

Certain applications of the 231C occasionally require that the transmitter be attended remotely.

Full provision has been made in the design of the 231C for a variety of remote control facilities.

The arrangement here illustrated employs a telephone dial for remote selection of the ten available frequencies and for selecting the type of emission, as well as for switching the transmitter on and off the air. Complete control and transmission is effected over a single telephone pair.

Four other basic remote control arrangements, each suited to different types of installation, are shown in the 231C Bulletin which is free for the asking.

COLLINS RADIO COMPANY

## **COLLINS 231C** Control Facilities

## DESIGNED TO GOVERNMENT SPECIFICATIONS

This latest addition to the Hallicrafters family of communications receivers was mechanically and electrically designed by the twelve engineers in our own laboratories. But the specifications and performance characteristics were the result of exhaustive analysis of more than 600 requested reports and voluntary recommendations including specifications of government engineers.

Specific requirements for the best operation in the tropics and Sub-Arctic were included, as were military and marine requisites, broadcast monitoring necessities, professional communications requirements, DX needs and, of course, regional and general amateur requirements.

We sincerely believe the SUPER SKYRIDER has every performance characteristic accepted or demanded by leading engineers in each branch of radio communications. It could, we feel, easily sell for \$250.00, but the Hallicrafters have only one way of arriving at the selling price of a model. It can be, and is, figured on a sliderule. That method showed the SUPER SKYRIDER could sell, complete with crystal and 14 tubes, less only speaker, for \$159.50 net.

kyridz

THE NEW

For the first time in communications history, the Hallicrafters present, as regulation accessories, reproducers of the famous Bass Reflex type. Especially designed by Hallicrafters-Jensen engineers, these are, we believe, the finest single-speaker enclosures made. Model R-8 (above) is  $23\frac{1}{2} \times 17\frac{1}{2} \times 10\frac{1}{4}$ , complete with special PM Jensen speaker, \$19.50 net. Model R-12 is 30  $\times 22\frac{1}{2} \times 16$ , with special PM Jensen speaker, \$29.50. Both are handsome wooden cabinets finished in Gunmetal gray, providing a pleasing color match with the finish on the 1941 SUPER SKYRIDER.

AN BAN

## THE NEW 1941 SUPER

## pide POINTS 0

Price was not a factor in the design of this model. It has details of construction as costly as skilled engineering necessitated. Nine features of construction are listed below. Additional features include provision for plugging in phonograph record player, also added facility for feeding recording heads through use of proper microphone.

Wide angle reading "S" meter operated on the vacuum tube voltmeter principle. Meter scale calibrated directly in "S" units and DB's over S9.

TSED BY 33

Latest design in escutcheons to provide maximum visibility of dials and meter. Indirectly lighted dials have direct reading band indicator.

Logging dial permits accurate resctting of main dial to a known frequency control; can be locked in position for permanence of dial setting.

Air trimmers—heavy coll-form construction—inductance and capacity trimming for accurate tracking—laid out for lowest losses—rigid mounting brackets—each coll assembly isolated by suitable shielding.

New type inertia-controlled back-lashfree dial mechanism on both main tuning and bandspread dials. This mechanism is preloaded and the main shafts are supported at both ends with ball bearings.

GOVERNMENTS

## TRCHNICAL INTEREST

the

ehi

Controls on the front panel are: Micrometer scale main tuning inertia controlled. Calibrated band spread. Tone and AC ON-OFF. Beat Frequency Oscillator. A.F. Gain. R.F. Gain. 6 position band switch. Antenna Trimmer. 6 position selectivity control. Crystal phasing. Adjustable noise limiter. Send-Receive Switch, A.V.C.-B.F.O. Switch, Bass boost switch. Phone jack.

Accurate long scale calibrated band spread on amateur bands of 10, 20, 40 and 80 meters provides effective frequency meter tuning.

Design of crystal circuit enables crystal gain to be predetermined and greater gain realized. Maximum select with no reduction in sensitivity. selectivity

hallectafters inc.

cago, Uninois, U.S.A.

Air-permeability tuned 1F transform-ers operating at 455kc provides highest gain obtainable with higher signalto-noise ratio.

К

Designed to Government Speed Designed to 6 step selectivity from broad high fidelity to extremely sharp CW crystal by a combination of expanding 1F amplifier and variable crystal circuit. Every selectivity requirement fulfilled.

#### Section Communications Managers of the A.R.R.L. Communications Department

All appointments in the League's field organization are made by the proper S.C.M., elected by members in each Section listed. Mail your S.C.M. (on the 16th of each month) a postal covering your radio activities for the previous 30 days. Tell him your DX, plans for experimenting, results in phone and traffic. He is interested, whether you are an A.R.R.L. member or get your (ST at the newsstands; he wants a report from every active ham. If interested and qualified for O.R.S., O.P.S. or other appointments he can tell you about them, too.

supply put nearly 2200 volts on his 2000-volt G-E Pyranol capacitors, but it doesn't phase Rruditchka. He knows Pyranol capacitors can take it-that they can be operated continuously at 10% above rated voltage with complete safety. Pyranol makes them extra compact, too, and they are available in either round or rectangular shapes for both upright and inverted mounting.

GL-872.....\$9 **Plate Current** 1.25 amp Max. Peak Inverse Volts 7500

GL-872-A......\$11 **Plate Current** 1.25 amp Max. Peak Inverse Volts 10,000

CPEAKING of power-supply changes, should you be changing yours? If you have a high-power rig, you may be loading your rectifier tubes pretty heavily. If so, you can get greater dependability and longer tube life by changing to GL-872's or GL-872-A's. Commercial operators in all parts of the country have made that change, and they're money ahead for it. That's reason enough, we believe, for you to consider doing the same.

The G-E distributor near you handles our complete line of transmitting tubes and Pyranol capacitors. He has full information, plus bulletins GEA-3315A (G-E Transmitting Tubes) and GEA-2021B (G-E Pyranol Capacitors). If you don't know where he's located, use the convenient coupon.

General Electric Co. Sec. Q-161-4 Schenectady, N. Y. Please send names of near-by G-E dealers, and also □ GEA-3315A (G-E Transmitting Tubes) □ GEA-2021B (G-E Pyranol Capacitors) Name Address.....

Southeastern Division WILLIAM C. SHELTON Box 552, Daytona Beach, Fla. Southwestern Division

West Gulf Division WILLIAM A. GREEN 801 Ross St., Abilene, Texas The AMERICAN RADIO RELAY LEAGUE, INC., is a non-commercial association of radio amateurs, bonded for the promotion of interest in amateur radio communication and experimentation, for the relaying of messages by radio, for the advancement of the radio art and of the public welfare, for the representation of the radio amateur in legislative matters, and for the maintenance of fraternalism and a high standard of conduct.

It is an incorporated association without capital stock, chartered under the laws of Connecticut. Its affairs are governed by a Board of Directors, elected every two years by the general membership. The officers are elected or appointed by the Directors. The League is noncommercial and no one commercially engaged in the manufacture, sale or rental of radio apparatus is eligible to membership on its board.

"Of, by and for the amateur," it numbers within its ranks practically every worth-while amateur in the nation and has a history of glorious achievement as the standard-bearer in amateur affairs.

Inquiries regarding membership are solicited. A bona fide interest in amateur radio is the only essential qualification; ownership of a transmitting station and knowledge of the code are not prerequisite. Correspondence should be addressed to the Secretary.

Address all general correspondence to the administrative headquarters at West Hartford, Connecticut.

IN THE few short weeks since we last addressed you on this page, the great European tragedy has flamed to new dimensions, has become a threat to all the world, and has made profound changes in the attitude of our own people and our own government. Inescapably this situation brings us new problems.

When we got up the A.R.R.L. Neutrality Code at the outbreak of the war, we did not include in it a self-imposed prohibition against working amateurs in belligerent countries and colonies, for the excellent reason that we did not for a moment expect that there would be any. From time to time there have been some, and it seems that the situation requires discussion. There are some foreign amateur stations that seem more than willing to give American amateurs information concerning the military situation, and one can only gather that they are being encouraged to do this for the purpose of cultivating us. It would be questionable neutrality for us to lend ourselves to such a situation. Our citizens and ships are obliged to keep out of belligerent territory, and no great extension of that thought would preclude our direct exchange of views with belligerents during these difficult days.

But the problem goes beyond that. The mad race in Europe unhappily seems likely to spread to still more countries so that there is no telling whether there will be any countries left untouched on that unfortunate continent. Moreover, in the few remaining countries not yet aflame, and where there are on the air at the most a few dozen amateurs, it seems probable that the stations are not operating with the full consent of their governments, which again is a hazardous condition for us.

League headquarters therefore has reluctantly come to the opinion that we ought not to work any European amateurs whomsoever, even for the barest routine exchange of signal reports. It just doesn't any longer become us in anyone else's eyes, regardless of our own knowledge of the utter unimportance of the contact. We are impelled to this conclusion by every broad-gauge consideration of the interests of our art. It is difficult to come to this decision. We are immensely sorry to have to make this recommendation because amateur radio on this side is truly neutral and is well capable of continuing to deal with the amateur of every nation, neutral or not, as a brother. By concerning ourselves strictly with technical matters, we could avoid entanglement and embarrassment. Yet we know that other people will not think so, and the safety of United States amateur radio compels us to give heed. After all, what is the value of the pleasure in a few fleeting DX contacts when these activities lay the individual amateur open to suspicion and prejudice the standing of our whole fraternity?

Put it down, then, as part of the A.R.R.L. Neutrality Code that we pledge ourselves to work no Europeans until the conflagration there subsides.

No law or regulation compels us to do this. No law or regulation is responsible for any part of our Neutrality Code. In fact, if such things had been dictated to us by the government at the outbreak of the war, we might well have been aroused to resentment at such a curb on traditional and constitutional rights. Our code is self-imposed. But, being voluntary, we are indeed the more strongly bound by it. It is another demonstration of the coöperative ability of the United States amateur to conduct himself in a temperate way and to police himself. Our position with our government is not the result of happenstance: we have earned their trust by demonstration down through the years of our sanity and foresight and our respect for the best interests of our country. We can take pride in this code of ours. It enabled us to demonstrate, in the early weeks of the trouble, that we could again be counted upon to take care of ourselves, and that the government need not worry about our violating neutrality or serving as dangerous channels of communication, even unwittingly. It was that showing alone that prevented the unnecessary closing down of ham radio during those weeks when everybody had the down-yonders and anything could happen. Official Washington was frankly amazed at the speed with which we amateurs ourselves spread this code around amongst our brethren, and our rigid

observance of it tremendously enhanced our prestige. This demonstration of trustworthiness again stood us excellently when the war spread with amazing suddenness in May. We must be able to count upon its doing so as the situation grows more tense with every passing day.

It is therefore to this code of conduct that we owe our security to-day. It must continue to be absolutely respected by us all. The government cannot police 50,000 amateurs; if they believed we required constant monitoring, it would be easier to suspend us. Therefore nothing is of greater importance than that every last one of us so conduct himself that his operations are above suspicion. This is not a job that headquarters can do for you; it depends upon what you fellows do in your individual shacks.

Let's summarize it: We do not work amateurs anywhere in Europe, belligerent or otherwise. We keep all our international contacts with other continents strictly on the basis of experiment and small talk. We relay no intelligence of any sort from one country to a third country. We talk only in plain language, and we always sign our call at the end of each transmission. Even amongst ourselves we do not discuss on the air anything about the war or any topic that might have a military significance for an interceptor. In other words, we make an absolutely rigid separation between this war and our interest in amateur radio, that the

#### FLASH:

#### Foreign Communications Prohibited!

Our printer had just got that much of our editorial set up in type when, about noon of June 5th, the F.C.C. issued an order, effective at once, suspending communication between amateurs licensed by F.C.C. and those in any foreign country. Thus a great deal of what we were talking about is removed from a discretionary basis, made mandatory. Let the Commission's order speak for itself:

#### Order No. 72

At a meeting of the Federal Communications Commission held at its office in Washington on the fourth day of June, 1940,

Pursuant to authority contained in Sec. 303 of the Communications Act of 1934, and in accordance with Article 8, Sec. 1, of the General Radio Regulations (Cairo Revision, 1938) annexed to the International Telecommunications Convention (Madrid, 1934):

IT IS ORDERED, that amateur radio operators and amateur radio stations licensed by the Federal Communications Commission shall not exchange communications with operators or radio stations of any foreign government or located in any foreign country; provided, however, that this order is not intended to prohibit the exchange of communications between licensed amateur operators and licensed amateur stations in the continental United States and licensed amateur operators and licensed amateur stations in the several territories and possessions of the United States, or between licensed amateur operators and licensed amateur stations in the continental United States and United States citizens authorized to operate amateur radio stations in the Philippine Islands or the Canal Zone, or between licensed amateur operators and licensed amateur stations in the several territories and possessions of the United States.

IT IS FURTHER ORDERED, that all rules and regulations of the Commission inconsistent with this order be, and the same are hereby, suspended, pending the further order of the Commission.

This order shall become effective immediately.

> By the Commission: T. J. Slowie, Secretary

This order washes out all foreign DX. K4 (and KC4), all the varieties of K6, and K7 of course are still OK — these are U. S. K5 and NY are OK, as are all the KA stations operated at military or naval bases. Also approved is communication with any other KA station licensed to a United States citizen; otherwise it is not.

Inevitably there will be some hardships under these restrictions. If you are connected with any cases in which these requirements prevent communication with a distant United States citizen who desperately needs it, communicate the facts to your division director it may be possible to do something about it.

A monthly magazine cannot keep up with this fast-moving international situation. The best possible service of information is being given over W1AW and the A.R.R.L. Official Broadcasting system. Further news, interpretations of this regulation, etc., will go out daily over W1AW. Keep yourself informed by making it a practice to listen daily for the fast developments that come between the issues of *QST*.

## A Stabilized Variable-Frequency Oscillator

Design Considerations for High-Stability Transmitter Frequency Control

BY G. M. BROWN,\* W2CVV

Some two years ago, when the owner and operator of W2CVV got tired of trying to dodge the QRM on the 4-Mc. 'phone band with a few moth-eaten crystals, the obvious expedient was to build some sort of continuously variable oscillator for controlling the transmitter frequency.

After perusal of various articles on e.c.o.'s and inspection of some such oscillators in service, none of which seemed to be the entire answer to the problem, it was decided to start with fundamentals and see what could be done.

The stabilized variable-frequency oscillator which resulted, as well as others of essentially the same design built by W2ACB, W2HZL, W2VO, W2GFH, W1JLT and others, has been so uniformly successful on all bands from 10 to 160 that this article has been prepared. It is not intended to cover complete constructional details, although all components, constants, and circuits together with photographs of the original model are given, but rather is to be used as a guide in designing an oscillator to fit the needs of the individual builder. To this end the reasons for all design variations which may better fit individual needs, are included.

#### The Requirements

No design problem can be successfully attacked without a rather accurate outline of the desired features of the contemplated equipment. When boiled down, these features for a variable oscillator, in their approximate order of importance, are outlined below.

1. Frequency Stability

Although there is plenty of room for argument as to the relative importance of various requirements, there can be little doubt that a high order of frequency stability, under any and all conditions, belongs at the top of the list. We all like to get close to the edge of the band now and then, and Grand Island QSL's are uniformly unwelcome.

2. Reset Accuracy

Reset accuracy is very nearly as important as frequency stability — neither can be fully utilized without the other.

3. Convenience of Operation

Setting of the frequency must be accomplished by means of a single control.

\* General Electric Co., Schenectady, N. Y.

The necessary switches must be provided to permit the oscillator to be turned on alone, without the rest of the transmitter being energized, thus avoiding the cardinal sin of e.c.o. operators of swishing carriers up and down the band.

Means must be provided for automatically energizing the oscillator with the transmitter during normal operation, without requiring manipulation of additional send-receive switches.

#### 4. Economy

Inexpensive receiver-type components must be used wherever possible without sacrificing necessary operational requirements.

#### **Frequency Stability**

Since the achievement of exceptional frequency stability is of major importance, that problem was taken up first. An analysis of the various factors tending to cause frequency variations resulted in a list of the most important as follows:

- 1. Temperature variations.
- 2. Humidity variations.
- 3. Oscillator plate voltage variations.
- 4. Oscillator loading variations.
- 5. Mechanical shifting of parts.

Temperature variations affect frequency by

'The stabilized variable-frequency oscillator built by W2CVV. The lower dial makes six revolutions for complete band coverage, the smaller dial above indicating the number of tuning dial revolutions.

July 1940

Maybe you have an e.c.o. that satisfies you right down to the ground, or maybe you're just on the verge of making your first stab at variable-frequency control. In either case you'll do well to read this article with care, because it not only sets out the problems in clear-cut fashion, but also provides practical solutions to them. And perhaps some of the suggestions will make that good e.c.o. even better.

changing the mechanical size and thus the electrical characteristics of the frequency-determining circuits. With increasing temperature, coils become larger and have more inductance, and ordinary air condensers become larger and have more capacity. Both these effects tend to lower the resonant frequency. They may both be quite well compensated for over a reasonably small frequency range, such as a single amateur band, by a fixed condenser so constructed as to have a negative temperature coefficient. Fortunately the development of small, cheap titaniumdioxide capacitors having such a coefficient makes the use of a bulky bimetallic compensator unnecessary.

The final selection of the amount of temperature compensation required can best be determined by cut-and-try methods, since there will be considerable variation in individual circuit components and mechanical arrangements. A rough calculation, however, will at least provide a starting point. Since titanium dioxide compensators have a negative temperature coefficient of 0.06 per cent per degree C, approximately ten to twenty times the positive coefficient of the normal coil and condenser combination, the use of five to ten per cent titanium dioxide capacity in the total tank capacity will be a good place to start. If the completed oscillator has a tendency to drift down in frequency as it warms up, it means that more compensation is needed, and vice versa. The results of tests on the first model indicate that the 20-µµfd. Erie Ceramicon compensator is about right with 240 to 340  $\mu\mu$ fd. total tuning capacity. Of course, it is entirely possible to obtain satisfactory compensation with compensators having coefficients lower than 0.06 per cent -- in fact, if the proper negative coefficient is available, the entire fixed padder,  $C_3$  (Fig. 1), may be used to compensate the coil and variable capacitor, and no other compensation used. Another possibility is to use a zero-coefficient capacitor for  $C_3$ , and make  $C_6$  only large enough to compensate for the other circuit components.

Although such compensation is quite effective in compensating for frequency drift caused by ambient temperature changes and general heating of the oscillator unit during operation, changes from tube heating cannot be disposed of so easily. It was, therefore, deemed advisable not to make any attempt to compensate for tube changes, but rather to minimize their effect by using a small, low capacity, lightly loaded oscillator tube of the type ordinarily employed for the heterodyning oscillator of receivers, and a high-C oscillator tank circuit.

The effects of humidity on oscillator frequency are not entirely understood, and can be completely eliminated only by hermetically sealed compartments. The use of wax-sealed high-stability fixed padding condensers for a major portion of the tank circuit was found to provide adequate freedom from humidity effects under normal operating conditions.

The frequency of the conventional electroncoupled, or Dow, oscillator can be so designed and adjusted that its frequency is relatively

The frequency-control unit using the same principles, built by Lyle Peer, W2ACB, has a somewhat different mechanical arrangement and directly-calibrated dial. The inner scale of the upper dial indicates the number of revolutions of the lower dial.

independent of minor changes in supply voltage and output coupling. Careful measurements have shown, however, that the optimum adjustment of such things as screen to plate voltage ratio is dependent on L/C ratio, and consequently is not uniform over a frequency band.

To avoid the necessity for critical adjustments to obtain freedom from supply voltage and loading effects on the frequency, it was decided to eliminate the causes rather than to attempt to compensate for them. The supply voltage variations were easily disposed of by the use of a modification of the voltage-regulated power supply described in August, 1937, QST.<sup>1</sup> Variations in

<sup>&</sup>lt;sup>1</sup>Grammer, "Battery Performance from the R.A.C. Power Supply," QST, August, 1937.

loading on the oscillator were eliminated by using an untuned buffer amplifier lightly coupled to the oscillator circuit. These two expedients, together with complete shielding of the oscillator circuit, have the additional advantage of almost entirely eliminating any effect on the frequency by tuning of subsequent transmitter circuits.

5-µµfd. midget variable.

8

1 1

ີບໍ່ບໍ່

So long as no loading or supply voltage variations are to be permitted, there is no need for tolerating the complications of an electroncoupled oscillator. Accordingly, the 6J5 tube was selected, since it has the lowest interelectrode capacities of any of the suitable conventional tubes. The metal variety was used, and so mounted that its base pins project into the oscillator compartment, thereby achieving very complete shielding.

Some oscillators are so sensitive to vibration that the family cat tiptoeing across a feather bed will sound like a hammer shop. This condition is caused by poor selection of components, or poor mechanical design. Contrary to popular belief, the answer is not to use large coils, massive condensers and copper tubing connections. Rather, the frequency-determining components should be small and light, and, of course, of good quality. They should be sturdily mounted as compactly as possible, with all leads as short as

The oscillator circuit is in the small compartment at left center. The oscillator tuning condenser and that of the output stage are ganged together and driven by a worm gear taken from an old b,c. dial unit. Stiff wiring here how intertiandly. has been intentionally avoided to reduce vibration troubles.

practicable. Bus wire connections with rightangle bends and straight runs like the highways in Kansas look nice, but are susceptible to vibration.

The new wax-treated silver-plated mica fixed condensers, such as Sickles "Silver Caps" and Cornell Dubilier "Silver Mikes" possess about the same electrical stability as air dielectric condensers, and are much easier to mount mechanically. Either may be used for the fixed padders. Large air condensers with thin plates, such as broadcast tuning condensers, are particularly to be avoided because of their large size and poor mechanical stability. The variable condensers in the oscillator circuit should have small, light, stiff plates, wide air gap, and — of course — good bearings.

Plug-in coils and coil-switching devices have never contributed to stability, and should be avoided. With modern tubes, doubler and quadrupler stages are so simple and cheap that there is seldom any need for operating the frequency determining circuit on more than one band.

#### **Circuit Considerations**

With these points in mind, the stabilized oscillator unit shown in the photographs was developed. Referring to the schematic diagram, Fig. 1, the variable oscillator, which covers a frequency range from 1750 to 2050 kc., uses a conventional modified Hartley circuit, with the plate of the tube  $(VT_1)$  at r.f. ground potential, and the cathode tapped up on the tank coil. The condenser  $C_3$  is the 200- $\mu\mu$ fd. fixed padder,  $C_4$  a 25- $\mu\mu$ fd. variable padder for band setting,  $C_5$  the 100- $\mu\mu$ fd. tuning capacitor, and  $C_6$  the 20- $\mu\mu$ fd. titanium dioxide temperature compensator. Altional condenser having a variation of 2 or 3  $\mu\mu$ fd., and readily accessible, is desirable for

QST for

output amplifier are near the front panel.

A view of the chassis, with the cabinet removed. The power supply is along the rear edge, the regulator tube being beside the 80 rectifier. The tube near the far edge, in front of the power transformer, is the control tube for the regulated supply. The oscillator tube and 6V6 buffer are spaced on either side of the band-setting control, just in front of the power supply. The crystal oscillator and

bringing the oscillator back on calibration in case of ageing of components. It can consist of a twoplate double-spaced Hammarlund APC, or can be constructed as shown in Fig. 3.

The coil  $L_1$  must be tightly wound on any available low-loss form (preferably ceramic) of suitable size and must, of course, be mounted rigidly. The size given in the parts list was determined by the form available and was found to be about right.

These oscillator components, together with  $C_1$ ,  $C_2$ ,  $R_1$  and the bottom side of the socket for  $VT_1$ , must be in a shielded compartment. This compartment should be no larger than required to provide space for the components with reasonable clearance, and must be sturdily constructed of at least  $\frac{1}{16}$  inch material.

The oscillator must be lightly loaded for high stability, and it was found that using the oscillator cathode tap as the loading tap provided adequate excitation without too much loading.

 $VT_2$  the buffer amplifier, should be so located that its excitation lead can be as short as possible after leaving the oscillator compartment.

There is nothing particularly critical about the remaining circuits. Good practice should of course be followed, but the stability has already been determined when the oscillator section is complete.

The tetrode buffer,  $VT_2$ , is impedance coupled to the grid of  $VT_4$  by means of the untuned choke  $L_2$ , the capacitor  $C_{11}$  and the grid leak  $R_8$ .

The Pierce crystal oscillator  $VT_3$  uses these same coupling components, and is provided with a switch  $S_1$  for selecting any one of three crystals. A fourth position on the switch disconnects all crystals and grounds the grid. Normal operating cathode bias for the crystal oscillator tube is produced by the voltage drop in  $R_5$ . When the grid is grounded, the voltage drops in both  $R_5$  and  $R_6$  are applied as bias, reducing the plate current to a very low value.

The output tube  $VT_4$  receives its excitation from either the buffer  $VT_2$  or the crystal oscillator  $VT_3$ , and can operate as an amplifier on 1750-2050 kc., or as a doubler with 3500-4000 kc. output. Since its tank circuit has negligible effect on frequency, plug-in coils are used for  $L_3$  to cover these two bands.

The 25- $\mu\mu$ fd. output tuning condenser  $C_{14}$  is ganged with the oscillator tuning condenser  $C_5$ for single-dial control. Those who may have experienced trouble attempting to line up ganged condensers in a receiver may be reluctant to attempt ganging these condensers, but it will be found to be a much simpler proposition, mainly because of the heavy loading on the output tube and the fact that a relatively narrow band is to be covered. As a matter of fact, the coils for the original model were designed with a Lightning Calculator, and found to track adequately with no changes. In addition, the 100-µµfd. padding condenser  $C_{15}$  is brought out to the front panel, making compensation convenient for any mistracking or output loading.

Note that the output tuning capacitor  $C_{14}$  has 25- $\mu\mu$ fd. maximum capacity, while the oscillator condenser,  $C_5$ , which is gauged with it, has 100  $\mu\mu$ fd. This does not complicate tracking, with the

## **Portable Kinks**

#### Useful Circuit and Antenna Ideas

#### BY HARRY W. DREYER,\* WIANC

THE writer has lived — and operated ham rigs — in about seventeen different locations, principally in New England, Long Island and Chicago, in the past too many years, so that a change of QTH is no longer a thrill. The structures housing the ham equipment have varied from penthouses to one-room cabins in the Maine woods, with excursions into 12-foot row boats and the engine room, 100 feet underground, of a large

Fig. 1 — The traced-out antenna system when the antenna post on a b.c. receiver is connected to a "ground."  $C_1$  and  $C_2$  are capacities from the primary of the power transformer to core and chassis. Man-made static comes in through the power line and develops a voltage across the antenna coil between chassis and the pipe ground,  $G_1$ .

hotel near Grand Central Station, New York (the antenna was down there, too). Ham radio worked at all these places — some better, some worse, but all better than no hamming at all. The following remarks are the story of a series of things learned in meeting unusual problems offered at various locations.

Probably the first thing that worries the average ham who moves into a new and unusual QTH is the antenna. He usually thinks of the antenna

18

as the whole radiating system, and more often than not, if a c.w. man, does not even connect a wire to a "ground" because the rig works FB without it.

Actually the radiating system may be a farflung network, including everything that has r.f. in it (said r.f. originating somewhere in the rig). We are all familiar with the weird and unwanted lighting up of lamp bulbs on the front porch or even as far removed as on the neighbor's premises. These are examples of extended radiating systems where current maxima happen to come at or near lamps. That they put out our signals to other states, countries and even continents is not questioned, but obviously they are not the most efficient radiating systems that can be devised. And they are usually the finest producers of key clicks and 'phone QRM. So what to do?

Every ham who has done b.c. service work knows that almost any 110-volt b.c. set will bring in husky signals if its "ANT" post is connected to the nearest "ground" — steam radiator, water pipe or sometimes a BX line or gas pipe. In the joy of discovering this cheap antenna it is usually not noticed that such a connection also is most efficient in bringing in all forms of man-made static, clicks, dial-'phone QRM, etc. Look at Fig. 1 and you will see that the chassis is not grounded, and that reception is possible in a way that the designer never intended.

Now this may seem to have little bearing on a ham transmitter installation, but consider Willie Jones who has just moved his 40-watt rig into a new QTH and hitches it to an abandoned b.c.l. antenna about 50 feet long, loads up his final and proceeds to contact the 80-meter c.w. band with good average efficiency and better than good

Fig. 2 — Tuned ground lead for use where the set is located some distance from the actual ground.

<sup>\*34</sup> Prospect St., Terryville, Conn.

enthusiasm. Let us ask ourselves (but not Willie), what is his radiating system? Well, something less than a quarter wave of it may be on the 50-foot b.c. antenna. Where is the other quarter wave? You can find it if you go looking for it with a sensitive r.f. meter, and if Willie happens to have 400 watts instead of 40 you will find the current maxima lighting up lamps in curious places.

We do not pretend to have a cure-all for all of these troubles, especially those where the radiating portion of the antenna passes over and close to the house, but we have cured some bad ones. Generally the nearest thing to a good ground in any house is the cold water pipe, right where it comes through the cellar wall from the street. As a ground for low frequencies, audio units, power packs and such, a wire run to it will generally be o.k. no matter what its length. But if your antenna feed system is such that the chassis of the final wants to be "hot," a wire to this water pipe will not work if it is more than a couple of feet long. In most cases, just don't ground the chassis, or else ground it through an r.f. choke so it will be an audio ground only. However, one or two cases we have found yielded to the treatment shown in Fig. 2. This is, in effect, a ground wire  $\frac{1}{2}$  wave long and it is a part of the radiating system, but Almost any title we might pick for this article would fail to give a complete idea of its contents. We'll sum it up by saying that it contains a lot of useful suggestions, chiefly in connection with portable operation under conditions where good antennas cannot be secured, but with other ideas suitable for fixed-station operation as well. You'll be tempted to try them.

perfect, though it may be near enough so that no serious trouble will occur. Few commercial rigs will pass this test.

We want to put the major portion of our r.f. into a radiating system as high and as clear of surrounding objects as possible. But compromises are a part of our daily life, and only experience teaches what violent compromises frequently will work quite well. Often the ham whose family leases a shore cottage for one or two months in the summer leaves all his gear home because the cottage is only one story high — 15 feet, maybe — with no trees near. So he says, "What's the use?" This is an appalling mistake. A QTH near

Fig. 3 — Shore location and antenna of WIANC/1 at Grove Beach Point, 1938 B.H. (before hurricane).

it won't light the neighbor's Mazdas because both ends of it are at zero potential and it transfers no energy into 110-volt mains provided it does not run close to and parallel to an open wire. LC looks like a wave trap but is not. L and C are not the correct values to produce resonance for the signal frequency; they simply combine to form some value of reactance, either inductive or capacitive, which we select by varying them.

When the radiator is fed by a non-resonant transmission line or center-fed by a tuned line these troubles rarely occur. End-fed Zepp jobs often are bad offenders. Single-wire fed doublets also give some trouble. Or any sort of improperlyadjusted antenna and feeder system can do it.

If the radiator is one-half wave or more long, an r.f. ground should not be needed. A good test is to observe whether connecting a ground wire to the chassis of the final changes the r.f. current or voltage materially at any point in the radiating or feeding system. If it does, all is not 100% salt water is one where great height above ground is distinctly not needed. Look at Fig. 3, a sketch of W1ANC/1 on Long Island Sound, one of the best locations we have ever had. The antenna is unorthodox, being grounded at its far end in the waters of the Sound. In addition to working FB. it gave continuous lightning protection and didn't spill any of our precious 20 watts around the surrounding 110-volt lines. With a rig consisting of a 42 e.c.o. and a single 6L6 final at 400 volts, we were able to contact Europe about a half hour before the high-power New York and Long Island boys on 40-meter c.w. On 80 c.w. our reports within sensible distances were S8 and S9. On a sked to Norfolk, Va., at noon on 40-meter c.w. we were always S7.

A different sort of trouble was encountered in a one-room shack in the woods near Ellsworth, Maine. Both transmitter and receiver were operating from a Vibrapack and 6-volt battery, and it seemed impossible to get rid of the vibrator

### **July 1940**

Fig. 4 -- Converting a receiver using 6.3-volt tubes to 6-volt battery-vibrator pack operation.

hash because no ground connection was available. You couldn't drive a pointed drill rod into the ground anywhere within shooting distance of the cabin; there was no well, no buried metal pipes, and it was winter so we couldn't bury anything if we had had it. Purely by accident it was found that about 200 feet of antenna wire laid at random on top of the ground, over brush and stumps, gave a ground that removed most of the hash from the pack and also reduced most of the ignition QRM from the gas-driven charger which was our only source of power and light.

The antenna at this location was hung high up in a spruce tree without climbing it. About 175 feet of mason's cord with a 2-pound fishing sinker was laid carefully out on a hard road so that it would not snarl. A couple of husky overhand swings and a heave put the sinker over a branch about 70 feet from the ground. Some judicious jiggling of the line was needed to get the sinker back down to the ground. Then a length of No. 16 enamelled copper-steel wire was pulled up over the branch, an insulator spliced in, and pulled up to a convenient height. The excess wire coming down from the branch was coiled and fastened at a height and concealed from the local small fry. Many antennas have been put up this way by the writer, who is at the half-century mark in years and not as active in climbing as formerly.

