NEW A-P RECTIFIER TUBE FOR EXPERIMENTAL CW

Price \$9.75. Diagram of connections furnished free with each tube. Come on, you CW enthusiasts! It's for you—a brand new rectifier tube for your experimental CW, which makes the expensive high voltage DC generator unnecessary. Simply step up your 110 V. A C lighting supply with a small transformer to 350, 500, or 750 volts, and two of the new tubes do the rest, rectifying both halves of the cycle so the plates of your transmitting tubes get all the high potential direct current necessary—without the use of a high voltage generator.

The A-P Rectifier has a 75 milliampere carrying capacity, which is sufficient to operate five A-P Transmitting Tubes in parallel. For high power CW transmission, use additional A-P Rectifier Tubes in parallel.

A-P Rectifiers used in Type O A-C DeForest Radiophones are equipped with the SHAW standard condensite fourprong base, and licensed under SHAW patents. Price \$9.75. Order from your dealer or direct from addresses below.

The New A-P RECTIFIER TUBE

RADIOTRONS

"A TUBE FOR EVERY NEED"

Radiotrons are now recognized as the amateur's and experimenter's standard for Radio detection, amplification and power work. They are available at established Radio dealers throughout the United States.

Scientifically designed and manufactured in the country's largest lamp factories, Radiotrons come to the experimenter with uniform and dependable characteristics.

One of the following tubes is certain to meet your requirements

U. V. 200 DETECTOR \$5.00

U. V. 201 AMPLIFIER \$6.50

U. V. 202 POWER TUBE 5-Watt \$8.00 U. V. 203 POWER TUBE 50-Watt

\$30.00

U. V. 204 POWER TUBE 250-Watt \$110.00

The Radio Corporation's tubes are covered by patents dated November 7th, 1905, January 15th, 1907, and February 18th, 1908, as well as by other patents issued and pending. Tubes licensed for amateur and experimental use only. Any other use will constitute an infringement.

Your dealer has Illustrated Bulletins on Radiotrons, or write direct to

San Francisco, Calif.

We RADIO MAGNAVOX

BRINGS IN THE WEAK SIGNALS

In spite of the fact that the Radio Magnavox when used with a suitable amplifier, will give forth stronger signals than any known receiver, it is, by reason of its patented electrodynamic design, extremely sensitive to weak signals also. And remember that full field strength is not necessary for the average signal. Less than one ampere through the field will be sufficient for all but the very weakest, or when extreme volume is necessary.

Price \$45 At Your Dealers

If you are building a Radiophone be sure and use Magnavox Transmitter microphones—They will give you Maximum Modulation.

RECEIVERS GOOD IN USER'S OWN

View of Paragon R. A. Ten Amplifying Short Wave Regenerative Receiver - identical with the sets used in these tests.

Licensed under Armstrong and Marconi Patents.

Prominent amateurs endorse Paragons after careful tests and comparisons. "Comes up to all advertised requirements," says Y. M. C. A. Radio School.

A great number of genuine Paragon R.A.Ten Regenerative Receiving Sets are now in actual use, more than fulfilling every advertised su-

periority.

Mr. J. L. Hornung of the Department of Education, East Side Y. M. C. A., writes:

Gentlemen:
We are in receipt of your
Paragon R. A. Ten Regenerative Receiver and wish to extend a few words of apprecia-

tend a few words of approximation.

The receiver has been given a due trial, in which comparative tests have been made with the best types of regenerative receivers now on the market. We find that it comes up to all of the specified requirements made in your advertisements without any contradictions whatsoever!

Very truly yours,
Y. M. C. A. Radio School.

By J. L. Hornung.

"Heard Stations Never Heard Before"

A recent advertisement for Paragons carried the headline, "You'll hear stations you never heard before." In this connection, this letter from J. Edw. Brown is interesting.

Gentlemen:

Gentlemen:

Gentlemen:

I thought it may be of interest to you to know about the Paragon R. A. Ten Receiver just installed a short time ago.

I hooked this up on the evening of Jan 8. The first thing picked up was Wisconsin. From that time on we "heard stations that had never been heard before" in this section.

I picked up the steamer Glouster (KQG) off Barnegat, talking to Asbury Park on detector alone, as the first stage ampli-

Outstanding features of the Genuine

PARAGONR. A. TEN

(Registered U.S. Patent Office) Amplifying Short WaveReceiver Wave length, 160 to 1,000

meters. Amplification 100 times.

lo dead end losses whatever. Vernier attachments on all controls.

Coupling has scale of 1800. Free from all body capacity effects.

Guaranteed for two years.
"The weaker the signal, the stronger the amplification." Price, eighty-five dollars.

fer was uncomfortable for the ears.

Another surprise was that the instrument seems to be protected, as I failed to get any body capacity whatever!

This is the best by far that I have ever heard—especially for strength of signals on detector alone.

alone.
I congratulate you on having such a wonderful machine—and at the price of \$85.00—for at this amount it places the instrument within the reach of most amateurs.

Very truly,

J. Edw. Brown.

Another amateur with a similar experience writes:
Bayshore, New York.
Gentlemen:
I have recently had the pleasure of trying out one of your Paragon R. A. TENS, and I am taking this time to congratulate you upon the design and con-

struction of the tuner that, in my opinion, is the best thing that ever was placed on the market. Stations that, before the R. A.'s installation were QRZ, or not heard at all, pounded in as though a two step had been added to the set; and the tuning was much sharper than I had hitherto ever experienced.

and the tuning was much sharper than I had hitherto ever experienced.

There are two points that are especially to be commended: The ability to tune down to 150 meters with no loss of amplification, and the insensitiveness of the tuner to external capacity effects. These two points render it entirely possible to handle traffic by long jumps under the jam of 200 and up. I trust that you may be interested in the results as enumerated, and in the points of superiority, over other tuners, that struck me forcibly.

Very truly yours, 2BGR

Tremaine House. as

The letters quoted here, as well as many others of similar nature, are on file at our office. Such whole-hearted endorsement from experienced operators should guide you in your radio work. A Paragon Receiver may cost Eighty-five Dollars, to be sure—But, a genuine Paragon is nevertheless the best "buy," per dollar, on the market. Remember, also, the guarantee is for Two Years. The instrument is built to long outlast the guarantee.

Order a Paragon R. A. Ten, or get our descriptive booklet by using the coupon below.

THE NEW RADIO LICENSES

POR the first time in the history of Radio communication a more than ordinary distinction between the various classes of Radio men in the commercial field is to be made.

At the present time there are only two classes of professional operators—first and second grade. There is a third grade that is hardly worth mentioning.

Several months ago, representatives of the various radio service companies, steamship owners and officers of the United Radio Telegraphers' Association conferred with Secretary Alexander and Commissioner Chamberlain for the purpose of establishing a new system of radio licenses for commercial operators. An acceptable system was inaugurated. It becomes effective on July 1, 1921. The speed minimum has been increased from 20 words a minute to 25 words a minute. This new ruling is indeed welcomed by all commerical and governmenf radio men, and particularly by the shore station operators who have been handling traffic with vessels at sea. The average ship operator is hardly capable of transacting his business consistently at a speed of more than 20 words a minute.

The Radio Convention of 1912 provided for a first and second class license. Under the new ruling, licenses issued by the Department of Commerce will be graded according to the length of

Announcement ••

T gives us much pleasure to announce that United States Deputy Game Warden Mr. Lawrence Mott of New York City and Avalon, Catalina Island, California, has joined the staff of "Pacific Radio News," as Associate Editor. By profession Mr. Mott is a well known author, his first book having been published by the Century Company of New York, while he was still in Harvard, from which seat of learning he graduated in '05. Since that time Mr. Mott has traveled up and down and round-about the world in search of sport - big game shooting, fishing - and gathering material for his many books and short stories. He was staff correspondent for the New York "Sun" in the Far East during a period of the war, and, for various services rendered has been decorated by forcign governments.

Warden Mott has ever been a radio enthusiast. He is a firm believer in marvels STILL to be achieved, and is continually experimenting at his up-to-the-minute station on Catalina Island. He confines himself exclusively to CW work, being convinced that along these lines lies the REAL future of radio effort. Our new Associate Editor will, from time to time, give us editorials, and articles that will be found pertinent to matters in which we are all interested.

service of the holder of a license. A successful applicant for a commercial license will first receive a third grade, second class license. He will not receive his first grade license until his

commercial radio service warrants the issuance of same.

It will be impossible in the future for an inexperienced operator to obtain a commercial first grade license. His experience will be clearly shown by the grade of license that he holds. Operators have often been placed in charge of the radio equipment aboard ship without any previous experience whatsoever. As a war-time measure such misplacement was unavoidable but it should not be tolerated when the supply of commercial operators far exceed the demand. The standing of the professional operator has been lowered considerably by such action on the part of the various commercial companies.

Salaries paid to ship operators several years ago were as low as \$35.00 a month. The present day ship operator receives from \$85.00 to \$125.00 a month with a substantial allowance for port pay. A beginner in commercial radio is not entitled to such salaries and the new license system will keep many from entering the commercial field. It is generally understood that salaries will be paid according to the grade of license held. If this system is placed into effect, the professional old-time operator should receive an increase in salary.

In this manner, chance will be a very small factor. Advancement and salary increases will be the reward of the deserving.

Entered as second class matter January 22, 1920, at the Post Office at San Francisco, Cal., under the Act of March 3, 1879.

EDITOR'S NOTE

Mr. A. K. Aster has written four articles for "Pacific Radio News", the first of which appears herewith. Each article will be in the form of a complete chapter.

Chapter 2 deals with Voltage Amplifiers: Chapter 3 deals with Power Amplifiers; Chapter 4 describes the new system of tape reception using a vacuum tube.

T HE important part which relay and long distance work is playing in the amateur field today makes it necessary for the amateur to thoroughly understand audion amplifiers if he desires to be up to date. From personal observation, it is evident to me that amplifiers are very little understood. In this and a series of articles which are to follow it, I will make an attempt to explain the action of the audion as an amplifier and then discuss the various types of amplifiers suitable for radio telegraphic and telephonic work.

In 1884 Edison was apparantly examining the phenomena involved when carbon filament lamps are run at high efficiency. He discovered that if he placed

THE

AUDION AMPLIFIER

By A. K. ASTER

Instructor, Department of Physics, University of California

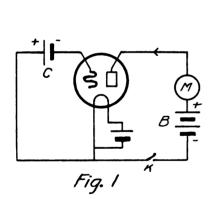

In 1907 Lee de Forest inserted a grid between the filament and plate and found that he thereby could control the current flowing from the plate to filament. He called this new device the "Audion."

The action of the thermionic valve as the audion is commonly called to-day is as follows: Referring to Fig. 1, first assume the case where there is no grid in the tube at all. As soon as key (k) is closed the battery (b) charges the plate positively and attracts to it the negative electrons which are being shot off from the hot filament, this causes a current to flow in the diagram. This current is commonly referred to as the plate current. Now as-

tive plate and hence increase the plate current slightly, the amount depending on the grid and plate potentials.

3. Assume the grid to be controlled to the mid-point of a resistance connected directly across the filament (not shown in the diagram). The grid will now be at zero potential with respect to the filament.

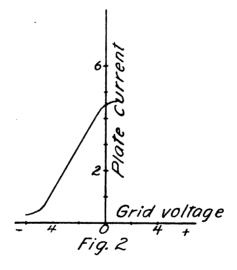

It will therefore neither attract or repel electrons shot off from the filament In their course from the filament to the place a few electrons will strike the place and charge it negatively. This charge will be conducted away to the filament and the grid will remain at zero potential with respect to the filament. The result is that the tube will

a metal plate between the legs of a horseshoe-shaped filament in a carbon filament lamp and connected a wire from the plate through a galvanometer to the positive side of the filament (the filament being heated by a direct current) that the galvanometer indicated a few milliamperes when the filament was glowing. He observed that when the plate was connected to the negative side of the filament little or no current flowed. This was the first important discovery which lead to the present audion. The phenomena he discovered is known as the "Edison Effect."

In 1904 Fleming made use of this phe-

In 1904 Fleming made use of this phenomena in his so-called "Fleming Valve" for the detection of radio signals. This device is too well known to need further description here. Those who are not familiar with it will find it described in any good book on Wireless Telegraphy.

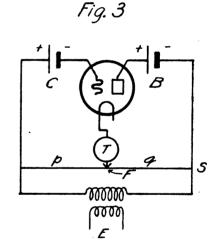

sume a grid to be placed between the plate and filament. Here we will consider four cases.

1. Assume the grid to be entirely insulated from the plate and filament. Some of the negative electrons shot off from the filament and attracted to the plate will strike the grid and charge it negatively. This charging will continue (assuming no leakage) until the grid is charged so highly negative as to repel practically all the negative electrons shot off from the filament and hence

(assuming no leakage) until the grid is charged so highly negative as to repel practically all the negative electrons shot off from the filament and hence practically stop the plate current.

2. Assume the grid to be connected to the positive side of the filament. The grid will now act as a second plate and because of its positive charge attract to it some of the electrons from the filament, and as will be expected, a small grid current will flow. Some of the electrons attracted to the grid wil miss it and go on to the more posi-

act as though there were no grid in it at all.

4. Assume the grid connected to the negative side of the filament. The grid will now be charged negatively, the amount depending on the tube, filament battery, etc. It will then act as a partial barrier to the electrons flowing from the filament to the plate and a complete one if the grid is charged negative to a sufficient degree. This does not occur in practice unless a sufficiently large negative grid battery is put in the circuit.

