PERPETUAL

TROUBLE SHOOTER'S
MANUAL

REG. U.S. PAT. OFF.

JOHN F. RIDER

DESCRIPTION

This model is a 4 tube (plus rectifier) superhetrodyne radio receiver designed for use on 117 volts 60 cycle AC or 117 volts DC power supply.

The tubes used are:—

- | | | | |
|----------|----------------------|----------|----------------------|
| 1—12SA7 | Oscillator Converter | 1—12SQ7 | AVC Detector and 1st |
| 1—12SK7 | I.F. Amplifier | | Audio |
| 1—35Z5GT | Power Rectifier | 1—50L6GT | Power Output |

This receiver covers the frequency range from 540 kilocycles to 1630 kilocycles (KC).

INSTALLATION

The loop antenna incorporated in the receiver is sufficient for all normal reception. If the receiver is to be used in very remote areas or in a building constructed mainly of steel, it may be necessary to use an external antenna. The antenna should be approximately fifty feet long, including lead in, and placed as far away from trees, buildings, etc., as possible. The lead in from the external antenna should be connected to the wire at the back of the receiver. An external ground is not necessary.

When using a DC power supply and after allowing sufficient time for the tubes to warm up the receiver does not operate, remove the line cord plug from the receptacle and reverse. Replace the plug in the reversed position and allow tubes to warm up at which time the receiver will operate.

If an excessive hum is noticed when operating from an AC power source, reverse the line cord plug to determine which position gives the best results.

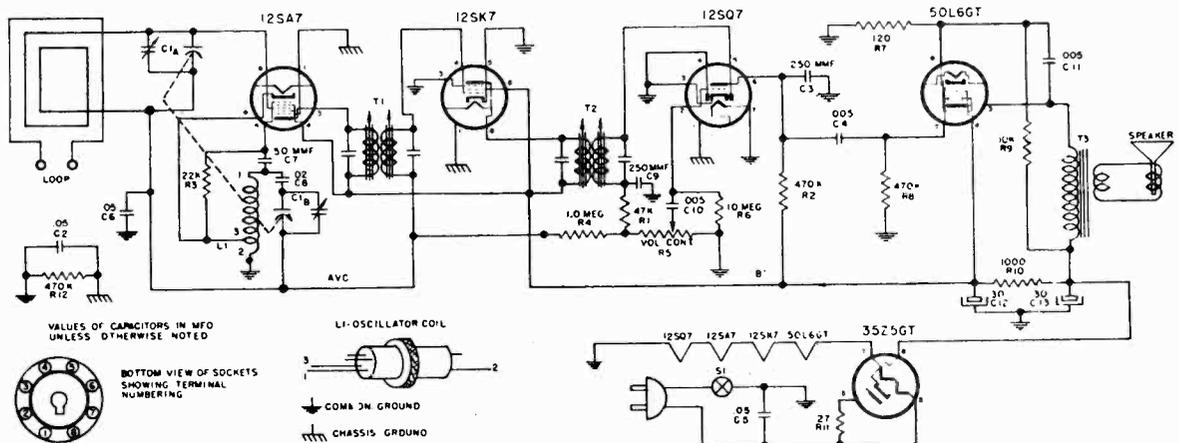

NOTE: All loop antennas are somewhat directional in their characteristics.

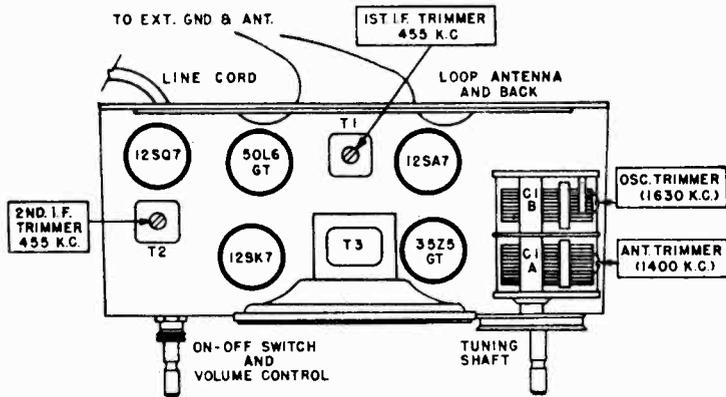

Reception can sometimes be improved and/or local interference reduced by turning the set in a different direction.

OPERATION

To turn the receiver on, rotate the on-off switch and volume control knob (left hand control) clockwise about one-half its range. This supplies power to the receiver. Allow about thirty seconds for the tubes to warm up after which the desired station may be tuned by rotating the station selector (right hand control).

For best tone, tune the desired station with the volume control turned low. This enables you to get the exact point where the station comes in best. Then, adjust the volume to the desired level with volume control.

ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milli-watts is .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final check.

CAUTION: This is an A.C.-D.C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the Receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

DESCRIPTION

This model is a 4 tube (plus rectifier) superheterodyne radio receiver designed for use on 117 volts 60 cycle AC or 117 volts DC power supply.

The tubes used are:—

- 1—12SA7 Oscillator Converter 1—12SQ7 AVC Detector and 1st Audio
- 1—12SK7 I.F. Amplifier
- 1—35Z5GT Power Rectifier 1—50L6GT Power Output

This receiver covers the frequency range from 540 kilocycles to 1630 kilocycles (KC).

OPERATION

To turn the receiver on, rotate the on-off switch and volume control knob (left hand control) clockwise about one-half its range. This supplies power to the receiver. Allow about thirty seconds for the tubes to warm up after which the desired station may be tuned by rotating the station selector (right hand control).

For best tone, tune the desired station with the volume control turned low. This enables you to get the exact point where the station comes in best. Then, adjust the volume to the desired level with volume control.

ALIGNMENT PROCEDURE

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

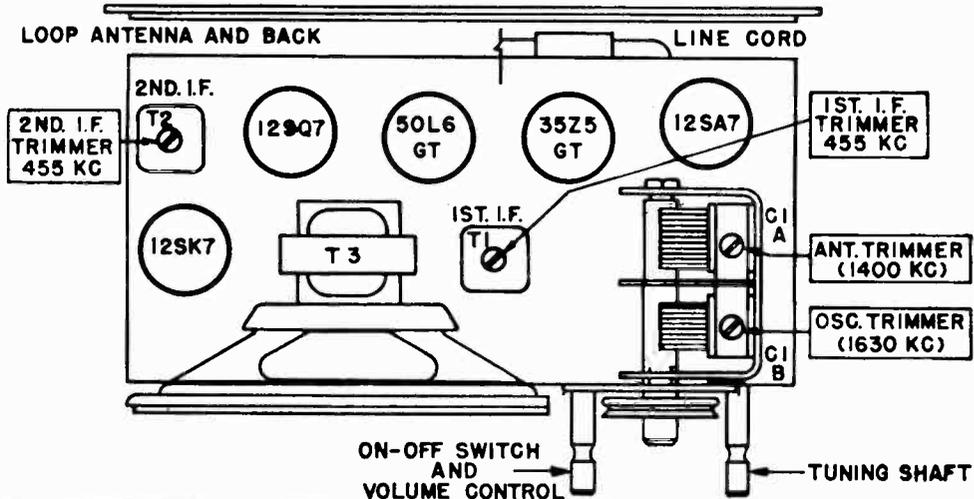

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milli-watts is .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final check

CAUTION: This is an A.C.-D.C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the Receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

Tune in signal from generator	1400 KC		Loosely coupled to loop antenna	C1A	Antenna

*Connect ground lead of signal generator to common negative.

DESCRIPTION

Model 11611 is a 4-tube superheterodyne portable receiver designed for operation on a 117 volt 50-60 cycle, 117 volt DC power supply or from a self-contained battery.

This receiver covers the frequency range from 535 kilocycles to 1600 kilocycles (K.C.).

- The tubes used are:—
- 1R5—Mixer, Oscillator
- 1U4—I. F. Amplifier
- 1S5—Detector and first Audio
- 3Q4—Power Output

No rectifier tube is required as a Selenium rectifier is used when operating on A. C. current.

INSTALLATION

The radio is shipped from the factory minus the battery. One combination A. B. Battery Pack is required, having 90 volts "B" and 7½ volts "A," such as Ray-o-vac No. AB-994, General No. 60A6F6/5, Burgess No. D5A60 or Eveready No. 753.

To install the battery remove the back from the cabinet, place the battery in the space provided and insert the battery plug into the socket.

The battery A-C switch, located on the top right side of the chassis, is accessible from the rear of the cabinet after removing the back. For battery operation this switch should be turned so that the extended portion of the knob is over the A. C. socket, thereby making it impossible to connect the radio to A. C. current without setting the change-over switch in its proper position. The set is now ready for operation from its self-contained Battery.

To operate the receiver from 117 volts A. C. or D. C., turn the battery A. C. switch away from the A. C. socket. Remove the A. C. cord from its brackets on the cabinet back and insert the plug into the A. C. socket, placing the plug on the other end of the cord into the wall receptacle. The receiver is now ready for operation on 117 volts A. C. or D. C. current.

ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A. V. C. action from interfering with correct alignment.

With the output meter connect across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final check.

CAUTION: This is an A.C.-D. C. receiver and if alignment is made with the receiver connected to 117 volts A. C. or D. C., it is necessary to isolate the signal generator or the receiver from the line by use of a transformer, or place a .2 M. F. D. condenser in both test leads of the Signal Generator.

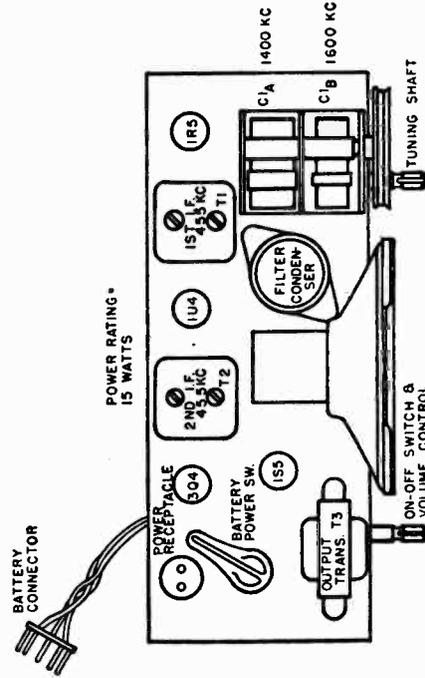

ALIGNMENT PROCEDURE
(Continued)

Position of Variable	Generator Frequency	Dummy Ant. Mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	455 KC	.1	*1R5 Grid (Stator of CIA)	T2	Output I. F.
Fully open	455 KC	.1	*1R5 Grid (Stator of CIA)	T1	Input I. F.
Fully open	1600 KC	.00025	**Ant. lead (Stapled to Cabinet)	C1B	Oscillator
Tune in signal from generator	1400 KC	.00025	**Ant. lead (Stapled to Cabinet)	C1A	Antenna

*Connect ground lead of signal generator to Common "B."

**Connect ground lead of signal generator to ground wire stapled to cabinet.

If it should become necessary to re-adjust the loop antenna loading coil tune in a weak station, between 600 and 650 kilocycles, and adjust for maximum output.

	C10-475	Alternate I. F. Transformer May be used as 1st or 2nd I. F. Transformer

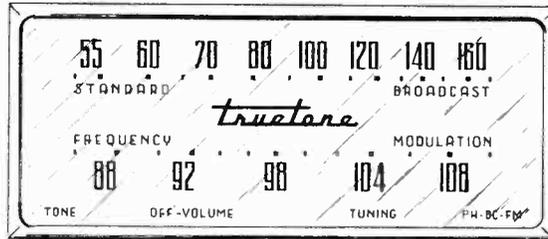

CHECK YOUR LINE VOLTAGE

Unless otherwise marked this radio must be operated on a supply of 105-125 volts AC, 60 cycles only. Do not connect the radio to a wall outlet unless

certain that the power supply is correct for the receiver. If in doubt, telephone your local power company before inserting the plug. Radios of this model which are to be used on other power supplies are marked accordingly.

FM BAND

88 - 108 MEGACYCLES — This band is calibrated in megacycles and covers the newly allocated frequency modulation band of 88-108 megacycles. Reception in this band is usually limited to "line of sight" distances between the transmitting and receiving antennas. This is normally up to about 30 miles with approximately 45 miles being the extreme range.

BROADCAST BAND

540 - 1600 KILOCYCLES — This band is calibrated in channel numbers. To obtain the kilocycle number add a zero to the number on the dial scale.

TONE CONTROL

Use this knob to adjust the tone of the receiver. When turned clockwise the high notes will predominate and when turned counter-clockwise a deep bass effect will result.

BAND AND PHONO RADIO SWITCH

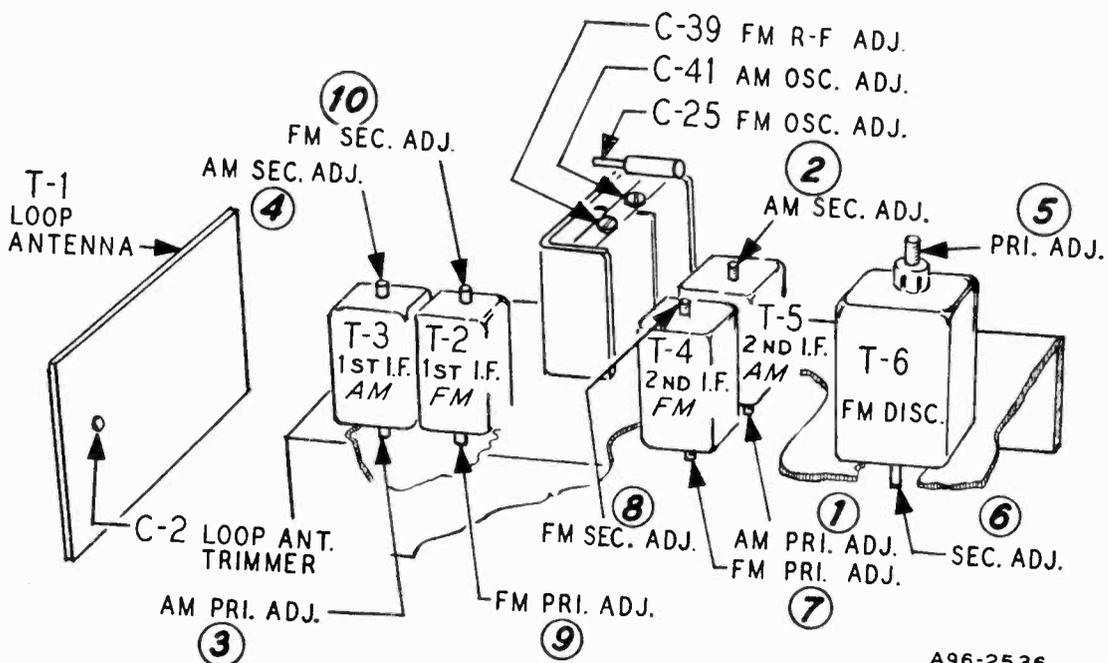

This control has three positions, FM, Broadcast and Phono. In the Phono position, the electrical circuits are connected for the reproduction of records played on the Automatic Record Changer.

ON-OFF SWITCH AND VOLUME CONTROL

The On-Off switch and Volume control are operated by the same knob. To turn the radio on, turn the knob clockwise until a click is heard. Allow approximately 30 seconds for the tubes to heat. Then continue to turn the knob clockwise to increase the volume.

TUNING KNOB

Use this control to tune in the desired station. Turn the knob until the station is heard. Then slowly rotate it back and forth until the signal is clearest and strongest. If signal is too strong, reduce it by means of the volume control, not by using the tuning knob.

Frequency modulation 88-108 MC

DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed! Then install the string as shown, winding three turns counter-clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.

ALIGNMENT PROCEDURES AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR		GANG CONDENSER SETTING		ADJUST FOR	
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	ADJUST	ADJUST FOR
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	2nd I.F. Pri. (1) and Sec. (2)	Maximum Output

1400 KC	External Antenna Lead	50 mmf	Chassis Base	Antenna C-2	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).

Allow chassis and signal generator to "Heat Up" for several minutes.

FM ALIGNMENT NOTES

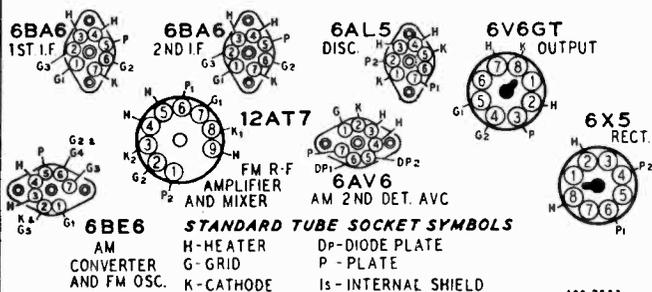

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the

27 K ohm resistor (R-10) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—AM I-F coils must be aligned before attempting to align the FM I-F coils.

NOTE D—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

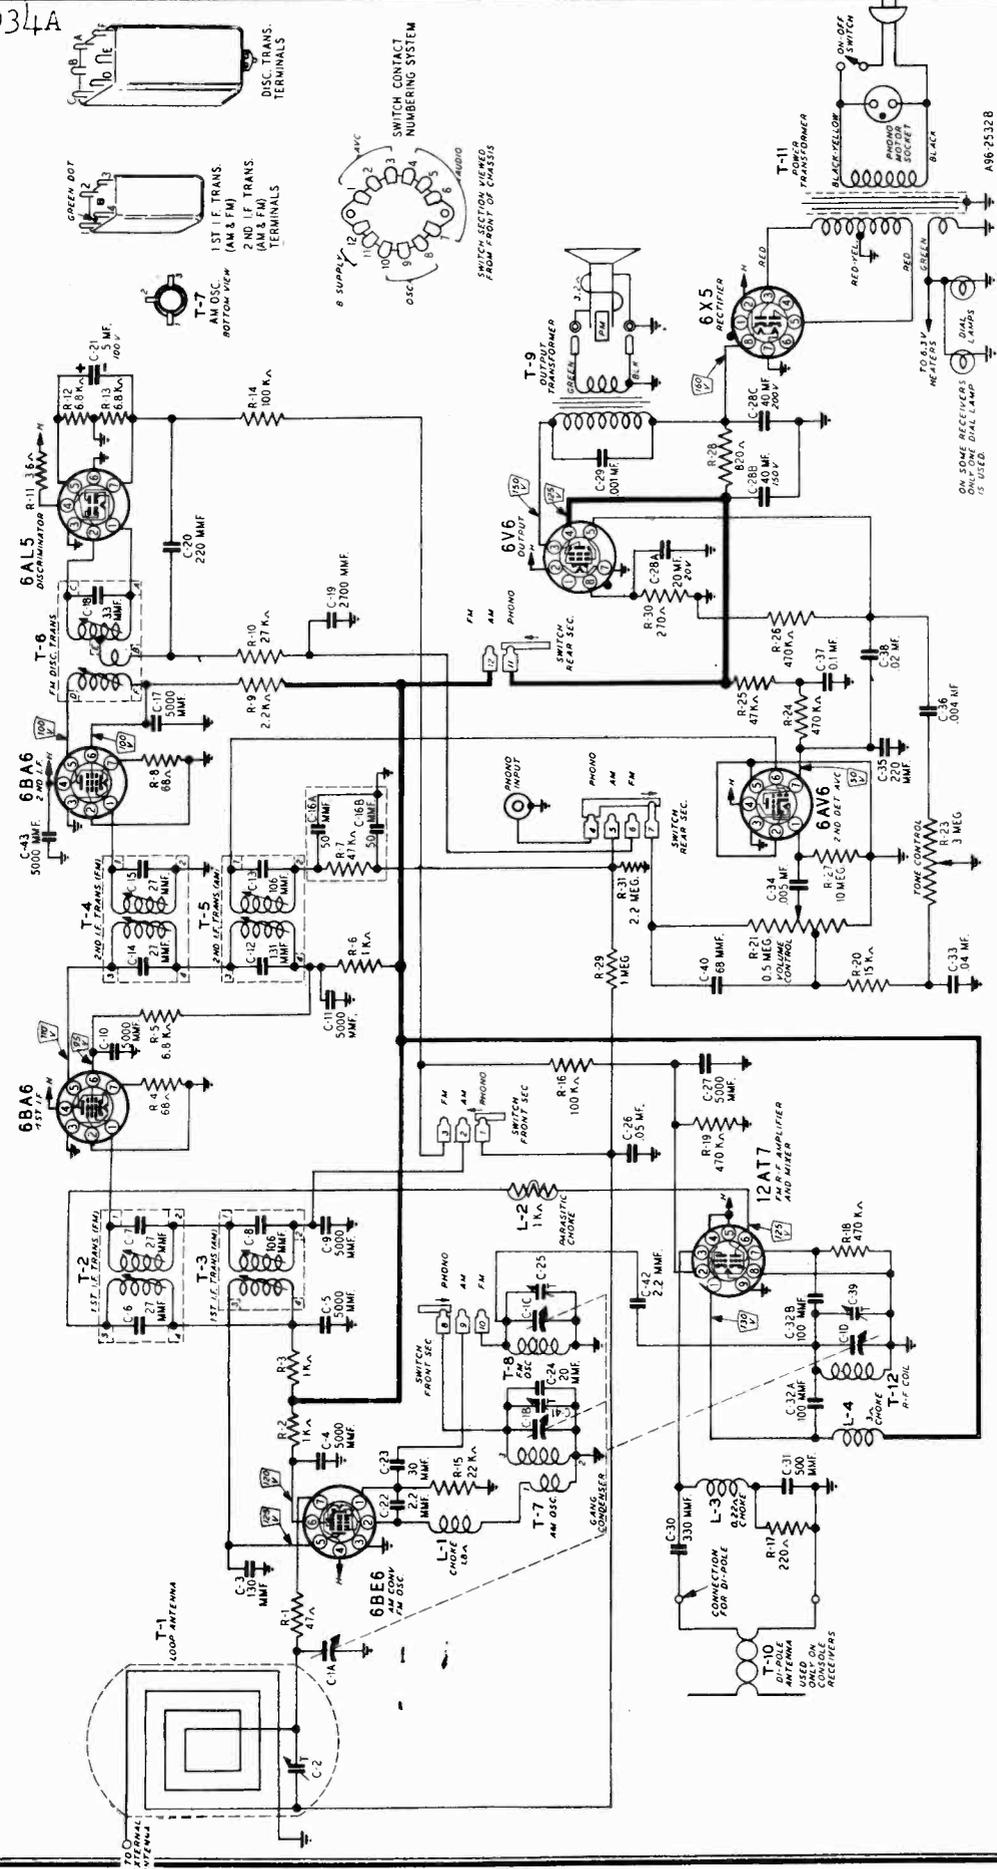

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube voltmeter. Conditions of measurement are:

Line voltage117 Volts AC
 Signal InputNone
 A Variation of ±10% is usually permissible.

MODEL D1034A

RECORD CHANGER: Gen. Instr. Model 700F, See pages, RCD.CH.19-1,2 to RCD.CH.19-9.

REPLACEMENT PARTS LIST

NOTICE: There is a model number label on the chassis. This label identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information on this label.

	*Needle only

*When ordering needles, specify part number and letter stamped on Cartridge.

MODEL D1046A

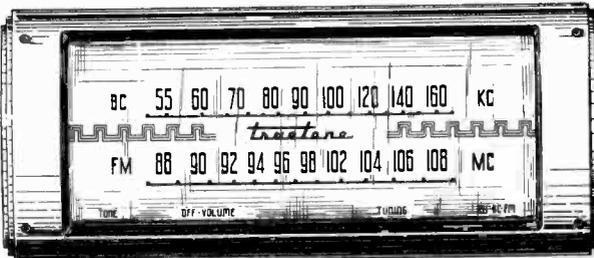

CHECK YOUR LINE VOLTAGE

Unless otherwise marked this radio must be operated on a supply of 105-125 volts AC, 60 cycles only. Do not connect the radio to a wall outlet unless

certain that the power supply is correct for the receiver. If in doubt, telephone your local power company before inserting the plug. Radios of this model which are to be used on other power supplies are marked accordingly.

FM BAND

88 - 108 MEGACYCLES — This band is calibrated in megacycles and covers the newly allocated frequency modulation band of 88-108 megacycles. Reception in this band is usually limited to "line of sight" distances between the transmitting and receiving antennas. This is normally up to about 30 miles with approximately 45 miles being the extreme range.

BROADCAST BAND

540 - 1600 KILOCYCLES — This band is calibrated in channel numbers. To obtain the kilocycle number add a zero to the number on the dial scale.

TONE CONTROL

Use this knob to adjust the tone of the receiver. When turned clockwise the high notes will predominate and when turned counter-clockwise a deep bass effect will result.

ON-OFF SWITCH AND VOLUME CONTROL

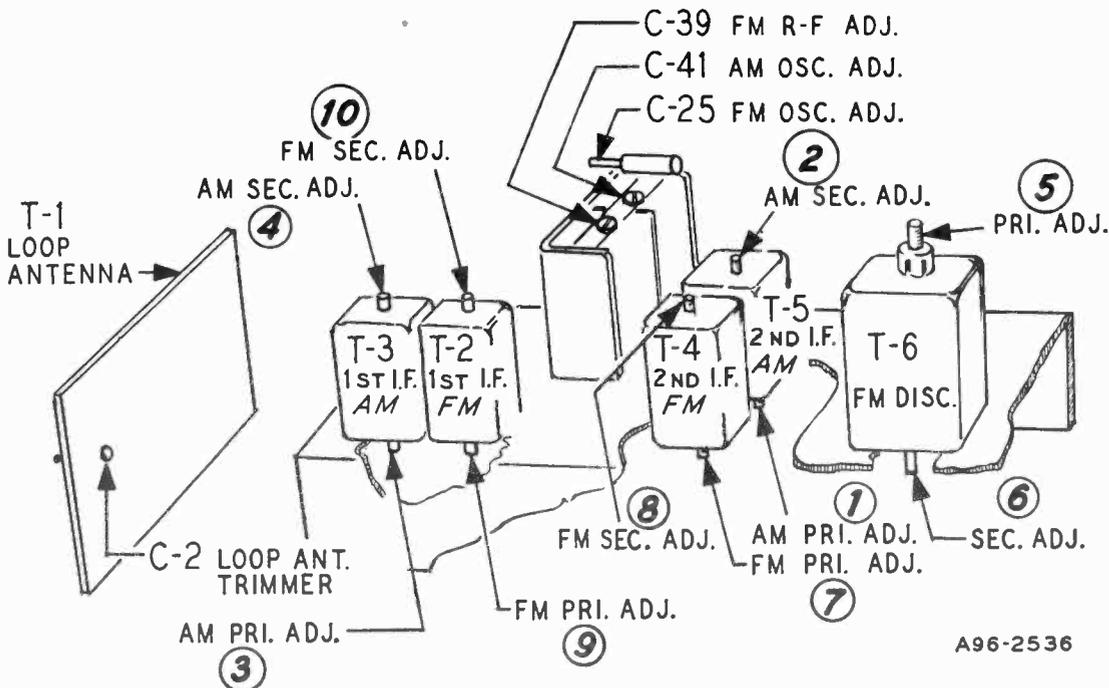

The On-Off switch and Volume control are operated by the same knob. To turn the radio on, turn the knob clockwise until a click is heard. Allow approximately 30 seconds for the tubes to heat. Then continue to turn the knob clockwise to increase the volume.

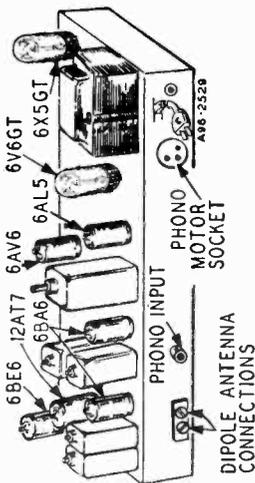

BAND AND PHONO RADIO SWITCH

This control has three positions, FM, Broadcast and Phono. In the Phono position, the electrical circuits are connected for the reproduction of records played on the Automatic Record Changer.

TUNING KNOB

Use this control to tune in the desired station. Turn the knob until the station is heard. Then slowly rotate it back and forth until the signal is clearest and strongest. If signal is too strong, reduce it by means of the volume control, not by using the tuning knob.