#### **Receivers and Transmitters**

A word now about receivers at portable locations may not be amiss. Many have been described in these pages - good ones all, no doubt - but the author has always wanted his own pet communications receiver to use. It is very easy to do if you have a good 6-volt battery and reliable means of charging it, also a vibrator powerpack — the same one you will use on the transmitter. We happen to have a Hammarlund HQ120, but believe the same remarks apply to all modern communication receivers using 6.3volt tubes. As shown in Fig. 4, the wiring changes

are amazingly simple, and to change back and forth between 6-volt and 110-volt operation is a matter of seconds. Break in on the heater circuit near the transformer and bring out a pair of wires to two binding posts. Provide a removable jumper (or a switch) to return to 110-volt operation. Next, make up a 4-wire cable, with two of the wires terminating in a tube base of the type that will plug in the rectifier socket in your set (5Z4 in the HQ120). These two wires carry plate voltage to the filter in the receiver, and the other two carry 6-volt current to the heaters. The former two are connected to the prongs going to the two plates (negative) and the heater or filament of the rectifier (positive). No additional filter was necessary on the HQ120. Hash could be heard in the presence of no signal, but did not register on the "S" meter. A signal of even ½S was enough to squelch all of the hash. A curious result of this extremely low noise level was noticed in b.c. reception. Good reception during all daylight hours was had from WSB, Atlanta,

Fig. 5 - A simple portable 160-meter 'phone outfit, using a 6N7G m.o.p.a. and 6L6 modulator. The Hartley oscillator provides neutralizing voltage for the amplifier, using the plate-to-plate capacity of the double triode as a neutralizing condenser. Neutralization is accomplished by adjusting the oscillator cathode tap. C1, C2 - 700-µµfd. variable (two sections of 350-µµfd.

- R1, R2 50,000-ohm compression-type carbon variable resistors. Fixed resistors may be substituted, after experiment to determine optimum values. R3 - 200 ohms, 2-watt.
- R4-25,000-ohm variable (adjust for 200 volts on oscillator plate).
- -25 turns No. 14 enamelled, diameter 11/2 inches, length 2¼ inches, with adjustable tap. - 30 turns No. 14 bare, diameter 2½ inches, length
- La 4 inches, Tappable every turn.
- -S. b. microphone transformer. Tu-
- $T_2$  Output transformer, 1:1 or 1.5:1. NC Capacity between plates of 6N7G.
- RFC 2.5 mh. r.f. choke.

whose signal stayed at a constant S2. At night, fading and heterodynes spoiled it badly. Signals on the 28-Mc. amateur band were present 24 hours a day, although after dark only the 4th and 5th districts were heard. Any signal S1 or better was QSA5. No serious attempt was made to log extreme DX sigs because it was during the period of World War No. 2.

Reams have been written about portable transmitters, and ours were not worthy of additional description except as to the output circuit used. Just one transmitter was made, using a 6N7G tube as two triodes in a neutralized m.o.p.a. circuit, with a single 6L6 driven by a carbon mike for the modulator. It is thought that this circuit realizes nearly the maximum stable output on 160-meter 'phone that can be had from one 6-volt battery and vibrator pack. Its circuit is shown in Fig. 5. It will be noticed that the fixed capacity between the two 6N7G plates is used as a fixed neutralizing capacity, adjustment being made by varying the tap on the Hartley oscillator. It worked FB.

#### — And a Flexible Output Circuit

Our only other contribution is a rather unusual and very flexible output circuit which really goes back to the days of spark. But like old Limberger, it is still good. A variation of it is still in use at permanent W1ANC in Terryville, Conn., and is a constant source of amazement to the many visiting hams who are more thoroughly grounded in the more conventional circuits. Fig. 6 is about it. The final is a TZ40 on 160, 80, 40 and as a doubler, weakly, on 20 (60 watts). The tuned circuit is  $L_1$  and the combination of  $C_1$  and the

Fig. 6 — Band-switching output circuit for matching a wide range of impedances. The amplifier is grid neutralized, thus avoiding plate-tank complications. Condensers  $C_1$  and  $C_2$  are described in the text. The diagram shows the method of connecting to a two-wire feeder system. For a grounded antenna or single-wire feed, switch S is closed and the antenna or feeder connected to the lower side of  $C_2$ . Loading is adjusted by varying  $C_2$ , the tank being re-resonated by  $C_1$  after each change in  $C_2$ . With tuned feeders, avoid exact multiples of a quarter wave in line length, since these represent points of very high or very low impedance, which are difficult to match. Intermediate lengths can be matched without difficulty.

Fig. 7 — Simplified output circuit connected to various types of antennas, mostly unorthodox arrangements used in portable work or where space is quite limited. The tank coil is described in the text. Sufficient tuning condenser capacity should be provided to give about 2  $\mu_{\mu}$ fd. per meter, since there is no additional selectivity between tank and antenna to suppress harmonics. A 350- $\mu_{\mu}$ fd. condenser will serve for 160, 80 and 40 meters. The coil should be wound of bare wire so every turn can be tapped; the smallest Mueller phosphor-bronze test clips are quite satisfactory for the purpose.

When the total length of wire in the loop arrangement, Fig. 7-C, is less than H<sub>0</sub> wavelength, the circuit at 7-D should be used. Fig. 7-E is for extremely short wires, such as a 10-foot antenna used on 1.75 Mc.

two sections of  $C_2$  all in series.  $C_1$  is made from two old Cardwell  $0.001-\mu fd.$  (43-plate) b.c. condensers which have been double spaced, ganged and their stators connected in parallel. This results in a good high-voltage condenser of about  $400-\mu\mu fd.$  capacity. (Needless to say, this combination has seen service in almost as many other final stages as there are prongs in a rake.)

 $C_2$  is a large, wide-spaced 4-gang b.c. con-(Continued on page 80)

## $\star$ WHAT THE LEAGUE IS DOING $\star$

#### SPECIAL ELECTION NOTICE

#### To all A.R.R.L. members of the Southwestern Division:

Y ou are hereby notified that a special election is about to be held in the Southwestern Division to elect a director to fill the vacancy left by the resignation of Chas. E. Blalack, W6GG, to become vice-president of the League. The election will be for the unexpired remainder of the 1939–1940 term, plus the next regular term of two years, 1941–1942, as provided in By-Law 24.

If more than one eligible candidate is named, voting will take place during the month of September, 1940, on ballots that will be mailed from the headquarters office in late August.

Nomination is by petition. Nominating petitions are hereby solicited. Your attention is invited to the pertinent portions of the Constitution and By-Laws of the League, a copy of which will be mailed any member upon request. Ten or more A.R.R.L. members residing in the Southwestern Division may join in nominating any eligible West Gulf member of the League as a candidate. The following form is suggested:

Executive Committee

The American Radio Relay League West Hartford, Conn.

We the undersigned members of the Southwestern Division, hereby nominate ....., W6..., of ....., as a candidate for director from this division for the remainder of 1940 and for the next following full term of 1941-1942.

#### (Signatures and addresses)

The signers must be League members in good standing. The nominee must have been both a member of the League and a licensed radio amateur operator for a continuous term of at least four years immediately preceding receipt by the Secretary of his petition of nomination, except that a lapse of not to exceed ninety days in the renewal of the operator's license and a lapse of not to exceed thirty days in the renewal of membership in the League, at any expiration of either during the four-year period, will not disqualify the candidate. He must be without commercial radio connections: he may not be commercially engaged in the manufacture, selling or renting of radio apparatus normally capable of being used in radio communication or experimentation, nor commercially engaged in the publication of radio literature intended, in whole or part, for consumption by licensed radio amateurs. Further details concerning eligibility are given in By-Law 12. His complete name and address, and call, should be stated. All petitions must be filed at the headquarters office of the League in West Hartford, Conn., by noon E.S.T. of the 20th day of August, 1940. No member shall append his signature to more than one petition. To be valid, a petition must have the signatures of at least ten members in good standing. Petitioners are urged to have an ample number of signatures, since nominators are frequently found not to be members in good standing.

Balloting will close at noon, October 1, 1940, and the successful candidate will take office as soon as the result can be determined.

This election constitutes an important part of the machinery of self-government in A.R.R.L., and members are urged to take the initiative and file nominating petitions immediately.

For the Board of Directors:

K. B. WARNER, Secretary

June 4, 1940

#### THE 1940 BOARD MEETING

THE Board of Directors of the A.R.R.L. came back to Hartford for their 1940 two-day annual session at the end of May. Most of the directors coming in a day early on the Memorial Day holiday, there was time to inspect the headquarters station and the headquarters offices, to pound brass at W1AW, and to play with some of the new gadgets in the QST lab. Then for two days the Board was in executive session, with every director present. Their reports showed continued growth in League membership and activity, a general feeling of satisfaction on the part of amateurs with the way the League has been handling their affairs, and a spirit of unity that we need for the trying days ahead. The minutes of the meeting are here reproduced for your information. A great many things of importance happened and you owe it to yourself to read the minutes carefully because we have space and time here to summarize them but briefly.

The sad state in which the world finds itself these days naturally was reflected in our affairs at this meeting by the Board. The full cooperation of amateur radio is being offered our Government in any way in which it may be needed. All through the Board meeting the feeling kept cropping out that amateur code proficiency was one of the most important things these days, and

the officers of the League were directed to take certain steps that will help amateurs to build up their code proficiency and make them conscious of its great importance. Realizing that things can move very fast at such a time as this, and that multi-men committees and boards might be too slow to deal with an emergency concerning our frequency bands, the Board made a very large grant of powers to the President to act as a committee of one in such a crisis, following a unanimous recommendation to this effect by the Committee on Amateur Frequency Assignments. We hope it will never come to that, but we are ready. Steps were also ordered taken to unite amateur opinion in the two Americas, in keeping with the fact that of major countries it is now only Latin America and ourselves who remain on the air. We need members, too, and every active amateur ought to be a member of the League, that we may move in concert — and so the Board appointed a new Membership Committee to build up League membership.

As usual at Board meetings, the question of 'phone allocation came in for a long consideration. At the end, it was decided to print a proposition in QST and take a poll of amateur sentiment on it. It will be printed next month. Briefly, the plan is to see whether you approve widening the 'phone allocation to 3800-4000 kc. and also, separately, whether you approve widening and shifting the 20-meter allocation to 14,000-14,200kc. If you do, and if the Commission is willing, the Board is disposed to go ahead with the proposals. If you turn them down they will die there — at least for another year.

On the business side, you will remember that the Board last year appointed a committee to engage a firm of business engineers to make a survey of the League headquarters establishment. This job was finished this spring and the report made to the directors. It is only natural that they should have found room for improvement, but in general they found the headquarters highly satisfying and so advised the Board in a report of 67 pages and many tables and charts. This report the Board examined in considerable detail. The pertinent portions of it will be published soon by the Board, probably next issue, for your information. Acting upon a major recommendation of the report, the Board formed a Finance Committee to advise in the establishment of budgets, in approving investments, etc. This committee consists of Mr. Reid, chairman, and Messrs. Blalack and Hill. . . . Also on the business side, the Board again examined proposals for setting up a social security or retirement plan for League employees, who are not covered by the Social Security Act, but again rejected all proposals. . . . Appropriations totaled \$7825, being \$3200 for the cost of the meeting, \$3625 for director expenses in 1941, \$500 for the Finance Committee and \$500 available for sending SCM's and QSL Managers to their division conventions.

The Chicago gang was again authorized to throw a national convention in the autumn of 1941, subject to some contractual relations yet to be worked out.

The only requests to be made immediately of the F.C.C. are for the repeal of the "nuisance regulation" about every mike-user having to sign the log, and a plea for more examining points, particularly with a view to having one in each state... The Board shelved propositions to ask F.C.C. to open part of the five-meter band for television and part of the ten-meter for f.m.

On the administrative side, the Board examined and rejected a proposal that two of the division directors be selected to double as president and vice-president, but did adopt a provision excluding the president and vice-president from voting on changes of by-laws. They similarly declined to relax eligibility requirements, to authorize official delegates to conventions, and to expand the Royal Order of the Wouff Hong. A few changes in by-laws were made for administrative convenience. For the particular information of our Canadian members we should like to explain that the changes in by-laws concerning Canada are purely for convenience and that they are absolutely without change of effect or intention; in fact, the important two last by-laws are repeated in precisely the former language.

Amateur radio's liaison with the Red Cross was improved by the adoption of an expression of League aims and policies toward the Red Cross, a mutual recognition of the needs and capabilities of both organizations in time of community distress.

In the officers' elections held at the close of its annual meeting, the Board elected George W. Bailey, W1KH, as president of the League, succeeding Dr. E. C. Woodruff, W8CMP. Charles A. Blalack, W6GG, was elected vice-president, assuming the post relinquished by Mr. Bailey.

W1KH, well-known throughout the country because of his frequent appearances at hamfests and conventions, brings to his new post a thorough familiarity with amateur problems resulting from a long and active career on the air, as well as a business background and a personality wellfitted for leadership.

W6GG becomes the first Pacific Coast officer the League has had, and his election is expected to improve East-West liaison in A.R.R.L. affairs. He, too, has a long background of amateur experience and has been active in the Board as director of the Southwestern Division.

Dr. Woodruff, W8CMP, retiring as president after two terms in the chair, was elected to succeed the late Hiram Percy Maxim upon his death in 1936. The second president the League has had in all its quarter-century of existence, Dr. Woodruff has held high the torch of lofty idealism, of unquenchable devotion to the principles of public service and national responsibility, bequeathed him by his predecessor. Handed a hard job made harder by the stature of the man who came before him, he succeeded in it to a degree that only history will reveal. His wisdom and humility, his sincere love for amateur radio and his untiring labors in its behalf, have made him well-loved and long to be remembered.

The minutes follow:

#### MINUTES OF 1940 ANNUAL MEETING OF THE BOARD OF DIRECTORS AMERICAN RADIO RELAY LEAGUE

#### May 31-June 1, 1940

In compliance with the Constitution and responsive to due notice, the Board of Directors of the American Radio Relay League, Inc., convened in regular annual meeting at The Hartford Club, Hartford, Conn., on May 31, 1940, with Dr. Eugene C. Woodruff, President, in the Chair. The meeting was called to order at 10:03 A.M., Eastern Daylight Saving Time, and the opening roll call showed the following directors present:

Eugene C. Woodruff, President George W. Bailey, Vice-President Alexander Reid, Canadian General Manager E. Ray Arledge, Delta Division Charles E. Blalack, Southwestern Division Ralph J. Gibbons, Northwestern Division Ralph J. Gibbons, Northwestern Division Glen R. Glasscock, Rocky Mountain Division William A. Green, West Gulf Division W. Bradley Martin, Atlantic Division J. L. McCargar, Pacific Division Percy C. Noble, New England Division Floyd E. Norwine, Jr., Midwest Division William C. Shelton, Southeastern Division Fred W. Young, Dakota Division

Absent, R. H. G. Mathews, Central Division. There were also present Secretary K. B. Warner, Communications Manager F. E. Handy. Assistant Secretary A. L. Budlong and, as technical advisor to the Board, J. J. Lamb, A.R.R.L. Research Engineer. At the invitation of the Board, there was also in attendance as a non-participating observer, Alternate Director Russell Bennett, New England Division. The Chairman read a letter from Treasurer A. A. Hebert, sending his greetings to the Board and regretting his inability to be present because of illness.

On motion of Mr. Caveness, unanimously VOTED that the minutes of the 1939 annual meeting of the Board of Directors are approved in the form in which they were issued by the Secretary.

On motion of Mr. Green, unanimously VOTED that the annual reports of the officers to the Board of Directors are accepted and the same placed on file.

On motion of Mr. Caveness, after discussion, VOTED that all acts performed and all things done by the Executive Committee since the last meeting of the Board, and by it reported to the Board, are ratified and confirmed by the Board as the actions of the Board.

On motion of Mr. Blalack, after discussion, VOTED that the Board, having considered its mail action in which it decided not to call for new elections in the Central, Roanoke and Southwestern Divisions, pursuant to the 1939 revision of By-Law 21, now ratifies the action taken and decides to take this position as of September 18, 1939. Mr. Young requested to be recorded as voting opposed.

On motion of Mr. Green, unantmously VOTED that the Board, having considered its mail action in which it decided to refrain from requesting the Federal Communications Commission to open the frequencies 7200-7300 kc. to A-3 emission, now ratifies the action taken and decides to take this position as of September 29, 1939.

On motion of Mr. McCargar, unanimously VOTED that

the Board, having considered its mail action in which it decided that it had no objection to the opening of 59-60 Mc. to frequency-modulated voice transmission, now ratifies the action taken and decides to adopt this position as of February 19, 1940.

Mr. Bailey reported as chairman of the committee to arrange a business survey of the headquarters organization of the League, making reference to the survey report which had been rendered direct to the directors by Messrs. Boox, Fry, Allen & Hamilton, of Chicago. After extended discussion, on motion of Mr. Green, unanimously VOTED to accept the report of the survey and to discharge the committee with the thanks of the Board.

On the question of the report of the Committee on Amateur Frequency Assignments, on motion of Mr. Caveness, unanimously VOTED that at Chairman Noble's request the receipt of the report goes over until the morrow.

Mr. Martin presented a report as chairman of the Committee on the Royal Order of the Wouff Hong, and Mr. Blalack presented a dissenting report as a member of that committee. On motion of Mr. Green, unanimously VOTED to retain the committee and defer discussion of the subject until General Counsel Segal is present, Mr. Blalack then to have opportunity to present his views anew.

Mr. Reid made an oral report as Canadian General Manager. On motion of Mr. Caveness, unanimously VOTED that in view of the circumstances Mr. Reid's oral report is accepted. During the submission of director reports, Mr. Mathews, delayed en route, joined the meeting, at 11:35 A.M. In turn, every division director read and submitted a written report on conditions in his division.

The Board recessed for luncheon at 12:28 P.M., reconvening at 1:53 P.M. with all directors in attendance except Mr. Norwine, and with all other persons hereinbefore mentioned present.

Proceeding to a consideration of subjects raised by individual directors at their own initiative:

Moved, by Mr. Noble, that the regulations governing the affiliation of clubs with the League be revised to provide that 51% or more of the club members must be licensed amateurs, in addition to the present regulation requiring that 51% of the licensed members be members of the League. But, after discussion, the motion was rejected.

During the foregoing discussion, Mr. Norwine and General Counsel Paul M. Segal joined the meeting, at 1:59 P.M.

Moved, by Mr. Noble, that, in view of the fact that amateur radio in the United States gets a good deal of support from the War and Navy Departments (and that largely because of the amateurs' ability to handle code), and in view of the present action of this government in the matter of national defense, both the Secretary and the Communications Manager be instructed to put on a campaign through the pages of QST stressing the importance of the ability to handle fast code, and suggesting that amateurs send as fast, or a triffe faster, than the receiving operator can comfortably copy, for the purpose of increasing his code speed, and that radio clubs coöperate in giving their members the opportunity of increasing their code speed. On motion of Mr. Young, unanimously VOTED to amend the pending motion by substituting the words "code proficiency" for the expression "the ability to handle fast code." After further discussion, the question being on the amended motion, the same was unanimously ADOPTED.

Moved, by Mr. Norwine, that the Federal Communications Commission be requested to expand the 75-meter 'phone allocation to read 3800 to 4000 kc. The Board then engaged in a general discussion of the 'phone allocations in all bands, following which it was moved by Mr. Blalack that the motion be amended by striking out its entire text and substituting the following: "That a poll be taken by including in each copy of QST in the August, 1940, issue, a postcard with the return address of the League and the proper questions thereon, covering separately the matter of increasing 'phone frequency to read from 3800 to 4000 kc., and increasing 'phone allocations to read from 14,000 to 14,200 kc. Only votes of U. S. A. licensed amateurs are to be' tabulated, and must be received at headquarters by October 1, 1940. If 40% or more of the expressions received are in favor of either or both propositions, the Sccretary shall

QST for

ascertain how the Federal Communications Commission would regard a formal request from the League on the said subjects. He shall then advise the Board the results both of the poll and of his solicitation of F.C.C. sentiment, and shall seek the further instructions of the Board. That the Secretary is instructed to print in the issue of QST carrying the poll an article showing the reasons and justifications for the poll." After further discussion, the yeas and nays being ordered, the said question was decided in the affirmative: Whole number of votes cast, 14; necessary for adoption, 8; years, 13; nays, 1. Those who voted in the affirmative are Messrs. Arledge, Blalack, Caveness, Gibbons, Glasscock, Green, Hill, Martin, Mathews, McCargar, Norwine, Shelton and Young. Mr. Noble voted opposed. Messrs. Woodruff, Bailey and Reid abstained. So the motion was amended. The question then being on the adoption of the amended motion, and the yeas and nays again being ordered, the said question was decided in the affirmative: Whole number of votes cast, 14; necessary for adoption, 8; yeas, 8; nays, 6. Those who voted in the affirmative are Messrs. Arledge, Blalack, Hill, Mathews, McCargar, Norwine, Shelton and Young. Those who voted opposed are Messrs. Caveness, Gibbons, Glasscock, Green, Martin and Noble. Abstentions: Messrs. Woodruff, Bailey and Reid. So the poll was ordered in the language proposed.

At the instance of Mr. Gibbons, the Board proceeded to an examination of the report of the survey of the headquarters organization. On motion of Mr. Gibbons, ORDERED that Messrs. Handy, Budlong, and Lamb retire from the meeting. After discussion, on motion of Mr. Mathews, VOTED that the Board of Directors shall appoint a Finance Committee, in accordance with the recommendations of the survey, page 61, to act in an advisory capacity in the establishment of expense budgets and the results obtained in comparison to those budgets, and to approve investments and otherwise provide a check on the responsibilities of the Treasurer and of the Secretary; the committee to consist of three members elected by the directors from amongst their own number, and to serve for one year. On motion of Mr. Gibbons, the Board proceeded to the selection of a committee by ballot. Mr. Mathews nominated Messrs. Blalack, Caveness and Reid. Mr. Caveness withdrew his name. Mr. Noble nominated Mr. Bailey. Mr. McCargar nominated Mr. Hill. The Chairman appointed Mr. Segai as teller to canvass the balloting. The result was the selection of the following committee: Mr. Reid, chairman; Mr. Blalack; Mr. Hill.

On motion of Mr. Noble, after discussion, VOTED that, A. A. Hebert having retired as office manager and manager of credits & collections on the Secretary's staff, his salary as Treasurer of the League is fixed at \$2000 per year, effective June 1, 1940. Mr. Gibbons requested to be recorded as voting opposed.

The Board was in recess from 5:05 P.M. to 5:16 P.M.

After further extended discussion of the survey report, on motion of Mr. Gibbons, unanimously VOTED that the members of the Board are authorized to make this report available to any member of the League upon request.

At this point Messrs. Handy, Budlong and Lamb rejoined the meeting at the request of the Board.

Moved, by Mr. McCargar, to amend certain portions of the Constitution & By-Laws to read respectively as follows:

Section 2, Article III, Constitution: The President and Vice-President shall be elected by the Board of Directors from among their number and shall hold office for two years, or until their successors are elected and qualified, provided they continue to be members of the Board of Directors. The Secretary, The Communications Manager and the Treasurer shall be appointed by the Board of Directors.

Section 1, Article IV, Constitution: The affairs of the League shall be managed by a Board of Directors under the Constitution & By-Laws and the general provisions of the laws under which it is incorporated. The Board of Directors shall consist of one Director from

The A.R.R.L. Board of Directors at Hartford, June 1, 1940 The retiring president, Dr. Eugene C. Woodruff, W8CMP, stands in the front center.

July 1940

each of the several territorial divisions of the League in the United States and Possessions, elected by the members of the League thereof, and a Canadian General Manager.

By-Law 25: The President and Vice-President of the Leegue shall be elected by the Board of Directors at their annual session in presidential election year.

By-Law 26: The President and Vice-President shall be elected at the annual session of the Board of Directors held in each even-numbered year. Their terms of office shall begin at the conclusion of the meeting at which they are elected and shall continue for two years, or until their successors are duly elected and qualified, provided they continue to be members of the Board of Directors.

After discussion, the yeas and nays being ordered, the said question was decided in the negative: Whole number of votes cast, 15; necessary for adoption, 12; yeas, 2; nays, 13. Messrs. McCargar and Reid voted in the affirmative. Those who voted opposed are Messrs. Arledge, Blalack, Caveness, Gibbons, Glasscock, Green, Hill, Martin, Mathews, Noble, Norwine, Shelton and Young. Messrs. Woodruff and Bailey abstained. So the motion was lost.

Moved, by Mr. McCargar, that each A.R.R.L. affiliated club and/or A.R.R.L. section be authorized to send to its division convention one delegate for each twenty-five club or League members or fraction thereof, such delegation to carry to the convention any resolutions or other matters for consideration by the convention, and to speak for the club during discussions on resolutions. But, after discussion, the said motion was rejected.

Moved, by Mr. McCargar, that By-Law 12 be amended to provide that, amongst those declared to be eligible for directors, are "Persons conducting small service businesses that repair and service broadcast-listener receivers, or employees of such servicing businesses, provided they do not service or handle amateur equipment." After discussion, the yeas and nays being ordered, the said question was decided in the negative: Whole number of votes cast, 15; necessary for adoption, 12; yeas, 2; nays, 13. Messrs. Arledge and McCargar voted in favor. Those who voted opposed are Messrs. Blalack, Caveness, Gibbons, Glasscock, Grean, Hill, Martin, Mathews, Noble, Norwine, Reid, Shelton and Young, Messrs. Woodruff and Bailey abstained. So the motion was lost.

The Board recessed for dinner at 6:42 P.M., reconvening at 8:05 P.M., with all directors and other persons hereinbefore mentioned in attendance.

Moved, by Mr. McCargar, that By-Law 54 be amended to read as follows:

54. These By-Laws may be amended in any part by a two-thirds vote, to be determined by yeas and nays, of the entire membership of the Board of Directors, excepting the President and Vice-President, at any meeting; or, provided due notice of such proposed amendment shall have been submitted every Director at least sixty days in advance, they may be amended by a two-thirds vote, to be determined by yeas and nays, of the Directors present at any meeting, excepting the President and Vice-President, a quorum being present and voting. They may not be suspended except in the particular cases provided for in the By-Laws themselves.

The yeas and nays being ordered, the said question was decided in the affirmative: Whole number of votes cast, 15; necessary for adoption, 12; yeas, 12; nays, 3. Those who voted in the affirmative are Messrs. Arledge, Blalack, Caveness, Gibbons, Martin, Mathews, McCargar, Noble, Norwine, Reid, Shelton and Young. Those who voted opposed are Messrs. Glasscock, Green and Hill, Messrs. Woodruff and Bailey abstained. So the by-law was amended as proposed. Mr. McCargar requested the Secretary to make record of his proposal to amend Article VII of the Constitution in the same manner at the next meeting of the Board.

On motion of Mr. Glasscock, unanimously VOTED that the Communications Manager is directed to provide the directors a summary of the results of the frequency-measuring tests of Official Observers after each test. On motion of Mr. Glasscock, unanimously VOTED that the President is directed to appoint a committee of three members of the Board as a Membership Committee, to increase League membership.

Moved, by Mr. Glasscock, that there be included in the poll of amateur sentiment hereinbefore provided, the question of moving the 14-Mc. 'phone allocation to the highfrequency end of the band instead of the low-frequency end. But, after discussion, the motion was rejected.

Moved, by Mr. Shelton, that the Federal Communications Commission be requested to open part of the fivemeter band to television. At the request of the Board, Mr. Lamb discussed the technical implications. But, after further discussion, the motion was rejected.

On motion of Mr. Shelton, unanimously VOTED that the League, through its Secretary, shall work towards the establishment of a F.C.C. examining point in every state, the objective being the eliminating of the large numbers of Class C licenses now existing.

Moved, by Mr. Shelton, that the Section Communications Manager be allowed to meet with the director in joint meeting at the expense of the League, in lieu of attendance at state or division conventions, this meeting to be held directly before the Board meeting. But, after discussion, the said motion was rejected, 5 votes in favor to 9 opposed.

Moved, by Mr. Blalack, that that section of the By-Laws appearing under the heading "Canada" and now comprising By-Laws 28 to 36, inclusive, be simplified to read as follows:

#### CANADA

28. A Canadian General Manager and an alternate shall be elected in each odd-numbered year. All the provisions of these By-Laws affecting or governing directors and alternate directors from the divisions of the League in the United States and Possessions shall apply to the Canadian General Manager and his alternate; provided, however, that the holders of these offices, and their nominators, and any petitioners for a witness to the counting of the ballots, and any such witness, and any petitioners for removal, and any committee members or assistants appointed by the Canadian General Manager, must be Canadian members of the League.

29. The Canadian General Manager shall be a member of the Board of Directors. He shall be the liaison officer of the League between the Board of Directors and its Canadian members. He shall have general supervision of League activities in Canada and shall be responsible to the Board of Directors for League welfare in all matters in Canada. He shall keep himself informed on conditions and activities in Canada and on the needs and desires of League members therein, that he may faithfully and intelligently represent them in the Board of Directors. He shall, so far as able, attend all meetings of the Board of Directors. At each annual meeting of the Board, he shall present a written report on the status of the affairs of the League in Canada.

30. The policy of the League in Canada shall be that of a friendly hand for the amateurs of a sister country pending their growth to such numbers and strength that their ability to form and conduct a self-governing non-commercial amateur organization throughout the Dominion is evident. The activities of the League in Canada shall be regarded as a temporary stewardship undertaken at the request of Canadian amateurs. Whenever Canadian amateurs shall petition for their own organization, and it is manifest to a majority of the entire Board of Directors that the success of a separate Dominion organization is assured, the Board of Directors shall aid in establishing and proclaiming a separate all-Canadian organization to be known as the Canadian Radio Relay League to operate under a constitution similar in tenor to that of this League; and this League shall thenceforth relinquish all direct activity in Canada.

The yeas and nays being ordered, the said question was decided in the affirmative: Whole number of votes cast, 15; necessary for adoption (in view of the amendment of By-Law 54), 10; yeas, 15; nays, 0. Every director voted in the affirmative, except the President and Vice-President. So the by-laws were amended as proposed.

Moved, by Mr. Blalack, that in the two places each in By-Laws 21 and 31 where there is reference to a period of two months, the word "two" be changed to "three." The yeas and nays being ordered, the said question was decided in the affirmative: Whole number of votes cast, 15; necessary for adoption, 10; yeas, 15; nays, 0. Every director voted in the affirmative, except the President and Vice-President. So the by-laws were amended as proposed.

Moved, by Mr. Blalack, that the Board approve a tryout in the Southwestern Division of the plan submitted for the expansion of the Royal Order of the Wouff Hong as a more active function of the League; that the sum of \$250 be appropriated for the tryout under the terms and conditions set forth in the plan; that the Treasurer of the League be appointed as the executive secretary-treasurer; that Directors McCargar, Norwine and Blalack be appointed a committee to make such minor changes in the plan as they deem necessary before the same is put into operation. But, after discussion, the said motion was rejected.

The Board adjourned at 9:02 P.M. under order to reconvene at the same place at 9 A.M. on the morrow. The Board did reassemble at the same location on June 1, 1940, and was called to order at 9:20 A.M. with all directors in attendance except Mr. Arledge, and all other persons hereinbefore mentioned except Mr. Segal.

Continuing in a consideration of matters raised by individual directors at their own initiative:

On motion of Mr. Green, after discussion, unanimously VOTED that the Board of Directors shall publish in QSTthe substance of the findings of the recent survey of headquarters, for the information of the membership.

On motion of Mr. Green, unanimously VOTED that, as a matter of A.R.R.L. policy, the General Manager shall offer to our Government the full coöperation of amateur radio in any national emergency, in whatever manner they deem best.

On motion of Mr. Green, unanimously VOTED that the sum of five hundred dollars (\$500) is hereby appropriated from the surplus of the League, as of this date, for the use of the Finance Committee, any unexpended remainder of this sum on the date of the next annual Board meeting to be returned to surplus.

On motion of Mr. Green, VOTED that the General Manager is instructed to have some one of his staff concentrate very strongly on the Latin-American amateur situation, in order to unite amateur opinion in the two Americas.

Director Arledge and Mr. Segal joined the meeting at 9:58 A.M.

Moved, by Mr. Green, that the Board set up a committee to study the advisability of streamlining our organization, speeding up its actions, possibly eliminating the Executive Committee; and to draw up legislation to that effect and to see that it is presented sixty days prior to the next Board meeting. But, after discussion, the said motion was rejected.

At the request of Mr. Green, unanimous consent was given Mr. Handy to outline recent relations with the American Red Cross, After discussion, on motion of Mr. Green, unanimously VOTED that the following statement of an understanding negotiated by Mr. Handy with the Red Cross is adopted as an expression of League aims and official policy towards the American Red Cross:

The purpose of this understanding between the American Red Cross and the American Radio Relay League is to secure maximum coöperation in time of disaster.

The Board of Directors of the American Radio Relay League at its meeting June 1, 1940, considered the relationships of the American amateur radio fraternity with the American Red Cross in time of disasters involving disruption of communication.

The American Radio Relay League recognizes the American Red Cross as the agency chartered by Congress to represent the American people in carrying on disaster relief and therefore as the primary agency.

The American Red Cross recognizes that amateur radio service, because of its excellent geographical station coverage, and especially the available stations

## July 1940

possessing emergency power supply, can render valuable aid in reëstablishing communication when other facilities have been disrupted.

The American Red Cross welcomes the coöperation of the American Radio Relay League with local Red Cross chapters to extend radio planning into chapter jurisdictions and to correlate radio amateur operations to assure the best possible communications by such facilities. The coöperation with American Red Cross chapters may be furthered by individual chapters' designation of an American Radio Relay League Emergency Coördinator to serve as a member of the Red Cross Chapter Sub-Committee on Transportation & Communication as recommended in the Chapter Disaster Preparedness & Relief Manual, ARC 209.

On motion of Mr. Mathews, after discussion unanimously VOTED that the Secretary is instructed to recommend to the Federal Communications Commission the striking out of that part of paragraph b of F.C.C. Rule 152.45 which relates to the signing of the log of an amateur 'phone station by all persons using the microphone.

On motion of Mr. Mathews, after discussion, unanimously VOTED that the Board of Directors authorizes the Chicago Area Radio Club Council to hold an A.R.R. L. national convention in Chicago in the fall of 1941, subject to the terms of a satisfactory contract to be executed between the Council and the League, similar in tenor to that for the 1938 national convention.

On motion of Mr. Mathews, VOTED that the Secretary is instructed to give serious consideration to the many detailed recommendations of the organization survey and particularly to the matter of inefficient layout of office space. looking forward to the possibility of rearrangement at the time of lease renewal.

On motion of Mr. Young, affiliation was granted the following societies, whose applications had been investigated and approved by the respective division directors:

Amateur Radio Club of SavannahSavannah, Ga. Cahokia Amateur Badio ClubEast St. Louis, Ill.

