Picking a portable printer is an exercise in compromises: The perfect low-cost, lightweight, high-speed, high-quality printer doesn't exist. Overall, portable printers are slower and produce lower-quality output than their desktop counterparts.

The closest thing we found to our ideal portable printer was the Lexmark IBM 4070 IJ. This unit is one of just three printers to repeat as best overall from our May Lab Report.

The Mannesmann Tally MobileWriter PS won in our quality rankings hands down, but at \$999 and 8.3 pounds, it may cost and weigh more than your notebook computer does. Its main advantage is its complete PostScript interpreter and 2 MB of RAM.

For Mac PowerBook users, the under-5-pound, \$439 Apple Portable StyleWriter is our top choice. It comes standard with a battery that lasts for about 40 minutes. The printer supports Macs using the serial-to-parallel conversion cable.

For the best in speed...

BEST OVERALL Lexmark IBM 4070 IJ

Though not the fastest printer in this category, the 4070 IJ produces high-quality output from its 360-dpi print mechanism and comes in a compact and easily transportable package. Its retail price of \$449 makes it the lowest-priced printer ranked for best overall.

HONORABLE MENTIONS

The Lexmark IBM 4039Laser series

are among the easiest-to-use printers on the market. The front-panel LCD displays error messages in plain English rather than in cryptic codes. The driver setup is smart enough to load for existing applications. The standard flash ROM lets you download fonts that remain in the printer after it's powered down. And the printer uses only 24 W when in idle or power-saver mode.

The C-Tech Speedjet 300 and its twin, the TI MicroMarc, achieve ink-jet price and quality with

performance previously achieved only by dot-matrix and laser printers. The Speedjet has a wide print head that can print two lines of text at a time, so it can make just half the number of passes made by most ink-jet printers. The Speedjet is

also notable for its unique paper-handling mechanism: We didn't encounter the jams and misfeeds we are accustomed to with low-cost ink-jets.

Several printers achieve excellent 600-dpi resolution, but only the GCC Select Press 600 gives you

600-dpi tabloid prints that go right up to the edge of the page. All the other 600-dpi printers leave an unprintable region around the outside edge of the page that can measure a quarter of an inch or more. For proofing print runs, the full-bleed capability of the Select Press 600 is a more accurate match to the final-press capabilities.

Dubious Achievements

Kyocera is making innovations

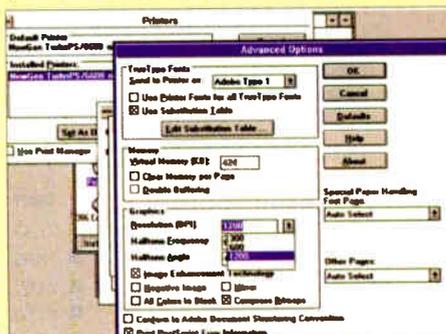

in the area of toner consumption: The cartridge in the Ecosys series never requires replacement. The Ecosys FS-1500A and Ecosys FS-3500A use a microfine ceramic toner that continuously cleans, polishes, and reconstructs the print drum while the printer is being used. You replenish the toner every 6000 pages by refilling the Ecoline cartridge. Since the toner cartridge assembly is constructed to last for the life of the printer, the result is fewer discarded cartridges to take up landfill space. If a cartridge fails, you can incinerate it: when the cartridge burns, it releases only water vapor and carbon dioxide, so there are no noxious chemicals added to the air.

TI is the first printer vendor we have seen that makes basic documentation "optional." Although this seems like a viable alternative for a large corporate account with an in-house help desk, it's unfair to individuals who need to troubleshoot problems.

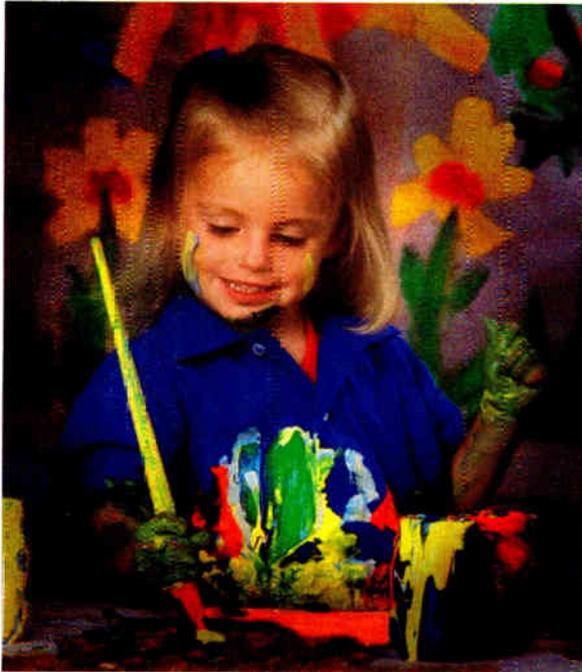

You can see the structure of the Technical Setup menu by printing a Help page, described on the next page. For a description of all of the functions of each menu item, refer to the microWriter Printer User's Reference Manual, which does not ship with the printer.

The NewGen Turbo PS/660 B driver provides

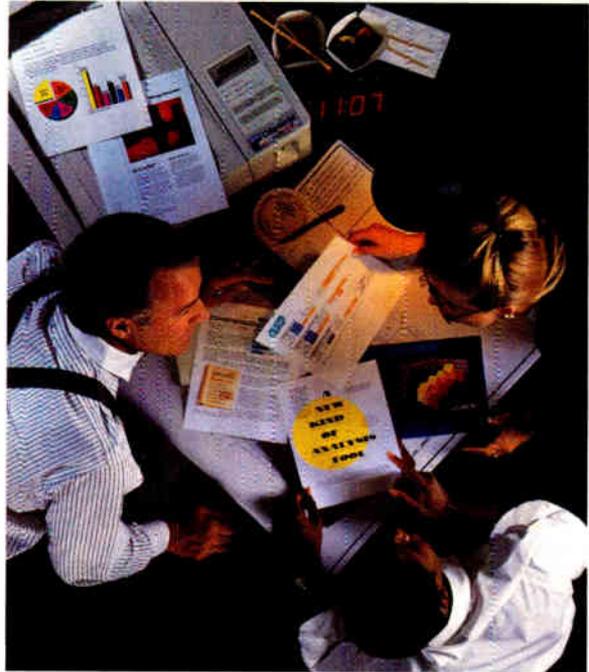

you with an option for 1200-dpi printing, but it's just a tease— if you select 1200 dpi, the printer won't operate. You must select 600 dpi for correct operation.

June 14, 1963.
Cindy Smith plays with color.

Thirty years later her business
depends on it.

Introducing the QMS ColorScript Laser 1000. Now your business has total freedom of expression.

For Cindy, communicating decision-critical information quickly, flawlessly and in brilliant color is now her livelihood. That's why she depends on the QMS ColorScript® Laser 1000 Print System. It frees her to print entire forms and letterhead with color logos, images and high quality text without changing paper. It saves her the cost of stocking special forms, letterhead and multiple sets of supplies and uses standard paper and transparencies. It improves her message by highlighting key data with color in multipage presentations and documents. Add direct connection to a variety of networks and anyone can realize both greater productivity and a per user cost that rivals personal printers. Plus, our easy software loadable upgrades virtually eliminate obsolescence.

Save money. Save time. Free yourself from limitations. Discover the advantages of the QMS® ColorScript Laser 1000 Print System.

- Laser color and monochrome printing • Compatibility with PostScript™ Level 2 and Level 1, HP PCL®5C and HP-GL®
- TrueType font scaling
- Automatic collation • Simultaneous input and automatic emulation switching • 65 resident type fonts • EfiColor™ and Colorimetric color dictionaries and Apple ColorSync™ device profile • Supports DOS, Windows™, Macintosh® and Unix® applications • Software loadable system upgrades

Expression is a serious business.
Call QMS today at 800 841-0760 or 205 633-4300
for the name of a reseller demonstrating
the QMS ColorScript Laser 1000 in your area.

INTRODUCING CodeBase++™ 5.0

Now C++ programmers can discover the DBMS power of dBASE, FoxPro & Clipper.

Not only is the new **CodeBase++ 5.0** 100% compatible with the data, index and memo files of dBASE®, FoxPro® and Clipper®, you also get all the important benefits of programming in C++.

You get C++ speed and size.

Most developers are familiar with the amazing speed and compact size of C and C++ programs. Now harness this speed for your own database programs. Compare the performance with those "executables" of dBASE, FoxPro, Clipper (which contain imbedded interpreters) to those of similar C and C++ programs. Also, be sure to compare the size of their EXE's to those created with **CodeBase++** (which are as small as 45K!).

You get object oriented programs.

CodeBase++ 5.0 is a C++ class library for database management. Now you can experience the object oriented productivity gains of C++ , together with the power of a complete DBMS.

You get multi-user sharing with dBASE, FoxPro and Clipper.

Now your multi-user C++ programs can share data, index and memo files at the same time as concurrently running FoxPro, Clipper and dBASE programs. Turbo-charge critical xBase applications sharing data on a network with C++ and **CodeBase++** with no incompatibilities.

NEW-You get xBase queries and relations with instant results.

We've added Bit Optimization Query Technology to **CodeBase++** for stunning query performance (**BOT** is similar to FoxPro's Rushmore). Our product analyzes your queries using index information, so a record is only actually retrieved when it belongs in your query solution set.

With **CodeBase++** you can literally query a huge 500,000 record data file in less than a second on a 25MHz 80386!

You get C++ portability.

As with C, ANSI C++ is an international standard across all hardware platforms. This means you can port **CodeBase++** applications between DOS, Windows, NT, OS/2, Unix, and Macintosh—today.

NEW - You get code generation.

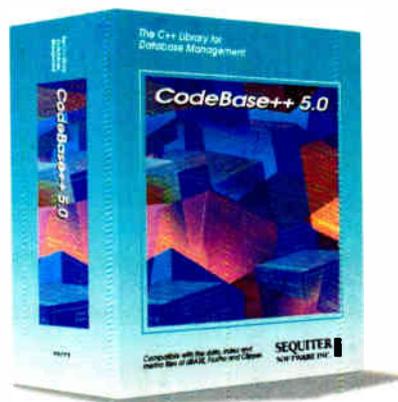

Save hours of coding time with our automatic source code generation, containing all of the specialized class definitions needed to support your data structures.

Product Sales Summary		
Month of:	Product	Quantity
Nov 1992	Database	62 \$25,137.00
Nov 1992	Spreadsheet	50 \$2,860.00
Nov 1992	Monthly Summary	321 \$47,063.00
Dec 1992	Database	62 \$24,862.00
Dec 1992	Spreadsheet	53 \$1,975.00
Dec 1992	Monthly Summary	615 \$44,737.00
Summary		236 \$91,748.00

Using our visual report writer is easy; simply draw your report, then include it in any program you write.

PLUS-You get CodeReporter FREE!

Our visual report writer, **CodeReporter**, uses the speed of **BOT** to run reports lightning fast. To test this amazing performance yourself, call: 403/437-2410 for your free working model.

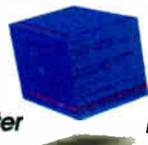

The new CodeBase++ is your best C++ solution for xBase file access and database management.

Digital Signatures

Cryptographic algorithms can create nonforgeable signatures for electronic documents, making them valid legal instruments

BRUCE SCHNEIER

For ages, special seals or handwritten signatures on documents have served as proof of authorship of, or agreement with, the contents of a document. Several attributes make the use of handwritten signatures compelling. These include the following:

- A signature is not forgeable and serves as proof that the signer deliberately signed the document.
- A signature is authentic and convinces the recipient that the signer deliberately signed the document.
- A signature is not reusable. It's part of the document, and an unscrupulous person cannot transfer it to a different document.
- Once signed, a document is unalterable.
- A signature cannot be repudiated. Since the signature and the document are physical objects, the signer cannot later claim that he or she didn't sign it.

These attributes would all hold true in an ideal world; in reality, however, none of them is completely true. Signatures can be forged, or they can be lifted off one piece of paper and moved to another. Documents can be altered after they are signed. But for simplicity's sake, I'll assume that the signatures discussed in this article exist in an ideal world.

It would be nice to have nonforgeable signatures on computer documents, but there are problems with this concept. First, bit streams are easy to copy; the mere presence of such a signature means nothing. Even if a person's signature was made difficult to forge—if it was accompanied by a graphical image of a fingerprint, for example—with today's cut-and-paste software it's all too easy to move a valid signature from one document to another. Second, documents are easy to modify after they are signed, without leaving any evidence of modification.

So, when you receive a piece of E-mail containing critical information, how do you know who it is from? Can you be sure that the "from" line isn't forged? Are you certain that someone hasn't tampered with the document's contents during transit? If necessary, could you prove any of this in court?

Digital signatures are an attempt to create documents that can be mathematically and legally traced to their authors. A *digital signature* is a string of bits attached to an electronic document, which could be a word processing file or an E-mail message. This bit string is generated by the signer, and it's based on both the document's data and the person's secret password. Someone who receives the document can prove—both to himself or herself and to a court—that the signer actually signed the document. If the document is altered, the signer can also prove—to himself and to a court—that he did not sign the altered document.

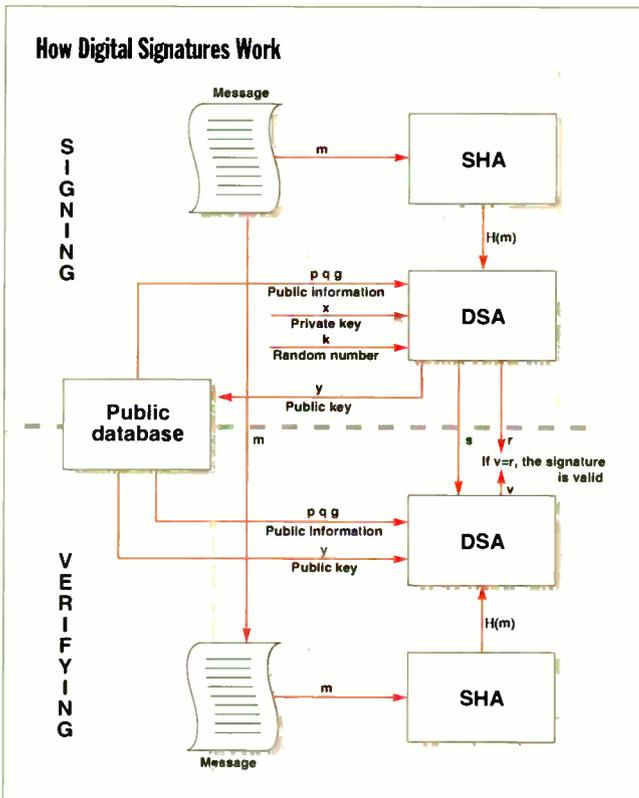

Digital Signatures Defined

Public-key cryptography can be used for digital signatures. Public-key cryptography uses special encryption algorithms with two different keys: a public key that every-

one knows, and a private key that only one person knows. The term *key*, as it's used here, describes a unique bit pattern. Public-key algorithms encrypt the contents of an electronic document using both keys. The resulting file is an amalgam of both the public and private keys and the original document's contents.

This technique accomplishes several things. First, the file's data is secure because of the private key. Because

Suppose an electronic document or message (m) is to serve as a legal instrument. The signer uses the SHA to create a hash value of the document's contents, $H(m)$. Next, the signer selects public prime numbers p , q , and g , a random number k , and a private key x . These values and the hash are supplied to the DSA, which creates the signature values s and r . The verifier provides the DSA with the document's hash value; the signature s ; the same p , q , and g ; and the public key y . If the result (v) from the verifier's DSA matches the other signature value r , then the signature is valid. This also proves that the document's contents have not been altered.

the file's data also relies on the public key, anyone owning the public key can verify the file's authenticity. Since this file is also a function of the original document's contents, any alteration to the encrypted file causes the verification to fail. Finally, it is computationally infeasible (on the order of thousands of years) to calculate the private key from the public key.

For example, suppose Alice signs a document for Bob using her private key. Ignoring the mathematics for a moment, the digital signature works like this: Alice (the signer) generates a mathematical function of her private key and the document. This is the signature. Bob (the verifier) then generates a mathematical function of Alice's public key and her signature. If this function matches the document, the signature is valid. If it does not, the signature is not valid. The point here is that the security of the digital signature algorithm prevents someone from pretending to be Alice and forging her signature.

This arrangement satisfies the signature characteristics we're looking for:

- The document's signature is not forgeable, since only Alice knows her private key.
- The signature is authentic. When Bob verifies the message

with Alice's public key, he knows that she signed it.

- The signature is not reusable; the signature is a function of the document and cannot be transferred to any other document.
- The signed document is unalterable; any alteration makes the document unverifiable with Alice's public key.
- The signature cannot be repudiated. Bob doesn't need Alice's help to verify her signature.

Notice that these features nicely match the list of attributes discussed earlier with regard to handwritten signatures. Best of all, Alice and Bob don't have to meet face-to-face or exchange any physical pieces of paper. With possession of Alice's public key, Bob can be certain that the purchase order for 10,000 widgets that he receives from her through an E-mail service is valid.

The Digital Signature Standard

In 1991, NIST, the National Institute of Standards and Technology, proposed the DSA (Digital Signature Algorithm) for the then-new DSS (Digital Signature Standard). The mathematical algorithm was developed at NSA, the National Security Agency, and is related to other digital signature algorithms in the academic literature (see the bibliography).

The DSA uses the following parameters:

- p , which equals a prime number 2^L bits long, where L ranges from 512 to 1024 and is a multiple of 64. (In the original standard, the size of p was fixed at 512 bits. This was changed after much criticism.)
- q , which equals a 160-bit prime factor of $p-1$.
- g , which equals $h(p-1)/q$, where h is any number less than $p-1$ such that $h(p-1)/q \bmod p$ is greater than 1.
- x , which is a number less than q .
- y , which equals $gx \bmod p$.

Additionally, the algorithm makes use of a one-way hash function: the SHA (Secure Hash Algorithm). Details will come later; for now, it's just $H(x)$.

The first three parameters, p , q , and g , are public and can be common across a network of users. The individual private key is x ; the individual public key is y .

Now back to the example. Alice wants to sign a message, m . First she generates a random number k that is less than q . Then she generates $r = (g^k \bmod p) \bmod q$, and $s = (k^{-1} (H(m) + xr)) \bmod q$. The parameters r and s are her signature. They can be sent with her message or stored separately (see the figure "How Digital Signatures Work").

Bob wants to verify a signature, r and s , of message m . He knows p , q , and g , plus Alice's individual public key, y . Bob computes the following:

$$w = s^{-1} \bmod q$$

$$u1 = (H(m) * w) \bmod q$$

$$u2 = (r * w) \bmod q$$

$$v = ((g^{u1} * y^{u2}) \bmod p) \bmod q$$

If $v = r$, then the signature is verified as Alice's.

Proofs for the mathematical relationships are found in the NIST documentation. Essentially, Alice is generating two parameters, r and s , that are functions of her message, her private key, and a random variable. For an adversary to be able to forge Alice's

signature, he or she has to be able to recover x from r and s . This problem is conjectured (although not proved) to be equivalent to solving the discreet logarithm problem mod p . As I will show later, this is computationally impossible.

Real-world implementations of the DSA can be speeded up through precomputations. Note that the value r is not dependent on the message. You can create a string of random k values and then precompute r values for each of them. You can also precompute $k-1$ for each of those k values. Then, when a message comes along, you can compute s for a given r and $k-1$. This pre-computation speeds up the DSA considerably.

Public and Private Keys

Certain values of p and q are much easier to crack than others. If someone used one of these "cooked" moduli (i.e., values), then his or her signature would be easy to forge. This isn't a problem, for two reasons: The moduli for which this property holds true are easy to detect, and these moduli are so rare that the chances of using one when choosing a modulus randomly are negligibly small—smaller, in fact, than the chances of accidentally generating a composite number using a probabilistic prime-generation routine.

NIST recommends the use of the secure method shown in the text box "Steps for Generating Two Primes for a Digital Signature." This method ensures that there is a public means of generating p and q . For all practical purposes, the two-primes method prevents the use of "cooked" values for p and q . If someone were to hand you a p and a q , you might wonder where the person got them. However, if somebody hands you the values for S and C that generate the random p and q , you can work through this routine to derive p and q . Since this is a one-way function, it prevents someone from working backward to create a bogus S and C .

Implementation and Security

The mathematics of the DSS are straightforward. The hardest part is the software that's required to perform arithmetic operations on numbers that are 1000 bits long.

As for security, NIST's announcement of the DSA/DSS standard created a maelstrom of criticisms and accusations that were more of a political than an academic nature. RSA Data Security, the purveyor of the RSA algorithm, led the charge against DSS. The company wanted RSA, and not another algorithm, to be used as the standard (see the text box "RSA Digital Signatures").

But the only technical criticism

of DSS's security was the key size. The original standard required only 512-bit keys. Since the algorithm gets its security from the difficulty of computing discrete logs modulo p , this was worrisome to most cryptographers. There have been advances in the problem of calculating discrete logarithms in a finite field, and 512 bits is too short for long-term security. It's possible to crack 512-bit keys in a matter of months or years, which is far too short an interval for special contracts and diplomatic agreements that must survive 40 years or longer.

In response, NIST made the key size variable, from 512 bits to 1024 bits. It would take all the world's computers far longer than the age of the universe to calculate a discrete logarithm modulo a 1024-bit number.

The Secure Hash Algorithm

In practical implementations, the DSA is too inefficient to sign long documents directly. In the standard, the DSA is implemented with the SHA. Therefore, in my example, instead of signing a document, Alice signs the hash of the document (i.e., a value that is generated by a hash algorithm operating on the document's data).

The NIST and NSA designed the SHA for use with the DSA. The standard itself is called the SHS (Secure Hash Standard); SHA is the algorithm used in the standard.

The SHA speeds encryption times drastically, and since the chances of two different documents' having the same 160-bit hash are only one in 2^{160} , anyone can safely trust a signature of the hash to represent a signature of the document.

If a two-way hash function were used, it would be a trivial matter to create multiple documents that hashed to the same value, so anyone who signed a particular document could, in a sense, be duped into signing a multitude of documents. Therefore, this protocol cannot work without one-way hash functions.

The SHA accepts an arbitrary-length message input and produces a 160-bit message-digest output. The algorithm is complicated, but it's straightforward. First, the message is padded so that it is a multiple of 512 bits long. Next, the algorithm appends a 1, and then as many zeros as necessary to make the message's length 64 bits short of a multiple of 512. Finally, a 64-bit value that represents the message's length before padding is tacked onto the message.

Five 32-bit variables, as defined by the SHS, are initialized with the following hexadecimal values:

Steps for Generating Two Primes for a Digital Signature

This algorithm generates the two primes p and q , such that p divides $p-1$. The prime p is between 512 and 1024 bits long, for some multiple of 64 bits. The prime q is 160 bits long. Let $L-1 = n^{160} \cdot b$, where L is the length of p , and n and b are two numbers.

1. Choose an arbitrary sequence of at least 160 bits and call it S . Let g be the length of S in bits.
2. Compute $U = \text{SHA}(S) \text{ xor } \text{SHA}((S+1) \text{ mod } 2g)$.
3. Form q from U by setting both the most significant bit and the least significant bit to 1.
4. Check to see whether q is prime.
5. If q is not prime, go back to step 1.
6. Let $C = 0$ and $N = 2$.
7. For $k = 0, 1, \dots, n$, let $V_k = \text{SHA}((S + N + k) \text{ mod } 2g)$.
8. Let $W = V_0 + V_1 \cdot 2^{160} + \dots + V_{n-1} \cdot 2^{(n-1) \cdot 160} + (V_n \text{ mod } 2b) \cdot 2^{n \cdot 160}$ and $X = W + 2L - 1$. Note that X is a $2L$ -bit number.
9. Let $p = X - ((X \text{ mod } 2q) - 1)$. Note that p is congruent to 1 mod $2q$.
10. If $p < 2L - 1$, go to step 13.
11. Check to see whether p is prime.
12. If p is prime, you're done; go to step 15.
13. Let $C = C + 1$ and $N = N + n + 1$.
14. If $C = 4096$, go to step 1. Otherwise, go to step 7.
15. Save the value of S and the value of C used to generate p and q .

