WINDSOR, ONT., CAN.

NOMPLETELY revolutionizing present day standards, Tower offers these five new, brilliantly conceived and executed cones. Select no speaker until you see them!

MODEL "28"

Suggestive of the days of chivwith elaborate heraldic grill and armature type unit. Superb volume and tone quality.

No matter what design meets your fancy-sailing ship or medieval castle, popular drum or octagonal cone — there's a Tower Speaker of highest quality to delight both the eye and ear.

See your dealer or write us for illustrated circular.

TOWER MFG. CORP. 124 Brookline Ave., Boston

Hdventurer

A genuine sailing ship model cast in bas-relief with bright natural colorings. Armature unit. WEST OF DES MOINES, IA., \$10.50

Castle Cone

A creative work of art finished in two-toned bronze. Employs powerful new type armature unit for power tube amplification. WEST OF DES MOINES, IA., \$10.50

Pirate Ship \$7<u>95</u>

The most amazing cone on the market! A fine old PIRATE SHIP with exceptional reproducing qualities. The utmost in eye and ear value.

WEST OF DES MOINES, IA., \$8.75

NEW IMPROVED \$15~ Meistersinger

America's most beautiful conel Both a wall and table model with new armature type unit for power tubes. Mahogany ished frame. Art Metal Base.

Over Two Million Tower Products now in use!

The Keystone

of Many a

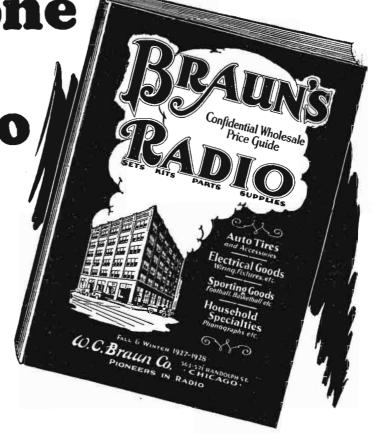

Retail Radio Store

-the Braun Confidential Wholesale Price Guide

Placing, at the Instant Call of Dealers Everywhere, the Greatest Radio Stock in All the World

From a very modest beginning, the W. C. Braun Company has shown a steady and rapid rise, until it now ranks as one of the largest distributors of radio products in the country. pany was originally conceived with the thought in mind of furnishing a base of supplies for the average small retail radio dealer who could not hope to carry large stocks and, of neces-sity, must have a dependable source from which he could draw quickly for the servicing of his trade.

In the spirit of wishing to develop this idea to its fullest extent, we early inaugurated a policy of carrying all of the most popular manufactured lines of radio parts, kits, sets and supplies.

Coupled with our present large warehousing space, a trained, skilled organization and the best physical equipment possible that money can buy, we stand now in a position to give better service to our dealers than ever before.

Be First in Your Town to Get This Franchise

Last season our line of Monroe sets enjoyed a phenomenal popularity in every section of the country. Into their construction we placed the very finest materials obtainable, and only the most highly skilled workmanship. As a result, these sets became very popular with our dealers because of the lack of servicing and the trouble-free service which they gave in the hands of the users. This year these old dealers will push these sets to the very limit, and although our appointments have been very widespread there are many good districts yet open for the Monroe franchise.

Braun Service Will "Make" Your Store

We are now so equipped in stock that practically all orders are shipped the same day of receipt. Telegraph orders are given very special attention and positively leave for destination on the same day the order is received. If you do not know about the Braun exceptionally speedy service you are counseled to write us immediately for your copy of the new Confidential Wholesale Price Guide which has just come from the press. This book has proven the foundation of many a successful retail radio store. In it you will find listed practically all the nationally-known radio lines in a completeness never heretofore reached by us or any other concern.

It will also point out to your the Braun plan of stabilizing radio retailing through carrying selected, limited allied lines during the season when the radio business is slack. It will also set out in detail the elaborate advertising and sales promotion help which our new Sales Promotion Department is equipped to furnish all Braun dealers.

In writing for this book please use your letterhead and give the names of two wholesale firms from which you have purchased in the past.

FROST-RADIO DE LUXE

Specified Exclusively for the Magnaformer

FROST-RADIO De Luxe Parts

are exclusively specified for the Magnaformer 9-8 "Commander in Chief of the Air," described and illustrated in this publication. Go to your dealer and ask him for the following FROST parts for this great receiver: 1 No. 1810 De Luxe 10-ohm Rheostat; 1 No. S-1810 De Luxe 10-ohm Rheostat with switch; 1 No. 1830 De Luxe 30-ohm Rheostat; 1 No. 1824 De Luxe 400-ohm Potentiometer; 4 No. 253 Cord Tip Jacks.

FROST-RADIO Parts are also specified for the following popular circuits: Camfield Super-Selective 9; Bodine AC 6; Melo-Heald 14; S-M Unipac; Infradyne; Best's 45 Kilocycle 1928 Super, and many others.

Fine quality and 100% performance won this national acceptance of FROST-RADIO for the country's leading circuits. FROST Quality always leads!

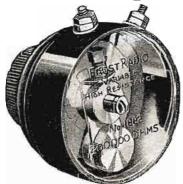

No. 253 CORD TIP JACK
The handy cord tip jack with the spring
clutch. 2 pairs used in the Magnaformer. Per pair 30c

DE LUXE BAKELITE RHEOSTATS
Air cooled Bakelite frame; flexible Bakelite resistance mounting strip; hand-buffed nickel plated metal parts; Bakelite pointer knob. Series 1800, any resistance (shown at left).

Series S-1800, any resistance, with filament

FROST-RADIO De Luxe Parts Are of Unbeatable Quality

FROST-RADIO
DE LUXE VARIABLE HIGH
RESISTANCES

Have frictionless roller contact that reveals no wear or resistance strip changes after tests of over a million rotations. Perfect control of volume; entirely free from jerks or sudden changes. Bakelite pointer knob; polished Bakelite case and transparent Bakelite dust cover. 2,000 to 500,000 obms. Series 1880, 2 terminals, \$1.75

With the Editor

WITH this issue, the CITIZENS RADIO CALL WITH this issue, the CITIZENS RADIO CALL BOOK enters into the seventh year of publication. The CITIZENS RADIO CALL BOOK of today is very much different from the modest looseleaf Call Book of 1921. Originally conceived to supply the demand of the commercial and amateur operator for a Call Book containing all of the radio stations of the world, this magazine has slowly changed, both in physical appearance and type of content. We have endeavored, as year after year passed, to improve the magazine so that it would appeal to the radio public as a whole. Nor have we neglected our original readcrs. An amateur cedition of the CITIZENS RADIO CALL BOOK appears triannually, supplying an up-to-date list of all commercial, broadcast and amateur stations in the world.

THERE has been considerable discussion during the past few years that the "parts business" is on the decline and that the custom-built receiver has lost favor with the radio public. A careful analysis of the situation has disclosed the falsity of such an assumption. The magazines catering to the radio experimenter and the bome constructor all report that their circulation is increasing with each passing year. The constant introduction of new their circulation is increasing with each passing year. The constant introduction of new circuits and highly improved apparatus such as radio frequency transformers, audio frequency transformers, sockets, condensers, drum dials and other single control devices have so held the attention of the home constructor, that all indications point to an increased interest in that field instead of a decrease. There always will be an interest will be largely governed by the quality of the receiver or power device described in the radio publications of today and tomorrow. We well realize the tremendous factor we constitute in this field in keeping the interest of the home constructor centered around custom-built receivers and power devices, and will exert every effort to bring before him apparatus, receivers and the like which are of such quality as to merit his continued interest.

Amazingly Easy Way to get into ELECTRICITY

Don't spend your life waiting for \$5 raises in a dull, hopeless job. Now . . . and forever . . . say good-bye to 25 and 35 dollars a week. Let me show you how to qualify for jobs leading to salaries of \$50, \$60 and up, a week, in Electricity—NOT by correspondence, but by an amazing way to teach, that makes you an electrical expert in 90 days! Getting into Electricity is far easier than you imagine!

Learn Without Lessons in 90

ACK of experience age, or education bars no one. I don't care if you don't know an armature from an air brake — I don't expect you to! I don't care if you're 16 years old or 48—it makes no difference! Don't let lack of money stop you. Most of the men at Coyne have no more money than you have. That's why I have worked out my astonishing offers.

Railroad Fare Allowed

I will allow your railroad fare to Chicago, and if you should need part-time work I'll assist you to it. Then, in 12 brief weeks, in the great roaring shops of Coyne, I train you as you never dreamed you could be trained ... on the greatest outlay of electrical apparatus ever assembled . . . costing hundreds of thousands of dollars . . .

real dynamos, engines, power plants, autos, switchboards, transmitting stations . . . everything from door-bells to farm power and lighting . . . full-sized . . . in full operation every day!

No Books—No Printed Lessons

No dull books, no baffling charts

Prepare For Jobs Like These

Here are a few of hundreds of positions open to Coyne-trained men. Our free em-ployment bureau gives you lifetime employment service.

Armature Expert
S100 a Week
Substation Operator
S65 a Week
Auto Electrician S110 a Week
Inventor
Unilimited Inventor - Unlimited Maintenance Engineer \$150 a Week Service Station Owner

Radio Expert - \$100 a Week

Now In Our **New Home**

This is our new, fireproof, modern home wherein is installed thousands of dol-lars, worth of the newest ed thousands of col-orth of the newest lost modern Elec-Equipment of all We now have that amount of floor devoted to the ex-teaching of prac-

all real actual work . . . building real batteries . . . winding real armatures, operating real motors, dynamos and generators, wiring houses, etc., etc. That's a glimpse of how we make you a master electrician in 90 days, teaching you far more than the average ordinary electrician ever knows and fitting you to step into jobs leading to big pay immediately after graduation. Here, in this world-famous Parent school -and nowhere else in the world-can you get such

Jobs, Pay, Future

Don't worry about a job, Coyne training settles the job question for life. De-mand for Coyne men often

exceeds the supply. Our employment bureau gives you lifetime service. Two weeks after graduation, Clyde F. Hart got wests after graduation, organization as position as electrician with the Great Western Railroad at over \$100 a week. That's not unusual. We can point to many of Coyne men making up to \$600 a month. \$60 a week is only the beginning of your opportunity. You can go into radio, battery or automotive electrical business for yourself and make up to \$15,000 a year. Get the Facts

Coyne is your one great chance to get into electricity. Every obstacle is removed. This school is 28 years old—Coyne training is tested—proven beyond all doubt—endorsed by many large electrical concerns. You can find out everything absolutely free. Simply mail the coupon and let me send you the big, free Coyne book of 150 photographs... facts... jobs... salaries... opportunities. Tells you how many earn expenses while training and how we assist our graduates in the field. This does not obligate you. So act at once. Just mail coupon. So act at once. Just mail coupon.

Two Years Ahead in Design

Two Years Ahead in Design
At the Radio Trade Show in Chicago, the announcement of the Magnaformer was one of the few startlingly new ideas in radio development. We know
from actual observation that the Magnaformer is
two years ahead in design, for it incorporates advanced and evolutionary ideas throughout. It is
distinctly different, with its self-shielding, matched
units, double amplification for each R. F. stage and
excellent laboratory construction. It is a fresh idea
—the very heart of the new and better receiver in
which its remarkable qualities are given full range.
Coming, asit does, when the air has been cleared by
the new rulings of the federal radio commission,
it makes it possible to secure exceptional results,
accomplishments heretofore unknown to radio fans.

HE new Magnaformer 9-8 Receiver has won the instant approval of radio experts. It has created a new standard of all-around radio efficiency. It is the season's feature circuit in Radio, Citizens Radio Call Book, Popular Radio, and other well-known magazines. This widespread acceptance and enthusiasm is due to the inherent excellence of the circuit—its hair-splitting selectivity, perfected, superb tone, great volume and extremely long range. During the first test of the Magnaformer Receiver this Spring, 43 D-X stations were logged from Chicago, including three on the Pacific Coast. The engineers present during the test were astounded. Subsequent performances have shown that the Magnaformer does the amazing thing consistently. Winter reception will see many additional record performances, according to the experts. see many additional record performances, according to the experts. The enthusiastic reception accorded in Chicago is now being given the Magnaformer the country over. Its performance is sensational. It is the talked-about circuit in radio professional and amateur circles. One of the real thrills and joys in truly exceptional radio performances is in store for the man who "builds his own," and it is impossible to duplicate the work of the Magnaformer in any

The secret of the Magnaformer circuit's efficiency lies in the new Magnaformer intermediate long-wave transformers with which it is equipped. These transformers are a distinct innovation in radio. They are refreshingly new in design, in workmanship and in performance. This new and superior construction meets the present-day demand for greater radio efficiency, a demand far more critical than ever before, due to radio's rapid advancement in factory-built receivers. The circuit throughout is new and modern. It has the latest lighted drum dials, controlled by knobs instead of the fingers; unique Ferranti transformers give equal amplification of all audio frequencies; output tone filter insures retention of tone quality.

tion of all audio frequencies; output tone filter insures retention of tone quality.

Thus, in the Magnaformer you have a precision-built instrument that ranks foremost in laboratory circles and which is available to set builders in the perfection of a truly remarkable radio receiver, a receiver that is designed from the best available parts possible to produce, all matched perfectly into a compact, high-quality receiving set of the first order.

Truly, it has well earned its name, Magnaformer, the "Great Creator."

Magnaformers are different, outstanding and unusual in four vital respects

FIRST—Magnaformers are precisely and unal-terably tuned in the laboratory to exactly the same wave length in such a manner that they al-ways positively pass the full and complete signal-wave with all of its harmonic carrying side-bands intact; result—surprisingly beautiful tone quality.

SECOND—The combined elements of technical engineering design of Magnaformer Intermediates are such that the incoming signal receives double the usual amplification in each R. F. stage; result—a very powerful output perfectly controlled from a whisper to volume enough to fill a large hall—every sound clear and distinct.

hall—every sound clear and distinct.

THIRD—Magnaformers are thoroughly and scientifically shielded—so that the tubes to which they are connected will not oscillate, no matter bow closely together or in what position they are placed in the receiver—a very important factor of its superior design; result—no fuss, no fuming, no squeals, squawks, blurps nor hisses. Just beautiful, natural reception, clear, full-toned, quiet, powerful.

FOURTH — Mechanically, Magnaformers are as nearly perfect as engineering skill can make them. The three foregoing electrical factors are depend-

ent, outstanding and unusual in four vital respects
ent on perfection of Mechanical Design to insure
their unvarying performance. The primary and secondary coils of each Magnaformer are wound on
pure Bakelite and are permanently fixed so that
their inductances cannot possibly change. The secondary inductances are exactly tuned in the laboratory by small variable condensers which are
fixed and locked after the tuning is done. These
small condensers are locked in entirely separate
Bakelite compartments and are ENTIRELY outside the electrostatic fields of the coils. No jar or
capacities of Magnaformers after they leave the
laboratory. The coils also are locked in entirely
separate Bakelite compartments. Both coils and
condensers are specially treated before being locked
in their separate compartments. They cannot possibly be affected by moisture, atmospheric or climatic changes; result — a permanency of vital
and the performance of everything else is dependent.
The coils also are locked in entirely
separate Bakelite compartments. Both coils and
condensers are specially treated before being locked
in their separate compartments. They cannot possibly be affected by moisture, atmospheric or climatic changes; result — a permanency of vital

An Appreciation to the Set Builder. We take off our hats to the set builder, the man who has really made radio what it is today. Without set builders—the makers of custom-built receives the science of radio would still be in the infant state science of radio would still be in the infant state. The superations, the innovations, the continues. He superations, the innovations, the continues are superations, the superations of the superations of the set builder in the set builder. It was the set builder who was the first to recognize radio's possibilities. It is to bis untiring zeal that radio is what it is today.

The set builder deserves the respect of every professional radio engineer and manufacturer in the industry.

Here's to the Knight of the soldering iron!

Enjoy This Thrill!

Enjoy This Thrill?

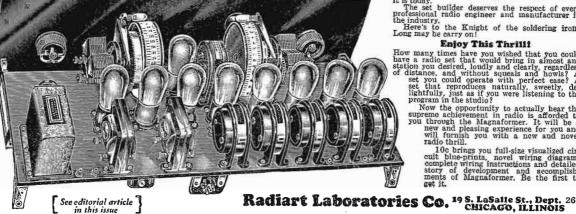

How many times have you wished that you could have a radio set that would bring in almost any station you desired, loudly and clearly, regardless of distance, and without squeals and howls? A set you could operate with perfect ease? A set that reproduces naturally, sweetly, delightfully, just as if you were listening to the program in the studio?

Now the opportunity to actually hear the supreme achievement in radio is afforded to you through the Magnaformer. It will be a new and pleasing experience for you and will furnish you with a new and novel radio thrill.

10c brings you full-size visualized cir-

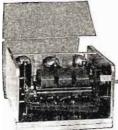

radio thrill.

10c brings you full-size visualized circuit blue-prints, novel wiring diagram, complete wiring instructions and detailed story of development and accomplishments of Magnaformer. Be the first to get it.

EML Now You Can Build the

Remler R. F. Amplifier and Antenna Compensator

Antenna Compensator

The No. 710 R. F. Amplifier incorporates two stages of R. F. Amplification and a detector. Entirely enclosed in a sheet copper case which gives complete electro-magnetic shielding. It is designed for single-dial control, either with Remler Drum Dial or the ordinary 360° vernier dial. An Antenna Compensator, supplied with the amplifier, nullifies the de-tuning effect of the antenna, which interferes with efficient operation in the usual single-control R. F. amplifier. A Switch is provided for selective or non-selective tuning.

Included in the Remler No. 710 Amplifier are special solenoid-type, small diameter coils, the Remler 3-in-Line Condenser, Remler No. 50 Sockets, and special resistances.

No. 710....Price \$55.00

Easily - Quickly Safely

USE THE REMLER

Radio Frequency **Amplifier** and Associated Parts

Control Panel of Infradyne

Kit

The Remler Infradyne Kit, No. 750, includes the following apparatus: Etched copper control panel (illustrated above); pressed steel instrument panel, two No. 110 Remler Drum Dials; one No. 659 Twin-Rotor Condenser; four No. 50 Remler Soekets, three No. 35 Remler Choke Coils; one special Coil; all necessary fixed condensers, rheostats, and fixed resistances; jacks; switches, binding posts; and wire and battery cable in colors to agree with wiring diagram.

The complete instructions include sche matic wiring diagram; full-size cable harness template; schematic cable lay-out; dia-gram of parts and wiring under steel base; plan view of top of steel base.

No. 750-Infradyne Foundation Kit ----Price \$52.00

Infradyne Amplifier

The Remler Infradyne Amplifier is a three-stage radio frequency unit which is adapted for use in connection with practically all standard sets of the tuned radio-frequency or neutrodyne types, and which also fully meets the requirements of the Infradyne Circuit.

The No. 700 Infradyne Amplifier offers a marked improvement in the selectivity and sensitivity of any set with which it is used.

This instrument is the result of the development of a simple and effective method for controlling energy transfer through tube capacities at high frequencies. It is unique in that amplification is accomplished at the fixed and very short wave length of 86 meters.

\$27.50

REMLER INFRADYNE CABINET This copper cabinet, embossed in two-tone brown crystalline enamel, together with a decorated wood base, supplies the highest standards of convenience and appearance for the new Infradync. Size: 11x26 inches. No. 760......Price \$15.00

Two Hours Work-

Then Perfect Reception

The new Remler R. F. Amplifier and Infradyne Foundation Kit are designed to meet the growing demand for complete, tested and trouble-free construction units for the Infradyne Circuit.

Now, you can easily build the Infradyne in two hours with the simplest tools. Now, you can be sure of matched parts, scien-tifically correct design, and proper location of each piece of apparatus.

Remler leadership and reputation in the manufacture of quality parts is your guarantee of satisfaction.

Write for special Infradyne folder and also a two-color catalog of Remler parts.

Remler Division of GRAY & DANIELSON MFG. CO.

260 First Street, San Francisco

Eastern Warchouse: Elkhart, Ind.
New York

By assembling Remler Units Nos. 700, 710, 750 and 760, together with two transformers and one voltmeter, you can build the complete Infradyne.

Now every part is checked and tested to give maximum results with every other part. The diagrams make it impossible to go wrong in either the wiring or the placement of parts.

While the ordinary factory set is designed to meet average conditions of reception, the Infradyne is so flexible in adjustment and control that it will meet the exact requirements of your particular locality.

And when you have built the Infradyne, you will have a set which for years to come will give you ideal reception at a minimum cost.

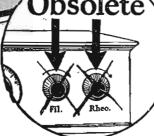

Watch Dog of Your Tubes

70U never make a mistake when you investin AMPERITES. The most clever and popular circuit of today may be replaced by another tomorrow. But AMPER-ITE does duty year after year in any circuit you wish to construct. It never wears out. It is the only automatic self-variable filament control. And there is nothing else "just as good." It is radio's most permanent and satisfactory investment.

solves the tube control problem

AMPERITE simplifies wiring and operation. Insures just the proper filament current for each and every tube. Does away with all hand rheostats on the panel. Precludes tube damage from under or excessive "A" current-resulting in both increased tube life and at all times maximum tube performance.

If you want AMPERITE performance you must insist upon AMPERITE. Nothing else will do. More essential than ever if you use a battery eliminator or trickle charger. Types for every tube. Sold everywhere. Price complete with mounting \$1.10 (in U.S.A.).

Season's Best Hook-ups FREE

Write today for new "AMPERITE Book" just off press. A veritable jewel for last minute information on the season's most popular hook-ups and construction data. Address Dept. CCB-2.

The "SELF-ADJUSTING" Rheostat

No More BBatteries On Your Radio Brings You This Super B'Eliminator COMPLETE WITH RAYTHEON TUBE

O AWAY WITH "B" BATTERIES

— their annoyance and trouble — the constant expense of changing them. The great Super "B" Eliminator offered in this ad is easily and instantly attached to any light socket. It delivers a steady flow of power. Hum, noise, distortion, pulses and all other disturbances are gone. You can use this power unit for any type or style of set. It gives immediate satisfaction—100% efficient. Built with heavy duty chokes, transformers and finest condensers in the filter circuits—the most modern, powerful and flexible "B" Eliminator on the market.

Now Sold for \$1.00 Down

Radio retailers everywhere have asked the cash price of \$42.50 for this great "B" Eliminator. Now, because of our enormous buying power, we are able to offer it to you for only \$29.50 to be paid in easy installments. This is the most sensational offer ever made. Never before has a power unit of this class been available at such a price on easy payments.

Try It for 30 Days

Only \$1.00 pinned to the coupon below brings you this great Super "B" Eliminator. Then we want you to try it and test it at our expense for one month. You don't pay us another penny until you are fully satisfied, as we know you will be. After you have experienced the difference this power unit makes in your set you will want to keep it. Then send us only \$5.00 a month until you have paid the total price of only \$29.50.

Fully Guaranteed

The Super "B" Eliminator complete with famous Raytheon tube is guaranteed for one year against mechanical and electrical defects. Written guarantee goes with each unit. The strong construction assures its endurance—it lasts a life-time.

What Users Say

"This is to advise that Super 'B' Eliminator ordered by me has arrived in very good condition and that I am very much pleased with the performance of this Eliminator."

JOHN L. KAMEEN, 535 Clinton St., Vandling, Pa.

JOHN L. KAMEEN, 535 Clinton St., Vandling, Pa. "In all I have four eliminators from you and they all are excellent. No hum or noise whatsoever."

No hum or noise whatsoever."

J. H. MILLER, 134 N. Carrollton Ave., New Orleans, La.
"I received my new Raytheon 'B' Eliminator about an hour ago. It is working fine."

HERBERT FERRIS, R. R. Box 681, Indianapolis, Ind.

Description

The case is beautifully finished in burl walnut wood design. The panel is black etched in gold. Equipped with rubber covered cord and socket plug.

Use the New Power Tubes

Equipped with high voltage taps and variable adjustments so that any of the new power tubes may be used. Operates from 110-120 A. C., 50-60 cycle current. Has tap for intermediate voltage on which 67½ to 90 volts may be obtained. The detector tap will supply 22½ to 67½ volts. Variable adjustment will deliver any desired detector voltage. On and off switch and high and low voltage switch are integral parts of the eliminator. No additional switches or cord switches are necessary.

The full wave rectifying Raytheon tube has made possible the delivery of great current at a high voltage with efficient apparatus. The Super Power Raytheon eliminator will deliver up to 180 volts. More than enough for any set from one to twelve tubes. This Raytheon Rectifying Tube has an indefinite life because it has no filament to burn out. Complete instructions with each unit for wiring to radio set.

POWERFUL seven-tube radio at factory price. Test it without spending a cent. We claim the Randolph Seven will out-perform any radio and we want you to satisfy yourself that it will. To do this, we will send you this powerful radio to try for 30 days. Test it for distance, clearness, ease of operation, tone and every other way you can. Unless it more than satisfies you, returnit to us. **Every** Randolph set must make good before it is sold.

Battery ALL ELECTRIC OPERATION

The Randolph Seven is sold for use with batteries or connected for operation direct to electric light socket—absolutely batteryless—no chargers or batteries—just plug in socket and tune in. 100% efficient either way. Its construction and performance have been tested and approved by leading radio engineers and authorities and leading radio and scientific publications.

Single Control—Illuminated Drum

One drum dial operated by one simple vernier control tunes in all stations with easy selectivity to tremendous volume. No overlapping of stations. Illuminated drum permits operation in the dark. Volume control for finer volume modulation. This is a 7-tube tuned radio frequency receiver with power transformers and power amplification. Space wound solenoid coils Full and completely shielded. A real receiver of the highest quality. Tremendous distance, wonderful tone quality, simple to operate.

The Randolph cabinets are in themselves beautiful pieces of furniture made of carefully selected solid burl walnut. Bas-relief bronze escutcheon plates are mounted on the dial panel. In design and appearance it is a cabinet worthy of the high-quality radio it contains. Solid walnut beautifully shaped surrounds the soft verdi-green panel. Nothing has been spared to make the Randolph Seven the leading radio receiver. We are so sure that it will surpuss even your best hopes that we know how safe we are in making the **30 day free trial offer.**

I have logged more than 50 stations from coast to coast.—Lloyd Davenport, Littlefield, Texas.
I have logged 52 stations from Cuba to Seattle—the set is a world beater.—J. Tampkinson, Detroit, Mich. Your set is a revelation—has all others tied to the post for distance and selectivity.—Waldo Powers, Vergennes, Vermont.
On strength of its performance sold two more sets this week. T. Scanlow, Orlando, Florida.

Beautiful Ampliphonic Console Set

Made of the finest carefully selected solid walnut. Two-tone shaded finish. Has built-in cone loud-speaker that compares with any on the market and accurately reproduces high and low notes. Send for the folder today that shows this beautiful console in full colors and gives complete details. Compares with most table sets in price. For battery or all-electric operation ready to plug in and tune in. Write for complete descriptions.

Utilizing New 340 Tubes

Unique Features

The Aero-Seven Receiver, which is being featured in the prominent radio magazines and newspapers, is a new tried and tested tuned R. F. circuit, incorporating the most modern radio improvements at a popular price. It is a distinct innovation in a tuned R. F. receiver, utilizing three stages of R. F. and three stages of resistance-coupled audio. Circuit is built around the famous improved Aero Universal Colls, with improved Amsco S. L. tuning 3-gang condenser, S-M single-control drum dial and the tried and tested parts of other famous manufacturers. Such names as Carter, X-L, Westinghouse, Aero, Amsco and Silver-Marshall assure you of a circuit that is the final word in perfection.

Distinct features are: the new Hi-Mu tube at input and in R. F. stages, potentiometer control, higher amplification, 10-kilocycle selectivity and true single control,

The Aero-Seven has a broadcast range from below 200

meters to over 550 meters (1500-500 kc) and requires no shielding as with the small Aero coils, direct pick-up is negligible and coupling between coils is the very minimum. The coils are twice-matched at both high and low frequencies of the broadcast band, thus eliminating many difficulties in single dial control and overcoming one of the principle causes of disappointments.

The adjustable compensators on the Amsco condensers facilitate the equalization of circuits, solving the major problem of tandem tuning.

The extremely sharp selectivity of the Aero-Seven circuit is due to the low resistance of the coils. The high voltage gain per stage, due to the extremely low loss construction assures extreme distant reception and greatest volume and sensitivity is assured through the high efficiency of the coil windings.

See article

windings

New and Unique Hookup 3 Stages of Radio Frequency 3 Stages of Audio Amplification

The Aero-Seven has a new and unique hook-up that incorporates three stages of R. F. and three stages of Audio. There are two stages of tuned radio frequency and a special coupling stage, the secondary function of which is to prevent antenna detuning, thereby giving single control which is both theoretically and practically perfect. This independent antenna circuit is of a new and efficient design and employs a resistance connected between the antenna and ground inputting to the first grid circuit. Fire CX340 tubes are used—3 in the R. F. circuit, one detector and one in the audio.

In the three audio stages, one 171 power tube is used, one 201A tube and the one CX340 tube in the input. The officult, therefore, is different from the usual 7-tube R. F. circuits, which variations contribute to its optimum selectivity, perfect quality and thrilling volume. The combination of all the various parts, the matching of the Aero S. square officers of the two control and potentiometer control, greatly simplifies operation and tuning, while adding efficiency to the circuit.

First Use of New CX340 Tubes—

First Use of New CX340 Tubes 1-6/10 Times Better

Utilizing the new CX340 Cunningham tubes in place of the usual 201A, gives the Aero-Seven the distinction of being the first circuit using this superior method. CX340 tubes are 1-6/10 times more effective than 201A tubes, having a 5-volt filament and .25 amperes; plate, 180 volts maximum. In this receiver 90 volts is used constantly on the plate for the R. F. circuit, something seldom attempted but efficiently worked out here. It is a High Mu tube, having a high amplification factor (Mu-30) and is used both as a detector and as a radio and audio amplifier. The Aero-Seven is specially designed to operate with this new and better CX340 tube and the results secured will be a pleasing revelation to you. It is surprising what tone and volume is secured with a minimum use of current.

Resistance Coupled Audio Amplification

Resistance coupled audio amplification in the Aero-7 attains a quality of reproduction unapproachable in other systems. It preserves the extraordinary quality consistently achieved by Aero-7's 10-kilocycle selectivity.

10 Kilocycle Selectivity Now a Real Fact

Ten kilocycle selectivity is OPTIMUM Selectivity. It means a receiver that tunes sharply enough to eliminate interference and yet does not tune so sharply as to cause distortion. It is the ideal tuning characteristic. "Optimum tuning." says the engineer, when he means a perfect set.

Why bother with anything but the best? Why put up with anything but 10-kilocycle selectivity, as represented in the Aero-Seven circuit?

Due to the low-loss construction of the colls and condensers in the Aero-Seven and the great selectivity so sharp that you cannot get two stations at one time under present broadcast regulations, at the same time providing adequate frequency margin to prevent high "cut off"—distortion.

distortion.

Imaxime what this means in perfect radio reception.
Selectivity, the ability to tune in clearly, sharply, without fear of disturbance in getting the station you want
whenever you want it—that's something every radio fan
has long desired. It is an actuality in the Aero-Seven—
a feature that is necessary in an up-to-date circuit—a
feature that you get in the Aero-Seven when you build it.

New, Modern, Proved Features in Aero-Seven

10 Kilocycle selectivity.
Resistance coupled amplification.
Uses new CX340 tubes instead of 201A.
3 stages of R. F.
3 stages of audio amplification.
Extreme D-X reception.
Potentiometer control.
Silver-Marshall single drum dial.
True single control.
Aere Coils are twice matched at both high and low frequencies.

both high and low frequencies.

Amsco adjustable condensers.
Carter resistances.
Westinghouse Foundation Unit.
X-L Posts.
High quality parts throughout.
Range below 200 to above 550
meters (1,500-500 KC).
Low loss characteristics throughout.

Perfectly compensated—variation in antenna circuit doesn't affect it.
Wiring underneath sub-panel.
Simple construction.
Easy to build in quick time.
The most popular-priced 7-tube circuit.
The Aero-Seven-tube Receiver assures you of the very latest in radio. It has everything—beautiful tone. 10 kilocycle selectivity—extreme long range and a volumo at your command that can be raised to music-hall proportion or lowered to slumbering whispers. The particularly meritorious application of resistance coupling creates a most remarkable tone. It gives you a receiver that is in a class all its own—a real conqueror of space—2 companion that you can depend upon absolutely in any emergency. It delivers quality that is quality, and yet its construction is so low in cost as to be almost unbelievable.

An Opportunity for Set Builders

The set builder will find the Aero-Seven a most profitable receiver to build. It is an extremely simple circuit—efficient, high grade and having a record of exceptional performance. It could hardly be duplicated in a factory-built set at double the cost.

a factory-built set at double the cost.
You can make big money building this set for your friends and get a real "kick" out of it yourself.
Complete parts, drilled and engraved panels and foundation units are being distributed through the jobbing trade and are available at leading radio stores everywhere. If your dealer's name and we will see that you are supplied promptly.

A full-size working blueprint and booklet of assembly and operating instructions with complete data is furnished, which makes it both practical and easy to build his circuit quickly. Build yours early—get the jump on the other fellow.

AERO PRODUCTS, INC.

1768 Wilson Ave., Dept.309 Chicago, U. S. A.

ASSOCIATED MANUFACTURERS-AMSCO, AERO, CARTER, WESTINGHOUSE-MICARTA, SILVER-MARSHALL, X-L.

Tell 'Em You Saw It in the Citizens Radio Call Book

1768 Wilson Ave., Chicago. Aero Products, Inc. Dear Sirs: Enclosed find 10e for which please send me Dept. 809 Dear Sirs: Enclosed and the for which please sent me life-size blueprints, assembly diagrams, construction data and all the facts in building the new Aero-Seven Receiver. Name Address

Pioneering is important

BALKITE "AB" A complete unit, replacing both "A" and "B" batteries and supplying both "A" and "B" current from the light socket. Contains no battery in any form. Operates only while the set is in use. Turns on and off at the light switch. Two models. 135 volts "B" current, \$59.50. 180 volts, \$67.50.

BALKITE "A" Like Balkite "AB" above, but for the "A" circuit only. One of the most remarkable developments in radio. Price \$32.50.

BALKITE "B" Like Balkite "AB" above, but for the "B" circuit only. The accepted "B" power supply. Has probably the longest life of any device in radio. Three models at remarkably low prices. 90 volts, \$22.50. 135 volts, \$32.50. 180 volts, \$39.50.

BALKITE CHARGER The standard battery charger for radio "A" batteries. Noiseless. Can be used during reception. Three models, all trickle chargers. Prices, \$17.50, \$9.50, \$7.50.

Prices are slightly higher West of the Rockies and in Canada.

but performance is more so

Most of the great improvements in radio power have been made by Balkite. First noiseless battery charging. Then successful light socket "B" power. Then trickle charging. And today, most important of all, Balkite "AB," a complete unit containing no battery in any form, supplying both "A" and "B" power directly from the light socket, and operating only while the set is in use.

Important as this pioneering has been, yet it has not been the most important factor in making Balkite the leader. The real factor has been Balkite performance in the hands of its owners. With 2,000,000 units in the field Balkite has a record of long life and freedom from trouble seldom equalled in any industry. The first Balkite "B," purchased 5 years ago is still in use and will be for years to come. To your radio dealer Balkite is a synonym for quality. The electrolytic rectification developed and used by Balkite is so reliable that today it is standard on the signal systems of most of the railroads of the country. These facts have made Balkite one of the best-known names in radio.

Today, whatever type of set you own, whatever type of power equipment you want, Balkite has it. And production is so enormous that prices are astonishingly low. Balkite today costs no more than ordinary equipment. Your dealer will recommend the particular equipment you need for your set.

JEWELL

INSTRUMENTS

JEWELL better instruments for radio

When an instrument for radio use is desired by anyone—manufacturer, dealer, amateur, set-owner or set-builder—there is a great deal of pleasure in knowing that better instruments—Jewell instruments—are available, which are certain to give complete satisfaction in their use.

Pattern No. 139
High resistance voltmeter for set owners use in testing "B" voltage

Pattern No. 111 Radio service set. Helps solve adealer's service problems

There are Jewell instruments for every radio need. For the dealer we have tube testers, service test sets, special portable voltmeters, ammeters, galvanometers, etc. For the set builder and owner, a complete array of instruments for panel mounting and portable testing in keeping the set working at its very best. For the amateur we have transmitting instruments that will delight the most exacting. The famous Jewell triopatterns 54, 64 and 74 have made amateur transmitting history and are the choice of most amateurs. For the manufacturer of radio receiving sets or accessories we can furnish any desired instrument for your testing laboratory. Our complete line of instruments gives an advantage of choice from many suitable designs. Our years of experience manufacturing instruments has furnished us with a fund of knowledge that is available to our many friends in the radio industry and we invite you to bring your instrument and testing problems to us.

New Jewell instruments for radio use are brought out as the need for any specific testing equipment demands. This year finds three new Jewell radio products—Pattern Nos. 115, 133 and 139—all illustrated herewith. Each has a decided value and all are of the well known Jewell quality.

Write for a copy of our 32-page radio instrument catalog No. 15-C

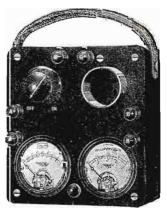

Jewell Electrical Instrument Co. 1650 Walnut St. - Chicago

Pattern No. 135
This style instrument as voltmeter or animeter is the type
used in most receiving sets

Pattern No. 133
Radio set analyzer—for the service man

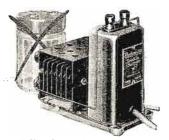

Pattern No. 115
The newest and most up-to-date
tube checker on the market

Revolutionizing Knalis Clocket Power!

Modernize your Trickle Charger or Power Unit

No Bulbs · No Liquids · No Noise

Replacement Unit

Eliminates, acids, liquids and charging bulbs.

Makes any electrolytic unit dry, noiseless. Requires no watering or other attention. Increases charging rate.

Throw away the acid jar on your present trickle charger or power unit. Install the new KUPROX all-metal Replacement Unit in its place. In less than two minutes banish all the bother of watering and other attentionthe danger of ruined rugs and clothing. Very easy to attach. Requires but two very simple binding post connec-tions. Makes your charger absolutely dry, and gives a higher charging rate. Fits all standard electrolytic chargers and power units. List Price, complete with full instructions.

\$450

from any radio dealer

No acids, liquids, or charging bulbs.... Dry permanent power that requires no attention

At last, radio power as dependable and permanent as your house current, that requires no more attention than the snap of a switch. KUPROX, the new, dry metallic rectifier supplies all radio power, A, B, and C, constantly, dependably-probably the greatest of all developments in light socket radio power.

With KUPROX Devices your set is truly electric. KUPROX is all-metal—dry—it needs no watching or watering-it cannot wear out. Various models, from Trickle Chargers to the Combinations which supply all radio power from a single compact unit.

FREE BOOKLET FOR YOU: "The Secret of Successful Battery Elimination," describing KUPROX Devices, will be mailed Free on request. Write for it.

THE KODEL RADIO CORPORATION

KUPROX "A" TRANSI-FIERS—Batteryless, noise-less, electric "A" power. Dry, dependable, needs no attention. Operates any receiver. 4-volt or 6-volt, \$28.50 and up

KUPROX A & B TRANSI-FIERS—All radio power FIERS—All radio power from a single unit. Con-trolled from set switch. Absolutely dry, requires no attention. \$57.50 and up.

KUPROX "B" TRANSI-FIERS—Dry, permanent, free of hum. Guaranteed voltage at rated output. Models for all sets and circuits, \$14.50 and up.

Recharge Your Dry "B" Batteries

Now you can make your dry cell B batteries last many times as long as before. One of the outstanding achievements of the past year in radio is this new system for rectifying ordinary dry cell B batteries.

No Bulbs · No Liquids · No Noise

Trickl-B-Recharger

Makes a "B" Power Unit of any set of dry cell "B" batteries. Connected to the light socket it performs like the trickle charger on the "A" battery, supplying new life constantly into the dry cell "B" batteries. With this new system "B" batteries can be made to last indefinitely. Very simple to operate and very economical. Simply attach to your "B" batteries, turn on the light socket and forget it. Uses no acids or liquids of any kind. List price, complete with tube.

Type HW Madison-Moore
One Spot Transformer

Reception at one and only one point on the dial came with the

Madison-Moore One Spot Transformer

The pinnacle of perfection for battery-operated receiving sets was reached.

Madison-Moore, thru a long period of exhaustive laboratory tests, have perfected the

Madison-Moore ONE SPOT Batt'ry-less Transformer

Now, for the first time, the set builder may successfully build a receiving set to operate on alternating current. All the desirable features of the celebrated One Spot are included in this but the connection is made with the light socket, eliminating all A, B and C batteries.

This new member of the Madison-Moore line of Finest Radio Apparatus is made from the same high grade materials and sold under the same strict guarantee as the Famous One Spot Trans-

former. A set made with these transformers not only covers the United States wave band, 200-600 meters, but may also be adapted to the shorter and longer wave lengths, making possible excellent reception from foreign stations.

The November issue of Citizens' Radio Call Book will contain a detailed description of this *batt'ry-less* set. Get them, build a set and enjoy complete, up-to-the minute radio efficiency.

Your radio dealer has both types ready for delivery NOW. If he can't supply your needs, send directly to us.

contains all the proof-send for it today! Extra Dollars for You Almost at Once

Think of earning \$15, \$20, \$30 extra "on the side" every week without interfering with your regular job, beginning only a few weeks after you start this training! You can—my Radio training course is world-famous as the "Training That Pays For Itself." My thorough, practical usable training meth-

Pays For Itself." My thorough, practical usable training That ods show you how to pick up this extra cash in your spare hours, while all the time you're preparing for the bigger Radio job ahead. In this way, you can pay for your course and put money in the bank, all through profits I teach you to make right after you start with me. And then, after only a few months of spare time training, you're ready to take the bigger Radio positions!

Send Today For 64-Page FREE BOOK-Mail Coupon

Send the coupon below, and I'll send you my 64-page book—it's free. Hundreds of pictures and facts about the opportunities for big money in the Radio field, how I help you take advantage of them, the 6 outfits of practice material I send you that you can build into 100 Radio circuits, and the other pay-raising facts you want to read. No previous Radio experience needed to take advantage of this offer, and no special schooling is necessary. Find out all the facts for yourself—mail coupon today.

| Dear Mr. Smith: Herewith a photograph of myself in my Radio laboratory here at Detroit. I am making almost three times what I made before taking your course, and will receive another substantial increase very soon. As you know, in the capacity of Radio Engineer here I am in full charge of Radio activities apart from the sales department. So far I have met with steady advancement, and I expect more for the future. The knowledge I got from you enabled me to get where I am today, and believe me, I shall always be | Engr. A Beldenamel Aerial Is the Best

The Beldenamel Aerial Kit

is the sure solution for aerial, lead-in and ground wire troubles. It includes a Beld-enamel Aerial, Belden Lightning Arrester, Belden Lead-in and Ground Wire, Insulators, Screw Eyes, Screws, Lead-in Strap, Ground Strap, Insulated Staples - in fact, everything that is required for a highly efficient aerial that is as good after years of service as when first installed. R. M. A. standard.

Use a Beldenamel Aerial Wire for long distance. It does not deteriorate in service. After years of operation it is just as efficient as when new.

Kadlu Accessultes
that Improve Reception

The Belden Non-Air-Gap

type Lightning Arrester fur-

nishes protection against

damage from lightning. Approved by fire underwriters.

Belden Colorubber Flexible Tinned Hookup Wire is ideal for ground wires and for inter-set wiring. Furnished in an assortment of colors for code wiring.

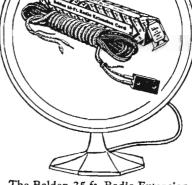

This is a wire that endures. Weather does not affect it.

Belden Radio Accessories have been developed through years of service to exacting radio manufacturers. Belden Radio Accessories in the black and orange striped cartons are of the same quality as used in the most expensive radio sets. For uniformly satisfactory results, specify Belden when you buy radio accessories.

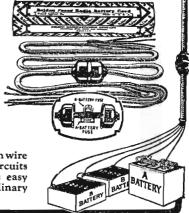

To avoid static and reduce interference, use an indoor aerial. Belden Inside Aerial Wire is easily concealed and very effi-

The Belden 25-ft. Radio Extension Cord is insulated with Colorubber, which prevents loss of tone volume through leakage. The Bakelite Connector attaches to the loud speaker terminals without tools.

The Belden Fused Radio Battery Cord provides:

- 1. An A-Battery fuse that protects your A battery against short circuits, and resulting fire hazards.
- 2. A B-Battery fuse that protects your B battery and safeguards tubes.
- A color code on each wire for identifying circuits which makes it as easy to install as an ordinary battery cord.

There are many fluxes for soldering but only one— is safe for Radio!

FLUX for soldering is a general term; it embraces, as a class, all types of soldering fluxes. To designate a flux as safe for radio construction is specific; it means rosin. Chloride pastes, acids and fluid solutions are soldering fluxes, and are well adapted for certain work, but conductive and corrosive properties forbade their use for radio assembly. Their active elements, zinc and ammonium chlorides, display spreading, creeping tendencies that promote leakage and will eventually cause increased resistance in the wiring.

Rosin, an organic mixture, is a non-conductor and non-corrosive. The glass-like surface of this material does not readily

lend itself to the collection of dust (carbon particles) as will the sticky organic greases of paste. Nor will rosin attract moisture from the atmosphere; the chlorides of pastes and fluids will. Moisture plus carbon particles defeat the best insulations produced. Moisture plus chlorides carbon particles defeat the best insulations produced.

rides direct a slow but determined corrosive attack upon supporting metals. Such slow corrosion in wiring causes a steadily increasing resistance to the flow of electrical energy.

Kester Rosin Core Radio Solder scientifically combines radio's premier flux, Rosin, with a solder alloy of unvarying quality. The use of Kester Radio Solder furnishes the user with a means of accomplishing Safer, Faster, and Cleaner set wiring. Constructors who solder-protect wiring with Kester Radio Solder enjoy increased receptive range, improved tonal quality and the satisfying assurance that their receivers will never be forced into the discard

through the corrosive and conductive action of a chloride flux.

Manufacturers of Radio Sets and Equipment: Tests conducted with the various types of commercial fluxes are under constant observation in our laboratory. Can we assist you in your soldering problems?

The Outstanding Radio Power Units

What does it mean to you that over fifty leading manufacturers of light socket power units submitted their designs to the Raytheon research laboratories for approval and right to use Raytheon long life rectifying tubes? Just this—that Raytheon's technical personnel and unusual scientific facilities in conjunction with the use of the Raytheon rectifier are invaluable aids in the making of a reliable radio power unit.

Look over the Raytheon-approved devices. They are the outstanding radio power units by reason of their highly dependable performance. Today, over 700,000 receivers are performing at the height of their efficiency by being powered with Raytheon-approved light socket power units.

Your dealer can show you a Raytheon-equipped unit exactly suited to the needs of your receiver.

RAYTHEON MANUFACTURING CO. Cambridge, Mass.

Raytheon Type BA A-B-C Power 350 M.A.

Raytheon Type A 2½ Amps.

When you see this green Seal of Approval on a power unit you know that it is a Raytheon-approved unit and can buy it with full confidence in the integrity of its makers and the performance of the device.

BROWNING-DRAKE KIT

Antenna system—One Browning-Drake space wound antenna coil, mounted on .0005 condenser, with velvet vernier illuminated dial. Regenaformer system—One Browning-Drake transformer; slot wound primary, space wound secondary, mounted on one .00025 condenser with velvet vernier illuminated dial. Complete with instructions. List price \$25.00.

FOUNDATION UNIT

Consists of front and base panels, drilled and engraved; with sockets, resistor clips, soldering lugs, machine screws and wire. List price \$15.00.

NEUTRALIZER

The Browning-Drake balancing or neutralizing device lists for \$1.00. This system of neutralizing is recommended by Browning and Drake.

CARTRIDGE RESISTANCE

The cartridge resistance—another Browning-Drake Corporation product. Lists for 75c.

BUILD the MOST POPULAR Kit Set! BROWNING-DRAKE

ROWNING-DRAKE, in the summer of 1924, gained an unprecedented popularity that has never waned despite the fact that countless designs for home construction have come and gone since that time.

Browning-Drake sells twice as many parts as their nearest competitor. Such popularity is explained by the fact that Browning-Drake has been founded on the sound, scientific research work of Prof. Glenn H. Browning and Dr. Frederick H. Drake, at Cruft Laboratory of Harvard University.

The Official Browning-Drake Kit Set incorporates minor refinements to take care of present day broadcasting conditions and makes the set adaptable to "B" Eliminator and power tube operation. The way to build this kit set is made easy by essential instructions contained in every kit, or sent in booklet form upon receipt of twenty-five cents.

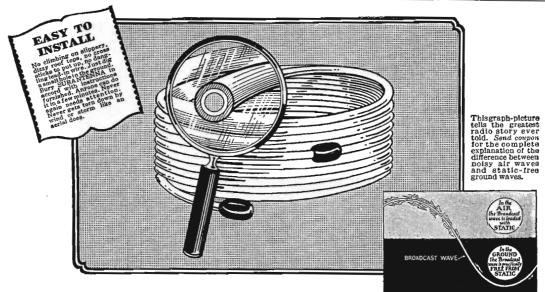

To those who wish to buy Browning-Drake Radio completely built, we offer two new factory-built models together with the still popular 5-R of last season. These receivers are unconditionally guaranteed to give satisfactory performance. If your dealer cannot supply you with the Browning-Drake Corporation Kit or the complete receivers, send us his name and we will take care of your requirements immediately.

DEALERS: The Official Browning-Drake Kit and the other genuine specified parts of associate manufacturers can be had from your distributor. If he cannot supply you with kits or sets, write or wire us. Your needs will be met at once.

BROWNING-DRAKE CORPORATION MASS.

on the loud speaker, that I have never been able to reach with my outside aerial. It absolutely cuts down interference to the minimum,

cuts static out, too -not just partly

H.S. M., North Carolina

And besides that he gets stations with his Subantenna that he never could coax out of the air with an aerial! Read what Mr. H.S. M. of North Carolina thinks of Subantenna, in his letter which we have reprinted in brackets at the top of this column. He is just one of many thousands of fans who are enjoying clearer, louder, better long distance radio reception since discarding the unsightly, static-collecting, up-in-the-air type of aerial, and using in its stead, Subantenna, the new underground antenna.

Every Night a Good Radio Night -Now an Actuality

Gone is the time when the first warm day is the signal for pushing the radio back in the corner until cold weather comes again. A thing of the past is the disappointment of having an evening's radio fun spoiled by an unexpected storm or attack of static. stall a Subantenna and your radio will be as dependable as the sunrise. On any night, in any season, in any weather you can get real "distance," enjoyable clarity and bigger usable volume than you ever could before—all you need is a Subantenna.

What Scientists Found Out

For years the heads of great laboratories have been trying to perfect a means of tuning static out of radio impulses received from the air. And all this time they knew not only that the same radio wave which travelled thru the air also travelled thru the ground, but that the ground is practically free from static! Knowing this, a group of inventors set out to develop a device by which the radio wave could be satisfactorily picked up from the ground. Result! Sub-antenna—already tested and proved by thousands of users—and offered to YOU to test on an unconditional, unqualified guarantee basis. Read herewith, a few more of the voluntary letters of praise which Sub-antenna users have sent in. Then get the whole explanation of Subantenna-why the ground is almost static-free -- why Subantenna increases the distance-getting capabilities of practically any set — why it increases volume and improves selectivity. Get this information from your dealer, or mail the coupon from this announcement for booklet and our free trial offer. Now, read:

Says its WONDERFUL!

"After 4 years of testing aerials I at last found the master in the Subantenna. The first night I used it was a very hot summer night. Static was very bad on my outdoor aerial. I connected my Subantenna and one could hardly believe the results. It was wonderful."—F. L. C., Mass.

Works Fine with "B" Eliminator

"We have the Subantenna installed and it is all you claim it to be. It works fine and

we enjoy it very much. We also have a B Battery Eliminator and the two together work fine. We would not want to go back on the high-in-the-air aerial again as we get so much better reception on Subantenna."— A. J. L., Maine.

SURPRISED!

"I received the Subantenna and installed it the same night and believe me I was surprised with the result for I was quite suspicious about it. I am well satisfied. R. É. G., Canada.

Make This Convincing Test

Install SUBANTENNA. Leave your_old aerial up. Select a bad night when DX is almost impossible with the ordinary aerial. Make a comparison station for station connecting first your aerial, then SUBAN-TENNA. If, from stations that are just a mess of jumbled noise with the old aerial, you don't get reception that rivals local in sweetness and clarity the instant you switch to SUBANTENNA, this test won't cost you even a single penny. Obtain a SUBANTENNA from your dealer or send coupon the once for scientific explanation of at once for scientific explanation of SUBANTENNA and for particulars of GUARANTEE and FREE TRIAL OFFER. SEND COUPON NOW!

ACME CELATSITE

Solid or Stranded
Circuit Wire

Recommended in the hook-ups of leading radio magazines

Flexible Celatsite For Sub-Panel Wiring

RINE tinned copper wires twisted into a cable, then covered with

improved, non-inflammable Celatsite compound. Soft and yielding, therefore, excellent for point-to-point and sub-panel wiring of radio sets. The insulation strips easily and the wires, being tinned, solder readily. Colors, red, yellow, green, maroon, brown, slate, blue, white and black. Sold only in 25-foot coils, in cartons colored to match the contents.

Acme Solid Celatsite For Above-Panel Wiring

This is Nos. 14, 16, 18 and 19 tinned copper wire covered with improved, non-inflammable Celatsite compound. The insulation strips easily and will not crack at the bends. Acme Solid Celatsite in the small sizes is adaptable for sub-panel wiring; in the larger sizes it is ideal for visible wiring; the bright colors of varying shade make a splendid appearance. Made in red, yellow, green, maroon, brown, slate, blue, white and black; 30-inch lengths, single or assorted colors.

Acme Spaghetti

Acme Spaghetti is oil, moisture and acid proof, and highly dielectric; the choice of manufacturers of the most delicate electrical instruments. In 30-inch lengths, for wire sizes from 12 to 18. Nine bright colors; red, yellow, green, maroon, brown, slate, blue, white and black. (We also make tinned bus bar, round and square, in 2 and $2\frac{1}{2}$ -ft. lengths.)

Made of seven strands of copper wire thoroughly enameled, then twisted into a firm cable. This type of antenna resists corrosion and presents maximum surface to the incoming wave,

thus greatly improving the signals. Made in size to equal Nos. 14 and 16 solid enameled antenna wire. (We also make solid and stranded bare, and stranded tinned antenna.)

Acme Loop Antenna

No wire but the best should be sold for loops. Acme Loop Antenna Wire is composed of sixty strands of No. 38 bare copper wire, to give it flexibility, and five strands of No. 36 phosphor bronze wire, to prevent stretching. Green or brown cotton next to the wire, and an outer covering of green or brown silk, result in splendid insulation and a very pleasing appearance. In convenient spools.

Acme Celatsite Battery Cable

A thoroughly insulated cable composed of five, six, seven, eight or nine Flexible Celatsite wires all enclosed in brown Rayon braid. Each wire is of a different color. The workmanship and material are of the best. One to a box.

with or without terminals.

Follow the Example of Thousands—Join the Radio Association—Learn Radio— Take Advantage of Its Big-Pay Opportunities

THE RADIO ASSOCIATION OF AMER-ICA (composed of radio manufacturers, engineers, designers, dealers, enthusiastic amateurs) will help you make money in Radio, full or part-time. It will teach you how to build and repair sets; start you in business, if you wish; give you the training you need to pass a licensed operator's examination and to become a Radio Engineer.

Earned \$500 in Spare Hours

Hundreds of members earn \$3 an hour serving their communities as "radio doctors." Member Lyle Follick, Lansing, Mich., has already made \$500 in his spare time. Member Werner Eichler, Rochester, N. Y., is earning \$50 a week. Member F. J. Buckley, Sedalia, Mo., is earning as much money in his spare time as he receives from his employer. The Association will train you to be a "radio doctor" and to build sets "tailored" to your neighborhood needs, that you can sell for less than the "ready-made" sets offered by your local dealers.

We Will Start You in Business

If you prefer a business of your own to becoming a Radio Engineer, our co-operative plan will start you in a business of your own without capital.

This plan gives the ambitious man his opportunity to establish himself in his community.

Many have followed this plan and established radio stores.

Doubled His Income in Two Months

Member W. E. Thon, Chicago, was a clerk in a hardware store when he joined the Association. The training we gave him enabled him to secure the managership of the Radio Department of a large store at a 220% increased salary.

"I attribute my success entirely to the Radio Association," he writes. "Your method of instruction is wonderful."

Membership in the Association has increased the salaries of innumerable men. Some turned their extra hours into cash being "radio doctors" for their neighbors; others by accepting employment with neighborhood radio dealers. Scores of our members are now connected with big radio organizations in different ca-pacities. Others are proprietors of prosperous stores.

From Clerk to Owner

"In 1922 I was a clerk," writes Member
McGregor, Ia., "when I K. O. Benzing, McGregor, Ia., enrolled. Since then I have built hundreds of sets-from 1-tube Regenerative to Superhetrodynes.

"I am now operating my own store and my income is 400% greater than when l joined the Association. My entire success is due to the splendid help you have given me.

Membership Privileges

If interested in Radio as a profession or a profitable hobby, join the Association. You will receive a comprehensive and practical training in Radio that will fit you for Radio's big-pay opportunities. You will have the benefit of proven business-building plans. Our Employment Service will be at your disposal. You will have the privilege of buying radio parts at wholesale. You will have the Association behind you in carrying out your ambitions.

ACT NOW-If You Want the No-Cost Membership Plan

Now is the time for you to join. The success of the Association was so tre-mendous during 1926 that we are still able to offer a limited number of Memberships that may not-need not-cost you a cent. To secure one of them, write today without fail. We will send you details and also our book, "Your Opportunity in the Radio Industry," that will open your eyes to the possibilities in Radio for you. Let us hear from you at once.

New and Distinctive Radio Consoles from the "EXCELLO" Line

The creation of these smart designs so closely in keeping with the present trend is an achievement to delight all radio fans. These Consoles come with or without horn speaker of long air travel type. Accommodates 22 inch cone type speaker as well as batteries, charger or eliminator.

The sound chamber is so designed that confusing vibrations arising when a cone is enclosed in a cabinet are entirely eliminated. This is accomplished by open grill in front and back. All parts of set and accessories instantly accessible.

Quality cabinet work of true Excello type. Doors of 5-ply butt walnut. Special filler panels are furnished without extra charge for any Excello Console to accommodate Atwater-Kent, Fada, Freed-Eisemann, Grebe, Stromberg - Carlson, Kellogg, as well as all other standard receivers.

DEALERS AND DISTRIBUTORS write for interesting proposition in open territory.

See the new Excello Consoles at your dealer or write to us for descriptive catalog.

HORDARS TRANSFORMERS

130 M. A. FULL WAVE RECTIFIER

Here is a power unit that will satisfy the ever increasing demand for improved quality of reception. A split secondary 550 volts either side of center, makes possible full wave rectification, using two 216-B or two 281 tubes. Current capacity, 130 milliamperes. The low voltage secondary, 71/2 volts, will supply two UX-210 power tubes, enabling the use of pushpull amplification in last audio stage. The Double Choke Unit 2099 is designed for this power unit. Contains two individual chokes of 30 henries, 130 milli-amperes capacity each.

T-2098 Transformer, 41/2" x 51/4" x 53/4" List Price, \$20.00 T-2099, Choke Unit 3½" x 4%" x 5 5%" high

List Price ${}^c R$ ealistic tone \$14.00 quality, that elusive but much talked of characteristic of radio reception --can be obtained only through the use of apparatus of the finest materials and workmanship. For years Thordarson transformers have been the choice of many discriminating manufacturers of quality receiving sets. Follow the lead of the leaders. If you enjoy good music specify Thordarson transformers

THORDARSON ELECTRIC MANUFACTURING CO.

Transformer Specialists Since 1895

WORLD'S OLDEST AND LARGEST EXCLUSIVE TRANSFORMER MAKERS

Huron and Kingsbury Streets - Chicago, Ill. U.S.A.

POWER PUSH-PULL TRANSFORMER and CHOKE

Quality reproduction that cannot be obtained with straight audio amplification, is made possible through the Thordarson power push pull combination. This arrangement is designed for use with power tubes only and has sufficient capacity for all tubes up to and including the UX-210. Makes an ideal power amplifier when used with power supply unit T-2098.

Input transformer couples stage of straight audio to stage of push-pull. Output choke is center-tapped with 30 henries on either side of center tap. Dimensions of both transformer and choke, 21/2" x 21/2" x 3" high.

> Input Transformer T-2408 List Price, \$8.00

> > Output Choke T-2420

List Price \$8.00

A. C. TUBE FILAMENT **SUPPLY**

The new R. C. A. and Cunningham A. C. filament tubes will be very popular with the home constructor this season. The Thordarson Transformer T-2445 is designed especially for these tubes. Three separate filament windings are provided.

Sec. No. 1, $1\frac{1}{2}$ volts, will supply six UX-226 amplifier tubes.

Sec. No. 2, $2\frac{1}{2}$ volts, will supply two UX-227 detector tubes.

Sec. No. 3, 5 volts, will supply two 5 volt power tubes.

In addition to the above, this transformer is equipped with a receptacle for the B-supply input plug. Supplied with six-foot cord and separable plug for attachment to the light circuit. Transformer in compound filled, crackle-finished case. Dimensions $2\frac{3}{4}$ " x $5\frac{3}{4}$ " x $4\frac{3}{4}$ ".

> A. C. Tube Supply, T-2445 List Price, \$10.00

What I would do if I wanted more money By J. MATHESON BELL

 $F^{
m IRST}$ of all I'd make up my mind definitely that I was going to get it.

I don't believe any man living can get

mination will conquer failure anytime, anywhere.

I'll work harder on my present job to make the boss feel that he owes me more.

But I won't stop there.

I'll put my spare time to work.

I'll quit losing money by making my evenings pay.

I wouldn't give up my present job but I'd make more money by working longer hours.

I'd find something that could be sold evenings, either in my home or some one else's home.

That something would have to be a little out of the ordinary because it would have to be of special interest in the evening.

That would be the time of day when both the man and his wife are at home so I'd find something that would be of interest to both of them.

I feel sure that such an article would have to be something for the home, something they would both use and enjoy.

So far so good, but what will that something

Piano?

Fine, but come to think of it I can't even play one myself so that's out.

Automobile-

Sounds better, guess I could learn how, but seems to me that everybody I know has one. At any rate the auto sounds good—let's see if there is anything better.

Phonograph-

Doesn't sound near so good as the auto.

Vacuum Sweeper

Not so much interest to the man and I don't see just how I'd show up dust at night.

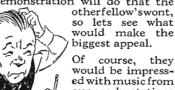

Radio-

Why, the Sam Hill didn't I think of that before, but let's see if it will do -let's see what its good points are as

How Can I Make More? well as its bad ones.

True-I don't know anything about radio, but I have lots of friends who have learned something about it, so I think I could. What sounds good to me is, that I can demonstrate in the home in the evening, the very time of the day for me, and that's just when all the music is being broadcasted.

I'll have competition. I expect it. I'll have to know just what my demonstration will do that the

would be impressed with music from our nearby stations but I feel sure that if I bring in great distances they will be more impressed. It will have to

Thinks Hard! bring in music loud enough so they can sit away back in the room and enjoy it. It must have volume.

They may be satisfied with music from nearby stations, but they'll ask me for distance, so I must be able to get "by" our powerful nearby station. The radio I want must be selective so I can tune out our nearby station if I desire.

I can picture myself in some prospect's home with a radio that will do that, but I wonder if that is enoughmaybe my competitor will be there also—maybe he can do all those things as well as I can.

Then where am I?

I've got it—I'll tell you what my radio must do—I want one that my prospect can do all the tuning, so that he will get the thrill of bringing in the music from a distance clear and loud and with a tone that will please.

After all he is the one who is going to operate it, so why wouldn't it be better and best if all he had to do was sell himself. I'll admit I'm not much of a salesman, so if I find a radio that

will sell itself then I'll not only whip competition but I'lldoiteasily.

Best of all, I'll make that extra money I want.

Who knows, I may be so suc-cessful at it that I can give up my present job and give it all mytime -Geethat sounds

Gets An Ideatoo good to be true, but other men have done it so why can't I-I can

But what radio can I sell that will do what I want and yet sell at a reasonable price—I don't want one so high that my people can't buy but it must be a good one.

Then when I do sell it, they will want me to fix anything that goes wrong so somebody must teach me how to service radio—that's something I can't afford to overlook.

Where is such a radio?

Where is a manufacturer who will

teach me how to sell and how to demonstrate— where I can learn this business, both selling and servicing radio — there must be someone.

There is-Ozarka Incorporated of Chicago—the sign of the long distance

Writes to Mr. Bell goose—they have a 64-page book "The Ozarka Plan" which they will send me if I tell them about myself and mention the name Where of my county. is my pen and some Use paper? I'm going to make more money and I'm going to start / Coupon! going to start

right now by
Writing for
this book.

Announcing New and Improved

The Improved AERO Universal Coil

At last-a true universal coil. This improved coil is suitable for any straight tuned radio frequency circuit, both bridge and loss balance. It is easily and ideally adaptable to 3, 4, 5, 6 or 7 tube sets and can be used with all types of tubes—201-A, 199, 112, and the new 240 tubes and A. C. tubes.

Sharp selectivity, true tone quality, distance and volume, to a heretofore unknown degree, are assured where these coils are used. For that reason the improved Aero 6, Aero 7, Aero 4, and other circuits built around these coils will be more popular than ever during the coming season.

NEWAEROKITS Employing the Improved AERO Universal Coil

Code No. U-16

The AERO Universal Tuned Radio Frequency Kit Kit of 4 Coils (For Improved Aero-Dyne 6)

The AERO Universal Tuned Radio Frequency Kit Kit of 3 Coils (For Aero-Seven)

AERO Universal 3-Circuit Tuner

In the form of a 3 circuit tuner with a fixed tickler, this Aero Coil will improve any circuit. Adaptable only to 201-A, 199, 112, or the new A. C. Tubes. Has variable primary for governing selectivity.

Code U-55 (for .0005 Condenser) or Code U-553 (for .00035 Condenser).....Price \$4.00

AERO Radio Frequency Regenerative Kit

AERO Universal Antenna Coupler

A highly efficient low-loss and antenna coupler with variable primary, adaptable to 201-A, 199, 112, 240 and the new A. C. Tubes.

Code No. U-96 (for .0005 Condenser) or Code No. U-963 (for .00035 Condenser).

AERO Universal Wave Trap Unit

Makes an excellent wave trap due to low distributive capacity and low high frequency resistance. Helps greatly in

AERO Choke 60

Has uniform choking action over a wide range of wave lengths. Eliminates customary "holes" in the tuning range—so common with ordinary chokes. You will find the Aero Choke 60 perfect in every respect. Price each \$1.50

AERO Short Wave Kit

AERO Transmitter Kits

An interchangeable Transmitter Kit at last. Kit 2040-K has range of 16.5 to 52 meters. Kit 4080-K has range of 36 to 90 mounting bases and two rechangeables.

meters. Kit includes two mounting ba choke coils that are interchangeable. Price (each kit).....

AERO Choke 248

IMPORTANT NOTICE

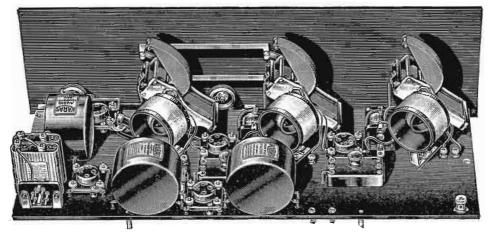

We furnish foundation units, drilled and engraved by Westinghouse Micarta for the Acro Short Wave, Acro 6, Acro 7, Acro 4, Acro Transmitter, and The Chicago Daily News 4 tube circuits. This is a special service for the home set builder. Full working blue prints with each unit. Dealers may secure samples of blue prints to show their trade for 25c each.

Any of these Aero Kits, Coils and Chokes should be available at your dealer's. If he cannot supply you, order direct from the factory. Be sure to specify code or key numbers when ordering.

(ARAS Scores Again for 1927-28 With the NEW 2-Dial EQUAMATIC Sensation

RWA

The 5-Tube Receiver that Leads the World in Performance!

EW Karas Type 28 Transformer, Price,

UTSTANDING among all of the season's radio receivers is the NEW Karas 2-Dial Equamatic—the 1927-28 Sensation that leads them all in performance. This marvelous new Equamatic has 2-Dial Control, insuring simplified, easy tuning, with maximum and equal efficiency over the entire broadcast waveband.

The Karas 2-Dial Equamatic is completely balanced and perfectly neutralized. It offers set builders who want utmost volume and superb tone quality the very pinnacle of perfection in these two all-important requisites. In addition, the Karas 2-Dial Equamatic makes

use of a 24-inch panel and baseboard, thus shortening the set and simplifying its assembly. The three Karas Type 17 S. F. L. Removable Shaft Condensers are of the latest design. Two of these condensers are operated together by means of the Karas 2-Dial Control System, giving wonderfully accurate tuning in conjunction with the Karas Micrometric Vernier Dials.

For a tremendous volume of round, clear, pure, undistorted, full, mellow tones you will not find a rival to equal the Karas 2-Dial Equamatic. To build this great receiver you will need the Karas parts listed and illustrated here, plus certain other standard parts easily obtainable anywhere. Mail the coupon for complete information about this receiver and about the NEW Karas parts now at your dealer's.

The NEW Karas Output Filter. Price, \$8.00.

The NEW Karas S.F.L. Condenser with Removable Shaft. Price, .00025 mfd., \$5; .00037 mfd., \$5.25; .0003

Karas Equamatic Inductance Coils. Set of 3, \$12.00.

Karas Parts for the 2-Dial Equamatic

Karas Micrometric Ver-nier Dials. Price, \$3.50.

The Karas 2-Dial Equamatic is fully described and illustrated in this issue of The Citizens Radio Call Book.

The New KARAS Products for 1927-28 are Superlatively Better

For the 1927-28 scason Karas offers several new products of superlative quality and distinction. Among these is the NEW Karas Type 28 Audio Transformer. This new transformer is scientifically impregnated and is housed in a lifetime steel clad, spun-scaled case which effectively guards its marvelous amplifying qualities. The Type 28 gives full, clear, undistorted amplification of all low notes as well as perfect reproduction of high notes, and has tremendous volume. Two of these transformers are used in the Karas 2-Dial Equamatic.

The new Karas S. F. L. Variable Condensers, Types 11, 17 and 23, have removable shafts, allowing for sub-panel, baseboard or single hole mounting from either side, and permitting the use of 0-100 or 100-0 dials. This right or left hand single hole method of mounting is an exclusive Karas achievement. These condensers are true straight frequency line type, separating all adjoining wave-lengths by equal distances on the dial. In the Karas 2-Dial

Equamatic 3 Type 17 S.F.L. Condensers are used.

The new Karas Output Filter sweetens and clarifies tone qualities and prevents demagnetization and eliminates chattering of the loud speaker. This new Karas Filter exactly matches our new Type 28 Transformer in size, and because of their compact design two transformers and a filter occupy no more space in the set than is needed for two ordinary large size transformers. The Karas Output Filter is equipped with choke of 100 henrys and a large capacity paper condenser.

Clear, Smooth Reception ALWAYS!

That is why the Cyclic everywhere CURRENT SUPPLY

Dependable! When you hook up a Majestic unit you know you are going to have continuously clear reception. Thousands of fans—all over the country—have proven the superiority of Majestic units. That's why you play safe when you buy Majestic.

Majestic Super "B"

Recognized as the leader in popularity, sales, and efficiency. For sets 1 to 12 tubes. List price of unit complete with the Majestic Super Power Tube,

\$2950

Majestic Master-B

The precision B Power Unit offering complete control of all output voltage taps. List price complete with Majestic super power tube

\$32⁵⁰

Majestic Special Master-B

Similar in appearance and design to Master-B but equipped with four B+ taps for sets requiring same. List price complete with Majestic super power tube

\$3250

ACE Models for Sets using the new A-C Tubes - Ask for Specifications

The 1927-28 season will see a tremendous demand for Power Units—Majestic has established a solid reputation with the trade and the public. All Majestic Units are DRY. Public opinion is opposed to the use in the home of devices containing liquids.

Manufactured by

GRIGSBY-GRUNOW-HINDS CO.

4560 Armitage Ave., Chicago, Ill.

Majestic

Super-Power B-Rectifier

Most powerful B-Rectifier made, sturdily built for long life and heavy duty.

1000 hr. guarantee (glass breakage only excepted). Gives a year or more of service.

Retail price \$4.50

Complete and B' Complete and B' Sight Socket Power that works

- and Keeps on Working

STERLING Socket Power Units, both "A" and "B", have made good on performance. In the homes of hundreds of radio owners they have shown themselves to be as thoroughly reliable as good designing, honest workmanship, fine materials can make them.

"Light Socket" your set the Sterling way and say good-bye to batteries once and forever. Know for the first time the pleasure of continuous full powered light socket operation ... without batteries, without chargers ... with nothing more to do than turn on your set switch.

R-94, 4-volt "A" Power unit for Radiolas, \$32.00 complete.

Sterling "A" Power R-96

This unit entirely takes the place of the storage "A" battery. It uses the famous Raytheon A—the little unbreakable copper cylinder that displaces the rectifying tube. Has a steady output of 6 honest volts. Is meter equipped and fully automatic. Price \$47.00 com-

RT-41, especially designed "B" unit for Radiolas. Price \$27.00 complete.

Sterling "B" Power R-81

For 3 to 8 tube sets including power tube. Output at 35 mils. is 150 volts. All three voltages Detector, Medium and High are adjustable within wide limits. On and Off switch. List Price: including Raytheon B-H tube, \$28.50.

R-98, a universal "B-C" power supply. Price \$38.00 complete.

R-97, "Heavy Duty" "B-C" Model for very largest sets. Price \$53.50 complete.

Products

Test Your "B" Power Voltage

To get full value from your "B" Power Unit you should know that your Power Unit is delivering the correct voltage to the detector, amplifier and power tubes. Low resistance battery testing voltmeters are worthless for testing socket power units. This specially designed Voltmeter is accurate for both. Tests all D. C. circuits up to 300 volts. R-415 DC Model, 0-300 volts......\$8.50 R-417 AC Model, 0-150 volts......\$7.50

Test Your Radio Tubes

The Sterling Tube Tester shows at a glance whether your tubes are performing at their best or whether they are "all shot". No calculations. Simple to use. For large tubes.

R-411\$7.50

Still the undisputed undisputed leader

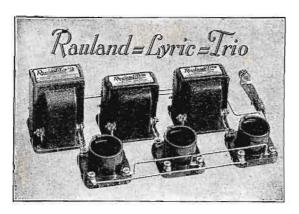

Rauland Lyric

If you love music, and want your radio set to reproduce tones fault-lessly, there is one audio transformer you can absolutely depend on—the famous Rauland-Lyric.

Voices and instruments alike are amplified with amazing realness by the Rauland-Lyric; with faithful amplification of those "overtones" essential to full, natural reproduction. The amplification curve of the Rauland-Lyric illustrates its outstanding superiority in tone purity.

The Rauland-Lyric is the undisputed leader in its field. It is invariably chosen by set builders who want the utmost in perfect tone quality.

Write for "Modern Audio Amplification", a free book, describing this fine unit.

A new high mark in three-stage audio amplifiers

Your receiver's tone quality depends in large measure on correct audio amplification. The famous Rauland-Lyric Transformer may now be combined with two Rauland-Trios (impedance units) to form the Rauland-Lyric-Trio—the highest known perfection in three-stage audio amplification. Rauland-Trio is a compact, well-made unit—containing in one shell—inductance, resistance, and capacity in correctly balanced relation.

New 1927 Radio Key Book

You'll enjoy reading it—48 pages of interesting, up-to-the-minute facts about radio, simply told. Also full construction details of all leading types of circuits. Send to cents (coin or stamps) to cover postage and mailing cost.

The Bradleyleak is a variable grid leak providing stepless adjustment over a wide range.

The Bradleystat is a compression resistance rheostat that provides stepless control of the filament current.

The Bradleyohm

is a variable resistor made in a great variety of sizes providing widely varying resistance values. Extensively used in B-eliminators.

Radio Parts that improve the performance of every radio hook-up

ALLEN-BRADLEY radio parts are designed for the convenience of set and power-unit builders. They are easily installed and provide the refinement of adjustment demanded by all radio enthusiasts. With Allen-Bradley parts it is easy to secure the outstanding results that make the building of sets and power-supply units well worth while.

These superior parts are equally advantageous for use on sets in service. Because of their small size and one-hole mounting features they can be used to replace inferior parts on sets in service.

Allen-Bradley Co.

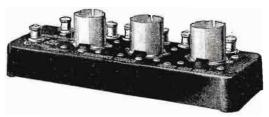

488 Clinton St.

Milwaukee, Wis.

The Bradleyunit

is a fixed resistor that does not vary with age or atmospheric changes. It is guaranteed to be accurately within 5% of its rating. Used on many Beliminators, and ideal for resistance coupled amplifiers. Made in a wide range of resistance values.

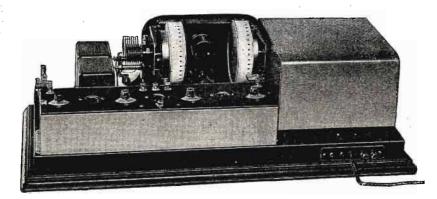

The Bradley-Amplifier

is a resistance coupled amplifier which uses Bradleyunit Resistors. It does not deteriorate in service and is not affected by atmospheric changes. It is so compact that it can readily be used to replace transformer coupled amplifiers with a decided improvement in tone quality.

5 or 10 tubes Local or Distance

Model "DX" 1928 INFRADYNE

You Can Wire This Set In One Hour — and tune in on stations you never heard before

COPPER SHIELDED CABINET

The Cabinet problem solved. A pure copper diepunched embossed cabinet in lacquered crystalline. The 1928 idea.

8 Distinctive Features -

- 1—5 or 10 tune reception by the throw of a switch. Local or DX. The Universal Receiver.
- 2—Illuminated drum controls. The new Remler system. Logging space on dials.
- 3—Tuned r.f. unit comes completely wired and each compartment shielded. A copper shielded case then again re-shields the entire amplifier. Automatic coupling coils.
- 4—Chassis wired and the set completely assembled for you. 90% of the wiring is in place. Hours of time saved.
- 5—No soldering. Screw terminals used throughout. Positive contact. Entirely foolproof.
- out. Positive contact. Entirely foolproof.
 6-No cabinet to buy. The copper cabinet goes

\$17950

with the assembly.

is the price for the complete assembly with 90% of the wiring in place. Deduct \$7.00 if unassembled kit is desired. Wiring chart and wires go with each kit. If no cabinet is wanted deduct \$15.00 from the price of the assembly.

- 7—Antenna Compensator for bringing the r.f. amplifier into resonance. Switch for broad or sharp tuning.
- 8—Jewell voltmeter on control panel. Tube protective devices. Silver Marshall Audio Amplifier.

Telegraph your order if you are in a hurry. C. O. D. shipments accepted when half cash accompanies order. DEALERS and PROFESSIONAL SET BUILDERS are invited to write for attractive proposition.

TOW you can build radio's greatest receiver in an hour-or less. You take a screwdriverhook on a few wires and your distance breaking set is ready for operation. A new 1928 idea of assembly brings you this INFRADYNE with 90% of the work completed. The chassis is wired for you. The sockets are in place and you simply follow a few instructions to finish the job of building the ultimate in radio—the INFRADYNE. No receiver can excel it for long distance range. It is the most beautiful receiver on the market. The latest vogue in shielding, assembly and chassis construction. You can also buy the parts separately—or in complete kit form. A large booklet on the new Infradyne is ready for you. It contains a wealth of common-sense data of great value to any radio man. It is yours for the asking.

No Matter What Set You Have

ACME Apparatus will make it better

THESE are the days of quality reception and that's where Acme comes in, Acme for Amplification. During all these years of Radio Broadcasting, Acme has had this thought in mind, "After all how well you can hear is the thing that counts."

There's the Acme double free-edge cone speaker—thousands in use, thousands of satisfied listeners. It took five years and 320 experimental models to make this speaker.

There's the Acme B Power Supply with Raytheon tube, the first on the market. Three years of experience in making and selling these eliminators has earned the reputation of making the B Power Supply that stands up and works.

People tell us, "I have one of your

first eliminators and it's still going strong."

Acme now offers a single stage power amplifier to add to any set. All you have to do is connect your set, your B supply and your speaker to the amplifier, put in a power tube, plug into the lamp socket and your radio enjoyment will increase a hundred fold. No additional A battery current and no C battery to add, both of these supplies are included in the unit.

Acme has two booklets, (Amplification without Distortion) telling how to improve any radio set and (Power Supply for Radio Sets) telling the story of Lamp Socket operation.

Fill in the coupon below for the one you want.

ACME E-4 B-Supply \$35.00

ACME K-1 SPEAKER \$25.00

ACME PA-1 Power Amplifier \$12.50

the transformer

Packed and sold ONLY in the Red-White-and-Blue boxes . . . a symbol of greatness and dependability you can rely on.

AHEAD OF ITS TIME—

that's almost human in its amazing delivery

Overnight LINCOLN transformer has won enviable words. Leaping the gap of time it has snatched radio reception out of the future, and brought it back where you can have and enjoy it right now-TODAY. Beyond question, in a field where surprises are ever-present, here is one of the most delightful. And available to all.

Four Reasons Why LINCOLN Is Winning Superlatives

In actual performance LINCOLN more than matches the good things we have said about it. It does its job unbelievably well. Even when you have said "wonderful!" you still feel the word does not do justice to the performance. Could you be satisfied with less in your set? Or do you want super selectivity that is super selectivity? And distance that puts local availability into far-off stations? And tone that brings in shading and overtones with exactness of reproduction? And the stability that keeps what you want when you want it?

Not on just one—but on all of these essential features, LINCOLN is master of the air. Until you actually hear it in operation, you cannot imagine how much difference such a simple thing as a transformer can make.

Send at once for LINCOLN literature. No obligation

DEALERS AND JOBBERS: LINCOLN offers an unusually attractive proposition. Write for discounts.

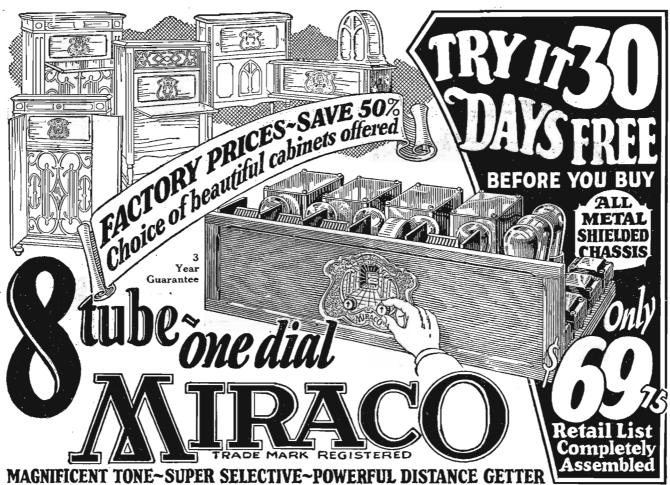

ZIG

ZAG

The ONLY loop with a continuous, unbroken circuit of sixty strands of No. 38 and five strands of No. 36 low resistance wire from grid to filament TAPPED exactly at electrical center. Small in size, but a giant in performance because of its advanced scientific construction. Surprisingly low priced. Dealers are being stocked as fast as possible—if yours hasn't ZIG ZAG yet; ask him to get it for you.

30 EUCLID ARCADE, CLEVELAND, O.

BEST LINCOLN RADIO

Electric or Battery Set

America's big, old, reliable Radio Corporation* (8th successful year) guarantees its big, powerful, latest 6, 7 and 8 tube Miraco sets to give "the finest, most enjoyable performance obtainable in high grade radios." Unless 30 days' use in your home fully satisfies you and everybody who hears it that a Miraco is unbeatable at any price for beautiful, clear cathedral tone, razor-edge selectivity, powerful distance reception, easy operation, etc.— don't buy it! Your verdict final—absolutely no strings to this. Save or make lots of money on sets and equipment by writing for testimony of nearby users and Amazing Special Factory Offer.

Run from Light Socket or Batteries

Miraco's work equally fine on electric house Dealers Write ! current or with bat-

Coas

choice. Many thousands of Miraco users -who bought after thorough comparisons—testify they enjoy programs Coast to Coast, Canada to Mexico, loud and to coast, Canada to Mexico, four and clear—with the magnificent cathedral tone quality of costliest sets. Don't confuse Miraco's with cheap, "squawky" radios. Miraco's have finest parts, latest approved shielding, metal chassis, etc. as used in \$200 sets.

Deal Direct with Big Reliable Makers

Your Miraco reaches you completely assembled, rigidly tested, fully guaranteed. Easy to connect and operate. 30 days free trial. 3 year guarantee if you buy. Choice of beautiful consoles [with latest built-in orthophonic type speakers having 8 feet of tone travel] and table cabinets, also offered. You take no risk, you insure satisfaction, you enjoy rock-bottom moneysaving prices by dealing direct with one of radio's oldest, most successful builders of fine sets.

USER-AGENTS! Make big profits showing your Miraco set to friends

Dependable Standardized Super Parts Accepted as the Best in Radio

If you want the ultimate in radio reception -if you are one of those who demand range, clarity, volume and selectivity, then you will appreciate Victoreen supremacy in the super field! Victoreen has gained the confidence of those whose radio experience is based on scientific knowledge. They accept the new products of Victoreen, knowing that a progressive step has been made in Radio-one that has passed the experimental stage and arrived at the point of the utmost in satisfactory results.

VICTOREEN RADIO FREQUENCY TRANSFORMERS No. 170—For Storage Battery Tubes No. 171—For Dry Battery Tubes

The very heart of the Super Circuit! These units are instruments of great precision, being matched and tuned to within one-third of one per cent and eliminating the necessity of tube matching. Due to their peculiar construction, stray fields are eliminated, enabling the Transformers to be placed in cluse relation to each other. Interstage oscillation is prevented in this efficient instrument.

Price \$7.00

VICTOREEN 112 AUDIO TRANSFORMER UNIT

This unit is worthy of its place in the Victoreen Circuit and renders a marvelous offering in tonal quality—presenting all the intimate naturalness of the original program.

Designed to handle up to 400 volts of B battery supply, this unit is especially adapted to the Western Electric cone speaker or similar types. The transformer consists of two fod use with two 112 power tubes. stages of Audio amplification in one case and is designed

AMERTRAN RADIO PRODUCTS

STANDARDS OF EXCELLENCE—FIRST IN IMPROVEMENTS

Audio Transformers

For audio frequency amplification or operation of radio sets from alternating current power lines, Amer-Tran Radio Products, have the well deserved name of producing results not obtainable by any other devices.

The AmerTran De Luxe Audio Transformer produces absolutely faithful amplification with natural quality. When it is used with proper tubes and loud speaker,

and clear signals from a detec-tor tube it will produce natural volume over the entire audible range. Until you have listened to radio amplified by these transformers you have not heard the truest quality of full volume. AmerTran De Luxe transformers are made in two types for first and second stages and are sold at \$10 each.

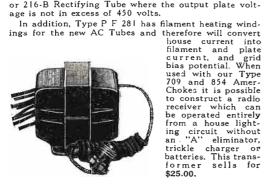

Power Transformers

Not content with making it possible to secure quality in the output of your radio set AmerTran has produced a new transformer which makes it easy to eliminate B and C batteries by supplying noiseless rectified current from the alternating current lines. Full descriptive matter of these circuits will be sup-

plied upon request. This Amer Tran Power Transformer Type P F 52 is for use on 110 Volts, 50 to 60 cycles and sells at

AmerTran Power Transformer Typp F 281 has been designed for use with a UX-281 Rectifying Tube which can be operated at 550 volts, and deliver 110 Milliamperes D. C. as a half-wave rectifier. A 750 volt plate winding with a tap for 550 volts enables the transformer to be used with a UX-281 or 216-B Rectifying Tube where the output plate voltor 216-B Rectifying Tube where the output plate voltage is not in excess of 450 volts.

Filament Heater Transformers

The AmerTran Filament Heating Transformer Type H-67 is another recent development intended for use with a new RCA UX-226 Raw AC Amplifier Tubes and the new UY-227 detector tube. It also has a third filament winding capable of handling two UX-171 tubes. In connection with the new AC Tubes, Type H-67 becomes a power source for the filament and is therefore a real "A" battery eliminator. With a good plate supply system and a set with the new AC and Power Tubes in the last stage the H-67 AmerTran transforms the

transforms the ordinary house transforms the ordinary house lighting current down to the lower voltages for a correct operation of the new tubes. This transformer costs \$12.00.

Chokes

AmerChoke Type 854 is a scientifically designed impedance or choke coil of general utility, designed primarily for use in filter circuits. As an output impedance for by-passing direct current from the loud speaker it is just as efficient and more economical than an output transformer. Rixed condenser, the tone quality equals that of the best output transformer. DC saturation is prevented by two adjustable butt joints in the core. AmerChoke Type 854 sells for \$6.00. AmerChoke Type 418—½ Henry at two amperes—D C Resistance 0.7 ohms is listed at \$6.00. Type 709 AmerChoke—50 to 20 Henries at 120 milliamperes—D C resistance 210 ohms, sells at \$10.00. \$10.00.

Resistors

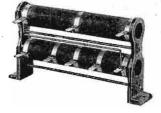

Resistors

AmerTran Resistor Type 400 is particularly well adapted for use across the output of high voltage filter circuits to act as a stabilizer and tapped potentiometer for obtaining various plate voltages, and it is also useful for other purposes such as a multiplier for voltmeter, etc. It will withstand current on 30 milliamperes continuously without undue heating in open air. AmerTran Resistor Type 400 has a cold resistance of approximately 41,000 ohms across the two sections in series and contains eight solder terminals. It is priced at \$7.50.

You will note the use of several of the above units in circuits described in this publication. They were selected on the basis of dependable, high quality performance.

Full information on the construction of radio apparatus using the above parts will be gladly sent on request. When writing ask for our booklet. "Improving

on request. When writing ask for our booklet, "Improving the Audio Amplifier."

Unexcelled— "The Aristocrat"

the finest looking—finest tuning

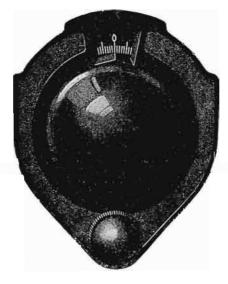

Vernier Port Dial

No. 702
POINTER KNOB
3/16", '4", One Piece
(2 '4" circle)

No. 792
VERNIER POINTER
%". E-Z-Toon movement
(3 %" circle)

This Vernier is foolproof—troubleproof. One turn of the knob drives the dial 14 points on the scale. No gears, chains, or cogs to get out of order. The friction action is sure and simple—and cannot wear out or break down. Readings are visible thru a port in the casing. No back lash is possible. With this new Vernier Dial, you'll bring in stations you've never before been able to tune in.

FIRST in noteworthy improvements, the new "Aristocrat" Vernier-Port Dial is no exception to the excellence of Kurz-Kasch products. This new Vernier-Port, all bakelite dial affords you a real opportunity to bring your old set up-to-date and also improve its efficiency, all at a cost no more than ordinary vernier dials.

The Aristocrat is the only efficient Vernier-Port Dial on the market with all mechanism and condenser shaft-ends concealed. It cannot be surpassed for beauty—nor equalled in efficiency. You must install these dials to appreciate what a wonderful improvement they will make on your radio.

You may have this Vernier-Port Dial to match the panel of your radio. Furnished in black, mahogany or walnut finish. The graining of the colored dials is exquisite—obtained by an exclusive KURZ-KASCH process!

The Aristocrat Vernier Port Dial is supplied in three finishes—black with white markings and mahogany or walnut with gold markings—at the same low price—\$2. It is sold at all the better dealers. If yours cannot supply you, tell us about it.

Tell 'Em You Saw It in the Citizens Radio Call Book

with which he made the four World's Records described on the opposite page—how that set has been duplicated hundreds of times, each one performing as well as the original—how later developments and refinements have enabled him to improve on the original in the New World's Record Super 10—and how you can, even without any previous experience, build a World's Record Super 10 for yourself.

who wants the most powerful and sensitive set it is possible to build. Many claim to have received far distant stations once or twice, but Mr. Scott with his World's Record Super proved his claims to record honors by bringing in consistently, night after night, stations distant six thousand miles or more. The new World's Record Super 10, in actual comparative tests with the original receiver on which the records were made, has proved that it is even more powerful and brings in the far distant stations with almost unbelievable volume.

No other receiver has approached the marvelous DX records that the World's Record Super has established, and it is safe to say none will for years to come.

REMARKABLE SELECTIVITY—Here is a receiver for today's conditions. In Chicago, where there are about forty broadcasting stations, the New World's Record Super 10 cuts through with the greatest of ease. It brings in distant stations only a few meters apart with such volume that you think you have a local station until you hear the call letters and find you are listening to a station hundreds of miles away.

NATURAL TONE QUALITY—A receiver may have great DX ability and wonderful selectivity, but what good is it if the tone is raspy or distorted? When you hear the New World's Record Super 10, you will

realize that here at last is a receiver that it is a pleasure to listen to.

EASY TO BUILD—With the parts here listed, any one can build an exact duplicate of the New World's Record Super 10. The only tools required are a screw driver, pliers, and soldering iron. The building instructions and full size blue prints show exactly where to place each part and how to run every connection, and are so simple and easy to follow that any one, even without previous experience in building a radio receiver, can duplicate this marvelous receiver and own the finest radio set available today.

Here's your chance to build a radio set that will give you all that radio has to give—distance, selectivity, clear and natural tone. Experience is not required, for full instructions will be sent you by Mr. Scott himself. Don't hesitate—don't delay. Send now for full details. Then you can't forget it, and you'll never regret it.

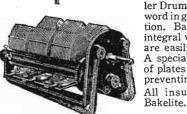

Greatest DX Receiver Worlds Record

Super 10

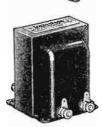

Selectone Transformers cut through the local stations with ease, and their tremendous amplification brings in the distant stations with great volume.

They are supplied in perfectly matched sets, insuring maximum amplification and the finest tone

The new Remler Three-in-Line Condenser with the Remler Drum Dial represents the last word in gang condenser construction. Balancing condensers are integral with the main unit, and are easily and quickly adjusted. A special staggered connection of plates makes it self-shielding, preventing interstage coupling, All insulation is of genuine

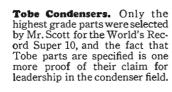

Thordarson Amplifying Transformers were used in the original World's Record Super, designed by Mr. Scott. Because of the unusual tone quality obthe diffusion apparatus is again selected. Two Thordarson R-200 Amplifying Transformers and one R-76 Output Transformer are used in this receiver. If you enjoy good music, insist on Thordarson amplification.

The famous Benjamin Spring **Cushioned Shock Absorbing** Socket was the choice of Mr. E. H. Scott in his original World's Record Super.

Mr. Scott has paid the very highest tribute to the efficiency of Benjamin Shock Absorbing Sockets by again selecting them for this newest and greatest ϵ ? radio receivers.

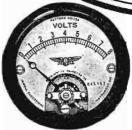

The authenticity of the startling achievements of the World's Record Super (as listed below) is based upon hundreds of verifications by leading Broadcasting Stations and Publications from Coast to Coast.

On March 17th established new World's Record for loop aerial reception—8,375 miles with Loud Speaker Volume.

On the night of March 29th established new World's Record with the reception of sixf-reign stations distant 6,000 miles or more.

Established new World's Record for *greatest* number of broadcasting stations heard that are located 6,000 or more miles away.

Established new World's Record for most consistent reception, night after night, of Stations 6,000 miles or more distant—117 programmes from 19 different Foreign Stations, heard between December 27th and April 10th.

In the careful selection of parts and accessories for the New World's Record Super 10, it is quite natural that a Jewell Pattern No. 135 Radio Voltmeter should be chosen. The black enameled case encloses afine. D'Arsonval, moving coil type movement having silvered parts and equipped with a zero adjuster. The scale is silver etched with black characters. A special mounting arrangement makes it easy to mount in a radio panel. It is the ideal instrument for filament control.

Jones Ten Contact Multi-plug and 4 ft. Cable enable all batteries to be placed out of sight and simplify wiring. Now used on over one million receivers; endorsed by leading radio engineers.

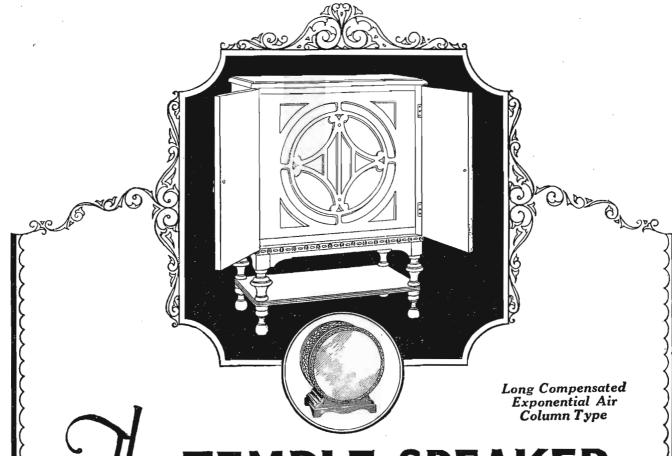

Carter Rheostats are so designed that they are seifcooling and contact arm shaped so that it provides smooth contact with constant pressure at all times, making control of filaments noiseless.

The TEMPLE SPEAKER improves the tone quality of ANY radio set

Like a Strad violin, a Steinway piano or other fine musical instruments, the outstanding quality is tone. And that is equally true of radio speakers. No matter how much you have paid for your set, if it fails to radiate purity of tone, then it has failed in its purpose.

Wherever the Temple is heard its audience is more than enthusiastic—it marvels—for no one believed that such reproduction of tone was possible.

No longer need you worry about radio reception. Today, in the TEMPLE SPEAKER, you are guaranteed results never before known. Because it is designed on an acoustical principle that is scientifically correct, you can now enjoy a rich-

ness, mellowness and purity of tone that will surpass your fondest expectations. Listen to the Temple once. That's the way to buy speakers. Any dealer will be glad to give you a home demonstration.

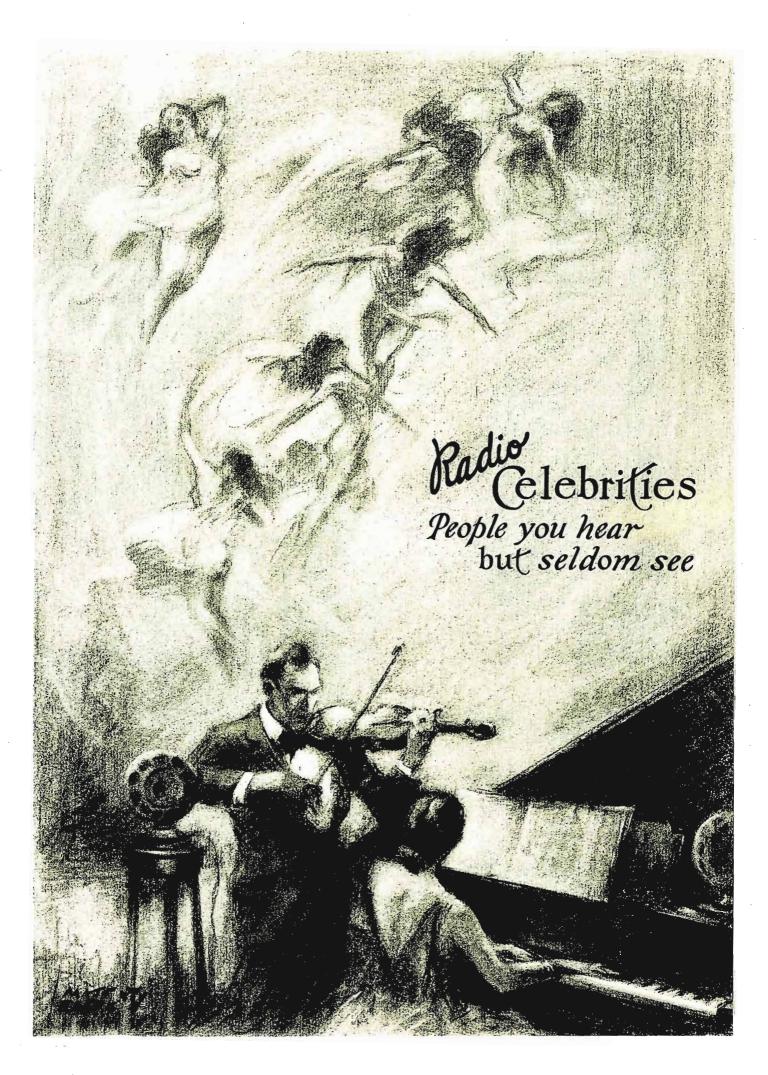

Regardless of the cost or make of your particular set, the TEMPLE SPEAKER will enhance its tone quality, will increase your pleasure in radio a thousand-fold over what you have been used to. Irrespective of the nature of the program—be it opera, an orchestra, ball game, etc., TEMPLE will bring it to you clearly, unfailing in its fullness.

Rigid sales policy backed by extensive advertising campaign.

LEADERS IN SPEAKER DESIGN

Tell 'Em You Saw It in the Citizens Radio Call Book

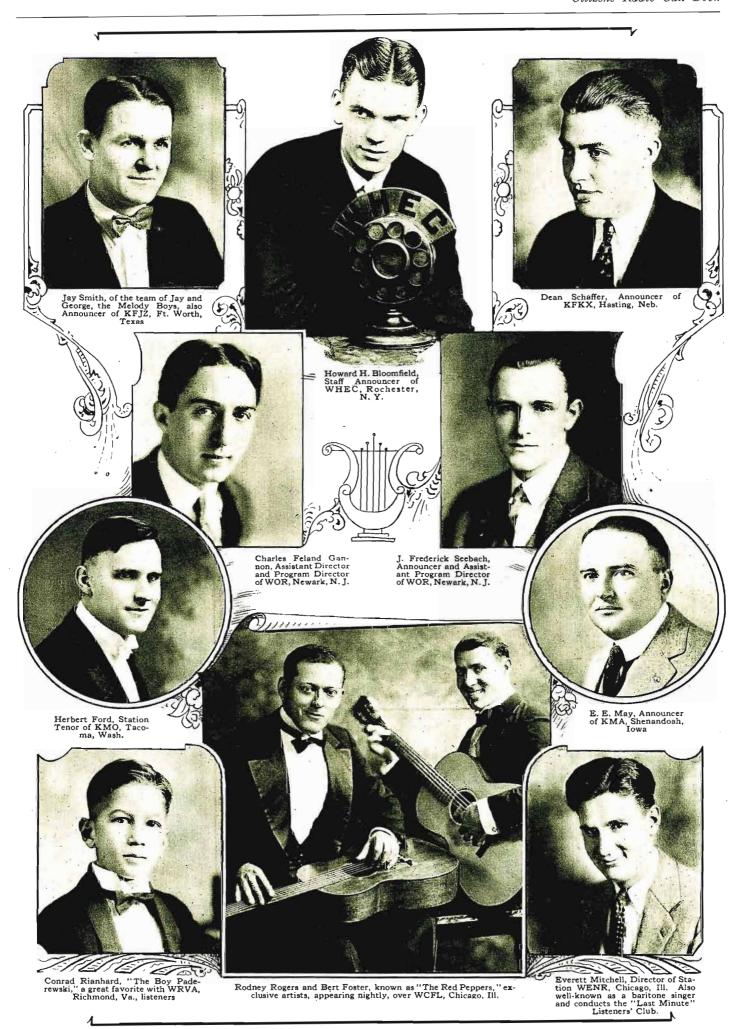

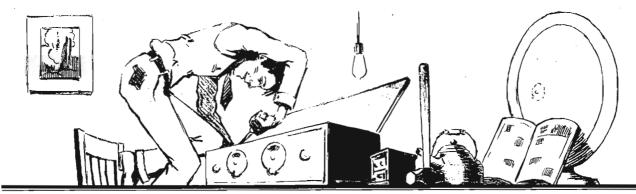

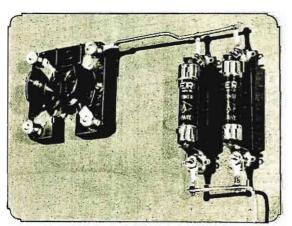

AMPERE ANDY'S ASSISTORS

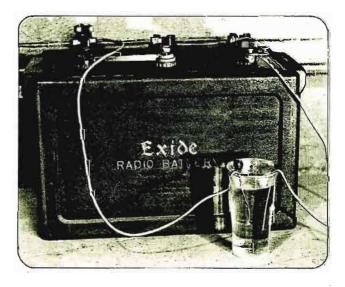

A Convenient Polarity Indicator

A convenient method for determining the polarity of any type of battery is to use a solution of common table salt in a glass of water. Connect a wire to each terminal of the battery and insert them into the glass of water as far apart as possible. Bubbles will appear around one of the wires. This will be the negative. Care should be observed in testing batteries by this method that high voltages are not handled, since the salt solution is a partial conductor of electricity and such a combination is dangerous. If a salt solution is inconvenient, a potato may be used for the same purpose, by peeling part of the outer skin away and sticking the two wires into the potato. A blue stain will appear around the positive wire.

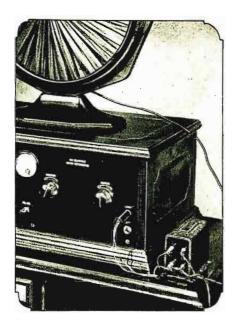

A New Method for Reaming Holes

A convenient emergency means for reaming a hole in a panel or similar material is found in the use of the tang of a "mill" or "bastard" file. The hole to be reamed should be at least ½ inch in diameter to allow the insertion of the tang. The file is then revolved first in one direction and then the other, about one-half turn each way. When the hole being reamed is quite large, an adjustable machinist's wrench can be used as a handle for turning the file. Care should be exercised that the "bite" is quite small, when reaming the hole, or the material will be gouged out and seriously chipped.

Solving an Old Problem in Filament Control

The experimenter does not have at all times the proper values of filament resistors in his experimental work. A convenient means for inserting a proper resistance for a ballast resistor is in the use of two or more quarter ampere resistors in parallel. As an example: suppose a power tube requiring one-half ampere is to be used with a ballast resistor. The correct voltage may be applied to the tube by connecting two quarter ampere resistors in parallel. The current passed between two resistors will be sufficient to properly operate the tube and is the same as that passed by a one-half ampere ballast resistor or Amperite. In like manner one ampere tubes may be operated by the same method.

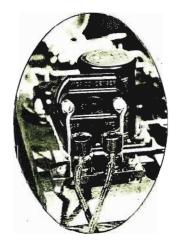

Keep High Voltage Out of Speaker Windings

High voltage may be effectively kept out of the windings of an expensive loud speaker by the use of an out-put transformer. This device is an especially designed transformer of the proper ratio, which is connected to the receiver in the same manner as a loud speaker. The speaker in turn is connected to the remaining two terminals of the output transformer Electrical impulses are transferred through the transformer and actuate the speaker in the regular manner without high voltage being present. Output transformers are obtainable in a number of different types, either for mounting in the exterior or interior of the receiver. The use of an output transformer insures a longer life in respect to the speaker, as well as considerably improving the quality of the reproduction.

A Handy Vernier Adjustment

Many radio sets are still equipped with a plain circular dial which characterized receivers a few years ago. These particular dials are just as efficient as the newer type of vernier dials and many set owners still use them. A very handy vernier adjustment for this type of dial may be found in the use of the rubber eraser on a new pencil. The rubber is placed partly against the panel and partly against the edge of the dial and slowly rotated in the proper direction to turn the dial. Sufficient friction is obtained between the rubber eraser and the dial to turn it a few degrees for a minute adjustment. With a little practice the operator will find this type of vernier to be as good as the more expensive types.

Improving Tone Quality

The tone quality of a receiver may be often improved by shunting a condenser across the speaker or head phone terminals. The proper capacity of this shunting condenser is best found by trial. Any capacity from .005 mfd. to .02 mfd. will give excellent results. The use of a condenser for this purpose-will decrease the volume of the receiver to a very slight degree, but the added quality of reproduction fully compensates for the loss in volume.

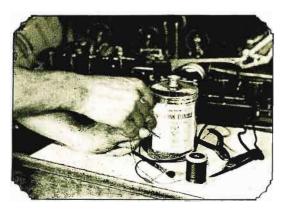

Spade terminals on battery cables will usually slip from the binding post unless the post is at all times tightly clamped down. The constant vibration experienced by a radio set due to passing traffic, will shortly jar the terminal loose, and crackling and other extraneous noises will be heard in the reproduction. A convenient method for insuring a positive contact between the binding post and spade terminals is to bend each of the side members of the terminal, one in one direction and the other in an opposite direction, so that a condition similar to a lock washer exists. A terminal bent in such a manner will invariably hold its place even though the binding post is not securely clamped.

Blueing Screw Heads

It is often desirable to have a number of wood screws with blue heads for use in mounting the front panel on a radio set. If the blued screws are not handy, they may be easily made by heating common iron screws of the proper size and screw head in an alcohol or gas flame until they have the proper color. The flame must be one of intense heat and the screw must remain in the hottest part of the flame for some length of time so that the blue oxide may form. After the proper color has appeared, the screw may be dropped in a container of water nearby so that it may be quickly cooled.

Repairing Frayed Cord Tips

Cord tips are sometimes subject to a fraying in which the fabric around the tinsel works out from within the cord tip. Since this braided covering acts as a strengthening device in respect to the conductor, the cord tip soon breaks loose from the wire if the end of the fabric becomes frayed. If a short length of fine black or brown silk thread is "whipped" around the frayed portion of the cord and securely held in place while a liberal coat of flexible collodion is applied, a permanent repair will be made. In fact, such a repair will withstand continuous abuse for a much longer period than the original type of construction.

Skinning Silk Covered Wire

The use of a pair of pliers or a knife in skinning a length of silk covered copper wire often results in the free end of the wire being cut off. This often necessitates rewinding of a coil. The best procedure for skinning silk or cotton covered wire is to double over a piece of No. 00 sand paper and draw the wire between the folds. The fineness of the sand paper is just right to grasp the tiny fibers of the insulating material and will effectively remove the covering. A distinct advantage in using this system is that the sand paper also polishes the wire, which allows it to be easily soldered.

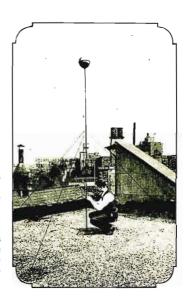

Testing Fixed Condensers for Short Circuits

It is often desirable to test a fixed condenser to determine whether or not it is short circuited. The average fixed condenser of today will invariably break down if an excessive voltage is applied. If the condenser under suspicion is included in a circuit containing a pair of head phones and a battery, it may be readily tested. If a decided click is heard in the head phones when the circuit is completed, the condenser is short circuited and should be immediately discarded.

A Novel Out-Door Antenna

A unique and highly efficient out-door antenna has recently been placed upon the market by Mid-western manufacturer. The antenna consists principally of a large hollow globe of a noncorrosive aluminum alloy. The efficiency of this type of antenna is extremely high, due to the high mass conductivity and the bunched capacity effect of such a construction. A condenser is formed between the supporting shaft and the ball proper, due to their insulation from each other. This condenser acts as a neutralizer of the entire antenna system. All-around results with this particular type of antenna are characterized by increased selectivity and a decided lack of in-terference.

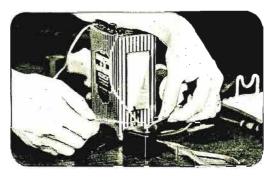

A Handy Drilling Template

It is sometimes necessary to drill a panel for mounting a condenser or other device, and no template for the proper drilling of holes is available. An accurate template may be easily made by using a piece of cardboard or other stiff paper similar to that used for the cover of the average magazine. Pierce a hole in the center of the paper and force it over the shaft of the condenser or other piece of apparatus. Then with a sharp pencil feel around on the surface of the paper until you are directly over one of the screw holes, and then with a slight push pierce the paper and repeat until all the holes are located. This method, if care is exercised, will accurately transfer the location of all holes on the piece of apparatus which are necessary for its proper mounting. The same accuracy is possible in using this type of template as is with the template supplied with the part originally.

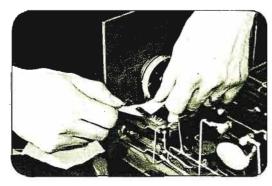

Holding Wire in Place on an Unfinished Coil

It is often necessary to lay aside a coil before the winding is completed. This will invariably result in the wire becoming loosened, due to its inherent springiness and the coil, therefore, must be rewound. If a heavy rubber band is placed around the coil, it may be easily slipped over the unfinished end of the coil and will securely hold the wire in place, so that there is little possibility of the wire slipping.

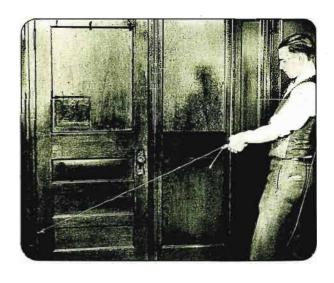

Testing By-Pass Condensers

The question often arises as to whether or not a by-pass condenser is in good condition. A simple method for testing a condenser is to apply 90 Volts of Direct Current to the terminals for a few seconds and then allow the condenser to remain undisturbed for two minutes without any voltage being applied. Then "short" the terminals with a piece of insulated wire. If a healthy flash is observed when the terminals are shorted, the condenser is in good condition

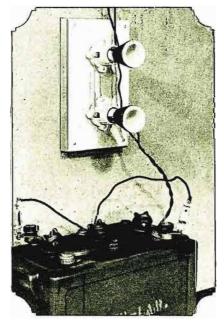

Cleaning Jack Contacts

Crackling and other extraneous noises in a radio receiver may often be traced to dirty contacts on jacks. Perfect contact by the various springs is an absolute necessity. Jacks should be given a periodical overhauling and their contacts carefully cleaned, either by the use of a very fine file, such as is used for filing points in automobile timers, or a very fine grade of sand paper. Care should be taken in the use of the file or sand paper that only the corrosion is removed from the contacts. If too much of the material is removed, the various springs will not make the proper connection.

Charging a Storage Battery on Direct Current

Storage batteries may be easily charged from the 110 Volt Direct Current power supply by the introduction of a suitable resistance in one side of the circuit. A resistance suitable for this purpose is the heater element used in the ordinary electric heater employing the reflector principle. Its power rating should be ap proximately 600 watts. This will give a charging rate of approximately 5 amperes. If a lower charging rate is desired, two elements may be hooked in series, which will give a charging rate of approximately 21/2 amperes. Some suitable mounting device should be made for holding the elements, since the heat developed is quite intense and damage will result to the surrounding furniture or woodwork due to the blistering of the varnish. A sheet of transite board (compressed asbestos) is admirably suited for this purpose. A device of this type should be mounted in some out-of-the-way place where children can not reach it. A good circulation of air around the element is necessary.

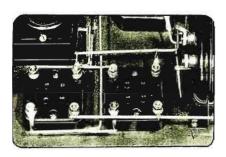

Straightening Bus-Bar Wire

The experimenter is often confronted with the difficulty of straightening the coil of hookup wire which is usually included in a kit of parts used in the construction of a receiver. There are a number of methods in common use which may be used. One of them is to twist one end of the wire around the pin of the lower hinge supporting a heavy door and tugging on the free end of the wire, which is securely held by a pair of heavy pliers. wire is usually a soft drawn copper, and is easily stretched. The stretching process, if properly done, will straighten the wire to a remarkable degree. After the wire has been straightened, it may be laid upon the floor and cut into convenient lengths for use. Another method is to proceed as above, but instead of using a pair of pliers, fasten the wire in the chuck of a machinist's hand drill and slowly turn the handle until the wire is twisted into a straight length. The last mentioned method hardens the wire somewhat and does not allow it to be repeatedly bent at the same point without the possibility of breaking.

Good Contact Between Socket and Tube Necessary

Lack of sensitivity and volume in a receiver can often be traced to poor contact between the socket contact springs and the prongs of the tube. The exceedingly feeble currents passing through the socket must meet with a minimum of resistance, and in this respect, perfect contact between the prongs and socket is an absolute necessity. A liberal application of a fine grade of sand paper on the tube prongs will quickly remove any of the corrosion and high spots which make for a poor contact. It is advisable to clean the prongs at regular intervals.

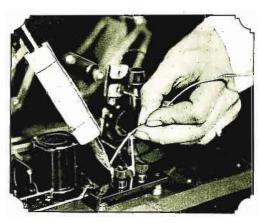

A Power Tube Substitute

The experimenter is not always the proud possessor of a power tube and yet he has often A reasonable substitute for a desired one. power tube in the last stage of audio amplifi-cation can be found in connecting up two ordinary 201-A type tubes, with their plate and grid elements in parallel. In other words, an extra 201-A tube is connected to the plate and grid terminals of the last audio frequency amplifying tube. The filament of the extra tube is connected to the "A" battery in the regular manner through a ballast resistor or the other. The accompanying photograph rheostat. clearly illustrates the proper connections.

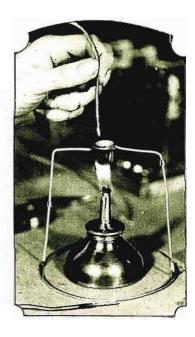

A Heat Insulated Soldering Iron

Comparatively few experimenters have not experienced the difficulty of mutilating or even destroying component parts in a receiver, due to an accidental touch with the hot part of the soldering iron. Invariably the soldering tip alone does not create any damage. The metal housing immediately in back of the any dallage. The metal housing immediately in back of the tip is usually the part which comes in contact with the moulded portion of an instrument or the like, and the extreme heat will cause the composition to melt or char. This difficulty may be completely overcome by wrapping a piece of sheet asbestos around the heated portions of the iron, which are not in use for a trial coldering currosce. With this prequision it is possible to actual soldering purposes. With this precaution it is possible to use the soldering iron with impunity among delicate pieces of apparatus in the receiver. It is advisable to remove the asbestos when ordinary soldering is done, since the iron may be damaged through overheating.

A Tinning Bath

An easily constructed tinning bath may be quickly made from a few spare parts around the work-shop. Procure an old oil-can and cut off the spout about 1 inch from the bottom. Form a wick from a number of strands of cotton string, or if piece of wick from an old kerosene lamp is handy, use it. Insert the wick through the opening in the base of the spout and allow approximately 3/ inch to project beyond the other end. Be sure to have a sufficient length of wick so as to allow it to reach the bottom of the oil-can. Fill the can with denatured alcohol and permit the alcohol to be absorbed by the wick. This will make an excellent alcohol lamp, which is capable of creating a very intense heat. Next construct a stand from a length of busbar wire, to support a thimble directly over the alcohol lamp. Use care in forming the stand so that no solder joints are in the vicinity of the thimble, since the heat present when the lamp is burning is sufficient to melt them. Light the lamp and suspend the thimble over the flame. Only a short time is required before the thimble is hot enough to melt any solder which is placed within it. After sufficient solder has been melted to almost fill the thimble it may be used as a tinning bath for tinning the ends of wires, spring contacts, etc.

A Panel With a Satin Finish

A very pleasing satin effect may be given any panel by observing the following procedure. After the panel has been drilled, lay it on a piece of newspaper which has been placed on a flat surface. Then with a fine grade of sand paper, No. 0 or 00, sand the surface of the panel along its length, applying at the same time a liberal quantity of lubricating oil. Do not limit the strokes in sanding to less than the total length of the panel, or the satin effect will not be uniform. After the total surface has been covered, remove the surplus oil with a soft cloth, wash the surface with gasoline or a similar cleaning compound, and polish with a dry cloth. Under no circumstances use a coarse grade of sand paper, since its application on the highly finished surface of the panel will gouge out deep scratches, which are virtually impossible to remove.

Like a Thermometer - It Registers at One Point

OT SPOT Reception is another achievement of that well-known master of the ether, Merwyn Heald, B.S., E.E. His great success in designing The famous Melo-Heald Eleven Circuit is fully covered in your copy of the Spring, 1927 Call Book. The Call Book now covers this latest development in radio reception, The famous HOT SPOT Fourteen, in full detail in the editorial pages of this issue for your benefit. See page 121. Certified Melo-formers (audio frequency) and Certified Melocouplers (radio frequency), the transformers that make such excellent reception possible, are the secret of the great success of these two wonder works in radio. The same mixing system is used in the HOT SPOT Fourteen that made the Melo-Heald Eleven famous. Each intermediate transformer is designed specifically for its position. Only one oscillator setting is necessary for each station—real single point reception. 14 Tubes—No Oscillator Repeats. 8 Stages of Intermediate—3 Stages of Audio. 2 Tuning Controls—Easily Tuned as Single Stage. "A" BAT., 2 Amps.—"B" BAT., 35 Milliamperes. Loop Regeneration—Potentiometer—Volume Control. Refer to the article and let the Editor of the Call Book tell you the rest of its virtues, and how to build The famous HOT SPOT Fourteen.

Certified MELOFORMERS make three stages of ideal audio possible, and also render beautiful reproduction without slightest distortion on as high as four stages. Meloformers can be used for audio frequency in any set, as well as those designed by Mr. Heald and described in the Citizens Radio Call Book. Specifications: Height, 21/4 in. O. A.; Base, 2 in. square; Top, 13/8 in. diameter. Can be obtained through Dealers everywhere.

Certified MELOCOUPLERS are guaranteed radio frequency transformers for specific service in high-powered Fourteen and Eleven Tube Circuits. Each is built with an air-core, peaked, wound and tested at the same point of efficiency, making kits unnecessary, which is also true of Certified Multistage Meloformers. Specifications: Height, 2½ in. O. A.; Base, 2 in square; Top, 1½ in. diameter. Can be obtained through Dealers everywhere.

The famous Melo-Heald Eleven Circuit

Tell 'Em You Saw It in the Citizens Radio Call Book

The Tyrman Ten

Constructed in Citizen's Radio Laboratory, This Receiver Incorporates the Most Outstanding Features of Design. Its
Performance Surpasses All Expectations

INCE the last three years a great number of engineers endeavored to design the "ideal" super-heterodyne receiver and endless articles have been written telling the set builders how and why this set should be built.

However, progress had to be made from year to year. Instruments underwent a process of improvements and today it does not mean

difficulties to produce intermediate frequency transformers of exact calibration in large quantities. It was emphasized in previous publications, that the intermediate frequency transformer is the very heart of the super-heterodyne circuit. But thousands of these receivers have been built using properly matched units without giving the expected satisfaction. Where was the fault and who was to blame? The fact is that a properly designed intermediate frequency amplifier will not function properly if subjected to a faulty input construction and a wrong amplifying system after its rectification. What is proper in these questions might be an interesting subject for discussion among designing experts. It occurs that super-heterodyne rcceivers, which are marvelous in the laboratory will not satisfy if duplicated outside of that scientific work bench, and this because the home builder does not incorporate certain engineering thoughts like diminishing wiring feedbacks, straight capacities, etc. It remained to our laboratory to lay out a receiver where least chance is given to deviations of very important details and where the duplication of our model ise com-

This was especially necessary with this new circuit, where all newest improvements have been incorporated and harmony had to be created between a number of circuits. The "one spot" idea has been made use of with a compromise to eliminate all critical features of shorter wave intermediate frequency amplification. The theory of this system is in the separation of the two beat

notes to an extent where one of them will appear beyond the dial range. Thus we have seen the following system of super-heterodynes in the past:

First. The standard super-heterodyne receiver. The receiving sig-

nal was changed by the oscillator signal to a long wave. For example, if the intermediate frequency amplifier was designed to a frequency of 40 K.C., a signal of 700 K.C. (428 meters) had to be counteracted with an oscillator frequency of 740 or 660 K.C. (405, respectively 455 meters). There are two settings for each station on the oscillator condenser, and of course this caused not only difficulties

in logging but also heterodyne interference, when the lower beat of one station touched the high beat of the other. The advantage of this original superheterodyne was its stability (if the I. F. amplifying transformers happened to be of proper design). Combinations of iron and air core units were used. These transformers, however, even if matched on instruments, were subject to electrical changes when working in cascade, and especially iron core stages change their characteristics as soon as regeneration sets in.

Second. The short wave intermediate frequency superheterodyne receiver: This system, instead of utilizing the difference of frequencies for intermediate frequency amplification, uses the same frequency for this purpose. An intermediate frequency amplifier of 3000 K. C. will require a beat frequency of 2300 K. C. for a 700 K. C. signal. It is seen that two critical features play their part in this circuit. First, the short wave oscillator, and, second, the short wave intermediate frequency amplifier. The difficulties can be overcome only with extremely careful design and expert layout.

Third. The one spot long wave transformer utilizing a frequency slightly lower than the broadcast band.

A compromise had to be reached and finally a transformer of 340 K.C. maximum amplification has been decided on by the engineers, utilizing the stabilizing advantages of long wave amplification but remaining below that wave to avoid the double beat interference. The above

700 K. C. signal will require an oscillator frequency of 1040 respectively 360 K. C., the latter being outside of the dial range. Only signals above 890 K. C. (below 330 meters) can have a double setting on the oscillator tuner if the antenna dial is left

Photo A—Suggested assembly of Tyrman Ten with loudspeaker and accessories

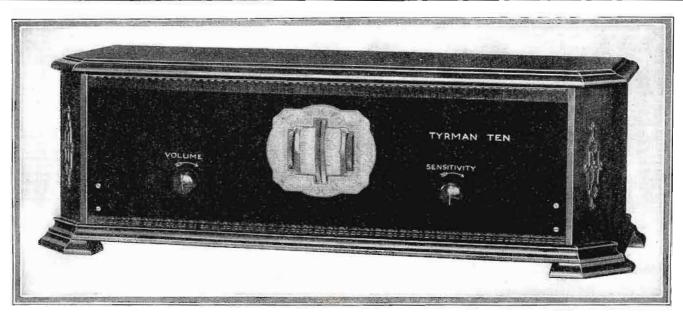

Photo B-Front view of receiver showing harmonious panel arrangement

in resonance. However, tuning both dials to the resonance no signals appear twice on the dial, as the 640 K. C. separation between beat notes will not allow duplication with a very selective antenna system.

Thus we have arrived at a stage where compromise is reached between extremes in construction, as it was done in innumerable cases of other industrial achievements.

The new radio conditions culminating in greater activity of home construction are characterized by the strife for greater satisfaction, and leading designers recognize the fact that only quality in its highest sense will meet the approval of the most discriminating set building public of these days.

Constructively this receiver offers a keynote for standardization and simplicity. The strikingly pleasant appearance of its front view with the centralized Vernier Drum control keeps harmony with the layout of the subpanel, the instruments being placed to make use of every space available. All Tyrman parts are designed for subpanel wiring. The transformers simply hook into the Kurz-Kasch Capacity Connector which is placed under the subpanel and contains a moulded wiring system. Thus, this receiver inaugurates the first step for the standardization of amateur set building, enabling the beginner to construct a duplicate of our laboratory model. The shielded tube socket will not only assure each tube to function under

the influence of magnetic and static fields, but acts also as shield between the stages of the radio frequency cascade. This layout together with the capacity effect of the Kurz-Kasch Capacity Connector is responsible for the perfect electrical stabilization of the circuit.

A stage of radio frequency is built ahead of the long wave amplifying system. Although this was not carried out satisfactorily in previous amateur-built super-heterodyne circuits, it is greatly responsible for the success of this receiver. The designer's aim was to create selectivity on the antenna stage equal to that obtained by a directional loop, and thus localize the tuning control to the dials. As it is well known by experimenters, there was a poor balance in selectivity between the antenna and oscillator circuits, and previous receivers had to rely on an extremely selective oscillator tuning, thus cutting into the side band and inflicting upon tonal performance. In our case the radio frequency stage is sufficiently sharp to allow more broadness in the oscillator for obtaining same selectivity.