Wall Street Radio Club

Moved, by Mr. Arledge, that a permanent advertising committee of three members elected from members of the Board by the members of the Board be elected each year and to serve until the following Board meeting for the purpose of passing on the eligibility of advertisers to the columns of QST when and before any advertiser is rejected by the Secretary or advertising manager; a vote of two to one being final. Extended discussion ensued, after which, the yeas and nays being demanded, the said question was decided in the negative: Whole number of votes cast, 15; necessary for adoption, 8; yeas, 6; nays, 9. Those who voted in the affirmative are Messrs. Arledge, Blalack, Mathews, McCargar, Shelton and Young, Those who voted opposed are Messrs. Caveness, Gibbons, Glasscock, Green, Hill, Martin, Noble, Norwine and Reid. So the motion was lost.

Moved, by Mr. Arledge, that the sum of five hundred dollars (\$500) be hereby appropriated from the surplus of the League, as of this date, for the purpose of defraying the traveling expenses of the Section Communications Managers of the League, within the continental limits of the United States, to attend one official A.R.R.L. convention within their respective divisions in the period between this date and the date of the next annual meeting of the Board; and for the further purpose of defraying traveling expenses of the

A.R.R.L. President George W. Bailey W1KH

QSL Managers of the League, within the continental limits of the United States, to attend one official A.R.R.L. convention within the call areas for which they are the respective QSL Managers during the time between this date and the date of the holding of the next annual meeting of the Board, provided that such convention be within a radius of 500 miles from the QSL Manager's place of residence; reimbursement to be made at the rate of two cents per mile via the shortest commonly-traveled route, plus one night's hotel accommodation at \$2.50, and an allowance of \$2.00 for convention registration fee; allowance of these expenses to be subject to approval by the Communications Manager upon examination of detailed report of the activities of the Section Communications Manager or QSL Manager at each such convention, to be submitted with his expense account; and any unexpended remainder of this appropriation at the date of the holding of the next annual meeting of the Board to be restored to surplus. Moved, by Mr. Young, to amend the motion by striking out the provision for QSL Managers; but the said motion was rejected, 5 votes in favor to 9 opposed. On motion of Mr. Martin, unanimously VOTED to amend the motion to substitute the word "the" for the words "\$2.00 for," so that the full amount of the convention registration fee is allowed. Moved, by Mr. Martin, further to amend the motion to provide an allowance of the railroad coach fare instead of two cents per mile; but the said motion was rejected. The question then being upon the adoption of the motion as amended in respect of the convention registration fee, the same was thereupon ADOPTED.

Moved, by Mr. Gibbons, that there be hereby appropriated from the surplus of the League, as of this date, the sum of three thousand two hundred dollars (\$3200) for the purpose of defraying the expenses of holding this meeting of the Board of Directors, any unexpeuded remainder of the sum to be restored to surplus. Moved, by Mr. Young, to amend the motion to provide that the Secretary be instructed to report to the directors the expenses of each director. Ruled, by the Chair, that the proposal for amendment is out of order but would be entertained later as a separate motion. Whereupon, the question being upon Mr. Gibbons' motion, the same was unanimously ADOPTED.

The Board recessed for luncheon at 12:25 P.M., reconvening at 1:50 P.M. with all directors and other persons hereinbefore mentioned in attendance.

Mr. Noble presented a unanimous report of the Committee on Amateur Frequency Assignments. On motion of Mr. Norwine, unanimously VOTED to accept the report as read and place the same on file.

Pursuant to the foregoing report, on motion of Mr. Noble, after discussion of the problem of preserving amateur rights in the present situation, unanimously VOTED (1) that the Board of Directors makes an open authorization of ten thousand dollars (\$10,000) for the defense of amateur frequencies; and (2) that the President of the League is appointed as a committee of one with full power to act at his own discretion and without supervision in the expenditure of this fund, without liability as to anything except misappropriation; and (3) that the President is requested, but not hound, to use the services of Messrs. Warner and Segal at any stage he may think necessary; and (4) if, in the judgment of the President, anything needs to be done, he is fully authorized by the Board—without consultation with it to speak for and on behalf of the Board in all aspects of protecting amateur operation.

On motion of Mr. Caveness, after discussion, unanimously VOTED that the sum of three thousand six hundred and twenty-five dollars (\$3625) is hereby appropriated from the surplus of the League, as of January 1, 1941, for the legitimate administrative expenses of directors in the calendar year 1941, said amount allocated to the Canadian General Manager and to the division directors as follows:

Canadian Conseral Manager	e 950
Vallaulah General Mallager	¢ ∴00
Atlantic Division Director	200
Central Division Director	450
Dakota Division Director	225
Delta Division Director	250
Hudson Division Director	200
Midwest Division Director	225
New England Division Director	175
Northwestern Division Director	250
Pacific Division Director	250
Roanoke Division Director	200
Rocky Mountain Division Director	-200
Southeastern Division Director	200
Southwestern Division Director	250
West Gulf Division Director	300

\$3625

any unexpended remainders of these funds at the end of the year 1941 to be restored to surplus.

On the question of the desirability of requesting that a portion of the 10-meter band be opened to frequency-modulated transmission, on motion of Mr. Caveness the subject was laid on the table.

On motion of Mr. Green, after discussion. unanimously VOTED that the Planning Committee is continued, with a vote of thanks from the Board to its present members.

On motion of Mr. Hill, unanimously VOTED that consent is given the Secretary to present data on a retirement plan for headquarters employees. The Secretary recalled his discussion of this question in his annual report, and presented a plan based upon an arrangement with an insurance company, the annual cost of which to the League would be approximately \$2400. Moved by Mr. Norwine, that the Board authorize the institution of the plan as submitted. But, after discussion, unanimous consent being given, Mr. Norwine withdrew the motion and moved that the sum of not to exceed three thousand dollars (\$3000) per year be placed at the disposal of the Executive Committee for the effectuation of a suitable retirement plan. But, after further discussion, the motion was rejected, 5 votes in favor to 10 opposed.

Moved, by Mr. Blalack, that directors' annual reports be submitted to headquarters four weeks before the annual meeting; that headquarters make copies of same and mail to each director copies of all reports, so that the same shall be received by the individual directors at least two weeks before the annual meeting. But, after discussion, the motion was rejected, 7 votes in favor to 8 opposed.

A.R.R.L. Vice-President Charles E. Blalack W6GG

## QST for

#### OFFICERS' REPORTS AVAILABLE TO MEMBERS

In April of each year the officers of the League make comprehensive written reports to the Board of Directors. The Board of Directors has made these reports available to the membership of the League. Interested members may obtain copies postpaid at the cost price of 50¢ per copy. Address the Secretary at West Hartford.

On motion of Mr. Young, unanimously VOTED that the Secretary is instructed to prepare a statement of the expenses of each person connected with the 1940 meeting of the Board and send it to all directors after the expenses are all determined.

Moved, by Mr. Noble, that one page of QST be devoted each month to emergency work — including rules for procedure and names of county and community coordinators. After discussion, with unanimous consent, Mr. Noble simplified the motion to provide that one page of QST be dovoted each month to emergency work. But, after further discussion, the motion was rejected.

On motion of Mr. Caveness, after discussion, unanimously VOTED that the 1941 annual meeting of the Board shall be held in Hartford on Friday and Saturday, May 9th and 10th.

Proceeding to the election of president and vice-president, on motion of Mr. Mathews, two-thirds concurring, Special Rule A was suspended. The Chair appointed Alternate Director Bennett and General Counsel Segal as Tellers. By special order of the Board, secret written nominations were made.

Nominations for president being in order, the Tellers announced that those nominated were Mr. Woodruff, Mr. Bailey and Fred H. Schnell of Chicago. The vote was then taken and the result of the ballot was announced by the Tellers as follows:

> Whole number of votes cast, 15 Necessary for election, 8 For Mr. Bailey, 11 For Mr. Schnell, 1 For Mr. Woodruff, 3

Mr. Bailey, having received a majority of the votes cast, was thereupon declared elected president of the League, for a term of two years.

Proceeding to the election of a vice-president, those nominated were Messrs, Blalack, Caveness, Reid, Schneil, Segal and Woodruff. The vote having been taken, the result of the first ballot was announced by the Tellers as follows:

> Whole number of votes cast, 13 Necessary for election, 7 For Mr. Blalack, 5 For Mr. Caveness, 2 For Mr. Reid, 2 For Mr. Woodruff, 4

No candidate having received a majority, a second ballot was ordered, the result of which was announced as follows:

Whole number of votes cast, 13 Necessary for election, 7 For Mr. Blalack, 6 For Mr. Caveness, 1 For Mr. Reid, 1 For Mr. Woodruff, 5

No candidate having received a majority, a third ballot was ordered, the result of which was announced as follows:

Whole number of votes cast, 13 Necessary for election, 7 For Mr. Blalack, 7 For Mr. Woodruff, 6 Mr. Blalack, having received a majority of the votes cast, was thereupon declared by the Tellers to be elected vicepresident of the League for a term of two-years.

On motion of Mr. Gibbons, the Board rose in token of appreciation of the splendid services of Dr. Woodruff to the League. (Applause.) Mr. Bailey spoke briefly in appreciation of the honor shown him by his election.

On the joint motion of Messrs. Mathews and Gibbons, the Board adjourned, sine die, at 4:58 P.M.

(In the course of its deliberations the Board also discussed, without formal action, an appeal by K6NYD in the matter of the 1939 DX Contest, communication with the Byrd Antarctic Expedition, code tests from W1AW, F.C.C. monitoring work, headquarters movie, b.c.l. image interference, emergency nets not devoted entirely to amateur activity, DX Contest rules, QST articles on home recording, the extension of Class A to the 160-meter band, automatic issuance of Class A after holding Class B three years, and the work of the Planning Committee, Total time in session, 14 hours, 13 minutes. Total appropriations, \$7825.)

> K. B. WARNER, Secretary.

## **Counting Words Per Minute Electrically**

#### A Combination Audio Oscillator and Counter for Code Practice

BY M. J. LARSEN\*

**T**HE device described herein was built as an aid for code instruction. The average speed in words per minute is indicated by a meter to enable the sender to keep a continuous check on his rate. For convenience, a code oscillator and power supply are included on the same chassis.

#### **Principle of Operation**

The principle of operation of the counter may be explained with reference to the circuit diagram of Fig. 1. The key operates relay 1. One lever of this relay operates the oscillator. The other lever is connected to the grid of  $V_2$ , a 2A3, which operates relay 2. Between characters the key is open, levers of relay 1 released, and the grid of  $V_2$  approaches the cathode potential as  $C_1$  discharges through  $R_1$ . This activates relay 2. When the key is down condenser  $C_1$  is charged very quickly through the lower resistance,  $R_2$ , the grid goes to ground potential and relay 2 releases, since the cathodes of the 2A3's are positive. By proper adjustment of  $R_1$ , relay 2 is activated only between characters and not between the dots and dashes of the character.

On the break of relay 2, the small condenser  $C_2$  is charged by a 200- to 300-volt supply. On the make of relay 2 this charge is transferred to condenser  $C_3$ . The network composed of  $C_3$ ,  $C_4$ ,  $C_5$  and  $R_3$ ,  $R_4$  acts as a low-pass filter so that the average charge and discharge current from  $C_3$  flows through the grid resistors of the 6A6 with but very little pulsating component. Because of the values selected for the capacitances and resistances of the filter,  $C_3$  does not rise to more than a few volts, say 6 volts, with a medium sending rate. Thus  $C_2$  discharges from about 300

\* Instructor in Electrical Engineering, Michigan College of Mining and Technology, Houghton, Mich. volts down to about 6 volts on each impulse of the relay. That is,  $C_2$  transfers very nearly all of its charge to  $C_3$  between each character. The charge transferred per second, then, which represents the average current flowing from  $C_3$ , is  $Q_2f$  where f is the number of characters per second. The average current flowing through  $R_3$  and  $R_4$  is  $Q_2f$  or  $C_2Ef$ , where E is the charging potential of  $C_2$ . The potential appearing between the two grids of the 6A6 is simply this current times the combined grid resistance or

$$2E_{g} = C_{2}Ef\left(\frac{R_{7}(R_{5}+R_{8})}{R_{5}+R_{6}+R_{7}}\right). \text{ (Approx.)}$$

The grid voltage, then, can be fixed roughly by adjustment of  $C_2$  and E for a given rate, while the finer adjustment can be taken care of by  $R_7$ .

The 6A6 operates the microammeter M through a direct-current type of push-pull arrangement. The bias required for the 6A6, supplied by the 6H6, is not critical, although one particular bias for a given plate supply will produce the most linear relationship between  $E_{\sigma}$  and current through the meter. If the elements of the 6A6 are balanced, the meter will indicate zero with no signal on the grids. If the elements are not balanced, adjustment can be made by substituting a variable resistance for either  $R_8$  or  $R_9$ .

#### Calibration

The counter was constructed to operate a 0-1 milliampere direct-current meter. Calibration was made on the basis of 5 characters per word. For 20 words per minute, therefore, the number of impulses per second, f, becomes 1.67. Adjustments of  $C_2$ , E, and  $R_7$ , as given in the above equation, were made so that full scale on the

The code-practice unit is built on a standard chassis. The relays and oscillator transformer are mounted underneath. The unit is intended to work with a magnetic speaker. а С В Э С

QST for

A novel method of continuous measurement of sending speed. Possibly a bit elaborate for the average beginner, but a useful device for the radio club which conducts code classes.

meter represented 20 words per minute. Thus the rate could be read easily from the meter with no change in scale and without using a calibration curve. By further adjustment of  $R_7$ , full scale can be made to indicate 40 words per minute.

Departures from true reading are caused by  $C_2$  not quite discharging the same amount because of some voltage variation across  $C_8$  with change in rate, by a slight non-linearity between grid voltage and meter current, and line voltage fluctuations. By test, however, the total error has not exceeded 5 per cent.

#### **Oscillator and Power Supply**

The oscillator employed is a tuned-grid type

with  $C_8$  adjusted with respect to the reflected inductance of a high-impedance speaker to give a tone having about a 500-cycle frequency. Keying is accomplished by changing the grid of the 2A3 from ground to cathode potential through the outer lever of relay 1.

The main power supply from the 83 is conventional except that the extra bleeder is provided for the adjustment of the charging potential of  $C_2$ . Extensive filtering is not necessary, a single choke-input section being sufficient.

An assembled view of the apparatus is shown in the photograph. The only controls are the knobs for adjusting  $R_1$  and  $R_7$ . Once calibrated, the only adjustment necessary is that of  $R_1$ , which each sender may have to adjust somewhat to suit his style and approximate speed. The requirement for correct indication of the rate is that the sending be reasonably well done. If there is little discrimination between character spacing and the spacing between dots and dashes, then the time delay will not function properly. But this is a helpful limitation in that it demands good sending.

## An Efficient U.H.F. Unit for the Amateur **Television Transmitter**

#### **Crystal-Controlled 112-Mc. Output for Video or Voice Modulation**

#### BY L. C. WALLER,\* W2BRO

HE r.f. unit described in this article is particularly designed for amateur television transmission, in combination with the camera-modulator unit described by Mr. J. B. Sherman in May QST.<sup>1</sup> Addition of the receiver described in the June issue <sup>2</sup> completes the amateur television station.

At present there are three frequency bands available for amateur television transmissions.

 a KCA Mile, Co., He., Harrison, Y.Y.
 a KA New Electronic Television Transmitting System for the Amateur"; QST, May, 1940.
 <sup>2</sup> "A Receiver for the New Amateur Television System"; QST, June, 1940.

The 112-Mc. r.f. section of the television transmitter is capable of 20-watt or better carrier output with video grid modulation. It also makes an excellent 'phone transmitter of considerably greater carrier output with con-ventional plate modulation. Starting with a 7-Mc. Tritet oscillator quadrupling in the plate circuit, 112-Mc. excitation is obtained with only two additional doublers. The 829 final stage operates as a straight push-pull amplifier.

These are 112-116 Mc., 224-230 Mc., and all frequencies above 300 Mc. It is desirable, for technical reasons, to use the lowest frequency band available; hence, this transmitter is designed to operate in the present 112-116 Mc. (21/2-meter) band.

At first thought, it might seem that a transmitter suitable for handling amateur television signals would have to be of very special design; however, such is not the case. The r.f. unit, shown in the circuit of Fig. 1 and the accompanying photographs, is of simple, straightforward, u.h.f. design. Only 4 r.f. stages are required, thanks to the Tri-tet crystal oscillator which quadruples the 7.119-Mc. crystal frequency. Any good 40-meter crystal can be used.

The 6L6 oscillator is followed by two 6L6 frequency doublers, as shown in Fig. 1. The new RCA-829 twin beam-power tube, especially designed for u.h.f. operation, is used as a straight 112-Mc. r.f. power amplifier. This tube is especially well adapted because of its low drivingpower and low modulating-power requirements. The 829, in grid-modulated amplifier service, requires only 0.5 watt of r.f. driving power and negligible video modulating power. The neces-sary video modulating signal of only 17 volts peak value is easily supplied from the cathode circuit of the 6L6 modulator (located on the camera unit). The carrier output of the 829 operating at about 500 volts is approximately 23 watts.

The Tri-tet crystal oscillator stage is conventional. As usual with this highly efficient circuit, careful attention must be given to the design and adjustment of the cathode tank,  $L_1$ - $C_1$ . Selfexcited oscillations are practically certain to occur if the value of  $L_1$  or  $C_1$  is not correct. When the oscillator is operating with the plate tank  $L_2$ -C<sub>6</sub> tuned out of resonance, the d.c. plate current will be 45 or 50 ma. At no-load resonance (with  $C_7$  disconnected), the oscillator plate current should make a fast, sharp dip of about 8 to 14 ma. Care must be taken that the 28-Mc. fourth harmonic is selected; a plate-current dip at the 21-Mc. third harmonic will also be within the tuning range of  $L_2$ -C<sub>6</sub>. The crystal-current indicator bulb B will glow just a little more than a dull red when the Tri-tet is working properly. When the oscillator plate tank is tuned to the

<sup>\*</sup> RCA Mfg. Co., Inc., Harrison, N. J.

fourth harmonic of the crystal, the crystal current should make a noticeable dip.

The 56-Mc. doubler stage is also conventional. No trouble was experienced in its adjustment or operation. The 112-Mc. doubler is unusual only with respect to the "series-tuned" plate-tank circuit employed. An ordinary parallel-tuned circuit will not provide as good efficiency or power output at 112 Mc., because of the poor L-C ratio obtainable. In the circuit shown, the tube output capacitance is in series with  $C_{14}$ . These capacitances tune  $L_4$  somewhat like a split-stator condenser, with the result that the total effective capacitance shunted across  $L_4$  is only one-half that of the tube capacitance alone. Thus,  $L_4$  can have almost as much inductance as the 56-Mc. doubler plate coil,  $L_3$ . The inductance of  $L_4$  should be adjusted by squeezing or pulling the coil turns until  $C_{14}$  resonates when half meshed. In this manner, the r.f. voltage node on  $L_4$  can be made to fall very close to the center of the coil. The power output of the 112-Mc. doubler is almost as good as that of the 56-Mc. doubler; it is even

The 866 rectifiers are enclosed in aluminum shielding centered on the power-pack chassis.

Short, direct connections in the exciter r.f. circuits contribute to the cause of efficiency. The video input concentric-line terminal is to the left of the 829 socket.

adequate for plate modulation of the 829, where a final-amplifier d.c. grid current of 11 ma. is required.

The 829 stage uses a resonant-line ( $\frac{1}{4}$ -wave) plate circuit and a fixed-tuned grid circuit. The grid coil,  $L_7$ , is tuned only by the tube input capacitance. Tuning is initially accomplished by adjusting the length of  $L_7$ . The latter can be squeezed or elongated by means of two bakelite dowel rods; resonance is indicated by the 829 d.c. grid-current meter. A final-amplifier grid current of 2 ma., or slightly less, is adequate for gridmodulated television service. If the grid current is found to be too high, it can be reduced by loosening the coupling of  $L_5$  or  $L_6$ , by reducing the plate voltage on one or both of the doubler stages (the preferable method), or by slightly detuning the 112-Mc. doubler stage.

To set the screen voltage on the 829, adjust the sliding tap on  $R_{14}$  in small steps, starting at the

Really practical amateur television transmission has arrived, at last. And here is the evidence that there is nothing especially complicated about the r.f. end of a ham television transmitter. The job described by W2BRO in this article has been thoroughly proved in field tests, in combination with the camera-modulator and receiver units described by J. B. Sherman in May and June QST, and has clearly demonstrated the straightforward practicability of good quality amateur television communication with simplified, economical apparatus. This 112-Mc. rig has shown its worth as a high-grade 'phone transmitter, too. So look it over, u.h.f. 'phone gang.

## July 1940

ground end, so that under no condition of operation will the 829 screen voltage exceed 225 volts, measured to the cathode (not to ground).

The amplifier plate-tank circuit is tuned to resonance by means of condenser  $C_{21}$ , after the shorting bar at the upper end of the plate rods has been adjusted approximately to the proper position. The 829, like other beam types, should never be operated without a load. A 25-watt lamp clipped across the plate rods 4 or 5 inches from

the shorting bar serves nicely as a dummy antenna. If the 829 is tuned to resonance with no load, severe overheating of the screens will occur with possible damage to the tube.

The +B lead from the shorting bar on  $L_8$  down to plate-meter jack  $J_7$  should be made with shielded wire, with the shield grounded to the aluminum plate-rod mounting bracket. This lead thus has sufficient capacitance to ground to serve as an r.f. by-pass for the plate meter.

Condenser  $C_{21}$  consists of two thin brass discs. about the size of American pennies, mounted on the ends of two 6-32 brass screws. The plate rods are drilled and tapped for the screws, as shown in the photographs. The screws are slotted to take an all-bakelite screw-driver for purposes of adjustment. A tool having a metal tip is not satisfactory.

The video modulating voltage from the camera unit, via a concentric line, is shunt-fed into the

**OST** for
amplifier grid circuit by means of  $C_{17}$  and  $R_{13}$ . The resistance of  $R_{13}$  should be low enough to avoid degeneration effects due to modulation of the d.c. grid current, and high enough so as not to load the video modulator output circuit too heavily. A value of 3000 ohms is satisfactory.

In order to grid-modulate the 829 properly, it is essential that the plate circuit be heavily loaded. In other words, when  $C_{21}$  is detuned from resonance, the amplifier plate current should not rise more than a few milliamperes. This heavyloading requirement is characteristic of "efficiency" modulating systems.

Because of the relatively large power input and plate dissipation which the 829 is rated to handle. and its small physical size, the bulb of this tube becomes very hot during operation. For this reason, forced-air cooling is essential. Any small, inexpensive electric fan placed 6 or 8 inches from the tube will provide the necessary cooling.

Table 1 gives the more important voltage and

## A Different Portable-Emergency Transmitter

#### Simplified Design With the Inverted Amplifier

#### BY R. P. AUSTIN,\* W3EVA

Now that emergency amateur equipment has had its "baptism in fire" on many occasions during the past few years, the need for such gear in every ham station should be quite apparent. The argument that it might never find use in some localities is not a particularly good one — New England thought "it can't happen here," and was fooled.

Normally the starting point in the design of an auxiliary rig is the junk-box, and that's where I started on this one. A few odd condensers, coil forms and beam-power tubes turned up, and a small 5- by 6- by 9-inch metal cabinet that was slowly gathering dust crystallized the design.

#### The Circuit

With c.w. operation in mind, and break-in operation a "must," the need for good, clean keying at any speed was imperative. My personal favorite in this line is the regenerative pentode oscillator. I have two of them now, and either one keys beautifully, with any of 18 crystals, without chirps, blurps, or bloops at speeds up to 150 w.p.m. These keying tests have been conducted with a tape transmitter, tape recorder and an oscilloscope. No difficulty was encountered

\* 113 Second Street, Laurel, Md.

The inverted-amplifier portable emergency rig set up in the field ready to go. Antenna output terminals are at the extreme left; the left-hand dial tunes the amplifier and the dial under the plate meter tunes the oscillator. Key jack and crystal socket are available from the front of the panel. with a key lead up to 50 feet in length, and no keying relays were used. So experience indicated the regenerative oscillator circuit, and the junkbox dictated a 6V6G tube. A 6V6, 6F6 and 6L6 all were tried later, with some differences in output but none in keying characteristics.

A very desirable form of amplifier to follow the oscillator would be one that is simple without sacrificing efficiency and requires no fixed bias or neutralization. Such an amplifier is readily obtained by connecting the two grids of a beampower tube together (resulting in a high- $\mu$  triode) and then inverting <sup>1</sup> it; i.e., the grid (control and screen) is grounded and the cathode is left up in the air. This greatly simplifies the amplifier, because the only parts required are tube, socket, plate coil and condenser, plate by-pass condenser and a low-impedance link to the oscillator stage. There isn't much to that, is there?

The wiring diagram shown in Fig. 1 will give a better idea of the inverted-amplifier connection as well as the rest of the circuit. Doubtless some of the boys are going to indulge in hoarse laughs at this idea, but if they try it they will soon change their tune. It enables us to obtain a cheap, simple and relatively foolproof rig that leaves nothing to be asked for. Of course, the transmitter can be operated on only one band with any one crystal, but crystals are not as scarce as they used to be. A Tritet oscillator could be used to give two-band operation from one crystal but, in my experience, I have yet to see an oscillator of that type that will give good keying at all speeds. And it takes more space.

#### Construction

No particular care need be taken in the construction of the rig other than that according to general good practice in amateur design. It is necessary to shield the two stages from each other, since there is a possibility that the amplifier will oscillate if its plate circuit is inductively coupled back to the oscillator plate circuit. However, a simple single shielding baffle was found to be all that is necessary. The link from the oscillator plate coil to the cathode-grid circuit of the amplifier is made by twisting together two pieces of flexible rubber-covered wire. A similar line leads from the amplifier output link to the antenna terminals.

The tube and coil sockets are mounted below <sup>1</sup>Romander, "The Inverted Ultraudion Amplifier," QST, Sept. 1933.

e.

the chassis. Wires to the tuning condensers are brought through the chassis by means of small porcelain feed-through insulators. The crystal socket is mounted on the panel to make it accessible and to reduce any drift due to heating. A d.p.d.t. toggle switch, also mounted on the panel, allows the plate current of either tube to be measured by flipping the switch.

Either glass or metal tubes can be used in the oscillator without modification --- the metal tubes save slightly on space. Either glass or metal tubes can be used in the amplifier, but the shield connection should not be grounded. A glass tube is slightly to be preferred.

The power cable terminates in a 4-prong plug so that the set may be used with any of three available power supplies: a 250-volt 50-ma. genemotor, a 325-volt a.c. power pack, and a 400-volt 100ma. a.c. power supply.

#### Performance

The output terminals of the transmitter should be connected to a link-line coupling to a tuned

tank. Any of the usual antennas can be used, and there is no need for elaboration on this point. I have used both endfed and Zepp-type antennas in this manner, and the output can be connected directly to a low-impedance line feeding the current loop of an antenna, or a quarter-wave grounded Marconi antenna can be used directly from the link, with a variable condenser in series for resonating the system.

In operation with the 400-volt supply, the inverted amplifier draws only 7 ma. with the key up, 20 ma. with the key down but with no amplifier load, and 85 ma. with the amplifier loaded. Heavier loading at this voltage only drops the output and wastes power. The oscillator draws about 25 ma.

Using this transmitter with the regular home Zepp, inputs from 10 to 30 watts resulted in contacts with all districts but W7 on 7 Mc. The reports were good, and must have been fairly ac-

## A Heterodyne Exciter

#### Stabilized Frequency-Control Unit for Transmitters

#### BY W. RODERIC BLISS,\* W1FMZ, AND PHILIP A. BAILEY,† W1BKO

THE production of beat frequencies by the mixture of two other frequencies is well known to the amateur. It is the principle upon which the superheterodyne receiver relies, and the method by which c.w. stations are made audible. It is equally useful in transmission, and has had some application in that field. Before describing the exciter unit shown in the accompanying photographs it may be well to review the method by which beats are employed to obtain stable frequency control.

If a stable high frequency such as is obtained from a well-adjusted crystal oscillator is combined, in a Class-C amplifier, with a low frequency from a high-C oscillator, four major output frequencies will be found. The first will be, of course, the crystal frequency, which we shall call  $f_c$ . The second will be the low frequency, represented by  $f_s$ . Then there will be found the two beat frequencies,  $f_c$  plus  $f_s$  and  $f_c$  minus  $f_s$ . These combination frequencies are the ones used to accomplish our aims.

<sup>\*</sup> Naval Research Laboratories, Washington, D. C. † 14 Alsop Ave., Middletown, Conn.

Suppose we have a crystal oscillator operating at a frequency of 6.5 Mc. and mix this with the output of a 500-kc. oscillator in the grid circuit of a Class-C amplifier. The plate could be tuned to 6.0 Mc., 6.5 Mc., or 7.0 Mc. and an output found on these frequencies with a neon bulb or a flashlight bulb and loop. If the low-frequency oscillator were variable from 500 kc. to 1000 kc., two variable frequencies could be found -5.5Mc. to 6.0 Mc., and 7.0 Mc. to 7.5 Mc. This last frequency range would be very useful for QSY on 40 meters and the higher frequency bands.

The stability of the beat frequencies considerably surpasses the stability of the e.c.o.'s commonly used for QSY. The drift at worst is equal to the crystal oscillator drift plus the drift of the low-frequency oscillator, and by design it is quite possible to have the two oscillators drift in opposite directions, and thus tend to balance out when the upper sideband is used. The authors have made no attempt to do this, for it was not found necessary. The frequency drift of a high-C low-frequency oscillator is often less than that of a high-frequency crystal oscillator when measured in cycles per second, so that even the sum of the

two drifts is still very small. The stability of a low-frequency oscillator can easily be confirmed by remembering that a b.c. receiver stays tuned on a broadcast station pretty well and no especial care is used in the design of the b.c. oscillator!

Since the output tank could hardly tune to  $f_s$ , this unwanted frequency is eliminated. It is desirable to eliminate also  $f_c$ , since this will fall outside the band in which QSY is contemplated. This can be done by using a two-tube mixer circuit, with the crystal frequency introduced into the grids in parallel and the beat frequency taken from the plate circuit to which the plates are connected in push-pull. This circuit is well known as a "balanced modulator." In the arrangement of Fig. 1 the low frequency is applied to the grids in pushpull. It will be seen, therefore, that with crystal signal balanced out and the mixer tank tuned to many times the

The exciter unit is designed for relay-rack mounting. A direct-reading dial, hand calibrated, facilitates frequency setting.

In this rear view, the ervstal tank circuit is at the extreme left. The next two tubes are the 6V6 crystal oscillator and VR150 regulator. The self-controlled oscillator tank condenser is centered on the panel, with the coil and tube behind it. The three tubes in a row are the two 6F6's for the mixer circuit and the VR150 for the self-controlled oscillator. The output tank of the mixer is at the extreme right.

low frequency, the only resonances found in the output will be at the beat frequencies.

Some experimenting was necessary to determine the lowest  $f_s$  which could be used. With  $f_s$ too low,  $f_c$  plus  $f_c$  comes so near  $f_c$  minus  $f_s$  that the mixer plate tuning does not distinguish between the two. The minimum  $f_s$  for 7 Mc. was found to be about 500 kc.; that is, the resonances in the mixer plate were 1000 kc. apart. This minimum value of  $f_s$  is subject to experiment by the individual constructor, as it varies with the Q of the mixer plate tank, its loading, and the skill of the operator.

This minimum low frequency is also proportional to  $f_{\rm e}$ . If it is desired to work on 3500 to 4000 kc.,  $f_{\rm s}$  should not be less than 250 kc., and on 14 Mc. no less than 1000 kc.

The advantages of using the heterodyne method of QSY may be briefly summed up as follows:

1. Less drift than with a conventional e.c.o.

2. Out-of-band crystals, formerly considered useless, may be used.

3. High-power amplifiers operate on a frequency different from either the crystal or variable oscillator, eliminating feedback which

This frequency-control unit gives sufficient r.f. output (about 3 watts) to substitute for the crystal oscillator in many transmitters, and gives the advantage of highly-stable variable-frequency control. In the model described the output frequency is in the 7-Mc. region, but suitable choice of oscillator frequencies make it readily adaptable for lower or higher output frequencies. causes frequency instability and crystal heating or fracture.

4. Keying may be accomplished more satisfactorily than in other exciter units.

5. Construction does not require the exacting care that would be necessary in an e.c.o. of comparable stability.

6. Calibration is much more positive and more easily checked than in any other variablefrequency exciter.

#### **Exciter** Circuit

The circuit which emerged after much experiment is shown in Fig. 1. The crystal oscillator is a 6V6 coupled to the screens of the 6F6 mixers. The 6N7 serves as a push-pull low frequency oscillator which excites the control grids of the mixer tubes.

The 6V6 crystal oscillator is quite conventional in design. The plate voltage is held down to 150 volts by the VR150 regulator tube. This results in low crystal current and heating, in addition to providing some degree of independence from line-voltage fluctuation. If desired, any other form of plate-supply regulation may be used with equivalent results.

The crystal is a Bliley B5R unit calibrated at 6499 kc., (6500 kc. would be ideal) and is similar in size and low-drift characteristics to the familiar B5 unit. This  $6500\pm 5$  kc. unit may be obtained from most amateur supply houses or from the manufacturer. Several other methods of obtaining crystal control outside the band will suggest themselves to the amateur. An 80-meter 'phone band crystal will double into the range of 7800 to 8000 kc. and the lower sideband of the beat frequencies may be used by mixing after doubling in the crystal stage. Another alterna-

tive with the same crystal is to heterodyne the fundamental frequency back into the 80-meter c.w. band and double after the mixer. The fundamental frequency of some 10- or 20-meter harmonically-operated crystals may fall a convenient distance outside the amateur band.