RSA Digital Signatures

Another public-key cryptography algorithm, RSA, can be used to implement digital signatures. A patent was awarded to MIT in 1983 for the RSA algorithm; a year later, RSA Data Security, Inc. (Redwood City, CA), was founded to market and license it.

The algorithm's name comes from the first letters of the last names of its creators: Ron Rivest, Adi Shamir, and Leonard Adleman. RSA digital signatures are an ISO standard (ISO/IEC 9796) and a French banking standard (Etebac 5). NIST (the National Institute of Standards and Technology) didn't use RSA for its own standard because of patent problems: RSA is patented in this country, but not abroad.

With RSA, the public key consists of two numbers, n and d . The variable n is the product of two secret primes, p and q . The variable d is a random number, relatively prime to $(p-1)(q-1)$. The private key is e , calculated such that $d \cdot e = 1 \pmod{(p-1)(q-1)}$.

To sign a message m , you first use a one-way hash function to compute the hash of m : $H(m)$. The signature, s , is $H(m)^e \pmod n$. To verify the signature, you calculate $s^d \pmod n$. If $s = H(m)$, then the signature is valid.

 DD = 10 32 54 76
 EE = C3 D2 E1 F0

The main loop of the algorithm then begins. It processes the message 512 bits at a time and continues for as many 512-bit blocks as are in the message.

First the five variables are copied into different variables: AA into A, BB into B, CC into C, DD into D, and EE into E. The main loop has four rounds of 20 operations each. Each operation performs some nonlinear operation on A, B, C, and D and then does shifting and adding.

The SHA's set of nonlinear functions are as follows:

$f(X,Y,Z) = XY$ or $(\text{not } X)Z$, for the first 20 operations.

$f(X,Y,Z) = X \text{ xor } Y \text{ xor } Z$, for the second 20 operations.

$f(X,Y,Z) = XY$ or XZ or YZ , for the third 20 operations.

$f(X,Y,Z) = X \text{ xor } Y \text{ xor } Z$, for the fourth 20 operations.

There are also four hexadecimal constants used in the algorithm. They are as follows:

$K_1 = 5A827999$, for the first 20 operations.

$K_2 = 6ED9EBA$, for the second 20 operations.

$K_3 = 8F1BBCDC$, for the third 20 operations.

$K_4 = CA62C1D1$, for the fourth 20 operations.

The message block is transformed from 16 32-bit words (M_0 to M_{15}) to 80 32-bit words (W_0 to W_{79}) by using the following algorithm:

$W_t = M_t$, for $t = 0$ to 15;

$W_t = W_{t-3} \text{ xor } W_{t-8} \text{ xor } W_{t-14} \text{ xor } W_{t-16}$, for $t = 16$ to 79

If t is the operation number (from 1 to 80), and M_j represents the j th sub-block of the message (from 0 to 15), and $\lll s$ represents a left shift of s bits, then the 80 operations look like the following:

TEMP = $(A \lll 5) + f_1(B,C,D) + E + W_t + K_t$

E = D

D = C

C = $(B \lll 30)$

B = A

A = TEMP

After all this, A, B, C, D, and E are added to AA, BB, CC, DD, and EE, respectively, and the algorithm continues with the next block of data. The final output is the concatenation of A, B, C, D, and E.

Using the SHA has two other benefits besides reducing the length of the message to be signed. The signature is kept separate from the document, and the recipient's storage requirements for the document and signature are much smaller.

An archival system can use this type of protocol to verify the existence of documents without storing their contents. The central database could just store the hashes of files. It doesn't have to see the files at all; users submit their hashes to the database, and the database time-stamps the submissions and stores them. If there is ever any disagreement about who created a document and when, the database could resolve it by finding the hash in its files. This has vast implications concerning privacy: Alice could copyright a document but still keep the document secret. Only if she wished to prove her copyright would she have to make the document public. ■

OS/2 Extended Attributes

What they are, why they break, and how to fix them

MARK J. MINASI

I recently reinstalled OS/2 2.1 on a system. On the first boot, I got a number of messages, which I'm unfortunately now quite familiar with, about "lost" and "cross-linked" EAs (extended attributes). I got tired of seeing these messages, so I looked into what causes them and found some interesting things.

With OS/2 1.2's introduction on Thanksgiving weekend of 1989 came a new file system named the High Performance File System, or HPFS. Among the HPFS's features was the ability to extend a file's attributes beyond the traditional four—read-only, hidden, system, and archive—allowing programmers to create attributes that were appropriate to a particular application.

Microsoft and IBM believed that EAs would become a big deal, but nobody really used them except in the operating system itself. Microsoft liked EAs so much, however, that it came up with a way to shoehorn them back into the FAT-based (file allocation table) file system. EAs were a minor irritant in OS/2 1.2 and 1.3, but they're very important under OS/2 2.x: Much of OS/2's Workplace Shell information (e.g., icons, colors, and window placement) is encoded into EAs. So EA problems under OS/2 2.x often mean system crashes.

First, you need to look at how EAs are represented in the FAT-based file system. As you may know, the FAT-based file system uses the directory and the FAT as a pair: The directory tells your system what files you have, and the FAT tells the system where those files are. DOS first looks to the directory to find out file size, name, date, and where to go in the FAT to get more information. Then the system follows the FAT pointer to the indicated area of the FAT, which, in turn, describes exactly where on disk to find the files.

Microsoft decided to store the EAs on the disk in the data area, alongside the files. Each file's EAs occupy at least one cluster of hard disk space. (Clusters are fixed-size areas on disk; the size is most commonly 2 KB, but it can be as large as 16 KB.) Now, a cluster can't just sit out on disk without OS/2's knowledge (otherwise, OS/2 would just overwrite the area), so each cluster in the FAT must be marked as *taken*.

But taken by what? A cluster that claims it is occupied but has no owner in the directory is called a *lost*

cluster and considered an error condition. In fact, if many utilities—one of them being CHKDSK—find such a cluster, it is removed. So each EA cluster must have an owner. Microsoft solved that problem by making all the separate EA clusters one big file called EA DATA. SF. The space between EA and DATA, and between DATA, and SF makes it difficult to mess around with or erase the file.

Now you need to know how the system knows which files go with what EAs. Each DOS directory entry has 10 bytes of unused space. It's a relic that DOS 1.0 inherited from CP/M, which used that space to hold file allocation information. As the file allocation information appeared elsewhere in DOS, that left 10 unused bytes. What Microsoft did was to use the first two of those unused bytes for something that I'll call an *extended attribute pointer*, or EAP. The figure "Relationship Among DOS Directory, FAT, and Extended Attributes" shows how

DAVE CUTLER © 1993

the directory entries, FAT entries, EAPs, and EAs might look for two files. Now that you've seen the FAT and EA pointers depicted, it may be obvious what can go wrong with EAs under a FAT-based system. Just as the directory-to-FAT links can become damaged, leading to the unfortunately familiar lost clusters and cross-linked clusters, so, too, can the directory-to-EA links cause problems. These problems manifest themselves in a number of ways.

continued

Cross-Linked EAs

Of the three EA-related problems, cross-links are the worst. Sometimes a CHKDSK run will show an error message explaining that a file is cross-linked on an EA. This just means that one file's EAP and another file's EAP point to the same place (e.g., both lay claim to cluster 150 of EA DATA.SF). CHKDSK can't fix this problem; it can only complain about it, because two files both claim ownership of an EA. How can CHKDSK know which one is telling the truth? The only options that the designers of CHKDSK would have would be to first disconnect one file's EAP, trashing an EA for a file that might need it; second, disconnect both file's EAP; or third, copy an EA to another part of EA DATA.SF and point the second file's EAP to the copy.

Consider this scenario. You install OS/2 and use it for a while, but you run into some kind of trouble—the desktop disappears and you don't have a backup, or the like. So you decide to reinstall OS/2. Before you do, however, you completely remove the previous copy of OS/2, eliminating every single OS/2-related file, including EA DATA.SF. This is generally a good procedure; for example, many OS/2 betas have recommended installing OS/2 fresh on your disk, not on top of a previous copy of OS/2. Furthermore, experience shows that OS/2 installed atop a damaged copy of OS/2 sometimes does not overwrite the troubled parts of the older OS/2 installation.

Now suppose you reinstall OS/2; you now have a brand-new EA DATA.SF file that contains information only on the newly installed OS/2 files. Perhaps, for example, the file CMD.EXE has a pointer that refers it to EA cluster 200. But consider the files that you didn't erase that contain the EA pointers. What if one of those files used to have an EA in EA cluster 200? It still contains a pointer that points to EA cluster 200. That's where cross-linked EAs come from. So, to avoid cross-linked EAs, remember: When removing OS/2 prior to reinstalling OS/2, do not erase EA DATA.SF.

Suppose you've already got cross-linked EAs. What do you do then? Take a look at the following example of a cross-linked EA error message from CHKDSK:

Correction and Amplification

We'd like to correct some factual errors in the October Beyond DOS column "The Visual Toolbox." Mark J. Minasi mistakenly confused VREXX, a product originally developed by IBM (which has since been placed in the public domain as shareware), with VisPro/REXX, a commercial product developed by HockWare (Cary, NC). In the column, Minasi gives a short programming example of how to create a dialog box for an OS/2 program using VisPro/REXX, but the code is for VREXX. The column also attributed erroneously two drawing functions—VDraw and VArc—to VisPro/REXX when they are, in fact, part of VREXX.

In addition, the column incorrectly stated that "VisPro/REXX is simply a bunch of new [OS/2] REXX functions." In fact, VisPro/REXX offers developers a visual-programming environment that's CUA 1991-compliant. Minasi reported that he experienced dropped numbers when using VisPro/REXX's sample calculator application; but at BYTE, using a different PC and mouse, we were unable to duplicate that experience. Although not in error at the time of publication, Watcom International's VX-REXX price jumped from \$99 to \$199 on October 1.

```
SYS1324: C:\UTIL\X.EXE is cross-linked on
extended attribute 110.
```

```
SYS1324: C:\UTIL\Y.EXE is cross-linked on
extended attribute 111.
```

```
SYS1324: C:\OS2\DLL\IMP.DLL is cross-linked
on extended attribute 110.
```

```
SYS1324: C:\OS2\DLL\NLS.DLL is cross-linked
on extended attribute 111.
```

Listed are two pairs of files—X.EXE/IMP.DLL and Y.EXE/NLS.DLL. In each case, only one of these files is the rightful owner of the EA. Which is it? Well, if you've just reinstalled OS/2, then it's easy—the OS/2 files. Otherwise, you may have to experiment a little. You do this with EAUTIL. The OS/2 documentation has more information on EAUTIL, but briefly, you can use EAUTIL/S to split EAs from their files and EAUTIL/J to join an EA with a file.

To fix NLS.DLL and Y.EXE, I would first use EAUTIL/S to remove the EA from NLS.DLL. That would, in passing, erase the EAP in NLS.DLL; the EAP in Y.EXE would still be in place. To get rid of the EAP in Y.EXE, the best answer is probably to cheat and boot under DOS. DOS has no knowledge of EAPs, so most DOS operations blithely overwrite any EAPs. Just copy Y.EXE to YY.EXE and then rename it back to Y.EXE, and the EAP will be gone. Then reboot under OS/2 and reattach the EA to NLS.DLL with EAUTIL/J.

Lost EAs

By now, you have seen that a *lost* EA is an EA cluster that has no EA pointer pointing to it. When CHKDSK/F comes across such a cluster, it prints a message that says "Lost extended attributes have been found. Do you want to display them as files (Y/N)?"

If you tell CHKDSK to make them files, it gives them names such as EA0000.CHK. You can rejoin them to files using the EAUTIL program. On the other hand, if you know that you'll never use them, you can free up the space by answering "no" to the question. The error message "Has attempted to claim an extended attribute that does not exist..." occurs when a pretender points to an EA cluster that it doesn't own; in fact, the cluster doesn't even exist. Suppose your EAs used to range up to 2000 clusters; that means that some file out there has an EA pointer with a value of 2000. But then suppose you blast OS/2 and the EA DATA.SF file, reinstalling OS/2 and incidentally re-creating EA DATA.SF. But the new installation only has about 400 EA clusters. That means that the old pretender, which still thinks it has an EA—but doesn't—points to an EA whose value is above the highest EA value known to OS/2. Result: the above message. CHKDSK/F fixes the problem by blanking out the pointer.

EA problems are an unfortunate side effect of the nature of the Workplace Shell. Knowing how to handle their vagaries will make you better-equipped to solve the certain problems that will pop up now and then due to EAs. ■

NT's Structured Exception Handling

Windows NT's structured exception handling gives you clutter-free, reliable, and tighter code. But the price may not be worth the effort.

STEVE NIEZGODA, LLOYD HOLT, AND DEREK WOJCIECH

Microsoft wants to convince software developers that Windows NT is the operating system for the next generation of software. One tack it's taking to prove its case is touting NT's structured-exception-handling architecture, claiming it ensures robustness at all levels of the operating system. It's a good argument. Structured exception handling has many benefits. It lets you avoid cluttering code with conditional statements that check each operation's inputs and results, thereby diverting attention from the algorithm. It reduces the overall amount of code because calling routines don't need to perform the same tests as invoked routines. Finally, it gives you a mechanism for handling errors that can't be checked with preconditions.

But the promise of more reliable software raises some questions: Should you use structured exception handling in new software development? Can you retrofit it to your legacy applications? What are the benefits of NT structured exception handling in performance, program size, and source code readability? We set out to answer those questions by testing the toughness of NT's structured exception handling.

NT structured exception handling provides many benefits, such as recovery from memory errors and hardware traps. But it is not the software developer's cure-all. You pay for its benefits in reduced performance. And for legacy applications, the price of retrofitting may be too high.

Categories of Exceptions

You can classify NT exceptions into two categories: kernel- and user-defined. Kernel-defined exceptions include hardware traps, math or memory errors, and debugger instructions. User-defined exceptions are generated through the Win32 API routine `RaiseException()`, which transfers control to a user-written, frame-based exception handler.

Often, both the operating system and the programming language cooperate to handle an exception. (Some exceptions, like debugger instructions, are handled exclusively by the operating system.) The operating-system component is the exception dispatcher. The language component is the frame-based exception handler.

All NT exceptions are serviced by a kernel module

called the *exception dispatcher*. When an exception occurs while your CPU is in kernel mode, the exception dispatcher invokes the appropriate frame-based exception handler. If it can't find one, a fatal error exists and `ExitWindows()` is called. When exceptions turn up while your CPU is in user mode, the dispatcher locates an exception handler by performing the search shown in the figure "Systematic Search for an Exception Handler." If it can't locate a handler, it invokes the kernel default handler, `ExitProcess()`.

Your compiler handles the frame-based exception-handling mechanism. Using language constructs, a code block can be guarded by several exception handlers. When invoked, the code block's local variables and parameters (the stack frame) are pushed onto the program stack. The exception handlers guarding the code block are statically associated with this stack frame during compi-

JOHN NELSON © 1993

lation. When an exception occurs, the exception dispatcher dynamically searches for the exception handlers associated with the current stack frame. If none is found, the dispatcher continues searching the call stack. This process is known as *unwinding the stack*.

Structured Exception Mechanics

To support structured exception handling, Microsoft extended the C language by adding the keywords `try` and

Compiler, we gamed might into the kernel dispatcher. Memory_Allocate is functionally equivalent to Simple, but its error-reporting scheme mimics the approach used in software libraries. Typically, a library routine informs the invoking function when an error occurs but lets the invoking function determine the appropriate course of action. Library routines seldom directly inform you of errors.

we required that exceptions be handled by the invoking function rather than the offending function.

The None implementation of `filecopy()` is written as one function. The exception checking and correction logic are complex and difficult to follow. An exception structure, passed on the program stack, can be populated from seven different places

NOVEMBER 1993 BYTE 319

Hands On Some Assembly Required

except. These keywords mark, respectively, the beginnings of the guarded code block and the exception logic. This is the syntax:

Systematic Search for an Exception Handler

but to mimic ordinary routines found in software development projects. Our experiment modeled applications that gracefully recover from errors triggered by low-level routines.

Hands On Some Assembly Required

within `filecopy()`. In each exception condition, a significant amount of code is dedicated to freeing resources.

After writing `None`, we realized that nobody would write it as we did, since many C programmers dislike rigidly structured programming. Consequently, we created a more realistic non-exception-handling implementation called `None-Optimized`.

`None-Optimized` improves `None`'s readability by two techniques. First, file routines (e.g., `fopen()` and `fread()`) are wrapped, user-written functions. The parameter list for a wrapper function includes the parameter list for the corresponding file function, plus a pointer to the exception structure. For example, `fopen()` is wrapped in the user-function `file_open()`:

```
FILE *file_open(char *fname, char *type,
                ExcStruc *es)
{
    FILE *f;

    if((f = fopen(fname, type)) == NULL)
    {
        es->code = errno;
        es->Action = OPENING;
        es->Object = fname;
    }
}
```

```
    }
    return f;
}
```

Second, a macro containing a `GOTO` statement is used to disguise the plethora of `IF...THEN...ELSE` statements—for example,

```
#define Execute(A) A;if(es->code)
goto cleanup;

if((buf = malloc(BUFSIZE)) != NULL)
{
    Execute(in = file_open(infile, "r",es));

    /* Start the copy code. */
cleanup:
    /* Free memory, close files, etc. */
#undef Execute
}
```

`Execute(A)` hides the `IF...THEN...ELSE` statements associated with `fopen()`.

Compiler and NT also use wrapper functions. However, instead of passing an error structure on the stack, they raise exceptions. In Compiler, this entails populating a global exception structure and invoking `raise()`. The NT implementation is similar, but it does not use global variables. Here's the `fopen()` wrapper function for the NT implementation:

```
FILE *file_open(char *fname, char *type)
{
    FILE *f;
    static DWORD exceptionArguments[3];

    if((f = fopen(fname, type)) == NULL) {
        exceptionArguments[0] = (DWORD) errno;
        exceptionArguments[1] = (DWORD) fname;
        exceptionArguments[2] =
            (DWORD) OPENING;
        RaiseException(100, 0, 3,
            exceptionArguments);
    }
    return f;
}
```

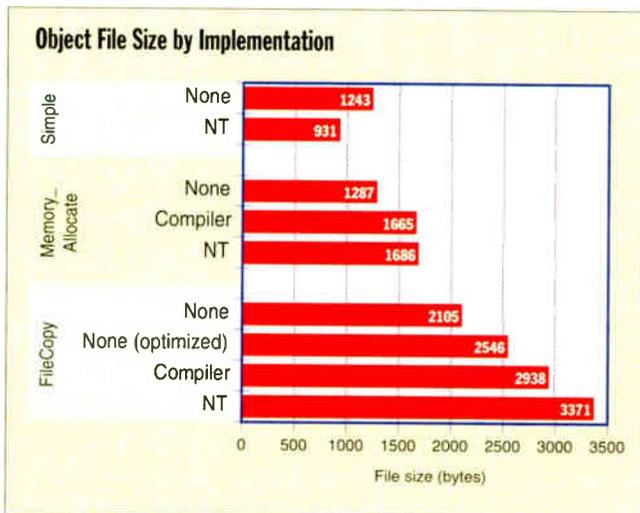

Test Environment

We ran our experiments on a stand-alone IBM PS/2 Model 95 with 16 MB of RAM running Windows NT, March 1993 beta. We wrote all programs in Microsoft C 7.0 for the Win32 subsystem. We used PView, NT's process viewer utility, to determine the amount of CPU time the main thread of execution used and the percentages of CPU time spent in privileged and user modes.

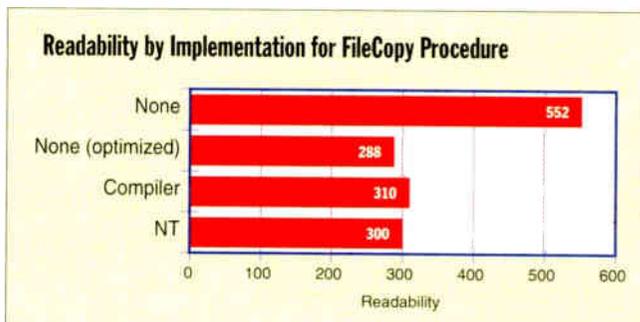

To measure program readability, we combined lines of code, number of functions, and nesting depth metrics. We determined lines of code by counting C statements and excluding comment lines and lines containing a single bracket. We determined nesting depth by counting the number of statements nested inside each function and taking the maximum.

Performance Analysis

When exceptions don't occur, implementation only slightly affects performance (see the figure "CPU Usage by Implementation—

The smallest object files were created by the Simple procedure; the largest was created by FileCopy.

Structured exception handling improves source code readability because exceptions and wrapper functions reduce the nesting depth. The ratings here represent a metric comprising such concepts as complexity, maintainability, and reliability.

NT's Structured Exception Handling

Windows NT's structured exception handling gives you clutter-free, reliable, and tighter code. But the price may not be worth the effort.

**STEVE NIEZGODA, LLOYD HOLT, AND
DEREK WOJCIECH**

Microsoft wants to convince software developers that Windows NT is the operating system for the next generation of software. One tack it's taking to prove its case is touting NT's structured-exception-handling architecture, claiming it ensures robustness at all levels of the operating system. It's a good argument. Structured exception handling has many benefits. It lets you avoid cluttering code with conditional statements that check each operation's inputs and results, thereby diverting attention from the algorithm. It reduces the overall amount of code because calling routines don't need to perform the same tests as invoked routines. Finally, it gives you a mechanism for handling errors that can't be checked with preconditions.

But the promise of more reliable software raises some questions: Should you use structured exception handling in new software development? Can you retrofit it to your legacy applications? What are the benefits of NT structured exception handling in performance, program size, and source code readability? We set out to answer those questions by testing the toughness of NT's structured exception handling.

NT structured exception handling provides many benefits, such as recovery from memory errors and hardware traps. But it is not the software developer's cure-all. You pay for its benefits in reduced performance. And for legacy applications, the price of retrofitting may be too high.

Categories of Exceptions

You can classify NT exceptions into two categories: kernel- and user-defined. Kernel-defined exceptions include hardware traps, math or memory errors, and debugger instructions. User-defined exceptions are generated through the Win32 API routine `RaiseException()`, which transfers control to a user-written, frame-based exception handler.

Often, both the operating system and the programming language cooperate to handle an exception. (Some exceptions, like debugger instructions, are handled exclusively by the operating system.) The operating-system component is the exception dispatcher. The language component is the frame-based exception handler.

All NT exceptions are serviced by a kernel module

called the *exception dispatcher*. When an exception occurs while your CPU is in kernel mode, the exception dispatcher invokes the appropriate frame-based exception handler. If it can't find one, a fatal error exists and `ExitWindows()` is called. When exceptions turn up while your CPU is in user mode, the dispatcher locates an exception handler by performing the search shown in the figure "Systematic Search for an Exception Handler." If it can't locate a handler, it invokes the kernel default handler, `ExitProcess()`.

Your compiler handles the frame-based exception-handling mechanism. Using language constructs, a code block can be guarded by several exception handlers. JOHN NELSON © 1993

tion. When an exception occurs, the exception dispatcher dynamically searches for the exception handlers associated with the current stack frame. If none is found, the dispatcher continues searching the call stack. This process is known as *unwinding the stack*.

Structured Exception Mechanics

To support structured exception handling, Microsoft extended the C language by adding the keywords `try` and

Hands On Some Assembly Required

except. These keywords mark, respectively, the beginnings of the guarded code block and the exception logic. This is the syntax:

```
try-except-statement ::=
  try compound-statement
  except (expression)
  compound-statement
```

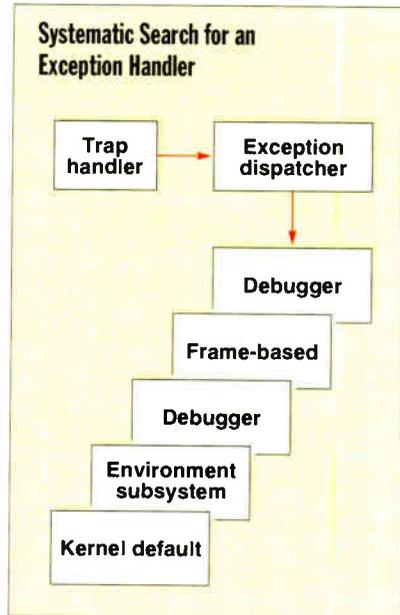

The first compound-statement is the guarded statement or body. Expression represents the exception filter. The second compound-statement is the exception handler. Microsoft also added several compiler-independent, exception-handling system service calls to the Win32 API, including RaiseException().