From the above statements it is obvious that the grid acts as a controlling device for the stream of electrons flowing from the filament to the plate. Let us now examine this phenomena a little further. Take a circuit such as Fig. 1 and place a milliameter in the plate circuit and provide some means in the grid circuit for varying the potential from

say (-50) to (+50) volts and put 100 volts in the plate circuit. Now leave the plate voltage and plot the values of the plate current for the various values of grid voltage. The result will be that of a curve of the form of Fig. 2. It will be observed that if we keep on the straight portion of the curve, a given change in grid voltage will produce a large change in plate current, hence a large change in voltage across the plate large change in voltage across the plate load assuming the resistance of the plate circuit to remain constant. This is the circuit to remain constant. This is the amplifying action of audion and the property which makes it suitable for amplifying radio, telephone and other currents. The ratio of a resulting change in plate load voltage to a given change in grid voltage is the so-called voltage amplification constant of a tube. This varies from 5 to 40 in practice although tubes having a factor as high as 200 have been built but they are not stable in operation. This factor is nearly constant over the usable range of the tube as is for the most part dependent

on the structural dimensions of the tube although somewhat dependent on the

although somewhat dependent on the voltage and filament current.

The voltage amplification constant of a tube can be easily measured by a simple bridge. Arrange a circuit as shown in Fig. 3 (b) and (c) are the plate and grid batteries respectively. (S) is a slide wire of about 40 or 50 ohms resistance. This should be about 3 or 4 feet long and stretched in a straight line, never wound on a drum, for best results. (E) is a buzzer having a secondary winding or a transformer for best results. (E) is a buzzer having a secondary winding or a transformer connected to a suitable source of alternating current (about 500 cycles is best) and (T) a telephone receiver. To operate this bridge proceed as follows. Adjust the grid and plate batteries to the values that are normally used with the tube under test. Then adjust the slider (F) on the slide wire till a minimum sound is heard in the telephone receiver, then if (p) is the length of the slide wire on the grid side of the slider slide wire on the grid side of the slider and (q) the length on the plate side

(q) divided by (p) gives the voltage amplification constant of the tube for amplification constant of the tube for the particular grid and plate voltages and filament current used. The lengths (p) and (q) can be measured in any convenient units, inches, centimeters or any other one as long as they are both measured in the same units. By this simple means the amateur can easily determine the voltage amplification constant of the tubes he is using.

The reader should not be misled at this point to think that the factor for

a given tube will give the amount of a given tube will give the amount of amplification he can expect from an amplifying circuit. The amplification produced by any amplifying circuit depends largely on the type and electrical constants of the circuit as well as the tube used in it. The amplification constant, does, to be sure, give very nearly the amplification produced by certain types of voltage amplifiers. This matter will be discussed later.

In the next article certain types of

In the next article certain types of amplifying circuits will be discussed.

WHY NOT A "CW" CLUB?

By LAWRENCE MOTT Associate Editor

K NIGHTS of the CW!
Can we not get together and have CW nights?

Far be it from me to decry the Hon. Spark Brotherhood-of Vast Numbers and Degree! They are enthusiastic—oh, very!—gentlemen—all! They are—many of them—kindly, and well disposed toward us, of the CW few! But—taking it by and large—there is only a pathetically small number of Brothers' Sparks with well take the trouble to true in for who will take the trouble to tune in for the sparsely scattered CW men? The spark emitters out number CW operators! They easily drown-out CW! And—without selfish intent, I am sure—they so far—have effectually blocked any efficient CW experimentation—that is, in and about Los Angeles!

Let me put it bluntly. CW is THE coming thing-in radio communication. I quite appreciate the point of view of spark men. They have—more or less expensively—set up unto themselves more—or less—efficient stations, and they between two—to them—evils: (1) junk the soon-to-be ancient and hoary spark—and install CW—or (2) give up radio work!

But Progress marches steadily onward be it remembered! When radio was first discussed, the line owners laughed, loudly, long and uproariously — and fought radio effort—fearful as to that which would happen to their lines should which would happen to their lines should radio become efficient! But was radio downhearted? NO! The world-wide recognition that it has earned for itself speaks with resounding loudness! So shall it be with CW—among the amateur enthusiasts!

However, all this by-the-way.

Perhaps fellow CW operators on the

Pacific Coast, and elsewhere, will join with me in trying to get together for say, two nights each week, at stated hours, and on pre-arranged, exact wavelengths. I am convinced that in this way, and only in this way, can we do satisfactory work, and without causing the lease QRM to the spark chaps. In other words, I am a firm believer in "live and let live"! I ask a fair chance for CW work and investigational effort

from spark operators! If CW co-enthusiasts will immediately write to me, giving their operating wave-lengths, sta-tion data, details, etc., I shall, with pleasure collect this material, assemble it in succinct form, arrange hours for CW work, and then beg the courtesy of Ye Ed of "P.R.N." to publish it. CW men will then have some authentic information that, as a nucleus, will, I hope, lead to excellent co-operation and hope, lead to excellent co-operation and effective results. I would further suggest that CW men form a Club, or Association, to be known as "The Pacific CW Club", or any kind, simly a small (as yet) group of men, banded together for the furthering of their lines of endeavor. Should such a Club come into existence I am sure that enough UN-SELFISH spark operators can be found who will not "hog" the air spaces on the nights that we are working, a short time each night. It is not much to ask, for the advancement of radio work! for the advancement of radio work!

And, to use famous (!) words, "may I not" point out to amateurs that the authorities at Washington are most kindly disposed toward amateur work in general, realizing, very properly, that these efforts, when conducted within the rules and regulations set down for them tend strongly for the good of radio advancement of these United States. BUT that Washington cannot, and will not, approve of operators who deliberately and wilfully exceed wave-lengths the amount of power they use, is a foregone conclusion. The law-breakers, may and do, "get away" with this sort of thing for a time, but the day will undoubtedly come when a sudden official round-up will be made, and sad indeed will be the hearts of many amateurs, who now nightly fill the air with "horrid sound", on the broadest of broad kind of transmission. Should more severe restrictions be placed on the amateur classes, the recklessly-broad operators will be the ones that the rest o' us will have to thank. And the innocent chaps, the fellows who are serious in their radio efforts, will suffer with the others! ately and wilfully exceed wave-lengths others!

Why all this senseless, useless chatter, night after night, hour after hour? nerve-racking pandemonium of sound, in which CW is hopelessly lost! Owing to differences in time, if we, on the Pacific Coast bang on which we have a sound in the coast bang on which we have a sound in the coast bang on which we have a sound in the coast bang on which we have a sound in the coast bang on which we have a sound in the coast bang on which we have a sound in the coast bang on which we have a sound in the coast bang on the coast bang of the coast bang on the coast bang of the coast bang on the coast bang on the coast bang of the coast Coast, hang on until midnight, or after to work a CW friend in the mid-west, or father, that friend must sit up until 2 and 3 in the morning, to get any results, and it is an imposition to ask this, as a regular diet!

Hence I reiterate the plea: If CW operators can form a little Club of their own, with their own officers, will spark men give a bit of time, twice a week, to CW experiment and effort?

And will CW men, reading these lines and interested in the idea, write to me, at Avalon, Catalina Island, California, giving me the data that I have requested?

I would call attention to the fact thet —having been granted a Commercial Li-cense, Experiment Grade, and a Station License to operate it on various wave-lengths—my call letters have been changed from 6BX to 6XAD.

The Station of U. S. Deputy Game Warden, Lawrence Mott, Situated at Avalon, Catalina Island, Calif., has been granted a Commercial Operating License-Experiment Grade-and the Call Letters changed from "6BX" to "6XAD". He asks that his many friends please NOTE this, when calling him, and when listening for him.

This Department is conducted by the U.S. Radio Inspectors of the Sixth District. CO-OPERATE!

WITH THE RADIO INSPECTOR

Questions answered by the Inspector. No names will be printed. initial your letters only.

FOREWORD: THE RESPONSE TO OUR REQUEST FOR QUESTIONS TO BE ANSWERED IN THIS DEPART. HAS NOT BEEN GENEROUS. WE AGAIN ASK YOU TO USE THESE COLUMNS.

AN OPEN LETTER FROM THE INSPECTOR

DEPARTMENT OF COMMERCE

Navigation Service Office of Radio Inspector Custom House,

San Francisco, Calif. March 15, 1921.

Editor, Pacific Radio News, San Francisco, Calif.

Dear Sir:

I would like to call the attention of the readers of your Magazine to a few pertinent points in connection with the operation of amateur radio stations, chiefly as regards violations of the Radio Laws and Regulations.

The use of "two letter", or initial

calls is unlawful.

2. No authority for wave-lengths in excess of 200 meters may be granted for radio telephone sets.
3. Telephone sets require licenses just

the same as radio telegraph stations.

I have observed that, in a number of cases, amateurs who are assigned regular official call letters do not use them. Instead, they use the last two letters of the call (or three letters, as the case may be), call (or three letters, as the case may be), and omit entirely to use the numeral part of the call. This constitutes, in effect, the signing of false call letters, as no call letters, or signals can be used by any station except the calls assigned by the Department of Commerce, which is given on the station license. This does not, of course, mean that "personal" signs may not be used, when there are several operators in a station, but if these latter are used, the full and complete official call must also be used at the same time so that no doubt as to the identity of the that no doubt as to the identity of the

station may exist to anyone who may happen to hear it working.

A number of experimenters and amateurs seem to be of the erroneous opinion that the use of operation of a tube telephone, or continuous wave transmitter is sufficient excuse to use a longer wavelength than 200 meters. This is absolutely and entirely contrary to law, and anyone who so operates is liable to prosecution under the Radio Laws, unless specific authority to use a longer wave-length has been granted under a special or experimental station license, in the usual manner. I might add that the desire to operate a telephone on these longer waves a telephone on these longer waves does NOT constitute any reason for the issuance of a special or experimental license.

In all cases licenses for both station and operator are required where the operation of a radio telephone transmitter is desired. These licenses and the examination for them are all exactly the same as for a telegraph equipment. This requires that the operator be able to copy at least 10 words per minute in the Continental Morse Code and to answer a number of reasonable questions concerning the operation and adjustment of his apparatus and the Laws and Regulations governing radio communication.

Contrary to popular impression, a telephone or vacuum tube transmitter will operate on 200 meters as well as on any longer wave-length. I have experimented

with vacuum tubes myself and have found with vacuum tubes myself and have found no trouble in getting to 200 meters and even lower. I used two 5W. tubes on various wave-lengths. On 375 meters I obtained about 1.2 amperes and with the same apparatus I returned to 200 meters and the radiation dropped to about 1.1 amperes, and 180 meters, which was the lowest wave-length I attempted at this time, radiated just a little over 1 ampere. time, radiated just a little over I ampere. The natural period of the antenna I used was 140 meters, and on the lower wavelength I was only able to use an extremely small inductance in the antenna circuit, which inductance was not sufficient for maximum coupling. If my antenna had been a little smaller, I do not believe that the radiation would have decreased noticeably on the lower wage and other experiably on the lower wave, and other experiably on the lower wave, and other experiments I have performed indicated the same result. I have seen one vacuum tube radiate efficiently on 90 meters, the radiation being about .6 of an ampere, on a single 5 W. tube. In this case the antenna had a natural period of but 40 meters, which indicates that the great trouble with most amateur telephones is that they are unable to get reasonable coupling on 200 meters, and I believe that if the amateurs who claim that they are unable to get their tubes on 200 meters will cut their antennae in half that they would have no trouble in half that they would have no trouble

in reaching the wave-length they desire Respectfully, D. B. McGOWN, Asst. Radio Inspector.

QUESTIONS and ANSWERS

A. K. Selma, Cal., asks:

Ques.-I have a radio set which will not send outside of the state. It is a one-inch coil, and I am located in a small town near Fresno. Do I need a license?

Ans.—Yes. The law states that all stations must be licensed where they transmit to beyond the borders of the state, or WHERE INTERFERENCE WITH THE RECEPTION OF SIGNALS FROM BEYOND THE STATE WOULD OCCUR. It is not possible that a transmitting set of any kind could be so arranged so that some times its operation might not interfere with someone receiving signals from outside of the state, hence all stations, as well as yours, must be licensed.

Ques.—I have a copy of the Radio Laws and Regulations. It says that I may obtain a license by applying by mail,

as I am unable to come to San Francisco for examination. How is this done?

Ans.—Address Radio Inspector, 215 Custom House, San Francisco, and the necessary blanks will be sent you. It is necessary for you to show evidence, usually in the form of an affidavit, that you are able to send and receive at the rate of ten words per minute, five letters per word, and answer fully all the questions asked on the application blank.

F. G. G., Los Banos, says.

A number of unlicensed spark coils near me interfere greatly with me. I have a receiving set only. I tell these fellows they should have licenses, and they laugh at me. Is a license necessary? They interfere particularly with the reception of signals from Seventh District amateurs.

Ans.—Yes, they must be licensed. Heavy fines and imprisonment are provided for the punishment of persons who send without licenses. See answer above to A. K. of Selma. This clearly comes under the law's provisions, as the signals from the Seventh District come from outside the state.

R. J. L., Eureka, Cal.:

Ques.-Where can a call list of amateurs be obtained?

Ans.—The book "Amateur Stations of the United States," edition of June 30, 1921, is the best we know of. Send 15 cents (no stamps) to Superintendent of Documents, Government Printing Office, Washington, D. C., and the book may be obtained. A similar book, "Government and Commercial Stations of the United States," which contains all special stations as well, may be obtained for 15 cents from the same address.