Crystals which have been accidentally ground too thin to fall inside the amateur band may be used if they fall an appropriate  $f_{\bullet}$  outside the band. If they are too near the operating frequency, a few more swipes with carborundum will put the frequency high enough. In this case, the lower sideband would be the one to pick out in the mixer plate-circuit tuning.

The low-frequency oscillator uses a 6N7 double triode to obtain push-pull output. For the sake of stability, the plate voltage for this tube is also kept to 150 volts by a VR150. Since the 6N7 operates as a self-excited oscillator, voltage regulation is particularly important if the maximum of stability is to be obtained. Fortunately, only seven to fourteen per cent of the beat frequency stability is dependent upon the low-frequency oscillator. The tuning condenser used in this oscillator is a common double-section broadcast job, and is quite satisfactory if care is used to see that there will be no excessive thrust on the shaft due to mounting conditions. A small 50- $\mu\mu$ fd. air trimmer is connected between the stator sections for purposes of calibration.

The circuit of the low-frequency oscillator makes use of a condenser and resistor from plate to opposite grid to effect regenerative feedback. This was the handiest scheme and was left as first hooked up. Possibly other circuits will work as well or better, but no need was felt in the authors' case for a change. In any case, the oscillation should be smooth and continuous all over the range of the tuning condenser. The coupling condensers to the 6F6 mixers are purposely made small in order to reduce the reaction of the other circuits upon the frequency of the lowfrequency oscillator. Too small a condenser will, of course, reduce the excitation excessively.

The dial is a homemade affair, based on the works of a National Velvet Vernier, with a celluloid pointer substituted for the regular dial. The card mounted behind the pointer is made similar to the Bliley frequency chart. Four scales are calibrated upon it. The outside strip is the direct frequency reading of the low-frequency

## An Acorn-Tube 112-Mc. Converter

#### BY M. P. REHM,\* W2HNY

The 112-Mc. converter is a simple gadget. It is built on a single piece of heavy aluminum, with a small piece to serve as a panel and support for the dial. The output-coupling circuit is mounted at the rear of the chassis. The oscillator tuning condenser is the one nearest the dial.

As a start toward improving our ultrahigh-frequency gear, a better 112-Mc. receiver seemed imperative. We have a Hallierafter Five-Ten receiver which has a wide-band i.f. position originally designed to receive 56-Mc. modulatedoscillator signals (remember?), so we decided to try the receiver as a double-i.f. superhet for 112 Mc. with an acom-tube converter.

The accompanying photograph shows the finished converter using two 955 acorn tubes. The mixer tunes from 106 to 119 Mc., and the oscillator tunes from 81 to 94 Mc., giving a difference frequency of 25 Mc. In operation the Five-Ten is tuned to 25 Mc. and acts as the i.f. amplifier for the converter.

The circuit is quite simple and straightforward, as can be seen from Fig. 1. The detector coil is 8 turns of No. 14 wire  $\frac{1}{2}$  inch in diameter, spaced to occupy  $\frac{1}{2}$ -inch winding length, and it is tuned by a two-plate midget condenser. The detector plate coil,  $L_2$ , is 12 turns of No. 18 push-back wire,  $\frac{3}{4}$ inch in diameter, close wound and tuned to 25 Mc. by a small air padding condenser. The coupling link is two turns around  $L_2$ , and the output is carried through a short twisted-pair lead to the receiver input. Bias is obtained through the cathode resistor,  $R_1$ , which is by-passed by a small trimmer condenser set to about 20  $\mu\mu$ fd.

The oscillator coil,  $L_3$ , is 5 turns of No. 14 wire  $\frac{1}{2}$  inch in diameter, spaced to cover  $\frac{5}{2}$  inch and tapped at the center. The tuning condenser has three plates and the padding condenser is set at maximum capacity. The oscillator coupling condenser is set "very light" — about 5  $\mu\mu$ fd. This system of coupling from oscillator plate to detector cathode may be called "cathode injection"

\* 969 Roanoke Avenue, Riverhead, New York.

and is used to good advantage in ultra-high-frequency work.

With 100 volts on the plates, the detector should draw 0.4 ma. with the oscillator off and 0.6 ma. with the oscillator on, by proper adjustment of the coupling condenser. The oscillator draws about 5.0 ma.

At present, the parts are just mounted on a  $\frac{1}{6}$ -inch thick aluminum chassis which measures 5 x 7 inches, but everything is "tied down tight." All parts are above the chassis and there is a central ground connection directly under each socket. The sockets are supported on edge by small heavy brackets, as are the condensers  $C_1$ ,  $C_2$  and  $C_4$ . The tuning condensers are ganged and track nicely over eighty degrees of the dial, the 112–116 Mc. band, covering 22 of these degrees. With a five-to-one ratio dial, this spread is ample.

Standard receiving tubes can be used in this circuit but the efficiency will be very poor. The life of acorn tubes is long and their inter-electrode capacity is less than the standard types, so for the slight extra cost, a much better converter will result.

Almost any other i.f. can be used, and a lower frequency would give better efficiency, but it must have a wide pass band. This converter used successfully into a two-stage tuned r.f. (Continued on page 104)

A converter for 112 Mc. doesn't have to be a fancy affair to be effective. Here is a simple one that is short on complexity but long on performance, and it will work into any 25-Mc. amplifier or receiver you may have.

## A Portable Transmitter-Receiver

#### Simple Low-Power Station for All-Around Work

#### BY LON M. HILDEBRAND,\* WGQUE

**D**URING the design of the small transmitter-receiver to be described, a few important constructional details were uppermost in the mind of the builder. It had to be small and compact, capable of operation from either a.c. or storage battery power supplies, simple and easy to construct, and the cost was to be kept as low as possible. In addition it was to operate with either end-fed or Zepp-type antennas. Operation was to be confined to the 40- and 80-meter c.w. bands.

This little rig satisfies all of the above requirements, and the results have been better than were anticipated. With an a.c. power supply delivering 400 volts, the input to the 6L6 amplifier is about 30 watts. Using a 250-volt dynamotor or vibratorpack and storage battery, the input is around 12 watts. In the writer's shack this rig is used as the 80-meter transmitter, and the big rig is left on 40 meters. The middle-western states are contacted regularly on 80. Many of the parts for this rig will be found in the amateur's "junk box." Not much attention was paid to low-loss materials, as the cost was to be kept as low as possible.

Several of these rigs are now in operation in and near Stockton, and all but one are built with separate power supplies, with cable and plug-in connections. The one exception has the a.c. power supply built on the same chassis and, with the exception of a slight hum in the receiver on 40 meters, operates just as efficiently as those using an external supply. The hum is so low that it is not objectionable, and for those who wish to

\*682 North Central Avenue, Stockton, Calif.

build all the units on one chassis, I would suggest an 8 by 12 by 2 inch chassis. This allows ample room for the gear and will fit into a 13 by 9 inch metal cabinet.

With the particular model shown on these pages, a 7 by 9 by 2 inch chassis was used. By exercising a little care in the placement of parts, the components will not appear to be too crowded. This size of chassis fits nicely into an 8 by 10 inch metal cabinet.

The placement of parts on both the chassis and the front panel can be seen from the photographs, and there is no need for a lengthy description. The band-set condenser in the receiver is mounted under the chassis, with the shaft extending up through the chassis, and it is not touched except when changing bands. The main tuning condenser,  $C_2$ , is mounted on the panel and gives good bandspread over both the 40- and 80-meter amateur bands. The only shielding used in the transmitter-receiver is a shield can around the 6C6 (or 6D6 — they work equally well) detector tube.

#### Construction

Before mounting any parts or cutting any holes in the chassis, the two condensers and the meter should be mounted on the panel. The circuit diagram, Fig. 1, shows that the band-spread condenser rotor is grounded, so there is no need to insulate it from the panel, but both sides of the transmitter tank condenser,  $C_8$ , are "hot" and the condenser must be insulated from the panel.

The complete transmitter-receiver is shown here sitting alongside a genemotor power supply. The tuning dial on the left controls the receiver tuning and the one on the right controls the transmitter tuning. Along the bottom, from left to right: headphones jack, send-receive switch, regeneration control, pilot light and key jack. The antenna tuning condenser can be seen at the rear of the cabinet.

### 42

The fellow interested in a simple and inexpensive station that is complete will find many ideas in this description of a rig that can be either the whole works or a useful adjunct to the regular job.

A small strip of bakelite or hard rubber about 1 inch wide and 2 inches long is used for insulation by first drilling a hole in the center of the strip to support the condenser shaft bearing and then mounting the strip on the panel. The strip is supported by screws through holes at each end of the strip. The hole in the panel through which the condenser shaft extends must, of course, be large enough to clear any of the metal of the shaft bearing and locking nut. The tuning dial covers this hole so there is no reason for not making it sufficiently large. The two tuning condensers are mounted high on the panel to allow plenty of room for the other parts and to give the panel a neat appearance.

The transmitter coil socket, 6L6 socket and 6C5 socket are mounted on the chassis directly in back of the tank condenser, in the order named. They are kept as near as possible to the righthand edge of the chassis. The crystal socket is mounted on a line to the left of the midpoint between the 6L6 and 6C5 sockets, as close to the sockets as possible without making it impossible to get the tubes and crystal into their sockets. The 4-prong socket that takes the power cable plug is mounted at the center rear of the chassis, as close to the edge as possible.

The receiver coil socket, audio choke and audio tube socket are mounted behind the bandspread tuning condenser, in the order named and close to the left-hand edge of the chassis. The audio choke is an old audio transformer with the primary and secondary connected in series but, if one prefers, resistance coupling can be used, with some loss in signal strength. The detector tube socket is mounted to the right of the detector coil, allowing enough space for the tube shield to clear the meter, and the band-set tuning condenser is mounted on the chassis behind the detector tube socket. Make sure that the bandset condenser will have enough room under the chassis so that the plates can be set to any position. The detector grid leak and condenser are mounted on the band-spread condenser, thus giving a very short lead to the detector grid. After space has been provided for all the parts, punching and drilling can proceed.

The front panel and chassis are held together by the headphones and keying jacks, regeneration control, pilot light and send-receive switch. Only the headphones jack must be insulated from the metal panel, and the necessary fiber washers are readily available at any radio store.

Wiring of all parts is straightforward in all respects. Bear in mind that this is a portable rig and will be subject to some rough use. Make all soldered connections firm and solid.

Two small feed-through insulators are mounted

A top rear view of the chassis shows the relative position of the parts. The knob just visible over the crystal is used to set the receiver band-set coudenser, which is mounted under the chassis. The receiver antenna terminal is at the right-hand corner — the empty socket takes the power supply plug. on the transmitter side of the metal cabinet, about 3 inches apart and about 2 inches from the top. These are used to connect to Zepp feeders when this type of feed system is used to the antenna. An old b.c. variable condenser, mounted as high as possible at the rear of the cabinet, is used for tuning the feed line. This condenser is insulated from the cabinet in the same manner as the tank tuning condenser on the panel. Short flexible leads about 4 inches long, with small battery clips on the ends, are used to connect between the condenser and antenna terminals and permit either series or parallel tuning. When an end-fed antenna is used, the antenna is coupled through a  $0.002-\mu fd$ . mica condenser to a short piece of wire soldered to the "hot" end of the tank coil on the coil form. Terminals of the antenna winding on the coil form are brought to the top of the form and fastened with a small bolt through each side of the coil form. The bolt protrudes about  $\frac{1}{2}$  inch from the form, and it is an easy matter to clip the flexible leads from the antenna condenser and the feed-through insulators to the bolts. This winding is not used, of course, with an end-fed antenna.

Although not shown in the wiring diagram, a small mica condenser of about  $0.001-\mu$ fd. capacity can be connected between the plate of the 6C5 and the crystal. This will remove the plate voltage (Continued on page 106)

#### CONDUCTED BY E. P. TILTON,\* WIHDQ

MAY, that magic month of u.h.f. DX, has come and gone, and the 1940 season is off to a flying start. Greatly increased interest and activity, particularly in W4 and W5, the considerable improvement in equipment and operating technique, and a generally better understanding of the factors involved in working skip-DX have resulted in a total of stations heard and worked which probably exceeds that of any previous season, despite the fact that conditions appear to have been slightly less favorable, to date, than in corresponding periods of previous years.

Skip, in general, has been longer, in keeping with the trend noticed last summer. When 56-Mc. skip was first noted, in 1935, the usual contacts were W1, 2, or 3, to W8 and the nearer W9's; the average distance being of the order of 700 miles. Work thus far in 1940 has been almost entirely over distances in excess of 800 miles, with 900-1200 being most common. Significantly, fellows who are located at in-between distances from populous 5-meter areas have turned in long callsheard lists, reporting poor results in making contacts.

Up to 1938, the openings were frequently of long duration, with even the lowest-powered stations hammering in with terrific strength for hours at a stretch; 1940 finds openings spotty in most instances, with small areas open at any given time, and for shorter periods. Constant observation of conditions has taught many of the older hands at the game the fine art of figuring out just when and where the skip is going to pop, however, and most of us are convinced that we work DX on Five plenty of times in 1940 when similar conditions would have produced no excitement a few seasons back.

A complete listing of all the DX worked in the past month would make bulky and uninteresting reading; hence only highlights are reported herein. But let no one think that we are not interested in such reports. It has been requested in QST many times, and we ask, again, that anyone hearing or working any u.h.f. DX report his observations as completely as possible. This information is not only very useful to your conductor but it is also available to anyone who is genuinely interested in studying this most fascinating business of 56-Mc. DX.

The season started, in earnest, on April 29th, with a contact between W4EQK, Clearwater, Fla., and W5VV, Austin, Texas. Now both Tom Herrin, W4AKA (op. at EQK), and Wilmer Allison, W5VV, are hardened campaigners who have \*329 Central St., Springfield, Mass.

worked plenty of DX on the lower frequencies, but when they got together on Five (for the first u.h.f. DX for both) neither could carry on a rational conversation, and both suffered a bad case of "fumblitis." There's something about this business of DX on Five! We work the world on Ten or Twenty without a quivver, but let a W9, a W5, or a W4 break through on Five - and note the tenseness of the voices on the band! We sit on the edges of our chairs, our hands shaking, as we shout ourselves hoarse at some equally excited fellow a mere thousand miles away! We spend two-thirds of the year telling everyone that skip-DX doesn't really count in the u.h.f. picture but whenever the skip breaks out, so does the gooseflesh!

The first extended opening occurred on April 30th when W4's had quite a time of it working into W1, 2, 3, 5, 8, and 9. Wednesday, May 1st, was better, with 900- to 1200-mile DX being worked generally over two-thirds of the country. May 2d was the peak, with practically the entire period from 9 A.M. to midnight open for DX in some parts of the country. DX was worked in every call area during this hectic period, and thirty-two states are included in the reports. Let

"The Four Horsemen of Phoenix." Left to right: W6QLZ, W6KKQ, W6KTJ, W6JFO. Three-section vertical 8JK beam of W6KTJ in background.

45

no one say that DX cannot be worked on Five from his location!

#### HERE AND THERE:

**U**BSERVER Extraordinary is W1LLL of Hartford. Brownie jumps that Skyrider back and forth from Ten to Five a dozen times an hour when DX is in the offing. And when it breaks, he's the guy who gets the first lick every time — and with a pair of 6L6's and an ordinary city location, tool

Getting on Five in a location where local signals are nonexistent is quite a problem. The first thing we heard when we warmed up the receiver on the night of May 1st was a furor of W1's, 2's, and 3's, all frantically calling W4EQM. This had not subsided before a calm (and definitely southern) voice was heard "Calling CQ-Five; W4EQM, Langdale, Alabama, calling CQ-Five." Again the roar, as everyone in the skip zone went after Alabama – and again, the same voice "calling CQ-Five; W4EQM . . ." After about three rounds of this, some rather uncomplimentary remarks began to be injected into the calls of the die-hards who were still trying, but still no answer from the gentleman from Alabama! This was all solved a few days later when the boys at W4EQM discovered that the r.f. stage in their converter was work and the gang in these parts "got Alabama" in rapid succession. As this is being written, W4EQM tells us that he has worked only W1 and that he has never yet heard a local signall

W4FPM, Atlanta, Ga., got his T-40 doubling from Ten on May 1st. Lee could hardly have picked a more opportune moment than 8:34 P.M. of that date, when his first "CQ-Five" netted W1HXP, quickly followed by W1's INJ, EKT,

Ground-plane antenna used by W8CIR/8 during the May Relay. This looks like the answer to the problem of an efficient portable radiator. Concentric feedline permits vertical feeder without the usual mechanical troubles. LKM, and HDQ; W3's BZJ, CUD, AIR, and GYG; and W8's PKJ and FYC. Not bad for a first-nighter!

New stations in W5 are bringing out the fact that this area is one of our best bets for skip DX. W5AJG and W5VV have reported the band open frequently during May, when no DX has been heard in the east at all. North-south work, particularly W9-W5, has been most frequent. Top performance of the month was turned in by W5AJG, Dallas, Texas, who polished off an even 50 contacts on May 2d. Starting at 9 A.M., Leroy worked W8CIR, and followed with 49 others in 14 states (Mass., N. Y., N. J., Pa., Ohio, Mich., W. Va., Va., Ill., Ind., Iowa, Wis., Minn., and S. Dak.); finishing up at 10:21 P.M. with 540 Marathon points for one day's work! The first 50-point contact to be recorded in the U.H.F. Marathon was made by W5AJG with W1DEI, Natick, Mass., 1550 miles. Also worked was your conductor but we happen to be a mere twelve miles under the 1500-mile mark! Leroy says he might have done better but he was sick that day and had to rest from 2 to 5 P.M.I DX was worked from Dallas (by W5AJG or his partner, W5EHM) on May 1st, 2d, 13th, 16th, 18th, 19th, and 21st. On the 21st, both hoys worked into Massachusetts again. This 1500-mile work is the subject of much discussion hereabouts, with some of us wondering if this is not extended single-hop work; 1200 miles is normally considered to be the limit of single-hop DX but the nature of this particular work has made it appear that only one hop was involved. If it was double-hop, then it must have been by a somewhat devious route, for there was no 750-mile business being done at the time Leroy and Pat were heard in Massachusetts.

Others in W5 who have been giving these old hands some competition are BHO and EEX of Houston; EIN and IHT of Big Lake; FNQ and FWS of Texon; and VV of Austin, all of Texas; and FYF of Oklahoma City. W5FYF heard W1HDQ, W2MO, W3BZJ, W8CIR, and W9USI, on May 2d. It seems that quite a few of us missed a chance at Oklahoma that evening — just because we neglected the high end. Yes, the band still goes to 60 Mc., and Vance holds forth on 59,476.

Another high-ender is W1BJE, Westport Harbor, Mass., 59,120. And while we're on the subject, W1ELP, Cambridge. Mass., would like to have you take a look above 58.5 for his f.m. signal. Bill runs 400 waits to 35T's - you can do thatwith f.m. — and the signal is easily read on even the mostselective receivers. It may not sound too smooth, but it canbe copied. There will soon be a 12-element beam up in the air110 feet at W1ELPt

Did someone say that high power is needed to work DX on Five? Ask W5BHO, Houston, Texas, how he does it with 15 watts, a super-regen receiver, and a half-wave vertical antenna 12 feet off ground! The 600 watts at W5VV seem to produce a slightly different result. Wilmer gets plenty of heard cards but is having some trouble pulling in weak signals, though it seems that his DM-36-HRO combination should do the trick if anything will.

W6QG, Santa Ana, Cal., worked W7HEA, Zillea, Wash. (HK-54's, 225 watts; freq. 58 Mc.); W7FFE, Houlton, Oregon (110 watts to 809's freq. 58.5 Mc.); and W7FDJ, also of Houlton (160 watts to HF-100 on 57.2 Mc., 8-element vertical beam), on May 1st, between 8:35 and 9:30 P.M. (P.S.T.). Ray runs 30 watts, 'phone; 80 watts, c.w.; to a single 800. He reports that W6IOJ, North Hollywood, worked the same stations.

These fellows in California have a somewhat limited field for ordinary 900-1200-mile skip, as this radius takes in much sparsely-settled country. May 12th appeared to hold promise, as short skip was pronounced on Ten, but nothing was heard until 8:55 P.M. when an unidentified XE-1 was heard calling "CQ United States." The signal was badly frequencymodulated and was not positively identified but is believed to have been genuine, as the harmonic of XDA was reported in several places in the west at about this time. Five was open for W6QG again on May 18th and Ray worked the boys at Houlton, Oregon, again; and W7EUI of Kirkland, Wash. W7EUI, who runs 75 watts to 801's on 58 Mc., says that he finds that the band frequently appears to be open when he listens around mid-day, but that signals are seldom heard. The band was open for W6-W7 work from 12:30 to 2 P.M. on the 18th. ł

5

W60VK is going to get some fellows on Five if he has to supply the equipment for them to operatel Jim sent a receiver up to 6GBN at Estrella Peak, and Tommy (GBN) now supplies the missing link between Phoenix and Tucson. Both W6QLZ and W60VK are now working on W6PBD at Douglas, Ariz., to get him on Five. W5INI at Silver City, N. M., is expected to join this group in a projected Phoenixto-El Paso 56-Mc. relay.

W9ZJB picked May (of all months, Vince!) to undergo an operation, but he got in on the fireworks early in the month, and expects to spend quite a bit of time at home "recuperating." Vince worked 23 stations on skip, on May 2d.

W9ZHB got going at 10 A.M., May 2d, and worked W5's AJG, EHM, EIN, IHT, FNQ, and VV before 1:30 P.M. That night Ed worked W1KRW; W3's GQS, AIR, CYW, and FJ; and W4AUU, At 11:22 P.M., Ed ran across the harmonic of W9HDU, Colorado Springs, who was on Ten. Changing to 28 Me., 2HB found that HDU could not transmit on Five but could listen there, so Ed went back to Five and a contact was made with sigs equal to those on 28 Mc. Ed got all excited when he heard the harmonic of LSI on Five on May 19th, and dug down deep for some sign of South American DX, but without success. We are reminded that YV4AE promised W4FPM that he would be on Five shortly. He says he has heard W signals on Five and is determined to make the first Intercontinental QSO in 56-Mc. history.

#### **RELAY HIGHLIGHTS:**

W ITH many of the high scorers yet to be heard from as this is being written, it is impossible to present a true picture of the scoring in the Fourth U.H.F. Relay of May 18th and 19th. Far greater participation was in evidence, and messages were handled over much longer routes than in previous events. It looks like W3AC/3 again, though Goyn had plenty of close competition this time. W2DKJ/2 was right up near the top, despite a misfortune which cost him plenty at the outset. Art was working portable in a hospital, of all places, when the a.c. line he was using was switched to d.c. Some fireworks ensued, but luckily not much of the truckload of expensive apparatus Art had assembled for the event was in use at the time.

Messages were exchanged between W8CVQ, Kalamazoo, Mich., and W2AMJ, Bergenfield, N. J., during the contest period over a network consisting of W8CVQ, W8QDU, W8NYD, W8CIR, W8CIR/8, W3BKB, W3BZJ, W2AMJ; and slight variations of this net, to include W3AC/3, W3HWM, W3RL, and a flock of W2's and W1's, provided a nearly sure-fire route for east-west traffic.

Several openings for sporadic-E DX provided the means for an exchange of messages between stations which have been isolated in previous relays. A new record for snappy long-distance relay work was set when a brief opening gave W6OVK, Tucson, Ariz., a chance to give a message directed "To any East-Coast Amateur" to W5VV, at 7:12 P.M., Saturday. This was handed on by Wilmer to W9CLH, Roselle, Ill., a few minutes later. By a route not yet definitely known, but probably via W9VHG, this message was given to W8CVQ, who passed it on to W8QDU. Fred got it off to W4QN at Orlando, Fla., at 6:04 P.M., Sunday, thereby completing the nearest thing we've yet seen to a 56-Mc. Transcontinental Relay. That three skip contacts were required shows that we are still a long way from linking both coasts by a reliable u.h.f. circuit. Some "heads-up" operating on the part of W3AIR and W4ASE made it possible for a message from W1HUV, Winchester, Mass., to reach Florida in record time. As many inquiries have been received regarding the next Relay, we announce that the date has been set for the weekend of Sept. 14th and 15th.

#### 112 MC.:

**THE** ERE'S the story on the new 112-Mc. DX record announced last month. On April 21st, while operating atop Mt. Soledad, a 860-foot elevation near San Diego, Cal., W60IN contacted W6BCX/6 at Mt. LaCumbre, 6 miles north of Santa Barbara, a distance of about 185 miles. The following Sunday, W60IN working from the same location made contact with W6BCX, this time operating from Mt.

#### U.H.F. DX RECORDS *Two-Way Work* 56 Mc.: W1EYM — W6DNS, July 22, 1938. 2500 miles. 112 Mc.: W60IN/6 — W6BCX/6, April 28, 1940. 200 miles. 224 Mc.: W1KLJ — W1HDF, May 18, 1940. 13 miles.

Santa Ynez, a 4300-foot elevation, 20 miles northwest of Santa Barbara, an airline distance of 200 miles. W6QZA was at the same location and also worked W60IN. W6BCX says that QZA was 20 feet farther away, and so should qualify as "champ."

The rig of W6OIN is an RK-34, parallel-rod oscillator mounted under the hood, with a concentric line feeding a quarter-wave radiator on the top of the car. Input is 18 watts. Receiver is a 6J5 mounted on the steering post, with the audio in the glove compartment. W6BCX used a mobile transceiver.

W6OIN reports that he has made about 50 contacts over distances around 100 miles in the last few months on 112 Mc., and conditions are just now beginning to be good! This 100-mile work with low power that has been reported so frequently from the west coast had us stumped for a while, as no one in the east seems to be able to even approach these results except by the use of high power in the very best locations. Ray explains this by saying that the California boys are blessed with very frequent and pronounced temperature inversions during all the summer months. As soon as the desert country to the east becomes heated, there is an overrunning layer of hot dry air at an elevation of 1000 to 6000 feet. The cool moist breezes from the ocean (that famous California climate, you know) form a perfect inversion setup which produces u.h.f. bending of an extreme nature. On both 56 and 112 Mc., contacts over distances of 100 miles or more are frequently made with very low power. Ray would like schedules with stations north of San Diego for tests on 224 Mc., to see whether this fortunate condition would permit long-distance work on this frequency also.

The record of 160 miles established last fall by W9VTK and W9WYX was also exceeded on May 5th, when Mike Villard, W1DMV, operating under the call W6YX/6, piloted a Piper Cub Trainer at an elevation of about 8000 feet, maintaining contact with W6HJT/6 located at Lick Observatory on Mt. Hamilton, until they were 165 miles apart; contact being lost abruptly when the plane was just north of Chico, Cal. The rig used in the plane was a pair of HY-615's in a resonant-line oscillator, powered with a Vibropack operated from a tiny 17-ampere-hour storage battery. At Mt. Hamilton, W6HJT/6 used a pair of HK-24's at 150 watts and a 3-element rotary beam.

These fellows point out that the advent of the new lowcost light plane has brought down the cost of rental of a ship of this sort to a point where any group interested in setting a new record for 112-Mc. work might do well to hire a couple of these ships and go to it. They point out that, for \$0, a 65-h.p. ship and pilot service can be had for an hour's time. This is sufficient to climb to 10,000 feet and still have approximately 15 minutes' operating at this elevation. With two ships at 10,000 feet, a range of operation of 320 miles is theoretically possible; a distance which is probably beyond the range of possibility from any ground location.

Our past experience in high-altitude portable work indicates that there are other factors than mere height above the surrounding country in this business of long-distance work on the ultra-highs. A good beam; a quiet location; a high-powered transmitter; and, most important of all, a fortunate condition as to temperature inversion, will go a (Continued on page 106)

#### VK BOOTLEGGING

WARNING over-enthusiastic Australian experimenters of the danger from their attempts to carry on transmissions on the amateur bands, the editorial in April "Amateur Radio" points out the Institute has no sympathy "with those who are foolish enough to break the law in such flagrant fashion." The duty of all real amateurs, says the editor, is to coöperate with the authorities in the suppression of any further illicit transmissions. "We can hardly expect the penalty to be slight," he continues, "and we don't mind saying that we hope it won't . . . such a selfish and irresponsible attitude has considerably upset any chances the Australian amateur possesses with regard to the restitution of our experimental licenses."

#### L.R.M. CONTEST

THE 1940 edition of Lithuania's annual "Radio Contest" which took place in February was won by LY1AP in the radiotelephone section and LY1BX in the c.w. division. A unique feature of this L.R.M.-sponsored event is that it invites participation by all short-wave listeners, who are given points for their receiving work. The society points out that one purpose of these contests is to acquaint the general public with the work of the radio amateur. Many such listeners, having heard a number of local stations at work, become interested themselves in the hobby, join the association and so strengthen their numbers.

#### LU MILITARY RESERVE

FOLLOWING what seems to be internationally a general tendency recently in amateurgovernment relations, the Radio Club Argentino has announced a proposed affiliation of radio amateurs with the military services, to be pat-

terned after the U.S.A.'s Army and Navy reserve affiliations. The plan was inspired by Captain Shaw of the Argentine army, and drawn up by Alberto E. Bird, LU4FD. It contemplates the establishment of nets, first by zones and second by the operating ability of member-stations. Although both 'phone and c.w. nets will be set up, it is expected the latter groups will make up the backbone of the organization.

Sr. Bird proposes likewise a number of special experimental amateur stations devoted to scientific research in radio, to operate jointly under the supervision of the Club and the government department of communications.

#### S.A.R.R.L. RECESSES

As or June 30, 1940, the headquarters of the South African Radio Relay League is discontinuing all normal activities, pending cessation of hostilities, by decision of its executive council at the annual general meeting. The headquarters, now staffed only by a secretary serving in an honorary capacity, will handle only important correspondence with sections and divisions, relations with the government, and keeping the records of the League. "QTC" made its final appearance in April, and circular letters to members will be utilized should the need arise to get in touch with them promptly.

Effective May 1st, the postoffice department discontinued the handling of QSL cards. Those for foreign countries will not be accepted for transmission, and those arriving from other countries will be stopped and disposed of as the censor sees fit.

The Council has strongly urged each division to continue their activities, including regular meetings and publication of monthly news letters.

(Continued on page 70)

## 1940 A.R.R.L. QSO Party Results

#### BY E. L. BATTEY,\* WIUE

A CTIONS speak louder than words — and the scores listed here, representing the actions in the Third Annual A.R.R.L. QSO Party say more than words ever could regarding the success of the affair. Held January 6th–7th, 1940, this gettogether for League Members enjoyed a considerably greater participation than either of the previous member-only parties. 533 operators reported results.

#### **Congratulations** to the Winners!

Awards of tie holders with individually engraved diamond-shaped pendants have been made to the winners in the 62 Sections from which entries were received. There were no logs from Alaska or P. I. The champs are: W1BFT, W1BIH, W1DFQ, W1EKN, Ŵ1EOB, W1KTB, W1LAB, W2GSA, W2HXQ, W2IOP, W3BES, W3BZE, W3EDP, W3HUM, W4AGI, W4AXP, W4CXY, W4DQ, W4EFM, W4HF, W4EV, K4FCV, W5ASG, W5AWT, W5AQE, W5BKC, W5HAG, W5HBH, W5WG, W6AFH, W6CIS, W6CW, W6FYR, W6IPH, W6KFC, W6MUS, K6PAH, W6PAR, W6IFH, W6AFC, W6NOS, K6PAH, W6PAR, W6PBV, W6PUZ, W7AYQ, W7FJQ, W7GPP, W7JC, W8DZC, W8LCN, W8NCJ, W80FN, W8QDU, W9CWW, W9EII, W9ENH, W9FOQ, W9FS, W9GKS, W9RQM, W9RSO, W9QPG, W9TH, W9VKF, W9ZAR, and W9ZTL. 27 of these were also winners in at least one of the previous A.R.R.L. Parties, and their calls are indicated by italics. Special credit is due the following, who led their Sections in all three Parties ('38, '39 and '40): W4AGI, W4CXY, WSLCN, W80FN, W4EFM, W9CWW, W9RQM and W9VKF.

#### Participants' Comments

Some representative comments received from participants with their logs will serve to express the spirit of the affair and the manner in which it was received: "It was a lot of fun and I met a lot of old pals I used to QSO on 200 meters back in 1924." - W9CLV. "Surely had a swell time and especially got a big kick out of the increased use of break-in." - W5CJP. "My 71/2 watts worked better than I thought they would! Made 9212 points." - W9NYH. "W.A.S. has eluded me for 15 years. For 2 years have lacked only Delaware and Vermont at this QTH. In last hour of contest, Vermont answered CQ at 11:15, and three contacts later at 11:30, Delaware answered CQ, for W.A.S. here!" - W6MUF. "All my rigs were torn down except the little 10-watt emergency 'standby' rig. Don't feel so badly at the

\* Assistant Communications Manager.

**July 1940** 

way it worked 'em in this hot contest - and a couple of W6's, too." - W8AQ. "It was an excellent affair particularly because the prevailing spirit was definitely a 'party spirit' with plenty of good fellowship." — W3DPU. "Met old timers of some twelve years ago. Hope we have another real soon." -- W8AOR. "May I say that I greatly enjoyed the time spent in operating in the contest and lend my voice to those looking for a bigger and better one next year!" -W3ATR. "New station record of 40 QSO's in one hour." ---W3BES. "This contest has everything the boys have said. It has all the fun of the SS, ORS and DX contests combined." - W2IOP. "Enjoyed copying the 'clean cut' c.w. signals in this Party, but regretted the lack of participation on the 'phone bands." - W2HXQ. "Handled 15 messages during the contest just to show the spirit of the 'A.R.R.L.' Will be looking for the next party." - W3GJY. This contest is more fun than others I think because there is more of a personal feeling in the contacts." - W1KRQ. "This contest affords a nice diversion and chance to contact lots of old boys and know that they are still alive." - W9CWW. "The inactivity of the 'phone gang was the big disappointment of the contest. There were hours at a time when I failed to hear a single 'phone station besides my own call 'A.R.R.L.'" - W7UQ (W9AHR op.) "It was great fun working all the familiar calls again. I have been in all three of the A.R.R.L. parties held so far and enjoy them a lot, even more than the SS." — W9RQM.

#### Highlighters

The highest scorer in each district: W1TS 37,200; W2GSA 36,669; W3BES 43,140; W4EV 29,441; W5WG 31,742; W6KFC 32,860; W7GPP 10,752; W8OFN 36,934; W9RQM 38,491.

Those scoring over 25,000 points: W3BES 43,140, W9RQM 38,491, W1TS 37,200, W8OFN 36,934, W2GSA 36,669, W9RSO 36,580, W2IOP 35,055, W9ZAR, 33,524, W9EYH 33,110, W9FS 33,060, W9VDY 33,060, W6KFC 32,860, W5WG 31,742, W9TH 31,692, W3EDP 31,130, W8QDU 30,576, W4EV, 29,441, W5KC 29,028, W2HHF 27,984, W1BFT 27,390, W3DGM 27,280, W9CWW 27,000, W8NCJ 26,180, W9ZRP 25,252.

Leaders in number of members worked: W3BES 360, W2GSA 360, W9RQM 316, W2IOP 313, W8OFN 313, W1TS 310, W9RSO 310, W9EYH 301, W9ZAR 289, W9VDY 285, W3EDP 283, W9TH 278, W9FS 276, W8QDU (Continued on page 70)

#### STARTING TOOL FOR DRILLS

**IREADING** the article about polystyrene insulation, page 32, QST, Aug., 1939, in which it is stated that a heavy blow with a center punch may cause a star fracture, prompted me to write you suggesting the use of a tool which I have found extremely useful for starting holes in the construction of radio apparatus. The tool is easily made from a small triangular file, as shown in the illustration of Fig. 1.

The file is ground similar to one half of an ordinary drill bit, but comes to a point in place

Fig. 1 — Tool for starting drills in metal or other materials.

of the web and has no twist. It is used in an ordinary hand drill. It cuts quickly and will not slip or run. Drills have no tendency to slip or run when the hole is started with this tool; it is not necessary to use a center punch. — Gordon Crayford, Lacombe, Alta.

#### LOW-COST 14-MC. VERTICAL

W9EVD of River Forest, Ill., sends in the description of simple 14-Mc. vertical antenna which he and several of the other boys around his neck of the woods are using with good results. The thing is so simple that it ought to be possible to run it up in an hour or two.

A rough idea of the arrangement is shown in Fig. 2. The bottom part is a 22-foot "two-bytwo" on which are mounted stand-off insulators to carry a 21-foot length of antenna wire. To the top end of the "two-by-two" is fastened one of those collapsible "window-sill" b.c. receiving antennas. These antennas may be obtained with a 12-foot length which, when added to the 21-foot wire, makes a 33-foot half-wave antenna for 14 Mc.

The assembly is light enough so that one person should have no difficulty in managing it on top of a roof while the guying ropes are fastened in place. Wire could be used for the guys if broken up into small sections with insulators but W9EVD has found that rope guys will do a good job and last a long time if they are soaked in linseed oil before using. He uses ordinary clothesline.

Fig. 2 — Simple 14-Mc. vertical antenna costing less than three dollars.

Any conventional method of feeding the antenna may be used; W9EVD feeds his at the base with Zepp feeders.

#### ELIMINATING 'PHONE INTERFERENCE WITH LINE TELEPHONE

IF OTHER amateurs operating powerful 'phone transmitters in the 20-meter band have as much trouble as I have had in clearing crosstalk with their own (and neighbors') telephones, the diagram of Fig. 3 will enable them to clear entirely the interference without impairing the operation of either the telephone or radio transmitter.

This type of trouble results in the radio transmission being heard often S9-plus in the telephone receiver and is the result of r.f. rectification in the carbon telephone transmitter. The standard telephone practice is to put r.f. chokes in the fuse box in the telephone line and, in some cases, by-pass the transmitter with a mica condenser of about 0.002-µfd. capacity. This generally clears up interference from r.f. pick-up from

Fig. 3 — Filter for eliminating interference with telephone installations from ham 'phone transmitters. R.F.C. is a jumble-wound coil of 25 turns No. 24 d.c.  $1\frac{1}{2}$ -in. diameter. C is a capacity of 0.002  $\mu$ fd.

adjacent police radio stations, 80-meter 'phones and other stations operating on the lower frequencies. In my case all the usual devices failed to stop the interference and the telephone trouble department was unable to do anything further, while complaints were becoming severe.

A series of experiments showed that the trouble could be reduced by shielding the tele- . phone lead-in wires. The most effective and complete cure, however, was simply to wind about 25 turns of No. 24 d.c.c. wire in a jumble-wound coil about 11/2 inches in diameter and put it right in back of the telephone transmitter, connecting it in series between the lead connected to the center terminal as shown. A mica by-pass may be required on some installations and it is a good preventive against more complaints if the station operates on other frequencies. The telephone trouble men were shown this and were glad to find a way of clearing the trouble. They put in similar chokes at several other points where interference was severe, entirely clearing the trouble in every case. They said that the same conditions were noticed on the telephones near the local airport because of interference from the radio stations there and because several frequencies were used, the trouble had been difficult to clear entirely.

I hope this may help some of the other boys who may run into this trouble. -A. G. Sheffield, VE4SS.

#### NEUTRALIZING R.F. STAGES WITH A MODULATING MONITOR

I SUPPOSE that there is nothing new in ham radio, but from time to time we do run across ideas that are new to us. Here is something I discovered by accident. I have never seen the idea published.

While changing bands in the old rig, I always tuned the buffer stages with the final plate power off and, in so doing, I noticed the modulation monitor's carrier-level meter showing a reading. With a little thought, I realized I had a very sensitive neutralizing indicator.

With this method I re-neutralized all the r.f. stages and was surprised at the amount of neutralization that was necessary to eliminate all the r.f. in the various tank circuits. For a high degree of accuracy, the monitor can be rather tightly coupled as the tubes become more perfectly neutralized. Also, the percentage-ofmodulation indicator will register any audio frequency that might be introduced in the various stages by hum or feedback.

Try it sometime and see if your stages are perfectly neutralized. — Phillip F. Jones, Jr., W4FWD.

#### 'SCOPE COUPLING

COUPLING a cathode-ray 'scope for r.f. energy from a 'phone rig employing link coupling from the final to antenna or antenna-tuning unit generally means the use of an extra coil. The diagram of Fig. 4 illustrates a simple but effective means of securing the voltage without the necessity of an extra coil, while the coupling may be easily varied to the correct value for any band.

In the diagram  $C_1$  may be any small condenser, such as a double-spaced  $35 - \mu \mu f d$ . variable. This condenser is connected to one side of the link coil, which may be any of the numerous types on the market. Then, the other side of the condenser is connected to the *ungrounded* terminal of the vertical deflection plates. The r.f. input may be varied by increasing or decreasing the capacity of the condenser.

With link coupling to an antenna tuner unit, the link may have to be grounded either directly or through a condenser,  $C_2$ . This might be of more importance at low power than at the

Fig. 4 — Coupling oscilloscope to link output. (See text for values.)

higher powers. The idea of unbalance may be suggested, but satisfactory operation doesn't require much capacity and any unbalance introduced will be slight. — George W. Brooks, W1JNO.

#### IMPROVING THE USEFULNESS OF A GLOBE

**T**HIS is a relatively simple way to fix up your globe (without mutilating it) to enable you to determine the great circle direction of certain points from your home. The necessary implements are a pencil, a short piece of fine wire, and a common pin.

Wrap one end of the wire around the pin, place the pin on the equator of the globe, run the wire along the equator to a point 90 degrees from the pin point and at this point wrap the wire around the pencil point. A little nick on the side of the lead near the point will help to keep the wire from slipping off the pencil point. Check a number of times and make certain you have exactly 90 degrees between your pencil point and pin point. In this checking you will notice that unless your wire is taut and exactly along the equator, your measurement may be off as much as a degree or more. Be sure the wire is near the points of the pin and pencil to reduce error.

Then, put the pin point on the location of your home and proceed to make a circle around the globe with your home as the center. The idea is shown in Fig. 5. I found the best way to do this was to swing the pencil through an arc of an inch or so, holding it taut, then mark the globe for about a half inch or so, and then move on and repeat. The reason for taking this added precaution is that the wire has some lag in following the pencil and it tends to bring the pencil a degree or so closer to the pin point.

After you have the circle completed, mark due South on it and make certain it is accurate. If your globe doesn't have a ring on it, you can run a string from pole to pole through your home town and determine due South in this manner. (If you are south of the equator, due North will be your starting point on the circle.) Now take your wire, pin, and pencil, without altering, and mark off your 90-degree spots on the circle. If your work is accurate, you will come out even. (Suggest you work both ways from starting point.) Then mark off 45-degree spots and 10- or 15degree spots if you wish.

Now take a narrow strip of paper and place it along the equator and mark off 15 or 45 individual degrees on the paper and then, with this paper scale, mark off the degree points on the circle.

In numbering your degrees on the circle, start with North as zero and move westerly from this point around the world numbering every 10 or 15 degrees back to North as 360 degrees; i.e., NE is 45 degrees, East is 90, South 180, West 270, etc.

Fig. 5 — New scale on globe by which bearing from the home location to any point may be quickly determined.

Now whenever you want the true direction of a certain place from your home, just stretch a string between the two places and see where it crosses the circle you have made and you have it.

A card or a composition disc with 360 degrees marked on it is a handy thing, especially when you have determined where true North is by means of polaris or old sol (covered in previous issues of QST).

You are now ready for a lot of fun and quick calculating and figuring for that new antenna or directive array you have been planning. — John S. Ingraham,  $W^{\gamma}CYC$ .

#### NOTE ON TUBE KEYING SYSTEMS

W5CY points out that a reduction in drive to a stage in which a tube keyer is connected may result, if provision is not made to keep the operating bias at the same value used without the keying tubes. The amplifier grid return is normally made to ground, as shown at "A," Fig. 6, so that if the keyer tubes are connected between the amplifier center tap and ground, the

Fig. 6 — Grid returns with tube keyers. The common version shown at A may require an adjustment of amplifier bias to prevent over-biasing.

voltage drop across the keyer tubes will be applied as additional bias to the grid. W5CY suggests connecting the grid return to filament center tap, as shown at "B," but this leaves the keying tubes in the negative high-voltage line only. It should be possible to effect an equivalent remedy by simply decreasing the grid-leak resistance, leaving the grid return connected to ground and maintaining center-tap keying.

#### OUR COVER

W2BRO's 2½-meter crystal-controlled television transmitter rates the nomination for Cover I this month. The u.h.f. boys may well benefit from the description of Lee Waller's rig even those not committing television at the moment.

Our thanks go to Bob Burnap of R.C.A. for getting this shot for us.

The Publishers of QST assume no responsibility for statements made herein by correspondents.

#### **READ THE REGS**

Cheney, Washington

Editor, QST: There seems to be a growing practice lately of purposely removing some of the final power supply filter for the purpose of making the note "easier to distinguish," particularly during contests. I have heard that a few actually admitted this practice. Now, while the resulting note isn't exactly raw a.c., it is definitely not the ideal note for amateurs today. In fact, it is illegal, besides being very undemocratic with regards to other amateurs who strive to keep the c.w. note nothing less than T9. Let's see if we can't all strive to keep our notes on a T9 basis.

Another point which many of us have forgotten or neglected is section 324 of the F.C.C. R&R. It is still in effect, you know, and pertains to amateur radio as well as commercials. It in effect says that all stations must use only sufficient power to insure satisfactory communication over the given distance and under the existing conditions. Now we can't possibly stick to this rule with engineering precision, but we can do something about the abominable practice of using 500 watts or more for those cross-town roundtables on 160 meters. There are many grounds for a short call or test across the street on a kw., but if we are going to spend the evening talking to the next door neighbor or the friend two miles away let's use a low-power rig - say a two-stage platemodulated rig running 3 to 10 watts input. My 6F6 final with 5 watts input gives me very nice reports on 160 'phone at distances of 50 to 100 miles . . . and does not interfere with stations across the state during the busy hours on the band. You'd be surprised what you can dig out of the junk box. I didn't spend one cent for my flea-power rig. Also it saves a great deal on power bills on local contacts.

I advise all amateurs to take an evening off during the next thunderstorm and read all the rules and regulations of the F.C.C. Then let's resolve to keep our operating and engineering practices within the law. It is the best insurance I know of to keep our rights to use the amateur bands.

- Harry K. Long, W7CQK

#### W2AOE, W9AEJ AND OTHERS

Editor, QST:

742 Central St., Plainfield, N. J.

I note with interest W9AEJ's comments on my proposals. Evidently he and undoubtedly many other hams fail to realize the size of our need for new amateurs on the ultra high frequencies. If all the hams that we will get in the next twenty years by the present methods could be brought on the air at once and forced to go on u.h.f. for all time, our u.h.f. population would still be pitifully small. We need new types of amateurs and new methods of getting them.

Amateurs fail to realize that playing dog in the manger is a good game only if you are sure of your manger. In our case the F.C.C. can take away our little used playgrounds on the basis of lack of occupancy. With commercial television, frequency modulation, facsimile, aircraft and countless other services crying for more room, how can we possibly expect to hold large slices of the spectrum when giving them little or no use?

If amateurs really are supposed to be of assistance to the country in time of war, I would like to point out that the opinion of our Australian friends has long been outmoded. Our Army is going to 'phone in an increasing number of places where speed, not secrecy, is essential. In time of war

**July 1940** 

we will need thousands of radiotelephone operators and, what is more important, people who can service this type of equipment. It is of course quite true that we will need trained c.w. men, but we are getting them by our present methods.

In the light of the present blitzkreig tactics in Europe, it seems to me that the League can be of the greatest possible service to the country by immediately instituting steps to prevent our government from committing the colossal folly of shutting down amateur radio stations in time of war. Let us present instead a comprehensive plan for the creation of country side u.h.f. nets with inter-connections to the present A.A.R.S. and N.C.R. for the purpose of reporting aircraft flights, parachutists, etc. We need little elaboration to see that with wire communications disrupted, amateur radio offers the only possible means of taking care of this situation. Such a plan would require thousands of operators, not the paltry few in action to-day.

With such a plan in force, the old idea that a shutdown of amateurs in war time is essential would have little or no ground to stand on. This idea is based on the assumption that with no amateurs on the air no spies will use radio. It is about as effective as the "concealed weapon" laws are in preventing criminals from carrying guns. But unless amateur radio can offer some actual benefit to the country, there would be no point in maintaining it and taking the time to supervise it.

Can someone give a good reason why we should not have 50,000 hams on the u.h.f. bands, with or without code training, that will outweigh in importance the saving of these frequencies for amateur use, and the obvious service such a group can render in time of war?

- D. A. Griffin, WSAOE

Editor, QST:

Huron, So. Dakota

I think the suggestions of W9AEJ in his article "Another Solution" on page 51 of the June, 1940 issue of QST practical, and would like to see it a part of our regulations. Too many new hams who have not been with us long enough to acquire the proper ham spirit go on 160-meter 'phone with tight-coupled misfit antennas, doubling in the final and causing widespread harmonic interference to b.c.l.'s. They never become good operators nor do they ever find out the advantages of c.w. over 'phone. The suggestions of W9AEJ would build a better class of amateurs.

- Philip G. McGinnis, W9IQD

Editor, QST:

Griffin, Indiana

May QST arrived yesterday, and as usual I turned first to the "Correspondence" section. An article under the heading of "Another Solution" met my eye. I read and re-read it and found it hard to believe that any sane individual could sign his name to such a mess of words and statements. I went back and gave a few minutes to the ideas expressed by W2AOE in his story of how it should be done and I would have held myself in check, had not W9AEJ come forth with the complete solution. I am not fully in accord with W2AOE, not by a long shot! When someone comes along with a problem to be solved, of course then we must have a solution. But until there is a problem to be solved. why in tarnation

(Continued on page 68)

F. E. HANDY, WIBDI, Communications Mgr.

E. L. BATTEY, WIUE, Asst. Communications Mgr.

A.R.R.L. Extends Its Code of Neutrality Precautions to Prohibit Any European Contacts. The extension of the European conflict again focuses attention on the necessary precautions that radio amateurs should observe to permit unrestricted continuance of our amateur radio in the United States.

This is not the time to demonstrate how amateur radio can cross certain international boundaries. For the last three months QST has recommended avoidance of any radio work with belligerents or any amateurs in the theater of war. Irresponsibility of certain licensees cannot be condoned. It must be emphasized that any amateur who will work a belligerent or a European (since all are involved or close to involvement) is totally inconsiderate of the more important rights of himself or his fellow amateurs. It is high time that individual tolerance of every license holder toward any few who insist on jeopardizing his privileges, be thrown out of the window. It is the right thing for all of us to monitor our DX bands closely and ask full coöperation of any amateur who flouts any part of our precautionary code. The League's Official Observers are on the job doing this, but let every one of us help.

The League now extends its code of operating precautions, printing them prominently again

#### POINTS IN EXTENDED A.R.R.L. CODE OF OPERATING PRECAUTIONS

1. Do not contact *any* European station.

2. Do not relay anything from one country to another: confine any international contact to technical subjects or trivial small talk,

3. Do not use any code or cipher\*; use plain language, English recommended. Sign *each* transmission with your assigned call; do not permit unlicensed operators to use equipment; contact no unlicensed stations; follow every F.C.C. regulation with utmost care.

4. Do not talk about the war over the air (even among ourselves), or discuss any happenings that might have military significance.

\* Only exception, authorized AARS/NCR station drills.

below. Please comply with the following points carefully, and also make yourself part of the informal Neutrality Patrol. Contact by radio direct (or send radiograms if unsuccessful) any amateurs heard wherein it seems necessary to ask better observance of any one of the operating precautions set forth. Send A.R.R.L. the name and call of any amateur who is uninformed, or non-coöperative, or misunderstands this situation and its importance to all of us, so we may take steps to send him information.

The views in Washington on the actual situation are extremely realistic in the various governmental departments. Our friends there hope that for our own good we shall not require more monitoring surveillance or restriction. This is a request that every licensee who reads these lines may do his part in observing the precautionary code, and assisting others to do likewise. A.R.R.L. will gladly send information to any amateur who tells you he is uninformed or misunderstands. Let us remember that *there is surveillance*, and be watchful to see that the sensible precautions are observed, to avoid possible curtailment. --F, E, H.

#### AMATEUR RADIO AND THE IMPERIAL VALLEY EARTHQUAKE

"On Saturday, May 18th, at 8:37 P.M. P.S.T. (time courtesy of stopped clocks), a sharp earth tremor was felt at many points in Southern California. Most severe shocks were at Brawley and Imperial, where the writer was at the moment passing several others who were in a hurry to get out from under a building. We were in the downtown area at the time. Most of the people killed were doing the same as we were, running out of collapsing buildings and being struck by falling areades; however, I guess my number wasn't up!

"As the brick dust settled from fallen buildings in the first shock, I was able to find my car under an arcade, as yet undamaged, and finally drove over to the house. Everyone at home seemed OK except for fright, so I proceeded to put the rig on the air, the power having come on in the meantime. I raised W6DZC at Loma Linda and requested him to notify the Red Cross, etc. Shocks continued, a very severe one at 10:30 P.M. doing over a million dollar's damage at Brawley.

"Notable work was done by W6DZC, who stayed on the air all night handling messages and watching the frequencies of stations active in the area. Numerous messages were handled by W6PTM, DAZ, DZC, OXQ, VEY, GG, EFD and MMW on 3.9 Mc. The Amateur Net for the American Legion on 1.75 Mc. was active all night, with W6LCU and W6NLY in the valley doing an excellent job. W6QNM, San Diego, whom I contacted shortly after 9 p.M., and W6JVK, W6DEP and W6DXM, and many others on the Coast, did splendid work. Telephone lines were not entirely out but were swamped under the tremendous traffic load. A Los Angeles newspaper stated that its first information about the quake came via amateur radio."

- Chuck Lunder, W6HWJ

#### ARTICLE CONTEST

Which do you consider "the most interesting amateur band?" If you have followed the contest articles in the past few issues of QST you know what some of the gang have to say on this subject. We are inviting more articles for the C.D. contest based on various individuals' ideas of the most interesting band. What is your choice?

A. J. Burton, W5BDX, wins the prize this month with his article, which approaches the question from a somewhat new angle.

Send in your article on why such-and-such-aband is, in your opinion, the best available. Each month we will print the most interesting and valuable article received on this subject. So far articles have been printed on the Ten, Twenty. Forty and Eighty Meter bands. Please mark your contribution "for the C.D. contest." Prize winners may select a 1940 bound Handbook, QST Binder and League Emblem, six logs, eight pads radiogram blanks, DX Map and three pads, or any other combination of A.R.R.L. supplies of equivalent value. Try your luck!

### The Most Interesting Band

#### BY A. J. BURTON, W5BDX\*

My FAVORITE band? Why One Hundred-Sixty Meter C.W. is the best band for local ragchews with lowpower, for passing traffic across town and for medium distance contacts, although it isn't very hard to work all states on One-Sixty C.W. if a fellow wants to make the effort. On the One-Sixty 'phone band, practically any kind of a contact can be made, as a listen any evening will demonstrate. Most of the Army Amateur Phone Nets operate on this band with excellent results and for neighboring contacts with fellows you have met or hope to meet in the future, One-Sixty 'phone is swell.

Now, to take part in organized activity on C.W., Eighty Meters is perfect. There we find the trunk lines, the group nets, and Army Amateur C.W. nets. To pass traffic to practically anywhere just get on Eighty C.W., give a short CQ QTC and the traffic hounds will be on your neck, or rather frequency, like a ton of bricks. If you are a rag-chewer you will find plenty of like-minded operators there. If you are looking for DX it's on Eighty also and, brother, you really get a thrill working DX in Eighty Meters. Then there is Seventy-Five Meter 'phone, and my friend, that is a band. Local vicinity rag-chews all day long, up to three or four hundred miles, and at night, take your pick, far and near, all over the country.

So down to Forty Meters where we have practically everything, traffic, rag-chews, DX, nets, contests, low power, medium power, high power, everything, everywhere. And then Twenty Meter C.W. Do you need those hard-

And then Twenty Meter C.W. Do you need those hardto-get states for W.A.S.? You will probably find them here. Or more countries for the Century Club or that elusive Asian? Here they are; dig them out. If you are a 'phone addict and also a DX hound Twenty Meter 'phone is your meat.

Suppose we don't have a class A ticket and want to work 'phone DX? We just drop down to ten meters and there we have practically the same as Twenty Meters. Not as much QRM, maybe not quite as consistent but full of lots of surprises. Low-power is just as good as high-power on Ten Meters too. Ten Meter C.W. is good for everything, too, but lately it hasn't been very occupied. Maybe if we get on that band it will wake up.

So we come to Five Meters. Perfect low power, local band, fixed station or mobile, and any time DX might pop

\* 910 South 25th St., Fort Smith, Arkansas.

into your receiver. What a thrill to be talking to locals and have the DX start to roll in.

Now Two-and-a-Half Meters is opening up with lots of experimenting with both amplitude and frequency modulation. If we are of an investigative mind by all means we should get on that band or even One-and-One-Quarter Meters, There's lots of room for experimenting.

So it settles down to this: My favorite band — the Most Interesting Band — is the band I choose to operate on any given time, depending on my operating interest at that time! They are *all* interesting, depending on what I want to do.

### 0.B.S.

The following is a supplement to the list of A.R.R.L. Official Broadcasting Stations in October QST (page 76): W1LVK, W2HXQ, W2KXT, W4EFD, W8REC, W9BQY.

### **Brass Pounders' League**

#### FLASH!... A.R.R.L. Code Proficiency Certificates are to be issued monthly to amateurs who qualify for them.

W1AW regular transmissions by tape at 15, 20, and 25 words per minute will be supplemented by additional practice transmissions. One scheckule per month will be transmitted on all W1AW frequencies for rating purposes. See full details next month.

Every licensed amateur is eligible for one of the Code Proficiency Certificates. It will be a chance to prove yourself a true amateur, and receive evidence of your increase in skill after being licensed. The certificates will be given for reporting "solid copy" by ear on the official monthly transmission of plain language groups at fixed speeds.

As the transmissions are continued increased skill will receive recognition when it is demonstrated. QST will report the calls of all who receive certificate awards. See next month's announcement for details. It is not too early to start practicing copying the W1AW and other OBS transmissions, planning round-table groups (clubs) for making definite code speed gains possible. There will be a Club Certificate available for individual attainment in such groups, too. The way to get set for the first test transmission is to try to set down on paper for 15 to 30 minutes each day something that is a little faster than can conveniently be set down correctly. Count on nailing down an A.R.R.L. Code Proficiency Certificate in the first run, to be announced in next QST.

--- Communications Manager.

#### BRIEFS

Capt. S. C. Collins completed four years as Liaison Officer, Army Amateur Radio System, this June. His new post will be at Patterson Field, Ohio. His successor is Lieutenant Stevenson who was formerly the Officer in Charge of station KA1HR. He will arrive in Washington sometime in June.

#### NATIONAL SOARING CONTEST

'The Eleventh Annual National Soaring Contest will be held in Elmira, N. Y., from June 29th to July 14th. Amateur radio has played a big part in all the soaring meets held in Elmira, providing emergency communication in case of disaster, handling traffic, and furnishing communication between the different take-off sites and between the launching winch and the glider, which many times were out of sight of each other.

The Elmira Amateur Radio Association again this year is sponsor of radio communications and has appointed John Mulligan, WSRTW, director of communications. Application has been made to F.C.C. for the call WSUSA, which was granted for use at the 1939 meet. It is hoped a 100-watt all-band transmitter will be available for traffic handling and general rag chewing. Portable-mobile rigs will handle the launchings and landings. All amateurs are cordially invited to attend this meet. Bring your tickets! All field operations will be carried on in the 28-Mc. band. There will be daily 28-Mc. glider-to-ground work, and it is requested that all hams be on the look-out for this flea-power transmitter. Any and all reports of reception will be greatly appreciated.

### April '40 O.R.S.-O.P.S. Parties

WITH the absence of W3BES from the April O.R.S. Party, a "dark horse" stepped up into first place with a "beautiful" score — W3HQE. We understand that BES was on for less than one hour, it may have been a case of "when the cat's away . . ." Hi. Congrats to W3HQE and also to W3DGM, who was a close second. In the O.P.S. group W9WXL pushed up into first place, followed by W2JME and W4QI, all more or less new faces in the front row. FB! The next quarterly get-togethers for O.R.S., O.P.S. and all League officials are scheduled for July 27th and 28th. Don't miss them!

### QST for

#### **JULY HAMFEST SCHEDULE**

July 7th, at Shelton, Conn.: A ham get-together will be held in Shelton, Conn., starting at 2:00 P.M. E.D.S.T. on Sunday, July 7th. Sponsor is the Southern Connecticut American Emergency Network. The affair will be held on the grounds of the White Hills Coon Hollow Club, about a mile from Route 110. Registration should be made in advance. All hams, their families and friends, are invited. There will be games, dancing, plenty of prizes and refreshments. Fee: 75¢ for OM's; XYL's and children free. Further information may be obtained from the secretary, S. M. Sill, 305 Derby Ave., Derby, Conn.

July 20th-21st, at Glacier Park: The Fifth Annual Glacier Park Hamfest is to be held at Two Medicine in Glacier Park, July 20th and 21st. There is no registration fee. Walter E. Partlow, W7FGZ, 1308 3rd Ave. No., Great Falls, Mont., is the president for the hamfest, and further information can be secured from him, W7AQK, W7ABT, W7FUQ or W7DSS. Program and stunts will be arranged for the hams as well as for the ladies, with fishing, hiking and boating on Two Medicine, portable radio operation and plenty of subjects for the camera fans.

July 21st, near Peoria, Ill .: The Peoria Amateur Radio Association is holding its Second Annual Central Illinois Hamfest on Sunday, July 21st. The place: Loscher Park, about 11/2 miles north of Peoria, on Route 150. As usual, there will be free refreshments, and plenty of prizes, including several large prizes, such as an RME DM36 and a Meissner Signal Shifter. There will be the traditional contests, and plenty of interesting activities are planned for the ladies. Facilities will be available for playing ping-pong, baseball or horseshoes. A dance is planned for the evening. Lunch may be purchased at the refreshment stand, or you may bring your own. Advance registration is 75¢ for the OM, 25¢ extra for the YL or YF and children. At the gate, fees will be \$1, and 50¢.

July 21st, at Rolling Green Park, Pa.: The Third Annual Hamfest of the Susquehanna Valley Amateur Radio Club is scheduled for July 21st at Rolling Green Park, on Route 11, midway between Sunbury and Selinsgrove, Pa. Registration at 1:00 P.M.; program starts at 1:45 P.M. The program will include a demonstration and talk on frequency modulation, and several reels of motion pictures. Banquet will be held at 6:30 P.M. in the Park restaurant, followed by a short program and the prize drawings. The afternoon activities will be in the Park theatre. Additional details may be obtained from the club secretary, John W. Fisher, R. D. 2, Selinsgrove, Pa.

July 21st, at Round Lake, Wis.: The Round Lake Ham-fest is staged annually by the Fox River Valley Affiliated Radio Clubs, Sheboygan, Fond Du Lac, Two Rivers and Manitowoc. It has come to be a firmly established part of amateur radio activity in that region. This year's hamfest will be held on July 21st. The Round Lake site, approximately 18 miles southeast of Fond Due Lac, Wis., is ideal for an outdoor hamfest. Last year's attendance was 247, representing 38 communities. An even greater turn-out is expected this year. Don't miss it!

### W1AW Summer Schedule

JULY-AUGUST OPERATING-VISITING HOURS 7:00 P.M.-1:00 A.M. E.D.S.T. daily, including Saturday-Sunday.

ADDITIONAL STATION HOURS 1

1:00 P.M.-7:00 P.M. E.D.S.T. daily, except Saturday-Sunday.

OFFICIAL BROADCAST SCHEDULE (for sending addressed information to all radio amateurs):

#### Frequencies

C.W.: 1761-3825-7280-14,254-28,600 kcs. (simultaneously) Speeds (W.P.M.) Starting Times (P.M.)

E.D.S.T.	C.D.S.T.	M.D.S.T.	P.D.S.T.	M	T	W	Th	F	Sat	Sun
8:30	7:30	6:30	5:30	<b>20</b>	15	<b>25</b>	15	20	-	20
Midnight	11:00	10:00	9:00	15	25	15	20	15	15	

PHONE: 1806, 3950.5, 14,237, 28,600 kcs.

Each code transmission will be followed in turn by voice transmission on each of the above frequencies.

GENERAL OPERATION:

Besides specific schedules in different bands, W1AW devotes the following periods, except Saturdays and Sundays, to GENERAL work in the following bands:

Time, E.D.S.T.	Frequency
2:00 p.m 3:00 p.m. <sup>1</sup>	28,600 kc. Phone/CW
7:00 р.м 7:30 р.м.	14,237 kc. Phone
7:30 р.м 8:00 р.м.	14,254 kc. CW
8:00 p.m 8:30 p.m.	3825 kc. CW
9:30 р.м10:00 р.м.	3950.5 kc. Phone
11:00 р.м11:30 р.м.	7280 kc. CW
11:30 р.мMidnight	1806/1761 kc. Phone/CW

At other times, and on Saturdays and Sundays, operation is devoted to the most profitable use of bands for general contacts and to participation in special week-end operating activities. The station is not operated on legal national holidavs.

Give W1AW a call for an accurate frequency measurement, to communicate with any department of A.R.R.L., to rag-chew when time permits, or to pass a message to ham friends, making use of the Headquarters station's multiband facilities.

<sup>1</sup>Except for weeks of July 7th, 14th, 28th, and week of Aug. 4th providing for the attendants' vacations.

#### W2USA, World's Fair

A busy corner of the "shack" at W2USA, New York World's Fair. Fred Seid, W2MQ, keeps an eye on the opera-tors as they do their stuff. Nils Michael-sen, W2LSD, organizer of Forty Traffic System is working the 7-Me size in the System, is working the 7-Mc. rig, in the foreground. The receiver and transmitter, beyond him, is on 3.5-Mc. c.w., and the pair of units at the end of the bench are on 28-Mc. 'phone. The large transmitter on the floor is on 3.9-Mc. 'phone. At this writing W2USA is getting under way for the new Fair season. All bands will be used with a good number of operators making possible full operation.

### **July 1940**

#### HOW:

IF YOU have been tolerant enough to follow this pillar since its inception a few years ago, you may have noticed that from time to time a note of pride has crept into the stuff, pride in being able to tell about the exploits of the DX gang which, we think, is one of the most highly specialized and developed groups in the amateur radio game. We've always had that pride about them since the old days when we found them the first to take up new technical developments and learn things about DX conditions. Occasionally there have been incidents that have tried to shake that faith but they never got to first base with us.

Recently our confidence and loyalty for the DX gang has been put to a real test. Into this gang of bowled owls there has filtered an element that we aren't too keen about. We like to think that the element is made up of some of the newcomers, unfamiliar with their heritage and the traditions that make up the DX gang, but we can't be sure. We refer to those DX men who are either too stubborn or too stupid to refrain from working belligerents during these troubled times, even though the reasons for not doing so have been pointed out to them time after time in the pages of QST. Some we can partially excuse because they haven't seen that particular part of our magazine, and others should be excused, we imagine, because they can't read. Then there is a small group of twerps who get a boot out of working ham stations in belligerent countries, and they just won't stop (they claim) until they are told to by the F.C.C. We think just a little too much of ham radio to let any such lads be responsible for our privileges being curtailed, and that's why we'd like to make an informal suggestion. If you hear any such goings on, call the ham and tell him lightly and politely to lay off until the time comes again when we can work any and all stations without jeopardizing ham radio's position. If he's any kind of a guy at all he'll realize he isn't doing anything to help ham radio and will desist.

