1. GENERAL DESCRIPTION

1.1 Purpose of Unit

The 356M-1 Monitor Amplifier (figure 1) is a 10-watt, high-fidelity audio amplifier. The 356M-1 is normally used in an audio console to drive program monitor speakers.

1.2 Unit Description

The 356M-1 consists of an input transformer, a 13-transistor amplifier with a level control, and associated components on a plug-in, etched circuit card. A remotely controlled photoconductive device controls the output level. An external capacitor is required for proper operation. The capacitor is not supplied with the 356M-1, but is normally installed in the console.

Caution

Be sure the external capacitor is connected as shown in figure 4 before energizing the equipment. Otherwise, the amplifier and speaker may be damaged.

2. UNIT CHARACTERISTICS

2.1 Physical Characteristics

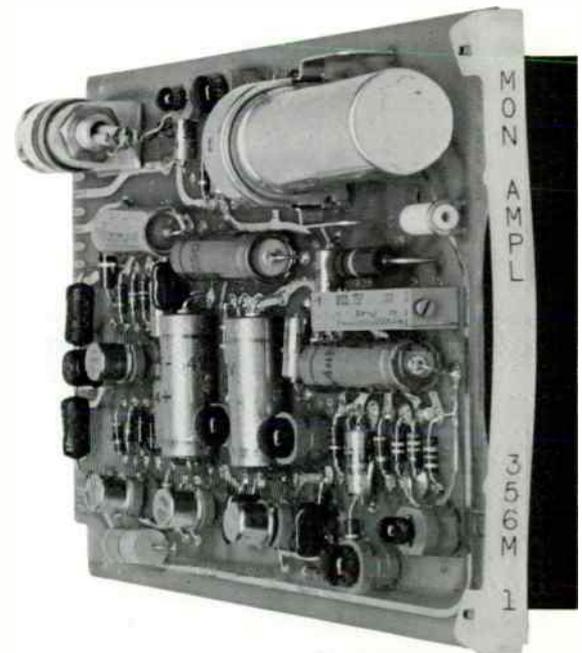

Size:

4 by 6 by 3-3/8 inches

Weight:
15 ounces

Type of Construction:
Etched circuit card

Type of Mounting:
22-contact card receptacle
(CPN 372-7009-000)

B502-014-Pb

Figure 1. 356M-1 Monitor Amplifier

2.2 Operating Characteristics

Ambient Service Conditions:

Temperature
0° to 50°C (32° to 122°F)

Relative Humidity
Up to 95%

Altitude
Up to 10,000 feet above msl

Type of Service:
Continuous

2.3 Electrical Characteristics

Power Requirements:
47 volts dc at 750 ma, 5 mv pp maximum ripple
6 volts dc at 60 ma, regulated

Input Impedance:
600 ohms, balanced

Input Level:
-50 dbm nominal

Output Impedance (Unbalanced):
8 ohms nominal

Output Level:
10 watts (rms) into 8 ohms

Gain:
90 db

Frequency Response:
30 to 15,000 Hz ± 1 db (referred to 1000 Hz)

Distortion:
1%, maximum

3. CIRCUIT DESCRIPTION

The 356M-1 (figure 4) consists of an input transformer, six amplifier stages, five emitter followers, a photoconductive level control, and associated components. Transformer T1 and capacitor C1 couple the input signal to the base of transistor Q1, which is direct coupled to the base of emitter follower Q2. The network consisting of

R4, R5, and C2 provides negative feedback. Remotely controlled photoconductive level control RV1 shunts the signal path. Potentiometer R38, in series with the lamp in the photoconductive level control, is a fine gain adjustment. The cascaded stages consisting of transistors Q4 through Q8 amplify the signal. Class A amplifier Q9 drives the phase inverter, transistors Q10 and Q11. The phase inverter drives the class AB output stage, which consists of transistors Q13 and Q14. Silicon diodes CR1, CR2, and CR3 provide the bias for transistors Q10 and Q11. The external capacitor, charged by conduction through Q14, supplies the operating voltage for transistor Q13. The output impedance of the amplifier is 8 ohms.

The photoconductive level control consists of a photocell and a 6-volt lamp sealed in a can. The resistance of the photocell, shunting the signal path, decreases as the voltage applied to the lamp is increased.