SSENTIALLY, the Janke arc is an arc burning between two electrodes in a non-conducting fluid.

Practically every known metal has been used in

the construction of experi-

mental electrodes and several different kinds of non-conducting fluids have been Janke arc, but the best results have been obtained by making the anode out of copper, the cathode of carbon, and by the use of denatured alcohol as the nonconducting fluid.

Strictly speaking, alcohol is not a nonconductor, but the term has been accepted by the United States Patent Office as applied to this arc. Alcohol does, how-ever, offer an extremely high resistance to radio-frequency currents, and a some-what less but still high resistance to direct current.

Under certain well defined conditions this arc will produce radio-frequency oscillations. Current is fed to the arc under a pressure of 200 to 500 volts. A capacity and inductance are arranged in the circuit as shown in cut 1. For wavelengths in the neighborhood of 1,000 meters the capacity should be 2 mf. The inductance is kept as low as possible. The electrodes are completely immersed in the alcohol. If now the arc is struck and adjusted carefully, strong oscilla-tions are produced in the closed oscillating circuit, which may be transferred to the antenna through the oscillation transformer.

The arc is automatically kept in adjustment by a solenoid attached to the anode, which also functions as a choke coil.

The design and construction of this solenoid must be very exact.

The anode holder, to the upper end of which is attached the solenoid core, and to the lower end the copper anode tip, is constructed of brass tubing. Vents are provided so that the gas forming at the electrodes rises to the upper part of the container where it is cooled by the water cooling coils and condensed back into liquid.

The anode tip is of an inverted cup shape, which provides a small chamber wherein the arc proper takes place. This cup shaped anode fits down over the carbon cathode which is held in place at the bottom of the container by holders

provided for the purpose.

When the arc is burning, pocket of hydrocarbon vapor is formed secret of the oscillations. No magnetic field is used, however, to "scavenge" the arc, and therein lies its principle difference from the Poulsen arc.

Alcohol, being an excellent cooling medium, performs a second very important function in dissipating the intense heat of the arc. In performing this function, the temperature of the alcohol of course has a tendency to rise greatly, but is prevented from doing so by a set of copper cooling coils which line the inner wall of the container, through which cold water is circulated.

The oscillations produced by the Janke arc are not as steady as those produced by the Poulsen arc. For this reason they are unsatisfactory for telegraph purposes. They are, however, suitable to a certain

degree for telephone purposes.

If the engineering skill were to be applied to the Janke arc that has been applied to other systems, a good radio telephone and telegraph system might be developed.

The problems presented in this small

ie JANKE ARC

By H. L. RODMAN

arc, however, are really very great. The difficulty and danger of a very highly explosive substance which is created on the electrodes while the arc is burning

is one in particular.

This substance was shown by one chemist to be copper acetylid. A slight tap with a metal object such as a screw-driver will explode any quantity. It is extremely sensitive to impact and heat.

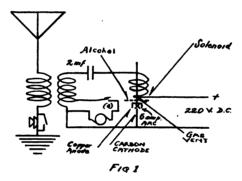

This explosive is only dangerous when

the electrodes are lifted out for repairs or cleaning. As long as the electrodes are immersed in the alcohol, the copper acetylid is not dangerous.

As in the Poulsen arc, the cooling of the copper anode is important, and for this reason three sets of electrodes in series are used to provide a larger cool-

ing surface.

Each anode plays in a sheath and a spider clutch is so arranged that when the arc is struck by the lifting solenoid. the length of each of the three arc gaps is identical.

Due to the fact that there is no means provided in this arc for restoring the resistance of the arc gap during the charging portion of the cycle, the efficiency is comparatively low. This same omis-sion is also partly responsible for the fact that the oscillations produced are not as steady as those of the Poulsen arc.

By inserting a micraphone transmitter in the ground lead, good telephonic results have been obtained, but here again is met the old problems of micraphone current limitations.

The radiation must be confined to two or three amperes and even this current at radio-frequency will very quickly overheat almost any micraphone.

The microphone most used at the Fairmont Hotel experimental station, in San Francisco, were water cooled, but although the heat is rapidly carried off by water, the carbon granules are not prevented from becoming white under which heat the transmitter rapidly deteriorates.

It will be noted that the closed oscillating circuit is inductively coupled to the antenna circuit. This is instrumental in weeding out harmonics. The tuning between primary and secondary is ex-tremely sharp. A very slight detuning on either side of resonance will decrease the antenna current to almost zero.

This latter feature is brought into use when the set is used for telegraphing. One turn of the primary is shorted by a key, as at (a) in cut 1, with or without the chopper in series. The chopper may be cut in or out by the chopper shorting switch.

When this one primary turn is shorted by closing the key, the open and closed circuits are thrown out of resonance and the antenna current drops to nearly zero.

Using a wavelength of 1,800 meters, it

is only necessary to detune the primary 75 to 100 meters to produce this effect.

Due to the fact that the potential difference across one turn of inductance is very low when using a current of five amperes through the arc, there is almost no sparking at the key or across the chopper when the latter is used. The note produced by the chopper is fully as clear as is obtained by the chopper in-terrupting a direct current circuit of equal current.

This method of signalling proved much more satisfactory than putting the key and chopper in series with the ground lead. The microphone placed in this position, however, does not function anywhere near as well as when directly in series with the ground lead.

It is apparent that in this system a low ground resistance and an antenna carefully designed as to capacity for the wavelength and power to be employed are of utmost importance. The antenna circuit, including the turns of inductance used, must be of the lowest resistance possible to obtain maximum radiation and

over-all efficiency.

There are possibilities in this arc, and it is not difficult to construct an experimental set. The fact that no magnetic field is necessary as in the Poulsen arc makes the construction of the arc proper

comparatively simple.

A one-half kilowatt set operating on 110 volts has been used successfully but the efficiency decreases on low voltage. 220 volts has been found to be most satisfactory.

This arc has also been applied to experiments in other branches of high frequency work, and there are also unlimited possibilities there, as well as its application to medical science.

As to practical results obtained, with a radiation of 2.75 amperes in the antenna at the Fairmont Hotel, San Francisco, the voice was heard and the conversation reported in detail by an operator at Vancouver, B. C., and by ships at sea in the neighborhood of 1500 miles.

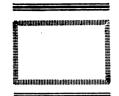

But it all comes back to the current carrying limitations of the micraphone. Some other system of modulation must be used other than a micraphone transmitter inserted in the ground lead, to make this system a success for long distances. This, of course, is not by any means impossible.

The Janke patents are owned by the National Radio Company, of San Francisco. Calif.

THE DUO-FREQUENCY SYSTEM OF SEMI-SECRET TRANSMISSION

By H. Tenny

A LTHOUGH the fact has not become generally known in the amateur world, we are about to witness a remarkable development in vacuum-tube transmission, which will be caused by the application of the multi-frequency principle, the apparent possibilities of which are truly astounding.

The extent to which this latest phase of vacuum-tube work has been developed in the laboratories of the large electrical plants who are exploiting the vacuum tube is only a matter of conjecture. The writer has heard vague rumors which lead him to believe that the bulk of present research work is directed toward the development of super-imposed frequencies on undampt waves with the objectives of multiplex transmission and reception, reduction of interference, secrecy of transmission, and increased utilization of restricted wave-length ranges permitted by law for certain classes of communication.

The realization of these invaluable benefits is being sought through the utilization of the range of frequencies which lies between highest perceptible audibility (about 6,000 cycles per second) and lowest common radio frequencies (wavelength of 10,000 to 15,000 meters.)

The simplest application of this principle consists of:

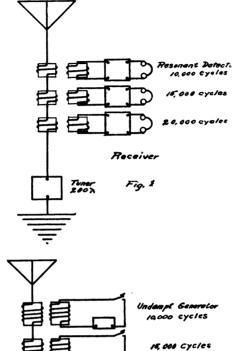

- (a) The generation and radiation of an undampt radio frequency, preferably the optimum length with respect to the fundamental of the antenna.
- (b) The superimposition on this "carrier" of one or more secondary frequencies, which will effect, in equivalent, "100% modulation." These frequencies will preferably be above audibility and below radio range.
- (c) The modulation of these frequencies for signaling purposes, either by voice chopper, or key.
- (d) Primary reception of carrier frequency with standard receiving apparatus
- (e) Selective individual tuning of the superimposed frequencies by means of separately coupled tuned amplifier circuits

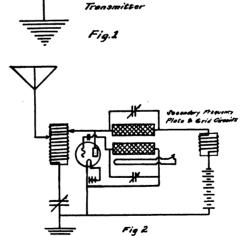

A schematic and purely theoretical circuit which will, to a certain degree, accomplish these ends, is shown in Figure 1. The practical working of such an arrangement would be for a number of reasons, an impossibility.

of reasons, an impossibility.

For preliminary experimental purposes we may confine ourselves to a single secondary frequency, using a single power tube as a generator for both the carrier and secondary frequency. Within certain limits this can be successfully done, and has the advantage of requiring none but standard and common pieces of apparatus which can be easily and cheaply obtained.

In the "Colpitts" transmitter circuit the secondary frequency can be generated by regenerative coupling between ocillatory circuits placed in the plate and grid leads, the frequency generated being the frequency of the grid circuit. As illustrated in Figure 2, honeycomb or duolateral inductances of the 1200

Figure 4. Secondary Frequency modulation by Heising system.

Figure 5. Amplification of secondary

turn size can be used with standard variable or fixed receiving type condensers for forming the circuits. Signalling for transmission can be best accomplished by coupling several turns of inductance to the grid coil, short-circuiting them with the sending key. Pressing the key will then cause a change of inductance in the grid coil, changing the frequency generated, and will be tuned for at the receiving end in the same manner as for compensated-system signals in highpower arc work.

The minimum capacity of the condensers used should be not less than .0005 MF, as the secondary circuits will otherwise have a choking effect upon the short-wave carrier frequency.

The secondary-frequency circuits are placed in the receiving circuit as shown in Figure 3, using coils and condensers identical in size and characteristics as those in the transmitter.

The operation of the system is best proceeded with as follows:

- (a) Adjust transmitter to maximum radiation of carrier frequency.
- (b) Gradually increase feed-back coupling between plate and grid coils of secondary-frequency circuits until oscillations are produced, keeping shunt condensers at maximum capacity.

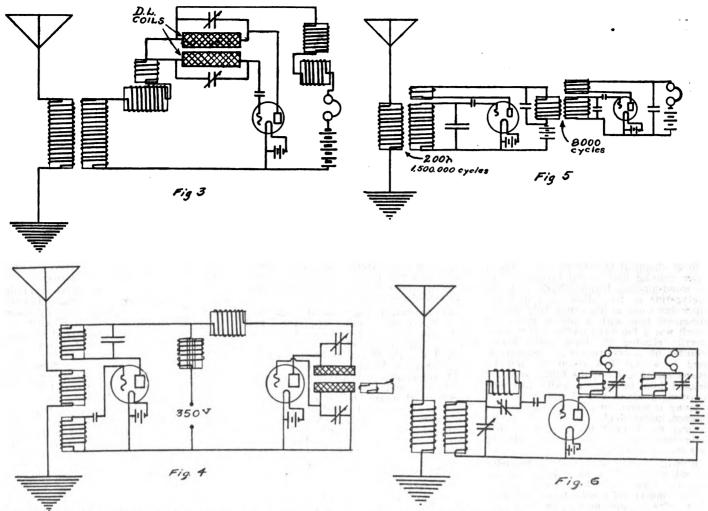

Secondary oscillations can be detected by their effect on the reading of the radiation meter. The system will be at the most efficient operating point when the antenna circuit has increased to about ten or fifteen per cent above normal. This increase is due to the change from the average current of the carrier frequency to the R.M.S. current-reading of the super-imposed secondary frequency. If the generation of the secondary frequency stops the carrier oscillations, retune the transmitter to a more stable adjustment.

- (c) Couple the compensating key inductance to grid coil as shown in Figure 2, using carbon-granule microphone in place of key if speech transmission is desired.
- (d) At the receiving end: Cause the receiver to oscillate at radio frequency weakening coupling between plate and grid secondary-frequency coils to prevent generation of secondary oscillations. Adjust receiver to the tune of the transmitted carrier wave, which can be heard by the heterodyne effect, the beat note of which must be adjusted low enough to be inaudible, in other words, the oscillations of the receiver grid circuit must be in exact synchronism with the received oscillations.
- (e) Gradually increase coupling between plate and grid coils of the secondary frequency circuits until oscilla-

frequencies by resonant transformer method, using regenerative and oscillating amplifier circuit.

Figure 6. Duplex reception with one tube, using compensating keying on both carrier and secondary frequency.

tions are generated. Vary the frequency so generated by tuning with the conden-ser shunted around the grid coil, until the beat note of the transmitted secondary frequency is heard in the phones. This beat note, and therefore the sig-nals transmitted on it, can only be heard on the ordinary regenerative re-ceiver unless the auxiliary circuits herein described are used.

The advantage of such an arrangement are: Secrecy, or semi-secrecy of transmission, increased convenience in heterodyne receiving due to the less critical adjustment of beat note due to lower frequencies heterodyned; possibility of dueler transmissionard resolutions. frequencies heterodyned; possibility of duplex transmission and reception, using compensation method of signalling in both the carrier and secondary frequencies; adaptability of secondary frequencies to multi-step amplification without the drawback of the extremely critical adjustments necessary in the ordinary 200 meter radio-frequency amplification by the r. f. transformer method.

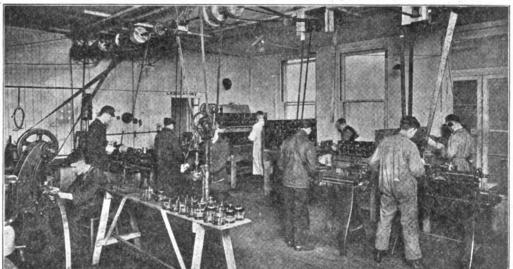

Figures 4. 5, and 6, will indicate the adaptability of the system to the most well-known of modern vacuum-tube circuits.

PALO ALTO WIRELESS \$175,000 PLANT IS READY FOR ACTION

The Federal Telegraph Company's new \$175,000 wireless station has just been completed, according to Chief Engineer R. R. Beal of the Federal company, and will be the hub unit of a Coast system now being erected in various other parts of the Pacific Coast.

This station is the first in the world This station is the first in the to carry on communication with four different stations at one time, and has umbrella type of antenna system, with a diameter of 3000 feet. Similar stations are being erected at Portland, Or., and Los Angeles.

Rapid Growth of Pacific Coast Manufacturer

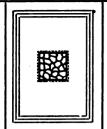

HOSE who have been following radio development in the West have watched with interest the growth and development of The Colin B. Kennedy Company of San Francisco. This organization was started less than two years ago by the man whose name it years ago by the man whose name it bears. Following the example of many of the great figures in the world of American business today, Kennedy started in a very small way. In fact he began manufacturing in a small loft with a few tools and the assistance of one boy. He has now associated with him a very

capable group of engineer executives to assist in the design and development of the apparatus and in the conduct of the business.

The expanded organization is looking to the future of radio with the same vision which inspired its founder. The radio development of the future is firmly linked up with the interests of the individual experimenter and student.

The photograph above, which is reproduced from a recent issue of the "Journal of Electricity and Western Industry", shows a corner of the factory where Kennedy Equipment is produced.

ARCHIBALD AUGUSTAS GETS A **SCARE**

(By Volney G. Mathison) Author of: "A Bungled Affair," "The Fall of Samuel Jones," "Tougher Than a Goat," and others.

AMUEL JONES swears that if I don't leave off writing about him he's going to break my darned neck. He says he is get-

ting to be the laughing-stock of the town and his reputation is ruined (I didn't know it could be). He indignantly declares that a local chemical factory has sent him a letter quoting him special bargain prices on wood-alcohol, formaldehyde, and nitroglycerine in ten-gallon lots; and the other day some of his young lady friends presented him with a pillow cover on which was a big hand-embroidered snake merrily chasing the long, lanky brasspounder up a cocoanut tree. Samuel is mad is a wet hen about it, and he warns me to cut out the funny stuff. I begged him to let me write just one more story about him that I have been keeping in mind for a long time, but he refused, point-blank. So now I am up against it. I can't think of any other code-slinger who is such a side-splitting jackass as Samuel Jones.

Rumaging around through all the piles of old trash in the back alleys of my memory, however. I have come upon a sack of musty old recollections that have to do with a gone-and-forgotten wireless school that used to be in an old, ramshackle building down near the Frisco water-front. Many years have slipped by since I sat in at the long practice table and went through the daily copying and went through the daily copying grind, starting in at nine a. m. at the top of the front page of the morning "Examiner" and winding up at five p. m. at the bottom of the last page of the evening "Bulletin," but the singing of the practice buzzer and the inky smells from the print shop on the floor above come back to me as vividly as though they were of yesterday.

And no less distinctly do I remember the faces of that assembly of young villains (Samuel Jones were there, too, I'm not writing about him, remember), who studied the function of the commutator by plastering thin, invisible chips of mica on the lower ends of the brushes. or demonstrated the actions of a closed oscillatory circuit by running a piece of number forty magnet-wire from the number forty magnet-wire from the spark-gap and deftly fastening the end under the knob of the sending-key, where some poor devil's thumb was sure to get tangled up in it. This stunt was invented by Shakespeare, the school poet, who could rhyme decrement with devilment as easily as he could do sleight-of-hand tricks with spare receivers or de-tectors or anything else lying around not so big as to rip his coat-pockers. Then we had Kid Brady, the house-breaker, who left his meal-ticket in the school one who left his meal-ticket in the school one
Saturday night and who, coffee-and-less
and hungry, got pinched next morning
as he climbed up the rain-spout and jimried a back-window to get it.

"A very select body of students," the
school circular called them, but a very
villainous band of hundred par cent

villainous band of hundred per cent hooligans would have been better said; at least so declared Pop Cranby, the in-

structor, who led a dog's life among them. Indeed, I remember how one time that gang of heartless young hyenas got hold of a poor unsophisticated ham, fresh from the country and in a hurry to get a job, and persuaded him to—but that reminds me of my friend Archibald Augustas. I'm mighty glad I thought of Archibald because he makes me think of a rattling good story, and now Samuel Jones and the rest of that hair-raising band of young Apaches in the old wireless-school can go to the devil.

Mr. Archibald Augustas McGink used to be the assistant radio inspector. and slim and supercorrectly dressed in classy tailor-made clothes, he always and slim and supercorrectly dressed in classy tailor-made clothes, he always looked exactly like a bill-board ad for Kubbleheimer Klothes. Indeed, Archibald Augustas was the very embodiment of dignity and reserve. All the hams within a thousand miles of San Francisco lived in mortal dread of him. And have wonder. In his day, Archibald Augustas cisco lived in mortal dread of him. And no wonder. In his day, Archibald Au-gustas shortened down and sharpened up more wave-lengths, and scared more contumacious, law-breaking wireless fiends to death than any other man has ever done in the history of radio.

Nor were the amateur fanatics alone in their dread of Archibald Augustas. He was no less the terror of the regular seagoing brass-pounders; for he used to give them their license examinations. Everybody knows what a cold and unfriendly sort of dungeon a radio-inspector's office is, at best. Everything is stiff and formal and you always get a creepy feeling in the middle of your back as you listen to the dictation of a stern and awful letter proclaiming the license suspension of some depraved operator who has been found guilty of making superfluous signals to the outrageous extent of saying good morning old man to a fellow code-slinger, or perhaps some scoundrelly ham is being skinned and scalped for running his outfit on two hundred and one and a quarter meters, and so on and so on, ad infinitum. Put a reserved and coldly proud person such as Mr. Archibald Augustas McGink in such an atmosphere and you could not find a more frigid combination anywhere south of the north pole.

One chilly winter morning, punctiliously at nine a. m., Archibald Augustas stepped dignifiedly into the office, put away his hat and overcoat, bid Miss Frimble, the stenographer, a frozen good morning, and seated himself stiffy in the chief inspector's chair. Mr. Woodnut, the chief radio inspector, had just killed the decrement of the high-power station out at Bolinas, and today he was going out with a shovel to bury it, leaving his assistant in supreme command of the front-line trenches. So Archibald Augustas sat proudly in the chief's big swivelchair and importantly proceeded to read the morning mail.

While the assistant inspector was thus occupied. Miss Frimble sat gazing upon him: and as she gazed she sighed, deeply and longingly. Tall, skinny, and scrawny. Miss Frimble was the faded vet prim remains of a bud that had bloomed and

blossomed so long ago that-but this is no ancient history, anyway. She adoringly idolized Arichbald Augustas and whenever occasion offered plainly showed that she thought him a perfectly won-derful man. Aware of her sentiments the assistant inspector felt a profound secret disgust; though he sometimes con-soled himself by reflecting that he couldn't help it if his wonderful person-ality was so irresistably attractive.

Ry nine-fifteen a. m., Miss Frimble had, as usual, sighed wistfully twenty times as she sat looking hungrily upon Archibald Augustas, and at nine-sixteen a. m. she was about to make it twentyone times, when she heard a sound of shuffling footsteps out in the corridor. A moment later, the office door was opened suddenly, and looking toward it Miss Frimble saw a sight that froze her maidenly blood with horror.

She had ample reason to be horrified. A hideous black negro had slipped boldly into the office and now stood in the middle of the room, fidgeting strangely. Clad in a pair of ragged Charlie Chaplin trousers, with shoes to match, a shape-less felt hat jammed down on his head and wearing an old dirty coat a dozen times too big for him, he was indeed a frightful-looking object. Miss Frimble sat like one paralyzed.

Archibald Augustus had also heard the

door open. For a few minutes, he affected to be busy with the mail on his desk; then he ostentatiously swung the big swivel-chair round and condescended to look at the negro, who was still standing, nervously shifting his weight from one foot to the other. "Well?" interrogated Archibald Augus-

tas, in his best secretary-of-the-navy

"I-Iwant to t-take the examination f-for a commercial f-first grade license,"

"I-want to t-take the examination f-for a commercial f-first grade license,"

"I-want to t-take the examination f-for a commercial f-first grade license,"

f-for a commercial f-first grade license," stuttered the dark-faced youth, acting as though a good deal embarrassed.

"Very well," replied the assistant inspector, coldly and without interest, "sit there,"—he indicated a small writing table near the stenographer's desk.

"Please give him the application-blanks, Miss Frimble," directed Archibald Augustus a triffe puzzled at the old

blanks, Miss Frimble," directed Archibald Augustas, a trifle puzzled at the old maid's evident alarm. It was the first time a negro had ever come to take a license examination, but still there was nothing surprising about it. The assistant inspector swung his chair around again and resumed his reading of the

With extreme trepidation, Miss Frimble picked out the required blanks and laid them on the writing-desk before the frightful-looking negro; and then she fled

trightful-looking negro; and then she ned to Archibald Augustas.

"Mr. McGink, are you blind!" she hissed into the sensitive ear of the assistant inspector. "Can't you see that awful fellow is wearing a disguise?"

Tremendously irritated at the rude way.

the homely stenographer hissed in his ear, Archibald Augustas shot around in his chair, an angry reorimand burning on his lips. But Miss Frimble's face was a sickly grey, and she was watching the

negro fearfully out of the corner of her eye. Involuntarily, the assistant inspector followed her glances, and with startling suddeness, he perceived that she was right. The fellow was not a negro at all. His face was twice as black on one side as it was on the other, and a small white spot was plainly visible behind his right ear. His slouch hat was still pulled down onto his ears, but there was a bunch of hair resembling the frayed end of a manila hawser sticking out at the back, which looked strangely out of place on such a black person. As he wrote on the application blanks, the black stuff on his hands came off onto the paper, smudging everywhere.

"Yes, I knew he was disguised the moment I saw him," lied Archibald Augustas, affecting a calmness that he absolutely did not feel at all. "Go back to your desk and remain perfectly quiet. "I will—er, I shall attend to him presently.

Bestowing an adoring glance upon Archibald Augustas, in appreciation of his wonderful courage, Miss Frimble re-treated to her post, leaving the assistant inspector a great deal more alarmed than herself.

After a few moments, Archibald Augustas cautiously stole another glance at the disguised villain, and a cold dread suddenly clutched at the assistant in-spector's heart as he observed that despite the blacking on the fellow's face, he bore a startling resemblance to an ugly-tempered Mexican amateur of North Beach, whom Archibald Augustas had brought to justice not long before for malicious interference with the naval stations, and who had openly sworn that he would be revenged both for the confiscation of his apparatus and for the hundred-dollar fine he had been forced to pay. The more the assistant inspector looked, the more certainly did he seem to perceive that the black scoundrel who had him so neatly corralled was just that same Mexican. Archibald Augustas could see through it all closely. Somehow, the fellow had learned of Mr. Woodnut's absence, and he had chosen this time for getting a bloody revenge.

Archibald Augustas was convinced that he was in awful danger. Already could he feel the keen blade lunging in be-tween his ribs and things, and he winced and sickened as he imagined the grinning murderer taking a savage delight in twisting the knife around in his vitals like an angry farmer cranking a contrary Ford. The assistant inspector broke into a cold sweat. He tried to think what to do, and he immediately realized that there was only one thing to do; he must get away, someway, anyway-and mighty quick.

But that was easier thought of than one. Though there was a window close at hand, it was sixty feet to the street; and the black villian was sitting directly between Archibald Augustas and the door. It was a desperate predicament.

The assistant inspector soon decided that had better produce the forefree.

that he had better make a dash for freedom rather than sit helplessly waiting for the murderous Mexican to spring upon him. There was a water-cooler near the door, and he made up his mind that he would step over to it, pretending that he was merely going to get a drink of water. Once that far, he would stand a slightly better chance of getting to the door, alive.

Mustering every atom of his insignificant stock of courage, Archibald Augustas arose hesitatingly from the big swivel-chair and walked nervously toward the water-cooler. He got to it safely, and was about to keep on going toward

the door, but glancing warily at the disguised malefactor, from whom he was now separated by no more than the width of a desk, he saw that the fellow seemed to be watching him sharply. Instantly, the assistant inspector's mite of courage took wings and flew away. He leaned weakly against the cooler and shakily drew a glass of water. Just as he made to drink it, the pseudo-negro inadvertently bumped his elbow into a large stack of books lying on the table at which he was sitting.

The books fell to the floor with a loud Dismayed, Archibald Augustas involuntarily sucked in his breath, taking the glass of water down his windpipe instead of his throat. Choking and terrified, and still clutching the drinking-glass, he shot to the door in a single stride. About one hundredth part of a second later, he had vanished.

But we must not forget poor Miss Frimble! Fairly petrified with horror and dread at having been thus shamefully abandoned by Archibald Augustas, she could only sit gazing fascinatedly upon the hideous black villain who confronted her.

The pretended negro was obviously much worried at the sudden disappear-ance of the assistant inspector. Finishing with the application blanks, he became aware of Miss Frimbles' frozen gaze and he began to shift about, ner-

Minutes passed. The clock on the wall ticked with oppressive loudness in the absolute stillness of the room. absolute stillness or the room.

Frimble sat as though made of stone, without seeming even to breathe. disguised stranger became increasingly nervous and fidgety. At last he could stand the scrawny stenographer's horrified stare no longer.

"Aw, what th' heck's the matter with you!" he burst out, in a voice and ascent strangely unlike that of a negro, or of a Mexican either, for that matter. "You don't have to sit there an' look like I was goin' to chew yuh up, you homely old battle-axe!"

"E-e-e-e-e! Murder! Help!" screeched Miss Frimble, springing to her feet and upsetting her chair. Electrified with terror and shrinking like the whicele of a

upsetting her chair. Electrified with terror and shrieking like the whistle of a piney-woods logging train, she made a giraffe-sprint to the door.

Just as she got to it, the door was violently thrown open and Archibald Augustas was kicked forcibly into the room by a big brawny policeman, who had the squirming assistant inspector firmly grasped by the back of the neck. Instantly, Miss Frimble threw her arms around her hero and renewed her earsplitting squeals.

The bluecoat caught sight of the black-faced cause of all the commotion

and his eyes bulged with astonishment.
"In th' noime of th' hivinly St. Patrick!" he ejaculated, letting go of the assistant inspector. "No wonder yez was

assistant inspector. "No wonder yez was runnin' down the sthreet loike twinty million divils was afther yez, begorrah!"

He slammed the door shut and placed himself against it, while Archibald Augustas struggled to untangle himself from the distasteful embrace of the frantic Miss

Frimble.
"Yez be a grand lookin' sight be'ant

"Yez be a grand lookin' sight be ant the cark youth's astonishing disguise. "Whur in th' divil did yez come from, an' what be yez thryin' to do here?"

"I know him, officer," panted Archibald Augustas, who has at last managed to free himself from the hysterical Miss Frimble, "He's a fellow we arrested and fined not long ago for malicious

interfering. He said at the time he'd get even—he's a Mexican."

"Mexican your foot!" interjected the black-faced mystery, who seemed to be making a desperate effort at calmness, "I'm off'n the Chilean square-rigger lyin' out in the stream off Goat Island, if you want to know!"

"Yez talk more loike a West Oakland hoodlum than a Chileno," retorted the policeman.

"Well, I ain't no Chileno an' I ain't no hoodlum, neither," returned the mys-terious captive. "I shipped cabin-boy last year on the steam schooner wood" goin' to South America an' wood" goin' to South America, an' I got left at Valparaiso, down in Chile. Then I got shanghaied onto the "Madrone" a Chilean three-masted bark, where I been kept prisoner ever since. We come into Frisco Bay about a week ago an' one night I went over the side an' swum ashore, but the next night the Chilenos spotted me down on the water-front an' they blackjacked me an' took me back aboard. Night before last I jumped out in these clothes an' the black show-paint I reckon my outfit ain't much good."
"Regereck and Market much good."

"Begorrah, no! Tis mighty quear yez asn't picked up sooner. But what wasn't picked up sooner. were yez wantin' up here?"

"I used to have a amateur wireless set once, an' I know a good deal about wireless," replied the captive, promptly. "I was goin' to try an' get a license an' get out on a ship. If I go down on the front an' try to ship cabin-boy again, I'll get crimped again sure"

I'll get crimped again sure."
"What's your noime, an' whur did yez come from

ome from in the furrst place?"
"Frank Morris, an' I come from Petaluma.

The policeman scratched his head. The distinguished youth's story was more than half plausible. He was hardly more than a boy, and it was not the first time the bluecoat had heard of victims being shanghaied and held prisoner aboard foul South American hookers. But yet, there was something strange about the fellow's coming into the radio inspector's office while wearing such a make-up.

"I guess yez'll have to tell it to th' judge." decided the policeman, "come along."

The captive protested, strenuously, but the bluecoat got him firmly by the coat sleeve and marched him down the

street, accompanied (though not assisted) by Archibald Augustas.

Twenty minutes later the trio were in the police station. The prisoner was handed over for cross-examination to a couple of raspy-voiced detectives, raked him over the coals for half an hour without succeeding in budging him

in the least from his story.

A little later, he was hailed before a police judge. Archibald Augustas and police judge. Archibald Augustas and the policeman told of their parts in the affair, and then the prisoner repeated his story, exactly as he had told it before in the radio inspector's office. The judge listened with no great interest; he seemed inclined to accept the youth's

"I don't see that the prisoner is guilty of any particular offense—" he began, but before he could say more one of the detectives came hurrying into the courtroom.

"Beg pardon, your honor," he broke in, abruptly, "but we just phoned the marine exchange, and they say there is no Chilean ship of any description in the harbor; and according to the nautical register there's no such vessel as the "Madrone" at all.

NEW YORK RADIO CONVENTION & EXHIBIT SHOWS MARVELOUS ADVANCE IN RADIO DESIGN

(By Arthur H. Lynch)

March 16, 17, 18 and 19 were indeed days of great radio activity in New York. A convention and exhibition was held on the roof of the Hotel Pennsylvania, under the auspices of the Executive Radio Council, Second District.

Many new forms of improved apparatus were publicly demonstrated for the first time, and the interest shown proves conclusively that the surface of amateur radio endeavor has only been scratched. Every moment of the event indicated that great strides have been made in the past few months and that the future will be productive of surprises beyond the wildest dreams of yesteryear.

With several complete receiving stations in operation, most of which were equipped with loud-speakers of one kind or another, there was never a quiet moment, and to the uninitiated the affair brought back the story of the Tower of Babel.

Much interest centered about a miniature automobile which was run about the floor, controlled by radio. Its movements were most uncanny, as no human activity was to

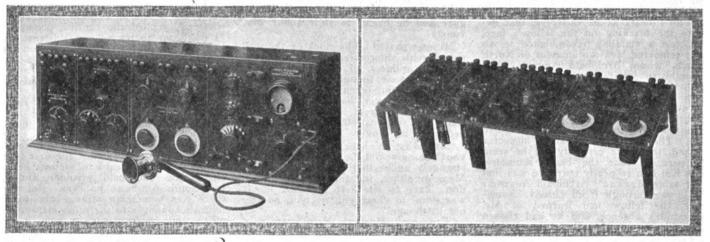

words had been passed, but these two went into the finals alone.

New Devices Demonstrated

One of the most unique devices shown at the exhibition was as startling in its importance as it was small in size. It was a new type Pacent telephone plug. It is no longer necessary to take off the telephone tips from the cords when the phone is to be used in connection with a plub and jack control outfit. The accompanying illustration tells the story better than words. You will see, from them, that a single screw holds all the members in place. There are two sets of phosphor bronze clips, which are merely pressed together to allow the tips to pass through holes in them, and hold the tips securely when the pressure is released. The same applies to the use of solid con-The connected tips are then inductors. serted into the grooves in the moulded bakelite pieces, which are then screwed together. The tension cord, which is usually provided with telephone cords, is held securely between the two bakelite sections, so

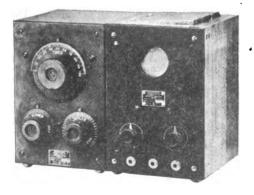

Radio Corporation on the Job

Among the sages of amateur radio endeavor the opinion was frequently voiced that one could safely bet his bottom "iron man" on the fact that there was money to be made in the manufacture of amateur equipment and the future was all to the good, because the Radio Corporation was going into the thing on a wholesale basis. The opinion was everywhere expressed that they were not going in the amateur apparatus business for the sole purpose of doing the amateurs a favor. Our old friend, Mr. Boucheron, was very much on the job and spent a great deal of his time accepting congratulations from his many friends upon his accession to the throne of Director of Publicity of the Radiocorp. Under the direction of Mr. Galler, who smilingly answered more than a million foolish questions during the exhibition, the amateurs and the professionals were introduced to a most remarkable little piece of apparatus. It is an outfit, made entirely of parts which may be procured from any radio supply house, which Mr Galler uses for demonstration purposes

be noticed and no sound was to be heard, A station, located in the exhibition hall, controlled the action of the auto, which closely resembled a torpedo on wheels and equipped with a mast, from which a spiral coil hung.

Each day was livened by talks, delivered by representative amateur and commercial radio men, and much interest was shown in the speed receiving contest, which was won by Bennie Seuter of the New York "Times" trans-ocean press staff, who attained a speed of 48 3-5 words a minute for two minutes and made no mistakes. Second honors went to N. Bernstein, who attained the same speed, but made two mistakes. Many others stuck in the contest until forty

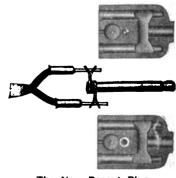

that everything desired in a plug has been taken care of.

Another innovation, found at the Pacent Electric Booth, was a new form of condenser, developed by Dubilier, for C. W. transmission. The condenser itself is a radical departure, in that it is very small in size and unpretentious in appearance, though it has been well designed and built. Its most conspicuous change from the usual run of Dubilier condensers lies in the fact that it is equipped with a new insulator which will doubtlessly prove of great value to radio in general, but especially to the amateur. It is common knowledge that much amateur antenna current is dissi-pated because of poor insulation. This new condenser, upon which the insulator is mounted, will go a long way toward in-creased radiation because of reduction of losses in the power circuits. It is made of many thin sections of pure ruby mica. tightly pressed together and turned to size. After the insulator has been turned to the proper proportions, which includes the making of the flutes, found on insulators of the moulded types designed for the same purpose, it is impregnated by a special com-pound. The new insulator is soon to be made in forms which may be used for antenna insulation, though the present applications are exclusively for panel and the described mounting.

when he makes visits to such foreign missions as Boston. There is much to say concerning this little outfit. It was designed for connection to any lamp socket, where 110 volts of the A. C. variety is to be found. It is complete, with a carrying case, which measures 12x10x6 inches, including everything.

The set was made by Milford Squire, a former amateur who is making a name for himself as a designer of efficient radio apparatus. The set, complete, consists of everything essential for an A. C. self-rectifying transmitter, including a dummy antenna circuit wherein there is a variable resistance and capacitance, while the regular

The New Pacent Plug

antenna inductor affords the variation of inductance, either in the dummy or regular antenna circuit, depending on the position of the switch. The set has been designed for normal use of 10 watts, but will stand 100 per cent overload, without overheating, so that 20 watts could be consistently delivered to the antenna for demonstration purposes. Though the set was designed for telegraphy, it can be used for telephony by merely inserting rectifiers.

Other New Manufacturers of Note

With several new devices, including storage batteries, battery chargers, crystal detectors and a combination short-wave regenerative receiver unit and a detector and two stage audio frequency amplifier, the West-inghouse Electric and Manufacturing Company is blazing the trail in the race for the lead in the construction of amateur radio equipment. This company has recently secured the services fo many men whose patents and research work in radio will be of value in producing other apparatus to round out the line, which will incorporate all the company's name stands for. If all the apparatus is to be as good as the tuner and amplifier units, it will be good. I'ne circuit is of unique design, in that the inductance and capacity are changed at the same time. There is not enough space to describe it here, but you can take it from one who tried it, the receiver certainly tunes sharply.

Ship Owners' Radio Service, Inc., had a half kilowatt quench spark set hooked up and ran the official station for the transmission of messages, to all parts of the coun-For receiving they used a Grebe CR 3 and a Grebe detector and amplifier unit. The transmitter was a Kilbourne & Clark development. At this booth there was also shown a new De Forest radiophone transmitter, but great interest was shown in the new "B" battery which the company has just started to sell. The station cleared forty-eight messages in forty-eight minutes.

Every once in a while from the corner in which Grebe and his company had their booth, a shrill piercing sound came forth, caused by our friendly enemy POZ. LCM also kept up a continual round of high speed stuff, which gave the fast "ops" an opportunity to exploit their ability to the awe of the beginners and the ladies, most of whom wondered what it was all about. In addition to the regular Grebe line, the CR 6A came in for great attention.

The two illustrations will serve to indicate the general idea of the new line which the De Forest Company now offers for sale. As will be seen, each unit is complete in itself, but lends itself very readily to use with other units, which may be procured at anv time. The set in the cabinet is the MIDGET RADIOPHONE, complete, with a short-wave regenerative receiver, made with honeycomb variometers, a detector unit and a single stage amplifier unit. The cabinets may be secured for any desired number of units, but while the set is being gathered together, the legs, shown in the other illustration, serve to hold the units either in the position shown, or upright.

Baldy Phones were much in evidence, both at their own booth as well as in many of the stations which were in operation.

A very complete line of parts, wire and apparatus was displayed by the Shotton Radio Company of Scranton and Albany. They were pushing along the Shramco rheostat, which is made of Nichrome and mounted on asbestos.

Mr. O. Luscomb, president of the Clapp-Eastham Company, and his corps were on the job, giving everyone information on their idea of design and construction. Their apparatus is well known, and they are now introducing a baby knife switch of unique design.

U. R. T. A. TO OCCUPY COMFORT-ABLE QUARTERS

THE Pacific Coast office of the United Radio Telegraphers' Association which has formerly been located at 24 California Street, will be closed and new offices opened at 52 California Street. A large assembly room, containing pool and billiard tables, card tables, writing desks and other conveniences, will be at the disposal of the members. The new quarters are in the heart of the shipping district of San Francisco and within easy reach of the various offices of radio service companies.

Mr. C. Langevin, local chairman of the U. R. T. A., announces that the membership of the organization is increasing apply and the financial condition of the association has been sufficiently used to warrant the expenditure ciently good to warrant the expenditure of a large sum of money to thoroughly equip the new assembly rooms. The Masters, Mates and Pilots will occupy rooms on the same floor of the building in which the U. R. T. A. is located.

ADDRESS ERRATA

The correct address of station 6EF is 4421 Mettler Street, Los Angeles,

RADIO CLUB **NEWS**

SGT. LUFKIN IS NEW PRESIDENT OF S. F. RADIO CLUB

GT. W. E. Lufkin, former Chairman of the Pacific Coast Radio Convention Committee, was elected President of the San Francisco Radio Club, Inc., of the San Francisco Radio Club, Inc., on Thursday, April 8th, and will be installed on April, 15th. Mr. C. Thompson was elected Vice-President and Mr. C. Shomaker is the new Treasurer. Mr. Highstone is Sergeant-at-Arms; Mr. R. Lyon is Chief Operator and Mr. G. F. Barry retains the office of Secretary.

Major J. F. Dillon, U. S. Radio Install the new officers on April 15th

install the new officers on April 15th.

MAJOR DILLON SPEAKS AT BAY COUNTIES RADIO CLUB THE U. S. Radio Inspector address-

ed the Bay Counties Radio Club on April 9th at the usual weekly meeting of the club. Radio laws and legislation were discussed and a most interesting

were discussed and a most interesting discussion followed.

On April 1, Mr. Babcock, Chief Electrical Engineer of the Southern Pacific Company, spoke on the use of A. C. for radiophone work. He explained the construction of transformers suitable for that work.

that work.

The Club has purchased a Mimeograph for the use of printing the club's monthly paper. A complete radio station is being constructed. It will be one of the most modern in the West.

Mr. B. F. McNamee. President of the Club, will entertain the club members with special radiophone concerts. The address of the Secretary, Mr. R. W. Carroll, has been changed to 444 24th Street. Oakland, Calif. The station call is 6BG.

PALO ALTO RADIO CLUB ELECTS OFFICERS

THE following were elected as of-ficers of the Palo Alto Radio Club. President. Hans O. Strom; Vice-President, C. V. Jensen; Secretary, Hat-to Tappenbeck; Treasurer, F. W. Kolkmann.

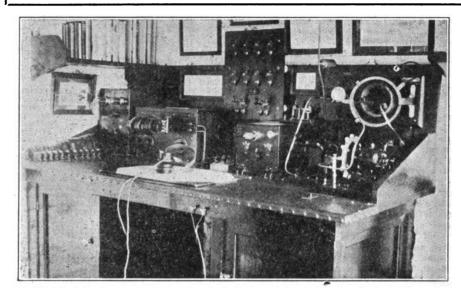

mann.

The club now meets at 232 Lytton Avenue, Palo Alto. The club rooms will be open at all times to members and experiments of various nature will be performed. A receiving set and remote control transmitter will be installed shortly. Meetings are held every Wednesday evening. Communications should be addressed to the Secretary, 315 Alma Street, Palo Alto.

TACOMA RADIO CLUB HOLDS BANQUET

R ADIO men of the Northwest are rejoicing over the success of the banquet and social affair held in Tacoma, several weeks ago. Radio amateurs and companied the server and teurs and commercial men from various cities in the northern state were present and radio conditions in general were discussed. The stations of various club members were visited the following day. President Reichert of the Tacoma Radio Club spoke on amateur co-operation and his address was appreciated by all. Rev. Sebastian Ruth (7YS). Miss Winfred Dow, Mr. and Mrs. "7CB" and many others prominent in the Northwest were present.

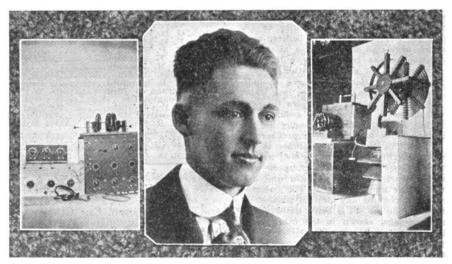

=3 B V=== WEST CHESTER, PA.

P AUL U. Watson (3BV) believes that you can't get more out of a station than you put into it. Observe the photo of his station closely and it will be readily seen that everything is arranged in "ship-shape." The entire equipment is home made. Honey-comb and Duolateral coils have been used with much success. The following stations have recently been heard: BZR, NAT, VAL, NDD, NSS, NPL, NBA.

NPZ, NPG, XDA, NGE, NAX, NAR, NAM, NED, NAJ, and many vessels at sea. A regular tuning chart is kept up-to-date by Watson and it is an easy matter to tune to any wavelength by merely consulting the chart. Baldy phones are used. The transmitter is wired with 1/4-inch copper tubing and has done remarkably good work of

6 E B -- LOS ANGELES

THE above photographs show the station of Mr. L. F. Seefred, 6EB, Los Angeles, Cal., and the center photo is a good one of the operator. This station is too well known on the Coast to require much comment. Many records have to be added to its credit of late. A short-wave regenerative receiver of the variometer type and a 2-stage amplifier, are doing the trick when it comes to long distance receiving. Everything is home-made, with the exception

of the phones. Baldy's are used by 6BE. All howling has been eliminated from the receiving set but local interference from an uncanny buzz from the ference from an uncanny buzz from the power lines has been a detriment to better receiving. On high power 750 watts is used. One turn in the OT primary, .01 MF condenser, 1750 RPM rotary and a 5-amp radiation meter complete the transmitting set.

From the 3 to 4 A. m. a straight gap is used. With the exception of the Dubilier Condenser, the transmitter is home made.

home made.

CALLS HEARD BY WESTERN AMATEURS

This department has met with such favor that we will devote as much space to same as possible. Unusual Records are Particularly Desirable. Your list should be neatly printed in ink, using one side of paper only.
All errors will thereby be avoided.

All errors will thereby be avoided.

Los Angeles, Cal., March 24, 1921.

"Pacific Radio News."
San Francisco, Cal.
Gentlemen:
It might prove of interest to the readers of your magazine to know what I have done in the way of long-wave arc reception during the summer months of 1919 and 1920.

Using an Audiotron detector (without any amplifiers), "pancake" type long-wave inductances (using an ultra-audion hook-up with a home-made "Eaton" oscillator) and Baldwin phones on a 200 meter transmitting antenna, I have copied POZ NZR WII WSO NSS NWW NAA NAM NAO NDD NAW BZQ NBA NAT WUJ WZO NPM NPZ NPL NPX, and spark stations KET KIE XDA. All were received with good audibility. POZ was only heard once, but just barely readable, and it was at noon time. He was calling LCM at the time, not only once, but several times. So was sure of it. Very truly yours,
H. C. Seefred, Radio 6EA.

Single tube and homemade short-wave set Is used. On the night of March 31 I tried to copy an important message to be given the police or sheriff and it seemed like more QKM than usual had to be going at that time. When something like this is being sent the amateurs in general would appreciate a luli for a few minutes.

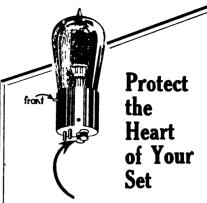

The law is to call a station by transmitting its call letters three times and signing three times; but how many stations do you hear every night that obeys it. If I couldn't get the call then it would be more than useless to try to send a message.

Amateur radio stations copied and worked by radio station "YQ" at Avalon Calif.

T RADIO H Oscillation Transformer

Type TH-2

An Oscillation Transformer for the modern amateur must be pleasing in appearance, must not be too expensive, and above all, it must be efficient. The "T & H" Transformer, the first of a series of radio instruments to be placed on the amateur market, truly fulfills all of these requirements. All woodwork is of walnut, finished a dull natural, blends well with either mahogany or oak instruments that may comprise any other apparatus in the station. The supports are of heavy formica slotted to receive the ribbon of polished brass. There are eight complete turns of 11/4 inch ribbon on the secondary, while the primary is made with either 11/4 inch (Type TH-1) or with 3 inch (Type TH-2) ribbon, and has 3 turns. Coupling between the two windings may be as much as 12 inches.

The instrument may be mounted on the table top in a horizontal position or fastened to the wall or other vertical opject, with one coil above the other, as illustration above.

Consistent long-distant transmission is the desire of every amateur. To accomplish this with low power and shortwave-length allowed by the government, no energy must be lost. A feature of the "T & H" Oscillation Transformer is that there are no metal parts near the windings to absorb the energy that is so valuable, nor is there appreciable resist-ance losses, because of the large surface of the ribbon. Diameter of windings, 18 inches.

Interpanel Sets

The Most Advanced Idea in Radio Telephone Transmitting and Receiving Apparatus

THE DeForest RADIOPHONE INTER-PANEL Set establishes a new standard of design and efficiency for DeForest Apparatus, and provides the most convenient and all 'round satisfactory method of purchasing Radio Apparatus yet invented.

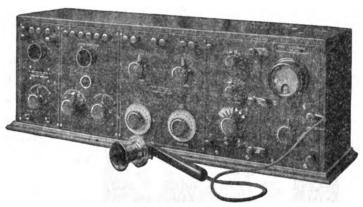

The INTERPANEL Set consists of a series of panels, each constituting a complete piece of apparatus in itself, and designed to be combined with other panels, thus forming a Set complete as may be desired, the operating possibilities depending only upon the total number of panels used. The Set for both Telephone and Telegraph transmission and reception consists of four panels

Type MT-100-A complete short wave Tuner of highest possible efficiency;

Type MP-100-A new Audion Control panel designed especially for tubes of the gaseous type, now considered as standard;

Type MP-200—A one-step Amplifier panel complete in every respect; and

Type OT-3— A complete Radiophone Transmitter, capable of transmitting speech at least 30 miles, and up to 500 miles.

Complete Set of Four Units, in cabinet. Each panel sold separately for mounting in home constructed cabinet; or completely assembled in cabinet as shown above. Also for mounting in Horizontal or Vertical Table-style. Complete Set as above, Complete Set of Four Units, in cabinet. without batteries or tubes; type MS-1; \$189.25.

Panels are all 9 inches high; varying widths. Designed for placing side by side, with binding posts in line and convenient to wire. Adaptable to any operating requirement. Panels may be bought individually and mounted in operator's own cabinet; or bought completely mounted in cabinet. Or panels alone may be mounted on table in either horizontal or vertical style.

30 Mile Range for the Telephone Transmitter on Average Amateur Aerial

Tests show a 30-mile telephone transmitting range for the Set, which can be exceeded under favorable conditions. Telegraph range from 60 to 100 miles with unlimited reception possibilities.

One 6-volt storage battery required for all filaments and microphone; Motor-generator, "B" Battery or rectifier supply may be used.

The INTERPANEL Set provides the ultimate in RADIOPHONE apparatus; ease and convenience in installation and operation; minimum space, handsome appearance, great efficiency and extreme economy.

Vertical Panel-style mounting, without cabinet. Two legs hold each panel upright. Any number of panels may be joined and mounted this way.

method of mounting.

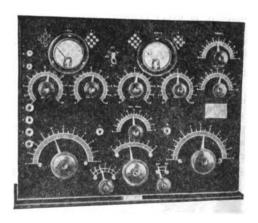

ARE YOU IN THE CLASS

of discriminating purchasers who keep quality foremost in their selections? If so, the two new receivers shown below are of interest to you

The Altaceiver, type CW-3 comprises a long wave damped or undamped wave receptor combined with a detector and three step audio-frequency amplifier. Inside tube mounting, potentiometer plate battery control, separate filament battery control, detector plate and filament circuit meters, vernier tuning adjustment and undistorted amplification are among its many special features. Used by the Chicago Tribune in copying foreign press despatches.

The Multiceiver, type MC-3 combines a short-wave regenerative receiver of the tuned tertiary type and of extreme efficiency, with a detector and three-step audio-frequency amplifier. Delicate plate and filament potential control, detector plate and filament meters, inside tube mounting, special battery-control, transmitting-receiving switch, antenna series condenser, and special amplifying transformers are provided. Provision made for addition of external loaders or use of external tuner and detector by means of simple plug and jack.

DEALERS: WRITE US FOR PROPOSITION

1. That we are selling the variety of variometers for \$5.25 that formerly sold for \$10.00 and the variocouplers for \$4.25 that sold for \$8.00.

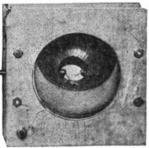

2. That our variometers and variocouplers will equal any at any price for efficiency and workmanship.

That we guarantee the windings on our variometers to stay put, regardless of climatic conditions.

4. That our Short-Wave Regenerative Receiver is in a class by itself for price. The fact that it is cheap does not reflect on the quality and efficiency.

5. That our Short-Wave Regenerative Receiver is just the instrument for C. W. reception and performs better in some cases with one-step of amplification than with two.

6. That we do not want dissatisfied customers and will refund your money on any order that does not come up to your expectation.

Our Type V-1 Variometer is a thoroughly efficient instrument. It has positive contact bearings and we guarantee that the windings will stay put regardless of climatic conditions. Our price, postpaid, \$5.25. Size: 5"x5"x23%". Has 3/16" shaft.

Our Type C-1 Variocoupler.

Tresco

When you think of tuners say TRESCO. One for every need and wave length.

Presume you would like to hear something of the luck I have had with your "TRESCO tuner", which I bought of you some time ago. I am more than pleased with it. If I could not get another, I wouldn't take a hundred dollars for it, and it is certainly the best tuner I have ever used. All stations of from 4,000 to 20,000 meters come in loud and strong, and without amplifier. Another feature is, that it will work right through static, with a little adjustment. Since owning this Tuner, I haven't "closed up" on account of static.

PARKIN MFG. CO. ISSUES NEW CATALOG

M R. John Parkin, Manager of the Parkin Mfg. Co., of San Rafael, has taken the lead in bringing down the price of radio apparatus to what it was some years ago. The new Parkin catasome years ago. The new Parkin catalog is now ready and contains many material reductions in the price of apparatus manufactured by the Company.

WIRELESS ENDANGERING JOBS OF MUSICIANS

HE wireless telephone concerts which are caught daily by 600 amateur operators in this city and about the bay have drawn the fire of the San Francisco Musicians' Union, according to a

story told at a demonstration concert during a Commonwealth Club luncheon at the Palace. Complaint has been made that union musicians are being deprived of a living by amateur operators "sneaking" the music sent from the California Theatre apparatus to ships at sea during afternoon and evening performances. The canny telephone brigands are furnishing the music to dance parties, so the complaint goes. The story was told by Lieutenant Ellery W. Stone, general manager of the Moorhead Laboratories of this city, manufacturing the radio telephonic equipment. He predicted that wireless telephones will some day be part of the ordinary equipment of the home.

TRANSFORMERS

The new "Puget" transformer is now ready. Don't be misled by ads for low voltage transformers. The "Puget" is resonant and puts the most energy into your condenser. The 1/2 K.W. far outclasses 1 K.W.'s of other makes.

Introducing The Dubilier Universal Condenser

Will handle 100 watts of C. W. energy.

THE DUBILIER UNIVERSAL CONDENSER is the first condenser especially designed for low power continuous wave transmitters which will also prove suitable for reception work. This condenser is made of the finest clear India Mica, its capacity is absolutely constant and is so maintained by special spring clamps which silde on the pressure plates. This unique construction permits an extremely compact unit and the losses are so small as to be immeasurable. They are tested at 1500 volts and rated at 1000 volts so that they can be used on C. W. sets up to and including 100 watts.

The No. 577 DUBILIER UNIVERSAL CONDENSER can be supplied in practically all capacities at \$2,00 each.

Builetin D2 describing the DUBILIER UNIVERSAL CONDENSER, together with literature describing other high grade apparatus will be sent you on receipt of five cents in stamps.

SOMETHING NEW IN HEADSETS

"Navy Type, 50,000 Ohms, A. C., Weight 9 oz., complete with head band and polarity indicating cord.

Price \$14.00

Send 5c for Catalog "C"

With recent improvements in our Navy Type Headset we have succeeded in bringing out a headset with an A. C. resistance of 50,000 ohms at 800 cycles, a thing which has never before been accomplished in a commercial headset. It has a natural high pitch and will bring in thousand cycle notes clearly and distinctly and undamped waves can be read clearly and distinctly through static.

The improved Navy is peculiarly adapted to vacuum

The improved tube reception.

They are permanently adjusted at their highest point of efficiency and then carefully matched in tone. Because of their rugged construction they remain adjusted

cause of their rugged construction they remain adjusted indefinitely.

The most exacting comparative tests have convinced us that our High Impedance Navy Type Headset is the best on the market, regardless of price. It is the most sensitive, most durable, and at the same time the lightest high-grade headset built. Our guarantee stands back of every one of these claims.

If you need a reliable and super-sensitive headset, you cannot afford to be without this new high impedance model. Send us \$14 and we will mail you a Navy Type Headset. Try it for 10 days. If you are not absolutely satisfied with your purchase, return the headset and we will refund the money immediately.

4nnouncement

WING to the increased popularity of CW transmission and the increasing demand for Ray-Di-Co motor generator units it has been necessary to open a Western point of distribution. The territory consisting of the states of Colorado, Wyoming, Utah, Nebraska, western Kansas, northern New Mexico, Deadwood and Lead, South Dakota, will in the future be cared for by H. H. Buckwalter, 713 Lincoln Street, Denver, Colo. Mr. Buckwalter is a well-known radio man in this territory has a large personal acquaintance with the amateur and will shortly have a stock of the "MIDGET" "HYLO" and "STANDARD" motor generator units in stock for immediate shipment. Later it is hoped he will have a stock on hand which will care for shipments to dealers throughout the entire west. Just another step by Ray-Di-Co to give the amateur better service and attention. Mr. Buckwalter will be glad to render any assistance possible to the amateurs in his territory.

ARCHIBALD AUGUSTAS GETS A SCARE

(Continued from page 333)

There was an ominous silence. The judge regarded the prisoner with an angry glare. Before he could speak, however, there was a violent commotion outside, and a moment later a puffing and perspiring person came rushing un-dignifiedly into the courtroom. Catching sight of the mysterious prisoner, he

sight of the mysterious prisoner, he stopped and seemed to stagger.

"Good Lord!" he groaned, putting his hand to his head, "You're a sweet-looking sight, all right, all right!"

"How in heck did you find out I was here?" demanded the black-faced enigma.

"How did I find out!" barked the other, mopping the sweat and dust from his face with his handkerchief. "When you didn't show up this morning, and when I saw that hell-fired gang of young hyenas acting so blamed queer and snickhyenas acting so blamed queer and snick-ering up their sleeves like they were, I knew blasted good and well something was rotten in Denmark: finally I got Kid Brady by the back of the neck and laid him out on a practice-table and sat on him until he spit out the truth. Then I breezed down to the inspector's office, where I found that old sister to a firewagon siren babbling something about a black monster, and right away I knew what'd happened, so I rambled up here, —and when it comes to a twenty-four caret, double-barreled damn fool, you take the prize—"

take the prize—!"

"Here, here!" yapped the judge, banging on his desk with his mallet. "What

does all this mean, anyway?"
"Excue me, Your Honor," answered the new-comer, turning to the judge, "I'm the instructor at the wireless school down on Main Street, and this proper important addle-brained image of poor, ignorant, addle-brained image of a countrified jackass is one of my pupils. That gang of criminals down at the school found out he was pretty shy on cash and in a hurry to get a license so he can get a ship; and so they talked him into this confounded crack-brained scheme. They bought the clothes and the nigger-paint, and early this morning they went up to where he rooms and dolled him up. The idea was to take the license examination in disguise, and if he passed all right, to come back in a few days without the coon-town outfit and take the ex over again in his own name. Why that cursed crowd of young ourang-utans made him believe it was a surefire stunt that'd been pull-ed a dozen times before and—but, Lord, I wish somebody'd tell me what they'll do next, blast em!"—and Pop Cranby mopped his face again.

The crowds in the courtroom were

amazed.

amazed.

"Where did you get that story about the Chilean ship?" demanded the judge of the youthful prisoner.

"The fellows picked it out of a dime novel fer me."

"Holy Mackerel!" groaned Pop Cran-

by.
Archibald Augustas cleared his throat.
His face had become dignified and

stern.
"This is outrageous, Your Honor,"

"This is outrageous. Your Honor,"
he began, in his coldest secretary-ofthe-navy tone. "It is evident that this
person has dangerous criminal tendencies. I suggest that he be sentenced
to at least twelve months at hard labor."
Right here, Archibald Augustas overstepped himself. Had he remained silent,
things might have gone hard with the things might have gone hard with the

adventurous amateur, but the assistant (Continued on page 350)

Bust Thru the QRM With a Benwood Removable Point Disc

ANY NOTE

ANY FRE-**OUENCY**

Double Your Radiation

Sparking points are variable from 2 to 16. Teeth are Renewable as well as Removable.

Disc is Six Inches in diameter and sparking points are One Inch in width. Complete disc weighs less than half pound; absolutely accurate and finely

This disc enables the operator to vary the frequency of the spark at will, regardless of the speed of the motor used. It enables the operator to obtain the maximum radiation from any spark transmitter by being able to change the spark discharge frequency to conform to Any Condenser Capacity and Any Wave Length that is in use at the present time. This disc will absolutely increase the transmitting range of Any spark transmitter because it is at once applicable to any make transformer on the market regardless of the voltage. It is the ultimate in rotary disc design and fills the long-felt need of every radio man.

A Clear note can now be had at all times. As soon as the sparking points on this disc become worn and uneven a complete new set can at once be put into service thus assuring the operator of maximum results at all times. The center of the disc is **Moulded Bakelite**, the best insulation obtainable. Disc is fitted with carefully machined brass bushing and set screws for fastening to the motor shaft. It is also furnished with shaft for use with any of the enclosed Benwood gaps that are now in use.

Price complete with 16 sparking points, \$10.00

Specify size of motor shaft when ordering. Extra sparking points 20 cents each or \$2.50 per set of 16.

DUCK'S New Big-200 Page No. 14 Wireless Catalog 21 and 27

Mailed for 12c, either in stamps or coin, which amount you are privileged to deduct on your first order of \$1.00. Catalog positively not sent otherwise. This edition of our wireless catalog is the most complete and elaborate we have ever put out. It embraces everything in wireless worth while. As an encyclopedia of information it is invaluable. It is printed on excellent paper with wireless catalog to take the place of Duck's, and above all, that you can absolutely rely on the quality of every instrument listed in this catalog. In a word it is all worth while catalogs in one.

Improved Type Sayville Rotary Gap

The picture above really does not do it justice. There is no rotary gap we have ever sold that we consider in the same class with this gap, and we have therefore, discontinued the sale of all other types listed in our catalog.

Any purchaser is privileged to return it within three days if it does not come up to all the high claims we make for it. A first-class Rotary Gap is the very heart of an efficient transmitting set, and we cannot too strongly emphasize care in the selection of this instrument if effective and dependable results are desired.

THE WILLIAM B. DUCK CO., 210-212 Superior St., Toledo, Ohio

A Word To the Wise!

The "STANDARD VT BATTERY" is The "STANDARD VT BATTERY" is made by people who specialize. They concentrate their facilities upon the manufacture of plate circuit batteries. They know how and why plate circuit batteries are used, and what is expected of them in the way of service—for which purposes an assembly of common flashlight batteries will not serve efficiently. ficiently.

Dealers who sell any of the three types of the "STANDARD VT BATTERY" guarantee them fully. They know of their excellent qualities, and offer you the benefit of their knowledge and selection when they sell you the "STANDARD VT BATTERY." Still, they're not expensive. This, combined with A-I quality, is the secret of their extensive use.

Treat yourself to a full round of satisfaction by purchasing the "STANDARD VT BATTERY" from your nearest dealer.

inspector's overweening assumption pi-

qued the judge.

"I suggest that you keep your mouth shut!" snapped the ruler of the court-room, glaring at Archibald Augustas with a glassy eye. "The case is dismissed. Get out!"

Fortunately for the young adventurer, Mr. Woodnut, the chief radio inspector had a sense of humor, and in spite of all protests on the part of Archibald Augustas, he insisted that the amazing amateur from Petaluma be permitted to go through with the examination.

The candidate came through with flying colors. Since Mr. Woodnut chanced to be again absent on the day when

to be again absent on the day when the lucky amateur completed the exam-ination, it devolved upon Archibald Augustas to check the question sheets. Grudgingly, the assistant inspector Grudgingly, the assistant inspector checked out a percentage amply sufficient for a license; grudgingly, he got out the license-book and filled out a commercial first-grade license; and thirty minutes later when the new operator came back with the oath of secrecy duly sworn to, he still more grudgingly sign-

sworn to, he still more grudgingly signed his name to the document.

"The next time you come for an examination in disguise, I would suggest that you engage a performer in a vaude-ville minstrel-show to give you a few points regarding the preparation of your costume," he remarked in his extra-best excretary-of-the-navy style as he handed secretary-of-the-navy style, as he handed over the license.

over the license.

The freshly-made operator rolled up the crinkly bit of paper and stowed it away safely in an inner pocket before replying:

"Humph, I reckon if that cop hadn't grabbed you, you'd be runnin' yet!"—and with this the newly-fledged brasspounder (er—it wasn't Samuel Jones, remember) drew himself up with all the proudness of an emperor and marched majestically from the room.

(The End)

PACIFIC COAST ADVISORY COUN-CIL BENEFITS THE AMATEUR

THE first meeting of the Pacific Coast Advisory Radio Council was held at the Palace Hotel in San Francisco, March 15th. The following radio officials were present: Major J. F. Dillon, chairman of the board; Commander Clark, U. S. N.; Lt. Commander McCaughey, District Radio Communication Superintendent in San Francisco; Captain C. I. Hoppough, U. S. A. Signal Corps, Presidio, San Francisco; Mr. C. Langevin, Pacific Coast Chairman of the United Radio Telegraphers' Association; United Radio Telegraphers' Association; Mr. A. E. Bessey, Pacific Coast District Manager of the ARRL, and many other radio service company and manufacturers' representatives. A good attendance was had at the banquet and short addresses were delivered by the members of the Council. Commander Clark surprised the gathering with a most interesting address on the Naval Communication Service and the manner in which the navy traffic is taken "from the hook" and sent to the various stations in the world. Immediately after the banquet the meeting of the Council was called to order. Mr. H. W. Dickow introduced the members of the Council and an opening address was delivered by Major J. F. Dillon. Proposals were asked for

NEW YORK WIRELESS CONVENTION

Continued from page 335)
Federal Telephone and Telegraph Company have several new pieces of apparatus for use in connection with V. T. and C. W. sets, including some filament lighting and "B" potential transformers and telephone jacks which take care of the automatic filament lighting which has come to be such a feature of late

John Grinan (J. G.), who, in bygone days, was the first to push a spark transmitter signal across the United States, was very much on the job. With his associates of the Continental Company, he was expounding the virtues of the Paragon Ten, which, by the way, was much in evidence in other booths, where receiving sets were kept in operation.