We aren't just talking to take up space. We know that the condition exists and we want to see it cleaned up. Every time we turn on the receiver we hear fellows hard at it, and we keep getting lists from some of them, proudly enumerating the Europeans and belligerents they've been working. Naturally we don't run the dope in this column, but we'd like to see the dopes run out of the DX gang. Any time they want to play ball, like the vast majority does, we'll welcome them back. Even if they don't like to have us tell them they might at least recognize the trust placed in all of us by the now off-the-air DX stations who, as their letters show, count on us in this country to keep ham radio going for them until after the hostilities. Let's not betray that trust.

#### DXCC ROUND UP:

WE PULLED a small boot last month in assuming that QST would get around to everybody by the end of June, the date set for the meeting. It will have reached most, but not all, of the members, but it shouldn't cause too much trouble among the members at the meeting, because they can use the June list of DXCC without too much error.

Speaking of the meeting, we've had notes from some of the gang and we've talked with others, and no one has come out against it, so we'll have the tea and cakes all waiting on June 29 for the first meeting of the DXCC. W6GRL leads the parade this month so he's the chairman unless, of course, Dave Evans has pulled down all of Doc's antennas for some experiments. Don't forget to let us know how many DXCC members you worked during the week-end of the 29th.

The printer's devil scored heavily on us last month, but we hope you all assumed that the general call in the party is to be "CQ CC" and not "CQ CO" as the little man tried to make it.

#### WHERE:

THE excitement this month is about KH6SHS (14,397 T9). Jerry apparently is squared away with the governor down there and is now pretty active, having worked W1HX, W2GTZ, W8OSL, W5BB and others. His address, if you don't already have it, is Jerry Petranek, Box 86, Tutuila, U. S. Samoa. W1FTR, down that way on WCFT. says there are two licensed hams in Samoa, but we don't know who the other one is . . . . . Another Pacific Islander the gang is catching up with is **KE6SRA** (14,350 T8). W2GTZ, W6WN, W6ZS, W5BB and others worked him, but we haven't yet seen anything of the list he was going to send through for DXCC credits ..... Just as W6MUS was going to tear down his rotary antenna he hooked AC4YN (14,295 T9) at 1340 GT. Now he's building a fence around the antenna and has hired two small boys to keep it polished and shiny ..... W1HX heard a KF6JP (14,380 T9) in the early morning ..... Cards have been coming through from a couple of EA's. The addresses, if they'll help, are: EA7BA, Dr. Jose M. Gil Guerra, General Queipo de Llano, num. 33., Cadiz, Spain, and EA4AC, Luciano Garcia, Antonio del Rincon, 5, Guadalajara, Spain ..... Speaking of cards, you'll notice in the I.A.R.U. news section this month that QSL cards to go out of South Africa are not accepted, and incoming cards are being held by the censor.

#### (Continued on next left-hand page)

For a long time we didn't believe there was any W2GT, because we never heard him on the air, but we finally tracked the guy down and got a picture and the dope. Doubtless the reason we hadn't heard him was that while we were after the milk, W2GT was skimming off the cream. Ed Hopper of Bergenfield, N. J., is an outstanding example of what hard work and determination can do for a fellow who's interested in DX. Ed has more patience and less power than a lot of fellows, but neither seems to have handicapped him. The receiver is an HRO, and the transmitter uses a 1B4 e.c.o. into a 6L6 buffer working Class A, and that drives a 35T at 150 watts input. Practically all the work is done on 20, with a rope-driven 3-element rotary antenna. Ed has heen a ham for the past 16 years, but most of the DX has been worked in the past 31/2 years.

PIE wound transmitting chokes such as the R-152 and the R-154 have served the amateur well for some six years. This is a long time, particularly in amateur radio where there has been a steady trend toward higher plate voltages and higher frequencies. The old piewound chokes have protested this state of affairs from time to time by a strong odor of burned insulation, but mostly they have just shown passive resistance. (Editor's Note: Passive resistance absorbs power just like any other kind of resistance.)

Such being the case, we decided to make a thorough investigation of transmitter choke design. A large number of chokes were tested at frequencies from 1.5 to

30 MC with a peak RF voltage of 2500 volts. Measurements were made throughout this range to determine whether the chokes were inductive, capacitive or resonant at the amateur bands. Approximate impedance values were noted, and close attention was given to temperature rise and "hot spots." Measurements of input and output power were taken with and without connection of the RF chokes, and accurate information was thus obtained on the effect of the chokes on amplifier efficiency.

The tests included not only the conventional chokes already available, but also scores of new chokes, ranging from the simplest single-layer windings to the most unusual looking shapes and forms. Various combinations of single-layer windings, conical windings and duo-lateral pies were used.

We finally arrived at the new choke shown in the sketch at the top of this page. Different diameters are combined in such a way as to give sufficient inductance for high reactance at 1.7 and 3.5 MC, and to keep the distributed capacity low, causing the series-resonant frequency of the choke to fall at about 26 MC. Single layer helical windings are used throughout the choke because this type is best for low distributed capacity.

The impedance of the choke is high for all of the amateur bands between 1.7 and 30 MC, and may be used anywhere in this range except at 26 MC. It may be used in parallel-feed circuits without overheating, and without causing a detectable loss of efficiency in the RF amplifier to which it is applied. It is free from voltage breakdown at RF peaks as high as 20,000 volts.

This new type of choke is necessarily somewhat taller than those in present use, but this is likely to prove an advantage in the actual construction of an RF amplifier. The height of the choke is about the same as that of the currently popular medium-power tubes. Thus the connection to the top of the choke may be made by an almost horizontal, short connection from the plate cap of the tube.

By and large, we think the new choke is FB.

T. M. FERRILL, JR.

The output filter condenser has two important functions-

- 1. It suppresses hum.
- 2. It prevents common coupling through the power supply. The power supply impedance must be low to prevent oscillation (motorboating), or unwanted degenerative effects.

Here, as in other filter circuit applications, FP Capacitors are unexcelled from the standpoint of low impedance, dependability and compactness. A few of the many stock sizes are:

Туре	Capacity	Working Voltage	Can Size
FPS140	125 mfd.	350 v	138" dia. x 3"
FPS146	40 mfd.	450 v	1" dia. x 3"
FPS149	80 mfd.	450 v	1%" dia. x 3"
FPD238	40-40 mfd.	450 v	13/8" dia. x 3"

In the past, space and cost limitations have frequently prevented engineers from using optimum capacities in filter condensers.

The startling compactness of FP Capacitors removes this limitation—now you can use enough capacity to produce real results. But insist on genuine *FP* construction—it is your guarantee of proper life and performance.

Thomas A. Consalvi—W3EOZ—knows receivers. He has seen just about all of them—and he's actually given most of them a whirl. Many manufacturers have sent him sets to be tested under normal as well as exceptional amateur conditions. Here's what he says about the new RCA AR-77 with which he recently replaced a receiver costing more than \$300 in his shack:

"In many features, the AR-77 is superior to any other I ever tried—at any price. In every way, it matches the performance of my old receiver costing more than twice as much. Some features, particularly the noise silencer, are far superior. Its performance on high frequencies is unbeatable; its signal-

AR-7/7

COMMUNICATION

RECEIVER

to-noise ratio excellent and its stability unmatched. I've tried it under all sorts of conditions and there is negligible drift, even over long periods."

Getting back to the noise limiter, Mr. Consalvi states: "It's the first really effective noise silencer I've ever tried. It really works. For instance, I've had three automobiles at the same time going full blast just outside of my shack, making all possible ignition noise. Then, I've gone to my AR-77, picked up the weakest signals I could find—signals inaudible without the noise limiter in operation—and brought them in 100%!"

Tests under average conditions show maximum drift at 30 Mc to be only 3.0 KC on one hour run, thereby keeping signal audible. A 2-to-1 ratio of signal-to-noise is obtained at an average sensitivity of 2 microvolts throughout range. Frequency coverage, 540-31,000 KC in *six* ranges. Try it at your nearest RCA distributor's store. You be the judge! Complete Technical Bulletin sent on request.

> Net Price, **\$139.50** f.o.b. factory. 8" Speaker in matched cabinet, **\$8.00**.

HIGHLY ACTIVE: Instantly snaps into oscillation. Accurately follows keying.

POWERFUL: Uniformly high power standardized in a loaded oscillator with measured output.

ACCURATE AND STABLE: Frequency guaranteed .03% accurate. Drift less than 4 cycles/mc./°C.

DEPENDABLE: Thirty-one checks and inspections, including a final overload test, assure reliable operating characteristics.

Ask your distributor for Circular A-7

#### WHÖ:

HAM radio lingo must give the censors a bad time every now and then. WONLZ sent a letter to VS2AL which had been checked by the censor. The words removed from the text were "QRM," "DXCC" and the like!.... Speaking of the DXCC reminds us that, because of a step-up in production schedule, cards for the DXCC must be in by the 20th of the month to make the next QST, rather than by the first as used to be the case ..... .. W6KMS writes to say that he's going out to Wake Island shortly for PAA, where he'll be on 20 and 40 c.w. Paul adds that, because of the high cost of QSL-ing from Wake, cards should be sent to the W6 QSL Manager, and KC6KMS will QSL upon return to the mainland ..... We hope everyone is happy now that VU7BR came through with a second batch of cards. Apparently the first ones were lost en route ... LU5FB writes to say that most LU's QSL via the district QSL Managers to W's - cards to LU's can go direct or to LU4AA. LU's get on the low end of 40 for c.w. contacts in the early morning hours, when the 'phone QRM is least W8OSL has met personally 27 members of the DXCC above 115 countries, which may or may not be a record. But the best way to meet a lot of them is to get on for the DXCC Round Up on June 29th and 30th, on 14 Mc.

---- WIJPE

Flash! A last-minute development changes the DX picture considerably. Be sure to read this month's editorial on page 12.

#### BRIEFS

The Jersey Shore Amateur Radio Association gave a very successful demonstration of amateur radio during the week of April 8, in connection with the Asbury Park Cavalcade of Progress, held in Convention Hall, Asbury Park, N. J. A complete 400-watt radiophone and c.w. transmitter was set up by a committee consisting of W2GMR, AlW, FZY, FQK and GUM. Other members of the Association who took turns in operating and giving information to visitors included W2HWX, IKL, LMB, LYY, AER, CZP, BZT, MWW and GAK. Practically all the traffic accepted from visitors was handled by BZJ. The amateur radio exhibit and demonstration was the most popular feature among the 53 exhibits on display.

Code speed practice transmissions are being made by W2SC on 3510-kc. each Tuesday and Friday at 8:30 P.M. E.S.T. Here is an opportunity to increase your code speed proficiency. Transmissions are made at speeds from 15 to 40 w.p.m. W2SC is the Second Corps Area A.A.R.S. Net Control Station located at Governors Island, N. Y. The automatic transmitting head of WVP, Army station at the Island, is used for purposes of the code practice. Try your hand at these transmissions on Tuesday and Friday nights.

The first W.P.R. certificate to be issued outside of Puerto Rico itself went to H. S. Bradley, WSJIW. This certificate is issued by the Puerto Rico Amateur Radio Club to amateurs working 25 K4's and submitting verifications.

Winner of the Code Speed Contest at the 1940 Hudson Division Convention was Clay A. Littleton, Jr., W2MNE, who copied a speed of 40 w.p.m. using a typewriter. He won the \$10 prize for this, and was also conceded the prize for best pencil copy. The contest was conducted by D. R. Wingate, W2KEZ, who set up his automatic equipment for the test runs.

The Southwest Weather Reporting Net (general call QWX), which operates on 3540 kc. during the winter, has moved to 7080 kc. for the summer and operates at 5:00 P.M., Mountain Time, daily.

Reorganization of the Chair Warmers Club has recently taken place. This club is for disabled radio amateurs everywhere and it is desired to make the membership as complete as possible. Bulletins are issued to C.W.C. members at regular intervals. Harold Brooks, W9EVB, is president, and Rudy Drews, W8DSQ, is secretary. Send applications to the secretary at 1413 Sheridan St., Lansing, Mich.

# HIP-12D-X AND STABILITY Plus"

N ever-increasing numbers, amateurs are turning to the "HQ-120-X" because they find it to be everything they have ever hoped for in a medium-priced receiver. Loud praise from thousands who are already using "HQ-120-X" receivers was earned by pioneering on the part of Hammarlund engineers. They put into this receiver features which hams could *really use*, features which are rapidly changing the whole scheme of receiver design. And, today, the "HQ" is even better than ever because our engineers are ever alert to make the slightest improvement. In buying an "HQ-120-X" you do not get two or three year old engineering, but right up-to-the-minute improvements.

Words can hardly express the quality of this fine receiver. To really appreciate its smooth performance, it is necessary to hear and operate it. By all means, visit your dealer and operate the "HQ" yourself, and experience "selectivity and stability plus."

EXPORT DEPARTMENT, 100 VARICK ST., NEW YORK CITY

YOU'VE solved your problem of getting maximum efficiency from your transmitter when you invest in a Model 1696-A Modulation Monitor.

And ... better yet ... it saves you money by increasing your range without the added expense of remodeling your transmitter. (Amateur experience has shown that a properly modulated 10-watt rig can be as efficient as a 50% modulated 40-watt transmitter.) The Model 1696-A is easy to use. Plug it into your A.C. line — make simple coupling to the transmitter output and the monitor shows:

#### CARRIER REFERENCE LEVEL PER CENT OF MODULATION

INSTANTANEOUS NEON FLASHER (no inertia) indicates when per cent of modulation has exceeded your predetermined setting. Setting can be from 40 to 120 per cent.

Use of the monitor permits compliance with FCC regulations. Two RED • DOT Lifetime Guaranteed Triplett instruments. . . . Modernistic metal case, 141/2" x 75/8" x 41/2", with black suede electro enamel finish. Black and white panel.

Modulation Monitor Booklet — regular purchase price \$1.00 — Furnished FREE with each Model 1696-A. Tells you what you want to know about this monitor, and includes details, including diagrams, for operation of Model 1696-A.

#### Model 1696-A. Amateur Net Price (U.S.A.) \$34.84

Model 666-H. This Volt-Ohm-Milliammeter is a complete pocket-size tester with AC-DC voltage ranges: 0-10-50-250-1000-5000 at 1000 ohms per volt; DC Milliamperes 0-10-100-500; High and Low Ohms Scales. REDODOT Lifetime Guaranteed Measuring Instrument. Amateur Net ..... \$14.50

Since Century Club applications are falling off, and more personnel time will be required for issuing the Code Pro-ficiency Certificates, the next listing of Century Club Awards and standings will be scheduled for September QST.

THE new Hammarlund "PA-150" is an ideal final amplifier for the amateur interested in medium power. The "PA-150" is extremely compact, measuring only  $11\frac{1}{2}$ " x 8" x  $5\frac{1}{2}$ " and is capable of outputs up to 175 watts with low-priced HK-24 tubes. Other tubes such as 35-T can be used for higher outputs. The entire foundation unit is designed around the new Hammarlund "HFB" insulated rotor condensers, further adding to the economy of this excellent unit.

If your present rig uses an 807 or similar output tube of around 15 watts, it will be a simple matter to add the "PA-150" and really go places. For further technical information, see October 1939 "QST" Page 38, and write for folder containing diagrams of amplifier and power supply, as well as complete list of parts. Ask your dealer to show you the new "PA-150" — it's really FB.

## Important GAMMATRON 111 54 Improvements

The new improved 54 GAMMATRON offers greater plate voltage capabilities up to 3000. The U. H. F. efficiency is higher. This great combination of features makes the 54 ideal for a wide range of applications. Efficiencies shown below are obtainable in conventional circuits of proper design. WRITE FOR DATA.

#### WTDR

The Schoolship of the Massachusetts Nautical School, the steam bark Nantucket, is on her annual cruise, this year to Central American waters, From May 11th to September 23d, the following points will be visited: Boston, Gloucester, Washington, Norfolk, St. Thomas, San Juan, Guantanamo, Cristobal, C. Z., St. Petersburg, Havana, East Lamoine, Glen Cove, Fall River and Cataumet, Mass., an estimated sailing distance of 8985 miles. The Nantucket carries 118 cadets in training for officers' positions in the U.S. Merchant Marine, and has a crew and officer complement of another 25 men, including 3 radiomen. The radio call is WTDR. Communication with amateur stations is desired, with the view of having personal messages from the cadets forwarded to their parents and friends. WTDR will listen on the 7-Mc. amateur band at 0700 GMT, and will answer on 8280 kc.; and will also listen on the 14-Mc. band at 1900 GMT, answering on 12,420 kc. A.R.R.L. will be interested in hearing of any contacts with the Nantucket.

#### NEW BATTERY TUBES

SYLVANIA announces a group of three new 1.4-volt, 50-ma. battery tubes which are designed for efficient performance at low plate voltages. All are of the loktal type.

#### ILC5

This type is an r.f. amplifier pentode with medium cut-off characteristic satisfactory for a.v.c. circuits. Operating conditions are as follows:

Plate voltage	45	90
Screen voltage	45	45
Grid voltage *	0	0
Plate current	1.1	1.15 ma.
Screen current	0.25	0.2 ma.
Plate resistance	0.7	1.5 meg.
Mutual conductance	750	775 $\mu$ mhos.

#### **ILC6**

The 1LC6 is a pentagrid converter with operating conditions and characteristics as follows:

Plate voltage	45	90
Screen voltage †	35	35
Anode grid voltage	45	45
Control grid voltage 1	0	0
Oscillator grid resistor	0.2	0.2 meg.
Plate resistance	0.3	0.65 meg.
Plate current	0.7	0.75 ma.
Screen current	0.75	0.7 ma.
Anode grid current	1.4	1.4 ma.
Oscillator grid current	0.035	0.035 ma.
Total cathode current	2.9	2.9 ma.
Conversion conductance:	•	
Control grid voltage at 0	250	$275 \ \mu mhos.$
Control grid voltage at $-2$	50	50 µmhos.
Control grid voltage at $-3$	5	5 µmhos.

The LD5 is a diode-audio pentode with characteristics and operating conditions as follows:

Plate voltage	. 90
Screen voltage	. 45
Grid voltage	. 0
Plate current	0.6 ma.
Screen current,	. 0.1 ma.
Plate resistance	. 0.95 meg.
Transconductance	. 600 µmhos.
* A resistance of at least 1 meg. should be	in the grid re-

turn to negative filament, Pin No. 8.

 † Obtained preferably from by-passed series resistor.
 ‡ A resistance of at least 1 meg. should be in the grid return to negative filament, Pin No. 8.

## \* NEW APPARATUS \*

#### IMPROVED ACORN SOCKET

**T**HOSE who use u.h.f. gear should be interested in the improved Hammarlund acorn tube socket Type UHS-900. The base of low-loss "Iso-Q" is fitted with new-type silver-plated beryllium contacts which are grooved so that the tube snaps firmly into place and will not jar losse nor shift position. In addition, a shield is available which completes the internal shielding of the acorn pentode, greatly reducing coupling between input and output circuits.

#### **NEW SOLDEBLESS CO-AXIAL FITTINGS**

**COMMUNICATIONS** Products Co. of Jersey City, N. J., now have a complete line of compression-type fittings for concentric lines and antennas which require no soldering. The fittings are waterproof and it is claimed that a saving of 75 per cent in labor of installation is possible. The concentric half-wave antenna is made in three sizes for powers up to 1000 watts.

#### NEW SOLDERING IRON

**S**OMETHING new in the way of soldering irons is the Ducon "Solder Master." In this iron, the head is fitted with a spill-proof cup which holds 48 drops of solder which is kept in a molten state by the heat of the iron. Each pressure of the thumb on a button on the handle of the iron releases a single drop of solder through a nozzle. This feature makes it unnecessary to hold the solder strip to the point of the iron, thereby releasing one hand for holding the work. It should also prove handy in making connections which are difficult of access. It is made by the Dual Remote Control Co., Inc., 31776 West Warren, Wayne, Mich.

#### U.H.F. PUSH-PULL TRANSMITTING PENTODE

**T**HE latest trend in transmitting tubes seems to be toward the multiple-unit type. Close upon the heels of the double and quadruple parallel-connected triodes of Eimac comes the announcement of the 829 by RCA. The envelope of this tube, which is designed for u.h.f. performance, contains two beam tetrodes. The cathodes are connected together inside the tube, while the heaters are connected in series with the center tap brought out to a separate terminal so that they may be operated in series from a 12.6-volt supply or in parallel from a 6.3-volt supply. The tube is designed particularly for push-pull operation.

Maximum CCS ratings in Class-C telegraph service are: d.c. plate voltage, 500; total plate current, 240 ma.; total plate dissipation, 40 watts; maximum plate input, 120 watts. Typical power output is approximately 83 watts. The tube may be operated at full ratings at frequencies up to 200 Mc. and at reduced input to 250 Mc. Less than I-watt driving power (at the grid) is required for full output at 200 Mc. and no neutralizing is required.

#### **Correspondence** Department

#### (Continued from page 53)

must there be a solution? I could not swim when I was five years old, but I learned in due time. I could not operate 75and/or 20-meter 'phone when I first became a ham, but I can do so now. Ten was not worth the effort just a few years ago; even 20 and 40, not to mention 80 and 160, were not everything that the ham wanted. Needless to say "we got there just the same." We got there just the same way that we are getting to the ultra-high's to-day. New equipment is being developed along with new theories and practice. I think all of this effort being expended on how to solve a problem that is not even a problem could well be directed to doing a little more "actual practice" on the ultra high's. In other words give us the dope on your discoveries, show us some simple circuits and put them on pages and pages of QST...

And all of this talk of killing two birds with one stone. The only birds that some of you other birds want to kill are the little young birds who, as yet, have only a little fuss on them. Some day you old birds are going to slip, and when you do, since you killed two birds with one stone while they were unable to defend themselves, ham radio will be no more, Why persecute the beginners?

- Russell M. Price, W9GWL

Strays

#### I.R.E.-A.I.E.E. PACIFIC COAST CONVENTION

THE Institute of Radio Engineers plan a Pacific Coast convention to be held in Los Angeles on August 28th, 29th and 30th. This is a combined effort of the A.I.E.E. and the I.R.E. with one joint session of interest to both groups.

In reference to the Stray which appeared on page 18 of QST for May, the Precision Transformer Company, Grand Haven Road, Muskegon, Mich., advises that antenna wire in any length can be supplied.

Automobile-radio antenna connectors make good and inexpensive mike connectors. They are handy wherever shielded leads are to be connected. The cost — just six cents. — W5BKS.

which is perfectly natural. The Eimac 100TH's drive easily, neutralize perfectly on both bands; operate very efficiently, giving a high output to the antenna.

Outstanding results like this, coupled with economy in operation, are the reasons why most of the leading radio amateurs in the world use Eimac tubes. Chances are you'll find it easier to get results if you switch to

#### **CAN'T** OU FOOL E N G I N E E R

The old time medicine man was a colorful character but he has no place in an age which insists upon quality — not fanciful claims.

Take transformers, for example! We could make claims, ballyhoo our product to high heaven but it wouldn't mean a thing because you can't fool an engineer — he buys on Fact not Fancy!

Typical of this is the Kenyon line of Plug-in Transformers which, because they give PLUS value, are favored by engineers who read specifications.

## QUALITY ALWAYS TELLS

PAT. APP. FOR

Note these Kenyon features which challenge comparison!

- **Over 20 different types** 1.
- Uniform response 30 to 20,000 cycles. 2. (No D. C. in primary)
- 3. No wire sizes smaller than No. 44 (assuring absolute dependability) 4. Positively Submersion-Proof (3%" |
- lap on all sealed joints)
- 5. Humbucking construction employed (not practical in smaller sizes)
- 6. 11-prong base allows maximum electrical versatility <u>plus</u> more rigid mechanical mounting 7. A 'first' by Kenyon

Send for the new Kenyon Catalog which gives complete data on the more than 20 different types of plug in trans-formers as well as Laboratory Standard transformers, broad cast and industrial transformers, etc. Many graphs, charts and valuable data. It's yours for the asking.

#### I. A. R. U. News

#### (Continued from page 48)

The purpose of this suspension of headquarters activity, as stated by the Council, is simply a conservation of funds by reducing operating expenses.

#### NEWS AND NOTES

"AMATEUR DAY" was a recent featured event of both the Radio Club de Cuba and the Radio Club Argentino. Government officials who were invited to speak on amateur-government relations had much praise for the past accomplishments of amateurs and expressed good-will on the part of the government. . . . During the weekends of May the L.A.B.R.E. staged a national Brazilian QSO party, c.w. and 'phone. Points were allowed for contacts depending on which band was used (extra credit given for 80meter work) and a multiplier was determined by the distance worked. "CN," for concurso nacional, replaced "CQ" in the contest. . . . Like so many other society organs, the Belgian magazine "QSO" has been carrying a course in elementary theory.

### A.R.R.L. OSO Party Results

# MORE NEW **"Designed for Application"** MILLEN GEAR

**ESPECIALLY** for mobile rigs! 33991 is socket for RCA 991 voltage regulator tubes. 32150 is entirely new type of Isolantite bushing. Fits  $\frac{1}{4}$ " hole in chassis. Locked in place instantly with drop of solder. No nuts to vibrate loose. 33087 is "snap action" base clamp for 807, etc. No tools required to remove tubes. 10050 is dial lock that does not cause detuning when operated. Single hole mounting. 10060 is concentric type shaft lock for "screw driver adjusted" controls. 33888 is socket shield to permit full advantage from use of "S" type of single ended metal tubes in high gain amplifiers. Provides effective electrostatic shield between grid and plate circuits. 20935 is double spaced ultra midget variable. 39006 is a radically new type of insulated flexible coupling which permits hubs to slide back and forth, in and out, twist, etc., without backlash!

**THESE** are just a few of the many new products that are continuously being added to the MILLEN line of ENGINEERED radio products. Other recent products, still too new to be listed in our general catalog, include FM discriminators (60504, etc.) and IF transformers, terminal blocks (37104, etc.), and many new styles of "UHF" transmitting and receiving condensers, etc., etc.

YOUR distributor can show you these and other new as well as regular MILLEN components.

# The Type "F" Frame

Through no particular effort on our part, this sturdy frame, capable of housing a variety of both fixed and variable air condensers, is staging a "comeback" via the commercial radio application route.

I W9BQJ

7676-101-38

W2BZJ

2580- 43-30

Special Type FR-500-PD Balanced Variable

> FIXED TYPES 150 to 1000 mmfds., .070" gap with .040" buffed plates with rounded edges, plus a special 220 mmfd. unit (See cut) with .153" airgap, .6000 V. peak at 60

cycles.

Since our recent catalogs have not included them, we present two representative types with general characteristics for your information.

Amateur and commercial engineers will be interested in the fixed units for loading medium power tank circuits, and the dual variable is noteworthy for its adaptability for mechanically balanced, low torque work, particularly where a necessity for perfect bearings dictates the use of ball races.

### General Characteristics of the "F" Frame:

- End plates and tie rods Brass, nickel plated.
- Plates, fixed or variable Aluminum (3S).
- Insulation --- G.E. Mycalex No. 1364.
- Frame size 4" wide x 4" high.
- Mounting Two standard "X" mounting feet, or four special long brackets (see cut of variable unit) or by three mounting posts on end plate.
- Bearings (on variables) May be standard ball thrust rear bearing with front shoulder bearing, full ball bearings at each end, or any desired combination.

• Capacity --- Standard combinations in the variable type.

Special Type FS-220-YS Fixed Capacitor

Quotations on request, but a list of standard types will be shown in Catalog No. 42, soon to be released.

THE HANDIEST BOOK OF ALL!

unouncing

48 Pages Chock Full of Timely Circuits, Photographs,

Construction Features and Data on Amateur

Radio's Finest Transmitting Tubes, 15c Amgteur Net.

Here's the Guide you've been waiting for—the most genuinely helpful, complete and practical volume of its kind RCA has ever issued. Written specifically for the amateur, it contains 48 pages filled with timely technical information on transmitter construction, transmitting tube circuits and complete data on amateur radio's greatest line of tubes.

Hot Off the Press

Easy-to-build rigs designed from "mike to tank"; latest in cathode modulation; "hot" plate-modulated and c-wrigs; straight-forward single-stage circuits, up-to-the-minute data on famous tubes such as the RCA-802, 806, 807, 808, 809, 810, 811, 812, 828 and many others. Tells what to do and exactly how to do it. Richly illustrated, it is a boon to the newcomer, indispensable to the old-timer -a book that is a "must item" for every shack.

Available through RCA Power Tube Distributors, or send 15c direct to RCA Commercial Engineering Section, Harrison, N. J.

# of United States Stations Use

Jaylor's 866

THOUSANDS

all

CUSTON

# Here's the Success Story!

The famous Taylor 866 is celebrating its Seventh Anniversary seven years of Sales Leadership—seven years of real "dollar and cents" savings to thousands of amateur and commercial users.

In 1933, with competitive tubes selling for \$7.50, (just reduced from \$12.50) the announcement of the broadly guaranteed Taylor 866 at \$1.65 was the sensation of the radio world. Sales of Taylor's 866 skyrocketed and leadership has been constantly maintained.

In 1939, Taylor introduced its new Heavy Duty Shielded 866 at \$1.50\*. Since then increasing numbers of unsolicited reports have acclaimed its performance in Broadcast, Police, Airline and Amateur installations.

If you want real "More Watts Per Dollar" value, insist on Taylor Tubes. Taylor's liberal guarantee protects your investment.

\* Same characteristics as 866A. Peak inverse 10,000 volts.

ACTUAL SIZE New Shielded

'More Watts Per Dollar

PORT ARTHUR COLLEGE - not privately owned, not operated for profit, a college built and endowed by the late capitalist-philanthropist, John W. Gates - offers the most thorough practical Radio training in America. P. A. C. owns Radio Station KPAC, which is equipped with the very latest type 1000-Watt high fidelity RCA transmitter, operating on 1220 kc. with directional antenna system. The college is authorized to teach RCA texts. Additional equipment consists of the latest type Marine and Airways Transmitter installation complete; SOS Automatic Alarm; Marine Direction Finder, two-way Television Transmitter and Receiver; Trans-radio Press Receiving Equipment; laboratory facilities where every phase of practical radio assembly technique is taught. Students assemble composite transmitters, audio amplifiers, RF amplifiers, etc. The Radio training covers thoroughly Airways, Press, Announcing, Teletype, Typewriting, Laboratory and practical experience at KPAC transmitter, control room and studios. Announcing is an optional part of this training; nevertheless a number of students annually make successful announcers.

Port Arthur College pioneered the teaching of radio with its first classes in 1909, and for thirty-one years has maintained an active Employment Bureau that is successful in placing graduates in airways, broadcast and marine radio industries.

If interested in details about the Radio Course, write for Bulletin R

### 14th Annual Rocky Mountain Division Convention

### Lincoln Park and Auditorium, Grand Junction, Colo., July 6th and 7th

THE Western Slope Radio Club, sponsoring the 14th Annual West Gulf Division A.R.R.L. Convention to be held in Grand Junction, Colo., July 6th and 7th, expect to cover every square foot of the 125 acres of recreation grounds in Lincoln Park with conventioneering hams. To secure this result they have arranged a program including demonstrations, technical talks, special meetings, a conducted tour through the Rio Grande shops, prize drawings, etc. The preregistration fee (deadline July 1st) is \$2.50; thereafter \$3.00 (ladies, \$1.50). Special rates on the Rio Grande Railroad. Write M. E. Erickson, W9FQT, Grand Junction, Colo.

### **Heterodyne Exciter**

(Continued from page 40)

oscillator. The next in is the five-meter band calibration. This is followed in turn by 10- and 20-meter band scales. A dial drive such as the National PW would probably give smoother action, but has the disadvantage of not being directly calibrated.

The frequency range of the variable oscillator is 500 to 1000 kc. This is very convenient, for the calibration is easily obtained by beating with broadcast stations. With 150 plate volts, regulated by a VR150, the stability as regards drift and shift due to line voltage variation is highly satisfactory. Even better stability could be obtained by using a pair of electron-coupled oscillators in place of the 6N7, but in the authors' case it was not found necessary.

The mixer stage is the most unorthodox. The screens are not given any positive voltage; they are returned to ground through an r.f. choke. If (Continued on next left-hand page)

"RCA Equipment is Tops"

says S. A. Greever, W5EXW, AND OWNER OF SOUTHWEST RADIO SUPPLY, DALLAS, TEXAS

The famous AR-77 offers unmatched stability...with maximum drift only 3.0 KC. at 30 MC. on a one-bour run. It offers bighest signal-to-noise ratio: 2-to-1 of signal over noise at 2 microvolts sensitivity throughout the range! Polystyreneinsulation.Temperature compensation.Dual R.F. alignment—and many features that make for DX on schedule!

Down around Dallas, amateurs know Sneed Greever. The country over, amateurs know his call: W5EXW. And amateurs respect Mr. Greever's judgment. He says:

"We consider our RCA Franchise on Power Tubes, Receiving Tubes, Test Equipment and Amateur Equipment a most valuable asset."

Amateurs come to him for RCA Equipment because they believe, with him, that RCA Equipment is dependable! They know that no other manufacturer offers RCA's world-widebackground in communications . . . or RCA's facilities and personnel. They know that RCA Amateur Receivers are your *best* buy, dollar for dollar.

Over 335 million RCA Radio Tubes have been purchased by radio users... in tubes, as in parts and test equipment, it pays to go RCA ALL THE WAY.

Tubes and Test Equipment

RCA MANUFACTURING COMPANY, INC., CAMDEN, N. J.

the ordinary screen voltage is applied to them, the load is too heavy for the crystal oscillator, and the conversion efficiency is reduced. Obviously, no r.f. at the crystal frequency can appear in the plate tank, for the screens are excited in parallel, and the r.f. balances out in the pushpull output. The control grids are driven in push-pull by the low-frequency oscillator, but no signal from this source can be found in the mixer plate circuit because its resonant frequency is far removed from that of the driving oscillator.

Two points of resonance will be found in the output of the 6F6's. One is the frequency 6499 kc. plus 500 to 1000 kc., and the other 6499 kc. minus 500 to 1000 kc. The first and higher frequency resonance is the correct one, of course, for it gives an operating range of approximately 7000 to 7500 kc. If the double frequency of an 80-meter 'phone-band crystal had been used, the lower frequency sideband should be used.

#### **Operating Data**

Doubling is possible in the mixer stage but is to be strongly discouraged because it gives four output frequencies. If the low-frequency oscillator is set at 500 kc, these would be 14,000, 14,500, 12,000 and 12,500 kc. It is easy to mistake one of these frequencies for the other, and may lead to off-frequency or double-frequency operation.

With no load on the mixers, the low frequency will be found to change about 200 cycles when the mixer plate tuning is swung through resonance. This is due to a reactive load reflected through the tubes. When the output is loaded, however, this effect becomes very small. The coupling to the next amplifier is obtained by a link, and is the most satisfactory method found.

The plate circuit efficiency of the 6F6's runs about 50 per cent. Other tubes such as 42's and 89's were tried as mixers and worked as well. The beam power tubes, while giving somewhat greater output, were troublesome because of parasitics. A pair of 6L6's, for instance, will give up to 15 watts output as compared with about 3 watts for the 6F6's. The plate current was correspondingly greater, but they were never free from spurious oscillations. Because of increased loading of the low-frequency oscillator, the frequency stability was much less.

For c.w. work, either the crystal or the lowfrequency oscillator may be keyed. Both methods give a clean-cut note with no chirp. This is probably because the other tuned circuits in the transmitter are on a frequency different from either of the oscillators and thus there is much less liability of transients acting upon them.

This variable frequency exciter has been in use at W1BKO for over two months and is used to drive three 6L6's as doublers in cascade, ending up with a pair of 6L6's on five meters. It is very easy to set the v.f. unit on a station's frequency while listening to him, and come back to him on his own exact frequency. The signal has never failed to get a report of excellent stability. It is definitely better than most e.c.o.'s of ordinary design and equally as stable as any crystal controlled transmitter that we have heard.

#### NEW ENGLAND DIVISION

MAINE SCM, H. W. Castner, WIIIE - The Pine Tree Net closed for the summer on May 3rd after a most successful season. Your S.C.M. had the pleasure of visiting the Portland Amateur Wireless Ass'n on May 14. I am most happy to report some real action in Waterville. The boys up there have formed a fine club, called The Waterville Amateur Radio Club. HSE is president and LMM secv.treas. BTG is vice-president. The boys meet every two weeks in the summer and every week in the winter. We expect to hear JPC with a 242A soon. The boys at OR are doing some fine DX work on 14 Mc. with 500 watts 'phone and 1 kw. on c.w. Many of the boys down this way for-warded a lot of messages to our vice-president, "George," W1KH, on his birthday, May 14th. This fine idea was started by "Ed" W1LYK. Any of you fellows who belong to radio clubs anywhere in New England will be most interested to find out more about the New England Radio Club Council. Information is available from Frank L. Baker, Secy., WIALP, 21 Colby Road, North Quincy, Mass. This Council does a tremendous good in gathering opinion for the information of the New England Director. I most sincerely arge every radio club to investigate. FV is planning to get a good rig on the air by fall, with either 807's or 809's doing the pushing. I enjoyed a visit to the Northeastern Amateur Radio Club in Wiscasset, May 1st. HYK entertained, and passed out a swell feed. We never saw a new ham make faster improvement than MLP. Good work, Carl. We still need many more Emergency Coordinators in cities and towns. Fellows, this is a most worthy activity. We had a serious flood disaster last August, over West Baldwin way, and no-one on earth knows where or when these things strike, so be prepared. The best preparation is to be lined up with the Emergency Corps so that the authorities know where help can be obtained. I have a full and complete instruction sheet telling you exactly what to do and what NOT to do in emergencies. Better send for one. DHH is on 3.9.-Mc. 'phone. VF is active in the N.C.R. LRQ is C.C. on 7191 kc. GOJ still maintains the 14300-kc. 'phone schedule with 5FYZ. LIC has assembled an emergency station and is ready for anything. LHA is rebuilding. LIP is on 1.75-Mc. 'phone every evening. MNI is back on 1.75-Mc. 'phone. KSL is building a small c.w. rig for code practice. LVV and LEH operate the rig at the N.Y.A. station in Eastport, MII. LVJ is working in Woodland, but can't use his rig on the 25-cycle supply there. EOP is on 3.9-Mc, 'phone some, FJP has completed a new rig. LOZ received his W.A.S. certificate after being licensed only 18 months. Fine work, Capt. Rounds. EBM is active, and has schedule with LYK often. The Naval Reserve in Lewiston and Auburn entertained the local hams on April 27th with a fine supper, and 28 attended. If any of you boys are in Boothbay Harbor this summer, be sure to look up LUK. "Ralph" is one grand fellow and very active in the club there. If you are looking for the S.C.M. on the air, I shall stay on 3597 kc. all summer, and the "latchstring" is hanging way out. The A.A.R.S. is still hitting the high spots, and these boys are improving all the time. I hear that BWR is going to do some active duty in the Navy. GKC is still "all hopped up" over that rig on the island; I understand that the engine to furnish the power for the rigs will have to be taken there by airplane.

EASTERN MASSACHUSETTS — SCM, Frank L. Baker, Jr., W1ALP — SS is Radio Supervisor Mass. N.Y.A. JDF puts an S9 signal into Boston. Welcome to Billy Dale of Somerville, none other than the old star of stage and screen, now on 28 Mc. with call MQO. MJK on 28 Mc. is a member of Boston Symphony Orchestra. We have talent in our midst. LTC and MGQ both have new Jr. ops. Congrats. LYH changed QTH. FVN is on 28 Mc. again. JGQ wants more Lynn hams for Emergency Corps. What say, gang? LZV is on 112-Mc. mobile and visited HDQ. LVN changed QTH to Falmouth; will be on 7 and 112 Mc. MDU is in the F.T.S. HUV using a.m. worked KH using f.m. on 56 Mc., for first f.m. contact. ELP and KH had first two-way f.m. QSO on 56 Mc. that has been reported. HIL resigned his O.O. and O.P.S. Sorry, Larry, you felt it necessary. Hope you are with us again later. LNN is new O.R.S. S.S.A.R.C. of Quincy had election of officers: pres., ALP; vice-pres., BIO and CPB; secy., FWS; treas., FVD. KH and ALP attended M.V.A.R.C. annual banquet, ALP and GTN attended dedication of the Parkway Radio Ass'n new station HOB, which is on 1.75- and 3.9-Mc. 'phone: the call was secured, in memory of a deceased member. IXL has 1kw. on 3.9-, 14- and 28-Mc. 'phone. He and KQN applied for O.P.S. KH went to Hudson Div. Convention. MKN has HK24 in final and is back on 1.75-Mc. 'phone. LQV is handling traffic at C.C.C. Camp. AGX is keeping his daily schedules. BDU is on with his daily schedules. WI will be on soon. FGT is back on. AAR is on 1.75-Mc. phone, 3.5-Mc. c.w., 112-Mc. 'phone and also 112-Mc. mobile. EHT worked Wyoming for 45th state. 56-Mc. activity is picking up around Boston. GCU is working on portable rig and superhet. KCQ worked portable at Tufts College on Engineering night on 1.75-Mc. 'phone with HWQ, KIQ and MKU. HWE has A.A.R.S. daily schedule on 28 Mc. BIO, DNL, IHA, ALP, LYL and KRL were at Worcester Convention. CGB is on 28 Mc. with pair of T55's. QW has two new poles at his new home. IN has a new vertical antenna for 56 and 28 Mc. 5HGC from Okla. has been visiting some of the locals. The E. Mass. O.R.S. Net closed for the summer, to reopen Sept. 3rd.

Trailie: W11WH 288 BDU 179 AGX 93 AAR 87 MDU 43 QW 28 KH-HWE 20 LNN 19 WI 11 MKN 10 GCU 7 LQV 5 BB 4 IXL-GAG 3 KCQ-JXU 2 KZT 56 AKS 194 FWQ 26 JSM 99 LBY 96 KTE 7 JCK 268 (WLGV 39) EPE 304 FSL 76 JJY 130 MEU 10 KCT 176 IIM 11. (Mar.-Apr.: W1WI 9 SS 10 JJY 208.)

WESTERN MASSACHUSETTS - SCM, William J. Barrett, W1JAH -- JAH enjoyed meeting all of the gang who attended Worcester Convention. The emergency rig had a good workout in the A.A.R.S. ZCB contest, and guess we are all set now. Other members of the Section who were on for the contest using emergency-powered set-ups included EOB, BVR and AZW. BVR conducted A.A.R.S. meeting at the Convention at Worcester. Perce has new 6-volt supply for the receiver, and reports that it worked swell in the contest. AJ has been supplying the Hartford Weather Bureau with River data via the Conn. Valley Net. Ralph had visits from IIP, JMH, MJP and LPC, and also hooked a few K6's on 7 Mc. DCH keeps active in A.A.R.S. KRX reports that he is helping LNF to get rig on air. Bill also says that KTX is building 56-Mc. portable for use in car and shack. JYH needs only Nevada for W.A.S. BNL reports Hetrofil working fine, and that cathode modulation is next on the program. MIM, Fitchburg's new YL op, is active on 3517 kc. KZU is active on 3.5 and 112 Mc. LEP has 500-watt a.c. generator. LRE is operating mobile on 112 Mc. How about some reports?

Traffic: W1JAH 148 (WLGH 36) BVR 34 (WLG 118) AJ 17 DCH 6 KRX-JYH 5 EOB 539 BIV 178 LJF 105.

NEW HAMPSHIRE — SCM, Carl B. Evans, W1BFT-DMD — The Manchester Radio Club was entertained on May 24th by Dick Briggs, BVL. of the Hytron Corp., who gave an interesting talk concerning transmitting tubes, particularly the new HY75 and HY69. He also demonstrated a concentric type oscillator on approximately one meter, using a type HY75 tube. Guest hams from Concord, Nashua and Millord were present. Refreshments followed and a good time was had by all. IP expects to be on 112 Mc. soon. N.H.N. is off until fall. Net schedules will begin about the middle of September. If you fellows prefer a longer report in Q87, why not send in a few news items, regularly?

Traffic: W1FFL 260 (WLGB 17) JDP 96 JGI 92 CMR 71 TA 63 GEY 55 MLO 47 KKQ 41 IDY 28 BFT 25 IP 23 JBM 22 HGV-ANS 21 GVJ 20 FX 19 JKH 16 JDV 13 KMH 11 EAL-MKD 8 LMC-MMG 7 CEA 6 HXJ 4.

RHODE ISLAND — SCM, Clayton C. Gordon, W1HRC — The new club that was formed in Providence has selected the name — "Narragansett Association of Amateur Radio Operators." Membership at present consists of MJL, KYK, KOG, KCS, LWA, and a couple of unlicensed fellows. MJL is studying for commercial telegraph ticket at school, and has promise of a job. KYK has new receiving antenna at new QTH. LWA got nearly 2,000,000 points in O.R.S. party, working five new states with new Hertz autenna on 3.5 Mc. He is captain of the N.A.A.R.O. Bowling Team which bowled AQ and lost, as was predicted. MCN is keeping two daily schedules for traffic. IZO is active on 112 Mc. 'phone and N.C.R. Your S.C.M. has been out of town for over 5 weeks, and has been using the portable emergency transmitter and receiver described in the 1940 Handbook. Although there has been some difficulty at times getting through solid, I have been able with about 15 watts and a piece of No. 14 rubber-covered wire about 50 feet long, to make contact on the A.A.R.S. drills at least once a week from Pittsfield, Mass., all daylight on 3.5 Mc. and one night worked solid in the drill with W1INU, using only a spiral spring antenna stretched out less than 10 feet long in the hotel room itself, no ground connection. For distances of 40 to 50 miles with reasonably decent antenna and ordinary lack of ORM which would prevail under emergency conditions, I believe this rig is absolutely dependable and reliable. Cost me: Receiver — approx. \$15,00; Transmitter — approx. \$10.00; Power Supply with Vibrator — approx. \$12.00. Have visited JAH, BVR, BKG and JLT while up in this neck of the woods, as well as attending two nice meetings of the Pittsfield Radio Club and a Hobby Show at the Y.M.C.A. which had the Amateurs as a feature. LWA deserves special credit for doing such reporting in extra fine shape, and Old Reliable GTN for the traffic totals. Tnx, pals.

VERMONT -- SCM, Clifton G. Parker, W1KJG -The April QSO party was well attended throughout the Section and many old friendships renewed. KTB went to town, hopping all over all bands for highest score in every band and highest total score of 35,100 points. FB! Runners up were MJU, KJG, FSV, KOO. The bulk of contacts were on 3.5-Mc. c.w. with nearly all stations operating on that band only. Stations submitting logs with scores above 10,000 were: MJU, 30,000; KJG, 22,500; FSV, 21,000; KOO, 20,800; LWC, 16,900; KWB, 16,800. With three parties during the past season, the Section should have a good start on another contest early in the fall. A.E.C. registrations since last month: MLJ, MKM, MMU. New O.R.S.: MLJ and KWB, which aid materially in filling in some "hard-to-deliver" spots for which this Section is famous. LWC has gone to Ford School in Michigan. BLC is active on 3.5 Mc. KEP (Mrs. DQK) and LJZ joined the Y.L.R.L., making Vermont 100% on eligible membership in this activity. MKM perfected a stormproof 1.75-Mc. half-wave using No. 6 H. D. copper, etc.! LRL is back on at Fort Ethan Allen after a winter's sojourn in New Mexico. KXY is expected to return to old QTH from Georgia about June 10th. QQ is active on 7 Mc. John and his XYL visited at DQK and BJP. KTB visited DQK, JZF, LJZ, and reports CUN now on 1.75-Mc. 'phone. KJR spent some time with JVS and GAE while MLJ and AOA dropped in on MJU. AOA is back on after long intermission; he is usually on 3696 kc. MMU is now on Vermont Traffic Net. DQK completed a top-loaded vertical for 1.75-Mc. 'phone work. KVB is leaving for New London with portable rig to keep in contact with gang; he will be at WNLC there. KOO is on the road for the summer and is giving his A.E.C. rig a real shakedown cruise while reporting in on the various drills. LBJ moved across the river to Northumberland where he is now operating under the N. H. gang. MJU is control station of Vermont Traffic Net, meeting daily except Sunday at 8 P.M. on 3860 kc. This net will continue during summer on above schedule until otherwise specified by the control. Appointments for this Section now in force, as of May 15th, are : O.B.S.: FPS, KTB. O.O.: AVP, BJP. O.P.S.: AD, AVP, DQK, GAN, MCQ. O.R.S.: BNS, FSV. KOO, KTB, KVB, KWB, MJU, MLJ, R.M.: BNS (Eastern Vt.), FSV (Western Vt.).

Traffic: W1FSV 176 KJG 103 MJU 78 KTB 49.

CONNECTICUT - SCM, Frederick Ellis, Jr., W1CTI --- KKS takes top traffic honors this month, B.P.L. and high station in the Section. Congratulations, Bill. BCG moved into his new home, May 30th, and will install his station in the special radio room. UE and JMY attended New England and Hudson Division Conventions and visited 2USA. GB is all set to go to town on Field Day. LOC will operate portable from Norfolk, Va., this summer, and expects seven other amateur operators from his destroyer, U.S.S. Semmes, to give LOC/3 a good work-out, Rumor has it that KYQ can now work "Bk-in." FB! TD worked 7CRE, 6RLQ and 6KLV on 3.5 Mc. 1KE is on the way to Puerto Rico. 2MQB/1 will operate at LOC/3 along with MJY/1. CJD says the Middlesex Radio Club recently held a meeting, the first in two years! EH contacted F.C.C., the State Dept. and F.B.I. on a recent Washington trip. 8MYW/1 has an NC 1-10 and will be glad to listen for 224-Mc. stations. We are all glad to hear that ES is recovering and is back at the office, even if only for part of the day. BGJ asks why there isn't more 1.75-Mc. c.w. activity. LIG is out of St. Vincent's Hospital. MHT is now on 1.75-Mc. 'phone. MQM is newest member of B.A.R.A. The following are on, or about to go on 112 Mc.: MQM, MGC, KZC, IIS, LIG, MHH, MGS. New officers for B.A.R.A.: pres., ACV; vice-pres., IIS; secv., MHH; treas., KAB; act. mgr., APA. Plans for Field Day are under way, and B.A.R.A. is going out after top place. On Sunday, May 19th, the Manchester Radio Club held a pre-field day outing in a field in back of LMK's home; 3.5- and 7-Mc. antennae were put up on portable 40-foot masts. Within two hours the station was on the air and made the first contact, using all emergency power. On May 23rd C.B.A. held a dinner at the General Putnam Inn, Norwalk, celebrating over 10 years of organization. BCG, president of C.B.A., was master of ceremonies and introduced the following speakers: ACV, EER, JYQ, QV, LOC, BHV, CTI and Captain Reuben King, Commandant of Combat Train, Norwalk National Guard Unit. BHV gave an outstanding demonstration of magic, entertaining the gang for over an hour. C.B.A. expects to be located at the rifle range of the Norwalk Rod and Gun Club in Easton for Field Day. The Nutmeg Net closed May 31st after the most successful season in its history. The net will reopen Sept. 2nd. In the meantime, use 3640 kc, and "CN" for Conn. contacts.

#### HUDSON DIVISION

EASTERN NEW YORK - SCM, Robert E. Haight, W2LU-KWG is doing swell job at West Point. MIY helped boys at Albany Radio Club during Albany-N.Y.C. motor boat races. LU can be heard on 3530 kc. MHW is new member of A1-Opr. Club; he's doing FB work on T.L. "G." Don't let this summer weather get you, fellows. Report to your S.C.M. LLU is still on c.w. from Feura Bush. ACB is operating 3.9-Mc. 'phone and lining up Field Day program for S.A.R.A. AMM is heard on 28,590 kc., schedules ICLI Sundays. HNH/2, in Kingston, is using rebuilt rig: 41 e.c.o., 6L6 doubler, 6L6 final, 50 watts on 7 and 3.5 Mc, ALP, on 14,200 kc., schedules 6SDD at San Francisco (formerly 2AUT). DEL is back on 3.5 Mc. Welcome, Horton. SZ is reinstated as O.R.S. No. 16.

Traffic: W2KWG 172 MIY 56 LU 38 MHW 36.

NORTHERN NEW JERSEY - SCM, Joseph P. Jessup, W2GVZ - Ass't S.C.M. in Charge of Emergency Coordination, Les Baglee, W2JMX, R.M.'s: 2BZJ, 2CGG, 2GVZ. P.A.M.: 2HNP. Section Net frequency: 3630 kc. New appointments: O.R.S. — MAX; O.P.S. — DBY; O.B.S. — KXT. New A.E.C. registrations: BCC, BLV, BNU, DBY, EQS, EXY, FPM, HLS, IAY, IBR, IYG, KIL, LAU, LIS, MDV, MDZ, MIG, MND, MOR. We now have approximately 175 A.E.C. registrations, including 15 E.C.'s. There are roughly 1600 hams and 125 large cities and towns in the Section, so we have hardly scratched the surface as yet. Our aim is to obtain 100% registration and to have an E.C. in every city and town. Please do your share and get in touch with JMX. The Tri-County, Inc., gang is building a lot of emergency gear for F.D. The J.S.A.R.A. is also getting all set for F.D. HXI has worked 60 countries using three zepps and separate feeders. BLV is recuperating from two operations and joined the A.E.C. Harry is an active, allaround ham in spite of severe physical handicaps, and he deserves a lot of credit. LOP and GQM rendered valuable assistance to JMX in the demonstration at Summit mentioned last month, and IZP also worked hard to have his rig ready in time for the show. FPM and KXT are applying for O.P.S. IYQ uses an 807 final. MKW operated GYO at Open House at Technical High School in Bayonne and originated a flock of traffic. KIQ is fixing his rig for "bk-in" and is build-ing a portable job. CZM is working 14-Mc. 'phone. HLC will soon be a W3 at Troy Hills. LYV is molding the junk heap into a 1.75-Mc. job. HXI finished a new e.c.o., and it works FB. Looks like KHA was high man for N.N.J. April O.R.S. Party, with about 9 million points. FB. MAX expects to go portable during the summer. LXI has new final with a pair of 812's; Wally is also building an emergency rig. We need lots of them! BZJ is busy working on portable (Continued on page 88)

2½ Meter Transceiver \*

Ideal for spring and summer portable operation - simple and convenient

*List Price* **\$27.50** LESS TUBES AND BATTERIES 40% Discount to Amateurs

GENERAL: The DK2 is a com-pletely self-contained 112 mc, radiophone transmitter and receiver, for use in your car, plane, boat, or while being carried, for portable work. It is very simple to operate. The working

range is between 2 to 30 miles depending on the location. Astonishing results have been obtained.

#### **SPECIFICATIONS**

CASE: Size  $11\frac{1}{2}$ " long x  $9\frac{1}{2}$ " high x  $6\frac{1}{2}$ " wide, grey wrinkle finish metal, heavy leather handle. All hatteries are self-contained in case. Removable side panel for easy access to the hatteries and  $-\frac{1}{2}$ . atteries and tube

FREQUENCY: Will cover 112 mc. to 118 mc. (amateur 2.5 meter hand).

BATTERY REQUIREMENTS: Three 45 volt B batteries like Burgess 5308; and four No. 6 dry cells, or two Burgess 2F2H

batteries. TUBES USED: One type 6J5GT, one type 6G6G. SHIPPING WEIGHT: 12 pounds.

# **BOOK REVIEW**

Radio at Ultra-High Frequencies, published by RCA Review, 75 Varick Street, New York City. 456 pages; gratis to subscribers to RCAReview.

This volume is a collection of technical papers, by engineers of the RCA Laboratories, dealing with various aspects of work above 30 megacycles. Many have previously been published in engineering journals, including RCA Review, but a number make their first appearance in the present volume. An extremely useful purpose is served in bringing together important material, from an organization which has done considerable research work in this field, on the subject of ultra-high frequencies. The book is divided into five parts; transmitting methods and equipment, propagation and relaying, measurement, reception, and ultra-high frequencies above 300 megacycles. Papers on television, phase and frequency modulation, frequency control, u.h.f. antennas, and many related subjects are included. Amateurs interested in u.h.f. work will find plenty of worth-while reading.

Radio at Ultra-High Frequencies is not sold directly, but is given free with the third year of a subscription to RCA Review. It is a companion volume to previously-published Television and Radio Facsimile, which are similar groupings of RCA papers on the subjects indicated.

---- G. G.

### **Portable Kinks**

(Continued from page 21)

denser, vintage of about 1927, still obtainable in most junk shops for from 50 cents to \$1.00. Each end two of its 360-µµfd. sections are paralleled, the whole making a split-stator condenser with 720  $\mu\mu$ fd. per section, or a net of perhaps 360  $\mu\mu$ fd. but having a grounded center very necessary to our purpose. The coil  $L_1$  is tapped and the taps connected to a Centralab switch. I will not give the number of turns in the taps because they must be determined by experiment according to the feed system in use. In any event, use about 1 to 2  $\mu\mu$ fd. per meter in the tuning condenser because there are no other tuned circuits between the final plate and the antenna. You will gain in harmonic suppression and ease of driving the final. WIANC has never had a pink ticket or an OO card in ten years of operation.

Now as to some of the simplified output circuits used in the portables. All of them follow the general scheme of Fig. 7. A coil is used which can be tapped at every turn by a number of connectors going to the plate, the cathode (or filament), two for load, one for ground, and an extra for shorting out end turns for 40-meter operation. If you want 20-meter operation better wind up an extra coil of 6 or 8 turns self-supported and clip on that. It will work, but don't expect 95% plate efficiency. At W1ANC, L1 is 40 turns spaced over 5 inches,  $2\frac{1}{2}$  inches in diameter. Many other dimensions are o.k.

Our favorite antenna is a center-fed wire about 130 feet long, with several bends in it to keep it all on the property. It runs in a general North and South direction but is not particularly directional, we hope. Figs. 7A to 7E show rough antenna dimensions and corresponding output feed connections to put energy into almost anything which will conduct electricity.

#### (Continued from page 85)

equipment for F.D. Walt is a busy guy as R.M., O.R.S., E.C., as well as being on the job as T.L. "A," A.A.R.S., and N.C.R. JUC turned in a nice traffic total for two weeks' work. ARB says that the damage to his beam reported in this column two months ago never happened. Sorry, I was misinformed, and glad that the beam is OK. Ramsey Radio Club meets once per month and expects to grow. The officers are MOO, pres.; FXZ, vice-pres.; and MSR, sec. and treas. FPM and DBY expect to be in F.D. with a 110 volt generator. The problem is to make it portable without using a half-ton truck. (GVZ has the same problem.) Officers of Livingston Radio Club are LZW Pres. and JQE Sec.-Treas. CBL is celebrating the arrival of first jr op. ALO got hitched. AVO has tower and beam back up at new QTH. KM has new tower, but only a flag on it so far by courtesy of CCJ. GVZ operated with a 110 volt generator and a 20 watt rig in recent A.A.R.S. emergency power contest. The Hudson Division Convention, which was sponsored by U.C.A.R.A., brought quite a gang down from headquarters, including, Woodruff, Bailey, Handy, Budlong, Goodman, Battey, Moskey and others. Speakers at the afternoon organization meeting were 1BDI, 2GVZ, SJMX and 2DBQ. As announced at the convention, there is an R.M. job open for a qualified O.R.S. who can organize and run a 7-Mc. Section Net. Hard luck broke up our two previous attempts, but we would like to try again to set up a 7-Mc. Net. All O.P.S. and O.R.S. are requested to let the S.C.M. know whether or not they favor retaining the two months' period of probation now applied to new applicants for O.P.S. and O.R.S. The gang who attended the convention had a good time, and thanks are due to the Convention Committee of U.C.A.R.A. for the hard work performed in planning and running the show. The N.N.J. Net closed down for the summer at the end of May and will resume operations after

Labor Day. Traffic: W2GVZ 281 (WLNI 4) CGG 218 LMN 189 (WLNX 45) JUC 106 HCO 71 BZJ 69 KMI 54 MKW-LDB 52 IYQ 50 LXI 49 DYO 38 MAX 23 KHA 21 MNT 13 HXI 12 CJX 10 CIZ 8 JDC 4 IZV 3 MEO 2. (Mar.-Apr.: W2MEO 22 DBY 1.) NEW YORK CITY AND LONG ISLAND — SCM,

E. L. Baunach, W2AZV - JAU is out for O.R.S. LYH sends his first report and is trying for O.R.S. MQN is a new station at 47 N. Jerusalem Rd., Hempstead. NAJ is a newcomer at 232 E. 201 St., Bronx. LYH is a new station in Lindenhurst. ELK regrets to state that the elevation to Benedicthood has been cancelled. AEU manages to be on for a few minutes a day. HMJ got his second-class telegraph ticket. KMS and KMT joined the regular Army. KYV enjoyed his first O.R.S. party. Both LZR and EYS did well in the O.R.S. party. AXZ's time was limited to one hour on the party. LGK spent plenty of time on his t.r.f. set for Field Day. GPY is back on 7 Mc. with a new doublet antenna. FAQ installed a new Zepp feeder system with FB results. Ex-LED is now 8SSH and is one of the Benedicts. IXQ has become heir to a number of Loktal tubes, so now he is working on a 28-112-Mc. converter. PF will be active with the regular Army during the First Army Maneuvers in N. Y. this August. CHK is back on 3710 kc. LYG handled mostly N.C.R. traffic during the month. JBL is back on the air for his summer vacation. CKQ, LPJ and PL are ops at 2USA. Election results at HJ the City College Radio Club: pres., LBI; vice-pres. and chief op., MXJ; treas., KSF. The station will be on 'phone in October or earlier. EC reports that the A.-P. Trunk Line closed for the season May 31st. LID reports that the Nit-Wit Network on 1805 kc. is going treat; newcomers are AA and DLR; all stations are invited to join and have a rag-chew. The Section Net on 3710 kc, will meet at 9 P.M. E.S.T. for the summer months for rag-chews and traffic. MCG is teaching radio operating at the New York Vocational High School, 21 W. 138 St. The course is free,

and MCG would be glad to help anyone with the exam. #### ATLANTIC DIVISION

EASTERN PENNSYLVANIA - SCM, Jerry Mathis, W3BES - 3ADE is in the rebuilding mood again. 3AGV snagged three new countries in one morning, KA,

KE, KF. 3AOC gave 1.8-Mc. cathode modulation a whirl, but is back on 3.5 for the summer. R.M. 3AQN thanks the traffic gang for cooperation in maintaining 5- to 8-hour traffic service to K6, K5, etc. 3BES moved to another QTH: 6042 Master St., Phila. 3BIL is revamping his portable equipment and yows that the Chester boys will "go over the top" in Field Day, 3BRZ worked KC4USA on 14-Mc. 'phone. 3DGM made over 20MM points in the O.R.S. party, which should make him a dangerous competitor in Field Day. 3BXE has his 807 e.c.o. Field Day rig "eating out of his hand." 3EEW and 3ENX are constructing the electronic key as per 211,E's QST article. 3EEW is placing message blanks in a local barber shop to bolster summer traffic. 3FPC, staunch long-wave ham, won a 14-Mc. vertical radiator at the Newark Convention, 3GHD reports contacting KE6SRA and CR6AF. 3GHM and 3GET are getting organized for Field Day. 3GKO finally made good his threat to lead the Section in traffic. 3GKR has a lot of confidence in his 65-foot mast, 3GIW has plenty of sock on 1.75-Mc. c.w. lately; next comes the audio. 3GYK is QRL Field Day preparations, 3HFE also reports plenty of Field Day activity. 3HXA and 3HQE had their one-lung F.D. rig out for an airing, and claim to be "all set." 3HRD received W.A.S. certificate. 3HRS informs us that the Philippine Net is still taking traffic for the west coast, K7, K6 and KA. 3HZK will join the E. Pa. Net when his net crystal arrives. 3HZV is glad he entered his "peanut whistle" in the O.R.S. party. On May 15th, some of the local F.T.S. boys had a meeting; among those present were 3GJY, HFE, EEW, GKO, HZV, HRD and others. 3QP wants the boys to look for him on Field Day for one extra QSO, 8ASW is training radio operators for the P.N.G. 8EU enjoyed the C.B.S. broadcast of the Susquehanna Emergency Net drill. New QTH of 8FLA is 127 N. Catherine St., Shenandoah. 8QGG urges more O.P.S. activity on 'phone bands other than 3.9 Mc. 8QLW operated at the first Hobby Show in Honesdale where messages were accepted and sent. 3QV states that the York Road Radio Club is getting loaded for bear in the coming Field Day. The Beacon Radio Amateurs won't tell where their Field Day is to be held????? The Phila. Wireless Assn. and the Yeadon Club are likewise reported to be on the march. Frankford confidently feels it is "in the bag." We are still looking for an Emergency Coordinator for Harrisburg area

Traffic: **W3**ADE 45 3AGV 2 3AKB 140 (WLQP 23) 3AOC 14 (WLQ) 7) 3AQN 82 3BES-BIL 5 3BXE 41 3DGM 8 3DRO 9 3EEW 264 3EML 1178 3FPC 2 3FXZ 4 3GET 2 3GHD 11 3GHM 4 3GKO 1363 3GKR 3 3GYK 20 3HCT 6 3HFE 10 3HRD 11 3HRS 253 3HZK 29 3HZV 66 3IAY-3ILK 4 3INH 22 3QP 608 8ASW 200 8EU 14 8GV 2 8HKS 9 8QLW 21 8SNZ 14 WLQA 74. SOUTHERN NEW JERSEY — SCM, Lester H, Allen,

W3CCO — Ass't SCM and A.A.R.S. Liaison R.M., Ed. G. Raser, W3ZI — N.C.R. Liaison R.M., Ed. B. Kerr, W3CCC Regional Coördinator in charge of Emergency Coördination, Ted Toretti, W3BAQ — R.M.'s: 3BEI, 3BYR, 3EUH — P.A.M., 3GNU. Section Net frequencies: O.R.S., 3700 kc.; O.P.S., 1980 kc. For those in the Southern New Jersey Section who plan to do a little visiting during the vacation, a bit of scouting for appointees such as Emergency Coordinators, O.R.S., O.P.S., Official Observers, etc., should prove interesting and very helpful to the Section. Any recommendations will be most welcome. HTJ worked K6OQE on 1.75-Mc. 'phone and was running 300 watts input. CFS has new 1/2-kw. rig on 3.9 Mc. and needs only Arizona and Idaho for W.A.S. GEV held successful schedules with HC2CC, who hails from Crosswicks, during the past two months, ASQ is conducting a code class every Monday night. ATF is experimenting with facsimile, IOK has TZ20 in new final. BWF is busy gathering up States for a 'phone W.A.S. HW has his vertical radiator working top-notch on 1.75-Mc. phone. GNM completed his new Class B modulator. AFH received S.W.L. letter from England; Bill operates on 1.75-Mc. 'phone. GNU, our P.A.M., also was heard in England while operating 1.75-Mc. 'phone. ISY and ISZ are Trenton's latest additions. AQ has a new 6L6, 807, T-55 exciter unit for the 1-kw, rig. AYC, BXA and HHZ staged a demonstration for the Bordentown Hobby Show. IRT is new call in Hainesport on 1.75-Mc. 'phone. GRW is experimenting with a new trick circuit for oscillator use. EED is building a 1/2= kw. rig using a pair of 100TH's. EFE has been assigned a new call, W6SPR; Paul wishes to contact the boys in our Section; he is operating 7-Mc. e.c.o. EFF has a dandy new signal on 3.9-Mc. 'phone. HKO finished winding a generator for 110 volts and works FB on his portable-emergency rig.