The audio amplifying system consists of one stage of straight transformer coupled amplifications and a push-pull stage for the second audio. It was emphasized in an earlier issue of this magazine that transformer coupled audio amplification is the most suitable for super-heterodyne circuits, and again this method is

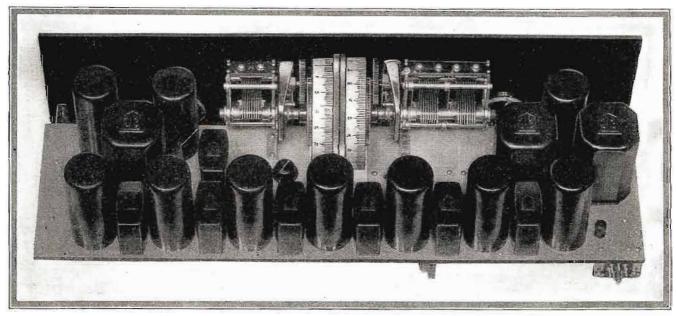

Photo C-Rear view of apparatus mounted on sub-panel showing shields provided for tubes

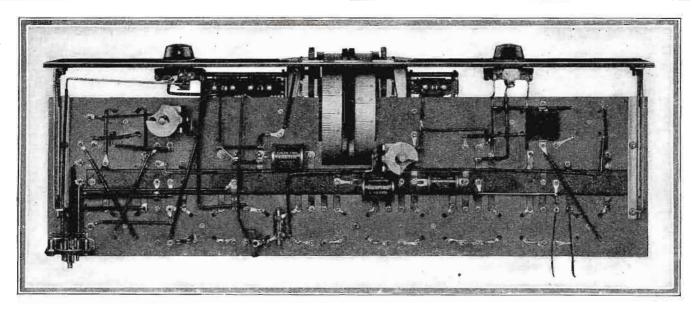

Photo D-Bottom view showing position of Kurz-Kasch capacity connector

advised by the designers. The push-pull stage of the second audio, and especially the output transformer, assures perfect tonal quality. It was more than useful to provide on these transformers a ground connection for their cores leading to a perfect stabilization of the audio frequency amplifying circuit.

The input circuit is combined of one stage of radio frequency and an oscillator. The Tyrman Type 8-70 Radio Frequency Transformer is used for the first, these units covering 200 to 550 meters with a .00035 condenser. To assure uniformity, moulded tubings are provided for the secondary windings; the specified Camfield condensers with adjustable capacities are a further aid in matching the radio frequency stages. As both grid returns have the common negative potential, a .00025 condenser is inserted in the grid of the first detector and a positive bias for this grid obtained by a 3-megohm resistance to the positive filament.

The oscillator stage with its Type 8-71 Tuned Radio Frequency Transformer, covering 900 to 1850 K. C., is coupled to the grid of the first detector by a 50-mmf. Midget Condenser. This capacity feed is the simplest and most efficient coupling method and has to be adjusted but once.

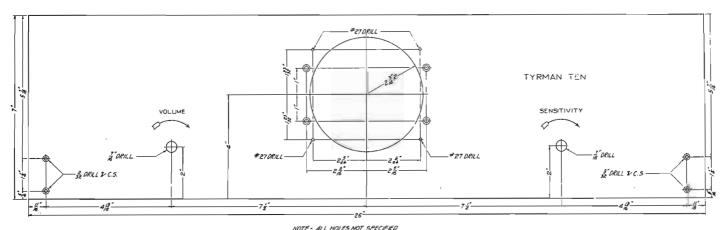

Two volume controls are provided on the front panel, the 25-ohm Rheostat for the first detector tube and a 200-ohm Potentiometer for the grid returns of the intermediate frequency amplifier. The rheostat can be left in one position except on the most powerful local signals. All tubes except the one mentioned are automatically kept at five volts by fixed resistances.

Before assembling the parts it is recommended to prepare the Kurz-Kasch Capacity Connector according to Fig. 3. Only the con-

nection actually to be used are left on the strip, while all those marked with "off" should be removed by bending them back and forth until they break. Two tabs are provided for each minus A and each plus B connection. It will be noted that both minus A tabs are used for the filaments throughout except the first detector, which is controlled by a 25-ohm Rheostat. It is emphasized that the removing of tabs has to be don every carefully, especially where only one of the double tabs (plus B, minus A) is used. The terminal strips are separated by very thin strips of bakelite and there is a possibility of short-circuiting, if the tabs are not broken off close to the strip. Of the plus B terminals the upper tabs represent the plus 45 V lead, while the lower one contains the plus 90 V connections. It will be noted that a number of tabs are bent above the strip where the center holes are used for mounting other apparatus. Utmost care should be taken of the extreme left plus B terminal, where the upper (plus 45 V) tab is removed, while the lower tab is bent around; at this place the bend is not made close to the edge in order to avoid short-circuiting the two plus B leads. Where both of the double B and double A tabs are removed both breaks should be inspected for shortcircuiting and in case of touching the stubs should be separated with a knife.

It is advisable to keep the following schedule of assembling:

- 1. Front Panel and Subpanel
- 2. Audio Transformers
- 3. Capacity Connector
- 4. All other apparatus on subpanel
- 5. Vernier Drums

NOTE - ALL HOLES NOT SPECIFIED ARE 15' DRILL AND COUNTERSINK

Fig. 1-Panel Layout

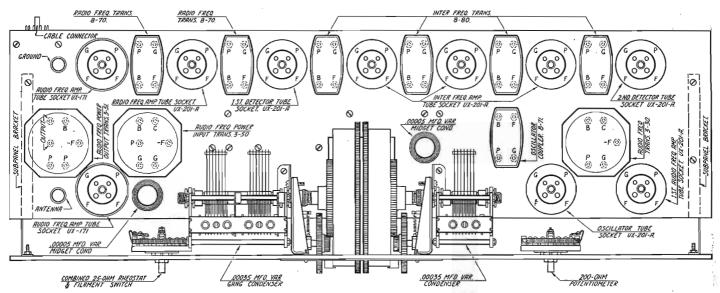

Fig. 2-Diagram showing top view of receiver

It will be noted that several terminals of the audio transformers and two terminals of the 7-71 R. F. Transformer (oscillator coupler) fit through the center holes of the capacity connector. If the latter is prepared according to the instructions given above, the terminals of the transformer will fit through the tab holes of the capacity connector and actually comply with the circuit diagram. Figure 2 gives a detailed picture of the position of parts on the subpanel, while Figure 3 will show all wiring connections as they are made on the lower part of the subpanel. Where possible solder lugs are used instead of wire, thus assuring short leads. The dial brackets are connected with the subpanel by means of auxiliary brackets, and this system, representing the rotor terminal of the tuning condenser, is used also for connecting it to the minus A tab of the Capacity Connector.

It will be noted that a midget condenser is used for aerial coupling. The advantage of this coupling is eminent, as it allows positive regulation of the signals, whatever antenna is to be used, and also serves for regulation of selectivity to any desired degree. For average use thirty to forty feet of indoor aerial would be

sufficient to bring in long distance stations. It is advisable to set the midget condenser receiving a wave of approximately three hundred meters to the best volume without oscillation and leave it in this position. The midget condenser regulating the capacity feed of the oscillator should be tuned to the lowest volume on a distant station.

It is advisable to ground the escutcheon on the front panel to the minus filament, utilizing one of its mounting screws for this purpose. The speaker jacks are incorporated in the new No. 669 Yaxley Cable plug especially designed for this purpose and connected to the output terminal of the Type 3-51 Tyrman transformer. No external capacities are required for these audio units. All necessary by-pass condensers are incorporated in the transformers.

The model of this receiver constructed in the laboratory of the CITIZENS RADIO CALL BOOK was built from the exact list of parts appearing herewith. While it is possible for the experienced constructor or experimenter to successfully substitute other reliable parts for those actually specified, it is recommended that the novice strictly

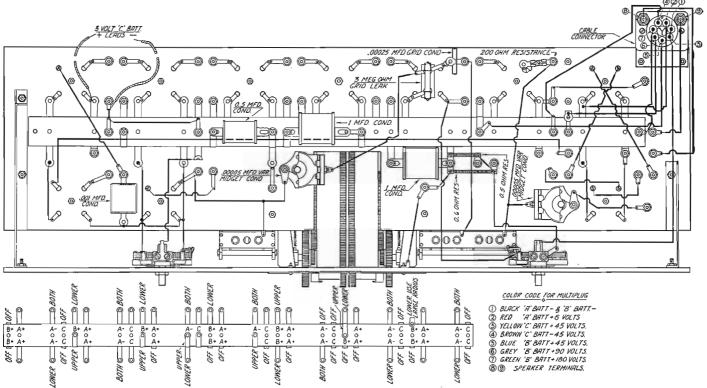

Fig. 3-Pictorial wiring diagram with all parts mounted on the sub-panel

adhere to the list of parts as given below.

2 Tyrman Type 8-70 R.F. Transformers

1 Tyrman Type 8-71 R.F. Transformer

4 Tyrman Type 8-80 R.F. Transformers

1 Tyrman Type 3-30 Audio Transformer

Walnut is used, rubbed to a high gloss, with embossed ornaments on the corners and doors. The lower compartment has ample room for all the batteries, charges and other accessories.

The Corbett "C" cabinet shown in photo "B" is for use when the set is to be placed on a table. It is designed in the style of an ancient Italian treasure chest and presents quite an attractive appearance. Walnut is used, in the natural finish, polished to an eggshell gloss. Both the console and the cabinet are manufactured by the Corbett Cabinet Mfg. Co., St. Marys, Pa.

The Willard storage battery is contained in a hard rubber case with threaded rubber insulation, insuring a maximum life and stability of output. There are three sizes recommended for radio work, that of 120 ampere hour capacity being best suited for this particular set. A smaller capacity will do, but to render the same service as the larger battery it must be charged more often.

The Sterling R-98 power supply furnishes both the "B" and "C" current at any value desired from 0 to 180 volts, readily regulated by means of variable resistances controlled by external knobs. A type "BH" Raytheon tube is used, insuring the utmost smoothness of operation. The unit is mounted in an attractive metal

1 Corbett Walnut Console Type C-10-20.

1 Corbett Walnut Cabinet Type C.

1 Willard 120 Amp. Hour Storage "A" Battery.

1 Sterling Type R-98 "B" Supply.

1 Temple Type 18 Speaker.

1 Kodel Kuprox Charger.

1 Jewell Type 595 A-B Relay.

The model C-10-20 Corbett console shown in photo "A" consists of two parts, the cabinet and the table. They may be bought separately or together. The combination makes an attractive piece of furniture well worthy of a place in the finest home.

case with all ternimals and controls brought out to a single panel. A cord and plug makes it convenient to connect to the light socket. The power supply is manufactured by the Sterling Mig. Co., Cleveland, Ohio.

The Temple 18 speaker is built on a newly developed plan that gives true reproduction over a full scale of seven octaves, allowing realistic values to everything from a single instrument to an entire orchestra. The speaker is eighteen inches in diameter and is mounted in an attractive metal case finished with brown crystalline enamel. It is made by Temple, Inc., Chicago, Ill.

The Kodel Kuprox charger uses a dry metallic rectifier which is silent in operation and practically foolproof, as well as positive in operation. The battery charger is manufactured by the Kodel Radio Corp., Cincinnati, Ohio.

The Jewell 595 AB relay is a device that automatically controls the accessories used with this receiver. When the set is turned on, the power flowing through the Kuprox charger is cut off, and the "B" Power Supply energized. As soon as the receiver switch is thrown to the off position, the relay automatically turns on the power and places the charger in operation so that the charge withdrawn from the battery is replaced. At the same time the "B" Power Supply is turned off. This always keeps the storage battery at peak charge, where it delivers the most efficient service. The relay is made by the Jewell Electrical Instrument Co., Chicago, Ill.

(If further information on any of the above accessories is desired, it may be obtained by writing direct to the manufacturer.)

The Aero-Seven Receiver

Here Is a Single Control Receiver That Gives Excellent Quality

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

■HE Aero-Seven is a seven-tube receiver using a ballast tube antenna coupling, two stages of tuned radio frequency amplification detector and three stages of resistance coupled audio amplification.

All three tuning condensers are coupled to a single shaft eliminating all difficulties in tuning and making the set a single control affair. All condensers must be identical and all the coils of the same size and number of turns.

The ballast tube is a refinement of the aperiodic coupled antenna system so extersively used in commercial radio stations. The tube acts as a rectifier, allowing the incoming signal to pass from the grid to the plate and it effectively retards any tendency to radiate energy.

Aperiodic coupling makes the set independent of the aerial. The antenna simply acts as a collector of energy and is in no way instrumental in affecting the tuning of the set itself. This means that there is no need of having an antenna control or variable coupling device.

The fixed antenna coil and the two radio frequency transformers are identical. They are of low loss construction, having the minimum dielectric in the field, consistent with mechanical strength and uniform operation.

The transformers are long and slender, 33/8 inches high and 2 inches in diameter, the secondary being wound with 77 turns and the primary with 15. The wire on the primary need not be as large as the secondary. The primary fits inside the coil nearest the filament end.

Due to the small diameter of the coils, their magnetic field is so restricted they may be mounted vertical if at least 4 inches apart with no danger of intercoupling. All connections are brought out at the base.

The tuning unit consists of a gang of three .0005 mfd. variable condensers controlled by a single shaft. The unit is base mounted and controlled by a drum type dial with a friction vernier. As pressure is constant at all times, there is no slipping or backlash and tuning is smooth and positive. A distinct advantage of the drum type dial is that the reading is always at a plane with the eyes and the numbers are large enough to read at a distance. This enables one to tune without having to lean forward.

A 1000-ohm fixed resistance is shunted between the antenna and ground terminals. Two .5 mfd. condensers are used, one between the ground and the secondary of the first radio frequency transformer, the other between the ground and the secondary of the second transformer. No condenser is needed for the third, for the condenser connected to the first transformer serves that one as well.

Volume is controlled by a 200-potentiometer shunted across the filament leads, the rotating arm being connected to the filament terminal of the three transformers.

The filament current for the ballast tube and the two radio frequency tubes is controlled by a 6-ohm rheostat, that for the defector and three amplifiers by all-ohm, 1-ampere fixed resistance.

The detector tube is mounted in a spring suspension socket, which absorbs vibration, eliminating microphonic noises. Do not use a soft tube for a detector in this circuit, for tests have shown that the same type of tubes in all sockets, save the last, give the

most satisfactory results. Take particular note that the grid leak is connected between the grid and filament, not across the grid condenser. Use a high resistance leak, about 5megohm.

The grid condenser is an impregnated .00025 mfd. There is no need in using one with a grid leak mounting, for the mounting will be of no service. A separate mounting concealed under the baseboard holds the leak. Keep the leads in the grid circuit as short as possible. A good plan is to mount the condenser directly on the grid terminal of the socket.

A .001 fixed condenser is shunted across the plate and negative filament leads. This condenser is to bypass the radio frequency current and keep it out of the amplifier.

A small radio frequency

choke in the lead between the plate and the amplifier effectively prevents the radio frequency current from entering.

The first audio amplifying unit consists of two resistances, one of 1/4-megohm, the other 2-megohm with a small fixed condenser in the grid lead between them. The next one is a coupling of 1/4megohm and 1-megohm, while the last is .05-megohm and $\frac{1}{2}$ megohm.

These units may be assembled out of the parts or may be purchased in a block. Resistance coupled amplification gives smoother signals than transformer coupled and there is no distortion due to transformers. However, it will not give volume of transformers, so three stages will have to be used.

The added mellowness will well repay for the use of the extra tube. Resistance coupled amplifiers will take a higher B voltage than transformers and it is advisable to employ an eliminator, for the drain is rather heavy. A power tube is used for the last

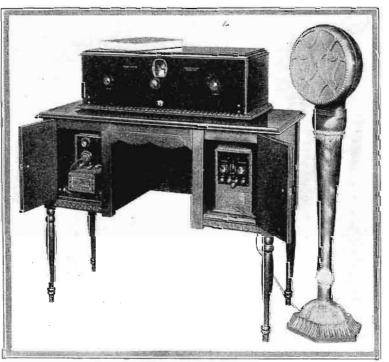

Photo A. View of receiver mounted on table with suggested accessories

stage with anything up to 200 volts on the plate. It is not advisable to go beyond this point, ft is not advisable to go beyond this point, for no additional amplification will result.

Ninety volts for all the rest of the tubes is satisfactory. Use

on the under side, the location of the parts making that possible. Shorter leads may be obtained by sub-wiring the surface, for they can go in straight lines instead of having to weave back and forth between instruments. Also there is less danger of short circuiting by careless handling, and no need to use great quantities of spaghetti insulating.

List of Accessories Used with the Aero Seven Receiver

The following is a list of accessories which have been actually

- 1-Southern Toy Company's Mahogany Radio Table
- 1-Majestic "A" Current Supply
- 1-Majestic Super "B" Current Supply
- 1-Yar True-Tone Speaker

Photo "A" shows the Aero Seven Receiver installed in a Southern Toy Company's Cabinet in conjunction with the Southern Toy Company's Radio Table. Both pieces of furniture are manufactured by

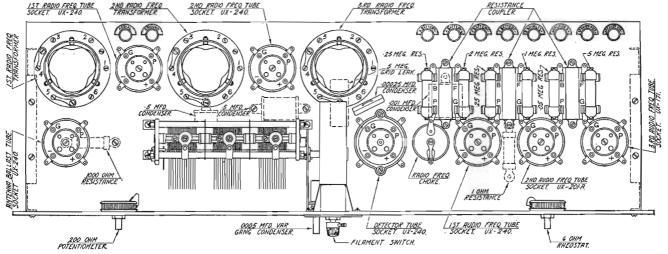

Fig. 2. Sub-panel layout

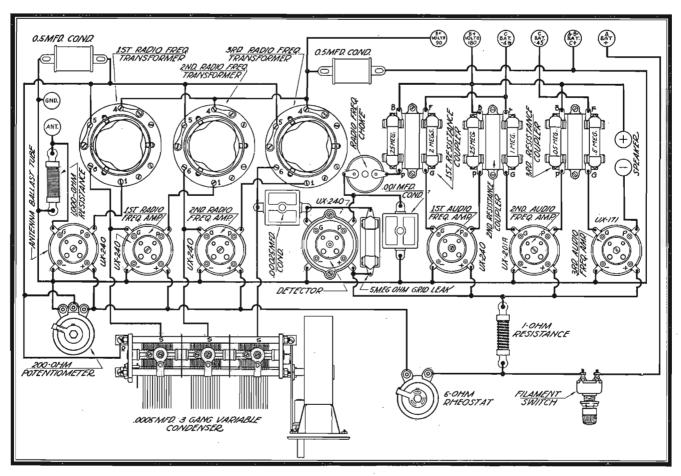

Fig. 3. Graphic wiring diagram illustrating in a pictorial manner all connections to the various parts in the receiver

the Southern Toy Company of Hickory, North Carolina. Both the Cabinet and Radio Table are beautifully finished in a varnished and oil rubbed finish. Each piece of furniture is sturdily constructed with sufficient room provided for the proper storage of accessories and "C" Batteries.

The speaker shown is a product of the Yahr & Lange Manufacturing Company of Milwaukee, Wisconsin. This speaker is unique since it uses an exporential air column. This type of construction when used in connection with the excellent reproducing unit supplied with this speaker will give wonderful tone quality. The speaker is tastefully finished in dark green and gold enamel.

Both "A" and "B" power supply is derived from Majestic Current Supply units manufactured by the Grigsby-Grunow-Hinds Company of Chicago, Illinois. Both of these units are similar in physical appearance. The "A" current supply is capable of supplying 2½ amperes at 6 volts and has a number of safety devices for preventing excess

voltage being applied to the filaments of the tubes in the receiver. In addition to these a receptacle is provided in the case of the "A" current supply for the plugging-in of the Majestic "B" supply. The switch on the "A" current supply will then control both "A" and "B" power supplies. The "A" current supply uses a dry plate rectifier whose operating characteristics insure a long and dependable life. The Majestic "B" current supply used in this installation has a maximum power output of 50 mils at 180 volts. The combination of four terminals for "B" current supply as well as a "high" and "low" switch affords an extremely wide range of "B" voltages. The rectifier tube used in the Majestic "B" power supply is manufactured by the makers of the Majestic units and is guaranteed for 1,000 hours, which is equivalent to one year of average use.

(If further information on any of these accessories is desired, it may be had by writing direct to the manufacturers.)

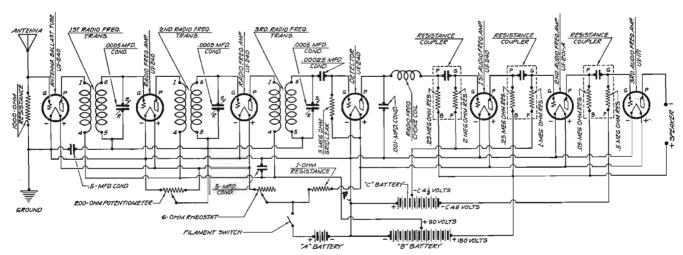

Fig. 4. Schematic wiring diagram

The New World's Record Super 10

Recent Additions and Refinements Make the New World's Record Super 10 a Leader in Multi-Tube Receivers

All Illustrations and Construction Data Prepared in the Laboratory of The Citizens Radio Call Book

HE New World's Record Super 10 is, as its name implies, a tentube receiver, using sixvolt 201 A type tubes in all circuits but the last audio, which requires a 210 type in order to handle the tremendous volume. It is designed for operation with a short indoor or outdoor antenna of about 20 feet or 30 feet overall length, a feature which contributes materially to the selectivity of the receiver. Sub-panel type of construction is used, which facilitates assembly and wiring, beautifies the receiver, and adds considerably to the efficiency of the set as a whole because of the shorter plate and grid leads thus made possible.

The set has two major and three refining controls, symmetrically located on the panel in such manner as to make operation simple and easy, yet still retaining highest efficiency. The first major control (directly to the left of the filament voltmeter, Photo B) is geared to a drum dial which varies the setting of a three-gang condenser unit, tuning the input system of the receiver. The opposite major control, in connection with another drum dial and single section condenser, is used to tune the oscillator.

which generates the heterodyning frequencies, producing the beat signal which is amplified by the intermediate stages. The three refining controls, from left to right on the panel, are adjustments of the input circuit, the R. F. filament current, and the stabilization of the intermediate stages respectively. No filament switch is in evidence on the panel, this being built in the rheostat controlling the two R. F. tubes, which is located directly under the 0-8 volt Jewel Filament Voltmeter. When this rheostat is in OFF position, the filament current is automatically shut off by the action of an ingenious spring switch which is positive in its action. Filament current for all tubes but the first two input tubes is adjusted to the proper value by a master Rheostat located on the sub-panel. The exception of the two input tubes is necessary in order to effect the highest efficiency from the input amplifying circuit. The master rheostat is set at the value giving 5 volts reading on the voltmeter, and once correctly set, requires no further attention. From the foregoing, an idea of the ease and simplicity with which the World's Record Super 10 is adjusted and operated, can be quite readily acquired.

The receiver in itself consists of two stages of tuned radio fre-

Photo A. The World's Record Super 10 Installed in a Console

quency amplification, with antenna pickup arrangement, preceding the first detector of the familiar super-heterodyne circuit. Considering the circuit in its respective divisions, we find first two tubes devoted to radio frequency amplification, a first detector, an oscillator, three stages of intermediate frequency amplification, a second detector, and two stages of cascade audio frequency amplification. The ten tubes are all so connected into the circuit that the object of the receiver -the interception and amplification of distant and local signals -is most admirably accom-

In sharp contrast to the previous models, the Super 10 is designed for antenna operation. This system of signal pickup is possible because of the two radio frequency amplifying stages, which intensify weak and minute signals, ordinarily too feeble to actuate the first detector tube of the average super. The use of two stages of tuned radio frequency preceding the detector in connection with the antenna, thus extends the range of the receiver to heretofore unattained distance.

People who find it inconvenient to use a loop antenna

will greatly appreciate the advantages this new arrangement permits.

Aside from the extended range and sensitivity added by the RF amplifier, there are a number of other minor but important features that are only peculiar to the World's Record Super 10. The use of RF preceding the first detector of the super-heterodyne receiver is a generally recommended procedure when greatest sensitivity and selectivity is wanted.

This new receiver employs in the radio frequency stages three radio frequency couplers expressly designed and matched for use with the super-heterodyne and gang control tuning. The secondaries of these new units are actually matched to within one turn in an effort to secure uniform tuning on the gang condenser, so that resonance of each stage will take place when all three sections of the 3-gang condenser are alike in setting. Differences in wiring, and the effects of different types of antennas are compensated for by the use of four separate adjustments, of which three are made when the receiver is given the initial test and not touched again.

Changes in the inductance of the antenna coupling unit, caused

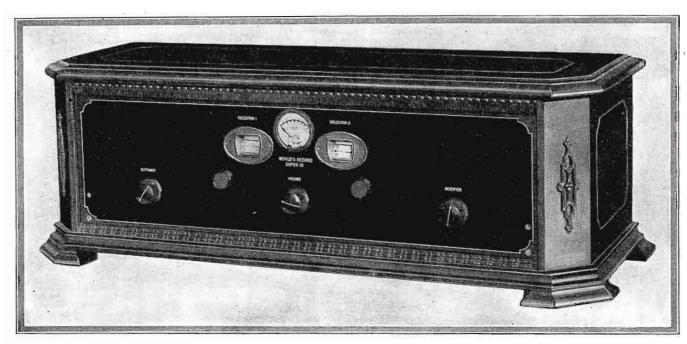

Photo B. View showing panel arrangement and drum dials

by antenna resistance and characteristics, are compensated with a midget condenser which is shunted across the end section of the 3-gang condenser, which tunes this unit. The midget is located at the extreme left of the panel, and is only semi-active in operation, being one of the refining controls used when tuning extreme long distances. Inequalities in the two remaining circuits, caused by differences in wiring and slight inconsistencies in equipment, are balanced off with small trimmers located on the frame of the gang condenser. By looking over the top of the set, it will be noted that between each section is located a small set screw. This set screw is the adjustment for a semi-fixed variable trimmer capacity, which is used to adjust any inequalities caused by influences as mentioned above. The adjustment of these trimmer capacities is accomplished by tuning in a comparatively weak station with the midget condenser set so that the plates mesh about one-half. The trimmer set screws are then adjusted until the station comes in with maximum strength and clarity.

The output of the RF stages is delivered to the first detector of the receiver, where the heterodyne frequency is impressed on the incoming signal. This takes place in the grid lead of the detector tube, where the oscillator pickup coil is located. It will

be noted that a grid leak and condenser is used on the first detector and that the first detector has a negative connection to the filament. Usually when condenser and grid leak are used, the grid return is positive, but in this particular receiver, better results are secured with a negative bias. A choke in the plate lead of the first detector prevents radio frequency strays from finding their way into the intermediate frequency stages, being by-passed by the .0001 mfd. fixed condenser shunted across the plate and A neg. filament lead.

This brings us to the second amplifyng circuit of the receiver by intermediate stages, which amplify the beat frequency produced by the heterodyning of the oscillator frequency and the incoming signals. Two transformers are used as filters, and two other transformers are used to step up the amplification.

The intermediate frequency amplifier is stabilized with a 400-ohm potentiometer which enables operation on the right portion of the curve of the transformer, and makes control of the amplification and volume simple and smooth. This potentiometer is the sensitivity control of the intermediate frequency stages and should be so adjusted that the tubes are just below the point of oscillation, where the greatest sensitivity, amplification and tone

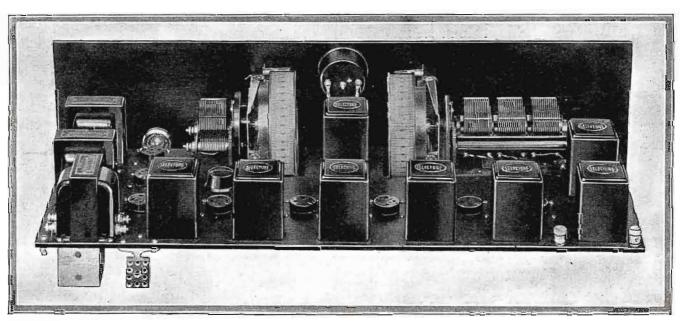

Photo C. Rear view of completed receiver

is obtained. This is important while tuning for long distance stations.

The output of the intermediate frequency amplifier is delivered to the second detector, which is of the grid bias rectification type. The use of this method of rectification accounts for the great stability and freedom from noise which is an outstanding characteristic of the New Super 10. The second detector is heavily loaded, and the grid bias eliminates the possibility of distortion caused by overloading. A second choke in the plate lead of this detector in connection with a .002 mfd. fixed condenser makes certain that no strays find their way into the AF amplifier.

The Audio Frequency Amplifier is so generally and favorably well known that it hardly needs description. Two Thordarson R-200 transformers are used in connection with a 201-A and CX 210 tube. The output of the set is fed to the speaker through an output speaker coupling transformer, used in the plate circuit of the last tube to isolate the direct potential from the speaker windings.

Due to the terrific volume delivered to the last stage by the amplifying circuits of the receiver, it has been found advisable to use a 210 Power Tube in the last state of the audio. The use of this tube makes it possible to operate the set at full volume

facilitates wiring. In assembling the set and wiring, as much of the apparatus as can be conveniently put in place should be installed, and the greater part of the wiring may be done with the panel and base separate. When all the connections have been made that are possible with the panel and sub-base apart, they can be fastened together and the receiver completed.

Wiring should be systematically completed in divisions to avoid mistakes and confusion. It is a wise procedure to first wire all the filament circuits, and by screwing the panel and sub-base together temporarily make sure that all the circuits are correctly connected. The last audio stage can be tested separately with a 201A and storage battery for continuity. When you are sure the filament circuit is absolutely right, wire up the radio frequency stages, the intermediate frequency stages, first and second detector and oscillator, and the first audio stages. First wire in plate and grid circuits, leaving the B positive and grid returns to the last.

While the tuning is not difficult or critical, it will take a night or two to become thoroughly familiar with the operation of this set. The potentiometer on the right and the 15-ohm rheostat in the center control both volume and selectivity. The small midget condenser on the left is used principally when tuning for DX. On

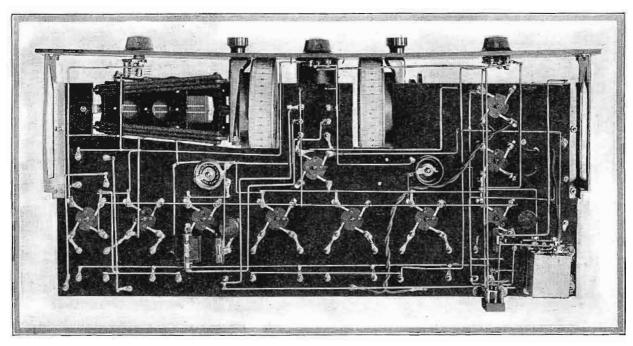

Photo D. Bottom view showing arrangement of parts mounted on under side of sub-panel

without the slightest trace of distortion even on the most adjacent stations, due to its heavy load carrying capacity.

Its use makes necessary the construction of a Thordarson Heavy Duty Plate Supply Unit to furnish sufficient current to handle the load of this tube, but as this is easily assembled, it is recommended as a source of plate potential.

There are four leads taken off the eliminator, coded as follows on the Jones 10 wire base mounting battery outlet: The Blue 45 volts for the oscillator and first detector, Pink 90 volts for the RF, Intermediate second detector and first audio tubes, and 400 volts (Brown) for the last audio stage and 210 amplifier. The 210 uses filament current from the light socket, a separate provision having been made for this feature on the Plate Supply Unit. The grid return lead from the last Audio Transformer (White) is connected to the filament winding of the Eliminator and provides the necessary C bias on the 210. The Yellow cord is the negative and Eliminator Negative, and $4\frac{1}{2}$ -volt C positive common return. The $4\frac{1}{2}$ negative bias for the second detector and first Audio tubes comes from the Orange wire of the cable. The usual filament Red for Positive and Green for Negative is used in this new cable arrangement.

The construction of the receiver is even easier than previous models due to the use of the sub-panel construction, which greatly

strong local stations keep the filaments on the radio frequency tubes fairly low. If they are burned too brightly, they will oscillate and tuning will be very broad. If a strong local station appears to cover a large part on one or both dials, the filaments of the radio frequency tubes are too bright. Turn the rheostat in the center anti-clockwise to reduce the filaments and turn the potentiometer as far as possible in a clockwise direction without causing the intermediate frequency tubes to oscillate or squeal.

List of Parts Required for the Construction of the World's Record Super 10 Receiver

The list of parts given below were used in the construction of the laboratory model of the Worlld's Record Super 10 Receiver. Experienced experimenters will have no difficulty in substituting other good makes of apparatus for those specified. The novice, however, is advised to strictly adhere to the list as given herewith, since he will then be assured of satisfactory results.

List of Accessories

- 1 Excello Model R-22 Console.
- 1 Corbett Type "C" Cabinet.
- 1 Tower "Pirate Ship" Model Speaker.

The Excello Model R-22 is a wall type console made of American Walnut with five-ply walnut top and panels. Front doors are of matched butt walnut. The tone chamber is built in the receiver compartment and is hinged as part of the cover top.

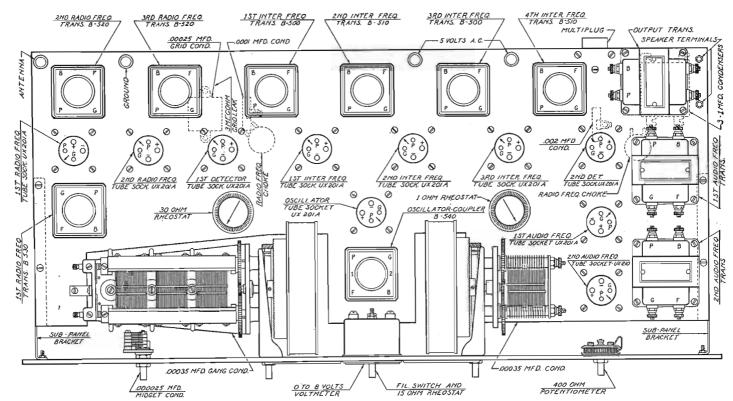

Fig. 2. Baseboard layout showing arrangement of parts

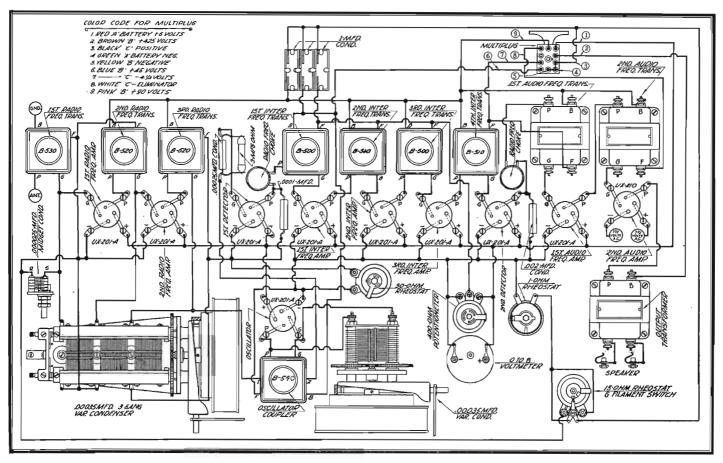

Fig. 3. Pictorial wiring diagram. Check this drawing against completely wired receiver

This tone chamber when used in conjunction with the external cone speaker will give an excellence of reproduction which is quite surprising. There is ample space for batteries and accessories. The "A" supply rests on a shelf, which may be drawn forward for inspection and removal of the unit. This eliminates all possibilities of scratching the woodwork. The console is finished in a beautiful two-tone piano finish.

A Corbett Type "C" Cabinet is recommended for housing this set if the use of a console is not advisable. The one in question is a beautiful piece of furniture, designed along the same lines as the Italian furniture of the Renaissance Period. Delicate scroll work and embossed ornaments are used to add attractiveness to an already beautiful cabinet. It is finished in natural walnut, rubbed to a high gloss.

The Tower "Pirate Ship" Model Speaker is an attractive ornament as well as a most practical instrument. Designed with the object in view of combining the beautiful with the useful, it easily fulfills the utmost expectations of the critical fan. Gazing upon the stately galleon plowing its foamy path over the billowing waves will throw one into the state of reverie so essential to fully appreciate the splendid tone quality and truthful reproduction of the speaker proper. The cone is 14 inches in diameter and is of such construction as to respond readily to all the delicate impulses of fine music. The speaker is made by the Tower Manufacturing Corporation, Boston, Mass.

(If further information on any of the above described accessories is desired, it may be secured by writing direct to the manufacturer.)

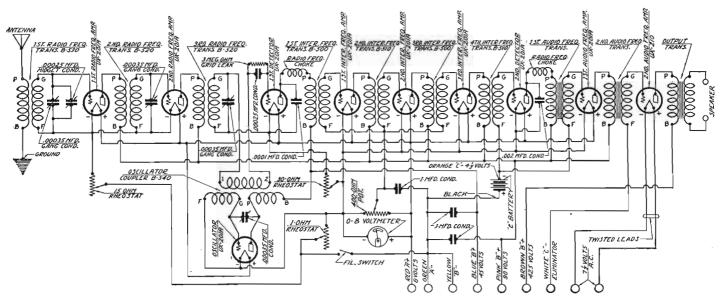

Fig. 4. Schematic wiring diagram

An Ultra Powerful Distortionless Amplifier for Radio Set or Phonograph

The Unipac May Also Serve as a Receiver A B C Power Plant Without Alteration

HE power pack described herewith is an unusually powerful device, and of very wide application, since operated from a 105 to 120 volt, 60 cycle, light socket, it will provide a stage of practically distortionless power amplification for any radio receiver, B power for any standard set, A, B and C power for any receiver employing A.C. tubes, or it will, without alteration, serve in conjunction with a magnetic record

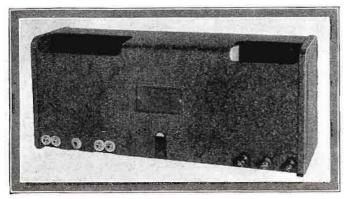

Photo A-Front view of Uni-pack mounted in metal cabinet

pick-up and a loud speaker, to convert any phonograph into the latest type of electrical reproducing instrument. Because of the universal nature of its uses, it has been termed a "Unipac," and in the following paragraphs its particular advantages, constructional features and operating details will be considered.

The Unipac consists of a stage of power amplification, and an A, B, C power plant in a single metal cabinet. The amplifier consists of a very high grade input transformer feeding a CX310 power amplifier tube, together with an output transformer to prevent damage to a loud speaker due to the high plate current involved. This stage may be joined to a radio receiver as a final high power output stage, but its amplification is not sufficient for direct use with a phonograph pick-up. For phonograph use, a CX326 amplifier tube is used, connected between the record pick-up and the input transformer primary, thus providing two amplifier tubes in all, the pair serving to develop ample volume for dancing in a small auditorium, or even out of doors, so great is the amplification and undistorted power output.

Power for the operation of the amplifier tubes is obtained from two power transformers which feed raw A.C. direct to the filaments, and which also provide the high voltage necessary for the two CX316B rectifier tubes, the output of which, properly filtered, is used for plate and grid voltages. A portion of the rectifier output is taken through a voltage dividing resistor, to be used for the B (and C) circuit of any standard receiver. In order to provide constant unfluctuating power to a radio receiver B circuit, a voltage regulator tube is used. The power transformers each have an extra 1.5 volt winding, one winding of one transformer being used to light the CX326 input amplifier tube filament. This, as well as the other winding, may be used to light the CX326 tubes of a receiver, while both windings also connected in series will serve to light a CX327 detector tube.

The need for a power amplifier output stage in conjunction with any receiver is today generally recognized, for it is now known that none of the smaller receiving amplifier tubes such as

the 201A, 112, or even 171 type can possibly deliver, without distortion, the power necessary for home entertainment at ordinary volumes. The maximum undistorted power output of a 201A tube is 55 milliwatts; of a 112, 195 milliwatts; and of a 171 tube, 700 milliwatts. The only tube at present available that, for second or last stage audio operation, will give the 1,000 to 1,500 milliwatts of undistorted nower output necessary is the 210 type. In the Unipac a 210 amplifier is employed. The input and output transformers feeding this tube are the well-known Silver-Marshall 220 and 221 audio and output transformers, which give a rising amplification curve, so that the amplifier delivers greatest power to a loud speaker such as the Western Electric cone, at 30 cycles. This is desirable since the efficiency of all speakers falls off at low frequencies, and the Unipac amplifier thus tends to compensate for this failing. Above 200 cycles, the amplification is substantially equal for all frequencies up to 5,000 cycles, above which frequency the amplifier rapidly "cuts off," or ceases to amplify.

The power stage is connected directly to the first stage output of a radio set, but in cases where the receiver has no audio amplifier, or one so old as to be discarded because of distortion introduced, the extra 326 input tube in the Unipac may be used as a first stage amplifier by simply joining the detector output to the Unipac input through the medium of a good audio transformer or a resistor coupler unit. Ordinarily, this 326 input tube serves to amplify the output of a magnetic phonograph record pick-up up to the value needed to be impressed on the 210 power stage, but, as stated, its use is not limited, and it may be used as a first stage audio tube as well, so that the Unipac becomes a complete receiver amplifier and A, B, C power supply as well.

Two values of receiver B voltage are available from the Unipac—45 volts at up to 10 milliamperes, and 90 volts at up to 45 milliamperes. Both voltages are unusually constant under varying current drains and as a result of the use of an 874 voltage regulator tube, there is absolutely no tendency to motorboating or

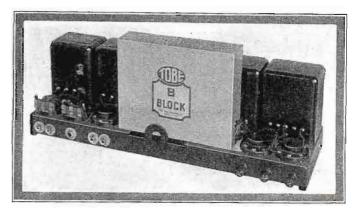

Photo B-View of assembly with cabinet removed

other noises when the Unipac is used as a receiver B power supply. Extra windings on the power transformer provide 115 volts for the lighting of the new 1.5 volt A.C. tubes as used in a radio set, while the two 1.5 volt windings of the two transformers if connected in series will also serve to light a standard 2.5 volt heater type detector. (The transformer voltage is then 3,

but about ½ volt is lost in the wiring, so that the 2.5 volt tube may be lighted direct from the 3 volt source.)

1-Tobe 662 Condenser Block

25 Ft. Kellogg Hook-up Wire

Tubes Needed

2-CX316B Rectofiers

1-CX310 Amplifier

1-CX374 Regulator

1-CX326 A.C. Amplifier

To assemble the Unipac, all transformers are mounted on the chassis, leaving the condenser until last (its mounting feet are clamped under two of the tube sockets). The binding posts and jacks are mounted upon the chassis edge, using the insulating washers accompanying it. The resistor is mounted by having

two of its lugs soldered to the +45 and +90 binding posts. The small FT64 resistors are mounted directly on the amplifier tube sockets, the socket mounting screws falling under them being left out.

The wiring is easily done, fastening wire ends under terminal screws or soldering to lugs, as most convenient. While no pictorial diagram appears, no difficulty should be found in following the schematic, as all terminal markings are exactly as on the instruments themselves. After the Unipac has been wired, it should be carefully gone over to see that no connection errors have been made, and that the twisted filament lines from the amplifier tube sockets to the power transformers are isolated from the rest of the wiring.

To test the Unipac, it should have both power transformer attachment plugs inserted in a two-way receptable and the 336 and 310 tubes inserted in the two left sockets. Both should light—the 326 very dull, the 310 fairly bright. Both tubes should be removed and one 316B inserted in one of the two right sockets, followed by the CX374 in the center socket. The 316B should light and the 374 should glow with a pinkish discharge. If the second 316B is put in the remaining light socket, the glow tube should brighten perceptibly. If a voltmeter is handy, the 45 and 90 volt readings should be checked. The former should show 45 to 50 volts, the latter between 85 and 95, depending upon individual glow tubes.

With both amplifier tubes also in place, and a speaker connected to the output jacks, a roar should be heard, disappearing if the input tipjacks are shorted, or decreasing to a slight hum if a record pick-up is connected to the input tipjacks. Reversing one of the plugs from a power transformer will probably decrease the hum, and they should be left connected in the fashion giving the least hum. (Both cords may be connected to one plug, if desired, which will serve as an on-off switch. The cords must be carefully "poled," though, for least hum.)

For operation with a receiver, a pair of leads from the first audio stage output should terminate in a plug, to be inserted in the double-circuit jack of the Unipac. This connection drops the input tube, which is then only used with a record pick-up. Of course, the first audio stage receiver tube may be dropped, and the grid lead of the receiver first audio stage connected to the input tipjack connecting to the grid of the 326 tube. The grid return is then made through the negative B connection from Unipac to receiver.

The Eight-in-Line Super-Heterodyne Receiver

An Entirely New Conception of a Super-Heterodyne Which May Be Assembled and Placed into Operation Within Fifteen Minutes

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

OW if it doesn't work, I am going to murder someone," is the popular sentiment of one who has just used up a pound of solder, a mile of bus bar, the spare time of a week and most of his precious supply of patience assembling a Super Heterodyne Receiver. It is an enormous task, even if the results are worth the effort. But when it just simply won't quit oscillating, or can't be made to oscillate, or won't amplify or the tubes won't light,

things take on a different aspect and there is some likelihood of the threat being realized.

Someone is always taking the joy out of life, but for every one removing smiles and dimples there is another who takes delight in putting them right back where they belong, so we continue our balanced existence.

Always some broadminded soul is at work to make our tasks lighter, our troubles less and our pleasure greater. Just think how much easier it is to press a button in the wall and have light than to have to blunder around, stumbling over chairs till the oil lamp is found, then strike a match and light it.

But that is getting away from radio, but contrary to general practice let us go a bit farther and consider the man who contemplates building himself a motor boat. He has visions of the type of craft he wants, knows the lines and has an idea of the results he may expect. He goes ahead and builds it, following his own inclinations as to shape of hull and appearance. Now the craft is finished, all but the engine. He can build that also if he wants to. But just how many individuals will take the trouble to make a gasoline engine when they know that they can buy one all put together and ready to run for less than the parts and labor would cost? It is quite true that a number do go around to garages and machine shops and pick up parts here and there until a complete engine results. It may run, but more than likely it will creep.

What has all that to do with radio you ask. Simply this. A sympathetic engineer in Colorado grew tired of

sceing his friends tearing their hair because their home made supers would not work properly, or still worse, refusing to even start building them because the mountain looked too steep to climb. Funny isn't it, how steep a hill always looks till we start going up it.

Anyway, this engineer, being a friend of humanity, sought to help his suffering fellow men by providing all the "workings" of a Super Heterodyne in a single, foolproof, dust-proof, convenient unit.

This he did, and now the fellow who built his boat but bought the engine may get out the old saw and screwdriver and make himself a panel and cabinet, confident that he can buy the "engine" in one piece, at one place, and rest assured it will work and do what he wants. The particular advantage of this plan is that it allows an individual a chance to express his individ-

uality, both as to appearance of the set and selection of the instruments to be mounted on the panel.

The "workings" consists of a plywood box shaped much like the toy piano usually purchased for little daughter at Christmas time. Instead of keys it has a shelf on which are flush mounted the eight sockets to accommodate the tubes.

On the vertical panel under this shelf are a row of binding posts. These connect to the loop, batteries, instruments on the panel and loud speaker. And that is all that is visible on the outside.

Inside it is a different story, but you may rest assured that the instrument you will purchase will be sealed, with the guarantee broken the same time the seal is. The normal individual is not likely to dissect his Waterbury to find out what makes it go, and there is no more reason why he should open the box.

First comes the oscillator coil which consists of a primary and a split secondary, bank wound between bakelite discs. Next the first detector. The grid leak and condenser are soldered directly to the terminal of the socket eliminating all leads in this circuit.

The intermediate transformers are tuned to a frequency of 85,000 cycles. They are mounted on a bakelite strip and screwed in place.

The balancing of the intermediate frequency transformers is done by means of small two plate condensers. These are controlled by means of a lock nut which is set and locked as soon as the correct position is found. This climinates the variance of the frequency on the cycle peaks, insuring

absolute co-ordination of all three instruments.

The amplifying transformers are worthy of note as they are not separate finished instruments but are incorporated directly as part of the set.

Distortionless amplification is obtained, due to the generous proportions of the amplifying transformers and their design.

All leads carrying heavy current are square bus bar, the other connections tinned, stranded cable. A notable fact is that there

Photo A. View of receiver in console showing suggested accessories

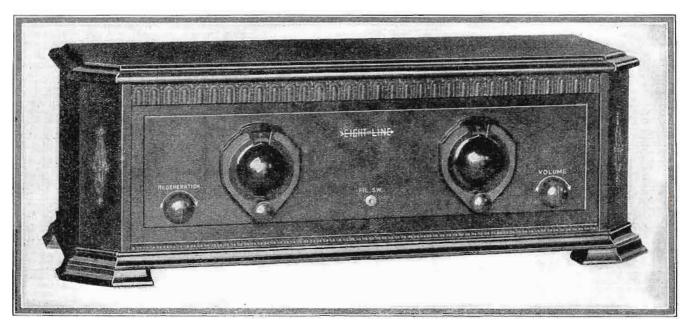

Photo B. View of receiver in cabinet

are no leads of any considerable length in the oscillator or radio frequency circuits.

The set is, as a newspaper writer put it, a superhereterodyne with the "IF" taken out. "If it works" is the common alibi of set builders. This unit is bound to work because everything is adjusted to harmony before leaving the factory. In fact the manufacturers are so confident of the merit of this device that they guarantee it to operate satisfactorily.

The layout of the panel is optional to the likes and dislikes of the builder. A suggested layout is given, but there is no special advantage of adhering to it as one slightly different may be more pleasing to your eye, and will work just as well. The only instruments to be mounted on the panel are a rheostat large enough to carry the current of the tubes, two .0005 variable

condensers of the straight line frequency type, one midget condenser and a switch for the filament.

Leads from the binding posts on the unit go directly to these instruments. Flexible, rubber covered wire is best, as it does not break easily.

The distinct advantage of this set is that the "works" do not need to be behind the panel. They may be above or below, or over to one side, anywhere as long as the leads do not exceed a reasonable length.

This makes the set adaptable to any cabinet that may be on hand, able to fit into a phonograph, or built into an automobile with a small control panel within reach and the "works" and batteries under the seat.

Standard 201-A type tubes are used for all but the last ampli-

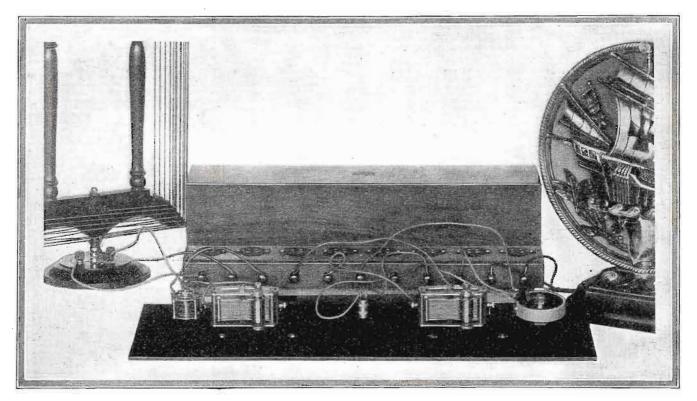

Photo C. View of receiver showing connections as made to the panel, loop and loud speaker

fier and a power tube may be used if more volume is desired.

This set will not bring in the same station at more than one point on the dial save at the high end of the waveband, and even there it is not bad enough to be really objectionable.

The loop is directional and greatest amount of volume is obtained when the loop is pointed towards the station wanted. If a nearby

adjustment and therefore does not require any careful adjusting.

LIST OF PARTS FOR EIGHT-IN-LINE RECEIVER

The model of this receiver constructed in the laboratory of the Citizens Radio Call Book was built from the exact list of parts appearing herewith. While it is possible for the ex-

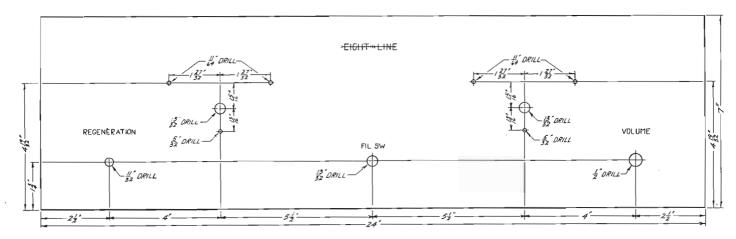

Fig. 1. Front panel layout

local station is in the same direction as the distant one desired, turn the loop broad side against the interfering station until it is nearly completely turned out. Retune the receiver for the station wanted, leaving the loop in the same position until reception is satisfactory. This method will slightly decrease the amount of volume from the distant station, but will eliminate the interference from the nearby broadcasting station.

The receiver is very easy to tune, as there are only four variable controls on the front panel. The two variable condensers are for tuning the oscillator and loop circuit; the rheostat controls the filaments of the intermediate tubes. The small condenser is for controlling the proper amount of regeneration required in the loop circuit.

perienced constructor or experimenter to successfully substitute other reliable parts for those actually specified, it is recommended that the novice strictly adhere to the list of parts as given below.

- 1-Eight-In-Line Unit
- 1-Lignole 7"x24" Drilled and Engraved Panel
- 1-DeJur 10 ohm Rheostat
- 2-DeJur .0005 mfd. Variable Condensers
- 1-Muter Filament Switch.
- 1-Marco .000045 mfd. Midget Variable Condenser
- 2-Gurz-Kasch Aristocrat Varnier Dials, Walnut Finish

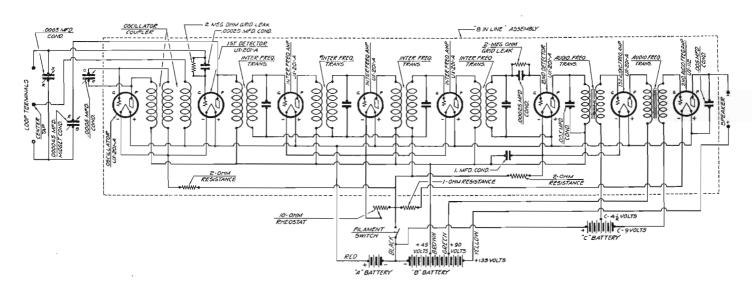

Fig. 2. Shematic wiring diagram

When receiving nearby stations, it is advisable to set the regenerative condenser at minimum. Increasing it will enable you to obtain a greater amount of sensitivity on weak signals. The proper adjustment of this condenser is of great help for adding sensitivity in the loop circuit.

The rheostat controlling the intermediate tubes is not critical in

- 1-Yaxley 1 ohm Resistance
- 1-Pkg. Kester Radio Solder
- 10-Ft. Acme Flexible Celesite Wire
- 7-Sonatron Type 201-A Tubes
- 1-Sonatron Type 171 Tube

List of Accessories for Use with the Eight-In-Line

The following is a list of accessories which have been tested in actual performance of the Eight-in-Line Receiver and have given favorable results. While these particular accessories are recommended, it is possible to make any reasonable substitution without loss of efficiency in the receiver.

- 1-Corbett D-20 Console
- 1-Corbett "C" Cabinet
- 1-Webster Bone-Dri AB Eliminator
- 1-Baker-Smith Type G Speaker
- 1-Bodine Loop

The Corbett C-20 Console shown in photo "A" is a very attractive piece of furniture, well worthy of a place in the

by a sensitive reproducing unit and none of the delicate overtones are lost, nor is reception ever hazy or blurred. This reproducing unit is made by the Baker-Smith Co. of San Francisco, California.

The Bodine loop as illustrated is a product of the Bodine Electric Company of Chicago. The wire constituting the loop is bank wound. A jack arrangement is provided at the base of the loop by which contact is made to the two ends and the center tap of the loop. This allows the loop to be rotated at will without the possibility of the wires becoming entangled. A further advantage of the loop is that it may be easily adapted for short wave reception by simply withdrawing the loop partly from the base so that only the two upper springs make contact. This will "cut out" one-half of the loop and will allow the reception of signals as low as 150 meters.

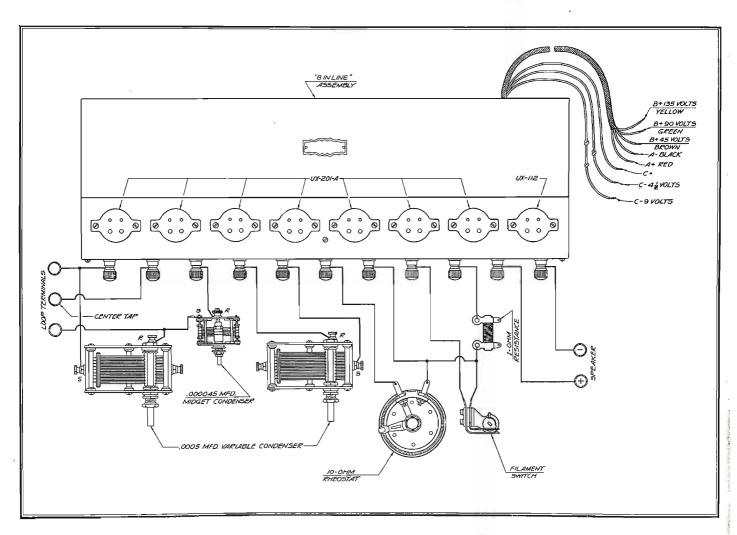

Fig. 3. Graphic wiring illustration showing all connections

finest home. Walnut is used, rubbed to a high gloss, with embossed ornaments on the corners and doors. The lower compartment has ample room for the eliminator and other accessories which might be stored there. The Corbett Type "C" Cabinet shown in photo "B" is used when the set is placed on a table. It is designed in the style of an ancient Italian treasure chest and presents quite an attractive appearance. Walnut is used in the natural finish, polished to an egg shell gloss. Both the console and the cabinet are manufactured by the Corbett Cabinet Manufacturing Co. of St. Mary's, Pennsylvania.

The Baker-Smith reproducer portrays a ship of the time of Columbus under full sail. The design is attractively moulded in cast white metal, the only kind that will not audibly vibrate when placed in the path of sound waves. The cone is controlled

The Webster Bone-dri AB Eliminator as illustrated in photo "A" is a new adaptation of AB climinators. It will supply "A" battery current up to receivers using ten tubes. The rectifier consists of two Raytheon cartridges which give full wave rectification, assuring no audible hum. The "B" source is rectified by means of a Raytheon type gaseous rectifier. The eliminator is supplied with knobs by which the "B" voltage may be rectified on all circuits. There is also a control by which the "A" battery voltage may be regulated to compensate for the difference in multiples of tubes. This eliminator is very staple and does not require attention at any time.

(If further information is desired on any of these accessories it may be had by writing direct to the manufacturer.)

The New Two Control Equamatic Receiver

Here Is a Vastly Improved Receiver Designed to Replace the Original Equamatic Receiver

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

EW receivers have bounded forward into general favor with such rapidity as the Equamatic. This is not altogether due to "follow the leader" tactics nor to stimulus on the part of the manufacturers.

The receiver is really worthy of sincere praise, for it follows a design that gives the largest output for the smallest input. It gives value received for every cent invested. Since first described in these columns a year ago, many letters have been received from enthusiastic builders telling of the remarkable results they have obtained.

And some of them seem all the more remarkable when one pauses to consider that the receiver uses but five tubes and can

be built complete with tubes and batteries for less than one hundred dollars.

And now comes an improvement that will be pleasing to many. The design has been altered so that the receiver may be operated successfully by the truly unfortunate people who are blessed with only two hands. By joining the two radio frequency controls with a link coupling, they may be turned as a unit, speeding up tuning and eliminating the bother of first swinging one condenser, then the other, several times till at last they are in unison.

Any lack of synchronism that may have resulted as an error in building may be easily overcome. The primary of the transformer is fastened to the condenser shaft by a set screw. It may be set on the bias slightly, or if that does not give the desired results, its axis may be shifted.

The units are assembled with such precision before leaving the factory one need suffer no apprehension as to any extreme difficulties.

If they are home made, extreme care must be exercised,

for the two must be identical or they will not function in synchronism over the entire wavelength scale. For your convenience, the secondary consists of sixty turns of No. 20 D.C.C. wire wound on a two and one-half inch tube, while the primary is a fifteenturn coil, two inches in diameter. In order to have the wire remain in place without dope, the primary tube is machine turned with a channel wide enough for the fifteen turns.

It takes more tools than a hammer and screwdriver to make the mountings. By consulting the diagrams you may determine the particulars. The only way a good job may be done is by employing some machine work. If the builder does not possess these requirements, it is best to purchase the coils ready made. They are the heart of the set and the secret of its success, and any error on their part will spoil the entire system. In fact, it is not advisable for anyone but the most experienced experimenter to attempt to wind the coils, since a novice will invariably have poor results.

The condensers must be of the straight line frequency type or they will not co-ordinate with the rotating coils. Be sure they have shafts extending far enough for the coil to be attached.

Builders will notice that the panel of this set is much shorter than last year's model. This is accomplished by doubling back the amplifier instead of continuing it in line. Due to the new type of shielded transformer this is possible without setting up any magnetic fields to run loose through the set, causing much

trouble. An output transformer used is very desirable, since it keeps the high voltage direct-current out of the loud speaker, improving tone quality and preventing damage to the driving magnets.

One especial advantage of this set is that the length of the aerial makes no material difference in regards to reception as long as it is kept within reasonable limits. For the builder who is far from local interference and has all the space he can use, an aerial two hundred feet long will be none too large. And for the city brother who must share the apartment house roof with at least twenty others, and is close to several of the high-powered broadcasting stations, an aerial from twenty to one hundred feet will be perfectly suitable. Reception in the city is not nearly so satisfactory as in the country, due to no fault of the set or the operator.

With the air full of a multitude of sounds, including street cars, ice machines, static and power hums, a certain amount of signal intensity is obliterated. If this amount happens to be

that infinitesimal portion that determines whether a signal is or is not inaudible, it makes quite a difference in the range of the set.

Here is where the Equamatic shines. Figuratively speaking, it is as flexible as a piece of rubber hose. There are so many means of adjustments besides the main tuning controls, and a person with average patience may adjust it till much of the local interference is choked out. The coupling between the primary and secondary of the variocoupler, the one hooked to the antenna and ground, may be loosened. That is, the set screw holding the secondary to the baseboard may be loosened and the coil drawn farther from the primary. The looser the coupling, the sharper the signal.

And by a sharp signal is meant that the band of transferred

Photo A. View showing two control Equamatic Receiver mounted in an Excello Console, with appropriate accessories

Photo B. Front view of receiver mounted in a Southern Toy Cabinet

energy is lessened. If the coil tunes in a band of three meters with the coupling jammed tight, it may cut down to one-half meter by opening the coupling to one inch.

That means that only the energy which radiates on that particular half-meter channel is received. It is a strange phenomenon that there is no material decrease of the volume of the desired signal. It is often confined in such a narrow range of the tuning condenser one may tune right past the point without hearing a sound if not looking for that particular station.

All radio frequency amplifiers have a tendency to oscillate, often very pronounced. There are several ways to eliminate this, the one used in the Equamatic being a radio frequency choke consisting of one hundred turns of fine wire wound on an iron core. This successfully throttles the undesirable oscillations. The coupling of the radio frequency transformers may also be varied. This depends on the receiver, tubes used, and plate voltage. It will do no harm to experiment; it is quite possible it will improve reception and selectivity. In addition, a variable condenser between the plate and negative filament of the radio frequency tubes act as a neutralizer. This is an improvement that was not in last year's model and does much to correct the differences of internal capacity of the tubes. It is a good policy to leave the tubes in the sockets, once they have been placed and adjusted. Changing will only cause confusion.

The filament current of the radio frequency tubes is controlled

by a ten-ohm rheostat, that of the detector by a twenty-ohm rheostat, and the audio frequency amplifiers by Amperite resistors inserted directly in the lead.

The grid condenser of the detector is of .00025 mfd., the leak is two megohms. Place the condenser as close to the socket as possible. The shorter the grid leads, the better the efficiency. Cushion sockets eliminate all microphonic vibration which is so evident in regions of flimsy building construction, heavy coal trucks and the like. Often the only reason a tube howls is because the elements are vibrating. If the shocks are all absorbed before reaching the tubes, the noise is also eliminated.

