FREQUENCY MEASUREMENTS OF BROADCASTING STATIONS DURING NOVEMBER

During this month the Radio Division of the Department of Commerce measured the frequency of 383 broadcasting stations representing an increase over the next highest month, viz., October, when 381 were measured. One hundred and fifty-three, or 40 per cent deviated less than 50 cycles; 86, or 22.5 per cent

deviated less than 100 cycles; 76, or 20 per cent, deviated less than 200 cycles. The others, numbering 68, or 17.5 per cent, went over 200 cycles. A considerable gain over previous monthly lists is indicated in the class deviating less than 50 cycles.

The following table gives the figures for the months December, 1930, to November, 1931, inclusive:

Month	Number stations measured	Less than 50 cycles	Less than 100 cycles	Less than 200 cycles	Over 200 cycles

PRELIMINARY NOTE ON AN AUTOMATIC RECORDER GIVING A CONTINUOUS HEIGHT RECORD OF THE KENNELLY-HEAVISIDE LAYER

In a paper of the above title, by T. R. Gilliland and G. W. Kenrick, Research Paper 373, Bureau of Standards Journal of Research, November, 1931, a description is given of a preliminary installation of a recorder which gives a continuous automatic record of the height of the Kennelly-Heaviside layer. The pulse signal or group retardation method is employed with modifications which permit a continuous record to be made. Suggestions are made for improvements which might be incorporated in a permanent installation. Reprint copies of this paper will be available within a few weeks and may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C. The price will be quoted by that office on application.