ELECTRICAL SPECIFICATIONS

Intermediate Frequency—
AM 455 KC — FM 10.7 MC

Power Output—
117 volts AC—40 watts
60 watts phono operating

Selectivity — AM — 45 KC broad
at 1000 times signal, measured
at 1000 KC

Power Output—
1.9 watts maximum
.8 watts 10% distortion

I.F. FM—200 KC broad at 2 times
down
I.F. FM—950 KC broad at 200
times down

Speaker—8 inch PM dynamic

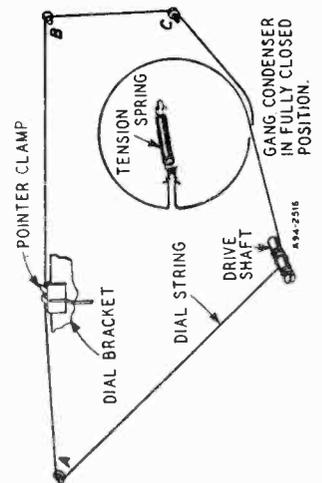

AM Sensitivity—(For .5 watt output
with external antenna)
25 microvolts average

Frequency Ranges—
Broadcast 540-1600 KC
Frequency modulation 88-108 MC

FM Sensitivity—(For .5 watt output)
25 microvolts average

DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns counter-clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.

ALIGNMENT PROCEDURES AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR		GANG CONDENSER SETTING		ADJUST FOR

				Maximum Output
				Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

MODEL D1046A

FM STAGES

The following is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).

Allow chassis and signal generator to "Heat Up" for several minutes.

RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the

27 K ohm resistor (R-10) and its junction with the terminal strip. Adjust for zero voltage indication.

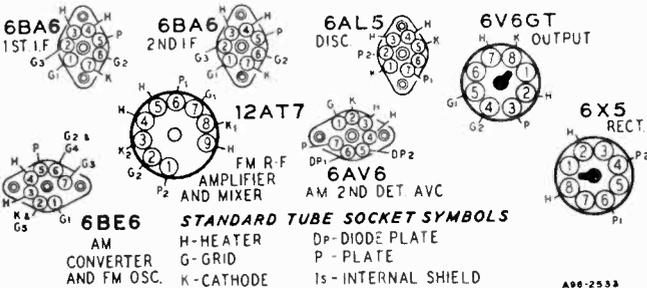

NOTE C—AM I-F coils must be aligned before attempting to align the FM I-F coils.

NOTE D—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

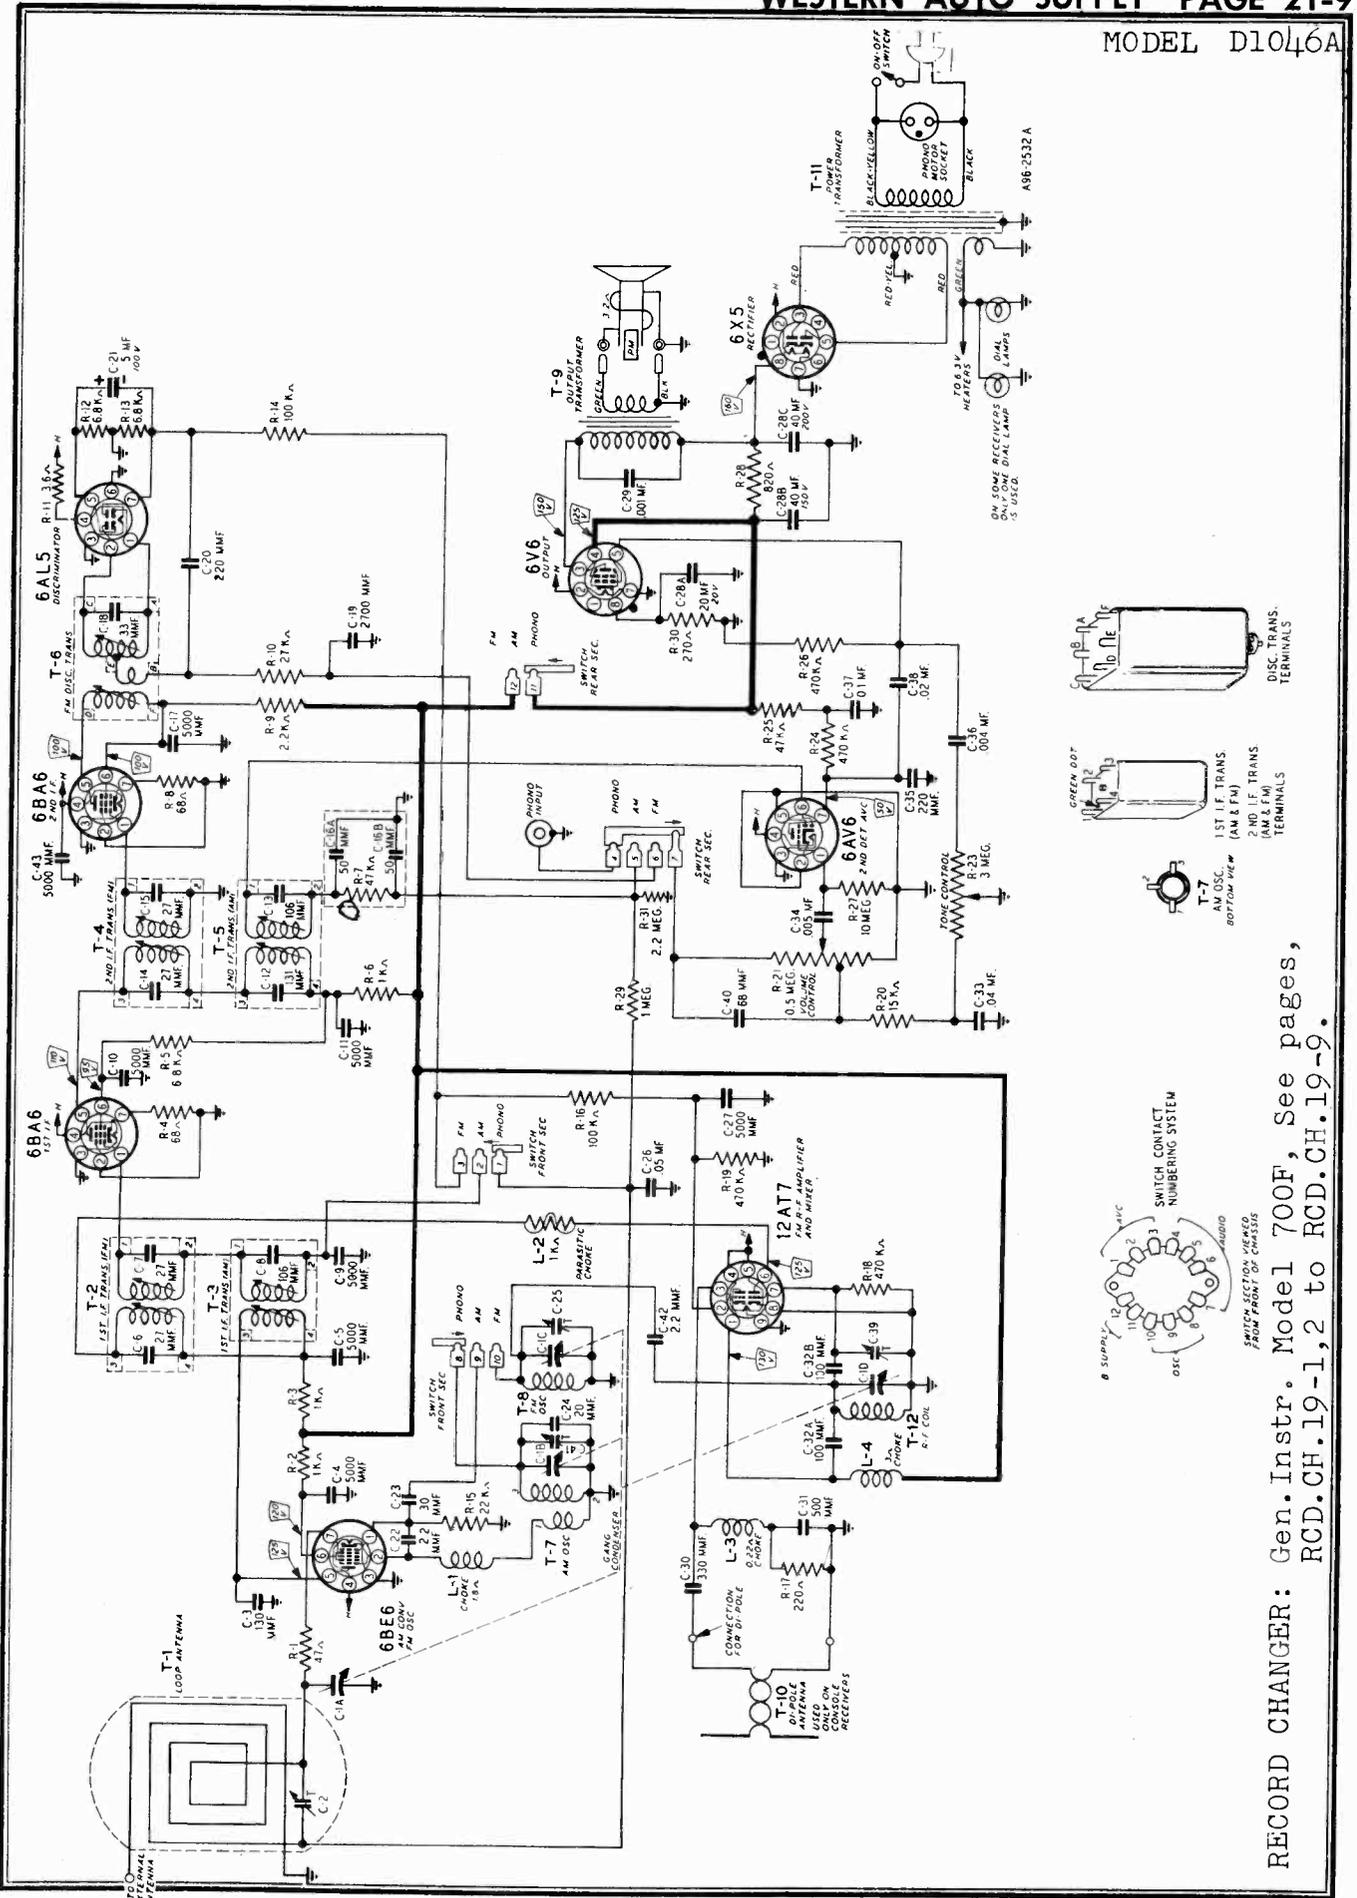

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage117 Volts AC
Signal InputNone
A Variation of ±10% is usually permissible.

1400 KC	External Antenna Clip On Loop	Chassis	50 mmf.	Tune Receiver to 1400 KC.	Antenna (C-3) Trimmer

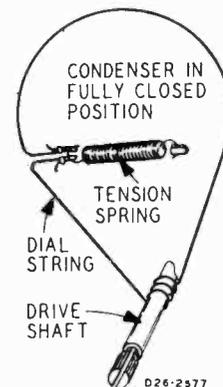

SPECIFICATIONS

6 Tube Superheterodyne, including Rectifier Tube. Intermediate Frequency 455 KC
Tuning Frequency Range 540 to 1600 KC Sensitivity 10 Microvolts Average
Power Consumption 35 watts (At 117 volts AC) Selectivity 50 KC Wide at 1000 Times Signal
Power Output. . 1.5 watt maximum, .9 watt (10% distortion) Speaker 5 1/4" PM Dynamic

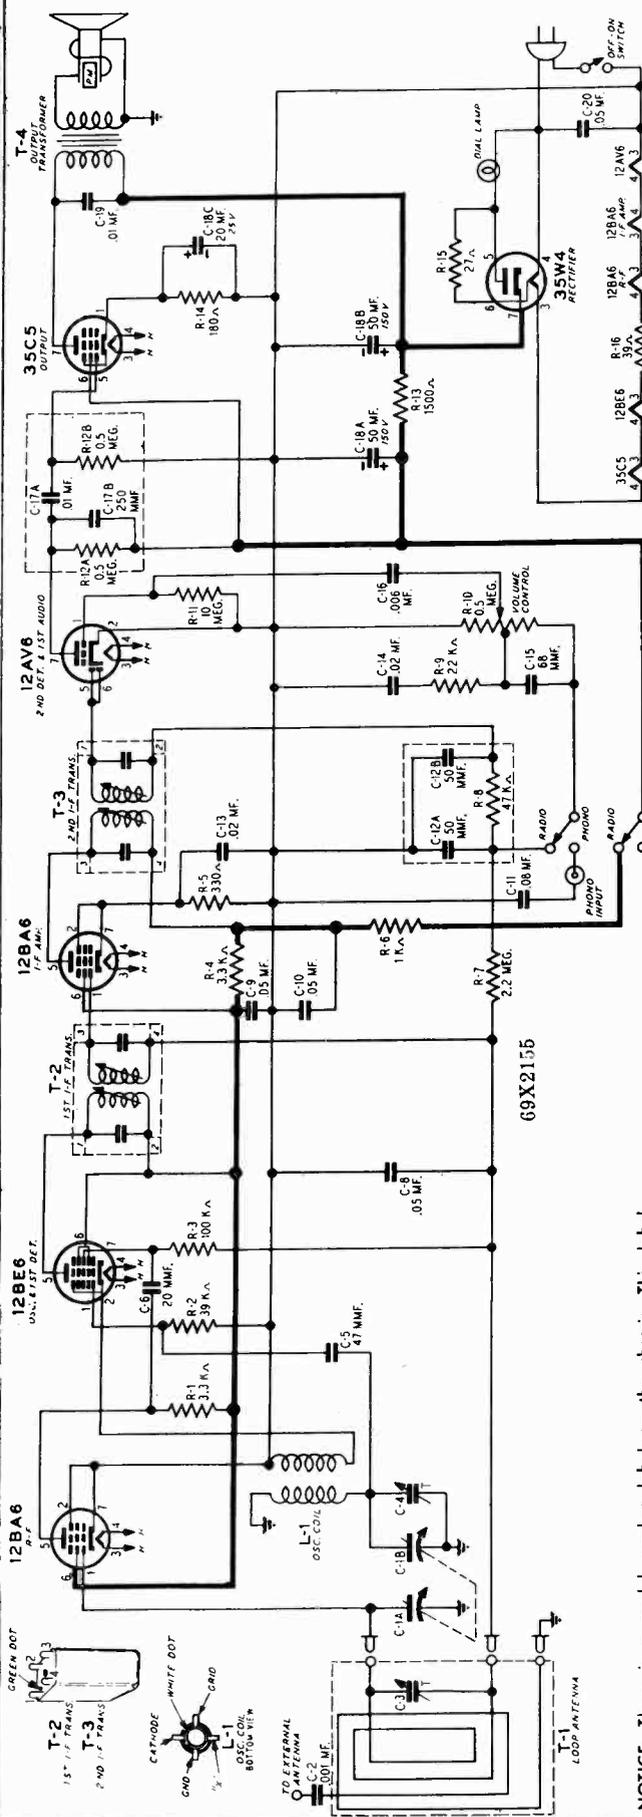

DRIVE CORD REPLACEMENT

Turn the large drive pulley to the fully closed position. Use a new 10x75 drive cord assembly or a piece of cord 15 inches long and fasten one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind 2 3/4 turns counterclockwise around the tuning shaft with the turns progressing toward the front of the chassis. After string is installed, stretch the tension spring and fasten free end of cord to spring.

TUBE SOCKET VOLTAGES

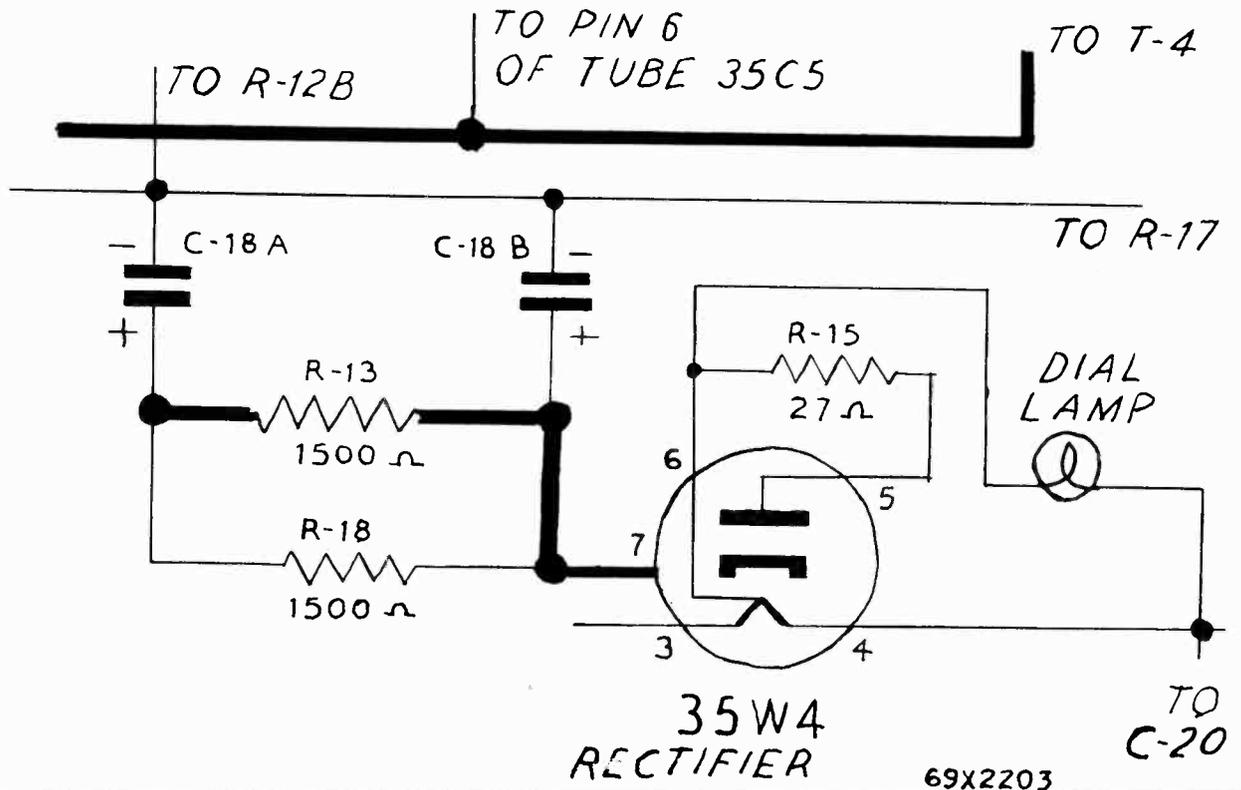

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

- Line voltage117 Volts AC
- Signal InputNone
- A Variation of $\pm 10\%$ is usually permissible.

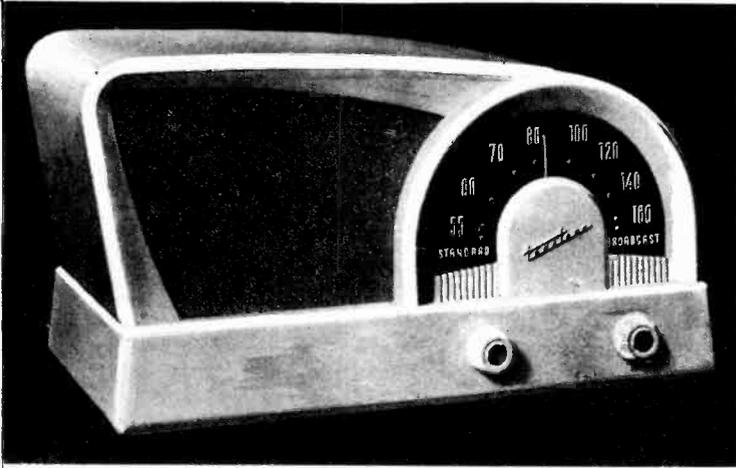

TRUETONE MODELS D2017 & D2018
ISSUE "A"

The circuit of the 35W4 rectifier tube has been modified to reduce hum and to lengthen the life of the pilot light lamp. A 1500 ohm resistor R-18 was also added to the circuit. A partial schematic incorporating these changes is shown below. Due to these changes the voltage reading on Pin #7 of the 35C5 output tube now reads 97 volts instead of 104 volts as shown on the bottom socket voltage chart.

MODELS D2017B, D2018B

ON-OFF SWITCH AND VOLUME CONTROL

TUNING KNOB

Turn until the desired station is heard. Then slowly rotate the knob back and forth until the signal is clearest and strongest. If signal is too strong, reduce it by means of the volume control, not by using the tuning knob.

Turn radio on by turning knob to the right. A click will be heard—allow approximately 30 seconds for tubes to heat. Continue to turn the knob to the right until the desired volume level is obtained. To turn radio off, turn knob to left until click is heard.

GENERAL INFORMATION

ANTENNA

A Stratoscope Loop Antenna is built on the chassis of this radio. For reception of stations no other antenna or ground is required.

When operating the radio with the built-in loop aerial, directional effects are obtained. Better reception of distant stations and reduction of local interference may be obtained by rotating the radio until the desired signal is at a maximum.

TUBES AND DIAL LAMP

The type designation of each tube is stamped on both the tube and the radio chassis base. The correct position in which each tube must be installed is also shown in the tube position illustration.

All tubes and the dial lamp must be in their sockets to operate the radio.

CAUTION—If the dial lamp burns out do not operate the receiver until after the lamp is replaced, as rectifier

tube failure may result. Use **ONLY** a number 47 dial lamp. To remove the dial lamp, push lamp into socket, turn slightly counterclockwise and withdraw from socket.

The tubes in the radio should be checked periodically by taking them out and having them tested. To reach the tubes for servicing, remove the cabinet back from the rear of the receiver. See instructions on cabinet back.

Be sure receiver is turned OFF when checking or replacing tubes, or damage to the receiver may result.

When replacing the tubes, be sure that they are inserted in the proper sockets. To install a tube into a miniature type tube socket, line up the tube prongs with the holes in the socket and then gently push the tube down until it is held firmly in the socket.

Refasten the cabinet back in place before operating the radio.

IF THE RADIO FAILS TO OPERATE SATISFACTORILY

If, after rechecking the foregoing instructions carefully, the radio still does not appear to operate satisfactorily, proceed as follows:

FIRST—Check Phono-Radio Switch. If the radio does not operate after it has been on for a while, check the PHONO-RADIO switch at the rear of the chassis. For radio operation this switch must be in the RADIO position.

SECOND—Check Power Supply. Be sure there is power at the convenience outlet to which the radio is connected. To determine this, connect a lamp to the outlet and see whether or not the lamp lights.

Check the voltage of the power supply with that shown on the power rating notice on the cabinet back. If the supply is AC, also check the frequency (cycles) on the power rating notice. If there is any doubt concerning the power supply, withdraw the plug from the outlet and consult the local power company before reinserting the plug.

When used on a DC line, if the set does not operate after one minute, reverse the plug.

THIRD — Check Tube Positions. See that the tubes are in the correct sockets as shown in the illustration.

CHECK YOUR LINE VOLTAGE

Unless otherwise marked, this radio must be operated on a power supply of 105-125 volts AC, 50 to 60 cycles only, or 105-125 volts DC. Do not connect the radio to the power source until certain that the power supply is correct for the receiver. If in doubt, telephone your local power company before connecting the receiver.

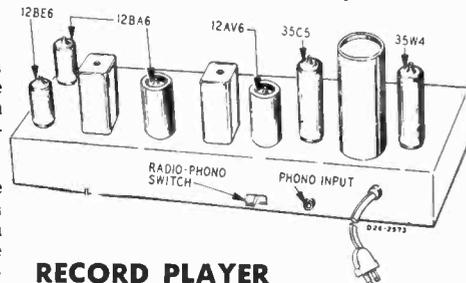

If there appears to be excessive hum when using the radio on AC, reverse the plug. Leave the plug inserted the way which gives the least hum.

When operating the receiver on a DC power supply, if it does not operate within one minute after it is turned on, reverse the power plug in the proper supply outlet.

DIAL SCALE

540 to 1600 Kilocycles

The dial scale is calibrated in channel numbers. To convert these channel numbers to kilocycles add a zero to the dial number. Thus when the dial pointer is at 100 on the dial, the radio is tuned to 1000 kilocycles.

RECORD PLAYER CONNECTION AND PHONO-RADIO SWITCH

This receiver has a PHONO socket located at the rear of the chassis. When it is desired to play records through the radio, insert the connector on the cable of any standard record player or changer into this socket. Then, push the PHONO-RADIO switch to PHONO and use volume control to adjust the sound level.

NOTE—Be sure to push the PHONO-RADIO switch back to the RADIO position when through playing records otherwise the radio will not operate.

Make certain that the tubes are operating. (Glass tubes will light very dimly.)

FOURTH—Test Tubes. Remove the tubes from the radio, take them to your local radio dealer and have them tested either by means of a tube tester or by inserting them in a radio that is operating satisfactorily.

FIFTH—Service. If the radio does not function properly after the above procedure has been followed and the tubes have been tested, get in touch with the dealer from whom the radio was purchased or call in a competent radio technician.

SERVICE DATA

ALIGNMENT PROCEDURE

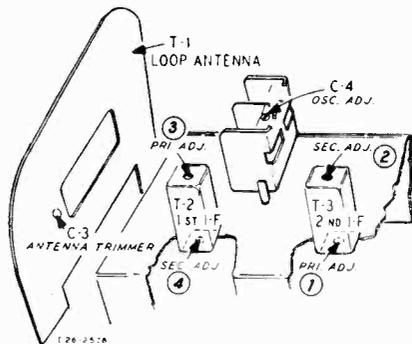

The following equipment is required for aligning:
Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter: Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf.
Volume Control—Maximum All Adjustments.
Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

FREQUENCY SETTING	SIGNAL GENERATOR ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TUNING SLUGS (I-F) AND TRIMMERS TO MAXIMUM
455 KC	Control Grid 12BA6—1.F. Prong No. 1	"X" Point	.1 mf.	Turn Rotor to full open	2nd I.F. Pri. (1) & Sec. (2)
455 KC	Control Grid 12BE6—1st Det. Prong No. 7	"X" Point	.1 mf.	Turn Rotor to full open	1st I.F. Pri. (3) & Sec. (4)

SPECIFICATIONS

6 Tube Superheterodyne, including Rectifier Tube.	Intermediate Frequency	455 KC	
Tuning Frequency Range	540 to 1600 KC	Sensitivity	10 Microvolts Average
Power Consumption	.35 watts (At 117 volts AC)	Selectivity	50 KC Wide at 1000 Times Signal
Power Output	1.5 watt maximum, .9 watt (10% distortion)	Speaker	5 1/4" PM Dynamic

DRIVE CORD REPLACEMENT

Turn the large drive pulley to the fully closed position. Use a new 10x78 drive cord assembly or a piece of cord 16 inches long and fasten one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind 2 3/4 turns counterclockwise around the tuning shaft with the turns progressing toward the front of the chassis. After string is installed, stretch the tension spring and fasten free end of cord to spring.

REPLACEMENT PARTS LIST

NOTICE: There is a model number label on the chassis. This label identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

MODELS D2017B, D2018B

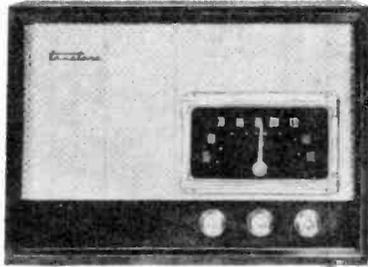

TUBE SOCKET VOLTAGES

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and "X" point. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

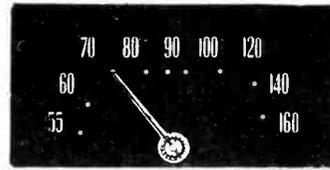

- Line voltage117 Volts AC
- Signal InputNone
- A Variation of $\pm 10\%$ is usually permissible.

HOW TO OPERATE THE CONTROLS

THE DIAL SCALE
is calibrated to cover frequencies between 540 Kc and 1600 Kc. Add a zero to the dial number to obtain the frequency in kilocycles (Kc). Example: When pointer is set to 70, radio is tuned to 700 Kc. See your newspaper for frequencies of local stations.

TONE AND RADIO-PHONO SWITCH
Use to switch from radio to phonograph operation; also to select most pleasing tone. Four tone positions are provided, two for RADIO and two for PHONO. Starting with the extreme counter-clockwise setting and turning in a clockwise direction the four positions are as follows:

- Radio Bass
- Radio Treble
- Phono Treble
- Phono Bass

The Treble position gives widest tone range and the Bass setting accentuates low tones.

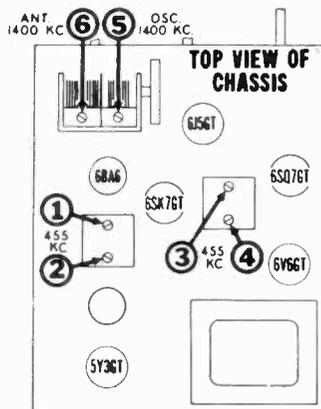

ON-OFF SWITCH AND VOLUME CONTROL
Turn this knob clockwise to turn set on. Continuing to turn clockwise will increase volume.

TUNING CONTROL
Use this control to tune receiver to the desired station.

ALIGNMENT PROCEDURE

1. With the gang condenser fully meshed, the dial pointer should be in a horizontal position at low end of dial, parallel to the bottom edge of dial scale. If it is set incorrectly, merely hold tuning control shaft steady and turn pointer to correct position.
2. Connect an output meter across the speaker voice coil or from the plate of the 6V6GT tube to chassis through a .1 Mfd. condenser.
3. Connect the ground lead of signal generator to the receiver chassis.
4. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIG. GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Lug on trimmer No. 6 on antenna section of gang (see figure below for location of trimmer).	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.

200 MMFD. Mica Condenser	External Antenna Clip	1400 KC	Tune to 1400 KC generator signal	6	Broadcast Antenna	Adjust for maximum output.

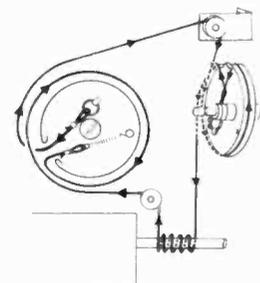

TRIMMER LOCATIONS

DIAL AND POINTER DRIVE CORD ARRANGEMENT SIDE VIEW

To string dial cord, set gang condenser to fully open position and use following parts:

- 114955 Clip on end of cord
- 117057 Cord (3 feet)
- 119087 Ring for dial cord
- 505161 Tension spring

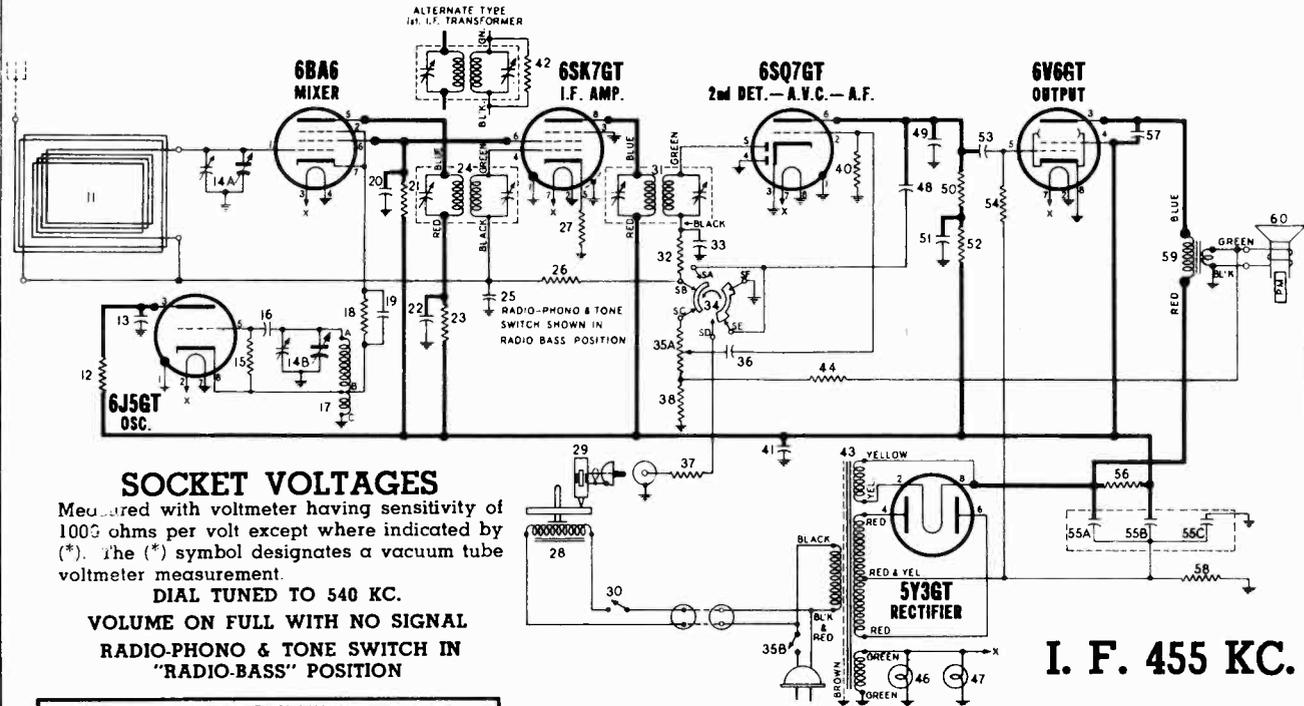

To replace and properly position pointer see step 1 in "Alignment Procedure" above.

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the speaker.

MODEL D2022

SOCKET VOLTAGES

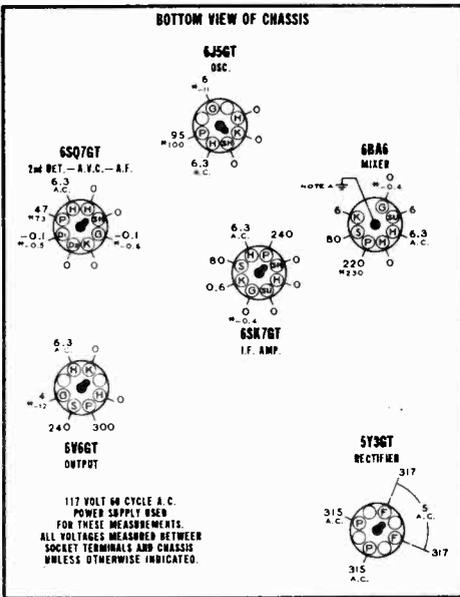

Measured with voltmeter having sensitivity of 100Ω ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

DIAL TUNED TO 540 KC.

VOLUME ON FULL WITH NO SIGNAL
RADIO-PHONO & TONE SWITCH IN
"RADIO-BASS" POSITION

I. F. 455 KC.

Lettered terminals in illustrations correspond to similarly lettered terminals on the circuit diagram

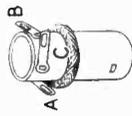

NOTE A: Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver may be measured with an A.C. Vacuum Tube Voltmeter or a "channel" type instrument containing a tuned and calibrated amplifier.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F. and I.F. stages are carefully and accurately aligned by utilizing the alignment procedure given above.
2. Connect Signal Generator as shown below.
3. The values of stage gain which are given here were measured with a fixed bias of 3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to A.V.C. at

4. Set Signal Generator for operation at 600 Kc with 400 cycle modulation and carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.
6. When using a "channel" type instrument, carefully tune it for maximum output at desired frequency before making measurements.

DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

MODEL D2027A

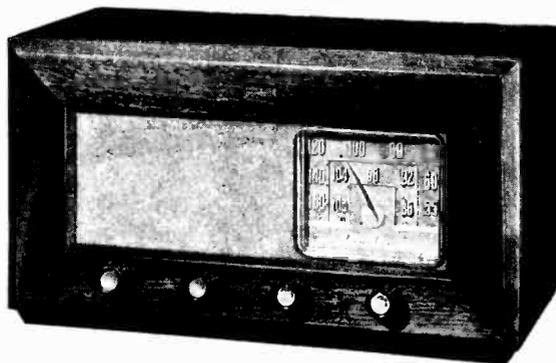

CHECK YOUR LINE VOLTAGE

Unless otherwise marked this radio must be operated on a supply of 105-125 volts AC, 50 to 60 cycles only. Do not connect the radio to a wall outlet unless

certain that the power supply is correct for the receiver. If in doubt, telephone your local power company before inserting the plug. Radios of this model which are to be used on other power supplies are marked accordingly.

FM BAND

88 - 108 MEGACYCLES — This band is calibrated in megacycles and covers the newly allocated frequency modulation band of 88-108 megacycles. Reception in this band is usually limited to "line of sight" distances between the transmitting and receiving antennas. This is normally up to about 30 miles with approximately 45 miles being the extreme range.

BROADCAST BAND

540 - 1600 KILOCYCLES — This band is calibrated in channel numbers. To obtain the kilocycle number add a zero to the number on the dial scale.

TONE CONTROL

Use this knob to adjust the tone of the receiver. When turned clockwise the high notes will predominate and when turned counter-clockwise a deep bass effect will result.

ON-OFF SWITCH AND VOLUME CONTROL

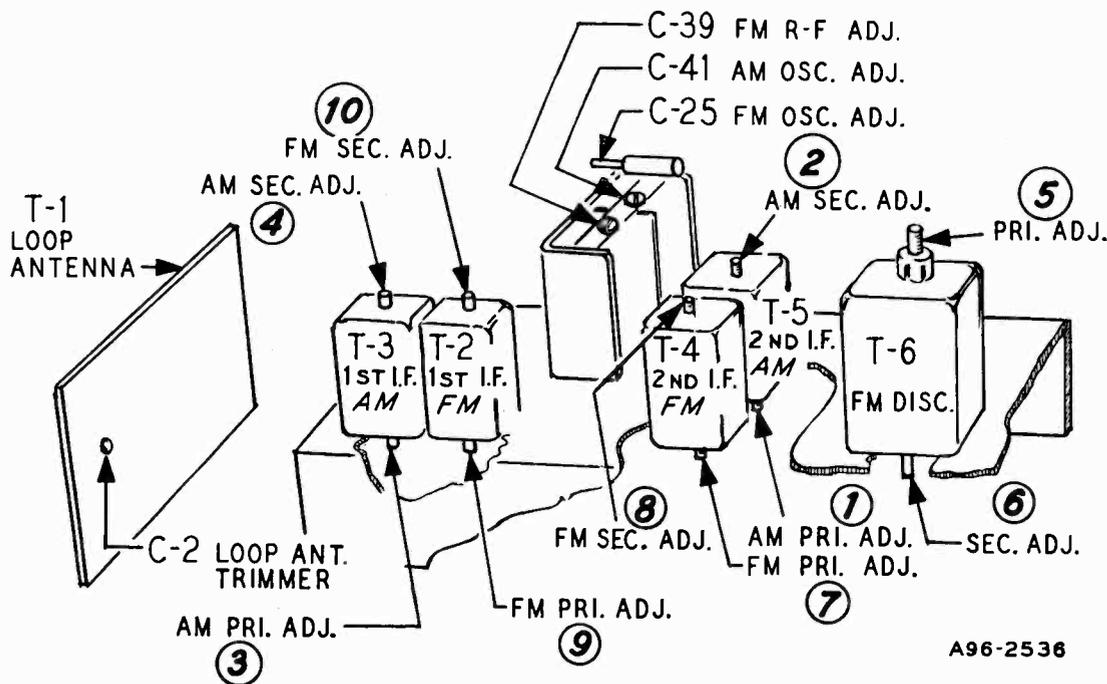

The On-Off switch and Volume control are operated by the same knob. To turn the radio on, turn the knob clockwise until a click is heard. Allow approximately 30 seconds for the tubes to heat. Then continue to turn the knob clockwise to increase the volume.

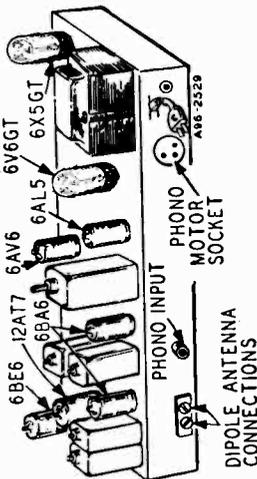

BAND AND PHONO RADIO SWITCH

This control has three positions, FM, Broadcast and Phono. In the Phono position, the electrical circuits are connected for the reproduction of records played on a record player. (See paragraph "Record Player Connection.")

TUNING KNOB

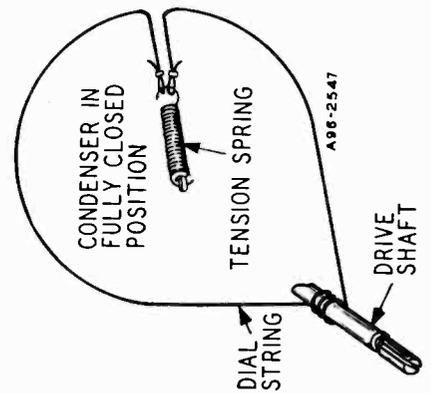

Use this control to tune in the desired station. Turn the knob until the station is heard. Then slowly rotate it back and forth until the signal is clearest and strongest. If signal is too strong, reduce it by means of the volume control, not by using the tuning knob.

DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns counter-clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.

Intermediate Frequency—
AM 455 KC — FM 10.7 MC

Selectivity — AM — 45 KC broad at 1000 times signal, measured at 1000 KC

I.F. FM—200 KC broad at 2 times down

I.F. FM—950 KC broad at 200 times down

AM Sensitivity—(For .5 watt output with external antenna) 50 microvolts average

FM Sensitivity—(For .5 watt output) 25 microvolts average

ELECTRICAL SPECIFICATIONS

Power Output—
117 volts AC—40 watts

Power Output—
1.9 watts maximum
.8 watts 10% distortion

Speaker—5¼ inch PM dynamic

Frequency Ranges—
Broadcast 540-1600 KC
Frequency modulation 88-108 MC

ALIGNMENT PROCEDURES AM STAGES

The following is required for aligning: An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed. Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR		GANG CONDENSER SETTING		ADJUST FOR	
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	ADJUST	ADJUST FOR
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	2nd I.F. Pri. (1) and Sec. (2)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	1st I.F. Pri. (3) and Sec. (4)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	2nd I.F. Pri. (1) and Sec. (2)	Maximum Output
1670 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Oscillator C-41	Maximum Output
1400 KC	External Antenna Clip	50 mmf	Chassis Base	Antenna C-2	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

MODEL D2027A

FM STAGES

The following is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).

Allow chassis and signal generator to "Heat Up" for several minutes.

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.

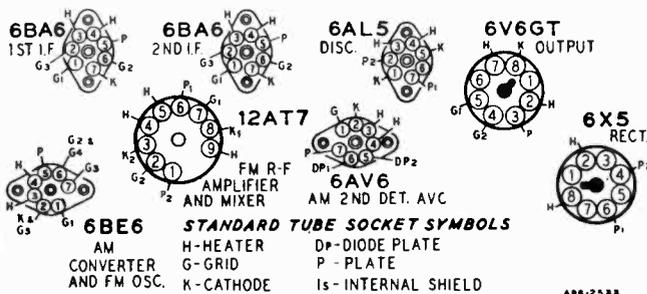

Note output voltage on the zero center DC vacuum tube voltmeter

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the

27 K ohm resistor (R-10) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—AM I-F coils must be aligned before attempting to align the FM I-F coils.

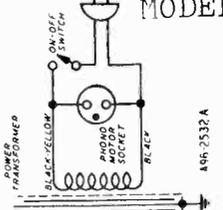

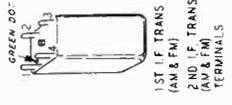

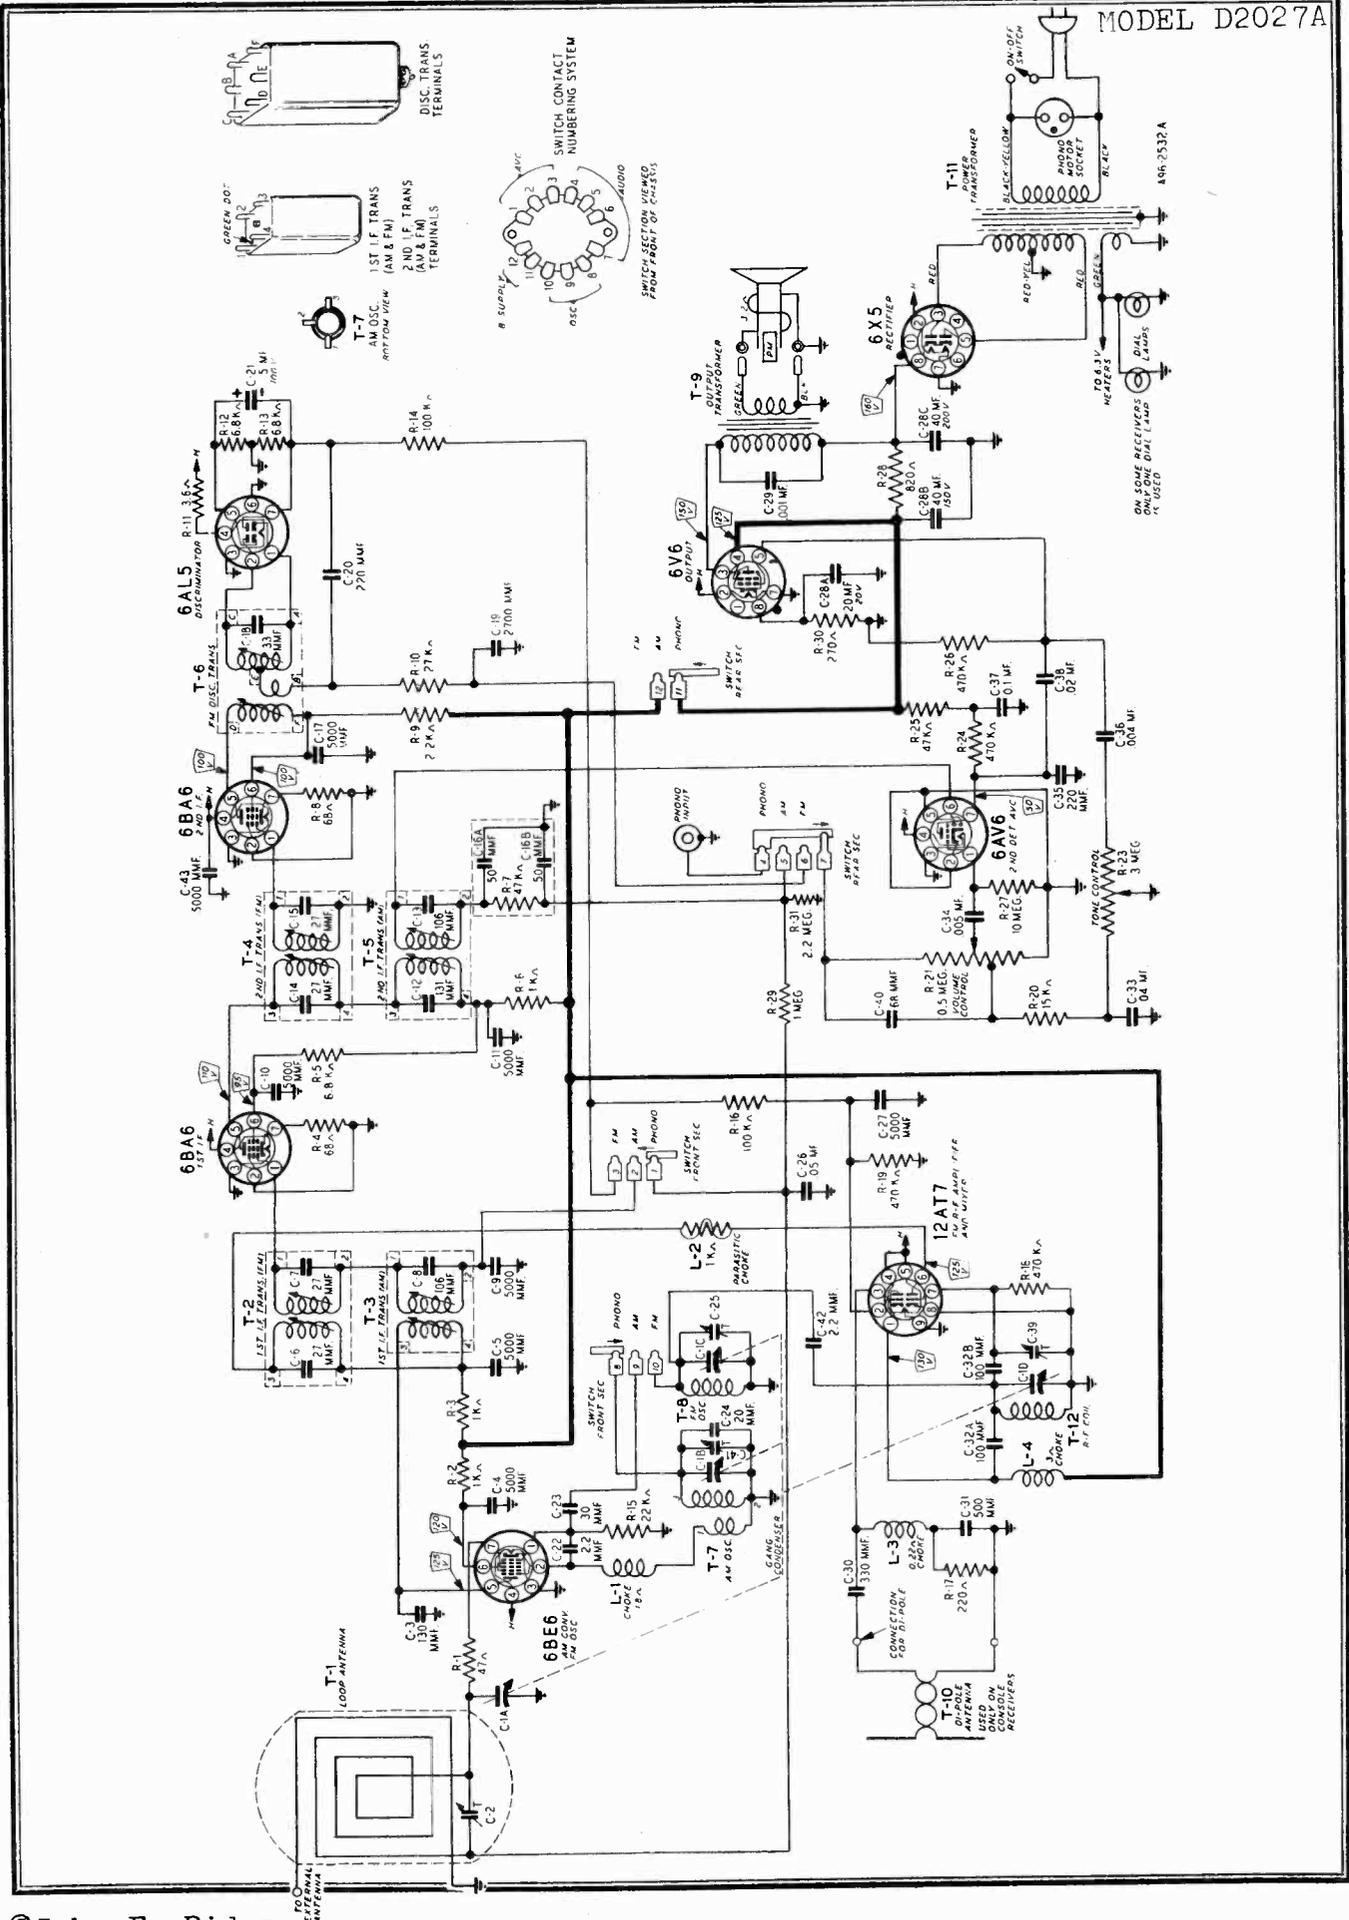

NOTE D—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give some output on the zero center DC vacuum tube voltmeter as in Note A.

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube voltmeter. Conditions of measurement are:

- Line voltage117 Volts AC
- Signal InputNone
- A Variation of ±10% is usually permissible.

ALIGNMENT PROCEDURE

ALIGNING INSTRUCTIONS

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given below in the order listed. After realignment has been completed repeat the procedure as a final check. For alignment points refer to Figure No. 2.

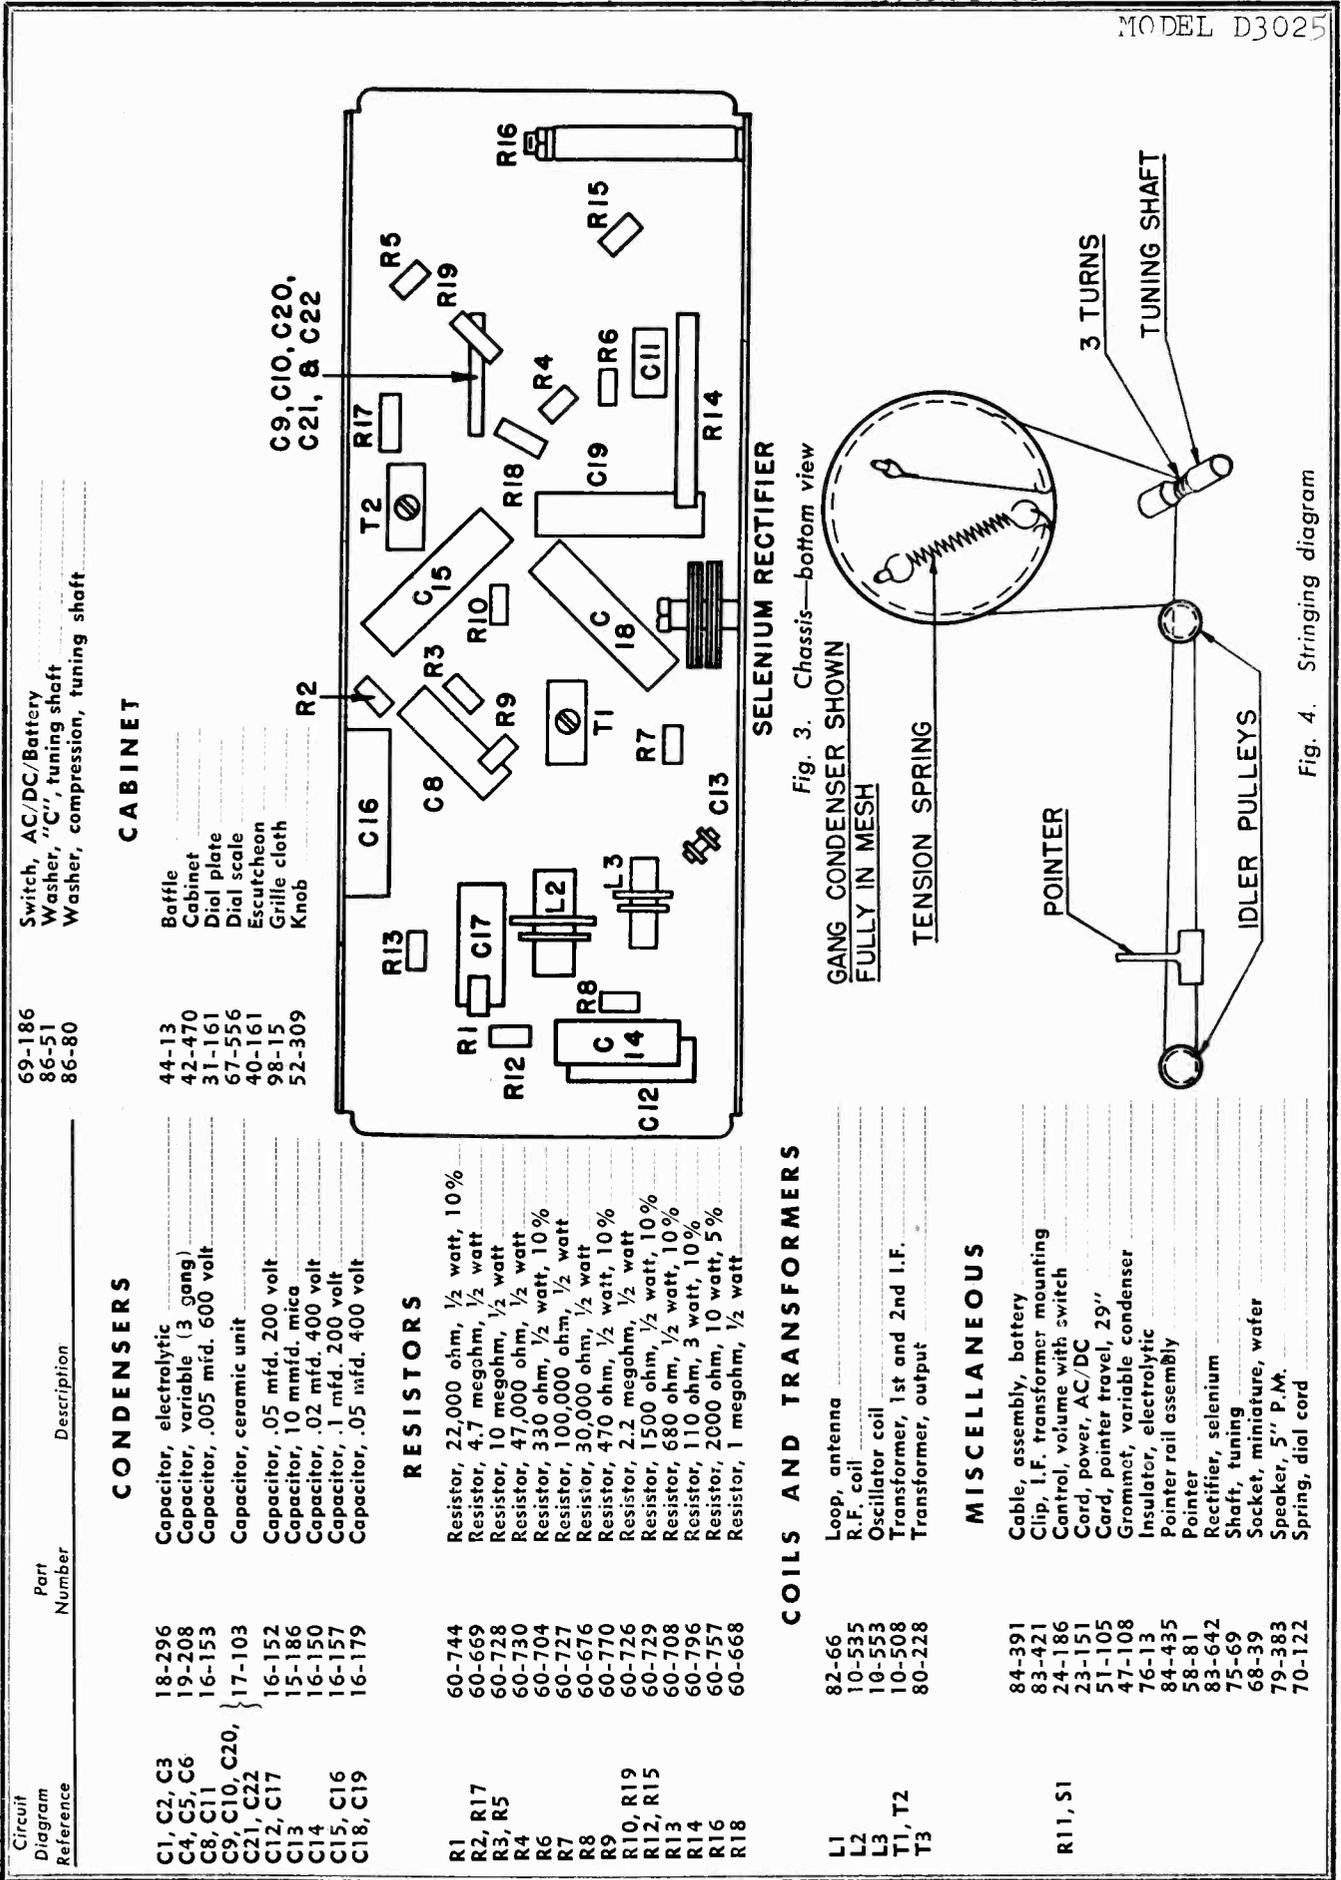

Volume control—Maximum: all adjustments.
 Connect ground lead of signal generator to common "B." negative.
 Connect dummy antenna in series with output lead of signal generator.
 Connect output meter across voice coil of speaker.