If an exception happens within the body of a try-except statement, an exception filter is evaluated to determine the program's course of action. If the filter evaluates to EXCEPTION_EXECUTE_HANDLER, control is transferred to the exception handler. This transfer is similar to a C longjmp(); stack frames are wound back to (but not including) the frame of the try statement. If the filter evaluates to EXCEPTION_CONTINUE_SEARCH, the search for a handler continues by unwinding the stack. Finally, if the exception filter evaluates to EXCEPTION_CONTINUE_EXECUTION, the exception is dismissed, and control is returned to the point where the exception occurred, if possible.

Increasingly Complex Tests

We created three increasingly complex procedures to evaluate NT structured exception handling. The procedures are named Simple, Memory_Allocate, and FileCopy. They range in functionality from simple memory allocation to a three-file I/O routine with stringent error-reporting requirements.

The procedures were meant not to be full-fledged applications

When Microsoft Windows NT encounters an exception while the CPU is in user mode, its exception dispatcher systematically searches for a handler to deal with it. If none is found, it invokes the kernel default, which terminates the process.

but to mimic ordinary routines found in software development projects. Our experiment modeled applications that gracefully recover from errors triggered by low-level routines.

To isolate the components of NT structured exception handling, we implemented each procedure several ways. The implementations produced identical results while using different technical approaches.

Two versions of each implementation were developed. The first, Error Free, executes without exceptions. It let us measure the performance overhead inherent to each approach. The second version, Staged Error, forces an exception to occur. It let us draw conclusions about the exception dispatcher and the frame-based exception-handling mechanism. The figure "Relationships Among Test Components" illustrates the relationships among procedures, implementations, and versions.

How the Implementations Work

Our None implementation provides error checking without structured exception handling. None is a baseline that illustrates the architecture of non-exception-handling programs. It uses IF...THEN...ELSE constructs and passes errors as variables on the program stack. None does not use GOTO statements, and each function contains one entry point and one exit point.

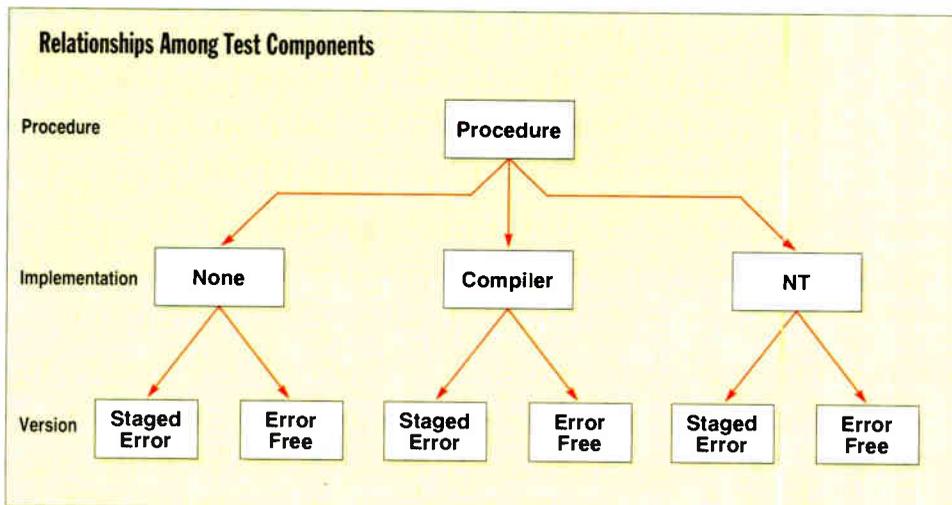

To isolate the exception dispatcher (the operating system) from the frame-based exception handler (the language/compiler), we needed a frame-based handler that didn't invoke the dispatcher. Our search for a language-only exception handler led us to an ANSI C implementation written by Jonathan Amsterdam (see "Taking Exception to C," August 1991 BYTE).

Amsterdam's code, the basis for our Compiler implementation, uses several macros to store a linked list of stack frames that are PUSHed and POPped onto the program stack. The macros are used as follows:

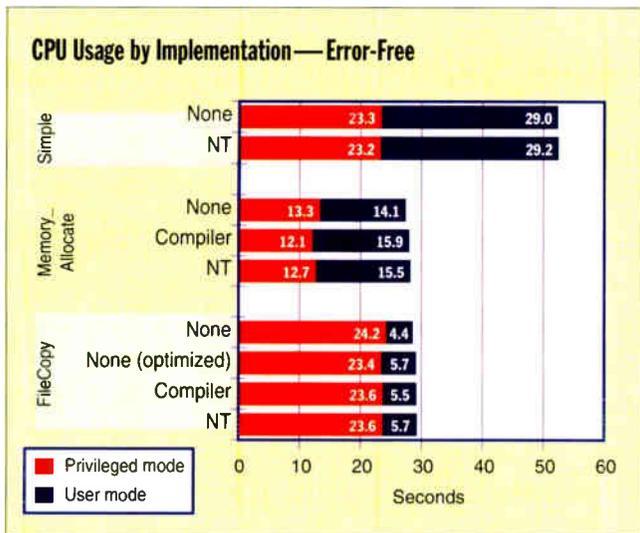

```

/* This is a C macro. */
WITH_HANDLING
{
  /* Code goes here. */
}
/* This is another C
/* macro. */
ON_EXCEPTION
{
  /* Error-handling code
  /* goes here. */
  /* This is a C macro,
  /* too. */
} END_HANDLING
  
```

A program raises an exception by calling the raise() function. This implementation supports nested exceptions and locates the correct handler by unwinding the

The relationship among the procedures, implementations, and versions used to test Windows NT structured exception handling.

When we ran the test procedures in their Error Free implementation, CPU performance was barely affected.

stack. It stores exceptions as global variables; they are passed as variables on the program stack when `raise()` is invoked.

Amsterdam documented several flaws in his solution. However, we did not select this approach for its robustness, but because it is frame-based, can be implemented in ANSI C, and resembles the NT implementation in syntax and method.

Our NT implementation uses NT structured exception handling. We tested both kernel- and user-defined exceptions.

The Simple Procedure

The Simple procedure's primary purpose is to provide performance data. It's straightforward: No I/O calls or error structures are passed on the stack. It was trivial to write, ensuring that any performance overhead brought about by NT structured exception handling would be easy to observe.

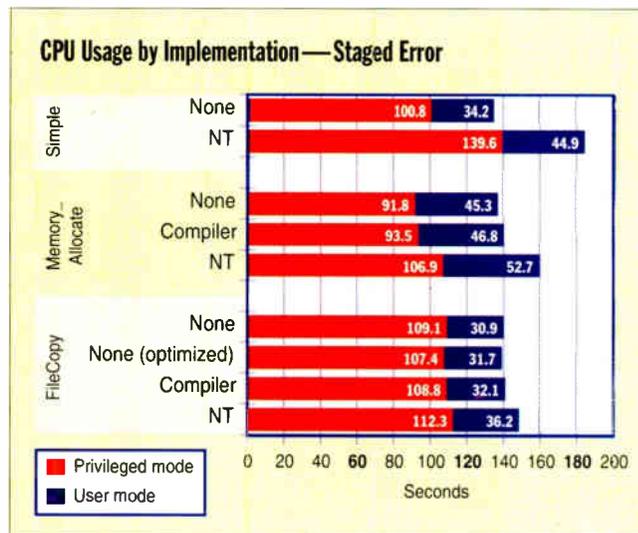

Simple consists of one function that allocates 3 bytes of memory using the standard C library routine `malloc()`. It then copies a two-character string to the returned pointer. If `malloc()` fails, the function reports an error.

Simple has two implementations. None and NT. In the None implementation, the value `malloc()` returns is checked with an IF... THEN... ELSE statement. In the NT implementation, the program assumes that `malloc()` succeeds and performs `strcpy()` without checking the return value. If `malloc()` returns a null pointer, an ACCESS_VIOLATION exception occurs during the `strcpy()`.

Memory_Allocate Procedure

We designed Memory_Allocate to get a close look at the frame-based exception handler and the exception dispatcher. By comparing the Compiler and None implementations, we gained insight into frame-based exception handlers. By comparing NT and Compiler, we gained insight into the kernel dispatcher.

Memory_Allocate is functionally equivalent to Simple, but its error-reporting scheme mimics the approach used in software libraries. Typically, a library routine informs the invoking function when an error occurs but lets the invoking function determine the appropriate course of action. Library routines seldom directly inform you of errors.

When we ran the test procedures in their Staged Error implementation, CPU performance was affected dramatically.

Memory_Allocate consists of two functions: `Do_test()` invokes a homegrown memory allocation routine, `our_malloc()`, which in turn makes calls to the Win32 API. The staged error occurs in `our_malloc()`; the error code and description are reported in `do_test()`.

Memory_Allocate's None resembles Simple's None implementation; `do_test()` uses an IF... THEN... ELSE statement to test the value returned by `our_malloc()`. The Compiler and NT implementations raise user-defined exceptions if an error occurs in `our_malloc()`. The exceptions are handled in `do_test()` (see the listing on page 322).

FileCopy

FileCopy is the most complex procedure. Simple and Memory_Allocate provide lots of performance data, but they are too algorithmically simple to show how structured exception handling affects source code readability. FileCopy is much more arduous.

In our research, we noticed the terseness of error messages displayed by exception handlers. We decided that FileCopy's messages must provide the error code, the action being performed, and the name of the object causing the error. For example, if file X does not exist and is mistakenly opened for reading, you get the error message "Error 2 occurred while opening file X."

We also wanted plenty of LOOP and IF... THEN... ELSE constructs to test whether structured exception handling gracefully backs out of errors that occur deep within a program. We reasoned that by nesting a series of IF... THEN... ELSE statements in which each ELSE block contains some kind of cleanup code, we would witness the benefits of structured exception handling.

FileCopy reads the contents of one file and outputs alternating lines to two other files. Allocating and deallocating buffers, opening and closing three files, and looping to copy data guarantee complicated logic and tedious cleanup. As in Memory_Allocate, we required that exceptions be handled by the invoking function rather than the offending function.

The None implementation of `filecopy()` is written as one function. The exception checking and correction logic are complex and difficult to follow. An exception structure, passed on the program stack, can be populated from seven different places

Hands On Some Assembly Required

within `filecopy()`. In each exception condition, a significant amount of code is dedicated to freeing resources.

After writing `None`, we realized that nobody would write it as we did, since many C programmers dislike rigidly structured programming. Consequently, we created a more realistic non-exception-handling implementation called `None-Optimized`.

`None-Optimized` improves `None`'s readability by two techniques. First, file routines (e.g., `fopen()` and `fread()`) are wrapped, user-written functions. The parameter list for a wrapper function includes the parameter list for the corresponding file function, plus a pointer to the exception structure. For example, `fopen()` is wrapped in the user-function `file_open()`:

```
FILE *file_open(char *fname, char *type,
                ExcStruc *es)
{
    FILE *f;

    if((f = fopen(fname, type)) == NULL)
    {
        es->code = errno;
        es->Action = OPENING;
        es->Object = fname;
    }
}
```

```
}
return f;
}
```

Second, a macro containing a `GOTO` statement is used to disguise the plethora of `IF...THEN...ELSE` statements—for example,

```
#define Execute(A)      A;if(es->code)
                        goto cleanup;

if((buf = malloc(BUFSIZE)) != NULL)
{
    Execute(in = file_open(infile, "r",es));

    /* Start the copy code. */
cleanup:
    /* Free memory, close files, etc. */
#undef Execute
}
```

`Execute(A)` hides the `IF...THEN...ELSE` statements associated with `fopen()`.

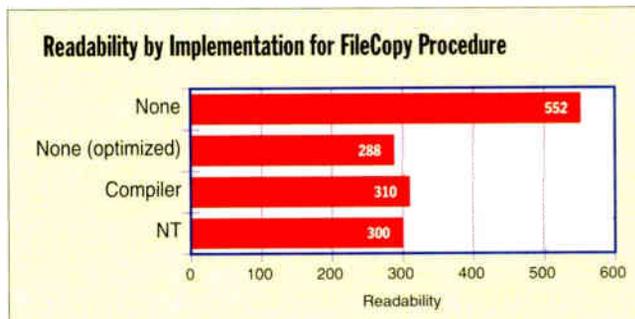

Compiler and NT also use wrapper functions. However, instead of passing an error structure on the stack, they raise exceptions. In Compiler, this entails populating a global exception structure and invoking `raise()`. The NT implementation is similar, but it does not use global variables. Here's the `fopen()` wrapper function for the NT implementation:

```
FILE *file_open(char *fname, char *type)
{
    FILE *f;
    static DWORD  exceptionArguments[3];

    if((f = fopen(fname, type)) == NULL) {
        exceptionArguments[0] = (DWORD) errno;
        exceptionArguments[1] = (DWORD) fname;
        exceptionArguments[2] =
            (DWORD) OPENING;
        RaiseException(100, 0, 3,
            exceptionArguments);
    }
    return f;
}
```

The smallest object files were created by the Simple procedure; the largest was created by FileCopy.

Structured exception handling improves source code readability because exceptions and wrapper functions reduce the nesting depth. The ratings here represent a metric comprising such concepts as complexity, maintainability, and reliability.

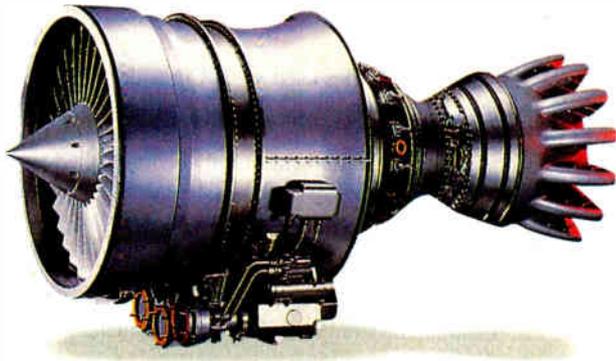

Test Environment

We ran our experiments on a stand-alone IBM PS/2 Model 95 with 16 MB of RAM running Windows NT, March 1993 beta. We wrote all programs in Microsoft C 7.0 for the Win32 subsystem. We used PView, NT's process viewer utility, to determine the amount of CPU time the main thread of execution used and the percentages of CPU time spent in privileged and user modes.

To measure program readability, we combined lines of code, number of functions, and nesting depth metrics. We determined lines of code by counting C statements and excluding comment lines and lines containing a single bracket. We determined nesting depth by counting the number of statements nested inside each function and taking the maximum.

Performance Analysis

When exceptions don't occur, implementation only slightly affects performance (see the figure "CPU Usage by Implementation—

Choose The Right Performance.

Getting the best performance often means choosing the next generation of technology. If you're looking for leading edge performance from a personal computer, take a look at DIGICOM's new P5 system. Based on Intel's Pentium™ Processor 60/66MHz, this system delivers the power needed for demanding networking, multimedia and graphical workstation applications.

Partial code illustrating the NT implementation; the Compiler implementation is similar.

```
void do_test()
{
    try {
        buf = our_malloc(FORCE_ERROR ? 100000000 : 3);
        strcpy(buf, "ok");
    }
    except (theException = GetExceptionCode()) {
        /* Check error code and report error. */
    }
}

void *our_malloc(size_t size)
{
    HLOCAL memhandle;

    if((memhandle = LocalAlloc(LMEM_FIXED, (UINT)
        size)) == NULL) {
        RaiseException(GetLastError(), 0, 0, NULL);
        return NULL;
    }
    else
        return LocalLock(memhandle);
}
```

Error-Free"). The None implementation consistently outperforms Compiler (2.1 percent faster) and NT (0.2 to 2.9 percent faster) because it doesn't incur the overhead of saving the stack frame. This registration penalty is about the same for both Compiler and NT, which differ by less than 1 percent.

When an exception occurs, implementation significantly affects performance (see the figure "CPU Usage by Implementation—Staged Error"). Again, None is fastest, followed by Compiler and NT. Most startling is the NT implementation's poor performance—it executes 6 percent to 37 percent slower than None.

This performance degradation has two causes: the frame-based exception handler and the exception dispatcher. The frame-based exception handler imposes a 1 percent to 2 percent performance penalty, evidenced by comparing the None and Compiler implementations. Compiler and NT incur the delay of unwinding the stack frame and locating the appropriate exception handler. NT takes the most CPU and (more important) privileged-mode time. We believe this increase reflects the invocation of the kernel dispatcher. Compiler never invokes the kernel exception dispatcher; thus, it executes 6 percent to 14 percent faster than NT.

The differences in execution time between NT and the other implementations are primarily due to the increased time spent in privileged mode. In other words, the kernel dispatcher is the primary cause of NT's sluggish performance.

Size and Readability

In the Simple procedure, an IF...THEN...ELSE construct is matched head-to-head with a try-except construct. The IF...THEN...ELSE produces a larger object file, implying that try-except generates tighter code than IF...THEN...ELSE (see the figure "Object File Size by Implementation"). But the more complex procedures require wrapper functions and code to populate the exception structure. The NT implementations of Memory_Allocate and FileCopy produce the largest object files.

There are no appreciable differences in executable file sizes. We attribute this to the simplicity of our test programs.

Determining source code readability is subjective (see the figure "Readability by Implementation for FileCopy Procedure"). For

brevery, we wove the concepts of complexity, maintainability, and reliability into a single metric, computed as follows:

$$\text{Readability} = \frac{\text{Lines of Code/Function}}{\text{Maximum Nesting Depth} \times \text{Number of Functions}}$$

This is a melding of metrics used by Q. Cui and J. Gannon ("Data Oriented Exception Handling," *IEEE Transactions on Software Engineering*, May 1992). While there is no evidence that these metrics are independent (and can simply be multiplied together), combining them provides an unadorned, reasonable standard for comparing readability among the different implementations.

Structured exception handling improves program readability primarily because exceptions and wrapper functions significantly reduce the maximum nesting depth. Rather than one large complex function, the Compiler and NT implementations produce many small, simple functions.

None-Optimized is the dark-horse implementation. It edges out NT in readability, but its complexity is not reflected in our metric. The macro is subtle, making None-Optimized difficult to maintain. Even so, None-Optimized proves that complex error handling can be implemented without exception handling in roughly the same amount of code.

We encountered a substantial learning curve in programming structured exception handling, partly due to the lack of documentation and examples. The biggest hurdle was orienting our thinking to design in terms of exceptions.

Mixed Conclusions

NT structured exception handling is no panacea. It fails to provide major benefits in execution time or compiled program size. Our data shows that the kernel-exception dispatcher imposes a significant performance penalty whenever it is invoked. Structured exception handling improves source code readability. But a language-based exception-handling implementation or a cleverly designed C program provides comparable improvements.

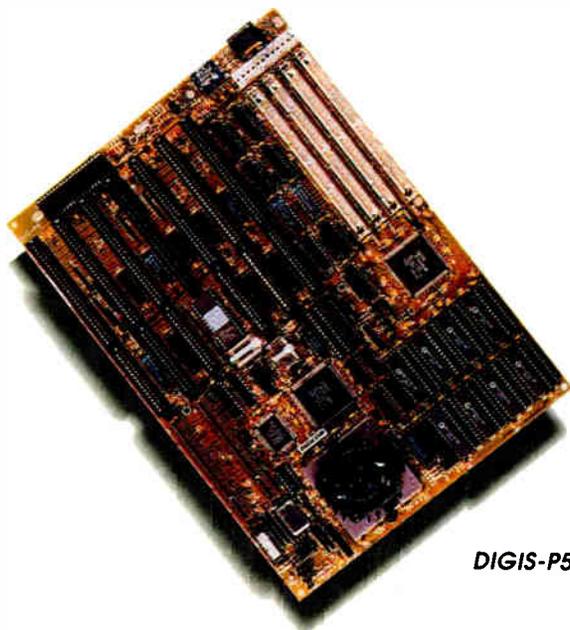

NT exception handling has one capability that cannot be duplicated in vanilla C or compiler-only implementations: kernel-defined exceptions. Without an operating-system implementation of exception handling, there is simply no way to recover from hardware traps or math and memory errors.

Our test environment could not duplicate the subtleties found in a large software development project. The real proving ground for structured exception handling is an environment in which several modules and exceptions interact. For example, if your applications are prone to memory errors, use NT's structured exception handling. There is no alternative. But since truly robust exception handling is an integral part of software design, you'll find that trying to retrofit existing code is not worth the effort.

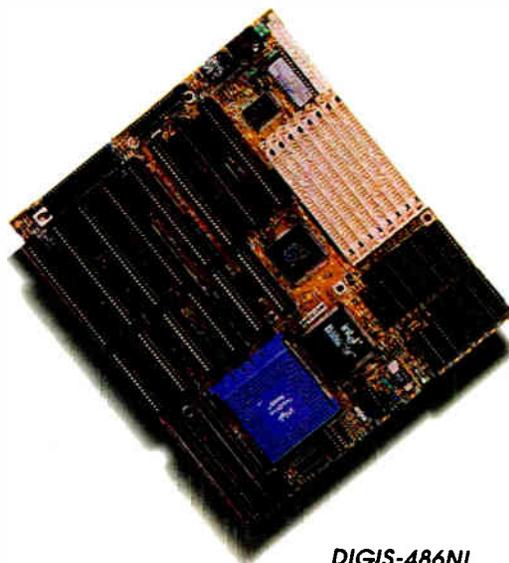

For your new development projects, structured exception handling has its benefits, but you will pay a price in performance. However, when exceptions occur, you may be willing to pay that price. Try it on a test project and judge for yourself. ■

Digicom Is The Direction To Go For Everything You Need To Get

Looking for computer systems and mainboards? you don't have to go all over the map to get exactly what you need. Save yourself a lot of time and trouble by going direct to Digicom, the single supplier with all the solutions. The complete product line includes EISA, ISA and VESA buses, mainboards with CPUs from 386SX upward, and systems ranging from booksize to tower configurations. Digicom-definitely the way to go!

Look for the Intel inside® symbol on our quality computer systems

Looking for something?

From people and places
to finger prints and genes,
the *MS-160SE™* finds it
FAST...
at 160 megabytes/sec!

Whether you are looking for a needle in a haystack or just the number of times that Abraham, Isaac and Jacob appear in the Bible, you need an *MS-160 Search Engine (SE)*. The *MS-160SE* combines a free text search engine with a RAM DISK capable of reading 160 megabytes per second. Searches are performed using exact or fuzzy templates. If you are interested in taking statistics, the board will report the number of times your template was matched. If you want to see each reference, our software will stop the processor and let you see it.

MS-160SE search templates are specified using "regular expressions." Each byte in the expression can specify a single value or a range defined by an upper and lower bound. Up to eight 32-byte wide templates can be used together to form complex search patterns. Alternatively, all eight templates can be used to define a large template that can be up to 256 bytes in length. The Microway *MS-160* processor features 512 comparators and 64-bit wide memory to search your data at 160 megabytes per second. The *MS-160* also contains a data router and event detector which are controlled by our software. The throughput of its 512 specialized integer units is 10 billion compares per second, which is the equivalent free text searching speed of five hundred 486s or a 10,000 MIPS processor!

The *MS-160SE* is just as at home in the laboratory as it is in a law office or library. Examples of its use include genetic engineering, meteorological science, image processing and the analysis of spectra of any kind. Numerous applications exist in law enforcement, from

finding missing persons and vehicles to analyzing finger prints. The board can also be used as a part of a data logger or data feed parser, triggering on pre-defined events. When used as a 2D filter, the template becomes a 256 by 256 1-bit grid or a combination of eight 256 by 32 1-bit grids.