The Multiplug is an ideal method of connecting the batteries. It eliminates the row of binding posts and saves time and trouble in making connections. As the leads are all marked and each a different color, there is no danger of them becoming confused. Consequently there is little danger of tube blowouts due to wrong connections. A baseboard of bakelite with concealed wiring is used. This has the double advantage of having most of the wiring out of sight, and also making it easy to dust the set. Diagrams are given showing the layout of the instruments. This should be followed closely in regard to mounting the instruments, especially the radio frequency transformers. These must be placed at an angle of 58 degrees, for at that point intercoupling is reduced to a minimum. A good plan is to inscribe a line showing the angle at the base of each coil and fill it with white

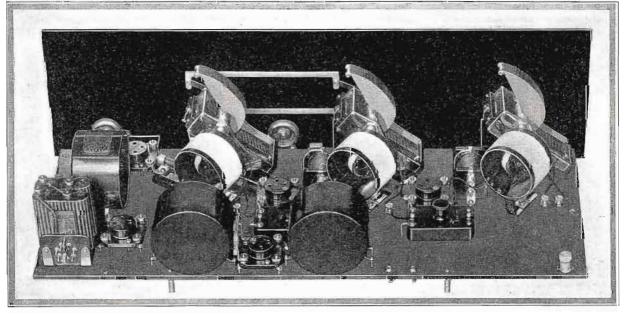

Photo C. Rear view of completed receiver

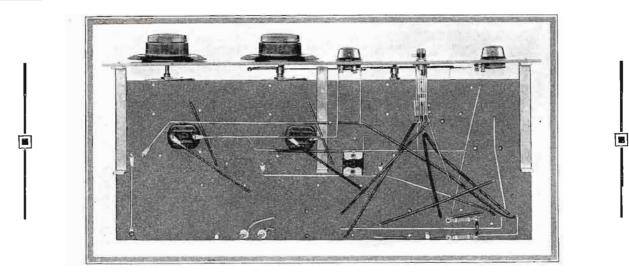

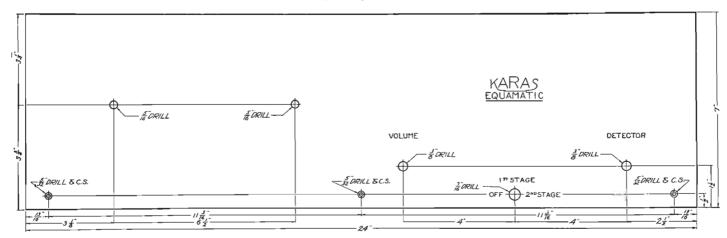

Photo D. , Bottom view showing arrangement of fixed condensers and switch

Panel layout

lead, or a similar marking material. Then in case the coils become shifted or jolted out of line in construction or use, they may be again set in the proper relation without having to resort to measuring.

Before placing the set in use, insert the tubes in the sockets and connect the "A" battery. This is a simple precaution to determine whether the wiring is correct. To further check the circuit, disconnect the positive "A" and touch all the other leads

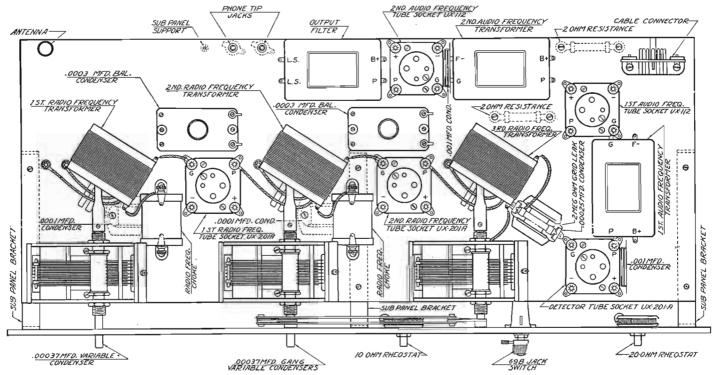

Fig. 2. Baseboard layout giving location of parts

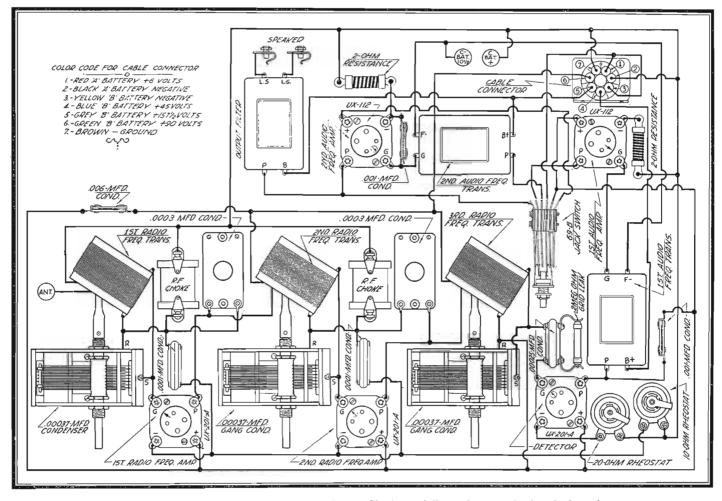

Fig. 3. Graphic illustrations showing all connections. Check carefully against completely wired receiver.

to the terminal of the battery. Should the tubes light, there is a "short" somewhere. If not, then connect the leads to their proper terminals and the set is ready to use.

The following is a list of accessories which have actually demonstrated their ability to properly operate the Two Control Equamatic Receiver. While these particular accessories are suggested, any reasonable substitute may be made without decreasing the all-round efficiency of the receiver.

- 1-Excello R-31 Model Console
- 1—Southern Toy Company "Blue Ridge" Cabinet 1—Fansteel Model A-6 "A" Power Supply
- 1-Burns "B" Power Supply
- 1-Burns Cone Speaker

The Magnaformer 9-8 Receiver

A Receiver Incorporating Precision Built and Perfectly Matched Shielded Tuned Intermediate Transformers

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

HE success of any Super-Heterodyne receiver is dependent primarily upon its stages of intermediate frequency amplification. To insure the finest operation the transformers in the intermediate frequency amplifier must be built with extreme care and precision. In this respect the transformers used in the Magnaformer 9-8 receiver may be considered the ultimate insofar as efficient operation is concerned. The transformers are the result of a

number of years of research both in laboratories and practical operation. Not only has the best of radio engineering ability been employed in obtaining the final product, but the mechanical design has been given every consideration together with the fundamentals of engineering other than those usually employed in the radio field.

The Magnaformer 9-8 receiver may be truly considered to be a receiver that is designed from the best available parts possible to produce all perfectly matched into a compact, high quality receiving set of the first order. Its ability to detect and reproduce signals is so acute that the set has an unlimited range. All musical notes within the audible scale are passed from the second detector and if a good speaker is used there will be a perfect reproduction of a studio program. The selectivity is so marked that even the most powerful local station can be tuned out and a DX station brought through with a minimum of interference.

This receiver is so powerful that a switching device is provided by which either eight or nine tubes may be used at will. This is highly desirable since the tremendous volume delivered by the set when nine tubes are used on local stations is overbearing. Therefore only eight tubes are necessary. The nine tubes are extremely convenient, however, when distant reception is wanted. This arrangement is only possible through the use of five stages of intermediate frequency amplification. Up to the

present time only three or four stages of amplification were normally possible. However, the excellent design of the transformers used in this receiver allow the use of five stages with attendant increased selectivity and reception range.

Mechanically, the transformers are as nearly perfect as engineering skill can make them. The primary and secondary coils are wound on bakelite and are permanently fixed so that their inductance cannot possibly change. The secondary coil is accurately tuned in the

manufacturer's laboratory by small variable condensers which are fixed and locked after the tuning is done.

These small condensers are outside the shielded metal case, being entirely clear of the electrostatic field of the transformer and therefore not affected. They are sealed in an air-tight compartment and connected across the secondary. No jar or jolt can change the capacity of the condenser, nor are they affected by moisture or

climatic changes. This means that there is a uniform performance the year around and the set will work just as well, as far as the transformers are concerned, in any climate or geographical location.

Due to the efficient shielding, the transformers may be mounted closely together. There is no need of employing an engineer to determine the angle of mounting. They are mounted in a single plane, all parallel.

The characteristics of the transformers are such that the incoming signal receives double the usual amplification in each radio frequency stage, hence, a powerful output which may be controlled from a mere whisper to such volume so as to fill a large hall.

The Magnaformer 9-8 receiver may readily be classed with the "easy to build" sets because all parts are placed where they are readily accessible. The easiest and most logical layout is the one used. Every part fits in perfect harmony with its neighbor, giving a mininum of wiring and a maximum amount of internal beauty and accessibility conveniences that are often sadly ignored in home constructed receivers.

The oscillator is located midway between the two tuning condensers and is well out of the way. Its location allows the total length of the front panel to be reduced three inches.

The five intermediate frequency transformers, the two audio transformers and the output filter are mounted in a line at the rear of

the baseboard, the tube for each transformer being placed directly in front of it. Spring suspension sockets are used, eliminating microphonic noises and any damage to the tubes due to rough handling.

Directly behind the first intermediate transformer are the plug-in jacks for the loop aerial. Only two are used since this receiver does not require regeneration. Regeneration is not necessary in the Magnaformer circuit to obtain extreme selectivity and ample volume on distant stations, but it can be readily incorporated if one so desires.

Photo A—How the Magnaformer 9-8 Receiver appears when installed in a console with appropriate accessories

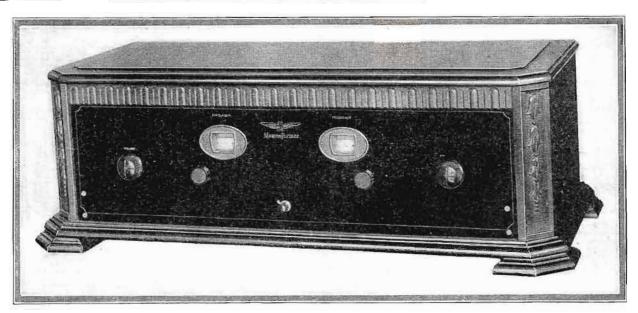

Photo B-The completed receiver installed in a cabinet

However, regeneration is not advised for any but the experienced operator. It complicates tuning and has a tendency to make the set howl and squeal if not properly controlled when tuning in stations. If the urge for additional work and worry is irresistible, regeneration may be accomplished by revamping the hook-up in the following manner.

The wire from the coupler which is normally connected to the rotor of the condenser, or in the case of the Remler condenser, the side which does not connect in the filament circuit, should be disconnected and fastened instead to the center tap of the loop. This means that three plug-in jacks, instead of two will be needed.

The condenser is now cut out of the circuit. Run a wire from the plate tap of the first radio frequency transformer to the rotor of a midget condenser which must be installed. From the stator of the midget condenser run a wire to the rotor of the variable condenser and from there to the lower post on the loop. This gives a three-terminal loop and an additional control to juggle.

Now to return to the description of the receiver. The oscillator coil is mounted in a bakelite case with the six taps brought out to terminals, the two primary on one face, the four secondary on the other.

Remler twin rotor condensers are used for tuning. These are controlled by a drum type vernier dial with worm gear mechanism. Due to the high ratio of the reduction, unusually slow movement may be obtained, which is quite essential in tuning in distant stations. The condenser is hung from the panel by a bracket. A unique arrangement is that the supporting screw and the lock nut that holds the tuning shaft are covered by the bezel. This gives a pleasing panel display free from unsightly screw heads.

The dial on the drum is of paper of such a texture that the calls of stations may be written on it with ink without the danger of them blurring, or with pencil, which may be erased without leaving an unsightly splotch. The dial is graduated throughout the entire circle in a scale of 0-200.

The dials are illuminated by means of a six-volt lamp run from the battery or eliminator. As the light is thrown on the face of the dial instead of through it, the glow is rather diffused, giving a mellow effect, bright at the top of the bezel and fading into darkness at the bottom.

The two tuning controls are all that need be seen when the set is in operation. A good plan is to turn out all the lights in the room and listen-in in the darkness. It is a well-known physical fact that when the eyes are at rest the ears are more sensitive. Signals may often be logged in the darkness that would be inaudible in the light.

The double-pole double-throw switch to "cut out" one of the intermediate frequency transformers is located at the lower center of the panel between the two tuning controls. It is of the rotary cam type,

a twist of the fingers changing from one combination to the other.

Three rheostats, two fixed resistances and a potentiometer are the supplementary controls. These need only be touchd at the initial adjustment, or when some change is to be made in the operation of the set. The potentiometer and the six-ohm rheostats are mounted on the panel, one at each end. The potentiometer controls the volume and the rheostat the brilliancy of the filaments. Soft tubes are always best for detectors if any real selectivity and sensitiveness to weak signals is desired. They are quite critical as to filament consumption and additional rheostats must be provided. These are mounted on the baseboard, for they need to be set but once and then left alone. The Amperites for the two audio amplifier tubes are slung in cartridge clips to the under side of the baseboard.

A small radio frequency choke must be in the plate lead of the second detector. This is to prevent radio frequency current from feeding into the amplifier.

An output filter is used to remove all harshness and discord from the amplified signal. It also keeps the direct current out of the loud speaker, preventing it from becoming polorized and therefore less sensitive.

All battery connections are made through a Multiplug. The receptacle mounted on the under side of the baseboard in the center, the place most conveniently located for accessibility to all parts of the set.

Standard bus bar wire should be used throughout. Bare wire if possible and insulated wire only where there is danger of two leads becoming shorted.

A simple test to insure against any danger to tubes due to any defect in wiring or excessive voltage on the filament is the insertion of an ordinary electric lamp in series with the negative B line at the B battery terminals. Now turn on the set, and if the lamp does not light, the wiring is safe. If the lamp does light, correct the trouble before taking it out of the line. Be certain to remove the bulb before trying to operate the set, as you cannot get satisfactory results with the lamp in series with the "B" battery due to its high resistance.

It is very simple to tune the receiver. Begin by turning the knob of the filament rheostat to the right. This will light the filaments of all the tubes and the lamps on the dials as well. Turn the control knob of the potentiometer about one-third or one-half to the right. Now turn the two tuning dials through any particular range, keeping them pretty close together. When you hear a signal, tune sharply with the right hand dial, then further increase the resonance and volume with the left hand dial. Then adjust the volume control and the rheostats until results are satisfactory.

Under favorable circumstances this set will give a tremendous volume, and music and speech of such resonant tones and purity as to be surprising. Due to the great amplifying power of the intermediate frequency transformers, distant stations may be brought in with gratifying volume that are inaudible on the average set.

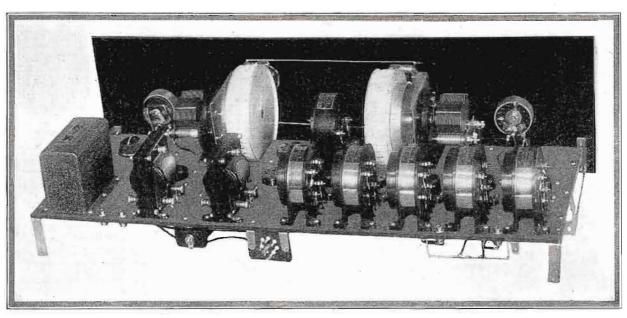

Photo C-Rear view of Magnaformer 9-8 Receiver

List of Parts Required for the Magnaformer 9-8 Receiver

The laboratory model of the Magnaformer 9-8 receiver was constructed from the list of parts given below. While it is possible for the experienced constructor to substitute other good apparatus for that actually specified, it is advisable that the novice strictly adhere to the list given herewith.

- 1-Formica 7x26x3/16 inches Drilled and Engraved Panel
- 1-Formica 9x25x3/16 inches Drilled Sub-Panel

List of Accessories Used with the Magnaformer 9-8 Receiver

The following is a list of accessories that have actually demonstrated their ability to properly operate the Magnaformer 9-8 Receiver. While these particular accessories are suggested, it is possible to make any reasonable substitution without decreasing the all-around efficiency of the receiver.

- 1 Fritts Super Consolette.
- 1 Fritts 26-inch Standard Super Cabinet.
- 1 Rowan 100 ampere-hour "A" Grade Storage Battery.
- 1 Muter "B" Power Supply
- 1 Temple Model 13 Speaker.
- 1 Sterling Type R-108 Charger.
- 1 Qualitone Loop.
- 1 Jewel Type 595 A-B Relay.

The large photographic reproduction shown in Photo "A" shows how the Magnaformer Receiver appears when installed in a Fritts Super-Consolette. The smaller photographic reproduction shown in Photo "B" illustrates how the receiver appears when it is installed in a Fritts Standard Super Cabinet alone. Both of the above mentioned pieces of furniture are manufactured by the D. H. Fritts Company of Chicago, Illinois, who specialize in solid walnut radio furniture. The consolette is beautifully carved and is finished in a two-tone effect. The hardware is slightly polychromed, which sets it off very beautifully against

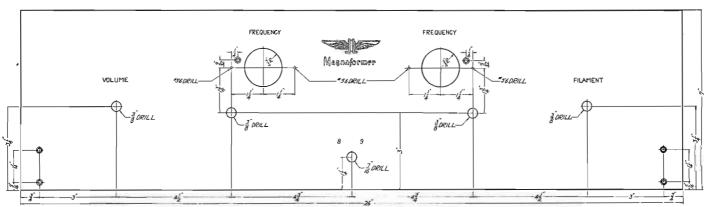

Figure 1. Front panel layout

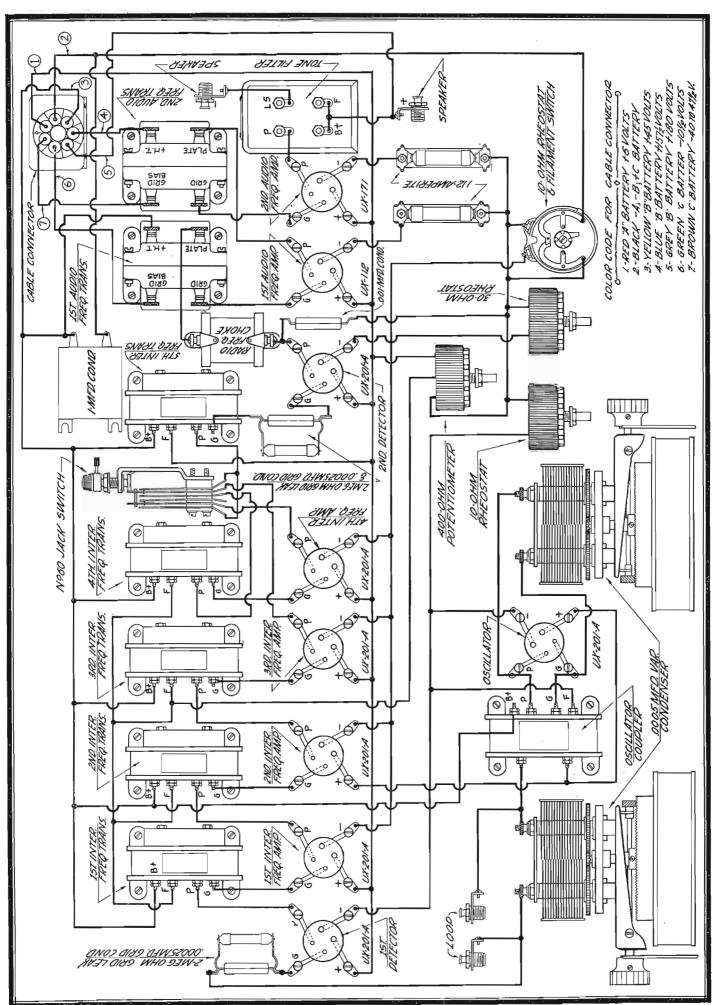

Figure 2. Graphic wiring diagram. Carcfully check the completed receiver against this diagram

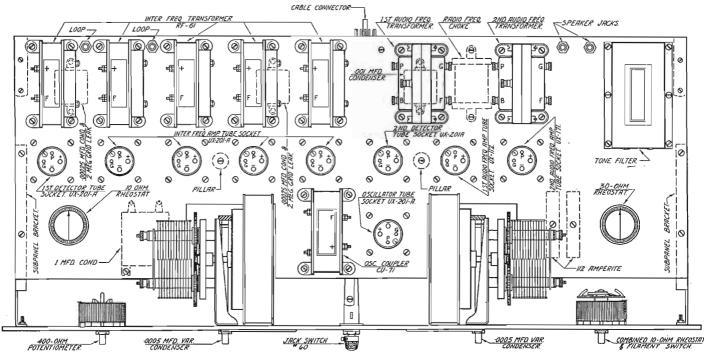

Figure 3. Baseboard layout of Magnaformer 9-8 Receiver. Note symmetrical layout of apparatus

the darker wood constituting the console. Ample space is provided in the battery compartment of the consolette for the storage of all necessary apparatus for the proper operation of the receiver.

A Rowan Storage Battery is used to supply the necessary "A" voltage for heating the filaments of the tubes. This particular battery is well made and is contained in a solid rubber case. A handy carrying handle is provided which is a distinct advantage. Screw terminals are provided for an easy attachment of the connecting wires.

The "B" battery supply is obtained from a Muter "B" Power Unit. This device is manufactured by the Leslie F. Muter Company of Chicago, Illinois. Rectification is accomplished by the use of a standard full wave rectifier tube such as the RCA UX 213 Tube. Five "B" voltages are obtained with the "Power" binding post delivering 180 volts for a UX 171 tube. The Temple Speaker shown with this installation is manufactured by Temple, Incorporated, of Chicago, Illinois. In outward appearance this speaker appears to be a cone type, but such is not the case. A coil horn is used which is a slightly modified exponential type recently developed. An air column of approximately 6 feet is used, which when combined with the reproducing unit of excellent

design gives a reproduction of music and speech which is startling in its clarity and strength.

The "A" battery is kept at full charge at all times by the use of a Sterling Charger. This charger is by far the smallest on the market at the present time, and delivers $2\frac{1}{2}$ amperes of fully rectified current to the battery. The extreme compactness is due to the use of two Raytheon Cartridge Rectifiers. Acids, bulbs and other means of rectification are not used in connection with this charger.

The Qualitone Loop shown with this installation is manufactured by the Duro Metal Products Company of Chicago, Illinois. It is entirely constructed of solid walnut lumber, and is very beautiful in design. The Jewel Relay shown makes the entire installation of accessories automatic in character, since the relay automatically turns the power devices on and off. All of the accessories are directly controlled by the filament switch on the receiver. The charger is turned on when the set is not in use and the "B" Eliminator is turned on when the set is in use.

(If further information on any of these accessories is desired, it may be had be writing direct to the manufacturers.)

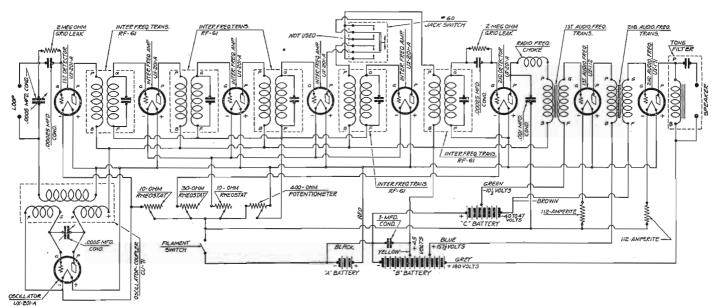

Figure 4. Schematic wiring diagram of receiver

A New Raytheon A B C Power Unit

Here Is a Complete Power Assembly That Does Away
With All Batteries

This Unit Has Been Constructed and Completely Tested in Our Laboratory

ND now has been developed a really efficient, compact. reliable eliminator that performs all the work of the three sets of batteries, does it better, cheaper and requires practically no maintenance.

Due to the heavy duty of both lighting filaments and supplying plate current, the eliminator must of necessity be of generous proportions.

Some builders like to incorporate the set and the eliminator into a single unit placed in a console cabinet, while others would rather have it remote, connected with a multicord cable.

For the sake of clearness of description, we consider our instrument as a separate unit in itself. The only drakback in including it in the set proper is that the losses are released in the form of heat.

Cooling is best effected by placing the instrument in an ex-

point is near the peak of best operation and is also the drain of the average set using eight tubes. A load of less than 200 mills is not desirable, for that is not enough to enable the tube to function properly and power is lost. The power transformer is one that is rated at 200 watts. It has a primary winding for 110 volts, two secondary windings of 350 volts each and a 5-volt winding to supply the filament of the power amplifier.

To prevent undue surges upon starting and damage in case of a short, a resistance of from 10 to 20 ohms is placed in series with the primary. This has a tendency to absorb fluctuations of the line voltage, and also to cut down the input voltage to around 80 volts.

Many of the transformers available have the resistance already mounted and connected. However, if home-made, 50 turn of No. 16 enameled iron wire, wound on a 3-inch asbestos square,

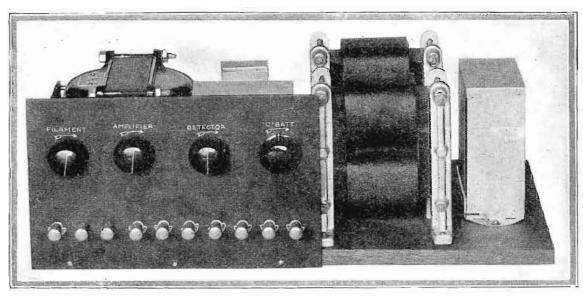

Photo A. Front view of climinator showing binding posts and controls

posed position where air may circulate freely about the tube, but if there is danger of mechanical injury resulting, a well perforated metal cover may be placed over it. The heart of this eliminator and the reason it is practical is the new Raytheon type BA tube. It has a bulb very much like the old style Mazda lamp, clear glass with the tip on top. It is fitted with the standard four prong base and will fit all modern sockets.

The elements are similar to the two smaller tubes, but are of more rugged construction and the cap is shaped like half a walnut shell.

The reason the glass is so much larger than the lighter duty tubes is because the load to be carried is 350 milliamperes, where the others are 60 and 85 respectively. A greater load means more heat, and the only way the heat can be drawn away from the tube is by means of the glass bulb. The larger the bulb the more cooling surface. Under a normal load the tube should show no color. If overloaded a tiny spot of cherry red will develop. It is not safe to operate it at this heat, for the life will be greatly shortened.

Under proper conditions this tube should deliver a thousand hours of active service, and it will do far more with careful treatment. The most satisfactory load is around 280 mills, for that will be satisfactory. Two Mazda lamps in parallel will do for a makeshift.

It is very good policy to fuse the primary. Two three ampere plug fuses are the right size. They will blow the instant something goes wrong, often before the trouble would be otherwise detected.

The three high voltage output terminals of the transformer go to a buffer condenser. This instrument is just what the name implies, a shock absorber, that smoothes the wrinkles out of the current before it is rectified. It is a double unit, consisting of two condensers each with a capacity of .2 mfd. They are connected in scries, the two 350-volt leads going to the outside terminals, the neutral lead to the middle.

The two outside leads then go to the terminals of the socket marked F— and F+.

An air gap socket is best for this purpose, as there is nothing to it, that is, there is no useless material employed that would tend to obstruct the radiation of heat. The air gap adds insulation and prevents the possibility of deposits of dust forming a path for a short circuit. When one stops to consider that there is 700 volts between the two filament terminals just waiting an excuse to jump over and cause a lot of trouble, one will better

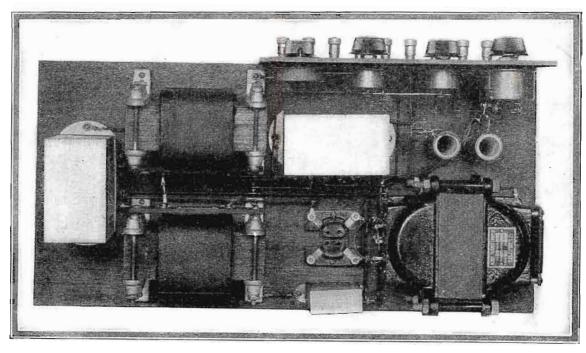

Photo B. Top view of eliminator showing arrangement of parts

appreciate this precaution.

The plate terminal goes to a 10 henry choke. There are two identical chokes employed, connected in series. Be sure that they are rated for 350 mills or over. If they are rated at less than the load to be carried, there is danger of them puncturing or shorting. A short in a choke coil is very hard to detect and it will cause no end of trouble.

The purpose of the choke is to iron out the pulsations in the current. After passing through the Raytheon tube the current is direct, but instead of flowing in a continuous stream like the current from a battery, it is surging in spurts. The choke retards one pulsation till the one behind catches up with it, and the output is a continuous flow, which means a noiseless plate and filament supply.

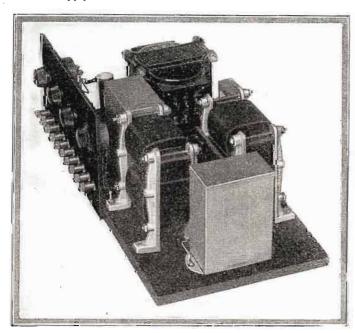

Photo C. End view

Across the first choke is a double unit condenser consisting of two four mid. blocks. The outer terminals of these are connected to the terminals of the choke, while the center terminal is connected to the center tap of the high voltage winding on the transformer. To the outer terminal of the second 10 henry choke is attached another multiple unit condenser. This one consists of an eight and three one mfd. units. The eight mfd. tap goes to the choke, the other three to fixed and variable resistances,

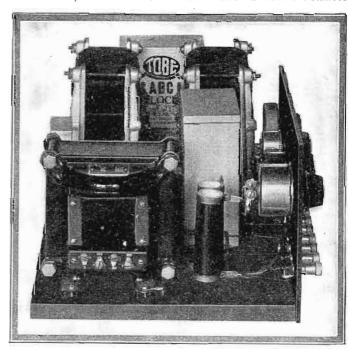

Photo D. End view of eliminator showing placement of resistances and controls

governing the output voltage for the requirements of the different tubes.

The center tap is connected to the center tap of the first condenser and also the center tap of the high voltage winding.

As the B plus terminal for the amplifier requires the full delivered output of the eliminator, there is no resistance needed.

If the intermediate stage amplifier requires a slightly lower voltage, it is connected to the next binding post in line, which will deliver approximately 150 volts. If the whole 180-volt output is too great for the volume desired, the last post may be omitted and this one used instead. To get the exact voltage needed a universal clarostat is inserted in this lead. By means of this, the

voltage may be cut down.

The detector always works best on a lower voltage than the amplifier. If one of the soft tubes is used, the adjustment is somewhat critical and often a distant station may be brought in much better if the voltage is either raised or lowered slightly. To accomplish this, another universal clarostat is used. The voltage may be cut down to around 30, or raised as high as wanted.

The negative A and B and the positive C are all connected to the same terminal. In this lead is inserted a fixed resistance wound on a porcelain tube. This has a resistance of 1000 ohms.

The negative C Battery is connected to the terminal indicated on the multiple unit condenser, and also to the center tap of the 5-volt winding on the transformer.

To obtain the proper grid bias a potentiometer is shunted across the common negative output terminal and the center tap on the high voltage winding. The potentiometer arm is connected to the negative C battery. By rotating this arm the grid bias is altered.

Power tubes perform best if alternating current is fed to the filament. And incidentally, the current consumption of a power tube is so great it would soon ruin the Raytheon tube to supply it as well as the rest of the set. The winding delivers exactly 5 volts, and as the power tube is not critical, working equally well over a range of 2 volts fluctuation, no rheostat is needed.

This set, as designed, is suited only for sets using the 201-A tubes. It can be used for the others, but alterations to suit will have to be made.

Each tube in itself draws 250 mills. The Raytheon tube will

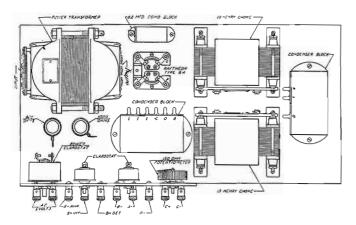

Fig. 1. Baseboard layout

only pass a current of 350°mills. In that case it seems as if but one tube could be used in the set. It would if the filaments were hooked in parallel, as they usually are. Now if the filaments were hooked in series, the voltage would be the number of tubes in the set times five, the voltage used by each, but the amperage would still be only 250 mills, the same as one tube draws. So that solves that problem.

Hook the filaments in series, all but the high amperage power tube. That means rewiring part of the set. It is not as hard as it sounds. Simply cut the wires from each socket and hook the negative to the positive of the socket next to it. The rheostats on the set are now no longer of any use, so omit them.

Bring the two terminals, one negative, the other positive, out and connect them to the binding posts so marked on the set.

The terminal on the eliminator for the positive A has a larger power clarostat shunted by an 800-ohm resistance. Before turning on the power to the set, be sure that all the resistance is in. That will prevent an overload on the tube filaments. Gradually cut out resistance till the tubes are functioning properly.

The entire eliminator may be mounted on a piece of good substantial wood, or metal, whichever best suits you. It must be able to hold the weight, whichever is used. The finished instrument tips the scale to 40 pounds.

If directions are followed carefully and standard parts used, there is no reason why the eliminator should not function per-

fectly. Juggle the controls a bit till best results are obtained. Then rest assured that with proper care your power requirements will be taken care of for the life of the tube. That should be two years, the way most sets are run.

LIST OF PARTS

If any of the parts listed below are substituted, care should be taken to see that the exact equivalent is used.

The Improved Camfield Duoformer Seven

True Tone Quality and Total Absence of Oscillation Brings This Receiver to the Front

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

HE Duoformer Seven is a circuit especially to be recommended as it gives the full advantage of seven tubes and the simplicity of control of a five-tube set.

It is similar to the conventional five-tube, tuned radio fre-

It is similar to the conventional five-tube, tuned radio frequency circuit in so far as the controls are concerned. The one outstanding difference is that the first tube is untuned and directly coupled to the aerial and ground, making extreme volume possible, still not sacrificing much selectivity.

The other refinement is the push pull amplifier, which rounds out the tones, giving enough volume to satisfy the most discriminating

The radio frequency transformers are somewhat different from the usual run, and they gave some outstanding advantages that are worthy of special consideration.

The duoformer is the result of much research in the field of oscillation prevention, while still maintaining the full quota of volume and selectivity. It is well known that when the tendency to oscillate is overcome the resulting tone quality is far superior to any otherwise obtained. Combined with a simplicity of construction this circuit should make a special appeal to the builder who does not care to fuss with the critical adjustments necessary to neutralize or balance the average receiver.

An unusual system of preventing oscillation is embodied in the special construction of the duoformer. The outstanding features are simplicity of construction combined with high efficiency over the full range of broadcast wavelengths. This circuit does not require that its builder be a radio engineer or have the highly complex technical knowledge to successfully prevent oscillation or make the minute adjustments before the set will function properly.

In order to understand the methods used to prevent oscillation we

must first make a brief survey of the causes of oscillation in a tuned radio frequency amplifier.

When two circuits are tuned to the same frequency and brought into electrical proximity there is a decided tendency for the current in one circuit to be transferred inductively to the other. There are several channels of transfer, any one or all of which may be the cause of the disturbance.

The first is inductive coupling between the windings of an interstage transformer. Here the output of one tube is fed into another tube through two coils of wire wound on the same form, or on forms in close proximity. The degree of current flow may be regulated by varying the coupling between the two coils or throwing one coil slightly out of resonance with a condenser.

The second is capacity coupling through a condenser. Radio frequency current thinks nothing of walking right through a condenser, and it will never overlook a single opportunity, no matter how slight, to step off the beaten path and go wandering about where it is not wanted.

Certain condensers in a set are to be desired, for they by-pass the radio frequency around coils or between coupled circuits. However, there is one form of condenser in a set that is not only avoidable, but quite detrimental to the welfare of reception. That is the action

induced by two wires running parallel. In wires of the same polarity this effect is not noticed, but let a grid and plate lead get within speaking distance and there is trouble right away. The chief cause for this effect is carelessness of construction.

All of the sets designed in our laboratory and described in this publication are designed to minimize coupling of wires. If the builder carefully follows our wiring diagrams there will be small chance of unsatisfactory results from this cause.

The third is the internal capacity of the tubes. This we cannot overcome, for as soon as the tubes are altered in design their other characteristics are also changed.

There are numerous methods of preventing the oscillation due to internal capacity of tubes, all of which work, some better than others, of course.

The method employed in the duoformer is unique and quite a step from the usual practice. At first glance it would seem that the internal capacity of a vacuum tube would be so slight as to have no material effect upon the operation of the set. This is far from the truth, for the internal capacity of a tube has a tremendous influence upon its functioning, particularly

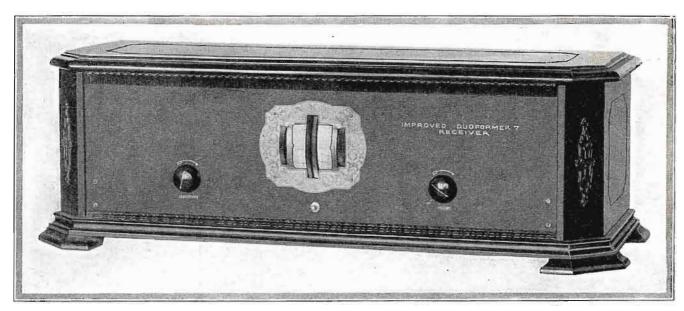

View of completed receiver installed in a console with suggested accessories

at the eligher frequencies.

In designing the duoformer the engineers fully recognized the existence of feedback through the tube capacity and the necessity of compensating for it in order to prevent oscillations when all stages of the radio frequency amplifier are tuned to resonance.

Under the usual conditions the current fed back from the plate circuit to the grid circuit through the tube is of such phase as to add to the voltage already existing between the grid and the filament, causing oscillation. If the right phase relation is found oscillation will cease.

All the constants of the duoformer are arranged in relative proportion so that the current fed back from the plate to the grid is in

Front view of receiver mounted in a Corbett cabinet

the proper relation, and all tendency to oscillate is discouraged.

This feature, combined with the physical design of the duoformer, practically eliminates all electromagnetic coupling between successive stages, and a circuit design embodying the proper use of by-pass condensers makes it possible to build a seven tube receiver that has a high and uniform efficiency over the entire range of broadcast frequencies.

The instruments are mounted on a bakelite subpanel with all wiring and many of the small parts on the under side. The panel contains the two tuning dials, two variable resistances and a filament switch.

The antenna lead is brought directly to the grid of the first radio frequency tube, and the negative filament to the ground. Across the two is a 1000 ohm resistance, which forms a leakage path for the surplus energy and prevents the tube from jamming.

Between the filament and plate leads of all the tubes but the audio amplifiers are .001 mfd. fixed condensers used to by-pass the radio frequency.

The detector tube has a 3 megohin grid leak across a .00025 condenser

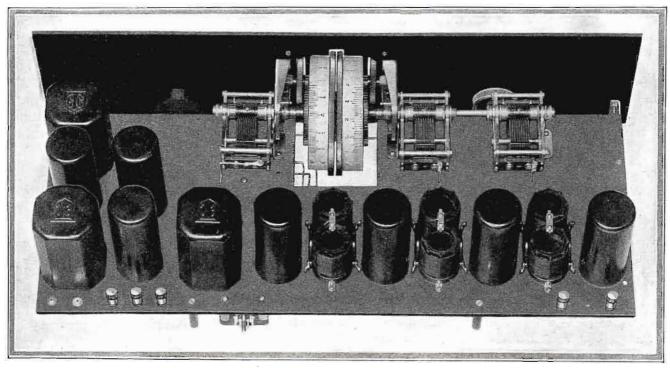

Volume is controlled by a 10,000 ohm variable resistance which connects to the B terminals of all the radio frequency transformers.

A "C" battery is needed, four and one-half volts for the first audio stage and ten and one-half for the second.

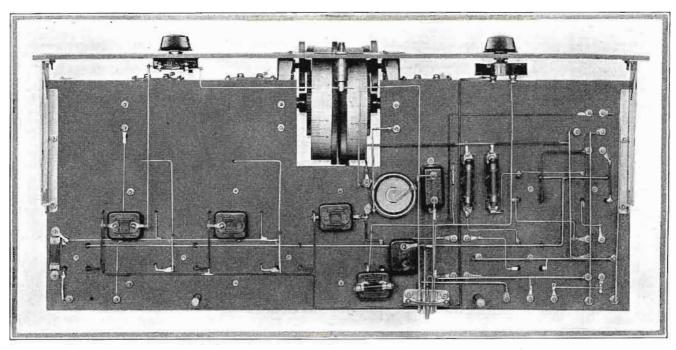

With the push pull system, a transformer with a double secondary is used, one grid connecting to each half. An output transformer of similar construction prevents the direct current from the "B" battery enetering the reproducing horn and demagnetizing the windings.

The tuning of the duoformer is similar to most of the other tuned radio frequency sets and anyone who is the least bit familiar will have not the slightest difficulty in bringing in stations. The two dials will read the same or nearly so. It is practically impossible to get them absolutely in unison through the full scale, but one or two degrees off will make no material difference in reception.

If it is found that the gang condensers do not tune sharp enough, a set screw located on the axis of either of them may be loosened and the plates rotated free from the shaft until the spot of sharpest tuning is reached. Due to the fact that the set is home made, no set adjustment can be made on the instruments at the factory. Sometimes a

Rear view. Note neatness of subpanel layout

Bottom view, Note how subpanel is cut away to allow for drum dials

difference of two inches in the connecting wires will be enough to throw the condensers out of harmony.

It is a simple operation to adjust them, and once they are set, they require no further attention.

201-A tubes are used for all but the last stage audio amplifier. As they are all of the same internal capacity, there is no special need of matching them.

LIST OF PARTS

These parts of their equivalent will give satisfactory results:

- 1-7x26x3/16-in. Drilled and Engraved Formica Panel.
- 1-10x25x3/16-in. Drilled Formica Subpanel.
- 3-Camfield .00035 mfd. Variable Condensers.

A Compact Portable "B" Eliminator Test Set Here Is a Handy Adjunct to Service Man's Kit

This Instrument Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

N designing a portable tester for field testing of "B" battery eliminators with especial view towards correction of poor design in eliminators, it is necessary to consider the following points:

- 1. Portability.
- 2. Ruggedness.
- 3. Universal application.

The idea of portability requires that all parts shall be contained within a small case. This at once eliminates oscillagraphs, vacuum tube-voltmeters and other devices especially applicable for "hum" tests. Therefore it is necessary to assume that choke coils and condensers are properly designed and installed. This assumption is reasonable if the eliminator can be made to supply voltages to a sensitive radio set without more than ordinary hum.

The testing is then limited to the taking of voltage-current curves (regulation) on the several taps. It is necessary that the tester contain variable loads to be applied to the several taps of the eliminator, and it is necessary that these loads may be removed in order that a practical test may be applied by actually measuring the input to a radio receiving set.

The idea of portability requires that as few meters as possible be used and that each meter be made to serve the maximum of use by means of switches which throw it into several circuits. Schemes for switching these instruments will be explained fully further on.

The requirements of "ruggedness" are that it shall be portable

Photo A. Top view of competed test set

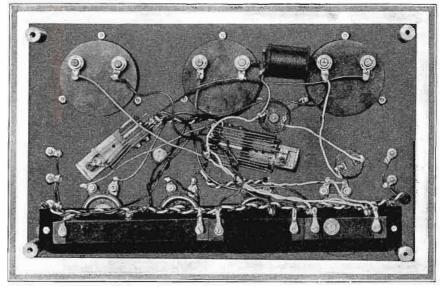

Photo B. Bottom view showing all wiring

without special care as to prevention of knocks and vibration. This demands that very rugged instruments be used throughout, and this ruggedness eliminates such things as galvanometers and microammeters, vacuum tubes, etc.

It is necessary that the test set be as nearly universal in application as possible. Voltages as high as 500 volts must be read and currents to 40 milliamperes must be handled. At least 3 voltage taps must be provided, and the self-contained, variable loads must be capable of simulating any radio set.

The problem of a high resistance voltmeter is an old one with which the public is familiar by now. The reading of the voltages on "B" battery eliminators requires that the voltmeter shall be of such high resistance that the current drawn shall be small in order that it may not add to the load of the eliminator. Commercial voltmeters with a range of 150 volts draw from 15 to 20 milliamperes, and this is sufficient in some cases to badly overload the eliminator.

A milliammeter may be used as a high resistance voltmeter by means of a current limiting series resistor called a multiplier.

If E is the maximum voltage to be measured and I is the current range of the milliammeter, then R, the resistance required to cause full deflection of meter on voltage E is found through the use of the following formula:

$$R = \frac{E}{I}.$$
 The I is in amperes.

Assume a 1 milliampere ammeter with a negligible resistance of about 30 ohms and a voltage of 500 volts, then:

Rm =
$$\frac{500}{.001}$$
 = 500,000 ohms.

The Rm is the resistance of the multiplier. This is a very expensive resistor and money can be saved and other advantages may be obtained by the method as shown in Fig. 1.

The voltmeter, of ordinary range and price, draws entirely too much current for use in measuring voltages of a "B" current supply device. However, it may be used as a standard in calibrating a milliammeter for use as a high resistance voltmeter using a high resistance, variable rheostat of the carbon type such as the Carter "Hi-Ohm" for a multiplier. The advantages of such a variable multiplier is that several ranges may be provided on one instrument and each may be checked by means of the standard low resistance voltmeter.

When the proper setting of the No. 5 "Hi-Ohm" is obtained,

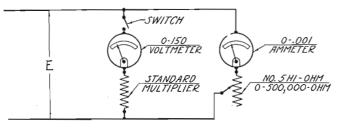

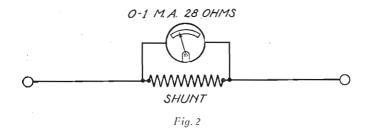

Fig. 1

the switch may be opened to stop the drain caused by the standard voltmeter.

If range of meter is .001 ampere the scale will read from zero to 1 by tenths or every 2 tenths. If "Rm" is set to cause full scale deflection when standard meter reaches 100 volts, then the voltages of the ammeter will correspondingly be 100 times the milliampere reading.

Correspondingly, a voltage of 500 volts may be measured if a reading of 0.2 milliampere corresponds with a standard voltage reading of 100.

Do not turn "Rm" to zero, or the milliammeter will be ruined by the excessive current flowing through it. It is well to insert a fixed resistance of about 50,000 ohms in series with "Rm" to protect the meter.

The simplest method of using one ammeter to measure the currents in several circuits is that of using one shunt in each circuit and by means of switches to apply a milliammeter across each shunt in turn. The theory of the shunted milliammeter for measuring currents is shown in Fig. 2.

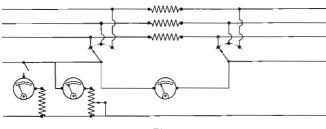

Fig. 3

Range of meter = 0-1 M.A. or 0-.001 Amp. Resistance of meter = 28 ohms. Voltage required to cause full deflection: $\mathbf{E} = \mathbf{RI} = 28 \times .001 = .028$ volt.

This is the voltage across the shunt also.

Assume currents up to 10 M.A. are to be measured.

Current through meter = .001 Amp. Current through shunt = .009 Amp.

Resistance of shunt =

$$R = \frac{E}{I} = \frac{0.028}{0.009} = 3.11 \text{ olums.}$$

Similarly, if:

Rm=Resistance of meter in ohms.

Im=Range of meter in ohms.

It =Total current (in amperes) to be measured.

 $R_s = Resistance$ of shunt in ohms.

$$R_s = \frac{R_m \times I_m}{I_t - I_m}$$

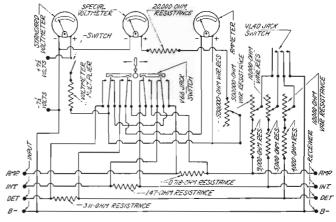

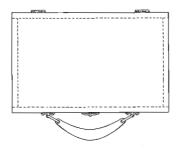

Fig. 4. Schematic wiring diagram

The switching arrangement for applying the milliammeter across several shunts is shown in the Fig. 3.

It will be seen in studying the schematic wiring diagram, Fig. 4, that the voltmeters may be connected to the first triple throw switch and thus be transferred from one circuit to the other at the same time that the millian meter is transferred. It will be also noted

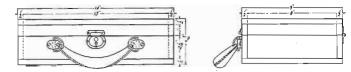

Fig. 7. Details of carrying case

that if the voltmeters are connected on the other triple throw switch, the milliammeter will indicate the voltage alone.

It was desired that the test set could be placed between the eliminator and the radio set in order to measure the current and voltages supplied to the radio set. For this reason a double set of posts is provided. The left-hand set of posts goes to the eliminator and the right-hand set goes to the radio set.

It is also desired that an internal, variable load be supplied to simulate actual load conditions. Each load consists of a fixed and variable resistor in series so that the fixed resistor is equivalent to the lowest resistance that a radio set would be expected

W

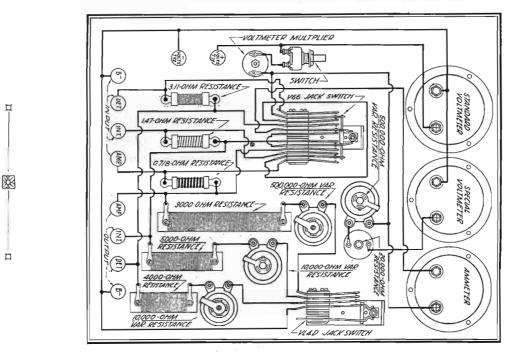

Fig. 5. Graphic illustration

to offer and such that the fixed resistors plus the full value of the variable resistors shall be equivalent to the highest resistance that a radio set would be expected to offer. That is, it should simulate either single-tube or multi-tube sets.

Three such loads are required, one from each of the voltage taps, and these loads must be connected between the voltage taps on the "B" in such a way that they can be instantly removed. Such a provision is supplied in the special jack switch which was designed for this purpose.

This test set has been of much value in the checking of manufacturers' designs and has furnished data for many successful sales arguments relating to regulation and adaptability of "B" battery eliminators.

List of Parts for "B" Eliminator Test Set

While the laboratory model of this device was constructed from the exact list of parts given below, the experienced experimenter will find no difficulty in making any reasonable substitution for those parts specified. However, the novice is advised to strictly adhere to the parts given, if satisfactory results are to

be expected.

- 10 Eby Binding Posts.

The "Hot Spot" Fourteen

This Receiver Is a Combination of Power, Selectivity and Sensitivity

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

HE Melo-Heald Eleven, introduced in our last issue, has met with such favorable comment that the designers have come forth with a big brother. This is the Hot Spot Fourteen. It in no way supplants the Eleven, but may be regarded in the same light as a twelve cylinder car alongside an eight. In automotive terms, it is easier riding, more flexible and the load is distributed through fourteen tubes instead of eleven. Each tube does less, but the total is a tremendous gain with more economical operation, far more selectivity and ability to cut through locals.

This set was designed primarily to meet the almost exasperating conditions in the metropolitan areas where one must dive and wiggle between high powered locals to even get a glimpse of the outside world.

Using a loop in the heart of Chicago, in the middle of the summer we have repeatedly brought in distant stations through high powered locals, on only two meters difference in wavelength.

The conventional three tap loop is used on this receiver. It must be rotated till in line with the station desired and then tuned to exactly that wavelength. Regenera-

tion on the loop is desirable, but oscillation is most certainly not. Very often the reason why reception is not successful is because the loop is oscillating just enough to cause whistling, and the resulting discord is blamed on almost everything else under the sun but the loop. The correct procedure is to bring the loop to regeneration and keep it there. This is done with the midget condenser. The moment a whistle occurs turn back till it ceases, and that is the best point of operation.

The oscillator tube governs the loop and is the means of regulating the incoming signal. In the Hot Spot Fourteen the intermediate frequency is so high that it prevents the loop from crashing and is far enough from the emitted frequency of broadcasting stations to reduce to a minimum the tendency to pick up harmonics. The second harmonic of a local high powered station can be received if one turns the loop exactly to the plane of that station and tunes sharply, but it is not easy, which is quite nice. This reduction of harmonics and the ability to pick up a certain station at but one place on the dial is the reason for choosing the very appropriate name "Hot Spot." Like the thermometer, a certain station reads a certain degree on the scale.

Local stations may be brought in with such tremendous volume as to paralyze the receiver. This causes tremendous distortion and no modulation. While receiving locals, set the loop at an angle and the full tone quality will be obtained with no loss of volume.

The grid coil of the oscillator and the secondary of the mixing coupler are linked together in parallel, shunted by the tuning

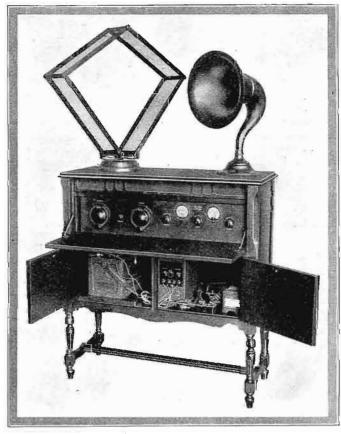

Photo A-View showing "Hot Spot" Fourteen with suggested accessories mounted in Excello console

condenser. The plate coil of the oscillator is entirely out of the argument, further isolated by a radio frequency choke.

The first detector tube is connected to give grid detection for sensitivity while the second detector tube is wired for plate detection, giving quality—a desirable combination.

The Intermediate Frequency amplifier is different from the regular run of transformers in that each transformer was designed for the particular stage in which it was to operate. The fundamental principle is employing a lower amplification constant for each transformer, and more transformers. You will notice by consulting the schematic diagram that each transformer is numbered, and that instead of stopping at the conventional three or four, they keep right on adding up until they make the grand total of eight, just twice as many as common practice dictates.

Evereyone knows that an eight cylinder car will not go twice as fast as a four, but it will go faster and it will ride easier. That is the same principle employed here. The individual transformer will not give as great an amplification constant as one designed for a set employing fewer tubes, but while

cach one gives less, the total is in the same ratio as the car; much more volume and selectivity. It is well worth the investment of four-additional tubes to achieve this, for the results are quite satisfactory, and seeing the transformers are designed to work together with a gradual increase as they go along there is no tendency to crowd or distort.

The transformers are air core and are so stable in operation that the potentiometer may be carried on the negative side of zero. This advantage may be readily seen when one considers the high value of a shunting resistance. When the grid is positive the resistance is lowered and the sharpness of the transformer is reduced considerably. The farther the potentiometer is turned toward the negative the higher the resistance and the sharper the tuning. It is possible to continue farther in this circuit than common practice dictates, removing the troublesome shunt which limits the possibilities of the receiver.

The audio amplifier uses three stages of distortionless transformers. These have a ratio of four to one. Volume is controlled by means of a potentiometer shunted across the second stage. In this manner the output may be controlled from a mere whisper to full volume without throwing the rest of the circuit out of balance, such as would happen if plug and jacks were used.

On this potentiometer is mounted a filament switch. It might just as well be on the rheostat, as both have to be turned to bring the set to the point of maximum sensitivity, the advantage being that with the rheostat it is often desirable to bring the filaments to the correct temperature once and then leave them there, while the poten-

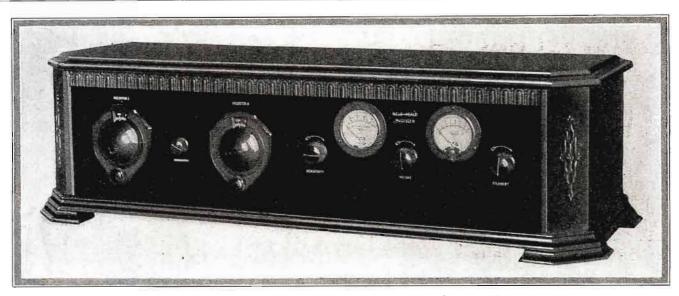

Photo B-Front view of receiver shown installed in a Corbett cabinet

tiometer is changed from station to station. For that reason we chose this unique method of filament control.

For the oscillator, the two detectors and the audio amplifiers we will use 201-A tubes, and for the Intermediate Frequency amplifier 199 tubes. This is a great saver of filament current and the total plate drain is approximately 35 mills. There is nothing materially gained by using the larger tubes in the Intermediate Frequency amplifier, while the low Mu tubes are quite suitable, in fact, superior, for they perform the same work with less current consumption.

In order to avoid burning the 199 tubes at too high a temperature, a fixed 4-ohm resistance is placed in the lead. This never allows the voltage to exceed 3.5 volts. For DX work the tubes should be normally operated at 3 volts. For local stations or extreme selectivity satisfactory results will be obtained by burning the tubes below normal. A combination voltmeter is used, reading either plate voltage in the amplifier circuit or filament voltage on the 199 tubes, at the throw of a switch. Watch this meter closely, for it will tell whether or not your set is being supplied with the correct voltages, and prevents overloading.

The other meter is a milliameter. The set should ordinarily not draw more than 40 mills, but to provide for power tubes a meter reading up to 100 is recommended.

The 3-ohm rheostat on the panel controls the 199 tubes, the two semi-fixed resistances mounted on the baseboard control the 201-A tubes. The 6-ohm governs the current supplied the oscillator and first detector, while the 3-ohm regulates the second detector and the three audio amplifiers.

One precaution to be observed very closely is to never remove or place in the sockets any of the 199 tubes while the current is turned on. They are controlled in parallel. If only one is in the socket, the current intended for eight tubes will pass through it, and quite likely it will be decidedly worthless in less time than it takes to telf of the decease.

It is well to put in a word in regard to the one mfd. fixed condensers. Look at your diagram and then install them exactly where they are represented. It is not enough that they be in the circuit; to perform correctly they must be in the exact spot indicated.

It is rather difficult to specify exact "B" battery voltages, for everyone has his pet theory as to just what is best. Three blocks of 45 volts each should be used, and taps taken off at wherever the set works best for you.

If a power tube is used in the last stage audio amplifier, an additional "C" battery is needed. Nine volts is correct for a 112 tube, with 135 volts on its plate.

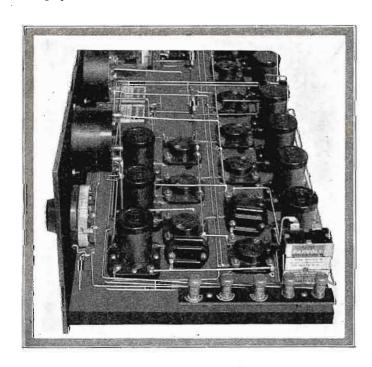

Photo C-End view looking from right end of front panel

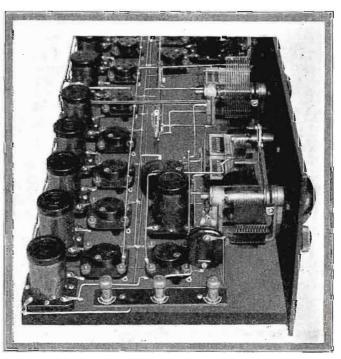

Photo D-End view looking from left end of front panel

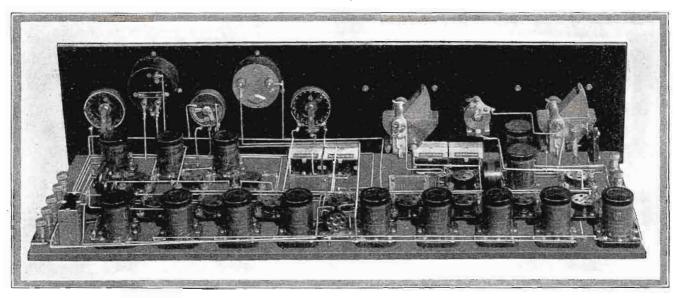

Photo E-Rear view of completely wired receiver

All the connections but the loop, "C" battery and reproducer are brought out to a multi-plug. Binding posts are provided for these.

There is so much to this set that the laying out must be done with great care or one will discover that there is not room for certain parts and others are unduly crowded. The best plan to follow is to measure the baseboard carefully, allowing plenty of room for each

instrument, wiring them as they are screwed down. If one waits till they are all in place before doing the wiring, complications will develop. First mount the transformers and sockets, putting on all the common and connecting wires, then mount the other instruments, and when they are all mounted and connected, assemble the panel and make the connections between it and the baseboard.

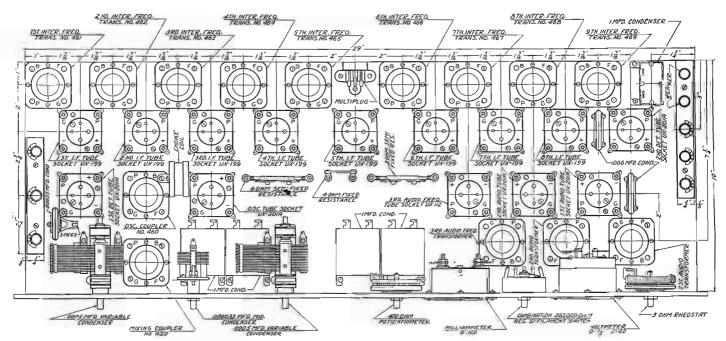

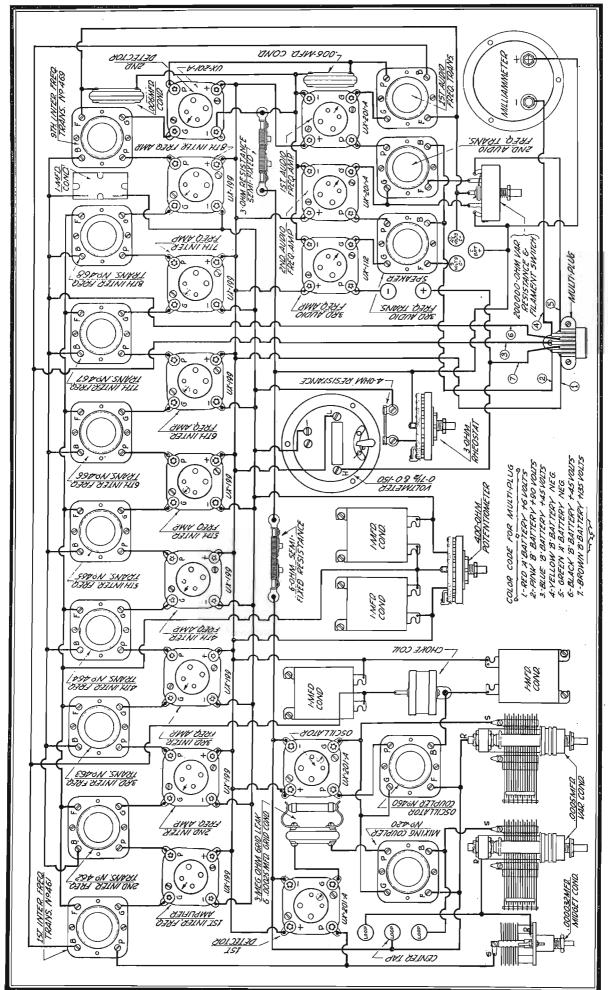

Fig. 2-Baseboard layout showing arrangement of all parts

Check this carefully against receiver when wiring is drawn in detail. part 3—Graphic illustration showing each

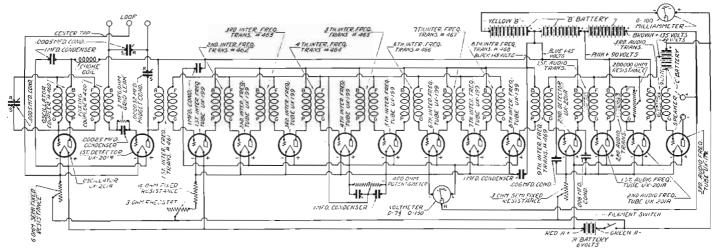

Fig. 4-Schematic wiring diagram for the advanced experimenter

Soldering is an art not fully appreciated by the layman. Because solder adheres to a joint does not mean that the joint is soldered. With a set of this size, one may readily appreciate what it means to have a faulty joint and not be able to find it. Be sure your solder is uniting the joint, not merely coating it.

Volumes have been written on why rosin should be used as a flux, but still it is shunned like the smallpox. If you positively have to use acid, equip yourself with a bottle of alcohol and a No. 6 water color brush. Swab each joint after soldering and then wipe dry with a rag.

Use care in soldering to the lugs of fixed condensers, for if the heat reaches the inside it is liable to melt something and ruin the condenser. It is a good precaution to test a condenser as soon as you buy it to make sure it has not been damaged by rough handling, and again as soon as it is soldered to be certain it is not opened or shorted in soldering.

Be sure to carefully check all wiring before placing the tubes in the sockets.

LIST OF PARTS FOR "HOT SPOT" FOURTEEN

The model of this receiver constructed in the laboratory of the CITIZENS RADIO CALL BOOK was built from the exact list of parts appearing herewith. While it is possible for the experienced constructor or experimenter to successfully substitute other reliable parts for those actually specified, it is recommended that the novice strictly adhere to the list of parts as given below.

It is necessary that good accessories be used with this receiver. The "Hot-Spot" Fourteen is not a critical receiver, but it is readily seen that a device as sensitive as this demands care in the selection of

Any well constructed three tap loop will give satisfaction.

"B" battery eliminators may be used, provided they are adequate for its demands and capable of retaining their efficiency over a long period of time.

Choice of speakers is largely a matter of personal preference, and any speaker which satisfies that condition may be used.

The cabinet shown in Photo "B" is a product of the Corbett Manufacturing Company of St. Marys, Pa. It is constructed entirely of walnut and has a beautiful hand-rubbed finish. The top of the cabinet is fastened to the body by means of a continous piano hinge, while the two corner posts in the front are grooved to fit around the front panel of the receiver. The top rail is provided with screws to securely hold the receiver in place after it has been inserted in the cabinet.

The Hot Spot Fourteen Receiver obtains its "A" power supply from a 100 ampere-hour Willard Storage Battery, manufactured by the Willard Storage Battery Company of Cleveland, Ohio. The battery is contained in a solid rubber case and is provided with a handy carrying handle as well as screws for quickly attaching wires. The battery is kept at full charge by a Sterling "A" Battery Charger, manufactured by the Sterling Manufacturing Company of Cleveland, Ohio. This charger is unique in that it delivers 21/2 amperes of fully rectified current and is by far the smallest charger on the market at the present time. No acids or bulbs are used in this type of charger, the rectification being accomplished by the use of two Raytheon Cartridge Rectifiers.

An Electrically Operated Tuned Radio Frequency Receiver

Herewith Is Described a Complete Receiver and Power Unit Operating Directly From the Light Socket

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

HE trend of evolution in radio is following two parallel, though different channels. Out of the chaos of several years ago, there have evolved two distinct types of receivers that are holding their own due to their superior qualities. Generally speaking, these may be considered as the super-heterodyne group and the tuned radio frequency group. While the super-heterodyne type of receiver has enjoyed great popularity, the tuned radio frequency receiver has not been neglected. This is largely due to the careful research and design given to the apparatus used in that type of receiver. When thought turns to detail rather than generalities, progress is sure to result, and while it is not spectacular, it is always beneficial to those who use the improved product. More care and consideration is being directed towards parts than ever before. It may be truly said that the time has come when one may safely buy all the necessary parts to construct a receiver, with the assurance that it will operate satisfactorily when completed.

One of the outstanding receivers of today is the Bodine AC Six. This set has been designed to operate from an ABC Power Unit and has been wired for such. Batteries cannot be used unless the set is rewired. Full instructions for the con-

struction of the necessary Power Unit are included in this article and are given below. There are several unique phases of construction that are well worth discussion. The first is the radio frequency transformers. These are wound on a pattern closely resebling a figure eight. The primary and secondary coils are closely wound together into a single layer coil. There is no appreciable amount of dielectric in the field of the transformer; the only foreign member being the supporting post which rises through the intersection of the two loops of the figure eight. The coils are "doped" with an insulating compound and are self-supporting. The four terminals of the transformer are brought out, two at the top and two at the base. A

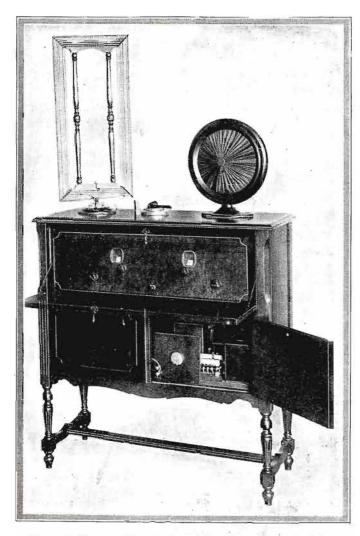

Photo A. How the Electrically Operated Receiver Looks When Installed in a Console

bakelite cross piece on each end of the supporting post contains the soldering lugs, making connections readily accessible.

Due to the construction of the coils, the magnetic field is practically limited to the coil itself. This eliminates all of the bother of placing the coils at a non-intercoupling angle, and obviates the necessity of shielding.

Balancing of the radio frequency amplifying circuits is accomplished by the use of Phasatrols. This remarkable instrument fills a long-felt want. It consists of a fixed condenser and a variable resistance sealed in a case and controlled by a slotted screw. An insulated screwdriver is used to vary the resistance in balancing out the circuits. The Phasatrols are mounted on the under side of the bakelite sub-panel and are so constructed that a single hole is all that is necessary for proper mounting. The screw head used for varying the resistance is built within the mounting bushing. This, coupled with the single mounting hole feature, enables the device to be mounted into place with a minimum of effort and effectively keeps the instrument out of sight and still accessible for adjustment.

Two tuning controls are provided, a single condenser for tuning the antenna, and a three gang condenser for tuning the radio frequency cir-

cuits. It very often happens that there is a slight difference in the capacity of the condensers constituting a gang, due to one of the plates of a condenser becoming slightly bent. The probabilities of such an occurrence have been overcome by the use of a tiny condenser in parallel with each of the condensers in the gang. This small condenser consists of two circular plates of spring phosphor bronze, the size of a dime, separated by a sheet of mica. A set screw, passing through, then governs the distance between the two plats, which in turn effects the capacity.

The audio amplifying transformers have been designed to register all frequencies over a scale of from thirty to three thousand cycles. They do not accentuate either the bass or high notes,

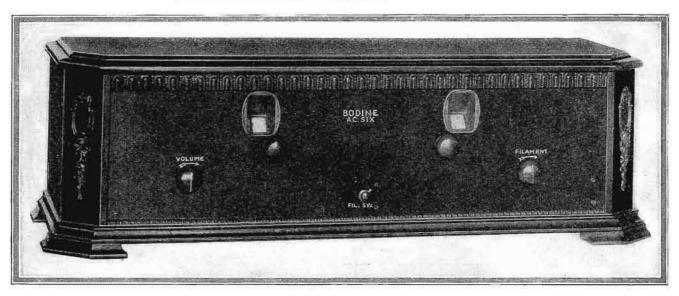

Photo B. Completed receiver installed in a Corbett cabinet

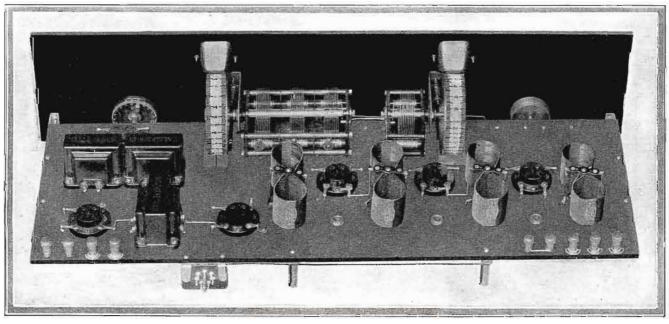

but give practically an even range of amplification over the entire scale. The cores consist of composite punchings instead of laminations. This prevents all "singing" and chattering when the transformers are under a heavy load. An air gap provides for magnetic leakage. The transformers are wound in a ratio of 3 to 1, giving as close to distortionless tone quality as is possible.

Since the filaments of the tubes are heated by a power unit, they are all connected in series, except the last audio stage, which uses a power tube. The filament of this tube is heated directly by raw A.C. current and separate pair of wires are provided for it. The leads from the five-volt terminals of the transformer to the socket of the power tube must be of rubber covered wire and must be twisted if the set is to function properly without A.C. hum.

All the other connections to the eliminator are brought out to a Multiplug. The Multiplug is double ended, since it serves as a coupling between the power unit and the set, and plugs directly into each device.

While the parts specified below have been used in the laboratory model of the receiver, it is possible to make any reasonable substitute without interfering with the all-round efficiency of the receiver. The novice is advised, however, to strictly adhere to the parts given herewith, since he will then be assured that the set will give satisfactory results.

Miscellaneous lugs, screws, nuts, etc.

In tuning, select a station somewhere close to 350 meters, and swing the two condenser dials until the station is brought in as loud and clear as possible without distorting or jamming. Very likely the set will oscillate and squeal most vigorously. Then take a screwdriver and adjust the first Phasatrol until a point is reached where a minimum of oscillation occurs.

Now adjust the second and third Phasatrols while slowly swinging the gang condenser back and forth across the wave of the station. This will clear up the remaining oscillation. For a final check, tune in a distant station and readjust until it is clear and sharp.

The Power Unit uses the QRS 400 mil. tube. It is of ample size and capacity to handle a set twice this size, so there is little danger of overloading with attendant destruction of apparatus.

The only external connections made to the eliminator are a cord plugged into the nearest light socket, or baseboard receptacle, and a cable leading to the radio set. There is no switch provided for the Power Unit in the set proper. It is therefore necessary to either install a switch or pull the plug out of the receptable each time the set is turned off. If the plug is pulled out, there is an absolute certainty that the current is off. This is the best plan; the next best is to have a pilot light on the same circuit. A reading lamp placed on top of the console makes an ideal pilot.

LIST OF PARTS NECESSARY FOR THE CONSTRUC-TION OF THE QRS ABC POWER UNIT

These parts or any reasonable substitute will give satisfactory results:

- 1-Thordarson Type 2291 Power Transformer.
- 1-Thordarson Twin 10-henry Choke.
- 1-John E. Fast QRS Condenser Block. Type 1050.
- 1-John E. Fast QRS Buffer Block. Type 1051.
- 1-Airgap Socket.
- 1-Jewell 0-300 Milliammeter, Pattern 135.
- 2-XL Binding Posts.
- 1-7x7x3/16-inch Celeron Panel.
- 1-Carter Resistor Kit No. 401.
- 1-13x14x1/2-inch Wood Baseboard.
- 20-Feet Acme Celatsite Wire.
- 1-QRS 400 mil. Tube.

In construction, the QRS Power Supply consists of an input

transformer, a rectifying tube, the necessary chokes, condensers, resistances and accessories such as a milliammeter, multiplug, etc.

The transformer is enclosed in a crystalline enamel case, and consists of a primary winding which is connected to the 110-volt A.C. lighting circuit, a 600-volt secondary winding with a center tap to supply the 300-volt circuits for rectification, a winding to supply the heater filament of the power tube.

A bank of four 0.1 mfd. fixed condensers is located between the transformer and the choke coil. Two of the condensers are across the high voltage input winding to the tube; the other two are across the low voltage heater winding. From the first two the wires continue direct to the two filament terminals on the socket, the ones on the heater winding connecting to the grid and

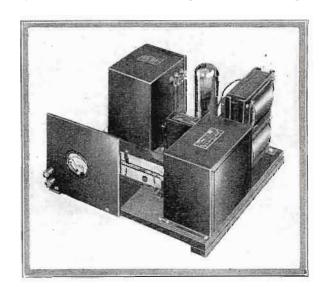

Photo E. Baseboard arrangement of QRS power unit

plate terminals. The plate lead continues to one terminal of the 10-henry choke. The center tap of the heater winding is grounded to the core of the choke coil and transformer.

A large condenser with taps for different capacities is connected across the choke with all leads brought to the indicated terminals. It will be noticed that a section of the condenser is across each portion of the output. These sections are not all of the same capacity and care must be taken in consulting the wiring diagrams to make sure that no mistakes are made.

The bank of resistances consists of three units, with a number

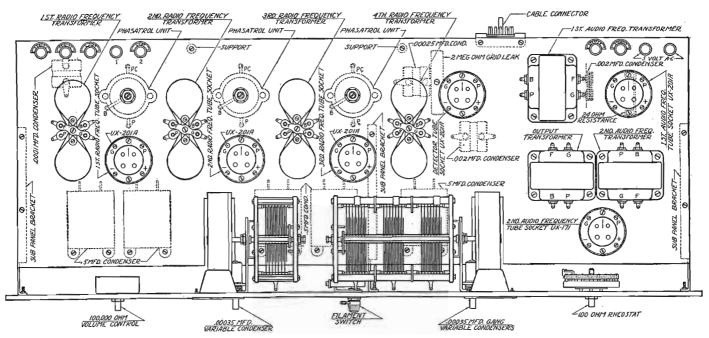

Fig. 1. Baseboard layout

of taps. Each tap is labeled and is connected to the proper terminal on the output Multiplug. When constructing the Power Supply, mount all the heavy instruments first and be sure that they are securely anchored with bolts that pass clear through the baseboard and are secured by washers and nuts on the under side. If ordinary wood screws are used, there is a danger of them pulling out when the unit is handled.

With filaments connected in series there is no need of having a separate rheostat for each tube, or even for each group of tubes. One rheostat, approximately one hundred ohms, will handle all of them nicely.

The tube employed for rectification is the QRS 400 mil. rectifier. The bulb is much larger than any of the receiving tubes, being almost the size of a fifty watt transmitting tube. The reason

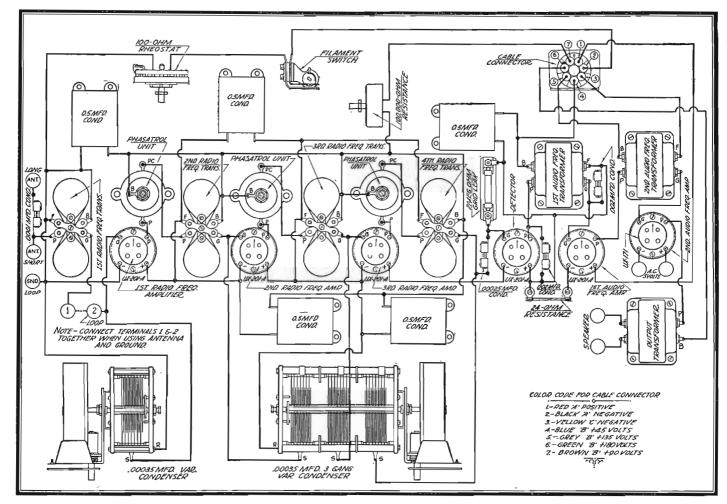

Fig. 2. Graphic illustration

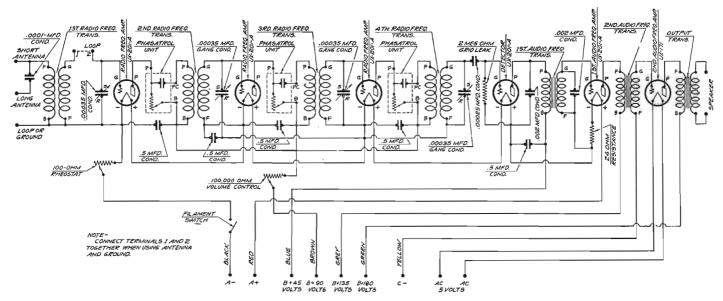

Fig. 3. Schematic wiring diagram

for the generous glass shell is to provide a large cooling surface. The elements are much the same as in the smaller rectifying tubes, but are of more rugged construction. The tube is silent in operation, and when operating normally will glow slightly. It fits any of the standard sockets in use at the present time.

List of Accessories

The following is a list of accessories which have actually been tested with the Electrically Operated Receiver and have been found to operate satisfactorily with it. While these particular accessories are suggested, it is possible to make any reasonable substitution without sacrificing the all around efficiency of the receiver. It is advisable, however, not to attempt a substitution in regard to the "ABC" unit:

- 1-QRS, ABC Power Unit (described above)
- 1-Corbett Model C-28-inch Cabinet
- 1-Excello Model R-22 Walnut Radio Console
- 1-Sonochorde Junior Speaker
- 1-Bodine Model L-350 Loop

Photo "A" shows the Electrically Operated Receiver installed in the Excello Console with the necessary accessories for its proper operation. Photo "B" shows the receiver as it will appear when in-

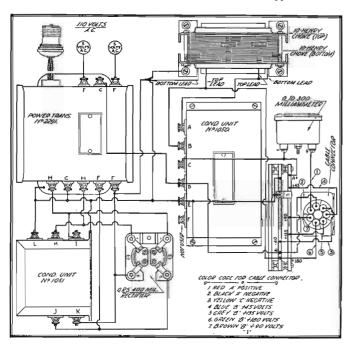

Fig. 4. Graphic arrangement of power unit

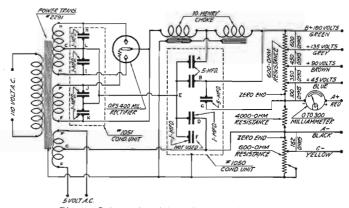

Fig. 5. Schematic wiring diagram of power unit

stalled in a cabinet alone. The Console is manufactured by the Excello Products Company of Chicago, Illinois. It is constructed entirely of solid walnut, the doors being finished in a two-tone effect with a dark panel and lighter trim. Ample space is provided both for the receiver and the accessories. This is of vital importance since the QRS, ABC unit requires ample ventilation due to the heating of the rectifier tube. The Console has the added advantage of a built-in speaker, which when used in conjunction with the Sonochorde speaker will give a fidelity of reproduction which is delightful.

The cabinet is manufactured by the Corbett Manufacturing Company of St. Marys' Pennsylvania. The cabinet is an excellent piece of workmanship, being made entirely of solid walnut and finished in a varnished and hand rubbed finish. The Sonochorde Junior Speaker is manufactured by the Bowdette Manufacturing Company of Chelsea, Massachusetts. It is an actual counter-part of the larger cone speaker known as the Sonochorde Senior Speaker, the only difference being in the actual size. The smaller type is capable of the same excellent reproduction as the larger type of speaker. The front of the cone is covered with a high grade of silk material, which in its pleated condition is quite attractive.

The Bodine Loop shown in this installation is a product of the Bodine Electric Company of Chicago. The wire constituting the loop is bank-wound. A jack arrangement is provided in the base of the loop by which contact is made to the two ends and the center-tap of the loop. This allows the loop to be rotated at will without the possibility of the wires becoming entangled. A further advantage of the loop is that it may be easily adapted for short wave reception by simply withdrawing the loop partly from the base so that only the two upper springs make contact. This will "cut-out" one-half of the loop and will allow the reception of signals as low as 150 meters.

(If further information on any of these accessories is desired, it may be had by writing direct to the manufacturers.)

The 1928 Model Infradyne

Complete Details on the Assembly of the New Model of This Popular Ten-Tube Receiver

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

¶ HE 1928 Model Infradyne not only oversteps all of the cut and dried conventionalities of radio set construction, but it also represents a new type of home constructed receiver that is unique in performance, pleasing to the eye, and above all, most satisfactory in operation. The New Infradyne has gone so far as to eliminate cabinet, panel, bus bar wiring and all external capacity effects. Absolutely no wood and only a minimum of bakelite enter into its construction. Like the auto, it can boast of an all metal chassis, body and wheels. Aluminum and pressed copper are the metals employed.

The cabinet is an artistically designed cowl of copper fitting over the entire set like the hood of a sewing machine. The outside is finished in a seal brown crystalline lacquer with embossed panels of a burnt sienna tone. The inside of it is lacquered with a transparent varnish so that the natural copper finish is present. One very important fact is that the back of the hood is just as pleasing to the eye as the front, which certainly obviates the need of pushing the set up against the wall as is usually the case with the home con-

structed receiver. This will be especially appreciated when one stops to consider that very often one will want the set on the porch, or other place where it is visible on all sides. The hood is not affected by heat or moisture, making it perfectly secure under both the hot rays of the sun or the extremely damp atmosphere along the sea coast or lakes.

The tuning controls are brought out to a dashboard which is located in the center of the front side. This panel is made of copper, etched with acid in a pleasing design of Grecian simplicity. This dashboard is "floating," being secured only by the bushings holding the various instruments. Unsightly screw heads do not mar the front of this receiver. A voltmeter with a full scale deflection of five volts is located in the center of the control panel. This is to indicate the filament voltage of the 199 type tubes in the Infradyne amplifier and in the oscillator.

Two major controls are used to regulate the tuning. The radio frequency control is located on the left side of the voltmeter, while the Infradyne control is located on the right side. A bezel is set in the panel for each control to enable the operator to see the graduations on the illuminated dial. Both controls are of

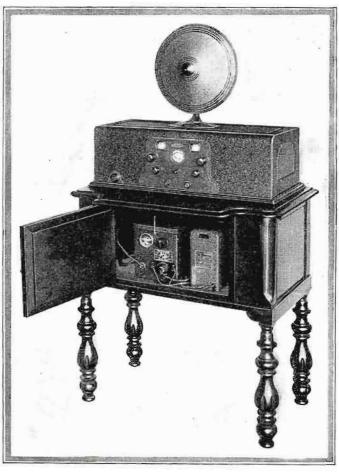

Photo "A." The Infradyne Receiver Installed on a Table with Appropriate Accessories

the drum type and are so placed that they are just flush with the panel.

Directly below the tuning controls are three rheostats labeled "Volume," "Voltage" and "Sensitivity." They control the filament voltage for the different sets of tubes. At the bottom of the panel is a jack for head phones and a threeway switch for shifting from local to DX. reception. For local use, the Infradyne amplifier is cut out of the circuit and the set becomes a single dial two stage tuned radio frequency receiver. This gives ample volume in an average room. In changing from local to distance reception, the switch is turned to the right as far as it will go, which automatically inserts the Infraydne unit into the circuit, lights the tubes and places the set in operation so that the operator may tune in on the other side of the continent.

At the left hand end of the receiver is the two stage tuned radio frequency amplifier. This is entirely enclosed in a pressed copper cabinet with a removable top. The unit includes a three gang variable condenser, three radio frequency transformers, three flush mounted sockets and other miscellaneous parts.

There is an additional shielding partition between each of the three transformers. Tuning with a maximum of efficiency is accomplished in an ingenious manner. As the condenser rotates, an eccentric cam brings pressure upon a spring bar which in turn rotates a shaft. The primaries of the three transformers are fastened to this shaft by means of compound levers. They are pushed up and down inside of the secondary coils, the coupling varying with the frequency tuned. A method of correcting the coupling and bringing all three transformers into resonance is provided in a sliding collar and lock nut fastened to the top end of the secondary. The entire secondary is supported on a rod and if it appears to be a bit out of resonance, it may be moved up or down a fraction of an inch until the difficulty is remedied. The three stage amplifier comes as a unit and is fastened to the main baseboard by means of screws. All wiring is done on the under side, between the two bases.

The Infradyne amplifier is the standard unit with which we are all familiar. It includes the four balancing controls, three flush mounted sockets and all the necessary binding posts. The entire unit is enclosed in a copper cabinet with a bakelite top. It is mounted

on the rear side of the baseboard, reaching from the radio frequency amplifier to the right hand end of the receiver.

In the center of the baseboard directly between the two tuning condensers is the oscillator system. It is flush mounted, all the apparatus being slung on the under side of the panel. To the right and forward are the detector and two stage audio amplifier. An output transformer is included.

For the convenience of the home constructor, the manufacturer has put the sct into convenient kits. One distinct advantage of this method is that a set may be built which is not a complete Infradyne receiver and yet will give satisfactory reception. At first one may buy the baseboard, the radio frequency amplifier and detector and enjoy a five-tube receiver until such a day as it is convenient to add the Infradyne amplifier. The wiring is such that none of it need be ripped out when an addition is made. Only one tuning condenser, the three gang, is needed for this simple set.

The baseboard is made of pressed steel and much resembles an inverted baking pan. It is deep enough to allow plenty of room for wiring and instruments. It is supplied by the manufacturer already drilled for all wires and instrument mounting. It is lacquered black on the outside, while the under side is finished in the natural copper.

Near the extreme left end of the receiver, directly under the radio frequency amplifier, is the antenna compensator. It consists of a tiny variometer hooked in series with the antenna, with a three pole rotary switch tapping off different turns on the primary coil. This compensation is used to tune the antenna circuit and for bringing it to resonance.

The wiring of this receiver utilizes a type of harness seldom seen in radio, but one which is quite common in telephone systems and electrical circuits. It uses the bunched cable method, that is, insulated wire, a different color for each circuit, all tied together into a bundle. This method of wiring looks extremely neat and gives the receiver more of the appearance of a delicate instrument than a high tension power plant.

The rheostats are mounted directly on the baseboard with angle brackets and are controlled from the panel by means of extension shafts. Fixed resistances regulate the voltage of the audio amplifier tubes.

The phone jack is inserted in the plate lead of the first audio transformer. The current passing through a two step amplifier is of tremendous volume and is not desirable for headset reception. A jack on the rear of the baseboard is available for the loud speaker. In addition to the speaker jack, a cable for the battery connections and two binding posts for the antenna and ground are provided.

LIST OF PARTS NEEDED FOR THE CONSTRUCTION OF THE 1928 MODEL INFRADYNE

The list of parts given below were used in the laboratory model of the receiver. While it is possible for the experinced experimenter to substitute other good apparatus for that actually specified, it is advisable that the novice strictly adhere to the list given below:

- 1-Pressed Steel Base
- 2-Bronze Control Panels
- 2-Remler Universal Drum Dials No. 110
- 1-Remler Condenser No. 659
- 4-Remier Sockets 50
- 3-Remler Choke Coils No. 35
- 1-Remler Special Coil and Spacer
- 1-Frost 10-ohm Rheostat, Extension Shaft and Bushing
- 1-Frost 21/2-ohm Rheostat, Extension Shaft and Bushing
- 1-Frost 4-ohm Rheostat
- 1-Frost 2-ohm Fixed Resistance
- 1-Frost 4-ohm Fixed Resistance
- 1-Frost 6-ohm Fixed Resistance
- 1-Frost Jack No. 953
- 1-Frost Jack No. 954
- 1-Electrad .00025 mfd. Fixed Condenser No. GS
- 1-Electrad .00025 mdf. Fixed Condenser P
- 1-Electrad .001 mfd. Fixed Condenser
- 3-Electrad .005 mfd. Fixed Condenser
- 1-Electrad 4-megohm Grid Leak
- 1-Yaxley Switch 69
- 2-Eby Engraving Binding Posts
- 1-Celeron 4x34x1/5-inch Strip
- 1-Special Adjustable Condenser
- 2-Special Bakelite Terminal Blocks
- 1-Acme Battery Cable

All of the above parts are included in the Infradyne Foundation Kit No. 750

- 1-Remler Infradyne Unit No. 700
- 1-Remler Radio Frequency Ampifier Unit complete assembled and wired No. 710
- 1-Remler Infradyne Cabinet No. 760
- 1-Ekko Ground Clamp
- 1-Pkg. Kester Radio Solder
- 4-Ceco Type "BX" Tubes
- 1—Ceco Type "F" Tubes
- 5-Ceco Type "A" Tubes
- 2-Silver-Marshall Audio Transformers No. 220
- 1-Silver-Marshall Output Transformer No. 221

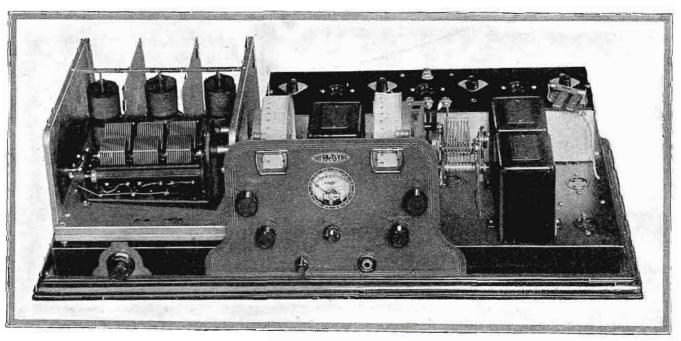

Photo B. View showing arrangement of parts with covers removed

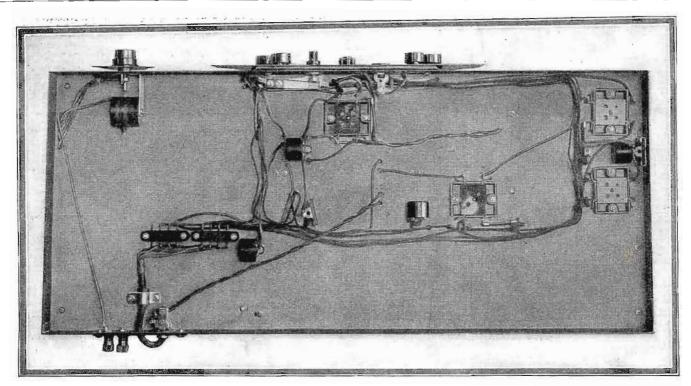

Photo C. Bottom view showing cable harness

1-Jewell 0.5 Voltmeter

Miscellaneous lugs, screws, etc.

The 201-A tubes are used in the radio frequency amplifier, 199 tubes in the Infradyne amplifier and oscillator. Either a 200-A or 201-A tube makes a good detector, a 201-A for the first stage audio amplifier and a 171 power tube for the second stage. Next turn the panel switch from "off" to "local." All the tubes but the oscillator and those in the Infradyne amplifier and second detector should burn. The light on the left tuning dial should also light up. Now turn the switch to "Distance" and all of the tubes will light. The voltmeter reads only on the 199 tubes and it should be kept at exactly three volts.

Now turn the switch back to "Local" position and begin tuning. Set the larger knob of the antenna compensator control knob at No. 3, then adjust the inner knob at approximately 45 degrees. The left hand dial is the only one used for "local" tuning, and at first it should be set at zero. Turn the volume control until a roar is heard in the speaker. Turn back a bit on the volume control and rotate the dial slowly until a signal is picked up.

With a good steady signal proceed to balance the radio frequency amplifier. On a bakelite strip incorporated in the base of the three gang tuning condenser are three midget condensers, regulated by set screws. They have been carefully regulated be-

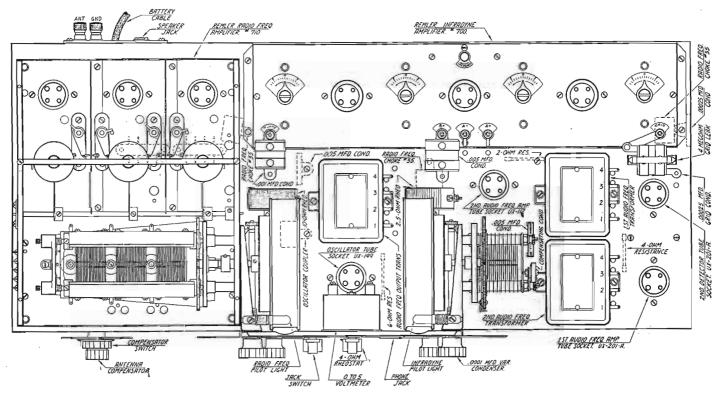

Fig. 1. Baseboard layout showing arrangement of parts

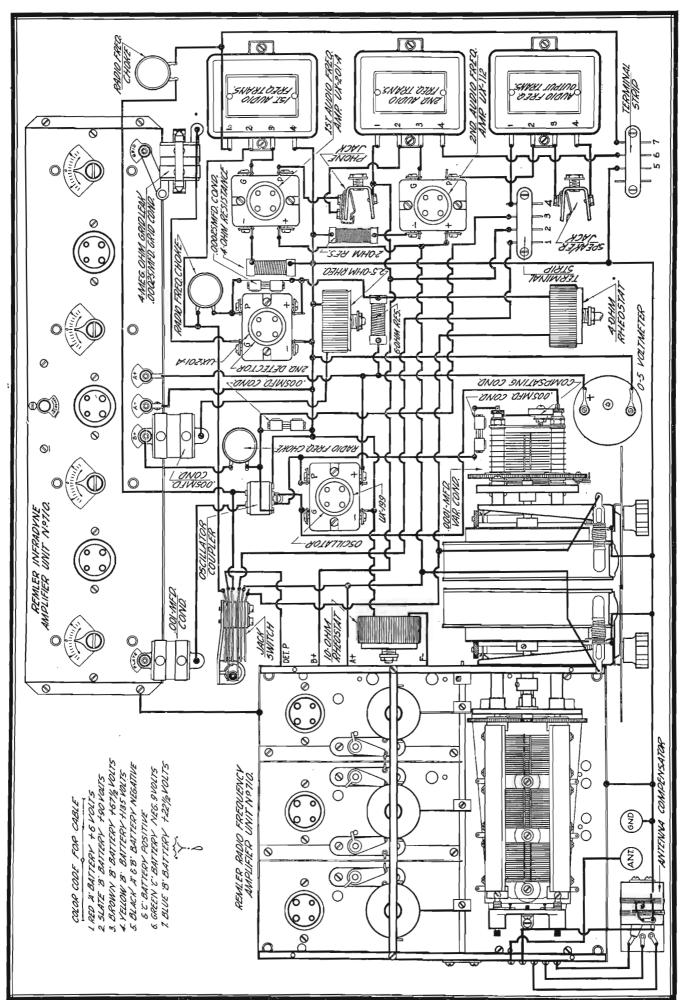

Fig. 2. Graphic illustrations shown all connections

fore leaving the factory, so only a slight turn will be needed. The object in balancing is to narrow the tuning range on the dial to an absolute minimum. When the station comes in with the greatest volume on the sharpest-dial adjustment, with only one peak, the condenser is perfectly balanced. Now as a matter of checking, tune in a station at the high end of the dial. Adjust the antenna compensator till signals are loudest, then vary the balancing condenser and observe if the reception has improved. If the volume of the signals is much greater when the condenser screw is turned, an error has been made in the original adjustment and the whole thing should be readjusted, this time on the high wave station. It takes patience and plenty of time, but the results are well worth the effort, for when once adjusted no more attention need be given it and signals will come in loud and clear over the entire scale with no mushy overtones to spoil the reception.

After one is satisfied that the radio frequency amplifier is working properly, throw the switch over the "Distance." The Infradyne is then connected in the circuit. Set the right hand tuning condenser at zero and then turn the four controls on the Infradyne amplifier to minimum. Next turn the "Increase" screw

.1-Utah Cone Junior Speaker

The Ehlert Super Excellent Speaker Console is finished in walnut of the correct height to make operation of the receiver easy. There is an unusually large battery compartment, the door of which swings outward. A screen opening is provided in the door, behind which the speaker may be placed. A shelf is built in the door for the speaker to rest upon. The table has an attractive top with beveled edges. The four supporting legs are short and fluted, making a firm foundation. Holes in the back of the cabinet are provided for the battery connections which go to the receiver.

A Sterling R-96 "A" Power Supply is a highly efficient device using the Raytheon Cartridge units. It is of unusually large capacity and will furnish ample current for a receiver the size of the Infradyne. Because of the special design, the owner will not find his power supply antiquated when high capacity Raytheon Cartridge units are developed. They are mounted on clips on the under side, and may be replaced with others at any time convenient. There is a Sterling meter adjustment which gives voltage control to the actual amount required by the tubes. The instrument is contained in a metal cabinet finished in a dark

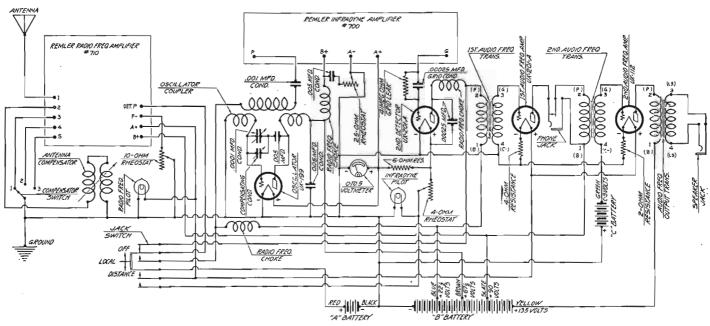

Fig. 3. Schematic wiring diagram

about two-thirds of the way to the right. Use the fingers for this, not pliers. Set the sensitivity control until a series of whistles are heard, then adjust the increase screw till the whistles disappear. Now rotate the right hand tuning control till a station is brought in. It is best to check on the same stations used in tuning the radio frequency amplifier earlier in the balancing.

Now while swinging the right hand control back and forth across the wave of the station being received, adjust the four controls on the Infradyne until the signal clears up and the various circuits in the amplifier are in resonance. If the set breaks into oscillation, turn the sensitivity control back a bit. This final adjustment should be made on a distant station, preferably when one is wearing headphones. Above all else, don't get impatient and don't try to rush. The time spent in delicate adjustment is well worth the effort.

LIST OF ACCESSORIES FOR USE WITH THE INFRADYNE RECEIVER

The following is a list of accessories that have actually demonstrated their ability to properly operate the 1928 Model Infradyne Receiver. While these particular accessories are suggested, it is possible to make any reasonable substitution without decreasing the all-around efficiency of the receiver:

- 1-Ehlert Super Excellent Speaker Console
- 1-Sterling Type R-96 "A" Power Supply
- 1-Fansteel Type B-180 "B" Power Supply

green enamel with nickel trimmings. It operates from 110 volts 60 cycles A.C. and is made by the Sterling Manufacturing Company of Cleveland, Ohio.

The Fansteel "B" Supply Model 180 employs the tantalum and electrolyte rectifier, which has proven itself so successfully in years of actual operation. It is silent and requires very little attention. This model is of ample capacity to supply any set now on the market using a voltage of 180 at 55 milliamperes, maximum output. Taps are provided for the lesser "B" voltages required. The unit is contained in an attractive metal case with a carrying handle at the top. It is supplied also with a flexible rubber covered cord and attachment plug, which is screwed in the nearest light socket. This unit is made by the Fansteel Products Corporation, North Chicago, Illinois.

The Utah Cone Junior is an attractive speaker employing the principle used in the original Nathaniel Baldwin, Mica diaphragm. The unit has been enlarged in proportion to deliver correct volume and tone quality without distortion at power tube operation. The cone is floating, being supported by the driving armature passing through its center. It is of attractive design and is ornamented with a single band of decoration around the outside edge. The base is of ample spread and weight to make tipping and possible damage quite unlikely. This speaker is made by the Utah Radio Products Company of Salt Lake City, Utah.

(If further information on any of the above described accessories is desired, it may be secured by writing direct to the manufacturer.)

Further Notes on the Camfield Super-Selective 9

Herewith Are Given Additional Notes on the Theory and Operation of This Receiver Together with Complete Constructional Details

N the March, 1927, issue of the CITIZENS RADIO CALL BOOK there appeared a descriptive article on the Camfield Super-Selective 9 Receiver. The immediate popularity attained by this new circuit, which combines the best features of the tuned radio frequency and super-heterodyne circuits together with the incorporation of an accurately designed band pass filter in the intermediate frequency amplifier, warrants our devoting considerable space in this issue to a more detailed explanation of its theory, construction, balancing and operation. Furthermore, several minor changes for the improvement of the circuit have been included in this article.

The circuit used in the Camfield Super-Selective 9 has been

developed to fill the requirements for a super-sensitive and super-selective receiver that could be satisfactorily operated in congested broadcasting districts such as the metropolitan areas of New York and Chicago, as well as being sensitive and powerful enough for the reception of distant stations from any location in the United States or Canada.

For several years the superheterodyne circuit has been very popular whenever extreme sensitivity combined with selectivity has been desired. About three years ago the super-heterodyne was considered to be the most satisfactory circuit for use under any conditions, but with the large number of broadcasting stations now on the air in the metropolitan areas, a serious drawback of this type of circuit has developed. This difficulty is the presence of so-called oscillator harmonics.

Many "supers" that were popular several years ago can be operated today in congested broadcasting districts with the oscillator tube entirely removed from the circuit. A "super" that is designed to operate on an intermediate frequency of 50 kilocycles will receive any local broadcasting station regardless of the oscilla-

tor dial setting if there happens to be another local station on the air having a frequency of 50 kilocycles above or below the first station. This condition spoils the selectivity of the Super-Heterodyne Receiver, which is one of its chief advantages, and has resulted in decreased popularity of this type of circuit for use in metropolitan areas.

In the Super 9 Receiver this condition of oscillator-harmonics has been entirely eliminated. This is accomplished by the use of two stages of tuned radio frequency amplification ahead of the first detector tube and also by the choice of an intermediate

frequency of 95 kilocycles. There are no stations in the United States that are exactly 95 kilocycles apart. Furthermore, when the two radio frequency stages are tuned to resonance with the station that it is desired to be received, they will not pass signals from stations broadcasting at a frequency 90 or 100 kilocycles above or below the station being received. Hence, no energy from such stations can get to the first detector tube to heterodyne with the incoming signal and thereby spoil selectivity and cause squeals and howls or heterodyne beat notes in the loud speaker, as would be the case with the previous types of loop operated Super-Heterodyne Receivers.

In any Super-Heterodyne there must be a definite minimum

of input energy to the first detector tube before the circuit will function. This factor constitutes one of the most important limits to the sensitivity of the circuit.

Signals so weak that they will not actuate the first detector tube in an ordinary "super" are picked up and amplified through two stages of tuned radio frequency amplification before reaching the first detector tube in the Camfield Super-Selective 9. This makes it possible to get satisfactory reception of distant stations with this new circuit that could not be received at all with the previous types of Super-Heterodynes.

The Super-Selective 9 Receiver is the first radio set made available to radio fans using a band pass filter in the intermediate frequency amplifier. A band pass filter is a network of inductance and capacity designed to pass a particular band of frequencies with uniform amplification and to reject all other frequencies.

The filter used in this receiver has been designed to pass a band of frequencies 10 kilocycles wide between 90 and 100 kilocycles. All frequencies lying within this band are amplified equally by the intermediate stages. The filter is designed to cut offi very sharply on both sides of this band, and the

circuit, therefore, has excellent selectivity.

Photo A. Phantom view of receiver installed in Fritts Consolette

It must be remembered that the frequency of a broadcasting station on any given wave length is absolutely constant. It is modulated by the frequency of the voice or music being transmitted and, therefore, varies about 5 kilocycles above and below the rated frequency. If a circuit is not designed to give practically uniform amplification over a band of frequencies 5 kilocycles above and below that of the incoming wave some of the voice or music frequencies will not be properly amplified and distortion results. This action and consequent distortion has been

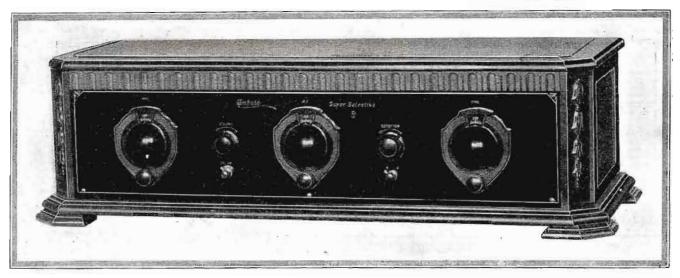

Photo B. Front view of receiver mounted in cabinet

very noticeable in Super-Heterodyne circuits where extreme selectivity is obtained by the use of the so-called peak intermediate frequency transformers. The use of the 10 kilocycle band pass filter eliminates this cause of distortion.

All former Super-Heterodyne circuits have been designed to operate on a loop. It is a well known fact that a loop does not pick up as much energy as a short antenna, and for this reason many experimenters have attempted to couple an antenna to a Super-Heterodyne Receiver. The result has always been the same; the selectivity being utterly destroyed.

In the case of the Camfield Super 9 the use of the band pass filter gives such perfect selectivity that it is possible to not only use an antenna but also to use two stages of radio frequency amplification. This naturally results in greater sensitivity than can be obtained with any other type of circuit.

The Camfield Super 9 may be operated either as a 5 tube two control tuned radio frequency set or as a 9 tube Super-Heterodyne. This transfer from 5 to 9 tubes is accomplished by a jack switch mounted on the front panel as shown in Figure 2. The manner of connecting this switch in the circuit is illustrated in the schematic wiring diagram of Figure 4 and the pictorial wiring diagram of Figure 3. The circuit is so arranged that when the switch is thrown to the left only the two radio frequency tubes, the first detector and the audio amplifier tubes are used. When operated this way the output of the first detector tube is connected directly to the audio frequency amplifier. When the switch is thrown to the right the remaining four tubes are auto-

matically inserted into the proper circuits and the receiver operates as a nine-tube Super-Heterodyne.

This feature provides for the economical operation of the receiver when the reception of local stations only is desired. This is an exclusive feature of the Super-Selective 9 and is not found in any other circuit. Furthermore, this arrangement of the wiring makes it possible to construct the receiver in two units. It fills the requirements of those who at present can only afford a five-tube set but who will want a nine-tube Super-Heterodyne at some later date. The five-tube end of the circuit may be constructed first and the other four tubes added at any later date without changing any of the original wiring.

In the Camfield Super-Selective 9 squeals and whistles due to oscillator harmonics have been eliminated in the manner described above. Further stability is obtained by designing the circuit and the parts used so as to prevent sustained oscillation of the radio frequency amplifier circuits.

The special construction of the radio frequency transformers used in this receiver prevents disturbing oscillations in the radio frequency portion of the circuit.

Oscillation in a tuned radio frequency amplifier is usually caused by coupling between the output and the input circuit of a stage of amplification. One or more of the following forms of coupling are always inherent to a certain degree in tuned radio frequency amplifier circuits.

First—Inductive coupling between the windings of interstage radio frequency transformers.

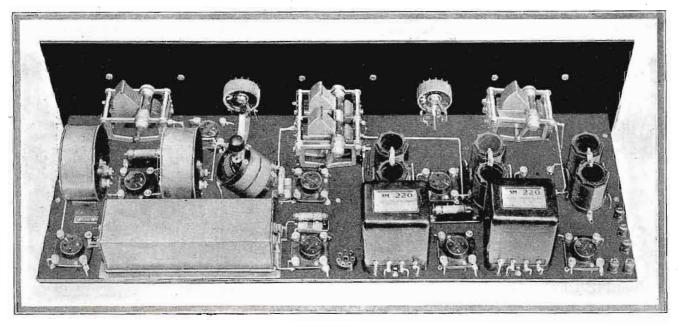

Photo C. Rear view of completed receiver

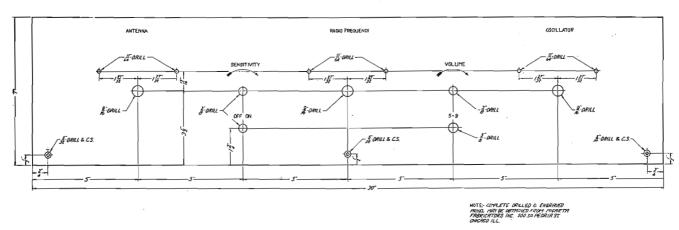

Figure 1. Layout of front panel

Second—Capacity and conductive coupling in the wiring of the

Third—Capacity coupling between the two circuits due to the capacity between the grid and plate of the vacuum tube.

The first cause is comparatively easy to eliminate. The radio frequency transformers used in this receiver have been so designed that their effective external magnetic field is minimized. Thus, when three of these transformers are used in a set, magnetic coupling between them is negligible.

The second cause of oscillation may be eliminated by the proper arrangement of parts and wires in the receiver and the proper use of by-pass condensers. This has been done in the layout recommended for the Camfield Super-Selective 9 Receiver. It is therefore advocated that the builder of the set follow the detailed instructions as closely as possible for this reason.

The third cause of oscillation, that is, the grid-plate capacity of the vacuum tube, cannot be eliminated without entirely changing the design of the tube itself.

In the past few years, several methods of compensating for the energy fed back from the plate circuit to the grid circuit through the tube capacity have been developed. The most noteworthy of these is the use of some means to feed back additional energy from the plate circuit to the grid circuit in such a manner that it is out of phase with the energy fed back through the tube, thus preventing oscillation. Several different ways of doing this are in use today, and some of them unquestionably have a great deal of merit. However, these systems have several disadvantages. Principal among them is that the means of feeding back compensating energy is often very critical in its adjustment, and that the circuits using such a means of neutralization are not equally efficient over the full range of wave lengths.

Another means of preventing oscillation in general use today is to insert a resistance, or introduce in some other manner a loss in the grid circuit of the tube. It is very easy to prevent oscillations in this manner, but it can be done only at the expense of decreasing the sensitivity of the circuit and broadening its tuning.

Some set and part manufacturers prevent oscillation by using tuned radio frequency transformers of very low efficiency, so that the over-all gain in each stage of the radio frequency amplifier is so low that oscillations are not produced. This is generally accomplished by making the primary inductance so small that the proper degree of coupling between the primary and secondary is not obtained. Practically all transformers that do not necessitate the use of some form of compensating feed-back or resistance in the grid circuit are made in this manner. They usually have the characteristics of being fairly efficient on the low wave lengths and inefficient on the upper range of the broadcasting band.

In support of this comparatively inefficient type of transformer, some manufacturers and technical writers have made the statement that the minute capacity between the grid and plate of a tube does not cause a sufficient transfer of energy to produce oscillation. They claim that oscillations are caused entirely by coupling between transformers and coupling in the wiring, and that it can be overcome by the use of closed-field transformers. This, however, is not the case. Feed-back due to tube capacity does exist in all well designed radio frequency amplifiers and must be compensated for if oscillation of the circuit is to be prevented. To substantiate this we quote the following statement from "Principles of Radio Communications," by J. H. Morecroft, Chapter Six, page 432.

"It would seem as though the capacity (electrostatic) of a vacuum tube is so small as to be negligible, but such is far from

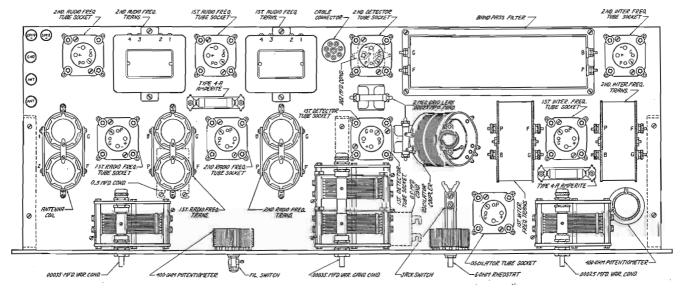

Figure 2. Location of parts on sub-panel and front panel

Citizens Radio Call Book

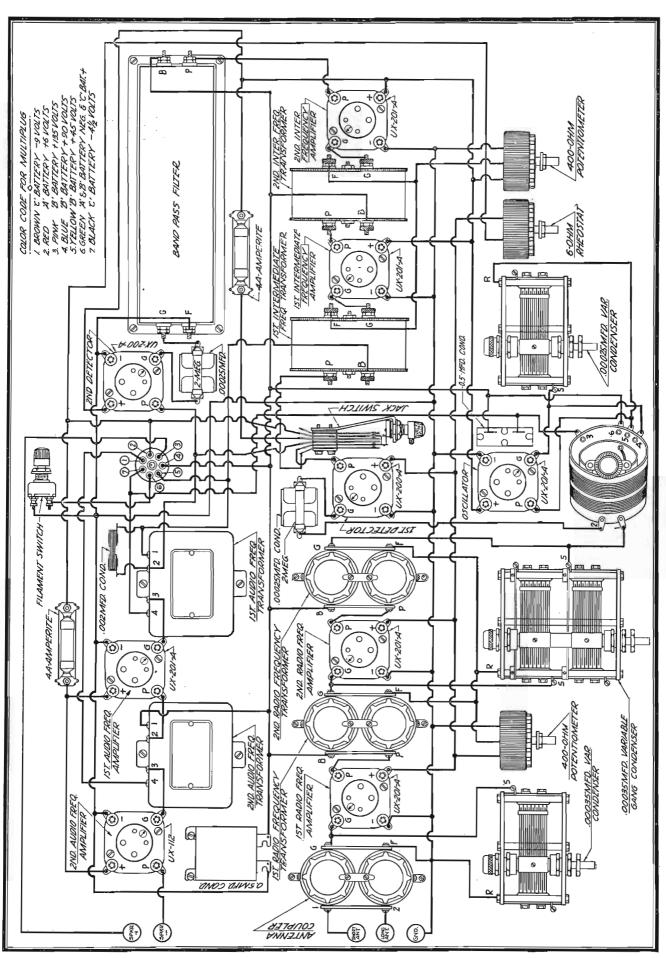

Figure 3. Graphic wiving diagram of Super-Selective 9 Receiver

the truth; the internal capacity of a tube may have very great effect on its operation, especially at high frequencies."

In designing the radio frequency transformers used in this receiver the engineers fully recognized the existence of a feedback through the tube capacity and the necessity of compensating for it in order to prevent oscillations when all stages of the radio frequency amplifiers were tuned to resonance. Not satisfied with the means previously employed, which either resulted in inefficient operation or in the necessity of making critical internal adjustments, they worked along an entirely new line.

Under the usual conditions existing in tuned radio frequency amplifiers, the currents fed back from the plate circuit to the grid circuit, through the tube capacity, is of such phase as to add to the voltage already existing between the grid and filament of the tube, and thereby cause oscillation. It obviously follows that if the right phase relation is obtained between the current fed back through the tube and the current existing in the grid circuit, oscillation would be prevented.

It is well known that the phase relation between current and voltage in any circuit or group of circuits depends upon the relative constants of such circuits, namely, the inductance, the resistance and the capacity. In the case of transformers, the mutual inductance and the distributed capacity between the primary and the secondary must also be taken into consideration.

In designing the transformer, the relative production of all of the constants mentioned above were arranged in such a manner those actually specified and still get good results from the receiver. However, it is recommended that the novice strictly adhere to the list of parts specified. Successful construction of the receiver will then be assured, since the diagrams will tell him exactly where to drill holes, locate parts and make connections.

In the event that apparatus other than that specified is used, care should be taken that the necessary mounting holes are modified so that the apparatus may be properly mounted.

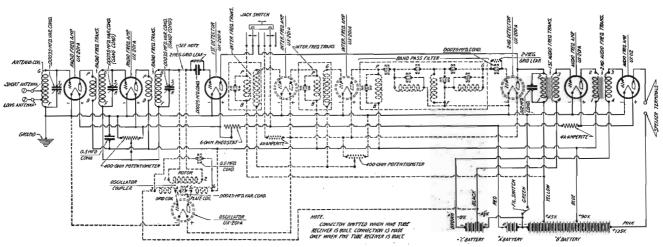

Figure 4. Schematic wiring diagram of complete receiver

that the current fed back from the plate to the grid circuit is of such nature so as to prevent oscillation.

This feature, combined with the physical design of the transformers, which practically eliminates all electro-magnetic coupling between successive stages, and a circuit design embodying the proper use of by-pass condensers, makes it possible to build a five-tube tuned radio frequency set that is extremely simple to construct, and which has a high and uniform efficiency over the entire range of broadcast wave lengths.

In the Camfield Super-Selective 9, three tuning controls are used in order to provide for maximum efficiency in the reception of distant stations. It would be possible to use a 3-gang condenser to tune the three radio frequency coils, but this would result in the loss of some of the efficiency, due to the fact that it is impossible to make the antenna coil tune exactly the same over the full range of wave lengths as the two radio frequency transformers. By providing a separate tuning condenser for the antenna coil greater efficiency is obtained, particularly in the reception of weak signals from distant stations. This gives the circuit two tuning controls when it is operated as a five-tube set and three controls when it is operated as a nine-tube set. However, these three controls are not hard to handle, even by an inexperienced operator, as will be explained later in connection with notes on balancing and tuning.

The laboratory model of this receiver was built from the exact list of parts appearing herewith. The experienced constructor or experimenter can substitute other reliable makes of apparatus for

- 1 Carter Midget Battery Switch
- 1 Carter No. 6 Jack Switch
- 5 Eby Engraved Binding Posts
- 1 Jones Type P. Multiplug
- 2 Amperite No. 4-A
- 1 Micarta or Formica 7x30-inch Drilled and Engraved Panel
- 1 Micarta or Formica 10x29-inch Drilled Sub-Panel
- 40 Feet Acme Celatsite Wire
- 1 Package Kester Radio Solder
- 1 Ekko Ground Clamp
 - Miscellaneous lugs, wire, screws, etc.

The 7x30-inch front panel and the 10x29-inch sub-panel may be purchased with all holes drilled. If the builder prefers to do this drilling himself, a complete set of actual size blue prints may be obtained through any of the stores selling complete parts for the Camfield Super-Selective 9 or direct from the CITIZENS RADIO CALL BOOK. Persons not experienced in the construction of radio sets will find it advisable to obtain these blue prints even if drilled front panels and sub-panels are to be used.

The first step in the construction is to mount the sub-panel on the three sub-panel brackets as shown in Figure 2. Next mount all of the parts that are to be secured to the sub-panel. Then fasten the front panel to the sub-panel by means of the sub-panel brackets and next mount the three condensers, the 6-ohm rheostats, one of the 400-ohm potentiometers, the filament switch and the transfer switch to the front panel.

(Continued on Page 168)

The "Best Lincoln" Nine Super Heterodyne Receiver

An Easily Constructed Receiver of Excellent Design, Capable of Highly Satisfactory Service

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

HE problem of how many many tubes a Super Heterodyne should have has puzzled many a prospective set builder. Some contend that the number should be as high as fourteen, and no doubt the future will bring forth some other experimenter who will advise a greater number. By employing crystal detectors and cutting down on the audio amplification, the number can be reduced till the receiver might be mistaken for a tuned R. F. circuit at first glance, and by employing trick circuits, making one tube do the work of two or more, the number may be still further reduced.

Such is nice for theory and speculation, but it takes a skilled operator to make any of the doubled-up circuits act like one that is straightened out. While crystals will work perfectly as detectors, they are not up to tubes in efficiency, and while they will save dollars for tubes invested, they cut off miles of reception.

Here is a set that will delight both the pocketbook and the ear, as well as the emotion commonly referred to as a "big kick" when long distance reception is discussed.

This set is quite simple in construction, as all unnecessary minor refinements that tend toward

confusion have been done away with. When less than ten tubes are used, there is no need of taking elaborate precautions, as the chances of unruly operation are much less than in larger sets. Those following our instructions will have a super which will be a delight to own and will give the owner the satisfaction of knowing it is inexpensive both in original cost and maintenance.

To simplify construction, the set is mounted on a wooden base-board. The panel is only twenty-four inches long and is grained to resemble polished walnut. The holes are already drilled and marked with appropriate labels in gold-filled engraving. The whole lends a subdued tone, further enhanced by a white-faced milliammeter with a gold rim. The controls are all close to the center of the panel, making them readily accessible.

For family use, a jack for the cone reproducer is used. Then, for the convenience of the "boiled owl" who sits up all night tuning for London and Japan, another jack for headphones is convenient. This jack connects to the first audio transformer,

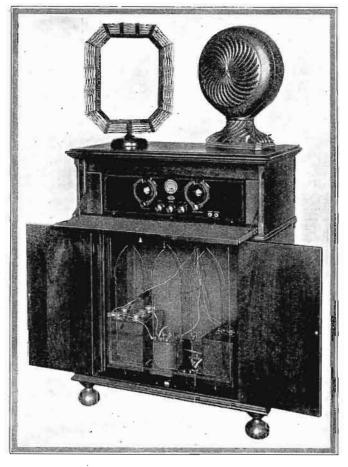

Photo A. Completed receiver mounted in console, with suggested accessories

cutting out the ear-bursting volume, without sacrificing any of the selectivity. This arrangement of the jacks makes it possible to pick up a weak station and tune it in till it reaches loud speaker volume, then switch over to the reproducer. It is not commonly known, but much of the remarkable long distance work boasted of as loud speaker reception was first brought in by the use of headphones. Distant signal logging is an art as fine as watchmaking and about as exasperating to the uninitiated, but when one knows how it is so simple it seems ridiculous.

While much of the DX heard depends upon the man who turns the knobs, the set is not to be slighted. Fresh batteries, soldered connections, sensitive reproducers and reliable tubes all contribute their share to the final results. It is very seldom a set of sloppy construction or slipshod maintenance that is a world beater.

Often factors beyond the control of the operator are responsible for poor reception. A set in the heart of a city will never reach as far as one in the country. A set inside a steel building will seldom receive long distance on a loop. The range of a receiver in the summer is about one-fifth as great as in the win-

ter. And so on, but the purpose of this article is to initiate the reader to the merits and construction of the "Best Lincoln Super."

The conventional loop aerial is used, as most Super Heterodynes work best with a loop. An outside aerial requires additional apparatus and sacrifices the selectivity. Across the loop terminals is a variable condenser, which is one of the major controls. It brings the loop and first detector in resonance with the incoming signal.

A second condenser is across the grid and plate of the oscillator. The adjustment of this is more critical than that of the tuning condenser. It is commonly noted that there will be two beat frequencies on the oscillator condenser while only one on the tuner. Choose the frequency that seems to be the first harmonic and log it as the desired one. It will be found that the tuning and oscillator scale readings will be nearly the same on the correct frequency, while on the second harmonic the scale of the oscillator condenser

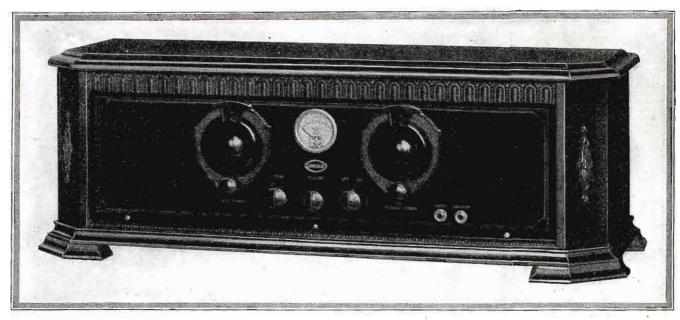

Photo B. View showing panel arrangement and engraving

will be from ten to thirty divisions off. An evening of experimenting will teach the builder more about handling his set than a volume of reading matter.

A regeneration control is desirable, since it brings the set up to the point of maximum efficiency and prevents much undue howling. A midget condenser of .000045 mfd. capacity is provided for this purpose. As it need be adjusted but once, it is mounted on the baseboard. All tubes are mounted in non-microphonic

1-9x23x1/2-inch Wood Baseboard

The intermediate frequency transformers are mounted in bakelite cases with the terminals brought out at the tops. They are not subject to intensive intercoupling, therefore may be mounted quite close together. They are placed in a line, allowing the shortest connecting leads. A bus connects all the filament terminals but the last intermediate, which goes directly to the positive terminal of the "A" battery.

The plate and grid leads go directly to the corresponding sockets. All nine sockets are mounted in a row, an arrangement which not only makes the set look neater and more businesslike,

but tends toward the shortest possible leads as well.

No grid leak or condenser is used in the first detector circuit, but in the second a condenser of .0005 and a 2-megohm grid leak have been found quite suitable for the requirements. The detector tube feeds into an audio transformer across the primary of which is shunted a .0025 by-pass condenser.

Power tubes are used in both steps of the audio amplifier; for the first a 112 and the second a 171. A bias of nine volts is placed on the grid of the 112 and forty-five on the 171. However, these voltages should be experimented with to find the most suitable value.

The filaments of both audio tubes are controlled by Amperites, the detector by a 20-ohm rheostat and intermediates and first detector by a 3-ohm rheostat. The oscillator is regulated by an aditional 20-ohm rheostat. The 3-ohm rheostat is mounted on the panel. The others, which need to be adjusted but seldom, are mounted conveniently on the baseboard. By consulting the wiring diagram one will observe that the intermediate frequency transformers are all numbered. There are five of them, and the

ALL HOLES UNLESS DTHERWISE SPECIFIEL ARE 🐉 DRILL AND COUNTERSINK. Fig. 1. Panel layout

designating numerals run from 100 to 500. The scheme employed here is slightly different from standard practice in that numbers 100 and 500 are peaked at 771/2 K.C. with a very large amplifying factor; numbers 200, 300 and 400 are very sharply tuned at 155 K.C.

List of Parts

These parts or their equivalent will give satisfactory results:

List of Accessories Required for the "Best Lincoln" Nine Super-Heterodyne Receiver

The following list of accessories have actually been tested with the "Best Lincoln" Nine Super Heterodyne Receiver and have been found to operate very satisfactorily with it. While it is suggested that the accessories specified be used, it is possible to make any reasonable substitution without seriously interfering with the efficiency of the receiver.

1 Excello Model R-31 Console.

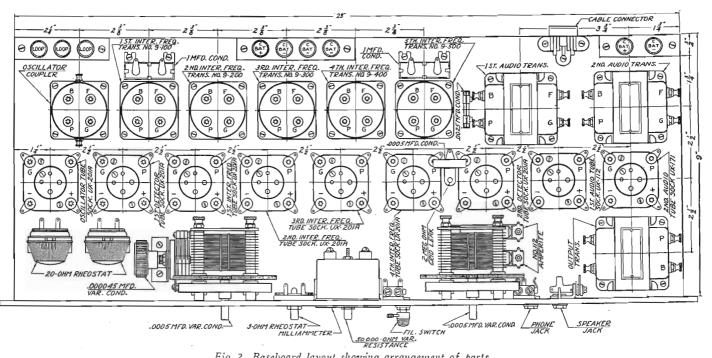

Fig. 2. Baseboard layout showing arrangement of parts

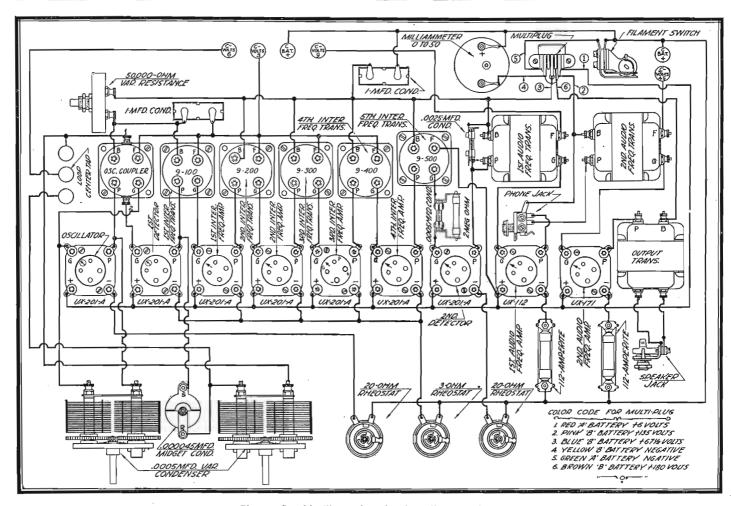

Fig. 3. Graphic illustration showing all connections

- 1 Corbett Model "C" 24-inch Cabinet.
- 1 Rowan "A" Storage Battery.
- 1 Kokomo Electric Co.s Kingston "B" Power Supply.
- 1 Allwood Speaker.
- 1 Balkite Model "N" Charger.
- 1 Zig-Zag Loop.
- 1 Yaxley Model 444 Relay.

The Excello Console style R-31 incorporates an unusually substantial construction and uses a design that will harmonize beautifully with the furnishings enhancing the appearance of the average American drawing room. It is made entirely of American

Walnut with five-ply walnut veneer top and panels. The front doors are made of selected Matched Butt Walnut. There is a remarkably large battery compartment which also contains the reproducing horn used in conjunction with the Allwood speaker. The horn is of special fibre construction which allows true tone quality. The generous sound chamber gives ample volume and freedom from distortion. This sound chamber when used in conjunction with the Allwood speaker gives a reproduction which is more than satisfactory. A screen placed inside the doors of the battery compartment allows the speaker to be heard, but prevents (Continued on Page 166)

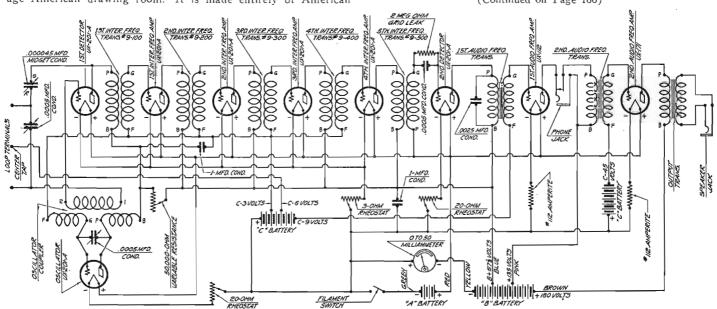

Fig. 4. Schematic wiring diagram

A High-Amplification Shielded Super-Heterodyne

This Receiver Employs a Laboratory Assembled and Calibrated Amplifier

Assembly and Thorough Test Has Been Made in the Laboratory of the Citizens Radio Call Book

HE performance of any radio receiver is dependent upon the excellence of the design of every individual part of the whole receiver. Particularly is this true of the super-heterodyne circuit, which really consists of three separate circuits, each of which alone may be likened to a whole set.

In the receiver described herewith, this fact has been given most careful consideration, and the design of the entire receiver worked can be heard with good volume.

In the Improved Laboratory Super-Heterodyne is at last found a receiver free of the almost age-old bugaboo of individually matched long wave transformers, for the long wave amplifier is a sealed, laboratory-calibrated unit that will not vary one kilocycle in operation with standard tubes. Almost ever builder of a super-heterodyne has either been disappointed in his set's not possessing the expected

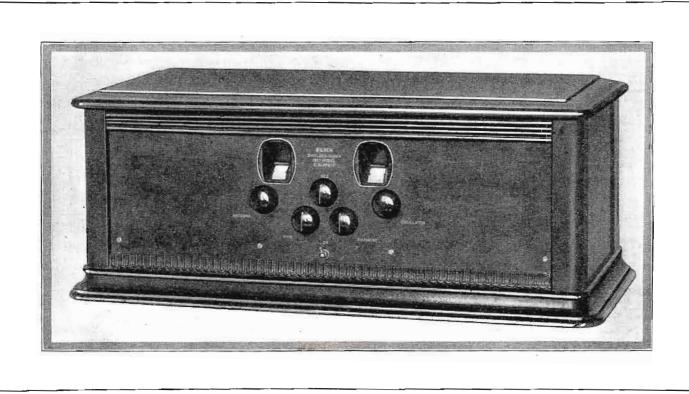

Photo A-Front view of receiver in Ehlert cabinet

out so that each individual section of the set would operate at peak efficiency. As an example, the first detector circuit with but a single tube will give a head-phone range of several hundred to many thousands of miles on short waves. With the two audio stages added, head-phone volume gives way to ample loud-speaker volume, while with all light tubes operating, the performance of the receiver is really remarkable.

The selectivity of the receiver is equally remarkable, and in Chicago it is quite possible to bring in stations at distant points, with but 10, or in some cases, even 5 to 7, kilocycles separation from powerful local stations. This is made possible through judicious use of shielding of detector, oscillator, and I.F. amplifier. The shielding is so effective that local stations can barely be heard with no antenna connected to the set; but upon the addition of a 24-inch length of wire for an antenna, all the local stations and a number of distant ones

knife-like selectivity, or, if he has employed really sharp, efficient transformers, they only too frequently do not function properly. This condition is not always due to the individual transformers not having been properly matched to begin with, but because individual assembly conditions result in altered circuit capacities and operating conditions which do not duplicate the laboratory conditions under which the transformers were first matched. Then, again, any of the popular iron-core 30, 40, 50 or 60 kilocycle transformers have very low winding capacities for operation with low circuit, and low tube capacities. Since the operating frequency of typical long wave transformers is largely determined by the total circuit capacity, and since winding capacity is generally low, it follows that any small variations in wiring, assembly, or tube capacity will represent a large proportionate change of the total capacity, with the result that individual receiver stages built with accurately laboratory matched transformers may

often be as far as 15 to 20 kilocycles apart. This, of course, means little or no selectivity, even if there still remains fair amplification. The logical way to build an intermediate amplifier is to use not iron-core-air-core transformer combinations, but to follow along the lines of best RF amplifier design practice and use low resistance air-core transformers throughout, tuned with large fixed capacities, so that variations in tube capacities represent such small percentage changes of the whole as to be ineffectual. Exactly this course has been followed in the Laboratory Super, but it has been carried a step farther, and the whole amplifier built into a single, carefully tested unit, so that two causes of variation have been eliminated, and the remaining third-tube capacity-rendered so small a percentage change as not to affect operation. On top of this, the whole amplifier is completely shielded, each of the R.F. stages and detector being housed in individual compartments of a copper-brass catacomb. The amplifier without shielding is remarkably efficient, but when

mum so that stations are heard at but one, or, at the most, two dial points. It is grid-tuned with a 350 mmf. condenser with consequent absence of hand capacity effect. Its output at different wavelengths is sufficiently constant for practical requirements, as is its calibration; while the coupling to first detector is variable.

A copper can 15 inches long, 5 inches wide, and 3 inches deep holds the I.F. amplifier and second detector. It contains four individual stage compartments, each holding an R.F. transformer and its tuning capacity, a tube socket, and the necessary wiring and bypass condensers. Three R.F. stages and a detector are employed, with the whole unit tuned to exactly 112 kilocycles. The reason for the selection of this intermediate frequency is that very satisfactory low resistance air-core tuned R.F. transformers may be built for operation there. The 112 kilocycle amplifier frequency results in decreased interference possibilities. Normally, in a super employing, say, 50 kilocycle intermediate frequency, two stations 50 kilocycles away will heterodyne each

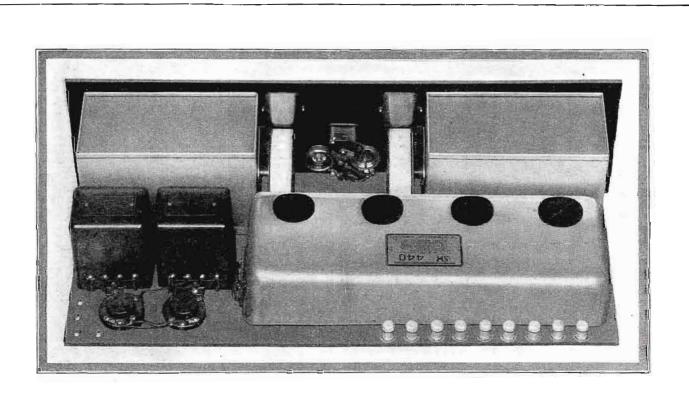

Photo B-View showing receiver ready for operation with shields in place

the shielding is added the amplification jumps tremendously. Actually, shielding adds at least 50 to 100 per cent in volume on weak stations—exactly as it would intelligently applied to any multi-stage RF amplifier. This is because of the elimination of detrimental feed-backs, always and invariably present with unshielded amplifier stages.

Eight tubes are employed in the Improved Laboratory Model Super-Heterodyne—a first detector, an oscillator, three long wave amplifiers, a second detector, and two audio stages. The first detector circuit is very similar to the conventional short-wave regenerative circuits so popular, a small 75 mmf. midget condenser controlling regeneration; while a .00035 modified SLW-SLF condenser does the tuning. The coil system is a conventional S-M plug-in coil, so connected that both regeneration and tuning condenser are at ground potential, with consequent total absence of hand-capacity effect. No provision is made to use a loop, as it has been found that for extreme selectivity the use of an antenna—the coupling to which is variable—provides for greater flexibility than a loop.

The oscillator circuit is designed to keep harmonics at a mini-

other and be received without the use of the local oscillator at all, selectivity being dependent upon the selectivity of the antenna tuner and the local coil pick-up. As the intermediate frequency is increased, this possibility decreases, since it is far easier for an antenna tuner to discriminate between stations 112 kilocycles apart than between powerful locals 30, 50 or even 60 kilocycles apart. Further, powerful stations are generally spaced on even 10 kilocycle separations, so that the odd 112 kilocycle frequency is a greater aid to selectivity. Coil pick-up is, of course, absent in the shielded amplifier, and wiring pick-up is almost negligible, since all wiring is very close to the grounded metal panel or chassis. Complete shielding of first detector and oscillator sections prevents pick-up of strong local stations on the coil systems themselves, though for receivers to be operated in the country, or in non-congested broadcasting centers, these two shields might be omitted.

The audio amplifier offers a very unusual point of very great value in an ultra-selective receiver. This is the 5,000 cycle cut-off. or decrease in amplification, which aids receiver selectivity. Frequencies above 5,000 cycles do not contribute to realism of re-

production, according to no less an authority than the Bell Telephone Laboratories, while in the range above 5,000 cycles lie practically all parasitic amplifier noises, atmospheric disturbances and the only too prevalent heterodyne squeals. These the 5.000 cycle cut-off tends to decrease very markedly, and almost entirely eliminate.

Parts List

These parts or their equivalent will give satisfactory results:

1-Van Doorn Panel and Chassis Unit, pierced, with hardware

1-Carter .00015 Condenser with leak clips

1-Carter M-200 Potentiometer

2-Carter 1/2 mfd. Condensers

1-Carter 3-ohm Rheostat

1-Carter Battery Switch

4-Carter No. 10 Tipjacks

1-Polymet 2-megohm Leak

2-S-M 220 Audio Transformers

4-S-M 511 Tube Sockets

2-S-M 805 Vernier Drum Dials

1-S-M 275 R.F. Choke

1-S-M 342 .000075 mi. Condenser

2-S-M 320 .00035 Condensers

9-X-L Binding Posts

7—Ceco Type "A" Tubes 1—Ceco Type "J-71" Tubes

Assembly

Upon the chassis should be mounted the detector and oscillator assemblics, inside the stage shield pans if shields are to be used. The end mounting screw of each 511 tube socket is used to join the A— to the chassis, so a lug should be placed under the screw head, to be soldered to the F— socket terminal, and the under side of the chassis scraped bright for good contact with the fastening nut. One terminal of the .00015 grid condenser should be bent at right angles and fastened directly under the "G" terminal screw. The single long screw holds the 275 choke coil in the detector stage assembly.

The binding posts mount in the nine holes at the rear of the chassis using the insulating washers to positively insulate them from the chassis, as do the four tipjacks. The "Ground" post grounds to the metal chassis, and the fastening screw of this post holds one end of the second ½ mfd. condenser tightly to the chassis, while the free end must be bent up clear and free of the metal chassis.

The A— connection is made to the amplifier through a contact between amplifier shield and chassis to which it is fastened with four screws. The two audio amplifier tube sockets mount using their rear fastening screws to connect the F— posts to the chassis. All possible wiring should be done on the chassis before proceeding further, leaving free the wire ends that will connect to the instruments on the front panel; and to the two audio transformers which mount last. The potentiometer should be mounted as shown, using insulating washers to thoroughly insulate its frame from the panel. The rheostat and the midget condenser

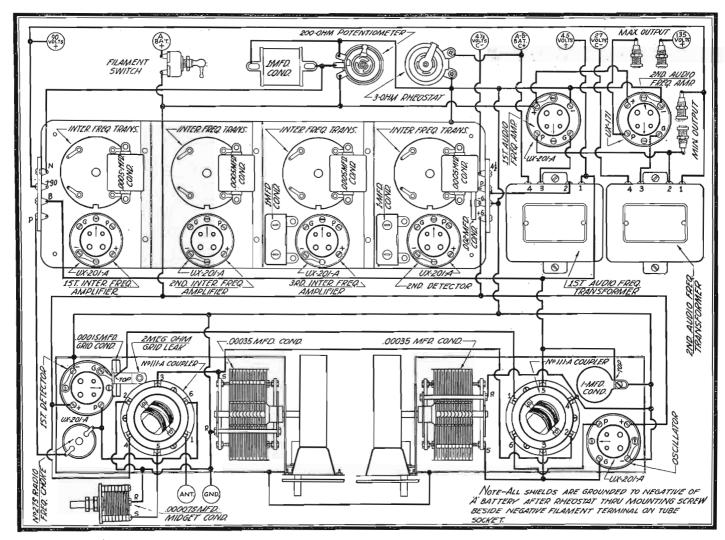

Fig. 2-Graphic illustration showing all connections

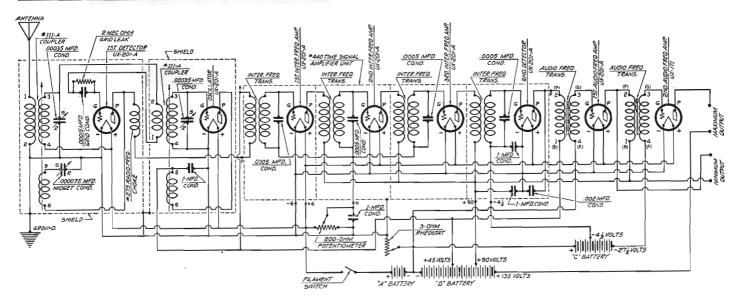

Fig. 3—Schematic wiring diagram

are similarly mounted, except that care is taken to make good contact between them and the panel.

The drive mechanisms of the dials should be dropped into the bracket bearings intended for them, the shafts pushed through the holes in the front panel, and the two brackets bolted to the panel using the screws provided. One variable condenser fastens to either bracket, using the shaft mounting nut provided. A drum should be slipped over each condenser shaft, with set screw loosened, and pushed up until the drum scale edge is just ready to enter the crack in the drive mechanism shaft. With a knife blade this crack should be widened to receive the drum scale edge, and the drum pushed well up on the condenser shaft. The scale should then be adjusted to read 100 degrees against the indicator points in the panel windows, when the condenser plates are entirely disengaged, upon which the set screw in the drum dial hub should be tightened on the condenser shaft. With the knobs fastened on the drive shafts, the condenser dials should rotate if the knobs are turned.

The connections to the condensers, rheostat, and potentiometer should be made before fastening the panel to the chassis. After they have been put in, machine screws and nuts serve to hold panel and chassis together. The on-off switch mounts in the one remaining panel hole, with insulating washers to thoroughly insulate it from the panel and chassis. (It may have been previously connected in circuit, and allowed to hang on the wiring until ready to be mounted.) In wiring, a little slack should be left in each connecting wire, which should be cut to fall about as shown in the bottom view of the chassis. After testing, all wiring may be bunched and laced into neat cables, using very heavy waxed shoemaker's thread. Two leads should not be joined or included in the cable—they are the wires running from the detector stage along the bottom of the chassis and up to posts 1 and 2 of the oscillator coil socket.

Operation

To operate the set, all tubes (a total of seven CX301A and one CX371 tubes are needed) should be inserted, except the first detector tube. The CX371 goes in the right rear socket. With the on-off switch on, the rheostat should be turned to within ½-inch to ½-inch of the full right position. If the potentiometer "GAIN" knob is turned to the right, a "plunk" will be heard at some point. This can be detected by varying the oscillator drum, which should cause a number of shrill whistles to be heard. The "GAIN" knob should always be operated just to the left of the "plunk" point—to the right of which squeals were heard when the "OSCILLATOR" dial was varied. The receiver is least sensitive when the "GAIN" knob is at the left, and the most sensitive when the "GAIN" knob is just to the left of the "plunk" point.

The first detector tube should be inserted, and the midget condenser set all out. The antenna coil rotor should be set at 45 degrees-the oscillator rotor all in. A small antenna 30 to 60 feet long should be used, or even a larger one if the set is not too close to powerful local stations. Stations may be tuned in using the two drum adjustments only. Weak stations may be intensified by turning up the "REGENERATION" condenser on the front panel. This condenser functions similarly to the "GAIN" knob, in that as it is turned to the right to interleave the plates, signal strength on weak stations will increase up to the point where the first detector oscillates, and the signal turns into a squeal. Adjusting the midget condenser will react slightly on the setting of the "ANTENNA" drum. The position of the antenna coil rotor should generally be at about 45 degrees. With a small antenna, it may work best all in; with a large antenna, at nearly right angles. The sharpness of tuning of the antenna dial depends upon the setting of this rotor, as well as that of the midget condenser. The oscillator rotor should be adjusted once on a very weak signal at about 300 to 350 meters, and once set for maximum volume, may be left alone.

Battery or Power Operation Optional

The Laboratory Super-Heterodyne may be operated from standard A, B and C battery equipment, or it may be operated from light socket power equipment, either partially or wholly—using the standard CX301A, CX112, and CX371 tubes; either a 6-volt storage A battery with trickle charger known, when both units are combined, as an "A Power Unit"), or from a direct true A power unit such as the new ABOX A supply. As there is considerable variation in B power units, a type employing a glow tube voltage regulator is recommended. Dry C batteries should be used. The receiver may be adapted for use with McCullough, Sovereign, or other A.C. tubes.

Use of Output Transformer or Power Pack

It is highly desirable that an output transformer such as Silver-Marshall 221 or 222 be used between the receiver and the loud speaker. This unit has not been included in the set, since the ideal way to build it is to leave out the audio stages entirely and use, instead, a power pack such as the Unipac described elsewhere in this issue—a power amplifier and B supply combined. The first audio tube may be built into the Unipac as a CX326 tube with the first audio transformer in the set itself. In this case, the Unipac would serve beautifully as a phonograph amplifier with a record pick-up connected to the CX326 input tube's grid circuit, or as a two-stage amplifier for the radio set with the secondary of the single audio transformer in the set connected to the Unipac in place of the record pick-up by means of a single phone cord.

The Two Tube Browning-Drake Receiver With Power Amplifier

Here Is the Popular Browning-Drake Receiver in an Entirely New Form, Equipped with a High Quality Power Amplifier

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

ROWNING - DRAKE is essentially a radio frequency development, and as such, has nothing directly to do with the audio end. The "Official" assembly, recommended by Browning and Drake, uses a combination amplifier which is believed by them to give exceptionally good results. From the point of distance getting ability, there appears to be little to choose between these systems. Tone quality and the inclination of the constructor have governed the choice of which model should be built.

Many things go in cycles, however. Two years ago the fan who wished the utmost in tone quality built a resistance amplifier, or later on an impedance coupled system for greater volume. Transformers then on the market seemed manifestly inferior to either of the later methods of audio amplification. Audio transformer manufacturers have not, however, remained idle. Much research and experimentation has been conducted. Considerable money was spent and a great deal of thought put upon the problem of bringing the audio transformer to the point where it would equal, or possibly, surpass the other systems. These efforts have been far from unsuccessful, and the result is that we now have transformers which will compete with the best resistance coupled systems on tone quality and, of course, give considerably greater volume. It is not meant here to state opinions or draw conclusions as to the relative merits of audio amplifiers. The only conclusion to be reached is that there are several excellent methods at the present time, transformer being one of them. The situation has been still further emproved by the recent practice of market-

ing combination "B" eliminators and audio amplifiers, designed for use with any R.F. and detector unit.

The Browning-Drake development was considered as more likely to be used than any other to precede such an arrangement. A foundation unit has, therefore, been prepared in commercial form by that company, designed particularly for use with external amplifiers. This article, therefore, will describe the two-tube Browning-Drake receiver as preceding the well-known AmerTran Power Pack, an exceptionally high grade eliminator and amplifier, using the best audio transformers available, and designed for a 210 power tube in the output. It is believed by Prof. Browning and by the officials of the AmerTran Company that this combination is almost ideal for present day construction, where distance getting ability, a high degree of

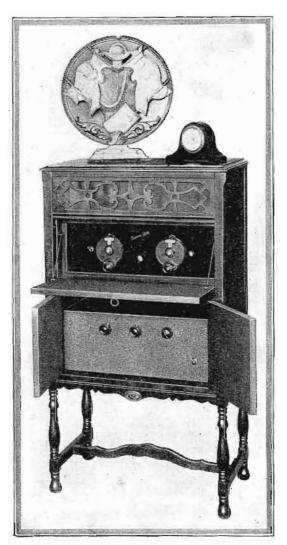

Photo A. View showing receiver and complete power amplifier installed in a console

selectivity, and tone uqality with great volume is desired.

Now we are concerned, prior to the input of the last tube, in getting a voltage amplification gain, but at the end of the amplifier we have a unit, our loudspeaker, which requires real physical energy development. A power tube is required to get this, and we cannot get power out of a one-half ampere filament and 180 volts of B power.

To get ample amplification, a power tube of the 210 type must be used which consumes over one ampere for the filament and should operate with from 350 to 450 volts on the plate. On the bass notes alone, many times energy is required to give the same amount of volume as middle or upper-register notes and it is these very bass notes that give a background to the music. A painting without canvas to hold it together would be a sorry mess, and so is music with the bass cut out.

Many experimenters and engineers have worked in radio realizing that more bass was needed. The majority of this development work was done on the audio amplifier, but it does not seem to have been realized that there was little use in building up a bass if the loudspeaker was not energized enough to reproduce it. It is very much like that case of the man who built himself a boat in his cellar and then had to tear down half of the house to get it out.

The semi-power tube does not handle the excellent audio amplifier we now have with the real quality which is to be demanded of the radio of tomorrow, if not of today. The writer feels that by next winter the 210 type of tube will be in extensive use and that anything less

will not be considered where the best in quality is desired.

Probably the first concern to realize this need and sell commercial apparatus which made it available to the home builder was the American Transformer Company of Newark, N. J. They have had a high voltage power unit on the market for some time. It supplies 450 volts to the plate of a 210 tube, the filament being lighted from the house lighting current, so that no extra drain is imposed upon the A battery.

The design of a practical commercial unit which would handle this work was not without much grief. When the transformer and choke units had been satisfactorily designed, it was found that no commercial condenser was available which would withstand the high volt-

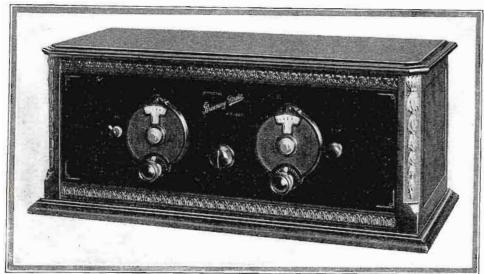

Photo B. Front view of receiver mounted in a cabinet

ages. The Tobe-Deutschmann Company of Cambridge finally developed a special high-voltage condenser for this work, which was then combined with the AmerTran products, and the first successful high-voltage power pack was available.

The complete audio amplifier is built with the pack so that this unit may be connected onto the detector of any of our existing receivers and the finest type of present-day music is then available. The AmerTran Company has developed audio transformers to the point where their quality compares most favorably with the better types of impedance and resistance amplifiers. Two of these, their regular first and second stage De Luxe models, are used in the accompanying amplifier.

Here is real quality. When the signals of a good concert come through this into the 210 power tube, with 450 volts giving it plenty of reserve, a good cone speaker, such as the Western Electric, becomes a real musical instrument. Compared with the ordinary radio type of amplification, it is like the small square piano compared to our present-day grand pianos. Some of the semi-power tube amplifiers approach it, particularly if they are not run very near what may be called the "saturation point," but in the last analysis they do not compare with a 210 tube amplifier.

Many people say, "Why have all this power?" Let us draw an analogy. Today there is less and less opportunity of driving fast on the public highways and yet greater power is a feature of all this year's motor cars, and few salesmen will talk of any speed under 70 miles an hour. This is selling cars. Why? Because it is much more consfortable to drive a 70-mile-an-hour car at 35 miles an hour than to drive a 50-mile-an-hour car at the

It is the flexibility, the sense of great reserve, the comparative loafing along and easy work of the motor at touring speeds which make the fast and powerful cars desirable. This applies to radio. With the 210 type of tube the reader is literally loafing along even when strong volume is being used. An unusual fortissimo passage finds the tube handling it with ease, like the unexpected climbing curve in a high-powered car. There is enough energy to give the bass notes color and intensity and some to spare.

same speed.

As may be noted, the foundation unit is equipped with two self-contained sockets for the radio frequency and detector tubes. The regenaformer unit and the antenna tuning unit from the Official Kit-Set are to be mounted as shown with the Regenaformer to the left of the de-

tector socket and the antenna tuning unit to the left of the radio frequency socket, which is at the center front of the subbase. Mounting should be accomplished by the use of 6 x 32 screws inserted through the bottom of the sub-panel into the girder frame condensers. After the Official Kit is mounted, the tuning dials should be removed as well as the drilling templates which are furnished with them. These templates are not to be used, inasmuch as the front panel is already drilled. The dials should be slipped onto the condenser shafts, the dial lights secured by means of the small machine screws which extend from the dial heads through the front panel, and the metal caps should then be replaced over the shaft ends after the dial set screws are made tight.

The 30 ohm filament rheostat should next be mounted at the center of the panel with the tolder tab at the top. Mount the Yaxley

filament switch at the left end of the front panel and insert the 33 ohm resistance cartridge in the clips at the left of the antenna tuning unit. Now mount the antenna and ground binding posts at the left end of the sub-base with the antenna post in the left rear corner. The Precise .0001 variable antenna condenser can next be mounted in the position shown to the rear left of the antenna coil. Now, mount the A+ and A— binding posts to the rear of the regenaformer and the B+ amplifier and the input binding posts which is unmarked at the right end of the sub-base. Insert the 8 megohm resistor in the resistor clips just below the regenaformer coil. The mechanical assembly of the receiver is now complete and the builder can immediately proceed with the wiring.

The filament circuit should be wired first. Run a wire from the A binding post to the left terminal on the filament switch. Connect the right terminal of the filament switch to one solder tab on each of the dial lights and to the Amperite filament control which should be mounted in the resistor clips at the center of the sub-base. From the other terminal of the Amperite run a wire to the +F filament terminal spring on the detector socket and to the 30 ohm rheostat. From the other terminal of the rheostat connect a wire o the 33 ohm resistance cartridge. Connect the other terminal of the 33 ohm resistance cartridge to the F filament terminal spring on the radio frequency socket. Now, connect the A- binding post to the frame of the regenaformer tuning condenser, thence to the free terminals of the dial lights. Next, connect from this same wiring line at the regenaformer condenser frame to the ground binding post and to the center tap on the antenna coil. A connection should now be made from this same line to the -F filament terminal spring on each of the sockets.

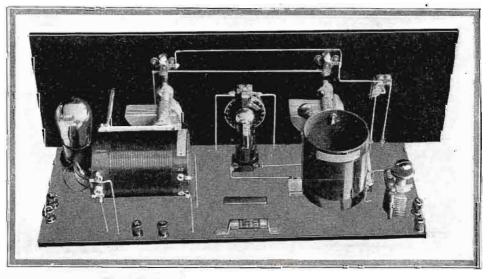

Photo C. Rear view of two tube Browning-Drake receiver

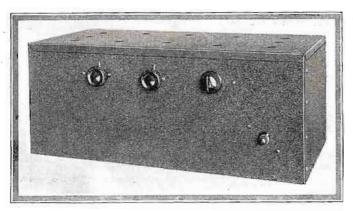

Photo D. Front view of powere amplifier showing controls

This completes the filament wiring and the tubes and lights in the dial heads should be illuminated when the filament switch and rheostat are turned on. Now, connect the frame of the antenna tuning condenser to the antenna binding post and the rotating plates to the stationary plates of the antenna tuning condenser. From this same point connect to the grid terminal on the radio frequency socket. This terminal is provided with a solder lug on the top of the base panel. Now, mount the neutralizing condenser on the bakelite strap attached to the back of the antenna tuning condenser frame. Connect a wire from the neutralizer disc to the plate terminal of the radio frequency socket. This wire should go down to the base panel and be attached on the under side, having in series with it a Tinytobe .001 fixed condenser. Above the sub-panel on the plate terminal will be found a solder lug which should be connected to the lower regenaformer primary solder lug, marked P. Now, connect a wire from the terminal just above this contact, marked +B, to the binding post, marked B+ amplifier. Solder one terminal of the 1 mfd. Tobe condenser to this B battery binding post and connect the other terminal of the by-pass condenser to the minus filament post, marked A-. Connect a wire from the unmarked binding post up through the panel to either one of the regenaformer tickler solder lugs. To this same

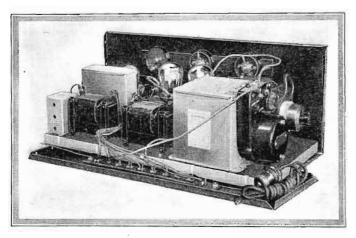

Photo E. Rear view of amplifier with case removed

wire connect one terminal of a Tinytobe .001 by-pass condenser and from the other terminal of the Tinytobe condenser run a wire to the minus filament binding post or any wire connected to this binding post. Next, connect the plate terminal of the detector socket to the unused soldering lug on the regenaformer primary. Run a wire from the resistor contact nearest the front panel, at the right end of the base panel, to the grid terminal of the detector socket and to one terminal of a .00007 Tinytobe condenser. Connect the other terminal of this Tinytobe condenser to the opposite grid leak resistor clip and, above the panel, connect this same clip to the fixed plates in the regenaformer tuning condenser. The wiring is now completed and after a complete inspection the receiver can be connected to batteries or to the AmerTran power pack.

As a convenient and safe test, place the tubes in their sockets and connect a 6-volt storage battery to the A battery binding posts. The

tubes should light with the rheostat and switch turned on. Now, remove one of he A battery wires with the rheostat and switch in the "on" position and touch it to the unmarked binding post and to the B+ amplifier binding post. The filaments should not light at either of these contacts. If the filaments do light, the B battery wiring is short circuited on the filament line and the error must be corrected.

The construction and placement of parts in the AmerTran power amplifier and B supply is evident from the picture wiring diagram. The 110 volt supply from the house lighting mains is fed into a transformer which steps the voltage up to several hundred volts. This high voltage alternating current is then rectified by a UX 216-B rectifying tube and passed through a filter consisting of two Type 854 AmerTran chokes and three special Tobe filter condensers. The output is pure direct current, such as could be obtained from a sufficient supply of B batteries. This high voltage current is then passed through an AmerTran resistor, Type 400, which makes any desirable voltage available for use in the two-tube circuit.

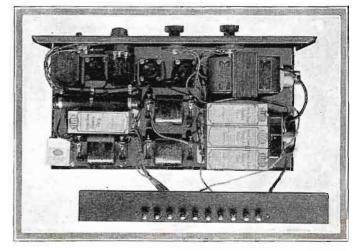

Photo F. Top view showing arrangement of parts on baseboard

The correct voltages are indicated on the instruction sheet which comes packed with the AmerTran resistor, Type 400. The operation of the power pack is automatic from the filament switch on the receiver, due to the control of the 110-volt circuits by the Yaxley automatic switch. The connections of the apparatus are clearly shown in the picture wiring diagram and further details need not be given. The power pack itself should not be grounded inasmuch as a grounding connection is made through the A— connection at the two-tube receiver unit. The UX 216-B rectifier tube should be inserted in the socket nearest the AmerTran power transformer and the UX 210 amplifier tube in the socket to the right of this in the picture diagram. A UX 201-A tube should be used in the socket on the extreme right. The amplifying transformer connections, while not marked in the picture diagram, are self-evident from the connections of the grid

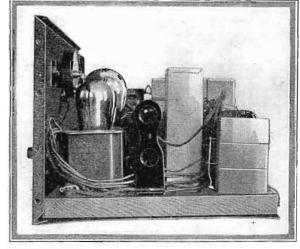

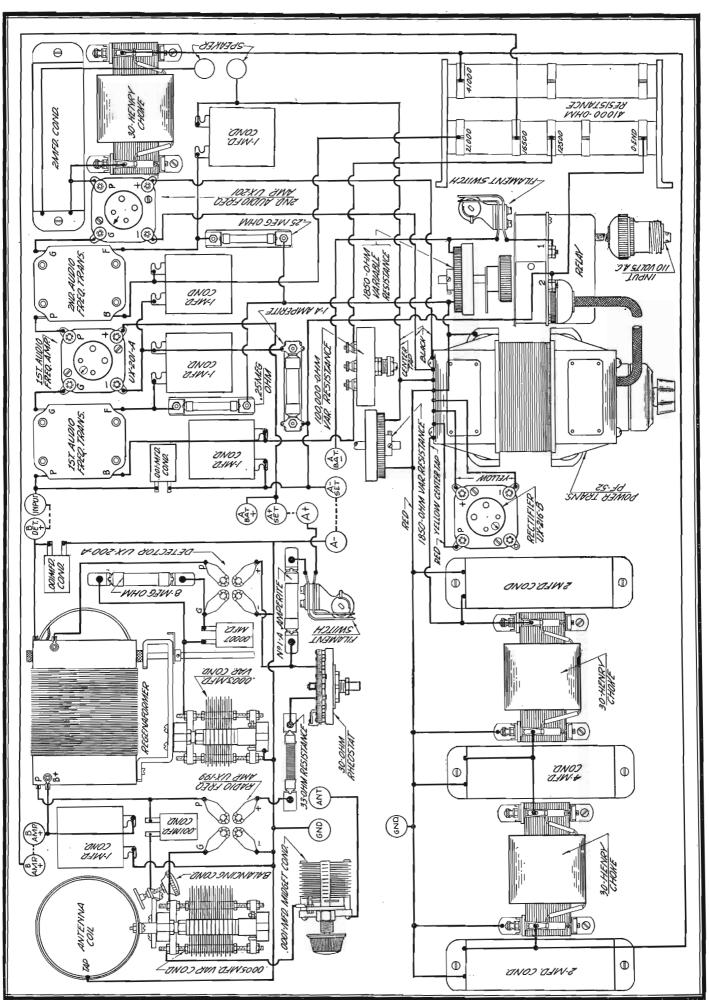

Photo G. End view of power amplifier with metal panel in place

terminals to their respective sockets. With apparatus placed exactly as shown no trouble should be experienced in completing the assembly. Large simplified diagrams on the AmerTran power pack are furnished by the manufacturer and more detailed information on the Official Browning-Drake two-tube unit can be secured on request from the Browning-Drake Corporation.

LIST OF PARTS

Any substitution from the following parts should be made with care.

- 1-7x21x3/16 inches Drilled and Engraved Micarta Panel
- 1—7½x18x3/16 inches Drilled Micarta Sub-Panel with Sockets and Clips Attached
- 1-Browning-Drake Neutralizer
- 2-Browning-Drake Tuning Units
- 2-Tobe .001 mfd. Tinytobe Fixed Con-
- 1—Tobe .00007 mfd. Tinytobe Fixed Condensers densers
- 1-Tobe 1 mfd. By-Pass Condenser
- 1-Yaxley Filament Switch
- 1-Yaxley 30-ohm Rheostat
- 6-Engraved Eby Binding Posts
- 1-Precise .0001 Midget Condenser
- 1-Browning-Drake 33 ohm Resistance Cartridge
- 1-Dirham 8 megohm Grid Leak
- 1-Type 1-A Amperite and Mounting
- 1-Ekko Ground Clamp
- 1-Package Kester Radio Solder
- 20-Feet Acme Celesite Wire
- 1-AmerTran De Luxe 1st Stage Transformer
- 1-AmerTran De Luxe 2nd Stage Transformer
- 1-AmerTran Amerchoke No. 854
- 1-Tobe 2 mfd. Type 604 By-Pass Condenser
- 4—Tobe 1 mfd. By-Pass Condensers
- 1-Tobe .001 mfd. Fixed Condenser
- 3-Benjamin No. 9044 Sockets
- 1-AmerTran Power Transformer No. PF52
- 2-Amerchokes No. 854
- 1-AmerTran Resistor Type 400
- 2-Tobe 2 mfd. Type 602 Filter Condensers
- 1-Tobe 4 mfd. Type 604 Filter Condenser
- 1—C. R. L. O. 100,000 ohm Variable Resistance
- 2-Federal No. 25 Potentiometers
- $1-9x31x\frac{1}{2}$ inches Wood Baseboard
- 10-Engraved Eby Binding Posts
- 1-Metal Case
- 1-Yaxley Relay
- 2-Durham 1/4 Megohm Grid Leaks and Mountings
- 30-Feet Belden Flexible Rubber Covered Wire
- 1-Sonatron Type X199 Tube
- 1-Sonatron Type 200-A Tube
- 1-Sonatron Type 201-A Tube
- 1-Sonatron Type 210 Tube
- 1-Sonatron Type 216-B Tube

List of Accessories Used with the Browning-Drake Receiver with Power Amplifier

The following is a list of accessories which have actually been tested with the Browning-Drake Receiver and have been found to operate satisfactorily with it. While these particular accessories are suggested, it is possible to make any reasonable substitution without sacrificing the all-around efficiency of the receiver:

- 1 Chillicothe Model 405 Console.
- 1 Signal Electric Co. 21-inch Cabinet.

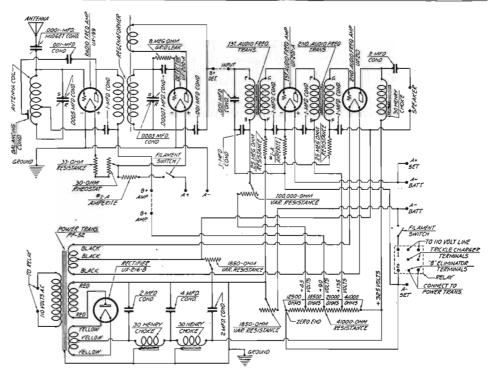

Fig. 2. Schematic wiring diagram of receiver and power amplifier

- 1 Rowan "A" Storage Battery.
- 1 Baker-Smith Model "H" Speaker.

The Chillicothe Model 405 Console is a narrow upright model much resembling a phonograph cabinet. It has a receiver compartment just large enough for the Browning-Drake Receiver, with room for the Amertran "B" Supply and Amplifier in the lower compartment. The panel slides in a channel and is held securely by a stay-bar which fastens to the top. A built-in loud speaker is contained in the cabinet above the receiver compartment. The built-in speaker is attached to the hinged lid, and is out of the way when the lid is turned back when some internal adjustment on the receiver is made. The lower compartment has two hinged doors with attractive door-pulls of brass. The cabinet is finished in an attractive walnut finish, rubbed to a lustrous finish. It is made by the Chillicothe Furniture Co. of Chillicothe.

The Signal Cabinet is a small size cabinet, made especially for the Browning-Drake Receiver. It is harmoniously decorated with embossed scroll work and ornaments. The construction is lighter than the larger models of cabinets and it does not appear nearly so massive. It is made of walnut veneer, finished in an attractive brown. The cabinet is made by the Signal Electric Co. of Menominee, Mich.

The necessary "A" supply for the operation of the receiver is obtained from a Rowan 100 amp. hour storage battery. This battery is exceptionally well constructed, and is capable of withstanding overloads, since it has an excellent recuperative power. It is installed in a high-grade rubber case and has handy screw terminals for connecting wires.

The Baker-Smith Model "H" Reproducing Cone is as attractive in physical appearance as it is efficient in satisfactory reproduction. This particular model is fashioned to represent an escutcheon plate of some medieval coat of arms. It makes an attractive ornament for the den and lends an air of solemn grandeur to any room in which it is placed. The reproducing cone floats at the rim, being suspended only from the armature which protrudes through the center. The speaker does not employ power tubes, and is mounted on a weighted base which prevents tipping. It is made by the Baker-Smith Co., Inc., San Francisco, Calif.

(If further information on any of the above described accessories is desired, it may be secured by writing direct to the manufacturer.)

The New N-28 Nine-in-Line Receiver

Here Is a New Model of a Receiver Which Has Risen to the Peak of Popularity in an Amazingly Short Time

This receiver was constructed and all illustrations were made in the Designing Laboratory of The Citizens Radio Call Book

THE Nine-In-Line Receiver was accepted with such enthusiasm, in two previous issues of this magazine, that several major changes have been made in the layout and the apparatus which are very beneficial to the operation and appearance of the receiver. Those having built previous models of this receiver will find these changes of interest when considering the annual revamping of their receiver. Those who have not built previous models should find in this receiver a receiver worthy of considerable attention and thought when considering the construction of a new receiver.

The major changes which are incorporated in the new Model N-28 are: improvements in the Intermediate Frequency Transformers, new Audio Frequency Transformers, the addition of an Output Transformer and Drum Dial Controls which create a very attractive

The improvement in the Intermediate Frequency Transformers is in the winding of the secondary coils. A wire of lower resistance is now used. This permits a sharper tuning transformer, closed matching at the factory and a slightly greater gain per stage, also the "cut off" is much better than in the previous transformers. This improvement, alone, will give considerably better reception.

The new Audio Frequency Transformers were designed to bridge the features of over and under amplification, giving a more true life signal with all intonations and overtones so pleasing to the ear of a connoisseur of fine music. The new transformers are much larger than those in previously described models. Great care was taken in the selection of iron for the cores and the method and compounds used in the impregation of the coils. The result is that the frequency response curve is almost ideal. They readily respond to the deep notes of 100 cycles and under, and at the same time do not give an ear-splitting shriek to those above 3,500 cycles.

The purpose of the output transformer is to act as a tone filter, removing much of the scratchiness due to in-

terference from nearby sources of disturbances and at the same time keeping the high plate voltage, necessary for the operation of power tubes, out of the loudspeaker windings which might cause undue strain and at times serious damage.

The new drum dials used are the Remler Universal Type 110. These dials are very attractive and have an illuminated dial, which is a great aid in tuning, especially when the receiver is placed in a dark corner of the room. The vernier ratio of these dials is comparatively low and the control knob of the right size and distance from the panel to make them accurate and easy to tune. There is no backlash or wabble, the motion being smooth and continuous. Remler Twin Rotor tuning condensers are used in conjunction with the drum dials, as these condensers are ideal for use in the super-heterodyne type of receiver, as there is no grounded rotor to cause trouble by being "hot."

The dials tune almost together and the tuning is extremely sharp. Grasp each tuning knob between the thumb and first finger, of each hand, and tune very slowly over a given range. If one tunes rapidly he is quite apt to hear nothing, for he will pass right by a station.

There are three other controls on the panels besides the two drum

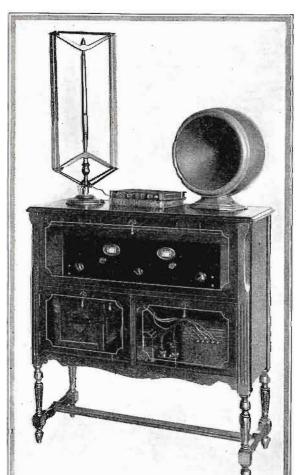

dials; these are three rheostats, one for each of the two detectors and one for the intermediate frequency amplifiers. The filament switch controlling the filaments of all tubes is mounted on the rheostat in the center of the panel. When this rheostat is tuned all of the way to the left the switch is off and all filaments are turned off. The only other variable control of the receiver is the midget condenser. This is mounted on the end of the sub-panel just in front of the three plug-in jacks for the loop antenna. This condenser is used to control regeneration and needs to be adjusted but rarely and it is therefore unnecessary for it to be mounted on the panel.

The sockets and intermediate frequency transformers are mounted in such fasion as to allow connections without leads, the socket terminal connecting directly to the transformer terminal. The advantage of this method of mounting is self apparent inasmuch as the possibility of capacity coupling is very greatly reduced.

It might be suggested, here, that in laying out the panel and sub-panel great care should be exercised in the correctness of dimensions. It is advisable to use a square and an accurate scale for this work. There are drilling templates furnished with the Benjamin sockets and the Remler Drum Dials. After the panels have been laid out it is suggested that the various parts be laid on the panels as an added precaution to insure

Photo A. Nine in Line in console with suggested accessories perfect fitting of the various mounting screws and holes. The radio frequency choke is mounted in the same type of case as the intermediate frequency transformers and is placed between the two audio frequency transformers. This is a convenient position, as it is very close to the "B" battery leads at this point.

Five fixed condensers are used, one .005 mfd., two .002 mfd. and two 1. mfd. The smaller condensers are of the moulded bakelite type, sealed into an airtight case. The two 1. mfd. condensers are of the rolled paper and tinfoil type. The three smaller ones are supported directly by their connecting wires and the two large ones are screwed to the sub-panel. The location of these condensers on the sub-panel and in the circuit may be seen in the various diagrams and photo-

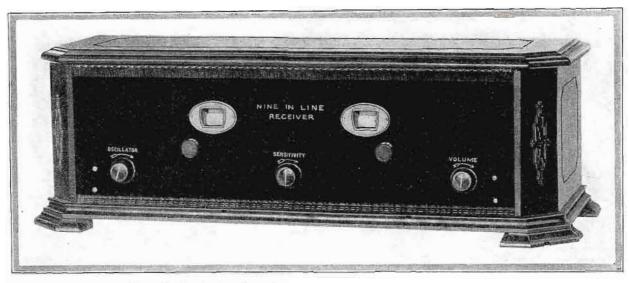

Photo B. Front view of receiver showing panel arrangement and engraving

graphs. Their purpose goes without speaking.

The Amperite resistor which controls the amplifier tubes is slung in a cartridge clip, which is furnished with the Amperite, on the underside of the baseboard directly under the amplifier. The type 3-A is correct for this purpose. The carrying capacity must be threequarters of an ampere.

In addition to the three jacks for the loop there are five more at the opposite end of the sub-panel. Two of these are for the reproducer and the other three for the "C" battery. These jacks are of the cord tip species, where connection is made by pressure against a spring. These are quite convenient, for the wires may be released by pulling, while it only takes a push of the thumb to drive the wire. or cord tip, in firmly. In addition of this convenience the space occupied by corp-tip jacks is much less than that of binding posts, and as this receiver has been built as small as possible, all available space is at a premium.

List of Parts Required

- 3-H. F. L. Trainsformers No. H210
- 2-H. F. L. Transformers No. H215
- 2-H. F. L. Transformers No. C16
- 1-H. F. L. R. F. Choke L425
- 1-H. F. L. R. F. Transformer L430
- 1-H. F. L. Output Transformer C25
- 9-Benjamin Sockets No. 9044
- 2-Benjamin Brackets No. 8629

- 2-Remler Universal Drum Dials
- 2-Remler .0005 mfd. Variable Condensers
- 2-Carter 1 mfd, By-pass Condensers
- 1-Carter .0005 mfd. Fixed Condenser
- 2-Carter .002 mfd. Fixed Condensers
- 1-Carter 6 ohm Rheostat
- 1-Carter 6 ohm Rheostat with Switch
- 8-Carter Cord tip jacks
- 1-Carter 200,000 ohm "Hi-Ohm"
- 1-Jones Type BM Multiplug
- 1—Celeron 7"x26"x36" Drilled and Engraved Panel 1—Celeron 8"x24"x36" Drilled Sub-Panel
- 1-3-A Amperite
- 30-Feet Acme Celesite Wire
- 1-Package Kester Radio Solder Miscellaneous Lugs, Screws, Nuts, etc.

List of Accessories Used with the New N-28 Nine-in-Line Receiver

The following is a list of accessories which have proven by a actual test to operate most satisfactorily with the new N-28 Nine-in-Line Receiver. While these particular accessories are suggested, it is possible for any reasonable substitution to be made without seriously decreasing the all around efficiency of the receiver.

1-Excello Type R-22 Walnut Radio Table

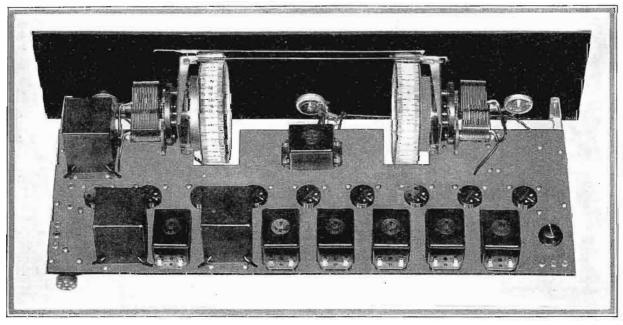

Photo C. Bottom view showing mounting on condensers and multiplug

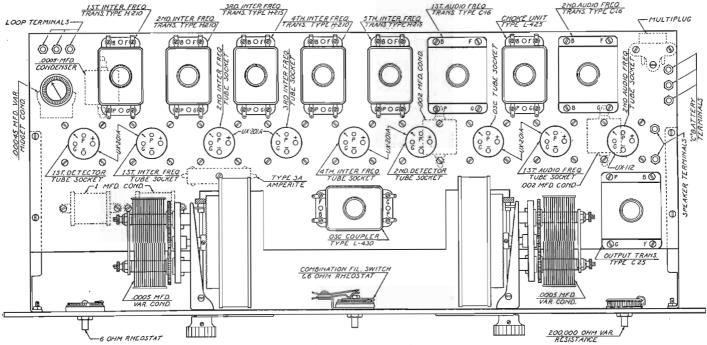

Fig. 1. Top view showing arrangement of parts on sub-panel

- 1-Corbett Model "C 26" Radio Cabinet
- 1-Rowan 100 amp. "A" Grade Radio Battery
- 1-General Radio "B" Power Supply.
- 1-Acme K-1 Loudspeaker
- 1-Acme A-7 Charger
- 1-Qualitone Loop
- 1-Yaxley Type 444 Automatic Power Control

The new N-28 Nine-in-Line Receiver appears in photo A installed in an Excello console with the necessary accessories for its proper operation. The console is manufactured by the Excello Products Co. of Chicago, Illinois, and is constructed entirely of solid walnut, being finished in a two-tone effect. Ample space is provided for both the receiver and the necessary "C" batteries, together with the proper accessories. A slide is provided in the accessory compartment for the "A" battery, so that it may be easily withdrawn for testing and inspection.

"A" supply is obtained from a Rowan "A" battery, manufactured by the Walter Rowan Battery Supply Co. of Chicago, Illinois. This particular battery is exceptionally well made and is housed in a solid rubber case. It is provided with screw terminals for attaching wires and a handy carrying handle. "B" supply is derived from a General Radio "B" power unit, which uses the celebrated Raytheon tube for rectifying purposes. A handy switch is provided on the front of the power supply for turning it on and off, if automatic control is not used. This type of "B" power supply is fully able to supply the necessary voltage for the operation of the Improved Nine-in-Line Receiver, without danger of overloading.

The speaker shown in this installation is one manufactured by the Acme Apparatus Co. of Cambridge, Massachusetts. It is a double free-edge cone, actuated by an adjustable unit. This adjustable feature is very desirable, since this allows the unit to be adjusted to the particular type of receiver being used.

The "A" battery is kept at full charge by an Acme full wave charger which is also manufactured by the Acme Apparatus Co. of Cambridge, Massachusetts. The rectifying device in this charger uses two Raytheon cartridge rectifiers, whose maximum output is 2½ amperes of rectified current. This type of charger is very desirable on account of its extremely small size and compactness.

The loop used in this installation is a new model manufactured by the Duro Metal Products Co. of Chicago, Illinois. It is made entirely of walnut, beautifully finished. A high grade of wire is utilized, which is bank wound.

A Yaxley automatic power control is used in conjunction with the accessories shown herewith, so that an entirely automatic accessory system is obtained. All power accessories are controlled directly from the filament switch of the receiver. In other words, the charger is connected to the battery when the set is turned off and the "B" battery is connected to the receiver and energised when the set is turned on. This makes a highly desirable installation, which is thoroughly automatic in character and will insure a fully charged "A" battery at all times

(If any further information on any of the above accessories is desired, it may be had by writing to the manufacturers.)

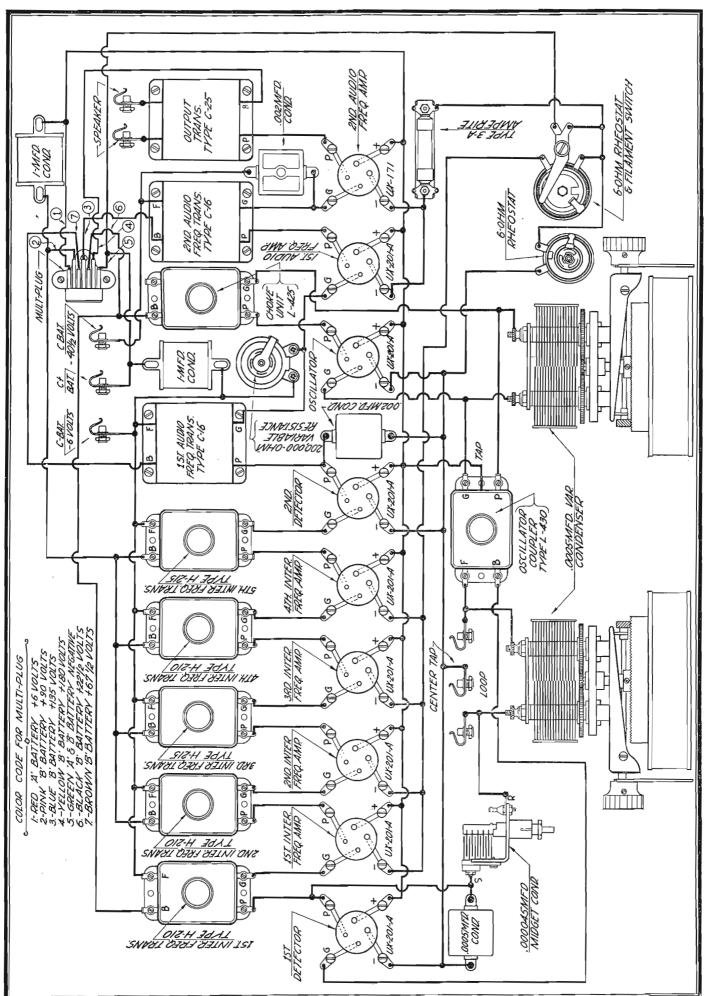

Fig. 3. Graphic illustration showing all cannections. Check carefully against completely wired receiver

The Improved Remler 45 K. C. Super-Heterodyne Receiver

Here Is an Up-to-Date and Improved Model of the Remler 45 K.C. Super

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

N retrospective review of the almost phenomenal growth of the Super-Heterodyne in the favor of the radio public, and the tremendous possibilities of the circuit, one can scarcely comprehend the enormous amount of work involved in the painstaking research required in the evolution of the present-day Super-Heterodyne from the monstrous contraption known at the close of the war.

"Old timers" in the radio field will remember that the first superheterodyne brought to their attention was a twelve-tube affair, mounton a five-foot pine plank. There was no panel, and the parts were connected with the garden variety of bell wire. The tuning seemingly required the undivided attention of five men, and if one man attempted to tackle the proposition, it took at least a half hour to bring the apparatus to a point of resonance.

Each stage of the intermediate frequency amplifier consisted of a pair of honeycomb coils and two variable condensers, one across each coil. Each stage also had its private and individual "B" battery, in addition to the three "A" batteries which were necessary.

The only tubes available at the time were the ones made for and used by the Navy. Their normal current consumption was anywhere from one to two and a half amperes each. Consider, if you will, one tube of the type then used drawing as much current as eight of the modern ones.

There were no broadcast stations at that time (1919), and all that

could be heard were code signals from the boats on the lakes and the long wave transatlantic stations. The set howled like a banshee, each stage contributing a frequency of its own. Distortion of signals was bad, the operator being able to change the note to any frequency desired, once the set was in resonance. Nor did the receiver remain in resonance. It had a heart-breaking manner of suddenly detuning and going into sustained oscillation. The volume was terrific when compared to the volume obtainable with receivers of that time.' However, tone quality was totally absent and if a receiver of that type were placed beside one of our present-day eight-tube receivers, it would be very conspicuous by the seeming lack of tone.

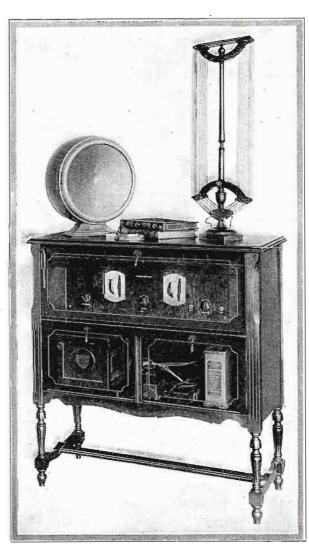

Photo A. View of receiver mounted in console, with suggested accessories

To delve into the dim and hoary past is especially appropriate in an article on the Remler 45 K.C. Super-Heterodyne, for the Remler Intermediate can truly be considered as one of the first offerings of that type of apparatus made available to the radio public. The fact that this particular type of apparatus has been used continuously for over a number of years with no radical change in design is ample proof as to the all-round efficiency of the receiver using them.

Readers of this magazine will, no doubt, recall the article which appeared in the Fall, 1925, issue of the Citizens Radio Call Book, describing the 45 K. C. Remler Super-Heterodyne. Incorporating the best practices of receiver design prevalent at that time, it met with instant favor with the radio public. Its popularity has not decreased with the passing of years. This is amply shown by the tremendous correspondence from our readers on the subject. In conjunction with the requests of our readers, the designing laboratory has produced an improved model of the Remler 45 K. C. Super-Heterodyne Receiver and herewith offer it to the radio public.

Perfect co-ordination of tuning and selectivity have been considered paramount features, as well as an ability to work through bad local interference. Physical appearance has been well considered and the panel layout is such as will delight the most discriminating builder. The recognized Remler hookup has been used, but employing parts that in

our estimation would give the most satisfactory service. All of the instruments with the exception of the three variable condensers, rheostats and phone jacks are mounted on a bakelite sub-panel, with all connecting wires on the under side and out of sight.

The oscillator coupler consists of a plate and grid coil of green silk-covered wire, wound on a bakelite form with the pickup coil placed inside. This much resembles the variocoupler in external appearance and is used for much the same purpose, only in this case, instead of controlling wave length, it controls the degree of pickup of the oscillator. The control is not critical, and there is no need of having the tuning knob on the front of the panel.

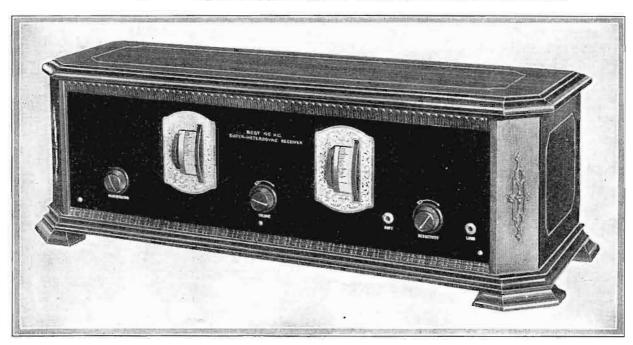

Photo B. Front view of receiver in cabinet

Once the oscillator has been set at the desired coupling, it need not be touched again unless tubes have been changed or some other radical change is made.

Regeneration is controlled by a midget condenser connected between the upper loop terminal and the plate of the first detector tube. This control in this particular set is a bit more sensitive than common, and it is a good plan to have the control knob on the front of the panel. By skillful manipulation one is able to weed out distortion, which would otherwise cause mushy reception.

The two major tuning controls are variable condensers. One tunes the loop circuit and the other regulates the frequency of the oscillator tube. They should tune almost in unison when the set is functioning properly. Drum type dials are used, allowing an unusually low gear ratio. Rapid tuning of a super-heterodyne has never brought satisfactory results. It is well to realize from the first that the only method of obtaining successful operation

is to turn the dials very slowly, stopping at each division to make sure that no station is audible at that spot. Very often a station may be passed over with rapid tuning and not a signal heard, while by being careful it may be received with sufficient volume to be clearly distinguished.

Four intermediate frequency transformers are used in this receiver. Two are known as the Type 600 and the remaining two as the Type 610. The Type 600 are primarily transformers and are wound on an iron core. On the other hand, the Type 610, while similar to the Type 600, has an air core. The secondary windings of the Type 610 are tuned with condensers and act as filters. The combination of air and iron in rotation gives a maximum signal intensity with a degree of sharpness that is exceedingly helpful in tuning in distant stations.

A small variable condenser is shunted across the secondary terminals of the first 610 transformer. It is controlled by a set screw protruding through the top. In order to adjust it a wooden

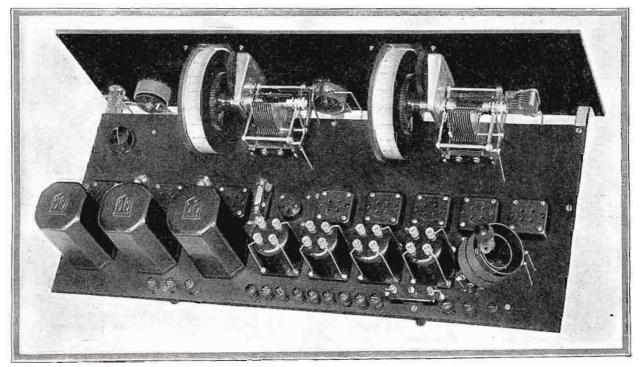

Photo C. Rear view. Note neatness of sub-panel layout

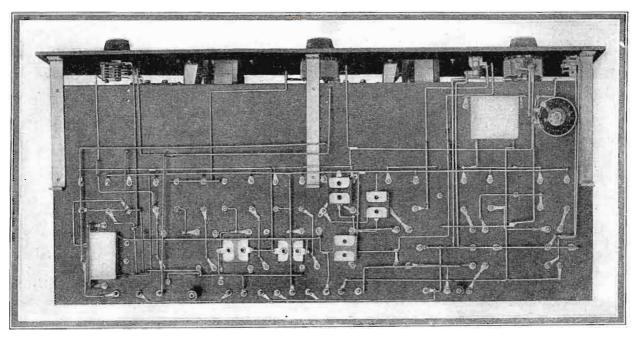

Photo D. Bottom view. The sub-panel does not need to be cut away for the drum dials

wedge must be used. This may be cut from a dowel rod or any piece of wood that may be handy. Do not use a metal screw-driver for this purpose, since body capacity is transferred directly to the condenser through the hand. The purpose of the condenser is to peak the transformers at the proper frequency. There is another condenser of .00025 mfd. capacity across the second 610 transformer, but this one is fixed and requires no adjustment.

A grid condenser or grid leak is not used on the first detector tube. The second detector tube requires a condenser of .0005 mfd. capacity and a two-megohm leak for the most satisfactory results. The plate of the second detector tube is by-passed to the negative filament by a .0025 mfd. fixed condenser. A phone jack is inserted in the plate circuit of the first audio tube for the use of headphones when only one person is using the set and no loud speaker reproduction is wanted. When only one stage of audio is used, the volume is decreased to a point where headphones may be worn with comfort on all but local stations. The sensitivity of the set is not decreased, and some authorities claim that it is increased by cutting out the last audio tubes. This remains to be proven, however, since it is a matter of personal opinion. The main purpose of the jack is to satisfy the cravings of the super DX friend who must sit up all night exploring the ether. A loud speaker in such a case would prove detrimental to his peace of mind, for it would keep the family awake.

The amplifier uses a push-pull system, employing two tubes on the last stage, with their output fed directly to a countertapped output transformer. Mellowness and depth of tone are possible with a push-pull amplifier that cannot be otherwise obtained.

Consulting the diagrams will acquaint one with the proper voltages for the tubes. Three taps must be brought from the positive "B," one for all the tubes before the audio amplifier, one for the first step of audio and the full battery voltage for the second step. Two separate sets of "C" batteries are needed, one for the intermediate amplifier and the other for the audio amplifier. Taps are taken from these batteries and care must be taken to see that they are of correct values. As a "C" battery is generally of small proportions, it may be mounted directly inside the receiver cabinet if desired. Nothing is gained by having long leads, and a considerable amount of efficiency is sacrificed.