Mesco was also on the "qui vive," and the writer found Mr. Elts, manager of the Radio Department, perched atop a table in a secluded spot adjoining the lecture hall, where he was listening, unobserved, to a talk by Mr. K. B. Warner of Q. S. T. He is hot on the trail of an association of radio manufacturers and dealers, in which he has been able to create a great deal of interest. Sort of a Love Feast of Competitors.

F. M. Doolittle is belying his name, in that he is not doing little. Several of his new developments have been described in radio papers, but his latest development, and one for which he expresses a great deal of hope, is a new anchor gap, for use in connection with a break-in system. It consists of two plates separated by an insulating substance and held together by a screw and nut passed through the center. The gap is airtight and the surfaces are so close together that the increase in damping is very small.

The Signal Corps and the Navy kept booths in continuous operation, where several outfits, now used by those services, were shown in operation.

Among the other exhibitors were the Acme Apparatus Company, Adams-Morgan Company, American Electro-Technical Appliance Company, American Radio Relay League, American Radio and Research Corporation, Burgess Battery Company, Chi-cago Radio Laboratories, Experimenter Publishing Company, Lehigh Radio Company, Radio Distributing Company, Super Radio Laboratories, The Radio Club, Irvington, N. J.; C. D. Tuska Company, United States Department of Commerce, Radio Service, Westchester Electric Appliance Company, Inc., Wireless Press, and Y. M. C. A. Radio Schools.

INTRODUCING The PACENT UNIVERSAL PLUG

CONNECTIONS TO SOLDER NO PRICE \$2.00

The Only Plug DESIGNED For Radio Work

THE PACENT UNIVERSAL PLUG, now obtainable from your dealer, is the plug for which you have been waiting. It consists of three parts; two moulded bakelite pieces, each with a recessed finger grip, and the plug with its connecting spring clips. The two moulded pieces are held together with a single screw which fits into a threaded brass insert.

into a threaded brass insert.

In addition to telephone headset work, the PACENT UNIVERSAL PLUG may be used very effectively for "plugging in" a microphone transmitter, manipulating key, a loading inductance, the serch coil of a wavemeter, a remote control switch, a plate battery or high voltage generator, in fact its adaptability renders its name synonymous with its uses.

The effective and practical design of the PACENT UNIVERSAL PLUG was so appreciated by the United States Navy Department, that the plug was officially approved and a most gratifying letter was received from the Navy Department commending its many desirable features.

Catalog No. 50—PACENT UNIVERSAL PLUG—Price \$2.00

Bulletin P. 11 describing the PACENT UNIVERSAL PLUG and literature describing other unique apparatus will be sent you on receipt of five cents in stamps.

PACIFIC COAST ADVISORY COUNCIL

(Continued from page 350) and the meeting began in earnest. Prof. Tinsley representing the S. F. Radio Club, read the first proposal. The purpose of the proposal was to secure the sanction of the Department of Commerce for wavelengths in excess of 200 meters for CW work and the abolition of the 300 meter wave for commercial work. Much discussion followed and the proposal was accepted by the Board. Revisions thereto will be made and it will be forwarded to Washington. Chairman Dillon received the wild applause of the evening when he announced that he would endeavor to have ten radio of the longer wave. The next meeting of the Council will be held in June.

HARDING OKEHS S. F. WIRELESS PROJECT

R P. Schwerin, president of the Federal Telegraph Company has returned home from Washington, D. C., has been instructed by President Harding and Secretary of State Hughes to go ahead with the company's contract with the Chinese government to construct the largest wireless station in the world at Shanghai. Telegraphic advices from the national capital are to the effect that the Harding administration is confident it can get withdrawn or overruled the protest against the contract made to the Peking government by Great Britain, Japan and Denmark.—S. F. "Bulletin."

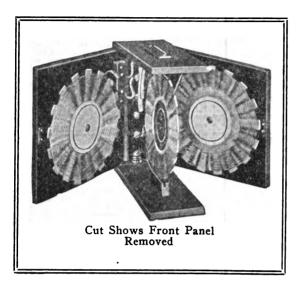

S. F. NAVY DISTRICT ESTAB-LISHES NEW WIRELESS RECORD

HE district banner for naval radio achievements in February hangs in the Twelfth Naval District headquarters.

During February this district received and sent over 1,000,000 words through a distance of almost 300 times the earth's diameter; brought in a ship in the fog by sending wireless bearings; relayed a message from one vessel to another 7000 miles from the first, and cent first aid instructions to the wife of sent first aid instructions to the wife of an officer, the victim of appendicitis, isolated on the Farallones.

Commander Scott D. McCaughey is district radio chief.—S. F. "Call."

FOUR MORE STEPS-

of Amplification, or its equivalent, may be gained without additional expense by using a "Spider-Web" Regenerative Set. The outfit itself gives an amplification equal to two-steps and you save the price of two steps more on the cost. Just think---a complete Regenerative Set to bring in sparks or the phone concerts (tunes to over 450 meters).

A MASTERPIECE

Short Wave Regenerative Receiver

TYPE R. S. 7 PRICE \$50.00

f. o. b. factory

150 to 750 meters

This regenerative receiver is constructed of the best material throughout. The panel is of grained Formica and beautifully engraved, the whole being enclosed in a Birch-mahogany cabinet and, to say the least, it is the last word in beauty and simplicity of operation. Each instrument is tested for C. W. before it leaves the factory.

WIRELESS and Kindred Science Revolutionized!

Whether or not you believe in the present electro-magnetic and valve theory of wireless, you should read my book "Revolutionary Theories in Wireless," and I believe you will agree with me that electro-magnetic waves are not the dominating cause for wireless transmission and that we have no valve or rectifying detectors in use at present.

valve or rectifying detectors in After you read this book you will understand wireless and wireless apparatus from a different angle than you have ever read before. The only book in print advancing the conducive theory of wireless transmission, the valveless theory of detectors, the new attractive theory of electricity, etc.

Among the many new ideas advanced are thermo-coherers, thermo-microphones, vacuum microphones, electrostatic receiver, earth primary and secondary battery, improved electrolytic interrupters, how to fly by manual power and secret of soaring.

This book will doubtless prove the key Eventually you will study, tead

to many of the mysteries of gravita-tion, life, magnetism, electricity, light, chemistry, and kindred science. Get on the right track in your study and experiments in wireless.

I have been highly complimented on my book by The Experimenter Publishing Co., The International Society of Radioists, Joseph Branch Publishing Co., and others.

and co., and others.

Above book is bound in full cloth, has 200 pages, 72 illustrations, and 129 intensely interesting articles on science and describing by the Summers' theory all the most used wireless apparatus.

Eventually you will study, teach, and experiment by the Summers theory, why not now? Book sent postpaid upon the receipt of \$2.50. Address,

FRANK E. SUMMERS, Dept. P.R.N., Memphis, Mo., U.S.A. SPECIAL PRICES TO DEALERS IN BOOKS

AUDION DETECTOR AND AMPLIFIER VT., 50 CENTS. Honeycomb coll mountings, 25c cents. Back mounted rheostats, 40 cents. Composition for molding your own knobs, panels, etc., 35 cents pound. Send stamp for particulars. Palmers Electrical Equipment Co., Dept. 5, Palmers, Minn.

FOR SALE—Regenerative receiver, 150 to 600 meters, \$25.00; Navy type loose coupler, 6,000 M., \$15.00; 2-inch Mesco. spark coll, \$10.00; smail type coupler, \$5.00; Amplifying transformer, mounted complete, \$4.50. All apparatus guaranteed like new. Lester F. Wertz, Temple, Pa.

BARGAINS—Audion Panel, \$8.25; Couplers, \$12.50; Lightning Switch, \$2.00; K. D. Condenser, \$1.00; Transmitting Condenser, \$1.50; Coil Transmitter, \$3.50. L. L. Johns, Mulvane, Kan.

THE BEST HONEYCOMB COILS AT THE LOWEST PRICE. Many satisfied customers are using them. Immediate delivery on the following sizes: 25 turns, 45c; 35 turns, 45c; 50 turns, 55c; 75 turns, 60c; 100 turns, 65c; 150 turns, 70c; 200 turns, 75c; 250 turns, 80c; 300 turns, 85c; 400 turns, 90c. Postage extra. Superior Coil Co., 1831 Balboa St., San Francisco, Cal.

SHEETS - TUBES - RODS

Made from Anhydrous Redmanol Resins

Formica is a homogeneous waterproof insulation with exceptionally high dilectric properties. It is readily machined and does not warp or shrink.

Formica is the ideal material for panels and other insulation parts of Radio Apparatus, on account of its superior electrical and mechanical properties, as well as its splendid appearance.

ACME APPARATUS

Acme 250, 500, 1000

Spark Transformers
C. W. Power Transformers
Modulation Transformers
Amplifying Transformers
Filament Heating Transform

Special Transformers
Amplifiers
Detectors
11/2 Henry Choke Coils
Anti-Light Blinkers

The ACME SPARK TRANSFORMERS have the highest efficiency, highest power factor, highest spark frequency and lowest price of any on the market. Acme 250, Acme 500, Acme 1,000.

The ACME C. W. POWER TRANSFORMERS are for use with rectifying devices or for A. C. directly on the plates of power tubes. 50 watt, 200 watt, 500 watt.

The ACME MODULATION TRANSFORMERS give maximum modulation without distortion. Type A-3.

The ACME AMPLIFYING TRANSFORMERS are the result of experiments by transformer and radio engineers. Correct ratio and impedance. Type A-2 The ACME FILAMENT TRANSFORMERS allow the use of A. C. for power tube filament heating with easy control. 75 watt, 150 watt.

The ACME AMPLIFIER AND ACME DETECT-OR contain in a small space what so often requires considerably more.

The ACME CHOKE COILS are 1½ Henries for use in ironing out and for modulation.

The ACME ANTI-LIGHT BLINKERS eliminate blinking of lights when transmitting.

Special price reductions

REAR VIEW OF AUDION CONTROL PANEL

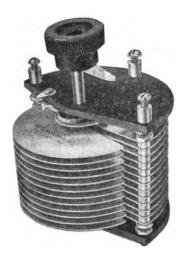

This is the greatest panel value ever offered. It will not discolor like hard rubber, nor is it brittle or easily damaged. The panel is cut from solid sheet, not moulded. Surface highly polished. Lettering and scales machine cut, not stamped, and whitened. Metal parts heavily nickeled. Filament rheostat back mounted. Wound for 5 ohms, it permits close adjustment of filament temperature. See prices above.

These prices are special, very special, and temporary only. The apparatus is standard, ace high in quality, and the saving to you considerable, in fact far greater than you may reasonably expect to secure again for some time to come, if ever. Mail your orders at once—

At Last, Fellows-ARealCondenser-Built for Your "C.W." Set

"Wireless Shop Variable Condensers" Are Quality Instruments

That is the reason the up-to-the-minute amateur was so quick to recognize and specify them. Are you using them in that new set you are building? If not, why not? You can't go wrong, as we fully guarantee them to give satisfaction or cheerfully refund your money. You couldn't ask anything more.

The new "Wireless Shop CW" Variable Condenser was developed to meet the demand for a condenser which would not break down when used with high plate voltages. You don't have to take your receiving condensers to pieces and add spacers any longer. The NEW WIRELESS SHOP CW VARIABLE CONDENSER does the trick.

Heavy construction and only the best of materials and workmanship make this condenser suitable for even the most critical. These condensers are at the present time furnished in three capacities only, but if you need a special capacity for your own particular set, write us. We are especially well equipped to make you anything you may need in the condenser line, as that is our SPECIALTY.

No. 1500—15 plate, approximately 0004 m. f. max. capacity.....\$6.00 No. 2500—25 plate, approximately .0006 m. f. max. capacity..... 7.50 No. 3500—35 plate, approximately .0008 m. f. max. capacity..... 9.00

Regularly fitted with mounting screws and knob and pointer. Will be supplied with a metal dial instead of pointer at 75c additional, or with a moulded Bakelite knob and dial, finely engraved with graduations and numbers filled in white at \$1.00 extra.

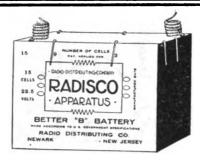

Postal charges and insurance must accompany all orders. Insurance charges on any of the above condensers is only 5c.

No batteries at the price are as good

No batteries at any price are better.

RADISCO BETTER "B" BATTERIES

arc

powerful sturdy long=lived

Two pages of superlatives couldn't promise more

Since the *still better* Radisco Better "B" Batteries have been at the service of the radio traternity, amateurs as well as commercial operators, have endorsed them highly, by personal recommendation and by continued use.

Your Radisco dealer has a plentiful supply of these powerful batteries. His name, added to the Radisco trade mark is your guarantee of complete satisfaction.

> No. 1 (31/4x2x21/2 in.)...\$1.50 (Shipping Weight 2 pounds)

No. 2 (61/2x4x3 in.).....\$2.65 (Shipping Weight 5 pounds)

Larger size has Variable Voltage feature. Tapped in groups of three cells. Ask your dealer to explain it.

Use Radisco Better "B" Batteries for C. W. work. A radio phone operating on Radisco batteries is exceptionally quiet, and free from the disagreeable hum of a motor generator, or the rectified 60 cycle tone.