The heart of the board, the *MS-160* processor, can also be used to build instruments, such as logic analyzers, or intelligent hard disk controllers which include a text filter. Microway's engineering staff can help you to implement such designs.

The *MS-160SE* can be interfaced from PC languages, such as Microsoft C, or you can use canned applications. A Microway Text Retrieval package comes with the card. This package is ideal for law offices or libraries which must be able to instantly make complex searches on data bases downloaded from CDs or hard disks. A complete document management package is available which can handle text and images together, as well as a TCP/IP network interface that makes it possible to build a "Search Server."

The *MS-160SE* can be fitted with up to 320 megabytes of memory. Software and hardware developers are encouraged to contact Microway at 508-746-7341. We'll show you how to find whatever you're looking for... fast.

JERRY POURNELLE

Fenasoft and Furniture

I have just come back from Brazil by way of Washington, D.C. Alas, all my time in Brazil was spent in São Paulo. John Dvorak and I went down for Fenasoft, a large computer exposition and fair. We flew from Los Angeles to Lima, Peru, and from there, supposedly, to São Paulo; but the São Paulo airport was socked in, so we landed in Rio. That turned out to be a good thing because we got to see Rio de Janeiro from the air, and that has to be one of the loveliest cities on this planet. I'm now determined to get down there when I have more time.

São Paulo, on the other hand, has the look and feel of Newark only six times as large—there are between 15 million and 20 million people—with Cleveland jammed in to provide a sea-coast. It has the deadest river I have ever seen in my life, with, I swear it, streaks of red, black, and deep purple through the greenish-brown water. Not only don't birds land near that river, they don't even seem to fly over it. São Paulo smog and traffic make me appreciate a bad day in Los Angeles. However, it's also the place where most business—and nearly all computer business—is done in Brazil. It has the only building in the country capable of holding a big convention and exposition; and Fenasoft is *big*.

It may or may not be the largest computer convention in the world. That depends on how you define a computer convention—clearly, there are larger consumer electronics shows—and more important, how you define convention; because Fenasoft is more like a fair than like Comdex. Indeed, Dvorak and I instantly agreed that this is the way the West Coast Computer Faire ought to have been: big booths operated by giants like Microsoft and IBM, startups and users groups scattered throughout the show, lots of dealers and distributors selling discounted product like mad—there was a feeding frenzy for books and software—and huge crowds of people.

Just how many people isn't clear. The exposition hall is comparable in size to the main hall of the Las Vegas Convention Center, and it was considerably more crowded than that hall is during Comdex. On the other hand, Comdex in Las Vegas has more than one large hall. Meanwhile,

in the Brazilian culture it's traditional to use superlatives. John Dvorak and I were each given a number of different attendance estimates, some clearly impossible. Mostly, the attendance depends on the turnover: how many people come for just a couple of hours, to be replaced by newcomers? I do know that I counted 220 people a minute entering at the main gate, and this at two different times of day; if they sustained that rate 10 hours a day (the hall was open late into the night), they'd have a really big show. In any event, it's large enough to count as a world-class computer exposition.

The crowds were mixed. Brazilian professionals tend to wear neckties with or without jackets, and I'd guess something like a quarter of the visitors had ties. São Paulo counts as the second-largest Japanese city in the world—only Tokyo has more Japanese—and there were a fair number of Japanese among the crowds, virtually all of them students or professionals. Like

AMY ETRA © 1993

In a busy month, Jerry attends a computer show in Brazil, changes his working locale, experiments further with OS/2, and looks at math programs

early Comdex shows, there were few professional women, and most of them were exhibitors. That's going to change.

Brazil has a highly stratified society. One way that stratification is preserved is that the public universities are excellent, and admission is through academic merit. But the public lower-grade schools are universally thought rather poor, so admission to the universities is largely confined to graduates of expensive private schools. A university education is pretty well required for entry into the professions and is of great advantage in business.

Computers were both expensive and rare in Brazil until recently. This is because they had market-reservation laws: you could own and use only Brazilian-made computers, and if the police caught you using an IBM or Apple machine, they confiscated it. Like as not, your machine would (quite legally) end up on the desk of a bureaucrat or politician.

That all ended a couple of years ago, and the floodgates opened. There's still a high tariff on computers, but there's also a well-developed system of smuggling. One Brazilian journalist told me, "Smugglers are very serious people here. They even give warranties and provide technical support." Thus, the computer revolution is coming to Brazil—and that will have a profound effect on the social structure. After all, these little machines don't care where you learned to use them, and indeed, given that the universities haven't had access to small computers and don't have many professors who are familiar with them, it's likely that you'll learn to use a computer somewhere other than in a university.

The saying goes, "God made men, but Sam Colt made them equal." One of Pournelle's laws is that computers neither know nor care about your age, sex, color, or where you learned to use them. They do care a lot about talent and ability.

Communications from Brazil weren't easy, but both Dvorak and I managed. Since we've each done books on computer communications—alas, his was for sale in both English and Portuguese at the show, but there was no trace

of mine in any language—it was inevitable that neither of us would give up until we had established E-mail connections. John got his first. The only machine he carries is a Gateway HandBook, and he uses some odd shareware communications program. He also carries an acoustic coupler, which allowed him to use the phone in the press center at the convention site. I didn't have an acoustic device with me, and I preferred to do my minor telephone surgery in the

privacy of my hotel room. In the future, I'll take an acoustic coupler.

I had both a Gateway HandBook and a Gateway Nomad 486. I often carry a Supra modem, but this time I had the Macronix MaxLite 144. The MaxLite 144 is about the smallest full-featured fax modem you can carry, not a great deal bigger than the 9-V battery it runs on. (There's also an AC converter, which is as well because the battery doesn't last all that long; I once got less than an hour.)

I never did get connected to BIX or GENIE from Brazil, but I did manage MCI Mail, once with Procomm Plus 2.0, and once with the terminal program you get with Windows 3.1. It wasn't easy, and it required considerable mucking about with modem initializations and several wasted phone connections at overseas rates; it's very frustrating to get locked on at international rates and still be unable to communicate. The key is to call a number you know works with error correction and set your modem with AT X commands so that it ignores the dial tone and connects blindly after you dial. If you don't get an error-correcting lock, hang up quickly.

The various modem commands—well over a hundred—are explained very well in the MaxLite 144 manual. I've looked at a lot of modem manuals, and this is one of the clearest. Calling from Brazil isn't a fair test of a modem. Calling from the Bellevue Hotel in Washington, D.C., is fair, but severe: Washington in general, and the Bellevue in particular, seem to have about the worst phone connections

in the U.S. You simply cannot manage communications without an error-correcting connection; moreover, 9600 bps is nearly impossible, while a 2400-bps connection requires so many correction retries that it's effectively slower than a straight 1200 bps on a clean line. The MaxLite 144 sometimes needed several tries, but I did get connected to MCI Mail, BIX, GENIE, and my home system using Procomm Plus 2.0.

I am now familiar with three major manufacturers of modems: USRobotics, Supra, and Macronix. In overall performance, I rank their products in that order. The USRobotics Courier will establish error-correcting connections quicker and easier than the other two modems, and it sometimes will manage communications after a fashion over noisy lines without error correction. On the other hand, it's too big to carry in your briefcase, and pretty big for checked luggage. USRobotics Couriers are the most upgradable; they are offering a "when available" upgrade to the emerging 28,800-bps standard for \$99.

I had slightly less trouble with the Supra modem than I did with the MaxLite 144; that is, it took an average of four tries to get an error-correcting connection to Tymnet using the MaxLite 144, and only three to get an error-correcting connection to the same line using the Supra modem. On the other hand, the Supra modem is larger than the MaxLite 144: not so large that you can't get it into a carry-on bag, but large enough; and it won't run off a battery, so you have to carry the adapter as well. I stuff the MX power supply in checked luggage and carry the MaxLite 144 with a battery in my computer case, where it's small enough not to be noticed.

The bottom line is that I could and did rely on the MaxLite 144 for my communications, and it did the job. It's small, handy, and neat, and it comes with decent fax modem software and excellent manuals. Recommended.

I'm in a dither over computer furniture. I recently rearranged my office for the first time in four years, and as part of that I wanted to rethink my workstation. Since I spend much of my life sitting here, my chair and computer furniture are extremely important to me.

My first requirement is a big screen (I currently use a Nanao FlexScan T560i)

Computers were both expensive and rare in Brazil until recently. This is because they had market-reservation laws: you could own and use only Brazilian-made computers. If the police caught you using an IBM or Apple machine, they confiscated it, and it might end up on the desk of a bureaucrat.

WITHOUT THIS SEAL, YOU'RE ONLY TESTING YOUR LUCK.

See us at Fall Comdex, at the HILTON booth #512

Nothing is more frustrating than a PC problem. It can mean hours of wasted productivity and hundreds of dollars of expense for both the user and the manufacturer. A PC with the *QAPLus Tested™* seal means that the manufacturer uses *QAPLus®* software in a

rigorous program to assure that its PCs are fully compatible and meet the highest standards of quality.

A COMPLETE QUALITY ASSURANCE SOLUTION

One facet of the *QAPLus Tested* program is *QAPLus/Factory™* which provides dynamic burn-in capabilities using state-of-the-art diagnostics. Its exhaustive testing, tracking, and reporting features facilitate the effective measure and control of production processes.

QAPLus/Factory can help eliminate product returns and repair calls due to incompatibility and marginal quality assurance testing. The bottom line is lower manufacturing and support costs, increased product quality and customer satisfaction, and a more competitive business.

BACKED BY COMPREHENSIVE SUPPORT

QAPLus/Factory customers can receive an on-site quality survey by our PC quality assurance expert, along with installation and training. Plus, they will be enrolled in our Priority Support Program which includes remote diagnostic troubleshooting, access to DiagSoft's BBS, and frequent product updates to support the latest technology.

THE INDUSTRY STANDARD

DiagSoft's *QAPLus* software is the de facto standard for PC compatibility and quality assurance testing. *QAPLus/Factory* is in use worldwide by leading manufacturers and integrators, such as: Digital Equipment Corporation, Gateway 2000, Intergraph, Micronics, Mylex,

and Trillium Computer Resources. They help us ensure that our *QAPLus* software is on the leading edge of technology.

THE SEAL THAT MAKES THE DEAL

The *QAPLus Tested* seal on a computer system ensures PC users they are receiving a system that has passed the most rigorous diagnostic hardware tests available. Our *QAPLus* OEM version and remote control software can also be bundled with systems to allow support personnel to remotely operate systems, and provide an even greater level of support.

ISO 9000 SUPPORT

QAPLus/Factory supports the ISO 9000 requirements for testing and traceability. It streamlines this process by ensuring that all data collection is automatic and consistent throughout the process.

FEATURES INCLUDE:

- Network or Stand-Alone Operation
- Unattended Scripted Testing
- Complete Test Logging
- Hardware Level Diagnostics
- Extensive System Information
- Detailed Quality Analysis Reports

AB1193

about 30 inches from my nose and precisely at eye level with my head in a comfortable position. Second is keyboard height: I like my keyboard where I can reach it without strain as I rest my elbows on the chair arms. Just about as important is a good place for a mouse. Third, there *must* be flat table space all around, where I can pile software, press releases about products I'm writing about, books I am copying from, maps, character sketches, notes for scenes, and so forth. It can be anywhere, but I really like to have some space dead in front of me.

Fourth, I need places to put auxiliary equipment: stereo speakers, a DAT (digital audiotape) drive, the USRobotics external modem, an external CD-ROM drive, an external WORM drive, and my little pocket tape recorder I use to dictate notes during my daily walk and its transcriber; that sort of thing. Fifth, I need legroom, since I can't sit in the same position for very long.

For the past few years, I've used a com-

puter table I found at Builder's Emporium. It's 4 feet by 2 feet. It has a retractable keyboard drawer with a raised mouse platform, and you can see it in the photo of me. It had problems. I had to raise the height of the whole thing (I attached heavy-duty casters) to get the keyboard high enough. It put the screen closer than I like. The worst thing was that there's no flat surface space between the screen and the keyboard, so I have to turn my head to see what I'm working on. Still, it worked well enough to let me turn out a number of books, including *Prince of Sparta*, *The Children's Hour*, *Fallen Angels*, *The Gripping Hand*, and several others, as well as these columns and a bunch of other stuff. It wasn't perfect, but it was good enough.

Alas, when I shifted the office around (there's a good reason having to do with heat flow), there was no room for that big table at my new location. Time to rethink the entire situation.

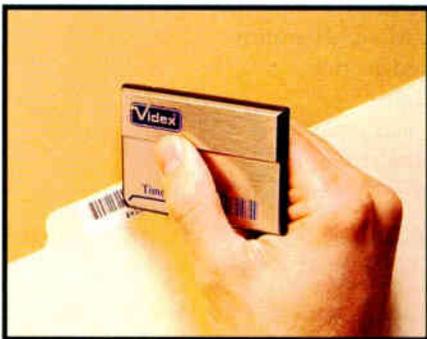

One choice was the Forminco line,

which you may have seen at various computer shows: IBM often features Forminco workstations at their OS/2 Test Drive Centers. You'll remember if you've seen them: they are large black and chrome open framework units on casters. When we set one up here, Mrs. Pournelle referred to it as "the condor cage," no bad description if said affectionately.

The Forminco units score high on keyboard height and placement: you can adjust that easily to almost any position you like. Same for screen placement: the screen is on an adjustable stand of its own, so it doesn't rest on a desktop computer. Moreover, if you use a tower machine (I do), there's lots of flat surface where the desktop would have gone. (There's also a system for supporting a desktop machine on its side alongside the workstation, thus more or less converting the desktop to a tower.)

The legroom is great. There's an ingenious placement of the mouse, and Forminco makes (included with the workstation but also available separately) the Mouse Arena, an odd-looking but extremely effective combination mouse pad and stand with a wrist rest and a gizmo to hold the

Three Good Reasons for Choosing Videx Bar Code Readers:

Portable

Proven performers in any environment—from the office to the outdoors—Videx's family of bar code readers leads the industry as the most portable, durable, programmable data collectors. Make your job easy. Keep track of time, attendance, assets, inventory, work-in-process, shipping and receiving with a bar code reader from Videx®.

TimeWand® I, DuraWand®, and TimeWand II are designed for today's world of diverse applications and

Durable

demanding environments. All at prices that make them the obvious choice.

Programmable

TimeWand I	\$298
DuraWand	\$495

You're looking at the vast difference between new Designer 4.0 and all other illustration programs.

Introducing new Micrografx Designer™ 4.0.

With symbol creation and placement to one micron, new Designer 4.0 from Micrografx is a measurable improve-

Designer 4.0's new intuitive interface is easy to learn and use with hint lines and context-sensitive help.

ment in technical illustration. In fact, hair-splitting accuracy is only the start of what will seem like an endless list of new features. And before you furrow a brow, you'll be glad to know that Designer 4.0 is first, last and always easy to use.

You get advanced features including 3-D drawing with rotation, smooth shading, and light source control.

Make adjustments quickly with object snap, wireframe view of images, custom dimension units, direct entry of coordinates and dimensions, and auto dimensioning. And 32,767 layers keep everything organized. The bottom line: you're always in control while creating, editing and manipulating symbols.

Now, while Designer 4.0 is filled with sophisticated features, you'll have it up and running in no time. A new streamlined interface means you can find everything fast. Hint lines, context-sensitive help, a customizable tool bar, and more keep you close to the tools you use the most. There's even invaluable extras like image editing, advanced

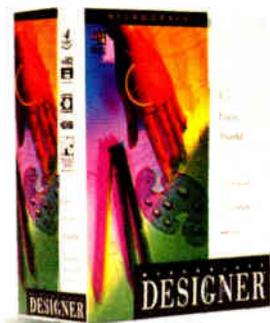

Complete graphic design capabilities range from powerful text management to advanced color separation.

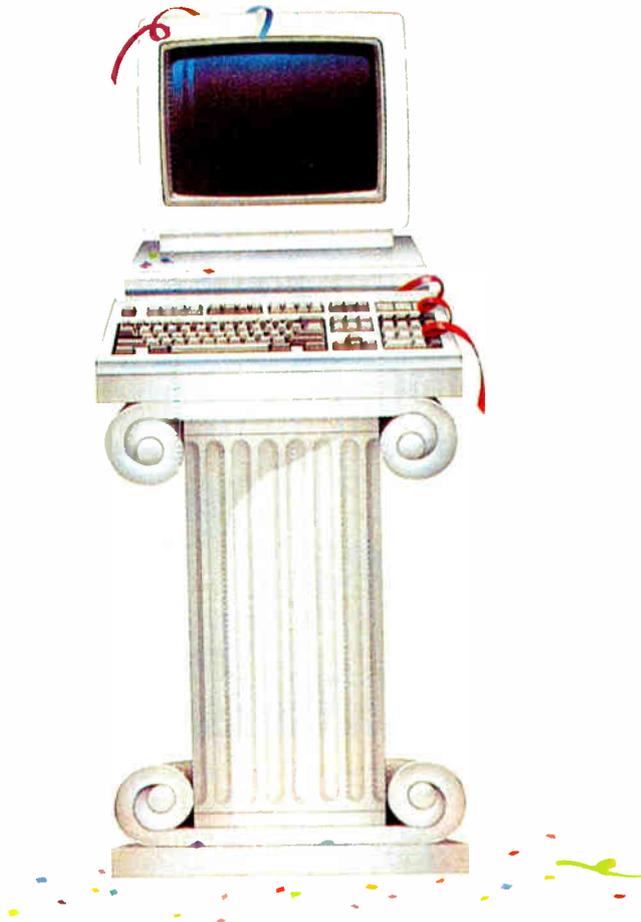

text and layout capabilities, color separation and slide show utilities, plus 1,200 clip art images and 25 photo images on floppy disk, with

13,740 clip art symbols and 200 photo images on CD-ROM, and more. See for yourself how it measures up.

The Professionals' Choice For Graphics Illustration.

Everyone makes claims. We make sure.

When the industry wants product testing taken to the nth degree, they take it to NSTL.

In every field, one name sets the standard. In microcomputer testing, the name is NSTL, the leading independent testing lab.

The NSTL compatibility certification seal on a product says that it withstood the toughest lab in the industry — and it's ready for your business.

The seal saves you a lot of comparison and guesswork. It says you'll find the product compatible with a wide range of business applications and hardware. It helps you make the right choice.

Real-world testing for real-world use.

Beyond compatibility testing, we access nearly every conceivable

problem — from engineering-level hardware bugs to the everyday usability of business software.

And we test with the end-user in mind, in a real-world environment, just the way your staff uses equipment. Except our trials are more punishing.

Our publications, and others that publish our work.

In a separate facility we also do comparison testing for our own Ratings Reports: *Software Digest*[®], *PC Digest*[®] and *LAN Reporter*[®]. They're read by people who purchase an average of more than \$500,000 in microcomputer hardware and software annually.

And because of the respect we've earned, some of the industry's leading publications, like *Data Communications*,

LAN Times, *Unix World* and *Datapro Research Group* publish our test results.

Look for the NSTL seal and be sure.

Experts rely on the NSTL name: now you can, too. The final test of a product is its compatibility in a business environment. The NSTL mark tells you it's already met that test. Look for it when you compare products.

mouse tail out of the way. If you do much mousing around, you ought to look into this. The wrist rest really works.

There's also a built-in padded wrist rest as part of the keyboard support, and it's really neat. I grew up working with typewriters, and we never thought of wrist rests. I use chair arms for more or less the same purpose. However, my partner Larry Niven likes wrist rests, and I confess I quickly got spoiled by the Forminco keyboard stand when I set it up for trial.

The Forminco system has a left-handed stand that you can put either the mouse or your coffee on. There's a weird stand for the telephone and a removable copy holder. Everything is removable and adjustable. All told, the Forminco system is handsome, well designed, and comfortable to work at.

Where it loses points is efficient use of volume. It needs some kind of shelf attachment to provide a place for auxiliary equipment. In particular, it has no drawer for labels and calculators and the other stuff I use a lot. It's also just large enough to be a problem for my new location. If I adopt it, I'll need to do some serious rearrangement, and what with upcoming trips, I can't get to that for a couple of weeks or more.

Just at the moment I've done a kludge, with my screen on a cabinet and the keyboard on a funky old sewing-machine table. Very longtime readers will recall this is the arrangement I had for Ezekial, my old machine who's now on exhibit in the Smithsonian. I may keep that: after all, I did a million words or more with that arrangement, so it must work pretty well. On the other hand, I already miss the comfort of the Forminco condor cage and its neat ergonomic features. We'll see when I get back from Sweden. Meanwhile, if you do a lot of work sitting in front of a computer, you should look into the Forminco line of ergonomic computer workstations.

I'm continuing to experiment with OS/2, and I'm getting frustrated. It's so useful I want to adopt it; but then I run into some new problem.

Example: I found the OS/2 screen displays intolerably slow. This turns out to be an ill-chosen default setting: go into the OS/2 systems setup folder, deactivate animations, and things will go much faster.

Another problem is disk space. I have OS/2 on an IBM PS/2 Model 77 with 8

MB of memory. The hard disk is partitioned into an 80-MB C drive and a 125-MB D drive. You might think that would be enough; but it's not, at least not for me, and the result could have been a disaster.

Now granted, I have to put a lot more stuff on my hard disk than most. I'm forever trying out programs, and since I use stuff rather than do formal evaluations, anything I'm going to write about has to stay around long enough for me to get used

to it. In addition, OS/2 is wonderful for communications, but that means that some days people send me enormous files. I function as a system operator on both BIX and GENie, so sometimes I download a bunch of stuff from there. E-mail ac-

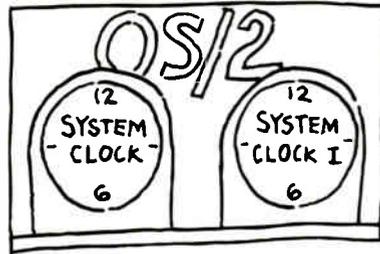

cumulates.

The result is that the PS/2's disks get full, and I don't notice it. This isn't a big problem as long as I am running DOS applications; but it's different if you want to run Windows programs.

Last night, my son Richard and I decided to play around with the DeLorme Mapping Street Atlas USA. It's wonderful. If you don't have it, get it. Amazing detail, not only just about every street in the U.S., but fire roads in Los Angeles and even High Sierra trails. You can cut and paste into CorelDraw with it, too, and print from that.

The DeLorme atlas is a Windows program on a CD-ROM. Richard, who isn't familiar with OS/2 but uses Windows a lot, opened the Windows OS/2 program manager and installed it easily enough; except that when we open the program manager, there comes a message about NAVPOPOP.EXE being unavailable. I don't know what that is, but I've got used to having this error message. It doesn't seem to do any harm, except that I have to tell the machine everything is OK before it will do anything else, and that's annoying if I'm trying to get something done in a hurry.

Alas, for me OS/2 has been full of oddities like that. I have two copies of the system clock, named System Clock and System Clock:1. Every attempt I have made to eliminate the superfluous copy has failed. There's probably a way to do it, but I sure don't know what it is, and neither does an IBM guru who wrote a book about using OS/2. It seems this is an essential file, and for your own protection, OS/2 won't let you eliminate any essential files—even if you have somehow inadvertently managed

to duplicate one of them.

Anyway, we installed the DeLorme atlas, whereupon I got a message that the disk partition containing the file SWAPPING.DAT had insufficient space, and I had a problem, and I must not ignore this message. The default thing to do was close the program. That seemed reasonable, so I tried it, whereupon the computer went off into the land of lost bits and stayed there until I turned it off. Ctrl-Alt-Del did nothing interesting. It was hardware reset time.

It wasn't quite the infamous Windows UAE (unrecoverable applications error). When the system came back up, I did the same thing again and got the same error message; it gives three choices, and any but the default choice lets the machine recover. The default, though, turns it into a UAE. Beware.

A search through the OS/2 documents reveals remarkably little about SWAPPING.DAT. I wanted to go in and set aside considerably more space for that swap file; this wouldn't be as efficient as the IBM

dynamic reallocation, but it would sure make my life simpler when the disk was getting full. Alas, the printed manuals aren't too helpful, and neither is the Master Help Index.

