BUILDS BEST SUPER-HET

KHJ FINDS SOLUTION TO QUESTION OF PAY

EXPERIENCE PROVES THAT PROGRAMS ARE BETTER

Artists Being Paid Indirectly By Donor of Program—Government Reaches a Similar Conclusion

WASHINGTON.—Has the answer to the question "Who Shall Pay for Radio Broadcasting," reached a satisfactory settlement? The department of commerce year book seems to think that it

The introduction of the commercial element into Radio broadcasting, is probably the most important development during the past year. Previously all broadcasters sent out programs at their own expense, but recently some stations established a fixed rate per hour for the use of their transmitters.

"It now appears possible," the year book states, "that the cost of broadcasting may be borne more and more by those (Continued on page 2)

Left, Lenore Everett, KGO dramatic player heard recently in the comedy-drama "Homing," broadcast from KGO. Above, Dorothy Raye, celebrated songster in the "Around the Rainbo" show at Mann's Million Dollar Gardens, broadcast from WQJ. Right, Lotta May Kelly, feature on the "Nite Cap" program at WJAX.

SOOTH COPS WITH TENDER SAW SOLOS

OSTON.-Nothing surprises the director of a station any more. The other night someone called WEEI during a dance program and requested that they "play something soothing for the benefit of the Hing-ham police." So when the program ended, Stanley Greenlaw got out his saw and pounded out "Ole Black Joe" and a few more "soothers" for the law und order department.

Lambdin Kay Enters Movies | Convicts Broadcast Direct to Show How Stations Work

ATLANTA, Ga.-Movie acting is the latest role that Lambdin Kay, announcer at WSB, has had to play as part of the day's work at the broadcasting station.

He was the entire cast of characters in a one-man production filmed by an Atlanta theater as part of a Radio fantasie. He was shown in action before the microphone giving WSB's familiar salutation to the world while an impersonator simultaneously gave the call from behind the scene.

from State Penitentiary

PHILADELPHIA.—Early last spring amplifying apparatus was installed inside the bleak walls of the Eastern State Penitentiary in this city, and connected by telephone lines to Station WIP.

Done as an experiment, the first broadeast caused much excitement. Three thousand telegrams poured into the studio offering congratulations and begging for

It was tried again recently, with even greater success than the first broadcast.

TESTS PROVE TWO CONTROL **SET PERFECT**

Cuts Through All Locals

Designer, J. G. Ryan, Tells Radiophans How to Build-Gets Both Coasts Regular

So simple a child can operate it, the most practical super-heterodyne has been developed at last in the laboratories of Radio Digest. The new wonder set, designed and built by John G. Ryan, Radio engineer of repute, not alone is simple to operate but just as simple to

In tests made over a period of ninety days coast to coast reception has been regular.

Simple to operate and construct, the efficient set is built from the fewest possible number of parts. Its cost will not exceed \$78.00, and additional accessories, most of which are already possessed by the average Radiophan, cannot possibly cost more than \$76.40.

Selectivity is one of its prime assets. (Continued on page 2)

NEW TRANSMITTING SYSTEM DEVELOPED

INTERCHANGEABLE CODES CONTINUALLY ALTERED

Receiving Apparatus Automatically Responds to Change-Sends Message Written Similar to Typewriter

LONDON .- A new system of transmitting commercial intelligence and news by Radio, which is directly transferred from a typewriter in the transmitting station to the tape which spins out written characters in the receiving office, has been discovered. The discovery is due to the enterprise of two German scientists, but its exploitation and the development of its possibilities were quickly seized upon by William Dubilier, the well-known Radio manufacturer.

The machine consists of a typewriter, a registering apparatus, and an assembly of eight compartments, each containing what looks like a transformer built on top of a magneto. At the head of each compartment are movable rods which send out the message by means of musical

Uses Interchangeable Code

The receiving apparatus looks even simpler-a four-tube set, a box full of plugs and wires, and a camera-like mechanism, with a motor attachment; besides this, the wheel around which the tape runs. Secrecy is obtained by means of the fact that countless combinations can be used at will. The receiving apparatus automatically responds to the change, so that in the event of any suspicion arising that messages are being tapped their method of despatch can be immediately altered.

Not ony can the time periods be changed between the notes, but the combination of notes used can be changed at will, so that the transmitter may be changed automatically every few words without in any way affecting the operation of the receiving apparatus. Since transmission is effected by means of musical notes, atmospherics-the bugbear of Radio-

are eliminated. The potentialities of the invention to business houses, which have so far fought shy of Radio because of its lack of secrecy, are enormous. Big stores can transact business between headquarters and all their branches in this way with utmost secrecy, changing their code from day to day.

BEST OF SUPER-HETS

(Continued from page 1)

Chicago, as is known to all local listeners, is one of the most trying cities for All the Live News of Radio..... a receiving set. So many local stations are on the air nightly as to make out of town reception practically impossible except on Monday night when Chicago stations are silent.

But the Radio Digest super-het proved equal to the task.

The set was moved from one congested ether locality to another. Every test proved it capable of cutting through

the worst of interference. Eliminate Unnecessary Controls

Satisfied that the set was super selective, the next problem was to eliminate all but the absolutely necessary controls so that even the uninitiated listener in could operate it satisfactorily.

After considerable work in designing the result was a super-heterodyne with but two tuning controls, a rheostat and a potentiometer. The two tuning controls are for condensers, one of which tunes the loop aerial and the other, the oscil-

John G. Ryan, the designer and builder of the set, now tells how anyone may duplicate it. His story appears on page 21 of this issue.

KHJ HAS PAID TALENT

(Continued from page 1)

wishing to reach the great audience available through this system of communication.

Station KHJ, believes that they have found a solution to the question. They reiterate the statements made by the Departmental year book. "Uncle John" Daggett, director of the station stated that at the time KHJ first went on the air, an appeal was made for the artists to come and appear before the microphone for the good that they could do.

Practically every program now presented over KHJ is being put on by some bank, store or industry of Los Angeles, or vicinity. The artists are being paid by the donor of the programs, not as much as they usually get for regular performances, but enough to feel that they are being paid for their work, and

that it is not charity. KHJ has always been noted for the level excellence of its programs and it is thought this new scheme, evolved through expediency and experience, will bring even a higher class of entertainment to the listeners in.

DUBILIER'S NEW SECRECY DEVICE

William Dubilier, well-known condenser manufacturer, has recently brought to the attention of others a Radio secrecy code transmitter and receiver invented by two German scientists Commercial news and intelligence is typed on what appears to be an ordinary typewriter, which in turn sends out a jargon of code. This is picked up by a special receiver and converted to the proper written words on a tape.
P. & A. Photo.

Announcers Rile Fans

WASHINGTON, D. C.-Local Radiophans are complaining that announcers for the various stations in signing off are slurring over the calls of their stations so tions to the careless way in which some that many times the letters are not un-

some of the "travelfans" who are trying to make a record on stations received.

One of the bugs in discussing the problem compared the signing off of some staletter writers sign their names. That is, derstandable. This is causing trouble to the signing off is unintelligible.

Looking Ahead

The Simplest Possible Super-Het's Wiring Diagram will be shown next week by John G. Ryan. He will show the easiest method of wiring this excellent superheterodyne. If you want the least amount of trouble, watch for this article.

Constructing Various Types of Low Loss Inductances will be the text of the next article written by Jacques Fournier on "'Low Loss,' What It Is and Why.' Low loss fans should read this article.

Operating and Trouble Shooting for the Owner of an Atwater Kent Model 20 Receiver, will be shown in a coming issue. Many points on receiving will be taken into consideration and it is written so anyone can operate a set of this type.

Regenerative Radio Frequency Hook-Up, a feature to appear in our next issue shows an excellent method of combining Radio frequency with regeneration. Selectivity is gained, as well as added signal strength.

Course Its

For ease of tuning, selectivity and long distant reception, you can't beat a Crosley. Actual performances prove this day in and day out.

Here are what a few of the happy Crosley users say:

Apponnag, Rhode Island.

"I purchased my Crosley one tube No. 50 around the first of August and I think it is my duty to express my satisfaction of its performance during the warm spell. Have heard New York, Boston, Plttsburgh, Cincinnati, Chicago, Detroit, Ottawa, Canada, and many other stations."

Dallas, Texas.

'The set, Model 51, has already surpassed my greatest expectations. On the night of September 13th, Oakland, California, was received with sufficient volume to be clearly heard throughout seven rooms. Kansas City, Chicago and many other stations were received with respectively greater volume."

respectively greater volume.

Chicago, Illinois.

"My Trirdyn has done all that you claimed for it. The first silent night, Monday, September 22nd, using only two tubes, I pulled in twenty-eight stations. On the following night with most of the Chicago stations going full blast, using two tubes, I pulled in Memphis, Cincinnati, Dallas and Omaha."

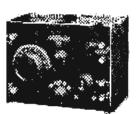

(Names upon request)

These are only a few of the thousands of unsolicited letters that come to us. You. too, can enjoy similar results with a Crosley. And the cost of any Crosley is remarkably low.

BEFORE YOU BUY-COMPARE YOUR CHOICE WILL BE A CROSLEY

RADIO FIELD GROWS FAST, REPORT SAYS

MANY COMPANIES ARE FI-NANCIALLY SOUND

Midwest Economic Institute Shows Promising Future for Industry Not Even Thought One Once

CHICAGO.—Coincidental with the fourth anniversary of Radiocasting now being celebrated, comes a statement from the Midwest Economic institute which tells in interesting fashion the immense growth and present financial stability of the Radio industry.

According to the institute Radiocasting has so appealed to the public imagination, not only in this country but continental Europe, to such a degree that in England, where Radio has become a national fad almost to the same extent as in America, some 900,000 receiving licenses have been issued and the total number of listeners in is around 4,000,000. And it is interesting to note that the American invisible audience is now estimated conservatively at 5,000,000 persons.

Becoming Financially Sound Fast "Another interesting angle of the Radio industry," the report of the Midwest Economic institute continues, 'is the financial side of the question. A few years ago the Radio Corporation of America was practically alone in the field so far as financing through issued securities was concerned, but today there are about a dozen such corporations aligned with all the other large corporate enterprises representing the industries of the

country in the financial markets. "That the whole industry has benefitted by this financial set-up is evidenced by exhaustive reports published in the latest Poor's and Moody's manuals of such companies as DcForest Radio company, Dubilier Condenser and Radio, Hazeltine, Ware Radio, J. W. Jones Radio, Tower Radio, Marconi Wireless and Marconi of Canada, Limited, and others who are among the leading manufacturing concerns which have been working at capacity to supply the demand of the public for equipment and whose earnings and future prospects augur prosperity

Surprising Statistics on Industry

"Four years ago the Radio industry was not considered of sufficient importance to give it an individual classification in the field of husiness. It was grouped under electrical products, along with electrical toys. When broadcasting started many hailed it as a fad that would live only for a brief period. Today it is considered one of the first industries of the world and that sales of Radio equipment are not likely to reach a saturation point for at least ten years.

"It is surprising to note that now there are more than 3,000 manufacturers of Radio supplies in the United States, 1,000 distributors and 27,000 retailers. More than 250,000 persons are connected directly or indirectly with Radio industry. All told Radio business approximating \$115,000,000 was done in this country last year, and \$50,000,000 of this was in vacuum tubes alone."

Ohio State Uses Elaborate Scheme for Announcing Gridiron Contests

Special Studio Gives Vision of Field for Announcing Plays as They Are Made-Nine Microphones Allow Listeners in to Hear Cheering and University Bands

By Alton D. Spencer COLUMBUS, Ohio.-What is believed to be the most claborate arrangement ever made by any broadcasting station for sending out the results of an athletic event are those used at the Ohio Stadium, the largest in the Big Ten football conference. Ohio state's broadcasting station, WEAO, furnishes the power that

carrys the sound picture gridiron contests to a host of listeners.

Profiting by the experience of one season of broadcasting home games, attaches of the station have set the stage at the stadium and behind the brick walls of the engineering laboratory, where the plant is located. This gives the maximum of efficiency in giving the running story of the games and snatches of cheering and band music-as complete a picture as can be obtained without being in actual attendance.

Eliminate Relay Announcers

The greatest improvement made in the system is the elimination of relay announcers. This system was discarded partly because of the difficulty of getting dyed-in-the-wool football fan away from the game long cnough to do the announcing at the studio. Last year it became necessary once or twice to put one unskilled in "gridiron" phraseology on the line, with uncomplimentary re-

sults. The system employed this fall centers all announcing, cheering, band music and customary sounds of the game in a tiny white booth located in the middle of the west press box at the stadium. It connects directly with the broadcasting sta-

Nine microphones send the audible impressions picked up into a miniature switchboard at the announcer's booth. Eight of these are located in the upper tiers or aprons at the east and west centers of the stadium. The ninth is for the exclusive use of the announcers. In addition to wires from the "cheering microphones," lines connecting with assistants located at the henches of the rival teams flow into the booth.

Seated at a table just below the plate glass window of the little house, An- public demonstration here. nouncer A. Lee Henderson and Engineer Robert C. Higgy have complete control of the situation. From their window they have a comprehensive view of the game and the happenings in the big horseshoe. What cannot be seen is relayed to them hy the two information scouts camping on the team benches. At the station, located about two blocks away, Operator M. F. McDowell and his assistant, A. M. Rose, handle the intricate transmitting apparatus and the control of sound volume, which is accomplished through an adaptation of certain telephone equip-

ment to the needs of Radio. Connect All Incoming Lines

The stadium broadcasting headquarters is an innovation, being simply a small studio for the announcer. The walls are padded and draped with studio cloth, making it as nearly soundproof as it is possible. All incoming lines connect with a small switchboard designed by Mr. Higgy for this purpose. By the pressure of a button, the voice of Announcer Henderson comes through without interference. Other switches bring in either or both of the "cheering microphones."

PLAN HUGE OPENING FOR CHICAGO SHOW

INTERNATIONAL EXHIBITS FORM GRAND DISPLAY

Amateur Set Builder's Contest Attracting Nation Wide Attention-Many New Devices Promised

CHICAGO.—Fans throughout the middle west are anxiously awaiting the opening of the Third Annual Chicago Radio show which takes place on Tuesday afternoon, November 18, and continues until midnight, Sunday, November 23, at the Coliseum in this city.

The exhibits, which will all be of the De Luxe variety, will completely fill the huge building and all of its additions, occupying nearly one hundred thousand square feet of floor space.

Notable among the exhibits will be some French receivers, tubes and battery eliminators, recently perfected by a celebrated French electrical wizard, which threaten to revolutionize Radio reception. These startling devices, which are not yet on the market, will be given their first

Contest for Set Builders

In addition to the vast number of manufacturers' displays through which they will introduce their new models to the enthusiasts of this country, there will also be several extremely interesting novelty exhibits, including a "New Inventions' Department," a "Practical Minature Model Exhibit" and an "Amateur Set Builder's Contest." The latter is attracting nation wide attention and entries arc coming in from all parts of the American continent.

Feature programs will be broadcast very afternoon and evening direct from the special studio which has been installed in the south balcony of the Coliseum. Six of the most powerful broadcasting stations in Chicago will contribute talent.

Financiers Interested

Confidential representatives of the world's most important banking houses will also be in constant attendance, looking for opportunities to finance new and feasible Radio inventions. One eastern capitalist has authorized his Chicago representative to invest a large sum in five of the most promising local companies. the selection to be made after a careful investigation, which will begin on the opening night of the show.

Numerous Italian and Japanese sets will be on exhibit. Many of these arrived too late to be shown at the New York show, and will be seen here for the first time in the United States.

New Transmitter Operates Like Pistol; Is Portable

LONDON, Eng.-A new transmitter has heen invented here recently, which can be carried about and used for summoning help in case of an attack by robbers or other distressing occasions. The set is operated much like firing a pistol, and sends a signal which can be picked up at moderate distances by any receiving set.

Here it is! all ready to tune in

All you have to do is to use and enjoy it

SOME people like to spend days and weeks "collecting" a radio receiver part by part, and putting the whole together. Most people don't. They like an instrument to be ready—and each part of it known to be beyond challenge. They like a beautiful case that helps to furnish a room. They don't want the bother of stringing wires or of assembling parts. They want certain, quick results as soon as they receive their instrument.

Such people gravitate naturally toward the De Forest D-12 Radiophone. From the very beginning you get splendid results with it, even if you are an admitted "greenhorn." Yet such is the technical skill embodied in it that whether you are expert or otherwise you can go forward progressively with this instrument; you can fully realize the wizardry of radio as it calls the mysterious voices from the brimming radioways.

That the De Forest Radiophone is the standard

in the radio world you probably know; for Dr. Lee De Forest, the great creative genius of radio, is its sponsor. A cheap machine it is not—though it costs about one-third less than any other that produces anything like equal results. An economical instrument it is. Sound engineering principles have given it a really surprising range; and this without any outside or inside wire, any ground wire. Also, the De Forest is conveniently movable from room to room.

Remember that the purchase of the De Forest D-12 gives you at one price everything that is required to make it usable in your own home. There is nothing extra that you need buy. It contains tubes—batteries—loud speaker—loop—everything necessary.

It will pay you to look up a De Forest Agent

De Forest from first to last stands for all that is substantial and thorough and fundamentally right in radio.

De Forest agents are qualified to give sound and practical advice and help in radio. When you find a De Forest agent you find a man who knows radio—a man who has given us his word that he will see that every instrument he sells is thoroughly inspected and properly serviced after the sale. Avail yourself of his help. He desires, as do we, that you should get the fullest enjoyment and satisfaction from your instrument.

DE FOREST RADIOPHONE

De Forest (Separate) Loud Speaker For beauty and clear reproduction—

Use the De Forest Loud Speaker. In this instrument are all the best qualities of phonograph and telephone receivers adapted to radio. It reproduces naturally, brilliantly, without distortion, your favorite music, the voices of your favorite speakers and entertainers. The adjustment of the reproducing unit assures uniform response over entire range of audible frequencies. Its horn is shaped to retain the full brilliancy of the original sound, and also to add volume. Every De Forest Loud Speaker is guaranteed free from defects. Sold by authorized De Forest dealers only. Price with 6 feet of cord, \$25.00.

Every set deserves De Forest Tubes

The original three-electrode vacuum tube that made present-day radio possible was a De Forest. Today, as in the past, De Forest tubes are unsurpassed for giving volume and beauty and clearness of tone reproduction. They are economical of current and have unusual long life.

De Forest tubes can be used with all standard circuits. The DV-3 is for use with dry cells, the DV-2 with storage batteries. They are guaranteed against defects in material and workmanship. Sold only by authorized De Forest dealers. Price \$4.00.

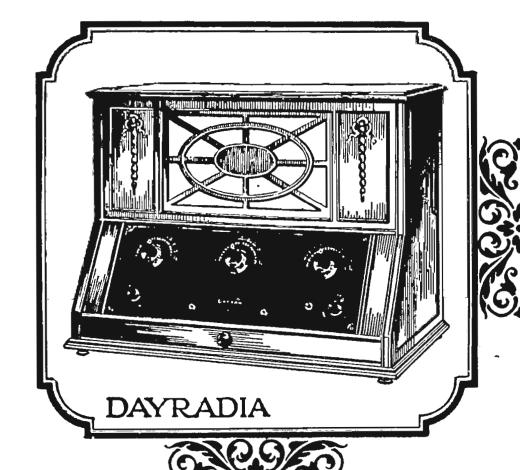

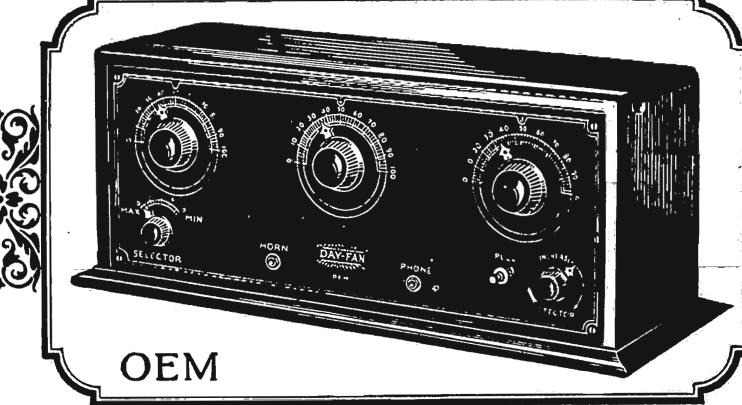

De Forest DV-2 Tube for use with Storage Batteries.

UNIQUE CONTEST ON AIR FOR WGR'S FANS

LISTENERS MAKE UP OWN SELECTIONS TO PLAY

Prize Offered to Program Which Meets With Public Approval-Contest Open to All

BUFFALO, N. Y.—Here is a new kind f a contest! It is designed to give the Radio audience a chance to pick its own

programs. The original idea was that of Harold Gieser, director of the Vincent Lopez Hotel Statler dance orchestra, broad-casting from WGR. The listening

public is invited to pick out their favorite selections from those played by Gieser's band of jazz artists and make up what listener considers to be, from his own personal viewpoint, an ideal program.

He is then to mail this program, arranged the way he thinks it should be played, to Harold Gieser, in care of

After a certain period of time has elapsed, which will be announced later, the plan being to give everyone a fair chance to hear all or most of the Lopez selections, Mr. Gieser's orchestra will play the programs submitted. At this time the Radio audience will be asked

grams and, after an announced period of time, write in, telling which program they

liked the best. Winner to Receive Photograph The one whose program is the subject of the greatest number of approval letters will be declared the winner. An announcement will be made to that effect on the air and in The Radio Digest, and the winner will receive a large auto-

graphed photograph of the Vincent Lopez orchestra, including Harold Gieser himself. Duplicate awards will be made in case of tie.

The idea of this contest is to give Mr. Gieser and his men an opportunity to study more closely the likes and dislikes of WGR's Radio audience and to make the listening public actually feel to a greater degree the very great interest which Mr. Gieser and all those working with him, has in the Radio audience.

Appoint Musical Director

CHICAGO.-All music of WBCN, the Southtown Economist station now building on the south side, will be under the direct supervision of Guy Shrigley, a musician of years' standing in the Chicago field.

TERFECTION to the last detail! Even the unique bearing of the new Bradleydenser is a marked improvement over the older types. The rugged brass plates, the grounded rotor construction, and the new detachable dust shield are other details that serve to increase the high-frequency efficiency of the Bradleydenser. Exhaustive laboratory tests reveal exceptional improvements in efficiency. In fact, the Bradleydenser sets a new low record for losses. It tunes the weakest oscillations with the least energy loss, and, therefore, increases the range of any set. There are many other new and striking features of the Bradleydenser. Our new literature explains them, fully. Send for our latest bulletin on the Bradleydenser today.

LECTRASO

Clear reception and selectivity are what every radio fan wants. To obtain these advantages, every part should be chosen wisely - beginning with the panel.

Electrasote Panels are unaffected by climatic conditions, they will not warp or change color. Due to their electrical qualities they reduce surface leakage to a minimum. And yet they cost less than other standard panels.

Electrasote is one of the famous 'sote" products introduced by The Pantasote Company, Inc.

Radiola Regenoflex —for tone quality!

Radiola Regenoflex

with compartments to hold the batteries; with 4 Radiotrons WD-11 and Radiola Loudspeaker. Complete except batteries and antenna......\$191

Same without Radiotrons and Loudspeaker....\$150

Distance. Selectivity. Non-radiation. Records of performance. All these have made a name for the Regenoflex. But its greatest fame is for tone quality! No background noises—no harsh sounds of reproduction. Clear, true tone!

The day is past when distance has a charm to cover harshness. Distance reception is no longer an achievement. You must have distance and clearness. Concerts and music from far stations must be music when they come in—as worth hearing as where they are played. Speeches must be clear, voices recognizable, humanly real. It is through the achievement of this clearness and reality that the Regenoflex has earned its greatest claim of fame.

NAVY ALLOWS USE OF RADIO PATENTS

ATTORNEY GENERAL STONE HANDS DOWN OPINION

Reflex and Radio Frequency Sets Are Released for General Manufacture Independents

CHICAGO .- Attorney General Harlan F. Stone and the judge advocate general of the U. S. Navy, assisted by Congressman Fred Britten of Chicago, have recently accomplished a notable work in licensing independent Radio manufacturers to use the navy-owned German patents making sets.

The German patents held by the navy cover the manufacture of both reflex and Radio frequency sets.

During the war the U.S. Navy confiscated and later purchased a number of German Radio patents, among which was the famous Schloeinilch and Von Bronck patent. Inasmuch as these patents covered the principle of the reflex and Radio frequency circuits, independent Radio manufacturers' hands were tied.

Without licenses to manufacture under these patents all sets built that utilized either of these principles were infringements. Now, however, with the recent promise of the judge advocate general of the navy to issue licenses to use these patents, set makers will have no obstacle in their path.

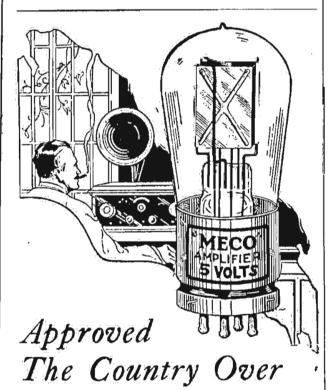

Alaska Fan Hears Station WQJ Broadcasting Program

CHICAGO.-Word has been received at Station WQJ, located in this city, that the program broadcast on the evening of October 21, was received with excellent volume at Petersburg, Alaska.
J. L. MacKechnie, was the Radiophan

who was listening in and heard them.

"Your program is coming in here clear with slight interference" the letter said, "and Jerry Sullivan has just finished singing 'I'm sorry,' this was at 8:45 p. m. Alaskan time."

The distance from Chicago to Petersburg is approximately 2,467 miles figured on the great circle.

To gain the approval of thousands of critical radiophans in every part of the country MECO Tubes have had to produce greater volume without impairing clear, distinct, receptive tones. That they have done this is attested by the increasing number of receiving sets that use no other tubes. Look for the name "MECO" on the base of the tubes you buy.

MECO Tubes operate in any receiving set, in 5-volt and 3-volt sizes with large or small bases. Your dealer has MECO Tubes at standard prices or can get them from recognized jobbers.

Metropolitan Electric Co. Des Moines, Iowa

STATION KYW; PIONEER

(Continued from page 5) with the original broadcasting set, is still

housed on the roof.

As more and more programs were booked and broadcast, a larger and larger staff was needed. Mr. Wetherbee originated the "World Crier" service, the first news service ever to be broadcast. At first the news was broadcast only over a three and a half hour period. Today the Radiophan may tune in on KYW on every hour and half hour throughout the 24 hours, and hear the latest news bulletins.

Nor have the other forms of entertainment been neglected. There is a studio fully equipped in the Hearst building, on the tenth floor. Two afternoon frolics, popular music shows given on Tuesday and Thursday afternoons, are broadcast from this studio, as are four night shows each week, midnight revues on Wednesday and Friday night and the "Evening at Home" shows Tuesday and Thursday.
There is a third studio in the Congress

hotel where each Saturday night a program of classical music of a high order is broadcast. Besides this feature, KYW calls upon the Congress hotel each evening, with the exception, of course, of Sunday night, and of Monday, silent night, for a half hour's dinner music. This, at the present time, is being furnished by Joska De Barbara's celebrated Continental orchestra, and by Paul Whiteman's Collegian orchestra.

The daily half hour visit of Walter Wilson (Uncle Bob) with the kiddies, is not a new venture. Uncle Bob's humor post of program editor, Mack Howard and fun is just what the children seek. makes himself generally useful, and

He is always in close touch with themhe tells them stories and sings songs. The letters he receives, only serve to show the immense family of happy youngsters who daily await his 6:30 Radio comedy song, "Mrs. Schlagenhauer." o'clock bedtime story.

To the ever busy housewives, comes that few minutes of relaxation each day, when they tune in Mrs. Anna J. Peterson. KYW broadcasts daily Mrs. Peterson's "Table Talks," whereby the housewife plete daily menus.

On Wednesday and Friday of each week, for the benefit of theater goers, KYW has inaugurated its "Radio Review."

A word as to the personnel of the station. It has long since been impossible for Mr. Wetherbee, Mr. Evans, Mr. Eastman and Mr. Swift, to do all of this work. There is now an assistant director, Harold A. (Shorty) Fall. There is not one, but several, announcers. There is Logan (Steve) Trumbull, chief announcer; Edwin Borrof, who in addition to his work announcing the eight o'clock classical music show from the Edison building, is in charge of that studio, and the studio in the Congress hotel; there is Ransom Sherman, who has recently been added to the staff to announce one frolic a week, and otherwise entertain with saxophone and piano.

Herbert S. Mintz, known to the Radio world as "Our Herbie," is in charge of the Evening American studio. He bears the title of night manager of the Evening American-Westinghouse KYW feature service. Herbie's duties are many. In

"Bobbie" Brown stands by with the overseas ukulele, ever ready to entertain. All of these are staff men. Surely everybody has heard of "Art" Linick, creator of the

And, ah! The ladies. In addition to Miss Menkes, are two others attached to KYW, and they both have important roles. There is Mary Casey, program editor and Mrs. Anna La Porte, who handles most of the bulky correspondence.

Had names been mentioned in the order of their importance, the roster of the engineering army would have appeared

Mr. Evans, engineer in charge, is assisted by the following licensed operators: D. A. Myer, Charles C. Hines, E. H. Gager, H. E. Randol, John Michaels, D. A. Johnson, J. C. Howard, C. W. Sheets and F. A.

WGR Orchestra on Records BUFFALO.-M. A. Rigg, Jr., general manager of WGR, announces that the Vincent Lopez Hotel Statler dance, orchestra of which Harold Gieser is director, has been made exclusive Cameo record artists. This orchestra is one of the chief regular features at WGR. It is reported that the first recording will be it is important that you register with done so that the first release will be in Engineering Extension department, Iowa December.

Ames Has Course in Set Building

State College to Give One Week's Instruction-Students Required to Furnish Own Material

AMES, Ia.—A Radio construction short course will be given at Iowa State college, beginning at 1:00 p. m. Monday, November 17, and closing at 12:00 o'clock Saturday, November 22.

This course is open to anyone interested in Radio who wishes to spend a week on the construction of a receiving set. There are o fees of any kind, the only requirement being that each person furnish the parts necessary for the set he decides to build.

Work will be under the direction of competent instructors, and any of the popular types of receiving sets may be constructed. Only a limited number can be accommodated. If you wish to attend, State college, Ames, Iowa.

Just ONE Dial to turn to get coast to coast range. Just ONE Dial to adjust to get perfect tone reception. Just ONE Dial to tune to get the utmost in selectivity.

Here—at last—is a five tube tuned radio frequency Receiver with a decidedly different and distinctive simplicity of design. It is a beautiful set—beautifully made,—and with its simple **ONE** Dial Control it will do anything any other five tube set will do,—and do it easier, quicker and better.

The Mohawk Tunes Out Local Stations

And Brings in Distant Ones Easy

Just ONE Dial to turn on the MOHAWK, and as you turn it you tune in station after station covering the complete range of radiocasting wave lengths. It cuts out the nearby stations with ease and brings in the distant ones clear and distinct. You can operate it with an aerial of any length,—inside or outside,—without making adjustments and it will give satisfactory results under varying conditions.

The Mohawk 5-Tube Receiver

Built in a distinctive period type walnut cabinet, here is a Radio set which will instantly appeal to the artistic taste of the most critical. Yet its beauty is not "only skin deep." The quality goes clear through.

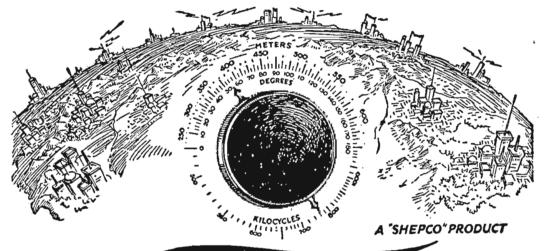

If you want the last word in Radio Receiving Sets, don't fail to see the MOHAWK,—hear it, and try it, before you buy. You might pay more for a Radio set,—but you cannot buy a better one than the MO-HAWK. Ask your dealer about MOHAWK. If he does not have it, accept no substitute. Write us. NOVEL THEATER AT WLS AMUSES FANS

ALL PERFORMERS UNDER TEN YEARS OF AGE

Known to Public as Big Ford and Little Glenn's Woodshed Theater Lullaby Players

CHICAGO.—Ford Rush and Glenn Rowell, star performers at Station WLS, have introduced an innovation to the Radio public. Recently they started to tell the little tots in a chatty way, how they were building a woodshed piece by piece, and when it was completed, it turned out to be a little tots' theater.

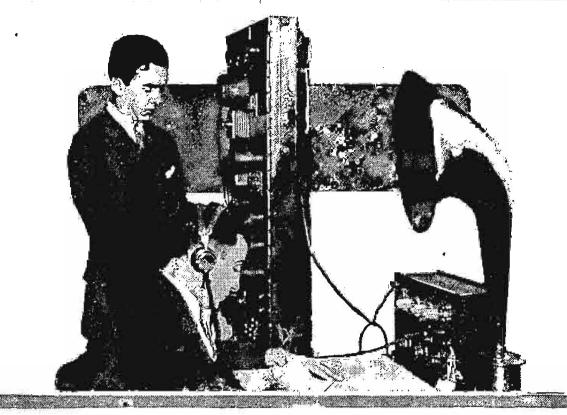

On November 6, Chicago children all under 10 years of age, put on their first playlet called "Robinson Crusoe's Princess." The troupe was introduced as "Big Ford and Little Glenn's Woodshed Theater Lullaby Players." Their second playlet was produced on November 13, and was called "Going to School in Mother Goose Land."

Future playlets to be staged by the "Woodshed Theater Lullaby Players" are as follows: November 20, "Mr. and Mrs. Robin Hood Find a Winter Home" and November 27, "The Sleeping Beauty." The program starts at 7 o'clock and lasts for twenty minutes.

Future Dramas and Readings

Many other musical selections and dramatic readings to be given from Sta-Ford and Little Glenn's Lullaby Trip to Egypt; November 18, Little Billy Yeo, Jr., Headed Man," "His Baby Brother" and Goes to the Circus" and Big Ford and "Dirty Hands:" November 19, Oliver Wen-Little Glenn's Lullaby Trip to Russia. "Dirty Hands;" November 19, Oliver Wendell Holmes, reading by Oxley Taylor; November 20, musical version of Italian opera "Cavaliera Rusticana," directed by Robert W. Stevens; November 22, "WLS Has Choir Rehearsal' and Big Ford and tain food which seems to be flooding the Little Glenn's Lullaby Trip to Japan; November 25, "Much Ado About Nothing,"

GIMBEL'S NEW STATION—WGBS

Station WGBS, the first station in New York city to use storage batteries exclusively for power, went on the air recently with excellent program. Photo shows R. C. Powell, chief operator working the amplifier, while F. Vecchio, another operator is at the receiver.

Russel Lowell, reading by Oxley Taylor, musical readings by Virginia Stanton tion WLS in the future are: November musical readings by Virginia Stanton 15, "WLS Hears New Talent" and Big accompanied by Ruth Marie Marcotte; November 27, musical version of the American opera "National," directed by (six years old) in comedy readings, "Bald Robert W. Stevens; November 29, "WLS

Sarnoff Speaks for High Power

R.C.A. Manager Defends Test of Giant Station to Secure Better Broadcasting

OAKLAND, Calif.-"The problem of super-broadcasting, like any other department of progress, will be settled upon the principle of public service," said David Sarnoff, vice president and general manager of the Radio Corporation of America, broadcasting recently from KGO, General Electric station located here.

Speaking in defense of giant radiocastcrs, Mr. Sarnoff continued:

"The problem of interference need not stand in the way of better broadcasting, for the third national Radio conference has wisely recommended that high power broadcasting stations shall be located outside and at some distance from the populous centers.

'I regard super-broadcasting as a stimulating form of competition to other systems of national broadcasting. It provides an effective substitute for wire line networks connecting a multitude of low power stations.

"I can say that we are ready and willing to demonstrate the measure of service that super-broadcasting can render by erecting an experimental station, suitably located, that will prove the promise which super-broadcasting holds.'

PHONE, which is one of the most simple and clearest toned radio sets you have ever listened to, is the latest achievement of Mr. D. P. Coats of Chicago.

This radio outfit is entirely different from all others and just the kind of a set you have been waiting for. No outside wires needed. No troublesome storage batteries. It is built complete in a beautiful mahogany finished cabinet, Console type, with the loud speaker built right in so the entire family can listen to it just like a phonograph. No unsightly wires, or batteries lying around—no wires to connect up—no extras to buy. Everything is inside the cabinet. It is a real piece of furniture. You can set this attractive Radio Set in any room in the house and it will harmonize with your best furniture perfectly.

Hear Music and Talking 1000 Miles Away

TRANS-CONTINENTAL RADIO-PHONE is guaranteed to have a range of 1000 miles and it will "tune in" stations covering all broadcasting wave lengths within a thousand-mile radius of your home. It is a 4-tube set—yet so simple in construction, so compact in make-up-so loud and clear in tone, and yet so easy to operate that even a child can use it without any trouble whatever. Just imagine the unique pleasure of sit-ting with your family or friends in your

OPERATING AND TROUBLE SHOOTING

For the Owner of an Ainsworth-Gates Ranger 5

HE best obtainable accessory equipment should be used-no receiver can give good tone or volume on a poor loud speaker or pair of phones.

Accessories Required

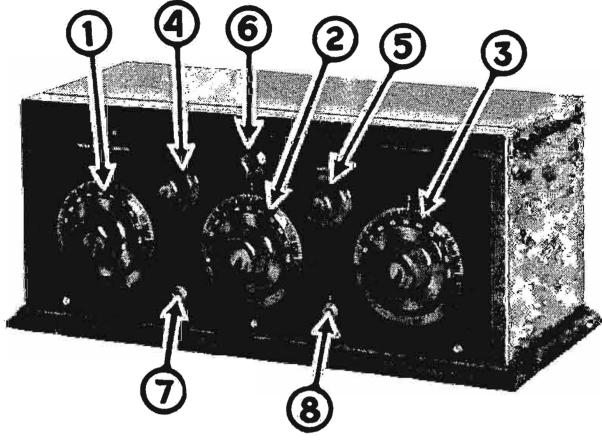

Five good amplifier tubes-6 volt, 14 ampere type, or four amplifier tubes and one detector tube. Two 45-volt or four 2214-volt special large size dry cell type B batteries, or two 48-volt storage B batteries of 4½ A. H. capacity. One Radio A battery, 6-volt storage type, 80 to 120 A. H. (preferably the latter, owing to greater efficiency in operation.) One pair receivers. One loud speaker.

Antenna

Use an outdoor antenna, the horizontal portion being 40 to 80 feet, with insulated wire lead-in as short as possible.

A large, long antenna or an antenna of proper dimensions with a long lead to the set will tune broadly and in some instances where the location is within a mile or so of a powerful transmitting station, make it almost impossible to tune out the local station. The lead-in from the vertical portion of the antenna should not parallel any water or drain pipes, steel girder or other conducting substances, as any of these conditions tend to broaden the tuning and decrease the

A floortenna is made from number 14 mesh copper, brass or well galvanized ordinary fly screen wire. Should cover 36 square feet or area approximately 6 by 6 feet (preferably on the second or third floor, or in attic and in some room other than that containing the set). Place preferably under carpet or rug. Walking or placing furniture thereon does not affect its efficiency. It is recommended for the portable floortenna, four pieces number 14 mesh wire 18 inches wide, 6 feet long, connected together by short soldered

preferably in the attic; should be put second binding post on right (on back up on insulators and can be mounted on of set) marked "L"; also try "S." If an the roof trusses. Start the wire at a point outside antenna less than 60 feet long, an where a lead can be run down to set, run the wire around the attic in a square or rectangular manner, bringing the wire back to the starting point. Join the wires together to make a closed loop, then connect and solder an insulated wire to continue down to set.

Ground wire should be number 10 insulated (or equivalent) wire. The ground lead must be well connected to a water piece of 2-inch galvanized pipe, about 6 top is about 1 inch above the ground. Run ground wire from set to this pipe, positive A. solder the connection to pipe or use an

size stranded, enamcled wire installed is used, connect the lead-in wire to the inside antenna or a floortenna is used, run antenna lead to first binding post on right marked "S"; also try "L." Run the ground wire to third post marked

Connecting the Batteries

For •A battery (6-volt storage) leads, number 10 or heavier flexible wire is preferable, although number 12 can be used. Run one lead or wire from the pipe. The use of an approved ground pole or binding post marked negative on clamp is recommended or the use of a battery to binding post marked A minus on set. Run a second lead or wire from feet long. Flatten and close one end, the pole or binding post on battery marked drive (flattened end) in ground until the positive, sometimes marked with red washer, to binding post on set marked

First connect in series all B batteries; ires.

The indoor antenna should be of large | approved ground clamp.

If an outside antenna over 60 feet long ered wire for all B connections. usc number 14 or 18 flexible rubber cov-

Run a lead or wire from the negative of the first battery to the negative B binding post on the set. From the same battery (if dry cell type is used try both 16 and 18 volt taps) run a wire or lead to the binding post on set marked Dct. positive. If storage B batteries are used, each cell equals 2 volts. Count 8 or 9 cells from negative end for this lead. From the last (second or fourth) battery run a lead from the positive of the battery to the binding post marked Amp. positive on set. Operation of Ranger Five

After all connections have been made to the set, including the connections of the A and B batteries, aerial and ground,

and phones or loud speaker, it will be necessary for the operator to recognize a condition of tuning known as "resonance." Resonance may be had by bringing the three dials, 1, 2 and 3 to practically the same number. Some variations may be necessary between the setting of dial number 1 and dials number 2 and 3. This condition is best found, as stated before, by setting the three dials to practically the same number, turning the amplifier rheo-stat number 5 from "off" position to right until the greatest disturbance is heard, either in the head set or on the loud speaker. If head set is used, number 7 jack will probably be found most satisfactory. If loud speaker is used, use number 8 jack. If detector tube is used. the detector rheostat, number 4, should be turned from "off" position to right to about one-half or three-quarters of its range. If an amplifier tube is used in place of a detector tube, the detector rheostat number 5 from "off" position to right quarter on, and usually just touching the 'on" position will give the best results. It is not necessary to have a station in order to find this point of resonance. It will soon be recognized as a point of sensitivity when things are in proper adjustment. By finding the proper adjustment for both rheostats numbers 4 and 5, which depends mostly on the condition of the batteries, then the dials may be turned about five degrees each way from any given number until the point of resonance or greater disturbance is known. If a station is found at this setting then the unmarked adjustment, number 6, may be brought into use. This adjustment is (Continued on page 34)

Build Your Set with Goodrich Rubber

Here's Why It Will Bring In Those Distant Stations Clearer Than Ever—

DY scientific tests, Goodrich Rubber Radio Products show the lowest dielectric losses of Dany practical radio insulating materials. This quality alone means that they give the greatest efficiency in radio frequency amplification. The set built of Goodrich Products will give maximum range and selectivity for its type.

Fifty-five years of rubber manufacturing experience are a guarantee of their reliability. Build for the greatest efficiency with these—

GOODRICH RADIO PANELS—dielectric constant, at radio frequencies, 3.5; low moisture absorption and high softening points make them superior. They may be worked with ordinary tools, and retain their rich glossy finish. Full assortment of sizes in attractive black or mahogany colors.

GOODRICH BATTERY MATS-A protection from overflowing liquids.

GOODRICH VARIOMETERS (UNWOUND)— Wind them to suit yourself.

GOODRICH RADIOPHONE EAR CUSHIONS —Shut out all outside noises.

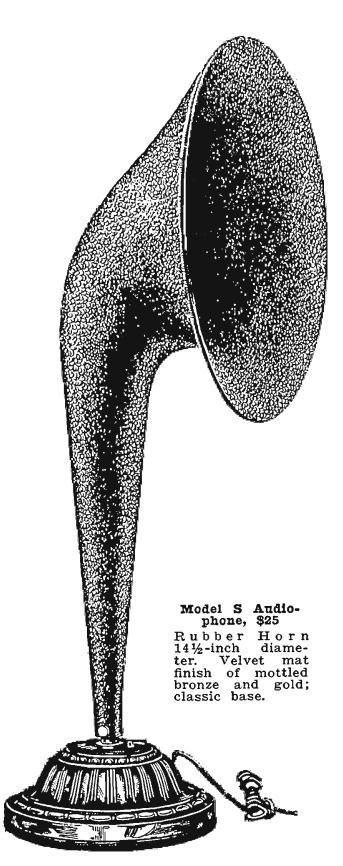

GOODRICH V. T. SOCKETS—Special spring lock—releases at a touch of the finger, no turning or twisting the tube. Contacts may be cleaned without removing the tube. Eliminates danger of tube breakage. Low dielectric losses.

GOODRICH HARD RUBBER TUBES—Very low dielectric losses.

GOODRICH SPAGHETTI TUBING—Will not corrode wiring.

Send for our booklet "Rubber for More Perfect Radio Reception."

THE B. F. GOODRICH RUBBER COMPANY ESTABLISHED 1870 Akron, Ohio

Both Must be Musical Instruments

If you are to enjoy the rich resonance of an old Cremona violin, your loud speaker must also be a true musical instrument. So designed and powered as to respond as faithfully to the inspiring crescendos of a Wagner opera as to the whispers of a Moonlight Sonata.

The new Bristol AUDIOPHONE does that. With its joyous, open-throated Rubber horn, and its finely adjusted tone mechanism, it is on a musical plane with the noblest instrument or voice at your favorite station.

In addition to Model S, shown here the Bristol line includes Model J, \$20, Baby Grand, \$15, and the "Baby" at \$12.50. Send for bulletins AY-3017 and 3011, mentioning the name of your dealer.

THE BRISTOL COMPANY Waterbury, Conn.

AUDIOPHONE

LOUD SPEAKER

Why it is Better

"MASTER of Every Note in the Orchestral Range" is the proven claim of the Federal No. 65 Audio Frequency Transformer! Volume without distortion is the basis for the beauty of Federal Tone.

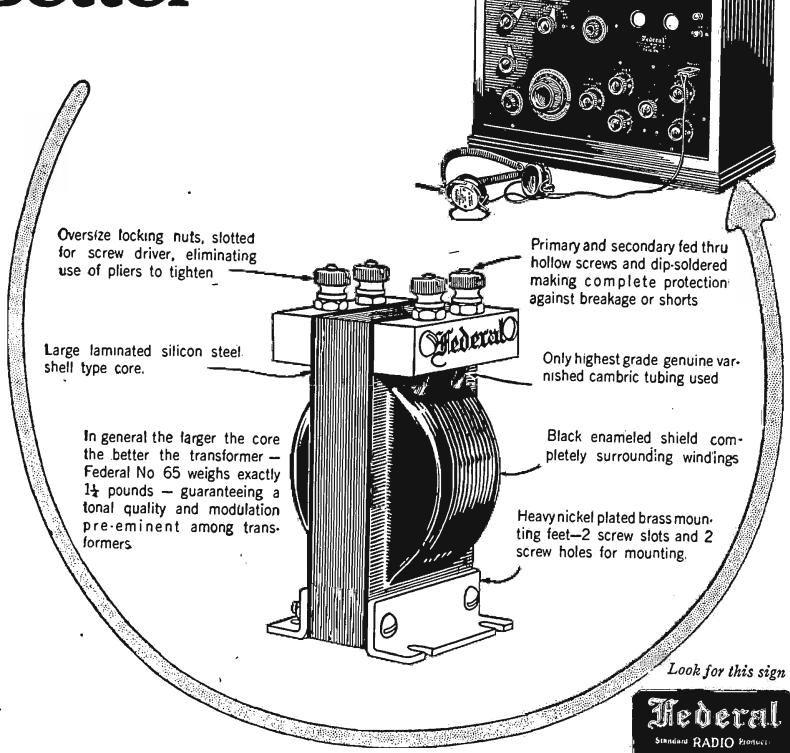

From its oversize locking nuts to its heavy brassmounting feet the Federal No. 65 Transformer incorporates the same engineering skill that has made Federal the recognized leader in electrical communication apparatus since 1890.

Insist upon Federal parts for your "pet" hook-up. There are over 130 standard parts bearing the Federal iron-clad performance guarantee.

GREAT LAKES BOAT BOASTS FINEST SET

BENSON FORD, CALL KFTC, HAS LATEST IN RADIO

Direct Interphone Connects Captain with Shore-WWJ Music Guides Vessel Through Storm

DETROIT.—One of the best Radio-equipped ships on the Great lakes or on the ocean as well, is the Benson Ford, a new freighter owned by Henry Ford.

When the steamer's captain, William H. Daniels, desired to talk to the captain of some other ship, or with the captain of the Henry Ford, II, another Ford freighter, he notifies the ship's operator. The latter immediately gets in communication with the ship. Captain Daniels then merely presses a button at his desk, and starts talking into a microphone just as he would into a telephone on shore. This is called the interphone system, and through its use time and effort are saved.

KFTC Has Wide Range

Kenneth L. Brown, Radio operator of the Benson Ford, has been able to keep in touch with ships in any part of the Great lakes at all times since the Benson Ford was placed into commission. He also can communicate with ships along the Atlantic coast, with shore stations on the Great lakes and on the Atlantic coast.

The transmitter is a 500-watt set, using two 250-watt modulators, two 250-watt oscillators and a 50-watt speech amplifier. It can transmit an interrupted continuous wave or continuous wave, and an auxiliary spark transmitter is carried for emergencies. KFTC are the call letters, and under the license the station can be operated on 600, 706, 909, or 1,875, meters.

Use Music to Steer Ship Up in the pilot house is Radio's latest contribution to the safety of sailing, a Radio compass. It is said that on the ship's first trip to Duluth the entertainment broadcast by the Detroit News station, WWJ, was used in keeping the ship on its course through Lake Superior. Bearings also were taken from WWJ and the land station at Cape May, N. J., during the most severe storm experienced on the trip to Duluth.

The Reader's View

Another Call for Plain Announcing

Some of the announcers cannot be heard very clearly when they make announcement of the call letters, name of station, location and what has been rendered by that station. Some seem to be either too near the microphone or else they do not speak loud enough, as the announcement comes all in a jumble. It should be the a whole service without telling who they same as this: W—O—S, Jeffer—son City, Mis—souri. This would do away with so many inquiries as to letters of

I think that on Sunday nights when church services are broadcast that some announcement of the station rendering it should be made in some part of the service. Several stations do it.

There are lots of good announcers who cannot be missed when heard.

Glad to hear that spark "plugs" are on 750 instead of 450 meters, as is was very annoying. Yet some are still doing it .-Louis O. Dutcher, Rensselaer, N. Y.

A School for Broadcasters

I get the Digest every week, regular as a W. U. clock, and think it the best all-round Radio paper extant. I try out nearly every new hook-up in it weekly, and they all work, even on impromptu connections.

I have had in mind some time to write you about a very annoying matter to Radio listeners, in this: A good many stations have a careless habit of not announcing as often as they should. Some, in giving Sunday services, will carry on are, although they have ample time between songs, prayers, etc., to say what city they are in, at least. Others will play long tedious band concerts without saying a word for half an hour or more.

Why not have a small space in your paper captioned, "A School for Broadcasters," "Suggestions for Broadcasters," or somewhat like these, which could be a sort of clearing house for fans all over without getting stung by either bees or to contribute and thus get it before a great body of broadcasters all at once.

I would be glad to hear from you on of material. this, what you think of it, or if you know a better way to get this to the attention be.-J. E. Burch, Powers, Colo.

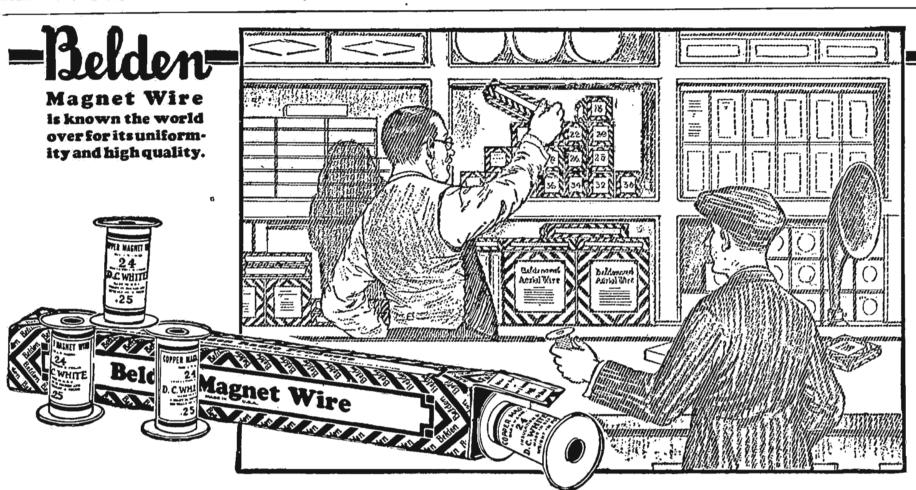

of all stations.

I trust you will give the above matter very earnest consideration, as half the satisfaction of hearing any program is to know where it is coming from .- R. G. Goodwin, Kansas City, Mo.

Want More Plays Broadcast

I have for some time been wanting to get this off my chest, so here goes. Why don't we have more Radio plays? There is nothing more interesting or more helpful to us who are marooned in out-ofthe way places away from good theaters. Not long ago KGO put on a play "Turn to the Right," which was one of the best I ever heard. Together with the descriptions by Mrs. Church it was possible to visualize the whole setting. Another comedy from WLS, "Almost Insane," and another involving a test of a man by sitting on a bee hive for seven minutes for the satisfaction of his sweetheart her gave us a great laugh. As for me, they can't send out too much of that sort

Here's to broadcasting as is and as can

The kind of Letters Wind Your Own Coils Thordarson-gets-No. 6 for the New Hook-ups!

The joy of real accomplishment comes to 'Belden Radio Magnet Wire has been used the radio fan who tries the new hookups and succeeds in making new records of long distance reception. He leadsothers follow!

This fascinating work calls for special coils of new specifications. The enterprising experimenter winds his own coils to save time and to be sure that the new set will operate at the highest efficiency. To him comes the thrill of true scientific discovery and research.

for many years by famous manufacturers of radio devices. They require wire of uniform gauge, carefully insulated with high grade cotton or silk insulation from one end of the spool to the other.

You should insist on Belden Radio Magnet Wire for your own protection. Every spool is full weight, plainly marked, and of full gauge throughout. Be sure to get Belden Wire-it makes a world of difference!

Other Belden Radio Products

Our instructive booklet, "Helpful Hints for Radio Fans" describes many other Belden Radio Products, such as Enameled Aerial Wire, Loop and Litz Wires, New Terminals, Sockets, and many other important items. Know all about these efficient radio products. Send for the booklet, now!

Radio Dealers

Belden Magnet Wire is merchandised in handy cartons of 5 spools each. Every spool is marked for weight, insulation and gauge. Send for complete dealer bulletin, by writing us on your business letterhead. Write, today.

Takes the Hot Potatoes Out of Singers' Mouths

Sure your Set is good, but that embarrassing evening you invited friends to listen to a program and the singers seemed to have hot potatoes in their mouths, and you finally gave up; what was the trouble?

Look at the Condensers! HILCO Condensers absolutely do not change in capacity. They are incased in solid metal and built up of tested mica and metal. No rough handling or MOISTURE will ever spoil them.

HILCO CONDENSERS are guaranteed accurate within 5%. They will never spoil the balance of your set.

HILCO CONDENSERS are preeminent from an engineering standpoint, both from a low phase angle and because they have an extremely low equivalent series resistance.

Take those old inaccurate, changeable capacity condensers out of your set and put in efficient, always-on-the-job HILCOS. They will save you many a wasted, embarrassed evening, and make that good set better.

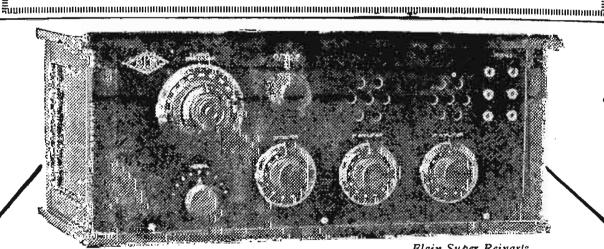

> For Sale at all dealers at our usual fair prices

Standard Socket, 750

Audio or Radio Uniformer, \$5.00

Flewelling Sockets require no downward pressure on tube. Contact is firm and made on side of tube terminals not bottom! Extra spacing of contacts make it of the true low-loss design. Flewelling Condenser is close to per-

fection in lowness of losses and other electrical characteristics. Most carefully built mechanically. Exceptionally satisfactory in tuning any circuit.

Flewelling Uniformer wins First Prize at Radio World's Fair as representing greatest advance of the year in set construction. Greatly reduces wiring and work of constructing a set. Astatic wound coils make a very selective tuned Radio Frequency set.

Flewelling Type S Tuner is of the approved basket weave design. With 80 and 30 turn coils (as regularly supplied) and in series with a .0005 mfd. Flewelling Condenser extra sharp tuning is secured from 220 to 550 meters. It is a real distance getter.

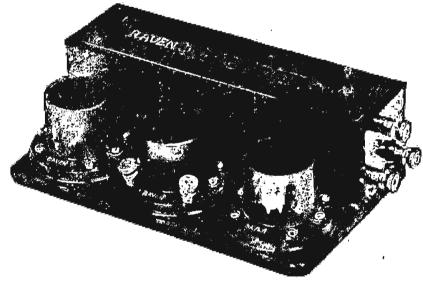

Flewelling Friction Vernier gives a ratio of 20 to 1 on a 4-inch dial. Friction disc is of special gum rubber. Knob is extra large and has real "feel."