IAZ reports his portable rig in good order and available for any emergency. ZI thanks all members of the O.R.S. Net for the excellent coöperation during the past operating season in making our Net one of the most outstanding in these parts, and specially commends the unfailing work of our two R.M.'s for their untiring efforts. The Section O.R.S. Net closed May 30th and will reopen Sept. 3rd. GNU thanks the members of the O.P.S. Net for their endeavors in establishing a 'Phone Net for the Section and particularly commends the outstanding work of the 'Phone R.M., EUH, who carried the Net Control duties like a veteran. The O.P.S. Net closed for the summer on June 3rd, and will resume operations Sept. 9th. FXN schedules BWT in Washington, D. C., several times per week. GMY is joining the A.A.R.S. IHD is on the air in full swing after a month's sick leave. Glad to hear you're feeling better, Carl. CCC threatens to bury the ole peanut roaster and steam up the 200-watter. EHB is at Fort Monmouth attending the Signal School. QL is now located at Cheltonham, Md., one of the control points for NAA. ZI was in "drydock" for a few weeks recovering from an operation. GLG schedules his brother 1CMO weekly on 3.9-Mc, 'phone; Willis has 500 watts to the final. EGE is going into higher power. IOW packs a nice wallop on 1.75-Mc, 'phone. CFR bought new receiver. IMY is new Official 'Phone. FMR still maintains daily schedules with 9CAC on 14-Mc. 'phone after a period of two years. TG9BA was recent guest at US's, HKY and FFE (TG9BA QSO'ed his YF from US). IFT and INS are operating 112 Mc. The CRC clubs have several emergency rigs built up perking FB. HEO reports DX very good on 3.9 Mc. DNU has new QTH directly across the street. IDZ is working on new e.c.o. using a 7A7 on BC band. ABS has given up 1.75 Mc. for the summer and is exploring the ultra-highs. GCU would appreciate the comments on his Official Broadcasts. How about it, gang? Let Ray know if you are copying him. IHO will be active around Sept. and wishes to be remembered to the S.J. boys, IP reports for the first time and mentions he has an all-band rig using a 100TH in the final at 380 watts input, and wishes to renew acquaintances in S.J. Section. FIS is interested in making schedules on 112 Mc. with anyone in the vicinity of Trenton. The Delaware Valley Radio Ass'n wishes to advise its many friends the 4th Annual Outing and Hamfest will be held August 11th (Sunday), at the Trenton State Fair Grounds. The affair promises a good time to all who attend. All inquiries should be sent in care of Bill Hannah, W3EUH, General Chairman for this year's Outing and Hamfest. Until next month, a pleasant vacation and 73.

WESTERN NEW YORK — SCM, Fred Chichester, W8PLA — R.M.'s: BJO, CSE, DSS, FCG, P.A.M.'s: CGU, RVM. E.C.'s: FNT, GWY, RVM, SBV, SMH. Net frequency: 3720 kc. BJO, who has been one of the most active traffic men in the Section, is putting in his spare time getting a cabin cruiser ready for the summer. PCN has been doing a nice job acting as N.C.S. since Kernie quit, and turns in the largest traffic report of the Section for the month. John Long, W8ABX, one of the best known amateurs of the Section and chief technician at WHAM, was killed instantly in an automobile accident May 9th. The three broadcast stations in Rochester observed a minute of silence during the funeral. NCM, secretary of the Rochester Amateur Radio Ass'n, had his car destroyed by fire. All the R.A.R.A.'s secretarial records went up in smoke with it. TYS had a transmitter on exhibit at the Rochester Scout-o-Rama. A baby girl arrived at MC's, April 28th. MNW will be married June 15th. The R.A.R.A. is sponsoring a code instruction class which has 15 members, including one YL. JAD connected a spark coil to his wire fence to keep the neighborhood kids off his new lawn, but the cops made him disconnect it after the neighbor's dog got the surprise of his life. NBI will be married July 6th or sooner. The YL's of Rochester have shown great interest in ham radio and the club is encouraging them to form an auxiliary. New hams in the Section: USF, Rochester; URK, Waddington; and UGH, UHI, UJW of Buffalo, NWH has completed a positive peak modulation indicator at a total cost of 17 cents, using three fixed resistors and a neon bulb. QZP finished an e.e. frequency shifter for use on 14 and 7 Mc. The Western New York

Radio Council has been reorganized with GFP as chairman and IIO secretary. A better understanding exists between the clubs, and the Council is going along in fine shape. The Buffalo Mike and Key Club is in full swing in the new meeting place. They will hold a picnic on July 23rd at Emery Park. A good time and a good turn-out are expected. Lloyd Childs, famed Army and Navy plane-testing pilot from the Curtiss plant, spoke at the last meeting on "Testing New Planes for Army and Navy Use." The club will hold no meeting during June and July. The Kenmore-Buffalo-Tonawanda Radio Club attended a Radio Council joint meeting, and several difficulties were ironed out, NWH announces a kw. 110-volt a.c. generator ready for Field Day. The four transmitters that will be used on all bands have been tried out in different QTH's to determine best location for full set-up. It is expected that Grand Island (N. will be the place selected. Balloon and kite antennas will be used, and the Field Day activities will have the full support of the entire club membership. The 112-Mc. contest, sponsored by the club, closed June first, and prizes will be awarded those attaining the highest number of contacts on this band. Last meeting of the club will be held on May 24th. It is expected that the club will have a transmitter next season. JIW manages to hook such stations as K4KD and HH2MC with his 15 watts on 14 Mc. Howy has just received his A-1 Op's certificate. NEL, disgusted with 'phone, is planning a c.w. rig. DHB moved to a camp on the St. Lawrence River for the summer. URH, a new ham at Waddington, will be on all bands but will work into the new St. Lawrence Valley Net regularly. MLM expects to be on 1.75-Mc. 'phone soon with 170 watts. TEP and FFN visited NNJ. CKC/4 is running a fishing boat at Clearwater, Fla. CUY keeps schedule with CMW/9, formerly of Alexander. DSS expected to have his new 90-foot mast up by June first. The St. Lawrence Valley Net has finally gotten under way with Ken Aitken, W8RVM, as P.A.M.; 21 stations have been signed up so far, and five of these have been appointed O.P.S. They are: RVM, LMF, BCU, LLN, UNY, A spot frequency of 1880 kc, will be used. Traffic in the net will be cleared through the present W.N.Y. Net. A number of the stations are also members of the Emergency Corps. Much credit is due RVM for the formation of this net.

MARYLAND-DELAWARE-DISTRICT OF COLUM-BIA - SCM, Hermann E. Hobbs, W3CIZ - 3ZD Regional E.C.; W3BWT Chief R.M.; CXL and CDG R.M.'s. 3IRR keeps regular schedules with BAK. Jean Hudson will operate the Camp radio, 1KNP, Spofford, New Hampshire. 3AXP will enter the Army Air Corps as flying cadet. Dot and Jean Hudson have joined the Y.L.R.L. BHE has an entirely new outfit. BKZ and GXU are fixed to work on 112 Mc. FSP says he soon will be with them. DOG is back on the air with 750 watts and a signal shifter worked 19 sections in 2 hrs. and 40 mins. with 32 contacts. DRD is looking for traffic sked and QSL for WAS. EQK was appointed Chairman Baltimore Amateur Radio Ass'n; he is building a portable emergency transmitter for all bands. ICT is key station for Baltimore and vicinity in F.T.S. IMN is back on. WU has a new crystal selector holder and switch for eight crystals.

Traffic: **W3**BKZ 318 BWT 667 CXL 286 (WLM 3698) CDG 8 CIZ 739 ECP 115 EIZ 41 EKZ 10 EQK 16 GYQ 43 HQU 360 ICT 35 IMN 23 WU 1. (Mar.-Apr. **W3**BKZ 245.)

#### DELTA DIVISION

DUISIANA — SCM, W. J. Wilkinson, Jr., W5DWW — ERV is active on 28 and 7 Mc. FPZ moved to Lafayette. AYZ is back in Shreveport. EEL has YL op at his home. Congrats, OM. HQN visited HHV. WG is showing interest on 'phone bands. HBY has new portable. FXF and HIJ are trying to get on 28 Mc. IHH is building new rig. IBW is now stationed in Venezuela. GIZ is about ready to put kw. on air. DGB visited in New Orleans. DKR is now located in La Place. GND added Sky Buddy to his collection of receivers. IXL is operating on 28 Mc. CXQ recently visited R.C.A. factory in N. J. CJO is building new shack. EBB has been visiting. IHM has been transferred to New York, and DXK to Pennsylvania.

٠

It's no disgrace to be licked by some "dit dah" speed artist. Real code speed is practically impossible to get alone, regardless of the hours upon hours spent in prac-tice. It requires special training in fundamentals, proper mental co-ordination and expertiy directed practice, all of which you get with Candler Training. You'll be amazed at the progress you can make in only a short time. Thousands upon thousands of amateurs and professional ops owe their smooth, rhythmic speed to Candler Training. Code Champions, like T. R. McBIroy and L. R. McDon-ald, WSCW, attribute their amazing speed to the mental training that Candler gives. It's the real short-cut to the Code Speed — and it is not expensive.

#### A Stabilized Variable Oscillator

#### (Continued from page 17)

6L6 either amplifying or doubling, providing variable condensers having the same plate shape are used and the ratio of fixed to variable capacity is the same in both circuits.

Although the rectifier alone, or the rectifier and voltage regulator could have been built as a separate unit, thereby avoiding some heating, it was decided that to eliminate extra units and cables an integral power supply would be installed. This uses a standard receiver power transformer and type 80 rectifier tube. The singlestage condenser-input filter was found to provide adequate filtering for the crystal oscillator, buffer, and output stages.

Additional filtering for the variable frequency oscillator is provided by the voltage regulator, using a 6F5  $(VT_5)$  for the amplifier and a 6C5 or  $6J5 (VT_6)$  for the series regulator. The circuit of the regulator is similar to that discussed by Grammer in August, 1937, QST, with minor changes. The 6C5 or 6J5 was used in place of the 2A3 originally specified, since the smaller tube can easily pass the low current required for the oscillator, and a separate filament winding is not required. With all heaters supplied from the same grounded 6.3-volt winding, the heater-cathode potential of  $VT_6$  is 150 volts, which seems to cause no difficulty.

Capacitor  $C_{17}$  is included since it reduces output ripple of the regulated supply by 6 to 8 db.

#### Keying Circuit

Although this equipment was not designed for oscillator keying, tests were made to see just what it would do. In the course of these tests, a rather interesting keying circuit was developed for use with the voltage-regulated power supply, which is applicable to any oscillator using a similar supply. This circuit makes it possible to key plate voltage without breaking high current with the keying relay, and with complete control over both the "make" and "break" time con-stants. Unfortunately, triode oscillators still do not have the best keying characteristics, and it was found that when the time constants were so increased as to avoid clicks, some chirps were produced, particularly on the high-frequency bands. Although it has not been tried, it is entirely possible that the electron-coupled 6SK7 oscillator as discussed by Perrine in September, 1939, QST,<sup>2</sup> could be used in place of the 6J5 with somewhat more satisfactory keying. And while we are borrowing ideas from Perrine, the method he uses for feeding the oscillator tube heater looks good, too.

In any case, and particularly on the highfrequency bands, it is recommended that a later stage, rather than the oscillator, be keyed. Then the full advantages of the circuit isolation will be realized.

For those who may wish to try it, the operation of the rectifier keying circuit is as follows: The

<sup>2</sup> Perrine, "An Answer to the E.C.O. Problem," QST, September, 1939.

T is the textbook, written by J. Douglas Fortune, W9UVC, in collaboration with the Thordarson engineering staff, in answer to thousands of requests for a simplified book on becoming a radio amateur.

AMATEUR RADIO

BEGINNER'S GUIDE

It takes you step-by-step — how to study code — how to get your license — radio theory made understandable --- how to build your first transmitter and receiver - how to use those same parts in building larger equipment. 160 pages. Over 100 illustrations!

Competent authorities, who have previewed it, judged this book the best of its kind they have ever seen.

Complete kit, less only meters, tubes, and crystals. Former Regular Amateur Net Price - \$69.75

keying relay contacts (not the key — there are 300 volts there) are connected between  $R_{14}$  and the plate of  $VT_6$  by means of the jack  $S_1$ , and approximately -45 volts (not critical as to voltage or regulation, and need supply a maximum of 4 milliamperes) connected between the open end of  $R_{15}$  and ground. With these connections and the key closed the circuit is normal, with  $R_{14}$ connected between the plate and grid of  $VT_6$ . With the key open, -45 volts is connected to the grid of  $VT_6$  through  $R_{15}$  and  $R_{14}$ , biasing it to cut-off and removing voltage from the oscillator.

The necessary adjustments for the most satisfactory keying can be made by adding capacitors to ground from the plate of  $VT_5$  and the junction of  $R_{14}$  and  $R_{15}$ . The former capacitor, together with the 2-megohm resistor  $R_{14}$ , determines the time constant for the "make." The stray circuit capacity may be all that is required to prevent clicks. In any case, only a few micromicrofarads will be required. The "break" time constant is determined by the 100,000-ohm resistor  $R_{15}$  and the capacitor  $C_{21}$ ; 0.05  $\mu$ fd. was found best in the original model, but may need to be varied in individual cases.

Fig. 3 -- Capacity trimmer for calibration correction (See text)

With the circuit as shown, the variable oscillator only is keyed. If it is desired to key the crystal oscillator,  $VT_3$  should be operated from the regulated supply as well as  $VT_1$ . The switch  $S_3$  is used to remove voltage from the variable oscillator when the crystal oscillator is being used.

#### General

The plate control switch  $S_2$  is of particular importance. In the first of its four positions, "Off," the negative of the rectifier and the positive lead to the 6L6 output tube are both open. In the "Auto" position, the circuit to the 6L6 is closed, and the negative of the rectifier is connected to an external lead, which should go through a normally-open contact of the transmitter plate control relay or switch to ground for automatic operation. The "Tune" position of S2 grounds the negative of the rectifier, placing plate voltage on the oscillator and buffer, but removes plate voltage from the 6L6. This is the position normally used for setting frequency on the low-frequency bands, since a signal of about the proper strength to produce a strong heterodyne in the receiver is generated. If a stronger (Continued on next left-hand page)

# A NEW CHOKE FOR THE AMATEUR BANDS

The R-175 transmitting r.f. choke is suitable for parallel-feed as well as series-feed circuits in transmitters of up to 3000 yols modulated plate supply. Without plate modulation of the transmitter, they are suitable for 4000-volt amplifiers.

Use of pie-wound r.f. chokes in parallel-feed circuits resulted in decrease of transmitter r.f. output—often as much as 15%. The decrease with the R-175 is less than **1%**. In contrast to conventional r.f. chokes, the inductive reactance of the R-175 is high throughout the 28- and 14-mc. bands as well as the 1.7-, 3.5-, and 7-mc. bands. The characteristics of this new National choke are:

### SENSITIVE RELAYS for RADIO CONTROL and General Applications

For Electronic Key

\$3.30

11-D

RCH relays are designed to have a curve of tractive pull vs. armature spacing that changes very sharply near the point of closure. With such a curve, small changes in current cause a relatively enormous variation in magnetic pull, resulting in unusually high drop-out ratio. Light in weight, rugged and dependable. Rated power sensitivity: 5.0 milliwatts. Drop-out ratio at 1.5 ms. 70% min. Coil: 6000 ohms. Con-tacts: solid silver.

CONNECTICUT U S A RADIO CONTROL GRANBY

Representative for Canada: Radio College of Canada, 54 Bloor St. West, Toronto signal is needed on 10 or 20, the switch may be placed in the "On" position, energizing the entire unit and producing additional radiation from the coupling link to the transmitter.

To take full advantage of the frequency stability of such an oscillator as this, a precision dial which can be read to at least one part in five hundred should be used. If expense is not too important a consideration, a National PW dial is about the best available. The dial used on the original model, however, was home made, and probably merits description here. A standard 12/1 splitgear worm drive was removed from an old automobile broadcast-receiver tuning condenser, and so fitted that it could be used to drive  $C_5$  and  $C_{14}$ on a common shaft. The worm shaft was brought out to a dial on the front panel, which was hand calibrated from 0 to 100 for 360 degrees rotation. With the 12 to 1 reduction, this dial makes 6 revolutions or 600 divisions, for 180-degree rotation of the tuning condenser. A small dial, numbered 1 to 6, was driven by a dial cord belt from, and used to count revolutions of, the worm shaft. Backlash is of no importance in this string linkage, since the small dial need be read only to one part in 6. It should, of course, be so belted that it makes somewhat less than one revolution for six revolutions of the main dial.

A rather desirable variation of this dial was used by W2ACB in the oscillator that he constructed. In place of the small dial for counting turns of the main dial, he used a four-inch dial so driven from the worm shaft by dial cord that it makes about 300 degrees rotation for 180 degrees rotation of the tuning condensers. Direct frequency calibrations are then engraved or written directly on the large dial for the various bands. Even with the best of workmanship, however, these scales are only intended to be approximate, and the linear calibration must be used for precision frequency setting. Incidentally, W2ACB used a 50 to 1 worm drive instead of 6 to 1, which accounts for the 25 divisions needed for the linear scale.

A few words about performance are probably in order. During almost two years of operation of the original model, its frequency calibration has consistently stayed well within  $\pm 0.025$  per cent. It was once carried in the trunk of a car for 300 miles, during which it was demonstrated at a banquet, which included a thorough "bounce test," and when rechecked found to be less than 1 kc. off calibration at 3900 kc. Warm-up drift in the 3500-4000 kc. band is approximately 1 kc., mostly confined to the first minute.

As for mechanical stability, the "bounce test" referred to above consists of listening to the c.w. note on a communications carrier while the entire unit is dropped approximately 12 inches to a table. Each time this test has been made the only effect on the note has been a single warble almost obscured by the crash as the unit strikes the table.

Although 7 tubes are used in the original unit, construction is not difficult, since all circuits are straightforward and no critical adjustments need (Continued on next left-hand page)

**MODEL** MT-8 is the high fidelity extended range reproducer built primarily for broadcast monitoring and recording work. It employs an especially designed eight inch loud speaker working in conjunction with the well-known Jensen *Peri-dynamic* and *Bass-Reflex* principles.

Mean energy density acoustic measurements show an excellent frequency characteristic from 50 to 10,000 cps. The polar characteristic is substantially superior to any single speaker device we know of. It represents the final perfection in the technically superior amateur station. Cabinet

dimensions are 24 x 17½ x 11¼. Complete with heavy duty Permanent Magnet Speaker — wall mounting brackets included — \$17.70 amateur's net. Jensen Radio Mfg. Co., 6601 S. Laramie Ave., Chicago.

be made. If desired some simplifications, as shown in Fig. 2, may be made without sacrificing stability. Note that the crystal oscillator has been omitted, and a simplified voltage regulator used. A voltage-regulated power supply using a VR-150-30 provides adequate voltage stability, with a reduction in power supply complications. Its use will, of course, prohibit the use of the keying circuit described.

### **Efficient U.H.F. Television Unit**

#### (Continued from page 35)

one side of the a.c. line. Also, when the 5-pin male cable connector is pulled out of the transmitter chassis, the primary circuit of the highvoltage transformer is automatically opened.

Primary rheostat  $R_1$  is used to reduce the d.c. output voltage of the supply, which has a maximum full-load value of about 510 volts. This arrangement is very convenient when the r.f. stages are being adjusted initially. A Jones plug is used to connect  $R_1$  in the circuit; the rheostat is not mounted on the chassis because of the large amount of heat it must dissipate.

It should be noted that excellent filtering is required for television transmitter plate supplies. Otherwise, hum "bars" will appear on the received picture. The four electrolytic condensers comprising  $C_3$  are not shown in the bottom view of the power supply. The circuit was revised and these condensers were added after this photograph was taken.

### **Performance**

The transmitter, essentially as described, was operated on plate-modulated 'phone over a period of several months at W2BRO. After the usual "bugs" were eliminated, it performed as smoothly as any low-frequency rig the writer ever built — and a lot better than some!

A television "field test" has been made with the receiver (operated by portable W2ICA) located at Nutley, N. J., and the transmitter at Delawanna, N. J., a distance of about  $1\frac{1}{2}$ miles. Excellent pictures were received on the 906-P4 Kinescope, even with a poor inside antenna on the receiver. Tests over much greater distances are planned for the near future. On the basis of the various operating tests made, it is anticipated that distances of 10 to 15 miles can easily be covered with this equipment. A close-spaced 3-element beam antenna is recommended for both receiver and transmitter.

Much work remains to be done on the antenna problem, to say nothing of the interesting circuits of the apparatus involved. At last, amateur television is in a position to go places. New hurdles are waiting to be leaped, new records to be set. The pioneering amateur again has a vast new field for research and experimentation. The problems involved are new and tantalizing and, although within our ability to solve, are nottoo-easy. Amateur ingenuity is due for a real workout.

Let's go!

# Take the Meissner "SIGNAL-SHIFTER

along on your vacation —

### it's a complete

### Portable Transmitter !!!

Size —	Weight —	Power —
⅔ Cu. Ft.	25 Lbs.	7.5 Watts

# The New Meissner

is a pi network such as described on page 133 of the 1940 Handbook. It provides:

- Accurate impedance match between any type antenna and receiver ...
- Tremendous boost in Signal Strength where previously badly mismatched . . .
- Substantial reduction in noise pick-up . . .
- Decided improvement in image rejection . . .

DON'T DELAY! Prove the remarkable efficiency of the SIGNAL-SPLICER on your own receiver. See your Parts Jobber at once - or write for further information. Only \$3.95 net.

Yes, sir! The Meissner SIGNAL-SHIFTER is really a surprisingly efficient little transmitter --all by itself! Just lift it from your operating table and give it a vacation, too. In the tourist cabin, summer home, shooting lodge or cottage-at-theshore — wherever 110-volt power is available the SIGNAL-SHIFTER is always ready to keep you in contact with your skeds!

Its crystal-pure note and extreme flexibility make it easily capable of WAS on 40, 80 or 160 meter CW. Provides 7.5 watts (conservatively rated) on 20, 40 and 80 - somewhat higher on 160.

Easily coupled to a zepp or single-wire feeder, its ability to "get out" will amaze you. And its economy can't be overlooked! Just one moderate price covers a De Luxe variable-frequency exciter for your home station and at the same time provides a husky little portable rig -- complete and ready to operate!

Better look it over at your Jobber's - NOW!!!

### **WWV Schedules**

EXCEPT for the special broadcasts of WWV using 20 kw. as described below, WWV is now running a continuous schedule (day and night) on 5000 kc. with a power output of 1 kw. This continuous transmission is modulated with the standard pitch in music, 440 cycles per second.

Each Tuesday, Wednesday and Friday (except legal holidays), the National Bureau of Standards station, WWV, transmits with a power of 20 kw. on three carrier frequencies as follows: 10:00 to 11:30 A.M., E.S.T., on 5000 kc.; noon to 1:30 P.M., E.S.T., on 10,000 kc.; 2:00 to 3:30 P.M., E.S.T., on 15,000 kc. The Tuesday and Friday transmissions are unmodulated c.w. except for 1-second standard-time intervals consisting of short pulses with 1000-cycle modulation. On the Wednesday transmissions, the carrier is modulated 30% with a standard audio frequency of 1000 c.p.s. The accuracy of the frequencies of the WWV transmissions is better than 1 part in 10,000,000.

think they have a 'phone (usually listed under some other name) and what say you give them a buzz and see if we can fix up a sked for, say, some Sunday morning, early.

Sure. It's a swell idea, but let's try it this way. Here is my phone number, my name and address. Now suppose you drop Aunt Tillie a card or a note, with those items, and sug-gest the sked idea to her. Then if she is interested she can buzz me and we will be very glad to have the folks come out when they find it convenient. If she does it on her own initiative, we feel less as though we are a humored screwball. The facilities of the shack are ready and waiting for anyone who will make the effort to use them. I have found the above procedure most effective, and the reduction on one's telephone bill is surprising.

- Jack Ferguson, W1IIM

EDITOR'S NOTE. - Perhaps it would be just as well to forget the whole thing. Then no one would be bothered either Aunt Tillie or the other hams on the band who would have to listen to her.

#### WIRELESS VICS

Carleton College, Northfield, Minn,

Editor, QST: Lately I have been coming into contact with a great number of these so-called "wireless vics." In the dormitory that I am in here there are no less than three of them, and prospects of a few more. The fellows are not satisfied just to have the vic and let the sig carry a few feet to a couple of radios, but have gone so far as to put antennas on them. They have not as yet put out any great sigs, but if they carry out their intentions WLW will have some competition! Now two of them have the bright idea of talking back and forth on their transmitters - point-to-point communication on the broadcast band! What next?! Maybe I have the wrong slant on this, but for two fellows to be able to buy some simple equipment and also a regular radio set and be able to broadcast entertainment and to use it for point-topoint communication burns me, especially after the work that we hams have to put in to get that "ticket."

I guess according to law they are within their rights to a certain extent, but just how far does this little deal go? Can we all go on the air with our low-powered broadcast station and make a little side money, too, as some fellow is apparently doing at Dartmouth?

Seems to me that it just hain't right we have to get a license to go on the air but they don't. 'Course I realize we have more advantages, and I am not advocating abolition of licenses.

Any of the rest of you touchy about this subject too?

- C. J. Ellis, W9YBV EDITOR'S NOTE. - Use of wireless record players as described by W9YBV is illegal. See May 1939 QST, page 26. Such operation should in every case be reported to the local Radio Inspector.

### **Catalogs and Pamphlets**

THE following catalogs and pamphlets are available to amateurs upon requests addressed to the manufacturer or his local representative:

#### Collins Radio Co., Cedar Rapids, Iowa

A 12-page bulletin describes the new 231Ctransmitter which is available in 500-, 1000- and 3000-watt models covering a range of 2500 to 20,000 kc. An automatic tuning device is incorporated which tunes the circuits to predetermined frequencies by remote dial control. The transmitter is equipped for high-speed c.w. and i.c.w. code, or telephone transmissions.

#### Hygrade Sylvania Corp., Emporium, Penna.

The new radio-tube base chart being distributed to Sylvania dealers and servicemen, although reduced in size  $(21\frac{1}{2})$  by 13), has an increased number of base views. For the 376 types extant, there are shown 118 views and an index and cross-index are included.

### New RCA Test Oscillator #167 3450

Let this new RCA Test Oscillator make your tough servicing jobs simpler! It has the range you want — 6 bands: 100 to 30,000 KC. in fundamentals... with harmonics of 6th band for U-H-F applications. AC operated. High output, for single-stage alignment work, or for sets misaligned altogether — plus a new, precision, easy-reading dial-scale, trim appearance and RCA engineering make it a real buy at only \$34.50. Ask your RCA Distributor to show you all its features.

Over 335 million RCA Radio Tubes have been purchased by radio users... in tubes, as in parts and test equipment, it pays to go RCA ALL THE WAY.

RCA Manufacturing Company, Inc., Camden, New Jersey A Service of the Radio Corporation of America

### **Portable Transmitter Receiver**

(Continued from page 44)

from the crystal mounting and eliminate any possibility of shock from this source.

#### **Operation**

There is not a great deal to be said about the operation of the rig because it has been repeated so often for similar ones. With 400 volts on the plate of the 6L6 and with the antenna closely coupled, the plate current will run from 80 to 100 ma. With 250 volts from a genemotor or vibrator-pack supply the plate current will be about 40 ma. A  $\frac{1}{4}$ -watt neon bulb can be connected to one of the output terminals to indicate maximum output or a small dial lamp can be used.

A short piece of wire about 5 or 6 feet long has been found to be very satisfactory for the receiving antenna, and quite sufficient headphone volume is obtained. The antenna trimmer condenser, C, is usually set to give quite loose coupling, particularly on the 7-Mc. band. Once set, the trimmer does not have to be touched again.

The send-receive switch transfers the plate voltage from the receiver to the transmitter and back. The heaters of all the tubes are left running at all times, to eliminate any delay in the switchover process.

### **On the Ultra Highs**

(Continued from page 47)

long way toward making up for a few thousand feet of altitude.

W3BZJ went up in a plane with an Abbott transceiver, on May 4th, as scheduled. Poor visibility prevented their going much over 1000 feet but ten stations were worked, of which eight were 25 or more miles distant. Best DX was W2BZB, Palisades Park, N. J., contacted when the ship was over Langhorne, Pa., a distance of 75 miles.

The Marathon award for April was won by a 112-Mc. man, W6RVL, Los Angeles, came through with some nice contacts (including two of 100 miles each) to turn in the highest score reported for April: 86 points.

112-Mc. work accounted for quite a percentage of the points reported in the May Relay, too. Though no long relays were reported that we know of, the boys on Five and 2½ worked together much more successfully this time. Messages originating on 112 Mc. were handled over longer jumps on Five in several instances. Operating atop High Point, N. J., alongside W3AC/3 was W2IQQ/3. Using a pole oscillator with an RK-34 on a perilous perch some 15 feet off ground, Wilson had a flock of contacts with W2's in the New York area and out on Long Island, a distance of approximately 70 miles.

#### 224 MC.:

Our "Centimeter Net," W1's JJR, HDF, KJC, AIY, and KLJ, got together Saturday night, May 18th, to fatten up their Relay scores with some contacts on 224 Mc. at 10 points each. Since last month W1KLJ and W1HDF have done two-way work on 1¼, so our record box now shows this 13-mile work on 224 Mc. There may have been longer two-way contacts than this on this band. If so, we'd certainly like to hear about it. Work on 224 Mc. appears to be almost entirely confined to someone putting on a rig and then going out for a ride with a receiver to see how far it can be beard.

New tubes recently announced bring multi-stage transmitter design within the realm of practicability. Thus far, only W3GLV and W6QLZ have reported attainment of crystal control on 224 Mc. The new, but expensive, 829 and 1628 make this a cinch — if you have the price. Other tubes which have possibilities are the new HY-75, and even the oid standbys, the HK-24, 54, and 35T.
## HAM-ADS

## Noticia

Como en años anteriores, la editorial "Revista Telegráfica" de Buenos Aires, la más importante de Hispano-América en técnica de radio, ha traducido y editado castellano nuestro "THE en RADIO AMATEUR'S HAND-BOOK" edición 1940.

La fiel y cuidada traducción de las ediciones anteriores, confiada a ingenieros argentinos, se repite este año y se completa también una impresión lujosa y con esmerada.

La edición 1940 del "THE RADIO AMATEUR'S HAND-BOOK" contiene el mejor material que puede ofrecerse a un aficionado y con objeto de facilitar la búsqueda de la información que se desee, se ha dividido en varias secciones, agrupando en ellas los temas con la mayor prolijidad. Es, en consecuencia, Un Manual cien por ciento dedicado al aficionado y por lo tanto indispensable en su biblioteca.

"THE RADIO AMATEUR'S HANDBOOK" en Castellano puede remitirlo la American Radio Relay League, West Hartford, Conn., E.U. de N.A. a razón de \$1.50 el ejemplar libre de porte o "Revista Telegráfica," Perú 165, Buenos Aires, Argentina por \$5 moneda argentina.

AMERICAN RADIO **RELAY LEAGUE** 

## Your Nearby Dealer Is Your Best Friend

Your nearby dealer is entitled to your patronage. He is equipped with a knowledge and understanding of amateur radio. He is your logical source of advice and counsel on what equipment you should buy. His stock is complete. He can supply your needs without delay. His prices are fair and consistent with the high quality of the goods he carries. He is responsible to you and interested in you.

One of these dealers is probably in your city—Patronize him!

#### Instantaneous Finger-Tip Control of Low, Medium or High Frequency Tuning CONVENIENT . . . SELECTIVE . . . EFFICIENT

Imagine tuning all frequencies from 90 kilocycles to 60 megacycles, efficiently and accurately from one receiving position, with never a thought to peaking critical circuits, plug-in inductances or complicated switching arrangements. Imagine having at your finger-tips the finest superheterodyne type receiver for reception of almost everything to be heard in the present day radio spectrum.

You can have all this and more when you assemble RME units as we have them pictured above. The basic, foundation unit is the new RME-99, outstanding precision communications receiver. The unit at the extreme left is the LF-90 LOW FREQUENCY INVERTER which permits reception of all channels from 90 to 600 kilocycles. The center unit is the DM-30X BAND EXPANDER designed to expand the RME-99's frequency coverage to include all channels up to and including 60 megacycles (or the DM-36 for specific ham band coverage of 28 and 60 MC permitting extended bandspread tuning).

This line-up presents a truly commercial control panel with every adjustment for precise and efficient FULL RANGE reception. In this modern era of diversified radio reception, the receiver which does not receive all the useful communication channels, is a receiver of incomplete capability.

In buying your new receiving equipment, check its tuning range for FULL COVER-AGE. Make certain it is COMPLETE. A combination of RME receiving units assures you of COMPLETE tuning. Write us today for complete information, and be satisfied in the long run.

The UTC Special Series includes Audio Transformers for input, matching, driver, and output applications of every type. These units, expressly designed for amateur service, set a new standard of value per dollar. They are attractively housed and ruggedly constructed, with mounting facilities suitable for chassis or breadboard type equipment.

#### Amateur Iconoscope RCA-1847

for the amateur

Just announced by RCA-designed and licensed specifically for amateur and experimental use-engineered by the same men who produced the larger Iconoscopes-this "Mini-ike" paves the way for a brand new thrill for the radio pioneer. In size it is 75%" long, with a 2" face on which the images are focused. The free booklet mentioned below includes full specifications, with circuit diagrams and equipment information.

Amateur Net Price . . . . . \$24.50

Think of the thrill of seeing the fellow amateur you've been talking with — of pioneering your way to new air adventures!

# New Thrills, New Adventures for the Radio Pioneer . . . .

The experimental equipment pictured on this page was designed and constructed by RCA engineers to illustrate the possibilities of the new RCA-1847 Iconoscope in Amateur Television. Demonstrated in actual operation, this equipment was the hit of the Chicago Parts Show. Most amateurs already have many of the required components. And, even though you start from "scratch," it is possible to duplicate this system for no more than the cost of a medium-power transmitter!

Images are 30 frame, 120 line; require a total band width of less than 0.4 Mc, and are amazingly clear and stable. Operation is on the 2<sup>1</sup>/<sub>2</sub>-meter band where there is plenty of room. See articles in May and June QST for further details.

FREE! A new booklet, hot off the press, containing complete data on how to build this complete Television Rig is yours for the asking. Get one from your nearest RCA Amateur Equipment Jobber, or write to RCA Commercial Engineering Section, Harrison, N. J.