However, if you open an OS/2 window (which gives you a command-line session) and type HELP SWAP, there appear all kinds of useful information on the swap file. By editing CONFIG.SYS, you can set the size of the swap file or cause the system to warn you when file size on that disk partition is getting low. Once again, it's typical of OS/2 to have a nifty feature like that and then hide it from you.

Of course, what I really need is more memory.

Eight megabytes aren't really enough for a multitasking system running both DOS and Windows applications, and memory is cheap. (Or it used to be; just now there's a panic again, but it will probably be over by the time you read this.) Once I have more memory, I'll install Stacker—there's a perfectly good OS/2 version—to make

more room on the hard disk.

Next I would like to attach a good optical drive to the PS/2; that way, I can migrate a lot of programs I don't use often and still have them available at need. I've got a new Maximum Storage Duette dual-purpose WORM and read/write optical drive. It works fine with DOS, and if I can make that work with OS/2, I'll be in great shape. Report next month.

Meanwhile, I can report that OS/2 does Windows programs quite well, provided that you've got enough memory and disk space.

I think my real problem with OS/2 is that I installed it during a period when it wasn't entirely stable, and there seem to be remnants of different versions in my system. Several IBM OS/2 gurus assure me that my odd experiences are not typical. On advice from those gurus, I am about to use LapLink to send all my essential application files over to the Maximum Storage optical drive, reformat and repartition my hard disk, and start over. This will take a day, including reconfiguring OS/2 the way I want it, but they tell me it will eliminate a lot of the squirrely things

I think my real problem with OS/2 is that I installed it during a period when it wasn't entirely stable, and there seem to be remnants of different versions in my system.

SOME APPLICATIONS NEED A REAL REALTIME OPERATING SYSTEM

Whether you're monitoring a nuclear reactor or handling credit-card transactions, you need realtime performance you can count on around the clock. The kind of performance QNX® has delivered for well over a decade. QNX sustains a host of successful mission-critical applications in a wide range of industries. From POS to medical instrumentation, from SCADA to voice mail, thousands of VARs and OEMs rely on QNX for their realtime solutions. It's easy to see why. QNX is a microkernel OS combining realtime executive-class speed with a rich, self-hosted development environment. You won't have to waste time on cross-

development, so you'll see faster time-to-market and easier maintenance for your applications. QNX is remarkably flexible. You can easily strip it down to an embedded system or build it up to a vast network serving hundreds of CPUs. QNX follows Open Systems standards like POSIX and TCP/IP, so all your applications become all the more portable and interoperable. And you can run most popular DOS packages—even Microsoft® Windows® 3.1 in standard mode under QNX. So if you're looking for a time-tested foundation for your mission-critical applications, it's time for a real realtime solution. It's time for QNX.

NEW!
version 4.0

We slash interface development time across DOS, UNIX, POSIX, VMS...

(and we can prove it)

More features, more flexibility, and full emulation of GUI functionality in text-based modes. That's what you'll get with new Vermont Views® v4.0.

If you want to create sophisticated user interfaces—and save tremendous time and effort doing it—Vermont Views is exactly what you need. Vermont Views gives you the ability to emulate GUI interfaces for both DOS and terminal systems and provides you with seamless portability among DOS, UNIX, and VMS.

Vermont Views® allows you to add more of the features today's end users want—in a fraction of the time.

- ▶ Powerful menu driven WYSIWYG screen painter
- ▶ Contains a library of over 630 C functions
- ▶ Includes over 90 tutorials
- ▶ Unsurpassed portability
- ▶ No run-time fees or royalties

NEW! Vermont Views® PLUS

An enhanced version of Vermont Views for DOS. Develop multi-megabyte, graphic-enhanced C applications with support for all popular DOS extenders and graphic libraries.

Call 1-800-848-1248 for a free demo of the ultimate application interface!

that keep happening to me.

I do want you to note that I've stayed with OS/2 despite my problems. IBM OS/2 expert Dave Whittle (who was in Brazil with us) points out that he's been reading the column for years and recalls a number of problems I had with Windows. All true. And I'm told that there will be, about the time you read this, a true peer-to-peer OS/2 network as easy to set up and use as Windows for Workgroups. I sure hope so. Despite multiple annoyances that have had me tearing my hair out, there's a lot to like about OS/2.

The SyDOS Personal CD is the solution to the problem of how to install and use CD-ROM software where there's no CD drive. For instance, Richard at UCLA uses an NCR 3170 Windows laptop. A laptop is very convenient for a student, but there's a great deal of software on CD-ROMs that he could use. The Personal CD handles that nicely.

It's a self-contained unit about the size of a shoe box that connects to the parallel port. The software installs automatically from a floppy disk, about like the software for a BSE Flashdrive, which isn't surprising since BSE wrote the software for SyDOS. It's a bit more complicated than installing the BSE parallel-port Flashdrive, because accessing a CD-ROM requires that you run MSCDEX.EXE, but SyDOS has automated that installation, too. You can, if you have the memory, add buffers (the default is four, and 10 is optimum), but otherwise it's rare that you'll need anything but the default values.

Unlike the BSE Flashdrive, a CD-ROM drive needs too much power for battery operation, so you'll probably put this in checked luggage for trips. It's rugged enough to take that. It will also play CD audio records.

Obviously, this isn't as fast or convenient as a CD-ROM that works through the bus, but even that is changing. New developments in parallel-port technology are making that port as fast as a bus extension used to be. Even now, this sure beats the heck out of endlessly swapping floppy disks for big program installations. Recommended.

Stanford Graphics is so good I don't know where to start. From the title, you might guess that it's another drawing program; actually, it is one of the most powerful statistical-analysis and presentation management programs I have ever seen. It will take your data, massage it in myriad ways, and present it in over 60 graphics formats. Contour graphs, 3-D

graphs, scatter plots—you name it, this will show it.

John Tukey, America's foremost statistical theorist, has always admonished his students to *look* at their data, not just run it through equations; two of his students, looking for new ways to do that, developed a program called MacSpin for the Macintosh. It encouraged you to play around with numbers, always the best way to learn. That was pretty good, but it was limited by what a Fat Mac could do.

Stanford Graphics isn't limited at all. It's also easy to install, passing the Lazy Reviewer Test. Richard had it up and running and was doing useful things with it without ever taking the shrink wrap off the manual. Richard spent last year doing political polling analyses for the American Enterprise Institute and got extremely familiar with Microsoft Excel, which he likes a lot. After an hour with this program, he's ready to abandon Excel and change to Stanford Graphics. For what he does, Stanford's spreadsheet is at least as good as Excel. Excel has a better macro capability, but on most other counts, Stanford Graphics wins hands down, and it also has much of the presentation building power of PowerPoint. Incidentally, Stanford Graphics can access data from Excel and most other standard sources.

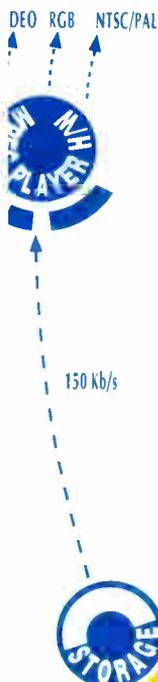

Not only will Stanford Graphics do data analysis, it will let you tinker with the data. Change values on-screen to see what that does. What if 5 percent of the Anglo lower-middle-class Protestants who favor Perot shift to Clinton? What if we pitch our product toward the 30–35 age bracket instead of 7-year-olds? All spreadsheets will let you tinker, of course, but this makes it easy: just drag data points around with the mouse. It also encourages you to think about ways to present your information: think of this as a kind of electronic implementation of Edward Tufte's marvelous book *The Visual Display of Quantitative Information*.

Stanford Graphics needs a high-end 486 machine (it will run on a 286 without a math chip, but you won't like it), but any good analysis program needs good hardware. I'll summarize this way: if I'd had a 486 with Stanford Graphics in the 1960s, I'd have been the greatest political scientist and operations research worker of the decade. If you do economics, business analysis, statistics, or almost anything that involves numerical data, you can't afford not to have this. Highly recommended.

World Radio History

music, you need to know about this company. Record, edit, transcribe, print: a complete composer environment. Atari and Amiga don't seem able to move back into the mainstream of the computer revolution, but each has captured a pretty good niche. At the moment, Atari pretty well owns the popular music field, with Amiga its only serious rival. That could change as high-end PCompatibles move to multimedia, but so far it hasn't.

I don't have enough space to do Dr. T's software justice; just let me say that if you are serious about music, you'll want to know about it. I'm not musical, but Mrs. Pournelle is, and she's been impressed by it.

The math program wars continue, and there are now a number of excellent packages out there. There's a new-and-improved version of Macsyma, the original symbolic algebra program and still the most powerful of the lot, but others are catching up. One I haven't mentioned before is Maple V. The Student Edition of Maple V is one of the

best buys in the computer math program field. Unless you've got really high-end requirements, it will do all you'll ever want, it's pretty easy to learn, and it works the same on Macs, PCs, and various workstations.

The Student Edition of Maple V is one of the best buys in the computer math program field. Unless you've got really high-end requirements, it will do all you'll ever want.

MathSoft continues to release their various handbooks. The latest is McGraw-Hill's *Theory and Problems of Electric Circuits*, a classic work translated to computer form. Mathcad's major strength is in the available specialized handbooks in almost every field: electricity, electronics, chemistry, materials science, mechanical engineering, and so forth, which make it very easy to do practical applications.

I can remember haunting the old ARPANET in order to use Macsyma, which was available only if you had an MIT ARPANET account. Now there are half a dozen excellent programs, each more powerful and with much better graphics capabilities than the old Macsyma: enough so that I can no longer keep up with which one is "best"; and that's not important anyway. The fact is they're all

good enough, and any engineering or science student or professional who doesn't have one of these is at an enormous disadvantage. If you get familiar with any one of these, you'll be miles ahead.

If you do many computer presentations, you might want to know about PRO Presenter. This is a wireless infrared receiver that attaches to the mouse port (or the serial port that your mouse attaches to), a tiny transmitter clicker with two buttons, and software to make your computer think those are the left and right buttons of your mouse.

Since most presentation software can be set to run with mouse-clicks, once you set this up, you can walk around the room and control the presentation. It comes in a small simulated-leather case and weighs only a few ounces. Not something everyone needs, but it's convenient if you do happen to need it.

I don't usually recommend anything I don't use, but sometimes I get so used to something I'm reluctant to change, even when something "better" comes along. That's the situation with Ascend versus Arabesque ECCO. Ascend

How many memory management tools does it take to create a program?

Just one....

Why use a multitude of memory management tools when one will do? Introducing Blinker 3.0, a Windows™ linker, a royalty-free 286 DOS extender, a DOS dynamic overlay linker and a memory swap utility, all in one unique product. Now there is an easy way to maintain and enhance existing DOS systems and write new Windows programs. Compatible with virtually every popular PC programming language, including CA-Clipper®, Blinker 3.0 creates memory efficient programs in a matter of seconds. The result - increased productivity and lower training costs.

An intelligent memory management solution for DOS

Combining a DOS extender with an award-winning dynamic overlay linker used by over 40,000 developers offers a unique advantage. Blinker 3.0 creates programs which automatically detect whether the runtime machine can run in protected mode. If not, the **same program** will simply run in real mode using dynamic overlays. This process is completely invisible to the end user. Now you can concentrate on the code instead of worrying about the runtime environment. Programs automatically utilize all the available memory on every PC, from the smallest 8086 right up to the Pentium and beyond!

A 286 DOS extender with no runtime royalties!

Now everyone can afford to break the 640Kb DOS barrier! Directly access up to 16 megabytes of extended memory just as if it were conventional memory on any 80286 or above. Run multi-

programs will run under Windows, DESQview™ and OS/2™ as well as DOS. And Blinker 3.0 features a completely transparent compiler-independent VM system to access up to 64 Mb of virtual memory.

With a Windows linker for luck.

Create Microsoft Windows®-compatible segmented .EXEs quickly and easily for programs written in Microsoft™ C, C++, Visual C++, Assembler, FORTRAN, Pascal, Watcom™ C, Symantec™ C++, CA-Clipper 5.x (using Clip4Win™), Borland™ C, C++ and Assembler.

Make the smart choice!

Blinker 3.0 offers greater functionality than any other product, or combination of similar products on the market, for a fraction of the cost. You get the fastest link speeds available for DOS and Windows in one linker, plus industry standard .EXEs for compatibility with copy protection, antivirus and compression software. Blinker 3.0 fully supports all versions of CodeView® and is just one 200Kb .EXE of highly optimized assembly code. What's more, there are no run-time royalties on any programs you create. Doesn't that sound too good to be true?! Then try it! With our 30 day money back guarantee you just can't lose!

megabyte programs in protected mode in less than 256 Kb of conventional memory, solving low memory problems caused by network shells and other memory hungry TSRs. Boost program performance - all code and data is memory resident so there is no swapping to disk. Blinker 3.0 is fully compatible with the DPMI, VCPI and XMS specifications so your protected mode

Circle 381 on Inquiry Card (RESELLERS: 382).

You could hire National Software Testing Laboratories to help you make the right LAN purchasing decisions.

Or you could subscribe to LAN REPORTER.

Unlike single-user systems and applications, a poor network choice hurts everyone on the network.

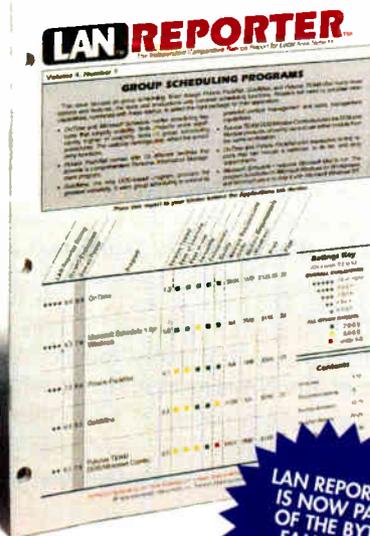

Be sure the products you buy deliver as promised. LAN Reporter, published by NSTL and BYTE, delivers the truth about network and workgroup applications, environments, and hardware.

DESIGNED FOR SERIOUS BUYERS

Subscribing to LAN Reporter puts you in control of the buying process. Each issue tells which products deliver the power... speed... security... compatibilities... and expansion capabilities you need to tie your systems together.

- Authoritative, independent recommendations
- In-depth explanations of new technology
- Comparisons of product performance, usability, quality and value
- Comparisons of product features
- Complete product specs
- Detailed test results

LAN REPORTER IS PUBLISHED BY NSTL, THE INDUSTRY'S FIRST AND MOST AUTHORITATIVE INDEPENDENT TESTING LABORATORY.

LAN REPORTER IS NOW PART OF THE BYTE FAMILY OF PUBLICATIONS!

NSTL tests level the playing field so products show their strengths and weaknesses in head-to-head, feature-to-feature competition. In real-world, applications-based environments like the one you work in every day.

CLEAR-CUT WINNERS

The result: objective recommendations for the best products in each market category. Clearly described by expert test technicians—without ads or distractions of any kind.

From wireless LANs to WANs, from micro-to-mainframe links to workgroup applications, LAN Reporter tests the products you need —

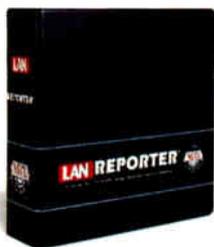

- Group scheduling
- EISA Ethernet cards
- Windows-based peer-to-peer networks
- SQL servers
- 486 66MHz servers
- Windows databases
- Network management software
- LAN E-mail
- Unix servers
- LAN operating systems
- Bridges and gateways

LAN Reporter's features charts are so complete that vendors consult them before designing upgrades. Shouldn't you consult us before buying your next LAN equipment?

THE SCIENCE OF NSTL TESTING

NSTL is the laboratory of choice for buyers facing high-stakes network purchases. We originated the concept of testing micro-computer products. Today our state-of-the-art benchmarks and methodologies are universally regarded as definitive.

FREE BINDER!

To help you build your resource library, you get a FREE durable, 3-ring binder with tabbed subject dividers upon payment.

2 FREE ISSUES

Include payment with your order now (check or credit card) and receive two additional issues with our compliments.

ORDER NOW!

YES, please enter my subscription to LAN Reporter for one year (12 issues) at \$445, and send my free binder with my first issue. If I elect to include payment now, add two additional issues to my subscription at no cost. I must be completely satisfied with LAN Reporter or I will receive a full refund of my entire investment.

World Radio History

does a far better job of keeping track of your goals and philosophies, but in the day-to-day tracking of contacts and notes and organizing the countless snippets of information that flow in every day, Arabesque ECCO is much better. Ascend grew out of a pen-and-paper system, and some of its roots show. ECCO was designed by computer people.

On the other hand, I have a lot of time invested in Ascend, I like it, and it is quite good at helping me sort out what's important and what isn't. I continue to use Ascend, but stay tuned; meanwhile, if you don't use one of these programs, you're missing something. A good time and task management system can change your life.

The CD-ROM of the month is from Allegro New Media. Allegro is the company formed when one of the founding partners of the Bureau of Electronic Publishing broke off to go it alone, and it's very much worth your while to get the Allegro catalog. This month's CD-ROM is a Business Library that includes *Business-to-Business Communications Handbook*, *Finance and Accounting for Nonfinancial Managers*. *International Herald Tribune*

Guide to Business Travel: Europe, works on marketing research and real estate, and lots more stuff like that. It needs Windows 3.1, meaning it works with OS/2 2.1 but not 2.0.

The computer books of the month are Gordon M. Campbell's *System 7.1: The Complete Sourcebook* (Windcrest/McGraw Hill, 1993), a very good user-level work from installation to some quite advanced features, and Dan Gookin's *MS-DOS to the Max, Version 6* (Microsoft Press, 1993). I still don't recommend MS-DOS 6, because I greatly prefer Stacker and Quarterdeck's QEMM for file compression and memory management and Symantec's caching software; but, of course, MS-DOS 6 does work, and you get an awful lot for your money. If you do use it, Gookin's book is a good way to learn how to get the most out of it.

The game of the month is Space Quest V—The Next Mutation from Sierra Online. The latest antics of Roger Wilco, the janitor turned space cadet, as he saves the universe. It's a silly, mindless game, but Larry Niven loves it. He's got through

two previous Roger Wilco games and is happily working through this one. The graphics are wonderful.

One minor correction: last month I made a reference to Chaplin's film *City Lights*. Mea culpa. I should have said *Modern Times*.

I'm out of space, and there's an enormous pile of new software and hardware left on my ready table. Next month, I'll look at some multimedia authoring programs; Stacker 3.1; more on OS/2 and optical drives; the latest and greatest from ATI Technologies, including their multimedia upgrade kit; and however much more of the pile I can get to. Now I'm off to Sweden, where they're giving me a birthday party. ■

What's New Hardware

FAST X STATION ▲

A medium-resolution color X Window System station based on the Intel 960 RISC processor, the Hewlett-Packard (Santa Clara, CA) Envixez Model 15Ci (\$2495) has 6 MB of RAM and 1 MB of video RAM. The 15-inch monitor shows 256 colors at resolutions of up to 1024 by 768 pixels with a 70-Hz refresh rate.

Phone: (800) 752-0900 or (415) 857-1501.

Circle 1064 on Inquiry Card.

DUAL-SPEED CD-ROM

CMS Enhancements' (Irvine, CA) CD-ROM drives for PCs and Macs (from \$699) feature dual transfer rates of 150 and 300 KBps, average seek times of 280

ms, and 256 KB of data cache. The drives, available as internal or external units, are compatible with Multisession Photo CD, QuickTime, High Sierra, Mac HFS, ISO 9660, XA, and standard audio CDs.

Phone: (714) 222-6000.

Circle 1070 on Inquiry Card.

Texel's (Santa Clara, CA) internal DM-3028 (\$499) and external DM-5028 (\$599) CD-ROM drives provide a sustained data transfer rate of 335 KBps and an average access speed of 240 ms. PC- and Mac-compatible, each drive is Multisession Photo CD-capable and includes a 64-KB buffer, an automatic lens cleaner, and a dustproof door.

Phone: (408) 980-1838.

Circle 1071 on Inquiry Card.

NETWORK ON A CARD

A managed 10Base-T module for the INX 5000 intelligent wiring hub, the 10BT-MGR (from \$2095) incorporates an on-board SNMP agent, making a separate network management module unnecessary. The 10BT-

MGR, from Racal-Datacom (Boxborough, MA), has three 24-port cards, freeing slots for network expansion. The hot-swappable module includes automatic port partitioning, which isolates any port that's transmitting erroneous data; automatic polarity correction allows you to change the polarity without re-wiring.

Phone: (800) 722-2555 or (508) 263-9929.

Circle 1067 on Inquiry Card.

MAC ACCELERATOR BOARD

The Tornado graphics board (\$799) from Mirror Technolo-

gies (St. Paul, MN) provides on-board QuickDraw acceleration and 24-bit color on 21-inch monitors. Used with multisync monitors, the board provides on-the-fly resolution switching. An optional NTSC adapter lets you directly connect your system to your TV or VCR. An optional add-on board, ChargeCard (\$599; bundled with Tornado, \$1299) speeds some functions in Adobe Photoshop.

Phone: (612) 633-4450.

Circle 1068 on Inquiry Card.

COLOR MONITORS

From Radius (San Jose, CA), the PrecisionColor Display/20v monitor (\$2199) is compatible with Macs and PCs. The 20-inch display shows two full pages at resolutions as high as 1152 by 870 pixels on Macs and 1280 by 1024 pixels on PCs. RadiusWare software lets you switch resolutions and bit depth on the fly. The unit has 75-Hz refresh rates and is MPR II compliant.

Phone: (408) 434-1010.

Circle 1072 on Inquiry Card.

The Flexscan F560iW (\$1699), a 17-inch flat-square monitor from Nanao (Torrance, CA), provides a resolution of 1280 by 1024 pixels at a 76-Hz refresh rate. The energy-saving monitor includes ErgoCoat antireflective coating, WideView, and front-mounted controls built around a digital control system that stores information about the screen configurations and display modes that you set.

Phone: (213) 325-5202.

Circle 1073 on Inquiry Card.

ViewSonic (Walnut, CA) has upgraded its New Generation ViewSonic 15 color monitor (\$599) to a "green" machine. The energy-efficient monitor conforms to the VESA power-savings management standard by powering down in three stages in direct response to the system's video-signal input. The flat-square display has a noninterlaced resolution of as high as 1280 by 1024 pixels.

Phone: (800) 888-8583 or (909) 869-7976.

Circle 1074 on Inquiry Card.

TURBO-SPEED MODEMS

The Courier V.32 turbo modems (from \$645) from USRobotics (Skokie, IL) support data rates of up to 19.2 Kbps and include the company's Adaptive Speed Leveling protocol for 21.6-Kbps throughput. The modem-to-computer interface rate is 115.2 Kbps, and some models have a proprietary protocol for high-speed cellular data transmission. Enhancements include 14.4-Kbps fax capabilities, support for EIA Class 2.0 fax communication, dial-back and link security, and the V.25bis protocol for synchronous dialing.

Phone: (708) 982-5010.

Circle 1069 on Inquiry Card.

PENTIUM TOWER

The TP66E2/VL tower workstation (from \$4999) has two in-line 60-MHz Pentium processors. Each built-to-order system includes 512 KB of processor cache, a dual-channel SCSI-2 connection, an S3 video accelerator with 1 MB of DRAM, 4 MB of system RAM (expandable to 128 MB), 12 drive bays, and eight expansion slots. The EISA-bus system supports symmetrical multi-processing under Windows

NT and SCO Unix. The basic system ships without a monitor or hard drive.

Contact: Ambra Computer, Raleigh, NC, (919) 713-1550.

Circle 1060 on Inquiry Card.

Hardware

PERSONAL DEVICE PROGRAMMER

The ChipLab Project Programmer (from \$895) from Data I/O (Redmond, WA) provides universal device support, such as flash, PROM, EPROM, PALs, microcontrollers, and sequencers.

Built for design engineers, ChipLab provides immediate support for target devices. The unit also provides configuration flexibility that lets you use it in other projects. ChipLab uses the company's standard device-programming algorithms, supports more than 40 device manufacturers and up to 48-pin packages, and accepts industry-standard ABEL files or JEDEC output.

