

Telemetry frees the heart patient by allowing continuous remote monitoring of his electrocardiogram. But high electrical noise levels, FCC regulations, antenna

design limitations and the need for patient comfort place severe constraints on the designer. For a look at the many problems of medical telemetry, see page 48.

# A good bench DVM is fast and accurate...

# A great bench DVM is fast, accurate, and easy to use!

**HP's 3480 is a great bench DVM.** Simple, foolproof controls and full, five-decade autoranging reduce operating effort and errors. Fast response time and low noise make millivolt adjustments easy. And high noise rejection makes the last digit fully useable.

Low injected noise will not disturb the circuit under test. And constant  $> 10^{10} \Omega$  input resistance on the lower three voltage ranges reduces loading errors.

The digital readout display is presented in standard format for easy reading, easy understanding; i.e., +143.17 mV-not backwards, or inside out. Other convenience features include a sampling-rate indicator and a manual trigger for quick one-shot samples.

Options and plug-ins are available to give you combinations of five DC ranges, five true-RMS AC ranges, and six ohms ranges. And you pay for only the capabilities you want. Prices begin at \$1500 for five ranges of fully autoranging DC.

For further information, contact your local HP field engineer, or write to Hewlett-Packard, Palo Alto, California 94304. In Europe: 1217 Meyrin-Geneva, Switzerland.

# EXPAND YOUR SPECTRUM ANALYZER CAPABILITY...

Expand it with:

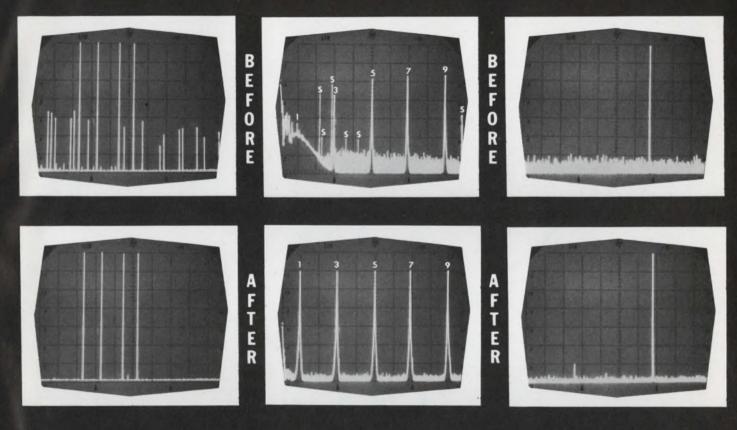

NV3 1223-15

- Increased Sensitivity . . . 6 dB
- Reduction of Internal Spurs
- Flat Response down to 200 kHz (not 10.1 MHz)
- Flat Response up to 2 GHz (not 1.8 GHz)
- 15 db Less LO Signal at the Input Port
- 20 dB More Input Before Burn-out

Now, all these things are economically possible with RELCOM's M1F doublebalanced mixer... designed for use on analyzers with a 2 to 4 GHz LO and a 2 GHz IF. Just a small investment will give your instrument expanded capability to make more critical measurements.

For a better idea of what this mixer can do for your analyzer, compare the following spectrum analyzer photographs.

A major consideration in spectrum analysis is whether the response is real, or is internally generated. Spurious frequency components generated in the first mixer of the 8551B/851Bare shown below. Where there are really only four -20 dBm input signals at 250, 350, 470, and 550 MHz, other spurious signals are present in the display. The 8551B/851B is unspecified below 10 MHz. The numbered (in MHz) responses are -50 dBm calibrating signal inputs. Notice the low frequency response roll-off. The responses labeled "S" are internally generated spurious signals. The rise at the left of the picture shows the desensitization due to the LO feed-thru to the 2 GHz IF of the spectrum analyzer. The dynamic range and sensitivity of the 8551B/851B is limited by the noise figure of the instrument. Shown below is a 600 MHz input signal at -20 dBm and a 500 MHz input signal at about -80 dBm. The settings on the analyzer are as follows: Horizontal scale 30 MHz/cm, vertical scale 10 dB/cm and IF bandwidth 10 kHz. Can you see the 500 MHz signal?

With the same input signals and spectrum analyzer settings as above, substitution of the Relcom Model M1F Double-Balanced Mixer for the first mixer (single-diode) in the spectrum analyzer eliminates the confusing intermodulation products. The vertical scale is 10 dB/cm. Substitution of the Relcom Model M1F Double-Balanced Mixer for the first analyzer mixer under the same conditions as above provides: (1) a *flat* frequency response in the 200 kHz to 10 MHz range, (2) increased gain and less noise for more dynamic range, (3) a drastic reduction in internally generated spurious signals, and (4) a reduction in the desensitization due to the LO feed-thru. Substitution of the Relcom Model M1F Double-Balanced Mixer for the first spectrum analyzer mixer reveals the presence of the low-level 500 MHz signal. Reduction of the spectrum analyzer IF gain provides the same reference amplitude for the 600 MHz input. The M1F provides about 6 dB improvement in the spectrum analyzer noise figure.

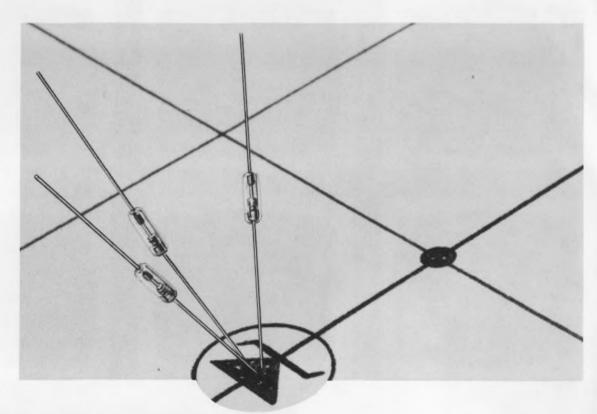

Same advantages apply in the 1.8 to 4.2 GHz range.

Buy a Model M1F now, and see its remarkable value for yourself. We'll include applications data with delivery. If you're not completely satisfied, just return the mixer within two weeks for a full refund. Act today! Delivery from stock. Price, \$275 each.

# Run it hot, run it cold, run it wet, run it dry... ZERO-TC diodes always run it constant voltage...

### Weather or not.

When all you can stand in your new circuit design is a few millivolts output voltage change over many degrees centigrade variation, a ZERO-TC diode is the ideal equalizer.

Providing voltage-time stability limits as low as 5 ppm/1,000 hours of operation, ZERO-TC's provide environment-tight, hermetic glass seals, "no-failure" RamRod\* construction and oxide-passivation for long-term, low-leakage stability and integrity of characteristics under most any external climate conditions.

We'll show you how to use them to best advantage, too.

Send for AN-437, an application note explaining all the design criteria and characteristics you'll need to know about how to lock in voltage stability and circuit equilibrium under most any ambient temperature/ humidity environments. Write: Motorola Semiconductor Products Inc., P.O. Box 20912, Phoenix, Arizona 85036.

You'll also receive a Selector Guide — for choosing the exact reference device you'll need from 141 standard ZERO-TC types and the key to hundreds of specials, too.

So you can do just the right thing about the weather.

\*Trademark Motorola Inc.

# Instrument Specialties new inlay-overlay technique

# improves contact reliability, preserves spring characteristics.

A new technique from Instrument Specialties, employing beryllium copper spring material inlaid or overlaid with precious metal alloys, solves many critical contact spring problems in a better, more economical way. You can improve surface conductivity at low voltage levels without electroplating. And, in high-current applications, you can obtain thicker contact sections without the added production cost of assembled contacts.

Using this technique, Instrument Specialties can also furnish springs with a stripe of non-solderable material, creating an effective solder barrier for fast, clean connections.

This cost-saving process can provide many combinations of precious metals with spring materials, either as individual springs or in convenient strip form.

In volume production, it could be your most economical way to combine superior contact characteristics with optimum spring performance. Or, depending upon your needs, an Instrument Specialties spring specialist may recommend one of our other proved techniques—Contips,<sup>®</sup> selective plating, riveted or welded contacts, etc.—to solve your problem. Write today for more information. There's no obligation. Address: Dept. ED-64.

# FOUR FOR FREE!

# RCA offers you four plastic power transistors without charge.

RCAType	Package	V (sus) CER V	h FE	I C A	V CE V				
$f_{T} = 0.8 \text{ MHz min}; P_{T} = 100 \text{ W max}$									
2N5034 2N5035 2N5036 2N5037	TO-3 equiv. Straight lead TO-3 equiv. Straight lead	45 45 60 60	20-80 20-80 20-80 20-80	4 4 5 5	4 4 4 4				
$f_{\rm T}$ =0.8 MHz min; $P_{\rm T}$ =36 W max									
2N5293 2N5294 2N5295 2N5296 2N5297 2N5298	TO-66 equiv. Straight lead TO-66 equiv. Straight lead TO-66 equiv. Straight lead	75 75 50 50 70 70	30-120 30-120 30-120 30-120 20-80 20-80	0.5 0.5 1 1 1.5 1.5	4 4 4 4 4 4				
$f_{T} = 0.8 \text{ MHz min}; P_{T} = 50 \text{ W max}$									
2N5490 2N5491 2N5492 2N5493 2N5494 2N5495 2N5496 2N5497	Straight lead TO-66 equiv. Straight lead TO-66 equiv. Straight lead TO-66 equiv. Straight lead TO-66 equiv.	50 50 65 65 50 50 80 80	20-100 20-100 20-100 20-100 20-100 20-100 20-100 20-100	2 2.5 2.5 3 3.5 3.5 3.5	4 4 4 4 4 4 4				

Why? Because RCA has produced millions of plastic power transistors for automotive and audio applications, production techniques are proven, reliability is established, and prices are lower than hermetic counterparts. We're confident that you will design RCA plastic power into your circuits – once you've tried them!

Review the chart and select any four. They're ideal for applications such as voltage regulators, switching regulators, linear regulators, pulse amplifiers, linear amplifiers, power switching, solenoid relays, and many others.

Next, contact your *RCA Industrial Solid-State Distributor;* he is your source for the four free samples. This offer is good in the U.S.A., and expires December 31, 1970.

# RELAYS industry standards

CLARE

1

C. P. CLARE & CO.

Chicago 60645 and worldwide.

A General Instrument company.

# Its \$395 price beats competition! Butthat's only <u>One</u> reason to buy it! Look at the

# other reasons:

Hickok's new Model 3300 31/2 digit multimeter has 26 ranges of ac-dc voltage and current, and ohms.

Ranges are 100.0 millivolts to 15.00 kilovolts,
 1.000 milliamp to 1.999 amps, 100.0 ohms to
 199.9 megohms.

Measurement conveniences—automatic zeroing and polarity, constant input Z, LSI reliability.

Operates 24 hours off internal battery pack (more than anyone else's). And the battery pack is standard.

Recharges overnight (faster than others).

• Or, operates off the ac line, even during the recharge cycle.

Goof-proof, even in less experienced hands solid state circuitry is overload protected.

Rugged case is impact-resistant and shockproof.

Really, should you pay more? And maybe get less?

Circle Reader Service Card #9 for complete information. Or call your local Hickok man for a demonstration.

HICKOK INSTRUMENTATION GROUP 10514 Dupont Ave. • Cleveland, Ohio 44108 Phone 216-541-8060

CIMRON DIVISION

## What's so surprising about a new pulse generator with a rep rate of 1 HZ to 25 MHz, double pulse to 40 MHz, and rise time of 3 nanoseconds? The price: \$395.00

You can pay twice as much for what Cimron has designed into its new series of pulse generators. Or, you can spend the same money someplace else and get far less capability and performance. Even at its surprising price, the Model 3103 will handle just about any time domain testing requirement for the design and production of semiconductors and instruments.

First class features back up the 3103's great specs. There's simultaneous bipolar output, synchronous or asynchronous gating and a backmatched output amplifier that delivers a usable pulse even in the unterminated mode.

Whether your application calls for a simple repetitive clock source, controlled gating or external triggering, you get more for your money at Cimron. Select the 3103, or one of two companion models, for your specific requirement. The Model 3101 Logic Driver (just the thing for IC testing at \$265) gives you a simultaneous complement output that eliminates the need for an external inverter. And for \$325, the 3102 supplies a variable output to a full 10 volts into a 50 ohm load.

All our economical new pulse generators contain IC logic and are engineered with Cimron's "customer concern." So if you're ready to spend money on a general purpose timing pulse source, price Cimron. We wouldn't be surprised if you bought two of ours.

Write Cimron, Dept. E-112, 1152 Morena Boulevard, San Diego, Calif.

# NEW AUTO-POLARITY FET V-O-M SPEEDS TESTING

You've probably imagined the convenience and timesaving you'd enjoy if you could just clip one of the V-O-M leads to ground or to the chassis, and have your meter always read upscale regardless of the polarity of any other terminal you touched.

No need to imagine it any more ... you can see it and try it right now at your Triplett distributor. Called the Triplett Model 602, it's probably the most convenient V-O-M ever built. Its convenience goes well beyond the auto-polarity feature, though ... to AC and DC measurements from 10 mV to 1000 V in 8 ranges at 11 megohms DC and 10 megohms AC input resistance ... AC and DC from 0.02 to 1000 mA in 4 ranges ... resistances from 0.2 ohms to 1000 megohms in 6 ranges. And with an accuracy of 3% on voltage measurements, and a rugged suspension-type meter movement, the Model 602 has what it takes to make your job easier.

This great new V-O-M is only **\$100** suggested USA user net. For more information, or for a free, no-obligation demonstration, call your local Triplett distributor or your Triplett sales representative. Triplett Corporation, Bluffton, Ohio 45817.

The World's most complete line of V-O-M's ... choose the one that's just right for you.

- 1. Auto Polarity . . . convenient and time-saving; creates memory and suppressed scale.
- 2. High sensitivity (.3V AC and DC) at constant 11 megohms input resistance.
- 3. Simplified scale with only 2 arcs for 24 AC/DC ranges.

INFORMATION RETRIEVAL NUMBER 12

Want to do something about the high cost of interconnections? ...about runaway impedance values? ...about reliability?

## Call for Mektron<sup>°</sup> jumpers by Rogers!

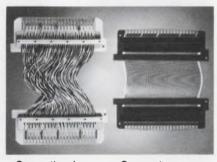

Mektron jumpers are designed for point-to-point signal transmission following practically any path — in any kind of computer or peripheral equipment. Their economies begin with proprietary manufacturing techniques like continuous etching and mass termination . . . and extend all the way to simple, foolproof installation.

Impedance? In each and every jumper, we'll guarantee to control it to within  $\pm 5^{0/6}$  of the value you specify.

Reliability? There are scores of connections in every jumper. While the connections we've made now number in the millions, no failure has ever occurred! And wiring errors just can't happen.

If this is the kind of signal or current-carrying hardware <u>YOU</u> need, let us tackle your interconnection requirements today. Call Bob Sanders at (203) 774-9605.

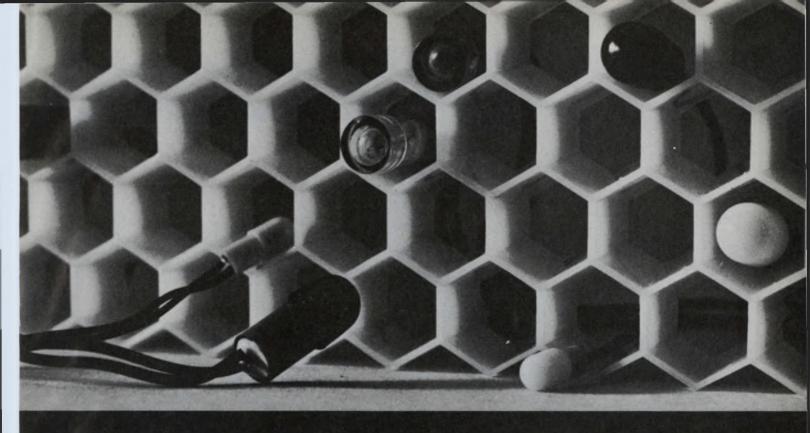

**Rogers Corporation / Rogers, Connecticut 06263** Mektron products are available from: Mektron Division, Rogers, Connecticut; Circuit Systems Division, Chandler, Arizona; Mektron N.V., Ghent, Belgium;

Conventional (wired) jumper Compact Mektron jumper

INFORMATION RETRIEVAL NUMBER 13

Just because you don't cost much doesn't mean you should wear out in a hurry. Our worker bugs are bred to overcome the problem of constant relamping which defeats the whole idea of using low cost units in the first place.

It's a matter of upbringing. We pay attention to detail in making the basic lamp.

Lamp assembly makes a difference, too. Such as the lamp and lead wires potted in place with high temperature polycarbonate for positive strain relief and resistance to temperature extremes. Or the flanged butyrate shell in clear, amber, red, green or white that assures simplified mounting with speed clips.

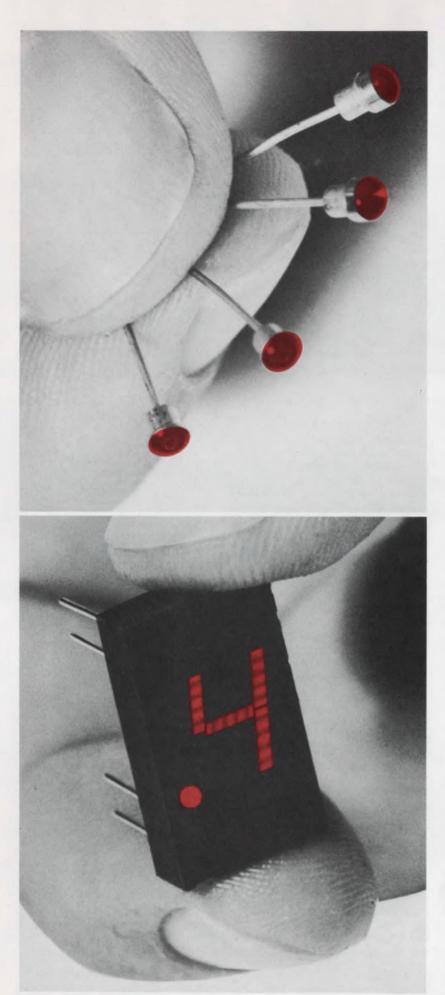

These Chicago Miniature lamps are available in the Migi-Lite (T-1) or Peanut-Lite (T-1¾) sizes for use in amplifiers, mobile equipment, computers, display panels, industrial controls... anywhere economy and extended life are important. Order the macrodome or cylindrical, neon or incandescent worker bugs. They're equally diligent.

The worker bugs are only a sample of the many species listed in our CML-1 Lited Devices Catalog. For off-the-shelf delivery, contact your local authorized Chicago Miniature Electronic Distributor.

> CHICAGO MINIATURE LAMP WORKS 4433 N. Ravenswood Ave., Chicago, Illinois 60640 (312) 784-1020 a GENERAL INSTRUMENT company

THE LIGHTING BUGS

# Our worker bugs put in longer hours.

# SOLID-LITE

### SOLID STATE LAMPS AND NUMERIC INDICATORS

New Solid-Lite semiconductor display devices use gallium phosphide, the most efficient of all visible-light electroluminescent materials. You get bright light at lower current.

### **SOLID-LITE Solid State Lamps**

Provide an area source of light-not just a pinpoint. These IC-compatible light-emitting diodes produce a lumi-

nous intensity of 2 millicandelas at 15 mA and 2.1 volts with easy wide-angle viewing. They offer:

- Low power consumption
- Excellent shock and vibration resistance
- High reliability-long life
- Low cost

### SOLID-LITE Solid State

**Numeric Indicators** 

Actual Size

Low-cost, seven-segment numeric indicators in standard 14-pin dual inline packages are compatible with TTL and DTL IC's. Large, bright numerals are pleasing to the eye. They offer:

- Low voltage operation at less than 1/4 watt total power
- Large character size-.33" x .21"
- Single-plane wide-angle viewing
- High reliability-long life
- Excellent shock and vibration resistance

Second generation IC "Multiplier Plus"

 $(\cos\theta)^2 \sum_{k=1}^n K^m$ 

ylna

# Plus What?...Plus built-in voltage regulator and current converter

Motorola's new MC1594/1494 introduces the second generation of monolithic IC four-quadrant multipliers based on the variable transconductance principle. The "multiplier plus" is easier to use than the familiar industry standard MC1595/ 1495, and it offers a new high level of performance.

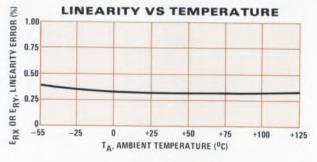

### "Plus" features for cost reduction

The built-in current and voltage regulator eliminates the effects of power supply fluctuation and reduces the number of external components required. It regulates all current sources on the monolithic chip, effectively immunizing the multiplier to supply voltage fluctuations. It also provides two (+4.3 V) regulated voltages to bias the offset adjust potentiometers. Interaction among the pots during adjustment is eliminated. Changes in offset voltage caused by supply irregularities are eliminated. Four external resistors are eliminated.

At the other end of the multiplier the differential current converter provides a single-ended output current referenced to ground.

### "Plus" features for Improved Performance

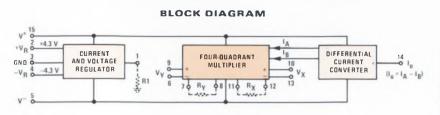

Linearity of 0.5% max (X or Y) for the MC1594 sets a new standard of excellence, and the MC1494 offers a fine 1.0% max error (X or Y). The "multiplier plus" is easier for the designer to use because it handles input and output voltages of  $\pm 10$  V with  $\pm 15$  V supplies. And power supply sensitivity is also significantly improved.

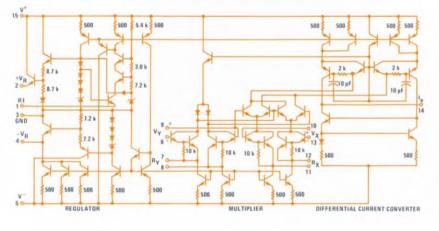

Please turn page for circuit information

# Don't take any chip from anybody... for more than a "spec" of difference specify Aerovox

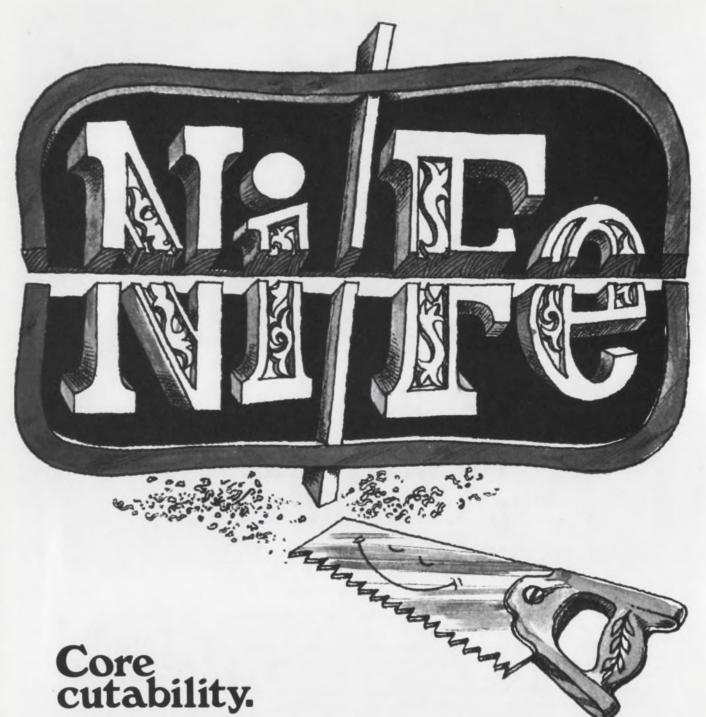

If other manufacturers could supply chips of "CERALAM" construction, then and only then would you be getting the ultimate in chip capacitors. The fact remains however, that only AERO-VOX manufactures chip capacitors using the superior "CERALAM"® construction . . . rugged chips combining ceramic dielectric layers and noble metal electrodes, all fired into a dense, monolithic block.

Along with state-of-the-art chips to meet microminiature size configurations, Aerovox offers you chips in any one of the three standard ceramic formulations including "NPO", the most stable capacitor dielectric available. TC materials are also available on order, as are chip capacitors with leads and thin epoxy coating for protection during handling. Take advantage of our capability to put more capacity into any size package.

If you're tired of waiting for your "chips" to come in and are more interested in deliveries and not promises, and you want the best chip capacitor available today and tomorrow, call Aerovox.

A EROVOX CORPORATION, NEW BEDFORD, MASSACHUSETTS 02741 • TEL. 617-994-9661 PLANTS IN: NEW BEDFORD, MA., OLEAN & FRANKLINVILLE, N.Y., MYRTLE BEACH, S.C. AND HAMILTON, ONT., CANADA

## Surprise! Only Arnold offers nickel/iron cut cores.

Most people are pleasantly surprised to discover that we can produce nickel-iron *cut* cores. They are, in fact, an Arnold exclusive. Including C-cores, E-cores, cut toroids, and special shapes.

So, if you're looking for a cut core for a lowloss, high-frequency transformer or for a similar specialized application, come to Arnold first. We've got cut cores (made from Deltamax, 4-79 Mo-Permalloy, Square Permalloy, Supermalloy, and Supermendur) with the high inductance, low loss, *and* economy you want.

Just one of the surprising things in magnetics that come from Arnold. Let's talk things over. Information on cut cores is yours when you call or write.

The Arnold Engineering Co., Dept. A1, Marengo, Illinois 60152 • Member Company of Allegheny Ludlum Industries • Branch Offices and Representatives in Principal Cities

# **Guess the** price of HP's new counter

## **Clues:**

it averages time intervals to 10 picoseconds it has a built-in 0.05% integrating DVM it's dc to 50 MHz, CW or burst its counter and DVM are easily programmable

Surprise: \$1550. That modest amount buys a Hewlett-Packard timer/counter that does things universal counters never did before. For example, it averages time intervals as short as 0.15 nanoseconds. So you can resolve to 10 picoseconds on repetitive signals.

50,443561

That modest sum also buys a counter with a built-in integrating digital voltmeter. So it's the only counter that can measure internal trigger level settings or other inputs with DVM precision. Now you can measure 10 to 90% rise times, half power points and other voltage-dependent time intervals. That means unprecedented simplicity, for example, in propagation

delay measurements. The counter also it provides three voltage ranges, 60 dB noise rejection and 0.05% accuracy.

Even without these exclusive features, the 5326's are real bargains. They count to 50 MHz direct with seven-digit resolution (eight digits optional), measure period and multiple period average and scale input frequencies by any power of 10 up to 108. They measure ratio and they totalize.

With programming and BCD output options, the 5326's fit easily into systems applications. Counter and DVM are DTL programmable through a common connector.

You can get all of these benefits in the features four integration times. As a DVM, 5326B for \$1550, or buy the same counter, less the DVM, in the 5326A for \$1195. Any way you look at the 5326 A or B-either is a great counter value. Your local field engineer has all the facts about HP's new IC counter line. Give him a call or write to Hewlett-Packard, Palo Alto, California 94304; Europe: 1217 Meyrin-Geneva, Switzerland.

conclusively here this month. After presentation of a paper and discussion by conferees, the following points were raised:

News Scope

NOVEMBER 22, 1970

Manufacturers often can't agree on standards.

• Standards are no good unless they can be monitored, and this is the role of the Government.

• If the Government steps in with "czar-like powers" to certify and enforce standards, both industry and users could be hurt.

• If users of electronic equipment—such as the American Hospitals Association—set up standards, people who know little about engineering would be specifying operational requirements.

• If organizations such as the Association for the Advancement of Medical Instrumentation, American National Standards Institute, the National Electrical Manufacturers Association and the EIA set standards, the members who financially support such organizations would be in the position of regulating themselves.

Meeting in the Washington Hilton Hotel, the conferees heard Dr. John Collins, president of the Association for the Advancement of Medical Instrumentation, present a paper strongly advocating a U. S. Government-funded standards group comprised of representatives from manufacturers, the medical profession, government and engineering fields.

But, Collins told ELECTRONIC DESIGN later, he would "like to see someone who is not the government set up standards." He said they should be formulated by "people

Medical electronics, such as that

who know how to make and operate the devices."

The economic outlook for healthcare electronics is good. Dr. Theodore Cooper, director of the National Heart and Lung Institute at the National Institutes of Health, said there were about 5000 types of medical devices on the market, produced by some 1300 manufacturers in the U. S.

He quoted Dept. of Commerce figures—"which may be underestimates," he said—showing that the total value of medical and dental instruments sold this year was \$2-billion and projecting a rise to \$2.8-billion by 1975.

# Minicomputer joins heart disease fight

A low-cost minicomputer may soon relieve doctors of the tedious job of analyzing electrocardiograms. Instead of printing out the results of an EKG alongside the patient, an EKG cart sends a 3-channel, multiplexed, composite analog FM signal over common voice grade telephone lines to a central computer facility. There, a low-priced 35-pound, Varian 620/i minicomputer demodulates the signal, yielding three signals.

These are converted from analog to a digital representation. They are then formated on magnetic tape and stored for further analysis.

The tape is then taken to the central processor—an IBM 360/65 —which examines the heart cycle intervals in terms of amplitude in millivolts and durations in seconds. The results are sent back to the user via teletypewriter or mail. The system was developed by the Boeing Co.'s Computer Services Div., Philadelphia, Pa.

# New weather satellite to offer better coverage

A satellite intended to provide more weather coverage than ever before is slated to be launched next month by NASA from the Western Test Range, Lomboc, Calif. The new spacecraft is designated NOAA-1 after the recently formed National Oceanic and Atmospheric Administration, which will operate it.

The satellite's sensing system contains advanced vidicon cameras and scanning radiometers that gather data around the clock visually by day and with infrared techniques at night. The information is being transmitted automatically with systems developed by the spacecraft's manufacturer, RCA Defense Electronics Products, Moorestown, N. J.

# IBM's minicomputer worries competitors

The announcement of IBM's new sensor-based minicomputer—the System/7—has stirred ripples of uneasiness in the remainder of the minicomputer industry. The day after the announcement the stocks of leading competitors dropped noticeably.

The shudders among competitors come from System/7's minimum price—\$352 per month rental of \$16,060 to buy. This is low enough to cause some buyers to

# News Scope<sub>continued</sub>

pass up the competition, even if the latter offers slightly lower prices.

System/7, a ready-to-operate system for gathering and processing analog or digital data, is aimed at the largest and most lucrative segment of the minicomputer market—the control of processes and manufacturing. Most mini manufacturers do not sell to this market directly but deal through OEMs. IBM is now a direct competitor of both the makers and marketers of minicomputers.

The front end of the IBM system contains input/output modules to condition the incoming information to match the needs of the central processing unit. In addition to the I/O and CPU, System/7 contains an operator's station to allow communication with the system. The CPU features a 400-ns cycle time, 16-bit words and a memory of 2000 words, expandable to 16,000. The CPU and memory are constructed of monolithic semiconductors.

Optional telecommunication controls are available to interface the S/7 with the S/360 or 370 or other IBM machines. System/7 cannot be used as a stand-alone computer.

### Panel criticizes AT&T on data communications

Dissatisfaction with American Telephone and Telegraph's handling of the needs of digital communications users was aired at a recent conference held in New York City.

Panelists at the conference consisted of AT&T competitors in data communications hardware and possible future competitors as data communications common carriers.

The major charges against the Bell System were:

• transmission via telephone lines is slow and error rate high with respect to cost.

• with data communications growing at 50 percent annually, the Bell System is not expanding fast enough to meet user needs.

telephone lines—designed for

voice transmission—are basically incompatible with optimum digital transmission.

• the Bell System has purposely used the courts to slow down the construction of a competing data transmission system.

The conference was sponsored by *Computer Decisions* magazine.

# Univac posts new entry in large-computer derby

With the largest plated-wire memory ever installed in a computer, Univac hopes to compete with IBM's System/370 and RCA's Models 2, 3, 6 and 7. The new Univac machine, which is scheduled to reach the market in November, 1971, is the Model 1110.

It has a capacity of 260,000 36bit words with a 320-nsec read time and 520-nsec write time. It contains a disc subsystem—a departure from Univac's usual practice of using drums only.

The basic 1110 system is said to be capable of performing three million calculations a second, providing 300 to 500% more computer power than the Univac 1108, previously the company's most powerful computer.

Without peripherals the Model 1110 will rent for about \$44,200 a month, with a purchase price of \$2-million.

Univac's entry into this price range appears to confirm RCA's belief that this is currently the most lucrative segment of the computer market.

# Infrared test system measures car exhaust

A small infrared test system to measure the emissions in automotive engine exhaust has been developed by Chrysler Corp.'s Space Operations in Huntsville, Ala.

To be used in manufacturing plants, automobile dealerships and by regulatory agencies, the system is "the first diagnotic tool that successfully measures all types of exhaust emissions together at the same time," the company says. Other devices sample gas emission components one at a time. The usual components of automotive exhaust are carbon monoxide, carbon dioxide and hydrocarbons.

A typical test starts with an exhaust sample drawn from the engine to the analyzer test cell. As the exhaust gas passes through the cell, energy from the infrared beam is absorbed by each emission component. Electrical detectors at the opposite end of the cell convert the energy into electrical signals, which are then scribed on a graph or chart.

About one-third the size of comparable nondispersive infrared test equipment, the vehicle exhaust analyzer is four feet long and three feet wide. The size reduction, the company says, is possible because the infrared dispersive energy beams use only one cell to sample exhaust, whereas other such devices need five.

Chrysler hopes to begin manufacturing the unit next month.

# TI sees good prospects for standard hybrids

"After approximately three years of selling custom hybrids and six years of in-house use, Texas Instruments has decided that there is also a large market for standard components."

That's how Lloyd Norman, manager of hybrid circuits for TI in Dallas explains the company's recently announced entry into the standard hybrid circuit market.

According to Norman, there is a large market for linear devices that require higher current or voltage breakdown than monolithics can supply. Hybrids can meet these voltage and current requirements at lower cost and in less space than a combination of monolithics and discrete components, he says.

Another large market, Norman predicts, will be in computer interface circuits, especially in meeting high-speed requirements. He expects much of his initial business to be with the military.

The first products released by TI include a positive voltage regulator that provides 1 A over an output range from 2 to 37.5 V.

"I don't believe anyone has a similar device with this packaging density," Norman says.

Other standard hybrids released include three different quad drivers and a power Darlington.

THEY'RE MOLEX EDGE CONNECTORS. "Straight-on" or "right-angle" types for printed circuit boards. Terminals crimped to wires automatically. Reliable? And how! Connector terminals are bifurcated. Provide a really solid contact. Yet you can slip the connector on and off time after time without any damage to the printed circuits. And it's not a preload unit. Carries only contacts required. From six to twenty-four. Comes in white or six other colors. Terminals available in tin-plated brass with gold plating or selective gold plating. A good example of how Molex helps create high-speed low-cost devices that simplify circuitry. If you want to save assembly time, steps and money, take a close look at these Molex edge connectors. For free samples write: Molex Incorporated, Downers Grove, Illinois 60515. Or you can make connections by

calling (312) 969-4550.

# The mini-est computer is a house of cards

### Stacked printed-circuit machine is smaller than a desk phone without sacrifice in performance

### Milton J. Lowenstein Computer Editor

By stacking printed-circuit cards —and with no other wiring—designers on the West Coast have come up with the smallest minicomputer yet built.

No bigger than the base of an ordinary desk telephone, the minimini does not sacrifice performance either. An 18-bit machine, it has a memory of 8192 words and a repertoire of 43 instructions. It can multiply in 33  $\mu$ s and divide in 43  $\mu$ s.

The tiny computer was designed by Bunker-Ramo Corp., Electronic Systems Div., Westlake, Calif., for military use—in guidance systems for missiles and torpedoes, among other applications. But plans are to offer it eventually on the civilian market, where it might be used in air and ground traffic control and for process control in industrial, chemical and machine plants, the company says. The new machine lends itself to distributed computing—the handling of dataprocessing tasks at the site of an operation or activity.

Pilot production for military applications is due to start in 1971, and the current price of the military version—designated BR-1018 —is \$30,000. But Ralph S. LaMontagne, vice president of Bunker-Ramo, says:

"The packaging technique used can make possible sharp reductions in cost through mass production. The price can be expected to fall as low as \$5000 when full-scale production is reached."

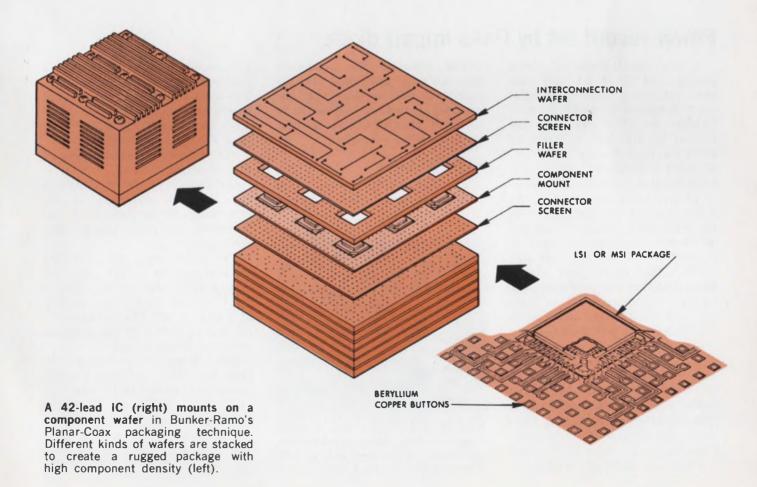

Three basic types of two-sided wafers are used to assemble the

computer components, central processing unit and input/output unit. The wafers—component, interconnection and connector-screen types —are stacked and then pressed together firmly to make electrical connections.

LSI or MSI semiconductors are mounted on the component wafers, and their leads are brought out to small beryllium-copper buttons (see diagram). The interconnection wafers carry the conductors up or down the stack and provide spacing. The connector-screen wafers then provide the wiring that runs across the stack.

A typical subassembly for one component wafer is a fraction of an inch thick; a stack of several subassemblies occupies very little volume. Wafers are typically 2 by 2 inches and can be used to package up to 200 MSI semiconductor devices per cubic inch.

All heat-generating components

NEWS

### (**mini-est**, *continued*)

are in intimate contact with the beryllium-copper, which is an excellent thermal conductor. Hot spots are thus eliminated, and temperature differentials throughout the assemblies do not exceed a few degrees, according to LaMontagne.

The use of the stacked connections also provides good electrical shielding, he says, thus minimizing the effects of cross talk, which can be a serious problem in such a compact structure. The elimination of most wiring, with its attendent problems of soldering and connectors, gives the system very high reliability, the Bunker-Ramo official reports.

The final assembly is made by stacking all of the cards and then clamping them together with screws. Once the screws are removed, any wafer can be replaced or repaired.

The central processing unit (CPU) and the input/output unit

High density packaging compresses memory, CPU and I/O units into this rugged subminiature computer.

(I/O) are essentially identical in construction. They each make use of nine LSI chips on the component wafers. The CPU has six component wafers containing a total of 10,000 gates.

The computer uses a binary, single-address, stored-program, parallel organization. It occupies only 67 cubic inches including memory. The I/O section has analog and digital capabilities. The system clock frequency is 1 MHz.

Maximum memory size supplied in the unit is 8192 words although smaller memories down to 2048 words are available at lower cost. The memory is expandable in steps to 131,072 words.

Staked, or planar-coax, assembly has made the most significant size reduction in the BR-1018 computer, but it is not limited only to that unit. Any electronic assembly can be built using the technique. In particular, Bunker-Ramo has fabricated a programmable counter and a pseudo random code generator. Both occupy less than one cubic inch and weigh less than 2' ounces.

Size is not the only advantage of the method, however. In production, fabrication cost reduction of over five times are expected in comparison to more conventional techniques.

The first models of the BR-1018 make use of a plated-wire memory. Semiconductor memories will be used when they become available, LaMontagne says.

### Power record set by GaAs Impatt diode

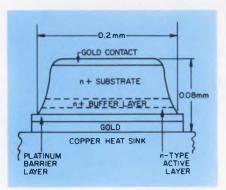

A new Impatt-diode cw power record—2.94 W at 6.1 GHz—has been set by a gallium arsenide diode developed by Bell Telephone Laboratories. The work was described by Dr. John C. Irvin of Bell's center in Murray Hill, N. J., at the International Electron Devices Meeting in Washington, D. C.

As Dr. Irvin pointed out, the significance of the achievement is not in the exact power level that was obtained—other researchers<sup>1</sup> reported 2.1 W at 9.2 GHz last July —but rather in the fact that a GaAs diode has now produced more cw power than even silicon units mounted on diamond heat sinks. The GaAs diode was mounted on a copper stud.

With this achievement, the GaAs Impatt diode now leads the Si type in three major areas: power, efficiency and low-noise performance. Unfortunately, as Irvin was careful to mention, it is more costly than the others. So, while it is not obvious that GaAs will be the preferred material for solid-state microwave generation in the future, it is now clear that the material cannot be automatically ruled out when high-power applications are being considered.

### Light doping is used

As described by Dr. Irvin, the new diode is a Schottky-barrier

**2.94 W of cw power** was obtained from this GaAs Schottky-barrier Impatt diode. It operated with an efficiency of 13.8% at 6.1 GHz.

type in which platinum is used as the barrier metal (see illustration). The GaAs is a three-layer epitaxial slice consisting of an n-type active layer and an  $n^+$ -type buffer layer on a Te-doped substrate.