4. MAINTENANCE

4.1 Troubleshooting

When trouble is suspected in the 356M-1, replace the card with a spare, if available. If the replacement card remedies the problem, visually inspect the defective card for loose connections and signs of component damage. If no faults are found, extend the card on the card extender and check for the dc voltages and ac signal levels indicated on the schematic diagram.

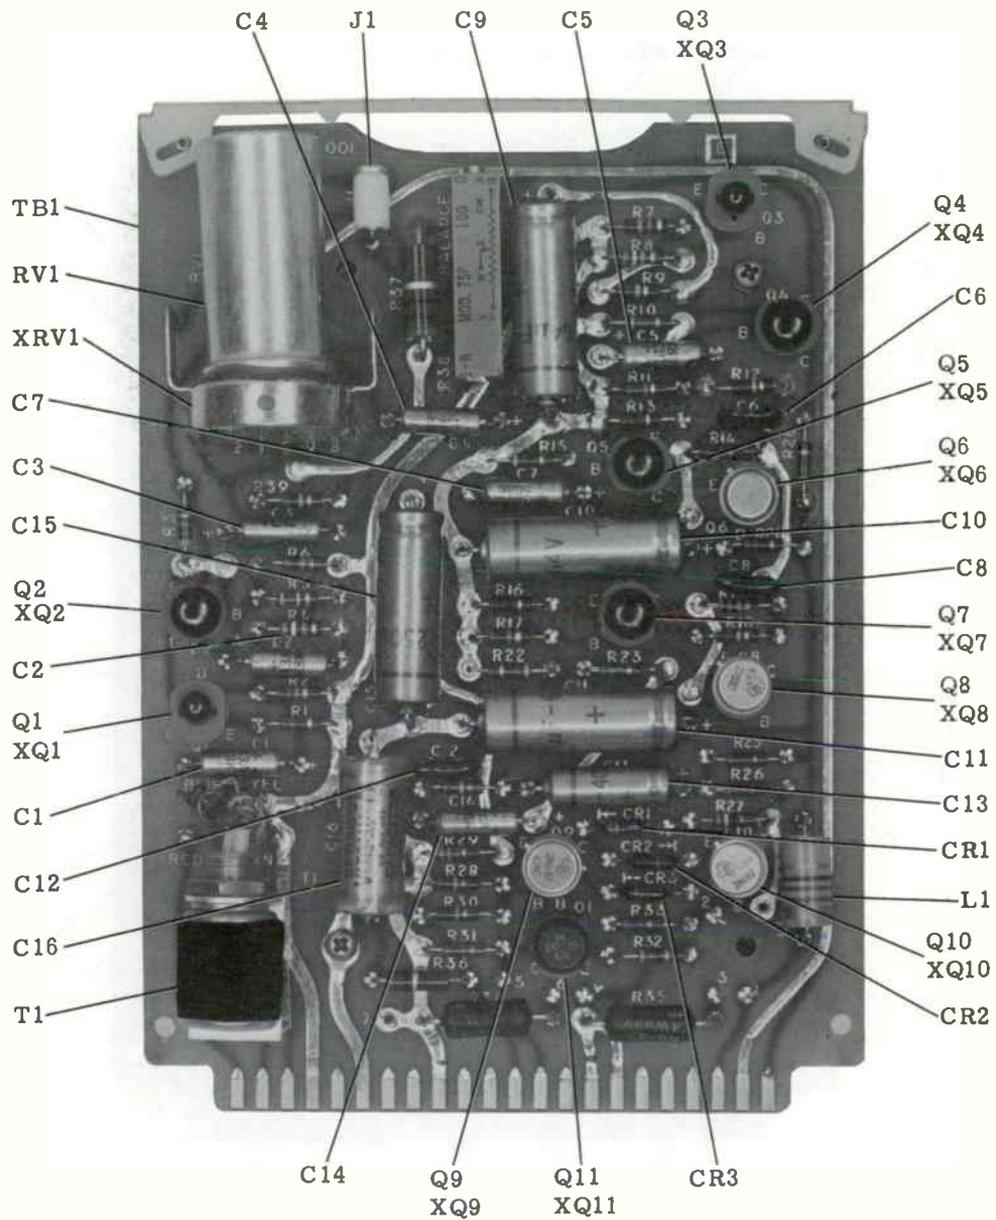

Caution

When making repairs, do not use a soldering iron rated at more than 40 watts. Do not jar the card to remove excess solder. Jarring the card may damage the lamp filaments in the photoconductive devices.