Phone: (800) 332-8246 or
(206) 881-6444.

Circle 1131 on Inquiry Card.

UPGRADE TO VESA LOCAL BUS

A kit for converting your ISA 386DX, 486SX, or 486DX PC to a VL-Bus system is available from PC-Build Computer Kits (Needham, MA). The conversion package (\$450, installed) includes an upgradable VL-Bus motherboard, 128 KB of expandable cache memory, a VL-Bus IDE controller, and an expandable 1-MB VL-Bus Super VGA video board with software drivers.

Phone: (617) 449-7575.

Circle 1132 on Inquiry Card.

DETACHABLE DISPLAY

The detachable display becomes a projection panel on Krolman's (Toronto, Ontario, Canada) pc-Panel (\$7950), an active-matrix color LCD projection panel and 33-MHz 486 notebook in one. You can add full-motion video clips to your presentations while working in PowerPoint, WordPerfect Presentations, or Harvard Graphics. The 7-pound system ships with 8 MB of RAM, a 200-MB removable hard drive, a 3 1/2-inch floppy drive, I/O ports,

and a built-in trackball.

Phone: (800) 388-3639 or
(416) 931-7039.

Circle 1133 on Inquiry Card.

SCSI FOR THE LOCAL BUS

From American Megatrends (Norcross, GA), the Fast Disk VLB SCSI host adapter (\$550) for motherboards using the VESA local bus supports up to 8 GB and seven SCSI drives. Throughput is 10 MBps; an on-board 16-MHz 386SX processor directs the I/O and cache support for up to 16 MB of on-board RAM.

Phone: (800) 828-9264 or
(404) 263-8181.

Circle 1135 on Inquiry Card.

PRESENTATION CONTROL

The two-button, credit-card-size ProPresenter (\$99) from Presentation Electronics (Rocklin, CA) gives you remote control over

your presentations. In versions compatible with PCs or Macs, the device

provides forward and reverse capabilities and requires no software installation for use with most presentation programs (software is provided for customizing ProPresenter). The device attaches to the PC mouse port or the Mac ADB and is upgradable to the ProPresenter Plus (upgrade, \$80).

Phone: (916) 652-9281.

Circle 1134 on Inquiry Card.

FASTER LABEL PRINTING

The LabelWriter II (\$249.95) from CoStar (Greenwich, CT) plugs into the serial port of your Mac and adds a text-only mode for quick printing. Other enhancements include the CoStar Driver, an INIT file that provides background printing; consolidation of the three windows into one resizable window; expanded functionality in the Desk Accessory; and addition of Printer

DIGITAL VIDEO SYSTEM

Media 100 (\$11,995), a digital, on-line, non-linear video-production system, lets you create NTSC or PAL video programs directly from your Mac. After you digitize your analog video and audio and store it, you can edit a complete video program using a picture-based interface and then record the finished program back onto videotape. Media 100's video output is 60 fields and 30 frames per second. The system, which consists of two NuBus boards and video-production software, supports input and output of four independent tracks of CD-quality stereo audio.

and Printer Setup menus.

Phone: (800) 426-7827 or
(203) 661-9700.

Circle 1137 on Inquiry Card.

A NOTEBOOK FOR GRAPHICS

With a 9 1/2-inch active-matrix color screen, the 486DX2-66 Smartbook (\$4631) is designed for CAD and graphic artists. When the unit is connected to an external monitor, you can increase the resolution to 1024 by 768 pixels. From Commax Technologies (San Jose, CA), the 6.2-pound notebook has a built-in trackball and a front-loading 3 1/2-inch floppy drive.

Phone: (408) 435-5000.

Circle 1138 on Inquiry Card.

HEAVY-DUTY BUT QUIET

The Genicom (Chantilly, VA) Model 3940IP heavy-duty dot-matrix printer (\$3995) has two co-resident paper paths. You can load two different forms or identical forms, and the printer will automatically switch to the second box of paper when the first runs out. Features in the 55-dB, 600-cps printer include a font-selection command, an automatic head-gap feature that senses the thickness of forms and auto-

matically adjusts for optimum print quality, and head-gap memory that lets you program the printer to recall the format for specific forms.

Phone: (800) 443-6426 or
(703) 802-9200.

Circle 1273 on Inquiry Card.

CD MAKER

You can create ISO9660-compliant CDs with the RCD-202 PC (\$4195), a recordable CD mastering system with a pre-mastering feature for Windows, from Pinnacle Micro (Irvine, CA). The discs (blank, \$39 each) can be read on a standard CD-ROM drive on any platform. You can create audio, audio and CD-ROM, CD-XA, CD-I, and multisession discs (Kodak Photo CD and Pinnacle Micro standards), which enable you to write and read data in more than one recording session. You can also use the RCD-202 PC as a backup device.

Phone: (800) 553-7070 or
(714) 727-3300.

Circle 1136 on Inquiry Card.

What's New Hardware

CAPTURE AND COMPRESS IMAGES

XingIt (\$795) is a real-time 30-frame-per-second MPEG video-encoder board for 386, 486, and Pentium PCs. Jointly developed by Xing Technology (Arroyo Grande, CA) and Philips Semiconductors, XingIt provides real-time capture, filtering, and compression of NTSC, PAL, and SECAM video signals. Used with Microsoft Video for Windows, it also provides MPEG

software playback in a 320- by 240-pixel window synchronized with WAV or MPEG audio without special display hardware.

Phone: (800) 294-6448 or (805) 473-0145.

Circle 1271 on Inquiry Card.

EASY SCANNING

An entry-level scanner, the ActionScanning System (\$999) from Epson America (Torrance, CA) is built around the company's ES-600C, a single-pass, 24-bit color scanner. It comes with Photoshop 2.5 LE image-editing

software, a Scantastic PS plug-in module, and a SCSI cable.

Phone: (800) 289-3776 or (310) 782-0770.

Circle 1143 on Inquiry Card.

CAD PLOTTER

From Pacific Data Products (San Diego, CA), the ProTracer II personal CAD plotter (\$1599) is specifically designed for working in AutoCAD. The plotter produces C-size plots at 360-dpi resolution or office documents on standard office paper and provides resident Epson LQ-1050 and IBM ProPrinter XL24E emulation. The plotter is also upgradable.

Phone: (619) 552-0880.

Circle 1279 on Inquiry Card.

MAGNETO-OPTICAL DRIVE

LaserSafe Plus (\$4995), a read/write removable magneto-optical drive for Macs and PCs, holds ISO-standard 1.3-GB disks and is backward compatible with 1-GB and 650-MB disks. From Iomega (Roy, UT), the drive has a sustained read capability of 2.2 MBps, a sustained write capability of 1.1 MBps, and an average seek time of 19 ms, the company says. Its read/write cache is 4 MB.

Phone: (801) 778-1000.

Circle 1276 on Inquiry Card.

PORTABLE UNIX

Based on the IBM RS/6000 Powerstation 220 workstation, the Powerportable (from \$13,495) offers Model 220 functionality, letting you download software from any RS/6000 machine, work with it, and then upload it. The Powerportable runs AIX 3.2 for the RS/6000 and includes 8 KB of I/O cache, a 32-bit Micro Channel adapter slot, and system I/O control logic. Other features include an

active-matrix color LCD, a 457-MB or 1.2-GB removable hard drive, 16 MB of RAM, and Ethernet and SCSI connectors.

Contact: Acer America, San Jose, CA, (800) 366-3355 or (408) 432-6200.

Circle 1062 on Inquiry Card.

SIMULTANEOUS SOUNDS

From Orchid Technology (Fremont, CA), the SoundWave 32 advanced wavetable/DSP sound card (\$299) provides simultaneous multimedia compatibility and support for the leading sound standards, letting you switch among standards, access multiple standards simultaneously, and update to new ones without additional hardware. The 16-bit card has more than 8 MB of sound samples; built-in CD-ROM interfaces for Sony and Mitsumi drives; and interfaces for stereo speaker output, microphone input, line output to connect to a home stereo, and line input for external audio devices. Speakers and a microphone are included.

Phone: (510) 683-0300.

Circle 1145 on Inquiry Card.

RISC BOX RUNS WINDOWS NT

A Mips R4400-based RISC PC for Windows NT, the limited-edition rPC 44LE (\$4495) from DeskStation Technology (Lenexa, KS) joins the company's Evolution Series of computers. The minitower is built around a 50-MHz processor that operates internally at 100 MHz. The rPC 44LE includes 16 MB of RAM (expandable to 64 MB), 512 KB of secondary cache memory, a SCSI-2 subsystem with a 240-MB hard drive and a Sony CD-ROM drive, an S3-based video card, and Windows NT installed.

Phone: (800) 793-3375 or (913) 599-1900.

Circle 1275 on Inquiry Card.

ANALOG FILM RECORDER ▲

Datagraf's (Wheeling, IL) Screen Image Recorder produces high-quality photographic images from your computer or workstation screen without software drivers. The SIR-115 (\$6000), for the Mac, and the SIR-121 (\$6500), for coexisting PCs and Unix workstations, are fully compatible with all software programs, according to Datagraf. The passive hardware interface completes a 35mm image in less than 15 seconds. You can also attach the image recorder to any computer-based microscope system for direct imaging of the system's monitor.

Phone: (800) 538-9231 or (708) 520-1223.

Circle 1140 on Inquiry Card.

A LAN FOR ONE

Designed for those who work with more than one PC, One-Man-LAN (from \$199) from PC InterConnect (Provo, UT) lets you access files on one or more secondary PCs as if the files were located within your primary system. You can convert any of your machines into a secondary or server PC and then return it to primary status. The two half-height ISA cards and software are compatible with Windows, NetWare, LANtastic, and Windows for Workgroups, as well as sector-level disk utilities and CD-ROMs. One-Man-LAN supports data transfer rates of up to 680 Kbps.

Phone: (801) 374-8880.

Circle 1066 on Inquiry Card.

Hardware

LONG DISTANCE FOR A SHORT-RANGE MODEM ▼

A short-range modem that can operate at distances of up to 14 miles over unshielded twisted-pair cable, the Model 1226 (\$165) can communicate with a serial device or another parallel

device. From Patton Electronics (Gaithersburg, MD), the modem sends data at a rate of 57.6 Kbps. With optical isolation and surge protection, the bidirectional Model 1226 can withstand ground loops and transient surges.

Phone: (301) 975-1000.

Circle 1274 on Inquiry Card.

MULTIMEDIA MONITOR

A 15-inch color monitor with built-in stereo speakers, the FM-1561A (\$799) accepts VGA, Super VGA, and noninterlaced video-input signals at a maximum resolution of 1280 by 1024 pixels. From Proton (Cerritos, CA), the monitor has a flat, anti-static, low-emission screen with an adjustable antiglare visor and a removable glass VDT filter.

Phone: (310) 404-2222.

Circle 1277 on Inquiry Card.

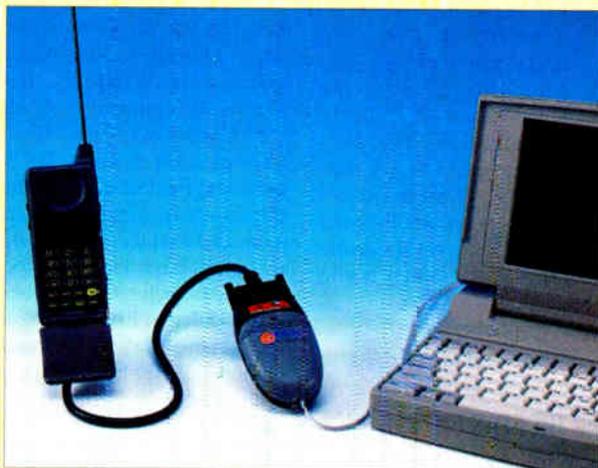

PRINTING IN KANJI

The Kanji JetWriter SX-600 (\$4995) is compatible with PCs, Macs, and Unix-based computers. The 600-dpi, 8-ppm printer includes expandable mincho and gothic kanji fonts and 35 standard English PostScript fonts. RISC-based, the printer has 8 MB of RAM (expandable to 16 MB), a 40-MB SCSI hard disk, dual page processing, HP PCL compatibility, and advanced memory management. The I/O Software (Rancho Cucamonga, CA) printer can print at 101 levels of gray scales.

Phone: (909) 483-5706.

Circle 1278 on Inquiry Card.

CELLULAR LINK FOR MODEMS AND FAXES

The I.D.E.A. (Intelligent Data Equipment Adapter) lets you connect your modem or fax machine to a portable cellular phone. Powered by a standard 9-V battery, the I.D.E.A. (from \$249.95) gives your cellular phone the characteristics of a standard phone line. The microprocessor-controlled system generates a dial tone, controls the functions of the phone, and provides a standard RJ-11 interface. The system, which is compatible with PCs, Macs, and palmtops, does not require additional software.

Contact: Ora Electronics, Chatsworth, CA, (818) 772-2700.

Circle 1063 on Inquiry Card.

MULTIDEVICE DIGITIZER TABLET

The Mac-compatible 12- by 12-inch UD-1212 multidevice digitizer tablet (\$695) tracks a stylus and a four-button cursor simultaneously. You can grab objects on the screen with both pointers

and manipulate them faster and more naturally than previously possible. The Wacom Technology (Vancouver, WA) device has a customizing menu strip with two pressure buttons that let you set the pressure-sensitive UltraPen for a firm or soft touch.

Twelve function/macro buttons and configure-setup/save and mode-selection buttons are also on the strip. The UltraPen offers 120 pressure levels and has a side switch that you set for specific functions.

Phone: (800) 922-6613 or (206) 750-8882.

Circle 1139 on Inquiry Card.

TURN YOUR PC GREEN

It looks like a power strip, but the PC Ener-g Saver (\$69.95) can sense when your PC is no longer in use and automatically switches it into a power-saving standby mode. You connect your CPU, monitor, keyboard, and printer to the device from PC Green Technologies (La Palma, CA), which works in concert with TSR software under DOS and as a WIN.INI file in Windows. The software also audits energy costs, letting you calcu-

late savings and the payback period. An on-screen configuration panel allows you to independently control monitor and printer power.

Phone: (800) 984-7336 or (714) 228-2230.

Circle 1144 on Inquiry Card.

TWO GRAPHICS CARDS FOR THE VL-BUS

ATI Technologies' (Toronto, Ontario, Canada) first retail VESA Local Bus card uses the company's mach32 graphics controller. The Graphics Ultra Pro V1.B (\$499) has 2 MB of VRAM and displays at resolutions of up to 1280 by 1024 pixels at 74 Hz. At 800- by 600-pixel resolution, the card displays 24-bit color.

Phone: (416) 882-2600.

Circle 1141 on Inquiry Card.

Cardinal Technologies' (Lancaster, PA) VideoSpectrum VL (\$199) uses a Cirrus 5428 accelerator chip and has 1 MB of DRAM. The card displays at resolutions of up to 1280 by 1024 pixels in 16 colors. At 640- by 480-pixel resolution, the card displays 24-bit color.

Phone: (717) 293-3000.

Circle 1142 on Inquiry Card.

2 GB TO GO

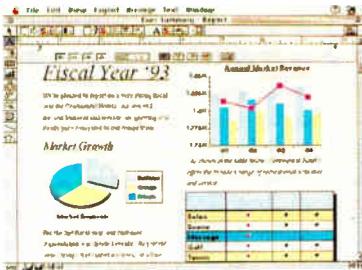

The Mac-compatible InereMeg removable hard drive cartridge (\$4586) now has a capacity of 2 GB. From MountainGate Data Systems (Reno, NV), the 3 1/2-inch full-height cartridge can be used by itself or with the InereMeg 6000, for a capacity of up to 12 GB. The cartridge has patented shock protection, spin-up/spin-down electronics, drive-status indicators, and a SCSI-2 connector.

Circle 1272 on Inquiry Card.

What's New Software

CREATE, INTEGRATE, COMMUNICATE ▲

Claris (Santa Clara, CA) calls its business-graphics-processing software, ClarisImpact 1.0 for Macintosh (\$399) puts in a single application the means of creating, editing, and presenting integrated text and graphics in reports or slides. Features encompass automatic graphics models for organizational charts and flowcharts, time lines, and network diagrams; "intelligent" editing; integrated word processing and presentations; and seamless cross-platform capabilities.

Phone: (408) 987-7000.

Circle 1285 on Inquiry Card.

WINDOWS CLIENT FOR OPTIX

Optix PC View (\$995 per user) from Blueridge Technologies (Flint Hill, VA) allows PCs run-

ning Windows to view document-image and text databases on multiuser Optix networks. With Optix PC View, users of Windows-based PCs can query, retrieve, view, and print images from the Unix-based SQL Optix Network Server and Natural Language Search text-search engine. The Optix client software lets Windows PCs call up files that take on the same screen appearance as they would on Mac clients.

Phone: (703) 675-3015.

Circle 1286 on Inquiry Card.

READ THE NEWS ON YOUR MAC

MacWire (\$995) lets you use your Mac to receive, filter, and display news in real time. From Mainstream Data (Salt Lake City, UT), MacWire works in background mode and thus does not need a dedicated computer. The software is fully compatible with wire services such as AP, Knight-Ridder/Tribune, UPI, Reuters, Business Wire, and Agence France Presse. It can also receive FM and satellite transmissions.

Phone: (801) 584-2800.

Circle 1284 on Inquiry Card.

CREATE 3-D AND MOTION SEQUENCES

Visual Reality (\$595) from Visual Software (Woodland Hills, CA) lets you create photo-realistic 3-D images and motion sequences in Windows. Built around the company's Renderize for Windows, Visual Reality has three other modules. The 3-D modeling module includes functions such as splines, cut, extrusion, and surface of revolution as well as basic building blocks of spheres, polygons, and cubes. The Renderize Live camera-animation module produces walk-throughs and fly-bys, and the image-composition module lets you create and manipulate multiple layers and work on high-resolution images in 2-D.

Phone: (818) 883-7900.

Circle 1287 on Inquiry Card.

SIMPLY COMMUNICATE

SITcomm (Simply Intuitive Telecommunications, \$120) is a communications program that lets Mac users connect to commercial on-line services, BBSes, and the Internet. With a toolbar user interface, the Aladdin Systems (Watsonville, CA) software provides quick access to its main

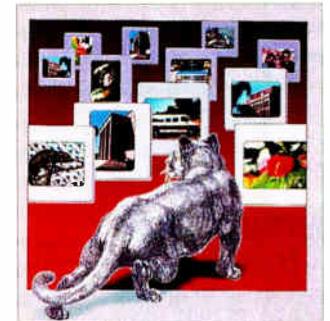

features. You can set up SITcomm so that it automatically logs on to communications services through an address book that contains your settings for each service you use. The program has automatic expansion and compression, foreign-file translation, and scripting.

Phone: (408) 761-6200.

Circle 1288 on Inquiry Card.

IMAGE MANAGER

Xing Technology's (Arroyo Grande, CA) Picture Prowler image management software utility (\$49.95) compresses imported images in real time. The soft-

ware imports BMP, TIF, TGA, GIF, PCX, WMF, and WPG files and converts them to ISO-standard JPEG format. Interactive thumbnail scrolling lets you quickly make a visual search of the cataloged images, retrieve them, and decompress them for viewing.

Phone: (805) 473-0145.

Circle 1289 on Inquiry Card.

32-BIT PC X SERVER

With Exceed/NT (\$645) from Hummingbird Communications (Markham, Ontario, Canada), you can work in Windows NT to connect to and display applications from X Window System-based systems. The seamless integration allows you to concurrently execute X clients and DOS, Windows, and Windows NT applications. Two windowing modes are available, and you can switch modes on the fly.

Phone: (416) 470-1203.

Circle 1290 on Inquiry Card.

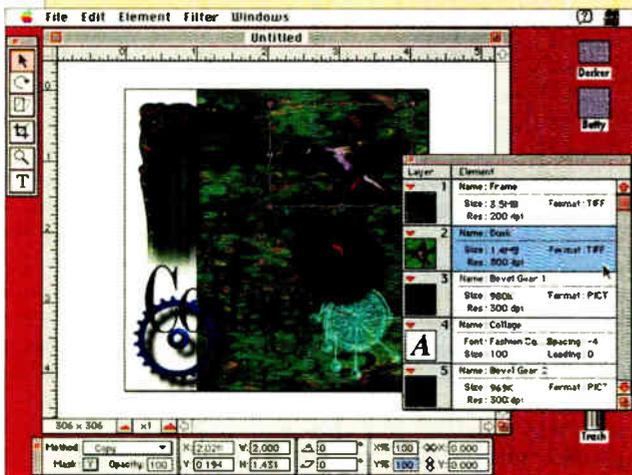

A MANY-FACETED SCHEDULER

Project Scheduler 6 for Windows (\$695) provides easy-to-use tools for planning, tracking, analysis, and reporting for multiple projects. Incorporating the ARTS (Advanced Resource Tracking Spreadsheet) technology, Project Scheduler lets you compare your baseline estimates of cost, work force, and time with the actual data you've entered to date and the remaining work to be done on an hourly, daily, weekly, or monthly basis.

The software supports matrix management with work, organizational, and resource breakdown structures that you can sort, filter, and cross-reference. Analysis and scenario modeling capabilities have an unlimited undo/redo option, and ODBC support lets you create a centralized project repository on the server. With the Object Oriented Report Writer, you can create custom reports of project data, such as time distribution and selective summaries, at any level of a breakdown structure.

Contact: Scitor, Foster City, CA, (415) 570-7700.
Circle 1280 on Inquiry Card.

MAC IMAGE BUILDER

The object-oriented, high-resolution image-composition program **Specular Collage** (\$395) works with graphics packages such as Adobe Photoshop and QuarkXPress to speed up and add flexibility to creating complex imagery. Collage defines each image element as an object that's separate from other image elements, letting you make corrections or adjustments to individual elements without having to re-create the entire composition. Features include import and export of PICT and TIFF files, a desktop page-layout interface, live alpha channels, numerical input, feathering, automatic shadows, and manipulation of high-resolution images as proxies.

Contact: *Specular International, Amherst, MA,*
(413) 253-3100.

PC-Write 4.1, Quicksoft (Seattle, WA), adds graphics, envelope printing, a customizable status line, a stress indicator, Windows Clipboard support, and more. \$69.

Phone: (206) 282-0452.

Circle 1306 on Inquiry Card.

What's New Software

CREATE CIRCUIT DESIGNS

A schematic capture and digital-simulation program from MicroCode Engineering (Orem, UT), CircuitMaker (\$199) lets you easily draw, modify, and combine circuit diagrams by employing your mouse to select devices from the device library. Advanced editing capabilities include rubber-band moving of wires and devices; cut, copy, and paste; and 90-degree rotation. The simulation feature allows you to test a circuit before you build it, and the trace option lets you simultaneously view the states of all nodes as the simulation runs. The macro devices feature lets you create your own functional devices, and you can export and print the circuit and waveforms.

Phone: (801) 226-4470.

Circle 1304 on Inquiry Card.

NETWORK SECURITY ▼

The Network Security Organizer (\$250 for a five-user license) from Leprechaun Software (Marietta, GA) is a network management tool that gives system administrators centralized control over workstation-based security and any antivirus system that is installed. Additionally, the program analyzes network vulnerability to viruses and provides

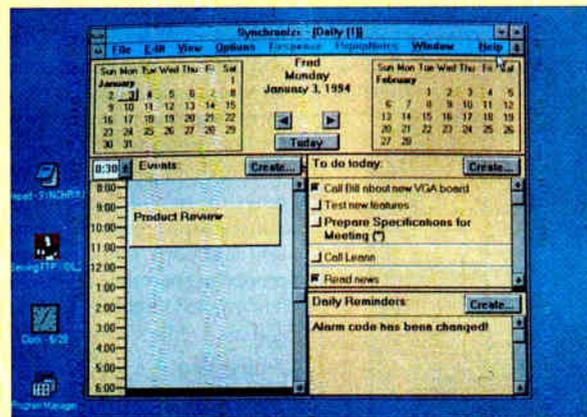

centralized asset management for workstation hardware and software as well as centralized reporting of virus hits across the network.

Circle 1296 on Inquiry Card.

ENTERPRISE-WIDE SCHEDULING IN WINDOWS

The Windows client release of Synchronize (\$100 per user), a scheduling and task management application, communicates directly across TCP/IP for worldwide access. The client/server design supports multiple time zones, letting you assign databases across geographic divisions of your enterprise-wide network. You can schedule meetings and resources, distribute agendas and memos, assign and track tasks, and send out reminders. You have access to daily, weekly, and monthly private and group calendar views, pop-up notes, and automatically updated to-do lists. The software supports PostScript printing and can run on palmtops.

Contact: CrossWind Technologies, Felton, CA.
(408) 335-4988.

Circle 1282 on Inquiry Card.

The Novell Interface Module (from \$49.95), PC Guardian's (San Rafael, CA) newest Data Security Plus module, allows a NetWare system administrator to manage from a remote location all access-control functions for a network and for workstations on the network. The module continually synchronizes your name and password on the network; thus, after gaining access to your workstation, you can log in to the network at any time without having to reenter your name and password.

Phone: (800) 288-8126 or (415) 459-0190.

Circle 1297 on Inquiry Card.

TWO-WAY CONNECTION

ReachOut Total Remote (\$249) from Ocean Isle Software (Vero Beach, FL) provides remote control and remote access across dissimilar networks. You can use the control and access capabilities at the same time or separately and dynamically switch between them. Features include the capability to prepare a document on a laptop, dial into the office network, and then fax the document using the office fax software. You can use the Total Remote file manager to transfer files between two PCs, synchronize files on both machines, or use the DOS copy command, the DOS shell, the Windows File Manager, or other file manager.

Phone: (407) 770-4777.

Up to Date Down to Earth

UNIX is changing the world of computers, the world of business—quite simply, changing the world. It's revolutionizing office automation. It's required for U.S. government computer contracts. It's the backbone of information strategies worldwide.

That's why you need *UNIXWORLD*—the magazine that keeps you up to date on the rapidly changing world of open systems computing. Each issue brings you the latest product trends and technical advances that can affect your business. The inside story on some of the biggest high tech companies. Easy to understand programming tips and tutorials that can help your company use UNIX to its fullest. And unbiased hardware and software reviews to help you invest wisely when you buy.

UNIXWORLD's in depth features go beyond dry technical facts to show how the pieces fit together—to tell you what's important about the advances and strategies that are changing your world. And *UNIXWORLD* consistently offers the freshest, most down-to-earth writing that you'll find in any computer publication.

Subscribe today and receive the next 12 issues of *UNIXWORLD* for just \$18.00—half the regular newsstand price. Save even more by ordering for two or three years. You can't lose—every subscription to *UNIXWORLD* comes with a no risk guarantee*.

What's New Software

A LINK FOR PEN-BASED SYSTEMS

Communications software for pen computers, **Mobile Access—Personal (\$195)** lets pen-based devices that use **AT&T Hobbit** or **Intel 80x86** processors access on-line information and send and receive documents over cellular, two-way radio, and land-based phone lines. Connectivity is via such transfer protocols as **Text/ASCII, XMODEM, YMODEM, and ZMODEM**, and **Kermit**. You can capture and reuse text to create commands and use the snippets list for instant access to terminal commands you use frequently.

Contact: *Notable Technologies, Foster City, CA, (510) 208-4400.*

Circle 1283 on Inquiry Card.

AD HOC WORK-FLOW MANAGEMENT

Developed as an application for Knowledge Integration Center's (Dublin, OH) cross-platform work-flow manager **KI Shell**, **Track-It (\$400)** can also be used as a stand-alone program. **Track-It** lets you plan, assign, and track daily ad hoc work on a project, giving you the capability to route forms and folders, access word processors and E-mail systems, and assign work to specified individuals or to a pool of individuals. You can also indicate the authorized level of effort expected of project members and specify reporting milestones.

Phone: (614) 792-9993.

Circle 1300 on Inquiry Card.

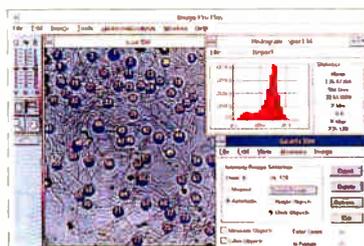

IMAGING FOR RESEARCH ▶

Image-processing software for scientific applications, **Image-Pro Plus** for Windows (\$1999) is built on the multiplatform developer's toolkit **HAIL** (Halo Ad-

vanced Imaging Library). The **Media Cybernetics** (Silver Spring, MD) software allows you to capture and process images; make manual and automatic measurements and classifications; define areas of interest; extract individual color channels, process them, and merge them back into the original image; analyze histograms and line profiles; and perform **JPEG** compression. The software supports **TWAIN** scanners, is **OLE 1-compliant**, provides network access, and has a record/playback capability to automate repetitive tasks.

Phone: (301) 495-3305.

Circle 1293 on Inquiry Card.

OPEN DATABASE CONNECTIVITY LINK

An ODBC-compliant database utility for Windows, **dbLink** (from \$199) from **AT Software** (Westlake Village, CA) lets you access and link data from any application that ODBC drivers have been developed for, such as **dBase**, **Oracle**, **Paradox**, **SQL Server**, **SQL for NetWare**, and **SQLBase**, to Windows applications that support **DDE**. Setup is automatic; **dbLink** operates independently of database format.

Phone: (805) 373-0051.

Circle 1302 on Inquiry Card.

E-MAIL LINK

Cyberdesk (\$395) from **Cyber-Corp** (Kennesaw, GA) lets you connect to and manage multiple E-mail and public information systems. Compatible with **CompuServe**, **MCI Mail**, **The Well**, and **cc:Mail**, **Cyberdesk's** special agents log on to each system and retrieve public and private messages and on-line files. The program lets you set up a scheduling routine for it to follow while you work on other projects, and it lets you converse with colleagues who use different E-mail systems. A single address book applies to all systems.

Phone: (404) 424-6240.

Circle 1303 on Inquiry Card.

MULTIDIMENSIONAL ANALYSIS

A spreadsheet that uses multidimensional analysis, **Corporate Vision**. The **Super Spreadsheet** (\$690) provides direct access to your database and lets you build graphs and spreadsheets that automatically view relationships among all fields in a database. From **IntelligenceWare** (Los Angeles, CA), **Corporate Vision** supports hypergraphs, customizable dialog boxes, and hypertext. Windows-compatible **Corporate Vision's** open architecture lets you access data from databases such as **dBase**, **Paradox**, **Oracle**, **Sybase**, and **SQL Server**.

Your software programs were barely speaking. Then something clicked.

If you're tired of playing matchmaker to software applications (even ones from the same vendor), you'll be pleased to hear this. There is a product that does it for you, now. Prodea Synergy™ makes

the programs you already have, and what you've built with them, work together. A few points and clicks, and applications will exchange just about everything but valentines.

Mr. R. Lee Allen of Schering-Plough, a company already using Prodea Synergy, put it less romantically although no less enthusiastically. "It's not like anything out

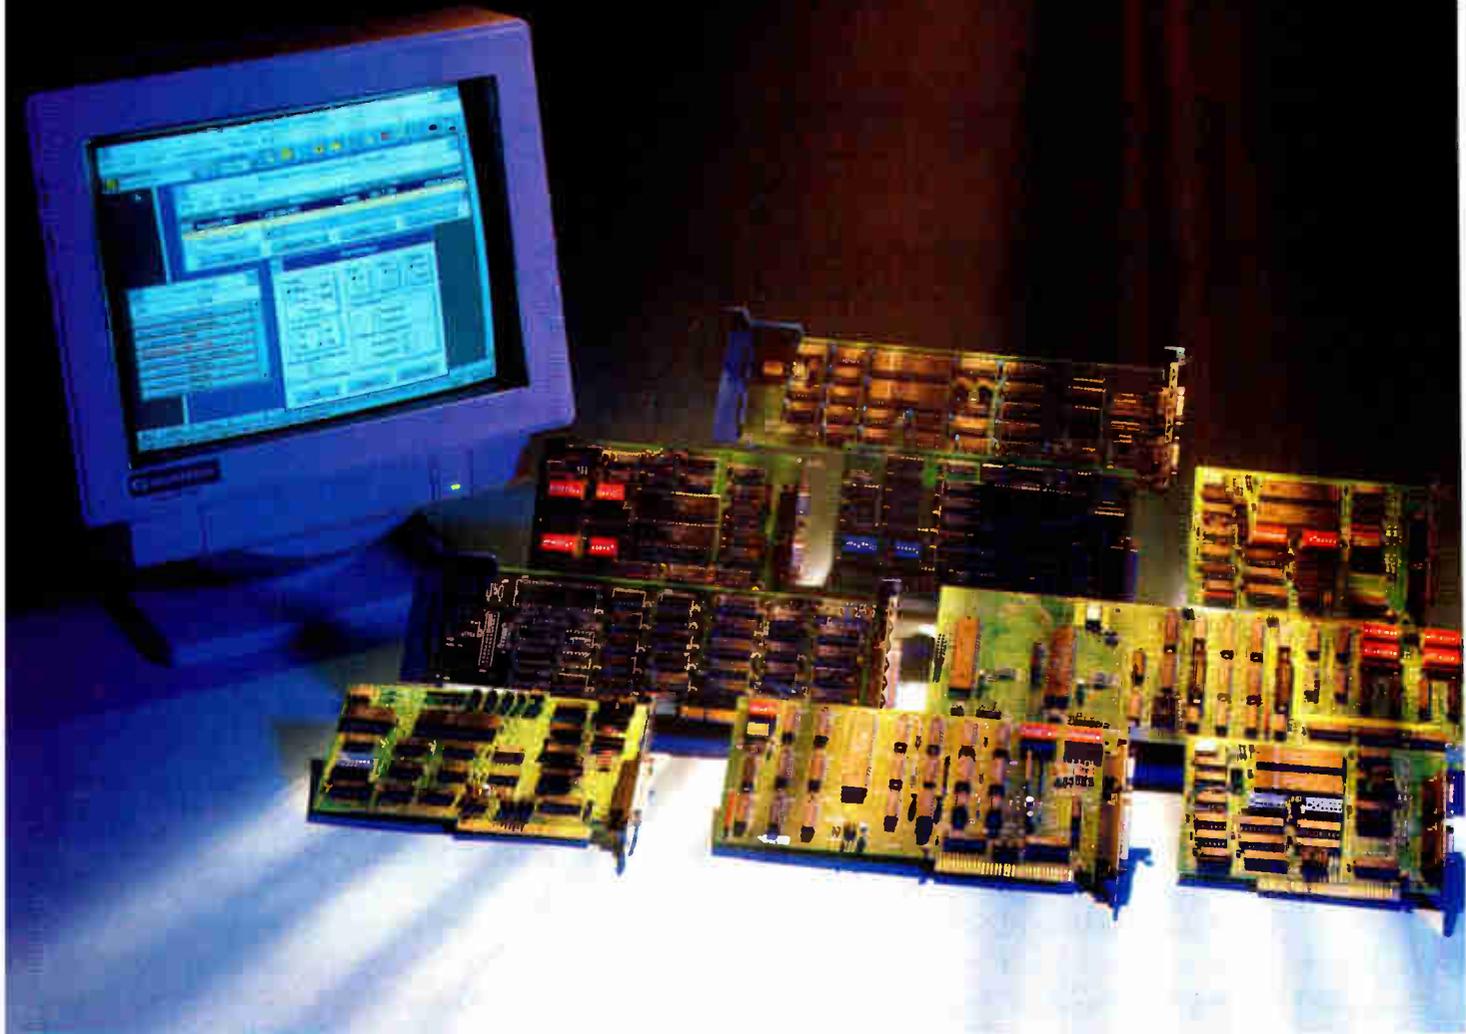

Drag and drop the icons, connect them with arrows. Data flows automatically.

there before. It's more than OLE or DDE. It transcends both languages and APIs."

You should also know that what you build is easy to pass on to others, without worrying about hot links, paste links or file location. Prodea Synergy runs under Windows™, costs \$495 and has a 30-day guarantee. For a limited time you also get a \$200 introductory cash rebate. Call us at 1-800-PRODEA-1. Your software programs will never look at one another the same way again.

PRODEA Synergy™

Quatech, your communication source for RS-232, 422 and 485 adapters.

Quatech manufactures a complete line of communication adapters for PC/XT/AT[®], Micro Channel[®] and compatible buses to meet asynchronous and synchronous, serial and parallel communication requirements with protocols such as RS-232, RS-422, RS-485, Current Loop and IEEE488.

Software support for SCO Unix[®], Windows[®], Xenix[®], OS/2[®] and DOS.

Data Acquisition and Industrial I/O products manufactured by Quatech are also available. Call for a free Data Acquisition and Communication Handbook today.

Communication adapters featuring: selectable/shareable interrupts, 16550 availability (baud rates up to 256K on standard asynchronous adapters) and address configurable as any COM port. Multiport adapters feature 2, 4, and 8 ports with independent serial interfaces. Most adapters provide AT interrupts (IRQ 2-7, 10-12, 14, 15).

Technical support for our products are available free of charge.

WIRELESS INFORMATION: Power for the Road Warrior!

Information is power, and EMBARCSM delivers it to the people who need it most—road warriors like you! EMBARC Information Services will keep you tuned to a variety of interests, and the world at large, to put you a step ahead in today's fast-moving, competitive marketplace.

Your EMBARC subscription includes general news and weather from *USA TODAY* at no additional charge. Optional services from *USA TODAY* include industry news selections such as Technology and Telecommunications, plus Personal Investing, Insurance, International News and even Sports—timely, useful information to boost productivity.

With HeadsUpTM industry news from INDIVIDUAL, Inc. you'll receive targeted wireless news briefs that impact your industry and professional specialty. Concise story briefs provide a quick read and eliminate information overload, and optional full-text retrieval provides details when needed. These and other information services are the perfect complement to EMBARC's fully featured, one-way wireless networking capabilities, including wireless E-mail, reports and file updates. The total service will keep you in the loop and productive in over 200 cities in the U.S. and Canada.

Call 1-800-EMBARC4, ext 725 to see what the power of wireless information can do for you.

DOS, MAC compatibility:
EMBARC service is available for DOS-based laptops and notebooks, HP 95LX and 100LX palmtops, and Macintosh PowerBooks.

Rout Ramses... Outwit Alexander... Knockout Napoleon...

History is littered with the bones of great men who thought their achievements would live forever. Now you can succeed where they failed as MicroProse brings you Sid Meier's **Civilization**. Guide a culture from its earliest stages, through agricultural and industrial revolutions, all the way to your own Space Age. Survive and dominate by outmaneuvering mankind's most legendary leaders. Carve your name indelibly in the pages of history. With Sid Meier's **Civilization**, you really can build a brave new world.

Printer Port Connections Are The New Tools Of The Trade.

Once you discover just how easy it is to install a backpack CD-ROM drive to your computer, you'll never be inconvenienced by conventional installation methods again. Just plug backpack into your computer and you're ready to go. No interface cards, hardware conflicts or expansion slots required. Because of its unique printer port interface, backpack fits all IBM PC compatibles and portables regardless of CPU speed. In addition, a built-in audio circuit with both headphone and line output jacks allows for connection of sound cards or Hi-Fi. You can run thousands of your favorite multimedia

programs and view Kodak™ Photo CDs too, with CD-ROM backpack. Compact and versatile, you can expect backpack to go wherever you go, bringing with you the wealth of information CD-ROM storage makes possible. Printer pass-through is included. Tape drive, hard drive and diskette backpack drives are also available. Call today for ordering information and a dealer nearest you.

NEVADA COMPUTER

Memory Shortage?
 As of 9/3/93 these are our prices. We are trying to maintain them for as long as possible. Due to a July 4 fire at an epoxy plant in Japan and an ever growing demand for memory, there is a worldwide shortage of memory. We are getting thousands of pieces per day and are offering all memory to our current customers at the lowest cost possible for the next several months. This is the prepaid price.

THE SIMPLE CONNECTION BEHIND COMPUTERS AND BACKPACK TAPE DRIVES.

It's fast. It's small. It's reliable. It's incredibly compatible.

Backpack is the best selling parallel port tape drive on the market. We'd like to tell you why.

With Backpack, tape backup is quick and simple. Just plug it into your printer port and it's ready to use. No hardware conflicts, no slots required. One model fits all IBM PCs, compatibles and portables, regardless of CPU speed.

Backpack can store up to 250MB on a tape using data compression, is completely QIC80 compatible, and reads QIC40 tapes. With its compact size

and 1Mbps transfer rate, Backpack is the smallest and fastest parallel port tape drive you can buy.

Micro Solutions is dedicated to the perfection of backup technology.

CD-ROM, hard drive, and diskette Backpack drives are also available. Call today for ordering information and a dealer nearest you.

Take Note: The World's Best SCSI Adapter Just Got Better

*and cheaper!
\$285**

Caching module adds blinding disk speed!

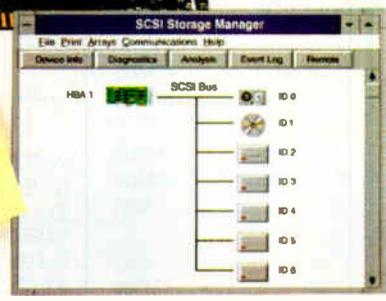

Array module supports RAID 0, 1 and 5

add standard or ECC SIMMs - up to 64 MB in a single slot

SCSI adapter - four ISA and EISA models

Storage Manager GUI for easy set-up, diagnostics, etc.

SmartCache III is the total, growable SCSI solution!

The world's best SCSI adapter is now the world's greatest bargain—priced lower than any major competitor. An unprecedented value, SmartCache III offers top performance and universal connectivity with all major SCSI-1, SCSI-2 and Fast SCSI devices, including hard drives, tape, CD-ROM and WORM.

It also comes with built-in support from all major operating systems, including DOS, Windows, OS/2, NetWare, Windows NT, NextStep and all versions of Unix.

And only SmartCache III gives you a growth path. Optional plug-on modules let you migrate easily to caching (with up to 64Mb cache), as well as full RAID capability. *Storage Manager*, our GUI utility, makes installation quick, easy and automatic. Plus, it gives you on-line and remote control over subsystem management, diagnostics, performance monitoring, and disk array configuration and control.

THE TEXAN

M&M PRO
Function of Five Boards in
One PC/AT Slot!

THE ALAMO

Optional SVGA

Optional JPEG Compression
& VGA to TV Output

We Have The Solution!

Ultra High Resolution Graphics Display Controllers from the World's first TMS34020 Manufacturer

Our PC/AT boards provide programmable display resolutions up to 1600 x 1280, and provide 72Hz or higher refresh rate for 1280 x 1024 and lower resolutions. 40 MHz TMS34020 Graphics Processor, VGA pass-through and RGB cable set are included. Software drivers are provided for TIGA, MS-Windows, and AutoCAD®. Drivers for the X Window System for Interactive and SCO UNIX are optional.

THE ALAMO **\$2,995**
24-BIT TRUE-COLOR at 1600 x 1200
6 MByte VRAM + 1 MByte DRAM

THE TEXAN 1600 **\$1,450**
256 Colors at 1600 x 1280, 60 Hz
2 MBytes VRAM + 1 MByte DRAM

THE TEXAN 1280 **\$1,250**
256 Colors at 1280 x 1024, 72 Hz
2 MBytes VRAM + 1 MByte DRAM

THE TEXAN 1024 **\$995**
256 Colors at 1024 x 768, 72 Hz
1 MByte VRAM + 1 MByte DRAM

Multimedia Graphics: Everything you need to get video into or out of the PC

M&M PRO **\$995 +**
24-bit TRUE-COLOR NTSC/PAL/
SECAM video window frame grabber.
Optional 12-bit per channel digital stereo
audio, hardware JPEG compression, on-
board 1024 x 768 SVGA, composite and
S-Video NTSC/PAL output with flicker filters.

M&M Basic (composite video) **\$500**
(composite & S-Video) **\$600**

NTSC/PAL frame grabber displays live video
window on VGA screen.

VIVA HC (NTSC or PAL) **\$700**
HI-COLOR ET4000 VGA with composite and
S-Video output with flicker filters. Configu-
rable for multi-channel display.

VIVA (NTSC) **\$550**
(PAL) **\$630**

Video, VGA and Audio mixer outputs VGA
to video as an overlay on an input video
signal.

VIVA Basic (NTSC or PAL) **\$300**
Internal or External VGA to Video converter
outputs VGA to composite and S-Video with
flicker filters. No TSR required for 640 x 480
modes.

MICROSOFT
WINDOWS

AUTODESK

Windows drivers provide 1600 x 1200, 24-bit TRUE COLOR on the ALAMO, 1600 x 1280, 256 color on THE TEXAN, and HI-COLOR on the VIVA HC.

Video for Windows compatible MCI/AVI Multimedia Windows drivers for the M&M PRO and M&M Basic.

DL-Xpress (included) and Soft Engine (optional) from Vibrant Graphics allow 24-bit TRUE-COLOR display on THE ALAMO and 256 color display on THE TEXAN for AutoCAD®, 3D Studio™, etc.

Monitors . . . IDEK 21" flat screen multiscan monitors 30-80 KHz . . . others available.

Recognized as the two best PC-diagnostic tools on the market.

NOW AVAILABLE IN ONE GREAT PACKAGE...

ALL NEW

VER. 5.0

Micro-Scope™

UNIVERSAL DIAGNOSTICS SOFTWARE

Fully operating system independent diagnostic software.

PCUPGRADE
UTILITY OF THE MONTH

Recently named as PC Upgrade Magazine's Utility of the Month.

FULLY OPERATING SYSTEM INDEPENDENT, BIOS INDEPENDENT, AND CMOS INDEPENDENT.

MICRO-SCOPE Universal Computer Diagnostics was developed to satisfy the expanding need for accurate system diagnosis in the rapidly growing desktop computer market.

- **CACHE MEMORY** – "Micro-Scope" Ver. 5.0 now fully tests cache memory and the cache controller subsystem.
- **LOW LEVEL FORMAT** – Ability to do factory style initialization of all IDE drives, together with the ability to do factory style low level formatting on all drives, including MF, RLL, ESDI, SCSI, and all IDE drives.
- **O/S, BIOS and CMOS INDEPENDENT** – Does not rely on O/S for diagnostics. Talks to PC on a hardware level regardless of the O/S, BIOS or CMOS setting.
- **TRUE HARDWARE DIAGNOSTICS** – Accurate testing of CPU, IRQs, DMA, memory, hard drive, floppy drive, video cards, etc.
- **DISPLAY DRIVE TYPE** – Reads and displays the actual drive parameters for any drive type automatically.
- **CPU DETERMINATION** – This capability is necessary for accurate system diagnosis on 386SX, 386DX, 486DX and 387 and 487 chip implementations. Because each of these specific chips has its own unique instruction set, and therefore cannot be accurately diagnosed with any program which cannot recognize these differences!
- **MEMORY TEST** – "Micro-Scope" 5.0 has no limitations as to the size of memory it can accurately test. Micro-Scope now also tests up to 2 meg of video memory!
- **MEMORY EXAMINE** – Displays any physical bit of memory. Very useful for determining memory conflicts. Very useful for determining available memory space.
- **BATCH CONTROL** – All tests, even destructive, may be selected for testing.
- **ERROR LOGGING** – Automatically inputs errors during testing to an error log.
- **AUTOMAPPING** – Automatically bad sector maps errors found on hard disks.
- **IRQ DISPLAY** – Show bits enabled in IRQ chip for finding cards that are software driven. (Network, etc.)
- **IRQ CHECK** – Talks directly to hardware and shows I/O address and IRQ of devices that respond.
- **SECTOR EDITOR** – Allows the editing of any sector of floppy or hard disk media (even track 0).
- **AND MUCH MORE...** We don't have enough space here for everything this software can do!

POST-PROBE™

THE EVER UNIVERSAL POST CARD FOR ALL PCs

The only Power-On Self-Test card you need to debug any "dead" PC!

SERVICE NEWS
PRODUCT OF THE MONTH

Named as Product of the Month in the July issue of Service News.

