# TV PICTURE-TUBE VOLTAGE AND SIGNAL SYSTEMS\*

In our analysis of the characteristics of high-voltage tv systems, last month, properties of picture tubes and their power requirements were discussed.

It was pointed out that a transient or flyback voltage supply is a part of the horizontal deflection output circuit and utilizes a transient voltage generated in the horizontal deflection coils to supply the high-voltage potential for the picture tube. A typical transient voltage-supply circuit was shown to illustrate this point.

Now, during the horizontal trace period a sawtooth of current builds up in the deflection coil and therefore a field is built up around the deflection coil. During the retrace period the deflection output tube is generally cut off, the rapid change in plate current causing the magnetic field to collapse and a high-amplitude single-alternation transient voltage to appear across the deflection coil. Were it not for the damping tube used in the secondary of the output transformer, this transient voltage would produce the series of damped oscillations, occurring at the resonant frequency of the deflection coil and the distributed circuit capacity. This one alternation, however, has a peak amplitude in the thousands of volts and can be used, if properly rectified, to develop a high d-c voltage.

The purpose of the horizontal sweep output transformer is to present the proper loading for the tube from the low impedance of the deflection coils. In so doing, the transformer turns ratio from primary to secondary is stepdown. This means that going from secondary to primary the transformer is actually stepup and the transient voltage developed in the secondary is further increased in amplitude by the stepup of the trans-

former and, consequently, the high-voltage pulse is still greater in amplitude in the primary of the output transformer. A higher boost in amplitude is also obtained by using an extended primary winding so there is a greater stepup between secondary and primary, the plate being tapped on at some point along the primary where the proper impedance match is made to the deflection coil.

The top of the primary winding is attached to the plate of a high-voltage rectifier tube which rectifies the transient voltage, which is now filtered to produce an essentially constant high-voltage d-c potential. It is important to note that the transient voltage itself is extremely short in duration and occurs during a portion of the horizontal retrace period. The actual spacing between pulses is relatively long and therefore if a d-c voltage is to be obtained the charge on the filter capacitor must be held during this interval. The actual frequency of any ripple voltage that might be apparent is the repetition rate of the horizontal sweep system, approximately 15,750, because one transient pulse is developed for every sweep period. It is apparent, therefore, that the ripple frequency is relatively high and rather small value capacitors can be used to do the filtering, a typical size being 500 mmfd. The time constant of the filter capacitors and resistor is sufficiently long to prevent any serious discharge of the filter capacitors during the interval between transient pulses. Fortunately, it is no difficult task to do this because the actual current required from the voltage source is extremely small and therefore the resistive component of the discharge circuit extremely high. Actually the second filter capacitor of the high voltage system is the capacity that ex-

---

ists between the second anode coating on the inside of the picture tube and the grounded outside coating which is external to the glass of the picture tube, the glass serving as a

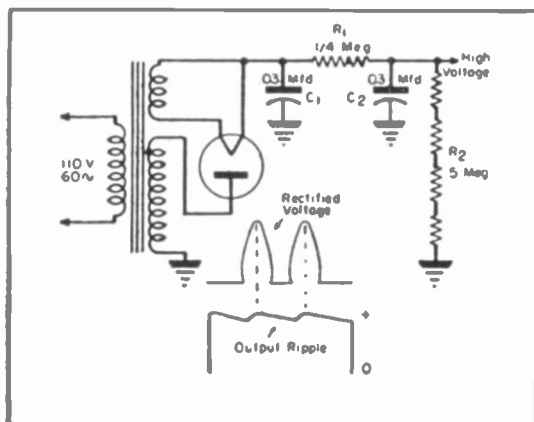

Fig. 1. Transformer high-voltage supply.

dielectric. The effective capacity between coatings is approximately 500 mmfd. A considerable charge can be retained on this capacity and although it is not dangerous it is often surprising and causes one to drop and injure the picture tube. It is wise to always ground the second anode momentarily to the outside coating before picking up the tube.

The heater potential for the high-voltage rectifier is obtained by means of a small few turn pickup coil which is also wound on the core of the horizontal output transformer. The energy inducted into the winding by the fast changing magnetic fields is sufficient to excite the heater of the high-voltage rectifier tube. The pickup loop is, of course, properly insulated for high-tension voltages.

#### Transformer Type High-Voltage Supplies

Two transformer supplies excited by 60-cycle power mains are shown in Figs. 1 and 2. If any amount of current were necessary at the extremely high voltages required the transformer would be massive. Fortunately, only a small current is necessary and although it is a high-voltage transformer, it need not be excessively bulky. Consequently, the windings are constructed of small diameter wire

and if, for any reason, a partial short is placed across the transformer, the windings open up. Many receivers use a safety resistor to limit the current, such as resistor  $R_1$  in Fig. 2, which prevents excessive secondary current in case of a partial or complete short across the high-voltage output of the power supply. One must be extremely cautious when working on the high voltage supply excited by the 60-cycle power mains because the current capabilities of such a system are very high. And, in addition, an appreciable charge is stored in the filter capacitors because they must be of a large capacity to effectively filter the low frequency, 120 or 60-cycle ripple frequency.

The simple high-voltage supply shown in Fig. 1 consists of a half-wave rectifier and a simple R-C filter. When so little current is drawn from the supply half-way rectification and simple filtering is all that is necessary to remove the ripple frequency. Actually the ripple component looks similar to a sawtooth wave as shown in Fig. 1, because capacitors  $C_1$  and  $C_2$  charge when the rectifier conducts and discharge when the rectifier is non-conducting or doing the opposite alternation of the applied 60-cycle sine wave. Every attempt is made

Fig. 2. A transformer high-voltage supply using a voltage doubler setup.

to keep this ripple under one per cent of the d-c output voltage by properly choosing a long-time constant R C filter which does not permit the capacitor to discharge appreciably during

the non-conducting alternation of the rectifier, in accordance with the current required. The time constant of the  $R C$  filter must be high in comparison to the period of the wave which it must filter. Of course, a given time constant can be formed with a large  $R$  and a small  $C$ , or a large  $C$  and a small  $R$ .

The choice of  $R$  and  $C$  depends on the current required and the regulation expected. For example, if the current requirements are extremely light the  $R$  of the time constant circuit is very large and for a given time constant a relatively small value of  $C$  is required. If the current requirements are higher or if better regulation is desired with a change in the brightness adjustment, a heavier load must be placed on the high-voltage power supply. This is accomplished by reducing the value of the bleeder resistor or the  $R$  of the time constant. In this arrangement, of course, a larger  $C$  must be used to produce an equivalent time constant, and the current capabilities of the entire system must be somewhat higher.

The power supply filter of Fig. 1 is called a double-section filter because of the addition of an input capacitor,  $C_1$ , and a series resistor  $R_1$ . In this filter system the initial peak charge is placed on  $C_1$  and the discharge voltage which is mainly developed across  $R_2$  is also filtered by capacitor  $C_2$ . Consequently the proper amount of ripple filtering can be obtained with the use of component parts of smaller value and size. The system of Fig. 2 uses

a voltage doubler output method in which capacitors  $C_1$  and  $C_2$  are charged on opposite alternations of the input sine wave. Consequently, in this circuit, the ripple frequency is 120 cycles and the components of the  $R C$  filter can be made smaller in value. Thus it is ideal when very high potentials are desired and an extremely high voltage can be obtained which is double the sine wave peak output of the secondary of the transformer.

### Oscillator High Voltage Supply

Another safe and practical means of generating the high voltage required for picture-tube operation is the use of a low-frequency oscillator and the voltage stepup characteristics of a tuned transformer. Such a basic oscillator high-voltage supply is shown in Fig. 3. In this type of supply a beam power tube or a power pentode is used to generate strong oscillations. For best stability and a constant output over a substantial range in frequencies a feed-back system using a tickler winding is used as the oscillating method.

The resonant frequency of the oscillation is set by the primary of the transformer and feedback to the grid is through the tickler winding, grid bias being developed by the grid current flow through  $R_g$  and sustained by capacitor  $C_g$ . The primary and secondary windings are generally over-coupled to obtain a broad bandwidth and in case of frequency drift due to heating or change in supply voltages, the output will remain essentially con-

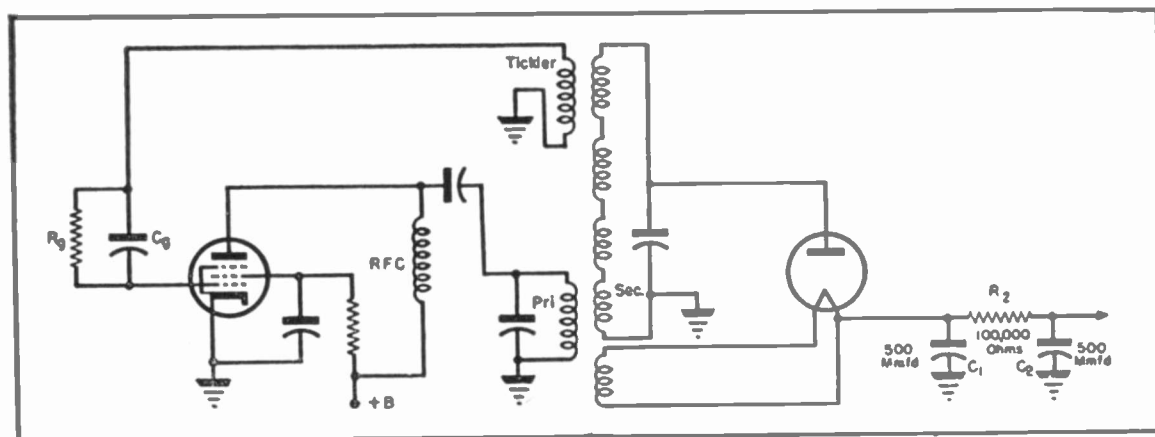

Fig. 3. An oscillator high-voltage supply system.

stant in spite of the frequency change. A high-voltage half-wave rectifier is placed across the secondary of the transformer and rectifies the resonant voltage developed across the secondary. Again a simple R C filter is used to remove the ripple frequency. The oscillators are designed to operate generally in the range somewhere between 50 and 300 kc. Consequently, with the relatively high frequency used, very little filtering is required. The oscillating high-voltage supply is again a very safe high-voltage system because of the small size of the filter capacitors and the fact that any load placed on the output of the high voltage will cause the oscillator to stop operating or decrease the output voltage to a safe value.

To obtain a substantial voltage amplification in the tuned transformer it is necessary that the secondary be lightly loaded and therefore have a high impedance as compared to the impedance of the primary winding. Fortunately, the television picture tube again draws only a very small current and does not contribute an appreciable load to the secondary of the tuned transformer. Other factors which insure a high voltage across the secondary is the proper choice of winding for the transformer and the proper choice of wire. In many of these high-voltage oscillating transformers Litz wire is used because of its inherent low resistance and substantial inductance. Consequently, it is possible to construct a winding which has an extremely high inductance by using many turns of wire and at the same time the resistance and consequent power loss will be low, if the wire used has a very low resistance. Of course, the smaller the wire the closer it can be wound and again the more inductance the winding will have. It is evident, therefore, that Litz wire is ideal because of its small diameter, high inductance, and low resistance. Inasmuch as the impedance of the secondary varies as the square root of the inductance over the capacitance, every attempt is made to keep the distributed capacity at a mini-

mum and the inductance high. Therefore, the secondary is resonant to the proper frequency with the distributed circuit capacity and no physical capacitor is shunted across the secondary. In addition, rectifier tube and component parts chosen must have a minimum of capacity. Again, as with the transient voltage supply the heater potential for the high-voltage rectifier is obtained from a small winding mounted on the transformer.

The secondary winding of the transformer is generally a pie-winding of five to six pies and in some cases, even the primary is constructed in a pie-winding arrangement. The layout of a typical pie-wound coil is shown in Fig. 4. The secondary is made up

Fig. 4. R-f transformer assembly used in high-voltage tv power supply systems.

of a series of five pie-windings, each pie-winding universally wound with 5 to 10 turns per layer. The separation between pies is generally a little greater than the pie width. Too great a pie width increases the distributed capacity and too narrow a pie width reduces the mechanical stability of the winding structure.

To analyze the advantages of a pie-wound secondary, let us assume a pie-wound secondary consisting of five pies and having a total output voltage of 5,000. This means that the voltage developed across each pie will be  $1/5$  of 5,000 or 1,000 volts. Consequently, each pie can be designed for a 1,000 volts difference of potential. If the entire secondary was universally

wound, or layer upon layer, the latter turns of the winding would be reasonably close to the beginning turns and consequently would have to be designed for a breakdown potential of

Fig. 5. Pulsed high-voltage supply system.

5,000 volts. Inasmuch as the start and finish of the pie-wound secondary are very well separated only the breakdown of the individual pie must be considered.

Likewise, the distributed capacity is not felt between the early windings of the secondary and the final windings, but again just between the windings of the individual pies, the distributed capacity of each pie adding in series causing a lower distributed capacity to exist between the start of the secondary winding and its termination.

Another system for generating a high transient voltage which can be rectified and used as a high voltage d-c potential is the pulse type high-voltage supply shown in Fig. 5. In this supply the grid of the pulse amplifier is driven by a short positive pulse such as might be obtained from the grid of a block tube oscillator. This sharp pulse drives the pulse amplifier to saturation causing a sharp change in plate current which develops a high voltage transient in the inductor and is stepped up to a high peak voltage by the auto-transformer connection. The top of the winding is again connected to a high-voltage rectifier which obtains its low-current heater voltage from the same auto-transformer by mutual coupling. A

simple R C filter is used in the output circuit.

An ingenious high voltage supply is that associated with the beam-relaxor horizontal-scanning generator developed by Farnsworth. In this circuit, Fig. 6, no sawtooth oscillator is required, the deflection amplifier functioning itself as an oscillator. The beam relaxor oscillator develops a short positive pulse in the plate circuit, which is stepped up in amplitude by the auto-transformer arrangement of the secondary and supplied to the plate of a high voltage rectifier. A simple R C filter is used to remove ripple.

In summation there are a number of methods which can be used to generate a high-voltage low-current source, and although the d-c potential is in the thousands of volts these supplies are relatively safe with the exception of the transformer type driven by excitation from the 60-cycle line.

However, the trend is away from the transformer type toward the safety of the transient voltage and oscillating voltage supply. All of these higher frequency high-voltage systems are practical and efficient, but must be well shielded to prevent interaction with other circuits associated with the television receiver. Fortunately, some

Fig. 6. A beam-relaxor type of circuit developed by Farnsworth.

interaction can be tolerated because the generation of the high-voltage pulse is during the retrace of the horizontal sawtooth, when the picture beam is cut off.

## A Free Market-Place for Buyers, Sellers, and Swappers.

**FOR SALE**—One 3 tube guitar amplifier and speaker in carrying case. W. Fuller, 4620 Stafford Rd., Lansing 10, Mich.

**WANTED**—4 coils for National model HRO -5TA1 (bandspread), 1.7 to 30 mc. State price. R. F. Becan, 132 Sussex St., Hackensack, N. J.

**FOR SALE**—Emerson 1946 7 tube 3-way portable radio, new, \$30. Shears Radio Service, N. Winchester Road, Cresap-town, Md.

**WANTED**—We would like to contract assembly or manufacture of radio equip. from reliable manufacturer. Have wonderful facilities. Labor situation excellent. We invite inquiries from reliable manufacturers interested. J. E. Proctor, 250 E. Woodward Ave., Rogers City, Mich.

**SWAP**—Join our Swappers Exchange. We cover the United States. Let us have your list of trade. Cost you \$1 for one year. Write for info. Baley's Radio Service, Winfield, Alabama.

**TRADE**—Stancor P-20 xmitter, cw and phone, complete with crystal, coils, mike, and Vibroplex "bug" key. Want Sparx or Feiler sig. tracer in good condition. Sam Torrisi, 57 Mechanic St. Lawrence, Mass.

**SELL OR TRADE**—35W amplifier, AC or 6 volt DC, with separ. DC supply; 2 Fox horn units, 6V; 4 Racon Giant horn units, 6V; 4 6' Racon Stormproof trumpets; 4 new 12" PM speakers. Want sig. gen. and VTVM. Leo. L. Bowman, St. Ignatius, Mont.

**FOR SALE**—Established radio and appliance shop, very reasonable. Good deal for man who knows the radio business. Alisal Radio and Appliance Shop, 553 E. Alisal St., Salinas, Calif.

**FOR SALE**—6 1LN5 at \$7.50; 6 No. 45 tubes at \$4.20; 2 Riders manuals, 11 and 14 at \$20; 2 Sams volumes, 1 and 2 at \$20; 6 No. 26 tubes at \$4.20; 4 No. 24 tubes at \$3.80. A. L. Murphy, Radio Sales and Service, Mount Vernon, Ga.

**FOR SALE**—RCA tube tester, model No. 156, perfect, with roll chart. Also RCA 5 tube auto radio, complete with 66" ant. and lead in. Perfect condition. Bill Seeley, Jr., 34 Main St., Keansburg, N. J.

**WANTED**—Positions for Graduate G.I. radio-television service, installation demonstration, Part Time or Full Time. The Delehanty School of Radio E. & T., Personnel Placement Bureau, 115 E. 11th St., New York 3, N. Y.

**BUY OR SELL**—Want test equip, meters, service panels, 16 mm movie films, projectors, radios, etc. Have power transformers, 250 phono motors (late style), xmitting tubes, etc. Warren Wigner, 1220 Fairview St., Fort Wayne 4, Ind.

**TRADE**—Any European set diagrams for service. Want tubes or war surplus parts. Write R. Veltman, 31 Kapel St., Hilversum, Holland

**FOR SALE**—U.S. Army tank radio xmitter, brand new, in 3 crates. Best offer over \$95 takes it. Frank Miele, 1312 Adea Ave., Bronx 67, N. Y.

**FOR SALE**—Radio servicing stock and test equipment. Owner desires to sell due to ill health. Will sell \$2,000 set up, including brand new Masco 35 watt P.A. system complete with Webster record player, and small selection of second hand radios for \$750 cash. Tubes and parts are all standard brands. For information write to Post Office Box 288, Lebanon, Pa.

**FOR SALE**—Triplet No. 1613 tube tester, \$29.50. Want battery eliminator for testing auto radios. Also Rider Vol. 11. Theodore Lohr, 140 - 28 - 247th St., Rosedale, L. I.

**FOR SALE**—Transvision 12" new de luxe model television set, with imputuner and table model cabinet, neatly wired, \$400 Jack's Radio Service, 296 Wainwright St., Newark, N. J.

**FOR SALE**—Slightly used Hickok 534 tube tester and analyser, perfect condition, like new \$120. Al Werhan, Manlius, N. Y.

**FOR SALE**—2 35 mm portable sound projectors. Robert Laraie, 8 Hill Block, Lewiston, Maine.

**FOR SALE**—Edwards (\$52) FM tuner; Allied's TRF tuner; and 10W phono amplifier. All mounted in relay racks complete with 12" and high fid. speaker. Cheap. James J. Gnagy, 931 Bellflower S.W., Canton 4, Ohio.

**FOR SALE**—Miniature tubes: 6AG5, 6AK5, 6C4, 6J6, 9001, 9003, 9004, and 9006, all new in orig. carton. Worth \$125, sell for \$50. Also Daco 303 tube tester, \$25. H. M. Bissell, 1061 Inglehart, St. Paul, Minn.

**FOR SALE**—A "Million" bat. operated volt ohm milliammeter, excellent condition, \$20. Also a Supreme "Audolyzer," factory reconditioned, \$100. Delbert Clark, 320 - 10th Ave., Menomonie, Wis.

**SALE OR TRADE**—One "Majestic 72" radio rec. in fine condition, complete. Need auto radio to fit '40 De Soto. Finkelstein Radio Co., 1414 Bronx River Ave., Bronx 59, New York

**FOR SALE**—RTL (Radio Technic Lab.) model 300, circuit tester, volt, ohm, ampere meter and vacuum tube volt meter. Little used in excellent condition, \$35. "Pritec" 1523 Fullerton Avenue, Chicago 14, Illinois.

**FOR SALE**—Hallicrafters S-41-W, \$30. In excellent condition. Franklin Nagy, Rt. 3, Box 243, Kannapolis, N. C.

**FOR SALE**—BC-412-B oscilloscope, complete with tubes. Best offer takes it! N. I. Wolk, 1411 Ave. N, Brooklyn 30, N. Y.

**SELL OR TRADE**—Radio trouble shooters handbook, Radio Physics, Ghiradi, Understanding Radio, magazines, parts, etc. Want radio and television course. Martin A. Levey, 1281 Bronx River Ave., Bronx 59, N. Y.

**TRADE**—SW3, complete; and a 10 meter xmitter, tubes, 40 meter crystal, (no power supply) for good 10 meter rec. F. Bou, 3131 N. Percy St., Philadelphia 33, Pa.

**SALE OR TRADE**—Pickups: Webster magnetic, 500 ohm PA model, \$4.50. Sure type 914A crystal, transcription type for up to 16" discs, \$7.50. You pay shipping. Paul H. Prokes, 9216 S. Menard Ave., Oak Lawn, Ill.

**BUY OR TRADE**—Have radio parts or cash for small pistol, band instruments, or 3" meters. Eddie Howell, General Delivery, Gastonia, N. C.

**FOR SALE**—HT-9 perfect condition, one year old, 10 meter coils, crystal and extra 814. First \$265 check. H. F. Reed, Box 57, Pyote, Texas.

**WANTED**—Rider's manuals vols. 10 to 14, in good condition, no pages missing, state price. Fred M. Merrill, Box 92, Callicoon, N. Y.

**FOR SALE**—"View Tone" television set, channels 1 to 6, new power transformer, 7" tube, \$110. Cash FOB N. Y. A. R. Dayes, 29 Charles St., Merrick, L. I. N. Y.

**WANTED**—P.I.R.E., May, June, 1941; and Dec., 1944. Vacuum tube design, by RCA engineers. Philip—Complex Variables. H. Hsu, 42 Divinity Hall, Divinity Ave., Cambridge 38, Mass.

**WANTED**—Xmitter as, HT-17, HT-6- silver-801, meck-gon, stancor-10-P, prefer local. Will buy or trade. G. Samkofsky, 527 Bedford Ave., Brooklyn 11, N. Y.

**SWAP**—Tubes, parts, radio books. Swap for patches, enemy radio equip. or 8mm movie projector. Or what have you? C. Richards, 2442 Morris Ave., 53, New York City.

**TRADE**—Scarce tubes, No. 50 and 81. Want "Elementary Radio Servicing" by Wellman. Also other books. Walter J. Bartell, 1107 N. Western Ave., Chicago 22, Illinois.

**FOR SALE**—Collins 70E-8V FO unit, used, \$20; 1 combination power xformer, 1,000 and 400V DC at 150 ma, each \$6; 1 new V70D tube, \$3.50; SCR522 xmitter, already converted, \$10. Vernard Rush, R. R. 2, Rockville, Indiana.

**FOR SALE**—Brand new Astatic J 30 mike with table stand, (reg price \$16.95), your price, \$7. F. Lewis, 548 Brompton, Chicago 13, Ill.

**FOR SALE**—Hammarlund Super Pro rec., model SP-400-SX, 100 kc crystal calibrator, perfect condition, \$250. Radio Communication Service, 4475 Myrtle St., San Deigo 5, Calif.

**WANTED**—Full time work with appliance dealer. Can repair radios, appliances, house wiring, etc. Graduate NRI and Coyne Elec. school. Single, age 27, locate anywhere in U. S. Claxton Daniel, RFD 4, Humboldt, Tennessee.

**SELL OR TRADE**—New and used tubes, parts, testers, panel meters, etc. Want amplifier, PA system, typewriter, or what have you? I. W. Stubblebine, 140 So. 4th St., Reading, Pa.

**FOR SALE**—Army BC-406 radar rec., containing power supply, IF stage, and UHF components, \$12.50. Melbourne Hellstrom, 6014 Broadway, West New York, N. J.

**WANTED**—Sig. gen. in good condition, similar to Precision E200, with audio output jack. A. Adams, 719 Park Ave., Williamsport, Pa.

**FOR SALE**—Sig. gen., 150kc to 34mc; oscilloscopes 5" CRT; VTVM; and audio generators. Built from kits. S. Lonigro, 52 Willowdale Ave., Montclair, N. J.

**SELL OR TRADE**—HF sweep gen.; sig. gen., 2 to 20mc; RCA 13 channel television front end. Want slide rule, mike, camera, television picture lens, or what have you? J. Bazewick, 3,000 No. Christiana, Chicago 18, Ill.

**SALE OR TRADE**—Weston 772 VOM, 20,000 ohm per volt; Hammarlund Comet Pro SW rec.; Scott 30 tube phi-harmonic all-wave rec.; Motorola car set. Want Trans-Atlantic portable, Hallicrafter Sky Ranger Precision tube tester, and test equip. Glenn Watt, Chanute, Kansas.

**FOR SALE**—Electronics magazines, complete set of 36 most recent issues, perfect, suitable for binding, \$6 R. S. Werner, 64 Forester St., S. W. Washington 20, D. C.

**WANTED**—Complete set of Riders manuals in usable condition. E. R. Peltier, CB and Q Tele. Office, McCook, Nebraska.

**WANTED**—Circuit information or diagram of German radio, Graetz 51GW. Also CL4 tube, or equivalent, for same. Write terms. Wilbur Parsons, 404 So. Ash St., Stockton, California.

**FOR SALE**—Viewtone 7" television set with built in AM radio. All in mahogany finished floor console cabinet, \$100. Send deposit, balance COD. Leading Radio and Appliance Co., 158-160 E. 3rd St., Mt. Vernon, N. Y.

**WANTED**—Aerovox 95 L-C checker, and Riders Vol. 14. Saxton's Radio and Electric Service, R 1, Pontiac, Ill.

**TRADE**—Will trade new copy Principles and Practices of Radio Service by H. J. Hicks for copy Cooks Math. for Radio Men, in good condition. Gerald Evans, 409 Center, Little Rock, Ark.

**SALE OR TRADE**—Edison's first type hand winding graphophone, like new, no scratches, with horn and 70 cylinder discs, original permanent needle Edison made. Want SX-28, Super Pro, or HRO with speakers. Fred Simonian, 85 Shepard St., Lynn, Mass.

**SALE OR TRADE**—Hammarlund crystal PRO, continual coverage from 550 kcs. to 30 mcs. Make offer. F. J. Liesman, 940 Elm St., Reading Pa.

**WANTED**—General radios, used, models 732-B and 650-A. Also distortion and noise meter, and impedance bridge, any condition. State condition and price. Jack's Radio Shop, 23 Washington St., Rensselaer, N. Y.

**FOR SALE**—AC radios: Philco, Majestic, Brunswick Kolster, Colonial and many others at low prices. Also power packs and transformers. Forward stamps for bulletin. Goldstone Radio, 1279 Sheridan Ave., Bronx, 56, N. Y.

**FOR SALE**—Hi-fidelity 25W Airline phono-mike amplifier with controls, like new, \$25. Robert Hall, 14802 Strathmoor, Detroit 27, Mich.

**TRADE**—Complete National Radio and Television course (NRI) 1947-48. Trade for instruments, radios, money etc. What have you? Stevens Radio Service, 346 Dewitt St., Buffalo 13, N. Y.

**WANTED**—We are in urgent need of SCR-300 walkie talkie's in new, or good used condition. Contact us immediately if you have them or can locate them. Wire or write air mail special delivery. J. E. Goode, 732 S. Sherman St., Chicago 5, Ill.