4.2 Spare Parts

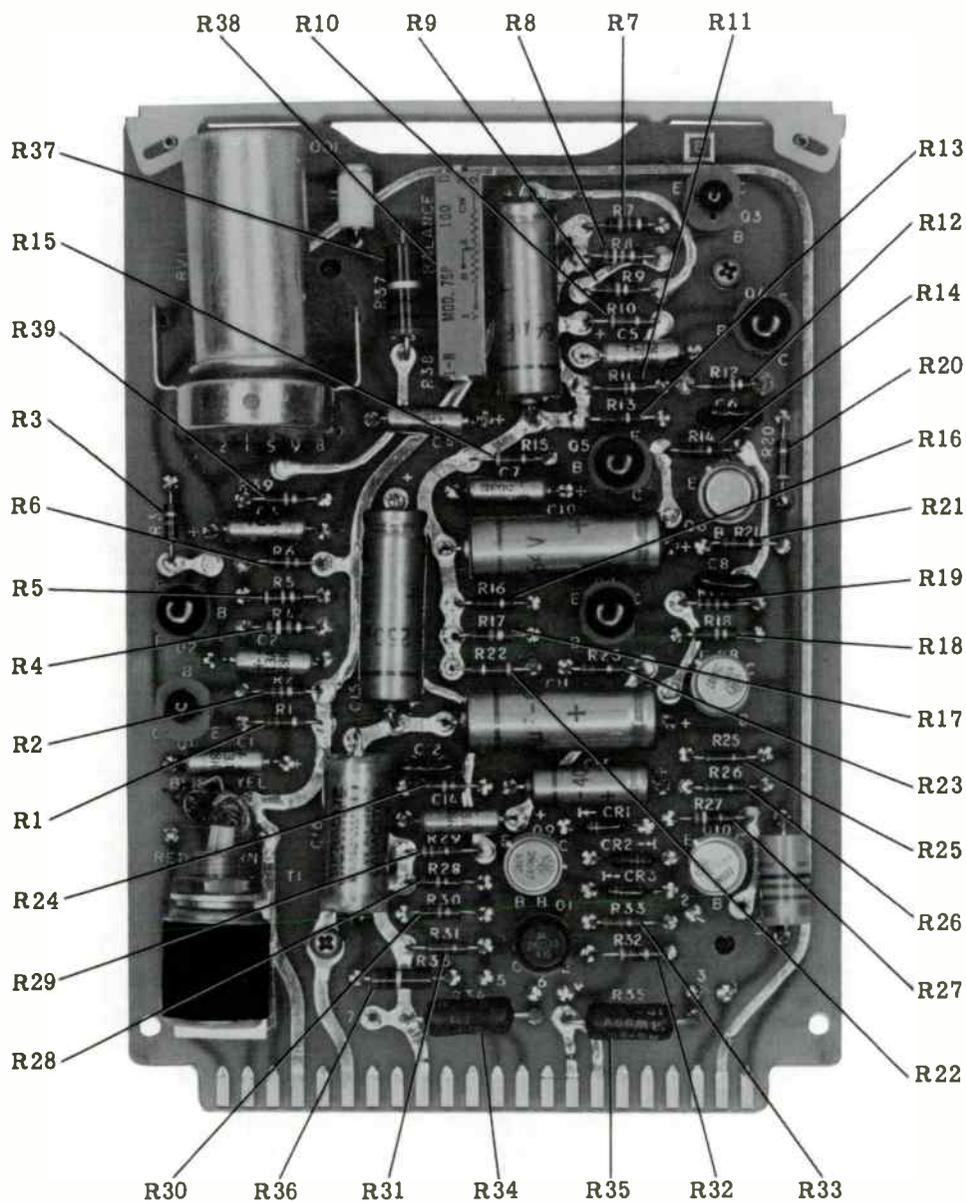

Spare parts may be ordered from the following address:
