# REACTANCE AND RESISTANCE

## IN PARALLEL

When a resistance is in parallel with a reactance (either inductive or capacitive), the resultant impedance of the combination is found from the expression

$$Z = \frac{XR}{\sqrt{R^2 + X^2}}$$

Sometimes Z and R are given and X has to be found or Z and X are given and R is the unknown. In that case the equation can be solved for X and R and we have

$$X = \frac{ZR}{\sqrt{R^2 - Z^2}} \quad R = \frac{ZX}{\sqrt{X^2 - Z^2}}$$

In all three of the above equations X can be either inductive reactance (X=6.28 fL) or it can be capacitive in which case X=1/(6.28 f C) where f is in cycles, L in henries and C in farads.

The table, Figure 3, has been prepared to permit the finding of any one of the three quantities X, R or Z when the other two are given. When X and R are given, divide the larger of the two quantities into the smaller one and thus get a ratio less than 1. Find this ratio in the left column and multiply the number obtained in the second column by R or X whichever is the larger and find Z.

Suppose R equals 1000 ohms and X is 200 ohms, which makes X/R = .20. The table shows us that Z/R is then 0.1961. Multiplying:

by R, we have Z = 0.1961 x 1000 = 196.1 ohms.

## IN SERIES

The impedance, Z, of a combination resistance, R, and a reactance, X, in series is given by the equation

$$Z = \sqrt{R^2 + X^2}$$

When Z is given and either X or R is the unknown, this equation can be re-written:

$$R = \sqrt{Z^2 - X^2}$$

$$X = \sqrt{Z^2 - R^2}$$

In all these equations all three quantities are expressed in ohms and X can be either capacitive reactance (1/6.28 fC) or inductive reactance (6.28 fL).

The table, Figure 4, gives the value of all three quantities for the case that either X or Z is equal to 1. In other cases, find the ratio R/X or X/R refer to the table and find the corresponding ratio Z/X or Z/R. The table can also be used when Z is given together with one of the other quantities. It was for this reason that the table had to be extended for values of R/X or X/R from .1 to 10 since otherwise it would have been sufficient to include values from 1 upwards or downwards but not both. Example: suppose X = 1,600 ohms and R = 1,000 ohms. Then X/R = 1.6; the table shows Z/R = 1.8868. Then Z, equals 1.8868 R or 1886.8 ohms.

Reactance and Resistance in Parallel reprinted from January 1936 Research Worker.

Reactance and Resistance in Series reprinted from July 1936 Research Worker.

**TODAY...**

## **EXACT-DUPLICATE Replacement Condensers**

● For years, AEROVOX has pioneered the exact-duplicate idea, despite vigorous opposition. We built up the most extensive line covering all standard set needs, while others offered general-utility units for make-shift replacements. No production runs have been too small for us, even on the more special types. Listings, constantly expanded, have always been kept up to date. Truly a colossal, difficult, costly job. ● But now, in 1939, we enjoy our reward: Our judgment is fully vindicated; servicemen prefer exact duplicates; and the condenser industry at large accords us that sincerest flattery of following in our footsteps.

*Insist on*

### **EXACT DUPLICATES...**

Your local AEROVOX jobber has the most up-to-date listing available for your use. You can immediately select and get that replacement which fits right, works right, looks right, for a stay-put, satisfactory, profitable job. Ask for latest catalog—or write us direct.