**FOR SALE**—Gross UHP-Two trans-rec. ideal for 225 and 2 meter band. Uses 6-AK5 detector. Can be used mobile or fixed. Complete with tubes, less power supply and in good condition. Terms cash. James Burns, 2524 Oswego Ave., Baltimore 15, Md.

**WANTED**—Used oscilloscope and VTVM. Please state condition. All letters answered. H. A. Printz, 205 Crawford S., Clay Center, Kansas.

**SELL OR SWAP**—SCR 522 rec. and xmitter with tubes. Xmitter has 3E29 final, 60W input. Perfect, now in use. Want BC348 or make offer. George F. Gnanadt, Creek Valley, Wellington, Ohio.

**FOR SALE**—Old model tube tester "Unimeter" good condition. Will sell for \$17 or swap for multimeter. Donald C. O'Niel, Dept. 59-C, 5034 Attleboro St., Jacksonville 5, Florida.

**FOR SALE**—Ex-GI selling out radio shop. New test equip. and new Riders manuals, plus stock. All for \$570. Send for list. All replies answered. Frank Ahearn, 2901 Wasp Rd., Camden, N. J.

**FOR SALE**—Wired Heathkit amplifier, \$12.50; Tel-ohmike TO-3 condenser tester, \$50; grab bag of 70 tubes, (list \$100-200), \$20; Hallicrafter S-38, \$42. Want Webster wire recorder. C. A. Winans, Morris, Ill.

**SALE OR TRADE**—Gardiner Sender; Bud oscillator; portable radio; Kleig lights. Want Meck 60N, Hallicrafter-HT6, etc. G. Samkofsky, 527 Bedford Ave., Brooklyn 11, N. Y.

**FOR SALE**—Brand new comb. Weston analyzer and tube checker, model 778, \$80. Also complete set of Radio Technical books (no Riders). Very reasonable, all new. Sid Levine, 764 Lafayette Ave., Brooklyn 21, N. Y.

**WANTED**—Test Instruments: sig. gen., VTVM, sig. tracer, oscilloscope, etc. State make, model No., condition, and price in first letter. A. F. Newman, 61-25 Parsons Blvd., Flushing, L. I.

**FOR SALE**—Supreme Vedolyaer, perfect condition, \$150. Also 90 and 1½V farm battery eliminators, \$9. Want to hear from those that have studied the course in Psychiana. Frederick R. Shutt, Box 144, Mullens, West Virginia.

**POSITION WANTED**—Have some experience repairing radios, tools, equip., etc. Prefer Tri-State area of Iowa, Minn., and Wis. Also have a Philco 6V input self rectifying vibrapack I wish to sell. Gerald R. Kernan, Harpers Ferry, Iowa.

**FOR SALE**—Transvision 7" television rec. with 3 stage booster and workshop TV 63 aerial and all diagrams. Fine picture. Wired and tested, \$150. Paul Leese, 706 W. Vine St., Lancaster, Pa.

## "vikane" impregnated paper tubulars for high temperature applications type GT "grey tiger"

Continuing lab and field tests prove GT's unusual stamina and performance to withstand severe temperature conditions encountered in electrical and electronic applications. Write for Catalog 200A. Cornell-Dubilier Electric Corporation, South Plainfield, New Jersey. Other plants in New Bedford, Worcester, and Brookline, Mass., and Providence, R. I.

*Consult your local Classified Telephone Directory, for your nearest authorized C-D distributor.*

### FEATURES OF HIGH TEMPERATURE "GREY TIGERS"

- "Vikane" impregnated capacitor element. Processed with "Vikane" a new development of the Cornell-Dubilier laboratories. Assures extra long life at high operating temperatures.
- End fill—Specially compounded for high temperature operation.
- New high temperature moisture seal and tube impregnated to withstand temperatures to 100°C.
- Excellent capacity stability over the high and low temperature range.
- High insulation resistance—at 77°F., above 10,000 megohms per unit or 2,000 megohms per mfd.
- Low power factor—averages 0.35% at 1,000 cycles.
- Available in all commercial capacity and voltage ratings.
- One type serves for all high or low temperature and humidity applications.