The following equipment is necessary for proper alignment:
 Signal generator that will provide the test frequencies as listed, 30% modulated, 400 c.p.s.
 Output meter.
 Non-metallic screwdriver.
 Dummy antenna—.1 mfd.

CAUTION: This is an AC-DC receiver and if alignment is made with the receiver connected to 117 volts AC or DC, it is necessary to isolate the signal generator or the receiver from the line by use of a transformer, or place a .2 M.F.D. condenser in both test leads of the Signal Generator.

Position of Tuner	Generator Freq.	Dummy Antenna	Generator Connection	Adjustments (in order shown)	Function
Min. Cap.	455 kc	0.1 mfd.	Pin #6 of 1U4 I-F Amp.	T2 (top and bottom)	I.F.
Min. Cap.	455 kc	0.1 mfd.	Pin #6 of 1R5 Conv.	T1 (top and bottom)	I.F.

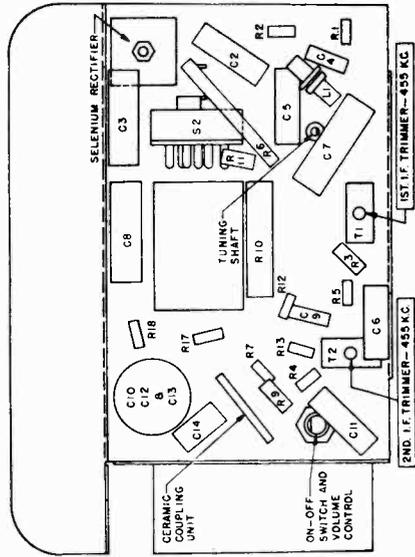

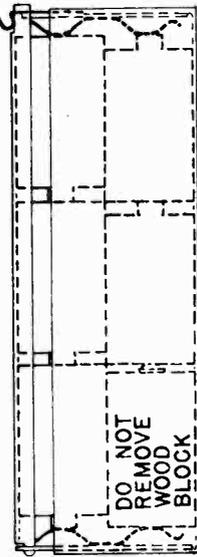

Fig. 3

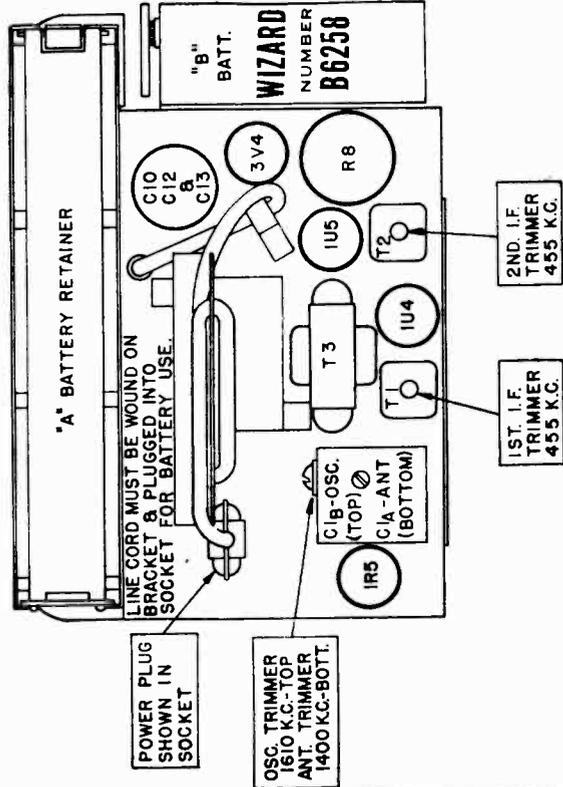

Fig. 2. Tube, Trimmer and Battery Locations

All voltages are measured from tube pin to common "B" negative with a 20,000 ohm per volt voltmeter.

Voltages shown in circles are obtained when set is operated on 117 volt current.

Voltages shown outside the circles are obtained when the set is operated on batteries. New batteries in good condition should be used for these measurements.

ALIGNMENT PROCEDURE

ALIGNING INSTRUCTIONS

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given below in the order listed. After realignment has been completed repeat the procedure as a final check. For alignment points refer to Figure No. 2.

Volume control—Maximum: all adjustments.
Connect ground lead of signal generator to common "B" negative.

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil of speaker.

The following equipment is necessary for proper alignment:
Signal generator that will provide the test frequencies as listed, 30% modulated, 400 c.p.s.

Output meter.

Non-metallic screwdriver.

Dummy antennas—.1 mfd., .00025 mfd.

CAUTION: This is an AC-DC receiver and if alignment is made with the receiver connected to 117 volts AC or DC, it is necessary to isolate the signal generator or the receiver from the line by use of a transformer, or place a .2 M.F.D. condenser in both test leads of the Signal Generator.

Position of Variable	Generator Frequency	Dummy Ant. Mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	455 KC	.1	* 1R5 Grid (Stator of C1A)	T2	Output I.F.
Fully open	455 KC	.1	* 1R5 Grid (Stator of C1A)	T1	Input I.F.

Tune in signal from generator	1400 KC	—	Loosely coupled to loop	C1A	Antenna

*Connect ground lead of signal generator to common "B" negative.

INSTALLATION

This radio comes to you complete with all hardware necessary for mounting, and also with a distributor suppressor, ammeter condenser and generator condenser. By referring to Figures 1 and 2, and following the instructions outlined below, you will find that it is very simple to install.

First determine where the receiver is to be mounted by holding it with the hands in the approximate location in the car. Using the front mounting bracket as a template, mark and drill two $\frac{3}{8}$ " holes in the instrument panel flange. Now secure the mounting bracket to the radio receiver with the screws provided, and then mount the front of the radio to the instrument panel, using the bolts, lock washers and nuts provided for this purpose. The back of the radio is supported by means of the rear mounting strap. The mounting strap should be formed to the correct angles, as illustrated in Figure 2, so that it can then be fastened to the fire wall. After marking and center-punching the fire wall at the correct location, drill with a $\frac{3}{8}$ " drill. The mounting strap is then secured to the radio and fastened to the fire wall of the car with the $\frac{1}{4}$ " bolt, lock washer and nut furnished with the receiver.

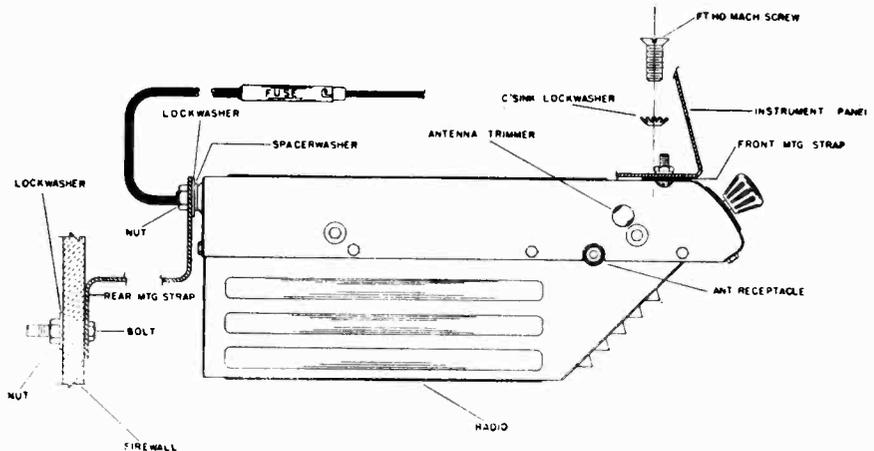

Fig. 2 Side View, Showing Mounting

CONNECTING THE RADIO

The antenna cable should be connected to the radio by inserting the jack into the socket provided on the side of the radio. Connect the battery cable to the hot side of the ammeter behind the instrument panel. The fuse should then be inserted into the cable receptor.

FINAL ADJUSTMENTS

The input circuit has been especially designed to be used with a low capacity antenna, of the fish pole or whip type.

Truetone Antennas are especially recommended for use with this radio.

To adjust the antenna trimmer condenser, carefully tune the receiver to a weak station at approximately 600 kilocycles (K.C.). Remove the snap button covering the antenna trimmer (See Figure 2) and adjust the trimmer for maximum volume. A small screw driver will be needed for this purpose.

DIAL POINTER ADJUSTMENT

If it should become necessary to readjust the dial pointer for correct calibration, this may be easily done without removing the radio from the car by proceeding as follows:

- A. Turn tuning knob to the right (clockwise) as far as it will go.
- B. Remove snap button located on the right side of the case (viewed from the front), in the extreme upper front corner.
- C. Insert screwdriver through hole in case and move dial pointer directly over white dot at high end of dial (1600KC).
- D. Tune receiver to station of known frequency in the center of the dial and readjust pointer for more accurate indication, if necessary.
- E. Replace snap button into hole in case.

CAUTION: Be careful not to scratch or damage dial scale or dial pointer when making this adjustment.

ACCESSORIES FURNISHED FOR INSTALLATION

All of the necessary parts that are needed for installing this receiver are furnished in the Mounting Parts Kit No. S84-192 and the Suppression Kit Assembly Part No. S84-230, as listed below. Also supplied are the rear mounting strap, Part No. B31-134, and the front mounting plate, Part No. B31-133.

MODEL D4818A

ELIMINATING MOTOR NOISE

IMPORTANT: Special care should be taken when mounting the radio to make sure all paint, grease, rust, etc., is removed from all three mounting points. A good electrical contact at these points will aid materially in eliminating motor noise.

GENERATOR CONDENSER

The generator condenser must be connected to the battery terminal of the generator in all cases. If your car is equipped with a generator using an automatic regulator, make sure the condenser IS NOT fastened to the field winding terminal. If in doubt, your local car dealer can advise you as to where the car manufacturer recommends connecting it.

DISTRIBUTOR SUPPRESSOR

Remove the coil to distributor high tension lead from the distributor. Cut the lead two inches from the end, and screw the distributor resistor on to the coil lead, then screw the short length into the resistor and plug the cable into the distributor cap.

AMMETER CONDENSER

A .5 MFD bypass condenser is furnished for attaching to the ammeter. This should be connected to either side of the ammeter with the ground lug fastened to a good ground nearby. In most cases the use of this condenser, the distributor suppressor, and the generator condenser, will eliminate all objectionable ignition interference.

ELECTRICAL ACCESSORIES

In some cases, it may be found that car accessories such as electric heaters, lighters, automatic relays, or gauges, may cause interference while in operation. Proper procedure in such cases is to try another by-pass condenser from ground to the suspected accessory until the source of the interference is found. The condenser then should be permanently mounted in this location.

HIGH AND LOW TENSION LEADS

In many cases the low tension battery leads, etc., are grouped together with the high tension wires. These leads will very often pick up motor noise and feed it into the

receiver through the battery circuit. In cases such as these it will be necessary to separate the low tension from the high tension wires and run them through another hole if they run from the engine compartment up to the instrument panel. This condition is particularly true on the V-8 Ford, as the battery and primary leads run through a special tube which also houses the high tension leads. Shield and ground these leads.

IGNITION COILS

In cars where the ignition coil is located on the back side of the instrument panel it is often necessary to use an additional condenser. It must be installed from the battery side of the ignition coil to the closest ground on the instrument panel.

Short leads are very important. Where coils are mounted either on the instrument panel or in the driver's compartment, it may be necessary to shield the high tension lead from the coil to the distributor.

WHEEL STATIC

Wheel Static is a form of interference caused by the rotation of the front wheels of the car, and it is, of course, only noticed when the car is in motion. If this form of interference is present it can be eliminated by installing wheel static collector springs between the inner hub cap and the spindle shaft.

BONDING OF FIRE WALL TUBES

Bonding the steering column to the fire wall with a short braid may also be effective. Clean the paint from the steering column at the fire wall where the column enters the motor compartment, and solder on a short piece of braid. Ground the end of the braid to the fire wall.

In some cases it may be necessary to ground the tubes and rods coming through the fire wall in order to reduce the interference. Clean them with emery cloth and spot-solder the braid, fastening the end under a convenient screw. A 1/4" piece of wire braid 20 inches long is furnished in the suppression kit assembly for this purpose.

MODEL D4818A

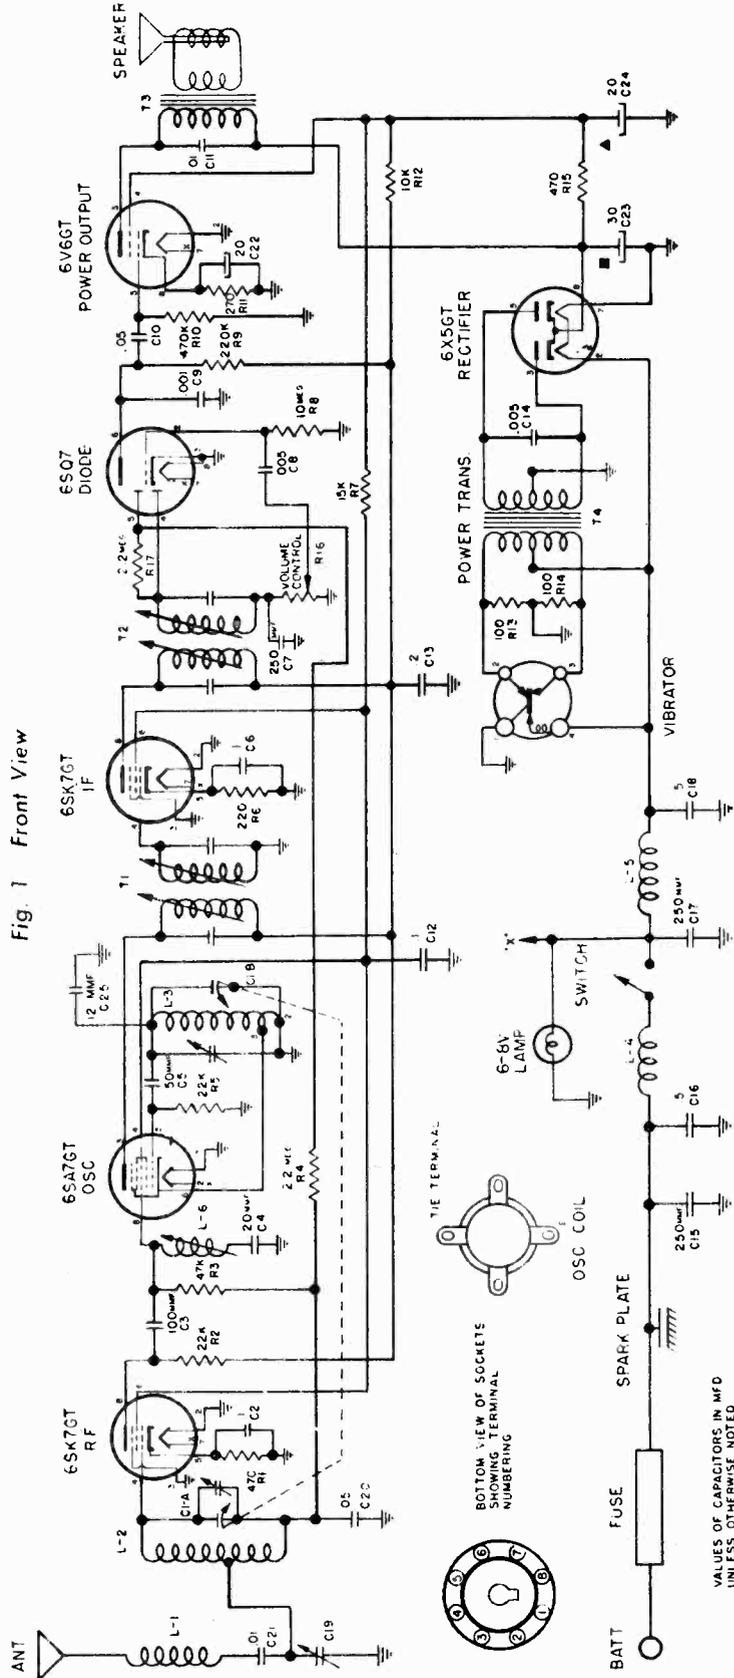

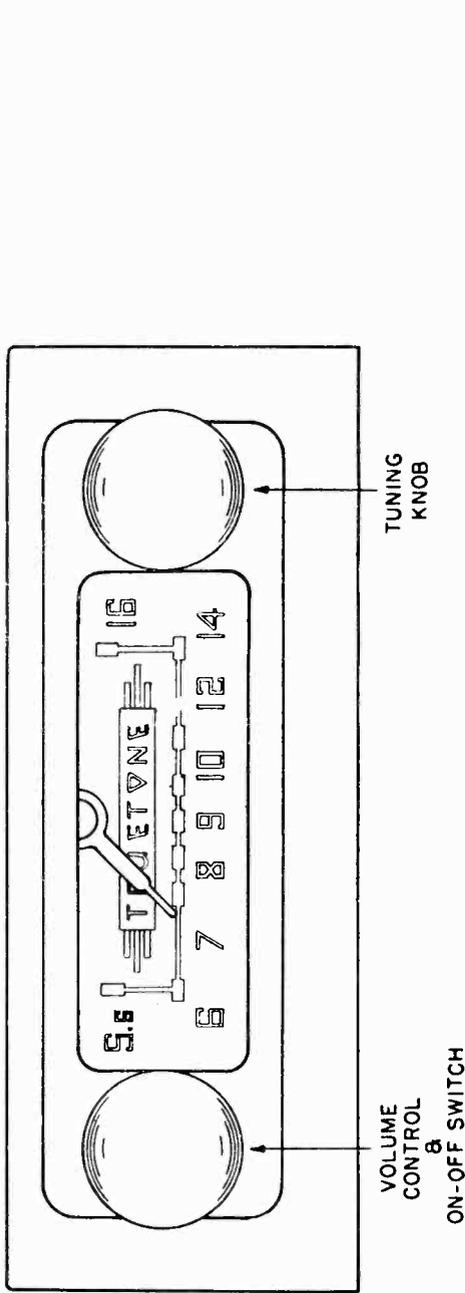

Fig. 3 Schematic Diagram

MODEL D4818A

ALIGNMENT PROCEDURE

The following equipment is necessary for proper alignment:

- Signal generator that will provide the test frequencies as listed.
- Non-metallic screwdriver.
- Output meter.
- Dummy antennas—.1 MFD., .00025 MFD.

For alignment points refer to Figures 4 and 5.

Dial Setting	Generator Frequency	Dummy Ant.	Generator Connections	Trimmer Reference	Trimmer Adjustment	Trimmer Function
Fully Open	455 KC	.1 MFD.	6SA7 Grid	T2	Maximum	Output I.F.
Fully Open	455 KC	.1 MFD.	6SA7 Grid	T1	Maximum	Input I.F.
Fully Open	455 KC	.00025 MFD.	Ant. lead	L6	Minimum	Wave trap
Fully Open	1600 KC	.00025 MFD.	Ant. lead	C1B	Maximum	Oscillator
Tune in signal from generator	1400 KC	.00025 MFD.	Ant. lead	C1A	Maximum	Antenna

NOTE: The antenna padder condenser, C19, (see Fig. 2) should be adjusted after the radio is installed in the car. Tune the receiver to a weak station at about 600 KC and adjust this trimmer for maximum volume.

INSTALLATION

This radio comes to you complete with all hardware necessary for mounting, and also with a distributor suppressor, ammeter condenser and generator condenser. By referring to Figures 1 and 2, and following the instructions outlined below, you will find that it is very simple to install.

First determine where the receiver is to be mounted by holding it with the hands in the approximate location in the car. Using the front mounting bracket as a template, mark and drill two $\frac{5}{8}$ " holes in the instrument panel flange. Now secure the mounting bracket to the radio receiver with the screws provided, and then mount the front of the radio to the instrument panel, using the bolts, lock washers and nuts provided for this purpose. The back of the radio is supported by means of the rear mounting strap. The mounting strap should be formed to the correct angles, as illustrated in Figure 2, so that it can then be fastened to the fire wall. After marking and center-punching the fire wall at the correct location, drill with a $\frac{3}{8}$ " drill. The mounting strap is then secured to the radio and fastened to the fire wall of the car with the $\frac{1}{4}$ " bolt, lock washer and nut furnished with the receiver.

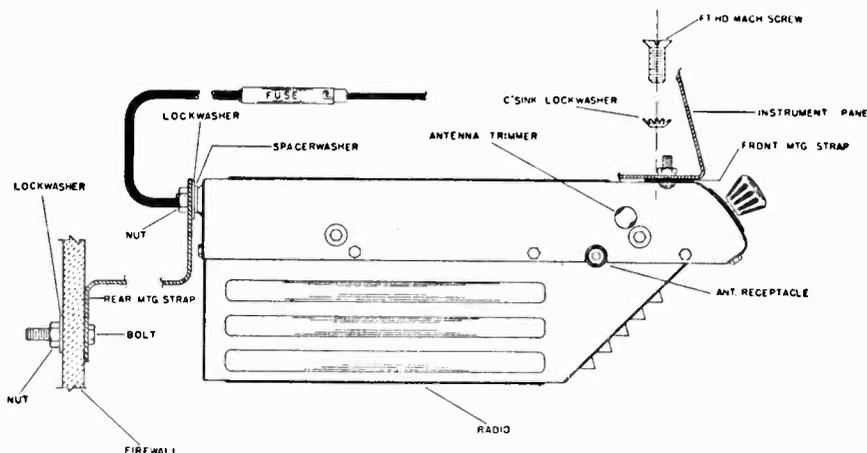

Fig. 2 Side View, Showing Mounting

CONNECTING THE RADIO

The antenna cable should be connected to the radio by inserting the jack into the socket provided on the side of the radio. Connect the battery cable to the hot side of the ammeter behind the instrument panel. The fuse should then be inserted into the cable receptor.

FINAL ADJUSTMENTS

The input circuit has been especially designed to be used with a low capacity antenna, of the fish pole or whip type.

Truetone Antennas are especially recommended for use with this radio.

To adjust the antenna trimmer condenser, carefully tune the receiver to a weak station at approximately 1100 kilocycles (K.C.). Remove the snap button covering the antenna trimmer (See Figure 2) and adjust the trimmer for maximum volume. A small screw driver will be needed for this purpose.

DIAL POINTER ADJUSTMENT

If it should become necessary to readjust the dial pointer for correct calibration, this may be easily done without removing the radio from the car by proceeding as follows:

- A. Turn tuning knob to the right (clockwise) as far as it will go.
- B. Remove snap button located on the right side of the case (viewed from the front), in the extreme upper front corner.
- C. Insert screwdriver through hole in case and move dial pointer directly over white dot at high end of dial (1600KC).
- D. Tune receiver to station of known frequency in the center of the dial and readjust pointer for more accurate indication, if necessary.
- E. Replace snap button into hole in case.

CAUTION: Be careful not to scratch or damage dial scale or dial pointer when making this adjustment.

ACCESSORIES FURNISHED FOR INSTALLATION

All of the necessary parts that are needed for installing this receiver are furnished in the Mounting Parts Kit No. S84-192 and the Suppression Kit Assembly Part No. S84-230, as listed below. Also supplied are the rear mounting strap, Part No. B31-134, and the front mounting plate, Part No. B31-133.

S84-192 MOUNTING PARTS KIT

1 $\frac{1}{4}$ " Bolt	2 External Tooth Lock Washers
2 $\frac{1}{4}$ " Lock Washers	2 Internal Tooth Lock Washers
2 $\frac{1}{4}$ " Hexagon Nuts	2 10-32 Hexagon Nuts
2 10-32 x $\frac{5}{8}$ " Screws	1 Washer Spacer
2 10-32 x $\frac{3}{8}$ " Screws	

S84-230 SUPPRESSION KIT & MISC. PARTS

1 S84-233 "A" lead assem.	1 S84-193 Suppression Kit consisting of:
1 A43-10 Fuse	2 .5 MFD Condensers
2 A52-256 Control knobs	1 Distributor Suppressor
1 A81-13 Sleeve (for fuse)	20" Wire Braid

MODEL D4318B

ELIMINATING MOTOR NOISE

IMPORTANT: Special care should be taken when mounting the radio to make sure all paint, grease, rust, etc., is removed from all three mounting points. A good electrical contact at these points will aid materially in eliminating motor noise.

GENERATOR CONDENSER

The generator condenser must be connected to the battery terminal of the generator in all cases. If your car is equipped with a generator using an automatic regulator, make sure the condenser IS NOT fastened to the field winding terminal. If in doubt, your local car dealer can advise you as to where the car manufacturer recommends connecting it.

DISTRIBUTOR SUPPRESSOR

Remove from distributor cap the high tension lead from the distributor. Cut the lead two inches from the end, and screw the distributor resistor on to the coil lead, then screw the short length into the resistor and plug the cable into the distributor cap.

AMMETER CONDENSER

A .5 MFD bypass condenser is furnished for attaching to the ammeter. This should be connected to either side of the ammeter with the ground lug fastened to a good ground nearby. In most cases the use of this condenser, the distributor suppressor, and the generator condenser, will eliminate all objectionable ignition interference.

ELECTRICAL ACCESSORIES

In some cases, it may be found that car accessories such as electric heaters, lighters, automatic relays, or gauges, may cause interference while in operation. Proper procedure in such cases is to try another by-pass condenser from ground to the suspected accessory until the source of the interference is found. The condenser then should be permanently mounted in this location.

HIGH AND LOW TENSION LEADS

In many cases the low tension battery leads, etc., are grouped together with the high tension wires. These leads will very often pick up motor noise and feed it into the

receiver through the battery circuit. In cases such as these it will be necessary to separate the low tension from the high tension wires and run them through another hole if they run from the engine compartment up to the instrument panel. This condition is particularly true on the V-8 Ford, as the battery and primary leads run through a special tube which also houses the high tension leads. Shield and ground these leads.

IGNITION COILS

In cars where the ignition coil is located on the back side of the instrument panel it is often necessary to use an additional condenser. It must be installed from the battery side of the ignition coil to the closest ground on the instrument panel.

Short leads are very important. Where coils are mounted either on the instrument panel or in the driver's compartment, it may be necessary to shield the high tension lead from the coil to the distributor.

WHEEL STATIC

Wheel Static is a form of interference caused by the rotation of the front wheels of the car, and it is, of course, only noticed when the car is in motion. If this form of interference is present it can be eliminated by installing wheel static collector springs between the inner hub cap and the spindle shaft.

BONDING OF FIRE WALL RODS AND TUBES

Bonding the steering column to the fire wall with a short braid may also be effective. Clean the paint from the steering column at the fire wall where the column enters the motor compartment, and solder on a short piece of braid. Ground the end of the braid to the fire wall.

In some cases it may be necessary to ground the tubes and rods coming through the fire wall in order to reduce the interference. Clean them with emery cloth and spot-solder the braid, fastening the end under a convenient screw. A 1/4" piece of wire braid 20 inches long is furnished in the suppression kit assembly for this purpose.

ALIGNMENT PROCEDURE

The following equipment is necessary for proper alignment:

- Signal generator that will provide the test frequencies as listed, modulated 400 cycles, 30%.
- Non-metallic screwdriver.
- Output meter.
- Dummy antennas—.1 MFD., 75 MMFD.

For alignment points refer to Figures 5 and 6.

Volume control—Maximum, all adjustments.
 No signal applied to antenna.
 Power input—6.3 volts.
 Connect dummy antenna in series with output lead of signal generator.
 Connect output meter across voice coil.
 Connect ground lead of signal generator to chassis.
 Repeat alignment procedure as a final check.

Dial Setting	Generator Frequency	Dummy Ant.	Generator Connections	Trimmer Reference	Trimmer Adjustment	Trimmer Function
Fully Open	455 KC	.1 MFD.	6SA7 Grid	T2	Maximum	Output I.F.
Fully Open	455 KC	.1 MFD.	6SA7 Grid	T1	Maximum	Input I.F.
Fully Open	455 KC	75 MMFD.	Ant. lead	L3	Minimum	Wave trap
Fully Open	1600 KC	75 MMFD.	Ant. lead	C1B	Maximum	Oscillator
Tune in signal from generator	1400 KC	75 MMFD.	Ant. lead	C19	Maximum	Antenna

NOTE: The antenna trimmer condenser, C3, (see Fig. 2) should be adjusted after the radio is installed in the car. Tune the receiver to a weak station at about 1100 KC and adjust this trimmer for maximum volume.

A34-105	Vibrator
A83-519	Wiper, grounding, for case covers

Note: Tubular condensers must be high temperature (85°C) wax type.

DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns counter-clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
 An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
 Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
 Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
 Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR				GANG CONDENSER SETTING	ADJUST	ADJUST FOR
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO			
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. (1) and Sec. (2)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. (3) and Sec. (4)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. (1) and Sec. (2)	Maximum Output
1620 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-41	Maximum Output
1400 KC	External Antenna Terminal	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-2	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:
 An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
 Non-metallic screwdriver.
 Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
 (If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
 Allow chassis and signal generator to "Heat Up" for several minutes.

Antenna	104.5	Same as above	300 ohms	FM	Tune rotor for max. AVC voltage	Ant. C-39	Maximum Deflection

RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN

FM ALIGNMENT NOTES

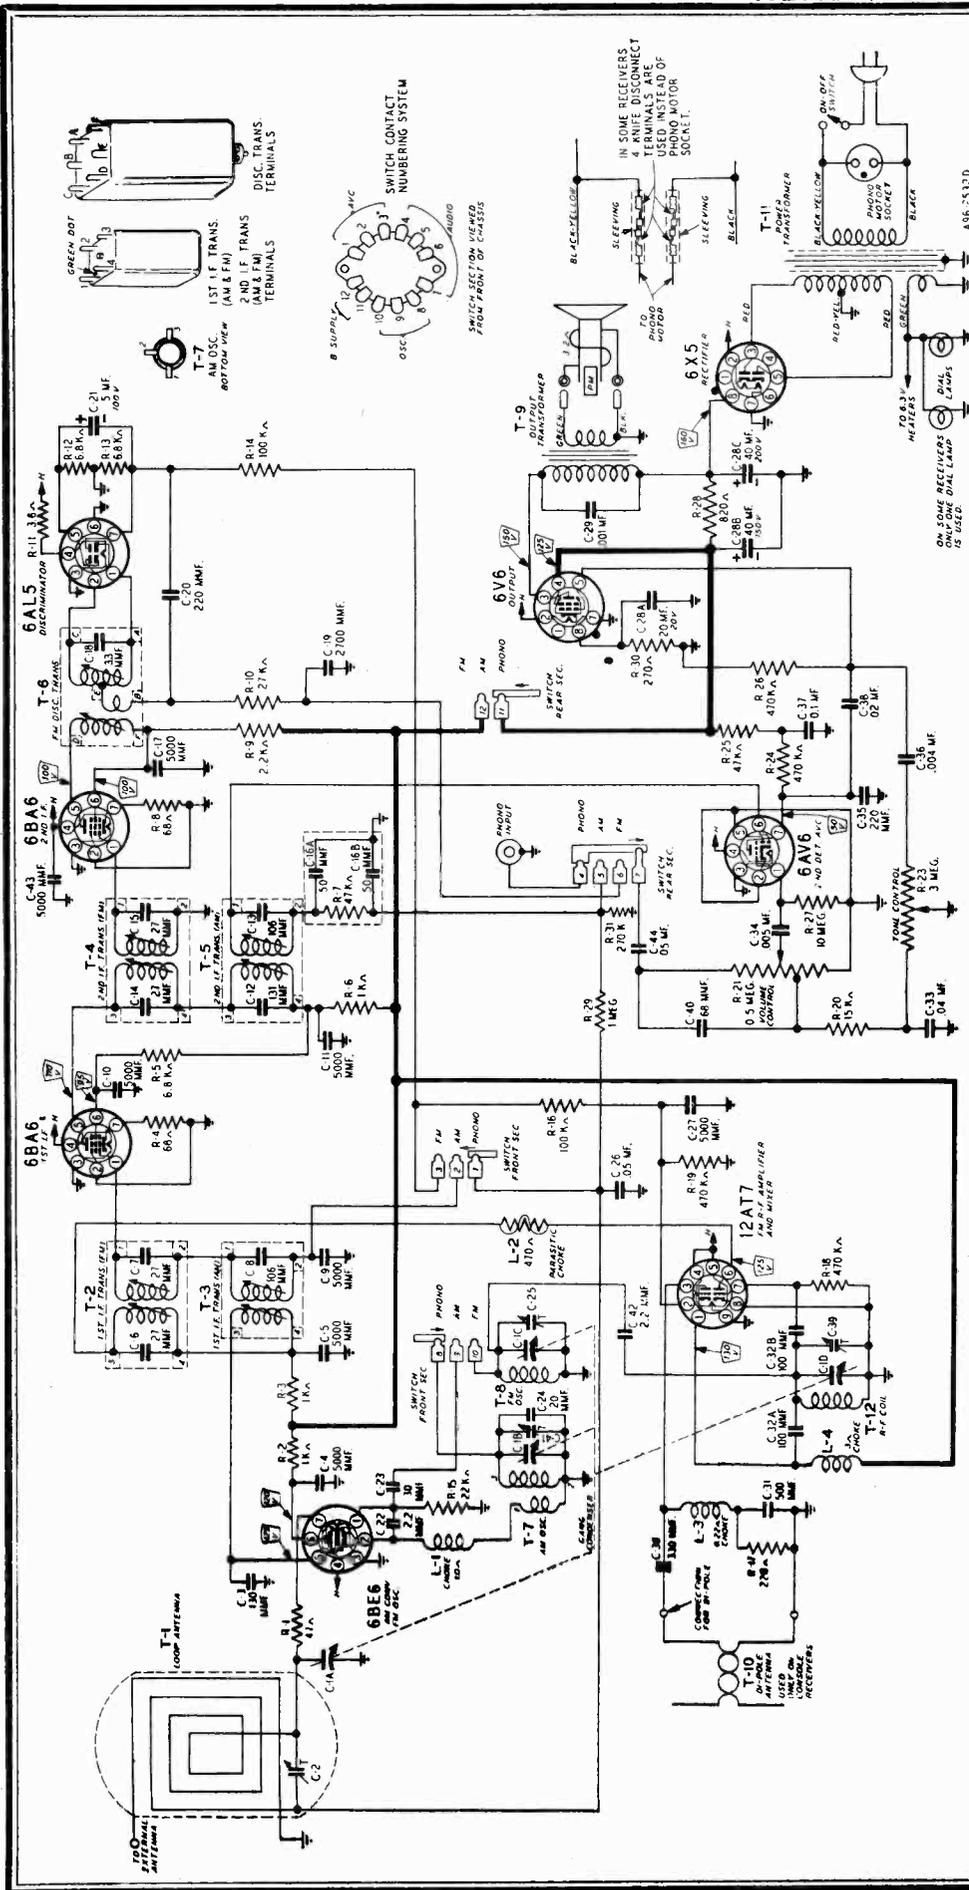

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
 Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the

27 K ohm resistor (R-10) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—AM I-F coils must be aligned before attempting to align the FM I-F coils.

NOTE D—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE-R-9 is 1000 Ohms not 2.2 K Ohms as shown on the schematic diagram.

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

- Line voltage 117 Volts AC
- Signal Input None
- A Variation of ±10% is usually permissible.

DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns counter-clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.

ELECTRICAL SPECIFICATIONS

Power Output—
 117 volts AC—40 watts
 60 watts phono operating

Power Output—
 1.9 watts maximum
 .8 watts 10% distortion

MODEL D1034C

ALIGNMENT PROCEDURES AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas - .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:
An accurately calibrated signal generator providing unmodulated signals of the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
Allow chassis and signal generator to "Heat Up" for several minutes.

FM ALIGNMENT NOTES

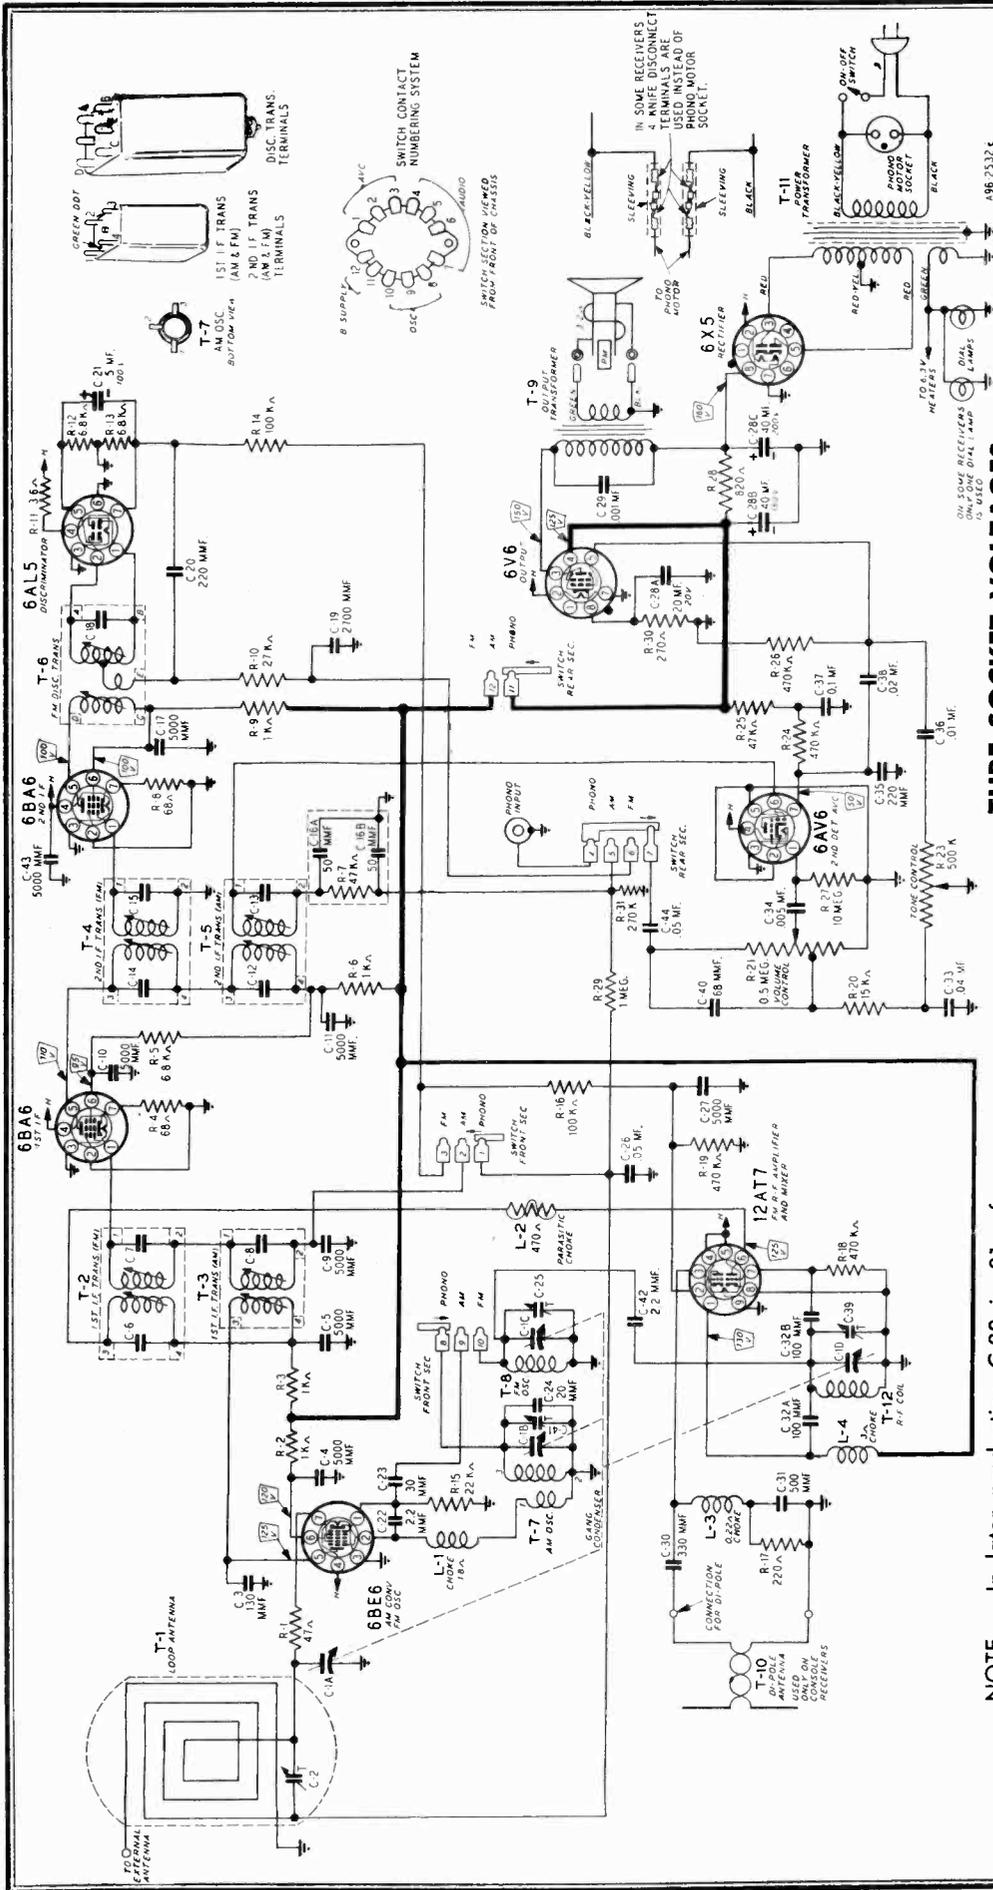

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
 Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the

27 K ohm resistor (R-10) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—AM I-F coils must be aligned before attempting to align the FM I-F coils.

NOTE D—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

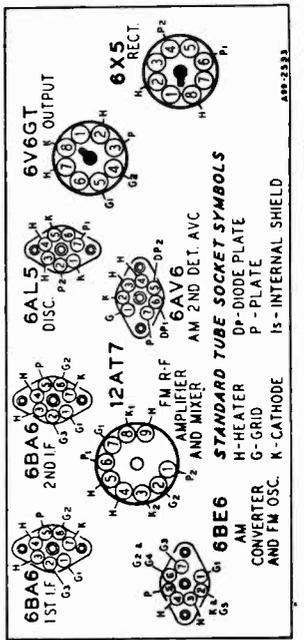

NOTE—R-9 is 1000 Ohms not 2.2 K Ohms as shown on the schematic diagram.

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

- Line voltage 117 Volts AC
- Signal input None
- A Variation of ±10% is usually permissible.

ALIGNMENT

BROADCAST BAND

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output, the tone control set for maximum treble, and the signal generator output attenuated to avoid A.V.C. action.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to AM.			
2	Stator of tuning capacitor (C44) through a 0.1 mfd capacitor	455 kc.	maximum capacity	455 kc. pri. and sec. of 1st and 2nd I-F trans. for max. output
<i>NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.</i>				
3	Radiated signal (no actual connection)	1600 kc.	1600 kc.	AM osc. trimmer (C46) for max. output
4	Radiated signal (no actual connection)	1400 kc.	tune to signal	AM ant. trimmer (C48) for max. output (rock-in adjustment)

FM BAND

Do not align the FM circuits until all AM adjustments have been completed.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to FM.			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 percent) between pin No. 7 of the 6AL5 tube and ground as shown on the schematic diagram.			
3	Connect a V. T. V. M. between points "X" and "Y" (see schematic diagram).			
4	Stator of FM ant. section (C43) on tuning capacitor through a .01 mfd mica capacitor	10.7 mc.	maximum capacity	Sec. of ratio det. trans. for zero (use medium strength signal)
5	Connect the V. T. V. M. between point "Z" and ground.			
6	Same as step 4	10.7 mc.	maximum capacity	Pri. of ratio det. trans. and pri. and sec. of 10.7 mc. 1st and 2nd I-F trans. for max.
<i>NOTE: The pri. of the ratio det. trans. peaks in two places. Use the peak with the slug farthest out.</i>				
7	Reconnect the V. T. V. M. between points "X" and "Y", and increase the signal strength 10 times.			
8	Same as step 4	10.7 mc.	maximum capacity	Recheck sec. of ratio det. trans. for zero voltage
9	Reconnect the V. T. V. M. between point "Z" and ground.			
10	Same as step 4	10.7 mc.	maximum capacity	Pri. of ratio det. trans. for maximum voltage
11	Remove the two 100,000 ohm resistors that were inserted in step 2.			
12	FM ant. terminal through a 300 ohm non-inductive resistor	105 mc.	105 mc.	FM osc. trimmer (C45) for maximum output
13	Same as step 12	105 mc.	105 mc.	FM ant. trimmer (C47) for maximum output

MODELS H-307T7, H-308T7, Ch. V-2136

WARNING

The chassis of this receiver is connected directly to one side of the power line. When making repairs or adjustments, it is recommended that the chassis be isolated from the line by means of an isolation transformer. Otherwise, *serious shock may result* if the radio chassis and ground are contacted at the same time.

ANTENNA INFORMATION

An external AM antenna can be coupled to the set by taping the lead-in wire to the outside of the rear cover as shown in Fig. 3. The wire should be dressed in the position shown and can be held in place with adhesive tape or other similar material.

The blue wire emerging from the hole in the rear cover is a "line" antenna for FM reception. It should be connected to the left antenna terminal as shown in Fig. 3. If an external FM antenna is to be used, disconnect the blue wire and connect the transmission line to the two terminals.

MODELS H-307T7, H-308T7, Ch. V-2136

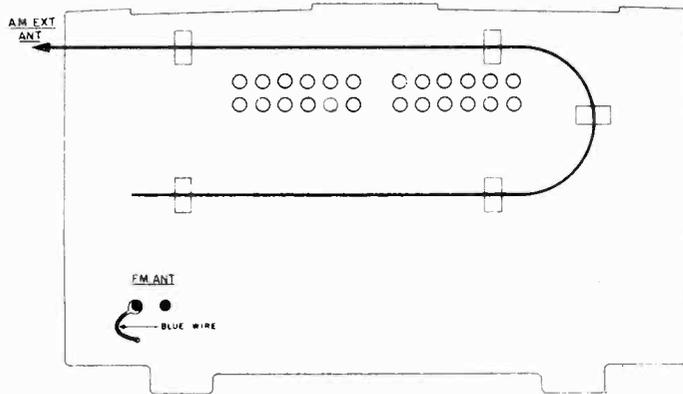

FIG. 3—ANTENNA COUPLING METHOD

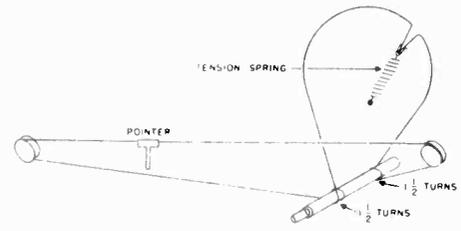

FIG. 4—DIAL DRIVE

ALIGNMENT BROADCAST BAND

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Check the dial pointer position by meshing the tuning capacitor plates completely and seeing that the dial pointer is set on the end mark of the dial scale.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to AM			
2	Stator of tuning capacitor (C33A) through a 0.1 mfd capacitor	455 kc.	minimum capacity	Pri. and sec. of T6 and T5 for max. output in order given
<i>NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.</i>				
3	Radiated signal (no actual connection)	1615 kc.	minimum capacity	AM osc. trimmer (C33D) for max. output
4	Radiated signal (no actual connection)	1400 kc.	tune to signal	AM R-F trimmer (C33B) for max. output (rock-in adjustment)

FM BAND

Do not align the FM circuits until all AM adjustments have been completed.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to FM.			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 per cent) between pin No. 7 of the 12AL5 tube and ground as shown on the schematic diagram.			
3	Connect a V.T.V.M. between points "X" and "Y" (see schematic diagram).			
4	Pin No. 7 of 12AT7 through a .01 mfd mica capacitor	10.7 mc.	minimum capacity	Sec. of T3 for zero (use medium strength signal)
5	Connect the V.T.V.M. between point "Z" and ground.			
6	Same as step 4	10.7 mc.	minimum capacity	Pri. of T3 and pri. and sec. of T1 and T2 for max.
7	Reconnect the V.T.V.M. between points "X" and "Y" and increase the signal strength 10 times.			
8	Same as step 4	10.7 mc.	minimum capacity	Recheck sec. of T3 for zero voltage
9	Reconnect the V.T.V.M. between point "Z" and ground			
10	Same as step 4	10.7 mc.	minimum capacity	Pri. of T3 for maximum voltage
11	Remove the two 100,000 ohm resistors that were inserted in step 2.			
12	FM ant. terminal through a 300 ohm non-inductive resistor	98 mc.	98 mc.	FM osc. core for maximum voltage
13	Same as step 12	98 mc.	98 mc.	FM R-F trimmer (C32) for maximum voltage
14	Same as step 12	105 mc.	tune to signal	FM R-F core for maximum voltage
15	Same as step 12	90 mc.	tune to signal	FM R-F trimmer (C32) for maximum voltage (rock-in)
16	Recheck steps 14 and 15 for tracking.

MODELS H-309P5, H-309P5U, Ch. V-2156

MODELS H-309P5 AND H-309P5U CHASSIS V-2156 SERVICE NOTES

SPECIFICATIONS

FREQUENCY RANGE540 to 1615 kc.
 INTERMEDIATE FREQUENCY455 kc.
 TUBE COMPLEMENT:
 1 1U4R-F Amplifier
 1 1R5Converter
 1 1U41-F Amplifier
 1 1U5Det., AVC, and 1st A-F Amp.
 1 3V4Output Amplifier

POWER OUTPUT:
 Maximum0.38 watt
 Undistorted0.18 watt

LOUDSPEAKER5 1/4" PM
 POWER SUPPLY:
 Battery Operation—"AB" Battery Pack (9 v. "A"
 and 90 v. "B")—Eveready 756W, Burgess T6Z60,
 or Ray-O-Vac AB601
 Line Operation105 to 120 volts, D-C
 or 50 to 60 cycles A-C

CURRENT CONSUMPTION (Battery Operation):
 "A" section of "AB" battery0.05 amp.
 "B" section of "AB" battery0.016 amp.

POWER CONSUMPTION (Line Operation)....15 watts

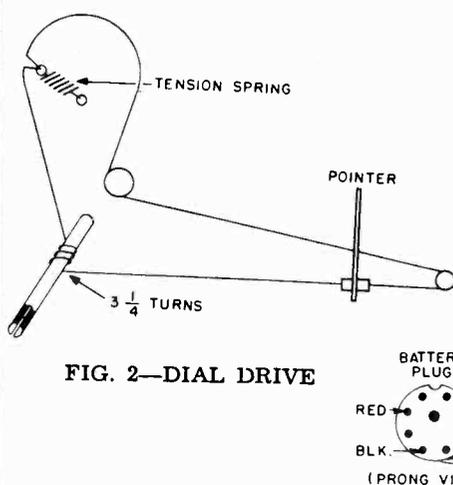

FIG. 2—DIAL DRIVE

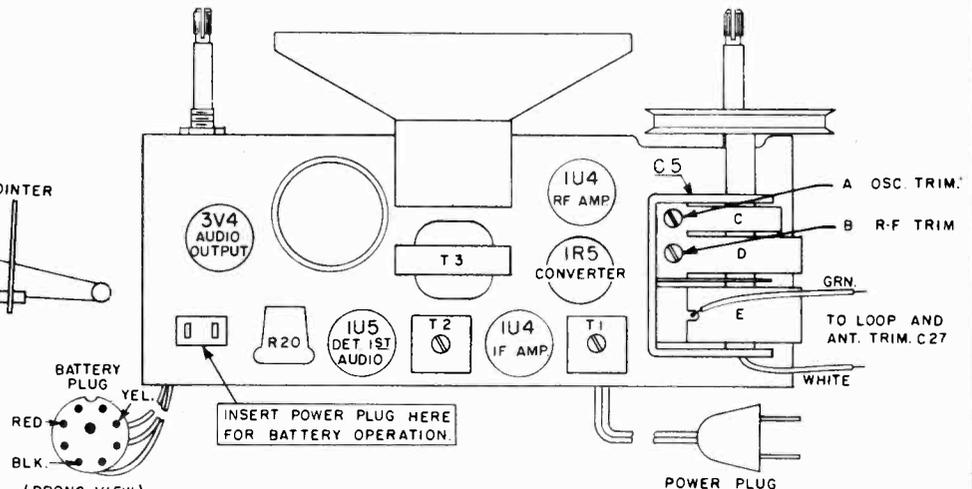

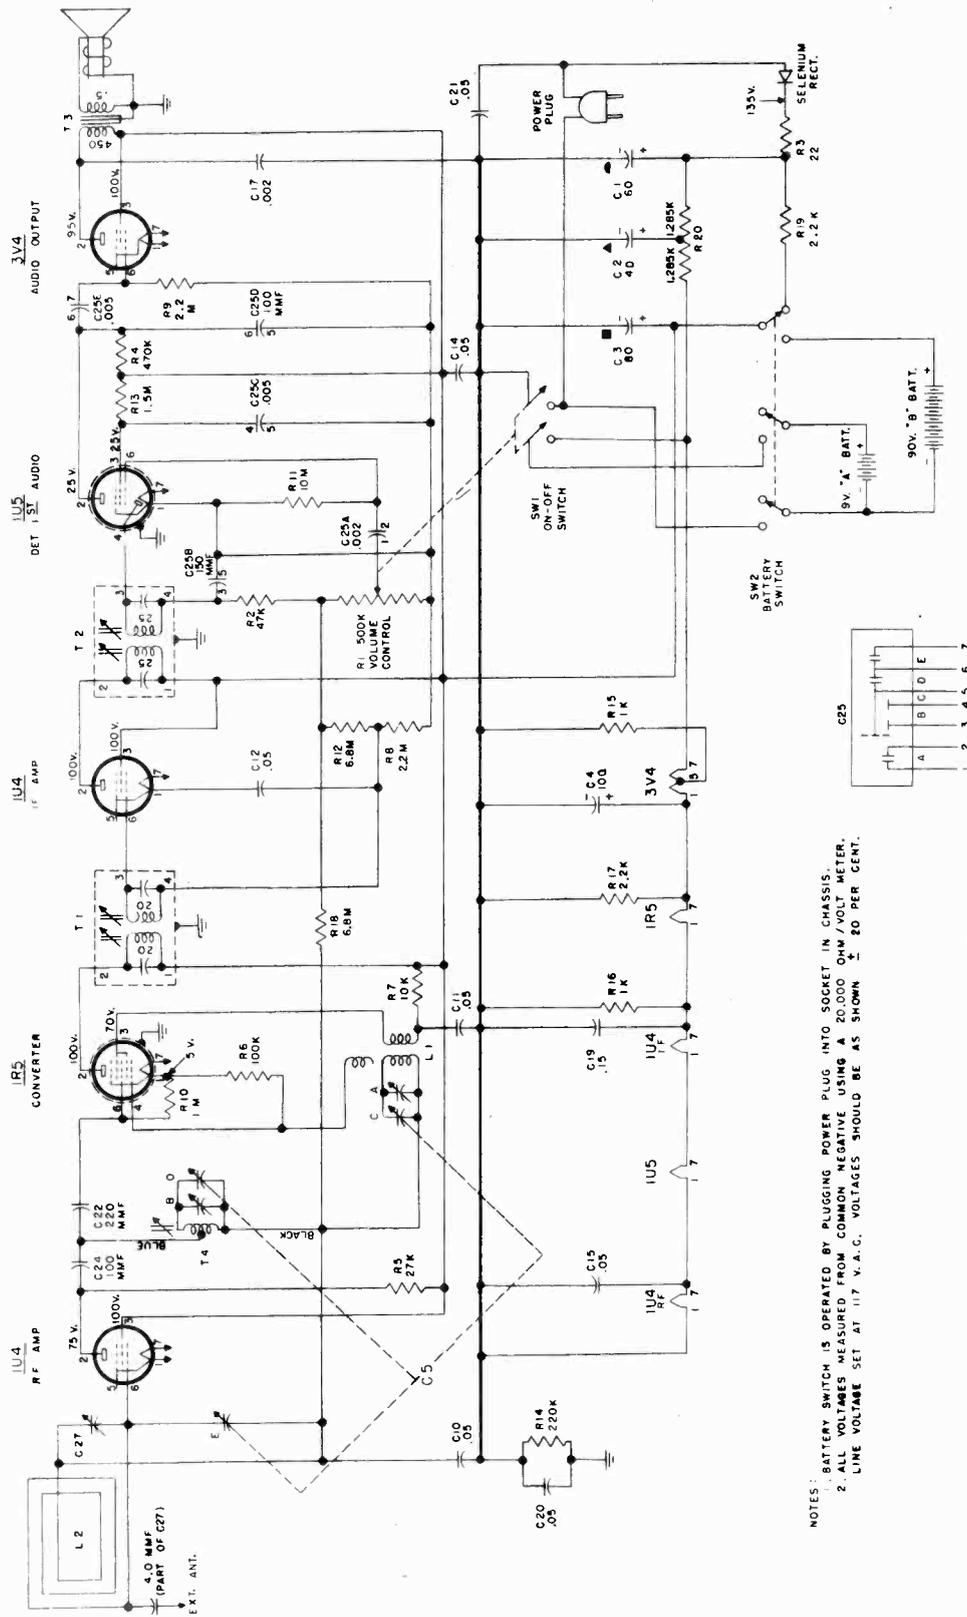

FIG. 3—CHASSIS LAYOUT

MODELS H-309P5, H-309P5U, Ch. V-2156

NOTES:
 1. BATTERY SWITCH IS OPERATED BY PLUGGING POWER PLUG INTO SOCKET IN CHASSIS.
 2. ALL VOLTMETERS MEASURED FROM COMMON NEGATIVE USING A 20,000 OHM/VOLT METER.
 LINE VOLTAGE SET AT 117 V.A.C. VOLTAGES SHOULD BE AS SHOWN ± 20 PER CENT.

FIG. 1—SCHEMATIC DIAGRAM OF V-2156 CHASSIS

MODELS H-309P5, H-309P5U, Ch. V-2156

ALIGNMENT

It is recommended that the chassis be isolated from the power line by means of an isolation transformer. While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust for Maximum Output—
1	Pin No. 6 of the 1R5 converter through a 200 mfm capacitor	455 kc.	Minimum capacity	Top and bottom slugs of T2 and T1 in order given *
2	Stator of antenna tuning section of gang (E) through a 200 mfm capacitor	1615 kc.	Minimum capacity	Osc. trimmer (A)
3	Same as step 2	1400 kc.	1400 kc.	R-F trimmer (B)
4	Same as step 2	600 kc.	600 kc.	Slug of R-F trans. (T4)**
5	Recheck steps 3 and 4			
6	Radiated signal	1400 kc.	1400 kc.	Antenna trimmer (C27)

* It is recommended that a fiber aligning tool that snugly fits the slot in the powdered iron core be used to prevent chipping of the slot.

** A 10/32" Allen wrench can be used to adjust the slug in T4.

PARTS LIST FOR MODELS H-309P5 AND H-309P5U

When ordering parts, specify model number of set in addition to part number and description of part.

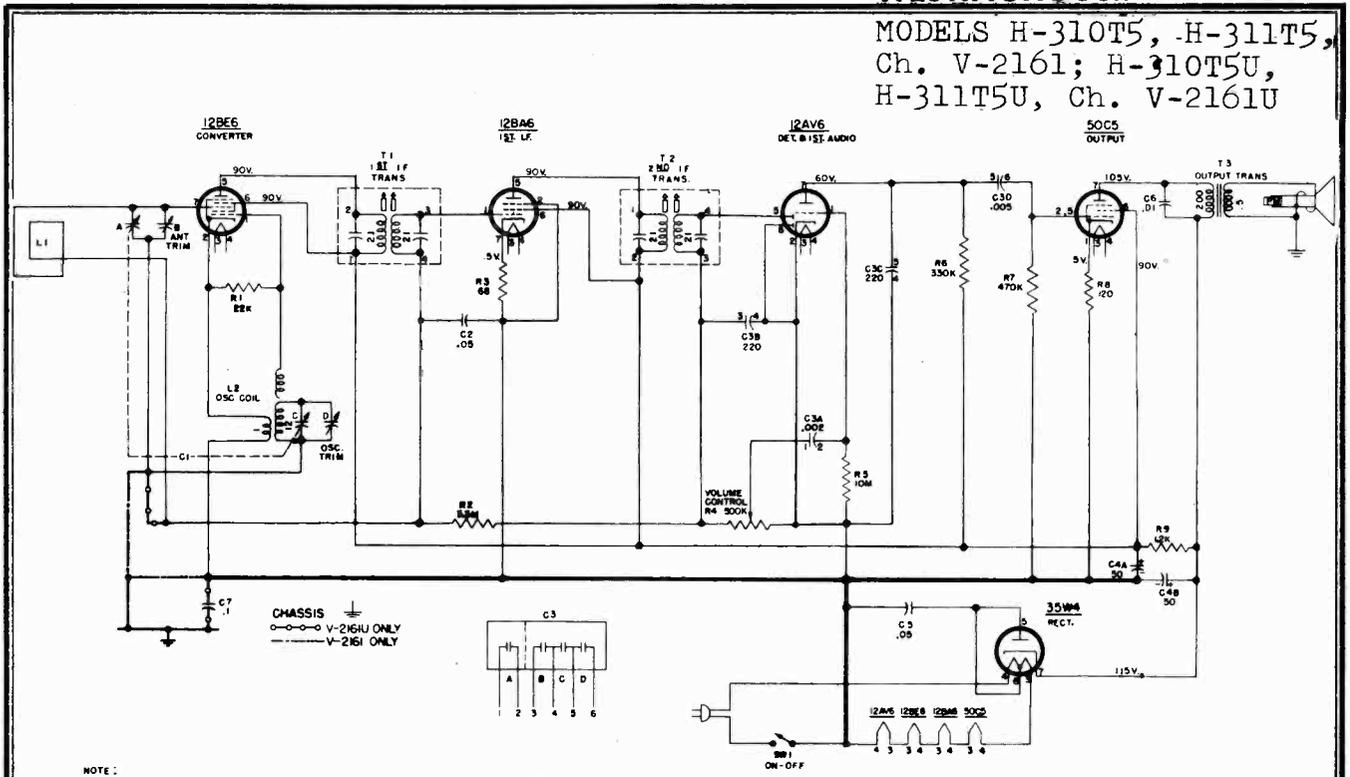

FIG. 3—SCHEMATIC DIAGRAM OF V-2161 AND V-2161U CHASSIS

WARNING: The V-2161 chassis is connected directly to one side of the power line. When making repairs or adjustments, it is recommended that the chassis be isolated from the line by means of an isolation transformer. Otherwise serious shock may result if the radio chassis and ground are contacted at the same time.

ALIGNMENT

It is recommended that the chassis be isolated from the power line by means of an isolation transformer. Make certain that the dial pointer is correctly positioned. When the gang is completely closed, the pointer should be over the small bump near the left end of the dial background. While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial	Adjust for Maximum Output—
1	Stator of R-F tuning capacitor (A) through a 0.1 mfd capacitor	455 kc.	Minimum capacity	Top and bottom slugs in 2nd and 1st I-F trans. in order given *
2	Same as step 1	1615 kc.	Minimum capacity	Osc. trimmer (D)
3	Radiated Signal	1400 kc.	1400 kc.	Ant. trimmer (B)

* It is recommended that a fiber aligning tool that snugly fits the slot in the powdered iron core be used to prevent chipping of the slot.

V-2153-1 CHASSIS

Ref. No.	Part No.	Description
C1	V-5651	Capacitor, variable (consists of A, B, C and D)
C2	RCP10W4503M	Capacitor, .05 mfd 400 v.
C3	V-6552-2	Capacitor, electrolytic (consists of A, B, C and D)
C4	RCP10W2503M	Capacitor, .05 mfd 200 v.
C5	RCP10W2104M	Capacitor, .1 mfd 200 v.
C6	RCP10W4202M	Capacitor, .002 mfd 400 v.
C7	V-9703-1	Capacitor, multiple (consists of A, B, C and D)
C8	RCP10W4202M	Capacitor, .002 mfd 400 v.
C9	RCP10W2104M	Capacitor, .1 mfd 200 v.
C10	RCP10W2104M	Capacitor, .1 mfd 200 v.
C11	RCP10W2503M	Capacitor, .05 mfd 200 v.
L1	V-5661	Coil, osc.
	V-9446-1	Rectifier, selenium
R1	RC20AE104M	Resistor, 100,000 ohms ½ w.
R2	RC20AE682M	Resistor, 6800 ohms ½ w.
R3	RC20AE474M	Resistor, 470,000 ohms ½ w.
R4	RC20AE823K	Resistor, 82,000 ohms ½ w.
R5	RC20AE222M	Resistor, 2200 ohms ½ w.
R6	RC20AE473M	Resistor, 47,000 ohms ½ w.
R7	RC20AE335M	Resistor, 3.3 megohms ½ w.
R8	V-6198-6	Control, volume 500,000 ohms (consists of R8 and SW1)
R9	RC20AE106M	Resistor, 10 megohms ½ w.
R10	RC20AE105M	Resistor, 1.0 megohms ½ w.
R11	RC20AE225M	Resistor, 2.2 megohms ½ w.
R12	RC30AE220M	Resistor, 22 ohms 1 w.
R14	RC20AE122K	Resistor, 1200 ohms ½ w.
R15	RC20AE821K	Resistor, 820 ohms ½ w.
R16	RC20AE224M	Resistor, 220,000 ohms ½ w.
R17	RC20AE102M	Resistor, 1000 ohms ½ w.
R18	RC20AE475M	Resistor, 4.7 megohms ½ w.
R19	RC20AE270K	Resistor, 27 ohms ½ w.
R20	V-9125-2	Resistor, ballast, 2710 ohms
SW1	V-6198-6	Switch, on-off (consists of SW1 and R8)
SW2	V-9420	Switch, line battery
T1	V-6972-5	Transformer, 1st I-F
T2	V-6972-6	Transformer, 2nd I-F

following parts apply only to Models H-314P4, H-314P4U, H-315P4 and H-315P4U:

V-1157-10	Cabinet (black cabinet, red grille)
V-1157-11	Cabinet (red cabinet, black grille)
V-9751-3	Handle (black)
V-9751-4	Handle (red)
V-5698-5	Knob (black)
V-5698-6	Knob (red)

MODELS H-316C7, H-326C7,
Ch. V-2136-1

SPECIFICATIONS

FREQUENCY RANGES:

Amplitude Modulation540 to 1615 kc.
Frequency Modulation88 to 108 mc.

INTERMEDIATE FREQUENCIES:

Amplitude Modulation455 kc.
Frequency Modulation10.7 mc.

TUBE COMPLEMENT:

- 1 12AT7R-F Amp. and Mixer (FM)
- 1 12BE6FM Osc. and AM Converter
- 1 12BA6I-F Amp.
- 1 6BJ6I-F Driver (FM)
- 1 12AL5Ratio Det. (FM)
- 1 12AV6Det. and AVC (AM) and A-F Amp.
- 1 50L6GTOutput Amp.

POWER OUTPUT:

Undistorted2.5 watts
Maximum3.0 watts

LOUDSPEAKER:10" PM

OPERATING

VOLTAGE:117 volts, 60 cycles AC

POWER CONSUMPTION:70 watts

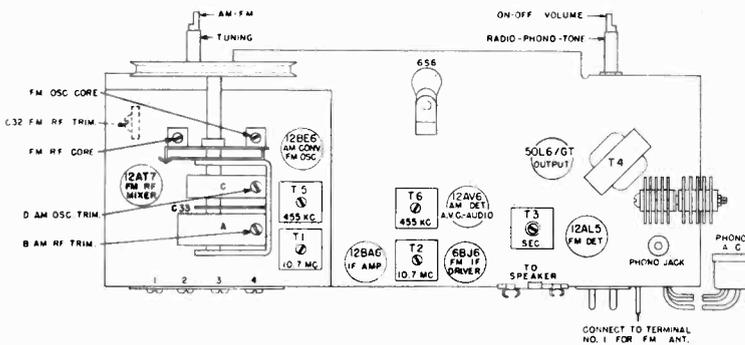

FIG. 2—TOP VIEW OF CHASSIS

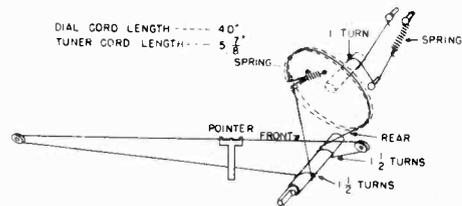

FIG. 3—DIAL DRIVE

WARNING: The chassis of this receiver is connected directly to one side of the power line. When making repairs or adjustments, it is recommended that the chassis be isolated from the line by means of an isolation transformer. Otherwise, serious shock may result if the radio chassis and ground are contacted at the same time.

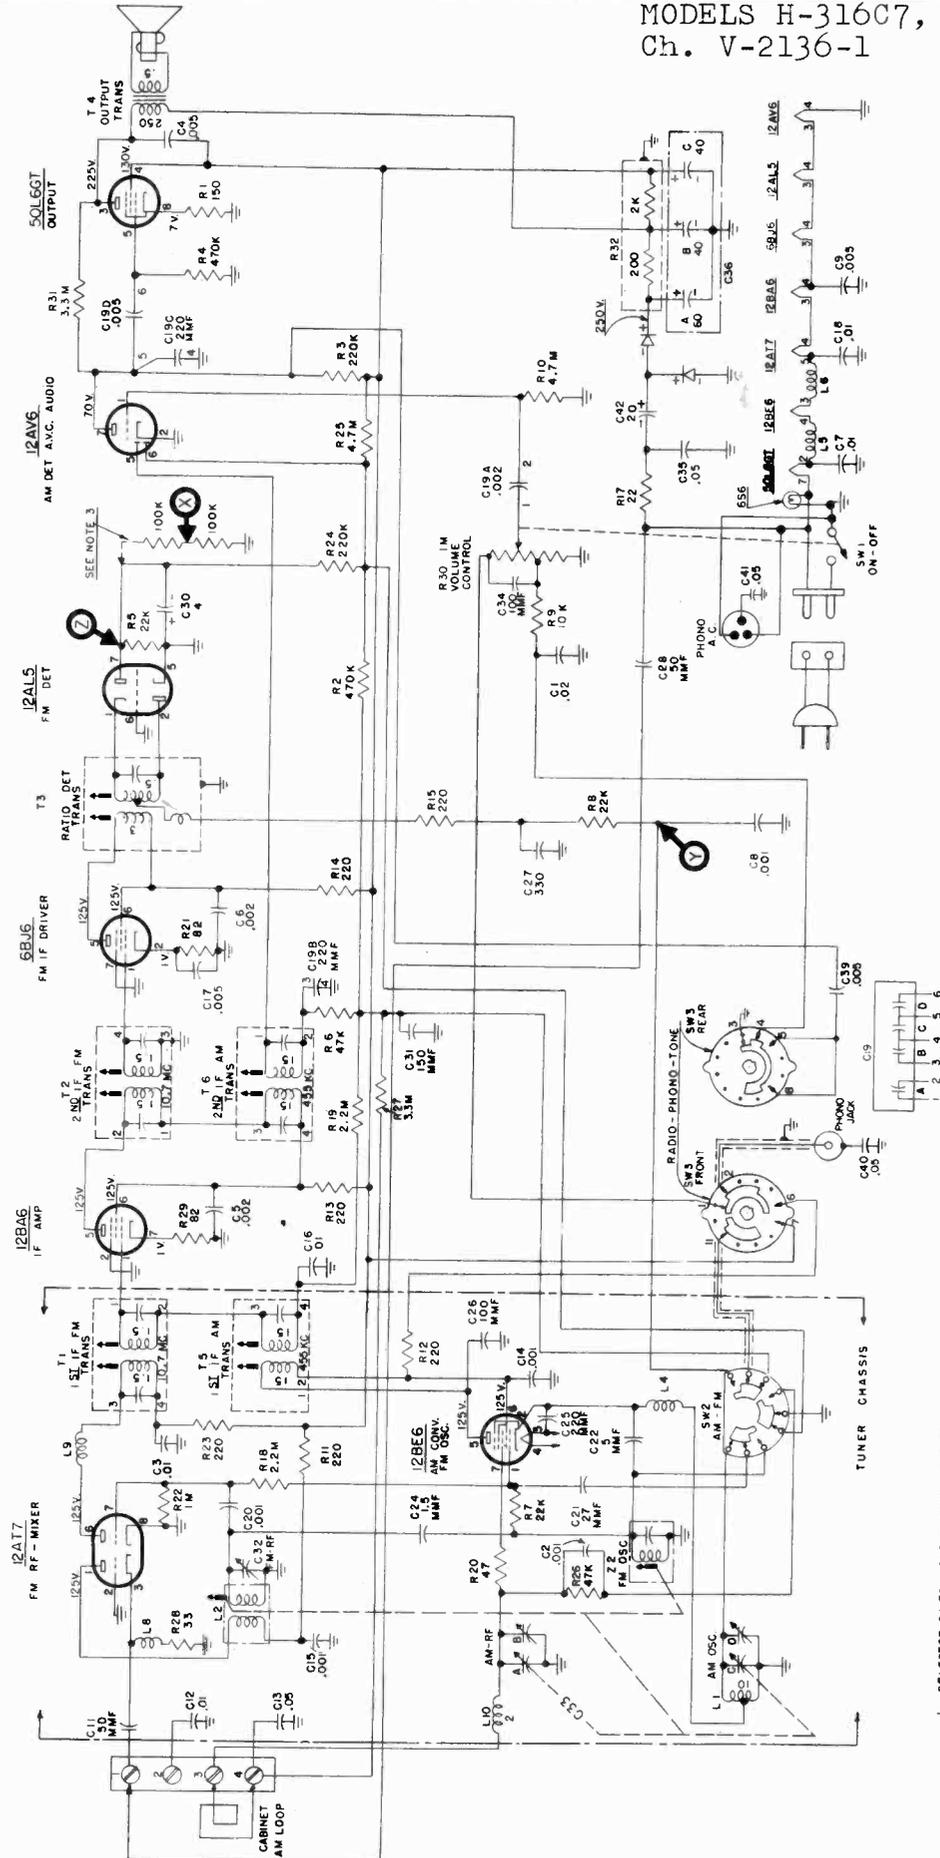

FIG. 1—SCHEMATIC DIAGRAM OF V-2136-1 CHASSIS

1. SELECTOR SWITCH SW2 IS SHOWN IN EXTREME CLOCKWISE POSITION OR AM BAND POSITION FROM THE FRONT.
2. SELECTOR SWITCH SW1 IS SHOWN IN EXTREME CLOCKWISE POSITION OR PHONO TREBLE POSITION AS VIEWED FROM FRONT.
3. TO BE INSTALLED FOR ALIGNMENT ONLY
4. ALL VOLTAGES MEASURED FROM CHASSIS (GROUND) USING A 20,000 OHM/VOLT METER. LINE VOLTAGE SET AT 117 V.A.C. VOLTAGES SHOULD BE AS SHOWN ± 20 PER CENT.

MODELS H-316C7, H-326C7,
Ch. V2136-1

**ALIGNMENT
BROADCAST BAND**

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Check the dial pointer position by meshing the tuning capacitor plates completely and seeing that the dial pointer is set on the end mark of the dial scale.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to AM and the radio-phono-tone control to RADIO			
2	Stator of tuning capacitor (A) through a 0.1 mfd capacitor	455 kc.	minimum capacity	Pri. and sec. of T6 and T5 for max. output in order given
<i>NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.</i>				
3	Radiated signal (no actual connection)	1615 kc.	minimum capacity	AM osc. trimmer (D) for max. output
4	Radiated signal (no actual connection)	1400 kc.	tune to signal	AM R-F trimmer (B) for max. output (rock-in adjustment)

FM BAND

Do not align the FM circuits until all AM adjustments have been completed.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to FM.			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 per cent) between pin No. 7 of the 12AL5 tube and ground as shown on the schematic diagram.			
3	Connect a V.T.V. M. between points "X" and "Y" (see schematic diagram).			
4	Pin No. 7 of 12AT7 through a 0.1 mfd mica capacitor	10.7 mc.	minimum capacity	Sec. of T3 for zero (use medium strength signal)
5	Connect the V.T.V.M. between point "Z" and ground.			
6	Same as step 4	10.7 mc.	minimum capacity	Pri. of T3 and pri. and sec. of T1 and T2 for max.
7	Reconnect the V.T.V.M. between points "X" and "Y" and increase the signal strength 10 times.			
8	Same as step 4	10.7 mc.	minimum capacity	Recheck sec. of T3 for zero voltage
9	Reconnect the V.T.V. M. between point "Z" and ground.			
10	Same as step 4	10.7 mc.	minimum capacity	Pri. of T3 for maximum voltage
11	Remove the two 100,000 ohm resistors that were inserted in step 2.			
12	FM ant. terminal through a 300 ohm non-inductive resistor	98 mc.	98 mc.	FM osc. core for maximum voltage
13	Same as step 12	98 mc.	98 mc.	FM R-F trimmer (C32) for maximum voltage
14	Same as step 12	105 mc.	tune to signal	FM R-F core for maximum voltage
15	Same as step 12	90 mc.	tune to signal	FM R-F trimmer (C32) for maximum voltage (rock-in)
16	Recheck steps 14 and 15 for tracking.			

PARTS LIST FOR MODEL H-316C7

CABINET AND MISCELLANEOUS

Part No. Description

- V-5982-6 Antenna assembly, AM loop
- V-6120-1 Background, dial
- V-1212-1 Cabinet (mahogany)
- V-5860-11 Cable assembly, speaker
- V-9822-1 Cable assembly, phono AC (female)
- V-9833-1 Cable assembly, phono AC (male)
- V-6415-2 Cable, phono pick-up
- V-9075-1 Clip, spring (ball head strike)
- V-5426 Clip, I-F mounting
- V-9053 Connector, phono
- V-3219S-1 Cord, dial drive (100' spool) ..
- V-9845-1 Cover, back (record changer)
- V-9834-1 Cover assembly, back (radio)
- V-8340 Doors (matched pairs)
- V-8341 Drawer, record changer (complete less hardware)
- V-9835-1 Escutcheon, dial
- V-9832-1 Grille assembly, panel
- V-9091-1 Hinge, L. H.
- V-9091-2 Hinge, R. H.
- V-6146-1 Knob, on-off-volume

Part No. Description

- V-6146-5 Knob, AM-FM
- V-9861-1 Knob, radio-phono-tone
- V-9104-6 Knob, tuning
- V-9252-2 Nameplate, Westinghouse
- No. 656 Pilot light
- V-9661 Plug, AC
- V-9826-3 Pointer, dial
- V-4967 Pull, drawer
- V-3166S Pulley, dial cord
- V-9678-2 Pulley, gang
- V-3353-11 Slide, mechanism, L. H.
- V-3353-12 Slide, mechanism, R. H.
- V-4292-1 Socket, miniature molded
- V-5556-1 Socket, miniature (12AT7)
- V-4292S-2 Socket, miniature molded (12BE6)
- V-3163 Socket, octal wafer
- V-9860-1 Socket, pilot light
- V-9770-2 Speaker, 10" PM
- V-3248S Spring, dial drive
- V-9076-1 Strike, ball head
- V-9348 Terminal board, ant.-gnd.

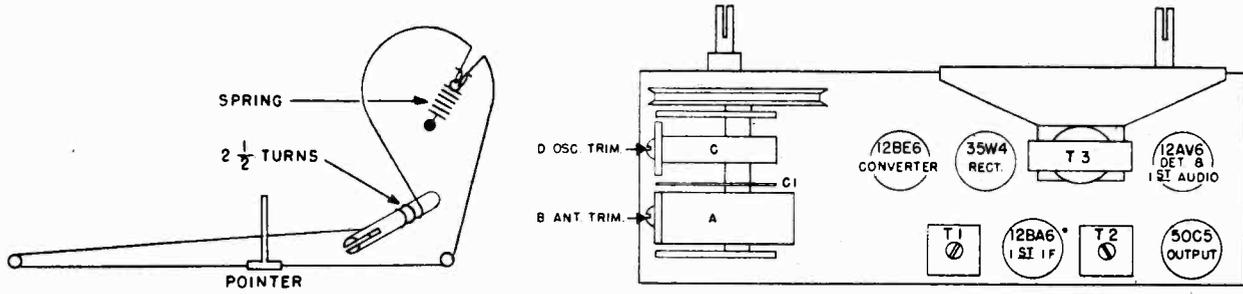

FIG. 3—DIAL DRIVE AND CHASSIS LAYOUT FOR V-2157-1 AND V-2157-1U CHASSIS

ALIGNMENT

It is recommended that the chassis be isolated from the power line by means of an isolation transformer.

Make certain that the dial pointer is correctly positioned.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial	Adjust for Maximum Output —
1	Stator of R-F tuning capacitor (A) through a 0.1 mfd capacitor	455 kc.	Minimum capacity	Top and bottom slugs in 2nd and 1st I-F trans. in order given*
2	Same as step 1	1615 kc.	Minimum capacity	Osc. trimmer (D)
3	Radiated Signal	1400 kc.	1400 kc.	Ant. trimmer (B)

*It is recommended that a fiber aligning tool that snugly fits the slot in the powdered iron core be used to prevent chipping of the slot.

CHASSIS PARTS

<i>Ref. No.</i>	<i>Part No.</i>	<i>Description</i>
C1	V-9990	Capacitor, variable (consists of A, B, C and D) (V-2157-1 chassis)
	V-10047	Capacitor, variable (consists of A, B, C and D) (V-2157 chassis)
C2	RCP10W2503M	Capacitor, .05 mfd 200 v.
C3	V-9634-1	Capacitor, multiple ceramic (consists of A,B,C and D)
C4	V-9991	Capacitor, electrolytic 50-50 mfd 150 v. (consists of A and B)
C5	RCP10W4503M	Capacitor, .05 mfd 400 v.
C6	RCP10W4103M	Capacitor, .01 mfd 400 v.
C7	RCP10W4104M	Capacitor, .1 mfd 400 v. (V-2157U and V-2157-1U chassis)
L1	V-9994	Loop, antenna (V-2157 chassis)
	V-10001	Loop, antenna (V-2157-1 chassis)
L2	V-9992	Coil, osc.
R1	RC20AE223M	Resistor, 22,000 ohms ½ w.
R2	RC20AE335M	Resistor, 3.3 meg. ½ w.
R3	RC20AE680M	Resistor, 68 ohms ½ w.
*R4	V-9993-1	Control, volume 500,000 ohms (assy consists of R4 and SW1)
R5	RC20AE106M	Resistor, 10 megs.
R6	RC20AE334M	Resistor, 330,000 ohms ½ w.
R7	RC20AE474M	Resistor, 470,000 ohms ½ w.
R8	RC20AE121M	Resistor, 120 ohms ½ w.
R9	RC30AE102M	Resistor, 1000 ohms 1 w.
*SW1	V-9993-1	Switch, on-off (assy consists of SW1 and R4)
T1	V-9735-1	Transformer, 1st I-F
T2	V-9735-1	Transformer, 2nd I-F
T3	V-9727-1	Transformer, audio (includes T3 and speaker)

MODELS H-323T5, Ch. V-2157-2; H-323T5U, Ch. V-2157-2U

FREQUENCY RANGE:540 to 1615 kc.