The constructor should have no difficulty in building the receiver. Careful examination of the various illustrations shown herewith will, no doubt, clear up any vague understanding in regard to the set. It is highly advisable that the circuit connections in the receiver are checked before the batteries are connected. This will prevent the ruination of the tubes in the receiver if a false connection is made.

List of Parts for Improved Remler 45 K.C. Super-Heterodyne Receiver

These parts or any reasonable substitute will give satisfactory results.

- 2-Camfield .0005 mfd. Variable Condensers
- 2-Remler Transformers No. 600

- 20 Feet Acme Celesite Wire
 - Miscellaneous lugs, screws, nuts, etc.

List of Accessories Used With the Improved Remler 45 K. C. Super-Heterodyne Receiver

The following is a list of parts which have been actually tested with the Improved Remler 45 K. C. Super-heterodyne Receiver and have been found to operate most satisfactorily with it. While

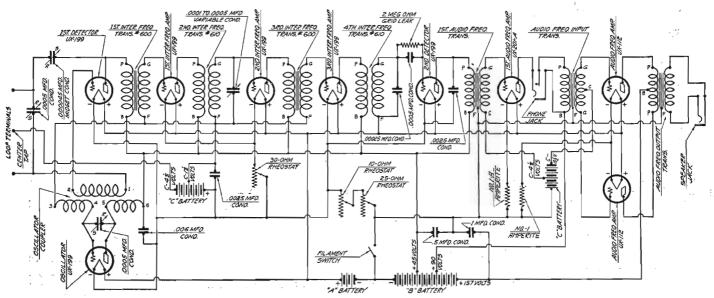

Fig. 3. Shematic wiring diagram

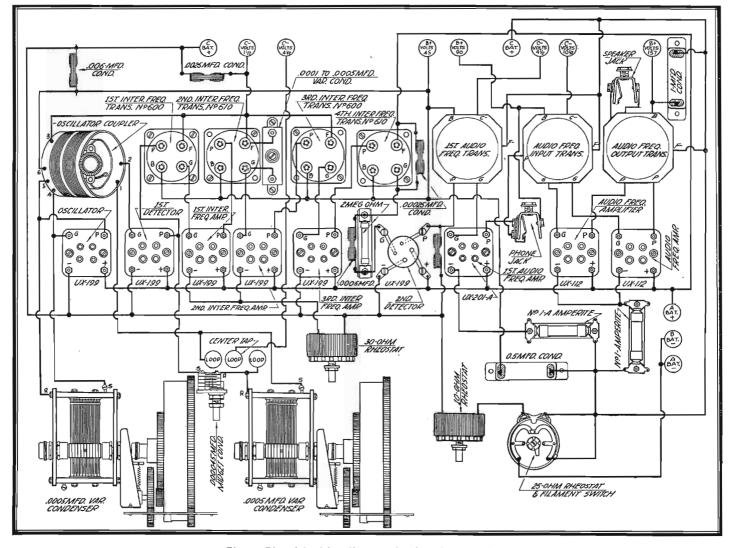

Fig. 4. Pictorial wiring diagram showing all connections

these particular accessories are suggested, it is possible to make any reasonable substitutes without decreasing the all-around efficiency of the receiver:

- 1-Excello Type R-22 Walnut Console
- 1—Corbett Type "C" 26-inch Cabinet 1—Rowan 100 amp. "A" Grade Radio Battery
- 1-Acme Type A-7 Charger
- 1-Acme Type K-1 Speaker
- 1-Acme Type E-1 "B" Power Supply
- 1-Fiat Type C Bank-Wound Loop
- 1—Jewel Type 595 A-B Relay

Photo A shows the Improved Remler 45 K. C. Super-heterodyne Receiver installed in a console with the necessary accessories for proper operation. In Photo B the receiver is shown as it appears when installed in a cabinet alone. The cabinet shown in Photo B is a product of the Corbett Cabinet Company, St. Marys, Pennsylvania. It is tastefully finished in a dark walnut hand-rubbed finish and has a very pleasing appearance. The corner posts of the cabinet are set off by polychrome decorations, which add considerably to its all-around appearance. The console is manufactured by the Excello Products Company of Chicago, Illinois. It is entirely constructed of solid walnut and is finished in a two-tone effect. Ample space is provided for both the receiver and necessary "C" batteries, as well as the necessary accessories for proper operation. The storage space for the accessories has an added advantage in that a sliding shelf is provided upon which the "A" battery is placed. This allows the battery to be withdrawn from the accessory compartment with little difficulty, for testing and examination.

The necessary "A" supply for the operation of the receiver is obtained from a Rowan 100 amp, hour storage battery. This battery is exceptionally well constructed, and is capable of withstanding over-

loads, since it has an excellent recuperative power. It is installed in a high-grade rubber case and has handy screw terminals for connect-

The Charger, "B" Supply and Speaker are all products of the Acme Apparatus Company of Cambridge, Massachusetts. The charger is a new departure in design and uses two 21/2 amp. Raytheon rectifying cartridges, which make it a full wave charger. Its extremely small size and high efficiency make it a highly desirable device. The speaker is a double free-edge cone type, with an adjustable unit. Its unique construction allows wonderful reproduction with tremendous volume, since it is virtually impossible to "blast" it. The "B" supply is derived from a Raytheon equipped "B" power unit. This particular unit is capable of delivering sufficient "B" battery potential for operating the receiver without danger of overloading. Sufficient controls are provided for varying the voltages of the various "B" circuits.

The loop used in this particular installation is the Fiat loop manufactured by the Radio Appliance Laboratories of Chicago, Illinois. This loop is very unique due to the fact that it is capable of being knocked down and stored in a very small space. An adjustable tension is provided by which the wire may be kept taut at all times. This device is made entirely of solid walnut and is tastefully finished in a varnished and hand-rubbed finish.

A Jewel relay is used in conjunction with the accessories shown herewith. The use of this device makes the entire installation of accessories automatic in character, since they are controlled entirely from the filament switch of the receiver. The relay is inserted in one side of the "A" battery lead. It is entirely automatic in character, turning the "B" battery eliminator and charger on and off as the set is used or turned off.

(If further information on any of these accessories is desired, it may be had by writing direct to the manufacturers.)

The St. James Upright Eight Super-Heterodyne Receiver

This Receiver Incorporates a Unique Design Which Allows It to Be Used Either as a Portable or Permanent Receiver

This Receiver Was Constructed and All Illustrations Made in the Laboratory of the Citizens Radio Call Book

ERE is a novel type of super-heterodyne receiver which should be warmly welcomed by the dweller of the modern tiny apartment or hotel, where floor space is at a premium.

This receiver has been designed with the idea in mind of getting the most set into the least possible space and yet retaining the high efficiency of the superheterodyne type of receiver. This receiver is unique in the field of super-heterodynes.

The entire receiver is mounted on two strips of bakelite two and one-half inches wide and eighteen inches long. These strips are placed in a wooden rack. In order to utilize every square inch of the space available, instruments are mounted both upright and inverted.

The entire receiver is only fifteen and one-half inches high, nineteen inches long and three inches deep. As compared to the usual run of bulky receivers, this is quite a saving of space. The inherent advantages of this form of construction are very short leads, portability and mechanical strength. The receiver may be carried quite easily in an automobile, hung on the wall in the home or installed in a motor or sail boat, not to mention taking it on camping trips.

When installed in the home, the St. James Vertical Eight may be mounted in a console or covered with a decorative fabric

and suspended from the wall, being scarcely thicker than some of the picture frames in common use.

There are two tuning controls mounted on the small front panel of the receiver. The variable condenser which is used to tune the loop antenna has a small knob on the shaft, similar to the type of knob which is usually used on a rheostat, by means of which the desired frequency may quite easily be tuned. A Karas Micrometric dial is used to turn the variable condenser which tunes the oscillator. This dial is of the friction vernier type and is very well suited to the purpose, as the oscillator condenser is very sharp in its tuning. It might be suggested that the instructions for mounting this dial, which are furnished with same, be followed very closely for the best operation of this type of

Photo A. View Showing receiver on a Southern Toy table with suggested accessories

dial. There is a potentiometer on the panel also, which controls the grid bias of the intermediate frequency amplifiers. This serves as a very suitable volume control. There is a rheostat placed in the wooden frame having the shaft extending through it. This rheostat has a slotted shaft by which it may be adjusted with a screw driver. As this controls the filaments of all tubes, it is not necessary to adjust it frequently. All connections are brought out of the side of the receiver with a Yaxley cable connector, with the exception of the "C" batteries, which are placed in the bottom of the receiver.

It has been found that by cutting down the amount of wire used in connecting up the various parts in a receiver, that the sharpness of tuning and the selectivity is very materially increased. The explanation for this is that each connecting wire acts as a tiny receiving antenna and the current received is induced in the wrong portion of the receiver. The average superheterodyne receiver has from twenty to fifty feet of wiring, and in direct contrast the St. James Upright Eight has but ten. From this fact it may easily be seen that the receiver will be much sharper than if it were spread out in such a way that it required two or three times this amount of wire.

Most of us are well enough

acquainted with photography to know that all the light, to be usefully registered in making a picture, must be received through the lens. If there is a leak in the bellows, or the plate does not fit tightly, there will be streaks on the finished picture and if it is not entirely worthless, it will be of less value than one of clear definition.

The same rule applies to a radio receiver. If all the induced energy is received at one point, the signal will naturally be of better quality than if it leaks in otherwise. The St. James Upright Eight, as described here, will not pick up a sound unless the loop is connected. All of the energy received comes through the single channel which it is supposed to come through. The result of this is that the signal is very sharp and clear.

There is no mushiness nor background in this receiver. When tuning past a transmitted wave, there will be silence; then the signal will snap in like a rifle shot as the tuning condensers come to the frequency of the transmitted wave, and as they pass, it dies out as abruptly.

Many of the noises in a receiver are induced by the fields of the

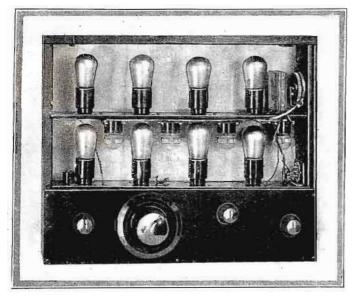

Photo B. View showing receiver without carrying case

coils, and may be heard with aerial disconnected. These disturbing sounds originate in electric motors, high frequency generators, meaning door bells, violet rays, machines and street cars. With coils having a large field, these tiny transmitters are easily picked up, and they cannot be tuned out, for they are on no specific wavelength.

A coil of restricted field is the only really effective way by which this difficulty may be overcome. The St. James intermediate frequency transformer has a coil with a field less than an inch in diameter. The field is so restricted that one may place his hand over the coils and so appreciably alter the tuning. The coils, as a further precaution, are de-hydrated. All of the moisture is removed by vacuum pumps and the glass container is then sealed, which makes the transformer immune to dampness in localities where salt water would ruin the transformer in a short time. The transformers are tuned before leaving the factory to a specific frequency. The kit consists of four transformers that have been matched to the same frequency, which insures maximum sensitivity. In case of accident, where replacement is needed, one of the transformers tuned to the same frequency may be obtained by mentioning the code number, which is on the transformers, when ordering.

A principle analogous to hydraulic phenomena is employed in the hookup. Consider a column of water inside a vertical pipe. If a tap at the bottom of the pipe is opened, the water level goes down, due to the emptying of the water. Now take a pipe and bend it in a U-shape with the open ends upward. If it is filled with water and some is drawn from one leg, the other leg also drops till the level is the same in both. This results in perfect equilibrium.

In the oscillator coupler this practice is carried out electrically. The signal must pass through two parallel channels and of necessity must be of the same strength in each. This results in a uniform signal, well balanced with all harmonics and unwanted interference successfully strained out. This is the first time this method has been used in a commercial receiver and patents have been obtained.

The design and construction of this receiver is so obvious, it is not essential that an elaborate description of the construction process be given. One point that is well to bring out is the method of obtaining regeneration. Instead of using a midget condenser, the two leads are twisted together and tuned by cutting the ends until the correct point is reached. If this is done

while receiving a DX station at the highest end of the tuning scale, the results will hold good for all time and need no further attention. About six inches of insulated Celesite wire twisted together is sufficient to give the desired capacity between the wires.

It is inadvisable to consider putting any annexes on this set. It was designed as an eight-tube set, and as such it works best. The tubes used are 201-A save the last stage of the audio amplifier and that uses 112.

It has been found that a voltage close to 45 is best on the first six tubes, while 90 volts on the first stage amplifier and 135 on the second give ample volume and tone quality.

LIST OF PARTS FOR THE ST. JAMES UPRIGHT EIGHT

- 1-St. James Wood Frame.
- 2-Formica 2½x18x3/16-inch strips.
- 4-St. James Transformers Type 2-40.
- 1-St. James Oscillator Type 2-40.
- 1-St. James Choke Coil Type 2-40.
- 2-Thordarson R-200 Audio Transformers.
- 1-Yaxley Cable Connector.
- 1-Yaxley 2-ohm Rheostat.
- 1-Yaxley 400-ohm Potentiometer.
- 2-Sangamo .005 mfd. Fixed Condensers.
- 1-Parvolt 1 mfd. By-Pass Condenser.
- 1-Formica Drilled and Engraved 5x19x3/16-inch Panel.
- 10-Feet Acme Celesite Wire.
- 1-Package Kester Radio Solder.
- 1-Sonatron Type 171 Tube.
- 7-Sonatron Type 201-A Tubes.

Miscellaneous Screws, Nuts, Lugs, etc.

List of Accessories for Use with the St. James Upright Eight Receiver

The following is a list of accessories that have actually demonstrated their ability to properly operate the St. James Upright Eight Receiver. While these particular accessories are suggested, it is possible to make any reasonable substitution without decreasing the all-around efficiency of the receiver:

- 1 Southern Toy Mahogany Radio Table.
- 1 Majestic "A" Current Supply.
- 1 Fansteel Type 135 "B" Power Supply.
- 1 Tower "Pirate Ship" Model Speaker.

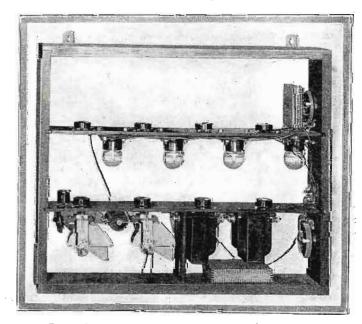

Photo C. View of receiver with front panel removed

The Southern table is an attractive piece of furniture, finished in genuine mahogany, rubbed to an eggshell gloss. It stands at the correct height from the floor to make operation of the set simple and untiresome. There is a compartment provided at each end; one to contain the "A" storage battery, or current

Citizens Radio Call Book

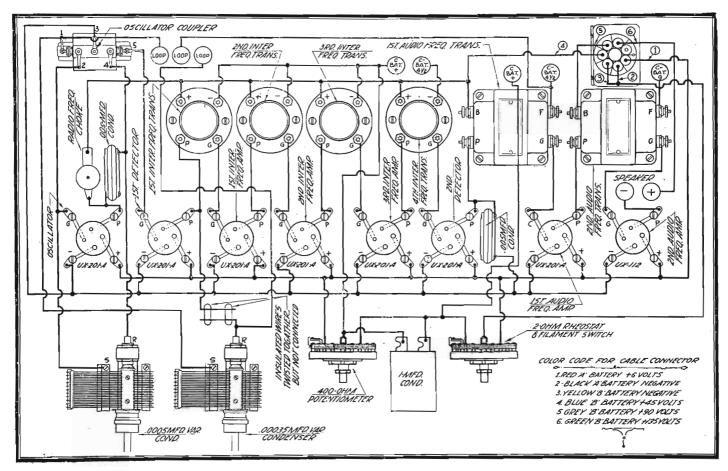

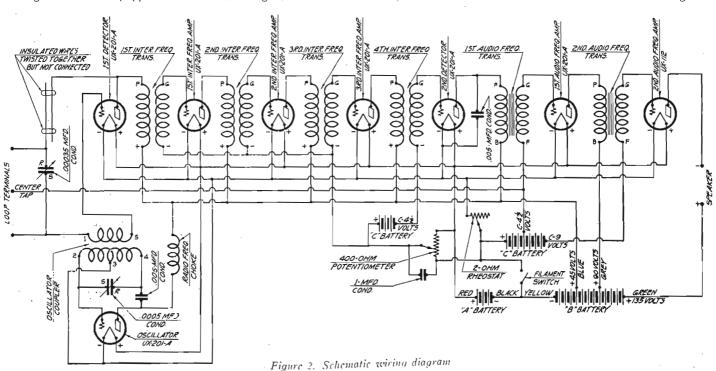

Figure 1. Graphic illustration showing in a pictorial manner all connections to the actual apparatus

supply device, the other the "B" supply and accessories. An open space in the center allows room for the knees. This table is made by the Southern Toy Company, Inc., of Hickory, North Carolina.

The Majestic "A" current supply is for use on 110 volts, 60 cycles, alternating current. It furnishes ample power for an eight-tube set, is stable in operation, and has no liquids or acids to spill. There is a rheostat on the front panel for regulating voltage. It is also equipped with an electro-magnetic cut-out to

prevent excessive voltage from being supplied to the tubes in the receiving set. A receptable is provided for plugging-in the "B" supply so that both "A" and "B" units are operated with only one light socket connection. There is a convenient switch on the cord of the "A" which controls both sources of power supply. It so desired, the filament switch on the receiver may be left turned on at all times. The switch controlling "A" and "B" units therefore acts also as a control for the set. or, in other words, for the entire radio installation. The case housing the

power unit is finished in a rich black crystal enamel, bakelite panel, complete with extension cord and attachment plug. This "A" supply is manufactured by the Grigsby-Grunow-Hinds Company of Chicago, Illinois.

The Balkite Power Supply entirely replaces the "B" battery and supplies "B" current direct from the light socket. It uses the celebrated Balkite rectifying principle, and is radically different from any other "B" device. It is entirely noiseless, a permanent piece of equipment with nothing to wear out or replace. It has no tubes to burn out. Once connected to the radio set, it requires no adjustment, giving an output of 40 milliamperes at 135 volts maximum. Taps are provided for the lesser voltages required. The Balkite "B" power supply is made by the Fansteel Products Company of North Chicago, Illinois.

The Tower "Pirate Ship" Speaker is right up to the minute in that it combines a Pirate-ship model with a reproducing horn, making an instrument both useful and highly ornamental. The design is cast metal, finished in bright colors and with a frame to match. The cone behind the ship is tinted to represent a cloudy sky, setting the ship off to good advantage and procuring an optical illusion which gives reality to an already beautiful design. The ship has all sail set and straining, and rides upon a sea of white-capped waves. A specially developed armature driving unit intensifies the delight of the 14-inch cone, producing excellent volume and tone quality. The speaker is provided with a 6-foot cord. It is made by the Tower Manufacturing Company of Brooklyn, New York.

(If further information on any of the above mentioned accessories is desired, it can be secured by writing direct to the manufacturer.)

New Two Control Equamatic Receiver (Continued from Page 105)

ness of the Puritan period to the more subtle workmanship of the present day. It is built of five-ply walnut, supported by feet of generous proportions. The compartment for the batteries also contains a reproducing horn with a long sound chamber. The accessories and the horn are both screened from view by a panel of cloth of gold, supported by a wooden framework. Two swinging doors open to the lower compartment, the front of the receiver compartment lowers, making a desk-like shelf for an arm rest. This console is made by the Excello Products Corporation, Cicero, Illinois.

The Southern "Blue Ridge" Cabinet is for use when a console is not desired. It is made of Walnut Veneer, decorated with attractive ornamented corners and base. It has a sliding baseboard so that the set may be readily removed from the cabinet for inspection and changes of connections. It is finished in natural tone, highly polished, and is made by the Southern Toy Company, Hickory, North Carolina.

The Fansteel A-6 "A" Suppy is a complete batteryless electric radio power unit giving uniform "A" current regardless of the drain. Power is supplied directly from the light socket. The device consists of a rectifier and an electrolytic filter condenser combined in one cell. It is complete in itself and operates only when the set is turned on, and is made by the Fansteel Products Company, Inc., North Chicago, Illinois.

(If any further information is desired on the above described accessories, it may be had by writing direct to the manufacturer.)

New Two Control Equamatic Receiver-List of Parts

These parts or their equivalent will give satisfactory results:

- 3-Karas .00037 Variable Condensers
- 3-Karas Equamatic R. F. Transformers
- 2-Karas Audio Transformers 28
- 2-Karas Micrometric Dials
- 1-Karas Output Filter
- 3-Karas Sub-panel Brackets
- 5—Benjamin Sockets 9040
- 1—Carter 10-ohm Rheostat—Imp.
- 1-Carter 20-ohm Rheostat-Imp.
- 2-Carter 2-ohm Fixed Resistors
- 2-Carter Tip Jacks
- 1-Carter Switch Jack
- 1-Yaxley Cable Connector

- 2-Samson No. 85 R. F. Chokes
- 2-Samson Balancing Condensers
- 1-Karas Link Motion
- 2-Polymet .001 mfd. Fixed Condensers
- 1-Polymet .006 mfd. Fixed Condenser
- 2-Sangamo .0001 mfd. Fixed Condensers
- 1-Sangamo .00025 mfd. Grid Condenser
- 1-X-L Binding Post
- 1-Formica 7x24x3/16-inch Drilled and Engraved Panel
- 1-Formica 9x23x3/16-inch Drilled Sub-panel
- 1-Durham 2-megohm Grid Leak
- 3—Ce Co Type "A" Tubes
- 2—Ce Co Type "F" Tubes
- 20 Feet Acme Celesite Wire
- 1 Package Kester Radio Solder
- 1-Ekko Ground Clamp

Miscellaneous lugs, screws, nuts, etc.

"Best Lincoln" Nine Super-Heterodyne Receiver

(Continued from Page 144)

the battery and other accessories from being seen. Another screen in the rear of the battery compartment provides an outlet for sound, preventing the hollow microphone sound so commonly developed when the speaker is mounted in a closed chamber. The doors of the lower compartment swing on hinges, while the door of the upper compartment drops, forming a desk and elbow rest. Generous carvings of walnut constitute the feet of the console, making a sound and jar proof foundation. This console is made by the Excello Products Corporation, Cicero, Illinois.

The Corbett type "C' cabinet is used when a console is not desired. It is finished in attractive scroll work and carved ornaments, much resembling jewel caskets of the period of the Italian Renaissance. It is finished in walnut highly polished. It is manufactured by the Corbett Cabinet Manufacturing Company of St. Marys, Pennsylvania.

The Kingston "B" Power Supply employs the well-known and popular Raytheon tube; is sound in operation and will deliver ample current for a set much larger than the Lincoln. Its steady "B" power keeps the radio at the peak of volume and clear reception. Attach it to the light socket and it is ready for use. It has an excellent record of successful operation since its introduction. Voltage taps allow three different voltages to be obtained at the same time, and each tap is varied over a wide range, it makes possible any desired voltage from 5 to 150 volts. This "B" Power Supply is made by the Kokomo Electric Company of Kokomo, Indiana.

The Allwood Speaker is very much like an old violin in its rich clear tone. A new shape more pleasing to the eye, and a new tone quality more pleasing to the ear, distinguish the Allwood from all other loud speakers. The peculiar construction of the tone chamber, and the use of wood, growing more mellow and sweet with age, mean that every sound is reproduced with acoustic fidelity, as distinct at a distance as near the loud speaker. It is made by the Imperial Carving Company of Allegan, Michigan.

The Model "N" Balkite Charger is a large capacity trickle charger. It was designed especially to serve the large sets employing power tubes. It has two rates, 5/10 and 8/10 amperes. The first rate is sufficient as a trickle charger for a set of five tubes. The second is for sets up to eight tubes, including power tubes. Water capacity is 16 ounces, approximately three times that of the average trickle charger. It requires an addition of water about once a month and operates from 110 volts A.C., 50 or 60 cycles. Special models are provided for localities that are furnished with a 25 or 50 cycle frequency. The unit consists of a transformer contained in a meal case and a glass jar containing an electrolyte with the rectifying strip of metal. A rubber covered cord with an attachment plug is furnished for connections to a power outlet. Binding posts for connection with the "A" battery are on top of the transformer. This trickle charger is made by the Fansteel Products Company, North Chicago, Illinois.

BIG PROFITS TO AGENTS AND DEALERS

Our Agents and Dealers make big money selling Metrodyne Sets. You can work all or part time. Demonstrate the superiority of Metrodynes right in your home. Metrodyne Radios have no competition. Lowest wholesale prices. Demonstrating set on 30 days' free trial. Greatest money-making opportunity. Send coupon, a letter or a postal for our agent's proposition.

Metrodyne Super-Seven Radio

A single dial control, 7 tube, tuned radio frequency set. Tested and approved by Popular Science Institute of Standards, Popular Radio Laboratory, Radio News Laboratory and by America's leading Radio Engineers. Designed and built by radio experts. Only the highest quality low loss parts are used. Magnificent, two-tone walnut cabinet with beautiful, with results in the property of the property gilt metal trimmings. Very newest 1928 model, embodying all the latest refinements.

Easiest set to operate. Only one small knob tunes in all stations. The dial is electrically lighted so that you can log stations in the dark. The volume control regulates the reception from a faint whisper to thunderous volume, 1,000 to 3,000 miles on loud speaker! The Metrodyne Super-Seven is a beautiful and efficient receiver, and we are so sure that you will be delighted with it, that we make this liberal 30 days' free trial offer. You to be the judge.

We are one of the pioneers of radio. The success of Metrodyne sets is due to our liberal 30 days' free trial offer, which gives you the opportunity of trying before buying. Thousands of Metrodynes have been bought on our liberal free trial basis. METRO ELECTRIC 2161-71 N. California Ave. • Dept. 31 · Chicago, Illinois

MAIL COUPON BELOW

Let'us send you proof of Metrodyne quality-our 30 days' free trial offer and 3 year guarantee

Mrs. Wm. Leffingwell, Westfield, N. J., writes: "The Metrodyne Radio I bought of you is a wow! This is as good as any \$225 machine I have ever seen."

N. M. Greene, Maywood, Ill., writes: "My time is up and the Metrodyne works fine. I got Havana, Cuba, Oakland, Calif., Denver, Colo., Toronto, Canada, all on the loud speaker."

J. W. Woods, Leadville, Colo., writes: "Received the Ttube Metrodyne in fine condition. Had it up and working
same day received. Was soon listening to Los Angeles, San
Diego, Oakland and other California points; also St. Louis
Kansas City and other east and south stations—all comin
in fine. Am more than pleased. Sure enjoying it."
We will send you hundreds of similar letters from
owners who acclaim the Metrodyne as the greatest
radio set in the world. A postal, letter or the coupon

Both the Audiola six and eight tube console receivers have single dial controls and are incased in the most exquisite piece of furniture. The entire front is of burled walnut with a beautiful grill in the lower compartment covering the loud speaker which is of the long air column type.

Those interested in securing both beauty of design and permanent satisfaction in operation will find it most desirable to secure a demonstration of the Audiola receiver at your local dealer. If he hasn't the Audiola on display, write us for free illustrated booklet.

6T STAGE SHIELDED SIX, Table Model, \$ 75.00 ST STAGE SHIELDED EIGHT, Table Model, 125.00 The Audiola Cabinet is of genuine walnut. In its simplicity is found its beauty. The artistic design of this cabinet lends itself to any scheme of interior decorating. This set may be had with either the STAGE SHIELDED Six or STAGE SHIELDED Eight Chassis.

Distributors write for open territory

AUDIOLA RADIO CO. 430 S. Green St. **CHICAGO**

The set is now ready for wiring. It is advisable to wire the negative filament and ground circuit first. Next make all of the positive filament connections. The rest of the wiring should be completed by starting with the antenna circuit and making all of the connections to the first radio frequency transformer, the antenna tuning condenser and the first tube socket. Next make the grid and plate connections to the second tube and so on throughout the entire circuit, wiring each tube in order. All of the "B" and "C" battery leads from the multi-plug to the various parts of the circuit should be put in finally.

The wiring of the set is very simple and no difficulty will be encountered if the builder will closely follow the schematic wiring diagram of Figure 4 and the pictorial wiring diagram of Figure 3.

After the set has been completely wired the wiring should be checked and rechecked several times to be sure that absolutely no mistakes have been made.

The next step is to hook up the batteries with the Multi-plug using the color code given in the pictorial wiring diagram of Figure 3. After the batteries have been connected insert a tube in the first radio frequency socket. This tube should light up when the filament switch is thrown to the right. It should continue to burn regardless of whether the five and nine tube transfer switch is thrown to right or left. It should also respond to variations of the 6-ohm rheostat on the right of the panel above the transfer switch. If the tube functions properly in the first socket it should be inserted in each succeeding socket in rotation. Its action in the second radio frequency stage and in the first detector should be the same as when in the first socket.

When the tube is inserted in the oscillator socket it should light only when both the filament switch and the transfer switch are thrown to the right. It should not respond to variations of the rheostat on the panel. This action should be the same when the tube is inserted in both intermediate frequency amplifier sockets and the second detector socket.

When the tube is inserted in the audio amplifier sockets it should light when the filament switch is thrown to the right and should continue to burn regardless of the position of the transfer switch, and it should not respond to variations of the 6-ohm rheostat.

After this checking has been completed the set is ready for an actual test on the air.

Notes on Balancing, Tuning and Operation

It is important that the 2-gang condenser be installed exactly as received. Do not try to make any adjustments until after the set is in operation. The condensers and coils are manufactured with a high degree of accuracy and little or no adjustment of the condenser is required.

When the set is completely assembled, wired and ready for test, first attempt to operate only the five-tube set. This part of the circuit should give satisfactory reception on all local stations and outside stations within a radius of two to three hundred miles. After the five-tube receiver is operating satisfactorily on the local stations proceed to balance the 2-gang condenser. To accomplish this, tune in a station on the lowest wave length possible. A weak signal just audible in the loud speaker should be used. When this is obtained tune the second dial, that is, the one on the 2-gang condenser, for maximum volume. Then loosen the set screws on one of the shield plates and move it back and forth, adjusting it for maximum volume. When maximum volume is obtained tighten the set screws and lock the shield plates in place. Next tune in a station on approximately 300 meters. Then take the tool provided with the 2-gang condenser and loosen the nuts on the right-hand side of one of the stator plate sections. Then insert the other end of the tool in the hole between the nuts and move the handle of the tool back and forth, toward and away from the panel. This motion shifts the entire section of stator plates. Make this adjustment for maximum signal strength. Leave the stator plates set in the position for maximum signal strength and lock them in that position by tightening the nuts. Next repeat this operation with the other section of stator plates. Then tune in some high wave length station at about 500 meters,

Why Not Be Our Agent?

Radio Buy at cost. We want Agents and Dealers in every locality to demonstrate and take orders for these amazing new 1928 Westgale Models. This is your chance to get a West-gale Radio at a big discount and make it pay you big money. Millions of radios will be sold this season. Birnbach "60" Bakelite 3-Circuit Tuner

This 3-Circuit Tuner is wound on colored Bakelite and will improve any Circuit. A marvel for performance. Use BIRNBACH TUNERS for the best tone quality, long range distance, and volume. For use with .0005 Mfd. Condenser. Tuning range 200 to over 550 meters.

No. 60... Colored Bakelite 3-Circuit Tuner........\$2.00 No. 60... Colored Bakelite Radio Frequency Coil.... 1.25

Birnbach "180" Bakelite 3-Circuit Tuner

This Tuner is larger in size than our No. 60 and in this form it is the most efficient TUNER ever designed. Distant stations can be tuned in with greater volume and the very best tone quality. For use with .0005 Mfd. Condenser. Tuning range 200 to over 570 meters.

BIRNBACH RADIO CO.

254 West 31st Street New York City or higher, if possible, and repeat the same series of stator plate adjustments, but from the left-hand side of the condenser. After these adjustments have been made the two radio frequency circuits will be practically in perfect balance over the entire broadcast spectrum.

After the five-tube set is operating properly, leave the first two dials tuned in on some station, throw the transfer switch over to the nine-tube position and pick up the station again by tuning the oscillator dial. On all of the lower wave length stations there are two possible settings of the oscillator dial. The correct one to use is the one that occurs lowest on the scale. As soon as this station has been received and tuned for maximum volume, adjust the potentiometer mounted on the sub-panel for the maximum volume consistent with good tone quality. Once this potentiometer is adjusted it may be left fixed for the reception of stations on all wave lengths and the adjustments will not have to be changed until tubes are replaced or until the batteries become considerably discharged. Next adjust the rotor of the coupling unit for maximum volume. This adjustment is not critical, about 50% coupling generally gives best results.

When the receiver is tuned in to any distant station it is sometimes possible to receive another station broadcasting on the next wave length above or below it by merely moving the oscillator dial up or down a degree or two. This interfering station can be eliminated by adjusting the other two dials for maximum volume on the desired station.

List of Accessories Used With the Camfield Super-Selective 9 Receiver

The following is a list of accessories which have been actually tested with the Camfield Super-Selective 9 Receiver and have been found to operate most satisfactorily with it. While these particular accessories are suggested, it is possible to make any reasonable substitute without decreasing the all-around efficiency of the receiver:

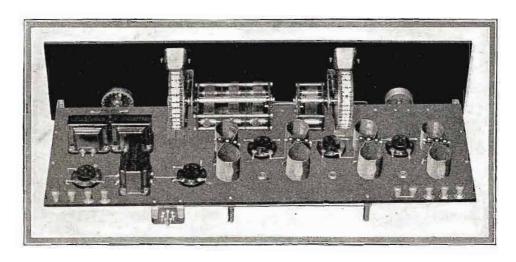

- 1 Fritts "Super" Consolette or 1 Fritts 30-inch Standard "Super" Cabinet
- 1 Sonochorde Senior Speaker
- 1 Type WTAM-5 Willard Storage "A" Battery
- 3 Type 486 Eveready Heavy Duty Layer-Bilt "B' Batteries
- 1 Model "J" Balkite Charger
- 2 Type 771 Eveready 4½-volt "C" Batteries

Photo "A" shows the Camfield Super-Selective 9 Receiver installed in a console with appropriate accessories. The consolette in photo "A" and the cabinet in photo "B" are both manufactured by the D. H. Fritts & Company of Chicago, who specialize in solid walnut radio furniture. Each of these pieces of furniture are beautifully finished in a varnished and water and oil handrubbed finish. A four post construction is used exclusively in this furniture, which is patterned after the original types of Italian chests. The decorations are slightly polychromed, with the handles finished in antique brass.

The speaker shown is a product of the Boudette Manufacturing Company of Chelsea, Mass. Its dark finish harmonizes very tastefully with the walnut finish of the consolette and cabinet. This particular model of the speaker, known as the Sonochorde Senior, is capable of very excellent tone quality. It has an adjustable reproducing unit.

"A" supply is obtained from a large capacity storage battery made by the Willard Storage Battery Company of Cleveland, Ohio. The battery is exceptionally well made and is capable of withstanding extensive overloading and rapid discharging. A Model "J" Balkite Charger is used to keep the "A" Battery at full charge at all times. This type of charger uses an electrolyte and a strip of rare tantalum metal for rectifying purposes. It is capable of charging a 6-volt battery at either a 2-ampere or trickle rate charge.

"B" Batteries are used in this particular installation. They are the familiar heavy duty type manufactured by the National Carbon Company. These Eveready Batteries incorporate the layerbilt type of battery construction and are able to supply a constant "B" current at a high rate of discharge. (If further information on any of these accessories is desired, it may be had by writing direct to the manufacturer.)

UNRIVALED PERFORMANCE

of CALL BOOK AC SIX RECEIVER

DUE TO BODINE TWIN-EIGHT R. F. COILS

A Truly Remarkable Receiver

The Call Book AC Six Receiver, described elsewhere in this issue, represents the last word in tuned radio frequency receivers. Three balanced R. F. stages, using Bodine Twin-Eight R. F. Transformers, provide tremendous amplification and extreme selectivity combined with

ease of operation and unequalled quality of reproduction. Full AC operation, the latest development in radio, is provided by the A, B and C power supply built into the set itself.

Efficiency Due to Twin-Eights

The unequalled sharpness and sensitivity of the Call Book AC Six Receiver is accounted for by the use of Bodine Twin-Eight Coils. No other R. F. coils will produce such remarkable results as Twin-Eights. The closely confined fields of these coils, together with exceptionally low R. F.

resistance, explain the razor-like selectivity of receivers using them. Tight magnetic coupling between the primary and jobbers advertising in this publication.

secondary, combined with small capacity coupling, provides an amplification per stage which cannot be attained with any other coil. Only by using Twin-Eights can full advantage be taken of three tuned R. F. stages, a fact attested to by the phenomenal performance of the Call Book AC Six Receiver.

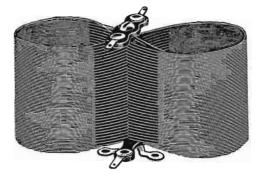

Twin-Eights Will Improve Any T. R. F. Set

Substitution of Twin-Eight Coils for other coils may be easily accom-plished and will result in marked improvement of selectivity and sensitiveness.

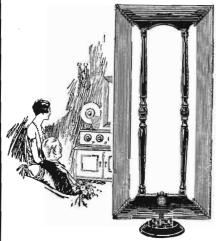

Send for free instructions and wiring diagrams on various Twin-Eight Receivers. All Twin-Eight Coils \$2.00. Specify size of condensers and circuit when ordering.

Full size constructional blue prints of the Call Book AC Six Receiver may be obtained from the Citizens

Radio Service Bureau, 508 South Dearborn Street, Chicago. Price, \$1.50, or they can be obtained from any of the radio jobbers advertising in this sublication.

RADIO'S MOST BEAUTIFUL LOOP

-AND MOST EFFICIENT, TOO!

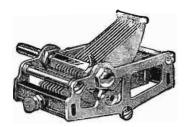

The Bodine DeLuxe Loop is a graceful bit of solid walnut furniture that enhances the most attractively decorated room. Its surpassing beauty is only equalled by its remarkable signal pick-up ability and high tuning efficiency. Attractive in size and shape. It is only 28 high, with 6 in. turning radius. Can be mounted on any radio set and does not appear awkward.

The exclusive plug and jack mounting eliminates trailing connecting wires and the jack may be mounted directly in the cabinet of the set if desired. A unique device keeps the wires always taut.

Model L-350 is used on the Call Book AC Six Receiver. Model L-500 will give excellent results on all popular super-heterodynes, as well as other loop receivers. Order Model L-500 for .0005 mfd. and L-350 for .00035 mfd. condensers. Either model \$12.00.

Only Nine Binding Posts to Connect to Front Panel

Anyone Can Construct This Receiver in a Couple Hours Time

Speaker connects directly to last two binding posts. The set is not sensitive to tubes in any respect. Any standard tubes with a power tube will give perfect results.

Draws only ten to fifteen milliamperes, depending on power tube used. Operates on any recognized B eliminator

Amazing Selectivity

To suit the most exacting owners in congested areas where distant reception is impaired by local stations.

Wonderful Tone Quality

Audio transformers especially designed to meet the requirements of this circuit reproduce faithfully an exquisite roundness of tone with no cutting of side bands. Unequalled in any other commercial receiver on the market,

Power

Due to a unique and original method of balancing not only the intermediate transformers but the entire unit as well, unusual stability is achieved. Intermediate tubes will carry over five volts without going into oscillation. Consequently extreme volume is possible without distortion.

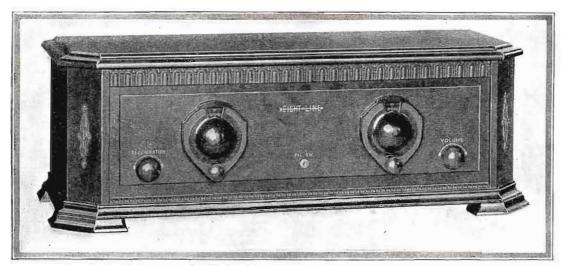

Adaptability

The unit is small, length of unit over all 20". Height 5", depth $7\frac{1}{2}$ ". Weighs only 15 lbs. Can be installed anywhere, and can be remote controlled. Ideal for installing in a car.

Read the Article

CORBETT CABINET AND SPECIAL LIGNOLE PANEL RECOMMENDED

Extreme Lack of Unnecessary Controls

Operation

Two tuning dials, a balancing condenser which is set permanently, a filament switch, and a volume control. The set is not critical in any way, and perfect results may be obtained by the most inexperienced operator. With the balancing condenser properly set the receiver will not go into oscillation even when the volume control is thrown wide open.

Uniformity

Contrary to the usual method of building kits this unit is actually tested "on the air" receiving distant stations. It is tested for selectivity, tone quality, and ability to bring in distant stations. The result is absolute uniformity.

Guarantee

Each unit is fully guaranteed against defective material and workmanship.

Announcing

CORBETT CABINETS

that add to the coziness of any home

THE SUPER-CRAFTSMANSHIP that goes into the making of every CORBETT Cabinet is the precise reason why the most exacting women are demanding CORBETT Radio Furniture.

These cabinets are made of the finest walnut and mahogany obtainable and lend themselves to harmonize with any arrangement in the modern home.

CONSTRUCTION AND MATERIAL

The structural details of Corbett Cabinets are carried out by experienced craftsmen, and are equal to any fine furniture. The plywood paneling making up the sides, top and front is of selected walnut and quartered mahogany. The frames are of select gumwood.

The popular high light or shaded effect finish on Console Models is hand rubbed to an egg shell gloss. The reflected lights give a distinct antique effect.

D-20-25 Models

D-20-25 Models

are beautifully decorated with vari-colored polychrome pulls and carvings, and the embossed moldings complete the decorative scheme. AN ILLUSTRATION OF THIS CABINET CAN NEVER DO FULL JUSTICE TO THE DISTINCTIVE BEAUTY BROUGHT OUT BY THE HAND PAINTED POLYCHROME DECORATIONS.

CORBETT Cabinets can be had in any models or sizes, as illustrated

SPECIFICATIONS FOR MODEL D-20-25

MODEL D-20-25
Top 16x34", height 43", Battery Compartment 14" high, 14" deep and 30" long, clearance for dials 134", depth back of panel 12". The cabinets are in stock with removable fillers to take 7x21" panel size. These fillers may be adjusted to take any panel size up to 7x28". Larger panel sizes up to 9x28", either straight or sloping front, may be had at no extra charge. Panel arrangements for all odd sizes on special orders will be glued in place before cabinet is finished, requiring about two weeks to make delivery. The top is hinged on all models. Shipping weight is 100 lbs.

MODELS C-10-20

Either piece may be purchased separately. The top of the table is completely finished and may be used with any cabinet receiver. It makes an excellent combination when used with any model "C" Cabinet up to 26" panel size. SIMILAR TABLES FOR LARGER CABINETS MAY BE HAD ON SPECIAL ORDER.

THE HIGH LIGHT EFFECT FINISH SET OFF WITH ANTIQUE BRONZE PULLS, MOLDINGS AND DECORATIONS MAKES THIS A WELL-APPOINTED PIECE OF FURNITURE.

SPECIFICATIONS

SPECIFICATIONS

Model C-20 Table Top 17"x33", overall height 33", Battery compartment 12" high, 15" deep, 30" long.

Model C-10 fits table exactly to make a combination console. Fillers are provided for 7x21" panel and may be adjusted to any size up to 7x26". Depth back of panel 12". Inside height 9". Inside length 29". Clearance for dials 15%". Sides grooved for panel with grooved and removable top rail. Equipped with piano hinge and fancy folding lid stay. Shipping weight 100 lbs.

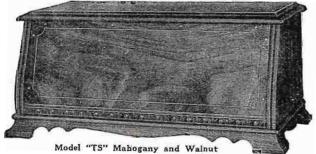

MODEL "C"

The ultimate in elaborate and attractive radio furniture is offered in our model "C". It is an adaptation of the old Italian Chests, being designed and decorated in the spirit of the Renaissance period. The top is made Walnut plywood selected for figure. The ends are made of solid walnut and walnut plywood. The back and base are finished to match. The back is grooved into place, and no nails or screws are used on any exposed surface. The front is grooved for 3/16" panel, the top rail being removable. Fancy folding top stay and piano hinge are applied.

Sownsend "B"Socket Power Best in World!

Says A. W. GALE of Gloversville, New York

Below is a reproduc-tion of Mr. Gale's letter of May 8th, 1927.

48 W. Fulton St., Gloversville, N. Y.

"Received the Townsend all O. K. It is the best in the World and that is saying some. I have a Radiola 4 tube. Get more stations than ever before. Some of them are CFCF, CKNC. WGY, KDKA, WGZ, WIP, WWJ, KTHS, KOP, KOA, WHAS, WTAM and KSD—besides four in Chicago, all in the East and then some."

Only Balance C.O.D.

Replaces "B" Batteries

The letter above speaks for itself—proves beyond doubt that the Townsend "B" Socket Power is the most remarkable value in Radio today. Sam E. Fry, of 1415 Holmes St., Kansas City, Mo., writes: "Eliminator works fine. Showed it to a friend and he wants one also. I will say it sure beats batteries. I get stations I never got before on a 6 tube set." Charles Ellis, 88 Jones Ave., Columbus, Ohio, says, "Your Eliminator is working fine. Have had station WJAX and others over 1,000 miles distant. Picked up 22 different stations one evening and around 30 another time. My neighbor has a \$27.50 Eliminator and I don't see that it works any better than yours."

Delivers up to 100 volts on any set, on D. C. or A. C.—any cycle. Full

New!

Centralab Power Rheostat

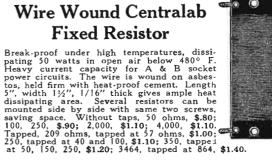

Potentiometer

This new unit is warp-proof, heat-proof. Constructed without fibre, permitting continuous operation at temperatures of 482° F. and beyond, in socket power circuits. Resistance wire is wound on metal core, asbestos insulated. Core expands with wire insuring smooth action. Narrow resistance strips give small resistance jumps per turn, further assurance of even regulation. Compact 2" diameter, 1" behind panel. Ohms—500, 250, 150, 15, 6, 3, .2, .5—price \$1.25.

The new Power Potentiometer is identical except for an additional terminal, and is especially suited to obtain variable voltages for detector tube and variable "C" bias in socket power currents. 15, 150, 250 ohms, \$1.50; 2,000, \$1.75; 5,000, \$2.00.

4th Terminal Centralab Potentiometer

This new three terminal unit is identical to the above units, except for added semi-variable contact arm, adjustable behind panel to any resistance value. 175 ohm unit gives 2 variable voltages in "A-B-C" power circuits. 250 ohms gives 2 variable taps for 67 volts and intermediate voltage in "B" output of the new Raytheon "A-B-C" power circuit. 2,000 ohms gives 2 variable "C" biases in "B" power circuits. Two 5,000 ohm units in series across "B" eliminator voltage regulation. 175, 250 ohms, \$2; 2,000, 3,000, 5,000, \$2.25.

Easy Chair Centralab Modu Plug 20 Feet of Cord

Tune with your dials to maximum strength and clarity of station, then from your easy chair use Modu plug to smooth it down to any degree of tone without changing ratio of high and low notes. No more jumping up to adjust dials for changes in character of program. Also use to connect two speakers in series at a distance from set. Price \$3.00.

At your dealer's, or C. O. D. Send for new A-B-C power circuits

BECAUSE

The Quali-Tone is the only loop that can claim two world records—brought in stations 8000 miles distant, and most consistent reception of far distant stations. In the Quali-Tone De Luxe, construction is of the highest quality throughout. Woodwork of selected, solid walnut, hand rubbed, natural finish. Only the finest grade of stranded wire, well insulated and covered with brown silk braiding is used. Wire spacers are made of best grade insulating material, reducing losses to a minimum. Every Quali-Tone loop has the special patented Quali-Tone adjustment which keeps the wires taut always. Three leads are furnished, the center tap being removable.

Compare Quali-Tone construction, design and performance,

Compare Quali-Tone construction, design and performance, and you will find that it excels in every particular. It incorporates every loop improvement and is flawless throughout. The De Luxe model turns within a radius of 5½ inches, the Quali-Tone, within a radius of 7½ inches, All Quali-Tone Loops are designed for use with .0005 condensers. Try the De Luxe for the finest reception.

NATIONAL TONE FILTER

Specified in the Magnaformer Set

More stress is being laid in Radio this year on fidelity and tone quality of tone than anything else. Everyone realizes now that higher voltages are required than used to be employed. Everyone is using power tubes, also, because they give better results. But power tubes take more "B" current than other types and if this current at a

into the loud speaker it may burn out the delicate windings. It will also, in many cases, put a steady pull on the speaker magnets which makes the performance much less satisfactory.

high voltage is passed direct

The NATIONAL Tone Filter overcomes these difficulties. It can be attached by anyone to any existing set in less time than it takes to tell about it. It is so connected as to keep all flows of direct current out of the loud speaker, thereby protecting and improving the tone quality. R. C. A. and other power tube manufacturers recommend a device of this kind for use with the 171 and 210 types of power tubes.

GOOD REASONS why your aerial should be a SUPER-BALL **ANTENNA**

- 1 Gives any radio greater selectivity, due to its "bunched capacity."
- Non-directional its unbroken spherical surface has the same antenna effect in all directions.
- 3 Receives all wave lengths with equal effi-
- Concentrated conductive surface reduces 4 interference.
- 5 Clarifies tone—built-in condenser acts as a neutralizer for entire antenna system.
- Minimizes static improves Summer re-
- 7 Attractive in appearance—10-inch aluminum alloy ball.

- Sheds ice and snow because of great density of metal used, and because its an "oily" metal.
- 9 Absolutely corrosion-proof unaffected by moisture.
- $10^{\, ext{Easy}}$ to install—and inexpensive.
- Can be placed within 10 feet of another aerial without interference.
- 12 Backed by our 30-day unqualified guarantee!

Ask your dealer about the Super-Ball Antenna-or write us for detailed in-formation.

DEALERS: Be prepared to supply your trade with this finest of all antennae. Order from your jobber and write us for Super-Ball Antenna selling helps.

Super-Ball Antenna Kit

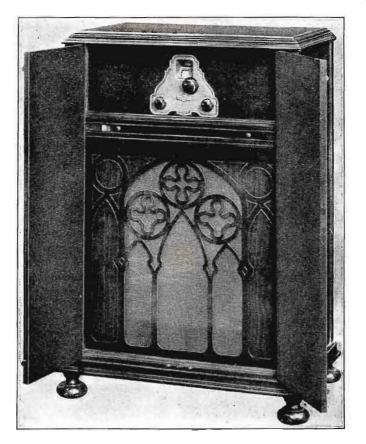

Contains all materials necessary for com-plete installation of Super-Ball Antenna, with complete directions for installation.

The Newest-the Classic Console

The exquisite beauty of the Chillicothe Radio Console, is creating a sensation among radio owners. Every set owner desires the enhancing artistry, so accurately expressed in this most attractive and convenient cabinet. "The Classic" Console is faultlessly constructed of genuine black walnut, "that master of woods."

A long air column Newcombe-Hawley horn with Baldwin unit,—standard equipment.

Sufficient space in lower compartment for all types of battery and electrical equipment.

A walnut panel which will accommodate all sets up to $26\frac{1}{2}$ "x9".

The above are additional advantages of this Chillicothe Console.

Here—in this new creation by the Chillicothe Furniture Company, you will find authentic distinctive design, simplicity and unsurpassed convenience,—truly a pleasant combination.

Interesting booklets on Chillicothe radio cabinets will be cheerfully mailed upon request. A letter to Department C, Chillicothe Furniture Company, Inc., Chillicothe, Missouri, will demonstrate how these cabinets will improve your set.

CONSTRUCTION

The same ideals which the Chillicothe Furniture Company has at all times expressed in the construction of their genuine Walnut Dining Room Suites, have been carried into this new field of radio cabinets, and built in "the Walnut center of America," by this reliable firm, you are assured of a radio cabinet superb.

"Built in the Walnut Center of America"

2 Radio Magazines for the price of one

Citizens Radio Call Book and "RADIO"—both for the price of "RADIO" alone. A full year subscription to both of these leaders in the radio magazine field for only \$2.50. Copies of both these magazines when purchased from a news dealer over a period of a year would cost you \$5.00. You save exactly \$2.50 by subscribing NOW. The publishers of these two magazines will cooperate to the fullest extent in the future for betterment of the radio parts business—for more extensively popularizing the better class of radio circuits—for giving you the down-to-the-minute ideas in radio just as soon as they are announced. You can hardly afford to pass up this liberal subscription offer. The saving is a big one. Both magazines mailed right to your address for a full year for the price of one. Think it over! Then clip the coupon—attach your check, money order or stamps to it — mail today, before you turn this page. If you are already a subscriber to either magazine you can extend your subscription for another year and get in on this great offer.

The Coupon Saves You \$250. Now is the time to mail it

For the enclosed \$2.50 you will immediately enter my subscription for one year to both "Citizens Radio Call Book" and "RADIO"—effective with the next issue. It is understood that there are no further payments of any kind to be made.

Name

21.

You can do anything with it—frame it, place it in your Victrola, put it in a bookcase, carry it with you wherever you go, on train, boat, auto, or camp, put it in your car, or place it in a neat highboy console in the most sumptuous living room. Its varied uses and its easy portability

make it truly the most desired of all radio circuits.

But on top of all this, the St. James Upright-8 is a receiver of exceptional merit. Its clear tones, its great selectivity and its long range put it in a class with any radio set, besides having distinctive qualities and features all its own. For true radio reception, the St. James Upright-8 is an astonishing radio innovation.

Features of the St. James Upright-"8"

Grid leads and radio frequency carrying conductors are as short as possible and lead directly to the points to be connected.

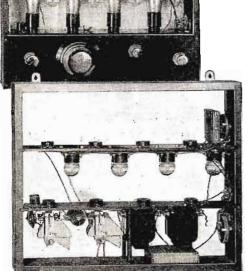

All of the points dealing with the handling and conservation of signal energy have received careful attention.

Due regard is given to interacting effects between the different frequencies employed in the set, by displacing them from each other to minimize such unwanted action.

Radio Receiver Like a Camera

A radio receiver, to be successful, may be compared in its action with a camera. All light received by the plate or film of the camera should enter at the lens, and all parts should be light-proof so that the image passed by the lens will be recorded clearly. If the bellows of the camera be leaky, or the plate holder defective, light will enter at those points and fog the plate, producing an unsuccessful picture.

In a like way, the St. James Upright-8 Receiver is fairly immune to signals and disturbing effects excepting through the proper channel, the loop collector or antenna system. If energy is received directly on the wiring of the set it has the same effect on the music at the speaker, as the light did on the plate of the camera. It fogs the signal, giving it an accompaniment of outside noises, which make the result a poor attempt at music.

Showing assembly with tubes and panel

The problem of obtaining immunity to such disturbing effects has heretofore been attempted by shielding the set by using metallic containers. This has been only partially successful, due to the fact that 100% shielding is not possible. In the St. James Upright-8 we have consistently worked to obtain immunity to disturbing effects by removing as far as possible the elements which would be affected by them. That is, "If you want to get rid of mice, allow them no food."

The St. James Intermediate Transformer was designed with this idea. The coils being less than one inch in diameter provide a very small external field and are affected very little by extraneous signals.

A complete plan for obtaining immunity to disturbing effects has been successfully worked out in the St. James Upright-8 or U 2-40 circuit, upon which patent papers have been filed by R. T. St. James, its designer.

Balance Secured Through Negative and Positive Wiring System

Comparing the action of a radio receiver to something which we can picture makes it easy to understand. We will consider that the wiring in a set where it progresses from left to right or right to left, is subjected to the same electrical effects as our loop or antenna.

We have approximately 90 feet of wire in the loop or antenna or collector; that is 90 feet in each, so that, with 30 to 50 feet of wire in the set, it represents a considerable portion of that used in the collector. Where the latter is tuned and so constructed that it operates continuously at one rather narrow band, the wiring in the set is exposed to the general effects of all signals and disturb-

ances, and there exists a certain pressure of varying intensity at all times in the of varying intensity at all times in the circuit which prevents good reception. This would be very much like a column of water enclosed in a pipe placed in perpendicular position. A pressure would be noted throughout. It becomes a simple matter to balance out this pressure by joining the one column with another of equal size in the form of a "U". The pressure in one column has balanced out the other and a state of equilibrium or balance is brought about. This is accomplished in exactly the same

equilibrium or balance is brought about. This is accomplished in exactly the same manner in the St. James Upright-8. The wiring of the set is divided into two portions, one in opposition to the other. Whatever energy is picked up on one leg is balanced out by the other, giving a circuit which is sensitive to energy passed through it in the proper channels, but immune to those trying to get in the side or back door.

Exceptional Results Secured

The various parts of the set are so laid out that two frequencies of widely varying bands are close together, preventing interaction. are close together, preventing interaction. The results obtained are a revelation from all standpoints. Selectivity, tone and freedom of noise level are all achieved to a degree never before experienced. A simplicity of design which in itself is a major accomplishment also contributes to its application to a variety of uses. The set proper is but 15 inches high, 19 inches long and THREE INCHES deep. It is compact enough to use for a portable, may be mounted in your car without taking up valuable space, installed in the Victrola, in fact a host of uses will suggest themselves. suggest themselves

Instant reception coming in like a rifle shot, and as quickly cleaning itself out with the slightest turn of the tuning dial. Volume enough for a convention hall, which may be shaded to a whisper without a change in its remarkable quality.

Only 10 Feet of Wiring

In the original descriptive matter that The St. James Laboratories furnished three years ago, a sentence will be recalled. "Consider that bus wire is worth a dollar an inch and use it accordingly."

Ten feet of wire makes all connections in the St. James Upright-8 set, and there are no adjustments to be made.

Set Builders

Here is radio's latest sensation—a quality receiver with a score of uses—so unique that it will immediately catch the eye and create interest. Be sure to build it. It will render exceptional results.

Standard parts for the complete Upright-8 circuit are made by the reliable manufacturers listed below, and may be purchased from leading jobbers and dealers, but if you cannot get them, write us direct and we will see that you are supplied promptly. Read the article in this issue—then you can build your receiver in quick time and at a price much lower than otherwise, due to the small amount of wiring required. You'll then have something to crow about.

Write for free descriptive literature and astounding testimony from fans the world over.

Robert T. St. James
"Bob," as his friends know him, was innoculated with the radio bug during the first Marconi exhibit at Mechanics Hall, Boston, Mass. For several years prior to the World War, he conducted a star amateur radio station. He is a charter member of the A. R. R. L. During the World War "Bob" was one of the first to enlist. His knowledge of radio put him in command of the First Division Naval Radio School at Harvariand later as director of education at Great Lakes. 12,000 men passed through his classes during the war, some of whom are radio bugs even today. Having been identified with radio since the days of wireless. Rob's experience fits in perfectly to carry on the duties of president of the St. James Laboratories, Chicago. He is designer of various radio parts and circuits, a well-known radio author and a member of the Institute of Radio Engineers.

S-M IS READY-For AC Tubes, Super

Quality Amplification— Or What Have You?

First and foremost in audio amplification stand the famous S-M 220 transformers. For over a year they have been acknowledged the finest known method of audio amplification. Experienced set designers use S-M audios in over half the season's popular circuits, for they know that a set built with S-M audio equipment is over half sold at the start. Remler depends on them for the new Infradyne, the Camfield Super Selective "9" owes its tone quality to S-M 220's-the Citizens Call Book OWN Receiver, the Citizens Super, counts on them. The finest amplifier known—the Unipacs—are built around them.

Broadcasting stations use them—WCAE, WEBH, WBBM, KFCR, WTAQ, KGDJ, WLBF. WCFL, the "Voice of Labor," monitors all transmissions with S-M 220's. Nathaniel Baldwin uses only S-M audios in loud speaker tests. What better recommendation is there?

Remember this—in 1927 many manufacturers having witnessed the phenomenal success of S-M audios, are copying characteristics introduced by S-M a year ago—the rising low frequency characteristic, 5000 cycle cut-off and loud speaker compensation. But no imitation ever equals an original, and no transformer now on the market or about to be introduced has anywhere near the steel or copper found in S-M 220's. And since the merit of an audio transformer is almost proportional to its size, S-M 220's remain the finest you can buy.

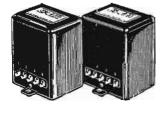

S-M guarantees this unconditionally—and will refund the purchase price for any S-M audio transformer you want to try if it doesn't give the finest quality you've ever heard in your own tests. First and foremost in audio amplification stand the famous S-M 220 transformers. For over

Type 220 is the famous husky four pound audio transformer that has outsold every other type this past year. Its primary impedance, the highest of any known transformer, insures marvelous low frequency reproduction, while its 5000 cycle cut-off cuts out back ground noise and heterodyne squeals. Price \$8.00.

Type 221 output transformer protects loud speakers from power tube plate current, and boosts low note reproduction to compensate all speakers. It is priced at \$7.50, or in type 222 with tip jacks, to improve any factory set, at \$8.00. 221 or 222 cores will not saturate in even 50-watt-tube amplifiers, so generous is their design.

Type 230 push-pull input transformer is for the fan who wants realism of reproduction in the full sense of the word. With two 171 or two 210 power tubes and a 230 and 231 in the last audio stage—well, radio becomes music with a vengeance. Price \$10.00.

Type 231 is a push-pull output transformer, for use with 230. It boosts low note reproduction as no output choke possibly can. Price \$10.00.

For the New Tubes

For the New Tubes

For filament lighting for all of the new A. C. tubes—CX226, CX326, UY227, C327, Sovereign, McCullough, etc.—Silver-Marshall offers type 325 filament lighting transformer with one 12 ampere, 1.5 volt and one 12 ampere 2.5 volt secondaries, as well as a center tapped 5 and 7.5 volt secondary. \$8.00.

For ABC supply, S-M type 329A transformer is ideal with CX280, CX380 or Q. R. S. rectifiers and A. C. tubes, with its two 225 volt secondaries, and its three 1.5, 2.5 and 5 volt filament windings. Price \$11.00.

S-M 328 super-power transformer is the huskiest yet—a full-wave type with two 550 volt secondaries, two 7.5 volt secondaries, and one 1.5 volt secondary. It is designed for one or two 216B or new 281 type rectifiers. Price \$18.00.

Type 331 Unichoke is a full B supply choke system for up to 130 milliamperes, priced at the ridiculously low figure of \$8.00. In operation, it requires but 7 to 8 mfd. of filter capacity whereas ordinary filters use two chokes and 8 to 14 mfd. of capacity. 331 Unichoke is not only a filter necessity, but will improve any B supply, for it has no equal.

Type 512 moulded bakelite socket fits all new 5 prong A. C. tubes—UY227, C327, etc. Price 75c.

Price 75c.

The 652A, ABC power supply kit, with glow tube voltage regulator, delivers 45 volts at 10 M. A., exactly 90 volts at up to 45 M. A. and 180 volts B, 40 volts C for a 171 power tube—or any intermediate voltages may be obtained if desired. It also furnishes AC at 1.5, 2.5 and 5 volts for complete operation of any receiver using any of the new A. C. tubes. Price, less Q. R. S. 85 M. A. rectifier and CX-374 voltage regulator, \$36.50. Type 652 "Reservoir B" will operate perfectly any receiver described in the Call Book—price \$34.50, less CX374 and CX213 tubes. CX313 tubes.

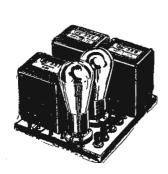

A Universal Drum Dial

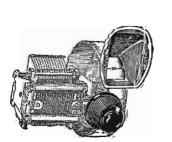

Type 805 is interchangeably right or left hand, for any condenser, clock-wise or anti-clock-wise. Easy to mount, it comes with panel window, knob, and illuminating bracket. Price \$3.00.

Silver-Marshall, Inc.

836 West Jackson Blvd.

Chicago, U.S.A.

UNIPACS-

Peers of All

Power Packs

OR the man who is content only with quality of reproduction truly OR the man who is content only with quality of reproduction truly realistic—as far ahead of any ordinary amplifier as the cone is ahead of a 1920 "loud-speaker"—S-M Unipacs offer positively marvelous realism of sound reproduction. They provide the same fine qualities that have placed S-M audio transformers far in the lead for audio amplification, plus the full advantages or real push-pull amplification with 210 or 171 tubes. All are housed in attractive brown crackle-finished steel cases; all will provide receiver B power as well as a stage off truly amazing power amplification. They may be built as phonograph amplifiers, two stage amplifier, ABC supplies—in fact, are of universal application. application.

Type 660-210 is a push-pull 210 power pack delivering from 4 to 17

Type 660-210 is a push-pull 210 power pack delivering from 4 to 17 times more power than any other 210 packs. Its quality of reproduction is guaranteed unequalled by any other known amplifier. It uses two CX-310 amplifier tubes, two CX316B or CX381 high power rectifiers, and one CX374 glow tube. Price, knock-down, \$83.25, or assembled ready to use, \$93.25.