"Low Loss," What It Is and Why

By Jacques Fournier

HE subject of "low loss" is one that uted capacity. The ohmic resistance can rubber or one of the phonol compounds, wound on a wooden, rubber or bakelite has only recently received much at be kept down in a variable condenser by but it was found that the introduction of form. This type was the only one in one set out to design a circuit that would of one piece. By using any one of these found possible to reduce the amount of dielectric entering into the construction circuits were brought out at the rate of plate is connected to the oscillating ciran improvement over previous hook-ups, resistance possible. while others merely added vacuum tubes and more controls. It was only when contact with the movable plates is by the limit of tubes and controls was means of a pigtail soldered to the shaft reached in tuned Radio frequency and and to some fixed point which is attached super-heterodyne that designers of apparatus turned to the lowering of the of securing greater selectivity and increased distance.

The first piece of apparatus to be concondenser, and about twenty different insulating materials are worthless and models of the "low loss" type have appeared on the market within the last few The points mentioned before have all weeks. This has led the general Radio public to believe that "low loss" applied factor which applies to every piece of apparatus in a receiving set. Although the term was not used in connection with them, the various types of inductance such as honeycomb coils and spider web coils, were the result of an effort to eliminate loss in the inductance. Constructing fixed condensers with mica as the dielectric instead of paper and similar substances, was a step in the direction of reducing losses in fixed condensers. The chief advantage of low losses is, as was mentioned, in increased sclectivity, as the increased range obtained is not very marked. When we say that a receiving set tunes very sharply, we mean that it has excellent selectivity and a little study of the matter will show that reducing the losses in a circuit which carries current at Radio frequency gives us sharp tuning. Variable Condensers

To reduce the loss in a variable condenser we endeavor to decrease, as much as possible, the omhic resistance and the high frequency resistance. To reduce the losses in an inductance we try to keep these two factors as low as possible, and a third point, which is known as distrib-

A Laboratory Instrument at a Popular Price

The superior features of the CONTINENTAL Lo Loss Condenser are so pronounced that the experienced operator can comprehend them at a glance. The general design of the instrument insures mechanical strength, rigidity, extreme accurracy and long life. This mechanical perfection was attained only by using quality materials, expert workmanship and many rigid inspections rigid inspections.

Official Test Radiofax of 25 plate Condenser at 1,000,000 cycles yields the resistance of .8 Ohm and a phase angle of 12

tention from engineers and advanced using material which does not have a experimenters, although it should have surface film, by soldering all of the plates of the condenser introduced losses in the received this careful attention three years together or by constructing the plates of form of hysteresis. By constructing conago. Instead of reducing losses, every the stator or the plates of the rotor out densers with metal end plates it has been two or three a week. Some of these were cuit with the absolute minimum ohmic

The best method, by far, of making to, but insulated from, the end plate. electric constant. There is a certain mini-Where the pigtail is not used and contact losses present in apparatus as a means with the movable plates is made through the bearing, the best type is the adjust-able cone. The type of bearing in which a metal ball is held between two depressidered from this angle was the variable sions is also good. Bearings made in

The points mentioned before have all been developed with a view to reducing the ohmic resistance; we will now cononly to variable condensers, but it is a sider methods of reducing the high frequency resistance. Condensers were, for a

a dielectric such as these into the field dielectric entering into the construction down to 2, 3 or 4 narrow and thin strips of insulating material, along the sides of the condenser. The capacity between the fixed and the movable plates is now almost proportion exists through the insulating material with its comparatively high dimum amount of dielectric possible in the construction of a condenser as the stator must be rigidly supported in place; to do this and yet keep the amount of insulating material small requires ingenuity of the highest order. Note that insulation around the rotor shaft is always bad and in general those condensers which have merely a sleeve of insulation around screws carrying the stator are not very

Inductance

The earliest forms of inductance were long time, made with end plates of hard naturally a single layer of insulated wire

use for several years until the development of the honeycomb coil. The honeycomb coil was produced to reduce the distributed capacity between the turns of the coil. A small capacity always exists between two conductors in which there is the slightest difference of potential or voltage and since the voltage in every turn of a coil is slightly higher or lower than that in the turns adjacent to it, a capacentirely through air and only a very small ity exists between the turns of an inductance. The Radio frequency currents have then, a tendency to enter the coil and go around the first turn and then traverse the coil by jumping from turn to turn through capacity effect instead of going around and around the coil and building up a magnetic field. In the honeycomb coil all turns cross each other at a sharp angle and are not parallel at any point so the distributed capacity has been materially lowered.

The type of insulation used on the wire also materially affects the distributed capacity and since enamel has a high dielectric constant it should not be used in wires that carry currents at Radio fre-

Market Quotations

(Continued from page 19)

quency; it is, however, all right for head telephone receivers and loud speakers. To keep the ohmic resistance of the inductance low, large size wire should be used; number 24 B & S gauge is the smallest size that should be used in winding inductances, while sizes up to number 18 and number 16 are to be preferred.

The third element of loss in an inductance is high frequency resistance and this is governed to a large extent by the method of supporting the wire and the substances placed within the magnetic field of the coil. Around any wire which is carrying currents at Radio frequency there exists a magnetic field in which the lines of force change their direction and intensity from 100,000 to 3,000,000 times per second, therefore as little solid material as possible should be placed in this field so that the lines of force will have a free path for their flow and change. Any solid materials used for supporting inductance offer resistance to the passage of these lines of force and cause hysteresis losses, which increase the high frequency resistance of the inductance.

The latest type of inductance brought out in the endeavor to reduce distributed capacity and hysteresis is the basket

Earn 50 to 200 a Week in RADIO

You can! Hundreds of ambitious men are already earning thousands of dollars in this wonderful new industry-you, too, can get your share. Mail coupon below for Free Book which describes fully the amazing money-making opportunities in Radio and tells how YOU can earn from \$5,000 to over \$10,000 a year.

The astounding growth of Radio has created thousands of big money opportunities. Millions of dollars were spent during the past year on Radio and thousands of young men are needed right now to meet the ever-increasing demand of work.

Men are needed to build, sell and install Radio sets—to design, test, repair as radio engineers and executives—as operators at land stations and on ships traveling the world over—as operators at the hundreds of broadcasting stations. And these are just a few of the wonderful opportunities.

Easy to Learn Radio at Home

No matter if you know nothing about Radio now, you can quickly become a radio expert, by our marvelous new method of practical instruction-

in Spare Time

instruction which includes all the mate-Pay Increases

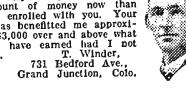

Over \$100 a Month I am averaging anywhere from \$75 to \$150 a month more than I was making before enrolling with you. I would not consider \$10,000 too much for the course.

(Signed) A. N. Long, 120 No. Main St., Greensburg, Pa.

Doubles Salary I can very easily make double the amount of money now than before I enrolled with you. Your course has benefitted me approximately \$3,000 over and above what I would have earned had I not taken it.

731 Bedford Ave.,
Grand Junction, Colo.

From \$15.00 to \$80.00 aWeek

Before I enrolled with you I was making \$15 a week on a farm. Now, I earn from \$2,080 to \$4,420 a year and the work is a hundred times easier than before. Since graduating a little over a year ago, I have earned almost \$4,000 and I believe the courso will be worth at least \$100,000 to me. (Signed) George A. Adams. Route I, Box 10, Tamaqua, Pa. rial for building the latest up-todate radio apparatus.

Scores of young men who have taken our course are already earning from \$75 to \$200 a week. Merle Wetzel of Chicago Heights, Ill., advanced from lineman to Radio Engineer, increasing his salary 100% even while taking our course! Emmett Welch, right after finishing his training, started earning \$300 a month and expenses. Another graduate is now an operator of a broadcasting station— PWX of Havana, Cuba, and earns \$250 a month. Still another graduate, only 16 years, is averaging \$70 a week in a radio store.

Wonderful Opportunities

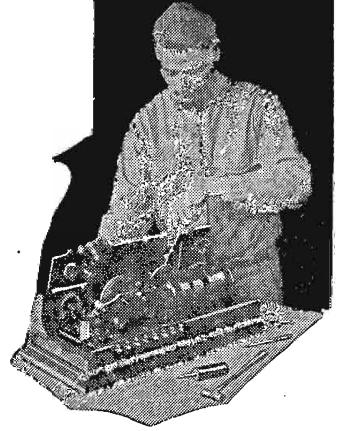

Hardly a week goes by without our receiving urgent calls for our graduates. "We need the services of a competent Radio Engineer." "We want men with executive ability in addition to radio knowledge to become our local managers." "We require the services of several resident demonstrators"—these are just a few small indications of the great variety of opportunities open to our graduates.

Take advantage of our practical training and the unusual condition in Radio to step into a big paying position in this wonderful new field. Radio offers you more money than you probably ever dreamed possible-fascinating easy work—a chance to travel and see the world if you care to or to take any one of the many radio positions all around you at home. And Radio offers you a glorious future!

The National Radio Institute is America's Pioneer Radio School—established in 1914. Our course is the absolutely complete one now being offered which qualifies for a government first-class commercial license. It gets you the bigger paying jobs in Radio.

How to Build the Simplest Possible Super-Het

Part I—Parts Essential for Building Set By John G. Ryan

HERE have been many articles published in Radio Digest and other Radio magazines, on super-heterodynes-long sets, short ones, high panels, deep baseboards, many controls, two controls, one stage of audio, two stages and push pull, preceded by straight R. F., and even reflexed. Fans have built them, some with success and some with nothing to show except a lot of parts and a fecling of disgust. The general reaction has been a demand for something simplerfor a set that the average man, not an engineer or even an advanced experimenter, could construct and operate succossfully. To which, one might well reply, "Well, don't build a super. Construct something with less tubes and less necessity for accuracy." Which is all very well but the fact remains that everyone seemingly wants a super-heterodyne this year and nothing else will do.

With all this in mind, Radio Digest began looking around for a super that would fill the bill, one that would com-

bine good looks and efficiency with low first cost and ease of assembly, with the "simplest possible" thought in mind let us consider what is essential to a superheterodyne. This type of receiver was developed to get around certain inherent disadvantages of vacuum tubes as they are now generally constructed. Tubes do not efficiently amplify or build up incoming Radio waves at the comparatively low wave lengths used by Radiocasting stations. We therefore, with another tube, create a new stream of energy at a wave length closely approximating that of the incoming program. The two are mixed together and create a new wave length which is much longer and far more efficiently handled by the tubes.

Essentials of a Super-Heterodyne

This is the principle involved; now for the essentials. First of all, there must be a means of tuning the loop aerial, which is all the antenna necessary with a super. This means of tuning is a variable condenser, the usual size being .0005 mfd., often known as a "twenty-three plate." It was mentioned above that one of the tubes creates a stream of energy. This tube is known as the "oscillator" and some means of varying the frequency of the energy developed must be provided, so that this frequency will always have a certain predetermined relationship to any incoming signals, no matter what their wave length. For this purpose too, we use a variable condenser, also of .0005 mfd. capacity. With this oscillator condenser is also used an oscillator coupler. The circuit must contain inductance, so this coupler provides grid circuit inductance, a plate circuit "feedback" coil and a small coil to be hooked into the grid circuit of the "mixer" tube and so combine the frequencies.

Having mixed the frequencies, we are now ready to amplify them and the question immediately comes up of how many amplifier tubes to use. It has been found good practice to use three; more than This brings the signals up to a volume too great for the average detector to handle

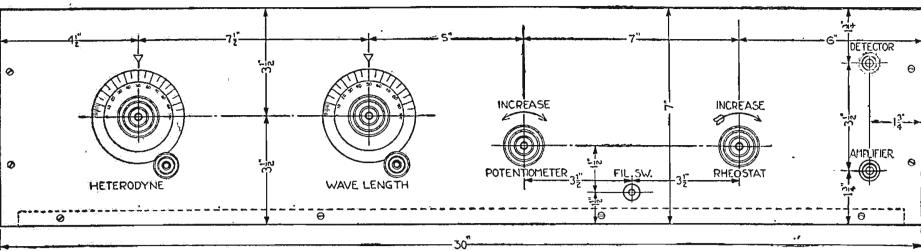

Figure 1

advantage of all the strengthening possible. Some means of coupling tubes together is always necessary and transformer coupling has been found both simple and highly satisfactory. So, we couple the tube in which the waves were mixed, to the first amplifier with a transformer, which is known as a "filter coupler," because, since one winding of this transformer is tuned with a fixed

while less than this would be not taking | property of filtering the wanted from the | the single narrow wave band that is passed unwanted and passing only the former.

Transformers Used

The transformers used to couple the first amplifier to the second and the second to the third and the third to the detector, are not tuned in either winding and are therefore known just as long wave transformers. One thing is important with regard to them, however; their "peak efficiency" must be fairly closely condenser, the transformer has the matched and must exactly coincide with

by the filter circuit. Every untuned transformer amplifies one particular frequency, or narrow band of frequencies, much better than it does the others over the range of wave lengths it will pass. For example, while our long wave transformers will pass frequencies included in the wave length range 5,000 to 9,000 meters, the voltage amplification at 7,000 meters is much greater than that at any other (Continued on page 34)

Introducing

COLONIAL

*OLONIAL is a new name in American radio. Behind its products, however, are two of the best radio engineers in the world-Dr. Fulton Cutting and Mr. Bowden Washington. The receiving sets designed by these engineers have an international reputation and their two latest models—the Colonial 16 and 17-are in refinement of design and performance, "abreast" of anything now available to the radio public.

Both types are beautifully housed. Cabinet by Brewster-the first time the design experience of the famous automobile body builder has been available to the radio public.

An enormous amount of thought has been put into the detailed design and it is believed that many small annoying defects which have been learned in ten years of radio manufacturing have been entirely eliminated. This means that the set will arrive in the customer's hands intact, and stay so.

The Colonial 16 is a five tube, dry battery operated receiver. The Colonial 17 is a four tube, dry battery operated receiver. Both employ tuned compensated radio frequency-a special Colonial achievement providing uniform response. They are extraordinarily selective, can be logged accurately, have fine volume of excellent quality and are extremely economical in operation.

COLONIAL POLICY

The basis of any selling policy can be no more sound than the product which the policy is devised to merchandise.

The two COLONIAL Models, now available to the trade, insofar as the the trade, insolar as the basic design of the circuits is involved, are engineered in a detailed way, we think, more carefully and completely than any receiver on the market today. COLONIAL receivers, we know and are willing to prove. and are willing to prove, more completely meet the performance desired by the radio audience than any other receiver so far produced. Selectivity, sensitivity, stability, uniform response, faithful reproduction, through perfect mechanical design, are incorporated in COLONIAL receivers and the utmost in reliability is obtained. in reliability is obtained.

COLONIAL'S manufacturing policy is to conduct our factory, from the engineering labora-tory down to the ship-ping room, in such a manner that every piece of COLONIAL apparatus which leaves our hands which leaves our hands will be received by the consumer perfectly designed, painstakingly constructed and 100% efficient in the work for which it was designed. To obtain this result means the most scrupulous inspection at every step of assembly. This step of assembly. This inspection is continually under the personal supervision of Dr. Fulton Cutting and Mr. Bowden Washington.

JOBBER POLICY

Exclusive franchise and absolute territorial protection are two of the outstanding features of what COLONIAL will

give its jobbers or distributors. We believe the jobber is entitled to this protection from the manufacturer.

manufacturer.

We believe he is entitled to full credit for any "direct to dealer" sales which might be made in his territory. We believe that the jobber who can handle his territory profitably for himself, his dealers and for the factory should be himself, his dealers and for the factory, should be afforded these protections. Consequently, as territorial limits are defined, there will be but one jobber in that territory enjoying COLONIAL franchise and that jobber will, at all times, have behind him every available resource of the available resource of the COLONIAL manufacturing organization to assist him in getting the inaximum amount of business out of his terri-

DEALER POLICY

In addition to rendering the jobber the closcst possible sales co-operation, COLONIAL has developed a dealer cooperative sales service that is unique and that is sure to be of signal is sure to be of signal importance to the retail merchant. COLONIAL will offer direct to the dealer, through the jobber, this sales plan, personally supervised and inaugurated by COLONIAL "dealer salesmen" which we know will at once be recognized as once be recognized as being the best, most di-rect and efficient manner of securing sales that has as yet been devised for radio for radio.

We have prepared our complete merchandising plan in the form of a booklet. You should se-cure your copy without

A SPECIAL INVITATION

is extended to jobbers and dealers in attendance at the Chicago Radio Show-November 18th to 23rd—to visit the COLONIAL Booth and see the first public display of COLONIAL 16 and 17.

Super-Radio

No Obstacle to Larger Developments

WE ARE entering an era of super-everything and now comes the super-broadcasting station. The annual conference recently held in Washington makes it clear that there is going to be startling developments immediately along this line. The conference has gone on record as favoring freedom to increase the power used, and the government is not disposed to interfere except for purposes of preventing abuses and adjusting disputes in the Radio field. Small stations, using low power for local broadcasting, are to be protected, but there is no needless obstacle to the larger development of the art.

The typical station of the future, it appears, will use many times the power now used, and therefore have a broader range. Moreover, in order to make the powerful stations function most efficiently, and keep them from making themselves a nuisance in their vicinity, they will be located not in the cities but outside of the cities. Broadcasting studios will probably be located in business centers, as they are now, but the programs will be carried by wire to the sending stations out in the country.

This should work very well but it is largely experimental. Radio innovators have to feel their way, and it is not sure yet whether super-power will be desirable or not. The coming year will tell, and also will determine the future of national broadcasting by means of inter-linked stations.

Set Must Be a Thing of Beauty Trimmings Add Dignity to Your Receiver

I T HAS not been so very long ago when a receiving set, especially those rigged up for distance work, had its equipment laying about on tables and workbenches. Wires and batteries lay about in a maze of disorder and the Radio corner was the pet grievance of the housewife, unless she banished it to the attic or garage.

Thanks to daddy time those days are gone. Sets are now marvels of neatness. In the past few months there has been a decided trend toward the artistic side of set building and mounting.

The same process, the development of the phonograph. Those with long enough memories can recall when the phonograph was a collection of wheels and cylinders, mounted atop a post and equipped with rubber ear pieces that were thrust into the ear openings like a bathing stopper. Then came the big old-fashioned floral horn and later the contained cabinets that are now almost universal.

When hundreds of keen minds are constantly seeking betterments, they come faster than if only a few are hunting them.

Radio and Advertising

Will the Radiophans Listen to Publicity Propaganda?

SERIOUS discussion is arising in places regarding the opportunities for misuse of the Radio in advertising or publicity. Part of the business of codifying the use of Radio will be that of fixing responsibility for utterances. Who is it that is broadcasting? What is his interest in the effect of the publicity given?

The public is not much interested in whether someone is paid for the cost of advertising by Radio. It is interested in knowing whose desire, whose impulse is causing the publicity.

Display advertising, whether in papers or magazines or other publications, usually has a form that brands it as interested. The publicity that does not have the form is now considered deceptive. Can interested Radio publicity be given a "form" that will show what it is?

In the course of time, it will be possible to fill the air with statements, implications, pleadings, for the benefit of one cause or another. This may be to the public's advantage providing only that the individual or organization that is back of the pleadings or arguments is known.

RADIO INDI-GEST

There's Music in the Air

Dear Indi:

I'm sending you a little ditty, I trust you will like same. If you care to have it gratis, there's nothing else I'd claim.

I read your Radio Digest, each line with thought and carc,

It amused me very much, perhaps you're not aware.

Last night my mood got the best of me, as sure as I was born.