INTERMEDIATE FREQUENCY:455 kc.

TUBE COMPLEMENT:

- 1 12BE6Converter
- 1 12BA6I-F Amp.
- 1 12AV6Det., AVC, and 1st A-F Amp.
- 1 50C5Output Amp.
- 1 35W4Rectifier

POWER OUTPUT:

- Undistorted0.9 watt
- Maximum1.5 watts

LOUDSPEAKER:4" P.M.

OPERATING VOLTAGE:105 to 120 volts, 50-60 cycles A-C or D-C

POWER CONSUMPTION:35 watts

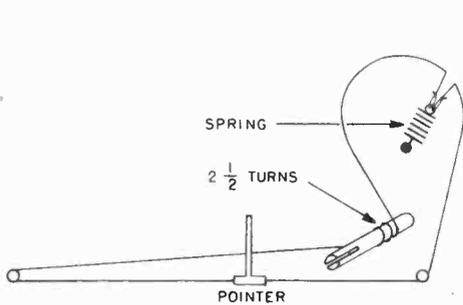

FIG. 1—DIAL DRIVE

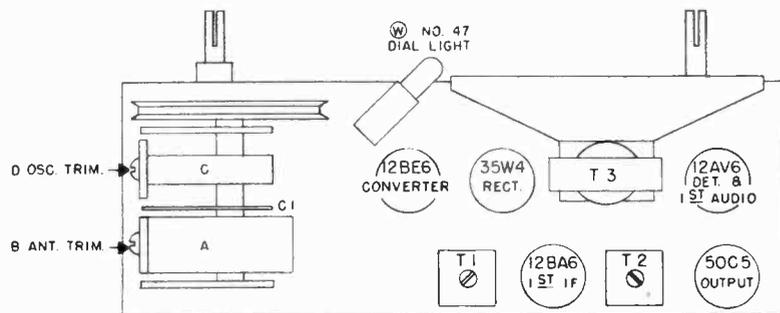

FIG. 2—CHASSIS LAYOUT

WARNING: The V-2157-2 chassis is connected directly to one side of the power line. When making repairs or adjustments, it is recommended that the chassis be isolated from the line by means of an isolation transformer. Otherwise serious shock may result if the radio chassis and ground are contacted at the same time.

MODELS H-323T5, Ch. V-2157-2;
H-323T5U, Ch. V-2157-2U

ALIGNMENT

It is recommended that the chassis be isolated from the power line by means of an isolation transformer.

Make certain that the dial pointer is correctly positioned.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial	Adjust for Maximum output—
1	Stator of R-F tuning capacitor (A) through a 0.1 mfd capacitor	455 kc.	Minimum capacity	Top and bottom slugs in 2nd and 1st I-F trans. in order given*
2	Same as step 1	1615 kc.	Minimum capacity	Osc. trimmer (D)
3	Radiated Signal	1400 kc.	1400 kc.	Ant. trimmer (B)

*It is recommended that a fiber aligning tool that snugly fits the slot in the powdered iron core be used to prevent chipping of the slot.

PARTS LIST FOR MODELS H-323T5 AND H-323T5U

When ordering parts, specify model number of set in addition to part number and description of part.

WARNING

The chassis is connected directly to one side of the power line. When making repairs or adjustments, it is recommended that the chassis be isolated from the line by means of an isolation transformer. Otherwise, serious shock may result if the radio chassis and ground are contacted at the same time.

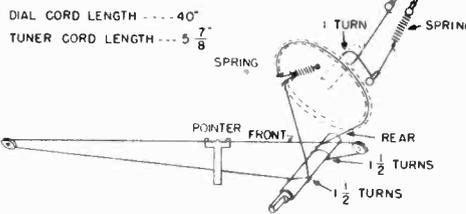

FIG. 3—DIAL DRIVE

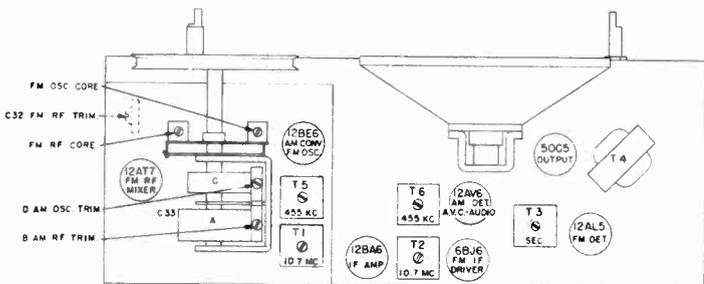

FIG. 4—TOP VIEW OF CHASSIS

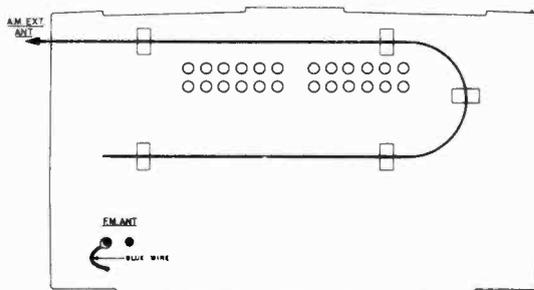

FIG. 5—ANTENNA COUPLING

ANTENNA INFORMATION

An external AM antenna can be coupled to the set by taping the lead-in wire to the outside of the rear cover as shown in Fig. 5. The wire should be dressed in the position shown and can be held in place with adhesive tape or other similar material.

The blue wire emerging from the hole in the rear cover is a "line" antenna for FM reception. It should be connected to the left antenna terminal as shown in Fig. 5. If an external FM antenna is to be used, disconnect the blue wire and connect the transmission line to the two terminals.

MODELS H-324T7, H-325T7,
Ch. V-2136-2; H-324T7U,
H-325T7U, Ch. V-2316

**ALIGNMENT
BROADCAST BAND**

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Check the dial pointer position by meshing the tuning capacitor plates completely and seeing that the dial pointer is set on the end mark of the dial scale.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to AM			
2	Stator of tuning capacitor (A) through a 0.1 mfd capacitor	455 kc.	minimum capacity	Pri. and sec. of T6 and T5 for max. output in order given
<i>NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.</i>				
3	Radiated signal (no actual connection)	1615 kc.	minimum capacity	AM osc. trimmer (D) for max. output
4	Radiated signal (no actual connection)	1400 kc.	tune to signal	AM R-F trimmer (B) for max. output (rock-in adjustment)

FM BAND

Do not align the FM circuits until all AM adjustments have been completed.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to FM			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 per cent) between pin No. 7 of the 12AL5 tube and ground as shown on the schematic diagram.			
3	Connect a V.T.V.M. between points "X" and "Y" (see schematic diagram).			
4	Pin No. 7 of 12AT7 through a .01 mfd mica capacitor	10.7 mc.	minimum capacity	Sec. of T3 for zero (use medium strength signal)
5	Connect the V.T.V.M. between point "Z" and ground.			
6	Same as step 4	10.7 mc.	minimum capacity	Pri. of T3 and pri. and sec. of T1 and T2 for max.
7	Reconnect the V.T.V.M. between points "X" and "Y" and increase the signal strength 10 times.			
8	Same as step 4	10.7 mc.	Minimum capacity	Recheck sec. of T3 for zero voltage
9	Reconnect the V.T.V.M. between point "Z" and ground.			
10	Same as step 4	10.7 mc.	minimum capacity	Pri. of T3 for maximum voltage
11	Remove the two 100,000 ohm resistors that were inserted in step 2.			
12	FM ant. terminal through a 300 ohm non-inductive resistor	98 mc.	98 mc.	FM osc. core for maximum voltage
13	Same as step 12	98 mc.	98 mc.	FM R-F trimmer (C32) for maximum voltage
14	Same as step 12	105 mc.	tune to signal	FM R-F core for maximum voltage
15	Same as step 12	90 mc.	tune to signal	FM R-F trimmer (C32) for maximum voltage (rock-in)
16	Recheck steps 14 and 15 for tracking.

If any circuit becomes grounded a hum will result. Microphonic tubes will cause audio howl. Check the 1L6 and 1S5. The wavemagnet is connected to the chassis by two wires that pass through the hollow dial pivots. If the R.F. becomes weak or dead, check the D.C. resistance of the wavemagnet. This D.C. resistance should be approximately .9 ohm. If it is open check the wavemagnet.

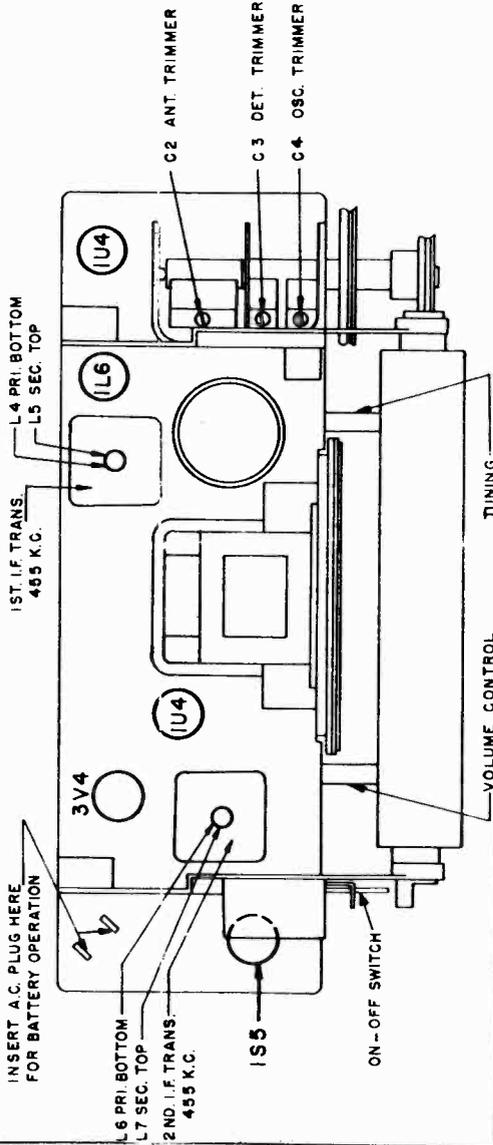

The 5G41 chassis is an AC, DC or battery operated super-heterodyne. The chassis is isolated from the DC circuit, and all measurements must be made from a common negative point. The most convenient place to reach this negative point is the negative side or container of the electrolytic. When the change-over Switch S1 is in AC position, the DC resistance from chassis to any circuit must be almost in-

MODEL G503,
Ch. 5G41

DETAILED VIEW OF I. F. TRANSFORMERS.

TUBE AND TRIMMER LOCATION

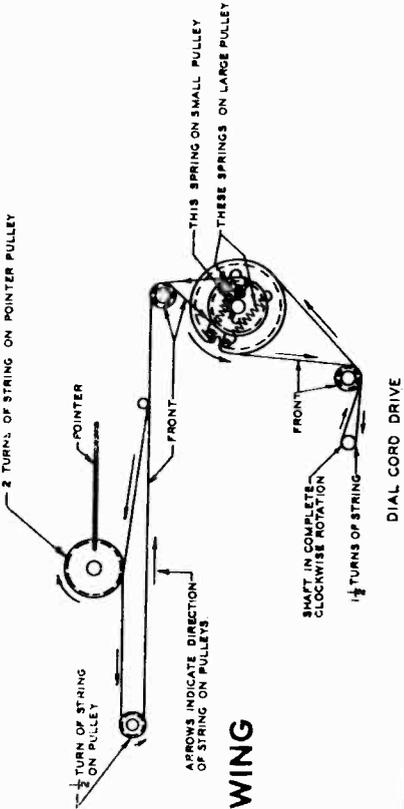

IF Alignment: Remove the chassis from the cabinet and arrange the units so that the wavemagnet can be connected. All the connections and adjustments can be made from the top of the chassis. Connect a signal generator, through a .1 mfd. dummy antenna, to the converter grid and B- (common return). Connect an output meter across the voice coil of the speaker (two lugs provided). Set the signal generator to 455 Kc. and adjust L4, L5, L6 and L7 for the maximum indication on the output meter. Always keep the signal output from the generator just high enough to get an indication, otherwise excessive loading may result.

RF Alignment: Connect a two turn loop across the leads of the signal generator, loosely couple this loop to the wavemagnet. Set the signal generator and the dial pointer of the receiver to 1600 Kc. and adjust C4 oscillator trimmer to resonance. Set the signal generator and dial pointer to 1400 and adjust C2 and C3 antenna detector trimmers to resonance. These trimmers are on the top of gang condenser. Check operation and re-install set in cabinet. Tune in a weak station near 1400 Kc. or use background noise and re-adjust antenna trimmer for maximum sensitivity.

The I.F. transformers incorporated in this receiver are of the new permeability tuned type. The advantage of an I.F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I.F. transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

DIAL CORD DRIVE

Clock and Timer Note:

The clock and timer assemblies used in this receiver are manufactured by Telechron. Face parts, such as hands, knobs, scales, bezel, etc., are not available through local Telechron service depots. We suggest that all clock and timer assemblies complete (less the rear cover and bushing - S-16768) be returned to your local Zenith Distributor for repair or replacement. Be sure to pack all clock and timer assemblies individually and carefully to prevent damage in shipment.

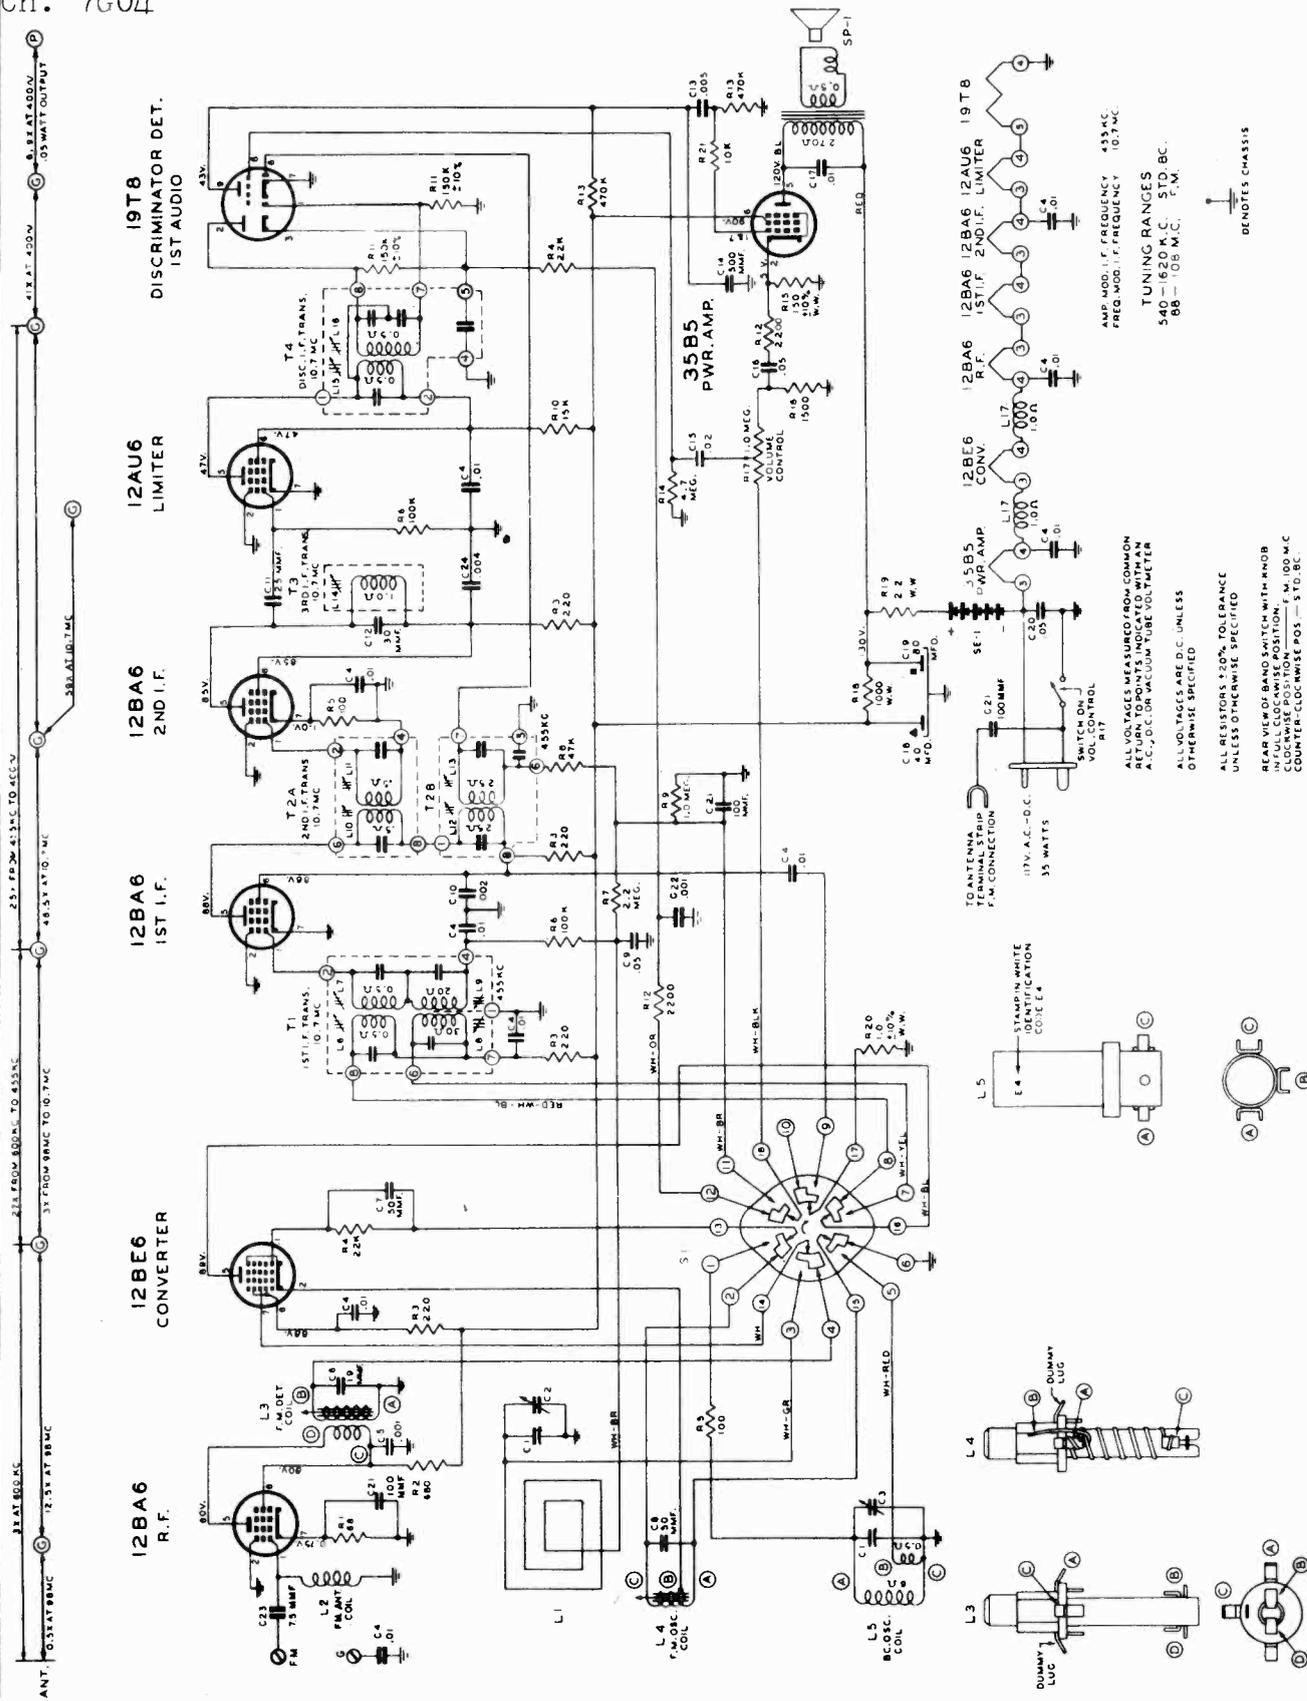

To remove the clock from the cabinet proceed as follows:

1. Remove the three 6/32 hex nuts that fasten the rear clock cover to the clock.
2. Slide the rear clock cover off the time set control shaft and then slide this cover down over the three-wire cable that connects the clock to the receiver.
3. Next unsolder the three-wire cable from the clock motor and switch. Be certain not to tear out the solder terminals from the clock motor or switch.
4. The clock can then be removed from the front of the cabinet.

⊕ DENOTES CHASSIS

The 7G04 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and one stage on the AM Band. There is one stage of RF amplification on the FM Band.

When adjustments are made on the 7G04 or any AC-DC chassis, a line isolation transformer (110-V input to 110-V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

FM-AM 1st IF Alignment: The alignment of the 1st IF transformer is conventional. The alignment slugs are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible. The 2nd AM and FM IF transformers and the discriminator transformer are the new permeability tuned type. The advantage of an IF transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these IF and discriminator transformers, tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Genera-

tor (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined in this service note.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

Alignment of this chassis will, in most cases, be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

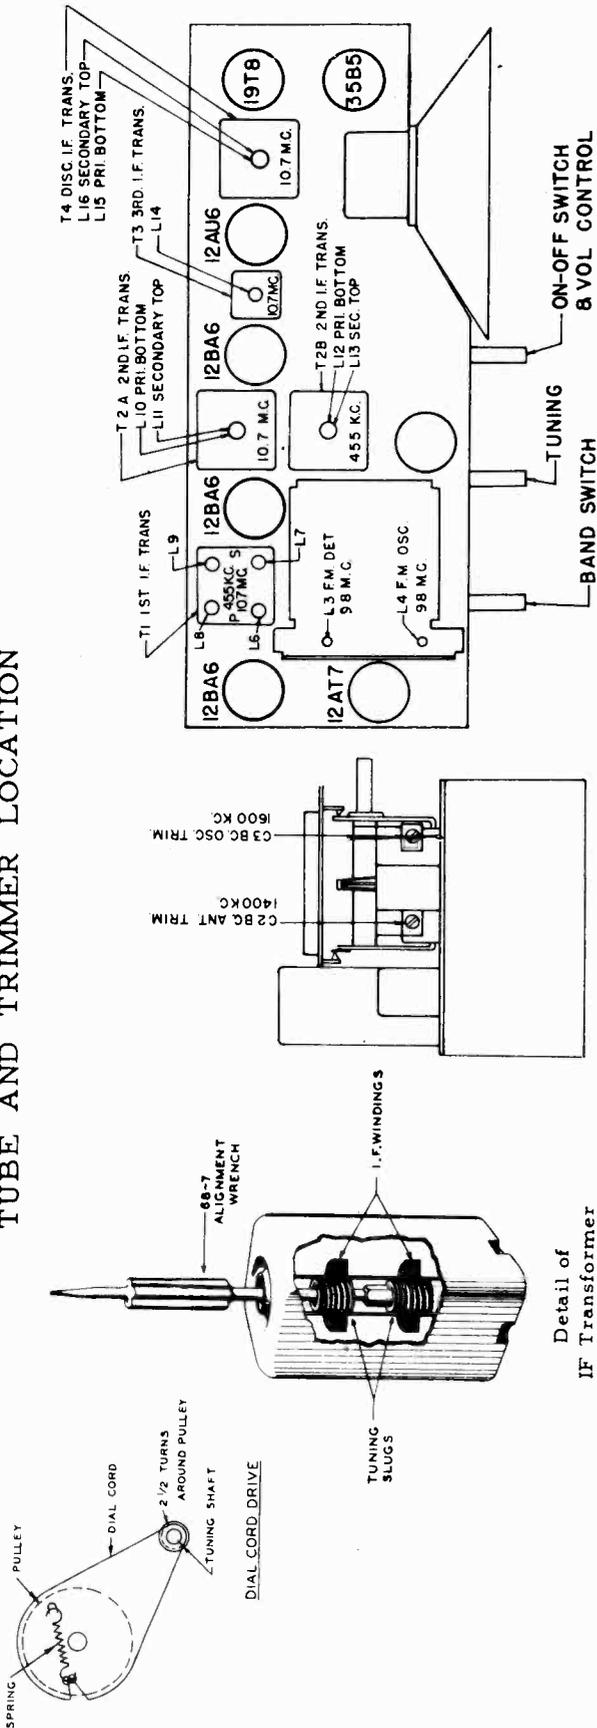

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

- (a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (half discriminator load).
- (b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (full discriminator load).
- (c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.
- (d) Loosen Slugs by applying a hot iron to the cement.

The 7G02 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and one stage on the AM Band. There is one stage of RF amplification on the FM Band.

When adjustments are made on the 7G02 or any AC-DC chassis, a line isolation transformer (110-V input to 110-V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

FM-AM 1st IF Alignment: The alignment of the 1st IF transformer is conventional. The alignment slugs are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible. The 2nd AM and FM IF transformers and the discriminator transformer are the new permeability tuned type. The advantage of an IF transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these IF and discriminator transformers, tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined in this service note.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

Alignment of this chassis will, in most cases, be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

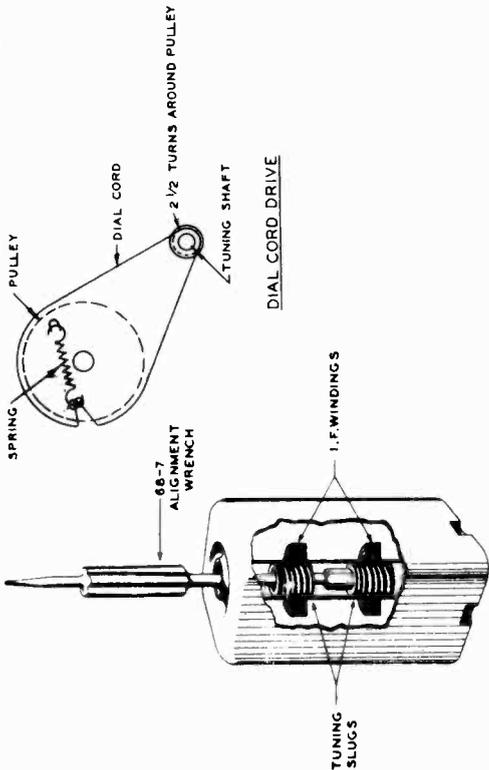

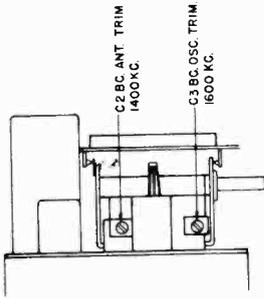

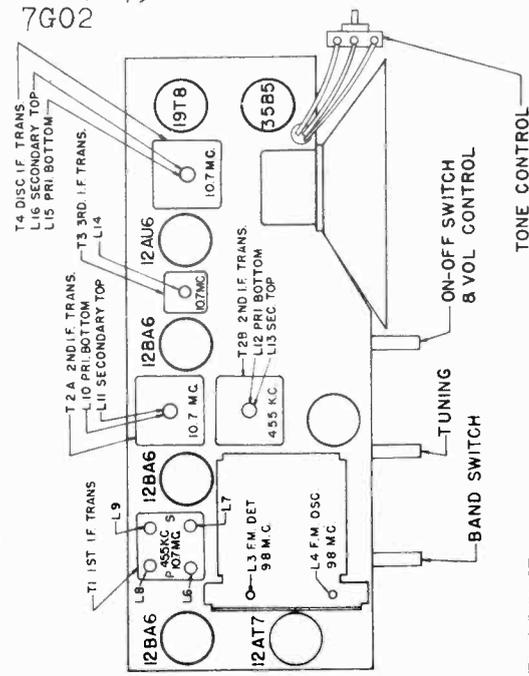

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

 POSITIONED FOR AM RECEPTION. F.M.
 POSITION IS INDICATED BY
 COUNTER-CLOCKWISE POS. STD. B.C.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) or zero will give the same results.