"The relatively modest doping of the substrate  $[8 \times 10^{17} \text{ cm}^{-3}]$  is thought to permit higher crystalline and chemical perfection in the structure with a consequent improvement in performance," Dr. Irvin said.

The buffer layer has a doping concentration of  $5 \times 10^{17}$  cm<sup>-3</sup> and is 8  $\mu$  thick. The active layer is 7  $\mu$  thick and has a doping density of 6  $\times$  10<sup>15</sup> cm<sup>-3</sup>. The metallization consists of 4000 Å of platinum followed by 7000Å of gold.

The efficiency of the 2.94-W diode was 13.8%, although a lower-power unit reached 14.3%.

# Displays to help CATV stand on its own feet

2 new systems roll 'local origination' text across viewers' screens at a smooth one line per second

### Elizabeth de Atley West Coast Editor

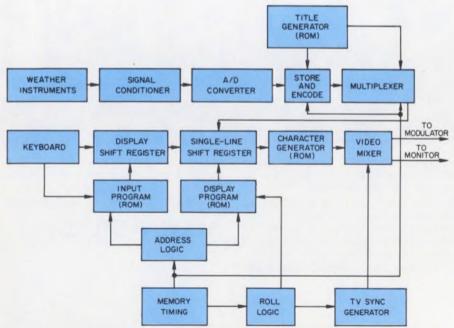

Two competing electronic systems that provide rapidly rolling displays of key-board entered text have been designed to help cable TV stations meet the Federal Communications Commission requirement for "local origination" programs.

The requirement goes into effect in April, 1971, and, according to a recent Rand Corp. study, will affect some 400 stations immediately. And the prospects are that cable TV will grow dramatically in the 1970s (see "Cable TV: Slumbering Giant—A Multibillion Industry?" ED 8, April 12, 1970, pp. 62-72).

But what is "local origination"? The FCC order doesn't spell it out, and right now CATV owners are interpreting it loosely. Some show old movies. Others pan the TV camera back and forth across the faces of a barometer, a thermometer and an electric clock. Still

**Daconics display system** allows the station editor to change copy for any of the channels without interrupting the program on the air (shown on the monitor at right). This permits almost instantaneous updating of news, sports scores, weather, or other information. The system includes a Hewlett-Packard computer (shown in the background).

This Data Technology system is set up for a weather display. The system displays two fixed lines of alphanumeric weather information plus six rolling lines of a 32-line stored text. It uses no computer.

others subscribe to a ticker-tape display from a national news service that taps out the news at teletype rate a character at a time. As one CATV program director puts it, "Such displays are tiresome to watch and won't sell CATV to communities that don't absolutely have to have it to receive the major networks."

Both of the new systems roll the text across the screen smoothly at about one line per second. They were designed by Data Technology, Inc., of Palo Alto, Calif., and Daconics, Inc., of nearby Sunnyvale.

### Simplicity vs elaborateness

The simpler of the two systems is Data Technology's. It stores 32 lines of keyboard-entered text and displays it in rolling format six lines at a time—about six words to the line. It also includes a twoline stationary alphanumeric display of weather information that is updated every few seconds. The big advantage of the system is its price—\$3500, compared with over \$4000 for a typical weather display system with a camera that pans weather instruments and a clock.

The Daconics system, which was designed for the San Jose CATV Co., is much more elaborate-and also much more expensive. Under the control of a Hewlett-Packard computer, it displays 15 lines of text at a time-approximately five words a line-in rolling format. The operator types in text of any desired length, and it is stored on a drum. Then he divides the text into pages of 14 lines each and assigns a separate label to each set of three pages. A special format that the operator can call up on his monitor gives him step-by-step instructions for assigning labels.

A single-channel system, including keyboard, HP computer, drum, video generator, special hardware and operating software, leases for \$1350 a month. Additional channels, with different text displayed on each channel, add \$110 each to

### NEWS

### (CATV, continued)

### the leasing price.

Both Data Technology and Daconics visualize other applications for their systems besides CATV stations. Data Technology, for example, expects to interest hotels, airports and possibly supermarkets, as a means of displaying specialties, paging customers, etc. Daconics believes its system will be useful in hospitals for recording and displaying patient information.

### How the systems work

The display circuitry for both the Data Technology system (see diagram) and the Daconics (see photo) is similar in concept. It includes two sets of recirculating shift registers and a read-only memory (ROM) character generator. One set of shift registers stores the entire display, while the other stores a single line, feeding it a character at a time into the character generator for display. In both systems, information from the keyboard is first stored in the display shift register. But in the Daconics system, each page of information is transferred by computer to a drum when the operator is satisfied that it is correct. Then when the operator sets the display into the rolling mode, the computer calls up the appropriate pages one after another into the recirculating shift registers for display.

The Data Technology system has no computer or drum, and operates only in the rolling mode. The information from the keyboard is stored in the larger of the two shift registers (the "text memory" in the diagram). The weather data is obtained from a roof-mounted instrument package. A signal conditioner converts the instrument outputs (temperature, wind velocity, etc.) into proportional analog voltages, which are then converted to digital signals by the A/D converter. In the "store and encode" modes, each signal is assigned an address in the display and converted to ASCII code. The title generator is a microprogrammed ROM that contains addressing and encoding for the weather titles— "temp," "wind velocity," etc.—and two instructions. One instruction is "read title directly"; the other is "read instrument measurement."

When the multiplexer receives a pulse from the memory timing circuit (a quartz crystal and frequency divider), it obtains the next instruction from the title generator and transfers either a title or an instrument reading into the line memory for display. The "input program" is a microprogramed ROM that allows information from the keyboard to enter the display shift register at the proper bit time. The display program is a microprogramed ROM that times the display to the normal scanning rate for TV.

### Most sensitive strain gauge developed

A linear-response, field-effect strain gauge, said to be the most sensitive yet developed, offers a gauge factor of 5800 and a signalto-noise ratio of greater than 5 to 1, And it has applications besides its role as a strain gauge, says its developer, Sandia Laboratories in Albuquerque, N. M.

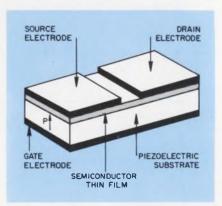

It can be used, Sandia says, as the active element of an accelerometer or seismometer, as well as a receiver transducer for low-intensity acoustic waves.

According to Dr. John C. Crawford, supervisor of Sandia's Solid-State Electronics Research Div., the device is made by evaporating a thin-film semiconductor on a substrate of polished lead zirconatelead titanate ceramic.

Since the ceramic material is piezoelectric, applied stress causes charges to concentrate at its two surfaces. Through field-effect coupling, these charges alter the charge density of the semiconductor —vapor-deposited p-type tellurium —thereby increasing or decreasing its conductivity. A gate electrode is provided on the back surface of the ceramic substrate by using gold electrodes to form ohmic contacts to the tellurium film.

The current flowing between the two contacts on the tellurium film thus is changed by field-effect coupling to the ceramic substrate. This change is directly proportional to the deformation in the ceramic.

With the exception of the relatively expensive tunnel diode transducer, the new device is the most sensitive of its type available, Sandia says. The gauge factor, or gain, of 5800—achieved in laboratory experiments—means, for example, that a mechanical deforma-

New FET ceramic strain gauge is sensitive and has a good S/N.

tion of 0.01% can produce a change in current of 58%. Conventional semiconductor gauges are generally limited to a gauge factor of 100 to 200, and conventional metal foil gauges to a factor of 1 to 2. The device, therefore, provides an unusually high signal-to-noise ratio. Even at strain levels as low as 1.4 by  $10^{-7}$  (indicating a change in length due to deformation of 0.000014%, the signal-to-noise ratio is greater than 5:1 when monitored on an ammeter. For greater accuracy a resistance bridge circuit might be used, Crawford says, "but only when operating in the lower strain areas, such as 10-7."

The semiconductor film exhibits an electronic instability—a carrier trapping at the semiconductorpiezoelectric interface—that limits its present use to transient measurements with frequencies above one cycle per second.

Though the device is sensitive to temperature, this disadvantage can be countered by calibrating it electrically in place after it is bonded. The device is reported usable as a transducer up to at least  $115^{\circ}C$  (239°F).

# **Controversy rages over R&D cutbacks: Do we need more PhD engineers?**

# Reader challenges views of 'so-called educators'

Sir:

The tone of your editorial in the August 16 issue (ED 17) and the article by your news editor, John Kessler, in the same issue, puzzles me in view of the many highly trained engineers and scientists who are currently pounding the pavement looking for work. The job market for these people is lousy, and yet you state the opinion that our most important problem is that we do not produce enough highly trained scientists and engineers, including PhDs.

The samples of opinions expressed in Kessler's article come for the most part from so-called educators whose only concern seems to be to do their own things with slave labor in the form of graduate students and then throwing them into the job market without any concern for their future.

Once a graduate student receives his MS or PhD he still has, on the average, 35 or 40 years of his life to devote to his profession and hopefully to contribute to our progress. Yet, in accord with these socalled educators, the editorial emphasizes that for our progress we need young scientists and engineers who are flexible and able to accept change. This is ridiculous and unfair.

Has anyone established scientifically that only inexperienced youth in the 20-30 age category could contribute to our technological progress? The cult of youth, which seem to be practiced in our universities and in certain industries, is in any case self-defeating. Why would any intelligent young man choose to enter a profession that requires years of training but promises only a few years of tenure afterward?

I suggest that your editorial is not serving the profession and the development of science and technology. I hope you will rethink the issues involved with due emphasis on human values.

B. W. Lee, PhD

Vice-President Noller Control Systems Richmond, Calif.

### **Educators** reply

Sir:

The gist of Mr. Lee's rather emotional complaint is that the "socalled educators" insist on training graduates in science and engineering without considering the latters' predicament in the present job market nor their personal future.

A change in professional careers is usually not a loss but an enrichment of the individual or society. It is easy to show that we need a great deal of cross-fertilization that is, a pool of manpower with technological training whose members can address themselves intelligently to modern problems, whether purely technological or not.

The present depression in job markets can be traced to a particular fashion in the political and social climate of this country. Since fashion changes are greatly accelerated by modern means of communication, we may assume that turns, from and to technology. from and to environmental protection, etc., will continue to go through cycles. If we were to follow these cycles, we would surely always lag behind the moment of need because the time required between when young people become interested in problems and choose a career until they are proficient in their professions is today five to ten years. Thus, at the crest of one fashion, we would regularly train people for the next slumpas we have just done.

Barring the unforeseen . . . the American society will continue to be a technocratic one and will stand and fall by virtue of its technological prowess in competition with the other technological top nations . . . . In view of this, technological manpower, whether or not to be used exactly in the area of the original competence, is going to be vital for many years to come, and we have to plan accordingly.

Frederick R. Eirich Dean of Research Polytechnic Institute Brooklyn, N. Y.

Sir:

Apparently this year is open season on educators. Perhaps we are open to Dr. Lee's criticism for having failed to foresee five or six years ago, when our present crop of students was admitted to graduate school, that cutbacks in federal R&D expenditures would drastically alter the employment picture for scientists and engineers by the time they had earned their degrees. Dr. Lee, perhaps, does not recall that at that time there were 20 job offers for every new PhD.

I can find nothing in your editorial that suggests only young men contribute to technological progress. It is a matter of record. however, that many of the most original and innovative pieces of new technology have resulted from the work of relatively young men. One need cite only the laser, the Gunn oscillator, the tunnel diode, and hundreds of other inventions. all of which came from men under 40. On the other hand, many of these inventions would not have found their way to commercial success if it had not been for the work of more experienced older engineers who knew how to transform a laboratory device into reality.

I believe our technological innovativeness comes from the interaction of men of varying ages, experience, and background, but that the continuous injection of young men into the system is essential to its over-all health.

Harvey Brooks

Dean of Engineering and Applied Physics Harvard University Boston, Mass.

# **TRY TO** MATCH THIS for size

and reliability

# you can't!

For their size, Type BB resistors pack a tremendous power dissipating ability. Rated 1/8 watt at 70°C in a 0.0004375 cu, in. volume.

And miniaturization has not reduced reliability. Tests prove it. They satisfy the highest level-the S level-of the latest MIL-R-39008 Established Reliability Specifications in all resistance values.

The key is hot molding-the Allen-Bradley way. A-B developed and built the machines. Only A-B uses them. They're fully automatic. Built-in precision control. A high degree of uniformity. Predictable performance from resistor to resistor-year after year.

For immediate delivery at factory prices call your authorized A-B industrial electronics distributor. Or write Marketing Dept., Electronics Division, Allen-Bradley Co., 1201 South Second St., Milwaukee, Wis. 53204. Export Office: 1293 Broad St., Bloomfield, N.J., U.S.A. 07003. In Canada: Allen-Bradley Canada Limited.

ALLEN-BRADLEY QUALITY ELECTRONIC COMPONENTS

# **Circuits and synergy**

To fill a variety of communications needs, Bell Labs and Western Electric have worked together to develop a special kind of integrated circuit. Based on two compatible and complementary technologies—silicon and tantalum —this "hybrid integrated circuit" is hundreds of times smaller and more reliable than circuits using discrete solid-state components.

The silicon portions of the circuit contain active components such as diodes and transistors; some low-precision resistors and the necessary interconnections are also formed on the tiny silicon chips. Hundreds of these chips are fabricated on one silicon slice. Tiny gold conductors—"beam leads"—are formed on each chip at the same time. Then the chips are separated and the beam leads bonded to tantalum thin-film circuits. Typically no more than one or two square inches, tantalum circuits contain precision resistors, capacitors, and interconnections etched into the metal film, previously deposited on glass or ceramic substrates.

Hybrid integrated circuits open new opportunities for circuit designers in many areas of communications systems engineering telephone equipment, transmission, switching.

In this hybrid integration technology, design and manufacturing are intimately related. Designer and maker must work closely together. The Bell System fosters this concerted action — this synergy — with Bell Labs, for research and development, and Western Electric for manufacturing and supply. At several plants Bell Labs and Western Electric engineers work together in Process Capability Laboratories, speeding new designs into manufacture.

Here are a few examples of their teamwork.

The tantalum portion of a hybrid circuit starts as a 2000-Angstrom layer of tantalum, deposited on glass or ceramic. This process, invented at Bell Labs, was first carried out in a vacuum under bell jars. Western Electric designed and built "open ended" machines. Now, deposition takes place as the glass or ceramic chips move through the machine on a chain.

For highest precision, newly formed tantalum thin-film resistors require adjustment. This is done by removing, electrochemically, just the right amount of tantalum to raise the resistance to the required value. Bell Labs devised the process; Western Electric computerized and automated it.

Silicon circuits are sensitive to impurities such as sodium ions in the air. So, they used to be sealed into expensive evacuated cans. But now, a gold and silicon-nitride shield gives the required protection at low cost. Originated by Bell Labs, it was put to work by Western Electric.

Making connections to integrated circuits once called for individual attachment of fine gold wires. Then Bell Labs came up with "beam leads": gold conductors plated into place on silicon circuits. In addition to being conductors, the leads also give mechanical support. Western Electric developed methods for bonding them to circuits.

Beam leads are fabricated as part of the silicon circuit but their free ends must be attached to other circuitry. Bell Labs and Western Electric have developed thermocompression bonding techniques for this job. With the proper combination of time, temperature, and pressure all leads on the silicon circuit are bonded simultaneously to a thinfilm circuit.

In the future, we hope to get more circuitry into less space and to find new functions for the technology. The circuit shown here, for instance, is one of some 200 logic "building blocks" for use in private branch exchanges, data sets, and other customer telephone equipment. It could not have been built with "discrete-component" technology. And we will not stop with silicon and tantalum. For other jobs, other materials may be better. Bell Labs and Western Electric are working together to find and apply them.

# NEW MICRO-MINIATURE CERAMIC TRIMMER CAPACITOR

now available for 45¢ in quantities of 1,000

We are pleased to introduce the 9300 series. You will find the unit is truly micro-miniature (.315 high with a .276 diameter and .200 pin spacing). Its rotary assembly is designed with special ceramic materials which provide longer life and complete environmental stability. Capacitance values are available up to 70 pf. For immediate delivery, please phone (201) 334-2676.

ELECTRONIC ACCURACY THROUGH MECHANICAL PRECISION

# Technology Abroad

The first of six medium-range airtraffic-control radar antennas for the West German Government has been installed at Bremen by AEG-Telefunken, Ulm. The 4.2-ton antenna is 47.5 by 30 feet and has an antenna gain of 38 dB at 23 cm. Transmitting power will be about 4 MW. The six-station system, designed to cope with growing air traffic over European routes, can acquire targets with an echo area of 15 square meters at 60,000 feet altitude and a distance of 150 nautical miles.

experimental high-voltage, An solid-state rectifier is to be tested soon at the Lydd, England, terminal of a dc power link operated jointly across the English Channel by France and Britain. The rectifier-developed by English Electric of Stafford with the assistance of Britain's Ministry of Technology-includes three thyristor stacks clad with ceramic for outdoor mounting. Design capacity is for 150-kV, 1250-A bridge rating with the use of 4 kV thyristors. At Lydd, the assembly, down-rated to 100 kV, will replace one arm of a 100-kV mercury arc bridge.

A four-pound, portable electrocardiogram recorder, based on the familiar cassette tape recorder, has been developed by Philips NV of the Netherlands for use by patients. The device can be used anywhere-a useful feature, since symptoms a doctor may want to monitor may occur when the patient is far from the doctor's office. The recorder consists of an electrode set and an amplifier that plugs into a standard cassette recorder. The patient attaches the electrodes to prescribed areas of his chest and connects them to the machine. The electrocardiogram record can be fed later into conventional laboratory equipment for analysis.

A three-million-volt electron microscope, developed by Hitachi, Ltd., in collaboration with Osaka

University in Japan, is 36 feet tall, weighs 67 tons and can magnify up to 100.000 times. Its high power enables the researcher to examine thick samples. The system includes a TV camera that is highly sensitive to electronics. It can thus detect low-energy electron beams in cases where samples might be damaged by irradiation at higher levels. Another feature permits suspension of specimens, including living cells, in a suitable environment as they are viewed through the electrontransparent walls of a pressure chamber.

The world's first fully automated natural gas pipeline—a 700-mile project in Iran-is to be served by an extensive telecommunications system operating at 7 GHz. The system will provide automatic control of eight compressor stations and will relay information by telemetry as either teleprinter code or voice communication. It will monitor control positions along the pipeline, giving operating personnel a continuing picture of various conditions, including pressure and flow. Initial design of the microwave system and assistance on optimum microwave site locations was carried out by International Aeradio, Ltd., of Southall, England.

The study of radio galaxies will be conducted at a new radiotelescope at Ootacamund, in southern India. The reflective surface of the telescope is a 530-by-30-meter array of 1100 stainless steel wires mounted parallel to the earth and supported by 24 equidistant steel towers. Radio waves reflected from the wire grid are focused on an array of 968 dipoles mounted along the telescope's focal line. The reflector can be rotated through a 140-degree angle. Now operating in the 324-to-329-MHz band, future additions will allow 100-MHz reception. The program is being sponsored by the Indian Government.

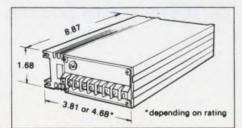

# A new low in power supply design.

Acopian's new low profile power supply offers outstanding performance. Line and load regulation is .005% or 2 mv. Ripple is 250 microvolts. Prolonged short circuits or overloads won't damage it. And built-in overvoltage protection is available as an option.

Yet, it's the thinnest, flattest, most "placeable" 4.0 amp series regulated power supply ever offered . . . just 1.68" low. This low profile makes it perfect for mounting on a  $1\frac{3}{4}$ " high panel, or vertically in a narrow space." Acopian's new flat package gives you design flexibility never before possible. And a surprisingly low price gives you extra budget flexibility as well.

Standard models include both wide and narrow voltage ranges. Outputs from 0 to 48 volts. Current

ratings from 1 to 4 amp. Prices from \$80.00.

For the full low-down on the new low-down power supply, write or call Acopian Corp., Easton, Pa. 18042. Telephone: 215-258-5441. And remember, Acopian offers 82,000 other power supplies, each shipped with this tag...

Refractory metallization the new breakthrough technology in pellet processing in the TA7706-leads the way to high-temperature, high-reliability designs in RF communications. TA7706, the first of a new generation of high-power, high-frequency transistors using this new refractory-metal process, can revolutionize your RF power equipment designs and provide long-life performance under all rated conditions. Exemplifying the high state of the "overlay" art in transistor design, the TA7706 features emitter ballasting, improved overdrive capability, and a ruggedized ceramic-metal package suitable for both stripline and lumped-constant circuits. Power output is 30 W (minimum) at 400 MHz with a minimum gain of 5 dB. Efficiency is in excess of 65%. The TA7706 is excellent for broadband applications, and is designed to provide rated output with infinite VSWR. For more information, see your local RCA Representative or your RCA Distributor. For technical data, write: RCA, Commercial Engineering,\* Harrison, N. J. 07029. International: RCA 2-4 rue du Lièvre, 1227 Geneva, Switzerland, or P. O. Box 112, Hong Kong.

# Washington Report

# Airlines want bigger say in R&D done by FAA

The nation's airlines, which will be paying higher taxes as a result of the passage of the Airport and Airways Development Act in Congress, have told the Federal Aviation Administration that they want better results from federal money spent on R&D. Through the Air Transport Association (ATA), the airlines told the FAA that they believe its R&D efforts have in the past been irrelevant and "largely a series of failures." In a position paper, the airlines stated that FAA's R&D efforts, when viewed from an engineering point of view, have often been stifled by a lack of vision and a lack of willingness to innovate and "even to clearly spell out needs." Referring to air traffic control needs, the ATA said, "Each R&D effort must also be considered in terms of its specific cost, the results to be expected in quantitative terms and the timetable on which the improvement can be expected to be implemented."

# Navy will ask permission for long ship leases

The Navy will ask Congress in January for permission to sign 10-year leases for 10 multipurpose ships. The new ships would take the place of the planned 30 Fast Deployment Logistics (FDL) ships that earlier this year were rejected by Congress. By leasing the ships, the Navy will avoid the cost of building, while the long leases will make the deal attractive to private ship builders. At present, the Navy is not allowed to sign a lease over five years. The ships are estimated to cost about \$25-million each, 10% to 15% of which will be spent for electronic equipment.

# **NASA sees possible microwave-band expansion**

NASA says that early results of its millimeter-wave experiment aboard the Applications Technology Satellite-5 (ATS-5) indicate that the overcrowded microwave band may be opened up to frequencies above 10,000 megahertz. Millimeter-wave frequencies, NASA says, offer better gain-toantenna characteristics, extremely wide bandwidths and allowance for a size and weight reduction in components. The space agency also reported that expected interference with the millimeter-wave portion of the frequency spectrum by snow and rain has not materialized; tests so far have shown that only a very heavy rain will affect communications. NASA is now trying to find out how far apart ground receiver stations must be placed so that one large storm doesn't entirely block communications.

# SST and imports move to front burner

As Congress reconvenes this week in a lame-duck session, the supersonic transport and import duties are expected to be in the first order of business. SST supporters say they expect to be able to get the \$297million measure through the Senate—it has already cleared the House. They feel that they will pick up supporters who, before election, were wary of the issue. Environmental safeguards are also expected to be added to the SST provision, thus drawing additional liberal support.

The question of protective import duties will come before the House early, but the fate of the bill is at best cloudy. The feeling is that so many amendments will be hung on it in the House or Senate that it will either be totally unacceptable, or, if passed, will be vetoed by the President. Compromises that may clear the way for passage are being sought.

# **DOD** personnel cuts to be higher than expected

The Dept. of Defense estimated that 35,000 jobs would be cut in the coming year due to budget tightening, but Civil Service Commission sources now say that as many as 100,000 DOD civilian employees may get the ax. The CSC is urging that the firings be accomplished as soon as possible to fit the coming budget. Layoffs are expected to begin around the first of the year.

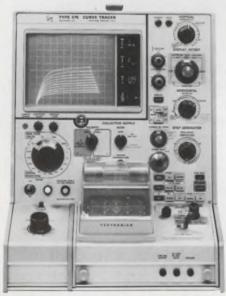

# Western Union seeks deal with Comsat

Western Union, an entrant in the domestic communications satellite competition, has said it would like the Communications Satellite Corp. to handle the space segment of its proposed system. Comsat has already joined with AT&T in a filing with the Federal Communications Commission for a domestic satellite system.

Meanwhile FCC Chairman Dean Burch has warned firms in the domestic-satellite field that they face serious problems—the key ones being limited orbital slots, costs and local distribution. It must be decided for example, Burch said, whether the role of CATV should be expanded, whether telephone company facilities should be utilized or whether new facilities should be constructed. Of tremendous importance to companies planning general-use networks, he pointed out, is whether the broadcast networks will decide to buy service from these carriers or put up their own networks.

**Capital Capsules:** Congressional sources say that the Navy will mothball at least four carriers in the coming year to cut operational costs. Types of carrier are not indicated. . . . The House of Representatives has awarded contracts amounting to \$450,000 to eight firms to study its automatic data-processing requirements. . . . Western Union has told the FCC that its existing New York-Washington microwave link will be saturated within two years and asks permission to add a 20-million-bit-per-second digital transmission capability. The proposed link would be opened by 1972 and would eventually serve New York, Philadelphia, Baltimore, Pittsburgh, Cincinnati, Cleveland, Columbus, Detroit and Indianapolis. . . AT&T and Comsat have two weeks to file with the FCC details on land interconnection arrangements for their proposed domestic satellite system. FCC asked for the additional data by December 1, stating that a "system proposal is not complete without some provisions for a terrestrial interconnection."

# NEW . . . A PULSED HIGH-CURRENT FIXTURE FOR THE 576 CURVE TRACER

576 Curve Tracer with 176 Fixture

576 Curve Tracer with Standard Test Fixture

ELECTRONIC DESIGN 24, November 22, 1970

The 176 Pulsed High-Current Fixture increases the Step Generator and Collector Supply ranges of the 576 Curve Tracer by a factor of ten (to 20 A Peak and 200 A Peak respectively). Pulsing the collector and base steps permits checking diode characteristics, and collector emitter breakdown, at currents much higher than previously possible as dissipation limits are not exceeded. The need for heat sinks is also eliminated. The 176 is easily added to the 576 in place of the standard test fixture.

TYPE 576 CURVE TRACER

The 576 offers many advanced features for semiconductor testing: Expanded Viewing Area — combines a 10 cm x 12 cm graticule with fiber-optic readout of scale factors, step amplitude, and Beta/div or  $g_m$ /div Swept or DC Collector Supply to 1500 V Leakage Measurements to 1 nA/div Multi-function Switching — direct-reading power limits, polarity tracking, auto positioning, mode changes Calibrated Display Offset — improved accuracy ( $\pm$  2%), increased resolution Step Generator Range to 2 A or 40 V Calibrated Step Offset — aid or oppose Pulsed Base Operation Interlock Operator Protection.

Your local Tektronix field engineer will be happy to demonstrate the 576 and 176 in your application. For additional information, please call him or write: Tektronix, Inc., P.O. Box 500, Beaverton, Oregon 97005.

# Now true precision in Allen-Bradley thin film networks.

Resistance networks for A/D and D/A conversion, digital volt meters and numerical control systems demand extreme precision. Allen-Bradley can deliver. Precision that starts with a patented chromium-cobalt resistive material vacuum deposited on a substrate made to Allen-Bradley specifications. Precision based on exclusive computer drawn grids. Precision backed by extensive design and testing facilities. Precision on a continuing basis assured by Allen-Bradley's 14 solid years of experience.

Add the reliability of a single substrate, uniform temperature characteristics, much lower attachment costs and you see why AllenBradley thin film networks are the logical replacement for discrete precision resistors.

SELECTED	SPECIFICATIONS
RESISTANCE RANGE	1K ohms to 2 megs, standard 25 ohms to 50 megs, special (Single substrate range 10,000 to 1)

# Introducing civionics — a term you'll be hearing more about

Pick up a magazine or newspaper, listen to a radio or television broadcast, and you will hear the language of the 70s: "Thermal pollution . . . anticrime legislation . . . postal reform . . . urban transportation . . . aircraft collision avoidance" and more. What is the common message that these words convey? Change.

Change in our society. Change in the electronics industry. Change in the education and skills demanded of the design engineer.

These changes, spurred by new national priorities, are even now creating new opportunities for the electronics industry. The ultimate size of these markets is hard to gauge, but there's little doubt that in time they will reshape the electronics industry.

Recognizing the importance of these shifts and their significance to the designer, ELECTRONIC DESIGN plans to carry a series of special reports next year, ranging from urban mass-transportation and anticrime electronics to pollution monitoring and control. These reports will be strictly hardware and design-oriented, not merely "blue sky" surveys. They will inform readers of hardware needs, as well as circuit and system problems and proposed solutions.

What is the most meaningful term we can apply to this changing technology? ELECTRONIC DESIGN suggests *civionics*—civilization electronics. By civionics we mean the application of electronics for the public good, as opposed to electronics that benefits the individual or a private business. For example, a highway traffic-control system would be considered civionics, since it is designed to allay auto congestion for the public. On the other hand, a solid-state car ignition system would be considered consumer electronics since it benefits individuals.

Highway traffic control already has a healthy headstart on some of the other civionics areas in creating a new market for the electronics industry. More than 40 cities in the U. S. have installed or are planning to install electronic traffic-control systems during the next two or three years. Improvements now under development or in the planning stage include vehicle-identification systems, carpassing devices and antiskid systems.

The electronics industry is on the threshold of breaking its dependence on aerospace and defense contracts. So, too, must the designer as he looks toward new opportunities in civionics in the years ahead.

RALPH DOBRINER

# The patient comes first in telemetry.

Hospital system design must consider transmitter size and weight, noise and FCC rules.

Biomedical telemetry will have a great impact on hospital care. By keeping an ambulatory patient under continuous observation, it can instantly warn the hospital staff of a medical crisis. And it can allow a patient, who otherwise might be forced to remain bedridden, almost complete freedom of movement. Finally, telemetry can save money, by giving older hospitals the capability of continuous patient monitoring with-

Edited by Milton J. Lowenstein

Philip A. DeLangis, President, Verité Scientific, Inc., 4060 226th St., Torrance, Calif. 90505

out the need for expensive rewiring.

At the moment, there are not many biomedical telemetry systems in operation. The only reason is that not enough of the necessary equipment is available. To make biomedical telemetry a reality, engineers must become aware of the needs of both hospitals and patients, and must be especially aware of the parameters that govern the design of such systems.

Although many forms of communication have been proposed for hospital telemetry—magnetic, coherent and noncoherent light and ultrasonics only electromagnetic radiation now has the efficiency and ease of transmission suitable to meet

all the requirements.

Once this obvious choice has been made, it is necessary to decide how information is to be carried. Power levels and the kind of modulation will have significant effects on system design. Therefore, basic specifications must be enumerated.

The most obvious parameters to be considered are the size of the transmitter, the design of the patient sensors and the interconnections between these devices. Since sensors for pulse and respiration rates, blood pressure, EKG, EEG and body temperature have their own design parameters, it can be assumed that these devices are available and can be directly wired to the transmitter.

To avoid burdening the patient and to ensure his cooperation in using the device, the transmitter must be as small and light as possible. An ideal size would be 1 by 1 by 1/4 inch with a weight of 1 ounce. Market surveys indicate that it could be as large as a pack of king-size cigarettes and weigh up to a pound and still be toleraable, but the lower limits are a more suitable design objective. If the transmitter is too large and heavy, certain patients—old people and children—will not be able to use it. Table 1 lists the basic transmitter specifications consistent with patient comfort, hospital environment and FCC regulations.

The transmitter must be shockproof and stable and able to withstand the normal hospital environment. Adjustments should not be necessary —tuning by means of packaged crystals, for instance, is almost mandatory. Table 1 lists several of the physical and operating parameters that define the transmitter.

Modular design of the transmitter is desirable, too. An attractive possibility is separately packaged power amplifiers and oscillators, for matching plug-in preamplifiers and modulators for different sensors.

## What kind of modulation?

Regulations of the FCC bear heavily on the choice of communication system. Part 15 of the FCC Rules and Regulations is especially significant to the design of biomedical telemetering. Some pertinent excerpts from this section are:

Operation in the band 88-108 MHz is limited to low power communication devices employed as telemetering devices or as wireless microphones. This band shall not be used for two-way communication.

Users of these devices shall take adequate precautions to insure that harmful interference is not caused to the reception of transmissions from any FM or television broadcast station or any other class of station licensed by the Commission. In the event that such interference does occur, operation of the telemetering device or wireless microphone shall be promptly suspended and shall not be resumed until the interference

# Table 1. Transmitter parameters

Size	1 by 1 by $\frac{1}{4}$ inches
Weight	1 ounce
Temperature range	0 to 40°C
Frequency stability	0.01%
Radiated power	50 $\mu$ V/m at 50 feet
Frequency range	88 to 108 MHz
Number of channels	1, with plug-in module capability for others
Bandwidth	0.05 to 150 Hz
Modulation	FM, or PCM
Operating range	70 m
Signal / noise	> 40:1
Antenna	whip
Installation time	< 5 min.
Adjustments	none
Calibration	1 mV pushbutton for EKG
Power	One 1.35 V mercury battery (hearing aid type, 60 day life)
Effect on patient	None

Hospital corridors offer no telemetering problems when they are straight. However, bends can shield the receiver from the transmitter.

1. An electrocardiogram telemetering transmitter is attached to patient Clifford W. Longell of Berkeley Heights, N. J. prior to placing him in a wheel chair. Although there are 12 points on the body that must be monitored for a complete EKG, present transmitters and receivers are limited to only one.

has been eliminated. Users of these devices must accept any interference which may be caused by the operation of any licensed station operating in accordance with the terms of its license.

The field strength of emissions radiated within the specified 200-kHz band shall not exceed 50  $\mu$ V/m at a distance of 50 feet or more from the device.

The field strength of emissions radiated on any frequency outside the specified 200-kHz band shall not exceed 40  $\mu$ V/m at a distance of 10 feet or more from the device.

Other paragraphs of the FCC regulations limit telemetering services to frequencies below 70 MHz, except for the 88-108 MHz band. Because low-frequency antennas become too large, the higher frequency band is the only one suitable for medical telemetry. A possible point of conflict is a requirement for periodic announcement of call letters. This is clearly impossible in the kind of transmitter we are considering. Careful study of legal ramifications must be made by the designer before he commits himself to a final design.

On a technical level, decisions are based on more solid information. Five basic types of modulation can be considered: amplitude modulation (AM); frequency modulation (narrow or broadband FM); pulse-amplitude modulation (PAM); pulse-position modulation (PPM); and pulse-code modulation (PCM)—sometimes called pulse-width modulation (PWM). For lowest equipment cost, AM is the best. However, when the performance requirements involved in the system, such as reliability and electrically noisy hospital environments (primarily radiated noise from other equipment), are considered wideband FM or PCM is the best choice.

Since noise is one of the major problems in a hospital environment, good signal-to-noise ratio is vital. A comparison of signal-to-noise ratios (S/N) is useful. Note that the subscript c in the following equations denotes the unmodulated carrier with the minimum bandwidth required to transmit information.

 $(S/N)_{AM} = S_c/N_c$ 

 $(S/N)_{FM} = 3\beta^2 (S_c/N_c)$ 

For a modulation index,  $\beta >>1$ , which is the case in wideband FM, S/N is significantly better than AM. The FM equation also shows that S/N for wideband FM is better than narrowband FM. A wider bandwidth system, of course, requires more stages of gain.

Performing the same comparison for PAM and PPM, we have  $(S/N)_{PAM} = S_c/N_{\sigma}$ 

and  $(S/N)_{PPM} = 1/2 (t_o/\tau_r) S_c/N_c$ , where  $t_o$  is the maximum frequency deviation and  $\tau_r$  is the rise time of the pulse.

It can be seen from these equations that PPM is a better choice than PAM and that

 $(S/N)_{AM} = (S/N)_{PAM}$ .

Increasing the modulation index  $(t_o)$  in PPM, or decreasing the pulse rise time, increases the S/N. It is more difficult to characterize S/N for PCM, but it improves exponentially, once past the threshold level, rather than linearly as in the case of FM or PPM.

To choose the best system in terms of both performance and cost criteria, a complete analysis of all the variables, including actual radiated noise levels in hospitals, must be made. Then competing systems—AM, FM, PCM—can be blocked out and compared on a cost-effective basis.

## **Determine output levels**

Assuming that the FM band will be used, the FCC maximum for radiated output must be less than 50  $\mu$ V/m at 50 feet. If a half-wave dipole is used as the transmitter antenna, the following relation between power and field intensity apply:

 $E = (49.2 P^{1/2}) / R$ 

where E is field intensity in volts, P is transmitted power in watts, and R is distance in meters.

In this case E is 50  $\mu$ V, R is 50 feet or 17 m, and

 $P = (ER)^{2}/49.2 = (50 \times 10^{-6} \times 17)^{2}/49.2$ = 147 × 10<sup>-10</sup> W.

Maximum power output, therefore, from the transmitter is  $0.0147 \ \mu W$ .

This power output, although feasible with a miniaturized transmitter, is very close to hospital noise levels. The FCC regulations that determine this low power were not written with the special problems of hospitals in mind.

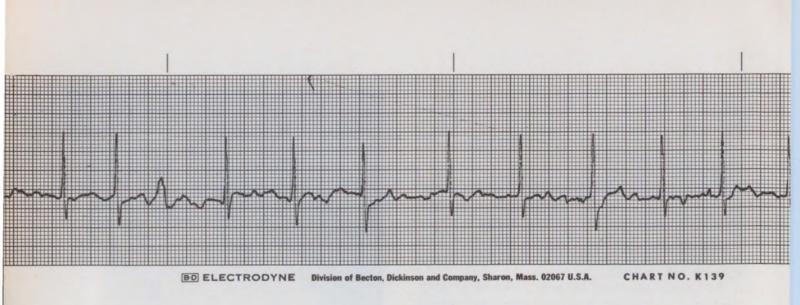

One way to overcome this inherent difficulty is to have the regulations changed. Another is to view the FCC limitation as referring to average output power. A pulse-modulated signal, rather than FM, can then concentrate energy at much higher power levels over a short duty cycle.

The earlier discussion of S/N and this power restriction suggest strongly the advantage of PCM in producing a strong, clear signal. Existing hospital telemetering systems rely on FM; future systems, it seems, should be built using PCM.

The possibility of power transmitted by the

2. This biomedical transmitter, in use in Overlook Hospital, Summit, N. J., is larger than ideal size. Additional design is necessary to make it small enough for young children or for transmission of several channels of medical data.

# Table 2. Receiver parameters

Frequency range	88 to 108 MHz
Bandwidth	0.05 to 150 Hz
Modulation	FM or PCM
Frequency stability	0.01%, crystal controlled
Temperature range	0 to 65°C
Number of signals/channel	1 with possible addition of 3 more
Signal/noise	> 40:1
Baseline drift at display device	< 1 mm/min; ±2 cm/day

Adjustments	none
Calibration	none
Power	115/230 V, 50/60 Hz

telemetry transmitter causing interference with other vital medical equipment must be explored, particularly in the case of a cardiac pacemaker used by a heart patient. But so far, the results of studies on pacemakers has indicated that there is no severe interference. And by shielding the leads of the transmitter and positioning it so that the patient's body is between it and the pacemaker, any interfering signal will be highly attenuated.

## Receiver design is important

Because of the severe limitations on the transmitter, a carefully designed receiver is necessary. Low noise characteristics are a must. Since several patients may be monitored simultaneously, there must be frequency channel allocations to keep them separate. Front-end modules can be used to match each transmitter, or several separate channels can be incorporated into a single receiver.

Size and weight are not critical parameters for the receiver, but stability and reliability are. Table 2 lists receiver specifications based on previously determined transmitter parameters. The transmitter is the limiting element in the design. Much more design freedom is possible with the receiver. However, there should be no need for adjustments or calibration—hospital personnel are not skilled in this area.

Receiving antennas should be placed at strategic locations to eliminate dead areas and to make the system operate satisfactorily with low transmitter power. One possibility is to make use of electrical wiring as a receiving antenna, provided this wiring is not shielded and contains no intervening transformers.

System complexity depends on the hospital and the kind of installation. Small and large hospitals have different needs. Installation in an existing hospital or designing into a new hospital will effect the specifications and performance. Radio noise levels are different in city and country. Obviously, each system must be carefully assembled for best results.

Another area that should be given careful consideration is that of proper human engineering. The elimination of adjustments and calibrations has been mentioned. Color coding and indexing of connectors are other areas where good design can prevent accidents. The hospital environment is one in which the staff is under pressure. The engineer must make his equipment simple and easy to use.

## Test your retention

Here are questions based on the main points of this article. Their purpose is to help you make sure you have not overlooked any important ideas. You'll find the answers in the article.

1. What are the major benefits of telemetry to the patient? to the hospital staff?

2. Why are transmission power limitations imposed on hospital telemetry by the FCC?

3. What kind of modulation has the best signal-to-noise ratio for hospital telemetry?

4. Why should hospital telemetry equipment be designed with no adjustments?

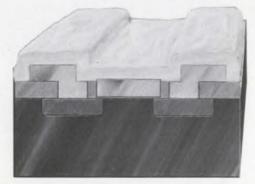

3. This display is located near the telemetry receiver in Overlook Hospital. Oscilloscope and alarm units are mounted below a hard-copy oscillograph which produces a permanent record, like that shown at the top of the page. The use of the scopes and oscillograph is desirable; the alarm units are mandatory.

# What makes ours the world's best MOS? Unique features. Like PSG passivation, cerdip, MOSAB.

Things that make Philco<sup>®</sup> MOS the most reliable on the market.

First, our PSG passivation. We apply a unique phosphosilicate glass over the entire surface of the chip—not just over the metallization. This produces the most trouble-free MOS you can buy.

All-over PSG passivation

Passivation over metal only

Our special PSG process ends surface ion migration and eliminates field inversion voltage effects—the "Fahrenheit freakout" that can cause all sorts of logic errors when chip temperatures rise. It also prevents corrosion, scratched metallization, and bridging of metal lines by stray conductive particles.

And PSG's high-temperature capability lets us give you MOS in cerdip—the low-cost hermetic packaging that meets all the environmental requirements of MIL Standard 883.

Sealing cerdip at 550° C

Then there's our patented MOSAB input device. It ensures <u>permanent</u> over-voltage protection at every input on every circuit. In conventional MOS circuits the voltage limit increases each time there's a transient surge, as shown on the curve tracer. Until eventually there's no over-voltage protection left.

These all add up to yields that are double the industry average... from a plant that can make up to a million perfect chips a week. And that means top reliability at attractive prices. INFORMATION RETRIEVAL NUMBER 35

# **Three-level logic eliminates inverters.**

The use of all NAND logic can reduce gate count by inherent generation of complemented variables.

Standard synthesis of logic circuits uses the 2-level AND-OR logic that results from Karnaugh maps or the Quine-McCluskey chart. The conventional results of this approach produce a design in which delay is minimized. But it is possible to make use of 3-level NAND logic<sup>1,2</sup> only and to reduce total gate count.

This is possible because the NAND design requires no complemented variables as inputs, and, consequently, no inversion gates. If complemented variables are needed, they can be produced within the designed logic structure.

A second advantage is that only one kind of logic gate need be kept in stock. This is most useful to engineers who have infrequent demands for logic circuits. The only disadvantage of the method is the increase in propagation time through the logic network as a result of the additional stage.

## Careful design reduces gate count

If minimum gate count is the design objective, the logic network should reflect alternate design techniques. There is no criterion by which the minimum gate count is assured, so the designer must investigate many possibilities.

Two-level AND-OR logic is related to all NAND logic by the following expression, based on DeMorgan's theorem:

$$ABC + DEF + GHI = [(ABC)'(DEF)' (GHI)']'.$$
(1)

The left-hand side of Eq. 1 is expressed in terms of two levels of AND-OR logic, while the righthand side is three-level NAND only. The following identities, which can be derived from fundamentals, also prove especially useful in reducing gate count:

$$[XY(Z)']' = [XY(XZ)']' = [XY(XZ)']' = [XY(XZ)']'$$
  
= [XY(XYZ)']', (2)  
and

$$[(W)'(XY)']'[(X)'(XY)']' = [(WX)'(XY)']'.$$
(3)

Edmond I. Vinarub, Electronic Systems Engineer, Reflectone, Inc., 2051 W. Main St., Stamford, Conn. 06904

The most direct way of describing the use of three-level NAND logic is to work through some examples.

Example 1:

Let F = W'XYZ + WX'YZ + WXY'Z + WXYZ' be the desired expression and W, X, Y and Z be the inputs. Substituting into Eq. 1, the expression becomes

 $\mathbf{F} = [(\mathbf{W}'\mathbf{X}\mathbf{Y}\mathbf{Z})'(\mathbf{W}\mathbf{X}'\mathbf{Y}\mathbf{Z})'(\mathbf{W}\mathbf{X}\mathbf{Y}'\mathbf{Z})'$ 

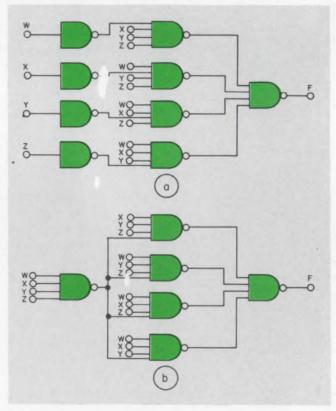

(WXYZ')']'.

The logic structure for this equation is shown in Fig. 1a. It uses nine NAND gates.

If F is further modified by the identities of Eq. 2,

F = [(WXYZ)'(XYZ) (WXYZ)'

(WYZ) (WXYZ)'(WXZ) (WXYZ)'(WXY)]'.

1. All-NAND logic can be used to perform any logic function. Straightforward application of NAND gating (a) makes use of nine gates. With manipulation, the count is reduced to six by eliminating inverters (b). The implementation of this logic (Fig. 1b) requires only six NAND gates. The original twolevel logic used four AND gates, one OR gate and four inverters, for a total of nine gates. **Example 2:** 

Let G = X'Y'Z + W'Y'Z.

If only uncomplemented variables are available, the implementation of this equation requires two AND gates, an OR gate and three inverters, or a total of six gates. The direct conversion into NAND logic results in

 $\mathbf{G} = [(\mathbf{X}'\mathbf{Y}'\mathbf{Z})'(\mathbf{W}'\mathbf{Y}'\mathbf{Z})']'.$ 

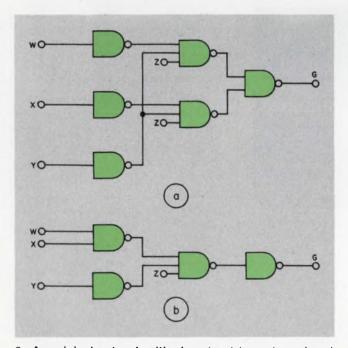

Figure 2a is the corresponding logic diagram. The circuit uses six NAND gates, which is no improvement. However, if the identity of Eq. 3 is used, the equation can be rewritten as

 $\mathbf{G} = [(\mathbf{W}\mathbf{X})'\mathbf{Y}'\mathbf{Z}]'',$ 

and this may be implemented as in Fig. 2b, using only four NAND gates.

Example 3:

The first two examples made use of either Eq.

2. An original network with six gates (a) can be reduced to four by using all-NAND logic (b). Note that the final gate in "b" is a NAND gate with only one input, or simply an inverter.

2 or Eq. 3 for simplification. This final example makes use of both relationships.

Let H = WXY' + WXZ' + XYZ'. The conventional solution uses six gates. Converting to NAND also uses six gates (Fig. 3)

 $\mathbf{H} = [(\mathbf{W}\mathbf{X}\mathbf{Y}')'(\mathbf{W}\mathbf{X}\mathbf{Z}')'(\mathbf{X}\mathbf{Y}\mathbf{Z}')']'.$ 

Applying first Eq. 2 and then Eq. 3, the modified function is

 $\mathbf{H} = [(\mathbf{W}\mathbf{X}(\mathbf{Y}\mathbf{Z})')'(\mathbf{X}\mathbf{Y}(\mathbf{Y}\mathbf{Z})')']'.$ 

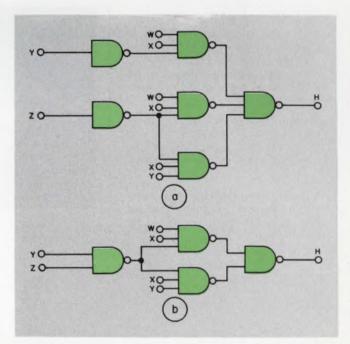

This yields the structure of Fig. 3b, which uses only four NAND gates.

The use of three-level NAND logic is one more tool for logic designers. It is an additional option when gate count or parts supply is critical.

3. Two simplifying equations are used to reduce the gate count in this final example. The number of gates is reduced even with an extra level by producing complemented variables within the logic structure.

### It's true.

After helping a jillion feet of paper tape wind and unwind its way through communications systems everywhere, Teletype announces the addition of magnetic tape data terminals.

There are some basic advantages in both mediums. But as you are well aware, the medium that's right for a system depends a lot on the application criteria.

The new magnetic tape data terminals have many operational features that make life less complicated for the operator.

New, modular line of Teletype<sup>®</sup> 4210 magnetic tape data terminals.

For example, take a look at the tape cartridge, which was specifically designed for reliability required for data transmission.

Its vital statistics are: 3" x 3" x 1".

It contains 100 feet of  $\frac{1}{2}$ " precision magnetic tape.

It will hold 150,000 characters of data, recorded at a density of 125 characters per inch. The equivalent of a 1000 foot roll of paper tape.

This means that your data is easier to store, easier to handle, easier to work with than ever before. And it's reusable.

# DATA COMMUNICATIONS equipment for on-line, real-time processing

The units have a "fast access" switch which will move tape forward or reverse at a speed of 33 inches per second. A digit counter provides a reference point to help locate various areas of the tape.

Four ASCII control code characters can be recorded in the data format to aid character search operations. When the terminal's "search" button is pressed, tape moves at the rate of 400 characters per second Also magnetic tape adds high speed on-line capability to low speed data terminals.

You can zip data along the line at up to 2400 words per minute. For example: Take a standard speed Teletype keyboard send-receive set, and a typical typist. Add a new magnetic tape unit to this combination and the on-line time savings can pay for the magnetic tape terminal in short order.

until the control code selected is detected. Then the terminal stops the tape automatically.

A "single step" switch is also provided which enables you to move the tape forward or backward one character at a time. In editing or correcting tape, you can send a single character using this feature. You can take better advantage of voice grade line speed capabilities.

An operator can prepare data for magnetic tape transmission using the keyboard terminal in local mode. Then send it on-line via the magnetic tape terminal up to 2400 words per minute.

These new modular magnetic tape data terminals offered by Teletype are perfectly compatible with model 33, model 35, model 37 and Inktronic<sup>®</sup> keyboard send-receive equipment.

Straight-through threading makes tape loading and unloading exceptionally easy.

They can send or receive at high or low speed. Or can be used independently as stand-alone terminals online.

If you would like to know more about this new line of Teletype magnetic tape data terminals, please write Teletype Corporation, Dept. 89-15, 5555 Touhy Avenue, Skokie, Illinois 60076.

Teletype 4210 magnetic tape data terminal with 37 keyboard send-receive set.

# **Ideas For Design**

# Vary op-amp gain by 2048:1 in steps of 2:1

An inexpensive circuit can lower the gain of an operational amplifier by a factor of two each time the binary outputs of a 4-bit binary counter increase. A total gain change of  $2^{11}$  or 2048 is possible using a circuit with only five spst miniature, dual-in-line relays and one quad-NAND gate (Fig. 1). The truth table for the circuit is shown in Fig. 2, in which a ZERO at a relay coil terminal indicates that the relay is energized.

Initially, relays 1, 2 and 3 are not energized (open) and relays 4 and 5 are energized (closed). The gain of the op amp is 1  $M\Omega/499\Omega \approx 2000$ .

On the first three counts relays 1, 2 and 3 turn on during the count that their respective inputs

1. A gain variation of 2048:1 is accomplished by the circuit. The logic (a) uses only three gates of the quad NAND. The relay coils (a) operate contacts (b) to change gain.

	COUNTER - RELAY								
COUNT	23	22	21	20	1	2	3	4	5
0	0	0	0	0	1	1	-	0	0
1	0	0	0	1	0	1	1	0	0
2	0	0	1	0	1	0	I	0	0
3	0	0	T	1	-	1	0	0	0
4	0	1	0	0	1	1	1	I	0
5	0	1	0	I	0	I	L	ŀ	0
6	0	1	I	0	1	0	1	1	0
7	0	I	-	I	I	I	0	I	0
8	1	0	0	0	I	1	I	0	1
9	I	0	0	1	0	Т	1	0	1
Ю	1	0	1	0	I	0	T	0	1
Ш	I	0	1	I	I	T	0	0	1

2. The truth table of relay operation uses ONE for a de-energized and ZERO for an energized relay as the circuit steps through 12 counts.

are ZERO, and the gain is progressively lowered by factors of two. On the fourth count relay 4 opens. Since relays 1, 2 and 3 are also open, the gain is 1 M $\Omega/7.99$  k  $\approx$  125. During the fifth, sixth and seventh count, relays 1, 2, and 3 again close. On the eighth count relay 5 opens and relay 4 closes. Since relays 1, 2, and 3 are again open, the gain is 1 M $\Omega/127.499$  k  $\approx$  7.84.

On the ninth, tenth and eleventh counts, relays 1, 2 and 3 again turn on. On the eleventh count the gain is  $125k/127.499k \approx 0.98$ , for a total reduction in gain of 2048.

# Transistor protects sensitive meter movements

Diode protection, often used for meter-movement overload protection, is useless for microammeters in which the meter voltage drop is below that required for conduction. But the circuit shown will limit the current through any meter to a predetermined value.

The transistor is connected so that the meter current flows through the collector circuit. The maximum base current is established by the battery and the resistor. The resistor is chosen so that the maximum collector current is between 1.5 and 2 times the full-scale meter current, a value the meter can stand. The resistor shown is the nominal value for a  $20-\mu A$  meter and must be changed for other movements. Also, because of the wide variation in beta for inexpensive

transistors, the maximum meter current should be checked.

VOTE FOR 312

# Generate normally distributed random numbers with BASIC

Normally distributed random numbers are often required for statistical problems such as sampling. BASIC language contains the instruction RND (-1), which generates uniformly—as opposed to normally—distributed random numbers,  $r_i$ , in the interval 0 to 1.

10 READ K,S,M 20 DATA 24,10,50 30 FOR I=1 TO 50 40 LET T=0 50 FOR J=1 TO K 60 LET R=RND(-1) 70 LET T=T+R 80 NEXT J 90 LET N=S\*SQR(12/K)\*(T-K/2)+M 100 PRINT N 110 NEXT I 120 END

Uniformly distributed random numbers are converted to normal distribution by this BASIC program. Any mean or standard deviation can be specified. Using the central limit theorem, the following formula, which yields normally distributed random numbers from a set of uniformly distributed numbers, can be derived:

$$x = \sigma \left(\frac{12}{k}\right)^{1/2} \left(\sum_{i=1}^{k} r_i - \frac{k}{2}\right) + \mu,$$

where

 $\sigma =$  standard deviation,

 $\mu = \text{mean},$ 

and

k = some quantity of uniformly distributed random numbers.<sup>1</sup> This equation appears in line 90 of the program shown.

The value of k is selected large for accuracy or small for computational efficiency.

The program listing is shown in the figure. In line 10, S is  $\sigma$ , M is  $\mu$ .

# Operate remote relays with low control-line voltage

The voltage level on equipment control lines in many new aircraft must be kept low. This makes it difficult to operate relays without resorting to a low-voltage control-line supply something that is usually not available. Other published' solutions to this problem use transformers, which take up valuable space, or zener diodes, which dissipate power either in standby or when the relay is energized. The following method is inexpensive, compact and dissipates little power.

When the remote switch is closed, the SCR conducts every half cycle as required by the 400-Hz relay coil. With the switch open,  $D_1$  prevents gate current flow through  $R_2$ .  $R_1$  and  $R_2$  establish

a maximum control-line voltage of 15 V peak at the highest aircraft supply (122 V rms).

# Solid-state circuit gives wide-range motor speed control

The speed of 12-V permanent-magnet motors may be smoothly controlled over a wide range by means of the circuit shown. The two transistors are connected so that when the emitter  $Q_1$  is positive with respect to its base, the impedance between the emitters of  $Q_1$  and  $Q_2$  is very low. When the emitter of  $Q_1$  is negative with respect to its base, the impedance is very high.

The base of  $Q_1$  is fed from a fullwave rectified voltage. The voltage on the emitter of  $Q_1$  starts from zero every half cycle, but its waveform is modified by the exponential charging current of  $C_1$ . The zero crossover point of the waveform can thus be varied by the adjustment of  $R_v$ . When the crossover point is reached,  $C_1$  is discharged through  $R_5$ , turning the SCR on. This provides a dc pulse to the motor, and the voltage across the transistors drops to zero. The action repeats every half cycle.  $D_5$  and  $D_6$  protect the circuit from the motor back-emf.  $R_6$  limits the open-circuit voltage.

J. Johnstone, Consultant Electronic Engineer, P. O. Box 4, Macclesfield, Cheshire, England. VOTE FOR 315

The setting of variable resistor  $R_{\rm v}$  controls the speed of a 12-V permanent-magnet motor. Stepless control with wide range of operation is a feature of the circuit, which makes use of readily available semiconductor components.

# CLAIREX ELECTRONICS A DIVISION OF CLAIREX CORPORATION

# Build two monostable multis with a single IC

Two independent monostable multivibrators on a single monolithic chip can be obtained by using a quad two-input NAND gate connected as shown. These monostable circuits are capable of output pulse widths that can be varied from less than 1  $\mu$ s up to several seconds. If simultaneous triggering is desired, just connect terminals 5 and 13 together and apply the trigger pulse to that connection.

The output pulse width is controlled by the time required for the coupling capacitor ( $C_1$  or  $C_2$ ) to charge to a voltage that initiates turn-on of the gate input transistor. For the MC846P the input transistor starts to turn on when the input voltage is on the order of 1.6 V. Since  $V_{ce(sat)}$  is approximately 0.3 V, the capacitor must charge to approximately 1.3 V. The total effective resistance in the charging circuit is 3.75 k $\Omega$  in parallel with the coupling resistor  $R_1$  (or  $R_2$ ). The charge time, t, can be determined from the equation

$$1.3 = rac{V_{ee} \ R_1}{3.75 + R_1} \ (1 - e^{t/RC})$$
  
where  $R = rac{3.75k \ imes \ R_1}{3.75k \ + \ R_1}$  and

$$C = C_1$$
.

W

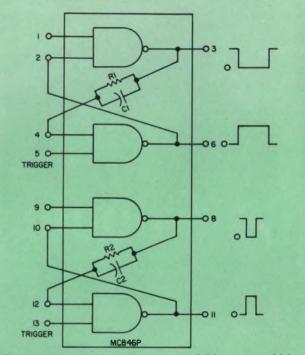

The coupling resistor  $R_1$  should be restricted to the following range of values:

$$[rac{4.875 imes 10^3}{
m V_{cc}-1.3}] < 
m R_{\scriptscriptstyle 1} < [rac{1}{
m 10~fC}]$$

where f = trigger frequency.

The lower limit on  $R_1$  is the value that produces an infinite-width output pulse. In other words, the circuit behaves as a Set/Reset bistable multivibrator. The upper limit on  $R_1$  is necessary since  $R_1$  provides the only discharge path for the coupling capacitor (due to the fact that the input diode internal to the IC is reverse-biased).

Since the capacitor must be completely discharged before any subsequent trigger pulse is applied,  $R_1$  should be sufficiently small to permit this. The upper limit allows a minimum of 10 RC time constants between trigger pulses. Larger values of  $R_1$  would cause the coupling capacitor to have an initial non-zero charge at the beginning of the next trigger pulse, and as a result

Two independently triggered, variable pulse-width monostable multivibrators can be built with this single quad two-input NAND gate. Connecting pins 5 and 13 together provides simultaneous triggering.

the output pulse width would be shorter than that predicted.

C. F. Reeves, Electronics Engineer, Code 2300, U. S. Navy Electronics Laboratory, 271 Catalina Blvd., San Diego, Calif. 92152.

# Product Source Directory

# **Test Instruments**

The test instruments covered in this Product Source Directory are divided into four groups digital voltmeters, frequency counters, oscilloscopes and spectrum analyzers.

Each table lists the instruments in ascending order of a major parameter, like maximum voltage or frequency. Units are subsequently arranged alphabetically according to manufacturer.

This directory updates last year's compilation. It includes only the instruments introduced or significantly modified since Nov. 22, 1969. For more information on how to obtain a copy of last year's directory, see page 83. A vital addendum to our word generator directory (ED 17, Aug. 16, 1970) is also in this issue.

Manufacturers are identified by the abbreviations shown in the Master Cross Index below. The following abbreviations are used in the tables: ina—information not available; n/a—not applicable; typ—typical.

# Select the right oscilloscope

There are probably more good oscilloscopes available on today's market than ever before. Picking the one that solves your measurement problem can be simplified if some in-depth thought is given to its use.

Is it to be used as a general-purpose lab scope on a production line or on a short-term project such as a proposal? Is it to be used in an airconditioned environment, the Sahara desert, the South Pole, or maybe atop Pikes Peak? Will it continuously test microvolt circuits, or must it record only a one-time occurrence? Perhaps you need a scope with a bandwidth of several hundred megaHertz for designing state-of-the-art computers.

Will the new oscilloscope be used only five hours a day or twenty-four hours a day? Is it to be carried on-board a commercial jet or will it always sit comfortably on a bench or scope cart? Will you be looking at the scope from 10 feet away?

By mentally answering these questions, you will be much closer to obtaining a scope that will solve your problems, without emptying your company's pocketbook needlessly.

## Lab scopes must do tomorrow's job today

General-purpose laboratory oscilloscopes are used in the fundamental design of almost every electronic product and circuit. Picking a lab scope to do only today's job is unwise since the engineer or technician who gets it tomorrow will probably be short-changed. For laboratory use, it is best to select a mainframe that will accept a variety of plug-in amplifiers for both the vertical and horizontal deflection axes.

There are several good reasons for this. First, the instrument's flexibility is vastly increased since the user can make special types of measurements without having to invest in a whole new oscilloscope. Secondly, manufacturers of plug-in scopes generally keep close pace with the designer's requirements, so that new plug-ins parallel state-of-the-art needs as they occur.

Today's lab scopes are not the big brutes of yesterday, which took up half the designer's bench. Power requirements for a good lab scope are now around 150 W and are achieved with solid-state devices, smaller power supplies, and convection cooling. This is probably not much of an issue in buying a single scope, but think of the wasted power—and money—used by 200 to 500-W scopes in big design labs.

A good mainframe should not limit the versatility of the available plug-ins. Even if you are doing millisecond work today, you will be dollars ahead tomorrow if you purchase a mainframe capable of at least 100-MHz performance in its vertical axis.

The heart of the entire oscilloscope is the display, since it is here that waveforms are evaluated. Be sure you can see what you are evaluating—today's lab scopes typically have 8 by 10-cm displays, and some are even larger.

If yours is a generally used lab scope, be sure the CRT has an internally scribed graticule where the phosphor and graticule are deposited in the same plane. This eliminates parallax errors and insures easier and more accurate interpretation of waveform characteristics.

Most lab-scope CRT graticules are divided into 10 divisions horizontally and eight divisions vertically. These are further subdivided into 0.2division markings on the major axes.

If display size is important to you, remember that a division is not always equal to 1 cm; manufacturers have standardized somewhat on the number of divisions rather than the size. Divisions come in many sizes—some are 0.6 cm to the division while others are 0.8, 0.95, 1, 1.27 or 1.34.

A few manufacturers put horizontal rows of dots 10% below the top of the uppermost division and 10% above the bottommost division. These dots are spaced 0.2 divisions apart and offer another finely divided scale for waveform evaluation. More important, though, they allow accurate measurement of the 10% and 90% points

Robert Bell, Product Manager, Hewlett-Packard Co., 1900 Garden of The Gods Rd., Colorado Springs, Colo. 80907.

(rise time) on pulses, when the signal base is located along the bottom graticule line and the peak along the top graticule line.

Most scope manufacturers use the same P-31 phosphor since it is the brightest, most burnresistant, and is pleasing to the eye. Its persistence is very short (approximately 40  $\mu$ s) so no confusing traces caused by display afterglow are viewed. Other important characteristics of the display are brightness, spot size and fidelity. Generally these are not specified, but a side-byside instrument comparison will quickly tell the whole story.

Before you reach that final decision, spend some time with the technicians who must calibrate and repair the oscilloscope, and see what they think. If they cannot keep your wonderful choice operating, then you are out of business.

One final word on lab scopes. If you are the small consumer—and most users are—ask about some of the extras you can buy for a minimal investment. Some of these are shown as operations on the data sheet, but not always. They include rear-panel outputs, higher sensitivities and outputs for cascading channels. Ignoring small trimmings may limit your most profitable tool—your design team.

## Portable scopes must be rugged

With most test equipment going solid-state today, it is somewhat difficult to distinguish between the lab and the portable oscilloscope. For our purposes, a portable scope will be considered one used for a specific field service requirement, such as on-site computer servicing. Generally speaking, portable oscilloscopes should be capable of line, 28-V, 400-Hz and battery operation for true on-site operation.

A desirable feature of battery operation is self-contained rechargeable batteries. Self-contained, rather than strapped-on batteries, keep the scope portable and easy to handle. The batteries should be capable of several hundred

# Special scopes have a niche, too

As the name implies, special oscilloscopes are usually employed for single-use applications. They may start from standard models but become highly directed toward a single application. They are more expensive than the standard unit, since the manufacturer must spend additional time on modifications. Special requirements can vary, from a different paint job all the way to new controls or a different mechanical chassis. Almost any requirement can be met if you are willing to pay for it. recharges and at least several hours of continuous operation per charge. Battery-check indicators are very helpful.

Portable models put the true test to environmental specifications, since they are more likely to operate in extremes than laboratory instruments. An oscilloscope used under field conditions must be ruggedly constructed.

The frills and calibrated gadgets on lab scopes are seldom needed on a portable model, since the waveforms being examined are already known. The portable scope is usually used to observe the qualitative nature of a waveform rather than its quantitative characteristics. The CRT traces of the portable scope must be especially bright, since the ambient light level ranges from that of a computer room to bright sunlight.

## Oscilloscope performance comes first

The adage, "It's performance that counts," is certainly true with respect to oscilloscopes. A scope that has all the frills and gadgets but cannot make the required measurement is a wasted investment.

Traditionally, oscilloscope performance is measured by frequency response or bandwidth. Most creditable scope manufacturers define bandwidth as the upper frequency limit at which the displayed signal amplitude drops 3 dB below the amplitude of a lower reference frequency (the display size is 71% of the reference).

The reference frequency should be at least 20 times less than the listed upper frequency limit. Also, the bandwidth should be measured when the scope is driven by a low-impedance source nominally 25 to 50 ohms. If you have reason to question a manufacturer's bandwidth specifications, ask him what the measurement conditions are or insist on a demonstration.

You should also beware of oscilloscopes that have non-Gaussian-responding amplifiers. Gaussian amplifiers roll off at 6 dB/octave. Other types of amplifiers may have excessive peaking (to increase the upper frequency limit) and may severely alter the fidelity of the displayed signal.

The range of vertical deflection factors determines the maximum and minimum signal amplitudes you are able to view. Some vertical ampilfier designs obtain low deflection factors by merely reducing the specified bandwidth—a fact not always noted on the data sheet. Full-system bandwidth at low deflection factors is another figure of merit to consider, and may determine if a scope will fit your application.

In recent years, the trend in oscilloscope design has been toward smaller frames and larger displays. This has been achieved mainly by using solid-state devices and field-expanding cathoderay tubes. Solid-state circuitry has in almost all

# Take a close look at oscilloscope data sheets.

respects replaced vacuum-tube designs and has proved to be more reliable, particularly under severe environmental conditions like humidity, temperature, and shock.

A vacuum-tube design is probably a poor investment today. Even though the purchase price may be less, the costs of maintenance and calibration are considerably greater than that of a solid-state design. Also, the drift, noise and frequency response obtainable are usually poorer. It might be worthwhile to consider that most technical trade schools have all but eliminated courses in vacuum-tube trouble shooting.

Another performance specification is a measure of the scope amplifier's ability to reject 60-Hz and other common-mode signals. This number, expressed in decibels or as a voltage ratio, is called the common-mode rejection ratio (CMRR). Most good oscilloscopes incorporate differential amplifiers to achieve a high CMRR. The common-mode signals developed across each side of a differential amplifier literally cancel each other.

An interesting characteristic of oscilloscopes is that poor circuit design always shows up in some way on the display. Few test instruments so dramatically show their problems in this way. The table is a listing of oscilloscope features to help you make a worthwhile comparison between competitive choices by looking at important specifications.

## Should you buy, rent or lease that scope?

After you decide which oscilloscope you want, you must then consider whether to rent or to buy. If the anticipated use is for only a few months, your best bet is to rent the scope. There are many good rental companies that will have the scope you want on hand. Some will even go out and buy what you want if guaranteed only a few months' rental.

Most rental companies shy away from special oscilloscopes, simply because they try to turn over rentals as quickly as possible, and special units have little selling appeal. Rental companies typically recover the price of an oscilloscope within one year. Therefore, if you want to buy but cannot afford to now, you may want to lease.

Leasing generally costs a little more than renting, but offers the option of purchasing at a later date. If the purchase option is exercised, only a portion of the money paid for leasing applies to the purchase.

One last word of advice—always renew your evaluation at each new buying opportunity, because new product innovations may make last year's decisions obsolete.

# digital Trequenc synthesizer accuracy

If your present application utilizes precision frequency selection and highly accurate sweep characteristics, then Spectra has just solved your problem with the SE-1200. Spectra Electronics has implemented into the SE-1200 a unique sweep design that digitally selects each discrete frequency with basic synthesizer accuracy. A high degree of reset-ability and start-stop sweep accuracy is achieved that has been untouchable by commonly used analog sweeps. If you are involved in designing systems in the following areas, you need to further consider the SE-1200.

Frequency Agile Receivers 
Multiple Channel Surveillance Receivers
Chirp Radar 
Doppler Radar 
Short Term Stability Measurements
Nuclear Magnetic Resonance
Spectroscopy Automatic Test Stations 
Programmed Test Equipment

#### SPECIFICATIONS

Frequency Range	
1	Hz-1.999999 MHz
Frequency Increm	ents 1 Hz
Stability	1 pp 10 <sup>7</sup> /day
Selection	Digital
Switching Speed	400 µsec
Spurious Signals	—90 dB
Harmonic Signals	—35 dB
Output Level	1 to 2 Volts

Sweep increments are selectable from 1 Hz to full band; Sweep startstop accuracy is basic synthesizer accuracy; Sweep characteristics are linear, frequency versus time; and selectable sweep rates are 10 Hz/ sec, 100 Hz/sec, 1 KHz/sec, 10 KHz/sec.

Price: \$3595.00

# Spectrum analyzers let's look at the field

Today's spectrum analyzers make possible fast precise frequency-domain measurements because of improved instrument designs. Some of these new units now employ sophisticated digital sampling techniques or can directly compute Fourier transforms at very high speeds. There are several types of analyzers from which to choose, and the buyer can even elect to perform his measurements in real time.

#### **Review practical spectrum analysis**

The Fourier transform of a sine wave that lasts from minus infinity to plus infinity is a deltic function. Since no practical instrument is capable of observing an infinitely long function, it must measure a time-limited segment of the signal.

The Fourier transform of a truncated sine wave lasting for  $\tau$  seconds is of the form (sin x)/x with an approximate 3-dB bandwidth of 1/ $\tau$  seconds. The signal to be measured may be time-limited by the observation time of the spectrum analyzer itself, or the signal may last for only a short duration as a pulsed sine wave.

Any spectrum analyzer that is capable of analyzing a signal within its frequency coverage in  $\tau$  seconds with a resolution of  $1/\tau$  is considered a real-time spectrum analyzer. An instrument like this is capable of displaying changes in either frequency or amplitude that occur within a period of  $\tau$  seconds.

As an example, consider a spectrum analyzer that can perform over a band from 0 to 500 Hz with a resolution of 1 Hz. When supplied with a one-second sample of the signal, the instrument can display all the frequencies that exist within the analysis range with a resolution of 1 Hz. If the signal changes at a rate faster than one second, then the instrument must be capable of displaying a full analysis range with a shorter time interval. However, the resolution will not

Harold Klipper, Vice President, Federal Scientific Corp., 615 W. 131 St., New York, N. Y. 10027.

be as fine since it is the reciprocal of the shorter time interval.

#### Swept analyzers are used most

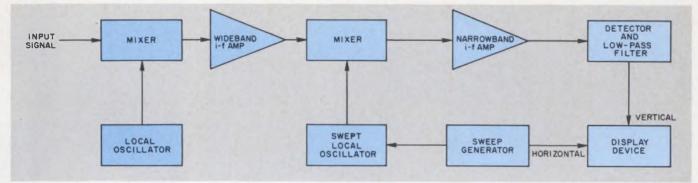

The most commonly used spectrum analyzer is the swept-frequency type. It employs a single narrowband filter whose center frequency is varied over the frequency-analysis range, while the filter bandwidth is held constant. As the filter is swept across the analysis range, its output is the magnitude of each frequency component of the input signal.

If we consider the example just given, the swept analyzer would move a 1-Hz filter from 0 to 500 Hz in order to perform the spectrum analysis. Since the effective time constant of a 1-Hzwide filter is one second, the filter must remain at each frequency location for one second.

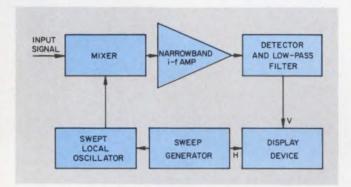

Thus, to perform an analysis from 0 to 500 Hz, approximately 500 seconds would be required. This may be entirely satisfactory if the signal lasts for 500 seconds and does not change during this time interval. However, if the signal is changing at a rate of one second, then real-time analysis is required.

The swept spectrum analyzer can be implemented in a number of forms. In most cases, this type of analyzer uses heterodyning to move the signal past a stationary filter by sweeping a local oscillator. Usually, the narrowband filter needed is implemented by using a narrowband i-f amplifier. When high resolution is required, the swept/ i-f spectrum analyzer (Fig. 1) is normally used. In this system, however, the wideband i-f amplifier normally limits the analysis range. The swept-front-end spectrum analyzer (Fig. 2) is usually used when a wider analysis range is required with moderate resolution. The electronically tuned filter spectrum analyzer (Fig. 3) is fairly new and is at present limited to measurements not requiring fine resolution.

As mentioned previously, the rate at which the filter may be moved across the band is limited by the time constant of the filter. Because of the long processing time required by the swept spec-

1. The swept/i-f spectrum analyzer is the most useful swept-type analyzer for making high-resolution measurements. Like other swept analyzers, it moves the input

2. **The swept-front-end spectrum analyzer** provides a reasonably wide frequency analysis range while giving moderate-resolution performance.

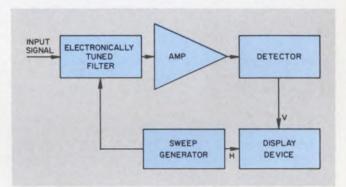

trum analyzer, it is not suitable to analyze spectra for short-duration signals.

#### Real-time instruments speed analysis

One of the first and simplest real-time spectrum analyzers uses multiple filters (Fig. 4) arranged so that the bandpass of each filter overlaps the adjacent filter, providing complete coverage of the analysis range. The output of each filter channel is proportional to the amplitude of the frequency component within the bandpass of the filter that is present at the input signal. The time constant of each filter is the reciprocal of its bandwidth.

Since each filter channel contains its own detector and low-pass filter, the output of the entire filter bank may be scanned as fast as necessary. It is possible, therefore, to scan the entire filter bank in the time constant of one filter, thus operating in real time.

There are two basic types of filter banks: one with constant bandwidth, and other with constant Q or constant percentage-bandwidth (one-third or one-octave bandwidth, etc.). In the constantbandwidth filter bank, the bandwidth of each filter is the same, but the center frequency of each filter is separated by approximately one signal past a stationary narrowband filter by sweeping a local oscillator. Its wideband i-f amplifier, however, normally limits the analysis range.

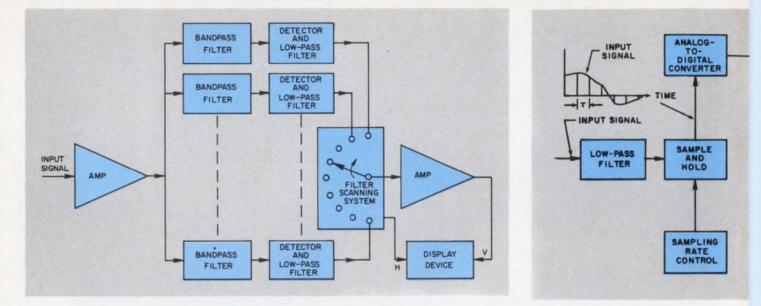

3. Electronically tuned filter spectrum analyzers are swept-type instruments, but are fairly new and limited to measurements not requiring fine resolution.

bandwidth from the previous filter. In the constant Q filter bank, filter bandwidth and spacing increase with center frequency, thus requiring fewer filters for coverage of a given analysis range.

Multiple-filter spectrum analyzers employing constant-bandwidth filter banks normally contain a few hundred individual filter channels. In order to obtain narrow bandwidth, these filters are generally centered at some frequency higher than that of the input signal. In order for the electronically switched filter scanning systems to operate properly, all filter channels must have the same amplitude response and a constant center frequency. The constant-Q filter banks generally operate at lower frequencies than the constant-bandwidth filters and consist of less than 100 channels.

#### Signal's time base can be compressed

The time-compression real-time spectrum analyzer (Fig. 5) compresses the time base of the input signal, thus expanding its spectrum and permitting it to be analyzed at very fast rates. The input signal is sampled with an analog-todigital converter, and the digitized samples are passed, in parallel binary form, into a recirculating digital memory.

4. Multiple-filter real-time spectrum analyzers cover the analysis range with adjacent filter channels having overlapping passbands. There are two basic types of filter banks—one with constant bandwidth and the other with constant Q.

Samples emerging from the memory output are fed back into the memory input. These samples are sequenced (with respect to the newly obtained input samples) so that the memory contains all samples in their order of arrival.

Thus, the time interval between successive digitized samples that emerge from the memory is extremely short compared to the interval between samples of the analog input signal. This speedup contracts the signal's time base.

The digital memory output is fed to a digital-to-analog converter. The output of this converter is an accelerated version of the original input signal. This waveform, after being passed through a low-pass filter to eliminate the sampling frequency, is applied to the equivalent of a swept spectrum analyzer.

For this application, the swept spectrum analyzer must cover a band that is S (the speedup factor) times the analysis range desired and has a filter bandwidth S times greater than the resolution required. The speedup factor is equal to the ratio of the length of the input sample to the length of the time-compressed sample (or the time between input samples to the time between samples after compression).

Consider the previous example of analyzing a band from 0 to 500 Hz with a 1-Hz resolution. Using swept techniques, the duration of the input signal should be one second. If this signal is compressed to 2 ms, the speedup factor is 500.

The input analysis range, which went from 0 to 500 Hz, would go from 0 to 250 kHz at the output, and the analysis filter required would go from 1 to 500 Hz. Since a filter with a bandwidth of 500 Hz has a time constant of 2 ms, it can be made to scan the range from 0 to 250 kHz in exactly one second, thus completing the analysis of the input signal.

#### Advantages of time compression

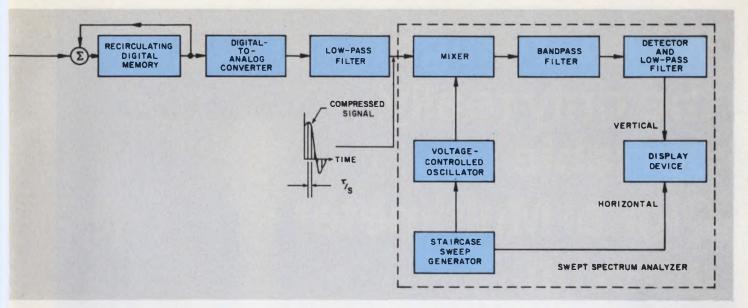

The time-compression spectrum analyzer allows the effective analysis range and bandwidth to be changed by simply varying the input sampling rate. In our example, if the input sampling rate is decreased by a factor of 10, then it will take 10 seconds to accumulate the same number of samples previously accumulated in one second. Since the output is still compressed to 2 ms, the speedup factor will be 5000 instead of the previous 500. The band of 0 to 250 kHz would then be equivalent to 0 to 50 Hz, and the 500-Hz filter bandwidth would yield a 0.1-Hz resoltuion.

The time-compression spectrum analyzer with its digital memory offers a major advantage. If at any time new data is prevented from entering the memory, the compressed input signal will continue to circulate in the digital memory. Thus, a transient or a short duration of the input signal is captured and may be continuously displayed and analyzed. In this respect, the time-compression analyzer with a digital memory behaves very much like a tape loop.

Besides the digital time-compression technique, there are a number of analog implementations for real-time analyzers, including the use of tape loops and magnetic drums. These, in general, are not widely and commercially available.

#### Other types of analyzers available

Another kind of spectrum analyzer is called the Coherent Memory Filter. It is a coherent

5. Time-compression real-time spectrum analyzers squeeze a signal's time base, thereby expanding its spectrum and permitting very fast analysis rates. The

instrument shown above uses digital sampling and a recirculating digital memory to capture even signal transients for continuous display and analysis.

delay-line integrator that performs spectrum analysis by means of an ultrasonic delay line and a heterodyning circuit in a closely regulated unitygain feedback loop. The physical phenomenon by which the spectrum analysis is performed can best be described as wave interference. This technique has not been applied to general laboratory spectrum analyzers but to system applications.

More recently, a number of signal-processing instruments are based on FFT (Fast Fourier Transform) techniques. These analyzers generally use a digital computer to obtain the Fourier transform of an input signal in real time up to a limited frequency, depending on their speed.

FFT spectrum analyzers can also find other characteristics of the input signal like the power spectral density, cross spectrum, cross power spectrum, transfer function, autocorrelation function, and the crosscorrelation function. As a rule, they are not used as general-purpose laboratory instruments, but rather as signal-processing equipment where more than the Fourier transform is required.

#### A glossary of terms

Analysis range, dispersion, or frequency coverage generally describe the frequency band over which spectrum analysis may be performed in a specified time period or in one scan or sweep. The resolution or selectivity of a spectrum analyzer is its ability to display two equal-amplitude signals separated by one resolution element. It should be noted that the complete filter shape of the analyzer is important because it influences noise bandwidth.

Sweep rate, sometimes called scan time or dis-

play period, is the time required to perform a spectrum analysis. All sweep rates available on a given instrument may not be usable for all analysis ranges and resolutions. For example, the selected resolution will determine the maximum rate for swept-type analyzers. For multiplefilter analyzers or time-compression analyzers, all display rates are usable with all analysis ranges. However, for real time operation, a sweep rate that is equal to the reciprocal of the selected resolution is required.

Sensitivity has been defined for a number of different measurements, including the minimum discernible signal, the minimum rms signal for full-scale deflection, or the condition that occurs when the signal plus noise is equal to twice the noise. The dynamic range is normally defined as the ratio of the signal for full-scale readout to the signal for minimum discernible readout.

Frequency linearity or frequency accuracy is a measure of the reliability of the display device (either supplied with the instrument or generated by the instrument's sweep output) to determine the frequency of a given response to a certain accuracy. Amplitude linearity (amplitude accuracy) is the error of the relative response of two output amplitudes with respect to the input amplitudes.

# When the lights go out, the only really portable Digital Multimeter goes on

# ...and on.

# Run the Fluke 8100A 0.02% digital multimeter anywhere, anytime up to 8 full hours off the rechargeable battery pack. Printer output now available.

BIBOA DIGITAL MULTIMETER

There are twenty or thirty digital multimeters around that lay claim to portability. The only one you can move around easily and use without a nearby wall plug is ours. It's the only portable machine that works where you need a portable machine.

True portability is just part of the story. The Fluke 8100A, with an accuracy of 0.02% and a selling price of \$795, with rechargeable battery option, gives you nine times the accuracy of three digit instruments for half the price of comparable four digit multimeters. We've used a new A to D technique to give you an instrument with low power drain for eight-hour continuous battery operation without recharging. (line operation only \$695)

The Fluke 8100A measures ac and dc volts in four ranges to 1200 volts and ohms in five ranges to twelve megohms. Readout is four full digits plus "1" for 20% overranging. Features include an active 2-pole switchable filter and automatic polarity indicator. All functions are push-button selectable.

Also available are RF and high voltage probes, switched ac-dc current shunts, a ruggedized case, and data output (line operation only). John Fluke Mfg. Co., Inc., P.O. a. Display time is customer selected (optional)

b. Display can be held

c. Offers multi-channel inputs d. Uses line time base for 0.1% accuracy e. Universal counter

f. Full counter-timer g. Offers battery-operation option

- h. Programmable
   i. Offers systems interface
   j. BCD output
- k. Includes digital voltmeter m. Features solid-state readout

n. Offers autoranging

p. Gate time selected automatically q. Display is continuously adjustable r. Crystal clock is optional

s. Features variable preset time base t. Plug in for all series 7000 oscilloscopes

u. Computing counter

v. Increases counter sensitivity by a factor of 30

(a) Dual-function instrument designed to be used as word generator and/or pulse generator.

(b) Can be used as pseudo-random signal generator for word lengths up to 1,000,000 bits.

(c) Pseudo-random signal generator only. Includes built-in error detection and automatic synchronization.

More information on the word generators in the above table can be obtained from Tau-Tron Inc., 685 Lawrence St., Lowell, Mass. 01852, phone: (617) 458-6871; or by circling 474 on the Information Retrieval card.

# **Up-to-date and thorough PE Examination Guides**

These two volumes offer the most convenient and economical coverage of the subject matter that must be mastered to successfully pass the preliminary examination (Engineer-in-Training) and the final examination for the professional license in electrical engineering.

Each concise, carefully organized volume presents problems from recent state examinations together with complete step-by-step solutions. Providing rapid access

> BASIC **ENGINEERING SCIENCES** AND STRUCTURAL ENGINEERING FOR ENGINEER-**IN-TRAINING EXAMINATIONS**

H. JACK APFELBAUM, P.E., Department of Mechanical Engineering, Lowell Technological Institute; and WALTER O. OTTESEN, P.E., Patent Counsel

Comprehensive and well balanced in its coverage of the concepts and techniques fundamental to all areas of engineering practice, this volume presents nearly two-hundred problems carefully chosen from recent examinations given by the individual states. Typical of the material the reader is likely to encounter in Engineer-in-Training Examinations, these are conveniently arranged by subject, and cover three broad areas: background material in mathematics, physics, and chemistry; the basic engineering sciences: statics, dynamics, fluid mechanics, thermodynamics, electricity, and engineering economy; and seven chapters detailing topics in structural engineering. Introductory sections precede each subject area and its fully worked-out problems, providing background in the specific concepts, principles, and terminology. More than three-hundred detailed illustrations insure a complete grasp of problem-solving techniques. #5712. 408 pages, illustrated, \$13.95

to important topics, vital for "open book" examinations, each also includes numerous pertinent illustrations and lists of references for further study.

Prepared by practicing engineers, the books have been written on the premise that the reader is versed in engineering, and that he is approaching the time when his State Board of Examiners will consider him qualified for taking the examinations.

ELECTRICAL ENGINEERING AND **ECONOMICS** AND ETHICS FOR PROFESSIONAL ENGINEERING EXAMINATIONS

JOHN S. LYONS, P.E.; and STANLEY W. DUBLIN. Institute of Environmental Medicine, New York University Medical Center

Presenting a wide range of problems in electrical engineering, this book concentrates on the subjects and topics that form the basis for an ever-changing technology. The portion of the book devoted to economics and legal and ethical considerations is equally complete, providing in-depth understanding that will prove valuable in future engineering assignments.

Almost one-hundred problems in electrical engineering range from basic circuitry to the uncategorizable "bonus" problems frequently encountered in examinations. More than onehundred-seventy illustrations illustrate the text. The section on economics features an unusual approach to such topics as interest, costs, valuation, and the like - the summarized use of formulas in solving nearly fifty typical problems. #5715, 320 pages, illustrated, \$12.95.

Hayden Professional Engineering Examination Series, LAWRENCE J. HOLLANDER, P.E., Editor-in-Chief. Subsequent volumes will focus on mechanical and civil engineering.

no lower price for mechanical refrigeration to -100° F

#### Single compressor and solid state controller mean economy plus reliability

Associated's Model SW-5101 Temperature Chamber offers a new concept in mechanical refrigeration that enables you to perform all military low-high temperature tests.

- = full 1 cubic foot test area
- temperature range from -100 to +350°F.
- all solid state controller with ± 3/4 °F stability
- delivery from stock
- adjustable high-temperature fail-safe with signal lamp
- indicating thermometer in door
- combination hinged and removable door
- bench-top design, can be modified for stacking
- stainless steel feed-through port, 3/4" diameter

Check the SW-5101 specifications against your testing requirements. You'll find they add up to outstanding performance at a down-to-earth price — without sacrifice of quality or reliability.

The new Associated catalog of environmental chambers is yours for the asking. Write for your free copy today.

# **New Products**

# Multiplying d/a converters slash prices down to \$125

 Hybrid Systems Corp., 95 Terrace

 Hall Ave., Burlington, Mass.

 Phone:
 (617)
 272-1522.
 P&A:

 \$125, \$150, \$175; stock to 4 weeks.

Utilizing four-quadrant multiplication, a series of three new lowcost multiplying d/a converters with 10, 11 and 12-bit capabilities feature price breakthroughs with costs of only \$125, \$150 and \$175, respectively, in single units.

The models 315-10, -11 and -12 multiplying converters with 10, 11 and 12 bits respectively, accept dc or ac reference signals and produce an output that is the mathematical product of this reference and the applied digital input.

They can accept positive and negative analog signals and positive and negative digital numbers. Outputs include the effect of the

AC reference multiplies a digital input which counts up at 100 Hz.

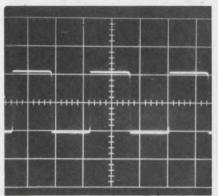

input and reference polarities.

The new converters can be used as conventional d/a converters in addition to their multiplying capabilities. Except for resolution, the three models are mechanically and electrically identical.

Typical electrical specifications include an output voltage range from -10 to +10 V, a 400-kHz bandwidth, a slew rate of 6 V/ $\mu$ s and output impedance of less than 1  $\Omega$ . Input impedance is 10 k $\Omega$  and the analog-reference voltage range is also -10 to +10 V. Operation is from  $\pm 15$ -V power supplies.

Mechanical specifications include completely self-contained modules measuring 2.8 by 3.1 by 0.4 in. Each is suitable for printed-circuit board mounting on 0.5-in. centers.

Dc reference switches digital input from ZERO to ONE state repeatedly.

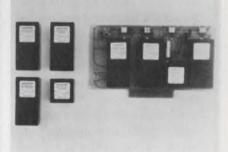

# Modular power supplies are 75% efficient

Power/Mate Corp., 514 S. River St., Hackensack, N. J. Phone: (201) 343-6294.

The HE series of power-supply modules features efficiencies of better than 75% at current and voltage ratings up to 200 A and up to 50 V dc. Forty-six models are offered in four package sizes. Builtin overvoltage and self-restoring current limiting are provided. Output current is limited on external loads. Remote sensing and programming are additional features. CIRCLE NO. 251

## Functional modules generate waveforms

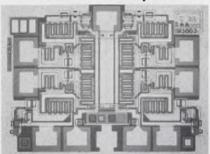

Wavetek, P. O. Box 651, San Diego, Calif. Phone: (714) 279-2200. P&A: \$54 to \$465; stock.

A unique series of modules with triggered and tone-burst capabilities can generate sine, square, triangle, pulse and ramp waveforms from dc to 100 kHz. The 120 series generators function as voltage-tofrequency converters, voltage-controlled oscillators, cw oscillators, timing signals, sweep generators, or tone-burst sources. They include four separate elements.

#### **IC's & SEMICONDUCTORS**

#### Monolithic clock driver dual sinks 1 ampere

Intersil, Inc., 10900 N. Tantau Ave., Cupertino, Calif. Phone: 257-5450. P&A: (408)\$10.70; stock.

Containing four independent outputs, each capable of sinking and sourcing up to 500 mA of current on the same MOS monolithic chip. the new IM5003 integrated-circuit clock driver can function as a dual NAND gate with a current-sinking capability of 1 A per output, when two or more outputs are paralleled with each other.

It also features a supply voltage capability as high as 30 V, with a resultant output-voltage swing of 2 V less than the supply differential voltage.

Any TTL quad driver can be used to drive the new monolithic IC clock driver to give four complete clock-driven circuits with TTL inputs in only two integrated-circuit packages.

The IM5003 clock driver can also be driven directly if the most negative MOS voltage is at ground level. It can also be driven through a capacitor when level-shifting applications are required.

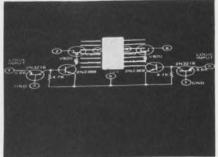

With its 1-A current-sinking capability, the new IM5003 clock driver becomes ideal for applications requiring clock drivers that can handle large currents.

A dual version of the IM5003 clock driver, known as the IM5013, will soon become available. It will contain two pairs of driver circuits that are internally wired in parallel with each other.

The new clock driver is currently available in two packaging configurations: either in a standard 14-pin dual-in-line case or in a TO-8 case. It is priced at \$10.70 for 100-piece quantities and is available from stock.

CIRCLE NO. 253

#### Flatpack analog switch has 50- $\Omega$ ON resistance

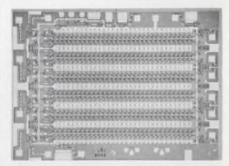

Crystalonics, A Teledyne Co., 147 Sherman St., Cambridge, Mass. Phone: (617) 491-1670. P&A: \$40; stock.

The flatpack CAG13C dual FET analog gate is a spst break-beforemake switch with maximum ON resistance of 50  $\Omega$ . It consists of two separate switch circuits capable of switching up to  $\pm 9$ -V signals and being controlled directly from most logic circuits. In addition to its zero-offset voltage, it turns off faster than it turns on for multiplexing without crosstalk.

CIRCLE NO. 254

#### **MOS/LSI** static register has six 32-bit content

Texas Instruments, Inc., 13500 N. Central Expwy, Dallas, Texas. Phone: (214) 238-2011. P&A: \$11.20; stock.

The TMS3112 is a MOS/LSI static shift register organized as six registers by 32 bits. Standard power-supply requirements for the new register are +5 and -12 V. Direct interface is possible with TTL and DTL circuits without input or output resistors. Only a single clock with a TTL swing is required, which can be easily obtained from a normal TTL gate.

#### DATA PROCESSING

#### **Flexible processor** starts from \$2450

Ferroxcube Corp., 5455 S. Valentia Way, Englewood, Colo. Phone: (303) 771-2000. P&A: \$2450 (basic FDC-302 unit); 60 days.

Designed for the OEM user who needs a low-cost and high-speed flexible processor, the new FDC-300 programmable digital controller features building-block system expandability starting with a low basic price of \$2450 (100-unit quantities or more).

The new system is composed of a frame with memory on plug-in cards. Additional plug-in cards containing logic circuitry turns the system into a processor. Furthermore, the user has the advantage of optionally purchasing whatever I/O hardware he needs, such as Teletype or punch cards, all of which are on plug-in cards.

The FDC-302 is the basic controller unit housed in a 5-1/4-in. rack-mountable chassis, which includes a core memory configuration of 4096 words by 18 bits with a full cycle time of 2.5  $\mu$ s. It is made up of 9 plug-in cards.

The system's memory is field ex-pandable up to 32,768 words which are directly addressable. It can logically operate upon full 18-bit words of 6 octal 3-bit bytes.

The controller organization uses minimal hardware in a logical configuration that also provides processing capabilities through 11 basic software techniques. This approach provides a controller system with sufficient processing speed at a low cost for most OEM processing applications.

The FDC-300 system is DTL/ TTL-interface compatible and contains program-interrupt control. It includes a plug-in control panel that contains sense switches and data indicators. Direct memory access is optionally available with a transfer rate of 400 kHz.

CIRCLE NO. 256

It's here - the first rf millivoltmeter to digitally readout both mV and dBm. The Model 92AD also is programmable, has binary coded decimal, range, and function outputs, and offers autoranging. Added to these features is the final touch of a vertical edge-meter that simplifies zeroing, peaking, and nulling operations.

Accuracy at all frequencies and voltage levels is the best ever offered by Boonton, long a leader in the rf millivoltmeter field. Created as the last word in "no-involvement" rf voltage measurement,

the 92AD may be easily integrated into a test console or computer-controlled test system.

#### DATA PROCESSING

#### Miniature calculator weighs only 38 oz

SCM Corp., 299 Park Ave., New York, N. Y. Phone: (212) 752-2700. Price: \$495.

A new lightweight portable calculator features dimensions of only 10 by 5 by 2 in. in a 38-oz package. It contains a built-in memory and an eight-numeral readout for displaying divisions, multiplications, additions, subtractions and accumulated products or quotients. It can also retain a constant multiplier or divisor for applications requiring repetitive calculations.

CIRCLE NO. 257

#### MOS/LSI keyboard encodes on one chip

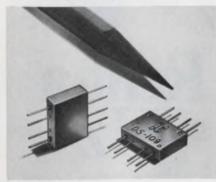

Clare-Pendar Co., P. O. Box 785, Post Falls, Idaho. Phone: (208) 773-4541. Availability: stock.

Up to 9 bits and 4 levels of encoding are accomplished on one chip in a new 88-key LSI/MOS keyboard. It uses a scanning technique that searches for a switch closure. Upon detecting a closure, valid encoded data appears at the bit outputs and a strobe appears to signal valid data. Features include 200mW power drain, two-key rollover and TTL/DTL/MOS compatibility. CIRCLE NO. 258

#### MICROWAVES & LASERS

# Broadband rf devices use tiny flatpacks

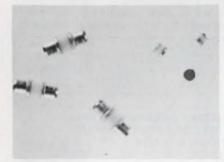

Anzac Electronics Div. of Adams-Russell Co., Inc., 39 Green St., Waltham, Mass. Phone: (617) 899-1900.

A new series of rf signal-processing components features subminiature flatpack configurations of only 0.125 by 0.375 by 0.5-in. The devices include a double balanced mixer (MD-113), a two-way isolated power divider (DS-109) and a hybrid magic-tee (HH-104), all covering the range of 10 MHz to 1 GHz.

CIRCLE NO. 259

# Schottky mixer diodes lower noise to 6 dB

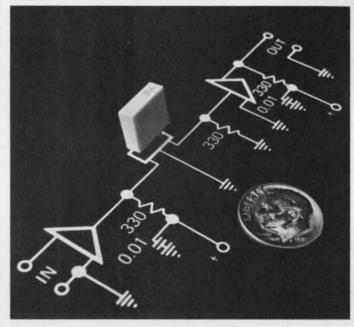

Aertech Industries, 825 Stewart Dr., Sunnyvale, Calif. Phone: (408) 732-0880. P&A: \$12 to \$36.50 (single units) \$26 to \$80.50 (matched pairs); stock to 3 wks.

Two new series of silicon Schottky-barrier mixer diodes feature noise figures as low as 6 dB. The A2S106 series provides 6 dB maximum noise figure at 9.375 GHz, while the A2S122 series provides 6.5 dB maximum noise figure at 16 GHz. Other units are available in flat-pill, prong-pill, chip and carrier configurations.

CIRCLE NO. 260

# If you'd like to make your FM radio 20 times smaller, we've got just the filter for you.

Our new 10.7 megahertz FM filter — the FM-4 — measures only 0.016 cubic inches in volume. But it replaces four tuned circuits more than twenty times its size. Price is competitive with IF cans, and it saves additional dollars by reducing the number of components and interconnections in your IF strip. It's just a sample of what Vernitron can do in piezoelectric filters — in which we've done the lion's share of development.

The FM-4 is based on the coupled-mode monolithic technique developed for our quartz filters. Result is a new level of performance — higher adjacent channel rejection, distortion less than ½ percent, bandwidths characteristically 235 kHz at 3 dB and 825 kHz at 40 dB. Insertion loss about 3.5 dB. It's just a sample of what we can do in piezoelectric filters — in which we've done the lion's share of development.

So, if you're on a size-reduction kick — or a cost reduction kick — our neat little FM-4 is a good place to start. In fact, for high-quality filters for almost any kind of communication equipment — military, commercial or consumer — get in touch.

Vernitron Piezoelectric Division, 232 Forbes Road, Bedford, Ohio 44146. Or: Vernitron (U.K.) Limited, Southampton, England.

#### The "no maintenance" PUNCHED TAPE READER

No edge guides No capstans, pinch rolls or brakes No lenses No lubrication No adjustments

You may have to replace this bulb after 25,000 hours.

New DECITEK Punched Tape Readers give greater accuracy, freedom from maintenance and longer tape life. With 20% to 30% fewer parts than units of comparable performance, they start, stop and hold tape accurately through a stepping motor/ dual sprocket bi-directional drive. Tests at 300 cps for more than a quarter-million cycles showed insignificant sprocket hole wear. **DECITEK Readers interchangeably** read 5, 6, 7 or 8-level paper, paperpolyester or metallized polyester tapes at 60 to 600 cps. Fiber optic elements illuminated by a single, easily replaced bulb eliminate crosstalk and partial or bit failure. Photo-

transistor sensing delivers high signal-to-noise ratio outputs. Inputoutputs are TTL or DTL compatible. For technical brochure, write DECITEK, 16 Sagamore Rd., Worcester, Mass. 01605. Call (617) 757-4577.

MICROWAVES & LASERS

# Beam-lead arrays use 1000 sensors

Texas Instruments, Inc., 13500 N. Central Expressway, Dallas, Tex. Phone: (214) 238-2011. Availability: 3 to 5 wks.

Custom-designed beam-lead sensor arrays are now available with anywhere from 50 to 1000 beamlead phototransistors on a PC board. They are available for either X-Y or linear addressing. Phototransistor beam-tip-to-beamtip size is 0.055 in. permitting array construction with center-tocenter spacing of 0.06 in. Placement accuracy for individual sensors is  $\pm 0.002$  in. Light and dark currents are 0.75 mA at 20 mW/ cm<sup>2</sup> and 0.1  $\mu$ A, respectively.

CIRCLE NO. 261

#### Red GaAsP LEDs emit 5000 foot-lamberts

Monsanto Electronic Special Products., 10131 Bubb Rd., Cupertino, Calif. Phone: (408) 257-2140. P&A: \$13.50; stock.

A new series of high-power red LEDs make possible typical light output levels of 5000 foot-lamberts at 2 V and 1 A. The MV 4 series has light output wavelength of 6700Å which is controlled to  $\pm 200$ Å, well above the sensitivity range of most photographic films. The series can allow peak currents to 25 A for 1- $\mu$ s durations at rates to 300 pulses/second. The MV 4 series are diffused planar GaAsP diodes.

CIRCLE NO. 262

# Wideband attenuator holds down phase shift

Koch Industries, 401 S. Dale St., Anaheim, Calif. Phone: (714) 527-1864. P&A: \$175; 30 days.

Operating over the frequency range of 3 to 65 MHz, the model 1001 wide-band voltage-controlled attenuator provides very low phase shifts of  $\pm 4$ ,  $\pm 1.5$  and  $\pm 0.7$  degrees for 30-dB attenuation at 50, 20 and 5 MHz, respectively. Its maximum attenuation is 50 dB.

CIRCLE NO. 263

When your laboratory needs a precision oscillator, or a pulse generator, or some other reasonably sophisticated instrument, should you buy it? Maybe not. As with a house or a car or a computer, there's a time to buy and a time to rent.

Actually there are a number of pretty good reasons for renting precision instruments any time . . . the elimination of problems like maintenance and calibration for example, or how to handle peak loads, or what to do with instruments that are obsolete or no longer needed. But let's face it, the most important reason is money. Frequently, renting instead of purchasing can save dollars, free capital for other uses, or provide financial advantages in other ways. So before you pay till it Hz, think RENTAL.

R.E.I. can give you the fastest service, the widest selection and the lowest rates of any rental firm in the country. One of our inventory centers is located near you, wherever you are, for instant delivery. Let us tell you more about the many advantages of renting vs. buying. Send today for your free copy of the new R.E.I. Instrument Rental Handbook.

# $10 \cdot \mu$ F 50-V capacitor is 0.5 by 1.87 in.

Wesco Electrical Co., Inc., 27 Olive St., Greenfield, Mass. Phone: (413) 774-4358. Availability: 4 to 5 wks.

Type 32MPC metallized polycarbonate capacitors are available in voltage ratings from 50 to 200 V dc with a 50-V 10- $\mu$ F unit measuring only 0.4 in. in dia by 1.187 in. long. Temperature range is -55 to +85°C. Retrace or stability is less than 0.3% and capacitance change is less than  $\pm 0.25\%$  from +25 to +85°C. Capacitance range is 0.012 through 10  $\mu$ F and standard tolerance is  $\pm 10\%$ . Tolerance to  $\pm 1\%$ is also available.

# A Compact S-Band TRAVELING-WAVE TUBE Performing with 45% EFFICIENCY 100 WATTS POWER OUTPUT

#### That's what you'll get from the WJ-395-1!

And you can vary the output level from 60 to 120 watts while maintaining a fixed value of rf drive with no significant change in efficiency by simply operating the tube under different sets of voltages.

Metal-ceramic construction of the WJ-395–1 is just one of the design features that ensures the maximum in reliable, long-life operation. Other features include small

size  $(1.6 \times 1.8 \times 13.5 \text{ inches and } 2.8 \text{ lbs.})$  and the ability to withstand extreme temperature, vibration, shock and static acceleration.

Power output, gain and overall efficiency are very nearly constant over the guaranteed frequency range of 2.2 to 2.3 GHz. The tube is designed to meet the power amplifier requirements of earth-orbit and deep-space missions, where high reliability, small size, light weight, and maximum overall efficiency are essential.

#### Tiny 3-1/2-digit DPM has GaAs LED readouts

Digilin, Inc., 1007 Air Way, Glendale, Calif. Phone: (213) 240-1200.

Containing a 3-1/2-digit display, type 3330 digital panel meter shrinks its size with a ruby-red GaAs LED readout. It measures just 1.15-in. high by 2.04-in. wide by 5-in. deep and is accurate to 0.1% full scale  $\pm 1$  digit. It automatically zero-adjusts itself, has external programming, is frontpanel relampable and offers optional BCD output. Input impedance is 100 MQ.

CIRCLE NO. 274

#### 3-1/2-digit multimeter retails for just \$275

Eldorado Electrodata Corp., 601 Chalomar Rd., Concord, Calif. Phone: (415) 686-4200. P&A: \$275: stock.

The model 1800 is a 3-1/2-digit 0.1% digital multimeter retailing for the low price of \$275. It measures 0.2 to 1000 V ac and dc in 5 ranges each, 200  $\Omega$  to 2 M $\Omega$  in 5 ranges, and currents of 200  $\mu$ A ac and dc with 200-nA resolution. Input impedance is 10 M $\Omega$  and measurement is by the dual-slope integration method. Battery operation is optionally available.

CIRCLE NO. 275

#### Versatile curve tracer comes in a \$79.95 kit

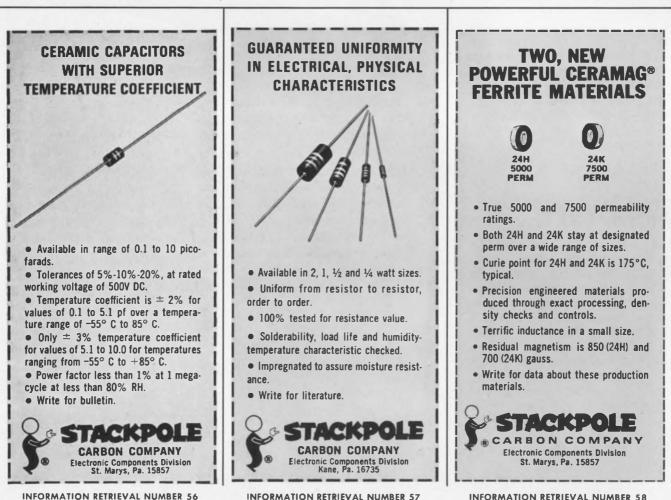

EICO Electronic Instruments, 283 Malta St., Brooklyn, N. Y. Phone: (212) 949-1100. P&A: \$79.95 (kit), \$119.95 (wired); stock.

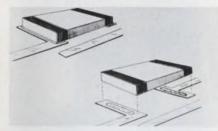

Diodes and signal and power transistors can easily be tested by the model 443 curve tracer which is available in kit form for only \$79.95. Its output is displayed on an oscilloscope. Diode tests include forward and reverse currents and voltages with variable 0-to-1400-V PIV tests. Transistor tests include  $h_{FE}$ ,  $h_{OE}$ ,  $I_{CEO}$ ,  $V_{CE}$  and  $BV_{CEO}$ .

### One-part silver epoxy bonds hybrid strips

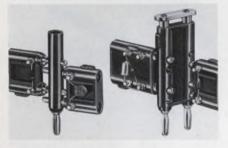

Epoxy Technology, Inc., 65 Grove St., Watertown, Mass. Phone: (617) 926-0136. Price: \$15/trial kit.

A new single-component electrically-conductive silver epoxy bonds chips in hybrid circuits. Epo-Tek H31 is a soft, smooth, slightly thixotropic, flowable paste of 100%-solids composition. Its volume resistivity is 0.0001 to 0.0005 ohm-cm and it cures in 15 minutes at 150°C or in 45 minutes at 120°C. It may be used at 200°C continuously or 350°C for short durations.

CIRCLE NO. 277

#### Series-parallel plugs build voltage networks

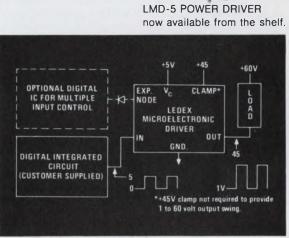

Pomona Electronics Co., Inc., 1500 E. 9th St., Pomona, Calif. Phone: (714) 623-3463. P&A: \$1.50, \$3.25; stock.

A new group of series-parallel isolation plugs can be used to build voltage dividers, attenuators, and other networks. The group consists of two versions: model 3501 single plug and model 3502 dual plug. Both items provide top banana jacks and upper pairs of cross holes isolated from lower cross hole pairs and banana plugs.

### New hybrid thick-film driver switches 325 watts

Typical Application and Connection Diagram

#### Typical Specifications

Control voltage	+ 12V
Output voltage	+65V
Continuous current	5 Amp
Pulsed current	7 Amp
Operating temp. range	-65 to +150°C

Need fast, custom designed hybrid electronics? Come to us.

We designed this unit to drive 5 to 7 amp lamps, solenoids, motors or other peripheral components. It converts low level input control signals into output levels high enough to drive the heavier loads.

#### **Fast Custom Design**

We're equipped to give you fast design and prototype service on any custom hybrid microelectronics package. Our engineers will come to you, if that's what you need.

You'll find our delivery dependable and our production standards among the highest in the industry.

The circuit described above is now stocked. Ask for catalog sheet. Or, for the whole story on our capability, write for brochure "Custom Hybrid Microcircuits."

# Put your frequency in shape for data transmission

Bulova computer-programs LC filter designs to select and shape frequencies that meet your data transmission specifications — commercial or military — for maximum performance, from DC to 80 MHz. Bulova can supply standard or custom designed low and high pass filters or bandpass filters to shape signals, eliminate noise and reduce error rate, or to make maximum use of the bandwidth available. Tone channel filters, IRIG filters or special filters and inductors are made to meet high use, long-life reliability.

Bits, Bytes, words — for your data transmission, or any other job that demands quality electric wave filtering, look to Bulova for performance that's reliable at costs that are realistic.

For data on Bulova LC filters, call (212) 335-6000, see EEM Section 2300, or write —

### Evaluation Samples

#### **Cable ties**

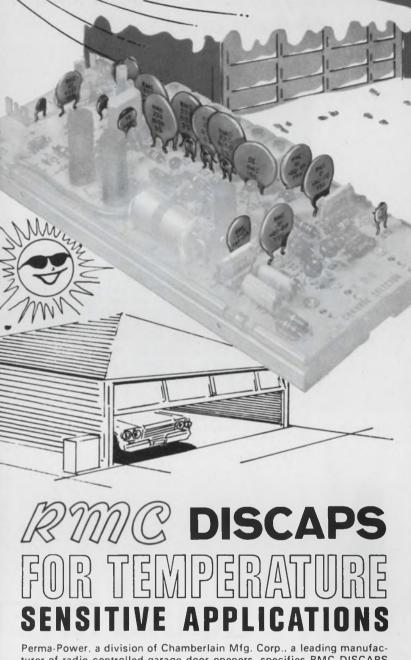

A new line of one-piece, all-nylon Pan-Ty cable ties offers all the advantages of 90-degree tie insertion into a self-locking head, as well as a curved-tip and low-profile design. Six cable ties are available for bundle sizes up to 4 in. in dia. These are available in miniature. intermediate, standard and heavy cross-section sizes. They meet all applicable military specifications and are offered in natural nylon and ten other colors. New Pan-Ty cable ties can be installed by hand or with tension-controlled production harnessing tools. They contain no metal barbs and require no twisting. Serrations at the top of the lead end of the cable tie provide a finger-grip tip which assists in pulling cable ties tight. Free samples are available. Panduit Corp.

CIRCLE NO. 286

#### **Foil chips**

A complete range of baked epoxycoated foil chips is available in many colors, textures and shapes. They are composed of minute uniformly cut particles of highly polished aluminum foil, with or without light-fast color pigments baked into an epoxy coating. They are compatible with polyester and epoxy resins, acrylic lacquers, vinyl or plastisol. Individual pigment particle size ranges from 0.004 by 0.002 by 0.00045 in. to 0.125-in. square by 0.002-in. thick in rectangular, square, hexagonal and star shapes. Additional sizes and shapes can be made to order. A chip sample folder is available. Meadowbrook Inventions, Inc.

# lots more about pots.

When you need a trimming potentiometer to meet *any* configuration, you can depend on WESTON to supply the right unit. Volume production of ¾-inch rectangular pots, the 530-533 Series enables Weston to supply these models at the lowest prices in the industry. We'll supply them in wirewound with a temperature coefficient of  $\pm$ 70 ppm/°C maximum, or CERMET with a T.C. of  $\pm$ 100 ppm/°C, maximum. Prices are as low as \$1.09 each in quantities of 500 units, with substantial reductions in larger quantities. Delivery is from stock.

Then, too, it's hard to beat our <sup>1</sup>/<sub>2</sub>-inch 701 Series Squaretrim<sup>®</sup> potentiometer available with either commercial or military specs. Prices are as low as \$1.85 each in quantities of 500 units.

When you want a small, single-turn, wirewound Squaretrim<sup>®</sup> potentiometer, order the 501-505 Series. Prices are as low as \$1.95 each in quantities of 500 units.

Buy them all from WESTON.

For samples or complete details on any or all of these units, call 717-876-1500, or write Weston Components Division, Archbald, Pa. 18403, *a Schlumberger company*.

# Synchron motors help money

In the vending business, a would-be customer with dollar bills and no coins might just as well be flat broke. Unless there's a bill changer around. Like this one made by Rowe International.

Feed it a dollar bill and, presto! Instant alchemy. That useless paper is turned into spendable change.

The acceptance of the bill provides a signal which is transformed into multiple pulses in a Hansen-actuated electromechanical pulse chopper. Impulses are then sent to a memory unit and the payoff is actuated. The major reason why Hansen motors are specified:

Dependability Contact your Hansen man and find out how Hansen dependability can help you

of product news and developments

A new video playback system known as Video Disc., utilizing thin plastic discs that play at 1500 revolutions/minute, has been jointly developed by London Records, subsidiary of British Decca of England, Teldec, and AEG-Telefunken of Western Germany. The new system uses 12-in. recorded discs containing five or twelve minutes of moving picture/ sound information. These are reproduced through a color or monochrome television set to which a video disc player is attached via the TV set's antenna terminals. The system is expected to be available for marketing in about 18 months. Tentative prices are \$150 for a manual player and from \$250 to \$300 for an automatic player.

CIRCLE NO. 355

Signetics Corp., Sunnyvale, Calif., is adding 50% more circuits to its Utilogic II line of dual-in-line silicone packages during the months of October and November, 1970. The new products include 3 MSI elements (two counters and one shift register), several AND gates, power drivers, a dual type-D flip flop and other devices.

CIRCLE NO. 356

Lockheed Electronics Data Products Div. has developed an 18-mil core for data-storage memories, known as the 18MTO5, that requires a drive current of only 420 mA yet features switching speeds as fast as 270 ns. According to Lockheed, this low drive current compares favorably with typical drive-current requirements for 18-mil cores of 750 to 800 mA for the same switching speeds. Lockheed says that future cores with 14-mil sizes and with the same low drive currents will become available.

NEW RELAY SOCKET ASSEMBLIES CATALOG

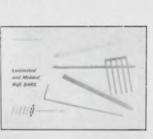

The new Curtis line of printed circuit snap-in track-mounted relay socket assemblies is completely illustrated in this new 2-color, 6 page catalog. Variations include RS8 octal relay sockets, as well as RS11 and RS15 with eleven and fifteen pin relay sockets. Complete dimensional drawings and list prices are included. All units snap in or pop out vertically from prepunched vinyl track and feature Curtis barrier terminal blocks. CSA approved. Send today for your free copy.

#### **Bus Bars For Noise Reduction**

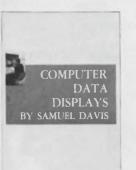

A 16 page Technical Bulletin is now available, describing a new concept in power or signal distribution. Basic mechanical and electrical design principles, along with descriptive pictures and diagrams, are included in this bulletin. These compact buses can replace bulky cable harnesses and repetitive wiring for computer or modular application. This method of construction satisfies the demanding requirements of low inductance and resistance of high speed, solid state systems. while controlling electrical noises.

# Devices, subsystems & design methods in computer data display

A 416-page guide to computer data displays, including the latest devices, subsystems, & techniques found in cathode ray tube displays. Brings you vital know-how on the latest techniques in character & line generation — provides hardwareoriented descriptions to thoroughly acquaint you with details for a wide variety of alphanumeric & graphic display systems. Detailed explanations, such as for deflection, Z-axis, & display processing subsystems, help you improvise on current techniques & create your own designs. Pub. Dec. 1969, 416 pp., 233 illus., 6" x 9", \$15.95. Circle the reader-service number below for a 15-day examination copy.

ELECTRONIC DESIGN 24, November 22, 1970

# **Electronic Design**

ELECTRONIC DESIGN'S function is:

• To aid progress in the electronics manufacturing industry by promoting good design.

• To give the electronic design engineer concepts and ideas that make his job easier and more productive.

• To provide a central source of timely electronics information.

• To promote two-way communication between manufacturer and engineer.

Want a subscription? ELECTRONIC DE-SIGN is sent free to qualified engineers and engineering managers doing design work, supervising design or setting standards in the United States and Western Europe. For a free subscription, use the postfree application form inside the back cover. If none is included, write to us direct for an application form.

If you do not qualify, you may take out a paid subscription for \$25 a year in the U.S.A., \$35 a year elsewhere. Single copies are \$1.50 each.

If you change your address, send us an old mailing label and your new address; there is generally a prepaid postcard for this inside the back cover. You will have to requalify to continue receiving ELECTRONIC DESIGN free.

#### The accuracy policy of ELECTRONIC DESIGN is:

• To make reasonable efforts to ensure the accuracy of editorial matter.

• To publish prompt corrections whenever inaccuracies are brought to our attention. Corrections appear at the end of the Letters column.

• To refuse any advertisement deemed to be misleading or fraudulent.

Microfilm copies are available of complete volumes of ELECTRONIC DE-SIGN at \$19.00 per volume, beginning with Volume 9, 1961. Work is now in process to complete the microfilm edition of Volumes 1-8. Reprints of individual articles may be obtained for \$2.00 each, prepaid (\$.50 for each additional copy of the same article) no matter how long the article. For further details and to place orders, contact the Customer Services Department, University Microfilms, 300 North Zeeb Road, Ann Arbor, Michigan 48106; telephone (313) 761-4700.

Want to contact us? If you have any comments or wish to submit a manuscript or article outline, address your correspondence to:

> Editor ELECTRONIC DESIGN, 850 Third Avenue, New York, N.Y. 10022.

# **Design Data from**

### **Quality Fasteners For All Designs**

This 8-page catalog provides design data on the complete group of DZUS 1/4-turn self-locking fasteners for standard, high speed and panel applications, as well as universal high strength multiple thread fasteners for high tensile and shear stresses. Dzus stud assemblies, wire forms and receptacles offer an exceptional, wide variety of combinations from stock to fit specific fastening requirements. Diagrams and tables give full details for rapid, unlimited design selection. Condensed or complete Catalog available on request.

#### **PEMHEX Self-clinching, Self-locking Nuts**

PEMHEX® fasteners are self-clinching to ensure permanent mounting in metal sheets 0.040" and thicker, and they mount with a squeeze into predrilled holes. A blue nylon element in each PEMHEX fastener provides thread-locking capabilities meeting or exceeding MIL-N-25027C\* specifications, and its hexagonal configuration prevents loosening or rotating in service. A PEMHEX nut can be used 15 times or more while maintaining prevailing torque. Here's a fastener that is reliable, economical and permanently mountable on thin metal. It's patented using PEM® self-clinching design.

# Mini-Computer Mated with Real-Time Analyzer for Automatic Testing

Complete Spectrum Processing System SP-6-1 automatically scales, equalizes, processes underwater acoustic data and noise/vibration signatures for production testing. Monitors on-line signals (nuclear reactor noise, heart sounds, machine tool vibration), recognizes aberrations, gives alarm. Setup conditions are entered via teletype unit as requested by computer. System prints out **all** spectral data or only frequency amplitude above preset levels. Data also pre-recordable on tape, played back often faster than real time. Analysis over frequency bands as wide as 40 kHz are possible. Many options. **CIRCLE NO. 176**

### NEW PLUG-IN PRINTED CIRCUIT POWER SUPPLIES

DUG POWER MATE CORP.

Power/Mate Corp. has introduced a new complete line of 129 models of Printed Circuit DC regulated power supplies now described in this 4 page catalog. These 129 CARD-PAC models collectively cover from 3.6 to 48 vdc and currents up to 2 amps. The CARD-PACS feature adjustable DC outputs, low cost, high performance and Power/ Mate's full five year warranty. The catalog covers complete specifications, model numbers, sizes and prices. Write, call or twx for your free copy.

#### A guide to computerized analysis & design

Use this new 448-page guide in putting the speed & accuracy of the computer to work in solving your analysis & design problems. Shows how to use z-transform in analyzing & synthesizing discrete time systems. Information on the analytical design of discrete systems helps you solve modern discrete-control problems such as minimum time & energy problems. Includes many analog, digital & hybrid computer techniques for systems simulation. Worked out sample problems & computer programs further help you in both solving analysis problems & implementing design objectives. Pub. Aug. 1970, 448 pp., 224 illus., 6" x 9", \$15.95. # New High Q Toroids

DALE

COIL

COUNTRY

Now PC-mount toroids designed to meet MIL-T-27C are part of Dale's growing standard inductor line. Two epoxy encapsulated styles: TE-2 (.437d x .270h) and TE-3 (.685d x .385h) conform to Type TF5SX20ZZ. Inductance range: .05 mh to 400 mh; Frequency: Audio to 5 mHz. And there are more styles coming to meet your applications for wave filters, frequency discriminators, DC power supplies and loading coils. Give Dale a shot at your next toroid requirement. Standard or special, you'll find there's plenty of time and money to be saved in Coil Country.