"This is the only card that will function in every system on the market. The documentation is extensive, and not only covers the expected POST Codes for different BIOS versions, but also includes a detailed reference to the bus signals monitored by the card."

— Scott Mueller from his globally recognized book, 'Upgrading & Repairing PCs, Second Edition'

- Includes pads for voltmeter to attach for actual voltage testing under load.
- 4 LEDs monitor +5vdc -5vdc +12vdc -12vdc.
- Monitors Hi & Lo clock and OSC cycles to distinguish between clock chip or crystal failure.
- Monitors I/O Write and I/O Read to distinguish between write and read errors.
- Monitors memory write/read to distinguish between address line failures and memory chip failures.
- Monitors ALE for proper CPU/DMA operation.
- Monitors Reset to determine if reset is occurring during POST, indicating short.
- Monitors progress of POST without POST codes.
- Reads POST codes from any IBM or compatible that emits POST codes. ISA/EISA/MCA.
- Compatible with Micro Channel computers.

- Dip switch allows easy selection of I/O ports to read.
- Includes tri-state LOGIC PROBE to determine actual chip failures.
- Manual includes chip layouts and detailed POST procedures for all major BIOS's.

This is the perfect package for all repair technicians and self-maintainers.

LEAVE IT TO US TO RACK THINGS UP

RECORTEC's Rack Mount PC compatible computers, monitors, keyboards and printer continue the tradition of manufacturing excellence RECORTEC started in 1969. With our broad product line, fast delivery, excellent pre and post sale service, it's no wonder more and more people "leave it to us to rack things up".

QUALITY

All products 100% tested and verified prior to shipment.

RELIABILITY

Field proven components backed by a comprehensive warranty.

SERVICE

Large stock for fast delivery plus assistance by knowledgeable sales and support personnel.

SOLUTIONS

Choose from many models which offer a wide range of solutions for a variety of rack mount needs. We also offer custom designs when a standard product just won't do.

CALL OR FAX FOR MORE INFORMATION.

Arnet's SurgeBlock™ Protection Keeps Our I/O Boards From Frying Like the Rest

Tests Prove Our Boards Withstand Surges That Make Other Boards Fail

Direct buyers want the best products. The best performance for the price, and — above all — *reliability*.

That's why Arnet uses a unique feature called SurgeBlock to protect every port on its I/O boards from power surges. They're the leading cause of I/O board failures because they're caused by countless sources — from lightning storms to simply walking across the floor.

SurgeBlock gives our I/O boards unbeatable reliability. It was the first onboard surge protection, and independent tests prove it's still the best. Call us and we'll send you the results that prove it.

The Best I/O Boards to Buy Direct

Not only are our boards the most reliable — with a field failure rate of less than 1% — they're also the best direct buy around. Here's why:

Unmatched Price/Performance

Our I/O solutions support from two to 512 users and operate at speeds from 2400 to 115K baud — with prices starting at less than \$70 per port!

Compatibility

Our I/O boards are compatible with more than 30 operating systems, including UNIX, Windows, DOS, Multiuser DOS and NetWare.™

30-Day Money-Back Guarantee Plus a Lifetime Warranty

We back our reliability with a 30-day, hassle-free money-back guarantee plus a Lifetime Warranty.

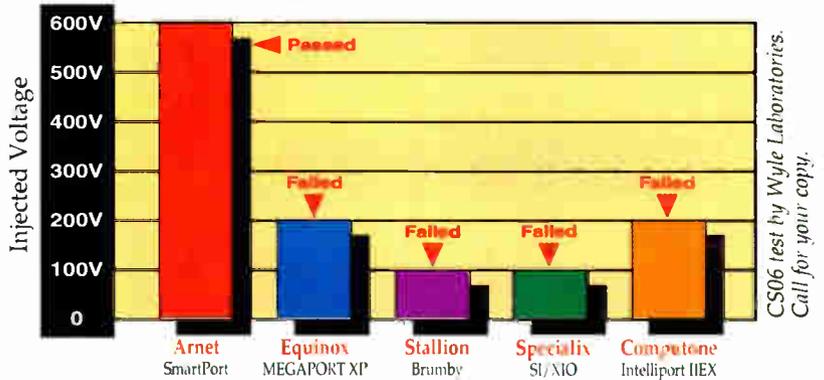

24-Hour Hot Swaps

If your board does fail, you can have a replacement at your site within 24 hours.

Attractive Terms

Qualified customers can buy with our convenient Arnet Gold credit card or other major credit cards. And we offer next day delivery!

Reseller Discounts Available

Cost-Effective, Expandable Intelligent Serial I/O

SmartPort and SmartPort Plus

Create PC systems that can grow as you do with SmartPort and SmartPort Plus. SmartPort is best suited for systems supporting up to 8 users per slot. SmartPort Plus is most cost-effective for systems requiring 16 to 32 users per slot. A powerful onboard processor offloads serial I/O from the host PC to dramatically improve data throughput.

- Supports I/O speeds up to 38.4K baud per port
- Up to 64 Kb of dual ported RAM
- Full signal support for modems and other devices
- RS-422 support on SmartPort Plus for longer distances
- SimulPort terminal paging software
- SimulPrint transparent printing utility

From **\$446**

Intelligent I/O Communications Subsystem for PCs

COMStax

Add a COMStax host card to your PC to support up to 128 users per slot. An onboard high performance 20 MHz RISC processor enables transmission rates up to 115.2K baud per port.

- Desktop stackable modules for asynchronous, synchronous and high-speed parallel printing
- Up to 8 stackable communication modules per host card
- RS-423 support for longer distances

Host Adapter From **\$596**
Modules From **\$371**

Workgroup Concentrator for Local and Remote Users

ClusterPort

Build large systems that can support remote users with ClusterPort. A host adapter card with two high-speed synchronous links connects to multiple 16-port Cluster Boxes or to modems for remote locations. Remote users can be connected without using costly multiplexers.

- Supports 128 ports per slot, 512 ports per system
- Supports local users thousands of feet from the host without modems (miles with optional Fiber Link Kit)
- 1.2 Mbps RS-422 synchronous link between host adapter and local Cluster Boxes; Up to 64Kbps synchronous for remotely-attached Cluster Boxes.

Host Adapter From **\$1721**
Cluster Boxes From **\$1121**

IBM and PS/2 are registered trademarks of the International Business Machines Corporation

Our products work where ordinary switching devices fail. This is because they are INTELLIGENT and conform to all IBM published keyboard and mouse protocol standards. We not only support the PS/2 model 90/95 but go even further than IBM does by allowing you to hot-plug the keyboard and bus mouse — even under OS/2!!! Boot any machine anytime with no 30x errors — even if no keyboard is attached. Individual system "Lock" lamps, typematic rates, etc. are also kept accurate across port switches.

THE COMPLETE HOME/BUSINESS SYSTEM

Voice/Fax/Data V32bis

1st YOU

This is a true 14.4 Kbps high speed fax/data modem with built-in VOICE capability. The software included allows you to receive fax and voice mail into user configured mail boxes. Personalize your own greetings. Use it as a regular high speed 14.4 kbps fax/modem or combine VOICE to make your own custom voice/fax mail system. YOU CHOOSE!

VOICE MAIL
FAX MAIL
DATA MAIL
PAGER SUPPORT
MAIL FORWARDING
FAX BROADCASTING

399

- Works with virtually all fax/modem class II software has upto 57600 Kbps data throught with compression.
- Supports message forwarding and beeper paging.
- Print your faxes to EPSON compatible or Laser Jet II compatible printers.
- Supports Auto-fallback to slower speeds on data and fax.
- Voice mail software provides remote access of messages.
- Comprehensive display of logs, voice and fax messages together with custom greeting messages and forwarding.
- Internal Plug-in board supports V32bis/V42bis for unsurpassed speed. . .
- Powerful script language lets you customize the voice/fax/data structure to suit your needs.
- Use as answering machine or complex voice/fax/data mail.

UPGRADABLE TO VFAST WHEN AVAILABLE

FAX SWITCHES DON'T WORK!

Distinctive Ring Detector DOES!

Automatically switches call to destination. Uses Bell's Distinctive Ring feature. Get exclusive number listing for each new party from your phone company (approx. \$4/mo.). Share up to 3 parties.

SHARE A LINE WITHOUT CONFUSION

The Selective Ring Detector uses the distinctive ring feature from your phone company. It is sometimes called "smart ring" or "custom ring". The detector can discriminate upto 3 different ring types. For a small charge per month (\$4 approx./line) you may obtain a new phone number from your phone company. The detector will separate the calls based on the unique ring type. The device prevents barge-in when a party is engaged in conversation. It also saves you expensive connection charges. It pays for itself in about a month. It is ideal for home office, fax separator or kids' calls. It is PBX compatible and easy to set up. Simply plug it in!

SAVE DOLLARS

And still sound professional!

The caller can't tell whether you have 3 lines or one!

3 PARTY \$89.00

CALLER I.D.

Identify the caller on the first ring. YOU decide to answer. Display pops caller's number. Can also connect to computer. Add caller to Database. TSR program pops caller's number, information and notes added. Maintains caller log.

Unit with LCD display \$89

ORION TELECOM 1-800-669-8088 1-214-335-4358

Turn Your PC into a Complete Video Production Studio

D/Vision®

VERSION 2.1

The Digital Advantages:

Speed, Simplicity, Low Cost

D/Vision uses Intel's i750 ActionMedia board to digitize material from a VCR onto your PC. Then you can "cut and paste" video like words in a word processor. And because D/Vision is truly "non-linear", you instantly see your edited program. No waiting for tapes to cue or a digital video file to be built. D/Vision has a simple user interface. Gone are complicated suites and expensive equipment. Everything is done on your PC.

SuperRTV™:

Digital Video with True Videotape Quality

Unlike other digital video software, D/Vision gives you true videotape picture quality. SuperRTV, an enhancement of Intel's RTV (Real Time Video), lets you "print" high quality, full-screen video directly to videotape.

One Tool, Many Uses

D/Vision also outputs "Video for Windows" and Quicktime digital video files. Or a clean SMPTE time-coded Edit Decision List. So whether you're producing broadcast television, desktop video or multimedia, you only need one easy-to-learn editing tool.

D/Vision is IBM compatible, thoroughly tested and backed by two support hotlines. Call today for the authorized dealer nearest you or a free Demo Disk.

Produce edited videotapes and multimedia digital video on your PC.

Now there's an easy way to produce

edited videotapes and multimedia

video: Use your personal computer and a software package called D/Vision.

Introducing D/Vision Version 2.1 using

Polaroid

Polaroid's Circular Polarizing Filters for computer monitors combine circular polarizer technology with optical quality materials and coatings to provide the ultimate in glare reduction and contrast enhancement technology. Polaroid CP-Filters suppress up to 99% of reflected light and are more effective than any other filter for improving contrast. Also, most CP Filter models have a transparent electrically conductive coating which reduces up to 98% of the electromagnetic radiation and eliminates static.

Polaroid produces a full range of optical quality anti-glare filters in glass and triacetate to fit most 9"-21" monitors.

Rhetorex Voice Processing boards make CTI a reality.

If you're asking "what's CTI," you're missing one of the hottest new technologies going.

Computer Telephony Integration links PC-based computer applications to the telephone network, providing voice/fax mail, interactive voice response, voice/fax servers and more.

Interested? Maybe you're already developing a CTI application. Then it's time to discover Rhetorex.™

For the best value in CTI technology—from our 2 and 4 port DSP-based voice and fax processing boards, to our 24-port platform—give Rhetorex a call. And start making CTI a reality today.

PARALLEL-TO-SCSI CONNECTIONS!

"This product... is darned near perfect." —Jerry Pournelle, *Byte Magazine* 3/93

"This year, the company outdid itself... The MiniSCSI Plus is even more elegant than its predecessor and almost twice as fast." —Jim Seymour, *PC Magazine* 12/92

Add up to 7 SCSI devices to your parallel port and still use your printer!

Up to twice as fast as our original MiniSCSI™ parallel-to-SCSI adapter, the MiniSCSI Plus adapter lets you run a CD-ROM, tape backup, SyQuest®, Bernoulli® or other SCSI device from almost any parallel port. For most notebook users, it's the only way to use SCSI devices. An integrated cable makes it a snap to share SCSI devices with desktops.

- KEY FEATURES:** 100% Printer Passthrough ▲ Weighs Just 7.2 Ounces
 ▲ Fully Compatible With Bidirectional and Unidirectional Parallel Ports
 ▲ Powered By SCSI Bus ▲ Only \$219

INTRODUCING AMREL'S

486 COLOR WORKSTATION

- Active-Matrix Color LCD
- Built-in PS/2 Trackball
- Power Management
- Password Security
- Removable HDD
- Docking Station

Total Expandability

Optional PCMCIA 2.0 Slots, Internal 14.4K Data/Fax Modem, and Docking Station delivers unlimited expandability to the SLT486DX notebook. The PCMCIA option adds two industry-standard Type II slots and lets you plug-in expansion cards—Data/Fax Modem, Flash memory, LAN adapter, or even wireless communication. The Docking Stations features four 16-bit ISA expansion slots, two 5.25" drive bays, built-in Ethernet adapter, and an electronic security system to protect both your notebook and your data.

Total Upgradability

Unique tri-speed motherboard design supports CPUs from 486DX/33 to 486DX2/66 and beyond so you will never outgrow your SLT notebook. RAM is upgradable from 4MB to 52MB to satisfy the most memory-demanding applications and a removable hard drive allows for easy storage expansion.

Laptops & Notebooks • Modems/Multiplexers

Notebook computers are great — except when it comes to playing simulation and action games. That's because they don't come equipped with a game port. ▶ Introducing the Parallel Game Port™ from Genovation. The PGP turns your notebook into a gamebook by converting the computer's printer port into a "virtual game port". With PGP, you also get a gender changer adapter, which lets you connect a joystick, yoke, pedals or even a weapon systems controller to your notebook or desktop DOS PC. ▶ The PGP is an indispensable accessory for today's serious gamer. Whether you race a car, fly combat, maneuver a tank, or wing along at 100 knots, the PGP's software features will enhance your play action. Look for the Parallel Game Port in the software section of your nearest computer dealer. Or call us at (800) 822-4333.

STICK IT TO YOUR NOTEBOOK.

Primax Made it a Snap!

Primax Electronics created and originally manufactured the modular printer sharing concept, and others put their name on it. Now you can get the original ModularLINK™ and its reliable technology directly from the Original Equipment Manufacturer! For truly hassle-free printer networking, look to ModularLINK™—the original Simple Printer Network™!

- ▼ Over 500,000 nodes installed worldwide
- ▼ Connects 16 computers with a single printer
- ▼ Starter Kit for 2 computers and 1 printer only \$129.95
- ▼ Fully compatible with existing SNAP™ networks
- ▼ Power-free for most applications

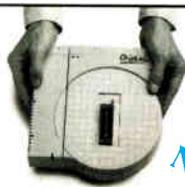

Pictured above is ModularLINK™ and a fully-compatible unit. Existing SNAP™ networks can be expanded using the ModularLINK™.

ModularLINK and Simple Printer Network are trademarks of Primax Electronics USA, Inc. SNAP is a trademark of ASP Computer Products, Inc.

**Only One Peer-to-Peer LAN
Gives You Four Connectivity Options
At One Low Price -- \$99 Per Node!**

Modem Networking

Ethernet Networking

Parallel Networking

Serial Networking

Only one peer-to-peer local area network offers you a solution that reflects the reality of business automation: a mix of different cabling and connectivity options on one LAN.

LANLink Professional gives you your choice of remote modem, or local ethernet, parallel and/or serial connections in any combination on the same network. And you can connect PCs running DOS, Windows or PC-MOS® operating systems seamlessly. All this flexibility in one product from one company at one price: **\$99 per node**. Plus you get rich networking features like print spooling, NetBIOS compatibility and more. Call The Software Link today.

**Throw away your \$ 3,000
PC Board Design Package
and buy another one for \$ 1,200**

EAGLE 2.6™
Schematic Capture, Layout Editor, 100% Autorouter, DRC, ERC: All In One Program

Does this really make sense? Yes it does!
The first thing you should be aware of is, software prices are only a matter of company policy - they are not necessarily related to the quality of a product!
So, why throw away an expensive product that does the job? Because it costs more money again and again than a reasonably priced program. Just think of the fees for Upgrades and Hotline support. For the comparable OrCAD® package, for example, you end up with annual fees that are half the price of a new complete EAGLE package, including drivers and libraries.

Maybe you have a ready heard. "It's German import!" That's true, it is German designed, like Mercedes and BMW. However, the company is American, and so are the people who serve you.

Our Hotline support is free, and excellent. Plus the program is fantastic (see EDN review).

So stop bleeding. Buy EAGLE with 30 day money back guarantee.

When I first installed and ran the EAGLE demo on my 386SX home computer, my first reaction was, "this is fantastic!"

The things that impressed me most about EAGLE were its simplicity, ease of use, and flexible design. Windows colors, scroll rates and the like can all be user configured to suit individual preferences. CadSoft provided excellent service both in sales and support, and there is every reason to believe that they will continue to do so.

EDN Hands-On section, EDN magazine, June 1993.

Thumbs up! Overall, I was impressed. EAGLE 2.6 is easy to learn and easy to use. EAGLE 2.6 has the capabilities and performance that most designers would expect of a higher priced package.

Off the Shelf Review, PRINTED CIRCUIT DESIGN magazine, March, 1993.

SOFTWARE/ENGINEERING

Circuit Simulation

Electrical Engineers!

Now you can run Analog/Mixed Signal Simulations on your PC or Mac with the Affordable and Powerful

ICAP/4 Simulation System

includes:

- New ISPACE3; SPICE 3F.2 Simulator
- Integrated Schematic Entry
- Model Libraries, more than 3000 Parts
- Waveform Graphics and Analysis

Full SPICE programs starting at \$95. Complete systems with schematic, ISPACE3 simulation, models and waveform graphics only \$1725.

Call or Fax for your Free Demo and information kit.

BIX: Your Coach to the Internet!

The Internet connects you with more than 10 million people, at universities, companies, and other online services. Now, get full access to the Internet free of charge when you subscribe to BIX! You'll also get expert assistance from BIX moderators who can help you find your way around the Internet.

These experts can guide you through the many services and features available, and help you find the information you're looking for. Anytime you need help, just join our special "internet" conference and get fast answers to your questions.

As you become more familiar with the Internet, you'll be able to download files from all over the world using FTP, connect to other sites and services through telnet, read and reply to Usenet Newsgroups, access utilities like finger and whois, and much more! BIX and the Internet together provide the largest and most effective technical resource for computing professionals.

And with over 600 local access numbers in the U.S., plus telnet access via the Internet, BIX makes it easy to connect. Try BIX today through our special 5 for Free offer - and become part of the top technical team!

New Member
5 hours for Free
Introductory Offer

Give BIX a try with our new 5 for Free Offer! Join BIX today and get 5 hours of evening and weekend access for free!

Take the rest of the calendar month to explore BIX, and then continue for our standard \$13 monthly membership fee.

Further details and complete rate information are provided during registration. Using any communications program, dial 1-800-695-4882. At the "logon" prompt enter bix.

Then at the "name?" prompt enter bix.byte39. If you have any questions, call us at 1-800-695-4775 (voice). Or fax us at 617-491-6642.

Send Internet mail to info@bix.com. Windows users can order BIXnav, our graphical interface for BIX, for easy point and click access. Details are available during registration.

Electronic Books

Quick, someone please tell all those CD-ROM publishers that most books are better left on paper

The custodians of any new medium are subject to panic attacks. *Here it is. Now what do we (shudder!) do with it?* The typical answer is, recycle the offerings of a previous medium.

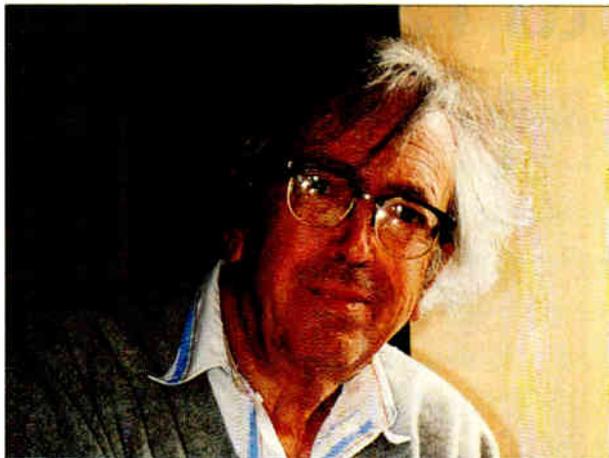

So the early-1930's talkies offered remakes of *Tom Sawyer* and *A Midsummer Night's Dream*, the latter hyped as the longest talkie ever made. The most popular available comedian, Joe E. Brown, was featured as Bottom the weaver; and do I misremember, or wasn't the young Mickey Rooney also featured? Anyway, you see the idea: The medium had to be made respectable, by having its best talents hype the content of a medium that was earlier, hence prestigious. Decades later, TV would likewise be legitimizing itself, by showing movies, which with its aid became "cinema."

And in the 1990s here's, ugh, the CD-ROM medium, and what the flacks are doing with that is promoting it as a neat repackager of books. Books! Books!! Jane Austen: The Complete Illustrated Novels on CD-ROM. How can I contain my excitement?

Easily. First of all, if I'm planning to browse the 60,000-odd words of her *Emma*, which will take a few hours, it's a lot more comfortable to sit this way and that way, holding a small book in one hand, than to prop myself erect while the clock ticks, in front of an immobile screen. Next, I've really no immediate use for the software that can tell me *Emma* uses the word *the* 1479 times, *marriage* 33 times, *drawing-room* 15 times, *Christian* a mere twice.

Granted, that diminuendo is amusing; granted also, word-frequency studies came in the 1930s and quickly went because hand-counting was simply unthinkable. But now that we control the data, isn't there reason for a revival? Miles Hanley and some students at the University of Minnesota used mere cards late in the 1930s to gather statistics on James Joyce's *Ulysses* that greatly aided Harvard's George Kingsley Zipf with Zipf's Law....

Sorry, am I getting ahead of you? Zipf's Law, one of the intellectual curiosities of this century: From the principle that you'd tend to place nearby the tools you'd use most often, Zipf derived a linear connection between frequency-of-use and usefulness. The commonest word in *Ulysses* (*the*) occurs 15,000 times; there are 15,000 words that occur once. You glimpse the principle; the third commonest word occurs about as often as the words that occur three times. The subject was never followed up, for two reasons: (1) Before computers, data such as what

MARY ANNE KENNER © 1993

the Hanley team had turned up simply wasn't accessible; (2) Zipf absolved all skeptics from any need to respond by dying just after his big book was published. (Five decades later, you can still hear the collective sigh of relief.)

So there's work still to be done on Zipf's Law, but that's not what the Great Literature CD-ROM has in mind. It offers "The Full Text of Over 500 Literary Classics," including an abominable translation, some 150 years old, of Dante's *Commedia*, the rights to which, of course, cost the publishers absolutely nothing, which is the main reason such dreary junk shows up in collections. There's also "full search and browse ability," but, Lord, how'd you begin to guess what to search for? Or use what you've found.

Let's face it, the one CD-ROM I've met that has a need for its search utilities is The Oxford English Dictionary, Second Edition, the whole 20 volumes. Dictionaries, by definition, are for searching. Alas, the printed versions will search on only one alphabet (word). But how often does OED-2 cite T. S. Eliot? The CD-ROM is quick to tell us: exactly 555 times. It will also display the citations, though more creakily than you'd like. And how many quotations, pray tell, from *Finnegans Wake*? Glad you asked: 185. Something meant to be consulted in-and-out is perfect for CD-ROM access: a dozen search indexes supplant the sole one permitted by print.

If you want to resume work on Zipf's Law, then welcome all those CD-ROM texts (which include *Jurassic Park*). Otherwise, just settle for the OED-2, which I find I use every day. The computerization is primitive—you can't, for instance, easily print your findings—but Oxford did understand what computers do best with books, which is not display them for reading. ■

Hugh Kenner is Franklin and Callaway Professor of English at the University of Georgia. He writes for publications ranging from the New York Times to Art & Antiques. You can contact him on BIX as "hkenner."