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with. Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot iron to the cement.

The 7G01 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands.

When adjustments are made on the 7G01 or any AC-DC chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustments will be impossible.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM I.F.'s. Observe the same precautions when making adjustments.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator To	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 7 12AT7 Converter 2 turns loosely cpl'd. to wavemagnet	.05 Mfd.	455 Kc Modulated	BC	600 Kc	L-9, 10, 13, 14, 17 and 18	Align I.F. channel for maximum output.
2	2 turns loosely cpl'd. to wavemagnet		1600 Kc. Modulated	BC	1600 Kc	C4	Set oscillator to dial scale
3	2 turns loosely cpl'd. to wavemagnet		1400 Kc Modulated	BC	1400 Kc	C3 and C2	Align det. and ant. stages
4 (a)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	10.7 Mc Unmodulated	FM		L19 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	10.7 Mc. Unmodulated	FM		L20 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 12BA6 2nd. IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM		L15 and L16 Prim. and Sec. of 3rd IF transformer	Align 3rd. IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 12BA6 1st. IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM		L11 and L12 Prim. and Sec. of 2nd. IF transformer	Align 2nd. IF transformer for maximum reading.
8 (c)	Pin 7 (grid) on 12AT7 converter tube socket	.05 Mfd.	10.7 Mc. Unmodulated	FM		L7 and L8 Prim and Sec. of 1st IF transformer	Align 1st. IF Transformer for maximum reading.
9 (c)(d)		270 ohms	98 Mc Unmodulated	FM	98 Mc.	L5 Osc. Coil Slug	Set Oscillator to dial scale
10 (c)(d)	Antenna Post P (Re-move line ant.)	270 ohms	98 Mc. Unmodulated	FM	98 Mc.	L3 and L2 Det. and RF coil Slugs	Align det. and ant. stages to maximum reading.

MODEL G725,
Ch. 7G01

PARTS LIST

DIAL ASSEMBLY

- 12-1407 Dial Light Socket Mtg. Brkt.
- *26-445 Dial Scale
- 46-538 Tuning Control Knob
- 46-718 Band Switch Knob
- *46-855 Tone Control Knob
- 57-1613 Cabinet Emblem Plate
- 57-1615 Dial Scale Clamping Plate
(4 Used)
- *57-1641 Name Plate
- *59-245 Dial Pointer
- 78-786 Dial Light Socket
- 80-69 Dial Cord Spring
- 80-209 Dial Cord Spring
- 80-444 Tuner Arm Tension Spring
- 80-580 Tuner Arm Stop Spring
- 80-581 Tuner Arm Pressure Spring
- 93-475 Felt Washer (Part of S-14124)
- 94-613 Iron Core Insulating Bushing
(3 Used on S-14429)
- 100-97 PL-1 Dial Light Bulb - 115V
- 114-26 #8-32 X 1/4" Hex. Hd. Sl. M. S.
(Used on 12-1407)
- 188-30 Retaining Ring (Used on
76-493)
- 188-102 Clamping Ring (46-538)
- S-13983 Dial Cord & Eyelet Assem.
- S-13945 Cam, Pulley & Bushing Assem.
- S-13981 Tone Control Brkt. & Lug
Assem.
- S-14129 Vol. Control Knob Assem.
- S-14429 Tuner Arm Assem.
- *S-16735 Pointer Pulley & Bushing Assem.
- *S-16884 Pulley & Shaft Assem.
- *S-16887 Dial Cord & Eyelet Assem.

COILS & CHOKES

- S-12256 L21 A.C. Line Choke Coil Assem.

DIAL CORD DRIVE

Detail of
IF Transformer

The 8G20 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and one stage on the AM Band. There is one stage of RF amplification on all Bands.

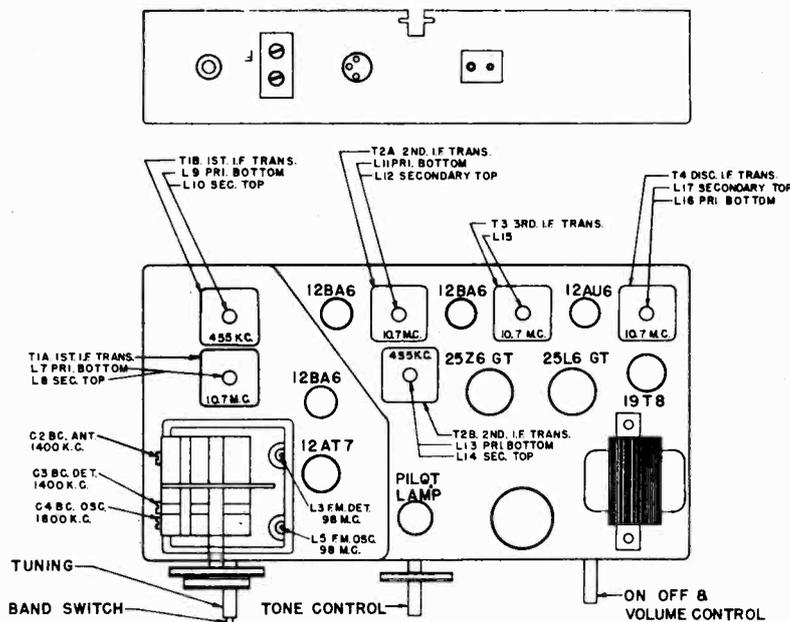

When adjustments are made on the 8G20 chassis, a line isolation transformer (110 V input to 110V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground and if there is any indication of voltage, reverse the plug before handling the set.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

AM And FM IF Alignment: The AM and FM IF transformers in this receiver are of the new permeability tuned type. The advantage of an I F transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I F transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator To	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 2 12AT7 Converter 2 turns loosely cpld. to wavemagnet	.05 Mfd.	455 Kc. Modulated 1600 Kc.	BC	600 Kc.	L9, 10, 13, 14	Align I F. channel for maximum output.
2	2 turns loosely cpld. to wavemagnet		Modulated 1400 Kc.	BC	1600 Kc.	C4	Set oscillator to dial scale.
3	2 turns loosely cpld. to wavemagnet		Modulated 10.7 Mc.	BC	1400 Kc.	C3, C2	Align detector and antenna stage.
4 (a)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	Unmodulated 10.7 Mc.	FM		L16 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	Unmodulated 10.7 Mc.	FM		L17 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 12BA6 2nd. I F.	.05 Mfd.	Unmodulated 10.7 Mc.	FM		L15 Prim. of 3rd. IF trans.	Align 3rd. IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 12BA6 1st. IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM		L11 and L12 Prim. and Sec. of 2nd. IF transformer.	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 2 (grid) on 12AT7 converter tube socket.	.05 Mfd.	10.7 Mc. Unmodulated	FM		L7 and L8 Prim. and Sec. of 1st. IF transformer.	Align 1st. IF transformer for maximum reading.
9 (c)	Antenna Post FM (Re-move line ant.)	270 ohms	98 Mc. Unmodulated	FM	98 Mc.	L5 Osc. Coil Slug.	Set Oscillator to dial scale.
10 (c) (d)		270 ohms	98 Mc. Unmodulated	FM	98 Mc.	L3 Det. Coil Slug	Align det. stage to maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot iron to the cement.

**DIAL CABLE DRAWING AND
DETAIL OF I. F. TRANSFORMER**

The I.F. transformers incorporated in this receiver are of the new permeability tuned type. The advantage of an I.F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I.F. transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other. In the event the receiver oscillates during phono operation, adjust C16 4-80 mmf. capacitor to a point at which the oscillation ceases. This position of no oscillation will sometimes vary with different cartridges, and in this case readjustment of C16 must be made.

The 7H02 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and two stages on the AM Band. There is one stage of RF amplification on the FM Band.

When adjustments are made on the 7H02 or any AC-DC chassis, a line isolation transformer (110-V input to 110-V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

The I.F. transformers and the discriminator transformer are the new permeability tuned type. The advantage of an IF transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these IF and discriminator transformers, tuning wrench 68-19 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined in this service note.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

Alignment of this chassis will, in most cases, be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

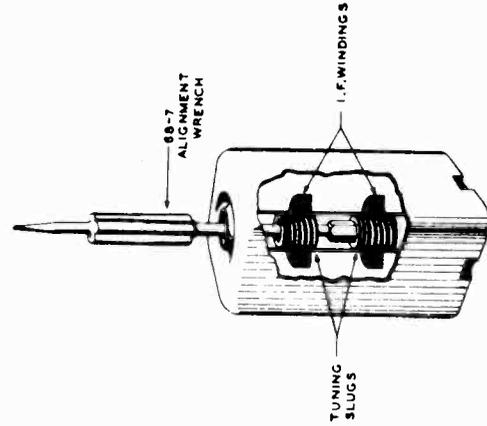

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

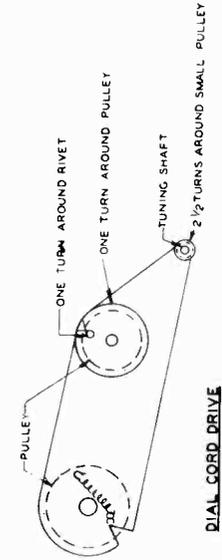

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (half discriminator load).

- (b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (full discriminator load).
- (c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.
- (d) Loosen Slugs by applying a hot iron to the cement.

TUBE AND TRIMMER LOCATION

The 8H20 revised chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and one stage on the AM Band. There is one stage of RF amplification on all Bands.

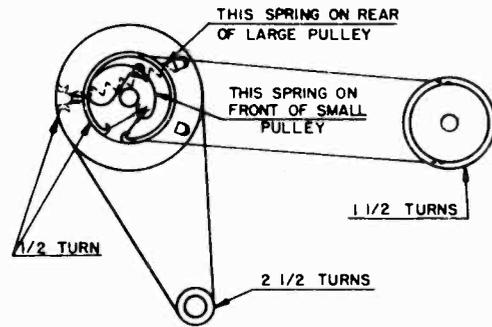

When adjustments are made on the 8H20 revised chassis, a line isolation transformer (110 V input to 110V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground and if there is any indication of voltage, reverse the plug before handling the set.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

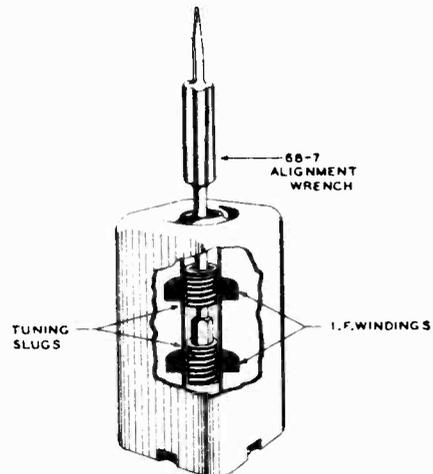

AM and FM IF Alignment: The AM and FM IF transformers in this receiver are of the new permeability tuned type. The advantage of an I F transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I F transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

TUBE AND TRIMMER LOCATION

The 8H20 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and one stage on the AM Band. There is one stage of RF amplification on all Bands.

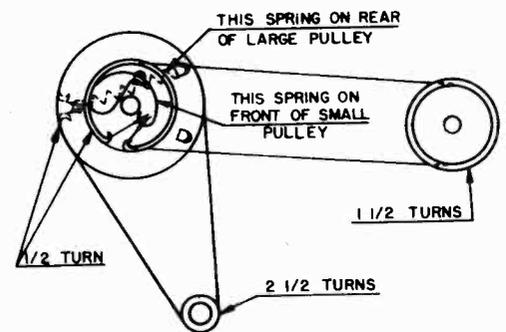

When adjustments are made on the 8H20 chassis, a line isolation transformer (110 V input to 110V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground and if there is any indication of voltage, reverse the plug before handling the set.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

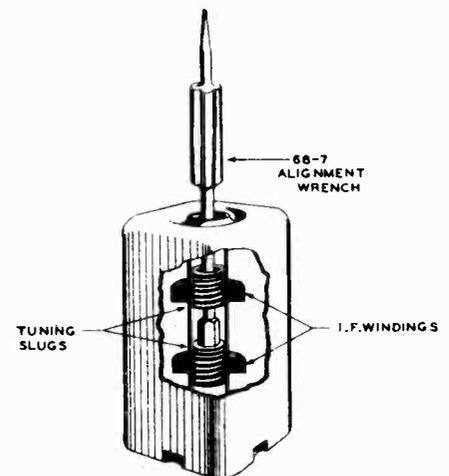

AM and FM IF Alignment: The AM and FM IF transformers in this receiver are of the new permeability tuned type. The advantage of an IF transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these IF transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

DIAL CORD DRIVE

IF Transformer

MODEL H880RZ,
Ch. 8H20

ALIGNMENT PROCEDURE

Operation	Connect Oscillator To	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 2 12AT7 Converter 2 turns loosely cpld. to wavemagnet	.05 Mfd.	455 Kc. Modulated 1600 Kc.	BC	600 Kc.	L9, 10, 13, 14	Align I. F. channel for maximum output.
2	2 turns loosely cpld. to wavemagnet		Modulated 1400 Kc.	BC	1600 Kc.	C4	Set oscillator to dial scale.
3	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	Modulated 10.7 Mc.	BC	1400 Kc.	C3, C2	Align detector and antenna stage.
4 (a)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	Unmodulated 100	FM		L16 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	Unmodulated 10.7 Mc.	FM		L17 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 12BA6 2nd. I F.	.05 Mfd.	Unmodulated 10.7 Mc.	FM		L15 Prim. of 3rd. IF trans.	Align 3rd. IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 12BA6 1st. IF.	.05 Mfd.	Unmodulated 10.7 Mc.	FM		L11 and L12 Prim. and Sec. of 2nd. IF transformer.	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 2 (grid) on 12AT7 converter tube socket.	.05 Mfd.	Unmodulated 10.7 Mc.	FM		L7 and L8 Prim. and Sec. of 1st. IF transformer.	Align 1st. IF transformer for maximum reading.
9 (c)	Antenna Post FM (Re- move line ant.)	270 ohms	98 Mc. Unmodulated	FM	98 Mc.	L5 Osc. Coil Slug.	Set Oscillator to dial scale.
10 (c) (d)		270 ohms	98 Mc. Unmodulated	FM	98 Mc.	L3 Det. Coil Slug	Align det. stage to maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot iron to the cement.

PARTS LIST

MODEL H880RZ,
Ch. 8H20

DIAL ASSEMBLY

54-292		Speed Nut (used on S-17165)
78-895		Dial Light Socket & Wire
80-69		Dial Cord Spring
80-746		Pulley Retaining Spring
80-747		Dial Cord Spring
80-781		Tuner Arm Tension Spring
94-732		Pointer Pulley Bushing (Part of S-17165)
100-97	PL-1	Pilot Light Bulb
114-262		#8 x 7/16" Hex. Hd. Sl. S.T. (2 used to Mount S-17149)
114-297		#6 x 1/4" Hex. Hd. Sl. S.T. (2 used to Mount S-17165)
148-122		Tuner Arm
188-30		Retaining Ring (used on S-17155)
S-17149		Dial Scale & Bracket Assembly (26-449 & 26-450)
S-17155		Tuning Shaft & Pulley Assembly
S-17157		Pointer & Pulley Assembly
S-17158		Dial Cord & Eyelet Assembly (Long)
S-17159		Dial Cord & Eyelet Assembly (Short)
S-17165		Bracket & Pulley Bushing Assembly

MODEL H723,
Ch. 7H04

DIAL ASSEMBLY

The 7H04 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and two stages on the AM Band. There is one stage of RF amplification on the FM Band.

When adjustments are made on the 7H04 or any AC-DC chassis, a line isolation transformer (110-V input to 110-V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

The IF transformers and the discriminator transformer are the new permeability tuned type. The advantage of an IF transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these IF and discriminator transformers, tuning wrench 68-19 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined in this service note.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

Alignment of this chassis will, in most cases, be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

NOTE: I.F. TRANSFORMER CORE ADJUSTMENTS ARE MADE BY TURNING THE PRIMARY ADJ. BOTTOM AND SECONDARY ADJ. TOP

Detail of IF Transformer

MODELS H1083E, H1036R,
H1087R, Ch. 10H20

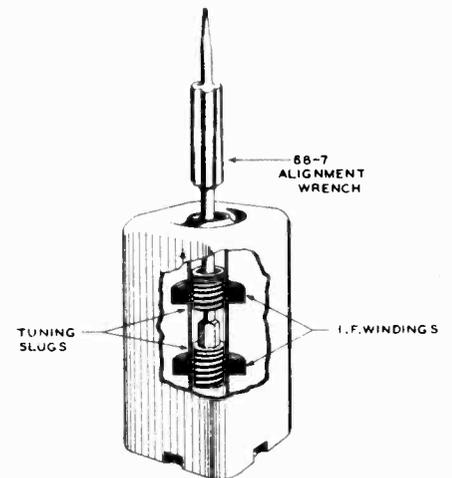

TUBE AND TRIMMER LOCATION

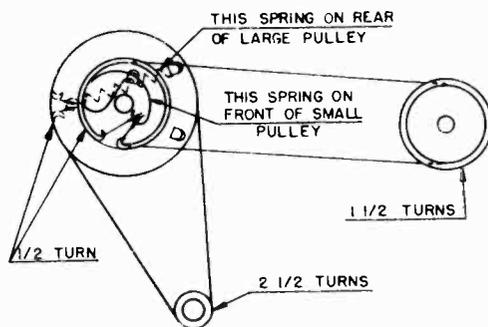

The 10H20 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and two stages on the AM Band. There is one stage of RF amplification on all Bands.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

AM and FM Alignment: The AM and FM IF transformers in this receiver are of the new permeability tuned type. The advantage of an IF transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these IF transformers the tuning wrench 68-19 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

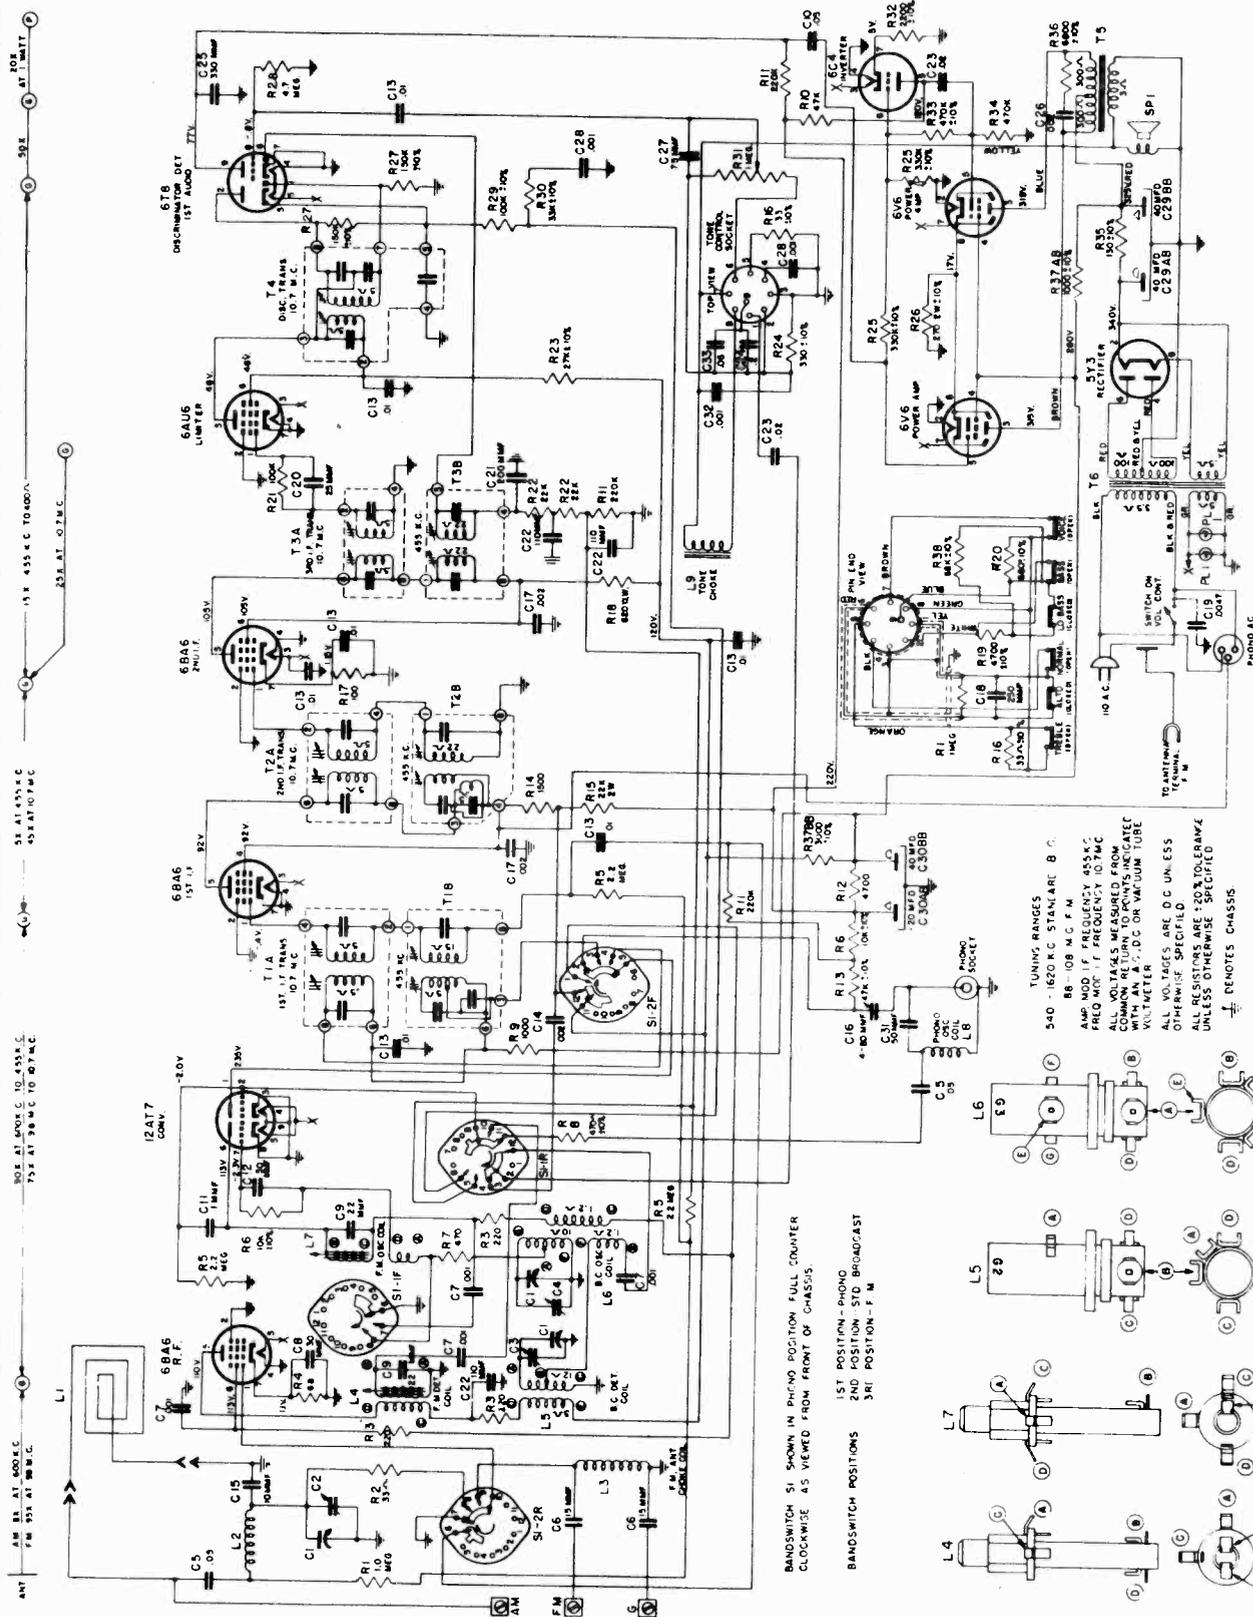

Detail of
IF Transformer

DIAL CORD DRIVE

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator To	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 1 2A7 Converter	.05 Mfd.	455 Kc.	BC	600 Kc.	Adj. Pri. and Sec. T1B, T2B, T3B	Align I. F. channel for maximum output.
2	2 turns loosely cpd. to wavemagnet		Modulated 1600 Kc.	BC	1600 Kc.	C4	Set oscillator to dial scale.
3	2 turns loosely cpd. to wavemagnet		Modulated 1400 Kc.	BC	1400 Kc.	C3, C2	Align detector and antenna stage.
4 (a)	Pin 1 (grid) on 6AU6 limiter.	.05 Mfd.	10.7 Mc.	FM		Adj. Primary of Discriminator T4	Align primary of discriminator for maximum reading.
5 (b)	Pin 1 (grid) on 6AU6 limiter.	.05 Mfd.	Unmodulated 10.7 Mc.	FM		Adj. Secondary of Discriminator T4	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 6BA6 2nd. I.F.	.05 Mfd.	10.7 Mc.	FM		Adj. Pri. and Sec. T3A	Align 3rd. IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 6BA6 1st. IF.	.05 Mfd.	10.7 Mc.	FM		Adj. Pri. and Sec. T2A	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 2 (grid) on 12AT7 converter tube socket.	.05 Mfd.	10.7 Mc.	FM		Adj. Pri. and Sec. T1A	Align 1st. IF transformer for maximum reading.
9 (c)	Antenna Post FM (Re-move line ant.)	270 ohms	98 Mc.	FM	98 Mc.	L7 Osc. Coil Slug.	Set Oscillator to dial scale.
10 (c) (d)		270 ohms	98 Mc.	FM	98 Mc.	L4 Det. Coil Slug	Align det. stage to maximum reading.

PARTS LIST

Model H1087R - H1086R (Chassis 10H20)

Part No.	Description	Quantity	Material
78-898	Dial Light Socket & Wire	1	Ceramic (7 used)
80-669	Dial Cord Spring	1	Ceramic (3 used)
80-746	Pulley Retaining Spring (used on S-17157)	1	Ceramic (3 used)
80-747	Dial Cord Spring	1	Ceramic (3 used)
93-1061	Shoulder Washer (used on S-17258)	1	Ceramic (3 used)
100-67	Dial Light Bulb	1	Ceramic (3 used)
188-30	Retaining Ring (used on S-17155)	1	Ceramic (3 used)
S-17155	Tuning Shaft & Pulley Assembly	1	Ceramic (3 used)
S-17157	Pointer & Pulley Assembly (59-219)	1	Ceramic (3 used)
S-17158	Dial Cord & Eyelet Assembly (Long)	1	Ceramic (3 used)
S-17159	Dial Cord & Eyelet Assembly (Short)	1	Ceramic (3 used)
S-17258	Dial Scale & Brkt. Assem. (26-449 & 26-450)	1	Ceramic (3 used)
S-17261	Brkt. & Pulley Assembly	1	Ceramic (3 used)
95-1150	2nd. & 3rd. I. F. Trans. (FM) (2 used)	2	Ceramic (3 used)
95-1153	Discriminator Trans.	1	Ceramic (3 used)
95-1201	1st. I. F. Trans. (FM)	1	Ceramic (3 used)
95-1248	2nd. I. F. Trans. (BC)	1	Ceramic (3 used)
95-1249	3rd. I. F. Trans. (BC)	1	Ceramic (3 used)
95-1254	Phone Oscillator Coil	1	Ceramic (3 used)
S-12603	Tone Choke Assembly	1	Ceramic (3 used)
S-13800	F. M. Osc. Coil Assembly	1	Ceramic (3 used)
S-15691	F. M. Detector Coil Assembly	1	Ceramic (3 used)
S-15743	Broadcast Detector Coil Assembly	1	Ceramic (3 used)
S-16344	Broadcast Oscillator Coil Assembly	1	Ceramic (3 used)
S-16345	Antenna Choke Coil Assembly	1	Ceramic (3 used)
S-16408	Antenna Choke Coil Assembly	1	Ceramic (3 used)

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series, with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

In the event the receiver oscillates during phono operation, adjust C16 4-80 mmf. capacitor to a point at which the oscillation ceases.

This position of no oscillation will sometimes vary with different cartridges, and in this case readjustment of C16 must be made.

(a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (Half discriminator load).

(b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (Full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot iron to the cement.