Type 660-171 is a lower powered unit, especially recommended as a third stage power amplifier for the new Infradyne or similar receivers, to which it will also supply all needed B power. Actually, it is more powerful than average 210 power packs. Price \$64.00 knockdown, or \$74.00 assembled, less two CX-371 amplifier tubes, one CX374 regulator tube and Q. R. S. 85 M. A. rectifier tube. After September 1st, add \$2.00 to above prices for extra filament windings for A. C. tubes, allowing Unipac to operate as complete ABC power supply. ing Unipac to operate as complete ABC power supply.

'Ever Hear a Real Receiver?

The Shielded Six-unquestionably the finest tuned R. F. receiver ever offered, is now ready in an improved model with hair-splitting selectivity, volume and distance to spare, and that same tone quality that has made practically every builder unreservedly and enthusiastically say—"the Shielded Six is the most wonderful receiver I've ever heard or built."

The Improved Shielded Six may be built for complete light socket operation, or for battery operation. Or for the man who wants the finest at any cost, it may be built with self contained 210 push-pull amplifier with all advantages of the superpower Unipac. Priced at \$95.00 for the receiver kit, including metal chassis, decorated bronze panel, individual stage shields, matched condensers and R. F. transformers, the "Six" is dollar for dollar, radio's best "buy," for it makes and holds thousands of satisfied users.

Here Is What Users Say of the Shielded Six

Gentlemen:

I have huilt your Silver Shielded Six and have gotten such extraordinary good results that I wish to take opportunity to congratulate you on this wonderful set. The set is very selective and easy to tune and has the best tone quality I ever heard. The Six is the greatest DX receiver that is made. I've had it only three months and heard 160 stations and all on a Western Cone speaker, never use phones. I've heard CZE, Mexico City, PWX, Havana, KOMO, FI, KGO, KNX, KLX, WAPI, KFU, CNMM, CKY, WCOA, WFHH, WOKO, 25 stations from Chicago, 15 from New York state and from all over the country and Canada, and most of my stations from California are verified, I use a 50 ft. aerial. Can get KDKA and Chicago stations without an aerial.

Yours truly, WITTBER.

Gentlemen:

Orexel Hill, Penna.

In two weeks' time I have logged 103
stations including four on the Pacific Coast,
three locals and at no time have I stayed
up later than 12:30 Eastern Standard
time. The Pacific Coast stations have been
verified as a matter of record. We have
seven locals and WJZ and WEAF practically the same as locals broadcasting simultaneously. I have listened to KFI while the
powerful WJZ and WEAF were on the air
and 3½ points away listened to the coast.

I am operating the set from a second
floor apartment aerial including lead amount
to 65 feet.

I have a boy nine years old and he
tunes distant stations with ease, showing
the set very simple to operate. Again I
thank you for placing such a wonderful
circuit on the market. Respectfully yours,
CHARLES L. WALL.

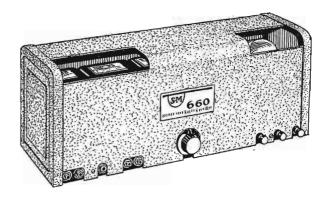

For Super Selectivity

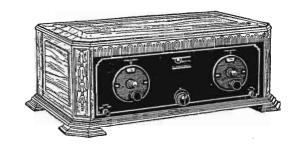

The S-M 440 Jewelers Time receiver is a copper and brass catacomb housing a three stage tuned R. F. amplifier and detector. Laboratory calibrated and peaked to exactly 112 K.C. Arlington's wavelength, it is so sharp that no interfering stations can be admitted. Large, low resistance tuned air-core transformers in individual shielded stages insure tremendous selectivity and far greater amplification than can possibly be secured from long wave amplifiers built of individual parts. Price \$35.00, assembled, wired and laboratory calibrated.

SUCCESSORS WHOLESALE RADIO CO. OF MISSOURT

The Improved Shielded Laboratory Receiver

Sensitivity: The Laboratory Receiver, in direct comparative tests, will bring in with loud speaker volume stations barely audible upon seven and eight tube shielded neutrodynes. Compared to other super-heterodynes, it will give greater volume, and generally bring in more stations, than any other eight or nine tube sets. In more stations, than any other eight or lime tube sets. Selectivity: Located in Chicago, the Laboratory Receiver will allow reception of out-of-town stations within 7 to 10 kilocycles of powerful locals. In comparative tests, it will give greater selectivity than any eight or mine tube super that can be built from standard parts. In fact, the set is so selective that it will take a week's careful combing of the broadcast range to log all stations within range!

tions within range!

Range: On short waves below 200 meters, the range is unlimited—5,000 to 12,000 mile reception is not at all unusual. In the 200 to 550 meter broadcast band, the range is 1,000 to 10,000 miles, but is guaranteed equal to or greater than that of any other receiver.

Between 500 and 3,000 meters, the range is guaranteed greater than that of any other receiver.

Volume: It can only be stated that the volume of the Laboratory Receiver is equal to that of any standard receiver, and is guaranteed equal or greater than that of any eight to ten tube set.

of any eight to ten tube set.

Wavelength Range: 30 to 3,000 meters with standard interchangeable plug-in coils.

Amplification: The firste detector and oscillator give a voltage amplifier of 25; the long wave and second detector 10,000 (10x10x10x10 for four tubes) and the audio amplifier, 400 (20x20 for two stages). The overall amplification is thus seen to be 100,000,000—about 80 times that of average eight tube super-heterodynes; about twice that of the best eight tube neutrodynes, and 20 times that of average seven tube shielded neutrodynes. The one hundred million amplification figure for the Laboratory Receiver is without extremely critical adjustment—critically adjusted for a very weak station, it will go up to a billion times or more!

ROM the Setbuilders Supply Co. you can get all parts for the new Laboratory Receiver, each and every item most carefully inspected and checked, and with a guarantee that your set, assembled from these parts, will give you results you've never had before on any set. You can also buy tubes, batteries, cabinets and loud speakers specially approved and tested for the Laboratory Super by McMurdo Silver and Ernest R. Pfaff.

It goes without saying that you want to own the Laboratory Receiver, just as you want the best of anything. And the Laboratory Receiver is the best, for it has features that you won't find in the most expensive factory set you could buy. Take its selectivity for instance—it will tune in out of town stations through local inter-ference that paralyzes ordinary sets. It's so sensi-tive it brings in these same stations with tre-mendous punch—when other sets don't even get through.

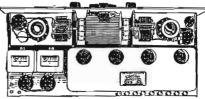

Then, its appearance is in the three to five hundred dollar class, though you're not handicapped by a factory cabinet—you can put your in any cabinet or console that suits your taste.

Guarantee

The Setbuilders Supply Company unconditionally guarantees the performance of any receiver built from the parts listed above to be superior to that of any other eight-tube receiver.

INGAP = "St gets that last mile" = INGAP SOCKET

DON'T FORGET!

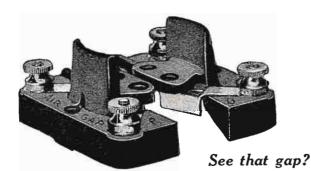

Your Socket Is Next in Importance to Your Tube. Tube Capacity and Socket Capacity Mean the Same Thing

When you select tubes on account of their low capacity, so essential in any T.R.F. or regenerative set, don't make the mistake and select a socket which adds to that tube capacity and neutralizes and does away with the advantages derived from the use of those efficient tubes.

TEST THE AIRGAP YOURSELF

TEST AIRGAPS by replacing your present sockets with AIRGAPS and note the improvement which you will easily detect. You will then appreciate the reason for the gap.

UNIVERSAL. THEY TAKE ALL U. X. AND ALL U. V. STORAGE BATTERY TUBES.

List Price

60c

THE GAP has the same effect as omitting the socket entirely. It creates a higher resistance path between GRID-PLATE terminals; decreases high frequency losses through and over the socket body, reduces undesirable feedback and intercoupling to a minimum, makes your set more easy to neutralize and control, causes it to go into oscillations more smoothly and not "spill" over until maximum results are had. You get maximum output at plate.

No dust, lint and moisture can collect between GRID-PLATE terminals to add to capacity, etc.

It will increase volume and improve reception to a degree which will surprise you.

Sent direct, postpaid, if your dealer cannot supply you, 60c each

FULL SIZE BLUE PRINTS

Actual size blue prints are now available for the construction of any circuit described in the Citizens Radio Call Book. Each set of four or more prints consists of a schematic wiring diagram, a graphic wiring diagram,

a baseboard layout, a front panel layout, and where a sub-panel is used, a sub-panel layout.

The schematic wiring diagram shows in a symbolic manner each piece of apparatus and all connections between component parts. It is of exceptional value to the experienced builder in that it allows an instant visualization of the circuit. The graphic wiring diagram is helpful to the less experienced builder, since it illustrates in a pictorial way all connections made between the various parts. Each instrument is carefully drawn to scale, with all terminals plainly marked so that the receiver may be completely assembled and wired with no chance of error even though the person has no knowledge of radio symbols.

The baseboard layout accurately shows the location of each piece of apparatus mounted on the baseboard or sub-panel. The front panel layout indicates the size and location of all holes and appropriate engraving. Either the baseboard or front panel layout can be used as a template, since they are drawn with such accuracy so as to insure the proper placing of parts on the baseboard and obviate the possibility of ruining the panel

through any inaccuracy in scaling or faulty calculation.

Receivers built from Citizens Radio Blue Prints will be exact duplicates of those built in our Laboratory, assuring positive success and the greatest satisfaction.

Camfield Super-Selective "9"

Using the FAMOUS RUSCO BAND PASS FILTER is the Most Sensitive and Selective Circuit ever developed

The circuit used has many features of proven merit never before incorporated in a radio receiving set. Outstanding among these features is the use of the famous Rusco Band Pass Filter in the intermediate frequency amplifier. This filter is designed to pass a band of frequencies 10 kilocycles wide. The amplification over this band is uniform and the cut-off on either side is extremely sharp. The result is perfect selectivity between wave bands of only 10 kilocycle separation in frequency. The uniform amplification over the band maintains perfect tone quality. The selectivity of this device is so perfect that it permits the use of radio frequency amplification ahead of the Super and the operation of the set on an antenna. This makes the Camfield Super-Selective 9 the most sensitive receiver ever developed. The net result is the simultaneous increasing of both sensitivity and selectivity to a degree heretofore considered impossible.

The turning of a switch on the panel converts this set from a five-tube two control radio frequency receiver for the reception of local stations, to a nine-tube super-selective and super-sensitive circuit capable of tuning through powerful local stations and receiving distant stations from coast to coast on a 10 kilocycle separation of frequencies.

This new circuit is easy to construct and simple to operate and comparatively inexpensive. It is entirely free from disturbing oscillator harmonics and it will out-perform any radio set you have ever used.

BAND PASS FILTER ASSURES

10 K. C. SEPARATION

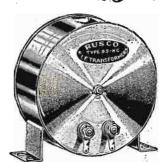

You wouldn't use a car like this in 1928 Then Why Build a Super that doesn't use Rusco Type 10 A RUSCO BAND PASS FILTER?

A good Super-Heterodyne is generally considered to be the Rolls Royce of radio receiving sets. If a man spent \$8000 for a Rolls Royce automobile that didn't have a self-starter he would be considered a good prospect for a padded cell. Then why spend good money building a Super-Heterodyne that does not incorporate a Band Pass Filter?

From a technical standpoint the band pass filter is the only satisfactiory way to give 10 kilocycle separation of frequency and at the same time to maintain perfect tone quality.

The Rusco Band Pass Filter has been incorporated in the Camfield Super-Selective 9 and its use makes that circuit the most sensitive and selective one ever

If you are interested in better tone quality and better selectivity coupled with more sensitivity than anything that has ever been on the market, build a Camfield Super-Selective 9 using the famous Rusco Band Pass Filter.

USES THE NON-OSCILLATING

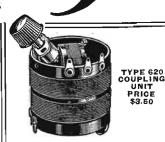

Camfield Duoformers

The Camfield Super-Selective 9 is stable in operation and entirely free from disturbing squeals and howls. This is because the famous Camfield Non-Oscillating Duoformers are used for the radio frequency transformers.

Duoformers are used for the radio frequency transformers.

These Duoformer Coils are a product of the Engineering Department of the Camfield Radio Manufacturing Company and have been so designed that properly constructed radio frequency amplifier circuits using them will be entirely free from disturbing oscillation. This is accomplished without the use of neutralizing condensers of any kind and is an exclusive feature of Camfield Duoformers.

Camfield Super-Selective USES THE FAMOUS

CAMFIELD **EQUALTUNE CONDENSERS** The following features of the Camfield Equaltune Condensers are not to

be found in any other one Condenser on the market:

Manufactured in all popular capacities and in units of one to five gangs.

1. To facilitate sharp tuning and perfect balancing in sets of the unit control type, the Camfield Equaltune Condensers are provided with a special adjustment feature which makes possible the perfect equalization of all circuits after the receiver has been completely wired. This eliminates the necessity for using Vernier or trimmer condensers of any kind. Complete instructions and a special tool for making this adjustment are packed with each double and three-gang condensers.

denser.

2. The shaft may be shortened or lengthened or entirely removed without affecting the adjustment of the rotor plates.

This provides a simple means for connecting several units together with a single shaft and anywhere from one to six condenser units may be operated with one dial. 3. The Condenser is so designed that it may be mounted from either end. This is accomplished by reversing the shaft cap nut and the panel mounting nut. After the shaft cap nut has been removed the shaft may be extended from the opposite end of the condenser by loosening the set screws on the rotor hub.

4. A variable spring tension is provided and the rotor is mounted on ball bearings which insure extremely smooth running over a long period of operation.

5. Camfield Equaltune Condensers are beautifully finished. The rotor and stator plates are of bright dipped brass. All other parts are hand buffed and nickel plated.

6. A pair of special brackets for mounting the condensers on a base-board or subpanel can be obtained at a slight additional cost. With the use of these brackets several single condensers may be mounted in a row on a base-board or sub-panel and all operated with a single shaft.

Camfield Super-Selective **MEANS PROFIT TO SET BUILDERS**

On actual demonstration the Camfield Super-Selective 9 will out-perform any other receiver.

The circuit used has many features of proven merit never before incorporated in a Radio receiving set. These features result in an outstanding achievement, namely: The simultaneous increasing of selectivity, sensitivity, and tone quality to a point heretofore considered impossible.

The turning of a switch on the panel converts this set from a five-tube 2-control receiver (with low battery consumption) for the reception of local stations to a 9-tube Super-Selective and Super-Sensitive circuit capable of

tuning through powerful local stations and receiving distant stations from coast to coast on a ten kilocycle separation of frequency.

These exclusive features of the Camfield Super-Selective 9 mean quick sales and more profits for you. Do not pass up this wonderful opportunity. Set Builders in all parts of the Country who have built the Camfield Super-Selective 9 are enjoying increased sales.

We stand back of this circuit and are ready to help you in every way. If you have any special questions regarding this circuit we will welcome a personal call or a letter from you. Either will receive our immediate attention.

What Kind & Voice Has Your Loud Speaker?

(New Output Transformer)

on your set will astonish and delight you by immediate, almost unbelievable improvement in reception. In nine cases out of ten that weak, distorted voice issuing from the speaker unit is suffering paralysis from high "B" Voltage. The Clarifer protects Speaker coils from this shattering current, assuring longer life as well as strong, full tone, clarity and volume.

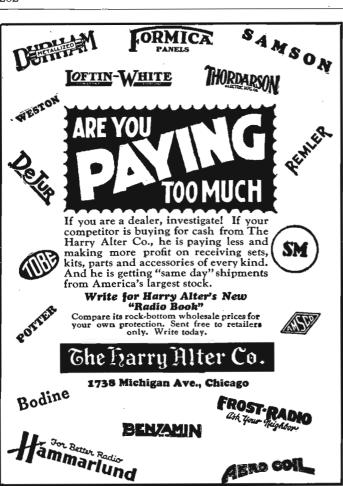

If your speaker is one of the great majority that fail to respond properly to the output of the set—you need a Muter Clarifier. It's the only thing that will remedy the cause. Easily attached in a few seconds without disturbing set. Try it out to your own satisfaction on our liberal guarantee—you won't recognize your set!

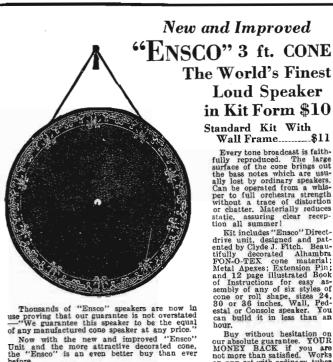

See Your Dealer—or Send Direct

Dealers can easily secure Muter Products for you from leading Jobbers. If, however, you have any difficulty in obtaining from your dealer, mail coupon direct to us. Prompt shipment will be made upon receipt of price or C. O. D. if preferred. Give your speaker a chance to produce its utmost. Mail coupon today.

RAYTHEON—Q. R. S. A-B-C UNIT CONDENSER **PACKS**

Fast Hi-Test Filter Condenser Pack, de-signed especially for use with the A. B. C. current supply, using the Raytheon BA 350 M.A. rectifying tube.

No. 1230—Raythe-on Condenser Kit, complete, \$22.25.

Fast condensers are the product of long research, and experience. They have been in use since 1919 in millions of radio sets and eliminators. The ones illustrated are exclusively designed, for use with the Q. R. S. and the Raytheon A. B. C. power units, or others of similar character.

The successful operation of all socket power devices depends greatly on the use of proper condensers. Fast condensers more than meet all requirements.

Filter packs mounted in handsome black enameled cases having fixed tinned combination knurled nut, terminal soldering

Filter packs mounted in handsome black enameled cases having fixed tinned combination knurled nut, terminal soldering lugs, permitting ready wiring as desired.

Capacities subjected to high potential surges, are constructed to withstand higher voltages than usually required. Short path type of rugged construction, absolutely non-inductive, and of high efficiency.

Fast condensers are designed to operate any A. B. C. current supply unit presented in any of the magazines, whether specified or not. Write us if in doubt. Send for special condenser booklet—free. Dealers and jobbers, write for prices and discounts.

ELECTRICAL AND RADIO

EVERY KIND OF RADIO INSTRUMENT

FOR MAKING ALL MEASUREMENTS— FOR LOCATING ALL TROUBLES AND FOR THE MANUFACTURER IN CHECKING HIS PRODUCT

A COMPLETE LINE of Weston Instrudistinguished for the same refinements in manufacture and extreme accuracy of performance which have characterized all Weston Measuring Instruments in the electrical field for the past forty years.

There is a model for every requirement—Battery and Battery Eliminator testing, checking Circuit Continuity, Audio Tube and Filament Voltages, locating and correcting all receiving set troubles, and for testing and checking radio equipment during manufacture.

There are instruments for built-in panels in home-constructed or manufactured sets, and for plugging into pin-jacks on manufacturers' models. And in addition to instruments for the set owner are Radio Set Testers, and Tube Testers for dealer repair shops and radio set servicing in the home. All these instruments are the most accurate and durable made.

A line of A. C. and D. C. testing instruments—All double range combinations for D. C. filament and battery testing, for battery eliminator testing, and for A. C. testing. Model 489 D. C. voltmeter—resistance 125 ohms per volt. Model 489 Battery Eliminator Voltmeter—1000 ohms per volt internal resistance. Model 528 A. C. voltmeter—accurate on any commercial frequency, extremely high internal resistance.

A complete line of 2 in. and $3\frac{1}{4}$ in. diameter panel instruments-

A. C. and D. C. and Thermo-Couple Types. These instruments are recommended for any and all service where miniature, but extremely accurate and durable instruments are required.

Model 476 A. C. 3¼ in. diameter. Model 517 A. C. 2 in. diameter.

Model 506, D. C. Model 425, Thermo-Couple Type.

Model 506 Pin-Jack Voltmeter

This is a meter especially adapted to the measurement of filament voltage on battery-operated sets. Designed with an internal resistance of 125 ohms per volt, this little instru-ment draws only 8 milliamperes, a highly desirable feature on dry cell operated sets. Every Radiola, Victor, or Brunswick Set should mount a pin-jack meter to assure ideal operating voltage, conserve tube and battery life, and satisfactory reception.

A self-contained high resistance instrument of 1000 ohms per volt for making battery, battery eliminator, audio tube and filament voltage tests and checking circuits.

Tell 'Em You Saw It in the Citizens Radio Call Book

There's money for you in

Wonderful opportunity for ambitious men to win success in this fast-growing profession

The Radio industry is expanding so rapidly that trained men are at a premium. There is a constant, urgent demand for operators -factory superintendents-engineers-service men-designerssalesmen.

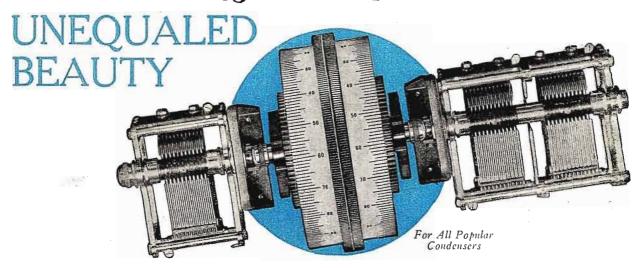

There is no better way for you to succeed in this fascinating business than to study the Radio Course of the International Correspondence Schools. This course is new and complete. It was written by practical authorities in this field. It is endorsed by leading radio experts and radio manufacturers.

Quincy J. Workman, of Scranton, Penna., writes that he has "nearly doubled his salary" since he took up the I. C. S. Radio Course. He is now manager of the Radio Department of a large

J. B. McCune, of Donora, Penna., writes that the I. C. S. Radio Course enabled him to start a radio business of his own. This same course enabled John M. Paynter, of the U. S. Lighthouse Service, Charleston, S. C., to get a position as Radio Operator and Ship's Electrician. Scores of other men in radio factories, laboratories and stores report similar progress.

You, too, can get in on the ground floor if you act quickly. But don't delay too long. Mark and mail the coupon today and let us tell you all about the I. C. S. Radio Course and what it can do for you.

TYRMAN LABORATORY CAssure Efficiency -Accuracy

SPECIFIED

All Tyrman Products are highly praised and recommended by every leading Radio Engineer. Citizens Radio Call Book specifies Tyrman Parts for use in the Improved Remler 45 K. C. Superheterodyne, the Camfield Duoformer 7, and the Tyrman "10" Receiver. See construction articles on these receivers in the isense.

TYRMAN VERNIER DRUM

For All Fine Receivers

Recognized by leading Radio manufacturers and engineers as the most perfect tuning device on the market. It is a new and most artistically designed instrument that assures a vastly improved performance and a beauty of appearance hitherto unknown. A high grade bronze escutcheon encloses the drums and verniers. It combines direct and vernier tuning, with the smoothest action ever obtained in such devices. Graduations are silver etched with raised lines and figures. New clutch arrangement guarantees perfect concentricity of drums and condenser shafts. Vernier held in steady contact with the drum by a flexible spring balanced bearing. Mounting holes for all popular condensers are provided. The beautiful Tyrman Vernier Drum will improve the looks of any receiver.

Camfield Equaltune Condensers

Camfield Duoformer Seven

No Distributing Oscillations with Camfield **Duoformers**

These high quality radio parts make the Camfield Duoformer Seven the season's leading Radio Frequency Circuit.

Camfield Type 351 Con-

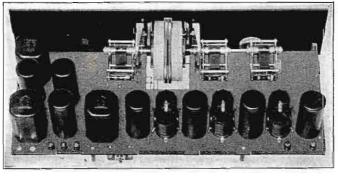

The Camfield type 22 Duoformer is a radio frequency transformer, espe-cially designed to avoid oscillation trouble in tuned radio frequency cir-cuits. Sets built with this transformer are both sensitive and selective, and are entirely free from disturbing oscillations without the necessity of neutralizing.

Camfield Type 22 Duo-

CAMFIELD RADIO MFG. CO.

35 E. Wacker Drive, Chicago

Construction Article In This Issue

The Camfield Duoformer Seven is a radio frequency receiver employing three stages of tuned R. F. amplification, detector and two stages of audio amplification using the two tube push-pull system in the last stage with the Tyrman input and output power Transformers.

The combination of the famous Camfield non-oscillating Duoformers and the Tyrman audio frequency Transformers make this the finest receiver ever developed from a standpoint of tone quality.

The set is simple to operate, having only two tuning controls, is selective and is sensitive for the reception of distant stations. It is one of the best all around sets you can build, and from a standpoint of tone quality it is unequaled by any other receiver.

Perfect **Tone Quality** with Tyrman Audio **Transformers**

Approved Recommended Specified

This year many radio manufacturers are replacing old transformers with the new Tyrman Audios, with vastly improved results. Technical engineers and designers of high-grade receivers all insist now on Tyrman Audio Transformers. Likewise in the popular CAMFIELD DUO-FORMER SEVEN the designer, in his search for transformers of surpassing excellence selected Tyrman Audios, and specifies them exclusively. The new Duoformer here pictured far surpasses last year's model. Never before has there been so great an improvement in Audio so great an improvement in Audio transformers. Tyrman Audios represent a masterpiece of acoustic engineering, and invariably improve the performance of any set in which they are used.

Tyrman Vernier Drum

This new and artistically designed instrument is acknowledged to be the most perfect tuning device on the market. It is designed in most distinctive fashion and presents a most luxurious appearance. Tyrman Vernier Drums combine direct and vernier tuning with the smoothest action ever obtained in such devices. They improve both the looks and They improve both the looks and performance of your receiver. A demonstration will convince you.

Tyrman Shielded Socket

Another Tyrman Product specified for use in the Duoformer. This new socket assures the proper functioning of each tube under the influ-ence of both static and magnetic fields. Constructed to allow baseboard mounting or subpanel wiring.

Write for Data Sheet giving characteristics of all CeCo Tubes

Tireless Performance

These gulls fly and fly until we wonder how such stamina can be contained in so frail an object.

Just so with CeCo Tubes. A strong combination of frail materials. Glass for a covering; hair-like wires for filament; fine spun metal for grid.

But so carefully engineered, so cleverly assembled so skillfully exhausted, so thoroughly tested that their durability is astounding to the radio operator and fan who judges CeCo performance by ordinary standards.

You expect MORE of CeCo Tubes—and get more.

A Type for Every Radio Need

General Purpose Tubes, Special Purpose Tubes, Power Tubes, Filament Type Rectifiers, Gas Filled Rectifiers and

Ask your radio dealer for complete data sheet of CeCo Tubes.

C. E. MANUFACTURING CO., Inc., Providence, R. I.

Announcing Our New

Gas Filled Rectifier

(NO FILAMENT)

TYPE D-G

Maximum Volts-300

Maximum Cur.-85 M-A

Long Life without decrease in output is assured if these values are not exceeded.

Easy Filtration. Less strain on Filter condensers and smoother output with less Hum or Ripple.

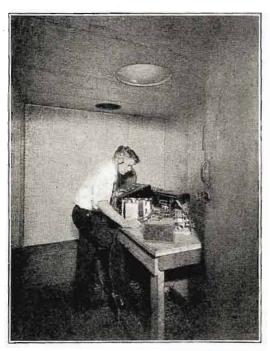

These tubes are tested in a Standard rectifying circuit using well designed parts. The unit is connected to a ripple test position, and tube checked both by phones and observed on an oscillograph, insuring a perfect tube which will give excellent results in well designed and constructed units.

Makes a Good "B" Eliminator—BETTER

GUARANTEED SERVICE

SHIELDED TESTING ROOM

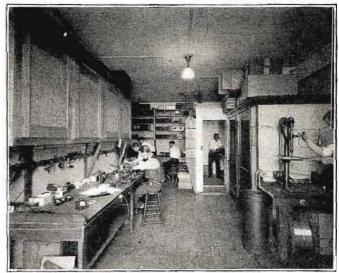

OUR completely equipped service laboratory, with its corps of carefully trained service men is at your service for testing and repairing all types of receivers, battery eliminators and power units. Only the most modern and up-to-date apparatus is used in testing and repairing any device delivered to us for service.

Any receiver or power device repaired by this highly efficient organization is positively guaranteed to perform in the same manner claimed by the manufacturer. (All receivers serviced in this laboratory are given a final test in a completely shielded room where the internal noises are absolutely eliminated.) This insures noise-free reception which is necessary for satisfactory performance. In addition, complete equipment is available for properly testing all types of power units.

We will repair, test or design any type of receiver you may desire. Being specialists in this field we are in an excellent position to rebuild your present receiver and bring it up to date.

If you are unable to personally deliver the receiver or unit you wish to have serviced, securely pack it in a strong box with plenty of cushioning material, such as excelsior, and ship it to us by American Railway Express, prepaid. It is not necessary to ship cabinet or accessories.

Remember — the confidence of many leading manufacturers has been placed in this laboratory. The Radio Service Laboratories will give to you the same conscientious service that the manufacturer, himself, would give you. It is more practical and wise to bring your problems here than to some irresponsible radio man who is unfamiliar with the merchandise you wish serviced. This is an era of specialized effort and our charges are no more than you would pay for inferior workmanship.

HITZ Manager

KUPROX

The REVOLUTIONARY new dry metallic disc rectifier obsoletes at a single stroke all present types of rectifiers, including electrolytic, tube and vibrating. It gives to RADIO, at last, a system of rectification that is absolutely dependable, noiseless and efficient, one that is as substantial as a piece of solid metal, and uses no glass, chemicals or liquids of any kind—a rectifier that requires absolutely no attention and is unlimited in its length of life.

TYPE "A" KUPROX REPLACEMENT UNIT.....each \$4.50 Replaces electrolytic and jars of all Trickle Chargers, "A" Powers, power units, etc., of the electrolytic type. Changes ½ ampere Trickle Charger to 1 ampere.

Model "A" KUPROX TRICKLE CHARGER....each \$10.50
A silent, dry 1 ampere Trickle Charger, can be installed and forgotten.

Model "D" KUPROX HOMECHARGER....each \$18.50 Noiseless, efficient, no renewals of any kind necessary. Two charging rates, ampere trickle rate and 3 ampere booster

Dubilier

The Pioneer

A history of the Dubilier organization takes us back to the very conception of wireless telegraphy. Then, practically every Dubilier device was a "special order" built for experimenters whose names are now famous. Today, these same electrical and radio engineers turn instinctively to Dubilier for either standard articles of manufacture or laboratory models for their research. This keeping step with the industry has given Dubilier a merited reputation for condensers which are way above the average in ruggedness, safety factor and long life.

List Price \$150

Why Bother With Outdoor Aerials?

Present-day broadcasting and modern receivers don't require them. A Dubilier Light Socket Aerial and a few feet of cord will give you a highly efficient antenna and do away with lead-in wires, insulators, faulty connections

and lightning arresters. The device consumes absolutely no current and needs

Rich Tones, Beauty and Compactness

Are but three reasons why Halldorson Overtone Audio and Output Transformers were chosen for the Bodine A. C. Receiver described in this issue of the Call Book.

The new Halldorson Overtone Audio Transformer is the result of several years' research work to develop a transformer that would faithfully reproduce broadcasting with present day loud speakers. With new ideas in design, its ability to amplify the overtones of both music and speech is a revelation.

The Halldorson Overtone Transformer delivers greater power on the low fre-

The Halldorson Overtone Transformer delivers greater power on the low frequencies and falls off gradually in amplification on the higher frequencies. The effect of this is readily apparent to the musical ear, for the overtones are brought to the foreground with a richness that is astonishing. Overtones that give depth and life to all music are amplified with a deep, rich power that can only be found in this new and remarkable unit.

Every part of the unit is made of the finest materials and assembled with the technical skill of master craftsmen. Each transformer is rigidly tested before leaven

ing the factory and is guaranteed to give perfect satisfaction. Made in one type for all circuits and all tubes. Price each,

The Halldorson Overtone Output Transformer

The Halldorson Overtone Output Transformer tends to even up the deficiencies of many present day loud speakers. Regardless of the receiver it is used with, it will improve the quality of reproduction. The greatest power is delivered to the loud speaker on the low frequencies so that bass notes are brought to the foreground with true fidelity.

brought to the foreground with true fidelity.

The Halldorson Overtone Output Transformer will greatly increase the power handling capacity of your loud speaker, and will protect it against possible harm through high plate current. Price each, \$6.00.

Replace your present transformers with Halldorson Overtones. If you use them once you'll use them always.

The Best and Cheapest "A" Power

Complete "A" Battery Eliminator

Licensed by the Andrews - Hammond Corporation under Andrews' condenser Andrews' condenser and other Andrews and Hammond patents and patent applications.

Complete

Slightly higher west of Rockies

Contains no battery and operates direct from the light socket

No Changes in Set Necessary

The Abox "A" Eliminator is a rectifier and the Abox Filter circuit built into one compact unit. It changes the alternating current from the light socket to 6-volt hum-free current. It is always ready at the touch of the switch to deliver the correct current so essential for maximum reception.

The Abox contains no battery in any form. It is never charged or discharged. It is fool proof in operation. It regulates against line voltage fluctuations and, regardless of line surges, no damage can be done to tubes. This is accomplished without automatic cut-outs or troublesome relays.

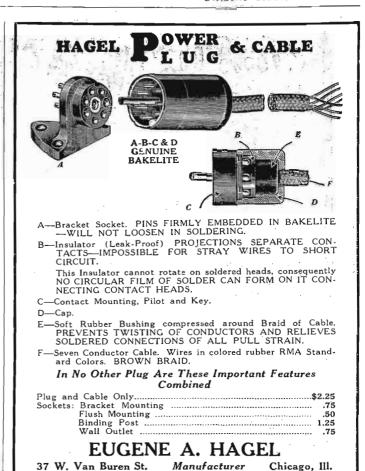

The ABOX FILTER is the filter circuit of the complete Abox. If you have a good two or five ampere charger, the Abox Filter can be used to filter its output and make a complete "A" Eliminator. Simply make four connections. Price \$19.50.

Radio dealers recommend and use the

Ground Clamp

because it eliminates the high percentage of radio troubles due to faulty ground

Imperfect ground contacts are responsible for a high percentage of all radio troubles. The ekko Clamp eliminates these troubles by insuring perfect contact. Radio dealers know this. That is why they include an ekko Clamp with radio set installations and instruct their service crews to use it in replacing old faulty grounds.

The hardened steel points of the ekko Clamp bite through paint, rust, dirt, corrosion or any other insulation. Its positive contact insures full signal strength. Easy to use. Ground wire screws to Clamp. Clamp attaches to nearest pipe by a turn of the screw. Non-corrosive, permanent. Finished in white nickel. Fits 1/4 to 11/4 inch pipe. At your dealer's.

Radio Dealers:

The ekko Clamp is supplied in lots of ten in an attractive counter display that helps you sell this most popular of all ground clamps. \

Push Pull Input Transformer

Push Pull

The New Symphonic Push Pull

gives great power with quality

You who love rich bass notes and tonal brilliancy will find this beautiful pair of Samson brush-copper-finished audio units - Push Pull Input Transformer and Push Pull Output Impedance have brought back into its own the push pull circuit, which eliminates tube harmonics.

With two type 171-power tubes having but 180 volts on their plates as much undistorted volume can be obtained as with a type 210 tube having 400 volts on its plate in an ordinary amplifying circuit — and two type 210 tubes can be used with these units for dancehall volume.

The Samson Symphonic Push Pull Input Transformer will satisfactorily work into tubes up to 50 watts capacity. Unfiltered AC current may be used on the filament in push pull circuits without hum in either first and second stages, or both stages. The Push Pull Output Impedance eliminates the distortion always found in any transformer-no matter how well it is made. Price per pair-\$19.50.

For those desiring to use more than one stage of push pull the new Symphonic Interstage Push Pull Transformer, Type Y is now available. Price-\$14.00.

This is the first announcement of the availability of these units for public use.

Send for free reprint article on a complete

audio amplifier. Our book—"Audio Amplification"—already accepted as a manual of audio design by many radio engineers-contains much original information of greatest practical value to those interested in bettering the quality of their reproduction. Sent upon receipt of 25c.

Those who desire to know how to get su-preme coil efficiency can obtain our new "Inductance Units Bulletin" which will be sent on receipt of 10c to cover cost of mailing.

For Perfect Reception

THE KINGSTON will maintain the radio set always at its perfection peak. It contains no acid or solution, operates without vibration or noise and will not heat. There are provided three different voltage terminals, each adjustable over a wide range, making possible any desired voltage from 5 to 200. A fourth variable voltage may be easily had, if desired, by connecting a separate variable resistor to one of the terminals. The primary or main current supply is controlled by a rheostat, making it possible to reduce the current entering the unit to the amount actually required for any individual set, thus protecting the set against overload.

Handsomely finished in satin black. Size: 9 inches long, 5½ inches wide, 8½ inches high. The Raytheon 85 milliampere type BH tube is used as rectifier. Fully guaranteed.

PRICES

Type 2, for 110-120 Volt A. C. 50 or 60 Cycle Current, \$35.00

For receiving sets having not more than eight tubes and not having type UX171 power tube or equivalent.

Type 2A, for 110-120 Volt A. C. 50 or 60 Cycle Current, \$42.50

For all sets using type UX171 power tube or equiva-lent and for all large sets having nine or more tubes.

Type 2C, for 110-120 Volt A. C. 25, 30 or 40 Cycle Current, \$47.50

Prices include type BH Raytheon tube

Any of these models will be furnished with an automatic control switch built in the unit for \$2.50 additional. With this the B unit is automatically switched on or off when switch on the radio set panel is turned.

KOKOMO ELECTRIC COMPANY кокомо **INDIANA**

There is a Sentinel Unit for every Radio Power Need-

Sentinel "Dry-A" and Sentinel "Dry-A-B-C"

are absolutely new units, operating without batteries, direct from house current. No acids, no refilling, no bother. Prices slightly higher.

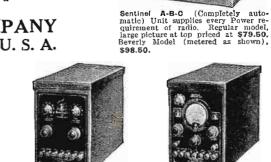

Completely Automatic. = **Power Units**

Know the joy of perfect radio reception by eliminating the cause of most of your troubles-your batteries.

Sentinel Radio Power Units provide steady, easily controlled current for all radio purposes. Select the unit or units your set needs, attach to receiver, plug in light socket and your battery worries are ended. Sentinel units are guaranteed. Your radio set switch controls their operation-keeps your power up to 'par" all the time.

Write today for complete descriptions of all Sentinel Units and name of nearest dealer. We will arrange for a demonstration without obligation of any kind.

A truly fine product

THE AMSCO COMPENSATED TRIPLET CONDENSER

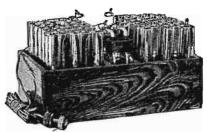

Engineering precision, from the formula for the curve of the tuning line to the final adjustment of the equalizing condensers, justifies the quiet commendation of engineers.

The two outstanding receiver developments of 1927, the Bodine Twin-8 and the Aero-7, use this condenser. We shall be pleased to send literature on these circuits.

The inclusion of Amsco Products—rheostats, sockets, resistors and condensers,—adds to any receiver a touch of real beauty and the assurance of electrical efficiency.

Amsco Products, Inc., Broome & Lafayette Sts., N.Y.C.

90 Volt Power Unit :: \$12.75

Hums, line noises, etc., positively impossible with this new advanced unit. Plug in and forget. Non-acid and noiseless. All detector and intermediate voltages plainly marked. Simpler to hook up than dry cells. Operates any type set, 1 to 12 tubes.

Greater volume and clearness guaranteed. thoroughly satisfied return after using 30 days for complete refund. Guaranteed further 2 years. For 110-120 volts A. C., 25 to 60 cycle current. 90 volts, \$12.75; 112½, \$15.25; 135, \$17.50; 157½, \$19.50; 180, \$24.00; 202½, \$26.00.

Also built for D. C. current 110 and 32 volts at only \$3.00 additional, any size above. Ample stock—same day shipments. Simply say—ship C. O. D. or write for my interesting literature, testimonials, etc.

WARD LEONARD

ELECTRIC COMPANY MOUNT VERNON, N. Y.

A New Standard of Speaker Performance.

Designed on unique acoustic principles, the Yar True-Tone Speaker establishes new standards of radio speaker performance!

Broadcast programs are reproduced with the utmost naturalness, without artificial vibrations or overtones, and in full, clear volume. This is due not only to the revolutionary design of this speaker, but also to the great density of the materials used. The entire speaker is made of cast aluminum. The reproducing unit will handle any voltage up to 200 volts without "blasting" or oscillation.

And it's a beautiful home ornament as well as a wonderfully efficient speaker. Its graceful lines and attractive finish harmonize with any home setting. It is supplied with 20 ft. of power cord—may be placed anywhere in a room, to balance furniture groupings, or for best acoustic effect.

PRICE, COMPLETE, \$35. If your dealer cannot supply you, order from us direct.

DEALERS: Ask your jobber about the Yar True-Tone Speaker or write us for further information.

Changes Your Set Into a Short Wave

Receiver
Sent postpaid anywhere in U. S. upon

where in U. S. upon receipt of \$15.00 M. O. or C. O. D. plus postage upon receipt of \$1.00 to guarantee carrying charges.

When ordering state kind of set so that detailed directions for use may be given if necessary. Also state type of tubes, such as UX 199, UV 199, WD11 or 201A.

The SUBMARINER

Regardless of the kind of set you have, this device will permit you to listen to short wave stations between 30 and 75 meters. Operates with sets such as T R F. Neutrodyne, Super-Heterodyne, regenerative sets and all other types. No additional tubes or batteries required. No changes to the wiring of the set. A short aerial and ground is connected to the "Submariner," and a cable and plug attaches it to the set. Requires less than a minute to attach or detach. Operates as a wave changer with Super-Heterodynes, and as a detector unit with others.

SHORT WAVE RECEPTION

is practical because they penetrate better, and there is less static. There are several powerful stations using the wave band covered by the "Submariner" for broadcasting programs. You may also learn code by listening to amateurs from all parts of the world. Get a thrill by tuning in a station your friends cannot get. You will have a highly efficient short wave receiver when the "Submariner" is attached to your set. Nothing else like it on the market. Take a trip in the low waves on board the "Submariner."

ORDER TODAY

We guarantee to refund if the "Submariner" fails to operate

Silver 🔨 Beauty

The Perfect "A" Eliminator

Perfect, because its principle is simple and correct!

THE 110 volts Alternating Current is scientifically reduced with the famous "Silver Beauty" transformer coil to deliver the proper voltage to an especially developed dry, noiseless rectifier, which transforms the electricity to direct current. This current of exact voltage is then transmitted through a patented special filter which clarifies the current eliminating all foreign which clarifies the current, eliminating all foreign noises caused by rectifier or generator.

The result! A smooth, noiseless, constant "A"

current supply, that makes radio reception the pleasure it is intended to be.

Silver Beauty is the outstanding "A" eliminator today. Nothing equals it. Endorsed by prominent radio engineers—adopted by leading distributors and dealers-approved by thousands of users.

These are sufficient reasons for making Silver Beauty your final choice.

Our Policy of LOWEST WHOLESALE PRICES

—that is, to endeavor to sell day by day for less than the prices of our legitimate competitors—is made possible because we sell for cash only.

We are not infallible. Others may on occasion cut our prices —may on occasion sell merchandise for one reason or another at prices lower than we, until we find it out.

We thank our customers who report any items on which we are being undersold. In other words, we will meet the price of any legitimate competitor if our customers will furnish us the name of the concern, together with the page number of the catalog in which the lower price is quoted. In comparing prices be sure to remember that we allow a cash discount of 3 per cent when cash accompanies order.

That our policy is believed in and appreciated is clearly proved by our rapid growth.

We give no credit. We give no extra discounts to a favored few. We are the headquarters of the thrifty dealers and professional set builders who pay as they go. Five specially

Test Your Battery Easily-Quickly-Accurately

Hydrometer

Test your battery without withdrawing the Hydrometer. Balls make reading simple and easy.

Swim all three, charged fully Sinks the white, charge still right Sinks the green, charge is lean Sinks the red, charge is dead

Accurate — durable — no float to read or break. Over six nillion patented Chaslyn Balls used by leading Battery Manufacturers as standard equipment in Glass-cased Batteries and Power Units. Ask your dealer. If he can't supply, send seventy-five cents to:

THE CHASLYN COMPANY 4607 Ravenswood Ave. CHICAGO

Install W-E-B-B Aerial supports and end your faulty receiving. Finest sets can be hampered by poor aerials. Use this and really enjoy your radio.

Combines attractive appearance with permanent, steady support and tension.

One-inch and ½-inch pipe sizes, both with 2 styles ball-and-socket One illustrated fits gable ridge; other for side wall, flat or sloping roof. Prices: ½-in., \$1.50; 1-in., \$3.00. See this at leading radio stores or write us direct.

TIMING GEARS CORP. 2801-15 Fulton St. Chicago, Ill.

Complete A. C. Operation A Practical Reality

For the past several seasons the trend has been toward complete battery elimination. Many satisfactory plate supply units operating from A. C. have been developed but filament operation from an A. C. source has presented more of a problem due to the larger currents required and increased expense in the rectifier and filter circuit.

The newly announced A. C. tubes offer an excellent solution to this problem.

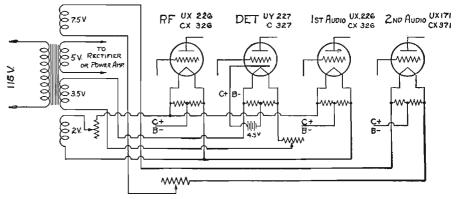

Type 440-A Low Voltage Transformer

The alternating current tubes require a source of low voltage capable of delivering large current. The various types of tubes require several different voltages. The type 440-A transformer supplies voltages for all popular A. C. tubes and sufficient current for all ordinary receiver requirements. Filament supply is provided for filament, separate heater, power amplifier and rectifier tubes. The following voltages and currents are available. Pri. 115 (for lines 105-125 volts) 60 cycles.

| Sec. 2 volts8 | amperes |
|---------------|---------|
| 3.5 volts2 | amperes |
| 5 volts2.5 | |
| 7.5 volts2 | amperes |

Price \$10

The above diagram shows how to adapt the filament wiring of the popular type of receiver to A. C. operation by use of General Radio parts especially designed for this purpose.

Type 438 Socket

The new type UX-227 or CX-327 detector tube has a separate heating element and requires a socket designed to take the new five prong base.

Type 439 Center Tap Resistance

Type 410 Rheostat

The new A. C. tubes require low resistance rheostats capable of carrying appreciably more current than those used with D. C. tubes.

| daed with D. C. tubes. | | |
|------------------------|-------------|--------|
| Resistance | Current | Price |
| .5 ohm | 3.5 amperes | \$1.25 |
| 1.5 ohm | 2.0 amperes | 1.25 |
| | | |

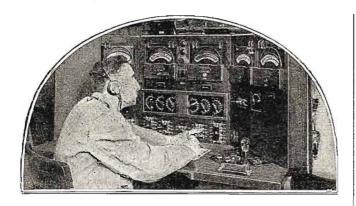

Your local dealer should bave the necessary parts in stock. If he is unable to supply you with all the items required, we shall be glad to send them to you prepaid upon receipt of list price.

TO CONTRACTOR OF THE ORIGINAL Tell 'Em You Saw It in the Citizens Radio Call Book

Once you attach this "A" Eliminator you can forget you ever heard about "A" Batteries, chargers and all their disappointments. Here is reliable power when you want it for all time to come. This eliminator does the work with any and all types of sets. Used in connection with any good "B" Eliminator you have a completely elec-

Only \$1.00 Down -Then Test It for 30 Days

This "A" Eliminator is of the finest quality, This "A" Eliminator is of the linest quality, identical with the best you can find anywhere selling for \$40.00 and \$45.00. However, you don't have to pay that much. Our tremendous buying power brings you this eliminator for 25% to 40% less. You pay only the low direct selling price of \$31.50 at the rate of but \$5.00 a month. Furthermore, you don't pay for it until it has made good on its own merits. Just fill out the coupon below and mail it to us with a dollar bill. That brings you this reliable "A"

Eliminator. Attach it to your set and test the good days before you pay another cent it for 30 days before you pay another cent. If it doesn't delight you—give you even better results than you obtained with "A" Batteries, return it at our expense and your money will be cheerfully refunded. You have no risk at all.

Not a Battery-Charger Combination

This "A" Eliminator consists of a large capacity rectifier which changes the alternating house lighting current to a direct current, and the most highly efficient heavy duty filter system that has ever been developed. This filter system with extremely high capacity condenser smooths out the pulsating direct current from the rectifier into even, constant, humless direct current for lighting the radio tubes. The "A" Eliminator comes to you complete. It is your only cost. There is no upkeep or replacements. You are assured of dependable current at 6 volts for any radio receiver using 201-A and power tubes.

Operates from the light socket 110-120 volts, 50-60 cycle A.C., output 6 volts direct current for all sets up to 12 tubes with or without power tubes. Current is used only while set is in use. It is always ready with dependable power whether used often or only at long intervals. As it contains no only at long intervals. As it contains no storage battery or charger in any form it is never charged or discharged.

Send Us the Coupon Now

Remember-this most modern and efficient of all "A" Eliminators is yours to try and of all "A" Eliminators is yours to try and test for 30 days upon our receipt of coupon and only \$1.00. In |reality you test it free for your dollar is refunded and we pay return express charges unless this eliminator makes good by test. Complete instruction for attaching go with each eliminator. You can attach it yourself. Once hooked up you can forget about it as it has no moving parts to wear out and is almost fool-proof in operato wear out and is almost fool-proof in opera-tion. Send for it now. Know what your set can do with smooth, even "A" power—get 100% efficiency from your set at all times.

Radio Dealers/

Get This Valuable (1928 Catalog FREE

The new 136-Page Colored and Illustrated 1928 Hamilton-Carr **Wholesale Radio Catalog** is ready. It has been carefully compiled after an exhaustive study of all radio sets and radio accessories on the market or to be introduced. We have examined these sets, accessories and parts and tested them in our own laboratories and know their value. You can be sure that you will find in this complete new catalog an accurate and reliable illustration and listing of everything pertaining to radio.

ALL THE CALL BOOK KITS

We show the latest Citizen's Radio Call Book Kits, including complete Parts for the following at the best dealers' prices:

Tyrman Ten, Karas 2-Dial Equamatic, Improved Infradyne, Best's 45 K. C. Super, Citizen's Super, Camfield Duoformer 7,

Scott's World Record Ten, Camfield Super 9, Bodine Electric, Aero Seven, Aerodyne, Improved 9-in-Line, Hot Spot 14, Magnaformer-9-8, Best Lincoln 8, Silver Shielded Super, S.M. Unipac.

This year electric (socket-power) radio receivers are very popular. The demand for them is constantly on the increase. In the Hamilton-Carr catalog you will find a complete showing of six, seven and eight-tube electric and non-electric sets. And you can be sure that both are of the finest quality—sure to deliver satisfaction. Easy to sell on demonstration. Styles of receivers in both table models and console models have been made to meet all requirements.

Nationally Advertised Accessories

All the fast-selling, nationally advertised accessories, parts and kits are shown in the new Hamilton-Carr Catalog. Many of these are advertised in this magazine now or have been in the past. All the recognized successful methods of converting old sets into electric sets are explained.

"A" and "B" Eliminators

The success and sale of "A" and "B" Eliminators is unquestioned. There is always a call for them. This new catalog shows all the latest improved models at astonishingly big discounts. You will want to stock them at once for immediate sales. You can win hundreds of customers with these great values.

III III Cruenana

Thousands of Other Amazing Values

Get this new catalog today and keep it handy. You will find in it everything you want in radio, including all new types of loud speakers and chargers. During the last few months cabinet and console designers have created many beautiful new models. All of these are shown.

Hamilton-Carr Service to Dealers

The Hamilton-Carr Radio Corporation is not new. They pioneered in the radio business and have devoted all their efforts exclusively to radio and bettering their service to dealers. The thousands and thousands of dealers now doing business with Hamilton-Carr show how successful we have been. We have perfected our organization in every department. Orders received are shipped when they are wanted without fail. We unconditionally stand back of all merchandise bought from us whether of our manufacture or not.

12-Hour Service that is a Fact and Not Just a Promise

A New, Larger Home—a Greater
Organization Make it Possible

BECAUSE of the steady expansion of our business, we have been forced to move into larger quarters, increasing our floor space several fold. Our working staff has been doubled. A group of expert radio merchants, assisted by an able corps of assistants, stand ready to give the quickest and most efficient distribution service ever afforded in the radio business.

From the beginning, we believed that the substantial future of radio retailing lay through the distributor carrying the burden of stock and investment and allowing the retailer to devote his entire resources and efforts to the proper handling of the consuming public. That our views in this direction were sound has been eloquently proven by the truly amazing upward growth of our business.

That we might carry this purpose to the furthermost point, we have provided warehouse space and operating facilities so that today we may give the same day service to every radio dealer in the country on practically all the leading lines of parts, accessories, equipment and finished sets. Most orders are shipped same day of receipt.

The Largest Selection of Radio Goods in the World—Make the Best of the Greatest Year in Radio History

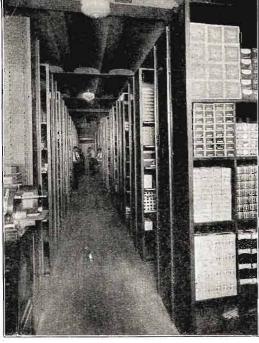

It is the belief of all those intimately associated with the industry that this will be the greatest year in radio history. The quality of radio apparatus has reached a high point of perfection. Broadcasting conditions were never better. Distribution facilities were never more highly developed. The public has never indicated a more wholesome confidence and appreciation of the desirability of radio in the home and the reliability of most of the apparatus now offered for its use.

All these factors form a basis of opportunity for selling radio which has not been paralleled in this field during the past two or three years. All indications point to a real boom for this Fall and Winter. Thousands of homes never yet graced by radio will this year be equipped, because there is a wide-spread feeling that broadcasting and reception equipment can now be depended upon. The dealer who does not take advantage of this opportunity will, in our opinion, pass up a chance that he will likely never see again.

Showing a section of aisles where goods are stored in all-steel service shelves in methodical order. Orders are filled easily, quickly and efficiently.

We invite all our dealers to visit us. Our new home has provided a ground floor Display Room and Service Counter with a skilled staff of attendants.

We have made vast preparations in anticipation of the rush of business which we know will come this Fall and Winter. We have perhaps the largest selection of radio goods ever assembled by one organization—all under one roof, ready to serve the dealer instantly. Our lines have been strengthened and our stocks sufficiently ample to care for our thousands of dealers and the new ones which we know will come to us,

Follow Braun's Year' Round Profit Guide

By the time of the appearance of this announcement, our new Fall and Winter Catalog will be off the press. In it you will find more than 200 pages listing practically all the leading reliable radio apparatus on the American market. In it you will find a complete list of the nationally known lines. We believe this book has been a means of establishing thousands of dealers upon a sound basis of retailing. Pointing as it does to a source for practically every radio article in demand, it gives the dealer an opportunity to service his trade with a minimum investment, and together with our service make a rapid turnover on his capital.

If you are not now on our list, we would suggest that you write us immediately on your official letterhead, and if you are not rated, give us the names of three wholesale establishments from which you now purchase. As it has to thousands of other dealers, let this book of ours be in truth, your Profit Guide in Radio.

W. C. BRAUN COMPANY

Pioneers in Radio

563-571 W. Randolph St. Dept. 91 CHICAGO

RADIO CONFIDENCE

ROM the very earliest days of radio --- while others shouted wild claims of performance and impossible exaggerations of selectivity --- we have been noted for sticking closely to the facts

---for offering sound advice and intelligent service---and have thereby gained the confidence of thousands of radio fans from all over the country.

Our New Free Service Laboratory

In order to continue rendering the very best radio service consistent with our reputation as the world's largest radio store we have

completely reorganized and enlarged our service laboratory.

This completely equipped laboratory is at your service. Our experts are in attendance to help you with your radio sets. If your set is not working properly, bring it to our service laboratory and we'll soon find out what's wrong.

Absolutely no charge is made for this service—and all are welcome.

Blue Prints and Kits

A Complete Service

We carry a complete stock of blue prints and parts to build all of the new sets illustrated and described in this issue of the

And Others

"Citizens Radio Ca'll Book." All parts offered to you are guaranteed exactly as specified. A few of the sets are as follows:

World's Record Super Ten
New Two Control Equamatic
Improved Nine-in-Line
Camfield Super-Selective Nine
Improved Remler
The "Best Lincoln" Nine
Silver Super
Eight-in-Line Super
Aero Seven
1928 Infradyne
Magnaformer 9-8 Receiver

Free Catalog

Come to our store or write us for a copy of our new 1927-1928 Radio Catalog. Parts for all the latest circuits including those described in this issue of the "Citizens Radio Call Book" are included.

Save Money

We guarantee to save you money on parts and accessories made by leading manufacturers. Get our catalog before you buy.

Set Builders and Dealers Write for Our Wholesale Catalog

CHICAGO SALVAGE STOCK STORE

"The Largest Radio Store in the World"

509 South State St. Dept. CB

CHICAGO, ILL.

Barawik Now Offers Lowest Wholesale Prices

to Community Set Builders, Dealers, Agents

ERE is an opportunity for the community set builder, the small dealer and the agent to concentrate all of his purchases at regular wholesale prices, in one place. No longer need he seek his parts and supplies from a dozen different sources.

Moreover, he will find here a 12 hour service, that will be of immense value to him in building up his circle of friends and customers. In almost every case, orders will be shipped the same day received by us.

Here he may draw upon the largest, most complete stock of radio parts, accessories and supplies in all the country. The very latest circuits are described and listed in all their parts, exactly as specified in the various publications. A special staff is maintained to keep the assembly of these circuits exactly correct, and an advisory department is ready at all times to assist each and every Barawik customer in the furthering of his set building activities.

Due to the tremendous volume and our universal connections with practically all of the leading manufacturers, the Barawik customer is always assured of obtaining the very most advanced, perfected, accredited parts and supplies. Each and every item is fresh, new and exactly as it comes from the manufacturer who makes it. We do not sell "job lots," obsolete stocks or "close-outs."

Radio Parts

The standard parts of all the famous radio manufacturers are here for you to choose from. Your favorite part can be had from BARAWIK at a bargain. Coils, transformers, condensers, panels, rheostats, switches, grid leaks, binding posts, brackets, wiring material, jacks, sockets, dials—everything you can think of—the best and most famous brands.

Radio Sets

Something new to the radio fan is the line of BARAWIK sets. Three series of models from which to choose: three-dial, two-dial and one-dial controls with 5, 6 and 8 tubes. The finest, most complete line of cabinets and consoles ever assembled. Marvelous values in portable sets—great bargains in standard sets for home use. A variety of styles for every purpose, every taste, every whim, and every pocketbook.

Radio Kits

For those dealers, set builders and agents who sell to others, and who "build their own," we have complete kits of parts for every known circuit at tremendous savings. The famous kits of the world's leading radio circuit designers—everything in the good

old reliable standby circuits, as well as the new pretentious ones that are the last word in radio perfection. Hundreds of thousands of builders have used our kits and saved thousands of dollars. Your savings now are greater than ever.

Radio Supplies

The BARAWIK CO. is famous for its variety of supplies, which it offers at moneysaving prices. Newest cone speakers, "B" eliminators, socket power equipment, amplifiers, latest amateur equipment, tubes, batteries; in fact, anything you can ask for is here, ready to ship, at a saving in price. Quality merchandise, selected goods by reliable makers—just what you want.

Get Our Prices on All the Famous Circuits Shown in Radio Call Book

It will pay you to get our prices for complete parts for the RADIO CALL BOOK circuits and all the popular circuits advertised and heralded in various radio magazines and newspapers. We save you money on every part. See our prices before you buy.

All merchandise guaranteed and of highest quality as required and specified.

Write today for our new 1927-1928 wholesale Radio Catalog and Builder's Guide, showing radio's newest creations.

If you are in the market for any set or hook-up shown in this issue and desire the parts at once, order direct from us.

Send for Buyer's Guide Now

You need this book before you spend another cent on radio. Just mail your request now and free copy will be sent you. Standard discounts to dealers, set builders, agents, schools, manufacturers, and all quantity buyers.

TRANSFORMERS

For Set Builders Who Demand

The new C16 and C25 Transformers will improve any circuit and will work in any Radio Set.

LAST SEASON'S RADIO SENSATION!

Now Greatly Improved By These Marvelous Additions—The Supreme Achievement In Audio Amplification

Technically and practically the H. F. L. C-16 is the most efficient Audio Frequency Transformer built. It is constructed to match perfectly the two circuits between which it is placed and carries signals at highest volume without blasting or developing harmonics, and will amplify signals of low amplitude as well.

Even with the most up-to-date broadcasting stations there is a noticeable loss in amplification at frequencies of 100 cycles or less, and again on the high registers of 5,000 cycles or over. Remote control operation takes another toll, only that the high register starts to drop off even sooner. In most cases at 3,500 cycles per second. Furthermore, it is a known fact that the amplification curves of the present day loud speaker shows over and under amplification of certain notes.

The H. F. L. C-16 Audio Transformer is so designed as to bridge over and under amplification. Therefore the amplification of all frequencies throughout the entire musical scale is accomplished with amazing, life-like truthfulness. A specially treated silicon steel alloy, combined with proper gapping and right proportion in density, make saturation of core practically impossible.

A Guarantee That Counts

H. F. L. Transformer against any mechanical or electrical defect.

Furthermore, we will exchange—free of charge—any H. F. L. Transformer that fails to give complete satisfaction, providing that the shells and terminals are not damaged.

and to make possible distinct amplification of low notes and frequencies of low amplitude with a marked absence of harmonics. The H. F. L. C-16 Audio Transformer is especially designed to operate with all power tubes as well as the standard type of tubes.

In conjunction with this core the correct size of wire and the correct balance of primary turns has been determined and is being used to insure the proper impedance

An important feature in connection with our C-16 audio is our H. F. L. C-25 Output Transformer. Its ability to handle the voltage output of the power amplifying tubes and at the same time match the impedance of the average speaker to the tubes, makes it a very desirable addition to audio amplification. It is especially recommended because of the protection it renders to the loud speaker unit without reducing the plate voltage.

The mechanical features of the H. F. L. C-16 and C-25 Transformers are: A coil designed and treated so as to exclude moisture and withstand heavy electrical surges without breaking down, complete magnetic shielding to avoid interstage coupling, with terminals brought out so as to insure short leads.

We positively guarantee each and every

HIGH FREQUENCY LABORATORIES

131B NORTH WELLS STREET

CHICAGO, ILLINOIS

enough current to operate the new high voltage power tubes. The Cloverleaf DOES. It supplies the 22-45-90-135 volt outputs for the radio frequency, detector and ordinary audio requirements of any set—then it provides 180 volts for the operation of the power tube. No buzz—no hum—no odor—no acids or liquids.

Small and Compact-Fits Inside Most Any Table-Type Set

The Cloverleaf "B" is only 3 inches wide, only 5% inches tall and only 9 inches long. Is "thin model" construction enables it to be placed inside most any radio cabinet. Or—fi it must be out in full view, its handsome crystal maroon finished metal case presents a neat appearance.

"B" ELIMINATOR-Finest Quality
Don't confuse the Cloverleaf "B" with cheap electrolytic or chemical "B" eliminators. The Cloverleaf is the standard gas-tube rectifier type which uses either the Raytheon or QRS tubes. Moreover, the Cloverleaf "B" is not to be classed with similar type eliminators which use only one choke coil in the filter circuit, and which use short-lived single-paper filter condensers. The Cloverleaf has two oversize chokes, has the very finest high voltage, heavy duty filter condensers that money can buy, and the best grade of wire wound resistances that can be made. A better "B" cannot be built—and no "B" eliminator offers you so many advantages as the Cloverleaf—and think! Its better quality and better construction acclaim it the true "lifetime" eliminator.

drive a power tube. Compare it with any other "B" eliminator at any price. Compare its performance compare its many detailed advantages such as the absence of exposed binding posts and many other important refinements. Make this test at our risk under our FREE TRIAL GUARANTEE OFFER.
Then decide why, if at all, you should pay more for a "B" eliminator than the ridiculously low price at which the Cloverleaf Lifetime "B" is sold. Mail coupon at once for full particulars of this great new "B," and for details of our FREE TRIAL GUAR-ANTEE OFFER and 2 Year Guarantee.

Made by the makers of Subantenna

the underground antenna whose remarkable performance has placed the Clowerleaf Mfg. In the envlable position of being known as makers of reliable radio apparatus the underground