A lonesome feeling crept over me, I felt depressed—forlorn.

to change my frown into a smile, I turned on my

Radio,
Before I had a chance to think, I heard the grandest

When I want music while I dine, I don't go very far, I turn my dials to the forties, and get Station WOR. If you want your soul to touch cloudland, as if you'd plainly see,

Just turn your dials to the fifties and listen to WJZ.

When I want to be in dreamland, as if in a cozy den, My life is changed into a joyous play, listening in on WHN.

Then come moments you want to be amused, there's no one to speak or say,

So I find peace and rest, listening in on KDKA.

How about your baseball fans, don't you get a laugh and thrill,

Tuning in WOR and listening to our friend, "Jolly Bill"? If you want your heart to be filled with constant ecstacy,
Turn your dials to the seventies and listen to WNYC.

Year doubt have to have for one Denne and have

You don't have to long for gay Paree, and keep your cabaret,
I keep my feet in trim listening to WEBJ.

You can keep your distant stations, to get Chilly I almost fear,

Life is sure worth while living, if there's music in your ear.

JUST A RADIO FAN.

Mrs. Partington Speaks Out

Dear Indi: Mizz Partington says she has heard a lot of Broadcasting station announcers reporting on their attendance at the recent big Radio conference, and

they are unanimous in admitting they had a very interesting conference, especially at the 12 inning tie game, where their old friend, Walter Johnson, saved the series, but they didn't say whether Walter gave them a ride in his new Lincoln. They said if Mr. Hoover, or somebody, had of give Mr. McGraw a few more Kellywatts power he would have faded the Senators ball club.

Mr. Crosley was at the conference but he hurried back home and him and Fred Smith opened up in WLW's new station studios on Monday night and the way they come in that night,

she says she thinks Mr. Crosley missed the ball games, while he traded Mr. Hoover out of a lot more watts for his new studio; anyhow they had more stuff than Walter Johnson ever had, on Monday night. She says, to judge by her October reception, the listeners won't have nothing to complain of this winter, unless they holler for Superduplex sets, to let 'em hear several stations to once. SIGNING OFF.

News Bulletins from Milwaukee Furnished in Co-operation with the Milwaukee Daily Beverage

Station WNG Receives a Few Telegrams

SALT LAKE CITY, Utah.—"Program coming in fine. Have band play, 'I Wish I Had a Girl'."—Bringem Young.

TEAPOT DOME, Okla.—"Program coming in fine. Sing 'Star Spangled Banner."—Harry Sinclair.
BUTTERNUT, Wis.—"Program coming in fine. Your station most easily tuned out."—A. Groucho.

BUFFALO, N. Y.—"Program coming in fine. Have Erskine Adams sing 'Aniline Blues."—Morris Koakley, Irish Scientist.

ZION, Ill.—"Program coming in fine. Have orchestra render 'Klassy Kut Kollege Klothes.' Glad to hear that they are so cheap that even college men can afford them."—U. W. Graduate.

WASHINGTON, D. C. (Or is it AC?—Ed.)—"Program

coming in fine. Congratulations. Come again. Very busy. Good Luck."—Cal Coolidge. CHICAGO, Ill.—"Program coming in fine. Tell soprano

singer that her bronchial tubes is not up to expectoration."—Mrs Partington.

NEW YORK CITY.—"Program coming in fine. Re-

NEW YORK CITY.—"Program coming in fine. Reception spoiled by the many single circuit sets I sold the public in 1922. There should be a law against them."—David Sarnoff, Vice President R. C. A.

THE THIRD TROMBONE PLAYER.

Another Girl Gone Wrong

Dear Indi: Aspirin, our colored cook, has quit, stopped and desisted. No more will her effervescent pancakes permeate their melodious odors through the upper halls whilst we scrub our teeth rid of the dark brown taste. Never again will her brobdingnagian form get jammed between the normal-sized kitchen door frame. Why, oh why, did she resign to fry eggs for the Smith's? We know but what our confidential sleuth hath reported: that we have a crystal set and the Smith's use six UV's.

SPIDER WEB.

Well Done!

Condensed

By DIELECTRIC

Following a futile search for something unusual my dials hit the wave of KSD, which brought in the music of bands in the street carnival at St. Louis, Mo. Coupled with the cheering of the crowds, short explanatory remarks from that stations' well known announcer, you felt inclined to join in the funand would, except for the two months' old youngster asleep in the room.

Boasting or boosting? Chicago stations were boosting Illinois stock when they described the advantages the state had to offer. They were rightfully boasting when reference was made to the new stadium and grounds surrounding it. Mikes give others a chance to tell, and you the opportunity to hear, of things about which you know little, perhaps.

Let's have the Welsh choir again that entertained through WSAI.

From WEAF's assortment I choose to mention the Gypsy string ensemble, a well drilled group of musicians, and the Penn Harmonic Male quartet, each member of which is possessed of a trained voice.

Nationality plays a part in the degree of interest aroused in a singer or public speaker. That alone would have caused many listeners to tune to WLS when they presented two artists, a Yakima Indian and an Eskimo—vocalist and pianist respectively. But when I listened to these men the impression was one of disappointment; the Indian sang faultless English songs and his accompanist lacked the frigidity of the North land. Their work was applauded both in and out the studio.

Most of us Radiophans know of Beban, the actor, and playwright. Possibly not so many have witnessed his unusual characterizations, yet his talk from the studio of WHAS disclosed to some extent the personality of the man. It is always a feature of interest to bring to Radiocast stations people whose work is of a public nature. Mr. Beban's closing remark, "I want to hug everybody," shows the advantage of Radio.

WBZ gave us some very good musical entertainment during a program of French songs and addresses, commemorative of some date in history that I can't recall. Especially pleasing was the singing of Massenet's "Elegie." This is not a selection to be sung in a perfunctory style and be interesting, which the artist fully appreciated.

Then away down in Atlanta, Ga., the First Presbyterian church organ was the medium by which many a listener was held to the dial setting of WSB. A good organ, capably played, and selections ranging over the various stops and combinations thereof made one feel the time spent in "Atla-anta, Georgia" was well spent."

I lost my ticket temporarily that was to take me on the long trip KDKA is conducting. However, it was recovered in time to rejoin the party for the visit to the Taj Mahal in India, one of the most beautiful buildings in all the world. The musical accompaniment to this travelogue was peculiarly fitting on this occasion. Why not arrange to make a trip via Radio to points of interest in the United States?

MIDNIGHT FROLIC AT CKAC TUESDAY

Saturday, November 15

Saturday, silent night for: WCX, WHB, WHO, WLW, WOO.

CKAC. Montreal, Canada (Eastern, 425), 7 p. m. kiddles' storics in French and English; 7:30, Mount Royal Hotel orchostra; 8:30, special studio entertainment; 10:30, Mount Royal Hotel dance orchestra. CNRO, Ottawa, Can. (Eastern, 435), 8:30 p. m., Chatcau

CNRO, Ottawa, Can. (Eastern, 435), 8:30 p. m., Chateau Laurier Hotel orchestra; Ottawa Temple choir; Mrs. F. E. Horning, violinist; Mrs. F. C. Meers, soprano; L. S. Virr, pianist, specialty number, Jack Grace. KFNF, Shenandoah, Iowa (Central, 266), 7:30 p. m., old time fiddling from Chicken Bristle, Pat McElroy, director; 10:30, request program, Seedhouse bunch. KFQX, Seattle, Wash. (Pacific, 233), 7-7:45 p. m., chlldren's entertainment; bedtime stories; 8-9, Ray Robinson and his Bagdad orchestra; 10-11, Ray Robinson and his Bagdad orchestra.

Robinson and his Bagdad orchestra; 10-11, Ray Robinson and his Bagdad orchestra.

KGO, Oakland, Calif. (Pacific, 312), 4-5:30 p. m., concert orchestra Hotel St. Francls; 8, "The Importance of Being Ernest," KGO players; 10-1, dance music, Henry Halstead's orchestra.

KGW, Portland, Ore. (Pacific, 492), 10 p. m., dance music, George Olsen's Metropolltan orchestra.

KLX, Oakland, Calif. (Pacific, 509), 2:30 p.m., Nevada-California game.

California game.

Goodhart; 3, club woman's period; 3:10, 1rma Hopper, composer

Headliners of the Week

LILAND" created such a favor-Able impression on Radio listeners in of WRC, that it is to be repeated by request this Saturday. This song cycle reveals the love of a monk for a nun, in a series of beautiful poems. This same evening is the 100th anniversary of a famous avenue. It is the birthday of Fifth avenue, New York, and the Fifth Avenue association will give the program.

The Mu Phi Epsilon musical society of the University of Kansas promises an entertaining and amusing recital Sunday night at WDAF, Kansas City.

The Merry Musical Maids of WOAW, playing again Monday night, are as jolly a lot of minstrels as the ages have produced.

General John J. Pershing, who will forever be an important part of the history of the World War, will speak again at WJY, Tuesday. A special midnight frolic dedicated to English

amateurs and under the auspices of the "Daily Express," London, will, perhaps, also interest American listeners in. H. Maurice Jacquet and Madame Andree Amalou Jacquet, two famous Parisian artists, will be on the program.

Hunting on a social scale will be the feature of the WGR program Wednesday, Prof. William T. Alexander of the Buffalo Society of Natural Sciences will give a lecture on the "Life of the Hunting Bee."

Thursday a number of great men will speak at the Near East Golden Rule dinner. The voices of Charles Evan Hughes, Chief Justice William H. Taft, Elihu Root, Cleveland H. Dodge and Henry Morgenthau will be picked up by the microphone of WJY and re-broadcast by WGY.

The Sixth U.S. Infantry band will play with snap and vigor Friday night at KSD, St. Louis. If you prefer something less military and a little more congenial, the Hoot Owls are on at KGW.

WBZ. Springfield, Mass. (Eastern, 337), 2:15 p. WBZ, Springfield, Mass. (Eastern, 337), 2:15 p. m.,
Harvard-Brown football game; 6, Leo Reisman's Hotel
Lenox ensemble; 6:30, Copley Plaza orchestra, W.
Edward Boyle; 7:05, bedtime story for the kiddies;
7:30, Hotel Kimball trio; 8, National Concert party;
Elize Biron, violinist; Florence Andrew, reader; Bett Charlton, soprano; 9, concert, F. Elva Whitmore,
director; 11:30, Leo Reisman and his Hotel Brunswick organization.

wick orchestra.

WCAE, Pittsburgh, Pa. (Eastern, 462), 2 p. m., Ed Lally and his Rendezvous cabaret orchestra; 3, Pitt-VV. & J. college football game; 6:30, William Penn hotel; 7:30, Uncle Kaybee; 7:45, popular songs, Lew Kennedy; Irene Setzler, accompanist; 8:30, Allegheny council, Knights of Columbus No. 285 artists.

WCAL, Northfield, Minn. (Central, 360), 9:45 a. m., St. Olaf College chanel services; 12 m., midnight muslcale, Delta Chi Girls' Literary society: chorus, Naomi Hanson, Bernice Armstrong, Sarah Magolssen, Ellen Kjos, Arndys Lundeberg, Marlon Vaaler, Evelyn Neste, Alice Ciere, Valeria Micheels, Anette Heldahl; Jeanette Bjorneby, reader; Orla Rice, violinist; Gladys Grindeland, accompanist.

Heldahi; Jeanette Bjorneby, reader; Orla Rice, violinist; Gladys Grindeland, accompanist.

WCCO, Minneapolis-St. Paul, Minn. (Central, 417), 10:45 a. m., "Getting Ready for Thanksgiving," Botty Crocker; 2 p. m., University of Minnesota-Illinois; 8, sectional American humor, John Scaman Garns; 8:30, Great Northern Glee clubs, Edward F. Flynn; 10:30, Joe Peyer's St. Paul Athletic club orchestra.

WCX, Detroit, Mich. (Eastern, 517), 4:15 p. m., mu-slcal program; 6, dinner concert broadcast from Hotel

sleal program; 6, dinner concert broadcast from Hotel Tuller.

WDAF, Kansas City, Mo. (Central, 411), 3:30-4:30 p. m., the Star's Radio orchestra; 6-7, school of the air, plano tuning-in number on the Duo-Art; address, member of the editorial ataff of the Star; the Tell-Me-a-Story Lady; wousle, Hotel Muehlebach Trianon ensemble; 11:45-1 a. m., Nighthawk frolic, the "Merry Old Chlef" and the Plantation players.

WDAR, Philadelphia, Pa. (Eastern, 395), 11:45 a. m., daily almanae; 12:02 p. m., Stanley theater organ recital; Arcadia cafe concert orchestra; 4:30, Cotton Pickers dance orchestra, direction Wilbur de Parls; 7:30, Dream Baddy.

WEAO, Columbus, Ohio (Eastern, 294), 11 a. m., minsic, artists from Marguerito Maniey Seidel School of Music; 1:15 p. m., Gladys Poston Pickett, planist; Drane Spaulding, tenor, from Seldel school; 2:30, play by play report of Ohio State-Michigan football game at Ohio Stadium.

WEBH, Chleago, III. (Central, 370), 7 p. m., Radio

period; 3:20, "The Small House Beautiful," Alice Folmshee; 3:30-3:50, composer's period; 6-6:30, Uncle Gebee; 6:30-7, Edward Avis, bird mimic; 7-7:30, Louis A. Goldberg, violinist; 9:30-10, Helen White Ruoss, harpist; Isador Lee Zenbaum, violinist; 10-10:30, Minnie Weil, planist; 10:30-11, The Paradise Vocal ensemble; 11-12, music.

WGN, Chicago, III. (Central, 370), 1:30 p. m., Notre Dame-Nebraska football game; 5:30, Skeezix time for the children; 6-6:30, organ recital, Lyon & Healy; 6:30-7, 8-8:30, dinner concert; 8:30-9, Helen Louise Shaffer, soprano; 10-11, dance program, Jack Chapman Drake orchestra; Don Bestor Blackstone orchestra.

NOTE THE BANJO AT WGR NEXT MONDAY

Note the determined expression on the face of Joe Roberts as he lovingly clasps his banjo to him. Joe is awfully fond of banjos. Just how fond he is of it can be understood by tuning in WGR at Buffalo the week of November 17, when the Vincent Lopez Hotel Statler dance orchestra is on the air (see the Digest program for WGR) and listening to him pick this banjo. Harold Gieser, the director, will feature Roberts that week.

Colegrove Studio, Buffalo.

children's hour stories, Blg Brother; 7-7:30, Rudy Sciger's Fairmont hotel orchestra; 8-9, Theodore J. 1rwln, organist; 9-10, program, H. B. Passmore, pianlst; 10-11, E. Max Bradfield's Versatile band.

WSB, Atlanta, Ga. (Central, 429), 12 m., entertainment; cotton market, weather; 5-6 p. m., Bonnie Barnhardt's bedtime story; news, markets; 8-9, concert; 10:45, Radlowl entertainment.

WWJ, Detroit, Mich. (Eastern, 517), 8 a. m., setting-up exercises, R. J. Horton; 9:30, talk, wouch's editor, Detroit News orchestra; Mrs. Claudine Secor, soprano; Harry A. McDougall, baritone.

Secrets of Selectivity and Regeneration

Part V-Conclusion; General Principles to Remember

By William W. Harper

N THE articles which have preceded an attempt was made to present the influence of the more important factors such as high frequency resistance and extraneous coupling, upon the regeneration and selectivity. In all cases the data given was based upon one stage of regenerative Radio frequency amplification. The more elaborate arrangements may also be subjected to similar analysis and the same principles can be

The second article disclosed a method of improving both selectivity and response by the use of more than one sharply tuned circuit. A receiving system consisting of one regenerative amplifier with two tuning circuits was described. It is well known that the degree of selectivity can be further increased by the utilization of more tuning circuits. Such an arrangement is shown in Figure 12.

In a system of this order the circuits LC and L1C1 are both adjusted to the condition of critical regeneration by utilizing the optimum number of plate coil turns in La1 and La2 respectively. This adjustment is made as described in the latter part of the third article.

The detector tube is strictly non-regenerative; that is, the circuit L2C2 is not regenerated by energy from the detector plate circuit. It has been found that only a very slight increase in selectivity occurs by using regeneration in the detector and if critical regeneration is used in the precedent amplifiers, nothing is gained in responsiveness.

Assuming the selectivity of a receiver comprising one tuning circuit to be as represented by the resonance curve num-

With only one tuning circuit it is selectivity. noticed that a certain station is heard

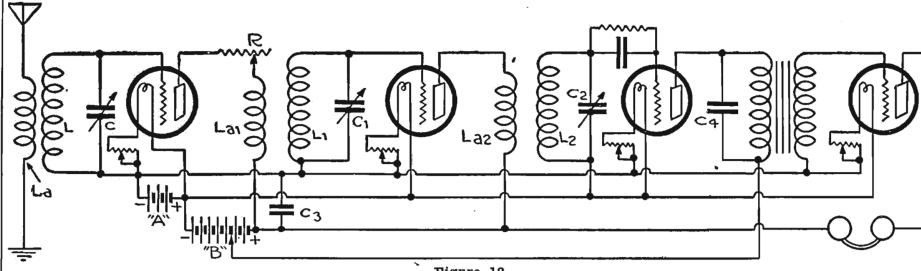

Figure 12

station on a non-regenerative set with of the construction of amplifying sys- this capacity. The number of turns one tuning circuit frequently gives response of this character. When one stage of regenerative amplification is used the same station will only be heard within the limits shown by curve 2, namely 325 to 475 meters. The greater amplitude of curve 2 when the set is tuned to exact resonance (in this case 400 meters) results from the regenerative amplification. Curve 3 illustrates the condition when a two stage tuned Radio frequency amplifier is used embracing three sharply tuned circuits. The spectrum of the transmitting station as received by such an arrangement is reduced to a band only 20 meters wide. Unfortunately the increase in selectivity is not proportional ber one in Figure 13, the increase in to the number of tuned circuits. That selectivity due to the addition of a second is, after the second or possibly the third and third tuned circuit might be pictured stage amplifier is added a further inas shown in curves 2 and 3 respectively. crease fails to appreciably improve the

For the home builder, it is necessary

from 250 meters to 550 meters. A local to know something of the general features used in conjunction with condensers of tems of this type. An attempt will be necessary to give an inductance of this made in this article to bring out these essentials.

> well made low loss condensers for use inch tube would be approximately correct. in the tuning circuits at C, C1 and C2. A capacity of 225-250 micromicrofarads is most desirable for this purpose. A covered It may be that too many turns condenser having metal end plates, are used, as will be apparent from the grounded rotor and pyrex insulation is point at which stations of known wave very satisfactory. Uniform wave length length are received. In this case turns or frequency characteristics are also an asset to a receiving condenser.

The coils L, L1 and L2 should have condenser dials are to read together. a value of about 375 microhenrics when

value depends entircly upon the size of wire and the coil diameter. Seventy As a first step, the builder should select | turns of number 24 dcc. wire on a 3 After the set is completed a test can be made to determine the wave length range can be removed. It is necessary to keep the number of turns the same if the

THE improved MAGNATRON available to you today knows no equal in the vacuum tube field. It is the most sensitive detector, the most powerful audio amplifier and the most stable Radio amplifier we have ever developed.

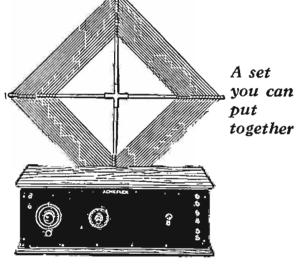

The improved MAGNATRON far surpasses even the original MAG-NATRONS upon which we have built our reputation. That, in itself, is saying enough.

The improved MAGNATRONS are tipless. This feature prevents breakage. The price is low. The MAGNATRON DC-201A, the MAGNATRON DC-199, and the MAGNATRON DC-199 with large base all list at only \$4 Your dealer sells them!

Connewey Electric Laboratories 309 Fifth Ave., New York City

Only one tuning dial

LL the tuning on an Acmenex Kitset is done A with one dial—the simplest possible way. It is so simple that your wife and the kiddies can use it to their hearts' content, getting "all the year 'round radio," and everything on a loudspeaker.

It is an easy set to make, too. It's the famous ACME 4-TUBE "REFLEX" set. Everything needed for putting the complete set together comes to you nicely packed in one wooden box for \$65.00. Even a screwdriver and a pair of pliers, the only tools needed, are given with the kit. No soldering necessary. That's a good riddance. No workshop or technical knowledge needed. The only accessories to get are the tubes, batteries, loudspeaker and cabinet.

Full directions and print of wiring are furnished with the set. Only 42 simple steps and it is done—in one evening easily. Send for descriptive circular.

SELECTIVITY SECRETS

(Continued from page 27)

The use of low loss eoils is recommended. A plain solenoid coil wound on a cardboard tube with double cotton covered wire is very satisfactory. A coil of this type is often more efficient than many of the more elaborate and "socalled" low loss inductances. The amhitious experimenter can do better by building basket weave coils or by spaced windings. Cardboard tubing is slightly more efficient than hard rubber and bakelite for use as eoil supports. In any instance the use of skeleton forms for the coil supports tends to improve the electrical characteristics of the coil, but experimental work in regenerated eircuits operated at frequencies within the broadeasting band indicates that the actual gain hardly warrants such construction. For this reason the experimenter will do well by using a simple and carefully constructed solenoid on a paper or cardboard

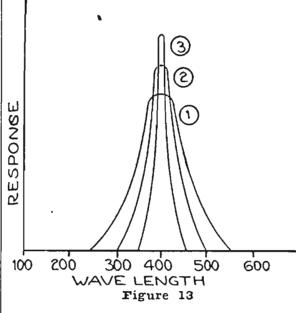

Impregnating Solution

An impregnating solution for coils consisting of celluloid dissolved in amyl acetate can be used with no harmful effects. With this preparation the high frequency resistance increase is practically immeasurable and the distributed capacity is increased by a very unimportant amount.

One of the most imperative things about the construction of any receiver is to keep the coils as far away as possible from both metallic objects and dielectric material. Great effort has recently been put forth to increase coil efficiency and some very good improvements have been made, but the Radio public will not benefit from this work until a complete understanding is reached in regard to the proper utilization of good coils. Many experimenters, and even commercial designers apparently ignore the fact that a condenser or metal tube socket in the increasing the losses in the coil by as previously brought out. Beginning with much as one hundred per cent. An edu-20 turns the optimum number can be

with the object of instructing the layity coil at a time until the set no longer on the technic of keeping the losses low in low loss coils.

The effect of wood, hard rubber and other dielectric material in increasing the losses is easily within the range of practical measurements. Unfortunately, it is difficult in such a short review to give any quantitative data as to how far It will be noticed that a variable rethe eoil should be from surrounding objects of various kinds. At least metallie of the first Radio amplifier. The maxiobjects should be no closer than 2 inches from the eoils. Don't eramp a big circuit

into a small cabinet, is possibly the best single warning to the layman.

Winding the Coils

The primaries La, La1, La2, can be wound on the same tube with the secondary coils, and closely adjacent (by a separation of not over 1/16 inch) to one end of these windings. The primary is wound in the same direction as the secondary. The number of primary turns concentrated field of a coil is capable of depends upon the circuit conditions, as

oscillates at any point of the tuning scale. This should always be carried out with the autenna and ground connected. The resistance of the antenna circuit affects to some extent the resistance of the first tuning circuit LC and in that way influences the point of critical regeneration. sistance, R, is shown in the plate circuit mum value of this resistance should be about 1,500 ohms. If the adjustment for the optimum number of plate eoil turns is made with this resistor set at half its maximum value, it will afford a very convenient control of the regeneration. In this way the set is electrically flexible and can be adjusted for maximum efficleney with various aerials.

The regenerative ability of vacuum tubes also varies to a marked degree and an adjustment of this kind will take care of such variations.

A large by-pass condenser is important across the A and B batteries as shown at C3. The actual capacity is not critical, but its value should lie between .1 and .5 microfarad. A second by-pass condenser, C4, is also desirable in the plate circuit of the rectifier of most Radio frequency amplifying systems. Its value may be from .001 to .005 microfarad.

It is very important that the high potential side of the secondary coils and the high potential sides of the tuning condensers be connected to the grids of the tubes. The end of the secondary coil away from the end adjacent to the primary is taken as the high potential side. The end of the secondary coil which is adjacent to the primary is the low potential side and is often termed the "grid return." The grid returns of the amplifiers go to the negative A battery lead always and the grid return preceding the detector tube goes to the from reducing the interstage coupling by resorted to.

eational campaign should be instituted reached by taking one turn off of each sloping the coils at a 57 degree angle, a further reduction can be obtained by keeping all the high potential ends of the secondary coils either up or down. That is, the coils should all be placed in the same position within the set.

Increasing Selectivity

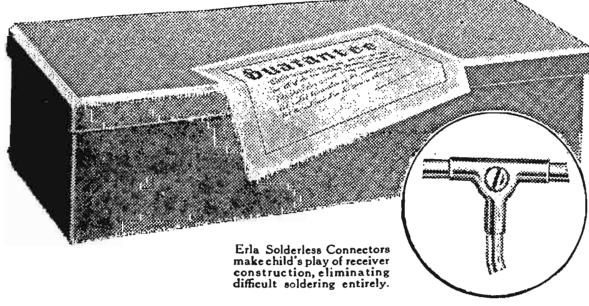

Often times it is possible to increase the selectivity of a receiver by proper shielding. This method is not recommended to the layman, inasmuch as it is difficult to secure proper shielding without decreasing the responsiveness of the entire receiver. For those who wish to attempt this kind of work reference is made to the recent work of R. H. Barfield (see Journal, Institution of Electrical Engineers [London] 62, pp. 249-264, March, 1924).

Where it is desired to operate a receiver using amplification of this kind in congested broadcasting areas, the writer strongly recommends the use of a tapped antenna coil at La. This coil should have a maximum of 20 turns and taps made at 3, 5, 10, 15 and 20 turns. With a well insulated and low resistance antenna it is possible to cut through very intense local interference by using only three turns in the antenna coil La.

In conclusion, the author regrets that he has not been in position to give more exacting constructional data concerning selective amplifying systems, such as panel layouts and the specifications for the constituent parts. It is believed that the Radio fraternity will appreciate the absurdity of all attempts to give a single formula for the construction of any special receiver. This can only be done when the exact value of the elements that make up the set are known as well as their relative positions.

(CONCLUSION.)

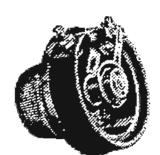

One hundred turns is the practicable limit for single layer windings, if any degree of efficiency is desired. For amounts positive side of the A battery. Aside greater than that bank winding should be

Build Most Efficient Circuits By Methods Most Advanced

With lowest dielectric and resistance losses ever known, Erla Miniloss Condensers, with new compensating plate form, lead in efficiency. 5 to 41 plates, \$3.50 to \$5.50.

Smoothness, excess capacity, freedom from noises distinguish Erla Precision Rheostats and Potentiometers. Rheostat, \$1.10-Po-tentiometer, \$1.25 and \$1.40.

Infrosted silver or gold, with Bakelite knob proportioned for utmost delicacy of touch. Erla Diala improve any receiver. 2°, 3°, 4° dia. 14° ehaft. Prices 50c to \$1.25.

A thousand and one circuits have been dangled before the radio amateur. Erla engineers, from the first, dedicated themselves to creating those circuits with the inherent superiority to remain in the forefront of radio advancement.

From this fixed purpose came Erla Duo-Reflex Circuits, most powerful in radio, tube for tube. Now research and development have intensified every original Erla advantage in the latest Erla circuits, ranging from one to five tubes, in loop and antenna models. Beyond present Erla perfection it is not possible to go in range, volume, tonal purity, selectivity or ease of control.

These finest circuits are now also easiest to build! Available in factory-sealed cartons, under warranty, are the complete Erla Knockdown Receivers, ready for truly professional assembly, by anyone who has handled pliers and screw-driver.

Erla precision apparatus, vital to matchless Erla results, is furnished complete, right down to Erla solderless connectors which banish soldering. The panel is drilled and lettered, while the baseboard is stenciled, correctly locating every unit and connection.

You yourself, therefore, can construct the most advanced radio circuits, by the most efficient and most economical method, confident that your receiver. sponsored by Erla, is unsurpassed. Ask your dealer about Erla Knockdown Receivers, or, if writing direct to us, give dealer's name.

ELECTRICAL RESEARCH LABORATORIES Department A, 2500 Cottage Grove Avenue, CHICAGO

UST as sure as you can show me that you are the right J kind of a man—that you have ambition and spunk and are determined to better your position and condition in lifejust that sure am I that I can show you a plan whereby you can make a success in this new field and reach your goal.

Radio has grown from nothing within three years to be one of the greatest industries in this country. I am satisfied I can show you a plan whereby you can make big money in territory not already covered, as I have with thousands of others.

The Ozarka Plan is the first and only one of its kind which enables the average man to start a manufacturing business of his own and pay no one any unnecessary profit. It will give the right kind of a man an opportunity to get on his feet even in his spare time, and establish himself in a permanent and profitable business of his own.

The man I am looking for is having a hard time making ends meet. He is willing to learn-willing to try and try hard, if he can only be shown and given a helping hand to get started.

The man I am looking for is not a "floater." He has a good position and he has held that position for some time. He is well and favorably known in his community—he is honest, hard working and industrious. He may not have much money—he is not completely broke and looking for a job. Generally he has a family and wants to do the best he can possibly do for that family.

J. MATHESON BELL

President

During the past three years I have shown over two thousand men how to get "out of the rut"
—how to pull themselves up and get on their feet. I am satisfied I can do this for you, or any other man, if you are willing to do your part. The public is buying radio instruments more and more every day, and yet in this wonderful business there is a field wide open for you.

Our entire plan of selling is described in a large illustrated book "The Ozarka Plan." This book is free for the asking and, for any man who is determined to improve his condition, it will no doubt be just what he is looking for. It has been the turning point in the lives of a great many men—it will mean the same to you. At any rate, you will enjoy reading it, because it is a story of men, a story of their successes and failures. It proves why some men fail while

others succeed. It shows clearly why a few men in this country are the employers of mobs of men who are toiling daily to make millionaires

Thousands of men have written me and stated that this book is the most wonderful story they have ever read. After all, it is the story of myself and the Ozarka organization, who have started from absolutely nothing in this world and pounded our way to success. I know that this book will be a revelation to you, and yet it is only a question of writing me a letter and telling me about yourself—tell me what you have done—tell me what you are now doing—and ask for Book No. 100.

BRAKS

In doing so, however, don't fail to give the name of your county.

The Ozarka Plan has been a very expensive book for us to publish, but nevertheless we will gladly send it to any man who feels that there is still an opportunity left for him to

gct what he wants. OZARKA, INC., 832 Washington Blvd., Chicago, Ill.

Batteries, Their Use, Abuse, Care and Upkeep

Part III—Construction of a Storage B Battery

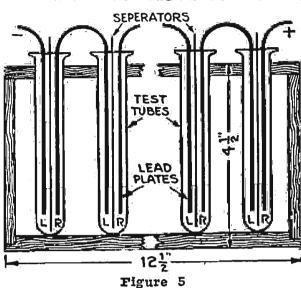

By William Fenwick

O OBTAIN maximum economy, the Radio enthusiast should adhere to these few simple rules:

Use the lowest A and B battery voltages which will give the results you want, and also as few tubes as possible, for each extra tube multiplies the current drain on the batterics.

Use a grid, or C battery on the audio-

frequency amplifier. As current is flowing in the circuit as ohms.

turned off as soon as the operator has of the vacuum tube as well.

frequency, detector and audio frequency circuits.

you should purchase a high resistance and construction, as well as in caring for voltmeter. Because of its low resistance, the ordinary pocket voltmeter drains quite a heavy current from the battery and the readings secured are inaccurate. The voltmeter should have a resistance of at least 50 ohms per volt; e. g., if the instrument is designed to measure up to 30 volts, its resistance should be at least 1,500

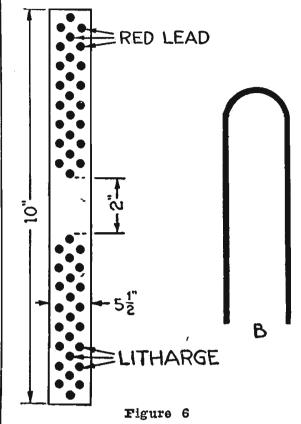

Even if a B battery has become exhausted, a part of it is still useful. All cells never go dead at once, so it is quite possible to make use of some. To do so, remove the covering that encloses the cells, disconnect them with a pair of wire cutters, and test each separately, throwing away the defective ones and keeping the active. They may be put to a number of uses, such as stepping-up another battery a few volts, or forming a C battery by connecting 4 or more in series, etc. Many more ways in which they can be utilized can be thought of by the thrifty

Construction of a Storage B Battery

The disadvantages of the dry cell type of B battery are quite numerous. One faulty cell in its makeup will produce a goodly amount of "noises;" it is also impossible to get at the particular cell without first tearing the battery to pieces. long as the filament is lit, it should be Neither does the voltage remain constant; it falls off slowly until nearly exhausted, stopped listening. By doing this it saves then decreases very rapidly. Whereas the A and B batteries, and the filament with the storage battery most of the drawthe vacuum tube as well.

Remember that dry batteries deteriorate overcome. Again a wet B battery is much when left in a hot or damp place; that more economical than a dry one, although they should be kept well ventilated; that it probably is not as convenient. The laying them on their side will shorten reason they are not very popular is betheir life considerably; that an individual cause they are seldom described and con-B battery should be used in the Radio sequently the Radio enthusiast thinks that they are far too complicated for him to construct. In reality a storage

Although it is only a few months since the writer has changed from dry to wet

B batteries, the latter have given first This consists of filling the holes at one rate service right along. The cost will be end of the plates with red lead, and those found extremely low compared with those

To measure the voltage of a B battery, B battery is quite simple in its operation at present on the market, for it does not exceed that of the common 45-volt dry battery.

The materials you will need to make a 48-volt storage B battery are: 2 dozen soft glass test tubes, 5 inches long, 34 inch in diameter; 2 dozen strips of lead, 10 inches long, 5% inch wide, 1/16 inch thick; 1 wooden test tube rack, size to hold 24 test tubes 2 pounds pure red lead; 2 pounds pure litharge (lead monoxide); 2 dozen hard rubber, glass, or celluloid separators, size to fit test tubes and a quantity of sulphuric acid and distilled

Dimensions of the test tube rack are: Base, 12% inches by 4% inches by $\frac{1}{2}$ inch; top, same length and width, and $\frac{1}{4}$ inch thick; and two end pieces, each 4 inches by 4% inches by ¼ inch. Figure 5 illustrates its assembly. The top contains 24 %-inch holes. These are arranged in three rows of eight and each holds a test tube. A small portion of the base should be scooped out directly beneath each hole so that the tubes may be

held firmly in place.

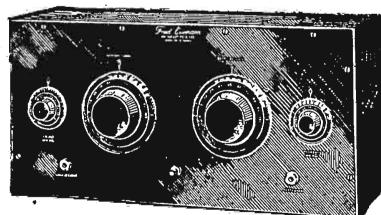

The battery plates consist of lead cut in strips 10 inches by % inch by 1/16 inch. Each plate has a number of small holes punched in it; a space of 2 inches should be left untouched at the center, though. See Figure 6. That holes can be punched at a machine shop, by hand with a twist drill, or even with a hammer and a large nail. Of course the first method is the best

Next, the plates have to be "pasted." (Continued on page 30)

The following article taken from the Sept. 23rd issue of the Camden (N. J.) Post-Telegram shows what their Radio Editor thinks of

FREED-EISEMANN

This new Hundred Dollar. FREED-EISEMANN Receiver is making Radio history!

AT THE SHOW

With many new makes of vacuum tubes appearing on the market, the radio listeners have requested informa-tion concerning them, their operation and qualities.

It is proposed here to cover the tube situation from time to time as new developments are made and the article today covers the new Goode Two-O-One A, quarter ampere detector and amplifier.

These tubes are manufactured by the Corneration of Owenshore

Goode Tube Corporation of Owensboro, Ky., and our tests and experiments with them show them to be extraordinarily fine for amplification.

The filament is rated at five volts to

operate on the standard six-volt battery. The current consumption is .25 amperes and the plate voltage recommended is from 20 to 120.

In the tests we loaded these tubes with 230 volts on the plate with no indication of choking.

By rheostat action, the burn-out

one tube. Nineteen volts were applied before the filament snapped. This is an indication of long tube life. The Goode tube is constructed with a standard hase to fit the standard

As a detector the operation is smooth, the tube working best with a grid leak of from two to five megohms. A higher resistance gives better

results on weak signals, but makes the operation slightly more critical.

Negative grid blasing with this tube as with all others, gives more satis-

factory results.

For a plate voltage of 60, the negative bias from the "C" battery should be from 1.5 to 3 volts. For 120 volts

on the plate the negative bias should be from 6 to 9 volts. It is encouraging from the viewpoint of the fans to realize that several reliable tubes are appearing on the market. It eventually will mean lower

prices and a plentiful supply
Everyone remembers with some feeling the tube situation of last winter when tubes were difficult to get, durindoubtedly to the absence of competition in the tube market and thefforts of manufacturers to uphold what undoubtedly was an exhorbitant price.

With the appearance of other tunes on the market, including the "Goode-Two-O-One A," the standard price already has dropped a dollar and the season promises no further shortage of a supply of good tubes for the fans

CARE OF BATTERIES

(Continued from page 29)

at the opposite end with litharge. Before either of these powders can be used, they have to be made into a paste. This is done by mixing them, scparately with slightly diluted sulphuric acid until they are of about the same consistency as a 20 percent solution of sulphuric acid putty. When handling sulphuric acid, the and pure distilled water. Remember the builder should always exercise the utmost care, for it is poisonous and corrosive. In diluting the acid, it must be slowly added to the water; never under any condition do it the reverse way.

The paste of red lead is tightly packed

into the holes at one end of all plates, and the litharge paste into the remaining holes at the other end. It is advisable to place the plates on a smooth, level surface, such as glass, when pasting them, and force as much paste as possible into the holes, using a manicurist's orange stick. The plates are then bent into the shape in Figure 6B.

Now is when the main difficulty arises in building this kind of battery. It is almost next to impossible to prevent the paste from falling out of a few holes. To overcome this, many recommend the battery being charged as soon as the plates have been pasted; others prefer letting the plates dry first. The writer let his stand for about four days with good re-

Separators are inserted in each test tube so that the plates can not come together basket wood (that has been boiled in Excellent separators can also be made from moving picture film, that has had

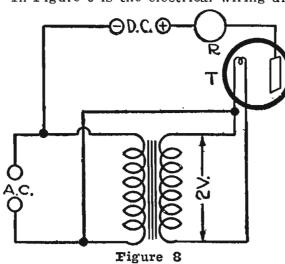

the chemicals removed from its surface by soaking in hot water, and cut into strips around 7 inches long. The details of how the test tubes, plates, and separators are mounted, is clearly shown in Figure 5.

Each test tube is filled to within an inch from the top with an electrolyte of water only in the solution evaporates, the acid docs not; merely add distilled water but never acid as the action of a storage B, battery is identical to that of a storage A battery, both should receive about the same attention.

A top view of the battery is in Figure 7. L indicates the litharge ends, and R the red lead ends of the plates; J are the lead jumpers which make connection between each row and the one preceding. On plates marked P and N, binding posts can be mounted instead of soldering wires to them, as it is more convenient when connecting or disconnecting it. Terminals can also be mounted on the ends of each row of test tubes if a variable voltage is desired. Each cell gives two volts, thus 24 will produce 48 volts

A sediment will gather at the bottom of each test tube in the course of time and should be removed before it piles up high enough to touch the plates or they will be short circuited.

The B Battery Charger In Figure 8 is the electrical wiring dia-

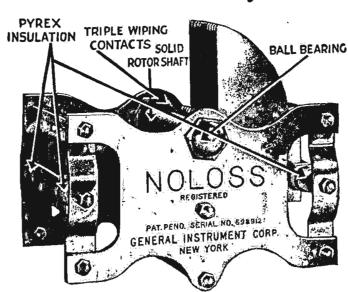

and cause a short circuit. These may be gram of the charger. This is of the gas made of hard rubber, glass, celluloid, fruit- type and employs a tungar bulb (marked T) for rectifying. Helpful Hints to Get the Most from Radio

Chapter IX—Use of Jacks and Switches in a Set

By Thomas W. Benson

IN THIS series of articles set opera-tion will be told in so simple a manner that the uninitiated can follow instructions and get the most out of reception, whether or not he knows anything about electricity or its application to broadcasting and reception. The series consists of thirteen chapters, of which the four next will be:

Chapter X-Amplifying the Signals. Chapter XI-Care of Radio Batteries.

Chapter XII-Telephones and Loud

Chapter XIII-Hints on Tuning.

THEN it becomes necessary or desirable to connect exterior apparatus to a set it is customary to employ jacks and plugs for the purpose. These permit of, rapidly shifting from head phones to loud talker or vice versa. Likewise a loop aerial or an outdoor aerial may be plugged in as desired. In practically all cases the jacks and plugs are handling the entire input or output energy as the case may be and any defect in the jacks or plugs will result in decreased efficiency.

Since the installation of jacks adds to the wiring in the set the best practice is to eliminate them wherever possible. The effect of the extra wiring may introduce parasitic feedbacks that produce oscillations or distortion or may lead to capacity losses.

There are three defects often found in jacks, the capacity loss between the springs, poor connections between jack Figure 22-Using loop as secondary of springs and plug or at the jack contacts untuned primary coupler to eliminate and leakage through the insulation be-tween the springs. The fact that a capacity of appreciable value exists between the springs of a jack makes their use in Radio frequency stages of transformer coupling practically impossible. still most common form of jack shown in Figure 21.

jacks have a lower capacity but even

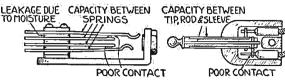

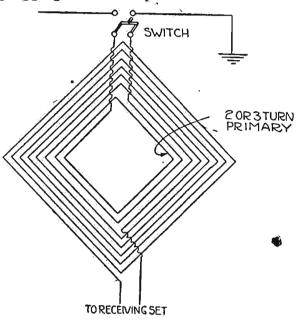

Figure 21-Showing causes of losses in plugs or jacks.

they should not be used to switch in and out Radio frequency amplifiers. The only other application of a jack and plug where the capacity present need enter into consideration is their use for plugging in the loop aerial.

jacks to change from outdoor to loop aerial.

The effect of using a plug and jack to plug in a loop aerial is to shunt a small capacity across the tuning condenser. This refers of course to the older and The condenser formed in the plug particularly has high losses because of the dielectric present and affects the sharp-

some energy. Since the amount of energy is but another reason for their eliminapicked up by a loop is minute these losses although small in themselves represent the loss of sufficient energy to limit the range of a receiver.

The use of anti-capacity jacks may reduce the capacity but the plug is the most serious offender. The better method is to use binding posts to connect the loop to a receiver. When it is desirable to use both loop and outdoor aerial as conditions warrant, the best arrangement is to connect the loop aerial to the tuning condenser and have two or three turns of wire on the loop form that can be connected to the outdoor aerial. Thus the loop always forms the tuning inductance while the outdoor aerial is connected in as desired by clipping it onto the extra turns on the loop which form an untuned primary or switching it in as shown in Figure 22.

Use for Plugging in Phones Since the capacity of the jacks and plugs is small it will have little effect upon the lower frequency currents found in audio frequency amplifiers and their use for plugging in phones or talker is permissible without loss from capacity effects. The question of leakage and poor contacts becomes important. Leakage in a jack may be due to inferior insulation or more often careless soldering of connections to the jack terminals. A jack insulated with fiber strips may work perfectly under certain conditions but the fiber may absorb moisture and thus form a conducting path between the springs. When soldering, the flux may splatter from the hot iron or if too much is used, flow over the strips and partially short the jack. Both these causes of leakage can be eliminated by the use of a jack requiring no soldering and that that is, the spring making contact with is insulated with bakelite.

A leaky jack usually causes a scratchy or frying noise in the receivers with a decrease in signal strength. Any losses from leakage would have a greater effect in lowering the efficiency of a set where

The newer types known as anti-capacity | ness of the tuning as well as dissipating | the jack is used to plug in the aerial. This tion in the aerial circuit.

> Poor contact in a jack may result from dirty or corroded contacts or from weak springs. The best of jacks may develop these defects after continued use but they can be readily cleaned up with a little fine sandpaper. Since the cost of the best jacks and plugs on the market is but little more than the inferior types it is poor economy to buy the cheapest. Use as few jacks as possible and use only the best having bakelite insulation, heavy contacts and stiff springs.

> Control Jacks So far no mention has been made of filament control jacks. They are used but little by the home builder and are

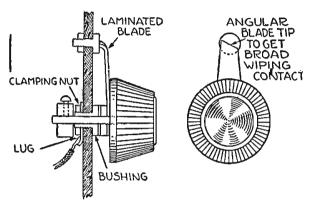

Figure 23-Cross section of an efficient switch.

found mostly on the manufactured sets. They add a touch of refinement and are entirely satisfactory if they meet the requirements of a good jack in all other respects.

It is extremely important that all jacks in the audio stages be connected alike, the tip of the plug should be connected to the positive of the B battery. The phones are then connected into the plugs with the marked cord going to the tip of the jack. If this method of connect.

CARE OF BATTERIES

(Continued from page 30) necting the B battery for charging as for the A battery; viz., make sure the connections of the battery and charger are positive to positive and negative to negative. The battery should only require about 10 to 15 minutes for charging after the first few times, but these may take quite a few hours. After several charges, the positive plates should turn chocolate brown color and the negative plates, a

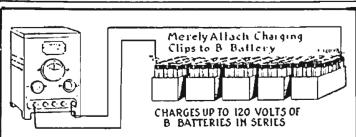

When this sort of battery is properly constructed and looked after, it will last for years. Moreover it gives equal, or even better service than dry cells.

The C Battery that the grid of a vacuum tube in an audio frequency amplifier should never be

allowed to become positive. If it does, it results in distorted signals. This is on account of the grid being the balancing and controlling element in the tube. As a preventive measure, the grid is so connected that it will receive a potential of from 5 to 1.5 volts.

The best way to impress a higher voltage on the grid is by means of a C battery. These are usually sold in 41/2-volt units with taps at 11/2, 3, and 41/2 volts. They are placed in the circuit by connecting the negative side to the secondary of the amplifying transformer, and the positive directly to the negative of the A battery. For plate voltages ranging from 45 to 130 volts, the grid bias can be anywhere between 11/2 and 9 volts. It is fairly well known among beginners The correct voltage can only be found by a test.

(THE END.)

Simple - No Trouble - Quick - Convenient

FRANCE WAY

Up to 120 Volts of "B" Battery IN SERIES

can be easily and quickly charged with the France Multi-Duty Super-Charger. No troublesome wire changing—just leave your batteries wired in series, attach clips, insert ordinary lamp to regulate charging rate and turn on current. Simple-Quick

Two, Four, Six and Eight volt Radio "A" or Auto batteries can also be charged at a 5 to 7 ampere rate.

The France Super-Charger is truly the highest attainment in battery chargers. No bulbs or acids, no noise, no sticking or sparking contacts—it embodies every desirable feature.

^{HE} Andrews

—the first set to combine selectivity and tone quality with distance and volume

Hitherto in buying a radio set you have had to choose between one with high selectivity and fine tone quality and one with great distance and volume. Up to this time both groups of qualities could not be found in one set.

Now the Andrews Deresnadyne 5-tube Radio Receiving Set, using the new and exclusive principle of the Deresonated and Balanced

Plate Circuit, for the first time successfully combines these absolute essentials of fine Broadcast Receiving. Mr. Robert J. Casey, head of the Chicago Daily News Laboratory, saysaboutit: "Thecircuit combines selectivity, range and quality in a degree that will astonish the old experimenter." Hear the Deresnadyne at your dealer's. Or write to us for a complete description.

ANDREWS RADIO COMPANY - 327 S. LA SALLE ST. - CHICAGO

Simple Homemade Selective Receiver

Hook-Up That Pulls in Distance and Volume

If there is any reader of the Radio Digest that wants to build a cheap, simple but a very selective set, here's one that is worth your time trying. The parts

WORKSHOP KINKS EARN A DOLLAR—

THERE are many little kinks worked out at home that would aid your fellow Radio worker if only he knew about them. There are new hook-ups, new ways of making parts and various unique ways of operating sets that are discovered every day. Radio Digest is very much interested in obtaining such material. Send them in with full details, including stamped envelope, so rejected copy may be returned. The work must be cntirely original, not copied. RADIO KINKS DEPARTMENT

Radio Digest, 510 North Dearborn St., Chicago

used for tuning are two 23-plate variable condensers and at present I am using a 180 degree variocoupler, with a winding of 100 turns and 10 taps. Of course any coupler may be used. The switch arm across the aerial condenser is to cut it out or in as desired.

The loop shown in the diagram is not absolutely necessary but I have found that it works best with it. I have used both WD-11 and 12 tubes and both worked equally well. I have been using from 30 to 40 volts on the plate, 22½ will work very well. After the set is wired up it should start delivering the goods but if it doesn't work go all over the set carefully with the diagram.

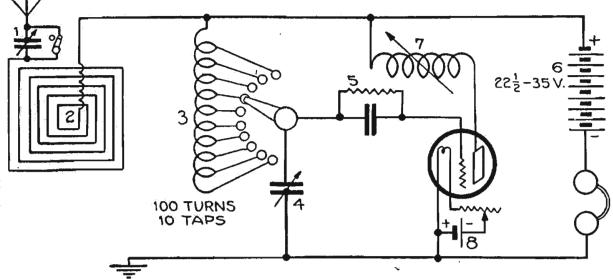

I have been getting very good results, picking up KGO, Oakland and KDKA, East Pittsburgh, and several northern stations come regularly with wonderful voluine. I have a small Murdock loud speaker and have gotten KFKX, WFAA, WHB, WBAP and WMC on it with one tube. The local stations are easily tuned out although they come in with a roar.

The diagram is self explanatory and very simple to hook-up. This is a very good little set and it will certainly bring stations in clear and loud if properly built and properly operated. - George Ross, Houston, Texas.

Wire for Spider Web Coils

Double silk covered wire is preferable for spider web and bank wound coils, as it affords satisfactory insulation, and also wire is also satisfactory, but it requires point to another. slightly more space.

LOOP USED WITH OUTSIDE AERIAL

1 is 23-plate variable condenser, 2 is loop aerial, 3 is 100 turn on stator, 4 is 23-plate variable condenser, 5 is grid leak and .005 condenser, 6 is B battery 22½—35 volts, 7 is rotor of variocoupler and 8 is dry cell.

Crysto-Tube Set
Reception from local broadcasting stations is in most cases obtained with sufficient volume on a crystal set. However,

to receive distant stations with any regularity, a tube set is necessary. A simple set combining the advantages of both a tube and crystal set can be constructed of a few parts, and can be so connected that reception on either one of the two detectors can be accomplished by a single

a saving in space. Double cotton covered movement of a contact switch from one house and instruments are as safe as if

The hook-up of this "crysto-tube" set

Digest a Reinartz hook-up by C. T. Hanavan and I have tried this circuit with good results, but with the tickler coil placed as shown in the accompanying diagram I obtained much better results. This arrangement is based on the original

Weagant circuit. This hook-up gave louder and greater distance signals than the straight tickler coil arrangement of the Reinartz circuit. The greatest improvement was in the ease

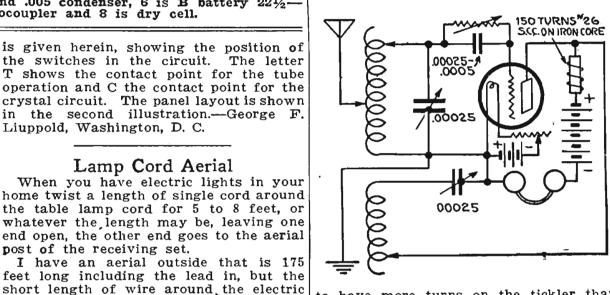

Reinartz Coil Based on

Old Weagant Circuit

Some time ago there appeared in Radio

with which the set could be controlled once the proper size of tickler coil was

The only trouble that was experienced in building the set using this circuit was to find the correct size of the tickler coil. The exact number of turns on this coil must be found by experimentation, as it varies with the design of the set. But in most cases it will be found necessary

to have more turns on the tickler than is generally used on the straight Reinartz set. Do not give up on the first tryout because the set will work and it will be well worth the effort used in experimenting with the tickler coil.—Earl T. Denton, West Chester, Pa.

Proper Tools Necessary When building a receiver use tools that

are designed for that purpose. Don't buy a pick ax and sledge hammer and think that you are going to build an efficient set. Several sizes of screwdrivers are usually necessary, and purchase a pair of long-nosed pliers to use when working around the corners in your wiring. If you purchase a soldering iron don't buy a big, heavy, cumbersome iron, but purchase one that is thin, which will enable you to reach into the corners to solder your connections. Handle your receiver with care ever. If you have a good protector the when putting it together, as it is a delicate piece of apparatus.

Make Your Selection Carefully

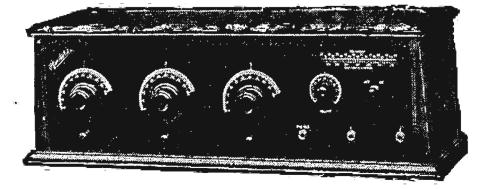

from among only a few of the better receivers. Consider among these the Pfanstiehl Model 7 receiver. You will always appreciate the suggestion.

- 1. Matchless reproduction
- 2. Extreme selectivity
- 3. Unusual simplicity
- 4. Simplest tuning

made possible by the Pfanstiehl Station Selector.

Your dealer will be pleased to demonstrate these features.

SUPER-HETERODYNE

(Continued from page 21)

wave length, and falls off rapidly on each side of this point. This point is known as the "peal: efficiency," and since we naturally want all the strengthening possible, our filter coupler is designed to pass this wave length and we mix the incoming with the oscillator frequency to produce it.

In order to separate the audio frequency component of our energy from the Radio frequency currents, a detector is necessary, so the signals are passed from the last Radio frequency amplifier stage through one of the long wave transformers into a vacuum tube equipped with grid leak and grid condenser and operated to rectify and detect instead of amplify. Since the Radiocast energy has been so tremendously increased by our three long wave Radio frequency amplifiers, it enters and leaves the detector so strong that only one stage of amplification at audible frequencies is necessary. This single tube is coupled to the detector by an audio frequency transformer in the usual way now familiar to most fans.

Two Tuning Controls

On the panel then, we require only two tuning controls, the variable condensers and two subsidiary controls but seldom touched, the potentiometer and rheostat. Considerably better selectivity will result if variable condensers of the low-loss type are used, with metal end plates and small strips of insulating fmaterial supporting the stator. Within the set we need seven tubes, namely, the first detector or "mixer," the oscillator, three amplifying at Radio frequencies, a second detector and one amplifier at audio frequencies. Due to the necessity of matching, certain parts of super-heterodynes are sold as a kit, which usually includes an oscillator coupler, a filter coupler and three long wave transformers. There may be other incidentals included such as large capacity condensers; if so, they need not be purchased separately. These kits may be designed to pass a wave length of 2,300 mcters, 3,500 meters, 4,600 meters, 6,100 meters, 8,300 meters and even 10,000 meters. Any of these kits are suitable for this super and may be used. The oscillator coupler may not look like that in the drawing, but this point makes no difference as many very excellent couplers are entirely enclosed and do not have a variable rotor as did this one. Too much stress cannot be laid on the use of highest quality, mica dielectric fixed condensers, as the writer has found that these condensers are second only to the matching of transformers in importance.

Panel and Baseboard Layout

Laying out the apparatus on panel and baseboard is the first thing to be done. It is most advisable to lay out everything on paper first and use the paper layouts as templates for center punching and drilling. The panel layout shown in Figure 1 should be made full size with ine center holes indicated. Condensers and potentiometers and rheostats are usually provided with templates for the mounting roles, so these smaller templates are pasted on the sheet of paper with shaft center holes carefully placed over the centers indicated in Figure 1. Shielding has not been found necessary ficient over the range of from 0-50 on in this set, so there are no shield holes the dials than it is from 50-100 on the to worry the constructor. A similar pro- | dials. This condition is overcome by the cedure is followed with the baseboard; use of the sensitizer, number 6, on the only center holes are shown in the base-board layout. The builder can easily place the lower dial range the sensitizer must the parts on the paper layout and deter- be turned fairly well in and on the upper mine the exact points for mounting ranges of the dial best results will be screws. It will be well worth while to had when the sensitizer is practically all

HOTO TO THE WATER THE HOTEL CONTRACTOR OF THE PARTY OF TH

board; pick one that is absolutely flat to begin with and made of a wood that you know is not so likely to warp. Halfinch vencer, made of thin laminations, can be obtained at any lumber yard, and while harder to put screws into will always look well and stay flat.

Some slight shifting of parts may be necessary due to the difference in sizes of different makes of apparatus. For example, the transformers may be considerably larger than those used in the set built by the writer, and the tube sockets may all have to be moved forward half an inch or so. Similarly, if a large C battery is to be used, it may suit the builder to move the audio frequency transformer and the .00025 mfd. -condenser slightly to the right, which may be done without affecting the working of the set in any way. However, the fan will find a full size drawing in the next article with center holes marked, a decided help as a starting point, and will probably be able to follow it exactly.

(Wiring a super-heterodyne, that is John G. Ryan's model, is as easy as hooking up a crystal set. Part II of Mr. Ryan's series will instruct you in the wiring.—Editor's Note.)

LOW LOSS—WHAT IS IT?

(Continued from page 20)

The piece of apparatus which should certainly receive attention in the very near future with a view to cutting down distributed capacity is the loop antenna. While one can secure a fair degree of selectivity by the use of a low loss condenser across a loop aerial and also because of the directional effect of the loop, still the selectivity leaves a lot to be desired. There seems no reason why a loop antenna could not be developed along the lines of a honeycomb coil on a large scale, or similar in design to a spider web coil. Other forms of winding will doubtless occur to experimenters in the very near future, and when loop antennas even but 10 per cent higher in efficiency make their appearance it will be a real advance in Radio reception. The present types of loop aerial have been in use for several years and it is to be hoped that the same amount of attention will soon be given them that has been given variable con-

(Build your own "low loss" inductances. Mr. Fournier will tell you how in his next article of this series .- Editor's Note.)

HOW TO OPERATE SET

(Continued from page 15)

a sensitizer and controls the state of sensitivity of the entire circuit. If the adjustment happens to be out too far the station will be tuned with a whistle. Under this condition it will be necessary to turn it in very slowly to a point where the whistle just disappears. Then by read-justing the dials 1, 2 and 3 slightly the proper quality and volume will be reached. Some times it is necessary after adjusting the dials the second time to turn the sensitizer back out just a trifle to procure the proper amount of volume.

If the operator has tuned Radio frequency sets before, it has probably been noticed that the set is much more ef-

Revolutionary

ROYALTY Variable High Resistances and the ROYALTY Variable Grid Leaks represent the greatest improve-ments ever made in this field. They

This wire winding climinates at one stroke all the common grid leak and resistance troubles. The lever arm

cannot scrape away the resistance

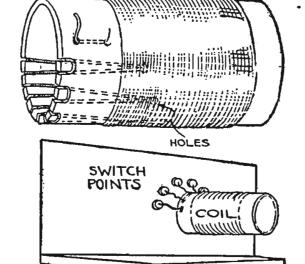

element. The grid leak and the high resistance are noiseless and

exercise some care in choosing a base- of the way out. The ideal condition in if the tube is mounted with tapped end the point where the dials can be brought Nebr. in to exact resonance while tuning a station without getting a whistle.

In leaving the set it is only necessary to withdraw the plug from the jack. This action cuts off both the A and B battery supply and makes it unnecessary to turn off the rheostats and also saves a great deal of time when again using the set in locating the proper rheostat positions. When the set has been unused for some time it is only necessary to plug into the proper jack and allow one or two minutes for the tubes and rheostats to warm up.

Accessible Taps on Coils

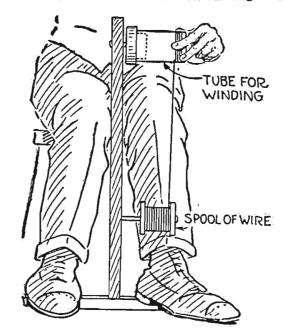

Notch one end of the tube and run the wire through holes in the tube and out

over the tongues formed by the notches then contacts can be easily made and soldered. Connections are especially handy ter .- H. T. Fredeaven, San Mateo, Calif.

Homemade Coil Winder

In the absence of a lathe, winding of inductances on bakelite or cardboard tubes is greatly facilitated by mounting both

tube and wire spool on a small stick of wood so that the hands are free to guide the windings and to rotate the tube. A head or cap to retain the tube may be obtained from any drug store. It should correspond, in size, to the tube used. Both spool and head are fastened to the board with a small nail. Another larger nail is driven through the bottom and with both feet resting on the projecting ends and the knees fixing the upper end, straight or bank winding is an easy mat-

Ouestions and Answers

Street Car Interference

(07078) RAP, Springfield, Ohio. I would like you to give me a little advice on the subject of interference from street cars. Here is the question, which I would like to have you publish in your paper: I am situated close to a street car line which passes by the front of the house and turns the corner a few doors away and continues on down a side street. My aerial is a single wire, inverted L-type on about a 45 degree angle with both trolley wires on front and side streets, and is located about 70 feet from the front trolley line. When the street car approaches within 2 or 3 blocks of either side of my house, I get a continued roar in the phones or horn until the car has reached about 7 blocks from the house before the station comes back again. At times I can hear the hum of the motors when no cars are in sight, a sound in-

creasing in pitch as the car gains speed.

The price is low because we ship

"knocked down."

No longer do you have to utilize the dining room table, or the sewing machine cahinet as a place to keep your radio set. The radio table Illustrated is a real piece of furniture, heautifully finished in handruhhed manogany; legs fitted with "domes of silence." The top measures 16228 inches; the table 1s 31 inches high. Comes by parcel post, knocked down; a pair of pilers is the only tool needed to assemble. Send no money; we'll ship the table and you pay the postman. This table is guaranteed to satisfy you—or money will be refunded.

Our new hooklet shows and describes many other styles of radio tables.

ADIO FURNITURE COMPANY

I have a Reinartz set built from one of to minimize the disturbances encountered your book of specifications. A friend of mine who has a neutrodyne, a few doors south of me has the same trouble with the street cars interfering. We both get excellent results though after 12:00 midnight when the cars stop running, often picking up many DX stations. Can you suggest a method to partially overcome this interference or will one of the wave traps you recently described help in any

What types of sets will re-radiate, thus bothering others in the immediate vicinity, or is the single circuit regenerative the only one that will do it?

A.—We are advising in your inquiry that interference of the nature to which you are subjected is very difficult to overcome. The only measure we can suggest

counterpoise in place of the usual ground. The single circuit regenerative set is not the only offender. A great many other circuits may be made to oscillate.

Push Pull Amplifier

When using the "Push-Pull" amplifica-

tion is a separate B battery necessary or can the same battery that is supplying detector and audio tubes be used?

Will UV-199 tubes function as push-pull amplifiers and what B battery voltage will be necessary?

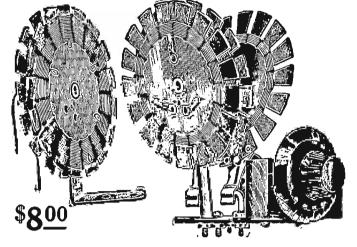

A.—A common B battery will serve for detector and push-pull amplifier stages. UV-199 tubes may be employed with fair results in consideration of their current consumption and will require probably 90 volts maximum, which is their limit. If volume is a consideration we would recommend that results afforded with the 6-volt tubes will far exceed those of the former.

GET MOST FROM RADIO

(Continued from page 19) ing is not followed the current is reversed through the phones in one of the jacks with the danger of weakening the permanent magents in the receivers

The same general rule applies to switches as to jacks. Keep them out of the tuning and amplifying circuits wherever possible. It is usual to include a filament switch but as mentioned previously it is bad practice to suddenly apply full voltage on the cold filament of the tube. Where a switch is used it will pay to turn the tubes off and on with the rheostats and use the switch only to make sure the circuit is open. The filament switch should be connected into the positive leg of the circuit to which the B battery negative is connected so it simultaneously opens both A and B battery circuits.

Tap Switches Tap switches are used very little in the modern tube sets but for those who wish to employ them a few pointers on what makes a good switch will be given. First of all the switch lever should turn in a bushing and have a slotted spring washer to keep it bearing snugly on the bushing. A lug for soldering is a necessity which clamps under the nut holding the bushing in the panel. The blade should be laminated and resilient enough to bear well on the contact points but not so stiff that the blades cut into the contacts. The end of the blade should be bent at an angle as shown in Figure 23 so a good wiping contact is obtained. Such a switch with the leads to the contact points soldered, will introduce very little resistance into the eircuit.

Simplicity should be the aim when selecting switches for a Radio set and for that reason the use of complicated switches intended to control audio stages by rotating a knob and similar devices should be avoided.

(Amplifying the signals will be the next topic treated upon by Mr. Benson in his series. You will learn how and why stages of frequency brings up audible sounds and make volume for a set.-Editor's Note.)

Make Your Radio Joy A Sure Thing

The quickest way to spend \$20 is to accidentally make a short circuit in a fivetube set. Zip, and your money is gone as well as your fun—until the radio store opens.

Either style of KANT-BLO means protection against blowing out tubes.

Kant-Blo

The KANT-BLO is not an extra accessory to your set. It is designed as a B battery Binding Post or as an A battery filament Switch Style—are at all the best radio stores. If your dealer is out of stock send us \$2 for a KANT-BLO Binding Post Style, or \$3 for the Switch Style, and we will ship any num-ber of KANT-BLOS direct to you, charges prepaid.

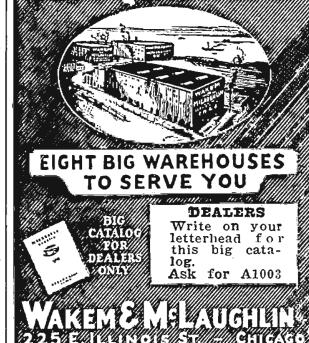

Manufactured by GANIO-KRAMER CO., Inc. New York Sole Distributors
APEX RADID CO.
503B Fifth Ave. New York

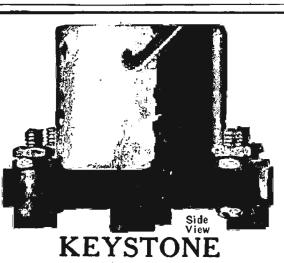

Sets for Use on Loops

Sets designed for use on an outdoor antenna do not ordinarily work on a loop antenna. To get good results out of a loop antenna, a set should be used that is designed especially for this purpose. Such a receiver contains from one to three or more stages of Radio frequency amplification. For loud-speaker operation at least four or five tubes should be used, unless the receiver is of the reflex variety in which the tubes do double duty.

Rection Decisions

HENDOURRAGERS

SOCKETS

will improve your receiving set, because of the following eight important points of superior construction:

1—Low Dielectric losses
2—Wiping contacts
3—Heavy bronze contact springs 4-Contact springs heavily plated and will not

corrode
5—Genuine bakelite base
6—Aluminum shell, improved locking device
7—Takes up small space
8—Unconditionally guaranteed

PRICE 90 CENTS

Weekly Financial Letter Points the Way Toward Successful Investments

RATES

\$60 Per Year — or Three Months' Trial, \$15 in Advance

Because many people have had good results with the STAR-ITE CRYSTAL with non-regenerative tube

used as a detector with non-regenerative tube sets, we have had a great many letters from radio folks who seem to be of the impression that this is the—as yet unperfected—OSCIL-LATING CRYSTAL, of which so much has been said in the radio press.

We have secured oscillation with crystals in a laboratory fashion, but would not altempt to sell the. STAR-ITE to take the place of amplifying tubes.

We do say that the STAR-ITE is the absolute planacle of perfection as a crystal to be used in a REFLEX Sct, or a CRYS-TAL Set, and as a detector in many nongenerative tube sets, and are glad to supgenerative tube sets, and are glad to sup-port our belief by making it extremely easy

to try one for yourself.

As this crystal is a new one put out by an old firm in the crystal business your dealer may not have it, but try to get him to order one for you, on our money back guarantee. If he does not wish to do so send us his name with a \$1.00 bill at our risk, and we will good you one with the understanding. we will send you one with the understanding that you may return it, and we will refund you the \$1.00 at any time within 30 days.

Gold Cat Whisker in Each Package

EXAMINE these two achievements at the Chicago Radio Show in the Coliseum—Booth 22, Section AA.

APEX VERNIER DIAL

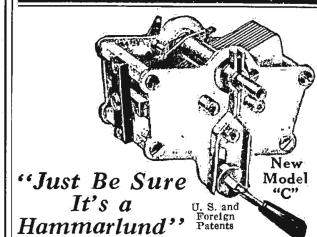

Do not bother with geared condensers, requiring many holes in the panel and careful lineup of pinion shafts, when this marvelous instrument provides the fine adjustment for tuning in distant stations. Radio 10 to 1—quickly applied to any shaft. For sale by all good radio dealers. If unable to ohtain, fill in coupon and enclose \$2.50 for nickel finish or \$3.50 for Gold Plated finish.

Coast To Coast On An 18-Inch Loop Assembla Your Own 7 Tube Super-Heterodyne—on a 7 x 18 panel in three hours, \$97.50 buys the parts completo, including drilled and engraved panels, condensers, sockots, transformers, dials, connecting plugs, cables, etc., with drawings, diagrams and instructions. Price of eahinets to fit—furnished on application. If your dealer cannot supply these parts for this complete Microdyne Itadio Sel, fill in coupon, mail check or moncy order and send dealer's name.

NATIONAL CARBON CO., INC. Headquarters for Radio Battery Information San Francisco New York

CANADIAN NATIONAL CARBON Co., LIMITED Factory and Offices: Toronto, Ontario

This tuning Unit has simplified et building

The Cosmopolitan Phusiformer, which has won the Universal praise of Radio Engineers, -enables you to start in with the small expense of a crystal or a one-tube set and to build, by degrees, a multi-tube set with as many stages of tuned R. F. as desired, simply by adding more tubes and Phusiformers. Radio sets that use Phusiformers as tuning units are free from oscillation, squeals and howls. Phusiformers are selfneutralizing, no extra condensers or coils are necessary to balance the capacity of the tubes. Build a Phusiformer tuned radio set and learn with what clarity and volume distant stations can be received.

COSMOPOLITAN PHUSIFORMER CORP. 15 W. 18th St. NEW YORK

Have you your EKKO

Broadcasting Station Stamp Album?

Here's what every radio fan has wanted—a convenient, permanent and authentic means of recording all stations heard over your set. The Ekko Album contains spaces for a stamp from each of more than 650 stations. These stamps are verified and prove your reception of the station.

Proof of Recept lon cards are furnished with the album. Proof of Reception cards are furnished with the album. Send the card to the station, together with ten cents, to cover cost of verification, give facts which prove you have heard their broadcasting. In return they send you their verified stamp as evidence of actual reception. The stamps are beautifully engraved in different colors, an individual stamp for every station showing the call letters.

The album is 9½ x 11 inches, handsomely bound in a two color cover. It contains 96 pages, with spaces for stamps of all recognized stations arranged alphabetically by states and call letters. Also an alphabetical list of the official names and other interesting features of stations, as well as a convenient log.

See your dealer today, get a copy of the Ekko Album and start a collection of these stamps. You will find this a new and fascinating method of verifying the stations you hear. If your dealer cannot supply you, sent direct on receipt of price. Money back if not satisfied.

Price \$1.75

THE EKKO COMPANY 111 West Monroe Street, Chicago

work bench. When an insulated wire is sometimes come in of low audibility. When signals suddenly take a drop, it is a good plan to check the trouble by getting in touch with other Radio listeners before blaming it on the set.

Embodies all proved principles of reproduction. Delicate shading, inflection and modulation of voice—this and the musical instrument re-created with remarkable volume and clarity of tone, with a stounding purity and faithfulness, even when sending is weak. Floods room with best that's in your set. Horn acoustically perfect. No battery needed—simply plug in like headphones. Handsome crystalline finish fibre horn approx. 22" high; heavy base prevents tipping. Polar indicating connecting cord included.

You Save Middlemen's Profits

Send direct—today—for your Majestic Speaker. Try it for ten days. Hear distant stations plainly. Test its clarity of tone and volume—no distortion, no harshness, no rattle, no blare or screech. Compare it with loud speakers selling for \$15 to \$25 and more. Then if you're not satisfied, simply return it at our expense and back goes your money. You—and you alone, are the judge. So mail your order today.

JAMES M. DAVIS CO.

30-A Euclid Arcade, Cleveland, Ohio Send a Majestic Speaker on your 10-day free trial offer. I enclose \$8.50. I reserve the right to return it at your expense within ten days if not satisfied and receive full refund of my money.

Puts the Joy in Radio

After all, what is sweeter to your ears than the music from some DX Station coming in on the loud speaker, clear and undistorted? To insure amplification without distortion, use the "HEGEHOG." This marvelous little audio transformer, half the size of any other made, is different in design—the most efficient construction known for transformers. It has an explaining the statement of the stateme clusive self-shielding feature that shuts out foreign noises. Unsurpassed for volume and tone quality. Saves space, mounts anywhere and easy to connect. Ideal for portables.

Write for Free Bulletin No. 94 showing complete line of Premier Quality Radio parts. Ask your dealer for Premler Free Hook Ups. If he does not have them send his name and receive a set free.

Quality Radio Parts

Biltmore Master Reflex

The Most Sensitive, the Purest Toned, the Finest Receiver Which Money Can Buy.

As sensitive as the Super-heterodyne.

As pure in tone as the finest phonograph.

As beautiful a piece of furniture as one could desire.

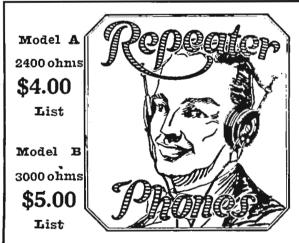

At an extremely moderate price.

Tested and Approved by the **POPULAR** RADIO LABORATORIES

Write, and let us tell you why a better receiver cannot be had

Dealers write

The Biltmore Radio Co. Dept. D. Boston 30, Mass.

Distance Lends Enchantment

Every real radio fan gets a distinct thrill when he 'listens in' to far-dis-tant stations through Repeater Phones. The remarkably beautiful tone quality, so clear and loud, gives a fascination never before experienced.

Of course there is a very definite reason for Repeater superiority. The "Single Pole" feature, exclusive to Repeater Phones, makes possible that extra power and fidelity of reproduc-tion. Our catalogue describes this feature and others in detail—ask for yours.

If your dealer cannot supply you send order direct to factory.

DEALERS

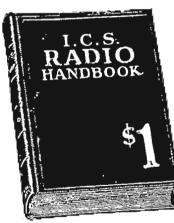

You will find Repeater Phones—a nationally advertised product—fast-moving merchandise. Ask for our Salos Plan and Discounts.

Detroit, U. S. A. The New Improved "Repeater"

Takes the Mystery out of **RADIO**

JUST OUT 514 PAGES

Compiled by HARRY F. DART,

Formerly with the Western Electrio Co., and U. S. Army Instructor of Radio. Technically edited by F. H. Doane

NO MORE need you turn from book to book, hoping to find what you want. It is all here, in 514 pages crammed full of every possible radio detail. Written in plain language, by engineers

for laymen. More than 100,000 sold. IT EXPLAINS: Electrical terms and circuits, antennas, batteries, generators and motors, electron (vacuum) tubes, every receiving hook-up, radio and audio frequency amplification, broadcast and commercial transmitters and receivers,

super-regeneration, codes, etc. Send \$1 to-day and get this 514-page I. C. S. Radio Handbook-the biggest value in radio to-day.

International Correspondence Schools

Box 8276-P, Scranton, Penna.

I enclose One Dollar. Please send me—postpald—the 514-page I. C. S. Radlo Handbook.

It is understood that if I am not entirely aatlafied I may return this book within five days and you will refund my money.

Check here ond enclose \$1.50 if you wish the de luxe edition, bound in Leotheroid.

"By many words wit is exhausted."
—Lao Tzu

The Synchrophase needs no extravagant claims.

A BROADCAST Receiver that marks an advance in radio design which will stand as a challenge to the industry for a long time to come. Its surpassing craftsmanship is equalled only by its easy, dependable operation.

Greater sensitivity has been gained through two stages of Balanced tuned radio frequency—the result of many months of intensive research by the Grebe engineering staff. Extreme selectivity has been obtained by the use of Binocular coils, which are unaffected by impulses from undesired local stations.

The settings for the various broadcast stations are equally spaced over the dials. This is accomplished by S-L-F (straight line frequency) condensers. The three dial readings are identical for a given station.

A new type of volume control gives an unbroken range of six variations of audio amplification.
